# P R E F A C E

## Clear, Connected, Complete: The Big Picture of Accounting

From the smallest mom-and-pop retailer to the largest multinational corporation, businesses of all sizes are recognizing that accounting professionals are no longer simply “number crunchers” but rather essential partners in achieving the fundamental goals of their organization.

*Intermediate Accounting, 17e* provides a powerful connection to accounting careers with:

- **A Clear organization** based around the essential interrelationship between accounting procedures and the activities of business. The order of the text chapters flows with a traditional balance sheet presentation without sacrificing links to business activities. The result is a more balanced treatment of coverage for instructors and students alike.
- **Connected and relevant coverage** that examines the issues that are driving accounting in today’s business environment, such as **fair value, valuation, and International Financial Reporting Standards**.
- **Complete and engaging pedagogy** that enhances the learning experience and prepares students for an evolving accounting profession. Each learning objective in the text is supplemented with a *Why* and *How* framework. This feature provides students with a snapshot of *why* things are accounted for the way they are before being asked *how* the information is used in making decisions.
- **Superior technology**, which allows instructors to pick and choose precisely the educational resources they want to accompany this text. CengageNOW™ *Express* offers a complete technology solution with interactive homework assignments that help students tackle the course’s most difficult concepts.

### CLEAR and Forward-Thinking Organization

No other text works this hard to demonstrate accounting’s integral importance to an organization’s decision-making capabilities. The innovative structure is unsurpassed in preparing students to serve as trusted advisors on the front lines of business.

In an effort to streamline the sequence of chapters in the text, the table of contents accounts for a more traditional balance sheet order of topics while still maintaining the structure of covering topics as they relate to business activities. The investing chapters fall before the financing chapters, which results in a more familiar order of presentation for instructors and students.

**Part 1—Foundations of Financial Accounting** provides students with the fundamentals of financial accounting and concludes with a module that covers the Time Value of Money as well as a new module on Fair Value.

**Part 2—Routine Activities of a Business** gets down to business, integrating accounting into management by exploring operating and investing activities.

**Part 3—Additional Activities of a Business** examines financing activities, leases, income taxes, and employee compensation.

**Part 4—Other Dimensions of Financial Reporting** rounds out the comprehensive coverage with earnings per share; derivatives, contingencies, business segments, and interim reports; accounting changes; and financial statement analysis, as well as the addition of a new chapter, Accounting in a Global Market.

## CONNECTED to Current and Relevant Coverage

One look at the business pages of any newspaper shows how illusory long-term success can be. Yesterday's runaway successes can quickly find themselves derailed by the new realities of today's business world. This is the first text to provide a real-world perspective that links accounting functions to the activities of business.

**Completely updated** to reflect the latest changes in accounting standards, practices, and techniques. The real company information has been revised to account for recent changes in financial statements and other company reports.

**International Financial Reporting Standards** topics, indicated by this symbol throughout the text, help students understand how accounting practices differ from country to country and reflect the increasingly global nature of business.

The international environment of business is dramatically changing the landscape of accounting. The Financial Accounting Standards Board (FASB) and the International Accounting Standards Board (IASB) are working together to develop one set of accounting standards to be used by companies in countries around the world. No longer is the United States making the rules for the rest of the world to follow. Instead, the FASB and the IASB are working hand-in-hand as financial accounting standards converge at a pace that was not dreamed of even five years ago.

These events have affected this textbook. Every chapter discusses relevant accounting standards and developments from both a U.S. and a global perspective. Each chapter begins with a discussion of the accounting standards and procedures used by companies complying with U.S. GAAP. Then those areas where U.S. GAAP and international accounting standards are significantly different are discussed so that the reader can understand how accounting standards around the world are similar and how they are different. A new chapter on Accounting in a Global Market further emphasizes the role of international financial reporting standards.

The objective of this approach is to develop in students the ability to see beyond the borders of the United States and understand that the global business environment is leading to global accounting standards. Users of this text will understand that they are not just learning U.S. GAAP. Instead, they are being prepared to be players in a

global accounting environment with the ability to understand and apply international accounting standards as well as U.S. accounting standards.

**Fair Value Accounting** is another major topic affecting the accounting environment. The credit crisis of 2008 is blamed by some on the inappropriate use of fair value accounting. A new module details the “why,” “when,” “where,” and “how” for using fair values in financial statements. Because this concept of fair value accounting is so important and affects so many of the principles and topics discussed later in the text, it has been placed near the front of the text following the discussion of the financial statements.

**Opening Scenario Questions** are critical-thinking questions that follow the real company chapter openers, with solutions provided at the end of each chapter so that students can check their answers as they think about how they would answer accounting-related issues businesses face.

## QUESTIONS

1. *What would be the consequences to a customer if their bank could not tell them if their paycheck (which is direct deposited) had in fact been deposited? What would be the consequences to the bank?*
2. *Suppose the Internal Revenue Service and employers had no system established to track the amount of income tax withheld from employee salaries. How would taxpayers demonstrate to the U.S. government that they had paid taxes? How would the government verify tax payments?*

Answers to these questions can be found on page 70.

**A Chapter on Earnings Management** in Part 1 establishes a framework for the remainder of the course. Students come to understand the importance and ramifications of earnings management through current, real-world examples, extracts from SEC enforcement actions, business press analysis, and the extensive use of academic research findings.

## COMPLETE Pedagogy to Connect to the Big Picture of Accounting

Just one glance tells you this accounting text is different. Refreshingly rich in color, appealing graphics, and icons, this text energizes students’ imaginations with a visually stimulating look they prefer.

**Why and How Framework** Following each learning objective, the authors provide additional reinforcement of the critical concepts by highlighting both the procedural aspects (the “how”) as well as the context (or “why”) for which they are applied. As they move through the chapter, students gain a greater understanding of both elements and can rationalize why businesses account for things the way they do.

### Overview of the Accounting Process

**1** Identify and explain the basic steps in the accounting process (accounting cycle).

**WHY** It is important to understand how accounting information flows through an organization and how that information is captured by the accounting information system.

**HOW** The accounting process, often referred to as the accounting cycle, generally includes the following steps: analyze business documents, journalize transactions, post to ledger accounts, prepare a trial balance, prepare adjusting entries, prepare financial statements, close the nominal accounts, and prepare a post-closing trial balance.

**Statement of Cash Flows “Revisited”** Chapter 21 provides coverage of the statement of cash flows in the second semester of the course. The book continues to provide a full chapter early in the text (Chapter 5) addressing the statement of cash flows and integrates this financial statement throughout the text, which results in the most comprehensive treatment of this important subject available.

## stop & think

Consider these four organizations: FASB, AICPA, SEC, and IASB. Which one do you think will be making U.S. GAAP twenty years from now?

- a) FASB
- b) AICPA
- c) SEC
- d) IASB

**Stop & Think** Multiple-choice questions have been written by the authors to accompany the Stop & Think boxed features. These critical-thinking boxes, found in every chapter, allow students to test their knowledge and then consult the answer found at the end of the chapter.

## fyi

In 2001, the IASB restructured itself as an independent body with closer links to national standard-setting bodies. At that time, the IASB adopted its current name and dropped its original name of the International Accounting Standards Committee (IASC).

**FYI** These margin boxes often provide additional context to an important topic by emphasizing additional points of interest.

## caution

Don't think that the conceptual framework is a useless exercise in accounting theory. Since its completion, the framework has significantly affected the nature of many accounting standards.

**Caution** Crucial cautions provide students with important points to consider when thinking about more complex concepts and topics.

## Chapter Updates and Enhancements

### Chapter 1

- Update on the standard-setting process
- Introduction of the revised GAAP hierarchy
- Introduction to the convergence of U.S. GAAP and IASB standards

## Chapter 3

- Updated opening case on Coca-Cola
- New coverage on minority interest as related to the consolidated balance sheet

## NEW! Fair Value Module

- Defines “fair value” and describes the valuation concepts used in determining fair value
- Explains the need for fair values in financial reporting and identifies where fair values are used in the financial statements
- Demonstrates a variety of valuation models and the preparation of fair value disclosures required under *SFAS No. 157*

## Chapter 7

- New discussion on the transfer and derecognition of receivables as addressed in *IAS 39*

## Chapter 8

- Expanded discussion of internal controls
- Expanded discussion of *EITF 00-21*, “Revenue Arrangements with Multiple Deliverables”
- New discussion on the asset-and-liability approach to revenue recognition that is currently being developed as a joint effort of the FASB and the IASB

## Chapter 9

- New discussion on accounting for declines in inventory values as addressed in *IAS 2*

## Chapter 10

- New discussion on the capitalization of interest as addressed in *IAS 23*
- New discussion on the recognition of increases and decreases in the value of property from growth or discovery as addressed in *IAS 41*
- New discussion on acquired in-process R&D as addressed in *SFAS No. 141R*
- Updated coverage on accounting for a bargain purchase
- Updated coverage on international accounting for intangibles as addressed in *IAS 38* and *IFRS 3*

## Chapter 12

- New discussion on the use of the fair value option for the reporting of financial assets and liabilities
- New discussion on the consolidation of special purposes entities as addressed in *SIC 12*

## Chapter 13

- New discussion on the current developments in the accounting for preferred stock
- New discussion on the current developments in the accounting for stock options
- New discussion on noncontrolling interest as defined under *SFAS No. 160*

## Chapter 14

- New discussion on the use of the fair value option for the reporting of financial assets and liabilities as addressed in *SFAS No. 159*

- New discussion on the classification of investment securities according to IFRS
- New discussion on equity method accounting according to IFRS
- New discussion on derecognition

## Chapter 15

- New guidance on distinguishing between operating and finance leases as described in *IAS 17*
- New discussion on the deferral of sale profits on a sale-leaseback that results in a finance (capital) lease according to *IAS 17*

## Chapter 16

- Comparison of the use of future tax rates under U.S. GAAP and *IAS 12*
- New discussion on deferred tax classification under IFRS
- New discussion on valuation allowance under *IAS 12*
- Expanded discussion of accounting for uncertain tax provisions

## Chapter 17

- Updated coverage of prior service cost, including discussion of *IAS 19*, “Employee Benefits”
- Updated discussion of amortization of prior service cost
- New discussion on plan contributions
- Added examples of financial statement reporting for various components of employee compensation

## Chapter 18

- New discussion on participating securities and the two-class method

## Chapter 19

- Added discussion of how IFRS affects derivatives, contingencies, business segments, and interim reports
- Introduction to the FASB’s Exposure Draft on improved loss contingency disclosure

## Chapter 21

- New comprehensive example of the statement of cash flows using Tesco, one of the largest supermarket chains in the United Kingdom

## NEW! Chapter 22

- New chapter on accounting in a global market
- Explains the importance and potential impact of a common set of accounting standards
- Outlines the history of the IASB and identifies the key differences between U.S. GAAP and IFRS
- Demonstrates the conversion of foreign currency financial statements into U.S. dollars using the translation method

## Chapter 23

- New introduction to equity valuation

# CONNECT and Reinforce Student Understanding

## Unmatched End-of-Chapter Material

Widely regarded as providing the most varied and expansive set of problem assignments available, *Intermediate Accounting, 17e* continues to raise the bar to new heights. Only *Intermediate Accounting* features such a diverse set of traditional exercises, problems, and cases:

- 15–25 Questions per chapter to help assimilate chapter content
- More than 400 Practice Exercises written by the authors
- Discussion Cases for homework or class discussion
- Exercises to reinforce key concepts or applications
- Problems that integrate several concepts or techniques
- Sample CPA Exam Questions written to provide students with similar problems commonly found on the CPA exam
- Selected Problems marked with a demonstration icon point students to the free Web site to view a visual demonstration of the problem with audio
- Selected Exercises or Problems have accompanying spreadsheet templates, marked with an icon

SPREADSHEET

DEMO PROBLEM

**Case Materials** have been designed to help accelerate the development of essential skills in critical thinking, communication, research, and teamwork. Retention and application of key concepts build as future accountants and business professionals take advantage of a wide range of tools found in this innovative section. These cases satisfy the skills-based curriculum endorsed by the AICPA's Core Competency Framework and the recommendations of the Accounting Education Change Commission (AECC).

**Deciphering Actual Financial Statements Cases** enable students to analyze financial data from recent annual reports from companies such as The Walt Disney Company, Coca-Cola, and the Boston Celtics.

### Case 8-63

#### Deciphering Financial Statements (The Walt Disney Company)

Locate the 2007 financial statements for **The Walt Disney Company** on the Internet.

1. Locate Disney's note on revenue recognition. What is Disney's revenue recognition policy for the various business segments?
2. Relating to video and video game sales, what other points in the revenue cycle (other than when video units are made widely available for sale by retailers) could Disney have used to recognize revenue?
3. Relating to motion pictures, what other points in the revenue cycle (other than when motion pictures are exhibited) could Disney have used to recognize revenue?

**Researching Accounting Standards Cases** ask students to visit the FASB's Web site to access designated pronouncements as they are applied to each chapter's topics.

### Case 2-51

#### Researching Accounting Standards

To help you become familiar with the accounting standards, this case is designed to take you to the FASB's Web site and have you access various publications. Access the FASB's Web site at <http://www.fasb.org>. Click on "Pronouncements & EITF Abstracts."

For this case, we will use *Statement of Financial Accounting Concepts No. 6*. Open *Concepts Statement No. 6*.

1. Read paragraph 137. Based on the information in this paragraph, what is a transaction?
2. Read paragraph 139. What is the difference between transactions with "cash consequences" and transactions involving "cash"?
3. Read paragraph 141. Based on the information in this paragraph, what is the primary difference between an accrual and a deferral?

**Ethical Dilemma Assignments** help develop the critical-thinking skills students will need as they wrestle with the business world's many "gray" issues.

**Case 1-29**

**Ethical Dilemma (Should you manipulate your reported income?)**

Accounting standards place limits on the set of allowable alternative accounting treatments, but the accountant must still exercise judgment to choose among the remaining alternatives. In making those choices, which of the following should the accountant seek to do?

1. Maximize reported income.
2. Minimize reported income.
3. Ignore the impact of the accounting choice on income and just focus on the most conceptually correct option.

Would your answer change if this were a tax accounting class? Why or why not?

**The Cumulative Spreadsheet Analysis Case** builds upon the lessons of each chapter to give students the opportunity to demonstrate and reinforce their understanding. Found at the end of Chapters 2–5, 7–20, and 23, each exercise requires students to create a spreadsheet that allows for numerous variables to be modified and their effects to be monitored. By the end of the course, students have constructed a spreadsheet that enables them to forecast operating cash flows for five years in the future, adjust forecasts for the most reasonable operating parameters, and analyze the impact of a variety of accounting assumptions based on the reported numbers.

**Case 20-60**

**Cumulative Spreadsheet Analysis**

This spreadsheet assignment is an extension of the spreadsheet assignment given in Chapter 13, part (1). Refer back to the instructions given in Chapter 13. That spreadsheet can form the foundation for this assignment.

1. In addition to preparing forecasted financial statements for 2012, Skywalker also wishes to prepare forecasted financial statements for 2013. All assumptions applicable to 2012 are assumed to be applicable to 2013. Sales in 2013 are expected to be 40% higher than sales in 2012. (Clearly state any additional assumptions that you make.)
2. Assume that Skywalker expects the number of days' sales in inventory in both 2012 and 2013 to be 60 days instead of 107.6 days. This change should make the forecasted level of the short-term loans payable in your spreadsheet negative for both 2012 and 2013.
  - (a) Explain why this change causes negative short-term loans payable.
  - (b) Because a negative amount of short-term loans payable is not possible, adjust your spreadsheet so that the value of short-term loans payable cannot be less than zero. What is the forecasted current ratio for 2012 and 2013 after you make this adjustment?

## Bonus Content

### Web-Based Chapter Enhancements

In response to instructor requests, subject-enhancing material from previous editions of the text is available on the Web site, [www.cengage.com/accounting/stice](http://www.cengage.com/accounting/stice). The result is a streamlined, easier-to-use text that provides ample supplement material for important topics.

CHAPTER	WEB MATERIAL
2	Illustration of Special Journals and Subsidiary Ledgers Illustration of Accrual Versus Cash Accounting
6	Petty Cash Fund
8	Deposit Method: Franchising Industry
10	Complexities in Accounting for Capitalized Interest
13	Quasi-Reorganizations Complexities in Accounting for Stock-Based Compensation

14	Changes in Classification Involving the Equity Method Introduction to Consolidation
15	Real Estate Leases
16	Intraperiod Tax Allocation
17	Details of Accounting for Postretirement Benefits Other Than Pensions Detailed Pension Present Value Calculations
22	Impact of Changing Prices on Financial Statements

## Your Course, Your Time, Your Way

### Introducing CengageNOW™ Express for Stice/Stice/Skousen *Intermediate Accounting, 17e*

CengageNOW *Express* is an online homework solution in accounting that delivers better student outcomes—NOW! CengageNOW *Express* encourages practice with the textbook homework that is central to success in accounting with author-written homework from the textbook, automatic grading and tracking student progress, and course management tools, including gradebook.

### Robust Product Support Web Site

[www.cengage.com/accounting/stice](http://www.cengage.com/accounting/stice) A robust Web site provides a wealth of resources for you and your students in *Intermediate Accounting* at no additional cost! With a multitude of chapter-enhancing features and study aids, these resources will allow students to excel in class and save you time in planning!

### Book Resources Available

- Expanded Material Topics
- Instructor's PowerPoint Slides
- Instructor's Resource Manual
- Solutions Manual

### Available for Every Chapter

- Business Application Features
- Check Figures
- Crossword Puzzles
- Enhanced Spreadsheet Templates
- Interactive Quizzes
- Internet Applications
- Learning Objectives
- Problem Demonstrations

## The Big Picture Package That Completes It All

An unsurpassed package of supplementary resources further accelerates the applied, real-world approach of *Intermediate Accounting*.

## For Instructors

**Instructor's Resource CD**, ISBN-10: 0-324-78315-9 | ISBN-13: 978-0-324-78315-5 Packages the Solutions Manual, Instructor's Resource Manual, Test Bank, ExamView®, instructor PowerPoint® slides, Excel spreadsheet solutions, and Cumulative Spreadsheet Analysis solutions on one convenient CD-ROM.

**Solutions Manual, Volume 1**: ISBN-10: 1-4390-4109-1 | ISBN-13: 978-1-4390-4109-3, **Volume 2**: ISBN-10: 1-4390-4110-5 | ISBN-13: 978-1-4390-4110-9, prepared by James D. Stice and Earl K. Stice, Brigham Young University.

This manual contains independently verified answers to all end-of-chapter questions, cases, exercises, and problems, written by the authors. Also available electronically on the (IRCD) and companion Web site.

**Instructor's Resource Manual**, prepared by Scott Colvin, Naugatuck Valley Community College.

This manual enhances class preparation with objectives, chapter outlines, teaching suggestions and strategies, and topical overviews of end-of-chapter materials. It also features assignment classifications with level of difficulty and estimate completion time, suggested readings on chapter topics, and transparency masters. The result is a comprehensive resource integration guide to supplement the course. Available electronically on the IRCD and companion Web site.

**Test Bank and ExamView®**, prepared by Larry A. Deppe, Weber State University.

The revised and expanded test bank is available in both Word files and computerized ExamView versions. Test items include multiple-choice questions and short examination problems for each chapter, along with solutions. Analysis problems are included to coincide with the emphasis on decision making in the text. Available electronically on the IRCD and companion Web site.

**Instructor's PowerPoint® Slides**, prepared by Sarita Sheth, Santa Monica College.

Hundreds of slides in PowerPoint format can be used in on-screen lecture presentations or printed out and used as traditional overheads. Additionally, they can be printed and distributed to students, allowing students to concentrate on the professor instead of hurrying to copy down information. Available electronically on the IRCD and companion Web site.

