To illustrate the difference between cumulative and noncumulative preferred stock, assume that a corporation's outstanding stock includes (1) 1,000 shares of \$100 par, 9% preferred stock—yielding \$9,000 per year (1,000 shares × \$100 par × 9%) in potential dividends, and (2) 4,000 shares of \$50 par value common stock. During 2014, the first year of operations, the directors declare cash dividends of \$5,000. In year 2015, they declare cash dividends of \$42,000. See Exhibit 13.11 for the allocation of dividends for these two years. Allocation of year 2015 dividends depends on whether the preferred stock is noncumulative or cumulative. With noncumulative preferred, the preferred stockholders never receive the \$4,000 skipped in 2014. If the preferred stock is cumulative, the \$4,000 in arrears is paid in 2015 before any other dividends are paid.

**Point:** Dividend preference does not imply that preferred stockholders receive more dividends than common stockholders, nor does it guarantee a dividend.

**EXHIBIT 13.11**

Allocation of Dividends  
(noncumulative vs.  
cumulative preferred stock)

**Example:** What dividends do cumulative preferred stockholders receive in 2015 if the corporation paid only \$2,000 of dividends in 2014? How does this affect dividends to common stockholders in 2015? *Answers:* \$16,000 (\$7,000 dividends in arrears, plus \$9,000 current preferred dividends). Dividends to common stockholders decrease to \$26,000.

	Preferred	Common
<b>Preferred Stock Is Noncumulative</b>		
Year 2014	<u>\$ 5,000</u>	<u>\$ 0</u>
Year 2015		
Step 1: Current year's preferred dividend	<u>\$ 9,000</u>	
Step 2: Remainder to common		<u>\$33,000</u>
Totals for 2014–2015	<u>\$14,000</u>	<u>\$33,000</u>
<b>Preferred Stock Is Cumulative</b>		
Year 2014	<u>\$ 5,000</u>	<u>\$ 0</u>
Year 2015		
Step 1: Dividend in arrears	\$ 4,000	
Step 2: Current year's preferred dividend	9,000	
Step 3: Remainder to common		<u>\$29,000</u>
Totals for year 2015	<u>\$13,000</u>	<u>\$29,000</u>
Totals for 2014–2015	<u>\$18,000</u>	<u>\$29,000</u>

A liability for a dividend does not exist until the directors declare a dividend. If a preferred dividend date passes and the corporation's board fails to declare the dividend on its cumulative preferred stock, the dividend in arrears is not a liability. The *full disclosure principle* requires a corporation to report (usually in a note) the amount of preferred dividends in arrears as of the balance sheet date.

**Participating or Nonparticipating Dividend** **Nonparticipating preferred stock** has a feature that limits dividends to a maximum amount each year. This maximum is often stated as a percent of the stock's par value or as a specific dollar amount per share. Once preferred

stockholders receive this amount, the common stockholders receive any and all additional dividends. **Participating preferred stock** has a feature allowing preferred stockholders to share with common stockholders in any dividends paid in excess of the percent or dollar amount stated on the preferred stock. This participation feature does not apply until common stockholders receive dividends equal to the preferred stock's dividend percent. Many corporations are authorized to issue participating preferred stock but rarely do, and most managers never expect to issue it.<sup>2</sup>

### Convertible Preferred Stock

Preferred stock is more attractive to investors if it carries a right to exchange preferred shares for a fixed number of common shares. **Convertible preferred stock** gives holders the option to exchange their preferred shares for common shares at a specified rate. When a company prospers and its common stock increases in value, convertible preferred stockholders can share in this success by converting their preferred stock into more valuable common stock.

### Callable Preferred Stock

**Callable preferred stock** gives the issuing corporation the right to purchase (retire) this stock from its holders at specified future prices and dates. The amount paid to call and retire a preferred share is its **call price**, or *redemption value*, and is set when the stock is issued. The call price normally includes the stock's par value plus a premium giving holders additional return on their investment. When the issuing corporation calls and retires a preferred stock, the terms of the agreement often require it to pay the call price *and* any dividends in arrears.

**Point:** The issuing corporation has the right, or option, to retire its callable preferred stock.

### IFRS

Like U.S. GAAP, IFRS requires that preferred stocks be classified as debt or equity based on analysis of the stock's contractual terms. However, IFRS uses different criteria for such classification. ■

### Reasons for Issuing Preferred Stock

Corporations issue preferred stock for several reasons. One is to raise capital without sacrificing control. For example, suppose a company's organizers have \$100,000 cash to invest and organize a corporation that needs \$200,000 of capital to start. If they sell \$200,000 worth of common stock (with \$100,000 to the organizers), they would have only 50% control and would need to negotiate extensively with other stockholders in making policy. However, if they issue \$100,000 worth of common stock to themselves and sell outsiders \$100,000 of 8%, cumulative preferred stock with no voting rights, they retain control.

A second reason to issue preferred stock is to boost the return earned by common stockholders. To illustrate, suppose a corporation's organizers expect to earn an annual after-tax income of \$24,000 on an investment of \$200,000. If they sell and issue \$200,000 worth of common stock, the \$24,000 income produces a 12% return on the \$200,000 of common stockholders' equity. However, if they issue \$100,000 of 8% preferred stock to outsiders and \$100,000 of common stock to themselves, their own return increases to 16% per year, as shown in Exhibit 13.12.

Net (after-tax) income .....	\$24,000
Less preferred dividends at 8% .....	(8,000)
Balance to common stockholders .....	\$16,000
Return to common stockholders (\$16,000/\$100,000) .....	16%

### EXHIBIT 13.12

Return to Common Stockholders When Preferred Stock Is Issued

<sup>2</sup> Participating preferred stock is usually authorized as a defense against a possible corporate *takeover* by an "unfriendly" investor (or a group of investors) who intends to buy enough voting common stock to gain control. Taking a term from spy novels, the financial world refers to this type of plan as a *poison pill* that a company swallows if enemy investors threaten its capture. A poison pill usually works as follows: A corporation's common stockholders on a given date are granted the right to purchase a large amount of participating preferred stock at a very low price. This right to purchase preferred shares is *not* transferable. If an unfriendly investor buys a large block of common shares (whose right to purchase participating preferred shares does *not* transfer to this buyer), the board can issue preferred shares at a low price to the remaining common shareholders who retained the right to purchase. Future dividends are then divided between the newly issued participating preferred shares and the common shares. This usually transfers value from common shares to preferred shares, causing the unfriendly investor's common stock to lose much of its value and reducing the potential benefit of a hostile takeover.

**Point:** Financial leverage also occurs when debt is issued and the interest rate paid on it is less than the rate earned from using the assets the creditors lend the company.

Common stockholders earn 16% instead of 12% because assets contributed by preferred stockholders are invested to earn \$12,000 while the preferred dividend is only \$8,000. Use of preferred stock to increase return to common stockholders is an example of **financial leverage** (also called *trading on the equity*). As a general rule, when the dividend rate on preferred stock is less than the rate the corporation earns on its assets, the effect of issuing preferred stock is to increase (or *lever*) the rate earned by common stockholders.

Other reasons for issuing preferred stock include its appeal to some investors who believe that the corporation's common stock is too risky or that the expected return on common stock is too low.

**Decision Maker**

**Concert Organizer** Assume that you alter your business strategy from organizing concerts targeted at under 1,000 people to those targeted at between 5,000 and 20,000 people. You also incorporate because of increased risk of lawsuits and a desire to issue stock for financing. It is important that you control the company for decisions on whom to schedule. What types of stock do you offer? ■ [Answers follow the chapter's Summary.]

**NEED-TO-KNOW**

13-3

Allocating Cash Dividends

C2

A company's outstanding stock consists of 80 shares of *noncumulative* 5% preferred stock with a \$5 par value and also 200 shares of common stock with a \$1 par value. During its first three years of operation, the corporation declared and paid the following total cash dividends:

2015 total cash dividends . . . . .	\$ 15
2016 total cash dividends . . . . .	5
2017 total cash dividends . . . . .	200

**Part 1.** Determine the amount of dividends paid each year to each of the two classes of stockholders: preferred and common. Also compute the total dividends paid to each class for the three years combined.

**Part 2.** Determine the amount of dividends paid each year to each of the two classes of stockholders assuming that the preferred stock is *cumulative*. Also determine the total dividends paid to each class for the three years combined.

**Solution—Part 1**

	Non-Cumulative Preferred	Common
2015 (\$15 paid)		
Preferred* . . . . .	\$ 15	
Common—remainder . . . . .	—	\$ 0
Total for the year . . . . .	<u>\$ 15</u>	<u>\$ 0</u>
2016 (\$5 paid)		
Preferred* . . . . .	\$ 5	
Common—remainder . . . . .	—	\$ 0
Total for the year . . . . .	<u>\$ 5</u>	<u>\$ 0</u>
2017 (\$200 paid)		
Preferred* . . . . .	\$ 20	
Common—remainder . . . . .	—	\$ 180
Total for the year . . . . .	<u>\$ 20</u>	<u>\$ 180</u>
2015–2017 (combined \$220 paid)		
Total for three years . . . . .	<u>\$ 40</u>	<u>\$ 180</u>

\* Holders of noncumulative preferred stock are entitled to no more than \$20 of dividends in any one year (5% × \$5 × 80 shares).

**Solution—Part 2**

	Cumulative Preferred	Common
2015 (\$15 paid)		
Preferred* . . . . .	\$ 15	
Common—remainder . . . . .	<u>    </u>	\$ 0
Total for the year . . . . .	<u>\$ 15</u>	<u>\$ 0</u>
(Note: \$5 in preferred dividends in arrears; (\$20 × 1 yr) – \$15 paid.)		
2016 (\$5 paid)		
Preferred—arrears from 2015 . . . . .	\$ 5	
Preferred* . . . . .	0	
Common—remainder . . . . .	<u>    </u>	\$ 0
Total for the year . . . . .	<u>\$ 5</u>	<u>\$ 0</u>
(Note: \$20 in preferred dividends in arrears; (\$20 × 2 yrs) – \$15 paid – \$5 paid.)		
2017 (\$200 paid)		
Preferred—arrears from 2016 . . . . .	\$20	
Preferred* . . . . .	20	
Common—remainder . . . . .	<u>    </u>	\$160
Total for the year . . . . .	<u>\$40</u>	<u>\$160</u>
(Note: \$0 in preferred dividends in arrears; (\$20 × 3 yrs) – \$15 paid – \$5 paid – \$40 paid.)		
2015–2017 (combined \$220 paid)		
Total for three years . . . . .	<u>\$60</u>	<u>\$160</u>

\* Holders of cumulative preferred stock are entitled to no more than \$20 of dividends declared in any year ( $5\% \times \$5 \times 80$  shares) plus any dividends in arrears.

QC5

## TREASURY STOCK

Corporations acquire shares of their own stock for several reasons: (1) to use their shares to acquire another corporation, (2) to purchase shares to avoid a hostile takeover of the company, (3) to reissue them to employees as compensation, and (4) to maintain a strong market for their stock or to show management confidence in the current price.

A corporation's reacquired shares are called **treasury stock**, which is similar to unissued stock in several ways: (1) neither treasury stock nor unissued stock is an asset, (2) neither receives cash dividends or stock dividends, and (3) neither allows the exercise of voting rights. However, treasury stock does differ from unissued stock in one major way: The corporation can resell treasury stock at less than par without having the buyers incur a liability, provided it was originally issued at par value or higher. Treasury stock purchases also require management to exercise ethical sensitivity because funds are being paid to specific stockholders instead of all stockholders. Managers must be sure the purchase is in the best interest of all stockholders. These concerns cause companies to fully disclose treasury stock transactions.

### Purchasing Treasury Stock

Purchasing treasury stock reduces the corporation's assets and equity by equal amounts. (We describe the *cost method* of accounting for treasury stock, which is the most widely used method. The *par value* method is another method explained in advanced courses.) To illustrate, Exhibit 13.13 shows Cyber Corporation's account balances *before* any treasury stock purchase (Cyber has no liabilities).

Assets		Stockholders' Equity	
Cash . . . . .	\$ 30,000	Common stock—\$10 par; 10,000 shares authorized, issued, and outstanding . . . . .	\$100,000
Other assets . . . . .	95,000	Retained earnings . . . . .	<u>25,000</u>
Total assets . . . . .	<u>\$125,000</u>	Total stockholders' equity . . . . .	<u>\$125,000</u>

### P3

Record purchases and sales of treasury stock and the retirement of stock.

### Corporations and Treasury Stock

### EXHIBIT 13.13

Account Balances *before*  
Purchasing Treasury Stock

Cyber then purchases 1,000 of its own shares for \$11,500 on May 1, which is recorded as follows:

<p>Assets = Liabilities + Equity -11,500                      -11,500</p> <div style="border: 1px solid black; padding: 2px; width: fit-content;"> <p>\$11.50 cost per share × 1,000 shares</p> </div>	<p>May 1</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 60%; padding: 5px;">                 Treasury Stock, Common .....             </td> <td style="width: 20%; text-align: right; padding: 5px;">11,500</td> <td style="width: 20%;"></td> </tr> <tr> <td style="padding: 5px;">                 Cash .....             </td> <td></td> <td style="text-align: right; padding: 5px;">11,500</td> </tr> <tr> <td colspan="3" style="padding: 5px;"> <i>Purchased 1,000 treasury shares at \$11.50 per share.</i> </td> </tr> </table>	Treasury Stock, Common .....	11,500		Cash .....		11,500	<i>Purchased 1,000 treasury shares at \$11.50 per share.</i>		
Treasury Stock, Common .....	11,500									
Cash .....		11,500								
<i>Purchased 1,000 treasury shares at \$11.50 per share.</i>										

This entry reduces equity through the debit to the Treasury Stock account, which is a contra equity account. Exhibit 13.14 shows account balances *after* this transaction.

**EXHIBIT 13.14**  
Account Balances *after*  
Purchasing Treasury Stock

Assets		Stockholders' Equity	
Cash .....	\$ 18,500	Common stock—\$10 par; 10,000 shares authorized and issued; 1,000 shares in treasury .....	\$100,000
Other assets .....	95,000	Retained earnings, \$11,500 restricted by treasury stock purchase .....	25,000
		<b>Less cost of treasury stock .....</b>	<b>(11,500)</b>
Total assets .....	<u>\$113,500</u>	Total stockholders' equity .....	<u>\$113,500</u>

**Point:** The Treasury Stock account is *not* an asset. Treasury stock does not carry voting or dividend rights.

**Point:** A treasury stock purchase is also called a *stock buyback*.

The treasury stock purchase reduces Cyber's cash, total assets, and total equity by \$11,500 but does not reduce the balance of either the Common Stock or the Retained Earnings account. The equity reduction is reported by deducting the cost of treasury stock in the equity section. Also, two disclosures are evident. First, the stock description reveals that 1,000 issued shares are in treasury, leaving only 9,000 shares still outstanding. Second, the description for retained earnings reveals that it is partly restricted.

### Reissuing Treasury Stock

Treasury stock can be reissued by selling it at cost, above cost, or below cost.

**Selling Treasury Stock at Cost** If treasury stock is reissued at cost, the entry is the reverse of the one made to record the purchase. For instance, if on May 21 Cyber reissues 100 of the treasury shares purchased on May 1 at the same \$11.50 per share cost, the entry is

<p>Assets = Liabilities + Equity +1,150                      +1,150</p> <div style="border: 1px solid black; padding: 2px; width: fit-content;"> <p>\$11.50 cost per share × 100 shares</p> </div>	<p>May 21</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 60%; padding: 5px;">                 Cash .....             </td> <td style="width: 20%; text-align: right; padding: 5px;">1,150</td> <td style="width: 20%;"></td> </tr> <tr> <td style="padding: 5px;">                 Treasury Stock, Common .....             </td> <td></td> <td style="text-align: right; padding: 5px;">1,150</td> </tr> <tr> <td colspan="3" style="padding: 5px;"> <i>Received \$11.50 per share for 100 treasury shares costing \$11.50 per share.</i> </td> </tr> </table>	Cash .....	1,150		Treasury Stock, Common .....		1,150	<i>Received \$11.50 per share for 100 treasury shares costing \$11.50 per share.</i>		
Cash .....	1,150									
Treasury Stock, Common .....		1,150								
<i>Received \$11.50 per share for 100 treasury shares costing \$11.50 per share.</i>										

**Point:** Treasury stock does not represent ownership. A company cannot own a part of itself.

Assets = Liabilities + Equity  
+4,800                      +4,600  
   +200

<div style="border: 1px solid black; padding: 2px; width: fit-content;"> <p>\$11.50 cost per share × 400 shares</p> </div> <div style="border: 1px solid black; padding: 2px; width: fit-content; margin-top: 10px;"> <p>[\$12 issue price - \$11.50 cost per share] × 400 shares</p> </div>	<p>June 3</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 60%; padding: 5px;">                 Cash .....             </td> <td style="width: 20%; text-align: right; padding: 5px;">4,800</td> <td style="width: 20%;"></td> </tr> <tr> <td style="padding: 5px;">                 Treasury Stock, Common .....             </td> <td></td> <td style="text-align: right; padding: 5px;">4,600</td> </tr> <tr> <td style="padding: 5px;">                 Paid-In Capital, Treasury Stock .....             </td> <td></td> <td style="text-align: right; padding: 5px;">200</td> </tr> <tr> <td colspan="3" style="padding: 5px;"> <i>Received \$12 per share for 400 treasury shares costing \$11.50 per share.</i> </td> </tr> </table>	Cash .....	4,800		Treasury Stock, Common .....		4,600	Paid-In Capital, Treasury Stock .....		200	<i>Received \$12 per share for 400 treasury shares costing \$11.50 per share.</i>		
Cash .....	4,800												
Treasury Stock, Common .....		4,600											
Paid-In Capital, Treasury Stock .....		200											
<i>Received \$12 per share for 400 treasury shares costing \$11.50 per share.</i>													

**Selling Treasury Stock above Cost** If treasury stock is sold for more than cost, the amount received in excess of cost is credited to the Paid-In Capital, Treasury Stock account. This account is reported as a separate item in the stockholders' equity section. No gain is ever reported from the sale of treasury stock. To illustrate, if Cyber receives \$12 cash per share for 400 treasury shares costing \$11.50 per share on June 3, the entry is

**Selling Treasury Stock below Cost** When treasury stock is sold below cost, the entry to record the sale depends on whether the Paid-In Capital, Treasury Stock account has a credit balance. If it has a zero balance, the excess of cost over the sales price is debited to Retained Earnings. If the Paid-In Capital, Treasury Stock account has a credit balance, it is debited for the excess of the cost over the selling price but not to exceed the balance in this account. When the credit balance in this paid-in capital account is eliminated, any remaining difference between the cost and selling price is debited to Retained Earnings. To illustrate, if Cyber sells its

**Point:** The phrase *treasury stock* is believed to arise from the fact that reacquired stock is held in a corporation's treasury.

**Point:** The Paid-In Capital, Treasury Stock account can have a zero or credit balance but never a debit balance.

remaining 500 shares of treasury stock at \$10 per share on July 10, equity is reduced by \$750 (500 shares × \$1.50 per share excess of cost over selling price), as shown in this entry:

July 10	Cash .....	5,000	
	<b>Paid-In Capital, Treasury Stock</b> .....	<b>200</b>	←
	<b>Retained Earnings</b> .....	<b>550</b>	←
	Treasury Stock, Common .....		5,750
	<i>Received \$10 per share for 500 treasury shares costing \$11.50 per share.</i>		

Assets = Liabilities + Equity  
+5,000                            -200  
    -550  
    +5,750

[\$10 issue price - \$11.50 cost per share] × 500 shares; not to exceed \$200

For any amount exceeding \$200 PIC from TS

\$11.50 cost per share × 500 shares

This entry eliminates the \$200 credit balance in the paid-in capital account created on June 3 and then reduces the Retained Earnings balance by the remaining \$550 excess of cost over selling price. A company never reports a loss (or gain) from the sale of treasury stock.

### Retiring Stock

A corporation can purchase its own stock and retire it. Retiring stock reduces the number of issued shares. Retired stock is the same as authorized and unissued shares. Purchases and retirements of stock are permissible under state law only if they do not jeopardize the interests of creditors and stockholders. When stock is purchased for retirement, we remove all capital amounts related to the retired shares. If the purchase price exceeds the net amount removed, this excess is debited to Retained Earnings. If the net amount removed from all capital accounts exceeds the purchase price, this excess is credited to the Paid-In Capital from Retirement of Stock account. A company’s assets and equity are always reduced by the amount paid for the retiring stock.

**Point:** Recording stock retirement results in canceling the equity from the original issuance of the shares.

A company began the current year with the following balances in its stockholders’ equity accounts.

Common stock—\$10 par, 500 shares authorized, 200 shares issued and outstanding .....	\$2,000
Paid-in capital in excess of par, common stock .....	1,000
Retained earnings .....	5,000
Total .....	<u>\$8,000</u>

**NEED-TO-KNOW 13-4**  
Recording Treasury Stock  
P3

All outstanding common stock was issued for \$15 per share when the company was created. Prepare journal entries to account for the following transactions during the current year.

- July 1 Purchased 30 shares of treasury stock at \$20 per share.
- Sept. 1 Sold 20 treasury shares at \$26 cash per share.
- Dec. 1 Sold the remaining 10 shares of treasury stock at \$7 cash per share.

## REPORTING OF EQUITY

### C3

Explain the items reported in retained earnings.

### Statement of Retained Earnings

Retained earnings generally consist of a company’s cumulative net income less any net losses and dividends declared since its inception. Retained earnings are part of stockholders’ claims on the company’s net assets, but this does *not* imply that a certain amount of cash or other assets is available to pay stockholders. For example, **Abercrombie & Fitch** has \$2,320,571 thousand in retained earnings, but only \$583,495 thousand in cash. This section describes events and transactions affecting retained earnings and how retained earnings are reported.

**Restrictions and Appropriations** The term **restricted retained earnings** refers to both statutory and contractual restrictions. A common *statutory* (or *legal*) *restriction* is to limit treasury stock purchases to the amount of retained earnings. The balance sheet in Exhibit 13.14 provides an example. A common *contractual restriction* involves loan agreements that restrict paying dividends beyond a specified amount or percent of retained earnings. Restrictions are usually described in the notes. The term **appropriated retained earnings** refers to a voluntary transfer of amounts from the Retained Earnings account to the Appropriated Retained Earnings account to inform users of special activities that require funds.

**Prior Period Adjustments** **Prior period adjustments** are corrections of material errors in prior period financial statements. These errors include arithmetic mistakes, unacceptable accounting, and missed facts. Prior period adjustments are reported in the *statement of retained earnings* (or the statement of stockholders’ equity), net of any income tax effects. Prior period adjustments result in changing the beginning balance of retained earnings for events occurring prior to the earliest period reported in the current set of financial statements. To illustrate, assume that ComUS makes an error in a 2013 journal entry for the purchase of land by incorrectly debiting an expense account. When this is discovered in 2015, the statement of retained earnings includes a prior period adjustment, as shown in Exhibit 13.15. This exhibit also shows the usual format of the statement of retained earnings.

**Point:** If a year 2013 error is discovered in 2014, the company records the adjustment in 2014. But if the financial statements include 2013 and 2014 figures, the statements report the correct amounts for 2013, and a note describes the correction.

### EXHIBIT 13.15

Statement of Retained Earnings with a Prior Period Adjustment

ComUS Statement of Retained Earnings For Year Ended December 31, 2015	
Retained earnings, Dec. 31, 2014, as previously reported . . . . .	\$4,745,000
Prior period adjustment	
<b>Cost of land incorrectly expensed (net of \$63,000 of income tax benefit)</b> . . . . .	<b>147,000</b>
Retained earnings, Dec. 31, 2014, as adjusted . . . . .	4,892,000
Plus net income . . . . .	1,224,300
Less cash dividends declared . . . . .	(301,800)
Retained earnings, Dec. 31, 2015 . . . . .	<u>\$5,814,500</u>

**Point:** Accounting for changes in estimates is sometimes criticized as two wrongs to make a right. Consider a change in an asset’s life. Depreciation neither before nor after the change is the amount computed if the revised estimate were originally selected. Regulators chose this approach to avoid restating prior period numbers.

Many items reported in financial statements are based on estimates. Future events are certain to reveal that some of these estimates were inaccurate even when based on the best data available at the time. These inaccuracies are *not* considered errors and are *not* reported as prior period adjustments. Instead, they are identified as **changes in accounting estimates** and are accounted for in current and future periods. To illustrate, we know that depreciation is based on estimated useful lives and salvage values. As time passes and new information becomes available, managers may need to change these estimates and the resulting depreciation expense for current and future periods.

**Closing Process** The closing process was explained earlier in the book as: (1) Close credit balances in revenue accounts to Income Summary, (2) Close debit balances in expense accounts to Income Summary, and (3) Close Income Summary to Retained Earnings. If dividends are recorded in a Dividends account, and not as an immediate reduction to Retained Earnings (as shown in this chapter), a fourth step is necessary to close the Dividends account to Retained Earnings.

## Statement of Stockholders' Equity

Instead of a separate statement of retained earnings, companies commonly report a statement of stockholders' equity that includes changes in retained earnings. A **statement of stockholders' equity** lists the beginning and ending balances of key equity accounts and describes the changes that occur during the period. The companies in Appendix A report such a statement. The usual format is to provide a column for each component of equity and use the rows to describe events occurring in the period. Exhibit 13.16 shows a condensed statement for **Apple**.

APPLE Statement of Stockholders' Equity					
(\$ millions, shares in thousands)	Common Stock Shares	Common Stock Amount	Retained Earnings	Other	Total Equity
<b>Balance, Sept. 29, 2012</b> . . . . .	<b>939,208</b>	<b>\$16,422</b>	<b>\$101,289</b>	<b>\$ 499</b>	<b>\$118,210</b>

## Reporting Stock Options

Many corporations whose shares are publicly traded issue **stock options**, which are rights to purchase common stock at a fixed price over a specified period. As the stock's price rises, the option's value increases. **Starbucks** and **Home Depot** offer stock options to both full- and part-time employees. Stock options are said to motivate managers and employees to (1) focus on company performance, (2) take a long-run perspective, and (3) remain with the company. A stock option is like having an investment with no risk ("a carrot with no stick").

To illustrate, Quantum grants each of its employees the option to purchase 100 shares of its \$1 par value common stock at its current market price of \$50 per share anytime within the next 10 years. If the stock price rises to \$70 per share, an employee can exercise the option at a gain of \$20 per share (acquire a \$70 stock at the \$50 option price). With 100 shares, a single employee would have a total gain of \$2,000, computed as  $\$20 \times 100$  shares. Companies report the cost of stock options in the income statement. Measurement of this cost is explained in advanced courses.

### Decision Insight

**Pump 'n Dump** Fraudulent information can be used by the owners of a company's stock to pump it up and claim it is undervalued, which causes naïve investors to seek to acquire the stock and drive up its price. After that, those behind the release of fraudulent information dump the stock at an inflated price. When later information reveals that the stock is overvalued, its price declines and investors still holding the stock lose value. This scheme is called *pump 'n dump*. Jonathan Lebed, at 15 years old, allegedly made about \$1 million in one of the most infamous cases of pump 'n dump. ■

## GLOBAL VIEW

This section discusses similarities and differences between U.S. GAAP and IFRS in accounting and reporting for equity.

**Accounting for Common Stock** The accounting for and reporting of common stock under U.S. GAAP and IFRS are similar. Specifically, procedures for issuing common stock at par, at a premium, at a discount, and for noncash assets are similar across the two systems. However, we must be aware of legal and cultural differences across the world that can impact the rights and responsibilities of common shareholders. **Samsung**'s terminology is a bit different as it uses the phrase "share premium" in reference to what U.S. GAAP would title "paid-in capital in excess of par value" (see Appendix A).

## Samsung

**Accounting for Dividends** Accounting for and reporting of dividends under U.S. GAAP and IFRS are consistent. This applies to cash dividends, stock dividends, and stock splits. **Samsung**, “declared cash dividends to shareholders of common stock and preferred stock as interim dividends for the six-month periods . . . and as year-end dividends.” Samsung, like many other companies, follows a dividend policy set by management and its board.

**Accounting for Preferred Stock** Accounting and reporting for preferred stock are similar for U.S. GAAP and IFRS, but there are some important differences. First, preferred stock that is redeemable at the option of the preferred stockholders is reported *between* liabilities and equity in U.S. GAAP balance sheets. However, that same stock is reported as a liability in IFRS balance sheets. Second, the issue price of convertible preferred stock (and bonds) is recorded entirely under preferred stock (or bonds) *and none is assigned to the conversion feature* under U.S. GAAP. However, IFRS requires that a portion of the issue price be allocated to the conversion feature when it exists. Samsung has preferred stock, which is noncumulative and nonvoting.

**Accounting for Treasury Stock** Both U.S. GAAP and IFRS apply the principle that companies do not record gains or losses on transactions involving their own stock. This applies to purchases, reissuances, and retirements of treasury stock. Consequently, the accounting for treasury stock explained in this chapter is consistent with that under IFRS. However, IFRS in this area is less detailed than U.S. GAAP.

**Sustainability and Accounting** The founder, Jack Ma, of **Alibaba Group**, as introduced in this chapter’s opening feature, explains that sustainability is an important part of his company’s mission. Jack explains: “I always believe we shouldn’t build an ‘empire;’ instead, we should build an ‘ecosystem.’ Every empire will be toppled someday, but an ecosystem is sustainable.” Jack points to his company’s website, which has set aside “0.3% of our annual revenue to fund efforts designed to encourage environmental awareness and conservation.” The site also states that they ban “all product postings related to shark fins, ivory, bear bile, cat and dog fur and meat, and various other products made from endangered animals.”

## Decision Analysis

Earnings per Share, Price-Earnings Ratio, Dividend Yield, and Book Value per Share

### Earnings per Share

**A1** \_\_\_\_\_  
Compute earnings per share and describe its use.

The income statement reports **earnings per share**, also called *EPS* or *net income per share*, which is the amount of income earned per share of a company’s outstanding common stock. The **basic earnings per share** formula is shown in Exhibit 13.17. When a company has no preferred stock, then preferred dividends are zero. The weighted-average common shares outstanding is measured over the income reporting period; its computation is explained in advanced courses.

#### EXHIBIT 13.17

Basic Earnings per Share

$$\text{Basic earnings per share} = \frac{\text{Net income} - \text{Preferred dividends}}{\text{Weighted-average common shares outstanding}}$$

To illustrate, assume that Quantum Co. earns \$40,000 net income in 2015 and declares dividends of \$7,500 on its noncumulative preferred stock. (If preferred stock is *noncumulative*, the income available [numerator] is the current-period net income less any preferred dividends *declared* in that same period. If preferred stock is *cumulative*, the income available [numerator] is the current-period net income less the preferred dividends whether declared or not.) Quantum has 5,000 weighted-average common shares outstanding during 2015. Its basic EPS<sup>3</sup> is

$$\text{Basic earnings per share} = \frac{\$40,000 - \$7,500}{5,000 \text{ shares}} = \$6.50$$

<sup>3</sup>A corporation can be classified as having either a simple or complex capital structure. The term **simple capital structure** refers to a company with only common stock and nonconvertible preferred stock outstanding. The term **complex capital structure** refers to companies with dilutive securities. **Dilutive securities** include options, rights to purchase common stock, and any bonds or preferred stock that are convertible into common stock. A company with a complex capital structure must often report two EPS figures: basic and diluted. **Diluted earnings per share** is computed by adding all dilutive securities to the denominator of the basic EPS computation. It reflects the decrease in basic EPS *assuming* that all dilutive securities are converted into common shares.

## Price-Earnings Ratio

A stock's market value is determined by its *expected* future cash flows. A comparison of a company's EPS and its market value per share reveals information about market expectations. This comparison is traditionally made using a **price-earnings** (or **PE**) **ratio**, expressed also as *price earnings*, *price to earnings*, or *PE*. Some analysts interpret this ratio as what price the market is willing to pay for a company's current earnings stream. Price-earnings ratios can differ across companies that have similar earnings because of either higher or lower expectations of future earnings. The price-earnings ratio is defined in Exhibit 13.18.

$$\text{Price-earnings ratio} = \frac{\text{Market value (price) per share}}{\text{Earnings per share}}$$

This ratio is often computed using EPS from the most recent period (for **Amazon**, its PE is 138; for **Altria**, its PE is 19). However, many users compute this ratio using *expected* EPS for the next period.

Some analysts view stocks with high PE ratios (higher than 20 to 25) as more likely to be overpriced and stocks with low PE ratios (less than 5 to 8) as more likely to be underpriced. These investors prefer to sell or avoid buying stocks with high PE ratios and to buy or hold stocks with low PE ratios. However, investment decision making is rarely so simple as to rely on a single ratio. For instance, a stock with a high PE ratio can prove to be a good investment if its earnings continue to increase beyond current expectations. Similarly, a stock with a low PE ratio can prove to be a poor investment if its earnings decline below expectations.

### Decision Maker

**Money Manager** You plan to invest in one of two companies identified as having identical future prospects. One has a PE of 19 and the other a PE of 25. Which do you invest in? Does it matter if your *estimate* of PE for these two companies is 29 as opposed to 22? ■ [Answers follow the chapter's Summary.]

## Dividend Yield

Investors buy shares of a company's stock in anticipation of receiving a return from either or both cash dividends and stock price increases. Stocks that pay large dividends on a regular basis, called *income stocks*, are attractive to investors who want recurring cash flows from their investments. In contrast, some stocks pay little or no dividends but are still attractive to investors because of their expected stock price increases. The stocks of companies that distribute little or no cash but use their cash to finance expansion are called *growth stocks*. One way to help identify whether a stock is an income stock or a growth stock is to analyze its dividend yield. **Dividend yield**, defined in Exhibit 13.19, shows the annual amount of cash dividends distributed to common shares relative to their market value.

$$\text{Dividend yield} = \frac{\text{Annual cash dividends per share}}{\text{Market value per share}}$$

Dividend yield can be computed for current and prior periods using actual dividends and stock prices and for future periods using expected values. Exhibit 13.20 shows recent dividend and stock price data for **Amazon** and **Altria Group** to compute dividend yield.

Company	Cash Dividends per Share	Market Value per Share	Dividend Yield
Amazon . . . . .	\$0.00	\$300	0.0%
Altria Group. . . . .	\$1.84	\$ 35	5.3%

Dividend yield is zero for Amazon, implying it is a growth stock. An investor in Amazon would look for increases in stock prices (and eventual cash from the sale of stock). Altria has a dividend yield of 5.3%, implying it is an income stock for which dividends are important in assessing its value.

## Book Value per Share

*Case 1: Common Stock (Only) Outstanding.* **Book value per common share**, defined in Exhibit 13.21, reflects the amount of equity applicable to *common* shares on a per share basis. To illustrate, we use Dillon Snowboards's data from Exhibit 13.4. Dillon has 30,000 outstanding common shares, and the stockholders'

### A2

Compute price-earnings ratio and describe its use in analysis.

**Point:** The average PE ratio of stocks in the 1950–2014 period is about 14.

### EXHIBIT 13.18

Price-Earnings Ratio

**Point:** Average PE ratios for U.S. stocks increased over the past two decades. Some analysts interpret this as a signal the market is overpriced. But higher ratios can at least partly reflect accounting changes that have reduced reported earnings.

### A3

Compute dividend yield and explain its use in analysis.

### EXHIBIT 13.19

Dividend Yield

### EXHIBIT 13.20

Dividend and Stock Price Information

**Point:** The *payout ratio* equals cash dividends declared on common stock divided by net income. A low payout ratio suggests that a company is retaining earnings for future growth.

### A4

Compute book value and explain its use in analysis.

equity applicable to common shares is \$365,000. Dillon’s book value per common share is \$12.17, computed as \$365,000 divided by 30,000 shares.

**EXHIBIT 13.21**

Book Value per Common Share

$$\text{Book value per common share} = \frac{\text{Stockholders' equity applicable to common shares}}{\text{Number of common shares outstanding}}$$

**Point:** Book value per share is also referred to as *stockholders' claim to assets on a per share basis*.

*Case 2: Common and Preferred Stock Outstanding.* To compute book value when both common and preferred shares are outstanding, we allocate total equity between the two types of shares. The **book value per preferred share** is computed first; its computation is shown in Exhibit 13.22.

**EXHIBIT 13.22**

Book Value per Preferred Share

$$\text{Book value per preferred share} = \frac{\text{Stockholders' equity applicable to preferred shares}}{\text{Number of preferred shares outstanding}}$$

The equity applicable to preferred shares equals the preferred share’s call price (or par value if the preferred is not callable) plus any cumulative dividends in arrears. The remaining equity is the portion applicable to common shares. To illustrate, consider LTD’s equity in Exhibit 13.23. Its preferred stock is callable at \$108 per share, and two years of cumulative preferred dividends are in arrears.

**EXHIBIT 13.23**

Stockholders' Equity with Preferred and Common Stock

Stockholders' Equity	
Preferred stock—\$100 par value, 7% cumulative, 2,000 shares authorized, 1,000 shares issued and outstanding . . . . .	\$100,000
Common stock—\$25 par value, 12,000 shares authorized, 10,000 shares issued and outstanding . . . . .	250,000
Paid-in capital in excess of par value, common stock . . . . .	15,000
Retained earnings . . . . .	<u>82,000</u>
Total stockholders' equity . . . . .	<u>\$447,000</u>

The book value computations are in Exhibit 13.24. Equity is first allocated to preferred shares before the book value of common shares is computed.

**EXHIBIT 13.24**

Computing Book Value per Preferred and Common Share

Total stockholders' equity . . . . .	\$447,000
Less equity applicable to preferred shares	
Call price (1,000 shares × \$108) . . . . .	\$108,000
Dividends in arrears (\$100,000 × 7% × 2 years) . . . . .	<u>14,000</u>
Equity applicable to common shares . . . . .	\$325,000
<b>Book value per preferred share (\$122,000/1,000 shares) . . . . .</b>	<b>\$ 122.00</b>
<b>Book value per common share (\$325,000/10,000 shares) . . . . .</b>	<b>\$ 32.50</b>

Book value per share reflects the value per share if a company is liquidated at balance sheet amounts. Book value is also the starting point in many stock valuation models, merger negotiations, price setting for public utilities, and loan contracts. The main limitation in using book value is the potential difference between recorded value and market value for assets and liabilities. Investors often adjust their analysis for estimates of these differences.

**Decision Maker**

**Investor** You are considering investing in **BMX**, whose book value per common share is \$4 and price per common share on the stock exchange is \$7. From this information, are BMX’s net assets priced higher or lower than its recorded values? ■ [Answers follow the chapter’s Summary.]

Barton Corporation began operations on January 1, 2014. The following transactions relating to stockholders' equity occurred in the first two years of the company's operations.

**2014**

- Jan. 1 Authorized the issuance of 2 million shares of \$5 par value common stock and 100,000 shares of \$100 par value, 10% cumulative, preferred stock.  
 Jan. 2 Issued 200,000 shares of common stock for \$12 cash per share.  
 Jan. 3 Issued 100,000 shares of common stock in exchange for a building valued at \$820,000 and merchandise inventory valued at \$380,000.  
 Jan. 4 Paid \$10,000 cash to the company's founders for organization activities.  
 Jan. 5 Issued 12,000 shares of preferred stock for \$110 cash per share.

**2015**

- June 4 Issued 100,000 shares of common stock for \$15 cash per share.

**Required**

- Prepare journal entries to record these transactions.
- Prepare the stockholders' equity section of the balance sheet as of December 31, 2014, and December 31, 2015, based on these transactions.
- Prepare a table showing dividend allocations and dividends per share for 2014 and 2015 assuming Barton declares the following cash dividends: 2014, \$50,000, and 2015, \$300,000.
- Prepare the January 2, 2014, journal entry for Barton's issuance of 200,000 shares of common stock for \$12 cash per share assuming
  - Common stock is no-par stock without a stated value.
  - Common stock is no-par stock with a stated value of \$10 per share.

**PLANNING THE SOLUTION**

- Record journal entries for the transactions for 2014 and 2015.
- Determine the balances for the 2014 and 2015 equity accounts for the balance sheet.
- Prepare the contributed capital portion of the 2014 and 2015 balance sheets.
- Prepare a table similar to Exhibit 13.11 showing dividend allocations for 2014 and 2015.
- Record the issuance of common stock under both specifications of no-par stock.

**SOLUTION**

- Journal entries.

2014			
Jan. 2	Cash .....	2,400,000

Total for the year	<u>\$110,000</u>	<u>\$190,000</u>
<b>Dividends per share</b>		
2014	\$ 0.00	\$ 4.17
2015	\$ 0.28	\$ 15.83

## 4. Journal entries.

## a. For 2014 (no-par stock without a stated value):

Jan. 2	Cash	2,400,000	
	Common Stock, No-Par Value		2,400,000
	<i>Issued 200,000 shares of no-par common stock at \$12 per share.</i>		

## b. For 2014 (no-par stock with a stated value):

Jan. 2	Cash	2,400,000	
	Common Stock, \$10 Stated Value		2,000,000
	Paid-In Capital in Excess of Stated Value, Common Stock		400,000
	<i>Issued 200,000 shares of \$10 stated value common stock at \$12 per share.</i>		

## Summary

**C1 Identify characteristics of corporations and their organization.** Corporations are legal entities whose stockholders are not liable for its debts. Stock is easily transferred, and the life of a corporation does not end with the incapacity of a

stockholder. A corporation acts through its agents, who are its officers and managers. Corporations are regulated and subject to income taxes. Authorized stock is the stock that a corporation's charter authorizes it to sell. Issued stock is the portion of

authorized shares sold. Par value stock is a value per share assigned by the charter. No-par value stock is stock *not* assigned a value per share by the charter. Stated value stock is no-par stock to which the directors assign a value per share.

**C2 Explain characteristics of, and distribute dividends between, common and preferred stock.** Preferred stock has a priority (or senior status) relative to common stock in one or more areas, usually (1) dividends and (2) assets in case of liquidation. Preferred stock usually does not carry voting rights and can be convertible or callable. Convertibility permits the holder to convert preferred to common. Callability permits the issuer to buy back preferred stock under specified conditions. Preferred stockholders usually hold the right to dividend distributions before common stockholders. When preferred stock is cumulative and in arrears, the amount in arrears must be distributed to preferred before any dividends are distributed to common.

**C3 Explain the items reported in retained earnings.** Stockholders' equity is made up of (1) paid-in capital and (2) retained earnings. Paid-in capital consists of funds raised by stock issuances. Retained earnings consists of cumulative net income (losses) not distributed. Many companies face statutory and contractual restrictions on retained earnings. Corporations can voluntarily appropriate retained earnings to inform others about their disposition. Prior period adjustments are corrections of errors in prior financial statements.

**A1 Compute earnings per share and describe its use.** A company with a simple capital structure computes basic EPS by dividing net income less any preferred dividends by the weighted-average number of outstanding common shares. A company with a complex capital structure must usually report both basic and diluted EPS.

**A2 Compute price-earnings ratio and describe its use in analysis.** A common stock's price-earnings (PE) ratio is computed by dividing the stock's market value (price) per share by its EPS. A stock's PE is based on expectations that can prove to be better or worse than eventual performance.

**A3 Compute dividend yield and explain its use in analysis.** Dividend yield is the ratio of a stock's annual cash dividends per share to its market value (price) per share. Dividend yield can be compared with the yield of other companies to determine whether the stock is expected to be an income or growth stock.

**A4 Compute book value and explain its use in analysis.** Book value per common share is equity applicable to common shares divided by the number of outstanding common shares. Book value per preferred share is equity applicable to preferred shares divided by the number of outstanding preferred shares.

**P1 Record the issuance of corporate stock.** When stock is issued, its par or stated value is credited to the stock account and any excess is credited to a separate contributed capital account. If a stock has neither par nor stated value, the entire proceeds are credited to the stock account. Stockholders must contribute assets equal to minimum legal capital or be potentially liable for the deficiency.

**P2 Record transactions involving cash dividends, stock dividends, and stock splits.** Cash dividends involve three events. On the date of declaration, the directors bind the company to pay the dividend. A dividend declaration reduces retained earnings and creates a current liability. On the date of record, recipients of the dividend are identified. On the date of payment, cash is paid to stockholders and the current liability is removed. Neither a stock dividend nor a stock split alters the value of the company. However, the value of each share is less due to the distribution of additional shares. The distribution of additional shares is according to individual stockholders' ownership percentage. Small stock dividends ( $\leq 25\%$ ) are recorded by capitalizing retained earnings equal to the market value of distributed shares. Large stock dividends ( $> 25\%$ ) are recorded by capitalizing retained earnings equal to the par or stated value of distributed shares. Stock splits do not necessitate journal entries but do necessitate changes in the description of stock.

**P3 Record purchases and sales of treasury stock and the retirement of stock.** When a corporation purchases its own previously issued stock, it debits the cost of these shares to Treasury Stock. Treasury stock is subtracted from equity in the balance sheet. If treasury stock is reissued, any proceeds in excess of cost are credited to Paid-In Capital, Treasury Stock. If the proceeds are less than cost, they are debited to Paid-In Capital, Treasury Stock to the extent a credit balance exists. Any remaining amount is debited to Retained Earnings. When stock is retired, all accounts related to the stock are removed.

## Guidance Answers to Decision Maker

**Entrepreneur** The 50% stock dividend provides you no direct income. A stock dividend often reveals management's optimistic expectations about the future and can improve a stock's marketability by making it affordable to more investors. Accordingly, a stock dividend usually reveals "good news" and because of this, it likely increases (slightly) the market value for your stock. The same conclusions apply to the 3-for-2 stock split.

**Concert Organizer** You have two basic options: (1) different classes of common stock or (2) common and preferred stock. Your objective is to issue to yourself stock that has all or a major-

ity of the voting power. The other class of stock would carry limited or no voting rights. In this way, you maintain control and are able to raise the necessary funds.

**Money Manager** Since one company requires a payment of \$19 for each \$1 of earnings, and the other requires \$25, you would prefer the stock with the PE of 19; it is a better deal given identical prospects. You should make sure these companies' earnings computations are roughly the same, for example, no extraordinary items, unusual events, and so forth. Also, your PE estimates for these companies do matter. If you are willing to pay

\$29 for each \$1 of earnings for these companies, you obviously expect both to exceed current market expectations.

**Investor** Book value reflects recorded values. BMX's book value is \$4 per common share. Stock price reflects the market's

expectation of net asset value (both tangible and intangible items). BMX's market value is \$7 per common share. Comparing these figures suggests BMX's market value of net assets is higher than its recorded values (by an amount of \$7 versus \$4 per share).

## Key Terms

Appropriated retained earnings	Discount on stock	Preferred stock
Authorized stock	Dividend in arrears	Premium on stock
Basic earnings per share	Dividend yield	Price-earnings (PE) ratio
Book value per common share	Earnings per share (EPS)	Prior period adjustments
Book value per preferred share	Financial leverage	Proxy
Call price	Large stock dividend	Restricted retained earnings
Callable preferred stock	Liquidating cash dividend	Retained earnings
Capital stock	Market value per share	Retained earnings deficit
Changes in accounting estimates	Minimum legal capital	Reverse stock split
Common stock	Noncumulative preferred stock	Simple capital structure
Complex capital structure	Nonparticipating preferred stock	Small stock dividend
Convertible preferred stock	No-par value stock	Stated value stock
Corporation	Organization expenses	Statement of stockholders' equity
Cumulative preferred stock	Paid-in capital	Stock dividend
Date of declaration	Paid-in capital in excess of par value	Stock options
Date of payment	Par value	Stock split
Date of record	Par value stock	Stockholders' equity
Diluted earnings per share	Participating preferred stock	Treasury stock
Dilutive securities	Preemptive right	

## Multiple Choice Quiz

## Answers at end of chapter

- A corporation issues 6,000 shares of \$5 par value common stock for \$8 cash per share. The entry to record this transaction includes:
  - A debit to Paid-In Capital in Excess of Par Value for \$18,000.
  - A credit to Common Stock for \$48,000.
  - A credit to Paid-In Capital in Excess of Par Value for \$30,000.
  - A credit to Cash for \$48,000.
  - A credit to Common Stock for \$30,000.
- A company reports net income of \$75,000. Its weighted-average common shares outstanding is 19,000. It has no other stock outstanding. Its earnings per share is:
  - \$4.69
  - \$3.95
  - \$3.75
  - \$2.08
  - \$4.41
- A company has 5,000 shares of \$100 par preferred stock and 50,000 shares of \$10 par common stock outstanding. Its total stockholders' equity is \$2,000,000. Its book value per common share is:
  - \$100.00
  - \$10.00
  - \$40.00
  - \$30.00
  - \$36.36
- A company paid cash dividends of \$0.81 per share. Its earnings per share is \$6.95 and its market price per share is \$45.00. Its dividend yield is:
  - 1.8%
  - 11.7%
  - 15.4%
  - 55.6%
  - 8.6%
- A company's shares have a market value of \$85 per share. Its net income is \$3,500,000, and its weighted-average common shares outstanding is 700,000. Its price-earnings ratio is:
  - 5.9
  - 425.0
  - 17.0
  - 10.4
  - 41.2

 Icon denotes assignments that involve decision making.

## Discussion Questions

1. What are organization expenses? Provide examples.
2. How are organization expenses reported?
3.  Who is responsible for directing a corporation's affairs?
4. What is the difference between authorized shares and outstanding shares?
5. What is the preemptive right of common stockholders?
6. List the general rights of common stockholders.
7. What is the difference between the market value per share and the par value per share?
8. What is the difference between the par value and the call price of a share of preferred stock?
9.  Why would an investor find convertible preferred stock attractive?
10. Identify and explain the importance of the three dates relevant to corporate dividends.
11. Why is the term *liquidating dividend* used to describe cash dividends debited against paid-in capital accounts?
12.  How does declaring a stock dividend affect the corporation's assets, liabilities, and total equity? What are the effects of the eventual distribution of that stock?
13.  What is the difference between a stock dividend and a stock split?
14.  Courts have ruled that a stock dividend is not taxable income to stockholders. What justifies this decision?
15. How does the purchase of treasury stock affect the purchaser's assets and total equity?
16.  Why do laws place limits on treasury stock purchases?
17. How are EPS results computed for a corporation with a simple capital structure?
18. What is a stock option?
19. How is book value per share computed for a corporation with no preferred stock? What is the main limitation of using book value per share to value a corporation?
20. Refer to **Apple's** fiscal 2013 balance sheet in Appendix A. How many shares of common **APPLE** stock are authorized? How many shares of voting common stock are issued?
21.  Refer to the 2013 balance sheet for **Google** in Appendix A. What is the par value per share of its preferred stock? Suggest a rationale for the amount of par value it assigned. **GOOGLE**
22.  Refer to the financial statements for **Samsung** in Appendix A. How much were its cash payments for treasury stock purchases for the year ended December 31, 2013? **Samsung**

Of the following statements, which are true for the corporate form of organization?

- \_\_\_ 1. Ownership rights cannot be easily transferred.
- \_\_\_ 2. Owners have unlimited liability for corporate debts.
- \_\_\_ 3. Capital is more easily accumulated than with most other forms of organization.
- \_\_\_ 4. Corporate income that is distributed to shareholders is usually taxed twice.
- \_\_\_ 5. It is a separate legal entity.
- \_\_\_ 6. It has a limited life.
- \_\_\_ 7. Owners are not agents of the corporation.

Prepare the journal entry to record Zende Company's issuance of 75,000 shares of \$5 par value common stock assuming the shares sell for:

- a. \$5 cash per share.
- b. \$6 cash per share.

Prepare the journal entry to record Jevonte Company's issuance of 36,000 shares of its common stock assuming the shares have a:

- a. \$2 par value and sell for \$18 cash per share.
- b. \$2 stated value and sell for \$18 cash per share.

Prepare the journal entry to record Autumn Company's issuance of 63,000 shares of no-par value common stock assuming the shares:

- a. Sell for \$29 cash per share.
- b. Are exchanged for land valued at \$1,827,000.

### QS 13-2

Issuance of common stock

P1

### QS 13-3

Issuance of par and stated value common stock

P1

### QS 13-4

Issuance of no-par common stock

P1

**QS 13-5**Issuance of common stock **P1**

Prepare the issuer's journal entry for each of the following separate transactions.

- On March 1, Atlantic Co. issues 42,500 shares of \$4 par value common stock for \$297,500 cash.
- On April 1, OP Co. issues no-par value common stock for \$70,000 cash.
- On April 6, MPG issues 2,000 shares of \$25 par value common stock for \$45,000 of inventory, \$145,000 of machinery, and acceptance of a \$94,000 note payable.

**QS 13-6**Accounting for cash dividends **P2**

Prepare journal entries to record the following transactions for Emerson Corporation.

- July 15 Declared a cash dividend payable to common stockholders of \$165,000.  
 Aug. 15 Date of record is August 15 for the cash dividend declared on July 15.  
 Aug. 31 Paid the dividend declared on July 15.

**QS 13-7**Accounting for small stock dividend **P2**

The stockholders' equity section of Jun Company's balance sheet as of April 1 follows. On April 2, Jun declares and distributes a 10% stock dividend. The stock's per share market value on April 2 is \$20 (prior to the dividend). Prepare the stockholders' equity section immediately after the stock dividend.

Common stock—\$5 par value, 375,000 shares authorized, 200,000 shares issued and outstanding . . . . .	\$1,000,000
Paid-in capital in excess of par value, common stock . . . . .	600,000
Retained earnings . . . . .	833,000
Total stockholders' equity . . . . .	<u>\$2,433,000</u>

**QS 13-8**Accounting for dividends **P2**

Which of the following statements are true regarding dividends?

- 1.** Cash and stock dividends reduce retained earnings.  
 **2.** Dividends payable is recorded at the time a cash dividend is declared.  
 **3.** The date of record refers to the date a cash dividend is paid to stockholders.  
 **4.** Stock dividends are a mechanism to keep the market price of stock affordable.

**QS 13-9**Preferred stock issuance and dividends **C2**

- Prepare the journal entry to record Tamasine Company's issuance of 5,000 shares of \$100 par value, 7% cumulative preferred stock for \$102 cash per share.
- Assuming the facts in part 1, if Tamasine declares a year-end cash dividend, what is the amount of dividend paid to preferred shareholders? (Assume no dividends in arrears.)

**QS 13-10**Dividend allocation between classes of shareholders **C2**

Stockholders' equity of Ernst Company consists of 80,000 shares of \$5 par value, 8% cumulative preferred stock and 250,000 shares of \$1 par value common stock. Both classes of stock have been outstanding since the company's inception. Ernst did not declare any dividends in the prior year, but it now declares and pays a \$110,000 cash dividend at the current year-end. Determine the amount distributed to each class of stockholders for this two-year-old company.

**QS 13-11**Purchase and sale of treasury stock **P3**

On May 3, Zirbal Corporation purchased 4,000 shares of its own stock for \$36,000 cash. On November 4, Zirbal reissued 850 shares of this treasury stock for \$8,500. Prepare the May 3 and November 4 journal entries to record Zirbal's purchase and reissuance of treasury stock.

**QS 13-12**Impacts of stock issuances, dividends, splits, and treasury transactions **P2 P3**

Listed below are various transactions that a company incurred during the current year. Indicate the impact on total stockholders' equity for each scenario. Specifically state whether stockholders' equity would "Increase," "Decrease," or have "No Effect" as a result of each transaction listed below. Consider each transaction independently.

- 1.** A stock dividend equal to 30% of the previously outstanding shares is declared.  
 **2.** New shares of common stock are issued for cash.  
 **3.** Treasury shares of common stock are purchased (assume the cost method).  
 **4.** Cash dividends are paid to shareholders.

Answer the following questions related to a company's activities for the current year:

1. A review of the notes payable files discovers that three years ago the company reported the entire amount of a payment (principal and interest) on an installment note payable as interest expense. This mistake had a material effect on the amount of income in that year. How should the correction be reported in the current-year financial statements?
2. After using an expected useful life of seven years and no salvage value to depreciate its office equipment over the preceding three years, the company decided early this year that the equipment will last only two more years. How should the effects of this decision be reported in the current-year financial statements?

**QS 13-13**

Accounting for changes in estimates; error adjustments

Murray Company reports net income of \$770,000 for the year. It has no preferred stock, and its weighted-average common shares outstanding is 280,000 shares. Compute its basic earnings per share.

**QS 13-14**

Basic earnings per share  
A1

Epic Company earned net income of \$900,000 this year. The number of common shares outstanding during the entire year was 400,000, and preferred shareholders received a \$20,000 cash dividend. Compute Epic Company's basic earnings per share.

**QS 13-15**

Basic earnings per share  
A1

Compute Topp Company's price-earnings ratio if its common stock has a market value of \$20.54 per share and its EPS is \$3.95. Would an analyst likely consider this stock potentially overpriced, underpriced, or neither? Explain.

**QS 13-16**

Price-earnings ratio  
A2 

Foxburo Company expects to pay a \$2.34 per share cash dividend this year on its common stock. The current market value of Foxburo stock is \$32.50 per share. Compute the expected dividend yield on the Foxburo stock. Would you classify the Foxburo stock as a growth or an income stock? Explain.

**QS 13-17**

Dividend yield A3 

The stockholders' equity section of Montel Company's balance sheet follows. The preferred stock's call price is \$40. Determine the book value per share of the common stock.

**QS 13-18**

Book value per common share  
A4 

Preferred stock—5% cumulative, \$10 par value, 20,000 shares authorized, issued, and outstanding . . . . .	\$ 200,000
Common stock—\$5 par value, 200,000 shares authorized, 150,000 shares issued and outstanding . . . . .	750,000
Retained earnings . . . . .	900,000
Total stockholders' equity . . . . .	<u>\$1,850,000</u>

**Air France-KLM** reports the following equity information for its fiscal year ended March 31, 2014 (euros in millions). Prepare its journal entry, using its account titles, to record the issuance of capital stock assuming that its entire par value stock was issued on March 31, 2014, for cash.

**QS 13-19**

International equity disclosures

March 31	2014
Issued capital . . . . .	€ 300
Additional paid-in capital . . . . .	2,971

Describe how each of the following characteristics of organizations applies to a corporation.

- |   |                         |
|---|-------------------------|
| 1. Owner authority and control            | 5. Duration of life     |
| 2. Ease of formation                      | 6. Owner liability      |
| 3. Transferability of ownership           | 7. Legal status         |
| 4. Ability to raise large capital amounts | 8. Tax status of income |

**EXERCISES****Exercise 13-1**

Characteristics of corporations

**Exercise 13-2**

Accounting for par, stated, and no-par stock issuances **P1**

Rodriguez Corporation issues 19,000 shares of its common stock for \$152,000 cash on February 20. Prepare journal entries to record this event under each of the following separate situations.

1. The stock has a \$2 par value.
2. The stock has neither par nor stated value.
3. The stock has a \$5 stated value.

**Exercise 13-3**

Recording stock issuances **P1**

Prepare journal entries to record the following four separate issuances of stock.

1. A corporation issued 4,000 shares of \$5 par value common stock for \$35,000 cash.
2. A corporation issued 2,000 shares of no-par common stock to its promoters in exchange for their efforts, estimated to be worth \$40,000. The stock has a \$1 per share stated value.
3. A corporation issued 2,000 shares of no-par common stock to its promoters in exchange for their efforts, estimated to be worth \$40,000. The stock has no stated value.
4. A corporation issued 1,000 shares of \$50 par value preferred stock for \$60,000 cash.

**Exercise 13-4**

Stock issuance for noncash assets **P1**

Sudoku Company issues 7,000 shares of \$7 par value common stock in exchange for land and a building. The land is valued at \$45,000 and the building at \$85,000. Prepare the journal entry to record issuance of the stock in exchange for the land and building.

**Exercise 13-5**

Stock dividends and splits

**P2** 

On June 30, 2015, Sharper Corporation’s common stock is priced at \$62 per share before any stock dividend or split, and the stockholders’ equity section of its balance sheet appears as follows.

Common stock—\$10 par value, 120,000 shares authorized, 50,000 shares issued and outstanding . . . . .	\$ 500,000
Paid-in capital in excess of par value, common stock . . . . .	200,000
Retained earnings . . . . .	<u>660,000</u>
Total stockholders’ equity . . . . .	<u>\$1,360,000</u>

1. Assume that the company declares and immediately distributes a 50% stock dividend. This event is recorded by capitalizing retained earnings equal to the stock’s par value. Answer these questions about stockholders’ equity as it exists *after* issuing the new shares.
  - a. What is the retained earnings balance?
  - b. What is the amount of total stockholders’ equity?
  - c. How many shares are outstanding?
2. Assume that the company implements a 3-for-2 stock split instead of the stock dividend in part 1. Answer these questions about stockholders’ equity as it exists *after* issuing the new shares.
  - a. What is the retained earnings balance?
  - b. What is the amount of total stockholders’ equity?
  - c. How many shares are outstanding?
3. Explain the difference, if any, to a stockholder from receiving new shares distributed under a large stock dividend versus a stock split.

**Check** (1b) \$1,360,000

(2a) \$660,000

**Exercise 13-6**

Stock dividends and per share book values

**P2** 

The stockholders’ equity of TVX Company at the beginning of the day on February 5 follows:

Common stock—\$10 par value, 150,000 shares authorized, 60,000 shares issued and outstanding . . . . .	\$ 600,000
Paid-in capital in excess of par value, common stock . . . . .	425,000
Retained earnings . . . . .	<u>550,000</u>
Total stockholders’ equity . . . . .	<u>\$1,575,000</u>

On February 5, the directors declare a 20% stock dividend distributable on February 28 to the February 15 stockholders of record. The stock's market value is \$40 per share on February 5 before the stock dividend. The stock's market value is \$33.40 per share on February 28.

1. Prepare entries to record both the dividend declaration and its distribution.
2. One stockholder owned 800 shares on February 5 before the dividend. Compute the book value per share and total book value of this stockholder's shares immediately before *and* after the stock dividend of February 5.
3. Compute the total market value of the investor's shares in part 2 as of February 5 and February 28.

**Check** (2) Book value per share: before, \$26.250; after, \$21.875

Match each description 1 through 6 with the characteristic of preferred stock that it best describes by writing the letter of that characteristic in the blank next to each description.

- A.** Callable                      **B.** Convertible                      **C.** Cumulative  
**D.** Noncumulative              **E.** Nonparticipating              **F.** Participating

- \_\_\_\_\_ 1. Holders of the stock are entitled to receive current and all past dividends before common stockholders receive any dividends.
- \_\_\_\_\_ 2. The issuing corporation can retire the stock by paying a prespecified price.
- \_\_\_\_\_ 3. Holders of the stock can receive dividends exceeding the stated rate under certain conditions.
- \_\_\_\_\_ 4. Holders of the stock are not entitled to receive dividends in excess of the stated rate.
- \_\_\_\_\_ 5. Holders of this stock can exchange it for shares of common stock.
- \_\_\_\_\_ 6. Holders of the stock lose any dividends that are not declared in the current year.

**Exercise 13-7**  
Identifying characteristics of preferred stock

**C2**

York's outstanding stock consists of 80,000 shares of *noncumulative* 7.5% preferred stock with a \$5 par value and also 200,000 shares of common stock with a \$1 par value. During its first four years of operation, the corporation declared and paid the following total cash dividends:

2015 total cash dividends . . . . .	\$ 20,000
2016 total cash dividends . . . . .	28,000
2017 total cash dividends . . . . .	200,000
2018 total cash dividends . . . . .	350,000

**Exercise 13-8**  
Dividends on common and noncumulative preferred stock

**C2**

Determine the amount of dividends paid each year to each of the two classes of stockholders: preferred and common. Also compute the total dividends paid to each class for the four years combined.

**Check** 4-year total paid to preferred, \$108,000

Use the data in Exercise 13-8 to determine the amount of dividends paid each year to each of the two classes of stockholders assuming that the preferred stock is *cumulative*. Also determine the total dividends paid to each class for the four years combined.

**Exercise 13-9**  
Dividends on common and cumulative preferred stock **C2**

On October 10, the stockholders' equity of Sherman Systems appears as follows:

Common stock—\$10 par value, 72,000 shares authorized, issued, and outstanding . . . . .	\$ 720,000
Paid-in capital in excess of par value, common stock . . . . .	216,000
Retained earnings . . . . .	<u>864,000</u>
Total stockholders' equity . . . . .	<u>\$1,800,000</u>

**Exercise 13-10**  
Recording and reporting treasury stock transactions

**P3** 

1. Prepare journal entries to record the following transactions for Sherman Systems.
  - a. Purchased 5,000 shares of its own common stock at \$25 per share on October 11.
  - b. Sold 1,000 treasury shares on November 1 for \$31 cash per share.
  - c. Sold all remaining treasury shares on November 25 for \$20 cash per share.
2. Explain how the company's equity section changes after the October 11 treasury stock purchase, and prepare the revised equity section of its balance sheet at that date.

**Check** (1c) Dr. Retained Earnings, \$14,000

**Exercise 13-11**

Preparing a statement of retained earnings

**C3**

The following information is available for Amos Company for the year ended December 31, 2015.

- a. Balance of retained earnings, December 31, 2014, prior to discovery of error, \$1,375,000.
- b. Cash dividends declared and paid during 2015, \$43,000.
- c. It neglected to record 2013 depreciation expense of \$55,500, which is net of \$4,500 in tax benefits.
- d. The company earned \$126,000 in 2015 net income.

Prepare a 2015 statement of retained earnings for Amos Company.

**Exercise 13-12**

Earnings per share

**A1**

**Check** (2) \$3.41

Ecker Company reports \$2,700,000 of net income for 2015 and declares \$388,020 of cash dividends on its preferred stock for 2015. At the end of 2015, the company had 678,000 weighted-average shares of common stock.

- 1. What amount of net income is available to common stockholders for 2015?
- 2. What is the company's basic EPS for 2015?

**Exercise 13-13**

Earnings per share

**A1**

**Check** (2) \$2.10

Kelley Company reports \$960,000 of net income for 2015 and declares \$120,000 of cash dividends on its preferred stock for 2015. At the end of 2015, the company had 400,000 weighted-average shares of common stock.

- 1. What amount of net income is available to common stockholders for 2015?
- 2. What is the company's basic EPS for 2015? Round your answer to the nearest whole cent.

**Exercise 13-14**

Price-earnings ratio computation and interpretation

**A2**

Compute the price-earnings ratio for each of these four separate companies. Which stock might an analyst likely investigate as being potentially undervalued by the market? Explain.

	A	B	C
1		<b>Earnings per Share</b>	<b>Market Value per Share</b>
2	<b>Company</b>		
3	1	\$12.00	\$176.40
4	2	10.00	96.00
5	3	7.50	93.75
6	4	50.00	250.00
7			

**Exercise 13-15**

Dividend yield computation and interpretation

**A3**

Compute the dividend yield for each of these four separate companies. Which company's stock would probably *not* be classified as an income stock? Explain.

	A	B	C
1		<b>Annual Cash Dividend per Share</b>	<b>Market Value per Share</b>
2	<b>Company</b>		
3	1	\$16.06	\$220.00
4	2	13.86	132.00
5	3	3.96	72.00
6	4	0.96	80.00
7			

**Exercise 13-16**

Book value per share

**A4**

The equity section of Cyril Corporation's balance sheet shows the following:

Preferred stock—6% cumulative, \$25 par value, \$30 call price, 10,000 shares issued and outstanding	\$ 250,000
Common stock—\$10 par value, 80,000 shares issued and outstanding	800,000
Retained earnings	535,000
<b>Total stockholders' equity</b>	<b><u>\$1,585,000</u></b>

[continued on next page]

Determine the book value per share of the preferred and common stock under two separate situations.

1. No preferred dividends are in arrears.
2. Three years of preferred dividends are in arrears.

**Check** (1) Book value of common, \$16.06 per share

**Unilever Group** reports the following equity information for the years ended December 31, 2013 and 2012 (euros in millions).

December 31	2013	2012
Share capital .....	€ 484	€ 484
Share premium .....	138	140
Other reserves .....	(6,746)	(6,196)
Retained profit .....	<u>20,468</u>	<u>20,964</u>
Shareholders' equity .....	€14,344	€15,392

**Exercise 13-17**  
Accounting for equity under IFRS

1. Match each of the three account titles—*share capital*, *share premium*, and *retained profit*—with the usual account title applied under U.S. GAAP from the following options:
  - \_\_\_\_\_ a. Paid-in capital in excess of par value, common stock
  - \_\_\_\_\_ b. Retained earnings
  - \_\_\_\_\_ c. Common stock, par value
2. Prepare Unilever's journal entry, using its account titles, to record the issuance of capital stock assuming that its entire par value stock was issued on December 31, 2012, for cash.
3. What were Unilever's 2013 dividends assuming that only dividends and income impacted retained profit for 2013 and that its 2013 income totaled €5,263?

Alexander Corporation reports the following components of stockholders' equity on December 31, 2015:

Common stock—\$25 par value, 50,000 shares authorized, 30,000 shares issued and outstanding .....	\$ 750,000
Paid-in capital in excess of par value, common stock .....	50,000
Retained earnings .....	<u>340,000</u>
Total stockholders' equity .....	<u>\$1,140,000</u>

**Exercise 13-18**  
Cash dividends, treasury stock, and statement of retained earnings

C3 P2 P3

In year 2016, the following transactions affected its stockholders' equity accounts.

- Jan. 2 Purchased 3,000 shares of its own stock at \$25 cash per share.
- Jan. 7 Directors declared a \$1.50 per share cash dividend payable on Feb. 28 to the Feb. 9 stockholders of record.
- Feb. 28 Paid the dividend declared on January 7.
- July 9 Sold 1,200 of its treasury shares at \$30 cash per share.
- Aug. 27 Sold 1,500 of its treasury shares at \$20 cash per share.
- Sept. 9 Directors declared a \$2 per share cash dividend payable on October 22 to the September 23 stockholders of record.
- Oct. 22 Paid the dividend declared on September 9.
- Dec. 31 Closed the \$52,000 credit balance (from net income) in the Income Summary account to Retained Earnings.

### Required

1. Prepare journal entries to record each of these transactions for 2016.
2. Prepare a statement of retained earnings for the year ended December 31, 2016.
3. Prepare the stockholders' equity section of the company's balance sheet as of December 31, 2016.

## PROBLEM SET A

Kinkaid Co. is incorporated at the beginning of this year and engages in a number of transactions. The following journal entries impacted its stockholders' equity during its first year of operations.

### Problem 13-1A

Stockholders' equity transactions and analysis

a.	Cash .....	300,000	
	Common Stock, \$25 Par Value .....		250,000
	Paid-In Capital in Excess of Par Value, Common Stock .....		50,000
b.	Organization Expenses .....	150,000	
	Common Stock, \$25 Par Value .....		125,000
	Paid-In Capital in Excess of Par Value, Common Stock .....		25,000
c.	Cash .....	43,000	
	Accounts Receivable .....	15,000	
	Building .....	81,500	
	Notes Payable .....		59,500
	Common Stock, \$25 Par Value .....		50,000
	Paid-In Capital in Excess of Par Value, Common Stock .....		30,000
d.	Cash .....	120,000	
	Common Stock, \$25 Par Value .....		75,000
	Paid-In Capital in Excess of Par Value, Common Stock .....		45,000

### Required

1. Explain the transaction(s) underlying each journal entry (a) through (d).
2. How many shares of common stock are outstanding at year-end?
3. What is the amount of minimum legal capital (based on par value) at year-end?
4. What is the total paid-in capital at year-end?
5. What is the book value per share of the common stock at year-end if total paid-in capital plus retained earnings equals \$695,000?

**Check** (2) 20,000 shares  
(3) \$500,000  
(4) \$650,000

### Problem 13-2A

Cash dividends, treasury stock, and statement of retained earnings

Kohler Corporation reports the following components of stockholders' equity on December 31, 2015:

Common stock—\$10 par value, 100,000 shares authorized, 40,000 shares issued and outstanding .....	\$400,000
Paid-in capital in excess of par value, common stock .....	60,000
Retained earnings .....	<u>270,000</u>
Total stockholders' equity .....	<u>\$730,000</u>

In year 2016, the following transactions affected its stockholders' equity accounts.

- Jan. 1 Purchased 4,000 shares of its own stock at \$20 cash per share.  
 Jan. 5 Directors declared a \$2 per share cash dividend payable on Feb. 28 to the Feb. 5 stockholders of record.  
 Feb. 28 Paid the dividend declared on January 5.  
 July 6 Sold 1,500 of its treasury shares at \$24 cash per share.  
 Aug. 22 Sold 2,500 of its treasury shares at \$17 cash per share.  
 Sept. 5 Directors declared a \$2 per share cash dividend payable on October 28 to the September 25 stockholders of record.  
 Oct. 28 Paid the dividend declared on September 5.  
 Dec. 31 Closed the \$388,000 credit balance (from net income) in the Income Summary account to Retained Earnings.

**Required**

1. Prepare journal entries to record each of these transactions for 2016.
2. Prepare a statement of retained earnings for the year ended December 31, 2016.
3. Prepare the stockholders' equity section of the company's balance sheet as of December 31, 2016.

**Check** (2) Retained earnings, Dec. 31, 2016, \$504,500

At September 30, the end of Beijing Company's third quarter, the following stockholders' equity accounts are reported.

Common stock, \$12 par value . . . . .	\$360,000
Paid-in capital in excess of par value, common stock . . . . .	90,000
Retained earnings . . . . .	320,000

**Problem 13-3A**  
Equity analysis—journal entries and account balances

P2

In the fourth quarter, the following entries related to its equity are recorded:

Oct. 2	Retained Earnings . . . . .	60,000	
	Common Dividend Payable . . . . .		60,000
Oct. 25	Common Dividend Payable . . . . .	60,000	
	Cash . . . . .		60,000
Oct. 31	Retained Earnings . . . . .	75,000	
	Common Stock Dividend Distributable . . . . .		36,000
	Paid-In Capital in Excess of Par Value, Common Stock . . . . .		39,000
Nov. 5	Common Stock Dividend Distributable . . . . .	36,000	
	Common Stock, \$12 Par Value . . . . .		36,000
Dec. 1	Memo — Change the title of the Common Stock account to reflect the new par value of \$4.		
Dec. 31	Income Summary . . . . .	210,000	
	Retained Earnings . . . . .		210,000

**Required**

1. Explain the transaction(s) underlying each journal entry.
2. Complete the following table showing the equity account balances at each indicated date (include the balances from September 30).

	Oct. 2	Oct. 25	Oct. 31	Nov. 5	Dec. 1	Dec. 31
Common stock . . . . .	\$ _____	\$ _____	\$ _____	\$ _____	\$ _____	\$ _____
Common stock dividend distributable . . . . .	_____	_____	_____	_____	_____	_____
Paid-in capital in excess of par, common stock . . . . .	_____	_____	_____	_____	_____	_____
Retained earnings . . . . .	_____	_____	_____	_____	_____	_____
Total equity . . . . .	\$ _____	\$ _____	\$ _____	\$ _____	\$ _____	\$ _____

**Check** Total equity: Oct. 2, \$710,000; Dec. 31, \$920,000

The equity sections from Atticus Group's 2015 and 2016 year-end balance sheets follow.

<b>Stockholders' Equity (December 31, 2015)</b>	
Common stock—\$4 par value, 100,000 shares authorized, 40,000 shares issued and outstanding . . . . .	\$160,000
Paid-in capital in excess of par value, common stock . . . . .	120,000
Retained earnings . . . . .	<u>320,000</u>
Total stockholders' equity . . . . .	<u>\$600,000</u>

**Problem 13-4A**  
Analysis of changes in stockholders' equity accounts

C3 P2 P3 

**Stockholders' Equity (December 31, 2016)**

Common stock—\$4 par value, 100,000 shares authorized, 47,400 shares issued, 3,000 shares in treasury . . . . .	\$189,600
Paid-in capital in excess of par value, common stock . . . . .	179,200
Retained earnings (\$30,000 restricted by treasury stock) . . . . .	400,000
	<u>768,800</u>
Less cost of treasury stock . . . . .	<u>(30,000)</u>
Total stockholders' equity . . . . .	<u>\$738,800</u>

The following transactions and events affected its equity during year 2016.

- Jan. 5 Declared a \$0.50 per share cash dividend, date of record January 10.  
 Mar. 20 Purchased treasury stock for cash.  
 Apr. 5 Declared a \$0.50 per share cash dividend, date of record April 10.  
 July 5 Declared a \$0.50 per share cash dividend, date of record July 10.  
 July 31 Declared a 20% stock dividend when the stock's market value is \$12 per share.  
 Aug. 14 Issued the stock dividend that was declared on July 31.  
 Oct. 5 Declared a \$0.50 per share cash dividend, date of record October 10.

**Required**

- How many common shares are outstanding on each cash dividend date?
- What is the total dollar amount for each of the four cash dividends?
- What is the amount of the capitalization of retained earnings for the stock dividend?
- What is the per share cost of the treasury stock purchased?
- How much net income did the company earn during year 2016?

**Check** (3) \$88,800  
 (4) \$10  
 (5) \$248,000

**Problem 13-5A**

Computation of book values and dividend allocations

Raphael Corporation's common stock is currently selling on a stock exchange at \$85 per share, and its current balance sheet shows the following stockholders' equity section:

Preferred stock—5% cumulative, \$___ par value, 1,000 shares authorized, issued, and outstanding . . . . .	\$ 50,000
Common stock—\$___ par value, 4,000 shares authorized, issued, and outstanding . . . . .	80,000
Retained earnings . . . . .	<u>150,000</u>
Total stockholders' equity . . . . .	<u>\$280,000</u>

**Required** (Round per share amounts to cents.)

- What is the current market value (price) of this corporation's common stock?
- What are the par values of the corporation's preferred stock and its common stock?
- If no dividends are in arrears, what are the book values per share of the preferred stock and the common stock?
- If two years' preferred dividends are in arrears, what are the book values per share of the preferred stock and the common stock?
- If two years' preferred dividends are in arrears and the preferred stock is callable at \$55 per share, what are the book values per share of the preferred stock and the common stock?
- If two years' preferred dividends are in arrears and the board of directors declares cash dividends of \$11,500, what total amount will be paid to the preferred and to the common shareholders? What is the amount of dividends per share for the common stock?

**Analysis Component**

- What are some factors that can contribute to a difference between the book value of common stock and its market value (price)?

**Check** (4) Book value of common, \$56.25  
 (5) Book value of common, \$55.00  
 (6) Dividends per common share, \$1.00

Weiss Company is incorporated at the beginning of this year and engages in a number of transactions. The following journal entries impacted its stockholders' equity during its first year of operations.

<b>a.</b>	Cash .....	120,000	
	Common Stock, \$1 Par Value .....		3,000

(5) \$136,000

Soltech Company's common stock is currently selling on a stock exchange at \$90 per share, and its current balance sheet shows the following stockholders' equity section.

Preferred stock—8% cumulative, \$___ par value, 1,500 shares authorized, issued, and outstanding . . . . .	\$ 375,000
Common stock—\$___ par value, 18,000 shares authorized, issued, and outstanding . . . . .	900,000
Retained earnings . . . . .	<u>1,125,000</u>
Total stockholders' equity . . . . .	<u>\$2,400,000</u>

**Problem 13-5B**

Computation of book values and dividend allocations

**Required** (Round per share amounts to cents.)

- What is the current market value (price) of this corporation's common stock?
- What are the par values of the corporation's preferred stock and its common stock?
- If no dividends are in arrears, what are the book values per share of the preferred stock and the common stock? (Round per share values to the nearest cent.)
- If two years' preferred dividends are in arrears, what are the book values per share of the preferred stock and the common stock? (Round per share values to the nearest cent.)
- If two years' preferred dividends are in arrears and the preferred stock is callable at \$280 per share, what are the book values per share of the preferred stock and the common stock? (Round per share values to the nearest cent.)
- If two years' preferred dividends are in arrears and the board of directors declares cash dividends of \$100,000, what total amount will be paid to the preferred and to the common shareholders? What is the amount of dividends per share for the common stock? (Round per share values to the nearest cent.)

**Check** (4) Book value of common, \$109.17  
(5) Book value of common, \$106.67  
(6) Dividends per common share, \$0.56

**Analysis Component**

- Discuss why the book value of common stock is not always a good estimate of its market value.

**SERIAL  
PROBLEM**

Business Solutions

P1 C1 C2

(This serial problem began in Chapter 1 and continues through most of the book. If previous chapter segments were not completed, the serial problem can begin at this point. It is helpful, but not necessary, to use the Working Papers that accompany the book.)

**SP 13** Santana Rey created Business Solutions on October 1, 2015. The company has been successful, and Santana plans to expand her business. She believes that an additional \$86,000 is needed and is investigating three funding sources.

- Santana's sister Cicely is willing to invest \$86,000 in the business as a common shareholder. Since Santana currently has about \$129,000 invested in the business, Cicely's investment will mean that Santana will maintain about 60% ownership, and Cicely will have 40% ownership of Business Solutions.
- Santana's uncle Marcello is willing to invest \$86,000 in the business as a preferred shareholder. Marcello would purchase 860 shares of \$100 par value, 7% preferred stock.
- Santana's banker is willing to lend her \$86,000 on a 7%, 10-year note payable. She would make monthly payments of \$1,000 per month for 10 years.

**Required**

- Prepare the journal entry to reflect the initial \$86,000 investment under each of the options (a), (b), and (c).
- Evaluate the three proposals for expansion, providing the pros and cons of each option.
- Which option do you recommend Santana adopt? Explain.

**GL  
GENERAL  
LEDGER  
PROBLEM**Available only in  
Connect Plus

The following General Ledger assignments highlight the impact, or lack thereof, on financial statements from equity-based transactions.

**GL 13-1** General Ledger assignment 13-1 is adapted from Problem 13-2A, including beginning equity balances. Prepare journal entries related to treasury stock, cash dividends, and net income. Then, prepare the statement of retained earnings and the stockholders' equity section of the balance sheet.

**GL 13-2** General Ledger assignment 13-2 is adapted from Problem 13-4A, including beginning and ending equity balances. Prepare journal entries related to cash dividends and stock dividends. Calculate the number of shares outstanding, the amount of net income, and the amount of retained earnings to be capitalized as a result of the stock dividend, if any.

**Beyond the Numbers****REPORTING IN  
ACTION**

C2 A1 A4

**APPLE**

**BTN 13-1** Refer to **Apple's** financial statements in Appendix A to answer the following.

- How many shares of common stock are issued and outstanding at September 28, 2013, and September 29, 2012? How do these numbers compare with the basic weighted-average common shares outstanding at September 28, 2013, and September 29, 2012?
- What is the book value of its entire common stock at September 28, 2013?
- What is the total amount of cash dividends paid to common stockholders for the years ended September 28, 2013, and September 29, 2012?
- Identify and compare basic EPS amounts across fiscal years 2013, 2012, and 2011. Identify and comment on any notable changes.
- How many shares does Apple hold in treasury stock, if any, as of September 28, 2013, and September 29, 2012?

**Fast Forward**

- Access Apple's financial statements for fiscal years ending after September 28, 2013, from its website ([Apple.com](http://Apple.com)) or the SEC's EDGAR database ([www.SEC.gov](http://www.SEC.gov)). Has the number of common shares outstanding increased since that date? Has the company increased the total amount of cash dividends paid compared to the total amount for fiscal year 2013?

**BTN 13-2** Key comparative figures for **Apple** and **Google** follow.

Key Figures	Apple	Google
Net income (in millions) . . . . .	\$ 37,037	\$ 12,920
Cash dividends declared per common share . . . . .	\$ 11.40	\$ —
Common shares outstanding (in millions) . . . . .	899.213	279.325
Weighted-average common shares outstanding (in millions) . . . . .	925.331	273.518
Market value (price) per share . . . . .	\$ 477.25	\$ 560.92
Equity applicable to common shares (in millions) . . . . .	\$123,549	\$ 87,309

## COMPARATIVE ANALYSIS

A1 A2 A3 A4

**APPLE**  
**GOOGLE**

### Required

1. Compute the book value per common share for each company using these data.
2. Compute the basic EPS for each company using these data.
3. Compute the dividend yield for each company using these data. Does the dividend yield of either of the companies characterize it as an income or growth stock? Explain.
4. Compute, compare, and interpret the price-earnings ratio for each company using these data.

**BTN 13-3** Harriet Moore is an accountant for New World Pharmaceuticals. Her duties include tracking research and development spending in the new product development division. Over the course of the past six months, Harriet has noticed that a great deal of funds have been spent on a particular project for a new drug. She hears “through the grapevine” that the company is about to patent the drug and expects it to be a major advance in antibiotics. Harriet believes that this new drug will greatly improve company performance and will cause the company’s stock to increase in value. Harriet decides to purchase shares of New World in order to benefit from this expected increase.

## ETHICS CHALLENGE

C3

### Required

What are Harriet’s ethical responsibilities, if any, with respect to the information she has learned through her duties as an accountant for New World Pharmaceuticals? What are the implications of her planned purchase of New World shares?

**BTN 13-4** Teams are to select an industry, and each team member is to select a different company in that industry. Each team member then is to acquire the selected company’s financial statements (or Form 10-K) from the SEC site ([www.SEC.gov](http://www.SEC.gov)). Use these data to identify basic EPS. Use the financial press (or [finance.yahoo.com](http://finance.yahoo.com)) to determine the market price of this stock, and then compute the price-earnings ratio. Communicate with teammates via a meeting, e-mail, or telephone to discuss the meaning of this ratio, how companies compare, and the industry norm. The team must prepare a single memorandum reporting the ratio for each company and identifying the team conclusions or consensus of opinion. The memorandum is to be duplicated and distributed to the instructor and teammates.

## COMMUNICATING IN PRACTICE

A1 A2

**Hint:** Make a transparency of each team’s memo for a class discussion.

**BTN 13-5** Access the February 24, 2014, filing of the 2013 calendar-year 10-K report of **McDonald’s**, (ticker MCD) from [www.SEC.gov](http://www.SEC.gov).

### Required

1. Review McDonald’s balance sheet and identify how many classes of stock it has issued.
2. What are the par values, number of authorized shares, and issued shares of the classes of stock you identified in part 1?
3. Review its statement of cash flows and identify what total amount of cash it paid in 2013 to purchase treasury stock.
4. What amount did McDonald’s pay out in common stock cash dividends for 2013?

## TAKING IT TO THE NET

C1 C3

**TEAMWORK IN ACTION**

P3

**Hint:** Instructor should be sure each team accurately completes part 1 before proceeding.

**BTN 13-6** This activity requires teamwork to reinforce understanding of accounting for treasury stock.

1. Write a brief team statement (a) generalizing what happens to a corporation’s financial position when it engages in a stock “buyback” and (b) identifying reasons why a corporation would engage in this activity.
2. Assume that an entity acquires 100 shares of its \$100 par value common stock at a cost of \$134 cash per share. Discuss the entry to record this acquisition. Next, assign *each* team member to prepare *one* of the following entries (assume each entry applies to all shares):
  - a. Reissue treasury shares at cost.
  - b. Reissue treasury shares at \$150 per share.
  - c. Reissue treasury shares at \$120 per share; assume the paid-in capital account from treasury shares has a \$1,500 balance.
  - d. Reissue treasury shares at \$120 per share; assume the paid-in capital account from treasury shares has a \$1,000 balance.
  - e. Reissue treasury shares at \$120 per share; assume the paid-in capital account from treasury shares has a zero balance.
3. In sequence, each member is to present his/her entry to the team and explain the *similarities* and *differences* between that entry and the previous entry.

**ENTREPRENEURIAL DECISION**

C2 P2

**BTN 13-7** Assume that **Alibaba Group** decides to launch a new website to market discount bookkeeping services to consumers. This chain, named Aladin, requires \$500,000 of start-up capital. The founder contributes \$375,000 of personal assets in return for 15,000 shares of common stock, but he must raise another \$125,000 in cash. There are two alternative plans for raising the additional cash. *Plan A* is to sell 3,750 shares of common stock to one or more investors for \$125,000 cash. *Plan B* is to sell 1,250 shares of cumulative preferred stock to one or more investors for \$125,000 cash (this preferred stock would have a \$100 par value, an annual 8% dividend rate, and be issued at par).

1. If the new business is expected to earn \$72,000 of after-tax net income in the first year, what rate of return on beginning equity will the founder earn under each alternative plan? Which plan will provide the higher expected return?
2. If the new business is expected to earn \$16,800 of after-tax net income in the first year, what rate of return on beginning equity will the founder earn under each alternative plan? Which plan will provide the higher expected return?
3. Analyze and interpret the differences between the results for parts 1 and 2.

**HITTING THE ROAD**

A1 A2 A3

**BTN 13-8** Review 30 to 60 minutes of financial news programming on television. Take notes on companies that are catching analysts’ attention. You might hear reference to over- and undervaluation of firms and to reports about PE ratios, dividend yields, and earnings per share. Be prepared to give a brief description to the class of your observations.

**GLOBAL DECISION**

A1 C3

**Samsung**

**BTN 13-9** Financial information for **Samsung** ([www.Samsung.com](http://www.Samsung.com)) follows (drawn from its financial statements and footnotes):

Net income less dividends available to preferred shares (in millions) . . . . .	₩ 25,893,396
Cash dividends declared for common stock (in millions) . . . . .	₩ 1,806,629
Cash dividends declared per common share . . . . .	₩ 14,300
Number of common shares outstanding (in millions)* . . . . .	130.915
Weighted average common shares outstanding (in millions) . . . . .	130.880
Equity applicable to common shares (in millions)† . . . . .	₩149,896,543

\*Computed as 147.299 mil. issued shares less 16.384 mil. treasury shares.  
 †Computed as ₩150,016,010 total equity less ₩119,467 preferred stock.

**Required**

1. Compute book value per share for Samsung.
2. Compute earnings per share (EPS) for Samsung.
3. Compare Samsung's dividends per share with its EPS. Is Samsung paying out a large or small amount of its income as dividends? Explain.

**ANSWERS TO MULTIPLE CHOICE QUIZ**

1. e; Entry to record this stock issuance is:

Cash (6,000 × \$8) .....	48,000
Common Stock (6,000 × \$5) .....	30,000
Paid-In Capital in Excess of Par Value, Common Stock .....	18,000

2. b;  $\$75,000/19,000 \text{ shares} = \$3.95 \text{ per share}$

3. d; Preferred stock =  $5,000 \times \$100 = \$500,000$

Book value per share =  $(\$2,000,000 - \$500,000)/50,000 \text{ shares} = \$30 \text{ per common share}$

4. a;  $\$0.81/\$45.00 = 1.8\%$

5. c; Earnings per share =  $\$3,500,000/700,000 \text{ shares} = \$5 \text{ per share}$   
PE ratio =  $\$85/\$5 = 17.0$

# Long-Term Liabilities

## Chapter Preview

### BOND BASICS

- A1** Fundamentals of:
  - Bond financing
  - Bond trading
  - Bond issuance procedures

### BOND ISSUANCES

- P1** Issuance at par
- P2** Issuance at a discount
- P3** Issuance at a premium
  - Bond pricing

### BOND RETIREMENT

- P4** Accounting for bond retirement:
  - At maturity
  - Before maturity
  - By conversion

### LONG-TERM NOTES

- C1** Types of notes
  - Recording notes

### DEBT ANALYSIS

- A2** Debt features
- A3** Debt-to-equity

## Learning Objectives

### CONCEPTUAL

- C1** Explain the types of notes and prepare entries to account for notes.
- C2** *Appendix 14A*—Explain and compute the present value of an amount(s) to be paid at a future date(s).
- C3** *Appendix 14C*—Describe interest accrual when bond payment periods differ from accounting periods.
- C4** *Appendix 14D*—Describe accounting for leases and pensions.

### ANALYTICAL

- A1** Compare bond financing with stock financing.
- A2** Assess debt features and their implications.
- A3** Compute the debt-to-equity ratio and explain its use.

### PROCEDURAL

- P1** Prepare entries to record bond issuance and interest expense.
- P2** Compute and record amortization of bond discount using straight-line method.

- P3** Compute and record amortization of bond premium using straight-line method.
- P4** Record the retirement of bonds.
- P5** *Appendix 14B*—Compute and record amortization of bond discount using effective interest method.
- P6** *Appendix 14B*—Compute and record amortization of bond premium using effective interest method.

LOS ANGELES—A trip to Tanzania changed Matthew Clough's life forever. "I took a trip to Africa to hike Mt. Kilimanjaro," recalls Matthew. "As I descended from the summit, I learned my friendly and hardworking porter, named Benson, only earns between \$1 to \$2 per day. This isn't enough to put a child through school. It was an epiphany trip for me." Matthew decided to pursue a business where he would donate a portion of each sale toward the education of a child in Tanzania.

"We carry backpacks for school and a rucksack to climb, so creating a mountain-inspired bag to tie the two together seemed like the natural solution," explains Matthew. The result was **Stone + Cloth (StoneCloth.com)**, an American-made backpack line, where Matthew pledges to give 10% of profits to educating children in Tanzania.

"I started by finding an old sewing machine on Craigslist," recounts Matthew. "I drove out to this trailer park in the middle of nowhere to pick it up. After that I just started making bags with zero resources and a wild imagination." Launching his fledgling business presented challenges. He especially needed to focus on managing liabilities to suppliers, shippers, and other creditors that help him sustain the business.

Matthew insists that effective management of liabilities, especially long-term financing from sources such as bonds and notes, is crucial to achieving his dream through business success. In his case, he launched Stone + Cloth with limited loans, or notes payable. "Starting a business can be scary," admits Matthew. Interest payments, principal repayments, and operating expenses must be controlled. "If there's one thing I've learned from starting this project," says Matthew, "I know I can't do it alone."

Matthew continues to monitor liabilities and their payment patterns, and he is not shy about striving to better learn the accounting side. "We're super small, so I manage everything," explains Matthew. "Some days I'll be down at our cut-and-sew shop, checking on the quality of the backpacks that are being produced, and I'll spend other days looking at where we've been so we can use that knowledge to make decisions for the future." He insists that accounting for and monitoring liabilities of long-term financing are important ingredients to a successful start-up. His company now generates sufficient income to pay for interest and principal on long-term liabilities.

## Inspiration Mountain

*"It's better to take action and course correct"*

—Matthew Clough

Still, the larger message of Stone + Cloth is education. "Education is valued in Tanzania. They understand how important it is and I want to help them achieve what they want to achieve," explains Matthew. "Your purchase [of a backpack] helps provide scholarships for students in need."

# BASICS OF BONDS

This section explains the basics of bonds and a company’s motivation for issuing them.

## Bond Financing

**A1**  
Compare bond financing with stock financing.

Projects that demand large amounts of money often are funded from bond issuances. (Both for-profit and nonprofit companies, as well as governmental units, such as nations, states, cities, and school districts, issue bonds.) A **bond** is its issuer’s written promise to pay an amount identified as the par value of the bond with interest. The **par value of a bond**, also called the *face amount* or *face value*, is paid at a specified future date known as the bond’s *maturity date*. Most bonds also require the issuer to make semiannual interest payments. The amount of interest paid each period is determined by multiplying the par value of the bond by the bond’s contract rate of interest for that same period. This section explains both advantages and disadvantages of bond financing.

**Advantages of Bonds** There are three main advantages of bond financing:

1. *Bonds do not affect owner control.* Equity financing reflects ownership in a company, whereas bond financing does not. A person who contributes \$1,000 of a company’s \$10,000 equity financing typically controls one-tenth of all owner decisions. A person who owns a \$1,000, 11%, 20-year bond has no ownership right. This person, or bondholder, is to receive from the bond issuer 11% interest, or \$110, each year the bond is outstanding and \$1,000 when it matures in 20 years.
2. *Interest on bonds is tax deductible.* Bond interest payments are tax deductible for the issuer, but equity payments (distributions) to owners are not. To illustrate, assume that a corporation with no bond financing earns \$15,000 in income *before* paying taxes at a 40% tax rate, which amounts to \$6,000 ( $\$15,000 \times 40\%$ ) in taxes. If a portion of its financing is in bonds, however, the resulting bond interest is deducted in computing taxable income. That is, if bond interest expense is \$10,000, the taxes owed would be \$2,000 ( $[\$15,000 - \$10,000] \times 40\%$ ), which is less than the \$6,000 owed with no bond financing.
3. *Bonds can increase return on equity.* A company that earns a higher return with borrowed funds than it pays in interest on those funds increases its return on equity. This process is called *financial leverage* or *trading on the equity*.

**Point:** Financial leverage reflects issuance of bonds, notes, and preferred stock.

To illustrate the third point, consider Magnum Co., which has \$1 million in equity and is planning a \$500,000 expansion to meet increasing demand for its product. Magnum predicts the \$500,000 expansion will yield \$125,000 in additional income before paying any interest. It currently earns \$100,000 per year and has no interest expense. Magnum is considering three plans. Plan A is to not expand. Plan B is to expand and raise \$500,000 from equity financing. Plan C is to expand and issue \$500,000 of bonds that pay 10% annual interest (\$50,000). Exhibit 14.1 shows how these three plans affect Magnum’s net income, equity, and return on equity (net income/equity). The owner(s) will earn a higher return on equity if expansion occurs. Moreover, the preferred expansion plan is to issue bonds. Projected net income under Plan C (\$175,000) is smaller than under Plan B (\$225,000), but the return on equity is larger because of less equity investment. Plan C has another advantage if income is taxable. This illustration reflects a general rule: *Return on equity increases when the expected rate of return from the new assets is higher than the rate of interest expense on the debt financing.*

**Example:** Compute return on equity for all three plans if Magnum is subject to a 40% income tax. Answer (\$ 000s):  
 A = 6.0% ( $\$100[1 - 0.4]/\$1,000$ )  
 B = 9.0% ( $\$225[1 - 0.4]/\$1,500$ )  
 C = 10.5% ( $\$175[1 - 0.4]/\$1,000$ )

### EXHIBIT 14.1

Financing with Bonds versus Equity

	Plan A: Do Not Expand	Plan B: Equity Financing	Plan C: Bond Financing
Income before interest expense . . . . .	\$ 100,000	\$ 225,000	\$ 225,000
Interest expense . . . . .	—	—	(50,000)
<b>Net income</b> . . . . .	<b>\$ 100,000</b>	<b>\$ 225,000</b>	<b>\$ 175,000</b>
Equity . . . . .	\$1,000,000	\$1,500,000	\$1,000,000
<b>Return on equity</b> . . . . .	<b>10.0%</b>	<b>15.0%</b>	<b>17.5%</b>

**Disadvantages of Bonds** The two main disadvantages of bond financing are these:

1. *Bonds can decrease return on equity.* When a company earns a lower return with the borrowed funds than it pays in interest, it decreases its return on equity. This downside risk of financial leverage is more likely to arise when a company has periods of low income or net losses.
2. *Bonds require payment of both periodic interest and the par value at maturity.* Bond payments can be especially burdensome when income and cash flow are low. Equity financing, in contrast, does not require any payments because cash withdrawals (dividends) are paid at the discretion of the owner (or board).

A company must weigh the risks and returns of the disadvantages and advantages of bond financing when deciding whether to issue bonds to finance operations.

## Bond Trading

Bonds are securities that can be readily bought and sold. A large number of bonds trade on both the New York Exchange and the American Exchange. A bond *issue* consists of a number of bonds, usually in denominations of \$1,000 or \$5,000, and is sold to many different lenders. After bonds are issued, they often are bought and sold by investors, meaning that any particular bond probably has a number of owners before it matures. Since bonds are exchanged (bought and sold) in the market, they have a market value (price). For convenience, bond market values are expressed as a percent of their par (face) value. For example, a company's bonds might be trading at 103½, meaning they can be bought or sold for 103.5% of their par value. Bonds can also trade below par value. For instance, if a company's bonds are trading at 95, they can be bought or sold at 95% of their par value.

**Point:** There are nearly 5 million individual U.S. bond issues, ranging from huge treasuries to tiny municipalities. This compares to about 12,000 individual U.S. stocks that are traded.

**Point:** Debt financing is desirable when interest is tax deductible, when owner control is preferred, and when return on equity exceeds the debt's interest rate.

**Point:** The phrase: *debt is cheaper than equity*, refers in part to interest expense on bonds being tax deductible whereas dividends on stock are not.

**Point:** The largest bond issuances in history occurred in 2013:  
Verizon . . . . . \$49 billion.  
Apple . . . . . \$17 billion.

## Decision Insight

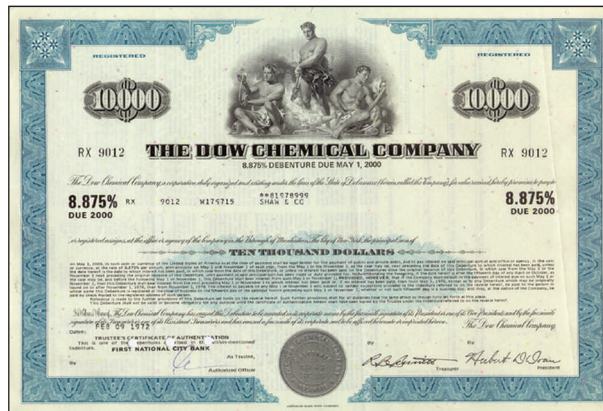

**Quotes** The **IBM** bond quote here is interpreted (left to right) as **Bonds**, issuer name; **Rate**, contract interest rate (5.7%); **Mat**, matures in year 2017 when principal is paid; **Yld**, yield rate (4.7%) of bond at current price; **Vol**, daily dollar worth (\$130,000) of trades (in 1,000s); **Close**, closing price (121.18) for the day as percentage of par value; **Chg**, change (+0.24%) in closing price from prior day's close. ■

Bonds	Rate	Mat	Yld	Vol	Close	Chg
IBM	5.7	17	4.7	130	121.18	+0.24%

## Bond-Issuing Procedures

State and federal laws govern bond issuances. Bond issuers also want to ensure that they do not violate any of their existing contractual agreements when issuing bonds. Authorization of bond issuances includes the number of bonds authorized, their par value, and the contract interest rate. The legal document identifying the rights and obligations of both the bondholders and the issuer is called the **bond indenture**, which is the legal contract between the issuer and the bondholders (and specifies how often interest is paid). A bondholder may also receive a bond certificate as evidence of the company's debt. A **bond certificate**, such as that shown in Exhibit 14.2, includes specifics such as the issuer's name, the par value, the contract interest rate, and the maturity date. Many companies reduce costs by not issuing paper certificates to bondholders.<sup>1</sup>

Courtesy of Dow Chemicals

**Point:** A bond with a par value of \$1,000 trading at 103½ sells for \$1,035 (\$1,000 × 1.035). A bond with a par value of \$1,000 trading at 95½ sells for \$955 (\$1,000 × 0.955).

## EXHIBIT 14.2

Bond Certificate

**Point:** *Indenture* refers to a bond's legal contract; *debenture* refers to an unsecured bond.

**Point:** The *spread* between the dealer's cost and what buyers pay can be huge. Dealers earn more than \$25 billion in annual spread revenue.

**Global:** In the United Kingdom, government bonds are called *gilts*—short for gilt-edged investments.

<sup>1</sup> The issuing company normally sells its bonds to an investment firm called an *underwriter*, which resells them to the public. An issuing company can also sell bonds directly to investors. When an underwriter sells bonds to a large number of investors, a *trustee* represents and protects the bondholders' interests. The trustee monitors the issuer to ensure that it complies with the obligations in the bond indenture. Most trustees are large banks or trust companies. The trustee writes and accepts the terms of a bond indenture before it is issued. When bonds are offered to the public, called *floating an issue*, they must be registered with the Securities and Exchange Commission (SEC). SEC registration requires the issuer to file certain financial information. Most company bonds are issued in par value units of \$1,000 or \$5,000. A *baby bond* has a par value of less than \$1,000, such as \$100.

## BOND ISSUANCES

This section explains accounting for bond issuances at par, below par (discount), and above par (premium). It also describes how to amortize a discount or premium and record bonds issued between interest payment dates.

### Issuing Bonds at Par

To illustrate an issuance of bonds at par value, suppose a company receives authorization to issue \$800,000 of 9%, 20-year bonds dated January 1, 2015, that mature on December 31, 2034, and pay interest semiannually on each June 30 and December 31. After accepting the bond indenture on behalf of the bondholders, the trustee can sell all or a portion of the bonds to an underwriter. If all bonds are sold at par value, the issuer records the sale as follows.

**P1**  
Prepare entries to record bond issuance and interest expense.

Assets = Liabilities + Equity  
+800,000 +800,000

2015 Jan. 1	Cash .....	800,000	
	Bonds Payable .....		800,000
	<i>Sold bonds at par.</i>		

This entry reflects increases in the issuer’s cash *and* long-term liabilities. The issuer records the first semiannual interest payment as follows.

Assets = Liabilities + Equity  
–36,000 –36,000

2015 June 30	Bond Interest Expense .....	36,000	
	Cash .....		36,000
	<i>Paid semiannual interest (9% × \$800,000 × ½ year).</i>		

The issuer pays and records its semiannual interest obligation every six months until the bonds mature. When they mature, the issuer records its payment of principal as follows.

Assets = Liabilities + Equity  
–800,000 –800,000

2034 Dec. 31	Bonds Payable .....	800,000	
	Cash .....		800,000
	<i>Paid bond principal at maturity.</i>		

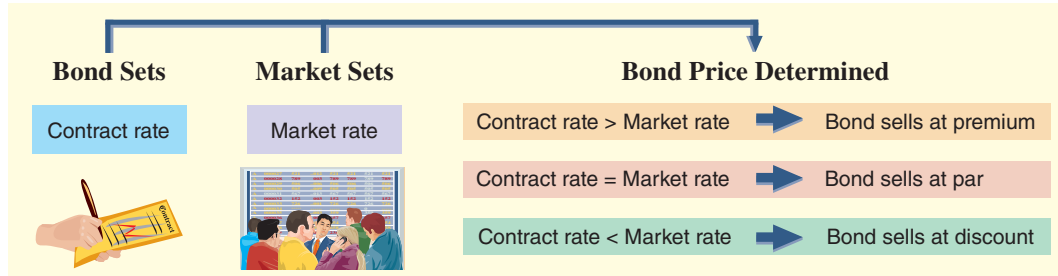

### Bond Discount or Premium

The bond issuer pays the interest rate specified in the indenture, the **contract rate**, also referred to as the *coupon rate*, *stated rate*, or *nominal rate*. The annual interest paid is determined by multiplying the bond par value by the contract rate. The contract rate is usually stated on an annual basis, even if interest is paid semiannually. For example, if a company issues a \$1,000, 8% bond paying interest semiannually, it pays annual interest of \$80 (8% × \$1,000) in two semiannual payments of \$40 each.

The contract rate sets the amount of interest the issuer pays in *cash*, which is not necessarily the *bond interest expense* actually incurred by the issuer. Bond interest expense depends on the bond’s market value at issuance, which is determined by market expectations of the risk of lending to the issuer. The bond’s **market rate** of interest is the rate that borrowers are willing to pay and lenders are willing to accept for a particular bond and its risk level. As the risk level increases, the rate increases to compensate purchasers for the bonds’ increased risk. Also, the market rate is generally higher when the time period until the bond matures is longer due to the risk of adverse events occurring over a longer time period.

Many bond issuers try to set a contract rate of interest equal to the market rate they expect as of the bond issuance date. When the contract rate and market rate are equal, a bond sells at par value, but when they are not equal, a bond does not sell at par value. Instead, it is sold at a *premium* above par value or at a *discount* below par value. Exhibit 14.3 shows the relation between the contract rate, market rate, and a bond’s issue price.

QC1

**EXHIBIT 14.3**

Relation between Bond Issue Price, Contract Rate, and Market Rate

**Issuing Bonds at a Discount**

A **discount on bonds payable** occurs when a company issues bonds with a contract rate less than the market rate. This means that the issue price is less than par value. To illustrate, assume that **Fila** announces an offer to issue bonds with a \$100,000 par value, an 8% annual contract rate (paid semiannually), and a two-year life. Also assume that the market rate for Fila bonds is 10%. These bonds then will sell at a discount since the contract rate is less than the market rate. The exact issue price for these bonds is stated as 96.454 (implying 96.454% of par value, or \$96,454); we show how to compute this issue price later in the chapter. These bonds obligate the issuer to pay two separate types of future cash flows:

1. Par value of \$100,000 cash at the end of the bonds' two-year life.
2. Cash interest payments of \$4,000 ( $\$100,000 \times 8\% \times 1/2$  year) at the end of each semiannual period during the bonds' two-year life.

The exact pattern of cash flows for the Fila bonds is shown in Exhibit 14.4.

**P2**

Compute and record amortization of bond discount using straight-line method.

**Point:** The difference between the contract rate and the market rate of interest on a new bond issue is usually a fraction of a percent. We use a difference of 2% to emphasize the effects.

**EXHIBIT 14.4**

Cash Flows for Fila Bonds

When Fila accepts \$96,454 cash for its bonds on the issue date of December 31, 2015, it records the sale as follows.

Dec. 31	Cash .....	96,454	
	Discount on Bonds Payable .....	3,546	
	Bonds Payable .....		100,000
	<i>Sold bonds at a discount on their issue date.</i>		

$$\begin{aligned} \text{Assets} &= \text{Liabilities} + \text{Equity} \\ +96,454 &+ 100,000 \\ &- 3,546 \end{aligned}$$

These bonds are reported in the long-term liability section of the issuer's December 31, 2015, balance sheet as shown in Exhibit 14.5. A discount is deducted from the par value of bonds to yield the **carrying (book) value of bonds**. Discount on Bonds Payable is a contra liability account.

**Point:** Book value at issuance always equals the issuer's cash borrowed.

Long-term liabilities			
Bonds payable, 8%, due December 31, 2017 .....	\$100,000		
<b>Less discount on bonds payable .....</b>	<b>3,546</b>	\$96,454	← carrying (book) value

**EXHIBIT 14.5**

Balance Sheet Presentation of Bond Discount

**Amortizing a Bond Discount** Fila receives \$96,454 for its bonds; in return it must pay bondholders \$100,000 after two years (plus semiannual interest payments). The \$3,546 discount is paid to bondholders at maturity and is part of the cost of using the \$96,454 for two years. The upper portion of panel A in Exhibit 14.6 shows that total bond interest expense of \$19,546 is the difference between the total amount repaid to bondholders (\$116,000) and the amount borrowed from bondholders (\$96,454). Alternatively, we can compute total bond interest expense as the sum of the four interest payments and the bond discount. This alternative computation is shown in the lower portion of panel A.

The total \$19,546 bond interest expense must be allocated across the four semiannual periods in the bonds' life, and the bonds' carrying value must be updated at each balance sheet

**EXHIBIT 14.6**

Interest Computation and Entry for Bonds Issued at a Discount

**Panel A: Interest Computations**

Amount repaid to bondholders		
Four interest payments of \$4,000 (4 pymts × [\$100,000 × 0.08 × 1/2 yr]) . . .	\$ 16,000	
Par value at maturity . . . . .	100,000	
Total repaid to bondholders . . . . .	116,000	
Less amount borrowed from bondholders . . . . .	(96,454)	
<b>Total bond interest expense</b> . . . . .	<b>\$ 19,546</b>	← Equal
<b>Alternative Computation</b>		
Four payments of \$4,000 (4 pymts × [\$100,000 × 0.08 × 1/2 yr]) . . . . .	\$ 16,000	
Plus discount . . . . .	3,546	
<b>Total bond interest expense</b> . . . . .	<b>\$ 19,546</b>	

Bond interest expense =  $\frac{\text{Total bond interest expense}}{\text{Number of interest periods}} = \frac{\$19,546}{4} = \$4,887$  (per interest period)

**Panel B: Entry to Record Interest Payment and Amortization**

2016–2017			
June 30 and	Bond Interest Expense . . . . .	4,887	
Dec. 31	Discount on Bonds Payable . . . . .		887 ← Discount ÷ periods
	Cash . . . . .		4,000 ← Par value × contract rate

To record semiannual interest and discount amortization (straight-line method).

date. This is accomplished using the straight-line method (or the effective interest method in Appendix 14B). Both methods systematically reduce the bond discount to zero over the two-year life. This process is called *amortizing a bond discount*.

The following section on discount amortization uses the straight-line method. Appendix 14B uses the effective interest method. An instructor can choose to cover either one or both methods. If the straight-line method is skipped, then jump two pages ahead to the section titled “Issuing Bonds at a Premium.”

**Straight-Line Method** The **straight-line bond amortization** method allocates an equal portion of the total bond interest expense to each interest period. To apply the straight-line method to Fila’s bonds, we divide the total bond interest expense of \$19,546 by 4 (the number of semiannual periods in the bonds’ life). This gives a bond interest expense of \$4,887 per period, which is \$4,886.5 rounded to the nearest dollar per period (all computations, including those for assignments, are rounded to the nearest whole dollar). Alternatively, we can find this number by first dividing the \$3,546 discount

by 4, which yields the \$887 amount of discount to be amortized each interest period. When the \$887 is added to the \$4,000 cash payment, the bond interest expense for each period is \$4,887. Panel B of Exhibit 14.6 shows how the issuer records bond interest expense and updates the balance of the bond liability account at the end of *each* of the four semiannual interest periods (June 30, 2016, through December 31, 2017).

Exhibit 14.7 shows the pattern of decreases in the Discount on Bonds Payable account and the pattern of increases in the bonds’ carrying value. The following points summarize the discount bonds’ straight-line amortization:

1. At issuance, the \$100,000 par value consists of the \$96,454 cash received by the issuer plus the \$3,546 discount.
2. During the bonds’ life, the (unamortized) discount decreases each period by the \$887 amortization ( $\$3,546/4$ ), and the carrying value (par value less unamortized discount) increases each period by \$887.
3. At maturity, the unamortized discount equals zero, and the carrying value equals the \$100,000 par value that the issuer pays the holder.

**Point:** Amortization always results in the carrying value of a bond moving closer to its par value.

**EXHIBIT 14.7**

Straight-Line Amortization of Bond Discount

Semiannual Period-End	Unamortized Discount*	Carrying Value†
(0) 12/31/2015 . . . . .	\$3,546	\$ 96,454
(1) 6/30/2016 . . . . .	2,659	97,341
(2) 12/31/2016 . . . . .	1,772	98,228
(3) 6/30/2017 . . . . .	885	99,115
(4) 12/31/2017 . . . . .	0‡	100,000

The two columns always sum to par value for a discount bond.

\* Total bond discount (of \$3,546) less accumulated periodic amortization (\$887 per semiannual interest period).  
 † Bond par value (of \$100,000) less unamortized discount.  
 ‡ Adjusted for rounding.

We see that the issuer incurs a \$4,887 bond interest expense each period but pays only \$4,000 cash. The \$887 unpaid portion of this expense is added to the bonds' carrying value. (The total \$3,546 unamortized discount is "paid" when the bonds mature; \$100,000 is paid at maturity but only \$96,454 was received at issuance.)

**Decision Insight**

**Ratings Game** Many bond buyers rely on rating services to assess bond risk. The best known are **Standard & Poor's, Moody's, and Fitch**. These services focus on the issuer's financial statements and other factors in setting ratings. Standard & Poor's ratings, from best quality to default, are AAA, AA, A, BBB, BB, B, CCC, CC, C, and D. Ratings can include a plus (+) or minus (-) to show relative standing within a category. Bonds rated in the A and B range are referred to as *investment grade*; lower-rated bonds are considered much riskier. ■

Bonds Payable		
12/31/2015	100,000

A company issues 8%, two-year bonds on December 31, 2015, with a par value of \$7,000 and semiannual interest payments. On the issue date, the annual market rate for these bonds is 10%, which implies a selling price of 96.46 or \$6,752. (a) Prepare an amortization table such as Exhibit 14.7 for these bonds; use the straight-line method to amortize the discount. Then, prepare journal entries to record (b) the issuance of bonds on December 31, 2015; (c) the first through fourth interest payments on each June 30 and December 31; and (d) the maturity of the bond on December 31, 2017.

### Issuing Bonds at a Premium

**P3**  
 Compute and record amortization of bond premium using straight-line method.

**Premium bond:**  
 Contract rate → Cash int. pymt.  
 Market rate → Interest expense  
 If Cash int. pymt. > Int. expense:  
 • Bond sells at premium  
 • Carrying value > par value  
 • Carrying value declines over time

When the contract rate of bonds is higher than the market rate, the bonds sell at a price higher than par value. The amount by which the bond price exceeds par value is the **premium on bonds**. To illustrate, assume that Adidas issues bonds with a \$100,000 par value, a 12% annual contract rate, semiannual interest payments, and a two-year life. Also assume that the market rate for Adidas bonds is 10% on the issue date. The Adidas bonds will sell at a premium because the contract rate is higher than the market rate. The issue price for these bonds is stated as 103.546 (implying 103.546% of par value, or \$103,546); we show how to compute this issue price later in the chapter. These bonds obligate the issuer to pay out two separate future cash flows:

1. Par value of \$100,000 cash at the end of the bonds' two-year life.
2. Cash interest payments of \$6,000 ( $\$100,000 \times 12\% \times 1/2$  year) at the end of each semiannual period during the bonds' two-year life.

The exact pattern of cash flows for the Adidas bonds is shown in Exhibit 14.8.

#### EXHIBIT 14.8

Cash Flows for Adidas Bonds

When Adidas accepts \$103,546 cash for its bonds on the issue date of December 31, 2015, it records this transaction as follows.

Assets = Liabilities + Equity  
 +103,546 +100,000  
           +3,546

Dec. 31	Cash .....	103,546
	Premium on Bonds Payable .....	3,546
	Bonds Payable .....	100,000
	<i>Sold bonds at a premium on their issue date.</i>	

These bonds are reported in the long-term liability section of the issuer's December 31, 2015, balance sheet as shown in Exhibit 14.9. A premium is added to par value to yield the carrying (book) value of bonds. Premium on Bonds Payable is an adjunct liability account.

#### EXHIBIT 14.9

Balance Sheet Presentation of Bond Premium

Long-term liabilities		
Bonds payable, 12%, due December 31, 2017 .....	\$100,000	
<b>Plus premium on bonds payable .....</b>	<b>3,546</b>	\$103,546

**Amortizing a Bond Premium** Adidas receives \$103,546 for its bonds; in return, it pays bondholders \$100,000 after two years (plus semiannual interest payments). The \$3,546 premium not repaid to issuer's bondholders at maturity goes to reduce the issuer's expense of using the \$103,546 for two years. The upper portion of panel A of Exhibit 14.10 shows that total bond interest expense of \$20,454 is the difference between the total amount repaid to bondholders (\$124,000) and the amount borrowed from bondholders (\$103,546). Alternatively, we can compute total bond interest expense as the sum of the four interest payments less the bond premium. The premium is subtracted because it will not be paid to bondholders when the bonds mature; see the lower portion of panel A. Total bond interest expense must be allocated over the four semiannual periods using the straight-line method (or the effective interest method in Appendix 14B).

**Point:** The phrase *ability to service debt* refers to making interest and principal payments on time.

**Panel A: Interest Computations**

Amount repaid to bondholders

Four interest payments of \$6,000 (4 pymts × [\$100,000 × 0.12 × 1/2 yr]) . . . .	\$ 24,000
Par value at maturity . . . . .	100,000
Total repaid to bondholders . . . . .	124,000
Less amount borrowed from bondholders . . . . .	(103,546)
<b>Total bond interest expense</b> . . . . .	<b>\$ 20,454</b>

**Alternative Computation**

Four payments of \$6,000 (4 pymts × [\$100,000 × 0.12 × 1/2 yr]) . . . . .	\$ 24,000	Equal
Less premium . . . . .	(3,546)	
<b>Total bond interest expense</b> . . . . .	<b>\$ 20,454</b>	

Bond interest expense (per interest period) =  $\frac{\text{Total bond interest expense}}{\text{Number of interest periods}} = \frac{\$20,454}{4} = \$5,113$

**Panel B: Entry to Record Interest Payment and Amortization**

*The following section on premium amortization uses the straight-line method. Appendix 14B uses the effective interest method. An instructor can choose to cover either one or both methods. If the straight-line method is skipped, then jump one page ahead to the section titled “Bond Pricing.”*

**Straight-Line Method** The straight-line method allocates an equal portion of total bond interest expense to each of the bonds’ semiannual interest periods. To apply this method to Adidas bonds, we divide the two years’ total bond interest expense of \$20,454 by 4 (the number of semiannual periods in the bonds’ life). This gives a total bond interest expense of \$5,113 per period, which is \$5,113.5 rounded down so that the journal entry balances and for simplicity in presentation (alternatively, one could carry cents). Panel B of Exhibit 14.10 shows how the issuer records bond interest expense and updates the balance of the bond liability account for each semiannual period (June 30, 2016, through December 31, 2017).

Semiannual Period-End	Unamortized Premium*	Carrying Value†
(0) 12/31/2015 . . . . .	\$3,546	\$103,546
(1) 6/30/2016 . . . . .	2,659	102,659
(2) 12/31/2016 . . . . .	1,772	101,772
(3) 6/30/2017 . . . . .	885	100,885
(4) 12/31/2017 . . . . .	<b>0‡</b>	<b>100,000</b>

\* Total bond premium (of \$3,546) less accumulated periodic amortization (\$887 per semiannual interest period).  
 † Bond par value (of \$100,000) plus unamortized premium.  
 ‡ Adjusted for rounding.

**Point:** A premium decreases Bond Interest Expense; a discount increases it.

**EXHIBIT 14.11**

Straight-Line Amortization of Bond Premium

During the bond life, carrying value is adjusted to par and the amortized premium to zero.

Exhibit 14.11 shows the pattern of decreases in the unamortized Premium on Bonds Payable account and in the bonds’ carrying value. The following points summarize straight-line amortization of the premium bonds:

1. At issuance, the \$100,000 par value plus the \$3,546 premium equals the \$103,546 cash received by the issuer.
2. During the bonds’ life, the (unamortized) premium decreases each period by the \$887 amortization (\$3,546/4), and the carrying value decreases each period by the same \$887.
3. At maturity, the unamortized premium equals zero, and the carrying value equals the \$100,000 par value that the issuer pays the holder.

**NEED-TO-KNOW 14-2**

Recording Premium Bonds

P3

A company issues 8%, two-year bonds on December 31, 2015, with a par value of \$7,000 and semiannual interest payments. On the issue date, the annual market rate for these bonds is 6%, which implies a selling price of 103.71 or \$7,260. (a) Prepare an amortization table such as Exhibit 14.11 for these bonds; use the straight-line method to amortize the premium. Then, prepare journal entries to record (b) the issuance of bonds on December 31, 2015; (c) the first through fourth interest payments on each June 30 and December 31; and (d) the maturity of the bond on December 31, 2017.

**Solution**

a.

The next section describes bond pricing. An instructor can choose to cover bond pricing or not. Assignments requiring the “Bond Pricing” section are Quick Study 14-3 and Exercises 14-3 and 14-8.

**Point:** Zero-coupon bonds do not pay periodic interest (contract rate is zero). These bonds always sell at a discount because their 0% contract rate is always below the market rate.

## Bond Pricing

Prices for bonds traded on an organized exchange are often published in newspapers and through online services. This information normally includes the bond price (called *quote*), its contract rate, and its current market (called *yield*) rate. However, only a fraction of bonds are traded on organized exchanges. To compute the price of a bond, we apply present value concepts. This section explains how to use *present value concepts* to price the Fila discount bond and the Adidas premium bond described earlier.

**Point:** [InvestingInBonds.com](http://InvestingInBonds.com) is a bond research and learning source.

**Present Value of a Discount Bond** The issue price of bonds is found by computing the present value of the bonds’ cash payments, discounted at the bonds’ market rate. When computing the present value of the Fila bonds, we work with *semiannual* compounding periods because this is the time between interest payments; the annual market rate of 10% is considered a semiannual rate of 5%. Also, the two-year bond life is viewed as four semiannual periods. The price computation is twofold: (1) Find the present value of the \$100,000 par value paid at maturity and (2) find the present value of the series of four semiannual payments of \$4,000 each; see Exhibit 14.4. These present values can be found by using *present value tables*. Appendix B at the end of this book shows present value tables and describes their use. Table B.1 at the end of Appendix B is used for the single \$100,000 maturity payment, and Table B.3 in Appendix B is used for the \$4,000 series of interest payments. Specifically, we go to Table B.1, row 4, and across to the 5% column to identify the present value factor of 0.8227 for the maturity payment. Next, we go to Table B.3, row 4, and across to the 5% column, where the present value factor is 3.5460 for the series of interest payments. We compute bond price by multiplying the cash flow payments by their corresponding present value factors and adding them together; see Exhibit 14.12.

**Point:** A bond’s market value (price) at issuance equals the present value of its future cash payments, where the interest (discount) rate used is the bond’s market rate.

**Point:** Many calculators have present value functions for computing bond prices.

### EXHIBIT 14.12

Computing Issue Price for the Fila Discount Bonds

Cash Flow	Table	Present Value Factor	Amount	Present Value
\$100,000 par (maturity) value . . . . .	B.1 (PV of 1)	0.8227	× \$100,000 =	\$ 82,270
\$4,000 interest payments . . . . .	B.3 (PV of ann.)	3.5460	× 4,000 =	14,184
<b>Price of bond</b> . . . . .				<b>\$96,454</b>

<b>Calculator</b>	
N = 4	PMT = 4,000
I/Yr = 5	FV = 100,000
PV = 96,454	

**Present Value of a Premium Bond** We find the issue price of the Adidas bonds by using the market rate to compute the present value of the bonds’ future cash flows. When computing the present value of these bonds, we again work with *semiannual* compounding periods because this is the time between interest payments. The annual 10% market rate is applied as a semiannual rate of 5%, and the two-year bond life is viewed as four semiannual periods. The computation is twofold: (1) Find the present value of the \$100,000 par value paid at maturity and (2) find the present value of the series of four payments of \$6,000 each; see Exhibit 14.8. These present values can be found by using present value tables. First, go to Table B.1, row 4, and across to the 5% column where the present value factor is 0.8227 for the maturity payment. Second, go to Table B.3, row 4, and across to the 5% column, where the present value factor is 3.5460 for the series of interest payments. The bonds’ price is computed by multiplying the cash flow payments by their corresponding present value factors and adding them together; see Exhibit 14.13.

**Point:** Calculator inputs defined:  
 N Number of semiannual periods  
 I/Yr Market rate per semiannual period  
 FV Future (maturity) value  
 PMT Payment (interest) per semiannual period  
 PV Price (present value)

### EXHIBIT 14.13

Computing Issue Price for the Adidas Premium Bonds

Cash Flow	Table	Present Value Factor	Amount	Present Value
\$100,000 par (maturity) value . . . . .	B.1 (PV of 1)	0.8227	× \$100,000 =	\$ 82,270
\$6,000 interest payments . . . . .	B.3 (PV of ann.)	3.5460	× 6,000 =	21,276
<b>Price of bond</b> . . . . .				<b>\$103,546</b>

<b>Calculator</b>	
N = 4	PMT = 6,000
I/Yr = 5	FV = 100,000
PV = 103,546	

**Decision Insight**

**Equivalent Payments Concept** Business decisions frequently involve concepts using the time value of money. To help in those decisions, the present value factors can be thought of as *equivalent payments*. For example, using the data in Exhibit 14.12, one payment of \$100,000 scheduled two years from today is the *equivalent* of a 0.8227 payment of \$100,000 today (assuming a market with 10% return). Similarly, four semiannual payments of \$4,000 over the next two years are the equivalent of 3.5460 payments of \$4,000 today (again, assuming a 10% return). ■

**BOND RETIREMENT**

**P4**  
Record the retirement of bonds.

This section describes the retirement of bonds (1) at maturity, (2) before maturity, and (3) by conversion to stock.

**Bond Retirement at Maturity**

The carrying value of bonds at maturity always equals par value. For example, both Exhibits 14.7 (a discount) and 14.11 (a premium) show that the carrying value of bonds at the end of their lives equals par value (\$100,000). The retirement of these bonds at maturity, assuming interest is already paid and entered, is recorded as follows:

Assets = Liabilities + Equity  
-100,000 -100,000

2017			
Dec. 31	Bonds Payable .....	100,000	
	Cash .....		100,000
	<i>To record retirement of bonds at maturity.</i>		

**Bond Retirement before Maturity**

Issuers sometimes wish to retire some or all of their bonds prior to maturity. For instance, if interest rates decline greatly, an issuer may wish to replace high-interest-paying bonds with new low-interest bonds. Two common ways to retire bonds before maturity are to (1) exercise a call option or (2) purchase them on the open market. In the first instance, an issuer can reserve the right to retire bonds early by issuing callable bonds. The bond indenture can give the issuer an option to *call* the bonds before they mature by paying the par value plus a *call premium* to bondholders. In the second case, the issuer retires bonds by repurchasing them on the open market at their current price. Whether bonds are called or repurchased, the issuer is unlikely to pay a price that exactly equals their carrying value. When a difference exists between the bonds' carrying value and the amount paid, the issuer records a gain or loss equal to the difference.

To illustrate the accounting for retiring callable bonds, assume that a company issued callable bonds with a par value of \$100,000. The call option requires the issuer to pay a call premium of \$3,000 to bondholders in addition to the par value. Next, assume that after the June 30, 2015, interest payment, the bonds have a carrying value of \$104,500. Then on July 1, 2015, the issuer calls these bonds and pays \$103,000 to bondholders. The issuer recognizes a \$1,500 gain from the difference between the bonds' carrying value of \$104,500 and the retirement price of \$103,000. The issuer records this bond retirement as follows.

Assets = Liabilities + Equity  
-103,000 -100,000 +1,500  
-4,500

July 1	Bonds Payable .....	100,000	
	Premium on Bonds Payable .....	4,500	
	Gain on Bond Retirement .....		1,500
	Cash .....		103,000
	<i>To record retirement of bonds before maturity.</i>		

**Point:** Bond retirement is also referred to as *bond redemption*.

**Point:** Gains and losses from retiring bonds were *previously* reported as extraordinary items. New standards require that they now be judged by the "unusual and infrequent" criteria for reporting purposes.

An issuer usually must call all bonds when it exercises a call option. However, to retire as many or as few bonds as it desires, an issuer can purchase them on the open market. If it retires less than the entire class of bonds, it recognizes a gain or loss for the difference between the carrying value of those bonds retired and the amount paid to acquire them.

## Bond Retirement by Conversion

Holders of convertible bonds have the right to convert their bonds to stock. When conversion occurs, the bonds' carrying value is transferred to equity accounts and no gain or loss is recorded. (We further describe convertible bonds in the Decision Analysis section of this chapter.)

To illustrate, assume that on January 1 the \$100,000 par value bonds of **Converse**, with a carrying value of \$100,000, are converted to 15,000 shares of \$2 par value common stock. The entry to record this conversion follows (the market prices of the bonds and stock are *not* relevant to this entry; the material in Chapter 13 is helpful in understanding this transaction):

Convertible Bond

Jan. 1	Bonds Payable .....	100,000	
	Common Stock .....		30,000
	Paid-In Capital in Excess of Par Value .....		70,000
	<i>To record retirement of bonds by conversion.</i>		

$$\begin{array}{r} \text{Assets} = \text{Liabilities} + \text{Equity} \\ -100,000 \quad +30,000 \\ \quad \quad \quad +70,000 \end{array}$$

QC4

### Decision Insight

**Junk Bonds** Junk bonds are company bonds with low credit ratings due to a higher than average likelihood of default. On the upside, the high risk of junk bonds can yield high returns if the issuer survives and repays its debt. Investors in junk bonds identify and buy bonds with low credit ratings when they believe those bonds will survive and payoff their obligations. ■

## LONG-TERM NOTES PAYABLE

Like bonds, notes are issued to obtain assets such as cash. Unlike bonds, notes are typically transacted with a *single* lender such as a bank. An issuer initially records a note at its selling price—that is, the note's face value minus any discount or plus any premium. Over the note's life, the amount of interest expense allocated to each period is computed by multiplying the market rate (at issuance of the note) by the beginning-of-period note balance. The note's carrying (book) value at any time equals its face value minus any unamortized discount or plus any unamortized premium; carrying value is also computed as the present value of all remaining payments, discounted using the market rate at issuance.

### Installment Notes

An **installment note** is an obligation requiring a series of payments to the lender. Installment notes are common for franchises and other businesses when lenders and borrowers agree to spread payments over several periods. To illustrate, assume that Foghog borrows \$60,000 from a bank to purchase equipment. It signs an 8% installment note requiring six

**C1** Explain the types of notes and prepare entries to account for notes.

annual payments of principal plus interest and it records the note's issuance at January 1, 2015, as follows.

Assets = Liabilities + Equity  
 +60,000 +60,000

Jan. 1	Cash .....	60,000	
	Notes Payable .....		60,000
	<i>Borrowed \$60,000 by signing an 8%, six-year installment note.</i>		

Payments on an installment note normally include the accrued interest expense plus a portion of the amount borrowed (the *principal*). This section describes an installment note with equal payments.

The equal total payments pattern consists of changing amounts of both interest and principal. To illustrate, assume that Foghog borrows \$60,000 by signing a \$60,000 note that requires six *equal payments* of \$12,979 at the end of each year. (The present value of an annuity of six annual payments of \$12,979, discounted at 8%, equals \$60,000; we show this computation in footnote 2.) The \$12,979 includes both interest and principal, the amounts of which change with each payment. Exhibit 14.14 shows the pattern of equal total payments and its two parts, interest and principal. Column A shows the note's beginning balance. Column B shows accrued interest for each year at 8% of the beginning note balance. Column C shows the impact on the note's principal, which equals the difference between the total payment in column D and the interest expense in column B. Column E shows the note's year-end balance.

**Point:** Most consumer notes are installment notes that require equal total payments.

**EXHIBIT 14.14**

Installment Note: Equal Total Payments Amortization Schedule

Period Ending Date	(A) Beginning Balance	Payments			(E) Ending Balance (A) - (C)
		(B) Debit Interest Expense 8% × (A)	(C) Debit Notes Payable (D) - (B)	(D) Credit Cash (computed)	
(1) 12/31/2015	\$60,000	\$ 4,800	\$ 8,179	\$12,979	\$51,821
(2) 12/31/2016	51,821	4,146	8,833	12,979	42,988
(3) 12/31/2017	42,988	3,439	9,540	12,979	33,448
(4) 12/31/2018	33,448	2,676	10,303	12,979	23,145
(5) 12/31/2019	23,145	1,852	11,127	12,979	12,018
(6) 12/31/2020	12,018	961	12,018	12,979	0
		<u>\$17,874</u>	<u>\$60,000</u>	<u>\$77,874</u>	

Although the six cash payments are equal, accrued interest decreases each year because the principal balance of the note declines. As the amount of interest decreases each year, the portion of each payment applied to principal increases. This pattern is graphed in the lower part of Exhibit 14.14. Foghog uses the amounts in Exhibit 14.14 to record its first two payments (for years 2015 and 2016) as follows:

2015 Dec. 31	Interest Expense .....	4,800	
	Notes Payable .....	8,179	
	Cash .....		12,979
	<i>To record first installment payment.</i>		

$$\begin{array}{rcl} \text{Assets} & = & \text{Liabilities} + \text{Equity} \\ -12,979 & - & -8,179 \quad -4,800 \end{array}$$

2016 Dec. 31	Interest Expense .....	4,146	
	Notes Payable .....	8,833	
	Cash .....		12,979
	<i>To record second installment payment.</i>		

$$\begin{array}{rcl} \text{Assets} & = & \text{Liabilities} + \text{Equity} \\ -12,979 & - & -8,833 \quad -4,146 \end{array}$$

Foghog records similar entries but with different amounts for each of the remaining four payments. After six years, the Notes Payable account balance is zero.<sup>2</sup>

### Mortgage Notes and Bonds

A **mortgage** is a legal agreement that helps protect a lender if a borrower fails to make required payments on notes or bonds. A mortgage gives the lender a right to be paid from the cash proceeds of the sale of a borrower’s assets identified in the mortgage. A legal document, called a *mortgage contract*, describes the mortgage terms.

*Mortgage notes* carry a mortgage contract pledging title to specific assets as security for the note. Mortgage notes are especially popular in the purchase of homes and the acquisition of plant assets. Less common *mortgage bonds* are backed by the issuer’s assets. Accounting for mortgage notes and bonds is similar to that for unsecured notes and bonds, except that the mortgage agreement must be disclosed. For example, **TIBCO Software** reports that its “mortgage note payable . . . is collateralized by the commercial real property acquired [corporate headquarters].”

**Point:** The Truth in Lending Act requires lenders to provide information about loan costs including finance charges and interest rate.

**Global:** Countries vary in the preference given to debtholders vs. stockholders when a company is in financial distress. Some countries such as Germany, France, and Japan give preference to stockholders over debtholders.

### Decision Maker

**Entrepreneur** You are a furniture retailer planning a Super Bowl sale on a home theater system that requires no payments for two years. At the end of two years, buyers must pay the full amount. The system’s suggested retail price is \$4,100, but you are willing to sell it today for \$3,000 cash. What is your sale price if payment will not occur for two years and the market interest rate is 10%? ■ [Answers follow the chapter’s Summary.]

<sup>2</sup> Table B.3 in Appendix B is used to compute the dollar amount of the six payments that equal the initial note balance of \$60,000 at 8% interest. We go to Table B.3, row 6, and across to the 8% column, where the present value factor is 4.6229. The dollar amount is then computed by solving this equation:

Table	Present Value Factor	Dollar Amount	Present Value
B.3	4.6229	× ?	= \$60,000

The dollar amount is computed by dividing \$60,000 by 4.6229, yielding \$12,979.

**Example:** Suppose the \$60,000 installment loan has an 8% interest rate with eight equal annual payments. What is the annual payment? Answer (using Table B.3): \$60,000/5.7466 = \$10,441

**NEED-TO-KNOW 14-3**

Recording Installment Note

C1 P5

On January 1, 2015, a company borrows \$1,000 cash by signing a four-year, 5% installment note. The note requires four equal total payments of accrued interest and principal on December 31 of each year from 2015 through 2018.

1. Compute the amount of each of the four equal total payments.
2. Prepare an amortization table for this installment note like the one in Exhibit 14.14.
3. Prepare journal entries to record the loan on January 1, 2015, and the four payments from December 31, 2015, through December 31, 2018.

**Solution**

1. Amount of each payment = Initial note balance/PV of annuity (from Table B.3)  
 = \$1,000/3.5460 = \$282 (rounded)

2. Amortization table for loan

Period Ending Date	(A) Beginning Balance [Prior (E)]	Payments			(E) Ending Balance [(A) – (C)]
		(B) Debit Interest Expense [5% × (A)]	(C) Debit Notes Payable + [(D) – (B)]	(D) Credit Cash = [computed]	
2015 .....	\$ 1,000	\$ 50	\$ 232	\$ 282	\$768
2016 .....	768	38	244	282	524
2017 .....	524	26	256	282	268
2018 .....	268	14*	268	282	0
		<u>\$128</u>	<u>\$1,000</u>	<u>\$1,128</u>	

\*Adjusted for rounding.

3.

2015 Jan. 1	Cash .....	1,000	
	Notes Payable .....		1,000
	<i>Borrowed \$1,000 by signing a 5% installment note.</i>		
2015 Dec. 31	Interest Expense .....	50	
	Notes Payable .....	232	
	Cash .....		282
	<i>To record first installment payment.</i>		
2016 Dec. 31	Interest Expense .....	38

## GLOBAL VIEW

This section discusses similarities and differences between U.S. GAAP and IFRS in accounting and reporting for long-term liabilities such as bonds and notes.

**Accounting for Bonds and Notes** The definitions and characteristics of bonds and notes are broadly similar for both U.S. GAAP and IFRS. Although slight differences exist, accounting for bonds and notes under U.S. GAAP and IFRS is similar. Specifically, the accounting for issuances (including recording discounts and premiums), market pricing, and retirement of both bonds and notes follows the procedures in this chapter. **Nokia** describes its accounting for bonds, which follows the amortized cost approach explained in this chapter (and in Appendix 14B), as follows: Loans payable [bonds] are recognized initially at fair value, net of transaction costs incurred. In the subsequent periods, loans payable are measured at amortized cost using the effective interest method.

**NOKIA**

Both U.S. GAAP and IFRS allow companies to account for bonds and notes using fair value (different from the amortized value described in this chapter). This method is referred to as the **fair value option**. This method is similar to that applied in measuring and accounting for debt and equity securities. *Fair value* is the amount a company would receive if it settled a liability (or sold an asset) in an orderly transaction as of the balance sheet date. Companies can use several sources of inputs to determine fair value, and those inputs fall into the following three classes (ranked in order of preference). The procedures for marking liabilities to fair value at each balance sheet date are in advanced courses.

Level 1: Observable quoted market prices in active markets for identical items.

Level 2: Observable inputs other than those in Level 1 such as prices from inactive markets or from similar, but not identical, items.

Level 3: Unobservable inputs reflecting a company's assumptions about value.

**Accounting for Leases and Pensions** Both U.S. GAAP and IFRS require companies to distinguish between operating leases and capital leases; the latter is referred to as *finance leases* under IFRS. The accounting and reporting for leases are broadly similar for both U.S. GAAP and IFRS. The main difference is the criteria for identifying a lease as a capital lease are more general under IFRS. However, the basic approach applies.

For pensions, both U.S. GAAP and IFRS require companies to record costs of retirement benefits as employees work and earn them. The basic methods are similar in accounting and reporting for pensions.

**Sustainability and Accounting** Matthew Clough, the founder of **Stone + Cloth**, as introduced in this chapter's opening feature, is a *social entrepreneur*. Matthew dedicates his business activities to helping Tanzanian children achieve their educational dreams. Each backpack sold generates enough money to support one month of education for a child in Tanzania. Matthew's plan is that this educational support system is sustainable through his business operations.

**Point:** Lease accounting is expected to change over the next year or so.

### Debt Features and the Debt-to-Equity Ratio

### Decision Analysis

*Collateral agreements* can reduce the risk of loss for both bonds and notes. Unsecured bonds and notes are riskier because the issuer's obligation to pay interest and principal has the same priority as all other unsecured liabilities in the event of bankruptcy. If a company is unable to pay its debts in full, the unsecured creditors (including the holders of debentures) lose all or a portion of their balances. These types of legal agreements and other characteristics of long-term liabilities are crucial for effective business decisions. The first part of this section describes the different types of features sometimes included with bonds and notes. The second part explains and applies the debt-to-equity ratio.

## Features of Bonds and Notes

This section describes common features of debt securities.

**Secured or Unsecured** **Secured bonds** (and notes) have specific assets of the issuer pledged (or *mortgaged*) as collateral. This arrangement gives holders added protection against the issuer's default. If the issuer fails to pay interest or par value, the secured holders can demand that the collateral be sold and the proceeds used to pay the obligation.

Secured Debt

Unsecured Debt

**A2** \_\_\_\_\_  
Assess debt features and their implications.

**Point:** More than a million municipal bonds, or “munis,” exist, and many are tax exempt. Munis are issued by state, city, town, and county governments to pay for public projects including schools, libraries, roads, bridges, and stadiums.

**Unsecured bonds** (and notes), also called *debentures*, are backed by the issuer’s general credit standing. Unsecured debt is riskier than secured debt. *Subordinated debentures* are liabilities that are not repaid until the claims of the more senior, unsecured (and secured) liabilities are settled.

**Term or Serial** **Term bonds** (and notes) are scheduled for maturity on one specified date. **Serial bonds** (and notes) mature at more than one date (often in series) and thus are usually repaid over a number of periods. For instance, \$100,000 of serial bonds might mature at the rate of \$10,000 each year from 6 to 15 years after they are issued. Many bonds are **sinking fund bonds**, which to reduce the holder’s risk require the issuer to create a *sinking fund* of assets set aside at specified amounts and dates to repay the bonds.

**Registered or Bearer** Bonds issued in the names and addresses of their holders are **registered bonds**. The issuer makes bond payments by sending checks (or cash transfers) to registered holders. A registered holder must notify the issuer of any ownership change. Registered bonds offer the issuer the practical advantage of not having to actually issue bond certificates. Bonds payable to whoever holds them (the *bearer*) are called **bearer bonds** or *unregistered bonds*. Sales or exchanges might not be recorded, so the holder of a bearer bond is presumed to be its rightful owner. As a result, lost bearer bonds are difficult to replace. Many bearer bonds are also **coupon bonds**. This term reflects interest coupons that are attached to the bonds. When each coupon matures, the holder presents it to a bank or broker for collection. At maturity, the holder follows the same process and presents the bond certificate for collection. Issuers of coupon bonds cannot deduct the related interest expense for taxable income. This is to prevent abuse by taxpayers who own coupon bonds but fail to report interest income on their tax returns.

**Convertible and/or Callable** **Convertible bonds** (and notes) can be exchanged for a fixed number of shares of the issuing corporation’s common stock. Convertible debt offers holders the potential to participate in future increases in stock price. Holders still receive periodic interest while the debt is held and the par value if they hold the debt to maturity. In most cases, the holders decide whether and when to convert debt to stock. **Callable bonds** (and notes) have an option exercisable by the issuer to retire them at a stated dollar amount before maturity.

**Decision Insight**

**Collateral** Lenders prefer that more liquid assets serve as collateral for loans. These usually are current assets such as accounts receivable or inventory. The reason is if borrowers default and collateral must be seized, then lenders desire assets that are easily sold to recover losses.

**Debt-to-Equity Ratio**

Beyond assessing different characteristics of debt as just described, we want to know the level of debt, especially in relation to total equity. Such knowledge helps us assess the risk of a company’s financing structure. A company financed mainly with debt is more risky because liabilities must be repaid—usually with periodic interest—whereas equity financing does not. A measure to assess the risk of a company’s financing structure is the **debt-to-equity ratio** (see Exhibit 14.15).

**A3**  
Compute the debt-to-equity ratio and explain its use.

**EXHIBIT 14.15**

Debt-to-Equity Ratio

$$\text{Debt-to-equity} = \frac{\text{Total liabilities}}{\text{Total equity}}$$

The debt-to-equity ratio varies across companies and industries. To apply the debt-to-equity ratio, let’s look at this measure for **Amazon.com** in Exhibit 14.16.

**EXHIBIT 14.16**

Amazon’s Debt-to-Equity Ratio

(\$ millions)	2013	2012	2011	2010
Total liabilities . . . . .	\$30,413	\$24,363	\$17,521	\$11,933
Total equity . . . . .	\$ 9,746	\$ 8,192	\$ 7,757	\$ 6,864
<b>Debt-to-equity . . . . .</b>	<b>3.1</b>	<b>3.0</b>	<b>2.3</b>	<b>1.7</b>
Industry debt-to-equity . . . . .	<b>1.6</b>	<b>1.5</b>	<b>1.5</b>	<b>1.4</b>

Amazon’s 2013 debt-to-equity ratio is 3.1, meaning that debtholders contributed \$3.10 for each \$1 contributed by equity holders. This implies a riskier than usual financing structure for Amazon. A similar concern is drawn from a comparison of Amazon with its competitors, where the 2013 industry ratio is 1.6. Analysis across the years shows that Amazon’s financing structure has risen to a riskier level in recent years. Given its growth in revenues and innovative past, investors have been patient in waiting for income. However, debtholders will grow increasingly concerned if income doesn’t rise in the near future.

## Decision Maker

**Bond Investor** You plan to purchase debenture bonds from one of two companies in the same industry that are similar in size and performance. The first company has \$350,000 in total liabilities and \$1,750,000 in equity. The second company has \$1,200,000 in total liabilities and \$1,000,000 in equity. Which company's debenture bonds are less risky based on the debt-to-equity ratio? ■ [Answers follow the chapter's Summary.]

Water Sports Company (WSC) patented and successfully test-marketed a new product. To expand its ability to produce and market the new product, WSC needs to raise \$800,000 of financing. On January 1, 2015, the company obtained the money in two ways:

- WSC signed a \$400,000, 10% installment note to be repaid with five equal annual installments to be made on December 31 of 2015 through 2019.
- WSC issued five-year bonds with a par value of \$400,000. The bonds have a 12% annual contract rate and pay interest on June 30 and December 31. The bonds' annual market rate is 10% as of January 1, 2015.

### Required

- For the installment note, (a) compute the size of each annual payment, (b) prepare an amortization table such as Exhibit 14.14, and (c) prepare the journal entry for the first payment.
- For the bonds, (a) compute their issue price; (b) prepare the January 1, 2015, journal entry to record their issuance; (c) prepare an amortization table using the straight-line method; (d) prepare the June 30, 2015, journal entry to record the first interest payment; and (e) prepare a journal entry to record retiring the bonds at a \$416,000 call price on January 1, 2017.
- Redo parts 2(c), 2(d), and 2(e) assuming the bonds are amortized using the effective interest method.

## PLANNING THE SOLUTION

- For the installment note, divide the borrowed amount by the annuity factor (from Table B.3) using the 10% rate and five payments to compute the amount of each payment. Prepare a table similar to Exhibit 14.14 and use the numbers in the table's first line for the journal entry.
- Compute the bonds' issue price by using the market rate to find the present value of their cash flows (use tables found in Appendix B). Then use this result to record the bonds' issuance. Next, prepare an amortization table like Exhibit 14.11 (and Exhibit 14B.2) and use it to get the numbers needed for the journal entry. Also use the table to find the carrying value as of the date of the bonds' retirement that you need for the journal entry.

## SOLUTION

### Part 1: Installment Note

- Annual payment = Note balance/PV Annuity factor =  $\$400,000/3.7908 = \$105,519$  (The present value annuity factor is for five payments and a rate of 10%.)
- An amortization table for the long-term note payable follows.

	A	B	C	D	E	F	G	H
1					<b>Payments</b>			
2		<b>(a)</b>	<b>(b)</b>		<b>(c)</b>		<b>(d)</b>	<b>(e)</b>
3			<b>Debit</b>		<b>Debit</b>		<b>Credit</b>	
4		<b>Beginning</b>	<b>Interest</b>		<b>Notes</b>			<b>Ending</b>
5		<b>Balance</b>	<b>Expense</b>	+	<b>Payable</b>	=	<b>Cash</b>	<b>Balance</b>
			<b>10% × (a)</b>		<b>(d) – (b)</b>		<b>(computed)</b>	<b>(a) – (c)</b>
6	(1) 12/31/2015	\$400,000	\$ 40,000		\$ 65,519		\$105,519	\$334,481
7	(2) 12/31/2016	334,481	33,448		72,071		105,519	262,410
8	(3) 12/31/2017	262,410	26,241		79,278		105,519	183,132
9	(4) 12/31/2018	183,132	18,313		87,206		105,519	95,926
10	(5) 12/31/2019	95,926	9,593		95,926		105,519	0
11			\$127,595		\$400,000		\$527,595	
12								

## NEED-TO-KNOW

### COMPREHENSIVE

c. Journal entry for December 31, 2015, payment.

Dec. 31	Interest Expense .....	40,000	
	Notes Payable .....	65,519	
	Cash .....		105,519
	<i>To record first installment payment.</i>		

**Part 2: Bonds (Straight-Line Amortization)**

a. Compute the bonds' issue price.

Cash Flow	Table	Present Value Factor*	Amount	Present Value
Par (maturity) value .....	B.1 in App. B (PV of 1)	0.6139	× 400,000	= \$245,560
Interest payments .....	B.3 in App. B (PV of annuity)	7.7217	× 24,000	= 185,321
Price of bond .....				<u>\$430,881</u>

\* Present value factors are for 10 payments using a semiannual market rate of 5%.

	<i>To record bond retirement (carrying value as of December 31, 2016).</i>		

**APPENDIX****Present Values of Bonds and Notes****14A**

This appendix explains how to apply present value techniques to measure a long-term liability when it is created and to assign interest expense to the periods until it is settled. Appendix B at the end of the book provides additional discussion of present value concepts.

**Present Value Concepts** The basic present value concept is that cash paid (or received) in the future has less value now than the same amount of cash paid (or received) today. To illustrate, if we must pay \$1 one year from now, its present value is less than \$1. To see this, assume that we borrow \$0.9259 today that must be paid back in one year with 8% interest. Our interest expense for this loan is computed as  $\$0.9259 \times 8\%$ , or \$0.0741. When the \$0.0741 interest is added to the \$0.9259 borrowed, we get the \$1 payment necessary to repay our loan with interest. This is formally computed in Exhibit 14A.1. The

Amount borrowed .....	\$0.9259
Interest for one year at 8% .....	0.0741
Amount owed after 1 year .....	<u>\$ 1.0000</u>

**C2**

Explain and compute the present value of an amount(s) to be paid at a future date(s).

**EXHIBIT 14A.1**

Components of a One-Year Loan

\$0.9259 borrowed is the present value of the \$1 future payment. More generally, an amount borrowed equals the present value of the future payment. (This same interpretation applies to an investment. If \$0.9259 is invested at 8%, it yields \$0.0741 in revenue after one year. This amounts to \$1, made up of principal and interest.)

To extend this example, assume that we owe \$1 two years from now instead of one year, and the 8% interest is compounded annually. *Compounded* means that interest during the second period is based on the total of the amount borrowed plus the interest accrued from the first period. The second period's interest is then computed as 8% multiplied by the sum of the amount borrowed plus interest earned in the first period. Exhibit 14A.2 shows how we compute the present value of \$1 to be paid in two years. This amount is \$0.8573. The first year's interest of \$0.0686 is added to the principal so that the second year's interest is based on \$0.9259. Total interest for this two-year period is \$0.1427, computed as \$0.0686 plus \$0.0741.

**Point:** Benjamin Franklin is said to have described compounding as "the money, money makes, makes more money."

**EXHIBIT 14A.2**

Components of a Two-Year Loan

<b>Amount borrowed</b> .....	<b>\$0.8573</b>
Interest for first year ( $\$0.8573 \times 8\%$ ) .....	<u>0.0686</u>
Amount owed after 1 year .....	0.9259
Interest for second year ( $\$0.9259 \times 8\%$ ) .....	<u>0.0741</u>
Amount owed after 2 years .....	<u><u>\$ 1.0000</u></u>

**Present Value Tables** The present value of \$1 that we must repay at some future date can be computed by using this formula:  $1/(1 + i)^n$ . The symbol *i* is the interest rate per period and *n* is the number of periods until the future payment must be made. Applying this formula to our two-year loan, we get  $1/(1.08)^2$ , or \$0.8573. This is the same value shown in Exhibit 14A.2. We can use this formula to find any present value. However, a simpler method is to use a *present value table*, which lists present values computed with this formula for various interest rates and time periods. Many people find it

helpful in learning present value concepts to first work with the table and then move to using a calculator.

Exhibit 14A.3 shows a present value table for a future payment of 1 for up to 10 periods at three different interest rates. Present values in this table are rounded to four decimal places. This table is drawn from the larger and more complete Table B.1 in Appendix B at the end of the book. Notice that the first value in the 8% column is 0.9259, the value we computed earlier for the present value of a \$1 loan for one year at 8% (see Exhibit 14A.1). Go to the second row in the same 8% column and find the present value of 1 discounted at 8% for two years, or 0.8573. This \$0.8573 is the present value of our obligation to repay \$1 after two periods at 8% interest (see Exhibit 14A.2).

**EXHIBIT 14A.3**

Present Value of 1

Periods	Rate		
	6%	8%	10%
1	0.9434	<b>0.9259</b>	0.9091
2	0.8900	<b>0.8573</b>	0.8264
3	0.8396	0.7938	0.7513
4	0.7921	0.7350	0.6830
5	0.7473	0.6806	0.6209
6	0.7050	0.6302	0.5645
7	0.6651	0.5835	0.5132
8	0.6274	0.5403	0.4665
9	0.5919	0.5002	0.4241
10	0.5584	0.4632	0.3855

**Example:** Use Exhibit 14A.3 to find the present value of \$1 discounted for 2 years at 6%. Answer: \$0.8900

**Applying a Present Value Table**

To illustrate how to measure a liability using a present value table, assume that a company plans to borrow cash and repay it as follows: \$2,000 after one year, \$3,000 after two years, and \$5,000 after three years. How much does this company receive today if the interest rate on this loan is 10%? To answer, we need to compute the present value of the three future payments, discounted at 10%. This computation is shown in Exhibit 14A.4 using present values from Exhibit 14A.3. The company can borrow

**EXHIBIT 14A.4**

Present Value of a Series of Unequal Payments

Periods	Payments	Present Value of 1 at 10%	Present Value of Payments
1	\$2,000	0.9091	\$ 1,818
2	3,000	0.8264	2,479
3	5,000	0.7513	<u>3,757</u>
Present value of all payments .....			<u><b>\$8,054</b></u>

\$8,054 today at 10% interest in exchange for its promise to make these three payments at the scheduled dates.

**Present Value of an Annuity** The \$8,054 present value for the loan in Exhibit 14A.4 equals the sum of the present values of the three payments. When payments are not equal, their combined present

value is best computed by adding the individual present values as shown in Exhibit 14A.4. Sometimes payments follow an **annuity**, which is a series of *equal* payments at equal time intervals. The present value of an annuity is readily computed.

To illustrate, assume that a company must repay a 6% loan with a \$5,000 payment at each year-end for the next four years. This loan amount equals the present value of the four payments discounted at 6%. Exhibit 14A.5 shows how to compute this loan's present value of \$17,326 by multiplying each payment by its matching present value factor taken from Exhibit 14A.3.

However, the series of \$5,000 payments is an annuity, so we can compute its present value with either of two shortcuts. First, the third column of Exhibit 14A.5 shows that the sum of the present values of 1 at 6% for periods 1 through 4 equals 3.4651. One shortcut is to multiply this total of 3.4651 by the \$5,000 annual payment to get the combined present value of \$17,326. It requires one multiplication instead of four.

The second shortcut uses an *annuity table* such as the one shown in Exhibit 14A.6, which is drawn from the more complete Table B.3 in Appendix B. We go directly to the annuity table to get the present value factor for a specific number of payments and interest rate. We then multiply this factor by the amount of the payment to find the present value of the annuity. Specifically, find the row for four periods and go across to the 6% column, where the factor is 3.4651. This factor equals the present value of an annuity with four payments of 1, discounted at 6%. We then multiply 3.4651 by \$5,000 to get the \$17,326 present value of the annuity.

### Compounding Periods Shorter Than a Year

The present value examples all involved periods of one year. In many situations, however, interest is compounded over shorter periods. For example, the interest rate on bonds is usually stated as an annual rate but interest is often paid every six months (semiannually). This means that the present value of interest payments from such bonds must be computed using interest periods of six months.

Assume that a borrower wants to know the present value of a series of 10 *semiannual payments* of \$4,000 made over five years at an *annual interest rate* of 12%. The interest rate is stated as an annual rate of 12%, but it is actually a rate of 6% per semiannual interest period. To compute the present value of this series of \$4,000 payments, go to row 10 of Exhibit 14A.6 and across to the 6% column to find the factor 7.3601. The present value of this annuity is \$29,440 ( $7.3601 \times \$4,000$ ).

*Appendix B further describes present value concepts and includes more complete present value tables and assignments.*

Periods	Payments	Present Value of 1 at 6%	Present Value of Payments
1	\$5,000	0.9434	\$ 4,717
2	5,000	0.8900	4,450
3	5,000	0.8396	4,198
4	5,000	<u>0.7921</u>	<u>3,961</u>
Present value of all payments . . . . .		<u>3.4651</u>	<u>\$17,326</u>

### EXHIBIT 14A.5

Present Value of a Series of Equal Payments (Annuity) by Discounting Each Payment

**Point:** Four payments of \$5,000 at the end of each of the next 4 years is the equivalent of 3.4651 payments of \$5,000 today.

Periods	Rate		
	6%	8%	10%
1	0.9434	0.9259	0.9091
2	1.8334	1.7833	1.7355
3	2.6730	2.5771	2.4869
4	<b>3.4651</b>	3.3121	3.1699
5	4.2124	3.9927	3.7908
6	4.9173	4.6229	4.3553
7	5.5824	5.2064	4.8684
8	6.2098	5.7466	5.3349
9	6.8017	6.2469	5.7590
10	7.3601	6.7101	6.1446

### EXHIBIT 14A.6

Present Value of an Annuity of 1

**Example:** Use Exhibit 14A.6 to find the present value of an annuity of eight \$15,000 payments with an 8% interest rate. Answer:  $\$15,000 \times 5.7466 = \$86,199$

OC6

**Example:** If this borrower makes five semiannual payments of \$8,000, what is the present value of this annuity at a 12% rate? Answer:  $4.2124 \times \$8,000 = \$33,699$

## APPENDIX

# Effective Interest Amortization

# 14B

**Effective Interest Amortization of a Discount Bond** The straight-line method yields changes in the bonds' carrying value while the amount for bond interest expense remains constant. This gives the impression of a changing interest rate when users divide a constant bond interest expense over a changing carrying value. As a result, accounting standards allow use of the straight-line method only when its results do not differ materially from those obtained using the effective interest method. The **effective interest method**, or simply *interest method*, allocates total bond interest expense over the bonds'

P5

*Appendix 14B—*Compute and record amortization of bond discount using effective interest method.

**Point:** The effective interest method computes bond interest expense using the market rate at issuance. This rate is applied to a changing carrying value.

**Point:** Contract rate determines cash interest paid, but the market rate determines the actual interest expense.

life in a way that yields a constant rate of interest. This constant rate of interest is the market rate at the issue date. Thus, bond interest expense for a period equals the carrying value of the bond at the beginning of that period multiplied by the market rate when issued.

Exhibit 14B.1 shows an effective interest amortization table for the Fila bonds (as described in Exhibit 14.4). The key difference between the effective interest and straight-line methods lies in computing bond interest expense. Instead of assigning an equal amount of bond interest expense to each period, the effective interest method assigns a bond interest expense amount that increases over the life of a discount bond. **Both methods allocate the same \$19,546 of total bond interest expense to the bonds' life, but in different patterns.** Specifically, the amortization table in Exhibit 14B.1 shows that the balance of the discount (column D) is amortized until it reaches zero. Also, the bonds' carrying value (column E) changes each period until it equals par value at maturity. Compare columns D and E to the corresponding columns in Exhibit 14.7 to see the amortization patterns. Total bond interest expense is \$19,546, consisting of \$16,000 of semiannual cash payments and \$3,546 of the original bond discount, the same for both methods.

**EXHIBIT 14B.1**

Effective Interest Amortization of Bond Discount

	A	B	C	D	E	F
1	<b>Bonds: \$100,000 Par Value, Semiannual Interest Payments, Two-Year Life,</b>					
2	<b>4% Semiannual Contract Rate, 5% Semiannual Market Rate</b>					
3		(A)	(B)	(C)	(D)	(E)
4	<b>Semiannual</b>	<b>Cash</b>	<b>Bond</b>	<b>Discount</b>	<b>Unamortized</b>	<b>Carrying</b>
5	<b>Interest</b>	<b>Interest</b>	<b>Interest</b>	<b>Amortization</b>	<b>Discount</b>	<b>Value</b>
6	<b>Period-End</b>	<b>Paid</b>	<b>Expense</b>	<b></b>	<b>Prior (D) – (C)</b>	<b>\$100,000 – (D)</b>
7		4% × \$100,000	5% × Prior (E)	(B) – (A)		
8	(0) <b>12/31/2015</b>				<b>\$3,546</b>	<b>\$ 96,454</b>
9	(1) <b>6/30/2016</b>	<b>\$4,000</b>	<b>\$4,823</b>	<b>\$ 823</b>	<b>2,723</b>	<b>97,277</b>
10	(2) 12/31/2016	4,000	4,864	864	1,859	98,141
11	(3) 6/30/2017	4,000	4,907	907	952	99,048
12	(4) 12/31/2017	4,000	4,952	952	<b>0</b>	<b>100,000</b>
13		<b>\$16,000</b>	<b>\$19,546</b>	<b>\$3,546</b>		

Column (A) is the par value (\$100,000) multiplied by the semiannual contract rate (4%).  
 Column (B) is the prior period's carrying value multiplied by the semiannual market rate (5%).  
 Column (C) is the difference between interest paid and bond interest expense, or [(B) – (A)].  
 Column (D) is the prior period's unamortized discount less the current period's discount amortization.  
 Column (E) is the par value less unamortized discount, or [\$100,000 – (D)].

Except for differences in amounts, journal entries recording the expense and updating the liability balance are the same under the effective interest method and the straight-line method. We can use the numbers in Exhibit 14B.1 to record each semiannual entry during the bonds' two-year life (June 30, 2016, through December 31, 2017). For instance, we record the interest payment at the end of the first semiannual period as follows:

Assets = Liabilities + Equity  
 -4,000 +823 -4,823

2016			
June 30	→	Bond Interest Expense .....	4,823
		Discount on Bonds Payable .....	823 ←
		Cash .....	4,000 ←
		<i>To record semiannual interest and discount amortization (effective interest method).</i>	

**P6**  
 Appendix 14B—Compute and record amortization of bond premium using effective interest method.

**Effective Interest Amortization of a Premium Bond** Exhibit 14B.2 shows the amortization table using the effective interest method for the Adidas bonds (as described in Exhibit 14.8). Column A lists the semiannual cash payments. Column B shows the amount of bond interest expense, computed as the 5% semiannual market rate at issuance multiplied by the beginning-of-period carrying value. The amount of cash paid in column A is larger than the bond interest expense because the cash payment is based on the higher 6% semiannual contract rate. The excess cash payment over the interest expense reduces the principal. These amounts are shown in column C. Column E shows the carrying

	A	B	C	D	E	F
<b>Bonds: \$100,000 Par Value, Semiannual Interest Payments, Two-Year Life, 6% Semiannual Contract Rate, 5% Semiannual Market Rate</b>						
	(A)	(B)	(C)	(D)	(E)	
<b>Semiannual Interest Period-End</b>	<b>Cash Interest Paid</b>	<b>Bond Interest Expense</b>	<b>Premium Amortization</b>	<b>Unamortized Premium</b>	<b>Carrying Value</b>	
	$6\% \times \$100,000$	$5\% \times \text{Prior (E)}$	$(A) - (B)$	$\text{Prior (D)} - (C)$	$\$100,000 + (D)$	
(0) 12/31/2015				\$3,546	\$103,546	
(1) 6/30/2016	\$6,000	\$5,177	\$ 823	2,723	102,723	
(2) 12/31/2016	6,000	5,136	864	1,859	101,859	
(3) 6/30/2017	6,000	5,093	907	952	100,952	
(4) 12/31/2017	6,000	5,048	952	0	100,000	
	\$24,000	\$20,454	\$3,546			

Column (A) is the par value (\$100,000) multiplied by the semiannual contract rate (6%).  
 Column (B) is the prior period's carrying value multiplied by the semiannual market rate (5%).  
 Column (C) is the difference between interest paid and bond interest expense, or [(A) - (B)].  
 Column (D) is the prior period's unamortized premium less the current period's premium amortization.  
 Column (E) is the par value plus unamortized premium, or [\$100,000 + (D)].

value after deducting the amortized premium in column C from the prior period's carrying value. Column D shows the premium's reduction by periodic amortization. When the issuer makes the first semiannual interest payment, the effect of premium amortization on bond interest expense and bond liability is recorded as follows:

2016			
June 30	→	Bond Interest Expense .....	5,177
		Premium on Bonds Payable .....	823 ←
	→	Cash .....	6,000
		<i>To record semiannual interest and premium amortization (effective interest method).</i>	

**EXHIBIT 14B.2**

Effective Interest Amortization of Bond Premium

Bonds Payable	
12/31/2015	100,000
6/30/2016	—
12/31/2016	—
6/30/2017	—
12/31/2017	<b>100,000</b>

Premium on Bonds Payable	
12/31/2015	3,546
6/30/2016	823
12/31/2016	864
6/30/2017	907
12/31/2017	952
12/31/2017	<b>0</b>

Assets	=	Liabilities	+	Equity
-6,000		-823		-5,177

Similar entries with different amounts are recorded at each payment date until the bond matures at the end of 2017. The effective interest method yields decreasing amounts of bond interest expense and increasing amounts of premium amortization over the bonds' life.

**IFRS**

Unlike U.S. GAAP, IFRS requires that interest expense be computed using the effective interest method with no exceptions. ■

**APPENDIX**

**Issuing Bonds between Interest Dates**

**14C**

An issuer can sell bonds at a date other than an interest payment date. When this occurs, the buyers normally pay the issuer the purchase price plus any interest accrued since the prior interest payment date. This accrued interest is then repaid to these buyers on the next interest payment date. To illustrate, suppose Avia sells \$100,000 of its 9% bonds at par on March 1, 2015, 60 days after the stated issue date. The interest on Avia bonds is payable semiannually on each June 30 and December 31. Since 60 days have passed, the issuer collects accrued interest from the buyers at the time of issuance. This amount is \$1,500 ( $\$100,000 \times 9\% \times \frac{60}{360}$  year). This case is reflected in Exhibit 14C.1.

**C3** Describe interest accrual when bond payment periods differ from accounting periods.

**EXHIBIT 14C.1**

Accruing Interest between Interest Payment Dates

Avia records the issuance of these bonds on March 1, 2015, as follows:

Assets = Liabilities + Equity
+101,500 +100,000
+1,500

Mar. 1	Cash .....	101,500	
	Interest Payable .....		1,500
	Bonds Payable .....		100,000
	<i>Sold bonds at par with accrued interest.</i>		

**Example:** How much interest is collected from a buyer of \$50,000 of Avia bonds sold at par 150 days after the contract issue date? *Answer: \$1,875 (computed as \$50,000 × 9% × <sup>150</sup>/<sub>360</sub> year)*

Liabilities for interest payable and bonds payable are recorded in separate accounts. When the June 30, 2015, semiannual interest date arrives, Avia pays the full semiannual interest of \$4,500 ( $\$100,000 \times 9\% \times \frac{1}{2}$  year) to the bondholders. This payment includes the four months' interest of \$3,000 earned by the bondholders from March 1 to June 30 *plus* the repayment of the 60 days' accrued interest collected by Avia when the bonds were sold. Avia records this first semiannual interest payment as follows:

Assets = Liabilities + Equity
-4,500 -1,500 -3,000

June 30	Interest Payable .....	1,500	
	Bond Interest Expense .....	3,000	
	Cash .....		4,500
	<i>Paid semiannual interest on the bonds.</i>		

The practice of collecting and then repaying accrued interest with the next interest payment is to simplify the issuer's administrative efforts. To explain, suppose an issuer sells bonds on 15 or 20 different dates between the stated issue date and the first interest payment date. If the issuer does not collect accrued interest from buyers, it needs to pay different amounts of cash to each of them according to the time that passed after purchasing the bonds. The issuer needs to keep detailed records of buyers and the dates they bought bonds. Issuers avoid this recordkeeping by having each buyer pay accrued interest at purchase. Issuers then pay the full semiannual interest to all buyers, regardless of when they bought bonds.

**Accruing Bond Interest Expense**

If a bond's interest period does not coincide with the issuer's accounting period, an adjusting entry is needed to recognize bond interest expense accrued since the most recent interest payment. To illustrate, assume that the stated issue date for Adidas bonds described in Exhibit 14.10 is September 1, 2015, instead of December 31, 2015, and that the bonds are sold on September 1, 2015. As a result, four months' interest (and premium amortization) accrue before the end of the 2015 calendar year. Interest for this period equals \$3,409, or  $\frac{4}{6}$  of the first six months' interest of \$5,113. Also, the premium amortization is \$591, or  $\frac{4}{6}$  of the first six months' amortization of \$887. The sum of the bond interest expense and the amortization is \$4,000 ( $\$3,409 + \$591$ ), which equals  $\frac{4}{6}$  of the \$6,000 cash payment due on February 28, 2016. Adidas records these effects with an adjusting entry at December 31, 2015.

**Point:** Computation of accrued bond interest may use months instead of days for simplicity purposes. For example, the accrued interest computation for the Adidas bonds is based on months.

Assets = Liabilities + Equity
-591 -3,409
+4,000

Dec. 31	Bond Interest Expense ( $\$5,113 \times \frac{4}{6}$ ) .....	3,409	
	Premium on Bonds Payable ( $\$887 \times \frac{4}{6}$ ) .....	591	
	Interest Payable ( $\$6,000 \times \frac{4}{6}$ ) .....		4,000
	<i>To record four months' accrued interest and premium amortization.</i>		

Similar entries are made on each December 31 throughout the bonds' two-year life. When the \$6,000 cash payment occurs on each February 28 interest payment date, Adidas must recognize bond interest expense and amortization for January and February. It must also eliminate the interest payable liability

created by the December 31 adjusting entry. For example, Adidas records its payment on February 28, 2016, as follows:

Feb. 28	Interest Payable . . . . .	4,000	
	Bond Interest Expense ( $\$5,113 \times \frac{3}{4}$ ) . . . . .	1,704	
	Premium on Bonds Payable ( $\$887 \times \frac{3}{4}$ ) . . . . .	296	
	Cash . . . . .		6,000
	<i>To record 2 months' interest and amortization, and eliminate accrued interest liability.</i>		

$$\begin{array}{rcl} \text{Assets} & = & \text{Liabilities} + \text{Equity} \\ -6,000 & & -4,000 \quad -1,704 \\ & & -296 \end{array}$$

**QC7**

The interest payments made each August 31 are recorded as usual because the entire six-month interest period is included within this company's calendar-year reporting period.

**Decision Maker**

**Bond Rater** You work for **Moody's** rating service and it's your job to assist in assigning a rating to a bond that reflects its risk to bondholders. Identify factors you consider in assessing bond risk. Indicate the likely levels (relative to the norm) for the factors you identify for a bond that sells at a discount. ■ [Answers follow the chapter's Summary.]

**APPENDIX**

# Leases and Pensions

# 14D

This appendix briefly explains the accounting and analysis for both leases and pensions.

**Lease Liabilities** A **lease** is a contractual agreement between a *lessor* (asset owner) and a *lessee* (asset renter or tenant) that grants the lessee the right to use the asset for a period of time in return for cash (rent) payments. Nearly one-fourth of all equipment purchases are financed with leases. The advantages of lease financing include the lack of an immediate large cash payment and the potential to deduct rental payments in computing taxable income. From an accounting perspective, leases can be classified as either operating or capital leases. (Lease accounting will change over the next few years, whereby operating leases are likely to be accounted for similar to capital leases . . . stay tuned!)

**C4** Describe accounting for leases and pensions.

**Operating Leases** **Operating leases** are short-term (or cancelable) leases in which the lessor retains the risks and rewards of ownership. Examples include most car and apartment rental agreements. The lessee records such lease payments as expenses; the lessor records them as revenue. The lessee does not report the leased item as an asset or a liability (it is the lessor's asset). To illustrate, if an employee of Amazon leases a car for \$300 at an airport while on company business, Amazon (lessee) records this cost as follows:

**Point:** Home Depot reports that its rental expenses from operating leases total more than \$900 million.

July 4	Rental Expense . . . . .	300	
	Cash . . . . .		300
	<i>To record lease rental payment.</i>		

$$\begin{array}{rcl} \text{Assets} & = & \text{Liabilities} + \text{Equity} \\ -300 & & -300 \end{array}$$

**Capital Leases** **Capital leases** are long-term (or noncancelable) leases by which the lessor transfers substantially all risks and rewards of ownership to the lessee.<sup>3</sup> Examples include most leases of airplanes and department store buildings. The lessee records the leased item as its own asset along with a lease liability at the start of the lease term; the amount recorded equals the present value of all lease payments. To illustrate, assume that K2 Co. enters into a six-year lease of a building in which it will sell sporting

<sup>3</sup> A *capital lease* meets any one or more of four criteria: (1) transfers title of leased asset to lessee, (2) contains a bargain purchase option, (3) has a lease term that is 75% or more of the leased asset's useful life, or (4) has a present value of lease payments that is 90% or more of the leased asset's market value.

equipment. The lease transfers all building ownership risks and rewards to K2 (the present value of its \$12,979 annual lease payments is \$60,000). K2 records this transaction as follows:

$$\begin{array}{r} \text{Assets} = \text{Liabilities} + \text{Equity} \\ +60,000 \quad +60,000 \end{array}$$

2015 Jan. 1	Leased Asset—Building . . . . .	60,000	
	Lease Liability . . . . .		60,000
	<i>To record leased asset and lease liability.</i>		

**Point:** Home Depot reports “certain locations . . . are leased under capital leases.” The net present value of this lease liability is about \$400 million.

K2 reports the leased asset as a plant asset and the lease liability as a long-term liability. The portion of the lease liability expected to be paid in the next year is reported as a current liability.<sup>4</sup> At each year-end, K2 records depreciation on the leased asset (assume straight-line depreciation, six-year lease term, no bargain purchase option, and no salvage value) as follows:

$$\begin{array}{r} \text{Assets} = \text{Liabilities} + \text{Equity} \\ -10,000 \quad -10,000 \end{array}$$

Dec. 31	Depreciation Expense—Leased Asset, Building . . . . .	10,000	
	Accumulated Depreciation—Leased Asset, Building . . . . .		10,000
	<i>To record depreciation on leased asset.</i>		

K2 also accrues interest on the lease liability at each year-end. Interest expense is computed by multiplying the remaining lease liability by the interest rate on the lease. Specifically, K2 records its annual interest expense as part of its annual lease payment (\$12,979) as follows (for its first year):

$$\begin{array}{r} \text{Assets} = \text{Liabilities} + \text{Equity} \\ -12,979 \quad -8,179 \quad -4,800 \end{array}$$

2015 Dec. 31	Interest Expense . . . . .	4,800	
	Lease Liability . . . . .	8,179	
	Cash . . . . .		12,979
	<i>To record first annual lease payment.*</i>		

\* These numbers are computed from a *lease payment schedule*. For simplicity, we use the same numbers from Exhibit 14.14 for this lease payment schedule—with different headings as follows:

Period Ending Date	(A) Beginning Balance of Lease Liability	Payments			(E) Ending Balance of Lease Liability (A) – (C)
		(B) Debit Interest on Lease Liability 8% × (A)	(C) Debit Lease Liability (D) – (B)	(D) Credit Cash Lease Payment	
12/31/2015 . . . . .	\$60,000	\$ 4,800	\$ 8,179	\$12,979	\$51,821
12/31/2016 . . . . .	51,821	4,146	8,833	12,979	42,988
12/31/2017 . . . . .	42,988	3,439	9,540	12,979	33,448
12/31/2018 . . . . .	33,448	2,676	10,303	12,979	23,145
12/31/2019 . . . . .	23,145	1,852	11,127	12,979	12,018
12/31/2020 . . . . .	12,018	961	12,018	12,979	0
		<u>\$17,874</u>	<u>\$60,000</u>	<u>\$77,874</u>	

**Point:** Fringe benefits are often 40% or more of salaries and wages, and pension benefits make up nearly 15% of fringe benefits.

**Pension Liabilities** A **pension plan** is a contractual agreement between an employer and its employees for the employer to provide benefits (payments) to employees after they retire. Most employers pay the full cost of the pension, but sometimes employees pay part of the cost. An employer records its payment into a pension plan with a debit to Pension Expense and a credit to Cash. A *plan administrator* receives payments from the employer, invests them in pension assets, and makes benefit payments to *pension recipients* (retired employees). Insurance and trust companies often serve as pension plan administrators.

**Point:** Two types of pension plans are (1) *defined benefit plan*—the retirement benefit is defined and the employer estimates the contribution necessary to pay these benefits—and (2) *defined contribution plan*—the pension contribution is defined and the employer and/or employee contributes amounts specified in the pension agreement.

Many pensions are known as *defined benefit plans* that define future benefits; the employer’s contributions vary, depending on assumptions about future pension assets and liabilities. Several disclosures are necessary in this case. Specifically, a pension liability is reported when the accumulated benefit obligation is *more than* the plan assets, a so-called *underfunded plan*. The accumulated benefit obligation is the present value of promised future pension payments to retirees. *Plan assets* refer to the market value of assets the plan

<sup>4</sup> Most lessees try to keep leased assets and lease liabilities off their balance sheets by failing to meet any one of the four criteria of a capital lease. This is because a lease liability increases a company’s total liabilities, making it more difficult to obtain additional financing. The acquisition of assets without reporting any related liabilities (or other asset outflows) on the balance sheet is called **off-balance-sheet financing**.

administrator holds. A pension asset is reported when the accumulated benefit obligation is *less than* the plan assets, a so-called *overfunded plan*. An employer reports pension expense when it receives the benefits from the employees' services, which is sometimes decades before it pays pension benefits to employees. (*Other Postretirement Benefits* refer to nonpension benefits such as health care and life insurance benefits. Similar to a pension, costs of these benefits are estimated and liabilities accrued when the employees earn them.)

## Summary

- C1 Explain the types of notes and prepare entries to account for notes.** Notes repaid over a period of time are called *installment notes* and usually follow one of two payment patterns: (1) decreasing payments of interest plus equal amounts of principal or (2) equal total payments. Mortgage notes also are common. Interest is allocated to each period in a note's life by multiplying its beginning-period carrying value by its market rate at issuance. If a note is repaid with equal payments, the payment amount is computed by dividing the borrowed amount by the present value of an annuity factor (taken from a present value table) using the market rate and the number of payments.
- C2<sup>A</sup> Explain and compute the present value of an amount(s) to be paid at a future date(s).** The basic concept of present value is that an amount of cash to be paid or received in the future is worth less than the same amount of cash to be paid or received today. Another important present value concept is that interest is compounded, meaning interest is added to the balance and used to determine interest for succeeding periods. An annuity is a series of equal payments occurring at equal time intervals. An annuity's present value can be computed using the present value table for an annuity (or a calculator).
- C3<sup>C</sup> Describe interest accrual when bond payment periods differ from accounting periods.** Issuers and buyers of debt record the interest accrued when issue dates or accounting periods do not coincide with debt payment dates.
- C4<sup>D</sup> Describe accounting for leases and pensions.** A lease is a rental agreement between the lessor and the lessee. When the lessor retains the risks and rewards of asset ownership (an *operating lease*), the lessee debits Rent Expense and credits Cash for its lease payments. When the lessor substantially transfers the risks and rewards of asset ownership to the lessee (a *capital lease*), the lessee capitalizes the leased asset and records a lease liability. Pension agreements can result in either pension assets or pension liabilities.
- A1 Compare bond financing with stock financing.** Bond financing is used to fund business activities. Advantages of bond financing versus stock include (1) no effect on owner control, (2) tax savings, and (3) increased earnings due to financial leverage. Disadvantages include (1) interest and principal payments and (2) amplification of poor performance.
- A2 Assess debt features and their implications.** Certain bonds are secured by the issuer's assets; other bonds, called *debentures*, are unsecured. Serial bonds mature at different points in time; term bonds mature at one time. Registered bonds have each bondholder's name recorded by the issuer; bearer bonds are payable to the holder. Convertible bonds are exchangeable for shares of the issuer's stock. Callable bonds can be retired by the issuer at a set price. Debt features alter the risk of loss for creditors.
- A3 Compute the debt-to-equity ratio and explain its use.** Both creditors and equity holders are concerned about the relation between the amount of liabilities and the amount of equity. A company's financing structure is at less risk when the debt-to-equity ratio is lower, as liabilities must be paid and usually with periodic interest.
- P1 Prepare entries to record bond issuance and interest expense.** When bonds are issued at par, Cash is debited and Bonds Payable is credited for the bonds' par value. At bond interest payment dates (usually semiannual), Bond Interest Expense is debited and Cash credited—the latter for an amount equal to the bond par value multiplied by the bond contract rate.
- P2 Compute and record amortization of bond discount using straight-line method.** Bonds are issued at a discount when the contract rate is less than the market rate, making the issue (selling) price less than par. When this occurs, the issuer records a credit to Bonds Payable (at par) and debits both Discount on Bonds Payable and Cash. The amount of bond interest expense assigned to each period is computed using the straight-line method.
- P3 Compute and record amortization of bond premium using straight-line method.** Bonds are issued at a premium when the contract rate is higher than the market rate, making the issue (selling) price greater than par. When this occurs, the issuer records a debit to Cash and credits both Premium on Bonds Payable and Bonds Payable (at par). The amount of bond interest expense assigned to each period is computed using the straight-line method. The Premium on Bonds Payable is allocated to reduce bond interest expense over the life of the bonds.
- P4 Record the retirement of bonds.** Bonds are retired at maturity with a debit to Bonds Payable and a credit to Cash at par value. The issuer can retire the bonds early by exercising a call option or purchasing them in the market. Bondholders can also retire bonds early by exercising a conversion feature on convertible bonds. The issuer recognizes a gain or loss for the difference between the amount paid and the bond carrying value.
- P5<sup>B</sup> Compute and record amortization of bond discount using effective interest method.** Bonds are issued at a discount when the contract rate is less than the market rate, making the issue (selling) price less than par. The amount of bond interest expense assigned to each period, including amortization of the discount, is computed using the effective interest method.
- P6<sup>B</sup> Compute and record amortization of bond premium using effective interest method.** Bonds are issued at a premium when the contract rate is higher than the market rate, making the issue (selling) price greater than par. The amount of bond interest expense assigned to each period, including amortization of the premium, is computed using the effective interest method.

## Guidance Answers to Decision Maker

**Entrepreneur** This is a “present value” question. The market interest rate (10%) and present value (\$3,000) are known, but the payment required two years later is unknown. This amount (\$3,630) can be computed as  $\$3,000 \times 1.10 \times 1.10$ . Thus, the sale price is \$3,630 when no payments are received for two years. The \$3,630 received two years from today is equivalent to \$3,000 cash today.

**Bond Investor** The debt-to-equity ratio for the first company is 0.2 ( $\$350,000/\$1,750,000$ ) and for the second company is 1.2 ( $\$1,200,000/\$1,000,000$ ), suggesting that the financing structure

of the second company is more risky than that of the first company. Consequently, as a buyer of unsecured debenture bonds, you prefer the first company (all else equal).

**Bond Rater** Bonds with longer repayment periods (life) have higher risk. Also, bonds issued by companies in financial difficulties or facing higher than normal uncertainties have higher risk. Moreover, companies with higher than normal debt and large fluctuations in earnings are considered to be higher risk. Discount bonds are more risky on one or more of these factors.

## Key Terms

Annuity	Debt-to-equity ratio	Pension plan
Bearer bonds	Discount on bonds payable	Premium on bonds
Bond	Effective interest method	Registered bonds
Bond certificate	Fair value option	Secured bonds
Bond indenture	Installment note	Serial bonds
Callable bonds	Lease	Sinking fund bonds
Capital leases	Market rate	Straight-line bond amortization
Carrying (book) value of bonds	Mortgage	Term bonds
Contract rate	Off-balance-sheet financing	Unsecured bonds
Convertible bonds	Operating leases	
Coupon bonds	Par value of a bond	

## Multiple Choice Quiz

Answers at end of chapter

- A bond traded at 97½ means that
  - The bond pays 97½% interest.
  - The bond trades at \$975 per \$1,000 bond.
  - The market rate of interest is below the contract rate of interest for the bond.
  - The bonds can be retired at \$975 each.
  - The bond's interest rate is 2½%.
- A bondholder that owns a \$1,000, 6%, 15-year bond has
  - The right to receive \$1,000 at maturity.
  - Ownership rights in the bond-issuing entity.
  - The right to receive \$60 per month until maturity.
  - The right to receive \$1,900 at maturity.
  - The right to receive \$600 per year until maturity.
- A company issues 8%, 20-year bonds with a par value of \$500,000. The current market rate for the bonds is 8%. The amount of interest owed to the bondholders for each semi-annual interest payment is
  - \$40,000
  - \$0
  - \$20,000
  - \$800,000
  - \$400,000
- A company issued five-year, 5% bonds with a par value of \$100,000. The company received \$95,735 for the bonds. Using the straight-line method, the company's interest expense for the first semiannual interest period is
  - \$2,926.50
  - \$5,853.00
  - \$2,500.00
  - \$5,000.00
  - \$9,573.50
- A company issued eight-year, 5% bonds with a par value of \$350,000. The company received proceeds of \$373,745. Interest is payable semiannually. The amount of premium amortized for the first semiannual interest period, assuming straight-line bond amortization, is
  - \$2,698
  - \$23,745
  - \$8,750
  - \$9,344
  - \$1,484

B(C,D) *Superscript letter B(C, D) denotes assignments based on Appendix 14B(14C, 14D).*

 *Icon denotes assignments that involve decision making.*

## Discussion Questions

1. What is the main difference between notes payable and bonds payable?
2. What is the main difference between a bond and a share of stock?
3.  What is the advantage of issuing bonds instead of obtaining financing from the company's owners?
4. What is a bond indenture? What provisions are usually included in it?
5. What are the duties of a trustee for bondholders?
6. What are the *contract* rate and the *market* rate for bonds?
7.  What factors affect the market rates for bonds?
- 8<sup>B</sup>  Does the straight-line or effective interest method produce an interest expense allocation that yields a constant rate of interest over a bond's life? Explain.
- 9<sup>C</sup> Why does a company that issues bonds between interest dates collect accrued interest from the bonds' purchasers?
10.  If you know the par value of bonds, the contract rate, and the market rate, how do you compute the bonds' price?
11. What is the issue price of a \$2,000 bond sold at 98¼? What is the issue price of a \$6,000 bond sold at 101½?
12. Describe the debt-to-equity ratio and explain how creditors and owners would use this ratio to evaluate a company's risk.
13.  What obligation does an entrepreneur (owner) have to investors that purchase bonds to finance the business?
14. Refer to **Apple**'s annual report in Appendix A. Is there any indication that Apple has issued long-term debt? **APPLE**
15. By what amount did **Samsung**'s long-term borrowings increase or decrease in 2013? **Samsung**
16. Refer to the statement of cash flows for **Samsung** in Appendix A. For the year ended December 31, 2013, what was the amount for repayment of long-term borrowings and debentures? **Samsung**
17. Refer to the statements for **Google** in Appendix A. For the year ended December 31, 2013, what is its debt-to-equity ratio? What does this ratio tell us? **GOOGLE**
- 18<sup>P</sup> When can a lease create both an asset and a liability for the lessee?
- 19<sup>P</sup> Compare and contrast an operating lease with a capital lease.
- 20<sup>P</sup> Describe the two basic types of pension plans.

Round dollar amounts to the nearest whole dollar.

Identify the following as either an advantage (A) or a disadvantage (D) of bond financing.

- \_\_\_ a. Bonds do not affect owner control.
- \_\_\_ b. A company earns a lower return with borrowed funds than it pays in interest.
- \_\_\_ c. A company earns a higher return with borrowed funds than it pays in interest.
- \_\_\_ d. Bonds require payment of periodic interest.
- \_\_\_ e. Interest on bonds is tax deductible.
- \_\_\_ f. Bonds require payment of par value at maturity.

## QUICK STUDY

### QS 14-1

Bond financing

A1

Enviro Company issues 8%, 10-year bonds with a par value of \$250,000 and semiannual interest payments. On the issue date, the annual market rate for these bonds is 10%, which implies a selling price of 87½. Prepare the journal entries for the issuance of the bonds. Assume the bonds are issued for cash on January 1, 2015.

### QS 14-2

Journalize bond issuance

P1

Using the bond details in QS 14-2, confirm that the bonds' selling price is approximately correct (within \$100). Use the present value tables B.1 and B.3 in Appendix B.

### QS 14-3

Computing bond price

P1

Garcia Company issues 10%, 15-year bonds with a par value of \$240,000 and semiannual interest payments. On the issue date, the annual market rate for these bonds is 8%, which implies a selling price of 117¼. Prepare the journal entry for the issuance of these bonds. Assume the bonds are issued for cash on January 1, 2015.

### QS 14-4

Journalize bond issuance

P1

**QS 14-5**

Computing bond price

Using the bond details in QS 14-4, confirm that the bonds' selling price is approximately correct (within \$100). Use the present value tables B.1 and B.3 in Appendix B.

P1

**QS 14-6****Straight-Line:** Bond computations

Enviro Company issues 8%, 10-year bonds with a par value of \$250,000 and semiannual interest payments. On the issue date, the annual market rate for these bonds is 10%, which implies a selling price of 87½. The straight-line method is used to allocate interest expense.

P2

1. What are the issuer's cash proceeds from issuance of these bonds?
2. What total amount of bond interest expense will be recognized over the life of these bonds?
3. What is the amount of bond interest expense recorded on the first interest payment date?

**QS 14-7**

Recording bond issuance and discount amortization

Sylvester Company issues 10%, five-year bonds, on December 31, 2014, with a par value of \$100,000 and semiannual interest payments. Use the following bond amortization table and prepare journal entries to record (a) the issuance of bonds on December 31, 2014; (b) the first interest payment on June 30, 2015; and (c) the second interest payment on December 31, 2015.

P1 P2

Semiannual Period-End		Unamortized Discount	Carrying Value
(0)	12/31/2014 .....	\$7,360	\$92,640
(1)	6/30/2015 .....	6,624	93,376
(2)	12/31/2015 .....	5,888	94,112

**QS 14-8****Straight-Line:** Bond computations

Enviro Company issues 8%, 10-year bonds with a par value of \$250,000 and semiannual interest payments. On the issue date, the annual market rate for these bonds is 5%, which implies a selling price of 123%. The straight-line method is used to allocate interest expense.

P3

1. What are the issuer's cash proceeds from issuance of these bonds?
2. What total amount of bond interest expense will be recognized over the life of these bonds?
3. What is the amount of bond interest expense recorded on the first interest payment date?

**QS 14-9**

Bond retirement by call option P4

On July 1, 2015, Advocate Company exercises an \$8,000 call option (plus par value) on its outstanding bonds that have a carrying value of \$416,000 and par value of \$400,000. The company exercises the call option after the semiannual interest is paid on June 30, 2015. Record the entry to retire the bonds.

**QS 14-10**

Bond retirement by stock conversion P4

On January 1, 2015, the \$2,000,000 par value bonds of Spitz Company with a carrying value of \$2,000,000 are converted to 1,000,000 shares of \$1.00 par value common stock. Record the entry for the conversion of the bonds.

**QS 14-11**

Computing payments for an installment note C1

Murray Company borrows \$340,000 cash from a bank and in return signs an installment note for five annual payments of equal amount, with the first payment due one year after the note is signed. Use Table B.3 in Appendix B to compute the amount of the annual payment for each of the following annual market rates: (a) 4%, (b) 8%, and (c) 12%.

**QS 14-12**

Bond features and terminology

A2

Enter the letter of the description *A* through *H* that best fits each term or phrase 1 through 8.

- Records and tracks the bondholders' names.
  - Is unsecured; backed only by the issuer's credit standing.
  - Has varying maturity dates for amounts owed.
  - Identifies rights and responsibilities of the issuer and the bondholders.
  - Can be exchanged for shares of the issuer's stock.
  - Is unregistered; interest is paid to whoever possesses them.
  - Maintains a separate asset account from which bondholders are paid at maturity.
  - Pledges specific assets of the issuer as collateral.
- \_\_\_\_\_ Registered bond
  - \_\_\_\_\_ Serial bond
  - \_\_\_\_\_ Secured bond
  - \_\_\_\_\_ Bearer bond
  - \_\_\_\_\_ Convertible bond
  - \_\_\_\_\_ Bond indenture
  - \_\_\_\_\_ Sinking fund bond
  - \_\_\_\_\_ Debenture

Compute the debt-to-equity ratio for each of the following companies. Which company appears to have a riskier financing structure? Explain.

	Atlanta Company	Spokane Company
Total liabilities . . . . .	\$429,000	\$ 549,000
Total equity . . . . .	572,000	1,830,000

**QS 14-13**  
Debt-to-equity ratio  
**A3** 

Garcia Company issues 10%, 15-year bonds with a par value of \$240,000 and semiannual interest payments. On the issue date, the annual market rate for these bonds is 14%, which implies a selling price of 75¼. The effective interest method is used to allocate interest expense.

1. What are the issuer’s cash proceeds from issuance of these bonds?
2. What total amount of bond interest expense will be recognized over the life of these bonds?
3. What amount of bond interest expense is recorded on the first interest payment date?

**QS 14-14<sup>B</sup>**  
**Effective Interest:**  
Bond discount computations  
**P5**

Garcia Company issues 10%, 15-year bonds with a par value of \$240,000 and semiannual interest payments. On the issue date, the annual market rate for these bonds is 8%, which implies a selling price of 117¼. The effective interest method is used to allocate interest expense.

1. What are the issuer’s cash proceeds from issuance of these bonds?
2. What total amount of bond interest expense will be recognized over the life of these bonds?
3. What amount of bond interest expense is recorded on the first interest payment date?

**QS 14-15<sup>B</sup>**  
**Effective Interest:**  
Bond premium computations  
**P6**

Madrid Company plans to issue 8% bonds on January 1, 2015, with a par value of \$4,000,000. The company sells \$3,600,000 of the bonds on January 1, 2015. The remaining \$400,000 sells at par on March 1, 2015. The bonds pay interest semiannually as of June 30 and December 31. Record the entry for the March 1 cash sale of bonds.

**QS 14-16<sup>C</sup>**  
Issuing bonds between interest dates **C3**

Jin Li, an employee of ETrain.com, leases a car at O’Hare airport for a three-day business trip. The rental cost is \$250. Prepare the entry by ETrain.com to record Jin Li’s short-term car lease cost.

**QS 14-17<sup>D</sup>**  
Recording operating leases **C4**

Algoma, Inc., signs a five-year lease for office equipment with Office Solutions. The present value of the lease payments is \$15,499. Prepare the journal entry that Algoma records at the inception of this capital lease.

**QS 14-18<sup>D</sup>**  
Recording capital leases **C4**

**Vodafone Group Plc** reports the following information among its bonds payable as of March 31, 2013 (pounds in millions).

Financial Long-Term Liabilities Measured at Amortized Cost			
(£ millions)	Nominal (par) Value	Carrying Value	Fair Value
4.625% (US dollar 500 million) bond due July 2018. . . . .	£313	£367	£354

**QS 14-19**  
International liabilities disclosures  
**P1** 

- a. What is the par value of the 4.625% bond issuance? What is its book (carrying) value?
- b. Was the 4.625% bond sold at a discount or a premium? Explain.

Refer to the information in QS 14-19 for **Vodafone Group Plc**. The following price quotes (from Yahoo! Finance Bond Center) relate to its bonds payable. The price quote indicates that the 4.625% bonds have a market price of 111.67 (111.67% of par value), resulting in a yield to maturity of 1.710%.

Price	Contract Rate (coupon)	Maturity Date	Market Rate (YTM)
111.67 . . . . .	4.625%	15-Jul-2018	1.710%

**QS 14-20**  
International liabilities disclosures and interpretations  
**P1** 

- a. Assuming that the 4.625% bonds were originally issued at par value, what does the market price reveal about interest rate changes since bond issuance? (Assume that Vodafone’s credit rating has remained the same.)
- b. Does the change in market rates since the issuance of these bonds affect the amount of interest expense reported on Vodafone’s income statement? Explain.
- c. How much cash would Vodafone need to pay to repurchase the 4.625% bonds at the quoted market price of 111.67? (Assume no interest is owed when the bonds are repurchased.)
- d. Assuming that the 4.625% bonds remain outstanding until maturity, at what market price will the bonds sell on the due date in 2018?

**EXERCISES**

Round dollar amounts to the nearest whole dollar. Assume no reversing entries are used.

**Exercise 14-1**

Recording bond issuance and interest

P1

On January 1, 2015, Boston Enterprises issues bonds that have a \$3,400,000 par value, mature in 20 years, and pay 9% interest semiannually on June 30 and December 31. The bonds are sold at par.

- 1. How much interest will Boston pay (in cash) to the bondholders every six months?
- 2. Prepare journal entries to record (a) the issuance of bonds on January 1, 2015; (b) the first interest payment on June 30, 2015; and (c) the second interest payment on December 31, 2015.
- 3. Prepare the journal entry for issuance assuming the bonds are issued at (a) 98 and (b) 102.

**Exercise 14-2**

**Straight-Line:**  
Amortization of bond discount

P2

Tano issues bonds with a par value of \$180,000 on January 1, 2015. The bonds’ annual contract rate is 8%, and interest is paid semiannually on June 30 and December 31. The bonds mature in three years. The annual market rate at the date of issuance is 10%, and the bonds are sold for \$170,862.

- 1. What is the amount of the discount on these bonds at issuance?
- 2. How much total bond interest expense will be recognized over the life of these bonds?
- 3. Prepare an amortization table like the one in Exhibit 14.7 for these bonds; use the straight-line method to amortize the discount.

**Exercise 14-3**

Computing bond interest and price; recording bond issuance

P2

Bringham Company issues bonds with a par value of \$800,000 on their stated issue date. The bonds mature in 10 years and pay 6% annual interest in semiannual payments. On the issue date, the annual market rate for the bonds is 8%.

- 1. What is the amount of each semiannual interest payment for these bonds?
- 2. How many semiannual interest payments will be made on these bonds over their life?
- 3. Use the interest rates given to determine whether the bonds are issued at par, at a discount, or at a premium.
- 4. Compute the price of the bonds as of their issue date.
- 5. Prepare the journal entry to record the bonds’ issuance.

**Check** (4) \$691,287

**Exercise 14-4**

**Straight-Line:**  
Recording bond issuance and discount amortization

P1 P2

Paulson Company issues 6%, four-year bonds, on December 31, 2015, with a par value of \$200,000 and semiannual interest payments. Use the following bond amortization table and prepare journal entries to record (a) the issuance of bonds on December 31, 2015; (b) the first interest payment on June 30, 2016; and (c) the second interest payment on December 31, 2016.

Semiannual Period-End	Unamortized Discount	Carrying Value
(0) 12/31/2015 .....	\$13,466	\$186,534
(1) 6/30/2016 .....	11,782	188,218
(2) 12/31/2016 .....	10,098	189,902

**Exercise 14-5**

**Straight-Line:** Recording bond issuance and discount amortization

P1 P2

Dobbs Company issues 5%, two-year bonds, on December 31, 2015, with a par value of \$200,000 and semiannual interest payments. Use the following bond amortization table and prepare journal entries to record (a) the issuance of bonds on December 31, 2015; (b) the first through fourth interest payments on each June 30 and December 31; and (c) the maturity of the bond on December 31, 2017.

Semiannual Period-End	Unamortized Discount	Carrying Value
(0) 12/31/2015 .....	\$12,000	\$188,000
(1) 6/30/2016 .....	9,000	191,000
(2) 12/31/2016 .....	6,000	194,000
(3) 6/30/2017 .....	3,000	197,000
(4) 12/31/2017 .....	0	200,000

Woodwick Company issues 10%, five-year bonds, on December 31, 2014, with a par value of \$200,000 and semiannual interest payments. Use the following bond amortization table and prepare journal entries to record (a) the issuance of bonds on December 31, 2014; (b) the first interest payment on June 30, 2015; and (c) the second interest payment on December 31, 2015.

Semiannual Period-End	Unamortized Premium	Carrying Value
(0) 12/31/2014 .....	\$16,222	\$216,222
(1) 6/30/2015 .....	14,600	214,600
(2) 12/31/2015 .....	12,978	212,978

**Exercise 14-6****Straight-Line:**

Recording bond issuance and premium amortization

P1 P3

Quatro Co. issues bonds dated January 1, 2015, with a par value of \$400,000. The bonds' annual contract rate is 13%, and interest is paid semiannually on June 30 and December 31. The bonds mature in three years. The annual market rate at the date of issuance is 12%, and the bonds are sold for \$409,850.

1. What is the amount of the premium on these bonds at issuance?
2. How much total bond interest expense will be recognized over the life of these bonds?
3. Prepare an amortization table like the one in Exhibit 14.11 for these bonds; use the straight-line method to amortize the premium.

**Exercise 14-7****Straight-Line:**

Amortization of bond premium

P3

Citywide Company issues bonds with a par value of \$150,000 on their stated issue date. The bonds mature in five years and pay 10% annual interest in semiannual payments. On the issue date, the annual market rate for the bonds is 8%.

1. What is the amount of each semiannual interest payment for these bonds?
2. How many semiannual interest payments will be made on these bonds over their life?
3. Use the interest rates given to determine whether the bonds are issued at par, at a discount, or at a premium.
4. Compute the price of the bonds as of their issue date.
5. Prepare the journal entry to record the bonds' issuance.

**Exercise 14-8**

Computing bond interest and price; recording bond issuance

P3

Check (4) \$162,172

On January 1, 2015, Shay issues \$700,000 of 10%, 15-year bonds at a price of 97½. Six years later, on January 1, 2021, Shay retires 20% of these bonds by buying them on the open market at 104½. All interest is accounted for and paid through December 31, 2020, the day before the purchase. The straight-line method is used to amortize any bond discount.

1. How much does the company receive when it issues the bonds on January 1, 2015?
2. What is the amount of the discount on the bonds at January 1, 2015?
3. How much amortization of the discount is recorded on the bonds for the entire period from January 1, 2015, through December 31, 2020?
4. What is the carrying (book) value of the bonds as of the close of business on December 31, 2020? What is the carrying value of the 20% soon-to-be-retired bonds on this same date?
5. How much did the company pay on January 1, 2021, to purchase the bonds that it retired?
6. What is the amount of the recorded gain or loss from retiring the bonds?
7. Prepare the journal entry to record the bond retirement at January 1, 2021.

**Exercise 14-9**

**Straight-Line:** Bond computations, amortization, and bond retirement

P4 P2

Check (6) \$8,190 loss

On January 1, 2015, Eagle borrows \$100,000 cash by signing a four-year, 7% installment note. The note requires four equal total payments of accrued interest and principal on December 31 of each year from 2015 through 2018.

1. Compute the amount of each of the four equal total payments.
2. Prepare an amortization table for this installment note like the one in Exhibit 14.14.

**Exercise 14-10**

Installment note with equal total payments

Check (1) \$29,523

C1

**Exercise 14-11**

Installment note entries

Use the information in Exercise 14-10 to prepare the journal entries for Eagle to record the loan on January 1, 2015, and the four payments from December 31, 2015, through December 31, 2018.

C1

**Exercise 14-12**

Applying debt-to-equity ratio

Montclair Company is considering a project that will require a \$500,000 loan. It presently has total liabilities of \$220,000 and total assets of \$620,000.

1. Compute Montclair's (a) present debt-to-equity ratio and (b) the debt-to-equity ratio assuming it borrows \$500,000 to fund the project.
2. Evaluate and discuss the level of risk involved if Montclair borrows the funds to pursue the project.

A3

**Exercise 14-13<sup>B</sup>****Effective Interest:**

Amortization of bond discount

Stanford issues bonds dated January 1, 2015, with a par value of \$500,000. The bonds' annual contract rate is 9%, and interest is paid semiannually on June 30 and December 31. The bonds mature in three years. The annual market rate at the date of issuance is 12%, and the bonds are sold for \$463,140.

1. What is the amount of the discount on these bonds at issuance?
2. How much total bond interest expense will be recognized over the life of these bonds?
3. Prepare an amortization table like the one in Exhibit 14B.1 for these bonds; use the effective interest method to amortize the discount.

P5

**Exercise 14-14<sup>B</sup>****Effective Interest:**

Amortization of bond premium

Quatro Co. issues bonds dated January 1, 2015, with a par value of \$400,000. The bonds' annual contract rate is 13%, and interest is paid semiannually on June 30 and December 31. The bonds mature in three years. The annual market rate at the date of issuance is 12%, and the bonds are sold for \$409,850.

1. What is the amount of the premium on these bonds at issuance?
2. How much total bond interest expense will be recognized over the life of these bonds?
3. Prepare an amortization table like the one in Exhibit 14B.2 for these bonds; use the effective interest method to amortize the premium.

P6

**Exercise 14-15****Straight-Line:**

Amortization and accrued bond interest expense

Duval Co. issues four-year bonds with a \$100,000 par value on June 1, 2015, at a price of \$95,948. The annual contract rate is 7%, and interest is paid semiannually on November 30 and May 31.

1. Prepare an amortization table like the one in Exhibit 14.7 for these bonds. Use the straight-line method of interest amortization.
2. Prepare journal entries to record the first two interest payments and to accrue interest as of December 31, 2015.

C3 P2

**Exercise 14-16<sup>C</sup>**

Recording bond issuance with accrued interest

On May 1, 2015, Brussels Enterprises issues bonds dated January 1, 2015, that have a \$3,400,000 par value, mature in 20 years, and pay 9% interest semiannually on June 30 and December 31. The bonds are sold at par plus four months' accrued interest.

1. How much accrued interest do the bond purchasers pay Brussels on May 1, 2015?
2. Prepare Brussels' journal entries to record (a) the issuance of bonds on May 1, 2015; (b) the first interest payment on June 30, 2015; and (c) the second interest payment on December 31, 2015.

C3 P1

**Check** (1) \$102,000**Exercise 14-17<sup>D</sup>**

Identifying capital and operating leases

Indicate whether the company in each separate case 1 through 3 has entered into an operating lease or a capital lease.

1. The lessor retains title to the asset, and the lease term is three years on an asset that has a five-year useful life.
2. The title is transferred to the lessee, the lessee can purchase the asset for \$1 at the end of the lease, and the lease term is five years. The leased asset has an expected useful life of six years.
3. The present value of the lease payments is 95% of the leased asset's market value, and the lease term is 70% of the leased asset's useful life.

C4

**Exercise 14-18<sup>D</sup>**

Accounting for capital lease

Harbor (lessee) signs a five-year capital lease for office equipment with a \$10,000 annual lease payment. The present value of the five annual lease payments is \$41,000, based on a 7% interest rate.

1. Prepare the journal entry Harbor will record at inception of the lease.
2. If the leased asset has a five-year useful life with no salvage value, prepare the journal entry Harbor will record each year to recognize depreciation expense related to the leased asset.

C4

**General Motors** advertised three alternatives for a 25-month lease on a new Tahoe: (1) zero dollars down and a lease payment of \$1,750 per month for 25 months, (2) \$5,000 down and \$1,500 per month for 25 months, or (3) \$38,500 down and no payments for 25 months. Use the present value Table B.3 in Appendix B to determine which is the best alternative for the customer (assume you have enough cash to accept any alternative and the annual interest rate is 12% compounded monthly).

**Exercise 14-19<sup>P</sup>**  
Analyzing lease options  
C4

**Heineken N.V.** reports the following information for its loans and borrowings as of December 31, 2013, including proceeds and repayments for the year ended December 31, 2013 (euros in millions).

Loans and borrowings (noncurrent liabilities)	
Loans and borrowings, December 31, 2013 . . . . .	€ 9,112
Proceeds (cash) from issuances of loans and borrowings . . . . .	1,663
Repayments (in cash) of loans and borrowings . . . . .	(2,474)

**Exercise 14-20**  
Accounting for long-term liabilities under IFRS

1. Prepare Heineken's journal entry to record its cash proceeds from issuances of its loans and borrowings for 2013. Assume that the par value of these issuances is €1,700.
2. Prepare Heineken's journal entry to record its cash repayments of its loans and borrowings for 2013. Assume that the par value of these issuances is €2,400, and the premium on them is €24.
3. Compute the discount or premium on its loans and borrowings as of December 31, 2013, assuming that the par value of these liabilities is €9,000.
4. Given the facts in part 3 and viewing the entirety of loans and borrowings as one issuance, was the contract rate on these loans and borrowings higher or lower than the market rate at the time of issuance? Explain. (Assume that Heineken's credit rating has remained the same.)

Round dollar amounts to the nearest whole dollar. Assume no reversing entries are used.

Hartford Research issues bonds dated January 1, 2015, that pay interest semiannually on June 30 and December 31. The bonds have a \$40,000 par value and an annual contract rate of 10%, and they mature in 10 years.

#### Required

For each of the following three separate situations, (a) determine the bonds' issue price on January 1, 2015, and (b) prepare the journal entry to record their issuance.

1. The market rate at the date of issuance is 8%.
2. The market rate at the date of issuance is 10%.
3. The market rate at the date of issuance is 12%.

### PROBLEM SET A

**Problem 14-1A**  
Computing bond price and recording issuance  
P1

**Check** (1) Premium, \$5,437

(3) Discount, \$4,588

Hillside issues \$4,000,000 of 6%, 15-year bonds dated January 1, 2015, that pay interest semiannually on June 30 and December 31. The bonds are issued at a price of \$3,456,448.

#### Required

1. Prepare the January 1, 2015, journal entry to record the bonds' issuance.
2. For each semiannual period, compute (a) the cash payment, (b) the straight-line discount amortization, and (c) the bond interest expense.
3. Determine the total bond interest expense to be recognized over the bonds' life.
4. Prepare the first two years of an amortization table like Exhibit 14.7 using the straight-line method.
5. Prepare the journal entries to record the first two interest payments.

**Problem 14-2A**  
**Straight-Line:**  
Amortization of bond discount  
P1 P2

**Check** (3) \$4,143,552  
(4) 12/31/2016  
carrying value, \$3,528,920

Refer to the bond details in Problem 14-2A, *except* assume that the bonds are issued at a price of \$4,895,980.

#### Required

1. Prepare the January 1, 2015, journal entry to record the bonds' issuance.
2. For each semiannual period, compute (a) the cash payment, (b) the straight-line premium amortization, and (c) the bond interest expense.

[continued on next page]

**Problem 14-3A**  
**Straight Line:**  
Amortization of bond premium  
P1 P3

**Check** (3) \$2,704,020  
(4) 12/31/2016  
carrying value, \$4,776,516

- Determine the total bond interest expense to be recognized over the bonds' life.
- Prepare the first two years of an amortization table like Exhibit 14.11 using the straight-line method.
- Prepare the journal entries to record the first two interest payments.

**Problem 14-4A****Straight-Line:**

Amortization of bond premium P1 P3

Ellis issues 6.5%, five-year bonds dated January 1, 2015, with a \$250,000 par value. The bonds pay interest on June 30 and December 31 and are issued at a price of \$255,333. The annual market rate is 6% on the issue date.

**Required**

- Calculate the total bond interest expense over the bonds' life.
- Prepare a straight-line amortization table like Exhibit 14.11 for the bonds' life.
- Prepare the journal entries to record the first two interest payments.

**Check** (2) 6/30/2017  
carrying value, \$252,668

**Problem 14-5A****Straight-Line:**

Amortization of bond premium and discount

P1 P2 P3

**Check** (2) \$97,819  
(3) 12/31/2016  
carrying value, \$308,589

Legacy issues \$325,000 of 5%, four-year bonds dated January 1, 2015, that pay interest semiannually on June 30 and December 31. They are issued at \$292,181 and their market rate is 8% at the issue date.

**Required**

- Prepare the January 1, 2015, journal entry to record the bonds' issuance.
- Determine the total bond interest expense to be recognized over the bonds' life.
- Prepare a straight-line amortization table like the one in Exhibit 14.7 for the bonds' first two years.
- Prepare the journal entries to record the first two interest payments.

**Analysis Component**

- Assume the market rate on January 1, 2015, is 4% instead of 8%. Without providing numbers, describe how this change affects the amounts reported on Legacy's financial statements.