**Cengage Custom Solutions** This service develops personalized solutions to meet your business education needs. Match your learning materials to your syllabus and create the perfect learning solution. Consider the following when looking at your customization options for Stice/Stice/Skousen, *Intermediate Accounting, 17e*:

- Remove chapters you do not cover or rearrange their order, creating a streamlined and efficient text.
- Add your own material to cover new topics or information, saving you time in planning and providing students a fully integrated course resource.
- Adopt a loose-leaf version of the text allowing students to integrate your handouts; this money-saving option is also more portable than the full book.

## For Students

**Excel Enhanced Spreadsheet Templates**, prepared by Michael Blue, Bloomsburg University.

Excel templates with validations are provided on the Web site for solving selected end-of-chapter exercises and problems that are identified in the text with a spreadsheet icon.

SPREADSHEET

## Acknowledgments and Thanks

Relevant pronouncements of the Financial Accounting Standards Board and other authoritative publications are paraphrased, quoted, discussed, and referenced throughout the text. We are indebted to the American Accounting Association, the American Institute of Certified Public Accountants, the Financial Accounting Standards Board, and the Securities and Exchange Commission for material from their publications.

Jim Stice,  
Fred Skousen,  
and Kay Stice

## Earl K. Stice

Earl K. Stice is the PricewaterhouseCoopers Professor of Accounting in the School of Accountancy and Information Systems at Brigham Young University where he has been on the faculty since 1998. He holds bachelor's and master's degrees from Brigham Young University and a Ph.D. from Cornell University. Dr. Stice has taught at Rice University, the University of Arizona, Cornell University, and the Hong Kong University of Science and Technology (HKUST). He won the Phi Beta Kappa teaching award at Rice University and was twice selected at HKUST as one of the ten best lecturers on campus. Dr. Stice has also taught in a variety of executive education and corporate training programs in the United States, Hong Kong, China, and South Africa, and he is currently on the

executive MBA faculty of the China Europe International Business School in Shanghai. He has published papers in the *Journal of Financial and Quantitative Analysis*, *The Accounting Review*, *Review of Accounting Studies*, and *Issues in Accounting Education*, and his research on stock splits has been cited in *Business Week*, *Money*, and *Forbes*. Dr. Stice has presented his research results at seminars in the United States, Finland, Taiwan, Australia, and Hong Kong. He is co-author of *Accounting: Concepts and Applications*, 9th edition, and *Financial Accounting: Reporting and Analysis*, 7th edition. Dr. Stice and his wife, Ramona, are the parents of seven children: Derrald, Han, Ryan Marie, Lorien, Lily, Rosie, and James.

## James D. Stice

James D. Stice is the W. Steve Albrecht Professor of Accounting in the Marriott School of Management at Brigham Young University. He also serves as an Associate Dean in the Marriott School. He holds bachelor's and master's degrees from BYU and a Ph.D. from the University of Washington, all in accounting. Professor Stice has been on the faculty at BYU since 1988. During that time, he has been selected by graduating accounting students as "Teacher of the Year" on numerous occasions. He was selected by his peers in the Marriott School at BYU to receive the "Outstanding Teaching Award" in 1995, and in 1999 he was selected by the University to receive its highest teaching award, the Maeser Excellence in Teaching Award. Professor Stice is also a visiting professor for INSEAD's MBA Program in France. Professor Stice has published articles in *The Journal of Accounting Research*, *The Accounting Review*, *Decision Sciences*, *Issues in Accounting Education*, *The CPA Journal*, and other academic and professional journals. In addition to this text, he has published two other textbooks: *Financial Accounting: Reporting and Analysis*, 7th edition, and *Accounting: Concepts and Applications*, 9th edition. In addition to his teaching and research, Dr. Stice has been involved in executive education for such companies as IBM, Bank of America, and Ernst & Young and currently serves on the board of directors of Nutraceutical Corporation. Dr. Stice and his wife, Kaye, have seven children: Crystal, J.D., Ashley, Whitney, Kara, Skyler, and Cierra.

## K. Fred Skousen

K. Fred Skousen, Ph.D., CPA, recently retired as the Advancement Vice President at Brigham Young University. He earned a bachelor's degree from BYU and master's and Ph.D. degrees from the University of Illinois. Professor Skousen has been a consultant to the Financial Executive Research Foundation, the Controller General of the United States, the Federal Trade Commission, and to several large companies. Dr. Skousen currently serves on the Board of Directors of several corporations and in 2008 received the Utah Business's Outstanding Director award. Professor Skousen taught at the University of Illinois and the University of Minnesota prior to joining the faculty at Brigham Young University. In 1970, he received the Distinguished Faculty Award for the School of Business Administration at the University of Minnesota. He received the College of Business Distinguished Faculty Award at Brigham Young University in 1975, the National Beta Alpha Psi Academic Accountant of the Year Award in 1979, and the 1980 Karl G. Maeser Research and Creative Arts Award at Brigham Young University. In 1984, Dr. Skousen was elected to the AICPA Council, and in 1985 he received the UACPA Outstanding Faculty Award. From 1989 to 1998, Dr. Skousen held the J. Willard and Alice S. Marriott Chair and was Dean of the Marriott School of Management. From 1998 to 2008, he served as Advancement Vice President at BYU. Dr. Skousen is the author or co-author of more than 50 articles, research reports, and books, including *An Introduction to the SEC*, *Intermediate Accounting*, *Accounting: Concepts and Applications*, and *Financial Accounting*. He served as Director of Research and as a member of the Executive Committee of the American Accounting Association from 1974 to 1976, is a past member of the American Institute of CPAs and the American Accounting Association, and is past-president of the Utah Association of CPAs. Fred and his wife, Julie, have five sons, one daughter, and 24 grandchildren.

# BRIEF CONTENTS

## ■ PART ONE: FOUNDATIONS OF FINANCIAL ACCOUNTING

1	Financial Reporting . . . . .	2

FINANCIAL REPORTING

In 1985, **Internorth**, an Omaha-based pipeline company, acquired **Houston Natural Gas**. The original plan was to maintain the corporate headquarters in Omaha, but the Houston contingent on the combined board of directors gradually took control of the company's affairs and decided to move the corporate headquarters to Houston. At about this same time, the combined company adopted the more modern, futuristic name of **Enron**.

Enron came into being at a challenging time for natural gas pipeline companies. Historically, the distribution chain delivering natural gas from producers to consumers had been very heavily regulated. The government set the well-head price of natural gas, the price at which producers could sell to pipeline companies. The rates that pipeline companies charged local utilities and that local utilities charged retail customers were also set by government agencies using a cost-plus basis that provided little incentive for innovation. To spur natural gas exploration in response to the energy crisis of the late 1970s, the wellhead price of natural gas was deregulated, leading to a rapid increase in prices paid to producers. However, retail prices were still kept low through regulation, and pipeline companies had difficulty buying all of the natural gas they needed to supply their local utility customers. Because of the problems created by partial deregulation, gas pipeline companies, including Enron, lobbied various government agencies to deregulate the entire natural gas distribution chain. As this deregulation evolved, the natural gas market became much more efficient but also much less predictable. In this new, free-market setting, the primary risk facing the gas producers and the local utilities arose from the volatility in energy prices. Neither side felt comfortable entering into long-term, fixed-price contracts, so most natural gas was traded under 30-day contracts.

## fyi

In the mid-1980s, Houston was a city reeling from an oil-patch recession triggered by falling oil prices. Oil prices were dropping in 1985 toward a low of around \$10 a barrel by 1986. Good news had been scarce for the Houston business community, so Enron's high-profile corporate relocation to the city was a significant shot in the arm. Enron chairman Kenneth Lay became a prominent Houston philanthropist, endowing professorships at both the University of Houston and Rice University and serving as chairman of the local United Way. Enron itself, under Mr. Lay's leadership, typically gave about 1% of its income before taxes to various charities. In 1999, Enron agreed to pay \$100 million over 30 years to have Houston's new baseball stadium named Enron Field, a pledge that was later rescinded in the wake of the scandal outlined below.

In 1990, Enron began serving as an intermediary, or market maker, for these 30-day contracts. Called the Gas Bank, this activity involved Enron's signing short-term agreements to purchase gas from a variety of producers,

## LEARNING OBJECTIVES

- 1 Describe the purpose of financial reporting and identify the primary financial statements.
- 2 Explain the function of accounting standards and describe the role of the FASB in setting those standards in the United States.
- 3 Recognize the importance of the SEC, AICPA, AAA, and IRS to financial reporting.
- 4 Realize the growing importance and relevance of international accounting issues to the practice of accounting in the United States and understand the role of the IASB in international accounting standard setting.
- 5 Understand the significance of the FASB's conceptual framework in outlining the qualities of good accounting information, defining terms such as *asset* and *revenue*, and providing guidance about appropriate recognition, measurement, and reporting.
- 6 Identify career opportunities related to accounting and financial reporting and understand the importance of personal ethics in the practice of accounting.

## EXHIBIT I-1

### Enron's Revenues and Operating Income: 1996–2000 (in millions)

bundling these contracts, and then offering long-term price commitments to local utilities. Basically, Enron was placing itself in the middle of these deals and offering to bear the price risk for a fee. In so doing, Enron made the first step in its transformation from a traditional pipeline company into a financial services and trading company. By 2000, Enron had branched out and was serving as a market maker for electricity, for oil, and even for paper. Enron even offered “weather derivatives” with which utilities could insure their profits against, say, an unusually mild winter that would lead to decreased customer demand. By 2000, Enron’s Wholesale Services Segment, which was the home of the

financial and trading services, had far outpaced the traditional pipeline business (transportation and distribution) in terms of both reported revenues and operating profits (see Exhibit I-1).

By February 2001, Enron was viewed as a model of a company in a traditional industry adapting and recreating itself to be successful in the information age. In fact, a *Fortune* magazine survey released that month named Enron “The Most Innovative Company in America” for the sixth consecutive year. Enron’s rapid rise in revenues and profits matched the rise in its stock price—the company was worth \$60 billion, and its price per share was \$80 (down just a bit

from its all-time high of \$90). The bursting of the high-tech stock bubble, however, saw Enron's stock price fall 50% by October 2001, comparable to the drops in other "new economy" companies but less than the 66% drop in the value of **Cisco Systems** during the same period. Until October 16, 2001, the Enron story looked like so many others that played out during the same period—an innovative company has its stock price pumped up by market euphoria followed by a subsequent return to a more realistic stock valuation. At this point, however, the Enron story diverged and was transformed into one of the most far-reaching, and certainly one of the most expensive, accounting scandals of all time.

On October 16, 2001, Enron released its third quarter earnings. The press release announced that Enron's "pro forma," or recurring, net income increased to \$393 million in the third quarter, compared to just \$292 million in the prior year. Enron CEO Kenneth Lay emphasized Enron's "continued excellent prospects" and chose not to give a detailed explanation of the \$1 billion special accounting charge (expense) that caused Enron's actual results for the period, reported according to generally accepted accounting principles, to be a \$644 million loss. The press release set off alarms all over Wall Street, and analysts and business reporters began digging to determine what was behind the \$1 billion charge. Over the next two days, two reporters from *The Wall Street Journal*, John Emshwiller and Rebecca Smith, reported that the \$1 billion charge stemmed from related-party transactions with certain special partnerships established by Enron's chief financial officer (CFO). This revelation cast a cloud of suspicion over Enron, a suspicion that was confirmed as more details about these partnerships, about Enron's revenue-reporting practices, and about the general corporate culture came to light. The stock price went into a freefall, from \$36.00 per share the week before the October 16, 2001, press release to just \$0.26 per share six weeks later on November 30. Enron filed for Chapter 11 bankruptcy on December 2, 2001; at the time, it was the biggest bankruptcy in U.S. history.

The mistakes that Enron made in its business model are topics to explore in another class. Briefly, Enron strayed too far from its core business and undertook projects and risks that were outside its area of expertise. In this textbook, we cover material that will help you understand Enron's accounting practices and how those practices were deceptive. It was this deception that ultimately led to the collapse of Enron because once a market maker such as Enron loses credibility with potential buyers and sellers, those buyers and sellers quickly transfer their business to some more

reliable party. Two areas in which Enron's accounting was questionable are outlined here; each of these will be discussed in more detail in later chapters.

*Special-purpose entities.* Part of business is deciding what your company should do itself and what it should hire other companies to do. Sometimes hiring other companies is called *outsourcing*. For example, companies outsource their janitorial services, their payroll accounting, and even the real estate management of their land and buildings.

Occasionally, companies do not make these outsourcing arrangements with other existing companies but facilitate the formation of small, separate companies that have the express purpose of performing the outsourced service. For example, if a manufacturing company wants to outsource its janitorial services but no acceptable janitorial company is available in the area, the manufacturing company could help some of its own janitors split off and start their own janitorial services company to which the manufacturing company could then outsource its janitorial work. If the establishment of this separate janitorial services company is done carefully, it is classified as a special-purpose entity (SPE) and, for accounting purposes, is accounted for as if it is a separate, independent company. As you can see, SPEs can be used for a variety of legitimate business purposes.

fyi

**From an accounting standpoint, companies have found these outsourcing arrangements attractive because, for example, if another company legally owns my buildings and I am just leasing or renting them, I don't have to include in my balance sheet as a liability the mortgage-like obligation to make the payments on the building for the next, say, 25 years. This is called off-balance-sheet financing, and as explained in Chapter 15, leasing is the most common form of off-balance-sheet financing.**

Enron abused the accounting rules for SPEs in two ways. First, a number of the SPEs established by Enron were not independent from the company at all. For example, one set of such entities, the Raptors, was owned and managed by the same person who was simultaneously serving as Enron's CFO. Second, it is clear from the transactions between Enron and some of these SPEs that the sole reason for their existence was to allow Enron to engage in transactions to which no independent company would have ever agreed. For example, in several transactions with the Raptors, Enron

sold an asset near the end of a reporting quarter; after the next quarter had started, Enron repurchased the asset from the Raptor. Apparently, the entire purpose of the sale and repurchase transactions was to allow Enron to get the asset temporarily off its books to avoid being required to report a loss on a decline in value of the asset.<sup>1</sup> Special-purpose entities (now referred to in accounting circles as “variable interest entities”) are discussed in detail in Chapter 12 in the section on off-balance-sheet financing.

*Gross trading revenues.* Each year, *Fortune* magazine publishes a list of the 500 largest companies in the United States ranked in terms of total reported revenue. In the 2002 list, 4 of the top 17 companies were energy-trading companies that were doing basically the same type of market making done by Enron. These four companies (Enron, **American Electric Power**, **Duke Energy**, and **El Paso Corporation**) all had higher revenues than much better known companies such as **Sears**, **Target**, **Home Depot**, and **Procter & Gamble**. As explained by *Fortune*,<sup>2</sup> this unexpected prominence of the energy companies in the top revenue list stemmed from a loophole in the revenue-reporting rules. Energy-trading companies were able to report revenue equal to the total dollar value of trades that they facilitated—called *gross revenue reporting*—rather than just reporting the commissions on those trades (as a stock broker does). This gross revenue

reporting is what allowed Enron to report the unbelievably large \$95 billion in revenues from its Wholesale Services segment, as shown in Exhibit 1-1. As you can imagine, the accounting standard setters were a bit embarrassed by this flaw in the accounting rules and closed this loophole in 2002.<sup>3</sup>

Enron's CFO, Andrew Fastow, who structured many of the suspect SPEs, pleaded guilty to wire and securities fraud and was sentenced to six years in prison. Jeffrey Skilling, the architect of Enron's move into financial risk management, was convicted of conspiracy, insider trading, and securities fraud and is currently serving a 24-year prison sentence. Enron's long-time CEO Kenneth Lay was also found guilty of conspiracy and fraud.<sup>4</sup>

The fallout from the Enron fiasco has been painful for many individuals who lost the money they had invested in Enron, but, on balance, has been good for the financial reporting environment in the United States. The public outrage over Enron and then **WorldCom**, which collapsed amid an accounting fraud a few months later, spurred Congress to pass the Sarbanes-Oxley Act of 2002. Sarbanes-Oxley increased government scrutiny of the auditing profession, raised the standards for internal accounting controls within corporations, and put corporate executives on notice that they would be held personally responsible for knowingly releasing misleading financial statements.

## QUESTIONS

1. *What regulatory changes made it advantageous for Enron to transform itself from a natural gas pipeline company into a financial risk management company?*
2. *In October 2001, Enron released its third quarter earnings. These earnings included a \$1 billion charge to income. What was it about this charge that raised the suspicions of the two Wall Street Journal reporters who were covering Enron?*
3. *Enron, and many other companies, used special-purpose entities (SPEs) as a form of off-balance-sheet-financing. With off-balance-sheet financing, a company, such as Enron, is able to borrow money to finance the acquisition of assets, but at the same time avoid reporting either the liability or the assets in its balance sheet. Why would a company want to engage in off-balance-sheet financing?*

**Answers to these questions can be found on page 35.**

<sup>4</sup> Because Mr. Lay died of a heart attack before he was sentenced and before he was able to pursue an appeal, his conviction was “abated” meaning that, under the law, it is as if he had never been convicted in the first place.

In this text you will learn about many of the key accounting issues integral to an understanding of the Enron case: the abuse of “pro forma” earnings in Chapter 6, revenue-reporting abuse in Chapter 8, and the notorious “special-purpose entities” in Chapter 12. In Chapter 19 you’ll even learn about the derivatives instruments that Enron, and many other companies, use to manage risk. As the Enron case illustrates, the intricacies of accounting often result in differences of opinion as to what accounting methods are appropriate and the level of disclosure that should be required of companies. Arguments over appropriate accounting are facts of life because accounting involves judgment. Even in cases that don’t involve financial statement scandal, the management of a company is likely to have some accounting disagreements with the independent auditor before the company’s financial statements are released. If a company falters, outside analysts are sure to find accounting judgments with which, in retrospect, they disagree. (*Note:* One of the disappointing aspects of the Enron case is that only a handful of financial analysts questioned Enron’s accounting practices before the October 16, 2001, press release announcing the \$1 billion charge.) If the FASB proposes a new accounting rule, it is certain that some business executives will proclaim the rule to be utterly absurd. This is not because managers are sleazy, conniving, and self-serving (although such managers certainly exist); it is because the business world is a complex place filled with complex transactions, and reasonable people can disagree about how to account for those transactions. As the Enron case illustrates and as the chapters in this book will explain in detail, accounting for the complex transactions that are commonplace today is much more than the simple “bean-counting” image portrayed of accounting in the popular press.

Your introductory accounting course gave you an overview of the primary financial statements and touched briefly on such topics as revenue recognition, depreciation, leases, pensions, deferred taxes, LIFO, and financial instruments. In intermediate accounting, all these topics are back, bigger and better than ever. Now, instead of getting an overview, you will actually get the nuts and bolts. Yes, some of these topics are complex—they are complex because the business world is a complex place. However, when you complete your course in intermediate accounting, you will be quite comfortable with a set of financial statements. In fact, you will probably find yourself skipping the statements themselves and turning directly to the really interesting reading—the notes.

Now is an exciting time to be studying accounting. Students have been learning double-entry bookkeeping for more than 500 years. Now it will be your privilege to witness the transformation of financial reporting via the twin forces of internationalization and information technology. Over the next five years, the increased integration of the worldwide market for capital will finally force diverse national accounting practices to converge to one global standard, with the United States being one of the last countries to accept that global standard. This text will help you understand the “how and why” of this process. In the longer term, the power of computers to create and analyze huge databases will change the very nature of accounting. Users will not learn about companies through a few pages of financial statements and notes but, ultimately, through online access to the raw financial data. It isn’t clear what “accounting” will entail in the technological future, but it is certain that those professionals trained in the underlying concepts of accounting and in the importance of accounting judgment and accounting estimates will be best able to make the transition. This book is intended to prepare you for the future.