**Problem 14-6A**

Installment notes

C1

**Check** (2) 10/31/2019  
ending balance, \$46,382

On November 1, 2015, Norwood borrows \$200,000 cash from a bank by signing a five-year installment note bearing 8% interest. The note requires equal total payments each year on October 31.

**Required**

- Compute the total amount of each installment payment.
- Complete an amortization table for this installment note similar to the one in Exhibit 14.14.
- Prepare the journal entries in which Norwood records (a) accrued interest as of December 31, 2015 (the end of its annual reporting period) and (b) the first annual payment on the note.

**Problem 14-7A**

Applying the debt-to-equity ratio

A3 

At the end of the current year, the following information is available for both Pulaski Company and Scott Company.

	Pulaski Company	Scott Company
Total assets .....	\$860,000	\$440,000
Total liabilities .....	360,000	240,000
Total equity .....	500,000	200,000

**Required**

- Compute the debt-to-equity ratios for both companies.
- Comment on your results and discuss the riskiness of each company's financing structure.

**Problem 14-8A<sup>B</sup>****Effective Interest:**

Amortization of bond discount P1 P5 

**Check** (2) \$97,819  
(3) 12/31/2016  
carrying value, \$307,308

Refer to the bond details in Problem 14-5A.

**Required**

- Prepare the January 1, 2015, journal entry to record the bonds' issuance.
- Determine the total bond interest expense to be recognized over the bonds' life.
- Prepare an effective interest amortization table like the one in Exhibit 14B.1 for the bonds' first two years.
- Prepare the journal entries to record the first two interest payments.

Refer to the bond details in Problem 14-4A.

### Required

1. Compute the total bond interest expense over the bonds' life.
2. Prepare an effective interest amortization table like the one in Exhibit 14B.2 for the bonds' life.
3. Prepare the journal entries to record the first two interest payments.
4. Use the market rate at issuance to compute the present value of the remaining cash flows for these bonds as of December 31, 2017. Compare your answer with the amount shown on the amortization table as the balance for that date (from part 2) and explain your findings.

### Problem 14-9A<sup>B</sup>

**Effective Interest:**  
Amortization of bond premium; computing bond price **P1 P6** 

**Check** (2) 6/30/2017 carrying value, \$252,865  
(4) \$252,326

Ike issues \$180,000 of 11%, three-year bonds dated January 1, 2015, that pay interest semiannually on June 30 and December 31. They are issued at \$184,566. Their market rate is 10% at the issue date.

### Required

1. Prepare the January 1, 2015, journal entry to record the bonds' issuance.
2. Determine the total bond interest expense to be recognized over the bonds' life.
3. Prepare an effective interest amortization table like Exhibit 14B.2 for the bonds' first two years.
4. Prepare the journal entries to record the first two interest payments.
5. Prepare the journal entry to record the bonds' retirement on January 1, 2017, at 98.

### Problem 14-10A<sup>B</sup>

**Effective Interest:**  
Amortization of bond; retiring bonds **P1 P4 P5 P6** 

**Check** (3) 6/30/2016 carrying value, \$182,448  
(5) \$5,270 gain

### Analysis Component

6. Assume that the market rate on January 1, 2015, is 12% instead of 10%. Without presenting numbers, describe how this change affects the amounts reported on Ike's financial statements.

Rogers Company signs a five-year capital lease with Packer Company for office equipment. The annual year-end lease payment is \$10,000, and the interest rate is 8%.

### Required

1. Compute the present value of Rogers's five-year lease payments.
2. Prepare the journal entry to record Rogers's capital lease at its inception.
3. Complete a lease payment schedule for the five years of the lease with the following headings. Assume that the beginning balance of the lease liability (present value of lease payments) is \$39,927. (*Hint:* To find the amount allocated to interest in year 1, multiply the interest rate by the beginning-of-year lease liability. The amount of the annual lease payment not allocated to interest is allocated to principal. Reduce the lease liability by the amount allocated to principal to update the lease liability at each year-end.)

### Problem 14-11A<sup>P</sup>

Capital lease accounting **C4**

**Check** (1) \$39,927

(3) Year 3 ending balance, \$17,833

Period Ending Date	Beginning Balance of Lease Liability	Interest on Lease Liability	Reduction of Lease Liability	Cash Lease Payment	Ending Balance of Lease Liability

4. Use straight-line depreciation and prepare the journal entry to depreciate the leased asset at the end of year 1. Assume zero salvage value and a five-year life for the office equipment.

Round dollar amounts to the nearest whole dollar. Assume no reversing entries are used.

Flagstaff Systems issues bonds dated January 1, 2015, that pay interest semiannually on June 30 and December 31. The bonds have a \$90,000 par value and an annual contract rate of 12%, and they mature in five years.

### Required

For each of the following three separate situations, (a) determine the bonds' issue price on January 1, 2015, and (b) prepare the journal entry to record their issuance.

1. The market rate at the date of issuance is 10%.
2. The market rate at the date of issuance is 12%.
3. The market rate at the date of issuance is 14%.

## PROBLEM SET B

### Problem 14-1B

Computing bond price and recording issuance **P1**

**Check** (1) Premium, \$6,948  
(3) Discount, \$6,326

**Problem 14-2B****Straight-Line:**

Amortization of bond discount

P1 P2

**Check** (3) \$3,790,000  
(4) 6/30/2016  
carrying value, \$3,068,500

Romero issues \$3,400,000 of 10%, 10-year bonds dated January 1, 2015, that pay interest semiannually on June 30 and December 31. The bonds are issued at a price of \$3,010,000.

**Required**

1. Prepare the January 1, 2015, journal entry to record the bonds' issuance.
2. For each semiannual period, compute (a) the cash payment, (b) the straight-line discount amortization, and (c) the bond interest expense.
3. Determine the total bond interest expense to be recognized over the bonds' life.
4. Prepare the first two years of an amortization table like Exhibit 14.7 using the straight-line method.
5. Prepare the journal entries to record the first two interest payments.

**Problem 14-3B****Straight-line:**

Amortization of bond premium

P1 P3

**Check** (3) \$2,607,068  
(4) 6/30/2016  
carrying value, 4,073,991

Refer to the bond details in Problem 14-2B, *except* assume that the bonds are issued at a price of \$4,192,932.

**Required**

1. Prepare the January 1, 2015, journal entry to record the bonds' issuance.
2. For each semiannual period, compute (a) the cash payment, (b) the straight-line premium amortization, and (c) the bond interest expense.
3. Determine the total bond interest expense to be recognized over the bonds' life.
4. Prepare the first two years of an amortization table like Exhibit 14.11 using the straight-line method.
5. Prepare the journal entries to record the first two interest payments.

**Problem 14-4B****Straight-Line:**

Amortization of bond premium

P1 P3

**Check** (2) 6/30/2017  
carrying value, \$326,493

Ripkin Company issues 9%, five-year bonds dated January 1, 2015, with a \$320,000 par value. The bonds pay interest on June 30 and December 31 and are issued at a price of \$332,988. Their annual market rate is 8% on the issue date.

**Required**

1. Calculate the total bond interest expense over the bonds' life.
2. Prepare a straight-line amortization table like Exhibit 14.11 for the bonds' life.
3. Prepare the journal entries to record the first two interest payments.

**Problem 14-5B****Straight-Line:**

Amortization of bond discount

P1 P2

**Check** (2) \$257,506

carrying value, \$202,646

Gomez issues \$240,000 of 6%, 15-year bonds dated January 1, 2015, that pay interest semiannually on June 30 and December 31. They are issued at \$198,494, and their market rate is 8% at the issue date.

**Required**

1. Prepare the January 1, 2015, journal entry to record the bonds' issuance.
2. Determine the total bond interest expense to be recognized over the life of the bonds.
3. Prepare a straight-line amortization table like the one in Exhibit 14.7 for the bonds' first two years.
4. Prepare the journal entries to record the first two interest payments.

**Problem 14-6B**

Installment notes

C1

**Check** (2) 9/30/2017  
ending balance, \$54,836

On October 1, 2015, Gordon Enterprises borrows \$150,000 cash from a bank by signing a three-year installment note bearing 10% interest. The note requires equal total payments each year on September 30.

**Required**

1. Compute the total amount of each installment payment.
2. Complete an amortization table for this installment note similar to the one in Exhibit 14.14.
3. Prepare the journal entries to record (a) accrued interest as of December 31, 2015 (the end of its annual reporting period) and (b) the first annual payment on the note.

At the end of the current year, the following information is available for both Atlas Company and Bryan Company.

	Atlas Company	Bryan Company
Total assets . . . . .	\$180,000	\$750,000
Total liabilities . . . . .	80,000	562,500
Total equity . . . . .	100,000	187,500

### Required

1. Compute the debt-to-equity ratios for both companies.
2. Comment on your results and discuss what they imply about the relative riskiness of these companies.

Refer to the bond details in Problem 14-5B.

### Required

1. Prepare the January 1, 2015, journal entry to record the bonds' issuance.
2. Determine the total bond interest expense to be recognized over the bonds' life.
3. Prepare an effective interest amortization table like the one in Exhibit 14B.1 for the bonds' first two years.
4. Prepare the journal entries to record the first two interest payments.

Refer to the bond details in Problem 14-4B.

### Required

1. Compute the total bond interest expense over the bonds' life.
2. Prepare an effective interest amortization table like the one in Exhibit 14B.2 for the bonds' life.
3. Prepare the journal entries to record the first two interest payments.
4. Use the market rate at issuance to compute the present value of the remaining cash flows for these bonds as of December 31, 2017. Compare your answer with the amount shown on the amortization table as the balance for that date (from part 2) and explain your findings.

Valdez issues \$450,000 of 13%, four-year bonds dated January 1, 2015, that pay interest semiannually on June 30 and December 31. They are issued at \$493,608, and their market rate is 10% at the issue date.

### Required

1. Prepare the January 1, 2015, journal entry to record the bonds' issuance.
2. Determine the total bond interest expense to be recognized over the bonds' life.
3. Prepare an effective interest amortization table like the one in Exhibit 14B.2 for the bonds' first two years.
4. Prepare the journal entries to record the first two interest payments.
5. Prepare the journal entry to record the bonds' retirement on January 1, 2017, at 106.

### Analysis Component

6. Assume that the market rate on January 1, 2015, is 14% instead of 10%. Without presenting numbers, describe how this change affects the amounts reported on Valdez's financial statements.

Braun Company signs a five-year capital lease with Verdi Company for office equipment. The annual year-end lease payment is \$20,000, and the interest rate is 10%.

### Required

1. Compute the present value of Braun's lease payments.
2. Prepare the journal entry to record Braun's capital lease at its inception.
3. Complete a lease payment schedule for the five years of the lease with the following headings. Assume that the beginning balance of the lease liability (present value of lease payments) is \$75,816. (*Hint:* To find

- Use straight-line depreciation and prepare the journal entry to depreciate the leased asset at the end of year 1. Assume zero salvage value and a five-year life for the office equipment.

**SERIAL PROBLEM**

Business Solutions

A1 A3

(This serial problem began in Chapter 1 and continues through most of the book. If previous chapter segments were not completed, the serial problem can begin at this point. It is helpful, but not necessary, to use the Working Papers that accompany the book.)

**SP 14** Santana Rey has consulted with her local banker and is considering financing an expansion of her business by obtaining a long-term bank loan. Selected account balances at March 31, 2016, for Business Solutions follow.

Total assets . . . . .	\$120,268	Total liabilities . . . . .	\$875	Total equity . . . . .	\$119,393
------------------------	-----------	-----------------------------	-------	------------------------	-----------

**Required**

- The bank has offered a long-term secured note to Business Solutions. The bank’s loan procedures require that a client’s debt-to-equity ratio not exceed 0.8. As of March 31, 2016, what is the maximum amount that Business Solutions could borrow from this bank (rounded to nearest dollar)?
- If Business Solutions borrows the maximum amount allowed from the bank, what percentage of assets would be financed (a) by debt and (b) by equity?
- What are some factors Santana Rey should consider before borrowing the funds?

**Check** (1) \$94,639

**Beyond the Numbers**

**REPORTING IN ACTION**

A1 A2

**APPLE**

**BTN 14-1** Refer to **Apple’s** financial statements in Appendix A to answer the following.

- Identify the items, if any, that make up Apple’s long-term debt as reported on its balance sheet at September 28, 2013.
- Assume that Apple has \$100 million in convertible debentures that carry a 4.25% contract rate of interest. How much annual cash interest must be paid on those convertible debentures?
- Assume that the convertible bonds discussed in part 2 are convertible into 20,000 shares of Apple’s stock. If the carrying value of these bonds is \$100 million, what is the entry recorded by Apple upon conversion?

**Fast Forward**

- Access Apple’s financial statements for the years ending after September 28, 2013, from its website ([Apple.com](http://Apple.com)) or the SEC’s EDGAR database ([www.SEC.gov](http://www.SEC.gov)). Has it issued additional long-term debt since the year-end September 28, 2013? If yes, identify the amount(s).

**COMPARATIVE ANALYSIS**

A3

**APPLE  
GOOGLE**

**BTN 14-2** Key figures for **Apple** and **Google** follow.

(\$ millions)	Apple		Google	
	Current Year	Prior Year	Current Year	Prior Year
Total assets . . . . .	\$207,000	\$176,064	\$110,920	\$93,798
Total liabilities . . . . .	83,451	57,854	23,611	22,083
Total equity . . . . .	123,549	118,210	87,309	71,715

**Required**

1. Compute the debt-to-equity ratios for Apple and Google for both the current year and the prior year.
2. Use the ratios you computed in part 1 to determine which company's financing structure is least risky. Assume an industry average of 0.44 for debt-to-equity.

**BTN 14-3** Traverse County needs a new county government building that would cost \$10 million. The politicians feel that voters will not approve a municipal bond issue to fund the building since it would increase taxes. They opt to have a state bank issue \$10 million of tax-exempt securities to pay for the building construction. The county then will make yearly lease payments (of principal and interest) to repay the obligation. Unlike conventional municipal bonds, the lease payments are not binding obligations on the county and, therefore, require no voter approval.

**ETHICS CHALLENGE**C4 A1 **Required**

1. Do you think the actions of the politicians and the bankers in this situation are ethical?
2. In terms of risk, how do the tax-exempt securities used to pay for the building compare to a conventional municipal bond issued by Traverse County?

**BTN 14-4** Your business associate mentions that she is considering investing in corporate bonds currently selling at a premium. She says that since the bonds are selling at a premium, they are highly valued and her investment will yield more than the going rate of return for the risk involved. Reply with a memorandum to confirm or correct your associate's interpretation of premium bonds.

**COMMUNICATING IN PRACTICE**

P3

**BTN 14-5** Access the March 27, 2014, filing of the 10-K report of **Home Depot** for the year ended February 2, 2014, from [www.SEC.gov](http://www.SEC.gov) (Ticker: HD). Refer to Home Depot's balance sheet, including its note 3 (on debt).

**TAKING IT TO THE NET**A2 **Required**

1. Identify Home Depot's long-term liabilities and the amounts for those liabilities from Home Depot's balance sheet at February 2, 2014.
2. Review Home Depot's note 3. The note reports that as of February 2, 2014, it had \$2.962 billion of "5.875% Senior Notes; due December 16, 2036; interest payable semiannually on June 16 and December 16." These notes have a face value of \$3.0 billion and were originally issued at \$2.958 billion.
  - a. Why would Home Depot issue \$3.0 billion of its notes for only \$2.958 billion?
  - b. How much cash interest must Home Depot pay each June 16 and December 16 on these notes?

**BTN 14-6<sup>B</sup>** Break into teams and complete the following requirements related to *effective interest* amortization for a premium bond.

**TEAMWORK IN ACTION**P2 P3 

1. Each team member is to independently prepare a blank table with proper headings for amortization of a bond premium. When all have finished, compare tables and ensure that all are in agreement.

*Parts 2 and 3 require use of these facts:* On January 1, 2015, McElroy issues \$100,000, 9%, five-year bonds at 104.1. The market rate at issuance is 8%. McElroy pays interest semiannually on June 30 and December 31.

2. In rotation, *each* team member must explain how to complete *one* line of the bond amortization table, including all computations for his or her line. (Round amounts to the nearest dollar.) All members are to fill in their tables during this process. You need not finish the table; stop after all members have explained a line.
3. In rotation, *each* team member is to identify a separate column of the table and indicate what the final number in that column will be and explain the reasoning.

[continued on next page]

**Hint:** Rotate teams to report on parts 4 and 5. Consider requiring entries for issuance and interest payments.

4. Reach a team consensus as to what the total bond interest expense on this bond issue will be if the bond is not retired before maturity.
5. As a team, prepare a list of similarities and differences between the amortization table just prepared and the amortization table if the bond had been issued at a discount.

**ENTREPRENEURIAL DECISION**

**BTN 14-7** Matthew Clough is the founder of **Stone + Cloth**. Assume that his company currently has \$250,000 in equity, and he is considering a \$100,000 expansion to meet increased demand. The \$100,000 expansion would yield \$16,000 in additional annual income before interest expense. Assume that the business currently earns \$40,000 annual income before interest expense of \$10,000, yielding a return on equity of 12% (\$30,000/\$250,000). To fund the expansion, he is considering the issuance of a 10-year, \$100,000 note with annual interest payments (the principal due at the end of 10 years).

**Required**

1. Using return on equity as the decision criterion, show computations to support or reject the expansion if interest on the \$100,000 note is (a) 10%, (b) 15%, (c) 16%, (d) 17%, and (e) 20%.
2. What general rule do the results in part 1 illustrate?

**HITTING THE ROAD**

**BTN 14-8** Visit your city or county library. Ask the librarian to help you locate the most recent financial records of your city or county government. Examine those records.

**Required**

1. Determine the amount of long-term bonds and notes currently outstanding.
2. Read the supporting information to your municipality’s financial statements and record
  - a. The market interest rate(s) when the bonds and/or notes were issued.
  - b. The date(s) when the bonds and/or notes will mature.
  - c. Any rating(s) on the bonds and/or notes received from **Moody’s**, **Standard & Poor’s**, or another rating agency.

**GLOBAL DECISION**

**Samsung**  
**APPLE**  
**GOOGLE**

**BTN 14-9** **Samsung** ([www.Samsung.com](http://www.Samsung.com)), **Apple**, and **Google** are competitors in the global marketplace. Selected results from these companies follow.

Key Figures	Samsung (₩ millions)		Apple (\$ millions)		Google (\$ millions)	
	Current Year	Prior Year	Current Year	Prior Year	Current Year	Prior Year
Total assets.....	₩214,075,018	₩181,071,570	\$207,000	\$176,064	\$110,920	\$93,798
Total liabilities.....	64,059,008	59,591,364	83,451	57,854	23,611	22,083
Total equity.....	150,016,010	121,480,206	123,549	118,210	87,309	71,715
Debt-to-equity ratio.....	?	?	0.68	0.49	0.27	0.31

**Required**

1. Compute Samsung’s debt-to-equity ratio for the current year and the prior year.
2. Use the data provided and the ratios computed in part 1 to determine which company’s financing structure is least risky.

**ANSWERS TO MULTIPLE CHOICE QUIZ**

1. b

2. a

3. c;  $\$500,000 \times 0.08 \times \frac{1}{2} \text{ year} = \$20,000$

4. a: Cash interest paid =  $\$100,000 \times 5\% \times \frac{1}{2} \text{ year} = \$2,500$   
Discount amortization =  $(\$100,000 - \$95,735)/10 \text{ periods} =$   
 $\$426.50$

Interest expense =  $\$2,500.00 + \$426.50 = \$2,926.50$

5. e:  $(\$373,745 - \$350,000)/16 \text{ periods} = \$1,484$

## Chapter Preview

### BASICS OF INVESTMENTS

- C1** Motivation for investments
  - Short-term versus long-term
  - Classification and reporting
  - Accounting basics

### NONINFLUENTIAL INVESTMENTS

- P1** Trading securities
- P2** Held-to-maturity securities
- P3** Available-for-sale securities

### INFLUENTIAL INVESTMENTS

- P4** Securities with significant influence
- C2** Securities with controlling influence
- A1** Analyze components of return on assets

## Learning Objectives

### CONCEPTUAL

- C1** Distinguish between debt and equity securities and between short-term and long-term investments.
- C2** Describe how to report equity securities with controlling influence.

- C3** *Appendix 15A*—Explain foreign exchange rates and record transactions listed in a foreign currency.

### ANALYTICAL

- A1** Compute and analyze the components of return on total assets.

### PROCEDURAL

- P1** Account for trading securities.
- P2** Account for held-to-maturity securities.
- P3** Account for available-for-sale securities.
- P4** Account for equity securities with significant influence.

## Step Into Her Shoes

CHARLESTON, SC—"I never had any intention to start a business," admits Hannah Davis. "But one of my friends bought this pair of shoes worn by working-class people throughout China. I thought they were cool and different and for some reason could not get them out of my mind. Then, sitting up in bed one day, I had an 'aha!' moment." That moment led Hannah to launch **BANGS (BANGSshoes.com)**. "BANGS is a social enterprise . . . an organization that uses a business plan as a tool to affect positive social developments," explains Hannah.

To make her social enterprise a reality, Hannah had to confront investing in international activities. "One of the biggest early challenges was establishing an international supply chain and finding a manufacturing partner," recalls Hannah. "There is so much competition in the manufacturing space, it's not easy to find someone who can make low quantities for low prices." She eventually succeeded, but had to contend with transactions in foreign exchanges as many of her investments span the globe. She also works hard at controlling costs. We "keep overhead low and focus on having a lean budget," explains Hannah. "We rely on technology to help us avoid big unnecessary expenses."

A major part of BANGS is its international focus and its work with intercorporate investments and entrepreneurial partners. "BANGS is about partnering that will meet the actual needs of the communities we serve," insists Hannah. "That

means providing tools that help people pull themselves out of poverty. The goal is to have a long-term impact and not a quick fix." To make this happen, Hannah studied the international activities of potential partners, including their financial systems and accounting controls. She explored various investment (nonprofit) relationships with BANGS and presently works with Kiva (Kiva.org) to fund entrepreneurial efforts worldwide.

Kiva is a nonprofit and was chosen as representative of real, sustainable means of development, says Hannah. "The model that BANGS uses is that 20 percent of net profits from each purchase of shoes is given to hand-selected entrepreneurs to

start their own businesses," says Hannah. "We track our sales . . . and write checks every month." BANGS highlights its monthly investments in other entrepreneurial businesses on its website.

"The social model of BANGS cannot have the impact I envision unless the business model is insanely successful." To ensure the success of BANGS Shoes, Hannah says she added "two amazing partners," George Derhofer and Peter Rushford.

So, how did Hannah decide on the name *BANGS*? "I decided to link the name of the company to the ideology behind the brand. The Chinese character for the word 'help' is phonetically spelled B-A-N-G."

*"If you have, you give"*

—Hannah Davis

Sources: *BANGS website*, September 2014; *Under 30 CEO*, April 2013; *FeelGood.org*, October 2012; *ColaDaily.com*, October 2013; *Collegiate Times*, November 2013

# BASICS OF INVESTMENTS

**C1**  
Distinguish between debt and equity securities and between short-term and long-term investments.

In prior chapters we discussed the reporting of both equity (common and preferred stock) and debt (bonds and notes) from the seller's (also called *issuer* or *investee*) standpoint. This chapter explains the reporting of both equity and debt from the buyer's (also called *investor*) standpoint. The first section of this chapter describes the motivation for investments, the distinction between short- and long-term investments, and the different classes of investments.

## Motivation for Investments

Companies make investments for at least three reasons. First, companies transfer *excess cash* into investments to produce higher income. Second, some entities, such as mutual funds and pension funds, are set up to produce income from investments. Third, companies make investments for strategic reasons. Examples are investments in competitors, suppliers, and even customers. Exhibit 15.1 shows short-term (S-T) and long-term (L-T) investments as a percent of total assets for several companies.

### EXHIBIT 15.1

Investments of Selected Companies

**Short-Term Investments** Cash equivalents are investments that are both readily converted to known amounts of cash and mature within three months. Many investments, however, mature between 3 and 12 months. These investments are **short-term investments**, also called *temporary investments* and *marketable securities*. Specifically, short-term investments are securities that (1) management intends to convert to cash within one year or the operating cycle, whichever is longer, and (2) are readily convertible to cash. Short-term investments are reported under current assets and serve a purpose similar to cash equivalents.

Short-term investments are reported under current assets and serve a purpose similar to cash equivalents.

**Long-Term Investments** Long-term investments in securities are defined as those securities that are not readily convertible to cash or are not intended to be converted into cash in the short term. Long-term investments can also include funds earmarked for a special purpose, such as bond sinking funds and investments in land or other assets not used in the company's operations. Long-term investments are reported in the noncurrent section of the balance sheet, often in its own separate line titled *Long-Term Investments*.

**Debt Securities versus Equity Securities** Investments in securities can include both debt and equity securities. *Debt securities* reflect a creditor relationship such as investments in notes, bonds, and certificates of deposit; they are issued by governments, companies, and individuals. *Equity securities* reflect an owner relationship such as shares of stock issued by companies.

## Classification and Reporting

Accounting for investments in securities depends on three factors: (1) security type, either debt or equity, (2) the company's intent to hold the security either short term or long term, and (3) the company's (investor's) percentage of ownership in the other company's (investee's) equity securities. Exhibit 15.2 identifies five classes of securities using these three factors. It describes each of these five classes of securities and the standard reporting required under each class.

### Debt Securities: Accounting Basics

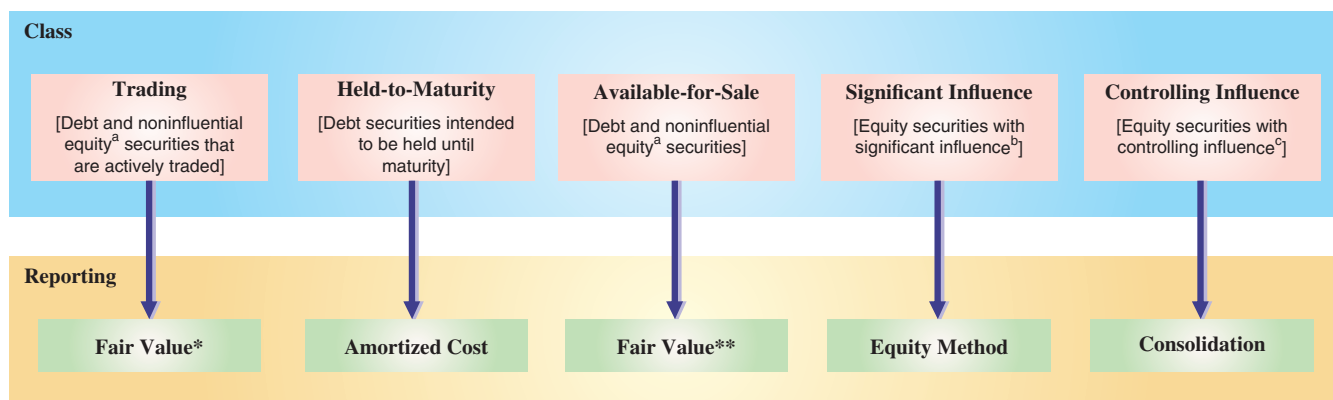

This section explains the accounting basics for *debt securities*, including that for acquisition, disposition, and any interest.

Scott Olson/Getty Images

**EXHIBIT 15.2**

Investments in Securities

<sup>a</sup> Holding less than 20% of voting stock (equity securities only). <sup>b</sup> Holding 20% or more, but not more than 50%, of voting stock. <sup>c</sup> Holding more than 50% of voting stock.

\* Unrealized gains and losses reported on the income statement.

\*\* Unrealized gains and losses reported in the equity section of the balance sheet and in comprehensive income.

**Acquisition.** Debt securities are recorded at cost when purchased. To illustrate, assume that Music City paid \$29,500 plus a \$500 brokerage fee on September 1, 2014, to buy Dell’s 7%, two-year bonds payable with a \$30,000 par value. The bonds pay interest semiannually on August 31 and February 28. Music City intends to hold the bonds until they mature on August 31, 2016; consequently, they are classified as held-to-maturity (HTM) securities. The entry to record this purchase follows. (If the maturity of the securities was short term, and management’s intent was to hold them until they mature, then they would be recorded in the Short-Term Investments—HTM account.)

2014		
Sept. 1	Long-Term Investments—HTM (Dell) .....	30,000
	Cash .....	30,000
	<i>Purchased bonds to be held to maturity.</i>	

Assets = Liabilities + Equity  
+30,000  
−30,000

**Interest earned.** Interest revenue for investments in debt securities is recorded when earned. To illustrate, on December 31, 2014, at the end of its accounting period, Music City accrues interest receivable as follows.

Dec. 31	Interest Receivable .....	700	
	Interest Revenue .....		700
	<i>Accrued interest earned (\$30,000 × 7% × 1/2).</i>		

Assets = Liabilities + Equity  
+700                           +700

The \$700 interest earned from September 1 to December 31 is computed as “Principal × Annual rate × Fraction of year” (shown above), which also equals 4/6 of the semiannual cash receipt of interest. Music City’s financial statements at December 31, 2014, report the interest revenue and the investment as shown in Exhibit 15.3.

On the income statement for year 2014:	
<b>Interest revenue</b> .....	<b>\$ 700</b>
On the December 31, 2014, balance sheet:	
<b>Long-term investments—Held-to-maturity securities (at amortized cost)</b> .....	<b>\$30,000</b>

**EXHIBIT 15.3**

Financial Statement Presentation of Debt Securities

On February 28, 2015, Music City records receipt of semiannual interest.

Feb. 28	Cash .....	1,050	
	Interest Receivable* .....		700
	Interest Revenue** .....		350
	<i>Received six months’ interest on Dell bonds.</i>		

\*\$30,000 × 7% × 4/12    \*\*\$30,000 × 7% × 2/12

Assets = Liabilities + Equity  
+1,050                           +350  
−700

**Point:** Feb. 28 entry reflects 4 months interest earned and accrued in 2014 and 2 months earned in 2015.

**Disposition.** When the bonds mature, the proceeds (not including the interest entry) are recorded as:

Assets = Liabilities + Equity  
 +30,000  
 -30,000

2016 Aug. 31	Cash .....	30,000	
	Long-Term Investments—HTM (Dell) .....		30,000
	<i>Received cash from matured bonds.</i>		

**Example:** What is cost per share? Answer: Cost per share is the total cost of acquisition, including broker fees, divided by number of shares acquired.

The cost of a debt security can be either higher or lower than its maturity value. When the investment is long term, the difference between cost and maturity value is amortized over the remaining life of the security. We assume for ease of computations that the cost of a long-term debt security equals its maturity value.

### Equity Securities: Accounting Basics

This section explains the accounting basics for *equity securities*, including that for acquisition, dividends, and disposition.

**Acquisition.** Equity securities are recorded at cost when acquired, including commissions or brokerage fees paid. To illustrate, assume that Music City purchases 1,000 shares of Intex common stock at par value for \$86,000 on October 10, 2014. It records this purchase of available-for-sale (AFS) securities as follows.

Assets = Liabilities + Equity  
 +86,000  
 -86,000

Oct. 10	Long-Term Investments—AFS (Intex) .....	86,000	
	Cash .....		86,000
	<i>Purchased 1,000 shares of Intex.</i>		

**Dividend earned.** Any cash dividends received are credited to Dividend Revenue and reported in the income statement. To illustrate, on November 2, Music City receives a \$1,720 quarterly cash dividend on the Intex shares, which it records as:

Assets = Liabilities + Equity  
 +1,720                      +1,720

Nov. 2	Cash .....	1,720	
	Dividend Revenue .....		1,720
	<i>Received dividend of \$1.72 per share.</i>		

**Disposition.** When the securities are sold, sale proceeds are compared with the cost, and any gain or loss is recorded. To illustrate, on December 20, Music City sells 500 of the Intex shares for \$45,000 cash and records this sale as:

Assets = Liabilities + Equity  
 +45,000                      +2,000  
 -43,000

Dec. 20	Cash .....	45,000	
	Long-Term Investments—AFS (Intex) .....		43,000
	Gain on Sale of Long-Term Investments .....		2,000
	<i>Sold 500 Intex shares (\$86,000 × 500/1,000).</i>		

## REPORTING OF NONINFLUENTIAL INVESTMENTS

Companies must value and report most noninfluential investments at *fair value*. The exact reporting requirements depend on whether the investments are classified as (1) trading, (2) held-to-maturity, or (3) available-for-sale.

### Trading Securities

**Trading securities** are *debt and equity securities* that the company intends to actively manage and trade for profit. Frequent purchases and sales are expected and are made to earn profits on short-term price changes. Trading securities are *always* reported as current assets.

**P1** Account for trading securities.

A gain is reported in the Other Revenues and Gains section on the income statement, whereas a loss is shown in Other Expenses and Losses. When the period-end fair value adjustment for the portfolio of trading securities is computed, it excludes the cost and fair value of any securities sold.

**NEED-TO-KNOW** 15-1

Trading Securities

P1

Berkshire Co. purchases investments in trading securities at a cost of \$130 on December 15, 2015. (This is its first and only purchase of such securities.) On December 28, Berkshire received a \$15 cash dividend from the stock purchased on December 15. At December 31, 2015, the trading securities had a fair value of \$140.

- Prepare the December 15 acquisition entry for the trading securities' portfolio.
- Prepare the December 28 receipt of cash dividends entry for the trading securities' portfolio.
- Prepare the December 31 year-end adjusting entry for the trading securities' portfolio.
- Explain how each account in entry *c* is reported in financial statements.
- Prepare the January 3, 2016, entry when a portion of its trading securities (that had originally cost \$33) is sold for \$36.

**Solution**

**a.**

Dec. 15	Short-Term Investments—Trading . . . . .	130	
	Cash . . . . .		130
	<i>To record purchase of trading securities.</i>		

**b.**

Dec. 28	Cash . . . . .	15	
	Dividend Revenue . . . . .		15
	<i>To record dividend received on trading securities.</i>

**Held-to-Maturity Securities**

**Held-to-maturity (HTM) securities** are *debt* securities a company intends and is able to hold until maturity. They are reported in current assets if their maturity dates are within one year or the operating cycle, whichever is longer. HTM securities are reported in long-term assets when the maturity dates extend beyond one year or the operating cycle, whichever is longer. All HTM securities are recorded at cost when purchased, and interest revenue is recorded when earned.

The portfolio of HTM securities is usually reported at (amortized) cost, which is explained in advanced courses. There is no fair value adjustment to the portfolio of HTM securities—neither to the short-term nor long-term portfolios. The basics of accounting for HTM securities were described earlier in this chapter.

**P2**

Account for held-to-maturity securities.

**Point:** Only debt securities can be classified as held-to-maturity; equity securities have no maturity date.

**Decision Maker**

**Money Manager** You expect interest rates to sharply fall within a few weeks and remain at this lower rate. What is your strategy for holding investments in fixed-rate bonds and notes? ■ [Answers follow the chapter's Summary.]

Prepare journal entries to record the following transactions involving the short-term securities investments of LA Life.

- a. On May 14, paid \$100 cash to purchase Muni's 90-day short-term debt securities (\$100 principal), dated May 15, that pay 8% interest (categorized as held-to-maturity securities).
- b. On November 16, received a check from Muni in payment of the principal and 90 days' interest on the debt securities purchased in transaction a.

**NEED-TO-KNOW** 15-2

**Held-to-Maturity Securities**

**QC2**

**Available-for-Sale Securities**

Available-for-sale (AFS) securities are debt and equity securities not classified as trading or held-to-maturity securities. AFS securities are purchased to yield interest, dividends, or increases in fair value. They are not actively managed like trading securities. If the intent is to sell AFS securities within the longer of one year or operating cycle, they are classified as short-term investments. Otherwise, they are classified as long-term investments.

**P3** Account for available-for-sale securities.

**Valuing and reporting available-for-sale securities.** As with trading securities, companies adjust the cost of the portfolio of AFS securities to reflect changes in fair value. This is done with a fair value adjustment to its total portfolio cost. However, any unrealized gain or loss for the portfolio of AFS securities is not reported on the income statement. Instead, it is reported in the equity section of the balance sheet (and is part of comprehensive income, explained later). To illustrate, assume that Music City had no prior period investments in available-for-sale securities other than those purchased in the current period. Exhibit 15.4 shows both the cost and fair value of those investments on December 31, 2014, the end of its reporting period.

	Cost	Fair Value	Unrealized Gain (Loss)
Improv bonds . . . . .	\$30,000	\$29,050	\$ (950)
Intex common stock, 500 shares . . . . .	43,000	45,500	2,500
Total . . . . .	<u>\$73,000</u>	<u>\$74,550</u>	<u>\$1,550</u>

**EXHIBIT 15.4**  
Cost and Fair Value of Available-for-Sale Securities

**Example:** If fair value in Exhibit 15.4 is \$70,000 (instead of \$74,550), what entry is made? Answer:  
Unreal. Loss—Equity 3,000  
FV Adj.—AFS 3,000

The year-end adjusting entry to record the fair value of these investments follows.

Dec. 31	Fair Value Adjustment—Available-for-Sale (LT) . . . . .	1,550	
	Unrealized Gain—Equity . . . . .		1,550
	To record adjustment to fair value of available-for-sale securities.		

Assets = Liabilities + Equity  
+1,550    +1,550

Exhibit 15.5 shows the December 31, 2014, balance sheet presentation—it assumes these investments are long term, but they can also be short term. It is also common to combine the cost of investments with the balance in the Fair Value Adjustment account and report the net as a single amount.

**Point:** Unrealized Loss—Equity and Unrealized Gain—Equity are permanent (balance sheet) equity accounts.

**EXHIBIT 15.5**

Balance Sheet  
Presentation of Available-for-Sale Securities

LT Investments—AFS	
1/1/2014	0
Purch.	73,000
12/31/2014	73,000
Fair Value Adj.—AFS (LT)	
1/1/2014	0
Adj.	1,550
12/31/2014	1,550

Assets	
Long-term investments—Available-for-sale (at cost) . . . . .	\$73,000
Fair value adjustment—Available-for-sale . . . . .	<u>1,550</u>
Long-term investments—Available-for-sale (at fair value) . . . . .	\$74,550
or simply	
Long-term investments—Available-for-sale (at fair value; cost is \$73,000) . . . . .	\$74,550
Equity	
... consists of usual equity accounts ...	
Add unrealized gain on available-for-sale securities* . . . . .	\$ 1,550

\* Often included under the caption Accumulated Other Comprehensive Income.

**Point:** Income is increased by selling AFS securities with unrealized gains; income is reduced by selling those with unrealized losses.

Let's extend this illustration and assume that at the end of its next calendar year (December 31, 2015), Music City's portfolio of long-term AFS securities has an \$81,000 cost and an \$82,000 fair value. It records the adjustment to fair value as follows.

Assets = Liabilities + Equity  
-550 = -550

Dec. 31	Unrealized Gain—Equity . . . . .	550
	Fair Value Adjustment—Available-for-Sale (LT) . . . . .	550
	<i>To record adjustment to fair value of available-for-sale securities.</i>	

**Example:** If cost is \$83,000 and fair value is \$82,000 at Dec. 31, 2015, it records the following adjustment:  
Unreal. Gain—Equity 1,550  
Unreal. Loss—Equity 1,000  
FV Adj.—AFS 2,550

The effects of the 2014 and 2015 securities transactions are reflected in the following T-accounts.

Unrealized Gain—Equity		Fair Value Adjustment—Available-for-Sale (LT)	
Adj. 12/31/15	550	Bal. 12/31/14	1,550
		Adj. 12/31/15	550
	<b>Bal. 12/31/15</b>	<b>Bal. 12/31/15</b>	<b>1,000</b>
	<b>1,000</b>		

↑ Amounts reconcile. ↑

This adjustment can also be determined using our “3-Step Adjusting Process.”

- Step 1:** Determine what unadjusted balance equals: Fair Value Adj—AFS = \$1,550 Dr.
- Step 2:** Determine what adjusted balance should equal: Fair Value Adj—AFS = \$1,000 Dr.  
Explanation: \$82,000 fair value > \$81,000 cost, thus the Fair Value Adj—Trading requires a \$1,000 debit so securities are at fair value.
- Step 3:** Record the \$550 adjusting entry to get from Step 1 to Step 2.  
Explanation: This implies a \$550 credit to Fair Value Adj—AFS (and reduction of Unrealized Gain).

**Point:** Fair Value Adj.—AFS is a permanent account, shown as a deduction or addition to the investment account.

**Selling available-for-sale securities.** Accounting for the sale of individual AFS securities is identical to that described for the sale of trading securities. When individual AFS securities are sold, the difference between the cost of the individual securities sold and the net proceeds (sale price less fees) is recognized as a gain or loss.

**Alert** Both U.S. GAAP (and IFRS) permit companies to use fair value in reporting financial assets (referred to as the fair value option). This option allows companies to report any financial asset at fair value and recognize value changes in income. This method was previously reserved only for trading securities, but is now an option for available-for-sale and held-to-maturity securities (and other “financial assets and liabilities” such as accounts and notes receivable, accounts and notes payable, and bonds). U.S. standards also set a three-level system to determine fair value:  
—Level 1: Use quoted market values.  
—Level 2: Use observable values from related assets or liabilities.  
—Level 3: Use unobservable values from estimates or assumptions.  
To date, a fairly small set of companies has chosen to broadly apply the fair value option—but, we continue to monitor its use ...

Gard Company completes the following selected transactions related to its short-term investments.

- May 8 Purchased 300 shares of FedEx stock as a short-term investment in available-for-sale securities at \$40 per share plus \$975 in broker fees.
- Sept. 2 Sold 100 shares of its investment in FedEx stock at \$47 per share and held the remaining 200 shares; broker's commission was \$225.
- Oct. 2 Purchased 400 shares of Ajay stock for \$60 per share plus \$1,600 in commissions. The stock is held as a short-term investment in available-for-sale securities.

### NEED-TO-KNOW 15-3

#### Available-for-Sale Securities

P3

#### Required

- Prepare journal entries for the above transactions.
- Prepare an adjusting journal entry as of December 31, if the fair values of the equity securities held by Gard are \$48 per share for FedEx and \$55 per share for Ajay. (This year is the first year Gard Company acquired short-term investments.)

#### Solution

1. May 8	Short-Term Investments—AFS (FedEx) . . . . .	12,975	
	Cash . . . . .		12,975
	<i>Purchased FedEx stock; (300 sh. × \$40) + \$975.</i>		
Sept. 2	Cash . . . . .	4,475	
	Gain on Sale of Short-Term Investment . . . . .		150
	Short-Term Investments—AFS (FedEx) . . . . .		4,325
<i>Sold FedEx shares; original cost is (\$12,975 × 100/300)</i>			
Oct. 2	Short-Term Investments—AFS (Ajay) . . . . .	25,600	
	Cash . . . . .		25,600
	<i>Purchased Ajay shares; (400 sh. × \$60) + \$1,600.</i>		

- Computation of unrealized gain or loss follows.

Short-Term Investments in Available-for-Sale Securities	Shares	Cost per Share	Total Cost	Fair Value per Share	Total Fair Value	Unrealized Gain (Loss)
FedEx . . . . .	200	\$43.25	\$ 8,650	\$48.00	\$ 9,600	
Ajay . . . . .	400	64.00	<u>25,600</u>	55.00	<u>22,000</u>	
Totals . . . . .			<u>\$34,250</u>		<u>\$31,600</u>	<u>\$(2,650)</u>

The adjusting entry follows:

Dec. 31	Unrealized Loss—Equity . . . . .	2,650	
	Fair Value Adjustment—Available-for-Sale (ST) . . . . .		2,650
	<i>To reflect an unrealized loss in fair values.</i>		

ST Investments—AFS			
1/1/2014	0		
5/8/2014	12,975		
		9/2/2014	4,325
10/2/2014	25,600		
12/31/2014	34,250		

Fair Value Adj.—AFS (ST)			
1/1/2014	0		
		Adj.	2,650
		12/31/2014	2,650

## REPORTING OF INFLUENTIAL INVESTMENTS

### Investment in Securities with Significant Influence

A long-term investment classified as **equity securities with significant influence** implies that the investor can exert significant influence over the investee. An investor that owns 20% or more (but not more than 50%) of a company's voting stock is usually presumed to have a significant influence over the investee. In some cases, however, the 20% test of significant influence is overruled by other, more persuasive, evidence. This evidence can either lower the 20% requirement

### P4

Account for equity securities with significant influence.

or increase it. The **equity method** of accounting and reporting is used for long-term investments in equity securities with significant influence, which is explained in this section.

Long-term investments in equity securities with significant influence are recorded at cost when acquired. To illustrate, Micron Co. records the purchase of 3,000 shares (30%) of Star Co. common stock at a total cost of \$70,650 on January 1, 2014, as follows.

Assets = Liabilities + Equity +70,650 -70,650	<table border="0" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 10%; padding: 5px;">Jan. 1</td> <td style="width: 70%; padding: 5px;">                     Long-Term Investments—Star ..... 70,650                      Cash ..... 70,650  <i>To record purchase of 3,000 Star shares.</i> </td> <td style="width: 20%;"></td> </tr> </table>	Jan. 1	Long-Term Investments—Star ..... 70,650 Cash ..... 70,650 <i>To record purchase of 3,000 Star shares.</i>	
Jan. 1	Long-Term Investments—Star ..... 70,650 Cash ..... 70,650 <i>To record purchase of 3,000 Star shares.</i>			

The investee’s (Star) earnings increase both its net assets and the claim of the investor (Micron) on the investee’s net assets. Thus, when the investee reports its earnings, the investor records its share of those earnings in its investment account. To illustrate, assume that Star reports net income of \$20,000 for 2014. Micron then records its 30% share of those earnings as follows.

Assets = Liabilities + Equity +6,000                      +6,000	<table border="0" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 10%; padding: 5px;">Dec. 31</td> <td style="width: 70%; padding: 5px;">                     Long-Term Investments—Star ..... 6,000                      Earnings from Long-Term Investment ..... 6,000  <i>To record 30% equity in investee earnings.</i> </td> <td style="width: 20%;"></td> </tr> </table>	Dec. 31	Long-Term Investments—Star ..... 6,000 Earnings from Long-Term Investment ..... 6,000 <i>To record 30% equity in investee earnings.</i>	
Dec. 31	Long-Term Investments—Star ..... 6,000 Earnings from Long-Term Investment ..... 6,000 <i>To record 30% equity in investee earnings.</i>			

The debit reflects the increase in Micron’s equity in Star. The credit reflects 30% of Star’s net income. Earnings from Long-Term Investment is a *temporary* account (closed to Income Summary at each period-end) and is reported on the investor’s (Micron’s) income statement. If the investee incurs a net loss instead of a net income, the investor records its share of the loss and reduces (credits) its investment account. The investor closes this earnings or loss account to Income Summary.

The receipt of cash dividends is not revenue under the equity method because the investor has already recorded its share of the investee’s earnings. Instead, cash dividends received by an investor from an investee are viewed as a conversion of one asset to another; that is, dividends reduce the balance of the investment account. To illustrate, Star declares and pays \$10,000 in cash dividends on its common stock. Micron records its 30% share of these dividends received on January 9, 2015, as:

Assets = Liabilities + Equity +3,000 -3,000	<table border="0" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 10%; padding: 5px;">Jan. 9</td> <td style="width: 70%; padding: 5px;">                     Cash ..... 3,000                      Long-Term Investments—Star ..... 3,000  <i>To record share of dividend paid by Star.</i> </td> <td style="width: 20%;"></td> </tr> </table>	Jan. 9	Cash ..... 3,000 Long-Term Investments—Star ..... 3,000 <i>To record share of dividend paid by Star.</i>	
Jan. 9	Cash ..... 3,000 Long-Term Investments—Star ..... 3,000 <i>To record share of dividend paid by Star.</i>			

The book value of an investment under the equity method equals the cost of the investment plus (minus) the investor’s equity in the *undistributed (distributed)* earnings of the investee. Once Micron records these transactions, its Long-Term Investments account appears as in Exhibit 15.6.

**EXHIBIT 15.6**

Investment in Star  
Common Stock (Ledger  
Account)

Long-Term Investment—Star			
	1/1/2014 Investment acquisition	70,650	
	12/31/2014 Share of earnings	6,000	
	12/31/2014 Balance	76,650	
			1/9/2015 Share of dividend      3,000
	1/9/2015 Balance	73,650	

**Point:** Security prices are sometimes listed in fractions. For example, a debt security with a price of  $22\frac{1}{4}$  is the same as \$22.25.

Micron’s account balance on January 9, 2015, for its investment in Star is \$73,650. This is the investment’s cost *plus* Micron’s equity in Star’s earnings since its purchase *less* Micron’s equity in Star’s cash dividends since its purchase. When an investment in equity securities is sold, the gain or loss is computed by comparing proceeds from the sale with the book value of

the investment on the date of sale. If Micron sells its Star stock for \$80,000 on January 10, 2015, it records the sale as:

Jan. 10	Cash .....	80,000	
	Long-Term Investments—Star .....		73,650
	Gain on Sale of Investment .....		6,350
	Sold 3,000 shares of stock for \$80,000.		

$$\begin{array}{rcl} \text{Assets} & = & \text{Liabilities} + \text{Equity} \\ +80,000 & & +6,350 \\ -73,650 & & \end{array}$$

## Investment in Securities with Controlling Influence

A long-term investment classified as **equity securities with controlling influence** implies that the investor can exert a controlling influence over the investee. An investor who owns more than 50% of a company's voting stock has control over the investee. This investor can dominate all other shareholders in electing the corporation's board of directors and has control over the investee's management. In some cases, controlling influence can extend to situations of less than 50% ownership. Exhibit 15.7 summarizes the accounting for investments in equity securities based on an investor's ownership in the stock.

The *equity method with consolidation* is used to account for long-term investments in equity securities with controlling influence.

The investor reports *consolidated financial statements* when owning such securities. The controlling investor is called the **parent**, and the investee is called the **subsidiary**. Many companies are parents with subsidiaries. Examples are (1) **Gap Inc.**, the parent of Gap, Old Navy, and Banana Republic; and (2) **Brunswick**, the parent of Mercury Marine, Sea Ray, and U.S. Marine. A company owning all the outstanding stock of a subsidiary can, if it desires, take over the subsidiary's assets, retire the subsidiary's stock, and merge the subsidiary into the parent. However, there often are financial, legal, and tax advantages if a business operates as a parent controlling one or more subsidiaries. When a company operates as a parent with subsidiaries, each entity maintains separate accounting records. From a legal viewpoint, the parent and each subsidiary are separate entities with all rights, duties, and responsibilities of individual companies.

**Consolidated financial statements** show the financial position, results of operations, and cash flows of all entities under the parent's control, including all subsidiaries. These statements are prepared as if the business were organized as one entity. The parent uses the equity method in its accounts, but the investment account is *not* reported on the parent's financial statements. Instead, the individual assets and liabilities of the parent and its subsidiaries are combined on one balance sheet. Their revenues and expenses also are combined on one income statement, and their cash flows are combined on one statement of cash flows. The procedures for preparing consolidated financial statements are in advanced courses.

### C2

Describe how to report equity securities with controlling influence.

### EXHIBIT 15.7

Accounting for Equity Investments by Percent of Ownership

Unlike U.S. GAAP, IFRS requires uniform accounting policies be used throughout the group of consolidated subsidiaries. Also, unlike U.S. GAAP, IFRS offers no detailed guidance on valuation procedures. ■

## Accounting Summary for Investments in Securities

Exhibit 15.8 summarizes the standard accounting for investments in securities. Recall that many investment securities are classified as either short term or long term depending on management's intent and ability to convert them in the future. Understanding the accounting for these investments enables us to draw better conclusions from financial statements in making business decisions.

**EXHIBIT 15.8**

Accounting for Investments in Securities

Classification	Accounting
<b>Short-Term Investment in Securities</b>	
Held-to-maturity (debt) securities . . . . .	<b>Cost</b> (without any discount or premium amortization)
Trading (debt and equity) securities . . . . .	<b>Fair value</b> (with fair value adjustment to income)
Available-for-sale (debt and equity) securities . . . . .	<b>Fair value</b> (with fair value adjustment to equity)
<b>Long-Term Investment in Securities</b>	
Held-to-maturity (debt) securities . . . . .	<b>Cost</b> (with any discount or premium amortization)
Available-for-sale (debt and equity) securities . . . . .	<b>Fair value</b> (with fair value adjustment to equity)
Equity securities with significant influence . . . . .	Equity method
Equity securities with controlling influence . . . . .	Equity method (with consolidation)

**Comprehensive Income** **Comprehensive income** is defined as all changes in equity during a period except those from owners' investments and dividends. Specifically, comprehensive income is computed by adding or subtracting *other comprehensive income* to net income:

Net income . . . . .	\$ #
Other comprehensive income . . . . .	#
Comprehensive income . . . . .	<u>\$ #</u>

**Point:** Some users believe that since AFS securities are not actively traded, reporting fair value changes in income would unnecessarily increase income variability and decrease usefulness.

**Other comprehensive income** includes unrealized gains and losses on available-for-sale securities, foreign currency translation adjustments, and certain pension adjustments. (*Accumulated other comprehensive income* is defined as the cumulative impact of *other comprehensive income*.)

Comprehensive income is reported in financial statements in one of two ways (which reflects new FASB guidance):

1. On a separate *statement of comprehensive income* that immediately follows the income statement.
2. On the lower section of the income statement (as a single continuous *statement of income and comprehensive income*).

Option 1 is the most common. **Google**, for example, reports a statement of comprehensive income following its income statement. Shown here is an abbreviated version of the Google statement:

**GOOGLE**

<b>Net income</b> . . . . .	<b>\$12,920</b>	<div style="border: 1px solid black; padding: 5px; display: inline-block;">Other comprehensive income</div>
Available-for-sale investments, net of tax . . . . .	(554)	
Foreign currency translation from consolidation . . . . .	89	
Cash flow hedges, net of tax . . . . .	52	
Other comprehensive income . . . . .	(413)	
<b>Total comprehensive income</b> . . . . .	<b><u>\$12,507</u></b>	

Option 2 adds the components of other comprehensive income to net income on the bottom of the income statement to compute a continuous statement of income and comprehensive income. There is no difference in the numbers; it is simply a matter of how those numbers are presented. A third option, which is no longer generally acceptable by itself, was to include the components of other comprehensive income and its total along with the total of comprehensive income in the statement of equity.

**QC4**

**GLOBAL VIEW**

This section discusses similarities and differences for the accounting and reporting of investments when financial statements are prepared under U.S. GAAP vis-à-vis IFRS.

**Accounting for Noninfluential Securities** The accounting for noninfluential securities is broadly similar between U.S. GAAP and IFRS. *Trading securities* are accounted for using fair values with unrealized gains and losses reported in net income as fair values change. *Available-for-sale securities* are accounted for using fair values with unrealized gains and losses reported in other comprehensive income as

fair values change (and later in net income when realized). *Held-to-maturity securities* are accounted for using amortized cost. Similarly, companies have the option under both systems to apply the fair value option for available-for-sale and held-to-maturity securities. Also, both systems review held-to-maturity securities for impairment. There are some differences in terminology under IFRS: (1) trading securities are commonly referred to as *financial assets at fair value through profit and loss*, and (2) available-for-sale securities are commonly referred to as *available-for-sale financial assets*. **NOKIA** reports the following categories for noninfluential securities: (1) *Financial assets at fair value through profit or loss*, consisting of financial assets held for trading and financial assets designated upon initial recognition as at fair value through profit or loss, and (2) *Available-for-sale financial assets*, which are measured at fair value.

**NOKIA**

**Accounting for Influential Securities** The accounting for influential securities is broadly similar across U.S. GAAP and IFRS. Specifically, under the *equity method*, the share of investee's net income is reported in the investor's income in the same period the investee earns that income; also, the investment account equals the acquisition cost plus the share of investee income less the share of investee dividends (minus amortization of excess on purchase price above fair value of identifiable, limited-life assets). Under the *consolidation method*, investee and investor revenues and expenses are combined, absent intercompany transactions, and subtracting noncontrolling interests. Also, nonintercompany assets and liabilities are similarly combined (eliminating the need for an investment account), and noncontrolling interests are subtracted from equity. There are some differences in terminology: (1) U.S. GAAP companies commonly refer to earnings from long-term investments as *equity in earnings of affiliates* whereas IFRS companies commonly use *equity in earnings of associated (or associate) companies*, and (2) U.S. GAAP companies commonly refer to noncontrolling interests in consolidated subsidiaries as *minority interests* whereas IFRS companies commonly use *noncontrolling interests*.

**Sustainability and Accounting** The founder, Hannah Davis, of **BANGS**, as introduced in this chapter's opening feature, is a social entrepreneur. "There is one reason I consciously decide to stick with the turbulent journey of launching a social enterprise, and that reason is people," explains Hannah. "The really important part about BANGS is that we only invest in sustainable methods of change . . . If you give a man a fish, he eats for a day. If you teach a man to fish, he eats for a lifetime—and that's the BANGS mentality." The graphic in the margin identifies the model of sustainability that BANGS utilizes and its motto: *Help People Help Themselves*.

**Components of Return on Total Assets****Decision Analysis**

A company's **return on total assets** (or simply *return on assets*) is important in assessing financial performance. The return on total assets can be separated into two components, profit margin and total asset turnover, for additional analyses. Exhibit 15.9 shows how these two components determine return on total assets.

**Return on total assets = Profit margin × Total asset turnover**

$$\frac{\text{Net income}}{\text{Average total assets}} = \frac{\text{Net income}}{\text{Net sales}} \times \frac{\text{Net sales}}{\text{Average total assets}}$$

Profit margin reflects the percent of net income in each dollar of net sales. Total asset turnover reflects a company's ability to produce net sales from total assets. All companies desire a high return on total assets. By considering these two components, we can often discover strengths and weaknesses not revealed by return on total assets alone. This improves our ability to assess future performance and company strategy.

To illustrate, consider return on total assets and its components for **Gap Inc.** in Exhibit 15.10.

Fiscal Year	Return on Total Assets	=	Profit Margin	×	Total Asset Turnover
2014	16.7%	=	7.9%	×	2.11
2013*	15.0	=	7.3	×	2.06
2012	11.5	=	5.7	×	2.01
2011	16.0	=	8.2	×	1.95
2010	14.1	=	7.7	×	1.83

\* 2013 sales and income data scaled by 52/53 due to the 53-week year.

**A1**

Compute and analyze the components of return on total assets.

**EXHIBIT 15.9**

Components of Return on Total Assets

**EXHIBIT 15.10**

Gap's Components of Return on Total Assets

At least three findings emerge. First, Gap's return on total assets improved over the past few years from 11.5% in 2012 to 16.7% in 2014. Second, total asset turnover has improved over this period, from 1.83 to 2.11. Third, Gap's profit margin dipped in 2012, but has otherwise stayed between 7.3% and 8.2%. These components reveal the dual role of profit margin and total asset turnover in determining return on total assets. They also reveal that the driver of Gap's recent improvement in return on total assets is both total asset turnover and profit margin.

Generally, if a company is to maintain or improve its return on total assets, it must meet any decline in either profit margin or total asset turnover with an increase in the other. If not, return on assets will decline. Companies consider these components in planning strategies. A component analysis can also reveal where a company is weak and where changes are needed, especially in a competitor analysis. If asset turnover is lower than the industry norm, for instance, a company should focus on raising asset turnover at least to the norm. The same applies to profit margin.

## Decision Maker

**Retailer** You are an entrepreneur and owner of a retail sporting goods store. The store's recent annual performance reveals (industry norms in parentheses): return on total assets = 11% (11.2%); profit margin = 4.4% (3.5%); and total asset turnover = 2.5 (3.2). What does your analysis of these figures reveal? ■ [Answers follow the chapter's Summary.]

## NEED-TO-KNOW

### COMPREHENSIVE

The following transactions relate to Brown Company's long-term investments. Brown did not own any long-term investments prior to these transactions. Show (1) the necessary journal entries and (2) the relevant portions of each year's balance sheet and income statement that reflect these transactions for both years.

#### 2014

- Sept. 9 Purchased 1,000 shares of Packard, Inc., common stock for \$80,000 cash. These shares represent 30% of Packard's outstanding shares.
- Oct. 2 Purchased 2,000 shares of AT&T common stock for \$60,000 cash as a long-term investment. These shares represent less than a 1% ownership in AT&T.
- 17 Purchased as a long-term investment 1,000 shares of Apple Computer common stock for \$40,000 cash. These shares are less than 1% of Apple's outstanding shares.
- Nov. 1 Received \$5,000 cash dividend from Packard.
- 30 Received \$3,000 cash dividend from AT&T.
- Dec. 15 Received \$1,400 cash dividend from Apple.
- 31 Packard's net income for this year is \$70,000.
- 31 Fair values for the investments in equity securities are Packard, \$84,000; AT&T, \$48,000; and Apple Computer, \$45,000.
- 31 For preparing financial statements, note the following post-closing account balances: Common Stock, \$500,000, and Retained Earnings, \$350,000.

#### 2015

- Jan. 1 Sold Packard, Inc., shares for \$108,000 cash.
- May 30 Received \$3,100 cash dividend from AT&T.
- June 15 Received \$1,600 cash dividend from Apple.
- Aug. 17 Sold the AT&T stock for \$52,000 cash.
- 19 Purchased 2,000 shares of Coca-Cola common stock for \$50,000 cash as a long-term investment. The stock represents less than a 5% ownership in Coca-Cola.
- Dec. 15 Received \$1,800 cash dividend from Apple.
- 31 Fair values of the investments in equity securities are Apple, \$39,000, and Coca-Cola, \$48,000.
- 31 For preparing financial statements, note the following post-closing account balances: Common Stock, \$500,000, and Retained Earnings, \$410,000.

## PLANNING THE SOLUTION

- Account for the investment in Packard under the equity method.
- Account for the investments in AT&T, Apple, and Coca-Cola as long-term investments in available-for-sale securities.

- Prepare the information for the two years' balance sheets by including the relevant asset and equity accounts, and the two years' income statements by identifying the relevant revenues, earnings, gains, and losses.

## SOLUTION

### 1. Journal entries for 2014.

Sept. 9	Long-Term Investments—Packard .....	80,000	
	Cash .....		80,000
	<i>Acquired 1,000 shares, representing a 30% equity in Packard.</i>		
Oct. 2	Long-Term Investments—AFS (AT&T) .....	60,000	
	Cash .....		60,000
	<i>Acquired 2,000 shares as a long-term investment in available-for-sale securities.</i>		
Oct. 17	Long-Term Investments—AFS (Apple) .....	40,000	
	Cash .....		40,000
	<i>Acquired 1,000 shares as a long-term investment in available-for-sale securities.</i>		
Nov. 1	Cash .....	5,000	
	Long-Term Investments—Packard .....		5,000
	<i>Received dividend from Packard.</i>		
Nov. 30	Cash .....	3,000	
	Dividend Revenue .....		3,000
	<i>Received dividend from AT&amp;T.</i>		
Dec. 15	Cash .....	1,400	
	Dividend Revenue .....		1,400
	<i>Received dividend from Apple.</i>		
Dec. 31	Long-Term Investments—Packard .....	21,000	
	Earnings from Investment (Packard) .....		21,000
	<i>To record 30% share of Packard's annual earnings of \$70,000.</i>		
Dec. 31	Unrealized Loss—Equity .....	7,000	
	Fair Value Adjustment—Available-for-Sale (LT)* .....		7,000
	<i>To record change in fair value of long-term available-for-sale securities.</i>		

\* Fair value adjustment computations:

	Cost	Fair Value	Unrealized Gain (Loss)
AT&T	\$ 60,000	\$48,000	\$(12,000)
Apple	<u>40,000</u>	<u>45,000</u>	<u>5,000</u>
Total	<u>\$100,000</u>	<u>\$93,000</u>	<u>\$ (7,000)</u>

Required balance of the Fair Value Adjustment—Available-for-Sale (LT) account (credit) .....	\$(7,000)
Existing balance .....	<u>0</u>
Necessary adjustment (credit) .....	<u>\$(7,000)</u>

LT Investments—AFS	
1/1/2014	0

Gain on sale of long-term investments .....	12,000
Loss on sale of long-term investments .....	(8,000)

## APPENDIX

# Investments in International Operations

## 15A

Many entities from small entrepreneurs to large corporations conduct business internationally. Some entities' operations occur in so many different countries that the companies are called **multinationals**. Many of us think of **Coca-Cola** and **McDonald's**, for example, as primarily U.S. companies, but most of their sales occur outside the United States. Exhibit 15A.1 shows the percent of international sales and income for selected U.S. companies. Managing and accounting for multinationals present challenges. This section describes some of these challenges and how to account for and report these activities.

Two major accounting challenges that arise when companies have international operations relate to transactions that involve more than one currency. The first is to account for sales and purchases listed in a foreign currency. The second is to prepare consolidated financial statements with international subsidiaries. For ease in this discussion, we use companies with a U.S. base of operations and assume the need to prepare financial statements in U.S. dollars. This means the *reporting currency* of these companies is the U.S. dollar.

**EXHIBIT 15A.1**  
International Sales and Income as a Percent of Their Totals

**Point:** Transactions listed or stated in a foreign currency are said to be *denominated* in that currency.

**Exchange Rates between Currencies** Markets for the purchase and sale of foreign currencies exist all over the world. In these markets, U.S. dollars can be exchanged for Canadian dollars, British pounds, Japanese yen, euros, or any other legal currencies. The price of one currency stated in terms of another currency is called a **foreign exchange rate**. Exhibit 15A.2 lists recent exchange rates for selected currencies. The exchange rate for British pounds and U.S. dollars is \$1.8980, meaning 1 British pound could be purchased for \$1.8980. On that same day, the exchange rate between Mexican pesos and U.S. dollars is \$0.0925, or 1 Mexican peso can be purchased for \$0.0925. Exchange rates fluctuate due to changing economic and political conditions, including the supply and demand for currencies and expectations about future events.

**C3**  
Explain foreign exchange rates and record transactions listed in a foreign currency.

**Point:** To convert currency, see XE.com

Source (unit)	Price in \$U.S.	Source (unit)	Price in \$U.S.
Britain (pound)	\$1.8980	Canada (dollar)	\$0.9793
Mexico (peso)	0.0925	Japan (yen)	0.0090
Taiwan (dollar)	0.0305	Europe (euro)	1.2920

**EXHIBIT 15A.2**  
Foreign Exchange Rates for Selected Currencies\*

\* Rates will vary over time based on economic, political, and other changes.

### Decision Insight

**Greek Haircut** Investors in government debt securities in the eurozone are wary of the heightened default risk with securities issued by certain eurozone member nations. For example, a few years ago, buyers of certain Greek bonds were repaid only 30% of principal because of the government's inability to honor its full obligation on the bonds. ■

Glow Images

**Sales and Purchases Listed in a Foreign Currency** When a U.S. company makes a credit sale to an international customer, accounting for the sale and the account receivable is straightforward if sales terms require the international customer's payment in U.S. dollars. If sale terms require (or allow) payment in a foreign currency, however, the U.S. company must account for the sale and the account receivable in a different manner.

**Sales in a Foreign Currency** To illustrate, consider the case of the U.S.-based manufacturer Boston Company, which makes credit sales to London Outfitters, a British retail company. A sale occurs on December 12, 2014, for a price of £10,000 with payment due on February 10, 2015. Boston Company keeps its accounting records in U.S. dollars. To record the sale, Boston Company must translate the sales price from pounds to dollars. This is done using the exchange rate on the date of the sale. Assuming the exchange rate on December 12, 2014, is \$1.80, Boston records this sale as follows.

Assets = Liabilities + Equity  
+18,000                      +18,000

Dec. 12	Accounts Receivable—London Outfitters . . . . .	18,000	
	Sales* . . . . .		18,000
	<i>To record a sale at £10,000, when the exchange rate equals \$1.80. * (£10,000 × \$1.80/£)</i>		

When Boston Company prepares its annual financial statements on December 31, 2014, the current exchange rate is \$1.84. Thus, the current dollar value of Boston Company’s receivable is \$18,400 (£10,000 × \$1.84/£). This amount is \$400 higher than the amount recorded on December 12. Accounting principles require a receivable to be reported in the balance sheet at its current dollar value. Thus, Boston Company must make the following entry to record the increase in the dollar value of this receivable at year-end.

Assets = Liabilities + Equity  
+400                              +400

Dec. 31	Accounts Receivable—London Outfitters . . . . .	400	
	Foreign Exchange Gain . . . . .		400
	<i>To record the increased value of the British pound for the receivable.</i>		

**Point:** Foreign exchange gains are credits, and foreign exchange losses are debits.

On February 10, 2015, Boston Company receives London Outfitters’s payment of £10,000. It immediately exchanges the pounds for U.S. dollars. On this date, the exchange rate for pounds is \$1.78. Thus, Boston Company receives only \$17,800 (£10,000 × \$1.78/£). It records the cash receipt and the loss associated with the decline in the exchange rate as follows.

Assets = Liabilities + Equity  
+17,800                      -600  
-18,400

Feb. 10	Cash . . . . .	17,800	
	Foreign Exchange Loss . . . . .	600	
	Accounts Receivable—London Outfitters . . . . .		18,400
	<i>Received foreign currency payment of an account and converted it into dollars.</i>		

Gains and losses from foreign exchange transactions are accumulated in the Foreign Exchange Gain (or Loss) account. After year-end adjustments, the balance in the Foreign Exchange Gain (or Loss) account is reported on the income statement and closed to the Income Summary account.

**Example:** Assume that a U.S. company makes a credit purchase from a British company for £10,000 when the exchange rate is \$1.62. At the balance sheet date, this rate is \$1.72. Does this imply a gain or loss for the U.S. company? *Answer: A loss.*

**Purchases in a Foreign Currency** Accounting for credit purchases from an international seller is similar to the case of a credit sale to an international customer. In particular, if the U.S. company is required to make payment in a foreign currency, the account payable must be translated into dollars before the U.S. company can record it. If the exchange rate is different when preparing financial statements and when paying for the purchase, the U.S. company must recognize a foreign exchange gain or loss at those dates. To illustrate, assume NC Imports, a U.S. company, purchases products costing €20,000 (euros) from Hamburg Brewing on January 15, when the exchange rate is \$1.20 per euro. NC records this transaction as follows.

Assets = Liabilities + Equity  
+24,000                      +24,000

Jan. 15	Inventory . . . . .	24,000	
	Accounts Payable—Hamburg Brewing . . . . .		24,000
	<i>To record a €20,000 purchase when exchange rate is \$1.20 (€20,000 × \$1.20/€).</i>		

NC Imports makes payment in full on February 14 when the exchange rate is \$1.25 per euro, which is recorded as follows.

Assets = Liabilities + Equity  
-25,000                      -24,000                      -1,000

Feb. 14	Accounts Payable—Hamburg Brewing . . . . .	24,000	
	Foreign Exchange Loss . . . . .	1,000	
	Cash . . . . .		25,000
	<i>To record cash payment toward €20,000 account when exchange rate is \$1.25 (€20,000 × \$1.25/€).</i>		

## Decision Insight

**Global Greenback** What do changes in foreign exchange rates mean? A decline in the price of the U.S. dollar against other currencies usually yields increased international sales for U.S. companies, without hiking prices or cutting costs, and puts them on a stronger competitive footing abroad. At home, they can raise prices without fear that foreign rivals will undercut them. ■

**Consolidated Statements with International Subsidiaries** A second challenge in accounting for international operations involves preparing consolidated financial statements when the parent company has one or more international subsidiaries. Consider a U.S.-based company that owns a controlling interest in a French subsidiary. The reporting currency of the U.S. parent is the dollar. The French subsidiary maintains its financial records in euros. Before preparing consolidated statements, the parent must translate financial statements of the French company into U.S. dollars. After this translation is complete (including that for accounting differences), it prepares consolidated statements the same as for domestic subsidiaries. Procedures for translating an international subsidiary's account balances depend on the nature of the subsidiary's operations. The process requires the parent company to select appropriate foreign exchange rates and to apply those rates to the foreign subsidiary's account balances, and report the change as a component of other comprehensive income. This is described in advanced courses.

Google reported \$75 million in other comprehensive income as a result of consolidating the non-U.S. dollar financial statements of its subsidiaries.

**Global:** A weaker U.S. dollar often increases global sales for U.S. companies.

## Decision Maker

**Entrepreneur** Assume that **Ben & Jerry's** purchases milk from dairies in both the U.S. and Canada. The price of the Canadian dollar in terms of the U.S. dollar jumps from US\$0.70 to US\$0.80. Is the ice cream maker now more or less likely to buy milk from Canadian or U.S. suppliers? ■ [Answers follow the chapter's Summary.]

# Summary

**C1 Distinguish between debt and equity securities and between short-term and long-term investments.** *Debt securities* reflect a creditor relationship and include investments in notes, bonds, and certificates of deposit. *Equity securities* reflect an owner relationship and include shares of stock issued by other companies. Short-term investments in securities are current assets that meet two criteria: (1) They are expected to be converted into cash within one year or the current operating cycle of the business, whichever is longer, and (2) they are readily convertible to cash, or *marketable*. All other investments in securities are long term. Long-term investments also include assets not used in operations and those held for special purposes, such as land for expansion. Investments in securities are classified into one of five groups: (1) trading securities, which are always short-term; (2) debt securities held-to-maturity; (3) debt and equity securities available-for-sale; (4) equity securities in which an investor has a significant influence over the investee; and (5) equity securities in which an investor has a controlling influence over the investee.

**C2 Describe how to report equity securities with controlling influence.** If an investor owns more than 50% of another company's voting stock and controls the investee, the investor's financial reports are prepared on a consolidated basis. These reports are prepared as if the company were organized as one entity.

**C3A Explain foreign exchange rates and record transactions listed in a foreign currency.** A foreign exchange rate is the price of one currency stated in terms of another. An entity with transactions in a foreign currency when the exchange rate changes between the transaction dates and their settlement will experience exchange gains or losses. When a company makes a

credit sale to a foreign customer and sales terms call for payment in a foreign currency, the company must translate the foreign currency into dollars to record the receivable. If the exchange rate changes before payment is received, exchange gains or losses are recognized in the year they occur. The same treatment is used when a company makes a credit purchase from a foreign supplier and is required to make payment in a foreign currency.

**A1 Compute and analyze the components of return on total assets.** Return on total assets has two components: profit margin and total asset turnover. A decline in one component must be met with an increase in another if return on assets is to be maintained. Component analysis is helpful in assessing company performance compared to that of competitors and its own past.

**P1 Account for trading securities.** Investments are initially recorded at cost, and any dividend or interest from these investments is recorded in the income statement. Investments classified as trading securities are reported at fair value. Unrealized gains and losses on trading securities are reported in income. When investments are sold, the difference between the net proceeds from the sale and the cost of the securities is recognized as a gain or loss.

**P2 Account for held-to-maturity securities.** Debt securities held-to-maturity are reported at cost when purchased. Interest revenue is recorded as it accrues. The cost of long-term held-to-maturity securities is adjusted for the amortization of any difference between cost and maturity value.

**P3 Account for available-for-sale securities.** Debt and equity securities available-for-sale are recorded at cost when purchased. Available-for-sale securities are reported at their fair

values on the balance sheet with unrealized gains or losses shown in the equity section. Gains and losses realized on the sale of these investments are reported in the income statement.

#### P4 Account for equity securities with significant influence.

The equity method is used when an investor has a significant influence over an investee. This usually exists when an in-

vestor owns 20% or more of the investee's voting stock but not more than 50%. The equity method means an investor records its share of investee earnings with a debit to the investment account and a credit to a revenue account. Dividends received reduce the investment account balance.

### Guidance Answers to Decision Maker

**Money Manager** If you have investments in fixed-rate bonds and notes when interest rates fall, the value of your investments increases. This is so because the bonds and notes you hold continue to pay the same (high) rate while the market is demanding a new lower interest rate. Your strategy is to continue holding your investments in bonds and notes, and, potentially, to increase these holdings through additional purchases.

**Retailer** Your store's return on assets is 11%, which is similar to the industry norm of 11.2%. However, disaggregation of return on assets reveals that your store's profit margin of 4.4% is much higher than the norm of 3.5%, but your total asset turnover of 2.5 is much lower than the norm of 3.2. These results suggest that, as compared with competitors, you are less efficient in using assets.

You need to focus on increasing sales or reducing assets. You might consider reducing prices to increase sales, provided such a strategy does not reduce your return on assets. For instance, you could reduce your profit margin to 4% to increase sales. If total asset turnover increases to more than 2.75 when profit margin is lowered to 4%, your overall return on assets is improved.

**Entrepreneur** You are now less likely to buy Canadian milk products because it takes more U.S. money to buy a Canadian dollar (and milk). For instance, the purchase of milk from a Canadian dairy with a \$1,000 (Canadian dollars) price would have cost the U.S. company \$700 (U.S. dollars, computed as  $C\$1,000 \times US\$0.70$ ) before the rate change, and \$800 (US dollars, computed as  $C\$1,000 \times US\$0.80$ ) after the rate change.

### Multiple Choice Quiz

Answers at end of chapter

- A company purchased \$30,000 of 5% bonds for investment purposes on May 1. The bonds pay interest on February 1 and August 1. The amount of interest revenue accrued at December 31 (the company's year-end) is:
  - \$1,500
  - \$1,375
  - \$1,000
  - \$625
  - \$300
- Earlier this period, Amadeus Co. purchased its only available-for-sale investment in the stock of Bach Co. for \$83,000. The period-end fair value of this stock is \$84,500. Amadeus records a:
  - Credit to Unrealized Gain—Equity for \$1,500.
  - Debit to Unrealized Loss—Equity for \$1,500.
  - Debit to Investment Revenue for \$1,500.
  - Credit to Fair Value Adjustment—Available-for-Sale for \$3,500.
  - Credit to Cash for \$1,500.
- Mozart Co. owns 35% of Melody Inc. Melody pays \$50,000 in cash dividends to its shareholders for the period. Mozart's entry to record the Melody dividend includes a:
  - Credit to Investment Revenue for \$50,000.
  - Credit to Long-Term Investments for \$17,500.
  - Credit to Cash for \$17,500.
  - Debit to Long-Term Investments for \$17,500.
  - Debit to Cash for \$50,000.
- A company has net income of \$300,000, net sales of \$2,500,000, and total assets of \$2,000,000. Its return on total assets equals:
  - 6.7%
  - 12.0%
  - 8.3%
  - 80.0%
  - 15.0%
- A company had net income of \$80,000, net sales of \$600,000, and total assets of \$400,000. Its profit margin and total asset turnover are:
 

	Profit Margin	Total Asset Turnover
a.	1.5%	13.3
b.	13.3%	1.5
c.	13.3%	0.7
d.	7.0%	13.3
e.	10.0%	26.7

**A** *Superscript A denotes assignments based on Appendix 15A.*

 **Icon denotes assignments that involve decision making.**

## Discussion Questions

- Under what two conditions should investments be classified as current assets?
-  On a balance sheet, what valuation must be reported for short-term investments in trading securities?
- If a short-term investment in available-for-sale securities costs \$10,000 and is sold for \$12,000, how should the difference between these two amounts be recorded?
- Identify the three classes of noninfluential and two classes of influential investments in securities.
- Under what conditions should investments be classified as current assets? As long-term assets?
- For investments in available-for-sale securities, how are unrealized (holding) gains and losses reported?
- If a company purchases its only long-term investments in available-for-sale debt securities this period and their fair value is below cost at the balance sheet date, what entry is required to recognize this unrealized loss?
- On a balance sheet, what valuation must be reported for debt securities classified as available-for-sale?
- Under what circumstances are long-term investments in debt securities reported at cost and adjusted for amortization of any difference between cost and maturity value?
- In accounting for investments in equity securities, when should the equity method be used?
- Under what circumstances does a company prepare consolidated financial statements?
- 12<sup>A</sup>** What are two major challenges in accounting for international operations?
- 13<sup>A</sup>** Assume a U.S. company makes a credit sale to a foreign customer that is required to make payment in its foreign currency. In the current period, the exchange rate is \$1.40 on the date of the sale and \$1.30 on the date the customer pays the receivable. Will the U.S. company record an exchange gain or loss?
- 14<sup>A</sup>**  If a U.S. company makes a credit sale to a foreign customer required to make payment in U.S. dollars, can the U.S. company have an exchange gain or loss on this sale?
-  Refer to **Apple**'s statement of comprehensive income in Appendix A. What is the amount of foreign currency translation adjustment for the year ended September 28, 2013? Is this adjustment an unrealized gain or an unrealized loss?
- Refer to **Google**'s statement of comprehensive income. What was the amount of its 2013 *change in net unrealized gains* for its AFS investments?
-  Refer to the income statement of **Samsung** in Appendix A. How can you tell that it uses the consolidated method of accounting?

Which of the following statements *a* through *g* are true of long-term investments?

- \_\_\_ **a.** They are held as an investment of cash available for current operations.  
 \_\_\_ **b.** They can include funds earmarked for a special purpose, such as bond sinking funds.  
 \_\_\_ **c.** They can include investments in trading securities.  
 \_\_\_ **d.** They can include debt securities held-to-maturity.  
 \_\_\_ **e.** They are always easily sold and therefore qualify as being marketable.  
 \_\_\_ **f.** They can include debt and equity securities available-for-sale.  
 \_\_\_ **g.** They can include bonds and stocks not intended to serve as a ready source of cash.

A solar company invests in the following securities. Identify those investments as either an investment in debt (D) securities or equity (E) securities.

- |                                      |                                       |                                       |
|--------------------------------------|---------------------------------------|---------------------------------------|

Distinguishing between short- and long-term investments

**C1**

### QS 15-2

Distinguishing between debt and equity securities

**C1**

### QS 15-3

Short-term equity investments **P1**

**QS 15-4**

Recording trading securities

P1

Prepare Hertog Company's journal entries to reflect the following transactions for the current year.

- May 7 Purchases 200 shares of Kraft stock as a short-term investment in trading securities at a cost of \$50 per share plus \$300 in broker fees.
- June 6 Sells 200 shares of its investment in Kraft stock at \$56 per share. The broker's commission on this sale is \$150.

**QS 15-5**

Multiyear fair value adjustments to trading securities

P1

Kitty Company began operations in 2014 and maintains short-term investments in trading securities. The year-end cost and fair values for its portfolio of these investments follow. Prepare journal entries to record each December 31 year-end fair value adjustment for these securities.

Portfolio of Trading Securities	Cost	Fair Value
December 31, 2014.....	\$37	\$35
December 31, 2015.....	42	46
December 31, 2016.....	60	69
December 31, 2017.....	56	55

**QS 15-6**

Debt securities transactions P2

On February 1, 2015, Garzon purchased 6% bonds issued by PBS Utilities at a cost of \$40,000, which is their par value. The bonds pay interest semiannually on July 31 and January 31. For 2015, prepare entries to record Garzon's July 31 receipt of interest and its December 31 year-end interest accrual.

**QS 15-7**

Available-for-sale securities

P3

Journ Co. purchased short-term investments in available-for-sale securities at a cost of \$50,000 on November 25, 2015. At December 31, 2015, these securities had a fair value of \$47,000. This is the first and only time the company has purchased such securities.

1. Prepare the December 31, 2015, year-end adjusting entry for the securities' portfolio.
2. For each account in the entry for part 1, explain how it is reported in financial statements.
3. Prepare the April 6, 2016, entry when Journ sells one-half of these securities for \$26,000.

**QS 15-8**

Available-for-sale securities

P3

Hiker Company completes the following transactions during the current year. Prepare the May 9 and June 2 journal entries and the December 31 adjusting entry. This is the first and only time the company purchased such securities.

- May 9 Purchases 200 shares of Higo stock as a short-term investment in available-for-sale securities at a cost of \$25 per share plus \$150 in broker fees.
- June 2 Sells 100 shares of its investment in Higo stock at \$28 per share. The broker's commission on this sale is \$90.
- Dec. 31 The closing market price (fair value) of the Higo stock is \$23 per share.

**QS 15-9**

Recording fair value adjustment for securities

P3

During the current year, Reed Consulting Group acquired long-term available-for-sale securities at a \$70,000 cost. At its December 31 year-end, these securities had a fair value of \$58,000. This is the first and only time the company purchased such securities.

1. Prepare the necessary year-end adjusting entry related to these securities.
2. Explain how each account used in part 1 is reported in the financial statements.

**QS 15-10**

Recording long-term equity securities P3

On May 20, 2015, Montero Co. paid \$1,000,000 to acquire 25,000 common shares (10%) of ORD Corp. as a long-term investment. On August 5, 2016, Montero sold one-half of these shares for \$625,000. What valuation method should be used to account for this stock investment? Prepare entries to record both the acquisition and the sale of these shares.

**QS 15-11**

Equity method transactions P4

Montero Co. holds 100,000 common shares (40%) of ORD Corp. as a long-term investment. ORD Corp. paid a \$100,000 dividend on November 1, 2015, and reported a net income of \$700,000 for 2015. Prepare Montero's entries to record (a) the receipt of the dividend and (b) the December 31, 2015, year-end adjustment required for the investment account.

Complete the following descriptions by filling in the blanks.

1. Equity securities giving an investor significant influence are accounted for using the \_\_\_\_\_.
2. Available-for-sale debt securities are reported on the balance sheet at \_\_\_\_\_.
3. Trading securities are classified as \_\_\_\_\_ assets.
4. Accrual of interest on bonds held as long-term investments requires a credit to \_\_\_\_\_.
5. The controlling investor (more than 50% ownership) is called the \_\_\_\_\_, and the investee company is called the \_\_\_\_\_.

**QS 15-12**

Describing investments in securities

C2

Complete the following descriptions by filling in the blanks.

1. The controlling investor is called the \_\_\_\_\_, and the investee is called the \_\_\_\_\_.
2. A long-term investment classified as equity securities with controlling influence implies that the investor can exert a \_\_\_\_\_ influence over the investee.

**QS 15-13**

Equity securities with controlling influence

C2

The return on total assets is the focus of analysts, creditors, and other users of financial statements.

1. How is the return on total assets computed?
2. What does this important ratio reflect?

**QS 15-14**

Return on total assets

A1

Return on total assets can be separated into two important components.

1. Write the formula to separate the return on total assets into its two basic components.
2. Explain how these components of the return on total assets are helpful to financial statement users for business decisions.

**QS 15-15**

Component return on total assets A1

A U.S. company sells a product to a British company with the transaction listed in British pounds. On the date of the sale, the transaction total of \$14,500 is billed as £10,000, reflecting an exchange rate of 1.45 (that is, \$1.45 per pound). Prepare the entry to record (1) the sale and (2) the receipt of payment in pounds when the exchange rate is 1.35.

**QS 15-16<sup>A</sup>**

Foreign currency transactions C3

On March 1, 2015, a U.S. company made a credit sale requiring payment in 30 days from a Malaysian company, Hamac Sdn. Bhd., in 20,000 Malaysian ringgits. Assuming the exchange rate between Malaysian ringgits and U.S. dollars is \$0.4538 on March 1 and \$0.4899 on March 31, prepare the entries to record the sale on March 1 and the cash receipt on March 31.

**QS 15-17<sup>A</sup>**

Foreign currency transactions C3

The **Carrefour Group** reports the following description of its trading securities (titled “financial assets reported at fair value in the income statement”).

These are financial assets held by the Group in order to make a short-term profit on the sale. These assets are valued at their fair value with variations in value recognized in the income statement.

**QS 15-18**

International accounting for investments

P1

Carrefour’s financial statements report €7 million in unrealized gains and €26 million in unrealized losses, both included in the fair value of those financial assets held for trading. What amount of these unrealized gains and unrealized losses, if any, are reported in its income statement? Explain.

Complete the following descriptions by filling in the blanks.

1. Debt securities reflect a \_\_\_\_\_ relationship such as investments in notes, bonds, and certificates of deposit.
2. Equity securities reflect an \_\_\_\_\_ relationship such as shares of stock issued by companies.
3. Short-term investments are securities that (1) management intends to convert to cash within \_\_\_\_\_ or the \_\_\_\_\_, whichever is longer, and (2) are readily convertible to \_\_\_\_\_.
4. Long-term investments in securities are defined as those securities that are \_\_\_\_\_ convertible to cash or are \_\_\_\_\_ to be converted into cash in the short term.

Debt and equity securities and short- and long-term investments

C1

**Exercise 15-2**

Accounting for short-term trading securities

P1

(c) Dr. Cash \$7,450

Prepare journal entries to record the following transactions involving the short-term securities investments of Duke Co., all of which occurred during year 2015.

- On March 22, purchased 1,000 shares of RIP Company stock at \$10 per share plus an \$80 brokerage fee. These shares are categorized as trading securities.
- On September 1, received a \$1.00 per share cash dividend on the RIP Company stock purchased in transaction *a*.
- On October 8, sold 500 shares of RIP Co. stock for \$15 per share, less a \$50 brokerage fee.

**Exercise 15-3**

Accounting for trading securities

P1 **Check** (3) Gain, \$2,000

Brooks Co. purchases various investments in trading securities at a cost of \$66,000 on December 27, 2015. (This is its first and only purchase of such securities.) At December 31, 2015, these securities had a fair value of \$72,000.

- Prepare the December 31, 2015, year-end adjusting entry for the trading securities' portfolio.
- Explain how each account in the entry of part 1 is reported in financial statements.
- Prepare the January 3, 2016, entry when Brooks sells a portion of its trading securities (that had originally cost \$33,000) for \$35,000.

**Exercise 15-4**

Accounting for short-term held-to-maturity securities

P2

Prepare journal entries to record the following transactions involving the short-term securities investments of Natura Co., all of which occurred during year 2015.

- On June 15, paid \$1,000,000 cash to purchase Remedy's 90-day short-term debt securities (\$1,000,000 principal), dated June 15, that pay 10% interest (categorized as held-to-maturity securities).
- On September 16, received a check from Remedy in payment of the principal and 90 days' interest on the debt securities purchased in transaction *a*.

**Exercise 15-5**

Accounting for short-term available-for-sale securities

P3

Prepare journal entries to record the following transactions involving the short-term securities investments of Krum Co., all of which occurred during year 2015.

- On August 1, paid \$450,000 cash to purchase Houtte's 9% debt securities (\$450,000 principal), dated July 30, 2015, and maturing January 30, 2016 (categorized as available-for-sale securities).
- On October 30, received a check from Houtte for 90 days' interest on the debt securities purchased in transaction *a*.

**Exercise 15-6**

Transactions in short-term and long-term investments

P1 P2 P3

Prepare journal entries to record the following transactions involving both the short-term and long-term investments of Cancun Corp., all of which occurred during calendar-year 2015. Use the account Short-Term Investments for any transactions that you determine are short term.

- On February 15, paid \$160,000 cash to purchase American General's 90-day short-term notes at par, which are dated February 15 and pay 10% interest (classified as held-to-maturity).
- On March 22, bought 700 shares of Fran Industries common stock at \$51 cash per share plus a \$150 brokerage fee (classified as long-term available-for-sale securities).
- On May 15, received a check from American General in payment of the principal and 90 days' interest on the notes purchased in transaction *a*.
- On July 30, paid \$100,000 cash to purchase MP3 Electronics's 8% notes at par, dated July 30, 2015, and maturing on January 30, 2016 (classified as trading securities).
- On September 1, received a \$1.00 per share cash dividend on the Fran Industries common stock purchased in transaction *b*.
- On October 8, sold 350 shares of Fran Industries common stock for \$64 cash per share, less a \$125 brokerage fee.
- On October 30, received a check from MP3 Electronics for three months' interest on the notes purchased in transaction *d*.

**Exercise 15-7**

Adjusting available-for-sale securities to fair value

P3 **Check** Unrealized loss, \$9,100

On December 31, 2015, Reggit Company held the following short-term investments in its portfolio of available-for-sale securities. Reggit had no short-term investments in its prior accounting periods. Prepare the December 31, 2015, adjusting entry to report these investments at fair value.

Available-for-Sale Securities	Cost	Fair Value
Verrizano Corporation bonds payable . . . . .	\$89,600	\$91,600
Preble Corporation notes payable . . . . .	70,600	62,900
Lucerne Company common stock . . . . .	86,500	83,100

On December 31, 2015, Lujack Co. held the following short-term available-for-sale securities. Lujack had no short-term investments prior to the current period. Prepare the December 31, 2015, year-end adjusting entry to record the fair value adjustment for these securities.

Available-for-Sale Securities	Cost	Fair Value
Nintendo Co. common stock . . . . .	\$44,450	\$48,900
Atlantic bonds payable . . . . .	49,000	47,000
Kellogg Co. notes payable . . . . .	25,000	23,200
McDonald's Corp. common stock . . . . .	46,300	44,800

**Exercise 15-8**

Fair value adjustment to available-for-sale securities

P3

Prescrip Co. began operations in 2014. The cost and fair values for its long-term investments portfolio in available-for-sale securities are shown below. Prepare Prescrip's December 31, 2015, adjusting entry to reflect any necessary fair value adjustment for these investments.

Portfolio of Available-for-Sale Securities	Cost	Fair Value
December 31, 2014 . . . . .	\$120,483	\$118,556
December 31, 2015 . . . . .	60,120	90,271

**Exercise 15-9**

Fair value adjustment to available-for-sale securities

P3

Ticker Services began operations in 2013 and maintains long-term investments in available-for-sale securities. The year-end cost and fair values for its portfolio of these investments follow. Prepare journal entries to record each year-end fair value adjustment for these securities.

Portfolio of Available-for-Sale Securities	Cost	Fair Value
December 31, 2013 . . . . .	\$372,000	\$360,860
December 31, 2014 . . . . .	428,500	455,800
December 31, 2015 . . . . .	600,200	700,500
December 31, 2016 . . . . .	876,900	780,200

**Exercise 15-10**

Multiyear fair value adjustments to available-for-sale securities

P3

Information regarding Carperk Company's individual investments in securities during its calendar-year 2015, along with the December 31, 2015, fair values, follows.

- Investment in Brava Company bonds: \$420,500 cost, \$457,000 fair value. Carperk intends to hold these bonds until they mature in 2020.
- Investment in Baybridge common stock: 29,500 shares; \$362,450 cost; \$391,375 fair value. Carperk owns 32% of Baybridge's voting stock and has a significant influence over Baybridge.
- Investment in Buffa common stock: 12,000 shares; \$165,500 cost; \$178,000 fair value. This investment amounts to 3% of Buffa's outstanding shares, and Carperk's goal with this investment is to earn dividends over the next few years.
- Investment in Newton common stock: 3,500 shares; \$90,300 cost; \$88,625 fair value. Carperk's goal with this investment is to reap an increase in fair value of the stock over the next three to five years. Newton has 30,000 common shares outstanding.
- Investment in Farmers common stock: 16,300 shares; \$100,860 cost; \$111,210 fair value. This stock is marketable and is held as an investment of cash available for operations.

**Exercise 15-11**

Classifying investments in securities; recording fair values

C1 P2 P3 P4

**Required**

- Identify whether each investment should be classified as a short-term or long-term investment. For each long-term investment, indicate in which of the long-term investment classifications it should be placed.
- Prepare a journal entry dated December 31, 2015, to record the fair value adjustment of the long-term investments in available-for-sale securities. Carperk had no long-term investments prior to year 2015.

**Check** (2) Unrealized gain, \$10,825

**Exercise 15-12**Securities transactions;  
equity method

P4

Prepare journal entries to record the following transactions and events of Kodax Company.

**2015**

- Jan. 2 Purchased 30,000 shares of Grecco Co. common stock for \$408,000 cash plus a broker's fee of \$3,000 cash. Bushtex has 90,000 shares of common stock outstanding and its policies will be significantly influenced by Kodax.
- Sept. 1 Grecco declared and paid a cash dividend of \$1.50 per share.
- Dec. 31 Grecco announced that net income for the year is \$486,900.

**2016**

- June 1 Grecco declared and paid a cash dividend of \$2.10 per share.
- Dec. 31 Grecco announced that net income for the year is \$702,750.
- Dec. 31 Kodax sold 10,000 shares of Grecco for \$320,000 cash.

**Exercise 15-13**Equity securities with  
controlling influence

C2

Complete the following descriptions by filling in the blanks.

- Consolidated \_\_\_\_\_ show the financial position, results of operations, and cash flows of all entities under the parent's control, including all subsidiaries.
- The equity method with \_\_\_\_\_ is used to account for long-term investments in equity securities with controlling influence.

**Exercise 15-14**

Return on total assets

A1

The following information is available from the financial statements of Regae Industries. Compute Regae's return on total assets for 2015 and 2016. (Round returns to one-tenth of a percent.) Comment on the company's efficiency in using its assets in 2015 and 2016.

	A	B	C	D
1		<b>2014</b>	<b>2015</b>	<b>2016</b>
2	Total assets, December 31	\$210,000	\$340,000	\$770,000
3	Net income	30,200	38,400	60,300
4				

**Exercise 15-15<sup>A</sup>**Foreign currency  
transactions

C3

Leigh of New York sells its products to customers in the United States and the United Kingdom. On December 16, 2015, Leigh sold merchandise on credit to Bronson Ltd. of London at a price of 17,000 pounds. The exchange rate on that day for £1 was \$1.4583. On December 31, 2015, when Leigh prepared its financial statements, the rate was £1 for \$1.4382. Bronson paid its bill in full on January 15, 2016, at which time the exchange rate was £1 for \$1.4482. Leigh immediately exchanged the 17,000 pounds for U.S. dollars. Prepare Leigh's journal entries on December 16, December 31, and January 15 (round to the nearest dollar).

**Exercise 15-16<sup>A</sup>**Computing foreign  
exchange gains and  
losses on receivables

C3

On May 8, 2015, Jett Company (a U.S. company) made a credit sale to Lopez (a Mexican company). The terms of the sale required Lopez to pay 800,000 pesos on February 10, 2016. Jett prepares quarterly financial statements on March 31, June 30, September 30, and December 31. The exchange rates for pesos during the time the receivable is outstanding follow.

May 8, 2015 .....	\$0.1323
June 30, 2015 .....	0.1352
September 30, 2015 .....	0.1368
December 31, 2015 .....	0.1335
February 10, 2016 .....	0.1386

Compute the foreign exchange gain or loss that Jett should report on each of its quarterly income statements for the last three quarters of 2015 and the first quarter of 2016. Also compute the amount reported on Jett's balance sheets at the end of each of its last three quarters of 2015.

The **Carrefour Group** reports the following description of its financial assets available-for-sale.

Assets available for sale are . . . valued at fair value. Unrealized . . . gains or losses are recorded as shareholders' equity until they are sold.

Carrefour's financial statements report €18 million in *net* unrealized losses (net of unrealized gains), which are included in the fair value of its available-for-sale securities reported on the balance sheet.

1. What amount of the €18 million net unrealized losses, if any, is reported in the income statement? Explain.
2. If the €18 million net unrealized losses are not reported in the income statement, in which statement are they reported, if any? Explain.

### Exercise 15-17

International accounting for investments

P3

Carlsville Company, which began operations in 2015, invests its idle cash in trading securities. The following transactions are from its short-term investments in trading securities.

#### 2015

- Jan. 20 Purchased 800 shares of Ford Motor Co. at \$26 per share plus a \$125 commission.
- Feb. 9 Purchased 2,200 shares of Lucent at \$44.25 per share plus a \$578 commission.
- Oct. 12 Purchased 750 shares of Z-Seven at \$7.50 per share plus a \$200 commission.
- Dec. 31 Fair value of the short-term investments in trading securities is \$130,000.

#### 2016

- Apr. 15 Sold 800 shares of Ford Motor Co. at \$29 per share less a \$285 commission.
- July 5 Sold 750 shares of Z-Seven at \$10.25 per share less a \$102.50 commission.
- July 22 Purchased 1,600 shares of Hunt Corp. at \$30 per share plus a \$444 commission.
- Aug. 19 Purchased 1,800 shares of Donna Karan at \$18.25 per share plus a \$290 commission.
- Dec. 31 Fair value of the short-term investments in trading securities is \$160,000.

#### 2017

- Feb. 27 Purchased 3,400 shares of HCA at \$34 per share plus a \$420 commission.
- Mar. 3 Sold 1,600 shares of Hunt at \$25 per share less a \$250 commission.
- June 21 Sold 2,200 shares of Lucent at \$42 per share less a \$420 commission.
- June 30 Purchased 1,200 shares of Black & Decker at \$47.50 per share plus a \$595 commission.
- Nov. 1 Sold 1,800 shares of Donna Karan at \$18.25 per share less a \$309 commission.
- Dec. 31 Fair value of the short-term investments in trading securities is \$180,000.

### Required

Prepare journal entries to record these short-term investment activities for the years shown. On December 31 of each year, prepare the adjusting entry to record any necessary fair value adjustment for the portfolio of trading securities.

### PROBLEM SET A

#### Problem 15-1A

Recording transactions and fair value adjustments for trading securities

P1

Rose Company had no short-term investments prior to year 2015. It had the following transactions involving short-term investments in available-for-sale securities during 2015.

- Apr. 16 Purchased 4,000 shares of Gem Co. stock at \$24.25 per share plus a \$180 brokerage fee.
- May 1 Paid \$100,000 to buy 91-day U.S. Treasury bills (debt securities): \$100,000 principal amount, 6% interest, securities dated May 1.
- July 7 Purchased 2,000 shares of PepsiCo stock at \$49.25 per share plus a \$175 brokerage fee.
- 20 Purchased 1,000 shares of Xerox stock at \$16.75 per share plus a \$205 brokerage fee.
- Aug. 3 Received a check for principal and accrued interest on the U.S. Treasury bills that matured on July 31.
- 15 Received an \$0.85 per share cash dividend on the Gem Co. stock.
- 28 Sold 2,000 shares of Gem Co. stock at \$30 per share less a \$225 brokerage fee.
- Oct. 1 Received a \$1.90 per share cash dividend on the PepsiCo shares.
- Dec. 15 Received a \$1.05 per share cash dividend on the remaining Gem Co. shares.
- 31 Received a \$1.30 per share cash dividend on the PepsiCo shares.

#### Problem 15-2A

Recording, adjusting, and reporting short-term available-for-sale securities

P3

**Required****Check** (2) Cost = \$164,220(3) Dr. Unrealized  
Loss—Equity \$4,470

1. Prepare journal entries to record the preceding transactions and events.
2. Prepare a table to compare the year-end cost and fair values of Rose's short-term investments in available-for-sale securities. The year-end fair values per share are: Gem Co., \$26.50; PepsiCo, \$46.50; and Xerox, \$13.75.
3. Prepare an adjusting entry, if necessary, to record the year-end fair value adjustment for the portfolio of short-term investments in available-for-sale securities.

**Analysis Component**

4. Explain the balance sheet presentation of the fair value adjustment for Rose's short-term investments.
5. How do these short-term investments affect Rose's (a) income statement for year 2015 and (b) the equity section of its balance sheet at year-end 2015?

**Problem 15-3A**

Recording, adjusting, and reporting long-term available-for-sale securities

P3

Grass Security, which began operations in 2015, invests in long-term available-for-sale securities. Following is a series of transactions and events determining its long-term investment activity.

**2015**

- Jan. 20 Purchased 1,000 shares of Johnson & Johnson at \$20.50 per share plus a \$240 commission.  
 Feb. 9 Purchased 1,200 shares of Sony at \$46.20 per share plus a \$225 commission.  
 June 12 Purchased 1,500 shares of Mattel at \$27.00 per share plus a \$195 commission.  
 Dec. 31 Per share fair values for stocks in the portfolio are Johnson & Johnson, \$21.50; Mattel, \$30.90; Sony, \$38.

**2016**

- Apr. 15 Sold 1,000 shares of Johnson & Johnson at \$23.50 per share less a \$525 commission.  
 July 5 Sold 1,500 shares of Mattel at \$23.90 per share less a \$235 commission.  
 July 22 Purchased 600 shares of Sara Lee at \$22.50 per share plus a \$480 commission.  
 Aug. 19 Purchased 900 shares of Eastman Kodak at \$17 per share plus a \$198 commission.  
 Dec. 31 Per share fair values for stocks in the portfolio are: Kodak, \$19.25; Sara Lee, \$20.00; Sony, \$35.00.

**2017**

- Feb. 27 Purchased 2,400 shares of Microsoft at \$67.00 per share plus a \$525 commission.  
 June 21 Sold 1,200 shares of Sony at \$48.00 per share less an \$880 commission.  
 June 30 Purchased 1,400 shares of Black & Decker at \$36.00 per share plus a \$435 commission.  
 Aug. 3 Sold 600 shares of Sara Lee at \$16.25 per share less a \$435 commission.  
 Nov. 1 Sold 900 shares of Eastman Kodak at \$22.75 per share less a \$625 commission.  
 Dec. 31 Per share fair values for stocks in the portfolio are: Black & Decker, \$39.00; Microsoft, \$69.00.

1. Prepare journal entries to record these transactions and events and any year-end fair value adjustments to the portfolio of long-term available-for-sale securities.
2. Prepare a table that summarizes the (a) total cost, (b) total fair value adjustment, and (c) total fair value of the portfolio of long-term available-for-sale securities at each year-end.
3. Prepare a table that summarizes (a) the realized gains and losses and (b) the unrealized gains or losses for the portfolio of long-term available-for-sale securities at each year-end.

**Problem 15-4A**

Accounting for long-term investments in securities; with and without significant influence

P3 P4

Selk Steel Co., which began operations on January 4, 2015, had the following subsequent transactions and events in its long-term investments.

**2015**

- Jan. 5 Selk purchased 60,000 shares (20% of total) of Kildaire's common stock for \$1,560,000.  
 Oct. 23 Kildaire declared and paid a cash dividend of \$3.20 per share.  
 Dec. 31 Kildaire's net income for 2015 is \$1,164,000, and the fair value of its stock at December 31 is \$30.00 per share.

**2016**

- Oct. 15 Kildaire declared and paid a cash dividend of \$2.60 per share.  
 Dec. 31 Kildaire's net income for 2016 is \$1,476,000, and the fair value of its stock at December 31 is \$32.00 per share.

**2017**

- Jan. 2 Selk sold all of its investment in Kildaire for \$1,894,000 cash.

**Part 1**

Assume that Selk has a significant influence over Kildaire with its 20% share of stock.

**Required**

1. Prepare journal entries to record these transactions and events for Selk.
2. Compute the carrying (book) value per share of Selk's investment in Kildaire common stock as reflected in the investment account on January 1, 2017.
3. Compute the net increase or decrease in Selk's equity from January 5, 2015, through January 2, 2017, resulting from its investment in Kildaire.

**Check** (2) Carrying value per share, \$29

**Part 2**

Assume that although Selk owns 20% of Kildaire's outstanding stock, circumstances indicate that it does not have a significant influence over the investee and that it is classified as an available-for-sale security investment.

**Required**

1. Prepare journal entries to record the preceding transactions and events for Selk. Also prepare an entry dated January 2, 2017, to remove any balance related to the fair value adjustment.
2. Compute the cost per share of Selk's investment in Kildaire common stock as reflected in the investment account on January 1, 2017.
3. Compute the net increase or decrease in Selk's equity from January 5, 2015, through January 2, 2017, resulting from its investment in Kildaire.

Stoll Co.'s long-term available-for-sale portfolio at December 31, 2014, consists of the following.

Available-for-Sale Securities	Cost	Fair Value
40,000 shares of Company A common stock .....	\$535,300	\$490,000
7,000 shares of Company B common stock .....	159,380	154,000
17,500 shares of Company C common stock .....	662,750	640,938

**Problem 15-5A**

Long-term investment transactions; unrealized and realized gains and losses

**C2 P3 P4**

Stoll enters into the following long-term investment transactions during year 2015.

- Jan. 29 Sold 3,500 shares of Company B common stock for \$79,188 less a brokerage fee of \$1,500.  
 Apr. 17 Purchased 10,000 shares of Company W common stock for \$197,500 plus a brokerage fee of \$2,400. The shares represent a 30% ownership in Company W.  
 July 6 Purchased 4,500 shares of Company X common stock for \$126,562 plus a brokerage fee of \$1,750. The shares represent a 10% ownership in Company X.  
 Aug. 22 Purchased 50,000 shares of Company Y common stock for \$375,000 plus a brokerage fee of \$1,200. The shares represent a 51% ownership in Company Y.  
 Nov. 13 Purchased 8,500 shares of Company Z common stock for \$267,900 plus a brokerage fee of \$2,450. The shares represent a 5% ownership in Company Z.  
 Dec. 9 Sold 40,000 shares of Company A common stock for \$515,000 less a brokerage fee of \$4,100.

The fair values of its investments at December 31, 2015, are: B, \$81,375; C, \$610,312; W, \$191,250; X, \$118,125; Y, \$531,250; and Z, \$278,800.

**Required**

1. Determine the amount Stoll should report on its December 31, 2015, balance sheet for its long-term investments in available-for-sale securities.
2. Prepare any necessary December 31, 2015, adjusting entry to record the fair value adjustment for the long-term investments in available-for-sale securities.
3. What amount of gains or losses on transactions relating to long-term investments in available-for-sale securities should Stoll report on its December 31, 2015, income statement?

**Check** (2) Cr. Unrealized Loss—Equity, \$20,002

**SERIAL PROBLEM**

Business Solutions

P1

(This serial problem began in Chapter 1 and continues through most of the book. If previous chapter segments were not completed, the serial problem can begin at this point. It is helpful, but not necessary, to use the Working Papers that accompany the book.)

**SP 15** While reviewing the March 31, 2016, balance sheet of Business Solutions, Santana Rey notes that the business has built a large cash balance of \$68,057. Its most recent bank money market statement shows that the funds are earning an annualized return of 0.75%. S. Rey decides to make several investments with the desire to earn a higher return on the idle cash balance. Accordingly, in April 2016, Business Solutions makes the following investments in trading securities:

- Apr. 16 Purchases 400 shares of Johnson & Johnson stock at \$50 per share plus a \$300 commission.
- Apr. 30 Purchases 200 shares of Starbucks Corporation at \$22 per share plus a \$250 commission.

On June 30, 2016, the per share market price (fair value) of the Johnson & Johnson shares is \$55 and the Starbucks shares is \$19.

**Required**

1. Prepare journal entries to record the April purchases of trading securities by Business Solutions.
2. On June 30, 2016, prepare the adjusting entry to record any necessary fair value adjustment to its portfolio of trading securities.

**GL GENERAL LEDGER PROBLEM**

Available only in Connect Plus

The following General Ledger assignments focus on the account for investments in available-for-sale securities and equity method investments.

**GL 15-1** General Ledger assignment 15-1 is adapted from Problem 15-2A. Prepare journal entries related to short-term investments in available-for-sale securities, including the adjustment to fair value, if necessary.

**GL 15-2** General Ledger assignment 15-2 is adapted from Problem 15-5A. Prepare journal entries related to long-term investments transactions and the related realized and unrealized gains.

**Beyond the Numbers**

**REPORTING IN ACTION**

**APPLE**

**BTN 15-1** Refer to **Apple's** financial statements in Appendix A to answer the following.

1. Are its financial statements consolidated? How can you tell?
2. What is the amount of *comprehensive income* for the year ended September 28, 2013?
3. Does it have any foreign operations? How can you tell?
4. Compute its return on total assets for the year ended September 28, 2013.

**Fast Forward**

5. Access Apple's annual report for a fiscal year ending after September 28, 2013, from either its website ([Apple.com](http://Apple.com)) or the SEC's database ([www.SEC.gov](http://www.SEC.gov)). Recompute its return on total assets for the years subsequent to September 28, 2013.

**COMPARATIVE ANALYSIS**

**APPLE GOOGLE**

**BTN 15-2** Key figures for **Apple** and **Google** follow.

(\$ millions)	Apple			Google		
	Current Year	1 Year Prior	2 Years Prior	Current Year	1 Year Prior	2 Years Prior
Net income	\$ 37,037	\$ 41,733	\$ 25,922	\$ 12,920	\$10,737	\$ 9,737
Net sales	170,910	156,508	108,249	59,825	50,175	37,905
Total assets	207,000	176,064	116,371	110,920	93,798	72,574

**Required**

1. Compute return on total assets for Apple and Google for the two most recent years.
2. Separate the return on total assets computed in part 1 into its components for both companies and both years according to the formula in Exhibit 15.9.
3. Which company has the highest total return on assets? The highest profit margin? The highest total asset turnover? What does this comparative analysis reveal? (Assume an industry average of 10.0% for return on assets.)

**BTN 15-3** Kasey Hartman is the controller for Wholemart Company, which has numerous long-term investments in debt securities. Wholemart's investments are mainly in five-year bonds. Hartman is preparing its year-end financial statements. In accounting for long-term debt securities, she knows that each long-term investment must be designated as a held-to-maturity or an available-for-sale security. Interest rates rose sharply this past year, causing the portfolio's fair value to substantially decline. The company does not intend to hold the bonds for the entire five years. Hartman also earns a bonus each year, which is computed as a percent of net income.

**Required**

1. Will Hartman's bonus depend in any way on the classification of the debt securities? Explain.
2. What criteria must Hartman use to classify the securities as held-to-maturity or available-for-sale?
3. Is there likely any company oversight of Hartman's classification of the securities? Explain.

**ETHICS  
CHALLENGE**

P2 P3

**BTN 15-4** Assume that you are Jolee Company's accountant. Company owner Mary Jolee has reviewed the 2015 financial statements you prepared and questions the \$6,000 loss reported on the sale of its investment in Kemper Co. common stock. Jolee acquired 50,000 shares of Kemper's common stock on December 31, 2013, at a cost of \$500,000. This stock purchase represented a 40% interest in Kemper. The 2014 income statement reported that earnings from all investments were \$126,000. On January 3, 2015, Jolee Company sold the Kemper stock for \$575,000. Kemper did not pay any dividends during 2014 but reported a net income of \$202,500 for that year. Mary Jolee believes that because the Kemper stock purchase price was \$500,000 and was sold for \$575,000, the 2015 income statement should report a \$75,000 gain on the sale.

**Required**

Draft a half-page memorandum to Mary Jolee explaining why the \$6,000 loss on sale of Kemper stock is correctly reported.

**COMMUNICATING  
IN PRACTICE**P4  

**BTN 15-5** Access the July 30, 2013, 10-K filing (for year-end June 30, 2013) of **Microsoft** (MSFT) at [www.SEC.gov](http://www.SEC.gov). Review its note 4, "Investments."

**Required**

1. How does the "cost-basis" total amount for its investments as of June 30, 2013, compare to the prior year-end amount?
2. Identify at least eight types of short-term investments held by Microsoft as of June 30, 2013.
3. What were Microsoft's unrealized gains and its unrealized losses from its investments for 2013?
4. Was the cost or fair value ("recorded basis") of the investments higher as of June 30, 2013?

**TAKING IT TO  
THE NET**C1 

**TEAMWORK IN ACTION**

C1 C2 P1 P2 P3 P4

**BTN 15-6** Each team member is to become an expert on a specific classification of long-term investments. This expertise will be used to facilitate other teammates' understanding of the concepts and procedures relevant to the classification chosen.

1. Each team member must select an area for expertise by choosing one of the following classifications of long-term investments.
  - a. Held-to-maturity debt securities
  - b. Available-for-sale debt and equity securities
  - c. Equity securities with significant influence
  - d. Equity securities with controlling influence
2. Learning teams are to disburse and expert teams are to be formed. Expert teams are made up of those who select the same area of expertise. The instructor will identify the location where each expert team will meet.
3. Expert teams will collaborate to develop a presentation based on the following requirements. Students must write the presentation in a format they can show to their learning teams in part 4.

**Requirements for Expert Presentation**

- a. Write a transaction for the acquisition of this type of investment security. The transaction description is to include all necessary data to reflect the chosen classification.
  - b. Prepare the journal entry to record the acquisition.
 

[Note: The expert team on equity securities with controlling influence will substitute requirements (d) and (e) with a discussion of the reporting of these investments.]
  - c. Identify information necessary to complete the end-of-period adjustment for this investment.
  - d. Assuming that this is the only investment owned, prepare any necessary year-end entries.
  - e. Present the relevant balance sheet section(s).
4. Re-form learning teams. In rotation, experts are to present to their teams the presentations they developed in part 3. Experts are to encourage and respond to questions.

**ENTREPRENEURIAL DECISION**

**BTN 15-7<sup>A</sup>** Refer to the opening feature in this chapter about Hannah Davis and her company, **BANGS**. Assume that the company must acquire the Japanese rights to the website BANGS, which will then be branded with its shoes for sale in Japan. Assume the company acquires those rights on January 1, 2015, from a Japanese distributor and agrees to pay 12,000,000 yen per year for those rights. Quarterly payments are due March 31, June 30, September 30, and December 31 each year. On January 1, 2015, the yen is worth \$0.00891.

**Required**

1. Prepare the journal entry to record the Internet rights purchased on January 1, 2015.
2. Prepare the journal entries to record the payments on March 31, June 30, September 30, and December 31, 2015. The value of the yen on those dates follows.

March 31 .....	\$0.00893
June 30 .....	0.00901
September 30 .....	0.00902
December 31 .....	0.00897

3. How can the company protect itself from unanticipated gains and losses from currency translation if all of the payments are specified to be paid in yen?

**HITTING THE ROAD**

C3

**BTN 15-8<sup>A</sup>** Assume that you are planning a spring break trip to Europe. Identify three locations where you can find exchange rates for the dollar relative to the euro or other currencies.

**BTN 15-9** Samsung, Apple, and Google are competitors in the global marketplace. Following are selected data from each company.

Key Figure	Samsung (Korean won millions)			Apple		Google	
	Current Year	One Year Prior	Two Years Prior	Current Year	Prior Year	Current Year	Prior Year
Net income	₩30,474,764	₩ 23,845,285	₩13,759,043	—	—	—	—
Net sales	228,692,667	201,103,613	165,001,771	—	—	—	—
Total assets	214,075,018	181,071,570	155,800,263	—	—	—	—
Profit margin	?	?	—	21.7%	26.7%	21.6%	21.4%
Total asset turnover	?	?	—	0.89	1.07	0.58	0.60

## GLOBAL DECISION

**Samsung**  
**APPLE**  
**GOOGLE**

### Required

1. Compute Samsung's return on total assets, and its components of profit margin and total asset turnover, for the most recent two years using the data provided.
2. Which of these three companies has the highest return on total assets? Highest profit margin? Highest total asset turnover? Interpret these results for the (a) current year and (b) prior year.

## ANSWERS TO MULTIPLE CHOICE QUIZ

1. d;  $\$30,000 \times 5\% \times 5/12 = \$625$
2. a; Unrealized gain =  $\$84,500 - \$83,000 = \$1,500$
3. b;  $\$50,000 \times 35\% = \$17,500$
4. e;  $\$300,000/\$2,000,000 = 15\%$
5. b; Profit margin =  $\$80,000/\$600,000 = 13.3\%$   
Total asset turnover =  $\$600,000/\$400,000 = 1.5$

# Reporting the Statement of Cash Flows

## Chapter Preview

### BASICS OF CASH FLOW REPORTING

- C1** Purpose, measurement, and classification  
Noncash activities
- P1** Format and preparation

### CASH FLOWS FROM OPERATING

- P2** Indirect and direct methods of reporting  
Illustration of indirect method  
Summary of indirect method adjustments

### CASH FLOWS FROM INVESTING

- P3** Three-stage process of analysis  
Analyzing noncurrent assets  
Analyzing other assets

### CASH FLOWS FROM FINANCING

- P3** Three-stage process of analysis  
Analyzing noncurrent liabilities  
Analyzing equity  
Overall summary using T-accounts
- A1** Analyzing cash

## Learning Objectives

### CONCEPTUAL

- C1** Distinguish between operating, investing, and financing activities, and describe how noncash investing and financing activities are disclosed.

### ANALYTICAL

- A1** Analyze the statement of cash flows and apply the cash flow on total assets ratio.

### PROCEDURAL

- P1** Prepare a statement of cash flows.
- P2** Compute cash flows from operating activities using the indirect method.
- P3** Determine cash flows from both investing and financing activities.

- P4** *Appendix 16A*—Illustrate use of a spreadsheet to prepare a statement of cash flows.

- P5** *Appendix 16B*—Compute cash flows from operating activities using the direct method.

## Lend an Ear

LOS ANGELES—“To have never heard music, laughter, nature—that’s unimaginable for me,” explains Bridget Hilton. “I’m inspired to enable people to have that joy in their lives.” That inspiration led Bridget, along with Joe Huff, to launch **LSTN** ([LSTNheadphones.com](http://LSTNheadphones.com)), a social enterprise “making headphones that sounded good, looked good, and were doing good!” Bridget explains that “we set forth on a mission that would set us apart—we’d produce great headphones made from reclaimed wood and, for every pair sold, LSTN would help restore hearing to a person in need.”

To make her mission a reality, Bridget had to learn to run a manufacturing business with little cash. First, she set up what she says are “the two most important things—a manufacturer and a charity partner.” However, cash shortage was still a problem. In response, Bridget “launched the site as a pre-order—in this day and age, you can launch a company with next to no money.”

Bridget admits that as business grew and revenue flowed in, it was hard to find the cash from operations to expand. Many entrepreneurs turn to external cash financing in such cases. However, Bridget tightened her belt and focused on a lean operation. “Keep the spending down as long as possible. You don’t need an office right away, or T-shirts with your logo, big events, a super fancy website, a bunch of employees,

etc.,” insists Bridget. “Work out of your house and coffee shops, use your network as much as possible, and put your head down and work hard. If you have a physical product, buy or make as little as possible (a minimum viable product) and test it to see if people even want it before you dump all your money into inventory.”

Bridget monitors and controls cash flows for each of her operating, investing, and financing activities. “Being frugal will help you not only financially, but it will also force you to be creative,” insists Bridget. Yet it is the mission that inspires her. “I love my company and what I do, so working is exciting.” Even her analysis of LSTN’s statement of cash flows, and its individual inflows and outflows, is embraced as it helps her stay on track.

To date, Bridget has successfully controlled cash outflows while growing cash inflows. She relies on cash flow information to make important business decisions, but never loses touch with her mission. “I recently returned from a trip to Peru,” says Bridget. “When I saw the faces that lit up when children connected and communicated with their families, I lost it. It was truly life changing . . . to even change one person’s life through our business proved that our plan was working.”

## BASICS OF CASH FLOW REPORTING

This section describes the basics of cash flow reporting, including its purpose, measurement, classification, format, and preparation.

### Purpose of the Statement of Cash Flows

The purpose of the **statement of cash flows** is to report cash receipts (inflows) and cash payments (outflows) during a period. This includes separately identifying the cash flows related to operating, investing, and financing activities. It is the detailed disclosure of individual sources and uses of cash that makes this statement useful to users. Information in this statement helps users answer questions such as these:

**Point:** Internal users rely on the statement of cash flows to make investing and financing decisions. External users rely on this statement to assess the amount and timing of a company's cash flows.

- What explains the change in the cash balance?
- Why do income and cash flows differ?
- Where does a company spend its cash?
- How much is paid in dividends?
- How does a company receive its cash?
- Is there a cash shortage?

### Importance of Cash Flows

Information about cash flows can influence decision makers in important ways. For instance, we look more favorably at a company that is financing its expenditures with cash from operations than one that does it by selling its assets. Information about cash flows helps users decide whether a company has enough cash to pay its existing debts as they mature. It is also relied upon to evaluate a company's ability to meet unexpected obligations and pursue unexpected opportunities. External information users, especially, want to assess a company's ability to take advantage of new business opportunities. Internal users such as managers use cash flow information to plan day-to-day operating activities and make long-term investment decisions.

**Macy's** striking turnaround is an example of how analysis and management of cash flows can lead to improved financial stability. Several years ago Macy's obtained temporary protection from bankruptcy. It desperately needed to improve its cash flows, and did so by engaging in aggressive cost-cutting measures. As a result, Macy's annual cash flow rose to \$210 million, up from a negative cash flow of \$38.9 million in the prior year. Macy's eventually met its financial obligations and then successfully merged with **Federated Department Stores**.

The case of **W. T. Grant Co.** is a classic example of the importance of cash flow information in predicting a company's future performance and financial strength. Grant reported net income of more than \$40 million per year for three consecutive years. At that same time, it was experiencing an alarming decrease in cash provided by operations. For instance, net cash outflow was more than \$90 million by the end of that three-year period. Grant soon went bankrupt. Users who relied solely on Grant's income numbers were unpleasantly surprised. This reminds us that cash flows as well as income statement and balance sheet information are crucial in business decisions.

Bloomberg via Getty Images

### Decision Insight

**Do You Know Your Cash Flows?** "A lender must have a complete understanding of a borrower's cash flows to assess both the borrowing needs and repayment sources. This requires information about the major types of cash inflows and outflows. I have seen many companies, whose financial statements indicate good profitability, experience severe financial problems because the owners or managers lacked a good understanding of cash flows."—Mary E. Garza, **Bank of America** ■

### Measurement of Cash Flows

Cash flows are defined to include both *cash* and *cash equivalents*. The statement of cash flows explains the difference between the beginning and ending balances of cash and cash equivalents. We continue to use the phrases *cash flows* and the *statement of cash flows*, but remember that both phrases refer to cash and cash equivalents.

Recall that a cash equivalent must satisfy two criteria: (1) be readily convertible to a known amount of cash and (2) be sufficiently close to its maturity so its market value is unaffected by interest rate changes. In most cases, a debt security must be within three months of its maturity

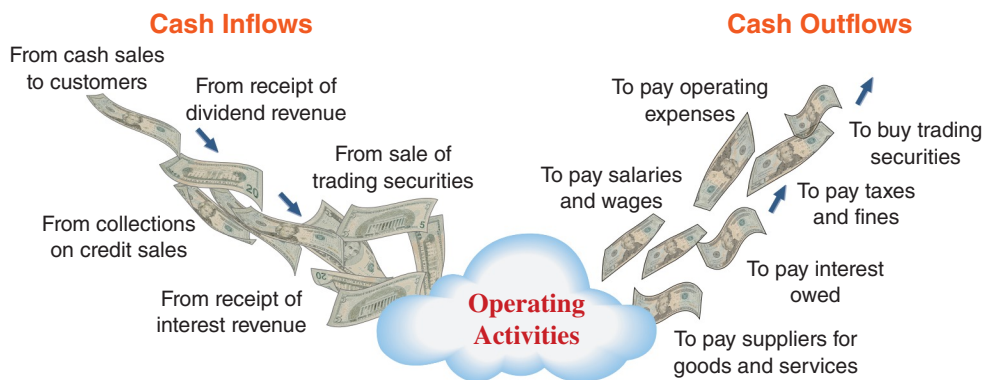

Cash Equivalents

to satisfy these criteria. Companies must disclose and follow a clear policy for determining cash and cash equivalents and apply it consistently from period to period. **American Express**, for example, defines its cash equivalents as “time deposits and other highly liquid investments with original maturities of 90 days or less.”

## Classification of Cash Flows

Since cash and cash equivalents are combined, the statement of cash flows does not report transactions between cash and cash equivalents, such as cash paid to purchase cash equivalents and cash received from selling cash equivalents. However, all other cash receipts and cash payments are classified and reported on the statement in one of three categories—operating, investing, or financing activities. Individual cash receipts and payments for each of these three categories are labeled to identify their originating transactions or events. A net cash inflow (source) occurs when the receipts in a category exceed the payments. A net cash outflow (use) occurs when the payments in a category exceed the receipts.

**Operating Activities** Operating activities include those transactions and events that determine net income. Examples are the production and purchase of inventory, the sale of goods and services to customers, and the expenditures to operate the business. Not all items in income, such as unusual gains and losses, are operating activities (we discuss these exceptions later). Exhibit 16.1 lists the more common cash inflows and outflows from operating activities.

### EXHIBIT 16.1

Cash Flows from Operating Activities

**Investing Activities** Investing activities generally include those transactions and events that affect long-term assets—namely, the purchase and sale of long-term assets. They also include (1) the purchase and sale of short-term investments in the securities of other entities, *except* trading securities, and (2) lending and collecting money for notes receivable. Exhibit 16.2 lists examples of cash flows from investing activities. Cash from collecting the principal amounts of notes that result from a loan to another party are classified as investing. However, the FASB requires that the collection of interest on notes be reported as an operating activity; also, if a note results from sales to customers, it is classified as operating.

### EXHIBIT 16.2

Cash Flows from Investing Activities

**C1** Distinguish between operating, investing, and financing activities, and describe how noncash investing and financing activities are disclosed.

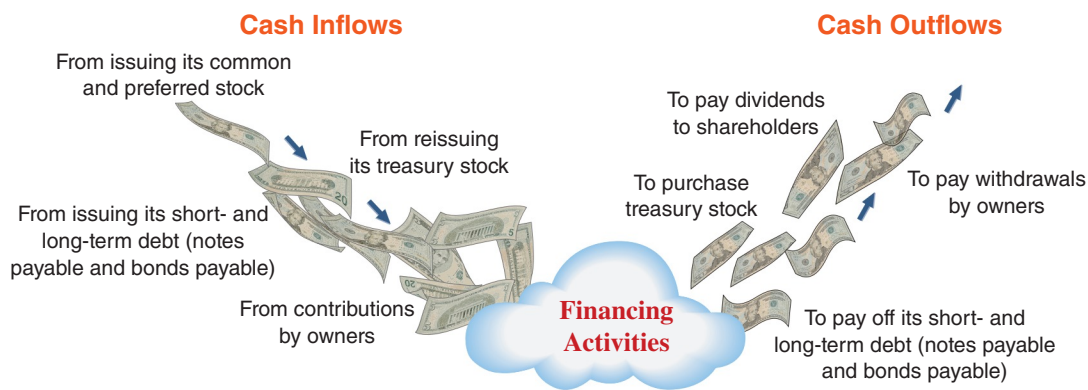

**Point:** The FASB requires that cash dividends received and cash interest received be reported as operating activities.

**Financing Activities** Financing activities include those transactions and events that affect long-term liabilities and equity. Examples are (1) obtaining cash from issuing debt and repaying the amounts borrowed and (2) receiving cash from or distributing cash to owners. These activities involve transactions with a company’s owners and creditors. They also involve borrowing and repaying principal amounts relating to both short- and long-term debt. GAAP requires that payments of interest expense be classified as operating activities. Exhibit 16.3 lists examples of cash flows from financing activities.

**Point:** Interest payments on a loan are classified as operating activities, but payments of loan principal are financing activities.

**EXHIBIT 16.3**

Cash Flows from Financing Activities

**Link Between Classification of Cash Flows and the Balance Sheet** As you see, operating, investing, and financing activities are loosely linked to different parts of the balance sheet. Operating activities, besides being affected by the income statement, are also affected by changes in current assets and current liabilities. Investing activities are affected by changes in long-term assets. Financing activities are affected by changes in long-term liabilities and equity. These links are shown in Exhibit 16.4. Exceptions to these links are: (1) current assets *unrelated* to operations, which are then treated as investing, and (2) current liabilities *unrelated* to operations, which are then treated as financing. Examples of the first exception are short-term notes receivable from noncustomers and marketable (not trading) securities, which are considered investing transactions. Examples of the second exception are short-term notes payable and dividends payable, which are considered financing transactions.

**EXHIBIT 16.4**

Linkage of Cash Flow Classifications to the Balance Sheet

**Decision Insight**

**Where in the Statement Are Cash Flows?** Cash flows can be delayed or accelerated at the end of a period to improve or reduce current period cash flows. Also, cash flows can be misclassified. Cash outflows reported under operating activities are interpreted as expense payments. However, cash outflows reported under investing activities are interpreted as a positive sign of growth potential. Thus, managers face incentives to misclassify cash flows. For these reasons, cash flow reporting warrants our scrutiny. ■

**Noncash Investing and Financing**

Some important investing and financing activities do not affect cash receipts or payments. One example of such a transaction is the purchase of long-term assets using a long-term note payable (loan). This transaction involves both investing and financing activities but does not affect any cash inflow or outflow, so it is not reported in any of the three sections of the statement of cash flows.

flows. Such transactions are reported at the bottom of the statement of cash flows or in a note to the statement because of their importance and the *full-disclosure principle*. Exhibit 16.5 lists transactions commonly disclosed as noncash investing and financing activities.

- Retirement of debt by issuing equity stock.
- Conversion of preferred stock to common stock.
- Lease of assets in a capital lease transaction.
- Purchase of long-term assets by issuing a note or bond.
- Exchange of noncash assets for other noncash assets.
- Purchase of noncash assets by issuing equity or debt.

### EXHIBIT 16.5

Examples of Noncash Investing and Financing Activities

## Format of the Statement of Cash Flows

A statement of cash flows must report information about a company's cash receipts and cash payments during the period. Exhibit 16.6 shows the usual format. A company must report cash flows from three activities: operating, investing, and financing. The statement then shows the net increase or decrease from those activities. Finally, it explains how transactions and events impact the prior period-end cash balance to produce its current period-end balance. Any non-cash investing and financing transactions are disclosed in a note disclosure or separate schedule.

### P1

Prepare a statement of cash flows.

COMPANY NAME Statement of Cash Flows For period Ended date	
<b>Cash flows from operating activities</b>	
[Compute operating cash flows using indirect or direct method]	
Net cash provided (used) by operating activities .....	\$ #
<b>Cash flows from investing activities</b>	
[List of individual inflows and outflows]	
Net cash provided (used) by investing activities .....	#
<b>Cash flows from financing activities</b>	
[List of individual inflows and outflows]	
Net cash provided (used) by financing activities .....	#
<b>Net increase (decrease) in cash</b> .....	<b>\$ #</b>
<b>Cash (and equivalents) balance at prior period-end</b> .....	<b>#</b>
<b>Cash (and equivalents) balance at current period-end</b> .....	<b>\$ #</b>
Separate schedule or note disclosure of any noncash investing and financing transactions is required.	

### EXHIBIT 16.6

Format of the Statement of Cash Flows

**Point:** Positive cash flows for a section are titled net cash "provided by" or "from." Negative cash flows are labeled as net cash "used by."

## Decision Maker

**Entrepreneur** You are considering purchasing a start-up business that recently reported a \$110,000 annual net loss and a \$225,000 annual net cash inflow. How are these results possible? ■ [Answers follow the chapter's Summary.]

## Preparing the Statement of Cash Flows

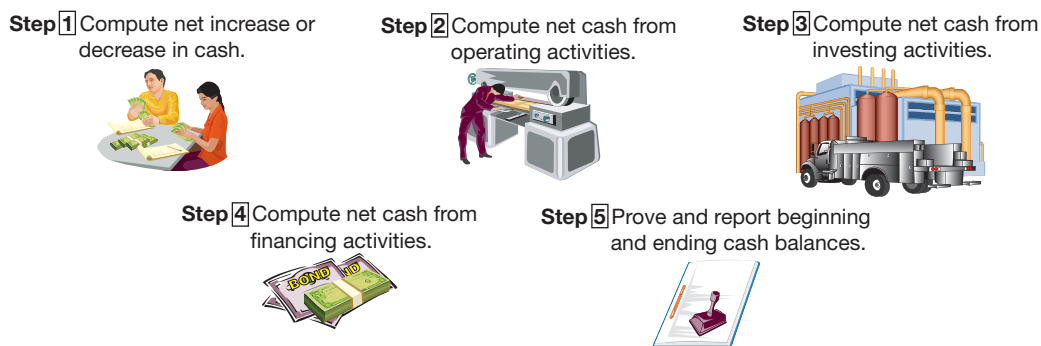

Preparing a statement of cash flows involves five steps, as shown in Exhibit 16.7.

- 1 Compute the net increase or decrease in cash.
- 2 Compute and report the net cash provided or used by operating activities (using either the direct or indirect method; both are explained).
- 3 Compute and report the net cash provided or used by investing activities.
- 4 Compute and report the net cash provided or used by financing activities.
- 5 Compute the net cash flow by combining net cash provided or used by operating, investing, and financing activities, and then *prove it* by adding it to the beginning cash balance to show that it equals the ending cash balance.

**Point:** View the change in cash as a *target number* (or check figure) that we will fully explain and prove in the statement of cash flows.

**EXHIBIT 16.7**

Five Steps in Preparing the Statement of Cash Flows

Computing the net increase or net decrease in cash is a simple but crucial computation. It equals the current period’s cash balance minus the prior period’s cash balance. This is the *bottom-line* figure for the statement of cash flows and is a check on accuracy.

**Analyzing the Cash Account** A company’s cash receipts and cash payments are recorded in the Cash account in its general ledger. The Cash account is therefore a natural place to look for information about cash flows from operating, investing, and financing activities. To illustrate, see the summarized Cash T-account of Genesis, Inc., in Exhibit 16.8. The Cash account increased \$5,000, from \$12,000 to \$17,000. Individual cash transactions are summarized in this Cash account according to the major types of cash receipts and cash payments. For instance, only the total of cash receipts from all customers is listed. Individual cash transactions underlying these totals can number in the thousands. Accounting software is available to provide summarized cash accounts.

**EXHIBIT 16.8**

Summarized Cash Account

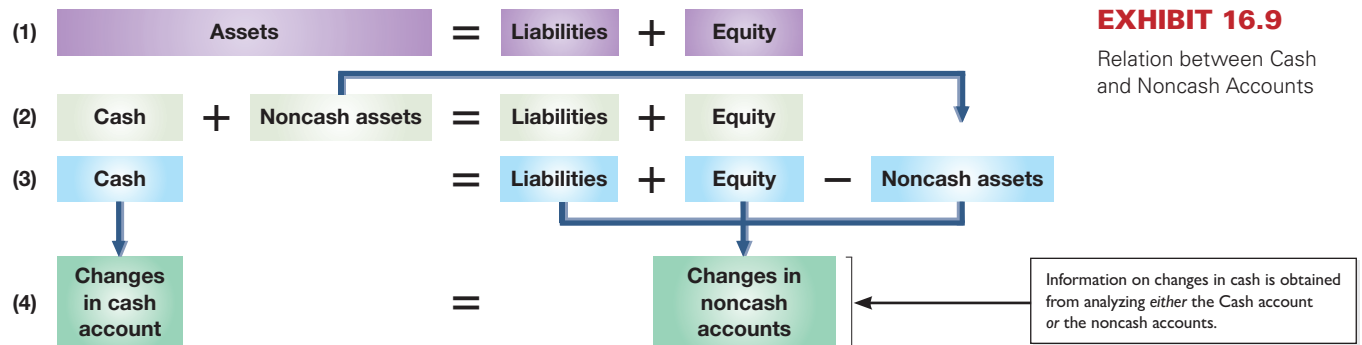

Cash	
Balance, Dec. 31, 2014 .....	12,000
Receipts from customers .....	570,000
Receipts from asset sales .....	2,000
Receipts from stock issuance ..	15,000
Payments for inventory .....	319,000
Payments for wages and operating expenses .....	218,000
Payments for interest .....	8,000
Payments for taxes .....	5,000
Payments for notes retirement .....	18,000
Payments for dividends .....	14,000
Balance, Dec. 31, 2015 .....	17,000

The statement of cash flows summarizes and classifies the transactions that led to the \$5,000 increase in the Cash account. Preparing a statement of cash flows from Exhibit 16.8 requires determining whether an individual cash inflow or outflow is an operating, investing, or financing activity, and then listing each by activity. However, preparing the statement of cash flows from an analysis of the summarized Cash account has two limitations. First, most companies have many individual cash receipts and payments, making it difficult to review them all. Accounting software minimizes this burden, but it is still a task requiring professional judgment for many transactions. Second, the Cash account does not usually carry an adequate description of each cash transaction, making assignment of all cash transactions according to activity difficult.

**Analyzing Noncash Accounts** A second approach to preparing the statement of cash flows is analyzing noncash accounts. This approach uses the fact that when a company records cash inflows and outflows with debits and credits to the Cash account (see Exhibit 16.8), it also records credits and debits in noncash accounts (reflecting double-entry accounting). Many of these noncash accounts are balance sheet accounts—for instance, from the sale of land for cash. Others are revenue and expense accounts that are closed to equity. For instance, the sale of services for cash yields a credit to Services Revenue that is closed to Retained Earnings for a corporation. In sum, *all cash transactions eventually affect noncash balance sheet accounts*. Thus,

we can determine cash inflows and outflows by analyzing changes in noncash balance sheet accounts.

Exhibit 16.9 uses the accounting equation to show the relation between the Cash account and the noncash balance sheet accounts. This exhibit starts with the accounting equation (at the top). It is then expanded in line (2) to separate cash from noncash asset accounts. To isolate cash on one side of the equation, line (3) shows noncash asset accounts being subtracted from both sides of the equation. Cash now equals the sum of the liability and equity accounts *minus* the noncash asset accounts. Line (4) points out that *changes* on one side of the accounting equation equal *changes* on the other side. It shows that we can explain changes in cash by analyzing changes in the noncash accounts consisting of liability accounts, equity accounts, and noncash asset accounts. By analyzing noncash balance sheet accounts and any related income statement accounts, we can prepare a statement of cash flows.

**Information to Prepare the Statement** Information to prepare the statement of cash flows usually comes from three sources: (1) comparative balance sheets, (2) the current income statement, and (3) additional information. Comparative balance sheets are used to compute changes in noncash accounts from the beginning to the end of the period. The current income statement is used to help compute cash flows from operating activities. Additional information often includes details on transactions and events that help explain both the cash flows and non-cash investing and financing activities.

Classify each of the following cash flows as operating, investing, or financing activities.

- |   |   |
|---|---|
| ___ a. Purchase equipment for cash                | ___ g. Cash paid for utilities                  |
| ___ b. Cash payment of wages                      | ___ h. Cash paid to acquire investments         |
| ___ c. Issuance of stock for cash                 | ___ i. Cash paid to retire debt                 |
| ___ d. Receipt of cash dividends from investments | ___ j. Cash received as interest on investments |

## CASH FLOWS FROM OPERATING

### Indirect and Direct Methods of Reporting

Cash flows provided (used) by operating activities are reported in one of two ways: the *direct method* or the *indirect method*. **These two different methods apply only to the operating activities section.**

The **direct method** separately lists each major item of operating cash receipts (such as cash received from customers) and each major item of operating cash payments (such as cash paid for inventory). The cash payments are subtracted from cash receipts to determine the net cash provided (used) by operating activities.

The **indirect method** reports net income and then adjusts it for items necessary to obtain net cash provided or used by operating activities. It does *not* report individual items of cash inflows and cash outflows from operating activities. Instead, the indirect method reports the necessary adjustments to reconcile net income to net cash provided or used by operating activities. **The net cash amount provided by operating activities is identical under both the direct and indirect methods.** This equality always exists. The difference in these methods is with the computation and presentation of this amount. The FASB

recommends the direct method, but because it is not required and the indirect method is arguably easier to compute, nearly all companies report operating cash flows using the indirect method.

To illustrate, we prepare the operating activities section of the statement of cash flows for Genesis. Exhibit 16.10 shows the December 31, 2014 and 2015, balance sheets of Genesis along with its 2015 income statement. We use this information to prepare a statement of cash flows that explains the \$5,000 increase in cash for 2015 as reflected in its balance sheets. This \$5,000 is computed as Cash of \$17,000 at the end of 2015 minus Cash of \$12,000 at the end of 2014.

*The next section describes the indirect method. Appendix 16B describes the direct method. An instructor can choose to cover either one or both methods. Neither section depends on the other. If the indirect method is skipped, then read Appendix 16B and return to the section (five pages ahead) titled "Cash Flows from Investing."*

**EXHIBIT 16.10**

Financial Statements

GENESIS Income Statement For Year Ended December 31, 2015		
Sales .....		\$590,000
Cost of goods sold .....	\$300,000	
Wages and other operating expenses .....	216,000	
Interest expense .....	7,000

Total liabilities and equity .....	\$357,000	\$288,000	

**Additional information for 2015**

- a. The accounts payable balances result from inventory purchases.
- b. Purchased \$60,000 in plant assets by issuing \$60,000 of notes payable.
- c. Sold plant assets with a book value of \$8,000 (original cost of \$20,000 and accumulated depreciation of \$12,000) for \$2,000 cash, yielding a \$6,000 loss.
- d. Received \$15,000 cash from issuing 3,000 shares of common stock.
- e. Paid \$18,000 cash to retire notes with a \$34,000 book value, yielding a \$16,000 gain.
- f. Declared and paid cash dividends of \$14,000.

## Applying the Indirect Method of Reporting

Net income is computed using accrual accounting, which recognizes revenues when earned and expenses when incurred. Revenues and expenses do not necessarily reflect the receipt and payment of cash. The indirect method of computing and reporting net cash flows from operating activities involves adjusting the net income figure to obtain the net cash provided or used by operating activities. This includes subtracting noncash increases from net income and adding noncash charges back to net income.

To illustrate, the indirect method begins with Genesis's net income of \$38,000 and adjusts it to obtain net cash provided by operating activities of \$20,000. Exhibit 16.11 shows the results of the indirect method of reporting operating cash flows, which adjusts net income for two types of adjustments. There are ① adjustments to income statement items that neither provide nor use cash and ② adjustments to reflect changes in balance sheet current assets and current liabilities (linked to operating activities). This section describes each of these adjustments.

**P2** \_\_\_\_\_  
Compute cash flows from operating activities using the indirect method.

GENESIS	
Statement of Cash Flows—Operating Section under Indirect Method	
For Year Ended December 31, 2015	
Cash flows from operating activities	
Net income . . . . .	\$ 38,000
Adjustments to reconcile net income to net cash provided by operating activities	
Income statement items not affecting cash	
① Depreciation expense . . . . .	24,000
Loss on sale of plant assets . . . . .	6,000
Gain on retirement of notes . . . . .	(16,000)
Changes in current assets and liabilities	
② Increase in accounts receivable . . . . .	(20,000)
Increase in inventory . . . . .	(14,000)
Increase in prepaid expenses . . . . .	(2,000)
Decrease in accounts payable . . . . .	(5,000)
Decrease in interest payable . . . . .	(1,000)
Increase in income taxes payable . . . . .	10,000
<b>Net cash provided by operating activities . . . . .</b>	<b>\$20,000</b>

### EXHIBIT 16.11

Operating Activities  
Section—Indirect Method

**① Adjustments for Income Statement Items Not Affecting Cash** The income statement usually includes some expenses and losses that do not reflect cash outflows. Examples are depreciation, amortization, depletion, bad debts expense, loss from an asset sale, and loss from retirement of notes payable. When there are expenses and losses that do not reflect cash outflows, the indirect method for reporting operating cash flows requires the following adjustment:

**Expenses and losses with no cash outflows are added back to net income.**

To see the logic of this adjustment, recall that items such as depreciation, amortization, and depletion have *no* cash effect, and adding them back cancels their deductions. To see the logic for losses, consider that items such as a plant asset sale and a notes retirement are usually recorded by recognizing the cash, removing all plant asset or notes accounts, and recording any loss or gain. The cash received or paid is part of either investing or financing cash flows. *No* operating cash flow effect occurs, and adding it back to net income cancels the deduction.

Similarly, when net income includes revenues that do not reflect cash inflows, the indirect method for reporting operating cash flows requires the following adjustment:

**Revenues and gains with no cash inflows are subtracted from net income.**

We apply these adjustments to the income statement items in Exhibit 16.10 that do not affect cash.

**Depreciation.** Depreciation expense is Genesis's only operating item that has no effect on cash flows. We must add back the \$24,000 depreciation expense to net income when computing

**Point:** An income statement reports revenues, gains, expenses, and losses on an accrual basis. The statement of cash flows reports cash received and cash paid for operating, financing, and investing activities.

cash provided by operating activities. Adding it back cancels the expense. (We later explain that any cash outflow to acquire a plant asset is reported as an investing activity.)

**Loss on sale of plant assets.** Genesis reports a \$6,000 loss on sale of plant assets as part of net income. This loss is a proper deduction in computing income, but it is *not part of operating activities*. Instead, a sale of plant assets is part of investing activities. Thus, the \$6,000 nonoperating loss is added back to net income (see Exhibit 16.11). Adding it back cancels the loss. We later explain how to report the cash inflow from the asset sale in investing activities.

**Gain on retirement of debt.** A \$16,000 gain on retirement of debt is properly included in net income, but it is *not part of operating activities*. This means the \$16,000 nonoperating gain must be subtracted from net income to obtain net cash provided by operating activities (see Exhibit 16.11). Subtracting it cancels the recorded gain. We later describe how to report the cash outflow to retire debt.

These three adjustments to net income for “items not affecting cash” are shown as follows in the operating section:

Net income . . . . .	\$ 38,000
Adjustments to reconcile net income to net cash provided by operating activities	
Income statement items not affecting cash	
Depreciation expense . . . . .	24,000
Loss on sale of plant assets . . . . .	6,000
Gain on retirement of notes . . . . .	(16,000)

② **Adjustments for Changes in Current Assets and Current Liabilities** This section describes adjustments for changes in current assets and current liabilities.

**Adjustments for changes in current assets.** Decreases in current assets require the following adjustment:

<b>Reconstructed Entry</b>	
Cash . . . . .	#
Current Asset . . . . .	#

**Decreases in current assets are added to net income.**

Increases in current assets require the following adjustment:

<b>Reconstructed Entry</b>	
Current Asset . . . . .	#
Cash . . . . .	#

**Increases in current assets are subtracted from net income.**

**Adjustments for changes in current liabilities.** Increases in current liabilities require the following adjustment to net income when computing operating cash flows:

<b>Reconstructed Entry</b>	
Cash . . . . .	#
Current Liabilities . . . . .	#

**Increases in current liabilities are added to net income.**

Conversely, when current liabilities decrease, the following adjustment is required:

<b>Reconstructed Entry</b>	
Current Liabilities . . . . .	#
Cash . . . . .	#

**Decreases in current liabilities are subtracted from net income.**

To illustrate, we apply these adjustment rules to the three noncash current assets and three current liabilities in Exhibit 16.10, which are then reported as follows in the operating section:

Net income . . . . .	\$ 38,000
Adjustments to reconcile net income to net cash provided by operating activities	
Increase in accounts receivable . . . . .	(20,000)
Increase in inventory . . . . .	(14,000)
Increase in prepaid expenses . . . . .	(2,000)
Decrease in accounts payable . . . . .	(5,000)
Decrease in interest payable . . . . .	(1,000)
Increase in income taxes payable . . . . .	10,000

Following is an explanation, including T-account analysis, for how these adjustments result in cash receipts and cash payments.

*Accounts receivable.* Following the rule above, the \$20,000 increase in the current asset of accounts receivable is subtracted from income. This increase implies that Genesis collects less cash than is reported in sales. To see this it is helpful to use *account analysis*. This involves setting up a T-account and reconstructing its major entries to compute cash receipts or payments as follows.

**Point:** Operating activities are typically those that determine income, which are often reflected in changes in current assets and current liabilities.

Accounts Receivable			
Numbers in black are taken from Exhibit 16.10. The red number is the computed (plug) figure.	Bal., Dec. 31, 2014	40,000	
	Sales	590,000	<b>Cash receipts = 570,000</b>
	Bal., Dec. 31, 2015	60,000	

We see that sales are \$20,000 greater than cash receipts. This \$20,000—reflected in the increase in Accounts Receivable—is subtracted from net income when computing cash provided by operating activities.

*Inventory.* The \$14,000 increase in inventory is subtracted from income. This increase implies that Genesis had greater cash purchases than cost of goods sold, as reflected in the following account analysis:

Inventory			
Bal., Dec. 31, 2014	70,000		
<b>Purchases =</b>	<b>314,000</b>	Cost of goods sold	300,000
Bal., Dec. 31, 2015	84,000		

*Prepaid expenses.* The \$2,000 increase in prepaid expense is subtracted from income, implying that Genesis's cash payments exceed its recorded prepaid expenses and is reflected in the following T-account:

Prepaid Expenses			
Bal., Dec. 31, 2014	4,000		
<b>Cash payments =</b>	<b>218,000</b>	Wages and other operating exp.	216,000
Bal., Dec. 31, 2015	6,000		

*Accounts payable.* The \$5,000 decrease in the current liability for accounts payable is subtracted from income. This decrease implies that cash payments to suppliers exceed purchases, which is reflected in the following T-account:

Accounts Payable			
		Bal., Dec. 31, 2014	40,000
<b>Cash payments =</b>	<b>319,000</b>	Purchases	314,000
		Bal., Dec. 31, 2015	35,000

*Interest payable.* The \$1,000 decrease in interest payable is subtracted from income. This decrease indicates that cash paid for interest exceeds interest expense, which is reflected in the following T-account:

Interest Payable			
		Bal., Dec. 31, 2014	4,000
<b>Cash paid for interest =</b>	<b>8,000</b>	Interest expense	7,000
		Bal., Dec. 31, 2015	3,000

*Income taxes payable.* The \$10,000 increase in income taxes payable is added to income. This increase implies that reported income taxes exceed the cash paid for taxes, which is reflected in the following T-account:

Income Taxes Payable		
Cash paid for taxes = 5,000	Bal., Dec. 31, 2014	12,000
	Income taxes expense	15,000
	Bal., Dec. 31, 2015	22,000

### Summary Adjustments for Operating Activities—Indirect Method

Exhibit 16.12 summarizes the adjustments to net income when computing net cash provided or used by operating activities under the indirect method.

#### EXHIBIT 16.12

Summary of Adjustments for Operating Activities—Indirect Method

Net Income (or Loss)	
①	Adjustments for operating items not providing or using cash
	+ Noncash expenses and losses
	<i>Examples:</i> Expenses for depreciation, depletion, and amortization; losses from disposal of long-term assets and from retirement of debt
	– Noncash revenues and gains
	<i>Examples:</i> Earnings from equity-method investments; gains from disposal of long-term assets and from retirement of debt
②	Adjustments for changes in current assets and current liabilities
	+ Decrease in noncash current operating asset
	– Increase in noncash current operating asset
	+ Increase in current operating liability
	– Decrease in current operating liability
<b>Net cash provided (used) by operating activities</b>	

#### Decision Insight

**How Much Cash Is in Income?** The difference between net income and operating cash flows can be large and sometimes reflects on the quality of earnings. This bar chart shows the net income and operating cash flows of three companies. Operating cash flows can be either higher or lower than net income. ■

#### NEED-TO-KNOW 16-2

Reporting Operating Cash Flows (Indirect)

P2

A company's current-year income statement and selected balance sheet data at December 31 of the current and prior years follow. Prepare the cash flows from operating activities section only of its statement of cash flows using the indirect method for the current year.

Income Statement For Current Year Ended December 31	
Sales revenue	\$120
Expenses	
Cost of goods sold	50
Depreciation expense	30
Salaries expense	17
Interest expense	3
Net income	<u>\$ 20</u>

Selected Balance Sheet Accounts		
At December 31	Current Yr	Prior Yr
Accounts receivable	\$12	\$10
Inventory	6	9
Accounts payable	7	11
Salaries payable	8	3
Interest payable	1	0

**Solution**

**Cash Flows from Operating Activities—Indirect Method**

QC2

## CASH FLOWS FROM INVESTING

The third major step in preparing the statement of cash flows is to compute and report cash flows from investing activities. We normally do this by identifying changes in (1) all noncurrent asset accounts and (2) the current accounts for both notes receivable and investments in securities (excluding trading securities). We then analyze changes in these accounts to determine their effect, if any, on cash and report the cash flow effects in the investing activities section of the statement of cash flows. **Reporting of investing activities is identical under the direct method and indirect method.**

### Three-Stage Process of Analysis

Information to compute cash flows from investing activities is usually taken from beginning and ending balance sheets and the income statement. We use a three-stage process to determine cash provided or used by investing activities: (1) identify changes in investing-related accounts, (2) explain these changes using reconstruction analysis, and (3) report their cash flow effects.

### P3

Determine cash flows from both investing and financing activities.

### Analyzing Noncurrent Assets

Information about the Genesis transactions provided earlier reveals that the company both purchased and sold plant assets during the period. Both transactions are investing activities and are analyzed for their cash flow effects in this section.

**Plant Asset Transactions** The *first stage* in analyzing the Plant Assets account and its related Accumulated Depreciation account is to identify any changes in these accounts from comparative balance sheets in Exhibit 16.10. This analysis reveals a \$40,000 increase in plant assets from \$210,000 to \$250,000 and a \$12,000 increase in accumulated depreciation from \$48,000 to \$60,000.

The *second stage* is to explain these changes. Items *b* and *c* of the additional information in Exhibit 16.10 affect plant assets. Recall that the Plant Assets account is affected by both asset purchases and sales; its Accumulated Depreciation account is normally increased from depreciation and decreased from the removal of accumulated depreciation in asset sales. To explain changes in these accounts and to identify their cash flow effects, we prepare *reconstructed entries* from prior transactions; *they are not the actual entries by the preparer.*

**Point:** Investing activities include (1) purchasing and selling long-term assets, (2) lending and collecting on notes receivable, and (3) purchasing and selling short-term investments other than cash equivalents and trading securities.

**Point:** Financing and investing info is available in ledger accounts to help explain changes in comparative balance sheets. Post references lead to relevant entries and explanations.

To illustrate, item *b* reports that Genesis purchased plant assets of \$60,000 by issuing \$60,000 in notes payable to the seller. The reconstructed entry for analysis of item *b* follows.

<b>Reconstruction</b>	Plant Assets .....	60,000	
	Notes Payable .....		60,000

Next, item *c* reports that Genesis sold plant assets costing \$20,000 (with \$12,000 of accumulated depreciation) for \$2,000 cash, resulting in a \$6,000 loss. The reconstructed entry for analysis of item *c* follows.

<b>Reconstruction</b>	<b>Cash</b> .....	<b>2,000</b>	
	Accumulated Depreciation .....	12,000	
	Loss on Sale of Plant Assets .....	6,000	
	Plant Assets .....		20,000

**Point:** When determining cash flows from investing, T-account analysis is key to reconstructing accounts and amounts.

We also reconstruct the entry for Depreciation Expense from the income statement. Depreciation expense results in no cash flow effect.

<b>Reconstruction</b>	Depreciation Expense .....	24,000	
	Accumulated Depreciation .....		24,000

These three reconstructed entries are reflected in the following plant asset and related T-accounts.

Plant Assets				Accumulated Depreciation—Plant Assets			
Bal., Dec. 31, 2014	210,000				Bal., Dec. 31, 2014	48,000	
<b>Purchase</b>	<b>60,000</b>	<b>Sale</b>	<b>20,000</b>	<b>Sale</b>	<b>12,000</b>	<b>Depr. expense</b>	<b>24,000</b>
Bal., Dec. 31, 2015	250,000				Bal., Dec. 31, 2015	60,000	

**Example:** If a plant asset costing \$40,000 with \$37,000 of accumulated depreciation is sold at a \$1,000 loss, what is the cash flow? What is the cash flow if this asset is sold at a gain of \$3,000? Answers: +\$2,000; +\$6,000.

This reconstruction analysis is complete in that the change in plant assets from \$210,000 to \$250,000 is fully explained by the \$60,000 purchase and the \$20,000 sale. Also, the change in accumulated depreciation from \$48,000 to \$60,000 is fully explained by depreciation expense of \$24,000 and the removal of \$12,000 in accumulated depreciation from the asset sale.

The *third stage* in analyzing the Plant Assets account looks back at the reconstructed entries to identify any cash flows. The identified cash flow effect is reported in the investing section of the statement as follows:

<b>Cash flows from investing activities</b>	
Cash received from sale of plant assets .....	\$2,000

The \$60,000 purchase described in item *b* and financed by issuing notes is a noncash investing and financing activity. It is reported in a note or in a separate schedule to the statement as follows:

<b>Noncash investing and financing activity</b>	
Purchased plant assets with issuance of notes .....	\$60,000

### Analyzing Additional Assets

Genesis did not have any additional noncurrent assets (or nonoperating current assets) and, therefore, we have no additional investing transactions to analyze. If other investing assets did exist, we would identify and report the investing cash flows using the same three-stage process illustrated for plant assets.

Use the following information to determine this company’s cash flows from investing activities.

- a. A factory with a book value of \$100 and an original cost of \$800 was sold at a loss of \$10.
- b. Paid \$70 cash for new equipment.
- c. Long-term stock investments were sold for \$20 cash, yielding a loss of \$4.
- d. Sold land costing \$175 for \$160 cash, yielding a loss of \$15.

**Solution**

Cash flows from investing activities	
Cash received from sale of factory*	\$ 90
Cash paid for new equipment	(70)
Cash received from sale of long-term investments	20
Cash received from sale of land	<u>160</u>
Net cash provided by investing activities	<u>\$200</u>

\*Cash received from sale of factory = Book value – Loss = \$100 – \$10 = \$90

**NEED-TO-KNOW 16-3**

Reporting Investing Cash Flows

P3

Do More: QS 16-5, QS 16-6, QS 16-9, E 16-7

**QC3**

**CASH FLOWS FROM FINANCING**

The fourth major step in preparing the statement of cash flows is to compute and report cash flows from financing activities. We normally do this by identifying changes in all noncurrent liability accounts (including the current portion of any notes and bonds) and the equity accounts. These accounts include long-term debt, notes payable, bonds payable, common stock, and retained earnings. Changes in these accounts are then analyzed using available information to determine their effect, if any, on cash. Results are reported in the financing activities section of the statement. **Reporting of financing activities is identical under the direct method and indirect method.**

**Three-Stage Process of Analysis**

We again use a three-stage process to determine cash provided or used by financing activities: (1) identify changes in financing-related accounts, (2) explain these changes using reconstruction analysis, and (3) report their cash flow effects.

**Analyzing Noncurrent Liabilities**

Information about Genesis provided earlier reveals two transactions involving noncurrent liabilities. We analyzed one of those, the \$60,000 issuance of notes payable to purchase plant assets. This transaction is reported as a significant noncash investing and financing activity in a footnote or a separate schedule to the statement of cash flows. The other remaining transaction involving noncurrent liabilities is the cash retirement of notes payable.

**Notes Payable Transactions** The *first stage* in analysis of notes is to review the comparative balance sheets from Exhibit 16.10. This analysis reveals an increase in notes payable from \$64,000 to \$90,000.

The *second stage* explains this change. Item *e* of the additional information in Exhibit 16.10 reports that notes with a carrying value of \$34,000 are retired for \$18,000 cash, resulting in a \$16,000 gain. The reconstructed entry for analysis of item *e* follows:

Reconstruction			
	Notes Payable	34,000	
	Gain on retirement of debt		16,000
	<b>Cash</b>		<b>18,000</b>

**Point:** Financing activities generally refer to changes in the noncurrent liability and the equity accounts. Examples are (1) receiving cash from issuing debt or repaying amounts borrowed and (2) receiving cash from or distributing cash to owners.

This entry reveals an \$18,000 cash outflow for retirement of notes and a \$16,000 gain from comparing the notes payable carrying value to the cash received. This gain does not reflect any cash inflow or outflow. Also, item *b* of the additional information reports that Genesis purchased plant assets costing \$60,000 by issuing \$60,000 in notes payable to the seller. We reconstructed this entry when analyzing investing activities: It showed a \$60,000 increase to notes payable that is reported as a noncash investing and financing transaction. The Notes Payable account is explained by these reconstructed entries as follows:

Notes Payable			
		Bal., Dec. 31, 2014	64,000
<b>Retired notes</b>	<b>34,000</b>	<b>Issued notes</b>	<b>60,000</b>
		Bal., Dec. 31, 2015	90,000

The *third stage* is to report the cash flow effect of the notes retirement in the financing section of the statement as follows:

Cash flows from financing activities	
Cash paid to retire notes . . . . .	\$(18,000)

### Analyzing Equity

The Genesis information reveals two transactions involving equity accounts. The first is the issuance of common stock for cash. The second is the declaration and payment of cash dividends. We analyze both.

**Common Stock Transactions** The *first stage* in analyzing common stock is to review the comparative balance sheets from Exhibit 16.10, which reveal an increase in common stock from \$80,000 to \$95,000.

The *second stage* explains this change. Item *d* of the additional information in Exhibit 16.10 reports that 3,000 shares of common stock are issued at par for \$5 per share. The reconstructed entry for analysis of item *d* follows:

<b>Reconstruction</b>	<b>Cash</b> . . . . .	<b>15,000</b>	
	Common Stock . . . . .		15,000

This entry reveals a \$15,000 cash inflow from stock issuance and is reflected in (and explains) the Common Stock account as follows:

Common Stock		
	Bal., Dec. 31, 2014	80,000
	<b>Issued stock</b>	<b>15,000</b>
	Bal., Dec. 31, 2015	95,000

The *third stage* discloses the cash flow effect from stock issuance in the financing section of the statement as follows:

Cash flows from financing activities	
Cash received from issuing stock . . . . .	\$15,000

**Retained Earnings Transactions** The *first stage* in analyzing the Retained Earnings account is to review the comparative balance sheets from Exhibit 16.10. This reveals an increase in retained earnings from \$88,000 to \$112,000.

The *second stage* explains this change. Item *f* of the additional information in Exhibit 16.10 reports that cash dividends of \$14,000 are paid. The reconstructed entry follows:

<b>Reconstruction</b>	Retained Earnings .....	14,000	
	<b>Cash</b> .....		<b>14,000</b>

This entry reveals a \$14,000 cash outflow for cash dividends. Also see that the Retained Earnings account is impacted by net income of \$38,000. (Net income was analyzed under the operating section of the statement of cash flows.) The reconstructed Retained Earnings account follows:

Retained Earnings			
		Bal., Dec. 31, 2014	88,000
<b>Cash dividend</b>	<b>14,000</b>	<b>Net income</b>	<b>38,000</b>
		Bal., Dec. 31, 2015	112,000

The *third stage* reports the cash flow effect from the cash dividend in the financing section of the statement as follows:

<b>Cash flows from financing activities</b>	
Cash paid for dividends .....	\$(14,000)

**Point:** Financing activities not affecting cash flow include declaration of a cash dividend, declaration of a stock dividend, issuance of a stock dividend, and a stock split.

We now have identified and explained all of the Genesis cash inflows and cash outflows and one noncash investing and financing transaction.

## Proving Cash Balances

The fifth and final step in preparing the statement is to report the beginning and ending cash balances and prove that the *net change in cash* is explained by operating, investing, and financing cash flows. This step is shown here for Genesis.

Net cash provided by operating activities .....	\$20,000
Net cash provided by investing activities .....	2,000
Net cash used in financing activities .....	(17,000)
<b>Net increase in cash</b> .....	<b>\$ 5,000</b>
Cash balance at 2014 year-end .....	<u>12,000</u>
Cash balance at 2015 year-end .....	<u>\$17,000</u>

The preceding table shows that the \$5,000 net increase in cash, from \$12,000 at the beginning of the period to \$17,000 at the end, is reconciled by net cash flows from operating (\$20,000 inflow), investing (\$2,000 inflow), and financing (\$17,000 outflow) activities. This is formally reported at the bottom of the complete statement of cash flows as shown in Exhibit 16.13.

**Global:** There are no requirements to separate domestic and international cash flows, leading some users to ask, "Where in the world is cash flow?"

## Decision Maker

**Reporter** Management is in labor contract negotiations and grants you an interview. It highlights a recent \$600,000 net loss that involves a \$930,000 extraordinary loss and a total net cash outflow of \$550,000 (which includes net cash outflows of \$850,000 for investing activities and \$350,000 for financing activities). What is your assessment of this company? ■ [Answers follow the chapter's Summary.]

**EXHIBIT 16.13**

Complete Statement of Cash Flows—Indirect Method

**Point:** Refer to Exhibit 16.10 and identify the \$5,000 change in cash. This change is what the statement of cash flows explains; it serves as a check.

**Point:** The statement of cash flows is usually the last prepared of the four required financial statements.

<b>GENESIS</b> Statement of Cash Flows For Year Ended December 31, 2015	
<b>Cash flows from operating activities</b>	
Net income . . . . .	\$ 38,000
Adjustments to reconcile net income to net cash provided by operating activities	
Income statement items not affecting cash	
Depreciation expense . . . . .	24,000
Loss on sale of plant assets . . . . .	6,000
Gain on retirement of notes . . . . .	(16,000)
Changes in current assets and liabilities	
Increase in accounts receivable . . . . .	(20,000)
Increase in inventory . . . . .	(14,000)
Increase in prepaid expenses . . . . .	(2,000)
Decrease in accounts payable . . . . .	(5,000)
Decrease in interest payable . . . . .	(1,000)
Increase in income taxes payable . . . . .	<u>10,000</u>
Net cash provided by operating activities . . . . .	\$20,000
<b>Cash flows from investing activities</b>	
Cash received from sale of plant assets . . . . .	<u>2,000</u>
Net cash provided by investing activities . . . . .	2,000
<b>Cash flows from financing activities</b>	
Cash received from issuing stock . . . . .	15,000
Cash paid to retire notes . . . . .	(18,000)
Cash paid for dividends . . . . .	<u>(14,000)</u>
Net cash used in financing activities . . . . .	(17,000)
Net increase in cash . . . . .	\$ 5,000
Cash balance at prior year-end . . . . .	12,000
Cash balance at current year-end . . . . .	<u>\$17,000</u>

**NEED-TO-KNOW 16-4**

Reporting Financing Cash Flows

P3

Use the following information to determine this company's cash flows from financing activities.

- a. Issued common stock for \$40 cash.
- b. Paid \$70 cash to retire a note payable at its \$70 maturity value.
- c. Paid cash dividend of \$15.
- d. Paid \$5 cash to acquire its treasury stock.

**Solution****Cash flows from financing activities**

Cash received from issuance of common stock . . . . .	\$ 40
Cash paid to settle note payable . . . . .	(70)
Cash paid for dividend . . . . .	(15)
Cash paid to acquire treasury stock . . . . .	<u>(5)</u>
Net cash used by financing activities . . . . .	<u>\$(50)</u>

QS 16-13, E 16-8

**OVERALL SUMMARY USING T-ACCOUNTS**

A statement of cash flows is prepared by analyzing changes in noncash balance sheet accounts. Exhibit 16.14 uses T-accounts to summarize how changes in Genesis's noncash balance sheet accounts affect its cash inflows and outflows (dollar amounts in thousands). The top of the exhibit shows the company's Cash T-account, and the lower part shows T-accounts for its

remaining balance sheet accounts. We see that the \$20,000 net cash provided by operating activities and the \$5,000 net increase in cash shown in the Cash T-account agree with the same figures in the statement of cash flows in Exhibit 16.13.

We explain Exhibit 16.14 in five parts (amounts in \$ thousands):

- Entry (1) records \$38 net income in the credit side of the Retained Earnings account and the debit side of the Cash account. This \$38 net income in the Cash T-account is adjusted until it reflects the \$5 net increase in cash.
- Entries (2) through (4) add the \$24 depreciation and \$6 loss on asset sale to net income, and subtract the \$16 gain on retirement of notes.
- Entries (5) through (10) adjust net income for changes in current asset and current liability accounts.
- Entry (11) records the noncash investing and financing transaction involving a \$60 purchase of assets by issuing \$60 of notes.
- Entries (12) and (13) record the \$15 stock issuance and the \$14 dividend.

### EXHIBIT 16.14

## GLOBAL VIEW

### Samsung

The statement of cash flows, which explains changes in cash (including cash equivalents) from period to period, is required under both U.S. GAAP and IFRS. This section discusses similarities and differences between U.S. GAAP and IFRS in reporting that statement.

**Reporting Cash Flows from Operating** Both U.S. GAAP and IFRS permit the reporting of cash flows from operating activities using either the direct or indirect method. Further, the basic requirements underlying the application of both methods are fairly consistent across these two accounting systems. Appendix A shows that **Samsung** reports its cash flows from operating activities using the indirect method, and in a manner similar to that explained in this chapter. Further, the definition of cash and cash equivalents is roughly similar for U.S. GAAP and IFRS.

There are, however, some differences between U.S. GAAP and IFRS in reporting operating cash flows. We mention two of the more notable. First, U.S. GAAP requires that cash inflows from interest revenue and dividend revenue be classified as operating, whereas IFRS permits classification under operating or investing provided that this classification is consistently applied across periods. Samsung reports its cash from interest received under operating, consistent with U.S. GAAP (no mention is made of any dividends received). Second, U.S. GAAP requires cash outflows for interest expense be classified as operating, whereas IFRS again permits classification under operating or financing provided that it is consistently applied across periods. (Some believe that interest payments, like dividend payments, are better classified as financing because they represent payments to financiers.) Samsung reports cash outflows for interest under operating, which is consistent with U.S. GAAP and acceptable under IFRS.

**Reporting Cash Flows from Investing and Financing** U.S. GAAP and IFRS are broadly similar in computing and classifying cash flows from investing and financing activities. A quick review of these two sections for **Samsung's** statement of cash flows shows a structure similar to that explained in this chapter. One notable exception is that U.S. GAAP requires that cash outflows for income tax be classified as operating, whereas IFRS permits the splitting of those cash flows among operating, investing, and financing depending on the sources of that tax. Samsung reports its cash outflows for income tax under operating, which is similar to U.S. GAAP.

**Sustainability and Accounting** **LSTN**, as introduced in this chapter's opening feature, places an emphasis on being a socially conscious and environmentally friendly alternative within the luxury headphone market. LSTN partners with The Starkey Hearing Foundation "to provide hearing for children in deaf schools," explains Bridget Hilton, its founder. "Ninety-five percent of children in deaf schools worldwide can be helped . . . [and] eighty percent of those people live in developing countries." LSTN also recognizes the need to work within the local markets so that its successes are sustainable. Our hearing products and services "will not undercut the local economies—these are basic senses that everyone on earth should be able to experience," explains Bridget. "To me, success in business is doing something you love while being financially secure." That is something we all hope is sustainable.

## Decision Analysis

## Cash Flow Analysis

### A1

Analyze the statement of cash flows and apply the cash flow on total assets ratio.

## Analyzing Cash Sources and Uses

Most managers stress the importance of understanding and predicting cash flows for business decisions. Creditors evaluate a company's ability to generate cash before deciding whether to lend money. Investors also assess cash inflows and outflows before buying and selling stock. Information in the statement of cash flows helps address these and other questions such as (1) How much cash is generated from or used in operations? (2) What expenditures are made with cash from operations? (3) What is the source of cash

for debt payments? (4) What is the source of cash for distributions to owners? (5) How is the increase in investing activities financed? (6) What is the source of cash for new plant assets? (7) Why is cash flow from operations different from income? (8) How is cash from financing used?

To effectively answer these questions, it is important to separately analyze investing, financing, and operating activities. To illustrate, consider data from three different companies in Exhibit 16.15. These companies operate in the same industry and have been in business for several years.

(\$ thousands)	BMX	ATV	Trex
Cash provided (used) by operating activities . . . . .	\$90,000	\$40,000	\$(24,000)
Cash provided (used) by investing activities			
Proceeds from sale of plant assets . . . . .			26,000
Purchase of plant assets . . . . .	(48,000)	(25,000)	
Cash provided (used) by financing activities			
Proceeds from issuance of debt . . . . .			13,000
Repayment of debt . . . . .	(27,000)		
Net increase (decrease) in cash . . . . .	<u>\$15,000</u>	<u>\$15,000</u>	<u>\$ 15,000</u>

**EXHIBIT 16.15**

Cash Flows of Competing Companies

Each company generates an identical \$15,000 net increase in cash, but its sources and uses of cash flows are very different. BMX's operating activities provide net cash flows of \$90,000, allowing it to purchase plant assets of \$48,000 and repay \$27,000 of its debt. ATV's operating activities provide \$40,000 of cash flows, limiting its purchase of plant assets to \$25,000. Trex's \$15,000 net cash increase is due to selling plant assets and incurring additional debt. Its operating activities yield a net cash outflow of \$24,000. Overall, analysis of these cash flows reveals that BMX is more capable of generating future cash flows than is ATV or Trex.

**Decision Insight**

**Free Cash Flows** Many investors use cash flows to value company stock. However, cash-based valuation models often yield different stock values due to differences in measurement of cash flows. Most models require cash flows that are "free" for distribution to shareholders. These *free cash flows* are defined as cash flows available to shareholders after operating asset reinvestments and debt payments. Knowledge of the statement of cash flows is key to proper computation of free cash flows. A company's growth and financial flexibility depend on adequate free cash flows. ■

**Point:** CFO (Cash flow from operations)  
Less: Capital Expenditures  
Less: Debt Repayments  
= FCF (free cash flows)

**Cash Flow on Total Assets**

Cash flow information has limitations, but it can help measure a company's ability to meet its obligations, pay dividends, expand operations, and obtain financing. Users often compute and analyze a cash-based ratio similar to return on total assets except that its numerator is net cash flows from operating activities. The **cash flow on total assets** ratio is shown in Exhibit 16.16.

$$\text{Cash flow on total assets} = \frac{\text{Cash flow from operations}}{\text{Average total assets}}$$

**EXHIBIT 16.16**

Cash Flow on Total Assets

This ratio reflects actual cash flows and is not affected by accounting income recognition and measurement. It can help business decision makers estimate the amount and timing of cash flows when planning and analyzing operating activities.

To illustrate, the 2013 cash flow on total assets ratio for **Nike** is 18.3%—see Exhibit 16.17. Is an 18.3% ratio good or bad? To answer this question, we compare this ratio with the ratios of prior years (we could also compare its ratio with those of its competitors and the market). Nike's cash flow on total assets ratio

Year	Cash Flow on Total Assets	Return on Total Assets
2013 . . . . .	18.3%	15.0%
2012 . . . . .	12.5	14.6
2011 . . . . .	12.3	14.5
2010 . . . . .	22.9	13.8
2009 . . . . .	13.5	11.6

**EXHIBIT 16.17**

Nike's Cash Flow on Total Assets

for several prior years is in the second column of Exhibit 16.17. Results show that its 18.3% return is its second highest return over the past five years. This is probably reflective of the recent recessionary period.

As an indicator of *earnings quality*, some analysts compare the cash flow on total assets ratio to the return on total assets ratio. Nike’s return on total assets is provided in the third column of Exhibit 16.17. Nike’s cash flow on total assets ratio exceeds its return on total assets in three of the five years, leading some analysts to infer that Nike’s earnings quality is good for that period because much of its earnings are realized in the form of cash.

**Point:** Cash flow ratios are often used by financial analysts.

**Point:** The following ratio helps assess whether operating cash flow is adequate to meet long-term obligations:

$$\text{Cash coverage of debt} = \frac{\text{Cash flow from operations}}{\text{Noncurrent liabilities}}$$

A low ratio suggests a higher risk of insolvency; a high ratio suggests a greater ability to meet long-term obligations.

### Decision Insight

**Cash Flow Ratios** Analysts use various other cash-based ratios, including the following two:

$$(1) \quad \text{Cash coverage of growth} = \frac{\text{Operating cash flow}}{\text{Cash outflow for plant assets}}$$

where a low ratio (less than 1) implies cash inadequacy to meet asset growth, whereas a high ratio implies cash adequacy for asset growth.

$$(2) \quad \text{Operating cash flow to sales} = \frac{\text{Operating cash flow}}{\text{Net sales}}$$

When this ratio substantially and consistently differs from the operating income to net sales ratio, the risk of accounting improprieties increases. ■

## NEED-TO-KNOW

### COMPREHENSIVE

Preparing Statement of Cash Flows—Indirect and Direct Methods

Umlauf’s comparative balance sheets, income statement, and additional information follow.

UMLAUF COMPANY Income Statement For Year Ended December 31, 2015		
Sales .....		\$446,100
Cost of goods sold .....	\$222,300	
Other operating expenses .....	120,300	
Depreciation expense .....	25,500	(368,100)
		<u>78,000</u>
Other gains (losses)		
Loss on sale of equipment .....	3,300	
Loss on retirement of bonds ..	825	(4,125)
Income before taxes .....		73,875
Income taxes expense .....		(13,725)
Net income .....		<u>\$ 60,150</u>

UMLAUF COMPANY Balance Sheets December 31, 2015 and 2014		
	2015	2014
<b>Assets</b>		
Cash .....	\$ 43,050	\$ 23,925
Accounts receivable .....	34,125	39,825
Inventory .....	156,000	146,475
Prepaid expenses .....	3,600	1,650
Total current assets .....	236,775	211,875
Equipment .....	135,825	146,700
Accum. depreciation—Equipment .....	(61,950)	(47,550)

<b>Liabilities</b>		
Accounts payable .....	\$ 28,800	\$ 33,750
Income taxes payable .....	5,100	4,425
Dividends payable .....	0	4,500
Total current liabilities .....	33,900	42,675
Bonds payable .....	0	37,500
Total liabilities .....	33,900	80,175
<b>Equity</b>		
Common stock, \$10 par .....	168,750	168,750
Retained earnings .....	108,000	62,100
Total liabilities and equity .....	<u>\$310,650</u>	<u>\$311,025</u>

### Additional Information

- Equipment costing \$21,375 with accumulated depreciation of \$11,100 is sold for cash.
- Equipment purchases are for cash.
- Accumulated Depreciation is affected by depreciation expense and the sale of equipment.
- The balance of Retained Earnings is affected by dividend declarations and net income.
- All sales are made on credit.
- All inventory purchases are on credit.
- Accounts Payable balances result from inventory purchases.
- Prepaid expenses relate to “other operating expenses.”

**Required**

1. Prepare a statement of cash flows using the indirect method for year 2015.
- 2<sup>B</sup> Prepare a statement of cash flows using the direct method for year 2015.

**PLANNING THE SOLUTION**

- Prepare two blank statements of cash flows with sections for operating, investing, and financing activities using the (1) indirect method format and (2) direct method format.
- Compute the cash paid for equipment and the cash received from the sale of equipment using the additional information provided along with the amount for depreciation expense and the change in the balances of equipment and accumulated depreciation. Use T-accounts to help chart the effects of the sale and purchase of equipment on the balances of the Equipment account and the Accumulated Depreciation account.
- Compute the effect of net income on the change in the Retained Earnings account balance. Assign the difference between the change in retained earnings and the amount of net income to dividends declared. Adjust the dividends declared amount for the change in the Dividends Payable balance.
- Compute cash received from customers, cash paid for inventory, cash paid for other operating expenses, and cash paid for taxes as illustrated in the chapter.
- Enter the cash effects of reconstruction entries to the appropriate section(s) of the statement.
- Total each section of the statement, determine the total net change in cash, and add it to the beginning balance to get the ending balance of cash.

**SOLUTION**

Supporting computations for cash receipts and cash payments.

(1) *Cost of equipment sold . . . . .	\$ 21,375
Accumulated depreciation of equipment sold . . . . .	(11,100)
Book value of equipment sold . . . . .	10,275
Loss on sale of equipment . . . . .	(3,300)
Cash received from sale of equipment . . . . .	<b>\$ 6,975</b>
Cost of equipment sold . . . . .	\$ 21,375
Less decrease in the Equipment account balance . . . . .	(10,875)
Cash paid for new equipment . . . . .	<b>\$ 10,500</b>
(2) Loss on retirement of bonds . . . . .	\$ 825
Carrying value of bonds retired . . . . .	37,500
Cash paid to retire bonds . . . . .	<b>\$ 38,325</b>
(3) Net income . . . . .	\$ 60,150
Less increase in retained earnings . . . . .	45,900
Dividends declared . . . . .	14,250
Plus decrease in dividends payable . . . . .	4,500
Cash paid for dividends . . . . .	<b>\$ 18,750</b>
(4) <sup>B</sup> Sales . . . . .	\$ 446,100
Add decrease in accounts receivable . . . . .	5,700
Cash received from customers . . . . .	<b>\$ 451,800</b>
(5) <sup>B</sup> Cost of goods sold . . . . .	\$ 222,300
Plus increase in inventory . . . . .	9,525
Purchases . . . . .	231,825
Plus decrease in accounts payable . . . . .	4,950
Cash paid for inventory . . . . .	<b>\$ 236,775</b>
(6) <sup>B</sup> Other operating expenses . . . . .	\$ 120,300
Plus increase in prepaid expenses . . . . .	1,950
Cash paid for other operating expenses . . . . .	<b>\$ 122,250</b>
(7) <sup>B</sup> Income taxes expense . . . . .	\$ 13,725
Less increase in income taxes payable . . . . .	(675)
Cash paid for income taxes . . . . .	<b>\$ 13,050</b>

\* Supporting T-account analysis for part 1 follows:

Equipment				Accumulated Depreciation—Equipment			
Bal., Dec. 31, 2014	146,700					Bal., Dec. 31, 2014	47,550
Cash purchase	10,500	Sale	21,375	Sale	11,100	Depr. expense	25,500
Bal., Dec. 31, 2015	135,825					Bal., Dec. 31, 2015	61,950

## 1. Indirect method:

<b>UMLAUF COMPANY</b> Statement of Cash Flows (Indirect Method) For Year Ended December 31, 2015	
Cash flows from operating activities	
Net income	\$60,150
Adjustments to reconcile net income to net cash provided by operating activities	
Income statement items not affecting cash	
Depreciation expense	25,500
Loss on sale of plant assets	3,300
Loss on retirement of bonds	825
Changes in current assets and current liabilities	
Decrease in accounts receivable	5,700
Increase in inventory	(9,525)
Increase in prepaid expenses	(1,950)
Decrease in accounts payable	(4,950)
Increase in income taxes payable	675

Cash paid to retire bonds payable	(38,325)
Cash paid for dividends	(18,750)
Net cash used in financing activities	(57,075)
Net increase in cash	\$19,125
Cash balance at prior year-end	23,925
Cash balance at current year-end	<u>\$43,050</u>

# Spreadsheet Preparation of the Statement of Cash Flows

## 16A

This appendix explains how to use a spreadsheet (work sheet) to prepare the statement of cash flows under the indirect method.

**Preparing the Indirect Method Spreadsheet** Analyzing noncash accounts can be challenging when a company has a large number of accounts and many operating, investing, and financing transactions. A *spreadsheet*, also called *work sheet* or *working paper*, can help us organize the information needed to prepare a statement of cash flows. A spreadsheet also makes it easier to check the accuracy of our work. To illustrate, we return to the comparative balance sheets and income statement shown in Exhibit 16.10. We use the following identifying letters *a* through *g* to code changes in accounts, and letters *h* through *m* for additional information, to prepare the statement of cash flows:

- a. Net income is \$38,000.
- b. Accounts receivable increase by \$20,000.
- c. Inventory increases by \$14,000.
- d. Prepaid expenses increase by \$2,000.
- e. Accounts payable decrease by \$5,000.
- f. Interest payable decreases by \$1,000.
- g. Income taxes payable increase by \$10,000.
- h. Depreciation expense is \$24,000.
- i. Plant assets costing \$20,000 with accumulated depreciation of \$12,000 are sold for \$2,000 cash. This yields a loss on sale of assets of \$6,000.
- j. Notes with a book value of \$34,000 are retired with a cash payment of \$18,000, yielding a \$16,000 gain on retirement.
- k. Plant assets costing \$60,000 are purchased with an issuance of notes payable for \$60,000.
- l. Issued 3,000 shares of common stock for \$15,000 cash.
- m. Paid cash dividends of \$14,000.

Exhibit 16A.1 shows the indirect method spreadsheet for Genesis. We enter both beginning and ending balance sheet amounts on the spreadsheet. We also enter information in the Analysis of Changes columns (keyed to the additional information items *a* through *m*) to explain changes in the accounts and determine the cash flows for operating, investing, and financing activities. Information about noncash investing and financing activities is reported near the bottom.

**Entering the Analysis of Changes on the Spreadsheet** The following sequence of procedures is used to complete the spreadsheet after the beginning and ending balances of the balance sheet accounts are entered:

- ① Enter net income as the first item in the statement of cash flows section for computing operating cash inflow (debit) and as a credit to Retained Earnings.
- ② In the statement of cash flows section, adjustments to net income are entered as debits if they increase cash flows and as credits if they decrease cash flows. Applying this same rule, adjust net income for the change in each noncash current asset and current liability account related to operating activities. For each adjustment to net income, the offsetting debit or credit must help reconcile the beginning and ending balances of a current asset or current liability account.
- ③ Enter adjustments to net income for income statement items not providing or using cash in the period. For each adjustment, the offsetting debit or credit must help reconcile a noncash balance sheet account.
- ④ Adjust net income to eliminate any gains or losses from investing and financing activities. Because the cash from a gain must be excluded from operating activities, the gain is entered as a credit in the operating activities section. Losses are entered as debits. For each adjustment, the related debit and/or credit must help reconcile balance sheet accounts and involve reconstructed entries to show the cash flow from investing or financing activities.
- ⑤ After reviewing any unreconciled balance sheet accounts and related information, enter the remaining reconciling entries for investing and financing activities. Examples are purchases of plant assets,

### P4

Illustrate use of a spreadsheet to prepare a statement of cash flows.

**Point:** Analysis of the changes on the spreadsheet are summarized here:

1. Cash flows from operating activities generally affect net income, current assets, and current liabilities.
2. Cash flows from investing activities generally affect noncurrent asset accounts.
3. Cash flows from financing activities generally affect noncurrent liability and equity accounts.

APPENDIX

# Direct Method of Reporting Operating Cash Flows

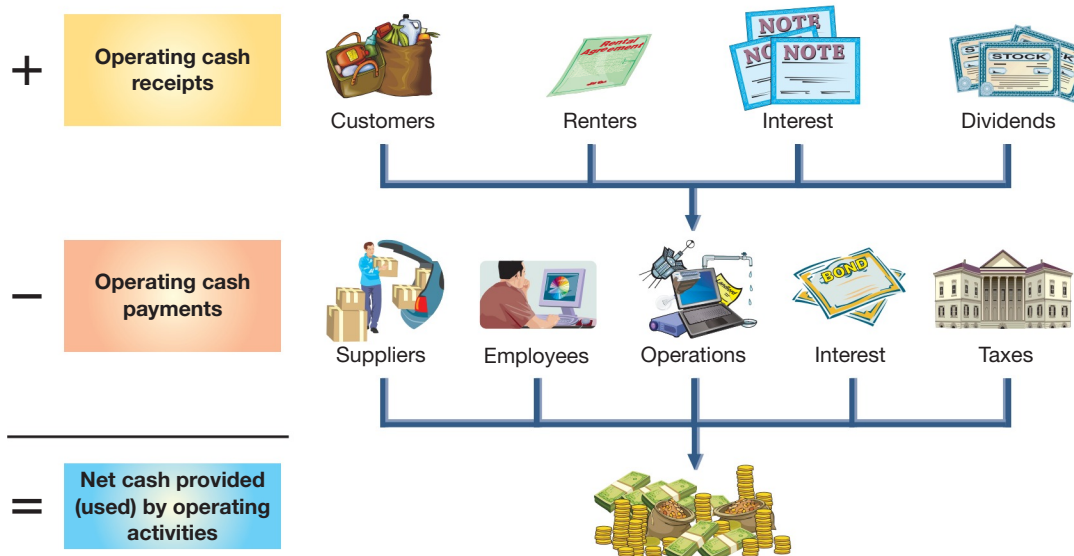

# 16B

We compute cash flows from operating activities under the direct method by adjusting accrual-based income statement items to the cash basis. The usual approach is to adjust income statement accounts related to operating activities for changes in their related balance sheet accounts as follows:

**P5** Compute cash flows from operating activities using the direct method.

$$\begin{array}{|c|} \hline \text{Revenue} \\ \text{or} \\ \text{expense} \\ \hline \end{array}
 + \text{ or } -
 \begin{array}{|c|} \hline \text{Adjustments for} \\ \text{changes in related} \\ \text{balance sheet accounts} \\ \hline \end{array}
 =
 \begin{array}{|c|} \hline \text{Cash receipts} \\ \text{or} \\ \text{cash payments} \\ \hline \end{array}$$

The framework for reporting cash receipts and cash payments for the operating section of the cash flow statement under the direct method is presented in Exhibit 16B.1. We consider cash receipts first and then cash payments.

**EXHIBIT 16B.1** Major Classes of Operating Cash Flows

**Operating Cash Receipts** A review of Exhibit 16.10 and the additional information reported by Genesis suggests only one potential cash receipt: sales to customers. This section, therefore, starts with sales to customers as reported on the income statement and then adjusts it as necessary to obtain cash received from customers to report on the statement of cash flows.

**Cash Received from Customers** If all sales are for cash, the amount received from customers equals the sales reported on the income statement. When some or all sales are on account, however, we must adjust the amount of sales for the change in Accounts Receivable. It is often helpful to use *account analysis* to do this. This usually involves setting up a T-account and reconstructing its major entries, with emphasis on cash receipts and payments.

To illustrate, we use a T-account that includes accounts receivable balances for Genesis on December 31, 2014 and 2015. The beginning balance is \$40,000 and the ending balance is \$60,000. Next, the income statement shows sales of \$590,000, which we enter on the debit side of this account. We now can reconstruct the Accounts Receivable account to determine the amount of cash received from customers as follows:

**Point:** An accounts receivable increase implies that cash received from customers is less than sales (the converse is also true).

Reconstructed Entry

Cash .....	570,000
Accts Recble. ....	20,000
Sales .....	590,000

Accounts Receivable		
Bal., Dec. 31, 2014	40,000	
Sales	590,000	<b>Cash receipts = 570,000</b>
Bal., Dec. 31, 2015	60,000	

**Example:** If the ending balance of Accounts Receivable is \$20,000 (instead of \$60,000), what is cash received from customers? Answer: \$610,000

This T-account shows that the Accounts Receivable balance begins at \$40,000 and increases to \$630,000 from sales of \$590,000, yet its ending balance is only \$60,000. This implies that cash receipts from customers are \$570,000, computed as \$40,000 + \$590,000 - [?] = \$60,000. This computation can be rearranged to express cash received as equal to sales of \$590,000 minus a \$20,000 increase in accounts receivable. This computation is summarized as a general rule in Exhibit 16B.2. Genesis reports the \$570,000 cash received from customers as a cash inflow from operating activities.

**EXHIBIT 16B.2**

Formula to Compute Cash Received from Customers—Direct Method

$$\text{Cash received from customers} = \text{Sales} + \text{Decrease in accounts receivable}$$

$$\text{Cash received from customers} = \text{Sales} - \text{Increase in accounts receivable}$$

**Other Cash Receipts** While Genesis’s cash receipts are limited to collections from customers, we often see other types of cash receipts, most commonly cash receipts involving rent, interest, and dividends. We compute cash received from these items by subtracting an increase in their respective receivable or adding a decrease. For instance, if rent receivable increases in the period, cash received from renters is less than rent revenue reported on the income statement. If rent receivable decreases, cash received is more than reported rent revenue. The same logic applies to interest and dividends. The formulas for these computations are summarized later in this appendix.

**Point:** Net income is measured using accrual accounting. Cash flows from operations are measured using cash basis accounting.

**Operating Cash Payments** A review of Exhibit 16.10 and the additional Genesis information shows four operating expenses: cost of goods sold; wages and other operating expenses; interest expense; and taxes expense. We analyze each expense to compute its cash amounts for the statement of cash flows. (We then examine depreciation and the other losses and gains.)

**Cash Paid for Inventory** We compute cash paid for inventory by analyzing both cost of goods sold and inventory. If all inventory purchases are for cash and the ending balance of Inventory is unchanged from the beginning balance, the amount of cash paid for inventory equals cost of goods sold—an uncommon situation. Instead, there normally is some change in the Inventory balance. Also, some or all purchases are often made on credit, and this yields changes in the Accounts Payable balance. When the balances of both Inventory and Accounts Payable change, we must adjust the cost of goods sold for changes in both accounts to compute cash paid for inventory. This is a two-step adjustment.

First, we use the change in the account balance of Inventory, along with the cost of goods sold amount, to compute cost of purchases for the period. An increase in inventory implies that we bought more than we sold, and we add this inventory increase to cost of goods sold to compute cost of purchases. A decrease in inventory implies that we bought less than we sold, and we subtract the inventory decrease from cost of

goods sold to compute purchases. We illustrate the *first step* by reconstructing the Inventory account of Genesis:

Inventory			
Bal., Dec. 31, 2014	70,000		
<b>Purchases =</b>	<b>314,000</b>	Cost of goods sold	300,000
Bal., Dec. 31, 2015	84,000		

The beginning balance is \$70,000, and the ending balance is \$84,000. The income statement shows that cost of goods sold is \$300,000, which we enter on the credit side of this account. With this information, we determine the amount for cost of purchases to be \$314,000. This computation can be rearranged to express cost of purchases as equal to cost of goods sold of \$300,000 plus the \$14,000 increase in inventory.

The second step uses the change in the balance of Accounts Payable, and the amount of cost of purchases, to compute cash paid for inventory. A decrease in accounts payable implies that we paid for more goods than we acquired this period, and we would then add the accounts payable decrease to cost of purchases to compute cash paid for inventory. An increase in accounts payable implies that we paid for less than the amount of goods acquired, and we would subtract the accounts payable increase from purchases to compute cash paid for inventory. The *second step* is applied to Genesis by reconstructing its Accounts Payable account:

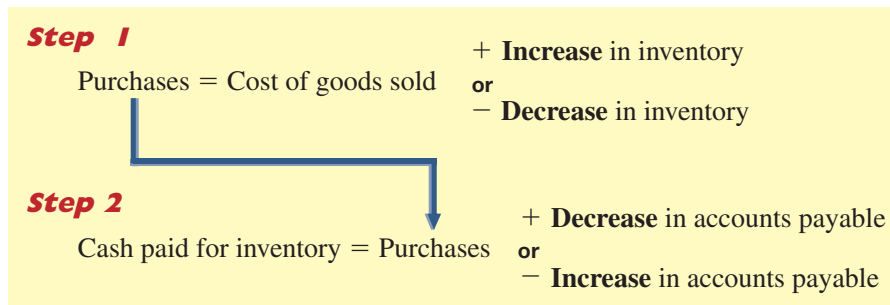

Accounts Payable			
		Bal., Dec. 31, 2014	40,000
<b>Cash payments =</b>	<b>319,000</b>	Purchases	314,000
		Bal., Dec. 31, 2015	35,000

Reconstructed Entry	
COGS.....	300,000
Inventory .....	14,000
Accounts Payable..	5,000
Cash.....	319,000

Its beginning balance of \$40,000 plus purchases of \$314,000 minus an ending balance of \$35,000 yields cash paid of \$319,000 (or \$40,000 + \$314,000 - [?] = \$35,000). Alternatively, we can express cash paid for inventory as equal to purchases of \$314,000 plus the \$5,000 decrease in accounts payable. The \$319,000 cash paid for inventory is reported on the statement of cash flows as a cash outflow under operating activities.

**Example:** If the ending balances of Inventory and Accounts Payable are \$60,000 and \$50,000, respectively (instead of \$84,000 and \$35,000), what is cash paid for inventory? Answer: \$280,000

We summarize this two-step adjustment to cost of goods sold to compute cash paid for inventory in Exhibit 16B.3.

**EXHIBIT 16B.3**

Two Steps to Compute Cash Paid for Inventory—Direct Method

**Cash Paid for Wages and Operating Expenses (Excluding Depreciation)** The income statement of Genesis shows wages and other operating expenses of \$216,000 (see Exhibit 16.10). To compute cash paid for wages and other operating expenses, we adjust this amount for any changes in their related balance sheet accounts. We begin by looking for any prepaid expenses and accrued liabilities related to wages and other operating expenses in the balance sheets of Genesis in Exhibit 16.10. The balance sheets show prepaid expenses but no accrued liabilities. Thus, the adjustment is limited to the change in prepaid expenses. The amount of adjustment is computed by assuming that all cash paid for wages and other operating expenses is initially debited to Prepaid Expenses. This assumption allows us to reconstruct the Prepaid Expenses account:

Prepaid Expenses			
Bal., Dec. 31, 2014	4,000		
<b>Cash payments =</b>	<b>218,000</b>	Wages and other operating exp.	216,000
Bal., Dec. 31, 2015	6,000		

Reconstructed Entry	
Wages and Other Expenses.....	216,000
Prepaid Expenses..	2,000
Cash.....	218,000

**Point:** A decrease in prepaid expenses implies that reported expenses include an amount(s) that did not require a cash outflow in the period.

Prepaid expenses increase by \$2,000 in the period, meaning that cash paid for wages and other operating expenses exceeds the reported expense by \$2,000. Alternatively, we can express cash paid for wages and other operating expenses as equal to its reported expenses of \$216,000 plus the \$2,000 increase in prepaid expenses.<sup>1</sup>

Exhibit 16B.4 summarizes the adjustments to wages (including salaries) and other operating expenses. The Genesis balance sheet did not report accrued liabilities, but we include them in the formula to explain the adjustment to cash when they do exist. A decrease in accrued liabilities implies that we paid cash for more goods or services than received this period, so we add the decrease in accrued liabilities to the expense amount to obtain cash paid for these goods or services. An increase in accrued liabilities implies that we paid cash for less than what was acquired, so we subtract this increase in accrued liabilities from the expense amount to get cash paid.

**EXHIBIT 16B.4**

Formula to Compute Cash Paid for Wages and Operating Expenses—Direct Method

Cash paid for wages and other operating expenses	=	Wages and other operating expenses	+ Increase in prepaid expenses	+ Decrease in accrued liabilities
			or - Decrease in prepaid expenses	or - Increase in accrued liabilities

**Cash paid for interest and income taxes** Computing operating cash flows for interest and taxes is similar to that for operating expenses. Both require adjustments to their amounts reported on the income statement for changes in their related balance sheet accounts. We begin with the Genesis income statement showing interest expense of \$7,000 and income taxes expense of \$15,000. To compute the cash paid, we adjust interest expense for the change in interest payable and then the income taxes expense for the change in income taxes payable. These computations involve reconstructing both liability accounts:

Reconstructed Entry

Int. Expense	7,000	
Int. Payable	1,000	
Cash		8,000

Interest Payable	
Bal., Dec. 31, 2014	4,000
<b>Cash paid for interest = 8,000</b>	
Interest expense	7,000
Bal., Dec. 31, 2015	3,000

Reconstructed Entry

Inc. Tax Exp.	15,000	
Inc. Tax Pay.	10,000	
Cash		5,000

Income Taxes Payable	
Bal., Dec. 31, 2014	12,000
<b>Cash paid for taxes = 5,000</b>	
Income taxes expense	15,000
Bal., Dec. 31, 2015	22,000

These accounts reveal cash paid for interest of \$8,000 and cash paid for income taxes of \$5,000. The formulas to compute these amounts are in Exhibit 16B.5. Both of these cash payments are reported as operating cash outflows on the statement of cash flows.

**EXHIBIT 16B.5**

Formulas to Compute Cash Paid for Both Interest and Taxes—Direct Method

Cash paid for interest	= Interest expense	+ Decrease in interest payable
		or - Increase in interest payable
Cash paid for taxes	= Income taxes expense	+ Decrease in income taxes payable
		or - Increase in income taxes payable

**Analyzing Additional Expenses, Gains, and Losses** Genesis has three additional items reported on its income statement: depreciation, loss on sale of assets, and gain on retirement of debt. We must consider each for its potential cash effects.

<sup>1</sup> The assumption that all cash payments for wages and operating expenses are initially debited to Prepaid Expenses is not necessary for our analysis to hold. If cash payments are debited directly to the expense account, the total amount of cash paid for wages and other operating expenses still equals the \$216,000 expense plus the \$2,000 increase in prepaid expenses (which arise from end-of-period adjusting entries).

**Depreciation Expense** Depreciation expense is \$24,000. It is often called a *noncash expense* because depreciation has no cash flows. Depreciation expense is an allocation of an asset's depreciable cost. The cash outflow with a plant asset is reported as part of investing activities when it is paid for. Thus, depreciation expense is *never* reported on a statement of cash flows using the direct method; nor is depletion or amortization expense.

**Loss on Sale of Assets** Sales of assets frequently result in gains and losses reported as part of net income, but the amount of recorded gain or loss does *not* reflect any cash flows in these transactions. Asset sales result in cash inflow equal to the cash amount received, regardless of whether the asset was sold at a gain or a loss. This cash inflow is reported under investing activities. Thus, the loss or gain on a sale of assets is *never* reported on a statement of cash flows using the direct method.

**Gain on Retirement of Debt** Retirement of debt usually yields a gain or loss reported as part of net income, but that gain or loss does *not* reflect cash flow in this transaction. Debt retirement results in cash outflow equal to the cash paid to settle the debt, regardless of whether the debt is retired at a gain or loss. This cash outflow is reported under financing activities; the loss or gain from retirement of debt is *never* reported on a statement of cash flows using the direct method.

**Point:** The direct method is usually viewed as *user friendly* because less accounting knowledge is required to understand and use it.

**Summary of Adjustments for Direct Method** Exhibit 16B.6 summarizes common adjustments for net income to yield net cash provided (used) by operating activities under the direct method.

Item	From Income Statement	Adjustments to Obtain Cash Flow Numbers
<b>Receipts</b>		
From sales	Sales Revenue	{ +Decrease in Accounts Receivable -Increase in Accounts Receivable
From rent	Rent Revenue	{ +Decrease in Rent Receivable -Increase in Rent Receivable
From interest	Interest Revenue	{ +Decrease in Interest Receivable -Increase in Interest Receivable
From dividends	Dividend Revenue	{ +Decrease in Dividends Receivable -Increase in Dividends Receivable
<b>Payments</b>		
To suppliers	Cost of Goods Sold	{ +Increase in Inventory {+Decrease in Accounts Payable -Decrease in Inventory -Increase in Accounts Payable
For operations	Operating Expense	{ +Increase in Prepaids {+Decrease in Accrued Liabilities -Decrease in Prepaids -Increase in Accrued Liabilities
To employees	Wages (Salaries) Expense	{ +Decrease in Wages (Salaries) Payable -Increase in Wages (Salaries) Payable
For interest	Interest Expense	{ +Decrease in Interest Payable -Increase in Interest Payable
For taxes	Income Tax Expense	{ +Decrease in Income Tax Payable -Increase in Income Tax Payable

### EXHIBIT 16B.6

Summary of Selected Adjustments for Direct Method

**Direct Method Format of Operating Activities Section** Exhibit 16B.7 shows the Genesis statement of cash flows using the direct method. Major items of cash inflows and cash outflows are listed separately in the operating activities section. The format requires that operating cash outflows be subtracted from operating cash inflows to get net cash provided (used) by operating activities.

The FASB recommends that the operating activities section of the statement of cash flows be reported using the direct method, which is considered more useful to financial statement users. *However, the FASB requires a reconciliation of net income to net cash provided (used) by operating activities when the direct method is used* (which can be reported in the notes). This reconciliation follows the preparation of the operating activities section of the statement of cash flows using the indirect method.

**Point:** Some preparers argue that it is easier to prepare a statement of cash flows using the indirect method. This likely explains its greater frequency in financial statements.

Currently, U.S. GAAP and IFRS allow cash flows from operating activities to be reported using either the indirect method or the direct method. The IASB and FASB are working on joint guidance that would require the direct method for the operating section with the indirect method's operating section disclosed in the footnotes. Stay tuned . . . ■

**EXHIBIT 16B.7**

Statement of Cash Flows—Direct Method

GENESIS Statement of Cash Flows For Year Ended December 31, 2015		
Cash flows from operating activities		
Cash received from customers	\$570,000	
Cash paid for inventory	(319,000)	
Cash paid for wages and other operating expenses	(218,000)	
Cash paid for interest	(8,000)	
Cash paid for taxes	<u>(5,000)</u>	
Net cash provided by operating activities		\$20,000
Cash flows from investing activities		
Cash received from sale of plant assets	2,000	
Net cash provided by investing activities		2,000
Cash flows from financing activities		
Cash received from issuing stock	15,000	
Cash paid to retire notes	(18,000)	
Cash paid for dividends	<u>(14,000)</u>	
Net cash used in financing activities		<u>(17,000)</u>
Net increase in cash		\$ 5,000
Cash balance at prior year-end		<u>12,000</u>
Cash balance at current year-end		<u>\$17,000</u>

**NEED-TO-KNOW 16-5**

Reporting Operating Cash Flows (Direct)

P5

A company's current-year income statement and selected balance sheet data at December 31 of the current and prior years follow. Prepare the cash flows from operating activities section only of its statement of cash flows using the direct method for the current year.

Income Statement For Current Year Ended December 31	
Sales revenue	\$120
Expenses	
Cost of goods sold	50
Depreciation expense	30
Salaries expense	17
Interest expense	<u>3</u>
Net income	<u>\$ 20</u>

Selected Balance Sheet Accounts		
At December 31	Current Yr	Prior Yr
Accounts receivable	\$12	\$10
Inventory	6	9
Accounts payable	7	11
Salaries payable	8	3
Interest payable	1	0

**Solution**

Cash Flows from Operating Activities—Direct Method For Current Year Ended December 31	
<b>Cash flows from operating activities*</b>	
Cash received from customers	\$118
Cash paid for inventory	(51)
Cash paid for salaries	(12)
Cash paid for interest	<u>(2)</u>
Net cash provided by operating activities	<u>\$53</u>

\*Supporting computations:

Cash received from customers = Sales of \$120 – Accounts Receivable increase of \$2.

Cash paid for inventory = COGS of \$50 – Inventory decrease of \$3 + Accounts Payable decrease of \$4.

Cash paid for salaries = Salaries Expense of \$17 – Salaries Payable increase of \$5.

Cash paid for interest = Interest Expense of \$3 – Interest Payable increase of \$1.

# Summary

**C1 Distinguish between operating, investing, and financing activities, and describe how noncash investing and financing activities are disclosed.** The purpose of the statement of cash flows is to report major cash receipts and cash payments relating to operating, investing, or financing activities. Operating activities include transactions and events that determine net income. Investing activities include transactions and events that mainly affect long-term assets. Financing activities include transactions and events that mainly affect long-term liabilities and equity. Noncash investing and financing activities must be disclosed in either a note or a separate schedule to the statement of cash flows. Examples are the retirement of debt by issuing equity and the exchange of a note payable for plant assets.

**A1 Analyze the statement of cash flows and apply the cash flow on total assets ratio.** To understand and predict cash flows, users stress identification of the sources and uses of cash flows by operating, investing, and financing activities. Emphasis is on operating cash flows since they derive from continuing operations. The cash flow on total assets ratio is defined as operating cash flows divided by average total assets. Analysis of current and past values for this ratio can reflect a company's ability to yield regular and positive cash flows. It is also viewed as a measure of earnings quality.

**P1 Prepare a statement of cash flows.** Preparation of a statement of cash flows involves five steps: (1) Compute the net increase or decrease in cash; (2) compute net cash provided or used by operating activities (*using either the direct or indirect method*); (3) compute net cash provided or used by investing activities; (4) compute net cash provided or used by

financing activities; and (5) report the beginning and ending cash balances and prove that the ending cash balance is explained by net cash flows. Noncash investing and financing activities are also disclosed.

**P2 Compute cash flows from operating activities using the indirect method.** The indirect method for reporting net cash provided or used by operating activities starts with net income and then adjusts it for three items: (1) changes in noncash current assets and current liabilities related to operating activities, (2) revenues and expenses not providing or using cash, and (3) gains and losses from investing and financing activities.

**P3 Determine cash flows from both investing and financing activities.** Cash flows from both investing and financing activities are determined by identifying the cash flow effects of transactions and events affecting each balance sheet account related to these activities. All cash flows from these activities are identified when we can explain changes in these accounts from the beginning to the end of the period.

**P4A Illustrate use of a spreadsheet to prepare a statement of cash flows.** A spreadsheet is a useful tool in preparing a statement of cash flows. Six key steps (see Appendix 16A) are applied when using the spreadsheet to prepare the statement.

**P5B Compute cash flows from operating activities using the direct method.** The direct method for reporting net cash provided or used by operating activities lists major operating cash inflows less cash outflows to yield net cash inflow or outflow from operations.

## Guidance Answers to Decision Maker

**Entrepreneur** Several factors might explain an increase in net cash flows when a net loss is reported, including (1) early recognition of expenses relative to revenues generated (such as research and development), (2) cash advances on long-term sales contracts not yet recognized in income, (3) issuances of debt or equity for cash to finance expansion, (4) cash sale of assets, (5) delay of cash payments, and (6) cash prepayment on sales. Analysis needs to focus on the components of both the net loss and the net cash flows and their implications for future performance.

**Reporter** Your initial reaction based on the company's \$600,000 loss with a \$550,000 decrease in net cash is not positive. However, closer scrutiny reveals a more positive picture of this company's performance. Cash flow from operating activities is \$650,000, computed as  $[?] - \$850,000 - \$350,000 = \$(650,000)$ . You also note that net income *before* the extraordinary loss is \$330,000, computed as  $[?] - \$930,000 = \$(600,000)$ .

## Key Terms

Cash flow on total assets  
Direct method  
Financing activities

Indirect method  
Investing activities

Operating activities  
Statement of cash flows

## Multiple Choice Quiz

## Answers at end of chapter

1. A company uses the indirect method to determine its cash flows from operating activities. Use the following information to determine its net cash provided or used by operating activities.

Net income .....	\$15,200
Depreciation expense .....	10,000
Cash payment on note payable .....	8,000
Gain on sale of land .....	3,000
Increase in inventory .....	1,500
Increase in accounts payable .....	2,850

- a. \$23,550 used by operating activities  
 b. \$23,550 provided by operating activities  
 c. \$15,550 provided by operating activities  
 d. \$42,400 provided by operating activities  
 e. \$20,850 provided by operating activities
2. A machine with a cost of \$175,000 and accumulated depreciation of \$94,000 is sold for \$87,000 cash. The amount reported as a source of cash under cash flows from investing activities is
- a. \$81,000.  
 b. \$6,000.  
 c. \$87,000.  
 d. Zero; this is a financing activity.  
 e. Zero; this is an operating activity.
3. A company settles a long-term note payable plus interest by paying \$68,000 cash toward the principal amount and

\$5,440 cash for interest. The amount reported as a use of cash under cash flows from financing activities is

- a. Zero; this is an investing activity.  
 b. Zero; this is an operating activity.  
 c. \$73,440.  
 d. \$68,000.  
 e. \$5,440.
4. The following information is available regarding a company's annual salaries and wages. What amount of cash is paid for salaries and wages?

Salaries and wages expense .....	\$255,000
Salaries and wages payable, prior year-end ....	8,200
Salaries and wages payable, current year-end ...	10,900

- a. \$252,300      c. \$255,000      e. \$235,900  
 b. \$257,700      d. \$274,100
5. The following information is available for a company. What amount of cash is paid for inventory for the current year?

Cost of goods sold .....	\$545,000
Inventory, prior year-end .....	105,000
Inventory, current year-end .....	112,000
Accounts payable, prior year-end .....	98,500
Accounts payable, current year-end .....	101,300

- a. \$545,000      c. \$540,800      e. \$549,200  
 b. \$554,800      d. \$535,200

A(B) *Superscript letter A (B) denotes assignments based on Appendix 16A (16B).*

 *Icon denotes assignments that involve decision making.*

## Discussion Questions

- What is the reporting purpose of the statement of cash flows? Identify at least two questions that this statement can answer.
- What are some investing activities reported on the statement of cash flows?
- What are some financing activities reported on the statement of cash flows?
- Describe the direct method of reporting cash flows from operating activities.
- When a statement of cash flows is prepared using the direct method, what are some of the operating cash flows?
- Describe the indirect method of reporting cash flows from operating activities.
- Where on the statement of cash flows is the payment of cash dividends reported?
-  Assume that a company purchases land for \$1,000,000, paying \$400,000 cash and borrowing the remainder with a long-term note payable. How should this transaction be reported on a statement of cash flows?
-  On June 3, a company borrows \$200,000 cash by giving its bank a 90-day, interest-bearing note. On the statement of cash flows, where should this be reported?
-  If a company reports positive net income for the year, can it also show a net cash outflow from operating activities? Explain.
-  Is depreciation a source of cash flow?