# Accounting and Financial Reporting

**1** Describe the purpose of financial reporting and identify the primary financial statements.

**WHY** The purpose of financial reporting is to aid interested parties in evaluating a company's past performance and in forecasting its future performance. The information about past events is intended to improve future operations and forecasts of future cash flows.

**HOW** Internal users have the ability to receive custom-designed accounting reports. External users must rely on the general-purpose financial statements. The five major components of the financial statements are:

- Balance sheet
- Income statement
- Statement of cash flows
- Explanatory notes
- Auditor's opinion

The overall objective of **accounting** is to provide information that can be used in making economic decisions.

Accounting is a service activity. Its function is to provide quantitative information, primarily financial in nature, about economic entities that is intended to be useful in making economic decisions—in making reasoned choices among alternative courses of action.<sup>5</sup>

Several key features of this definition should be noted.

- Accounting provides a vital service in today's business environment. The study of accounting should not be viewed as a theoretical exercise—accounting is meant to be a practical tool.
- Accounting is concerned primarily with quantitative financial information that is used in conjunction with qualitative evaluations in making judgments.
- Accounting information is used in making decisions about how to allocate scarce resources. Economists and environmentalists remind us constantly that we live in a world with limited resources. The better the accounting system that measures and reports the costs of using these resources, the better decisions can be made for allocating them.
- Although accountants place much emphasis on reporting what has already occurred, this past information is intended to be useful in making economic decisions about the future.

## caution

Remember that accounting information is only one type of information used in decision making. In many cases, qualitative data are more useful than quantitative data.

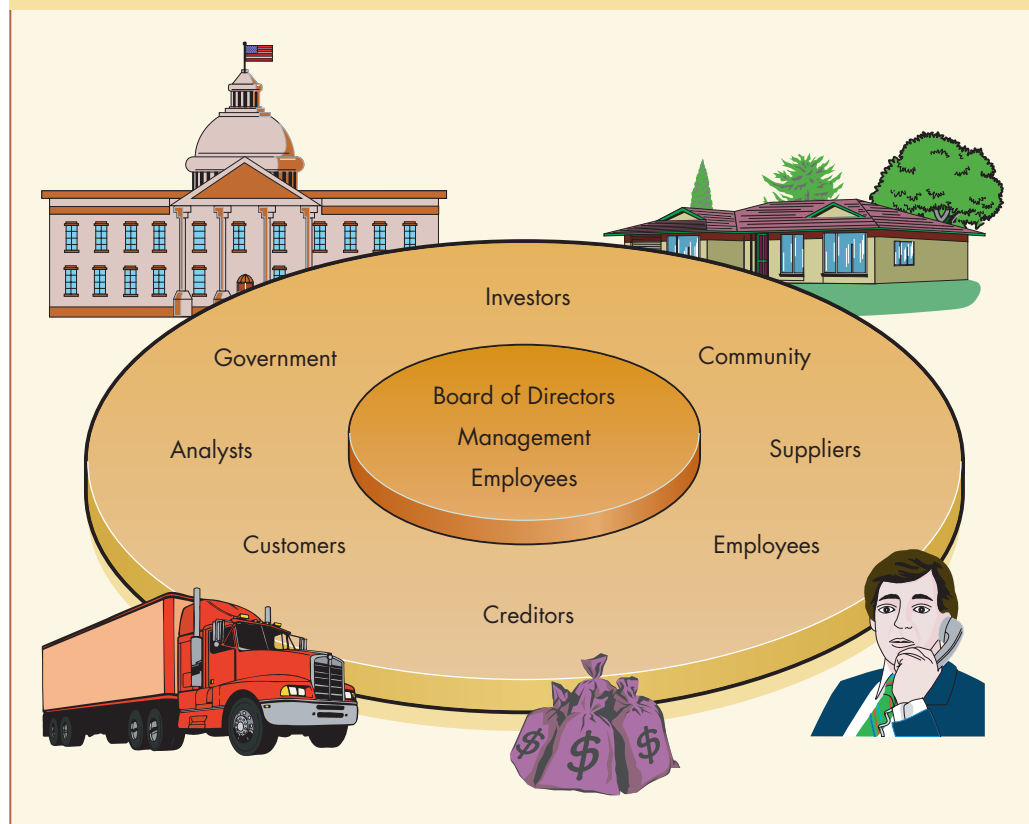

## Users of Accounting Information

Who uses accounting information and what information do they require to meet their decision-making needs? In general, all parties interested in the financial health of a company are called **stakeholders**. Stakeholder users of accounting information are normally divided into two major classifications:

<sup>5</sup> *Statement of the Accounting Principles Board No. 4*, "Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises" (New York: American Institute of Certified Public Accountants, 1970), par. 40.

EXHIBIT 1-2

## Major Internal and External Stakeholder Groups

- Internal users, who make decisions directly affecting the internal operations of the enterprise
- External users, who make decisions concerning their relationship to the enterprise

Major internal and external stakeholder groups are listed in Exhibit 1-2.

Internal users need information to assist in planning and controlling company operations and managing company resources. The accounting system must provide timely information needed to control day-to-day operations and to make major planning decisions such as:

- Do we make this product or another one?
- Do we build a new production plant or expand existing facilities?

**Management accounting** (sometimes referred to as *managerial* or *cost accounting*) is concerned primarily with financial reporting for internal users. Internal users, especially management, have control over the accounting system and can specify precisely what information is needed and how the information is to be reported.

**Financial accounting** focuses on the development and communication of financial information for external users. As a company grows and expands, it often finds its need for cash to be greater than that provided from profitable operations. In this situation, it will turn to people or organizations external to the company for funding. These external users need assurances that they will receive a return on their investment. Thus, they require information about the company's past performance because this information will allow them to forecast how the company can be expected to perform in the future.

Companies compete for external funding because external users have a variety of investment alternatives. The accounting information provided to external users aids in determining (1) whether a company's operations are profitable enough to justify additional funding and (2) how risky a company's operations are in order to determine what rate of return is necessary to compensate capital providers for the investment risk.

The types of decisions made by external users vary widely; therefore, their information needs are highly diverse. As a result, two groups of external users, creditors and investors, have been identified as the principal external users of financial information. **Creditors** need information about the profitability and stability of the company to decide whether to lend money to the company and, if so, what interest rate to charge. **Investors** (both existing stockholders and potential investors) need information concerning the safety and profitability of their investment.

## Incentives

As mentioned, companies often need external funding if they are to compete in the market place. Thus, the managers of these companies have an incentive to provide information that will attract external funding. They want to present information to external users that will make it appear as though their companies will be profitable in the future.

In their pursuit of external funding, management may not be as objective in evaluating and presenting accounting information as external users would like. As a result, care must be taken to ensure that accounting information is neutral. Standards have been established and safeguards have been implemented in an attempt to ensure that accounting information is neutral and objective.

## Financial Reporting

Most accounting systems are designed to generate information for both internal and external reporting. The external information is much more highly summarized than the information reported internally. Understandably, a company does not want to disclose every detail of its internal financial dealings to outsiders. For this reason, external financial reporting is governed by an established body of standards or principles that are designed to carefully define what information a firm must disclose to outsiders. Financial accounting standards also establish a uniform method of presenting information so that financial reports for different companies can be more easily compared. The development of these standards is discussed in some detail later in this chapter.

This textbook focuses on financial accounting and external reporting. The **general-purpose financial statements** are the centerpiece of financial accounting. These financial statements include the balance sheet, income statement, and statement of cash flows.

The three major financial statements, along with the explanatory notes and the auditor's opinion, are briefly described here.

- The balance sheet reports, as of a certain point in time, the resources of a company (the assets), the company's obligations (the liabilities), and the net difference between its assets and liabilities, which represents the equity of the owners. The balance sheet addresses these fundamental questions: What does a company own? What does it owe?
- The income statement reports, for a certain interval, the net assets generated through business operations (revenues), the net assets consumed (expenses), and the difference, which is called *net income*. The income statement is the accountant's best effort at measuring the economic performance of a company for the given period.

- The statement of cash flows reports, for a certain interval, the amount of cash generated and consumed by a company through the following three types of activities: operating, investing, and financing. The statement of cash flows is the most objective of the financial statements because it is somewhat insulated from the accounting estimates and judgments needed to prepare a balance sheet and an income statement.

fyi

The cash flow statement is the most recent of the primary financial statements. It has been required only since 1988.

## stop & think

In addition to the financial statements, the management of a company has a variety of other methods of communicating financial information to external users. Which one of the following is **NOT** one of those methods?

- Press releases
- Postings on the Internet
- Interviews with financial reporters
- Paid advertisements in the financial press
- Preparation and dissemination of detailed operating budgets
- Public meetings with analysts, institutional investors, and other interested parties

- Accounting estimates and judgments are outlined in the notes to the financial statements. In addition, the notes contain supplemental information as well as information about items not included in the financial statements. Using financial statements without reading the notes is like preparing for an intermediate accounting exam by just reading the table of contents of the textbook—you get the general picture, but you miss all of the important details. Each financial statement routinely carries the following warning printed at the bottom of the statement: “The notes to the financial statements are an integral part of this statement.”
- Auditors, working independently of a company’s management and internal accountants, examine the financial statements and issue an auditor’s opinion about the fairness of the statements and their adherence to proper accounting principles. The opinion is based

on evidence gathered by the auditor from the detailed records and documents maintained by the company and from a review of the controls over the accounting system. Obviously, there is a motivation on the part of management to present the financial information in the most favorable manner possible. It is the responsibility of the auditors to review management’s reports and to independently decide whether the reports are indeed representative of the actual conditions existing within the enterprise. The auditor’s opinion adds credibility to the financial statements. The types of opinions issued by auditors, along with their relative frequencies, are outlined in Exhibit I-3. As you can see, the audit opinion is almost always “unqualified.”

### EXHIBIT I-3

### Relative Frequency of Audit Opinions

Types of Audit Opinions Relative Frequency For the Year 2006	Companies
<i>UNQUALIFIED</i> : Financial statements are in accordance with generally accepted accounting principles. They are consistent, and all material information has been disclosed.	2,369
<i>UNQUALIFIED, WITH EXPLANATORY LANGUAGE</i> : The opinion is unqualified, but the auditor has felt it necessary to emphasize some item with further language.	3,624
<i>QUALIFIED</i> : Either the audit firm was somehow constrained from performing all the desired tests, or some item is accounted for in a way with which the auditor disagrees.	5
<i>NO OPINION</i> : The auditor refuses to express an opinion, usually because there is great uncertainty about whether the audited firm will be able to remain in business.	0
<i>ADVERSE</i> : The financial statements are not in accordance with generally accepted accounting principles.	1
Total	<u>5,999</u>

**Source:** Standard and Poor’s COMPUSTAT. The database includes firms traded on the New York, American, and NASDAQ exchanges.

The financial statements and accompanying notes (certified by the auditor's opinion) have historically been the primary mode of communicating financial information to external users.

## Development of Accounting Standards

**2** Explain the function of accounting standards and describe the role of the FASB in setting those standards in the United States.

**WHY** By defining which accounting methods to use and how much information to disclose, accounting standards save time and money for accountants. Users also benefit because they can learn one set of accounting rules to apply to all companies.

**HOW** The Financial Accounting Standards Board (FASB) sets accounting standards in the United States. The FASB is a private-sector body and has no legal authority. Accordingly, the FASB must carefully balance theory and practice in order to maintain credibility in the business community. The issuance of a new accounting standard is preceded by a lengthy public discussion. The Emerging Issues Task Force (EITF) works under the direction of the FASB and formulates a timely expert consensus on how to handle new issues not yet covered in FASB pronouncements.

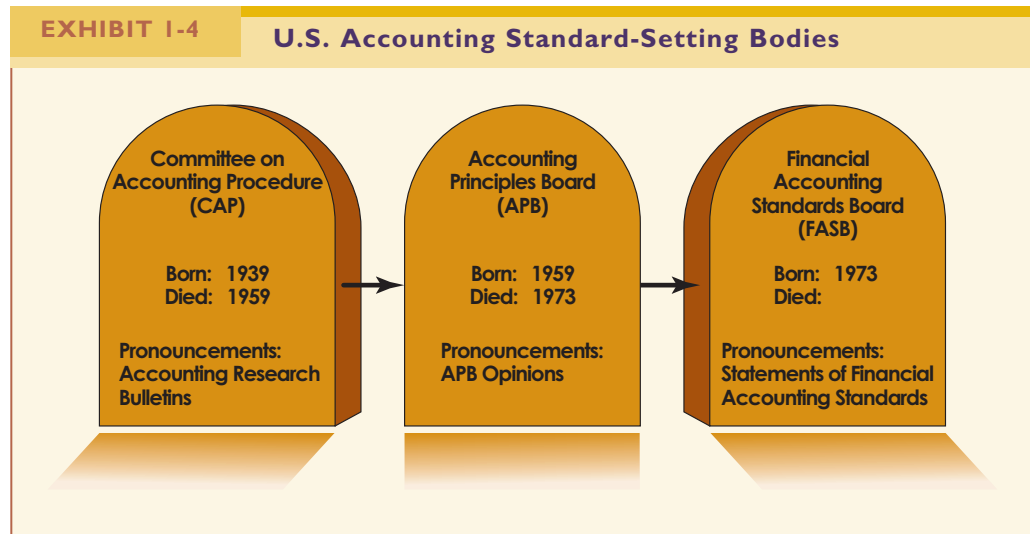

Consider this situation. A company decides to pay its managers partly in cash and partly in the form of options to buy the company's stock. The options would be very valuable if the company's stock price were to increase but would be worthless if the company's stock price were to decline. Because the company gives these potentially valuable options to employees, cash salaries don't need to be as high.

Should the value of the options be reported as salary expense or not? (You'll learn the answer to this surprisingly explosive question in Chapter 13.) One alternative is to let each company decide for itself. Users then must be careful about comparing the financial statements of two companies that have accounted for the same thing differently. Another alternative is to have one standard accounting treatment. Who sets the standard?

Accounting principles and procedures have evolved over hundreds of years in response to changes in business practices. The formal standard-setting process that exists today in the United States, however, has developed in just the past 75 years. The triggering event was the Stock Market Crash of 1929. In the aftermath of the crash, many market observers claimed that stock prices had been artificially inflated through questionable accounting practices. The **Securities and Exchange Commission (SEC)** was created to protect the interests of investors by ensuring full and fair disclosure. The SEC was also given specific legal authority to establish accounting standards for companies desiring to publicly issue shares in the United States. The emergence of the SEC forced the U.S. accounting profession to unite and to become more diligent in developing accounting principles. This led over time to the formation of a series of different private-sector organizations, each having the responsibility of issuing accounting standards. These organizations, their publications, and the time they were in existence are identified in Exhibit 1-4. The SEC has generally allowed these private-sector organizations to make the accounting standards in the United States. These standards are commonly referred to as **generally accepted accounting principles (GAAP)**. Remember, however, that the SEC retains the legal authority to establish U.S. accounting standards if it so chooses.

### Financial Accounting Standards Board

The **Financial Accounting Standards Board (FASB)** is currently recognized as the private-sector body responsible for the establishment of U.S. accounting standards. The FASB was organized in 1973, replacing the **Accounting Principles Board (APB)**. The APB was replaced because it had lost credibility in the business community and was seen as being too heavily influenced by accountants. As a result, the five full-time members of the FASB are drawn from a variety of backgrounds—auditing, corporate

accounting, financial services, and academia.<sup>6</sup> The members are required to sever all connections with their firms or institutions prior to assuming membership on the Board. Members are appointed for 5-year terms and are eligible for reappointment to one additional term. Headquartered in Norwalk, Connecticut, the Board has its own research staff and a 2007 operating budget of \$28 million, much of which comes from fees levied under the Sarbanes-Oxley Act on companies publicly traded in the United States.

Appointment of new Board members is done by the **Financial Accounting Foundation (FAF)**. The FAF is an independent, self-perpetuating body that, like the FASB, is made up of representatives from the accounting profession, the business world, government, and academia. However, the FAF has no standard-setting power, and its members are not full time. The FAF serves somewhat like a board of directors, overseeing the operations of the FASB. In addition to overseeing the FASB, the FAF is also responsible for selecting and supporting members of the **Governmental Accounting Standards Board (GASB)**. The GASB was established in 1984 and sets financial accounting standards for state and local government entities.

## The Standard-Setting Process

The major functions of the FASB are to study accounting issues and to establish accounting standards. These standards are published as **Statements of Financial Accounting Standards**. The FASB has also issued **Statements of Financial Accounting Concepts** that provide a framework within which specific accounting standards can be developed. The conceptual framework of the FASB is detailed later in the chapter.

The hallmark of the FASB's standard-setting process is openness. Because so many companies and individuals are impacted by the FASB's standards, the Board is meticulous about holding open meetings and inviting public comment. At any given time, the Board has a number of major projects under way. For example, as of April 21, 2008, the FASB was engaged in 23 agenda projects, 10 of which are joint projects with the International Accounting Standards Board (IASB) which is described later in this chapter. These FASB projects address fundamental issues such as revenue recognition and the distinction between liabilities and equity as well as technical issues relating to very complex business transactions such as the transfer of risk from insurance companies to reinsurance companies.

Each major project undertaken by the Board involves a lengthy process. The FASB staff assembles background information and the Board holds public meetings before a decision is made to even add a project to the FASB's formal agenda. After more study

<sup>6</sup> When it was initially established, the FASB was structured to have seven Board members. This number was reduced to five on July 1, 2008.

and further hearings, the Board often issues a report summarizing its *Preliminary Views*, which identifies the principal issues involved with the topic. This document includes a discussion of the various points of view as to the resolution of the issues, as well as an extensive bibliography, but it does not include specific conclusions. Interested parties are invited to comment either in writing or orally at a public hearing.

After comments from interested parties have been evaluated, the Board meets as many times as necessary to resolve the issues. These meetings are open to the public, and the agenda is published in advance. From these meetings, the Board develops an **Exposure Draft** of a statement that includes specific recommendations for financial accounting and reporting.

fyi

The FASB is quite scrupulous about holding all of its deliberations in public. In fact, since three (of five) votes are required to pass a FASB proposal, Board members are even careful not to discuss accounting issues at social occasions when three or more Board members are present.

After the Exposure Draft has been issued, reaction to the new document is again requested from the accounting and business communities. At the end of the exposure period, 30 days or longer, all comments are reviewed by the staff and the Board. Further deliberation by the Board leads to either the issuance of a *Statement of Financial Accounting Standards* (if at least three of the FASB members approve), a revised Exposure Draft, or in some cases, abandonment of the project. As you can see, the standard-setting process is a political one, full of consensus building, feedback, and compromise.

The final statement not only sets forth the actual standards but also establishes the effective date and method of transition. It also gives pertinent background information and the basis for the Board's conclusions, including reasons for rejecting significant alternative solutions. If any members dissent from the majority view, they may include the reasons for their dissent as part of the document. These dissents are interesting reading. For example, the dissent to *Statement No. 95* on the statement of cash flows reveals that

the Board members disagreed about a fundamental issue—whether payment of interest is an operating activity or a financing activity.<sup>7</sup>

The FASB also considers implementation and practice problems that relate to previously issued standards. Depending on the nature of a problem, the Board may issue a *Statement of Financial Accounting Standards* or an *Interpretation of a Statement of Financial Accounting Standards*. Problems that arise in practice

are also addressed in *FASB Staff Positions* prepared and issued by the staff of the FASB. These *Staff Positions*, which are reviewed by the Board prior to being issued, provide guidance for particular situations that arise in practice.

caution

This description makes the standard-setting process seem orderly and serene. It is not. Fierce disagreements over accounting standards are common, and some people hate the FASB.