- 12.** Refer to **Apple's** statement of cash flows in Appendix A. (a) Which method is used to compute its net cash provided by operating activities? (b) Its balance sheet shows an increase in accounts (trade) receivable from September 29, 2012, to September 28, 2013; why is this increase in accounts (trade) receivable subtracted when computing net cash provided by operating activities for the fiscal year ended September 28, 2013?
- 13.** Refer to **Google's** statement of cash flows in Appendix A. What are its

**APPLE**

**GOOGLE**

cash flows from financing activities for the year ended December 31, 2013? List the items and amounts.

- 14.** Refer to **Samsung's** 2013 statement of cash flows in Appendix A. List its cash flows from operating activities, investing activities, and financing activities.
- 15.** Refer to **Samsung's** statement of cash flows in Appendix A. What investing activities result in cash outflows for the year ended December 31, 2013? List items and amounts.

**Samsung**

**Samsung**

Classify the following cash flows as either operating, investing, or financing activities.

- \_\_\_ 1. Sold long-term investments for cash.
- \_\_\_ 2. Received cash payments from customers.
- \_\_\_ 3. Paid cash for wages and salaries.
- \_\_\_ 4. Purchased inventories for cash.
- \_\_\_ 5. Paid cash dividends.
- \_\_\_ 6. Issued common stock for cash.
- \_\_\_ 7. Received cash interest on a note.
- \_\_\_ 8. Paid cash interest on outstanding notes.
- \_\_\_ 9. Received cash from sale of land at a loss.
- \_\_\_ 10. Paid cash for property taxes on building.

**QUICK STUDY**

**QS 16-1**  
Transaction classification by activity

Label the following headings, line items, and notes with the numbers 1 through 13 according to their sequential order (from top to bottom) for presentation of the statement of cash flows.

- \_\_\_ a. "Cash flows from investing activities" title
- \_\_\_ b. "For period Ended date" heading
- \_\_\_ c. "Cash flows from operating activities" title
- \_\_\_ d. Company name
- \_\_\_ e. Schedule or note disclosure of noncash investing and financing transactions
- \_\_\_ f. "Statement of Cash Flows" heading
- \_\_\_ g. Net increase (decrease) in cash . . . . . \$ #
- \_\_\_ h. Net cash provided (used) by operating activities . . . . . \$ #
- \_\_\_ i. Cash (and equivalents) balance at prior period-end . . . . . \$ #
- \_\_\_ j. Net cash provided (used) by financing activities . . . . . \$ #
- \_\_\_ k. "Cash flows from financing activities" title
- \_\_\_ l. Net cash provided (used) by investing activities . . . . . \$ #
- \_\_\_ m. Cash (and equivalents) balance at current period-end . . . \$ #

**QS 16-2**  
Statement of cash flows

For each of the following three separate cases X, Y and Z, compute cash flows from operations using the indirect method. The list includes all balance sheet accounts related to cash from operating activities.

**QS 16-3**  
**Indirect:** Computing cash flows from operations

	Case X	Case Y	Case Z
Net income . . . . .	\$ 4,000	\$100,000	\$72,000
Depreciation expense . . . . .	30,000	8,000	24,000
Accounts receivable increase (decrease) . . . . .	40,000	20,000	(4,000)
Inventory increase (decrease) . . . . .	(20,000)	(10,000)	10,000
Accounts payable increase (decrease) . . . . .	24,000	(22,000)	14,000
Accrued liabilities increase (decrease) . . . . .	(44,000)	12,000	(8,000)

**QS 16-4**

**Indirect:** Computing cash from operations **P2**

Use the following information to determine this company's cash flows from operating activities using the indirect method.

MOSS COMPANY Selected Balance Sheet Information December 31, 2015 and 2014		
	2015	2014
<b>Current assets</b>		
Cash .....	\$84,650	\$26,800
Accounts receivable .....	25,000	32,000
Inventory .....	60,000	54,100
<b>Current liabilities</b>		
Accounts payable .....	30,400	25,700
Income taxes payable .....	2,050	2,200

MOSS COMPANY Income Statement For Year Ended December 31, 2015	
Sales .....	\$515,000
Cost of goods sold .....	<u>331,600</u>
Gross profit .....	183,400
<b>Operating expenses</b>	
Depreciation expense .....	\$ 36,000
Other expenses .....	<u>121,500</u>
Income before taxes .....	25,900
Income taxes expense .....	<u>7,700</u>
Net income .....	<u>\$ 18,200</u>

The following information is necessary to answer QS 16-5 and QS 16-6.

**QS 16-5**

**Indirect:** Computing investing cash flows **P2**

The plant assets section of the comparative balance sheets of Anders Company is reported below.

Anders Company Comparative Balance Sheets		
	2015	2014
<b>Plant assets</b>		
Equipment .....	\$ 180,000	\$270,000
Accum. Depr.—Equipment .....	<u>(100,000)</u>	<u>(210,000)</u>
Equipment, net. ....	\$ 80,000	\$ 60,000
Buildings .....	\$ 380,000	\$400,000
Accum. Depr.—Buildings .....	<u>(100,000)</u>	<u>(285,000)</u>
Buildings, net .....	<u>\$ 280,000</u>	<u>\$115,000</u>

Refer to the balance sheet data above from Anders Company. During 2015, equipment with a book value of \$40,000 and an original cost of \$210,000 was sold at a loss of \$3,000.

1. How much cash did Anders receive from the sale of equipment?
2. How much depreciation expense was recorded on equipment during 2015?
3. What was the cost of new equipment purchased by Anders during 2015?

**QS 16-6**

**Indirect:** Computing investing cash flows **P2**

Refer to the balance sheet data above from Anders Company. During 2015, a building with a book value of \$70,000 and an original cost of \$300,000 was sold at a gain of \$60,000.

1. How much cash did Anders receive from the sale of the building?
2. How much depreciation expense was recorded on buildings during 2015?
3. What was the cost of buildings purchased by Anders during 2015?

**QS 16-7**

Computing cash from asset sales **P3**

The following selected information is from Ellerby Company's comparative balance sheets.

At December 31	2015	2014
Furniture .....	\$132,000	\$ 184,500
Accumulated depreciation—Furniture .....	(88,700)	(110,700)

The income statement reports depreciation expense for the year of \$18,000. Also, furniture costing \$52,500 was sold for its book value. Compute the cash received from the sale of furniture.

Compute cash flows from investing activities using the following company information.

Sale of short-term investments	\$ 6,000
Cash collections from customers	16,000
Purchase of used equipment	5,000
Depreciation expense	2,000

**QS 16-8**

Computing cash flows from investing

P3

The following selected information is from Princeton Company's comparative balance sheets.

At December 31	2015	2014
Common stock, \$10 par value	\$105,000	\$100,000
Paid-in capital in excess of par	567,000	342,000
Retained earnings	313,500	287,500

**QS 16-9**

Computing financing cash flows

P3

The company's net income for the year ended December 31, 2015, was \$48,000.

1. Compute the cash received from the sale of its common stock during 2015.
2. Compute the cash paid for dividends during 2015.

Compute cash flows from financing activities using the following company information.

Additional short-term borrowings	\$20,000
Purchase of short-term investments	5,000
Cash dividends paid	16,000
Interest paid	8,000

**QS 16-10**

Computing cash flows from financing

P3

Use the following balance sheets and income statement to answer QS 16-11 through QS 16-16.

CRUZ, INC. Comparative Balance Sheets December 31, 2015		
	2015	2014
<b>Assets</b>		
Cash	\$ 94,800	\$ 24,000
Accounts receivable, net	41,000	51,000
Inventory	85,800	95,800
Prepaid expenses	5,400	4,200
Total current assets	227,000	175,000
Furniture	109,000	119,000
Accum. depreciation—Furniture	(17,000)	(9,000)
Total assets	\$319,000	\$285,000
<b>Liabilities and Equity</b>		
Accounts payable	\$ 15,000	\$ 21,000
Wages payable	9,000	5,000
Income taxes payable	1,400	2,600
Total current liabilities	25,400	28,600
Notes payable (long-term)	29,000	69,000
Total liabilities	54,400	97,600
<b>Equity</b>		
Common stock, \$5 par value	229,000	179,000
Retained earnings	35,600	8,400
Total liabilities and equity	\$319,000	\$285,000

CRUZ, INC. Income Statement For Year Ended December 31, 2015	
Sales	\$488,000
Cost of goods sold	314,000
Gross profit	174,000
Operating expenses	
Depreciation expense	\$37,600
Other expenses	89,100
Income before taxes	47,300
Income taxes expense	17,300
Net income	\$ 30,000

**QS 16-11**

Indirect: Computing cash from operations

P2

**Required**

Use the indirect method to prepare the cash provided or used from operating activities section only of the statement of cash flows for this company.

**QS 16-12**

Computing cash from asset sales

Refer to the data in QS 16-11.

Furniture costing \$55,000 is sold at its book value in 2015. Acquisitions of furniture total \$45,000 cash, on which no depreciation is necessary because it is acquired at year-end. What is the cash inflow related to the sale of furniture?

**QS 16-13**

Computing financing cash outflows

Refer to the data in QS 16-11.

1. Assume that all common stock is issued for cash. What amount of cash dividends is paid during 2015?
2. Assume that no additional notes payable are issued in 2015. What cash amount is paid to reduce the notes payable balance in 2015?

**QS 16-14<sup>B</sup>**

**Direct:** Computing cash received from customers

Refer to the data in QS 16-11.

1. How much cash is received from sales to customers for year 2015?
2. What is the net increase or decrease in cash for year 2015?

**QS 16-15<sup>B</sup>**

**Direct:** Computing operating cash outflows

Refer to the data in QS 16-11.

1. How much cash is paid to acquire inventory during year 2015?
2. How much cash is paid for operating expenses during year 2015?

**QS 16-16<sup>B</sup>**

**Direct:** Computing cash from operations

Refer to the data in QS 16-11.

Use the direct method to prepare the cash provided or used from operating activities section only of the statement of cash flows for this company.

**QS 16-17**

Analyses of sources and uses of cash

Financial data from three competitors in the same industry follow.

1. Which of the three competitors is in the strongest position as shown by its statement of cash flows?
2. Analyze and compare the strength of Moore's cash flow on total assets ratio to that of Sykes.

	A	B	C	D
1	(\$ thousands)	Moore	Sykes	Kritch
2	Cash provided (used) by operating activities	\$ 70,000	\$ 60,000	\$ (24,000)
3	Cash provided (used) by investing activities			
4	Proceeds from sale of operating assets			26,000
5	Purchase of operating assets	(28,000)	(34,000)	
6	Cash provided (used) by financing activities			
7	Proceeds from issuance of debt			23,000
8	Repayment of debt	(6,000)		
9	Net increase (decrease) in cash	\$ 36,000	\$ 26,000	\$ 25,000
10				
11	Average total assets	\$790,000	\$625,000	\$300,000

When a spreadsheet for a statement of cash flows is prepared, all changes in noncash balance sheet accounts are fully explained on the spreadsheet. Explain how these noncash balance sheet accounts are used to fully account for cash flows on a spreadsheet.

**QS 16-18<sup>A</sup>**

Noncash accounts on a spreadsheet

P4

Use the following financial statements and additional information to (1) prepare a statement of cash flows for the year ended December 31, 2016, using the *indirect method*, and (2) analyze and briefly discuss the statement prepared in part 1 with special attention to operating activities and to the company's cash level.

**QS 16-19**

**Indirect:** Preparation of statement of cash flows

P1 P2 P3

<b>MONTGOMERY INC.</b> Comparative Balance Sheets December 31, 2016 and 2015		
	2016	2015
<b>Assets</b>		
Cash .....	\$ 30,400	\$ 30,550
Accounts receivable, net .....	10,050	12,150

Income tax expense .....	<u>3,375</u>
Net income .....	<u>\$10,500</u>

**Additional Information**

- No dividends are declared or paid in 2016.
- Issued additional stock for \$10,000 cash in 2016.
- Purchased equipment for cash in 2016; no equipment was sold in 2016.

Answer each of the following questions related to international accounting standards.

- Which method, indirect or direct, is acceptable for reporting operating cash flows under IFRS?
- For each of the following four cash flows, identify whether it is reported under the operating, investing, or financing section (or some combination) within the indirect format of the statement of cash flows reported under IFRS and under U.S. GAAP.

**QS 16-20**

International cash flow disclosures

C1

Cash Flow Source	US GAAP Reporting	IFRS Reporting
a. Interest paid .....		
b. Dividends paid .....		
c. Interest received .....		
d. Dividends received .....		

### EXERCISES

The following transactions and events occurred during the year. Assuming that this company uses the *indirect method* to report cash provided by operating activities, indicate where each item would appear on its statement of cash flows by placing an *x* in the appropriate column.

#### Exercise 16-1

**Indirect:** Cash flow classification **C1**

	Statement of Cash Flows			Noncash Investing and Financing Activities	Not Reported on Statement or in Notes
	Operating Activities	Investing Activities	Financing Activities		
a. Declared and paid a cash dividend . . . . .	_____	_____	_____	_____	_____
b. Recorded depreciation expense . . . . .	_____	_____	_____	_____	_____
c. Paid cash to settle long-term note payable . . . . .	_____	_____	_____	_____	_____
d. Prepaid expenses increased in the year . . . . .	_____	_____	_____	_____	_____
e. Accounts receivable decreased in the year . . . . .	_____	_____	_____	_____	_____
f. Purchased land by issuing common stock . . . . .	_____	_____	_____	_____	_____
g. Inventory increased in the year . . . . .	_____	_____	_____	_____	_____
h. Sold equipment for cash, yielding a loss . . . . .	_____	_____	_____	_____	_____
i. Accounts payable decreased in the year . . . . .	_____	_____	_____	_____	_____
j. Income taxes payable increased in the year . . . . .	_____	_____	_____	_____	_____

#### Exercise 16-2

**Indirect:** Reporting cash flows from operations

P2

Hampton Company reports the following information for its recent calendar year. Prepare the operating activities section of the statement of cash flows for Hampton Company using the *indirect method*.

Income Statement Data		Selected Year-End Balance Sheet Data	
Sales . . . . .	\$160,000	Accounts receivable increase . . . . .	\$10,000
Expenses		Inventory decrease . . . . .	16,000
Cost of goods sold . . . . .	100,000	Salaries payable increase . . . . .	1,000
Salaries expense . . . . .	24,000		
Depreciation expense . . . . .	12,000		
Net income . . . . .	<u>\$ 24,000</u>		

#### Exercise 16-3

**Indirect:** Reporting and interpreting cash flows from operations

P2

Arundel Company disclosed the following information for its recent calendar year.

Income Statement Data		Selected Year-End Balance Sheet Data	
Revenues . . . . .	\$100,000	Accounts receivable decrease . . . . .	\$24,000
Expenses		Purchased a machine for cash . . . . .	10,000
Salaries expense . . . . .	84,000	Salaries payable increase . . . . .	18,000
Utilities expense . . . . .	14,000	Other accrued liabilities decrease . . . . .	8,000
Depreciation expense . . . . .	14,600		
Other expenses . . . . .	3,400		
Net loss . . . . .	<u>\$ (16,000)</u>		

#### Required

1. Prepare the operating activities section of the statement of cash flows using the *indirect method*.
2. What were the major reasons that this company was able to report a net loss but positive cash flow from operations?
3. Of the potential causes of differences between cash flow from operations and net income, which are the most important to investors?

The following income statement and information about changes in noncash current assets and current liabilities are reported.

<b>SONAD COMPANY</b> Income Statement For Year Ended December 31, 2015	
Sales .....	\$1,828,000
Cost of goods sold .....	991,000
Gross profit .....	837,000
Operating expenses	
Salaries expense .....	\$245,535
Depreciation expense .....	44,200
Rent expense .....	49,600
Amortization expenses—Patents .....	4,200
Utilities expense .....	18,125
	361,660
	475,340
Gain on sale of equipment .....	6,200
Net income .....	\$ 481,540

**Exercise 16-4**

**Indirect:** Cash flows from operating activities

P2

Changes in current asset and current liability accounts for the year that relate to operations follow.

Accounts receivable .....	\$30,500 increase	Accounts payable .....	\$12,500 decrease
Inventory .....	25,000 increase	Salaries payable .....	3,500 decrease

**Required**

Prepare only the cash flows from operating activities section of the statement of cash flows using the *indirect method*.

Fitz Company reports the following information. Use the *indirect method* to prepare only the operating activities section of its statement of cash flows for the year ended December 31, 2015.

Selected 2015 Income Statement Data	Selected Year-End 2015 Balance Sheet Data
Net income .....	\$374,000
Depreciation expense .....	44,000
Amortization expense .....	7,200
Gain on sale of plant assets .....	6,000
	Accounts receivable decrease .....
	\$17,100
	Inventory decrease .....
	42,000
	Prepaid expenses increase .....
	4,700
	Accounts payable decrease .....
	8,200
	Salaries payable increase .....
	1,200

**Exercise 16-5**

**Indirect:** Cash flows from operating activities

P2

Salud Company reports the following information. Use the *indirect method* to prepare only the operating activities section of its statement of cash flows for the year ended December 31, 2015.

Selected 2015 Income Statement Data	Selected Year-End 2015 Balance Sheet Data
Net income .....	\$400,000
Depreciation expense .....	80,000
Gain on sale of machinery .....	20,000
	Accounts receivable increase .....
	\$40,000
	Prepaid expenses decrease .....
	12,000
	Accounts payable increase .....
	6,000
	Wages payable decrease .....
	2,000

**Exercise 16-6**

**Indirect:** Cash flow from operations

P2

Use the following information to determine this company's cash flows from investing activities.

- Equipment with a book value of \$65,300 and an original cost of \$133,000 was sold at a loss of \$14,000.
- Paid \$89,000 cash for a new truck.
- Sold land costing \$154,000 for \$198,000 cash, yielding a gain of \$44,000.
- Long-term investments in stock were sold for \$60,800 cash, yielding a gain of \$4,150.

**Exercise 16-7**

Cash flows from investing activities

P3

**Exercise 16-8**

Cash flows from financing activities

P3

Use the following information to determine this company's cash flows from financing activities.

- Net income was \$35,000.
- Issued common stock for \$64,000 cash.
- Paid cash dividend of \$14,600.
- Paid \$50,000 cash to settle a note payable at its \$50,000 maturity value.
- Paid \$12,000 cash to acquire its treasury stock.
- Purchased equipment for \$39,000 cash.

**Exercise 16-9****Indirect:** Statement of cash flows under IFRS

P1

**Peugeot S.A.** reports the following financial information for the year ended December 31, 2011 (euros in millions). Prepare its statement of cash flows under the *indirect method*. (*Hint:* Each line item below is titled, and any necessary parentheses added, as it is reported in the statement of cash flows.)

Net income	€ 784	Cash paid for purchases of treasury stock	€ (199)
Depreciation and amortization	3,037	Cash paid for other financing activities	(2,282)
Gains on disposals and other	(883)	Cash from disposal of plant assets and intangibles	189
Net increase in current operating assets	(1,183)	Cash paid for plant assets and intangibles	(3,921)
Cash paid for dividends	(290)	Cash and cash equivalents, December 31, 2010	10,442

**Exercise 16-10**Analyses of cash flow on total assets **A1**

A company reported average total assets of \$1,240,000 in 2014 and \$1,510,000 in 2015. Its net operating cash flow was \$102,920 in 2014 and \$138,920 in 2015. Calculate its cash flow on total assets ratio for both years. Comment on the results and any change in performance.

**Exercise 16-11****Indirect:** Preparation of statement of cash flows

P1 P2 P3 A1

The following financial statements and additional information are reported.

IKIBAN INC. Income Statement For Year Ended June 30, 2015	
Sales	\$678,000
Cost of goods sold	<u>411,000</u>
Gross profit	267,000
Operating expenses	
Depreciation expense	\$58,600
Other expenses	<u>67,000</u>
Total operating expenses	<u>125,600</u>
	141,400
Other gains (losses)	
Gain on sale of equipment	<u>2,000</u>
Income before taxes	143,400
Income taxes expense	<u>43,890</u>
Net income	<u>\$ 99,510</u>

IKIBAN INC. Comparative Balance Sheets June 30, 2015 and 2014		
	2015	2014
<b>Assets</b>		
Cash	\$ 87,500	\$ 44,000
Accounts receivable, net	65,000	51,000
Inventory	63,800	86,500
Prepaid expenses	<u>4,400</u>	<u>5,400</u>
Total current assets	220,700	186,900
Equipment	124,000	115,000
Accum. depreciation—Equipment	<u>(27,000)</u>	<u>(9,000)</u>
Total assets	<u>\$317,700</u>	<u>\$292,900</u>
<b>Liabilities and Equity</b>		
Accounts payable	\$ 25,000	\$ 30,000
Wages payable	6,000	15,000
Income taxes payable	<u>3,400</u>	<u>3,800</u>
Total current liabilities	34,400	48,800
Notes payable (long term)	<u>30,000</u>	<u>60,000</u>
Total liabilities	64,400	108,800
<b>Equity</b>		
Common stock, \$5 par value	220,000	160,000
Retained earnings	<u>33,300</u>	<u>24,100</u>
Total liabilities and equity	<u>\$317,700</u>	<u>\$292,900</u>

**Additional Information****Check** (b) Cash paid for dividends, \$90,310

- A \$30,000 note payable is retired at its \$30,000 carrying (book) value in exchange for cash.
- The only changes affecting retained earnings are net income and cash dividends paid.

- c. New equipment is acquired for \$57,600 cash.
- d. Received cash for the sale of equipment that had cost \$48,600, yielding a \$2,000 gain.
- e. Prepaid Expenses and Wages Payable relate to Other Expenses on the income statement.
- f. All purchases and sales of inventory are on credit.

(d) Cash received  
from equip. sale, \$10,000

### Required

1. Prepare a statement of cash flows for the year ended June 30, 2015, using the *indirect method*.
2. Compute the company's cash flow on total assets ratio for its fiscal year 2015.

Refer to the information in Exercise 16-11. Using the *direct method*, prepare the statement of cash flows for the year ended June 30, 2015.

### Exercise 16-12<sup>B</sup>

**Direct:** Preparation of statement of cash flows

P1 P3 P5

Complete the following spreadsheet in preparation of the statement of cash flows. (The statement of cash flows is not required.) Prepare the spreadsheet as in Exhibit 16A.1; report operating activities under the *indirect method*. Identify the debits and credits in the Analysis of Changes columns with letters that correspond to the following transactions and events *a* through *h*.

- a. Net income for the year was \$100,000.
- b. Dividends of \$80,000 cash were declared and paid.
- c. Scoreteck's only noncash expense was \$70,000 of depreciation.
- d. The company purchased plant assets for \$70,000 cash.
- e. Notes payable of \$20,000 were issued for \$20,000 cash.
- f. Change in accounts receivable.
- g. Change in inventory.
- h. Change in accounts payable.

### Exercise 16-13

**Indirect:** Cash flows spreadsheet

31							

**Exercise 16-14<sup>B</sup>**

**Direct:** Cash flow classification

C1 P5 

The following transactions and events occurred during the year. Assuming that this company uses the *direct method* to report cash provided by operating activities, indicate where each item would appear on the statement of cash flows by placing an x in the appropriate column.

	Statement of Cash Flows			Noncash Investing and Financing Activities	Not Reported on Statement or in Notes
	Operating Activities	Investing Activities	Financing Activities		
a. Retired long-term notes payable by issuing common stock	_____	_____	_____	_____	_____
b. Paid cash toward accounts payable	_____	_____	_____	_____	_____
c. Sold inventory for cash	_____	_____	_____	_____	_____
d. Paid cash dividend that was declared in a prior period	_____	_____	_____	_____	_____
e. Accepted six-month note receivable in exchange for plant assets	_____	_____	_____	_____	_____
f. Recorded depreciation expense	_____	_____	_____	_____	_____
g. Paid cash to acquire treasury stock	_____	_____	_____	_____	_____
h. Collected cash from sales	_____	_____	_____	_____	_____
i. Borrowed cash from bank by signing a nine-month note payable	_____	_____	_____	_____	_____
j. Paid cash to purchase a patent	_____	_____	_____	_____	_____

**Exercise 16-15<sup>B</sup>**

**Direct:** Computation of cash flows

P5

For each of the following three separate cases, use the information provided about the calendar-year 2016 operations of Sahim Company to compute the required cash flow information.

<b>Case X:</b> Compute cash received from customers:	
Sales	\$515,000
Accounts receivable, December 31, 2015	27,200
Accounts receivable, December 31, 2016	33,600
<b>Case Y:</b> Compute cash paid for rent:	
Rent expense	\$139,800
Rent payable, December 31, 2015	7,800
Rent payable, December 31, 2016	6,200
<b>Case Z:</b> Compute cash paid for inventory:	
Cost of goods sold	\$525,000
Inventory, December 31, 2015	158,600
Accounts payable, December 31, 2015	66,700
Inventory, December 31, 2016	130,400
Accounts payable, December 31, 2016	82,000

**Exercise 16-16<sup>B</sup>**

**Direct:** Cash flows from operating activities P5

Refer to the information about Sonad Company in Exercise 16-4. Use the *direct method* to prepare only the cash provided or used by operating activities section of the statement of cash flows for this company.

**Exercise 16-17<sup>B</sup>**

**Direct:** Preparation of statement of cash flows and supporting note

P1 P3 P5

Use the following information about the cash flows of Ferron Company to prepare a complete statement of cash flows (*direct method*) for the year ended December 31, 2015. Use a note disclosure for any non-cash investing and financing activities.

Cash and cash equivalents balance, December 31, 2014	\$ 40,000
Cash and cash equivalents balance, December 31, 2015	148,000
Cash received as interest	3,500
Cash paid for salaries	76,500

[continued on next page]

[continued from previous page]

Bonds payable retired by issuing common stock (no gain or loss on retirement) . . . . .	185,500
Cash paid to retire long-term notes payable . . . . .	100,000
Cash received from sale of equipment . . . . .	60,250
Cash received in exchange for six-month note payable . . . . .	35,000
Land purchased by issuing long-term note payable . . . . .	105,250
Cash paid for store equipment . . . . .	24,750
Cash dividends paid . . . . .	10,000
Cash paid for other expenses . . . . .	20,000
Cash received from customers . . . . .	495,000
Cash paid for inventory . . . . .	254,500

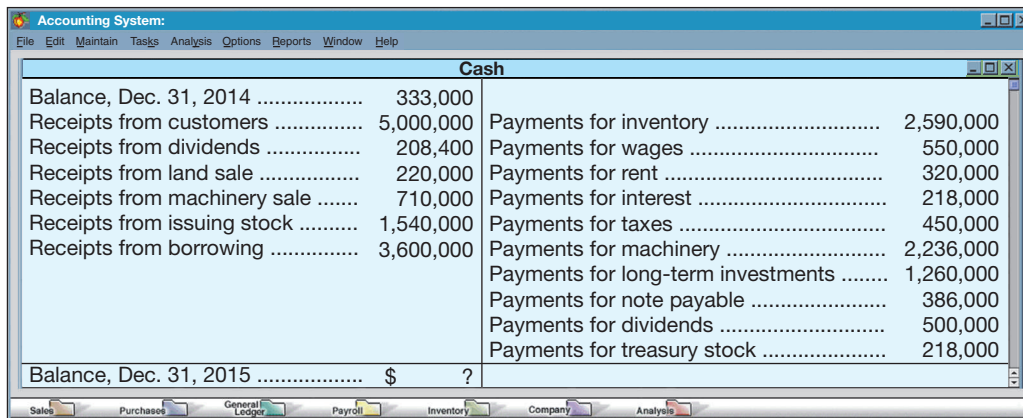

The following summarized Cash T-account reflects the total debits and total credits to the Cash account of Thomas Corporation for calendar-year 2015.

- Use this information to prepare a complete statement of cash flows for year 2015. The cash provided or used by operating activities should be reported using the *direct method*.
- Refer to the statement of cash flows prepared for part 1 to answer the following questions *a* through *d*:  
 (a) Which section—operating, investing, or financing—shows the largest cash (i) inflow and (ii) outflow? (b) What is the largest individual item among the investing cash outflows? (c) Are the cash proceeds larger from issuing notes or issuing stock? (d) Does the company have a net cash inflow or outflow from borrowing activities?

**Exercise 16-18<sup>B</sup>**

**Direct:** Preparation of statement of cash flows from Cash T-account

P1 P3 P5 

Lansing Company’s 2015 income statement and selected balance sheet data (for current assets and current liabilities) at December 31, 2014 and 2015, follow.

**PROBLEM SET A**

LANSING COMPANY Selected Balance Sheet Accounts		
At December 31	2015	2014
Accounts receivable . . . . .	\$5,600	\$5,800
Inventory . . . . .	1,980	1,540
Accounts payable . . . . .	4,400	4,600
Salaries payable . . . . .	880	700
Utilities payable . . . . .	220	160
Prepaid insurance . . . . .	260	280
Prepaid rent . . . . .	220	180

LANSING COMPANY Income Statement For Year Ended December 31, 2015	
Sales revenue . . . . .	\$97,200
Expenses	
Cost of goods sold . . . . .	42,000
Depreciation expense . . . . .	12,000
Salaries expense . . . . .	18,000
Rent expense . . . . .	9,000
Insurance expense . . . . .	3,800
Interest expense . . . . .	3,600
Utilities expense . . . . .	2,800
Net income . . . . .	<u>\$ 6,000</u>

**Problem 16-1A**

**Indirect:** Computing cash flows from operations

P2

**Required**

Prepare the cash flows from operating activities section only of the company’s 2015 statement of cash flows using the *indirect method*.

**Check** Cash from operating activities, \$17,780

**Problem 16-2A<sup>B</sup>****Direct:** Computing cash flows from operations

P5

Refer to the information in Problem 16-1A.

**Required**Prepare the cash flows from operating activities section only of the company's 2015 statement of cash flows using the *direct method*.**Problem 16-3A****Indirect:** Statement of cash flows

A1 P1 P2 P3

Forten Company, a merchandiser, recently completed its calendar-year 2015 operations. For the year, (1) all sales are credit sales, (2) all credits to Accounts Receivable reflect cash receipts from customers, (3) all purchases of inventory are on credit, (4) all debits to Accounts Payable reflect cash payments for inventory, and (5) Other Expenses are paid in advance and are initially debited to Prepaid Expenses. The company's income statement and balance sheets follow.

<b>FORTEN COMPANY</b> Income Statement For Year Ended December 31, 2015		
Sales .....		\$582,500
Cost of goods sold .....		<u>285,000</u>
Gross profit .....		297,500
Operating expenses		
Depreciation expense .....	\$ 20,750	
Other expenses .....	<u>132,400</u>	153,150
Other gains (losses)		
Loss on sale of equipment .....		<u>(5,125)</u>
Income before taxes .....		139,225
Income taxes expense .....		<u>24,250</u>
Net income .....		<u>\$114,975</u>

<b>FORTEN COMPANY</b> Comparative Balance Sheets December 31, 2015 and 2014		
	<u>2015</u>	<u>2014</u>
<b>Assets</b>		
Cash .....	\$ 49,800	\$ 73,500
Accounts receivable .....	65,810	50,625
Inventory .....	275,656	251,800
Prepaid expenses .....	<u>1,250</u>	<u>1,875</u>
Total current assets .....	392,516	377,800
Equipment .....	157,500	108,000
Accum. depreciation—Equipment .....	<u>(36,625)</u>	<u>(46,000)</u>

Total current liabilities .....	63,141	120,675
Long-term notes payable .....	<u>65,000</u>	<u>48,750</u>
Total liabilities .....	128,141	169,425
<b>Equity</b>		
Common stock, \$5 par value .....	162,750	150,250
Paid-in capital in excess of par, common stock .....	37,500	0
Retained earnings .....	<u>185,000</u>	<u>120,125</u>
Total liabilities and equity .....	<u>\$513,391</u>	<u>\$439,800</u>

**Additional Information on Year 2015 Transactions**

- The loss on the cash sale of equipment was \$5,125 (details in *b*).
- Sold equipment costing \$46,875, with accumulated depreciation of \$30,125, for \$11,625 cash.
- Purchased equipment costing \$96,375 by paying \$30,000 cash and signing a long-term note payable for the balance.
- Borrowed \$4,000 cash by signing a short-term note payable.
- Paid \$50,125 cash to reduce the long-term notes payable.
- Issued 2,500 shares of common stock for \$20 cash per share.
- Declared and paid cash dividends of \$50,100.

**Required**

- Prepare a complete statement of cash flows; report its operating activities using the *indirect method*. Disclose any noncash investing and financing activities in a note.

**Analysis Component**

- Analyze and discuss the statement of cash flows prepared in part 1, giving special attention to the wisdom of the cash dividend payment.

**Check** Cash from operating activities, \$40,900

Refer to the information reported about Forten Company in Problem 16-3A.

### Required

Prepare a complete statement of cash flows using a spreadsheet as in Exhibit 16A.1; report its operating activities using the *indirect method*. Identify the debits and credits in the Analysis of Changes columns with letters that correspond to the following list of transactions and events.

- a. Net income was \$114,975.
- b. Accounts receivable increased.
- c. Inventory increased.
- d. Prepaid expenses decreased.
- e. Accounts payable decreased.
- f. Depreciation expense was \$20,750.
- g. Sold equipment costing \$46,875, with accumulated depreciation of \$30,125, for \$11,625 cash. This yielded a loss of \$5,125.
- h. Purchased equipment costing \$96,375 by paying \$30,000 cash and (i.) by signing a long-term note payable for the balance.
- j. Borrowed \$4,000 cash by signing a short-term note payable.
- k. Paid \$50,125 cash to reduce the long-term notes payable.
- l. Issued 2,500 shares of common stock for \$20 cash per share.
- m. Declared and paid cash dividends of \$50,100.

**Additional Information on Year 2015 Transactions**

- The loss on the cash sale of equipment was \$2,100 (details in *b*).
- Sold equipment costing \$51,000, with accumulated depreciation of \$22,850, for \$26,050 cash.
- Purchased equipment costing \$113,250 by paying \$43,250 cash and signing a long-term note payable for the balance.
- Borrowed \$5,000 cash by signing a short-term note payable.
- Paid \$47,500 cash to reduce the long-term notes payable.
- Issued 3,000 shares of common stock for \$15 cash per share.
- Declared and paid cash dividends of \$53,600.

**Required**

**Check** Cash from operating activities, \$130,200

1. Prepare a complete statement of cash flows; report its operating activities using the *indirect method*. Disclose any noncash investing and financing activities in a note.

**Analysis Component**

2. Analyze and discuss the statement of cash flows prepared in part 1, giving special attention to the wisdom of the cash dividend payment.

**Problem 16-4B<sup>A</sup>**

**Indirect:** Cash flows spreadsheet

P1 P2 P3 P4

Refer to the information reported about Gazelle Corporation in Problem 16-3B.

**Required**

Prepare a complete statement of cash flows using a spreadsheet as in Exhibit 16A.1; report its operating activities using the *indirect method*. Identify the debits and credits in the Analysis of Changes columns with letters that correspond to the following list of transactions and events.

- a. Net income was \$158,100.
- b. Accounts receivable decreased.
- c. Inventory decreased.
- d. Prepaid expenses decreased.
- e. Accounts payable decreased.
- f. Depreciation expense was \$38,600.
- g. Sold equipment costing \$51,000, with accumulated depreciation of \$22,850, for \$26,050 cash. This yielded a loss of \$2,100.
- h. Purchased equipment costing \$113,250 by paying \$43,250 cash and **(i.)** by signing a long-term note payable for the balance.
- j. Borrowed \$5,000 cash by signing a short-term note payable.
- k. Paid \$47,500 cash to reduce the long-term notes payable.
- l. Issued 3,000 shares of common stock for \$15 cash per share.
- m. Declared and paid cash dividends of \$53,600.

**Check** Analysis of Changes column totals, \$681,950

**Problem 16-5B<sup>B</sup>**

**Direct:** Statement of cash flows

P1 P3 P5

**Check** Cash used in financing activities, \$(51,100)

Refer to Gazelle Corporation's financial statements and related information in Problem 16-3B.

**Required**

Prepare a complete statement of cash flows; report its operating activities according to the *direct method*. Disclose any noncash investing and financing activities in a note.

**Problem 16-6B**

**Indirect:** Statement of cash flows

P1 P2 P3

Satu Company, a merchandiser, recently completed its 2015 operations. For the year, (1) all sales are credit sales, (2) all credits to Accounts Receivable reflect cash receipts from customers, (3) all purchases of inventory are on credit, (4) all debits to Accounts Payable reflect cash payments for inventory, (5) Other Expenses are cash expenses, and (6) any change in Income Taxes Payable reflects the accrual and cash payment of taxes. The company's income statement and balance sheets follow.

**SATU COMPANY**  
Comparative Balance Sheets  
December 31, 2015 and 2014

	2015	2014
<b>Assets</b>		
Cash .....	\$ 58,750	\$ 28,400
Accounts receivable .....	20,222	25,860
Total current assets .....	78,972	54,260
Inventory .....	165,667	140,320
Equipment .....	107,750	77,500
Accum. depreciation—Equipment .....	(46,700)	(31,000)
Total assets .....	<u>\$305,689</u>	<u>\$241,080</u>
<b>Liabilities and Equity</b>		
Accounts payable .....	\$ 20,372	\$157,530
Income taxes payable .....	2,100	6,100
Total current liabilities .....	22,472	163,630
<b>Equity</b>		
Common stock, \$5 par value .....	40,000	25,000
Paid-in capital in excess of par, common stock .....	68,000	20,000
Retained earnings .....	175,217	32,450

P1 P2 P3 P4

**Check** Analysis of Changes column totals, \$543,860

Refer to Satu Company's financial statements and related information in Problem 16-6B.

**Required**

Prepare a complete statement of cash flows; report its cash flows from operating activities according to the *direct method*.

**Problem 16-8B<sup>B</sup>**

**Direct:** Statement of cash flows

P1 P3 P5

**Check** Cash provided by financing activities, \$3,000

**SERIAL  
PROBLEM**Business Solutions  
(Indirect)

P1 P2 P3

(This serial problem began in Chapter 1 and continues through most of the book. If previous chapter segments were not completed, the serial problem can begin at this point. It is helpful, but not necessary, to use the Working Papers that accompany the book.)

**SP 16** Santana Rey, owner of Business Solutions, decides to prepare a statement of cash flows for her business. (Although the serial problem allowed for various ownership changes in earlier chapters, we will prepare the statement of cash flows using the following financial data.)

**BUSINESS SOLUTIONS**  
Income Statement  
For Three Months Ended March 31, 2016

Computer services revenue . . . . .	\$25,307
Net sales . . . . .	18,693
Total revenue . . . . .	44,000
Cost of goods sold . . . . .	\$14,052
Depreciation expense— Office equipment . . . . .	400
Depreciation expense— Computer equipment . . . . .	1,250
Wages expense . . . . .	3,250
Insurance expense . . . . .	555
Rent expense . . . . .	2,475
Computer supplies expense . . . . .	1,305
Advertising expense . . . . .	600
Mileage expense . . . . .	320
Repairs expense—Computer . . . . .	960
Total expenses . . . . .	<u>25,167</u>
Net income . . . . .	<u>\$18,833</u>

**BUSINESS SOLUTIONS**  
Comparative Balance Sheets  
December 31, 2015, and March 31, 2016

	Mar. 31, 2016	Dec. 31, 2015
<b>Assets</b>		
Cash . . . . .	\$ 68,057	\$48,372
Accounts receivable . . . . .	22,867	5,668
Inventory . . . . .	704	0
Computer supplies . . . . .	2,005	580
Prepaid insurance . . . . .	1,110	1,665
Prepaid rent . . . . .	825	825
Total current assets . . . . .	<u>95,568</u>	<u>57,110</u>
Office equipment . . . . .	8,000	8,000
Accumulated depreciation—Office equipment . . . . .	(800)	(400)
Computer equipment . . . . .	20,000	20,000
Accumulated depreciation— Computer equipment . . . . .	(2,500)	(1,250)
Total assets . . . . .	<u>\$120,268</u>	<u>\$83,460</u>
<b>Liabilities and Equity</b>		
Accounts payable . . . . .	\$ 0	\$ 1,100
Wages payable . . . . .	875	500
Unearned computer service revenue . . . . .	0	1,500
Total current liabilities . . . . .	<u>875</u>	<u>3,100</u>
<b>Equity</b>		
Common stock . . . . .	98,000	73,000
Retained earnings . . . . .	21,393	7,360
Total liabilities and equity . . . . .	<u>\$120,268</u>	<u>\$83,460</u>

**Required**

Prepare a statement of cash flows for Business Solutions using the *indirect method* for the three months ended March 31, 2016. Recall that owner Santana Rey contributed \$25,000 to the business in exchange for additional stock in the first quarter of 2016 and has received \$4,800 in cash dividends.

**Check** Cash flows used  
by operations: \$(515)

**GL  
GENERAL  
LEDGER  
PROBLEM**Available only in  
Connect Plus

The following General Ledger assignments highlight the impact, or lack thereof, on the statement of cash flows from summary journal entries derived from consecutive trial balances. Prepare summary journal entries reflecting changes in consecutive trial balances. Then prepare the statement of cash flows (direct method) from those entries. Finally, prepare the reconciliation to the indirect method for net cash provided (used) by operating activities.

**GL 16-1** General Ledger assignment based on Exercise 16-11

**GL 16-2** General Ledger assignment based on Problem 16-1

**GL 16-3** General Ledger assignment based on Problem 16-6

## Beyond the Numbers

**BTN 16-1** Refer to **Apple's** financial statements in Appendix A to answer the following.

1. Is Apple's statement of cash flows prepared under the direct method or the indirect method? How do you know?
2. For each fiscal year 2013, 2012, and 2011, is the amount of cash provided by operating activities more or less than the cash paid for dividends?
3. What is the largest amount in reconciling the difference between net income and cash flow from operating activities in fiscal 2013? In fiscal 2012? In fiscal 2011?
4. Identify the largest cash inflow and cash outflow for investing *and* for financing activities in fiscal 2013 and in fiscal 2012.

### Fast Forward

5. Obtain Apple's financial statements for a fiscal year ending after September 28, 2013, from either its website ([Apple.com](http://Apple.com)) or the SEC's database ([www.SEC.gov](http://www.SEC.gov)). Since September 28, 2013, what are Apple's largest cash outflows and cash inflows in the investing and in the financing sections of its statement of cash flows?

## REPORTING IN ACTION

A1 

**APPLE**

**BTN 16-2** Key figures for **Apple** and **Google** follow.

(\$ millions)	Apple			Google		
	Current Year	1 Year Prior	2 Years Prior	Current Year	1 Year Prior	2 Years Prior
Operating cash flows . . . . .	\$ 53,666	\$ 50,856	\$ 37,529	\$ 18,659	\$16,619	\$14,565
Total assets . . . . .	207,000	176,064	116,371	110,920	93,798	72,574

## COMPARATIVE ANALYSIS

A1 

**APPLE**

**GOOGLE**

### Required

1. Compute the recent two years' cash flow on total assets ratios for Apple and Google.
2. What does the cash flow on total assets ratio measure?
3. Which company has the highest cash flow on total assets ratio for the periods shown?
4. Does the cash flow on total assets ratio reflect on the quality of earnings? Explain.

**BTN 16-3** Katie Murphy is preparing for a meeting with her banker. Her business is finishing its fourth year of operations. In the first year, it had negative cash flows from operations. In the second and third years, cash flows from operations were positive. However, inventory costs rose significantly in year 4, and cash flows from operations will probably be down 25%. Murphy wants to secure a line of credit from her banker as a financing buffer. From experience, she knows the banker will scrutinize operating cash flows for years 1 through 4 and will want a projected number for year 5. Murphy knows that a steady progression upward in operating cash flows for years 1 through 4 will help her case. She decides to use her discretion as owner and considers several business actions that will turn her operating cash flow in year 4 from a decrease to an increase.

### Required

1. Identify two business actions Murphy might take to improve cash flows from operations.
2. Comment on the ethics and possible consequences of Murphy's decision to pursue these actions.

## ETHICS CHALLENGE

C1 A1  

**BTN 16-4** Your friend, Diana Wood, recently completed the second year of her business and just received annual financial statements from her accountant. Wood finds the income statement and balance sheet informative but does not understand the statement of cash flows. She says the first section is especially confusing because it contains a lot of additions and subtractions that do not make sense to her. Wood adds, "The income statement tells me the business is more profitable than last year and that's most important. If I want to know how cash changes, I can look at comparative balance sheets."

## COMMUNICATING IN PRACTICE

C1  

**Required**

Write a half-page memorandum to your friend explaining the purpose of the statement of cash flows. Speculate as to why the first section is so confusing and how it might be rectified.

**TAKING IT TO THE NET**

**BTN 16-5** Access the March 31, 2014, filing of the 10-K report (for year ending December 31, 2013) of **Mendocino Brewing Company, Inc.** (ticker: MENB), at [www.SEC.gov](http://www.SEC.gov).

**Required**

1. Does Mendocino Brewing use the direct or indirect method to construct its consolidated statement of cash flows?
2. For the year ended December 31, 2013, what is the largest item in reconciling the net income to net cash provided by operating activities?
3. In the recent two years, has the company been more successful in generating operating cash flows or in generating net income? Identify the figures to support the answer.
4. In the year ended December 31, 2013, what was the largest cash outflow for investing activities *and* for financing activities?
5. What item(s) does Mendocino Brewing report as supplementary cash flow information?
6. Does Mendocino Brewing report any noncash financing activities for 2013? Identify them, if any.

**TEAMWORK IN ACTION**

C1 A1 P2 P5

**BTN 16-6** Team members are to coordinate and independently answer one question within each of the following three sections. Team members should then report to the team and confirm or correct teammates' answers.

1. Answer *one* of the following questions about the statement of cash flows.
  - a. What are this statement's reporting objectives?
  - b. What two methods are used to prepare it? Identify similarities and differences between them.
  - c. What steps are followed to prepare the statement?
  - d. What types of analyses are often made from this statement's information?
2. Identify and explain the adjustment from net income to obtain cash flows from operating activities using the indirect method for *one* of the following items.
  - a. Noncash operating revenues and expenses.
  - b. Nonoperating gains and losses.
  - c. Increases and decreases in noncash current assets.
  - d. Increases and decreases in current liabilities.
- 3<sup>B</sup> Identify and explain the formula for computing cash flows from operating activities using the direct method for *one* of the following items.
  - a. Cash receipts from sales to customers.
  - b. Cash paid for inventory.
  - c. Cash paid for wages and operating expenses.
  - d. Cash paid for interest and taxes.

**Note:** For teams of more than four, some pairing within teams is necessary. Use as an in-class activity or as an assignment. If used in class, specify a time limit on each part. Conclude with reports to the entire class, using team rotation. Each team can prepare responses on a transparency.

**ENTREPRENEURIAL DECISION**

C1 A1  

**BTN 16-7** Review the chapter's opener involving **LSTN** and its entrepreneurial owner, Bridget Hilton.

**Required**

1. In a business such as LSTN, monitoring cash flow is always a priority. Even though it is off to a successful start and is growing with a positive net income, explain how cash flow can lag behind net income.
2. LSTN is a privately owned company. What are potential sources of financing for its future expansion?

**BTN 16-8** Jenna and Matt Wilder are completing their second year operating Mountain High, a downhill ski area and resort. Mountain High reports a net loss of \$(10,000) for its second year, which includes an \$85,000 extraordinary loss from fire. This past year also involved major purchases of plant assets for renovation and expansion, yielding a year-end total asset amount of \$800,000. Mountain High’s net cash outflow for its second year is \$(5,000); a summarized version of its statement of cash flows follows:

Net cash flow provided by operating activities . . . . .	\$295,000
Net cash flow used by investing activities . . . . .	(310,000)
Net cash flow provided by financing activities . . . . .	10,000

**Required**

Write a one-page memorandum to the Wilders evaluating Mountain High’s current performance and assessing its future. Give special emphasis to cash flow data and their interpretation.

**BTN 16-9** Visit **The Motley Fool’s** website ([Fool.com](http://Fool.com)). Enter the *Fool’s School* (at [Fool.com/School](http://Fool.com/School)). Identify and select the link “How to Value Stocks.” (This site might ask you to register with your email address; registration had been free and did grant access to articles on the site.)

**Required**

1. Click on “Introduction to Valuation Methods,” and then “Cash-Flow-Based Valuations.” How does the Fool’s school define cash flow? What is the school’s reasoning for this definition?
2. Per the school’s instruction, why do analysts focus on earnings before interest and taxes (EBIT)?
3. Visit other links at this website that interest you such as “How to Read a Balance Sheet,” or find out what the “Fool’s Ratio” is. Write a half-page report on what you find.

**BTN 16-10** Key comparative information for **Samsung** ([www.Samsung.com](http://www.Samsung.com)), which is a leading manufacturer of electronic consumer products, follows.

(₩ in millions)	Current Year	1 Year Prior	2 Years Prior
Operating cash flows . . . . .	₩ 46,707,440	₩ 37,972,809	₩ 22,917,901
Total assets . . . . .	214,075,018	181,071,570	155,800,263

**Required**

1. Compute the recent two years’ cash flow on total assets ratio for Samsung.
2. How does Samsung’s ratio compare to **Apple’s** and **Google’s** ratios from BTN 16-2?

**ANSWERS TO MULTIPLE CHOICE QUIZ**

1. b;

Net income . . . . .	\$15,200
Depreciation expense . . . . .	10,000
Gain on sale of land . . . . .	(3,000)
Increase in inventory . . . . .	(1,500)
Increase in accounts payable . . . . .	<u>2,850</u>
Net cash provided by operations . . . . .	<u>\$23,550</u>

3. d; FASB requires cash interest paid to be reported under operating.
4. a; Cash paid for salaries and wages = \$255,000 + \$8,200 – \$10,900 = \$252,300
5. e; Increase in inventory = \$112,000 – \$105,000 = \$7,000  
 Increase in accounts payable = \$101,300 – \$98,500 = \$2,800  
 Cash paid for inventory = \$545,000 + \$7,000 – \$2,800 = \$549,200

2. c; Cash received from sale of machine is reported as an investing activity.

# Analysis of Financial Statements

## Chapter Preview

### BASICS OF ANALYSIS

- C1** Analysis: Its purpose, building blocks, and information needs
- C2** Standards for comparisons, and analysis tools

### HORIZONTAL ANALYSIS

- P1** Application of:
  - Comparative balance sheets
  - Comparative income statements
  - Trend analysis

### VERTICAL ANALYSIS

- P2** Application of:
  - Common-size balance sheet
  - Common-size income statement
  - Common-size graphics

### RATIO ANALYSIS AND REPORTING

- P3** Liquidity and efficiency
  - Solvency
  - Profitability
  - Market prospects
- A1** Analysis reports

## Learning Objectives

### CONCEPTUAL

- C1** Explain the purpose and identify the building blocks of analysis.
- C2** Describe standards for comparisons in analysis.

### ANALYTICAL

- A1** Summarize and report results of analysis.

- A2** *Appendix 17A*—Explain the form and assess the content of a complete income statement.

### PROCEDURAL

- P1** Explain and apply methods of horizontal analysis.

- P2** Describe and apply methods of vertical analysis.

- P3** Define and apply ratio analysis.

## Motley Fool

ALEXANDRIA, VA—In Shakespeare’s Elizabethan comedy *As You Like It*, only the fool could speak truthfully to the king without getting his head lopped off. Inspired by Shakespeare’s stage character, Tom and David Gardner vowed to become modern-day fools who tell it like it is. With under \$10,000 in start-up money, the brothers launched **The Motley Fool (Fool.com)**. And befitting of a Shakespearean play, the two say they are “dedicated to educating, amusing, and enriching individuals in search of the truth.”

The Gardners do not fear the wrath of any king, real or fictional. They are intent on exposing the truth, as they see it, “that the financial world preys on ignorance and fear.” As Tom explains, “There is such a great need in the general populace for financial information.” Who can argue, given their brilliant success through practically every medium, including their website, radio shows, newspaper columns, online store, investment newsletters, and global expansion.

Despite the brothers’ best efforts, however, ordinary people still do not fully use information available in financial

statements. For instance, discussions keep appearing on The Motley Fool’s online bulletin board that can be easily resolved using reliable and published accounting data. So, it would seem that the Fools must continue their work of “educating and enriching” individuals and showing them the advantages of financial statement analysis.

Following The Motley Fool’s objectives, this chapter introduces horizontal and vertical analyses—tools used to reveal crucial trends and insights from financial information. It also expands on ratio analysis, which gives insight into a company’s financial condition and performance. By arming ourselves with the information contained in this chapter and the investment advice of The Motley Fool, we can be sure to not play the fool in today’s financial world.

*“The Motley Fool . . . is similar to what goes on in a library”*

— Tom Gardner

## BASICS OF ANALYSIS

### C1

Explain the purpose and identify the building blocks of analysis.

**Point:** Financial statement analysis tools are also used for personal financial investment decisions.

**Point:** Financial statement analysis is a topic on the CPA, CMA, CIA, and CFA exams.

**Financial statement analysis** applies analytical tools to general-purpose financial statements and related data for making business decisions. It involves transforming accounting data into more useful information. Financial statement analysis reduces our reliance on hunches, guesses, and intuition as well as our uncertainty in decision making. It does not lessen the need for expert judgment; instead, it provides us an effective and systematic basis for making business decisions. This section describes the purpose of financial statement analysis, its information sources, the use of comparisons, and some issues in computations.

### Purpose of Analysis

Internal users of accounting information are those involved in strategically managing and operating the company. They include managers, officers, internal auditors, consultants, budget directors, and market researchers. The purpose of financial statement analysis for these users is to provide strategic information to improve company efficiency and effectiveness in providing products and services.

External users of accounting information are *not* directly involved in running the company. They include shareholders, lenders, directors, customers, suppliers, regulators, lawyers, brokers, and the press. External users rely on financial statement analysis to make better and more informed decisions in pursuing their own goals.

We can identify other uses of financial statement analysis. Shareholders and creditors assess company prospects to make investing and lending decisions. A board of directors analyzes financial statements in monitoring management's decisions. Employees and unions use financial statements in labor negotiations. Suppliers use financial statement information in establishing credit terms. Customers analyze financial statements in deciding whether to establish supply relationships. Public utilities set customer rates by analyzing financial statements. Auditors use financial statements in assessing the "fair presentation" of their clients' financial results. Analyst services such as **Dun & Bradstreet**, **Moody's**, and **Standard & Poor's** use financial statements in making buy-sell recommendations and in setting credit ratings. The common goal of these users is to evaluate company performance and financial condition. This includes evaluating (1) past and current performance, (2) current financial position, and (3) future performance and risk.

### Building Blocks of Analysis

Financial statement analysis focuses on one or more elements of a company's financial condition or performance. Our analysis emphasizes four areas of inquiry—with varying degrees of importance. These four areas are described and illustrated in this chapter and are considered the *building blocks* of financial statement analysis:

- **Liquidity and efficiency**—ability to meet short-term obligations and to efficiently generate revenues.
- **Solvency**—ability to generate future revenues and meet long-term obligations.
- **Profitability**—ability to provide financial rewards sufficient to attract and retain financing.
- **Market prospects**—ability to generate positive market expectations.

Applying the building blocks of financial statement analysis involves determining (1) the objectives of analysis and (2) the relative emphasis among the building blocks.

We distinguish among these four building blocks to emphasize the different aspects of a company's financial condition or performance, yet we must remember that these areas of analysis are interrelated. For instance, a company's operating performance is affected by the availability of financing and short-term liquidity conditions. Similarly, a company's credit standing is not limited to satisfactory short-term liquidity but depends also on its profitability and efficiency in using assets. Early in our analysis, we need to determine the relative emphasis of each building block. Emphasis and analysis can later change as a result of evidence collected.

## Decision Insight

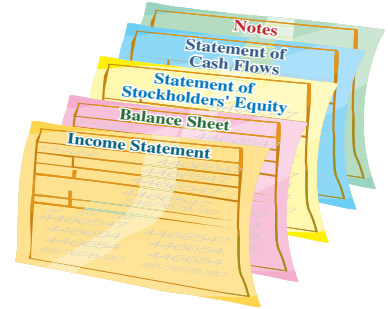

**Chips and Brokers** The phrase *blue chips* refers to stock of big, profitable companies. The phrase, comes from poker, where the most valuable chips are blue. The term *brokers* refers to those who execute orders to buy or sell stock. The term comes from wine retailers—individuals who broach (break) wine casks. ■

## Information for Analysis

Some users, such as managers and regulatory authorities, are able to receive special financial reports prepared to meet their analysis needs. However, most users must rely on **general-purpose financial statements** that include the (1) income statement, (2) balance sheet, (3) statement of stockholders' equity (or statement of retained earnings), (4) statement of cash flows, and (5) notes to these statements.

**Financial reporting** refers to the communication of financial information useful for making investment, credit, and other business decisions. Financial reporting includes not only general-purpose financial statements but also information from SEC 10-K or other filings, press releases, shareholders' meetings, forecasts, management letters, auditors' reports, and webcasts.

Management's Discussion and Analysis (MD&A) is one example of useful information outside traditional financial statements. **Apple's** MD&A (available at [Investor.Apple.com](http://Investor.Apple.com) and 'Item 7' in the annual report), for example, begins with an overview, followed by critical accounting policies and estimates. It then discusses operating results followed by financial condition (liquidity, capital resources, and cash flows). The final few parts discuss legal proceedings, market risk of financial instruments, and risks from interest rate and foreign currency fluctuations. The MD&A is an excellent starting point in understanding a company's business activities.

## Decision Insight

**Analysis Online** Many websites offer free access and screening of companies by key numbers such as earnings, sales, and book value. For instance, **Investor's Business Daily** has information for more than 10,000 stocks ([www.investors.com](http://www.investors.com)). ■

## Standards for Comparisons

When interpreting measures from financial statement analysis, we need to decide whether the measures indicate good, bad, or average performance. To make such judgments, we need standards (benchmarks) for comparisons that include the following:

- **Intracompany**—The company under analysis can provide standards for comparisons based on its own prior performance and relations between its financial items. Apple's current net income, for instance, can be compared with its prior years' net income and in relation to its revenues or total assets.
- **Competitor**—One or more direct competitors of the company being analyzed can provide standards for comparisons. **Coca-Cola's** profit margin, for instance, can be compared with **PepsiCo's** profit margin.
- **Industry**—Industry statistics can provide standards of comparisons. Such statistics are available from services such as Dun & Bradstreet, Standard & Poor's, and Moody's.
- **Guidelines (rules of thumb)**—General standards of comparisons can develop from experience. Examples are the 2:1 level for the current ratio or 1:1 level for the acid-test ratio. Guidelines, or rules of thumb, must be carefully applied because context is crucial.

All of these comparison standards are useful when properly applied, yet measures taken from a selected competitor or group of competitors are often best. Intracompany and industry measures are also important. Guidelines or rules of thumb should be applied with care, and then only if they seem reasonable given past experience and industry norms.

## C2

Describe standards for comparisons in analysis.

**Point:** Each chapter's *Reporting in Action* problems engage students in intracompany analysis, whereas *Comparative Analysis* problems require competitor analysis (Apple vs. Google vs. Samsung).

## Tools of Analysis

Three of the most common tools of financial statement analysis are

1. **Horizontal analysis**—comparison of a company's financial condition and performance across time.
2. **Vertical analysis**—comparison of a company's financial condition and performance to a base amount.
3. **Ratio analysis**—measurement of key relations between financial statement items.

The remainder of this chapter describes these analysis tools and how to apply them.

### Decision Insight

**Fraud Fighters.** Horizontal, vertical, and ratio analysis tools can uncover fraud by identifying amounts out of line with expectations. One can then follow up and ask questions that can either identify a logical reason for such results or confirm/raise suspicions of fraud. Many past fraud schemes could have been identified much earlier had people applied these tools and pressured management for explanations. ■

QC1

## HORIZONTAL ANALYSIS

P1

Explain and apply methods of horizontal analysis.

Analysis of any single financial number is of limited value. Instead, much of financial statement analysis involves identifying and describing relations between numbers, groups of numbers, and changes in those numbers. Horizontal analysis refers to examination of financial statement data *across time*. (The term *horizontal analysis* arises from the left-to-right [or right-to-left] movement of our eyes as we review comparative financial statements across time.)

### Comparative Statements

Comparing amounts for two or more successive periods often helps in analyzing financial statements. **Comparative financial statements** facilitate this comparison by showing financial amounts in side-by-side columns on a single statement, called a *comparative format*. Using figures from **Apple's** financial statements, this section explains how to compute dollar changes and percent changes for comparative statements.

**Computation of Dollar Changes and Percent Changes** Comparing financial statements over relatively short time periods—two to three years—is often done by analyzing changes in line items. A change analysis usually includes analyzing absolute dollar amount changes and percent changes. Both analyses are relevant because dollar changes can yield large percent changes inconsistent with their importance. For instance, a 50% change from a base figure of \$100 is less important than the same percent change from a base amount of \$100,000 in the same statement. Reference to dollar amounts is necessary to retain a proper perspective and to assess the importance of changes. We compute the *dollar change* for a financial statement item as follows:

**Example:** Which is a more significant change, a 70% increase on a \$1,000 expense or a 30% increase on a \$400,000 expense?  
Answer: The 30% increase.

$$\text{Dollar change} = \text{Analysis period amount} - \text{Base period amount}$$

*Analysis period* is the point or period of time for the financial statements under analysis, and *base period* is the point or period of time for the financial statements used for comparison purposes. The prior year is commonly used as a base period. We compute the *percent change* by dividing the dollar change by the base period amount and then multiplying this quantity by 100 as follows:

$$\text{Percent change (\%)} = \frac{\text{Analysis period amount} - \text{Base period amount}}{\text{Base period amount}} \times 100$$

We can always compute a dollar change, but we must be aware of a few rules in working with percent changes. To illustrate, look at four separate cases in this chart:

Case	Analysis Period	Base Period	Change Analysis	
			Dollar	Percent
A	\$ 1,500	\$(4,500)	\$ 6,000	—
B	(1,000)	2,000	(3,000)	—
C	8,000	—	8,000	—
D	0	10,000	(10,000)	(100%)

When a negative amount appears in the base period and a positive amount in the analysis period (or vice versa), we cannot compute a meaningful percent change; see cases A and B. Also, when no value is in the base period, no percent change is computable; see case C. Finally, when an item has a value in the base period and zero in the analysis period, the decrease is 100 percent; see case D.

It is common when using horizontal analysis to compare amounts to either average or median values from prior periods (average and median values smooth out erratic or unusual fluctuations).<sup>1</sup> We also commonly round percents and ratios to one or two decimal places, but practice on this matter is not uniform. Computations are as detailed as necessary, which is judged by whether rounding potentially affects users' decisions. Computations should not be excessively detailed so that important relations are not lost among a mountain of decimal points and digits.

**Comparative Balance Sheets** Comparative balance sheets consist of balance sheet amounts from two or more balance sheet dates arranged side by side. The usefulness of this method of analysis is often improved by showing each item's dollar change and percent change to highlight large changes.

Analysis of comparative financial statements begins by focusing on items that show large dollar or percent changes. We then try to identify the reasons for these changes and, if possible, determine whether they are favorable or unfavorable. We also follow up on items with small changes when we expected the changes to be large.

Exhibit 17.1 shows comparative balance sheets for Apple Inc. (Nasdaq: AAPL). A few items stand out on the asset side. Apple's inventories show a substantial 123.0% increase. While some of this increase can be explained by growth in operations as evidenced by a 9.2% increase in sales, the bulk of this increased inventory seems inefficient (with increased risks from obsolescence and consumer fads). Other notable increases occur with (1) short-term (and long-term) securities and cash, reflecting Apple's success but also a limited vision for reinvestment; (2) goodwill and property, plant and equipment, reflecting Apple's continued growth; and (3) accounts receivable, which warrants attention as it exceeds the growth in sales. Its sizable total asset growth of 17.6% must be accompanied by future income to validate Apple's asset reinvestments. Some of Apple's shareholders are concerned about its growing assets and declining return on assets.

On Apple's financing side, we see the 17.6% increase is driven by a 44.2% increase in liabilities (equity increased only 4.5%). The largest increase is due to issuance of long-term debt, followed by various increases in current liabilities. We also see a 2.9% growth (\$2,967) in retained earnings, which is much less than its \$37,037 in net income. This is in part due to cash dividends and stock repurchases.

**Comparative Income Statements** Comparative income statements are prepared similarly to comparative balance sheets. Amounts for two or more periods are placed side by side, with additional columns for dollar and percent changes. Exhibit 17.2 shows Apple's comparative income statements.

Apple reports substantial sales growth of 9.2% in 2013. This finding helps support management's 17.6% growth in assets as reflected in the comparative balance sheets. The 21.4% growth in cost of sales with only a 9.2% sales increase raises a concern with Apple's control over its

**Example:** When there is a value in the base period and zero in the analysis period, the decrease is 100%. Why isn't the reverse situation an increase of 100%? Answer: A 100% increase of zero is still zero.

**Point:** Spreadsheet programs can help with horizontal, vertical, and ratio analyses, including graphical depictions of financial relations.

**Point:** Business consultants use comparative statement analysis to provide management advice.

**Point:** Percent change can also be computed by dividing the current period by the prior period and subtracting 1.0. For example, the 9.2% sales increase in Exhibit 17.2 is computed as:  $(\$170,910/\$156,508) - 1$ .

<sup>1</sup> *Median* is the middle value in a group of numbers. For instance, if five prior years' incomes are (in 000s) \$15, \$19, \$18, \$20, and \$22, the median value is \$19. When there are two middle numbers, we can take their average. For instance, if four prior years' sales are (in 000s) \$84, \$91, \$96, and \$93, the median is \$92 (computed as the average of \$91 and \$93).

Other income, net . . . . .	1,156	522	634	121.5
Income before provision for income taxes . . . . .	50,155	55,763	(5,608)	(10.1)
Provision for income taxes . . . . .	13,118	14,030	(912)	(6.5)
Net income . . . . .	<u>\$ 37,037</u>	<u>\$ 41,733</u>	<u>(4,696)</u>	(11.3)
Basic earnings per share . . . . .	\$ 40.03	\$ 44.64	(\$4.61)	(10.3)
Diluted earnings per share . . . . .	\$ 39.75	\$ 44.15	(\$4.40)	(10.0)

costs of sales. Similarly, we see a 14.0% increase in operating expenses, which exceeds the 9.2% sales growth (not good news). However, much of this is due to increased research and development costs, from which management hopes to reap future rewards. Apple reports a decline of 11.3% in net income, which is again mainly attributed to the 21.4% growth in cost of sales.

### Trend Analysis

*Trend analysis*, also called *trend percent analysis* or *index number trend analysis*, is a form of horizontal analysis that can reveal patterns in data across successive periods. It involves computing trend percents for a series of financial numbers and is a variation on the use of percent changes. The difference is that trend analysis does not subtract the base period amount in the numerator. To compute trend percents, we do the following:

1. Select a *base period* and assign each item in the base period a weight of 100%.
2. Express financial numbers as a percent of their base period number.

Specifically, a *trend percent*, also called an *index number*, is computed as follows:

$$\text{Trend percent (\%)} = \frac{\text{Analysis period amount}}{\text{Base period amount}} \times 100$$

To illustrate trend analysis, we use the Apple data shown in Exhibit 17.3.

(in millions)	2013	2012	2011	2010	2009
Net sales . . . . .	\$170,910	\$156,508	\$108,249	\$65,225	\$42,905
Cost of sales . . . . .	106,606	87,846	64,431	39,541	25,683
Operating expenses . . . . .	15,305	13,421	10,028	7,299	5,482

**Point:** *Index* refers to the comparison of the analysis period to the base period. Percents determined for each period are called *index numbers*.

#### EXHIBIT 17.3

Sales and Expenses

These data are from Apple’s current and prior financial statements. The base period is 2009 and the trend percent is computed in each subsequent year by dividing that year’s amount by its 2009 amount. For instance, the revenue trend percent for 2013 is 398.3%, computed as \$170,910/\$42,905. The trend percents—using the data from Exhibit 17.3—are shown in Exhibit 17.4.

	2013	2012	2011	2010	2009
Net sales . . . . .	398.3%	364.8%	252.3%	152.0%	100.0%
Cost of sales . . . . .	415.1	342.0	250.9	154.0	100.0
Operating expenses . . . . .	279.2	244.8	182.9	133.1	100.0

#### EXHIBIT 17.4

Trend Percents for Sales and Expenses

Graphical depictions often aid analysis of trend percents. Exhibit 17.5 shows the trend percents from Exhibit 17.4 in a *line graph*, which can help us identify trends and detect changes in direction or magnitude. It reveals that the trend line for revenue consistently exceeds that for both operating expenses and for cost of sales (except for 2010 and 2013). The marked increase in cost of sales in 2013 is concerning for Apple because its long-run profitability will suffer if those costs are not controlled. The trend line for operating expenses is encouraging because it lags revenue growth for each year from 2010–2013; however, the 2013 cost of sales reflects a marked rise in its trend line and exceeds that for net sales, which is worrying.

#### EXHIBIT 17.5

Trend Percent Lines for Sales and Expenses of Apple

**EXHIBIT 17.6**

Revenue Trend Percent Lines—Apple, Google and Samsung

**APPLE**  
**GOOGLE**  
**Samsung**

Exhibit 17.6 compares Apple’s revenue trend line to that of **Google** and **Samsung** for this same period. Apple is able to grow its revenue in each year relative to its base year. In this respect Apple outperforms its competitors, although both Google and Samsung performed well over this same period of time. These data indicate that Apple’s products and services have met with great consumer acceptance.

Trend analysis of financial statement items can include comparisons of relations between items on different financial statements. For instance, Exhibit 17.7 compares Apple’s revenue and total assets. The rate of increase in total assets (435.8%) is more than the increase in revenues (398.3%) since 2009. Is this result favorable or not? The answer is that Apple was *less* efficient in using its assets in 2013 versus 2009. Management has not generated revenues sufficient to compensate for the asset growth.

**EXHIBIT 17.7**

Sales and Asset Data for Apple

(in millions)	2013	2009	Trend Percent (2013 vs. 2009)
Net sales . . . . .	\$170,910	\$42,905	<b>398.3%</b>
Total assets . . . . .	207,000	47,501	<b>435.8</b>

Overall we must remember that an important role of financial statement analysis is identifying questions and areas of interest, which often direct us to important factors bearing on a company’s future. Accordingly, financial statement analysis should be seen as a continuous process of refining our understanding and expectations of company performance and financial condition.

**Decision Maker**

**Auditor** Your tests reveal a 3% increase in sales from \$200,000 to \$206,000 and a 4% decrease in expenses from \$190,000 to \$182,400. Both changes are within your “reasonableness” criterion of ±5%, and thus you don’t pursue additional tests. The audit partner in charge questions your lack of follow-up and mentions the *joint relation* between sales and expenses. To what is the partner referring? ■ [Answers follow the chapter’s Summary.]

**NEED-TO-KNOW 17-1**

Horizontal Analysis

P1

Compute trend percents for the following accounts, using 2012 as the base year (round percents to whole numbers). State whether the situation as revealed by the trends appears to be favorable or unfavorable for each account.

(\$ millions)	2015	2014	2013	2012
Sales . . . . .	\$500	\$350	\$250	\$200
Cost of goods sold . . . . .	400	175	100	50

**Solution**

(\$ millions)	2015	2014	2013	2012
Sales . . . . .	250%	175%	125%	100%
	(\$500/\$200)	(\$350/\$200)	(\$250/\$200)	(\$200/\$200)
Cost of goods sold . . . . .	800%	350%	200%	100%
	(\$400/\$50)	(\$175/\$50)	(\$100/\$50)	(\$50/\$50)

**Analysis:** The trend in sales is favorable; however, we need more information about economic conditions such as inflation rates and competitors’ performances to better assess it. Cost of sales is also rising (as expected with increasing sales); however, cost of sales is rising faster than the increase in sales, which is unfavorable and bad news. A quick analysis of the gross margin percentage would highlight this concern.

Do More: QS 17-3, QS 17-4, E 17-3

## VERTICAL ANALYSIS

Vertical analysis is a tool to evaluate individual financial statement items or a group of items in terms of a specific base amount. We usually define a key aggregate figure as the base, which for an income statement is usually revenue and for a balance sheet is usually total assets. This section explains vertical analysis and applies it to **Apple**. (The term *vertical analysis* arises from the up-down [or down-up] movement of our eyes as we review common-size financial statements. Vertical analysis is also called *common-size analysis*.)

### Common-Size Statements

The comparative statements in Exhibits 17.1 and 17.2 show the change in each item over time, but they do not emphasize the relative importance of each item. We use **common-size financial statements** to reveal changes in the relative importance of each financial statement item. All individual amounts in common-size statements are redefined in terms of common-size percents. A *common-size percent* is measured by dividing each individual financial statement amount under analysis by its base amount:

$$\text{Common-size percent (\%)} = \frac{\text{Analysis amount}}{\text{Base amount}} \times 100$$

**Common-Size Balance Sheets** Common-size statements express each item as a percent of a *base amount*, which for a common-size balance sheet is usually total assets. The base amount is assigned a value of 100%. (This implies that the total amount of liabilities plus equity equals 100% since this amount equals total assets.) We then compute a common-size percent for each asset, liability, and equity item using total assets as the base amount. When we present a company's successive balance sheets in this way, changes in the mixture of assets, liabilities, and equity are apparent.

Exhibit 17.8 shows common-size comparative balance sheets for Apple. Some relations that stand out on both a magnitude and percentage basis include (1) a 2.3% point increase in short-term securities, which equates to a \$7,904 million increase; (2) a new issuance of \$16,960 million in long-term debt; and (3) a 7.1% decrease in retained earnings, which equates to a \$2,967 million decrease. The lack of substantial change in the balance sheet suggests a mature company, but with some lack of focus as evidenced by the increasing amount in short- and long-term securities. This buildup in securities is a concern as the return on securities is historically smaller than the return on operating assets from successful reinvestment. Time will tell whether Apple can continue to generate sufficient revenue and income from its growing asset base.

**Common-Size Income Statements** Analysis also benefits from use of a common-size income statement. Revenue is usually the base amount, which is assigned a value of 100%. Each common-size income statement item appears as a percent of revenue. If we think of the 100% revenue amount as representing one sales dollar, the remaining items show how each revenue dollar is distributed among costs, expenses, and income.

Exhibit 17.9 shows common-size comparative income statements for each dollar of Apple's revenue. The past two years' common-size numbers are similar with a few exceptions. One important exception is the decrease of 5.0 cents in net income per each net sales dollar—evidenced by the decrease in income as a percent of net sales from 26.7% to 21.7%. This implies that management is *not* effectively controlling costs. Much of this is attributed to the rise in cost of sales from 56.1% to 62.4% as a percent of net sales. In sum, analysis here shows that common-size percents for successive income statements can uncover potentially important changes in a company's cost management. (Evidence of no changes, especially when changes are expected, is also informative.)

### Common-Size Graphics

Two of the most common tools of common-size analysis are trend analysis of common-size statements and graphical analysis. The trend analysis of common-size statements is similar to that of comparative statements discussed under vertical analysis. It is not illustrated here because the only difference is the substitution of common-size percents for trend percents. Instead, this

## P2

Describe and apply methods of vertical analysis.

Income Statement	
Sales	10,000
Expenses	6,000
Income	4,000

**Point:** The base amount in common-size analysis is an aggregate amount from that period's financial statement.

**Point:** Common-size statements often are used to compare two or more companies in the same industry.

**Point:** Common-size statements are also useful in comparing firms that report in different currencies.

**Global:** International companies sometimes disclose "convenience" financial statements, which are statements translated in other languages and currencies. However, these statements rarely adjust for differences in accounting principles across countries.

section discusses graphical analysis of common-size statements.

An income statement readily lends itself to common-size graphical analysis. This is so because revenues affect nearly every item in an income statement. Exhibit 17.10 shows Apple’s 2013 common-size income statement in graphical form. This pie chart highlights the contribution of each cost component of net sales for net income (for this graph, “other income, net” is included in selling, general, administrative, and other costs).

**EXHIBIT 17.10**  
Common-Size Graphic of Income Statement

Exhibit 17.11 previews more complex graphical analyses available and the insights they provide. The data for this exhibit are taken from Apple’s *Segments* footnote. Apple reports six operating segments for 2013: (1) Americas, (2) Europe, (3) China, (4) Japan, (5) Asia Pacific, and (6) Retail.

**EXHIBIT 17.11**  
Sales and Operating Income Margin Breakdown by Segment

The bars in Exhibit 17.11 show the level of net sales for each of the six reportable segments of Apple. Its Americas segment generates \$62,739 million of its total net sales, which is roughly 37% of its total sales. The five other bars show the level of sales generated from each of the other international segments, including its retail segment. At the bottom of each bar is that segment’s operating income margin, defined as segment operating income divided by segment net sales. The Americas segment yields a 36% operating income margin; margins for the other five segments are shown at the bottom of each of the other segment bars. This type of graphic presentation can lead to questions about the profitability of each segment and discussion of potential expansions into the more lucrative segments. For example, the Japan segment yields an operating margin of 51%. A natural question for management is what potential is there to further expand sales into the Japan segment and maintain the similar operating margin? This type of analysis can help users in determining strategic plans and actions.

Graphical analysis is also useful in identifying (1) sources of financing including the distribution among current liabilities, noncurrent liabilities, and equity capital and (2) focuses of investing activities, including the distribution among current and noncurrent assets. To illustrate, Exhibit 17.12 shows a common-size graphical display of Apple’s assets. Common-size balance sheet

**EXHIBIT 17.12**  
Common-Size Graphic of Asset Components

analysis can be extended to examine the composition of these subgroups. For instance, in assessing liquidity of current assets, knowing what proportion of *current* assets consists of inventories is usually important, and not simply what proportion inventories are of *total* assets.

Common-size financial statements are also useful in comparing different companies. Exhibit 17.13 shows common-size graphics of Apple, Google, and Samsung on financing sources. This graphic highlights the larger percent of equity financing for Google versus Apple and Samsung. It also highlights the somewhat larger noncurrent (debt) financing of Apple versus Google and Samsung. Comparison of a company's common-size statements with competitors' or industry common-size statistics alerts us to differences in the structure or distribution of its financial statements but not to their dollar magnitude.

**NEED-TO-KNOW** 17-2

Express the following comparative income statements in common-size percents and assess whether or not this company's situation has improved in the most recent year (round percents to whole numbers).

Vertical Analysis

P2

Comparative Income Statements For Years Ended December 31, 2015 and 2014		
	2015	2014
Sales .....	\$800	\$500
Total expenses .....	560	400
Net income .....	\$240	\$100

**Solution**

	2015	2014
Sales .....	100%	100%
	(\$800/\$800)	(\$500/\$500)
Total expenses .....	70%	80%
	(\$560/\$800)	(\$400/\$500)
Net income .....	30%	20%

Do More: QS 17-5, E 17-4, E 17-6

**QC2**

*Analysis:* This company's situation has improved. This is evident from its substantial increase in net income as a percent of sales for 2015 (30%) relative to 2014 (20%). Further, the company's sales increased from \$500 in 2014 to \$800 in 2015 (while expenses declined as a percent of sales from 80% to 70%).

**RATIO ANALYSIS**

**P3**  
Define and apply ratio analysis.

Ratios are among the more widely used tools of financial analysis because they provide clues to and symptoms of underlying conditions. A ratio can help us uncover conditions and trends difficult to detect by inspecting individual components making up the ratio. Ratios, like other analysis tools, are usually future oriented; that is, they are often adjusted for their probable future trend and magnitude, and their usefulness depends on skillful interpretation.

A ratio expresses a mathematical relation between two quantities. It can be expressed as a percent, rate, or proportion. For instance, a change in an account balance from \$100 to \$250 can be expressed as (1) 150% increase, (2) 2.5 times, or (3) 2.5 to 1 (or 2.5:1). Computation of a ratio is a simple arithmetic operation, but its interpretation is not. To be meaningful, a ratio must refer to an economically important relation. For example, a direct and crucial relation exists between an item's sales price and its cost. Accordingly, the ratio of cost of goods sold to sales is meaningful. In contrast, no obvious relation exists between freight costs and the balance of long-term investments.

This section describes an important set of financial ratios and their application. The selected ratios are organized into the four building blocks of financial statement analysis: (1) liquidity and efficiency, (2) solvency, (3) profitability, and (4) market prospects. All of these ratios were explained at relevant points in prior chapters. The purpose here is to organize and apply them under a summary framework. We use four common standards, in varying degrees, for comparisons: intracompany, competitor, industry, and guidelines.

**Point:** Some sources for industry norms are *Annual Statement Studies* by Robert Morris Associates, *Industry Norms & Key Business Ratios* by Dun & Bradstreet, *Standard & Poor's Industry Surveys*, and Reuters.com/finance.

### Liquidity and Efficiency

*Liquidity* refers to the availability of resources to meet short-term cash requirements. It is affected by the timing of cash inflows and outflows along with prospects for future performance. Analysis of liquidity is aimed at a company's funding requirements. *Efficiency* refers to how productive a company is in using its assets. Efficiency is usually measured relative to how much revenue is generated from a certain level of assets.

Both liquidity and efficiency are important and complementary. If a company fails to meet its current obligations, its continued existence is doubtful. Viewed in this light, all other measures of analysis are of secondary importance. Although accounting measurements assume the company's continued existence, our analysis must always assess the validity of this assumption using liquidity measures. Moreover, inefficient use of assets can cause liquidity problems. A lack of liquidity often precedes lower profitability and fewer opportunities. It can foretell a loss of owner control. To a company's creditors, lack of liquidity can yield delays in collecting interest and principal payments or the loss of amounts due them. A company's customers and suppliers of goods and services also are affected by short-term liquidity problems. Implications include a company's inability to execute contracts and potential damage to important customer and supplier relationships. This section describes and illustrates key ratios relevant to assessing liquidity and efficiency.

**Working Capital and Current Ratio** The amount of current assets less current liabilities is called **working capital**, or *net working capital*. A company needs adequate working capital to meet current debts, to carry sufficient inventories, and to take advantage of cash discounts. A company that runs low on working capital is less likely to meet current obligations or to continue operating. When evaluating a company's working capital, we must not only look at the dollar amount of current assets less current liabilities, but also at their ratio. The *current ratio* is defined as follows (see Chapter 3 for additional explanation):

$$\text{Current ratio} = \frac{\text{Current assets}}{\text{Current liabilities}}$$

Drawing on information in Exhibit 17.1, **Apple's** working capital and current ratio for both 2013 and 2012 are shown in Exhibit 17.14. Also, **Google** (4.58), **Samsung** (2.16), and the industry's current ratio (2.5) are shown in the margin. Apple's 2013 ratio (1.68) is lower than competitors' ratios, but it is not in danger of defaulting on loan payments. A high current ratio suggests a strong liquidity position and an ability to meet current obligations. A company can, however, have a current ratio that is too high. An excessively high current ratio means that the company has invested too much in current assets compared to its current obligations.

(in millions)	2013	2012
Current assets . . . . .	\$ 73,286	\$ 57,653
Current liabilities . . . . .	43,658	38,542
<b>Working capital . . . . .</b>	<b>\$29,628</b>	<b>\$19,111</b>
<b>Current ratio</b>		
\$73,286/\$43,658 =	<b>1.68 to 1</b>	
\$57,653/\$38,542 =		<b>1.50 to 1</b>

**EXHIBIT 17.14**  
Apple's Working Capital and Current Ratio

**Current ratio**  
**Google = 4.58**  
**Samsung = 2.16**  
**Industry = 2.5**

An excessive investment in current assets is not an efficient use of funds because current assets normally generate a low return on investment (compared with long-term assets).

Many users apply a guideline of 2:1 (or 1.5:1) for the current ratio in helping evaluate a company's debt-paying ability. A company with a 2:1 or higher current ratio is generally thought to be a good credit risk in the short run. Such a guideline or any analysis of the current ratio must recognize at least three additional factors: (1) type of business, (2) composition of current assets, and (3) turnover rate of current asset components.

**Point:** When a firm uses LIFO in a period of rising costs, the standard for an adequate current ratio usually is lower than if it used FIFO.

**Type of business.** A service company that grants little or no credit and carries few inventories can probably operate on a current ratio of less than 1:1 if its revenues generate enough cash to pay its current liabilities. On the other hand, a company selling high-priced clothing or furniture requires a higher ratio because of difficulties in judging customer demand and cash receipts. For instance, if demand falls, inventory may not generate as much cash as expected. Accordingly, analysis of the current ratio should include a comparison with ratios from successful companies in the same industry and from prior periods. We must also recognize that a company's accounting methods, especially choice of inventory method, affect the current ratio. For instance, when costs are rising, a company using LIFO tends to report a smaller amount of current assets than when using FIFO.

**Composition of current assets.** The composition of a company's current assets is important to an evaluation of short-term liquidity. For instance, cash, cash equivalents, and short-term investments are more liquid than accounts and notes receivable. Also, short-term receivables normally are more liquid than inventory. Cash, of course, can be used to immediately pay current debts. Items such as accounts receivable and inventory, however, normally must be converted into cash before payment is made. An excessive amount of receivables and inventory weakens a company's ability to pay current liabilities. The acid-test ratio (see below) can help with this assessment.

**Turnover rate of assets.** Asset turnover measures a company's efficiency in using its assets. One relevant measure of asset efficiency is the revenue generated. A measure of total asset turnover is revenues divided by total assets, but evaluation of turnover for individual assets is also useful. We discuss both receivables turnover and inventory turnover next.

**Decision Maker**

**Banker** A company requests a one-year, \$200,000 loan for expansion. This company's current ratio is 4:1, with current assets of \$160,000. Key competitors carry a current ratio of about 1.9:1. Using this information, do you approve the loan application? Does your decision change if the application is for a 10-year loan? ■ [Answers follow the chapter's Summary.]

**Acid-Test Ratio** Quick assets are cash, short-term investments, and current receivables. These are the most liquid types of current assets. The *acid-test ratio*, also called *quick ratio*, and introduced in Chapter 5, reflects on a company's short-term liquidity.

$$\text{Acid-test ratio} = \frac{\text{Cash} + \text{Short-term investments} + \text{Current receivables}}{\text{Current liabilities}}$$

Apple's acid-test ratio is computed in Exhibit 17.15. Apple's 2013 acid-test ratio (1.23) is lower than that for Google (4.25) and Samsung (1.37), but is greater than the 1:1 common guideline for

**EXHIBIT 17.15**  
Acid-Test Ratio

(in millions)	2013	2012
Cash and equivalents . . . . .	\$14,259	\$10,746
Short-term securities . . . . .	26,287	18,383
Current receivables . . . . .	13,102	10,930
Total quick assets . . . . .	<u>\$53,648</u>	<u>\$40,059</u>
Current liabilities . . . . .	<u>\$43,658</u>	<u>\$38,542</u>
<b>Acid-test ratio</b>		
\$53,648/\$43,658 . . . . .	<b>1.23 to 1</b>	
\$40,059/\$38,542 . . . . .		<b>1.04 to 1</b>

**Acid-test ratio**  
Google = 4.25  
Samsung = 1.37  
Industry = 0.9

an acceptable acid-test ratio. The ratio for Apple is also greater than the 0.9 industry norm; thus, we are not concerned. As with analysis of the current ratio, we need to consider other factors. For instance, the frequency with which a company converts its current assets into cash affects its working capital requirements. This implies that analysis of short-term liquidity should also include an analysis of receivables and inventories, which we consider next.

**Accounts Receivable Turnover** We can measure how frequently a company converts its receivables into cash by computing the *accounts receivable turnover*. This ratio is defined as follows (see Chapter 9 for additional explanation).

$$\text{Accounts receivable turnover} = \frac{\text{Net sales}}{\text{Average accounts receivable, net}}$$

Short-term receivables from customers are often included in the denominator along with accounts receivable. Also, accounts receivable turnover is more precise if credit sales are used for the numerator, but external users generally use net sales (or net revenues) because information about credit sales is typically not reported. Apple's 2013 accounts receivable turnover is computed as follows (\$ millions).

$$\frac{\$170,910}{(\$10,930 + \$13,102)/2} = 14.2 \text{ times}$$

Apple's value of 14.2 exceeds that of both Google's 7.1 and Samsung's 8.4. Accounts receivable turnover is high when accounts receivable are quickly collected. A high turnover is favorable because it means the company need not commit large amounts of funds to accounts receivable. However, an accounts receivable turnover can be too high; this can occur when credit terms are so restrictive that they negatively affect sales volume.

**Inventory Turnover** How long a company holds inventory before selling it will affect working capital requirements. One measure of this effect is *inventory turnover*, also called *merchandise turnover* or *merchandise inventory turnover*, which is defined as follows (see Chapter 6 for additional explanation).

$$\text{Inventory turnover} = \frac{\text{Cost of goods sold}}{\text{Average inventory}}$$

Using Apple's cost of goods sold and inventories information, we compute its inventory turnover for 2013 as follows (if the beginning and ending inventories for the year do not represent the usual inventory amount, an average of quarterly or monthly inventories can be used).

$$\frac{\$106,606}{(\$791 + \$1,764)/2} = 83.45 \text{ times}$$

Apple's inventory turnover of 83.45 is more than Google's 55.55 and Samsung's 7.47, and the industry's 7.0. A company with a high turnover requires a smaller investment in inventory than one producing the same sales with a lower turnover. Inventory turnover can be too high, however, if the inventory a company keeps is so small that it restricts sales volume.

**Days' Sales Uncollected** Accounts receivable turnover provides insight into how frequently a company collects its accounts. Days' sales uncollected is one measure of this activity, which is defined as follows (Chapter 8 provides additional explanation).

$$\text{Days' sales uncollected} = \frac{\text{Accounts receivable, net}}{\text{Net sales}} \times 365$$

Any short-term notes receivable from customers are normally included in the numerator.

**Global:** Ratio analysis helps overcome currency translation problems, but it does not overcome differences in accounting principles.

**Point:** Some users prefer using gross accounts receivable (before subtracting the allowance for doubtful accounts) to avoid the influence of a manager's bad debts estimate.

**Accounts receivable turnover**  
 Google = 7.1  
 Samsung = 8.4  
 Industry = 5.0

**Point:** Ending accounts receivable can be substituted for the average balance in computing accounts receivable turnover if the difference between ending and average receivables is small.

**Inventory turnover**  
 Google = 55.55  
 Samsung = 7.47  
 Industry = 7.0

Rita Qian/AFP/Getty Images

Apple's 2013 days' sales uncollected follows.

**Days' sales uncollected**

Google = 54.2

Samsung = 44.5

$$\frac{\$13,102}{\$170,910} \times 365 = 28.0 \text{ days}$$

Both Google's days' sales uncollected of 54.2 days and Samsung's 50.7 days are more than the 28.0 days for Apple. Days' sales uncollected is more meaningful if we know company credit terms. A rough guideline states that days' sales uncollected should not exceed  $1\frac{1}{2}$  times the days in its (1) credit period, *if* discounts are not offered or (2) discount period, *if* favorable discounts are offered.

**Days' Sales in Inventory** *Days' sales in inventory* is a useful measure in evaluating inventory liquidity. Days' sales in inventory is linked to inventory in a way that days' sales uncollected is linked to receivables. We compute days' sales in inventory as follows (Chapter 6 provides additional explanation).

$$\text{Days' sales in inventory} = \frac{\text{Ending inventory}}{\text{Cost of goods sold}} \times 365$$

Apple's days' sales in inventory for 2013 follows.

**Days' sales in inventory**

Google = 6.0

Samsung = 50.7

Industry = 35

$$\frac{\$1,764}{\$106,606} \times 365 = 6.0 \text{ days}$$

**Point:** Average collection period is estimated by dividing 365 by the accounts receivable turnover ratio. For example, 365 divided by an accounts receivable turnover of 6.1 indicates a 60-day average collection period.

If the products in Apple's inventory are in demand by customers, this formula estimates that its inventory will be converted into receivables (or cash) in 6.0 days. If all of Apple's sales were credit sales, the conversion of inventory to receivables in 6.0 days *plus* the conversion of receivables to cash in 28.0 days implies that inventory will be converted to cash in about 34.0 days (6.0 + 28.0).

**Total Asset Turnover** *Total asset turnover* reflects a company's ability to use its assets to generate sales and is an important indication of operating efficiency. The definition of this ratio follows (Chapter 10 offers additional explanation).

$$\text{Total asset turnover} = \frac{\text{Net sales}}{\text{Average total assets}}$$

Apple's total asset turnover of 0.89 for 2013 follows, which is greater than that for Google (0.58) but less than that for Samsung (1.16).

**Total asset turnover**

Google = 0.58

Samsung = 1.16

Industry = 1.2

$$\frac{\$170,910}{(\$176,064 + \$207,000)/2} = 0.89 \text{ times}$$

## Solvency

*Solvency* refers to a company's long-run financial viability and its ability to cover long-term obligations. All of a company's business activities—financing, investing, and operating—affect its solvency. Analysis of solvency is long term and uses less precise but more encompassing measures than liquidity. One of the most important components of solvency analysis is the composition of a company's capital structure. *Capital structure* refers to a company's financing sources. It ranges from relatively permanent equity financing to riskier or more temporary short-term financing. Assets represent security for financiers, ranging from loans secured by specific assets to the assets available as general security to unsecured creditors.

This section describes the tools of solvency analysis. Our analysis focuses on a company's ability to both meet its obligations and provide security to its creditors *over the long run*. Indicators of

this ability include *debt* and *equity* ratios, the relation between *pledged assets and secured liabilities*, and the company's capacity to earn sufficient income to *pay fixed interest charges*.

**Debt and Equity Ratios** One element of solvency analysis is to assess the portion of a company's assets contributed by its owners and the portion contributed by creditors. This relation is reflected in the debt ratio (also described in Chapter 2). The *debt ratio* expresses total liabilities as a percent of total assets. The **equity ratio** provides complementary information by expressing total equity as a percent of total assets. **Apple's** debt and equity ratios follow.

(in millions)	2013	Ratios
Total liabilities . . . . .	\$ 83,451	<b>40.3%</b> [Debt ratio]
Total equity . . . . .	123,549	<b>59.7</b> [Equity ratio]
Total liabilities and equity . . . . .	<u>\$207,000</u>	<u>100.0%</u>

**Point:** For analysis purposes, noncontrolling interest is usually included in equity.

**Debt ratio :: Equity ratio**  
**Google = 21.3% :: 78.7%**  
**Samsung = 29.9% :: 70.1%**  
**Industry = 35% :: 65%**

Apple's financial statements reveal more equity than debt. A company is considered less risky if its capital structure (equity and long-term debt) contains more equity. One risk factor is the required payment for interest and principal when debt is outstanding. Another factor is the greater the stockholder financing, the more losses a company can absorb through equity before the assets become inadequate to satisfy creditors' claims. From the stockholders' point of view, if a company earns a return on borrowed capital that is higher than the cost of borrowing, the difference represents increased income to stockholders. The inclusion of debt is described as *financial leverage* because debt can have the effect of increasing the return to stockholders. Companies are said to be highly leveraged if a large portion of their assets is financed by debt.

**Point:** Bank examiners from the FDIC and other regulatory agencies use debt and equity ratios to monitor compliance with regulatory capital requirements imposed on banks and S&Ls.

**Debt-to-Equity Ratio** The ratio of total liabilities to equity is another measure of solvency. We compute the ratio as follows (Chapter 14 offers additional explanation).

$$\text{Debt-to-equity ratio} = \frac{\text{Total liabilities}}{\text{Total equity}}$$

Apple's debt-to-equity ratio for 2013 is

$$\$83,451/\$123,549 = 0.68$$

Apple's 0.68 debt-to-equity ratio is higher than that of Samsung (0.43) and Google (0.27), and greater than the industry ratio of 0.6. Consistent with our inferences from the debt ratio, Apple's capital structure has less debt than equity, which helps limit risk. Recall that debt must be repaid with interest, while equity does not. These debt requirements can be burdensome when the industry and/or the economy experience a downturn. A larger debt-to-equity ratio also implies less opportunity to expand through use of debt financing.

**Debt-to-equity**  
**Google = 0.27**  
**Samsung = 0.43**  
**Industry = 0.6**

**Times Interest Earned** The amount of income before deductions for interest expense and income taxes is the amount available to pay interest expense. The following *times interest earned* ratio reflects the creditors' risk of loan repayments with interest (see Chapter 11 for additional explanation).

$$\text{Times interest earned} = \frac{\text{Income before interest expense and income taxes}}{\text{Interest expense}}$$

**Point:** The times interest earned ratio and the debt and equity ratios are of special interest to bank lending officers.

The larger this ratio, the less risky is the company for creditors. One guideline says that creditors are reasonably safe if the company earns its fixed interest expense two or more times each

year. Apple's times interest earned ratio follows. Apple's 369.8 result suggests that its creditors have little risk of nonrepayment.

#### Times interest earned

Google = 184.2

Samsung = 76.3

$$\frac{\$37,037 + \$136 + \$13,118}{\$136} = 369.8 \text{ times}$$

### Decision Insight

**Bears and Bulls** A *bear market* is a declining market. The phrase comes from bear-skin jobbers who often sold the skins before the bears were caught. The term *bear* was then used to describe investors who sold shares they did not own in anticipation of a price decline. A *bull market* is a rising market. This phrase comes from the once popular sport of bear and bull baiting. The term *bull* came to mean the opposite of *bear*. ■

## Profitability

We are especially interested in a company's ability to use its assets efficiently to produce profits (and positive cash flows). *Profitability* refers to a company's ability to generate an adequate return on invested capital. Return is judged by assessing earnings relative to the level and sources of financing. Profitability is also relevant to solvency. This section describes key profitability measures and their importance to financial statement analysis.

**Profit Margin** A company's operating efficiency and profitability can be expressed by two components. The first is *profit margin*, which reflects a company's ability to earn net income from sales (Chapter 3 offers additional explanation). It is measured by expressing net income as a percent of sales (*sales* and *revenues* are similar terms). Apple's profit margin follows.

#### Profit margin

Google = 21.6%

Samsung = 13.3%

Industry = 11%

$$\text{Profit margin} = \frac{\text{Net income}}{\text{Net sales}} = \frac{\$37,037}{\$170,910} = 21.7\%$$

To evaluate profit margin, we must consider the industry. For instance, an appliance company might require a profit margin between 10% and 15%, whereas a retail supermarket might require a profit margin of 1% or 2%. Both profit margin and *total asset turnover* make up the two basic components of operating efficiency. These ratios reflect on management because managers are ultimately responsible for operating efficiency. The next section explains how we use both measures to analyze return on total assets.

**Return on Total Assets** *Return on total assets* is defined as follows.

$$\text{Return on total assets} = \frac{\text{Net income}}{\text{Average total assets}}$$

Apple's 2013 return on total assets is

#### Return on total assets

Google = 12.6%

Samsung = 15.4%

Industry = 9%

$$\frac{\$37,037}{(\$176,064 + \$207,000)/2} = 19.3\%$$

**Point:** Many analysts add back  $\text{Interest expense} \times (1 - \text{Tax rate})$  to net income in computing return on total assets.

Apple's 19.3% return on total assets is higher than that for many businesses and is higher than Google's 12.6%, Samsung's 15.4%, and the industry's 9% return. We also should evaluate any trend in the rate of return.

The following equation shows the important relation between profit margin, total asset turnover, and return on total assets.

$$\text{Profit margin} \times \text{Total asset turnover} = \text{Return on total assets}$$

or

$$\frac{\text{Net income}}{\text{Net sales}} \times \frac{\text{Net sales}}{\text{Average total assets}} = \frac{\text{Net income}}{\text{Average total assets}}$$

Both profit margin and total asset turnover contribute to overall operating efficiency, as measured by return on total assets. If we apply this formula to Apple, we get

$$21.7\% \times 0.89 = 19.3\% \text{ (with rounding)}$$

Google:  $21.6\% \times 0.58 = 12.6\%$   
 Samsung:  $13.3\% \times 1.16 = 15.4\%$   
 (with rounding)

This analysis shows that Apple's superior return on assets versus that of both Google and Samsung is driven by its higher profit and, in the case of Google, also by its better asset turnover.

**Return on Common Stockholders' Equity** Perhaps the most important goal in operating a company is to earn net income for its owner(s). *Return on common stockholders' equity* measures a company's success in reaching this goal and is defined as follows.

$$\text{Return on common stockholders' equity} = \frac{\text{Net income} - \text{Preferred dividends}}{\text{Average common stockholders' equity}}$$

Apple's 2013 return on common stockholders' equity is computed as follows:

$$\frac{\$37,037 - \$0}{(\$118,210 + \$123,549)/2} = 30.6\%$$

**Return on common equity**  
 Google = 16.2%  
 Samsung = 22.5%  
 Industry = 15%

The denominator in this computation is the book value of common equity (noncontrolling interest is often included in common equity for this ratio). In the numerator, the dividends on cumulative preferred stock are subtracted whether they are declared or are in arrears. If preferred stock is noncumulative, its dividends are subtracted only if declared. Apple's return on common stockholders' equity (30.6%) is superior to Google's 16.2% and Samsung's 22.5%.

## Decision Insight

**Wall Street** *Wall Street* is synonymous with financial markets, but its name comes from the street location of the original New York Stock Exchange. The street's name derives from stockades built by early settlers to protect New York from pirate attacks. ■

## Market Prospects

Market measures are useful for analyzing corporations with publicly traded stock. These market measures use stock price, which reflects the market's (public's) expectations for the company. This includes expectations of both company return and risk—as the market perceives it.

**Price-Earnings Ratio** Computation of the *price-earnings ratio* follows (Chapter 13 provides additional explanation).

$$\text{Price-earnings ratio} = \frac{\text{Market price per common share}}{\text{Earnings per share}}$$

**Point:** PE ratio can be viewed as an indicator of the market's expected growth and risk for a stock. High expected risk suggests a low PE ratio. High expected growth suggests a high PE ratio.

**PE (year-end)**  
**Google = 30.5**  
**Samsung = 6.9**

**Point:** Some investors avoid stocks with high PE ratios under the belief they are "overpriced." Alternatively, some investors sell these stocks short—hoping for price declines.

Predicted earnings per share for the next period is often used in the denominator of this computation. Reported earnings per share for the most recent period is also commonly used. In both cases, the ratio is used as an indicator of the future growth and risk of a company's earnings as perceived by the stock's buyers and sellers.

The market price of Apple's common stock at the start of fiscal year 2014 was \$477.25. Using Apple's \$40.03 basic earnings per share, we compute its price-earnings ratio as follows (some analysts compute this ratio using the median of the low and high stock price).

$$\frac{\$477.25}{\$40.03} = 11.9$$

Apple's price-earnings ratio is less than that for Google, but it is higher than that for Samsung and near the norm for this period.

**Dividend Yield** *Dividend yield* is used to compare the dividend-paying performance of different investment alternatives. We compute dividend yield as follows (Chapter 13 offers additional explanation).

$$\text{Dividend yield} = \frac{\text{Annual cash dividends per share}}{\text{Market price per share}}$$

Apple's dividend yield, based on its fiscal year-end market price per share of \$477.25 and its \$11.40 cash dividends per share, is computed as follows.

$$\frac{\$11.40}{\$477.25} = 2.4\%$$

**Dividend yield**  
**Google = 0.0%**  
**Samsung = 1.0%**

**Point:** Corporate PE ratios and dividend yields are found in daily stock market quotations listed in *The Wall Street Journal*, *Investor's Business Daily*, or other publications and web services.

Some companies, such as Google, do not declare and pay dividends because they wish to reinvest the cash to grow their businesses in the hope of generating greater future earnings and dividends.

## Summary of Ratios

Exhibit 17.16 summarizes the major financial statement analysis ratios illustrated in this chapter and throughout the book. This summary includes each ratio's title, its formula, and the purpose for which it is commonly used.

### Decision Insight

**Ticker Prices** *Ticker prices* refer to a band of moving data on a monitor carrying up-to-the-minute stock prices. The phrase comes from *ticker tape*, a 1-inch-wide strip of paper spewing stock prices from a printer that ticked as it ran. Most of today's investors have never seen actual ticker tape, but the phrase survives. ■

**EXHIBIT 17.16**

Financial Statement Analysis Ratios\*

Ratio	Formula	Measure of
<b>Liquidity and Efficiency</b>		
Current ratio	$= \frac{\text{Current assets}}{\text{Current liabilities}}$	Short-term debt-paying ability
Acid-test ratio	$= \frac{\text{Cash} + \text{Short-term investments} + \text{Current receivables}}{\text{Current liabilities}}$	Immediate short-term debt-paying ability
Accounts receivable turnover	$= \frac{\text{Net sales}}{\text{Average accounts receivable, net}}$	Efficiency of collection
Inventory turnover	$= \frac{\text{Cost of goods sold}}{\text{Average inventory}}$	Efficiency of inventory management
Days' sales uncollected	$= \frac{\text{Accounts receivable, net}}{\text{Net sales}} \times 365$	Liquidity of receivables
Days' sales in inventory	$= \frac{\text{Ending inventory}}{\text{Cost of goods sold}} \times 365$	Liquidity of inventory
Total asset turnover	$= \frac{\text{Net sales}}{\text{Average total assets}}$	Efficiency of assets in producing sales
<b>Solvency</b>		
Debt ratio	$= \frac{\text{Total liabilities}}{\text{Total assets}}$	Creditor financing and leverage
Equity ratio	$= \frac{\text{Total equity}}{\text{Total assets}}$	Owner financing
Debt-to-equity ratio	$= \frac{\text{Total liabilities}}{\text{Total equity}}$	Debt versus equity financing
Times interest earned	$= \frac{\text{Income before interest expense and income taxes}}{\text{Interest expense}}$	Protection in meeting interest payments
<b>Profitability</b>		
Profit margin ratio	$= \frac{\text{Net income}}{\text{Net sales}}$	Net income in each sales dollar
Gross margin ratio	$= \frac{\text{Net sales} - \text{Cost of goods sold}}{\text{Net sales}}$	Gross margin in each sales dollar
Return on total assets	$= \frac{\text{Net income}}{\text{Average total assets}}$	Overall profitability of assets
Return on common stockholders' equity	$= \frac{\text{Net income} - \text{Preferred dividends}}{\text{Average common stockholders' equity}}$	Profitability of owner investment
Book value per common share	$= \frac{\text{Shareholders' equity applicable to common shares}}{\text{Number of common shares outstanding}}$	Liquidation at reported amounts
Basic earnings per share	$= \frac{\text{Net income} - \text{Preferred dividends}}{\text{Weighted-average common shares outstanding}}$	Net income per common share
<b>Market Prospects</b>		
Price-earnings ratio	$= \frac{\text{Market price per common share}}{\text{Earnings per share}}$	Market value relative to earnings
Dividend yield	$= \frac{\text{Annual cash dividends per share}}{\text{Market price per share}}$	Cash return per common share

\* Additional ratios also examined in previous chapters included credit risk ratio; plant asset useful life; plant asset age; days' cash expense coverage; cash coverage of growth; cash coverage of debt; free cash flow; cash flow on total assets; and payout ratio.

**NEED-TO-KNOW 17-3**

For each ratio listed, identify whether the change in ratio value from 2014 to 2015 is regarded as favorable or unfavorable.

Ratio Analysis

P3

Ratio	2015	2014	Ratio	2015	2014
1. Profit margin	6%	8%	4. Accounts receivable turnover	8.8	9.4
2. Debt ratio	50%	70%	5. Basic earnings per share	\$2.10	\$2.00
3. Gross margin	40%	36%	6. Inventory turnover	3.6	4.0

**Solution**

Ratio	2015	2014	Change
1. Profit margin ratio . . . . .	6%	8%	Unfavorable
2. Debt ratio . . . . .	50%	70%	Favorable
3. Gross margin ratio . . . . .	40%	36%	Favorable
4. Accounts receivable turnover . . . . .	8.8	9.4	Unfavorable
5. Basic earnings per share . . . . .	\$2.10	\$2.00	Favorable
6. Inventory turnover . . . . .	3.6	4.0	Unfavorable

**OC3**

**GLOBAL VIEW**

The analysis and interpretation of financial statements is, of course, impacted by the accounting system in effect. This section discusses similarities and differences for analysis of financial statements when prepared under U.S. GAAP vis-à-vis IFRS.

**Horizontal and Vertical Analyses** Horizontal and vertical analyses help eliminate many differences between U.S. GAAP and IFRS when analyzing and interpreting financial statements. Financial numbers are converted to percentages that are, in the best-case scenario, consistently applied across and within periods. This enables users to effectively compare companies across reporting regimes. However, when fundamental differences in reporting regimes impact financial statements, such as with certain recognition rule differences, the user must exercise caution when drawing conclusions. Some users will reformulate one set of numbers to be more consistent with the other system to enable comparative analysis. This reformulation process is covered in advanced courses. The important point is that horizontal and vertical analyses help strip away differences between the reporting regimes, but several key differences sometimes remain and require adjustment of the numbers.

**Ratio Analysis** Ratio analysis of financial statement numbers has many of the advantages and disadvantages of horizontal and vertical analyses discussed above. Importantly, ratio analysis is useful for business decisions, with some possible changes in interpretation depending on what is and what is not included in accounting measures across U.S. GAAP and IFRS. Still, we must take care in drawing inferences from a comparison of ratios across reporting regimes because what a number measures can differ across regimes. **Piaggio**, which manufactures two-, three- and four-wheel vehicles and is Europe’s leading manufacturer of motorcycles and scooters, offers the following example of its own ratio analysis applied to its financing objectives: “The object of capital management . . . , [and] consistent with others in the industry, the Company monitors capital on the basis of a total liabilities to equity ratio. This ratio is calculated as total liabilities divided by equity.”

**Sustainability and Accounting** **The Motley Fool**, as introduced in this chapter’s opening feature, emphasizes the importance of a sustainable and vibrant work environment. The Gardners wrote, “Sustainable advantage will not always be easy. That’s one of the reasons that we value discussion in The Motley Fool . . . When determining a subjective attribute like sustainable advantage, we should all be interested in discovery.” Morgan Housel, a Fool employee, explains that. “At the Motley Fool, we observe that the best . . . culture [is] built on trust and respect” (*USA Today*, April 2014). Thus, sustainability at the Fool means a dynamic, energetic, questioning workforce to analyze and interpret the information conveyed through financial reports.

## Decision Insight

**Not Created Equal** Financial regulation has several goals. Two of them are to ensure adequate accounting disclosure and to strengthen corporate governance. For disclosure purposes, companies must now provide details of related-party transactions and material off-balance-sheet agreements. This is motivated by several major frauds. For corporate governance, the CEO and CFO must now certify the fairness of financial statements and the effectiveness of internal controls. Yet, concerns remain. A study reports that 23% of management and administrative employees observed activities that posed a conflict of interest in the past year (KPMG 2009). Another 12% witnessed the falsifying or manipulating of accounting information. The bottom line: All financial statements are not of equal quality. ■

Analysis Reporting

Decision Analysis

Understanding the purpose of financial statement analysis is crucial to the usefulness of any analysis. This understanding leads to efficiency of effort, effectiveness in application, and relevance in focus. The purpose of most financial statement analyses is to reduce uncertainty in business decisions through a rigorous and sound evaluation. A *financial statement analysis report* helps by directly addressing the building blocks of analysis and by identifying weaknesses in inference by requiring explanation: It forces us to organize our reasoning and to verify its flow and logic. A report also serves as a communication link with readers, and the writing process reinforces our judgments and vice versa. Finally, the report helps us (re) evaluate evidence and refine conclusions on key building blocks. A good analysis report usually consists of six sections:

A1

Summarize and report results of analysis.

1. **Executive summary**—brief focus on important analysis results and conclusions.
2. **Analysis overview**—background on the company, its industry, and its economic setting.
3. **Evidential matter**—financial statements and information used in the analysis, including ratios, trends, comparisons, statistics, and all analytical measures assembled; often organized under the building blocks of analysis.
4. **Assumptions**—identification of important assumptions regarding a company's industry and economic environment, and other important assumptions for estimates.
5. **Key factors**—list of important favorable and unfavorable factors, both quantitative and qualitative, for company performance; usually organized by areas of analysis.
6. **Inferences**—forecasts, estimates, interpretations, and conclusions drawing on all sections of the report.

We must remember that the user dictates relevance, meaning that the analysis report should include a brief table of contents to help readers focus on those areas most relevant to their decisions. All irrelevant matter must be eliminated. For example, decades-old details of obscure transactions and detailed miscues of the analysis are irrelevant. Ambiguities and qualifications to avoid responsibility or hedging inferences must be eliminated. Finally, writing is important. Mistakes in grammar and errors of fact compromise the report's credibility.

## Decision Insight

**Short Selling** *Short selling* refers to selling stock before you buy it. Here's an example: You borrow 100 shares of Nike stock, sell them at \$40 each, and receive money from their sale. You then wait. You hope that Nike's stock price falls to, say, \$35 each and you can replace the borrowed stock for less than you sold it for, reaping a profit of \$5 each less any transaction costs. ■

Use the following financial statements of Precision Co. to complete these requirements.

1. Prepare comparative income statements showing the percent increase or decrease for year 2015 in comparison to year 2014.
2. Prepare common-size comparative balance sheets for years 2015 and 2014.

NEED-TO-KNOW

COMPREHENSIVE

3. Compute the following ratios as of December 31, 2015, or for the year ended December 31, 2015, and identify its building block category for financial statement analysis.
- Current ratio
  - Acid-test ratio
  - Accounts receivable turnover
  - Days' sales uncollected
  - Inventory turnover
  - Debt ratio
  - Debt-to-equity ratio
  - Times interest earned
  - Profit margin ratio
  - Total asset turnover
  - Return on total assets
  - Return on common stockholders' equity

PRECISION COMPANY Comparative Income Statements For Years Ended December 31, 2015 and 2014

### PLANNING THE SOLUTION

- Set up a four-column income statement; enter the 2015 and 2014 amounts in the first two columns and then enter the dollar change in the third column and the percent change from 2014 in the fourth column.
- Set up a four-column balance sheet; enter the 2015 and 2014 year-end amounts in the first two columns and then compute and enter the amount of each item as a percent of total assets.

- Compute the required ratios using the data provided. Use the average of beginning and ending amounts when appropriate (see Exhibit 17.16 for definitions).

**3. Ratios for 2015:**

- a. Current ratio:  $\$514,000/\$265,000 = 1.9:1$  (liquidity and efficiency)
- b. Acid-test ratio:  $(\$79,000 + \$65,000 + \$120,000)/\$265,000 = 1.0:1$  (liquidity and efficiency)
- c. Average receivables:  $(\$120,000 + \$100,000)/2 = \$110,000$   
Accounts receivable turnover:  $\$2,486,000/\$110,000 = 22.6$  times (liquidity and efficiency)
- d. Days' sales uncollected:  $(\$120,000/\$2,486,000) \times 365 = 17.6$  days (liquidity and efficiency)
- e. Average inventory:  $(\$250,000 + \$265,000)/2 = \$257,500$   
Inventory turnover:  $\$1,523,000/\$257,500 = 5.9$  times (liquidity and efficiency)
- f. Debt ratio:  $\$665,000/\$1,684,000 = 39.5\%$  (solvency)
- g. Debt-to-equity ratio:  $\$665,000/\$1,019,000 = 0.65$  (solvency)
- h. Times interest earned:  $\$185,000/\$44,000 = 4.2$  times (solvency)
- i. Profit margin ratio:  $\$94,000/\$2,486,000 = 3.8\%$  (profitability)
- j. Average total assets:  $(\$1,684,000 + \$1,678,000)/2 = \$1,681,000$   
Total asset turnover:  $\$2,486,000/\$1,681,000 = 1.48$  times (liquidity and efficiency)
- k. Return on total assets:  $\$94,000/\$1,681,000 = 5.6\%$  or  $3.8\% \times 1.48 = 5.6\%$  (profitability)
- l. Average total common equity:  $(\$1,019,000 + \$966,000)/2 = \$992,500$   
Return on common stockholders' equity:  $\$94,000/\$992,500 = 9.5\%$  (profitability)

**APPENDIX****17A****Sustainable Income****A2**

Explain the form and assess the content of a complete income statement.

When a company's revenue and expense transactions are from normal, continuing operations, a simple income statement is usually adequate. When a company's activities include income-related events not part of its normal, continuing operations, it must disclose information to help users understand these events and predict future performance. To meet these objectives, companies separate the income statement into continuing operations, discontinued segments, extraordinary items, comprehensive income, and earnings per share. For illustration, Exhibit 17A.1 shows such an income statement for ComUS. These separate distinctions help us measure *sustainable income*, which is the income level most likely to continue into the future. Sustainable income is commonly used in PE ratios and other market-based measures of performance.

**Continuing Operations** The first major section (①) shows the revenues, expenses, and income from continuing operations. Users especially rely on this information to predict future operations. Many

**EXHIBIT 17A.1**Income Statement  
(all-inclusive) for  
a Corporation

ComUS Income Statement For Year Ended December 31, 2015		
	Net sales .....	\$8,478,000
	Operating expenses	
	Cost of goods sold .....	\$5,950,000
	Depreciation expense .....	35,000
	Other selling, general and administrative expenses .....	515,000
	Interest expense .....	<u>20,000</u>
①	Total operating expenses .....	(6,520,000)
	Other gains (losses)	
	Loss on plant relocation .....	(45,000)
	Gain on sale of surplus land .....	<u>72,000</u>
	Income from continuing operations before taxes .....	1,985,000
	Income taxes expense .....	<u>(595,500)</u>
	Income from continuing operations .....	1,389,500
	<b>Discontinued segment</b>	
②	Income from operating Division A (net of \$180,000 taxes) .....	420,000
	Loss on disposal of Division A (net of \$66,000 tax benefit) .....	<u>(154,000)</u>
	Income before extraordinary items .....	266,000
	Income before extraordinary items .....	1,655,500
	<b>Extraordinary items</b>	
③	Gain on land expropriated by state (net of \$85,200 taxes) .....	198,800
	Loss from earthquake damage (net of \$270,000 tax benefit) .....	<u>(630,000)</u>
	Net income .....	<u>\$1,224,300</u>
	<b>Earnings per common share (200,000 outstanding shares)</b>	
④	Income from continuing operations .....	\$ 6.95
	Discontinued operations .....	<u>1.33</u>
	Income before extraordinary items .....	8.28
	Extraordinary items .....	<u>(2.16)</u>
	Net income (basic earnings per share) .....	<u>\$ 6.12</u>

users view this section as the most important. Earlier chapters explained the items comprising income from continuing operations.

**Discontinued Segments** A **business segment** is a part of a company's operations that serves a particular line of business or class of customers. A segment has assets, liabilities, and financial results of operations that can be distinguished from those of other parts of the company. A company's gain or loss from selling or closing down a segment is separately reported. Section ② of Exhibit 17A.1 reports both (1) income from operating the discontinued segment for the current period prior to its disposal and (2) the loss from disposing of the segment's net assets. The income tax effects of each are reported separately from the income taxes expense in section ①.

**Extraordinary Items** Section ③ reports **extraordinary gains and losses**, which are those that are *both unusual and infrequent*. An **unusual gain or loss** is abnormal or otherwise unrelated to the company's regular activities and environment. An **infrequent gain or loss** is not expected to recur given the company's operating environment. Reporting extraordinary items in a separate category helps users predict future performance, absent the effects of extraordinary items. Items usually considered extraordinary include (1) expropriation (taking away) of property by a foreign government, (2) condemning of property by a domestic government body, (3) prohibition against using an asset by a newly enacted law, and (4) losses and gains from an unusual and infrequent calamity ("act of God"). Items *not* considered extraordinary include (1) write-downs of inventories and write-offs of receivables, (2) gains and losses from disposing of segments, and (3) financial effects of labor strikes.

Gains and losses that are neither unusual nor infrequent are reported as part of continuing operations. Gains and losses that are *either* unusual *or* infrequent, but *not* both, are reported as part of continuing operations *but* after the normal revenues and expenses.

## Decision Maker

**Small Business Owner** You own an orange grove near Jacksonville, Florida. A bad frost destroys about one-half of your oranges. You are currently preparing an income statement for a bank loan. Can you claim the loss of oranges as extraordinary? ■ [Answers follow the chapter's Summary.]

**Earnings per Share** The final section ④ of the income statement in Exhibit 17A.1 reports earnings per share for each of the three subcategories of income (continuing operations, discontinued segments, and extraordinary items) when they exist. Earnings per share is discussed in Chapter 13.

**Changes in Accounting Principles** The *consistency concept* directs a company to apply the same accounting principles across periods. Yet a company can change from one acceptable accounting principle (such as FIFO, LIFO, or weighted-average) to another as long as the change improves the usefulness of information in its financial statements. A footnote would describe the accounting change and why it is an improvement.

Changes in accounting principles require retrospective application to prior periods' financial statements. *Retrospective application* involves applying a different accounting principle to prior periods as if that principle had always been used. Retrospective application enhances the consistency of financial information between periods, which improves the usefulness of information, especially with comparative analyses. Accounting standards also require that *a change in depreciation, amortization, or depletion method for long-term operating assets is accounted for as a change in accounting estimate*—that is, prospectively over current and future periods. This reflects the notion that an entity should change its depreciation, amortization, or depletion method only with changes in estimated asset benefits, the pattern of benefit usage, or information about those benefits.

**Point:** Changes in principles are sometimes required when new accounting standards are issued.

QC4

## Summary

**C1 Explain the purpose and identify the building blocks of analysis.** The purpose of financial statement analysis is to help users make better business decisions. Internal users want information to improve company efficiency and effectiveness in providing products and services. External users want information to make better and more informed decisions in pursuing their goals. The common goals of all users are to evaluate a company's (1) past and current performance, (2) current financial position, and (3) future performance and risk. Financial statement analysis focuses on four "building blocks" of analysis: (1) liquidity and efficiency—ability to meet short-term obligations and efficiently generate revenues; (2) solvency—ability to generate future revenues and meet long-term obligations; (3) profitability—ability to provide financial rewards sufficient to attract and retain financing; and (4) market prospects—ability to generate positive market expectations.

**C2 Describe standards for comparisons in analysis.** Standards for comparisons include (1) intracompany—prior performance and relations between financial items for the company under analysis; (2) competitor—one or more direct competitors of the company; (3) industry—industry statistics; and (4) guidelines (rules of thumb)—general standards developed from past experiences and personal judgments.

**A1 Summarize and report results of analysis.** A financial statement analysis report is often organized around the building blocks of analysis. A good report separates interpretations and conclusions of analysis from the information underlying them. An analysis report often consists of six sections: (1) executive summary, (2) analysis overview, (3) evidential matter, (4) assumptions, (5) key factors, and (6) inferences.

**A2A Explain the form and assess the content of a complete income statement.** An income statement has four *potential* sections: (1) continuing operations, (2) discontinued segments, (3) extraordinary items, and (4) earnings per share.

**P1 Explain and apply methods of horizontal analysis.** Horizontal analysis is a tool to evaluate changes in data across time. Two important tools of horizontal analysis are comparative statements and trend analysis. Comparative statements show amounts for two or more successive periods, often with changes disclosed in both absolute and percent terms. Trend analysis is used to reveal important changes occurring from one period to the next.

**P2 Describe and apply methods of vertical analysis.** Vertical analysis is a tool to evaluate each financial statement item or group of items in terms of a base amount. Two tools of vertical analysis are common-size statements and graphical analyses. Each item in common-size statements is expressed as a percent of a base amount. For the balance sheet, the base amount is usually total assets, and for the income statement, it is usually sales.

**P3 Define and apply ratio analysis.** Ratio analysis provides clues to and symptoms of underlying conditions. Ratios, properly interpreted, identify areas requiring further investigation. A ratio expresses a mathematical relation between two quantities such as a percent, rate, or proportion. Ratios can be organized into the building blocks of analysis: (1) liquidity and efficiency, (2) solvency, (3) profitability, and (4) market prospects.

## Guidance Answers to Decision Maker

**Auditor** The *joint relation* referred to is the combined increase in sales and the decrease in expenses yielding more than a 5% increase in income. Both *individual* accounts (sales and expenses) yield percent changes within the  $\pm 5\%$  acceptable range. However, a joint analysis suggests a different picture. For example, consider a joint analysis using the profit margin ratio. The client's profit margin is 11.46% ( $\$206,000 - \$182,400 / \$206,000$ ) for the current year compared with 5.0% ( $\$200,000 - \$190,000 / \$200,000$ ) for the prior year—yielding a 129% increase in profit margin! This is what concerns the partner, and it suggests expanding audit tests to verify or refute the client's figures.

**Banker** Your decision on the loan application is positive for at least two reasons. First, the current ratio suggests a strong ability to meet short-term obligations. Second, current assets of \$160,000

and a current ratio of 4:1 imply current liabilities of \$40,000 (one-fourth of current assets) and a working capital excess of \$120,000. This working capital excess is 60% of the loan amount. However, if the application is for a 10-year loan, our decision is less optimistic. The current ratio and working capital suggest a good safety margin, but indications of inefficiency in operations exist. In particular, a 4:1 current ratio is more than double its key competitors' ratio. This is characteristic of inefficient asset use.

**Small Business Owner** The frost loss is probably not extraordinary. Jacksonville experiences enough recurring frost damage to make it difficult to argue this event is both unusual and infrequent. Still, you want to highlight the frost loss and hope the bank views this uncommon event separately from continuing operations.

### Multiple Choice Quiz

Answers at end of chapter

1. A company's sales in 2014 were \$300,000 and in 2015 were \$351,000. Using 2014 as the base year, the sales trend percent for 2015 is:
- a. 17%      c. 100%      e. 48%
- b. 85%      d. 117%

Use the following information for questions 2 through 5.

#### GALLOWAY COMPANY Balance Sheet December 31, 2015

##### Assets

Cash .....	\$ 86,000
Accounts receivable .....	76,000
Merchandise inventory .....	122,000
Prepaid insurance .....	12,000
Long-term investments .....	98,000
Plant assets, net .....	436,000
Total assets .....	<u>\$830,000</u>

##### Liabilities and Equity

Current liabilities .....	\$124,000
Long-term liabilities .....	90,000
Common stock .....	300,000
Retained earnings .....	316,000
Total liabilities and equity .....	<u>\$830,000</u>

2. What is Galloway Company's current ratio?
- a. 0.69  
b. 1.31  
c. 3.88  
d. 6.69  
e. 2.39
3. What is Galloway Company's acid-test ratio?
- a. 2.39  
b. 0.69  
c. 1.31  
d. 6.69  
e. 3.88
4. What is Galloway Company's debt ratio?
- a. 25.78%  
b. 100.00%  
c. 74.22%  
d. 137.78%  
e. 34.74%
5. What is Galloway Company's equity ratio?
- a. 25.78%  
b. 100.00%  
c. 34.74%  
d. 74.22%  
e. 137.78%

<sup>A</sup> Superscript letter A denotes assignments based on Appendix 17A.

 Icon denotes assignments that involve decision making.

## Discussion Questions

1. Explain the difference between financial reporting and financial statements.
2. What is the difference between comparative financial statements and common-size comparative statements?
3. Which items are usually assigned a 100% value on (a) a common-size balance sheet and (b) a common-size income statement?
4.  What three factors would influence your evaluation as to whether a company's current ratio is good or bad?
5.  Suggest several reasons why a 2:1 current ratio might not be adequate for a particular company.
6.  Why is working capital given special attention in the process of analyzing balance sheets?
7.  What does the number of days' sales uncollected indicate?
8.  What does a relatively high accounts receivable turnover indicate about a company's short-term liquidity?
9.  Why is a company's capital structure, as measured by debt and equity ratios, important to financial statement analysts?
10.  How does inventory turnover provide information about a company's short-term liquidity?
11.  What ratios would you compute to evaluate management performance?
12.  Why would a company's return on total assets be different from its return on common stockholders' equity?
13. Where on the income statement does a company report an unusual gain not expected to occur more often than once every two years or so?
14. Refer to **Apple's** financial statements in Appendix A. Compute its profit margin for the years ended September 28, 2013, and September 29, 2012. **APPLE**
15. Refer to **Google's** financial statements in Appendix A to compute its equity ratio as of December 31, 2013, and December 31, 2012. **GOOGLE**
16. Refer to **Samsung's** financial statements in Appendix A. Compute its debt ratio as of December 31, 2013, and December 31, 2012. **Samsung**
17. Use **Samsung's** financial statements in Appendix A to compute its return on total assets for fiscal year ended December 31, 2013. **Samsung**

## QUICK STUDY

Which of the following items *a* through *i* are part of financial reporting but are *not* included as part of general-purpose financial statements?

### QS 17-1

Financial reporting

**C1**

- |   |   |
|---|---|
| <input type="checkbox"/> a. Income statement          | <input type="checkbox"/> f. Statement of cash flows                                     |
| <input type="checkbox"/> b. Balance sheet             | <input type="checkbox"/> g. Stock price information and analysis                        |
| <input type="checkbox"/> c. Prospectus                | <input type="checkbox"/> h. Statement of shareholders' equity                           |
| <input type="checkbox"/> d. Financial statement notes | <input type="checkbox"/> i. Management discussion and analysis of financial performance |
| <input type="checkbox"/> e. Company news releases     |   |

### QS 17-2

Standard of comparison

**C2**

Identify which standard of comparison, (a) intracompany, (b) competitor, (c) industry, or (d) guidelines, is best described by each of the following.

1. Is often viewed as the best standard of comparison.
2. Rules of thumb developed from past experiences.
3. Provides analysis based on a company's prior performance.
4. Compares a company against industry statistics.

### QS 17-3

Horizontal analysis

**P1**

Compute the annual dollar changes and percent changes for each of the following accounts.

	2015	2014
Short-term investments . . . . .	\$374,634	\$234,000
Accounts receivable . . . . .	97,364	101,000
Notes payable . . . . .	0	88,000

Use the following information for Tide Corporation to determine the 2014 and 2015 trend percents for net sales using 2014 as the base year.

**QS 17-4**  
Trend percents  
P1

(\$ thousands)	2015	2014
Net sales . . . . .	\$801,810	\$453,000
Cost of goods sold . . . . .	392,887	134,088

Refer to the information in QS 17-4. Use that information for Tide Corporation to determine the 2014 and 2015 common-size percents for cost of goods sold using net sales as the base.

**QS 17-5**  
Common-size analysis P2

For each ratio listed, identify whether the change in ratio value from 2014 to 2015 is usually regarded as favorable or unfavorable.

**QS 17-6**  
Ratio interpretation  
P3 

Ratio	2015	2014	Ratio	2015	2014
1. Profit margin . . . . .	9%	8%	5. Accounts receivable turnover . . . . .	5.5	6.7
2. Debt ratio . . . . .	47%	42%	6. Basic earnings per share . . . . .	\$1.25	\$1.10
3. Gross margin . . . . .	34%	46%	7. Inventory turnover . . . . .	3.6	3.4
4. Acid-test ratio . . . . .	1.00	1.15	8. Dividend yield . . . . .	2.0%	1.2%

The following information is available for Morgan Company and Parker Company, similar firms operating in the same industry. Write a half-page report comparing Morgan and Parker using the available information. Your discussion should include their ability to meet current obligations and to use current assets efficiently.

**QS 17-7**  
Analysis of short-term financial condition  
A1 

	A	B	C	D	E	F	G	H
1	<b>Morgan</b>			<b>Parker</b>				
2		<b>2015</b>	<b>2014</b>	<b>2013</b>		<b>2015</b>	<b>2014</b>	<b>2013</b>
3	Current ratio	1.7	1.6	2.1		3.2	2.7	1.9
4	Acid-test ratio	1.0	1.1	1.2		2.8	2.5	1.6
5	Accounts receivable turnover	30.5	25.2	29.2		16.4	15.2	16.0
6	Merchandise inventory turnover	24.2	21.9	17.1		14.5	13.0	12.6
7	Working capital	\$70,000	\$58,000	\$52,000		\$131,000	\$103,000	\$78,000
8								

**Team Project:** Assume that the two companies apply for a one-year loan from the team. Identify additional information the companies must provide before the team can make a loan decision.

A review of the notes payable files discovers that three years ago the company reported the entire \$1,000 cash payment (consisting of \$800 principal and \$200 interest) toward an installment note payable as interest expense. This mistake had a material effect on the amount of income in that year. How should the correction be reported in the current-year financial statements?

**QS 17-8<sup>A</sup>**  
Error adjustments  
A2 

Answer each of the following related to international accounting and analysis.

- a. Identify a limitation to using ratio analysis when examining companies reporting under different accounting systems such as IFRS versus U.S. GAAP.
- b. Identify an advantage to using horizontal and vertical analyses when examining companies reporting under different currencies.

**QS 17-9**  
International ratio analysis  
C2 

Match the ratio to the building block of financial statement analysis to which it best relates.

- |                                      |                                       |                         |                            |
|--------------------------------------|---------------------------------------|-------------------------|----------------------------|
| <b>A.</b> Liquidity and efficiency   | <b>B.</b> Solvency                    | <b>C.</b> Profitability | <b>D.</b> Market prospects |
| _____ 1. Equity ratio                | _____ 6. Accounts receivable turnover |                         |                            |
| _____ 2. Return on total assets      | _____ 7. Debt-to-equity               |                         |                            |
| _____ 3. Dividend yield              | _____ 8. Times interest earned        |                         |                            |
| _____ 4. Book value per common share | _____ 9. Gross margin ratio           |                         |                            |
| _____ 5. Days' sales in inventory    | _____ 10. Acid-test ratio             |                         |                            |

**EXERCISES**

**Exercise 17-1**  
Building blocks of analysis  
C1

**Exercise 17-2**

Identifying financial ratios

Identify which of the following six metrics *a* through *f* best completes questions 1 through 3 below.

- a. Days' sales uncollected
  - b. Accounts receivable turnover
  - c. Working capital
  - d. Return on total assets
  - e. Total asset turnover
  - f. Profit margin
1. Which two ratios are key components in measuring a company's operating efficiency? \_\_\_\_\_  
Which ratio summarizes these two components? \_\_\_\_\_
  2. What measure reflects the difference between current assets and current liabilities? \_\_\_\_\_
  3. Which two short-term liquidity ratios measure how frequently a company collects its accounts?  
\_\_\_\_\_

**Exercise 17-3**

Computation and analysis of trend percents

P1

Compute trend percents for the following accounts, using 2011 as the base year (round the percents to whole numbers). State whether the situation as revealed by the trends appears to be favorable or unfavorable for each account.

	2015	2014	2013	2012	2011
Sales . . . . .	\$282,880	\$270,800	\$252,600	\$234,560	\$150,000
Cost of goods sold . . . . .	128,200	122,080	115,280	106,440	67,000
Accounts receivable . . . . .	18,100	17,300	16,400	15,200	9,000

**Exercise 17-4**

Common-size percent computation and interpretation

Express the following comparative income statements in common-size percents and assess whether or not this company's situation has improved in the most recent year (round the percents to one decimal).

<b>GOMEZ CORPORATION</b>		
Comparative Income Statements		
For Years Ended December 31, 2015 and 2014		
	2015	2014
Sales . . . . .	\$740,000	\$625,000
Cost of goods sold . . . . .	560,300	290,800
Gross profit . . . . .	179,700	334,200
Operating expenses . . . . .	128,200	218,500
Net income . . . . .	<u>\$ 51,500</u>	<u>\$115,700</u>

**Exercise 17-5**

Determination of income effects from common-size and trend percents

P1 P2

Common-size and trend percents for Rustynail Company's sales, cost of goods sold, and expenses follow. Determine whether net income increased, decreased, or remained unchanged in this three-year period.

	Common-Size Percents			Trend Percents		
	2015	2014	2013	2015	2014	2013
Sales . . . . .	100.0%	100.0%	100.0%	105.4%	104.2%	100.0%
Cost of goods sold . . . . .	63.4	61.9	59.1	113.1	109.1	100.0
Total expenses . . . . .	15.3	14.8	15.1	106.8	102.1	100.0

Simon Company's year-end balance sheets follow. Express the balance sheets in common-size percents. Round amounts to the nearest one-tenth of a percent. Analyze and comment on the results.

At December 31	2015	2014	2013
<b>Assets</b>			
Cash .....	\$ 31,800	\$ 35,625	\$ 37,800
Accounts receivable, net .....	89,500	62,500	50,200
Merchandise inventory .....	112,500	82,500	54,000
Prepaid expenses .....	10,700	9,375	5,000
Plant assets, net .....	<u>278,500</u>	<u>255,000</u>	<u>230,500</u>
Total assets .....	<u>\$523,000</u>	<u>\$445,000</u>	<u>\$377,500</u>
<b>Liabilities and Equity</b>			
Accounts payable .....	\$129,900	\$ 75,250	\$ 51,250
Long-term notes payable secured by mortgages on plant assets .....	98,500	101,500	83,500
Common stock, \$10 par value .....	163,500	163,500	163,500
Retained earnings .....	<u>131,100</u>	<u>104,750</u>	<u>79,250</u>
Total liabilities and equity .....	<u>\$523,000</u>	<u>\$445,000</u>	<u>\$377,500</u>

**Exercise 17-6**

Common-size percents

Refer to Simon Company's balance sheets in Exercise 17-6. Analyze its year-end short-term liquidity position at the end of 2015, 2014, and 2013 by computing (1) the current ratio and (2) the acid-test ratio. Comment on the ratio results. (Round ratio amounts to two decimals.)

**Exercise 17-7**

Liquidity analysis

Refer to the Simon Company information in Exercise 17-6. The company's income statements for the years ended December 31, 2015 and 2014, follow. Assume that all sales are on credit and then compute: (1) days' sales uncollected, (2) accounts receivable turnover, (3) inventory turnover, and (4) days' sales in inventory. Comment on the changes in the ratios from 2014 to 2015. (Round amounts to one decimal.)

**Exercise 17-8**

Liquidity analysis and interpretation

For Year Ended December 31	2015	2014
Sales .....	\$673,500	\$532,000
Cost of goods sold .....	\$411,225	\$345,500
Other operating expenses .....	209,550	134,980
Interest expense .....	12,100	13,300
Income taxes .....	<u>9,525</u>	<u>8,845</u>
Total costs and expenses .....	642,400	502,625
Net income .....	<u>\$ 31,100</u>	<u>\$ 29,375</u>
Earnings per share .....	<u>\$ 1.90</u>	<u>\$ 1.80</u>

Refer to the Simon Company information in Exercises 17-6 and 17-8. Compare the company's long-term risk and capital structure positions at the end of 2015 and 2014 by computing these ratios: (1) debt and equity ratios—percent rounded to one decimal, (2) debt-to-equity ratio—rounded to two decimals, and (3) times interest earned—rounded to one decimal. Comment on these ratio results.

**Exercise 17-9**

Risk and capital structure analysis

Refer to Simon Company's financial information in Exercises 17-6 and 17-8. Evaluate the company's efficiency and profitability by computing the following for 2015 and 2014: (1) profit margin ratio—percent rounded to one decimal, (2) total asset turnover—rounded to one decimal, and (3) return on total assets—percent rounded to one decimal. Comment on these ratio results.

**Exercise 17-10**

Efficiency and profitability analysis

**Exercise 17-11**  
Profitability analysis

Refer to Simon Company’s financial information in Exercises 17-6 and 17-8. Additional information about the company follows. To help evaluate the company’s profitability, compute and interpret the following ratios for 2015 and 2014: (1) return on common stockholders’ equity—percent rounded to one decimal, (2) price-earnings ratio on December 31—rounded to one decimal, and (3) dividend yield—percent rounded to one decimal.

Common stock market price, December 31, 2015 . . . . .	\$30.00
Common stock market price, December 31, 2014 . . . . .	28.00
Annual cash dividends per share in 2015 . . . . .	0.29
Annual cash dividends per share in 2014 . . . . .	0.24

**Exercise 17-12**  
Analysis of efficiency and financial leverage

Roak Company and Clay Company are similar firms that operate in the same industry. Clay began operations in 2013 and Roak in 2010. In 2015, both companies pay 7% interest on their debt to creditors. The following additional information is available.

	Roak Company			Clay Company		
	2015	2014	2013	2015	2014	2013
Total asset turnover . . . . .	3.1	2.8	3.0	1.7	1.5	1.1
Return on total assets . . . . .	9.0%	9.6%	8.8%	5.9%	5.6%	5.3%
Profit margin ratio . . . . .	2.4%	2.5%	2.3%	2.8%	3.0%	2.9%
Sales . . . . .	\$410,000	\$380,000	\$396,000	\$210,000	\$170,000	\$110,000

Write a half-page report comparing Roak and Clay using the available information. Your analysis should include their ability to use assets efficiently to produce profits. Also comment on their success in employing financial leverage in 2015.

**Exercise 17-13<sup>A</sup>**  
Income statement categories

In 2015, Randa Merchandising, Inc., sold its interest in a chain of wholesale outlets, taking the company completely out of the wholesaling business. The company still operates its retail outlets. A listing of the major sections of an income statement follows:

- A.** Income (loss) from continuing operations
- B.** Income (loss) from operating, or gain (loss) from disposing, a discontinued segment
- C.** Extraordinary gain (loss)

Indicate where each of the following income-related items for this company appears on its 2015 income statement by writing the letter of the appropriate section in the blank beside each item.

Section	Item	Debit	Credit
_____	1. Net sales . . . . .		\$2,900,000
_____	2. Gain on state’s condemnation of company property (net of tax) . . . . .		230,000
_____	3. Cost of goods sold . . . . .	\$1,480,000	
_____	4. Income taxes expense . . . . .	217,000	
_____	5. Depreciation expense . . . . .	232,500	
_____	6. Gain on sale of wholesale business segment (net of tax) . . . . .		775,000
_____	7. Loss from operating wholesale business segment (net of tax) . . . . .	444,000	
_____	8. Salaries expense . . . . .	640,000	

**Exercise 17-14<sup>A</sup>**  
Income statement presentation **A2**

Use the financial data for Randa Merchandising, Inc., in Exercise 17-13 to prepare its income statement for calendar year 2015. (Ignore the earnings per share section.)

**Nintendo Company, Ltd.**, reports the following financial information as of, or for the year ended, March 31, 2013. Nintendo reports its financial statements in both Japanese yen and U.S. dollars as shown (amounts in millions).

Current assets . . . . .	¥1,192,250	\$12,683,516
Total assets . . . . .	1,447,878	15,402,966
Current liabilities . . . . .	194,475	2,068,887
Net sales . . . . .	635,422	6,759,818
Net income . . . . .	7,099	75,527

1. Compute Nintendo's current ratio, net profit margin, and sales-to-total-assets using the financial information reported in (a) yen and (b) dollars. Round amounts to two decimals.
2. What can we conclude from a review of the results for part 1?

**Exercise 17-15**  
Ratio analysis under different currencies

Selected comparative financial statements of Haroun Company follow.

Total liabilities and equity .....	<u>\$152,390</u>	<u>\$134,424</u>	<u>\$115,698</u>

**Required**

1. Compute each year's current ratio. (Round ratio amounts to one decimal.)
2. Express the income statement data in common-size percents. (Round percents to two decimals.)
3. Express the balance sheet data in trend percents with 2013 as the base year. (Round percents to two decimals.)

**Check** (3) 2015, Total assets trend, 131.71%

**Analysis Component**

4. Comment on any significant relations revealed by the ratios and percents computed.

**Problem 17-3A**

Transactions, working capital, and liquidity ratios

P3

Plum Corporation began the month of May with \$700,000 of current assets, a current ratio of 2.50:1, and an acid-test ratio of 1.10:1. During the month, it completed the following transactions (the company uses a perpetual inventory system).

- May 2 Purchased \$50,000 of merchandise inventory on credit.  
 8 Sold merchandise inventory that cost \$55,000 for \$110,000 cash.  
 10 Collected \$20,000 cash on an account receivable.  
 15 Paid \$22,000 cash to settle an account payable.  
 17 Wrote off a \$5,000 bad debt against the Allowance for Doubtful Accounts account.  
 22 Declared a \$1 per share cash dividend on its 50,000 shares of outstanding common stock.

**Check** May 22: Current ratio, 2.19; Acid-test ratio, 1.11

- 26 Paid the dividend declared on May 22.
- 27 Borrowed \$100,000 cash by giving the bank a 30-day, 10% note.
- 28 Borrowed \$80,000 cash by signing a long-term secured note.
- 29 Used the \$180,000 cash proceeds from the notes to buy new machinery.

May 29: Current ratio, 1.80; Working capital, \$325,000

**Required**

Prepare a table showing Plum’s (1) current ratio, (2) acid-test ratio, and (3) working capital after each transaction. Round ratios to two decimals.

Selected year-end financial statements of Cabot Corporation follow. (All sales were on credit; selected balance sheet amounts at December 31, 2014, were inventory, \$48,900; total assets, \$189,400; common stock, \$90,000; and retained earnings, \$22,748.)

**Problem 17-4A**  
Calculation of financial statement ratios

P3

CABOT CORPORATION Income Statement For Year Ended December 31, 2015	
Sales .....	\$448,600
Cost of goods sold .....	<u>297,250</u>
Gross profit .....	151,350
Operating expenses .....	98,600
Interest expense .....	<u>4,100</u>
Income before taxes .....	48,650
Income taxes .....	<u>19,598</u>
Net income .....	<u>\$ 29,052</u>

CABOT CORPORATION Balance Sheet December 31, 2015			
<b>Assets</b>		<b>Liabilities and Equity</b>	
Cash .....	\$ 10,000	Accounts payable .....	\$ 17,500
Short-term investments .....	8,400	Accrued wages payable .....	3,200
Accounts receivable, net .....	29,200	Income taxes payable .....	3,300
Notes receivable (trade)* .....	4,500	Long-term note payable, secured by mortgage on plant assets .....	63,400
Merchandise inventory .....	32,150	Common stock .....	90,000

			Retained earnings .....	98,300	93,600

**Check** (1) Kyan: Accounts receivable turnover, 14.8; Inventory turnover, 5.3

(2) Barco: Profit margin, 21.1%; PE, 16.6

### Required

- For both companies compute the (a) current ratio, (b) acid-test ratio, (c) accounts (including notes) receivable turnover, (d) inventory turnover, (e) days' sales in inventory, and (f) days' sales uncollected. Identify the company you consider to be the better short-term credit risk and explain why. Round to one decimal place.
- For both companies compute the (a) profit margin ratio, (b) total asset turnover, (c) return on total assets, and (d) return on common stockholders' equity. Assuming that each company's stock can be purchased at \$75 per share, compute their (e) price-earnings ratios and (f) dividend yields. Round to one decimal place. Identify which company's stock you would recommend as the better investment and explain why.

### Problem 17-6A<sup>A</sup>

Income statement computations and format

A2 

Selected account balances from the adjusted trial balance for Olinda Corporation as of its calendar year-end December 31, 2015, follow.

	Debit	Credit
a. Interest revenue .....		\$ 14,000
b. Depreciation expense—Equipment .....	\$ 34,000	
c. Loss on sale of equipment .....	25,850	
d. Accounts payable .....		44,000
e. Other operating expenses .....	106,400	
f. Accumulated depreciation—Equipment .....		71,600
g. Gain from settlement of lawsuit .....		44,000
h. Accumulated depreciation—Buildings .....		174,500
i. Loss from operating a discontinued segment (pretax) .....	18,250	
j. Gain on insurance recovery of tornado damage (pretax and extraordinary) .....		29,120
k. Net sales .....		998,500
l. Depreciation expense—Buildings .....	52,000	
m. Correction of overstatement of prior year's sales (pretax) .....	16,000	
n. Gain on sale of discontinued segment's assets (pretax) .....		34,000
o. Loss from settlement of lawsuit .....	23,750	
p. Income taxes expense .....	?	
q. Cost of goods sold .....	482,500	

**Required**

Answer each of the following questions by providing supporting computations.

1. Assume that the company's income tax rate is 30% for all items. Identify the tax effects and after-tax amounts of the four items labeled pretax.
2. What is the amount of income from continuing operations before income taxes? What is the amount of the income taxes expense? What is the amount of income from continuing operations?
3. What is the total amount of after-tax income (loss) associated with the discontinued segment?
4. What is the amount of income (loss) before the extraordinary items?
5. What is the amount of net income for the year?

**Check** (3) \$11,025  
(4) \$243,425  
(5) \$263,809

**Problem 17-3B**

Transactions, working capital, and liquidity ratios **P3**

**Check** June 3:  
Current ratio, 2.88;  
Acid-test ratio, 2.40

Koto Corporation began the month of June with \$300,000 of current assets, a current ratio of 2.5:1, and an acid-test ratio of 1.4:1. During the month, it completed the following transactions (the company uses a perpetual inventory system).

- June
- 1 Sold merchandise inventory that cost \$75,000 for \$120,000 cash.
  - 3 Collected \$88,000 cash on an account receivable.
  - 5 Purchased \$150,000 of merchandise inventory on credit.
  - 7 Borrowed \$100,000 cash by giving the bank a 60-day, 10% note.
  - 10 Borrowed \$120,000 cash by signing a long-term secured note.
  - 12 Purchased machinery for \$275,000 cash.
  - 15 Declared a \$1 per share cash dividend on its 80,000 shares of outstanding common stock.
  - 19 Wrote off a \$5,000 bad debt against the Allowance for Doubtful Accounts account.
  - 22 Paid \$12,000 cash to settle an account payable.
  - 30 Paid the dividend declared on June 15.

**Required**

Prepare a table showing the company's (1) current ratio, (2) acid-test ratio, and (3) working capital after each transaction. Round ratios to two decimals.

June 30: Working capital, \$(10,000); Current ratio, 0.97

Selected year-end financial statements of Overton Corporation follow. (All sales were on credit; selected balance sheet amounts at December 31, 2014, were inventory, \$17,400; total assets, \$94,900; common stock, \$35,500; and retained earnings, \$18,800.)

**Problem 17-4B**  
Calculation of financial statement ratios  
**P3**

<b>OVERTON CORPORATION</b>	
Income Statement	
For Year Ended December 31, 2015	
Sales .....	\$315,500
Cost of goods sold .....	236,100
Gross profit .....	79,400
Operating expenses .....	49,200
Interest expense .....	2,200
Income before taxes .....	28,000
Income taxes .....	4,200
Net income .....	<u>\$ 23,800</u>

<b>OVERTON CORPORATION</b>			
Balance Sheet			
December 31, 2015			
<b>Assets</b>		<b>Liabilities and Equity</b>	
Cash .....	\$ 6,100	Accounts payable .....	\$ 11,500
Short-term investments .....	6,900	Accrued wages payable .....	3,300
Accounts receivable, net .....	12,100	Income taxes payable .....	2,600
Notes receivable (trade)* .....	3,000	Long-term note payable, secured by mortgage on plant assets .....	30,000
Merchandise inventory .....	13,500	Common stock, \$5 par value .....	35,000
Prepaid expenses .....	2,000	Retained earnings .....	35,100
Plant assets, net .....	<u>73,900</u>	Total liabilities and equity .....	<u>\$117,500</u>
Total assets .....	<u>\$117,500</u>		

\* These are short-term notes receivable arising from customer (trade) sales.

**Required**

Compute the following: (1) current ratio, (2) acid-test ratio, (3) days' sales uncollected, (4) inventory turnover, (5) days' sales in inventory, (6) debt-to-equity ratio, (7) times interest earned, (8) profit margin ratio, (9) total asset turnover, (10) return on total assets, and (11) return on common stockholders' equity. Round to one decimal place; for part 6, round to two decimals.

**Check** Acid-test ratio, 1.6 to 1; Inventory turnover, 15.3

Summary information from the financial statements of two companies competing in the same industry follows.

**Problem 17-5B**  
Comparative ratio analysis **A1 P3**

	Fargo Company	Ball Company		Fargo Company	Ball Company
<b>Data from the current year-end balance sheets</b>			<b>Data from the current year's income statement</b>		
<b>Assets</b>			Sales .....		
Cash .....	\$ 20,000	\$ 36,500	Cost of goods sold .....	290,600	480,000
Accounts receivable, net .....	77,100	70,500	Interest expense .....	5,900	12,300
Current notes receivable (trade) ...	11,600	9,000	Income tax expense .....	5,700	12,300
Merchandise inventory .....	86,800	82,000	Net income .....	33,850	61,700
Prepaid expenses .....	9,700	10,100	Basic earnings per share .....	1.27	2.19
Plant assets, net .....	<u>176,900</u>	<u>252,300</u>			
Total assets .....	<u>\$382,100</u>	<u>\$460,400</u>	<b>Beginning-of-year balance sheet data</b>		
<b>Liabilities and Equity</b>			Accounts receivable, net .....	\$ 72,200	\$ 73,300
Current liabilities .....	\$ 90,500	\$ 97,000	Current notes receivable (trade) ...	0	0
Long-term notes payable .....	93,000	93,300	Merchandise inventory .....	105,100	80,500
Common stock, \$5 par value .....	133,000	141,000	Total assets .....	383,400	443,000
Retained earnings .....	<u>65,600</u>	<u>129,100</u>	Common stock, \$5 par value .....	133,000	141,000
Total liabilities and equity .....	<u>\$382,100</u>	<u>\$460,400</u>	Retained earnings .....	49,100	109,700

**Check** (1) Fargo: Accounts receivable turnover, 4.9; Inventory turnover, 3.0

(2) Ball: Profit margin, 9.2%; PE, 11.4

### Required

- For both companies compute the (a) current ratio, (b) acid-test ratio, (c) accounts (including notes) receivable turnover, (d) inventory turnover, (e) days' sales in inventory, and (f) days' sales uncollected. Identify the company you consider to be the better short-term credit risk and explain why. Round to one decimal place.
- For both companies compute the (a) profit margin ratio, (b) total asset turnover, (c) return on total assets, and (d) return on common stockholders' equity. Assuming that each company paid cash dividends of \$1.50 per share and each company's stock can be purchased at \$25 per share, compute their (e) price-earnings ratios and (f) dividend yields. Round to one decimal place; for part b, round to two decimals. Identify which company's stock you would recommend as the better investment and explain why.

### Problem 17-6B<sup>A</sup>

Income statement computations and format

Selected account balances from the adjusted trial balance for Harbor Corp. as of its calendar year-end December 31, 2015, follow.

	Debit	Credit
a. Accumulated depreciation—Buildings		\$ 400,000
b. Interest revenue		20,000
c. Net sales		2,640,000
d. Income taxes expense	\$ ?	
e. Loss on hurricane damage (pretax and extraordinary)	64,000	
f. Accumulated depreciation—Equipment		220,000
g. Other operating expenses	328,000	
h. Depreciation expense—Equipment	100,000	
i. Loss from settlement of lawsuit	36,000	
j. Gain from settlement of lawsuit		68,000
k. Loss on sale of equipment	24,000	
l. Loss from operating a discontinued segment (pretax)	120,000	
m. Depreciation expense—Buildings	156,000	
n. Correction of overstatement of prior year's expense (pretax)		48,000
o. Cost of goods sold	1,040,000	
p. Loss on sale of discontinued segment's assets (pretax)	180,000	
q. Accounts payable		132,000

### Required

Answer each of the following questions by providing supporting computations.

- Assume that the company's income tax rate is 25% for all items. Identify the tax effects and after-tax amounts of the four items labeled pretax.
- What is the amount of income from continuing operations before income taxes? What is the amount of income taxes expense? What is the amount of income from continuing operations?
- What is the total amount of after-tax income (loss) associated with the discontinued segment?
- What is the amount of income (loss) before the extraordinary items?
- What is the amount of net income for the year?

**Check** (3) \$(225,000)  
(4) \$558,000  
(5) \$510,000

### SERIAL PROBLEM

Business Solutions

P3

(This serial problem began in Chapter 1 and continues through most of the book. If previous chapter segments were not completed, the serial problem can begin at this point. It is helpful, but not necessary, to use the Working Papers that accompany the book.)

**SP 17** Use the following selected data from Business Solutions's income statement for the three months ended March 31, 2016, and from its March 31, 2016, balance sheet to complete the requirements below: computer services revenue, \$25,307; net sales (of goods), \$18,693; total sales and revenue, \$44,000; cost of goods sold, \$14,052; net income, \$18,833; quick assets, \$90,924; current assets, \$95,568; total assets, \$120,268; current liabilities, \$875; total liabilities, \$875; and total equity, \$119,393.

### Required

- Compute the gross margin ratio (both with and without services revenue) and net profit margin ratio (round the percent to one decimal).
- Compute the current ratio and acid-test ratio (round to one decimal).
- Compute the debt ratio and equity ratio (round the percent to one decimal).
- What percent of its assets are current? What percent are long term (round the percent to one decimal)?

## Beyond the Numbers

**BTN 17-1** Refer to **Apple's** financial statements in Appendix A to answer the following.

- Using fiscal 2011 as the base year, compute trend percents for fiscal years 2011, 2012, and 2013 for net sales, cost of sales, operating income, other income (expense) net, provision for income taxes, and net income. (Round percents to one decimal.)
- Compute common-size percents for fiscal years 2012 and 2013 for the following categories of assets: (a) total current assets, (b) property, plant and equipment, net, and (c) goodwill plus acquired intangible assets, net. (Round percents to one decimal.)
- Comment on any notable changes across the years for the income statement trends computed in part 1 and the balance sheet percents computed in part 2.

### Fast Forward

- Access Apple's financial statements for fiscal years ending after September 28, 2013, from its website ([Apple.com](http://Apple.com)) or the SEC database ([www.SEC.gov](http://www.SEC.gov)). Update your work for parts 1, 2, and 3 using the new information accessed.

## REPORTING IN ACTION

A1 P1 P2

## APPLE

**BTN 17-2** Key figures for **Apple** and **Google** follow.

(\$ millions)	Apple	Google
Cash and equivalents . . . . .	\$ 14,259	\$18,898
Accounts receivable, net . . . . .	13,102	8,882
Inventories . . . . .	1,764	426
Retained earnings . . . . .	104,256	61,262
Cost of sales . . . . .	106,606	25,858
Revenues . . . . .	170,910	59,825
Total assets . . . . .	207,000	110,920

## COMPARATIVE ANALYSIS

C2 P2

## APPLE GOOGLE

### Required

- Compute common-size percents for each of the companies using the data provided. (Round percents to one decimal.)
- Which company retains a higher portion of cumulative net income in the company?
- Which company has a higher gross margin ratio on sales?
- Which company holds a higher percent of its total assets as inventory?

**BTN 17-3** As Beacon Company controller, you are responsible for informing the board of directors about its financial activities. At the board meeting, you present the following information.

	2015	2014	2013
Sales trend percent . . . . .	147.0%	135.0%	100.0%
Selling expenses to sales . . . . .	10.1%	14.0%	15.6%
Sales to plant assets ratio . . . . .	3.8 to 1	3.6 to 1	3.3 to 1
Current ratio . . . . .	2.9 to 1	2.7 to 1	2.4 to 1
Acid-test ratio . . . . .	1.1 to 1	1.4 to 1	1.5 to 1
Inventory turnover . . . . .	7.8 times	9.0 times	10.2 times
Accounts receivable turnover . . . . .	7.0 times	7.7 times	8.5 times
Total asset turnover . . . . .	2.9 times	2.9 times	3.3 times
Return on total assets . . . . .	10.4%	11.0%	13.2%
Return on stockholders' equity . . . . .	10.7%	11.5%	14.1%
Profit margin ratio . . . . .	3.6%	3.8%	4.0%

## ETHICS CHALLENGE

A1

After the meeting, the company's CEO holds a press conference with analysts in which she mentions the following ratios.

	2015	2014	2013
Sales trend percent . . . . .	147.0%	135.0%	100.0%
Selling expenses to sales . . . . .	10.1%	14.0%	15.6%
Sales to plant assets ratio . . . . .	3.8 to 1	3.6 to 1	3.3 to 1
Current ratio . . . . .	2.9 to 1	2.7 to 1	2.4 to 1

### Required

1. Why do you think the CEO decided to report 4 ratios instead of the 11 prepared?
2. Comment on the possible consequences of the CEO's reporting of the ratios selected.

## COMMUNICATING IN PRACTICE

A1 P3

**BTN 17-4** Each team is to select a different industry, and each team member is to select a different company in that industry and acquire its financial statements. Use those statements to analyze the company, including at least one ratio from each of the four building blocks of analysis. When necessary, use the financial press to determine the market price of its stock. Communicate with teammates via a meeting, e-mail, or telephone to discuss how different companies compare to each other and to industry norms. The team is to prepare a single one-page memorandum reporting on its analysis and the conclusions reached.

## TAKING IT TO THE NET

P3

**BTN 17-5** Access the February 21, 2014, filing of the December 31, 2013, 10-K report of **The Hershey Company** (ticker HSY) at [www.SEC.gov](http://www.SEC.gov) and complete the following requirements.

### Required

Compute or identify the following profitability ratios of Hershey for its years ending December 31, 2013, and December 31, 2012. Interpret its profitability using the results obtained for these two years.

1. Profit margin ratio (round the percent to one decimal).
2. Gross profit ratio (round the percent to one decimal).
3. Return on total assets (round the percent to one decimal). (Total assets at year-end 2011 were \$4,407,094 in thousands.)
4. Return on common stockholders' equity (round the percent to one decimal). (Total shareholders' equity at year-end 2011 was \$880,943 in thousands.)
5. Basic net income per common share (round to the nearest cent).

## TEAMWORK IN ACTION

P1 P2 P3

**Hint:** Pairing within teams may be necessary for part 2. Use as an in-class activity or as an assignment. Consider presentations to the entire class using team rotation with transparencies.

**BTN 17-6** A team approach to learning financial statement analysis is often useful.

### Required

1. Each team should write a description of horizontal and vertical analysis that all team members agree with and understand. Illustrate each description with an example.
2. *Each* member of the team is to select *one* of the following categories of ratio analysis. Explain what the ratios in that category measure. Choose one ratio from the category selected, present its formula, and explain what it measures.
  - a. Liquidity and efficiency
  - b. Solvency
  - c. Profitability
  - d. Market prospects
3. Each team member is to present his or her notes from part 2 to teammates. Team members are to confirm or correct other teammates' presentations.

## ENTREPRENEURIAL DECISION

A1 P1 P2 P3

**BTN 17-7** Assume that David and Tom Gardner of **The Motley Fool (Fool.com)** have impressed you since you first heard of their rather improbable rise to prominence in financial circles. You learn of a staff opening at The Motley Fool and decide to apply for it. Your resume is successfully screened from the thousands received and you advance to the interview process. You learn that the interview consists of analyzing the following financial facts and answering analysis questions below. (The data are taken from a small merchandiser in outdoor recreational equipment.)

	2015	2014	2013
Sales trend percents .....	137.0%	125.0%	100.0%
Selling expenses to sales .....	9.8%	13.7%	15.3%
Sales to plant assets ratio .....	3.5 to 1	3.3 to 1	3.0 to 1
Current ratio .....	2.6 to 1	2.4 to 1	2.1 to 1
Acid-test ratio .....	0.8 to 1	1.1 to 1	1.2 to 1
Merchandise inventory turnover .....	7.5 times	8.7 times	9.9 times
Accounts receivable turnover .....	6.7 times	7.4 times	8.2 times
Total asset turnover .....	2.6 times	2.6 times	3.0 times
Return on total assets .....	8.8%	9.4%	11.1%
Return on equity .....	9.75%	11.50%	12.25%
Profit margin ratio .....	3.3%	3.5%	3.7%

**Required**

Use these data to answer each of the following questions with explanations.

1. Is it becoming easier for the company to meet its current liabilities on time and to take advantage of any available cash discounts? Explain.
2. Is the company collecting its accounts receivable more rapidly? Explain.
3. Is the company's investment in accounts receivable decreasing? Explain.
4. Is the company's investment in plant assets increasing? Explain.
5. Is the owner's investment becoming more profitable? Explain.
6. Did the dollar amount of selling expenses decrease during the three-year period? Explain.

**BTN 17-8** You are to devise an investment strategy to enable you to accumulate \$1,000,000 by age 65. Start by making some assumptions about your salary. Next compute the percent of your salary that you will be able to save each year. If you will receive any lump-sum monies, include those amounts in your calculations. Historically, stocks have delivered average annual returns of 10–11%. Given this history, you should probably not assume that you will earn above 10% on the money you invest. It is not necessary to specify exactly what types of assets you will buy for your investments; just assume a rate you expect to earn. Use the future value tables in Appendix B to calculate how your savings will grow. Experiment a bit with your figures to see how much less you have to save if you start at, for example, age 25 versus age 35 or 40. (For this assignment, do not include inflation in your calculations.)

**HITTING THE ROAD**

C1 P3

**BTN 17-9** **Samsung** ([www.Samsung.com](http://www.Samsung.com)), which is a leading manufacturer of consumer electronic products, along with **Apple** and **Google**, are competitors in the global marketplace. Key figures for Samsung follow (in KRW millions).

Cash and equivalents .....	₩ 16,284,780	Cost of sales .....	₩137,696,309
Accounts receivable, net .....	27,875,934	Revenues .....	228,692,667
Inventories .....	19,134,868	Total assets .....	214,075,018
Retained earnings .....	148,600,282		

**GLOBAL DECISION**

**Samsung**  
**APPLE**  
**GOOGLE**

**Required**

1. Compute common-size percents for Samsung using the data provided. (Round percents to one decimal.)
2. Compare the results with Apple and Google from BTN 17-2.

**ANSWERS TO MULTIPLE CHOICE QUIZ**

1. d;  $(\$351,000/\$300,000) \times 100 = 117\%$
2. e;  $(\$86,000 + \$76,000 + \$122,000 + \$12,000)/\$124,000 = 2.39$
3. c;  $(\$86,000 + \$76,000)/\$124,000 = 1.31$
4. a;  $(\$124,000 + \$90,000)/\$830,000 = 25.78\%$
5. d;  $(\$300,000 + \$316,000)/\$830,000 = 74.22\%$

# 18

chapter

# Managerial Accounting Concepts and Principles

## Chapter Preview

### MANAGERIAL ACCOUNTING BASICS

- C1** Purpose of managerial accounting
- Nature of managerial accounting
- Managerial decisions
- Fraud and ethics in managerial accounting

### MANAGERIAL COST CONCEPTS

- C2** Types of cost classifications
- C3** Identification of cost classifications
- Cost concepts for service companies

### REPORTING

- C4** Manufacturer costs
- Balance sheet
- P1** Income statement
- C5** Flow of activities
- P2** Schedule of cost of goods manufactured
- C6** Managerial accounting trends
- A1** Inventory analysis

## Learning Objectives

### CONCEPTUAL

- C1** Explain the purpose and nature of, and the role of ethics in, managerial accounting.
- C2** Describe accounting concepts useful in classifying costs.
- C3** Define product and period costs and explain how they impact financial statements.

- C4** Explain how balance sheets and income statements for manufacturing, merchandising, and service companies differ.
- C5** Explain manufacturing activities and the flow of manufacturing costs.
- C6** Describe trends in managerial accounting.

### ANALYTICAL

- A1** Assess raw materials inventory management using raw materials inventory turnover and days' sales in raw materials inventory.

### PROCEDURAL

- P1** Compute cost of goods sold for a manufacturer and for a merchandiser.
- P2** Prepare a schedule of cost of goods manufactured and explain its purpose and links to financial statements.

## Follow the Sun

CALGARY, CANADA—As a child, Eden Full experimented with solar electricity, starting with a desktop solar car she built from a kit as a 10-year-old. In high school, Eden tinkered with how to arrange solar panels to generate the most electricity. “I found that to get the most electricity, you have to face your solar panels toward the sun,” says Eden. Thus was born the SunSaluter, Eden’s invention that uses a water filtration system to automatically rotate solar panels to follow the sun’s path each day.

Like most successful entrepreneurs, Eden is finding success by creating a niche. While solar tracking is not a novel idea, Eden notes that “solar trackers can be expensive, many require electricity, and they often involve complex mechanisms prone to failure. A lot of technologies fail simply because they are too complicated.” Because Eden’s product does not use electricity, and it creates clean filtered water while it also produces solar electricity, its use has great potential benefit in developing countries. “When I realized I could invent a technology for social good, I fell in love with tinkering with something that mattered,” she says.

With her product and a desire to change the world, Eden started her company, **SunSaluter**. Though still small, her company generates enough revenue to cover its costs. Eden

stresses it is good to start a business when one is young. Risk is low, and “if the owners are passionate about their idea, someone will provide financing.” In addition to passion and seed money, aspiring entrepreneurs need to understand basic

*“If it’s beneficial and sustainable, you have to keep pushing”*

—Eden Full

managerial principles, cost classifications, and cost flows. Managerial accounting information enables Eden to plan and control costs and make good decisions. But, as Eden notes, “innovators must execute what they plan to do,” and information on costs can help owners see if their plans are working.

Eden notes that it took her a while to “understand how to develop a realistic product with market potential.” While financial success ultimately rests on monitoring and controlling operations, Eden measures success by more than just profits. “Anything that provides economic value should have a positive social impact,” claims Eden. “You have to think about long-term returns.” Eden offers sound advice for aspiring entrepreneurs: “Find your passion. But, no matter what your dream is, there will be tough days. Don’t give up.” And, of course, follow the sun.

## MANAGERIAL ACCOUNTING BASICS

**Managerial accounting** is an activity that provides financial and nonfinancial information to an organization's managers. Managers include, for example, employees in charge of a company's divisions; the heads of marketing, information technology, and human resources; and top-level managers such as the chief executive officer (CEO) and chief financial officer (CFO). To do their jobs, such managers need more than just the general-purpose financial statements provided by the financial accounting system. This section explains the purpose of managerial accounting (also called *management accounting*) and compares it with financial accounting.

### Purpose of Managerial Accounting

#### C1

Explain the purpose and nature of, and the role of ethics in, managerial accounting.

The purpose of managerial accounting is to provide useful information to managers of an organization. Managerial accounting helps managers with three key tasks: (1) determining the costs of an organization's products and services, (2) planning future activities, and (3) comparing actual results to planned results. For example, managerial accounting information can help the marketing manager decide whether to advertise on social media such as **Twitter**; it also can help the information technology manager decide whether to buy new computers. Managerial accounting information also helps the CEO decide which divisions to expand and which to eliminate.

**Point:** Costs are important to managers because they impact both the financial position and profitability of a business. Managerial accounting assists in analysis, planning, and control of costs.

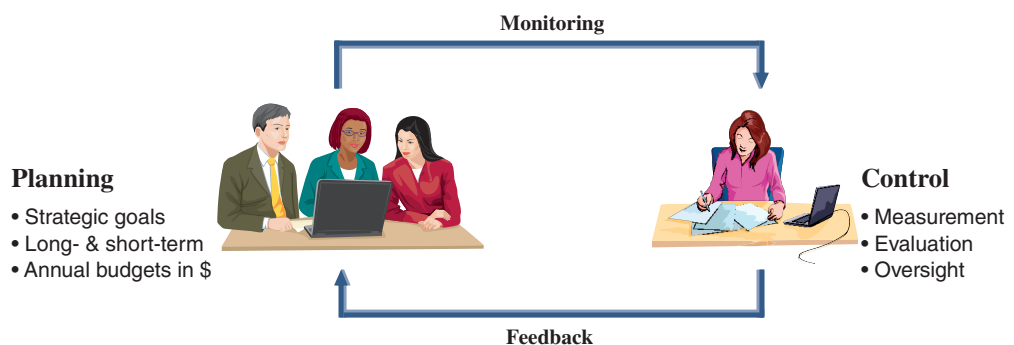

The remainder of this book looks carefully at how managerial accounting information is gathered and how managers use it. We begin by showing how the managerial accounting system collects cost information and assigns it to an organization's products and services. Information about such costs is important for many decisions that managers make, such as predicting the future costs of a product or service. Predicted costs are used in product pricing, profitability analysis, and in deciding whether to make or buy a product or component. More generally, much of managerial accounting involves gathering information about costs for planning and control decisions.

**Planning** is the process of setting goals and making plans to achieve them. Companies make long-term strategic plans that usually span a 5- to 10-year horizon. Strategic plans usually set a firm's long-term direction based on opportunities such as new products, new markets, and capital investments. A strategic plan's goals and objectives are broadly defined given its long-term orientation. With long-term plans in place, companies then set short-term plans, which are more operational in nature. Short-term plans translate the strategic plan into actions, and they are more concrete and consist of better-defined objectives and goals. A short-term plan often covers a one-year period that, when translated in monetary terms, is known as a budget.

**Control** is the process of monitoring planning decisions and evaluating an organization's activities and employees. It includes the measurement and evaluation of actions, processes, and outcomes. Feedback provided by the control function allows managers to revise their plans. Measurement of actions and processes also allows managers to take corrective actions to obtain better outcomes. For example, managers periodically compare actual results with planned results. Exhibit 18.1 portrays the important management functions of planning and control. In later chapters, we explain how managers also use this information to direct and improve business operations.

### EXHIBIT 18.1

Planning and Control  
(including monitoring and feedback)

## Nature of Managerial Accounting

Managerial accounting differs from financial accounting. We discuss seven key differences in this section, as summarized in Exhibit 18.2.

### EXHIBIT 18.2

Key Differences between Managerial Accounting and Financial Accounting

	Financial Accounting	Managerial Accounting
1. Users	External: Investors, creditors, and others outside of the managers of the organization	Internal: Managers, employees, and decision makers inside the organization
2. Purpose of information	Help external users make investment, credit, and other decisions	Help managers make planning and control decisions
3. Flexibility of reporting	Structured and often controlled by GAAP	Relatively flexible (no GAAP constraints)
4. Timeliness of information	Often available only after an audit is complete	Available quickly without the need to wait for an audit
5. Time dimension	The past; historical information with some predictions	The future; many projections and estimates, with some historical information
6. Focus of information	The whole organization	An organization's projects, processes, and divisions
7. Nature of information	Monetary information	Mostly monetary; but also nonmonetary information

**Users and Decision Makers** Companies accumulate, process, and report financial accounting and managerial accounting information for different groups of decision makers. Financial accounting information is provided primarily to external users including investors, creditors, analysts, and regulators. External users rarely have a major role in managing a company's daily activities. Managerial accounting information, in contrast, is provided primarily to internal users who are responsible for making and implementing decisions about a company's business activities.

**Purpose of Information** Investors, creditors, and other external users of financial accounting information must often decide whether to invest in or lend to a company. If they have already done so, they must decide whether to continue owning the company or carrying the loan. Internal decision makers must plan a company's future. They seek to take advantage of opportunities or to overcome obstacles. They also try to control activities. Managerial accounting information helps internal users make both planning and control decisions.

**Flexibility of Practice** External users compare companies by using financial reports, and they need protection against false or misleading information. Thus, financial accounting relies on accepted principles that are enforced through an extensive set of rules and guidelines, or GAAP. Internal users need managerial accounting information for planning and controlling their company's activities rather than for external comparisons. Internal users require different types of information, depending on the activity and the type of organization. Thus, managerial accounting systems are flexible and differ across companies. The design of a company's managerial accounting system depends largely on the nature of the business and the arrangement of its internal operations. Managers can decide for themselves what information they want and how they want it reported. Even within a single company, different managers often design their own systems to meet their special needs. The important question a manager must ask is whether the information being collected and reported is useful for planning, decision making, and control purposes.

**Point:** It is desirable to accumulate certain information for management reports in a database separate from financial accounting records.

**Point:** The Institute of Management Accountants issues statements that govern the practice of managerial accounting. Accountants who pass a qualifying exam are awarded the CMA.

**Point:** Financial statements are usually issued several weeks after the period-end. GAAP requires the reporting of important events that occur while the statements are being prepared. These events are called *subsequent events*.

**Timeliness of Information** Formal financial statements reporting past transactions and events are not immediately available to outside parties. Independent certified public accountants often must *audit* a company's financial statements before providing them to external users. Thus, because audits often take several weeks to complete, financial reports to outsiders usually are not available until well after the period-end. However, managers can quickly obtain managerial accounting information. External auditors need not review it. Estimates and projections are acceptable. To get information quickly, managers often accept less precision in reports. As an example, an early internal report to management prepared right after the year-end could report net income for the year between \$4.2 and \$4.8 million. An audited income statement could later show net income for the year at \$4.6 million. The internal report is not precise, but its information can be more useful because it is available earlier.

*Internal auditing* plays an important role in managerial accounting. Internal auditors evaluate the flow of information not only inside but also outside the company. Managers are responsible for preventing and detecting fraudulent activities in their companies.

**Time Dimension** To protect external users from false expectations, financial reports deal primarily with results of both past activities and current conditions. While some predictions such as service lives and salvage values of plant assets are necessary, financial accounting avoids predictions whenever possible. In contrast, managerial accounting regularly includes predictions of conditions and events. As an example, one important managerial accounting report is a budget, which predicts revenues, expenses, and other items. If managerial accounting reports were restricted to the past and present, managers would be less able to plan activities and less effective in managing and evaluating current activities.

### EXHIBIT 18.3

Focus of External Reports

Reports to external users focus on company as a whole

**Focus of Information** Companies often organize into divisions and departments, but investors rarely can buy shares in one division or department. Nor do creditors lend money to a company's single division or department. Instead, they own shares in or make loans to the entire company. Financial accounting focuses primarily on a company as a whole as depicted in Exhibit 18.3.

The focus of managerial accounting is different. While top-level managers are responsible for managing the whole company, most other managers are responsible for much smaller sets of activities. These middle-level and lower-level managers need managerial accounting reports dealing with specific activities, projects, and subdivisions for which they are responsible. For instance, division sales managers are directly responsible only for the results achieved in their divisions. Accordingly, to improve performance, they need only information about results achieved in their own divisions. This information includes the level of success achieved by each individual, product, or department in each division of the whole company as depicted in Exhibit 18.4.

### EXHIBIT 18.4

Focus of Internal Reports

Reports to internal users focus on company units and divisions

**Nature of Information** Both financial and managerial accounting systems report monetary information. Managerial accounting systems also report considerable nonmonetary information. Monetary information is an important part of managerial decisions, and nonmonetary information also plays a crucial role, especially when monetary effects are difficult to measure. Common examples of nonmonetary information include customer and employee satisfaction data, the percentage of on-time deliveries, and product defect rates.

## Managerial Decision Making

Although there are differences between financial and managerial accounting, the two are not entirely separate. Some similar information is useful to both external and internal users. For instance, information about costs of manufacturing products is useful to all users in making decisions. Also, both financial and managerial accounting affect people's actions. For example, **Trek's** sales compensation plan affects the behavior of its salesforce when selling its

James Startt/Agence Zoom/Getty Images

manufactured bikes. Trek also must estimate the effects of promotions on buying patterns of customers. These estimates impact the equipment purchase decisions for manufacturing and can affect the supplier selection criteria established by purchasing. Thus, financial and managerial accounting systems do more than measure; they also affect people's decisions and actions.

## Fraud and Ethics in Managerial Accounting

Fraud, and the role of ethics in reducing fraud, are important factors in running business operations. Fraud involves the use of one's job for personal gain through the deliberate misuse of the employer's assets. Examples include theft of the employer's cash or other assets, overstating reimbursable expenses, payroll schemes, and financial statement fraud. Three factors must exist for a person to commit fraud: opportunity, financial pressure, and rationalization. This is known as the *fraud triangle*. Fraud affects all business and it is costly: A 2014 *Report to the Nation* from the Association of Certified Fraud Examiners (ACFE) estimates the average U.S. business loses 5% of its annual revenues to fraud.

The most common type of fraud, where employees steal or misuse the employer's resources, results in an average loss of \$130,000 per occurrence. For example, in a billing fraud, an employee sets up a bogus supplier. The employee then prepares bills from the supplier and pays these bills from the employer's checking account. The employee cashes the checks sent to the bogus supplier and uses them for his or her own personal benefit. An organization's best chance to minimize fraud is through reducing opportunities for employees to commit fraud.

**Implications for Managerial Accounting** Fraud increases a business's costs, and an important goal of managerial accounting is accurate cost information. Left undetected, inflated costs can result in poor pricing decisions, an improper product mix, and faulty performance evaluations. All of these can lead to poor financial results for the company. Management can develop accounting systems to closely track costs and identify deviations from expected amounts. In addition, managers rely on an **internal control system** to monitor and control business activities. An internal control system is the policies and procedures managers use to:

- Ensure reliable accounting.
- Urge adherence to company policies.
- Protect assets.
- Promote efficient operations.

Combating fraud and other dilemmas requires ethics in accounting. **Ethics** are beliefs that distinguish right from wrong. They are accepted standards of good and bad behavior. Identifying the ethical path can be difficult. The **Institute of Management Accountants (IMA)**, the professional association for management accountants, has issued a code of ethics to help accountants involved in solving ethical dilemmas. The IMA's Statement of Ethical Professional Practice requires that management accountants be competent, maintain confidentiality, act with integrity, and communicate information in a fair and credible manner.

The IMA provides a "road map" for resolving ethical conflicts. It suggests that an employee follow the company's policies on how to resolve such conflicts. If the conflict remains unresolved, an employee should contact the next level of management (such as the immediate supervisor) who is not involved in the ethical conflict.

**Point:** The IMA also issues the Certified Management Accountant (CMA) and the Certified Financial Manager (CFM) certifications. Employees with the CMA or CFM certifications typically earn higher salaries than those without.

**Point:** The Sarbanes-Oxley Act requires each issuer of securities to disclose whether it has adopted a code of ethics for its senior officers and the content of that code.

## Decision Ethics

**Production Manager** You invite three friends to a restaurant. When the dinner check arrives, David, a self-employed entrepreneur, picks it up saying, "Here, let me pay. I'll deduct it as a business expense on my tax return." Denise, a salesperson, takes the check from David's hand and says, "I'll put this on my company's credit card. It won't cost us anything." Derek, a factory manager for a company, laughs and says, "Neither of you understands. I'll put this on my company's credit card and call it overhead on a cost-plus contract my company has with a client." (*A cost-plus contract means the company receives its costs plus a percent of those costs.*) Adds Derek, "That way, my company pays for dinner *and* makes a profit." Who should pay the bill? Why? ■ [Answers follow the chapter's Summary.]

## MANAGERIAL COST CONCEPTS

### C2

Describe accounting concepts useful in classifying costs.

Because managers use costs for many different purposes, organizations classify costs in different ways (that is, different costs for different purposes). This section explains common ways to classify costs and links them to managerial decisions. We illustrate these cost classifications with Rocky Mountain Bikes, a manufacturer of bicycles.

### Types of Cost Classifications

**Fixed versus Variable** At a basic level, a cost can be classified by how it behaves with changes in the volume of activity. Thus, a cost can be classified as fixed or variable. A **fixed cost** does not change with changes in the volume of activity (within a range of activity known as an activity's *relevant range*). For example, straight-line depreciation on equipment is a fixed cost. A **variable cost** changes in proportion to changes in the volume of activity. Sales commissions computed as a percent of sales revenue are variable costs. Additional examples of fixed and variable costs for a bike manufacturer are provided in Exhibit 18.5. Classification of costs as fixed or variable is helpful in cost-volume-profit analyses and short-term decision making. We discuss these in Chapters 21 and 25.

#### EXHIBIT 18.5

Fixed and Variable Costs

**Fixed Cost:** Rent for Rocky Mountain Bikes' building is \$22,000, and it doesn't change with the number of bikes produced.

**Variable Cost:** Cost of bicycle tires is variable with the number of bikes produced—this cost is \$15 per pair.

**Direct versus Indirect** A cost is often traced to a **cost object**, which is a product, process, department, or customer to which costs are assigned. **Direct costs** are traceable to a single cost object. **Indirect costs** cannot be easily and cost-beneficially traced to a single cost object. Assuming the cost object is a bicycle, Rocky Mountain Bikes will first identify the costs that can be directly traced to bicycles. The direct costs traceable to a bicycle as a cost object would include direct material and direct labor costs used in its production. Such direct costs include wheels, brakes, chains, and seat, plus the wages and benefits of the employees who work directly on making the bike.

What are indirect costs associated with bicycles? One example is the salary of the supervisor. She monitors the production process and other factory activities, but she does not actually work on producing any bikes. Thus, her salary cannot be directly traced to bikes. Likewise, depreciation (other than the units-of-production method) on manufacturing warehouses cannot be traced to individual bikes. Another example is a maintenance department that provides services to two or more departments of a company making bicycles and strollers. If the cost object is the bicycle, the wages of the maintenance department employees who clean the factory area every night would be indirect costs. Exhibit 18.6 identifies more examples of direct and indirect costs when the cost object is a bicycle.

### Decision Maker

**Entrepreneur** You wish to trace as many of your assembly department's direct costs as possible. You can trace 90% of them in an economical manner. To trace the other 10%, you need sophisticated and costly accounting software. Do you purchase this software? ■ [Answers follow the chapter's Summary.]

**Direct Costs (for bicycle)**

- Tires
- Seats
- Handlebars
- Bike maker wages
- Frames
- Chains
- Brakes
- Bike maker benefits

**Indirect Costs (for bicycle)**

- Factory accounting
- Factory administration
- Factory rent
- Factory manager's salary
- Factory light and heat
- Factory intranet
- Insurance on factory
- Factory equipment depreciation\*

\* For all depreciation methods other than units-of-production.

**EXHIBIT 18.6**

Direct and Indirect Costs for a Bicycle

**Product versus Period Costs** All production (or factory) costs are product costs. **Product costs** are those production costs necessary to create a product and consist of: direct materials, direct labor, and factory overhead. Overhead refers to production costs other than direct materials and direct labor. Product costs are capitalized as inventory during and after completion of the products; they are recorded as cost of goods sold when those products are sold.

**Period costs** are non-production costs and are usually more associated with activities linked to a time period than with completed products. Common examples of period costs include salaries of the sales staff, wages of maintenance workers, advertising expenses, and depreciation on office furniture and equipment. Period costs are expensed in the period when incurred either as selling expenses or as general and administrative expenses.

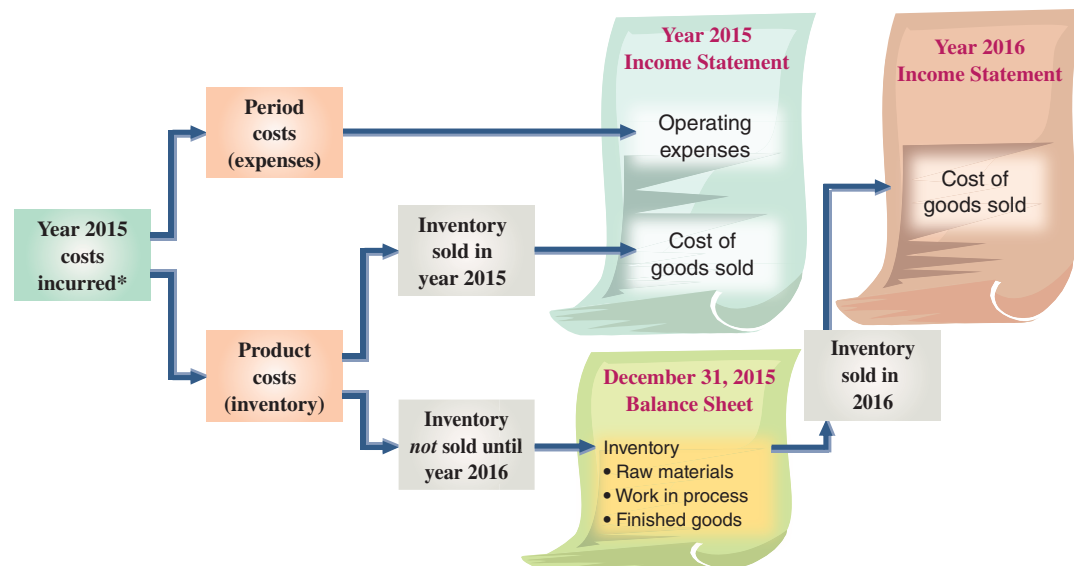

A distinction between product and period costs is important because period costs are expensed when incurred and reported on the income statement whereas product costs are capitalized as inventory on the balance sheet until that inventory is sold. An ability to understand and identify product costs and period costs is crucial to using and interpreting a *schedule of cost of goods manufactured*, described later in this chapter.

Exhibit 18.7 shows the different effects of product and period costs. Period costs flow directly to the current income statement as expenses. They are not reported as assets. Product costs are

**C3**

Define product and period costs and explain how they impact financial statements.

**Point:** Product costs are either in the income statement as part of cost of goods sold or in the balance sheet as inventory. Period costs appear only on the income statement under operating expenses.

**EXHIBIT 18.7**

Period and Product Costs in Financial Statements

**Point:** For a team approach to identifying period and product costs, see *Teamwork in Action* in the *Beyond the Numbers* section.

\* This diagram excludes costs to acquire assets other than inventory.

first assigned to inventory. Their final treatment depends on when inventory is sold or disposed of. Product costs assigned to finished goods that are sold in year 2015 are reported on the 2015 income statement as cost of goods sold. Product costs assigned to unsold inventory are carried forward on the balance sheet at the end of year 2015. If this inventory is sold in year 2016, product costs assigned to it are reported as cost of goods sold in that year’s income statement.

Exhibit 18.8 summarizes typical managerial decisions for common cost classifications.

**EXHIBIT 18.8**

Summary of Cost Classifications and Example Managerial Decisions

**Point:** In subsequent chapters, we discuss some other ways to classify costs. The three cost classifications presented here are the foundation.

Costs Classified As	Example Managerial Decision
Variable or Fixed . . . . .	How many units must we sell to break even? What will profit be if we raise the selling price? Should we add a new line of business?
Direct or Indirect . . . . .	How well did our departments perform?
Product or Period . . . . .	What is the cost of our inventory? Are selling expenses too high?

**Identification of Cost Classifications**

It is important to understand that a cost can be classified using any one (or combination) of the three different means described here. Understanding how to classify costs in several different ways enables managers to use cost information for a variety of decisions. Factory rent, for instance, is classified as a *product* cost; it is *fixed* with respect to the number of units produced, and it is *indirect* with respect to the product. Potential multiple classifications are shown in Exhibit 18.9 using different cost items incurred in manufacturing mountain bikes. The finished bike is the cost object. Proper allocation of these costs and the managerial decisions based on cost data depend on a correct cost classification.

**EXHIBIT 18.9**

Examples of Multiple Cost Classifications

Cost Item	Fixed or Variable	Direct or Indirect	Product or Period
Bicycle tires and wheels . . . . .	Variable	Direct	Product
Wages of assembly worker* . . . . .	Variable	Direct	Product
Advertising . . . . .	Fixed	Indirect	Period
Production manager’s salary . . . . .	Fixed	Indirect	Product
Office depreciation . . . . .	Fixed	Indirect	Period
Factory depreciation (straight-line) . . . . .	Fixed	Indirect	Product
Oil and grease applied to gears/chains** . . . . .	Variable	Indirect	Product
Sales commissions . . . . .	Variable	Indirect	Period

\*In some cases wages can be classified as fixed costs. For example, union contracts might limit an employer’s ability to adjust its labor force in response to changes in demand. In this book, unless told otherwise, assume that factory wages are variable costs.

\*\*Oil and grease are indirect costs as it is not practical to track how much of each is applied to each bike.

**Cost Concepts for Service Companies**

The cost concepts described are generally also applicable to service organizations. For example, consider **Southwest Airlines**, and assume the cost object is a flight. The airline’s cost of beverages for passengers is a variable cost based on number of flights. The monthly cost of leasing an aircraft is fixed with respect to number of flights. We can also trace a flight crew’s salary to a specific flight whereas we likely cannot trace wages for the ground crew to a specific flight. Classification as product versus period costs is not relevant to service companies because services are not inventoried. Instead, costs incurred by a service firm are expensed in the reporting period when incurred.

To be effective, managers in service companies must understand and apply cost concepts. They seek and rely on accurate cost estimates for many decisions. For example, an airline manager must often decide between canceling or rerouting flights. The manager must be able to estimate costs saved by canceling a flight versus rerouting. Knowledge of fixed costs is equally important. We explain more about the cost requirements for these and other managerial decisions later in this book.

Justin Sullivan/Getty Images

**Service Costs**

- Beverages and snacks
- Cleaning fees
- Pilot and copilot salaries
- Attendant salaries
- Fuel and oil costs
- Travel agent fees
- Ground crew salaries

Following are selected costs of a company that manufactures computer chips. Classify each as either a product cost or a period cost. Then classify each of the product costs as direct material, direct labor, or overhead.

1. Plastic boards used to mount chips
2. Advertising costs
3. Factory maintenance workers' salaries
4. Real estate taxes paid on the sales office
5. Real estate taxes paid on the factory
6. Factory supervisor salary
7. Depreciation on factory equipment
8. Assembly worker hourly pay to make chips

7. Depreciation on factory equipment. . . . .			X	
8. Assembly worker hourly pay to make chips. . . . .		X		

**REPORTING**

Companies with manufacturing activities differ from both merchandising and service companies. The main difference between merchandising and manufacturing companies is that merchandisers buy goods ready for sale while manufacturers produce goods from materials and labor. **Amazon.com** is an example of a merchandising company. It buys and sells goods without physically changing them. **Adidas** is primarily a manufacturer of shoes, apparel, and accessories. It purchases materials such as leather, cloth, dye, plastic, rubber, glue, and laces and then uses employees' labor to convert these materials to products. Southwest Airlines is a service company that transports people and items. Some companies have several types of activities. For example, **Best Buy** is a merchandiser that also provides services via its Geek Squad.

The next section discusses costs for manufacturing companies. We then discuss the reporting of activities for manufacturing, merchandising, and service companies. Importantly, as these types of organizations have different kinds of costs and they classify costs in different ways, their accounting reports will also differ in some respects.

**Manufacturers' Costs**

**Direct Materials** Direct materials are tangible components of a finished product. **Direct material costs** are the expenditures for direct materials that are separately and readily traced through the manufacturing process to finished goods. Examples of direct materials in manufacturing a mountain bike include its tires, seat, frame, pedals, brakes, cables, gears, and handlebars. The chart in the margin shows that direct materials generally make up about 45% of manufacturing costs in today's products, but this amount varies across industries and companies.

**Typical Manufacturing Costs in Today's Products**

**Point:** Direct material and direct labor costs increase with increases in production volume and are called *variable costs*. Overhead can be both variable and fixed. When overhead costs vary with production, they are called *variable overhead*. When overhead costs don't vary with production, they are called *fixed overhead*.

**Point:** All factory costs, other than direct materials and direct labor, are classified as Factory Overhead.

**Direct Labor** **Direct labor** refers to the efforts of employees who physically convert materials to finished product. **Direct labor costs** are the wages and salaries for direct labor that are separately and readily traced through the manufacturing process to finished goods. Examples of direct labor in manufacturing a mountain bike include operators directly involved in converting raw materials into finished products (welding, painting, forming) and assembly workers who attach materials such as tires, seats, pedals, and brakes to the bike frames.

**Factory Overhead** **Factory overhead**, also called *manufacturing overhead*, consists of all manufacturing costs that are not direct materials or direct labor. **Factory overhead costs** cannot be separately or readily traced to finished goods. Thus, all factory overhead costs are considered indirect costs. These costs include indirect materials, **indirect labor**, and other costs not directly traceable to the product. **Indirect materials** are materials used in manufacturing and become part of the final product, but they are *not* clearly identified with specific product units. Often, direct materials are classified as indirect materials when their costs are low. Examples include screws and nuts used in assembling mountain bikes, and staples and glue used in manufacturing shoes. Applying the *materiality principle*, companies may decide it does not make economic sense to individually trace costs of each of these materials to individual products. For example, keeping detailed records of the amount of glue used to manufacture one shoe is not cost-beneficial.

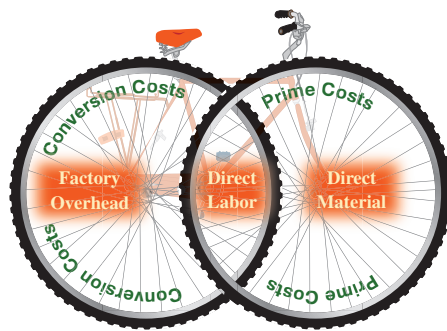

**Indirect labor costs** refer to the costs of workers who assist in or supervise the manufacturing process. Examples include costs for employees who maintain the manufacturing equipment and salaries of production supervisors. Those workers do not assemble products. These costs are not linked to specific units of product, though they are indirectly related to production. Overtime premiums paid to direct laborers are also included in overhead because overtime is due to delays, interruptions, or constraints not necessarily identifiable to a specific product or batches of product.

Factory overhead costs also include maintenance of the mountain bike factory, supervision of its employees, repairing manufacturing equipment, factory utilities (water, gas, electricity), factory manager's salary, factory rent, depreciation on factory buildings and equipment, factory insurance, property taxes on factory buildings and equipment, and factory accounting and legal services. Factory overhead does *not* include selling and administrative expenses because they are not incurred in manufacturing products. These expenses are *period costs*, and they are recorded as expenses on the income statement when incurred.

### EXHIBIT 18.10

Prime and Conversion Costs and Their Makeup

**Prime costs** =  
Direct materials + Direct labor.  
**Conversion costs** =  
Direct labor + Factory overhead.

**Prime and Conversion Costs** Direct material costs and direct labor costs are also called **prime costs**—expenditures directly associated with the manufacture of finished goods. Direct labor costs and overhead costs are called **conversion costs**—expenditures incurred in the process of converting raw materials to finished goods. Direct labor costs are considered both prime costs and conversion costs. Exhibit 18.10 conveys the relation between prime and conversion costs and their components of direct material, direct labor, and factory overhead.

## Balance Sheet

Manufacturers carry several unique assets and usually have three inventories instead of the single inventory that merchandisers carry. The three inventories are raw materials, work in process, and finished goods.

**Raw Materials Inventory** **Raw materials inventory** refers to the goods a company acquires to use in making products. Companies use raw materials in two ways: directly and indirectly. Raw materials that are possible and practical to trace to an end-product are called *direct materials*; they are included in raw materials inventory. Raw materials that are either impossible or impractical to trace to an end-product are classified as indirect materials (such as solder used for welding); they often come from factory supplies or raw materials inventory.

## C4

Explain how balance sheets and income statements for manufacturing, merchandising, and service companies differ.

**Work in Process Inventory** Another inventory held by manufacturers is **work in process inventory**, also called *goods in process inventory*. It consists of products in the process of being manufactured but not yet complete. The amount of work in process inventory depends on the type of production process. If the time required to produce a unit of product is short, the work in process inventory is likely small; but if weeks or months are needed to produce a unit, the work in process inventory is usually larger.

**Finished Goods Inventory** A third inventory owned by a manufacturer is **finished goods inventory**, which consists of completed products ready for sale. This inventory is similar to merchandise inventory owned by a merchandising company.

Marco Prosch/Getty Images

**Balance Sheets for Merchandising and Service Companies** The current assets section of the balance sheet will look different for merchandising and service companies as compared to manufacturing companies. A merchandiser will report only merchandise inventory rather than the three types of inventory reported by a manufacturer. A service company's balance sheet does not have any inventory held for sale. Exhibit 18.11 shows the current assets section of the balance sheet for a manufacturer, a merchandiser, and a service company. Note that the manufacturer, Rocky Mountain Bikes, shows three different inventories. The merchandiser, Tele-Mart, shows one inventory, and the service provider, Northeast Air, shows no inventory of goods for sale.

Manufacturers also often own unique plant assets such as small tools, factory buildings, factory equipment, and patents to manufacture products. Merchandisers and service providers also typically own fixed assets.

### EXHIBIT 18.11

Balance Sheets for  
Manufacturer, Merchandiser,  
and Service Provider

ROCKY MOUNTAIN BIKES Balance Sheet (partial) December 31, 2015	TELE-MART (Merchandiser) Balance Sheet (partial) December 31, 2015	NORTHEAST AIR (Service Provider) Balance Sheet (partial) December 31, 2015
<b>Assets</b>	<b>Assets</b>	<b>Assets</b>

Finished goods inventory . . . 10,300	Prepaid insurance . . . . . 300	Total current assets . . . . . <u>\$41,800</u>
Factory supplies . . . . . 350	Total current assets . . . . . <u>\$62,800</u>	
Prepaid insurance . . . . . 300		
Total current assets . . . . . <u>\$68,600</u>		

## Income Statement

The main difference between the income statement of a manufacturer and that of a merchandiser involves the items making up cost of goods sold. In this section, we look at how manufacturers determine and report cost of goods sold.

**Cost of Goods Sold** In earlier chapters, you studied how merchandisers report cost of goods sold. Exhibit 18.12 compares the components of cost of goods sold for a merchandiser with those for a manufacturer. To determine its cost of goods sold, a *merchandiser* adds cost of goods purchased to beginning merchandise inventory and then subtracts ending merchandise inventory. To determine its cost of goods sold, a *manufacturer* adds cost of goods manufactured to beginning finished goods inventory and then subtracts ending finished goods inventory.

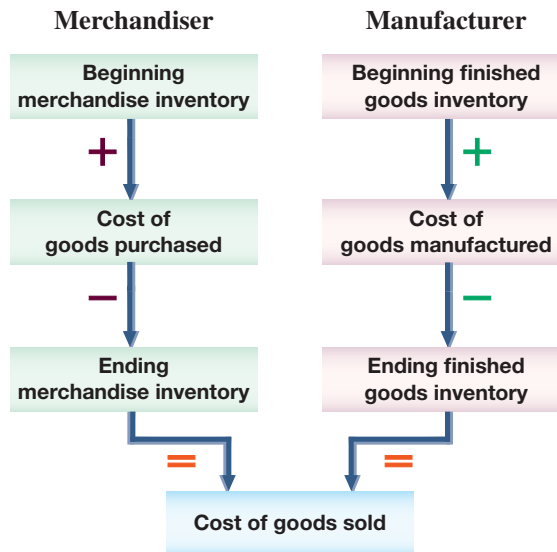

In computing cost of goods sold, a merchandiser uses *merchandise* inventory while a manufacturer uses *finished goods* inventory. A manufacturer's inventories of raw materials and work in process are not included in finished goods because they are not available for

### P1

Compute cost of goods sold for a manufacturer, and for a merchandiser.

**EXHIBIT 18.12**

Cost of Goods Sold Computation

sale. A manufacturer also shows cost of goods *manufactured* instead of cost of goods *purchased*. This difference occurs because a manufacturer produces its goods instead of purchasing them ready for sale. The Cost of Goods Sold sections for both a merchandiser (Tele-Mart) and a manufacturer (Rocky Mountain Bikes) are shown in Exhibit 18.13 to highlight these differences. The remaining income statement sections are similar for merchandisers and manufacturers.

**EXHIBIT 18.13**

Cost of Goods Sold for a Merchandiser and Manufacturer

Merchandising Company (Tele-Mart)		Manufacturing Company (Rocky Mtn. Bikes)	
Cost of goods sold		Cost of goods sold	
<b>Beginning merchandise inventory</b> .....	\$ 14,200	<b>Beginning finished goods inventory</b> .....	\$ 11,200
<b>Cost of merchandise purchased</b> .....	<u>234,150</u>	<b>Cost of goods manufactured*</b> .....	<u>170,500</u>
Goods available for sale .....	248,350	Goods available for sale .....	181,700
<b>Less ending merchandise inventory</b> .....	<u>12,100</u>	<b>Less ending finished goods inventory</b> .....	<u>10,300</u>
Cost of goods sold .....	<u>\$236,250</u>	Cost of goods sold .....	<u>\$171,400</u>

\* Cost of goods manufactured is reported in the income statement of Exhibit 18.14.

Although the cost of goods sold computations are similar, the numbers in these computations reflect different activities. A merchandiser’s cost of goods purchased is the cost of buying products to be sold. A manufacturer’s cost of goods manufactured is the sum of direct materials, direct labor, and factory overhead costs incurred in producing products.

**Income Statement for Service Company** Since a service provider does not make or buy inventory to be sold, it does not report cost of goods manufactured or cost of goods sold. Instead, its operating expenses include all of the costs it incurred in providing its service. Southwest Airlines, for example, reports large operating expenses for employee pay and benefits, fuel and oil, and depreciation.

**Reporting Performance** Exhibit 18.14 shows the income statement for Rocky Mountain Bikes. Its operating expenses include selling expenses and general and administrative expenses, which include salaries for those business functions as well as depreciation for related equipment. Operating expenses do not include manufacturing costs such as factory workers’ wages and depreciation of production equipment and the factory buildings. These manufacturing costs are reported as part of cost of goods manufactured and included in cost of goods sold. This exhibit also shows the income statement for Tele-Mart (merchandiser) and Northeast Air (service provider). Note that Tele-Mart reports *cost of merchandise purchased* instead of cost of goods manufactured. Tele-Mart reports its operating expenses like those of the manufacturing company. Finally, the income statement for Northeast Air shows only operating expenses.

**Point:** Manufacturers treat costs such as depreciation and rent as product costs if they are related to manufacturing.

**EXHIBIT 18.14**

Income Statements for Manufacturer, Merchandiser, and Service Provider

Activities and Cost Flows in Manufacturing

## Flow of Manufacturing Activities

In addition to income statements and balance sheets, manufacturing companies typically prepare additional reports to help managers plan and control the manufacturing process. In order to understand these reports, we must first understand the flow of manufacturing activities and costs. Exhibit 18.15 shows the flow of manufacturing activities and the cost flows of those activities. As you can see (across the top row), the activities flow consists of *materials activity* followed by *production activity* followed by *sales activity*. The boxes below those activities show the costs for each activity and how costs flow across the three manufacturing activities. We explain further in this section.

\* DM = direct materials, IM = indirect materials.

**Point:** Knowledge of managerial accounting provides us a means of measuring manufacturing costs and is a sound foundation for studying advanced business topics.

**Materials Activity** The far left side of Exhibit 18.15 shows the flow of raw materials. Manufacturers usually start a period with some beginning raw materials inventory left over from the previous period. The company then acquires additional raw materials in the current period. Adding these purchases to beginning inventory gives *total raw materials available for use* in production. These raw materials are then either used in production in the current period or remain in inventory at the end of the period for use in future periods.

**Production Activity** The middle section of Exhibit 18.15 describes production activity. Four factors come together in production: beginning work in process inventory, raw materials, direct labor, and overhead. *Beginning work in process inventory* consists of partially complete products from the previous period. To the beginning work in process inventory are added direct materials, direct labor, and manufacturing overhead.

The production activity that takes place in the period from those inputs results in products that are either finished or remain unfinished. The cost of finished products makes up the **cost of goods manufactured** for the current period. The cost of goods manufactured is the total cost of making and finishing products in the period. That amount is included on the income statement in the computation of cost of goods sold, as we showed in Exhibit 18.14. Unfinished products are identified as *ending work in process inventory*. The cost of unfinished products consists of raw materials, direct labor, and factory overhead, and is reported on the current period's balance sheet. The costs of both finished goods manufactured and work in process are *product costs*.

**Sales Activity** The far right side of Exhibit 18.15 shows what happens to the finished goods: The company combines the beginning inventory of finished goods with the newly completed units (goods manufactured). Together, they make up *total finished goods available for sale* in

the current period. These goods now are ready for sales activity. As they are sold, the cost of finished products sold is reported on the income statement as cost of goods sold. The cost of any finished products not sold in the period is reported as a current asset, *finished goods inventory*, on the current period's balance sheet.

### Schedule of Cost of Goods Manufactured

Managers of manufacturing firms typically analyze product costs in detail. Such analysis can help managers make better decisions about materials, labor, and overhead in order to reduce the cost of goods manufactured and maximize the company's profits. A company's manufacturing activities are described in a separate report, called a **schedule of cost of goods manufactured**. (It is also called a *manufacturing statement*, a *statement of cost of goods manufactured*, or a similar term.) By whatever name, the schedule of cost of goods manufactured summarizes the types and amounts of costs incurred in a company's manufacturing process. Exhibit 18.16 shows the schedule of cost of goods manufactured for Rocky Mountain Bikes. The schedule is divided into four parts: *direct materials*, *direct labor*, *overhead*, and *computation of cost of goods manufactured*. The schedule of cost of goods manufactured is completed in the following steps.

- ① Compute direct materials used. Add the beginning raw materials inventory of \$8,000 to the current period's purchases of \$86,500. This yields \$94,500 of total raw materials available for use. A physical count of inventory shows \$9,000 of ending raw materials inventory. If \$94,500 of materials were available for use, and \$9,000 of materials remains in inventory, then \$85,500 of materials were used in the period. (*Note:* All raw materials are direct materials for Rocky Mountain Bikes.)
- ② Compute direct labor costs used. Rocky Mountain Bikes had total direct labor costs of \$60,000 for the period. This amount includes payroll taxes and fringe benefits.

**P2** Prepare a schedule of cost of goods manufactured and explain its purpose and links to financial statements.

Raw Materials Inventory		
Beg. bal.	8,000	
Purch.	86,500	
		Mtls. used 85,500
End. bal.	9,000	

ROCKY MOUNTAIN BIKES		
Schedule of Cost of Goods Manufactured		
For Year Ended December 31, 2015		
①	<b>Direct materials</b>	
	Raw materials inventory, Dec. 31, 2014	\$ 8,000
	Raw materials purchases	86,500
	Raw materials available for use	94,500
	Less raw materials inventory, Dec. 31, 2015	9,000
	Direct materials used	\$ 85,500
②	<b>Direct labor</b>	60,000
③	<b>Factory overhead</b>	
	Indirect labor	9,000
	Factory supervision	6,000
	Factory utilities	2,600

	Total factory overhead	30,000
④	Total manufacturing costs	\$ 175,500
	Add work in process inventory, Dec. 31, 2014	2,500
	Total cost of work in process	178,000
	Less work in process inventory, Dec. 31, 2015	7,500
	<b>Cost of goods manufactured</b>	<b>\$ 170,500</b>

**EXHIBIT 18.16**  
Schedule of Cost of Goods Manufactured

**Point:** Manufacturers sometimes report variable and fixed overhead separately in the schedule of cost of goods manufactured to provide more information to managers about cost behavior.

- ③ Compute total factory overhead costs used. The statement lists each important factory overhead item and its cost. All of these costs are indirectly related to manufacturing activities. In addition, period expenses, such as selling expenses and other costs not related to manufacturing activities, are *not* reported on this statement. Total factory overhead cost for the period is \$30,000. Some companies report only *total* factory overhead on the schedule of cost of goods manufactured and attach a separate schedule listing individual overhead costs.
- ④ Compute the *cost of goods manufactured*. Total manufacturing costs for the period are \$175,500 (\$85,500 + \$60,000 + \$30,000), the sum of direct materials used and direct labor and overhead costs incurred. This amount is added to beginning work in process inventory. This gives the total work in process during the period of \$178,000 (\$175,500 + \$2,500). A physical count shows \$7,500 of work in process inventory remains at the end of the period. We then compute the current period's cost of goods manufactured of \$170,500 by taking the \$178,000 total work in process and subtracting the \$7,500 cost of ending work in process inventory. The cost of goods manufactured amount is also called *net cost of goods manufactured* or *cost of goods completed*.

Work in Process Inventory

**Using the Schedule of Cost of Goods Manufactured** Management uses information in the schedule of cost of goods manufactured to plan and control the company's manufacturing activities. To provide timely information for decision making, the statement is often prepared monthly, weekly, or even daily. In anticipation of release of its much-hyped iPad, **Apple** grew its inventory of critical components, and its finished goods inventory. The schedule of cost of goods manufactured contains information useful to external users, but it is not a general-purpose financial statement. Companies rarely publish this schedule because managers view this information as proprietary and potentially harmful to the company if released to competitors.

**Manufacturing Cost Flows across Accounting Reports** The previous section showed manufacturing activities and cost flows and their reporting in the schedule of cost of goods manufactured. This cost information is also used to complete the financial statements at the end of an accounting period. Exhibit 18.17 summarizes how product costs flow through the accounting system: Direct materials, direct labor, and overhead costs are summarized in the schedule of cost of goods manufactured; then the amount of the cost of goods manufactured from that statement is used to compute cost of goods sold on the income statement. Physical counts determine the dollar amounts of ending raw materials inventory and work in process inventory, and those amounts are included on the end-of-period balance sheet. (*Note:* This exhibit shows only partial reports.)

**EXHIBIT 18.17**

**Trends in Managerial Accounting**

The analytical tools and techniques of managerial accounting have always been useful, and their relevance and importance continue to increase. This is so because of changes in the business environment. This section describes some of these changes and their impact on managerial accounting.

**C6** Describe trends in managerial accounting.

**Customer Orientation** There is an increased emphasis on *customers* as the most important constituent of a business. Customers expect to derive a certain value for the money they spend to buy products and services. Specifically, they expect that their suppliers will offer them the right service (or product) at the right time and the right price. This implies that companies accept the notion of **customer orientation**, which means that employees understand the changing needs and wants of their customers and align their management and operating practices accordingly.

**Global Economy** Our *global economy* expands competitive boundaries and provides customers more choices. The global economy also produces changes in business activities. One notable case that reflects these changes in customer demand and global competition is auto manufacturing. The top three Japanese auto manufacturers (**Honda, Nissan, and Toyota**) once controlled more than 40% of the U.S. auto market. Customers perceived that Japanese auto manufacturers provided value not available from other manufacturers. Many European and North American auto manufacturers responded to this challenge and regained much of the lost market share.

**E-Commerce** People have become increasingly interconnected via smartphones, text messaging, and other electronic applications. Consumers thus expect and demand to be able to buy items electronically, whenever and wherever they want. Many businesses have enhanced their websites to allow for online transactions. Online sales now make up about 6% of total retail sales.

**Point:** Goals of a TQM process include reduced waste, better inventory control, fewer defects, and continuous improvement. Just-in-time concepts have similar goals.

**Service Economy** Businesses that provide services, such as telecommunications and health care, constitute an ever-growing part of our economy. In developed economies like the United States, service businesses typically account for over 60% to 70% of total economic activity.

Companies must be alert to these and other factors. Many companies have responded by adopting the **lean business model**, whose goal is to *eliminate waste* while “satisfying the customer” and “providing a positive return” to the company.

"My boss wants us to appeal to a younger and hipper crowd. So, I'd like to get a tattoo that says-- 'Accounting rules!'"

Copyright © Jerry King, www.artizans.com

**Lean Practices** **Continuous improvement** rejects the notions of “good enough” or “acceptable” and challenges employees and managers to continuously experiment with new and improved business practices. This has led companies to adopt practices such as total quality management (TQM) and just-in-time (JIT) manufacturing. The philosophy underlying both practices is continuous improvement; the difference is in the focus.