**Emerging Issues Task Force** The methodical, sometimes slow, nature of the standard-setting process has been one of the principal points of criticism of the FASB. There seems to be no alternative to the lengthy process, however, given the philosophy that

<sup>7</sup> Three of the seven members of the FASB dissented to *Statement of Financial Accounting Standards No. 95*. Prior to 1991, a majority of the seven-member board (four members) was the minimum requirement for approval of an Exposure Draft or a final statement of standards. This requirement was changed to a minimum approval of five members or to what has been referred to as a "super-majority." A number of close, 4-3, votes that resulted in standards not favored by many businesspeople led to strong pressure on the Financial Accounting Foundation to change the voting requirements. Although not favored by members of the FASB, the change was made in 1990. In April 2002, the voting requirement was changed back to 4-3 as an attempt to increase the efficiency and speed of the Board's deliberations. When the number of Board members was reduced from seven to five on July 1, 2008, the simple majority rule (three out of five) was retained.

arriving at a consensus among members of the accounting profession and other interested parties is important to the Board's credibility.

In an effort to overcome this criticism and provide more timely guidance on issues, in 1984 the FASB established the **Emerging Issues Task Force (EITF)**. The EITF assists the FASB in the early identification of emerging issues that affect financial reporting. Members of the EITF include the senior technical partners of the major national CPA firms plus representatives from major associations of preparers of financial statements. The EITF meets periodically, typically at least once every quarter.

As an emerging issue is discussed, an attempt is made to arrive at a consensus treatment for the issue. If a consensus is reached, that consensus opinion defines the generally accepted accounting treatment until the FASB considers the issue. The EITF not only helps the FASB and its staff to better understand emerging issues but also in many cases determines that no immediate FASB action is necessary.

Abstracts of the FASB Emerging Issues Task Force are published periodically. The abstracts are identified by a two-part number; the first part represents the year the issue was discussed, and the second part identifies the issue number for that year. For example, among the consensuses reached in 2007 was Issue No. 07-1, "Accounting for Collaborative Arrangements" which deals with accounting for activities in which two or more companies collaborate to produce a motion picture, develop a new drug, create a new piece of software, and so forth. Although many of the issues are very specialized by topic and industry, the importance of the EITF to the standard-setting process cannot be overemphasized. Because discussions rarely last more than a day or two and a consensus is reached on a majority of the issues discussed, timely guidance is provided to the accounting profession without the lengthy due process of the FASB.

**FASB Summary** Remember this: The FASB has no enforcement power. Legal authority to set U.S. accounting standards rests with the SEC. FASB standards are "generally accepted," meaning that, overall, the FASB standards are viewed by the business community as being good accounting. However, the credibility of the FASB has fluctuated through the years as different issues have been resolved. For example, within the past 10 years the business community has been outraged by proposed standards for accounting for stock-based compensation and for goodwill. In both of those cases (which are discussed in Chapters 13 and 10, respectively), the FASB was forced to significantly revise its initial proposal. The FASB's job has been described as a "balancing act" between theoretical correctness and practical acceptability.

In addition to the FASB, several other bodies impact accounting standards and are important in other ways to the practice of accounting. Some of these bodies are discussed here.

## Other Organizations Important to Financial Reporting

**3** Recognize the importance of the SEC, AICPA, AAA, and IRS to financial reporting.

**WHY** Financial accounting rules are not created by the FASB in a vacuum, and numerous groups provide input into the development of accounting standards.

**HOW** Securities and Exchange Commission (SEC). To speed the improvement of disclosure, the SEC sometimes implements broad disclosure requirements in areas still being deliberated by the FASB.

American Institute of Certified Public Accountants (AICPA). The AICPA sets some accounting standards, particularly those related to specific industries.

American Accounting Association (AAA). The AAA helps disseminate research results and facilitates improvements in accounting education.

Internal Revenue Service (IRS). Financial accounting is not the same as tax accounting. However, many specifics learned in intermediate accounting are similar to the corresponding tax rules.

## Securities and Exchange Commission

The SEC was created by an act of Congress in 1934. Its primary role is to regulate the issuance and trading of securities by corporations to the general public. Prior to offering securities for sale to the public, a company must file a registration statement with the Commission that contains financial and organizational disclosures. In addition, all publicly held companies are required to furnish annual financial statements (called a *10-K filing*), quarterly financial statements (*10-Q filing*), and other periodic information about significant events (*8-K filing*). The SEC also requires companies to have their external financial statements audited by independent accountants.

fyi

The first chairman of the SEC was Joseph P. Kennedy, father of the late President John F. Kennedy.

The Commission's intent is not to prevent the trading of speculative securities

but to insist that investors have adequate information. As a result, the SEC is vitally interested in financial reporting and the development of accounting standards. The Commission carefully monitors the standard-setting process. The Commission also brings to the Board's attention emerging problems that need to be addressed and sends observers to meet with the EITF.

When the Commission was formed, Congress gave it power to establish accounting principles as follows:

The Commission may prescribe, in regard to reports made pursuant to this title, the form or forms in which the required information shall be set forth, the items or details to be shown in the balance sheet and the earning statement, and the methods to be followed in the preparation of reports in the appraisal or valuation of assets and liabilities. . . .<sup>8</sup>

The Commission has generally refrained from fully using these powers, preferring to work through the private sector in the development of standards. Throughout its existence, however, the Commission has issued statements pertaining to accounting and auditing issues. For example, the SEC occasionally issues **Staff Accounting Bulletins (SABs)**, which are SEC staff interpretations and do not necessarily represent official positions. In recent years, these SABs have proved to be very influential. For example, *SAB 101* on revenue recognition is discussed at length in Chapter 8. The formal SEC rules are found in the Code of Federal Regulations (CFR). For example, on March 4, 2008, Chapter II of Title 17 of the CFR was amended by the SEC to allow non-U.S. companies to use International Accounting Standards, instead of U.S. GAAP, in their financial statement filings with the SEC. This is an extremely interesting development that will be discussed in more detail later in this chapter.

Although the SEC is generally supportive of the FASB, there have been disagreements between the two bodies. One of the most public of these disagreements occurred in the late 1970s and concerned the accounting for oil and gas exploratory costs. The FASB issued a standard in 1977, and the SEC publicly opposed the standard; the FASB finally succumbed to the pressure and reversed its position in 1979. (See *Statements No. 19* and *No. 25* in the list of FASB Statements in an appendix to this textbook.) In recent years, the SEC and FASB have increased their efforts at behind-the-scenes coordination and consultation. Still, the two bodies are not in complete harmony. For example, the SEC has been impatient with the FASB's slow progress on improving financial reporting. Often, the SEC establishes broad disclosure requirements in an area while the FASB deliberates about the specific accounting rules. In recent years, this was the pattern with stock-based compensation, environmental disclosures, and derivatives.

As mentioned above, the SEC requires all publicly traded companies in the United States to have their financial statements audited. The auditors of those financial statements must be registered and periodically inspected by the Public Company

<sup>8</sup> Securities Exchange Act of 1934, Section 13(b).

Accounting Oversight Board (PCAOB), which is a private-sector organization created by the Sarbanes-Oxley Act of 2002. The SEC has congressional authority to oversee the PCAOB's activities.

## American Institute of Certified Public Accountants

The **American Institute of Certified Public Accountants (AICPA)** is the professional organization of practicing **certified public accountants (CPAs)** in the United States. The organization was founded in 1887, and it publishes a monthly journal, the *Journal of Accountancy*. (Note: Anyone interested in current developments in accounting should regularly read the *Journal of Accountancy*.) The AICPA has several important responsibilities, including certification and continuing education for CPAs, quality control, and standard setting.

The AICPA is responsible for preparing and grading the Uniform CPA Examination. This computer-based examination is offered year round in authorized testing centers around the United States. In addition to passing the examination, an individual must meet the state education and experience requirements in order to obtain state certification as a CPA. Most states now require CPAs to meet continuing education requirements in order to retain their licenses to practice. The AICPA assists its members in meeting these requirements through an extensive Continuing Professional Education (CPE) program.

The AICPA is also concerned with maintaining the integrity of the profession through its Code of Professional Conduct and through a quality control program, which includes a process of peer review of CPA firms conducted by other CPAs. For CPA firms that audit publicly traded clients, these AICPA peer reviews are now somewhat overshadowed by the registration and inspection program of the PCAOB mentioned previously.

Prior to the formation of the FASB, accounting principles were established under the direction of the AICPA. Both the CAP and the APB were AICPA committees. Although the FASB replaced the APB as the official standard-setting body for the profession, the AICPA continues to influence the establishment of accounting standards. The AICPA helps the FASB identify emerging issues and communicates the concerns of CPAs on accounting issues to the FASB. In addition, the AICPA frequently establishes the specialized standards that relate to particular industries. For example, in *Statement of Position (SOP) 04-2*, the AICPA issued a set of rules for the accounting for a variety of real estate time-sharing transactions.

## American Accounting Association

The **American Accounting Association (AAA)** is an organization for accounting professors, with 5,859 academic members as of the end of 2007. The AAA sponsors national and regional meetings where accounting professors discuss technical research and share innovative teaching techniques and materials. The AAA also organizes working committees of professors to study and comment on accounting standards issues. In addition, the AAA publishes a number of academic journals, including *The Accounting Review*, a quarterly research journal, and *Accounting Horizons*, which contains articles addressing many real-world accounting problems. In fact, *Accounting Horizons* is an excellent journal to read for more depth on intermediate accounting issues.

One of the most significant actions of the AAA is to motivate and facilitate curriculum revision. As the accounting profession changes, it is critical that accounting educators continually revise their curricula to keep pace with these changes. The AAA provides forums for educators to share ideas about changes in curriculum and rewards

The icon consists of the lowercase letters 'fyi' in a white, serif font, centered within a green, downward-pointing arrow shape.

Ask your instructor if he or she is a member of the AAA.

innovative curriculum revision efforts. For example, in 1993 our university (Brigham Young University) was given the *Innovation in Accounting Education Award* for the integrative revision of our intermediate financial accounting, managerial accounting, tax, audit, and information systems courses. By the way, our university received this accounting education innovation award again in 2007 (the only university to receive it twice), but we probably shouldn't tell you any more because you might think we are bragging.

## Internal Revenue Service

Tax accounting and financial accounting are different, but the popular perception is that they are one and the same. Tax accounting and financial accounting were designed with different purposes in mind. In the **Thor Power Tool** case (1979), the Supreme Court stated:

The primary goal of financial accounting is to provide useful information to management, shareholders, creditors, and others properly interested; the major responsibility of the accountant is to protect these parties from being misled. The primary goal of the income tax system, in contrast, is the equitable collection of revenue. . . .

Although this text on intermediate financial accounting is not a study of income tax accounting, the U.S. tax rules as administered by the **Internal Revenue Service (IRS)** will still be discussed from time to time. In most areas, financial accounting and tax accounting are closely related. For example, your study of leases, depreciation, and inventory valuation in this text will aid your understanding of the corresponding tax rules.

## What Is GAAP?

With all of these different bodies (FASB, EITF, AICPA, and SEC) establishing accounting standards, what is GAAP? Historically, the Auditing Standards Board of the AICPA has defined GAAP in the context of the phrase included in the standard auditor's opinion: "present fairly . . . in conformity with generally accepted accounting principles."<sup>9</sup> However, because the AICPA hierarchy was developed from the standpoint of the auditor, the FASB felt it was important to issue a new hierarchy from a broader perspective. Accordingly, in 2008 the FASB issued a revised GAAP hierarchy.<sup>10</sup> This hierarchy of pronouncements is illustrated in Exhibit 1-5. Note that the standards of the FASB (and its predecessors) have the highest authority. The FASB is convinced of the importance of accounting standards that are set within its rigorous due process described earlier in the chapter. Also note down there in the "other" category that the textbook you are reading is also included in the GAAP hierarchy.

For firms required to file financial statements with the SEC, the SEC rules and interpretive releases have the same authority as the standards listed in category A. The pronouncements in category A are of particular importance to auditors because Rule 203 of the AICPA Code of Professional Conduct specifies that an auditor must not express an unqualified opinion when there is a material departure from category A pronouncements.

The FASB is not completely satisfied with this hierarchy. According to the FASB, one problem with the traditional hierarchy is that the Statements of Financial Accounting Concepts are relegated to a low-priority position, equal in authority with accounting textbooks(!). The FASB plans to address this issue in a broader project to improve the conceptual framework. As discussed later in this chapter, the conceptual framework embodied in the Statements of Financial Accounting Concepts forms an increasingly important foundation for all financial accounting standards.

- AICPA Statements of Position (if NOT cleared by the FASB)
- Widely recognized accounting practices
- FASB Concepts Statements
- IASB international standards
- Accounting textbooks

## International Accounting Issues

**4** Realize the growing importance and relevance of international accounting issues to the practice of accounting in the United States and understand the role of the IASB in international accounting standard setting.

**WHY** Because business is increasingly conducted across national borders, companies must be able to use their financial statements to communicate with external users all over the world. As a result, divergent national accounting practices are converging to an overall global standard.

**HOW** The International Accounting Standards Board (IASB) is an international body that releases financial reporting standards. IASB standards have become the accepted worldwide standard.

Divergent national accounting practices around the world can have an extremely significant impact on reported financial statements. With the increasing integration of the worldwide economy, these accounting differences have become impossible to ignore. For example, to raise debt or equity capital, many non-U.S. firms, such as **Sony**, **British Petroleum**, and **Nokia**, list their securities on U.S. exchanges and borrow from U.S. financial institutions. The number of non-U.S. companies listed on the New York Stock Exchange (NYSE) has increased substantially in recent years. As of September 24, 2007, 421 foreign share issues (from 45 countries) were trading on the NYSE. In addition, many U.S. companies have listed their shares on foreign exchanges; for example, **Boeing's** shares trade on the Amsterdam, Brussels, London, Swiss, and Tokyo stock exchanges. U.S. companies also do substantial amounts of business in foreign currencies; **Disney** has significant amounts of business denominated in Japanese yen, European euros, British pounds, and Canadian dollars.

The international nature of business requires companies to be able to make their financial statements understandable to users all over the world. The significant differences in accounting standards that exist throughout the world complicate both the preparation of financial statements and the understanding of these financial statements by users.

## International Differences in GAAP

As will be noted throughout this text, there are some differences between U.S. GAAP and GAAP of other countries. The good news is that the fundamental concepts underlying accounting practice are the same around the world. As a result, a solid understanding of U.S. GAAP will allow you to quickly grasp the variations that exist in different countries. Throughout this book, we will include specific coverage of the areas in which significant differences exist in accounting practices around the world. One other piece of good news is that the demands of international financial statement users are forcing accountants around the world to harmonize differing accounting standards. Accordingly, the differences that currently exist will gradually diminish over time.

## International Accounting Standards Board

Just as the FASB establishes accounting standards for U.S. entities, other countries have their own standard-setting bodies. In an attempt to harmonize conflicting standards, the **International Accounting Standards Board (IASB)** was formed in 1973 to develop worldwide accounting standards. Like the FASB, the IASB develops proposals, circulates these among interested organizations, receives feedback, and then issues a final pronouncement. The 14 Board members of the IASB come from many countries and represent a variety of professional backgrounds. As of April 2008, the 14 Board members included individuals from the United States, the United Kingdom, France, Sweden, China, Australia, South Africa, and Japan. Most of the Board members are CPAs with audit experience, but in April 2008 the IASB also included a securities analyst, several people with corporate accounting experience, and an accounting professor (Mary Barth from Stanford University).

The early standards of the IASB were primarily catalogs of the diverse accounting practices then used worldwide. Recent IASB projects have been more focused and innovative. For example, the substance of IASB decisions on improving earnings-per-share reporting was embraced by the FASB. In fact, the FASB and the IASB worked closely to develop compatible standards. In 2002, the IASB and the FASB entered into a joint agreement, called the Norwalk Agreement, in which they pledged to work together to develop a set of “fully compatible” accounting standards as soon as possible, and to continue to work together to make sure that those standards stay compatible. This joint effort is proceeding along two fronts. First, the IASB and the FASB have identified several accounting standard issues on which they could achieve full compatibility without too much difficulty. These issues include the accounting for some inventory costs, accounting for the exchange of nonmonetary assets, and the reporting of accounting changes, all of which have been completed, and the computation of earnings per share, which is still in progress. Second, the IASB and FASB are working together on larger projects involving fundamental issues such as revenue recognition, the accounting for business combinations, and a joint conceptual framework.

The accounting standards produced by the IASB are referred to as *International Financial Reporting Standards (IFRSs)* and *International Accounting Standards (IASs)*. The difference between these two sets of standards is merely one of timing; the IASB standards issued before 2001 are called *IAS* and those issued since 2001 are called *IFRS*. In practice, the entire body of IASB standards is referred to simply as *IFRS*. The international counterpart of the FASB’s Emerging Issues Task Force (EITF) is called the International Financial Reporting Interpretations Committee (IFRIC) which was called the Standing Interpretations Committee (SIC) before 2002.

IFRSs are envisioned to be a set of standards that can be used by all companies regardless of where they are based. In fact, IFRSs will supplement or even replace

fyi

In 2001, the IASB restructured itself as an independent body with closer links to national standard-setting bodies. At that time, the IASB adopted its current name and dropped its original name of the International Accounting Standards Committee (IASC).

## stop & think

Consider these four organizations: FASB, AICPA, SEC, and IASB. Which one do you think will be making U.S. GAAP twenty years from now?

- a) FASB
- b) AICPA
- c) SEC
- d) IASB

standards set by national standard setters such as the FASB. IASB standards have gained widespread acceptance throughout the world. And as mentioned earlier, in 2008 the SEC began allowing non-U.S. companies with shares trading on U.S. stock exchanges to issue their financial reports using IASB standards. Before this change, all non-U.S. companies wishing to have their shares traded in the United States were required to provide financial statements in accordance with U.S. GAAP. Historically, financial disclosure requirements in the United States have been the strictest in the world, and foreign companies have been reluctant to provide the U.S. GAAP disclosures. With the new SEC rule, the number of non-U.S. companies listed on U.S. stock exchanges may increase dramatically. The SEC is now considering whether to allow U.S. companies to use IASB standards, rather than FASB standards, in the financial reports that they provide to their U.S. shareholders. If this happens, the FASB may cease to exist. So pay attention because the next few years will be momentous ones in terms of the history of accounting standard setting.

In order to prepare you for a professional world in which both FASB and IASB standards will be used, both sets of standards will be covered in this textbook. The focus will be on FASB standards, but you will also receive comprehensive exposure to the IASB standards in each major topic area throughout the chapters of the text. In addition, Chapter 22 contains capstone coverage of International Accounting Standards.

## A Conceptual Framework of Accounting

**5** Understand the significance of the FASB's conceptual framework in outlining the qualities of good accounting information, defining terms such as *asset* and *revenue*, and providing guidance about appropriate recognition, measurement, and reporting.

**WHY** The conceptual framework allows for the systematic adaptation of accounting standards to a changing business environment. The FASB uses the conceptual framework to aid in an organized and consistent development of new accounting standards. In addition, learning the FASB's conceptual framework allows one to understand and, perhaps, anticipate future standards.

**HOW** The conceptual framework outlines the objectives of financial reporting and the qualities of good accounting information, precisely defines commonly used terms such as *asset* and *revenue*, and provides guidance about appropriate recognition, measurement, and reporting. Recording an item in the accounting records through a journal entry is called *recognition*. To be recognized, an item must meet the definition of an element and be measurable, relevant, and reliable.

A strong theoretical foundation is essential if accounting practice is to keep pace with a changing business environment. Accountants are continually faced with new situations, technological advances, and business innovations that present new accounting and reporting problems. These problems must be dealt with in an organized and

consistent manner. The **conceptual framework** plays a vital role in the development of new standards and in the revision of previously issued standards. Recognizing the importance of this role, the FASB stated that fundamental concepts “guide the Board in developing accounting and reporting standards by providing . . . a common foundation and basic reasoning on which to consider merits of alternatives.”<sup>11</sup> In a very real sense, then, the FASB itself is a primary beneficiary of a conceptual framework.

In addition, when accountants are confronted with new developments that are not covered by GAAP, a conceptual framework provides a reference for analyzing and resolving emerging issues. Thus, a conceptual framework not only helps in understanding existing practice but also provides a guide for future practice.

## Nature and Components of the FASB’s Conceptual Framework

Serious attempts to develop a theoretical foundation of accounting can be traced to the 1930s. Among the leaders in such attempts were accounting educators, both individually and collectively as a part of the American Accounting Association (AAA). In 1936, the Executive Committee of the AAA began issuing a series of publications devoted to accounting theory, the last of which was published in 1965 and entitled “A Statement of Basic Accounting Theory.” During the period from 1936 to 1973, the AAA and the AICPA issued several additional publications, in their attempt to develop a conceptual foundation for the practice of accounting.<sup>12</sup>

Although these publications made significant contributions to the development of accounting thought, no unified structure of accounting theory emerged from these efforts. When the FASB was established in 1973, it responded to the need for

a general theoretical framework by undertaking a comprehensive project to develop a “conceptual framework for financial accounting and reporting.” This project has been described as an attempt to establish a so-called constitution for accounting.

The conceptual framework project was one of the original FASB agenda items. Because of its significant potential impact on many aspects of financial reporting and, therefore, its controversial nature, progress was deliberately slow. The project had high

priority and received a large share of FASB resources. In February 2000, after almost 30 years, the FASB issued the last of seven Statements of Financial Accounting Concepts

### caution

Don’t think that the conceptual framework is a useless exercise in accounting theory. Since its completion, the framework has significantly affected the nature of many accounting standards.

<sup>11</sup> *Statement of Financial Accounting Concepts No. 6*, “Elements of Financial Statements” (Stamford, CT: Financial Accounting Standards Board, December 1985), p. i.

<sup>12</sup> Among the most prominent of these publications were the following:

- Maurice Moonitz, *Accounting Research Study No. 1*, “The Basic Postulates of Accounting” (New York: American Institute of Certified Public Accountants, 1961).
- William A. Paton and A. C. Littleton, “An Introduction to Corporate Accounting Standards, Monograph 3” (Evanston, IL: American Accounting Association, 1940).
- Thomas H. Sanders, Henry R. Hatfield, and W. Moore, “A Statement of Accounting Principles” (New York: American Institute of Accountants, Inc., 1938).
- Robert T. Sprouse and Maurice Moonitz, *Accounting Research Study No. 3*, “A Tentative Set of Broad Accounting Principles for Business Enterprises” (New York: American Institute of Certified Public Accountants, 1962).
- *Statement of the Accounting Principles Board No. 4*, “Basic Concepts and Accounting Principles Underlying Financial Statements of Business Enterprises” (New York: American Institute of Certified Public Accountants, October 1970).
- *Report of the Study Group on the Objectives of Financial Statements*, “Objectives of Financial Statements” (New York: American Institute of Certified Public Accountants, October 1973).

(usually referred to as *Concepts Statements*), which provide the basis for the conceptual framework.<sup>13</sup>

The seven Concepts Statements address four major areas.

1. *Objectives*: What are the purposes of financial reporting?
2. *Qualitative characteristics*: What are the qualities of useful financial information?
3. *Elements*: What is an asset? a liability? a revenue? an expense?
4. *Recognition, measurement, and reporting*: How should the objectives, qualities, and elements definitions be implemented?

## Objectives of Financial Reporting

Without identifying the goals for financial reporting (e.g., who needs what kind of information and for what reasons), accountants cannot determine the recognition criteria needed, which measurements are useful, or how best to report accounting information. The key financial reporting objectives outlined in the conceptual framework are as follows:

- Usefulness
- Understandability
- Target audience: investors and creditors
- Assessing future cash flows
- Evaluating economic resources
- Primary focus on earnings

**Usefulness** The overall objective of financial reporting is to provide information that is useful for decision making. The FASB states

Financial reporting should provide information that is useful to present and potential investors and creditors and other users in making rational investment, credit, and similar decisions.<sup>14</sup>

**Understandability** Financial reports cannot and should not be so simple as to be understood by everyone. Instead, the objective of understandability recognizes a fairly sophisticated user of financial reports, that is, one who has a reasonable understanding of accounting and business and who is willing to study and analyze the information presented.<sup>15</sup> In other words, the information should be comprehensible to someone like you.

**Target Audience: Investors and Creditors** Although there are many potential users of financial reports, the objectives are directed primarily toward investors and creditors. Other external users, such as the IRS or the SEC, can require selected information from individuals and companies. Investors and creditors, however, must rely to a significant extent on the information contained in the periodic financial reports supplied by management. In addition, information useful to investors and creditors in most cases will be useful to other external users (i.e., customers and employees).

<sup>13</sup> The seven Concepts Statements issued by the FASB are

- (1) Objectives of Financial Reporting by Business Enterprises
- (2) Qualitative Characteristics of Accounting Information
- (3) Elements of Financial Statements of Business Enterprises
- (4) Objectives of Financial Reporting by Nonbusiness Organizations
- (5) Recognition and Measurement in Financial Statements of Business Enterprises
- (6) Elements of Financial Statements (a replacement of No. 3, broadened to include not-for-profit as well as business enterprises)
- (7) Using Cash Flow Information and Present Value in Accounting Measurements

<sup>14</sup> *Statement of Financial Accounting Concepts No. 1*, par. 34.

<sup>15</sup> *Ibid.*

**Assessing Future Cash Flows** Investors and creditors are interested primarily in a company's future cash flows. Creditors expect interest and loan principals to be paid in cash. Investors desire cash dividends and sufficient cash flow to allow the business to grow. Thus, financial reporting should provide information that is useful in assessing amounts, timing, and uncertainty (risk) of prospective cash flows.

**Evaluating Economic Resources** Financial reporting should also provide information about a company's assets, liabilities, and owners' equity to help investors, creditors, and others evaluate the financial strengths and weaknesses of the enterprise and its liquidity and solvency. Such information will help users determine the financial condition of a company, which, in turn, should provide insight into the prospects of future cash flows.

**Primary Focus on Earnings** Information about company earnings, measured by accrual accounting, generally provides a better basis for forecasting future performance than does information about current cash receipts and disbursements. Thus, the FASB states that "the primary focus of financial reporting is information about a company's performance provided by measures of earnings and its components."<sup>16</sup>

## Qualitative Characteristics of Accounting Information

The overriding objective of financial reporting is to provide useful information. This is a very complex objective because of the many reporting alternatives. To assist in choosing among financial accounting and reporting alternatives, the conceptual framework identifies the qualitative characteristics of useful accounting information. The key characteristics discussed here are as follows:

- Benefits greater than cost
- Relevance
- Reliability
- Comparability
- Materiality

The relationships among these characteristics and their components are illustrated in Exhibit 1-6.

**Benefits Greater Than Cost** Information is like other commodities in that it must be worth more than the cost of producing it. The difficulty in assessing cost effectiveness of financial reporting is that the costs and benefits, especially the benefits, are not always evident or easily measured. In addition, the costs are borne by an identifiable and vocal constituency, the companies required to prepare financial statements. The benefits are spread over the entire economy. Thus, the FASB more frequently hears complaints about the expected cost of a new standard than it hears praise about the expected benefits. In the majority of its recent standards, the FASB has included a section attempting to describe the expected costs and benefits of the standard.

**Relevance** The FASB describes **relevance** as "making a difference." Qualities of relevant information are as follows:

- Feedback value
- Predictive value
- Timeliness

PhotoDisc/Getty Images

The estimated cost of environmental cleanup represents a trade-off of relevance and reliability.

<sup>16</sup> *Statement of Financial Accounting Concepts No. 1*, par. 43.

Text not available due to copyright restrictions

Relevant information normally provides both **feedback value** and **predictive value** at the same time. Feedback on past events helps confirm or correct earlier expectations. Such information can then be used to help predict future outcomes. For example, when a company presents comparative income statements, an investor has information to compare last year's operating results with this year's. This provides a general basis for evaluating prior expectations and for estimating what next year's results might be.

**Timeliness** is essential for information to "make a difference" because if the information becomes available after the decision is made, it isn't of much use. Financial reporting is increasingly criticized on the timeliness dimension because in the age of information technology, users are becoming accustomed to getting answers overnight, not at the end of a year or a quarter.

**Reliability** Information is reliable if it is relatively free from error and represents what it claims to represent. **Reliability** does not mean absolute accuracy. Information that is based on judgments and that includes estimates and approximations cannot be totally accurate, but it should be reliable. The objective, then, is to present the type of information in which users can have confidence. Such information must have the following:

- Verifiability
- Representational faithfulness
- Neutrality

**Verifiability** implies consensus. Accountants seek to base the financial statements on measures that can be verified by other trained accountants using the same measurement methods. **Representational faithfulness** means that there is agreement between a measurement and the economic activity or item that is being measured.

**Neutrality** is similar to the all-encompassing concept of “fairness.” If financial statements are to satisfy a wide variety of users, the information presented should not be biased in favor of one group of users to the detriment of others. Neutrality also suggests that accounting standard setters should not be influenced by potential effects a new rule will have on a particular company or industry. In practice, neutrality is very difficult to achieve because firms that expect to be harmed by a new accounting rule often lobby vigorously against the proposed standard.

Many of the difficult decisions in choosing appropriate accounting practices boil down to a choice between relevance and reliability. Emphasizing reliability results in long preparation times as information is double-checked, and there is an avoidance of estimates and forecasts that cloud the data with uncertainty. On the other hand, relevance often requires the use of instant information full of uncertainty. A good illustration is information regarding expected environmental cleanup costs. Toxic waste cleanup takes years, and any forecast of the total expected cleanup cost is full of assumptions. These forecasts are not very reliable, but they are extremely relevant—ask any company that has ever purchased property without considering the potential environmental liabilities. As the world has filled with competing sources of instant information, the accounting standards have slowly moved toward more relevance and less reliability.

**Comparability** The essence of **comparability** is that information becomes much more useful when it can be related to a benchmark or standard. The comparison may be with data for other firms or it may be with similar information for the same firm but for other periods of time. Comparability of accounting data for the same company over time is often called **consistency**. Comparability requires that similar events be accounted for in the same manner on the financial statements of different companies and for a particular company for different periods. It should be recognized, however, that uniformity is not always the answer to comparability. Different circumstances may require different accounting treatments.

**Materiality** **Materiality** deals with this specific question: Is the item large enough to influence the decision of a user of the information? Quantitative guidance concerning materiality is lacking, so managers and accountants must exercise judgment in determining whether an item is material. All would agree that an item causing net income to change by 10% is material. How about 1%? Most accountants would say an item changing net income by 1% is immaterial unless the item results from questionable income manipulation or something else indicative of broader concern. Remember that there is no definitive numerical materiality threshold—the accountant must use his or her judgment. In recognition of the importance of the concept of materiality, the SEC released *Staff Accounting Bulletin (SAB) No. 99* in August 1999 to offer additional guidance on this concept. The SEC confirmed that materiality can never be boiled down to a simple numerical benchmark. However, the SEC said that, in terms of an auditor considering whether an item is material, extra scrutiny should be given to items that change a loss to a profit, that allow a company to meet analyst earnings expectations, or that allow management to meet a bonus threshold that otherwise would have been missed.

**What About Conservatism?** No discussion of the qualities of accounting information is complete without a discussion of **conservatism**, which historically has been the guiding principle behind many accounting practices. The concept of conservatism can be summarized as follows: When in doubt, recognize all losses but don't recognize any gains. In formulating the conceptual framework, the FASB did not include conservatism in the list of qualitative characteristics (see Exhibit 1-6). Nevertheless, conservatism is an important concept. Financial statements that are deliberately biased to understate assets and profits lose the characteristics of relevance and reliability.

## caution

Although the conceptual framework excludes conservatism from its list of qualitative characteristics, most practicing accountants are still conservative in making their estimates and judgments.

Since the conceptual framework was formulated, the accounting standards have moved away from conservatism. For example, recognition of unrealized gains on financial instruments is now required in contrast to the conservative lower-of-cost-or-market rule in existence when the conceptual framework was written. However, as pointed out by the FASB in *Concepts Statement No. 2*, there is still a place for practical conservatism. When two estimates are equally likely, the prudent

decision is to use the more conservative number. This approach provides a counterbalance to the natural optimism and exaggeration of managers and entrepreneurs.

### Elements of Financial Statements

The FASB definitions of the 10 basic financial statement elements are listed in Exhibit 1-7. These elements compose the building blocks upon which financial statements are constructed. These definitions and the issues surrounding them are discussed in detail as the elements are introduced in later chapters.

Text not available due to copyright restrictions

## Recognition, Measurement, and Reporting

To recognize or not to recognize . . . THAT is the question. One way to report financial information is to boil down all the estimates and judgments into one number and then use that one number to make a journal entry. This is called **recognition**. The key assumptions and estimates are then described in a note to the financial statements. Another approach is to skip the journal entry and just rely on the note to convey the information to users. This is called **disclosure**.

The recognition versus disclosure question has been at the heart of many accounting standard controversies and compromises in recent years. Two examples follow.

- The business community absolutely refused to accept the FASB's decision to require recognition of the value of employee stock options as compensation expense. The FASB initially compromised by requiring only disclosure of the information (FASB *Statement No. 123*) but finally insisted that, starting in 2006, businesses must recognize the expense rather than just disclose it.
- The FASB has used disclosure requirements to give firms some years of practice in reporting the fair value of financial instruments (FASB *Statement Nos. 105, 107, and 119*). Some standards now require recognition of those fair values (FASB *Statement Nos. 115 and 133*), and FASB *Statement No. 157* provides extensive guidance on the use of and required disclosures regarding fair value measurements in the financial statements.

The conceptual framework provides guidance in determining what information should be formally incorporated into financial statements and when. These concepts are discussed here under the following three headings:

- Recognition criteria
- Measurement
- Reporting

**Recognition Criteria** For an item to be formally recognized, it must meet one of the definitions of the elements of financial statements.<sup>17</sup> For example, a receivable must meet the definition of an asset to be recorded and reported as such on a balance sheet. The same is true of liabilities, owners' equity, revenues, expenses, and other elements. An item must also be reliably measurable in monetary terms to be recognized. For example, as mentioned earlier, many firms have obligations to clean up environmental damage. These obligations fit the definition of a liability, and information about them is relevant to users, yet they should not be recognized until they can be reliably quantified. Disclosure is preferable to recognition in situations in which relevant information cannot be reliably measured.

**Measurement** Closely related to recognition is measurement. Five different measurement attributes are currently used in practice.

1. **Historical cost** is the cash equivalent price exchanged for goods or services at the date of acquisition. (Examples of items measured at historical cost: land, buildings, equipment, and most inventories.)
2. **Current replacement cost** is the cash equivalent price that would be exchanged currently to purchase or replace equivalent goods or services. (Example: some inventories that have declined in value since acquisition.)
3. **Fair value** is the cash equivalent price that could be obtained by selling an asset in an orderly transaction. (Example: many financial instruments.)
4. **Net realizable value** is the amount of cash expected to be received from the conversion of assets in the normal course of business. (Example: accounts receivable.)

<sup>17</sup> *Statement of Financial Accounting Concepts No. 5*, "Recognition and Measurement in Financial Statements of Business Enterprises" (Stamford, CT: Financial Accounting Standards Board, December 1984), par. 63.

Photodisc/Getty Images

Most inventories are valued at historical cost—the cash equivalent price exchanged for the goods at the date of acquisition.

## caution

You will be doing lots of present value calculations during your course in intermediate accounting. Check the batteries in your calculator.

5. **Present (or discounted) value** is the amount of net future cash inflows or outflows discounted to their present value at an appropriate rate of interest. (Examples: long-term receivables, long-term payables, and long-term operating assets determined to have suffered an impairment in value.)

On the date an asset is acquired, all five of these measurement attributes have approximately the same value. The differences arise as the asset ages, business conditions change, and the original acquisition price becomes a less relevant measure of future economic benefit.

Current accounting practice in the United States is said to be based on historical costs, although, as illustrated, each of the five measurement attributes is used. Still, historical cost is the dominant measure and is used because of its high reliability. Many users believe that current replacement costs or fair values, though less reliable, are more relevant than historical costs for future-oriented decisions. Here we see the classic trade-off between relevance and reliability. In recent years we have seen an increasing emphasis on relevance and thus a movement away from historical cost. Most financial instruments are now reported at fair value, and the present value of forecasted cash flows is becoming a more common measurement attribute. The importance of forecasted cash flow information is evidenced by the fact that the most recent addition to the conceptual framework (*Concepts Statement No. 7* adopted in February 2000)

outlines the appropriate approach to computing the present value of cash flows. In spite of this trend, the United States still lags behind other countries in the use of market values in financial statements. For example, many British companies report their land and buildings at estimated market values.

**Reporting** The conceptual framework indicates that a “full set of financial statements” is necessary to meet the objectives

of financial reporting. Included in the recommended set of general-purpose financial statements are reports that show the following:

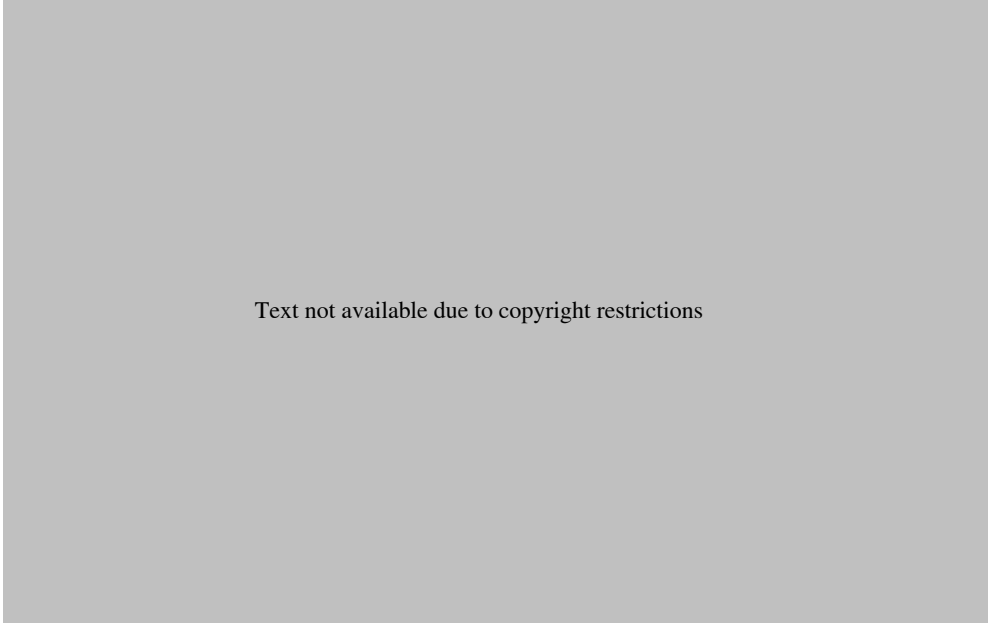

- Financial position at the end of the period
- Earnings (net income) for the period
- Cash flows during the period
- Investments by and distributions to owners during the period
- Comprehensive income (total nonowner changes in equity) for the period

The first three items have obvious reference to the three primary financial statements: balance sheet, income statement, and statement of cash flows. By the way, at the time the conceptual framework was formulated, there was no requirement to prepare a statement of cash flows. One of the early consequences of the completed conceptual framework was an increased emphasis on cash flow and the addition of the cash flow statement to the set of primary financial statements. The fourth reporting recommendation is typically satisfied with a **statement of changes in owners' equity**. Finally, a statement of comprehensive

income is intended to summarize all increases and decreases in equity except for those arising from owner investments and withdrawals. **Comprehensive income** differs from earnings in that it includes unrealized gains and losses not recognized in the income statement. Examples of these unrealized gains and losses include those arising from foreign currency translations, changes in the value of available-for-sale securities, and changes in the value of certain derivative contracts. Although the concept of comprehensive income has been discussed by the FASB for 20 years, it was finally operationalized in 1998. Beginning in that year, companies were required to provide, in at least one place, information relating to these unrealized gains and losses.