**Total quality management** focuses on quality improvement and applies this standard to all aspects of business activities. In doing so, managers and employees seek to uncover waste in business activities including accounting activities such as payroll and disbursements. To encourage an emphasis on quality, the U.S. Congress established the Malcolm Baldrige National Quality Award (MBNQA). Entrants must conduct a thorough analysis and evaluation of their business

using guidelines from the Baldrige committee. **Ritz Carlton Hotel** is a recipient of the Baldrige award in the service category. The company applies a core set of values, collectively called *The Gold Standards*, to improve customer service.

**Just-in-time manufacturing** is a system that acquires inventory and produces only when needed. An important aspect of JIT is that companies manufacture products only after they receive an order (a *demand-pull* system) and then deliver the customer’s requirements on time. This means that processes must be aligned to eliminate any delays and inefficiencies including inferior inputs and outputs. Companies must also establish good relations and communications with their suppliers. On the downside, JIT is more susceptible to disruption than traditional systems. As one example, several **General Motors** plants were temporarily shut down due to a strike at an assembly division; the plants supplied components *just in time* to the assembly division.

**Point:** The time between buying raw materials and selling finished goods is called *throughput time*.

**Value Chain** The **value chain** refers to the series of activities that add value to a company’s products or services. Exhibit 18.18 illustrates a possible value chain for a retail cookie company. Companies can use lean practices across the value chain to increase efficiency and profits.

### EXHIBIT 18.18

Typical Value Chain (Cookie Retailer)

**Implications for Managerial Accounting** Adopting the lean business model can be challenging because to foster its implementation, all systems and procedures that a company follows must be realigned. Managerial accounting has an important role to play by providing accurate cost and performance information. Companies must understand the nature and sources of cost and must develop systems that capture costs accurately. Developing such a system is important to measuring the “value” provided to customers. The price that customers pay for acquiring goods and services is an important determinant of value. In turn, the costs a company incurs are key determinants of price. All else being equal, the better a company is at controlling its costs, the better its performance.

**Corporate Social Responsibility** In addition to maximizing shareholder value, when making decisions corporations often must consider the demands of other stakeholders, including employees, suppliers, and society in general. **Corporate social responsibility (CSR)** is a concept that goes

beyond just following the law. For example, to reduce its impact on the environment, **Three Twins Ice Cream** uses only cups and spoons made from organic ingredients. **United By Blue**, an apparel and jewelry company, removes one pound of trash from waterways for every product sold. Companies like **Microsoft**, **Google**, and **Walt Disney**, ranked at the top of large multinational companies in terms of CSR, report progress on their CSR goals on their company websites.

## Decision Insight

**Balanced Scorecard** The *balanced scorecard* aids continuous improvement by augmenting financial measures with information on the “drivers” (indicators) of future financial performance along four dimensions: (1) *financial*—profitability and risk, (2) *customer*—value creation and product and service differentiation, (3) *internal business processes*—business activities that create customer and owner satisfaction, and (4) *learning and growth*—organizational change, innovation, and growth. ■

## GLOBAL VIEW

Managerial accounting is more flexible than financial accounting and does not follow a set of strict rules. However, many international businesses use the managerial accounting concepts and principles described in this chapter.

**Customer Focus** **Nestlé**, one of the world’s leading nutrition and wellness companies, adopts a customer focus and strives to understand its customers’ tastes. For example, Nestlé employees spent three days living with people in Lima, Peru, to understand their motivations, routines, buying habits, and everyday lives. This allowed Nestlé to adjust its products to suit local tastes.

**Reporting Manufacturing Activities** Nestlé must classify and report costs. In reporting inventory, Nestlé includes direct production costs, production overhead, and factory depreciation. A recent Nestlé annual report shows the following:

(in millions of Swiss francs)	Ending Inventory	Beginning Inventory
Raw materials, work in progress, and sundry supplies . . . . .	3,499	3,815
Finished goods . . . . .	5,138	5,302

Nestlé managers use this information, along with the more detailed information found in a schedule of cost of goods manufactured, to plan and control manufacturing activities.

**Sustainability and Accounting** Nestlé’s version of corporate social responsibility focuses on sustainability. The company seeks to increase shareholder value by reducing water usage, improving farmers’ operations, and enhancing children’s nutrition in developing countries. Eden Full, founder of this chapter’s opening company **SunSaluter**, designed her company around the development of sustainable energy and water conservation.

## Raw Materials Inventory Turnover and Days’ Sales in Raw Materials Inventory

## Decision Analysis

Managerial accounting information helps business managers perform detailed analyses that are not readily available to external users of accounting information. Inventory management is one example. Using publicly available financial statements, an external user can compute the *inventory turnover* ratio. However, a managerial accountant can go much further.

### Raw Materials Inventory Turnover

A business manager can assess how effectively a company manages its *raw materials* inventory by computing the **raw materials inventory turnover** ratio as shown in Exhibit 18.19.

$$\text{Raw materials inventory turnover} = \frac{\text{Raw materials used}}{\text{Average raw materials inventory}}$$

**A1** Assess raw materials inventory management using raw materials inventory turnover and days’ sales in raw materials inventory.

### EXHIBIT 18.19

Raw Materials Inventory Turnover

This ratio reveals how many times a company turns over (uses in production) its raw materials inventory during a period. Generally, a high ratio of raw materials inventory turnover is preferred, as long as raw materials inventory levels are adequate to meet demand. To illustrate, Rocky Mountain Bikes reports direct (raw) materials used of \$85,500 for a year, with a beginning raw materials inventory of \$8,000 and an ending raw materials inventory of \$9,000 (see Exhibit 18.16). Raw materials inventory turnover for Rocky Mountain Bikes for that year is computed as in Exhibit 18.20.

### EXHIBIT 18.20

Raw Materials Inventory  
Turnover Computed

$$\text{Raw materials inventory turnover} = \$85,500 / [(\$8,000 + \$9,000) / 2] = 10.06 \text{ (rounded).}$$

### Days' Sales in Raw Materials Inventory

To further assess raw materials inventory management, a manager can measure the adequacy of raw materials inventory to meet production demand. **Days' sales in raw materials inventory** reveals how much raw materials inventory is available in terms of the number of days' sales. It is a measure of how long it takes raw materials to be used in production. It is defined and computed for Rocky Mountain Bikes in Exhibit 18.21.

### EXHIBIT 18.21

Days' Sales in Raw  
Materials Inventory  
Turnover

$$\begin{aligned} \text{Days' sales in raw materials inventory} &= \text{Ending raw materials inventory} / \text{Raw materials used} \times 365 \\ &= \$9,000 / \$85,500 \times 365 = 38.4 \text{ days (rounded)} \end{aligned}$$

This computation suggests that it will take 38 days for Rocky Mountain Bikes' raw materials inventory to be used in production. Assuming production needs can be met, companies usually prefer a *lower* number of days' sales in raw materials inventory. Just-in-time manufacturing techniques can be useful in lowering days' sales in raw materials inventory; for example, **Dell** keeps less than seven days of production needs in raw materials inventory for most of its computer components.

## NEED-TO-KNOW

### COMPREHENSIVE

The following account balances and other information are from SUNN Corporation's accounting records for year-end December 31, 2015. Use this information to prepare (1) a table listing factory overhead costs, (2) a schedule of cost of goods manufactured (show only the total factory overhead cost), and (3) an income statement.

Advertising expense . . . . .	\$ 85,000	Work in process inventory, Dec. 31, 2014 . . . . .	\$ 8,000
Amortization expense—Factory patents . . . . .	16,000	Work in process inventory, Dec. 31, 2015 . . . . .	9,000
Bad debts expense . . . . .	28,000	Income taxes . . . . .	53,400
Depreciation expense—Office equipment . . . . .	37,000	Indirect labor . . . . .	26,000
Depreciation expense—Factory building . . . . .	133,000	Interest expense . . . . .	25,000
Depreciation expense—Factory equipment . . . . .	78,000	Miscellaneous expense . . . . .	55,000
Direct labor . . . . .	250,000	Property taxes on factory equipment . . . . .	14,000
Factory insurance used up . . . . .	62,000	Raw materials inventory, Dec. 31, 2014 . . . . .	60,000
Factory supervisor salary . . . . .	74,000	Raw materials inventory, Dec. 31, 2015 . . . . .	78,000
Factory supplies used . . . . .	21,000	Raw materials purchases . . . . .	313,000
Factory utilities . . . . .	115,000	Repairs expense—Factory equipment . . . . .	31,000
Finished goods inventory, Dec. 31, 2014 . . . . .	15,000	Salaries expense . . . . .	150,000
Finished goods inventory, Dec. 31, 2015 . . . . .	12,500	Sales . . . . .	1,630,000

### PLANNING THE SOLUTION

- Analyze the account balances and select those that are part of factory overhead costs.
- Arrange these costs in a table that lists factory overhead costs for the year.

- Analyze the remaining costs and select those related to production activity for the year; selected costs should include the materials and work in process inventories and direct labor.
- Prepare a schedule of cost of goods manufactured for the year showing the calculation of the cost of materials used in production, the cost of direct labor, and the total factory overhead cost. When presenting overhead cost on this statement, report only total overhead cost from the table of overhead costs for the year. Show the costs of beginning and ending work in process inventory to determine cost of goods manufactured.
- Organize the remaining revenue and expense items into the income statement for the year. Combine cost of goods manufactured from the schedule of cost of goods manufactured with the finished goods inventory amounts to compute cost of goods sold for the year.

**SOLUTION**

# Summary

**C1 Explain the purpose and nature of, and the role of ethics in, managerial accounting.** The purpose of managerial accounting is to provide useful information to management and other internal decision makers. It does this by collecting, managing, and reporting both monetary and nonmonetary information in a manner useful to internal users. Major characteristics of managerial accounting include (1) focus on internal decision makers, (2) emphasis on planning and control, (3) flexibility, (4) timeliness, (5) reliance on forecasts and estimates, (6) focus on segments and projects, and (7) reporting both monetary and nonmonetary information. Ethics are beliefs that distinguish right from wrong. Ethics can be important in reducing fraud in business operations.

**C2 Describe accounting concepts useful in classifying costs.** We can classify costs as (1) fixed vs. variable, (2) direct vs. indirect, and (3) product vs. period. A cost can be classified in more than one way, depending on the purpose for which the cost is being determined. These classifications help us understand cost patterns, analyze performance, and plan operations.

**C3 Define product and period costs and explain how they impact financial statements.** Costs that are capitalized because they are expected to have future value are called *product costs*; costs that are expensed are called *period costs*. This classification is important because it affects the amount of costs expensed in the income statement and the amount of costs assigned to inventory on the balance sheet. Product costs are commonly made up of direct materials, direct labor, and overhead. Period costs include selling and administrative expenses.

**C4 Explain how balance sheets and income statements for manufacturing, merchandising, and service companies differ.** The main difference is that manufacturers usually carry three inventories on their balance sheets—raw materials, work in process, and finished goods—instead of one inventory that merchandisers carry. Service company balance sheets do not include inventories of items for sale. The main difference between income statements of manufacturers and merchandisers is the items making up cost of goods sold. A merchandiser uses merchandise inventory and the cost of goods purchased to compute cost of goods sold; a manufacturer uses finished goods inventory and the cost of goods manufactured to compute cost of goods sold. A service company's income statement does not include cost of goods sold.

**C5 Explain manufacturing activities and the flow of manufacturing costs.** Manufacturing activities consist of materials, production, and sales activities. The materials activity consists of the purchase and issuance of materials to production. The production activity consists of converting materials into finished goods. At this stage in the process, the materials, labor, and overhead costs have been incurred and the schedule of cost of goods manufactured is prepared. The sales activity consists of selling some or all of finished goods available for sale. At this stage, the cost of goods sold is determined.

**C6 Describe trends in managerial accounting.** Important trends in managerial accounting include an increased focus on satisfying customers, the impact of a global economy, and the growing presence of e-commerce and service-based businesses. The lean business model, designed to eliminate waste and satisfy customers, can be useful in responding to recent trends. Concepts such as total quality management, just-in-time production, and the value chain often aid in application of the lean business model.

**A1 Assess raw materials inventory management using raw materials inventory turnover and days' sales in raw materials inventory.** A high raw materials inventory turnover suggests a business is more effective in managing its raw materials inventory. We use days' sales in raw materials inventory to assess the likelihood of production being delayed due to inadequate levels of raw materials. We prefer a high raw materials inventory turnover ratio and a small number of days' sales in raw materials inventory, provided that raw materials inventory levels are adequate to keep production steady.

**P1 Compute cost of goods sold for a manufacturer and for a merchandiser.** A manufacturer adds beginning finished goods inventory to cost of goods manufactured and then subtracts ending finished goods inventory to get cost of goods sold. A merchandiser adds beginning merchandise inventory to cost of goods purchased and then subtracts ending merchandise inventory to get cost of goods sold.

**P2 Prepare a schedule of cost of goods manufactured and explain its purpose and links to financial statements.** This schedule reports the computation of cost of goods manufactured for the period. It begins by showing the period's costs for direct materials, direct labor, and overhead and then adjusts these numbers for the beginning and ending inventories of the work in process to yield cost of goods manufactured.

## Guidance Answers to Decision Maker and Decision Ethics

**Production Manager** It appears that all three friends want to pay the bill with someone else's money. David is using money belonging to the tax authorities, Denise is taking money from her company, and Derek is defrauding the client. To prevent such practices, companies have internal audit mechanisms. Many companies also adopt ethical codes of conduct to help guide employees. We must recognize that some entertainment expenses are justifiable and even encouraged. For example, the tax law allows certain

deductions for entertainment that have a business purpose. Corporate policies also sometimes allow and encourage reimbursable spending for social activities, and contracts can include entertainment as allowable costs. Nevertheless, without further details, payment for this bill should be made from personal accounts.

**Entrepreneur** Tracing all costs directly to cost objects is always desirable, but you need to be able to do so in an economically

feasible manner. In this case, you are able to trace 90% of the assembly department's direct costs. It may not be economical to spend more money on a new software to trace the final 10% of

costs. You need to make a cost-benefit trade-off. If the software offers benefits beyond tracing the remaining 10% of the assembly department's costs, your decision should consider this.

## Key Terms

Continuous improvement

Control

Total quality management (TQM)

Value chain

Variable cost

Work in process inventory

## Multiple Choice Quiz

Answers at end of chapter

- Continuous improvement
  - Is used to reduce inventory levels.
  - Is applicable only in service businesses.
  - Rejects the notion of "good enough."
  - Is used to reduce ordering costs.
  - Is applicable only in manufacturing businesses.
- A direct cost is one that is
  - Variable with respect to the cost object.
  - Traceable to the cost object.
  - Fixed with respect to the cost object.
  - Allocated to the cost object.
  - A period cost.
- Costs that are incurred as part of the manufacturing process, but are not clearly traceable to the specific unit of product or batches of product, are called
  - Period costs.
  - Factory overhead.
  - Variable costs.
  - Operating expenses.
  - Fixed costs.
- The three major cost components of manufacturing a product are
  - Direct materials, direct labor, and factory overhead.
  - Period costs, product costs, and conversion costs.
  - Indirect labor, indirect materials, and fixed expenses.
  - Variable costs, fixed costs, and period costs.
  - Overhead costs, fixed costs, and direct costs.
- A company reports the following for the current year.
 

Finished goods inventory, beginning year	\$6,000
Finished goods inventory, ending year	3,200
Cost of goods sold	7,500

 Its cost of goods manufactured for the current year is
  - \$1,500.
  - \$1,700.
  - \$7,500.
  - \$2,800.
  - \$4,700.

 Icon denotes assignments that involve decision making.

## Discussion Questions

- Describe the managerial accountant's role in business planning, control, and decision making.
- Distinguish between managerial and financial accounting on
  - Users and decision makers.
  - Purpose of information.
  - Flexibility of practice.
  - Time dimension.
  - Focus of information.
  - Nature of information.
-  Identify the usual changes that a company must make when it adopts a customer orientation.
- Distinguish between direct labor and indirect labor.
- Distinguish between (a) factory overhead and (b) selling and administrative overhead.
- Distinguish between direct material and indirect material.

7. What product cost is listed as both a prime cost and a conversion cost?
8.  Assume that we tour **Samsung's** factory where it makes its products. **Samsung** List three direct costs and three indirect costs that we are likely to see.
9.  Should we evaluate a production manager's performance on the basis of operating expenses? Why?
10.  Explain why knowledge of cost behavior is useful in product performance evaluation.
11. Explain why product costs are capitalized but period costs are expensed in the current accounting period.
12.  Explain how business activities and inventories for a manufacturing company, a merchandising company, and a service company differ.
13.  Why does managerial accounting often involve working with numerous predictions and estimates?
14. How do an income statement and a balance sheet for a manufacturing company and a merchandising company differ?
15. Besides inventories, what other assets often appear on manufacturers' balance sheets but not on merchandisers' balance sheets?
16. Why does a manufacturing company require three different inventory categories?
17. Manufacturing activities of a company are described in the \_\_\_\_\_. This schedule summarizes the types and amounts of costs incurred in its manufacturing \_\_\_\_\_.
18. What are the three categories of manufacturing costs?
19. List several examples of factory overhead.
20.  List the four components of a schedule of cost of goods manufactured and provide specific examples of each for **APPLE**.
21.  Prepare a proper title for the annual schedule of cost of goods manufactured **GOOGLE** of **Google**. Does the date match the balance sheet or income statement? Why?
22.  Describe the relations among the income statement, the schedule of cost of goods manufactured, and a detailed listing of factory overhead costs.
23.  Define and describe two measures to assess raw materials inventory management.
24.  Can management of a company such as **APPLE** use cycle time and cycle efficiency as useful measures of performance? Explain.
25. Access **Dell's** annual report (10-K) for the fiscal year ended February 1, 2013, at the SEC's EDGAR database (**SEC.gov**) or its website (**Dell.com**). From its financial statement notes, identify the titles and amounts of its inventory components.

## QUICK STUDY

Identify whether each description most likely applies to managerial or financial accounting.

### QS 18-1

Managerial accounting versus financial accounting 

- \_\_\_\_\_ 1. Its primary users are company managers.
- \_\_\_\_\_ 2. Its information is often available only after an audit is complete.
- \_\_\_\_\_ 3. Its primary focus is on the organization as a whole.
- \_\_\_\_\_ 4. Its principles and practices are very flexible.

### QS 18-2

Fixed and variable costs 

A cell phone company offers two different plans. Plan A costs \$80 per month for unlimited talk and text. Plan B costs \$0.20 per minute plus \$0.10 per text message sent. You need to purchase a plan for your 14-year-old sister. Your sister currently uses 1,700 minutes and sends 1,600 texts each month.

1. What is your sister's total cost under each of the two plans?
2. Suppose your sister doubles her monthly usage to 3,400 minutes and sends 3,200 texts. What is your sister's total cost under each of the two plans?

### QS 18-3

Direct and indirect costs 

Diez Company produces sporting equipment, including leather footballs. Identify each of the following costs as direct or indirect. The cost object is a football produced by Diez.

- \_\_\_\_\_ 1. Electricity used in the production plant.
- \_\_\_\_\_ 2. Labor used on the football production line.
- \_\_\_\_\_ 3. Salary of manager who supervises the entire plant.
- \_\_\_\_\_ 4. Depreciation on equipment used to produce footballs.
- \_\_\_\_\_ 5. Leather used to produce footballs.

### QS18-4

Classifying product costs 

Identify each of the following costs as either direct materials, direct labor, or factory overhead. The company manufactures tennis balls.

- \_\_\_\_\_ 1. Rubber used to form the cores
- \_\_\_\_\_ 2. Factory maintenance
- \_\_\_\_\_ 3. Wages paid to assembly workers
- \_\_\_\_\_ 4. Glue used in binding rubber cores to felt covers
- \_\_\_\_\_ 5. Depreciation—Factory equipment
- \_\_\_\_\_ 6. Cans to package the balls

Identify each of the following costs as either a product cost or a period cost.

- |   |  |
|---|--|
| _____ 1. Factory maintenance            | _____ 5. Rent on factory building                |
| _____ 2. Sales commissions              | _____ 6. Interest expense                        |
| _____ 3. Depreciation—Factory equipment | _____ 7. Office manager salary                   |
| _____ 4. Depreciation—Office equipment  | _____ 8. Indirect materials used in making goods |

**QS 18-5**

Product and period costs

C3

Compute ending work in process inventory for a manufacturer with the following information.

Raw materials purchased . . . . .	\$124,800
Raw materials used in production . . . . .	74,300
Direct labor used . . . . .	55,000
Total factory overhead . . . . .	95,700
Work in process inventory, beginning of year . . . . .	26,500
Cost of goods manufactured . . . . .	221,800

**QS 18-6**

Inventory reporting for manufacturers

C4

Compute cost of goods sold for 2015 using the following information.

Finished goods inventory, Dec. 31, 2014 . . . . .	\$345,000
Work in process inventory, Dec. 31, 2014 . . . . .	83,500
Work in process inventory, Dec. 31, 2015 . . . . .	72,300
Cost of goods manufactured, 2015 . . . . .	918,700
Finished goods inventory, Dec. 31, 2015 . . . . .	283,600

**QS 18-7**

Cost of goods sold

P1

Compute cost of goods sold using the following information:

Finished goods inventory, beginning . . . . .	\$ 500
Cost of goods manufactured . . . . .	4,000
Finished goods inventory, ending . . . . .	750

**QS 18-8**

Cost of goods sold

P1

Compute the total manufacturing cost for a manufacturer with the following information for the month.

Raw materials purchased . . . . .	\$32,400
Raw materials used in production . . . . .	53,750
Direct labor used . . . . .	12,000
Factory supervisor salary . . . . .	8,000
Salesperson commissions . . . . .	6,200
Depreciation expense—Factory building . . . . .	3,500
Depreciation expense—Delivery equipment . . . . .	2,200
Indirect materials . . . . .	1,250

**QS 18-9**

Manufacturing cost flows

C5

Prepare the 2015 schedule of cost of goods manufactured for Barton Company using the following information.

Direct materials . . . . .	\$190,500
Direct labor . . . . .	63,150
Factory overhead costs . . . . .	24,000
Work in process, Dec. 31, 2014 . . . . .	157,600
Work in process, Dec. 31, 2015 . . . . .	142,750

**QS 18-10**

Cost of goods manufactured

P2

**QS 18-11**

Direct materials used

P2

Use the following information to compute the cost of direct materials used for the current year.

	January 1	December 31
Inventories		
Raw materials inventory .....	\$ 6,000	\$7,500
Work in process inventory .....	12,000	9,000
Finished goods inventory .....	8,500	5,500
Activity during current year		
Materials purchased .....		\$123,500
Direct labor .....		94,000
Factory overhead .....		39,000

**QS 18-12**

Trends in managerial accounting

C6

Match each concept with its best description by entering its letter in the blank.

- |                                     |   |
|-------------------------------------|---|
| _____ 1. Just-in-time manufacturing | <b>A.</b> Focuses on quality throughout the production process.                               |
| _____ 2. Continuous improvement     | <b>B.</b> Flexible product designs can be modified to accommodate customer choices.           |
| _____ 3. Customer orientation       | <b>C.</b> Every manager and employee constantly looks for ways to improve company operations. |
| _____ 4. Total quality management   | <b>D.</b> Inventory is acquired or produced only as needed.                                   |

**QS 18-13**

Direct materials used

C5

**Nestlé** reports beginning raw materials inventory of 3,815 and ending raw materials inventory of 3,499 (both numbers in millions of Swiss francs). If Nestlé purchased 13,860 (in millions of Swiss francs) of raw materials during the year, what is the amount of raw materials it used during the year?

**QS 18-14**

Raw materials inventory management **A1**

**Nestlé** reports beginning raw materials inventory of 3,815 and ending raw materials inventory of 3,499 (both numbers in millions of Swiss francs). Assume Nestlé purchased 13,860 and used 14,176 (both amounts in millions of Swiss francs) in raw materials during the year. Compute raw materials inventory turnover and the number of days' sales in raw materials inventory.

**EXERCISES**

Both managerial accounting and financial accounting provide useful information to decision makers. Indicate in the following chart the most likely source of information for each business decision.

**Exercise 18-1**

Sources of accounting information

C1

Business Decision	Primary Information Source	
	Managerial	Financial
1. Determine whether to lend to a company .....	___	___
2. Evaluate a purchasing department's performance .....	___	___
3. Report financial performance to board of directors .....	___	___
4. Estimate product cost for a new line of shoes .....	___	___
5. Plan the budget for next quarter .....	___	___
6. Measure profitability of an individual store .....	___	___
7. Prepare financial reports according to GAAP .....	___	___
8. Determine location and size for a new plant .....	___	___

**Exercise 18-2**

Cost classification

C2

Listed here are product costs for the production of soccer balls. Classify each cost (a) as either variable or fixed and (b) as either direct or indirect. What patterns do you see regarding the relation between costs classified in these two ways?

Product Cost	Variable or Fixed		Direct or Indirect	
	Variable	Fixed	Direct	Indirect
1. Leather covers for soccer balls .....	—	—	—	—
2. Annual flat fee paid for office security .....	—	—	—	—
3. Coolants for machinery .....	—	—	—	—
4. Wages of assembly workers .....	—	—	—	—
5. Lace to hold leather together .....	—	—	—	—
6. Taxes on factory .....	—	—	—	—
7. Machinery depreciation (straight-line) .....	—	—	—	—

TechPro offers instructional courses in e-commerce website design. The company holds classes in a building that it owns. Classify each of TechPro’s costs below as (a) variable or fixed and (b) direct or indirect. Assume the cost object is an individual class.

- |   |   |
|---|---|
| _____ 1. Depreciation on classroom building | _____ 4. Travel expenses for salesperson            |
| _____ 2. Monthly Internet connection cost   | _____ 5. Depreciation on computers used for classes |
| _____ 3. Instructional manuals for students | _____ 6. Instructor wage (per class)                |

**Exercise 18-3**

Cost classifications for a service provider

Listed below are costs of providing an airline service. Classify each cost as (a) either variable or fixed, and (b) either direct or indirect. Consider the cost object to be a flight.

Cost	Variable or Fixed		Direct or Indirect	
	Variable	Fixed	Direct	Indirect
1. Advertising .....	—	—	—	—
2. Beverages and snacks .....	—	—	—	—
3. Regional vice-president salary .....	—	—	—	—
4. Depreciation on ground equipment .....	—	—	—	—
5. Fuel and oil used in planes .....	—	—	—	—
6. Flight attendant salaries .....	—	—	—	—
7. Pilot salaries .....	—	—	—	—
8. Maintenance worker wages .....	—	—	—	—
9. Customer service salaries .....	—	—	—	—

**Exercise 18-4**

Cost classifications for a service company

Some costs related to **Apple’s** iPad are listed below. Classify each cost as either direct materials, direct labor, factory overhead, selling expenses, or general and administrative expenses.

- |  |   |
|--|---|
| _____ 1. Display screen                        | _____ 5. Glue to hold iPad cases together                                   |
| _____ 2. Assembly-line supervisor salary       | _____ 6. Uniforms provided for each factory worker                          |
| _____ 3. Wages for assembly workers            | _____ 7. Wages for retail store worker                                      |
| _____ 4. Salary of the chief executive officer | _____ 8. Depreciation (straight-line) on robotic equipment used in assembly |

**Exercise 18-5**

Classifying manufacturing costs

**Georgia Pacific**, a manufacturer, incurs the following costs. (1) Classify each cost as either a product or a period cost. If a product cost, identify it as direct materials, direct labor, or factory overhead, and then as a prime and/or conversion cost. (2) Classify each product cost as either a direct cost or an indirect cost using the product as the cost object.

**Exercise 18-6**

Cost classification

Cost	Product Cost				Period Cost	Direct Cost	Indirect Cost
	Prime		Conversion				
	Direct Materials	Direct Labor	Direct Labor	Overhead			
1. Factory utilities .....	—	—	—	—	—	—	—
2. Advertising .....	—	—	—	—	—	—	—
3. Amortization of patents on factory machine .....	—	—	—	—	—	—	—
4. State and federal income taxes .....	—	—	—	—	—	—	—
5. Office supplies used .....	—	—	—	—	—	—	—
6. Insurance on factory building .....	—	—	—	—	—	—	—
7. Wages to assembly workers .....	—	—	—	—	—	—	—

**Exercise 18-7**

Balance sheet identification and preparation

C4

Current assets for two different companies at fiscal year-end 2015 are listed here. One is a manufacturer, Rayzer Skis Mfg., and the other, Sunrise Foods, is a grocery distribution company. (1) Identify which set of numbers relates to the manufacturer and which to the merchandiser. (2) Prepare the current asset section for each company from this information. Discuss why the current asset section for these two companies is different.

Account	Company 1	Company 2
Cash .....	\$ 7,000	\$ 5,000
Raw materials inventory .....	—	42,000
Merchandise inventory .....	45,000	—
Work in process inventory .....	—	30,000
Finished goods inventory .....	—	50,000
Accounts receivable, net .....	62,000	75,000
Prepaid expenses .....	1,500	900

**Exercise 18-8**

Cost of goods manufactured and cost of goods sold computation

P1 P2

Using the following data, compute (1) the cost of goods manufactured and (2) the cost of goods sold for both Garcon Company and Pepper Company for the year ended December 31, 2015.

	Garcon Company	Pepper Company
Beginning finished goods inventory .....	\$12,000	\$16,450
Beginning work in process inventory .....	14,500	19,950
Beginning raw materials inventory .....	7,250	9,000
Rental cost on factory equipment .....	27,000	22,750
Direct labor .....	19,000	35,000
Ending finished goods inventory .....	17,650	13,300
Ending work in process inventory .....	22,000	16,000
Ending raw materials inventory .....	5,300	7,200
Factory utilities .....	9,000	12,000
Factory supplies used .....	8,200	3,200
General and administrative expenses .....	21,000	43,000
Indirect labor .....	1,250	7,660
Repairs—Factory equipment .....	4,780	1,500
Raw materials purchases .....	33,000	52,000
Selling expenses .....	50,000	46,000
Sales .....	195,030	290,010
Cash .....	20,000	15,700
Factory equipment, net .....	212,500	115,825
Accounts receivable, net .....	13,200	19,450

**Check** Garcon COGS, \$91,030

Use the data in Exercise 18-8 to prepare an income statement and the current assets section of the balance sheet for each company. Ignore income taxes.

**Exercise 18-9**  
Prepare financial statements for a manufacturer **C4 P2**

Refer to the data in Exercise 18-8. Compute the total (1) prime costs and (2) conversion costs for each company.

**Exercise 18-10**  
Cost classification **C2**

Compute cost of goods sold for each of these two companies for the year ended December 31, 2015.

	A	B	C
1	<b>Unimart</b>		<b>Precision Manufacturing</b>
2			
3	Beginning inventory		
4	Merchandise	\$275,000	
5	Finished goods		\$450,000
6	Cost of purchases	500,000	
7	Cost of goods manufactured		900,000
8	Ending inventory		
9	Merchandise	115,000	
10	Finished goods		375,000
11			

**Exercise 18-11**  
Cost of goods sold computation **P1**

**Check** Unimart COGS, \$660,000

For each of the following accounts for a manufacturing company, place a ✓ in the appropriate column indicating that it appears on the balance sheet, the income statement, the schedule of cost of goods manufactured, and/or a detailed listing of factory overhead costs. Assume that the income statement shows the calculation of cost of goods sold and the schedule of cost of goods manufactured shows only the total amount of factory overhead. (An account can appear on more than one report.)

**Exercise 18-12**  
Components of accounting reports **P2**

	A	B	C	D	E
1		<b>Balance Sheet</b>	<b>Income Statement</b>	<b>Sched. of Cost of Goods Manuf'd.</b>	<b>Overhead Report</b>
2	<b>Account</b>				
3	Accounts receivable				
4	Computer supplies used (office)				
5	Beginning finished goods inventory				
6	Beginning work in process inventory				
7	Cash				
8	Depreciation expense—Factory building				
9	Depreciation expense—Office building				
10	Direct labor				
11	Ending work in process inventory				
12	Ending raw materials inventory				
13	Factory maintenance wages				
14	Income taxes				
15	Insurance on factory building				
16	Property taxes on factory building				
17	Raw materials purchases				
18	Sales				
19					

Given the following selected account balances of Delray Mfg. prepare its schedule of cost of goods manufactured for the year ended December 31, 2015. Include a listing of the individual overhead account balances in this schedule.

**Exercise 18-13**  
Preparation of schedule of cost of goods manufactured **P2**

Sales .....	\$1,250,000	Repairs—Factory equipment .....	\$ 5,250
Raw materials inventory, Dec. 31, 2014 .....	37,000	Rent cost of factory building .....	57,000
Work in process inventory, Dec. 31, 2014 .....	53,900	Advertising expense .....	94,000
Finished goods inventory, Dec. 31, 2014 .....	62,750	General and administrative expenses .....	129,300
Raw materials purchases .....	175,600	Raw materials inventory, Dec. 31, 2015 .....	42,700
Direct labor .....	225,000	Work in process inventory, Dec. 31, 2015 .....	41,500
Factory computer supplies used .....	17,840	Finished goods inventory, Dec. 31, 2015 .....	67,300
Indirect labor .....	47,000		

**Check** Cost of goods manufactured, \$534,390

**Exercise 18-14**  
Income statement preparation **P2**

Use the information in Exercise 18-13 to prepare an income statement for Delray Mfg. (a manufacturer). Assume that its cost of goods manufactured is \$534,390.

**Exercise 18-15**  
Schedule of cost of goods manufactured and cost of goods sold **P1 P2**

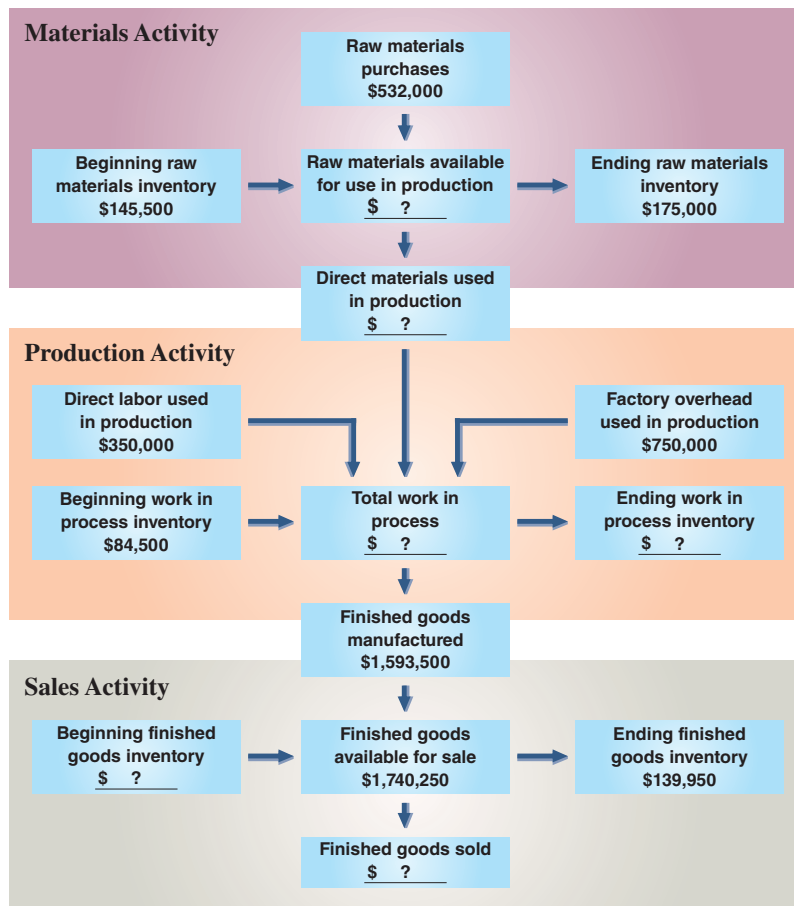

Beck Manufacturing reports the information below for 2015. Using this information:  
 1. Prepare the schedule of cost of goods manufactured for the year.  
 2. Compute cost of goods sold for the year.

Raw Materials Inventory		Work in Process Inventory		Finished Goods Inventory	
Begin. Inv.	10,000	Begin. Inv.	14,000	Begin. Inv.	16,000
Purchases	45,000	Materials	46,500	Cost of goods mfg	131,000
Avail for Use	55,000	Direct labor	27,500	Avail for sale	147,000
		Overhead	55,000		
		Avail for mfg.	143,000		
End. Inv.	8,500	End. Inv.	12,000	End. Inv.	18,000

*Notes: In the original image, red arrows indicate that 'Materials used 46,500' from the Raw Materials Inventory table points to the 'Materials' entry in the Work in Process Inventory table. Similarly, 'Cost of goods mfg 131,000' from the Work in Process Inventory table points to the 'Cost of goods mfg' entry in the Finished Goods Inventory table. The 'Cost of goods sold 129,000' is also shown in the Finished Goods Inventory table.*

**Exercise 18-16**  
Cost flows in manufacturing **C5**

The following chart shows how costs flow through a business as a product is manufactured. Some boxes in the flowchart show cost amounts. Compute the cost amounts for the boxes that contain question marks.

**Exercise 18-17**  
Lean business concepts **C6**

Many fast-food restaurants compete on lean business concepts. Match each of the following activities at a fast-food restaurant with the lean business concept it strives to achieve. Some activities might relate to more than one lean business concept.

- |   |                                   |
|---|-----------------------------------|
| _____ 1. Courteous employees                | a. Just-in-time (JIT)             |
| _____ 2. Food produced to order             | b. Continuous improvement (CI)    |
| _____ 3. Clean tables and floors            | c. Total quality management (TQM) |
| _____ 4. Orders filled within three minutes |                                   |
| _____ 5. Standardized food making processes |                                   |
| _____ 6. New product development            |                                   |

Listed here are the total costs associated with the 2015 production of 1,000 drum sets manufactured by TrueBeat. The drum sets sell for \$500 each.

**PROBLEM SET A**

Costs	Variable or Fixed		Product or Period	
	Variable	Fixed	Product	Period
1. Plastic for casing—\$17,000	\$17,000	—	\$17,000	—
2. Wages of assembly workers—\$82,000	—	—	—	—
3. Property taxes on factory—\$5,000	—	—	—	—
4. Accounting staff salaries—\$35,000	—	—	—	—
5. Drum stands (1,000 stands purchased)—\$26,000	—	—	—	—
6. Rent cost of equipment for sales staff—\$10,000	—	—	—	—
7. Upper management salaries—\$125,000	—	—	—	—
8. Annual flat fee for factory maintenance service—\$10,000	—	—	—	—
9. Sales commissions—\$15 per unit	—	—	—	—
10. Machinery depreciation, straight-line—\$40,000	—	—	—	—

**Problem 18-1A**

Cost computation, classification, and analysis

**Required**

- Classify each cost and its amount as (a) either variable or fixed and (b) either product or period. (The first cost is completed as an example.)
- Compute the manufacturing cost per drum set.

**Check** (1) Total variable production cost, \$125,000

**Analysis Component**

- Assume that 1,200 drum sets are produced in the next year. What do you predict will be the total cost of plastic for the casings and the per unit cost of the plastic for the casings? Explain.
- Assume that 1,200 drum sets are produced in the next year. What do you predict will be the total cost of property taxes and the per unit cost of the property taxes? Explain.

The following calendar year-end information is taken from the December 31, 2015, adjusted trial balance and other records of Leone Company.

**Problem 18-2A**

Classifying costs

Advertising expense	\$ 28,750	Miscellaneous production costs	\$ 8,425
Depreciation expense—Office equipment	7,250	Office salaries expense	63,000
Depreciation expense—Selling equipment	8,600	Raw materials purchases	925,000
Depreciation expense—Factory equipment	33,550	Rent expense—Office space	22,000
Factory supervision	102,600	Rent expense—Selling space	26,100
Factory supplies used	7,350	Rent expense—Factory building	76,800
Factory utilities	33,000	Maintenance expense—Factory equipment	35,400
Direct labor	675,480	Sales	4,462,500
Indirect labor	56,875	Sales salaries expense	392,560

**Required**

- Identify and classify each of the costs above as either a product or period cost.
- Classify each of the product costs as either direct materials, direct labor, or factory overhead.
- Classify each of the period costs as either selling or general and administrative expenses.

Using the data from Problem 18-2A and the inventory information for Leone Company below, complete the requirements below. Assume income tax expense is \$233,725 for the year.

**Problem 18-3A**

Schedule of cost of goods manufactured and income statement; inventory analysis

Inventories	
Raw materials, December 31, 2014	\$166,850
Raw materials, December 31, 2015	182,000
Work in process, December 31, 2014	15,700
Work in process, December 31, 2015	19,380
Finished goods, December 31, 2014	167,350
Finished goods, December 31, 2015	136,490

**Check** (1) Cost of goods manufactured, \$1,935,650

**Required**

1. Prepare the company’s 2015 schedule of cost of goods manufactured.
2. Prepare the company’s 2015 income statement that reports separate categories for (a) selling expenses and (b) general and administrative expenses.

**Analysis Component**

3. Compute the (a) inventory turnover, defined as cost of goods sold divided by average inventory, and (b) days’ sales in inventory, defined as 365 times ending inventory divided by cost of goods sold, for both its raw materials inventory and its finished goods inventory. (To compute turnover and days’ sales in inventory for raw materials, use raw materials used rather than cost of goods sold.) Discuss some possible reasons for differences between these ratios for the two types of inventories. Round answers to one decimal place.

**Problem 18-4A**

Ending inventory computation and evaluation

**Check** (1) Ending (heel) inventory, 3,000 units; \$24,000

Nazaro’s Boot Company makes specialty boots for the rodeo circuit. On December 31, 2014, the company had (a) 300 pairs of boots in finished goods inventory and (b) 1,200 heels at a cost of \$8 each in raw materials inventory. During 2015, the company purchased 35,000 additional heels at \$8 each and manufactured 16,600 pairs of boots.

**Required**

1. Determine the unit and dollar amounts of raw materials inventory in heels at December 31, 2015.

**Analysis Component**

2. Write a one-half page memorandum to the production manager explaining why a just-in-time inventory system for heels should be considered. Include the amount of working capital that can be reduced at December 31, 2015, if the ending heel raw material inventory is cut by half.

**Problem 18-5A**

Inventory computation and reporting

Shown here are annual financial data at December 31, 2015, taken from two different companies.

	Music World Retail	Wave-Board Manufacturing
Beginning inventory		
Merchandise .....	\$200,000	
Finished goods .....		\$500,000
Cost of purchases .....	300,000	
Cost of goods manufactured .....		875,000
Ending inventory		
Merchandise .....	175,000	
Finished goods .....		225,000

**Required**

1. Compute the cost of goods sold section of the income statement at December 31, 2015, for each company. Include the proper title and format in the solution.
2. Write a half-page memorandum to your instructor (a) identifying the inventory accounts and (b) describing where each is reported on the income statement and balance sheet for both companies.

**Check** (1) Wave-Board’s cost of goods sold, \$1,150,000

**PROBLEM SET B**

Listed here are the total costs associated with the 2015 production of 15,000 Blu-ray Discs (BDs) manufactured by Maxwell. The BDs sell for \$18 each.

**Problem 18-1B**

Cost computation, classification, and analysis

Costs	Variable or Fixed		Product or Period	
	Variable	Fixed	Product	Period
1. Plastic for BDs—\$1,500 .....	\$1,500		\$1,500	
2. Wages of assembly workers—\$30,000 .....				
3. Cost of factory rent—\$6,750 .....				
4. Systems staff salaries—\$15,000 .....				
5. Labeling—\$0.25 per BD .....				
6. Cost of office equipment rent—\$1,050 .....				
7. Upper management salaries—\$120,000 .....				
8. Annual fixed fee for cleaning service—\$4,520 .....				
9. Sales commissions—\$0.50 per BD .....				
10. Machinery depreciation, straight-line—\$18,000 .....				

**Required**

1. Classify each cost and its amount as (a) either variable or fixed and (b) either product or period. (The first cost is completed as an example.)
2. Compute the manufacturing cost per BD.

**Check** (2) Total variable production cost, \$35,250

**Analysis Component**

3. Assume that 10,000 BDs are produced in the next year. What do you predict will be the total cost of plastic for the BDs and the per unit cost of the plastic for the BDs? Explain.
4. Assume that 10,000 BDs are produced in the next year. What do you predict will be the total cost of factory rent and the per unit cost of the factory rent? Explain.

The following calendar year-end information is taken from the December 31, 2015, adjusted trial balance and other records of Best Bikes.

**Problem 18-2B**  
Classifying costs  
C2 C3

Advertising expense . . . . .	\$ 20,250	Miscellaneous production costs . . . . .	\$ 8,440
Depreciation expense—Office equipment . . . . .	8,440	Office salaries expense . . . . .	70,875
Depreciation expense—Selling equipment . . . . .	10,125	Raw materials purchases . . . . .	894,375
Depreciation expense—Factory equipment . . . . .	35,400	Rent expense—Office space . . . . .	23,625
Factory supervision . . . . .	121,500	Rent expense—Selling space . . . . .	27,000
Factory supplies used . . . . .	6,060	Rent expense—Factory building . . . . .	93,500
Factory utilities . . . . .	37,500	Maintenance expense—Factory equipment . . . . .	30,375
Direct labor . . . . .	562,500	Sales . . . . .	4,942,625
Indirect labor . . . . .	59,000	Sales salaries expense . . . . .	295,300

**Required**

1. Identify and classify each of the costs above as either a product or period cost.
2. Classify each of the product costs as either direct materials, direct labor, or factory overhead.
3. Classify each of the period costs as either selling or general and administrative expenses.

Using the information from Problem 18-2B and the inventory information for Best Bikes below, complete the requirements below. Assume income tax expense is \$136,700 for the year.

**Problem 18-3B**  
Schedule of cost of goods manufactured and income statement; analysis of inventories  
P2 A1

Inventories	
Raw materials, December 31, 2014 . . . . .	\$ 40,375
Raw materials, December 31, 2015 . . . . .	70,430
Work in process, December 31, 2014 . . . . .	12,500
Work in process, December 31, 2015 . . . . .	14,100
Finished goods, December 31, 2014 . . . . .	177,200
Finished goods, December 31, 2015 . . . . .	141,750

**Required**

1. Prepare the company’s 2015 schedule of cost of goods manufactured.
2. Prepare the company’s 2015 income statement that reports separate categories for (a) selling expenses and (b) general and administrative expenses.

**Check** (1) Cost of goods manufactured, \$1,816,995

**Analysis Component**

3. Compute the (a) inventory turnover, defined as cost of goods sold divided by average inventory, and (b) days’ sales in inventory, defined as 365 times ending inventory divided by cost of goods sold, for both its raw materials inventory and its finished goods inventory. (To compute turnover and days’ sales in inventory for raw materials, use raw materials used rather than cost of goods sold.) Discuss some possible reasons for differences between these ratios for the two types of inventories. Round answers to one decimal place.

**Problem 18-4B**

Ending inventory computation and evaluation **C4** 

Racer’s Edge makes specialty skates for the ice skating circuit. On December 31, 2014, the company had (a) 1,500 skates in finished goods inventory and (b) 2,500 blades at a cost of \$20 each in raw materials inventory. During 2015, Racer’s Edge purchased 45,000 additional blades at \$20 each and manufactured 20,750 pairs of skates.

**Required**

1. Determine the unit and dollar amounts of raw materials inventory in blades at December 31, 2015.

**Check** (1) Ending (blade) inventory, 6,000 units; \$120,000

**Analysis Component**

2. Write a one-half page memorandum to the production manager explaining why a just-in-time inventory system for blades should be considered. Include the amount of working capital that can be reduced at December 31, 2015, if the ending blade raw materials inventory is cut in half.

**Problem 18-5B**

Inventory computation and reporting **C4 P1**

Shown here are annual financial data at December 31, 2015, taken from two different companies.

	TeeMart (Retail)	Aim Labs (Manufacturing)
Beginning inventory		
Merchandise .....	\$100,000	
Finished goods .....		\$300,000
Cost of purchases .....	250,000	
Cost of goods manufactured .....		586,000
Ending inventory		
Merchandise .....	150,000	
Finished goods .....		200,000

**Required**

1. Compute the cost of goods sold section of the income statement at December 31, 2015, for each company. Include the proper title and format in the solution.
2. Write a half-page memorandum to your instructor (a) identifying the inventory accounts and (b) identifying where each is reported on the income statement and balance sheet for both companies.

**Check** (1) TeeMart cost of goods sold, \$200,000

**SERIAL PROBLEM**

Business Solutions **C2 C4 P2**

(This serial problem begins in Chapter 1 and continues through most of the book. If previous chapter segments were not completed, the serial problem can begin at this point. It is helpful, but not necessary, to use the Working Papers that accompany the book.)

**SP 18** Santana Rey, owner of Business Solutions, decides to diversify her business by also manufacturing computer workstation furniture.

**Required**

1. Classify the following manufacturing costs of Business Solutions as either (a) variable or fixed and (b) direct or indirect.

Product Costs	Variable or Fixed		Direct or Indirect	
	Variable	Fixed	Direct	Indirect
1. Monthly flat fee to clean workshop.....	—	—	—	—
2. Laminate coverings for desktops.....	—	—	—	—
3. Taxes on assembly workshop .....	—	—	—	—
4. Glue to assemble workstation component parts .....	—	—	—	—
5. Wages of desk assembler .....	—	—	—	—
6. Electricity for workshop .....	—	—	—	—
7. Depreciation on tools .....	—	—	—	—

- Prepare a schedule of cost of goods manufactured for Business Solutions for the month ended January 31, 2016. Assume the following manufacturing costs:  
 Direct materials: \$2,200  
 Factory overhead: \$490  
 Direct labor: \$900  
 Beginning work in process: none (December 31, 2015)  
 Ending work in process: \$540 (January 31, 2016)  
 Beginning finished goods inventory: none (December 31, 2015)  
 Ending finished goods inventory: \$350 (January 31, 2016)
- Prepare the cost of goods sold section of a partial income statement for Business Solutions for the month ended January 31, 2016.

**Check** (3) COGS, \$2,700

## Beyond the Numbers

**BTN 18-1** Managerial accounting is more than recording, maintaining, and reporting financial results. Managerial accountants must provide managers with both financial and nonfinancial information including estimates, projections, and forecasts. An important estimate for **Apple** is its reserve for warranty claims, and the company must provide shareholders information on these estimates.

### Required

- Access and read Apple's "Warranty costs" section of the "Critical Accounting Policies and Estimates" footnote to its financial statements, from Appendix A. How does management establish and adjust the warranty reserve? What are some of the effects if the company's actual results differ from its estimates?
- What is the management accountant's role in determining those estimates?
- What are some factors that could impact the warranty accrual in a given year?

### Fast Forward

- Access **Apple's** annual report for a fiscal year ending after September 28, 2013, from either its website [[Apple.com](http://Apple.com)] or the SEC's EDGAR database [[SEC.gov](http://SEC.gov)]. Answer the questions in parts 1, 2, and 3 after reading the current "Critical Accounting Policies and Estimates." Identify any major changes.

## REPORTING IN ACTION

C1 

## APPLE

**BTN 18-2** Both **Apple** and **Google** have audit committees as part of their boards of directors. Access each company's website ([investor.apple.com](http://investor.apple.com) or [investor.google.com](http://investor.google.com)) and read about the purpose of the audit committee.

### Required

- From Apple's website, select Leadership & Governance, Committee Charters, and Audit and Finance. What is the purpose of Apple's audit committee?
- From Google's website, select Corporate Governance, Board Committees, and Audit. What is the purpose of Google's audit committee?
- Based on your answers to parts 1 and 2, how would management accountants be involved in assisting the audit committee in carrying out its responsibilities?

## COMPARATIVE ANALYSIS

C2 

## APPLE GOOGLE

**BTN 18-3** Assume that you are the managerial accountant at Infostore, a manufacturer of hard drives, CDs, and DVDs. Its reporting year-end is December 31. The chief financial officer is concerned about having enough cash to pay the expected income tax bill because of poor cash flow management. On November 15, the purchasing department purchased excess inventory of CD raw materials in anticipation of rapid growth of this product beginning in January. To decrease the company's tax liability, the chief financial officer tells you to record the purchase of this inventory as part of supplies and expense it in the current year; this would decrease the company's tax liability by increasing expenses.

### Required

- In which account should the purchase of CD raw materials be recorded?
- How should you respond to this request by the chief financial officer?

## ETHICS CHALLENGE

C1 C3 

**COMMUNICATING  
IN PRACTICE**

C6

**BTN 18-4** Write a one-page memorandum to a prospective college student about salary expectations for graduates in business. Compare and contrast the expected salaries for accounting (including different subfields such as public, corporate, tax, audit, and so forth), marketing, management, and finance majors. Prepare a graph showing average starting salaries (and those for experienced professionals in those fields if available). To get this information, stop by your school's career services office; libraries also have this information. The website [JobStar.org](http://JobStar.org) (click on "Salary Info") also can get you started.

**TAKING IT TO  
THE NET**

C1

**BTN 18-5** Managerial accounting professionals follow a code of ethics. As a member of the Institute of Management Accountants, the managerial accountant must comply with Standards of Ethical Conduct.

**Required**

1. Identify, print, and read the *Statement of Ethical Professional Practice* posted at [www.IMA.net.org](http://www.IMA.net.org). (Under "Resources and Publications" select "Ethics Center," and then select "IMA Statement of Ethical Professional Practice.")
2. What four overarching ethical principles underlie the IMA's statement?
3. Describe the courses of action the IMA recommends in resolving ethical conflicts.

**TEAMWORK IN  
ACTION**

C5 P2

**BTN 18-6** The following calendar-year information is taken from the December 31, 2015, adjusted trial balance and other records of Dahlia Company.

Advertising expense	\$ 19,125	Direct labor	\$ 650,750
Depreciation expense—Office equipment	8,750	Indirect labor	60,000
Depreciation expense—Selling equipment	10,000	Miscellaneous production costs	8,500
Depreciation expense—Factory equipment	32,500	Office salaries expense	100,875
Factory supervision	122,500	Raw materials purchases	872,500
Factory supplies used	15,750	Rent expense—Office space	21,125
Factory utilities	36,250	Rent expense—Selling space	25,750
Inventories		Rent expense—Factory building	79,750
Raw materials, December 31, 2014	177,500	Maintenance expense—Factory equipment	27,875
Raw materials, December 31, 2015	168,125	Sales	3,275,000
Work in process, December 31, 2014	15,875	Sales discounts	57,500
Work in process, December 31, 2015	14,000	Sales salaries expense	286,250
Finished goods, December 31, 2014	164,375		
Finished goods, December 31, 2015	129,000		

**Required**

1. Each team member is to be responsible for computing **one** of the following amounts. You are not to duplicate your teammates' work. Get any necessary amounts from teammates. Each member is to explain the computation to the team in preparation for reporting to class.
  - a. Materials used.
  - b. Factory overhead.
  - c. Total manufacturing costs.
  - d. Total cost of work in process.
  - e. Cost of goods manufactured.
2. Check your cost of goods manufactured with the instructor. If it is correct, proceed to part 3.
3. Each team member is to be responsible for computing **one** of the following amounts. You are not to duplicate your teammates' work. Get any necessary amounts from teammates. Each member is to explain the computation to the team in preparation for reporting to class.
  - a. Net sales.
  - b. Cost of goods sold.
  - c. Gross profit.
  - d. Total operating expenses.
  - e. Net income or loss before taxes.

**Point:** Provide teams with transparencies and markers for presentation purposes.

**BTN 18-7** Eden Full of **SunSaluter** must understand manufacturing costs to effectively operate and succeed as a profitable and efficient business.

**ENTREPRENEURIAL  
DECISION**

C1 C2 C6  

**Required**

1. What are the three main categories of manufacturing costs Eden must monitor and control? Provide examples of each.
2. What are four goals of a total quality management process? How can SunSaluter use TQM to improve its business activities?

**BTN 18-8** Visit your favorite fast-food restaurant. Observe its business operations.

**HITTING THE  
ROAD**

C1 C2 

**Required**

1. Describe all business activities from the time a customer arrives to the time that customer departs.
2. List all costs you can identify with the separate activities described in part 1.
3. Classify each cost from part 2 as fixed or variable, and explain your classification.

**BTN 18-9** Access **Samsung's** 2013 annual report from its website ([www.samsung.com](http://www.samsung.com)). Like **Apple**, Samsung offers warranties on its products.

**GLOBAL  
DECISION**

C1 

**Required**

1. Access and read footnote 18, "Provisions," included in Samsung's 2013 annual report. What amount of warranty expense did Samsung record during 2013? What amount of warranty claims did Samsung pay in 2013?
2. Access and read information on Apple's accrued warranty in footnote 10 of its 2013 annual report. What amount of warranty expense did Apple record during 2013? What amount of warranty claims did Apple pay in 2013?
3. Using your answer from parts 1 and 2, which company was more accurate in estimating warranty claims for 2013?

**Samsung  
APPLE**

**ANSWERS TO MULTIPLE CHOICE QUIZ**

1. c
2. b
3. b
4. a
5. e; Beginning finished goods + Cost of goods manufactured (COGM) – Ending finished goods = Cost of goods sold  

$$\$6,000 + \text{COGM} - \$3,200 = \$7,500$$

$$\text{COGM} = \underline{\$4,700}$$

# 19

chapter

# Job Order Costing

## Chapter Preview

### JOB ORDER COSTING

Cost accounting system

**C1** Job order production

Comparing job order and process operations

Production activities in job order costing

Cost flows

**C2** Job cost sheet

### JOB ORDER COST FLOWS AND REPORTS

**P1** Materials cost flows and documents

**P2** Labor cost flows and documents

**P3** Overhead cost flows and recording applied overhead

Recording actual overhead

Summary of cost flows

Schedule of cost of goods manufactured

### ADJUSTING FACTORY OVERHEAD AND PRICING

Overhead T-account and actual vs applied overhead

**P4** Underapplied or overapplied overhead

**A1** Pricing services

## Learning Objectives

### CONCEPTUAL

**C1** Describe important features of job order production.

**C2** Explain job cost sheets and how they are used in job order costing.

### ANALYTICAL

**A1** Apply job order costing in pricing services.

### PROCEDURAL

**P1** Describe and record the flow of materials costs in job order costing.

**P2** Describe and record the flow of labor costs in job order costing.

**P3** Describe and record the flow of overhead costs in job order costing.

**P4** Determine adjustments for overapplied and underapplied factory overhead.

ST. STEPHEN, SC—Growing up, Quintin Middleton was fascinated by swords. “It all started with the movies . . . *Star Wars* and *He-Man*,” laughs Quintin. Working part-time at a knife shop to help pay for his study of aircraft mechanics at a local technical school, Quintin decided he wanted to make knives. But not just any knives. Quintin makes handmade culinary knives of the very highest quality. Although his business, **Middleton Made Knives** ([Middletonmadeknives.com](http://Middletonmadeknives.com)), is young and small, Quintin has sold his knives to chefs of both local and national renown. One top chef, Craig Deihl, says buying one of Quintin’s knives “is like buying a tailored suit. Everything is made to order, and Quintin gives personalized attention.”

Quintin uses direct labor (his own!) in making knives. He begins with only the highest-quality raw materials, including high-carbon steel, stainless steel, and exotic woods for the handles. His production process is labor-intensive; every step, from knife design to grinding the edges, is done by hand. Quintin keeps his overhead costs low by working out of a 12-by-16-foot storage shed in his backyard. “I also keep fixed costs low by not stocking inventory,” explains Quintin, who makes his knives to order. Quintin uses a job order costing system—the topic of this chapter—to track his costs and to make quick business decisions regarding costs and selling prices. In Quintin’s case, he separately tracks the costs of making each special-order knife and the costs of making each group (“job lot”) of standard knives. Job order costing enables entrepreneurs like Quintin to better isolate costs and avoid the runaway costs often experienced by start-ups that fail to use such costing techniques.

Like many entrepreneurs who build their own businesses, Quintin started with little more than a dream. He used his own money to buy his equipment. Although not a chef, he wanted to make knives for chefs, and after many rejections he “finally made a knife that [a top chef] liked.” Quintin’s dream continues to grow with his business. Someday he hopes to have a small knife “factory,” with about 10 employees. Expanding his business will increase Quintin’s materials, labor, and overhead costs, and he will need to rely even more on accurate cost information to succeed.

Courtesy of Quintin Middleton

## Sharpest Knife in the Shed

*“Passion creates quality”*  
—Quintin Middleton

Quintin notes that “to succeed in any business you need a great product.” In Quintin’s case that means constantly striving to make better knives. In addition to a passion for quality, persistence is critical, believes Quintin, and he encourages young entrepreneurs to believe in themselves. “Follow your great ideas, and always have a plan,” says Quintin.

## JOB ORDER COSTING

This section describes a cost accounting system, job order production and costing, and contrasts job order production with process operations.

### Cost Accounting System

**Point:** Cost accounting systems accumulate costs and then assign them to products and services.

**C1** Describe important features of job order production.

Companies use cost accounting systems to generate timely and accurate cost information. A **cost accounting system** records manufacturing activities using a *perpetual* inventory system, which continuously updates records for costs of materials, work in process, and finished goods inventories. A cost accounting system also provides timely information about inventories and manufacturing costs per unit of product. This is especially helpful for managers' efforts to control costs and determine selling prices.

The two basic types of cost accounting systems are *job order costing* and *process costing*. In the next section we differentiate between job order operations and process operations. We then describe job order costing in this chapter and process costing in the next chapter.

### Job Order Production

Many companies produce products individually designed to meet the needs of a specific customer. Each customized product is manufactured separately and its production is called **job order production**, or *job order manufacturing* (also called *customized production*, which is the production of products in response to special orders). Examples of such products or services include special-order machines, a factory building, custom jewelry, wedding invitations, tattoos, and audits by an accounting firm. The production activities for a customized product represent a **job**.

A key feature of job order production is the diversity, often called *heterogeneity*, of the products produced. That is, each customer order differs from another customer order in some important respect. These differences can be large or small. For example, **Nike** allows custom orders over the Internet, enabling customers to select materials and colors and to personalize their shoes with letters and numbers.

When a job involves producing more than one unit of a custom product, it is often called a **job lot**. Products produced as job lots could include benches for a church, imprinted T-shirts for a 10K race or company picnic, or advertising signs for a chain of stores. Although these orders involve more than one unit, the volume of production is typically low, such as 50 benches, 200 T-shirts, or 100 signs.

### Comparing Job Order and Process Operations

**Process operations**, also called *process manufacturing* or *process production*, is the mass production of products in a continuous flow of steps. Unlike job order production, where every product differs depending on customer needs, process operations are designed to mass-produce large quantities of identical products. For example, each year **Penn** makes millions of tennis balls, and **The Hershey Company** produces over a billion pounds of chocolate.

Exhibit 19.1 lists important features of job order and process operations. Both types of operations are used by manufacturers and also by service companies. Movies made by **Walt Disney** and financial audits done by **KPMG** are examples of job order service operations. Order processing in large mail-order firms like **L.L. Bean** is an example of a process service operation.

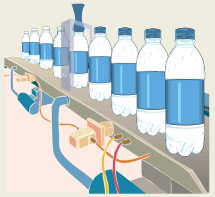

Maddie Meyer/Getty Images

**Point:** Many professional examinations, including the CPA and CMA exams, require knowledge of job order and process costing.

#### EXHIBIT 19.1

<ul style="list-style-type: none"> <li>• Custom orders</li> <li>• Heterogeneous products and services</li> <li>• Low production volume</li> <li>• High product flexibility</li> <li>• Low to medium standardization</li> </ul> 	<ul style="list-style-type: none"> <li>• Repetitive procedures</li> <li>• Homogeneous products and services</li> <li>• High production volume</li> <li>• Low product flexibility</li> <li>• High standardization</li> </ul> 

## Production Activities in Job Order Costing

An overview of job order production activity and cost flows is shown in Exhibit 19.2. This exhibit shows the March production activity of Road Warriors, which installs entertainment systems and security devices in cars and trucks. The company customizes any vehicle by adding speakers, amplifiers, video systems, alarms, and reinforced exteriors.

### EXHIBIT 19.2

Job Order Production Activities and Cost Flows

Job order production for Road Warriors requires materials, labor, and overhead costs. Recall that direct materials are used in manufacturing and can be clearly identified with a particular job. Similarly, direct labor is effort devoted to a particular job. Overhead costs support production of more than one job. Common overhead items are depreciation on factory buildings and equipment, factory supplies (indirect materials), supervision and maintenance (indirect labor), cleaning, and utilities.

Exhibit 19.2 shows that materials, labor, and overhead are added to Jobs B15, B16, B17, B18, and B19, which were started during the month (March). Alarm systems are added to Jobs B15 and B16; Job B17 receives a high-end audio and video entertainment system. Road Warriors completed Jobs B15, B16, and B17 in March and delivered Jobs B15 and B16 to customers. At the end of March, Jobs B18 and B19 remain in work in process inventory and Job B17 is in finished goods inventory.

**Point:** Factory insurance and property taxes are included in overhead.

### Decision Insight

**Target Costing** Many producers determine a target cost for their jobs. Target cost is determined as follows:  $\text{Expected selling price} - \text{Desired profit} = \text{Target cost}$ . If the projected target cost of the job as determined by job costing is too high, the producer can apply *value engineering*, which is a method of determining ways to reduce job cost until the target cost is met. ■

### Cost Flows

Because they are product costs, manufacturing costs flow through inventory accounts (Raw Materials Inventory, Work in Process Inventory, and Finished Goods Inventory) until the related goods are sold. While a job is being produced, its accumulated costs are kept in **Work in Process Inventory**. When a job is finished, its accumulated costs are transferred from Work in Process Inventory to **Finished Goods Inventory**. When a finished job is delivered to a customer, its accumulated costs are transferred from Finished Goods Inventory to Cost of Goods Sold.

These general ledger inventory accounts, however, do not provide enough detail for managers of job order operations to plan and control production activities. Managers need to know the costs of each individual job (or job lot). Subsidiary records store this information about the manufacturing costs for each individual job. The next section describes the use of these subsidiary records.

## C2

Explain job cost sheets and how they are used in job order costing.

## EXHIBIT 19.3

## Job Cost Sheet

## Job Cost Sheet

A major aim of a **job order costing system** is to determine the cost of producing each job or job lot. In the case of a job lot, the system also aims to compute the cost per unit. The accounting system must include separate records for each job to accomplish this, and it must capture information about costs incurred and charge these costs to each job.

A **job cost sheet** is a separate record maintained for each job. Exhibit 19.3 shows a job cost sheet for Road Warriors. This job cost sheet identifies the customer, the job number assigned, the product, and key dates.

Accounting System: Exhibit 19-3

						Materials 600.00		
						Labor 1,000.00		
						Overhead 1,600.00		
						Total cost 3,200.00		

**Point:** Documents (electronic and paper) are crucial in a job order system. The job cost sheet is the cornerstone. Understanding it aids in grasping concepts of capitalizing product costs and product cost flow.

## QC1

sum of the costs on job cost sheets for all jobs that are not yet complete. The balance in the Finished Goods Inventory account at any point in time is the sum of the costs on job cost sheets for all jobs that *are* complete and awaiting sale. The balance in Cost of Goods Sold is the sum of all job sheets for jobs that have been sold and delivered to the customer. Managers use job cost sheets to monitor costs incurred to date and to predict and control costs for each job. In the next section we use Road Warriors' production and sales activity for March to illustrate job order costing and the use of job cost sheets.

## JOB ORDER COST FLOWS AND REPORTS

The previous section provided an overview of job order costing. Next we look at job order costing in more detail, including the source documents for each cost flow. In this example, Road Warriors begins the month (March) with \$1,000 in Raw Materials Inventory and nothing in the Work in Process Inventory or Finished Goods Inventory accounts.

Materials

## Materials Cost Flows and Documents

This section focuses on the flow of materials costs and the related documents in a job order costing system. We begin analysis of the flow of materials costs by examining Exhibit 19.4. When materials are first received from suppliers, the employees count and inspect them and record the items' quantity and cost on a receiving report. The **receiving report** serves as the *source document* for recording materials received in both a materials ledger card and in the general ledger. In nearly all job order cost systems, **materials ledger cards** (or electronic files) are perpetual records that are updated each time materials are purchased and each time materials are issued for use in production.

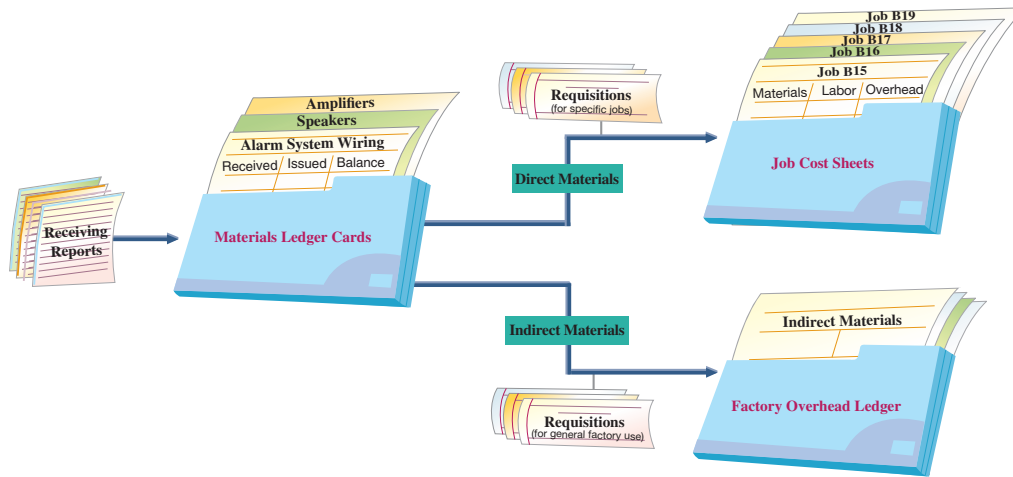

To illustrate the purchase of materials, Road Warriors acquired \$2,750 of materials on credit on March 4, 2015. These include both direct and indirect materials. This purchase is recorded as shown below. After this entry is recorded, each individual materials ledger card is updated to

## P1

Describe and record the flow of materials costs in job order costing.

**Point:** Some companies certify certain suppliers based on the quality of their materials. Goods received from these suppliers are not always inspected by the purchaser to save costs.

**EXHIBIT 19.4**  
Materials Cost Flows

reflect the added materials. In addition, the entry is posted to the Raw Materials Inventory and Accounts Payable general ledger accounts.

Mar. 4	Raw Materials Inventory.....	2,750	
	Accounts Payable .....		2,750
	<i>To record purchase of materials for production.</i>		

Assets = Liabilities + Equity  
+2,750    +2,750

Exhibit 19.4 shows that materials can be requisitioned for use either on a specific job (direct materials) or as overhead (indirect materials). Direct materials include costs, such as alarm system wiring, that are easily traced to individual jobs. Indirect materials include costs, such as those for screws, that are not easily traced to jobs. Cost of direct materials flows from the materials ledger card to the job cost sheets. The cost of indirect materials flows from the materials ledger card to the Indirect Materials account in the factory overhead ledger, which is a subsidiary ledger controlled by the Factory Overhead account in the general ledger. The factory overhead ledger includes all of the individual overhead costs.

Exhibit 19.5 shows a materials ledger card for one type of material received and issued by Road Warriors. The card identifies the item as alarm system wiring and shows the item’s stock number, its location in the storeroom, information about the maximum and minimum quantities that should be available, and the reorder quantity. For example, two units of alarm system wiring were purchased on March 4, 2015, as evidenced by receiving report C-7117. After this purchase the company has three units of alarm system wiring on hand. Materials ledger cards would also be updated for each of the other materials purchased.

When materials are needed in production, a production manager prepares a **materials requisition** and sends it to the materials manager. For direct materials, the requisition shows the job

**EXHIBIT 19.5**  
Materials Ledger Card

<b>MATERIALS LEDGER CARD</b>											
<b>Road Warriors</b> Los Angeles, California											
<b>Item</b>	Alarm system wiring			<b>Stock No.</b>	M-347		<b>Location in Storeroom</b>	Bin 137			
<b>Maximum quantity</b>	5 units			<b>Minimum quantity</b>	1 unit		<b>Quantity to reorder</b>	2 units			
Date	Receiving Report Number	Received			Issued			Balance			
		Units	Unit Price	Total Price	Requisition Number	Units	Unit Price	Total Price	Units	Unit Price	Total Price
3/4/2015	C-7117	2	225.00	450.00					1	225.00	225.00
3/7/2015					R-4705	1	225.00	225.00	3	225.00	675.00
									2	225.00	450.00

number, the type of material, the quantity needed, and the signature of the manager authorized to make the requisition. Exhibit 19.6 shows the materials requisition for alarm system wiring for Job B15. For requisitions of indirect materials, which cannot be traced to individual jobs, the “Job No.” line in the requisition form might read “For General Factory Use.”

**EXHIBIT 19.6**  
Materials Requisition

MATERIALS REQUISITION		No. R-4705
<b>Road Warriors</b> Los Angeles, California		
Job No. <u>          B15          </u>	Date <u>          3/7/2015          </u>	
Material Stock No. <u>          M-347          </u>	Material Description <u>          Alarm system wiring          </u>	
Quantity Requested <u>          1          </u>	Requested By <u>          C. Luther          </u>	
Quantity Provided <u>          1          </u>	Date Provided <u>          3/7/2015          </u>	
Filled By <u>          M. Bateman          </u>	Material Received By <u>          C. Luther          </u>	
Remarks _____		

Requisitions are often accumulated and recorded in one journal entry. The frequency of entries depends on the job, the industry, and management procedures. In this example, Road Warriors records materials requisitions at the end of each week. These materials requisitions are shown below.

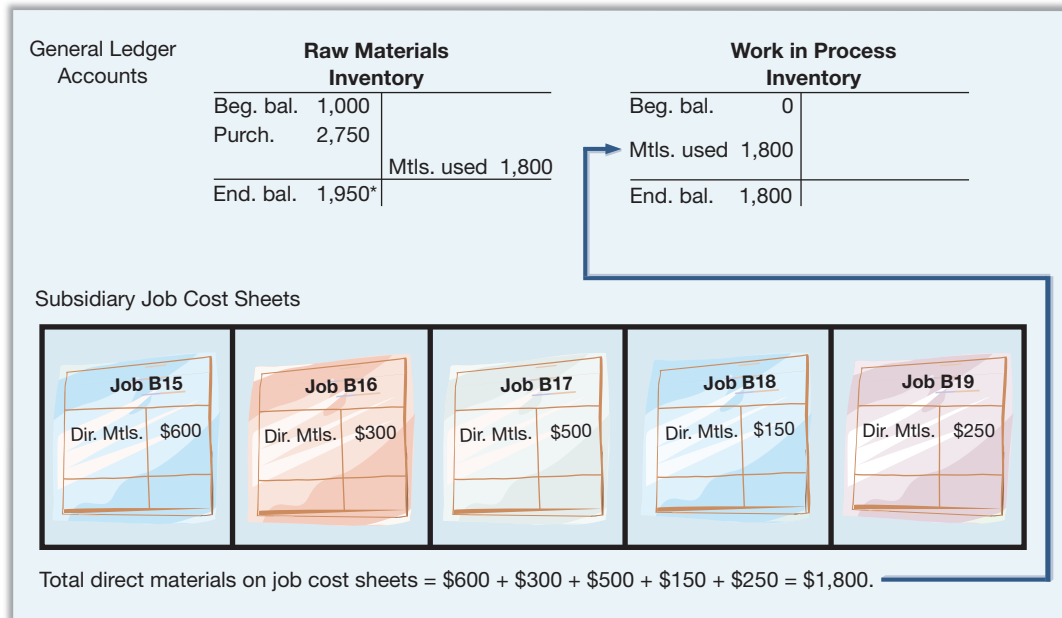

Direct materials—requisitioned for specific jobs	
Job B15 .....	\$ 600
Job B16 .....	300
Job B17 .....	500
Job B18 .....	150
Job B19 .....	<u>250</u>
<b>Total direct materials</b> .....	<b>\$1,800</b>
Indirect materials—requisitioned for general factory use .....	<u>550</u>
Total .....	<u><u>\$ 2,350</u></u>

The use of direct materials for the week (including alarm system wiring for Job B15) yields the following entry.

Assets = Liabilities + Equity  
 +1,800  
 -1,800

Mar. 7	Work in Process Inventory .....	1,800	
	Raw Materials Inventory .....		1,800
	<i>To record use of direct materials.</i>		

This entry is posted both to general ledger accounts and to subsidiary records. Posting to subsidiary records includes debits to job cost sheets and credits to materials ledger cards. Exhibit 19.7 shows the postings to general ledger accounts (Work in Process Inventory and Raw Materials Inventory) and to the job cost sheets (subsidiary records). The Raw Materials Inventory account began the month with \$1,000 of beginning inventory; it was increased for the March 7 purchase of \$2,750. The \$1,800 cost of materials used reduces Raw Materials Inventory and increases Work in Process Inventory. Note that the total amount of direct materials used so far (\$1,800) is reflected in Work in Process Inventory and in the job cost sheets. Later we show the accounting for indirect materials. At this point, it is important only to know that requisitions of indirect materials do not directly impact Work in Process Inventory.

**EXHIBIT 19.7**  
Posting Direct Materials Used to the General Ledger and Job Cost Sheets

\* Equals total amount from all materials ledger cards (not shown in this exhibit).

A manufacturing company purchased \$1,200 of materials (on account) for use in production. The company used \$200 of direct materials on Job 1 and \$350 of direct materials on Job 2. Prepare journal entries to record these two transactions.

**Solution**

Raw Materials Inventory . . . . .	1,200	
Accounts Payable . . . . .		1,200
<i>To record purchase of materials on account.</i>		
Work in Process Inventory . . . . .	550	
Raw Materials Inventory . . . . .		550
<i>To record use of direct materials in production.</i>		

**NEED-TO-KNOW 19-1**

Recording Direct Materials

P1

Do More: QS 19-4, E 19-8

**Labor Cost Flows and Documents**

Labor is the next manufacturing cost to account for. Exhibit 19.8 shows that factory labor costs are classified as either direct or indirect. Direct labor costs flow to individual job cost sheets. To assign direct labor costs to individual jobs, companies use **time tickets** to track how each employee’s time is used. Employees fill out time tickets to record how much time they spent on each job. For many companies, this process is automated: Employees swipe electronic identification badges, and a computer system assigns employees’ hours worked to individual jobs. An employee who works on several jobs during a day completes separate time tickets for each job. In all cases, supervisors check and approve the accuracy of time tickets.

Indirect labor includes factory costs like supervisor salaries and maintenance worker wages. These costs cannot be assigned directly to individual jobs. Instead, the company determines the amounts of supervisor salaries from their salary contracts and the amounts of maintenance worker wages from time tickets, and classifies those costs as overhead. These costs flow to the factory overhead ledger. Later in the chapter we show how these overhead costs are allocated to specific jobs.

**P2**

Describe and record the flow of labor costs in job order costing.

**Point:** Many employee fraud schemes involve payroll, including overstated hours on time tickets.

**EXHIBIT 19.8**

Labor Cost Flows

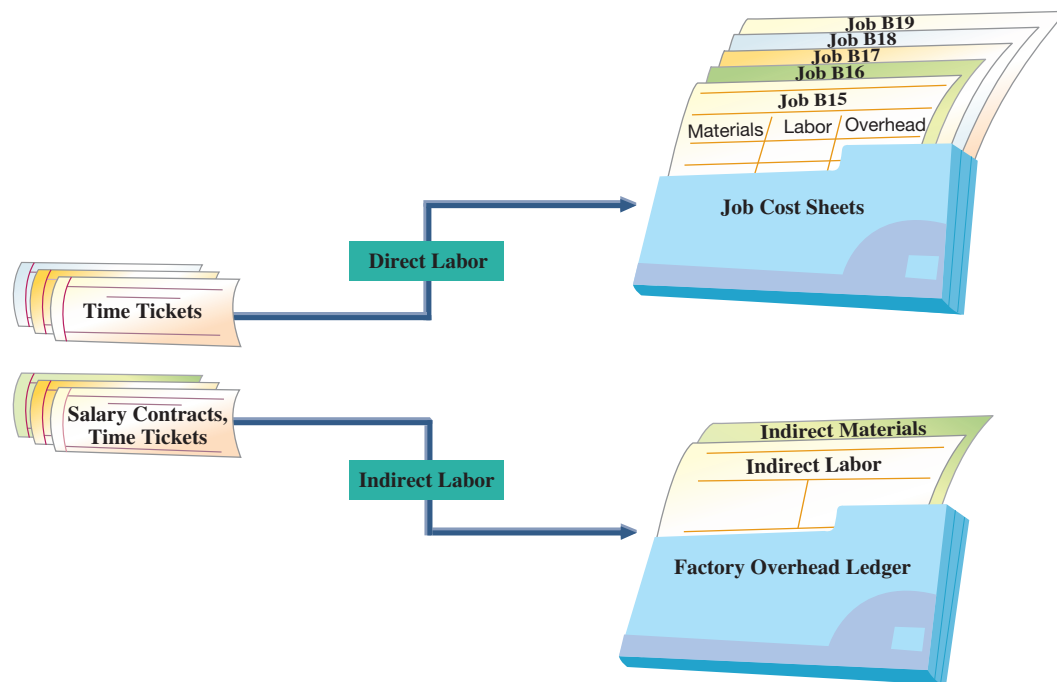

Exhibit 19.9 shows a time ticket reporting the time a Road Warrior employee spent working on Job B15. The employee’s supervisor signed the ticket to confirm its accuracy. The hourly rate and total labor cost are computed after the time ticket is turned in.

**EXHIBIT 19.9**

9:00	12:00	3.0	\$20.00
Approved By <u>E. Luther</u>			<b>Total Cost</b> \$60.00

**Remarks**  
.....  
.....  
.....

Time tickets are often accumulated and recorded in one journal entry. The frequency of these entries varies across companies. In this example, Road Warriors journalizes direct labor monthly. During March, Road Warriors’ factory payroll costs total \$5,300. Of this amount, \$4,200 can be traced directly to jobs, and the remaining \$1,100 is classified as indirect labor, as shown below.

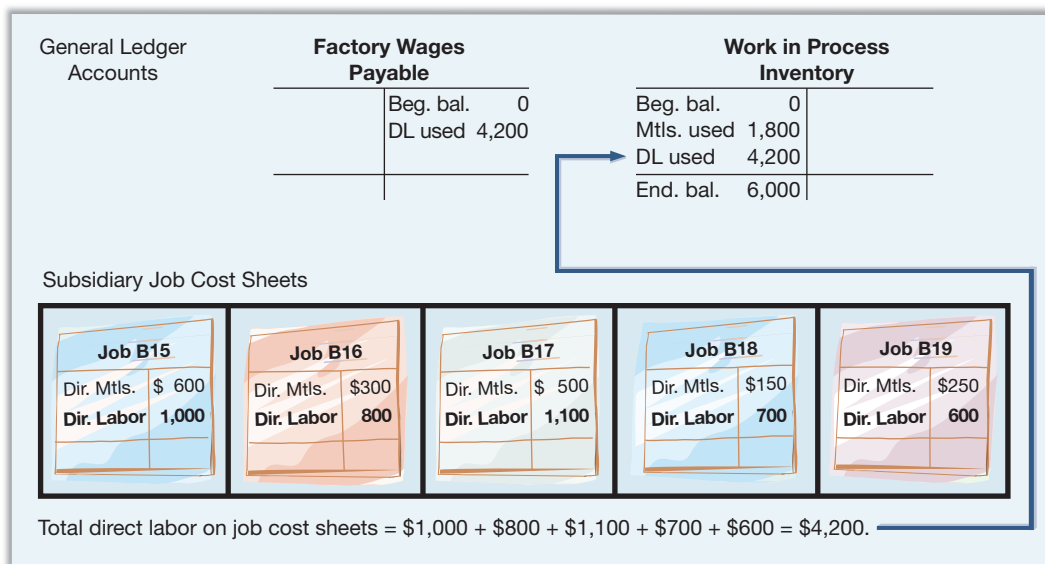

Direct labor—traceable to specific jobs	
Job B15 .....	\$ 1,000
Job B16 .....	800
Job B17 .....	1,100
Job B18 .....	700
Job B19 .....	600
<b>Total direct labor</b> .....	<b>\$4,200</b>
Indirect labor .....	1,100
Total .....	<u>\$ 5,300</u>

The following entry records direct labor for the month, based on all the direct labor time tickets for the month.

Mar. 31	Work in Process Inventory .....	4,200	
	Factory Wages Payable.....		4,200
	<i>To record direct labor used for the month.</i>		

Assets = Liabilities + Equity  
 +4,200    +4,200

This entry is posted to the general ledger accounts, Work in Process Inventory and Factory Wages Payable (or Cash, if paid), and to individual job cost sheets. Exhibit 19.10 shows these postings. Time tickets are used to determine how much of the monthly total direct labor cost (\$4,200) to assign to specific jobs. This total matches the amount of direct labor posted to the Work in Process Inventory general ledger account. After this entry is posted, the balance in Work in Process Inventory is \$6,000, consisting of \$1,800 of direct materials and \$4,200 of direct labor. Later we show the accounting for indirect labor. At this point it is important only to know that the use of indirect labor does not impact Work in Process Inventory.

**EXHIBIT 19.10**

Posting Direct Labor to General Ledger and Job Cost Sheets

A manufacturing company used \$5,400 of direct labor in production activities in May. Of this amount, \$3,100 of direct labor was used on Job A1 and \$2,300 of direct labor was used on Job A2. Prepare the journal entry to record direct labor used.

**Solution**

Work in Process Inventory.....	5,400	
Factory Wages Payable.....		5,400
<i>To record direct labor used in production.</i>		

**NEED-TO-KNOW 19-2**

Recording Direct Labor  
**P2**

Do More: QS 19-5, E 19-9

**Overhead Cost Flows and Recording Applied Overhead**

We turn now to overhead costs. Unlike direct materials and direct labor, overhead costs cannot be traced directly to individual jobs. Instead, the accounting for overhead costs follows the four-step process shown in Exhibit 19.11. Overhead accounting requires managers to first estimate what total overhead costs will be for the coming period. We cannot wait until the end of a period to allocate overhead to jobs, because a job order costing system uses perpetual inventory records that require

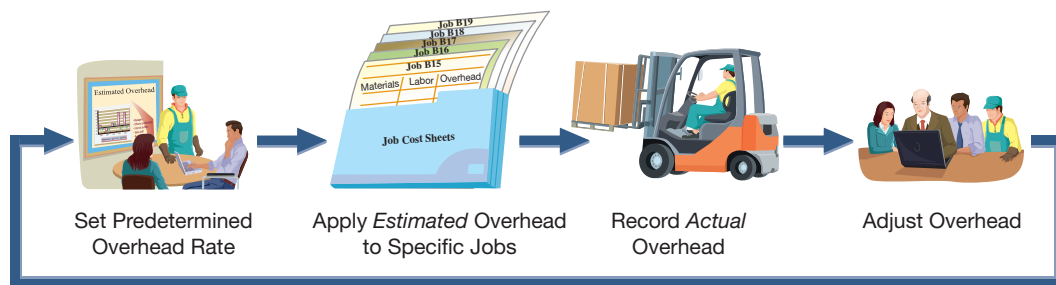

**Overhead**

**P3**

Describe and record the flow of overhead costs in job order costing.

**EXHIBIT 19.11**

Four-Step Process for Overhead

up-to-date costs. This estimated overhead cost, even if it is not exactly precise, is needed to estimate a job’s total costs before its completion. Such estimated costs are useful for managers in many decisions, including setting prices and identifying costs that are out of control. At the end of the year, the company adjusts its estimated overhead to the actual amount of overhead incurred for that year, and then considers whether to change its predetermined overhead rate for the next year. We discuss each of these steps below.

**Predetermined Overhead Rates** Being able to estimate overhead in advance requires a **predetermined overhead rate**, also called *predetermined overhead allocation (or application) rate*. The predetermined overhead rate requires an estimate of total overhead cost and an allocation factor such as total direct labor cost *before* the start of the period. Exhibit 19.12 shows the usual formula for computing a predetermined overhead rate (estimates are commonly based on annual amounts). This rate is used during the period to allocate estimated overhead to jobs. Some companies use multiple activity (allocation) bases and multiple predetermined overhead rates for different types of products and services.

**Point:** Predetermined overhead rates can be estimated using mathematical equations, statistical analysis, or professional experience.

**EXHIBIT 19.12**

Predetermined Overhead Rate Formula

$$\text{Predetermined overhead rate} = \frac{\text{Estimated overhead costs}}{\text{Estimated activity base}}$$

© Royalty-Free/Corbis

**Overhead Allocation Bases** We generally allocate overhead by linking it to another factor used in production, such as direct labor or machine hours. The factor to which overhead costs are linked is known as the *activity (or allocation) base*. The allocation should reflect a “cause and effect” relation between the base and overhead costs. A manager must think carefully about how many and which activity bases to use. This managerial decision influences the accuracy with which overhead costs are allocated to individual jobs. In turn, the cost of individual jobs might impact a manager’s decisions for pricing or performance evaluation.

**Recording Applied Overhead** To illustrate, Road Warriors applies (also termed *allocates, assigns, or charges*) overhead by linking it to direct labor. At the start of the current year, management estimates total direct labor costs of \$125,000 and total overhead costs of \$200,000. Using these estimates, management computes its predetermined overhead rate as 160% of direct labor cost (\$200,000 ÷ \$125,000). Earlier we showed that Road Warriors used \$4,200 of direct labor in March. We then use the predetermined overhead rate of 160% to allocate \$6,720 (equal to \$4,200 × 1.60) of overhead. The entry to record this allocation is:

**Point:** Factory Overhead is a temporary account that holds costs. The Factory Overhead account is closed to zero at the end of the year.

Mar. 31	Work in Process Inventory .....	6,720	
	Factory Overhead .....		6,720
	<i>To apply overhead at 160% of direct labor.</i>		

Then, overhead is allocated to each individual job based on the amount of the activity base that job used (in this example, direct labor). Exhibit 19.13 shows these calculations for Road Warriors’ March production activity.

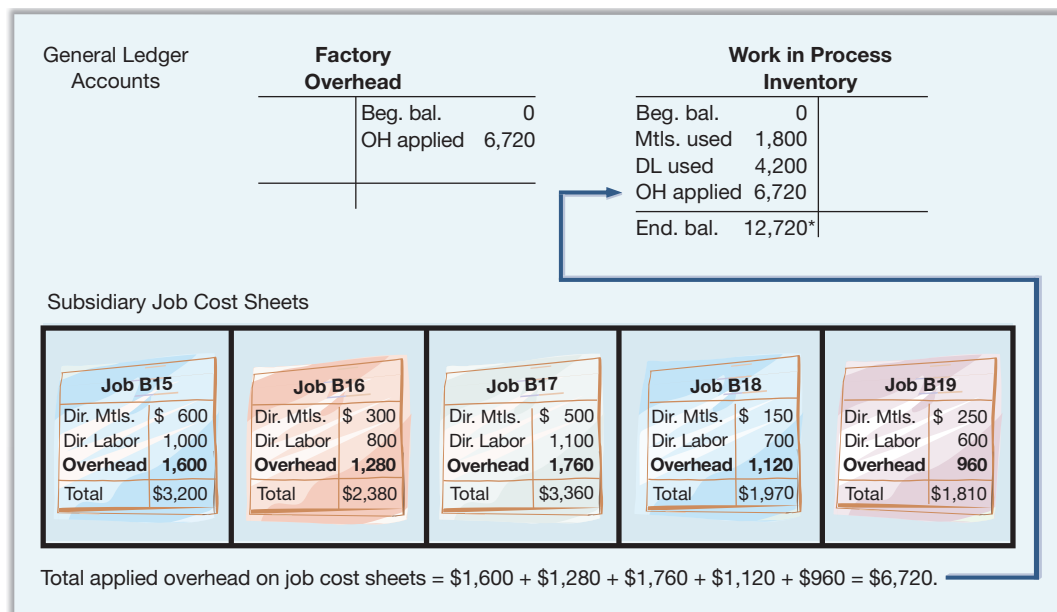

Job	Direct Labor Cost	Predetermined Overhead Rate*	Allocated Overhead
B15 .....	\$1,000	1.6	\$1,600
B16 .....	800	1.6	1,280
B17 .....	1,100	1.6	1,760
B18 .....	700	1.6	1,120
B19 .....	600	1.6	960
Total .....	<u>\$4,200</u>		<u>\$6,720</u>

\*160% of direct labor cost

After overhead is journalized in the general journal and the amounts of overhead to allocate to each job are determined (Exhibit 19.13), postings to general ledger accounts and to individual job cost sheets follow, as in Exhibit 19.14.

**EXHIBIT 19.13**

Allocating Overhead to Specific Jobs

**EXHIBIT 19.14**

Posting Overhead to General Ledger and Job Cost Sheets

\* Total product costs assigned to jobs = \$3,200 + \$2,380 + \$3,360 + \$1,970 + \$1,810 = \$12,720, equal to the ending balance in Work in Process Inventory in the general ledger.

At this point, estimated (allocated) overhead has been posted to general ledger accounts and to individual job cost sheets. In addition, we verified that the balance in the Work in Process Inventory account equals the sum of the accumulated balances in the job cost sheets. In the next section we discuss how to record *actual* overhead.

A manufacturing company estimates it will incur \$240,000 of overhead costs in the next year. The company allocates overhead using machine hours, and estimates it will use 1,600 machine hours in the next year. During the month of June, the company used 80 machine hours on Job 1 and 70 machine hours on Job 2.

1. Compute the predetermined overhead rate to be used to apply overhead during the year.
2. Determine how much overhead should be applied to Job 1 and to Job 2 for June.
3. Prepare the journal entry to record overhead applied for June.

**Solution**

1.  $\$240,000 / 1,600 = \$150$  per machine hour.
2.  $80 \times \$150 = \$12,000$  applied to Job 1;  $70 \times \$150 = \$10,500$  applied to Job 2.

3.

Work in Process Inventory.....	22,500	
Factory Overhead.....		22,500
<i>To record applied overhead.</i>		

**NEED-TO-KNOW 19-3**

Recording Applied Overhead

P3

QC2

Do More: QS 19-6, QS 19-8, QS 19-11, E 19-10

**Point:** Companies also incur *nonmanufacturing* costs, such as advertising, salesperson's salaries, and depreciation on assets not used in production. These types of costs are not considered overhead, but instead are treated as period costs and charged directly to the income statement. These period costs can be relevant to managers' pricing decisions.

## Recording Actual Overhead

Factory overhead includes all factory costs other than direct materials and direct labor. Two sources of overhead costs are *indirect* materials and *indirect* labor. These costs are recorded from materials requisition forms for indirect materials and from salary contracts or time tickets for indirect labor. Two other sources of overhead are (1) vouchers authorizing payment for factory items such as supplies or utilities and (2) adjusting journal entries for costs such as depreciation on factory assets.

Factory overhead usually contains many different costs. These costs are recorded with debits to the Factory Overhead general ledger account, and with credits to various accounts. Next we show how to record journal entries for actual overhead costs. While journal entries for different types of overhead costs might be recorded with varying frequency, in our example we assume these entries are each made at the end of the month.

**Recording Indirect Materials Used** During March, Road Warriors incurred \$550 of actual indirect materials costs, as supported by materials requisitions. The use of these indirect materials yields the following entry.

Mar. 31	Factory Overhead . . . . .	550	
	Raw Materials Inventory . . . . .		550
	<i>To record indirect materials used during the month.</i>		

This entry is posted to the general ledger accounts, Factory Overhead and Raw Materials Inventory, and is posted to Indirect Materials in the subsidiary factory overhead ledger. Note that unlike the recording of *direct* materials, actual *indirect* materials costs incurred are not immediately recorded in Work in Process Inventory and are not posted to job cost sheets.

**Recording Indirect Labor Used** During March, Road Warriors incurred \$1,100 of actual indirect labor costs. These costs might be supported by time tickets for maintenance workers or by salary contracts for production supervisors. The use of this indirect labor yields the following entry.

Mar. 31	Factory Overhead . . . . .	1,100	
	Factory Wages Payable . . . . .		1,100
	<i>To record indirect labor used during the month.</i>		

This entry is posted to the general ledger accounts, Factory Overhead and Factory Wages Payable, and is posted to Indirect Labor in the subsidiary factory overhead ledger. Note that unlike the recording of *direct* labor, actual *indirect* labor costs incurred are not recorded immediately in Work in Process Inventory and are not posted to job cost sheets.

**Recording Other Overhead Costs** During March, Road Warriors incurred \$5,270 of actual other overhead costs. These costs could include items such as factory building rent, depreciation on the factory building, factory utilities, and other such costs indirectly related to production activities. These costs are recorded with debits to Factory Overhead and credits to other accounts such as Cash, Accounts Payable, Utilities Payable, and Accumulated Depreciation—Factory Equipment. The entry to record these other overhead costs for March is as follows.

Mar. 31	Factory Overhead . . . . .	5,270	
	Accumulated Depreciation—Factory Equipment . . .		2,400
	Rent Payable . . . . .		1,620
	Utilities Payable . . . . .		250
	Prepaid Insurance . . . . .		1,000
	<i>To record actual overhead costs for the month.</i>		

This entry is posted to the general ledger account, Factory Overhead, and is posted to separate accounts for each of the overhead items in the subsidiary factory overhead ledger. Note that actual overhead costs incurred are not recorded in Work in Process Inventory and are not posted to job cost sheets. Only applied overhead is recorded in Work in Process Inventory and posted to job cost sheets.

A manufacturing company used \$400 of indirect materials and \$2,000 of indirect labor during the month. The company also incurred \$1,200 of depreciation on factory equipment, \$500 of depreciation on office equipment, and \$300 of factory utilities. Prepare the journal entry to record actual factory overhead costs incurred during the month.

**Solution**

Factory Overhead . . . . .	3,900	
Raw Materials Inventory . . . . .		400
Factory Wages Payable . . . . .		2,000
Accumulated Depreciation—Factory Equipment* . . . . .		1,200
Utilities Payable . . . . .		300
<i>To record actual overhead costs used in production.</i>		

\*Depreciation on office equipment is a period cost and is excluded from factory overhead.

**Summary of Cost Flows**

In this section we summarize the flow of costs. Exhibit 19.15 shows how costs for a manufacturing company flow to its financial statements.

**EXHIBIT 19.15**

Cost Flows and Reports

\*Reported on the schedule of cost of goods manufactured.

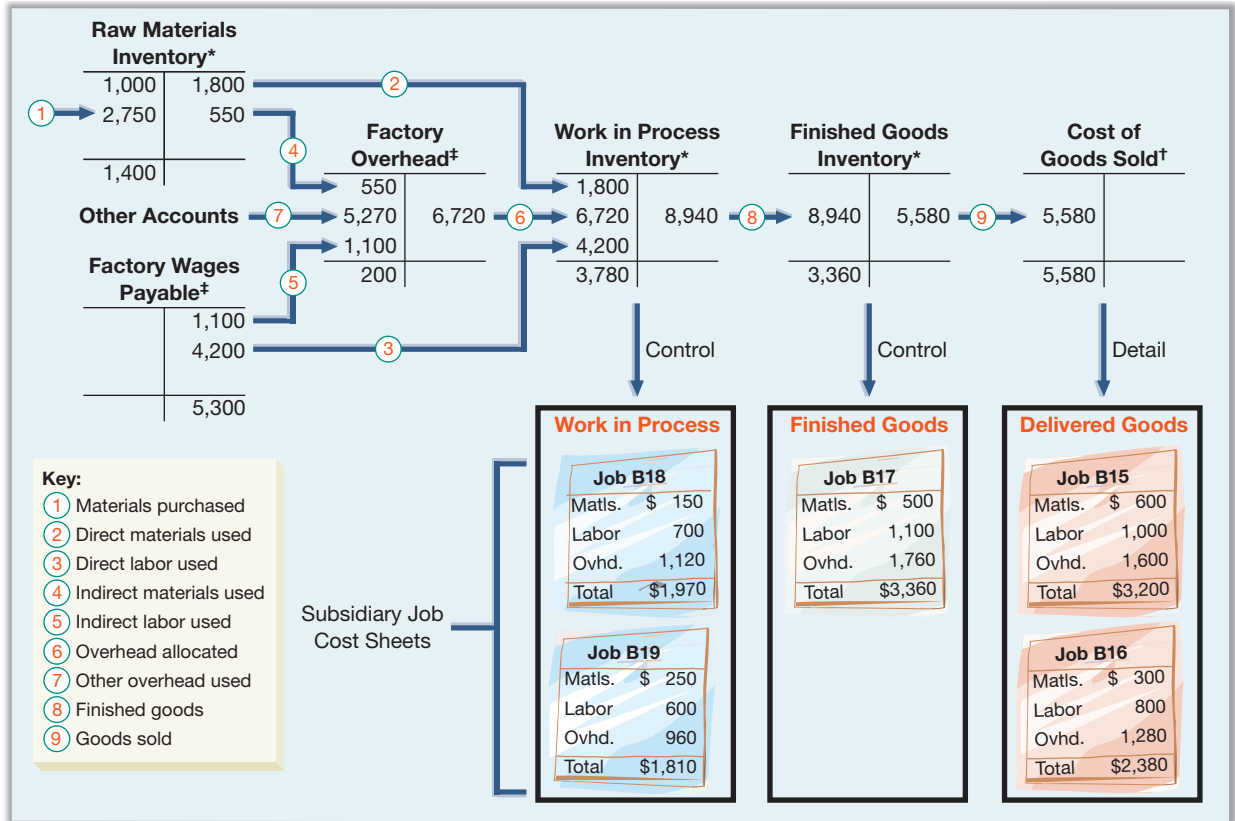

Exhibit 19.15 shows that direct materials used, direct labor used, and factory overhead applied flow through the Work in Process Inventory and Finished Goods balance sheet accounts. The cost of goods manufactured (COGM) is computed and shown on the schedule of cost of goods manufactured. When goods are sold, their costs are transferred from Finished Goods Inventory to the income statement as cost of goods sold.

Period costs do not impact inventory accounts. As a result, they do not impact cost of goods sold, and they are not reported on the schedule of cost of goods manufactured. They are reported on the income statement as operating expenses.

We next show the flow of costs and their reporting for our Road Warriors example. The upper part of Exhibit 19.16 shows the flow of Road Warriors' product costs through general ledger accounts. Arrow lines are numbered to show the flows of costs for March. Each numbered cost flow reflects journal entries made in March. The lower part of Exhibit 19.16 shows summarized job cost sheets and their status at the end of March. The sum of costs assigned to the two jobs in process (\$1,970 + \$1,810) equals the \$3,780 balance in Work in Process Inventory. Also, costs assigned to Job B17 equal the \$3,360 balance in Finished Goods Inventory. These balances in Work in Process Inventory and Finished Goods Inventory are reported on the end-of-period balance sheet. The sum of costs assigned to Jobs B15 and B16 (\$3,200 + \$2,380) equals the \$5,580 balance in Cost of Goods Sold. This amount is reported on the income statement for the period.

**EXHIBIT 19.16**

Job Order Cost Flows and Ending Job Cost Sheets

\* The ending balances in the inventory accounts are carried to the balance sheet.

† The Cost of Goods Sold balance is carried to the income statement.

‡ Factory Overhead is considered a temporary account; when these costs are allocated to jobs, its balance is reduced.

Exhibit 19.17 shows the journal entries made in March. Each entry is numbered to link with the arrow lines in Exhibit 19.16. In addition, Exhibit 19.17 concludes with the summary journal entry to record the sales (on account) of Jobs B15 and B16.

**EXHIBIT 19.17**

Entries for Job Order Production Costs\*

①	Raw Materials Inventory.....	2,750		⑥	Work in Process Inventory.....	6,720	
	Accounts Payable.....		2,750		Factory Overhead.....		6,720

\* Exhibit 19.17 provides summary journal entries. *Actual* overhead is debited to Factory Overhead. *Applied* overhead is credited to Factory Overhead.

## Schedule of Cost of Goods Manufactured

We end the Road Warriors example with the schedule of cost of goods manufactured in Exhibit 19.18. This schedule is similar to the one reported in the previous chapter, with one key difference: *Total manufacturing costs includes overhead applied rather than actual overhead costs.* In this example, actual overhead costs were \$6,920, while applied overhead was \$6,720. We discuss how to account for this difference in the next section.

Work in Process Inventory	
Beg. bal.	0
Mtls. used	1,800
DL used	4,200
OH applied	6,720
Ttl mfg. costs	12,720
	<b>COGM 8,940</b>
End. bal.	3,780

ROAD WARRIORS Schedule of Cost of Goods Manufactured For the Month of March, 2015	
Direct materials used . . . . .	\$ 1,800
Direct labor used . . . . .	4,200
Factory overhead applied*. . . . .	<u>6,720</u>
Total manufacturing costs . . . . .	\$12,720
Add: Work in process, March 1, 2015 . . . . .	<u>0</u>
Total cost of work in process . . . . .	12,720
Less: Work in process, March 31, 2015 . . . . .	<u>3,780</u>
Cost of goods manufactured . . . . .	<u>\$ 8,940</u>

### EXHIBIT 19.18

Schedule of Cost of Goods Manufactured

\* Actual overhead = \$6,920. Overhead is \$200 underapplied.

## ADJUSTING FACTORY OVERHEAD

Refer to the debits in the Factory Overhead account in Exhibit 19.16 (or Exhibit 19.17). The total cost of factory overhead incurred during March is \$6,920 (\$550 + \$5,270 + \$1,100). The \$6,920 of actual overhead costs does not equal the \$6,720 of overhead applied to work in process inventory (see ⑥). This leaves a debit balance of \$200 in the Factory Overhead account. Companies usually wait until the end of the year to adjust the Factory Overhead account for differences between actual and applied overhead. We show how this is done in the next section.

### Factory Overhead T-Account

Exhibit 19.19 shows a Factory Overhead T-account. The company applies overhead (credits the Factory Overhead account) using a predetermined rate estimated at the beginning of the year. During the year, the company records actual overhead costs with debits to the Factory Overhead account. Exhibit 19.20 shows what to do when, at year-end, actual overhead does not equal applied overhead. First, we determine whether the applied overhead is more or less than the actual overhead:

Factory Overhead	
Actual amounts	Applied amounts

### EXHIBIT 19.19

Factory Overhead T-account

- When *less* overhead is applied than is actually incurred, the remaining debit balance in the Factory Overhead account is called **underapplied overhead**.
- When *more* overhead is applied than is actually incurred, the resulting credit balance in the Factory Overhead account is called **overapplied overhead**.

When overhead is underapplied, it means that individual jobs have not been charged enough overhead during the year, and cost of goods sold for the year is too low. When overhead is overapplied, it means that jobs have been charged too much overhead during the year, and cost of goods sold is too high. In either case, a journal entry is needed to adjust Factory Overhead and Cost of Goods Sold. Exhibit 19.20 summarizes this entry.

**EXHIBIT 19.20**

Adjusting Factory Overhead

Overhead Costs	Factory Overhead Balance Is	Overhead Is	Journal Entry Required
Actual > Applied	Debit	Underapplied	Cost of Goods Sold . . . . . # Factory Overhead . . . . . #
Actual < Applied	Credit	Overapplied	Factory Overhead . . . . . # Cost of Goods Sold . . . . . #

**P4**

Determine adjustments for overapplied and underapplied factory overhead.

**Example:** If we do not adjust for underapplied overhead, will net income be overstated or understated? Answer: Overstated.

**Underapplied or Overapplied Overhead**

To illustrate, assume that Road Warriors applied \$200,000 of overhead to jobs during 2015. This equals the amount of overhead that management estimated in advance for the year. We further assume that Road Warriors incurred a total of \$200,480 of actual overhead costs during 2015. Thus, at the end of the year, the Factory Overhead account has a debit balance of \$480.

The \$480 debit balance reflects manufacturing costs not assigned to jobs. This means that the balances in Work in Process Inventory, Finished Goods Inventory, and Cost of Goods Sold do not include all production costs incurred. The required journal entry depends on whether the difference (under- or overapplied) is material. When the underapplied overhead amount is immaterial, it is closed to the Cost of Goods Sold account with the following adjusting entry.

Dec. 31	Cost of Goods Sold . . . . .	480	
	Factory Overhead . . . . .		480
	<i>To adjust for underapplied overhead costs.</i>		

The \$480 debit (increase) to Cost of Goods Sold reduces income by \$480. After this entry, the Factory Overhead account has a zero balance. (When the underapplied or overapplied overhead is material, the amount is normally allocated to the Cost of Goods Sold, Finished Goods Inventory, and Work in Process Inventory accounts. This process is covered in advanced courses.) We treat overapplied overhead at the end of the period in the same way we treat underapplied overhead, except that we debit Factory Overhead and credit Cost of Goods Sold for the amount.

**NEED-TO-KNOW 19-5**

Adjusting Overhead

**P4**

A manufacturing company applied \$300,000 of overhead to its jobs during the year. For the independent scenarios below, prepare the journal entry to adjust over- or underapplied overhead. Assume the adjustment amounts are not material.

1. Actual overhead costs incurred during the year equal \$305,000.
2. Actual overhead costs incurred during the year equal \$298,500.

**Solution**

1.

Cost of Goods Sold . . . . .	5,000	
Factory Overhead . . . . .		5,000
<i>To close underapplied overhead to Cost of Goods Sold.</i>		

2.

Factory Overhead . . . . .	1,500	
Cost of Goods Sold . . . . .		1,500
<i>To close overapplied overhead to Cost of Goods Sold.</i>

## Job Order Costing of Services

The principle of customization also applies to service companies. Most service companies meet customers' needs by performing a custom service for a specific customer. Examples of such services include an accountant auditing a client's financial statements, an interior designer remodeling an office, a wedding consultant planning and supervising a reception, and a lawyer defending a client. Whether the setting is manufacturing or services, job order operations involve meeting the needs of customers by producing or performing custom jobs. We show an example of job order costing for an advertising service in the Decision Analysis section of this chapter.

### Decision Maker

**Management Consultant** One of your tasks is to control and manage costs for a consulting company. At the end of a recent month, you find that three consulting jobs were completed and two are 60% complete. Each unfinished job is estimated to cost \$10,000 and to earn a revenue of \$12,000. You are unsure how to recognize work in process inventory and record costs and revenues. Do you recognize any inventory? If so, how much? How much revenue is recorded for unfinished jobs this month? ■ [Answers follow the chapter's Summary.]

## GLOBAL VIEW

**Porsche AG** manufactures high-performance cars. Each car is built according to individual customer specifications. Customers can use the Internet to place orders for their dream cars. Porsche employs just-in-time inventory techniques to ensure a flexible production process that can respond rapidly to customer orders. For a recent year, Porsche reported €33,781 million in costs of materials and €9,038 million in personnel costs, which helped generate €57,081 million in revenue.

Sean Gallup/Getty Images

**Sustainability and Accounting** Porsche's sustainability efforts extend beyond its manufacturing operations to event management. Each year when the company sponsors a professional tennis tournament, it uses a Porsche Cayenne Hybrid to shuttle players to and from the venue. In addition, the company sells event tickets that include public transportation, thus reducing the number of distinct journeys to the venue by about 30%. In addition, **Middleton Made Knives** applies sustainability through Quintin Middleton's choice of materials. The steel used for his knife blades can be recycled, and new trees can be planted to supply the wood for his knife blades.

### Pricing for Services

### Decision Analysis

The chapter described job order costing mainly using a manufacturing setting. However, these concepts and procedures are applicable to a service setting. Consider AdWorld, an advertising agency that develops Web-based ads for small firms. Each of its customers has unique requirements, so costs for each individual job must be tracked separately.

AdWorld uses two types of labor: Web designers (\$65 per hour) and computer staff (\$50 per hour). It also incurs overhead costs that it assigns using two different predetermined overhead allocation rates: \$125 per designer hour and \$96 per staff hour. For each job, AdWorld must estimate the number of designer and staff hours needed. Then total costs pertaining to each job are determined using the procedures in the chapter. [Note: Most service firms have neither the raw materials inventory nor finished goods inventory. Such firms do typically have inventories of supplies, and they can have work in process inventory (services in process inventory).]

To illustrate, a manufacturer of golf balls requested a quote from AdWorld for an advertising engagement. AdWorld estimates that the job will require 43 designer hours and 61 staff hours, with the following total estimated cost for this job.

**A1** Apply job order costing in pricing services.

<b>Direct Labor</b>		
Designers (43 hours × \$65) . . . . .	\$ 2,795	
Staff (61 hours × \$50) . . . . .	<u>3,050</u>	
Total direct labor . . . . .		\$ 5,845
<b>Overhead</b>		
Designer related (43 hours × \$125) . . . . .	5,375	
Staff related (61 hours × \$96) . . . . .	<u>5,856</u>	
Total overhead . . . . .		<u>11,231</u>
Total estimated job cost . . . . .		<u>\$17,076</u>

AdWorld can use this cost information to help determine the price quote for the job (see *Decision Maker, Sales Manager*, below).

Another source of information that AdWorld must consider is the market, that is, how much competitors will quote for this job. Competitor information is often unavailable; therefore, AdWorld's managers must use estimates based on their assessment of the competitive environment.

### Decision Maker

**Sales Manager** As AdWorld's sales manager, assume that you estimate costs pertaining to a proposed job as \$17,076. Your normal pricing policy is to apply a markup of 18% from total costs. However, you learn that three other agencies are likely to bid for the same job, and that their quotes will range from \$16,500 to \$22,000. What price should you quote? What factors other than cost must you consider? ■ [Answers follow the chapter's Summary.]

### NEED-TO-KNOW

#### COMPREHENSIVE

The following information reflects Walczak Company's job order production activities for May.

Raw materials purchases . . . . .	\$16,000
Factory payroll cost . . . . .	15,400
Overhead costs incurred	
Indirect materials . . . . .	5,000
Indirect labor . . . . .	3,500
Other factory overhead . . . . .	9,500

Walczak's predetermined overhead rate is 150% of direct labor cost. Costs are allocated to the three jobs worked on during May as follows.

	Job 401	Job 402	Job 403
Work in process inventory, April 30			
Direct materials . . . . .	\$3,600		
Direct labor . . . . .	1,700		
Applied overhead . . . . .	2,550		
Costs during May			
Direct materials . . . . .	3,550	\$3,500	\$1,400
Direct labor . . . . .	5,100	6,000	800
Applied overhead . . . . .	?	?	?
Status on May 31 . . . . .	<b>Finished (sold)</b>	<b>Finished (unsold)</b>	<b>In process</b>

**Required**

1. Determine the total cost of:
  - a. The April 30 inventory of jobs in process.
  - b. Materials (direct and indirect) used during May.
  - c. Labor (direct and indirect) used during May.
  - d. Factory overhead incurred and applied during May and the amount of any over- or underapplied overhead on May 31.
  - e. The total cost of each job as of May 31, the May 31 inventories of both work in process and finished goods, and the cost of goods sold during May.
2. Prepare summarized journal entries for the month to record:
  - a. Materials purchases (on credit), direct materials used in production, direct labor used in production, and overhead applied.
  - b. Actual overhead costs, including indirect materials, indirect labor, and other overhead costs.
  - c. Transfer of each completed job to the Finished Goods Inventory account.
  - d. Cost of goods sold.
  - e. The sale (on account) of Job 401 for \$35,000.
  - f. Removal of any underapplied or overapplied overhead from the Factory Overhead account. (Assume the amount is not material.)
3. Prepare a schedule of cost of goods manufactured for May.

**PLANNING THE SOLUTION**

- Determine the cost of the April 30 work in process inventory by totaling the materials, labor, and applied overhead costs for Job 401.
- Compute the cost of materials used and labor by totaling the amounts assigned to jobs and to overhead.
- Compute the total overhead incurred by summing the amounts for the three components. Compute the amount of applied overhead by multiplying the total direct labor cost by the predetermined overhead rate. Compute the underapplied or overapplied amount as the difference between the actual cost and the applied cost.
- Determine the total cost charged to each job by adding the costs incurred in April (if any) to the cost of materials, labor, and overhead applied during May.
- Group the costs of the jobs according to their completion status.
- Record the direct materials costs assigned to the three jobs.
- Transfer costs of Jobs 401 and 402 from Work in Process Inventory to Finished Goods.
- Record the costs of Job 401 as cost of goods sold.
- Record the sale (on account) of Job 401 for \$35,000.
- On the schedule of cost of goods manufactured, remember to include the beginning and ending work in process inventories and to use applied rather than actual overhead.

**SOLUTION**

1. Total cost of
  - a. April 30 inventory of jobs in process (Job 401).
  - b. Materials used during May.

Direct materials . . . . .	\$3,600
Direct labor . . . . .	1,700
Applied overhead . . . . .	<u>2,550</u>
Total cost . . . . .	<u>\$7,850</u>

Direct materials	
Job 401 . . . . .	\$ 3,550
Job 402 . . . . .	3,500
Job 403 . . . . .	<u>1,400</u>
Total direct materials . . . . .	8,450
Indirect materials . . . . .	<u>5,000</u>
Total materials used . . . . .	<u>\$13,450</u>

**c. Labor used during May.**

Direct labor	
Job 401.....	\$ 5,100
Job 402.....	6,000
Job 403.....	800
Total direct labor.....	11,900
Indirect labor.....	3,500
Total labor used.....	<u>\$15,400</u>

**d. Factory overhead incurred in May.**

Actual overhead	
Indirect materials.....	\$ 5,000
Indirect labor.....	3,500
Other factory overhead.....	9,500
Total actual overhead.....	18,000
Overhead applied (150% × \$11,900).....	17,850
Underapplied overhead.....	<u>\$ 150</u>

**e. Total cost of each job.**

	401	402	403
Work in process, April 30			
Direct materials.....	\$ 3,600		
Direct labor.....	1,700		
Applied overhead*.....	2,550		
Cost incurred in May			
Direct materials (from part b)....	3,550	\$ 3,500	\$ 1,400
Direct labor.....	5,100	6,000	800
Applied overhead*.....	7,650	9,000	1,200
Total costs.....	<u>\$24,150</u>	<u>\$18,500</u>	<u>\$3,400</u>

\* Equals 150% of the direct labor cost.

Total cost of the May 31 inventory of work in process (Job 403) = \$3,400

Total cost of the May 31 inventory of finished goods (Job 402) = \$18,500

Total cost of goods sold during May (Job 401) = \$24,150

**2. Journal entries.**

**a. Record raw materials purchases, direct materials used, direct labor used, and overhead applied.**

Raw Materials Inventory.....	16,000	
Accounts Payable.....		16,000
<i>To record materials purchases.</i>		
Work in Process Inventory.....	8,450	
Raw Materials Inventory.....		8,450
<i>To assign direct materials to jobs.</i>		
Work in Process Inventory.....	11,900	
Factory Payroll Payable.....		11,900
<i>To assign direct labor to jobs.</i>		
Work in Process Inventory.....	17,850	
Factory Overhead.....		17,850
<i>To apply overhead to jobs.</i>		

**b. Record actual overhead costs.**

Factory Overhead.....	5,000	
Raw Materials Inventory.....		5,000
<i>To record indirect materials.</i>		
Factory Overhead.....	3,500	
Factory Payroll Payable.....		3,500
<i>To record indirect labor.</i>		
Factory Overhead.....	9,500	
Cash.....		9,500
<i>To record other actual factory overhead.</i>		

**c.** Transfer of completed jobs to Finished Goods Inventory.

Finished Goods Inventory . . . . .	42,650	
Work in Process Inventory . . . . .		42,650
<i>To record completion of jobs</i>		
<i>(\$24,150 for Job 401 + \$18,500 for Job 402).</i>		

**d.** Record cost of job sold.

Cost of Goods Sold . . . . .	24,150	
Finished Goods Inventory . . . . .		24,150
<i>To record costs for sale of Job 401.</i>		

**e.** Record sales for job sold.

Accounts Receivable . . . . .	35,000	
Sales . . . . .		35,000
<i>To record sale of Job 401.</i>		

**f.** Close overhead to cost of goods sold.

Cost of Goods Sold . . . . .	150	
Factory Overhead . . . . .		150
<i>To assign underapplied overhead to Cost of Goods Sold.</i>		

**3.**

<b>WALCZAK COMPANY</b>	
Schedule of Cost of Goods Manufactured	
For Month Ended May 31	
Direct materials . . . . .	\$ 8,450
Direct labor . . . . .	11,900
Factory overhead applied* . . . . .	<u>17,850</u>
Total manufacturing costs . . . . .	38,200
Add: Work in process, April 30 . . . . .	<u>7,850</u>
Total cost of work in process . . . . .	46,050
Less: Work in process, May 31 . . . . .	<u>3,400</u>
Cost of goods manufactured . . . . .	<u>\$42,650</u>

\* Actual overhead = \$18,000. Overhead is \$150 underapplied.

## Summary

### **C1** Describe important features of job order production.

Certain companies called *job order manufacturers* produce custom-made products for customers. These customized products are produced in response to a customer's orders. A job order manufacturer produces products that usually are different and, typically, produced in low volumes. The production systems of job order companies are flexible and are not highly standardized.

### **C2** Explain job cost sheets and how they are used in job order costing.

In a job order costing system, the costs of producing each job are accumulated on a separate job cost sheet. Costs of direct materials, direct labor, and overhead applied are accumulated separately on the job cost sheet and then added to determine the total cost of a job. Job cost sheets for jobs in process, finished jobs, and jobs sold make up subsidiary records controlled by general ledger accounts.

**A1 Apply job order costing in pricing services.** Job order costing can usefully be applied to a service setting. The resulting job cost estimate can then be used to help determine a price for services.

**P1 Describe and record the flow of materials costs in job order costing.** Costs of direct materials flow to the Work in Process Inventory account and to job cost sheets. Costs of indirect materials flow to the Factory Overhead account and to the factory overhead subsidiary ledger. Receiving reports evidence the purchase of raw materials, and requisition forms evidence the use of materials in production.

**P2 Describe and record the flow of labor costs in job order costing.** Costs of direct labor flow to the Work in Process Inventory account and to job cost sheets. Costs of

indirect labor flow to the Factory Overhead account and to the factory overhead subsidiary ledger. Time tickets document the use of labor.

**P3 Describe and record the flow of overhead costs in job order costing.** Overhead costs are charged to jobs using a predetermined overhead rate. Actual overhead costs incurred are accumulated in the Factory Overhead account that controls the subsidiary factory overhead ledger.

**P4 Determine adjustments for overapplied and underapplied factory overhead.** At the end of each year, the Factory Overhead account usually has a residual debit (underapplied overhead) or credit (overapplied overhead) balance. Assuming the balance is not material, it is transferred to Cost of Goods Sold, and the Factory Overhead account is closed.

## Guidance Answers to Decision Maker

**Management Consultant** Service companies (such as this consulting firm) do not recognize work in process inventory or finished goods inventory—an important difference between service and manufacturing companies. For the two jobs that are 60% complete, you could recognize revenues and costs at 60% of the total expected amounts. This means you could recognize revenue of \$7,200 ( $0.60 \times \$12,000$ ) and costs of \$6,000 ( $0.60 \times \$10,000$ ), yielding net income of \$1,200 from each job.

**Sales Manager** The price based on AdWorld's normal pricing policy is \$20,150 ( $\$17,076 \times 1.18$ ), which is within the price range offered by competitors. One option is to apply normal pricing policy and quote a price of \$20,150. On the other hand, assessing the competition, particularly in terms of their service quality and other benefits they might offer, would be useful. Although price is an input customers use to select suppliers, factors such as quality and timeliness (responsiveness) of suppliers are important. Accordingly, your price can reflect such factors.

## Multiple Choice Quiz

Answers at end of chapter

- A company's predetermined overhead allocation rate is 150% of its direct labor costs. How much overhead is applied to a job that requires total direct labor costs of \$30,000?
  - \$15,000
  - \$30,000
  - \$45,000
  - \$60,000
  - \$75,000
- A company's cost accounting system uses direct labor costs to apply overhead to work in process and finished goods inventories. Its production costs for the period are: direct materials, \$45,000; direct labor, \$35,000; and overhead applied, \$38,500. What is its predetermined overhead allocation rate?
  - 10%
  - 110%
  - 86%
  - 91%
  - 117%
- A company's ending inventory of finished goods has a total cost of \$10,000 and consists of 500 units. If the overhead

applied to these goods is \$4,000, and the predetermined overhead rate is 80% of direct labor costs, how much direct materials cost was incurred in producing these 500 units?

- \$10,000
- \$6,000
- \$4,000
- \$5,000
- \$1,000

- A company's Work in Process Inventory T-account follows.

Work in Process Inventory		
Beginning balance	9,000	
Direct materials	94,200	
Direct labor	59,200	
Overhead applied	31,600	Cost of goods manufactured <u>?</u>
Ending balance	17,800	

The Cost of Goods Manufactured is

- a. \$193,000      c. \$185,000      e. \$176,200  
 b. \$211,800      d. \$144,600
5. At the end of its current year, a company learned that its overhead was underapplied by \$1,500 and that this amount is not considered material. Based on this information, the company should
- a. Close the \$1,500 to Finished Goods Inventory.
- b. Close the \$1,500 to Cost of Goods Sold.  
 c. Carry the \$1,500 to the next period.  
 d. Do nothing about the \$1,500 because it is not material and it is likely that overhead will be overapplied by the same amount next year.  
 e. Carry the \$1,500 to the income statement as “Other Expense.”

 Icon denotes assignments that involve decision making.

## Discussion Questions

- Why must a company estimate the amount of factory overhead assigned to individual jobs or job lots?
-  The chapter used a percent of labor cost to assign factory overhead to jobs. Identify another factor (or base) a company might reasonably use to assign overhead costs.
-  What information is recorded on a job cost sheet? How do management and employees use job cost sheets?
- In a job order costing system, what records serve as a subsidiary ledger for Work in Process Inventory? For Finished Goods Inventory?
- What journal entry is recorded when a materials manager receives a materials requisition and then issues materials (both direct and indirect) for use in the factory?
-  How does the materials requisition help safeguard a company’s assets?
- Samsung** uses a “time ticket” for some employees. How are time tickets used in job order costing? **Samsung**
- What events cause debits to be recorded in the Factory Overhead account? What events cause credits to be recorded in the Factory Overhead account?
- Google** applies overhead to product costs. What account(s) is(are) used to eliminate overapplied or underapplied overhead from the Factory Overhead account, assuming the amount is not material? **GOOGLE**
-  Assume that **Apple** produces a batch of 1,000 iPhones. Does it account for this as 1,000 individual jobs or as a job lot? Explain (consider costs and benefits). **APPLE**
- Why must a company use predetermined overhead rates when using job order costing?
-  How would a hospital apply job order costing? Explain.
-  **Harley-Davidson** manufactures 30 custom-made, luxury-model motorcycles. Does it account for these motorcycles as 30 individual jobs or as a job lot? Explain. **HARLEY-DAVIDSON**
- Assume **Sprint** will install and service a server to link all of a customer’s employees’ smartphones to a centralized company server, for an up-front flat price. How can Sprint use a job order costing system? **SPRINT**

Determine which of the following are most likely to be considered as a job and which as a job lot.

- |  |   |
|--|---|
| _____ 1. Hats imprinted with company logo. | _____ 4. A 90-foot motor yacht.                 |
| _____ 2. Little League trophies.           | _____ 5. Wedding dresses for a chain of stores. |
| _____ 3. A hand-crafted table.             | _____ 6. A custom-designed home.                |

## QUICK STUDY

### QS 19-1

Jobs and job lots

The left column lists the titles of documents and accounts used in job order costing. The right column presents short descriptions of the purposes of the documents. Match each document in the left column to its numbered description in the right column.

- |                                    |   |
|------------------------------------|---|
| <b>A.</b> Time ticket              | _____ 1. Shows amount of time an employee works on a job.   |
| <b>B.</b> Materials ledger card    | _____ 2. Accumulates the cost of incurred overhead and the overhead cost assigned to specific jobs. |
| <b>C.</b> Voucher                  | _____ 3. Perpetual inventory record of raw materials received, used, and available for use.         |
| <b>D.</b> Factory Overhead account | _____ 4. Shows amount approved for payment of an overhead or other cost.                            |
| <b>E.</b> Materials requisition    | _____ 5. Communicates the need for materials to complete a job.                                     |

### QS 19-2

Documents in job order costing

P1 P2 P3

**QS 19-3**  
Job cost sheets **C2**

Clemens Cars' job cost sheet for Job A40 shows that the cost to add security features to a car was \$10,500. The car was delivered to the customer, who paid \$14,900 in cash for the added features. What journal entries should Clemens record for the completion and delivery of Job A40?

**QS 19-4**  
Direct materials journal entries **P1**

During the current month, a company that uses job order costing purchases \$50,000 in raw materials for cash. It then uses \$12,000 of raw materials indirectly as factory supplies and uses \$32,000 of raw materials as direct materials. Prepare journal entries to record these three transactions.

**QS 19-5**  
Direct labor journal entries **P2**

During the current month, a company that uses job order costing incurred a monthly factory payroll of \$180,000. Of this amount, \$40,000 is classified as indirect labor and the remainder as direct. Prepare journal entries to record these transactions.

**QS 19-6**  
Factory overhead rates **P3**

A company incurred the following manufacturing costs this period: direct labor, \$468,000; direct materials, \$390,000; and factory overhead, \$117,000. Compute its overhead cost as a percent of (1) direct labor and (2) direct materials. Express your answers as percents, rounded to the nearest whole number.

**QS 19-7**  
Factory overhead journal entries **P3**

During the current month, a company that uses job order costing incurred a monthly factory payroll of \$175,000. Of this amount, \$44,000 is classified as indirect labor and the remainder as direct labor for the production of Job 65A. Factory overhead is applied at 90% of direct labor. Prepare the journal entry to apply factory overhead to this job.

**QS 19-8**  
Predetermined overhead rate **P3**

At the beginning of a year, a company predicts total direct materials costs of \$900,000 and total overhead costs of \$1,170,000. If the company uses direct materials costs as its activity base to allocate overhead, what is the predetermined overhead rate it should use during the year?

**QS 19-9**  
Entry for over- or underapplied overhead **P4**

A company's Factory Overhead T-account shows total debits of \$624,000 and total credits of \$646,000 at the end of the year. Prepare the journal entry to close the balance in the Factory Overhead account to Cost of Goods Sold.

**QS 19-10**  
Entry for over- or underapplied overhead **P4**

A company allocates overhead at a rate of 150% of direct labor cost. Actual overhead cost for the current period is \$950,000, and direct labor cost is \$600,000. Prepare the journal entry to close over- or underapplied overhead to Cost of Goods Sold.

**QS 19-11**  
Applied overhead **P3**

On March 1 a dressmaker starts work on three custom-designed wedding dresses. The company uses job order costing and applies overhead to each job (dress) at the rate of 40% of direct materials costs. During the month, the jobs used direct materials as shown below. Compute the amount of overhead applied to each of the three jobs.

	Job 1	Job 2	Job 3
Direct materials used . . . . .	\$5,000	\$7,000	\$1,500

**QS 19-12**  
Manufacturing cost flows **P1 P2 P3**

Refer to the information in QS 19-11. During the month, the jobs used direct labor as shown below. Jobs 1 and 3 are not finished by the end of March, and Job 2 is finished but not sold by the end of March. (1) Determine the amounts of direct materials, direct labor, and factory overhead applied that would be reported on job cost sheets for each of the three jobs for March. (2) Determine the total dollar amount of Work in Process Inventory at the end of March. (3) Determine the total dollar amount of Finished Goods Inventory at the end of March. Assume the company has no beginning Work in Process or Finished Goods inventories.

	Job 1	Job 2	Job 3
Direct labor used . . . . .	\$9,000	\$4,000	\$3,000

An advertising agency is estimating costs for advertising a music festival. The job will require 200 direct labor hours at a cost of \$50 per hour. Overhead costs are applied at a rate of \$65 per direct labor hour. What is the total estimated cost for this job?

**QS 19-13**  
Job order costing of services **A1**

Refer to this chapter's Global View. **Porsche AG** is the manufacturer of the Porsche automobile line. Does Porsche produce in jobs or in job lots? Explain.

**QS 19-14**  
Job order production  
**C1** 

Match each of the terms/phrases numbered 1 through 5 with the best definition on the right.

- |                                 |   |
|---------------------------------|---|
| _____ 1. Cost accounting system | <b>a.</b> Production of products in response to customer orders.                        |
| _____ 2. Target cost            | <b>b.</b> Production activities for a customized product.                               |
| _____ 3. Job lot                | <b>c.</b> A system that records manufacturing costs using a perpetual inventory system. |
| _____ 4. Job                    | <b>d.</b> The expected selling price of a job minus its desired profit.                 |
| _____ 5. Job order production   | <b>e.</b> Production of more than one unit of a custom product.                         |

**EXERCISES**

**Exercise 19-1**  
Job order production  
**C1**

The following information is from the materials requisitions and time tickets for Job 9-1005 completed by Great Bay Boats. The requisitions are identified by code numbers starting with the letter Q and the time tickets start with W. At the start of the year, management estimated that overhead cost would equal 110% of direct labor cost for each job. Determine the total cost on the job cost sheet for Job 9-1005.

**Exercise 19-2**  
Job cost computation  
**C2**

Date	Document	Amount
7/1/2015 . . . . .	Q-4698	\$1,250
7/1/2015 . . . . .	W-3393	600
7/5/2015 . . . . .	Q-4725	1,000
7/5/2015 . . . . .	W-3479	450
7/10/2015 . . . . .	W-3559	300

As of the end of June, the job cost sheets at Racing Wheels, Inc., show the following total costs accumulated on three custom jobs.

**Exercise 19-3**  
Analysis of cost flows  
**C2 P1 P2 P3** 

	Job 102	Job 103	Job 104
Direct materials . . . . .	\$15,000	\$33,000	\$27,000
Direct labor . . . . .	8,000	14,200	21,000
Overhead applied . . . . .	4,000	7,100	10,500

Job 102 was started in production in May and the following costs were assigned to it in May: direct materials, \$6,000; direct labor, \$1,800; and overhead, \$900. Jobs 103 and 104 are started in June. Overhead cost is applied with a predetermined rate based on direct labor cost. Jobs 102 and 103 are finished in June, and Job 104 is expected to be finished in July. No raw materials are used indirectly in June. Using this information, answer the following questions. (Assume this company's predetermined overhead rate did not change across these months.)

1. What is the cost of the raw materials requisitioned in June for each of the three jobs?
2. How much direct labor cost is incurred during June for each of the three jobs?
3. What predetermined overhead rate is used during June?
4. How much total cost is transferred to finished goods during June?

**Check** (4) \$81,300

**Exercise 19-4**

Overhead rate; costs assigned to jobs

P3

**Check** (2) \$22,710

In December 2014, Shire Computer’s management establishes the 2015 predetermined overhead rate based on direct labor cost. The information used in setting this rate includes estimates that the company will incur \$747,500 of overhead costs and \$575,000 of direct labor cost in year 2015. During March 2015, Shire began and completed Job No. 13-56.

1. What is the predetermined overhead rate for 2015?
2. Use the information on the following job cost sheet to determine the total cost of the job.

JOB COST SHEET						
Customer's Name		Keiser Co.			Job No. 13-56	
Job Description		5 plasma monitors—61 inch				
Date	Direct Materials		Direct Labor		Overhead Costs Applied	
	Requisition No.	Amount	Time-Ticket No.	Amount	Rate	Amount
Mar. 8	4-129	\$5,000	T-306	\$ 700		
Mar. 11	4-142	7,020	T-432	1,250		
Mar. 18	4-167	3,330	T-456	1,250		
Totals						

**Exercise 19-5**

Analysis of costs assigned to work in process

P3

Lorenzo Company uses a job order costing system that charges overhead to jobs on the basis of direct material cost. At year-end, the Work in Process Inventory account shows the following.

A	B	C	D	E
1	<b>Work in Process Inventory</b>			
2	Acct. No. 121			
3	<b>Date</b>	<b>Explanation</b>	<b>Debit</b>	<b>Credit</b>
4	2015			
5	Dec. 31	Direct materials cost	1,500,000	
6	31	Direct labor cost	300,000	
7	31	Overhead applied	600,000	
8	31	To finished goods		2,350,000
9				50,000

1. Determine the predetermined overhead rate used (based on direct material cost).
2. Only one job remained in work in process inventory at December 31, 2015. Its direct materials cost is \$30,000. How much direct labor cost and overhead cost are assigned to this job?

**Check** (2) Direct labor cost, \$8,000

**Exercise 19-6**

Recording product costs

P1 P2 P3

Starr Company reports the following information for August.

Raw materials purchased on account . . . . .	\$76,200
Direct materials used in production . . . . .	\$48,000
Factory wages earned (direct labor) . . . . .	\$15,350
Overhead rate . . . . .	120% of direct labor cost

Prepare journal entries to record the following events.

1. Raw materials purchased.
2. Direct materials used in production.
3. Direct labor used in production.
4. Applied overhead.

The following information is available for Lock-Tite Company, which produces special-order security products and uses a job order costing system.

	April 30	May 31
<b>Inventories</b>		
Raw materials .....	\$43,000	\$ 52,000
Work in process .....	10,200	21,300
Finished goods .....	63,000	35,600
<b>Activities and information for May</b>		
Raw materials purchases (paid with cash) .....		210,000
Factory payroll (paid with cash) .....		345,000
<b>Factory overhead</b>		
Indirect materials .....		15,000
Indirect labor .....		80,000
Other overhead costs .....		120,000
Sales (received in cash) .....		1,400,000
Predetermined overhead rate based on direct labor cost .....		70%

**Exercise 19-7**

Cost flows in a job order costing system

P1 P2 P3 P4

Compute the following amounts for the month of May.

- Cost of direct materials used.
- Cost of direct labor used.
- Cost of goods manufactured.
- Cost of goods sold.\*
- Gross profit.
- Overapplied or underapplied overhead.

\*Do not consider any underapplied or overapplied overhead.

**Check** (3) \$625,400

Use information in Exercise 19-7 to prepare journal entries for the following events for the month of May.

- Raw materials purchases for cash.
- Direct materials usage.
- Indirect materials usage.

**Exercise 19-8**

Journal entries for materials P1

Use information in Exercise 19-7 to prepare journal entries for the following events for the month of May.

- Direct labor usage.
- Indirect labor usage.
- Total payroll paid in cash.

**Exercise 19-9**

Journal entries for labor P2

Use information in Exercise 19-7 to prepare journal entries for the following events for the month of May.

- Incurred other overhead costs (record credit to Other Accounts).
- Application of overhead to work in process.

**Exercise 19-10**

Journal entries for overhead P3

Refer to information in Exercise 19-7. Prepare the journal entry to allocate (close) overapplied or underapplied overhead to Cost of Goods Sold.

**Exercise 19-11**

Adjusting factory overhead P4

Record the journal entry to close over- or underapplied factory overhead to Cost of Goods Sold for each of the two companies below.

**Exercise 19-12**

Adjusting factory overhead P4

	Storm Concert Promotions	Valle Home Builders
Actual indirect materials costs .....	\$22,000	\$ 12,500
Actual indirect labor costs .....	46,000	46,500
Other overhead costs .....	17,000	47,000
Overhead applied .....	88,200	105,200

**Exercise 19-13**

Recording events in job order costing

P1 P2 P3 P4

Using Exhibit 19.17 as a guide, prepare summary journal entries to record the following transactions and events *a* through *g* for a company in its first month of operations.

- a. Raw materials purchased on account, \$90,000.
- b. Direct materials used in production, \$36,500. Indirect materials used in production, \$19,200.
- c. Paid cash for factory payroll, \$50,000. Of this total, \$38,000 is for direct labor and \$12,000 is for indirect labor.
- d. Paid cash for other actual overhead costs, \$11,475.
- e. Applied overhead at the rate of 125% of direct labor cost.
- f. Transferred cost of jobs completed to finished goods, \$56,800.
- g. Sold jobs on account for \$82,000. The jobs had a cost of \$56,800.

**Exercise 19-14**

Factory overhead computed, applied, and adjusted

P3 P4

In December 2014, Custom Mfg. established its predetermined overhead rate for jobs produced during 2015 by using the following cost predictions: overhead costs, \$750,000, and direct labor costs, \$625,000. At year-end 2015, the company's records show that actual overhead costs for the year are \$830,000. Actual direct labor cost had been assigned to jobs as follows.

Jobs completed and sold . . . . .	\$513,750
Jobs in finished goods inventory . . . . .	102,750
Jobs in work in process inventory . . . . .	<u>68,500</u>
Total actual direct labor cost . . . . .	<u>\$685,000</u>

- 1. Determine the predetermined overhead rate for 2015.
- 2. Set up a T-account for Factory Overhead and enter the overhead costs incurred and the amounts applied to jobs during the year using the predetermined overhead rate.
- 3. Determine whether overhead is overapplied or underapplied (and the amount) during the year.
- 4. Prepare the adjusting entry to allocate any over- or underapplied overhead to Cost of Goods Sold.

**Check** (3) \$8,000 underapplied

**Exercise 19-15**

Factory overhead computed, applied, and adjusted

P3 P4

In December 2014, Infodeo established its predetermined overhead rate for movies produced during 2015 by using the following cost predictions: overhead costs, \$1,680,000, and direct labor costs, \$480,000. At year-end 2015, the company's records show that actual overhead costs for the year are \$1,652,000. Actual direct labor cost had been assigned to jobs as follows.

Movies completed and released . . . . .	\$425,000
Movies still in production . . . . .	<u>50,000</u>
Total actual direct labor cost . . . . .	<u>\$475,000</u>

- 1. Determine the predetermined overhead rate for 2015.
- 2. Set up a T-account for overhead and enter the overhead costs incurred and the amounts applied to movies during the year using the predetermined overhead rate.
- 3. Determine whether overhead is overapplied or underapplied (and the amount) during the year.
- 4. Prepare the adjusting entry to allocate any over- or underapplied overhead to Cost of Goods Sold.

**Check** (3) \$10,500 overapplied

**Exercise 19-16**

Overhead rate calculation, allocation, and analysis

P3

Moonrise Bakery applies factory overhead based on direct labor costs. The company incurred the following costs during 2015: direct materials costs, \$650,000; direct labor costs, \$3,000,000; and factory overhead costs applied, \$1,800,000.

- 1. Determine the company's predetermined overhead rate for 2015.
- 2. Assuming that the company's \$71,000 ending Work in Process Inventory account for 2015 had \$20,000 of direct labor costs, determine the inventory's direct materials costs.
- 3. Assuming that the company's \$490,000 ending Finished Goods Inventory account for 2015 had \$250,000 of direct materials costs, determine the inventory's direct labor costs and its overhead costs.

**Check** (3) \$90,000 overhead costs

Custom Cabinetry has one job in process (Job 120) as of June 30; at that time, its job cost sheet reports direct materials of \$6,000, direct labor of \$2,800, and applied overhead of \$2,240. Custom Cabinetry applies overhead at the rate of 80% of direct labor cost. During July, Job 120 is sold (on account) for \$22,000, Job 121 is started and completed, and Job 122 is started and still in process at the end of the month. Custom Cabinetry incurs the following costs during July.

July Product Costs	Job 120	Job 121	Job 122	Total
Direct materials . . . . .	\$1,000	\$6,000	\$2,500	\$9,500
Direct labor . . . . .	2,200	3,700	2,100	8,000
Overhead applied . . . . .	?	?	?	?

- Prepare journal entries for the following in July.
  - Direct materials used in production.
  - Direct labor used in production.
  - Overhead applied.
  - The sale of Job 120.
  - Cost of goods sold for Job 120.
- Compute the July 31 balances of the Work in Process Inventory and the Finished Goods Inventory general ledger accounts.

**Exercise 19-17**  
Manufacturing cost flows  
P1 P2 P3

Hansel Corporation has requested bids from several architects to design its new corporate headquarters. Frey Architects is one of the firms bidding on the job. Frey estimates that the job will require the following direct labor.

	A	B	C
1	Labor	Estimated Hours	Hourly Rate
2	Architects	150	\$300
3	Staff	300	75
4	Clerical	500	20
5			

Frey applies overhead to jobs at 175% of direct labor cost. Frey would like to earn at least \$80,000 profit on the architectural job. Based on past experience and market research, it estimates that the competition will bid between \$285,000 and \$350,000 for the job.

- What is Frey’s estimated cost of the architectural job?
- What bid would you suggest that Frey submit?

**Exercise 19-18**  
Job order costing for services  
A1 

**Check** (1) \$213,125

A recent balance sheet for **Porsche AG** shows beginning raw materials inventory of €83 million and ending raw materials inventory of €85 million. Assume the company purchased raw materials (on account) for €3,108 million during the year. (1) Prepare journal entries to record (a) the purchase of raw materials and (b) the use of raw materials in production. (2) What do you notice about the € amounts in your journal entries?

**Exercise 19-19**  
Direct materials journal entries P1 

Marcelino Co.’s March 31 inventory of raw materials is \$80,000. Raw materials purchases in April are \$500,000, and factory payroll cost in April is \$363,000. Overhead costs incurred in April are: indirect materials, \$50,000; indirect labor, \$23,000; factory rent, \$32,000; factory utilities, \$19,000; and factory equipment depreciation, \$51,000. The predetermined overhead rate is 50% of direct labor cost. Job 306 is sold for \$635,000 cash in April. Costs of the three jobs worked on in April follow.

	Job 306	Job 307	Job 308
Balances on March 31			
Direct materials . . . . .	\$ 29,000	\$ 35,000	
Direct labor . . . . .	20,000	18,000	
Applied overhead . . . . .	10,000	9,000	
Costs during April			
Direct materials . . . . .	135,000	220,000	\$100,000
Direct labor . . . . .	85,000	150,000	105,000
Applied overhead . . . . .	?	?	?
Status on April 30 . . . . .	Finished (sold)	Finished (unsold)	In process

**PROBLEM SET A**

**Problem 19-1A**  
Production costs computed and recorded; reports prepared  
C2 P1 P2 P3 P4

**Required**

1. Determine the total of each production cost incurred for April (direct labor, direct materials, and applied overhead), and the total cost assigned to each job (including the balances from March 31).
2. Prepare journal entries for the month of April to record the following.
  - a. Materials purchases (on credit).
  - b. Direct materials used in production.
  - c. Direct labor paid and assigned to Work in Process Inventory.
  - d. Indirect labor paid and assigned to Factory Overhead.
  - e. Overhead costs applied to Work in Process Inventory.
  - f. Actual overhead costs incurred, including indirect materials. (Factory rent and utilities are paid in cash.)
  - g. Transfer of Jobs 306 and 307 to Finished Goods Inventory.
  - h. Cost of goods sold for Job 306.
  - i. Revenue from the sale of Job 306.
  - j. Assignment of any underapplied or overapplied overhead to the Cost of Goods Sold account. (The amount is not material.)
3. Prepare a schedule of cost of goods manufactured.
4. Compute gross profit for April. Show how to present the inventories on the April 30 balance sheet.

**Check** (2) \$5,000 underapplied  
 (3) Cost of goods manufactured, \$828,500

**Analysis Component**

5. The over- or underapplied overhead is closed to Cost of Goods Sold. Discuss how this adjustment impacts business decision making regarding individual jobs or batches of jobs.

**Problem 19-2A**

Source documents, journal entries, overhead, and financial reports

P1 P2 P3 P4

Bergamo Bay’s computer system generated the following trial balance on December 31, 2015. The company’s manager knows something is wrong with the trial balance because it does not show any balance for Work in Process Inventory but does show a balance for the Factory Overhead account. In addition, the accrued factory payroll (Factory Payroll Payable) has not been recorded.

	Debit	Credit
Cash .....	\$170,000	
Accounts receivable .....	75,000	
Raw materials inventory .....	80,000	
Work in process inventory .....	0	
Finished goods inventory .....	15,000	
Prepaid rent .....	3,000	
Accounts payable .....		\$ 17,000
Notes payable .....		25,000
Common stock .....		50,000
Retained earnings .....		271,000
Sales .....		373,000
Cost of goods sold .....	218,000	
Factory overhead .....	115,000	
Operating expenses .....	<u>60,000</u>	
Totals .....	<u>\$736,000</u>	<u>\$736,000</u>

After examining various files, the manager identifies the following six source documents that need to be processed to bring the accounting records up to date.

Materials requisition 21-3010:	\$10,200 direct materials to Job 402
Materials requisition 21-3011:	\$18,600 direct materials to Job 404
Materials requisition 21-3012:	\$5,600 indirect materials
Labor time ticket 6052:	\$36,000 direct labor to Job 402
Labor time ticket 6053:	\$23,800 direct labor to Job 404
Labor time ticket 6054:	\$8,200 indirect labor

Jobs 402 and 404 are the only units in process at year-end. The predetermined overhead rate is 200% of direct labor cost.

**Required**

1. Use information on the six source documents to prepare journal entries to assign the following costs.
  - a. Direct materials costs to Work in Process Inventory.
  - b. Direct labor costs to Work in Process Inventory.
  - c. Overhead costs to Work in Process Inventory.
  - d. Indirect materials costs to the Factory Overhead account.
  - e. Indirect labor costs to the Factory Overhead account.
2. Determine the revised balance of the Factory Overhead account after making the entries in part 1. Determine whether there is any under- or overapplied overhead for the year. Prepare the adjusting entry to allocate any over- or underapplied overhead to Cost of Goods Sold, assuming the amount is not material.
3. Prepare a revised trial balance.
4. Prepare an income statement for 2015 and a balance sheet as of December 31, 2015.

**Check** (2) \$9,200 underapplied overhead

(3) T. B. totals, \$804,000  
(4) Net income, \$85,800

**Analysis Component**

5. Assume that the \$5,600 on materials requisition 21-3012 should have been direct materials charged to Job 404. Without providing specific calculations, describe the impact of this error on the income statement for 2015 and the balance sheet at December 31, 2015.

Widmer Watercraft’s predetermined overhead rate for 2015 is 200% of direct labor. Information on the company’s production activities during May 2015 follows.

- a. Purchased raw materials on credit, \$200,000.
- b. Materials requisitions record use of the following materials for the month.

Job 136 .....	\$ 48,000
Job 137 .....	32,000
Job 138 .....	19,200
Job 139 .....	22,400
Job 140 .....	6,400
Total direct materials .....	128,000
Indirect materials .....	19,500
Total materials used .....	<u>\$147,500</u>

**Problem 19-3A**  
Source documents, journal entries, and accounts in job order costing  
**P1 P2 P3**

- c. Paid \$15,000 cash to a computer consultant to reprogram factory equipment.
- d. Time tickets record use of the following labor for the month. These wages were paid in cash.

Job 136 .....	\$ 12,000
Job 137 .....	10,500
Job 138 .....	37,500
Job 139 .....	39,000
Job 140 .....	3,000
Total direct labor .....	102,000
Indirect labor .....	24,000
Total .....	<u>\$126,000</u>

- e. Applied overhead to Jobs 136, 138, and 139.
- f. Transferred Jobs 136, 138, and 139 to Finished Goods.
- g. Sold Jobs 136 and 138 on credit at a total price of \$525,000.

- h. The company incurred the following overhead costs during the month (credit Prepaid Insurance for expired factory insurance).

Depreciation of factory building . . . . .	\$68,000
Depreciation of factory equipment . . . . .	36,500
Expired factory insurance . . . . .	10,000
Accrued property taxes payable . . . . .	35,000

- i. Applied overhead at month-end to the Work in Process Inventory account (Jobs 137 and 140) using the predetermined overhead rate of 200% of direct labor cost.

**Required**

- 1. Prepare a job cost sheet for each job worked on during the month. Use the following simplified form.

Job No. _____	
Materials . . . . .	\$ _____
Labor . . . . .	_____
Overhead . . . . .	_____
Total cost . . . . .	\$ _____

**Check** (2e) Cr. Factory Overhead, \$177,000

- 2. Prepare journal entries to record the events and transactions *a* through *i*.
- 3. Set up T-accounts for each of the following general ledger accounts, each of which started the month with a zero balance: Raw Materials Inventory; Work in Process Inventory; Finished Goods Inventory; Factory Overhead; Cost of Goods Sold. Then post the journal entries to these T-accounts and determine the balance of each account.
- 4. Prepare a report showing the total cost of each job in process and prove that the sum of their costs equals the Work in Process Inventory account balance. Prepare similar reports for Finished Goods Inventory and Cost of Goods Sold.

**Check** (4) Finished Goods Inventory, \$139,400

**Problem 19-4A**

Overhead allocation and adjustment using a predetermined overhead rate

P3 P4

In December 2014, Learer Company’s manager estimated next year’s total direct labor cost assuming 50 persons working an average of 2,000 hours each at an average wage rate of \$25 per hour. The manager also estimated the following manufacturing overhead costs for 2015.

Indirect labor . . . . .	\$ 319,200
Factory supervision . . . . .	240,000
Rent on factory building . . . . .	140,000
Factory utilities . . . . .	88,000
Factory insurance expired . . . . .	68,000
Depreciation—Factory equipment . . . . .	480,000
Repairs expense—Factory equipment . . . . .	60,000
Factory supplies used . . . . .	68,800
Miscellaneous production costs . . . . .	36,000
Total estimated overhead costs . . . . .	<u>\$1,500,000</u>

At the end of 2015, records show the company incurred \$1,520,000 of actual overhead costs. It completed and sold five jobs with the following direct labor costs: Job 201, \$604,000; Job 202, \$563,000; Job 203, \$298,000; Job 204, \$716,000; and Job 205, \$314,000. In addition, Job 206 is in process at the end of 2015 and had been charged \$17,000 for direct labor. No jobs were in process at the end of 2014. The company’s predetermined overhead rate is based on direct labor cost.

**Required**

1. Determine the following.
  - a. Predetermined overhead rate for 2015.
  - b. Total overhead cost applied to each of the six jobs during 2015.
  - c. Over- or underapplied overhead at year-end 2015.
2. Assuming that any over- or underapplied overhead is not material, prepare the adjusting entry to allocate any over- or underapplied overhead to Cost of Goods Sold at the end of 2015.

**Check** (1c) 12,800  
underapplied  
(2) Cr. Factory  
Overhead \$12,800

Sager Company manufactures variations of its product, a technopress, in response to custom orders from its customers. On May 1, the company had no inventories of work in process or finished goods but held the following raw materials.

Material M .....	200 units @ \$250 =	\$50,000
Material R .....	95 units @ 180 =	17,100
Paint .....	55 units @ 75 =	4,125
Total cost .....		<u>\$71,225</u>

On May 4, the company began working on two technopresses: Job 102 for Worldwide Company and Job 103 for Reuben Company.

**Required**

Using Exhibit 19.3 as a guide, prepare Job cost sheets for Jobs 102 and 103. Using Exhibit 19.5 as a guide, prepare materials ledger cards for Material M, Material R, and paint. Enter the beginning raw materials inventory dollar amounts for each of these materials on their respective ledger cards. Then, follow the instructions in this list of activities.

- a. Purchased raw materials on credit and recorded the following information from receiving reports and invoices.

Receiving Report No. 426, Material M, 250 units at \$250 each.  
Receiving Report No. 427, Material R, 90 units at \$180 each.

**Instructions:** Record these purchases with a single journal entry. Enter the receiving report information on the materials ledger cards.

- b. Requisitioned the following raw materials for production.

Requisition No. 35, for Job 102, 135 units of Material M.  
Requisition No. 36, for Job 102, 72 units of Material R.  
Requisition No. 37, for Job 103, 70 units of Material M.  
Requisition No. 38, for Job 103, 38 units of Material R.  
Requisition No. 39, for 15 units of paint.

**Instructions:** Enter amounts for direct materials requisitions on the materials ledger cards and the job cost sheets. Enter the indirect material amount on the materials ledger card. Do not record a journal entry at this time.

- c. Received the following employee time tickets for work in May.

Time tickets Nos. 1 to 10 for direct labor on Job 102, \$90,000.  
Time tickets Nos. 11 to 30 for direct labor on Job 103, \$65,000.  
Time tickets Nos. 31 to 36 for equipment repairs, \$19,250.

**Instructions:** Record direct labor from the time tickets on the job cost sheets. Do not record a journal entry at this time.

**Problem 19-5A**

Production transactions, subsidiary records, and source documents

P1 P2 P3 P4

- d. Paid cash for the following items during the month: factory payroll, \$174,250, and miscellaneous overhead items, \$102,000. Use the time tickets to record the total direct and indirect labor costs.

*Instructions:* Record these payments with journal entries.

- e. Finished Job 102 and transferred it to the warehouse. The company assigns overhead to each job with a predetermined overhead rate equal to 80% of direct labor cost.

*Instructions:* Enter the allocated overhead on the cost sheet for Job 102, fill in the cost summary section of the cost sheet, and then mark the cost sheet "Finished." Prepare a journal entry to record the job's completion and its transfer to Finished Goods.

- f. Delivered Job 102 and accepted the customer's promise to pay \$400,000 within 30 days.

*Instructions:* Prepare journal entries to record the sale of Job 102 and the cost of goods sold.

- g. Applied overhead to Job 103 based on the job's direct labor to date.

*Instructions:* Enter overhead on the job cost sheet but do not make a journal entry at this time.

- h. Recorded the total direct and indirect materials costs as reported on all the requisitions for the month.

*Instructions:* Prepare a journal entry to record these costs.

- i. Recorded the total overhead costs applied to jobs.

*Instructions:* Prepare a journal entry to record the allocation of these overhead costs.

- j. Compute the balance in the Factory Overhead account as of the end of May.

**Check** (h) Dr. Work in Process Inventory, \$71,050

**Check** Balance in Factory Overhead, \$1,625 Cr., overapplied

## PROBLEM SET B

### Problem 19-1B

Production costs computed and recorded; reports prepared

C2 P1 P2 P3 P4

Perez Mfg.'s August 31 inventory of raw materials is \$150,000. Raw materials purchases in September are \$400,000, and factory payroll cost in September is \$232,000. Overhead costs incurred in September are: indirect materials, \$30,000; indirect labor, \$14,000; factory rent, \$20,000; factory utilities, \$12,000; and factory equipment depreciation, \$30,000. The predetermined overhead rate is 50% of direct labor cost. Job 114 is sold for \$380,000 cash in September. Costs for the three jobs worked on in September follow.

	Job 114	Job 115	Job 116
Balances on August 31			
Direct materials . . . . .	\$ 14,000	\$ 18,000	
Direct labor . . . . .	18,000	16,000	
Applied overhead . . . . .	9,000	8,000	
Costs during September			
Direct materials . . . . .	100,000	170,000	\$ 80,000
Direct labor . . . . .	30,000	68,000	120,000
Applied overhead . . . . .	?	?	?
Status on September 30 . . . . .	Finished (sold)	Finished (unsold)	In process

### Required

- Determine the total of each production cost incurred for September (direct labor, direct materials, and applied overhead), and the total cost assigned to each job (including the balances from August 31).
- Prepare journal entries for the month of September to record the following.
  - Materials purchases (on credit).
  - Direct materials used in production.
  - Direct labor paid and assigned to Work in Process Inventory.
  - Indirect labor paid and assigned to Factory Overhead.
  - Overhead costs applied to Work in Process Inventory.
  - Actual overhead costs incurred, including indirect materials. (Factory rent and utilities are paid in cash.)
  - Transfer of Jobs 114 and 115 to the Finished Goods Inventory.
  - Cost of Job 114 in the Cost of Goods Sold account.
  - Revenue from the sale of Job 114.
  - Assignment of any underapplied or overapplied overhead to the Cost of Goods Sold account. (The amount is not material.)

**Check** (2) \$3,000 overapplied

3. Prepare a schedule of cost of goods manufactured.
4. Compute gross profit for September. Show how to present the inventories on the September 30 balance sheet.

(3) Cost of goods manufactured, \$500,000

### Analysis Component

5. The over- or underapplied overhead adjustment is closed to Cost of Goods Sold. Discuss how this adjustment impacts business decision making regarding individual jobs or batches of jobs.

Cavallo Mfg.'s computer system generated the following trial balance on December 31, 2015. The company's manager knows that the trial balance is wrong because it does not show any balance for Work in Process Inventory but does show a balance for the Factory Overhead account. In addition, the accrued factory payroll (Factory Payroll Payable) has not been recorded.

**Problem 19-2B**  
Source documents, journal entries, overhead, and financial reports

P1 P2 P3 P4 

	Debit	Credit
Cash .....	\$ 64,000	
Accounts receivable .....	42,000	
Raw materials inventory .....	26,000	
Work in process inventory .....	0	
Finished goods inventory .....	9,000	
Prepaid rent .....	3,000	
Accounts payable .....		\$ 10,500
Notes payable .....		13,500
Common stock .....		30,000
Retained earnings .....		87,000
Sales .....		180,000
Cost of goods sold .....	105,000	
Factory overhead .....	27,000	
Operating expenses .....	45,000	
Totals .....	<u>\$321,000</u>	<u>\$321,000</u>

After examining various files, the manager identifies the following six source documents that need to be processed to bring the accounting records up to date.

Materials requisition 94-231:	\$4,600 direct materials to Job 603
Materials requisition 94-232:	\$7,600 direct materials to Job 604
Materials requisition 94-233:	\$2,100 indirect materials
Labor time ticket 765:	\$5,000 direct labor to Job 603
Labor time ticket 766:	\$8,000 direct labor to Job 604
Labor time ticket 777:	\$3,000 indirect labor

Jobs 603 and 604 are the only units in process at year-end. The predetermined overhead rate is 200% of direct labor cost.

### Required

1. Use information on the six source documents to prepare journal entries to assign the following costs.
  - a. Direct materials costs to Work in Process Inventory.
  - b. Direct labor costs to Work in Process Inventory.
  - c. Overhead costs to Work in Process Inventory.
  - d. Indirect materials costs to the Factory Overhead account.
  - e. Indirect labor costs to the Factory Overhead account.

**Check** (2) \$6,100  
underapplied overhead

(3) T. B. totals,  
\$337,000

(4) Net income,  
\$23,900

2. Determine the revised balance of the Factory Overhead account after making the entries in part 1. Determine whether there is under- or overapplied overhead for the year. Prepare the adjusting entry to allocate any over- or underapplied overhead to Cost of Goods Sold, assuming the amount is not material.
3. Prepare a revised trial balance.
4. Prepare an income statement for 2015 and a balance sheet as of December 31, 2015.

#### Analysis Component

5. Assume that the \$2,100 indirect materials on materials requisition 94-233 should have been direct materials charged to Job 604. Without providing specific calculations, describe the impact of this error on the income statement for 2015 and the balance sheet at December 31, 2015.

#### Problem 19-3B

Source documents, journal entries, and accounts in job order costing

P1 P2 P3

Starr Mfg.'s predetermined overhead rate is 200% of direct labor. Information on the company's production activities during September 2015 follows.

- a. Purchased raw materials on credit, \$125,000.
- b. Materials requisitions record use of the following materials for the month.

Job 487 .....	\$30,000
Job 488 .....	20,000
Job 489 .....	12,000
Job 490 .....	14,000
Job 491 .....	<u>4,000</u>
Total direct materials .....	80,000
Indirect materials .....	<u>12,000</u>
Total materials used .....	<u>\$92,000</u>

- c. Paid \$11,000 cash for miscellaneous factory overhead costs.
- d. Time tickets record use of the following labor for the month. These wages are paid in cash.

Job 487 .....	\$ 8,000
Job 488 .....	7,000
Job 489 .....	25,000
Job 490 .....	26,000
Job 491 .....	<u>2,000</u>
Total direct labor .....	68,000
Indirect labor .....	<u>16,000</u>
Total .....	<u>\$84,000</u>

- e. Allocated overhead to Jobs 487, 489, and 490.
- f. Transferred Jobs 487, 489, and 490 to Finished Goods.
- g. Sold Jobs 487 and 489 on credit for a total price of \$340,000.
- h. The company incurred the following overhead costs during the month (credit Prepaid Insurance for expired factory insurance).

Depreciation of factory building .....	\$37,000
Depreciation of factory equipment .....	21,000
Expired factory insurance .....	7,000
Accrued property taxes payable .....	31,000

- i. Applied overhead at month-end to the Work in Process Inventory account (Jobs 488 and 491) using the predetermined overhead rate of 200% of direct labor cost.

**Required**

1. Prepare a job cost sheet for each job worked on in the month. Use the following simplified form.

Job No. _____	
Materials . . . . .	\$ _____
Labor . . . . .	_____
Overhead . . . . .	_____
Total cost . . . . .	\$ _____

2. Prepare journal entries to record the events and transactions *a* through *i*.
3. Set up T-accounts for each of the following general ledger accounts, each of which started the month with a zero balance: Raw Materials Inventory, Work in Process Inventory, Finished Goods Inventory, Factory Overhead, Cost of Goods Sold. Then post the journal entries to these T-accounts and determine the balance of each account.
4. Prepare a report showing the total cost of each job in process and prove that the sum of their costs equals the Work in Process Inventory account balance. Prepare similar reports for Finished Goods Inventory and Cost of Goods Sold.

**Check** (2e) Cr. Factory Overhead, \$118,000  
(3) Finished Goods Inventory, \$92,000 bal.

In December 2014, Pavelka Company’s manager estimated next year’s total direct labor cost assuming 50 persons working an average of 2,000 hours each at an average wage rate of \$15 per hour. The manager also estimated the following manufacturing overhead costs for 2015.

Indirect labor . . . . .	\$159,600
Factory supervision . . . . .	120,000
Rent on factory building . . . . .	70,000
Factory utilities . . . . .	44,000
Factory insurance expired . . . . .	34,000
Depreciation—Factory equipment . . . . .	240,000
Repairs expense—Factory equipment . . . . .	30,000
Factory supplies used . . . . .	34,400
Miscellaneous production costs . . . . .	18,000
Total estimated overhead costs . . . . .	<u>\$750,000</u>

**Problem 19-4B**  
Overhead allocation and adjustment using a predetermined overhead rate

P3 P4

At the end of 2015, records show the company incurred \$725,000 of actual overhead costs. It completed and sold five jobs with the following direct labor costs: Job 625, \$354,000; Job 626, \$330,000; Job 627, \$175,000; Job 628, \$420,000; and Job 629, \$184,000. In addition, Job 630 is in process at the end of 2015 and had been charged \$10,000 for direct labor. No jobs were in process at the end of 2014. The company’s predetermined overhead rate is based on direct labor cost.

**Required**

1. Determine the following.
  - a. Predetermined overhead rate for 2015.
  - b. Total overhead cost applied to each of the six jobs during 2015.
  - c. Over- or underapplied overhead at year-end 2015.
2. Assuming that any over- or underapplied overhead is not material, prepare the adjusting entry to allocate any over- or underapplied overhead to Cost of Goods Sold at the end of year 2015.

**Check** (1c) \$11,500 overapplied  
(2) Dr. Factory Overhead, \$11,500

King Company produces variations of its product, a megatron, in response to custom orders from its customers. On June 1, the company had no inventories of work in process or finished goods but held the following raw materials.

**Problem 19-5B**  
Production transactions, subsidiary records, and source documents

P1 P2 P3 P4

Material M . . . . .	120 units @ \$200 =	\$24,000
Material R . . . . .	80 units @ 160 =	12,800
Paint . . . . .	44 units @ 72 =	<u>3,168</u>
Total cost . . . . .		<u>\$39,968</u>

On June 3, the company began working on two megatrons: Job 450 for Encinita Company and Job 451 for Fargo, Inc.

### Required

Using Exhibit 19.3 as a guide, prepare job cost sheets for Jobs 450 and 451. Using Exhibit 19.5 as a guide, prepare materials ledger cards for Material M, Material R, and paint. Enter the beginning raw materials inventory dollar amounts for each of these materials on their respective ledger cards. Then, follow instructions in this list of activities.

- a. Purchased raw materials on credit and recorded the following information from receiving reports and invoices.

Receiving Report No. 20, Material M, 150 units at \$200 each.  
Receiving Report No. 21, Material R, 70 units at \$160 each.

*Instructions:* Record these purchases with a single journal entry. Enter the receiving report information on the materials ledger cards.

- b. Requisitioned the following raw materials for production.

Requisition No. 223, for Job 450, 80 units of Material M.  
Requisition No. 224, for Job 450, 60 units of Material R.  
Requisition No. 225, for Job 451, 40 units of Material M.  
Requisition No. 226, for Job 451, 30 units of Material R.  
Requisition No. 227, for 12 units of paint.

*Instructions:* Enter amounts for direct materials requisitions on the materials ledger cards and the job cost sheets. Enter the indirect material amount on the materials ledger card. Do not record a journal entry at this time.

- c. Received the following employee time tickets for work in June.

Time tickets Nos. 1 to 10 for direct labor on Job 450, \$40,000.  
Time tickets Nos. 11 to 20 for direct labor on Job 451, \$32,000.  
Time tickets Nos. 21 to 24 for equipment repairs, \$12,000.

*Instructions:* Record direct labor from the time tickets on the job cost sheets. Do not record a journal entry at this time.

- d. Paid cash for the following items during the month: factory payroll, \$84,000, and miscellaneous overhead items, \$36,800. Use the time tickets to record the total direct and indirect labor costs.

*Instructions:* Record these payments with journal entries.

- e. Finished Job 450 and transferred it to the warehouse. The company assigns overhead to each job with a predetermined overhead rate equal to 70% of direct labor cost.

*Instructions:* Enter the allocated overhead on the cost sheet for Job 450, fill in the cost summary section of the cost sheet, and then mark the cost sheet "Finished." Prepare a journal entry to record the job's completion and its transfer to Finished Goods.

- f. Delivered Job 450 and accepted the customer's promise to pay \$290,000 within 30 days.

*Instructions:* Prepare journal entries to record the sale of Job 450 and the cost of goods sold.

- g. Applied overhead cost to Job 451 based on the job's direct labor used to date.

*Instructions:* Enter overhead on the job cost sheet but do not make a journal entry at this time.

- h. Recorded the total direct and indirect materials costs as reported on all the requisitions for the month.

*Instructions:* Prepare a journal entry to record these.

- i. Recorded the total overhead costs applied to jobs.

*Instructions:* Prepare a journal entry to record the allocation of these overhead costs.

- j. Compute the balance in the Factory Overhead account as of the end of June.

**Check** Balance in Factory Overhead, \$736 Cr., overapplied

(This serial problem began in Chapter 1 and continues through most of the book. If previous chapter segments were not completed, the serial problem can begin at this point. It is helpful, but not necessary, to use the Working Papers that accompany the book.)

## SERIAL PROBLEM

Business Solutions

P1 P2 P3

**SP 19** The computer workstation furniture manufacturing that Santana Rey started in January is progressing well. As of the end of June, Business Solutions's job cost sheets show the following total costs accumulated on three furniture jobs.

	Job 602	Job 603	Job 604
Direct materials . . . . .	\$1,500	\$3,300	\$2,700
Direct labor . . . . .	800	1,420	2,100
Overhead . . . . .	400	710	1,050

Job 602 was started in production in May, and these costs were assigned to it in May: direct materials, \$600; direct labor, \$180; and overhead, \$90. Jobs 603 and 604 were started in June. Overhead cost is applied with a predetermined rate based on direct labor costs. Jobs 602 and 603 are finished in June, and Job 604 is expected to be finished in July. No raw materials are used indirectly in June. (Assume this company's predetermined overhead rate did not change over these months).

### Required

1. What is the cost of the raw materials used in June for each of the three jobs and in total?
2. How much total direct labor cost is incurred in June?
3. What predetermined overhead rate is used in June?
4. How much cost is transferred to Finished Goods Inventory in June?

**Check** (1) Total materials, \$6,900  
(3) 50%

The **General Ledger** tool in *Connect* automates several of the procedural steps in accounting so that the financial professional can focus on the impacts of each transaction on various reports and performance measures.

**GL 19-1** General Ledger assignment GL 19-1, based on Problem 19-1A, focuses on transactions related to job-order costing. Prepare summary journal entries to record the cost of jobs and their flow through the manufacturing environment. Then prepare a schedule of cost of goods manufactured and a partial income statement.

## GL GENERAL LEDGER PROBLEM

Available only in Connect Plus

 connect plus+ ACCOUNTING

## Beyond the Numbers

**BTN 19-1** Apple's financial statements and notes in Appendix A provide evidence of growth potential in its sales.

### Required

1. Identify at least two types of costs that will predictably increase as a percent of sales with growth in sales.
2. Explain why you believe the types of costs identified for part 1 will increase, and describe how you might assess Apple's success with these costs. (*Hint:* You might consider the gross margin ratio.)

### Fast Forward

3. Access Apple's annual report for a fiscal year ending after September 28, 2013, from its website [[Apple.com](http://Apple.com)] or the SEC's EDGAR database [[www.SEC.gov](http://www.SEC.gov)]. Review and report its growth in sales along with its cost and income levels (including its gross margin ratio).

## REPORTING IN ACTION

C1 

APPLE

## COMPARATIVE ANALYSIS

### APPLE GOOGLE

**BTN 19-2** Manufacturers and merchandisers can apply just-in-time (JIT) to their inventory management. Both **Apple** and **Google** want to know the impact of a JIT inventory system for their operating cash flows. Review each company's statement of cash flows in Appendix A to answer the following.

#### Required

1. Identify the impact on operating cash flows (increase or decrease) for changes in inventory levels (increase or decrease) for both companies for each of the three most recent years.
2. What impact would a JIT inventory system have on both Apple's and Google's operating income? Link the answer to your response for part 1.
3. Would the move to a JIT system have a one-time or recurring impact on operating cash flow?

## ETHICS CHALLENGE

**BTN 19-3** An accounting professional requires at least two skill sets. The first is to be technically competent. Knowing how to capture, manage, and report information is a necessary skill. Second, the ability to assess manager and employee actions and biases for accounting analysis is another skill. For instance, knowing how a person is compensated helps anticipate information biases. Draw on these skills and write a half-page memo to the financial officer on the following practice of allocating overhead.

*Background:* Assume that your company sells portable housing to both general contractors and the government. It sells jobs to contractors on a bid basis. A contractor asks for three bids from different manufacturers. The combination of low bid and high quality wins the job. However, jobs sold to the government are bid on a cost-plus basis. This means price is determined by adding all costs plus a profit based on cost at a specified percent, such as 10%. You observe that the amount of overhead allocated to government jobs is higher than that allocated to contract jobs. These allocations concern you and motivate your memo.

**Point:** Students could compare responses and discuss differences in concerns with allocating overhead.

## COMMUNICATING IN PRACTICE

**BTN 19-4** Assume that you are preparing for a second interview with a manufacturing company. The company is impressed with your credentials but has indicated that it has several qualified applicants. You anticipate that in this second interview, you must show what you offer over other candidates. You learn the company currently uses a periodic inventory system and is not satisfied with the timeliness of its information and its inventory management. The company manufactures custom-order holiday decorations and display items. To show your abilities, you plan to recommend that it use a cost accounting system.

#### Required

In preparation for the interview, prepare notes outlining the following:

1. Your cost accounting system recommendation and why it is suitable for this company.
2. A general description of the documents that the proposed cost accounting system requires.
3. How the documents in part 2 facilitate the operation of the cost accounting system.

**Point:** Have students present a mock interview, one assuming the role of the president of the company and the other the applicant.

## TAKING IT TO THE NET

**BTN 19-5** Many contractors work on custom jobs that require a job order costing system.

#### Required

Access the website [AMSL.com](http://AMSL.com); click on "Construction Management Software," and then on "STARBUILDER." Prepare a one-page memorandum for the CEO of a construction company providing information about the job order costing software this company offers. Would you recommend that the company purchase this software?

## TEAMWORK IN ACTION

**BTN 19-6** Consider the activities undertaken by a medical clinic in your area.

#### Required

1. Do you consider a job order costing system appropriate for the clinic?
2. Identify as many factors as possible to lead you to conclude that it uses a job order system.

**BTN 19-7** Refer to the chapter opener regarding Quintin Middleton and his company, **Middleton Made Knives**. All successful businesses track their costs, and it is especially important for start-up businesses to monitor and control costs.

### ENTREPRENEURIAL DECISION

C1 C2  

#### Required

1. Assume that Middleton Made Knives uses a job order costing system. For the basic cost category of direct materials, explain how a job cost sheet for Middleton Made Knives would differ from a job cost sheet for a service company.
2. For the basic cost categories of direct labor and overhead, provide examples of the types of costs that would fall into each category for Middleton Made Knives.

**BTN 19-8** Job order costing is frequently used by home builders.

### HITTING THE ROAD

C2 P1 P2 P3 

#### Required

1. You (or your team) are to prepare a job cost sheet for a single-family home under construction. List four items of both direct materials and direct labor. Explain how you think overhead should be applied.
2. Contact a builder and compare your job cost sheet to this builder's job cost sheet. If possible, speak to that company's accountant. Write your findings in a short report.

**BTN 19-9** **Apple** and **Samsung** are competitors in the global marketplace. Apple's and Samsung's financial statements are in Appendix A.

### GLOBAL DECISION

C1  

#### Required

1. Determine the change in Apple's and Samsung's inventories for the most recent year reported. Then identify the impact on net resources generated by operating activities (increase or decrease) for the change in inventory level (increase or decrease) for Apple and Samsung for that same year.
2. How would the move to a just-in-time (JIT) system likely impact future operating cash flows and operating income?
3. Would a move to a JIT system likely impact Apple more than it would Samsung? Explain.

### APPLE Samsung

## ANSWERS TO MULTIPLE CHOICE QUIZ

1. c;  $\$30,000 \times 150\% = \underline{\$45,000}$
2. b;  $\$38,500/\$35,000 = \underline{110\%}$
3. e; Direct materials + Direct labor + Overhead = Total cost;  
 $\text{Direct materials} + (\$4,000/.80) + \$4,000 = \$10,000$   
 $\text{Direct materials} = \underline{\$1,000}$
4. e;  $\$9,000 + \$94,200 + \$59,200 + \$31,600 - \text{Finished goods} = \$17,800$   
 $\text{Thus, finished goods} = \underline{\underline{\$176,200}}$

- A2** Hybrid costing system
- C4** *Appendix: FIFO method*

## Learning Objectives

### CONCEPTUAL

- C1** Explain process operations and the way they differ from job order operations.
- C2** Define and compute equivalent units and explain their use in process costing.
- C3** Describe accounting for production activity and preparation of a process cost summary using weighted average.
- C4** *Appendix*—Describe accounting for production activity and preparation of a process cost summary using FIFO.

### ANALYTICAL

- A1** Compare process costing and job order costing.
- A2** Explain and illustrate a hybrid costing system.

### PROCEDURAL

- P1** Record the flow of materials costs in process costing.

- P2** Record the flow of labor costs in process costing.
- P3** Record the flow of factory overhead costs in process costing.
- P4** Record the transfer of goods across departments, to Finished Goods Inventory, and to Cost of Goods Sold.

## Mixing It Up

MADISON HEIGHTS, MI—Like many small businesses, **Kar's Nuts** ([karsnuts.com](http://karsnuts.com)) started at home, where Sue Kar roasted peanuts to sell at nearby Tiger Stadium. From humble beginnings, the company now has the country's best-selling branded trail mix, Sweet 'n Salty Mix. Kar's CEO and family-owner Nick Nicolay notes that "Sweet 'n Salty is our flagship item, and we sell over 15 million pounds of it each year."

Unlike products made in job order operations, Kar's operates a continuous production line that runs around the clock, processing over 26 million pounds of different trail mixes during the year. High production volumes are characteristic of products made in process operations. This operation requires production managers to track costs differently than in job order systems, and Kar's relies on a process costing system to monitor and control its costs. These systems track the costs of each process, which in Kar's case include roasting, blending, and packaging.

Each of Kar's processes adds direct materials costs. In the roasting department, thousand-pound supersacks of peanuts and sunflower kernels are roasted and then transferred to the blending department. "We're choosy with ingredients, and use only jumbo peanuts because they taste better," says Nick. In the blending department, direct materials like dark chocolate chunks, raisins, and various berries are blended with the roasted nuts.

Like many process operations, Kar's relies heavily on automation. Much of the work is done by machines, including roasters, conveyors, bucket elevators, and robots. The overhead costs of running the machines must be carefully monitored and (as in job order costing) allocated. In process costing,

overhead costs are allocated to individual processes, such as roasting, blending, and packaging, rather than to individual jobs. With costly raw materials and overhead costs, Nick and his production managers must be adept at interpreting process cost summary reports to monitor and control costs.

While Kar's has been in business for many years, Nick stresses the need for the company to remain entrepreneurial and creative: "Coming up with innovative, new products can be challenging. No one's creating new fruits or nuts, so our charge is to take what's out there and continue to come up with unique, tasty, healthy combinations to meet new demand." A 30-minute internal meeting was the genesis of the idea for Sweet 'n Salty.

According to Nicolay, "We thought a sweet and salty trail mix would be a good alternative to candy bars in vending machines in the summertime. . . . But it quickly became more than a seasonal item." Likewise, Kar's developed Second Nature, a line focused on meeting trends toward even healthier snacks. "We saw that consumers wanted a more premium, upscale, healthy eating option, and we responded with this line of mixes that includes all-natural ingredients," says Nick.

Nick encourages young entrepreneurs to "enjoy what you do and work hard." Though he started as a banker, Nick realized that "snack food is in my family's blood," and he made the move to Kar's. Now, the company boasts yearly sales of over \$90 million, and Nick has plans for his products to be sold in nearly all the top grocery stores in the United States within the next few years. "There is a lot of geography left," notes Nick.

*"We roast around the clock . . . the demand is there"*

—Nick Nicolay

## PROCESS OPERATIONS

**C1** Explain process operations and the way they differ from job order operations.

In the previous chapter we described differences in job order and process operations and illustrated job order costing. Recall that job order operations involve individual, customized jobs, with little standardization of work activities. **Process operations** involve the mass production of similar products in a continuous flow of sequential processes. A key feature of process operations is the high level of standardization needed if the system is to produce large volumes of products. Thus, process operations use a standardized process to make similar products; job order operations use a customized process to make unique products.

**Penn**, a maker of tennis balls, reflects a process operation. Tennis players want every tennis ball to be the same in terms of bounce, playability, and durability. This uniformity requires Penn to use a production process that can repeatedly make large volumes of tennis balls to the same specifications. Such a process is unlike job order operations, where customers want products or services customized to their individual needs. Process operations also extend to services, such as mail sorting in large post offices and order processing in retailers like **Amazon.com**. Other companies using process operations include:

Company*	Product	Company	Product
Kellogg	Cereals	Heinz	Ketchup
Pfizer	Pharmaceuticals	Mars	M&Ms
Procter & Gamble	Household products	Hershey	Chocolate
Coca-Cola	Soft drinks	Suja	Organic juice

\*For virtual tours of process operations visit [PennRacquet.com/video.html](http://PennRacquet.com/video.html) (tennis balls) and [Hersheys.com/ads-and-videos/how-we-make-chocolate.aspx](http://Hersheys.com/ads-and-videos/how-we-make-chocolate.aspx) (chocolate).

### Organization of Process Operations

Each of these products involves operations having a series of repetitive *processes*, or steps, resulting in a noncustomized product or service. A production operation that makes tennis balls, for instance, might include the three steps shown in Exhibit 20.1. Understanding such processes for companies with process operations is crucial for measuring their costs. Increasingly, process operations use machines and automation to control product quality and reduce manufacturing costs.

#### EXHIBIT 20.1

Process Operations:  
Making of Tennis Balls

In a process operation, each process is identified as a separate *production department*, *workstation*, or *work center*. With the exception of the first process or department, each receives the output from the prior department as a partially processed product. Depending on the nature of the process, each process applies direct labor, overhead, and, perhaps, additional direct materials to move the product toward completion. Only the final process or department in the series produces finished goods ready for sale to customers. In Exhibit 20.1, the first step in tennis ball production involves cutting rubber into pellets and forming the core of each ball. These rubber cores are passed to the second department, where felt is cut into covers and glued to the rubber cores. The completed tennis balls are then passed to the final department for quality checks and packaging.

Tracking costs for several related departments can seem complex. Yet because process costing procedures are applied to *the activity of each department or process separately*, we need to consider only one process at a time. This simplifies the procedures. In addition, as we will show in this chapter, many of the journal entries in a process costing system are like those in a job order costing system.

## Comparing Process and Job Order Costing Systems

Both **job order costing systems** and **process costing systems** track direct materials, direct labor, and overhead costs. The measurement focus in a job order costing system is on the individual job or batch, whereas in a process costing system, it is on the individual process. Regardless of the measurement focus, we are ultimately interested in determining the cost per unit of product (or service) resulting from either system.

While both measure costs per unit, these two accounting systems differ in terms of how they do so. A job order system measures cost per unit upon completion of a job, by dividing the total cost for that job by the number of units in that job. As we showed in the previous chapter, job cost sheets accumulate the costs for each job. In a job order system, the cost object is a job. A process costing system measures unit costs at the end of a period (for example, a month) by combining the costs per equivalent unit (explained in the next section) from each separate department. In process costing, the cost object is the process. Differences in the way these two systems apply materials, labor, and overhead costs are highlighted in Exhibit 20.2.

**A1** Compare process costing and job order costing.

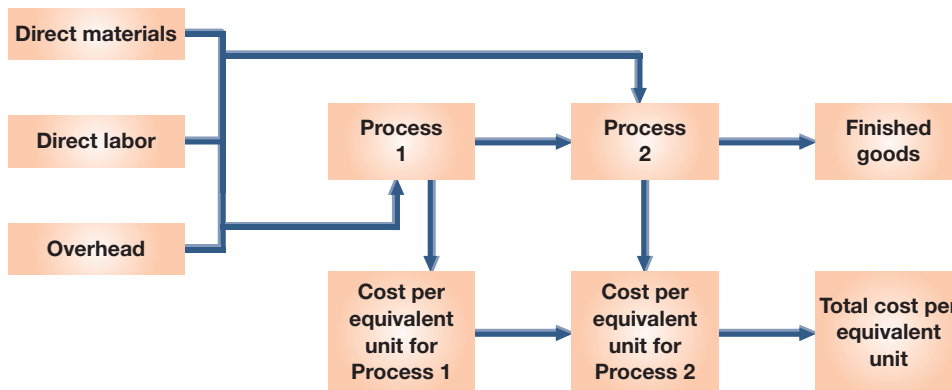

**Point:** The cost object in a job order system is the specific job; the cost object in a process costing system is the process.

QC1

### Job order systems

### Process systems

### EXHIBIT 20.2

Cost Flows: Comparing Job Order and Process Costing Systems

**Transferring Costs across Departments** A key difference between job order and process costing arises with respect to work in process inventory: Job order costing often uses *only one* Work in Process Inventory account; the balance in this account agrees with the accumulated balances across all the job cost sheets for the jobs still in process. Process costing, however, uses *separate* Work in Process Inventory accounts for each department. When the production process is complete in process costing, the completed goods and the accumulated costs are transferred from the Work in Process Inventory account for the final department in the series of processes to the Finished Goods Inventory account. Exhibit 20.3 summarizes the journal entries to capture this flow of costs for a tennis ball manufacturer.

**EXHIBIT 20.3**

Flow of Costs through Separate Work in Process Accounts

Work in Process Inventory—Felt department . . . . .	##

**QC2**

Complete the following table with either a yes or no regarding the attributes of job order and process costing systems.

	Job Order	Process
Uses direct materials, direct labor, and overhead costs . . . . .	a. _____	e. _____
Uses job cost sheets to accumulate costs . . . . .	b. _____	f. _____
Typically uses several Work in Process Inventory accounts . . . . .	c. _____	g. _____
Yields a cost per unit of product . . . . .	d. _____	h. _____

**Solution**

a. yes   b. yes   c. no   d. yes   e. yes   f. no   g. yes   h. yes

**C2**

Define and compute equivalent units and explain their use in process costing.

**Equivalent Units of Production**

Companies with process operations typically end each period with inventories of both finished goods and work in process. For example, a maker of tennis balls ends each period with a large number of completed tennis balls and a large number of partially completed tennis balls in inventory. Clearly, a completed tennis ball differs from a partially completed one. How, then, does a manufacturer measure its production activity when it has some partially completed goods at the end of a period? A key idea in process costing is that of **equivalent units of production (EUP)**, a term that refers to the number of units that *could have been* started and completed given the costs incurred during the period. For example, 100,000 tennis balls that are 60% through the production process is equivalent to 60,000 (100,000 units × 60%) tennis balls that have completed the entire production process. This means that the cost to put 100,000 units 60% of the way through the production process is *equivalent to* the cost to put 60,000 units completely through the production process. Having information about the costs of partially completed goods makes it possible to measure the firm’s production activity for the period.

**EUP for Materials and Conversion Costs** In many processes, the equivalent units of production for direct materials are not the same with respect to direct labor and overhead. For example, direct materials, like rubber for tennis ball cores, might enter production entirely at the beginning of a process; direct labor and overhead, in contrast, might be used continuously throughout the process. How does a manufacturer account for these timing differences? Again, by measuring equivalent units of production. For example, if all of the direct materials to produce 10,000 units have entered the production process, but those units have received only 20% of their direct labor and overhead costs, equivalent units would be computed as:

EUP for direct materials	=	10,000 × 100%	=	10,000
EUP for direct labor	=	10,000 × 20%	=	2,000
EUP for overhead	=	10,000 × 20%	=	2,000

As discussed in a previous chapter, direct labor and factory overhead can be classified as *conversion costs*—that is, as costs of converting direct materials into finished products. Many businesses with process operations compute **conversion cost per equivalent unit**, which is the combined costs of direct labor and factory overhead per equivalent unit. If, as shown in the example above, direct labor and overhead enter the production process at the same rate, it is convenient to combine them and focus on them, together, as conversion costs. In addition, advances in technology

**Point:** When overhead is applied based on direct labor cost, the percentage of completion for direct labor and overhead will be the same.

enable companies to automate their production processes and reduce direct labor costs. For these reasons, many companies with process operations use the categories of direct materials and conversion costs both for accounting and decision-making purposes. We illustrate this in the next section.

**Weighted Average versus FIFO** As we will show later, there are different ways to compute the number of equivalent units. These methods make different assumptions about how costs flow. The **weighted-average method** combines units and costs *across two periods* in computing equivalent units. The **FIFO method** computes equivalent units based only on production activity in the *current period*. The objectives, concepts, and journal entries (but not amounts) are the same under the weighted-average and FIFO methods; the computations of equivalent units differ. While the FIFO method is generally considered to be more precise than the weighted-average method, it requires more calculations. Often, the differences between the two methods are not large. When using a just-in-time inventory system, these different methods will yield very similar results because inventories are immaterial. **In this chapter we assume the weighted-average method for inventory costs and illustrate the FIFO method in the appendix.**

## PROCESS COSTING ILLUSTRATION

In this section we provide a step-by-step illustration of process costing. Each process (or department) in a process operation follows these steps:

1. Determine the physical flow of units.
2. Compute the equivalent units of production.
3. Compute the cost per equivalent unit of production.
4. Assign and reconcile costs.

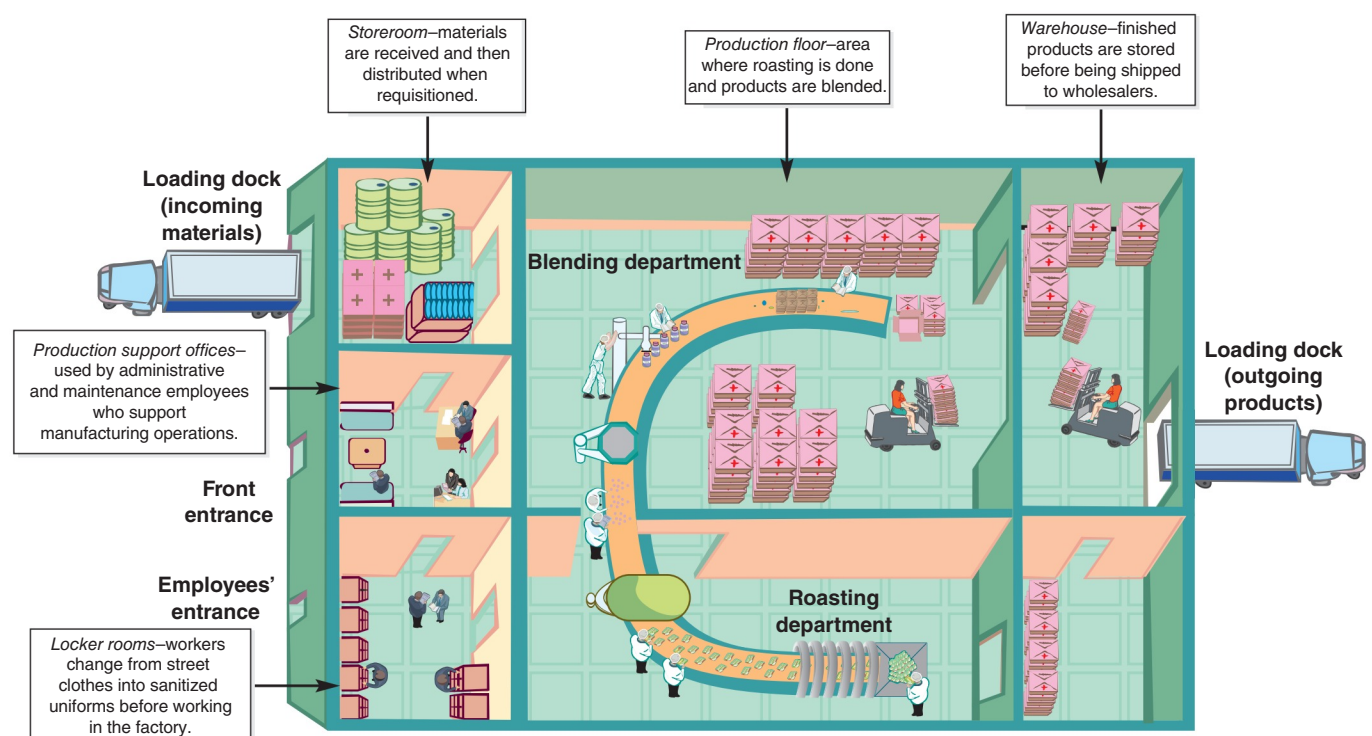

The next section shows these steps for the first of two sequential processes used by a company to produce one of its products.

### Overview of GenX Company's Process Operation

The GenX Company produces an organic trail mix called FitMix. Its target customers are active people who are interested in fitness and the environment. GenX sells FitMix to wholesale distributors, who in turn sell it to retailers. FitMix is manufactured in a continuous, two-process operation (roasting and blending), shown in Exhibit 20.4.

### C3

Describe accounting for production activity and preparation of a process cost summary using weighted average.

### EXHIBIT 20.4

GenX's Process Operation

In the first process (roasting department), GenX roasts, oils, and salts organically grown peanuts. These peanuts are then passed to the blending department, the second process. In the blending department, machines blend organic chocolate pieces and organic dried fruits with the peanuts from the first process. The blended mix is then inspected and packaged for delivery. In both departments, direct materials enter production at the beginning of the process, while conversion costs occur continuously throughout each department’s processing. Exhibit 20.5 presents production data (in units) for GenX’s roasting department. This exhibit includes the percentage of completion for both materials and conversion; for example, beginning work in process inventory is 100% complete with respect to materials but only 65% complete with respect to conversion.

**EXHIBIT 20.5**

Production Data (in units) for Roasting Department

Roasting Department	Units	Percentage of Completion	
		Direct Materials	Conversion
Beginning work in process inventory (March 31) . . . . .	30,000	100%	65%
Units started this period . . . . .	+90,000	—	—
Units completed and transferred out . . . . .	<u>-100,000</u>	100%	100%
Ending work in process inventory (April 30) . . . . .	<u>20,000</u>	100%	25%

Exhibit 20.6 presents production cost data for GenX’s roasting department. We will use the data in Exhibits 20.5 and 20.6 to illustrate the four-step approach to process costing.

**EXHIBIT 20.6**

Roasting Department Production Cost Data

GenX—Roasting Department		
Beginning work in process inventory (March 31)		
Direct materials costs . . . . .	\$ 81,000	
Conversion costs . . . . .	<u>108,900</u>	\$189,900
Costs during the current period (April)		
Direct materials costs . . . . .	279,000	
Direct labor costs* . . . . .	171,000	
Factory overhead costs applied (120% of direct labor)* . . . . .	<u>205,200</u>	<u>655,200</u>
Total production costs . . . . .		<u>\$845,100</u>

\*Total conversion costs for the month equal \$376,200 (\$171,000 + \$205,200).

**Step 1: Determine Physical Flow of Units**

A *physical flow reconciliation* is a report that reconciles (1) the physical units started in a period with (2) the physical units completed in that period. A physical flow reconciliation for GenX’s roasting department is shown in Exhibit 20.7 for April.

**EXHIBIT 20.7**

Physical Flow Reconciliation

GenX—Roasting Department			
Units to Account For		Units Accounted For	
Beginning work in process inventory . . . . .	30,000 units	Units completed and transferred out . . . . .	100,000 units
Units started this period . . . . .	<u>90,000 units</u>	Ending work in process inventory . . . . .	<u>20,000 units</u>
Total units to account for . . . . .	<u>120,000 units</u>	Total units accounted for . . . . .	<u>120,000 units</u>
		reconciled	

**Step 2: Compute Equivalent Units of Production**

The second step is to compute *equivalent units of production* for direct materials and conversion costs for April. Since direct materials and conversion costs typically enter a process at different rates, departments must compute equivalent units separately for direct materials and conversion costs. Exhibit 20.8 shows the formula to compute equivalent units under the weighted-average method for both direct materials and conversion costs.

$$\text{Equivalent units of production (EUP)} = \text{Number of whole units completed and transferred to next department}^* + \text{Number of equivalent units in ending work in process inventory}$$

\*Or transferred to finished goods inventory.

For GenX's roasting department, we must convert the 120,000 physical units measure to *equivalent units* based on how each input has been used. The roasting department fully completed its work on 100,000 units, and partially completed its work on 20,000 units (from Exhibit 20.5). Equivalent units are computed by multiplying the number of units accounted for (from Step 1) by the percentage of completion for each input—see Exhibit 20.9.

GenX—Roasting Department		
Equivalent Units of Production	Direct Materials	Conversion
Equivalent units completed and transferred out (100,000 × 100%) . . . . .	100,000 EUP	100,000 EUP
Equivalent units for ending work in process		
Direct materials (20,000 × 100%) . . . . .	20,000 EUP	
Conversion (20,000 × 25%) . . . . .		5,000 EUP
Equivalent units of production . . . . .	120,000 EUP	105,000 EUP

The first row of Exhibit 20.9 reflects units transferred out in April. The roasting department entirely completed its work on the 100,000 units transferred out. These units have 100% of the materials and conversion required, or 100,000 equivalent units of each input (100,000 × 100%).

GenX ended the month with 20,000 partially completed units. For direct materials, the units in ending work in process inventory include all materials required, so there are 20,000 equivalent units (20,000 × 100%) of materials in the unfinished physical units. Regarding conversion, the units in ending work in process inventory include 25% of the conversion required, which implies 5,000 equivalent units of conversion (20,000 × 25%).

The final row reflects the total equivalent units of production, which is whole units of product that could have been manufactured with the amount of inputs used to create some complete and some incomplete units. For GenX, the amount of inputs used to produce 100,000 complete units and to start 20,000 additional units is equivalent to the amount of direct materials in 120,000 whole units and the amount of conversion in 105,000 whole units.

A department began the month with 8,000 units in work in process inventory. These units were 100% complete with respect to direct materials and 40% complete with respect to conversion. During the current month, the department started 56,000 units and completed 58,000 units. Ending work in process inventory includes 6,000 units, 100% complete with respect to direct materials and 70% complete with respect to conversion. Use the weighted-average method of process costing to:

1. Compute the department's equivalent units of production for the month for direct materials.
2. Compute the department's equivalent units of production for the month for conversion.

#### Solution

1. EUP for materials = 58,000 + (6,000 × 100%) = 64,000 EUP
2. EUP for conversion = 58,000 + (6,000 × 70%) = 62,200 EUP

### Step 3: Compute Cost per Equivalent Unit

Under the weighted-average method, the computation of EUP does not separate the units in beginning inventory from those started this period, as shown above. Similarly, the weighted-average method combines the costs of beginning work in process inventory with the costs incurred in the current period. This total cost is then divided by the equivalent units of production (from step 2), to compute the average cost per equivalent unit. This process is illustrated in

#### EXHIBIT 20.8

Computing EUP—  
Weighted-Average Method

OC3

**Point:** The weighted-average method mixes production activity and costs across two periods.

**Point:** Managers can examine changes in monthly costs per equivalent unit to help control the production process.

Exhibit 20.10. For direct materials, the cost averages \$3.00 per EUP. For conversion, the cost per equivalent unit averages \$4.62 per unit.

### EXHIBIT 20.10

Cost per Equivalent Unit of Production—Weighted Average

GenX—Roasting Department		
Cost per Equivalent Unit of Production	Direct Materials	Conversion
Costs of beginning work in process inventory***	\$ 81,000	\$108,900
Costs incurred this period***	<u>279,000</u>	<u>376,200**</u>
Total costs	\$360,000	\$485,100
÷ Equivalent units of production (from step 2)	<u>120,000 EUP</u>	<u>105,000 EUP</u>
= Cost per equivalent unit of production	<u>\$3.00 per EUP*</u>	<u>\$4.62 per EUP†</u>

\*\$360,000 ÷ 120,000 EUP \*\*\$171,000 + \$205,200 †\$485,100 ÷ 105,000 EUP \*\*\* From Exhibit 20.6

### Step 4: Assign and Reconcile Costs

The EUP from step 2 and the cost per EUP from step 3 are used in step 4 to assign costs to (a) units that the roasting department completed and transferred to the blending department (100,000 units), and (b) units that remain in process in the roasting department (20,000 units). This is illustrated in Exhibit 20.11.

### EXHIBIT 20.11

Report of Costs Accounted For—Weighted Average

GenX—Roasting Department		
<b>Cost of units completed and transferred to blending dept.</b>		
Direct materials (100,000 EUP × \$3.00 per EUP)	\$300,000	
Conversion (100,000 EUP × \$4.62 per EUP)	<u>462,000</u>	
Cost of units completed this period		\$762,000
<b>Cost of ending work in process inventory</b>		
Direct materials (20,000 EUP × \$3.00 per EUP)	60,000	
Conversion (5,000 EUP × \$4.62 per EUP)	<u>23,100</u>	
Cost of ending work in process inventory		<u>83,100</u>
<b>Total costs accounted for</b>		<b><u>\$845,100</u></b>

**Cost of Units Completed and Transferred** The 100,000 units completed and transferred to the blending department required 100,000 EUP of direct materials and 100,000 EUP of conversion. Thus, we assign \$300,000 (100,000 EUP × \$3.00 per EUP) of direct materials cost to those units. Similarly, we assign \$462,000 (100,000 EUP × \$4.62 per EUP) of conversion to those units. The total cost of the 100,000 completed and transferred units is \$762,000 (\$300,000 + \$462,000) and their average cost per unit is \$7.62 (\$762,000 ÷ 100,000 units).

**Cost of Units for Ending Work in Process** There are 20,000 incomplete units in work in process inventory at period-end. For direct materials, those units have 20,000 EUP of material (from step 2) at a cost of \$3.00 per EUP (from step 3), which yields the materials cost of work in process inventory of \$60,000 (20,000 EUP × \$3.00 per EUP). For conversion, the in-process units reflect 5,000 EUP (from step 2). Using the \$4.62 conversion cost per EUP (from step 3) we obtain conversion costs for in-process inventory of \$23,100 (5,000 EUP × \$4.62 per EUP). Total cost of work in process inventory at period-end is \$83,100 (\$60,000 + \$23,100).

As a check, management verifies that total costs assigned to units completed and transferred plus the costs of units in process (from Exhibit 20.11) equal the costs incurred by production. Exhibit 20.12 shows the costs incurred by production this period. We then reconcile the *costs accounted for* in Exhibit 20.11 with the *costs to account for* in Exhibit 20.12.

GenX—Roasting Department		
<b>Cost of beginning work in process inventory</b>		
Direct materials.....	\$ 81,000	
Conversion .....	<u>108,900</u>	\$ 189,900
<b>Cost incurred this period</b>		
Direct materials.....	279,000	
Conversion .....	<u>376,200</u>	<u>655,200</u>
<b>Total costs to account for.....</b>		<b><u>\$845,100</u></b>

**EXHIBIT 20.12**

Report of Costs to Account For—Weighted Average

The roasting department manager is responsible for \$845,100 in costs: \$189,000 from beginning work in process plus \$655,200 of materials and conversion incurred in the period. At period-end, that manager must show where these costs are assigned. The roasting department manager reports that \$83,100 are assigned to units in process and \$762,000 are assigned to units transferred out to the blending department (per Exhibit 20.11). The sum of these amounts equals \$845,100. Thus, the total *costs to account for* equal the total *costs accounted for* (minor differences can sometimes occur from rounding).

A department began the month with conversion costs of \$65,000 in its beginning work in process inventory. During the current month, the department incurred \$55,000 of conversion costs. Equivalent units of production for conversion for the month was 15,000 units. The department completed and transferred 12,000 units to the next department. The department uses the weighted-average method of process costing.

1. Compute the department's cost per equivalent unit for conversion for the month.
2. Compute the department's conversion cost of units transferred to the next department for the month.

**Solution**

1.  $(\$65,000 + \$55,000) / 15,000 \text{ units} = \$8.00$  per EUP for conversion
2.  $12,000 \text{ units} \times \$8.00 = \$96,000$  conversion cost transferred to next department

**Process Cost Summary**

An important managerial accounting report for a process costing system is the **process cost summary** (also called *production report*), which is prepared separately for each process or production department. Three reasons for the summary are to (1) help department managers control and monitor their departments, (2) help factory managers evaluate department managers' performances, and (3) provide cost information for financial statements. A process cost summary achieves these purposes by describing the costs charged to each department, reporting the equivalent units of production achieved by each department, and determining the costs assigned to each department's output. For our purposes, it is prepared using a combination of Exhibits 20.7, 20.9, 20.10, 20.11, and 20.12.

The process cost summary for the roasting department is shown in Exhibit 20.13. The report is divided into three sections. Section ① lists the total costs charged to the department, including direct materials and conversion costs incurred, as well as the cost of the beginning work in process inventory. Section ② describes the equivalent units of production for the department. Equivalent units for materials and conversion are in separate columns. It also reports direct materials and conversion costs per equivalent unit. Section ③ allocates total costs among units worked on in the period. The \$762,000 is the total cost of the 100,000 units transferred out of the roasting department to the blending department. The \$83,100 is the cost of the 20,000 partially completed units in ending inventory in the roasting department. The assigned costs are then added to show that the total \$845,100 cost charged to the roasting department in section ① is now assigned to the units in section ③.

**Point:** The key report in a job order costing system is a job cost sheet, which reports manufacturing costs per job. A process cost summary reports manufacturing costs per equivalent unit of a process or department.

**EXHIBIT 20.13**Process Cost Summary  
(Weighted-Average)

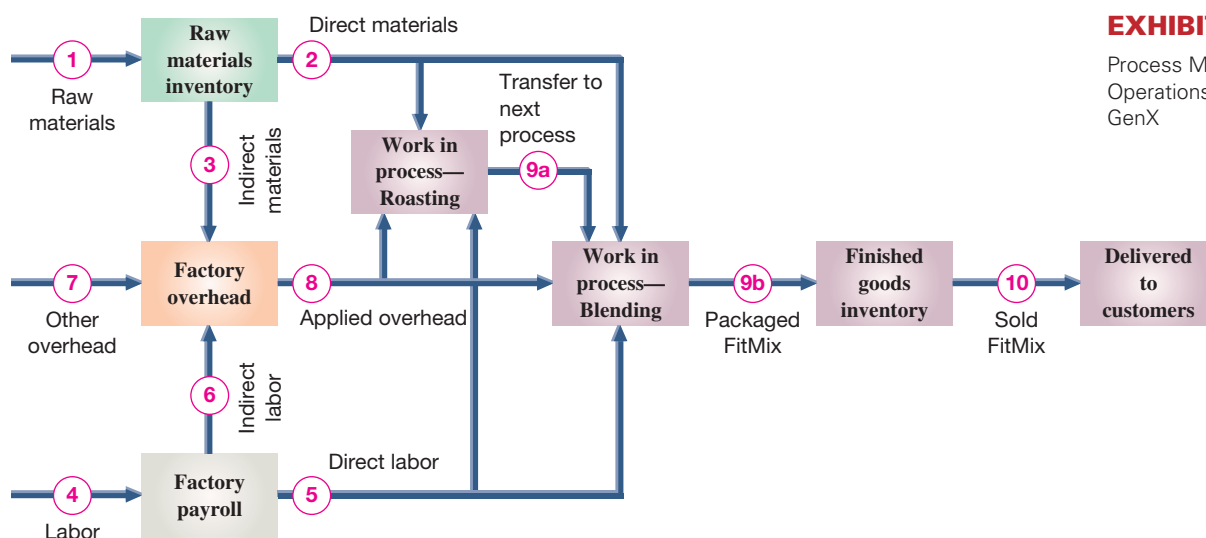

GenX COMPANY—ROASTING DEPARTMENT Process Cost Summary (Weighted-Average Method) For Month Ended April 30, 2015

reconciled

**ACCOUNTING AND REPORTING FOR PROCESS COSTING**

In this section we illustrate the journal entries to account for the operations of a process manufacturer. We continue to focus on GenX Company's roasting department. Exhibit 20.14 illustrates the flow of costs for GenX. Materials, labor, and overhead costs flow into the manufacturing processes. GenX keeps separate Work in Process Inventory accounts for the roasting and blending departments; when goods are packaged and ready for sale, their costs are transferred to the Finished Goods Inventory account.

Like a job order costing system, a process costing system relies on source documents. For example, *materials requisitions* are used to signal the use of direct and indirect materials. *Time tickets* are used to record the use of direct and indirect labor. While some companies might combine direct labor and overhead into conversion costs when computing costs per equivalent unit (as we showed previously), labor and overhead costs are accounted for separately within the company's accounts. In addition, since overhead costs typically cannot be tied to individual processes, but rather benefit all processes or departments, most companies use a single Factory Overhead account to accumulate actual and applied overhead costs.

**EXHIBIT 20.14**  
Process Manufacturing  
Operations and Costs:  
GenX

As with job order costing, process manufacturers must allocate, or apply, overhead to processes. This requires such companies to find good *allocation bases*, such as direct labor hours or machine hours used. With increasing automation, companies with process operations use fewer direct labor hours and thus are more likely to use machine hours to allocate overhead.

For some companies, a single allocation base will not provide good overhead allocations. For example, direct labor cost might be a good allocation base for GenX’s roasting department, but not for its blending department, depending on the amounts of direct labor used in each of those departments. As a result, a process manufacturer can use different overhead allocation rates for different production departments. However, all applied overhead is credited to a single Factory Overhead account.

Exhibit 20.15 presents cost data for GenX. Roasting department costs are from Exhibit 20.6. We use these data next to show the journal entries in a process costing system.

Raw materials inventory (March 31) . . . . .	\$100,000
Beginning work in process inventories (March 31)

Cost Data—GenX

### Accounting for Materials Costs

In Exhibit 20.14, arrow line **1** reflects the arrival of materials at GenX’s factory. These materials include organic peanuts, chocolate pieces, dried fruits, oil, salt, and packaging. They also include supplies for the production support office. GenX uses a perpetual inventory system and

**P1** Record the flow of materials costs in process costing.

makes all purchases on credit. The summary entry for receipts of raw materials in April follows (dates in journal entries are omitted because they are summary entries, often reflecting two or more transactions or events).

Assets = Liabilities + Equity  
 +400,000 +400,000

①	Raw Materials Inventory . . . . .	400,000	
	Accounts Payable . . . . .		400,000
	<i>Acquired materials on credit for factory use.</i>		

Natalia Kolesnikova/AFP/Getty Images

Arrow line ② in Exhibit 20.14 reflects the flow of direct materials to production in the roasting and blending departments. These direct materials are physically combined into the finished product. The manager of a process usually obtains materials by submitting a *materials requisition* to the materials storeroom manager. The entry to record the use of direct materials by GenX’s production departments in April follows. These direct materials costs flow into each department’s separate Work in Process Inventory account.

Assets = Liabilities + Equity  
 +279,000  
 +102,000  
 –381,000

②	Work in Process—Roasting . . . . .	279,000	
	Work in Process—Blending . . . . .	102,000	
	Raw Materials Inventory . . . . .		381,000
<i>To assign costs of direct materials used in production.</i>			

**Example:** What types of materials might the flow of arrow line ③ in Exhibit 20.14 reflect? Answer: Goggles, gloves, protective clothing, oil, salt, and cleaning supplies.

In Exhibit 20.14, arrow line ③ reflects the flow of indirect materials from the storeroom to factory overhead. These materials are not clearly linked with any specific production process or department but are used to support overall production activity. As these costs cannot be linked directly to either the roasting or blending departments, they are recorded in GenX’s single Factory Overhead account. The following entry records the cost of indirect materials used by GenX in April.

③	Factory Overhead . . . . .	71,250	
	Raw Materials Inventory . . . . .		71,250
	<i>To record indirect materials used in April.</i>		

### Accounting for Labor Costs

**P2** Record the flow of labor costs in process costing.

Exhibit 20.14 shows GenX’s factory payroll costs as reflected in arrow line ④. Exhibit 20.15 shows costs of \$171,000 for roasting department direct labor, \$183,160 for blending department direct labor, and \$78,350 for indirect labor. This total payroll of \$432,510 is a product cost, and it is allocated to either Work in Process Inventory or Factory Overhead, as we show next.

Time reports from the production departments and the production support office trigger payroll entries. (For simplicity, we do not separately identify withholdings and additional payroll taxes for employees.) In a process operation, the direct labor of a production department includes all labor used exclusively by that department. This is the case even if the labor is not applied to the product itself. If a production department in a process operation, for instance, has a full-time manager and a full-time maintenance worker, their salaries are direct labor costs of that process and are not factory overhead.

Arrow line ⑤ in Exhibit 20.14 shows GenX’s use of direct labor. The following entry then records direct labor used. These direct labor costs flow into each department’s separate Work in Process Inventory account.

Assets = Liabilities + Equity  
 +171,000 +354,160  
 +183,160

⑤	Work in Process Inventory—Roasting . . . . .	171,000	
	Work in Process Inventory—Blending . . . . .	183,160	
	Factory Payroll Payable . . . . .		354,160
<i>To record direct labor used in production.</i>			

Arrow line ⑥ in Exhibit 20.14 reflects GenX’s indirect labor costs. These employees provide clerical, maintenance, and other services that help production in both the roasting and blending departments. For example, they order materials, deliver them to the factory floor, repair equipment, operate and program computers used in production, keep payroll and other production records, clean up, and move goods across departments. The following entry records these indirect labor costs.