For financial reporting to be most effective, all relevant information should be presented in an unbiased, understandable, and timely manner. This is sometimes referred to as the **full disclosure principle**. Because of the cost-benefit constraint discussed earlier, however, it would be impossible to report all relevant information. Further, too much information could adversely affect understandability and, therefore, decision usefulness. Those who provide financial information must use judgment in determining what information best satisfies the full disclosure principle within reasonable cost limitations.

Two final points to remember are that the financial statements represent just one part of financial reporting and that financial reporting is just one vehicle used by companies to communicate with external parties. Exhibit 1-8 illustrates the total information spectrum. In one way, this chart is somewhat misleading. Financial reporting is represented as four-fifths of the information spectrum, with other information comprising the other fifth. In reality, the proportions are probably reversed. In a world where online

Text not available due to copyright restrictions

information is available 24 hours a day, the accounting profession faces the challenge of maintaining the relevance of financial reporting in the information spectrum.

## Traditional Assumptions of the Accounting Model

The FASB conceptual framework is influenced by several underlying assumptions, although these assumptions are not addressed explicitly in the framework. These five basic assumptions are

- Economic entity
- Going concern
- Arm's-length transactions
- Stable monetary unit
- Accounting period

The business enterprise is viewed as a specific **economic entity** separate and distinct from its owners and any other business unit. Identifying the exact extent of the economic entity is difficult with large corporations that have networks of subsidiaries and subsidiaries of subsidiaries with complex business ties among the members of the group. The *keiretsu* in Japan (groups of large firms with ownership in one another and interlocking boards of directors) are an extreme example. At the other end of the spectrum, it is often very difficult to disentangle the owner's personal transactions from the transactions of a small business.

In the absence of evidence to the contrary, the entity is viewed as a **going concern**. This continuity assumption provides support for the preparation of a balance sheet that reports costs assignable to future activities rather than market values of properties that would be realized in the event of voluntary liquidation or forced sale. This same assumption calls for the preparation of an income statement reporting only such portions of revenues and costs as are allocable to current activities.

Transactions are assumed to be **arm's-length transactions**. That is, they occur between independent parties, each of which is capable of protecting its own interests. The problem of related-party transactions was at the heart of the Enron scandal. Concern about Enron's accounting and business practices escalated dramatically when it was discovered that Enron's CFO was also managing partnerships that were buying assets from Enron.

Transactions are assumed to be measured in **stable monetary units**. Because of this assumption, changes in the dollar's purchasing power resulting from inflation have traditionally been ignored. To many accountants, this is a serious limitation of the accounting model. In the late 1970s, when inflation was in double digits in the United States, the FASB adopted a standard (*Statement No. 33*) requiring supplemental disclosure of inflation-adjusted numbers. However, because inflation has remained fairly low for the past twenty years, interest in *Statement No. 33* died, and it was repealed. Of course, many foreign countries with historically high inflation routinely require inflation-adjusted financial statements.

Because accounting information is needed on a timely basis, the life of a business entity is divided into specific **accounting periods**. By convention, the year has been established as the normal period for reporting, supplemented by interim quarterly reports. Even this innocent traditional assumption has come under fire. Many users want "flash" reports and complain that a quarterly reporting period is too slow. On the other hand, U.S. business leaders often claim that the quarterly reporting cycle is too fast and forces managers to focus on short-term profits instead of on long-term growth. Many other countries require financial statements only semiannually.

## Impact of the Conceptual Framework

The conceptual framework provides a basis for consistent judgments by standard setters, preparers, users, auditors, and others involved in financial reporting. A conceptual framework will not solve all accounting problems but if used on a consistent basis over time, it should help improve financial reporting.

The impact of the conceptual framework has been seen in many ways. For example, in *Concepts Statement No. 5*, the FASB outlines the need for a Statement of Comprehensive Income that would contain all of the changes in the value of a company during a period whether those value changes were created by operations, by changes in market values, by changes in exchange rates, or by any other source. This Statement of Comprehensive Income is now a required statement (according to *Statement of Financial Accounting Standards No. 130*). In addition, the existence of this statement as a place to report changes in market values of assets has facilitated the adoption of standards that result in more relevant values in the balance sheet. Examples are *SFAS No. 115* and the market values of investment securities and *SFAS No. 133* and the market values of derivatives. Without the conceptual framework to guide the creation of these standards, their provisions would have been even more controversial than they were.

Related to the conceptual framework is the push toward more “principles-based” accounting standards. In theory, principles-based standards would not include any exceptions to general principles and would not include detailed implementation and interpretation guidance. Instead, a principles-based standard would have a strong conceptual foundation and be applicable to a variety of circumstances by a practicing accountant using his or her professional judgment. A number of accounting standards in the United States, including those dealing with the accounting for leases and derivatives, are full of exceptions, special cases, and tricky implementation rules requiring hundreds of pages of detailed interpretation. The cry for an emphasis on principles-based standards is a reaction to the huge costs of trying to understand and use these voluminous, detailed standards. The ideal of basing accounting standards on a strong conceptual foundation is what motivated the FASB’s conceptual framework project in the first place and which continues to motivate the FASB and the IASB to work on a joint conceptual framework (with some parts expected to be completed as soon as 2009).

The framework discussed in this chapter will be a reference source throughout the text. In studying the remaining chapters, you will see many applications and a few exceptions to the theoretical framework established here. An understanding of the overall theoretical framework of accounting should make it easier for you to understand specific issues and problems encountered in practice.

## Careers in Financial Accounting and the Importance of Personal Ethics

**6** Identify career opportunities related to accounting and financial reporting and understand the importance of personal ethics in the practice of accounting.

**WHY** Accounting-related jobs are much more challenging and varied than that of the stereotypical bookkeeper with green eyeshades. Financial statement numbers impact the decisions of the public so accountants bear an ethical responsibility to provide unbiased information.

**HOW** Public accounting firms provide other customer services in addition to auditing. Because all companies have some financial reporting responsibilities, many financial accounting career opportunities are available in industry. In addition, a background in accounting, the language of business, is useful for any career in business. Without a commitment to strong personal ethical behavior, an accountant exercising judgment in preparing financial statements can bias the statements for personal or company gain.

If you are like most students who take intermediate accounting, you aren’t taking this class as a general social science elective. You intend to pursue a career in an accounting-related field. This introductory chapter closes with a brief discussion

of some of the careers in accounting. One piece of advice: The best career move you can make right now (in addition to taking this class, of course) is to become familiar with your school's job placement office. Ask the people there where the jobs are and what kinds of candidates employers are hiring. Have them help you get started crafting a "killer" résumé. Find out about summer internships. The sooner you start gathering information and establishing a network of contacts, the better.

The three major career areas in financial accounting are:

1. Public accounting
2. Corporate accounting
3. User (analyst, banker, consultant)

## Public Accounting

Public accountants do not work for a single business enterprise. Rather, they provide a variety of services for many different individual and business clients. In essence, a public accountant is a freelance accountant, an accountant for hire. Public accountants practice either individually or in firms.

A CPA is a certified public accountant. As mentioned earlier in connection with the discussion of the AICPA, in order to become a CPA, an individual must pass the CPA exam and satisfy education and work experience requirements that differ somewhat from state to state. One of the most significant (and controversial) developments in CPA licensing is the requirement adopted in many states that one must have 150 college credit hours (five years of full-time education) in order to become a CPA.

Traditionally, the most prominent role of CPAs has been as independent auditors of financial statements. Almost all large publicly held corporations are audited by a few large CPA firms. Listed in alphabetical order, the four largest firms are **Deloitte & Touche**, **Ernst & Young**, **KPMG**, and **PricewaterhouseCoopers**. Each of these firms is an international organization with many offices in the United States and abroad. Many small businesses are serviced by regional and local CPA firms, including a large number of sole practitioners. In these smaller firms, the role of auditing is often less important than the areas of tax reporting and planning and systems consulting. A CPA in a smaller firm is expected to be something of an accounting generalist as opposed to the more specialized positions of CPAs in large regional and national firms.

## Corporate Accounting

Public accountants move from client to client as accountants for hire. Of course, businesses also employ their own staffs of in-house accountants. A large business enterprise employs financial accountants who are primarily concerned with external financial reporting; management accountants who are primarily concerned with internal financial reporting; tax accountants who prepare the necessary federal, state, and local tax returns and advise management in matters relating to taxation; and internal auditors who review the work performed by accountants and others within the enterprise and report their findings to management. In smaller organizations, there

is less specialization and more combining of responsibility for the various accounting functions.

Not all CPAs are public accountants. Individuals who start their careers in public accounting and become CPAs often leave public accounting after a few years and join the in-house accounting staff of a business. Typically, the company they join is one of

The logo consists of the lowercase letters 'fyi' in a white, serif font, centered within a dark green, irregularly shaped box that has a pointed top.

You might also consider a career as an accounting instructor. Ask your instructor what he or she thinks.

the clients they audited or consulted for as a public accountant. In fact, this is the most common career path for college graduates who start out working for one of the large accounting firms.

### User (Analyst, Banker, Consultant)

Believe it or not, not everyone in the world wants to become an accountant. Many students take intermediate accounting in preparation for becoming a user of financial statements. Credit analysts in large banks are required to have a strong working knowledge of accounting to be able to evaluate the financial statements of firms seeking loans. Investment bankers and brokerage firms employ staffs of analysts to evaluate potential clients and to provide financial statement analysis services to customers. Consulting firms advise clients on how to improve operations. These days, most accounting-related consulting jobs require strong skills in information technology.

### The Importance of Personal Ethics

Personal ethics is not a topic one typically expects to study in an intermediate financial accounting course. However, accounting-related scandals such as the one involving Enron have demonstrated that personal ethics and financial reporting are inextricably connected. The flexibility inherent in the assumptions underlying the preparation of financial statements means that an accountant can intentionally deceive financial statement users and yet still technically be in compliance with GAAP. Thus, our financial reporting system is of limited value if the accountants who operate the system do not have strong personal ethics.

Most of us believe that intentionally trying to deceive others is wrong. You will be reminded throughout this text that accounting choices often impact real economic decisions such as whether to grant a loan, make an investment, or fire an employee. Real economic decisions impact peoples' lives, and it is sobering to think that accountants have this power in their hands. Your personal ethical standards are of paramount importance.

## Overview of Intermediate Accounting

This chapter has briefly described financial reporting and the accounting standard-setting process, introduced the organizations (and their acronyms) that all accountants should know, outlined the FASB conceptual framework (the “constitution” of accounting), discussed the major accounting-related careers, and reminded you of the importance of personal ethics. In the next four chapters, we will review everything you learned in introductory financial accounting, starting with the accountant's basic tools of analysis, the journal entry and the T-account. The text then covers the accounting standards for the different aspects of a business: operating, investing, and financing. The text concludes with individual chapters on a number of important topics such as deferred taxes, derivative financial instruments, and earnings per share.

As mentioned at the start of this chapter, now is an exciting time to be studying accounting because things are changing so fast. For example, one of the topics most discussed currently is the accounting for financial instruments. Thirty years ago when we took intermediate financial accounting, the accounting for financial instruments was a minor topic. The important point is that we really can't know what the important accounting issues will be thirty years from now. The best preparation for this unknown future is to learn the existing accounting rules, to understand how these rules arose, and to recognize the underlying concepts. That is the aim of this textbook.

## SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. During the late 1970s and 1980s, price regulations related to the production, transportation, and sale of natural gas were gradually phased out. This deregulation increased price uncertainty for all participants in the natural gas distribution chain. With its position in the middle of this distribution chain, Enron understood the risks facing participants on both ends of the chain and was able to structure price guarantee contracts to help companies manage those risks.
2. The \$1 billion charge stemmed from related-party transactions with certain special partnerships established by Enron's chief financial officer (CFO). The reporters' suspicions were aroused because such a huge loss was associated with private side deals orchestrated by Enron's CFO.
3. A simple numerical example illustrates the benefit of off-balance-sheet financing. Suppose that a company currently has total assets of \$100 and total liabilities of \$40. The company's debt ratio (total liabilities divided by total assets) is 40% ( $\$40/\$100$ ). Now assume that the company wants to borrow \$50 to purchase additional assets. With a standard financing arrangement, both assets and liabilities will increase by \$50, leading to a new debt ratio of 60% ( $\$90/\$150$ ). However, if the borrowing can be structured as an off-balance-sheet financing arrangement, neither the asset of \$50 nor the liability of \$50 will appear on the company's balance sheet and the reported debt ratio will stay at 40%. Obviously, a company looks better on paper if it has a reported debt ratio of 40% rather than 60%.

## SOLUTIONS TO STOP &amp; THINK

1. (Page 11) The correct answer is E. Detailed operating budgets are an example of managerial accounting information. This budget information would typically not be revealed to external users.
2. (Page 21) The correct answer is a matter of personal opinion. As the business world becomes more global, the need for accounting rules that apply across borders increases. In ten years, it is most likely that an international standard-setting body will be issuing accounting rules that apply to the global economy.

## REVIEW OF LEARNING OBJECTIVES

### 1 Describe the purpose of financial reporting and identify the primary financial statements.

The purpose of financial reporting is to aid interested parties in evaluating the company's past performance and in forecasting its future performance. The information about past events is intended to improve future operations and forecasts of future cash flows.

Internal users have the ability to receive custom-designed accounting reports. External users must rely on the general-purpose financial statements. The five major components of the financial statements follow:

- Balance sheet
- Income statement
- Statement of cash flows
- Explanatory notes
- Auditor's opinion

### 2 Explain the function of accounting standards and describe the role of the FASB in setting those standards in the United States.

Accounting standards help accountants meet the information demands of users by providing guidelines and limits for financial reporting.

Accounting standards also improve the comparability of financial reports among different companies. There are many different ways to account for the same underlying economic events, and users are never satisfied with the amount of financial information they receive—they always want to know more. By defining which methods to use and how much information to disclose, accounting standards save time and money for accountants. Users also benefit because they can learn one set of accounting rules to apply to all companies.

The Financial Accounting Standards Board (FASB) sets accounting standards in the United States. The FASB is a private-sector body and has no legal authority. Accordingly, the FASB must carefully balance theory and practice in order to maintain credibility in the business community. The issuance of a new accounting standard is preceded by a lengthy public discussion. The Emerging Issues Task Force (EITF) works under the direction of the FASB. The EITF formulates a timely expert consensus on how to handle new issues not yet covered in FASB pronouncements.

### 3 Recognize the importance of the SEC, AICPA, AAA, and IRS to financial reporting.

- *Securities and Exchange Commission (SEC)*. The SEC has legal authority to establish U.S. accounting rules but generally allows the FASB to set the standards. To speed the improvement of disclosure, the SEC sometimes implements broad disclosure requirements in areas still being deliberated by the FASB.
- *American Institute of Certified Public Accountants (AICPA)*. The AICPA is a key professional organization of practicing accountants. The AICPA administers the CPA exam, polices the practices of its members, and sets some accounting standards, particularly those related to specific industries.
- *American Accounting Association (AAA)*. The AAA is the professional organization of accounting professors. The AAA helps disseminate research results and facilitates improvements in accounting education.
- *Internal Revenue Service (IRS)*. Financial accounting is not the same as tax accounting. However, many specifics learned in intermediate accounting are similar to the corresponding tax rules.

### 4 Realize the growing importance and relevance of international accounting issues to the practice of accounting in the United States and understand the role of the IASB in international accounting standard setting.

Because business is increasingly conducted across national borders, companies must be able to use their financial statements to communicate with external users all over the world. As a result, divergent national accounting practices are converging to an overall global standard.

The International Accounting Standards Board (IASB) is an international body whose goal is to prepare a comprehensive set of financial accounting standards that can be used anywhere in the world. IASB standards have gained almost universal acceptance worldwide.

### 5 Understand the significance of the FASB's conceptual framework in outlining the qualities of good accounting information, defining terms such as *asset* and *revenue*, and providing guidance about appropriate recognition, measurement, and reporting.

The conceptual framework allows for the systematic adaptation of accounting standards to a changing business environment. The FASB uses the conceptual framework to aid in an organized and consistent development of new accounting standards. In addition, learning the FASB's conceptual framework allows one to understand and, perhaps, anticipate future standards.

The conceptual framework outlines the objectives of financial reporting and the qualities of good accounting information, precisely defines commonly used terms such as *asset* and *revenue*, and provides guidance about appropriate recognition, measurement, and reporting.

The key financial reporting objectives are as follows:

- Usefulness
- Understandability
- Target audience of investors and creditors
- Assessment of future cash flows and existing economic resources
- Primary focus on earnings

Qualities of useful accounting information are the following:

- Benefits greater than cost
- Relevance—feedback value, predictive value, and timeliness
- Reliability—verifiability, representational faithfulness, and neutrality
- Comparability
- Materiality

Recording an item in the accounting records through a journal entry is called *recognition*. To be recognized, an item must meet the definition of an element and be measurable, relevant, and reliable.

The following are the five measurement attributes used in practice:

- Historical cost
- Current replacement cost
- Fair value

- Net realizable value
- Present (or discounted) value

A full set of financial statements includes a balance sheet, income statement, statement of cash flows, statement of changes in owners' equity, and statement of comprehensive income.

**6 Identify career opportunities related to accounting and financial reporting and understand the importance of personal ethics in the practice of accounting.**

Public accountants are freelance accountants who provide auditing, tax, and a variety of other customer services. In addition, since all companies have some financial reporting responsibilities, there are many financial accounting career opportunities in industry. Because accounting is the language of business, any business career requires a familiarity with financial accounting. Finally, our financial reporting system is of limited value if the accountants who operate the system do not have strong personal ethics.