**Point:** A department’s indirect labor cost might include an allocated portion of the salary of a manager who supervises two or more departments. Allocation of costs between departments is discussed in a later chapter.

⑥	Factory Overhead .....	78,350	
	Factory Payroll Payable .....		78,350
	<i>To record indirect labor as overhead.</i>		

After GenX posts these entries for direct and indirect labor, the Factory Payroll Payable account has a balance of \$432,510 (\$354,160 + \$78,350). The entry below shows the payment of this total payroll. After this entry, the Factory Payroll Payable account has a zero balance.

④	Factory Payroll Payable.....	432,510	
	Cash .....		432,510
	<i>To record factory wages for April.</i>		

Assets = Liabilities + Equity  
 -432,510    -432,510

### Accounting for Factory Overhead

Overhead costs other than indirect materials and indirect labor are reflected by arrow line ⑦ in Exhibit 20.14. These overhead items include the costs of insuring production assets, renting the factory building, using factory utilities, and depreciating factory equipment not directly related to a specific process. The following entry records these other overhead costs for April.

**P3** \_\_\_\_\_  
 Record the flow of factory overhead costs in process costing.

⑦	Factory Overhead .....	262,400	
	Prepaid Insurance .....		11,930
	Utilities Payable .....		7,945
	Cash .....		21,875
	Accumulated Depreciation—Factory Equipment ...		220,650
	<i>To record other overhead costs incurred in April.</i>		

**Applying Overhead to Work in Process** Recall that companies use *predetermined overhead rates* to apply overhead. These rates are estimated at the beginning of a period and used to apply overhead during the period. The application of overhead allows managers to obtain up-to-date estimates of the costs of their processes during the period. This is important for process costing, where goods are transferred across departments before the entire production process is complete.

**Point:** The time it takes to process (cycle) products through a process is sometimes used to allocate costs.

Arrow line ⑧ in Exhibit 20.14 reflects the application of factory overhead to the two production departments. Factory overhead is applied to processes by relating overhead cost to another variable such as direct labor hours or machine hours used. In many situations, a single allocation basis such as direct labor hours (or a single rate for the entire plant) fails to provide useful allocations. As a result, management may use different rates for different production departments. In our example, GenX applies overhead on the basis of direct labor cost as shown in Exhibit 20.16.

Production Department	Direct Labor Cost	Predetermined Rate	Overhead Applied
Roasting .....	\$171,000	120%	\$205,200
Blending .....	183,160	120	<u>219,792</u>
Total .....			<u>\$424,992</u>

**EXHIBIT 20.16**  
 Applying Factory Overhead

GenX records its applied overhead with the following entry.

<b>8</b>	Work in Process Inventory—Roasting . . . . .	205,200	
	Work in Process Inventory—Blending . . . . .	219,792	
	Factory Overhead . . . . .		424,992
	<i>Applied overhead costs to production departments at 120% of direct labor cost.</i>		

**Decision Ethics**

**Budget Officer** You are working to identify the direct and indirect costs of a new processing department that has several machines. This department’s manager instructs you to classify a majority of the costs as indirect to take advantage of the direct labor-based overhead allocation method so it will be charged a lower amount of overhead (because of its small direct labor cost). This would penalize other departments with higher allocations. It also will cause the performance ratings of managers in these other departments to suffer. What action do you take? ■  
 [Answers follow the chapter’s Summary.]

**NEED-TO-KNOW 20-4**

Overhead Rate and Costs

P1 P2 P3

Tower Mfg. estimates it will incur \$200,000 of total overhead costs during 2015. Tower allocates overhead based on machine hours; it estimates it will use a total of 10,000 machine hours during 2015. During February 2015, the assembly department of Tower Mfg. uses 375 machine hours. In addition, Tower incurred actual overhead costs as follows during February: indirect materials, \$1,800; indirect labor, \$5,700; depreciation on factory equipment, \$8,000; factory utilities, \$500.

1. Compute the company’s predetermined overhead rate for 2015.
2. Prepare journal entries to record (a) overhead applied for the assembly department for the month and (b) actual overhead costs used during the month.

**Solution**

1. Predetermined overhead rate = Estimated overhead costs ÷ Estimated activity base  
 = \$200,000/10,000 = \$20 per machine hour.

2a.

Work in Process Inventory—Assembly . . . . .	7,500

**Accounting for Transfers**

**P4**

Record the transfer of goods across departments, to Finished Goods Inventory, and to Cost of Goods Sold.

Assets = Liabilities + Equity  
 +762,000  
 −762,000

**Transfers across Departments** Arrow line 9a in Exhibit 20.14 reflects the transfer of units from the roasting department to the blending department. The process cost summary for the roasting department (Exhibit 20.13) shows that the 100,000 units transferred to the blending department are assigned a cost of \$762,000. The entry to record this transfer follows.

9a

Work in Process Inventory—Blending . . . . .	762,000	
Work in Process Inventory—Roasting . . . . .		762,000
<i>To record the transfer of 100,000 units from the roasting department to the blending department.</i>		

Units and costs *transferred out* of the roasting department are *transferred into* the blending department. Exhibit 20.17 shows this transfer using T-accounts for the separate Work in Process Inventory accounts (first in units and then in dollars).

Roasting Department—Units		Blending Department—Units	
Beg. inv.	30,000 units	Beg. inv.	12,000 units

End. Inv.	83,100		

**EXHIBIT 20.17**

Production and Cost Activity—Transfer to Blending Department

\*\$81,000 direct materials + \$108,900 conversion

†\$91,440 transferred-in + \$10,000 DM + \$50,248 conversion

As Exhibit 20.17 shows, the blending department began the month with 12,000 units in beginning inventory, with a related cost of \$151,688. In computing its production activity and costs, the blending department must also consider the units and costs transferred in from the roasting department, as shown in Exhibit 20.17. The 100,000 units transferred in from the roasting department, and their related costs of \$762,000, are added to the blending department’s number of units and separate Work in Process (WIP) Inventory account.

The blending department then adds additional direct materials and conversion costs. The blending department incurred direct materials costs of \$102,000 and conversion costs of \$402,952 during the month. (Although not illustrated here, the concepts and methods used in this second department would be similar to those we showed in detail for the first department.)

**Accounting for Transfer to Finished Goods** Arrow line 9b in Exhibit 20.14 reflects the transfer of units and their related costs from the blending department to finished goods inventory. At the end of the month, the blending department transferred 97,000 completed units, with a related cost of \$1,262,940, to finished goods. The entry to record this transfer follows.

<b>9b</b>	Finished Goods Inventory . . . . .	1,262,940	
	Work in Process Inventory—Blending . . . . .		1,262,940
	<i>To record transfer of completed goods.</i>		

Assets = Liabilities + Equity  
 + 1,262,940  
 - 1,262,940

**Accounting for Transfer to Cost of Goods Sold** Arrow line 10 reflects the sale of finished goods. Assume that GenX sold 106,000 units of FitMix this period, and that its beginning finished goods inventory was 26,000 units with a cost of \$338,520. Also assume that its ending finished goods inventory consists of 20,000 units at a cost of \$260,400. Using this information, cost of goods sold is computed as in Exhibit 20.18.

Finished Goods Inventory	
Beg. bal.	338,520
COGM	1,262,940
Avail.	1,601,460
	<b>COGS 1,341,060</b>
End. bal.	260,400

Beginning finished goods inventory . . . . .	\$ 338,520
+ Cost of goods manufactured this period . . . . .	<u>1,262,940</u>
= Cost of goods available for sale . . . . .	1,601,460
– Ending finished goods inventory . . . . .	<u>260,400</u>
= Cost of goods sold . . . . .	<u><b>\$1,341,060</b></u>

**EXHIBIT 20.18**

Cost of Goods Sold

The summary entry to record cost of goods sold for this period follows:

Assets = Liabilities + Equity  
 -1,341,060                      -1,341,060

10	Cost of Goods Sold . . . . .	1,341,060	
	Finished Goods Inventory . . . . .		1,341,060
	<i>To record cost of goods sold for April.</i>		

## Trends in Process Operations

Some recent trends in process operations are discussed in the following paragraphs.

**Process Design** Management concerns with production efficiency can lead companies to entirely reorganize production processes. For example, instead of producing different types of computers in a series of departments, a separate work center for each computer can be established in one department. The process cost system is then changed to account for each work center's costs.

**Just-in-Time Production** Companies are increasingly adopting just-in-time techniques. With a just-in-time inventory system, inventory levels can be minimal. If raw materials are not ordered or received until needed, a Raw Materials Inventory account might be unnecessary. Instead, materials cost is immediately debited to the Work in Process Inventory account. Similarly, a Finished Goods Inventory account may not be needed. Instead, cost of finished goods may be immediately debited to the Cost of Goods Sold account.

**Automation** Companies are increasingly automating their production processes and using robots. For example, **Volkswagen** recently began using robots on tasks that are hard for humans to perform. This automation resulted in reduced direct labor costs and a healthier workforce.

**Continuous Processing** In some companies, materials move continuously through the manufacturing process. **Pepsi Bottling** uses a process in which inventory moves continuously through the system. In these cases, a **materials consumption report** summarizes the materials used and replaces materials requisitions.

**Services** Service-based businesses are increasingly prevalent. For routine, standardized services like oil changes and simple tax returns, computing costs based on the process is simpler and more useful than a cost per individual job. More complex service companies use process departments to perform specific tasks for consumers. Hospitals, for example, have radiology and physical therapy facilities, each with special equipment and trained employees. When patients need services, they are processed through departments to receive prescribed care.

**Customer Orientation** Focus on customer orientation also leads to improved processes. A manufacturer of control devices improved quality and reduced production time by forming teams to study processes and suggest improvements. An ice cream maker studied customer tastes to develop a more pleasing ice cream texture.

## GLOBAL VIEW

As part of a series of global environmental goals, **Anheuser-Busch InBev** set targets to reduce its water usage. The company uses massive amounts of water in beer production and in its cleaning and cooling processes. To meet these goals, the company followed recent trends in process operations. These included extensive redesign of production processes and the use of advanced technology to increase efficiency at wastewater treatment plants. As a result water usage decreased by almost 37 percent in its global operations.

**Sustainability and Accounting** As society becomes more attuned to health issues, businesses must respond. As described in the opener to this chapter, **Kar's Nuts** met demand for healthier snacks by offering trail mixes based on all-natural ingredients. The company also takes precautions to ensure its production process is allergen-free. For example, when transitioning its production line from products with allergens, such as wheat, workers perform a detailed cleaning of all conveyors and packaging equipment. These cleaning efforts add costs but help Kar's fulfill its obligations to its customers and ensure a sustainable product and business.

## Hybrid Costing System Decision Analysis

This chapter explained the process costing system and contrasted it with the job order costing system. Many organizations use a *hybrid system* that contains features of both process and job order operations. A recent survey of manufacturers revealed that a majority use hybrid systems (also called *operation cost systems*).

To illustrate, consider a car manufacturer's assembly line. On one hand, the line resembles a process operation in that the assembly steps for each car are nearly identical. On the other hand, the specifications of most cars have several important differences. At the **Ford** Mustang plant, each car assembled on a given day can be different from the previous car and the next car. This means that the costs of materials (subassemblies or components) for each car can differ. Accordingly, while the conversion costs (direct labor and overhead) can be accounted for using a process costing system, the component costs (direct materials) are accounted for using a job order system (separately for each car or type of car).

A hybrid system of processes requires a *hybrid costing system* to properly cost products or services. In the Ford plant, the assembly costs per car are readily determined using process costing. The costs of additional components can then be added to the assembly costs to determine each car's total cost (as in job order costing). To illustrate, consider the following information for a daily assembly process at Ford.

Assembly process costs	
Direct materials	\$10.6 million
Conversion costs	\$12.0 million
Number of cars assembled	1,000
Costs of three different types of steering wheels	\$240, \$330, \$480
Costs of three different types of seats	\$620, \$840, \$1,360

The assembly process costs \$22,600 per car. Depending on the type of steering wheel and seats the customer requests, the cost of a car can range from \$23,460 to \$24,440 (a \$980 difference).

Today companies are increasingly trying to standardize processes while attempting to meet individual customer needs. To the extent that differences among individual customers' requests are large, understanding the costs to satisfy those requests is important. Thus, monitoring and controlling both process and job order costs are important.

## Decision Ethics

**Entrepreneur** You operate a process production company making similar products for three different customers. One customer demands 100% quality inspection of products at your location before shipping. The added costs of that inspection are spread across all customers, not just the one demanding it. If you charge the added costs to that customer, you could lose that customer and experience a loss. Moreover, your other two customers have agreed to pay 110% of full costs. What actions (if any) do you take? ■ [Answers follow the chapter's Summary.]

**A2**

Weighted-Average Method

Pennsylvania Company produces a product that passes through two processes: grinding and mixing. Information related to its grinding department manufacturing activities for July follows. The company uses the weighted-average method of process costing.

<b>Grinding Department</b>		<b>Grinding Department</b>	
<b>Raw Materials</b>		Beginning work in process inventory (units) . . . . . 5,000	
Beginning inventory . . . . .	\$100,000	Percentage completed—Materials . . . . .	100%
Raw materials purchased on credit . . . . .	211,400	Percentage completed—Conversion . . . . .	70%
Direct materials used . . . . .	(190,000)	Beginning work in process inventory (costs)	
Indirect materials used . . . . .	<u>(51,400)</u>	Direct materials used . . . . .	\$ 20,000
Ending inventory . . . . .	<u>\$ 70,000</u>	Direct labor incurred . . . . .	9,600
<b>Factory Payroll</b>		Overhead applied (200% of direct labor) . . . . .	<u>19,200</u>
Direct labor incurred . . . . .	\$ 55,500	Total costs of beginning work in process . . . . .	<u>\$ 48,800</u>
Indirect labor incurred . . . . .	50,625	Units started this period . . . . .	20,000
Total payroll . . . . .	<u>\$106,125</u>	Units transferred to mixing this period . . . . .	17,000
<b>Factory Overhead</b>		Ending work in process inventory (units) . . . . . 8,000	
Indirect materials used . . . . .	\$ 51,400	Percentage completed—Materials . . . . .	100%
Indirect labor used . . . . .	50,625	Percentage completed—Conversion . . . . .	20%
Other overhead costs . . . . .	<u>71,725</u>		
Total factory overhead incurred . . . . .	<u>\$173,750</u>		
<b>Factory Overhead Applied</b>			
Overhead applied (200% of direct labor) . . . . .	<u>\$111,000</u>		

**Required**

Complete the requirements below for the grinding department.

1. Prepare a physical flow reconciliation for July.
2. Compute the equivalent units of production in July for direct materials and conversion.
3. Compute the costs per equivalent units of production in July for direct materials and conversion.
4. Prepare a report of costs accounted for and a report of costs to account for.

**PLANNING THE SOLUTION**

- Track the physical flow to determine the number of units completed in July.
- Compute the equivalent units of production for direct materials and conversion.
- Compute the costs per equivalent unit of production with respect to direct materials and conversion, and determine the cost per unit for each.
- Compute the total cost of the goods transferred to mixing by using the equivalent units and unit costs. Determine (a) the cost of the beginning work in process inventory, (b) the materials and conversion costs added to the beginning work in process inventory, and (c) the materials and conversion costs added to the units started and completed in the month.

**SOLUTION**

1. Physical flow reconciliation.

Units to Account For		Units Accounted For	
Beginning work in process inventory . . . . .	5,000 units	Units completed and transferred out . . . . .	17,000 units
Units started this period . . . . .	<u>20,000 units</u>	Ending work in process inventory . . . . .	<u>8,000 units</u>
Total units to account for . . . . .	<u>25,000 units</u>	Total units accounted for . . . . .	<u>25,000 units</u>
		↑ reconciled ↑	

2. Equivalent units of production (Weighted-average).

Equivalent Units of Production	Direct Materials	Conversion
Equivalent units completed and transferred out . . .	17,000 EUP	17,000 EUP
Equivalent units in ending work in process		
Direct materials (8,000 × 100%) . . . . .	8,000 EUP	
Conversion (8,000 × 20%) . . . . .		1,600 EUP
Equivalent units of production . . . . .	<u>25,000 EUP</u>	<u>18,600 EUP</u>

3. Costs per equivalent unit of production (Weighted-average).

Costs per Equivalent Unit of Production	Direct Materials	Conversion
Costs of beginning work in process . . . . .	\$ 20,000	\$ 28,800
Costs incurred this period . . . . .	<u>190,000</u>	<u>166,500*</u>
Total costs . . . . .	\$ 210,000	\$ 195,300
÷ Equivalent units of production (from part 2) . . . . .	<u>25,000 EUP</u>	<u>18,600 EUP</u>
= Costs per equivalent unit of production . . . . .	<u>\$8.40 per EUP</u>	<u>\$10.50 per EUP</u>

\*Direct labor of \$55,500 + overhead applied of \$111,000

4. Reports of costs accounted for and of costs to account for (Weighted-average).

Report of Costs Accounted For		
<b>Cost of units transferred out (cost of goods manufactured)</b>		
Direct materials (\$8.40 per EUP × 17,000 EUP) . . . . .	\$142,800	
Conversion (\$10.50 per EUP × 17,000 EUP) . . . . .	<u>178,500</u>	
Cost of units completed this period . . . . .		\$ 321,300

**APPENDIX**

# FIFO Method of Process Costing

# 20A

The FIFO method of process costing assigns costs to units assuming a first-in, first-out flow of product. The key difference between the FIFO and weighted-average methods lies in the treatment of beginning work in process inventory. Under the weighted-average method, the number of units and the costs in beginning work in process inventory are combined with production activity in the current period to compute

# C4

Appendix—Describe accounting for production activity and preparation of a process cost summary using FIFO.

## EXHIBIT 20A.1

Computing EUP—FIFO Method

costs per equivalent unit. Thus, the weighted-average method combines production activity across two periods.

The FIFO method, in contrast, focuses on production activity *in the current period only*. The FIFO method assumes that the units that were in process at the beginning of the period are completed during the current period. Thus, under the FIFO method equivalent units of production are computed as shown in Exhibit 20A.1.

$$\text{Equivalent units of production (EUP)} = \begin{matrix} \text{Number of equivalent} \\ \text{units needed to complete} \\ \text{beginning work in} \\ \text{process inventory} \end{matrix} + \begin{matrix} \text{Number of whole units} \\ \text{started, completed, and} \\ \text{transferred to the next} \\ \text{department}^* \end{matrix} + \begin{matrix} \text{Number of equivalent} \\ \text{units in ending work} \\ \text{in process inventory} \end{matrix}$$

\*Or to Finished Goods Inventory

In computing cost per equivalent unit, the FIFO method ignores the cost of beginning work in process inventory. Instead, FIFO uses *only the costs incurred in the current period*, as shown in Exhibit 20A.2.

## EXHIBIT 20A.2

Cost per EUP—FIFO Method

$$\text{Cost per EUP (FIFO)} = \frac{\text{Manufacturing costs added during the current period}}{\text{Equivalent units of production during current period}}$$

We use the data in Exhibit 20A.3 to illustrate the FIFO method for GenX’s roasting department.

## EXHIBIT 20A.3

Production Data—Roasting Department

GenX—Roasting Department	
Beginning work in process inventory (March 31)	
Units of product . . . . .	30,000 units
Percentage of completion—Direct materials . . . . .	100%
Percentage of completion—Conversion costs . . . . .	65%
Direct materials costs . . . . .	\$ 81,000
Conversion costs . . . . .	\$108,900
Activities during the current period (April)	
Units started this period . . . . .	90,000 units
Units transferred out (completed) . . . . .	100,000 units
Direct materials costs . . . . .	\$279,000
Direct labor costs . . . . .	\$171,000
Factory overhead costs applied (120% of direct labor) . . . . .	\$205,200
Ending work in process inventory (April 30)	
Units of product . . . . .	20,000 units
Percentage of completion—Direct materials . . . . .	100%
Percentage of completion—Conversion . . . . .	25%

Exhibit 20A.3 shows selected information from GenX’s roasting department for the month of April. Accounting for a department’s activity for a period includes four steps: (1) determine physical flow, (2) compute equivalent units, (3) compute cost per equivalent unit, and (4) determine cost assignment and reconciliation. This appendix describes each of these steps using the FIFO method for process costing.

**Step 1: Determine Physical Flow of Units** A *physical flow reconciliation* is a report that reconciles (1) the physical units started in a period with (2) the physical units completed in that period. The physical flow reconciliation for GenX’s roasting department is shown in Exhibit 20A.4 for April.

## EXHIBIT 20A.4

Physical Flow Reconciliation

GenX—Roasting Department			
Units to Account For		Units Accounted For	
Beginning work in process inventory . . . . .	30,000 units	Units completed and transferred out . . . . .	100,000 units
Units started this period . . . . .	<u>90,000 units</u>	Ending work in process inventory . . . . .	<u>20,000 units</u>
Total units to account for . . . . .	<u>120,000 units</u>	Total units accounted for . . . . .	<u>120,000 units</u>
	↑	reconciled	↑

**Step 2: Compute Equivalent Units of Production—FIFO** Exhibit 20A.4 shows that the roasting department completed 100,000 units during the month. The FIFO method assumes that the units in beginning inventory were the first units completed during the month. Thus, FIFO assumes that of the 100,000 completed units, 30,000 consist of units in beginning work in process inventory that were completed during the month. This means that 70,000 (100,000 – 30,000) units were both started and completed during the month. This also means that 20,000 units were started but not completed during the month (90,000 units started – 70,000 units started and completed). Exhibit 20A.5 shows how units flowed through the roasting department, assuming FIFO.

Roasting Department—Units		
Beg. inv.	30,000	→ 30,000 Completed and transferred out
Started	90,000	70,000 Started and completed
Total	120,000	
		<b>100,000 Transferred out</b>
End. inv.	20,000	

**EXHIBIT 20A.5**

FIFO—Flow of Units

In computing the equivalent units of production, the roasting department must consider these three distinct groups of units:

- Units in beginning work in process inventory (30,000).
- Units started and completed during the month (70,000).
- Units in ending work in process inventory (20,000).

GenX's roasting department then computes equivalent units of production under FIFO as shown in Exhibit 20A.6. We compute EUP for each of the three distinct groups of units, and sum them to find total EUP.

GenX—Roasting Department		
Equivalent Units of Production	Direct Materials	Conversion
(a) Equivalent units to complete beginning work in process		
Direct materials (30,000 × 0%)	0 EUP	
Conversion (30,000 × 35%)		10,500 EUP
(b) Equivalent units started and completed*	70,000 EUP	70,000 EUP
(c) Equivalent units in ending work in process		
Direct materials (20,000 × 100%)	20,000 EUP	
Conversion (20,000 × 25%)		5,000 EUP
Equivalent units of production	<u>90,000 EUP</u>	<u>85,500 EUP</u>

**EXHIBIT 20A.6**

Equivalent Units of Production—FIFO

*Units completed this period	100,000 units
Less units in beginning work in process	30,000 units
Units started and completed this period	<u>70,000 units</u>

**Direct Materials** To calculate the equivalent units of production for direct materials, we start with the equivalent units in beginning work in process inventory. We see that beginning work in process inventory was 100% complete with respect to materials; no materials were needed to complete these units. Thus, this group of units required 0 EUP during the month. Next, we consider the units started and completed during the month. In terms of direct materials, the 70,000 units started and completed during the month received 100% of their materials during the month. Thus, EUP for this group is 70,000 units (70,000 × 100%). Finally, we consider the units in ending work in process inventory. The roasting department started but *did not* complete 20,000 units during the month. This group received all of its materials during the month. Thus, EUP for this group is 20,000 units (20,000 × 100%). The sum of the EUP for these three distinct groups of units is 90,000 (computed as 0 + 70,000 + 20,000), which is the total number of equivalent units of production for direct materials during the month.

**Conversion** To calculate the equivalent units of production for conversion, we start by determining the percentage of conversion costs needed to complete the beginning work in process inventory. As Exhibit 20A.3 shows, the beginning work in process inventory of 30,000 units was 65% complete with respect to

conversion. Thus, this group of units required an additional 35% of conversion costs during the period to complete those units (100% – 65%), or 10,500 EUP (30,000 × 35%). Next, we consider the units started and completed during the month. The units started and completed during the month incurred 100% of their conversion costs during the month. Thus, EUP for this group is 70,000 units (70,000 × 100%). Finally, we consider the units in ending work in process inventory. The ending work in process inventory incurred 25% of its conversion costs (see Exhibit 20A.3) during the month. Thus, EUP for this group is 5,000 units (20,000 × 25%). The sum of the EUP for these three distinct groups of units is 85,500 (computed as 10,500 + 70,000 + 5,000). Thus, the roasting department’s equivalent units of production for conversion for the month is 85,500 units.

**NEED-TO-KNOW 20-5**

EUP—Direct Materials and Conversion (FIFO)

C4

A department began the month with 50,000 units in work in process inventory. These units were 60% complete with respect to direct materials and 40% complete with respect to conversion. During the month the department started 286,000 units; 220,000 of these units were completed during the month. The remaining 66,000 units are in ending work in process inventory, 80% complete with respect to direct materials and 30% complete with respect to conversion. Use the FIFO method of process costing to:

1. Compute the department’s equivalent units of production for the month for direct materials.
2. Compute the department’s equivalent units of production for the month for conversion.

**Solution**

1. EUP for materials = (50,000 × 40%) + (220,000 × 100%) + (66,000 × 80%) = 292,800 EUP
2. EUP for conversion = (50,000 × 60%) + (220,000 × 100%) + (66,000 × 30%) = 269,800 EUP

Do More: QS 20-14, QS 20-15, E 20-5, E 20-10

**Step 3: Compute Cost per Equivalent Unit—FIFO** To compute cost per equivalent unit, we take the direct materials and conversion costs added in April and divide by the equivalent units of production from step 2. Exhibit 20A.7 illustrates these computations.

**EXHIBIT 20A.7**

Cost per Equivalent Unit of Production—FIFO

GenX—Roasting Department		
Cost per Equivalent Unit of Production	Direct Materials	Conversion
Costs incurred this period (from Exhibit 20A.3) . . . . .	\$279,000	\$376,200
÷ Equivalent units of production (from step 2) . . . . .	<u>90,000 EUP</u>	<u>85,500 EUP</u>
Cost per equivalent unit of production . . . . .	\$3.10 per EUP	\$4.40 per EUP

It is essential to compute costs per equivalent unit for *each* input because production inputs are added at different times in the process. The FIFO method computes the cost per equivalent unit based solely on this period’s EUP and costs (unlike the weighted-average method, which adds in the costs of the beginning work in process inventory).

**NEED-TO-KNOW 20-6**

Cost per EUP—Direct Materials and Conversion (FIFO)

C4

A department started the month with beginning work in process inventory of \$130,000 (\$90,000 for direct materials and \$40,000 for conversion). During the month, the department incurred additional direct materials costs of \$700,000 and conversion costs of \$500,000. Assume that equivalent units for the month were computed as 250,000 for materials and 200,000 for conversion.

1. Compute the department’s cost per equivalent unit of production for the month for direct materials.
2. Compute the department’s cost per equivalent unit of production for the month for conversion.

**Solution**

1. Cost per EUP of materials = \$700,000/250,000 = \$2.80
2. Cost per EUP of conversion = \$500,000/200,000 = \$2.50

Do More: QS 20-15, QS 20-17, E 20-7

**Step 4: Assign and Reconcile Costs** The equivalent units determined in step 2 and the cost per equivalent unit computed in step 3 are both used to assign costs (1) to units that the production department completed and transferred to the blending department and (2) to units that remain in process at period-end.

In Exhibit 20A.8, under the section for cost of units transferred out, we see that the cost of units completed in April includes the \$189,900 cost carried over from March for work already applied to the 30,000 units that make up beginning work in process inventory, plus the \$46,200 incurred in April to complete those units. This section also includes the \$525,000 of cost assigned to the 70,000 units started and completed this period. Thus, the total cost of goods manufactured in April is \$761,100. The average cost per unit for goods completed in April is \$7.611 ( $\$761,100 \div 100,000$  completed units).

<b>Cost of units transferred out (cost of goods manufactured)</b>		
Cost of beginning work in process inventory		\$ 189,900
Cost to complete beginning work in process		
Direct materials (\$3.10 per EUP $\times$ 0 EUP)	\$ 0	
Conversion (\$4.40 per EUP $\times$ 10,500 EUP)	<u>46,200</u>	46,200
Cost of units started and completed this period		
Direct materials (\$3.10 per EUP $\times$ 70,000 EUP)	217,000	
Conversion (\$4.40 per EUP $\times$ 70,000 EUP)	<u>308,000</u>	<u>525,000</u>
Total cost of units finished this period		761,100
<b>Cost of ending work in process inventory</b>		
Direct materials (\$3.10 per EUP $\times$ 20,000 EUP)	62,000	
Conversion (\$4.40 per EUP $\times$ 5,000 EUP)	<u>22,000</u>	
Total cost of ending work in process inventory		<u>84,000</u>
<b>Total costs accounted for</b>		<b><u><u>\$845,100</u></u></b>

**EXHIBIT 20A.8**

Report of Costs Accounted For—FIFO

The computation for cost of ending work in process inventory is in the lower part of Exhibit 20A.8. That cost of \$84,000 ( $\$62,000 + \$22,000$ ) also is the ending balance for the Work in Process Inventory—Roasting account.

The roasting department manager verifies that the total costs assigned to units transferred out and units still in process equal the total costs incurred by production. We reconcile the costs accounted for (in Exhibit 20A.8.) to the costs that production was charged for as shown in Exhibit 20A.9.

Cost of beginning work in process inventory		
Direct materials	\$ 81,000	
Conversion	<u>108,900</u>	\$ 189,900
Costs incurred this period		
Direct materials	279,000	
Conversion	<u>376,200</u>	<u>655,200</u>
<b>Total costs to account for</b>		<b><u><u>\$845,100</u></u></b>

**EXHIBIT 20A.9**

Report of Costs to Account For—FIFO

The roasting department production manager is responsible for \$845,100 in costs: \$189,900 that had been assigned to the department's work in process inventory as of April 1 plus \$655,200 of costs the department incurred in April. At period-end, the manager must identify where those costs were assigned. The production manager can report that \$761,100 of cost was assigned to units completed in April and \$84,000 was assigned to units still in process at period-end.

**Process Cost Summary** The final report is the process cost summary, which summarizes key information from previous exhibits. Reasons for the summary are to (1) help managers control and monitor costs, (2) help upper management assess department manager performance, and (3) provide cost information for financial reporting. The process cost summary, using FIFO, for GenX's roasting department is in Exhibit 20A.10. Section 1 lists the total costs charged to the department, including direct materials and conversion costs incurred, as well as the cost of the beginning work in process inventory. Section 2 describes the equivalent units of production for the department. Equivalent units for conversion are in separate columns. It also reports direct materials and conversion costs per equivalent unit. Section 3 allocates total costs among units worked on in the period.

**EXHIBIT 20A.10**Process Cost Summary

reconciled

**Decision Maker**

**Cost Manager** As cost manager for an electronics manufacturer, you apply a process costing system using FIFO. Your company plans to adopt a just-in-time system and eliminate inventories. What is the impact of the use of FIFO (versus the weighted-average method) given these plans? ■ [Answers follow the chapter's Summary.]

# Summary

**C1 Explain process operations and the way they differ from job order operations.** Process operations produce large quantities of similar products or services by passing them through a series of processes, or steps, in production. Like job order operations, they combine direct materials, direct labor, and overhead in the operations. Unlike job order operations that assign the responsibility for each job to a manager, process operations assign the responsibility for each *process* to a manager.

**C2 Define and compute equivalent units and explain their use in process costing.** Equivalent units of production measure the activity of a process as the number of units that would be completed in a period if all effort had been applied to units that were started and finished. This measure of production activity is used to compute the cost per equivalent unit and to assign costs to finished goods and work in process inventory. To compute equivalent units, determine the number of units that would have been finished if all materials (or conversion) had been used to produce units that were started and completed during the period. The costs incurred by a process are divided by its equivalent units to yield cost per equivalent unit.

**C3 Describe accounting for production activity and preparation of a process cost summary using weighted average.** A process cost summary reports on the activities of a production process or department for a period. It describes the costs charged to the department, the equivalent units of production for the department, and the costs assigned to the output. The report aims to (1) help managers control their departments, (2) help factory managers evaluate department managers' performances, and (3) provide cost information for financial statements. A process cost summary includes the physical flow of units, equivalent units of production, costs per equivalent unit, and a cost reconciliation. It reports the units and costs to account for during the period and how they were accounted for during the period. In terms of units, the summary includes the beginning work in process inventory and the units started during the month. These units are accounted for in terms of the goods completed and transferred out, and the ending work in process inventory. With respect to costs, the summary includes materials and conversion costs assigned to the process during the period. It shows how these costs are assigned to goods completed and transferred out, and to ending work in process inventory.

**C4 Appendix—Describe accounting for production activity and preparation of a process cost summary using FIFO.** The FIFO method for process costing is applied and illustrated to (1) report the physical flow of units, (2) compute

the equivalent units of production, (3) compute the cost per equivalent unit of production, and (4) assign and reconcile costs.

**A1 Compare process costing and job order costing.** Process and job order manufacturing operations are similar in that both combine materials, and conversion to produce products or services. They differ in the way they are organized and managed. In job order operations, the job order costing system assigns product costs to specific jobs. In process operations, the process costing system assigns product costs to specific processes. The total costs associated with each process are then divided by the number of units passing through that process to get cost per equivalent unit. The costs per equivalent unit for all processes are added to determine the total cost per unit of a product or service.

**A2 Explain and illustrate a hybrid costing system.** A hybrid costing system contains features of both job order and process costing systems. Generally, certain direct materials are accounted for by individual products as in job order costing, but direct labor and overhead costs are accounted for similar to process costing.

**P1 Record the flow of materials costs in process costing.** Materials purchased are debited to a Raw Materials Inventory account. As direct materials are issued to processes, they are separately accumulated in a Work in Process Inventory account for that process. As indirect materials are used their costs are debited to Factory Overhead.

**P2 Record the flow of labor costs in process costing.** Direct labor costs are assigned to the Work in Process Inventory account pertaining to each process. As indirect labor is used its cost is debited to Factory Overhead.

**P3 Record the flow of factory overhead costs in process costing.** Actual overhead costs are recorded as debits to the Factory Overhead account. Estimated overhead costs are allocated, using a predetermined overhead rate, to the different processes. This allocated amount is credited to the Factory Overhead account and debited to the Work in Process Inventory account for each separate process.

**P4 Record the transfer of goods across departments, to Finished Goods Inventory, and to Cost of Goods Sold.** As units are passed through processes, their accumulated costs are transferred across separate Work in Process Inventory accounts for each process. As units complete the final process and are eventually sold, their accumulated cost is transferred to Finished Goods Inventory and finally to Cost of Goods Sold.

## Guidance Answers to Decision Maker and Decision Ethics

**Budget Officer** By instructing you to classify a majority of costs as indirect, the manager is passing some of his department's costs to a common overhead pool that other departments will partially absorb. Since overhead costs are allocated on the basis of direct labor for this company and the new department has a relatively low direct labor cost, the new department will be assigned less overhead. Such action suggests unethical behavior

by this manager. You must object to such reclassification. If this manager refuses to comply, you must inform someone in a more senior position.

**Entrepreneur** By spreading the added quality-related costs across three customers, the entrepreneur is probably trying to remain competitive with respect to the customer that demands the

100% quality inspection. Moreover, the entrepreneur is partly covering the added costs by recovering two-thirds of them from the other two customers who are paying 110% of total costs. This act likely breaches the trust placed by the two customers in this entrepreneur's application of its costing system. The costing system should be changed, and the entrepreneur should consider renegotiating the pricing and/or quality test agreement with this

one customer (at the risk of losing this currently loss-producing customer).

**Cost Manager** Differences between the FIFO and weighted-average methods are greatest when large work in process inventories exist and when costs fluctuate. The method used if inventories are eliminated does not matter; both produce identical costs.

## Key Terms

Conversion cost per equivalent unit

Equivalent units of production (EUP)

FIFO method

Job order costing system

Materials consumption report

Process costing system

Process cost summary

Process operations

Weighted-average method

## Multiple Choice Quiz

Answers at end of chapter

- Equivalent units of production are equal to
  - Physical units that were completed this period from all effort being applied to them.
  - The number of units introduced into the process this period.
  - The number of finished units actually completed this period.
  - The number of units that could have been started and completed given the cost incurred.
  - The number of units in the process at the end of the period.
- Recording the cost of raw materials purchased for use in a process costing system includes a
  - Credit to Raw Materials Inventory.
  - Debit to Work in Process Inventory.
  - Debit to Factory Overhead.
  - Credit to Factory Overhead.
  - Debit to Raw Materials Inventory.
- The production department started the month with a beginning work in process inventory of \$20,000. During the month, it was assigned the following costs: direct materials, \$152,000; direct labor, \$45,000; overhead applied at the rate of 40% of direct labor cost. Inventory with a cost of \$218,000 was transferred to finished goods. The ending balance of work in process inventory is
  - \$330,000.
  - \$ 17,000.
  - \$220,000.
  - \$112,000.
  - \$118,000.
- A company's beginning work in process inventory consists of 10,000 units that are 20% complete with respect to conversion costs. A total of 40,000 units are completed this period. There are 15,000 units in work in process, one-third complete for conversion, at period-end. The equivalent units of production (EUP) with respect to conversion at period-end, assuming the weighted-average method, are
  - 45,000 EUP.
  - 40,000 EUP.
  - 5,000 EUP.
  - 37,000 EUP.
  - 43,000 EUP.
- Assume the same information as in question 4. Also assume that beginning work in process had \$6,000 in conversion cost and that \$84,000 in conversion is added during this period. What is the cost per EUP for conversion?
  - \$0.50 per EUP
  - \$1.87 per EUP
  - \$2.00 per EUP
  - \$2.10 per EUP
  - \$2.25 per EUP

<sup>A</sup> *Superscript letter A denotes assignments based on Appendix 20A.*

 *Icon denotes assignments that involve decision making.*

## Discussion Questions

-  What is the main factor for a company in choosing between the job order costing and process costing systems? Give two likely applications of each system.
- The focus in a job order costing system is the job or batch. Identify the main focus in process costing.
-  Can services be delivered by means of process operations? Support your answer with an example.
- Are the journal entries that match cost flows to product flows in process costing primarily the same or much different than those in job order costing? Explain.

5. Identify the control document for materials flow when a materials requisition slip is not used.
6.  Explain in simple terms the notion of equivalent units of production (EUP). Why is it necessary to use EUP in process costing?
7.  What are the two main inventory methods used in process costing? What are the differences between these methods?
8.  Why is it possible for direct labor in process operations to include the labor of employees who do not work directly on products or services?
9. Assume that a company produces a single product by processing it first through a single production department. Direct labor costs flow through what accounts in this company's process cost system?
10. At the end of a period, what balance should remain in the Factory Overhead account?
11.  Is it possible to have under- or overapplied overhead costs in a process costing system? Explain.
12. Explain why equivalent units of production for both direct labor and overhead can be the same as, and why they can be different from, equivalent units for direct materials.
13. Companies such as **Samsung** apply **Samsung** process operations. List the four steps in accounting for production activity in a reporting period (for process operations).
14. Companies such as **Apple** commonly prepare a process cost summary. What purposes does **APPLE** a process cost summary serve?
15.  Are there situations where **Google** can use process costing? Identify at **GOOGLE** least one and explain it.
16.  **Samsung** produces digital televisions with a multiple process production line. Identify and list some of its production processing steps and departments.

For each of the following products and services, indicate whether it is more likely produced in a process operation or in a job order operation.

- |  |                            |
|--|----------------------------|
| _____ 1. Tennis courts                 | _____ 4. Luxury yachts     |
| _____ 2. Organic juice                 | _____ 5. Vanilla ice cream |

**Weighted average:**  
Computing equivalent  
units of production **C2**

Refer to QS 20-4. Compute the total equivalent units of production with respect to conversion for March using the weighted-average inventory method.

**QS 20-6<sup>A</sup>**

**FIFO:** Computing  
equivalent units **C4**

Refer to QS 20-4. Compute the total equivalent units of production with respect to conversion for March using the FIFO inventory method.

**QS 20-7**

**Weighted average:**  
Cost per EUP  
**C3**

A production department's beginning inventory cost includes \$394,900 of conversion costs. This department incurs an additional \$907,500 in conversion costs in the month of March. Equivalent units of production for conversion total 740,000 for March. Calculate the cost per equivalent unit of conversion using the weighted-average method.

**QS 20-8**

**Weighted average:**  
Computing equivalent  
units of production  
**C2**

The following refers to units processed by an ice cream maker in July. Compute the total equivalent units of production with respect to conversion for July using the weighted-average inventory method.

	Gallons of Product	Percent of Conversion Added
Beginning work in process . . . . .	320,000	25%
Goods started . . . . .	620,000	100
Goods completed . . . . .	680,000	100
Ending work in process . . . . .	260,000	75

**QS 20-9<sup>A</sup>**

**FIFO:** Computing  
equivalent units **C4**

Refer to QS 20-8 and compute the total equivalent units of production with respect to conversion for July using the FIFO inventory method.

**QS 20-10**

**Weighted average:**  
Equivalent units of  
production **C2**

The following information applies to QS 20-10 through QS 20-17.

The Carlberg Company has two manufacturing departments, assembly and painting. The assembly department started 10,000 units during November. The following production activity unit and cost information refers to the assembly department's November production activities.

Assembly Department	Units	Percent of Direct Materials Added	Percent of Conversion Added
Beginning work in process . . . . .	2,000	60%	40%
Units transferred out . . . . .	9,000	100%	100%
Ending work in process . . . . .	3,000	80%	30%

Beginning work in process inventory—Assembly dept. . . . .	\$1,581 (includes \$996 for direct materials and \$585 for conversion)
Costs added during the month:	
Direct materials . . . . .	\$10,404
Conversion . . . . .	\$12,285

**Required**

Calculate the assembly department's equivalent units of production for materials and for conversion for November. Use the weighted-average method.

**QS 20-11**

**Weighted average:**  
Cost per EUP **C2**

Refer to the information in QS 20-10. Calculate the assembly department's cost per equivalent unit of production for materials and for conversion for November. Use the weighted-average method.

Refer to the information in QS 20-10. Assign costs to the assembly department's output—specifically, the units transferred out to the painting department and the units that remain in process in the assembly department at month-end. Use the weighted-average method.

**QS 20-12**

**Weighted average:**  
Assign costs to output **C3**

Refer to the information in QS 20-10. Prepare the November 30 journal entry to record the transfer of units (and costs) from the assembly department to the painting department. Use the weighted-average method.

**QS 20-13**

**Weighted average:**  
Journal entry to transfer costs **P4**

Refer to the information in QS 20-10. Calculate the assembly department's equivalent units of production for materials and for conversion for November. Use the FIFO method.

**QS 20-14<sup>A</sup>**

**FIFO:** Equivalent units of production **C4**

Refer to the information in QS 20-10. Calculate the assembly department's cost per equivalent unit of production for materials and for conversion for November. Use the FIFO method.

**QS 20-15<sup>A</sup>**

**FIFO:** Cost per EUP **C4**

Refer to the information in QS 20-10. Assign costs to the assembly department's output—specifically, the units transferred out to the painting department and the units that remain in process in the assembly department at month-end. Use the FIFO method.

**QS 20-16<sup>A</sup>**

**FIFO:** Assign costs to output **C4**

Refer to the information in QS 20-10. Prepare the November 30 journal entry to record the transfer of units (and costs) from the assembly department to the painting department. Use the FIFO method.

**QS 20-17<sup>A</sup>**

**FIFO:** Journal entry to transfer costs **C4 P4**

The Plastic Flowerpots Company has two manufacturing departments, molding and packaging. At the beginning of the month, the molding department has 2,000 units in inventory, 70% complete as to materials. During the month, the molding department started 18,000 units. At the end of the month, the molding department had 3,000 units in ending inventory, 80% complete as to materials. Units completed in the molding department are transferred into the packaging department.

Cost information for the molding department for the month follows:

**QS 20-18**

**Weighted average:**  
Computing equivalent units and cost per EUP (direct materials)

**C2 C3**

Beginning work in process inventory (direct materials) . . . . .	\$ 1,200
Direct materials added during the month . . . . .	27,900

Using the weighted-average method, compute the molding department's (a) equivalent units of production for materials and (b) cost per equivalent unit of production for materials for the month. (Round to two decimal places.)

Refer to information in QS 20-18. Using the weighted-average method, assign direct materials costs to the molding department's output—specifically, the units transferred out to the packaging department and the units that remain in process in the molding department at month-end.

**QS 20-19**

**Weighted average:**  
Assigning costs to output **C3**

Azule Co. manufactures in two sequential processes, cutting and binding. The two departments report the information below for a recent month. Determine the ending balances in the Work in Process Inventory accounts of each department.

**QS 20-20**

Transfer of costs; ending WIP balances **C3**

	Cutting	Binding
Beginning work in process		
Transferred in from cutting dept. . . . .		\$ 1,200
Direct materials . . . . .	\$ 845	1,926
Conversion . . . . .	2,600	3,300
Costs added during March		
Direct materials . . . . .	\$ 8,240	\$ 6,356
Conversion . . . . .	11,100	18,575
Transferred in from cutting dept. . . . .		15,685
Transferred to finished goods . . . . .		30,000

**QS 20-21<sup>A</sup>**

**FIFO:** Computing equivalent units and cost per EUP (direct materials)

C4

BOGO Inc. has two sequential processing departments, roasting and mixing. At the beginning of the month, the roasting department has 2,000 units in inventory, 70% complete as to materials. During the month, the roasting department started 18,000 units. At the end of the month, the roasting department had 3,000 units in ending inventory, 80% complete as to materials.

Cost information for the roasting department for the month is as follows:

Beginning work in process inventory (direct materials) . . . . .	\$ 2,170
Direct materials added during the month . . . . .	27,900

Using the FIFO method, compute the roasting department's (a) equivalent units of production for materials and (b) cost per equivalent unit of production for materials for the month.

**QS 20-22<sup>A</sup>**

**FIFO:** Assigning costs to output C4

Refer to QS 20-21. Using the FIFO method, assign direct materials costs to the roasting department's output—specifically, the units transferred out to the mixing department and the units that remain in process in the roasting department at month-end.

**QS 20-23**

Recording costs of materials P1

Hotwax makes surfboard wax in a single operation. This period, Hotwax purchased \$62,000 in raw materials. Its production department requisitioned \$50,000 of those materials for use in production. Prepare journal entries to record its (1) purchase of raw materials and (2) requisition of direct materials.

**QS 20-24**

Recording costs of labor P2

Prepare journal entries to record the following production activities for Hotwax.

1. Incurred direct labor of \$125,000 (credit Factory Payroll Payable).
2. Incurred indirect labor of \$10,000 (credit Factory Payroll Payable).
3. Total factory payroll of \$135,000 was paid in cash.

**QS 20-25**

Recording costs of factory overhead P1 P3

Prepare journal entries to record the following production activities for Hotwax.

1. Requisitioned \$9,000 of indirect materials for use in production of surfboard wax.
2. Incurred \$156,000 overhead costs (credit "Other accounts").
3. Applied overhead at the rate of 140% of direct labor costs. Direct labor costs were \$125,000.

**QS 20-26**

Recording transfer of costs to finished goods P4

Hotwax completed products costing \$275,000 and transferred them to finished goods. Prepare its journal entry to record the transfer of units from production to finished goods inventory.

**QS 20-27**

Process cost summary

C3

**Anheuser-Busch InBev** is attempting to reduce its water usage. How could a company manager use a process cost summary to determine if the program to reduce water usage is successful?

**EXERCISES****Exercise 20-1**

Matching of product to cost accounting system

C1

For each of the following products and services, indicate whether it is more likely produced in a process operation or in a job order operation.

- |                       |                                |                                 |
|-----------------------|--------------------------------|---------------------------------|
| ___ 1. Beach towels   | ___ 5. Designed patio          | ___ 9. Concrete swimming pools  |
| ___ 2. Bolts and nuts | ___ 6. Door hardware           | ___ 10. Custom tailored dresses |
| ___ 3. Lawn chairs    | ___ 7. Cut flower arrangements | ___ 11. Grand pianos            |
| ___ 4. Headphones     | ___ 8. House paints            | ___ 12. Table lamps             |

Label each item *a* through *h* below as a feature of either a job order or process operation.

- |   |   |
|---|---|
| _____ <b>a.</b> Heterogeneous products and services | _____ <b>e.</b> Focus on individual batch   |
| _____ <b>b.</b> Custom orders                       | _____ <b>f.</b> Low product standardization |
| _____ <b>c.</b> Low production volume               | _____ <b>g.</b> Low product flexibility     |
| _____ <b>d.</b> Routine, repetitive procedures      | _____ <b>h.</b> Focus on standardized units |

**Exercise 20-2**

Compare process and job order operations

C1

Match each of the following items A through G with the best numbered description of its purpose.

- |   |  |
|---|--|
| <b>A.</b> Factory Overhead account          | <b>E.</b> Raw Materials Inventory account  |
| <b>B.</b> Process cost summary              | <b>F.</b> Materials requisition            |
| <b>C.</b> Equivalent units of production    | <b>G.</b> Finished Goods Inventory account |
| <b>D.</b> Work in Process Inventory account |  |

- \_\_\_\_\_ **1.** Notifies the materials manager to send materials to a production department.
- \_\_\_\_\_ **2.** Holds costs of indirect materials, indirect labor, and similar costs until assigned to production.
- \_\_\_\_\_ **3.** Holds costs of direct materials, direct labor, and applied overhead until products are transferred from production to finished goods (or another department).
- \_\_\_\_\_ **4.** Standardizes partially completed units into equivalent completed units.
- \_\_\_\_\_ **5.** Holds costs of finished products until sold to customers.
- \_\_\_\_\_ **6.** Describes the activity and output of a production department for a period.
- \_\_\_\_\_ **7.** Holds costs of materials until they are used in production or as factory overhead.

**Exercise 20-3**

Terminology in process costing

C1 A1 P1 P2 P3

The production department in a process manufacturing system completed 80,000 units of product and transferred them to finished goods during a recent period. Of these units, 24,000 were in process at the beginning of the period. The other 56,000 units were started and completed during the period. At period-end, 16,000 units were in process. Compute the department's equivalent units of production with respect to direct materials under each of three separate assumptions, using the weighted average method:

- All direct materials are added to products when processing begins.
- Beginning inventory is 40% complete as to materials and conversion costs. Ending inventory is 75% complete as to materials and conversion costs.
- Beginning inventory is 60% complete as to materials and 40% complete as to conversion costs. Ending inventory is 30% complete as to materials and 60% complete as to conversion costs.

**Exercise 20-4****Weighted average:**

Equivalent units computed

C2

**Check** (3) EUP for materials, 84,800

Refer to the information in Exercise 20-4 and complete the requirements for each of the three separate assumptions using the FIFO method for process costing.

**Exercise 20-5<sup>A</sup>**

**FIFO:** Equivalent units computed C4

**Check** (3) EUP for materials, 70,400

The Fields Company has two manufacturing departments, forming and painting. The company uses the weighted-average method of process costing. At the beginning of the month, the forming department has 25,000 units in inventory, 60% complete as to materials and 40% complete as to conversion costs. The beginning inventory cost of \$60,100 consisted of \$44,800 of direct material costs and \$15,300 of conversion cost.

During the month, the forming department started 300,000 units. At the end of the month, the forming department had 30,000 units in ending inventory, 80% complete as to materials and 30% complete as to conversion. Units completed in the forming department are transferred to the painting department.

Cost information for the forming department is as follows:

Beginning work in process inventory . . . . .	\$ 60,100
Direct materials added during the month . . . . .	1,231,200
Conversion added during the month . . . . .	896,700

**Exercise 20-6****Weighted average:**

Cost per EUP and costs assigned to output

C2

- Calculate the equivalent units of production for the forming department.
- Calculate the costs per equivalent unit of production for the forming department.
- Using the weighted-average method, assign costs to the forming department's output—specifically, its units transferred to painting and its ending work in process inventory.

**Exercise 20-7<sup>A</sup>****FIFO:** Costs per EUP

C4

Refer to the information in Exercise 20-6. Assume that Fields uses the FIFO method of process costing.

1. Calculate the equivalent units of production for the forming department.
2. Calculate the costs per equivalent unit of production for the forming department.

**Exercise 20-8****Weighted average:**

Computing equivalent units of production

C2

During April, the production department of a process manufacturing system completed a number of units of a product and transferred them to finished goods. Of these transferred units, 60,000 were in process in the production department at the beginning of April and 240,000 were started and completed in April. April's beginning inventory units were 60% complete with respect to materials and 40% complete with respect to conversion. At the end of April, 82,000 additional units were in process in the production department and were 80% complete with respect to materials and 30% complete with respect to conversion.

1. Compute the number of units transferred to finished goods.
2. Compute the number of equivalent units with respect to both materials used and conversion used in the production department for April using the weighted-average method.

**Check** (2) EUP for materials, 365,600

**Exercise 20-9****Weighted average:**

Costs assigned to output and inventories C2

**Check** (1) \$2.65 per EUP of direct materials

The production department described in Exercise 20-8 had \$850,368 of direct materials and \$649,296 of conversion costs charged to it during April. Also, its beginning inventory of \$167,066 consists of \$118,472 of direct materials cost and \$48,594 of conversion costs.

1. Compute the direct materials cost and the conversion cost per equivalent unit for the department.
2. Using the weighted-average method, assign April's costs to the department's output—specifically, its units transferred to finished goods and its ending work in process inventory.

**Exercise 20-10<sup>A</sup>**

**FIFO:** Computing equivalent units of production C4

Refer to the information in Exercise 20-8 to compute the number of equivalent units with respect to both materials used and conversion costs in the production department for April using the FIFO method.

**Exercise 20-11<sup>A</sup>**

**FIFO:** Costs assigned to output C4 P4

Refer to the information in Exercise 20-9 and complete its parts 1 and 2 using the FIFO method.

**Exercise 20-12****Weighted average:**

Completing a process cost summary

C3

The following partially completed process cost summary describes the July production activities of Ashad Company. Its production output is sent to its warehouse for shipping. All direct materials are added to products when processing begins. Beginning work in process inventory is 20% complete with respect to conversion. Prepare its process cost summary using the weighted-average method.

Equivalent Units of Production	Direct	
	Materials	Conversion
Units transferred out . . . . .	32,000 EUP	32,000 EUP
Units of ending work in process . . . . .	<u>2,500 EUP</u>	<u>1,500 EUP</u>
Equivalent units of production . . . . .	<u>34,500 EUP</u>	<u>33,500 EUP</u>
	Direct	
	Materials	Conversion
Costs of beginning work in process . . . . .	\$ 18,550	\$ 2,280
Costs incurred this period . . . . .	<u>357,500</u>	<u>188,670</u>
Total costs . . . . .	<u>\$376,050</u>	<u>\$190,950</u>
Units in beginning work in process (all completed during July) . . . . .		2,000
Units started this period . . . . .		32,500
Units completed and transferred out . . . . .		32,000
Units in ending work in process . . . . .		2,500

Refer to the information in Exercise 20-12. Prepare a process cost summary using the FIFO method. (Round cost per equivalent unit calculations to two decimal places.)

**Exercise 20-13<sup>A</sup>**  
**FIFO:** Completing a process cost summary  
**C3 C4**

Pro-Weave manufactures stadium blankets by passing the products through a weaving department and a sewing department. The following information is available regarding its June inventories:

	Beginning Inventory	Ending Inventory
Raw materials inventory . . . . .	\$ 120,000	\$ 185,000
Work in process inventory—Weaving . . . . .	300,000	330,000
Work in process inventory—Sewing . . . . .	570,000	700,000
Finished goods inventory . . . . .	1,266,000	1,206,000

**Exercise 20-14**  
 Production cost flow and measurement; journal entries  
**P1 P2 P3 P4**

The following additional information describes the company’s manufacturing activities for June:

Raw materials purchases (on credit) . . . . .	\$ 500,000
Factory payroll cost (paid in cash) . . . . .	3,060,000
Other factory overhead cost (Other Accounts credited) . . . . .	156,000
Materials used	
Direct—Weaving . . . . .	\$ 240,000
Direct—Sewing . . . . .	75,000
Indirect . . . . .	120,000
Labor used	
Direct—Weaving . . . . .	\$1,200,000
Direct—Sewing . . . . .	360,000
Indirect . . . . .	1,500,000
Overhead rates as a percent of direct labor	
Weaving . . . . .	80%
Sewing . . . . .	150%
Sales (on credit) . . . . .	\$4,000,000

**Required**

1. Compute the (a) cost of products transferred from weaving to sewing, (b) cost of products transferred from sewing to finished goods, and (c) cost of goods sold.
2. Prepare journal entries dated June 30 to record (a) goods transferred from weaving to sewing, (b) goods transferred from sewing to finished goods, and (c) sale of finished goods.

**Check** (1c) Cost of goods sold \$3,275,000

Refer to the information in Exercise 20-14. Prepare journal entries dated June 30 to record: (a) raw materials purchases, (b) direct materials usage, (c) indirect materials usage, (d) direct labor usage, (e) indirect labor usage, (f) other overhead costs, (g) overhead applied, and (h) payment of total payroll costs.

**Exercise 20-15**  
 Recording product costs  
**P1 P2 P3**

Elliott Company produces large quantities of a standardized product. The following information is available for its production activities for March.

**Exercise 20-16**  
**Weighted average:**  
 Process cost summary units and costs **C3**

Units		Costs	
Beginning work in process inventory . . . . .	2,000	Beginning work in process inventory	
Started . . . . .	20,000	Direct materials . . . . .	\$2,500
Ending work in process inventory . . . . .	5,000	Conversion . . . . .	<u>6,360</u> \$ 8,860
Status of ending work in process inventory		Direct materials added . . . . .	168,000
Materials—Percent complete . . . . .	100%	Direct labor added . . . . .	199,850
Conversion—Percent complete . . . . .	35%	Overhead applied (140% of direct labor) . . .	<u>279,790</u>
		Total costs to account for . . . . .	<u>\$656,500</u>
		Ending work in process inventory . . . . .	<u>\$ 84,110</u>

**Check** Cost per equivalent unit: materials, \$7.75; conversion, \$25.92

Prepare a process cost summary report for this company, showing costs charged to production, unit cost information, equivalent units of production, cost per EUP, and its cost assignment and reconciliation. Use the weighted-average method.

### Exercise 20-17

#### Weighted average:

Process cost summary

C3

Oslo Company produces large quantities of a standardized product. The following information is available for its production activities for May.

Units		Costs	
Beginning work in process inventory . . . . .	4,000	Beginning work in process inventory	
Started . . . . .	12,000	Direct materials . . . . .	\$2,880
Ending work in process inventory . . . . .	3,000	Conversion . . . . .	<u>5,358</u> \$ 8,238
Status of ending work in process inventory		Direct materials added . . . . .	197,120
Materials—Percent complete . . . . .	100%	Direct labor added . . . . .	123,680
Conversion—Percent complete . . . . .	25%	Overhead applied (90% of direct labor) . . .	<u>111,312</u>
		Total costs to account for . . . . .	<u>\$440,350</u>
		Ending work in process inventory . . . . .	<u>\$ 50,610</u>

**Check** (1) Cost per equivalent unit: materials, \$12.50; conversion, \$17.48

Prepare a process cost summary report for this company, showing costs charged to production, unit cost information, equivalent units of production, cost per EUP, and its cost assignment and reconciliation. Use the weighted-average method.

### Exercise 20-18<sup>A</sup>

#### FIFO: Equivalent units

C4 P4

RSTN Co. produces its product through two sequential processing departments. Direct materials and conversion are added to the product evenly throughout the process. The company uses monthly reporting periods for its process costing system. During October, the company finished and transferred 150,000 units of its product to Department 2. Of these units, 30,000 were in process at the beginning of the month and 120,000 were started and completed during the month. The beginning work in process inventory was 30% complete. At the end of the month, the work in process inventory consisted of 20,000 units that were 80% complete. Compute the number of equivalent units of production for October. Use the FIFO method.

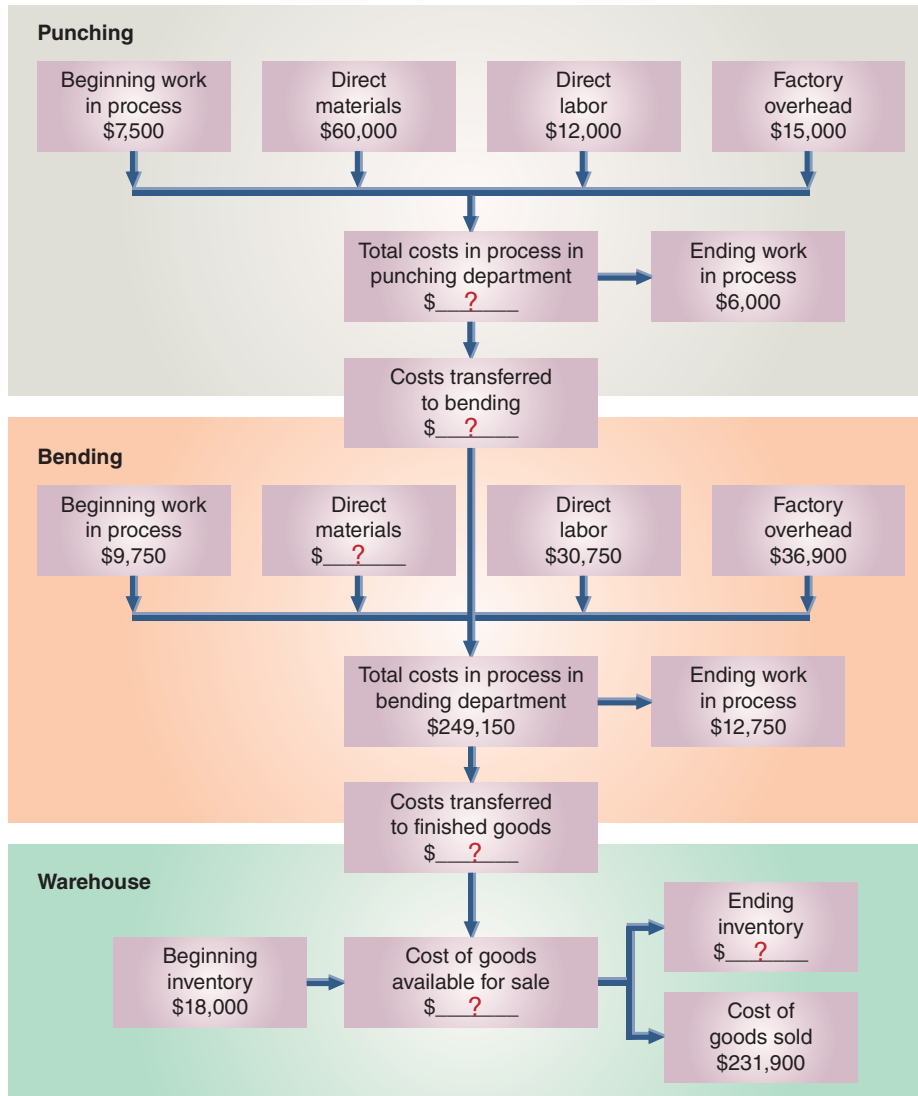

**Check** (1) 157,000 EUP

### Exercise 20-19

Production cost flows

P1 P2 P3 P4

The flowchart below shows the August production activity of the punching and bending departments of Wire Box Company. Use the amounts shown on the flowchart to compute the missing numbers identified by question marks.

Hi-Test Company uses the weighted-average method of process costing to assign production costs to its products. Information for September follows. Assume that all materials are added at the beginning of its production process, and that conversion costs are added uniformly throughout the process.

**Exercise 20-20**  
**Weighted average:**  
 Process cost summary

Work in process inventory, September 1 (2,000 units, 100% complete with respect to direct materials, 80% complete with respect to direct labor and overhead; includes \$45,000 of direct material cost, \$25,600 in direct labor cost, \$30,720 overhead cost) . . . . .	\$101,320
Units started in April . . . . .	28,000
Units completed and transferred to finished goods inventory . . . . .	23,000
Work in process inventory, September 30 ( ? units, 100% complete with respect to direct materials, 40% complete with respect to direct labor and overhead) . . . . .	\$ ?
Costs incurred in September	
Direct materials . . . . .	\$375,000
Conversion . . . . .	\$341,000

**Required**

Compute each of the following, assuming Hi-Test uses the weighted-average method of process costing.

1. The number of physical units that were transferred out and the number that are in ending work in process inventory.
2. The number of equivalent units for materials for the month.
3. The number of equivalent units for conversion for the month.
4. The cost per equivalent unit of materials for the month.
5. The cost per equivalent unit for conversion for the month.
6. The total cost of goods transferred out.
7. The total cost of ending work in process inventory.

**Exercise 20-21**

Recording costs of materials

P1

Prepare journal entries to record the following production activities.

1. Purchased \$80,000 of raw materials on credit.
2. Used \$42,000 of direct materials in production.
3. Used \$22,500 of indirect materials in production.

**Exercise 20-22**

Recording costs of labor

P2

Prepare journal entries to record the following production activities.

1. Incurred \$75,000 of direct labor in production (credit Factory Payroll Payable).
2. Incurred \$20,000 of indirect labor in production (credit Factory Payroll Payable).
3. Paid factory payroll.

**Exercise 20-23**

Recording overhead costs P3

Prepare journal entries to record the following production activities.

1. Paid overhead costs (other than indirect materials and indirect labor) of \$38,750.
2. Applied overhead at 110% of direct labor costs. Direct labor costs were \$75,000.

**Exercise 20-24**

Recording cost of completed goods P4

Prepare journal entries to record the following production activities.

1. Transferred completed goods from the Assembly department to finished goods inventory. The goods cost \$135,600.
2. Sold \$315,000 of goods on credit. Their cost is \$175,000.

**Exercise 20-25**

Recording cost flows in a process cost system

P1 P2 P3 P4

Laffer Lumber produces bagged bark for use in landscaping. Production involves packaging bark chips in plastic bags in a bagging department. The following information describes production operations for October.

	A	B
1		<b>Bagging Department</b>
2		
3	Direct materials used	\$ 522,000
4	Direct labor used	\$ 130,000
5	Predetermined overhead rate (based on direct labor)	175%
6	Goods transferred from bagging to finished goods	\$(595,000)
7		

The company's revenue for the month totaled \$950,000 from credit sales, and its cost of goods sold for the month is \$540,000. Prepare summary journal entries dated October 31 to record its October production activities for (1) direct material usage, (2) direct labor incurred (3) overhead allocation, (4) goods transfer from production to finished goods, and (5) credit sales.

**Check** (3) Cr. Factory Overhead, \$227,500

The following journal entries are recorded in Kiesha Co.'s process costing system. Kiesha produces apparel and accessories. Overhead is applied to production based on direct labor cost for the period. Prepare a brief explanation (including any overhead rates applied) for each journal entry *a* through *j*.

**Exercise 20-26**  
 Interpretation of journal entries in process costing  
**P1 P2 P3 P4**

<b>a.</b>	Raw Materials Inventory . . . . .	52,000	<b>g.</b>	Factory Payroll Payable . . . . .	38,000
	Accounts Payable . . . . .	52,000		Cash . . . . .	38,000
<b>b.</b>	Work in Process Inventory . . . . .	42,000	<b>h.</b>	Work in Process Inventory . . . . .	33,600
	Raw Materials Inventory . . . . .	42,000		Factory Overhead . . . . .	33,600
<b>c.</b>	Work in Process Inventory . . . . .	32,000	<b>i.</b>	Finished Goods Inventory . . . . .	88,000
	Factory Payroll Payable . . . . .	32,000		Work in Process Inventory . . . . .	88,000
<b>d.</b>	Factory Overhead . . . . .	6,000	<b>j.</b>	Accounts Receivable . . . . .	250,000
	Factory Payroll Payable . . . . .	6,000		Sales . . . . .	250,000
<b>e.</b>	Factory Overhead . . . . .	12,000		Cost of Goods Sold . . . . .	100,000
	Cash . . . . .	12,000		Finished Goods Inventory . . . . .	100,000
<b>f.</b>	Factory Overhead . . . . .	10,000			
	Raw Materials Inventory . . . . .	10,000			

Explain a hybrid costing system. Identify a product or service operation that might well fit a hybrid costing system.

**Exercise 20-27**  
 Hybrid costing system  
**A2**

Sierra Company manufactures woven blankets and accounts for product costs using process costing. The company uses a single processing department. The following information is available regarding its May inventories.

**PROBLEM SET A**

**Problem 20-1A**  
 Production cost flow and measurement; journal entries  
**P1 P2 P3 P4**

	Beginning Inventory	Ending Inventory
Raw materials inventory . . . . .	\$ 60,000	\$ 92,500
Work in process inventory . . . . .	435,000	515,000
Finished goods inventory . . . . .	633,000	605,000

The following additional information describes the company's production activities for May.

Raw materials purchases (on credit) . . . . .	\$ 250,000
Factory payroll cost (paid in cash) . . . . .	1,530,000
Other overhead cost (Other Accounts credited) . . . . .	87,000
Materials used	
Direct . . . . .	\$ 157,500
Indirect . . . . .	60,000
Labor used	
Direct . . . . .	\$ 780,000
Indirect . . . . .	750,000
Overhead rate as a percent of direct labor . . . . .	115%
Sales (on credit) . . . . .	\$2,500,000

**Required**

1. Compute the cost of (a) products transferred from production to finished goods, and (b) goods sold.
2. Prepare summary journal entries dated May 31 to record the following production activities during May: (a) raw materials purchases, (b) direct materials usage, (c) indirect materials usage, (d) direct labor costs incurred, (e) indirect labor costs incurred, (f) payment of factory payroll, (g) other overhead costs, (h) overhead applied, (i) goods transferred from production to finished goods, and (j) sale of finished goods.

**Check** (1b) Cost of goods sold, \$1,782,500

**Problem 20-2A**

**Weighted average:** Cost per equivalent unit; costs assigned to products

C2 C3

**Check** (2) Conversion cost per equivalent unit, \$4.50  
(3b) \$783,000

Victory Company uses weighted-average process costing to account for its production costs. Conversion cost is added evenly throughout the process. Direct materials are added at the beginning of the process. During November, the company transferred 700,000 units of product to finished goods. At the end of November, the work in process inventory consists of 180,000 units that are 30% complete with respect to conversion. Beginning inventory had \$420,000 of direct materials and \$139,000 of conversion cost. The direct material cost added in November is \$2,220,000, and the conversion cost added is \$3,254,000. Beginning work in process consisted of 60,000 units that were 100% complete with respect to direct materials and 80% complete with respect to conversion. Of the units completed, 60,000 were from beginning work in process and 640,000 units were started and completed during the period.

**Required**

1. Determine the equivalent units of production with respect to (a) direct materials and (b) conversion.
2. Compute both the direct material cost and the conversion cost per equivalent unit.
3. Compute the direct material cost and the conversion cost assigned to (a) units completed and transferred out, and (b) ending work in process inventory.

**Analysis Component**

4. The company sells and ships all units to customers as soon as they are completed. Assume that an error is made in determining the percentage of completion for units in ending inventory. Instead of being 30% complete with respect to labor, they are actually 60% complete. Write a one-page memo to the plant manager describing how this error affects its November financial statements.

**Problem 20-3A**

**Weighted average:** Process cost summary; equivalent units

C2 C3 P4

**Check** (1) Costs transferred out to finished goods, \$982,500

Fast Co. produces its product through a single processing department. Direct materials are added at the start of production, and conversion costs are added evenly throughout the process. The company uses monthly reporting periods for its weighted-average process costing system. The Work in Process Inventory account has a balance of \$84,300 as of October 1, which consisted of \$17,100 of direct materials and \$67,200 of conversion costs. During the month the company incurred the following costs:

Direct materials . . . . .	\$144,400
Conversion . . . . .	862,400

During October, the company started 140,000 units and transferred 150,000 units to finished goods. At the end of the month, the work in process inventory consisted of 20,000 units that were 80% complete with respect to conversion costs.

**Required**

1. Prepare the company's process cost summary for October using the weighted-average method.
2. Prepare the journal entry dated October 31 to transfer the cost of the completed units to finished goods inventory.

**Problem 20-4A**

**Weighted average:** Process cost summary, equivalent units, cost estimates

C2 C3 P4 

**Check** (1) EUP for conversion, 24,120  
(2) Cost transferred out to finished goods, \$2,664,000

Tamar Co. manufactures a single product in one department. All direct materials are added at the beginning of the manufacturing process. Conversion costs are added evenly throughout the process. During May, the company completed and transferred 22,200 units of product to finished goods inventory. Its 3,000 units of beginning work in process consisted of \$19,800 of direct materials and \$221,940 of conversion costs. It has 2,400 units (100% complete with respect to direct materials and 80% complete with respect to conversion) in process at month-end. During the month, \$496,800 of direct material costs and \$2,165,940 of conversion costs were charged to production.

**Required**

1. Prepare the company's process cost summary for May using the weighted-average method.
2. Prepare the journal entry dated May 31 to transfer the cost of completed units to finished goods inventory.

**Analysis Components**

3. The costing process depends on numerous estimates.
  - a. Identify two major estimates that determine the cost per equivalent unit.
  - b. In what direction might you anticipate a bias from management for each estimate in part 3a (assume that management compensation is based on maintaining low inventory amounts)? Explain your answer.

Refer to the data in Problem 20-4A. Assume that Tamar uses the FIFO method to account for its process costing system. The following additional information is available:

- Beginning work in process consisted of 3,000 units that were 100% complete with respect to direct materials and 40% complete with respect to conversion.
- Of the 22,200 units completed, 3,000 were from beginning work in process. The remaining 19,200 were units started and completed during May.

### Required

1. Prepare the company's process cost summary for May using FIFO.
2. Prepare the journal entry dated May 31 to transfer the cost of completed units to finished goods inventory.

### Problem 20-5A<sup>A</sup>

**FIFO:** Process cost summary; equivalent units; cost estimates

C3 C4 P4

**Check** (1) EUP for conversion, 22,920  
(2) Cost transferred out to finished goods, \$2,667,840

During May, the production department of a process manufacturing system completed a number of units of a product and transferred them to finished goods. Of these transferred units, 37,500 were in process in the production department at the beginning of May and 150,000 were started and completed in May. May's beginning inventory units were 60% complete with respect to materials and 40% complete with respect to conversion. At the end of May, 51,250 additional units were in process in the production department and were 60% complete with respect to materials and 20% complete with respect to conversion. The production department had \$505,035 of direct materials and \$396,568 of conversion cost charged to it during May. Its beginning inventory included \$74,075 of direct materials cost and \$28,493 of conversion cost.

1. Compute the number of units transferred to finished goods.
2. Compute the number of equivalent units with respect to both materials used and conversion used in the production department for May using the FIFO method.
3. Compute the direct materials cost and the conversion cost per equivalent unit for the department.
4. Using the FIFO method, assign May's costs to the units transferred to finished goods and assign costs to its ending work in process inventory.

### Problem 20-6A<sup>A</sup>

**FIFO:** Costs per equivalent unit; costs assigned to products

C2 C4

**Check** (2) EUP for materials, 195,750

Dengo Co. makes a trail mix in two departments: roasting and blending. Direct materials are added at the beginning of each process, and conversion costs are added evenly throughout each process. The company uses the FIFO method of process costing. During October, the roasting department completed and transferred 22,200 units to the blending department. Of the units completed, 3,000 were from beginning inventory and the remaining 19,200 were started and completed during the month. Beginning work in process was 100% complete with respect to direct materials and 40% complete with respect to conversion. The company has 2,400 units (100% complete with respect to direct materials and 80% complete with respect to conversion) in process at month-end. Information on the roasting department's costs of beginning work in process inventory and costs added during the month follows.

Cost	Direct Materials	Conversion
Of beginning work in process inventory.....	\$ 9,900	\$ 110,970
Added during the month.....	248,400	1,082,970

### Required

1. Prepare the roasting department's process cost summary for October using the FIFO method.
2. Prepare the journal entry dated October 31 to transfer the cost of completed units to the blending department.

### Analysis Component

3. The company provides incentives to department managers by paying monthly bonuses based on their success in controlling costs per equivalent unit of production. Assume that a production department underestimates the percentage of completion for units in ending inventory with the result that its equivalent units of production for October are understated. What impact does this error have on the October bonuses paid to that department's managers? What impact, if any, does this error have on November bonuses?

### Problem 20-7A<sup>A</sup>

**FIFO:** Process cost summary, equivalent units, cost estimates

C2 C3 C4 P4

**Check** (1) EUP for conversion, 22,920  
(2) Cost transferred out to blending, \$1,333,920

**PROBLEM SET B****Problem 20-1B**

Production cost flow and measurement; journal entries

P1 P2 P3 P4

Dream Toys Company manufactures video game consoles and accounts for product costs using process costing. The company uses a single processing department. The following information is available regarding its June inventories.

	Beginning Inventory	Ending Inventory
Raw materials inventory . . . . .	\$ 72,000	\$110,000
Work in process inventory . . . . .	156,000	250,000
Finished goods inventory . . . . .	160,000	198,000

The following additional information describes the company's production activities for June.

Raw materials purchases (on credit) . . . . .	\$200,000
Factory payroll cost (paid in cash) . . . . .	400,000
Other overhead cost (Other Accounts credited) . . . . .	170,500
Materials used	
Direct . . . . .	\$120,000
Indirect . . . . .	42,000
Labor used	
Direct . . . . .	\$350,000
Indirect . . . . .	50,000
Overhead rate as a percent of direct labor . . . . .	75%
Sales (on credit) . . . . .	\$1,000,000

**Required**

**Check** (1b) Cost of goods sold, \$600,500

1. Compute the cost of (a) products transferred from production to finished goods, and (b) goods sold.
2. Prepare journal entries dated June 30 to record the following production activities during June: (a) raw materials purchases, (b) direct materials usage, (c) indirect materials usage, (d) direct labor costs, (e) indirect labor costs, (f) payment of factory payroll (g) other overhead costs, (h) overhead applied, (i) goods transferred from production to finished goods, and (j) sale of finished goods.

**Problem 20-2B****Weighted average:**

Cost per equivalent unit; costs assigned to products

C2 C3

Abraham Company uses process costing to account for its production costs. Conversion is added evenly throughout the process. Direct materials are added at the beginning of the process. During September, the production department transferred 80,000 units of product to finished goods. Beginning work in process consisted of 2,000 units that were 100% complete with respect to direct materials and 85% complete with respect to conversion. Of the units completed, 2,000 were from beginning work in process and 78,000 units were started and completed during the period. Beginning work in process had \$58,000 of direct materials and \$86,400 of conversion cost. At the end of September, the work in process inventory consists of 8,000 units that are 25% complete with respect to conversion. The direct materials cost added in September is \$712,000, and conversion cost added is \$1,980,000. The company uses the weighted-average method.

**Required**

1. Determine the equivalent units of production with respect to (a) conversion and (b) direct materials.
2. Compute both the conversion cost and the direct materials cost per equivalent unit.
3. Compute both conversion cost and direct materials cost assigned to (a) units completed and transferred out and (b) ending work in process inventory.

**Analysis Component**

4. The company sells and ships all units to customers as soon as they are completed. Assume that an error is made in determining the percentage of completion for units in ending inventory. Instead of being 25% complete with respect to conversion, they are actually 75% complete. Write a one-page memo to the plant manager describing how this error affects its September financial statements.

**Check** (2) Conversion cost per equivalent unit, \$25.20

(3b) \$120,400

Braun Company produces its product through a single processing department. Direct materials are added at the beginning of the process. Conversion costs are added to the product evenly throughout the process. The company uses monthly reporting periods for its weighted-average process costing. The Work in Process Inventory account had a balance of \$21,300 on November 1, which consisted of \$6,800 of direct materials and \$14,500 of conversion costs.

During the month the company incurred the following costs:

Direct materials . . . . .	\$ 116,400
Conversion . . . . .	1,067,000

During November, the company finished and transferred 100,000 units of its product to finished goods. At the end of the month, the work in process inventory consisted of 12,000 units that were 100% complete with respect to direct materials and 25% complete with respect to conversion.

### Required

1. Prepare the company's process cost summary for November using the weighted-average method.
2. Prepare the journal entry dated November 30 to transfer the cost of the completed units to finished goods inventory.

### Problem 20-3B

Process cost summary; equivalent units

C2 C3 P4

**Check** (1) Cost transferred out to finished goods, \$1,160,000

Switch Co. manufactures a single product in one department. Direct labor and overhead are added evenly throughout the process. Direct materials are added as needed. The company uses monthly reporting periods for its weighted-average process costing. During January, Switch completed and transferred 220,000 units of product to finished goods inventory. Its 10,000 units of beginning work in process consisted of \$7,500 of direct materials and \$49,850 of conversion. In process at month-end are 40,000 units (50% complete with respect to direct materials and 30% complete with respect to conversion). During the month, the company used direct materials of \$112,500 in production, and incurred conversion costs of \$616,000.

### Required

1. Prepare the company's process cost summary for January using the weighted-average method.
2. Prepare the journal entry dated January 31 to transfer the cost of completed units to finished goods inventory.

### Analysis Components

3. The cost accounting process depends on several estimates.
  - a. Identify two major estimates that affect the cost per equivalent unit.
  - b. In what direction might you anticipate a bias from management for each estimate in part 3a (assume that management compensation is based on maintaining low inventory amounts)? Explain your answer.

### Problem 20-4B

#### Weighted average:

Process cost summary; equivalent units; cost estimates

C2 C3 P4 

**Check** (1) EUP for conversion, 232,000  
(2) Cost transferred out to finished goods, \$741,400

Refer to the information in Problem 20-4B. Assume that Switch uses the FIFO method to account for its process costing system. The following additional information is available.

- Beginning work in process consists of 10,000 units that were 75% complete with respect to direct materials and 60% complete with respect to conversion.
- Of the 220,000 units completed, 10,000 were from beginning work in process; the remaining 210,000 were units started and completed during January.

### Required

1. Prepare the company's process cost summary for January using FIFO. Round cost per EUP to three decimal places.
2. Prepare the journal entry dated January 31 to transfer the cost of completed units to finished goods inventory.

### Problem 20-5B<sup>A</sup>

**FIFO:** Process cost summary; equivalent units; cost estimates

C3 C4 P4

**Check** (1) Conversion EUP, 226,000  
(2) Cost transferred out, \$743,554

**Problem 20-6B<sup>A</sup>**

**FIFO:** Costs per equivalent unit; costs assigned to products

C2 C4

**Check** (2) EUP for materials, 273,500

During May, the production department of a process manufacturing system completed a number of units of a product and transferred them to finished goods. Of these transferred units, 62,500 were in process in the production department at the beginning of May and 175,000 were started and completed in May. May's beginning inventory units were 40% complete with respect to materials and 80% complete with respect to conversion. At the end of May, 76,250 additional units were in process in the production department and were 80% complete with respect to materials and 20% complete with respect to conversion. The production department had \$683,750 of direct materials and \$446,050 of conversion cost charged to it during May. Its beginning inventory included \$99,075 of direct materials cost and \$53,493 of conversion cost.

1. Compute the number of units transferred to finished goods.
2. Compute the number of equivalent units with respect to both materials used and conversion used in the production department for May using the FIFO method.
3. Compute the direct materials cost and the conversion cost per equivalent unit for the department.
4. Using the FIFO method, assign May's costs to the units transferred to finished goods and assign costs to its ending work in process inventory.

**Problem 20-7B<sup>A</sup>**

**FIFO:** Process cost summary, equivalent units, cost estimates

C2 C3 C4 P4

Belda Co. makes organic juice in two departments: cutting and blending. Direct materials are added at the beginning of each process, and conversion costs are added evenly throughout each process. The company uses the FIFO method of process costing. During March, the cutting department completed and transferred 220,000 units to the blending department. Of the units completed, 10,000 were from beginning inventory and the remaining 210,000 were started and completed during the month. Beginning work in process was 75% complete with respect to direct materials and 60% complete with respect to conversion. The company has 40,000 units (50% complete with respect to direct materials and 30% complete with respect to conversion) in process at month-end. Information on the cutting department's costs of beginning work in process inventory and costs added during the month follows.

Cost	Direct Materials	Conversion
Of beginning work in process inventory . . . . .	\$ 16,800	\$ 97,720
Added during the month . . . . .	223,200	1,233,960

**Required**

1. Prepare the cutting department's process cost summary for March using the FIFO method.
2. Prepare the journal entry dated March 31 to transfer the cost of completed units to the blending department.

**Analysis Component**

3. The company provides incentives to department managers by paying monthly bonuses based on their success in controlling costs per equivalent unit of production. Assume that the production department overestimates the percentage of completion for units in ending inventory with the result that its equivalent units of production for March are overstated. What impact does this error have on bonuses paid to the managers of the production department? What impact, if any, does this error have on these managers' April bonuses?

**SERIAL PROBLEM**

Business Solutions

C1 A1

(This serial problem began in Chapter 1 and continues through most of the book. If previous chapter segments were not completed, the serial problem can begin at this point.)

**SP 20** The computer workstation furniture manufacturing that Santana Rey started is progressing well. At this point, Santana is using a job order costing system to account for the production costs of this product line. Santana has heard about process costing and is wondering whether process costing might be a better method for her to keep track of and monitor her production costs.

**Required**

1. What are the features that distinguish job order costing from process costing?
2. Do you believe that Santana should continue to use job order costing or switch to process costing for her workstation furniture manufacturing? Explain.

**CP 20** Major League Bat Company manufactures baseball bats. In addition to its work in process inventories, the company maintains inventories of raw materials and finished goods. It uses raw materials as direct materials in production and as indirect materials. Its factory payroll costs include direct labor for production and indirect labor. All materials are added at the beginning of the process, and conversion costs are applied uniformly throughout the production process.

### Required

You are to maintain records and produce measures of inventories to reflect the July events of this company. Set up the following general ledger accounts and enter the June 30 balances: Raw Materials Inventory, \$25,000; Work in Process Inventory, \$8,135 (\$2,660 of direct materials and \$5,475 of conversion); Finished Goods Inventory, \$110,000; Sales, \$0; Cost of Goods Sold, \$0; Factory Payroll Payable, \$0; and Factory Overhead, \$0.

1. Prepare journal entries to record the following July transactions and events.
  - a. Purchased raw materials for \$125,000 cash (the company uses a perpetual inventory system).
  - b. Used raw materials as follows: direct materials, \$52,440; and indirect materials, \$10,000.
  - c. Recorded factory payroll payable costs as follows: direct labor, \$202,250; and indirect labor, \$25,000.
  - d. Paid factory payroll cost of \$227,250 with cash (ignore taxes).
  - e. Incurred additional factory overhead costs of \$80,000 paid in cash.
  - f. Allocated factory overhead to production at 50% of direct labor costs.
2. Information about the July inventories follows. Use this information with that from part 1 to prepare a process cost summary, assuming the weighted-average method is used.

<b>Units</b>	
Beginning inventory . . . . .	5,000 units
Started . . . . .	14,000 units
Ending inventory . . . . .	8,000 units
<b>Beginning inventory</b>	
Materials—Percent complete . . . . .	100%
Conversion—Percent complete . . . . .	75%
<b>Ending inventory</b>	
Materials—Percent complete . . . . .	100%
Conversion—Percent complete . . . . .	40%

3. Using the results from part 2 and the available information, make computations and prepare journal entries to record the following:
  - g. Total costs transferred to finished goods for July (label this entry g). (3g) \$271,150
  - h. Sale of finished goods costing \$265,700 for \$625,000 in cash (label this entry h).
4. Post entries from parts 1 and 3 to the ledger accounts set up at the beginning of the problem.
5. Compute the amount of gross profit from the sales in July. (*Note:* Add any underapplied overhead to, or deduct any overapplied overhead from, the cost of goods sold. Ignore the corresponding journal entry.)

ACCOUNTING

## Beyond the Numbers

### REPORTING IN ACTION

C2

### APPLE

**BTN 20-1** **Apple** reports in notes to its financial statements that, in addition to its products sold, it includes the following costs (among others) in cost of sales: customer shipping and handling expenses and warranty expenses.

#### Required

1. Why do you believe Apple includes these costs in its cost of sales?
2. What effect does this cost accounting policy for its cost of sales have on Apple's financial statements and any analysis of those statements? Explain.

#### Fast Forward

3. Access Apple's financial statements for the years after September 28, 2013, from its website ([Apple.com](http://Apple.com)) or the SEC's EDGAR website ([SEC.gov](http://SEC.gov)). Review its footnote relating to Summary of Significant Accounting Policies. Has Apple changed its policy with respect to what costs are included in the cost of sales? Explain.

### COMPARATIVE ANALYSIS

C1

### APPLE GOOGLE

**BTN 20-2** Manufacturers such as **Apple** and **Google** usually work to maintain a high-quality and low-cost operation. One ratio routinely computed for this assessment is the cost of goods sold divided by total expenses. A decline in this ratio can mean that the company is spending too much on selling and administrative activities. An increase in this ratio beyond a reasonable level can mean that the company is not spending enough on selling activities. (Assume for this analysis that total expenses equal the cost of goods sold plus total operating expenses.)

#### Required

1. For Apple and Google refer to Appendix A and compute the ratios of cost of goods sold to total expenses for their two most recent fiscal years. (Record answers as percents, rounded to one decimal.)
2. Comment on the similarities or differences in the ratio results across both years between the companies.

### ETHICS CHALLENGE

C1

**BTN 20-3** Many accounting and accounting-related professionals are skilled in financial analysis, but most are not skilled in manufacturing. This is especially the case for process manufacturing environments (for example, a bottling plant or chemical factory). To provide professional accounting and financial services, one must understand the industry, product, and processes. We have an ethical responsibility to develop this understanding before offering services to clients in these areas.

#### Required

Write a one-page action plan, in memorandum format, discussing how you would obtain an understanding of key business processes of a company that hires you to provide financial services. The memorandum should specify an industry, a product, and one selected process and should draw on at least one reference, such as a professional journal or industry magazine.

### COMMUNICATING IN PRACTICE

A1 C1 P1 P2

**BTN 20-4** You hire a new assistant production manager whose prior experience is with a company that produced goods to order. Your company engages in continuous production of homogeneous products that go through various production processes. Your new assistant e-mails you questioning some cost classifications on an internal report—specifically why the costs of some materials that do not actually become part of the finished product, including some labor costs not directly associated with producing the product, are classified as direct costs. Respond to this concern via memorandum.

### TAKING IT TO THE NET

C1

**BTN 20-5** Many companies acquire software to help them monitor and control their costs and as an aid to their accounting systems. One company that supplies such software is **proDacapo** ([prodacapo.com](http://prodacapo.com)). There are many other such vendors. Access proDacapo's website, click on "Products," then click on "Prodacapo Process Management," and review the information displayed.

#### Required

How is process management software helpful to businesses? Explain with reference to costs, efficiency, and examples, if possible.

**BTN 20-6** The purpose of this team activity is to ensure that each team member understands process operations and the related accounting entries. Find the activities and flows identified in Exhibit 20.14 with numbers ①–⑩. Pick a member of the team to start by describing activity number ① in this exhibit, then verbalizing the related journal entry, and describing how the amounts in the entry are computed. The other members of the team are to agree or disagree; discussion is to continue until all members express understanding. Rotate to the next numbered activity and next team member until all activities and entries have been discussed. If at any point a team member is uncertain about an answer, the team member may pass and get back in the rotation when he or she can contribute to the team’s discussion.

**TEAMWORK IN ACTION**

C1 P1 P2 P3 P4

**BTN 20-7** This chapter’s opener featured Nick Nicolay and his company **Kar’s Nuts**.

**Required**

1. Kar’s Nuts uses three processes: roasting, blending, and packaging. What are some benefits of using separate process cost summary reports for each process?
2. Nick tries to order raw materials just-in-time for their use in production. How does holding raw materials inventories increase costs? If the items are not used in production, how can they impact profits? Explain.
3. Suppose Kar’s Nuts decides to allow customers to make their own unique trail mix flavors. Why might the company then use a hybrid costing system?

**ENTREPRENEURIAL DECISION**

C3 A2  

**BTN 20-8** In process costing, the process is analyzed first and then a unit measure is computed in the form of equivalent units for direct materials, conversion (direct labor and overhead), and both types of costs combined. The same analysis applies to both manufacturing and service processes.

**Required**

Visit your local **U.S. Mail** center. Look into the back room, and you will see several ongoing processes. Select one process, such as sorting, and list the costs associated with this process. Your list should include materials, labor, and overhead; be specific. Classify each cost as fixed or variable. At the bottom of your list, outline how overhead should be assigned to your identified process. The following format (with an example) is suggested.

**HITTING THE ROAD**

C2 

**Point:** The class can compare and discuss the different processes studied and the answers provided.

Cost Description	Conversion		Variable Cost	Fixed Cost
	Direct Material	Direct Labor Overhead		
Manual sorting . . . . .		X	X	
⋮				
⋮				
Overhead allocation suggestions:				

**BTN 20-9** **Samsung**, **Apple**, and **Google** are competitors in the global marketplace. Selected data for Samsung follow.

(billions of Korean won)	Current Year	Prior Year
Cost of goods sold . . . . .	₩137,696.3	₩126,651.9
Operating expenses . . . . .	54,211.3	45,402.3
Total expenses . . . . .	<u>₩191,907.6</u>	<u>₩172,054.2</u>

**Required**

1. Review the discussion of the importance of the cost of goods sold divided by total expenses ratio in BTN 20-2. Compute the cost of goods sold to total expenses ratio for Samsung for the two years of data provided. (Record answers as percents, rounded to one decimal.)
2. Comment on the similarities or differences in the ratio results calculated in part 1 and in BTN 20-2 across years and companies. (Record answers as percents, rounded to one decimal.)

**GLOBAL DECISION**

C1  

**Samsung**  
**APPLE**  
**GOOGLE**

**ANSWERS TO MULTIPLE CHOICE QUIZ**

1. d
2. e
3. b;  $\$20,000 + \$152,000 + \$45,000 + \$18,000 - \$218,000 = \underline{\underline{\$17,000}}$
4. a;  $40,000 + (15,000 \times 1/3) = \underline{\underline{45,000 \text{ EUP}}}$
5. c;  $(\$6,000 + \$84,000) \div 45,000 \text{ EUP} = \underline{\underline{\$2 \text{ per EUP}}}$

### Learning Objectives

#### CONCEPTUAL

- C1** Describe different types of cost behavior in relation to production and sales volume.
- C2** Describe several applications of cost-volume-profit analysis.

#### ANALYTICAL

- A1** Compute the contribution margin and describe what it reveals about a company's cost structure.

- A2** Analyze changes in sales using the degree of operating leverage.

#### PROCEDURAL

- P1** Determine cost estimates using the scatter diagram, high-low, and regression methods of estimating costs.
- P2** Compute the break-even point for a single product company.

- P3** Graph costs and sales for a single product company.

- P4** Compute the break-even point for a multiproduct company.

## Find the Yeti

COLUMBIA, MO—After finishing his marketing degree and obtaining over 13 years of professional marketing and design experience, Reid Lyle needed a change. “I wanted to produce creative quality products with talented, genuine people in a business that I could actually influence for the better” says Reid. Reid, along with partners Ryan Montgomery and Jordan Roudenis, opened a custom T-shirt shop, **Fast Yeti Custom Tees** ([fastyetitees.com](http://fastyetitees.com)).

“We all contributed to every aspect of starting this business” says Reid. That includes brainstorming to find a name for their company. The trio came up with a mythical character, Freddie the Yeti, who allegedly trekked from the Ozark Mountains to convince the group to start a business. “Fast Yeti is memorable and fun,” says Reid. “It’s interesting. It raises questions.” During the week, Freddie roams the streets of Columbia, and customers who capture a photo of him receive a discount on merchandise. “A common misconception is that he’s a human wearing a costume,” jokes Ryan. “It’s a real yeti.”

While humor is a large part of their business, the owners have a serious focus on providing high-quality products to meet customer demands. “Everyone has a favorite T-shirt,” says Reid. “We want to be the shop that designs and sells it.” Jordan, the company’s production manager, says he “is very particular about how I do things. If I mess up, I fix it and try not to let it happen again. I try to perfect what I do.”

Operating at a small scale, in a highly competitive industry, requires the owners to understand and control their costs. Successful entrepreneurs must understand cost behavior to succeed. Identifying fixed and variable costs is key to understanding break-even points determining the amount of sales required to make a target income, key topics in this chapter. In addition to selling custom T-shirts, Fast Yeti also sells custom hats and polo shirts. Understanding multiproduct break-even points and sales mix is important in companies with diverse product lines. Contribution margin income statements, which separate fixed and variable costs, enable entrepreneurs to quickly see how changes in selling prices, variable costs, or fixed costs impact profit. Understanding contribution margins and cost-volume-profit analyses enables small businesses to profit and grow.

Reid, Ryan, and Jordan agree that young entrepreneurs should follow their passion and “make it happen.” “We all are interested in apparel, humor, and design,” says Reid. “Still, we all had to strip out old carpet and make our own shelves to get this store opened.” While still a young company, the trio is seeing their hard work rewarded with increasing sales. “We work hard,” says Ryan, “but it’s really fun.” And, if you see a yeti roaming around . . . take a photo.

*“The T-shirt is the epitome of creativity”*

—Reid Lyle

## IDENTIFYING COST BEHAVIOR

Planning a company's future activities and events is crucial to successful management. One of the first steps in planning is to predict the volume of activity, the costs to be incurred, sales to be made, and profit to be earned. An important tool in such planning is **cost-volume-profit (CVP) analysis**, which helps managers predict how changes in costs and sales levels affect profit. In its basic form, CVP analysis involves computing the sales level at which a company neither earns an income nor incurs a loss, called the *break-even point*. For this reason, this basic form of cost-volume-profit analysis is often called *break-even analysis*.

Managers use variations of CVP analysis to answer questions like:

- How much does income increase if we install a new machine to reduce labor costs?
- What is the change in income if selling prices decline and sales volume increases?
- How will income change if we change the sales mix of our products or services?
- What sales volume is needed to earn a target income?

Consequently, cost-volume-profit analysis is useful in a wide range of business decisions.

The concept of *relevant range* is important to classifying costs for CVP analysis. The **relevant range of operations** is the normal operating range for a business. Except for unusually good or bad times, management typically plans for operations within a range of volume neither close to zero nor at maximum capacity. The relevant range excludes extremely high or low operating levels that are unlikely to recur. CVP analysis requires management to classify costs as either *fixed* or *variable* with respect to production or sales volume, within the relevant range of operations. The remainder of this section discusses concepts of cost behavior as they relate to CVP analysis.

### Fixed Costs

*Fixed costs* remain unchanged despite variations in the volume of activity within a relevant range. For example, \$32,000 in monthly rent paid for a factory building remains the same whether the factory operates with a single eight-hour shift or around the clock with three shifts. This means that rent cost is the same each month at any level of output from zero to the plant's full productive capacity. Common examples of fixed costs include depreciation, property taxes, office salaries, and many service department costs.

Be sure to realize that the idea of fixed cost not changing as the level of production changes applies to the *total* dollar amount. It does not apply to the per unit amount. Rather, the fixed cost *per unit* of output decreases as volume increases. For instance, if 200 units are produced when monthly rent is \$32,000, the average rent cost per unit is \$160 (computed as  $\$32,000/200$  units). When production increases to 1,000 units per month, the average rent cost per unit decreases to \$32 (computed as  $\$32,000/1,000$  units).

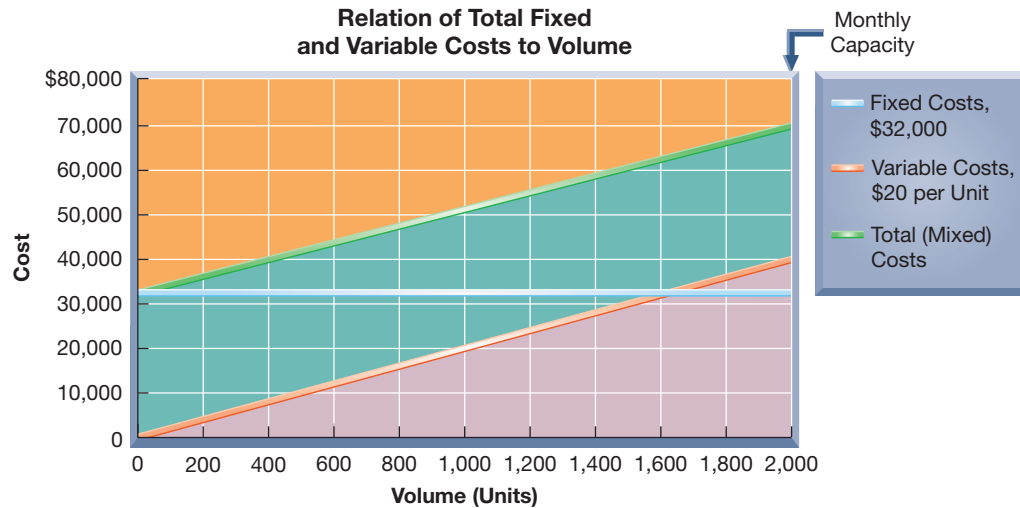

When production volume and costs are graphed, units of product are usually plotted on the *horizontal axis* and dollars of cost are plotted on the *vertical axis*. Fixed costs then are

gerenme/Vetta/Getty Images

represented as a horizontal line because they remain constant at all levels of production. To illustrate, the top graph in Exhibit 21.1 shows that fixed costs remain at \$32,000 at all production levels up to the company's monthly capacity of 2,000 units of output. The bottom graph in Exhibit 21.1 shows that fixed costs per unit fall as production levels increase. This drop in costs per unit as production levels increase is known as *economies of scale*. The *relevant range* for fixed costs in Exhibit 21.1 is 0 to 2,000 units. If the relevant range changes (that is, production capacity extends beyond this range), the amount of fixed costs will likely change.

**C1** Describe different types of cost behavior in relation to production and sales volume.

**EXHIBIT 21.1**

Relations of Total and Per Unit Costs to Volume

**Example:** If the fixed cost line in Exhibit 21.1 is shifted upward, does the total cost line shift up, down, or remain in the same place? *Answer:* It shifts up by the same amount.

**Example:** If the level of fixed costs in Exhibit 21.1 changes, does the slope of the total cost line change? *Answer:* No, the slope doesn't change. The total cost line is simply shifted upward or downward.

## Variable Costs

*Variable costs* change in proportion to changes in volume of activity. The direct materials cost of a product is one example of a variable cost. If one unit of product requires materials costing \$20, total materials costs are \$200 when 10 units of product are manufactured, \$400 for 20 units, \$600 for 30 units, and so on. In addition to direct materials, common variable costs include direct labor (if employees are paid per unit), sales commissions, shipping costs, and some overhead costs.

Notice that variable cost *per unit* remains constant but the *total* amount of variable cost changes with the level of production. When variable costs are plotted on a graph of cost and volume, they appear as a straight line starting at the zero cost level. This straight line is upward (positive) sloping. The line rises as volume of activity increases. A variable cost line using a \$20 per unit cost is graphed in Exhibit 21.1. The bottom graph in Exhibit 21.1 shows that variable cost per unit is constant as production levels change.

## Mixed Costs

Are costs either fixed or variable? No—another category, **mixed costs**, includes both fixed and variable cost components. For example, compensation for sales representatives often includes a fixed monthly salary and a variable commission based on sales. Utilities can also be considered a mixed cost; even if no units are produced, it is not likely a manufacturing plant will use no electricity or water. Like a fixed cost, a mixed cost is greater than zero when volume is zero; but unlike a fixed cost, it increases steadily in proportion to increases in volume.

**Point:** Fixed costs are constant in total but vary (decline) per unit as more units are produced. Variable costs vary in total but are fixed per unit.

The total (mixed) cost line in the top graph in Exhibit 21.1 starts on the vertical axis at the \$32,000 fixed cost point. Thus, at the zero volume level, total cost equals the fixed costs. As the activity level increases, the total cost line increases at an amount equal to the variable cost per unit. This line is highest when the volume of activity is at 2,000 units (the end point of the relevant range). In CVP analysis, mixed costs should be separated into fixed and variable components. The fixed component is added to other fixed costs, and the variable component is added to other variable costs.

## Step-wise Costs and the Relevant Range

A **step-wise cost** (or *stair-step cost*) reflects a step pattern in costs. Salaries of production supervisors often behave in a step-wise manner in that their salaries are fixed within a *relevant range* of the current production volume. However, if production volume expands significantly (for example, with the addition of another shift), additional supervisors must be hired. This means that the total cost for supervisory salaries goes up by a lump-sum amount. Similarly, if production volume takes another significant step up, supervisory salaries will increase by another lump sum. This behavior is graphed in Exhibit 21.2. See how the step-wise cost line is flat within ranges, called the *relevant range*. Then, when volume significantly changes, the cost shifts to another level for that range.

### EXHIBIT 21.2

Step-wise and Curvilinear Costs

In CVP analysis, a step-wise cost is usually treated as either a fixed cost or a variable cost. This treatment involves manager judgment and depends on the width of the relevant range and the expected volume. To illustrate, suppose after the production of every 25 snowboards, an operator lubricates the finishing machine. The cost of this lubricant reflects a step-wise pattern. Also, suppose that after the production of every 1,000 units, the snowboard cutting tool is replaced. Again, this is a step-wise cost. Note that the relevant range of 25 snowboards is much narrower than the relevant range of 1,000 snowboards. Some managers might treat the lubricant cost as a variable cost and the cutting tool cost as a fixed cost.

**Point:** Computer spreadsheets are important and effective tools for CVP analysis and for analyzing alternative “what-if” strategies.

## Curvilinear Costs

As shown earlier, variable costs increase at a constant rate as the volume of activity increases. For example, a salesperson’s commission of 7% of sales volume would increase at a constant rate as sales volume increases. **Curvilinear costs** also increase as volume increases, but at a nonconstant rate. The curved line in Exhibit 21.2 shows a curvilinear cost beginning at zero (when production is zero) and increasing at different rates as volume increases.

An example of a curvilinear cost is total direct labor cost when workers are paid by the hour. For example, a company might add new employees assigned to specialize in certain tasks. When production levels are relatively low, adding those specialized employees often yields more output. This is reflected in a flatter slope in the curvilinear cost graph in Exhibit 21.2. At some point, however, adding still more employees creates inefficiencies (they get in each other’s way); this inefficiency is reflected in a steeper slope for the curvilinear cost graph. In CVP analysis, curvilinear costs are often treated as variable costs, within a relevant range. This is reasonable for most types of curvilinear costs.

Determine whether each of the following is best described as a fixed, variable, mixed, step-wise, or curvilinear cost with respect to product units.

**NEED-TO-KNOW 21-1**

Classifying Costs

C1

	Type of Cost
Rubber used to manufacture tennis balls . . . . .	a. _____
Depreciation (straight-line method) . . . . .	b. _____
Electricity usage . . . . .	c. _____
Supervisory salaries . . . . .	d. _____
A salesperson's commission is 7% for sales of up to \$100,000, and 10% of sales for sales above \$100,000 . . . . .	e. _____

**Solution**

- a. variable   b. fixed   c. mixed   d. fixed\*   e. curvilinear

**QC1**

\*If more shifts are added, then supervisory salaries behave like a step-wise cost with respect to the number of shifts.

**MEASURING COST BEHAVIOR**

Identifying and measuring cost behavior requires careful analysis and judgment. An important part of this process is to identify costs that can be classified as either fixed or variable, which often requires analysis of past cost behavior. A goal of classifying costs is to develop a *cost equation*. The cost equation expresses total costs as a function of fixed costs plus variable cost per unit. Three methods are commonly used to analyze past costs: scatter diagrams, the high-low method, and least-squares regression. Each method is discussed in this section using the unit and cost data shown in Exhibit 21.3, which are taken from a start-up company that uses units produced as the activity base in estimating cost behavior.

**P1** Determine cost estimates using the scatter diagram, high-low, and regression methods of estimating costs.

Month	Units Produced	Total Cost
January . . . . .	27,500	\$21,500
February . . . . .	17,500	20,500
March . . . . .	25,000	25,000
April . . . . .	35,000	21,500
May . . . . .	47,500	25,500
June . . . . .	22,500	18,500
July . . . . .	30,000	23,500
August . . . . .	52,500	28,500
September . . . . .	37,500	26,000
October . . . . .	67,500	29,000
November . . . . .	62,500	31,000
December . . . . .	57,500	26,000

**EXHIBIT 21.3**  
Data for Estimating Cost Behavior

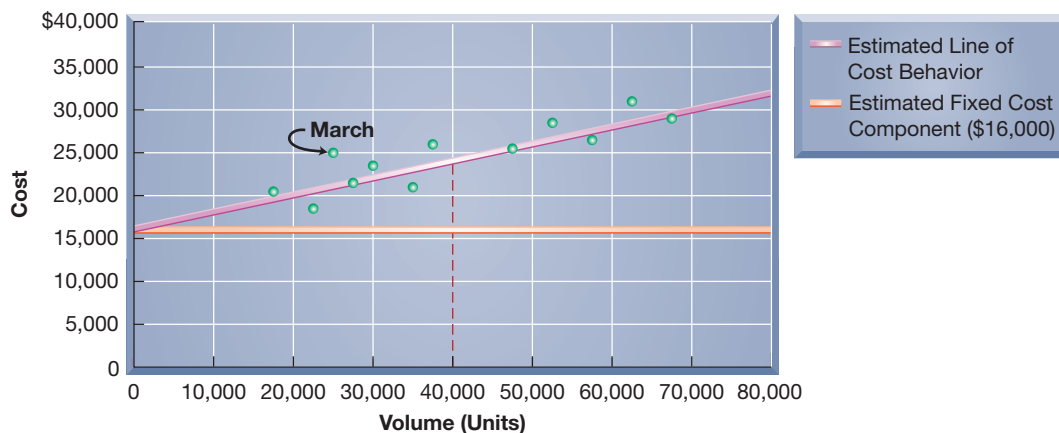

**Scatter Diagrams**

**Scatter diagrams** display past cost and unit data in graphical form. In preparing a scatter diagram, units are plotted on the horizontal axis, and costs are plotted on the vertical axis. Each individual point on a scatter diagram reflects the cost and number of units for a prior period. In Exhibit 21.4, the prior 12 months' costs and numbers of units are graphed. Each point reflects total costs incurred and units produced for one of those months. For instance, the point labeled March had units produced of 25,000 and costs of \$25,000.

The **estimated line of cost behavior** is drawn on a scatter diagram to reflect the relation between cost and unit volume. This line best visually "fits" the points in a scatter diagram. Fitting this line demands judgment, or can be done with spreadsheet software, as we illustrate

**EXHIBIT 21.4**

Scatter Diagram

in this chapter's Appendix. The line drawn in Exhibit 21.4 intersects the vertical axis at approximately \$16,000, which reflects fixed cost. To compute variable cost per unit, or the slope, we perform three steps. First, we select any two points on the horizontal axis (units), say 0 and 40,000. Second, we draw a vertical line from each of these points to intersect the estimated line of cost behavior. The point on the vertical axis (cost) corresponding to the 40,000 units point that intersects the estimated line is roughly \$24,000. Similarly, the cost corresponding to zero units is \$16,000 (the fixed cost point). Third, we compute the slope of the line, or variable cost, as the change in cost divided by the change in units. Exhibit 21.5 shows this computation.

**EXHIBIT 21.5**Variable Cost per Unit  
(Scatter Diagram)

$$\frac{\text{Change in cost}}{\text{Change in units}} = \frac{\$24,000 - \$16,000}{40,000 - 0} = \frac{\$8,000}{40,000} = \$0.20 \text{ per unit}$$

**Example:** In Exhibits 21.4 and 21.5, if units are projected at 30,000, what is the predicted cost? Answer: Approximately \$22,000.

Variable cost is \$0.20 per unit. Thus, the cost equation that management will use to estimate costs for different unit levels is **\$16,000 plus \$0.20 per unit produced.**

**High-Low Method**

The **high-low method** is a way to estimate the cost equation using just two points: the highest and lowest volume levels. The high-low method follows these steps:

**Step 1:** Identify the highest and lowest volume levels. It is important to note that these might not be the highest or lowest levels of *costs*.

**Step 2:** Compute the slope (variable cost per unit) using the high and low activity levels.

**Step 3:** Compute the total fixed costs by computing the total variable cost at either the high or low activity level, and then subtracting that amount from the total cost at that activity level.

We illustrate the high-low method next.

**Step 1:** In our case, the lowest number of units is 17,500, and the highest is 67,500. The costs corresponding to these unit volumes are \$20,500 and \$29,000, respectively (see the data in Exhibit 21.3).

**Step 2:** The variable cost per unit is calculated using a simple formula: change in cost divided by the change in units. Using the data from the high and low unit volumes, this results in a slope, or variable cost per unit, of \$0.17 as computed in Exhibit 21.6.

**EXHIBIT 21.6**Variable Cost per Unit  
(High-Low Method)

$$\frac{\text{Change in cost}}{\text{Change in units}} = \frac{\$29,000 - \$20,500}{67,500 - 17,500} = \frac{\$8,500}{50,000} = \$0.17 \text{ per unit}$$

**Step 3:** To estimate the fixed cost for the high-low method, we use the knowledge that total cost equals fixed cost plus variable cost per unit times the number of units. Then we pick either the high or low point to determine the fixed cost. This computation is shown in Exhibit 21.7—where we use the high point (67,500 units) in determining the fixed cost of \$17,525. (Use of the low point yields the same fixed cost estimate.)

$$\begin{aligned}
 \text{Total cost} &= \text{Fixed cost} + (\text{Variable cost per unit} \times \text{Units}) \\
 \$29,000 &= \text{Fixed cost} + (\$0.17 \text{ per unit} \times 67,500 \text{ units}) \\
 \$29,000 &= \text{Fixed cost} + \$11,475 \\
 \text{Fixed cost} &= \$17,525
 \end{aligned}$$

**EXHIBIT 21.7**

Determining Fixed Costs (High-Low Method)

Thus, the cost equation from the high-low method is **\$17,525 plus \$0.17 per unit produced**. This cost equation differs slightly from that determined from the scatter diagram method. A weakness of the high-low method is that it ignores all cost points except the highest and lowest volume levels.

**Example:** Using information from Exhibit 21.6, what is the amount of fixed cost at the low level of volume? Answer: \$17,525, computed as \$29,000 – (\$0.17 × 17,500 units).

**Least-Squares Regression**

**Least-squares regression** is a statistical method for identifying cost behavior. For our purposes, we use the cost equation estimated from this method but leave the computational details for more advanced courses. Such computations for least-squares regression are readily done using most spreadsheet programs or calculators. We illustrate this using Excel in this chapter’s Appendix. Using least-squares regression, the cost equation for the data presented in Exhibit 21.3 is **\$16,947 plus \$0.19 per unit produced**; that is, the fixed cost is estimated as \$16,947 and the variable cost at \$0.19 per unit.

**Comparison of Cost Estimation Methods**

The three cost estimation methods result in slightly different estimates of fixed and variable costs as summarized in Exhibit 21.8. Estimates from the scatter diagram, unless done with spreadsheet software, are based on a visual fit of the cost line and are subject to interpretation. Estimates from the high-low method use only two sets of values corresponding to the lowest and highest unit volumes. Sometimes these two extreme activity levels do not reflect the more usual conditions likely to recur. Estimates from least-squares regression use a statistical technique and all available data points.

Estimation Method	Fixed Cost	Variable Cost
Scatter diagram . . . . .	\$16,000	\$0.20 per unit
High-low method . . . . .	17,525	0.17 per unit
Least-squares regression . . . . .	16,947	0.19 per unit

**EXHIBIT 21.8**

Comparison of Cost Estimation Methods

We must remember that all three methods use *past data*. Thus, cost estimates resulting from these methods are only as good as the data used for estimation. Managers must establish that the data are reliable in deriving cost estimates for the future. If the data are reliable, the use of more data points, as in the regression or scatter diagram methods, should yield more accurate estimates than the high-low method. However, the high-low method is easier to apply and thus might be useful for obtaining a quick cost equation estimate.

Using the information below, apply the high-low method to determine the *cost equation* (total fixed costs plus variable costs per unit).

Activity Level	Units Produced	Total Cost
Lowest . . . . .	1,600	\$ 9,800
Highest . . . . .	4,000	17,000

**NEED-TO-KNOW 21-2**

High-Low Method  
P1

**Solution**

The variable cost per unit is computed as:  $[\$17,000 - \$9,800] / [4,000 \text{ units} - 1,600 \text{ units}] = \$3$  per unit. Total fixed costs using the lowest activity level is computed from the following equation:  $\$9,800 = \text{Fixed costs} + (\$3 \times 1,600 \text{ units})$ ; thus, fixed costs = \$5,000. This implies the cost equation is **\$5,000 plus \$3 per unit produced**. We can prove the accuracy of this cost equation at either the highest or lowest point shown here.

Do More: QS 21-3, E 21-6

**QC2**

Highest point:

$$\begin{aligned} \text{Total cost} &= \$5,000 + (\$3 \text{ per unit} \times 4,000 \text{ units}) \\ &= \$5,000 + \$12,000 \\ &= \$17,000 \end{aligned}$$

Lowest point:

$$\begin{aligned} \text{Total cost} &= \$5,000 + (\$3 \text{ per unit} \times 1,600 \text{ units}) \\ &= \$5,000 + \$4,800 \\ &= \$9,800 \end{aligned}$$

## CONTRIBUTION MARGIN AND BREAK-EVEN ANALYSIS

In this section we introduce the concept of *contribution margin*, the key measure in cost-volume-profit analysis. We also discuss break-even analysis, an important special case of cost-volume-profit analysis.

### Contribution Margin and Its Measures

**A1**  
Compute the contribution margin and describe what it reveals about a company's cost structure.

CVP analysis requires managers to classify costs as being fixed or variable with respect to volume of activity. In manufacturing companies, volume of activity usually refers to the number of units produced. We then classify a cost as either fixed or variable, depending on whether total cost changes as the number of units produced changes. Once we classify costs by behavior, we can then compute a product's contribution margin. **Contribution margin per unit**, or *unit contribution margin*, is the amount by which a product's unit selling price exceeds its total variable cost per unit. This amount contributes to covering fixed costs and generating profits. Exhibit 21.9 shows the formula used to calculate contribution margin per unit.

**EXHIBIT 21.9**

Contribution Margin per Unit

$$\text{Contribution margin per unit} = \text{Selling price per unit} - \text{Total variable cost per unit}$$

Another way to calculate contribution margin is as a ratio. The **contribution margin ratio**, which is the percent of a unit's selling price that exceeds total unit variable cost, is also useful for business decisions. It can be interpreted as the percent of each sales dollar that remains after deducting the total unit variable cost. Exhibit 21.10 shows the formula for the contribution margin ratio.

**EXHIBIT 21.10**

Contribution Margin Ratio

$$\text{Contribution margin ratio} = \frac{\text{Contribution margin per unit}}{\text{Selling price per unit}}$$

To illustrate the use of contribution margin, let's consider Rydell, which sells footballs for \$100 each and incurs variable costs of \$70 per football sold. Its fixed costs are \$24,000 per month with monthly capacity of 1,800 units (footballs). Rydell's contribution margin per unit is \$30, which is computed as follows.

AP Images/Skip Peterson

Selling price per unit . . . . .	\$100
Variable cost per unit . . . . .	70
Contribution margin per unit . . . . .	<u>\$ 30</u>

Thus, at a selling price of \$100 per unit, Rydell covers its variable costs and makes \$30 per football to contribute to fixed costs and profit. Rydell's contribution margin ratio is 30%, computed as  $\$30 / \$100$ . A contribution margin ratio of 30% implies that for each \$1 in sales, Rydell has \$0.30 that contributes to fixed cost and profit. Next we show how to use these contribution margin measures in break-even analysis.

**Decision Maker**

**Sales Manager** You are evaluating orders from two customers but can accept only one of the orders because of your company’s limited capacity. The first order is for 100 units of a product with a contribution margin ratio of 60% and a selling price of \$1,000 per unit. The second order is for 500 units of a product with a contribution margin ratio of 20% and a selling price of \$800 per unit. The incremental fixed costs are the same for both orders. Which order do you accept? ■ [Answers follow the chapter’s Summary.]

**Computing the Break-Even Point**

The **break-even point** is the sales level at which a company neither earns a profit nor incurs a loss. The concept of break-even applies to nearly all organizations, activities, and events. A key concern when launching a project is whether it will break even—that is, whether sales will at least cover total costs. The break-even point can be expressed in either units or dollars of sales.

To illustrate break-even analysis, let’s again look at Rydell, which sells footballs for \$100 per unit and incurs \$70 of variable costs per unit sold. Its fixed costs are \$24,000 per month. We compute the break-even point using the formula in Exhibit 21.11. This formula uses the contribution margin per unit (calculated above), which for Rydell is \$30 (\$100 – \$70). From this we can compute the break-even sales volume in units as follows:

$$\begin{aligned} \text{Break-even point in units} &= \frac{\text{Fixed costs}}{\text{Contribution margin per unit}} \\ &= \$24,000 / \$30 \\ &= 800 \text{ units per month} \end{aligned}$$

If Rydell sells 800 units, its profit will be zero. Profit increases or decreases by \$30 for every unit sold above or below that break-even point; if Rydell sells 801 units, profit will equal \$30. We also can calculate the break-even point in dollars. Also called *break-even sales dollars*, it uses the contribution margin ratio to determine the required sales dollars needed for the company to break even. Exhibit 21.12 shows the formula and Rydell’s break-even point in dollars:

$$\begin{aligned} \text{Break-even point in dollars} &= \frac{\text{Fixed costs}}{\text{Contribution margin ratio}} \\ &= \$24,000 / 30\% \\ &= \$24,000 / 0.30 \\ &= \$80,000 \text{ of monthly sales} \end{aligned}$$

To verify that Rydell’s monthly break-even point equals \$80,000 (or 800 units), we prepare a simplified income statement in Exhibit 21.13. It shows that the \$80,000 revenue from sales of 800 units exactly equals the sum of variable and fixed costs.

**P2** Compute the break-even point for a single product company.

**Point:** Selling prices and variable costs are usually expressed in per unit amounts. Fixed costs are usually expressed in total amounts.

**EXHIBIT 21.11**  
Formula for Computing Break-Even Sales (in Units)

**EXHIBIT 21.12**  
Formula for Computing Break-Even Sales (in Dollars)

**Point:** Even if a company operates at a level above its break-even point, management may decide to stop operating because it is not earning a reasonable return on investment.

RYDELL COMPANY	
Contribution Margin Income Statement (at Break-Even)	
For Month Ended January 31, 2015	
Sales (800 units at \$100 each) .....	\$80,000
Variable costs (800 units at \$70 each) .....	56,000
<b>Contribution margin</b> .....	<b>24,000</b>
Fixed costs .....	24,000
<b>Net income</b> .....	<b>\$ 0</b>

**EXHIBIT 21.13**  
Contribution Margin Income Statement for Break-Even Sales

**Point:** A contribution margin income statement is also referred to as a **variable costing income statement**. This differs from the traditional **absorption costing** approach where all product costs are assigned to units sold and to units in ending inventory. Recall that variable costing expenses all fixed product costs. Thus, income for the two approaches differs depending on the level of finished goods inventory; the lower inventory is, the more similar the two approaches are. GAAP requires financial statements for external users be prepared using absorption costing.

The statement in Exhibit 21.13 is called a *contribution margin income statement*. It differs in format from a conventional income statement in two ways. First, it separately classifies costs and expenses as variable or fixed. Second, it reports contribution margin (Sales – Variable costs). We will use the contribution margin income statement format in this chapter’s assignment materials because of its usefulness in CVP analysis.

## Computing the Margin of Safety

All companies wish to sell more than the break-even number of units. The excess of expected sales over the break-even sales level is called a company’s **margin of safety**, the amount that sales can drop before the company incurs a loss. It is often expressed in dollars or as a percent of the expected sales level.

To illustrate, recall that Rydell’s break-even point in dollars is \$80,000. If its expected sales are \$100,000, the margin of safety is \$20,000 (= \$100,000 – \$80,000). As a percent, the margin of safety is 20% of expected sales as shown in Exhibit 21.14.

### EXHIBIT 21.14

Computing Margin of Safety (in Percent)

$$\begin{aligned} \text{Margin of safety (in percent)} &= \frac{\text{Expected sales} - \text{Break-even sales}}{\text{Expected sales}} \\ &= \frac{\$100,000 - \$80,000}{\$100,000} \\ &= \$20,000 / \$100,000 \\ &= 20\% \end{aligned}$$

Management must assess whether the margin of safety is adequate in light of factors such as sales variability, competition, consumer tastes, and economic conditions.

### NEED-TO-KNOW 21-3

Contribution Margin, Break-Even Point, Margin of Safety

A1 P2

A manufacturer predicts fixed costs of \$400,000 for the next year. Its one product sells for \$170 per unit, and it incurs variable costs of \$150 per unit. The company predicts total sales of 25,000 units for the next year.

1. Compute the contribution margin per unit.
2. Compute the break-even point (in units).
3. Compute the margin of safety (in dollars).

#### Solution

1. Contribution margin per unit = \$170 – \$150 = \$20
2. Break-even point = \$400,000/\$20 = 20,000 units
3. Margin of safety = [25,000 × \$170] – [20,000 × \$170] = \$850,000

### P3

Graph costs and sales for a single product company.

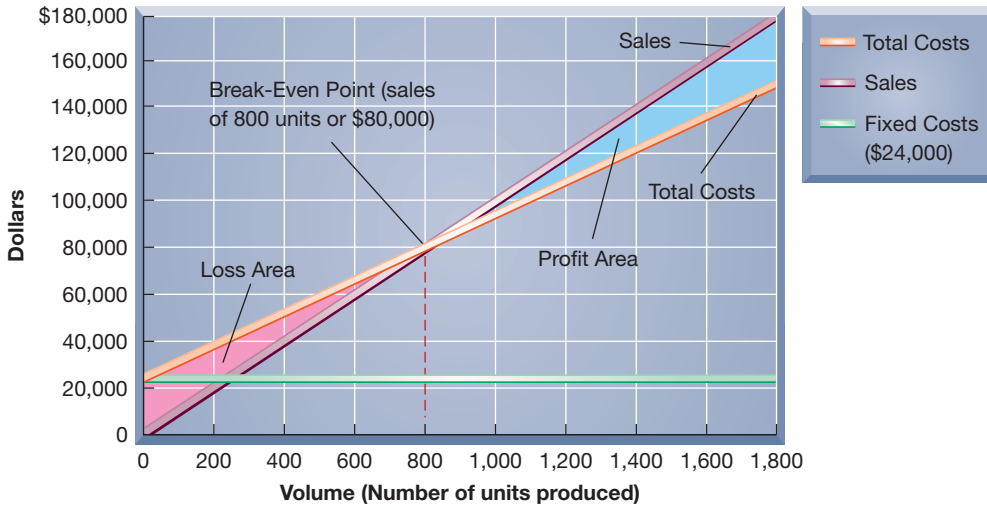

**Point:** CVP charts can also be drawn with computer programs.

## Preparing a Cost-Volume-Profit Chart

Exhibit 21.15 is a graph of Rydell’s cost-volume-profit relations. This graph is called a **cost-volume-profit (CVP) chart**, or a *break-even chart* or *break-even graph*. The horizontal axis is the number of units produced and sold, and the vertical axis is dollars of sales and costs. The lines in the chart depict both sales and costs at different output levels.

We follow three steps to prepare a CVP chart:

1. Plot fixed costs on the vertical axis (\$24,000 for Rydell). Draw a horizontal line at this level to show that fixed costs remain unchanged regardless of output volume (drawing this fixed cost line is not essential to the chart).
2. Draw the total (variable plus fixed) cost line for a relevant range of volume levels. This line starts at the fixed costs level on the vertical axis because total costs equal fixed costs

**EXHIBIT 21.15**  
Cost-Volume-Profit Chart

at zero volume. The slope of the total cost line equals the variable cost per unit (\$70). To draw the line, compute the total costs for any volume level, and connect this point with the vertical axis intercept (\$24,000). Do not draw this line beyond the productive capacity for the planning period (1,800 units for Rydell).

3. Draw the sales line. Start at the origin (zero units and zero dollars of sales) and make the slope of this line equal to the selling price per unit (\$100). To draw the line, compute dollar sales for any volume level and connect this point with the origin. Do not extend this line beyond the productive capacity. Total sales will be highest at maximum capacity.

The total cost line and the sales line intersect at 800 units in Exhibit 21.15, which is the break-even point—the point where total dollar sales of \$80,000 equals the sum of both fixed and variable costs (\$80,000). (Note that 800 units is the same result we calculated earlier using the formula in Exhibit 21.11.)

On either side of the break-even point, the vertical distance between the sales line and the total cost line at any specific volume reflects the profit or loss expected at that point. At volume levels to the left of the break-even point, this vertical distance is the amount of the expected loss because the total costs line is above the total sales line. At volume levels to the right of the break-even point, the vertical distance represents the expected profit because the total sales line is above the total cost line.

### Working with Changes in Estimates

Because CVP analysis uses estimates, knowing how changes in those estimates impact break-even is useful. For example, a manager might form three estimates for each of the components of break-even: optimistic, most likely, and pessimistic. Then ranges of break-even points in units can be computed, using the formula from Exhibit 21.11. To illustrate, assume Rydell’s managers provide the set of estimates in Exhibit 21.16.

	Selling Price per Unit	Variable Cost per Unit	Total Fixed Costs
Optimistic . . . . .	\$105	\$68	\$21,000
Most likely . . . . .	100	70	24,000
Pessimistic . . . . .	95	72	27,000

**Point:** CVP analysis is often based on sales volume, using either units sold or dollar sales. Other output measures, such as the number of units produced, can also be used.

**Example:** In Exhibit 21.15, the sales line intersects the total cost line at 800 units. At what point would the two lines intersect if selling price is increased by 20% to \$120 per unit? Answer:  $\$24,000/(\$120 - \$70) = 480$  units

QC3

**EXHIBIT 21.16**  
Alternative Estimates for Break-Even Analysis

If, for example, Rydell’s managers believe they can raise the selling price of a football to \$105, without any change in unit variable or total fixed costs, then the revised contribution margin per football is \$35 (\$105 – \$70), and the revised break-even in units follows in Exhibit 21.17.

**EXHIBIT 21.17**

Revised Break-Even in Units

$$\text{Revised break-even point in units} = \frac{\$24,000}{\$35} = 686 \text{ units (rounded)}$$

**EXHIBIT 21.18**

Break-Even Points for Alternative Estimates

Repeating this calculation using each of the other eight separate estimates above, and graphing the results, yields the three graphs in Exhibit 21.18.

These graphs show how changes in selling prices, variable costs, and fixed costs impact break-even. When selling prices can be increased without impacting unit variable costs or total fixed costs, break-even decreases (graph A). When competition reduces selling prices, and the company cannot reduce costs, break-even increases (graph A). Increases in either variable (graph B) or fixed costs (graph C), if they cannot be passed on to customers via higher selling prices, will increase break-even. If costs can be reduced and selling prices held constant, the break-even point decreases.

**Point:** This analysis changed only one estimate at a time; managers can examine how combinations of changes in estimates will impact break-even.

**Decision Ethics**

**Supervisor** Your team is conducting a cost-volume-profit analysis for a new product. Different sales projections have different incomes. One member suggests picking numbers yielding favorable income because any estimate is “as good as any other.” Another member points to a diagram of 20 months’ production on a comparable product and suggests dropping unfavorable data points for cost estimation. What do you do? [Answers follow the chapter’s Summary.]

**APPLYING COST-VOLUME-PROFIT ANALYSIS**

Managers consider a variety of strategies in planning business operations. Cost-volume-profit analysis is useful in helping managers evaluate the likely effects of these strategies.

**Computing Income from Sales and Costs**

An important question managers often ask is “What is the predicted income from a predicted level of sales?” To answer this, we look at four variables in CVP analysis—sales, variable costs, contribution margin, and fixed costs. Exhibit 21.19 shows these variables and their relations to income (pretax). We use these relations to compute expected income from predicted sales and cost levels.

**C2**

Describe several applications of cost-volume-profit analysis.

**EXHIBIT 21.19**

Income Relations in CVP Analysis

Sales
– Variable costs
— Contribution margin
– Fixed costs
— Income (pretax)

To illustrate, let's assume that Rydell's management expects to sell 1,500 units in January 2015. What is the amount of income if this sales level is achieved? Using the calculation format in Exhibit 21.19, we compute Rydell's expected income in Exhibit 21.20.

<b>RYDELL COMPANY</b>	
<b>Contribution Margin Income Statement</b>	
<b>For Month Ended January 31, 2015</b>	
Sales (1,500 units at \$100 each) . . . . .	\$150,000
Variable costs (1,500 units at \$70 each) . . . . .	<u>105,000</u>
Contribution margin . . . . .	45,000
Fixed costs . . . . .	<u>24,000</u>
Income (pretax) . . . . .	<u>\$ 21,000</u>

**EXHIBIT 21.20**

Computing Expected Pretax Income from Expected Sales

This income amount can also be computed as (units sold  $\times$  contribution margin per unit) – fixed costs, or  $(1,500 \times \$30) - \$24,000$ . The \$21,000 income is pretax. To find the amount of *after-tax* income from selling 1,500 units, management must apply the proper tax rate. Assume that the tax rate is 25%. Then we can prepare a projected after-tax income statement, shown in Exhibit 21.21. We can also compute pretax income as after-tax income divided by  $(1 - \text{tax rate})$ ; for Rydell, this is  $\$15,750 / (1 - 0.25)$ , or \$21,000.

**Point:** 1,500 units of sales is 700 units above Rydell's break-even point. Income can also be computed as 700 units  $\times$  \$30 contribution margin per unit.

<b>RYDELL COMPANY</b>	
<b>Contribution Margin Income Statement</b>	
<b>For Month Ended January 31, 2015</b>	
Sales (1,500 units at \$100 each) . . . . .	\$150,000
Variable costs (1,500 units at \$70 each) . . . . .	<u>105,000</u>
Contribution margin . . . . .	45,000
Fixed costs . . . . .	<u>24,000</u>
Pretax income . . . . .	21,000
Income taxes (25%) . . . . .	<u>5,250</u>
Net income (after tax) . . . . .	<u>\$ 15,750</u>

**EXHIBIT 21.21**

Computing Expected After-Tax Income from Expected Sales

Management then assesses whether this income is an adequate return on assets invested. Management should also consider whether sales and income can be increased by raising or lowering prices. CVP analysis is a good tool for addressing these kinds of "what-if" questions.

### Computing Sales for a Target Income

Many companies' annual plans are based on certain income targets (sometimes called *budgets*). Rydell's income target for this year is to increase income by 10% over the prior year. When prior year income is known, Rydell easily computes its target income. CVP analysis helps to determine the sales level needed to achieve the target income. Planning for the year is then based on this level.

We use the formula shown in Exhibit 21.22 to compute sales for a target income (pretax). To illustrate, Rydell has monthly fixed costs of \$24,000 and a 30% contribution margin ratio. Assume that it sets a target monthly income of \$12,000. Using the formula in Exhibit 21.22, we find that Rydell needs \$120,000 of sales to produce a \$12,000 pretax target income.

$$\begin{aligned} \text{Dollar sales at target income} &= \frac{\text{Fixed costs} + \text{Target income}}{\text{Contribution margin ratio}} \\ &= \frac{\$24,000 + \$12,000}{30\%} = \$120,000 \end{aligned}$$

**EXHIBIT 21.22**

Computing Sales (Dollars) for a Target Income

**Point:** Break-even is a special case of the formulas in Exhibits 21.22 and 21.23; simply set target income to \$0 and the formulas reduce to those in Exhibits 21.11 and 21.12.

Alternatively, we can compute *unit sales* instead of dollar sales. To do this, we substitute *contribution margin per unit* for the contribution margin ratio in the denominator. This gives the number of units to sell to reach the target income. Exhibit 21.23 illustrates this for Rydell. The two computations in Exhibits 21.22 and 21.23 are equivalent because sales of 1,200 units at \$100 per unit equal \$120,000 of sales.

**EXHIBIT 21.23**

Computing Sales (Units) for a Target Income

$$\begin{aligned} \text{Unit sales at target income} &= \frac{\text{Fixed costs} + \text{Target income}}{\text{Contribution margin per unit}} \\ &= \frac{\$24,000 + \$12,000}{\$30} = 1,200 \text{ units} \end{aligned}$$

We can also use the contribution margin income statement approach to compute sales for a target income, in two steps.

**Step 1:** Insert the fixed costs (\$24,000) and the target profit level (\$12,000) into a contribution margin income statement, as shown in Exhibit 21.24. To cover its fixed costs of \$24,000 and yield target income of \$12,000, Rydell must generate a contribution margin of \$36,000 (computed as \$24,000 plus \$12,000).

**Step 2:** Enter \$36,000 in the contribution margin row as step 2. With a contribution margin ratio of 30%, sales must be \$120,000, computed as \$36,000/0.30, to yield a contribution margin of \$36,000. We enter \$120,000 in the sales row of the contribution margin income statement and solve for variable costs of \$84,000 (computed as \$120,000 – \$36,000). At a selling price of \$100 per unit, Rydell must sell 1,200 units (\$120,000/\$100) to earn a target income of \$12,000.

**EXHIBIT 21.24**

Using the Contribution Margin Income Statement to Find Target Sales

RYDELL COMPANY Contribution Margin Income Statement For Month Ended January 31, 2015		
	Step 1	Step 2
Sales .....	?	\$120,000
Variable costs .....	?	84,000
Contribution margin .....	?	36,000
Fixed costs .....	24,000	24,000
Target income .....	\$12,000	\$12,000

$\$24,000 + \$12,000$        $\$36,000 / 0.30$

**NEED-TO-KNOW 21-4**

Contribution Margin and Target Income

A1 C2

A manufacturer predicts fixed costs of \$502,000 for the next year. Its one product sells for \$180 per unit, and it incurs variable costs of \$126 per unit. Its target (pretax) income is \$200,000.

1. Compute the contribution margin ratio.
2. Compute the dollar sales needed to yield the target income.
3. Compute the unit sales needed to yield the target income.

**Solution**

1. Contribution margin ratio =  $[\$180 - \$126] / \$180 = 30\%$
2. Dollar sales at target income =  $[\$502,000 + \$200,000] / 0.30 = \$2,340,000$
3. Unit sales at target income =  $[\$502,000 + \$200,000] / [\$180 - \$126] = 13,000 \text{ units}$

## Using Sensitivity Analysis

Earlier we showed how changing one of the estimates in a CVP analysis impacts break-even. We can also examine strategies that impact several estimates in the CVP analysis. For instance, we might want to know what happens to income if we automate a currently manual process. We can use *sensitivity analysis* to predict income if we can describe how these changes affect a company's fixed costs, variable costs, selling price, and volume. CVP analyses based on different estimates can be useful to management in planning business strategy. We provide examples next.

**Buy a New Machine** Assume Rydell is considering buying a new machine that would increase monthly fixed costs from \$24,000 to \$30,000 and would decrease variable costs by \$10 per unit (from \$70 per unit to \$60 per unit). Recall from Exhibit 21.12 that Rydell's break-even point in dollars is currently \$80,000. Management needs to know how the new machine would affect Rydell's break-even point in dollars. If Rydell maintains its selling price of \$100 per unit, its contribution margin per unit will increase to \$40—computed as the sales price of \$100 per unit minus the (new) variable costs of \$60 per unit. With this new machine, the revised contribution margin ratio per unit is 40% (computed as \$40/\$100). Rydell's revised break-even point in dollars would be \$75,000, as computed in Exhibit 21.25. The new machine would lower Rydell's break-even point by \$5,000, or 50 units, per month. The revised margin of safety increases to 25%, computed as  $(\$100,000 - \$75,000)/\$100,000$ .

$$\text{Revised break-even point in dollars} = \frac{\text{Revised fixed costs}}{\text{Revised contribution margin ratio}} = \frac{\$30,000}{40\%} = \$75,000$$

### EXHIBIT 21.25

Revised Break-Even

**Increase Advertising** Instead of buying a new machine, Rydell's advertising manager suggests increasing advertising instead. She believes that an increase of \$3,000 in the monthly advertising budget will increase sales by \$25,000 per month (at a selling price of \$100 per unit). The contribution margin will continue to be \$30 per unit. Recall from Exhibit 21.14 that the company's margin of safety was 20% when Rydell's expected sales level was \$100,000. Management wants to know how a new advertising campaign would affect Rydell's break-even point and margin of safety. With the advertising campaign, Rydell's revised break-even point in dollars is \$90,000, as computed in Exhibit 21.26.

$$\text{Revised break-even point in dollars} = \frac{\text{Revised fixed costs}}{\text{Revised contribution margin ratio}} = \frac{\$27,000}{30\%} = \$90,000$$

### EXHIBIT 21.26

Revised Break-Even  
(in dollars)

The revised margin of safety is then computed as shown in Exhibit 21.27. Without considering other factors, the advertising campaign would increase Rydell's margin of safety from 20% (see Exhibit 21.14) to 28%.

QC4

$$\begin{aligned} \text{Revised margin of safety (in percent)} &= \frac{\text{Expected sales} - \text{Break-even sales}}{\text{Expected sales}} \\ &= \frac{\$125,000 - \$90,000}{\$125,000} = 28\% \end{aligned}$$

### EXHIBIT 21.27

Revised Margin of Safety  
(in percent)

### Computing a Multiproduct Break-Even Point

**P4**  
 Compute the break-even point for a multiproduct company.

So far we have looked only at cases where the company sells a single product or service. However, many companies sell multiple products or services, and we can modify the CVP analysis for use in these cases. An important assumption in a multiproduct setting is that the sales mix of different products is known and remains constant during the planning period. **Sales mix** is the ratio (proportion) of the sales volumes for the various products. For instance, if a company normally sells 10,000 footballs, 5,000 softballs, and 4,000 basketballs per month, its sales mix can be expressed as 10:5:4 for footballs, softballs, and basketballs.

In multiproduct CVP analysis, we estimate the break-even point by using a **composite unit**, which summarizes the sales mix and contribution margins of each product. Multiproduct CVP analysis treats this composite unit as a single product. To illustrate, let’s look at Hair-Today, a styling salon that offers three cuts: basic, ultra, and budget in the ratio of 4 basic units to 2 ultra units to 1 budget unit (expressed as 4:2:1). Management wants to estimate its break-even point for next year. Unit selling prices for these three cuts are basic, \$20; ultra, \$32; and budget, \$16. Using the 4:2:1 sales mix, the selling price of a composite unit of the three products is computed as follows.

E+/Getty Images

Selling price per composite unit	
4 units of basic @ \$20 per unit . . . . .	\$ 80
2 units of ultra @ \$32 per unit . . . . .	64
1 unit of budget @ \$16 per unit . . . . .	16
Selling price of a composite unit . . . . .	<u>\$160</u>

Hair-Today’s fixed costs are \$192,000 per year, and its unit variable costs of the three products are basic, \$13; ultra, \$18; and budget, \$8. Variable costs for a composite unit of these products follow.

Variable costs per composite unit	
4 units of basic @ \$13 per unit . . . . .	\$52
2 units of ultra @ \$18 per unit . . . . .	36
1 unit of budget @ \$8 per unit . . . . .	8
Variable costs of a composite unit . . . . .	<u>\$96</u>

We calculate the contribution margin for a *composite unit* using essentially the same formula used earlier (see Exhibit 21.9), as shown in Exhibit 21.28:

**EXHIBIT 21.28**

Contribution Margin per Composite Unit

<b>Contribution margin per composite unit</b>	<b>=</b>	<b>Selling price per composite unit</b>	<b>–</b>	<b>Variable cost per composite unit</b>
\$64	=	\$160	–	\$96

We then use the contribution margin per composite unit to determine Hair-Today’s break-even point in composite units in Exhibit 21.29.

**EXHIBIT 21.29**

Break-Even Point in Composite Units

<b>Break-even point in composite units</b>	<b>=</b>	<b>Fixed costs</b>
		<b>Contribution margin per composite unit</b>
	=	$\frac{\$192,000}{\$64} = 3,000$ composite units

This computation implies that Hair-Today breaks even when it sells 3,000 composite units. To determine how many units of each product it must sell to break even, we use the expected sales mix of 4:2:1 and multiply the number of units of each product in the composite by 3,000 as follows.

Basic:	4 × 3,000	.....	12,000 units
Ultra:	2 × 3,000	.....	6,000 units
Budget:	1 × 3,000	.....	3,000 units
			<u>21,000 units</u>

**Point:** The break-even point in dollars for Exhibit 21.29 is  $\$192,000 / (\$64 / \$160) = \$480,000$ .

**Point:** Each composite unit represents 7 haircuts. Total haircuts at the break-even point equal 21,000 (3,000 composite units × 7 haircuts per composite unit).

Exhibit 21.30 verifies the results for composite units by showing Hair-Today’s sales and costs at this break-even point using a forecasted contribution margin income statement.

HAIR-TODAY				
Forecasted Contribution Margin Income Statement (at Break-Even)				
	Basic	Ultra	Budget	Total
<b>Sales</b>				
Basic (12,000 @ \$20) .....	\$240,000			
Ultra (6,000 @ \$32) .....		\$192,000		
Budget (3,000 @ \$16) .....			\$48,000	
Total sales .....				\$480,000
<b>Variable costs</b>				
Basic (12,000 @ \$13) .....	156,000			
Ultra (6,000 @ \$18) .....		108,000		
Budget (3,000 @ \$8) .....			24,000	
Total variable costs .....				288,000
Contribution margin .....	<u>\$ 84,000</u>	<u>\$ 84,000</u>	<u>\$24,000</u>	192,000
Fixed costs .....				192,000
Net income .....				<u>\$ 0</u>

**EXHIBIT 21.30**

Multiproduct Break-Even Income Statement

A CVP analysis using composite units can be used to answer a variety of planning questions. Once a product mix is set, all answers are based on the assumption that the mix remains constant at all relevant sales levels as other factors in the analysis do. If the sales mix changes, it is likely that the break-even point will change also. For example, if Hair-Today sells more ultra cuts and fewer basic cuts, its break-even point will decrease. We can vary the sales mix to see what happens under alternative strategies.

**Point:** Enterprise resource planning (ERP) systems can quickly generate multiproduct break-even analyses.

**Decision Maker**

**Entrepreneur** A CVP analysis indicates that your start-up, which markets electronic products, will break even with the current sales mix and price levels. You have a target income in mind. What analysis might you perform to assess the likelihood of achieving this income? ■ [Answers follow the chapter’s Summary.]

The sales mix of a company’s two products, X and Y, is 2:1. Unit variable costs for both products are \$2, and unit selling prices are \$5 for X and \$4 for Y. The company has \$640,000 of fixed costs.

1. What is the contribution margin per composite unit?
2. What is the break-even point in composite units?
3. How many units of X and how many units of Y will be sold at the break-even point?

**NEED-TO-KNOW 21-5**

Contribution Margin and Break-Even Point, Composite Units

**Solution**

1.

**Selling price of a composite unit**

2 units of X @ \$5 per unit .....	\$10
1 unit of Y @ \$4 per unit .....	4
Selling price of a composite unit .....	<u>\$14</u>

**Variable costs of a composite unit**

2 units of X @ \$2 per unit .....	\$4
1 unit of Y @ \$2 per unit .....	2
Variable costs of a composite unit .....	<u>\$6</u>

Do More: QS 21-14, E 21-21,  
E 21-23

Therefore, the contribution margin per composite unit is \$8.

2. The break-even point in composite units =  $\$640,000 / \$8 = 80,000$  units.
3. At break-even, the company will sell 160,000 units ( $80,000 \times 2$ ) of X and 80,000 units of Y ( $80,000 \times 1$ ).

### Making Assumptions in Cost-Volume-Profit Analysis

CVP analysis assumes that costs can be classified as variable or fixed. CVP analysis also assumes that selling prices per unit, variable costs per unit, and total fixed costs are all held constant. Further, multiproduct CVP analysis assumes a constant sales mix. If the expected costs and sales behavior differ from the assumptions, the results of CVP analysis can be limited. While the behavior of individual costs and sales may not be perfectly consistent with CVP assumptions, we can still perform useful analyses in spite of these assumptions' limitations, for reasons we describe next.

**Summing Costs Offsets Individual Deviations** Deviations from assumptions with individual costs are often minor when these costs are summed. That is, individual variable cost items may not be perfectly variable, but when we sum these variable costs, their individual deviations can offset each other. This means the assumption of variable cost behavior can be proper for total variable costs. Similarly, an assumption that total fixed costs are constant can be proper even when individual fixed cost items are not exactly constant.

**CVP Applies to a Relevant Range of Operations** Sales, variable costs, and fixed costs often are reasonably reflected in straight lines on a graph when the assumptions are applied over a relevant range. The validity of assuming that a specific cost is fixed or variable is more acceptable when operations are within the relevant range. As shown in Exhibit 21.2, a curvilinear cost can be treated as variable and linear if the relevant range covers volumes where it has a nearly constant slope. If the normal range of activity changes, some costs might need reclassification.

**CVP Analysis Yields Estimates** CVP analysis yields approximate answers to questions about costs, volumes, and profits. These answers do not have to be precise because the analysis makes rough estimates about the future. As long as managers understand that CVP analysis gives estimates, it can be a useful tool for starting the planning process. Other qualitative factors also must be considered.

### GLOBAL VIEW

Survey evidence shows that many German companies have elaborate and detailed cost accounting systems. Over 90 percent of companies surveyed report their systems focus on *contribution margin*. This focus helps German companies like **Volkswagen** control costs and plan their production levels. Recently, Volkswagen announced it expects its Spanish brand *SEAT* to break even within five years. For 2012, the *SEAT* brand lost €156 million on revenue of €6.485 billion.

**Sustainability and Accounting Volkswagen** (VW) is regarded as the most sustainable automotive group in the Dow Jones Sustainability Index—in part because of its efforts to embrace opportunities and manage risks deriving from economic, environmental, and social developments. The company recently entered a long-term contract to buy wind-generated power for several of its Mexican manufacturing facilities. VW expects the use of wind power not only to reduce its carbon emissions but also to save \$3.5 million per year in electric utility costs. Smaller companies can also make a difference. **Fast Yeti Custom Tees**, this chapter's feature company, buys its T-shirts from suppliers with good environmental practices. All of the company's shirts are made from 100% cotton, a natural and renewable fiber.

## Degree of Operating Leverage ■ ■ ■ Decision Analysis

CVP analysis is especially useful when management begins the planning process and wishes to predict outcomes of alternative strategies. These strategies can involve changes in selling prices, fixed costs, variable costs, sales volume, and product mix. Managers are interested in seeing the effects of changes in some or all of these factors.

One goal of all managers is to get maximum benefits from their fixed costs. Managers would like to use 100% of their output capacity so that fixed costs are spread over the largest number of units. This would decrease fixed cost per unit and increase income. The extent, or relative size, of fixed costs in the total cost structure is known as **operating leverage**. Companies having a higher proportion of fixed costs in their total cost structure are said to have higher operating leverage. An example of this is a company that chooses to automate its processes instead of using direct labor, increasing its fixed costs and lowering its variable costs.

A useful managerial measure to help assess the effect of changes in the level of sales on income is the **degree of operating leverage (DOL)**, calculated as shown in Exhibit 21.31.

$$\text{DOL} = \text{Total contribution margin (in dollars)} / \text{Pretax income}$$

To illustrate, let's return to Rydell Company and assume it sells 1,200 footballs. At this sales level, its contribution margin (in dollars) and pretax income are computed as:

Sales (1,200 × \$100) . . . . .	\$120,000
Variable costs (1,200 × \$70) . . . . .	84,000
<b>Contribution margin</b> . . . . .	<b>36,000</b>
Fixed costs . . . . .	24,000
<b>Income (pretax)</b> . . . . .	<b>\$ 12,000</b>

Rydell's degree of operating leverage (DOL) is then computed as shown in Exhibit 21.32.

$$\begin{aligned} \text{DOL} &= \text{Total contribution margin (in dollars)} / \text{Pretax income} \\ \text{DOL} &= \$36,000 / \$12,000 = 3.0 \end{aligned}$$

We then can use DOL to measure the effect of changes in the level of sales on pretax income. For example, if Rydell expects sales can either increase or decrease by 10%, and these changes would be within Rydell's relevant range, we can compute the change in pretax income using DOL as shown in Exhibit 21.33.

$$\begin{aligned} \text{Change in income (\%)} &= \text{DOL} \times \text{Change in sales (\%)} \\ &= 3.0 \times 10\% \\ &= 30\% \end{aligned}$$

## A2

Analyze changes in sales using the degree of operating leverage.

### EXHIBIT 21.31

Degree of Operating Leverage

### EXHIBIT 21.32

Rydell's Degree of Operating Leverage

### EXHIBIT 21.33

Impact of Change in Sales on Income

Thus, if Rydell's sales *increase* by 10%, its income will increase by \$3,600 (computed as \$12,000 × 30%), to \$15,600. If, instead, Rydell's sales decrease by 10%, its net income will decrease by \$3,600, to \$8,400. We can prove these results with contribution margin income statements, as shown below.

	Current	Sales Increase by 10%	Sales Decrease by 10%
Sales .....	\$120,000	\$132,000	\$108,000
Variable costs .....	<u>84,000</u>	<u>92,400</u>	<u>75,600</u>
Contribution margin .....	\$ 36,000	\$ 39,600	\$ 32,400
Fixed costs .....	<u>24,000</u>	<u>24,000</u>	<u>24,000</u>
Target (pretax) income .....	<u>\$ 12,000</u>	<u>\$ 15,600</u>	<u>\$ 8,400</u>

## NEED-TO-KNOW

### COMPREHENSIVE

Sport Caps Co. manufactures and sells caps for different sporting events. The fixed costs of operating the company are \$150,000 per month, and the variable costs are \$5 per cap. The caps are sold for \$8 per unit. The fixed costs provide a production capacity of up to 100,000 caps per month.

#### Required

- Use the formulas in the chapter to compute the following:
  - Contribution margin per cap.
  - Break-even point in terms of the number of caps produced and sold.
  - Amount of income at 30,000 caps sold per month (ignore taxes).
  - Amount of income at 85,000 caps sold per month (ignore taxes).
  - Number of caps to be produced and sold to provide \$60,000 of income (pretax).
- Draw a CVP chart for the company, showing cap output on the horizontal axis. Identify (a) the break-even point and (b) the amount of pretax income when the level of cap production is 70,000. (Omit the fixed cost line.)
- Use the formulas in the chapter to compute the
  - Contribution margin ratio.
  - Break-even point in terms of sales dollars.
  - Amount of income at \$250,000 of sales per month (ignore taxes).
  - Amount of income at \$600,000 of sales per month (ignore taxes).
  - Dollars of sales needed to provide \$60,000 of pretax income.

## PLANNING THE SOLUTION

- Identify the formulas in the chapter for the required items expressed in units and solve them using the data given in the problem.
- Draw a CVP chart that reflects the facts in the problem. The horizontal axis should plot the volume in units up to 100,000, and the vertical axis should plot the total dollars up to \$800,000. Plot the total cost line as upward sloping, starting at the fixed cost level (\$150,000) on the vertical axis and increasing until it reaches \$650,000 at the maximum volume of 100,000 units. Verify that the break-even point (where the two lines cross) equals the amount you computed in part 1.
- Identify the formulas in the chapter for the required items expressed in dollars and solve them using the data given in the problem.

## SOLUTION

- $$\begin{aligned} \text{Contribution margin per cap} &= \text{Selling price per unit} - \text{Variable cost per unit} \\ &= \$8 - \$5 = \underline{\underline{\$3}} \end{aligned}$$
  - $$\text{Break-even point in caps} = \frac{\text{Fixed costs}}{\text{Contribution margin per cap}} = \frac{\$150,000}{\$3} = \underline{\underline{50,000 \text{ caps}}}$$

- c. Income at 30,000 caps sold = (Units × Contribution margin per unit) – Fixed costs  
 = (30,000 × \$3) – \$150,000 = \$(60,000) loss
- d. Income at 85,000 caps sold = (Units × Contribution margin per unit) – Fixed costs  
 = (85,000 × \$3) – \$150,000 = \$105,000 profit
- e. Units needed for \$60,000 income =  $\frac{\text{Fixed costs} + \text{Target income}}{\text{Contribution margin per cap}}$   
 =  $\frac{\$150,000 + \$60,000}{\$3}$  = 70,000 caps

## 2. CVP chart.

3. a. Contribution margin ratio =  $\frac{\text{Contribution margin per unit}}{\text{Selling price per unit}} = \frac{\$3}{\$8} = 0.375$ , or 37.5%
- b. Break-even point in dollars =  $\frac{\text{Fixed costs}}{\text{Contribution margin ratio}} = \frac{\$150,000}{37.5\%} = \underline{\$400,000}$
- c. Income at sales of \$250,000 = (Sales × Contribution margin ratio) – Fixed costs  
 = (\$250,000 × 37.5%) – \$150,000 = \$(56,250) loss
- d. Income at sales of \$600,000 = (Sales × Contribution margin ratio) – Fixed costs  
 = (\$600,000 × 37.5%) – \$150,000 = \$75,000 income
- e. Dollars of sales to yield \$60,000 pretax income =  $\frac{\text{Fixed costs} + \text{Target pretax income}}{\text{Contribution margin ratio}}$   
 =  $\frac{\$150,000 + \$60,000}{37.5\%} = \underline{\$560,000}$

## APPENDIX

## Using Excel to Estimate Least-Squares Regression

## 21A

Microsoft Excel® and other spreadsheet software can be used to perform least-squares regressions to identify cost behavior. In Excel, the INTERCEPT and SLOPE functions are used. The following screen shot reports the data from Exhibit 21.3 in cells A1 through C13 and shows the cell contents to find the intercept (cell B15) and slope (cell B16). Cell B15 uses Excel to find the intercept from a least-squares regression of total cost (shown as C2:C13 in cell B15) on units produced (shown as B2:B13 in cell B15). Spreadsheet

software is useful in understanding cost behavior when many data points (such as monthly total costs and units produced) are available.

	A	B	C
1	<b>Month</b>	<b>Units Produced</b>	<b>Total Cost</b>
2	January	27,500	\$21,500
3	February	17,500	20,500
4	March	25,000	25,000
5	April	35,000	21,500
6	May	47,500	25,500
7	June	22,500	18,500
8	July	30,000	23,500
9	August	52,500	28,500
10	September	37,500	26,000
11	October	67,500	29,000
12	November	62,500	31,000
13	December	57,500	26,000
14			<b>Result</b>
15	<b>Intercept</b>	=INTERCEPT(C2:C13, B2:B13)	\$16,947.17
16	<b>Slope</b>	=SLOPE(C2:C13, B2:B13)	\$ 0.1930
17			

Excel can also be used to create scatter diagrams such as that in Exhibit 21.4. In contrast to visually drawing a line that “fits” the data, Excel more precisely fits the regression line. To draw a scatter diagram with a line of fit, follow these steps:

1. Highlight the data cells you wish to diagram; in this example, start from cell C13 and highlight through cell B2.
2. Then select “Insert” and “Scatter” from the drop-down menus. Selecting the chart type in the upper left corner of the choices under “Scatter” will produce a diagram that looks like that in Exhibit 21.4, without a line of fit.
3. To add a line of fit (also called a trend line), select “Layout” and “Trendline” from the drop-down menus. Selecting “Linear Trendline” will produce a diagram that looks like that in Exhibit 21.4, including the line of fit.

## Variable Costing and Performance Reporting

This chapter showed the usefulness of *contribution margin*, or selling price minus variable costs, in CVP analysis. The contribution margin income statement introduced in this chapter is also known as a **variable costing income statement**. In **variable costing**, only costs that change in total with changes in production levels are included in product costs. These costs include direct materials, direct labor, and *variable* overhead costs. Thus, under variable costing, *fixed* overhead costs are excluded from product costs. As we showed in this chapter, a variable costing approach can be useful in many managerial analyses and decisions.

The variable costing method is not allowed, however, for external financial reporting. Instead, GAAP requires **absorption costing**. Under absorption costing, product costs include direct materials, direct labor, and *all overhead*, both variable and fixed. Managers can use variable costing information for internal decision making, but they must use absorption costing for external reporting purposes.

Exhibit 21B.1 shows product cost per unit computations for both absorption and variable costing.

**EXHIBIT 21B.1**

Unit Cost Computation

	Absorption Costing	Variable Costing
Direct materials cost per unit . . . . .	\$ 4	\$ 4
Direct labor cost per unit . . . . .	8	8
Overhead cost		
Variable overhead cost per unit . . . . .	3	3
<b>Fixed overhead cost per unit . . . . .</b>	<u>10</u>	<u>—</u>
<b>Total product cost per unit . . . . .</b>	<b><u>\$25</u></b>	<b><u>\$15</u></b>

# Summary

## C1 Describe different types of cost behavior in relation to production and sales volume.

Cost behavior is described in terms of how its amount changes in relation to changes in volume of activity within a relevant range. Fixed costs remain constant to changes in volume. Total variable costs change in direct proportion to volume changes. Mixed costs display the effects of both fixed and variable components. Step-wise costs remain constant over a small volume range, then change by a lump sum and remain constant over another volume range, and so on. Curvilinear costs change in a nonlinear relation to volume changes.

## C2 Describe several applications of cost-volume-profit analysis.

Cost-volume-profit analysis can be used to predict what can happen under alternative strategies concerning sales volume, selling prices, variable costs, or fixed costs. Applications include “what-if” analysis, computing sales for a target income, and break-even analysis.

### A1 Compute the contribution margin and describe what it reveals about a company’s cost structure.

Contribution margin per unit is a product’s selling price less its total variable costs. Contribution margin ratio is a product’s contribution margin per unit divided by its selling price. Unit contribution margin is the amount received from each sale that contributes to fixed costs and income. The contribution margin ratio reveals what portion of each sales dollar is available as contribution to fixed costs and income.

### A2 Analyze changes in sales using the degree of operating leverage.

The extent, or relative size, of fixed costs in a company’s total cost structure is known as *operating leverage*. One tool useful in assessing the effect of changes in sales on income is the degree of operating leverage, or DOL. DOL is the ratio of the contribution margin divided by pretax income. This

ratio can be used to determine the expected percent change in income given a percent change in sales.

### P1 Determine cost estimates using the scatter diagram, high-low, and regression methods of estimating costs.

Three different methods used to estimate costs are the scatter diagram, the high-low method, and least-squares regression. All three methods use past data to estimate costs. Cost estimates from a scatter diagram are based on a visual fit of the cost line. Estimates from the high-low method are based only on costs corresponding to the lowest and highest sales. The least-squares regression method is a statistical technique and uses all data points.

### P2 Compute the break-even point for a single product company.

A company’s break-even point for a period is the sales volume at which total revenues equal total costs. To compute a break-even point in terms of sales units, we divide total fixed costs by the contribution margin per unit. To compute a break-even point in terms of sales dollars, divide total fixed costs by the contribution margin ratio.

### P3 Graph costs and sales for a single product company.

The costs and sales for a company can be graphically illustrated using a CVP chart. In this chart, the horizontal axis represents the number of units sold and the vertical axis represents dollars of sales or costs. Straight lines are used to depict both costs and sales on the CVP chart.

### P4 Compute the break-even point for a multiproduct company.

CVP analysis can be applied to a multiproduct company by expressing sales volume in terms of composite units. A composite unit consists of a specific number of units of each product in proportion to their expected sales mix. Multiproduct CVP analysis treats this composite unit as a single product.

## Guidance Answers to Decision Maker and Decision Ethics

**Sales Manager** The contribution margin per unit for the first order is \$600 (60% of \$1,000); the contribution margin per unit for the second order is \$160 (20% of \$800). You are likely tempted to accept the first order based on its high contribution margin per unit, but you must compute the total contribution margin based on the number of units sold for each order. Total contribution margin is \$60,000 (\$600 per unit  $\times$  100 units) and \$80,000 (\$160 per unit  $\times$  500 units) for the two orders, respectively. The second order provides the largest return in absolute dollars and is the order you would accept. Another factor to consider in your selection is the potential for a long-term relationship with these customers including repeat sales and growth.

**Supervisor** Your dilemma is whether to go along with the suggestions to “manage” the numbers to make the project look like it will achieve sufficient profits. You should not succumb to these suggestions. Many people will likely be affected negatively if you manage the predicted numbers and the project eventually

is unprofitable. Moreover, if it does fail, an investigation would likely reveal that data in the proposal were “fixed” to make it look good. Probably the only benefit from managing the numbers is the short-term payoff of pleasing those who proposed the product. One way to deal with this dilemma is to prepare several analyses showing results under different assumptions and then let senior management make the decision.

**Entrepreneur** You must first compute the level of sales required to achieve the desired net income. Then you must conduct sensitivity analysis by varying the price, sales mix, and cost estimates. Results from the sensitivity analysis provide information you can use to assess the possibility of reaching the target sales level. For instance, you might have to pursue aggressive marketing strategies to push the high-margin products, or you might have to cut prices to increase sales and profits, or another strategy might emerge.

## Key Terms

Absorption costing	Curvilinear cost	Operating leverage
Break-even point	Degree of operating leverage (DOL)	Relevant range of operations
Composite unit	Estimated line of cost behavior	Sales mix
Contribution margin per unit	High-low method	Scatter diagram
Contribution margin ratio	Least-squares regression	Step-wise cost
Cost-volume-profit (CVP) analysis	Margin of safety	Variable costing
Cost-volume-profit (CVP) chart	Mixed cost	Variable costing income statement

## Multiple Choice Quiz

Answers at end of chapter

- A company's only product sells for \$150 per unit. Its variable costs per unit are \$100, and its fixed costs total \$75,000. What is its contribution margin per unit?
  - \$50
  - \$250
  - \$100
  - \$150
  - \$25
- Using information from question 1, what is the company's contribution margin ratio?
  - 66⅔%
  - 100%
  - 50%
  - 0%
  - 33⅓%
- Using information from question 1, what is the company's break-even point in units?
  - 500 units
  - 750 units
  - 1,500 units
  - 3,000 units
  - 1,000 units
- A company's forecasted sales are \$300,000 and its sales at break-even are \$180,000. Its margin of safety in dollars is
  - \$180,000.
  - \$120,000.
  - \$480,000.
  - \$60,000.
  - \$300,000.
- A product sells for \$400 per unit and its variable costs per unit are \$260. The company's fixed costs are \$840,000. If the company desires \$70,000 pretax income, what is the required dollar sales?
  - \$2,400,000
  - \$200,000
  - \$2,600,000
  - \$2,275,000
  - \$1,400,000

<sup>A</sup> *Superscript letter A denotes assignments based on Appendix 21A.*

 *Icon denotes assignments that involve decision making.*

## Discussion Questions

- What is a variable cost? Identify two variable costs.
-  When output volume increases, do variable costs per unit increase, decrease, or stay the same within the relevant range of activity? Explain.
-  When output volume increases, do fixed costs per unit increase, decrease, or stay the same within the relevant range of activity? Explain.
-  How is cost-volume-profit analysis useful?
- How do step-wise costs and curvilinear costs differ?
- Describe the contribution margin ratio in layperson's terms.
- Define and explain the *contribution margin ratio*.
- Define and describe *contribution margin per unit*.
- In performing CVP analysis for a manufacturing company, what simplifying assumption is usually made about the volume of production and the volume of sales?
- What two arguments tend to justify classifying all costs as either fixed or variable even though individual costs might not behave exactly as classified?
-  How does assuming that operating activity occurs within a relevant range affect cost-volume-profit analysis?
- List three methods to measure cost behavior.
- How is a scatter diagram used to identify and measure the behavior of a company's costs?
- In cost-volume-profit analysis, what is the estimated profit at the break-even point?
-  Assume that a straight line on a CVP chart intersects the vertical axis at the level of fixed costs and has a positive slope that rises with each additional unit of volume by the amount of the variable costs per unit. What does this line represent?
- Apple** has both fixed and variable costs. Why are fixed costs depicted as a horizontal line on a CVP chart? **APPLE**
-  Each of two similar companies has sales of \$20,000 and total costs of \$15,000 for a month. Company A's total costs include \$10,000 of variable costs and \$5,000 of fixed costs. If Company B's total costs include \$4,000 of variable costs and \$11,000 of fixed costs, which company will enjoy more profit if sales double?
- \_\_\_\_\_ of \_\_\_\_\_ reflects expected sales in excess of the level of break-even sales.

19. **Google** produces tablet computers for sale. Identify some of the variable and fixed product costs associated with that production. **GOOGLE**  
 [Hint: Limit costs to product costs.]
20. Should **Apple** use single product or multiproduct break-even analysis? Explain. **APPLE**

21. **Samsung** is thinking of expanding sales of its most popular smart-phone model by 65%. Should we expect its variable and fixed costs for this model to stay within the relevant range? Explain. **Samsung**

Listed here are four series of separate costs measured at various volume levels. Examine each series and identify whether it is best described as a fixed, variable, step-wise, or curvilinear cost. (It can help to graph the cost series.)

Volume (Units)	Series 1	Series 2	Series 3	Series 4
0	\$ 0	\$450	\$ 800	\$100
100	800	450	800	105
200	1,600	450	800	120
300	2,400	450	1,600	145
400	3,200	450	1,600	190
500	4,000	450	2,400	250
600	4,800	450	2,400	320

**QUICK STUDY**

**QS 21-1**

Cost behavior identification

Determine whether each of the following is best described as a fixed, variable, or mixed cost with respect to product units.

- \_\_\_\_\_ 1. Rubber used to manufacture athletic shoes.
- \_\_\_\_\_ 2. Maintenance of factory machinery.
- \_\_\_\_\_ 3. Packaging expense.
- \_\_\_\_\_ 4. Wages of an assembly-line worker paid on the basis of acceptable units produced.
- \_\_\_\_\_ 5. Factory supervisor’s salary.
- \_\_\_\_\_ 6. Taxes on factory building.
- \_\_\_\_\_ 7. Depreciation expense of warehouse.

**QS 21-2**

Cost behavior identification

The following information is available for a company’s maintenance cost over the last seven months. Using the high-low method, estimate both the fixed and variable components of its maintenance cost.

Month	Maintenance Hours	Maintenance Cost
June	9	\$5,450
July	18	6,900
August	12	5,100
September	15	6,000
October	21	6,900
November	24	8,100
December	6	3,600

**QS 21-3**

Cost behavior estimation—high-low method

P1

This scatter diagram reflects past maintenance hours and their corresponding maintenance costs.

**QS 21-4**

Cost behavior estimation—scatter diagram

P1

- 1. Draw an estimated line of cost behavior.
- 2. Estimate the fixed and variable components of maintenance costs.

**QS 21-5** Compute and interpret the contribution margin ratio using the following data: sales, \$5,000; total variable cost, \$3,000.

A1 

**QS 21-6** SBD Phone Company sells its waterproof phone case for \$90 per unit. Fixed costs total \$162,000, and variable costs are \$36 per unit. Determine the (1) contribution margin per unit and break-even point in units.

**QS 21-7** SBD Phone Company sells its waterproof phone case for \$90 per unit. Fixed costs total \$162,000, and variable costs are \$36 per unit. How will the break-even point in units change in response to each of the following independent changes in selling price per unit, variable cost per unit, or total fixed costs? Use I for increase and D for decrease. (It is not necessary to compute new break-even points.)

Change	Break-Even in Units Will
1. Total fixed costs to \$190,000 . . . . .	_____
2. Variable costs to \$34 per unit. . . . .	_____
3. Selling price per unit to \$80 . . . . .	_____
4. Variable costs to \$67 per unit. . . . .	_____
5. Total fixed costs to \$150,000 . . . . .	_____
6. Selling price per unit to \$120 . . . . .	_____

**QS 21-8** SBD Phone Company sells its waterproof phone case for \$90 per unit. Fixed costs total \$162,000, and variable costs are \$36 per unit. Determine the (1) contribution margin ratio and (2) break-even point in dollars.

**QS 21-9** SBD Phone Company sells its waterproof phone case for \$90 per unit. Fixed costs total \$162,000, and variable costs are \$36 per unit. Compute the units of product that must be sold to earn pretax income of \$200,000. (Round to the nearest whole unit.)

**QS 21-10** Zhao Co. has fixed costs of \$354,000. Its single product sells for \$175 per unit, and variable costs are \$116 per unit. Determine the break-even point in units.

**QS 21-11** Zhao Co. has fixed costs of \$354,000. Its single product sells for \$175 per unit, and variable costs are \$116 per unit. If the company expects sales of 10,000 units, compute its margin of safety (a) in dollars and (b) as a percent of expected sales.

**QS 21-12** Zhao Co. has fixed costs of \$354,000. Its single product sells for \$175 per unit, and variable costs are \$116 per unit. The company expects sales of 10,000 units. Prepare a contribution margin income statement for the year ended December 31, 2015.

**QS 21-13** Zhao Co. has fixed costs of \$354,000. Its single product sells for \$175 per unit, and variable costs are \$116 per unit. Compute the level of sales in units needed to produce a target (pretax) income of \$118,000.

**QS 21-14** US-Mobile manufactures and sells two products, tablet computers and smartphones, in the ratio of 5:3. Fixed costs are \$105,000, and the contribution margin per composite unit is \$125. What number of each type of product is sold at the break-even point?

**QS 21-15** Corne Company expects sales of \$34 million (400,000 units). The company’s total fixed costs are \$17.5 million and its variable costs are \$35 per unit. Prepare a CVP chart from this information.

**QS 21-16** Singh Co. reports a contribution margin of \$960,000 and fixed costs of \$720,000. (1) Compute the company’s degree of operating leverage. (2) If sales increase by 15%, what amount of income will Singh Co. report?

A recent income statement for **Volkswagen** reports the following (in € millions). Assume 75 percent of the cost of sales and 75 percent of the selling and administrative costs are variable costs, and the remaining 25 percent of each is fixed. Compute the contribution margin (in € millions). (Round computations using percentages to the nearest whole euro.)

Sales .....	€126,875
Cost of sales .....	105,431
Selling and administrative expenses .....	15,500

**QS 21-17**

Contribution margin

Following are five graphs representing various cost behaviors. (1) Identify whether the cost behavior in each graph is mixed, step-wise, fixed, variable, or curvilinear. (2) Identify the graph (by number) that best illustrates each cost behavior: (a) Factory policy requires one supervisor for every 30 factory workers; (b) real estate taxes on factory; (c) electricity charge that includes the standard monthly charge plus a charge for each kilowatt hour; (d) commissions to salespersons; and (e) costs of hourly paid workers that provide substantial gains in efficiency when a few workers are added but gradually smaller gains in efficiency when more workers are added.

**EXERCISES**

**Exercise 21-1**

Cost behavior in graphs

The left column lists several cost classifications. The right column presents short definitions of those costs. In the blank space beside each of the numbers in the right column, write the letter of the cost best described by the definition.

- |                            |       |   |
|----------------------------|-------|---|
| <b>A.</b> Total cost       | _____ | <b>1.</b> This cost is the combined amount of all the other costs.  |
| <b>B.</b> Mixed cost       | _____ | <b>2.</b> This cost remains constant over a limited range of volume; when it reaches the end of its limited range, it changes by a lump sum and remains at that level until it exceeds another limited range. |
| <b>C.</b> Variable cost    | _____ | <b>3.</b> This cost has a component that remains the same over all volume levels and another component that increases in direct proportion to increases in volume.  |
| <b>D.</b> Curvilinear cost | _____ | <b>4.</b> This cost increases when volume increases, but the increase is not constant for each unit produced.   |
| <b>E.</b> Step-wise cost   | _____ | <b>5.</b> This cost remains constant over all volume levels within the productive capacity for the planning period.   |
| <b>F.</b> Fixed cost       | _____ | <b>6.</b> This cost increases in direct proportion to increases in volume; its amount is constant for each unit produced.   |

**Exercise 21-2**

Cost behavior defined

Following are five series of costs **A** through **E** measured at various volume levels. Examine each series and identify which is fixed, variable, mixed, step-wise, or curvilinear.

	A	B	C	D	E	F
	Volume (Units)	Series A	Series B	Series C	Series D	Series E
1	0	\$ 0	\$2,500	\$ 0	\$1,000	\$5,000
2	400	3,600	3,100	6,000	1,000	5,000
3	800	7,200	3,700	6,600	2,000	5,000
4	1,200	10,800	4,300	7,200	2,000	5,000
5	1,600	14,400	4,900	8,200	3,000	5,000
6	2,000	18,000	5,500	9,600	3,000	5,000
7	2,400	21,600	6,100	13,500	4,000	5,000

**Exercise 21-3**

Cost behavior identification

**Exercise 21-4**

Measurement of cost behavior using a scatter diagram

P1

A company reports the following information about its sales and its cost of sales. Each unit of its product sells for \$500. Use these data to prepare a scatter diagram. Draw an estimated line of cost behavior and determine whether the cost appears to be variable, fixed, or mixed.

Period	Sales	Cost of Sales	Period	Sales	Cost of Sales
1 .....	\$22,500	\$15,150	4 .....	\$11,250	\$ 8,250
2 .....	17,250	11,250	5 .....	13,500	9,000
3 .....	15,750	10,500	6 .....	18,750	14,250

**Exercise 21-5**

Scatter diagram and measurement of cost behavior

P1

Use the following information about sales and costs to prepare a scatter diagram. Draw a cost line that reflects the behavior displayed by this cost. Determine whether the cost is variable, step-wise, fixed, mixed, or curvilinear.

Period	Sales	Costs	Period	Sales	Costs
1 .....	\$760	\$590	9 .....	\$580	\$390
2 .....	800	560	10 .....	320	240
3 .....	200	230	11 .....	240	230
4 .....	400	400	12 .....	720	550
5 .....	480	390	13 .....	280	260
6 .....	620	550	14 .....	440	410
7 .....	680	590	15 .....	380	260
8 .....	540	430			

**Exercise 21-6**

Cost behavior estimation—scatter diagram and high-low

P1

Felix & Co. reports the following information about its sales and cost of sales. Draw an estimated line of cost behavior using a scatter diagram, and compute fixed costs and variable costs per unit sold. Then use the high-low method to estimate the fixed and variable components of the cost of sales.

Period	Units Sold	Cost of Sales	Period	Units Sold	Cost of Sales
1 .....	0	\$2,500	6 .....	2,000	\$5,500
2 .....	400	3,100	7 .....	2,400	6,100
3 .....	800	3,700	8 .....	2,800	6,700
4 .....	1,200	4,300	9 .....	3,200	7,300
5 .....	1,600	4,900	10 .....	3,600	7,900

**Exercise 21-7<sup>A</sup>**

Measurement of cost behavior using regression P1

Refer to the information from Exercise 21-6. Use spreadsheet software to use ordinary least-squares regression to estimate the cost equation, including fixed and variable cost amounts.

**Exercise 21-8**

Contribution margin

A1

A jeans maker is designing a new line of jeans called Slims. The jeans will sell for \$205 per pair and cost \$164 per pair in variable costs to make.

1. Compute the contribution margin per pair.
2. Compute the contribution margin ratio.
3. Describe what the contribution margin ratio reveals about this new jeans line.

Blanchard Company manufactures a single product that sells for \$180 per unit and whose total variable costs are \$135 per unit. The company's annual fixed costs are \$562,500. Use this information to compute the company's (a) contribution margin, (b) contribution margin ratio, (c) break-even point in units, and (d) break-even point in dollars of sales.

**Exercise 21-9**Contribution margin and break-even **P2**

Blanchard Company manufactures a single product that sells for \$180 per unit and whose total variable costs are \$135 per unit. The company's annual fixed costs are \$562,500. Prepare a CVP chart for the company.

**Exercise 21-10**CVP chart **P3**

Blanchard Company manufactures a single product that sells for \$180 per unit and whose total variable costs are \$135 per unit. The company's annual fixed costs are \$562,500.

**Exercise 21-11**Income reporting and break-even analysis **C2**

1. Prepare a contribution margin income statement for Blanchard Company showing sales, variable costs, and fixed costs at the break-even point.
2. If the company's fixed costs increase by \$135,000, what amount of sales (in dollars) is needed to break even? Explain.

Blanchard Company manufactures a single product that sells for \$180 per unit and whose total variable costs are \$135 per unit. The company's annual fixed costs are \$562,500. Management targets an annual pretax income of \$1,012,500. Assume that fixed costs remain at \$562,500. Compute the (1) unit sales to earn the target income and (2) dollar sales to earn the target income.

**Exercise 21-12**Computing sales to achieve target income **C2**

Blanchard Company manufactures a single product that sells for \$180 per unit and whose total variable costs are \$135 per unit. The company's annual fixed costs are \$562,500. The sales manager predicts that annual sales of the company's product will soon reach 40,000 units and its price will increase to \$200 per unit. According to the production manager, the variable costs are expected to increase to \$140 per unit but fixed costs will remain at \$562,500. The income tax rate is 20%. What amounts of pretax and after-tax income can the company expect to earn from these predicted changes? (*Hint:* Prepare a forecasted contribution margin income statement as in Exhibit 21.21.)

**Exercise 21-13**Forecasted income statement **C2****Check** Forecasted after-tax income, \$1,470,000

Bloom Company management predicts that it will incur fixed costs of \$160,000 and earn pretax income of \$164,000 in the next period. Its expected contribution margin ratio is 25%. Use this information to compute the amounts of (1) total dollar sales and (2) total variable costs.

**Exercise 21-14**Predicting sales and variable costs using contribution margin **C2**

Cooper Company expects to sell 200,000 units of its product next year, which would generate total sales of \$17 million. Management predicts that pretax net income for next year will be \$1,250,000 and that the contribution margin per unit will be \$25. Use this information to compute next year's total expected (a) variable costs and (b) fixed costs.

**Exercise 21-15**Computation of variable and fixed costs **C2**

Hudson Co. reports the contribution margin income statement for 2015 below. Using this information, compute Hudson Co.'s (1) break-even point in units and (2) break-even point in sales dollars.

**Exercise 21-16**Break-even **P2**

<b>HUDSON CO.</b>	
Contribution Margin Income Statement	
For Year Ended December 31, 2015	
Sales (9,600 units at \$225 each) .....	\$2,160,000
Variable costs (9,600 units at \$180 each) .....	<u>1,728,000</u>
Contribution margin .....	\$ 432,000
Fixed costs .....	<u>324,000</u>
Pretax income .....	<u>\$ 108,000</u>

**Exercise 21-17**

Target income and margin of safety (in dollars) **C2**

Refer to the information in Exercise 21-16.

1. Assume Hudson Co. has a target pretax income of \$162,000 for 2016. What amount of sales (in dollars) is needed to produce this target income?
2. If Hudson achieves its target pretax income for 2016, what is its margin of safety (in percent)? (Round to one decimal place.)

**Exercise 21-18**

Sensitivity analysis **C2**

Refer to the information in Exercise 21-16. Assume the company is considering investing in a new machine that will increase its fixed costs by \$40,500 per year and decrease its variable costs by \$9 per unit. Prepare a forecasted contribution margin income statement for 2016 assuming the company purchases this machine.

**Exercise 21-19**

Sensitivity analysis **C2**

Refer to the information in Exercise 21-16. If the company raises its selling price to \$240 per unit, compute its (1) contribution margin per unit, (2) contribution margin ratio, (3) break-even point in units, and (4) break-even point in sales dollars.

**Exercise 21-20**

Sensitivity analysis **C2**

Refer to the information in Exercise 21-16. The marketing manager believes that increasing advertising costs by \$81,000 in 2016 will increase the company's sales volume to 11,000 units. Prepare a forecasted contribution margin income statement for 2016 assuming the company incurs the additional advertising costs.

**Exercise 21-21**

Predicting unit and dollar sales **C2**

Nombre Company management predicts \$390,000 of variable costs, \$430,000 of fixed costs, and a pretax income of \$155,000 in the next period. Management also predicts that the contribution margin per unit will be \$9. Use this information to compute the (1) total expected dollar sales for next period and (2) number of units expected to be sold next period.

**Exercise 21-22**

CVP analysis using composite units **P4**

**Check** (3) 1,000 composite units

Handy Home sells windows and doors in the ratio of 8:2 (windows:doors). The selling price of each window is \$200 and of each door is \$500. The variable cost of a window is \$125 and of a door is \$350. Fixed costs are \$900,000. Use this information to determine the (1) selling price per composite unit, (2) variable costs per composite unit, (3) break-even point in composite units, and (4) number of units of each product that will be sold at the break-even point.

**Exercise 21-23**

CVP analysis using composite units **P4**

R&R Tax Service offers tax and consulting services to individuals and small businesses. Data for fees and costs of three types of tax returns follow. R&R provides services in the ratio of 5:3:2 (easy, moderate, business). Fixed costs total \$18,000 for the tax season. Use this information to determine the (1) selling price per composite unit, (2) variable costs per composite unit, (3) break-even point in composite units, and (4) number of units of each product that will be sold at the break-even point.

Type of Return	Fee Charged	Variable Cost per Return
Easy (Form 1040EZ) . . . . .	\$ 50	\$ 30
Moderate (Form 1040) . . . . .	125	75
Business . . . . .	275	100

**Exercise 21-24**

Operating leverage computed and applied **A2**

Company A is a manufacturer with current sales of \$6,000,000 and a 60% contribution margin. Its fixed costs equal \$2,600,000. Company B is a consulting firm with current service revenues of \$4,500,000 and a 25% contribution margin. Its fixed costs equal \$375,000. Compute the degree of operating leverage (DOL) for each company. Identify which company benefits more from a 20% increase in sales and explain why.

Refer to the information in Exercise 21-16.

1. Compute the company's degree of operating leverage for 2015.
2. If sales decrease by 5% in 2016, what will be the company's pretax income?
3. Assume sales for 2016 decrease by 5%. Prepare a contribution margin income statement for 2016.

**Exercise 21-25**  
Degree of operating leverage **A2**

The following costs result from the production and sale of 1,000 drum sets manufactured by Tight Drums Company for the year ended December 31, 2015. The drum sets sell for \$500 each. The company has a 25% income tax rate.

Variable production costs	
Plastic for casing .....	\$ 17,000
Wages of assembly workers .....	82,000
Drum stands .....	26,000
Variable selling costs	
Sales commissions .....	15,000
Fixed manufacturing costs	
Taxes on factory .....	5,000
Factory maintenance .....	10,000
Factory machinery depreciation .....	40,000
Fixed selling and administrative costs	
Lease of equipment for sales staff .....	10,000
Accounting staff salaries .....	35,000
Administrative management salaries .....	125,000

**PROBLEM SET A**

**Problem 21-1A**  
Contribution margin income statement and contribution margin ratio **A1**

**Required**

1. Prepare a contribution margin income statement for the company.
2. Compute its contribution margin per unit and its contribution margin ratio.

**Check** (1) Net income, \$101,250

**Analysis Component**

3. Interpret the contribution margin and contribution margin ratio from part 2.

Alden Co.'s monthly sales and cost data for its operating activities of the past year follow. Management wants to use these data to predict future fixed and variable costs.

**Problem 21-2A**  
Scatter diagram and cost behavior estimation **P1**

Month	Sales	Total Cost	Month	Sales	Total Cost
1 .....	\$320,000	\$160,000	7 .....	\$340,000	\$220,000
2 .....	160,000	100,000	8 .....	280,000	160,000
3 .....	280,000	220,000	9 .....	80,000	64,000
4 .....	200,000	100,000	10 .....	160,000	140,000
5 .....	300,000	230,000	11 .....	100,000	100,000
6 .....	200,000	120,000	12 .....	110,000	80,000

**Required**

1. Prepare a scatter diagram for these data with sales volume (in \$) plotted on the horizontal axis and total cost plotted on the vertical axis.
2. Estimate both the variable costs per sales dollar and the total monthly fixed costs using the high-low method. Draw the total costs line on the scatter diagram in part 1.
3. Use the estimated line of cost behavior and results from part 2 to predict future total costs when sales volume is (a) \$200,000 and (b) \$300,000.

**Check** (2) Variable costs, \$0.60 per sales dollar; fixed costs, \$16,000

**Problem 21-3A**

CVP analysis and charting **P2 P3**

Praveen Co. manufactures and markets a number of rope products. Management is considering the future of Product XT, a special rope for hang gliding, that has not been as profitable as planned. Since Product XT is manufactured and marketed independently of the other products, its total costs can be precisely measured. Next year's plans call for a \$200 selling price per 100 yards of XT rope. Its fixed costs for the year are expected to be \$270,000, up to a maximum capacity of 700,000 yards of rope. Forecasted variable costs are \$140 per 100 yards of XT rope.

**Required**

1. Estimate Product XT's break-even point in terms of (a) sales units and (b) sales dollars.
2. Prepare a CVP chart for Product XT like that in Exhibit 21.15. Use 7,000 units (700,000 yards/100 yards) as the maximum number of sales units on the horizontal axis of the graph, and \$1,400,000 as the maximum dollar amount on the vertical axis.
3. Prepare a contribution margin income statement showing sales, variable costs, and fixed costs for Product XT at the break-even point.

**Check** (1a) Break-even sales, 4,500 units

**Problem 21-4A**

Break-even analysis; income targeting and forecasting

**C2 P2 A1**

Astro Co. sold 20,000 units of its only product and incurred a \$50,000 loss (ignoring taxes) for the current year as shown here. During a planning session for year 2016's activities, the production manager notes that variable costs can be reduced 50% by installing a machine that automates several operations. To obtain these savings, the company must increase its annual fixed costs by \$200,000. The maximum output capacity of the company is 40,000 units per year.

<b>ASTRO COMPANY</b>	
Contribution Margin Income Statement	
For Year Ended December 31, 2015	
Sales .....	\$1,000,000
Variable costs .....	<u>800,000</u>
Contribution margin .....	200,000
Fixed costs .....	<u>250,000</u>
Net loss .....	<u>\$ (50,000)</u>

**Required**

1. Compute the break-even point in dollar sales for year 2015.
2. Compute the predicted break-even point in dollar sales for year 2016 assuming the machine is installed and there is no change in the unit selling price.
3. Prepare a forecasted contribution margin income statement for 2016 that shows the expected results with the machine installed. Assume that the unit selling price and the number of units sold will not change, and no income taxes will be due.
4. Compute the sales level required in both dollars and units to earn \$200,000 of target pretax income in 2016 with the machine installed and no change in unit sales price. Round answers to whole dollars and whole units.
5. Prepare a forecasted contribution margin income statement that shows the results at the sales level computed in part 4. Assume no income taxes will be due.

**Check** (3) Net income, \$150,000

(4) Required sales, \$1,083,333 or 21,667 units (both rounded)

**Problem 21-5A**

Break-even analysis, different cost structures, and income calculations

**C2 A1 P4**

Henna Co. produces and sells two products, T and O. It manufactures these products in separate factories and markets them through different channels. They have no shared costs. This year, the company sold 50,000 units of each product. Sales and costs for each product follow.

	Product T	Product O
Sales .....	\$2,000,000	\$2,000,000
Variable costs .....	<u>1,600,000</u>	<u>250,000</u>
Contribution margin .....	400,000	1,750,000
Fixed costs .....	<u>125,000</u>	<u>1,475,000</u>
Income before taxes .....	275,000	275,000
Income taxes (32% rate) .....	<u>88,000</u>	<u>88,000</u>
Net income .....	<u>\$ 187,000</u>	<u>\$ 187,000</u>

**Required**

1. Compute the break-even point in dollar sales for each product. (Round the answer to whole dollars.)
2. Assume that the company expects sales of each product to decline to 30,000 units next year with no change in unit selling price. Prepare forecasted financial results for next year following the format of the contribution margin income statement as just shown with columns for each of the two products (assume a 32% tax rate). Also, assume that any loss before taxes yields a 32% tax benefit.
3. Assume that the company expects sales of each product to increase to 60,000 units next year with no change in unit selling price. Prepare forecasted financial results for next year following the format of the contribution margin income statement shown with columns for each of the two products (assume a 32% tax rate).

**Check** (2) After-tax income: T, \$78,200; O, \$(289,000)

(3) After-tax income: T, \$241,400; O, \$425,000

**Analysis Component**

4. If sales greatly decrease, which product would experience a greater loss? Explain.
5. Describe some factors that might have created the different cost structures for these two products.

This year Burchard Company sold 40,000 units of its only product for \$25 per unit. Manufacturing and selling the product required \$200,000 of fixed manufacturing costs and \$325,000 of fixed selling and administrative costs. Its per unit variable costs follow.

Material .....	\$8.00
Direct labor (paid on the basis of completed units) .....	5.00
Variable overhead costs .....	1.00
Variable selling and administrative costs .....	0.50

Next year the company will use new material, which will reduce material costs by 50% and direct labor costs by 60% and will not affect product quality or marketability. Management is considering an increase in the unit selling price to reduce the number of units sold because the factory’s output is nearing its annual output capacity of 45,000 units. Two plans are being considered. Under plan 1, the company will keep the selling price at the current level and sell the same volume as last year. This plan will increase income because of the reduced costs from using the new material. Under plan 2, the company will increase the selling price by 20%. This plan will decrease unit sales volume by 10%. Under both plans 1 and 2, the total fixed costs and the variable costs per unit for overhead and for selling and administrative costs will remain the same.

**Required**

1. Compute the break-even point in dollar sales for both (a) plan 1 and (b) plan 2.
2. Prepare a forecasted contribution margin income statement with two columns showing the expected results of plan 1 and plan 2. The statements should report sales, total variable costs, contribution margin, total fixed costs, income before taxes, income taxes (30% rate), and net income.

**Check** (1) Break-even: Plan 1, \$750,000; Plan 2, \$700,000  
(2) Net income: Plan 1, \$122,500; Plan 2, \$199,500

Patriot Co. manufactures and sells three products: red, white, and blue. Their unit selling prices are red, \$20; white, \$35; and blue, \$65. The per unit variable costs to manufacture and sell these products are red, \$12; white, \$22; and blue, \$50. Their sales mix is reflected in a ratio of 5:4:2 (red:white:blue). Annual fixed costs shared by all three products are \$250,000. One type of raw material has been used to manufacture all three products. The company has developed a new material of equal quality for less cost. The new material would reduce variable costs per unit as follows: red, by \$6; white, by \$12; and blue, by \$10. However, the new material requires new equipment, which will increase annual fixed costs by \$50,000. (Round answers to whole composite units.)

**Required**

1. If the company continues to use the old material, determine its break-even point in both sales units and sales dollars of each individual product.
2. If the company uses the new material, determine its new break-even point in both sales units and sales dollars of each individual product.

**Analysis Component**

3. What insight does this analysis offer management for long-term planning?

**Problem 21-6A**

Analysis of price, cost, and volume changes for contribution margin and net income

P2 A1

**Problem 21-7A**

Break-even analysis with composite units

P4 

**Check** (1) Old plan break-even, 2,050 composite units (rounded)  
(2) New plan break-even, 1,364 composite units (rounded)

**PROBLEM SET B**

The following costs result from the production and sale of 12,000 CD sets manufactured by Gilmore Company for the year ended December 31, 2015. The CD sets sell for \$18 each. The company has a 25% income tax rate.

**Problem 21-1B**

Contribution margin income statement and contribution margin ratio

A1

Variable manufacturing costs	
Plastic for CD sets .....	\$ 1,500
Wages of assembly workers .....	30,000
Labeling .....	3,000
Variable selling costs	
Sales commissions .....	6,000
Fixed manufacturing costs	
Rent on factory .....	6,750
Factory cleaning service .....	4,520
Factory machinery depreciation .....	20,000
Fixed selling and administrative costs	
Lease of office equipment .....	1,050
Systems staff salaries .....	15,000
Administrative management salaries .....	120,000

**Required**

**Check** (1) Net income, \$6,135

1. Prepare a contribution margin income statement for the company.
2. Compute its contribution margin per unit and its contribution margin ratio.

**Analysis Component**

3. Interpret the contribution margin and contribution margin ratio from part 2.

**Problem 21-2B**

Scatter diagram and cost behavior estimation

P1

Sun Co.'s monthly sales and cost data for its operating activities of the past year follow. Management wants to use these data to predict future fixed and variable costs. (Dollar amounts are in thousands.)

Month	Sales	Total Cost	Month	Sales	Total Cost
1 .....	\$195	\$ 97	7 .....	\$145	\$ 93
2 .....	125	87	8 .....	185	105
3 .....	105	73	9 .....	135	85
4 .....	155	89	10 .....	85	58
5 .....	95	81	11 .....	175	95
6 .....	215	110	12 .....	115	79

**Required**

**Check** (2) Variable costs, \$0.40 per sales dollar; fixed costs, \$24,000

1. Prepare a scatter diagram for these data with sales volume (in \$) plotted on the horizontal axis and total costs plotted on the vertical axis.
2. Estimate both the variable costs per sales dollar and the total monthly fixed costs using the high-low method. Draw the total costs line on the scatter diagram in part 1.
3. Use the estimated line of cost behavior and results from part 2 to predict future total costs when sales volume is (a) \$100 and (b) \$170.

**Problem 21-3B**

CVP analysis and charting

P2 P3

Hip-Hop Co. manufactures and markets several products. Management is considering the future of one product, electronic keyboards, that has not been as profitable as planned. Since this product is manufactured and marketed independently of the other products, its total costs can be precisely measured. Next year's plans call for a \$350 selling price per unit. The fixed costs for the year are expected to be \$42,000, up to a maximum capacity of 700 units. Forecasted variable costs are \$210 per unit.

**Required**

1. Estimate the keyboards' break-even point in terms of (a) sales units and (b) sales dollars.
2. Prepare a CVP chart for keyboards like that in Exhibit 21.15. Use 700 keyboards as the maximum number of sales units on the horizontal axis of the graph, and \$250,000 as the maximum dollar amount on the vertical axis.
3. Prepare a contribution margin income statement showing sales, variable costs, and fixed costs for keyboards at the break-even point.

**Check** (1) Break-even sales, 300 units

Rivera Co. sold 20,000 units of its only product and incurred a \$50,000 loss (ignoring taxes) for the current year as shown here. During a planning session for year 2016's activities, the production manager notes that variable costs can be reduced 50% by installing a machine that automates several operations. To obtain these savings, the company must increase its annual fixed costs by \$150,000. The maximum output capacity of the company is 40,000 units per year.

**Problem 21-4B**  
Break-even analysis; income targeting and forecasting

C2 P2 A1

RIVERA COMPANY Contribution Margin Income Statement For Year Ended December 31, 2015	
Sales .....	\$750,000
Variable costs .....	<u>600,000</u>
Contribution margin .....	150,000
Fixed costs .....	<u>200,000</u>
Net loss .....	<u><u>\$ (50,000)</u></u>

**Required**

1. Compute the break-even point in dollar sales for year 2015.
2. Compute the predicted break-even point in dollar sales for year 2016 assuming the machine is installed and no change occurs in the unit selling price. (Round the change in variable costs to a whole number.)
3. Prepare a forecasted contribution margin income statement for 2016 that shows the expected results with the machine installed. Assume that the unit selling price and the number of units sold will not change, and no income taxes will be due.
4. Compute the sales level required in both dollars and units to earn \$200,000 of target pretax income in 2016 with the machine installed and no change in unit sales price. (Round answers to whole dollars and whole units.)
5. Prepare a forecasted contribution margin income statement that shows the results at the sales level computed in part 4. Assume no income taxes will be due.

**Check** (3) Net income, \$100,000

(4) Required sales, \$916,667 or 24,445 units (both rounded)

Stam Co. produces and sells two products, BB and TT. It manufactures these products in separate factories and markets them through different channels. They have no shared costs. This year, the company sold 50,000 units of each product. Sales and costs for each product follow.

**Problem 21-5B**  
Break-even analysis, different cost structures, and income calculations

C2 P4 A1 

	Product BB	Product TT
Sales .....	\$800,000	\$800,000
Variable costs .....	<u>560,000</u>	<u>100,000</u>
Contribution margin .....	240,000	700,000
Fixed costs .....	<u>100,000</u>	<u>560,000</u>
Income before taxes .....	140,000	140,000
Income taxes (32% rate) .....	<u>44,800</u>	<u>44,800</u>
Net income .....	<u><u>\$ 95,200</u></u>	<u><u>\$ 95,200</u></u>

**Required**

1. Compute the break-even point in dollar sales for each product. (Round the answer to the next whole dollar.)
2. Assume that the company expects sales of each product to decline to 33,000 units next year with no change in the unit selling price. Prepare forecasted financial results for next year following the format

**Check** (2) After-tax income: BB, \$39,712; TT, \$(66,640)

(3) After-tax income: BB, \$140,896; TT, \$228,480

of the contribution margin income statement as shown here with columns for each of the two products (assume a 32% tax rate, and that any loss before taxes yields a 32% tax benefit).

3. Assume that the company expects sales of each product to increase to 64,000 units next year with no change in the unit selling prices. Prepare forecasted financial results for next year following the format of the contribution margin income statement as shown here with columns for each of the two products (assume a 32% tax rate).

**Analysis Component**

4. If sales greatly increase, which product would experience a greater increase in profit? Explain.
5. Describe some factors that might have created the different cost structures for these two products.

**Problem 21-6B**

Analysis of price, cost, and volume changes for contribution margin and net income

A1 P2

This year Best Company earned a disappointing 5.6% after-tax return on sales (net income/sales) from marketing 100,000 units of its only product. The company buys its product in bulk and repackages it for resale at the price of \$20 per unit. Best incurred the following costs this year.

Total variable unit costs . . . . .	\$800,000
Total variable packaging costs . . . . .	\$100,000
Fixed costs . . . . .	\$950,000
Income tax rate . . . . .	25%

The marketing manager claims that next year’s results will be the same as this year’s unless some changes are made. The manager predicts the company can increase the number of units sold by 80% if it reduces the selling price by 20% and upgrades the packaging. This change would increase variable packaging costs by 20%. Increased sales would allow the company to take advantage of a 25% quantity purchase discount on the cost of the bulk product. Neither the packaging change nor the volume discount would affect fixed costs, which provide an annual output capacity of 200,000 units.

**Required**

1. Compute the break-even point in dollar sales under the (a) existing business strategy and (b) new strategy that alters both unit selling price and variable costs. (Round answers to the next whole dollar.)
2. Prepare a forecasted contribution margin income statement with two columns showing the expected results of (a) the existing strategy and (b) changing to the new strategy. The statements should report sales, total variable costs (unit and packaging), contribution margin, fixed costs, income before taxes, income taxes, and net income. Also determine the after-tax return on sales for these two strategies.

**Check** (1b) Break-even sales for new strategy, \$1,727,273 (rounded)

(2) Net income: Existing strategy, \$112,500; new strategy, \$475,500

**Problem 21-7B**

Break-even analysis with composite units

P4 

Milano Co. manufactures and sells three products: product 1, product 2, and product 3. Their unit selling prices are product 1, \$40; product 2, \$30; and product 3, \$20. The per unit variable costs to manufacture and sell these products are product 1, \$30; product 2, \$15; and product 3, \$8. Their sales mix is reflected in a ratio of 6:4:2. Annual fixed costs shared by all three products are \$270,000. One type of raw material has been used to manufacture products 1 and 2. The company has developed a new material of equal quality for less cost. The new material would reduce variable costs per unit as follows: product 1 by \$10 and product 2 by \$5. However, the new material requires new equipment, which will increase annual fixed costs by \$50,000.

**Required**

1. If the company continues to use the old material, determine its break-even point in both sales units and sales dollars of each individual product.
2. If the company uses the new material, determine its new break-even point in both sales units and sales dollars of each individual product. (Round to the next whole unit.)

**Analysis Component**

3. What insight does this analysis offer management for long-term planning?

**Check** (1) Old plan break-even, 1,875 composite units

(2) New plan break-even, 1,429 composite units (rounded)

(This serial problem began in Chapter 1 and continues through most of the book. If previous chapter segments were not completed, the serial problem can begin at this point. It is helpful, but not necessary, to use the working papers that accompany the book.)

**SERIAL PROBLEM**

Business Solutions

P4

**SP 21** Business Solutions sells upscale modular desk units and office chairs in the ratio of 3:2 (desk unit:chair). The selling prices are \$1,250 per desk unit and \$500 per chair. The variable costs are \$750 per desk unit and \$250 per chair. Fixed costs are \$120,000.

**Required**

1. Compute the selling price per composite unit.
2. Compute the variable costs per composite unit.
3. Compute the break-even point in composite units.
4. Compute the number of units of each product that would be sold at the break-even point.

**Check** (3) 60 composite units

**Beyond the Numbers**

**BTN 21-1** **Apple** offers extended service contracts that provide repair coverage for its products. As you complete the following requirements, assume that Apple’s repair services department uses many of the company’s existing resources such as its facilities, repair machinery, and computer systems.

**REPORTING IN ACTION**

C1 

**APPLE**

**Required**

1. Identify several of the variable, mixed, and fixed costs that Apple’s repair services department is likely to incur in carrying out its services.
2. Assume that Apple’s repair service revenues are expected to grow by 25% in the next year. How would we expect the costs identified in part 1 to change, if at all?
3. Based on the answer to part 2, can Apple use the contribution margin ratio to predict how income will change in response to increases in Apple’s repair service revenues?

**BTN 21-2** Both **Apple** and **Google** sell electronic devices like phones and computers, and each of these companies has a different product mix.

**COMPARATIVE ANALYSIS**

P2 A2 

**APPLE**  
**GOOGLE**

**Required**

1. Assume the following data are available for both companies. Compute each company’s break-even point in unit sales. (Each company sells many devices at many different selling prices, and each has its own variable costs. This assignment assumes an *average* selling price per unit and an *average* cost per item.)

	Apple	Google
Average selling price per unit sold. . . . .	\$550 per unit	\$470 per unit
Average variable cost per unit sold. . . . .	\$250 per unit	\$270 per unit
Total fixed costs (\$ in millions). . . . .	\$36,000	\$10,000

2. If unit sales were to decline, which company would experience the larger decline in operating profit? Explain.

**BTN 21-3** Labor costs of an auto repair mechanic are seldom based on actual hours worked. Instead, the amount paid a mechanic is based on an industry average of time estimated to complete a repair job. The repair shop bills the customer for the industry average amount of time at the repair center’s billable cost per hour. This means a customer can pay, for example, \$120 for two hours of work on a car when the actual time worked was only one hour. Many experienced mechanics can complete repair jobs faster than the industry average. The average data are compiled by engineering studies and surveys conducted in the auto

**ETHICS CHALLENGE**

C1 

repair business. Assume that you are asked to complete such a survey for a repair center. The survey calls for objective input, and many questions require detailed cost data and analysis. The mechanics and owners know you have the survey and encourage you to complete it in a way that increases the average billable hours for repair work.

### Required

Write a one-page memorandum to the mechanics and owners that describes the direct labor analysis you will undertake in completing this survey.

## COMMUNICATING IN PRACTICE

C2

**BTN 21-4** Several important assumptions underlie CVP analysis. Assumptions often help simplify and focus our analysis of sales and costs. A common application of CVP analysis is as a tool to forecast sales, costs, and income.

### Required

Assume that you are actively searching for a job. Prepare a half-page report identifying (1) three assumptions relating to your expected revenue (salary) and (2) three assumptions relating to your expected costs for the first year of your new job. Be prepared to discuss your assumptions in class.

## TAKING IT TO THE NET

C1

**BTN 21-5** Access and review the entrepreneurial information at **Business Owner's Toolkit [Toolkit.com]**. Access and review its *New Business Cash Needs Checklist* (or similar worksheets related to controls of cash and costs) under the "Start Up" link. (Look under the heading "Free Startup Downloads.")

### Required

Write a half-page report that describes the information and resources available at the Business Owner's Toolkit to help the owner of a start-up business to control and monitor its cash flows and costs.

## TEAMWORK IN ACTION

C2

**BTN 21-6** A local movie theater owner explains to you that ticket sales on weekends and evenings are strong, but attendance during the weekdays, Monday through Thursday, is poor. The owner proposes to offer a contract to the local grade school to show educational materials at the theater for a set charge per student during school hours. The owner asks your help to prepare a CVP analysis listing the cost and sales projections for the proposal. The owner must propose to the school's administration a charge per child. At a minimum, the charge per child needs to be sufficient for the theater to break even.

### Required

Your team is to prepare two separate lists of questions that enable you to complete a reliable CVP analysis of this situation. One list is to be answered by the school's administration, the other by the owner of the movie theater.

## ENTREPRENEURIAL DECISION

C1

A1

**BTN 21-7 Fast Yeti Custom Tees**, launched by entrepreneurs Reid Lyle, Jordan Roudenis, and Ryan Montgomery, produces apparel products. The company has a diverse product line of T-shirts, hats, and polo shirts.

### Required

1. Identify at least two fixed costs that will not change regardless of how many T-shirts Fast Yeti produces.
2. How could overly optimistic sales estimates potentially hurt Fast Yeti's business?
3. Explain how cost-volume-profit analysis can help Reid, Jordan, and Ryan manage Fast Yeti.

## HITTING THE ROAD

P4

**BTN 21-8** Multiproduct break-even analysis is often viewed differently when actually applied in practice. You are to visit a local fast-food restaurant and count the number of items on the menu. To apply multiproduct break-even analysis to the restaurant, similar menu items must often be fit into groups. A reasonable approach is to classify menu items into approximately five groups. We then estimate average selling price and average variable cost to compute average contribution margin. (*Hint:* For fast-food restaurants, the highest contribution margin is with its beverages, at about 90%.)

**Required**

1. Prepare a one-year multiproduct break-even analysis for the restaurant you visit. Begin by establishing groups. Next, estimate each group's volume and contribution margin. These estimates are necessary to compute each group's contribution margin. Assume that annual fixed costs in total are \$500,000 per year. (*Hint:* You must develop your own estimates on volume and contribution margin for each group to obtain the break-even point and sales.)
2. Prepare a one-page report on the results of your analysis. Comment on the volume of sales necessary to break even at a fast-food restaurant.

**BTN 21-9** Access and review **Samsung's** website ([www.samsung.com](http://www.samsung.com)) to answer the following questions.

**Required**

1. Do you believe that Samsung's managers use single product CVP analysis or multiproduct break-even analysis? Explain.
2. How does the addition of a new product line affect Samsung's CVP analysis?

**GLOBAL  
DECISION**

P4

**Samsung**

### ANSWERS TO MULTIPLE CHOICE QUIZ

1. a;  $\$150 - \$100 = \$50$
2. e;  $(\$150 - \$100)/\$150 = 33\frac{1}{3}\%$
3. c;  $\$75,000/\$50 \text{ CM per unit} = 1,500 \text{ units}$
4. b;  $\$300,000 - \$180,000 = \$120,000$
5. c; Contribution margin ratio =  $(\$400 - \$260)/\$400 = 0.35$   
Targeted sales =  $(\$840,000 + \$70,000)/0.35 = \$2,600,000$

- A1** Analyze expense planning using activity-based budgeting.

### PROCEDURAL

- P1** Prepare the operating budget components of a master budget—for a manufacturing company.
- P2** Prepare a cash budget.
- P3** Prepare budgeted financial statements.
- P4** *Appendix 22A—Prepare each component of a master budget and link each to the budgeting process—for a merchandising company.*

MONTERREY, MEXICO—To fulfill requirements for his high school degree, Daniel Gómez Iñiguez completed a project on how to make biodiesel fuel from vegetable oil and animal fats. “Searching the Internet, I realized it is real easy to make biodiesel at your home,” explains Daniel. As Daniel’s interest in making biodiesel grew, he expanded his knowledge by taking college courses on biodiesel production and joining an informal biodiesel club. His efforts led to connections with three partners—Guillermo Colunga, Antonio Lopez, and Maurico Pareja—and the group started **Solben**, a company that sells technology for biodiesel production.

Like most entrepreneurs, the partners faced challenges in getting their business going. “We regularly entered entrepreneurship competitions, knowing we had no chance to win,” admits Daniel. “The competitions wanted business plans and budgets, and we didn’t have those. But we learned something every time.” This continual learning enabled the company to find a niche by developing technology that can be effective in a developing economy. “Large plants are costly to build and expensive to operate,” says Daniel, “but most homegrown systems produce low-quality fuel. Our system makes high-quality fuel, even at small volumes, and it is modular, so the plant can grow as demand grows.”

As Solben grew, budgeting and the budgeting process became increasingly important. Daniel explains that budgets help formalize business plans and goals and help direct and monitor employees. Budgeted income statements enable managers to assess how changes in materials, labor, and overhead impact the bottom line. As Solben expanded its sales and its work force grew, the partners began developing more formal plans and budgets. “Budgeting gives us a plan of where we want to go,” asserts Daniel. “Still, we must never stop learning and adapting our plans.” Although budgets are expressed in monetary terms, Daniel says that “money is not the only way to measure success. Success is based on the number of people you can impact in a positive way.”

Daniel offers advice for budding entrepreneurs. “Do something you are really passionate about. And don’t be afraid of failure. Failure is positive if you learn from it. Always keep learning.” In Solben’s case, this emphasis on learning has led to sales of over \$3 million in a recent year, and an over 85 percent share of Mexico’s market for biodiesel technology production.

## BUDGET PROCESS AND ADMINISTRATION

### C1

Describe the benefits of budgeting and the process of budget administration.

### Budgeting as a Management Tool

An important management objective in large companies is to ensure that activities of all departments contribute to meeting the company's overall goals. This requires coordination. Budgeting helps to achieve this coordination. The budgeting process coordinates the activities of various departments to meet the company's overall goals.

Most companies prepare long-term strategic plans spanning 5 to 10 years. They then fine-tune them in medium-term and short-term plans. Long-term strategic plans provide a road map for the future about potential opportunities such as new products, markets, and investments. Medium- and short-term plans are more operational and translate strategic plans into actions. These action plans are fairly concrete and consist of defined objectives and goals.

Short-term financial plans are called *budgets* and typically cover a one-year period. A **budget** is a formal statement of a company's future plans. It is usually expressed in monetary terms because the economic or financial aspects of the business are the primary factors driving management's decisions. All managers should be involved in **budgeting**, the process of planning future business actions and expressing them as formal plans. Managers who participate in a budgeting process increase the likelihood of both personal and company success.

### Benefits of Budgeting

Budgets help fulfill the key managerial functions of planning and controlling. There are several benefits to having a written budget:

- A budget focuses on the future opportunities and threats to the organization. This focus on the future is important, because the daily pressures of operating an organization can divert management's attention to planning. The budgeting system counteracts this tendency by formalizing the planning process and demanding input. Budgeting makes planning an explicit management responsibility.
- The control function requires management to evaluate (benchmark) operations against some norm. Since budgeted performance takes into account important company, industry, and economic factors, a comparison of actual to budgeted performance provides an effective monitoring and control system. This evaluation assists management in identifying problems and taking corrective actions if necessary.
- An important management objective in large companies is to ensure that the activities of all departments contribute to meeting the company's overall goals. This requires coordination. Budgeting helps to achieve this coordination across departments.
- A written budget is an effective way to communicate management's specific action plans to all employees. When plans are not written down, conversations can lead to uncertainty and confusion among employees.
- Budgets can be used to motivate employees. Budgeted performance levels can provide goals for employees to attain or even exceed. Many companies provide incentives, like cash bonuses, for employee performance that meets or exceeds budget goals.

### Decision Insight

**Incentive Pay** Budgets are important in determining managers' pay. A recent survey shows that 82% of large companies tie managers' bonus payments to beating budget goals. For these companies, bonus payments are frequently more than 20% of total manager pay. ■

### Budgeting and Human Behavior

Budgets provide standards for evaluating performance and can affect the attitudes of employees evaluated by them. Budgeting can be used to create a positive effect on employees' attitudes, but it can also create negative effects if not properly applied. Budgeted levels of performance, for instance, must be realistic to avoid discouraging employees. Personnel who will be evaluated should be consulted and involved in preparing the budget to increase their commitment to

meeting it. Performance evaluations must allow the affected employees to explain the reasons for apparent performance deficiencies.

The budgeting process has three important guidelines:

1. Employees affected by a budget should be consulted when it is prepared (*participatory budgeting*).
2. Goals reflected in a budget should be attainable.
3. Evaluations should be made carefully with opportunities to explain differences between actual and budgeted amounts.

Budgeting can be a positive motivating force when these guidelines are followed.

Managers must also be aware of potential negative outcomes of budgeting. Under participatory budgeting, some employees might understate sales budgets and overstate expense budgets to allow themselves a cushion, or *budgetary slack*, to aid in meeting targets. For some businesses, pressure to meet budgeted results might lead employees to engage in unethical behavior or commit fraud. Finally, some employees might always spend their budgeted amounts, even on unnecessary items, to ensure their budgets aren't reduced for the next period.

**Example:** Assume a company's sales force receives a bonus when sales exceed the budgeted amount. How would this arrangement affect the participatory sales forecasts? Answer: Sales reps may understate their budgeted sales.

### Budget Reporting and Timing

The budget period usually coincides with the accounting period. Most companies prepare at least an annual budget, which reflects the objectives for the next year. To provide specific guidance, the annual budget usually is separated into quarterly or monthly budgets. These short-term budgets allow management to periodically evaluate performance and take corrective action.

The time period required for the annual budgeting process can vary considerably. Large, complex organizations usually require a longer time to prepare their budgets than do smaller organizations. This is so because considerable effort is required to coordinate the different units (departments) within large organizations.

Many companies apply **continuous budgeting** by preparing **rolling budgets**. As each monthly or quarterly budget period goes by, these companies revise their entire set of budgets for the months or quarters remaining and add new monthly or quarterly budgets to replace the ones that have lapsed. Thus, at any point in time, monthly or quarterly budgets are available for the next 12 months or four quarters. Exhibit 22.1 shows rolling budgets prepared at the end of five consecutive periods. The first set (at top) is prepared in December 2014 and covers the four calendar quarters of 2015. In March 2015, the company prepares another rolling budget for the next four quarters through March 2016. This same process is repeated every three months. As a result, management is continuously planning ahead.

Exhibit 22.1 reflects an annual budget composed of four quarters, prepared four times per year using the most recent information available. When continuous budgeting is not used, the fourth-quarter budget is nine months old and perhaps out of date when applied.

Companies Using Rolling Budgets

**EXHIBIT 22.1**

Rolling Budgets

### Decision Insight

**Budget Calendar** Many companies use long-range operating budgets. For large companies, three groups usually determine or influence the budgets: creditors, directors, and management. All three are interested in the companies' future cash flows and earnings. The annual budget process often begins six months or more before the budget is due to the board of directors. When rolling budgets are used, directors must be aware that management's updated budgets might be used to mask poor performance. ■

### Budget Committee

The task of preparing a budget should not be the sole responsibility of any one department. Similarly, the budget should not be simply handed down as top management's final word. Instead, budget figures and budget estimates developed through a *bottom-up* process usually are more useful. This includes, for instance, involving the sales department in preparing sales estimates. Likewise, the production department should have initial responsibility for preparing its own expense budget. Without active employee involvement in preparing budget figures, there is a risk these employees will feel that the numbers fail to reflect their special problems and needs.

Although most budgets should be developed using a bottom-up process, the budgeting system requires central guidance. This guidance is supplied by a budget committee of department heads and other executives responsible for seeing that budgeted

amounts are realistic and coordinated. If a department submits initial budget figures that do not reflect efficient performance, the budget committee should return them with explanatory comments on how to improve them. Then the originating department must either adjust its proposals or explain why they are acceptable. Communication between the originating department and the budget committee should continue as needed to ensure that both parties accept the budget as reasonable, attainable, and desirable.

**Point:** In a large company, developing a budget through a bottom-up process can involve hundreds of employees and take several weeks to finalize.

### Decision Insight

**Strategic Planning** Most companies allocate dollars based on budgets submitted by department managers. These managers verify the numbers and monitor the budget. Managers must remember, however, that a budget is judged by its success in helping achieve the company's mission. One analogy is that a hiker must know the route to properly plan a hike and monitor hiking progress. ■

Pixland/AGE fotostock

## THE MASTER BUDGET

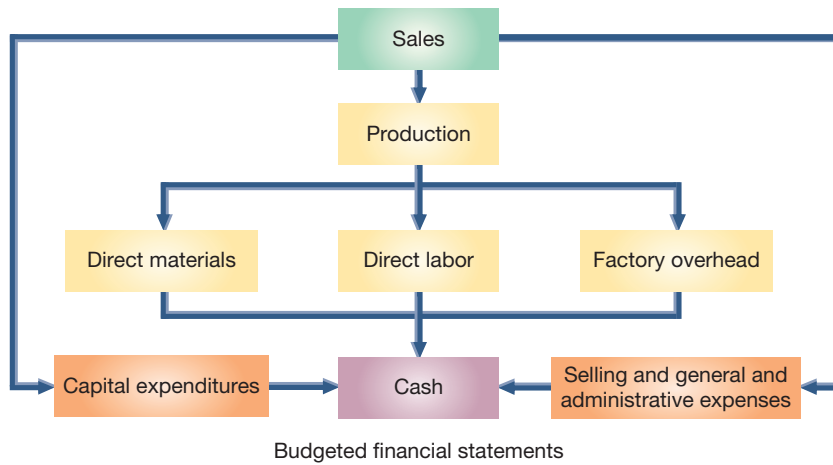

### C2

Describe a master budget and the process of preparing it.

A **master budget** is a formal, comprehensive plan for a company's future. It contains several individual budgets that are linked with each other to form a coordinated plan.

### Master Budget Components

Exhibit 22.2 summarizes the master budgeting process. The master budgeting process typically begins with the sales budget and ends with a cash budget and budgeted financial statements. The master budget includes individual budgets for sales, production (or purchases), various expenses, capital expenditures, and cash.

**EXHIBIT 22.2**  
Master Budget Process  
for a Manufacturer

The usual number and types of budgets included in a master budget depend on the company’s size and complexity. A manufacturer’s master budget should include, at a minimum, several operating budgets (shown in yellow in Exhibit 22.2), a capital expenditures budget, and a cash budget. Managers also often express the expected financial results of these planned activities with a budgeted balance sheet and a budgeted income statement. Some budgets require the input of other budgets. For example, direct materials and direct labor budgets cannot be prepared until a production budget is prepared. A company cannot plan its production until it prepares a sales budget.

**Point:** Merchandisers prepare merchandise purchase budgets instead of the operating budgets in Exhibit 22.2.

The rest of this chapter explains how Toronto Sticks Company (TSC), a manufacturer of youth hockey sticks, prepares its master budget. Its master budget includes operating, capital expenditures, and cash budgets for each month in each quarter. It also includes a budgeted income statement for each quarter and a budgeted balance sheet as of the last day of each quarter. We show how TSC prepares budgets for October, November, and December 2015. Exhibit 22.3 presents TSC’s balance sheet at the start of this budgeting period, which we often refer to as we prepare the component budgets.

Budgeting Periods

\* Equipment is depreciated on a straight-line basis over 10 years (salvage value is \$20,000).

# P1

Prepare the operating budget components of a master budget—for a manufacturing company.

## Operating Budgets

This section explains TSC’s preparation of operating budgets. Its operating budgets consist of the sales budget, production and manufacturing budgets, selling expense budget, and general and administrative expense budget. (The preparation of merchandising budgets is described in Appendix 22A.)

**Sales Budget** The first step in preparing the master budget is the **sales budget**, which shows the planned sales units and the expected dollars from these sales. The sales budget is the starting point in the budgeting process because plans for most departments are linked to sales.

The sales budget should emerge from a careful analysis of forecasted economic and market conditions, business capacity, proposed selling expenses (such as advertising), and predictions of unit sales. A company’s sales personnel are usually asked to develop predictions of sales for each territory and department. To illustrate, in September 2015, TSC sold 700 hockey sticks at \$60 per unit. After considering sales predictions and market conditions, TSC prepares its sales budget for the next three months (see Exhibit 22.4). Note that the sales budget in Exhibit 22.4 includes forecasts of both unit sales and unit prices. Some sales budgets are expressed only in total sales dollars, but most are more detailed. Management finds it useful to know budgeted units and unit prices for many different products, regions, departments, and sales representatives.

7	Total budgeted sales (dollars)	\$60,000	\$48,000	\$84,000	\$192,000
8					

### Decision Maker

**Entrepreneur** You run a start-up that manufactures designer clothes. Business is seasonal, and fashions and designs quickly change. How do you prepare reliable annual sales budgets? ■ [Answers follow the chapter’s Summary.]

**Production Budget** A manufacturer prepares a **production budget**, which shows the number of units to be produced in a period. The production budget is based on the unit sales projected in the sales budget, along with inventory considerations. Manufacturers often determine a certain amount of **safety stock**, a quantity of inventory that provides protection against lost sales caused by unfulfilled demands from customers or delays in shipments from suppliers. Exhibit 22.5 shows the general computation of the production required for a period. *A production budget does not show costs; it is always expressed in units of product.*

### EXHIBIT 22.5

Computing Production Requirements

In a *safety stock inventory system*, companies maintain sufficient inventory to reduce the risk and cost of running short. This practice requires enough production or purchases to satisfy the budgeted sales amounts. To illustrate, after assessing the cost of keeping inventory along with the risk and cost of inventory shortages, TSC decided that the number of units in its finished goods inventory at each month-end should equal 90% of next month’s predicted sales. For example, inventory at the end of October should equal 90% of budgeted November sales, and so on. This information along with knowledge of 1,010 units in inventory at September 30 (see Exhibit 22.3) allows the company to prepare the production budget shown in Exhibit 22.6. The

**Example:** Under a JIT system, how will a sales budget differ from a merchandise purchases or production budget? *Answer: The two budgets will be similar because future inventory should be near zero.*

**EXHIBIT 22.6**

Production Budget

5	Next month's budgeted sales (units) from Sales Budget*	800	1,400	900
6	Ratio of inventory to future sales	× 90%	× 90%	× 90%
7	Budgeted ending inventory (units)	720	1,260	810
8	Add: Budgeted sales (units)	1,000	800	1,400
9	Required units of available production	1,720	2,060	2,210
10	Deduct: Beginning inventory (units)	1,010**	720	1,260
11	Units to be produced	710	1,340	950
12				

\*From Sales Budget (Exhibit 22.4); January budgeted sales of 900 units from next quarter's sales budget.

\*\*October's beginning inventory (1,010 units) is inconsistent with company policy.

actual number of units of ending inventory at September 30 is not consistent with TSC's policy. This is not uncommon, as sales forecasts are uncertain and production can sometimes be disrupted.

The first three lines of TSC's production budget determine the budgeted ending inventories (in units). Budgeted unit sales are then added to the budgeted ending inventory to give the required units of production. We then subtract beginning inventory to determine the budgeted number of units to be produced. The information about units to be produced provides the basis for *manufacturing budgets* for the production costs of those units—direct materials, direct labor, and overhead.

Courtesy of JJW Images

**Decision Insight**

**Just-in-Time Inventory Systems** Managers of *just-in-time* (JIT) inventory systems use sales budgets for short periods (often as few as one or two days) to order just enough merchandise or materials to satisfy the immediate sales demand. This keeps the amount of inventory to a minimum (or zero in an ideal situation). A JIT system minimizes the costs of maintaining inventory, but it is practical only if customers are content to order in advance or if managers can accurately determine short-term sales demand. Suppliers also must be able and willing to ship small quantities regularly and promptly. ■

**Point:** Accurate estimates of future sales are crucial in a JIT system.

A manufacturing company predicts sales of 220 units for May and 250 units for June. The company wants each month's ending inventory to equal 30% of next month's predicted unit sales. Beginning inventory for May is 66 units. Compute the company's budgeted production in units for May.

**NEED-TO-KNOW 22-1**

Production Budget

P1

**Solution**

	<u>Units</u>
Budgeted ending inventory for May (250 × 30%) . . . . .	75
Plus: Budgeted sales for May . . . . .	<u>220</u>
Required units of available production . . . . .	295
Less: Beginning inventory . . . . .	<u>(66)</u>
Total units to be produced . . . . .	<u><u>229</u></u>

**QC1**

Do More: QS 22-12, QS 22-16, QS 22-17, E 22-3, E 22-10, E 22-11

**Direct Materials Budget** The **direct materials budget** shows the budgeted costs for the direct materials that will need to be purchased to satisfy the estimated production for the period. Whereas the production budget shows *units* to be produced, the direct materials budget translates the units to be produced into budgeted *costs*. (The same is true for the other two manufacturing budgets that we will discuss below—the direct labor budget and the factory overhead budget).

To develop a direct materials budget, companies need the following inputs:

- Number of units to produce (from the production budget).
- Materials requirements per unit—How many units (pounds, gallons, etc.) of direct materials go into each unit of finished product?
- Budgeted ending inventory (in units) of direct materials—As with finished goods, most companies maintain a safety stock of materials to ensure that production can continue.
- Beginning inventory (in units) of direct materials.
- Cost per unit of direct materials.

Using these inputs the company can then prepare a direct materials budget. As an example, Exhibit 22.7 shows the direct materials budget for TSC. This budget begins with the budgeted production, taken directly from the production budget. Next, TSC needs to know the amount of direct materials needed for each of the units to be produced—in this case, half a pound (.5) of wood. With these two inputs we can now compute the amount of direct materials needed for production. For example, to produce 710 hockey sticks in October, TSC will need 355 pounds of wood ( $710 \text{ units} \times 0.5 \text{ lbs.} = 355 \text{ lbs.}$ ).

### EXHIBIT 22.7

Direct Materials Budget

	A	B	C	D

2	<b>Direct Materials Budget</b>			
3	<b>October 2015–December 2015</b>			
4		<b>October</b>	<b>November</b>	<b>December</b>
5	Budgeted production units*	710	1,340	950
6	Materials requirements per unit	× 0.5	× 0.5	× 0.5
7	Materials needed for production (pounds)	355	670	475
8	Add: Budgeted ending inventory (pounds)	335	237.5	247.5**
9	Total materials requirements (pounds)	690	907.5	722.5
10	Deduct: Beginning inventory (pounds)	(178)	(335)	(237.5)
11	Materials to be purchased (pounds)	512	572.5	485.0
12				
13	Material price per pound	\$ 20	\$ 20	\$ 20
14	Total cost of direct materials purchases	\$10,240	\$11,450	\$9,700
15				

\*From Production Budget (Exhibit 22.6)

\*\*Computed from January 2016 production requirements, assumed to be 990 units.

The company then needs to consider its safety stock of direct materials. TSC has determined that it wants to have a safety stock of direct materials on hand at the end of each month to complete 50% of the budgeted units to be produced in the next month. Since TSC expects to produce 1,340 units in November, requiring 670 pounds of materials, it needs ending inventory of direct materials of 335 pounds ( $50\% \times 670$ ) at the end of October. TSC's total direct materials requirement for October is therefore 690 pounds ( $355 + 335$ ).

TSC already has 178 pounds of direct materials in its beginning inventory (refer to Exhibit 22.3). TSC deducts the amount of direct materials that were in beginning inventory from the total materials requirements for the month. For October, the calculation is 690 pounds  $-$  178 pounds, resulting in the need for 512 pounds of direct materials to be purchased in October.

The direct materials budget next translates the *pounds* of direct materials to be purchased into budgeted *costs*. TSC estimates that the cost of direct materials will be \$20 per pound over the quarter. At \$20 per pound, purchasing 512 pounds of direct materials for October production will cost \$10,240 (computed as  $\$20 \times 512$ ). Similar calculations are done to compute the cost of direct materials purchases for November (\$11,450) and December (\$9,700). (For December, assume the budgeted ending inventory of direct materials, based on January's production requirements, is 247.5 pounds). (*Note:* If the company expects direct materials costs to change in the future, it can easily work those changes into the direct materials budget. For example, if it expected the price of wood to jump to \$25 per pound in December—say, because a long-term contract with the supplier was about to expire—it could simply change that number in the direct materials budget.)

**Direct Labor Budget** The **direct labor budget** shows the budgeted costs for the direct labor that will be needed to satisfy the estimated production for the period. Because there is no “inventory” of labor, the direct labor budget is easier to prepare than the direct materials budget. TSC’s direct labor budget is shown in Exhibit 22.8. Fifteen minutes of labor time (a quarter of an hour) is required to produce one unit. Labor is paid at the rate of \$12 per hour. Budgeted labor hours are computed by multiplying the budgeted production level for each month by one-quarter (0.25) of an hour. Direct labor cost is then computed by multiplying budgeted labor hours by the labor rate of \$12 per hour.

**Point:** A quarter of an hour can be expressed as 0.25 hours.

	A	B	C	D

6	Labor requirements per unit (hours)	× 0.25	× 0.25	× 0.25
7	Total labor hours needed	177.5	335	237.5
8				
9	Labor rate (per hour)	\$ 12	\$ 12	\$ 12
10	Labor dollars	\$2,130	\$4,020	\$2,850
11				

\*From Production Budget (Exhibit 22.6)

**EXHIBIT 22.8**  
Direct Labor Budget

As before, estimated changes in direct labor costs can be easily shown in the budgeting process. Companies thus can ensure the right amount of labor for periods in which production is expected to change or to take into account expected changes in hourly labor rates.

A manufacturing company budgets production of 800 units during June and 900 units during July. Each unit of finished goods requires 2 pounds of direct materials, at a cost of \$8 per pound. The company maintains an inventory of direct materials equal to 10% of next month’s budgeted production. Beginning direct materials inventory for June is 160 pounds. Each finished unit requires 1 hour of direct labor at the rate of \$14 per hour. Compute the budgeted (a) cost of direct materials purchases for June and (b) direct labor cost for June.

**NEED-TO-KNOW 22-2**

Direct Materials and  
Direct Labor Budgets

P1

**Solution**

**a.**

Budgeted production (units) . . . . .	800
Materials requirements per unit (lbs.) . . . . .	× 2
Materials needed for production (lbs.) . . . . .	1,600
Add: Budgeted ending inventory (lbs.) . . . . .	180*
Total materials requirements (lbs.) . . . . .	1,780
Less: Beginning inventory (lbs.) . . . . .	(160)
Materials to be purchased (lbs.) . . . . .	<u>1,620</u>
Material price per pound . . . . .	\$ 8
Total cost of direct materials purchases . . . . .	\$12,960

\*900 units × 2 lbs. per unit × 10% = 180 lbs.

**b.**

Budgeted production (units) . . . . .	800
Labor requirements per unit (hours) . . . . .	× 1
Total direct labor hours needed . . . . .	<u>800</u>
Labor rate (per hour) . . . . .	\$ 14
Direct labor cost (June) . . . . .	\$11,200

E 22-5, E 22-8

**Factory Overhead Budget** The **factory overhead budget** shows the budgeted costs for factory overhead that will be needed to complete the estimated production for the period. TSC’s factory overhead budget is shown in Exhibit 22.9. TSC separates variable and fixed overhead costs in its overhead budget, as do many companies.

**EXHIBIT 22.9**

Factory Overhead Budget

	A	B	C	D
1	<b>TORONTO STICKS COMPANY</b>			
2	<b>Factory Overhead Budget</b>			
3	<b>October 2015–December 2015</b>			
4		<b>October</b>	<b>November</b>	<b>December</b>
5	Budgeted production (units)*	710	1,340	950
6	Variable factory overhead rate	× \$ 2.50	× \$ 2.50	× \$ 2.50
7	Budgeted variable overhead	1,775	3,350	2,375
8	Budgeted fixed overhead	1,500	1,500	1,500
9	Budgeted total overhead	<u>\$3,275</u>	<u>\$4,850</u>	<u>\$3,875</u>
10				

\*From Production Budget (Exhibit 22.6)

**Point:** Companies can use scatter diagrams, the high-low method, or regression analysis to classify overhead costs as fixed or variable.

Separating variable and fixed overhead costs enables companies to more closely estimate changes in overhead costs as production volume varies. The variable portion of overhead is assigned at the rate of \$2.50 per unit of production. This predetermined overhead rate might be based on inputs such as direct materials costs, machine hours, direct labor hours, or other activity measures. TSC’s fixed overhead consists entirely of depreciation on manufacturing equipment. From Exhibit 22.3, this is computed as \$18,000 per year  $[(\$200,000 - \$20,000)/10 \text{ years}]$ , or \$1,500 per month  $(\$18,000/12 \text{ months})$ . This fixed portion stays constant at \$1,500 per month.

The budget in Exhibit 22.9 is in condensed form; most overhead budgets are more detailed, listing each overhead cost item. Other costs included on overhead budgets commonly include supervisor salaries, indirect materials, indirect labor, utilities, and maintenance of manufacturing equipment. We explain these more detailed overhead budgets in the next chapter.

**Product Cost Per Unit** With the information from the three manufacturing budgets (direct materials, direct labor, and factory overhead), we can compute TSC’s product cost per unit. This is useful in computing cost of goods sold and preparing a budgeted income statement, as we show later. For budgeting purposes, TSC assumes it will normally produce 3,000 units of product each quarter, yielding fixed overhead of \$1.50 per unit. TSC’s other product costs are all variable. Exhibit 22.10 summarizes the product cost per unit calculation.

**EXHIBIT 22.10**

Product Cost Per Unit

Product Cost	Per Unit
Direct materials: ½ pound of materials × \$20 per pound of materials.....	\$10.00
Direct labor: 0.25 hours of direct labor × \$12 per hour of direct labor .....	3.00
Variable overhead (given).....	2.50
Fixed overhead (\$4,500 total fixed overhead per quarter/3,000 units of expected production per quarter.....	<u>1.50</u>
Total product cost per unit* .....	<u>\$17.00</u>

\*At the normal production level of 3,000 units per quarter.

**Selling Expense Budget** The **selling expense budget** is an estimate of the types and amounts of selling expenses expected during the budget period. It is usually prepared by the vice president of marketing or an equivalent sales manager. Budgeted selling expenses are based on the sales budget, plus a fixed amount of sales manager salaries.

To illustrate, TSC’s selling expense budget is in Exhibit 22.11. The firm’s selling expenses consist of commissions paid to sales personnel and a \$2,000 monthly salary paid to the sales manager. Sales commissions equal 10% of total sales and are paid in the month sales occur. Sales commissions are variable with respect to sales volume, but the sales manager’s salary is fixed. No advertising expenses are budgeted for this particular quarter.

**Point:** Other common selling expenses include advertising, delivery expenses, and marketing expenses.

	A	B	C	D	E
1	<b>TORONTO STICKS COMPANY</b>				
2	<b>Selling Expense Budget</b>				
3	<b>October 2015–December 2015</b>				
4		<b>October</b>	<b>November</b>	<b>December</b>	<b>Totals</b>
5	Budgeted sales*	\$60,000	\$48,000	\$ 84,000	\$192,000
6	Sales commission percent	× 10%	× 10%	× 10%	× 10%
7	Sales commissions	6,000	4,800	8,400	19,200
8	Salary for sales manager	2,000	2,000	2,000	6,000
9	Total selling expenses	\$ 8,000	\$ 6,800	\$ 10,400	\$ 25,200
10					

\*From Sales Budget (Exhibit 22.4)

**General and Administrative Expense Budget** The **general and administrative expense budget** plans the predicted operating expenses not included in the selling expenses or manufacturing budgets. The office manager responsible for general administration often is responsible for preparing the general and administrative expense budget.

Exhibit 22.12 shows TSC's general and administrative expense budget. It includes salaries of \$54,000 per year, or \$4,500 per month (paid each month when they are earned). Insurance, taxes, and depreciation on nonmanufacturing assets are other common examples of general and administrative expenses.

	A	B	C	D	E

2	<b>General and Administrative Expense Budget</b>				
3	<b>October 2015–December 2015</b>				
4		<b>October</b>	<b>November</b>	<b>December</b>	<b>Totals</b>
5	Administrative salaries	\$4,500	\$4,500	\$4,500	\$13,500
6	Total general and administrative expenses	\$4,500	\$4,500	\$4,500	\$13,500
7					

## Decision Insight

**No Biz Like Snow Biz** Ski resorts' costs of making snow are in the millions of dollars for equipment alone. Snowmaking involves spraying droplets of water into the air, causing them to freeze and come down as snow. Making snow can cost more than \$2,000 an hour. Snowmaking accounts for 40 to 50 percent of the budgeted costs for many ski resorts. ■

Gail Shotlander/Getty Images

## EXHIBIT 22.11

Selling Expense Budget

**Example:** If TSC expects a 12% sales commission will result in budgeted sales of \$220,000 for the quarter; what is the total amount of selling expenses for the quarter? Answer: \$32,400.

**Point:** Some companies combine selling and general administrative expenses into a single budget.

## EXHIBIT 22.12

General and Administrative Expense Budget

**Example:** In Exhibit 22.12, how would a rental agreement of \$5,000 per month plus 1% of sales affect the general and administrative expense budget? (Budgeted sales are in Exhibit 22.4.) Answer: Rent expense: Oct. = \$5,600; Nov. = \$5,480; Dec. = \$5,840; Total = \$16,920; Revised total general and administrative expenses: Oct. = \$10,100; Nov. = \$9,980; Dec. = \$10,340; Total = \$30,420.

A manufacturing company budgets sales of \$70,000 during July. It pays sales commissions of 5% of sales and also pays a sales manager a salary of \$3,000 per month. Other monthly costs include depreciation on office equipment (\$500), insurance expense (\$200), advertising (\$1,000), and office manager salary of \$2,500 per month. For the month of July, compute the total (a) budgeted selling expense and (b) budgeted general and administrative expense.

### Solution

- Total budgeted selling expense =  $(\$70,000 \times 5\%) + \$3,000 + \$1,000 = \$7,500$
- Total budgeted general and administrative expense =  $\$500 + \$200 + \$2,500 = \$3,200$

## NEED-TO-KNOW 22-3

Selling and General and Administrative Expense Budgets

P1

Do More: QS 22-5, QS 22-11

OC2

At this point we have illustrated how a manufacturing company prepares its operating budgets. Information from these operating budgets is useful in preparing the capital expenditures budget, the cash budget, and budgeted financial statements, as we show next.

**Capital Expenditures Budget** The **capital expenditures budget** shows dollar amounts estimated to be spent to purchase additional plant assets the company will use to carry out its budgeted business activities. It also shows any amounts expected to be received from plant asset disposals, as companies replace old assets with new ones. Thus, the capital expenditures budget shows the company’s expected investing activities in plant assets. It is usually prepared after the operating budgets. Since a company’s plant assets determine its productive capacity, this budget is usually affected by long-range plans for the business. Yet the process of preparing other budgets can reveal that the company requires more (or less) capacity, which implies more (or less) plant assets.

*Capital budgeting* is the process of evaluating and planning for capital (plant asset) expenditures. This is an important management task because these expenditures often involve long-run commitments of large amounts, affect predicted cash flows, and impact future debt and equity financing. This means that the capital expenditures budget is often linked with management’s evaluation of the company’s ability to take on more debt. We describe capital budgeting in a later chapter.

TSC does not anticipate disposal of any plant assets through December 2015, but it does plan to acquire additional equipment for \$25,000 cash near the end of December 2015. This is the only budgeted capital expenditure from October 2015 through December 2015. Thus, no separate budget is shown. TSC’s cash budget will reflect this \$25,000 planned expenditure.

### Cash Budget

After developing budgets for sales, manufacturing costs, expenses, and capital expenditures, the next step is to prepare the **cash budget**, which shows expected cash inflows and outflows during the budget period. The cash budget is especially important because it helps the company maintain a cash balance necessary to meet ongoing obligations. Most companies set an amount of cash they want to have on hand. By preparing a cash budget, management can prearrange loans to cover anticipated cash shortages before they are needed. A cash budget also helps management avoid a cash balance that is too large. Too much cash is undesirable because it earns a relatively low (if any) return. Exhibit 22.13 shows the general formula for the cash budget.

**P2** Prepare a cash budget.

#### EXHIBIT 22.13

General Formula for Cash Budget

When preparing a cash budget, we add expected cash receipts to the beginning cash balance and deduct expected cash disbursements. If the expected (preliminary) cash balance is too low, additional cash requirements appear in the budget as planned increases from short-term loans. If the preliminary cash balance exceeds the balance the company wants to maintain, the excess is used to repay loans (if any) or to acquire short-term investments. Information for preparing the cash budget is mainly taken from the operating and capital expenditures budgets. Preparing the cash budget typically requires the preparation of other supporting schedules; we show the first of these, a schedule of cash receipts from sales, next.

**Cash Receipts from Sales** Managers use the sales budget, combined with knowledge about how frequently customers pay on credit sales, to budget monthly cash receipts. To illustrate, Exhibit 22.14 presents TSC’s schedule of budgeted cash receipts.

	A	B	C	D	E
1	<b>TORONTO STICKS COMPANY</b>				
2	<b>Schedule of Cash Receipts from Sales</b>				
3	<b>October 2015–December 2015</b>				
4		<b>September</b>	<b>October</b>	<b>November</b>	<b>December</b>
5	Sales*	\$42,000	\$60,000	\$48,000	\$84,000
6	Less: Ending accounts receivable (60%)	25,200**	36,000	28,800	50,400
7	Cash receipts from				
8	Cash sales (40% of sales)		24,000	19,200	33,600
9	Collections of prior month's receivables		25,200	36,000	28,800
10	Total cash receipts		\$49,200	\$55,200	\$62,400
11					

\*From Sales Budget (Exhibit 22.4)

\*\*Accounts receivable balance from September 30 balance sheet (Exhibit 22.3)

### EXHIBIT 22.14

Computing Budgeted Cash Receipts from Sales

We begin with reference to TSC's budgeted sales (Exhibit 22.4). Analysis of past sales indicates that 40% of the firm's sales are for cash. The remaining 60% are credit sales; these customers are expected to pay in full in the month following the sales. We now can compute the budgeted cash receipts from customers, as shown in Exhibit 22.14. October's budgeted cash receipts consist of \$24,000 from expected cash sales ( $\$60,000 \times 40\%$ ) plus the anticipated collection of \$25,200 of accounts receivable from the end of September.

**Cash Payments for Materials** Managers use the beginning balance sheet (Exhibit 22.3) and the direct materials budget (Exhibit 22.7) to help prepare a schedule of cash disbursements for materials. Managers must also know *how* TSC purchases direct materials (pay cash or on account), and for credit purchases, how quickly TSC pays. TSC's materials purchases are entirely on account. It makes full payment during the month following its purchases. Using this information, the schedule of cash payments for materials is shown in Exhibit 22.15.

	A	B	C	D
1	<b>TORONTO STICKS COMPANY</b>			
2	<b>Schedule of Cash Payments for Direct Materials</b>			
3	<b>October 2015–December 2015</b>			
4		<b>October</b>	<b>November</b>	<b>December</b>
5	Materials purchases*	\$10,240	\$11,450	\$ 9,700
6	Cash disbursements for			
7	Current month purchases (0%)	0	0	0
8	Prior month purchases (100%)	7,060**	10,240	11,450
9	Total cash disbursements for direct materials	\$ 7,060	\$10,240	\$11,450
10				

\*From Direct Materials Budget (Exhibit 22.7)

\*\*Accounts payable balance from September 30 balance sheet (Exhibit 22.3)

### EXHIBIT 22.15

Computing Cash Payments for Materials Purchases

The schedule above can be modified for alternative payment timing. For example, if Toronto Sticks Company paid for 20% of its purchases in the month of purchase, and paid the remaining 80% of a month's purchases in the following month, its cash disbursements in December would equal \$11,100, computed as  $(20\% \times \$9,700)$  plus  $(80\% \times \$11,450)$ .

**Preparing the Cash Budget** Managing cash flows is vital for a company's success. The cash budget is useful in this regard because it summarizes many other budgets in terms of their effects on cash. To prepare the cash budget, TSC's managers use the budgets and other schedules listed below.

1. Cash receipts from sales (Exhibit 22.14).
2. Cash payments for direct materials (Exhibit 22.15).
3. Cash payments for direct labor (Exhibit 22.8).
4. Cash payments for variable overhead (Exhibit 22.9).
5. Cash payments for selling expenses (Exhibit 22.11).
6. Cash payments for general and administrative expenses (Exhibit 22.12).

Note that the *fixed overhead* assigned to depreciation in the factory overhead budget (Exhibit 22.9) does not require a cash payment. Therefore, it is not included in the cash budget. Other types of fixed overhead—such as payments for property taxes and insurance—are included if they require cash payments.

Additional information is typically needed to prepare the cash budget. For TSC, this additional information includes:

1. Income taxes payable (from the beginning balance sheet, Exhibit 22.3).
2. Expected dividend payments: TSC plans to pay \$3,000 of cash dividends in the second month of each quarter.
3. Loan activity: TSC’s managers want to maintain a minimum cash balance of \$20,000 at each month-end. This is important, as it helps ensure TSC maintains enough liquidity to pay its bills as they come due.

Courtesy of JJW Images

Exhibit 22.16 shows the full cash budget for TSC. The company begins October with \$20,000 in cash. To this is added \$49,200 in expected cash receipts from sales (from Exhibit 22.14). We next subtract expected cash payments for direct materials, direct labor, overhead, selling expenses, and general and administrative expenses. Income taxes of \$20,000 were due as of the end of September 30, 2015, and payable in October. We next discuss TSC’s loan activity, including any interest payments.

28				

\* Beginning loan balance (note payable) from Exhibit 22.3

\*\* Rounded to the nearest dollar.

**Loan Activity** TSC has an agreement with its bank that promises additional loans at each month-end, if necessary, so that the company keeps a minimum cash balance of \$20,000. If the cash balance exceeds \$20,000 at a month-end, TSC uses the excess to repay loans. If the cash balance is less than \$20,000 at month-end, the bank loans TSC the difference.

At the end of each month, TSC pays the bank interest on any outstanding loan amount, at the monthly rate of 1% of the beginning balance of these loans. For October, this payment is 1% of the \$10,000 note payable amount reported in the balance sheet of Exhibit 22.3. For November, TSC expects to pay interest of \$44, computed as 1% of the \$4,365 expected loan balance at October 31. No interest is budgeted for December because the company expects to repay the

loans in full at the end of November. Exhibit 22.16 shows that the October 31 cash balance increases to \$25,635 (before any loan-related activity). This amount is more than the \$20,000 minimum. Thus, TSC will pay off a portion of its outstanding loan. At the end of November, TSC's cash balance is sufficient to pay off its remaining loan balance. Had TSC's preliminary cash balance been below the \$20,000 minimum in any month, TSC would have increased its loan from the bank so that the ending cash balance was \$20,000. We show an example of this situation in Need-To-Know Comprehensive 2 at the end of this chapter.

## Decision Insight

**Cash Cushion** Why do some companies maintain a minimum cash balance even when the budget shows extra cash is not needed? For example, Apple's cash and short-term investments balance is over \$40 billion. According to Apple's CEO, Tim Cook, the cushion provides "flexibility and security," important in navigating uncertain economic times. A cash cushion also enables companies to jump on new ventures or acquisitions that may present themselves. ■

## BUDGETED FINANCIAL STATEMENTS

One of the final steps in the budgeting process is summarizing the financial statement effects. We next illustrate TSC's budgeted income statement and budgeted balance sheet.

**P3**

Prepare budgeted financial statements.

### Budgeted Income Statement

The **budgeted income statement** is a managerial accounting report showing predicted amounts of sales and expenses for the budget period. It summarizes the income effects of the budgeted activities. Information needed to prepare a budgeted income statement is primarily taken from already-prepared budgets. The volume of information summarized in the budgeted income statement is so large for some companies that they often use spreadsheets to accumulate the budgeted transactions and classify them by their effects on income.

We condense TSC's budgeted income statement and show it in Exhibit 22.17. All information in this exhibit is taken from the component budgets we've examined in this chapter. Also, we now can predict the amount of income tax expense for the quarter, computed as 40% of the budgeted pretax income. For TSC, these taxes are not payable until January 31, 2016. Thus, these taxes are not shown on the October–December 2015 cash budget in Exhibit 22.16, but they are included on the December 31, 2015, balance sheet (shown next).

**Point:** Lenders often require potential borrowers to provide cash budgets, budgeted income statements, and budgeted balance sheets, as well as data on past performance.

#### TORONTO STICKS COMPANY Budgeted Income Statement For Three Months Ended December 31, 2015

#### EXHIBIT 22.17

Budgeted Income Statement

## Budgeted Balance Sheet

The final step in preparing the master budget is summarizing the company's financial position. The **budgeted balance sheet** shows predicted amounts for the company's assets, liabilities, and equity as of the end of the budget period. TSC's budgeted balance sheet in Exhibit 22.18 is prepared using information from the other budgets. The sources of amounts are reported in the notes to the budgeted balance sheet.

### EXHIBIT 22.18

<sup>a</sup> Ending balance for December from the cash budget (in Exhibit 22.16).

<sup>b</sup> 60% of \$84,000 sales budgeted for December from the sales budget (in Exhibit 22.4).

<sup>c</sup> 247.5 pounds of raw materials in budgeted ending inventory at the budgeted cost of \$20 per unit (direct materials budget, Exhibit 22.7).

<sup>d</sup> 810 units in budgeted finished goods inventory (Exhibit 22.6) at the budgeted cost of \$17 per unit (Exhibit 22.10).

<sup>e</sup> September 30 balance of \$200,000 from the beginning balance sheet in Exhibit 22.3 plus \$25,000 cost of new equipment from the cash budget in Exhibit 22.16.

<sup>f</sup> September 30 balance of \$36,000 from the beginning balance sheet in Exhibit 22.3 plus \$4,500 depreciation expense from the factory overhead budget in Exhibit 22.9.

<sup>g</sup> Budgeted cost of materials purchases for December from Exhibit 22.7, to be paid in January.

<sup>h</sup> Income tax expense from the budgeted income statement for the fourth quarter in Exhibit 22.17, to be paid in January.

<sup>i</sup> Unchanged from the beginning balance sheet in Exhibit 22.3.

<sup>j</sup> September 30 balance of \$42,870 from the beginning balance sheet in Exhibit 22.3 plus budgeted net income of \$59,254 from the budgeted income statement in Exhibit 22.17 minus budgeted cash dividends of \$3,000 from the cash budget in Exhibit 22.16.

## Using the Master Budget

For a master budget to be useful, managers must employ it in their planning and controlling activities. With respect to *planning*, the master budget is clearly a plan for future activities. In addition, any stage in the master budgeting process might reveal undesirable outcomes. The new information can cause management to change its decisions. For example, an early version of the cash budget could show an insufficient amount of cash unless cash outlays are reduced. This information could yield a reduction in planned equipment purchases. Likewise, a budgeted balance sheet might reveal too much debt from too many planned equipment purchases; the company could reduce its planned equipment purchases and thus reduce its need for borrowing.

In *controlling* operations, managers typically compare actual results to budgeted results. Differences between actual and budgeted results are called *variances*. Management examines variances, particularly large ones, to identify areas for improvement and take corrective action. We discuss variances in more detail in the next chapter.

## GLOBAL VIEW

**Royal Philips Electronics** of the Netherlands is a diversified company. Preparing budgets and evaluating progress helps the company achieve its goals. In a recent annual report the company reports that it budgets sales to grow at a faster pace than overall economic growth. Based on this sales target, company managers prepare detailed operating, capital expenditure, and financial budgets.

Budgeted and actual results of companies that do global business are impacted by changes in foreign currency exchange rates. While most of Royal Philips's cash disbursements are in euros, the company's sales are in euros, U.S. dollars, Chinese yuan, Brazilian real, and other currencies. Forecasting future exchange rates and their impact on sales budgets is difficult. In addition, global economic and political uncertainties add to budgeting challenges.

**Sustainability and Accounting Solben**, this chapter's opener company, is focused on alternative fuels. According to the U.S. Department of Energy, burning biodiesel instead of petroleum diesel reduces tailpipe emissions and is better for the environment. Daniel Gómez Iñiguez, one of Solben's founders, notes that "the benefits of biodiesel technology extend beyond earth-friendly fuel. Our plants can be built in remote locations, and thus create local jobs. Companies like ours can have a global impact, and be an example of how socially responsible businesses can also be profitable." The sustainability of Solben's operations, and operations like it, is arguably one path to making business accountable.

### Activity-Based Budgeting

### Decision Analysis

**Activity-based budgeting (ABB)** is a budget system based on expected activities. Knowledge of expected activities and their levels for the budget period enables management to plan for resources required to perform the activities. Exhibit 22.19 contrasts a traditional budget with an activity-based budget for a company's accounting department. Traditional budgeting systems list items such as salaries, supplies, equipment, and utilities. With a traditional budget, management often makes across-the-board budget cuts or increases. For example, management might decide that each of the line items in the traditional budget must be cut by 5%. This might not be a good strategic decision. In contrast, ABB requires management to list activities performed by, say, the accounting department such as auditing, tax reporting, financial reporting, and cost accounting. An understanding of the resources required to perform the activities, the costs associated with these resources, and the way resource use changes with changes in activity levels allows management to better assess how expenses will change to accommodate changes in activity levels. Moreover, by knowing the relation between activities and costs, management can attempt to reduce costs by eliminating nonvalue-added activities.

## A1

Analyze expense planning using activity-based budgeting.

Traditional Budget		Activity-Based Budget	
Salaries .....	\$152,000	Auditing .....	\$ 58,000
Supplies .....	22,000	Tax reporting .....	71,000
Depreciation .....	36,000	Financial reporting .....	63,000
Utilities .....	14,000	Cost accounting .....	32,000
Total .....	<u>\$224,000</u>	Total .....	<u>\$224,000</u>

Finished goods inventory .....	96,600**	Long-term note payable .....	200,000
Total current assets .....	\$352,398	Total liabilities .....	275,818
Equipment .....	480,000	Common stock .....	435,000
Less: Accumulated depreciation ..	(90,000)	Retained earnings .....	31,580
Equipment, net .....	390,000	Total stockholders' equity .....	466,580
Total assets .....	<u>\$742,398</u>	Total liabilities and equity .....	<u>\$742,398</u>

\*2,425 pounds @ \$12.70, rounded to nearest whole dollar \*\*8,400 units @ \$11.50 per unit

**Additional Information**

- Sales for March total 10,000 units. Expected sales (in units) are: 10,500 (April), 9,500 (May), 10,000 (June), and 10,500 (July). The product's selling price is \$25 per unit.
- Company policy calls for a given month's ending finished goods inventory to equal 80% of the next month's expected unit sales. The March 31 finished goods inventory is 8,400 units, which complies with the policy. The product's manufacturing cost is \$11.50 per unit, including per unit costs of \$6.35 for materials (.5 lbs. at \$12.70 per lb.), \$3.75 for direct labor (1/4 hour × \$15 direct labor rate per hour), \$0.90 for variable overhead, and \$0.50 for fixed overhead. Fixed overhead consists entirely of \$5,000 of monthly depreciation expense. Company policy also calls for a given month's ending raw materials inventory to equal 50% of next month's expected materials needed for production. The March 31 inventory is 2,425 units of materials, which complies with the policy. The company expects to have 2,100 units of materials inventory on June 30.
- Sales representatives' commissions are 12% of sales and are paid in the month of the sales. The sales manager's monthly salary will be \$3,500 in April and \$4,000 per month thereafter.
- Monthly general and administrative expenses include \$8,000 administrative salaries and 0.9% monthly interest on the long-term note payable.
- The company expects 30% of sales to be for cash and the remaining 70% on credit. Receivables are collected in full in the month following the sale (none is collected in the month of the sale).
- All direct materials purchases are on credit, and no payables arise from any other transactions. One month's purchases are fully paid in the next month. Materials cost \$12.70 per pound.
- The minimum ending cash balance for all months is \$50,000. If necessary, the company borrows enough cash using a short-term note to reach the minimum. Short-term notes require an interest payment of 1% at each month-end (before any repayment). If the ending cash balance exceeds the minimum, the excess will be applied to repaying the short-term notes payable balance.
- Dividends of \$100,000 are to be declared and paid in May.
- No cash payments for income taxes are to be made during the second calendar quarter. Income taxes will be assessed at 35% in the quarter.
- Equipment purchases of \$55,000 are scheduled for June.

**Required**

Prepare the following budgets and other financial information as required:

- Sales budget, including budgeted sales for July.
- Production budget.
- Direct materials budget. Round costs of materials purchases to the nearest dollar.
- Direct labor budget.

5. Factory overhead budget.
6. Selling expense budget.
7. General and administrative expense budget.
8. Expected cash receipts from customers and the expected June 30 balance of accounts receivable.
9. Expected cash payments for purchases and the expected June 30 balance of accounts payable.
10. Cash budget.
11. Budgeted income statement, budgeted statement of retained earnings, and budgeted balance sheet.

**Additional Information**

- a. Sales for March total 10,000 units. Each month's sales are expected to exceed the prior month's results by 5%. The product's selling price is \$25 per unit.
- b. Company policy calls for a given month's ending inventory to equal 80% of the next month's expected unit sales. The March 31 inventory is 8,400 units, which complies with the policy. The purchase price is \$15 per unit.
- c. Sales representatives' commissions are 12.5% of sales and are paid in the month of the sales. The sales manager's monthly salary will be \$3,500 in April and \$4,000 per month thereafter.
- d. Monthly general and administrative expenses include \$8,000 administrative salaries, \$5,000 depreciation, and 0.9% monthly interest on the long-term note payable.
- e. The company expects 30% of sales to be for cash and the remaining 70% on credit. Receivables are collected in full in the month following the sale (none is collected in the month of the sale).
- f. All merchandise purchases are on credit, and no payables arise from any other transactions. One month's purchases are fully paid in the next month.
- g. The minimum ending cash balance for all months is \$50,000. If necessary, the company borrows enough cash using a short-term note to reach the minimum. Short-term notes require an interest payment of 1% at each month-end (before any repayment). If the ending cash balance exceeds the minimum, the excess will be applied to repaying the short-term notes payable balance.
- h. Dividends of \$100,000 are to be declared and paid in May.
- i. No cash payments for income taxes are to be made during the second calendar quarter. Income taxes will be assessed at 35% in the quarter.
- j. Equipment purchases of \$55,000 are scheduled for June.

**Required**

Prepare the following budgets and other financial information as required:

1. Sales budget, including budgeted sales for July.
2. Purchases budget.
3. Selling expense budget.
4. General and administrative expense budget.
5. Expected cash receipts from customers and the expected June 30 balance of accounts receivable.
6. Expected cash payments for purchases and the expected June 30 balance of accounts payable.
7. Cash budget.
8. Budgeted income statement, budgeted statement of retained earnings, and budgeted balance sheet.

**PLANNING THE SOLUTION**

- The sales budget shows expected sales for each month in the quarter. Start by multiplying March sales by 105% and then do the same for the remaining months. July's sales are needed for the purchases budget. To complete the budget, multiply the expected unit sales by the selling price of \$25 per unit.
- Use these results and the 80% inventory policy to budget the size of ending inventory for April, May, and June. Add the budgeted sales to these numbers and subtract the actual or expected beginning inventory for each month. The result is the number of units to be purchased each month. Multiply these numbers by the per unit cost of \$15. Find the budgeted cost of goods sold by multiplying the unit sales in each month by the \$15 cost per unit. Compute the cost of the June 30 ending inventory by multiplying the expected units available at that date by the \$15 cost per unit.
- The selling expense budget has only two items. Find the amount of the sales representatives' commissions by multiplying the expected dollar sales in each month by the 12.5% commission rate. Then include the sales manager's salary of \$3,500 in April and \$4,000 in May and June.
- The general and administrative expense budget should show three items. Administrative salaries are fixed at \$8,000 per month, and depreciation is \$5,000 per month. Budget the monthly interest expense on the long-term note by multiplying its \$200,000 balance by the 0.9% monthly interest rate.
- Determine the amounts of cash sales in each month by multiplying the budgeted sales by 30%. Add to this amount the credit sales of the prior month (computed as 70% of prior month's sales). April's cash receipts from collecting receivables equals the March 31 balance of \$175,000. The expected June 30 accounts receivable balance equals 70% of June's total budgeted sales.
- Determine expected cash payments on accounts payable for each month by making them equal to the merchandise purchases in the prior month. The payments for April equal the March 31 balance of

accounts payable shown on the beginning balance sheet. The June 30 balance of accounts payable equals merchandise purchases for June.

- Prepare the cash budget by combining the given information and the amounts of cash receipts and cash payments on account that you computed. Complete the cash budget for each month by either borrowing enough to raise the preliminary balance to the minimum or paying off short-term debt as much as the balance allows without falling below the minimum. Show the ending balance of the short-term note in the budget.
- Prepare the budgeted income statement by combining the budgeted items for all three months. Determine the income before income taxes and multiply it by the 35% rate to find the quarter's income tax expense.
- The budgeted statement of retained earnings should show the March 31 balance plus the quarter's net income minus the quarter's dividends.
- The budgeted balance sheet includes updated balances for all items that appear in the beginning balance sheet and an additional liability for unpaid income taxes. Amounts for all asset, liability, and equity accounts can be found either in the budgets, other calculations, or by adding amounts found there to the beginning balances.

**APPENDIX**

# Merchandise Purchases Budget

# 22A

Exhibit 22A.1 shows the master budget sequence for a merchandiser. Unlike a manufacturing company, a merchandiser must prepare a merchandise purchases budget rather than a production budget. In addition, a merchandiser does not prepare direct materials, direct labor, or factory overhead budgets. In this appendix we show the merchandise purchases budget for Hockey Den (HD), a retailer of hockey sticks.

**P4** Prepare each component of a master budget and link each to the budgeting process—for a merchandising company.

**EXHIBIT 22A.1**  
Master Budget Sequence—Merchandiser

**Merchandise purchases budget preparation.** Toronto Sticks Company is an exclusive supplier of hockey sticks to Hockey Den, meaning that the companies rely on the same budgeted sales figures (Exhibit 22.4) in preparing budgets. A merchandiser usually expresses a **merchandise purchases budget** in both units and dollars. Exhibit 22A.2 shows the general layout for this budget in equation form. If this formula is expressed in units and only one product is involved, we can compute the number of dollars of inventory to be purchased for the budget by multiplying the units to be purchased by the cost per unit.

Budgeted ending merchandise inventory	+	Budgeted sales for the period	-	Budgeted beginning merchandise inventory	=	Merchandise inventory to be purchased
---------------------------------------	---	-------------------------------	---	--	---	---------------------------------------

**EXHIBIT 22A.2**  
General Formula for Merchandise Purchases Budget

To illustrate, after assessing the cost of keeping inventory along with the risk and cost of inventory shortages, HD decided that the number of units in its inventory at each month-end should equal 90% of next month's predicted sales. For example, inventory at the end of October should equal 90% of budgeted November sales, and the November ending inventory should equal 90% of budgeted December sales, and so on. Also, HD expects the September 2015 per unit purchase cost of \$60 to remain unchanged through January 2016. This information along with knowledge of 1,010 units in inventory at September 30 (given) allows the company to prepare the merchandise purchases budget shown in Exhibit 22A.3.

**EXHIBIT 22A.3**

Merchandise Purchases Budget

	A	B	C	D
1	<b>HOCKEY DEN</b>			
2	<b>Merchandise Purchases Budget</b>			
3	<b>October 2015–December 2015</b>			
4		<b>October</b>	<b>November</b>	<b>December</b>
5	Next month's budgeted sales (units)	800	1,400	900
6	Ratio of inventory to future sales	× 90%	× 90%	× 90%
7	Budgeted ending inventory (units)	720	1,260	810
8	Add: Budgeted sales (units)	1,000	800	1,400
9	Required units of available merchandise	1,720	2,060	2,210
10	Deduct: Beginning inventory (units)	1,010*	720	1,260
11	Total units to be purchased	710	1,340	950
12				
13	Budgeted cost per unit	\$ 60	\$ 60	\$ 60
14	Budgeted cost of merchandise purchases	\$42,600	\$80,400	\$57,000
15				

\*Does not comply with company policy.

The first three lines of HD's merchandise purchases budget determine the required ending inventories (in units). Budgeted unit sales are then added to the desired ending inventory to give the required units of available merchandise. We then subtract beginning inventory to determine the budgeted number of units to be purchased. The last line is the budgeted cost of the purchases, computed by multiplying the number of units to be purchased by the predicted cost per unit.

**Other Master Budget Differences—Merchandiser vs. Manufacturer** In addition to preparing a purchases budget instead of production, direct materials, direct labor, and overhead budgets, other key differences in master budgets for merchandisers include:

1. Depreciation expense is included in the general and administrative expense budget of the merchandiser. For the manufacturer, depreciation on manufacturing assets is included in the factory overhead budget and treated as a product cost.
2. The budgeted balance sheet for the merchandiser will report only one asset for inventory. The balance sheet for the manufacturer will typically report three inventory assets: raw materials, work in process, and finished goods.

See Need-To-Know Comprehensive 2 for illustration of a complete master budget, including budgeted financial statements, for a merchandising company.

**NEED-TO-KNOW 22-4**

Merchandise Purchases Budget

P4

In preparing monthly budgets for the third quarter, a company budgeted sales of 120 units for July and 140 units for August. Management wants each month's ending inventory to be 60% of next month's sales. The June 30 inventory consists of 72 units. How many units should be purchased in July?

**Solution**

	<u>July</u>
Next month's budgeted sales (units) . . . . .	140
Ratio of inventory to future sales . . . . .	× 60%
Budgeted ending inventory (units) . . . . .	84
Add: Budgeted sales (units) . . . . .	+ 120
Required units of available merchandise . . . . .	204
Deduct: Beginning inventory (units) . . . . .	− 72
Units to be purchased . . . . .	<u>132</u>

Do More: QS 22-28, QS 22-29, QS 22-30, E 22-23

# Summary

**C1 Describe the benefits of budgeting and the process of budget administration.** Planning is a management responsibility of critical importance to business success. Budgeting is the process management uses to formalize its

plans. Budgeting promotes management analysis and focuses its attention on the future. Budgeting also provides a basis for evaluating performance, serves as a source of motivation, is a means of coordinating activities, and communicates management's

plans and instructions to employees. Budgeting is a detailed activity that requires administration. At least three aspects are important: budget committee, budget reporting, and budget timing. A budget committee oversees the budget preparation. The budget period pertains to the time period for which the budget is prepared such as a year or month.

**C2 Describe a master budget and the process of preparing it.** A master budget is a formal overall plan for a company. It consists of plans for business operations and capital expenditures, plus the financial results of those activities. The budgeting process begins with a sales budget. Based on expected sales volume, companies can budget production and manufacturing costs, selling expenses, and administrative expenses. Next, the capital expenditures budget is prepared, followed by the cash budget and budgeted financial statements. Merchandisers must budget merchandise purchases instead of manufacturing costs.

**A1 Analyze expense planning using activity-based budgeting.** Activity-based budgeting requires management to identify activities performed by departments, plan necessary activity levels, identify resources required to perform these activities, and budget the resources.

**P1 Prepare the operating budget components of a master budget—for a manufacturing company.** From budgeted

sales a manufacturer prepares a *production budget*. A *manufacturing budget* shows the budgeted production costs for direct materials, direct labor, and overhead. *Selling and general and administrative expense* budgets complete the operating budgets of the master budget.

**P2 Prepare a cash budget.** The cash budget shows expected cash inflows and outflows during a budgeting period. This budget helps management maintain the company's desired cash balance.

**P3 Prepare budgeted financial statements.** The operating budgets, capital expenditures budget, and cash budget contain much of the information to prepare a budgeted income statement for the budget period and a budgeted balance sheet at the end of the budget period. Budgeted financial statements show the expected financial consequences of the planned activities described in the budgets.

**P4<sup>A</sup> Prepare each component of a master budget and link each to the budgeting process—for a merchandising company.** The term *master budget* refers to a collection of individual component budgets. Each component budget is designed to guide persons responsible for activities covered by that component. A master budget must reflect the components of a company and their interaction in pursuit of company goals.

## Guidance Answers to Decision Maker

**Entrepreneur** You must deal with two issues. First, because fashions and designs frequently change, you cannot heavily rely on previous budgets. As a result, you must carefully analyze the market to understand what designs are in vogue. This will help you plan the product mix and estimate demand. The second issue is the budgeting period. An annual sales budget may be unreliable because tastes can quickly change. Your best bet might be to prepare monthly and quarterly sales budgets that you continuously monitor and revise.

**Environmental Manager** You are unlikely to have data on this new position to use in preparing your budget. In this situation, you can use activity-based budgeting. This requires developing a list of activities to conduct, the resources required to perform these activities, and the expenses associated with these resources. You should challenge yourself to be absolutely certain that the listed activities are necessary and that the listed resources are required.

## Key Terms

Activity-based budgeting (ABB)

## Multiple Choice Quiz

Answers at end of chapter

- A plan that reports the units of merchandise to be produced by a manufacturing company during the budget period is called a
  - Capital expenditures budget.
  - Cash budget.
  - Production budget.
  - Manufacturing budget.
  - Sales budget.

- A hardware store has budgeted sales of \$36,000 for its power tool department in July. Management wants to have \$7,000 in power tool inventory at the end of July. Its beginning inventory of power tools is expected to be \$6,000. What is the budgeted dollar amount of merchandise purchases?
  - \$36,000
  - \$43,000
  - \$42,000
  - \$35,000
  - \$37,000

3. A store has the following budgeted sales for the next five months.

May .....	\$210,000
June .....	186,000
July .....	180,000
August .....	220,000
September .....	240,000

Cash sales are 25% of total sales and all credit sales are expected to be collected in the month following the sale. The total amount of cash expected to be received from customers in September is

- a. \$240,000      c. \$60,000      e. \$220,000  
b. \$225,000      d. \$165,000
4. A plan that shows the expected cash inflows and cash outflows during the budget period, including receipts from

loans needed to maintain a minimum cash balance and repayments of such loans, is called

- a. A rolling budget.      d. A cash budget.  
b. An income statement.      e. An operating budget.  
c. A balance sheet.
5. The following sales are predicted for a company's next four months.

	September	October	November	December
Unit sales . . .	480	560	600	480

Each month's ending inventory of finished goods should be 30% of the next month's sales. At September 1, the finished goods inventory is 140 units. The budgeted production of units for October is

- a. 572 units.      c. 548 units.      e. 180 units.  
b. 560 units.      d. 600 units.

<sup>A</sup> *Superscript letter A denotes assignments based on Appendix 22A, which relates to budgets for merchandising companies.*

 *Icon denotes assignments that involve decision making.*

## Discussion Questions

-  Identify at least three roles that budgeting plays in helping managers control and monitor a business.
- What two common benchmarks can be used to evaluate actual performance? Which of the two is generally more useful?
-  What is the benefit of continuous budgeting?
- Identify three usual time horizons for short-term planning and budgets.
-  Why should each department participate in preparing its own budget?
-  How does budgeting help management coordinate and plan business activities?
-  Why is the sales budget so important to the budgeting process?
- What is a selling expense budget? What is a capital expenditures budget?
- Budgeting promotes good decision making by requiring managers to conduct \_\_\_\_\_ and by focusing their attention on the \_\_\_\_\_.
- GOOGLE**  **Google** prepares a cash budget. What is a cash budget? Why must operating budgets and the capital expenditures budget be prepared before the cash budget?
- APPLE**  **Apple** regularly uses budgets. What is the difference between a production budget and a manufacturing budget?
- APPLE**  Would a manager of an **Apple** retail store participate more in budgeting than a manager at the corporate offices? Explain.
- Samsung**  Does the manager of a **Samsung** distribution center participate in long-term budgeting? Explain.
- Samsung**  Assume that **Samsung's** consumer electronics division is charged with preparing a master budget. Identify the participants—for example, the sales manager for the sales budget—and describe the information each person provides in preparing the master budget.

## QUICK STUDY

The motivation of employees is one goal of budgeting. Identify three guidelines that organizations should follow if budgeting is to serve effectively as a source of motivation for employees.

### QS 22-1

Budget motivation **C1**

### QS 22-2

Budgeting process **C1**

Good management includes good budgeting. (1) Explain why the bottom-up approach to budgeting is considered a more successful management technique than a top-down approach. (2) Provide an example of implementation of the bottom-up approach to budgeting.

Identify which of the following sets of items are necessary components of the master budget.

- \_\_\_\_\_ 1. Operating budgets, historical income statement, and budgeted balance sheet.
- \_\_\_\_\_ 2. Prior sales reports, capital expenditures budget, and financial budgets.
- \_\_\_\_\_ 3. Sales budget, operating budgets, and historical financial budgets.
- \_\_\_\_\_ 4. Operating budgets, financial budgets, and capital expenditures budget.

**QS 22-3**

Components of a master budget

**C2**

Grace manufactures and sells miniature digital cameras for \$250 each. 1,000 units were sold in May, and management forecasts 4% growth in unit sales each month. Determine (a) the number of units of camera sales and (b) the dollar amount of camera sales for the month of June.

**QS 22-4**

Sales budget **P1**

Zilly Co. predicts sales of \$400,000 for June. Zilly pays a sales manager a monthly salary of \$6,000 and a commission of 8% of sales dollars. Prepare a selling expense budget for the month of June.

**QS 22-5**

Selling expense budget

**P1**

Liza's predicts sales of \$40,000 for May and \$52,000 for June. Assume 60% of Liza's sales are for cash. The remaining 40% are credit sales; these customers pay in the month following the sale. Compute the budgeted cash receipts for June.

**QS 22-6**

Cash budget **P2**

Zortek Corp. budgets production of 400 units in January and 200 units in February. Each finished unit requires five pounds of raw material Z, which costs \$2 per pound. Each month's ending inventory of raw materials should be 40% of the following month's budgeted production. The January 1 raw materials inventory has 130 pounds of Z. Prepare a direct materials budget for January.

**QS 22-7**

**Manufacturing:** Direct materials budget **P1**

Tora Co. plans to produce 1,020 units in July. Each unit requires two hours of direct labor. The direct labor rate is \$20 per hour. Prepare a direct labor budget for July.

**QS 22-8**

**Manufacturing:** Direct labor budget **P1**

Scora, Inc., is preparing its master budget for the quarter ending March 31. It sells a single product for \$50 per unit. Budgeted sales for the next four months follow. Prepare a sales budget for the months of January, February, and March.

**QS 22-9**

Sales budget

**P1**

	January	February	March	April
Sales in units . . . . .	1,200	2,000	1,600	1,400

X-Tel budgets sales of \$60,000 for April, \$100,000 for May, and \$80,000 for June. In addition, sales are 40% cash and 60% on credit. All credit sales are collected in the month following the sale. The April 1 balance in accounts receivable is \$15,000. Prepare a schedule of budgeted cash receipts for April, May, and June.

**QS 22-10**

Cash receipts budget **P2**

X-Tel budgets sales of \$60,000 for April, \$100,000 for May, and \$80,000 for June. In addition, sales commissions are 10% of sales dollars and the company pays a sales manager a salary of \$6,000 per month. Sales commissions and salaries are paid in the month incurred. Prepare a selling expense budget for April, May, and June.

**QS 22-11**

Selling expense budget

**P1**

Champ, Inc., predicts the following sales in units for the coming three months:

	May	June	July
Sales in units . . . . .	180	200	240

**QS 22-12**

**Manufacturing:** Production budget

**P1**

Each month's ending inventory of finished units should be 60% of the next month's sales. The April 30 finished goods inventory is 108 units. Compute Champ's budgeted production (in units) for May.

**QS 22-13**

**Manufacturing:** Direct materials budget

P1

Miami Solar manufactures solar panels for industrial use. The company budgets production of 5,000 units (solar panels) in July and 5,300 units in August. Each unit requires 3 pounds of direct materials, which cost \$6 per pound. The company’s policy is to maintain direct materials inventory equal to 30% of the next month’s direct materials requirement. As of June 30, the company has 4,500 pounds of direct materials in inventory, which complies with the policy. Prepare a direct materials budget for July.

**QS 22-14**

**Manufacturing:** Direct labor budget P1

Miami Solar budgets production of 5,000 solar panels in July. Each unit requires 4 hours of direct labor at a rate of \$16 per hour. Prepare a direct labor budget for July.

**QS 22-15**

**Manufacturing:** Factory overhead budget P1

Miami Solar budgets production of 5,300 solar panels for August. Each unit requires 4 hours of direct labor at a rate of \$16 per hour. Variable factory overhead is budgeted to be 70% of direct labor cost, and fixed factory overhead is \$180,000 per month. Prepare a factory overhead budget for August.

**QS 22-16**

**Manufacturing:** Production budget

P1

Atlantic Surf manufactures surfboards. The company’s sales budget for the next three months is shown below. In addition, company policy is to maintain finished goods inventory equal (in units) to 40% of the next month’s unit sales. As of June 30, the company has 1,600 finished surfboards in inventory, which complies with the policy. Prepare a production budget for the months of July and August.

	July	August	September
Sales (in units) . . . . .	4,000	6,500	3,500

**QS 22-17**

**Manufacturing:** Production budget

P1

Forrest Company manufactures phone chargers and has a JIT policy that ending inventory must equal 10% of the next month’s sales. It estimates that October’s actual ending inventory will consist of 40,000 units. November and December sales are estimated to be 400,000 and 350,000 units, respectively. Compute the number of units to be produced that would appear on the company’s production budget for the month of November.

**QS 22-18**

**Manufacturing:** Factory overhead budget P1

Hockey Pro budgets production of 3,900 hockey pucks during May. The company assigns variable overhead at the rate of \$1.50 per unit. Fixed overhead equals \$46,000 per month. Prepare a factory overhead budget for May.

**QS 22-19**

Cash receipts P2

Music World reports the following sales forecast: August, \$150,000; September, \$170,000. Cash sales are normally 40% of total sales and all credit sales are expected to be collected in the month following the date of sale. Prepare a schedule of cash receipts for September.

**QS 22-20**

Cash receipts, with uncollectible accounts

P2

The Guitar Shoppe reports the following sales forecast: August, \$150,000; September, \$170,000. Cash sales are normally 40% of total sales, 55% of credit sales are collected in the month following sale, and the remaining 5% of credit sales are written off as uncollectible. Prepare a schedule of cash receipts for September.

**QS 22-21**

Cash receipts, with uncollectible accounts P2

Wells Company reports the following sales forecast: September, \$55,000; October, \$66,000; and November, \$80,000. All sales are on account. Collections of credit sales are received as follows: 25% in the month of sale, 60% in the first month after sale, and 10% in the second month after sale. 5% of all credit sales are written off as uncollectible. Prepare a schedule of cash receipts for November.

**QS 22-22**

Computing budgeted accounts receivable

P2

Lighthouse Company anticipates total sales for June and July of \$420,000 and \$398,000, respectively. Cash sales are normally 60% of total sales. Of the credit sales, 20% are collected in the same month as the sale, 70% are collected during the first month after the sale, and the remaining 10% are collected in the second month. Determine the amount of accounts receivable reported on the company’s budgeted balance sheet as of July 31.

**QS 22-23**

Budgeted loan activity

P2

Messers Company is preparing a cash budget for February. The company has \$20,000 cash at the beginning of February and anticipates \$75,000 in cash receipts and \$100,250 in cash disbursements during February. What amount, if any, must the company borrow during February to maintain a \$5,000 cash balance? The company has no loans outstanding on February 1.

Use the following information to prepare a cash budget for the month ended on March 31 for Gado Company. The budget should show expected cash receipts and cash disbursements for the month of March and the balance expected on March 31.

- a. Beginning cash balance on March 1, \$72,000.
- b. Cash receipts from sales, \$300,000.
- c. Budgeted cash disbursements for purchases, \$140,000.
- d. Budgeted cash disbursements for salaries, \$80,000.
- e. Other budgeted cash expenses, \$45,000.
- f. Cash repayment of bank loan, \$20,000.

**QS 22-24**  
Cash budget  
P2

Following are selected accounts for a company. For each account, indicate whether it will appear on a budgeted income statement (BIS) or a budgeted balance sheet (BBS). If an item will not appear on either budgeted financial statement, label it NA.

Sales . . . . .	_____	Interest expense on note payable . . .	_____
Office salaries expense . . . . .	_____	Cash dividends paid . . . . .	_____
Accumulated depreciation . . . . .	_____	Bank loan owed . . . . .	_____
Amortization expense . . . . .	_____	Cost of goods sold . . . . .	_____

**QS 22-25**  
Budgeted financial statements  
P3

Gordands purchased \$600,000 of merchandise in August and expects to purchase \$720,000 in September. Merchandise purchases are paid as follows: 25% in the month of purchase and 75% in the following month. Compute cash disbursements for merchandise for September.

**QS 22-26<sup>A</sup>**  
**Merchandising:** Cash disbursements for merchandise P4

Meyer Co. forecasts merchandise purchases of \$15,800 in January, \$18,600 in February, and \$20,200 in March; 40% of purchases are paid in the month of purchase and 60% are paid in the following month. At December 31 of the prior year, the balance of accounts payable (for December purchases) is \$22,000. Prepare a schedule of cash disbursements for merchandise for each of the months of January, February, and March.

**QS 22-27<sup>A</sup>**  
**Merchandising:** Cash disbursements for merchandise P4

Raider-X Company forecasts sales of 18,000 units for April. Beginning inventory is 3,000 units. The desired ending inventory is 30% higher than the beginning inventory. How many units should Raider-X purchase in April?

**QS 22-28<sup>A</sup>**  
**Merchandising:** Computing purchases  
P4

Lexi Company forecasts unit sales of 1,040,000 in April, 1,220,000 in May, 980,000 in June, and 1,020,000 in July. Beginning inventory on April 1 is 280,000 units, and the company wants to have 30% of next month's sales in inventory at the end of each month. Prepare a merchandise purchases budget for the months of April, May, and June.

**QS 22-29<sup>A</sup>**  
**Merchandising:** Computing purchases  
P4

Montel Company's July sales budget calls for sales of \$600,000. The store expects to begin July with \$50,000 of inventory and to end the month with \$40,000 of inventory. Gross margin is typically 40% of sales. Determine the budgeted cost of merchandise purchases for July.

**QS 22-30<sup>A</sup>**  
**Merchandising:** Purchases budget P4

Activity-based budgeting is a budget system based on *expected activities*. (1) Describe activity-based budgeting, and explain its preparation of budgets. (2) How does activity-based budgeting differ from traditional budgeting?

**QS 22-31**  
Activity-based budgeting  
A1 

**Royal Philips Electronics** of the Netherlands reports sales of €25,400 million for a recent year. Assume that the company expects sales growth of 3 percent for the next year. Also assume that selling expenses are typically 20 percent of sales, while general and administrative expenses are 4 percent of sales.

1. Compute budgeted sales for the next year.
2. Assume budgeted sales for next year is €26,000 million, and then compute budgeted selling expenses and budgeted general and administrative expenses for the next year.

**QS 22-32**  
Operating budgets  
P1 

**EXERCISES**

**Exercise 22-1**

Budget consequences

C1

Participatory budgeting can sometimes lead to negative consequences. From the following list of outcomes that can arise from participatory budgeting, identify those with potentially *negative* consequences.

- \_\_\_\_\_ a. Budgetary slack will not be available to meet budgeted results.
- \_\_\_\_\_ b. Employees might understate expense budgets.
- \_\_\_\_\_ c. Employees might commit unethical or fraudulent acts to meet budgeted results.
- \_\_\_\_\_ d. Employees set sales targets too high.
- \_\_\_\_\_ e. Employees always spend budgeted amounts, even if on unnecessary items.
- \_\_\_\_\_ f. Employees might understate sales budgets and overstate expense budgets.

**Exercise 22-2**

Master budget definitions

C2

Match the definitions 1 through 9 with the term or phrase *a* through *i*.

- |  |   |                                  |
|--|---|----------------------------------|
| <b>A.</b> Budget                       | <b>D.</b> Safety stock                              | <b>G.</b> Sales budget           |
| <b>B.</b> Merchandise purchases budget | <b>E.</b> Budgeted income statement                 | <b>H.</b> Master budget          |
| <b>C.</b> Cash budget                  | <b>F.</b> General and administrative expense budget | <b>I.</b> Budgeted balance sheet |
- \_\_\_\_\_ 1. A comprehensive business plan that includes specific plans for expected sales, the units of product to be produced, the merchandise or materials to be purchased, the expenses to be incurred, the long-term assets to be purchased, and the amounts of cash to be borrowed or loans to be repaid, as well as a budgeted income statement and balance sheet.
  - \_\_\_\_\_ 2. A quantity of inventory or materials over the minimum to reduce the risk of running short.
  - \_\_\_\_\_ 3. A plan showing the units of goods to be sold and the sales to be derived; the usual starting point in the budgeting process.
  - \_\_\_\_\_ 4. An accounting report that presents predicted amounts of the company's revenues and expenses for the budgeting period.
  - \_\_\_\_\_ 5. An accounting report that presents predicted amounts of the company's assets, liabilities, and equity balances at the end of the budget period.
  - \_\_\_\_\_ 6. A plan that shows the units or costs of merchandise to be purchased by a merchandising company during the budget period.
  - \_\_\_\_\_ 7. A formal statement of a company's future plans, usually expressed in monetary terms.
  - \_\_\_\_\_ 8. A plan that shows predicted operating expenses not included in the selling expenses budget.
  - \_\_\_\_\_ 9. A plan that shows the expected cash inflows and cash outflows during the budget period, including receipts from any loans needed to maintain a minimum cash balance and repayments of such loans.

**Exercise 22-3**

**Manufacturing:**

Production budget

P1

Hospitable Co. provides the following sales forecast for the next four months:

	April	May	June	July
Sales (units) . . . . .	500	580	540	620

The company wants to end each month with ending finished goods inventory equal to 25% of next month's sales. Finished goods inventory on April 1 is 190 units. Assume July's budgeted production is 540 units. Prepare a production budget for the months of April, May, and June.

**Exercise 22-4**

**Manufacturing:** Direct

materials budget P1

Refer to the information in Exercise 22-3. In addition, each finished unit requires five pounds of raw materials and the company wants to end each month with raw materials inventory equal to 30% of next month's production needs. Beginning raw materials inventory for April was 663 pounds. Assume direct materials cost \$4 per pound. Prepare a direct materials budget for April, May, and June.

The production budget for Manner Company shows units to be produced as follows: July, 620; August, 680; September, 540. Each unit produced requires two hours of direct labor. The direct labor rate is currently \$20 per hour but is predicted to be \$21 per hour in September. Prepare a direct labor budget for the months July, August, and September.

**Exercise 22-5**  
**Manufacturing:** Direct labor budget P1

Rida, Inc., a manufacturer in a seasonal industry, is preparing its direct materials budget for the second quarter. It plans production of 240,000 units in the second quarter and 52,500 units in the third quarter. Raw material inventory is 43,200 pounds at the beginning of the second quarter. Other information follows. Prepare a direct materials budget for the second quarter.

**Exercise 22-6**  
**Manufacturing:** Direct materials budget P1

Direct materials . . . . . Each unit requires 0.60 pounds of a key raw material, priced at \$175 per pound. The company plans to end each quarter with an ending inventory of materials equal to 30% of next quarter's budgeted materials requirements.

Addison Co. budgets production of 2,400 units during the second quarter. In addition, information on its direct labor and its variable and fixed overhead is shown below. For the second quarter, prepare (1) a direct labor budget and (2) a factory overhead budget.

**Exercise 22-7**  
**Manufacturing:** Direct labor and factory overhead budgets P1

Direct labor . . . . . Each finished unit requires 4 direct labor hours, at a cost of \$9 per hour.  
Variable overhead . . . . . Applied at the rate of \$11 per direct labor hour  
Fixed overhead . . . . . Budgeted at \$450,000 per quarter

Rad Co. provides the following sales forecast and production budget for the next four months:

	April	May	June	July
Sales (units) . . . . .	500	580	530	600
Budgeted production (units) . . . . .	442	570	544	540

**Exercise 22-8**  
**Manufacturing:** Direct materials budget P1

The company plans for finished goods inventory of 120 units at the end of June. In addition, each finished unit requires 5 pounds of raw materials and the company wants to end each month with raw materials inventory equal to 30% of next month's production needs. Beginning raw materials inventory for April was 663 pounds. Each finished unit requires 0.50 hours of direct labor at the rate of \$16 per hour. The company budgets variable overhead at the rate of \$20 per direct labor hour and budgets fixed overhead of \$8,000 per month. Prepare a raw materials budget for April, May, and June.

Refer to Exercise 22-8. For April, May, and June, prepare (1) a direct labor budget and (2) a factory overhead budget.

**Exercise 22-9**  
**Manufacturing:** Direct labor and factory overhead budgets P1

Blue Wave Co. predicts the following unit sales for the coming four months: September, 4,000 units; October, 5,000 units; November, 7,000 units; and December, 7,600 units. The company's policy is to maintain finished goods inventory equal to 60% of the next month's sales. At the end of August, the company had 2,400 finished units on hand. Prepare a production budget for each of the months of September, October, and November.

**Exercise 22-10**  
**Manufacturing:** Production budget P1

Tyler Co. predicts the following unit sales for the next four months: April, 3,000 units; May, 4,000 units; June, 6,000 units; and July, 2,000 units. The company's policy is to maintain finished goods inventory equal to 30% of the next month's sales. At the end of March, the company had 900 finished units on hand. Prepare a production budget for each of the months of April, May, and June.

**Exercise 22-11**  
**Manufacturing:** Production budget P1

**Exercise 22-12**

**Manufacturing:** Preparing production budgets (for two periods)

P1

**Check** Second quarter production, 480,000 units

Electro Company manufactures an innovative automobile transmission for electric cars. Management predicts that ending finished goods inventory for the first quarter will be 75,000 units. The following unit sales of the transmissions are expected during the rest of the year: second quarter, 450,000 units; third quarter, 525,000 units; and fourth quarter, 475,000 units. Company policy calls for the ending finished goods inventory of a quarter to equal 20% of the next quarter's budgeted sales. Prepare a production budget for both the second and third quarters that shows the number of transmissions to manufacture. Ending inventory for the first quarter does not comply with company policy.

**Exercise 22-13**

**Manufacturing:** Direct materials budget P1

Electro Company budgets production of 450,000 transmissions in the second quarter and 520,000 transmissions in the third quarter. Each transmission requires 0.80 pounds of a key raw material. Electro Company aims to end each quarter with an ending inventory of direct materials equal to 20% of next quarter's budgeted materials requirements. Beginning inventory of this raw material is 72,000 pounds. Direct materials cost \$1.70 per pound. Prepare a direct materials budget for the second quarter.

**Exercise 22-14**

**Manufacturing:** Direct labor budget P1

Branson Belts makes hand-crafted belts. The company budgets production of 4,500 belts during the second quarter. Each belt requires 4 direct labor hours, at a cost of \$12 per hour. Prepare a direct labor budget for the second quarter.

**Exercise 22-15**

**Manufacturing:** Direct materials, direct labor, and overhead budgets

P1

MCO Leather Goods manufactures leather purses. Each purse requires 2 pounds of direct materials at a cost of \$4 per pound and 0.8 direct labor hours at a rate of \$16 per hour. Variable manufacturing overhead is charged at a rate of \$2 per direct labor hour. Fixed manufacturing overhead is \$10,000 per month. The company's policy is to end each month with direct materials inventory equal to 40% of the next month's materials requirement. At the end of August the company had 3,680 pounds of direct materials in inventory. The company's production budget reports the following. Prepare budgets for September and October for (1) direct materials, (2) direct labor, and (3) factory overhead.

Production Budget	September	October	November
Units to be produced . . . . .	4,600	6,200	5,800

**Exercise 22-16**

**Manufacturing:** Direct materials, direct labor, and overhead budgets

P1

Ornamental Sculptures Mfg. manufactures garden sculptures. Each sculpture requires 8 pounds of direct materials at a cost of \$3 per pound and 0.5 direct labor hours at a rate of \$18 per hour. Variable manufacturing overhead is charged at a rate of \$3 per direct labor hour. Fixed manufacturing overhead is \$4,000 per month. The company's policy is to maintain direct materials inventory equal to 20% of the next month's materials requirement. At the end of March the company had 5,280 pounds of direct materials in inventory. The company's production budget reports the following. Prepare budgets for March and April for (1) direct materials, (2) direct labor, and (3) factory overhead.

Production Budget	March	April	May
Units to be produced . . . . .	3,300	4,600	4,800

**Exercise 22-17**

Preparation of cash budgets (for three periods)

P2

Kayak Co. budgeted the following cash receipts (excluding cash receipts from loans received) and cash disbursements (excluding cash disbursements for loan principal and interest payments) for the first three months of next year.

	Cash Receipts	Cash Disbursements
January . . . . .	\$525,000	\$475,000
February . . . . .	400,000	350,000
March . . . . .	450,000	525,000

According to a credit agreement with the company's bank, Kayak promises to have a minimum cash balance of \$30,000 at each month-end. In return, the bank has agreed that the company can borrow up to \$150,000 at an annual interest rate of 12%, paid on the last day of each month. The interest is computed

based on the beginning balance of the loan for the month. The company repays loan principal with available cash on the last day of each month. The company has a cash balance of \$30,000 and a loan balance of \$60,000 at January 1. Prepare monthly cash budgets for each of the first three months of next year.

**Check** January ending cash balance, \$30,000

Jasper Company has sales on account and for cash. Specifically, 70% of its sales are on account and 30% are for cash. Credit sales are collected in full in the month following the sale. The company forecasts sales of \$525,000 for April, \$535,000 for May, and \$560,000 for June. The beginning balance of accounts receivable is \$400,000 on April 1. Prepare a schedule of budgeted cash receipts for April, May, and June.

**Exercise 22-18**  
Budgeted cash receipts  
P2

Karim Corp. requires a minimum \$8,000 cash balance. If necessary, loans are taken to meet this requirement at a cost of 1% interest per month (paid monthly). Any excess cash is used to repay loans at month-end. The cash balance on July 1 is \$8,400 and the company has no outstanding loans. Forecasted cash receipts (other than for loans received) and forecasted cash payments (other than for loan or interest payments) follow. Prepare a cash budget for July, August, and September. Round interest payments to the nearest whole dollar.

**Exercise 22-19**  
Cash budget  
P2

	July	August	September
Cash receipts .....	\$20,000	\$26,000	\$40,000
Cash disbursements .....	28,000	30,000	22,000

Foyert Corp. requires a minimum \$30,000 cash balance. If necessary, loans are taken to meet this requirement at a cost of 1% interest per month (paid monthly). Any excess cash is used to repay loans at month-end. The cash balance on October 1 is \$30,000 and the company has an outstanding loan of \$10,000. Forecasted cash receipts (other than for loans received) and forecasted cash payments (other than for loan or interest payments) follow. Prepare a cash budget for October, November, and December. Round interest payments to the nearest whole dollar.

**Exercise 22-20**  
Cash budget  
P2

	October	November	December
Cash receipts .....	\$110,000	\$80,000	\$100,000
Cash disbursements .....	120,000	75,000	80,000

Use the following information to prepare the September cash budget for PTO Manufacturing Co. The following information relates to expected cash receipts and cash disbursements for the month ended September 30.

- Beginning cash balance, September 1, \$40,000.
- Budgeted cash receipts from sales in September, \$255,000.
- Raw materials are purchased on account. Purchase amounts are: August (actual), \$80,000, and September (budgeted), \$110,000. Payments for direct materials are made as follows: 65% in the month of purchase and 35% in the month following purchase.
- Budgeted cash disbursements for direct labor in September, \$40,000.
- Budgeted depreciation expense for September, \$4,000.
- Other cash expenses budgeted for September, \$60,000.
- Accrued income taxes payable in September, \$10,000.
- Bank loan interest payable in September, \$1,000.

**Exercise 22-21**  
**Manufacturing:** Cash budget  
P2

Mike's Motors Corp. manufactures motors for dirt bikes. The company requires a minimum \$30,000 cash balance at each month-end. If necessary, the company takes a loan to meet this requirement, at a cost of 2% interest per month (paid at the end of each month). Any cash balance above \$30,000 at month-end is used to repay loans. The cash balance on July 1 is \$34,000, and the company has no outstanding loans at that time. Forecasted cash receipts and forecasted cash payments (other than for loan activity) are as follows. Prepare a cash budget for July, August, and September.

**Exercise 22-22**  
**Manufacturing:** Cash budget  
P2

	Cash Receipts	Cash Disbursements
July .....	\$ 85,000	\$113,000
August .....	111,000	99,900
September .....	150,000	127,400

**Exercise 22-23<sup>A</sup>****Merchandising:**

Preparation of purchases budgets (for three periods)

P4

Walker Company prepares monthly budgets. The current budget plans for a September ending inventory of 30,000 units. Company policy is to end each month with merchandise inventory equal to a specified percent of budgeted sales for the following month. Budgeted sales and merchandise purchases for the next three months follow.

1. Prepare the merchandise purchases budget for the months of July, August, and September.
2. Compute the ratio of ending inventory to the next month's sales for each budget prepared in part 1.
3. How many units are budgeted for sale in October?

	Sales (Units)	Purchases (Units)
July .....	180,000	200,250
August .....	315,000	308,250
September .....	270,000	259,500

**Exercise 22-24<sup>A</sup>****Merchandising:**

Preparation of a cash budget

P4

Use the following information to prepare the July cash budget for Acco Co. It should show expected cash receipts and cash disbursements for the month and the cash balance expected on July 31.

- a. Beginning cash balance on July 1: \$50,000.
- b. Cash receipts from sales: 30% is collected in the month of sale, 50% in the next month, and 20% in the second month after sale (uncollectible accounts are negligible and can be ignored). Sales amounts are: May (actual), \$1,720,000; June (actual), \$1,200,000; and July (budgeted), \$1,400,000.
- c. Payments on merchandise purchases: 60% in the month of purchase and 40% in the month following purchase. Purchases amounts are: June (actual), \$700,000; and July (budgeted), \$750,000.
- d. Budgeted cash disbursements for salaries in July: \$275,000.
- e. Budgeted depreciation expense for July: \$36,000.
- f. Other cash expenses budgeted for July: \$200,000.
- g. Accrued income taxes due in July: \$80,000.
- h. Bank loan interest paid in July: \$6,600.

**Check** Ending cash balance, \$122,400

**Exercise 22-25<sup>A</sup>****Merchandising:**

Preparing a budgeted income statement and balance sheet

P4

Use the information in Exercise 22-24 and the following additional information to prepare a budgeted income statement for the month of July and a budgeted balance sheet for July 31.

- a. Cost of goods sold is 55% of sales.
- b. Inventory at the end of June is \$80,000 and at the end of July is \$60,000.
- c. Salaries payable on June 30 are \$50,000 and are expected to be \$60,000 on July 31.
- d. The equipment account balance is \$1,600,000 on July 31. On June 30, the accumulated depreciation on equipment is \$280,000.
- e. The \$6,600 cash payment of interest represents the 1% monthly expense on a bank loan of \$660,000.
- f. Income taxes payable on July 31 are \$30,720, and the income tax rate applicable to the company is 30%.
- g. The only other balance sheet accounts are: Common Stock, with a balance of \$600,000 on June 30; and Retained Earnings, with a balance of \$964,000 on June 30.

**Check** Net income, \$71,680; Total assets, \$2,686,400

**Exercise 22-26<sup>A</sup>****Merchandising:**

Computing budgeted cash payments for purchases P4

**Check** Budgeted purchases: August, \$194,400; October, \$157,200

Hardy Company's cost of goods sold is consistently 60% of sales. The company plans to carry ending merchandise inventory for each month equal to 20% of the next month's budgeted cost of goods sold. All merchandise is purchased on credit, and 50% of the purchases made during a month is paid for in that month. Another 35% is paid for during the first month after purchase, and the remaining 15% is paid for during the second month after purchase. Expected sales are: August (actual), \$325,000; September (actual), \$320,000; October (estimated), \$250,000; and November (estimated), \$310,000. Use this information to determine October's expected cash payments for purchases.

**Exercise 22-27<sup>A</sup>****Merchandising:**

Computing budgeted purchases and cost of goods sold P4

Quick Dollar Company purchases all merchandise on credit. It recently budgeted the following month-end accounts payable balances and merchandise inventory balances. Cash payments on accounts payable during each month are expected to be: May, \$1,600,000; June, \$1,490,000; July, \$1,425,000; and August, \$1,495,000. Use the available information to compute the budgeted amounts of (1) merchandise purchases for June, July, and August and (2) cost of goods sold for June, July, and August.

[continued on next page]

	Accounts Payable	Merchandise Inventory
May 31 .....	\$150,000	\$250,000
June 30 .....	200,000	400,000
July 31 .....	235,000	300,000
August 31 .....	195,000	330,000

**Check** June purchases, \$1,540,000; June cost of goods sold, \$1,390,000

Big Sound, a merchandising company specializing in home computer speakers, budgets its monthly cost of goods sold to equal 70% of sales. Its inventory policy calls for ending inventory in each month to equal 20% of the next month's budgeted cost of goods sold. All purchases are on credit, and 25% of the purchases in a month is paid for in the same month. Another 60% is paid for during the first month after purchase, and the remaining 15% is paid for in the second month after purchase. The following sales budgets are set: July, \$350,000; August, \$290,000; September, \$320,000; October, \$275,000; and November, \$265,000.

Compute the following: (1) budgeted merchandise purchases for July, August, September, and October; (2) budgeted payments on accounts payable for September and October; and (3) budgeted ending balances of accounts payable for September and October. (*Hint:* For part 1, refer to Exhibits 22A.2 and 22A.3 for guidance, but note that budgeted sales are in dollars for this assignment.)

**Exercise 22-28<sup>A</sup>**  
**Merchandising:** Computing budgeted accounts payable and purchases—sales forecast in dollars **P4**

**Check** July purchases, \$236,600; Sept. payments on accts. pay., \$214,235

Hector Company reports the following sales and purchases data. Payments for purchases are made in the month after purchase. Selling expenses are 10% of sales, administrative expenses are 8% of sales, and both are paid in the month of sale. Rent expense of \$7,400 is paid monthly. Depreciation expense is \$2,300 per month. Prepare a schedule of budgeted cash disbursements for August and September.

	July	August	September
Sales .....	\$50,000	\$72,000	\$66,000
Purchases .....	14,400	19,200	21,600

**Exercise 22-29<sup>A</sup>**  
**Merchandising:** Budgeted cash disbursements **P4**

Castor, Inc., is preparing its master budget for the quarter ended June 30. Budgeted sales and cash payments for merchandise for the next three months follow:

Budgeted	April	May	June
Sales .....	\$32,000	\$40,000	\$24,000
Cash payments for merchandise .....	20,200	16,800	17,200

**Exercise 22-30<sup>A</sup>**  
**Merchandising:** Cash budget **P4**

Sales are 50% cash and 50% on credit. All credit sales are collected in the month following the sale. The March 30 balance sheet includes balances of \$12,000 in cash, \$12,000 in accounts receivable, \$11,000 in accounts payable, and a \$2,000 balance in loans payable. A minimum cash balance of \$12,000 is required. Loans are obtained at the end of any month when a cash shortage occurs. Interest is 1% per month based on the beginning of the month loan balance and is paid at each month-end. If an excess balance of cash exists, loans are repaid at the end of the month. Operating expenses are paid in the month incurred and consist of sales commissions (10% of sales), shipping (2% of sales), office salaries (\$5,000 per month), and rent (\$3,000 per month). Prepare a cash budget for each of the months of April, May, and June (round all dollar amounts to the nearest whole dollar).

Kelsey is preparing its master budget for the quarter ended September 30. Budgeted sales and cash payments for merchandise for the next three months follow:

Budgeted	July	August	September
Sales .....	\$64,000	\$80,000	\$48,000
Cash payments for merchandise .....	40,400	33,600	34,400

**Exercise 22-31<sup>A</sup>**  
**Merchandising:** Cash budget **P4**

Sales are 20% cash and 80% on credit. All credit sales are collected in the month following the sale. The June 30 balance sheet includes balances of \$15,000 in cash; \$45,000 in accounts receivable; \$4,500 in accounts payable; and a \$5,000 balance in loans payable. A minimum cash balance of \$15,000 is required. Loans are obtained at the end of any month when a cash shortage occurs. Interest is 1% per month based on the beginning of the month loan balance and is paid at each month-end. If an excess balance of cash exists, loans are repaid at the end of the month. Operating expenses are paid in the month incurred and consist of sales commissions (10% of sales), office salaries (\$4,000 per month), and rent (\$6,500 per month). (1) Prepare a cash receipts budget for July, August, and September. (2) Prepare a cash budget for each of the months of July, August, and September. (Round all dollar amounts to the nearest whole dollar.)

**Exercise 22-32<sup>A</sup>**

**Merchandising:**

Budgeted balance sheet

P4

The following information is available for Zetrov Company:

- a. The cash budget for March shows an ending bank loan of \$10,000 and an ending cash balance of \$50,000.
- b. The sales budget for March indicates sales of \$140,000. Accounts receivable are expected to be 70% of the current-month sales.
- c. The merchandise purchases budget indicates that \$89,000 in merchandise will be purchased on account in March. Purchases on account are paid 100% in the month following the purchase. Ending inventory for March is predicted to be 600 units at a cost of \$35 each.
- d. The budgeted income statement for March shows net income of \$48,000. Depreciation expense of \$1,000 and \$26,000 in income tax expense were used in computing net income for March. Accrued taxes will be paid in April.
- e. The balance sheet for February shows equipment of \$84,000 with accumulated depreciation of \$46,000, common stock of \$25,000, and ending retained earnings of \$8,000. There are no changes budgeted in the Equipment or Common Stock accounts.

Prepare a budgeted balance sheet for March.

**Exercise 22-33<sup>A</sup>**

**Merchandising:**

Budgeted income statement

P4

Fortune, Inc., is preparing its master budget for the first quarter. The company sells a single product at a price of \$25 per unit. Sales (in units) are forecasted at 45,000 for January, 55,000 for February, and 50,000 for March. Cost of goods sold is \$14 per unit. Other expense information for the first quarter follows. Prepare a budgeted income statement for this first quarter.

Commissions . . . . .	8% of sales dollars
Rent . . . . .	\$14,000 per month
Advertising . . . . .	15% of sales dollars
Office salaries . . . . .	\$75,000 per month
Depreciation . . . . .	\$40,000 per month
Interest . . . . .	15% annually on a \$250,000 note payable
Tax rate . . . . .	30%

**Exercise 22-34**

Activity-based budgeting

A1

Render Co. CPA is preparing activity-based budgets for 2015. The partners expect the firm to generate billable hours for the year as follows:

Data entry . . . . .	2,200 hours
Auditing . . . . .	4,800 hours
Tax . . . . .	4,300 hours
Consulting . . . . .	750 hours

The company pays \$10 per hour to data-entry clerks, \$40 per hour to audit personnel, \$50 per hour to tax personnel, and \$50 per hour to consulting personnel. Prepare a schedule of budgeted labor costs for 2015 using activity-based budgeting.

Black Diamond Company produces snow skis. Each ski requires 2 pounds of carbon fiber. The company's management predicts that 5,000 skis and 6,000 pounds of carbon fiber will be in inventory on June 30 of the current year and that 150,000 skis will be sold during the next (third) quarter. A set of two skis sells for \$300. Management wants to end the third quarter with 3,500 skis and 4,000 pounds of carbon fiber in inventory. Carbon fiber can be purchased for \$15 per pound. Each ski requires 0.5 hours of direct labor at \$20 per hour. Variable overhead is applied at the rate of \$8 per direct labor hour. The company budgets fixed overhead of \$1,782,000 for the quarter.

### Required

1. Prepare the third-quarter production budget for skis.
2. Prepare the third-quarter direct materials (carbon fiber) budget; include the dollar cost of purchases.
3. Prepare the direct labor budget for the third quarter.
4. Prepare the factory overhead budget for the third quarter.

Built-Tight is preparing its master budget for the quarter ended September 30, 2015. Budgeted sales and cash payments for product costs for the quarter follow:

	A	B	C	D
		July	August	September
1				
2	Budgeted sales	\$64,000	\$80,000	\$48,000
3	Budgeted cash payments for			
4	Direct materials	16,160	13,440	13,760
5	Direct labor	4,040	3,360	3,440
6	Factory overhead	20,200	16,800	17,200
7				

Sales are 20% cash and 80% on credit. All credit sales are collected in the month following the sale. The June 30 balance sheet includes balances of \$15,000 in cash; \$45,000 in accounts receivable; \$4,500 in accounts payable; and a \$5,000 balance in loans payable. A minimum cash balance of \$15,000 is required. Loans are obtained at the end of any month when a cash shortage occurs. Interest is 1% per month based on the beginning of the month loan balance and is paid at each month-end. If an excess balance of cash exists, loans are repaid at the end of the month. Operating expenses are paid in the month incurred and consist of sales commissions (10% of sales), office salaries (\$4,000 per month), and rent (\$6,500 per month).

1. Prepare a cash receipts budget for July, August, and September.
2. Prepare a cash budget for each of the months of July, August, and September. (Round amounts to the dollar.)

Merline Manufacturing makes its product for \$75 per unit and sells it for \$150 per unit. The sales staff receives a 10% commission on the sale of each unit. Its December income statement follows.

MERLINE MANUFACTURING Income Statement For Month Ended December 31, 2015	
Sales .....	\$2,250,000
Cost of goods sold .....	<u>1,125,000</u>
Gross profit .....	1,125,000
Operating expenses	
Sales commissions (10%) .....	225,000
Advertising .....	250,000
Store rent .....	30,000
Administrative salaries .....	45,000
Depreciation—Office equipment .....	50,000
Other expenses .....	<u>10,000</u>
Total expenses .....	<u>610,000</u>
Net income .....	<u>\$ 515,000</u>

### Problem 22-1A

#### Manufacturing:

Preparing production and manufacturing budgets

C2 P1

**Check** (1) Units manuf., 148,500;  
(2) Cost of carbon fiber purchases, \$4,425,000

### Problem 22-2A

**Manufacturing:** Cash budget

P2

### Problem 22-3A

#### Manufacturing:

Preparation and analysis of budgeted income statements

P3

Management expects December’s results to be repeated in January, February, and March of 2016 without any changes in strategy. Management, however, has an alternative plan. It believes that unit sales will increase at a rate of 10% *each* month for the next three months (beginning with January) if the item’s selling price is reduced to \$125 per unit and advertising expenses are increased by 15% and remain at that level for all three months. The cost of its product will remain at \$75 per unit, the sales staff will continue to earn a 10% commission, and the remaining expenses will stay the same.

**Required**

**Check** (1) Budgeted net income: January, \$196,250; February, \$258,125; March, \$326,187

1. Prepare budgeted income statements for each of the months of January, February, and March that show the expected results from implementing the proposed changes. Use a three-column format, with one column for each month.

**Analysis Component**

2. Use the budgeted income statements from part 1 to recommend whether management should implement the proposed changes. Explain.

**Problem 22-4A**  
**Manufacturing:**

Preparation of a complete master budget

P1 P2 P3

The management of Zigby Manufacturing prepared the following estimated balance sheet for March, 2015:

ZIGBY MANUFACTURING Estimated Balance Sheet March 31, 2015			
Assets		Liabilities and Equity	
Cash .....	\$ 40,000	Accounts payable .....	\$ 200,500
Accounts receivable .....	342,248	Short-term notes payable .....	12,000
Raw materials inventory .....	98,500	Total current liabilities .....	212,500
Finished goods inventory .....	325,540	Long-term note payable .....	500,000
Total current assets .....	806,288	Total liabilities .....	712,500
Equipment, gross. ....	600,000	Common stock .....	335,000
Accumulated depreciation .....	(150,000)	Retained earnings .....	208,788
Equipment, net .....	450,000	Total stockholders' equity .....	543,788
Total assets .....	<u>\$1,256,288</u>	Total liabilities and equity .....	<u>\$1,256,288</u>

To prepare a master budget for April, May, and June of 2015, management gathers the following information:

- a. Sales for March total 20,500 units. Forecasted sales in units are as follows: April, 20,500; May, 19,500; June, 20,000; and July, 20,500. Sales of 240,000 units are forecasted for the entire year. The product’s selling price is \$23.85 per unit and its total product cost is \$19.85 per unit.
- b. Company policy calls for a given month’s ending raw materials inventory to equal 50% of the next month’s materials requirements. The March 31 raw materials inventory is 4,925 units, which complies with the policy. The expected June 30 ending raw materials inventory is 4,000 units. Raw materials cost \$20 per unit. Each finished unit requires 0.50 units of raw materials.
- c. Company policy calls for a given month’s ending finished goods inventory to equal 80% of the next month’s expected unit sales. The March 31 finished goods inventory is 16,400 units, which complies with the policy.
- d. Each finished unit requires 0.50 hours of direct labor at a rate of \$15 per hour.
- e. Overhead is allocated based on direct labor hours. The predetermined variable overhead rate is \$2.70 per direct labor hour. Depreciation of \$20,000 per month is treated as fixed factory overhead.
- f. Sales representatives’ commissions are 8% of sales and are paid in the month of the sales. The sales manager’s monthly salary is \$3,000.
- g. Monthly general and administrative expenses include \$12,000 administrative salaries and 0.9% monthly interest on the long-term note payable.
- h. The company expects 30% of sales to be for cash and the remaining 70% on credit. Receivables are collected in full in the month following the sale (none is collected in the month of the sale).

- i. All raw materials purchases are on credit, and no payables arise from any other transactions. One month’s raw materials purchases are fully paid in the next month.
- j. The minimum ending cash balance for all months is \$40,000. If necessary, the company borrows enough cash using a short-term note to reach the minimum. Short-term notes require an interest payment of 1% at each month-end (before any repayment). If the ending cash balance exceeds the minimum, the excess will be applied to repaying the short-term notes payable balance.
- k. Dividends of \$10,000 are to be declared and paid in May.
- l. No cash payments for income taxes are to be made during the second calendar quarter. Income tax will be assessed at 35% in the quarter and paid in the third calendar quarter.
- m. Equipment purchases of \$130,000 are budgeted for the last day of June.

**Required**

Prepare the following budgets and other financial information as required. All budgets and other financial information should be prepared for the second calendar quarter, except as otherwise noted below. Round calculations up to the nearest whole dollar, except for the amount of cash sales, which should be rounded down to the nearest whole dollar.

1. Sales budget.
2. Production budget.
3. Raw materials budget.
4. Direct labor budget.
5. Factory overhead budget.
6. Selling expense budget.
7. General and administrative expense budget.
8. Cash budget.
9. Budgeted income statement for the entire second quarter (not for each month separately).
10. Budgeted balance sheet as of the end of the second calendar quarter.

**Check** (2) Units to produce: April, 19,700; May, 19,900  
 (3) Cost of raw materials purchases, April, \$198,000  
 (5) Total overhead cost, May, \$46,865  
 (8) Ending cash balance: April, \$83,346; May, \$124,295  
 (10) Budgeted total assets, June 30: \$1,299,440

Keggler’s Supply is a merchandiser of three different products. The company’s February 28 inventories are footwear, 20,000 units; sports equipment, 80,000 units; and apparel, 50,000 units. Management believes that excessive inventories have accumulated for all three products. As a result, a new policy dictates that ending inventory in any month should equal 30% of the expected unit sales for the following month. Expected sales in units for March, April, May, and June follow.

	Budgeted Sales in Units			
	March	April	May	June
Footwear .....	15,000	25,000	32,000	35,000
Sports equipment .....	70,000	90,000	95,000	90,000
Apparel .....	40,000	38,000	37,000	25,000

**Required**

1. Prepare a merchandise purchases budget (in units) for each product for each of the months of March, April, and May.

**Analysis Component**

2. The purchases budgets in part 1 should reflect fewer purchases of all three products in March compared to those in April and May. What factor caused fewer purchases to be planned? Suggest business conditions that would cause this factor to both occur and impact the company in this way.

**Problem 22-5A<sup>A</sup>**  
**Merchandising:**  
 Preparation and analysis of purchases budgets

**Check** (1) March budgeted purchases: Footwear, 2,500; Sports equip., 17,000; Apparel, 1,400

During the last week of August, Oneida Company’s owner approaches the bank for a \$100,000 loan to be made on September 2 and repaid on November 30 with annual interest of 12%, for an interest cost of \$3,000. The owner plans to increase the store’s inventory by \$80,000 during September and needs the loan to pay for inventory acquisitions. The bank’s loan officer needs more information about Oneida’s ability to repay the loan and asks the owner to forecast the store’s November 30 cash position. On September 1, Oneida is expected to have a \$5,000 cash balance, \$159,100 of net accounts receivable, and \$125,000

**Problem 22-6A<sup>A</sup>**  
**Merchandising:**  
 Preparation of cash budgets (for three periods)

of accounts payable. Its budgeted sales, merchandise purchases, and various cash disbursements for the next three months follow.

	A	B	C	D
1	Budgeted Figures*	September	October	November
2	Sales	\$250,000	\$375,000	\$400,000
3	Merchandise purchases	240,000	225,000	200,000
4	Cash disbursements			
5	Payroll	20,000	22,000	24,000
6	Rent	10,000	10,000	10,000
7	Other cash expenses	35,000	30,000	20,000
8	Repayment of bank loan			100,000
9	Interest on the bank loan			3,000
10				

\*Operations began in August; August sales were \$215,000 and purchases were \$125,000.

The budgeted September merchandise purchases include the inventory increase. All sales are on account. The company predicts that 25% of credit sales is collected in the month of the sale, 45% in the month following the sale, 20% in the second month, 9% in the third, and the remainder is uncollectible. Applying these percents to the August credit sales, for example, shows that \$96,750 of the \$215,000 will be collected in September, \$43,000 in October, and \$19,350 in November. All merchandise is purchased on credit; 80% of the balance is paid in the month following a purchase, and the remaining 20% is paid in the second month. For example, of the \$125,000 August purchases, \$100,000 will be paid in September and \$25,000 in October.

**Check** Budgeted cash balance: September, \$99,250; October, \$69,500; November, \$22,600

**Required**

Prepare a cash budget for September, October, and November for Oneida Company. Show supporting calculations as needed.

**Problem 22-7A<sup>A</sup>**

**Merchandising:**

Preparation and analysis of cash budgets with supporting inventory and purchases budgets

Aztec Company sells its product for \$180 per unit. Its actual and budgeted sales follow.

	Units	Dollars
April (actual) . . . . .	4,000	\$ 720,000
May (actual) . . . . .	2,000	360,000
June (budgeted) . . . . .	6,000	1,080,000
July (budgeted) . . . . .	5,000	900,000
August (budgeted) . . . . .	3,800	684,000

All sales are on credit. Recent experience shows that 20% of credit sales is collected in the month of the sale, 50% in the month after the sale, 28% in the second month after the sale, and 2% proves to be uncollectible. The product's purchase price is \$110 per unit. All purchases are payable within 12 days. Thus, 60% of purchases made in a month is paid in that month and the other 40% is paid in the next month. The company has a policy to maintain an ending monthly inventory of 20% of the next month's unit sales plus a safety stock of 100 units. The April 30 and May 31 actual inventory levels are consistent with this policy. Selling and administrative expenses for the year are \$1,320,000 and are paid evenly throughout the year in cash. The company's minimum cash balance at month-end is \$100,000. This minimum is maintained, if necessary, by borrowing cash from the bank. If the balance exceeds \$100,000, the company repays as much of the loan as it can without going below the minimum. This type of loan carries an annual 12% interest rate. On May 31, the loan balance is \$25,000, and the company's cash balance is \$100,000. (Round amounts to the nearest dollar.)

**Required**

1. Prepare a table that shows the computation of cash collections of its credit sales (accounts receivable) in each of the months of June and July.
2. Prepare a table that shows the computation of budgeted ending inventories (in units) for April, May, June, and July.
3. Prepare the merchandise purchases budget for May, June, and July. Report calculations in units and then show the dollar amount of purchases for each month.

**Check** (1) Cash collections: June, \$597,600; July, \$820,800

(3) Budgeted purchases: May, \$308,000; June, \$638,000

4. Prepare a table showing the computation of cash payments on product purchases for June and July.
5. Prepare a cash budget for June and July, including any loan activity and interest expense. Compute the loan balance at the end of each month.

(5) Budgeted  
ending loan balance: June,  
\$43,650; July, \$0

#### Analysis Component

6. Refer to your answer to part 5. Aztec's cash budget indicates the company will need to borrow more than \$18,000 in June. Suggest some reasons that knowing this information in May would be helpful to management.

Near the end of 2015, the management of Dimsdale Sports Co., a merchandising company, prepared the following estimated balance sheet for December 31, 2015.

#### Problem 22-8A<sup>A</sup>

##### Merchandising:

Preparation of a complete  
master budget P4

DIMSDALE SPORTS COMPANY			
Estimated Balance Sheet			
December 31, 2015			
Assets		Liabilities and Equity	
Cash .....	\$ 36,000	Accounts payable .....	\$360,000
Accounts receivable .....	525,000	Bank loan payable .....	15,000
Inventory .....	<u>150,000</u>	Taxes payable (due 3/15/2016) ....	<u>90,000</u>
Total current assets .....	\$ 711,000	Total liabilities .....	\$ 465,000
Equipment .....	540,000	Common stock .....	472,500
Less: Accumulated depreciation ...	<u>67,500</u>	Retained earnings .....	<u>246,000</u>
Equipment, net.....	<u>472,500</u>	Total stockholders' equity .....	<u>718,500</u>
Total assets .....	<u>\$1,183,500</u>	Total liabilities and equity .....	<u>\$1,183,500</u>

To prepare a master budget for January, February, and March of 2016, management gathers the following information.

- a. Dimsdale Sports's single product is purchased for \$30 per unit and resold for \$55 per unit. The expected inventory level of 5,000 units on December 31, 2015, is more than management's desired level for 2016, which is 20% of the next month's expected sales (in units). Expected sales are: January, 7,000 units; February, 9,000 units; March, 11,000 units; and April, 10,000 units.
- b. Cash sales and credit sales represent 25% and 75%, respectively, of total sales. Of the credit sales, 60% is collected in the first month after the month of sale and 40% in the second month after the month of sale. For the December 31, 2015, accounts receivable balance, \$125,000 is collected in January and the remaining \$400,000 is collected in February.
- c. Merchandise purchases are paid for as follows: 20% in the first month after the month of purchase and 80% in the second month after the month of purchase. For the December 31, 2015, accounts payable balance, \$80,000 is paid in January and the remaining \$280,000 is paid in February.
- d. Sales commissions equal to 20% of sales are paid each month. Sales salaries (excluding commissions) are \$60,000 per year.
- e. General and administrative salaries are \$144,000 per year. Maintenance expense equals \$2,000 per month and is paid in cash.
- f. Equipment reported in the December 31, 2015, balance sheet was purchased in January 2015. It is being depreciated over eight years under the straight-line method with no salvage value. The following amounts for new equipment purchases are planned in the coming quarter: January, \$36,000; February, \$96,000; and March, \$28,800. This equipment will be depreciated under the straight-line method over eight years with no salvage value. A full month's depreciation is taken for the month in which equipment is purchased.
- g. The company plans to acquire land at the end of March at a cost of \$150,000, which will be paid with cash on the last day of the month.

- h. Dimsdale Sports has a working arrangement with its bank to obtain additional loans as needed. The interest rate is 12% per year, and interest is paid at each month-end based on the beginning balance. Partial or full payments on these loans can be made on the last day of the month. The company has agreed to maintain a minimum ending cash balance of \$25,000 in each month.
- i. The income tax rate for the company is 40%. Income taxes on the first quarter's income will not be paid until April 15.

**Required**

Prepare a master budget for each of the first three months of 2016; include the following component budgets (show supporting calculations as needed, and round amounts to the nearest dollar):

1. Monthly sales budgets (showing both budgeted unit sales and dollar sales).
2. Monthly merchandise purchases budgets.
3. Monthly selling expense budgets.
4. Monthly general and administrative expense budgets.
5. Monthly capital expenditures budgets.
6. Monthly cash budgets.
7. Budgeted income statement for the entire first quarter (not for each month).
8. Budgeted balance sheet as of March 31, 2016.

**Check** (2) Budgeted purchases: January, \$114,000; February, \$282,000  
 (3) Budgeted selling expenses: January, \$82,000; February, \$104,000  
 (6) Ending cash bal.: January, \$30,100; February, \$210,300  
 (8) Budgeted total assets at March 31, \$1,568,650

**PROBLEM SET B**

**Problem 22-1B**

**Manufacturing:** Preparing production and manufacturing budgets

C2 P1

NSA Company produces baseball bats. Each bat requires 3 pounds of aluminum alloy. Management predicts that 8,000 bats and 15,000 pounds of aluminum alloy will be in inventory on March 31 of the current year and that 250,000 bats will be sold during this year's second quarter. Bats sell for \$80 each. Management wants to end the second quarter with 6,000 finished bats and 12,000 pounds of aluminum alloy in inventory. Aluminum alloy can be purchased for \$4 per pound. Each bat requires 0.5 hours of direct labor at \$18 per hour. Variable overhead is applied at the rate of \$12 per direct labor hour. The company budgets fixed overhead of \$1,776,000 for the quarter.

**Required**

1. Prepare the second-quarter production budget for bats.
2. Prepare the second-quarter direct materials (aluminum alloy) budget; include the dollar cost of purchases.
3. Prepare the direct labor budget for the second quarter.
4. Prepare the factory overhead budget for the second quarter.

**Check** (1) Units manuf., 248,000  
 (2) Cost of materials purchases, \$2,964,000

**Problem 22-2B**

**Manufacturing:** Cash budget

P2 A1

A1 Manufacturing is preparing its master budget for the quarter ended September 30, 2015. Budgeted sales and cash payments for product costs for the quarter follow.

	A	B	C	D
		July	August	September
1				
2	Budgeted sales	\$63,400	\$80,600	\$48,600
3	Budgeted cash payments for			
4	Direct materials	12,480	9,900	10,140
5	Direct labor	10,400	8,250	8,450
6	Factory overhead	18,720	14,850	15,210
7				

Sales are 20% cash and 80% on credit. All credit sales are collected in the month following the sale. The June 30 balance sheet includes balances of \$12,900 in cash; \$47,000 in accounts receivable; \$5,100 in accounts payable; and a \$2,600 balance in loans payable. A minimum cash balance of \$12,600 is required. Loans are obtained at the end of any month when a cash shortage occurs. Interest is 1% per month based on the beginning of the month loan balance and is paid at each month-end. If an excess balance of cash exists, loans are repaid at the end of the month. Operating expenses are paid in the month incurred and consist of sales commissions (10% of sales), office salaries (\$4,600 per month), and rent (\$7,100 per month).

1. Prepare a cash receipts budget for July, August, and September.
2. Prepare a cash budget for each of the months of July, August, and September. (Round amounts to the dollar.)

HCS Mfg. makes its product for \$60 and sells it for \$130 per unit. The sales staff receives a 10% commission on the sale of each unit. Its June income statement follows.

HCS MFG. Income Statement For Month Ended June 30, 2015	
Sales .....	\$1,300,000
Cost of goods sold .....	<u>600,000</u>
Gross profit .....	700,000
Operating expenses	
Sales commissions (10%) .....	130,000
Advertising .....	200,000
Store rent .....	24,000
Administrative salaries .....	40,000
Depreciation—Office equipment .....	50,000
Other expenses .....	<u>12,000</u>
Total expenses .....	<u>456,000</u>
Net income .....	<u>\$ 244,000</u>

**Problem 22-3B****Manufacturing:**

Preparation and analysis of budgeted income statements P3

Management expects June's results to be repeated in July, August, and September without any changes in strategy. Management, however, has another plan. It believes that unit sales will increase at a rate of 10% *each* month for the next three months (beginning with July) if the item's selling price is reduced to \$115 per unit and advertising expenses are increased by 25% and remain at that level for all three months. The cost of its product will remain at \$60 per unit, the sales staff will continue to earn a 10% commission, and the remaining expenses will stay the same.

**Required**

1. Prepare budgeted income statements for each of the months of July, August, and September that show the expected results from implementing the proposed changes. Use a three-column format, with one column for each month.

**Check** Budgeted net income: July, \$102,500; August, \$150,350; September, \$202,985

**Analysis Component**

2. Use the budgeted income statements from part 1 to recommend whether management should implement the proposed plan. Explain.

The management of Nabar Manufacturing prepared the following estimated balance sheet for June, 2015:

NABAR MANUFACTURING Estimated Balance Sheet June 30, 2015			
Assets		Liabilities and Equity	
Cash .....	\$ 40,000	Accounts payable .....	\$ 51,400
Accounts receivable .....	249,900	Income taxes payable .....	10,000
Raw materials inventory .....	35,000	Short-term notes payable .....	<u>24,000</u>
Finished goods inventory .....	<u>241,080</u>	Total current liabilities .....	85,400
Total current assets .....	565,980	Long-term note payable .....	<u>300,000</u>
Equipment, gross .....	720,000	Total liabilities .....	385,400
Accumulated depreciation .....	<u>(240,000)</u>	Common stock .....	600,000
Equipment, net .....	<u>480,000</u>	Retained earnings .....	<u>60,580</u>
Total assets .....	<u>\$1,045,980</u>	Total stockholders' equity .....	<u>660,580</u>
		Total liabilities and equity .....	<u>\$1,045,980</u>

**Problem 22-4B****Manufacturing:**

Preparation of a complete master budget

P1 P2 P3

To prepare a master budget for July, August, and September of 2015, management gathers the following information:

- a. Sales were 20,000 units in June. Forecasted sales in units are as follows: July, 21,000; August, 19,000; September, 20,000; October, 24,000. The product's selling price is \$17 per unit and its total product cost is \$14.35 per unit.
- b. Company policy calls for a given month's ending finished goods inventory to equal 70% of the next month's expected unit sales. The June 30 finished goods inventory is 16,800 units, which does not comply with the policy.
- c. Company policy calls for a given month's ending raw materials inventory to equal 20% of the next month's materials requirements. The June 30 raw materials inventory is 4,375 units (which also fails to meet the policy). The budgeted September 30 raw materials inventory is 1,980 units. Raw materials cost \$8 per unit. Each finished unit requires 0.50 units of raw materials.
- d. Each finished unit requires 0.50 hours of direct labor at a rate of \$16 per hour.
- e. Overhead is allocated based on direct labor hours. The predetermined variable overhead rate is \$2.70 per direct labor hour. Depreciation of \$20,000 per month is treated as fixed factory overhead.
- f. Monthly general and administrative expenses include \$9,000 administrative salaries and 0.9% monthly interest on the long-term note payable.
- g. Sales representatives' commissions are 10% of sales and are paid in the month of the sales. The sales manager's monthly salary is \$3,500 per month.
- h. The company expects 30% of sales to be for cash and the remaining 70% on credit. Receivables are collected in full in the month following the sale (none are collected in the month of the sale).
- i. All raw materials purchases are on credit, and no payables arise from any other transactions. One month's raw materials purchases are fully paid in the next month.
- j. Dividends of \$20,000 are to be declared and paid in August.
- k. Income taxes payable at June 30 will be paid in July. Income tax expense will be assessed at 35% in the quarter and paid in October.
- l. Equipment purchases of \$100,000 are budgeted for the last day of September.
- m. The minimum ending cash balance for all months is \$40,000. If necessary, the company borrows enough cash using a short-term note to reach the minimum. Short-term notes require an interest payment of 1% at each month-end (before any repayment). If the ending cash balance exceeds the minimum, the excess will be applied to repaying the short-term notes payable balance.

### Required

Prepare the following budgets and other financial information as required. All budgets and other financial information should be prepared for the third calendar quarter, except as otherwise noted below. Round calculations to the nearest whole dollar.

1. Sales budget.
2. Production budget.
3. Raw materials budget.
4. Direct labor budget.
5. Factory overhead budget.
6. Selling expense budget.
7. General and administrative expense budget.
8. Cash budget.
9. Budgeted income statement for the entire quarter (not for each month separately).
10. Budgeted balance sheet as of September 30, 2015.

**Check** (2) Units to produce: July, 17,500; August, 19,700

(3) Cost of raw materials purchases, July, \$50,760

(5) Total overhead cost, August, \$46,595

(8) Ending cash balance: July, \$96,835; August, \$141,180

(10) Budgeted total assets, Sept. 30: \$1,054,920

### Problem 22-5B<sup>A</sup>

#### Merchandising:

Preparation and analysis of purchases budgets

P4

H2O Sports Company is a merchandiser of three different products. The company's March 31 inventories are water skis, 40,000 units; tow ropes, 90,000 units; and life jackets, 150,000 units. Management believes that excessive inventories have accumulated for all three products. As a result, a new policy dictates that ending inventory in any month should equal 10% of the expected unit sales for the following month. Expected sales in units for April, May, June, and July follow.

	Budgeted Sales in Units			
	April	May	June	July
Water skis . . . . .	70,000	90,000	130,000	100,000
Tow ropes . . . . .	100,000	90,000	110,000	100,000
Life jackets . . . . .	160,000	190,000	200,000	120,000

**Required**

1. Prepare a merchandise purchases budget (in units) for each product for each of the months of April, May, and June.

**Check** (1) April budgeted purchases: Water skis, 39,000; Tow ropes, 19,000; Life jackets, 29,000

**Analysis Component**

2. The purchases budgets in part 1 should reflect fewer purchases of all three products in April compared to those in May and June. What factor caused fewer purchases to be planned? Suggest business conditions that would cause this factor to both occur and affect the company as it has.

During the last week of March, Sony Stereo’s owner approaches the bank for an \$80,000 loan to be made on April 1 and repaid on June 30 with annual interest of 12%, for an interest cost of \$2,400. The owner plans to increase the store’s inventory by \$60,000 in April and needs the loan to pay for inventory acquisitions. The bank’s loan officer needs more information about Sony Stereo’s ability to repay the loan and asks the owner to forecast the store’s June 30 cash position. On April 1, Sony Stereo is expected to have a \$3,000 cash balance, \$135,000 of accounts receivable, and \$100,000 of accounts payable. Its budgeted sales, merchandise purchases, and various cash disbursements for the next three months follow.

**Problem 22-6B<sup>A</sup>**

**Merchandising:** Preparation of cash budgets (for three periods)

P4

	A	B	C	D
1	Budgeted Figures*	April	May	June
2	Sales	\$220,000	\$300,000	\$380,000
3	Merchandise purchases	210,000	180,000	220,000
4	Cash disbursements			
5	Payroll	16,000	17,000	18,000
6	Rent	6,000	6,000	6,000
7	Other cash expenses	64,000	8,000	7,000
8	Repayment of bank loan			80,000
9	Interest on the bank loan			2,400
10				

\*Operations began in March; March sales were \$180,000 and purchases were \$100,000.

The budgeted April merchandise purchases include the inventory increase. All sales are on account. The company predicts that 25% of credit sales is collected in the month of the sale, 45% in the month following the sale, 20% in the second month, 9% in the third, and the remainder is uncollectible. Applying these percents to the March credit sales, for example, shows that \$81,000 of the \$180,000 will be collected in April, \$36,000 in May, and \$16,200 in June. All merchandise is purchased on credit; 80% of the balance is paid in the month following a purchase and the remaining 20% is paid in the second month. For example, of the \$100,000 March purchases, \$80,000 will be paid in April and \$20,000 in May.

**Required**

Prepare a cash budget for April, May, and June for Sony Stereo. Show supporting calculations as needed.

**Check** Budgeted cash balance: April, \$53,000; May, \$44,000; June, \$34,800

Connick Company sells its product for \$22 per unit. Its actual and budgeted sales follow.

	Units	Dollars
January (actual) . . . . .	18,000	\$396,000
February (actual) . . . . .	22,500	495,000
March (budgeted) . . . . .	19,000	418,000
April (budgeted) . . . . .	18,750	412,500
May (budgeted) . . . . .	21,000	462,000

**Problem 22-7B<sup>A</sup>**

**Merchandising:** Preparation and analysis of cash budgets with supporting inventory and purchases budgets

P4

All sales are on credit. Recent experience shows that 40% of credit sales is collected in the month of the sale, 35% in the month after the sale, 23% in the second month after the sale, and 2% proves to be uncollectible. The product’s purchase price is \$12 per unit. All purchases are payable within 21 days. Thus, 30% of

purchases made in a month is paid in that month and the other 70% is paid in the next month. The company has a policy to maintain an ending monthly inventory of 20% of the next month's unit sales plus a safety stock of 100 units. The January 31 and February 28 actual inventory levels are consistent with this policy. Selling and administrative expenses for the year are \$1,920,000 and are paid evenly throughout the year in cash. The company's minimum cash balance for month-end is \$50,000. This minimum is maintained, if necessary, by borrowing cash from the bank. If the balance exceeds \$50,000, the company repays as much of the loan as it can without going below the minimum. This type of loan carries an annual 12% interest rate. At February 28, the loan balance is \$12,000, and the company's cash balance is \$50,000.

**Required**

**Check** (1) Cash collections: March, \$431,530; April, \$425,150

(3) Budgeted purchases: February, \$261,600; March, \$227,400

(5) Ending cash balance: March, \$58,070; April, \$94,920

1. Prepare a table that shows the computation of cash collections of its credit sales (accounts receivable) in each of the months of March and April.
2. Prepare a table showing the computations of budgeted ending inventories (units) for January, February, March, and April.
3. Prepare the merchandise purchases budget for February, March, and April. Report calculations in units and then show the dollar amount of purchases for each month.
4. Prepare a table showing the computation of cash payments on product purchases for March and April.
5. Prepare a cash budget for March and April, including any loan activity and interest expense. Compute the loan balance at the end of each month.

**Analysis Component**

6. Refer to your answer to part 5. Connick's cash budget indicates whether the company must borrow additional funds at the end of March. Suggest some reasons that knowing the loan needs in advance would be helpful to management.

**Problem 22-8B<sup>A</sup>**

**Merchandising:**

Preparation of a complete master budget

Near the end of 2015, the management of Isle Corp., a merchandising company, prepared the following estimated balance sheet for December 31, 2015.

P4

ISLE CORPORATION Estimated Balance Sheet December 31, 2015			
Assets		Liabilities and Equity	
Cash .....	\$ 36,000	Accounts payable .....	\$360,000
Accounts receivable .....	525,000	Bank loan payable .....	15,000
Inventory .....	<u>150,000</u>	Taxes payable (due 3/15/2016) .....	<u>90,000</u>
Total current assets .....	\$ 711,000	Total liabilities .....	\$ 465,000
Equipment .....	540,000	Common stock .....	472,500
Less: Accumulated depreciation .....	<u>67,500</u>	Retained earnings .....	<u>246,000</u>
Equipment, net.....	<u>472,500</u>	Total stockholders' equity .....	<u>718,500</u>
Total assets .....	<u>\$1,183,500</u>	Total liabilities and equity .....	<u>\$1,183,500</u>

To prepare a master budget for January, February, and March of 2016, management gathers the following information.

- a. Isle Corp.'s single product is purchased for \$30 per unit and resold for \$45 per unit. The expected inventory level of 5,000 units on December 31, 2015, is more than management's desired level for 2016, which is 25% of the next month's expected sales (in units). Expected sales are: January, 6,000 units; February, 8,000 units; March, 10,000 units; and April, 9,000 units.
- b. Cash sales and credit sales represent 25% and 75%, respectively, of total sales. Of the credit sales, 60% is collected in the first month after the month of sale and 40% in the second month after the month of sale. For the \$525,000 accounts receivable balance at December 31, 2015, \$315,000 is collected in January 2016 and the remaining \$210,000 is collected in February 2016.
- c. Merchandise purchases are paid for as follows: 20% in the first month after the month of purchase and 80% in the second month after the month of purchase. For the \$360,000 accounts payable balance at December 31, 2015, \$72,000 is paid in January 2016 and the remaining \$288,000 is paid in February 2016.
- d. Sales commissions equal to 20% of sales are paid each month. Sales salaries (excluding commissions) are \$90,000 per year.

- e. General and administrative salaries are \$144,000 per year. Maintenance expense equals \$3,000 per month and is paid in cash.
- f. Equipment reported in the December 31, 2015, balance sheet was purchased in January 2015. It is being depreciated over eight years under the straight-line method with no salvage value. The following amounts for new equipment purchases are planned in the coming quarter: January, \$72,000; February, \$96,000; and March, \$28,800. This equipment will be depreciated using the straight-line method over eight years with no salvage value. A full month's depreciation is taken for the month in which equipment is purchased.
- g. The company plans to acquire land at the end of March at a cost of \$150,000, which will be paid with cash on the last day of the month.
- h. Isle Corp. has a working arrangement with its bank to obtain additional loans as needed. The interest rate is 12% per year, and interest is paid at each month-end based on the beginning balance. Partial or full payments on these loans can be made on the last day of the month. Isle has agreed to maintain a minimum ending cash balance of \$36,000 in each month.
- i. The income tax rate for the company is 40%. Income taxes on the first quarter's income will not be paid until April 15.

**Required**

Prepare a master budget for each of the first three months of 2016; include the following component budgets (show supporting calculations as needed, and round amounts to the nearest dollar):

1. Monthly sales budgets (showing both budgeted unit sales and dollar sales).
2. Monthly merchandise purchases budgets.
3. Monthly selling expense budgets.
4. Monthly general and administrative expense budgets.
5. Monthly capital expenditures budgets.
6. Monthly cash budgets.
7. Budgeted income statement for the entire first quarter (not for each month).
8. Budgeted balance sheet as of March 31, 2016.

**Check** (2) Budgeted purchases: January, \$90,000; February, \$255,000  
 (3) Budgeted selling expenses: January, \$61,500; February, \$79,500  
 (6) Ending cash bal.: January, \$182,850; February, \$107,850  
 (8) Budgeted total assets at March 31, \$1,346,875

*(This serial problem began in Chapter 1 and continues through most of the book. If previous chapter segments were not completed, the serial problem can begin at this point. It is helpful, but not necessary, to use the Working Papers that accompany the book.)*

**SERIAL PROBLEM**  
 Business Solutions  
**P3**

**SP 22** Santana Rey expects second-quarter 2016 sales of her new line of computer furniture to be the same as the first quarter's sales (reported below) without any changes in strategy. Monthly sales averaged 40 desk units (sales price of \$1,250) and 20 chairs (sales price of \$500).

BUSINESS SOLUTIONS Segment Income Statement* For Quarter Ended March 31, 2016	
Sales <sup>†</sup> .....	\$ 180,000
Cost of goods sold <sup>‡</sup> .....	<u>115,000</u>
Gross profit .....	65,000
Expenses	
Sales commissions (10%) .....	18,000
Advertising expenses .....	9,000
Other fixed expenses .....	<u>18,000</u>
Total expenses .....	<u>45,000</u>
Net income .....	<u>\$ 20,000</u>

\* Reflects revenue and expense activity only related to the computer furniture segment.  
<sup>†</sup> Revenue: (120 desks × \$1,250) + (60 chairs × \$500) = \$150,000 + \$30,000 = \$180,000  
<sup>‡</sup> Cost of goods sold: (120 desks × \$750) + (60 chairs × \$250) + \$10,000 = \$115,000

Santana Rey believes that sales will increase each month for the next three months (April, 48 desks, 32 chairs; May, 52 desks, 35 chairs; June, 56 desks, 38 chairs) if selling prices are reduced to \$1,150 for desks and \$450 for chairs, and advertising expenses are increased by 10% and remain at that level for all three months. The products' variable cost will remain at \$750 for desks and \$250 for chairs. The

sales staff will continue to earn a 10% commission, the fixed manufacturing costs per month will remain at \$10,000, and other fixed expenses will remain at \$6,000 per month.

### Required

1. Prepare budgeted income statements for each of the months of April, May, and June that show the expected results from implementing the proposed changes. Use a three-column format, with one column for each month.
2. Use the budgeted income statements from part 1 to recommend whether Santana Rey should implement the proposed changes. Explain.

**Check** (1) Budgeted income (loss): April, \$(660); May, \$945

## Beyond the Numbers

### REPORTING IN ACTION

### APPLE

**BTN 22-1** Financial statements often serve as a starting point in formulating budgets. Review **Apple's** financial statements in Appendix A to determine its cash paid for acquisitions of property, plant, and equipment in the current year and the budgeted cash needed for such acquisitions in the next year.

### Required

1. Which financial statement reports the amount of cash paid for acquisitions of property, plant, and equipment? Explain where on the statement this information is reported.
2. Indicate the amount of cash (a) paid for acquisitions of property and equipment in the year ended September 28, 2013, and (b) to be paid (budgeted for) next year under the assumption that annual acquisitions of property and equipment equal 20% of the prior year's net income.

### Fast Forward

3. Access Apple's financial statements for a year ending after September 28, 2013, from either its website [[Apple.com](http://Apple.com)] or the SEC's EDGAR database [[www.SEC.gov](http://www.SEC.gov)]. Compare your answer for part 2 with actual cash paid for acquisitions of property and equipment for that fiscal year. Compute the error, if any, in your estimate. Speculate as to why cash paid for acquisitions of property and equipment was higher or lower than your estimate.

### COMPARATIVE ANALYSIS

### APPLE GOOGLE

**BTN 22-2** One source of cash savings for a company is improved management of inventory. To illustrate, assume that **Apple** and **Google** both have \$1 billion per month in sales of one model of smartphone in Canada, and both forecast this level of sales per month for the next 24 months. Also assume that both Apple and Google have a 20% contribution margin, their fixed costs are equal, and that cost of goods sold is the only variable cost. Assume that the main difference between Apple and Google is the distribution system. Apple uses a just-in-time system and requires ending inventory of only 10% of next month's sales in inventory at each month-end. However, Google is building an improved distribution system and currently requires 30% of next month's sales in inventory at each month-end.

### Required

1. Compute the amount by which Google can reduce its inventory level if it can match Apple's system of maintaining an inventory equal to 10% of next month's sales. (*Hint:* Focus on the facts given and only on the Canadian market.)
2. Explain how the analysis in part 1 that shows ending inventory levels for both the 30% and 10% required inventory policies can help justify a just-in-time inventory system. Assume a 15% interest cost for resources that are tied up in ending inventory.

### ETHICS CHALLENGE

**BTN 22-3** Both the budget process and budgets themselves can impact management actions, both positively and negatively. For instance, a common practice among not-for-profit organizations and government agencies is for management to spend any amounts remaining in a budget at the end of the budget period, a practice often called "use it or lose it." The view is that if a department manager does not spend the budgeted amount, top management will reduce next year's budget by the amount not spent. To avoid losing budget dollars, department managers often spend all budgeted amounts regardless of the value added to products or services. All of us pay for the costs associated with this budget system.

### Required

Write a half-page report to a local not-for-profit organization or government agency offering a solution to the "use it or lose it" budgeting problem.

**BTN 22-4** The sales budget is usually the first and most crucial of the component budgets in a master budget because all other budgets usually rely on it for planning purposes.

**Required**

Assume that your company's sales staff provides information on expected sales and selling prices for items making up the sales budget. Prepare a one-page memorandum to your supervisor outlining concerns with the sales staff's input in the sales budget when its compensation is at least partly tied to these budgets. More generally, explain the importance of assessing any potential bias in information provided to the budget process.

**COMMUNICATING  
IN PRACTICE**

**BTN 22-5** Access information on e-budgets through **The Manage Mentor** website ([themanagementor.com/kuniverse/kmailers\\_universe/finance\\_kmailers/cfa/budgeting2.htm](http://themanagementor.com/kuniverse/kmailers_universe/finance_kmailers/cfa/budgeting2.htm)). Read the information provided.

**Required**

1. Assume the role of a senior manager in a large, multidivision company. What are the benefits of using e-budgets?
2. As a senior manager, what concerns do you have with the concept and application of e-budgets?

**TAKING IT TO  
THE NET**

**BTN 22-6** Your team is to prepare a budget report outlining the costs of attending college (full-time) for the next two semesters (30 hours) or three quarters (45 hours). This budget's focus is solely on attending college; do not include personal items in the team's budget. Your budget must include tuition, books, supplies, club fees, food, housing, and all costs associated with travel to and from college. This budgeting exercise is similar to the initial phase in activity-based budgeting. Include a list of any assumptions you use in completing the budget. Be prepared to present your budget in class.

**TEAMWORK IN  
ACTION**

**BTN 22-7** **Solben** sells technology to use in the production of biodiesel. Company founder Daniel Gómez Iñiguez stresses the importance of planning and budgeting for business success.

**Required**

1. How can budgeting help Daniel efficiently develop and operate his business?
2. Daniel plans to expand his business. How can a budget be useful in expanding a business's operations?

**ENTREPRENEURIAL  
DECISION**

**BTN 22-8** To help understand the factors impacting a sales budget, you are to visit three businesses with the same ownership or franchise membership. Record the selling prices of two identical products at each location, such as regular and premium gas sold at **Chevron** stations. You are likely to find a difference in prices for at least one of the three locations you visit.

**Required**

1. Identify at least three external factors that must be considered when setting the sales budget. (Note: There is a difference between internal and external factors that impact the sales budget.)
2. What factors might explain any differences identified in the prices of the businesses you visited?

**HITTING THE  
ROAD**

**BTN 22-9** Access **Samsung**'s income statement (in Appendix A) for the business year 2013.

**Required**

1. Is Samsung's selling and administrative expenses budget likely to be an important budget in its master budgeting process? Explain.
2. Identify three types of expenses that would be reported as selling and administrative expenses on Samsung's income statement.
3. Who likely has the initial responsibility for Samsung's selling and administrative expense budget? Explain.

**GLOBAL  
DECISION**

**Samsung**

**ANSWERS TO MULTIPLE CHOICE QUIZ**

1. c
2. e; Budgeted purchases = \$36,000 + \$7,000 - \$6,000 = \$37,000
3. b; Cash collected = 25% of September sales + 75% of August sales = (0.25 × \$240,000) + (0.75 × \$220,000) = \$225,000
4. d
5. a; 560 units + (0.30 × 600 units) - (0.30 × 560 units) = 572 units

# Flexible Budgets and Standard Costs

### Chapter Preview

#### FIXED BUDGET REPORTS

Fixed budget performance report  
Fixed budget reports for evaluation

#### FLEXIBLE BUDGET REPORTS

Purpose  
**P1** Preparation  
Flexible budget performance report

#### MATERIALS AND LABOR STANDARDS

**C1** Identifying standard costs  
Setting standard costs  
**C2** Cost variance analysis  
Cost variance computation  
**P2** Materials and labor variances

#### OVERHEAD STANDARDS AND VARIANCES

Flexible overhead budget  
Setting overhead standards  
**P3** Computing overhead variances  
**A1** Sales variances  
**P4** Overhead variances  
**P5** Standard cost entries

### Learning Objectives

#### CONCEPTUAL

- C1** Define *standard costs* and explain how standard cost information is useful for management by exception.
- C2** Describe cost variances and what they reveal about performance.

#### ANALYTICAL

- A1** Analyze changes in sales from expected amounts.

#### PROCEDURAL

- P1** Prepare a flexible budget and interpret a flexible budget performance report.
- P2** Compute materials and labor variances.

- P3** Compute overhead controllable and volume variances.

- P4** *Appendix 23A*—Compute overhead spending and efficiency variances.

- P5** *Appendix 23A*—Prepare journal entries for standard costs and account for price and quantity variances.

## Roll On

FORT COLLINS, CO—Avid mountain biker Chris Sugai was looking for a better bike. “I wanted a higher-end bike, one that was better at climbing, braking, and descending. I noticed that no one was making it, so I decided to do it.” Chris and his company, **Niner Bikes** ([www.ninerbikes.com](http://www.ninerbikes.com)), staked their future on 29-inch-wheel bikes, a radical departure from the more standard 26-inch wheel. “Everyone thought we were crazy,” laughs Chris, “but we’re convinced the 29-inch wheel gives the best ride quality.”

Apparently, many customers agree, as evidenced by the company’s over 400% increase in sales over the past few years.

Chris considers Niner Bikes to be a “virtual company.” The company does much of its work online via Google Docs. The company collects new product ideas from customer chat rooms, and an engineering and design team uses software to perform virtual testing and simulation. The resulting information is shared electronically with a marketing team to develop graphics. “I need to get the best people possible, and I can’t force them to move to a certain location. With Skype, iPads, and cell phones, I don’t need to. I’m very much for freedom and allowing people to work how they work best.”

Manufacturers like Niner Bikes must control materials, labor, and overhead costs. Determining standard costs helps. Since Niner Bikes makes only bikes with 29-inch wheels, it is able to better understand how design elements and bike components work together, enabling the company to develop very precise manufacturing specifications and standards. “We are able to focus on the minutest details. We just spent four hours

talking about a cable routing system for braking.” This attention to detail, and analysis of any variances in the actual manufacturing process from standards, helps Chris keep the manufacturing process on track.

Materials price and quantity variances are important in controlling the costs of expensive raw materials like carbon steel.

*“Great products come from great people”*

—Chris Sugai

Chris stresses the need for “precise specifications and controls; we don’t use any material that does not meet our requirements.” Unfavorable materials price variances could result from rising raw materials prices, which might cause the company to consider alternative suppliers or to raise its selling prices.

From sales of \$2.7 million in 2009 to over \$14 million currently, Niner Bikes has seen rapid growth. When production activity changes so rapidly, budgets can quickly become outdated. The use of flexible budgets, which reflect budgeted costs at several different production levels, can be useful in analyzing performance and making business decisions. While attention to budgeting, standard costs, and variances is important, Chris encourages potential entrepreneurs to build a business they are passionate about and to give back. “Part of our company’s mission statement is to give back to the community that makes what we do possible. Helping organizations that support the development and maintenance of bike trails is important for our company and the right thing to do.”

## Section 1—Flexible Budgets

To monitor and control operations, companies exercise budgetary control and require budget reports. **Budgetary control** refers to management's use of budgets to see that planned objectives are met. **Budget reports** contain relevant information that compares actual results to planned activities. Budget reports are sometimes viewed as progress reports, or *report cards*, on management's performance in achieving planned objectives. These reports can be prepared at any time and for any period. Three common periods for a budget report are a month, quarter, and year.

**Point:** Budget reports are often used to determine bonuses of managers.

The budgetary control process involves at least four steps: (1) develop the budget from planned objectives, (2) compare actual results to budgeted amounts and analyze any differences, (3) take corrective and strategic actions, and (4) establish new planned objectives and prepare a new budget. Exhibit 23.1 shows this continual process of budgetary control. Budget reports and related documents are effective tools for managers to obtain the greatest benefits from this budgetary process.

### EXHIBIT 23.1

Process of Budgetary Control

Because budgets are the main vehicle by which companies monitor and control operations, we need to look at them in some detail. As we showed in the previous chapter, a *master budget* is based on a predicted level of activity, such as sales volume, for the budget period. In preparing a master budget, two alternative approaches can be used: *fixed budgeting* or *flexible budgeting*. A **fixed budget**, also called a *static budget*, is based on a single predicted amount of sales or other activity measure. A **flexible budget**, also called a *variable budget*, is based on several different amounts of sales. As we will show in this section, a flexible budget is more useful than a fixed budget when the actual level of sales activity differs from the level of sales activity predicted at the beginning of the period. We look first at fixed budgets; understanding the limitations of fixed budgets better enables us to appreciate the benefits of flexible budgets later.

## FIXED BUDGET REPORTS

### Fixed Budget Performance Report

One use of a budget is to compare actual results with planned activities. Information useful for this analysis is often presented in a *performance report* that shows budgeted amounts, actual amounts, and *variances* (differences between budgeted and actual amounts). In a fixed budget control system, the master budget is based on a *single prediction* for sales volume, and the budgeted amount for each cost essentially assumes that a specific (or *fixed*) amount of sales will occur.

We illustrate fixed budget performance reports with Optel, which manufactures eyeglasses, frames, contact lenses, and related supplies. For 2015, Optel based its fixed budget on a prediction of 10,000 (composite) units of sales; costs also were budgeted based on 10,000 composite units of sales. Exhibit 23.2 shows a **fixed budget performance report**, a report that compares actual results with the results expected under a fixed budget. As the report shows, Optel's actual sales for the year were 12,000 composite units. In addition, Optel produced 12,000 composite units during the year (its inventory level did not change). The final column in the performance report shows the differences (variances) between the budgeted and actual amounts for each budget item.

OPTTEL Fixed Budget Performance Report For Month Ended January 31, 2015			
	Fixed Budget	Actual Results	Variances*
Sales (in units) . . . . .	10,000	12,000	
Sales (in dollars) . . . . .	\$100,000	\$125,000	\$25,000 F
Cost of goods sold			
Direct materials . . . . .	10,000	13,000	3,000 U
Direct labor . . . . .	15,000	20,000	5,000 U
Overhead			
Factory supplies . . . . .	2,000	2,100	100 U
Utilities . . . . .	3,000	4,000	1,000 U
Depreciation—machinery . . . . .	8,000	8,000	0
Supervisory salaries . . . . .	11,000	11,000	0
Selling expenses			
Sales commissions . . . . .	9,000	10,800	1,800 U
Shipping expenses . . . . .	4,000	4,300	300 U
General and administrative expenses			
Office supplies . . . . .	5,000	5,200	200 U
Insurance expenses . . . . .	1,000	1,200	200 U
Depreciation—office equipment . . . . .	7,000	7,000	0
Administrative salaries . . . . .	13,000	13,000	0
Total expenses . . . . .	88,000	99,600	11,600 U
Income from operations . . . . .	\$ 12,000	\$ 25,400	\$13,400 F

\* F = Favorable variance; U = Unfavorable variance.

## EXHIBIT 23.2

Fixed Budget Performance Report

This type of performance report designates differences between budgeted and actual results as *variances*. We use the letters *F* and *U* to describe the variances, with meanings as follows:

**F = Favorable variance** When compared to budget, the actual cost or revenue contributes to a *higher* income. That is, actual revenue is higher than budgeted revenue, or actual cost is lower than budgeted cost.

**U = Unfavorable variance** When compared to budget, the actual cost or revenue contributes to a *lower* income; actual revenue is lower than budgeted revenue, or actual cost is higher than budgeted cost.

This convention is common in practice and is used throughout this chapter.

## Budget Reports for Evaluation

A primary use of budget reports is as a tool for management to monitor and control operations. From the fixed budget performance report in Exhibit 23.2, Optel's management might raise questions such as:

- Why is actual income from operations \$13,400 higher than budgeted?
- Is manufacturing using too much direct material?
- Is manufacturing using too much direct labor?
- Why are sales commissions higher than budgeted?
- Why are so many of the variances unfavorable?

The performance report in Exhibit 23.2 will not be very useful in answering these types of questions. This is because it is not based on an “apples to apples” comparison. That is, the budgeted dollar amounts are based on 10,000 units of sales, but the actual dollar amounts are based on

**Example:** How is it that the favorable sales variance in Exhibit 23.2 is linked with so many unfavorable cost and expense variances? *Answer:* Costs have increased with the increase in sales.

12,000 units of sales. Clearly, the costs to make 12,000 units will be greater than the costs to make 10,000 units, so it is no surprise that Optel's total expense variance is unfavorable. In addition, the costs in Exhibit 23.2 with the highest unfavorable variances (direct materials, direct labor, and sales commissions) are typically considered *variable* costs, which increase directly with sales activity. In general, the fixed budget performance report is not very useful in analyzing performance when actual sales differ from predicted sales. In the next section we show how a flexible budget can be useful in analyzing performance.

### Decision Insight

**Cruise Control** Budget reporting and evaluation are used at service providers such as **Royal Caribbean Cruises Ltd.** It regularly prepares performance plans and budget requests for its fleet of cruise ships, which describe performance goals, measure outcomes, and analyze variances. ■

Melanie Stetson Freeman/The Christian Science Monitor/Getty Images

## FLEXIBLE BUDGET REPORTS

### Purpose of Flexible Budgets

To help address limitations with the fixed budget performance report, particularly from the effects of changes in sales volume, management can use a flexible budget. Since flexible budgets vary by level of activity, they are useful both before and after the period's activities are complete.

A flexible budget prepared before the period is often based on several levels of activity. Budgets for those different levels can provide a “what-if” look at operations. The different levels often include both a best-case and worst-case scenario. This allows management to make adjustments to avoid or lessen the effects of the worst-case scenario.

A flexible budget prepared after the period helps management evaluate past performance. It is especially useful for such an evaluation because it reflects budgeted revenues and costs based on the actual level of activity. Thus, the flexible budget gives an “apples to apples” comparison because the budgeted activity level is the same as the actual activity level. With a flexible budget, comparisons of actual results with budgeted performance are likely to be able to identify the causes of any differences. Such information can help managers focus attention on real problem areas and implement corrective actions.

### Preparation of Flexible Budgets

A flexible budget is designed to reveal the effects of different activity levels on revenues and costs. To prepare a flexible budget, management must classify costs as variable or fixed, within a relevant range. Recall that the total amount of a variable cost changes in direct proportion to a change in activity level. The total amount of fixed cost remains unchanged regardless of changes in the level of activity within a relevant (normal) operating range.

When we create the numbers in a flexible budget, we express each variable cost in one of two ways: either as (1) a constant amount per unit of sales or as (2) a percentage of a sales dollar. In the case of a fixed cost, we express its budgeted amount as the total amount expected to occur at any sales volume within the relevant range.

Exhibit 23.3 shows a set of flexible budgets for Optel for January 2015. Seven of its expenses are classified as variable costs. Optel expects these costs to change in total as sales change. Its remaining five expenses are fixed costs. These classifications result from management's investigation of each expense. Variable and fixed expense categories are *not* the same for every company, and we must avoid drawing conclusions from specific cases. For example, depending on the nature of a company's operations, office supplies expense can be either fixed or variable with respect to sales.

**P1** Prepare a flexible budget and interpret a flexible budget performance report.

**Point:** The usefulness of a flexible budget depends on valid classification of variable and fixed costs. Some costs are mixed and must be analyzed to determine their variable and fixed portions.

**EXHIBIT 23.3**

Flexible Budgets

<b>OPTEL</b>					
<b>Flexible Budgets</b>					
<b>For Month Ended January 31, 2015</b>					
	<u>Flexible Budget</u>		<u>Flexible Budget for Unit</u>		
	Variable Amount per Unit	Total Fixed Cost	Sales of		
			10,000	12,000	14,000
Sales .....	\$10.00		\$100,000	\$120,000	\$140,000
<b>Variable costs</b>					
Direct materials .....	1.00		10,000	12,000	14,000
Direct labor .....	1.50		15,000	18,000	21,000
Factory supplies .....	0.20		2,000	2,400	2,800
Utilities .....	0.30		3,000	3,600	4,200
Sales commissions .....	0.90		9,000	10,800	12,600
Shipping expenses .....	0.40		4,000	4,800	5,600
Office supplies .....	0.50		5,000	6,000	7,000
Total variable costs .....	<u>4.80</u>		<u>48,000</u>	<u>57,600</u>	<u>67,200</u>
Contribution margin .....	<u>\$ 5.20</u>		<u>\$ 52,000</u>	<u>\$ 62,400</u>	<u>\$ 72,800</u>
<b>Fixed costs</b>					
Depreciation—machinery .....		\$ 8,000	8,000	8,000	8,000
Supervisory salaries .....		11,000	11,000	11,000	11,000
Insurance expense .....		1,000	1,000	1,000	1,000
Depreciation—office equipment .....		7,000	7,000	7,000	7,000
Administrative salaries .....		<u>13,000</u>	<u>13,000</u>	<u>13,000</u>	<u>13,000</u>
Total fixed costs .....		<u>\$40,000</u>	<u>40,000</u>	<u>40,000</u>	<u>40,000</u>
Income from operations .....			<u>\$ 12,000</u>	<u>\$ 22,400</u>	<u>\$ 32,800</u>

The layout for the flexible budgets in Exhibit 23.3 follows a *contribution margin format*—beginning with sales followed by variable costs and then fixed costs. Both the expected individual and total variable costs are reported and then subtracted from sales. Sales minus variable costs equals contribution margin. The expected amounts of fixed costs are listed next, followed by the expected income from operations before taxes.

The first column of numbers in Exhibit 23.3 shows the variable costs per unit for each of Optel's variable costs. The second column of numbers shows Optel's fixed costs, which won't change as sales volume changes. The third, fourth, and fifth number columns show the flexible budget amounts computed for three different sales volumes. For instance, the third number column's flexible budget is based on 10,000 units. In this column, total variable costs for each of Optel's seven variable costs are computed as the variable cost per unit (from column 1) multiplied by 10,000 units. Also, the total fixed costs in this column are the same as those in the second number column.

Overall, the numbers in the third number column of Exhibit 23.3 are the same as those in the fixed budget of Exhibit 23.2 because the expected sales volume (10,000 units) is the same for both budgets. In addition, the flexible budget in Exhibit 23.3 reports budgeted costs for activity levels of 12,000 and 14,000 units. Note that the total variable costs increase as the activity levels increase, but the total fixed costs stay unchanged as activity increases. A flexible budget like that in Exhibit 23.3 can be useful to management in planning operations. In addition, as we will show in the next section, a flexible budget is particularly useful in analyzing performance when actual sales volume differs from that predicted by a fixed budget.

### Flexible Budget Performance Report

Recall that Optel's actual sales volume for January was 12,000 units. This sales volume is 2,000 units more than the 10,000 units originally predicted in the fixed budget. So, when management evaluates Optel's performance, it needs a flexible budget showing actual and budgeted dollar amounts at 12,000 units.

**Example:** Using Exhibit 23.3, what is the budgeted income from operations for unit sales of (a) 11,000 and (b) 13,000? Answers: \$17,200 for unit sales of 11,000; \$27,600 for unit sales of 13,000.

**Point:** Flexible budgeting allows a budget to be prepared at the actual output level. Performance reports are then prepared comparing the flexible budget to actual revenues and costs.

A **flexible budget performance report** compares actual performance and budgeted performance based on actual sales volume (or other activity level). This report directs management's attention to those costs or revenues that differ substantially from budgeted amounts. In Optel's case, we prepare this report after January's sales volume is known to be 12,000 units. Exhibit 23.4 shows Optel's flexible budget performance report for January. The flexible budget report shows a favorable net income variance of \$3,000. Management then uses this report to investigate variances and evaluate Optel's performance. Quite often management will focus on large variances. This report shows a \$5,000 favorable variance in total dollar sales. Because actual and budgeted volumes are both 12,000 units, the \$5,000 sales variance must have resulted from a higher than expected selling price. Management would like to determine if the conditions that resulted in higher selling prices are likely to continue.

### EXHIBIT 23.4

\* F = Favorable variance; U = Unfavorable variance.

The other variances in Exhibit 23.4 also direct management's attention to areas where corrective actions can help control Optel's operations. For example, both the direct materials and direct labor variances are relatively large and unfavorable. On the other hand, relatively large favorable variances are observed for shipping expenses and office supplies. Management will try to determine the causes for these variances, both favorable and unfavorable, and make changes to Optel's operations if needed.

In addition to analyzing variances using a flexible budget performance report, management can also take a more detailed approach based on a *standard cost* system. We illustrate this form of variance analysis next in the Standard Costs section of this chapter.

### Decision Maker

**Entrepreneur** The heads of both the strategic consulting and tax consulting divisions of your financial services firm complain to you about the unfavorable variances on their performance reports. "We worked on more consulting assignments than planned. It's not surprising our costs are higher than expected. To top it off, this report characterizes our work as *poor!*" How do you respond? ■ [Answers follow the chapter's Summary.]

A manufacturing company reports the fixed budget and actual results for the past year as shown below. The company's fixed budget assumes a selling price of \$40 per unit. The fixed budget is based on 20,000 units of sales, and the actual results are based on 24,000 units of sales. Prepare a flexible budget performance report for the past year.

	Fixed Budget (20,000 units)	Actual Results (24,000 units)
Sales . . . . .	\$800,000	\$972,000
Variable costs* . . . . .	160,000	240,000
Fixed costs . . . . .	500,000	490,000

\*Budgeted variable cost per unit = \$160,000/20,000 = \$8.00

### Solution

Flexible Budget Performance Report			
	Flexible Budget (24,000 units)	Actual Results (24,000 units)	Variance
Sales . . . . .	\$960,000*	\$972,000	\$12,000 F
Variable costs . . . . .	192,000**	240,000	48,000 U
Contribution margin . . . . .	768,000	732,000	36,000 U
Fixed costs . . . . .	500,000	490,000	10,000 F
Income from operations . . . . .	\$268,000	\$242,000	\$26,000 U

\*24,000 × \$40    \*\*24,000 × \$8

## Section 2—Standard Costs

In this section we show how *standard costs* can be used in a flexible budgeting system to enable management to better understand the reasons for variances. **Standard costs** are preset costs for delivering a product or service under normal conditions. These costs are established by personnel, engineering, and accounting studies using past experiences and data. Standard costs vary across companies. Management can use standard costs to assess the reasonableness of actual costs incurred for producing the product or providing the service. When actual costs vary from standard costs, management follows up to identify potential problems and take corrective actions. **Management by exception** means that managers focus attention on the most significant differences between actual costs and standard costs and give less attention to areas where performance is reasonably close to standard. Management by exception is especially useful when directed at controllable items, enabling top management to affect the actions of lower-level managers responsible for the company's revenues and costs.

Standard costs are often used in preparing budgets because they are the anticipated costs incurred under normal conditions. Terms such as *standard materials cost*, *standard labor cost*, and *standard overhead cost* are often used to refer to amounts budgeted for direct materials, direct labor, and overhead.

While many managers use standard costs to investigate manufacturing costs, standard costs can also help control *nonmanufacturing* costs. Companies providing services instead of products can also benefit from the use of standard costs. For example, while quality medical service is paramount, efficiency in providing that service is also important to medical professionals. The use of budgeting and standard costing is touted as an effective means to control and monitor medical costs, especially overhead.

### C1

Define *standard costs* and explain how standard cost information is useful for management by exception.

**Point:** Business practice often uses the word *budget* when speaking of total amounts and *standard* when discussing per unit amounts.

## MATERIALS AND LABOR STANDARDS

This section explains how to set direct materials and direct labor standards and how to prepare a standard cost card.

### Identifying Standard Costs

Managerial accountants, engineers, personnel administrators, and other managers combine their efforts to set standard costs. To identify standards for direct labor costs, we can conduct time and motion studies for each labor operation in the process of providing a product or service. From these studies, management can learn the best way to perform the operation and then set the standard labor time required for the operation under normal conditions. Similarly, standards for direct materials are set by studying the quantity, grade, and cost of each material used. (Standards for overhead costs are explained later in the chapter.)

Regardless of the care used in setting standard costs and in revising them as conditions change, actual costs frequently differ from standard costs. For instance, the actual quantity of material used can differ from the standard, or the price paid per unit of material can differ from the standard. Quantity and price differences from standard amounts can also occur for labor. That is, the actual labor time and actual labor rate can vary from what was expected.

**Example:** What factors might be considered when deciding whether to revise standard costs? *Answer:* Changes in the processes and/or resources needed to carry out the processes.

### Decision Insight

**Cruis'n Standards** The **Corvette** consists of hundreds of parts for which engineers set standards. Various types of labor are also involved in its production, including machining, assembly, painting, and welding, and standards are set for each. Actual results are periodically compared with standards to assess performance. ■

Car Culture/Getty Images

### Setting Standard Costs

To illustrate the setting of standard costs, we consider baseball bats manufactured by ProBat. Its engineers have determined that manufacturing one bat requires 0.90 kilograms (kg) of high-grade wood. They also expect some loss of material as part of the process because of inefficiencies and waste. This results in adding an *allowance* of 0.10 kg, making the standard requirement 1.0 kg of wood for each bat.

The 0.90 kg portion is called an *ideal standard*; it is the quantity of material required if the process is 100% efficient without any loss or waste. Reality suggests that some loss of material usually occurs with any process. The standard of 1.0 kg is known as the *practical standard*, the quantity of material required under normal application of the process. Most companies use practical rather than ideal standards.

ProBat needs to develop standard costs for direct materials, direct labor, and overhead. For direct materials and direct labor, ProBat must develop standard quantities and standard prices. For overhead, ProBat must consider the activities that drive overhead costs.

- High-grade wood can be purchased at a standard price of \$25 per kg. The purchasing department sets this price as the expected price for the budget period. To determine this price, the purchasing department considers factors such as the quality of materials, future economic conditions, supply factors (shortages and excesses), and any available discounts.
- The engineers also decide that two hours of labor time (after including allowances) are required to manufacture a bat. The wage rate is \$20 per hour (better-than-average skilled labor is required).
- ProBat assigns all overhead at the rate of \$10 per labor hour.

The standard costs of direct materials, direct labor, and overhead for one bat are shown in Exhibit 23.5 in what is called a *standard cost card*. These standard cost amounts are then used to prepare manufacturing budgets for a budgeted level of production.

**Point:** Companies promoting continuous improvement strive to achieve ideal standards by eliminating inefficiencies and waste.

STANDARD COST CARD			
Production factor	Standard Quantity	Standard Cost per Unit	Total Standard Cost
Direct materials (wood)	1 kg	\$25 per kg	\$25
Direct labor	2 hours	\$20 per hour	40
Overhead	2 labor hours	\$10 per hour	20
Total			\$85

**EXHIBIT 23.5**

Standard Cost Card

**COST VARIANCE ANALYSIS**

Knowing the standard costs they expect, companies have a way to monitor and analyze differences from the standards. A **cost variance**, also simply called a *variance*, is the difference between actual and standard costs. Cost variances can be favorable (F) or unfavorable (U). If actual cost is less than standard cost, the variance is considered favorable. If actual costs are greater than standard costs, the variance is unfavorable.<sup>1</sup> This section discusses cost variance analysis.

Exhibit 23.6 shows the flow of events in **variance analysis**: (1) preparing a standard cost performance report, (2) computing and analyzing variances, (3) identifying questions and their explanations, and (4) taking corrective and strategic actions. These variance analysis steps are interrelated and are frequently applied in good organizations.

**C2**

Describe cost variances and what they reveal about performance.

**EXHIBIT 23.6**

Variance Analysis

**Cost Variance Computation**

Management needs information about the factors causing a cost variance, but first it must properly compute the variance. In its most simple form, a cost variance (CV) is computed as shown in Exhibit 23.7.

$$\text{Cost Variance (CV)} = \text{Actual Cost (AC)} - \text{Standard Cost (SC)}$$

where:

$$\text{Actual Cost (AC)} = \text{Actual Quantity (AQ)} \times \text{Actual Price (AP)}$$

$$\text{Standard Cost (SC)} = \text{Standard Quantity (SQ)} \times \text{Standard Price (SP)}$$

**EXHIBIT 23.7**

Cost Variance Formulas

A cost variance is further defined by its components. Actual quantity (AQ) is the input (material or labor) used to manufacture the quantity of output. Standard quantity (SQ) is the standard input for the quantity of output. For example, if ProBat's actual output is 500 bats, its standard quantity of direct labor is 1,000 hours (500 bats  $\times$  2 hours per bat). Actual price (AP) is the actual amount paid to acquire the input (material or labor), and standard price (SP) is the standard price.

<sup>1</sup> Short-term favorable variances can sometimes lead to long-term unfavorable variances. For instance, if management spends less than the budgeted amount on maintenance or insurance, the performance report would show a favorable variance. Cutting these expenses can lead to major losses in the long run if machinery wears out prematurely or insurance coverage proves inadequate.

Two main factors cause a cost variance:

1. The difference between actual price per unit of input and standard price per unit of input results in a **price** (or rate) **variance**
2. The difference between actual quantity of input used and standard quantity of input used results in a **quantity** (or usage or efficiency) **variance**.

To assess the impacts of these two factors in a cost variance, we use the formulas in Exhibit 23.8.

**EXHIBIT 23.8**

Price Variance and Quantity Variance Formulas

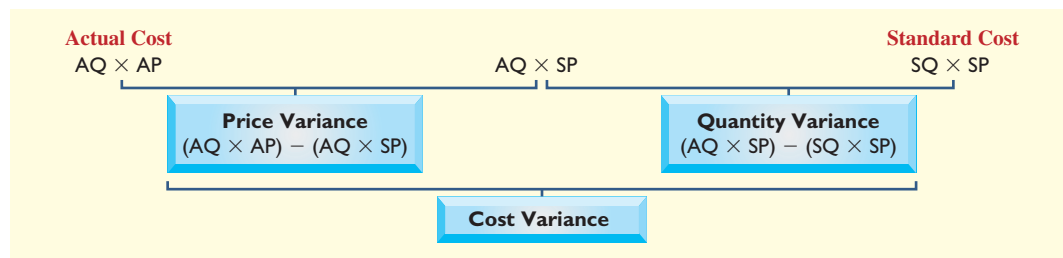

Exhibit 23.8 illustrates three important general rules in computing cost variances:

1. In computing a price variance, the quantity (actual) is held constant.
2. In computing a quantity variance, the price (standard) is held constant.
3. The cost variance, or total variance, is the sum of the price and quantity variances.

Managers sometimes find it useful to apply an alternative (but equivalent) computation for the price and quantity variances, as shown in Exhibit 23.9.

**EXHIBIT 23.9**

Alternative Price Variance and Quantity Variance Formulas

Price Variance (PV) = [Actual Price (AP) – Standard Price (SP)] × Actual Quantity (AQ)  
 Quantity Variance (QV) = [Actual Quantity (AQ) – Standard Quantity (SQ)] × Standard Price (SP)

The results from applying the formulas in Exhibits 23.8 and 23.9 are identical.

**Computing Materials and Labor Variances**

We illustrate the computation of the materials and labor cost variances using data from G-Max, a company that makes specialty golf equipment and accessories for individual customers. This company has set the following standard quantities and costs for direct materials and direct labor per unit for one of its handcrafted golf clubheads:

Direct materials (0.5 lb. per unit at \$20 per lb.) . . . . .	\$10.00
Direct labor (1 hr. per unit at \$8 per hr.) . . . . .	8.00
Total standard direct cost per unit . . . . .	<u>\$18.00</u>

**P2**  
 Compute materials and labor variances.

**Materials Cost Variances** During May 2015, G-Max budgeted to produce 4,000 clubheads (units). It actually produced only 3,500 units. It used 1,800 pounds of direct materials (titanium) costing \$21 per pound, meaning its total direct materials cost was \$37,800. To produce 3,500 units, G-Max should have used 1,750 pounds of direct materials (3,500 × 0.5 lb. per unit). This information allows us to compute both actual and standard direct materials costs for G-Max’s 3,500 units and its total direct materials cost variance as follows:

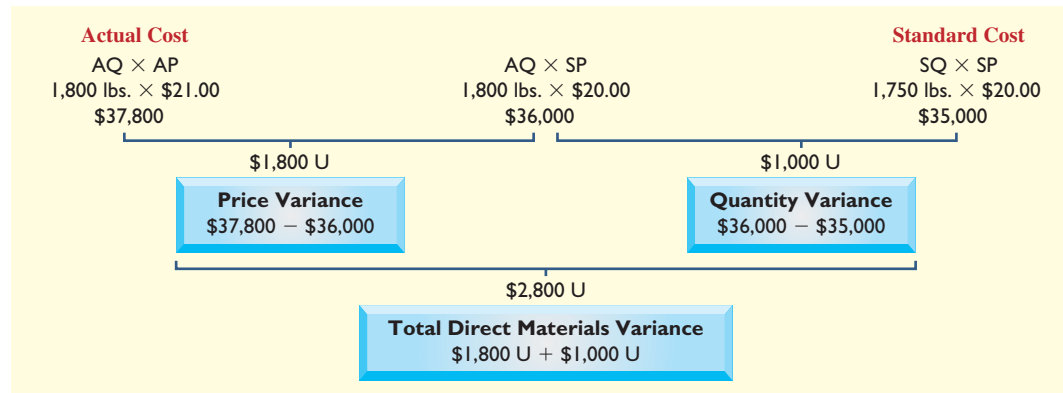

Direct Materials	Quantity	Price per Unit	Cost
Actual cost . . . . .	1,800 lbs.	@ \$21.00 per lb. =	\$37,800
Standard cost . . . . .	1,750 lbs.*	@ \$20.00 per lb. =	<u>35,000</u>
Direct materials cost variance (unfavorable) . . . . .			= <u>\$ 2,800</u>

\*Standard quantity = 3,500 units × 0.5 lb. per unit

Kristjan Maack/Getty Images/Nordic Photos

Management would like to determine if this unfavorable cost variance is due to unfavorable quantity or price variances, or both. To better isolate the causes of this \$2,800 unfavorable total direct materials cost variance, the materials price and quantity variances for these G-Max club-heads are computed and shown in Exhibit 23.10.

**EXHIBIT 23.10**

Materials Price and Quantity Variances\*

\*AQ is actual quantity; AP is actual price; SP is standard price; SQ is standard quantity allowed for actual output.

We now can see the two components of the \$2,800 unfavorable variance: The \$1,800 unfavorable price variance results from paying \$1 more per pound than the standard price, computed as 1,800 lbs. × \$1. G-Max also used 50 pounds more materials than the standard quantity (1,800 actual pounds – 1,750 standard pounds). The \$1,000 unfavorable quantity variance is computed as [(1,800 actual lbs. – 1,750 standard lbs.) × \$20 standard price per lb.]. Detailed price and quantity variances allow management to ask the responsible individuals for explanations and corrective actions.

**Evaluating Materials Variances** The purchasing department is usually responsible for the price paid for materials. Responsibility for explaining the price variance in this case rests with the purchasing manager if a price higher than standard caused the variance. The production department is usually responsible for the amount of material used. In this case the production manager is responsible for explaining why the process used more than the standard amount of materials.

Variance analysis presents challenges. For instance, the production department could have used more than the standard amount of material because the materials' quality did not meet specifications and led to excessive waste. In this case, the purchasing manager is responsible for explaining why inferior materials were acquired. However, if analysis shows that waste was due to inefficiencies, not poor-quality material, the production manager is responsible for explaining what happened.

In evaluating price variances, managers must recognize that a favorable price variance can indicate a problem with poor product quality. **Redhook Ale**, a micro-brewery in the Pacific Northwest, can probably save 10% to 15% in material prices by buying six-row barley malt instead of the better two-row from Washington's Yakima valley. Attention to quality, however, has helped Redhook Ale increase its sales. Purchasing activities are judged on both the quality of the materials and the purchase price variance.

© ColorBlind Images/Corbis

**Example:** Identify at least two factors that might have caused the unfavorable quantity variance and the unfavorable price variance in Exhibit 23.10. **Answer:** Poor quality materials or untrained workers for the former; poor price negotiation or higher-quality materials for the latter.

A manufacturing company reports the following for one of its products. Compute the direct materials (a) price variance and (b) quantity variance and indicate whether they are favorable or unfavorable.

Direct materials standard	8 pounds at \$6 per pound
Actual direct materials used	83,000 pounds @ \$5.80 per pound
Actual finished units produced	10,000

**Solution**

- a.** Price variance = (Actual quantity × Actual price) – (Actual quantity × Standard price)  
 = (83,000 × \$5.80) – (83,000 × \$6) = \$16,600 favorable
- b.** Quantity variance = (Actual quantity × Standard price) – (Standard quantity\* × Standard price)  
 = (83,000 × \$6) – (80,000 × \$6) = \$18,000 unfavorable

\*Standard quantity = 10,000 units × 8 standard pounds per unit = 80,000 pounds

**NEED-TO-KNOW 23-2**

Direct Materials Variances

P2

Do More: QS 23-8, E 23-9, E 23-11, E 23-12, E 23-13

**Labor Cost Variances** Labor cost for a specific product or service depends on the number of hours worked (quantity) and the wage rate paid to employees (price). To illustrate, G-Max’s direct labor standard for 3,500 units of its handcrafted clubheads is one direct labor hour per unit, or 3,500 hours at \$8 per hour. But because only 3,400 hours at \$8.30 per hour were actually used to complete the units, the actual and standard direct labor costs are

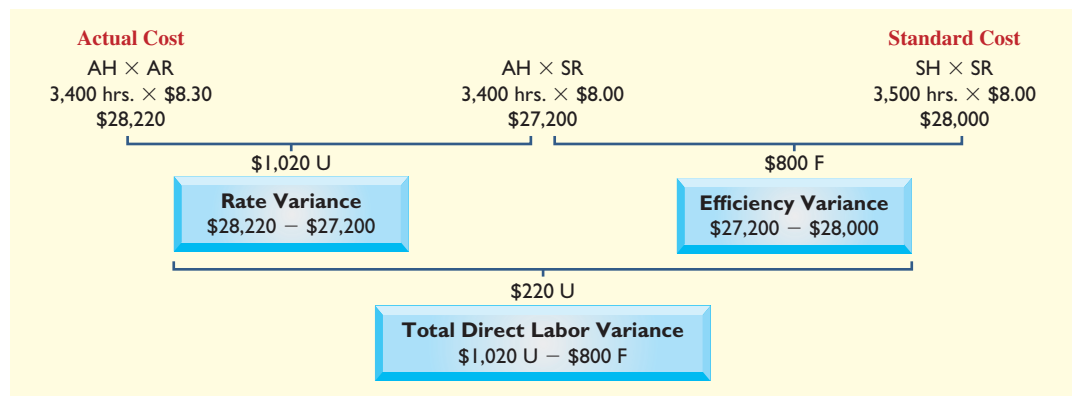

Direct Labor	Quantity	Rate per Hour	Cost
Actual cost.....	3,400 hrs.	@ \$8.30 per hr. =	\$28,220
Standard cost.....	3,500 hrs.*	@ \$8.00 per hr. =	28,000
Direct labor cost variance (unfavorable) .....			= \$ 220

\*Standard quantity = 3,500 units × 1 standard DLH per unit

This analysis shows that actual cost is merely \$220 over the standard; that small difference might suggest no immediate concern. The direct labor cost variance can be divided into price and quantity variances, which are almost always called *rate* and *efficiency* variances. Computing both the labor rate and efficiency variances reveals a different picture, however, as shown in Exhibit 23.11.

**EXHIBIT 23.11**

Labor Rate and Efficiency Variances\*

\* Here, we employ hours (H) for quantity (Q), and the wage rate (R) for price (P). Thus: AH is actual direct labor hours; AR is actual wage rate; SH is standard direct labor hours allowed for actual output; SR is standard wage rate.

**Example:** Compute the rate variance and the efficiency variance for Exhibit 23.11 if 3,700 actual hours are used at an actual price of \$7.50 per hour. Answer: \$1,850 favorable labor rate variance and \$1,600 unfavorable labor efficiency variance.

**Evaluating Labor Variances** Exhibit 23.11 shows that the total unfavorable labor cost variance results from an \$800 favorable efficiency variance and a \$1,020 unfavorable rate variance. The favorable efficiency variance results from using 100 fewer direct labor (3,400 actual DLH – 3,500 standard DLH) hours than standard for the units produced. The unfavorable rate variance results from paying a wage rate that is \$0.30 per hour higher (\$8.30 actual rate – \$8.00 standard rate) than standard. The personnel administrator or the production manager needs to explain why the wage rate is higher than expected. The production manager should also explain how the labor hours were reduced. If this experience can be repeated and transferred to other departments, more savings are possible.

One possible explanation of these labor rate and efficiency variances is the use of workers with different skill levels. If this is the reason, senior management must discuss the implications with the production manager who has the responsibility to assign workers to tasks with the appropriate skill level. In this case, an investigation might show that higher-skilled workers were used to produce 3,500 units of hand-crafted clubheads. As a result, fewer labor hours might be required for the work, but the wage rate paid these workers is higher than standard because of their greater skills. The effect of this strategy is a higher than standard total cost, which would require actions to remedy the situation or adjust the standard.

**Decision Maker**

**Production Manager** You receive the manufacturing variance report for June and discover a large unfavorable labor efficiency (quantity) variance. What factors do you investigate to identify its possible causes? [Answers follow the chapter’s Summary.]

The following information is available for York Company. Compute the direct labor rate and efficiency variances.

Actual direct labor cost (6,250 hours @ \$13.10 per hour) . . . . .	\$81,875
Standard direct labor hours per unit . . . . .	2.0 hours
Standard rate per hour . . . . .	\$13.00
Actual production (units) . . . . .	2,500 units
Budgeted production (units) . . . . .	3,000 units

### Solution

Total standard hours = 2,500 × 2.0 = 5,000	
Rate variance = (\$13.10 – \$13.00) × 6,250 = \$625 unfavorable	
Efficiency variance = (6,250 – 5,000) × \$13.00 = \$16,250 unfavorable

## OVERHEAD STANDARDS AND VARIANCES

In previous chapters we showed how companies can use *predetermined overhead rates* to allocate overhead costs to products or services. In a standard costing system this allocation is done using the *standard* amount of the overhead allocation base, such as standard labor hours or standard machine hours. Next we show how to use standard costs to develop flexible overhead budgets.

### Flexible Overhead Budgets

*Standard overhead costs* are the overhead amounts expected to occur at a certain activity level. Unlike direct materials and direct labor, overhead includes fixed costs and variable costs. This requires management to classify overhead costs as fixed or variable (within a relevant range), and to develop a flexible budget for overhead costs.

To illustrate, the first two number columns of Exhibit 23.12 show the overhead cost structure to develop G-Max's flexible overhead budgets for May 2015. At the beginning of the year, G-Max predicted variable overhead costs of \$1.00 per unit (clubhead), comprised of \$0.40 per unit for indirect labor, \$0.30 per unit for indirect materials, \$0.20 per unit for power and lights, and \$0.10 per unit for factory maintenance. In addition, G-Max predicts monthly fixed overhead of \$4,000.

With these variable and fixed overhead cost amounts, G-Max can prepare flexible overhead budgets at various capacity levels (four right-most number columns in Exhibit 23.12). At its maximum capacity (100% column), G-Max could produce 5,000 clubheads. At 70% of maximum capacity, G-Max could produce 3,500 (computed as 5,000 × 70%) clubheads. Recall that total variable costs will increase as production activity increases, but total fixed costs will not change as production activity changes. At 70% capacity, variable overhead costs are budgeted at \$3,500 (3,500 × \$1.00), while at 100% capacity variable costs are budgeted at \$5,000 (5,000 × \$1.00). At all capacity levels, fixed overhead costs are budgeted at \$4,000 per month.

### Setting Overhead Standards

To allocate overhead costs to products or services, management needs to establish the standard overhead cost rate. To do that, management must determine (1) an allocation base and (2) a predicted activity level.

**Allocation Base** The allocation base is some measure of input that management believes is related to overhead costs. Examples include direct labor hours or machine hours. In this section

**Point:** With increased automation, machine hours are frequently used in applying overhead instead of labor hours.

Halfdark/Getty Images

**EXHIBIT 23.12**

Flexible Overhead Budgets

G-MAX Flexible Overhead Budgets For Month Ended May 31, 2015						
Flexible Budget						
	Variable Amount per Unit	Total Fixed Cost	Flexible Budget at Capacity Level of			
			70%	80%	90%	100%
Production (in units) . . . . .	1 unit		<u>3,500</u>	<u>4,000</u>	<u>4,500</u>	<u>5,000</u>
Factory overhead						
Variable costs						
Indirect labor . . . . .	\$0.40/unit	\$1,400	\$1,400	\$1,600	\$1,800	\$2,000
Indirect materials . . . . .	0.30/unit	1,050	1,050	1,200	1,350	1,500
Power and lights . . . . .	0.20/unit	700	700	800	900	1,000
Maintenance . . . . .	0.10/unit	350	350	400	450	500
Total variable overhead costs . . . . .	<u>\$1.00/unit</u>	3,500	3,500	4,000	4,500	5,000
Fixed costs (per month)						
Building rent . . . . .		\$1,000	1,000	1,000	1,000	1,000
Depreciation—machinery . . . . .		1,200	1,200	1,200	1,200	1,200
Supervisory salaries . . . . .		1,800	1,800	1,800	1,800	1,800
Total fixed overhead costs . . . . .		<u>\$4,000</u>	4,000	4,000	4,000	4,000
Total factory overhead . . . . .			<u>\$7,500</u>	<u>\$8,000</u>	<u>\$8,500</u>	<u>\$9,000</u>
Standard direct labor hours 1 hr./unit . . . . .			3,500 hrs.	4,000 hrs.	4,500 hrs.	5,000 hrs.
Predetermined overhead rate per standard direct labor hour . . . . .				<u>\$ 2.00</u>		

**Point:** According to the U.S. Federal Reserve Board, U.S. businesses operated at an average capacity level of 80.1% between 1972 and 2013. Average capacity usage levels ranged from 78.7% for manufacturing businesses to 87.4% for mining companies.

**Example:** What would G-Max's standard overhead rate per unit be if management expected to operate at 70% capacity? At 100% capacity? Answer: At 70% capacity, the standard overhead rate is \$2.14 per unit (rounded), computed as \$7,500/3,500 direct labor hours. At 100% capacity, the standard overhead rate per unit is \$1.80 (\$9,000/5,000).

we assume that G-Max uses direct labor hours as an allocation base, and it has a standard of one direct labor hour per finished unit.

**Predicted Activity Level** When choosing the predicted activity level, management considers many factors. The level could be set at 100% of capacity, but this is rare. Difficulties in scheduling work, equipment breakdowns, and insufficient product demand typically cause the activity level to be less than full capacity. Also, good long-run management practices usually call for some excess plant capacity, to allow for special opportunities and demand changes. G-Max managers predicted an 80% activity level for May, or a production volume of 4,000 clubheads.

**Standard Overhead Rate** At the predicted activity level of 4,000 units, the flexible budget in Exhibit 23.12 predicts total overhead of \$8,000. At this activity level of 4,000 units, G-Max's standard direct labor hours is 4,000 hours (4,000 units × 1 direct labor hour per unit). G-Max's standard overhead rate is then computed as:

$$\begin{aligned}
 \text{Standard overhead rate} &= \frac{\text{Total overhead cost at predicted activity level}}{\text{Total direct labor hours at predicted activity level}} \\
 &= \frac{\$8,000}{4,000} = \$2 \text{ per direct labor hour}
 \end{aligned}$$

This standard overhead rate will be used in computing overhead cost variances, as we show next, and in recording journal entries in a standard cost system, which we show in the appendix to this chapter.

**Decision Insight**

**Measuring Up** In the spirit of continuous improvement, competitors compare their processes and performance standards against benchmarks established by industry leaders. Those that use **benchmarking** include Jiffy Lube, All Tune and Lube, and Speedee Oil Change and Tune-Up. ■

**Computing Overhead Cost Variances**

When standard costs are used, the cost accounting system applies overhead to the units produced using the predetermined standard overhead rate. The standard overhead applied is based on the predetermined overhead rate (at the predicted activity level) and the standard number of hours that *should have been used*, based on the actual production. Actual overhead incurred might be different from the overhead cost applied for a period, and management will again use *variance analysis*. The difference between the total overhead cost applied to products and the total overhead cost actually incurred is called an **overhead cost variance** (total overhead variance), which is defined in Exhibit 23.13.

**P3**

Compute overhead controllable and volume variances.

**EXHIBIT 23.13**

Overhead Cost Variance

$$\text{Overhead cost variance (OCV)} = \text{Actual overhead incurred (AOI)} - \text{Standard overhead applied (SOA)}$$

To illustrate, G-Max produced 3,500 units during the month, which should have used 3,500 direct labor hours. Recall that management expected to produce 4,000 units during the month; thus G-Max operated below its expected level. From Exhibit 23.12, G-Max’s predetermined overhead rate at the predicted capacity level of 4,000 units was \$2.00 per direct labor hour, so the standard overhead applied is \$7,000 (computed as 3,500 direct labor hours × \$2.00). Additional data from cost reports show that the actual overhead cost incurred in the month is \$7,650. Using the formula in Exhibit 23.13, we find that G-Max’s total overhead variance is \$650, computed as:

Actual total overhead (given) .....	\$7,650
Standard overhead applied (3,500 DLH × \$2.00 per DLH) .....	<u>7,000</u>
Total overhead variance (unfavorable) .....	<u>\$ 650</u>

This variance is unfavorable: G-Max’s actual overhead was higher than it should have been based on budgeted amounts.

**Overhead Controllable and Volume Variances** To help identify factors causing the overhead cost variance, managers separate out the *overhead controllable* and *overhead volume variances*, as illustrated in Exhibit 23.14. The results provide information useful for taking strategic actions to improve company performance.

**EXHIBIT 23.14**

Framework for Understanding Total Overhead Variance

The **controllable variance** is the difference between actual overhead costs incurred and the budgeted overhead costs based on a flexible budget. The controllable variance is so named because it refers to activities usually under management control. Since G-Max only produced 3,500 units during the month, we need to compare the *actual* overhead costs to make 3,500 units to the *budgeted* cost to make 3,500 units.

**Point:** The budgeted overhead cost is from a flexible budget.

A **volume variance** occurs when there is a difference between the actual volume of production and the standard volume of production. The volume variance is based solely on *fixed* overhead. The budgeted fixed overhead amount is the same regardless of the volume of production (within the relevant range). The applied fixed overhead is based, however, on the standard direct labor hours allowed for the actual volume of production. When a company operates at a capacity level different from what it expected, a volume variance will exist. We next compute the controllable and volume variances for G-Max.

The flexible budget in Exhibit 23.12 shows budgeted factory overhead of \$7,500 at the production volume of 3,500 units. The controllable variance is computed as:

<b>Overhead Controllable Variance</b>	
Actual total overhead (given) . . . . .	\$7,650
Budgeted total overhead (from flexible budget) . . . . .	<u>7,500</u>
Controllable variance (unfavorable) . . . . .	<u><b>\$ 150</b></u>

Next, we compute the volume variance. G-Max’s budgeted fixed overhead at the predicted capacity level for the month (4,000 units) was \$4,000. Recall from Exhibit 23.12 that G-Max’s predetermined fixed overhead rate at the predicted capacity level of 4,000 units was \$1 per direct labor hour. Thus, G-Max’s applied fixed overhead was \$3,500, computed as 3,500 direct labor hours × \$1.00 per unit. G-Max’s volume variance is computed as:

<b>Overhead Volume Variance</b>	
Budgeted fixed overhead (at predicted capacity) . . . . .	\$4,000
Applied fixed overhead (3,500 DLH × \$1.00 per DLH) . . . . .	<u>3,500</u>
Volume variance (unfavorable) . . . . .	<u><b>\$ 500</b></u>

**Analyzing Overhead Controllable and Volume Variances** How should the top management of G-Max interpret the unfavorable overhead controllable and volume variances? An unfavorable volume variance means that the company did not reach its predicted operating level. In this case, 80% of manufacturing capacity was budgeted but only 70% was used. Management needs to know why the actual level of production differs from the expected level. The main purpose of the volume variance is to identify what portion of the total overhead variance is caused by failing to meet the expected production level. Often the reasons for failing to meet this expected production level are due to factors, for example customer demand, that are beyond employees’ control. This information permits management to focus on explanations for the controllable variance, as we discuss next.

**Overhead Variance Reports** To help management isolate the reasons for the \$150 unfavorable overhead controllable variance, an *overhead variance report* can be prepared. A complete overhead variance report provides managers information about specific overhead costs and how they differ from budgeted amounts. Exhibit 23.15 shows G-Max’s overhead variance report for May. The overhead variance report shows the total overhead volume variance of \$500 unfavorable (shown near the top of the report) and the \$150 unfavorable overhead controllable variance (shown at the bottom right of the report). The detailed listing of individual overhead costs reveals the following: (1) Fixed overhead costs and variable factory maintenance costs were incurred as expected. (2) Costs for indirect labor and power and lights were higher than expected. (3) Indirect materials cost was less than expected. Management can use the variance overhead report to identify the individual overhead costs it wants to investigate.

**Appendix 23A describes an expanded analysis of overhead variances.**

**EXHIBIT 23.15**

Overhead Variance Report

<b>G-MAX</b>			
<b>Overhead Variance Report</b>			
<b>For Month Ended May 31, 2015</b>			
<b>Overhead Volume Variance</b>			
Expected production level . . . . .	80% of capacity (4,000 units)		
Production level achieved . . . . .	70% of capacity (3,500 units)		
Budgeted fixed overhead (4,000 DLH × \$1.00) . . . .	\$4,000		
Fixed overhead applied (3,500 DLH × \$1.00) . . . . .	\$3,500		
Volume variance . . . . .			<b>\$ 500 (unfavorable)</b>
<b>Overhead Controllable Variance</b>			
	<b>Flexible Budget</b>	<b>Actual Results</b>	<b>Variances*</b>
Variable overhead costs			
Indirect labor . . . . .	\$1,400	\$1,525	<b>\$125 U</b>
Indirect materials . . . . .	1,050	1,025	<b>25 F</b>
Power and lights . . . . .	700	750	<b>50 U</b>
Maintenance . . . . .	350	350	<b>0</b>
Total variable overhead costs . . . . .	3,500	3,650	<b>150 U</b>
Fixed overhead costs			
Building rent . . . . .	1,000	1,000	<b>0</b>
Depreciation—machinery . . . . .	1,200	1,200	<b>0</b>
Supervisory salaries . . . . .	1,800	1,800	<b>0</b>
Total fixed overhead costs . . . . .	4,000	4,000	<b>0</b>
Total overhead costs . . . . .	<u>\$7,500</u>	<u>\$7,650</u>	<b>\$150 U</b>

Total overhead variance = \$650 unfavorable

\* F = Favorable variance; U = Unfavorable variance.

A manufacturing company uses standard costs and reports the information below for January. The company uses machine hours to allocate overhead, and the standard is two machine hours per finished unit. Compute the total overhead cost variance, overhead controllable variance, and overhead volume variance for January. Indicate whether each variance is favorable or unfavorable.

**NEED-TO-KNOW 23-4**

Overhead Variances

P3

Predicted activity level . . . . .	1,500 units
Variable overhead rate budgeted . . . . .	\$2.50 per machine hour
Fixed overhead budgeted . . . . .	\$6,000 per month (\$2.00 per machine hour at predicted activity level)
Actual activity level . . . . .	1,800 units
Actual overhead costs . . . . .	\$15,800

**Solution**

<b>Total overhead cost variance</b>	
Actual total overhead cost (given) . . . . .	\$15,800
Standard overhead applied (1,800 × 2 × \$4.50) . . . . .	<u>16,200</u>
Total overhead variance (favorable) . . . . .	<u>\$ 400</u>

Do More: QS 23-13, QS 23-14, QS 23-15, E 23-17, E 23-19, E 23-20

**QC3**

<b>Overhead controllable variance</b>	
Actual total overhead cost (given) . . . . .	\$15,800
Flexible budget total overhead (1,800 × 2 × \$2.50) + \$6,000 . . . . .	<u>15,000</u>
Overhead controllable variance (unfavorable) . . . . .	<u>\$ 800</u>

<b>Overhead volume variance</b>	
Budgeted fixed overhead . . . . .	\$ 6,000
Applied fixed overhead (1,800 × 2 × \$2) . . . . .	<u>7,200</u>
Overhead volume variance (favorable) . . . . .	<u>\$ 1,200</u>

 **GLOBAL VIEW**

**BMW**, a German automobile manufacturer, uses concepts of standard costing and variance analysis. Production begins with huge rolls of steel and aluminum, which are then cut and pressed by large machines. Material must meet high quality standards, and the company sets standards for each of its machine operations. In the assembly department, highly trained employees complete the assembly of the

Painted car chassis, often to customer specifications. Again, BMW sets standards for how much labor should be used and monitors its employee performance. The company then computes and analyzes materials price and quantity variances and labor rate and efficiency variances and takes action as needed. Like most manufacturers, BMW uses *practical standards* and thus must address waste of raw materials in its production process. In a recent year, BMW used over 3 million tons of steel, plastic, and aluminum to make over 1.8 million cars. Of the 665,000 tons of these raw materials wasted in production, over 98% are recyclable.

**Sustainability and Accounting** *Niner Bikes* employs standard cost principles in making bikes. But, founder and CEO Chris Sugai offers flexible work schedules for his employees and insists that employees stay home after they or their spouses give birth. These benefits are costly, but they allow Chris to sustain a loyal workforce.

**Decision Analysis** Sales Variances

**A1**  
Analyze changes in sales from expected amounts.

This chapter explained the computation and analysis of cost variances. A similar variance analysis can be applied to sales. For this analysis, the budgeted amount of unit sales is the predicted activity level, and the budgeted selling price can be treated as a “standard” price. To illustrate, consider the following sales data from G-Max for two of its golf products, Excel golf balls and Big Bert drivers.

	Budgeted	Actual
Sales of Excel golf balls (units) . . . . .	1,000 units	1,100 units
Sales price per Excel golf ball . . . . .	\$10	\$10.50
Sales of Big Bert drivers (units) . . . . .	150 units	140 units
Sales price per Big Bert driver . . . . .	\$200	\$190

Using this information, we compute both the *sales price variance* and the *sales volume variance* as shown in Exhibit 23.16. The total sales price variance is \$850 unfavorable, and the total sales volume variance is \$1,000 unfavorable. However, further analysis of these total sales variances reveals that both the sales price and sales volume variances for Excel golf balls are favorable, while both variances are unfavorable for the Big Bert driver.

**EXHIBIT 23.16**

Computing Sales Variances\*

	Actual Results AS × AP	Flexible Budget AS × BP	Fixed Budget BS × BP
<b>Excel Golf Balls</b>			
Sales dollars (balls)	(1,100 × \$10.50) <b>\$11,550</b>	(1,100 × \$10) <b>\$11,000</b>	(1,000 × \$10) <b>\$10,000</b>
		\$550 F	\$1,000 F
		<b>Sales Price Variance</b> (AS × AP) – (AS × BP)	<b>Sales Volume Variance</b> (AS × BP) – (BS × BP)
<b>Big Bert Drivers</b>			
Sales dollars (drivers)	(140 × \$190) <b>\$26,600</b>	(140 × \$200) <b>\$28,000</b>	(150 × \$200) <b>\$30,000</b>
		\$1,400 U	\$2,000 U
		<b>Sales Price Variance</b> (AS × AP) – (AS × BP)	<b>Sales Volume Variance</b> (AS × BP) – (BS × BP)
<b>Total</b>		<b>\$850 U</b>	<b>\$1,000 U</b>

\* AS = actual sales units; AP = actual sales price; BP = budgeted sales price; BS = budgeted sales units (fixed budget).

Managers use sales variances for planning and control purposes. G-Max sold 90 combined total units (both balls and drivers) more than budgeted, yet its total sales price and sales volume variances are unfavorable. The unfavorable sales price variance is due mainly to a decrease in the selling price of Big

Bert drivers by \$10 per unit. Management must assess whether this price decrease will continue. Likewise, the unfavorable sales volume variance is due to G-Max selling fewer Big Bert drivers (140) than was budgeted (150). Management must assess whether this decreased demand for Big Bert drivers will persist.

Overall, management can use the detailed sales variances to examine what caused the company to sell more golf balls and fewer drivers. Managers can also use this information to evaluate and even reward salespeople. Extra compensation is paid to salespeople who contribute to a higher profit margin.

## Decision Maker

**Sales Manager** The current performance report reveals a large favorable sales volume variance but an unfavorable sales price variance. You did not expect to see a large increase in sales volume. What steps do you take to analyze this situation? ■ [Answers follow the chapter's Summary.]

Pacific Company provides the following information about its budgeted and actual results for June 2015. Although the expected June volume was 25,000 units produced and sold, the company actually produced and sold 27,000 units as detailed here:

## NEED-TO-KNOW COMPREHENSIVE

	Budget (25,000 units)	Actual (27,000 units)
Selling price . . . . .	\$5.00 per unit	\$141,210
Variable costs (per unit)		
Direct materials . . . . .	1.24 per unit	\$30,800
Direct labor . . . . .	1.50 per unit	37,800
Factory supplies* . . . . .	0.25 per unit	9,990
Utilities* . . . . .	0.50 per unit	16,200
Selling costs . . . . .	0.40 per unit	9,180
Fixed costs (per month)		
Depreciation—machinery* . . . . .	\$3,750	\$3,710
Depreciation—factory building* . . . . .	2,500	2,500
General liability insurance . . . . .	1,200	1,250
Property taxes on office equipment . . . . .	500	485
Other administrative expense . . . . .	750	900

\* Indicates factory overhead item; \$0.75 per unit or \$3 per direct labor hour for variable overhead, and \$0.25 per unit or \$1 per direct labor hour for fixed overhead.

### Standard costs based on expected output of 25,000 units:

	Standard Quantity	Total Cost
Direct materials, 4 oz. per unit @ \$0.31/oz. . . . .	100,000 oz.	\$31,000
Direct labor, 0.25 hrs. per unit @ \$6.00/hr. . . . .	6,250 hrs.	37,500
Overhead, 6,250 standard hours × \$4.00 per DLH . . . . .		25,000

### Actual costs incurred to produce 27,000 units:

	Actual Quantity	Total Cost
Direct materials, 110,000 oz. @ \$0.28/oz. . . . .	110,000 oz.	\$30,800
Direct labor, 5,400 hrs. @ \$7.00/hr. . . . .	5,400 hrs.	37,800
Overhead (\$9,990 + \$16,200 + \$3,710 + \$2,500) . . . . .		32,400

**Required**

1. Prepare June flexible budgets showing expected sales, costs, and net income assuming 20,000, 25,000, and 30,000 units of output produced and sold.
2. Prepare a flexible budget performance report that compares actual results with the amounts budgeted if the actual volume of 27,000 units had been expected.
3. Apply variance analysis for direct materials and direct labor.
4. Compute the total overhead variance, and the overhead controllable and overhead volume variances.
5. Compute spending and efficiency variances for overhead. (Refer to Appendix 23A.)
6. Prepare journal entries to record standard costs, and price and quantity variances, for direct materials, direct labor, and factory overhead. (Refer to Appendix 23A.)

**PLANNING THE SOLUTION**

- Prepare a table showing the expected results at the three specified levels of output. Compute the variable costs by multiplying the per unit variable costs by the expected volumes. Include fixed costs at the given amounts. Combine the amounts in the table to show total variable costs, contribution margin, total fixed costs, and income from operations.
- Prepare a table showing the actual results and the amounts that should be incurred at 27,000 units. Show any differences in the third column and label them with an *F* for favorable if they increase income or a *U* for unfavorable if they decrease income.
- Using the chapter's format, compute these total variances and the individual variances requested:
  - Total materials variance (including the direct materials quantity variance and the direct materials price variance).
  - Total direct labor variance (including the direct labor efficiency variance and rate variance).
  - Total overhead variance (including both controllable and volume overhead variances and their component variances). Variable overhead is applied at the rate of \$3.00 per direct labor hour. Fixed overhead is applied at the rate of \$1.00 per direct labor hour.

**SOLUTION**

1.

3. Variance analysis of materials and labor costs.

**Direct materials cost variances**

Actual cost . . . . .	110,000 oz. @ \$0.28	\$30,800
Standard cost . . . . .	108,000 oz. @ \$0.31	<u>33,480</u>
Direct materials cost variance (favorable) . . . . .		<u>\$ 2,680</u>

Price and quantity variances (based on formulas in Exhibit 23.10):

<b>Actual Cost</b>		<b>Standard Cost</b>
AQ × AP	AQ × SP	SQ* × SP
110,000 oz. × \$0.28	110,000 oz. × \$0.31	108,000 oz. × \$0.31
\$30,800	\$34,100	\$33,480
\$3,300 F		\$620 U
<b>Price Variance</b>		<b>Quantity Variance</b>
\$2,680 F		
<b>Total Direct Materials Variance</b>		

\*SQ = 27,000 actual units of output × 4 oz. standard quantity rate per unit

**Direct labor cost variances**

Actual cost . . . . .	5,400 hrs. @ \$7.00	\$37,800
Standard cost . . . . .	6,750 hrs. @ \$6.00	<u>40,500</u>
Direct labor cost variance (favorable) . . . . .		<u>\$ 2,700</u>

Rate and efficiency variances (based on formulas in Exhibit 23.11):

<b>Actual Cost</b>		<b>Standard Cost</b>
AH × AR	AH × SR	SH** × SR
5,400 hrs. × \$7	5,400 hrs. × \$6	6,750 hrs. × \$6
\$37,800	\$32,400	\$40,500
\$5,400 U		\$8,100 F
<b>Rate Variance</b>		<b>Efficiency Variance</b>
\$2,700 F		
<b>Total Direct Labor Variance</b>		

\*\*SH = 27,000 actual units of output × 0.25 standard DLH per unit.

4. Total, controllable, and volume variances for overhead.

<b>Total overhead cost variance</b>		
Total overhead cost incurred . . . . (given)		\$32,400
Total overhead applied . . . . . (27,000 units × .25 DLH per unit × \$4 per DLH)		<u>27,000</u>
Overhead cost variance (unfavorable) . . . . .		<u>\$ 5,400</u>
<b>Controllable variance</b>		
Total overhead cost incurred (given) . . . . .		\$32,400
Budgeted overhead (from flexible budget for 27,000 units) . . . . .		<u>26,500</u>
Controllable variance (unfavorable) . . . . .		<u>\$ 5,900</u>
<b>Volume variance</b>		
Budgeted fixed overhead (at predicted capacity) . . . . .		\$ 6,250
Applied fixed overhead (6,750 standard DLH × \$1.00 fixed overhead rate per DLH) . . . .		<u>6,750</u>
Volume variance (favorable) . . . . .		<u>\$ 500</u>

5. Variable overhead spending variance, variable overhead efficiency variance, fixed overhead spending variance, and fixed overhead volume variance. (See Appendix 23A.)

**Variable overhead variance** (factory supplies and utilities)

Variable overhead cost incurred . . . . .	(\$9,990 + \$16,200)	\$26,190
Variable overhead cost applied . . . . .	6,750 hrs. @ \$3/hr.	<u>20,250</u>
Variable overhead cost variance (unfavorable) . . . . .		<u>\$ 5,940</u>

Spending and efficiency variances (based on formulas in Exhibit 23A.2):

<b>Actual Overhead</b>		<b>Applied Overhead</b>
AH × AVR	AH × SVR	SH × SVR
\$26,190	5,400 × \$3	6,750 × \$3
	\$16,200	\$20,250
\$9,990 U		\$4,050 F
<b>Spending Variance</b>		<b>Efficiency Variance</b>
\$5,940 U		
<b>Total Variable Overhead Variance</b>		

**Fixed overhead variance** (depreciation on machinery and building)

Fixed overhead cost incurred . . . . .	(\$3,710 + \$2,500)	\$ 6,210
Fixed overhead cost applied . . . . .	6,750 hrs. @ \$1/hr.	<u>6,750</u>
Fixed overhead cost variance (favorable) . . . . .		<u>\$ 540</u>

Spending and volume variances (based on formulas in Exhibit 23A.2):

<b>Actual Overhead</b>	<b>Budgeted Overhead</b>	<b>Applied Overhead</b>
\$6,210	\$6,250	6,750 × \$1
		\$6,750
\$40 F		\$500 F
<b>Spending Variance</b>		<b>Volume Variance</b>
\$540 F		
<b>Total Fixed Overhead Variance</b>		

We can also compute:

**Controllable variance:** \$5,900 U (both spending variances plus variable overhead efficiency variance)

**Volume variance:** 500 F (identified as above)

6. Journal entries under a standard cost system. (Refer to Appendix 23A.)

Fixed Overhead Volume Variance.....		500
Factory Overhead**.....	32,400	

\* Overhead applied = 6,750 standard DLH × \$4 per DLH  
 \*\* Overhead incurred = \$9,990 + \$16,200 + \$3,710 + \$2,500

APPENDIX

# Expanded Overhead Variances and Standard Cost Accounting System

# 23A

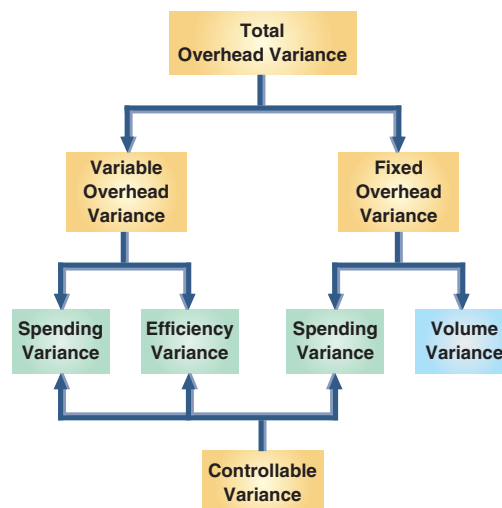

**Expanded Overhead Variances** Similar to analysis of direct materials and direct labor, overhead variances can be more completely analyzed. Exhibit 23A.1 shows an expanded framework for understanding these component overhead variances.

This framework uses classifications of overhead costs as either variable or fixed. Within those two classifications are further types of variances—spending, efficiency, and volume variances. We looked at the latter in the body of the chapter.

A **spending variance** occurs when management pays an amount different from the standard price to acquire an item. For instance, the actual wage rate paid to indirect labor might be higher than the standard rate. Similarly, actual supervisory salaries might be different than expected. Spending variances such as these cause management to investigate the reasons that the amount paid differs from the standard. Both variable and fixed overhead costs can yield their own spending variances.

Analyzing variable overhead also includes computing an **efficiency variance**, which occurs when standard direct labor hours (the allocation base) expected for actual production differ from the actual direct labor hours used. This efficiency variance reflects on the cost-effectiveness in using the overhead allocation base (such as direct labor).

Exhibit 23A.1 shows that we can combine the variable overhead spending variance, the fixed overhead spending variance, and the variable overhead efficiency variance to get the controllable variance.

**P4** Compute overhead spending and efficiency variances.

**EXHIBIT 23A.1**  
Expanded Framework for Total Overhead Variance

**Computing Variable and Fixed Overhead Cost Variances** To illustrate the computation of more detailed overhead cost variances, we return to the G-Max data. We know that G-Max produced 3,500 units when

4,000 units were budgeted. Additional data from cost reports (from Exhibit 23.15) show that the actual overhead cost incurred is \$7,650 (the variable portion of \$3,650 and the fixed portion of \$4,000). Recall from Exhibit 23.12 that each unit requires one hour of direct labor, that variable overhead is applied at a rate of \$1.00 per direct labor hour, and that the predetermined fixed overhead rate is \$1.00 per direct labor hour. Using this information, we can compute overhead variances for both variable and fixed overhead as follows:

<b>Variable Overhead Variance</b>	
Actual variable overhead (given) .....	\$3,650
Applied variable overhead (3,500 units × 1 standard DLH × \$1.00 VOH rate per DLH) .....	<u>3,500</u>
Variable overhead variance (unfavorable) .....	<u>\$ 150</u>

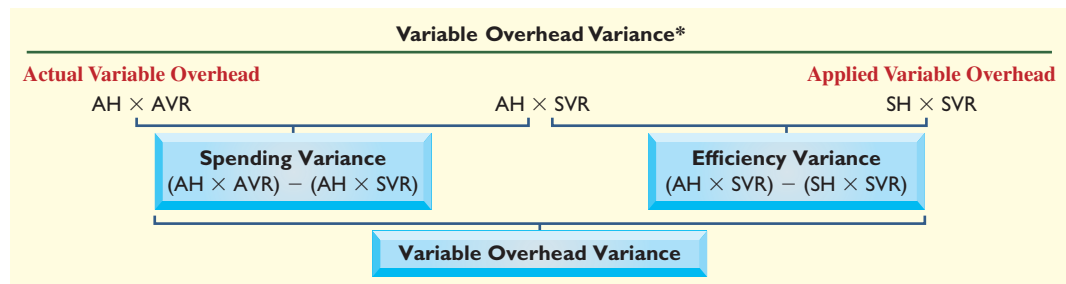

<b>Fixed Overhead Variance</b>	
Actual fixed overhead (given) .....	\$4,000
Applied fixed overhead (3,500 units × 1 standard DLH × \$1.00 FOH rate per DLH) .....	<u>3,500</u>
Fixed overhead variance (unfavorable) .....	<u>\$ 500</u>

Management should seek to determine the causes of these unfavorable variances and take corrective action. To help better isolate the causes of these variances, more detailed overhead variances can be used, as shown in the next section.

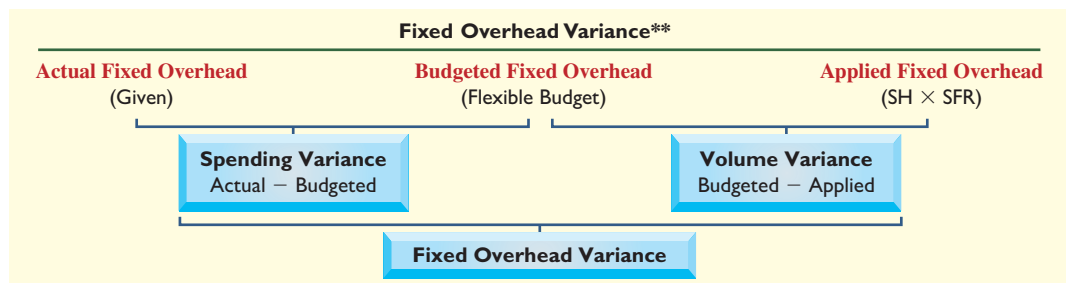

**Expanded Overhead Variance Formulas** Exhibit 23A.2 shows formulas to use in computing detailed overhead variances that can better identify reasons for variable and fixed overhead variances.

### EXHIBIT 23A.2

Variable and Fixed Overhead Variances

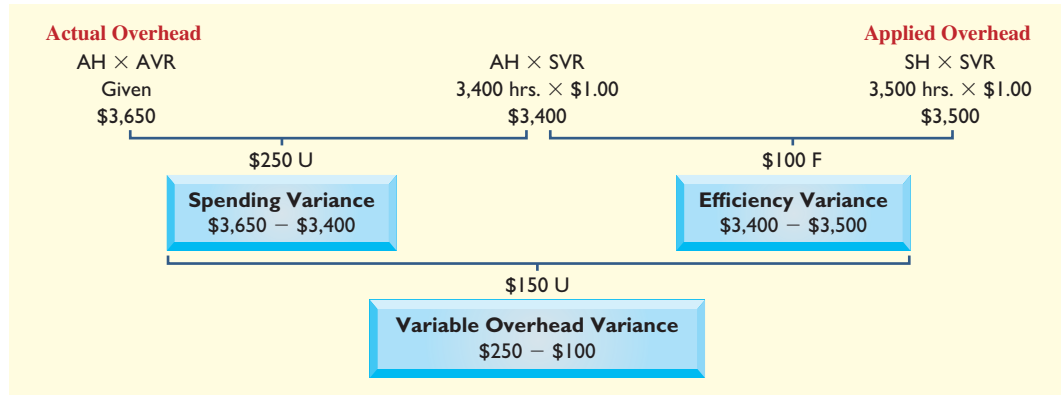

\* AH = actual direct labor hours; AVR = actual variable overhead rate; SH = standard direct labor hours; SVR = standard variable overhead rate.

\*\*SH = standard direct labor hours; SFR = standard fixed overhead rate.

**Variable Overhead Cost Variances** Using these formulas, Exhibit 23A.3 offers insight into the causes of G-Max's \$150 unfavorable variable overhead cost variance. Recall that G-Max applies overhead based on direct labor hours as the allocation base. We know that it used 3,400 direct labor hours to produce 3,500 units. This compares favorably to the standard requirement of 3,500 direct labor hours at one labor hour per unit. At a standard variable overhead rate of \$1.00 per direct labor hour, this should have resulted in variable overhead costs of \$3,400 (middle column of Exhibit 23A.3).

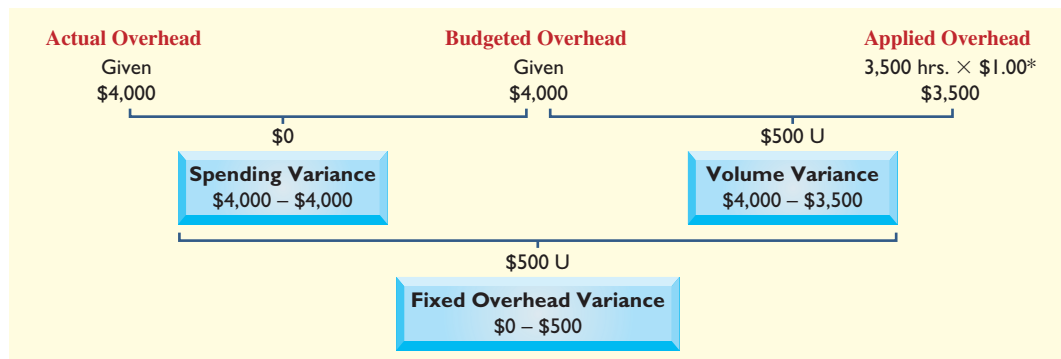

**EXHIBIT 23A.3**

Computing Variable Overhead Cost Variances

G-Max's cost records, however, report actual variable overhead of \$3,650, or \$250 higher than expected. This means G-Max has an unfavorable variable overhead spending variance of \$250 ( $\$3,650 - \$3,400$ ). On the other hand, G-Max used 100 fewer labor hours than expected to make 3,500 units, and its actual variable overhead is lower than its applied variable overhead. Thus, G-Max has a favorable variable overhead efficiency variance of \$100 ( $\$3,400 - \$3,500$ ).

**Fixed Overhead Cost Variances** Exhibit 23A.4 provides insight into the causes of G-Max's \$500 unfavorable fixed overhead variance. G-Max reports that it incurred \$4,000 in actual fixed overhead; this amount equals the budgeted fixed overhead for May at the expected production level of 4,000 units (see Exhibit 23.12). Thus, the fixed overhead spending variance is zero, suggesting good control of fixed overhead costs. G-Max's budgeted fixed overhead application rate is \$1 per hour ( $\$4,000/4,000$  direct labor hours), but the actual production level is only 3,500 units.

Using this information, we can compute the fixed overhead volume variance shown in Exhibit 23A.4. The applied fixed overhead is computed by multiplying 3,500 standard hours allowed for the actual production by the \$1 fixed overhead allocation rate. The volume variance of \$500 occurs because 500 fewer units are produced than budgeted; namely, 80% of the manufacturing capacity is budgeted but only 70% is used. Management needs to know why the actual level of production differs from the expected level.