## IASB SUMMARY

Topic	U.S. GAAP	IASB Standard
Accounting standard setter	Financial Accounting Standards Board (FASB)	International Accounting Standards Board (IASB)
Financial accounting standards	<ul style="list-style-type: none"> <li>• FASB Statements of Financial Accounting Standards (SFAS)</li> <li>• APB Opinions</li> <li>• Accounting Research Bulletins (ARB)</li> </ul>	<ul style="list-style-type: none"> <li>• International Financial Reporting Standards (IFRS)</li> <li>• International Accounting Standards (IAS)</li> </ul>
Group to address issues of interpretation or for which no formal standard currently exists	Emerging Issues Task Force (EITF)	<ul style="list-style-type: none"> <li>• International Financial Reporting Interpretations Committee (IFRIC)</li> <li>• Standing Interpretations Committee (SIC) before 2002</li> </ul>

## KEY TERMS

Accounting 8	American Institute of Certified Public Accountants (AICPA) 17	Comparability 26	Current replacement cost 28
Accounting periods 31	Arm's-length transactions 31	Comprehensive income 30	Disclosure 28
Accounting Principles Board (APB) 12	Certified public accountants (CPAs) 17	Conceptual framework 22	Economic entity 31
American Accounting Association (AAA) 17		Conservatism 26	Emerging Issues Task Force (EITF) 15
		Consistency 26	Exposure Draft 14
		Creditors 10	

Fair value 28	Going concern 31	Neutrality 26	Staff Accounting Bulletins (SABs) 16
Feedback value 25	Governmental Accounting Standards Board (GASB) 13	Predictive value 25	Stakeholders 8
Financial accounting 9	Historical cost 28	Present (or discounted) value 29	Statement of changes in owners' equity 29

## QUESTIONS

1. *Accounting* has been defined as a service activity. Who is served by accounting and how do they benefit?
2. How does the fact that there are limited resources in the world relate to accounting information?
3. Accounting is sometimes characterized as dealing only with the past. Give examples of how accounting information can be of value in dealing with the future.
4. Distinguish between management accounting and financial accounting.
5. What five items make up the general-purpose financial statements?
6. Contrast the roles of an accountant and an auditor.
7. Why are independent audits necessary?
8. What conditions led to the establishment of accounting standard-setting bodies in the United States?
9. Describe the structure of the FASB. Where does the FASB get its operating funds?
10. What are the differences in purpose and scope of the FASB's Statements of Financial Accounting Standards and Statements of Financial Accounting Concepts?
11. What characteristics of the standard-setting process are designed to increase the acceptability of standards established by the FASB?
12. (a) What role does the EITF play in establishing accounting standards? (b) Why can it meet this role more efficiently than the FASB?
13. How does the SEC influence the setting of accounting standards?
14. What is the AICPA? The AAA?
15. Explain the relationship between financial accounting rules and tax accounting rules.
16. Why is standard setting such a difficult and complex task?
17. According to the FASB's GAAP hierarchy, which set of accounting standards has the highest priority?
18. Why are differing national accounting standards converging to a common global standard?
19. What is the IASB? What is the SEC position regarding IASB standards?
20. List and explain the main reasons that a conceptual framework of accounting is important.
21. Identify the major objectives of financial reporting as specified by the FASB.
22. One objective of financial reporting is understandability. Understandable to whom?
23. Why is it so difficult to measure the cost effectiveness of accounting information?
24. Distinguish between the qualities of relevance and reliability.
25. Does reliability imply absolute accuracy? Explain.
26. Define *comparability*.
27. Of what value is consistency in financial reporting?
28. What is the current numerical materiality standard in accounting?
29. What is conservatism in accounting? What is an example of conservatism in accounting practice?
30. Identify the criteria that an item must meet to qualify for recognition.
31. Identify and describe five different measurement attributes.
32. Briefly describe the five traditional assumptions that influence the conceptual framework.
33. What is the most common career path for a college graduate who starts out in public accounting?
34. What user careers require a knowledge of intermediate accounting issues?

## EXERCISES

## Exercise I-1

**Aspects of the FASB's Conceptual Framework**

Determine whether the following statements are true or false. If a statement is false, explain why.

## LO5

1. Comprehensive income includes changes in equity resulting from distributions to owners.
2. Timeliness and predictive value are both characteristics of relevant information.
3. The tendency to recognize favorable events early is an example of conservatism.
4. The conceptual framework focuses primarily on the needs of internal users of financial information.
5. The seven Statements of Financial Accounting Concepts are considered part of generally accepted accounting principles.
6. The overriding objective of financial reporting is to provide information for making economic decisions.
7. The term *recognition* is synonymous with the term *disclosure*.
8. Once an accounting method is adopted, it should never be changed.

## Exercise I-2

**Conceptual Framework Terminology**

Match the numbered statements below with the lettered terms. An answer (letter) may be used more than once, and some terms require more than one answer (letter).

## LO5

1. Key ingredients in quality of relevance.
2. Traditional assumptions that influence the FASB's conceptual framework.
3. The idea that information should represent what it purports to represent.
4. An important constraint relating to costs and benefits.
5. An example of conservatism.
6. The availability of information when it is needed.
7. Recording an item in the accounting records.
8. Determines the threshold for recognition.
9. Implies consensus.
10. Transactions between independent parties.
 

(a) Cost effectiveness	(h) Timeliness
(b) Representational faithfulness	(i) Materiality
(c) Recognition	(j) Predictive value
(d) Verifiability	(k) Economic entity
(e) Time periods	(l) Lower-of-cost-or-market rule
(f) Unrealized	(m) Phrenology
(g) Completeness	(n) Arm's-length transactions

## Exercise I-3

**Objectives of Financial Reporting**

For each of the following independent situations, identify the relevant objective(s) of financial reporting that the company could be overlooking. Discuss each of these objectives.

## LO5

1. The president of Daughters, Inc., believes that the financial statements should be prepared for use by management only, because they are the primary decision makers.
2. Sparkling Tile Co. believes that financial statements should reflect only the present financial standing and cash position of the firm and should not provide any future-oriented data.
3. The vice president of Greed Enterprises, Inc., believes that the financial statements are to present only current-year revenues and expenses, not to disclose assets, liabilities, and owners' equity.
4. Lohan Co. has a policy of providing disclosures of only its assets, liabilities, and owners' equity.

- Bob Building, Inc., always discloses the assets, liabilities, and owners' equity of the firm along with the revenues and expenses. Bob's management believes that these items provide all of the information relevant to investing decisions.

**Exercise 1-4****Applications of Accounting Characteristics and Concepts****LO5**

For each situation listed, indicate by letter the appropriate qualitative characteristic(s) or accounting concept(s) applied. A letter may be used more than once, and more than one characteristic or concept may apply to a particular situation.

- Goodwill is recorded in the accounts only when it arises from the purchase of another entity at a price higher than the fair value of the purchased entity's identifiable assets.
- Land is valued at cost.
- All payments out of petty cash are debited to Miscellaneous Expense.
- Plant assets are classified separately as land or buildings, with an accumulated depreciation account for buildings.
- Periodic payments of \$2,300 per month for services of R. Robertson, who is the sole proprietor of the company, are reported as withdrawals.
- Small tools used by a large manufacturing firm are recorded as expenses when purchased.
- Investments in equity securities are initially recorded at cost.
- A retail store estimates inventory rather than taking a complete physical count for purposes of preparing monthly financial statements.
- A note describing the company's possible liability in a lawsuit is included with the financial statements even though no formal liability exists at the balance sheet date.
- Depreciation on plant assets is consistently computed each year by the straight-line method.
 

(a) Understandability	(g) Going concern
(b) Verifiability	(h) Economic entity
(c) Timeliness	(i) Historical cost
(d) Representational faithfulness	(j) Measurability
(e) Neutrality	(k) Materiality
(f) Relevance	(l) Comparability

**Exercise 1-5****Trade-Off Between Qualitative Characteristics****LO5**

In each of the following independent situations, an example is given requiring a trade-off between the qualitative characteristics discussed in the text. For each situation, identify the relevant characteristics and briefly discuss how satisfying one characteristic may involve not satisfying another.

- The book value of an office building is approaching its originally estimated salvage value of \$100,000. However, its fair value has been estimated at \$10 million. The company's management would like to disclose to financial statement users the current value of the building on the balance sheet.
- JCB Industries has used the FIFO inventory method for the past 20 years. However, all other major competitors use the LIFO method of accounting for inventories. JCB is contemplating a switch from FIFO to LIFO.
- Hobson Inc. is negotiating with a major bank for a significant loan. The bank has asked that a set of financial statements be provided as quickly after the year-end as possible. Because invoices from many of the company's suppliers are mailed several weeks after inventory is received, Hobson Inc. is considering estimating the amounts associated with those liabilities to be able to prepare its financial statements more quickly.

- Starship Inc. produces and sells satellites to government and private industries. The company provides a warranty guaranteeing the performance of the satellites. A recent space launch placed one of its satellites in orbit, and several malfunctions have occurred. At year-end, Starship Inc.'s auditors would like the company to disclose the potential liability in the notes to the financial statements. Officers of Starship Inc. believe that the satellite can be repaired in orbit and that disclosure of a contingency such as this would unnecessarily bias the financial statements.

**Exercise I-6****Elements of Financial Reporting****LO5**

For each of the following items, identify the financial statement element being discussed.

- Changes in equity during a period except those resulting from investments by owners and distributions to owners.
- The net assets of an entity.
- The result of a transaction requiring the future transfer of assets to other entities.
- An increase in assets from the delivery of goods that constitutes the entity's ongoing central operations.
- An increase in an entity's net assets from incidental transactions.
- An increase in net assets through the issuance of stock.
- Decreases in net assets from peripheral transactions of an enterprise.
- The payment of a dividend.
- Outflows of assets from the delivery of goods or services.
- Items offering future value to an entity.

**Exercise I-7****Assumptions of Financial Reporting****LO5**

In each of the following independent situations, an example is given involving one of the five traditional assumptions of the accounting model. For each situation, identify the assumption involved (briefly explain your answer).

- A subsidiary of Parent Inc. was exhibiting poor earnings performance for the year. In an effort to increase the subsidiary's reported earnings, Parent Inc. purchased products from the subsidiary at twice the normal markup.
- When preparing the financial statements for MacNeil & Sons, the accountant included certain personal assets of MacNeil and his sons.
- The operations of Uintah Savings & Loan are being evaluated by the federal government. During their investigations, government officials have determined that numerous loans made by top management were unwise and have seriously endangered the future existence of the savings and loan.
- Pine Valley Ski Resort has experienced a drastic reduction in revenues because of light snowfall for the year. Rather than produce financial statements at the end of the fiscal year, as is traditionally done, management has elected to wait until next year and present results for a two-year period.
- Colobri Inc. has equipment that was purchased in 1996 at a cost of \$150,000. Because of inflation, that same equipment, if purchased today, would cost \$225,000. Management would like to report the asset on the balance sheet at its current value.

**Exercise I-8****Measurement Attributes and Going Concern Problems****LO5**

One of the underlying assumptions of the accounting model is the going concern assumption. When this assumption is questionable, valuation methods used for assets and liabilities may differ from those used when the assumption is viable. For each of the following situations, identify the measurement attribute that would most likely be used if the company is not likely to remain a going concern.

1. Plant and equipment are carried at an amortized cost on a straight-line basis of \$2,100,000.
2. Bonds with a maturity price of \$1,500,000 and interest in arrears of \$400,000 are reported as a noncurrent liability.
3. Accounts receivable are carried at \$600,000, the gross amount charged for sales. No allowance for doubtful accounts is reported.
4. The reported LIFO cost of inventory is \$250,000.
5. Investments in a subsidiary company are recorded at initial cost plus undistributed profits.

**Exercise 1-9****LO5****Sample CPA Exam Questions**

1. One of the elements on a financial statement is comprehensive income. Comprehensive income excludes changes in equity resulting from which of the following?
  - (a) Loss from discontinued operations
  - (b) Unrealized loss from foreign currency translation
  - (c) Dividends paid to stockholders
  - (d) Unrealized loss on investments in noncurrent marketable equity securities
2. According to the FASB conceptual framework, the objectives of financial reporting for business enterprises are based on
  - (a) generally accepted accounting principles.
  - (b) reporting on management's stewardship.
  - (c) the need for conservatism.
  - (d) the needs of users of the information.
3. Statements of Financial Accounting Concepts are intended to establish
  - (a) generally accepted accounting principles in financial reporting by business enterprises.
  - (b) the meaning of "Present fairly in accordance with generally accepted accounting principles."
  - (c) the objectives and concepts for use in developing standards of financial accounting and reporting.
  - (d) the hierarchy of sources of generally accepted accounting principles.
4. According to Statements of Financial Accounting Concepts, neutrality is an ingredient of reliability? Of relevance?
 

(a) Yes	Yes
(b) Yes	No
(c) No	Yes
(d) No	No
5. According to the FASB conceptual framework, which of the following statements conforms to the realization concept?
  - (a) Equipment depreciation was assigned to a production department and then to product unit costs.
  - (b) Depreciated equipment was sold in exchange for a note receivable.
  - (c) Cash was collected on accounts receivable.
  - (d) Product unit costs were assigned to cost of goods sold when the units were sold.

**CASES****Discussion  
Case 1-10****How Should I Invest?**

Assume that you just inherited \$1 million. You are aware that numerous studies have shown that investments in equity securities (stocks) give the highest rate of return over the long run. However, you are not sure in which companies you should invest. You send for and receive the annual reports of several companies in three growth industries.

In making your investment decision, what useful information would you expect to find in the following?

1. The balance sheet
2. The income statement
3. The statement of cash flows

**Discussion  
Case I-11**

**The Advantage of Internal Users**

Emilio Valdez worked for several years as a loan analyst for a large bank. He recently left the bank and took a management position with Positron, a high-tech manufacturing firm. Emilio prepared for his first management meeting by extensively analyzing Positron's external financial statements. However, in the meeting, the other managers referred to lots of information that Emilio hadn't found in the financial statements. In addition to using the financial statements, the other managers were using computer printouts and reports unlike anything Emilio had seen in his years at the bank. After the meeting, Monique Vo, one of Emilio's associates, offered the following advice: "Emilio, you have to remember that you are an internal user now, not an external user." What does Monique mean?

**Discussion  
Case I-12**

**We Aren't Getting What We Expect**

Quality Enterprises Inc. issued its 2010 financial statements on February 22, 2011. The auditors expressed a "clean" opinion in the audit report. On July 14, 2011, the company filed for bankruptcy as a result of the inability to meet currently maturing long-term debt obligations. Reasons cited for the action include (1) large losses on inventory due to overproduction of product lines that did not sell, (2) failure to collect on a large account receivable due to the customer's bankruptcy, and (3) a deteriorating economic environment caused by a severe recession in the spring of 2011. Joan Stevens, a large stockholder with a large number of Quality shares, is concerned about the fact that a company with a clean audit opinion could have financial difficulty leading to bankruptcy just four months after the audit report was issued. "Where were the auditors?" she inquired. In reply, the auditors contend that on December 31, 2010, the date of the financial statements, the statements were presented in accordance with GAAP. What is an auditor's responsibility for protecting users from losses? Are auditors and investors in agreement on what an audit should provide?

**Discussion  
Case I-13**

**Does Lobbying Improve the Quality of Accounting Standards?**

The "due process" system of the FASB encourages public input into the standard-setting process. It invites written comments, holds public hearings, and often changes proposed standards in response to this input. However, some observers have suggested that this process makes the setting of accounting standards less a technical exercise and more a political one. Parties are known to lobby for or against proposed standards according to their economic interests.

1. How would accounting standard setting be improved by eliminating lobbying?
2. How would accounting standard setting be harmed by eliminating lobbying?

**Discussion  
Case I-14**

**How Important Are Economic Consequences?**

FASB *Statement No. 106* requires companies to recognize a liability for their obligation to pay for retirees' health care. Prior to this rule, most companies recognized no liability for their health care promises to employees, although an economic liability certainly existed. Many companies used the adoption of the FASB rule as an excuse to cut retiree health benefits, claiming that the FASB had suddenly created this liability. Thus, it seems that FASB *Statement No. 106* had an economic impact on retirees. Recognizing that accounting rules can have economic consequences, sometimes unintended and undesirable, should the impact on society be an important consideration for the FASB in setting accounting standards?

**Discussion  
Case I-15**

**Who Needs International Accounting?**

Tom Obstinate is disgusted by all of the emphasis being put on international accounting issues. Tom plans to practice accounting in the United States, with U.S. companies, using U.S. GAAP. Accordingly, Tom sees no reason to know anything about the International Accounting Standards Board or cross-national differences in accounting practices. Is there any merit in Tom's view? What might you say to Tom to get him to reconsider his position?

**Discussion  
Case I-16**

**You Need More Education!**

For more than three decades, accounting professionals, accounting educators, and accounting bodies have debated requiring more education for those entering the public accounting profession. In 1988, the AICPA passed a resolution mandating 150 college credit hours as a minimum educational requirement for all new members of its organization after 1999. This requirement placed added pressure on state legislators to pass new accounting legislation, and during the 1990s, an increasing number of states passed the "150-hour rule." Some groups, however, oppose this move and argue that it is restrictive to entry of minority groups and that it will unnecessarily reduce the number of accounting graduates and put accounting educators "out of work" as students opt for less expensive educational alternatives.

Why does the accounting profession recommend more education for new accounting professionals? Why would some groups resist this move? As an accounting student, were you deterred in your decision to major in accounting because of the "150-hour rule"? Why or why not?

**Discussion  
Case I-17**

**Let's Play by the IRS Rules**

Little attempt is made to reconcile the accounting standard differences between the IRS and the FASB. These differences are recognized as arising from differences in the objectives of the two bodies. However, the existence of differences requires companies to keep two different sets of records in some areas: records that follow the FASB pronouncements and those that follow the IRS rules and regulations.

Historically, the financial accounting standards in some countries have closely followed the tax rules established by the respective government. What applies for taxes often applies for the balance sheet and the income statement as well.

What are the advantages of merging accounting standards for taxes and financial reporting? What are the disadvantages? What would it take to change a system so deeply ingrained in the business fabric of either the United States or other countries?

**Discussion  
Case I-18**

**Cash Flow vs. Earnings**

The FASB concluded in *Concepts Statement No. 1* that investors and creditors are interested in an enterprise's future cash flows. However, the Board further stated that the primary focus of financial reporting is information about earnings. If an investor or creditor is interested in future cash flows, why isn't the focus on an examination of a firm's past cash flows? What are the limitations associated with using cash flows to measure the performance of an enterprise? Conversely, what are the risks to an investor or creditor of focusing solely on accrual-based earnings figures?

**Discussion  
Case I-19**

**The Trade-Off Between Relevance and Reliability**

The cable television industry is facing competition from companies using advanced technologies. The use of satellites allows programs to be beamed at low cost to locations not accessed by cable. This technology could eliminate the need for the current high-fixed-cost, physically intrusive cable systems. What information do cable companies need to evaluate the potential of satellite TV? What is a limitation associated with estimating demand for satellite TV? Why don't cable companies just wait and see whether satellite TV is a success?

**Discussion  
Case I-20****What Is an Asset?**

Conserv Corporation, a computer software company, is trying to determine the appropriate accounting procedure to apply to its software development costs. Management is considering capitalizing the development costs and amortizing them over several years. Alternatively, they are considering charging the costs to expense as soon as they are incurred. You, as an accountant, have been asked to help settle this issue. Which definitions of financial statement elements would apply to these costs? Based on this information, what accounting procedure would you recommend and why?

**Discussion  
Case I-21****Why Don't We Use Fair Values in the United States?**

Financial statements in the United States rely heavily on historical cost information, particularly in the valuation of land, buildings, and equipment. However, International Accounting Standards allow for fixed assets to be reported at their fair values. As an example, **Diageo** (the British consumer products firm owning brand names such as Smirnoff, Johnnie Walker, J&B, Gordon's, and Guinness) provided financial statements using a fair value basis to measure fixed assets. In its 2004 annual report, Diageo reported land and buildings with a fair value of £772 million. The assets' historical cost was £659 million. Why do accountants in the United States focus primarily on historical cost figures? If the £772 million figure is more relevant for investors and creditors, why don't traditional financial statements reflect fair values? What are the risks of presenting fair value information in the body of financial statements to investors, creditors, and auditors?

**Discussion  
Case I-22****Which Measurement Attribute Is Right for Bonds Payable**

Companies regularly obtain money through the issuance of bonds. The market value of bonds changes daily and on any given day is a function of many factors including economic variables, interest rates, industry developments, and firm specific information. Should bonds be reported on the books of the issuer at their market value on the balance sheet date? at their historical selling price? at their discounted present value? or at their eventual maturity value? For each of these measurement attributes, identify and discuss the issues associated with each attribute.