**EXHIBIT 23A.4**

Computing Fixed Overhead Cost Variances

\*3,500 units  $\times$  1 DLH per unit  $\times$  \$1.00 FOH rate per DLH

**Standard Cost Accounting System** We have shown how companies use standard costs in management reports. Most standard cost systems also record these costs and variances in accounts. This practice simplifies recordkeeping and helps in preparing reports. Although we do not need knowledge of standard cost accounting practices to understand standard costs and their use, we must know how to interpret the accounts in which standard costs and variances are recorded. The entries in this section briefly illustrate the important aspects of this process for G-Max's standard costs and variances for May.

The first of these entries records standard materials cost incurred in May in the Work in Process Inventory account. This part of the entry is similar to the usual accounting entry, but the amount of the debit equals the standard cost (\$35,000) instead of the actual cost (\$37,800). This entry credits Raw Materials Inventory for actual cost. The difference between standard and actual direct materials costs is recorded with debits to two separate materials variance accounts (recall Exhibit 23.10). Both the

**P5**

Prepare journal entries for standard costs and account for price and quantity variances.

materials price and quantity variances are recorded as debits because they reflect additional costs higher than the standard cost (if actual costs were less than the standard, they are recorded as credits). This treatment (debit) reflects their unfavorable effect because they represent higher costs and lower income.

May 31	Work in Process Inventory . . . . .	35,000	
	<b>Direct Materials Price Variance*</b> . . . . .	<b>1,800</b>	
	<b>Direct Materials Quantity Variance</b> . . . . .	<b>1,000</b>	
	Raw Materials Inventory . . . . .		37,800
	<i>To charge production for standard quantity of materials used (1,750 lbs.) at the standard price (\$20 per lb.), and to record material price and material quantity variances.</i>		

\* Many companies record the materials price variance when materials are purchased. For simplicity, we record both the materials price and quantity variances when materials are issued to production.

The second entry debits Work in Process Inventory for the standard labor cost of the goods manufactured during May (\$28,000). Actual labor cost (\$28,220) is recorded with a credit to the Factory Payroll Payable account. The difference between standard and actual labor costs is explained by two variances (see Exhibit 23.11). The direct labor rate variance is unfavorable and is debited to that account. The direct labor efficiency variance is favorable and that account is credited. The direct labor efficiency variance is favorable because it represents a lower cost and a higher net income.

May 31	Work in Process Inventory . . . . .	28,000	
	<b>Direct Labor Rate Variance</b> . . . . .	<b>1,020</b>	
	<b>Direct Labor Efficiency Variance</b> . . . . .		<b>800</b>
	Factory Payroll Payable . . . . .		28,220
	<i>To charge production with 3,500 standard hours of direct labor at the standard \$8 per hour rate, and to record the labor rate and efficiency variances.</i>		

The entry to assign standard predetermined overhead to the cost of goods manufactured must debit the \$7,000 predetermined amount to the Work in Process Inventory account. Actual overhead costs of \$7,650 were debited to Factory Overhead during the period (entries not shown here). Thus, when Factory Overhead is applied to Work in Process Inventory, the actual amount is credited to the Factory Overhead account. To account for the difference between actual and standard overhead costs, the entry includes a \$250 debit to the Variable Overhead Spending Variance, a \$100 credit to the Variable Overhead Efficiency Variance, and a \$500 debit to the Volume Variance (recall Exhibits 23A.3 and 23A.4). (An alternative [simpler] approach is to record the difference with a \$150 debit to the Controllable Variance account and a \$500 debit to the Volume Variance account.)

May 31	Work in Process Inventory . . . . .	7,000	
	<b>Volume Variance</b> . . . . .	<b>500</b>	
	<b>Variable Overhead Spending Variance</b> . . . . .	<b>250</b>	
	<b>Variable Overhead Efficiency Variance</b> . . . . .		<b>100</b>
	Factory Overhead . . . . .		7,650
	<i>To apply overhead at the standard rate of \$2 per standard direct labor hour (3,500 hours), and to record overhead variances.</i>		

**Point:** If variances are material they can be allocated between Work in Process Inventory, Finished Goods Inventory, and Cost of Goods Sold. This closing process is explained in advanced courses.

The balances of these different variance accounts accumulate until the end of the accounting period. As a result, the unfavorable variances of some months can offset the favorable variances of other months.

These ending variance account balances, which reflect results of the period's various transactions and events, are closed at period-end. If the amounts are *immaterial*, they are added to or subtracted from the

balance of the Cost of Goods Sold account. This process is similar to that shown in the job order costing chapter for eliminating an underapplied or overapplied balance in the Factory Overhead account. (*Note:* These variance balances, which represent differences between actual and standard costs, must be added to or subtracted from the materials, labor, and overhead costs recorded. In this way, the recorded costs equal the actual costs incurred in the period; a company must use actual costs in external financial statements prepared in accordance with generally accepted accounting principles.)

**Standard Costing Income Statement** In addition to the reports discussed in this chapter, management can use a **standard costing income statement** to summarize company performance for a period. This income statement reports sales and cost of goods sold at their standard amounts, and then lists the individual sales and cost variances to compute gross profit at actual cost. Exhibit 23A.5 provides an example. Unfavorable variances are added to cost of goods sold at standard cost; favorable variances are subtracted from cost of goods sold at standard cost.

G-MAX Standard Costing Income Statement For Year Ended December 31, 2015		
Sales revenue (at standard) . . . . .		*****
Sales price variance . . . . .	***	
Sales volume variance . . . . .	***	***
Sales revenue (actual) . . . . .		*****

Add unfavorable variances; subtract favorable variances.

**EXHIBIT 23A.5**

Standard Costing Income Statement

A company uses a standard cost accounting system. Prepare the journal entry to record these direct materials variances:

Direct materials cost actually incurred . . . . .	\$73,200
Direct materials quantity variance (favorable) . . . . .	3,800
Direct materials price variance (unfavorable) . . . . .	1,300

**Solution**

Work in Process Inventory . . . . .	75,700	
Direct Materials Price Variance . . . . .	1,300	
Direct Materials Quantity Variance . . . . .		3,800
Raw Materials Inventory . . . . .		73,200

# Summary

## C1 Define *standard costs* and explain how *standard cost information* is useful for management by exception.

Standard costs are the normal costs that should be incurred to produce a product or perform a service. They should be based on a careful examination of the processes used to produce a product or perform a service as well as the quantities and prices that should be incurred in carrying out those processes. On a performance report, standard costs (which are flexible budget amounts) are compared to actual costs, and the differences are presented as variances. Standard cost accounting provides management information about costs that differ from budgeted (expected) amounts. Performance reports disclose the costs or areas of operations that have significant variances from budgeted amounts. This allows managers to focus more attention on the exceptions and less attention on areas proceeding normally.

**C2 Describe cost variances and what they reveal about performance.** Management can use variances to monitor and control activities. Total cost variances can be broken into price and quantity variances to direct management's attention to those responsible for quantities used and prices paid.

**A1 Analyze changes in sales from expected amounts.** Actual sales can differ from budgeted sales, and managers can investigate this difference by computing both the sales price and sales volume variances. The *sales price variance* refers to that portion of total variance resulting from a difference between actual and budgeted selling prices. The *sales volume variance* refers to that portion of total variance resulting from a difference between actual and budgeted sales quantities.

**P1 Prepare a flexible budget and interpret a flexible budget performance report.** A flexible budget expresses variable costs in per unit terms so that it can be used to develop budgeted amounts for any volume level within the relevant range. Thus, managers compute budgeted amounts for evaluation after a period for the volume that actually occurred. To prepare a flexible budget, we express each variable cost as a constant amount per unit of sales (or as a percent of sales dollars). In contrast, the budgeted amount of each fixed cost is expressed as a total amount expected to occur at any sales

volume within the relevant range. The flexible budget is then determined using these computations and amounts for fixed and variable costs at the expected sales volume.

**P2 Compute materials and labor variances.** Materials and labor variances are due to differences between the actual costs incurred and the budgeted costs. The price (or rate) variance is computed by comparing the actual cost with the flexible budget amount that should have been incurred to acquire the actual quantity of resources. The quantity (or efficiency) variance is computed by comparing the flexible budget amount that should have been incurred to acquire the actual quantity of resources with the flexible budget amount that should have been incurred to acquire the standard quantity of resources.

**P3 Compute overhead controllable and volume variances.** Overhead variances are due to differences between the actual overhead costs incurred and the overhead applied to production. The overhead controllable variance equals the actual overhead minus the budgeted overhead, based on a flexible budget. The volume variance equals the budgeted fixed overhead minus the applied fixed overhead.

**P4<sup>A</sup> Compute overhead spending and efficiency variances.** An overhead spending variance occurs when management pays an amount different from the standard price to acquire an item. An overhead efficiency variance occurs when the standard amount of the allocation base to assign overhead differs from the actual amount of the allocation base used.

**P5<sup>A</sup> Prepare journal entries for standard costs and account for price and quantity variances.** When a company records standard costs in its accounts, the standard costs of direct materials, direct labor, and overhead are debited to the Work in Process Inventory account. Based on an analysis of the material, labor, and overhead costs, each quantity variance, price variance, volume variance, and controllable variance is recorded in a separate account. At period-end, if the variances are not material, they are debited (if unfavorable) or credited (if favorable) to the Cost of Goods Sold account.

## Guidance Answers to Decision Maker

**Entrepreneur** From the complaints, this performance report appears to compare actual results with a fixed budget. This comparison is useful in determining whether the amount of work actually performed was more or less than planned, but it is not useful in determining whether the divisions were more or less efficient than planned. If the two consulting divisions worked on more assignments than expected, some costs will certainly increase. Therefore, you should prepare a flexible budget using the actual number of consulting assignments and then compare actual performance to the flexible budget.

**Production Manager** As production manager, you should investigate the causes for any labor-related variances although you may not be responsible for them. An unfavorable labor efficiency variance occurs because more labor hours than standard were used during the period. There are at least three possible reasons for this: (1) materials quality could be poor, resulting in more labor consumption due to rework; (2) unplanned interruptions (strike, breakdowns, accidents) could have occurred during the period; and (3) a different labor mix might have occurred for a strategic reason such as to expedite orders. This new labor mix

could have consisted of a larger proportion of untrained labor, which resulted in more labor hours.

**Sales Manager** The unfavorable sales price variance suggests that actual prices were lower than budgeted prices. As the sales manager, you want to know the reasons for a lower than expected price. Perhaps your salespeople lowered the price of certain prod-

ucts by offering quantity discounts. You then might want to know what prompted them to offer the quantity discounts (perhaps competitors were offering discounts). You want to break the sales volume variance into both the sales mix and sales quantity variances. You could find that although the sales quantity variance is favorable, the sales mix variance is not. Then you need to investigate why the actual sales mix differs from the budgeted sales mix.

## Multiple Choice Quiz

Answers at end of chapter

- A company predicts its production and sales will be 24,000 units. At that level of activity, its fixed costs are budgeted at \$300,000, and its variable costs are budgeted at \$246,000. If its activity level declines to 20,000 units, what will be its fixed costs and its variable costs?
  - Fixed, \$300,000; variable, \$246,000
  - Fixed, \$250,000; variable, \$205,000
  - Fixed, \$300,000; variable, \$205,000
  - Fixed, \$250,000; variable, \$246,000
  - Fixed, \$300,000; variable, \$300,000
- Using the following information about a single product company, compute its total actual cost of direct materials used.
  - Direct materials standard cost: 5 lbs.  $\times$  \$2 per lb. = \$10.
  - Total direct materials cost variance: \$15,000 unfavorable.
  - Actual direct materials used: 300,000 lbs.
  - Actual units produced: 60,000 units.
  - \$585,000
  - \$600,000
  - \$300,000
  - \$315,000
  - \$615,000
- A company uses four hours of direct labor to produce a product unit. The standard direct labor cost is \$20 per hour. This period the company produced 20,000 units and used 84,160 hours of direct labor at a total cost of \$1,599,040. What is its labor rate variance for the period?
  - \$83,200 F
  - \$84,160 U
  - \$84,160 F
  - \$83,200 U
  - \$960 F
- A company's standard for a unit of its single product is \$6 per unit in variable overhead (4 hours  $\times$  \$1.50 per hour). Actual data for the period show variable overhead costs of \$150,000 and production of 24,000 units. Its total variable overhead cost variance is
  - \$6,000 F
  - \$6,000 U
  - \$114,000 U
  - \$114,000 F
  - \$0
- A company's standard for a unit of its single product is \$4 per unit in fixed overhead (\$24,000 total/6,000 units budgeted). Actual data for the period show total actual fixed overhead of \$24,100 and production of 4,800 units. Its volume variance is
  - \$4,800 U
  - \$4,800 F
  - \$100 U
  - \$100 F
  - \$4,900 U

 *Icon denotes assignments that involve decision making.*

## Discussion Questions

-  What limits the usefulness to managers of fixed budget performance reports?
-  Identify the main purpose of a flexible budget for managers.
- Prepare a flexible budget performance report title (in proper form) for Spalding Company for the calendar year 2015. Why is a proper title important for this or any report?
-  What type of analysis does a flexible budget performance report help management perform?
- In what sense can a variable cost be considered constant?
-  What department is usually responsible for a direct labor rate variance? What department is usually responsible for a direct labor efficiency variance? Explain.

7. What is a price variance? What is a quantity variance?
8.  What is the purpose of using standard costs?
9. **Google** monitors its fixed overhead. In an analysis of fixed overhead cost variances, what is the volume variance? **GOOGLE**
10. What is the predetermined standard overhead rate? How is it computed?
11. In general, variance analysis is said to provide information about \_\_\_\_\_ and \_\_\_\_\_ variances.
12.  **Samsung** monitors its overhead. In an analysis of overhead cost variances, what is the controllable variance and what causes it? **Samsung**
13. What are the relations among standard costs, flexible budgets, variance analysis, and management by exception?
14.  How can the manager of advertising sales at **Google** use flexible budgets to enhance performance? **GOOGLE**
15.  Is it possible for a retail store such as **Apple** to use variances in analyzing its operating performance? Explain. **APPLE**
16.  Assume that **Samsung** is budgeted to operate at 80% of capacity but actually operates at 75% of capacity. What effect will the 5% deviation have on its controllable variance? Its volume variance? **Samsung**

## QUICK STUDY

### QS 23-1

Flexible budget performance report

P1

Beech Company produced and sold 105,000 units of its product in May. For the level of production achieved in May, the budgeted amounts were: sales, \$1,300,000; variable costs, \$750,000; and fixed costs, \$300,000. The following actual financial results are available for May. Prepare a flexible budget performance report for May.

	Actual
Sales (105,000 units) .....	\$1,275,000
Variable costs .....	712,500
Fixed costs .....	300,000

### QS 23-2

Flexible budget P1

Based on predicted production of 24,000 units, a company anticipates \$300,000 of fixed costs and \$246,000 of variable costs. If the company actually produces 20,000 units, what are the flexible budget amounts of fixed and variable costs?

### QS 23-3

Flexible budget

P1

Brodrick Company expects to produce 20,000 units for the year ending December 31. A flexible budget for 20,000 units of production reflects sales of \$400,000; variable costs of \$80,000; and fixed costs of \$150,000. If the company instead expects to produce and sell 26,000 units for the year, calculate the expected level of income from operations.

### QS 23-4

Flexible budget performance report P1

Refer to information in QS 23-3. Assume that actual sales for the year are \$480,000, actual variable costs for the year are \$112,000, and actual fixed costs for the year are \$145,000. Prepare a flexible budget performance report for the year.

### QS 23-5

Standard cost card C1

BatCo makes metal baseball bats. Each bat requires 1 kg of aluminum at \$18 per kg and 0.25 direct labor hours at \$20 per hour. Overhead is assigned at the rate of \$40 per direct labor hour. What amounts would appear on a standard cost card for BatCo?

### QS 23-6

Cost variances C2

Refer to information in QS 23-5. Assume the actual cost to manufacture one metal bat was \$40. Compute the cost variance and classify it as favorable or unfavorable.

### QS 23-7

Management by exception C1

Managers use *management by exception* for control purposes.

1. Describe the concept of management by exception.
2. Explain how standard costs help managers apply this concept to monitor and control costs.

### QS 23-8

Materials variances

P2

Tercer reports the following on one of its products. Compute the direct materials price and quantity variances.

Direct materials standard (4 lbs. @ \$2/lb.) .....	\$8 per finished unit
Actual direct materials used .....	300,000 lbs.
Actual finished units produced .....	60,000 units
Actual cost of direct materials used .....	\$535,000

For the current period, Kayenta Company's manufacturing operations yield a \$4,000 unfavorable price variance on its direct materials usage. The actual price per pound of material is \$78; the standard price is \$77.50 per pound. How many pounds of material were used in the current period?

**QS 23-9**  
Materials cost variances  
**P2**

Juan Company's output for the current period was assigned a \$150,000 standard direct materials cost. The direct materials variances included a \$12,000 favorable price variance and a \$2,000 favorable quantity variance. What is the actual total direct materials cost for the current period?

**QS 23-10**  
Materials cost variances  
**P2**

The following information describes a company's usage of direct labor in a recent period. Compute the direct labor rate and efficiency variances for the period.

**QS 23-11**  
Direct labor variances  
**P2**

Actual direct labor hours used	65,000
Actual direct labor rate per hour	\$15
Standard direct labor rate per hour	\$14
Standard direct labor hours for units produced	67,000

Frontera Company's output for the current period results in a \$20,000 unfavorable direct labor rate variance and a \$10,000 unfavorable direct labor efficiency variance. Production for the current period was assigned a \$400,000 standard direct labor cost. What is the actual total direct labor cost for the current period?

**QS 23-12**  
Labor cost variances  
**P2**

Fogel Co. expects to produce 116,000 units for the year. The company's flexible budget for 116,000 units of production shows variable overhead costs of \$162,400 and fixed overhead costs of \$124,000. For the year, the company incurred actual overhead costs of \$262,800 while producing 110,000 units. Compute the controllable overhead variance.

**QS 23-13**  
Controllable overhead variance  
**P3**

AirPro Corp. reports the following for November. Compute the controllable overhead variance for November.

**QS 23-14**  
Controllable overhead variance  
**P3**

Actual total factory overhead incurred	\$28,175
Standard factory overhead:	
Variable overhead	\$3.10 per unit produced
Fixed overhead	
(\$12,000/12,000 predicted units to be produced)	\$1 per unit
Predicted units to produce	12,000 units
Actual units produced	9,800 units

Refer to information in QS 23-14. Compute the overhead volume variance for November.

**QS 23-15**  
Volume variance  
**P3**

Alvarez Company's output for the current period yields a \$20,000 favorable overhead volume variance and a \$60,400 unfavorable overhead controllable variance. Standard overhead applied to production for the period is \$225,000. What is the actual total overhead cost incurred for the period?

**QS 23-16**  
Overhead cost variances  
**P3**

Refer to the information in QS 23-16. Alvarez records standard costs in its accounts. Prepare the journal entry to charge overhead costs to the Work in Process Inventory account and to record any variances.

**QS 23-17<sup>A</sup>**  
Preparing overhead entries  
**P5**

Mosaic Company applies overhead using machine hours and reports the following information. Compute the total variable overhead cost variance.

**QS 23-18**  
Total variable overhead cost variance  
**P3**

Actual machine hours used	4,700 hours
Standard machine hours (for actual production)	5,000 hours
Actual variable overhead rate per hour	\$4.15
Standard variable overhead rate per hour	\$4.00

**QS 23-19<sup>A</sup>**

Overhead spending and efficiency variances **P4**

Refer to the information from QS 23-18. Compute the variable overhead spending variance and the variable overhead efficiency variance.

**QS 23-20**

Computing sales price and volume variances **A1**

Farad, Inc., specializes in selling used SUVs. During the month, the dealership sold 50 trucks at an average price of \$9,000 each. The budget for the month was to sell 45 trucks at an average price of \$9,500 each. Compute the dealership's sales price variance and sales volume variance for the month.

**QS 23-21**

Sales variances **A1**

In a recent year, **BMW** sold 216,944 of its 1 Series cars. Assume the company expected to sell 225,944 of these cars during the year. Also assume the budgeted sales price for each car was \$30,000, and the actual sales price for each car was \$30,200. Compute the sales price variance and the sales volume variance.

**EXERCISES**

**Exercise 23-1**

Classification of costs as fixed or variable

**P1**

JPAK Company manufactures and sells mountain bikes. It normally operates eight hours a day, five days a week. Using this information, classify each of the following costs as fixed or variable. If additional information would affect your decision, describe the information.

- \_\_\_ a. Bike frames
- \_\_\_ b. Screws for assembly
- \_\_\_ c. Repair expense for tools
- \_\_\_ d. Direct labor
- \_\_\_ e. Bike tires
- \_\_\_ f. Gas used for heating
- \_\_\_ g. Incoming shipping expenses
- \_\_\_ h. Taxes on property
- \_\_\_ i. Office supplies
- \_\_\_ j. Depreciation on tools
- \_\_\_ k. Management salaries

**Exercise 23-2**

Preparation of flexible budgets

**P1**

Tempo Company's fixed budget (based on sales of 7,000 units) for the first quarter of calendar year 2015 reveals the following. Prepare flexible budgets following the format of Exhibit 23.3 that show variable costs per unit, fixed costs, and three different flexible budgets for sales volumes of 6,000, 7,000, and 8,000 units.

	<b>Fixed Budget</b>	
Sales (7,000 units) .....		\$2,800,000
Cost of goods sold		
Direct materials .....	\$280,000	
Direct labor .....	490,000	
Production supplies .....	175,000	
Plant manager salary .....	65,000	<u>1,010,000</u>
Gross profit .....		1,790,000
Selling expenses		
Sales commissions .....	140,000	
Packaging .....	154,000	
Advertising .....	<u>125,000</u>	419,000
Administrative expenses		
Administrative salaries .....	85,000	
Depreciation—office equip. ....	35,000	
Insurance .....	20,000	
Office rent .....	<u>36,000</u>	<u>176,000</u>
Income from operations .....		<u>\$1,195,000</u>

**Check** Income (at 6,000 units), \$972,000

**Exercise 23-3**

Preparation of a flexible budget performance report

**P1**

Solitaire Company's fixed budget performance report for June follows. The \$315,000 budgeted expenses include \$294,000 variable expenses and \$21,000 fixed expenses. Actual expenses include \$27,000 fixed expenses. Prepare a flexible budget performance report showing any variances between budgeted and actual results. List fixed and variable expenses separately.

	<b>Fixed Budget</b>	<b>Actual Results</b>	<b>Variances</b>
Sales (in units) .....	<u>8,400</u>	<u>10,800</u>	
Sales (in dollars) .....	\$420,000	\$540,000	\$120,000 F
Total expenses .....	<u>315,000</u>	<u>378,000</u>	63,000 U
Income from operations .....	<u>\$105,000</u>	<u>\$162,000</u>	<u>\$ 57,000 F</u>

**Check** Income variance, \$21,000 F

Bay City Company’s fixed budget performance report for July follows. The \$647,500 budgeted total expenses include \$487,500 variable expenses and \$160,000 fixed expenses. Actual expenses include \$158,000 fixed expenses. Prepare a flexible budget performance report that shows any variances between budgeted results and actual results. List fixed and variable expenses separately.

	Fixed Budget	Actual Results	Variances
Sales (in units) . . . . .	<u>7,500</u>	<u>7,200</u>	
Sales (in dollars) . . . . .	\$750,000	\$737,000	\$13,000 U
Total expenses . . . . .	<u>647,500</u>	<u>641,000</u>	<u>6,500 F</u>
Income from operations . . . . .	<u>\$102,500</u>	<u>\$ 96,000</u>	<u>\$ 6,500 U</u>

**Exercise 23-4**  
Preparation of a flexible budget performance report

P1

**Check** Income variance, \$4,000 F

Match the terms *a–e* with their correct definition 1–5.

- a. Standard cost card      \_\_\_ 1. Quantity of input required under normal conditions.
- b. Management by exception      \_\_\_ 2. Quantity of input required if a production process is 100% efficient.
- \_\_\_ 3. Managing by focusing on large differences from standard costs.
- c. Standard cost      \_\_\_ 4. Record that accumulates standard cost information.
- d. Ideal standard      \_\_\_ 5. Preset cost for delivering a product or service under normal conditions.
- e. Practical standard

**Exercise 23-5**  
Standard costs

C1

Resset Co. provides the following results of April’s operations: F indicates favorable and U indicates unfavorable. Applying the management by exception approach, which of the variances are of greatest concern? Why?

Direct materials price variance . . . . .	\$ 300 F
Direct materials quantity variance . . . . .	3,000 U
Direct labor rate variance . . . . .	100 U
Direct labor efficiency variance . . . . .	2,200 F
Controllable overhead variance . . . . .	400 U
Fixed overhead volume variance . . . . .	500 F

**Exercise 23-6**  
Analyzing variances

C1

Presented below are terms preceded by letters *a* through *j* and a list of definitions 1 through 10. Enter the letter of the term with the definition, using the space preceding the definition.

- a. Fixed budget      \_\_\_\_\_ 1. The difference between actual and budgeted sales or cost caused by the difference between the actual price per unit and the budgeted price per unit.
- b. Standard costs
- c. Price variance      \_\_\_\_\_ 2. A planning budget based on a single predicted amount of sales or production volume; unsuitable for evaluations if the actual volume differs from the predicted volume.
- d. Quantity variance
- e. Volume variance
- f. Controllable variance      \_\_\_\_\_ 3. Preset costs for delivering a product, component, or service under normal conditions.
- g. Cost variance
- h. Flexible budget      \_\_\_\_\_ 4. A process of examining the differences between actual and budgeted sales or costs and describing them in terms of the amounts that resulted from price and quantity differences.
- i. Variance analysis      \_\_\_\_\_ 5. The difference between the total budgeted overhead cost and the overhead cost that was allocated to products using the predetermined fixed overhead rate.
- j. Management by exception      \_\_\_\_\_ 6. A budget prepared based on predicted amounts of revenues and expenses corresponding to the actual level of output.
- \_\_\_\_\_ 7. The difference between actual and budgeted cost caused by the difference between the actual quantity and the budgeted quantity.
- \_\_\_\_\_ 8. The combination of both overhead spending variances (variable and fixed) and the variable overhead efficiency variance.
- \_\_\_\_\_ 9. A management process to focus on significant variances and give less attention to areas where performance is close to the standard.
- \_\_\_\_\_ 10. The difference between actual cost and standard cost, made up of a price variance and a quantity variance.

**Exercise 23-7**  
Cost variances

C2

**Exercise 23-8**

Standard unit cost; total cost variance

C2

A manufactured product has the following information for June.

	Standard	Actual
Direct materials . . . . .	(6 lbs. @ \$8 per lb.)	48,500 lbs. @ \$8.10 per lb.
Direct labor . . . . .	(2 hrs. @ \$16 per hr.)	15,700 hrs. @ \$16.50 per hr.
Overhead . . . . .	(2 hrs. @ \$12 per hr.)	\$198,000
Units manufactured . . . . .		8,000

Compute the (1) standard cost per unit and (2) total cost variance for June. Indicate whether the cost variance is favorable or unfavorable.

**Exercise 23-9**

Direct materials variances P2

Refer to the information in Exercise 23-8 and compute the (1) direct materials price and (2) direct materials quantity variances. Indicate whether each variance is favorable or unfavorable.

**Exercise 23-10**

Direct labor variances

P2

Refer to the information in Exercise 23-8 and compute the (1) direct labor rate and (2) direct labor efficiency variances. Indicate whether each variance is favorable or unfavorable.

**Exercise 23-11**

Direct materials and direct labor variances

P2

Hutto Corp. has set the following standard direct materials and direct labor costs per unit for the product it manufactures.

Direct materials (15 lbs. @ \$4 per lb.) . . . . .	\$60
Direct labor (3 hrs. @ \$15 per hr.) . . . . .	45

During May the company incurred the following actual costs to produce 9,000 units.

Direct materials (138,000 lbs. @ \$3.75 per lb.) . . . . .	\$517,500
Direct labor (31,000 hrs. @ \$15.10 per hr.) . . . . .	468,100

Compute the (1) direct materials price and quantity variances and (2) direct labor rate and efficiency variances. Indicate whether each variance is favorable or unfavorable.

**Exercise 23-12**

Direct materials and direct labor variances

P2

Reed Corp. has set the following standard direct materials and direct labor costs per unit for the product it manufactures.

Direct materials (10 lbs. @ \$3 per lb.) . . . . .	\$30
Direct labor (4 hrs. @ \$6 per hr.) . . . . .	24

During June the company incurred the following actual costs to produce 9,000 units.

Direct materials (92,000 lbs. @ \$2.95 per lb.) . . . . .	\$271,400
Direct labor (37,600 hrs. @ \$6.05 per hr.) . . . . .	227,480

Compute the (1) direct materials price and quantity variances and (2) direct labor rate and efficiency variances. Indicate whether each variance is favorable or unfavorable.

**Exercise 23-13**

Computation and interpretation of materials variances P2

Hart Company made 3,000 bookshelves using 22,000 board feet of wood costing \$266,200. The company's direct materials standards for one bookshelf are 8 board feet of wood at \$12 per board foot.

1. Compute the direct materials price and quantity variances incurred in manufacturing these bookshelves.
2. Interpret the direct materials variances.

**Check** Price variance, \$2,200 U

Refer to Exercise 23-13. Hart Company records standard costs in its accounts and its materials variances in separate accounts when it assigns materials costs to the Work in Process Inventory account.

1. Show the journal entry that both charges the direct materials costs to the Work in Process Inventory account and records the materials variances in their proper accounts.
2. Assume that Hart's materials variances are the only variances accumulated in the accounting period and that they are immaterial. Prepare the adjusting journal entry to close the variance accounts at period-end.
3. Identify the variance that should be investigated according to the management by exception concept. Explain.

**Exercise 23-14<sup>A</sup>**

Materials variances recorded and closed

**Check** (2) Cr. to Cost of Goods Sold, \$21,800

The following information describes production activities of Mercer Manufacturing for the year:

Actual direct materials used . . . . .	16,000 lbs. at \$4.05 per lb.
Actual direct labor used . . . . .	5,545 hours for a total of \$105,355
Actual units produced . . . . .	30,000

**Exercise 23-15**

Direct materials and direct labor variances

Budgeted standards for each unit produced are 0.50 pounds of direct material at \$4.00 per pound and 10 minutes of direct labor at \$20 per hour.

1. Compute the direct materials price and quantity variances.
2. Compute the direct labor rate and efficiency variances. Indicate whether each variance is favorable or unfavorable.

After evaluating Null Company's manufacturing process, management decides to establish standards of 3 hours of direct labor per unit of product and \$15 per hour for the labor rate. During October, the company uses 16,250 hours of direct labor at a \$247,000 total cost to produce 5,600 units of product. In November, the company uses 22,000 hours of direct labor at a \$335,500 total cost to produce 6,000 units of product.

**Exercise 23-16**

Computation and interpretation of labor variances

**Check** (1) October rate variance, \$3,250 U

1. Compute the direct labor rate variance, the direct labor efficiency variance, and the total direct labor cost variance for each of these two months.
2. Interpret the October direct labor variances.

Sedona Company set the following standard costs for one unit of its product for 2015.

Direct material (20 lbs. @ \$2.50 per lb.) . . . . .	\$ 50
Direct labor (10 hrs. @ \$8.00 per hr.) . . . . .	80
Factory variable overhead (10 hrs. @ \$4.00 per hr.) . . . . .	40
Factory fixed overhead (10 hrs. @ \$1.60 per hr.) . . . . .	16
Standard cost . . . . .	<u>\$186</u>

**Exercise 23-17**

Computation of total variable and fixed overhead variances

The \$5.60 (\$4.00 + \$1.60) total overhead rate per direct labor hour is based on an expected operating level equal to 75% of the factory's capacity of 50,000 units per month. The following monthly flexible budget information is also available.

	A	B	C	D
1	<b>Operating Levels (% of capacity)</b>			
2	<b>Flexible Budget</b>	<b>70%</b>	<b>75%</b>	<b>80%</b>
3	Budgeted output (units)	35,000	37,500	40,000
4	Budgeted labor (standard hours)	350,000	375,000	400,000
5	Budgeted overhead (dollars)			
6	Variable overhead	\$1,400,000	\$1,500,000	\$1,600,000
7	Fixed overhead	600,000	600,000	600,000
8	Total overhead	<u>\$2,000,000</u>	<u>\$2,100,000</u>	<u>\$2,200,000</u>
9				

During the current month, the company operated at 70% of capacity, employees worked 340,000 hours, and the following actual overhead costs were incurred.

Variable overhead costs . . . . .	\$1,375,000
Fixed overhead costs . . . . .	628,600
Total overhead costs . . . . .	<u>\$2,003,600</u>

**Check** (2) Variable overhead cost variance, \$25,000 F

1. Show how the company computed its predetermined overhead application rate per hour for total overhead, variable overhead, and fixed overhead.
2. Compute the total variable and total fixed overhead variances.

### Exercise 23-18<sup>A</sup>

Computation and interpretation of overhead spending, efficiency, and volume variances **P4**

**Check** (1) Variable overhead: Spending, \$15,000 U; Efficiency, \$40,000 F

Refer to the information from Exercise 23-17. Compute and interpret the following.

1. Variable overhead spending and efficiency variances.
2. Fixed overhead spending and volume variances.
3. Controllable variance.

### Exercise 23-19

Computation of total overhead rate and total overhead variance **P3**

**Check** (1) Variable overhead rate, \$11.00 per hour

World Company expects to operate at 80% of its productive capacity of 50,000 units per month. At this planned level, the company expects to use 25,000 standard hours of direct labor. Overhead is allocated to products using a predetermined standard rate based on direct labor hours. At the 80% capacity level, the total budgeted cost includes \$50,000 fixed overhead cost and \$275,000 variable overhead cost. In the current month, the company incurred \$305,000 actual overhead and 22,000 actual labor hours while producing 35,000 units.

1. Compute the overhead application rate for total overhead.
2. Compute the total overhead variance.

### Exercise 23-20

Computation of volume and controllable overhead variances **P3**

**Check** (2) \$14,375 U

Refer to the information from Exercise 23-19. Compute the (1) overhead volume variance and (2) overhead controllable variance.

### Exercise 23-21

Overhead controllable and volume variances; overhead variance report **P3**

James Corp. applies overhead on the basis of direct labor hours. For the month of May, the company planned production of 8,000 units (80% of its production capacity of 10,000 units) and prepared the following overhead budget:

Overhead Budget	Operating Level
	80%
Production in units . . . . .	8,000
Standard direct labor hours . . . . .	24,000
Budgeted overhead	
Variable overhead costs	
Indirect materials . . . . .	\$ 15,000
Indirect labor . . . . .	24,000
Power . . . . .	6,000
Maintenance . . . . .	<u>3,000</u>
Total variable costs . . . . .	<u>48,000</u>
Fixed overhead costs	
Rent of factory building . . . . .	15,000
Depreciation—machinery . . . . .	10,000
Supervisory salaries . . . . .	<u>19,400</u>
Total fixed costs . . . . .	<u>44,400</u>
Total overhead costs . . . . .	<u>\$92,400</u>

During May, the company operated at 90% capacity (9,000 units) and incurred the following actual overhead costs:

Overhead costs	
Indirect materials	\$15,000
Indirect labor	26,500
Power	6,750
Maintenance	4,000
Rent of factory building	15,000
Depreciation—machinery	10,000
Supervisory salaries	<u>22,000</u>
Total actual overhead costs	<u>\$99,250</u>

1. Compute the overhead controllable variance.
2. Compute the overhead volume variance.
3. Prepare an overhead variance report at the actual activity level of 9,000 units.

Blaze Corp. applies overhead on the basis of direct labor hours. For the month of March, the company planned production of 8,000 units (80% of its production capacity of 10,000 units) and prepared the following budget:

Overhead Budget	Operating Level
	80%
Production in units	8,000
Standard direct labor hours	32,000
Budgeted overhead	
Variable overhead costs	
Indirect materials	\$10,000
Indirect labor	16,000
Power	4,000
Maintenance	<u>2,000</u>
Total variable costs	32,000
Fixed overhead costs	
Rent of factory building	12,000
Depreciation—machinery	20,000
Taxes and insurance	2,400
Supervisory salaries	<u>13,600</u>
Total fixed costs	<u>48,000</u>
Total overhead costs	<u>\$80,000</u>

During March, the company operated at 90% capacity (9,000 units), and it incurred the following actual overhead costs:

Overhead costs	
Indirect materials	\$10,000
Indirect labor	16,000
Power	4,500
Maintenance	3,000
Rent of factory building	12,000
Depreciation—machinery	19,200
Taxes and insurance	3,000
Supervisory salaries	<u>14,000</u>
Total actual overhead costs	<u>\$81,700</u>

1. Compute the overhead controllable variance.
2. Compute the overhead volume variance.
3. Prepare an overhead variance report at the actual activity level of 9,000 units.

Comp Wiz sells computers. During May 2015, it sold 350 computers at a \$1,200 average price each. The May 2015 fixed budget included sales of 365 computers at an average price of \$1,100 each.

1. Compute the sales price variance and the sales volume variance for May 2015.
2. Interpret the findings.

**Exercise 23-22**  
Overhead controllable and volume variances; overhead variance report  
**P3**

**Exercise 23-23**  
Computing and interpreting sales variances  
**A1**

**PROBLEM SET A**

Phoenix Company's 2015 master budget included the following fixed budget report. It is based on an expected production and sales volume of 15,000 units.

**Problem 23-1A**

Preparation and analysis of a flexible budget

P1

PHOENIX COMPANY Fixed Budget Report For Year Ended December 31, 2015		
Sales .....		\$3,000,000
Cost of goods sold		
Direct materials .....	\$975,000	
Direct labor .....	225,000	
Machinery repairs (variable cost) .....	60,000	
Depreciation—plant equipment (straight-line) .....	300,000	
Utilities (\$45,000 is variable) .....	195,000	
Plant management salaries .....	<u>200,000</u>	<u>1,955,000</u>
Gross profit .....		1,045,000
Selling expenses		
Packaging .....	75,000	
Shipping .....	105,000	
Sales salary (fixed annual amount) .....	<u>250,000</u>	430,000
General and administrative expenses		
Advertising expense .....	125,000	
Salaries .....	241,000	
Entertainment expense .....	<u>90,000</u>	<u>456,000</u>
Income from operations .....		<u>\$ 159,000</u>

**Required**

- Classify all items listed in the fixed budget as variable or fixed. Also determine their amounts per unit or their amounts for the year, as appropriate.
- Prepare flexible budgets (see Exhibit 23.3) for the company at sales volumes of 14,000 and 16,000 units.
- The company's business conditions are improving. One possible result is a sales volume of 18,000 units. The company president is confident that this volume is within the relevant range of existing capacity. How much would operating income increase over the 2015 budgeted amount of \$159,000 if this level is reached without increasing capacity?
- An unfavorable change in business is remotely possible; in this case, production and sales volume for 2015 could fall to 12,000 units. How much income (or loss) from operations would occur if sales volume falls to this level?

**Check** (2) Budgeted income at 16,000 units, \$260,000

(4) Potential operating loss, \$(144,000)

**Problem 23-2A**

Preparation and analysis of a flexible budget performance report

P1 P2 A1

Refer to the information in Problem 23-1A. Phoenix Company's actual income statement for 2015 follows.

PHOENIX COMPANY Statement of Income from Operations For Year Ended December 31, 2015		
Sales (18,000 units) .....		\$3,648,000
Cost of goods sold		
Direct materials .....	\$1,185,000	
Direct labor .....	278,000	
Machinery repairs (variable cost) .....	63,000	
Depreciation—plant equipment .....	300,000	
Utilities (fixed cost is \$147,500) .....	200,500	
Plant management salaries .....	<u>210,000</u>	<u>2,236,500</u>
Gross profit .....		1,411,500
Selling expenses		
Packaging .....	87,500	
Shipping .....	118,500	
Sales salary (annual) .....	<u>268,000</u>	474,000
General and administrative expenses		
Advertising expense .....	132,000	
Salaries .....	241,000	
Entertainment expense .....	<u>93,500</u>	<u>466,500</u>
Income from operations .....		<u>\$ 471,000</u>

**Required**

1. Prepare a flexible budget performance report for 2015.

**Analysis Component**

2. Analyze and interpret both the (a) sales variance and (b) direct materials cost variance.

**Check** (1) Variances: Fixed costs, \$36,000 U; Income, \$9,000 F

Antuan Company set the following standard costs for one unit of its product.

Direct materials (6 lbs. @ \$5 per lb.)	\$ 30
Direct labor (2 hrs. @ \$17 per hr.)	34
Overhead (2 hrs. @ \$18.50 per hr.)	<u>37</u>
Total standard cost	<u>\$101</u>

**Problem 23-3A**

Flexible budget preparation; computation of materials, labor, and overhead variances; and overhead variance report

P1 P2 P3 C2

The predetermined overhead rate (\$18.50 per direct labor hour) is based on an expected volume of 75% of the factory's capacity of 20,000 units per month. Following are the company's budgeted overhead costs per month at the 75% capacity level.

Overhead Budget (75% Capacity)	
Variable overhead costs	
Indirect materials	\$ 45,000
Indirect labor	180,000
Power	45,000
Repairs and maintenance	<u>90,000</u>
Total variable overhead costs	\$360,000
Fixed overhead costs	
Depreciation—building	24,000
Depreciation—machinery	80,000
Taxes and insurance	12,000
Supervision	<u>79,000</u>
Total fixed overhead costs	<u>195,000</u>
Total overhead costs	<u>\$555,000</u>

The company incurred the following actual costs when it operated at 75% of capacity in October.

Direct materials (91,000 lbs. @ \$5.10 per lb.)	\$ 464,100
Direct labor (30,500 hrs. @ \$17.25 per hr.)	526,125
Overhead costs	
Indirect materials	\$ 44,250
Indirect labor	177,750
Power	43,000
Repairs and maintenance	96,000
Depreciation—building	24,000
Depreciation—machinery	75,000
Taxes and insurance	11,500
Supervision	<u>89,000</u>
Total overhead costs	<u>560,500</u>
Total costs	<u>\$1,550,725</u>

**Required**

1. Examine the monthly overhead budget to (a) determine the costs per unit for each variable overhead item and its total per unit costs, and (b) identify the total fixed costs per month.
2. Prepare flexible overhead budgets (as in Exhibit 23.12) for October showing the amounts of each variable and fixed cost at the 65%, 75%, and 85% capacity levels.
3. Compute the direct materials cost variance, including its price and quantity variances.

**Check** (2) Budgeted total overhead at 13,000 units, \$507,000

(3) Materials variances: Price, \$9,100 U; Quantity, \$5,000 U

(4) Labor variances:  
Rate, \$7,625 U; Efficiency,  
\$8,500 U

4. Compute the direct labor cost variance, including its rate and efficiency variances.
5. Prepare a detailed overhead variance report (as in Exhibit 23.15) that shows the variances for individual items of overhead.

### Problem 23-4A

Computation of  
materials, labor, and  
overhead variances

P2 P3

Trico Company set the following standard unit costs for its single product.

Direct materials (30 lbs. @ \$4 per lb.)	\$120
Direct labor (5 hrs. @ \$14 per hr.)	70
Factory overhead—variable (5 hrs. @ \$8 per hr.)	40
Factory overhead—fixed (5 hrs. @ \$10 per hr.)	50
Total standard cost	<u>\$280</u>

The predetermined overhead rate is based on a planned operating volume of 80% of the productive capacity of 60,000 units per quarter. The following flexible budget information is available.

	Operating Levels		
	70%	80%	90%
Production in units	42,000	48,000	54,000
Standard direct labor hours	210,000	240,000	270,000
Budgeted overhead			
Fixed factory overhead	\$2,400,000	\$2,400,000	\$2,400,000
Variable factory overhead	\$1,680,000	\$1,920,000	\$2,160,000

During the current quarter, the company operated at 90% of capacity and produced 54,000 units of product; actual direct labor totaled 265,000 hours. Units produced were assigned the following standard costs:

Direct materials (1,620,000 lbs. @ \$4 per lb.)	\$ 6,480,000
Direct labor (270,000 hrs. @ \$14 per hr.)	3,780,000
Factory overhead (270,000 hrs. @ \$18 per hr.)	4,860,000
Total standard cost	<u>\$15,120,000</u>

Actual costs incurred during the current quarter follow:

Direct materials (1,615,000 lbs. @ \$4.10 per lb.)	\$ 6,621,500
Direct labor (265,000 hrs. @ \$13.75 per hr.)	3,643,750
Fixed factory overhead costs	2,350,000
Variable factory overhead costs	2,200,000
Total actual costs	<u>\$14,815,250</u>

**Check** (1) Materials  
variances: Price, \$161,500 U;  
Quantity, \$20,000 F

(2) Labor variances:  
Rate, \$66,250 F; Efficiency,  
\$70,000 F

### Required

1. Compute the direct materials cost variance, including its price and quantity variances.
2. Compute the direct labor cost variance, including its rate and efficiency variances.
3. Compute the overhead controllable and volume variances.

### Problem 23-5A<sup>A</sup>

Expanded overhead  
variances

P4

Refer to information in Problem 23-4A.

### Required

Compute these variances: (a) variable overhead spending and efficiency, (b) fixed overhead spending and volume, and (c) total overhead controllable.

Boss Company’s standard cost accounting system recorded this information from its December operations.

Standard direct materials cost. . . . .	\$100,000
Direct materials quantity variance (unfavorable) . . . . .	3,000
Direct materials price variance (favorable) . . . . .	500
Actual direct labor cost. . . . .	90,000
Direct labor efficiency variance (favorable) . . . . .	7,000
Direct labor rate variance (unfavorable) . . . . .	1,200
Actual overhead cost. . . . .	375,000
Volume variance (unfavorable) . . . . .	12,000
Controllable variance (unfavorable) . . . . .	9,000

**Problem 23-6A<sup>A</sup>**

Materials, labor, and overhead variances recorded and analyzed

**Required**

1. Prepare December 31 journal entries to record the company’s costs and variances for the month. (Do not prepare the journal entry to close the variances.)

**Check** (1) Dr. Work in Process Inventory (for overhead), \$354,000

**Analysis Component**

2. Identify the variances that would attract the attention of a manager who uses management by exception. Explain what action(s) the manager should consider.

Tohono Company’s 2015 master budget included the following fixed budget report. It is based on an expected production and sales volume of 20,000 units.

TOHONO COMPANY Fixed Budget Report For Year Ended December 31, 2015		
Sales . . . . .		\$3,000,000
Cost of goods sold		
Direct materials . . . . .	\$1,200,000	
Direct labor . . . . .	260,000	
Machinery repairs (variable cost) . . . . .	57,000	
Depreciation—machinery (straight-line) . . . . .	250,000	
Utilities (25% is variable cost) . . . . .	200,000	
Plant manager salaries . . . . .	<u>140,000</u>	<u>2,107,000</u>
Gross profit . . . . .		893,000
Selling expenses		
Packaging . . . . .	80,000	
Shipping . . . . .	116,000	
Sales salary (fixed annual amount) . . . . .	<u>160,000</u>	356,000
General and administrative expenses		
Advertising . . . . .	81,000	
Salaries . . . . .	241,000	
Entertainment expense . . . . .	<u>90,000</u>	<u>412,000</u>
Income from operations . . . . .		<u>\$ 125,000</u>

**PROBLEM SET B**

**Problem 23-1B**

Preparation and analysis of a flexible budget

**Required**

1. Classify all items listed in the fixed budget as variable or fixed. Also determine their amounts per unit or their amounts for the year, as appropriate.
2. Prepare flexible budgets (see Exhibit 23.3) for the company at sales volumes of 18,000 and 24,000 units.
3. The company’s business conditions are improving. One possible result is a sales volume of 28,000 units. The company president is confident that this volume is within the relevant range of existing capacity. How much would operating income increase over the 2015 budgeted amount of \$125,000 if this level is reached without increasing capacity?
4. An unfavorable change in business is remotely possible; in this case, production and sales volume for 2015 could fall to 14,000 units. How much income (or loss) from operations would occur if sales volume falls to this level?

**Check** (2) Budgeted income at 24,000 units, \$372,400

(4) Potential operating loss, \$(246,100)

**Problem 23-2B**

Preparation and analysis of a flexible budget performance report

P1 A1

Refer to the information in Problem 23-1B. Tohono Company's actual income statement for 2015 follows.

TOHONO COMPANY		
Statement of Income from Operations		
For Year Ended December 31, 2015		
Sales (24,000 units) . . . . .		\$3,648,000
Cost of goods sold		
Direct materials . . . . .	\$1,400,000	
Direct labor . . . . .	360,000	
Machinery repairs (variable cost) . . . . .	60,000	
Depreciation—machinery . . . . .	250,000	
Utilities (variable cost, \$64,000) . . . . .	218,000	
Plant manager salaries . . . . .	<u>155,000</u>	<u>2,443,000</u>
Gross profit . . . . .		1,205,000
Selling expenses		
Packaging . . . . .	90,000	
Shipping . . . . .	124,000	
Sales salary (annual) . . . . .	<u>162,000</u>	<u>376,000</u>
General and administrative expenses		
Advertising expense . . . . .	104,000	
Salaries . . . . .	232,000	
Entertainment expense . . . . .	<u>100,000</u>	<u>436,000</u>
Income from operations . . . . .		<u>\$ 393,000</u>

**Required**

1. Prepare a flexible budget performance report for 2015.

**Analysis Component**

2. Analyze and interpret both the (a) sales variance and (b) direct materials cost variance.

**Check** (1) Variances: Fixed costs, \$45,000 U; Income, \$20,600 F

**Problem 23-3B**

Flexible budget preparation; computation of materials, labor, and overhead variances; and overhead variance report

P1 P2 P3 C2

Suncoast Company set the following standard costs for one unit of its product.

Direct materials (4.5 lbs. @ \$6 per lb.) . . . . .	\$27
Direct labor (1.5 hrs. @ \$12 per hr.) . . . . .	18
Overhead (1.5 hrs. @ \$16 per hr.) . . . . .	<u>24</u>
Total standard cost . . . . .	<u>\$69</u>

The predetermined overhead rate (\$16.00 per direct labor hour) is based on an expected volume of 75% of the factory's capacity of 20,000 units per month. Following are the company's budgeted overhead costs per month at the 75% capacity level.

Overhead Budget (75% Capacity)	
Variable overhead costs	
Indirect materials . . . . .	\$22,500
Indirect labor . . . . .	90,000
Power . . . . .	22,500
Repairs and maintenance . . . . .	<u>45,000</u>
Total variable overhead costs . . . . .	\$180,000
Fixed overhead costs	
Depreciation—building . . . . .	24,000
Depreciation—machinery . . . . .	72,000
Taxes and insurance . . . . .	18,000
Supervision . . . . .	<u>66,000</u>
Total fixed overhead costs . . . . .	<u>180,000</u>
Total overhead costs . . . . .	<u>\$360,000</u>

The company incurred the following actual costs when it operated at 75% of capacity in December.

Direct materials (69,000 lbs. @ \$6.10 per lb.) . . . . .		\$ 420,900
Direct labor (22,800 hrs. @ \$12.30 per hr.) . . . . .		280,440
Overhead costs		
Indirect materials . . . . .	\$21,600	
Indirect labor . . . . .	82,260	
Power . . . . .	23,100	
Repairs and maintenance . . . . .	46,800	
Depreciation—building . . . . .	24,000	
Depreciation—machinery . . . . .	75,000	
Taxes and insurance . . . . .	16,500	
Supervision . . . . .	66,000	355,260
Total costs . . . . .		<u>\$1,056,600</u>

### Required

- Examine the monthly overhead budget to (a) determine the costs per unit for each variable overhead item and its total per unit costs, and (b) identify the total fixed costs per month.
- Prepare flexible overhead budgets (as in Exhibit 23.12) for December showing the amounts of each variable and fixed cost at the 65%, 75%, and 85% capacity levels.
- Compute the direct materials cost variance, including its price and quantity variances.
- Compute the direct labor cost variance, including its rate and efficiency variances.
- Prepare a detailed overhead variance report (as in Exhibit 23.15) that shows the variances for individual items of overhead.

**Check** (2) Budgeted total overhead at 17,000 units, \$384,000  
 (3) Materials variances: Price, \$6,900 U; Quantity, \$9,000 U  
 (4) Labor variances: Rate, \$6,840 U; Efficiency, \$3,600 U

Kryll Company set the following standard unit costs for its single product.

Direct materials (25 lbs. @ \$4 per lb.) . . . . .	\$100
Direct labor (6 hrs. @ \$8 per hr.) . . . . .	48
Factory overhead—variable (6 hrs. @ \$5 per hr.) . . . . .	30
Factory overhead—fixed (6 hrs. @ \$7 per hr.) . . . . .	42
Total standard cost . . . . .	<u>\$220</u>

**Problem 23-4B**  
 Computation of materials, labor, and overhead variances  
**P2 P3**

The predetermined overhead rate is based on a planned operating volume of 80% of the productive capacity of 60,000 units per quarter. The following flexible budget information is available.

	Operating Levels		
	70%	80%	90%
Production in units . . . . .	42,000	48,000	54,000
Standard direct labor hours . . . . .	252,000	288,000	324,000
Budgeted overhead			
Fixed factory overhead . . . . .	\$2,016,000	\$2,016,000	\$2,016,000
Variable factory overhead . . . . .	1,260,000	1,440,000	1,620,000

During the current quarter, the company operated at 70% of capacity and produced 42,000 units of product; direct labor hours worked were 250,000. Units produced were assigned the following standard costs:

Direct materials (1,050,000 lbs. @ \$4 per lb.) . . . . .	\$4,200,000
Direct labor (252,000 hrs. @ \$8 per hr.) . . . . .	2,016,000
Factory overhead (252,000 hrs. @ \$12 per hr.) . . . . .	3,024,000
Total standard cost . . . . .	<u>\$9,240,000</u>

Actual costs incurred during the current quarter follow:

Direct materials (1,000,000 lbs. @ \$4.25 per lb.)	\$4,250,000
Direct labor (250,000 hrs. @ \$7.75 per hr.)	1,937,500
Fixed factory overhead costs	1,960,000
Variable factory overhead costs	<u>1,200,000</u>
Total actual costs	<u>\$9,347,500</u>

**Check** (1) Materials variances: Price, \$250,000 U; Quantity, \$200,000 F (2) Labor variances: Rate, \$62,500 F; Efficiency, \$16,000 F

**Required**

1. Compute the direct materials cost variance, including its price and quantity variances.
2. Compute the direct labor cost variance, including its rate and efficiency variances.
3. Compute the total overhead controllable and volume variances.

**Problem 23-5B<sup>A</sup>**

Expanded overhead variances

P4

Refer to information in Problem 23-4B.

**Required**

Compute these variances: (a) variable overhead spending and efficiency, (b) fixed overhead spending and volume, and (c) total overhead controllable.

**Problem 23-6B<sup>A</sup>**

Materials, labor, and overhead variances recorded and analyzed

C1 P5 

Kenya Company's standard cost accounting system recorded this information from its June operations.

Standard direct materials cost	\$130,000
Direct materials quantity variance (favorable)	5,000
Direct materials price variance (favorable)	1,500
Actual direct labor cost	65,000
Direct labor efficiency variance (favorable)	3,000
Direct labor rate variance (unfavorable)	500
Actual overhead cost	250,000
Volume variance (unfavorable)	12,000
Controllable variance (unfavorable)	8,000

**Required**

1. Prepare journal entries dated June 30 to record the company's costs and variances for the month. (Do not prepare the journal entry to close the variances.)

**Analysis Component**

2. Identify the variances that would attract the attention of a manager who uses management by exception. Describe what action(s) the manager should consider.

**SERIAL PROBLEM**

Business Solutions

P1

(This serial problem began in Chapter 1 and continues through most of the book. If previous chapter segments were not completed, the serial problem can begin at this point. It is helpful, but not necessary, to use the working papers that accompany the book.)

**SP 23** Business Solutions's second quarter 2016 fixed budget performance report for its computer furniture operations follows. The \$156,000 budgeted expenses include \$108,000 in variable expenses for desks and \$18,000 in variable expenses for chairs, as well as \$30,000 fixed expenses. The actual expenses include \$31,000 fixed expenses. Prepare a flexible budget performance report that shows any variances between budgeted results and actual results. List fixed and variable expenses separately.

	Fixed Budget	Actual Results	Variances
Desk sales (in units)	144	150	
Chair sales (in units)	72	80	
Desk sales	\$180,000	\$186,000	\$6,000 F
Chair sales	36,000	41,200	5,200 F
Total expenses	<u>156,000</u>	<u>163,880</u>	<u>7,880 U</u>
Income from operations	<u>\$ 60,000</u>	<u>\$ 63,320</u>	<u>\$3,320 F</u>

**Check** Variances: Fixed expenses, \$1,000 U

## Beyond the Numbers

**BTN 23-1** Analysis of flexible budgets and standard costs emphasizes the importance of a similar unit of measure for meaningful comparisons and evaluations. When **Apple** compiles its financial reports in compliance with GAAP, it applies the same unit of measurement, U.S. dollars, for most measures of business operations. One issue for Apple is how best to adjust account values for its subsidiaries that compile financial reports in currencies other than the U.S. dollar.

### REPORTING IN ACTION

C1

## APPLE

#### Required

1. Read Apple's Note 1 in Appendix A and identify the financial statement where it reports the annual adjustment for foreign currency translation for subsidiaries that do not use the U.S. dollar as their functional currency.
2. Translating financial statements requires the use of a currency exchange rate. For each of the following financial statement items, explain the exchange rate the company would apply to translate into U.S. dollars.
  - a. Cash
  - b. Sales revenue
  - c. Property, plant and equipment

**BTN 23-2** The usefulness of budgets, variances, and related analyses often depends on the accuracy of management's estimates of future sales activity.

### COMPARATIVE ANALYSIS

A1

## APPLE GOOGLE

#### Required

1. Identify and record the prior three years' sales (in dollars) for **Apple** and **Google** using their financial statements in Appendix A.
2. Using the data in part 1, predict both companies' sales activity for the next two to three years. (If possible, compare your predictions to actual sales figures for those years.)

**BTN 23-3** Setting materials, labor, and overhead standards is challenging. If standards are set too low, companies might purchase inferior products and employees might not work to their full potential. If standards are set too high, companies could be unable to offer a quality product at a profitable rate and employees could be overworked. The ethical challenge is to set a high but reasonable standard. Assume that as a manager you are asked to set the standard materials price and quantity for the new 1,000 CKB Mega-Max chip, a technically advanced product. To properly set the price and quantity standards, you assemble a team of specialists to provide input.

### ETHICS CHALLENGE

C1

#### Required

Identify four types of specialists that you would assemble to provide information to help set the materials price and quantity standards. Briefly explain why you chose each individual.

**BTN 23-4** The reason we use the words *favorable* and *unfavorable* when evaluating variances is made clear when we look at the closing of accounts. To see this, consider that (1) all variance accounts are closed at the end of each period (temporary accounts), (2) a favorable variance is always a credit balance, and (3) an unfavorable variance is always a debit balance. Write a half-page memorandum to your instructor with three parts that answer the three following requirements. (Assume that variance accounts are closed to Cost of Goods Sold.)

### COMMUNICATING IN PRACTICE

P5

C2

#### Required

1. Does Cost of Goods Sold increase or decrease when closing a favorable variance? Does gross margin increase or decrease when a favorable variance is closed to Cost of Goods Sold? Explain.

2. Does Cost of Goods Sold increase or decrease when closing an unfavorable variance? Does gross margin increase or decrease when an unfavorable variance is closed to Cost of Goods Sold? Explain.
3. Explain the meaning of a favorable variance and an unfavorable variance.

## TAKING IT TO THE NET

C1

**BTN 23-5** Access **iSixSigma**'s website ([iSixSigma.com](http://iSixSigma.com)) to search for and read information about *benchmarking* to complete the following requirements. (*Hint*: Look in the "dictionary" link.)

### Required

1. Write a one-paragraph explanation (in layperson's terms) of benchmarking.
2. How does standard costing relate to benchmarking?

## TEAMWORK IN ACTION

C2

**BTN 23-6** Many service industries link labor rate and time (quantity) standards with their processes. One example is the standard time to board an aircraft. The reason time plays such an important role in the service industry is that it is viewed as a competitive advantage: best service in the shortest amount of time. Although the labor rate component is difficult to observe, the time component of a service delivery standard is often readily apparent—for example, "Lunch will be served in less than five minutes, or it is free."

### Required

Break into teams and select two service industries for your analysis. Identify and describe all the time elements each industry uses to create a competitive advantage.

## ENTREPRENEURIAL DECISION

C1 C2

**BTN 23-7** **Niner Bikes**, as discussed in the chapter opener, uses a costing system with standard costs for direct materials, direct labor, and overhead costs. Two comments frequently are mentioned in relation to standard costing and variance analysis: "Variances are not explanations" and "Management's goal is not to minimize variances."

### Required

Write a short memo to Chris Sugai, Niner Bikes' president, (no more than one page) interpreting these two comments in the context of his business.

## HITTING THE ROAD

C1

**BTN 23-8** Training employees to use standard amounts of materials in production is common. Typically, large companies invest in this training but small organizations do not. One can observe these different practices in a trip to two different pizza businesses. Visit both a local pizza business and a national pizza chain business and then complete the following.

### Required

1. Observe and record the number of raw material items used to make a typical cheese pizza. Also observe how the person making the pizza applies each item when preparing the pizza.
2. Record any differences in how items are applied between the two businesses.
3. Estimate which business is more profitable from your observations. Explain.

**BTN 23-9** Access the annual report of **Samsung** (at [samsung.com](http://samsung.com)) for the year ended December 31, 2013. The usefulness of its budgets, variances, and related analyses depends on the accuracy of management's estimates of future sales activity.

**GLOBAL  
DECISION**

**Samsung**

**Required**

1. Identify and record the prior two years' sales (in ₩ millions) for Samsung from its income statement.
2. Using the data in part 1, predict sales activity for Samsung for the next two years. Explain your prediction process.

**ANSWERS TO MULTIPLE CHOICE QUIZ**

1. c; Fixed costs remain at \$300,000; Variable costs =  $(\$246,000/24,000 \text{ units}) \times 20,000 \text{ units} = \$205,000$
2. e; Budgeted direct materials + Unfavorable variance = Actual cost of direct materials used; or,  $60,000 \text{ units} \times \$10 \text{ per unit} = \$600,000 + \$15,000 \text{ U} = \$615,000$
3. c;  $(\text{AH} \times \text{AR}) - (\text{AH} \times \text{SR}) = \$1,599,040 - (84,160 \text{ hours} \times \$20 \text{ per hour}) = \$84,160 \text{ F}$
4. b; Actual variable overhead – Variable overhead applied to production = Variable overhead cost variance; or  $\$150,000 - (96,000 \text{ hours} \times \$1.50 \text{ per hour}) = \$6,000 \text{ U}$
5. a; Budgeted fixed overhead – Fixed overhead applied to production = Volume variance; or  $\$24,000 - (4,800 \text{ units} \times \$4 \text{ per unit}) = \$4,800 \text{ U}$

### INVESTMENT CENTERS

**A1** ROI and residual income  
**A2** Margin and turnover  
**A3** Nonfinancial performance measures  
**A4** Cycle time  
**C2** Transfer pricing  
**C3** Joint costs allocation

## Learning Objectives

### CONCEPTUAL

- C1** Distinguish between direct and indirect expenses and identify bases for allocating indirect expenses to departments.
- C2** *Appendix 24A*—Explain transfer pricing and methods to set transfer prices.
- C3** *Appendix 24B*—Describe allocation of joint costs across products.

### ANALYTICAL

- A1** Analyze investment centers using return on investment and residual income.
- A2** Analyze investment centers using profit margin and investment turnover.
- A3** Analyze investment centers using the balanced scorecard.
- A4** Compute cycle time and cycle efficiency, and explain their importance to production management.

### PROCEDURAL

- P1** Prepare a responsibility accounting report using controllable costs.
- P2** Allocate indirect expenses to departments.
- P3** Prepare departmental income statements and contribution reports.

## Saving Troubled Waters

PHILADELPHIA—Brian Linton has a passion for oceans. Growing up in Singapore, Brian spent time scuba diving and tending to his 30 fish tanks. Traveling the world enabled Brian to see the “good, the bad, and the ugly of oceans and waterways.” Combining his love of the water with an entrepreneurial spirit, Brian started his company **United By Blue** ([UnitedByBlue.com](http://UnitedByBlue.com)), an apparel and jewelry company that removes one pound of trash in oceans and waterways for every product sold. As Brian notes, the company’s unique business model was driven by “a quest for concrete ways to contribute to real and significant conservation efforts.”

Building off Brian’s college experiences selling jewelry he imported from Thailand, United By Blue sells men’s and women’s clothing, bags, and jewelry. The company uses organic cotton and creative designs to make products that elicit a fun vibe associated with oceans and harbor villages. Offering a diverse product line requires Brian to pay attention to cost management and departmental profits. The Sand Shack, a product in the company’s jewelry department, “is a line of jewelry with chunky turquoise stones that generates much of the profits the company runs on,” says Brian. His managers monitor direct, indirect, and controllable costs; allocate indirect costs to departments; and “measure return on investment (ROI),” explains Brian.

While focusing on controlling costs, United By Blue also strives to remove plastic from its packaging. “The number one material we collect during cleanups is plastic debris. We try to

eliminate as much plastic as we can from our supply chain,” says Brian. Apparel tags are made from biodegradable substances, infused with flower seeds. T-shirts are packaged in banana fiber paper. “We use things that go back to the earth in a very natural way and actually grow life.” While these materials are more costly than plastic, they better fit the company’s philosophy and, Brian believes, help generate new business. “We have customers that double their orders the next season because of the cleanups,” Brian notes.

As United By Blue continues to grow, Brian focuses on financial *and* nonfinancial performance measures. From \$330,000 in 2010, revenues have grown to over \$2 million in 2013. A focus on departmental contribution margins enables the company to operate efficiently to finance future growth.

Likewise, more revenues mean the company collects more trash, over 170,000 pounds through early 2014 and a goal of over a million pounds. As company founder and chief trash collector, this nonfinancial indicator measures progress toward Brian’s vision of “doing the most good possible.”

Brian encourages young entrepreneurs to “leave a positive impact on this world” by focusing on what you love. “My heart is in the ocean, so whatever I am doing is going to be in that realm. Whatever your passion is, leave that positive impact.”

## DECENTRALIZATION

Companies are divided into smaller units, called *divisions*, *segments*, *departments*, or *subunits*, when they become too large to be managed effectively as a single unit. In these **decentralized organizations**, decisions are made by managers throughout the company rather than by a few top executives. Common ways to decentralize organizations are by geography or product line (also called *brand*). For example, **LinkedIn** organizes its operations into three geographic segments: North America, Europe, and Asia-Pacific. **Callaway Golf** organizes its operations around two product lines, golf balls and golf clubs, and **Kraft Foods Group (Kraft)** organizes its operations around six product lines.

In this section we discuss the motivation for and the advantages and disadvantages of decentralization. In later sections of this chapter we discuss performance measurement in decentralized organizations.

### Advantages of Decentralization

Many companies are so large and complex that they are broken into separate divisions for efficiency and/or effectiveness purposes. Divisions then are usually organized into separate departments. Each department is often placed under the direction of a manager. Providing lower-level managers with decision-making authority offers several advantages:

- Lower-level managers have timely access to detailed information about their departments. This enables these managers to better oversee and control their departments' operations.
- Providing lower-level managers with authority to make day-to-day decisions for their departments enables top-level managers to focus more on long-term strategy for the entire organization.
- Managing a division can be good training for employees who later might be promoted to top-level management.
- Having decision-making authority often boosts employee morale and retention.

### Disadvantages of Decentralization

Decentralization has potential disadvantages which organizations should consider:

- Because they are so focused on their own departments, department managers might make decisions that do not reflect the organization's overall strategy.
- When an organization has several departments, the decisions of individual departments might conflict with one another.
- Departments might duplicate certain activities (for example, payroll accounting or purchasing); such duplication increases costs. In many decentralized organizations, activities like payroll, purchasing, and other administrative functions are *centralized* to reduce costs.

### Performance Evaluation

When a company is decentralized, managers need to know how each department is performing. The accounting system must supply information about resources used and outputs achieved by each department. This requires a system to measure and accumulate revenue and expense information for each department.

Departmental information is prepared for internal managers to help control operations, appraise performance, allocate resources, and plan strategy. If a department is highly profitable, management may decide to expand its operations; if a department is performing poorly, information about revenues or expenses can suggest useful changes. Departmental information is rarely distributed publicly, because of its potential usefulness to competitors.

Financial information used to evaluate a department depends on whether it is evaluated as a cost center, profit center, or investment center.

- A **cost center** incurs costs without directly generating revenues. The manufacturing departments of a manufacturer and its service departments, such as accounting, advertising, and purchasing, are all cost centers. **Kraft's** Delaware manufacturing plant is a cost center.

- A **profit center** generates revenues and incurs costs. Product lines and selling departments are often evaluated as profit centers. Kraft's Kool-Aid and Capri Sun drinks are examples of profit centers. A profit center manager would not have the authority to make significant investing decisions, such as the decision to build a new manufacturing plant.
- An **investment center** generates revenues and incurs costs, and its manager is also responsible for the investments made in operating assets. For example, the manager of Kraft's beverage division has the authority to make decisions such as building a new manufacturing plant.

Evaluation of managers' performance depends on whether they are responsible for cost centers, profit centers, or investment centers. Cost center managers are evaluated on their ability to control costs. Profit center managers are judged on their ability to generate revenues in excess of the profit center's costs. Investment center managers are evaluated on their use of investment-center assets to generate income. In the remainder of this chapter we discuss alternative ways to measure performance for these different types of departments.

## RESPONSIBILITY ACCOUNTING

A **responsibility accounting system** can be set up to control costs and evaluate managers' performance by assigning costs to the managers responsible for controlling them. We discuss responsibility accounting and cost control in this section.

**P1** \_\_\_\_\_  
Prepare a responsibility accounting report using controllable costs.

### Controllable versus Uncontrollable Costs

We often evaluate a manager's performance using responsibility accounting reports that describe a department's activities in terms of whether a cost is controllable. **Controllable costs** are those for which a manager has the power to determine or at least significantly affect the amount incurred. **Uncontrollable costs** are not within the manager's control or influence. For example, department managers often have little or no control over depreciation expense because they cannot affect the amount of equipment assigned to their departments. Also, department managers rarely control their own salaries. However, they can control or influence items such as the cost of supplies used in their department. When evaluating managers' performances, we should use data reflecting their departments' outputs along with their controllable costs and expenses.

**Point:** Cost refers to a monetary outlay to acquire some resource that has a future benefit. Expense usually refers to an expired cost.

Distinguishing between controllable and uncontrollable costs depends on the particular manager and time period under analysis. For example, the cost of property insurance is usually not controllable at the department manager's level, but it is controllable by the executive responsible for obtaining the company's insurance coverage. Likewise, this executive does not control expenses resulting from insurance policies already in force. However, when a policy expires, this executive can renegotiate a replacement policy and then controls these costs. Therefore, all costs are controllable at some management level if the time period is sufficiently long. We must use good judgment in identifying controllable costs.

**QC1**

### Responsibility Accounting System

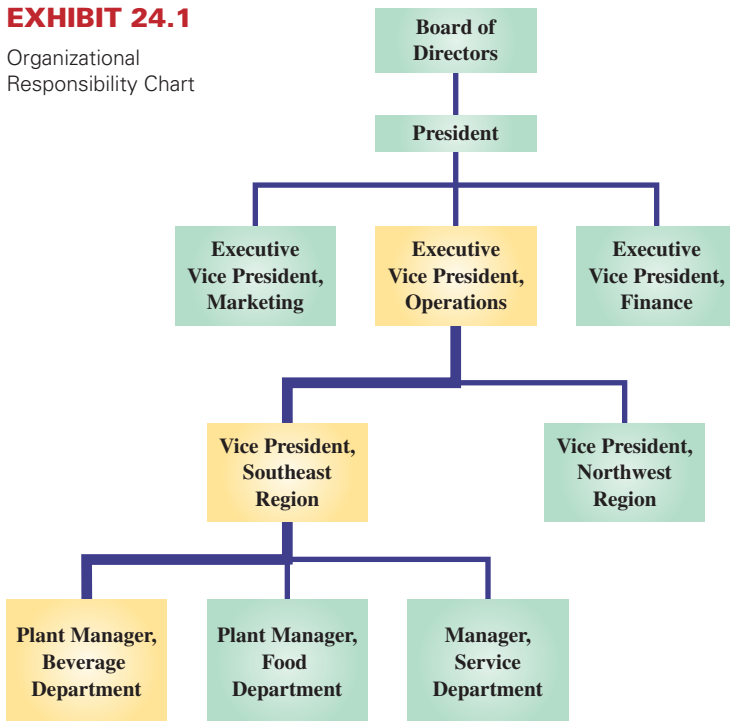

A responsibility accounting system uses the concept of controllable costs to assign managers the responsibility for costs and expenses under their control. Prior to each reporting period, a company prepares plans that identify costs and expenses under each manager's control. These **responsibility accounting budgets** are typically based on the flexible budgeting approach we showed in the previous chapter. However, a responsibility accounting budget includes only controllable costs.

A responsibility accounting system also involves performance reports. A **responsibility accounting performance report** reports actual expenses that a manager is responsible for and their budgeted amounts. Management's analysis of differences between budgeted and actual amounts often results in corrective or strategic managerial actions. Upper-level management uses performance reports to evaluate the effectiveness of lower-level managers in keeping costs within budgeted amounts.

**Point:** Responsibility accounting does not place blame. Instead, responsibility accounting is used to identify opportunities for improving performance.

**EXHIBIT 24.1**

Organizational Responsibility Chart

A responsibility accounting system recognizes that control over costs and expenses belongs to several levels of management. We illustrate this in the organization chart in Exhibit 24.1. The lines in this chart connecting the managerial positions reflect channels of authority. For example, the three department managers (beverage, food, and service) in this company are responsible for controllable costs incurred in their departments. These department managers report to the vice president (VP) of the Southeast region, and thus these same costs are subject to the overall control of this VP. Similarly, the costs of the Southeast region are reported to and subject to the control of the executive vice president (EVP) of operations, the president, and, ultimately, the board of directors.

**Responsibility Accounting Report**

Exhibit 24.2 shows summarized performance reports for the three management levels identified in Exhibit 24.1. The beverage department is a cost center, and its manager is responsible for controlling costs.

Exhibit 24.2 shows that costs under the control of the beverage department plant manager are totaled and included among the controllable costs of the VP of the Southeast region. Costs under the control of this VP are totaled and included among

**EXHIBIT 24.2**

Responsibility Accounting Performance Reports

<b>Executive Vice President, Operations</b>		<b>For July</b>		
<b>Controllable Costs</b>	<b>Budgeted Amount</b>	<b>Actual Amount</b>	<b>Over (Under) Budget</b>	
Salaries, VPs . . . . .	\$ 80,000	\$ 80,000	\$ 0

Service department . . . . .	43,200	42,000	(1,200)	
<b>Totals . . . . .</b>	<b>\$ 276,700</b>	<b>\$ 279,500</b>	<b>\$ 2,800</b>	

<b>Plant Manager, Beverage Department</b>		<b>For July</b>		
<b>Controllable Costs</b>	<b>Budgeted Amount</b>	<b>Actual Amount</b>	<b>Over (Under) Budget</b>	
Direct materials . . . . .	\$ 51,600	\$ 52,500	\$ 900	
Direct labor . . . . .	20,000	19,600	(400)	
Overhead . . . . .	8,000	7,800	(200)	
<b>Totals . . . . .</b>	<b>\$ 79,600</b>	<b>\$ 79,900</b>	<b>\$ 300</b>	

the controllable costs of the EVP of operations. In this way, responsibility accounting reports provide relevant information for each management level. (If the VP and EVP are responsible for more than just costs, the responsibility accounting system will be expanded, as we show later in this chapter.)

The number of controllable costs reported varies across management levels. At lower levels, managers have limited responsibility and thus few controllable costs. Responsibility and control broaden for higher-level managers; therefore, their reports span a wider range of costs. However, reports to higher-level managers usually are summarized because: (1) lower-level managers are often responsible for these detailed costs, and (2) detailed reports can obscure the broader issues facing the top managers of an organization.

**Point:** Responsibility accounting usually divides a company into subunits, or *responsibility centers*. A center manager is evaluated on how well the center performs, as reported in responsibility accounting reports.

## PROFIT CENTERS

When departments are organized as profit centers, responsibility accounting focuses on how well each department controlled costs *and* generated revenues. This information leads to **departmental income statements** as a common way to report profit center performance. When a company computes departmental profits, it confronts some accounting challenges that involve allocating expenses across departments. We next illustrate these allocations and departmental income reporting.

### Direct and Indirect Expenses

**Direct expenses** are costs readily traced to a department because they are incurred for that department's sole benefit. They require no allocation across departments. For example, the salary of an employee who works in only one department is a direct expense of that one department. Direct expenses are often, but not always, controllable costs.

**Indirect expenses** are costs that are incurred for the joint benefit of more than one department; they cannot be readily traced to only one department. For example, if two or more departments share a single building, all enjoy the benefits of the expenses for rent, heat, and light. Likewise, the *operating departments* that perform an organization's main functions, for example manufacturing and selling, benefit from the work of *service departments*. Service departments, like payroll and human resource management, do not generate revenues, but their support is crucial for the operating departments' success.

When we need information about departmental profits, indirect expenses are allocated across departments benefiting from them. Ideally, we allocate indirect expenses by using a cause-effect relation. When we cannot identify cause-effect relations, we allocate each indirect expense on a basis approximating the relative benefit each department receives.

**Illustration of Indirect Expense Allocation** To illustrate how to allocate an indirect expense, we consider a retail store that hires an outside company to provide cleaning services. Management allocates this cost across the store's three departments according to the floor space each occupies. Costs of cleaning services for a recent month are \$800. Exhibit 24.3 shows the square feet of floor space each department occupies. The store computes the percent of total square feet allotted to each department and uses the percentages to allocate the \$800 cost.

Specifically, because the jewelry department occupies 60% of the floor space, 60% of the total \$800 cost is assigned to it. The same procedure is applied to the other departments. When

**C1** Distinguish between direct and indirect expenses and identify bases for allocating indirect expenses to departments.

Department	Department Square Feet	Percent of Total Square Feet	Cost Allocated to Department
Jewelry. . . . .	2,400	60%	\$480
Watch repair. . . . .	600	15	120
China and silver. . . . .	<u>1,000</u>	<u>25</u>	<u>200</u>
Totals. . . . .	<u>4,000</u>	<u>100%</u>	<u>\$800</u>

### EXHIBIT 24.3

Indirect Expense Allocation

the allocation process is complete, these and other allocated costs are deducted from the gross profit for each department to determine net income for each.

## Allocation of Indirect Expenses

### P2

Allocate indirect expenses to departments.

We've just seen one example of how to allocate indirect expenses across departments—by percentage of floor space for cleaning services. Many other bases exist for allocating indirect expenses. This section describes how to identify appropriate allocation bases.

No standard rule identifies the best basis because expense allocation involves several factors, and the relative importance of these factors varies across departments and organizations. Judgment is required, and people do not always agree. Employee morale suffers when allocations are perceived as unfair. Thus, it is important to carefully design and explain the allocation of service department costs.

Purestock/SuperStock

**Point:** Some companies ask supervisors to estimate time spent supervising specific departments for purposes of expense allocation.

**Wages and Salaries** Employee wages and salaries can be either direct or indirect expenses. If their time is spent entirely in one department, their wages are direct expenses of that department. However, if employees work for the benefit of more than one department, their wages are indirect expenses and must be allocated across the departments benefited. An employee's contribution to a department usually depends on the number of hours worked in contributing to that department. Thus, a reasonable basis for allocating employee wages and salaries is the *relative amount of time spent in each department*. In the case of a supervisor who manages more than one department, recording the time spent in each department may not always be practical. Instead, a company can allocate the supervisor's salary to departments on the basis of the number of employees or the amount of sales in each department.

**Rent and Related Expenses** Rent expense for a building is reasonably allocated to a department on the basis of floor space it occupies. Location can often make some floor space more valuable than other space. Ground floor retail space, for instance, is often more valuable than basement or upper-floor space because all customers pass departments near the entrance but fewer go beyond the first floor. Thus, the allocation method can charge departments that occupy more valuable space a higher expense per square foot.

When no precise measures of floor space values exist, basing allocations on data such as customer traffic and real estate assessments is helpful. When a company owns its building, its expenses for depreciation, taxes, insurance, and other related building expenses are allocated like rent expense.

**Advertising Expenses** Effective advertising of a department's products increases its sales and customer traffic. Moreover, advertising products for some departments usually helps other departments' sales because customers also often buy unadvertised products. Thus, many stores treat advertising as an indirect expense allocated on the basis of each department's proportion of total sales. For example, a department with 10% of a store's total sales is assigned 10% of advertising expense. Another method is to analyze each advertisement to compute the web/newspaper space or TV/radio time devoted to the products of a department and charge that department for the proportional costs of advertisements. Management must consider whether this more detailed and costly method is justified.

**Equipment and Machinery Depreciation** Depreciation on equipment and machinery used in only one department is a direct expense of that department. Depreciation on equipment and machinery used by more than one department is an indirect expense to be allocated across departments. Accounting for each department's depreciation expense requires a company to keep records showing which departments use specific assets. The number of hours that a department uses equipment and machinery is a reasonable basis for allocating depreciation.

**Utilities Expenses** Utilities expenses such as heating and lighting are usually allocated on the basis of floor space occupied by departments. This practice assumes their use is uniform across departments. When this is not so, a more involved allocation can be necessary, although there is often a trade-off between the usefulness of more precise allocations and the effort to compute them. Manufacturers often allocate electricity cost to departments on the basis of the machine hours used or the horsepower of equipment located in each department.

**Service Department Expenses** To generate revenues, operating departments require support services provided by departments such as personnel, payroll, and purchasing. Such service departments are typically evaluated as *cost centers* because they do not produce revenues. A departmental accounting system can accumulate and report costs incurred by each service department for this purpose. The system then allocates a service department’s expenses to operating departments benefiting from them. Exhibit 24.4 shows some commonly used bases for allocating service department expenses to operating departments. In the next section we illustrate how to allocate costs to operating departments.

Service Department	Common Allocation Bases
Office expenses . . . . .	Number of employees or sales in each department
Personnel expenses . . . . .	Number of employees in each department
Payroll expenses . . . . .	Number of employees in each department
Purchasing costs . . . . .	Dollar amounts of purchases or number of purchase orders processed
Maintenance expenses . . . . .	Square feet of floor space occupied

**EXHIBIT 24.4**  
Bases for Allocating Service Department Expenses

### Departmental Income Statements

An income statement can be prepared for each operating department once expenses have been assigned to it. Its expenses include both direct expenses and its share of indirect expenses. For this purpose, it is useful to compile all expenses incurred in service departments before assigning those expenses to operating departments. We illustrate the steps to prepare departmental income statements using **A-1 Hardware** and its five departments. Two of them (office and purchasing) are service departments; the other three (hardware, housewares, and appliances) are operating (selling) departments. Allocating costs to operating departments and preparing departmental income statements involves four steps.

**P3** Prepare departmental income statements and contribution reports.

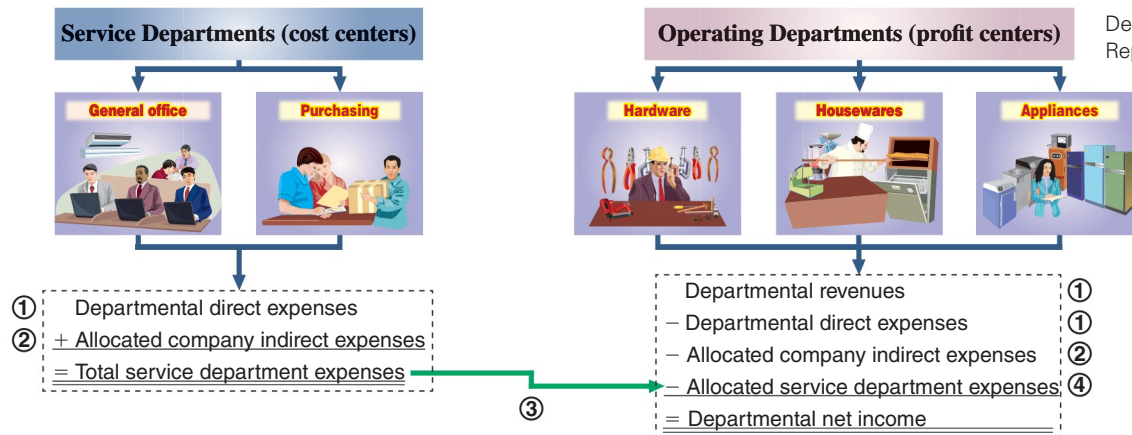

- Step 1:** Accumulating revenues and direct expenses by department.
- Step 2:** Allocating indirect expenses across departments.
- Step 3:** Allocating service department expenses to operating departments.
- Step 4:** Preparing departmental income statements.

Exhibit 24.5 summarizes these steps in preparing departmental performance reports for cost centers and profit centers (links to the steps are coded with circled numbers 1 through 4). A-1 Hardware’s service departments (general office and purchasing) are cost centers, so their performance will be based on how well they controlled total service department expenses. The company’s operating departments (hardware, housewares, and appliances) are profit centers, and their performance will be based on how well they generated departmental net income.

**Point:** Operating departments generate revenues. Service departments do not generate revenues.

**Step 1:** Step 1 accumulates revenues and direct expenses in departmental accounts for each department. As cost centers, the service departments do not generate revenues. Direct expenses

**EXHIBIT 24.5**  
Departmental Performance Reporting

**Point:** We sometimes allocate service department costs across other service departments before allocating them to operating departments. This “step-wise” process is covered in advanced courses.

for all five departments include salaries, wages, and other expenses that each department incurs but does not share with any other department.

**Step 2:** Step 2 allocates indirect company expenses across all service and operating departments. Indirect expenses can include items such as depreciation, rent, advertising, and any other expenses that cannot be directly assigned to a department. Indirect expenses are first recorded in *company* accounts. Then, an allocation base is identified for each expense, and costs are allocated using a *departmental expense allocation spreadsheet*, described next.

**Step 3:** Step 3 allocates service department expenses to operating departments. Service department expenses typically are not allocated to other service departments.<sup>1</sup> Exhibit 24.6 shows the use of a departmental allocation spreadsheet. It uses various allocation bases to allocate all of the direct and indirect expenses of service departments to operating departments. After this allocation, no expenses remain in the service departments, as shown in row 21 of Exhibit 24.6.

22			<u>\$72,200</u>	<u>\$ 0</u>	<u>\$ 0</u>	<u>\$34,900</u>	<u>\$19,200</u>

Computations for steps 2 and 3 are commonly made using a departmental expense allocation spreadsheet.

**Accumulate Revenues and Direct Expenses** First, direct and indirect expenses are accumulated by department and reported in the Expense Account Balance column (rows 8 through 17). The third section (rows 18 through 20) lists the service department expenses and shows their allocations to operating departments. The allocation bases are identified in the second column, and total expense amounts are reported in the third column.

**Allocate Indirect Expenses** Second (step 2), the four indirect expenses of rent, utilities, advertising, and insurance are allocated to all departments using the allocation bases identified. For example, consider rent allocation. Exhibit 24.7 lists the five departments’ square footage of space occupied.

<sup>1</sup>In some cases we allocate a service department’s expenses to other service departments when they use its services. For example, expenses of a payroll office benefit all service and operating departments and can be assigned to all departments. Nearly all examples and assignment materials in this book allocate service expenses *only to operating departments* for simplicity.

Department	Floor Space (Square Feet)	Value of Insured Assets (\$)	Sales (\$)	Number of Purchase Orders*
General office . . . . .	1,500	\$ 38,000		—
Purchasing . . . . .	1,500	19,000		—
Hardware . . . . .	4,050	85,500	\$119,500	394
Housewares . . . . .	2,700	57,000	71,700	267
Appliances . . . . .	<u>2,250</u>	<u>38,000</u>	<u>47,800</u>	<u>324</u>
Total . . . . .	<u>12,000</u>	<u>\$237,500</u>	<u>\$239,000</u>	<u>985</u>

**EXHIBIT 24.7**

Departments' Allocation Bases

\*Purchasing department tracks purchase orders by department.

The two service departments (office and purchasing) occupy 25% of the total space (3,000 sq. feet/12,000 sq. feet). However, they are located near the back of the building, which is of lower value than space near the front that is occupied by operating departments. Management estimates that space near the back accounts for \$1,200 (10%) of the total rent expense of \$12,000. Exhibit 24.8 shows how we allocate the \$1,200 rent expense between these two service

Department	Square Feet	Percent of Total	Allocated Cost*
General office . . . . .	1,500	50.0%	\$ 600
Purchasing . . . . .	<u>1,500</u>	<u>50.0</u>	<u>600</u>
Totals . . . . .	<u>3,000</u>	<u>100.0%</u>	<u>\$1,200</u>

**EXHIBIT 24.8**

Allocating Indirect (Rent) Expense to Service Departments

\*See row 13 of departmental expense allocation spreadsheet (Exhibit 24.6).

departments in proportion to their square footage. The calculations in Exhibit 24.8 show a simple rule for cost allocations:

$$\text{Allocated cost} = \text{Percentage of allocation base} \times \text{Total cost to allocate}$$

We then have the remaining amount of \$10,800 (\$12,000 – \$1,200) of rent expense to allocate to the three operating departments, as shown in Exhibit 24.9.

Department	Square Feet	Percent of Total	Allocated Cost*
Hardware . . . . .	4,050	45.0%	\$ 4,860
Housewares . . . . .	2,700	30.0	3,240
Appliances . . . . .	<u>2,250</u>	<u>25.0</u>	<u>2,700</u>
Totals . . . . .	<u>9,000</u>	<u>100.0%</u>	<u>\$10,800</u>

**EXHIBIT 24.9**

Allocating Indirect (Rent) Expense to Operating Departments

\*See row 13 of departmental expense allocation spreadsheet (Exhibit 24.6).

We continue step 2 by allocating the \$2,400 of utilities expense to all departments based on the square footage occupied, as shown in Exhibit 24.10.

Department	Square Feet	Percent of Total	Allocated Cost*
General office . . . . .	1,500	12.50%	\$ 300
Purchasing . . . . .	1,500	12.50	300
Hardware . . . . .	4,050	33.75	810
Housewares . . . . .	2,700	22.50	540
Appliances . . . . .	<u>2,250</u>	<u>18.75</u>	<u>450</u>
Totals . . . . .	<u>12,000</u>	<u>100.00%</u>	<u>\$2,400</u>

**EXHIBIT 24.10**

Allocating Indirect (Utilities) Expense to All Departments

\*See row 14 of departmental expense allocation spreadsheet (Exhibit 24.6).

Exhibit 24.11 shows the allocation of \$1,000 of advertising expense to the three operating departments on the basis of sales dollars. We exclude the service departments from this allocation because they do not generate sales.

### EXHIBIT 24.11

Allocating Indirect (Advertising) Expense to Operating Departments

Department	Sales	Percent of Total	Allocated Cost*
Hardware .....	\$119,500	50.0%	\$ 500
Housewares .....	71,700	30.0	300
Appliances .....	<u>47,800</u>	<u>20.0</u>	<u>200</u>
Totals .....	<u>\$239,000</u>	<u>100.0%</u>	<u>\$1,000</u>

\*See row 15 of departmental expense allocation spreadsheet (Exhibit 24.6).

Finally, to complete step 2 we allocate insurance expense to each service and operating department, as shown in Exhibit 24.12.

### EXHIBIT 24.12

Allocating Indirect (Insurance) Expense to All Departments

Department	Value of Insured Assets	Percent of Total	Allocated Cost*
General office .....	\$ 38,000	16.0%	\$ 400
Purchasing .....	19,000	8.0	200
Hardware .....	85,500	36.0	900
Housewares .....	57,000	24.0	600
Appliances .....	<u>38,000</u>	<u>16.0</u>	<u>400</u>
Total .....	<u>\$237,500</u>	<u>100.0%</u>	<u>\$2,500</u>

\*See row 16 of departmental expense allocation spreadsheet (Exhibit 24.6).

**Allocate Service Department Expenses** Third (step 3), total expenses of the two service departments are allocated to the three operating departments. Exhibit 24.13 shows the allocation of total general office expenses (\$15,300) to operating departments.

### EXHIBIT 24.13

Allocating Service Department (General Office) Expenses to Operating Departments

Department	Sales	Percent of Total	Allocated Cost*
Hardware .....	\$119,500	50.0%	\$ 7,650
Housewares .....	71,700	30.0	4,590
Appliances .....	<u>47,800</u>	<u>20.0</u>	<u>3,060</u>
Total .....	<u>\$239,000</u>	<u>100.0%</u>	<u>\$15,300</u>

\*See row 19 of departmental expense allocation spreadsheet (Exhibit 24.6).

Exhibit 24.14 shows the allocation of total purchasing department expenses (\$9,700) to operating departments.

### EXHIBIT 24.14

Allocating Service Department (Purchasing) Expenses to Operating Departments

Department	Number of Purchase Orders	Percent of Total	Allocated Cost*
Hardware .....	394	40.00%	\$3,880
Housewares .....	267	27.11	2,630
Appliances .....	<u>324</u>	<u>32.89</u>	<u>3,190</u>
Total .....	<u>985</u>	<u>100.00%</u>	<u>\$9,700</u>

\*See row 20 of departmental expense allocation spreadsheet (Exhibit 24.6).

**Step 4:** The departmental expense allocation spreadsheet can now be used to prepare departmental performance reports. The general office and purchasing departments are cost centers, and their managers will be evaluated on their control of costs, as we showed in Exhibit 24.2.

Exhibit 24.15 shows income statements for A-1 Hardware's three operating departments. This exhibit uses the spreadsheet (in Exhibit 24.6) for its operating expenses; information on sales and cost of goods sold comes from departmental records.

<b>A-1 HARDWARE</b>					
<b>Departmental Income Statements</b>					
<b>For Year Ended December 31, 2015</b>					
	<b>Hardware Department</b>	<b>Housewares Department</b>	<b>Appliances Department</b>	<b>Combined</b>	
Sales .....	\$119,500	\$71,700	\$47,800	\$239,000	
Cost of goods sold .....	<u>73,800</u>	<u>43,800</u>	<u>30,200</u>	<u>147,800</u>	
Gross profit .....	45,700	27,900	17,600	91,200	
Operating expenses					
Salaries expense .....	15,600	7,000	7,800	30,400	Direct expenses
Depreciation expense—Equipment .....	400	100	200	700	
Supplies expense .....	300	200	100	600	
Rent expense .....	4,860	3,240	2,700	10,800	Allocated indirect expenses
Utilities expense .....	810	540	450	1,800	
Advertising expense .....	500	300	200	1,000	
Insurance expense .....	900	600	400	1,900	
Share of general office expenses .....	7,650	4,590	3,060	15,300	Allocated service department expenses
Share of purchasing expenses .....	<u>3,880</u>	<u>2,630</u>	<u>3,190</u>	<u>9,700</u>	
Total operating expenses .....	<u>34,900</u>	<u>19,200</u>	<u>18,100</u>	<u>72,200</u>	
<b>Operating income (loss) .....</b>	<b><u>\$ 10,800</u></b>	<b><u>\$ 8,700</u></b>	<b><u>\$ (500)</u></b>	<b><u>\$ 19,000</u></b>	

**EXHIBIT 24.15**

Departmental Income Statements (Operating Departments)

Higher-level managers can use departmental income statements to determine which of a company's departments are most profitable. After considering all costs, A-1 Hardware's hardware department is its most profitable. As such, the company might attempt to expand its hardware department.

### Departmental Contribution to Overhead

Exhibit 24.15 shows that the appliances department reported an operating loss of \$(500). Should this department be eliminated? We must be careful when indirect expenses are a large portion of total expenses and when weaknesses in assumptions and decisions in allocating indirect expenses can markedly affect income. Also, operating department managers might have no control over the level of service department services they use. In these and other cases, we might better evaluate profit center performance using the **departmental contribution to overhead**, a measure of the amount of sales less *direct* expenses. A department's contribution is said to be "to overhead" because of the practice of considering all indirect expenses as overhead. Thus, the excess of a department's sales over direct expenses is a contribution toward at least a portion of its total overhead.

The upper half of Exhibit 24.16 shows a departmental contribution to overhead, as part of an expanded income statement. This format is common when reporting departmental contributions to overhead.

Using the information in Exhibits 24.15 and 24.16, we can evaluate the profitability of the three profit centers. For instance, let's compare the performance of the appliances department as described in these two exhibits. Exhibit 24.15 shows a \$500 loss resulting from this department's operations. Yet Exhibit 24.16 shows a \$9,500 positive contribution to overhead. The difference arises because the loss includes allocated indirect expenses while the contribution to overhead does not. The contribution of the appliances department is not as large as those of the other selling departments, but a \$9,500 contribution to overhead is better than a \$500 loss. This tells us that the appliances department is not a money loser. On the contrary, it is contributing \$9,500 toward defraying total indirect expenses of \$40,500.

**Example:** If the \$15,300 general office expenses in Exhibit 24.6 are allocated equally across departments, what is income for the hardware department and for the combined company? *Answer:* Hardware income, \$13,350; combined income, \$19,000.

**EXHIBIT 24.16**

Departmental Contribution to Overhead

<b>A-1 HARDWARE</b>				
<b>Income Statement Showing Departmental Contribution to Overhead</b>				
<b>For Year Ended December 31, 2015</b>				
	<b>Hardware Department</b>	<b>Housewares Department</b>	<b>Appliances Department</b>	<b>Combined</b>
Sales .....	\$119,500	\$ 71,700	\$47,800	\$239,000
Cost of goods sold .....	<u>73,800</u>	<u>43,800</u>	<u>30,200</u>	<u>147,800</u>
Gross profit .....	45,700	27,900	17,600	91,200
Direct expenses				
Salaries expense .....	15,600	7,000	7,800	30,400
Depreciation expense—Equipment .....	400	100	200	700
Supplies expense .....	<u>300</u>	<u>200</u>	<u>100</u>	<u>600</u>
Total direct expenses .....	<u>16,300</u>	<u>7,300</u>	<u>8,100</u>	<u>31,700</u>
<b>Departmental contributions to overhead .....</b>	<b><u>\$29,400</u></b>	<b><u>\$20,600</u></b>	<b><u>\$ 9,500</u></b>	<b><u>\$59,500</u></b>
Indirect expenses				
Rent expense .....				10,800
Utilities expense .....				1,800
Advertising expense .....				1,000
Insurance expense .....				1,900
General office department expense .....				15,300
Purchasing department expense .....				<u>9,700</u>
Total indirect expenses .....				<u>40,500</u>
Operating income .....				<b><u>\$ 19,000</u></b>

**Point:** Operating income is the same in Exhibits 24.15 and 24.16. The method of reporting indirect expenses in Exhibit 24.16 does not change total income but does identify each operating department's contribution to overhead.

**Behavioral Aspects of Departmental Performance Reports** An organization must consider potential effects on employee behavior from departmental income statements and contribution to overhead reports. These include:

- Indirect expenses are typically uncontrollable costs for a department manager. Thus departmental contribution to overhead might be a better way to evaluate department manager performance. Including uncontrollable costs in performance evaluation is inconsistent with responsibility accounting and can reduce department manager morale.
- On the other hand, including indirect expenses in the department manager's performance evaluation can lead the manager to be more careful in using service departments, which can reduce the organization's costs.
- Some companies allocate *budgeted* service department costs rather than actual service department costs. In this way, operating departments are not held responsible for excessive costs from service departments, and service departments are more likely to try to control their costs.

QC2

## EVALUATING INVESTMENT CENTER PERFORMANCE

We now come to the third type of responsibility center, the investment center. This section introduces both financial and nonfinancial measures of investment center performance.

A1

Analyze investment centers using return on investment and residual income.

### Financial Performance Evaluation Measures

Investment center managers are typically evaluated using performance measures that combine income and assets. These measures include return on investment, residual income, profit margin, and investment turnover. Consider the following data for ZTel, a company that operates two divisions: LCD and S-Phone. The LCD division manufactures liquid crystal display (LCD)

touch-screen monitors and sells them for use in computers, cellular phones, and other products. The S-Phone division sells smartphones. Exhibit 24.17 shows current-year income and assets for those divisions.

	LCD Division	S-Phone Division
Investment center income.....	\$ 526,500	\$ 417,600
Investment center average invested assets.....	2,500,000	1,850,000

**EXHIBIT 24.17**

Investment Center Income and Assets

**Investment Center Return on Investment** One measure to evaluate division performance is the investment center **return on investment (ROI)**, commonly called *return on assets (ROA)*. This measure is computed as follows:

$$\text{Return on investment} = \frac{\text{Investment center income}}{\text{Investment center average invested assets}}$$

The return on investment for the LCD division is 21% (rounded), computed as \$526,500/\$2,500,000. The S-Phone division's return on investment is 23% (rounded), computed as \$417,600/\$1,850,000. ZTel's management can use ROI as part of its performance evaluation for its investment center managers. For example, the actual ROI can be compared to a targeted ROI or to the ROI for similar departments at competing businesses.

**Investment Center Residual Income** Another way to evaluate division performance is to compute investment center **residual income**, which is computed as follows:

$$\text{Residual income} = \text{Investment center income} - \text{Target investment center income}$$

Assume ZTel's top management sets target income at 8% of investment center assets. For an investment center, this target is typically the cost of obtaining financing. Applying this target rate using the data from Exhibit 24.17 yields the residual income for ZTel's divisions shown in Exhibit 24.18.

	LCD Division	S-Phone Division
Investment center income.....	\$526,500	\$417,600
Less: Target investment center income		
\$2,500,000 × 8%.....	200,000	
\$1,850,000 × 8%.....		148,000
Investment center residual income.....	<u>\$326,500</u>	<u>\$269,600</u>

**EXHIBIT 24.18**

Investment Center Residual Income

princigalli/iStock/360/Getty Images

Notice that residual income is expressed in dollars, not as a percentage. The LCD division produced more dollars of residual income than the S-Phone division. Ztel's management can use residual income, along with ROI, to evaluate investment center manager performance.

Using residual income to evaluate division performance encourages division managers to accept all opportunities that return more than the target income, thus increasing company value. For example, the S-Phone division might (mistakenly) not want to accept a new customer that will provide a 15% return on investment, since that will reduce the S-Phone division's overall return on investment (23% as shown above). However, the S-Phone division should accept this opportunity because the new customer would increase residual income by providing income above the target income of 8% of invested assets.

**NEED-TO-KNOW** 24-1Return on Investment  
A1Do More: QS 24-9, QS 24-10,  
E 24-8, E 24-9, E 24-10

The media division of a company reports income of \$600,000, average invested assets of \$7,500,000, and a target income of 6% of invested assets. Compute the division's (a) return on investment and (b) residual income.

**Solution**

- a.  $\$600,000 / \$7,500,000 = 8\%$   
 b.  $\$600,000 - (\$7,500,000 \times 6\%) = \$150,000$

**Issues in Computing Return on Investment and Residual Income** Evaluations of investment center performance using return on investment and residual income can be affected by how a company answers the questions below:

1. How do you compute *average* invested assets? It is common to compute the average by adding the year's beginning amount of invested assets to the year's ending amount of invested assets, and dividing that sum by 2. Averages based on monthly or quarterly asset amounts are also acceptable.
2. How do you measure invested assets? It is common to measure invested assets using their *net* book values. For example, depreciable assets would be measured at their cost minus accumulated depreciation. As net book value declines over a depreciable asset's useful life, the result is that return on investment and residual income would increase over that asset's life. This might cause managers not to invest in new assets. In addition, in measuring invested assets, companies commonly exclude assets that are not used in generating investment center income, such as land held for resale.
3. How do you measure investment center income? It is common to exclude both interest expense and tax expense from investment center income. Interest expense reflects a company's financing decisions, and tax expense is typically considered outside the control of an investment center manager. Excluding interest and taxes in these calculations enables more meaningful comparisons of return on investment and residual income across investment centers and companies.

**Point:** *Economic Value Added* (EVA<sup>®</sup>), developed and trademarked by Stern, Stewart, and Co., is an approach to address issues in computing residual income. This method uses a variety of adjustments to compute income, assets, and the target rate.

**Decision Insight**

**In-the-Money** Executive pay is often linked to performance measures. Bonus payments are often based on exceeding a target return on investment or certain balanced scorecard indicators. Stock awards, such as stock options and restricted stock, reward executives when their company's stock price rises. The goal of bonus plans and stock awards is to encourage executives to make decisions that increase company performance and value. ■

**Investment Center Profit Margin and Investment Turnover** We can further examine investment center (division) performance by splitting return on investment into two measures—profit margin and investment turnover, as follows.

$$\text{Return on investment} = \text{Profit margin} \times \text{Investment turnover}$$

$$\frac{\text{Investment center income}}{\text{Investment center average assets}} = \frac{\text{Investment center income}}{\text{Investment center sales}} \times \frac{\text{Investment center sales}}{\text{Investment center average assets}}$$

**Profit margin** measures the income earned per dollar of sales. As learned in an earlier chapter, profit margin for the entire organization is calculated as net income divided by sales. In analyzing investment center performance, we typically use a measure of income *before* tax. Thus, for an investment center, profit margin is computed as investment center income divided by investment center sales. Likewise, **investment turnover** measures how efficiently an investment center generates sales from its invested assets. It is calculated as investment center sales divided by investment center average assets. Profit margin is expressed as a percent, while investment turnover is interpreted as the number of times assets were converted into sales. Higher profit margin and higher investment turnover indicate better performance.

**A2**  
Analyze investment centers using profit margin and investment turnover.

**Point:** This partitioning of return on investment is sometimes referred to as DuPont analysis.

To illustrate, consider **Walt Disney Co.**, which reports in Exhibit 24.19 results for two of its operating divisions: Media Networks and Parks and Resorts.

(\$ millions)	Media Networks	Parks and Resorts
Sales . . . . .	\$20,356	\$14,089
Income . . . . .	6,818	2,220
Average invested assets . . . . .	28,644	21,504

**EXHIBIT 24.19**

Walt Disney Division Sales, Income, and Assets

Profit margin and investment turnover for these two divisions are computed and shown in Exhibit 24.20:

(\$ millions)	Media Networks	Parks and Resorts
Profit margin		
\$6,818/\$20,356 . . . . .	33.49%	
\$2,220/\$14,089 . . . . .		15.76%
Investment turnover		
\$20,356/\$28,644 . . . . .	0.71	
\$14,089/\$21,504 . . . . .		0.66
Return on investment		
33.49% × 0.71 . . . . .	23.78%	
15.76% × 0.66 . . . . .		10.40%

**EXHIBIT 24.20**

Walt Disney Division Profit Margin and Investment Turnover

Disney's Media Networks division generates 33.49 cents of profit for every dollar of sales, while its Parks and Resorts division generates 15.76 cents of profit per dollar of sales. The Media Networks division (0.71 investment turnover) is slightly more efficient than the Parks and Resorts division (0.66 investment turnover) in using assets. Top management can use profit margin and investment turnover to evaluate the performance of division managers. The measures can also aid management when considering further investment in its divisions. As a result of both a much higher profit margin and more rapid investment turnover, the Media Networks division's return on investment (23.78%) is much greater than that of the Parks and Resorts division (10.40%).

### Decision Maker

**Division Manager** You manage a division in a highly competitive industry. You will receive a cash bonus if your division achieves an ROI above 12%. Your division's profit margin is 7%, equal to the industry average, and your division's investment turnover is 1.5. What actions can you take to increase your chance of receiving the bonus? ■ [Answers follow the chapter's Summary.]

A division reports sales of \$50,000, income of \$2,000, and average invested assets of \$10,000. Compute the division's (a) profit margin, (b) investment turnover, and (c) return on investment.

**Solution**

- $\$2,000/\$50,000 = 4\%$
- $\$50,000/\$10,000 = 5$
- $\$2,000/\$10,000 = 20\%$

### NEED-TO-KNOW 24-2

Margin, Turnover, and Return

E 24-11, E 24-13

## Nonfinancial Performance Evaluation Measures

Evaluating performance solely on financial measures such as return on investment or residual income has limitations. For example, some investment center managers might forgo profitable opportunities to keep their return on investment high. Also, residual income is less useful when comparing investment centers of different size. And, both return on investment and residual income can encourage managers to focus too heavily on short-term financial goals.

**A3** Analyze investment centers using the balanced scorecard.

In response to these limitations, companies consider nonfinancial measures. For example, a delivery company such as **FedEx** might track the percentage of on-time deliveries. The percentage of defective tennis balls manufactured can be used to assess performance of **Penn**'s production managers. **Walmart**'s credit card screens commonly ask customers at checkout whether the cashier was friendly or the store was clean. This kind of information can help division managers run their divisions and help top management evaluate division manager performance. A popular measure that uses some nonfinancial indicators is the balanced scorecard.

**Balanced Scorecard** The **balanced scorecard** is a system of performance measures, including nonfinancial measures, used to assess company and division manager performance. The balanced scorecard requires managers to think of their company from four perspectives:

1. **Customer:** What do customers think of us?
2. **Internal processes:** Which of our operations are critical to meeting customer needs?
3. **Innovation and learning:** How can we improve?
4. **Financial:** What do our owners think of us?

**Point:** One survey indicates that nearly 60% of global companies use some form of a balanced scorecard.

The balanced scorecard collects information on several key performance indicators within each of the four perspectives. These key indicators vary across companies. Exhibit 24.21 lists some common performance indicators used in the balanced scorecard.

**EXHIBIT 24.21**

Balanced Scorecard Performance Indicators

			
<b>Customer</b>	<b>Internal Processes</b>	<b>Innovation/Learning</b>	<b>Financial</b>
<ul style="list-style-type: none"> <li>• Customer satisfaction rating</li> <li>• # of new customers acquired</li> <li>• % of on-time deliveries</li> <li>• % of sales from new products</li> <li>• Time to fill orders</li> <li>• % of sales returned</li> </ul>	<ul style="list-style-type: none"> <li>• Defect rates</li> <li>• Cycle time</li> <li>• Product costs</li> <li>• Labor hours per order</li> <li>• Production days without an accident</li> </ul>	<ul style="list-style-type: none"> <li>• Employee satisfaction</li> <li>• Employee turnover</li> <li>• \$ spent on training</li> <li>• # of new products</li> <li>• # of patents</li> <li>• \$ spent on research</li> </ul>	<ul style="list-style-type: none"> <li>• Net income</li> <li>• ROI</li> <li>• Sales growth</li> <li>• Cash flow</li> <li>• Residual income</li> <li>• Stock price</li> </ul>

After selecting key performance indicators, companies collect data on each indicator and compare actual amounts to expected amounts to assess performance. For example, a company might have a goal of filling 98% of customer orders within two hours. Balanced scorecard reports are often presented in graphs or tables that can be updated frequently. Such timely information aids division managers in their decisions and can be used by top management to evaluate division manager performance.

Exhibit 24.22 is an example of balanced scorecard reporting on the customer perspective for an Internet retailer. This scorecard reports that the retailer is getting 62% of its potential customers successfully through the checkout process, and that 2.2% of all orders are returned. The *color* of the arrows in the right-most column reveals whether the company is exceeding its goal (green), barely meeting the goal (yellow), or not meeting the goal (red). The *direction* of the arrows

**EXHIBIT 24.22**

Balanced Scorecard Reporting: Internet Retailer

Customer Perspective	Actual	Goal
Checkout success	62%	↑
Orders returned	2.2%	↔
Customer satisfaction rating	9.5	↑
Number of customer complaints	142	↓

reveals any trend in performance: an upward arrow indicates improvement, a downward arrow indicates declining performance, and an arrow pointing sideways indicates no change. A review of these arrows' color and direction suggests the retailer is meeting or exceeding its goals on checkout success, orders returned, and customer satisfaction. Further, checkout success and customer satisfaction are improving. The red arrow shows the company has received more customer complaints than was hoped for; however, the number of customer complaints is declining. A manager would combine this information with similar information on the internal process, innovation and learning, and financial perspectives to get an overall view of division performance.

## Decision Maker

**Center Manager** Your center's usual return on total assets is 19%. You are considering two new investments for your center. The first requires a \$250,000 average investment and is expected to yield annual net income of \$50,000. The second requires a \$1 million average investment with an expected annual net income of \$175,000. Do you pursue either? ■ [Answers follow the chapter's Summary.]

## GLOBAL VIEW

**L'Oréal** is an international cosmetics company incorporated in France. With multiple brands and operations in over 100 countries, the company uses concepts of departmental accounting and controllable costs to evaluate performance. For example, for 2012 the company reports the following for the major divisions in its cosmetics branch:

Division	Operating Profit (€ millions)	
Consumer products . . . . .	€2,051	
Professional products . . . . .	615	
Luxury products . . . . .	1,077	
Active cosmetics . . . . .	311	€4,054 ←
Nonallocated costs . . . . .		(577)
Cosmetics branch total . . . . .		<u>€3,477</u> ←

Similar to "Departmental contributions to overhead" in Exhibit 24.16

Similar to "Operating income" in Exhibit 24.16

For L'Oréal, nonallocated costs include costs that are not controllable by division managers, including fundamental research and development and costs of service operations like insurance and banking. Excluding noncontrollable costs enables L'Oréal to prepare more meaningful division performance evaluations.

**Sustainability and Accounting** Kraft's cream cheese-making process generates a lot of a by-product called whey. Kraft recently retrofitted a manufacturing plant to convert whey into energy. Here, a "digestion" system converts whey into a biogas, which is then used to create steam to power manufacturing machines. In this way, the company has converted a by-product into a source of sustainable energy and yielded cost savings. **United By Blue**, this chapter's feature company, uses recyclable packaging and eliminates as much plastic as possible from its supply chain. Although they add costs, company founder Brian Linton believes these sustainability efforts increase customer loyalty and sales.

## Cycle Time and Cycle Efficiency

## Decision Analysis

Manufacturing companies commonly use nonfinancial measures to evaluate the performance of their production processes. For example, as lean manufacturing practices help companies move toward just-in-time manufacturing, it is important for these companies to reduce the time to manufacture their products and to improve manufacturing efficiency. One metric that measures that time element is **cycle time (CT)**, which describes the time it takes to produce a product or service. It is defined in Exhibit 24.23.

$$\text{Cycle time} = \text{Process time} + \text{Inspection time} + \text{Move time} + \text{Wait time}$$

*Process time* is the time spent producing the product. *Inspection time* is the time spent inspecting (1) raw materials when received, (2) work in process while in production, and (3) finished goods prior to shipment. *Move time* is the time spent moving (1) raw materials from storage to production and (2) work in process

### A4

Compute cycle time and cycle efficiency, and explain their importance to production management.

### EXHIBIT 24.23

Cycle Time

from one factory location to another factory location. *Wait time* is the time that an order or job sits with no production applied to it. Wait time can be due to order delays, bottlenecks in production, or poor scheduling.

Process time is considered **value-added time**: it is the only activity in cycle time that adds value to the product from the customer's perspective. The other three time activities are considered **non-value-added time**: they add no value to the customer.

Companies strive to reduce non-value-added time to improve **cycle efficiency (CE)**, which is a measure of production efficiency. Cycle efficiency is the ratio of value-added time to total cycle time, as shown in Exhibit 24.24.

### EXHIBIT 24.24

Cycle Efficiency

$$\text{Cycle efficiency} = \frac{\text{Value-added time}}{\text{Cycle time}}$$

To illustrate, assume that Rocky Mountain Bikes receives and produces an order for 500 Tracker mountain bikes. Assume that it took the following times to produce this order.

In this case, cycle time is 6.0 days (1.8 + 0.5 + 0.7 + 3.0 days). Also, cycle efficiency is 0.3, or 30%, computed as 1.8 days divided by 6.0 days. This means that Rocky Mountain Bikes' value-added time (its process time, or time spent working on the product) is 30%. The other 70% is spent on non-value-added activities.

If a company has a CE of 1, it means that its time is spent entirely on value-added activities. If the CE is low, the company should evaluate its production process to see if it can identify ways to reduce non-value-added activities. The 30% CE for Rocky Mountain Bikes is low, and its management should look for ways to reduce non-value-added activities.

### NEED-TO-KNOW

#### COMPREHENSIVE

Management requests departmental income statements for Gamer's Haven, a computer store that has five departments. Three are operating departments (hardware, software, and repairs) and two are service departments (general office and purchasing).

	General Office	Purchasing	Hardware	Software	Repairs
Sales .....	—	—	\$960,000	\$600,000	\$840,000
Cost of goods sold .....	—	—	500,000	300,000	200,000
Direct expenses					
Payroll .....	\$60,000	\$45,000	80,000	25,000	325,000
Depreciation .....	6,000	7,200	33,000	4,200	9,600
Supplies .....	15,000	10,000	10,000	2,000	25,000

The departments incur several indirect expenses. To prepare departmental income statements, the indirect expenses must be allocated across the five departments. Then the expenses of the two service departments must be allocated to the three operating departments. Total cost amounts and the allocation bases for each indirect expense follow.

Indirect Expense	Total Cost	Allocation Basis
Rent .....	\$150,000	Square footage occupied
Utilities .....	50,000	Square footage occupied
Advertising .....	125,000	Dollars of sales
Insurance .....	30,000	Value of assets insured
Service departments		
General office .....	?	Number of employees
Purchasing .....	?	Dollars of cost of goods sold

The following additional information is needed for indirect expense allocations.

Department	Square Feet	Sales	Insured Assets	Employees	Cost of Goods Sold
General office . . . . .	500		\$ 60,000		
Purchasing . . . . .	500		72,000		
Hardware . . . . .	4,000	\$ 960,000	330,000	5	\$ 500,000
Software . . . . .	3,000	600,000	42,000	5	300,000
Repairs . . . . .	<u>2,000</u>	<u>840,000</u>	<u>96,000</u>	<u>10</u>	<u>200,000</u>
Totals . . . . .	<u>10,000</u>	<u>\$2,400,000</u>	<u>\$600,000</u>	<u>20</u>	<u>\$1,000,000</u>

**Required**

1. Prepare a departmental expense allocation spreadsheet for Gamer’s Haven.
2. Prepare a departmental income statement reporting net income for each operating department and for all operating departments combined.

**PLANNING THE SOLUTION**

- Set up and complete four tables to allocate the indirect expenses—one each for rent, utilities, advertising, and insurance.
- Allocate the departments’ indirect expenses using a spreadsheet like the one in Exhibit 24.6. Enter the given amounts of the direct expenses for each department. Then enter the allocated amounts of the indirect expenses that you computed.
- Complete two tables for allocating the general office and purchasing department costs to the three operating departments. Enter these amounts on the spreadsheet and determine the total expenses allocated to the three operating departments.
- Prepare departmental income statements like the one in Exhibit 24.15. Show sales, cost of goods sold, gross profit, individual expenses, and net income for each of the three operating departments and for the combined company.

**SOLUTION**

Allocations of the four indirect expenses across the five departments.

Rent	Square Feet	Percent of Total	Allocated Cost
General office . . . . .	500	5.0%	\$ 7,500
Purchasing . . . . .	500	5.0	7,500
Hardware . . . . .	4,000	40.0	60,000
Software . . . . .	3,000	30.0	45,000
Repairs . . . . .	<u>2,000</u>	<u>20.0</u>	<u>30,000</u>
Totals . . . . .	<u>10,000</u>	<u>100.0%</u>	<u>\$150,000</u>

Utilities	Square Feet	Percent of Total	Allocated Cost
General office . . . . .	500	5.0%	\$ 2,500
Purchasing . . . . .	500	5.0	2,500
Hardware . . . . .	4,000	40.0	20,000
Software . . . . .	3,000	30.0	15,000
Repairs . . . . .	<u>2,000</u>	<u>20.0</u>	<u>10,000</u>
Totals . . . . .	<u>10,000</u>	<u>100.0%</u>	<u>\$50,000</u>

Advertising	Sales Dollars	Percent of Total	Allocated Cost
Hardware . . . . .	\$ 960,000	40.0%	\$ 50,000
Software . . . . .	600,000	25.0	31,250
Repairs . . . . .	<u>840,000</u>	<u>35.0</u>	<u>43,750</u>
Totals . . . . .	<u>\$2,400,000</u>	<u>100.0%</u>	<u>\$125,000</u>

Insurance	Assets Insured	Percent of Total	Allocated Cost
General office . . . . .	\$ 60,000	10.0%	\$ 3,000
Purchasing . . . . .	72,000	12.0	3,600
Hardware . . . . .	330,000	55.0	16,500
Software . . . . .	42,000	7.0	2,100
Repairs . . . . .	<u>96,000</u>	<u>16.0</u>	<u>4,800</u>
Totals . . . . .	<u>\$600,000</u>	<u>100.0%</u>	<u>\$30,000</u>

## 1. Allocations of service department expenses to the three operating departments.

General Office Allocations to	Employees	Percent of Total	Allocated Cost	Purchasing Allocations to	Cost of Goods Sold	Percent of Total	Allocated Cost
Hardware .....	5	25.0%	\$23,500	Hardware .....	\$ 500,000	50.0%	\$37,900
Software .....	5	25.0	23,500	Software .....	300,000	30.0	22,740
Repairs .....	10	50.0	47,000	Repairs .....	200,000	20.0	15,160
Totals .....	20	100.0%	\$94,000	Totals .....	\$1,000,000	100.0%	\$75,800

GAMER'S HAVEN Departmental Expense Allocations For Year Ended December 31, 2015							
	Allocation Base	Expense Account Balance	General Office Dept.	Purchasing Dept.	Hardware Dept.	Software Dept.	Repairs Dept.
<b>Direct Expenses</b>							
Payroll .....		\$ 535,000	\$ 60,000	\$ 45,000	\$ 80,000	\$ 25,000	\$ 325,000
Depreciation .....		60,000	6,000	7,200	33,000	4,200	9,600

## APPENDIX

# Transfer Pricing

## 24A

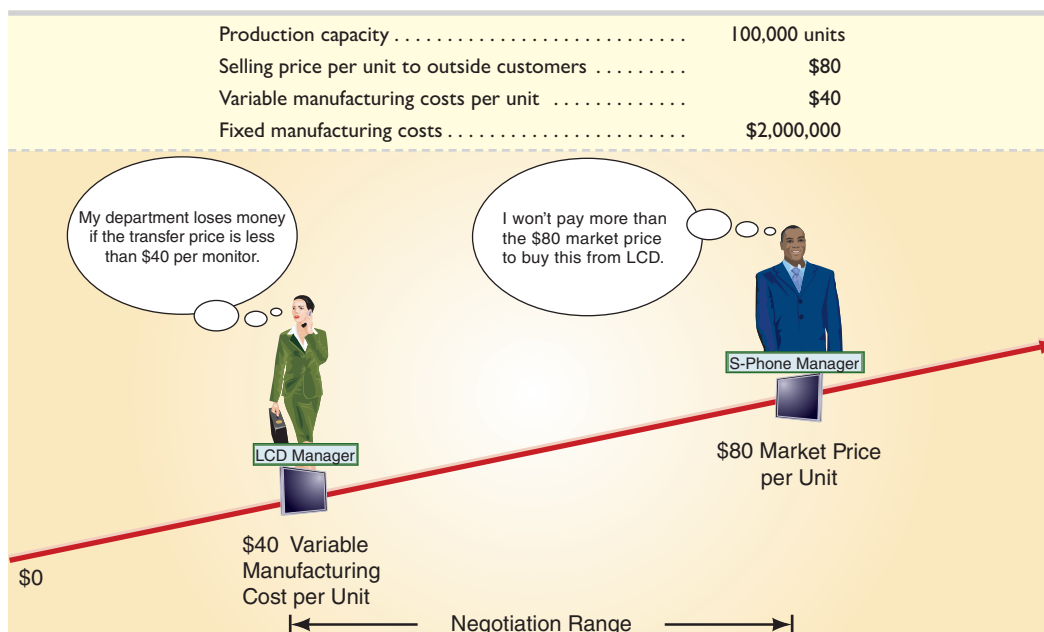

Divisions in decentralized companies sometimes do business with one another. For example, a separate division of **Harley-Davidson** manufactures its plastic and fiberglass parts used in the company's motorcycles. **Anheuser-Busch**'s metal container division makes cans and lids used in its brewing operations, and also sells cans and lids to soft-drink companies. A division of **Prince** produces strings used in tennis rackets made by Prince and other manufacturers. The price used to record transfers of goods across divisions of the same company is called the **transfer price**. Transfer prices can be used in cost, profit, and investment centers. Determining how to set transfer prices is the focus of this appendix.

In decentralized organizations, division managers have input on or decide transfer prices. Since these transfers are not with customers outside the company, the transfer price has no direct impact on the company's overall profits. However, transfer prices can impact performance evaluations and, if set incorrectly, lead to bad decisions.

**Alternative Transfer Prices** The top portion of Exhibit 24A.1 reports data on the LCD division of ZTel. That division manufactures liquid crystal display (LCD) touch-screen monitors for use in ZTel's S-Phone division's smartphones. The monitors can also be used in other products. The LCD division can sell its monitors to the S-Phone division as well as to buyers other than S-Phone. Likewise, the S-Phone division can purchase monitors from suppliers other than LCD.

**C2** Explain transfer pricing and methods to set transfer prices.

**Point:** Transfer pricing can impact company profits when divisions are located in countries with different tax rates; this is covered in advanced courses.

### EXHIBIT 24A.1

LCD Division  
Manufacturing  
Information—Monitors

The bottom portion of Exhibit 24A.1 reveals the range of transfer prices for transfers of monitors from LCD to S-Phone. As you can see, the transfer price can reasonably range from \$40 (the variable manufacturing cost per unit) to \$80 (the cost of buying the monitor from an outside supplier). The manager of LCD wants to report a divisional profit. Thus, this manager will not accept a transfer price less than \$40; a price less than \$40 would cause the division to lose money on each monitor transferred. The LCD manager will consider transfer prices of only \$40 or more. On the other hand, the S-Phone division manager also wants to report a divisional profit. Thus, this manager will not pay more than \$80 per monitor because similar monitors can be bought from outside suppliers at that price. The S-Phone manager will consider transfer prices of only \$80 or less.

As any transfer price between \$40 and \$80 per monitor is possible, how does ZTel determine the transfer price? The answer depends in part on whether the LCD division has excess capacity to manufacture monitors.

**No Excess Capacity** If the LCD division can sell every monitor it produces (100,000 units) at a market price of \$80 per monitor, LCD managers would not accept any transfer price less than \$80 per monitor. This is a **market-based transfer price**—one based on the market price of the good or service being transferred. Any transfer price less than \$80 would cause the LCD division managers to incur an unnecessary *opportunity cost* that would lower the division's income and hurt its managers' performance evaluation.

Typically, a division operating at full capacity will sell to external customers rather than sell internally. Still, the market-based transfer price of \$80 can be considered the maximum possible transfer price when there is excess capacity, which is the case we consider next.

**Excess Capacity** Now assume that the LCD division has excess capacity. For example, the LCD division might currently be producing only 80,000 units. Because LCD has \$2,000,000 of fixed manufacturing costs, both the LCD division and the top management of ZTel prefer that the S-Phone division purchases its monitors from LCD. For example, if S-Phone purchases its monitors from an outside supplier at the market price of \$80 each, LCD manufactures no units. Then, LCD reports a division loss equal to its fixed costs, and ZTel overall reports a lower net income as its costs are higher. Consequently, with excess capacity, LCD should accept any transfer price of \$40 per unit or greater, and S-Phone should purchase monitors from LCD. This will allow LCD to recover some (or all) of its fixed costs and increase ZTel's overall profits.

For example, if a transfer price of \$50 per monitor is used, the S-Phone manager is pleased to buy from LCD, since that price is below the market price of \$80. For each monitor transferred from LCD to S-Phone at \$50, the LCD division receives a *contribution margin* of \$10 (computed as \$50 transfer price less \$40 variable cost) to contribute toward recovering its fixed costs. This form of transfer pricing is called **cost-based transfer pricing**. Under this approach the transfer price might be based on variable costs, total costs, or variable costs plus a markup. Determining the transfer price under excess capacity is complex and is covered in advanced courses.

Transfer Pricing Approaches Used by Companies

**Additional Issues in Transfer Pricing** Several additional issues arise in determining transfer prices which include the following:

- **No market price exists.** Sometimes there is no market price for the product being transferred. The product might be a key component that requires additional conversion costs at the next stage and is not easily replicated by an outside company. For example, there is no market for a console for a Nissan Maxima and there is no substitute console Nissan can use in assembling a Maxima. In this case a market-based transfer price cannot be used.
- **Cost control.** To provide incentives for cost control, transfer prices might be based on standard, rather than actual costs. For example, if a transfer price of actual variable costs plus a markup of \$20 per unit is used in the case above, LCD has no incentive to control its costs.
- **Division managers' negotiation.** With excess capacity, division managers will often negotiate a transfer price that lies between the variable cost per unit and the market price per unit. In this case, the **negotiated transfer price** and resulting departmental performance reports reflect, in part, the negotiating skills of the respective division managers. This might not be best for overall company performance.
- **Nonfinancial factors.** Factors such as quality control, reduced lead times, and impact on employee morale can be important factors in determining transfer prices.

## APPENDIX

# 24B

## Joint Costs and Their Allocation

### C3

Describe allocation of joint costs across products.

Most manufacturing processes involve **joint costs**, which refer to costs incurred to produce or purchase two or more products at the same time. For example, a sawmill company incurs joint costs when it buys logs that it cuts into lumber as shown in Exhibit 24B.1. The joint costs include the logs (raw material) and their being cut (conversion) into boards classified as Clear, Select, No. 1 Common, No. 2 Common, No. 3 Common, and other types of lumber and by-products. After the logs are cut into boards, any further processing costs on the boards are not joint costs.

When a joint cost is incurred, a question arises as to whether to allocate it to different products resulting from it. The answer is that when management wishes to estimate the costs of individual products, joint costs are included and must be allocated to these joint products. However, when management needs information to help decide whether to sell a product at a certain point in the production process

or to process it further, the joint costs are ignored. (We study this sell-or-process-further decision in a later chapter.)

Financial statements prepared according to GAAP must assign joint costs to products. To do this, management must decide how to allocate joint costs across products benefiting from these costs. If some products are sold and others remain in inventory, allocating joint costs involves assigning costs to both cost of goods sold and ending inventory.

The two usual methods to allocate joint costs are the (1) *physical basis* and (2) *value basis*. The physical basis typically involves allocating a joint cost using physical characteristics such as the ratio of pounds, cubic feet, or gallons of each joint product to the total pounds, cubic feet, or gallons of all joint products flowing from the cost. This method is not preferred because the resulting cost allocations do not reflect the relative market values the joint cost generates. The preferred approach is the value basis, which allocates a joint cost in proportion to the sales value of the output produced by the process at the “split-off point”; see Exhibit 24B.1. The split-off point is the point at which separate products can be identified.

**EXHIBIT 24B.1**

Joint Products from Logs

**Physical Basis Allocation of Joint Costs** To illustrate the physical basis of allocating a joint cost, we consider a sawmill that bought logs for \$30,000. When cut, these logs produce 100,000 board feet of lumber in the grades and amounts shown in Exhibit 24B.2. The logs produce 20,000 board feet of No. 3 Common lumber, which is 20% of the total. With physical allocation, the No. 3 Common lumber is assigned 20% of the \$30,000 cost of the logs, or \$6,000 (\$30,000 × 20%). Because this low-grade lumber sells for \$4,000, this allocation gives a \$2,000 loss from its production and sale. The physical basis for allocating joint costs does not reflect the extra value flowing into some products or the inferior value flowing into others. That is, the portion of a log that produces Clear and Select grade lumber is worth more than the portion used to produce the three grades of common lumber, but the physical basis fails to reflect this.

Grade of Lumber	Board Feet Produced	Percent of Total	Allocated Cost	Sales Value	Gross Profit
Clear and Select . . . . .	10,000	10.0%	\$ 3,000	\$12,000	\$ 9,000
No. 1 Common . . . . .	30,000	30.0	9,000	18,000	9,000
No. 2 Common . . . . .	40,000	40.0	12,000	16,000	4,000
No. 3 Common . . . . .	20,000	20.0	6,000	4,000	(2,000)
Totals . . . . .	<u>100,000</u>	<u>100.0%</u>	<u>\$30,000</u>	<u>\$50,000</u>	<u>\$20,000</u>

**EXHIBIT 24B.2**

Allocating Joint Costs on a Physical Basis

**Value Basis Allocation of Joint Costs** Exhibit 24B.3 illustrates the value basis method of allocation. It determines the percents of the total costs allocated to each grade by the ratio of each grade’s sales value at the split-off point to the total sales value of \$50,000 (sales value is the unit selling price multiplied by the number of units produced). The Clear and Select lumber grades receive 24% of the total cost (\$12,000/\$50,000) instead of the 10% portion using a physical basis. The No. 3 Common lumber receives only 8% of the total cost, or \$2,400, which is much less than the \$6,000 assigned to it using the physical basis.

Grade of Lumber	Sales Value	Percent of Total	Allocated Cost	Gross Profit
Clear and Select . . . . .	\$12,000	24.0%	\$ 7,200	\$ 4,800
No. 1 Common . . . . .	18,000	36.0	10,800	7,200
No. 2 Common . . . . .	16,000	32.0	9,600	6,400
No. 3 Common . . . . .	4,000	8.0	2,400	1,600
Totals . . . . .	<u>\$50,000</u>	<u>100.0%</u>	<u>\$30,000</u>	<u>\$20,000</u>

**EXHIBIT 24B.3**

Allocating Joint Costs on a Value Basis

An outcome of value basis allocation is that *each* grade produces exactly the same 40% gross profit at the split-off point. This 40% rate equals the gross profit rate from selling all the lumber made from the \$30,000 logs for a combined price of \$50,000. It is this closer matching of cost and revenues that makes the value basis allocation of joint costs the preferred method.

**Example:** Refer to Exhibit 24B.3. If the sales value of Clear and Select lumber is changed to \$10,000, what is the revised ratio of the market value of No. 1 Common to the total? Answer: \$18,000/\$48,000 = 37.5%

# Summary

- C1 Distinguish between direct and indirect expenses and identify bases for allocating indirect expenses to departments.** Direct expenses are traced to a specific department and are incurred for the sole benefit of that department. Indirect expenses benefit more than one department. Indirect expenses are allocated to departments when computing departmental net income. Ideally, we allocate indirect expenses by using a cause-effect relation for the allocation base. When a cause-effect relation is not identifiable, each indirect expense is allocated on a basis reflecting the relative benefit received by each department.
- C2 Explain transfer pricing and methods to set transfer prices.** Transfer prices are used to record transfers of items between divisions of the same company. Transfer prices can be based on costs or market prices, or can be negotiated by division managers.
- C3 Describe allocation of joint costs across products.** A joint cost refers to costs incurred to produce or purchase two or more products at the same time. When income statements are prepared, joint costs are usually allocated to the resulting joint products using either a physical or value basis.
- A1 Analyze investment centers using return on investment and residual income.** A financial measure often used to evaluate an investment center manager is the *return on investment*, also called *return on assets*. This measure is computed as the center's income divided by the center's average total assets. Residual income, computed as investment center income minus a target income is an alternative financial measure of investment center performance.
- A2 Analyze investment centers using profit margin and investment turnover.** Return on investment can also be computed as profit margin times investment turnover. Profit margin (equal to income/sales) measures the income earned per dollar of sales, and investment turnover (equal to sales/assets) measures how efficiently a division uses its assets.
- A3 Analyze investment centers using the balanced scorecard.** A balanced scorecard uses a combination of financial and nonfinancial measures to evaluate performance. Customer, internal process, and innovation and learning are the three primary perspectives of nonfinancial measures used in balanced scorecards.

**A4 Compute cycle time and cycle efficiency, and explain their importance to production management.** It is important for companies to reduce the time to produce their products and to improve manufacturing efficiency. One measure of that time is cycle time (CT), defined as Process time + Inspection time + Move time + Wait time. Process time is value-added time; the others are non-value-added time. Cycle efficiency (CE) is the ratio of value-added time to total cycle time. If CE is low, management should evaluate its production process to see if it can reduce non-value-added activities.

- P1 Prepare a responsibility accounting report using controllable costs.** Responsibility accounting systems provide information for evaluating the performance of department managers. A responsibility accounting system's performance reports for evaluating department managers should include only the expenses (and revenues) that each manager controls.
- P2 Allocate indirect expenses to departments.** Indirect expenses include items like depreciation, rent, advertising, and other expenses that cannot be assigned directly to departments. Indirect expenses are recorded in company accounts, an allocation base is identified for each expense, and costs are allocated to departments. Departmental expense allocation spreadsheets are often used in allocating indirect expenses to departments.
- P3 Prepare departmental income statements and contribution reports.** Each profit center (department) is assigned its expenses to yield its own income statement. These costs include its direct expenses and its share of indirect expenses. The departmental income statement lists its revenues and costs of goods sold to determine gross profit. Its operating expenses (direct expenses and its indirect expenses allocated to the department) are deducted from gross profit to yield departmental net income. The departmental contribution report is similar to the departmental income statement in terms of computing the gross profit for each department. Then the direct operating expenses for each department are deducted from gross profit to determine the contribution generated by each department. Indirect operating expenses are deducted *in total* from the company's combined contribution.

## Guidance Answers to Decision Maker

**Division Manager** Your division's ROI without further action is 10.5% (equal to  $7\% \times 1.5$ ). In a highly competitive industry, it is difficult to increase profit margins by raising prices. Your division might be better able to control its costs to increase its profit margin. In addition, you might engage in a marketing program to increase sales without increasing your division's invested assets. Investment turnover and thus ROI will increase if the marketing campaign attracts customers.

**Center Manager** We must first realize that the two investment opportunities are not comparable on the basis of absolute dollars of

income or on assets. For instance, the second investment provides a higher income in absolute dollars but requires a higher investment. Accordingly, we need to compute return on investment for each alternative: (1)  $\$50,000 \div \$250,000 = 20\%$ , and (2)  $\$175,000 \div \$1 \text{ million} = 17.5\%$ . Alternative 1 has the higher return and is preferred over alternative 2. Do you pursue one, both, or neither? Because alternative 1's return is higher than the center's usual return of 19%, it should be pursued, assuming its risks are acceptable. Also, since alternative 1 requires a small investment, top management is likely to be more agreeable to pursuing it. Alternative 2's return is lower than the usual 19% and is not likely to be acceptable.

## Key Terms

Balanced scorecard	Indirect expenses	Responsibility accounting budget
Controllable costs	Investment center	Responsibility accounting performance report
Cost-based transfer pricing	Investment turnover	Responsibility accounting system
Cost center	Joint cost	Return on investment
Cycle efficiency (CE)	Market-based transfer price	Transfer price
Cycle time (CT)	Negotiated transfer price	Uncontrollable costs
Decentralized organization	Non-value-added time	Value-added time
Departmental contribution to overhead	Profit center	
Departmental income statements	Profit margin	
Direct expenses	Residual income	

## Multiple Choice Quiz

Answers at end of chapter

- A retailer has three departments—housewares, appliances, and clothing—and buys advertising that benefits all departments. Advertising expense is \$150,000 for the year, and departmental sales for the year follow: housewares, \$356,250; appliances, \$641,250; and clothing, \$427,500. How much advertising expense is allocated to appliances if allocation is based on departmental sales?
  - \$37,500
  - \$67,500
  - \$45,000
  - \$150,000
  - \$641,250
- Indirect expenses
  - Cannot be readily traced to one department.
  - Are allocated to departments based on the relative benefit each department receives.
  - Are the same as uncontrollable expenses.
  - a, b, and c* above are all true.
  - a and b* above are true.
- A division reports the information below. What is the division's investment (asset) turnover?
 

Sales . . . . .	\$500,000
Income . . . . .	75,000
Average assets . . . . .	200,000

- 37.5%
- 15
- 2.5
- 2.67
- 4

- A company operates three retail departments as profit centers, and the following information is available for each. Which department has the largest dollar amount of departmental contribution to overhead, and what is the dollar amount contributed?
 

Department	Sales	Cost of Goods Sold	Direct Expenses	Allocated Indirect Expenses
X . . . . .	\$500,000	\$350,000	\$50,000	\$40,000
Y . . . . .	200,000	75,000	20,000	50,000
Z . . . . .	350,000	150,000	75,000	10,000

- Department Y, \$55,000
- Department Z, \$125,000
- Department X, \$500,000
- Department Z, \$200,000
- Department X, \$60,000

- Using the data in question 4, Department X's contribution to overhead as a percentage of sales is
  - 20%
  - 30%
  - 12%
  - 48%
  - 32%

<sup>A(B)</sup> Superscript letter A (B) denotes assignments based on Appendix 24A (24B).

 Icon denotes assignments that involve decision making.

## Discussion Questions

- Why are many companies divided into departments?
- What is the difference between operating departments and service departments?
-  What are controllable costs?
- Controllable and uncontrollable costs must be identified with a particular \_\_\_\_\_ and a definite \_\_\_\_\_ period.
-  Why should managers be closely involved in preparing their responsibility accounting budgets?
-  What are two main goals in managerial accounting for reporting on and analyzing departments?
-  Is it possible to evaluate a cost center's profitability? Explain.

8. What is the difference between direct and indirect expenses?
9.  Suggest a reasonable basis for allocating each of the following indirect expenses to departments: (a) salary of a supervisor who manages several departments, (b) rent, (c) heat, (d) electricity for lighting, (e) janitorial services, (f) advertising, (g) expired insurance on equipment, and (h) property taxes on equipment.
10. **Samsung** has many departments. How is a department's contribution to overhead measured? **Samsung**
11.  **Google** aims to give its managers timely cost reports. In responsibility accounting, who receives timely cost reports and specific cost information? Explain. **GOOGLE**
- 12<sup>A</sup> What is a transfer price? Under what conditions is a market-based transfer price most likely to be used?
- 13<sup>B</sup> What is a joint cost? How are joint costs usually allocated among the products produced from them?
- 14<sup>B</sup>  Give two examples of products with joint costs.
15.  Each **Apple** retail store has several departments. Why is it useful for its management to (a) collect accounting information about each department and (b) treat each department as a profit center? **APPLE**
16.  **Apple** delivers its products to locations around the world. List three controllable and three uncontrollable costs for its delivery department. **APPLE**
17.  Define and describe *cycle time* and identify the components of cycle time.
18.  Explain the difference between value-added time and non-value-added time.
19. Define and describe *cycle efficiency*.
20.  Can management of a company such as **Samsung** use cycle time and cycle efficiency as useful measures of performance? Explain. **Samsung**

**QUICK STUDY**

Macee Department Store has three departments, and it conducts advertising campaigns that benefit all departments. Advertising costs are \$100,000 this year, and departmental sales for this year follow. How much advertising cost is allocated to each department if the allocation is based on departmental sales?

**QS 24-1**

Allocating costs to departments

P1

Department	Sales
Department 1 . . . . .	\$220,000
Department 2 . . . . .	400,000
Department 3 . . . . .	180,000

**QS 24-2**

Allocating costs to departments

P1

Mervon Company has two operating departments: mixing and bottling. Mixing has 300 employees and occupies 22,000 square feet. Bottling has 200 employees and occupies 18,000 square feet. Indirect factory costs for the current period follow: administrative, \$160,000; and maintenance, \$200,000. Administrative costs are allocated to operating departments based on the number of workers. Determine the administrative costs allocated to each operating department.

**QS 24-3**

Allocating costs to departments P1

Mervon Company has two operating departments: mixing and bottling. Mixing has 300 employees and occupies 22,000 square feet. Bottling has 200 employees and occupies 18,000 square feet. Indirect factory costs for the current period follow: administrative, \$160,000; and maintenance, \$200,000. If the maintenance costs are allocated to operating departments based on square footage, determine the amount of maintenance costs allocated to each operating department.

**QS 24-4**

Allocation and measurement terms

C1

In each blank next to the following terms, place the identifying letter of its best description.

- |   |  |
|---|--|
| 1. _____ Cost center                      | <b>A.</b> Incurs costs without directly yielding revenues.   |
| 2. _____ Investment center                | <b>B.</b> Provides information used to evaluate the performance of a department.                         |
| 3. _____ Departmental accounting system   | <b>C.</b> Holds manager responsible for revenues, costs, and investments.                                |
| 4. _____ Operating department             | <b>D.</b> Engages directly in manufacturing or in making sales directly to customers.                    |
| 5. _____ Profit center                    | <b>E.</b> Does not directly manufacture products but contributes to profitability of the entire company. |
| 6. _____ Responsibility accounting system | <b>F.</b> Incurs costs and also generates revenues.  |
| 7. _____ Service department               | <b>G.</b> Provides information used to evaluate the performance of a department manager.                 |

For each of the following types of indirect expenses and service department expenses, identify one allocation basis that could be used to distribute it to the departments indicated.

- \_\_\_\_\_ 1. Computer service expenses of production scheduling for operating departments.
- \_\_\_\_\_ 2. General office department expenses of the operating departments.
- \_\_\_\_\_ 3. Maintenance department expenses of the operating departments.
- \_\_\_\_\_ 4. Electric utility expenses of all departments.

**QS 24-5**

Basis for cost allocation

In each blank next to the following terms, place the identifying letter of its best description.

- \_\_\_\_\_ 1. Indirect expenses                    **A.** Costs not within a manager's control or influence
- \_\_\_\_\_ 2. Controllable costs                **B.** Costs that can be readily traced to a department
- \_\_\_\_\_ 3. Direct expenses                    **C.** Cost that a manager has the ability to affect
- \_\_\_\_\_ 4. Uncontrollable costs            **D.** Costs incurred for the joint benefit of more than one department

**QS 24-6**

Responsibility accounting terms

Car Mart pays \$130,000 rent each year for its two-story building. The space in this building is occupied by five departments as specified here.

Paint department	1,440 square feet of first-floor space
Engine department	3,360 square feet of first-floor space
Window department	2,016 square feet of second-floor space
Electrical department	960 square feet of second-floor space
Accessory department	1,824 square feet of second-floor space

**QS 24-7**

Rent expense allocated to departments

The company allocates 65% of total rent expense to the first floor and 35% to the second floor, and then allocates rent expense for each floor to the departments occupying that floor on the basis of space occupied. Determine the rent expense to be allocated to each department. (Round percents to the nearest one-tenth and dollar amounts to the nearest whole dollar.)

**Check** Allocated to paint dept., \$25,350

Use the information in the following table to compute each department's contribution to overhead (both in dollars and as a percent). Which department contributes the largest dollar amount to total overhead? Which contributes the highest percent (as a percent of sales)? Round percents to one decimal.

	Dept. A	Dept. B	Dept. C
Sales	\$53,000	\$180,000	\$84,000
Cost of goods sold	34,185	103,700	49,560
Gross profit	18,815	76,300	34,440
Total direct expenses	3,660	37,060	7,386
Contribution to overhead	\$	\$	\$
Contribution percent (of sales)	%	%	%

**QS 24-8**

Departmental contribution to overhead

Compute return on investment for each of the divisions below (each is an investment center). Comment on the relative performance of each investment center.

Investment Center	Net Income	Average Assets	Return on Investment
Cameras and camcorders	\$4,500,000	\$20,000,000	_____
Phones and communications	1,500,000	12,500,000	_____
Computers and accessories	800,000	10,000,000	_____

**QS 24-9**

Computing return on investment

Refer to information in QS 24-9. Assume a target income of 12% of average invested assets. Compute residual income for each division.

**QS 24-10**

Computing residual income **A1**

**QS 24-11**

Performance measures

Fill in the blanks in the schedule below for two separate investment centers A and B. Round answers to the nearest whole percent.

A1 A2

	Investment Center	
	A	B
Sales .....	\$ _____	\$10,400,000
Net income .....	\$ 352,000	\$ _____
Average invested assets .....	\$1,400,000	_____
Profit margin .....	8%	_____%
Investment turnover .....	_____	1.5
Return on investment .....	_____%	12%

**QS 24-12**

Computing profit margin and investment turnover

A company's shipping division (an investment center) has sales of \$2,420,000, net income of \$516,000, and average invested assets of \$2,250,000. Compute the division's profit margin and investment turnover.

A2

**QS 24-13**

Performance measures—balanced scorecard

Classify each of the performance measures below into the most likely balanced scorecard perspective it relates to. Label your answers using *C* (customer), *P* (internal process), *I* (innovation and growth), or *F* (financial).

A3

- \_\_\_\_\_ 1. Customer wait time
- \_\_\_\_\_ 2. Number of days of employee absences
- \_\_\_\_\_ 3. Profit margin
- \_\_\_\_\_ 4. Number of new products introduced
- \_\_\_\_\_ 5. Change in market share
- \_\_\_\_\_ 6. Employee training sessions attended
- \_\_\_\_\_ 7. Length of time raw materials are in inventory
- \_\_\_\_\_ 8. Customer satisfaction index

**QS 24-14**

Performance measures—balanced scorecard

**Walt Disney** reports the following information for its two Parks and Resorts divisions.

A3

	U.S.		International	
	Current year	Prior year	Current year	Prior year
	Hotel occupancy rates .....	81%	82%	85%

Assume Walt Disney uses a balanced scorecard and sets a target of 85% occupancy in its resorts. Using Exhibit 24.22 as a guide, show how the company's performance on hotel occupancy would appear on a balanced scorecard report.

**QS 24-15**

Manufacturing cycle time and efficiency

Compute and interpret (a) manufacturing cycle time and (b) manufacturing cycle efficiency using the following information from a manufacturing company.

A4

Process time .....	15 minutes
Inspection time .....	2 minutes
Move time .....	6.4 minutes
Wait time .....	36.6 minutes

**QS 24-16<sup>A</sup>**

Determining transfer prices without excess capacity C2

The windshield division of Fast Car Co. makes windshields for use in Fast Car's assembly division. The windshield division incurs variable costs of \$200 per windshield and has capacity to make 500,000 windshields per year. The market price is \$450 per windshield. The windshield division incurs total fixed costs of \$3,000,000 per year. If the windshield division is operating at full capacity, what transfer price should be used on transfers between the windshield and assembly divisions? Explain.

The windshield division of Fast Car Co. makes windshields for use in Fast Car’s assembly division. The windshield division incurs variable costs of \$200 per windshield and has capacity to make 500,000 windshields per year. The market price is \$450 per windshield. The windshield division incurs total fixed costs of \$3,000,000 per year. If the windshield division has excess capacity, what is the range of possible transfer prices that could be used on transfers between the windshield and assembly divisions? Explain.

**QS 24-17<sup>A</sup>**  
Determining transfer prices with excess capacity **C2**

A company purchases a 10,020 square-foot commercial building for \$325,000 and spends an additional \$50,000 to divide the space into two separate rental units and prepare it for rent. Unit A, which has the desirable location on the corner and contains 3,340 square feet, will be rented for \$1.00 per square foot. Unit B contains 6,680 square feet and will be rented for \$0.75 per square foot. How much of the joint cost should be assigned to Unit B using the value basis of allocation?

**QS 24-18<sup>B</sup>**  
Joint cost allocation **C3**

For a recent year **L’Oréal** reported operating profit of €3,385 (in millions) for its cosmetics division. Total assets were €12,888 (in millions) at the beginning of the year and €13,099 (in millions) at the end of the year. Compute return on investment for the year. State your answer as a percent, rounded to one decimal.

**QS 24-19**  
Return on investment **A1** 

Marvin Dinardo manages an auto dealership’s service department. Costs and expenses for a recent quarter for his department follows. List the controllable costs that would appear on a responsibility accounting report for the service department.

Costs and expenses	
Cost of parts sold . . . . .	\$30,000
Building depreciation (allocated) . . . . .	9,300
Manager’s salary . . . . .	12,000
Supplies . . . . .	15,900
Utilities (allocated) . . . . .	4,400
Wages . . . . .	16,000

**EXERCISES**

**Exercise 24-1**  
Responsibility accounting report **P1** 

Marathon Running Shop has two service departments (advertising and administrative) and two operating departments (shoes and clothing). During 2015, the departments had the following direct expenses and occupied the following amount of floor space.

Department	Direct Expenses	Square Feet
Advertising . . . . .	\$ 18,000	1,120
Administrative . . . . .	25,000	1,400
Shoes . . . . .	103,000	7,140
Clothing . . . . .	15,000	4,340

**Exercise 24-2**  
Departmental expense allocation-spreadsheet **P2**

The advertising department developed and distributed 120 advertisements during the year. Of these, 90 promoted shoes and 30 promoted clothing. The store sold \$350,000 of merchandise during the year. Of this amount, \$273,000 is from the shoes department, and \$77,000 is from the clothing department. The utilities expense of \$64,000 is an indirect expense to all departments. Prepare a departmental expense allocation spreadsheet for Marathon Running Shop. The spreadsheet should assign (1) direct expenses to each of the four departments, (2) the \$64,000 of utilities expense to the four departments on the basis of floor space occupied, (3) the advertising department’s expenses to the two operating departments on the basis of the number of ads placed that promoted a department’s products, and (4) the administrative department’s expenses to the two operating departments based on the amount of sales. Provide supporting computations for the expense allocations.

**Check** Total expenses allocated to shoes dept., \$177,472

The following is a partially completed lower section of a departmental expense allocation spreadsheet for Cozy Bookstore. It reports the total amounts of direct and indirect expenses allocated to its five departments. Complete the spreadsheet by allocating the expenses of the two service departments (advertising and purchasing) to the three operating departments.

**Exercise 24-3**  
Service department expenses allocated to operating departments **P2**

	A	B	C	D	E	F	G
1	<b>Allocation of Expenses to Departments</b>						
2		<b>Expense</b>					
3		<b>Account</b>	<b>Advertising</b>	<b>Purchasing</b>	<b>Books</b>	<b>Magazines</b>	<b>Newspapers</b>
4	<b>Allocation Base</b>	<b>Balance</b>	<b>Dept.</b>	<b>Dept.</b>	<b>Dept.</b>	<b>Dept.</b>	<b>Dept.</b>
5	Total department expenses.....	<u>\$698,000</u>	<u>\$24,000</u>	<u>\$34,000</u>	<u>\$425,000</u>	<u>\$90,000</u>	<u>\$125,000</u>
6	<b>Service department expenses</b>						
7	Advertising department..... Sales		?		?	?	?
8	Purchasing department..... Purch. orders			?	?	?	?
9	Total expenses allocated to						
10	operating departments.....	<u>?</u>	<u>\$ 0</u>	<u>\$ 0</u>	<u>?</u>	<u>?</u>	<u>?</u>

Advertising and purchasing department expenses are allocated to operating departments on the basis of dollar sales and purchase orders, respectively. Information about the allocation bases for the three operating departments follows.

Department	Sales	Purchase Orders
Books .....	\$495,000	516
Magazines .....	198,000	360
Newspapers .....	<u>207,000</u>	<u>324</u>
Total .....	<u>\$900,000</u>	<u>1,200</u>

**Check** Total expenses allocated to books dept., \$452,820

**Exercise 24-4**

Indirect payroll expense allocated to departments

P2

Jessica Porter works in both the jewelry department and the hosiery department of a retail store. Porter assists customers in both departments and arranges and stocks merchandise in both departments. The store allocates Porter’s \$30,000 annual wages between the two departments based on a sample of the time worked in the two departments. The sample is obtained from a diary of hours worked that Porter kept in a randomly chosen two-week period. The diary showed the following hours and activities spent in the two departments. Allocate Porter’s annual wages between the two departments.

Selling in jewelry department .....	51 hours
Arranging and stocking merchandise in jewelry department .....	6 hours
Selling in hosiery department .....	12 hours
Arranging and stocking merchandise in hosiery department .....	7 hours
Idle time spent waiting for a customer to enter one of the selling departments .....	4 hours

**Check** Assign \$7,500 to hosiery

**Exercise 24-5**

Departmental expense allocations

P2

Woh Che Co. has four departments: materials, personnel, manufacturing, and packaging. In a recent month, the four departments incurred three shared indirect expenses. The amounts of these indirect expenses and the bases used to allocate them follow.

Indirect Expense	Cost	Allocation Base
Supervision .....	\$ 82,500	Number of employees
Utilities .....	50,000	Square feet occupied
Insurance .....	<u>22,500</u>	Value of assets in use
Total .....	<u>\$155,000</u>	

Departmental data for the company’s recent reporting period follow.

Department	Employees	Square Feet	Asset Values
Materials .....	27	25,000	\$ 6,000
Personnel .....	9	5,000	1,200
Manufacturing .....	63	55,000	37,800
Packaging .....	<u>51</u>	<u>15,000</u>	<u>15,000</u>
Total .....	<u>150</u>	<u>100,000</u>	<u>\$60,000</u>

1. Use this information to allocate each of the three indirect expenses across the four departments.
2. Prepare a summary table that reports the indirect expenses assigned to each of the four departments.

**Check** (2) Total of \$29,600 assigned to materials dept.

Below are departmental income statements for a guitar manufacturer. The manufacturer is considering dropping its electric guitar department since it has a net loss. The company classifies advertising, rent, and utilities expenses as indirect.

**Exercise 24-6**  
Departmental contribution report  
**P3**

WHOLESALE GUITARS Departmental Income Statements For Year Ended December 31, 2015		
	Acoustic	Electric
Sales .....	\$112,500	\$105,500
Cost of goods sold .....	<u>55,675</u>	<u>66,750</u>
Gross profit .....	56,825	38,750
Operating expenses		
Advertising expense .....	8,075	6,250
Depreciation expense—equipment .....	10,150	9,000
Salaries expense .....	17,300	13,500
Supplies expense .....	2,030	1,700
Rent expense .....	6,105	5,950
Utilities expense .....	<u>3,045</u>	<u>2,550</u>
Total operating expenses .....	<u>46,705</u>	<u>38,950</u>
<b>Net income (loss) .....</b>	<b><u>\$ 10,120</u></b>	<b><u>(\$200)</u></b>

1. Prepare a departmental contribution report that shows each department’s contribution to overhead.
2. Based on contribution to overhead, should the electric guitar department be eliminated?

Jansen Company reports the following for its ski department for the year 2015. All of its costs are direct, except as noted.

**Exercise 24-7**  
Departmental income statement and contribution to overhead  
**P3**

Sales .....	\$605,000
Cost of goods sold .....	425,000
Salaries .....	112,000 (\$15,000 is indirect)
Utilities .....	14,000 (\$3,000 is indirect)
Depreciation .....	42,000 (\$10,000 is indirect)
Office expenses .....	20,000 (all indirect)

Prepare a (1) departmental income statement for 2015 and (2) departmental contribution to overhead report for 2015. (3) Based on these two performance reports, should Jansen eliminate the ski department?

You must prepare a return on investment analysis for the regional manager of Fast & Great Burgers. This growing chain is trying to decide which outlet of two alternatives to open. The first location (A) requires a \$1,000,000 investment and is expected to yield annual net income of \$160,000. The second location (B) requires a \$600,000 investment and is expected to yield annual net income of \$108,000. Compute the return on investment for each Fast & Great Burgers alternative and then make your recommendation in a half-page memorandum to the regional manager. (The chain currently generates an 18% return on total assets.)

**Exercise 24-8**  
Investment center analysis **A1** 

Megamart, a retailer of consumer goods, provides the following information on two of its departments (each considered an investment center).

**Exercise 24-9**  
Computing return on investment and residual income; investing decision  
**A1**

Investment Center	Sales	Income	Average Invested Assets
Electronics .....	\$40,000,000	\$2,880,000	\$16,000,000
Sporting goods .....	20,000,000	2,040,000	12,000,000

1. Compute return on investment for each department. Using return on investment, which department is most efficient at using assets to generate returns for the company?
2. Assume a target income level of 12% of average invested assets. Compute residual income for each department. Which department generated the most residual income for the company?
3. Assume the electronics department is presented with a new investment opportunity that will yield a 15% return on investment. Should the new investment opportunity be accepted? Explain.

**Exercise 24-10**

Computing margin and turnover; department efficiency **A2**

Refer to information in Exercise 24-9. Compute profit margin and investment turnover for each department. Which department generates the most net income per dollar of sales? Which department is most efficient at generating sales from average invested assets?

**Exercise 24-11**

Return on investment **A1 A2**

**Kraft Foods Group** reports the following for two of its divisions for a recent year. All numbers are in millions of dollars.

(\$ millions)	Beverage Division	Cheese Division
Invested assets, beginning . . . . .	\$2,662	\$4,455
Invested assets, ending . . . . .	2,593	4,400
Sales . . . . .	2,681	3,925
Operating income . . . . .	349	634

For each division, compute (1) return on investment, (2) profit margin, and (3) investment turnover for the year. Round answers to two decimal places.

**Exercise 24-12**

Residual income **A1**

Refer to the information in Exercise 24-11. Assume that each of the company's divisions has a required rate of return of 7%. Compute residual income for each division.

**Exercise 24-13**

Profit margin **A2**

**Apple Inc.** reports the following for three of its geographic segments for a recent year. All numbers are in millions of dollars.

(\$ millions)	Americas	Europe	China
Operating income . . . . .	\$22,817	\$13,025	\$ 8,541
Sales . . . . .	62,739	37,883	25,417

Compute profit margin for each division. Express answers as percentages, rounded to one decimal place.

**Exercise 24-14**

Return on investment **A1 A2**

ZNet Co. is a web-based retail company. The company reports the following for 2015.

Sales . . . . .	\$ 5,000,000
Operating income . . . . .	1,000,000
Average invested assets . . . . .	12,500,000

The company's CEO believes that sales for 2016 will increase by 20%, and both profit margin (%) and the level of average invested assets will be the same as for 2015.

1. Compute return on investment for 2015.
2. Compute profit margin for 2015.
3. If the CEO's forecast is correct, what will return on investment equal for 2016?
4. If the CEO's forecast is correct, what will investment turnover equal for 2016?

USA Airlines uses the following performance measures. Classify each of the performance measures below into the most likely balanced scorecard perspective it relates to. Label your answers using *C* (customer), *P* (internal process), *I* (innovation and growth), or *F* (financial).

- \_\_\_\_\_ 1. Cash flow from operations
- \_\_\_\_\_ 2. Number of reports of mishandled or lost baggage
- \_\_\_\_\_ 3. Percentage of on-time departures
- \_\_\_\_\_ 4. On-time flight percentage
- \_\_\_\_\_ 5. Percentage of ground crew trained
- \_\_\_\_\_ 6. Return on investment
- \_\_\_\_\_ 7. Market value
- \_\_\_\_\_ 8. Accidents or safety incidents per mile flown
- \_\_\_\_\_ 9. Customer complaints
- \_\_\_\_\_ 10. Flight attendant training sessions attended
- \_\_\_\_\_ 11. Time airplane is on ground between flights
- \_\_\_\_\_ 12. Airplane miles per gallon of fuel
- \_\_\_\_\_ 13. Revenue per seat
- \_\_\_\_\_ 14. Cost of leasing airplanes

**Exercise 24-15**  
Performance measures—  
balanced scorecard  
**A3**

Oakwood Company produces maple bookcases to customer order. It received an order from a customer to produce 5,000 bookcases. The following information is available for the production of the bookcases.

Process time . . . . .	6.0 days	Move time . . . . .	3.2 days
Inspection time . . . . .	0.8 days	Wait time . . . . .	5.0 days

1. Compute the company's manufacturing cycle time.
2. Compute the company's manufacturing cycle efficiency. Interpret your answer.
3. Oakwood believes it can reduce move time by 1.2 days and wait time by 2.8 days by adopting lean manufacturing techniques. Compute the company's manufacturing cycle efficiency assuming the company's predictions are correct.

**Exercise 24-16**  
Manufacturing cycle time  
and efficiency  
**A4** 

**Check** (2) Manufacturing  
cycle efficiency, 0.40

Best Ink produces ink-jet printers for personal computers. It received an order for 500 printers from a customer. The following information is available for this order.

Process time . . . . .	16.0 hours	Move time . . . . .	9.0 hours
Inspection time . . . . .	3.5 hours	Wait time . . . . .	21.5 hours

1. Compute the company's manufacturing cycle time.
2. Compute the company's manufacturing cycle efficiency. Interpret your answer.
3. Assume that Best Ink wishes to increase its manufacturing cycle efficiency to 0.80. What are some ways that it can accomplish this?

**Exercise 24-17**  
Manufacturing cycle time  
and efficiency  
**A4** 

The trailer division of Baxter Bicycles makes bike trailers that attach to bicycles and can carry children or cargo. The trailers have a retail price of \$200 each. Each trailer incurs \$80 of variable manufacturing costs. The trailer division has capacity for 40,000 trailers per year and incurs fixed costs of \$1,000,000 per year.

1. Assume the assembly division of Baxter Bicycles wants to buy 15,000 trailers per year from the trailer division. If the trailer division can sell all of the trailers it manufactures to outside customers, what price should be used on transfers between Baxter Bicycles' divisions? Explain.
2. Assume the trailer division currently only sells 20,000 trailers to outside customers, and the assembly division wants to buy 15,000 trailers per year from the trailer division. What is the range of acceptable prices that could be used on transfers between Baxter Bicycles' divisions? Explain.
3. Assume transfer prices of either \$80 per trailer or \$140 per trailer are being considered. Comment on the preferred transfer prices from the perspectives of the trailer division manager, the assembly division manager, and the top management of Baxter Bicycles.

**Exercise 24-18<sup>A</sup>**  
Determining transfer  
prices  
**C2**

**Exercise 24-19<sup>B</sup>**Joint real estate costs assigned **Check** Total Hilltop cost, \$3,000,000

Heart & Home Properties is developing a subdivision that includes 600 home lots. The 450 lots in the Canyon section are below a ridge and do not have views of the neighboring canyons and hills; the 150 lots in the Hilltop section offer unobstructed views. The expected selling price for each Canyon lot is \$55,000 and for each Hilltop lot is \$110,000. The developer acquired the land for \$4,000,000 and spent another \$3,500,000 on street and utilities improvements. Assign the joint land and improvement costs to the lots using the value basis of allocation and determine the average cost per lot.

**Exercise 24-20<sup>B</sup>**Joint product costs assigned **Check** (2) Inventory cost, \$2,268

Pirate Seafood Company purchases lobsters and processes them into tails and flakes. It sells the lobster tails for \$21 per pound and the flakes for \$14 per pound. On average, 100 pounds of lobster are processed into 52 pounds of tails and 22 pounds of flakes, with 26 pounds of waste. Assume that the company purchased 2,400 pounds of lobster for \$4.50 per pound and processed the lobsters with an additional labor cost of \$1,800. No materials or labor costs are assigned to the waste. If 1,096 pounds of tails and 324 pounds of flakes are sold, what is (1) the allocated cost of the sold items and (2) the allocated cost of the ending inventory? The company allocates joint costs on a value basis. (Round the dollar cost per pound to the nearest thousandth.)

**Exercise 24-21**Profit margin and investment turnover  **L'Oréal** reports the following for a recent year for the major divisions in its cosmetics branch.

(€ millions)	Sales	Income	Total Assets End of Year	Total Assets Beginning of Year
Professional products . . . . .	€ 2,717	€ 552	€ 2,624	€ 2,516
Consumer products . . . . .	9,530	1,765	5,994	5,496
Luxury products . . . . .	4,507	791	3,651	4,059
Active cosmetics . . . . .	<u>1,386</u>	<u>278</u>	<u>830</u>	<u>817</u>
Total . . . . .	<u>€18,140</u>	<u>€3,386</u>	<u>€13,099</u>	<u>€12,888</u>

1. Compute profit margin for each division. State your answers as percents, rounded to two decimal places. Which L'Oréal division has the highest profit margin?
2. Compute investment turnover for each division. Round your answers to two decimal places. Which L'Oréal division has the best investment turnover?

**PROBLEM SET A****Problem 24-1A**Responsibility accounting performance reports; controllable and budgeted costs 

Billie Whitehorse, the plant manager of Travel Free's Indiana plant, is responsible for all of that plant's costs other than her own salary. The plant has two operating departments and one service department. The camper and trailer operating departments manufacture different products and have their own managers. The office department, which Whitehorse also manages, provides services equally to the two operating departments. A budget is prepared for each operating department and the office department. The company's responsibility accounting system must assemble information to present budgeted and actual costs in performance reports for each operating department manager and the plant manager. Each performance report includes only those costs that a particular operating department manager can control: raw materials, wages, supplies used, and equipment depreciation. The plant manager is responsible for the department managers' salaries, utilities, building rent, office salaries other than her own, and other office costs plus all costs controlled by the two operating department managers. The annual departmental budgets and actual costs for the two operating departments follow.

	Budget			Actual		
	Campers	Trailers	Combined	Campers	Trailers	Combined
Raw materials . . . . .	\$195,000	\$275,000	\$ 470,000	\$194,200	\$273,200	\$ 467,400
Employee wages . . . . .	104,000	205,000	309,000	106,600	206,400	313,000
Dept. manager salary . . . . .	43,000	52,000	95,000	44,000	53,500	97,500
Supplies used . . . . .	33,000	90,000	123,000	31,700	91,600	123,300
Depreciation—Equip. . . . .	60,000	125,000	185,000	60,000	125,000	185,000
Utilities . . . . .	3,600	5,400	9,000	3,300	5,000	8,300
Building rent . . . . .	5,700	9,300	15,000	5,300	8,700	14,000
Office department costs . . . . .	<u>68,750</u>	<u>68,750</u>	<u>137,500</u>	<u>67,550</u>	<u>67,550</u>	<u>135,100</u>
Totals . . . . .	<u>\$513,050</u>	<u>\$830,450</u>	<u>\$1,343,500</u>	<u>\$512,650</u>	<u>\$830,950</u>	<u>\$1,343,600</u>

The office department's annual budget and its actual costs follow.

	Budget	Actual
Plant manager salary . . . . .	\$ 80,000	\$ 82,000
Other office salaries . . . . .	32,500	30,100
Other office costs . . . . .	<u>25,000</u>	<u>23,000</u>
Totals . . . . .	<u>\$137,500</u>	<u>\$135,100</u>

### Required

- Prepare responsibility accounting performance reports like those in Exhibit 24.2 that list costs controlled by the following:
  - Manager of the camper department.
  - Manager of the trailer department.
  - Manager of the Indiana plant.

In each report, include the budgeted and actual costs and show the amount that each actual cost is over or under the budgeted amount.

**Check** (1a) \$500 total over budget

(1c) Indiana plant controllable costs, \$1,900 total under budget

### Analysis Component

- Did the plant manager or the operating department managers better manage costs? Explain.

National Bank has several departments that occupy both floors of a two-story building. The departmental accounting system has a single account, Building Occupancy Cost, in its ledger. The types and amounts of occupancy costs recorded in this account for the current period follow.

Depreciation—Building . . . . .	\$18,000
Interest—Building mortgage . . . . .	27,000
Taxes—Building and land . . . . .	9,000
Gas (heating) expense . . . . .	3,000
Lighting expense . . . . .	3,000
Maintenance expense . . . . .	<u>6,000</u>
Total occupancy cost . . . . .	<u>\$66,000</u>

**Problem 24-2A**  
Allocation of building occupancy costs to departments

The building has 4,000 square feet on each floor. In prior periods, the accounting manager merely divided the \$66,000 occupancy cost by 8,000 square feet to find an average cost of \$8.25 per square foot and then charged each department a building occupancy cost equal to this rate times the number of square feet that it occupied.

Diane Linder manages a first-floor department that occupies 1,000 square feet, and Juan Chiro manages a second-floor department that occupies 1,800 square feet of floor space. In discussing the departmental reports, the second-floor manager questions whether using the same rate per square foot for all departments makes sense because the first-floor space is more valuable. This manager also references a recent real estate study of average local rental costs for similar space that shows first-floor space worth \$30 per square foot and second-floor space worth \$20 per square foot (excluding costs for heating, lighting, and maintenance).

### Required

- Allocate occupancy costs to the Linder and Chiro departments using the current allocation method.
- Allocate the depreciation, interest, and taxes occupancy costs to the Linder and Chiro departments in proportion to the relative market values of the floor space. Allocate the heating, lighting, and maintenance costs to the Linder and Chiro departments in proportion to the square feet occupied (ignoring floor space market values).

**Check** (1) Total allocated to Linder and Chiro, \$23,100; (2) total occupancy cost to Linder, \$9,600

### Analysis Component

- Which allocation method would you prefer if you were a manager of a second-floor department? Explain.

**Problem 24-3A**

Departmental income statements; forecasts

P3

Williams Company began operations in January 2015 with two operating (selling) departments and one service (office) department. Its departmental income statements follow.

<b>WILLIAMS COMPANY</b>			
<b>Departmental Income Statements</b>			
<b>For Year Ended December 31, 2015</b>			
	<b>Clock</b>	<b>Mirror</b>	<b>Combined</b>
Sales .....	\$130,000	\$55,000	\$185,000
Cost of goods sold .....	63,700	34,100	97,800
Gross profit .....	66,300	20,900	87,200
Direct expenses			
Sales salaries .....	20,000	7,000	27,000
Advertising .....	1,200	500	1,700
Store supplies used .....	900	400	1,300
Depreciation—Equipment .....	1,500	300	1,800
Total direct expenses .....	23,600	8,200	31,800
Allocated expenses			
Rent expense .....	7,020	3,780	10,800
Utilities expense .....	2,600	1,400	4,000
Share of office department expenses .....	10,500	4,500	15,000
Total allocated expenses .....	20,120	9,680	29,800
Total expenses .....	43,720	17,880	61,600
Net income .....	<u>\$ 22,580</u>	<u>\$ 3,020</u>	<u>\$ 25,600</u>

Williams plans to open a third department in January 2016 that will sell paintings. Management predicts that the new department will generate \$50,000 in sales with a 55% gross profit margin and will require the following direct expenses: sales salaries, \$8,000; advertising, \$800; store supplies, \$500; and equipment depreciation, \$200. It will fit the new department into the current rented space by taking some square footage from the other two departments. When opened the new painting department will fill one-fifth of the space presently used by the clock department and one-fourth used by the mirror department. Management does not predict any increase in utilities costs, which are allocated to the departments in proportion to occupied space (or rent expense). The company allocates office department expenses to the operating departments in proportion to their sales. It expects the painting department to increase total office department expenses by \$7,000. Since the painting department will bring new customers into the store, management expects sales in both the clock and mirror departments to increase by 8%. No changes for those departments' gross profit percents or their direct expenses are expected except for store supplies used, which will increase in proportion to sales.

**Required**

Prepare departmental income statements that show the company's predicted results of operations for calendar year 2016 for the three operating (selling) departments and their combined totals. (Round percents to the nearest one-tenth and dollar amounts to the nearest whole dollar.)

**Check** 2016 forecasted combined net income (sales), \$43,472 (\$249,800)

**Problem 24-4A**

Departmental contribution to income

P3

Vortex Company operates a retail store with two departments. Information about those departments follows.

	<b>Department A</b>	<b>Department B</b>
Sales .....	\$800,000	\$450,000
Cost of goods sold .....	497,000	291,000
Direct expenses		
Salaries .....	125,000	88,000
Insurance .....	20,000	10,000
Utilities .....	24,000	14,000
Depreciation .....	21,000	12,000
Maintenance .....	7,000	5,000

The company also incurred the following indirect costs.

Salaries . . . . .	\$36,000
Insurance . . . . .	6,000
Depreciation . . . . .	15,000
Office expenses . . . . .	50,000

Indirect costs are allocated as follows: salaries on the basis of sales; insurance and depreciation on the basis of square footage; and office expenses on the basis of number of employees. Additional information about the departments follows.

Department	Square footage	Number of employees
A . . . . .	28,000	75
B . . . . .	12,000	50

**Required**

- For each department, determine the departmental contribution to overhead and the departmental net income.
- Should Department B be eliminated? Explain.

**Check** (1) Dept. A net income, \$38,260

Georgia Orchards produced a good crop of peaches this year. After preparing the following income statement, the company believes it should have given its No. 3 peaches to charity and saved its efforts.

**Problem 24-5A<sup>B</sup>**  
Allocation of joint costs

GEORGIA ORCHARDS Income Statement For Year Ended December 31, 2015				
	No. 1	No. 2	No. 3	Combined
Sales (by grade)				
No. 1: 300,000 lbs. @ \$1.50/lb . . . . .	\$450,000			
No. 2: 300,000 lbs. @ \$1.00/lb . . . . .		\$300,000		
No. 3: 750,000 lbs. @ \$0.25/lb . . . . .			\$ 187,500	
Total sales . . . . .				\$937,500
Costs				
Tree pruning and care @ \$0.30/lb . . . . .	90,000	90,000	225,000	405,000
Picking, sorting, and grading @ \$0.15/lb . . . . .	45,000	45,000	112,500	202,500
Delivery costs . . . . .	15,000	15,000	37,500	67,500
Total costs . . . . .	150,000	150,000	375,000	675,000
Net income (loss) . . . . .	\$300,000	\$150,000	\$(187,500)	\$262,500

In preparing this statement, the company allocated joint costs among the grades on a physical basis as an equal amount per pound. The company’s delivery cost records show that \$30,000 of the \$67,500 relates to crating the No. 1 and No. 2 peaches and hauling them to the buyer. The remaining \$37,500 of delivery costs is for crating the No. 3 peaches and hauling them to the cannery.

**Required**

- Prepare reports showing cost allocations on a sales value basis to the three grades of peaches. Separate the delivery costs into the amounts directly identifiable with each grade. Then allocate any shared delivery costs on the basis of the relative sales value of each grade.
- Using your answers to part 1, prepare an income statement using the joint costs allocated on a sales value basis.

**Check** (1) \$129,600 tree pruning and care costs allocated to No. 2  
(2) Net income from No. 1 & No. 2 peaches, \$140,400 & \$93,600

**Analysis Component**

- Do you think delivery costs fit the definition of a joint cost? Explain.

**PROBLEM SET B**

**Problem 24-1B**

Responsibility accounting performance reports; controllable and budgeted costs

P1

Britney Brown, the plant manager of LMN Co.’s Chicago plant, is responsible for all of that plant’s costs other than her own salary. The plant has two operating departments and one service department. The refrigerator and dishwasher operating departments manufacture different products and have their own managers. The office department, which Brown also manages, provides services equally to the two operating departments. A monthly budget is prepared for each operating department and the office department. The company’s responsibility accounting system must assemble information to present budgeted and actual costs in performance reports for each operating department manager and the plant manager. Each performance report includes only those costs that a particular operating department manager can control: raw materials, wages, supplies used, and equipment depreciation. The plant manager is responsible for the department managers’ salaries, utilities, building rent, office salaries other than her own, and other office costs plus all costs controlled by the two operating department managers. The April departmental budgets and actual costs for the two operating departments follow.

	Budget			Actual		
	Refrigerators	Dishwashers	Combined	Refrigerators	Dishwashers	Combined
Raw materials . . . . .	\$400,000	\$200,000	\$ 600,000	\$385,000	\$202,000	\$ 587,000
Employee wages . . . . .	170,000	80,000	250,000	174,700	81,500	256,200
Dept. manager salary . . . . .	55,000	49,000	104,000	55,000	46,500	101,500
Supplies used . . . . .	15,000	9,000	24,000	14,000	9,700	23,700
Depreciation—Equip. . . . .	53,000	37,000	90,000	53,000	37,000	90,000
Utilities . . . . .	30,000	18,000	48,000	34,500	20,700	55,200
Building rent . . . . .	63,000	17,000	80,000	65,800	16,500	82,300
Office department costs . . . . .	<u>70,500</u>	<u>70,500</u>	<u>141,000</u>	<u>75,000</u>	<u>75,000</u>	<u>150,000</u>
Totals . . . . .	<u>\$856,500</u>	<u>\$480,500</u>	<u>\$1,337,000</u>	<u>\$857,000</u>	<u>\$488,900</u>	<u>\$1,345,900</u>

The office department’s budget and its actual costs for April follow.

	Budget	Actual
Plant manager salary . . . . .	\$ 80,000	\$ 85,000
Other office salaries . . . . .	40,000	35,200
Other office costs . . . . .	<u>21,000</u>	<u>29,800</u>
Totals . . . . .	<u>\$141,000</u>	<u>\$150,000</u>

**Required**

- Prepare responsibility accounting performance reports like those in Exhibit 24.2 that list costs controlled by the following:
  - Manager of the refrigerator department.
  - Manager of the dishwasher department.
  - Manager of the Chicago plant.

In each report, include the budgeted and actual costs for the month and show the amount by which each actual cost is over or under the budgeted amount.

**Analysis Component**

- Did the plant manager or the operating department managers better manage costs? Explain.

**Check** (1a) \$11,300 total under budget

(1c) Chicago plant controllable costs, \$3,900 total over budget

**Problem 24-2B**

Allocation of building occupancy costs to departments

P2

Harmon’s has several departments that occupy all floors of a two-story building that includes a basement floor. Harmon rented this building under a long-term lease negotiated when rental rates were low. The departmental accounting system has a single account, Building Occupancy Cost, in its ledger. The types and amounts of occupancy costs recorded in this account for the current period follow.

Building rent . . . . .	\$400,000
Lighting expense . . . . .	25,000
Cleaning expense . . . . .	<u>40,000</u>
Total occupancy cost . . . . .	<u>\$465,000</u>

The building has 7,500 square feet on each of the upper two floors but only 5,000 square feet in the basement. In prior periods, the accounting manager merely divided the \$465,000 occupancy cost by 20,000 square feet to find an average cost of \$23.25 per square foot and then charged each department a building occupancy cost equal to this rate times the number of square feet that it occupies.

Jordan Style manages a department that occupies 2,000 square feet of basement floor space. In discussing the departmental reports with other managers, she questions whether using the same rate per square foot for all departments makes sense because different floor space has different values. Style checked a recent real estate report of average local rental costs for similar space that shows first-floor space worth \$40 per square foot, second-floor space worth \$20 per square foot, and basement space worth \$10 per square foot (excluding costs for lighting and cleaning).

### Required

1. Allocate occupancy costs to Style's department using the current allocation method.
2. Allocate the building rent cost to Style's department in proportion to the relative market value of the floor space. Allocate to Style's department the lighting and cleaning costs in proportion to the square feet occupied (ignoring floor space market values). Then, compute the total occupancy cost allocated to Style's department.

**Check** Total costs allocated to Style's dept., (1) \$46,500; (2) Total occupancy cost to Style \$22,500

### Analysis Component

3. Which allocation method would you prefer if you were a manager of a basement department?

Bonanza Entertainment began operations in January 2015 with two operating (selling) departments and one service (office) department. Its departmental income statements follow.

**Problem 24-3B**  
Departmental income statements; forecasts

<b>BONANZA ENTERTAINMENT</b>			
Departmental Income Statements			
For Year Ended December 31, 2015			
	Movies	Video Games	Combined
Sales .....	\$600,000	\$200,000	\$800,000
Cost of goods sold .....	<u>420,000</u>	<u>154,000</u>	<u>574,000</u>
Gross profit .....	180,000	46,000	226,000
Direct expenses			
Sales salaries .....	37,000	15,000	52,000
Advertising .....	12,500	6,000	18,500
Store supplies used .....	4,000	1,000	5,000
Depreciation—Equipment .....	<u>4,500</u>	<u>3,000</u>	<u>7,500</u>
Total direct expenses .....	58,000	25,000	83,000
Allocated expenses			
Rent expense .....	41,000	9,000	50,000
Utilities expense .....	7,380	1,620	9,000
Share of office department expenses .....	<u>56,250</u>	<u>18,750</u>	<u>75,000</u>
Total allocated expenses .....	<u>104,630</u>	<u>29,370</u>	<u>134,000</u>
Total expenses .....	<u>162,630</u>	<u>54,370</u>	<u>217,000</u>
Net income (loss) .....	<u>\$ 17,370</u>	<u>\$ (8,370)</u>	<u>\$ 9,000</u>

The company plans to open a third department in January 2016 that will sell compact discs. Management predicts that the new department will generate \$300,000 in sales with a 35% gross profit margin and will require the following direct expenses: sales salaries, \$18,000; advertising, \$10,000; store supplies, \$2,000; and equipment depreciation, \$1,200. The company will fit the new department into the current rented space by taking some square footage from the other two departments. When opened, the new compact disc department will fill one-fourth of the space presently used by the movie department and one-third of the space used by the video game department. Management does not predict any increase in utilities costs, which are allocated to the departments in proportion to occupied space (or rent expense). The company allocates office department expenses to the operating departments in proportion to their sales. It expects the compact disc department to increase total office department expenses by \$10,000. Since the compact disc department will bring new customers into the store, management expects sales in both the movie and video game departments to increase by 8%. No changes for those departments' gross profit percents or for their direct expenses are expected, except for store supplies used, which will increase in proportion to sales.

**Required**

**Check** 2016 forecasted Movies net income (sales), \$52,450 (\$648,000)

Prepare departmental income statements that show the company's predicted results of operations for calendar year 2016 for the three operating (selling) departments and their combined totals. (Round percents to the nearest one-tenth and dollar amounts to the nearest whole dollar.)

**Problem 24-4B**

Departmental contribution to income

P3

Sadar Company operates a store with two departments: videos and music. Information about those departments follows.

	Videos Department	Music Department
Sales . . . . .	\$370,500	\$279,500
Cost of goods sold . . . . .	320,000	175,000
Direct expenses		
Salaries . . . . .	35,000	25,000
Maintenance . . . . .	12,000	10,000
Utilities . . . . .	5,000	4,500
Insurance . . . . .	4,200	3,700

The company also incurred the following indirect costs.

Advertising . . . . .	\$15,000
Salaries . . . . .	27,000
Office expenses . . . . .	3,200

Indirect costs are allocated as follows: advertising on the basis of sales; salaries on the basis of number of employees; and office expenses on the basis of square footage. Additional information about the departments follows.

Department	Square footage	Number of employees
Videos . . . . .	5,000	3
Music . . . . .	3,000	2

**Required**

**Check** (1) Music dept. net income, \$42,850

- For each department, determine the departmental contribution to overhead and the departmental net income.
- Should the video department be eliminated? Explain.

**Problem 24-5B<sup>B</sup>**

Allocation of joint costs

C3

Rita and Rick Redding own and operate a tomato grove. After preparing the following income statement, Rita believes they should have offered the No. 3 tomatoes to the public for free and saved themselves time and money.

RITA AND RICK REDDING				
Income Statement				
For Year Ended December 31, 2015				
	No. 1	No. 2	No. 3	Combined
Sales (by grade)				
No. 1: 500,000 lbs. @ \$1.80/lb . . . . .	\$900,000			
No. 2: 400,000 lbs. @ \$1.25/lb . . . . .		\$500,000		
No. 3: 100,000 lbs. @ \$0.40/lb . . . . .			\$ 40,000	
Total sales. . . . .				\$1,440,000
Costs				
Land preparation, seeding, and cultivating @ \$0.70/lb . . . . .	350,000	280,000	70,000	700,000
Harvesting, sorting, and grading @ \$0.04/lb. . . . .	20,000	16,000	4,000	40,000
Delivery costs . . . . .	10,000	7,000	3,000	20,000
Total costs . . . . .	380,000	303,000	77,000	760,000
Net income (loss) . . . . .	\$520,000	\$197,000	\$(37,000)	\$ 680,000

In preparing this statement, Rita and Rick allocated joint costs among the grades on a physical basis as an equal amount per pound. Also, their delivery cost records show that \$17,000 of the \$20,000 relates to crating the No. 1 and No. 2 tomatoes and hauling them to the buyer. The remaining \$3,000 of delivery costs is for crating the No. 3 tomatoes and hauling them to the cannery.

**Required**

1. Prepare reports showing cost allocations on a sales value basis to the three grades of tomatoes. Separate the delivery costs into the amounts directly identifiable with each grade. Then allocate any shared delivery costs on the basis of the relative sales value of each grade. (Round percents to the nearest one-tenth and dollar amounts to the nearest whole dollar.)
2. Using your answers to part 1, prepare an income statement using the joint costs allocated on a sales value basis.

**Check** (1) \$1,120 harvesting, sorting and grading costs allocated to No. 3  
(2) Net income from No. 1 & No. 2 tomatoes, \$426,569 & \$237,151

**Analysis Component**

3. Do you think delivery costs fit the definition of a joint cost? Explain.

*(This serial problem began in Chapter 1 and continues through most of the book. If previous chapter segments were not completed, the serial problem can begin at this point. It is helpful, but not necessary, to use the Working Papers that accompany the book.)*

**SP 24** Santana Rey’s two departments, computer consulting services and computer workstation furniture manufacturing, have each been profitable. Santana has heard of the balanced scorecard and wants you to provide details on how it could be used to measure performance of her departments.

**Required**

1. Explain the four performance perspectives included in a balanced scorecard.
2. For each of the four performance perspectives included in a balanced scorecard, provide examples of measures Santana could use to measure performance of her departments.

**SERIAL PROBLEM**

Business Solutions  
A3

**Beyond the Numbers**

**BTN 24-1** Review **Apple’s** income statement in Appendix A and identify its revenues for the years ended September 28, 2013, September 29, 2012, and September 24, 2011. For the year ended September 28, 2013, Apple reports the following product revenue mix. (Assume that its product revenue mix is the same for each of the three years reported when answering the requirements.)

iPhone	iPad and iPod	Mac	iTunes, Software and Services, and Accessories
53%	21%	13%	13%

**REPORTING IN ACTION**

**APPLE**

**Required**

1. Compute the amount of revenue from each of its product lines for the years ended September 28, 2013, September 29, 2012, and September 24, 2011.
2. If Apple wishes to evaluate each of its product lines, how can it allocate its operating expenses to each of them to determine each product line’s profitability?

**Fast Forward**

3. Access Apple’s annual report for a fiscal year ending after September 28, 2013, from its website ([Apple.com](http://Apple.com)) or the SEC’s EDGAR database ([www.SEC.gov](http://www.SEC.gov)). Locate its table of “Net Sales by Product” in the footnotes. How has its product mix changed from 2013?

**BTN 24-2** **Apple** and **Google** compete in several product categories. Sales, income, and asset information is provided for fiscal year 2013 for each company below.

(in millions)	Apple	Google
Sales . . . . .	\$170,910	\$ 59,825
Net income . . . . .	37,037	12,920
Invested assets, beginning of year . . . . .	176,064	93,798
Invested assets, end of year . . . . .	207,000	110,920

**COMPARATIVE ANALYSIS**

A2  
**APPLE**  
**GOOGLE**

**Required**

1. Compute profit margin for each company.
2. Compute investment turnover for each company.

**Analysis Component**

3. Using your answers to the questions above, compare the companies' performance for the year.

**ETHICS CHALLENGE**

**BTN 24-3** Super Security Co. offers a range of security services for athletes and entertainers. Each type of service is considered within a separate department. Marc Pincus, the overall manager, is compensated partly on the basis of departmental performance by staying within the quarterly cost budget. He often revises operations to make sure departments stay within budget. Says Pincus, "I will not go over budget even if it means slightly compromising the level and quality of service. These are minor compromises that don't significantly affect my clients, at least in the short term."

**Required**

1. Is there an ethical concern in this situation? If so, which parties are affected? Explain.
2. Can Marc Pincus take action to eliminate or reduce any ethical concerns? Explain.
3. What is Super Security's ethical responsibility in offering professional services?

**COMMUNICATING IN PRACTICE**

**BTN 24-4** Improvement Station is a national home improvement chain with more than 100 stores throughout the country. The manager of each store receives a salary plus a bonus equal to a percent of the store's net income for the reporting period. The following net income calculation is on the Denver store manager's performance report for the recent monthly period.

Sales . . . . .	\$2,500,000
Cost of goods sold . . . . .	800,000
Wages expense . . . . .	500,000
Utilities expense . . . . .	200,000
Home office expense . . . . .	75,000
Net income . . . . .	<u>\$ 925,000</u>
Manager's bonus (0.5%) . . . . .	<u>\$ 4,625</u>

In previous periods, the bonus had also been 0.5%, but the performance report had not included any charges for the home office expense, which is now assigned to each store as a percent of its sales.

**Required**

Assume that you are the national office manager. Write a half-page memorandum to your store managers explaining why home office expense is in the new performance report.

**TAKING IT TO THE NET**

**BTN 24-5** This chapter described and used spreadsheets to prepare various managerial reports (see Exhibit 24-6). You can download from websites various tutorials showing how spreadsheets are used in managerial accounting and other business applications.

**Required**

1. Link to the website [Lacher.com](http://Lacher.com). Select "Table of Contents" under "Microsoft Excel Examples." Identify and list three tutorials for review.
2. Describe in a half-page memorandum to your instructor how the applications described in each tutorial are helpful in business and managerial decision making.

**TEAMWORK IN ACTION****APPLE Samsung**

**BTN 24-6** **Apple** and **Samsung** compete across the world in several markets.

**Required**

1. Design a three-tier responsibility accounting organizational chart assuming that you have available internal information for both companies. Use Exhibit 24.1 as an example. The goal of this assignment is to design a reporting framework for the companies; numbers are not required. Limit your reporting framework to sales activity only.
2. Explain why it is important to have similar performance reports when comparing performance within a company (and across different companies). Be specific in your response.

**BTN 24-7** Brian Linton’s company, **United By Blue**, sells jewelry and apparel. His company plans for continued expansion into other types of products.

**ENTREPRENEURIAL DECISION**

**Required**

1. How can United By Blue use departmental income statements to assist in understanding and controlling operations?
2. Are departmental income statements always the best measure of a department’s performance? Explain.
3. Provide examples of nonfinancial performance indicators United By Blue might use as part of a balanced scorecard system of performance evaluation.

**BTN 24-8** Visit a local movie theater and check out both its concession area and its showing areas. The manager of a theater must confront questions such as:

**HITTING THE ROAD**

- How much return do we earn on concessions?
- What types of movies generate the greatest sales?
- What types of movies generate the greatest net income?

**Required**

Assume that you are the new accounting manager for a 16-screen movie theater. You are to set up a responsibility accounting reporting framework for the theater.

1. Recommend how to segment the different departments of a movie theater for responsibility reporting.
2. Propose an expense allocation system for heat, rent, insurance, and maintenance costs of the theater.

**BTN 24-9** Selected product data from **Samsung** ([www.samsung.com](http://www.samsung.com)) follow.

**GLOBAL DECISION**

**Samsung**

Product Segment for Year Ended (billions of Korean won)	Net Sales		Operating Income	
	Dec. 31, 2013	Dec. 31, 2012	Dec. 31, 2013	Dec. 31, 2012
Consumer electronics . . . . .	₩ 50,332	₩ 51,105	₩ 1,673	₩ 2,324
IT and mobile communications . . . . .	138,817	105,845	24,958	19,418

**Required**

1. Compute the percentage growth in net sales for each product line from fiscal year 2012 to 2013. Round percents to one decimal.
2. Which product line’s net sales grew the fastest?
3. Which segment was the most profitable?
4. How can Samsung’s managers use this information?

**ANSWERS TO MULTIPLE CHOICE QUIZ**

1. b;  $[\$641,250 / (\$356,250 + \$641,250 + \$427,500)] \times \$150,000 = \underline{\underline{\$67,500}}$
2. d;
3. c;  $\$500,000 / 200,000 = 2.5$
4. b;

	Department X	Department Y	Department Z
Sales . . . . .	\$500,000	\$200,000	\$350,000
Cost of goods sold . . . . .	<u>350,000</u>	<u>75,000</u>	<u>150,000</u>
Gross profit . . . . .	150,000	125,000	200,000
Direct expenses . . . . .	<u>50,000</u>	<u>20,000</u>	<u>75,000</u>
Departmental contribution to overhead . . .	<u>\$100,000</u>	<u>\$105,000</u>	<u>\$125,000</u>

5. a;  $\$100,000 / \$500,000 = \underline{\underline{20\%}}$

# Capital Budgeting and Managerial Decisions

### Chapter Preview

#### NONPRESENT VALUE METHODS

- P1** Payback period
- P2** Accounting rate of return

#### PRESENT VALUE METHODS

- P3** Net present value
- P4** Internal rate of return  
Comparison of methods
- A2** Break-even time

#### DECISIONS AND INFORMATION

- Decision making
- C1** Relevant costs and benefits

#### DECISION SCENARIOS

- A1** Additional business
  - Make or buy
  - Scrap or rework
  - Sell or process further
  - Sales mix selection
  - Segment elimination
  - Keep or replace

### Learning Objectives

#### CONCEPTUAL

- C1** Describe the importance of relevant costs for short-term decisions.

#### ANALYTICAL

- A1** Evaluate short-term managerial decisions using relevant costs.

- A2** Analyze a capital investment project using break-even time.

#### PROCEDURAL

- P1** Compute payback period and describe its use.

- P2** Compute accounting rate of return and explain its use.

- P3** Compute net present value and describe its use.

- P4** Compute internal rate of return and explain its use.

NEW YORK—Studying computer science and electrical engineering, Limor Fried used the skills she learned in class to make electrical devices like MP3 players, synthesizers, and toys. Thinking others might like her designs, she posted instructions for her projects on her website. Inundated with requests to sell her designs as project kits, Limor invested her tuition money in a large quantity of parts and began designing. The result is her company **Adafruit Industries**, which now boasts sales of over \$22 million per year.

Adafruit started small, with one employee (Limor) operating out of her dorm room. “The company took off,” says Limor, “because we sold learning projects that you would actually use or want to keep.” Projects like MintyBoost (a mobile-device charger assembled from an Altoids tin and electronic components), a set of bicycle lights that spell out words and draw symbols as you ride, and a mini-electric guitar are both fun to make and fun to use. “The idea is that people will learn a little about electronics by assembling the kits, and, in the end have a handmade good that is also useful.”

Limor uses accounting information to make business decisions. She priced her kits to yield about a \$10 contribution margin per kit. These profits enabled her to hire more employees and expand her business. Focusing on contribution margins enables Adafruit to add more-profitable products and eliminate less-profitable products. In addition to profits, Limor must consider qualitative factors in her decisions, and she focuses on customer satisfaction. “Everything is designed to be painless,” says Ada. “I spend a lot of time thinking about how customers will interact with products, and we always give good documentation.”

In addition to short-term decisions involving sales mix, Limor had to confront decisions regarding capital investments. Recently, the company moved from a small loft into a 12,000-square-foot industrial space. The industrial-grade power supply in this new space enabled investments in large equipment, enabling faster production. Net present value calculations, based on the cost of this new equipment and the future cash flows from additional sales, support such decisions. “It’s a new chapter in our business,” exclaims Limor. “I think we can quadruple our current size.”

## High Energy

*“We put our heart and soul into it . . . every day”*

—Limor Fried

For Limor, though, business is not just about making more profit. She is passionate about education, and in particular about encouraging young women to pursue engineering and related technical fields. “It is possible to help people all while running a business,” she says. Limor encourages young entrepreneurs to “go for it.” “Entrepreneurship is cool,” says Limor. “It’s about freedom, the ability to do great work with great people for great customers. It’s hard to do this if you are working for someone else.”

## Section 1—Capital Budgeting

**Capital budgeting** is the process of analyzing alternative long-term investments and deciding which assets to acquire or sell. Common examples of capital budgeting decisions include buying a machine or a building or acquiring an entire company. An objective for these decisions is to earn a satisfactory return on investment.

Capital budgeting decisions require careful analysis because they are usually the most difficult and risky decisions that managers make. These decisions are difficult because they require predicting events that will not occur until well into the future. Many of these predictions are tentative and potentially unreliable. Specifically, a capital budgeting decision is risky because (1) the outcome is uncertain, (2) large amounts of money are usually involved, (3) the investment involves a long-term commitment, and (4) the decision could be difficult or impossible to reverse, no matter how poor it turns out to be. Risk is especially high for investments in technology due to innovations and uncertainty.

Managers use several methods to evaluate capital budgeting decisions. Nearly all of these methods involve predicting future cash inflows and cash outflows of proposed investments, assessing the risk of and returns on those cash flows, and then choosing the investments to make. Management often restates future cash flows in terms of their present value. This approach applies the time value of money: A dollar today is worth more than a dollar tomorrow. Similarly, a dollar tomorrow is worth less than a dollar today. The process of restating future cash flows in terms of their present value is called *discounting*. The time value of money is important when evaluating capital investments, but managers sometimes apply evaluation methods that ignore present value. This section describes four methods for comparing alternative investments.

**Point:** The nature of capital spending has changed with the business environment. Budgets for information technology have increased from about 25% of corporate capital spending 20 years ago to an estimated 35% today.

### METHODS NOT USING TIME VALUE OF MONEY

All investments, whether they involve the purchase of a machine or another long-term asset, are expected to produce net cash flows. *Net cash flow* is cash inflows minus cash outflows. Sometimes managers perform simple analyses of the financial feasibility of an investment's net cash flow without using the time value of money. This section explains two of the most common methods in this category: (1) payback period and (2) accounting rate of return.

#### Payback Period

An investment's **payback period (PBP)** is the expected amount of time to recover the initial investment amount. Managers prefer investing in assets with shorter payback periods to reduce the risk of an unprofitable investment over the long run. Acquiring assets with short payback periods reduces a company's risk from potentially inaccurate long-term predictions of future cash flows.

#### P1

Compute payback period and describe its use.

**Computing Payback Period with Even Cash Flows** To illustrate use of the payback period for an investment with even cash flows, we look at data from FasTrac, a manufacturer of exercise equipment and supplies. (*Even cash flows* are cash flows that are the same each and every year; *uneven cash flows* are cash flows that are not all equal in amount.) FasTrac is considering several different capital investments, one of which is to purchase a machine to use in manufacturing a new product. This machine costs \$16,000 and is expected to have an eight-year life with no salvage value. Management predicts this machine will produce 1,000 units of product each year and that the new product will be sold for \$30 per unit. Exhibit 25.1 shows the expected net income and expected annual net cash flows for this asset over its life.

The amount of net cash flow from the machinery is computed by subtracting expected cash outflows from expected cash inflows. The Expected Net Cash Flow column of Exhibit 25.1 excludes all noncash revenues and expenses. Depreciation is FasTrac's only noncash item. Alternatively, managers can adjust the projected net income for revenue and expense items that do not affect cash flows. For FasTrac, this means taking the \$2,100 net income and adding back the \$2,000 depreciation, to yield \$4,100 of net cash flow.

**Point:** Annual net cash flow in Exhibit 25.1 equals net income plus depreciation (a noncash expense).

**EXHIBIT 25.1**

Cash Flow Analysis

FASTRAC Cash Flow Analysis—Machinery Investment January 15, 2015		
	Expected Net Income	Expected Net Cash Flow
Annual sales of new product .....	\$30,000	\$30,000
Deduct annual expenses		
Cost of materials, labor, and overhead (except depreciation) .....	15,500	15,500
Depreciation—Machinery .....	2,000	
Additional selling and administrative expenses .....	9,500	9,500
Annual pretax income .....	3,000	
Income taxes (30%) .....	900	900
Annual net income .....	<u>\$ 2,100</u>	
<b>Annual net cash flow</b> .....		<b><u>\$ 4,100</u></b>

The formula for computing the payback period of an investment that yields even net cash flows is in Exhibit 25.2.

$$\text{Payback period} = \frac{\text{Cost of investment}}{\text{Annual net cash flow}}$$

**EXHIBIT 25.2**

Payback Period Formula with Even Cash Flows

The payback period reflects the amount of time for the investment to generate enough net cash flow to return (or pay back) the cash initially invested to purchase it. FasTrac’s payback period for this machine is just under four years:

$$\text{Payback period} = \frac{\$16,000}{\$4,100} = 3.9 \text{ years}$$

The initial investment is fully recovered in 3.9 years, or just before reaching the halfway point of this machine’s useful life of eight years.

**Example:** If an alternative machine (with different technology) yields a payback period of 3.5 years, which one does a manager choose? Answer: The alternative (3.5 is less than 3.9).

**Decision Insight**

**e-Payback** Health care providers are increasingly using electronic systems to improve their operations. With *e-charting*, doctors’ orders and notes are saved electronically. Such systems allow for more personalized care plans, more efficient staffing, and reduced costs. Investments in such systems must be evaluated on the basis of payback periods and other financial measures. ■

Tetra Images/Getty Images

**Computing Payback Period with Uneven Cash Flows** Computing the payback period in the prior section assumed even net cash flows. What happens if the net cash flows are uneven? In this case, the payback period is computed using the *cumulative total of net cash flows*. The word *cumulative* refers to the addition of each period’s net cash flows as we progress through time. To illustrate, consider data for another investment that FasTrac is considering. This machine is predicted to generate uneven net cash flows over the next eight years. The relevant data and payback period computation are shown in Exhibit 25.3.

Year 0 refers to the period of initial investment in which the \$16,000 cash outflow occurs at the end of year 0 to acquire the machinery. By the end of year 1, the cumulative net cash flow is reduced to \$(13,000), computed as the \$(16,000) initial cash outflow plus year 1’s \$3,000 cash inflow. This process continues throughout the asset’s life. The cumulative net cash flow amount changes from negative to positive in year 5. Specifically, at the end of year 4, the cumulative net cash flow is \$(1,000). As soon as FasTrac receives net cash inflow of \$1,000 during the fifth year,

**Example:** Find the payback period in Exhibit 25.3 if net cash flows for the first 4 years are: Year 1 = \$6,000; Year 2 = \$5,000; Year 3 = \$4,000; Year 4 = \$3,000. Answer: 3.33 years

**EXHIBIT 25.3**

Payback Period Calculation  
with Uneven Cash Flows

Period*	Expected Net Cash Flows	Cumulative Net Cash Flows
Year 0 .....	\$(16,000)	\$(16,000)
Year 1 .....	3,000	(13,000)
Year 2 .....	4,000	(9,000)
Year 3 .....	4,000	(5,000)
Year 4 .....	4,000	(1,000)
Year 5 .....	5,000	4,000
Year 6 .....	3,000	7,000
Year 7 .....	2,000	9,000
Year 8 .....	2,000	11,000

Payback occurs between years 4 and 5.

**Payback period = 4 years + \$1,000/\$5,000 of year 5 = 4.2 years**

\* All cash inflows and outflows occur uniformly during years 1 through 8.

it has fully recovered the \$16,000 initial investment. If we assume that cash flows are received uniformly *within* each year, receipt of the \$1,000 occurs about one-fifth (0.20) of the way through the fifth year. This is computed as \$1,000 divided by year 5's total net cash flow of \$5,000, or 0.20. This yields a payback period of 4.2 years, computed as 4 years plus 0.20 of year 5.

**Using the Payback Period** Companies like short payback periods to increase return and reduce risk. The more quickly a company receives cash, the sooner it is available for other uses and the less time it is at risk of loss. A shorter payback period also improves the company's ability to respond to unanticipated changes and lowers its risk of having to keep an unprofitable investment.

Payback period should never be the only consideration in evaluating investments. This is so because it ignores at least three important factors. First, it fails to reflect differences in the timing of net cash flows within the payback period. In Exhibit 25.3, FasTrac's net cash flows in the first five years were \$3,000, \$4,000, \$4,000, \$4,000, and \$5,000. If another investment had predicted cash flows of \$9,000, \$3,000, \$2,000, \$1,800, and \$1,000 in these five years, its payback period would also be 4.2 years, but this second alternative could be more desirable because it returns cash more quickly. Second, payback period ignores *all* cash flows after the point where an investment's costs are fully recovered. For example, one investment might pay back its cost in 3 years but stop producing cash after 4 years. A second investment might require 5 years to pay back its cost yet continue to produce net cash flows for another 15 years. A focus on only the payback period would mistakenly lead management to choose the first investment over the second. Third, payback period ignores the time value of money.

**NEED-TO-KNOW 25-1**

Payback Period

P1

A company is considering purchasing equipment costing \$75,000. Future annual net cash flows from this equipment are \$30,000, \$25,000, \$15,000, \$10,000, and \$5,000. Cash flows occur uniformly during the year. What is this investment's payback period?

**Solution**

Period	Expected Net Cash Flows	Cumulative Net Cash Flows
Year 0 .....	\$(75,000)	\$(75,000)
Year 1 .....	30,000	(45,000)
Year 2 .....	25,000	(20,000)
Year 3 .....	15,000	(5,000)
Year 4 .....	10,000	5,000
Year 5 .....	5,000	10,000

Payback period = 3.5 years, computed as 3 + \$5,000/\$10,000

**Accounting Rate of Return**

The **accounting rate of return** is the percentage accounting return on annual average investment. It is called an "accounting" return because it is based on net income, rather than on cash flows. It is computed by dividing a project's after-tax net income by the average amount invested in it. To illustrate, we return to FasTrac's \$16,000 machinery investment described in

P2

Compute accounting rate of return and explain its use.

Exhibit 25.1. We first compute (1) the after-tax net income and (2) the average amount invested. The \$2,100 after-tax net income is already available from Exhibit 25.1.

If a company uses straight-line depreciation, we can find the average amount invested by using the formula in Exhibit 25.4. Because FasTrac uses straight-line depreciation, its average amount invested for the eight years equals the sum of the book value at the beginning of the asset's investment period and the book value at the end of its investment period, divided by 2, as shown in Exhibit 25.4.

$$\begin{aligned} \text{Annual average investment} &= \frac{\text{Beginning book value} + \text{Ending book value}}{2} \\ &\text{(straight-line case only)} \\ &= \frac{\$16,000 + \$0}{2} = \$8,000 \end{aligned}$$

**Point:** Amount invested includes all costs that must be incurred to get the asset in its location and ready for use.

#### EXHIBIT 25.4

Computing Average Amount Invested under Straight-Line Depreciation

If an investment has a salvage value, the average amount invested when using straight-line depreciation is computed as (Beginning book value + Salvage value)/2.

If a company uses a depreciation method other than straight-line, for example MACRS for tax purposes, the calculation of average book value is more complicated. In this case, the book value of the asset is computed for *each year* of its life. The general formula for the annual average investment is shown in Exhibit 25.5.

$$\text{Annual average investment} = \frac{\text{Sum of individual years' average book values}}{\text{Number of years of the planned investment}}$$

(general case)

#### EXHIBIT 25.5

General Formula for Average Amount Invested

Once we determine the annual after-tax net income and the annual average amount invested, the accounting rate of return is computed as shown in Exhibit 25.6.

$$\begin{aligned} \text{Accounting rate of return} &= \frac{\text{Annual after-tax net income}}{\text{Annual average investment}} \\ &= \frac{\$2,100}{\$8,000} = 26.25\% \end{aligned}$$

#### EXHIBIT 25.6

Accounting Rate of Return Formula

FasTrac management must decide whether a 26.25% accounting rate of return is satisfactory. To make this decision, we must factor in the investment's risk. For instance, we cannot say an investment with a 26.25% return is preferred over one with a lower return unless we consider any differences in risk. When comparing investments with similar lives and risk, a company will prefer the investment with the higher accounting rate of return.

**Using the Accounting Rate of Return** The accounting rate of return should never be the only consideration in evaluating investments. This is so because it has at least two important limitations: First, an asset's net income may vary from year to year. In this case, the accounting rate of return will also vary across years, and the project might appear desirable in some years and not in others. Second, the accounting rate of return ignores the time value of money.

The following data relate to a company's decision on whether to purchase a machine:

Cost .....	\$180,000
Salvage value .....	15,000
Annual after-tax net income .....	40,000

Assume net cash flows occur uniformly over each year and the company uses straight-line depreciation. What is the machine's accounting rate of return?

#### Solution

$$\begin{aligned} \text{Annual average investment} &= (\$180,000 + \$15,000)/2 = \$97,500 \\ \text{Accounting rate of return} &= \$40,000/\$97,500 = 41\% \text{ (rounded)} \end{aligned}$$

#### NEED-TO-KNOW 25-2

Accounting Rate of Return

## METHODS USING TIME VALUE OF MONEY

Methods Using Time Value of Money

**P3** Compute net present value and describe its use.

**Point:** The assumption of end-of-year cash flows simplifies computations and is common in practice.

This section describes two methods that help managers with capital budgeting decisions and that use the time value of money: (1) net present value and (2) internal rate of return. (To apply these methods, you need a basic understanding of the concept of present value. An expanded explanation of present value concepts is in Appendix B near the end of the book. You can use the present value tables at the end of Appendix B to solve many of this chapter’s assignments that use the time value of money.)

### Net Present Value

Net present value analysis applies the time value of money to future cash inflows and cash outflows so management can evaluate a project’s benefits and costs at one point in time. Specifically, **net present value (NPV)** is computed by discounting the future net cash flows from the investment at the project’s required rate of return and then subtracting the initial amount invested. A company’s required return, often called its *hurdle rate*, is typically its **cost of capital**, which is an average of the rate the company must pay to its long-term creditors and shareholders. (Computation of the cost of capital is covered in advanced courses.)

To illustrate, let’s return to FasTrac’s proposed machinery purchase described in Exhibit 25.1. Does this machine provide a satisfactory return while recovering the amount invested? Recall that the machine requires a \$16,000 investment and is expected to provide \$4,100 annual net cash inflows for the next eight years. If we assume that net cash inflows from this machine are received at each year-end and that FasTrac requires a 12% annual return, net present value can be computed as in Exhibit 25.7.

#### EXHIBIT 25.7

Net Present Value Calculation with Equal Cash Flows

	Net Cash Flows*	Present Value of 1 at 12%**	Present Value of Net Cash Flows
Year 1	\$ 4,100	0.8929	\$ 3,661
Year 2	4,100	0.7972	3,269
Year 3	4,100	0.7118	2,918
Year 4	4,100	0.6355	2,606
Year 5	4,100	0.5674	2,326
Year 6	4,100	0.5066	2,077
Year 7	4,100	0.4523	1,854
Year 8	4,100	0.4039	1,656
Totals	\$32,800		<b>20,367</b>
<b>Amount invested (at Year 0)</b>			<b>(16,000)</b>
<b>Net present value</b>			<b>\$ 4,367</b>

\* Cash flows occur at the end of each year.  
 \*\* Present value of 1 factors are taken from Table B.1 in Appendix B.

**Example:** What is the net present value in Exhibit 25.7 if a 10% return is applied? Answer: \$5,873

Source: www.stern.nyu.edu/adamordoran, data as of January 2014.

The first number column of Exhibit 25.7 shows the annual net cash flows. Present value of 1 factors, also called *discount factors*, are shown in the second column. Taken from Table B.1 in Appendix B, they assume that net cash flows are received at each year-end. (To simplify present value computations and for assignment material at the end of this chapter, we assume that net cash flows are received at each year-end.) Annual net cash flows from the first column of Exhibit 25.7 are multiplied by the discount factors in the second column to give present values of annual net cash flows shown in the third column. These annual amounts are summed to yield the total present value of net cash flows (\$20,367). The last three lines of this exhibit show the final NPV computations. The asset’s \$16,000 initial cost is deducted from the \$20,367 total present value of all future net cash flows to give this asset’s NPV of \$4,367. Thus, the present value of this machine’s future net cash flows exceeds the initial \$16,000 investment by \$4,367. FasTrac should invest in this machine.

**Net Present Value Decision Rule** The decision rule in applying NPV is as follows: When an asset’s expected future cash flows yield a *positive* net present value when discounted at the required rate of return, the asset should be acquired. This decision rule is reflected in the graphic below. When comparing several investment opportunities of similar cost and risk, we prefer the one with the highest positive net present value.

**Simplifying Computations** The computations in Exhibit 25.7 use separate present value of 1 factors for each of the eight years. Each year’s net cash flow is multiplied by its present value of 1 factor to determine its present value. The individual present values for each of the eight net cash flows are added to give the asset’s total present value. This computation can be simplified if annual net cash flows are equal in amount. A series of cash flows of equal dollar amount is called an **annuity**. One way is to use Table B.3, which gives the present value of 1 to be received periodically for a number of periods. To determine the present value of these eight annual receipts discounted at 12%, go down the 12% column of Table B.3 to the factor on the eighth line. This cumulative discount factor, also known as an *annuity* factor, is 4.9676. We then compute the \$20,367 present value for these eight annual \$4,100 receipts, computed as  $4.9676 \times \$4,100$ .

**Example:** Why does the net present value of an investment increase when a lower discount rate is used? Answer: The present value of net cash flows increases.

Another way to simplify present value calculations, whether net cash flows are equal in amount or not, is to use a calculator with compound interest functions or a spreadsheet program. We show how to use Excel functions to compute net present value in this chapter’s appendix. Whatever procedure you use, it is important to understand the concepts behind these computations.

**Decision Ethics**

**Systems Manager** Top management adopts a policy requiring purchases in excess of \$5,000 to be submitted with cash flow projections to the cost analyst for capital budget approval. As systems manager, you want to upgrade your computers at a \$25,000 cost. You consider submitting several orders all under \$5,000 to avoid the approval process. You believe the computers will increase profits and wish to avoid a delay. What do you do? ■ [Answers follow the chapter’s Summary.]

**Uneven Cash Flows** Net present value analysis can also be applied when net cash flows are uneven (unequal). To illustrate, assume that FasTrac can choose only one capital investment from among Projects A, B, and C. Each project requires the same \$12,000 initial investment. Future net cash flows for each project are shown in the first three number columns of Exhibit 25.8.

	Net Cash Flows			Present Value of 1 at 10%	Present Value of Net Cash Flows		
	A	B	C		A	B	C
Year 1 . . . . .	\$ 5,000	\$ 8,000	\$ 1,000	0.9091	\$ 4,546	\$ 7,273	\$ 909
Year 2 . . . . .	5,000	5,000	5,000	0.8264	4,132	4,132	4,132
Year 3 . . . . .	5,000	2,000	9,000	0.7513	3,757	1,503	6,762
Totals . . . . .	\$15,000	\$15,000	\$15,000		12,435	12,908	11,803
Amount invested . . . . .					(12,000)	(12,000)	(12,000)
<b>Net present value . . . . .</b>					<b>\$ 435</b>	<b>\$ 908</b>	<b>\$ (197)</b>

**EXHIBIT 25.8**  
Net Present Value Calculation with Uneven Cash Flows

**Example:** If 12% is the required return in Exhibit 25.8, which project is preferred? Answer: Project B. Net present values are: A = \$10; B = \$553; C = \$(715).

**Example:** Will the rankings of Projects A, B, and C change with the use of different discount rates, assuming the same rate is used for all projects? Answer: No; only the NPV amounts will change.

The three projects in Exhibit 25.8 have the same expected total net cash flows of \$15,000. Project A is expected to produce equal amounts of \$5,000 each year. Project B is expected to produce a larger amount in the first year. Project C is expected to produce a larger amount in the third year. The fourth column of Exhibit 25.8 shows the present value of 1 factors from Table B.1 assuming 10% required return.

Computations in the right-most columns show that Project A has a \$435 positive NPV. Project B has the largest NPV of \$908, because it brings in cash more quickly. Project C has a \$(197) *negative* NPV because its larger cash inflows are delayed. Projects with higher cash flows in earlier years generally yield higher net present values. If FasTrac requires a 10% return, it should reject Project C because its NPV implies a return *under* 10%. If only one project can be accepted, Project B appears best because it yields the highest NPV.

**NEED-TO-KNOW 25-3**

Net Present Value

P3

A company is considering two potential projects. Each project requires a \$20,000 initial investment and is expected to generate end-of-period annual cash flows as shown below. Assuming a discount rate of 10%, compute the net present value of each project.

	Net Cash Inflows			Total
	Year 1	Year 2	Year 3	
Project A . . . . .	\$12,000	\$8,500	\$ 4,000	\$24,500
Project B . . . . .	4,500	8,500	13,000	26,000

**Solution**

Net present values are computed as follows:

Year	Present Value of 1 at 10%	Project A		Project B	
		Net Cash Flows	Present Value of Net Cash Flows	Net Cash Flows	Present Value of Net Cash Flows
1	0.9091	\$12,000	\$10,909	\$ 4,500	\$ 4,091
2	0.8264	8,500	7,024	8,500	7,024
3	0.7513	4,000	3,005	13,000	9,767
Totals		\$24,500	\$20,938	\$26,000	\$20,882
Amount invested			(20,000)		(20,000)
<b>Net present value</b>			<b>\$ 938</b>		<b>\$ 882</b>

Do More: QS 25-2, QS 25-8, QS 25-9, QS 25-11, E 25-2, E 25-6, E 25-9

**QC3**

**Salvage Value** FasTrac predicted the \$16,000 machine to have zero salvage value at the end of its useful life (recall Exhibit 25.1). In many cases, assets are expected to have salvage values. If so, this amount is an additional net cash inflow expected to be received at the end of the final year of the asset’s life. All other computations remain the same. For example, the net present value of the \$16,000 investment that yields \$4,100 of net cash flows for eight years is \$4,367, as shown in Exhibit 25.7. If that machine is expected to have a \$1,500 salvage value at the end of its eight-year life, the present value of this salvage amount is \$606 (computed as  $\$1,500 \times 0.4039$ ). The net present value of the machine, including the present value of its expected salvage amount, is \$4,973 (computed as  $\$4,367 + \$606$ ).

**Accelerated Depreciation** Depreciation computations also affect net present value analysis. FasTrac computes depreciation using the straight-line method. Accelerated depreciation is also commonly used, especially for income tax purposes. Accelerated depreciation produces larger depreciation deductions in the early years of an asset’s life and smaller deductions in later years. This pattern results in smaller income tax payments in early years and larger payments in later

years. Accelerated depreciation does not change the basics of a present value analysis, but it can change the result. Using accelerated depreciation for tax reporting affects the NPV of an asset's cash flows because it produces larger net cash inflows in the early years of the asset's life and smaller ones in later years. Being able to use accelerated depreciation for tax reporting always makes an investment more desirable because early cash flows are more valuable than later ones.

**Point:** Tax savings from depreciation is called *depreciation tax shield*.

**Comparing Positive NPV Projects** In deciding whether to make a capital investment, we invest if the NPV is positive; we do not invest if the NPV is negative. When considering several projects of similar investment amounts and risk levels, we can compare the different projects' NPVs and rank them on the basis of their NPVs. However, if the amount invested differs substantially across projects, the NPV is of limited value for comparison purposes. One way to compare projects, especially when a company cannot fund all positive net present value projects, is to use the **profitability index**, which is computed as:

**Example:** When is it appropriate to use different discount rates for different projects?  
**Answer:** When risk levels are different.

$$\text{Profitability index} = \frac{\text{Present value of net cash flows}}{\text{Investment}}$$

Exhibit 25.9 illustrates the computation of the profitability index for three potential investments.

	Investment		
	1	2	3
Present value of net cash flows (a) . . . . .	\$900,000	\$375,000	\$270,000
Amount invested (b) . . . . .	750,000	250,000	300,000
Profitability index (a)/(b) . . . . .	1.2	1.5	0.90

**EXHIBIT 25.9**  
 Profitability Index

A profitability index less than 1 indicates an investment with a *negative* net present value. These potential investments, like Investment 3 in Exhibit 25.9, are eliminated from further consideration. Both Investments 1 and 2 have profitability indexes greater than 1, thus they have positive net present values. For example, Investment 1's NPV equals \$150,000 (computed as \$900,000 – \$750,000); Investment 2's NPV equals \$125,000 (computed as \$375,000 – \$250,000). Ideally, the company would accept all positive NPV projects, but if forced to choose, it should select the project with the higher profitability index. Thus, Investment 2 would be ranked ahead of Investment 1, based on its higher profitability index.

**Inflation** Large price-level increases should be considered in NPV analyses. Discount rates should already include inflation forecasts. Net cash flows can be adjusted for inflation by using *future value* computations. For example, if the expected net cash inflow in year 1 is \$4,100 and 5% inflation is expected, then the expected net cash inflow in year 2 is \$4,305, computed as \$4,100 × 1.05 (1.05 is the future value of \$1 [Table B.2] for 1 period with a 5% rate).

**Internal Rate of Return**

Another means to evaluate capital investments is to use the **internal rate of return (IRR)**, which equals the discount rate that yields an NPV of zero for an investment. This means that if we compute the total present value of a project's net cash flows using the IRR as the discount rate and then subtract the initial investment from this total present value, we get a zero NPV.

To illustrate, we use the data for FasTrac's Project A from Exhibit 25.8 to compute its IRR. Below is the two-step process for computing IRR with even cash flows.

**Step 1: Compute the present value factor for the investment project.**

$$\text{Present value factor} = \frac{\text{Amount invested}}{\text{Net cash flows}} = \frac{\$12,000}{\$5,000} = 2.4000$$

**Step 2: Identify the discount rate (IRR) yielding the present value factor.**

Search Table B.3 for a present value factor of 2.4000 in the three-year row (equaling the 3-year project duration). The 12% discount rate yields a present value factor of 2.4018. This implies that the IRR is approximately 12%.

**P4** \_\_\_\_\_  
 Compute internal rate of return and explain its use.

When cash flows are equal, as with Project A, we compute the present value factor by dividing the initial investment by its annual net cash flows. We then use an annuity table to determine the discount rate equal to this present value factor. For FasTrac’s Project A, we look across the three-period row of Table B.3 and find that the discount rate corresponding to the present value factor of 2.4000 roughly equals the 2.4018 value for the 12% rate.\* This row of Table B.3 is reproduced here:

Present Value of an Annuity of 1 for Three Periods					
Periods	Discount Rate				
	1%	5%	10%	12%	15%
3 . . . . .	2.9410	2.7232	2.4869	<b>2.4018</b>	2.2832

The 12% rate is the project’s IRR. A more precise IRR estimate can be computed using an Excel function, as we show in this chapter’s appendix.

**Uneven Cash Flows** If net cash flows are uneven, it is best to use either a calculator or spreadsheet software to compute the IRR. However, we can also use trial and error to compute the IRR. We do this by selecting any reasonable discount rate and computing the NPV. If the amount is positive (negative), we recompute the NPV using a higher (lower) discount rate. We continue these steps until we reach a point where two consecutive computations result in NPVs having different signs (positive and negative). Because the NPV is zero using IRR, we know that the IRR lies between these two discount rates. We can then estimate its value.

**Decision Insight**

**CEO-IRR** A survey reported that 41% of top managers would reject a project with an internal rate of return *above* the cost of capital *if* the project would cause the firm to miss its earnings forecast. The roles of benchmarks and manager compensation plans must be considered in capital budgeting decisions. ■

**Use of Internal Rate of Return** When we use the IRR to evaluate a project, we compare it to a predetermined **hurdle rate**, which is a minimum acceptable rate of return. The decision rule using IRR is applied as follows.

**Example:** How can management evaluate the risk of an investment? Answer: It must assess the uncertainty of future cash flows.

Top management selects the hurdle rate to use in evaluating capital investments. If the IRR is higher than the hurdle rate, the investment is made.

**Comparing Projects Using IRR** Multiple projects are often ranked by the extent to which their IRR exceeds the hurdle rate. The hurdle rate for individual projects is often different,

\* Since the present value factor of 2.4000 is not exactly equal to the 12% factor of 2.4018, we can more precisely estimate the IRR as follows:

<u>Discount rate</u>	<u>Present Value Factor from Table B.3</u>
12%	2.4018
15%	<u>2.2832</u>
	0.1186 = difference

$$\text{Then, IRR} = 12\% + \left[ (15\% - 12\%) \times \frac{2.4018 - 2.4000}{0.1186} \right] = \underline{\underline{12.05\%}}$$

depending on the risk involved. IRR is not subject to the limitations of NPV when comparing projects with different amounts invested because the IRR is expressed as a percent rather than as a dollar value in NPV.

## Decision Maker

**Entrepreneur** You are developing a new product and you use a 12% discount rate to compute its NPV. Your banker, from whom you hope to obtain a loan, expresses concern that your discount rate is too low. How do you respond? ■ [Answers follow the chapter's Summary.]

A machine costing \$58,880 is expected to generate net cash flows of \$8,000 per year for each of the next 10 years.

1. Compute the machine's internal rate of return (IRR).
2. If a company's hurdle rate is 6.5%, use IRR to determine whether the company should purchase this machine.

### Solution

1. Amount invested/net cash flows =  $\$58,880/\$8,000 = 7.36$ . Scanning the "Periods equal 10" row in Table B.3 for a present value factor near 7.36 indicates the IRR is 6%.
2. The machine should not be purchased because its IRR (6%) is less than the company's hurdle rate (6.5%).

## Comparison of Capital Budgeting Methods

We explained four methods that managers use to evaluate capital investment projects. How do these methods compare with each other? Exhibit 25.10 addresses that question. Neither the payback period nor the accounting rate of return considers the time value of money. On the other hand, both the net present value and the internal rate of return do.

### EXHIBIT 25.10

Comparing Capital Budgeting Methods

	Payback Period	Accounting Rate of Return	Net Present Value	Internal Rate of Return
<b>Measurement basis</b>	• Cash flows	• Accrual income	• Cash flows	• Cash flows
<b>Measurement unit</b>	• Years	• Percent	• Dollars	• Percent
<b>Strengths</b>	• Easy to understand • Allows comparison of projects	• Easy to understand • Allows comparison of projects	• Reflects time value of money • Reflects varying risks over project's life	• Reflects time value of money • Allows comparisons of dissimilar projects
<b>Limitations</b>	• Ignores time value of money • Ignores cash flows after payback period	• Ignores time value of money • Ignores annual rates over life of project	• Difficult to compare dissimilar projects	• Ignores varying risks over life of project

The payback period is probably the simplest method. It gives managers an estimate of how soon they will recover their initial investment. Managers sometimes use this method when they have limited cash to invest and a number of projects to choose from. The accounting rate of return yields a percent measure computed using accrual income instead of cash flows. The accounting rate of return is an average rate for the entire investment period. Net present value considers all estimated net cash flows for the project's expected life. It can be applied to even and uneven cash flows and can reflect changes in the level of risk over a project's life. Since NPV yields a dollar measure, comparing projects of unequal sizes is more difficult. The profitability index, based on each project's net present value, can be used in this case. The internal rate of return considers all cash flows from a project. It is readily computed when the cash flows are even but requires some trial and error or use of a computer estimation when cash flows are uneven. Because the IRR is a percent measure, it is readily used to compare projects with different investment amounts. However, IRR does not reflect changes in risk over a project's life.

### Decision Insight

**And the Winner Is . . .** How do we choose among the methods for evaluating capital investments? Management surveys consistently show the internal rate of return (IRR) as the most popular method followed by the payback period and net present value (NPV). Few companies use the accounting rate of return (ARR), but nearly all use more than one method. ■

## Section 2—Managerial Decisions

This section focuses on methods that use accounting information to make several important managerial decisions. Most of these involve short-term decisions. This differs from methods used for longer-term managerial decisions that are described in the first section of this chapter and in several other chapters of this book.

### DECISIONS AND INFORMATION

This section explains how managers make decisions and the information relevant to those decisions.

#### Decision Making

Managerial decision making involves five steps: (1) define the decision task, (2) identify alternative courses of action, (3) collect relevant information and evaluate each alternative, (4) select the preferred course of action, and (5) analyze and assess decisions made. These five steps are illustrated in Exhibit 25.11.

#### EXHIBIT 25.11

Managerial Decision Making

Both managerial and financial accounting information play an important role in most management decisions. The accounting system is expected to provide primarily *financial* information such as performance reports and budget analyses for decision making. *Nonfinancial* information is also relevant, however; it includes information on environmental effects, political sensitivities, and social responsibility.

#### Relevant Costs and Benefits

### C1

Describe the importance of relevant costs for short-term decisions.

Most financial measures of revenues and costs from accounting systems are based on historical costs. Although historical costs are important and useful for many tasks such as product pricing and the control and monitoring of business activities, their use can lead to incorrect decisions in some instances. Instead, an analysis of *relevant costs*, or *avoidable costs*, is especially useful in managers' short-term decisions. Three types of costs are pertinent to our discussion of relevant costs: sunk costs, out-of-pocket costs, and opportunity costs.

A *sunk cost* arises from a past decision and cannot be avoided or changed; it is irrelevant to future decisions. An example is the cost of computer equipment previously purchased by a company. This cost is not relevant to the decision of whether to replace the computer equipment. Likewise, depreciation of the original cost of plant (and intangible) assets are sunk costs. Most of a company's allocated costs, including fixed overhead items such as depreciation and administrative expenses, are sunk costs.

An *out-of-pocket cost* requires a future outlay of cash and is relevant for current and future decision making. These costs are usually the direct result of management's decisions. For instance, future purchases of computer equipment involve out-of-pocket costs. The cost of future computer purchases is relevant to the decision of whether to replace the computer equipment.

An *opportunity cost* is the potential benefit lost by taking a specific action when two or more alternative choices are available. An example is a student giving up wages from a job to attend summer school. The forgone wages should be considered as part of the total cost of attending summer school. Companies continually must choose from alternative courses of action. For instance, a company making standardized products might be approached by a customer to supply a special (nonstandard) product. A decision to accept or reject the special order must consider not only the profit to be made from the special order but also the profit given up by devoting time and resources to this order instead of pursuing an alternative project. The profit given up is an opportunity cost. Consideration of opportunity costs is important. Although opportunity costs are not entered in accounting records, they are relevant to many managerial decisions.

In sum, the relevant costs in making decisions are the **incremental costs**, also called *differential costs*, which are the additional costs incurred if a company pursues a certain course of action.

Besides relevant costs, management must also consider the relevant benefits associated with a decision. **Relevant benefits** refer to the additional or *incremental* revenue generated by selecting a particular course of action over another. In making decisions, managers should focus on those for which the relevant benefits exceed the relevant costs. As we will show, however, managers must also consider qualitative factors that are not easily expressed in terms of costs and benefits.

## MANAGERIAL DECISION SCENARIOS

Managers experience many different scenarios that require analyzing alternative actions and making a decision. We describe several different types of decision scenarios in this section. We set these tasks in the context of FasTrac, an exercise supplies and equipment manufacturer. We treat each of these decision tasks as separate from each other.

**A1** Evaluate short-term managerial decisions using relevant costs.

### Additional Business

FasTrac is operating at its normal level of 80% of full capacity. At this level, it produces and sells approximately 100,000 units of product annually. Its per unit and annual total sales and costs are shown in the contribution margin income statement in Exhibit 25.12. Its normal selling price is \$10.00 per unit, and each unit sold generates \$1.00 per unit of operating income.

FasTrac Contribution Margin Income Statement For Year Ended December 31, 2015		
	Per Unit	Annual Total
Sales (100,000 units).....	\$10.00	\$1,000,000
Variable costs		
Direct materials .....	(3.50)	(350,000)
Direct labor .....	(2.20)	(220,000)
Variable overhead .....	(0.50)	(50,000)
Selling expenses .....	(1.40)	(140,000)
Contribution margin.....	2.40	240,000
Fixed costs		
Fixed overhead .....	0.60	60,000
Administrative expenses.....	0.80	80,000
Operating income.....	<u>\$ 1.00</u>	<u>\$ 100,000</u>

### EXHIBIT 25.12

Selected Operating Income Data

A current buyer of FasTrac's products wants to purchase additional units of its product and export them to another country. This buyer offers to buy 10,000 units of the product at \$8.50 per unit, or \$1.50 less than the current price. The offer price is low, but FasTrac is considering the proposal because this sale would be several times larger than any single previous sale and it would use idle capacity. Also, the units will be exported, so this new business will not affect current sales.

To determine whether to accept or reject this order, management needs to know whether accepting the offer will increase net income. The analysis in Exhibit 25.13 shows that if management relies incorrectly on per unit historical costs, it would reject the sale because the selling price (\$8.50) per unit is less than the total historical costs per unit (\$9.00), and it thus yields a loss.

### EXHIBIT 25.13

Analysis of Additional Business Using Historical Costs

Additional Business	Per Unit	Total
Sales (10,000 additional units) . . . . .	\$ 8.50	\$ 85,000
Total costs and expenses (historical) . . . . .	<u>(9.00)</u>	<u>(90,000)</u>
Operating loss . . . . .	<u><u>\$(0.50)</u></u>	<u><u>\$(5,000)</u></u>

To correctly make its decision, FasTrac must analyze the costs of this potential new business differently. The \$9.00 historical cost per unit is not necessarily the incremental cost of this order. The following information regarding the order is available:

- The variable manufacturing costs to produce this order will be the same as for FasTrac's normal business—\$3.50 per unit for direct materials, \$2.20 per unit for direct labor, and \$0.50 per unit for variable overhead.
- Selling expenses for this order will be \$0.20 per unit, which is less than the selling expenses of FasTrac's normal business.
- Fixed overhead expenses will not change regardless of whether this order is accepted.
- This order will incur *incremental* administrative expenses of \$1,000 for clerical work. These are additional fixed costs due to this order.

We use this information to determine whether FasTrac should accept this new business. The analysis of relevant benefits and costs in Exhibit 25.14 suggests that the additional business should be accepted. It would yield \$20,000 of additional pretax income. More generally, FasTrac would increase its income with any price that exceeded \$6.50 per unit (\$65,000 incremental cost/10,000 additional units). The key point is that *management must not blindly use historical costs, especially allocated overhead costs*. Instead, management must focus on the incremental costs to be incurred if the additional business is accepted.

### EXHIBIT 25.14

Analysis of Additional Business Using Relevant Costs

FasTrac		
Contribution Margin Income Statement (for special order)		
For Year Ended December 31, 2015		
	Per Unit	Annual Total
Sales (10,000 units) . . . . .	\$8.50	\$85,000
Variable costs		
Direct materials . . . . .	(3.50)	(35,000)
Direct labor . . . . .	(2.20)	(22,000)
Variable overhead . . . . .	(0.50)	(5,000)
Selling expenses . . . . .	<u>(0.20)</u>	<u>(2,000)</u>
Contribution margin . . . . .	2.10	21,000
Fixed costs		
Fixed overhead . . . . .	—	—
Administrative expenses . . . . .	<u>(0.10)</u>	<u>(1,000)</u>
Operating income (incremental) . . . . .	<u><u>\$2.00</u></u>	<u><u>\$20,000</u></u>

**Point:** The income statement in Exhibit 25.14 is based on the incremental revenues and costs of the special order.

**Other Factors** An analysis of the incremental costs pertaining to the additional volume is always relevant for this type of decision. We must proceed cautiously, however, when the additional volume approaches or exceeds the factory's existing available capacity. If the additional volume requires the company to expand its capacity by obtaining more equipment, more space, or more personnel, the incremental costs could quickly exceed the incremental revenue. Another cautionary note is the effect on existing sales. All new units of the extra business will be sold outside FasTrac's normal domestic sales channels. If accepting additional business would cause existing sales to decline, this information must be included in our analysis. The contribution margin lost from a decline in sales is an opportunity cost. The company must also consider whether this customer is really a one-time customer. If not, can the company continue to offer this low price in the long run?

**Example:** Exhibit 25.14 uses quantitative information. Suggest some qualitative factors to be considered when deciding whether to accept this project. *Answer:* (1) Impact on relationships with other customers and (2) improved relationship with customer buying additional units.

A company receives a special order for 200 units that requires stamping the buyer's name on each unit, yielding an additional fixed cost of \$400 to its normal costs. Without the order, the company is operating at 75% of capacity and produces 7,500 units of product at the costs below. The company's normal selling price is \$22 per unit.

### NEED-TO-KNOW 25-5

Special Order

A1

Direct materials . . . . .	\$37,500
Direct labor . . . . .	60,000
Overhead (30% variable) . . . . .	20,000
Selling expenses (60% variable) . . . . .	25,000

The sales price for the special order is \$18 per unit. The special order will not affect normal unit sales and will not increase fixed overhead or fixed selling expenses. Variable selling expenses on the special order are reduced to one-half the normal amount. Should the company accept the special order?

#### Solution

Incremental variable costs per unit for this order of 200 units are computed as follows:

Direct materials $(\$37,500/7,500)$ . . . . .	\$ 5.00
Direct labor $(\$60,000/7,500)$ . . . . .	8.00
Variable overhead $[(0.30 \times \$20,000)/7,500]$ . . . . .	0.80
Variable selling expenses $[(0.60 \times \$25,000 \times 0.5)/7,500]$ . . . . .	1.00
Total incremental variable costs per unit . . . . .	<u>\$14.80</u>

QC4

The contribution margin from the special order is \$640, computed as  $[(\$18.00 - \$14.80) \times 200]$ . This will cover the incremental fixed costs of \$400 and yield incremental income of \$240. The offer should be accepted.

E 25-18

## Decision Maker

**Partner** You are a partner in a small accounting firm that specializes in keeping the books and preparing taxes for clients. A local restaurant is interested in obtaining these services from your firm. Identify factors that are relevant in deciding whether to accept the engagement. ■ [Answers follow the chapter's Summary.]

## Make or Buy

The managerial decision to make or buy a component is common. For example, **Apple** buys the component parts for its electronic products, but it could consider making these components in its own manufacturing facilities. This decision depends on incremental costs. We return to FasTrac to illustrate. FasTrac currently buys part 417, a component of the main product it sells, for \$1.20 per unit. FasTrac has excess productive capacity, and management is wondering whether the company should make part 417 instead of buy it. FasTrac estimates that making part 417

would incur variable costs of \$0.45 for direct materials and \$0.50 for direct labor. FasTrac's normal predetermined overhead application rate is 100% of direct labor cost. If management *incorrectly* relies on this historical overhead rate, it will prepare the analysis in Exhibit 25.15.

### EXHIBIT 25.15

Make or Buy Analysis  
Using Historical Costs

(per unit)	Make	Buy
Direct materials . . . . .	\$0.45	—
Direct labor . . . . .	0.50	—
<b>Overhead costs (using historical rate)</b> . . . . .	<b>0.50</b>	—
Purchase price . . . . .	—	\$1.20
Total costs . . . . .	<u>\$1.45</u>	<u>\$1.20</u>

Using the data in Exhibit 25.15, management would mistakenly believe that the cost to make the component part is \$1.45 per unit and conclude that the company is better off buying the part at \$1.20 per unit. This analysis is flawed, however, because it uses the historical predetermined overhead rate.

As we explained earlier, only *incremental* overhead costs are relevant to this make or buy decision. Incremental overhead costs might include, for example, additional power for operating machines, extra supplies, added cleanup costs, materials handling, and quality control. Assume that management computes an *incremental overhead rate* of \$0.20 per unit if it makes the part. We can then prepare a per unit analysis, using relevant costs, as shown in Exhibit 25.16.

### EXHIBIT 25.16

Make or Buy Analysis  
Using Relevant Costs

(per unit)	Make	Buy
Direct materials . . . . .	\$0.45	—
Direct labor . . . . .	0.50	—
<b>Overhead costs (using incremental rate)</b> . . . . .	<b>0.20</b>	—
Purchase price . . . . .	—	\$1.20
Total costs . . . . .	<u>\$1.15</u>	<u>\$1.20</u>

Exhibit 25.16 shows that the relevant cost to make part 417 is \$1.15. Based on this analysis, it is cheaper to make the part than to buy it. We can see that if incremental overhead costs are less than \$0.25 per unit, the total cost of making the part will be less than the purchase price of \$1.20 per unit.

**Other Factors** While our analysis suggests it is cheaper to make part 417, FasTrac must also consider several nonfinancial factors in the make or buy decision. These factors might include product quality, timeliness of delivery (especially in a just-in-time setting), reactions of customers and suppliers, and other intangibles like employee morale and workload. It must also consider whether making the part requires incremental fixed costs to expand plant capacity. When these additional factors are considered, small cost differences might not matter.

## NEED-TO-KNOW 25-6

Make or Buy

A1

A company currently pays \$5 per unit to buy a key part for a product it manufactures. The company believes it can make the part for \$1.50 per unit for direct materials and \$2.50 per unit for direct labor. The company allocates overhead costs at the rate of 50% of direct labor. Incremental overhead costs to make this part are \$0.75 per unit. Should the company make or buy the part?

**Solution**

(per unit)	Make	Buy
Direct materials . . . . .	\$1.50	—
Direct labor . . . . .	2.50	—
Overhead . . . . .	0.75	—
Cost to buy the part . . . . .	—	\$5.00
Total . . . . .	<u>\$4.75</u>	<u>\$5.00</u>

The company should make the part because the cost to make it is less than the cost to buy it.

**Decision Insight**

**Make or Buy IT** Companies apply make or buy decisions to their services. Many now outsource their information technology activities. Information technology companies provide infrastructure and services to enable businesses to focus on their key activities. It is argued that outsourcing saves money and streamlines operations, and without the headaches. ■

**Scrap or Rework**

Manufacturing processes sometimes yield defective products. In such cases, managers must make a decision on whether to scrap or rework products in process. Two points are important here. First, costs already incurred in manufacturing the defective units are sunk and not relevant. Second, we must consider opportunity costs—reworking the defective products uses productive capacity that could be devoted to normal operations.

To illustrate, assume that FasTrac has 10,000 defective units of a product that have already cost \$1 per unit to manufacture. These units can be sold as is (as scrap) for \$0.40 each, or they can be reworked for \$0.80 per unit and then sold for their full price of \$1.50 each. Should FasTrac sell the units as scrap or rework them?

The \$1 per unit manufacturing cost already incurred is irrelevant. Further, if FasTrac is operating near its maximum capacity, reworking the defects means that FasTrac is unable to manufacture 10,000 *new* units with an incremental cost of \$1 per unit and a selling price of \$1.50 per unit, meaning it incurs an *opportunity cost* of \$0.50 per unit (\$1.50 selling price – \$1.00 incremental cost). Our analysis is then reflected in Exhibit 25.17.

	Scrap	Rework
Sale of scrapped/reworked units (10,000 units) . . . . .	\$ 4,000	\$ 15,000*
Less out-of-pocket costs to rework defects (\$0.80 per unit) . . . . .		(8,000)
<b>Less opportunity cost of not making new units (\$0.50 per unit) . . . . .</b>		<b>(5,000)</b>
<b>Incremental net income . . . . .</b>	<b>\$4,000</b>	<b>\$ 2,000</b>

**EXHIBIT 25.17**

Scrap or Rework Analysis

\*10,000 × \$1.50

Scrapping the units would yield incremental income of \$4,000; reworking the units would yield only \$2,000 of income. Based on this analysis, the defective units should be scrapped and sold as is for \$0.40 each. If we had failed to include the opportunity costs of \$5,000, the rework option would have shown an income of \$7,000 instead of \$2,000, mistakenly making reworking appear more favorable than scrapping.

**Sell or Process Further**

Some companies must decide whether to sell partially completed products as is or to process them further for sale as other products. For example, a peanut grower could sell its peanut harvest as is, or it could process peanuts into other products such as peanut butter, trail mix, and candy. The decision depends on the incremental costs and benefits of further processing, as we show next.

To illustrate, suppose that FasTrac has 40,000 units of partially finished Product Q. It has already spent \$30,000 to manufacture these 40,000 units. FasTrac can sell the 40,000 units to another manufacturer as raw material for \$50,000. Alternatively, it can process them further and produce finished Products X, Y, and Z. Processing the units further will cost an additional \$80,000 and will yield total revenues of \$150,000. FasTrac must decide whether the added revenues from selling finished Products X, Y, and Z exceed the costs of finishing them.

Exhibit 25.18 presents the analysis.

**EXHIBIT 25.18**

Sell or Process Further Analysis

	Sell as Product Q	Process Further into Products X, Y, and Z
Incremental revenue . . . . .	\$50,000	\$150,000
Incremental cost . . . . .	—	(80,000)
Incremental income . . . . .	<u>\$50,000</u>	<u>\$ 70,000</u>

The analysis shows that the incremental income from processing further (\$70,000) is greater than the incremental income (\$50,000) from selling Product Q as is. Therefore, FasTrac should process further; by doing so, it will earn an additional \$20,000 of income (\$70,000 – \$50,000). Notice that the \$30,000 of previously incurred manufacturing costs are *excluded* from the analysis. These costs are sunk, and they are not relevant to the decision. The incremental revenue from selling Product Q as is (\$50,000) is properly included. It is the opportunity cost associated with processing further.

**NEED-TO-KNOW 25-7**

Sell or Process Further  
A1

For each of the two independent scenarios below, determine whether the company should sell the partially completed product as is or process it further into other saleable products.

- \$10,000 of manufacturing costs have been incurred to produce Product Alpha. Alpha can be sold as is for \$30,000 or processed further into two separate products. The further processing will cost \$15,000, and the resulting products can be sold for total revenues of \$60,000.
- \$5,000 of manufacturing costs have been incurred to produce Product Delta. Delta can be sold as is for \$150,000 or processed further into two separate products. The further processing will cost \$75,000, and the resulting products can be sold for total revenues of \$200,000.

**Solution**

1.

Alpha	Sell As Is	Process Further
Incremental revenue . . . . .	\$30,000	\$60,000
Incremental cost . . . . .	—	(15,000)
Incremental income . . . . .	<u>\$30,000</u>	<u>\$45,000</u>

Alpha should be processed further; doing so will yield an extra \$15,000 (\$45,000 – \$30,000) of income.

2.

Delta	Sell As Is	Process Further
Incremental revenue . . . . .	\$150,000	\$200,000
Incremental cost . . . . .	—	(75,000)
Incremental income . . . . .	<u>\$150,000</u>	<u>\$125,000</u>

Delta should be sold as is; doing so will yield an extra \$25,000 (\$150,000 – \$125,000) of income.

**Sales Mix Selection When Resources Are Constrained**

When a company sells a mix of products, some are likely to be more profitable than others. Management concentrates sales efforts on more profitable products. If production facilities or other factors are limited, producing more of one product usually requires producing less of others. In this case, management must identify the most profitable combination, or *sales mix* of products. To identify the best sales mix, management focuses on the *contribution margin per unit of scarce resource*.

**Point:** A method called *linear programming* is useful for finding the optimal sales mix for several products subject to many market and production constraints. This method is described in advanced courses.

To illustrate, assume that FasTrac makes and sells two products, A and B. The same machines are used to produce both products. A and B have the following selling prices and variable costs per unit:

(per unit)	Product A	Product B
Selling price . . . . .	\$5.00	\$7.50
Variable costs . . . . .	3.50	5.50

FasTrac has an existing capacity of 100,000 machine hours per year. In addition, Product A uses 1 machine hour per unit while Product B uses 2 machine hours per unit. With limited resources, FasTrac should focus its productive capacity on the product that yields the highest contribution margin per machine hour, until market demand for that product is satisfied. Exhibit 25.19 shows the relevant analysis.

	Product A	Product B
Selling price per unit . . . . .	\$5.00	\$7.50
Variable costs per unit . . . . .	<u>3.50</u>	<u>5.50</u>
Contribution margin per unit (a) . . . . .	\$1.50	\$2.00
Machine hours per unit (b) . . . . .	1.0	2.0
<b>Contribution margin per machine hour (a) × (b) . . . . .</b>	<b>\$1.50</b>	<b>\$1.00</b>

**EXHIBIT 25.19**

Sales Mix Analysis

Exhibit 25.19 shows that although Product B has a higher contribution margin per *unit*, Product A has a higher contribution margin per *machine hour*. In this case, FasTrac should produce as much of Product A as possible, up to the market demand. For example, if the demand for Product A is unlimited, FasTrac should produce 100,000 units of Product A and none of Product B. This sales mix would yield a contribution margin of \$150,000 per year, the maximum the company could make subject to its resource constraint.

If demand for Product A is limited—say, to 80,000 units—FasTrac will begin by producing those 80,000 units. This production level would leave 20,000 machine hours to devote to production of Product B. FasTrac would use these remaining machine hours to produce 10,000 units (20,000 machine hours/2 machine hours per unit) of Product B. This sales mix would yield the contribution margin shown in Exhibit 25.20.

	Contribution Margin	Machine Hours Used
Product A (80,000 × \$1.50 per unit) . . . . .	\$120,000	80,000
Product B (10,000 × \$2.00 per unit) . . . . .	<u>20,000</u>	<u>20,000</u>
Total . . . . .	<u>\$140,000</u>	<u>100,000</u>

**EXHIBIT 25.20**

Contribution Margin from Sales Mix, with Resource Constraint

With limited demand for Product A, the optimal sales mix yields a contribution margin of \$140,000, the best the company can do subject to its resource constraint and market demand. In general, if demand for products is limited, management should produce its most profitable product (per unit of scarce resource) up to the point of total demand (or its capacity constraint). It then uses remaining capacity to produce its next most profitable product.

**Point:** FasTrac might consider buying more machines to reduce the constraint on production. A strategy designed to reduce the impact of constraints or bottlenecks on production is called the *theory of constraints*.

A company produces two products, Gamma and Omega. Gamma sells for \$10 per unit and Omega sells for \$12.50 per unit. Variable costs are \$7 per unit of Gamma and \$8 per unit of Omega. The company has a capacity of 5,000 machine hours per month. Gamma uses 1 machine hour per unit, and Omega uses 3 machine hours per unit.

1. Compute the contribution margin per machine hour for each product.
2. Assume demand for Gamma is limited to 3,800 units per month. How many units of Gamma and Omega should the company produce, and what will be the total contribution margin from this sales mix?

**NEED-TO-KNOW** 25-8

Sales Mix with Constrained Resources

A1

**Solution**

1.

	Gamma	Omega
Selling price per unit .....	\$10.00	\$12.50
Variable costs per unit .....	<u>7.00</u>	<u>8.00</u>
Contribution margin per unit .....	\$ 3.00	\$ 4.50
Machine hours per unit .....	1	3
Contribution margin per machine hour .....	<u>\$ 3.00</u>	<u>\$ 1.50</u>

2. The company will begin by producing Gamma to meet the market demand of 3,800 units. This production level will consume 3,800 machine hours, leaving 1,200 machine hours to produce Omega. With 1,200 machine hours, the company can produce 400 units (1,200 machine hours/3 machine hours per unit) of Omega. The total contribution margin from this sales mix is:

Gamma .....	3,800 units × \$3.00 per unit = \$11,400
Omega .....	400 units × \$4.50 per unit = <u>1,800</u>
Total .....	<u>\$13,200</u>

### Decision Insight

Companies such as **Gap**, **Abercrombie & Fitch**, and **American Eagle** must continuously monitor and manage the sales mix of their product lists. Selling their products worldwide further complicates their decision process. The contribution margin of each product is crucial to their product mix strategies. ■

BananaStock/Punchstock

### Segment Elimination

When a segment, division, or store is performing poorly, management must consider eliminating it. As we showed in a previous chapter, determining a segment's *contribution to overhead* is an important first step in this analysis. Segments with revenues less than direct costs are candidates for elimination. However, contribution to overhead is not sufficient for this decision. Instead, we must further classify the segment's expenses as avoidable or unavoidable. **Avoidable expenses** are amounts the company would not incur if it eliminated the segment. **Unavoidable expenses** are amounts that would continue even if the segment was eliminated.

To illustrate, FasTrac is considering eliminating its treadmill division, which reported a \$500 operating loss for the recent year, as shown in Exhibit 25.21. From Exhibit 25.21, we see that the treadmill division contributes \$9,700 to recovery of overhead costs. The next step is to classify the division's costs as either avoidable or unavoidable. Variable costs, such as cost of goods sold and wages expense, are avoidable. In addition, some of the division's indirect expenses are avoidable; for example, if the treadmill division were eliminated, FasTrac could reduce its overall advertising expense by \$400 and its overall insurance expense by \$300. In addition, FasTrac could avoid office department expenses of \$2,200 and purchasing expenses of \$1,000 if the treadmill division were eliminated. It is important to realize that these *avoidable* expenses would not be allocated to other divisions of the company; rather, these expenses would be eliminated. Unavoidable expenses, however, will be reallocated to other divisions if the treadmill division is eliminated.

FasTrac's analysis shows that it can avoid a total of \$41,800 of expenses if it eliminates the treadmill division. However, because this division's sales are \$47,800, eliminating the division would reduce FasTrac's income by \$6,000 (\$47,800 - \$41,800). Based on this analysis, FasTrac should not eliminate its treadmill division. *Our decision rule is that a segment is a candidate for elimination if its revenues are less than its avoidable expenses.* Avoidable expenses can be viewed as the costs to generate this segment's revenues.

**Example:** How can insurance be classified as either avoidable or unavoidable? *Answer:* It depends on whether the assets insured can be removed and the premiums canceled.

Treadmill Division	Total	Avoidable Expenses	Unavoidable Expenses
Sales .....	\$47,800		
Cost of goods sold .....	<u>30,000</u>	\$30,000	
Gross profit .....	17,800		
Direct expenses			
Wages expense .....	7,900	7,900	
Depreciation expense—Equipment .....	<u>200</u>		\$ 200
Total direct expenses .....	<u>8,100</u>		
Departmental contribution to overhead .....	\$ 9,700		
Indirect expenses			
Rent and utilities expense .....	3,150		3,150
Advertising expense .....	400	400	
Insurance expense .....	400	300	100
Share of office department expenses .....	3,060	2,200	860
Share of purchasing department expenses .....	<u>3,190</u>	<u>1,000</u>	<u>2,190</u>
Total indirect expenses .....	<u>10,200</u>		
Operating income (loss) .....	<u>\$ (500)</u>		
Total avoidable expenses .....		<u>\$41,800</u>	
Total unavoidable expenses .....			<u>\$6,500</u>

**EXHIBIT 25.21**

Classification of Segment Operating Expenses for Analysis

**Point:** The analysis is summarized as:

Sales	\$47,800
Avoidable expenses	(41,800)
Reduction in income	\$ 6,000

Because sales > avoidable expenses, do not eliminate division.

**Other Factors** When considering elimination of a segment, we must assess its impact on other segments. A segment could be unprofitable on its own, but it might still contribute to other segments' revenues and profits. It is possible then to continue a segment even when its revenues are less than its avoidable expenses. Similarly, a profitable segment might be discontinued if its space, assets, or staff can be more profitably used by expanding existing segments or by creating new ones. Our decision to keep or eliminate a segment requires a more complex analysis than simply looking at a segment's performance report.

**Example:** Give an example of a segment that a company might profitably use to attract customers even though it might incur a loss. Answer: Warranty and post-sales services.

A bike maker is considering eliminating its tandem bike division because it operates at a loss of \$6,000 per year. Sales for the year total \$40,000, and the company reports the costs for this division as shown below. Should the tandem bike division be eliminated?

	Avoidable Expenses	Unavoidable Expenses
Cost of goods sold .....	\$30,000	\$ —
Direct expenses .....	8,000	—
Indirect expenses .....	2,500	3,000
Service department costs .....	<u>250</u>	<u>2,250</u>
Total .....	<u>\$40,750</u>	<u>\$5,250</u>

**Solution**

Total avoidable costs of \$40,750 are greater than the division's sales of \$40,000, suggesting the division should be eliminated. Other factors might be relevant, since the shortfall in sales (\$750) is low. For example, are sales expected to increase in the future? Does the sale of tandem bikes help sales of other types of products?

**NEED-TO-KNOW 25-9**

Segment Elimination

**Keep or Replace Equipment**

Businesses periodically must decide whether to keep using equipment or replace it. Advances in technology typically mean newer equipment can operate more efficiently and at lower cost than older equipment. If the reduction in *variable* manufacturing costs with the new equipment is greater

than its net purchase price, the equipment should be replaced. In this setting, the net purchase price of the equipment is its total cost minus any trade-in allowance or cash receipt for the old equipment.

For example, FasTrac has a piece of manufacturing equipment with a book value (cost minus accumulated depreciation) of \$20,000 and a remaining useful life of four years. At the end of four years the equipment will have a salvage value of zero. The market value of the equipment is currently \$25,000.

FasTrac can purchase a new machine for \$100,000 and receive \$25,000 in return for trading in its old machine. The new machine will reduce FasTrac's variable manufacturing costs by \$18,000 per year over the four-year life of the new machine. FasTrac's incremental analysis is shown in Exhibit 25.22.

### EXHIBIT 25.22

Keep or Replace Analysis

	Increase or (Decrease) in Net Income
Cost to buy new machine . . . . .	\$(100,000)
Cash received to trade in old machine . . . . .	25,000
Reduction in variable manufacturing costs . . . . .	<u>72,000*</u>
Total increase (decrease) in net income . . . . .	<u>\$ (3,000)</u>

\*18,000 × 4 years

The analysis in Exhibit 25.22 shows that FasTrac should not replace the old equipment with this newer version as it will decrease income by \$3,000. Note, the book value of the old equipment (\$20,000) is not relevant to this analysis. Book value is a sunk cost, and it cannot be changed regardless of whether FasTrac keeps or replaces this equipment.

QC6

## GLOBAL VIEW

**Siemens AG** is a global electrical engineering and electronics company headquartered in Germany. Recently, the company announced plans to invest £160 million to build a wind turbine plant in the United Kingdom. Net present value analyses support such decisions. In this case, Siemens foresees strong future cash flows based on increased demand for clean sources of energy, like wind power.

**Sustainability and Accounting** Net present value calculations extend to investments in sustainable energy sources like solar power. Predicting the future benefits of solar panel installations, in terms of reduced energy costs, is challenging for several reasons. First, the amount of solar energy that can be produced depends on geographic location, with locations nearer the equator typically better. Second, south-facing roofs are better able to capture solar energy than other orientations. Third, cost savings from solar energy require predictions of the future costs of other sources of power, which can be volatile. While challenging, these factors must be considered when performing a net present value calculation on a potential investment in solar power.

Sustainability extends beyond natural resources. **Adafruit**'s founder Limor Fried invests in programs to educate future engineers and entrepreneurs. In this way Limor is helping to develop and sustain the human capital that will benefit society in the future.

## Decision Analysis ■ ■ ■ Break-Even Time

A2

Analyze a capital investment project using break-even time.

The first section of this chapter explained several methods to evaluate capital investments. Break-even time of an investment project is a variation of the payback period method that overcomes the limitation of not using the time value of money. **Break-even time (BET)** is a time-based measure used to evaluate a capital investment's acceptability. Its computation yields a measure of expected time, reflecting the time period until the *present value* of the net cash flows from an investment equals the initial cost of the investment. In basic terms, break-even time is computed by restating future cash flows in terms of present values and then determining the payback period using these present values.

To illustrate, we return to the FasTrac case described in Exhibit 25.1 involving a \$16,000 investment in machinery. The annual net cash flows from this investment are projected at \$4,100 for eight years. Exhibit 25.23 shows the computation of break-even time for this investment decision.

**EXHIBIT 25.23**  
Break-Even Time Analysis\*

Year	Cash Flows	Present Value of 1 at 10%	Present Value of Cash Flows	Cumulative Present Value of Cash Flows
0	\$(16,000)	1.0000	\$(16,000)	\$(16,000)
1	4,100	0.9091	3,727	(12,273)
2	4,100	0.8264	3,388	(8,885)
3	4,100	0.7513	3,080	(5,805)
4	4,100	0.6830	2,800	(3,005)
5	4,100	0.6209	2,546	(459)
6	4,100	0.5645	2,314	1,855
7	4,100	0.5132	2,104	3,959
8	4,100	0.4665	1,913	5,872

\* The time of analysis is the start of year 1 (same as end of year 0). All cash flows occur at the end of each year.

The right-most column of this exhibit shows that break-even time is between 5 and 6 years, or about 5.2 years—also see margin graph (where the line crosses the zero point). This is the time the project takes to break even after considering the time value of money (recall that the payback period computed without considering the time value of money was 3.9 years). We interpret this as cash flows earned after 5.2 years contribute to a positive net present value that, in this case, eventually amounts to \$5,872.

Break-even time is a useful measure for managers because it identifies the point in time when they can expect the cash flows to begin to yield net positive returns. Managers expect a positive net present value from an investment if break-even time is less than the investment’s estimated life. The method allows managers to compare and rank alternative investments, giving the project with the shortest break-even time the highest rank.

**Decision Maker**

**Investment Manager** Management asks you, the investment manager, to evaluate three alternative investments. Investment recovery time is crucial because cash is scarce. The time value of money is also important. Which capital budgeting method(s) do you use to assess the investments? [Answers follow the chapter’s Summary.]

Determine the appropriate action in each of the following managerial decision situations.

- Packer Company is operating at 80% of its manufacturing capacity of 100,000 product units per year. A chain store has offered to buy an additional 10,000 units at \$22 each and sell them to customers so as not to compete with Packer Company. The following data are available.

Costs at 80% Capacity	Per Unit	Total
Direct materials	\$ 8.00	\$ 640,000
Direct labor	7.00	560,000
Overhead (fixed and variable)	12.50	1,000,000
Totals	<u>\$27.50</u>	<u>\$2,200,000</u>

In producing 10,000 additional units, fixed overhead costs would remain at their current level but incremental variable overhead costs of \$3 per unit would be incurred. Should the company accept or reject this order?

- Green Company uses Part JR3 in manufacturing its products. It has always purchased this part from a supplier for \$40 each. It recently upgraded its own manufacturing capabilities and has enough excess capacity (including trained workers) to begin manufacturing Part JR3 instead of buying it. The company prepares the following cost projections of making the part, assuming that overhead is allocated to the part at the normal predetermined rate of 200% of direct labor cost.

Direct materials	\$ 11
Direct labor	15
Overhead (fixed and variable) (200% of direct labor)	30
Total	<u>\$56</u>

**NEED-TO-KNOW**  
**COMPREHENSIVE**

The required volume of output to produce the part will not require any incremental fixed overhead. Incremental variable overhead cost will be \$17 per unit. Should the company make or buy this part?

3. Gold Company's manufacturing process causes a relatively large number of defective parts to be produced. The defective parts can be (a) sold for scrap, (b) melted to recover the recycled metal for reuse, or (c) reworked to be good units. Reworking defective parts reduces the output of other good units because no excess capacity exists. Each unit reworked means that one new unit cannot be produced. The following information reflects 500 defective parts currently available.

Proceeds of selling as scrap	\$2,500
Additional cost of melting down defective parts	400
Cost of purchases avoided by using recycled metal from defects	4,800
Cost to rework 500 defective parts	
Direct materials	0
Direct labor	1,500
Incremental overhead	1,750
Cost to produce 500 new parts	
Direct materials	6,000
Direct labor	5,000
Incremental overhead	3,200
Selling price per good unit	40

Should the company melt the parts, sell them as scrap, or rework them?

4. White Company can invest in one of two projects, TD1 or TD2. Each project requires an initial investment of \$100,000 and produces the year-end cash inflows shown in the following table. Use net present values to determine which project, if any, should be chosen. Assume that the company requires a 10% return from its investments.

	Net Cash Flows	
	TD1	TD2
Year 1	\$ 20,000	\$ 40,000
Year 2	30,000	40,000
Year 3	70,000	40,000
Totals	<u>\$120,000</u>	<u>\$120,000</u>

## PLANNING THE SOLUTION

- Determine whether Packer Company should accept the additional business by finding the incremental costs of materials, labor, and overhead that will be incurred if the order is accepted. Omit fixed costs that the order will not increase. If the incremental revenue exceeds the incremental cost, accept the order.
- Determine whether Green Company should make or buy the component by finding the incremental cost of making each unit. If the incremental cost exceeds the purchase price, the component should be purchased. If the incremental cost is less than the purchase price, make the component.
- Determine whether Gold Company should sell the defective parts, melt them down and recycle the metal, or rework them. To compare the three choices, examine all costs incurred and benefits received from the alternatives in working with the 500 defective units versus the production of 500 new units. For the scrapping alternative, include the costs of producing 500 new units and subtract the \$2,500 proceeds from selling the old ones. For the melting alternative, include the costs of melting the defective units, add the net cost of new materials in excess over those obtained from recycling, and add the direct labor and overhead costs. For the reworking alternative, add the costs of direct labor and incremental overhead. Select the alternative that has the lowest cost. The cost assigned to the 500 defective units is sunk and not relevant in choosing among the three alternatives.
- Compute White Company's net present value of each investment using a 10% discount rate.

## SOLUTION

1. This decision involves accepting additional business. Since current unit costs are \$27.50, it appears initially as if the offer to sell for \$22 should be rejected, but the \$27.50 cost includes fixed costs. When the analysis includes only *incremental* costs, the per unit cost is as shown in the following table. The offer should be accepted because it will produce \$4 of additional profit per unit (computed as \$22 price less \$18 incremental cost), which yields a total profit of \$40,000 for the 10,000 additional units.

Direct materials .....	\$ 8.00
Direct labor .....	7.00
Variable overhead (given) .....	3.00
Total incremental cost .....	<u>\$18.00</u>

2. For this make or buy decision, the analysis must not include the \$13 nonincremental overhead per unit (\$30 – \$17). When only the \$17 incremental overhead is included, the relevant unit cost of manufacturing the part is shown in the following table. It would be better to continue buying the part for \$40 instead of making it for \$43.

Direct materials .....	\$11.00
Direct labor .....	15.00
Variable overhead .....	17.00
Total incremental cost .....	<u>\$43.00</u>

3. The goal of this scrap or rework decision is to identify the alternative that produces the greatest net benefit to the company. To compare the alternatives, we determine the net cost of obtaining 500 marketable units as follows:

Incremental Cost to Produce 500 Marketable Units	Sell As Is	Melt and Recycle	Rework Units
Direct materials			
New materials .....	\$ 6,000	\$6,000	
Recycled metal materials .....		(4,800)	
Net materials cost .....		1,200	
Melting costs .....		400	
Total direct materials cost .....	6,000	1,600	
Direct labor .....	5,000	5,000	\$1,500
Incremental overhead .....	3,200	3,200	1,750
Cost to produce 500 marketable units .....	14,200	9,800	3,250
Less proceeds of selling defects as scrap .....	(2,500)		
Opportunity costs* .....			5,800
Net cost .....	<u>\$11,700</u>	<u>\$9,800</u>	<u>\$9,050</u>

\* The \$5,800 opportunity cost is the lost contribution margin from not being able to produce and sell 500 units because of reworking, computed as  $(\$40 - [\$14,200/500 \text{ units}]) \times 500 \text{ units}$ .

The incremental cost of 500 marketable parts is smallest if the defects are reworked.

#### 4. TD1:

	Net Cash Flows	Present Value of 1 at 10%	Present Value of Net Cash Flows
Year 1 .....	\$ 20,000	0.9091	\$ 18,182
Year 2 .....	30,000	0.8264	24,792
Year 3 .....	70,000	0.7513	52,591
Totals .....	\$120,000		95,565
Amount invested .....			(100,000)
<b>Net present value .....</b>			<b>\$ (4,435)</b>

#### TD2:

	Net Cash Flows	Present Value of 1 at 10%	Present Value of Net Cash Flows
Year 1 .....	\$ 40,000	0.9091	\$ 36,364
Year 2 .....	40,000	0.8264	33,056
Year 3 .....	40,000	0.7513	30,052
Totals .....	\$120,000		99,472
Amount invested .....			(100,000)
<b>Net present value .....</b>			<b>\$ (528)</b>

White Company should not invest in either project. Both are expected to yield a negative net present value, and it should invest only in positive net present value projects.

## APPENDIX

## 25A

## Using Excel to Compute Net Present Value and Internal Rate of Return

Computing present values and internal rates of return for projects with uneven cash flows is tedious and error prone. These calculations can be performed simply and accurately by using functions built into Excel. Many calculators and other types of spreadsheet software can perform them too. To illustrate, consider FasTrac, a company that is considering investing in a new machine with the expected cash flows shown in the following spreadsheet. Cash outflows are entered as negative numbers, and cash inflows are entered as positive numbers. Assume FasTrac requires a 12% annual return, entered as 0.12 in cell C1.

	A	B	C	D	E
1	Annual discount rate		0.12		
2	Initial investment, made at beginning of period 1		-16000		
3	Annual cash flows received at end of period:				
4		1	3000		
5		2	4000		
6		3	4000		
7		4	4000		
8		5	5000		
9		6	3000		
10		7	2000		
11		8	2000		
12					
13			=NPV(C1,C4:C11)+C2		
14					
15			=IRR(C2:C11)		
16					

To compute the net present value of this project, the following is entered into cell C13:

$$=NPV(C1,C4:C11)+C2$$

This instructs Excel to use its NPV function to compute the present value of the cash flows in cells C4 through C11, using the discount rate in cell C1, and then add the amount of the (negative) initial investment. For this stream of cash flows and a discount rate of 12%, the net present value is \$1,326.03.

To compute the internal rate of return for this project, the following is entered into cell C15:

$$=IRR(C2:C11)$$

This instructs Excel to use its IRR function to compute the internal rate of return of the cash flows in cells C2 through C11. By default, Excel starts with a guess of 10%, and then uses trial and error to find the IRR. The IRR equals 14% for this project.

## Summary

**C1 Describe the importance of relevant costs for short-term decisions.** A company must rely on relevant costs pertaining to alternative courses of action rather than historical costs. Out-of-pocket expenses and opportunity costs are relevant because these are avoidable; sunk costs are irrelevant because they result from past decisions and are therefore unavoidable. Managers must also consider the relevant benefits associated with alternative decisions.

**A1 Evaluate short-term managerial decisions using relevant costs.** Relevant costs are useful in making decisions

such as to accept additional business, make or buy, and sell as is or process further. For example, the relevant factors in deciding whether to produce and sell additional units of product are incremental costs and incremental revenues from the additional volume.

**A2 Analyze a capital investment project using break-even time.** Break-even time (BET) is a method for evaluating capital investments by restating future cash flows in terms of their present values (discounting the cash flows) and then calculating the payback period using these present values of cash flows.

**P1 Compute payback period and describe its use.** One way to compare potential investments is to compute and compare their payback periods. The payback period is an estimate of the expected time before the cumulative net cash inflow from the investment equals its initial cost. A payback period analysis fails to reflect risk of the cash flows, differences in the timing of cash flows within the payback period, and cash flows that occur after the payback period.

**P2 Compute accounting rate of return and explain its use.** A project's accounting rate of return is computed by dividing the expected annual after-tax net income by the average amount of investment in the project. When the net cash flows are received evenly throughout each period and straight-line depreciation is used, the average investment is computed as the average of the investment's initial book value and its salvage value.

**P3 Compute net present value and describe its use.** An investment's net present value is determined by predicting the future cash flows it is expected to generate, discounting them at a rate that represents an acceptable return, and then by subtracting the investment's initial cost from the sum of the present values. This technique can deal with any pattern of expected cash flows and applies a superior concept of return on investment.

**P4 Compute internal rate of return and explain its use.** The internal rate of return (IRR) is the discount rate that results in a zero net present value. When the cash flows are equal, we can compute the present value factor corresponding to the IRR by dividing the initial investment by the annual cash flows. We then use the annuity tables to determine the discount rate corresponding to this present value factor.

## Guidance Answers to Decision Maker and Decision Ethics

**Systems Manager** Your dilemma is whether to abide by rules designed to prevent abuse or to bend them to acquire an investment that you believe will benefit the firm. You should not pursue the latter action because breaking up the order into small components is dishonest and there are consequences of being caught at a later stage. Develop a proposal for the entire package and then do all you can to expedite its processing, particularly by pointing out its benefits. When faced with controls that are not working, there is rarely a reason to overcome its shortcomings by dishonesty. A direct assault on those limitations is more sensible and ethical.

**Entrepreneur** The banker is probably concerned because new products are risky and should therefore be evaluated using a higher rate of return. You should conduct a thorough technical analysis and obtain detailed market data and information about any similar products available in the market. These factors might provide sufficient information to support the use of a lower return. You must convince yourself that the risk level is consistent with the discount

rate used. You should also be confident that your company has the capacity and the resources to handle the new product.

**Partner** You should identify the differences between existing clients and this potential client. A key difference is that the restaurant business has additional inventory components (groceries, vegetables, meats, etc.) and is likely to have a higher proportion of depreciable assets. These differences imply that the partner must spend more hours auditing the records and understanding the business, regulations, and standards that pertain to the restaurant business. Such differences suggest that the partner must use a different "formula" for quoting a price to this potential client vis-à-vis current clients.

**Investment Manager** You should probably focus on either the payback period or break-even time because both the time value of money and recovery time are important. Break-even time method is superior because it accounts for the time value of money, which is an important consideration in this decision.

## Multiple Choice Quiz

Answers at end of chapter

- A company inadvertently produced 3,000 defective MP3 players. The players cost \$12 each to produce. A recycler offers to purchase the defective players as they are for \$8 each. The production manager reports that the defects can be corrected for \$10 each, enabling them to be sold at their regular market price of \$19 each. The company should:
  - Correct the defect and sell them at the regular price.
  - Sell the players to the recycler for \$8 each.
  - Sell 2,000 to the recycler and repair the rest.
  - Sell 1,000 to the recycler and repair the rest.
  - Throw the players away.
- A company's productive capacity is limited to 480,000 machine hours. Product X requires 10 machine hours to produce; Product Y requires 2 machine hours to produce. Product X sells for \$32 per unit and has variable costs of \$12 per unit; Product Y sells for \$24 per unit and has

- variable costs of \$10 per unit. Assuming that the company can sell as many of either product as it produces, it should:
- Produce X and Y in the ratio of 57% and 43%.
  - Produce X and Y in the ratio of 83% X and 17% Y.
  - Produce equal amounts of Product X and Product Y.
  - Produce only Product X.
  - Produce only Product Y.
- A company receives a special one-time order for 3,000 units of its product at \$15 per unit. The company has excess capacity and it currently produces and sells the units at \$20 each to its regular customers. Production costs are \$13.50 per unit, which includes \$9 of variable costs. To produce the special order, the company must incur additional fixed costs of \$5,000. Should the company accept the special order?
    - Yes, because incremental revenue exceeds incremental costs.
    - No, because incremental costs exceed incremental revenue.
    - No, because the units are being sold for \$5 less than the regular price.
    - Yes, because incremental costs exceed incremental revenue.
    - No, because incremental costs exceed \$15 per unit when total costs are considered.
  - A company is considering the purchase of equipment for \$270,000. Projected annual cash inflow from this equipment is \$61,200 per year. The payback period is:
    - 0.2 years
    - 5.0 years
    - 4.4 years
    - 2.3 years
    - 3.9 years
  - A company buys a machine for \$180,000 that has an expected life of nine years and no salvage value. The company expects an annual net income (after taxes of 30%) of \$8,550. What is the accounting rate of return?
    - 4.75%
    - 42.75%
    - 2.85%
    - 9.50%
    - 6.65%

 Icon denotes assignments that involve decision making.

## Discussion Questions

- Capital budgeting decisions require careful analysis because they are generally the \_\_\_\_\_ and \_\_\_\_\_ decisions that management faces.
- What is capital budgeting?
-  Identify four reasons that capital budgeting decisions by managers are risky.
- Identify two disadvantages of using the payback period for comparing investments.
-  Why is an investment more attractive to management if it has a shorter payback period?
- What is the average amount invested in a machine during its predicted five-year life if it costs \$200,000 and has a \$20,000 salvage value? Assume that net income is received evenly throughout each year and straight-line depreciation is used.
- If the present value of the expected net cash flows from a machine, discounted at 10%, exceeds the amount to be invested, what can you say about the investment's expected rate of return? What can you say about the expected rate of return if the present value of the net cash flows, discounted at 10%, is less than the investment amount?
- Why is the present value of \$100 that you expect to receive one year from today worth less than \$100 received today? What is the present value of \$100 that you expect to receive one year from today, discounted at 12%?
-  If a potential investment's internal rate of return is above the company's hurdle rate, should the investment be made?
-  Why does the use of the accelerated depreciation method (instead of straight-line) for income tax reporting increase an investment's value?
- GOOGLE**  Google has many types of costs. What is an out-of-pocket cost? What is an opportunity cost? Are opportunity costs recorded in the accounting records?
- Samsung**  Samsung must confront sunk costs. Why are sunk costs irrelevant in deciding whether to sell a product in its present condition or to make it into a new product through additional processing?
- APPLE**  Identify the incremental costs incurred by Apple for shipping one additional iPod from a warehouse to a retail store along with the store's normal order of 75 iPods.
- APPLE**  Apple is considering expanding a store. Identify three methods management can use to evaluate whether to expand.
- Samsung**  Assume that Samsung manufactures and sells 60,000 units of a product at \$11,000 per unit in domestic markets. It costs \$6,000 per unit to manufacture (\$4,000 variable cost per unit, \$2,000 fixed cost per unit). Can you describe a situation under which the company is willing to sell an additional 8,000 units of the product in an international market at \$5,000 per unit?

## QUICK STUDY

Park Co. is considering an investment that requires immediate payment of \$27,000 and provides expected cash inflows of \$9,000 annually for four years. What is the investment's payback period?

### QS 25-1

Payback period P1

Park Co. is considering an investment that requires immediate payment of \$27,000 and provides expected cash inflows of \$9,000 annually for four years. If Park Co. requires a 10% return on its investments, what is the net present value of this investment? (Round your calculations to the nearest dollar.)

**QS 25-2**  
Net present value **P3**

Park Co. is considering an investment that requires immediate payment of \$27,000 and provides expected cash inflows of \$9,000 annually for four years. Assume Park Co. requires a 10% return on its investments. Based on its internal rate of return, should Park Co. make the investment?

**QS 25-3**  
Internal rate of return **P4**

Howard Co. is considering two alternative investments. The payback period is 3.5 years for Investment A and 4 years for Investment B. (1) If management relies on the payback period, which investment is preferred? (2) Why might Howard's analysis of these two alternatives lead to the selection of B over A?

**QS 25-4**  
Analyzing payback periods **P1**

Project A requires a \$280,000 initial investment for new machinery with a five-year life and a salvage value of \$30,000. The company uses straight-line depreciation. Project A is expected to yield annual net income of \$20,000 per year for the next five years. Compute Project A's payback period.

**QS 25-5**  
Payback period **P1**

Project A requires a \$280,000 initial investment for new machinery with a five-year life and a salvage value of \$30,000. The company uses straight-line depreciation. Project A is expected to yield annual net income of \$20,000 per year for the next five years. Compute Project A's accounting rate of return. Express your answer as a percentage, rounded to two decimal places.

**QS 25-6**  
Accounting rate of return **P2**

Peng Company is considering an investment expected to generate an average net income after taxes of \$1,950 for three years. The investment costs \$45,000 and has an estimated \$6,000 salvage value. Compute the accounting rate of return for this investment; assume the company uses straight-line depreciation. Express your answer as a percentage, rounded to two decimal places.

**QS 25-7**  
Computation of accounting rate of return **P2**

Peng Company is considering an investment expected to generate an average net income after taxes of \$1,950 for three years. The investment costs \$45,000 and has an estimated \$6,000 salvage value. Assume Peng requires a 15% return on its investments. Compute the net present value of this investment. (Round each present value calculation to the nearest dollar.)

**QS 25-8**  
Net present value **P3**

If Quail Company invests \$50,000 today, it can expect to receive \$10,000 at the end of each year for the next seven years, plus an extra \$6,000 at the end of the seventh year. What is the net present value of this investment assuming a required 10% return on investments? (Round present value calculations to the nearest dollar.)

**QS 25-9**  
Computation of net present value **P3**

Yokam Company is considering two alternative projects. Project 1 requires an initial investment of \$400,000 and has a present value of cash flows of \$1,100,000. Project 2 requires an initial investment of \$4 million and has a present value of cash flows of \$6 million. Compute the profitability index for each project. Based on the profitability index, which project should the company prefer? Explain.

**QS 25-10**  
Profitability index **P3**

Following is information on an investment considered by Hudson Co. The investment has zero salvage value. The company requires a 12% return from its investments. Compute this investment's net present value.

**QS 25-11**  
Net present value **P3**

Investment A1	
Initial investment .....	(\$200,000)
Expected net cash flows in year:	
1 .....	100,000
2 .....	90,000
3 .....	75,000

- QS 25-12**  
Net present value, with salvage value **P3**  
Refer to the information in QS 25-11 and instead assume the investment has a salvage value of \$20,000. Compute the investment's net present value.
- 
- QS 25-13**  
Internal rate of return **P4**  
A company is considering investing in a new machine that requires a cash payment of \$47,947 today. The machine will generate annual cash flows of \$21,000 for the next three years. What is the internal rate of return if the company buys this machine?
- 
- QS 25-14**  
Net present value **P3**  
A company is considering investing in a new machine that requires a cash payment of \$47,947 today. The machine will generate annual cash flows of \$21,000 for the next three years. Assume the company uses an 8% discount rate. Compute the net present value of this investment. (Round your answer to the nearest dollar.)
- 
- QS 25-15**  
Relevant costs **C1**  
Label each of the following statements as either true ("T") or false ("F").  
 \_\_\_\_\_ 1. Relevant costs are also known as unavoidable costs.  
 \_\_\_\_\_ 2. Incremental costs are also known as differential costs.  
 \_\_\_\_\_ 3. An out-of-pocket cost requires a current and/or future outlay of cash.  
 \_\_\_\_\_ 4. An opportunity cost is the potential benefit that is lost by taking a specific action when two or more alternative choices are available.  
 \_\_\_\_\_ 5. A sunk cost will change with a future course of action.
- 
- QS 25-16**  
Decision to accept additional business **A1**  
Radar Company sells bikes for \$300 each. The company currently sells 3,750 bikes per year and could make as many as 5,000 bikes per year. The bikes cost \$225 each to make; \$150 in variable costs per bike and \$75 of fixed costs per bike. Radar received an offer from a potential customer who wants to buy 750 bikes for \$250 each. Incremental fixed costs to make this order are \$50,000. No other costs will change if this order is accepted. Compute Radar's additional income (ignore taxes) if it accepts this order.
- 
- QS 25-17**  
Make or buy **A1**  
Kando Company incurs a \$9 per unit cost for Product A, which it currently manufactures and sells for \$13.50 per unit. Instead of manufacturing and selling this product, the company can purchase Product B for \$5 per unit and sell it for \$12 per unit. If it does so, unit sales would remain unchanged and \$5 of the \$9 per unit costs assigned to Product A would be eliminated. Should the company continue to manufacture Product A or purchase Product B for resale?
- 
- QS 25-18**  
Make or buy **A1**  
Xia Co. currently buys a component part for \$5 per unit. Xia believes that making the part would require \$2.25 per unit of direct materials and \$1.00 per unit of direct labor. Xia allocates overhead using a predetermined overhead rate of 200% of direct labor cost. Xia estimates an incremental overhead rate of \$0.75 per unit to make the part. Should Xia make or buy the part?
- 
- QS 25-19**  
Scrap or rework **A1**  
Signal mistakenly produced 1,000 defective cell phones. The phones cost \$60 each to produce. A salvage company will buy the defective phones as they are for \$30 each. It would cost Signal \$80 per phone to rework the phones. If the phones are reworked, Signal could sell them for \$120 each. Assume there is no opportunity cost associated with reworking the phones. Compute the incremental net income from reworking the phones.
- 
- QS 25-20**  
Sell or process further **A1**  
Holmes Company produces a product that can either be sold as is or processed further. Holmes has already spent \$50,000 to produce 1,250 units that can be sold now for \$67,500 to another manufacturer. Alternatively, Holmes can process the units further at an incremental cost of \$250 per unit. If Holmes processes further, the units can be sold for \$375 each. Compute the incremental income if Holmes processes further.
- 
- QS 25-21**  
Sell or process further **A1**  
A company has already incurred \$5,000 of costs in producing 6,000 units of Product XY. Product XY can be sold as is for \$15 per unit. Instead, the company could incur further processing costs of \$8 per unit and sell the resulting product for \$21 per unit. Should the company sell Product XY as is or process it further?
- 
- QS 25-22**  
Selection of sales mix **A1**  
Excel Memory Company can sell all units of computer memory X and Y that it can produce, but it has limited production capacity. It can produce two units of X per hour *or* three units of Y per hour, and it has 4,000 production hours available. Contribution margin is \$5 for Product X and \$4 for Product Y. What is the most profitable sales mix for this company?

A guitar manufacturer is considering eliminating its electric guitar division because its \$76,000 expenses are higher than its \$72,000 sales. The company reports the following expenses for this division. Should the division be eliminated?

**QS 25-23**  
Segment elimination  
**A1**

	Avoidable Expenses	Unavoidable Expenses
Cost of goods sold .....	\$56,000	
Direct expenses .....	9,250	\$1,250
Indirect expenses .....	470	1,600
Service department costs .....	6,000	1,430

A division of a large company reports the information shown below for a recent year. Variable costs and direct fixed costs are avoidable, and 40% of the indirect fixed costs are avoidable. Based on this information, should the division be eliminated?

**QS 25-24**  
Segment elimination  
**A1**

	Total
Sales .....	\$200,000
Variable costs .....	145,000
Fixed costs	
Direct .....	30,000
Indirect .....	50,000
Operating loss .....	<u>\$ (25,000)</u>

Rory Company has a machine with a book value of \$75,000 and a remaining five-year useful life. A new machine is available at a cost of \$112,500, and Rory can also receive \$60,000 for trading in its old machine. The new machine will reduce variable manufacturing costs by \$13,000 per year over its five-year useful life. Should the machine be replaced?

**QS 25-25**  
Keep or replace decision  
**A1**

Heels, a shoe manufacturer, is evaluating the costs and benefits of new equipment that would custom fit each pair of athletic shoes. The customer would have his or her foot scanned by digital computer equipment; this information would be used to cut the raw materials to provide the customer a perfect fit. The new equipment costs \$90,000 and is expected to generate an additional \$35,000 in cash flows for five years. A bank will make a \$90,000 loan to the company at a 10% interest rate for this equipment's purchase. Use the following table to determine the break-even time for this equipment. (Round the present value of cash flows to the nearest dollar.)

**QS 25-26**  
Computation of break-even time  
**A2**

Year	Cash Flows*	Present Value of 1 at 10%	Present Value of Cash Flows	Cumulative Present Value of Cash Flows
0	\$(90,000)	1.0000	_____	_____
1	35,000	0.9091	_____	_____
2	35,000	0.8264	_____	_____
3	35,000	0.7513	_____	_____
4	35,000	0.6830	_____	_____
5	35,000	0.6209	_____	_____

\* All cash flows occur at year-end.

**Siemens AG** invests €80 million to build a manufacturing plant to build wind turbines. The company predicts net cash flows of €16 million per year for the next eight years. Assume the company requires an 8% rate of return from its investments.

**QS 25-27**  
Capital budgeting methods **P1 P3**

1. What is the payback period of this investment?
2. What is the net present value of this investment?

## EXERCISES

### Exercise 25-1

Payback period computation; uneven cash flows **P1**

**Check** 3.08 years

Beyer Company is considering the purchase of an asset for \$180,000. It is expected to produce the following net cash flows. The cash flows occur evenly throughout each year. Compute the payback period for this investment (round years to two decimals).

	Year 1	Year 2	Year 3	Year 4	Year 5	Total
Net cash flows . . . . .	\$60,000	\$40,000	\$70,000	\$125,000	\$35,000	\$330,000

### Exercise 25-2

Net present value **P3**

Refer to the information in Exercise 25-1 and assume that Beyer requires a 10% return on its investments. Compute the net present value of this investment. (Round to the nearest dollar.) Should Beyer accept the investment?

### Exercise 25-3

Payback period computation; straight-line depreciation **P1**

A machine can be purchased for \$150,000 and used for five years, yielding the following net incomes. In projecting net incomes, straight-line depreciation is applied, using a five-year life and a zero salvage value. Compute the machine's payback period (ignore taxes). (Round the payback period to three decimals.)

	Year 1	Year 2	Year 3	Year 4	Year 5
Net income . . . . .	\$10,000	\$25,000	\$50,000	\$37,500	\$100,000

### Exercise 25-4

Payback period; accelerated depreciation **P1**

**Check** 2.265 years

Refer to the information in Exercise 25-3 and assume instead that double-declining depreciation is applied. Compute the machine's payback period (ignore taxes). (Round the payback period to three decimals.)

### Exercise 25-5

Payback period computation; even cash flows **P1**

Compute the payback period for each of these two separate investments (round the payback period to two decimals):

- A new operating system for an existing machine is expected to cost \$520,000 and have a useful life of six years. The system yields an incremental after-tax income of \$150,000 each year after deducting its straight-line depreciation. The predicted salvage value of the system is \$10,000.
- A machine costs \$380,000, has a \$20,000 salvage value, is expected to last eight years, and will generate an after-tax income of \$60,000 per year after straight-line depreciation.

### Exercise 25-6

Net present value **P3**

Refer to the information in Exercise 25-5. Assume the company requires a 10% rate of return on its investments. Compute the net present value of each potential investment. (Round to the nearest dollar.)

### Exercise 25-7

Accounting rate of return **P2**

A machine costs \$700,000 and is expected to yield an after-tax net income of \$52,000 each year. Management predicts this machine has a 10-year service life and a \$100,000 salvage value, and it uses straight-line depreciation. Compute this machine's accounting rate of return.

### Exercise 25-8

Payback period and accounting rate of return on investment **P1 P2**

B2B Co. is considering the purchase of equipment that would allow the company to add a new product to its line. The equipment is expected to cost \$360,000 with a six-year life and no salvage value. It will be depreciated on a straight-line basis. The company expects to sell 144,000 units of the equipment's product each year. The expected annual income related to this equipment follows. Compute the (1) payback period and (2) accounting rate of return for this equipment.

Sales . . . . .	\$225,000
Costs	
Materials, labor, and overhead (except depreciation on new equipment) . . . . .	120,000
Depreciation on new equipment . . . . .	30,000
Selling and administrative expenses . . . . .	<u>22,500</u>
Total costs and expenses . . . . .	<u>172,500</u>
Pretax income . . . . .	52,500
Income taxes (30%) . . . . .	<u>15,750</u>
Net income . . . . .	<u>\$ 36,750</u>

**Check** (1) 5.39 years  
(2) 20.42%

After evaluating the risk of the investment described in Exercise 25-8, B2B Co. concludes that it must earn at least an 8% return on this investment. Compute the net present value of this investment. (Round the net present value to the nearest dollar.)

**Exercise 25-9**

Computing net present value **P3**

Following is information on two alternative investments being considered by Jolee Company. The company requires a 10% return from its investments.

	Project A	Project B
Initial investment . . . . .	\$(160,000)	\$(105,000)
Expected net cash flows in year:		
1 . . . . .	40,000	32,000
2 . . . . .	56,000	50,000
3 . . . . .	80,295	66,000
4 . . . . .	90,400	72,000
5 . . . . .	65,000	24,000

**Exercise 25-10**

NPV and profitability index

**P3**

For each alternative project compute the (a) net present value, and (b) profitability index. (Round your answers in part *b* to two decimal places.) If the company can only select one project, which should it choose? Explain.

Following is information on two alternative investments being considered by Tiger Co. The company requires a 4% return from its investments.

	Project X1	Project X2
Initial investment . . . . .	(\$80,000)	(\$120,000)
Expected net cash flows in year:		
1 . . . . .	25,000	60,000
2 . . . . .	35,500	50,000
3 . . . . .	60,500	40,000

**Exercise 25-11**

Net present value, profitability index

**P3**

Compute each project's (a) net present value and (b) profitability index. (Round present value calculations to the nearest dollar and round the profitability index to two decimal places.) If the company can choose only one project, which should it choose? Explain.

Refer to the information in Exercise 25-11 and instead assume the company requires a 12% return on its investments. Compute each project's (a) net present value and (b) profitability index. (Round present value calculations to the nearest dollar.) Express the profitability index as a percentage (rounded to two decimal places). If the company can choose only one project, which should it choose? Explain.

**Exercise 25-12**

Net present value, profitability index **P3**

Refer to the information in Exercise 25-11. Create an Excel spreadsheet to compute the internal rate of return for each of the projects. Based on internal rate of return, determine whether the company should accept either of the two projects.

**Exercise 25-13<sup>A</sup>**

Internal rate of return **P4**

Phoenix Company can invest in each of three cheese-making projects: C1, C2, and C3. Each project requires an initial investment of \$228,000 and would yield the following annual cash flows.

	C1	C2	C3
Year 1 . . . . .	\$ 12,000	\$ 96,000	\$180,000
Year 2 . . . . .	108,000	96,000	60,000
Year 3 . . . . .	168,000	96,000	48,000
Totals . . . . .	<u>\$288,000</u>	<u>\$288,000</u>	<u>\$288,000</u>

**Exercise 25-14**

Computation and interpretation of net present value and internal rate of return

**P3 P4** 

(1) Assuming that the company requires a 12% return from its investments, use net present value to determine which projects, if any, should be acquired. (2) Using the answer from part 1, explain whether the internal rate of return is higher or lower than 12% for Project C2.

**Exercise 25-15<sup>A</sup>**

Using Excel to compute IRR **P4**

Refer to the information in Exercise 25-10. Create an Excel spreadsheet to compute the internal rate of return for each of the projects. Round the percentage return to two decimals.

**Exercise 25-16**

Relevant costs

**C1**

Fill in each of the blanks below with the correct term.

1. A \_\_\_\_\_ arises from a past decision and cannot be avoided or changed; it is irrelevant to future decisions.
2. \_\_\_\_\_ refer to the incremental revenue generated from taking one particular action over another.
3. Relevant costs are also known as \_\_\_\_\_.
4. An \_\_\_\_\_ requires a future outlay of cash and is relevant for current and future decision making.
5. An \_\_\_\_\_ is the potential benefit lost by taking a specific action when two or more alternative choices are available.

**Exercise 25-17**

Accept new business or not

**A1**

Farrow Co. expects to sell 150,000 units of its product in the next period with the following results.

Sales (150,000 units) .....	\$2,250,000
Costs and expenses	
Direct materials .....	300,000
Direct labor .....	600,000
Overhead .....	150,000
Selling expenses .....	225,000
Administrative expenses .....	<u>385,500</u>
Total costs and expenses .....	<u>1,660,500</u>
Net income .....	<u>\$ 589,500</u>

The company has an opportunity to sell 15,000 additional units at \$12 per unit. The additional sales would not affect its current expected sales. Direct materials and labor costs per unit would be the same for the additional units as they are for the regular units. However, the additional volume would create the following incremental costs: (1) total overhead would increase by 15% and (2) administrative expenses would increase by \$64,500. Prepare an analysis to determine whether the company should accept or reject the offer to sell additional units at the reduced price of \$12 per unit.

**Check** Income increase, \$3,000

**Exercise 25-18**

Accept new business or not

**A1**

Goshford Company produces a single product and has capacity to produce 100,000 units per month. Costs to produce its current sales of 80,000 units follow. The regular selling price of the product is \$100 per unit. Management is approached by a new customer who wants to purchase 20,000 units of the product for \$75 per unit. If the order is accepted, there will be no additional fixed manufacturing overhead, and no additional fixed selling and administrative expenses. The customer is not in the company's regular selling territory, so there will be a \$5 per unit shipping expense in addition to the regular variable selling and administrative expenses.

	Per Unit	Costs at 80,000 Units
Direct materials .....	\$12.50	\$1,000,000
Direct labor .....	15.00	1,200,000
Variable manufacturing overhead .....	10.00	800,000
Fixed manufacturing overhead .....	17.50	1,400,000
Variable selling and administrative expenses .....	14.00	1,120,000
Fixed selling and administrative expenses .....	<u>13.00</u>	<u>1,040,000</u>
Totals .....	<u>\$82.00</u>	<u>\$6,560,000</u>

1. Determine whether management should accept or reject the new business.
2. What nonfinancial factors should management consider when deciding whether to take this order?

**Check** (1) Additional volume effect on net income, \$370,000

Gilberto Company currently manufactures 65,000 units per year of one of its crucial parts. Variable costs are \$1.95 per unit, fixed costs related to making this part are \$75,000 per year, and allocated fixed costs are \$62,000 per year. Allocated fixed costs are unavoidable whether the company makes or buys the part. Gilberto is considering buying the part from a supplier for a quoted price of \$3.25 per unit guaranteed for a three-year period. Should the company continue to manufacture the part, or should it buy the part from the outside supplier? Support your answer with analyses.

**Exercise 25-19**  
Make or buy decision

A1 

**Check** \$9,500 increased costs to buy

Gelb Company currently manufactures 40,000 units per year of a key component for its manufacturing process. Variable costs are \$1.95 per unit, fixed costs related to making this component are \$65,000 per year, and allocated fixed costs are \$58,500 per year. The allocated fixed costs are unavoidable whether the company makes or buys this component. The company is considering buying this component from a supplier for \$3.50 per unit. Should it continue to manufacture the component, or should it buy this component from the outside supplier? Support your decision with analysis of the data provided.

**Exercise 25-20**  
Make or buy

A1

**Check** Increased cost to make, \$3,000

A company must decide between scrapping or reworking units that do not pass inspection. The company has 22,000 defective units that cost \$6 per unit to manufacture. The units can be sold as is for \$2.50 each, or they can be reworked for \$4.50 each and then sold for the full price of \$8.50 each. If the units are sold as is, the company will be able to build 22,000 replacement units at a cost of \$6 each, and sell them at the full price of \$8.50 each. (1) What is the incremental income from selling the units as scrap? (2) What is the incremental income from reworking and selling the units? (3) Should the company sell the units as scrap or rework them?

**Exercise 25-21**  
Scrap or rework

A1

Varto Company has 7,000 units of its sole product in inventory that it produced last year at a cost of \$22 each. This year's model is superior to last year's and the 7,000 units cannot be sold at last year's regular selling price of \$35 each. Varto has two alternatives for these items: (1) they can be sold to a wholesaler for \$8 each, or (2) they can be reworked at a cost of \$125,000 and then sold for \$25 each. Prepare an analysis to determine whether Varto should sell the products as is or rework them and then sell them.

**Exercise 25-22**  
Scrap or rework A1

**Check** Incremental net income of reworking, \$(6,000)

Cobe Company has already manufactured 28,000 units of Product A at a cost of \$28 per unit. The 28,000 units can be sold at this stage for \$700,000. Alternatively, the units can be further processed at a \$420,000 total additional cost and be converted into 5,600 units of Product B and 11,200 units of Product C. Per unit selling price for Product B is \$105 and for Product C is \$70. Prepare an analysis that shows whether the 28,000 units of Product A should be processed further or not.

**Exercise 25-23**  
Sell or process further

A1 

Colt Company owns a machine that can produce two specialized products. Production time for Product TLX is two units per hour and for Product MTV is five units per hour. The machine's capacity is 2,750 hours per year. Both products are sold to a single customer who has agreed to buy all of the company's output up to a maximum of 4,700 units of Product TLX and 2,500 units of Product MTV. Selling prices and variable costs per unit to produce the products follow. Determine (1) the company's most profitable sales mix and (2) the contribution margin that results from that sales mix.

**Exercise 25-24**  
Sales mix determination and analysis

A1

	Product TLX	Product MTV
Selling price per unit . . . . .	\$15.00	\$9.50
Variable costs per unit . . . . .	4.80	5.50

**Check** (2) \$55,940

Suresh Co. expects its five departments to yield the following income for next year.

	A	B	C	D	E	F	G
1		<b>Dept. M</b>	<b>Dept. N</b>	<b>Dept. O</b>	<b>Dept. P</b>	<b>Dept. T</b>	<b>Total</b>
2	Sales	\$63,000	\$35,000	\$56,000	\$42,000	\$ 28,000	\$224,000
3	Expenses						
4	Avoidable	9,800	36,400	22,400	14,000	37,800	120,400
5	Unavoidable	51,800	12,600	4,200	29,400	9,800	107,800
6	Total expenses	61,600	49,000	26,600	43,400	47,600	228,200
7	Net income (loss)	\$ 1,400	\$(14,000)	\$29,400	\$(1,400)	\$(19,600)	\$ (4,200)
8							

**Exercise 25-25**  
Analysis of income effects from eliminating departments

A1 

**Check** Total income (loss)  
(1) \$(21,000), (2) \$7,000

Recompute and prepare the departmental income statements (including a combined total column) for the company under each of the following separate scenarios: Management (1) eliminates departments with expected net losses, and (2) eliminates departments with sales dollars that are less than avoidable expenses. Explain your answers to parts 1 and 2.

**Exercise 25-26**

Keep or replace

A1

Xinhong Company is considering replacing one of its manufacturing machines. The machine has a book value of \$45,000 and a remaining useful life of 5 years, at which time its salvage value will be zero. It has a current market value of \$52,000. Variable manufacturing costs are \$36,000 per year for this machine. Information on two alternative replacement machines follows. Should Xinhong keep or replace its manufacturing machine? If the machine should be replaced, which alternative new machine should Xinhong purchase?

	Alternative A	Alternative B
Cost . . . . .	\$115,000	\$125,000
Variable manufacturing costs per year . . . . .	19,000	15,000

**Exercise 25-27**

Comparison of payback and BET

P1 A2

This chapter explained two methods to evaluate investments using recovery time, the payback period and break-even time (BET). Refer to QS 25-26 and (1) compute the recovery time for both the payback period and break-even time, (2) discuss the advantage(s) of break-even time over the payback period, and (3) list two conditions under which payback period and break-even time are similar.

**PROBLEM SET A**

**Problem 25-1A**

Computation of payback period, accounting rate of return, and net present value

P1 P2 P3

Factor Company is planning to add a new product to its line. To manufacture this product, the company needs to buy a new machine at a \$480,000 cost with an expected four-year life and a \$20,000 salvage value. All sales are for cash, and all costs are out-of-pocket, except for depreciation on the new machine. Additional information includes the following.

Expected annual sales of new product . . . . .	\$1,840,000
Expected annual costs of new product	
Direct materials . . . . .	480,000
Direct labor . . . . .	672,000
Overhead (excluding straight-line depreciation on new machine) . . . . .	336,000
Selling and administrative expenses . . . . .	160,000
Income taxes . . . . .	30%

**Required**

1. Compute straight-line depreciation for each year of this new machine's life. (Round depreciation amounts to the nearest dollar.)
2. Determine expected net income and net cash flow for each year of this machine's life. (Round answers to the nearest dollar.)
3. Compute this machine's payback period, assuming that cash flows occur evenly throughout each year. (Round the payback period to two decimals.)
4. Compute this machine's accounting rate of return, assuming that income is earned evenly throughout each year. (Round the percentage return to two decimals.)
5. Compute the net present value for this machine using a discount rate of 7% and assuming that cash flows occur at each year-end. (*Hint:* Salvage value is a cash inflow at the end of the asset's life. Round the net present value to the nearest dollar.)

**Check** (4) 21.56%

(5) \$107,356

**Problem 25-2A**

Analysis and computation of payback period, accounting rate of return, and net present value P1 P2 P3

Most Company has an opportunity to invest in one of two new projects. Project Y requires a \$350,000 investment for new machinery with a four-year life and no salvage value. Project Z requires a \$350,000 investment for new machinery with a three-year life and no salvage value. The two projects yield the following predicted annual results. The company uses straight-line depreciation, and cash flows occur evenly throughout each year.

	Project Y	Project Z
Sales . . . . .	\$350,000	\$280,000
Expenses		
Direct materials . . . . .	49,000	35,000
Direct labor . . . . .	70,000	42,000
Overhead including depreciation . . . . .	126,000	126,000
Selling and administrative expenses . . . . .	25,000	25,000
Total expenses . . . . .	270,000	228,000
Pretax income . . . . .	80,000	52,000
Income taxes (30%) . . . . .	24,000	15,600
Net income . . . . .	\$ 56,000	\$ 36,400

**Required**

1. Compute each project’s annual expected net cash flows. (Round the net cash flows to the nearest dollar.)
2. Determine each project’s payback period. (Round the payback period to two decimals.)
3. Compute each project’s accounting rate of return. (Round the percentage return to one decimal.)
4. Determine each project’s net present value using 8% as the discount rate. For part 4 only, assume that cash flows occur at each year-end. (Round the net present value to the nearest dollar.)

**Check** For Project Y:  
 (2) 2.44 years, (3) 32%  
 (4) \$125,286

**Analysis Component**

5. Identify the project you would recommend to management and explain your choice.

Manning Corporation is considering a new project requiring a \$90,000 investment in test equipment with no salvage value. The project would produce \$66,000 of pretax income before depreciation at the end of each of the next six years. The company’s income tax rate is 40%. In compiling its tax return and computing its income tax payments, the company can choose between the two alternative depreciation schedules shown in the table.

**Problem 25-3A**

Computation of cash flows and net present values with alternative depreciation methods

	Straight-Line Depreciation	MACRS Depreciation*
Year 1 . . . . .	\$ 9,000	\$18,000
Year 2 . . . . .	18,000	28,800
Year 3 . . . . .	18,000	17,280
Year 4 . . . . .	18,000	10,368
Year 5 . . . . .	18,000	10,368
Year 6 . . . . .	9,000	5,184
Totals . . . . .	\$90,000	\$90,000

\* The modified accelerated cost recovery system (MACRS) for depreciation is discussed in Chapter 10.

**Required**

1. Prepare a five-column table that reports amounts (assuming use of straight-line depreciation) for each of the following for each of the six years: (a) pretax income before depreciation, (b) straight-line depreciation expense, (c) taxable income, (d) income taxes, and (e) net cash flow. Net cash flow equals the amount of income before depreciation minus the income taxes. (Round answers to the nearest dollar.)
2. Prepare a five-column table that reports amounts (assuming use of MACRS depreciation) for each of the following for each of the six years: (a) pretax income before depreciation, (b) MACRS depreciation expense, (c) taxable income, (d) income taxes, and (e) net cash flow. Net cash flow equals the income amount before depreciation minus the income taxes. (Round answers to the nearest dollar.)
3. Compute the net present value of the investment if straight-line depreciation is used. Use 10% as the discount rate. (Round the net present value to the nearest dollar.)
4. Compute the net present value of the investment if MACRS depreciation is used. Use 10% as the discount rate. (Round the net present value to the nearest dollar.)

**Check** Net present value:  
 (3) \$108,518  
 (4) \$110,303

**Analysis Component**

5. Explain why the MACRS depreciation method increases this project’s net present value.

**Problem 25-4A**

Analysis of income effects of additional business

A1

Jones Products manufactures and sells to wholesalers approximately 400,000 packages per year of underwater markers at \$6 per package. Annual costs for the production and sale of this quantity are shown in the table.

Direct materials . . . . .	\$ 576,000
Direct labor . . . . .	144,000
Overhead . . . . .	320,000
Selling expenses . . . . .	150,000
Administrative expenses . . . . .	<u>100,000</u>
Total costs and expenses . . . . .	<u>\$1,290,000</u>

A new wholesaler has offered to buy 50,000 packages for \$5.20 each. These markers would be marketed under the wholesaler's name and would not affect Jones Products's sales through its normal channels. A study of the costs of this additional business reveals the following:

- Direct materials costs are 100% variable.
- Per unit direct labor costs for the additional units would be 50% higher than normal because their production would require overtime pay at 1½ times the usual labor rate.
- Twenty-five percent of the normal annual overhead costs are fixed at any production level from 350,000 to 500,000 units. The remaining 75% of the annual overhead cost is variable with volume.
- Accepting the new business would involve no additional selling expenses.
- Accepting the new business would increase administrative expenses by a \$5,000 fixed amount.

**Required**

Prepare a three-column comparative income statement that shows the following:

1. Annual operating income without the special order (column 1).
2. Annual operating income received from the new business only (column 2).
3. Combined annual operating income from normal business and the new business (column 3).

**Check** Operating income:

(1) \$1,110,000

(2) \$126,000

**Problem 25-5A**

Analysis of sales mix strategies

A1

Edgerron Company is able to produce two products, G and B, with the same machine in its factory. The following information is available.

	Product G	Product B
Selling price per unit . . . . .	\$120	\$160
Variable costs per unit . . . . .	<u>40</u>	<u>90</u>
Contribution margin per unit . . . . .	<u>\$ 80</u>	<u>\$ 70</u>
Machine hours to produce 1 unit . . . . .	0.4 hours	1.0 hours
Maximum unit sales per month . . . . .	600 units	200 units

The company presently operates the machine for a single eight-hour shift for 22 working days each month. Management is thinking about operating the machine for two shifts, which will increase its productivity by another eight hours per day for 22 days per month. This change would require \$15,000 additional fixed costs per month.

**Required**

1. Determine the contribution margin per machine hour that each product generates.
2. How many units of Product G and Product B should the company produce if it continues to operate with only one shift? How much total contribution margin does this mix produce each month?
3. If the company adds another shift, how many units of Product G and Product B should it produce? How much total contribution margin would this mix produce each month? Should the company add the new shift? Explain.
4. Suppose that the company determines that it can increase Product G's maximum sales to 700 units per month by spending \$12,000 per month in marketing efforts. Should the company pursue this strategy and the double shift? Explain.

**Check** Units of Product G:

(2) 440

(3) 600

Elegant Decor Company's management is trying to decide whether to eliminate Department 200, which has produced losses or low profits for several years. The company's 2015 departmental income statements show the following.

<b>ELEGANT DECOR COMPANY</b>			
<b>Departmental Income Statements</b>			
<b>For Year Ended December 31, 2015</b>			
	Dept. 100	Dept. 200	Combined
Sales .....	\$436,000	\$290,000	\$726,000
Cost of goods sold .....	<u>262,000</u>	<u>207,000</u>	<u>469,000</u>
Gross profit .....	174,000	83,000	257,000
Operating expenses			
Direct expenses			
Advertising .....	17,000	12,000	29,000
Store supplies used .....	4,000	3,800	7,800
Depreciation—Store equipment .....	<u>5,000</u>	<u>3,300</u>	<u>8,300</u>
Total direct expenses .....	26,000	19,100	45,100
Allocated expenses			
Sales salaries .....	65,000	39,000	104,000
Rent expense .....	9,440	4,720	14,160
Bad debts expense .....	9,900	8,100	18,000
Office salary .....	18,720	12,480	31,200
Insurance expense .....	2,000	1,100	3,100
Miscellaneous office expenses .....	<u>2,400</u>	<u>1,600</u>	<u>4,000</u>
Total allocated expenses .....	<u>107,460</u>	<u>67,000</u>	<u>174,460</u>
Total expenses .....	<u>133,460</u>	<u>86,100</u>	<u>219,560</u>
Net income (loss) .....	<u>\$ 40,540</u>	<u>\$ (3,100)</u>	<u>\$ 37,440</u>

**Problem 25-6A**

Analysis of possible elimination of a department

In analyzing whether to eliminate Department 200, management considers the following:

- The company has one office worker who earns \$600 per week, or \$31,200 per year, and four salesclerks who each earn \$500 per week, or \$26,000 per year for each salesclerk.
- The full salaries of two salesclerks are charged to Department 100. The full salary of one salesclerk is charged to Department 200. The salary of the fourth clerk, who works half-time in both departments, is divided evenly between the two departments.
- Eliminating Department 200 would avoid the sales salaries and the office salary currently allocated to it. However, management prefers another plan. Two salesclerks have indicated that they will be quitting soon. Management believes that their work can be done by the other two clerks if the one office worker works in sales half-time. Eliminating Department 200 will allow this shift of duties. If this change is implemented, half the office worker's salary would be reported as sales salaries and half would be reported as office salary.
- The store building is rented under a long-term lease that cannot be changed. Therefore, Department 100 will use the space and equipment currently used by Department 200.
- Closing Department 200 will eliminate its expenses for advertising, bad debts, and store supplies; 70% of the insurance expense allocated to it to cover its merchandise inventory; and 25% of the miscellaneous office expenses presently allocated to it.

**Required**

- Prepare a three-column report that lists items and amounts for (a) the company's total expenses (including cost of goods sold)—in column 1, (b) the expenses that would be eliminated by closing Department 200—in column 2, and (c) the expenses that will continue—in column 3.
- Prepare a forecasted annual income statement for the company reflecting the elimination of Department 200 assuming that it will not affect Department 100's sales and gross profit. The statement should reflect the reassignment of the office worker to one-half time as a salesclerk.

**Check** (1) Total expenses: (a) \$688,560, (b) \$284,070

(2) Forecasted net income without Department 200, \$31,510

**Analysis Component**

- Reconcile the company's combined net income with the forecasted net income assuming that Department 200 is eliminated (list both items and amounts). Analyze the reconciliation and explain why you think the department should or should not be eliminated.

**PROBLEM SET B****Problem 25-1B**

Computation of payback period, accounting rate of return, and net present value

P1 P2 P3

Cortino Company is planning to add a new product to its line. To manufacture this product, the company needs to buy a new machine at a \$300,000 cost with an expected four-year life and a \$20,000 salvage value. All sales are for cash and all costs are out-of-pocket, except for depreciation on the new machine. Additional information includes the following.

Expected annual sales of new product . . . . .	\$1,150,000
Expected annual costs of new product	
Direct materials . . . . .	300,000
Direct labor . . . . .	420,000
Overhead (excluding straight-line depreciation on new machine) . . . . .	210,000
Selling and administrative expenses . . . . .	100,000
Income taxes . . . . .	30%

**Required**

1. Compute straight-line depreciation for each year of this new machine's life. (Round depreciation amounts to the nearest dollar.)
2. Determine expected net income and net cash flow for each year of this machine's life. (Round answers to the nearest dollar.)
3. Compute this machine's payback period, assuming that cash flows occur evenly throughout each year. (Round the payback period to two decimals.)
4. Compute this machine's accounting rate of return, assuming that income is earned evenly throughout each year. (Round the percentage return to two decimals.)
5. Compute the net present value for this machine using a discount rate of 7% and assuming that cash flows occur at each year-end. (*Hint:* Salvage value is a cash inflow at the end of the asset's life.)

**Check** (4) 21.88%

(5) \$70,915

**Problem 25-2B**

Analysis and computation of payback period, accounting rate of return, and net present value

P1 P2 P3

Aikman Company has an opportunity to invest in one of two projects. Project A requires a \$240,000 investment for new machinery with a four-year life and no salvage value. Project B also requires a \$240,000 investment for new machinery with a three-year life and no salvage value. The two projects yield the following predicted annual results. The company uses straight-line depreciation, and cash flows occur evenly throughout each year.

	Project A	Project B
Sales . . . . .	\$250,000	\$200,000
Expenses		
Direct materials . . . . .	35,000	25,000
Direct labor . . . . .	50,000	30,000
Overhead including depreciation . . . . .	90,000	90,000
Selling and administrative expenses . . . . .	18,000	18,000
Total expenses . . . . .	193,000	163,000
Pretax income . . . . .	57,000	37,000
Income taxes (30%) . . . . .	17,100	11,100
Net income . . . . .	<u>\$ 39,900</u>	<u>\$ 25,900</u>

**Required**

1. Compute each project's annual expected net cash flows. (Round net cash flows to the nearest dollar.)
2. Determine each project's payback period. (Round the payback period to two decimals.)
3. Compute each project's accounting rate of return. (Round the percentage return to one decimal.)
4. Determine each project's net present value using 8% as the discount rate. For part 4 only, assume that cash flows occur at each year-end. (Round net present values to the nearest dollar.)

**Analysis Component**

5. Identify the project you would recommend to management and explain your choice.

**Check** For Project A:

(2) 2.4 years

(3) 33.3%

(4) \$90,879

Grossman Corporation is considering a new project requiring a \$30,000 investment in an asset having no salvage value. The project would produce \$12,000 of pretax income before depreciation at the end of each of the next six years. The company’s income tax rate is 40%. In compiling its tax return and computing its income tax payments, the company can choose between two alternative depreciation schedules as shown in the table.

	Straight-Line Depreciation	MACRS Depreciation*
Year 1 . . . . .	\$ 3,000	\$ 6,000
Year 2 . . . . .	6,000	9,600
Year 3 . . . . .	6,000	5,760
Year 4 . . . . .	6,000	3,456
Year 5 . . . . .	6,000	3,456
Year 6 . . . . .	3,000	1,728
Totals . . . . .	<u>\$30,000</u>	<u>\$30,000</u>

\* The modified accelerated cost recovery system (MACRS) for depreciation is discussed in Chapter 10.

**Problem 25-3B**  
Computation of cash flows and net present values with alternative depreciation methods

**Required**

1. Prepare a five-column table that reports amounts (assuming use of straight-line depreciation) for each of the following items for each of the six years: (a) pretax income before depreciation, (b) straight-line depreciation expense, (c) taxable income, (d) income taxes, and (e) net cash flow. Net cash flow equals the amount of income before depreciation minus the income taxes. (Round answers to the nearest dollar.)
2. Prepare a five-column table that reports amounts (assuming use of MACRS depreciation) for each of the following items for each of the six years: (a) pretax income before depreciation, (b) MACRS depreciation expense, (c) taxable income, (d) income taxes, and (e) net cash flow. Net cash flow equals the amount of income before depreciation minus the income taxes. (Round answers to the nearest dollar.)
3. Compute the net present value of the investment if straight-line depreciation is used. Use 10% as the discount rate. (Round the net present value to the nearest dollar.)
4. Compute the net present value of the investment if MACRS depreciation is used. Use 10% as the discount rate. (Round the net present value to the nearest dollar.)

**Check** Net present value:  
(3) \$10,041  
(4) \$10,635

**Analysis Component**

5. Explain why the MACRS depreciation method increases the net present value of this project.

Windmire Company manufactures and sells to local wholesalers approximately 300,000 units per month at a sales price of \$4 per unit. Monthly costs for the production and sale of this quantity follow.

Direct materials . . . . .	\$384,000
Direct labor . . . . .	96,000
Overhead . . . . .	288,000
Selling expenses . . . . .	120,000
Administrative expenses . . . . .	<u>80,000</u>
Total costs and expenses . . . . .	<u>\$968,000</u>

**Problem 25-4B**  
Analysis of income effects of additional business

A1

A new out-of-state distributor has offered to buy 50,000 units next month for \$3.44 each. These units would be marketed in other states and would not affect Windmire’s sales through its normal channels. A study of the costs of this new business reveals the following:

- Direct materials costs are 100% variable.
- Per unit direct labor costs for the additional units would be 50% higher than normal because their production would require overtime pay at 1½ their normal rate to meet the distributor’s deadline.
- Twenty-five percent of the normal annual overhead costs are fixed at any production level from 250,000 to 400,000 units. The remaining 75% is variable with volume.
- Accepting the new business would involve no additional selling expenses.
- Accepting the new business would increase administrative expenses by a \$4,000 fixed amount.

**Required**

Prepare a three-column comparative income statement that shows the following:

**Check** Operating income:  
(1) \$232,000, (2) \$44,000

1. Monthly operating income without the special order (column 1).
2. Monthly operating income received from the new business only (column 2).
3. Combined monthly operating income from normal business and the new business (column 3).

**Problem 25-5B**

Analysis of sales mix strategies

A1 

Sung Company is able to produce two products, R and T, with the same machine in its factory. The following information is available.

	Product R	Product T
Selling price per unit . . . . .	\$60	\$80
Variable costs per unit . . . . .	<u>20</u>	<u>45</u>
Contribution margin per unit . . . . .	<u>\$40</u>	<u>\$35</u>
Machine hours to produce 1 unit . . . . .	0.4 hours	1.0 hours
Maximum unit sales per month . . . . .	550 units	175 units

The company presently operates the machine for a single eight-hour shift for 22 working days each month. Management is thinking about operating the machine for two shifts, which will increase its productivity by another eight hours per day for 22 days per month. This change would require \$3,250 additional fixed costs per month.

**Required**

**Check** Units of Product R:  
(2) 440  
(3) 550

1. Determine the contribution margin per machine hour that each product generates.
2. How many units of Product R and Product T should the company produce if it continues to operate with only one shift? How much total contribution margin does this mix produce each month?
3. If the company adds another shift, how many units of Product R and Product T should it produce? How much total contribution margin would this mix produce each month? Should the company add the new shift? Explain.
4. Suppose that the company determines that it can increase Product R's maximum sales to 675 units per month by spending \$4,500 per month in marketing efforts. Should the company pursue this strategy and the double shift? Explain.

**Problem 25-6B**

Analysis of possible elimination of a department

A1 

Esme Company's management is trying to decide whether to eliminate Department Z, which has produced low profits or losses for several years. The company's 2015 departmental income statements show the following.

ESME COMPANY			
Departmental Income Statements			
For Year Ended December 31, 2015			
	Dept. A	Dept. Z	Combined
Sales . . . . .	\$700,000	\$175,000	\$875,000
Cost of goods sold . . . . .	<u>461,300</u>	<u>125,100</u>	<u>586,400</u>
Gross profit . . . . .	238,700	49,900	288,600
Operating expenses			
Direct expenses			
Advertising . . . . .	27,000	3,000	30,000
Store supplies used . . . . .	5,600	1,400	7,000
Depreciation—Store equipment . . . . .	<u>14,000</u>	<u>7,000</u>	<u>21,000</u>
Total direct expenses . . . . .	46,600	11,400	58,000
Allocated expenses			
Sales salaries . . . . .	70,200	23,400	93,600
Rent expense . . . . .	22,080	5,520	27,600
Bad debts expense . . . . .	21,000	4,000	25,000
Office salary . . . . .	20,800	5,200	26,000
Insurance expense . . . . .	4,200	1,400	5,600
Miscellaneous office expenses . . . . .	<u>1,700</u>	<u>2,500</u>	<u>4,200</u>
Total allocated expenses . . . . .	<u>139,980</u>	<u>42,020</u>	<u>182,000</u>
Total expenses . . . . .	<u>186,580</u>	<u>53,420</u>	<u>240,000</u>
Net income (loss) . . . . .	<u>\$ 52,120</u>	<u>\$ (3,520)</u>	<u>\$ 48,600</u>

In analyzing whether to eliminate Department Z, management considers the following items:

- The company has one office worker who earns \$500 per week or \$26,000 per year and four salesclerks who each earn \$450 per week or \$23,400 per year for each salesclerk.
- The full salaries of three salesclerks are charged to Department A. The full salary of one salesclerk is charged to Department Z.
- Eliminating Department Z would avoid the sales salaries and the office salary currently allocated to it. However, management prefers another plan. Two salesclerks have indicated that they will be quitting soon. Management believes that their work can be done by the two remaining clerks if the one office worker works in sales half-time. Eliminating Department Z will allow this shift of duties. If this change is implemented, half the office worker's salary would be reported as sales salaries and half would be reported as office salary.
- The store building is rented under a long-term lease that cannot be changed. Therefore, Department A will use the space and equipment currently used by Department Z.
- Closing Department Z will eliminate its expenses for advertising, bad debts, and store supplies; 65% of the insurance expense allocated to it to cover its merchandise inventory; and 30% of the miscellaneous office expenses presently allocated to it.

### Required

- Prepare a three-column report that lists items and amounts for (a) the company's total expenses (including cost of goods sold)—in column 1, (b) the expenses that would be eliminated by closing Department Z—in column 2, and (c) the expenses that will continue—in column 3.
- Prepare a forecasted annual income statement for the company reflecting the elimination of Department Z assuming that it will not affect Department A's sales and gross profit. The statement should reflect the reassignment of the office worker to one-half time as a salesclerk.

**Check** (1) Total expenses:  
(a) \$826,400, (b) \$181,960

(2) Forecasted net  
income without Department  
Z, \$55,560

### Analysis Component

- Reconcile the company's combined net income with the forecasted net income assuming that Department Z is eliminated (list both items and amounts). Analyze the reconciliation and explain why you think the department should or should not be eliminated.

(This serial problem began in Chapter 1 and continues through most of the book. If previous chapter segments were not completed, the serial problem can begin at this point. It is helpful, but not necessary, to use the Working Papers that accompany the book.)

## SERIAL PROBLEM

Business Solutions

P1 P2

**SP 25** Santana Rey is considering the purchase of equipment for Business Solutions that would allow the company to add a new product to its computer furniture line. The equipment is expected to cost \$300,000 and to have a six-year life and no salvage value. It will be depreciated on a straight-line basis. Business Solutions expects to sell 100 units of the equipment's product each year. The expected annual income related to this equipment follows.

Sales .....	\$375,000
Costs	
Materials, labor, and overhead (except depreciation) .....	200,000
Depreciation on new equipment .....	50,000
Selling and administrative expenses .....	<u>37,500</u>
Total costs and expenses .....	<u>287,500</u>
Pretax income .....	87,500
Income taxes (30%) .....	<u>26,250</u>
Net income .....	<u>\$ 61,250</u>

### Required

Compute the (1) payback period and (2) accounting rate of return for this equipment. (Record answers as percents, rounded to one decimal.)

## Beyond the Numbers

### REPORTING IN ACTION

P3

### APPLE

**BTN 25-1** Assume **Apple** invested \$2.12 billion to expand its manufacturing capacity. Assume that these assets have a 10-year life, and that Apple requires a 10% internal rate of return on these assets.

#### Required

1. What is the amount of annual cash flows that Apple must earn from these projects to have a 10% internal rate of return? (*Hint: Identify the 10-period, 10% factor from the present value of an annuity table, and then divide \$2.12 billion by this factor to get the annual cash flows necessary.*)

#### Fast Forward

2. Access Apple's financial statements for fiscal years ended after September 28, 2013, from its website ([Apple.com](http://Apple.com)) or the SEC's website ([SEC.gov](http://SEC.gov)).
  - a. Determine the amount that Apple invested in capital assets for the most recent year. (*Hint: Refer to the statement of cash flows.*)
  - b. Assume a 10-year life and a 10% internal rate of return. What is the amount of cash flows that Apple must earn on these new projects?

### COMPARATIVE ANALYSIS

A1

### APPLE GOOGLE

**BTN 25-2** **Apple** and **Google** sell a variety of products, including smartphones and tablet computers. Some products are more profitable than others. Teams of employees in each company make advertising, investment, and product mix decisions. A certain portion of advertising for both companies is on a local basis to a target audience.

#### Required

1. Contact the local newspaper and ask the approximate cost of ad space (for example, cost of one page or one-half page of advertising) for a company's product or group of products (such as Apple iPads).
2. Estimate how many products this advertisement must sell to justify its cost. Begin by taking the product's sales price advertised for each company and assume a 20% contribution margin.
3. Prepare a half-page memorandum explaining the importance of effective advertising when making a product mix decision. Be prepared to present your ideas in class.

### ETHICS CHALLENGE

P3

**BTN 25-3** A consultant commented that "too often the numbers look good but feel bad." This comment often stems from estimation error common to capital budgeting proposals that relate to future cash flows. Three reasons for this error often exist. First, reliably predicting cash flows several years into the future is very difficult. Second, the present value of cash flows many years into the future (say, beyond 10 years) is often very small. Third, it is difficult for personal biases and expectations not to unduly influence present value computations.

#### Required

1. Compute the present value of \$100 to be received in 10 years assuming a 12% discount rate.
2. Why is understanding the three reasons mentioned for estimation errors important when evaluating investment projects? Link this response to your answer for part 1.

### COMMUNICATING IN PRACTICE

P1 P2 P3 P4

**BTN 25-4** Payback period, accounting rate of return, net present value, and internal rate of return are common methods to evaluate capital investment opportunities. Assume that your manager asks you to identify the type of measurement basis and unit that each method offers and to list the advantages and disadvantages of each. Present your response in memorandum format of less than one page.

**BTN 25-5** Many companies must determine whether to internally produce their component parts or to outsource them. Further, some companies now outsource key components or business processes to international providers. Access the website [sourcingmag.com](http://sourcingmag.com) and review the available information on business process outsourcing. (click on “What is BPO?”)

### TAKING IT TO THE NET

#### Required

1. According to this website, what is business process outsourcing?
2. What types of processes are commonly outsourced, according to this website?
3. What are some of the benefits of business process outsourcing?

**BTN 25-6** Break into teams and identify four reasons that an international airline such as **Southwest** or **Delta** would invest in a project when its direct analysis using both payback period and net present value indicate it to be a poor investment. (*Hint*: Think about qualitative factors.) Provide an example of an investment project that supports your answer.

### TEAMWORK IN ACTION

**BTN 25-7** Read the chapter opener about Limor Fried and her company, **Adafruit Industries**. Suppose Limor’s business continues to grow, and she builds a massive new manufacturing facility and warehousing center to make her business more efficient and reduce costs.

### ENTREPRENEURIAL DECISION

P1 P2 P3 P4

#### Required

1. What are some of the management tools that Limor can use to evaluate whether the new manufacturing facility and warehousing center will be a good investment?
2. What information does Limor need to use the tools that you identified in your answer to part 1?
3. What are some of the advantages and disadvantages of each tool identified in your answer to part 1?

**BTN 25-8** Visit or call a local auto dealership and inquire about leasing a car. Ask about the down payment and the required monthly payments. You will likely find the salesperson does not discuss the cost to purchase this car but focuses on the affordability of the monthly payments. This chapter gives you the tools to compute the cost of this car using the lease payment schedule in present dollars and to estimate the profit from leasing for an auto dealership.

### HITTING THE ROAD

#### Required

1. Compare the cost of leasing the car to buying it in present dollars using the information from the dealership you contact. (Assume you will make a final payment at the end of the lease and then own the car.)
2. Is it more costly to lease or buy the car? Support your answer with computations.

**BTN 25-9** Access **Samsung**’s 2013 Corporate Sustainability Report, from its website [www.samsung.com](http://www.samsung.com). Identify and read the section “Social Responsibility: Making Contributions Around the Globe.”

### GLOBAL DECISION

#### Required

Samsung’s 2013 Corporate Sustainability Report notes that the company spent 245 billion Korean won in 2012 for programs devoted to better health and education for children. Why would a company like Samsung pursue such a costly program?

**Samsung**

**ANSWERS TO MULTIPLE CHOICE QUIZ**

1. a; Reworking provides incremental revenue of \$11 per unit ( $\$19 - \$8$ ); it costs \$10 to rework them. The company is better off by \$1 per unit when it reworks these products and sells them at the regular price.
2. e; Product X has a \$2 contribution margin per machine hour [ $(\$32 - \$12)/10$  MH]; Product Y has a \$7 contribution margin per machine hour [ $(\$24 - \$10)/2$  MH]. It should produce as much of Product Y as possible.
3. a; Total revenue from the special order = 3,000 units  $\times$  \$15 per unit = \$45,000; and, Total costs for the special order = (3,000 units  $\times$  \$9 per unit) + \$5,000 = \$32,000. Net income from the special order = \$45,000 - \$32,000 = \$13,000. Thus, yes, it should accept the order.
4. c; Payback = \$270,000/\$61,200 per year = 4.4 years.
5. d; Accounting rate of return = \$8,550/[ $(\$180,000 + \$0)/2$ ] = 9.5%.

# Financial Statement Information

This appendix includes financial information for (1) **Apple**, (2) **Google**, and (3) **Samsung**. Apple states that it designs, manufactures, and markets mobile communication and media devices, personal computers, and portable digital music players, and sells a variety of related software, services, peripherals, networking solutions, and third-party digital content and applications; it competes with both Google and Samsung in the United States and globally. The information in this appendix is taken from their annual 10-K reports (or annual report for Samsung) filed with the SEC or other regulatory agency. An **annual report** is a summary of a company's financial results for the year along with its current financial condition and future plans. This report is directed to external users of financial information, but it also affects the actions and decisions of internal users.

A company often uses an annual report to showcase itself and its products. Many annual reports include photos, diagrams, and illustrations related to the company. The primary objective of annual reports, however, is the financial section, which communicates much information about a company, with most data drawn from the accounting information system. The layout of an annual report's financial section is fairly established and typically includes the following:

- Letter to Shareholders
- Financial History and Highlights
- Management Discussion and Analysis
- Management's Report on Financial Statements and on Internal Controls
- Report of Independent Accountants (Auditor's Report) and on Internal Controls
- Financial Statements
- Notes to Financial Statements
- List of Directors and Officers

This appendix provides the financial statements for Apple (plus selected notes), Google, and Samsung. The appendix is organized as follows:

- **Apple** A-2 through A-9
- **Google** A-10 through A-13
- **Samsung** A-14 through A-17

Many assignments at the end of each chapter refer to information in this appendix. We encourage readers to spend time with these assignments; they are especially useful in showing the relevance and diversity of financial accounting and reporting.

**APPLE**  
**GOOGLE**  
**Samsung**

*Special note:* The SEC maintains the EDGAR (**E**lectronic **D**ata **G**athering, **A**nalysis, and **R**etrieval) database at [www.SEC.gov](http://www.SEC.gov) for U.S. filers. The **Form 10-K** is the annual report form for most companies. It provides electronically accessible information. The **Form 10-KSB** is the annual report form filed by small businesses. It requires slightly less information than the Form 10-K. One of these forms must be filed within 90 days after the company's fiscal year-end. (Forms 10-K405, 10-KT, 10-KT405, and 10-KSB405 are slight variations of the usual form due to certain regulations or rules.)

**Apple Inc.**

**APPLE INC.  
SELECTED NOTES TO CONSOLIDATED FINANCIAL STATEMENTS****Basis of Presentation and Preparation**

The Company's fiscal year is the 52- or 53-week period that ends on the last Saturday of September. The Company's fiscal years 2013, 2012 and 2011 ended on September 28, 2013, September 29, 2012 and September 24, 2011, respectively. An additional week is included in the first fiscal quarter approximately every six years to realign fiscal quarters with calendar quarters. Fiscal year 2012 spanned 53 weeks, with a 14th week included in the first quarter of 2012. Fiscal years 2013 and 2011 spanned 52 weeks each. Unless otherwise stated, references to particular years, quarters, months and periods refer to the Company's fiscal years ended in September and the associated quarters, months and periods of those fiscal years.

**Revenue Recognition**

Net sales consist primarily of revenue from the sale of hardware, software, digital content and applications, peripherals, and service and support contracts. The Company recognizes revenue when persuasive evidence of an arrangement exists, delivery has occurred, the sales price is fixed or determinable, and collection is probable. Product is considered delivered to the customer once it has been shipped and title and risk of loss have been transferred. For most of the Company's product sales, these criteria are met at the time the product is shipped. For online sales to individuals, for some sales to education customers in the U.S., and for certain other sales, the Company defers revenue until the customer receives the product because the Company retains a portion of the risk of loss on these sales during transit. The Company recognizes revenue from the sale of hardware products, software bundled with hardware that is essential to the functionality of the hardware, and third-party digital content sold on the iTunes Store in accordance with general revenue recognition accounting guidance. The Company recognizes revenue in accordance with industry specific software accounting guidance for the following types of sales transactions: (i) standalone sales of software products, (ii) sales of software upgrades and (iii) sales of software bundled with hardware not essential to the functionality of the hardware.

For the sale of most third-party products, the Company recognizes revenue based on the gross amount billed to customers because the Company establishes its own pricing for such products, retains related inventory risk for physical products, is the primary obligor to the customer and assumes the credit risk for amounts billed to its customers. For third-party applications sold through the App Store and Mac App Store and certain digital content sold through the iTunes Store, the Company does not determine the selling price of the products and is not the primary obligor to the customer. Therefore, the Company accounts for such sales on a net basis by recognizing in

net sales only the commission it retains from each sale. The portion of the gross amount billed to customers that is remitted by the Company to third-party app developers and certain digital content owners is not reflected in the Company's Consolidated Statements of Operations.

The Company records deferred revenue when it receives payments in advance of the delivery of products or the performance of services. This includes amounts that have been deferred for unspecified and specified software upgrade rights and non-software services that are attached to hardware and software products. The Company sells gift cards redeemable at its retail and online stores, and also sells gift cards redeemable on the iTunes Store for the purchase of digital content and software. The Company records deferred revenue upon the sale of the card, which is relieved upon redemption of the card by the customer. Revenue from AppleCare service and support contracts is deferred and recognized over the service coverage periods. AppleCare service and support contracts typically include extended phone support, repair services, web-based support resources and diagnostic tools offered under the Company's standard limited warranty.

The Company records reductions to revenue for estimated commitments related to price protection and other customer incentive programs. For transactions involving price protection, the Company recognizes revenue net of the estimated amount to be refunded. For the Company's other customer incentive programs, the estimated cost of these programs is recognized at the later of the date at which the Company has sold the product or the date at which the program is offered. The Company also records reductions to revenue for expected future product returns based on the Company's historical experience. Revenue is recorded net of taxes collected from customers that are remitted to governmental authorities, with the collected taxes recorded as current liabilities until remitted to the relevant government authority.

**Shipping Costs**

For all periods presented, amounts billed to customers related to shipping and handling are classified as revenue, and the Company's shipping and handling costs are included in cost of sales.

**Warranty Expense**

The Company generally provides for the estimated cost of hardware and software warranties at the time the related revenue is recognized. The Company assesses the adequacy of its pre-existing warranty liabilities and adjusts the amounts as necessary based on actual experience and changes in future estimates.

**Apple Inc. Notes—continued****Software Development Costs**

Research and development costs are expensed as incurred. Development costs of computer software to be sold, leased, or otherwise marketed are subject to capitalization beginning when a product's technological feasibility has been established and ending when a product is available for general release to customers. In most instances, the Company's products are released soon after technological feasibility has been established. Costs incurred subsequent to achievement of technological feasibility were not significant, and software development costs were expensed as incurred during 2013, 2012 and 2011.

**Advertising Costs**

Advertising costs are expensed as incurred and included in selling, general and administrative expenses. Advertising expense was \$1.1 billion, \$1.0 billion and \$933 million for 2013, 2012 and 2011, respectively.

**Earnings Per Share**

Basic earnings per share is computed by dividing income available to common shareholders by the weighted-average number of shares of common stock outstanding during the period. Diluted earnings per share is computed by dividing income available to common shareholders by the weighted-average number of shares of common stock outstanding during the period increased to include the number of additional shares of common stock that would have been outstanding if the potentially dilutive securities had been issued.

**Cash Equivalents and Marketable Securities**

All highly liquid investments with maturities of three months or less at the date of purchase are classified as cash equivalents. The Company's marketable debt and equity securities have been classified and accounted for as available-for-sale. Management determines the appropriate classification of its investments at the time of purchase and reevaluates the designations at each balance sheet date. The Company classifies its marketable debt securities as either short-term or long-term based on each instrument's underlying contractual maturity date. Marketable debt securities with maturities of 12 months or less are classified as short-term and marketable debt securities with maturities greater than 12 months are classified as long-term. The Company classifies its marketable equity securities, including mutual funds, as either short-term or long-term based on the nature of each security and its availability for use in current operations. The Company's marketable debt and equity securities are carried at fair value, with the unrealized gains and losses, net of taxes, reported as a component of shareholders' equity. The cost of securities sold is based upon the specific identification method.

**Accounts Receivable (Trade Receivables)**

The Company has considerable trade receivables outstanding with its third-party cellular network carriers, wholesalers, retailers, value-added resellers, small and mid-sized businesses, and education, enterprise and government customers. The Company's cellular network carriers accounted for 68% and 66% of trade receivables as of September 28, 2013 and September 29, 2012, respectively. The additions and write-offs to the Company's allowance for doubtful accounts during 2013, 2012 and 2011 were not significant.

**Allowance for Doubtful Accounts**

The Company records its allowance for doubtful accounts based upon its assessment of various factors. The Company considers historical experience, the age of the accounts receivable balances, credit quality of the Company's customers, current economic conditions, and other factors that may affect customers' ability to pay.

**Inventories**

Inventories are stated at the lower of cost, computed using the first-in, first-out method, or market. If the cost of the inventories exceeds their market value, provisions are made currently for the difference between the cost and the market value.

<b>Inventories</b>	<b>2013</b>	<b>2012</b>
Components	\$ 683	\$124
Finished goods	1,081	667
<b>Total inventories</b>	<b>\$1,764</b>	<b>\$791</b>

**Property, Plant and Equipment**

Property, plant and equipment are stated at cost. Depreciation is computed by use of the straight-line method over the estimated useful lives of the assets, which for buildings is the lesser of 30 years or the remaining life of the underlying building; between two to five years for machinery and equipment, including product tooling and manufacturing process equipment; and the shorter of lease terms or ten years for leasehold improvements. The Company capitalizes eligible costs to acquire or develop internal-use software that are incurred subsequent to the preliminary project stage. Capitalized costs related to internal-use software are amortized using the straight-line method over the estimated useful lives of the assets, which range from three to five years. Depreciation and amortization expense on property and equipment was \$5.8 billion, \$2.6 billion and \$1.6 billion during 2013, 2012 and 2011, respectively.

<b>Property, Plant and Equipment</b>	<b>2013</b>	<b>2012</b>
Land and buildings	\$ 3,309	\$ 2,439
Machinery, equipment and internal-use software	21,242	15,984
Leasehold improvements	3,968	3,464
Gross property, plant and equipment	28,519	21,887
Accumulated depreciation and amortization	(11,922)	(6,435)
<b>Net property, plant and equipment</b>	<b>\$16,597</b>	<b>\$15,452</b>

## Apple Inc. Notes—continued

### Long-Lived Assets Including Goodwill and Other Acquired Intangible Assets

The Company reviews property, plant and equipment, inventory component prepayments, and certain identifiable intangibles, excluding goodwill, for impairment. Long-lived assets are reviewed for impairment whenever events or changes in circumstances indicate the carrying amount of an asset may not be recoverable. Recoverability of these assets is measured by comparison of their carrying amounts to future undiscounted cash flows the assets are expected to generate. If property, plant and equipment, inventory component prepayments, and certain identifiable intangibles are considered to be impaired, the impairment to be recognized equals the amount by which the carrying value of the assets exceeds its fair value. The Company did not record any significant impairments during 2013, 2012 and 2011.

The Company does not amortize goodwill and intangible assets with indefinite useful lives, rather such assets are required to be tested for impairment at least annually or sooner whenever events or changes in circumstances indicate that the assets may be impaired. The Company performs its goodwill and intangible asset impairment tests in the fourth quarter of each year. The Company did not recognize any impairment charges related to goodwill or indefinite lived intangible assets during 2013, 2012 and 2011. The Company established reporting units based on its current reporting structure. For purposes of testing goodwill for impairment, goodwill has been allocated to these reporting units to the extent it relates to each reporting unit. In 2013 and 2012, the Company's goodwill was allocated to the Americas and Europe reportable operating segments.

The Company amortizes its intangible assets with definite useful lives over their estimated useful lives and reviews these assets for impairment. The Company is currently amortizing its acquired intangible assets with definite useful lives over periods typically from three to seven years.

### Goodwill and Other Intangible Assets

The Company's acquired intangible assets with definite useful lives primarily consist of patents and licenses and are amortized over periods typically from three to seven years. The following table summarizes the components of gross and net intangible asset balances as of September 28, 2013 (in millions):

	Gross Carrying Amount	Accumulated Amortization	Net Carrying Amount
Definite lived and amortizable acquired intangible assets	\$ 6,081	\$ (2,002)	\$ 4,079
Indefinite lived and non-amortizable trademarks	100	0	100
Total acquired intangible assets	<u>\$ 6,181</u>	<u>\$ (2,002)</u>	<u>\$ 4,179</u>

The Company's gross carrying amount of goodwill was \$1.6 billion and \$1.1 billion as of September 28, 2013 and September 29, 2012, respectively. The Company did not have any goodwill impairment during 2013, 2012 or 2011. Amortization expense related to acquired intangible assets was \$960 million, \$605 million and \$192 million in 2013, 2012 and 2011, respectively.

### Fair Value Measurements

The Company applies fair value accounting for all financial assets and liabilities and non-financial assets and liabilities that are recognized or disclosed at fair value in the financial statements on a recurring basis. The Company defines fair value as the price that would be received from selling an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. When determining the fair value measurements for assets and liabilities, which are required to be recorded at fair value, the Company considers the principal or most advantageous market in which the Company would transact and the market-based risk measurements or assumptions that market participants would use in pricing the asset or liability, such as risks inherent in valuation techniques, transfer restrictions and credit risk. Fair value is estimated by applying the following hierarchy, which prioritizes the inputs used to measure fair value into three levels and bases the categorization within the hierarchy upon the lowest level of input that is available and significant to the fair value measurement:

*Level 1*—Quoted prices in active markets for identical assets or liabilities.

*Level 2*—Observable inputs other than quoted prices in active markets for identical assets and liabilities, quoted prices for identical or similar assets or liabilities in inactive markets, or other inputs that are observable or can be corroborated by observable market data for substantially the full term of the assets or liabilities.

*Level 3*—Inputs that are generally unobservable and typically reflect management's estimate of assumptions that market participants would use in pricing the asset or liability.

The Company's valuation techniques used to measure the fair value of money market funds and certain marketable equity securities were derived from quoted prices in active markets for identical assets or liabilities. The valuation techniques used to measure the fair value of all other financial instruments, all of which have counterparties with high credit ratings, were valued based on quoted market prices or model driven valuations using significant inputs

**Apple Inc. Notes—continued**

derived from or corroborated by observable market data. In accordance with the fair value accounting requirements, companies may choose to measure eligible financial instruments and certain other items at fair value. The Company has not elected the fair value option for any eligible financial instruments.

**Accrued Warranty and Indemnification**

The Company offers a basic limited parts and labor warranty on its hardware products. The basic warranty period for hardware products is typically one year from the date of purchase by the end-user. The Company also offers a 90-day basic warranty for its service parts used to repair the Company's hardware products. The Company provides currently for the estimated cost that may be incurred under its basic limited product warranties at the time related revenue is recognized. Factors considered in determining appropriate accruals for product warranty obligations include the size of the installed base of products subject to warranty protection, historical and projected warranty claim rates, historical and projected cost-per-claim, and knowledge of specific product failures that are outside of the Company's typical experience. The Company assesses the adequacy of its pre-existing warranty liabilities and adjusts the amounts as necessary based on actual experience and changes in future estimates. The following table shows changes in the Company's accrued warranties and related costs for 2013, 2012 and 2011 (in millions):

	<u>2013</u>	<u>2012</u>	<u>2011</u>
Beginning accrued warranty and related costs	\$ 1,638	\$ 1,240	\$ 761
Cost of warranty claims	(3,703)	(1,786)	(1,147)
Accruals for product warranty	5,032	2,184	1,626
Ending accrued warranty and related costs	<u>\$ 2,967</u>	<u>\$ 1,638</u>	<u>\$ 1,240</u>

<b>Accrued Expenses</b>	<u>2013</u>	<u>2012</u>
Accrued warranty and related costs	\$ 2,967	\$ 1,638
Accrued taxes	1,200	1,535
Deferred margin on component sales	1,262	1,492

Accrued compensation and employee benefits	959	735
Other current liabilities	6,177	5,104
Total accrued expenses	<u>\$13,856</u>	<u>\$11,414</u>

<b>Non-Current Liabilities</b>	<u>2013</u>	<u>2012</u>
Deferred tax liabilities	\$16,489	\$13,847
Other non-current liabilities	3,719	2,817
Total other non-current liabilities	<u>\$20,208</u>	<u>\$16,664</u>

**Long-Term Debt**

In May 2013, the Company issued floating- and fixed-rate notes with varying maturities for an aggregate principal amount of \$17.0 billion (collectively the "Notes"). The Notes are senior unsecured obligations, and interest is payable in arrears, quarterly for the floating-rate notes and semi-annually for the

fixed-rate notes. As of September 28, 2013, the fair value of the Company's Notes, based on Level 2 inputs, was \$15.9 billion.

**Segment Information and Geographic Data**

The following table shows information by operating segment for 2013, 2012 and 2011 (in millions):

### PRESENT AND FUTURE VALUE CONCEPTS

- C1** Time is money and the concept of interest

### VALUE OF A SINGLE AMOUNT

- P1** Present value of a single amount
- P2** Future value of a single amount

### VALUE OF AN ANNUITY

- P3** Present value of an annuity
- P4** Future value of an annuity

## Learning Objectives

### CONCEPTUAL

- C1** Describe the earning of interest and the concepts of present and future values.

### PROCEDURAL

- P1** Apply present value concepts to a single amount by using interest tables.
- P2** Apply future value concepts to a single amount by using interest tables.

- P3** Apply present value concepts to an annuity by using interest tables.

- P4** Apply future value concepts to an annuity by using interest tables.

## PRESENT AND FUTURE VALUE CONCEPTS

The old saying “Time is money” reflects the notion that as time passes, the values of our assets and liabilities change. This change is due to *interest*, which is a borrower’s payment to the owner of an asset for its use. The most common example of interest is a savings account asset. As we keep a balance of cash in the account, it earns interest that the financial institution pays us. An example of a liability is a car loan. As we carry the balance of the loan, we accumulate interest costs on it. We must ultimately repay this loan with interest.

Present and future value computations enable us to measure or estimate the interest component of holding assets or liabilities over time. The present value computation is important when we want to know the value of future-day assets *today*. The future value computation is important when we want to know the value of present-day assets *at a future date*. The first section focuses on the present value of a single amount. The second section focuses on the future value of a single amount. Then both the present and future values of a series of amounts (called an *annuity*) are defined and explained.

### Decision Insight

**What’s Five Million Worth?** A maintenance worker duped out of a \$5 million scratch-off ticket got his winnings seven years later. Robert Miles bought the ticket in 2006 at a convenience store where the owner and his two sons convinced Miles the ticket was worth \$5,000 and paid him \$4,000 for it. The brothers waited until 2012 to claim the jackpot, prompting an investigation, which uncovered the fraud. The \$5 million will be paid to Miles as a \$250,000 annuity over 20 years or as a lump-sum payment of \$3,210,000, which results in about \$2,124,378 after taxes. ■

## PRESENT VALUE OF A SINGLE AMOUNT

We graphically express the present value, called  $p$ , of a single future amount, called  $f$ , that is received or paid at a future date in Exhibit B.1.

The formula to compute the present value of a single amount is shown in Exhibit B.2, where  $p$  = present value (PV);  $f$  = future value (FV);  $i$  = rate of interest per period; and  $n$  = number of periods. (Interest is also called the *discount*, and an interest rate is also called the *discount rate*.)

$$p = \frac{f}{(1 + i)^n}$$

To illustrate present value concepts, assume that we need \$220 one period from today. We want to know how much we must invest now, for one period, at an interest rate of 10% to provide for this \$220. For this illustration, the  $p$ , or present value, is the unknown amount—the specifics are shown graphically as follows:

Conceptually, we know  $p$  must be less than \$220. This is obvious from the answer to this question: Would we rather have \$220 today or \$220 at some future date? If we had \$220 today, we could

### C1

Describe the earning of interest and the concepts of present and future values.

### EXHIBIT B.1

Present Value of a Single Amount Diagram

### P1

Apply present value concepts to a single amount by using interest tables.

### EXHIBIT B.2

Present Value of a Single Amount Formula

invest it and see it grow to something more than \$220 in the future. Therefore, we would prefer the \$220 today. This means that if we were promised \$220 in the future, we would take less than \$220 today. But how much less? To answer that question, we compute an estimate of the present value of the \$220 to be received one period from now using the formula in Exhibit B.2 as follows:

$$p = \frac{f}{(1 + i)^n} = \frac{\$220}{(1 + 0.10)^1} = \$200$$

**Point:** The FV factor when  $n = 2$  and  $i = 10\%$ , is 1.2100. Its reciprocal, 0.8264, is the PV factor when  $n = 2$  and  $i = 10\%$ .

We interpret this result to say that given an interest rate of 10%, we are indifferent between \$200 today or \$220 at the end of one period.

We can also use this formula to compute the present value for *any number of periods*. To illustrate, consider a payment of \$242 at the end of two periods at 10% interest. The present value of this \$242 to be received two periods from now is computed as follows:

$$p = \frac{f}{(1 + i)^n} = \frac{\$242}{(1 + 0.10)^2} = \$200$$

Together, these results tell us we are indifferent between \$200 today, or \$220 one period from today, or \$242 two periods from today given a 10% interest rate per period.

The number of periods ( $n$ ) in the present value formula does not have to be expressed in years. Any period of time such as a day, a month, a quarter, or a year can be used. Whatever period is used, the interest rate ( $i$ ) must be compounded for the same period. This means that if a situation expresses  $n$  in months and  $i$  equals 12% per year, then  $i$  is transformed into interest earned per month (or 1%). In this case, interest is said to be *compounded monthly*. For example, the present value of \$1 when  $n$  is 12 months and  $i$  is 12% compounded monthly follows:

$$p = \frac{1}{(1 + .01)^{12}} = \$0.8874$$

A present value table helps us with present value computations. It gives us present values (factors) for a variety of both interest rates ( $i$ ) and periods ( $n$ ). Each present value in a present value table assumes that the future value ( $f$ ) equals 1. When the future value ( $f$ ) is different from 1, we simply multiply the present value ( $p$ ) from the table by that future value to give us the estimate. The formula used to construct a table of present values for a single future amount of 1 is shown in Exhibit B.3.

### EXHIBIT B.3

Present Value of 1 Formula

$$p = \frac{1}{(1 + i)^n}$$

This formula is identical to that in Exhibit B.2 except that  $f$  equals 1. Table B.1 at the end of this appendix is such a present value table. It is often called a **present value of 1 table**. A present value table involves three factors:  $p$ ,  $i$ , and  $n$ . Knowing two of these three factors allows us to compute the third. (A fourth is  $f$ , but as already explained, we need only multiply the 1 used in the formula by  $f$ .) To illustrate the use of a present value table, consider three cases.

**Case 1** (solve for  $p$  when knowing  $i$  and  $n$ ). To show how we use a present value table, let's look again at how we estimate the present value of \$220 (the  $f$  value) at the end of one period ( $n = 1$ ) where the interest rate ( $i$ ) is 10%. To solve this case, we go to the present value table (Table B.1) and look in the row for 1 period and in the column for 10% interest. Here we find a present value ( $p$ ) of 0.9091 based on a future value of 1. This means, for instance, that \$1 to be received one period from today at 10% interest is worth \$0.9091 today. Since the future value in this case is not \$1 but \$220, we multiply the 0.9091 by \$220 to get an answer of \$200.

**Case 2** (solve for  $n$  when knowing  $p$  and  $i$ ). To illustrate, assume a \$100,000 future value ( $f$ ) that is worth \$13,000 today ( $p$ ) using an interest rate of 12% ( $i$ ) but where  $n$  is unknown. In particular, we want to know how many periods ( $n$ ) there are between the present value and the

future value. To put this in context, it would fit a situation in which we want to retire with \$100,000 but currently have only \$13,000 that is earning a 12% return and we will be unable to save any additional money. How long will it be before we can retire? To answer this, we go to Table B.1 and look in the 12% interest column. Here we find a column of present values ( $p$ ) based on a future value of 1. To use the present value table for this solution, we must divide \$13,000 ( $p$ ) by \$100,000 ( $f$ ), which equals 0.1300. This is necessary because *a present value table defines  $f$  equal to 1, and  $p$  as a fraction of 1*. We look for a value nearest to 0.1300 ( $p$ ), which we find in the row for 18 periods ( $n$ ). This means that the present value of \$100,000 at the end of 18 periods at 12% interest is \$13,000; alternatively stated, we must work 18 more years.

**Case 3** (solve for  $i$  when knowing  $p$  and  $n$ ). In this case, we have, say, a \$120,000 future value ( $f$ ) worth \$60,000 today ( $p$ ) when there are nine periods ( $n$ ) between the present and future values, but the interest rate is unknown. As an example, suppose we want to retire with \$120,000 in nine years, but we have only \$60,000 and we will be unable to save any additional money. What interest rate must we earn to retire with \$120,000 in nine years? To answer this, we go to the present value table (Table B.1) and look in the row for nine periods. To use the present value table, we must divide \$60,000 ( $p$ ) by \$120,000 ( $f$ ), which equals 0.5000. Recall that this step is necessary because a present value table defines  $f$  equal to 1 and  $p$  as a fraction of 1. We look for a value in the row for nine periods that is nearest to 0.5000 ( $p$ ), which we find in the column for 8% interest ( $i$ ). This means that the present value of \$120,000 at the end of nine periods at 8% interest is \$60,000 or, in our example, we must earn 8% annual interest to retire in nine years.

A company is considering an investment expected to yield \$70,000 after six years. If this company demands an 8% return, how much is it willing to pay for this investment today?

**Solution**

$\$70,000 \times 0.6302 = \underline{\$44,114}$  (using PV factor from Table B.1,  $i = 8\%$ ,  $n = 6$ ).

**NEED-TO-KNOW B-1**

Present Value of Single Amount

P1

## FUTURE VALUE OF A SINGLE AMOUNT

We must modify the formula for the present value of a single amount to obtain the formula for the future value of a single amount. In particular, we multiply both sides of the equation in Exhibit B.2 by  $(1 + i)^n$  to get the result shown in Exhibit B.4.

$$f = p \times (1 + i)^n$$

The future value ( $f$ ) is defined in terms of  $p$ ,  $i$ , and  $n$ . We can use this formula to determine that \$200 ( $p$ ) invested for 1 ( $n$ ) period at an interest rate of 10% ( $i$ ) yields a future value of \$220 as follows:

$$\begin{aligned} f &= p \times (1 + i)^n \\ &= \$200 \times (1 + 0.10)^1 \\ &= \$220 \end{aligned}$$

This formula can also be used to compute the future value of an amount for *any number of periods* into the future. To illustrate, assume that \$200 is invested for three periods at 10%. The future value of this \$200 is \$266.20, computed as follows:

$$\begin{aligned} f &= p \times (1 + i)^n \\ &= \$200 \times (1 + 0.10)^3 \\ &= \$200 \times 1.3310 \\ &= \$266.20 \end{aligned}$$

**P2** \_\_\_\_\_  
Apply future value concepts to a single amount by using interest tables.

**EXHIBIT B.4**

Future Value of a Single Amount Formula

**Point:** The FV factor in Table B2 when  $n = 3$  and  $i = 10\%$  is 1.3310.

A future value table makes it easier for us to compute future values ( $f$ ) for many different combinations of interest rates ( $i$ ) and time periods ( $n$ ). Each future value in a future value table assumes the present value ( $p$ ) is 1. As with a present value table, if the future amount is something other than 1, we simply multiply our answer by that amount. The formula used to construct a table of future values (factors) for a single amount of 1 is in Exhibit B.5.

### EXHIBIT B.5

Future Value of 1 Formula

$$f = (1 + i)^n$$

Table B.2 at the end of this appendix shows a table of future values for a current amount of 1. This type of table is called a **future value of 1 table**.

#### Point:

$1/\text{PV factor} = \text{FV factor}$ .

$1/\text{FV factor} = \text{PV factor}$ .

There are some important relations between Tables B.1 and B.2. In Table B.2, for the row where  $n = 0$ , the future value is 1 for each interest rate. This is so because no interest is earned when time does not pass. We also see that Tables B.1 and B.2 report the same information but in a different manner. In particular, one table is simply the *reciprocal* of the other. To illustrate this inverse relation, let's say we invest \$100 for a period of five years at 12% per year. How much do we expect to have after five years? We can answer this question using Table B.2 by finding the future value ( $f$ ) of 1, for five periods from now, compounded at 12%. From that table we find  $f = 1.7623$ . If we start with \$100, the amount it accumulates to after five years is \$176.23 ( $\$100 \times 1.7623$ ). We can alternatively use Table B.1. Here we find that the present value ( $p$ ) of 1, discounted five periods at 12%, is 0.5674. Recall the inverse relation between present value and future value. This means that  $p = 1/f$  (or equivalently,  $f = 1/p$ ). We can compute the future value of \$100 invested for five periods at 12% as follows:  $f = \$100 \times (1/0.5674) = \$176.24$  (which equals the \$176.23 just computed, except for a 1 cent rounding difference).

A future value table involves three factors:  $f$ ,  $i$ , and  $n$ . Knowing two of these three factors allows us to compute the third. To illustrate, consider these three possible cases.

**Case 1** (solve for  $f$  when knowing  $i$  and  $n$ ). Our preceding example fits this case. We found that \$100 invested for five periods at 12% interest accumulates to \$176.24.

**Case 2** (solve for  $n$  when knowing  $f$  and  $i$ ). In this case, we have, say, \$2,000 ( $p$ ) and we want to know how many periods ( $n$ ) it will take to accumulate to \$3,000 ( $f$ ) at 7% interest ( $i$ ). To answer this, we go to the future value table (Table B.2) and look in the 7% interest column. Here we find a column of future values ( $f$ ) based on a present value of 1. To use a future value table, we must divide \$3,000 ( $f$ ) by \$2,000 ( $p$ ), which equals 1.500. This is necessary because *a future value table defines p equal to 1, and f as a multiple of 1*. We look for a value nearest to 1.50 ( $f$ ), which we find in the row for six periods ( $n$ ). This means that \$2,000 invested for six periods at 7% interest accumulates to \$3,000.

**Case 3** (solve for  $i$  when knowing  $f$  and  $n$ ). In this case, we have, say, \$2,001 ( $p$ ), and in nine years ( $n$ ) we want to have \$4,000 ( $f$ ). What rate of interest must we earn to accomplish this? To answer that, we go to Table B.2 and search in the row for nine periods. To use a future value table, we must divide \$4,000 ( $f$ ) by \$2,001 ( $p$ ), which equals 1.9990. Recall that this is necessary because a future value table defines  $p$  equal to 1 and  $f$  as a multiple of 1. We look for a value nearest to 1.9990 ( $f$ ), which we find in the column for 8% interest ( $i$ ). This means that \$2,001 invested for nine periods at 8% interest accumulates to \$4,000.

### NEED-TO-KNOW B-2

Future Value of Single Amount

P2

Assume that you win a \$150,000 cash sweepstakes today. You decide to deposit this cash in an account earning 8% annual interest, and you plan to quit your job when the account equals \$555,000. How many years will it be before you can quit working?

#### Solution

$\$555,000/\$150,000 = 3.7000$  (the future value factor)

Table B.2 shows this value is not achieved until reaching 17 years at 8% interest.

## PRESENT VALUE OF AN ANNUITY

An *annuity* is a series of equal payments occurring at equal intervals. One example is a series of three annual payments of \$100 each. An *ordinary annuity* is defined as equal end-of-period payments at equal intervals. An ordinary annuity of \$100 for three periods and its present value (*p*) are illustrated in Exhibit B.6.

One way to compute the present value of an ordinary annuity is to find the present value of each payment using our present value formula from Exhibit B.3. We then add each of the three present values. To illustrate, let's look at three \$100 payments at the end of each of the next three periods with an interest rate of 15%. Our present value computations are

$$p = \frac{\$100}{(1 + 0.15)^1} + \frac{\$100}{(1 + 0.15)^2} + \frac{\$100}{(1 + 0.15)^3} = \$228.32$$

This computation is identical to computing the present value of each payment (from Table B.1) and taking their sum or, alternatively, adding the values from Table B.1 for each of the three payments and multiplying their sum by the \$100 annuity payment.

A more direct way is to use a present value of annuity table. Table B.3 at the end of this appendix is one such table. This table is called a **present value of an annuity of 1 table**. If we look at Table B.3 where *n* = 3 and *i* = 15%, we see the present value is 2.2832. This means that the present value of an annuity of 1 for three periods, with a 15% interest rate, equals 2.2832.

A present value of an annuity formula is used to construct Table B.3. It can also be constructed by adding the amounts in a present value of 1 table. To illustrate, we use Tables B.1 and B.3 to confirm this relation for the prior example:

From Table B.1		From Table B.3	
<i>i</i> = 15%, <i>n</i> = 1 . . . . .	0.8696		
<i>i</i> = 15%, <i>n</i> = 2 . . . . .	0.7561		
<i>i</i> = 15%, <i>n</i> = 3 . . . . .	0.6575		
Total . . . . .	<u>2.2832</u>	<i>i</i> = 15%, <i>n</i> = 3 . . . . .	<u>2.2832</u>

**P3**  
Apply present value concepts to an annuity by using interest tables.

**EXHIBIT B.6**  
Present Value of an Ordinary Annuity Diagram

**Point:** Excel functions follow:  
= -PV (rate, periods, payment)  
= -PV (0.15, 3, 100)  
= \$228.32

We can also use business calculators or spreadsheet programs to find the present value of an annuity.

### Decision Insight

**Count Your Blessings** "I don't have good luck—I'm blessed," proclaimed Andrew "Jack" Whittaker, a sewage treatment contractor, after winning the largest ever undivided jackpot in a U.S. lottery. Whittaker had to choose between \$315 million in 30 annual installments or \$170 million in one lump sum (\$112 million after-tax). ■

A company is considering an investment that would produce payments of \$10,000 every six months for three years. The first payment would be received in six months. If this company requires an 8% annual return, what is the maximum amount it is willing to pay for this investment today?

**Solution**

$\$10,000 \times 5.2421 = \underline{\underline{\$52,421}}$  is the maximum (using PV of annuity factor from Table B.3, *i* = 4%, *n* = 6).

### NEED-TO-KNOW B-3

Present Value of an Annuity

**P3**

# FUTURE VALUE OF AN ANNUITY

**P4**  
Apply future value concepts to an annuity by using interest tables.

The future value of an *ordinary annuity* is the accumulated value of each annuity payment with interest as of the date of the final payment. To illustrate, let's consider the earlier annuity of three annual payments of \$100. Exhibit B.7 shows the point in time for the future value ( $f$ ). The first payment is made two periods prior to the point when future value is determined, and the final payment occurs on the future value date.

**EXHIBIT B.7**  
Future Value of an Ordinary Annuity Diagram

**Point:** An ordinary annuity is a series of equal cash flows, with the payment at the end of each period.

One way to compute the future value of an annuity is to use the formula to find the future value of *each* payment and add them. If we assume an interest rate of 15%, our calculation is

$$f = \$100 \times (1 + 0.15)^2 + \$100 \times (1 + 0.15)^1 + \$100 \times (1 + 0.15)^0 = \$347.25$$

This is identical to using Table B.2 and summing the future values of each payment, or adding the future values of the three payments of 1 and multiplying the sum by \$100.

A more direct way is to use a table showing future values of annuities. Such a table is called a **future value of an annuity of 1 table**. Table B.4 at the end of this appendix is one such table. Note that in Table B.4 when  $n = 1$ , the future values equal 1 ( $f = 1$ ) for all rates of interest. This is so because such an annuity consists of only one payment and the future value is determined on the date of that payment—no time passes between the payment and its future value. The future value of an annuity formula is used to construct Table B.4. We can also construct it by adding the amounts from a future value of 1 table. To illustrate, we use Tables B.2 and B.4 to confirm this relation for the prior example:

From Table B.2		From Table B.4	
$i = 15\%, n = 0$ . . . . .	1.0000		
$i = 15\%, n = 1$ . . . . .	1.1500		
$i = 15\%, n = 2$ . . . . .	1.3225		
Total . . . . .	<u>3.4725</u>	$i = 15\%, n = 3$ . . . . .	<u>3.4725</u>

**Point:** Excel functions follow:  
= FV (rate, periods, payment)  
= FV (0.15, 3, 100)  
= \$347.25

Note that the future value in Table B.2 is 1.0000 when  $n = 0$ , but the future value in Table B.4 is 1.0000 when  $n = 1$ . Is this a contradiction? No. When  $n = 0$  in Table B.2, the future value is determined on the date when a single payment occurs. This means that no interest is earned because no time has passed, and the future value equals the payment. Table B.4 describes annuities with equal payments occurring at the end of each period. When  $n = 1$ , the annuity has one payment, and its future value equals 1 on the date of its final and only payment. Again, no time passes between the payment and its future value date.

## NEED-TO-KNOW B-4

Future Value of an Annuity

**P4**

A company invests \$45,000 per year for five years at 12% annual interest. Compute the value of this annuity investment at the end of five years.

**Solution**

$$\$45,000 \times 6.3528 = \underline{\underline{\$285,876}} \text{ (using the FV of annuity factor from Table B.4, } i = 12\%, n = 5).$$

# Summary

**C1 Describe the earning of interest and the concepts of present and future values.** Interest is payment by a borrower to the owner of an asset for its use. Present and future value computations are a way for us to estimate the interest component of holding assets or liabilities over a period of time.

**P1 Apply present value concepts to a single amount by using interest tables.** The present value of a single amount received at a future date is the amount that can be invested now at the specified interest rate to yield that future value.

**P2 Apply future value concepts to a single amount by using interest tables.** The future value of a single amount

invested at a specified rate of interest is the amount that would accumulate by the future date.

**P3 Apply present value concepts to an annuity by using interest tables.** The present value of an annuity is the amount that can be invested now at the specified interest rate to yield that series of equal periodic payments.

**P4 Apply future value concepts to an annuity by using interest tables.** The future value of an annuity invested at a specific rate of interest is the amount that would accumulate by the date of the final payment.

Assume that you must make two-year-ahead future value estimates using the *future value of 1 table* (Table B.2). Which interest rate column *and* number-of-periods row do you use when working with the following rates?

- 8% annual rate, compounded quarterly
- 12% annual rate, compounded annually
- 6% annual rate, compounded semiannually
- 12% annual rate, compounded monthly (the answer for number-of-periods in part 4 is not shown in Table B.2)

## QUICK STUDY

### QS B-1

Identifying interest rates in tables

C1

Ken Francis is offered the possibility of investing \$2,745 today and in return to receive \$10,000 after 15 years. What is the annual rate of interest for this investment? (Use Table B.1.)

### QS B-2

Interest rate on an investment P1

Megan Brink is offered the possibility of investing \$6,651 today at 6% interest per year in a desire to accumulate \$10,000. How many years must Brink wait to accumulate \$10,000? (Use Table B.1.)

### QS B-3

Number of periods of an investment P1

Flaherty is considering an investment that, if paid for immediately, is expected to return \$140,000 five years from now. If Flaherty demands a 9% return, how much is she willing to pay for this investment?

### QS B-4

Present value of an amount P1

CII, Inc., invests \$630,000 in a project expected to earn a 12% annual rate of return. The earnings will be reinvested in the project each year until the entire investment is liquidated 10 years later. What will the cash proceeds be when the project is liquidated?

### QS B-5

Future value of an amount P2

Beene Distributing is considering a project that will return \$150,000 annually at the end of each year for the next six years. If Beene demands an annual return of 7% and pays for the project immediately, how much is it willing to pay for the project?

### QS B-6

Present value of an annuity P3

Claire Fitch is planning to begin an individual retirement program in which she will invest \$1,500 at the end of each year. Fitch plans to retire after making 30 annual investments in the program earning a return of 10%. What is the value of the program on the date of the last payment (30 years from the present)?

### QS B-7

Future value of an annuity P4

**EXERCISES****Exercise B-1**

Present value of an amount **P1**

Mike Derr Company expects to earn 10% per year on an investment that will pay \$606,773 six years from now. Use Table B.1 to compute the present value of this investment. (Round the amount to the nearest dollar.)

**Exercise B-2**

Present value of an amount **P1**

On January 1, 2015, a company agrees to pay \$20,000 in three years. If the annual interest rate is 10%, determine how much cash the company can borrow with this agreement.

**Exercise B-3**

Number of periods of an investment **P2**

Tom Thompson expects to invest \$10,000 at 12% and, at the end of a certain period, receive \$96,463. How many years will it be before Thompson receives the payment? (Use Table B.2.)

**Exercise B-4**

Interest rate on an investment **P2**

Bill Padley expects to invest \$10,000 for 25 years, after which he wants to receive \$108,347. What rate of interest must Padley earn? (Use Table B.2.)

**Exercise B-5**

Future value of an amount **P2**

Mark Welsch deposits \$7,200 in an account that earns interest at an annual rate of 8%, compounded quarterly. The \$7,200 plus earned interest must remain in the account 10 years before it can be withdrawn. How much money will be in the account at the end of 10 years?

**Exercise B-6**

Future value of an amount **P2**

Catten, Inc., invests \$163,170 today earning 7% per year for nine years. Use Table B.2 to compute the future value of the investment nine years from now. (Round the amount to the nearest dollar.)

**Exercise B-7**

Interest rate on an investment **P3**

Jones expects an immediate investment of \$57,466 to return \$10,000 annually for eight years, with the first payment to be received one year from now. What rate of interest must Jones earn? (Use Table B.3.)

**Exercise B-8**

Number of periods of an investment **P3**

Keith Riggins expects an investment of \$82,014 to return \$10,000 annually for several years. If Riggins earns a return of 10%, how many annual payments will he receive? (Use Table B.3.)

**Exercise B-9**

Present value of an annuity **P3**

Dave Krug finances a new automobile by paying \$6,500 cash and agreeing to make 40 monthly payments of \$500 each, the first payment to be made one month after the purchase. The loan bears interest at an annual rate of 12%. What is the cost of the automobile?

**Exercise B-10**

Present values of annuities

**P3**

C&H Ski Club recently borrowed money and agrees to pay it back with a series of six annual payments of \$5,000 each. C&H subsequently borrows more money and agrees to pay it back with a series of four annual payments of \$7,500 each. The annual interest rate for both loans is 6%.

1. Use Table B.1 to find the present value of these two separate annuities. (Round amounts to the nearest dollar.)
2. Use Table B.3 to find the present value of these two separate annuities. (Round amounts to the nearest dollar.)

**Exercise B-11**

Present value with semiannual compounding

**C1 P3**

Otto Co. borrows money on April 30, 2015, by promising to make four payments of \$13,000 each on November 1, 2015; May 1, 2016; November 1, 2016; and May 1, 2017.

1. How much money is Otto able to borrow if the interest rate is 8%, compounded semiannually?
2. How much money is Otto able to borrow if the interest rate is 12%, compounded semiannually?
3. How much money is Otto able to borrow if the interest rate is 16%, compounded semiannually?

**Exercise B-12**

Present value of bonds

**P1 P3**

Spiller Corp. plans to issue 10%, 15-year, \$500,000 par value bonds payable that pay interest semiannually on June 30 and December 31. The bonds are dated December 31, 2015, and are issued on that date. If the market rate of interest for the bonds is 8% on the date of issue, what will be the total cash proceeds from the bond issue?

Compute the amount that can be borrowed under each of the following circumstances:

1. A promise to repay \$90,000 seven years from now at an interest rate of 6%.
2. An agreement made on February 1, 2015, to make three separate payments of \$20,000 on February 1 of 2016, 2017, and 2018. The annual interest rate is 10%.

**Exercise B-13**

Present value of an amount and of an annuity  
P1 P3

Algoe expects to invest \$1,000 annually for 40 years to yield an accumulated value of \$154,762 on the date of the last investment. For this to occur, what rate of interest must Algoe earn? (Use Table B.4.)

**Exercise B-14**

Interest rate on an investment P4

Steffi Derr expects to invest \$10,000 annually that will earn 8%. How many annual investments must Derr make to accumulate \$303,243 on the date of the last investment? (Use Table B.4.)

**Exercise B-15**

Number of periods of an investment P4

Kelly Malone plans to have \$50 withheld from her monthly paycheck and deposited in a savings account that earns 12% annually, compounded monthly. If Malone continues with her plan for two and one-half years, how much will be accumulated in the account on the date of the last deposit?

**Exercise B-16**

Future value of an annuity P4

Starr Company decides to establish a fund that it will use 10 years from now to replace an aging production facility. The company will make a \$100,000 initial contribution to the fund and plans to make quarterly contributions of \$50,000 beginning in three months. The fund earns 12%, compounded quarterly. What will be the value of the fund 10 years from now?

**Exercise B-17**

Future value of an amount plus an annuity  
P2 P4

- a. How much would you have to deposit today if you wanted to have \$60,000 in four years? Annual interest rate is 9%.
- b. Assume that you are saving up for a trip around the world when you graduate in two years. If you can earn 8% on your investments, how much would you have to deposit today to have \$15,000 when you graduate?
- c. Would you rather have \$463 now or \$1,000 ten years from now? Assume that you can earn 9% on your investments.
- d. Assume that a college parking sticker today costs \$90. If the cost of parking is increasing at the rate of 5% per year, how much will the college parking sticker cost in eight years?
- e. Assume that the average price of a new home is \$158,500. If new homes are increasing at a rate of 10% per year, how much will a new home cost in eight years?
- f. An investment will pay you \$10,000 in 10 years, and it will also pay you \$400 at the end of *each* of the next 10 years (years 1 thru 10). If the annual interest rate is 6%, how much would you be willing to pay today for this type of investment?
- g. A college student is reported in the newspaper as having won \$10,000,000 in the Kansas State Lottery. However, as is often the custom with lotteries, she does *not* actually receive the entire \$10 million now. Instead she will receive \$500,000 at the end of the year for *each* of the next 20 years. If the annual interest rate is 6%, what is the present value (today's amount) that she won? (Ignore taxes.)

**Exercise B-18**

Practical applications of the time value of money  
P1 P2 P3 P4

For each of the following situations, identify (1) the case as either (a) a present or a future value and (b) a single amount or an annuity, (2) the table you would use in your computations (but do not solve the problem), and (3) the interest rate and time periods you would use.

- a. You need to accumulate \$10,000 for a trip you wish to take in four years. You are able to earn 8% compounded semiannually on your savings. You plan to make only one deposit and let the money accumulate for four years. How would you determine the amount of the one-time deposit?
- b. Assume the same facts as in part (a) except that you will make semiannual deposits to your savings account.
- c. You want to retire after working 40 years with savings in excess of \$1,000,000. You expect to save \$4,000 a year for 40 years and earn an annual rate of interest of 8%. Will you be able to retire with more than \$1,000,000 in 40 years? Explain.
- d. A sweepstakes agency names you a grand prize winner. You can take \$225,000 immediately or elect to receive annual installments of \$30,000 for 20 years. You can earn 10% annually on any investments you make. Which prize do you choose to receive?

**Exercise B-19**

Using present and future value tables  
C1 P1 P2 P3 P4

**TABLE B.1\***

\*Used to compute the present value of a known future amount. For example: How much would you need to invest today at 10% compounded semiannually to accumulate \$5,000 in 6 years from today? Using the factors of  $n = 12$  and  $i = 5\%$  (12 semiannual periods and a semiannual rate of 5%), the factor is 0.5568. You would need to invest \$2,784 today ( $\$5,000 \times 0.5568$ ).

**TABLE B.2\*\***

## Learning Objectives

### CONCEPTUAL

- C1** Explain cost flows for activity-based costing.

### ANALYTICAL

- A1** Identify and assess advantages and disadvantages of activity-based costing.

### PROCEDURAL

- P1** Assign overhead costs using the plantwide overhead rate method.
- P2** Assign overhead costs using activity-based costing.

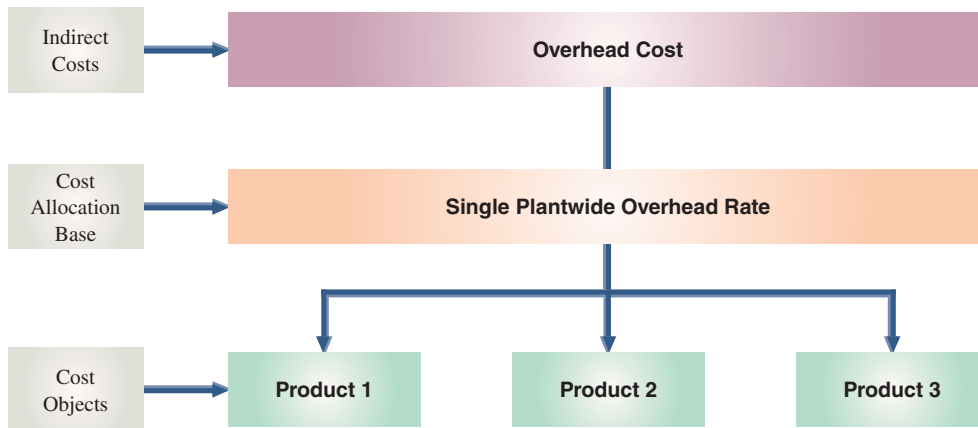

## PLANTWIDE OVERHEAD RATE METHOD

We previously explained how to assign overhead costs to jobs (and processes) by using a predetermined overhead rate per unit of an allocation base, such as direct labor cost. When a single overhead rate is used on a companywide basis, all overhead is lumped together, and a predetermined overhead rate per unit of an allocation base is computed and used to assign overhead to jobs (and processes). The use of a single predetermined overhead rate suggests that the overhead allocation process is simple. In reality, it can be complicated. This appendix reviews the traditional plantwide cost allocation procedure and then introduces the activity-based cost allocation procedure.

### Cost Flows under Plantwide Overhead Rate Method

The *single plantwide overhead rate method*, or simply the *plantwide overhead rate method*, uses one overhead rate to allocate overhead costs to products. For this method, the target of the cost assignment, or **cost object**, is the unit of product—see Exhibit C.1. The rate is determined using volume-related measures such as direct labor hours, direct labor cost dollars, or machine hours, which are readily available in most manufacturing settings. In some industries, overhead costs are closely related to these volume-related measures. In such cases it is logical to use this method as a basis for assigning indirect manufacturing costs to products.

**P1** Assign overhead costs using the plantwide overhead rate method.

**EXHIBIT C.1**  
Plantwide Overhead Rate Method

### Applying the Plantwide Overhead Rate Method

Under the single plantwide overhead rate method, total budgeted overhead costs are combined into one overhead cost pool. This cost pool is then divided by the chosen allocation base, such as total direct labor hours, to arrive at a single plantwide overhead rate. This rate then is applied to assign costs to *all products* based on the allocation base such as direct labor hours required to manufacture each product.

To illustrate, consider data from AutoGrand, a custom automobile manufacturer. AutoGrand applies overhead on the basis of direct labor hours. For its three jobs, AutoGrand reports the budgeted direct labor hours in Exhibit C.2.

Total Direct Labor Hours	
Job 236 . . . . .	4,000
Job 237 . . . . .	6,000
Job 238 . . . . .	10,000
Total . . . . .	<u>20,000</u>

**EXHIBIT C.2**  
AutoGrand's Budgeted Direct Labor Hours

AutoGrand has five manufacturing-related departments that generate overhead costs: janitorial, maintenance, factory accounting, machining, and assembly. Expenses incurred by each of these departments (provided in Exhibit C.3) are considered product costs.

**EXHIBIT C.3**

AutoGrand's Overhead Costs

Department	Budgeted Overhead Cost
Janitorial . . . . .	\$10,000
Maintenance . . . . .	15,000
Factory accounting . . . . .	8,000
Machining . . . . .	10,000
Assembly . . . . .	<u>18,000</u>
Total budgeted overhead cost . . . . .	<u>\$61,000</u>

The single plantwide overhead rate for AutoGrand is computed as follows:

$$\begin{aligned}
 \text{Plantwide overhead rate} &= \frac{\text{Total budgeted overhead cost}}{\text{Total budgeted direct labor hours}} \\
 &= \frac{\$61,000}{20,000 \text{ DLH}} \\
 &= \$3.05 \text{ per DLH}
 \end{aligned}$$

©Nick Daly/Getty Images/Digital Vision

This plantwide overhead rate is then used to allocate overhead cost to products based on the number of direct labor hours required to produce each unit as follows:

$$\text{Overhead allocated to each product unit} = \text{Plantwide overhead rate} \times \text{DLH per unit}$$

For AutoGrand, overhead cost is allocated to its three products as follows:

Job 236: \$3.05 per DLH × 4,000 DLH	=	\$12,200
Job 237: \$3.05 per DLH × 6,000 DLH	=	18,300
Job 238: \$3.05 per DLH × 10,000 DLH	=	<u>30,500</u>
Total		<u>\$61,000</u>

**NEED-TO-KNOW C-1**

Plantwide Overhead Rate Method

P1

HMS Mfg. predicts total overhead costs of \$2,480,000 for the next year. HMS assigns overhead based on 125,000 budgeted direct labor hours.

1. Compute the single plantwide overhead rate based on budgeted direct labor hours.
2. Assume the Deluxe model of the company's product required 25,000 direct labor hours during the year. How much overhead cost is assigned to the Deluxe model?

**Solution**

1. Plantwide overhead rate = Total budgeted overhead cost/Total budgeted direct labor hours  
 $= \$2,480,000/125,000 = \underline{\underline{\$19.84 \text{ per direct labor hour}}}$
2. Overhead assigned to Deluxe model = \$19.84 × 25,000 = \$496,000

**ACTIVITY-BASED COSTING**

**Cost Flows under Activity-Based Costing**

**C1** Explain cost flows for activity-based costing.

For companies with only one product, or with multiple products that use about the same amount of indirect resources, using a single overhead cost rate based on volume is adequate. Multiple overhead rates can further improve on cost allocations. For example, AutoGrand might use direct labor hours to allocate overhead costs of its assembly department and machine hours to allocate costs of its machining department. This could result in more accurate overhead cost allocations, if different products use different amounts of direct labor and machine hours.

Yet, when a company has many products that consume different amounts of indirect resources, even the multiple overhead rate system based on volume is often inadequate. Such a

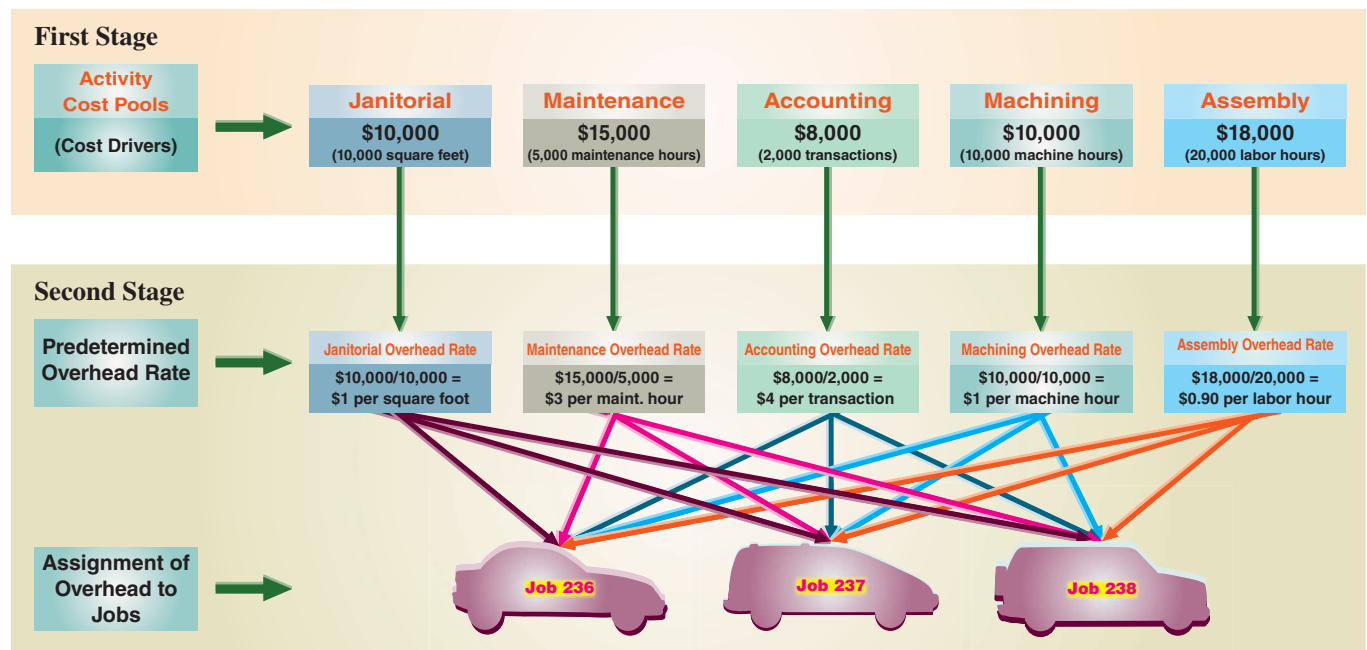

system usually fails to reflect the products' different uses of indirect resources and often distorts product costs. Specifically, low-volume complex products are usually undercosted, and high-volume simpler products are overcosted. This can cause companies to believe that their complex products are more profitable than they really are, which can lead those companies to focus on them to the detriment of high-volume simpler products. This creates a demand for a better cost allocation system for these indirect (overhead) costs.

**Activity-based costing (ABC)** attempts to better allocate costs to the proper users of overhead by focusing on *activities*. Costs are traced to individual activities and then allocated to cost objects. Exhibit C.4 shows the (two-stage) activity-based cost allocation method. The first stage identifies the activities involved in processing Jobs 236, 237, and 238 and forms activity cost pools by combining those activities. The second stage involves computing predetermined overhead cost rates for each cost pool and then assigning costs to jobs.

**Point:** Activity-based costing is used in many settings. A study found that activity-based costing improves health care costing accuracy, enabling improved profitability analysis and decision making. However, identifying cost drivers in a health care setting is challenging.

### EXHIBIT C.4

Activity-Based Cost Allocation

We begin our explanation at the top of Exhibit C.4. The first stage identifies individual activities, which are pooled in a logical manner into homogenous groups, or *cost pools*. A homogenous cost pool consists of activities that belong to the same process and/or are caused by the same cost driver. An **activity cost driver**, or simply *cost driver*, is a factor that causes the cost of an activity to go up or down. For example, preparing an invoice, checking it, and dispatching it are activities of the “invoicing” process and can therefore be grouped in a single cost pool. Moreover, the number of invoices processed likely drives the costs of these activities.

An **activity cost pool** is a temporary account accumulating the costs a company incurs to support an identified set of activities. Costs accumulated in an activity cost pool include the variable and fixed costs of the activities in the pool. Variable costs pertain to resources acquired as needed (such as materials); fixed costs pertain to resources acquired in advance (such as equipment). An activity cost pool account is handled like a factory overhead account.

In the second stage, after all activity costs are accumulated in an activity cost pool account, overhead rates are computed. Then, costs are allocated to cost objects (users) based on cost drivers (allocation bases).

**Point:** A cost driver is different from an allocation base. An allocation base is used as a basis for assigning overhead but need not have a cause-effect relation with the costs assigned. However, a cost driver has a cause-effect relation with the cost assigned.

## Applying Activity-Based Costing

To illustrate, let's return to AutoGrand's three jobs. Assume that resources used to complete Jobs 236, 237, and 238 are shown in panel A at the top of Exhibit C.5.

## P2

Assign overhead costs using activity-based costing.

**EXHIBIT C.5**

Activity Resource Use and Assignment of Overhead to Jobs

	Amount of Cost Driver Used			Activity Totals
	Job 236	Job 237	Job 238	
<b>Panel A: Cost Driver</b>				
Square feet of space . . . . .	5,000	3,000	2,000	
Maintenance hours . . . . .	2,500	1,500	1,000	
Number of transactions . . . . .	500	700	800	
Machine hours . . . . .	2,000	3,000	5,000	
Direct labor hours . . . . .	4,000	6,000	10,000	
<b>Panel B: Assignment of overhead to jobs</b>				
<b>Janitorial</b>				
\$1.00 × 5,000 sq. ft. . . . .	\$ 5,000			
\$1.00 × 3,000 sq. ft. . . . .		\$ 3,000		
\$1.00 × 2,000 sq. ft. . . . .			\$ 2,000	\$10,000
<b>Maintenance</b>				
\$3.00 × 2,500 maint. hrs. . . . .	7,500			
\$3.00 × 1,500 maint. hrs. . . . .		4,500		
\$3.00 × 1,000 maint. hrs. . . . .			3,000	15,000
<b>Factory Accounting</b>				
\$4.00 × 500 transactions . . . . .	2,000			
\$4.00 × 700 transactions . . . . .		2,800		
\$4.00 × 800 transactions . . . . .			3,200	8,000
<b>Machining</b>				
\$1.00 × 2,000 machine hrs. . . . .	2,000			
\$1.00 × 3,000 machine hrs. . . . .		3,000		
\$1.00 × 5,000 machine hrs. . . . .			5,000	10,000
<b>Assembly</b>				
\$0.90 × 4,000 labor hrs. . . . .	3,600			
\$0.90 × 6,000 labor hrs. . . . .		5,400		
\$0.90 × 10,000 labor hrs. . . . .			9,000	18,000
Total overhead assigned . . . . .	<u>\$20,100</u>	<u>\$18,700</u>	<u>\$22,200</u>	<u>\$61,000</u>

The \$61,000 of total costs are assigned to these three jobs using activity-based costing as shown in panel B at the bottom of Exhibit C.5 (*rates are taken from the second stage of Exhibit C.4*).

Exhibit C.6 compares the overhead costs assigned under two alternative cost allocation methods. We see that the costs assigned to the three jobs vary markedly depending on which allocation method is used. Costs assigned to Job 236 increase from \$12,200 under plantwide cost allocation to \$20,100 under activity-based costing. Costs assigned to Job 238 decline from \$30,500 to \$22,200. These differences in allocated amounts result from more accurately tracing costs to each job using activity-based costing where the allocation bases reflect actual cost drivers.

**EXHIBIT C.6**

Comparing Overhead Costs Assigned under Alternative Methods

Overhead Assigned	Job 236	Job 237	Job 238	Total
Plantwide cost allocation . . . . .	\$12,200	\$18,300	\$30,500	\$61,000
Activity-based costing (Exhibit C.5) . . . . .	20,100	18,700	22,200	61,000

**Advantages and Disadvantages of Activity-Based Costing**

Traditional cost systems capture overhead costs by individual department (or function) and accumulate these costs in one or more overhead accounts. Under the plantwide overhead rate method, companies then assign these overhead costs using a single allocation base such as direct labor or multiple volume-based allocation bases. Unfortunately, a single allocation base might not be closely related to the way these costs are actually incurred.

**A1** Identify and assess advantages and disadvantages of activity-based costing.

In contrast, activity-based cost systems capture costs by individual activity. These activities and their costs are then accumulated into activity cost pools. A company selects a cost driver (allocation base) for each activity pool. It uses this cost driver to assign the accumulated activity costs to cost objects (such as jobs or products) benefiting from the activity. As shown in Exhibit C.6, the activity-based costing (ABC) system can more accurately trace costs to individual jobs. More generally, we can conclude the following:

- ABC uses more allocation bases than a traditional cost system. For example, a Chicago-based manufacturer currently uses nearly 20 different activity cost drivers to assign overhead costs to its products. Exhibit C.7 lists common examples of overhead cost pools and their usual cost drivers.
- ABC is especially effective when the same department or departments produce many different types of products. For instance, more complex products often require more help from service departments such as engineering, maintenance, and materials handling. If the same amount of direct labor is applied to the complex and simple products, a traditional overhead allocation system assigns the same overhead cost to both. With activity-based costing, however, the complex products are assigned a larger portion of overhead. The difference in overhead assigned can affect product pricing, make or buy, and other managerial decisions.
- ABC encourages managers to focus on *activities* as well as the use of those activities. For instance, assume AutoGrand can reduce the number of transactions processed in factory accounting to 1,500 (375 transactions for Job 236, 525 transactions for Job 237, and 600 transactions for Job 238) and that through continuous improvement it can reduce costs of processing those transactions to \$4,500. The resulting rate to process a transaction is \$3 per transaction ( $\$4,500/1,500$  transactions—down from \$4 per Exhibit C.4). The cost of transaction processing is reduced for all jobs (Job 236, \$1,125; Job 237, \$1,575; Job 238, \$1,800). However, if those accounting costs are grouped in a single overhead cost pool, it is more difficult to identify cost savings and understand their effects on product costs.
- ABC requires managers to look at each item and encourages them to manage each cost to increase the benefit from each dollar spent. It also encourages managers to cooperate because it shows how their efforts are interrelated. This results in *activity-based management*.
- ABC requires more effort to implement and maintain than a traditional cost system. Determining cost drivers for many activities can be challenging. In addition, ABC does not always conform to GAAP; thus it can't readily be used for external reporting. For these reasons, the costs of implementing an ABC system can be high.

	Activity Cost Pool	Cost Driver
	Materials purchasing	Number of purchase orders
	Materials handling	Number of materials requisitions
	Personnel processing	Number of employees hired or laid off
	Equipment depreciation	Number of products produced or hours of use
	Quality inspection	Number of units inspected
	Indirect labor in setting up equipment	Number of setups required
	Engineering costs for product modifications	Number of modifications (engineering change orders)

### EXHIBIT C.7

Cost Pools and Cost Drivers in Activity-Based Costing

**NEED-TO-KNOW** C-2

Activity-Based Costing Method

P2

A company uses activity-based costing to determine the costs of its three products: A, B, and C. The budgeted cost and cost driver activity for each of the company's three activity cost pools follow.

Activity Cost Pool	Budgeted Cost	Budgeted Activity of Cost Driver		
		Product A	Product B	Product C
Activity 1 . . . . .	\$70,000	6,000	9,000	20,000
Activity 2 . . . . .	45,000	7,000	15,000	8,000
Activity 3 . . . . .	82,000	2,500	1,000	1,625

1. Compute the overhead activity rates for each of the company's three activities.
2. Compute the total amount of overhead allocated to Product A. Assume the actual activity usage was the same as the budgeted activity for Product A.

**Solution**

1.

Activity Cost Pool	Budgeted Cost	÷	Activity Driver*	=	Activity Rate
Activity 1 . . . . .	\$70,000		35,000		\$ 2.00
Activity 2 . . . . .	45,000		30,000		1.50
Activity 3 . . . . .	82,000		5,125		16.00

\*Computed as the sum of the budgeted cost driver activity of all three products.

2. Overhead allocated to Product A:

Activity Cost Pool	Activity Rate	×	Activity Usage	=	Overhead Allocated
Activity 1 . . . . .	\$ 2.00	×	6,000	=	\$12,000
Activity 2 . . . . .	1.50	×	7,000	=	10,500
Activity 3 . . . . .	16.00	×	2,500	=	40,000
Total . . . . .					<u>\$62,500</u>

Do More: QS C-3, QS C-4, QS C-5, QS C-6, E C-2, E C-5

**QC1**

# Summary

**C1 Explain cost flows for activity-based costing.** With ABC, overhead costs are first traced to the activities that cause them, and then cost pools are formed combining costs caused by the same activity. Overhead rates based on these activities are then used to assign overhead to products in proportion to the amount of activity required to produce them.

**A1 Identify and assess advantages and disadvantages of activity-based costing.** ABC improves product costing accuracy and draws management attention to relevant factors to control. The cost of constructing and maintaining an ABC system can sometimes outweigh its value.

**P1 Assign overhead costs using the plantwide overhead rate method.** The plantwide overhead rate equals total

budgeted overhead divided by budgeted plant volume, the latter often measured in direct labor hours or machine hours. This rate multiplied by the number of direct labor hours (or machine hours) required for each product provides the overhead assigned to each product.

**P2 Assign overhead costs using activity-based costing.** In activity-based costing, the costs of related activities are collected and then pooled in some logical manner into activity cost pools. After all activity costs have been accumulated in an activity cost pool account, users of the activity, termed *cost objects*, are assigned a portion of the total activity cost using a cost driver (allocation base).

## Key Terms

Activity-based costing (ABC)  
Activity cost driver

Activity cost pool  
Cost object

## Discussion Questions

1. Why are overhead costs allocated to products and not traced to products as direct materials and direct labor are?
2. Complete the following for a traditional two-stage allocation system: In the first stage, service department costs are assigned to \_\_\_\_\_ departments. In the second stage, a predetermined overhead rate is computed for each operating department and used to assign overhead to \_\_\_\_\_.
3. What is the difference between operating departments and service departments?
4. What is activity-based costing? What is its goal?
5. What is a cost object?
6. What is an activity cost driver?
7.  What company circumstances especially encourage use of activity-based costing?
8.  Identify at least four typical cost pools for activity-based costing in most organizations.
9. In activity-based costing, costs in a cost pool are allocated to \_\_\_\_\_ using predetermined overhead rates.
10. **Samsung** must assign overhead costs to its products. Activity-based costing is generally considered more accurate than other methods of assigning overhead. If this is so, why do all manufacturers not use it? **Samsung**
11. **Google** generates much of its revenue by providing online advertising. It is said that: "Activity-based costing is only useful for manufacturing companies." Is this a true statement? Explain. **GOOGLE**

In the blank next to the following terms, place the letter *A* through *D* corresponding to the best description of that term.

- |                          |  |
|--------------------------|--|
| 1. _____ Activity        | A. Measurement associated with an activity.              |
| 2. _____ Activity driver | B. A group of costs that have the same activity drivers. |
| 3. _____ Cost pool       | C. Anything to which costs will be assigned.             |
| 4. _____ Cost object     | D. A task that causes a cost to be incurred.             |

### QUICK STUDY

#### QS C-1

Costing terminology

**A1**

Chan Company identified the following activities, costs, and activity drivers for 2015. The company manufactures two types of go-karts: fast and standard.

Activity	Expected Costs	Expected Activity
Handling materials . . . . .	\$625,000	100,000 parts
Inspecting product . . . . .	900,000	1,500 batches
Processing purchase orders . . . . .	105,000	700 orders
Paying suppliers . . . . .	175,000	500 invoices
Insuring the factory . . . . .	300,000	40,000 square feet
Designing packaging . . . . .	75,000	2 models

#### QS C-2

Computing plantwide overhead rates

**P1**

1. Compute a single plantwide overhead rate assuming that the company assigns overhead based on 100,000 budgeted direct labor hours.
2. In January 2015 the fast model required 2,500 direct labor hours and the standard model required 6,000 direct labor hours. Assign overhead costs to each model using the single plantwide overhead rate.

Refer to the information in QS C-2. Compute the overhead activity rate for each activity, assuming the company uses activity-based costing.

#### QS C-3

Computing overhead rates under ABC **P2**

Qinto Company sells two types of products, basic and deluxe. The company provides technical support for users of its products, at an expected cost of \$250,000 per year. The company expects to process 10,000 customer service calls per year.

#### QS C-4

Assigning costs using ABC

**P2**

1. Determine the company's cost of technical support per customer service call.
2. During the month of January, Qinto received 650 calls for customer service on its deluxe model and 150 calls for customer service on its basic model. Assign technical support costs to each model using activity-based costing (ABC).

**QS C-5**

Activity-based costing rates and allocations

P2

A company has two products: standard and deluxe. The company expects to produce 34,300 standard units and 69,550 deluxe units. It uses activity-based costing and has prepared the following analysis showing budgeted cost and cost driver activity for each of its three activity cost pools.

Activity Cost Pool	Budgeted Cost	Budgeted Activity of Cost Driver	
		Standard	Deluxe
Activity 1 .....	\$87,000	3,000	2,800
Activity 2 .....	62,000	4,500	5,500
Activity 3 .....	93,000	2,500	5,250

1. What is the overhead cost per unit for the standard units?
2. What is the overhead cost per unit for the deluxe units?

**QS C-6**

Activity-based costing and overhead cost allocation

P2

The following is taken from Mortan Co.'s internal records of its factory with two operating departments. The cost driver for indirect labor and supplies is direct labor costs, and the cost driver for the remaining overhead items is number of hours of machine use. Compute the total amount of overhead cost allocated to operating department 1 using activity-based costing.

	Direct Labor	Machine Use Hours
Operating department 1 .....	\$18,800	2,000
Operating department 2 .....	13,200	1,200
Totals .....	<u>\$32,000</u>	<u>3,200</u>
<b>Factory overhead costs</b>		
Rent and utilities .....		\$12,200
Indirect labor .....		5,400
General office expense .....		4,000
Depreciation—Equipment .....		3,000
Supplies .....		2,600
Total factory overhead .....		<u>\$27,200</u>

**QS C-7**

Multiple choice overhead questions

A1

1. Which costing method tends to overstate the cost of high-volume products?
 

_____ a. Traditional volume-based costing	_____ c. Job order costing
_____ b. Activity-based costing	_____ d. Differential costing
2. If management wants the most accurate product cost, which of the following costing methods should be used?
 

_____ a. Volume-based costing using direct labor hours to allocate overhead
_____ b. Volume-based costing using a plantwide overhead rate
_____ c. Normal costing using a plantwide overhead rate
_____ d. Activity-based costing
3. Disadvantages of activity-based costing include which of the following?
 

_____ a. It is not acceptable under GAAP for external reporting.	_____ c. It can be used in an activity-based management.
_____ b. It can be costly to implement.	_____ d. Both a. and b.

**Additional Exercises and Problems for activity-based costing are available in *Connect Plus Accounting*.**

Real Cool produces two different models of air conditioners. The company produces the mechanical systems in their components department. The mechanical systems are combined with the housing assembly in its finishing department. The activities, costs, and drivers associated with these two manufacturing processes and the production support process follow.

Process	Activity	Overhead Cost	Driver	Quantity
<b>Components</b>	Changeover	\$ 500,000	Number of batches	800
	Machining	279,000	Machine hours	6,000
	Setups	225,000	Number of setups	120
		<u>\$ 1,004,000</u>		
<b>Finishing</b>	Welding	\$ 180,300	Welding hours	3,000
	Inspecting	210,000	Number of inspections	700
	Rework	75,000	Rework orders	300
		<u>\$ 465,300</u>		
<b>Support</b>	Purchasing	\$ 135,000	Purchase orders	450
	Providing space	32,000	Number of units	5,000
	Providing utilities	65,000	Number of units	5,000
		<u>\$ 232,000</u>		

## EXERCISES

### Exercise C-1

Using the plantwide overhead rate to assess prices

P1

Additional production information concerning its two product lines follows.

	Model 145	Model 212
Units produced . . . . .	1,500	3,500
Welding hours . . . . .	800	2,200
Batches . . . . .	400	400
Number of inspections . . . . .	400	300
Machine hours . . . . .	1,800	4,200
Setups . . . . .	60	60
Rework orders . . . . .	160	140
Purchase orders . . . . .	300	150

- Using a plantwide overhead rate based on machine hours, compute the overhead cost per unit for each product line.
- Determine the total cost per unit for each product line if the direct labor and direct materials costs per unit are \$250 for Model 145 and \$180 for Model 212.
- If the market price for Model 145 is \$800 and the market price for Model 212 is \$470, determine the profit or loss per unit for each model. Comment on the results.

**Check** (3) Model 212, \$(50.26) per unit loss

Refer to the information in Exercise C-1 to answer the following requirements.

- Using ABC, compute the overhead cost per unit for each product line.
- Determine the total cost per unit for each product line if the direct labor and direct materials costs per unit are \$250 for Model 145 and \$180 for Model 212.
- If the market price for Model 145 is \$800 and the market price for Model 212 is \$470, determine the profit or loss per unit for each model. Comment on the results.

### Exercise C-2

Using ABC to assess prices

P2

**Check** (3) Model 212, \$24.88 per unit profit

**Exercise C-3**

Using ABC for strategic decisions

P1 P2

Consider the following data for two products of Vigano Manufacturing.

	Overhead Cost	Product A	Product B
Number of units produced . . . . .		10,000 units	2,000 units
Direct labor cost (@\$24 per DLH) . . . . .		0.20 DLH per unit	0.25 DLH per unit
Direct materials cost . . . . .		\$2 per unit	\$3 per unit
<b>Activity</b>			
Machine setup . . . . .	\$121,000		
Parts handling . . . . .	48,000		
Quality control inspections . . . . .	80,000		
	<u>\$249,000</u>		

- Using direct labor hours as the basis for assigning overhead costs, determine the total production cost per unit for each product line.
- If the market price for Product A is \$20 and the market price for Product B is \$60, determine the profit or loss per unit for each product. Comment on the results.
- Consider the following additional information about these two product lines. If ABC is used for assigning overhead costs to products, what is the cost per unit for Product A and for Product B?

**Check** (2) Product B, \$26.10 per unit profit

Activity Drivers	Product A	Product B
Number of machine setups required for production . . . . .	10 setups	12 setups
Number of parts required . . . . .	1 part/unit	3 parts/unit
Inspection hours required . . . . .	40 hours	210 hours

- Determine the profit or loss per unit for each product. Should this information influence company strategy? Explain.

(4) Product B, (\$24.60) per unit loss

**Exercise C-4**

Using ABC in a service company

P2

Singh and Smythe is an architectural firm that provides services for residential construction projects. The following data pertain to a recent reporting period.

	Activities	Costs
<b>Design department</b>		
Client consultation . . . . .	1,500 contact hours	\$270,000
Drawings . . . . .	2,000 design hours	115,000
Modeling . . . . .	40,000 square feet	30,000
<b>Project management department</b>		
Supervision . . . . .	600 days	\$120,000
Billings . . . . .	8 jobs	10,000
Collections . . . . .	8 jobs	12,000

- Using ABC, compute the firm's activity overhead rates. Form activity cost pools where appropriate.
- Assign costs to a 9,200-square-foot job that requires 450 contact hours, 340 design hours, and 200 days to complete.

**Check** (2) \$150,200

Health Co-op is an outpatient surgical clinic that wants to better understand its costs. It decides to prepare an activity-based cost analysis, including an estimate of the average cost of both general surgery and orthopedic surgery. The clinic’s three cost centers and their cost drivers follow.

**Exercise C-5**  
Activity-based costing  
P2

Cost Center	Cost	Cost Driver	Driver Quantity
Professional salaries . . . . .	\$1,600,000	Professional hours	10,000
Patient services and supplies . . . . .	27,000	Number of patients	600
Building cost . . . . .	150,000	Square feet	1,500

The two main surgical units and their related data follow.

Service	Hours	Square Feet*	Patients
General surgery . . . . .	2,500	600	400
Orthopedic surgery . . . . .	7,500	900	200

\* Orthopedic surgery requires more space for patients, supplies, and equipment.

1. Assume costs are allocated based on number of patients. Compute the average cost per patient. (Round to the nearest whole dollar.)
2. Compute the cost per cost driver for each of the three cost centers.
3. Use the results from part 1 to allocate costs from each of the three cost centers to the general surgery unit. Compute total cost and average cost per patient for the general surgery unit.

**Check** (3) Average cost of general surgery, \$1,195 per patient

Craftmore Machining produces machine tools for the construction industry. The following details about overhead costs were taken from its company records.

**PROBLEM SET A**

Production Activity	Indirect Labor	Indirect Materials	Other Overhead
Grinding . . . . .	\$320,000		
Polishing . . . . .		\$135,000	
Product modification . . . . .	600,000		
Providing power . . . . .			\$255,000
System calibration . . . . .	500,000		

**Problem C-1A**  
Applying activity-based costing  
P1 P2 A1

Additional information on the drivers for its production activities follows.

Grinding . . . . .	13,000 machine hours
Polishing . . . . .	13,000 machine hours
Product modification . . . . .	1,500 engineering hours
Providing power . . . . .	17,000 direct labor hours
System calibration . . . . .	400 batches

**Required**

1. Compute the activity overhead rates using ABC. Form cost pools as appropriate.
2. Determine overhead costs to assign to the following jobs using ABC.

	Job 3175	Job 4286
Number of units . . . . .	200 units	2,500 units
Machine hours . . . . .	550 MH	5,500 MH
Engineering hours . . . . .	26 eng. hours	32 eng. hours
Batches . . . . .	30 batches	90 batches
Direct labor hours . . . . .	500 DLH	4,375 DLH

**Check** (3) Job 3175, \$373.25 per unit

3. What is the overhead cost per unit for Job 3175? What is the overhead cost per unit for Job 4286?
4. If the company used a plantwide overhead rate based on direct labor hours, what is the overhead cost for each unit of Job 3175? Of Job 4286?
5. Compare the overhead costs per unit computed in requirements 4 and 5 for each job. Which method more accurately assigns overhead costs?

**Problem C-2A**

Pricing analysis with ABC and a plantwide overhead rate

A1 P1 P2

Tent Master produces two lines of tents sold to outdoor enthusiasts. The tents are cut to specifications in department A. In department B the tents are sewn and folded. The activities, costs, and drivers associated with these two manufacturing processes and the company’s production support activities follow.

Process	Activity	Overhead Cost	Driver	Quantity
<b>Department A</b>	Pattern alignment	\$ 64,400	Batches	560
	Cutting	50,430	Machine hours	12,300
	Moving product	<u>100,800</u>	Moves	2,400
		<u>\$215,630</u>		
<b>Department B</b>	Sewing	\$327,600	Direct labor hours	4,200
	Inspecting	24,000	Inspections	600
	Folding	<u>47,880</u>	Units	22,800
		<u>\$399,480</u>		
<b>Support</b>	Design	\$280,000	Modification orders	280
	Providing space	51,600	Square feet	8,600
	Materials handling	<u>184,000</u>	Square yards	920,000
		<u>\$515,600</u>		

Additional production information on the two lines of tents follows.

	Pup Tent	Pop-up Tent
Units produced . . . . .	15,200 units	7,600 units
Moves . . . . .	800 moves	1,600 moves
Batches . . . . .	140 batches	420 batches
Number of inspections . . . . .	240 inspections	360 inspections
Machine hours . . . . .	7,000 MH	5,300 MH
Direct labor hours . . . . .	2,600 DLH	1,600 DLH
Modification orders . . . . .	70 modification orders	210 modification orders
Space occupied . . . . .	4,300 square feet	4,300 square feet
Material required . . . . .	450,000 square yards	470,000 square yards

**Required**

1. Using a plantwide overhead rate based on direct labor hours, compute the overhead cost that is assigned to each pup tent and each pop-up tent.
2. Using the plantwide overhead rate, determine the total cost per unit for the two products if the direct materials and direct labor cost is \$25 per pup tent and \$32 per pop-up tent.
3. If the market price of the pup tent is \$65 and the market price of the pop-up tent is \$200, determine the gross profit per unit for each tent. What might management conclude about the pup tent?
4. Using ABC, compute the total cost per unit for each tent if the direct labor and direct materials cost is \$25 per pup tent and \$32 per pop-up tent.
5. If the market price is \$65 per pup tent and \$200 per pop-up tent, determine the gross profit per unit for each tent. Comment on the results.
6. Would your pricing analysis be improved if the company used, instead of ABC, departmental rates determined using machine hours in department A and direct labor hours in department B? Explain.

**Check** (4) Pup tent, \$58.46 per unit cost

Maxlon Company manufactures custom-made furniture for its local market and produces a line of home furnishings sold in retail stores across the country. The company uses traditional volume-based methods of assigning direct materials and direct labor to its product lines. Overhead has always been assigned by using a plantwide overhead rate based on direct labor hours. In the past few years, management has seen its line of retail products continue to sell at high volumes, but competition has forced it to lower prices on these items. The prices are declining to a level close to its cost of production.

Meanwhile, its custom-made furniture is in high demand and customers have commented on its favorable (lower) prices compared to its competitors. Management is considering dropping its line of retail products and devoting all of its resources to custom-made furniture.

### Required

1. What reasons could explain why competitors are forcing the company to lower prices on its high-volume retail products?
2. Why do you believe the company charges less for custom-order products than its competitors?
3. Does a company's costing method have any effect on its pricing decisions? Explain.
4. Aside from the differences in volume of output, what production differences do you believe exist between making custom-order furniture and mass-market furnishings?
5. What information might the company obtain from using ABC that it might not obtain using volume-based costing methods?

### Problem C-3A

Assessing impacts of using a plantwide overhead rate versus ABC

A1

(This serial problem began in Chapter 1 and continues through most of the book. If previous chapter segments were not completed, the serial problem can begin at this point. It is helpful, but not necessary, to use the Working Papers that accompany the book.)

**SP C** After reading an article about activity-based costing in a trade journal for the furniture industry, Santana Rey wondered if it was time to critically analyze overhead costs at Business Solutions. In a recent month, Rey found that setup costs, inspection costs, and utility costs made up most of its overhead. Additional information about overhead follows.

### SERIAL PROBLEM

Business Solutions

P1 P2

Activity	Cost	Driver
Setting up machines . . . . .	\$20,000	25 batches
Inspecting components . . . . .	\$ 7,500	5,000 parts
Providing utilities . . . . .	\$10,000	5,000 machine hours

Overhead has been applied to output at a rate of 50% of direct labor costs. The following data pertain to Job 6.15.

Direct materials . . . . .	\$2,500	Number of parts . . . . .	400 parts
Direct labor . . . . .	\$3,500	Machine hours . . . . .	600 machine hours
Batches . . . . .	2 batches		

### Required

1. What is the total cost of Job 6.15 if Business Solutions applies overhead at 50% of direct labor cost?
2. What is the total cost of Job 6.15 if Business Solutions uses activity-based costing?
3. Which approach to assigning overhead gives a better representation of the costs incurred to produce Job 6.15? Explain.

# Chart of Accounts

Following is a typical chart of accounts, which is used in several assignments. Each company has its own unique set of accounts and numbering system. \*An asterisk denotes a contra account.

## Assets

### Current Assets

- 101 Cash
- 102 Petty cash
- 103 Cash equivalents
- 104 Short-term investments
- 105 Fair value adjustment, \_\_\_\_\_ securities (S-T)
- 106 Accounts receivable
- 107 Allowance for doubtful accounts\*
- 108 Legal fees receivable
- 109 Interest receivable
- 110 Rent receivable
- 111 Notes receivable
- 119 Merchandise inventory (or Inventory)
- 120 \_\_\_\_\_ inventory
- 121 \_\_\_\_\_ inventory
- 124 Office supplies
- 125 Store supplies
- 126 \_\_\_\_\_ supplies
- 128 Prepaid insurance
- 129 Prepaid interest
- 131 Prepaid rent
- 132 Raw materials inventory
- 133 Work in process inventory, \_\_\_\_\_
- 134 Work in process inventory, \_\_\_\_\_
- 135 Finished goods inventory

### Long-Term Investments

- 141 Long-term investments
- 142 Fair value adjustment, \_\_\_\_\_ securities (L-T)
- 144 Investment in \_\_\_\_\_
- 145 Bond sinking fund

### Plant Assets

- 151 Automobiles
- 152 Accumulated depreciation—Automobiles\*
- 153 Trucks
- 154 Accumulated depreciation—Trucks\*
- 155 Boats
- 156 Accumulated depreciation—Boats\*
- 157 Professional library
- 158 Accumulated depreciation—Professional library\*
- 159 Law library
- 160 Accumulated depreciation—Law library\*
- 161 Furniture
- 162 Accumulated depreciation—Furniture\*
- 163 Office equipment
- 164 Accumulated depreciation—Office equipment\*

- 165 Store equipment
- 166 Accumulated depreciation—Store equipment\*
- 167 \_\_\_\_\_ equipment
- 168 Accumulated depreciation—\_\_\_\_\_ equipment\*
- 169 Machinery
- 170 Accumulated depreciation—Machinery\*
- 173 Building \_\_\_\_\_
- 174 Accumulated depreciation—Building \_\_\_\_\_\*
- 175 Building \_\_\_\_\_
- 176 Accumulated depreciation—Building \_\_\_\_\_\*
- 179 Land improvements \_\_\_\_\_
- 180 Accumulated depreciation—Land improvements \_\_\_\_\_\*
- 181 Land improvements \_\_\_\_\_
- 182 Accumulated depreciation—Land improvements \_\_\_\_\_\*
- 183 Land

### Natural Resources

- 185 Mineral deposit
- 186 Accumulated depletion—Mineral deposit\*

### Intangible Assets

- 191 Patents
- 192 Leasehold
- 193 Franchise
- 194 Copyrights
- 195 Leasehold improvements
- 196 Licenses
- 197 Accumulated amortization—\_\_\_\_\_\*

## Liabilities

### Current Liabilities

- 201 Accounts payable
- 202 Insurance payable
- 203 Interest payable
- 204 Legal fees payable
- 207 Office salaries payable
- 208 Rent payable
- 209 Salaries payable
- 210 Wages payable
- 211 Accrued payroll payable
- 212 Factory payroll payable
- 214 Estimated warranty liability
- 215 Income taxes payable
- 216 Common dividend payable
- 217 Preferred dividend payable

- 218 State unemployment taxes payable
- 219 Employee federal income taxes payable
- 221 Employee medical insurance payable
- 222 Employee retirement program payable
- 223 Employee union dues payable
- 224 Federal unemployment taxes payable
- 225 FICA taxes payable
- 226 Estimated vacation pay liability

### Unearned Revenues

- 230 Unearned consulting fees
- 231 Unearned legal fees
- 232 Unearned property management fees
- 233 Unearned \_\_\_\_\_ fees
- 234 Unearned \_\_\_\_\_ fees
- 235 Unearned janitorial revenue
- 236 Unearned \_\_\_\_\_ revenue
- 238 Unearned rent

### Notes Payable

- 240 Short-term notes payable
- 241 Discount on short-term notes payable\*
- 245 Notes payable
- 251 Long-term notes payable
- 252 Discount on long-term notes payable\*

### Long-Term Liabilities

- 253 Long-term lease liability
- 255 Bonds payable
- 256 Discount on bonds payable\*
- 257 Premium on bonds payable
- 258 Deferred income tax liability

## Equity

### Owner's Equity

- 301 \_\_\_\_\_, Capital
- 302 \_\_\_\_\_, Withdrawals
- 303 \_\_\_\_\_, Capital
- 304 \_\_\_\_\_, Withdrawals
- 305 \_\_\_\_\_, Capital
- 306 \_\_\_\_\_, Withdrawals

### Paid-In Capital

- 307 Common stock, \$ \_\_\_\_\_ par value
- 308 Common stock, no-par value
- 309 Common stock, \$ \_\_\_\_\_ stated value
- 310 Common stock dividend distributable
- 311 Paid-in capital in excess of par value, Common stock
- 312 Paid-in capital in excess of stated value, No-par common stock

- 313 Paid-in capital from retirement of common stock
- 314 Paid-in capital, Treasury stock
- 315 Preferred stock
- 316 Paid-in capital in excess of par value, Preferred stock

### Retained Earnings

- 318 Retained earnings
- 319 Cash dividends (or Dividends)
- 320 Stock dividends

### Other Equity Accounts

- 321 Treasury stock, Common\*
- 322 Unrealized gain—Equity
- 323 Unrealized loss—Equity

### Revenues

- 401 \_\_\_\_\_ fees earned
- 402 \_\_\_\_\_ fees earned
- 403 \_\_\_\_\_ revenues
- 404 Revenues
- 405 Commissions earned
- 406 Rent revenue (or Rent earned)
- 407 Dividends revenue (or Dividends earned)
- 408 Earnings from investment in \_\_\_\_\_
- 409 Interest revenue (or Interest earned)
- 410 Sinking fund earnings
- 413 Sales
- 414 Sales returns and allowances\*
- 415 Sales discounts\*

### Cost of Sales

#### Cost of Goods Sold

- 502 Cost of goods sold
- 505 Purchases
- 506 Purchases returns and allowances\*
- 507 Purchases discounts\*
- 508 Transportation-in

#### Manufacturing

- 520 Raw materials purchases
- 521 Freight-in on raw materials
- 530 Direct labor
- 540 Factory overhead
- 541 Indirect materials
- 542 Indirect labor
- 543 Factory insurance expired
- 544 Factory supervision
- 545 Factory supplies used
- 546 Factory utilities
- 547 Miscellaneous production costs
- 548 Property taxes on factory building
- 549 Property taxes on factory equipment
- 550 Rent on factory building
- 551 Repairs, factory equipment
- 552 Small tools written off
- 560 Depreciation of factory equipment
- 561 Depreciation of factory building

### Standard Cost Variances

- 580 Direct material quantity variance
- 581 Direct material price variance
- 582 Direct labor quantity variance
- 583 Direct labor price variance
- 584 Factory overhead volume variance
- 585 Factory overhead controllable variance

### Expenses

#### Amortization, Depletion, and Depreciation

- 601 Amortization expense—\_\_\_\_\_
- 602 Amortization expense—\_\_\_\_\_
- 603 Depletion expense—\_\_\_\_\_
- 604 Depreciation expense—Boats
- 605 Depreciation expense—Automobiles
- 606 Depreciation expense—Building \_\_\_\_\_
- 607 Depreciation expense—Building \_\_\_\_\_
- 608 Depreciation expense—Land improvements \_\_\_\_\_
- 609 Depreciation expense—Land improvements \_\_\_\_\_
- 610 Depreciation expense—Law library
- 611 Depreciation expense—Trucks
- 612 Depreciation expense—\_\_\_\_\_ equipment
- 613 Depreciation expense—\_\_\_\_\_ equipment
- 614 Depreciation expense—\_\_\_\_\_
- 615 Depreciation expense—\_\_\_\_\_

#### Employee-Related Expenses

- 620 Office salaries expense
- 621 Sales salaries expense
- 622 Salaries expense
- 623 \_\_\_\_\_ wages expense
- 624 Employees' benefits expense
- 625 Payroll taxes expense

#### Financial Expenses

- 630 Cash over and short
- 631 Discounts lost
- 632 Factoring fee expense
- 633 Interest expense

#### Insurance Expenses

- 635 Insurance expense—Delivery equipment
- 636 Insurance expense—Office equipment
- 637 Insurance expense—\_\_\_\_\_

#### Rental Expenses

- 640 Rent expense
- 641 Rent expense—Office space
- 642 Rent expense—Selling space
- 643 Press rental expense
- 644 Truck rental expense
- 645 \_\_\_\_\_ rental expense

#### Supplies Expenses

- 650 Office supplies expense
- 651 Store supplies expense

- 652 \_\_\_\_\_ supplies expense
- 653 \_\_\_\_\_ supplies expense

### Miscellaneous Expenses

- 655 Advertising expense
- 656 Bad debts expense
- 657 Blueprinting expense
- 658 Boat expense
- 659 Collection expense
- 661 Concessions expense
- 662 Credit card expense
- 663 Delivery expense
- 664 Dumping expense
- 667 Equipment expense
- 668 Food and drinks expense
- 671 Gas and oil expense
- 672 General and administrative expense
- 673 Janitorial expense
- 674 Legal fees expense
- 676 Mileage expense
- 677 Miscellaneous expenses
- 678 Mower and tools expense
- 679 Operating expense
- 680 Organization expense
- 681 Permits expense
- 682 Postage expense
- 683 Property taxes expense
- 684 Repairs expense—\_\_\_\_\_
- 685 Repairs expense—\_\_\_\_\_
- 687 Selling expense
- 688 Telephone expense
- 689 Travel and entertainment expense
- 690 Utilities expense
- 691 Warranty expense
- 692 \_\_\_\_\_ expense
- 695 Income taxes expense

### Gains and Losses

- 701 Gain on retirement of bonds
- 702 Gain on sale of machinery
- 703 Gain on sale of investments
- 704 Gain on sale of trucks
- 705 Gain on \_\_\_\_\_
- 706 Foreign exchange gain or loss
- 801 Loss on disposal of machinery
- 802 Loss on exchange of equipment
- 803 Loss on exchange of \_\_\_\_\_
- 804 Loss on sale of notes
- 805 Loss on retirement of bonds
- 806 Loss on sale of investments
- 807 Loss on sale of machinery
- 808 Loss on \_\_\_\_\_
- 809 Unrealized gain—Income
- 810 Unrealized loss—Income
- 811 Impairment gain
- 812 Impairment loss

### Clearing Accounts

- 901 Income summary
- 902 Manufacturing summary