**Discussion  
Case I-23****But We Need Only One Accounting Standard—Fairness**

In the 1970s, a leader in the accounting profession proposed that there really needed to be only one underlying standard to govern the establishment of generally accepted accounting principles. That standard was identified as *fairness*. Financial statements should be prepared so that they are fair to all users: management, labor, investors, creditors. As changes occur in society, financial reporting should change to fairly reflect each user's needs. Because the financial statements are the responsibility of management, such a standard would require management to determine what reporting methods would be fair. What advantages do you see to this proposal? What would be management's most serious problem in applying a fairness standard?

**Discussion  
Case I-24****And Then There Were Four**

The existence of just four large CPA firms that service virtually all of the major industrial and financial companies and thus dominate the accounting profession has led to criticism through the years.

1. What dangers do you see from the dominance of a few large CPA firms? What advantages?
2. During the 1980s and 1990s, mergers among the large public accounting firms reduced the Big 8 to the Big 5. The death of **Arthur Andersen** (because of the **Enron** scandal) reduced the number to four. One reason offered for the mergers was that they improved the ability of the merging firms to provide the broad array of consulting services that provided an increasing share of the revenues of the large accounting firms. What problems do you think intensified as public accounting firms earned an ever-larger share of their income from consulting?

## Case I-25

**Deciphering Financial Statements (The Walt Disney Company)**

Locate the 2007 financial statements for **The Walt Disney Company** on the Internet and consider the following questions:

1. How well did Disney do financially during the year ended September 29, 2007? (*Hint:* Look at the income statement.)
2. Comment on the level of detail in Disney's balance sheet. Should there be more balance sheet categories or fewer?
3. In 2007, was Disney's net cash from operations sufficient to pay for its investments in parks, resorts, and other property and in the acquisition of other businesses?
4. Look at the notes to the financial statements. You will find 14 of them. Which ones seem to give you the most new information?
5. Find the auditor's opinion. Who is Disney's auditor? Was the 2007 audit opinion unqualified?

## Case I-26

**Deciphering Financial Statements (McDonald's Corporation)**

The following information comes from the 2006 financial statements of **McDonald's Corporation**.

Individual franchise arrangements generally include a lease and a license and provide for payment of initial fees, as well as continuing rent and service fees to the Company based upon a percent of sales with minimum rent payments that parallel the Company's underlying leases and escalations (on properties that are leased). McDonald's franchisees are granted the right to operate a restaurant using the McDonald's System and, in most cases, the use of a restaurant facility, generally for a period of 20 years. Franchisees pay related occupancy costs including property taxes, insurance, and maintenance. In addition, in certain markets outside the United States, franchisees pay a refundable, noninterest-bearing security deposit. Foreign affiliates and developmental licensees pay a royalty to the Company based upon a percent of sales. The results of operations of restaurant businesses purchased and sold in transactions with franchisees, affiliates, and others were not material to the consolidated financial statements for periods prior to purchase and sale. Revenues from franchised and affiliated restaurants consisted of:

(In millions)	2006	2005	2004
Rents and service fees .....	\$5,452.2	\$5,067.9	\$4,802.7
Initial fees .....	51.5	38.0	36.1
Revenues from franchised and affiliated restaurants .....	<u>\$5,503.7</u>	<u>\$5,105.9</u>	<u>\$4,838.8</u>

Future minimum rent payments due to the Company under existing franchise arrangements are:

(In millions)	Owned Sites	Leased Sites	Total
2007 .....	\$ 1,076.8	\$ 855.7	\$ 1,932.5
2008 .....	1,046.8	836.3	1,883.1
2009 .....	1,009.4	814.1	1,823.5
2010 .....	967.3	782.1	1,749.4
2011 .....	917.9	746.9	1,664.8
Thereafter .....	6,991.6	5,394.6	12,386.2
Total minimum payments .....	<u>\$12,009.8</u>	<u>\$9,429.7</u>	<u>\$21,439.5</u>

This \$21.4 billion amount represents the future minimum payments that McDonald's expected to receive from its franchisees as of December 31, 2006.

1. Using the element definition from the conceptual framework, should this \$21.4 billion be recorded as an asset in McDonald's 2006 balance sheet? Why or why not?
2. If your answer in part (1) is yes, what measurement attribute should be used in reporting the asset?

**Case I-27****Writing Assignment (Should the SEC replace the FASB?)**

Imagine that you have been selected to compete with students from other universities in presenting a case considering whether the FASB should be abolished and its standard-setting role taken over by the SEC.

Prepare a 1-page summary outlining the major arguments for and against the SEC replacing the FASB.

**Case I-28****Researching Accounting Standards**

To help you become familiar with the accounting standards, this case is designed to take you to the FASB's Web site and have you access various publications. Access the FASB's Web site at <http://www.fasb.org>. Click on "Pronouncements & EITF Abstracts."

For this case, we will use *Statement of Financial Accounting Concepts No. 1*. Open *Concepts Statement No. 1*.

1. Read paragraph 28. Based on information in this paragraph, what group of users benefits most from financial information and why?
2. Read paragraph 34. Based on information in this paragraph, what is assumed about the background and/or education of those who are using financial accounting information?
3. Read paragraph 43. Based on information in this paragraph, those interested in an enterprise's future cash flows should pay particular attention to information contained in which primary financial statement?

**Case I-29****Ethical Dilemma (Should you manipulate your reported income?)**

Accounting standards place limits on the set of allowable alternative accounting treatments, but the accountant must still exercise judgment to choose among the remaining alternatives. In making those choices, which of the following should the accountant seek to do?

1. Maximize reported income.
2. Minimize reported income.
3. Ignore the impact of the accounting choice on income and just focus on the most conceptually correct option.

Would your answer change if this were a tax accounting class? Why or why not?

CHAPTER

2

A REVIEW OF THE  
ACCOUNTING CYCLE

**T**om Clancy typed the first draft of his first novel, *The Hunt for Red October*, on an **IBM** Selectric typewriter while still holding down his full-time job as an insurance agent. The book was published in October 1984, and sales took off when it became known that the book was President Ronald Reagan's favorite. To date, Clancy has published a total of nine novels featuring the reluctant hero, Jack Ryan, and one featuring Ryan's son. The stories have been so popular that Clancy has commanded a \$25 million advance per book.

In *The Hunt for Red October*, Jack Ryan, who was trained as a historian, is a part-time analyst for the CIA. By the sixth novel in the series, *Debt of Honor*, a well-earned reputation for being a "good man in a storm" has landed Ryan, against his wishes, in the position of serving as the president's national security advisor. Jack Ryan's abilities are tested as an international crisis is touched off when a group of Japanese businessmen gain control of their government and determine that the only way to save the Japanese economy is through neutralization of U.S. power in the Pacific.

The first act of war against the United States is not an attack on a military target but on the bookkeeping system used by U.S. stock exchanges. A computer virus injected into the program used to record trades on all the major U.S. stock exchanges is activated at noon on Friday. The records of all trades made after that time are eliminated so that

No trading house, institution, or private investor could know what it had bought or sold, to or from whom, or for how much, and none could therefore know how much money was available for other trades, or for that matter, to purchase groceries over the weekend. (Tom Clancy, *Debt of Honor*, page 312)

The uncertainty created by the destruction of the stock exchanges' bookkeeping records threatens to throw the U.S. economy into a tailspin and distract U.S. policy makers from other moves being made by Japan in the Pacific. Jack Ryan saves the world as we know it and restores the U.S. economy to sound footing by . . . well, it wouldn't be fair to say—you'll have to read the book. Suffice it to say that a key part of the restoration plan is the repair of the stock exchanges' bookkeeping system.

This fictitious attack was an eerie precursor to the actual attack on the World Trade Center in New York City on September 11, 2001. In addition to the tragic loss of life, this attack also closed the New York Stock Exchange (NYSE) for four business days; it reopened the following Monday. The market fell by 7.1% when trading resumed. The impact on the U.S. economy could have been even greater if Wall Street firms had not had disaster recovery and data backup plans in place. In fact, within two months (November 9, 2001), the Dow Jones Industrial Average had recovered to its pre-attack level.

## LEARNING OBJECTIVES

- 1 Identify and explain the basic steps in the accounting process (accounting cycle).
- 2 Analyze transactions and make and post journal entries.
- 3 Make adjusting entries, produce financial statements, and close nominal accounts.
- 4 Distinguish between accrual and cash-basis accounting.
- 5 Discuss the importance and expanding role of computers to the accounting process.

## QUESTIONS

1. *What would be the consequences to a customer if their bank could not tell them if their paycheck (which is direct deposited) had in fact been deposited? What would be the consequences to the bank?*
2. *Suppose the Internal Revenue Service and employers had no system established to track the amount of income tax withheld from employee salaries. How would taxpayers demonstrate to the U.S. government that they had paid taxes? How would the government verify tax payments?*

Answers to these questions can be found on page 70.

These two examples, one fictitious and one tragically real, make a very good point: The business world in which we live and work would not be able to operate, for even one day, without a reliable method for recording the effects of transactions. A systematic method of recording transactions is necessary if companies such as IBM and **General Electric** (and even local music stores and Internet vendors) are to generate information with which to make sound business decisions.

This information is summarized in a variety of reports prepared from accounting records to assist users in making better economic decisions. Examples include the following:

1. General-purpose financial statements prepared for external user groups, primarily current or potential investors and creditors, who are involved financially with an enterprise but who are not a part of its management team.
2. Reports received by user groups within organizations, especially those in managerial positions, to assist them in planning and controlling the day-to-day operations of their organizations.
3. Tax returns and similar reports prepared to comply with Internal Revenue Service (IRS) requirements.
4. Special reports required by various regulatory agencies such as the Securities and Exchange Commission (SEC).

Each of these reports is based on data that are the result of an accounting system and a set of procedures collectively referred to as the **accounting process** or the **accounting cycle**. While this process follows a fairly standard set of procedures that has existed for centuries, the exact nature of the **accounting system** used to collect and report the data depends on the type of business, its size, the volume of transactions processed, the degree of automation employed, and other related factors. Every accounting system, however, should be designed to provide accurate information on a timely and efficient basis. At the same time, the system must provide controls that are effective in preventing mistakes and guarding against dishonesty.

Historically, accounting systems were maintained by hand and referred to as *manual systems*. Such systems continue to be used effectively in some situations. In today's business environment, however, most companies use computers to collect, process, and analyze financial information. Has the computer changed the accounting process? It allows businesses to collect and analyze much more information and do it quickly, but the computer has not changed the underlying accounting concepts involved—debits still equal credits; assets still equal liabilities plus owners' equity.

The purpose of this chapter is to review the basic steps of the accounting process including a brief review of debits and credits and the mechanics of bookkeeping. Get ready for a discussion of double-entry accounting, a system described by the German poet Goethe as “an absolutely perfect one.”<sup>1</sup>

<sup>1</sup> Johann Wolfgang von Goethe, *Wilhelm Meister's Apprenticeship and Travels*. Translated by Thomas Carlyle. Chapman and Hall, 1824.

# Overview of the Accounting Process

**1** Identify and explain the basic steps in the accounting process (accounting cycle).

**WHY** It is important to understand how accounting information flows through an organization and how that information is captured by the accounting information system.

**HOW** The accounting process, often referred to as the accounting cycle, generally includes the following steps: analyze business documents, journalize transactions, post to ledger accounts, prepare a trial balance, prepare adjusting entries, prepare financial statements, close the nominal accounts, and prepare a post-closing trial balance.

As you will recall from your introductory accounting class, the accounting process (or accounting cycle) consists of two interrelated parts, (1) the recording phase and (2) the reporting phase. The recording phase is concerned with collecting information about economic transactions and events and distilling that information into a form useful to the accounting process. For most businesses, the recording function is based on double-entry accounting procedures. In the reporting phase, the recorded information is organized and summarized using various formats for a variety of decision-making purposes. The two phases overlap because the recording of transactions is an ongoing activity that does not stop at the end of an accounting period but continues uninterrupted while events of the preceding period are being summarized and reported. The recording and reporting phases of the accounting process are reviewed and illustrated in this chapter. The form and content of the basic financial statements are discussed in depth and illustrated in Chapters 3, 4, and 5.

The accounting process, illustrated in Exhibit 2-1, generally includes the following steps in a well-defined sequence:

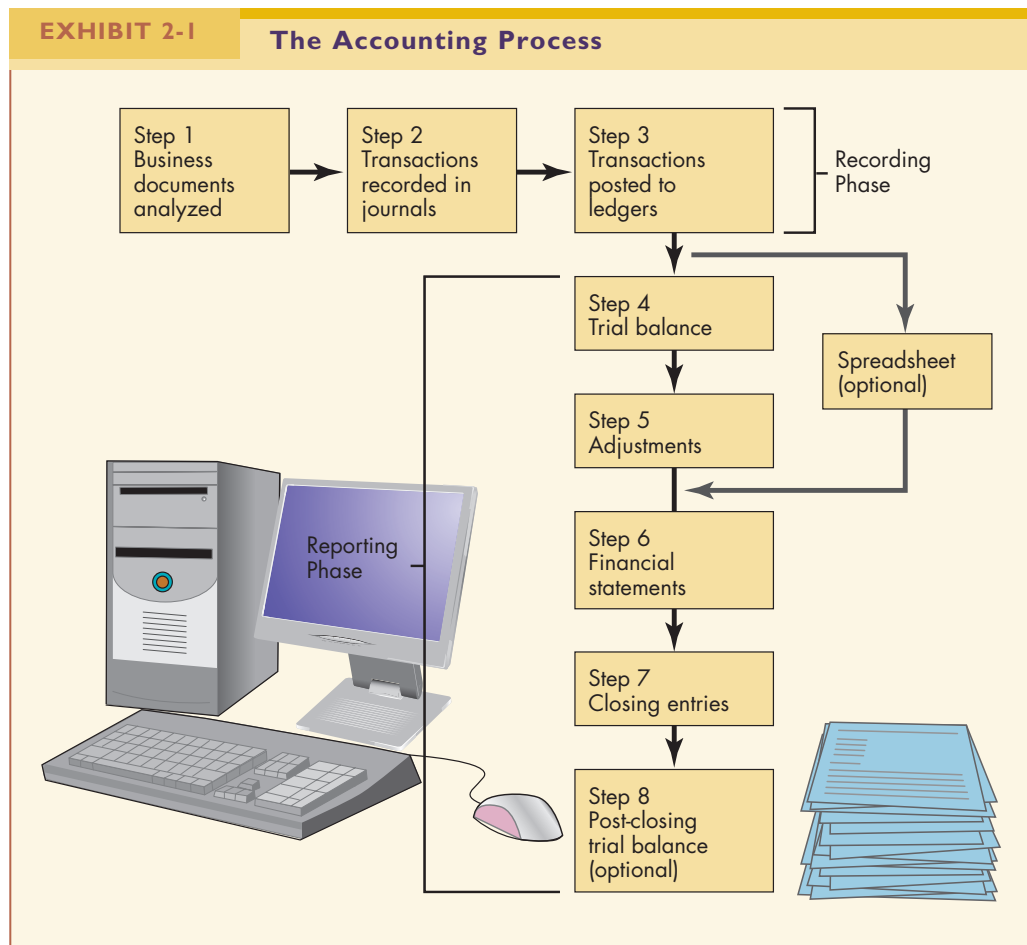

## Recording Phase

1. **Business documents are analyzed.** Analysis of the documentation of business activities provides the basis for making an initial record of each transaction.
2. **Transactions are recorded.** Based on the supporting documents from step 1, transactions are recorded using journal entries.
3. **Transactions are posted.** Transactions, as classified and recorded, are posted to the appropriate accounts.

## Reporting Phase

4. **A trial balance of the accounts in the general ledger is prepared.** The trial balance simply lists every account in the ledger along with its current debit or credit balance. This step in the reporting phase provides a general check on the accuracy of recording and posting.
5. **Adjusting entries are recorded.** Before financial statements can be prepared, all relevant information that has not been recorded must be determined and appropriate adjustments made. Adjusting entries must be recorded and posted so the accounts are current prior to the preparation of financial statements.
6. **Financial statements are prepared.** Statements summarizing operations and showing the financial position and cash flows are prepared from the information obtained from the adjusted accounts.
7. **Nominal accounts are closed.** Balances in the nominal (temporary) accounts are closed into the retained earnings account. This closing process results in beginning each accounting period with zero balances in all nominal accounts.
8. **A post-closing trial balance may be prepared** to determine the equality of the debits and credits after posting the adjusting and closing entries.

## fyi

As noted in Exhibit 2-1, an optional spreadsheet can be used for the reporting process. This spreadsheet has columns for the trial balance, adjustments, an adjusted trial balance, and the financial statements. All accounts with their balances are listed on the spreadsheet in the appropriate columns. Computer spreadsheets are often used to facilitate this process.

## stop &amp; think

Which of the following would **NOT** be the role of a bookkeeper?

- a) Analyzing and recording routine transactions
- b) Posting journal entries
- c) Interpreting accounting results
- d) Preparing a post-closing trial balance

Before we are immersed in the details associated with the accounting process, it is important to remember that functions such as journalizing, posting, and closing are bookkeeping functions. You must be familiar with the mundane details of bookkeeping and know how to analyze transactions in terms of debits and credits, but you should not expect to spend your entire accounting career doing bookkeeping. As an accountant, you will spend a great deal of your time involved in designing information systems, analyzing complex transactions, and interpreting accounting results. A knowledge of the fundamentals of bookkeeping provides a foundation upon which these activities are based. These activities are vital to the management of an organization.

## Recording Phase

**2** Analyze transactions and make and post journal entries.

**WHY** Transactions are events that transfer or exchange goods or services between or among two or more entities. These transactions provide the foundation for information captured by the accounting system.

**HOW** Business documents, such as invoices, provide evidence that transactions have occurred as well as the data required to record the transactions in the accounting records. The data are recorded with journal entries using a system of double-entry accounting. The journal entries are subsequently posted to ledger accounts.

Accurate financial statements can be prepared only if the results of business events and activities have been properly recorded. Certain events, termed **transactions**, involve the transfer or exchange of goods or services between two or more entities. Examples of business transactions include the purchase of merchandise or other assets from suppliers and the sale of goods or services to customers. In addition to transactions, other events and circumstances can affect the assets, liabilities, and owners' equity of the business. Some of those events and circumstances also must be recorded. Examples include the recognition of depreciation on plant assets or a decline in the market value of inventories and investments.

As indicated, the recording phase involves analyzing business documents, journalizing transactions, and posting to the ledger accounts. Before discussing these steps, the system of double-entry accounting will be reviewed because virtually all businesses use this procedure in recording their transactions.

### Double-Entry Accounting

As explained in Chapter 1, financial accounting rests on a foundation of basic assumptions, concepts, and principles that govern the recording, classifying, summarizing, and reporting of accounting data. **Double-entry accounting** is an old and universally accepted system for recording accounting data. With double-entry accounting, each transaction is recorded in a way that maintains the equality of the basic accounting equation:

$$\text{Assets} = \text{Liabilities} + \text{Owners' equity}$$

## caution

Remember that *debit* does not mean good (or bad) and *credit* does not mean bad (or good). *Debit* means left, and *credit* means right.

To review how double-entry accounting works, recall that a **debit** is an entry on the left side of an account and a **credit** is an entry on the right side. The debit/credit relationships of accounts were explained in detail in your introductory accounting course. Exhibit 2-2 summarizes these relationships for a corporation. You will note that assets, expenses, and dividends are

increased by debits and decreased by credits. Liabilities, capital stock, retained earnings, and revenues are increased by credits and decreased by debits. Note that while dividends reduce retained earnings, they are not classified as an expense and are not reported on the income statement.

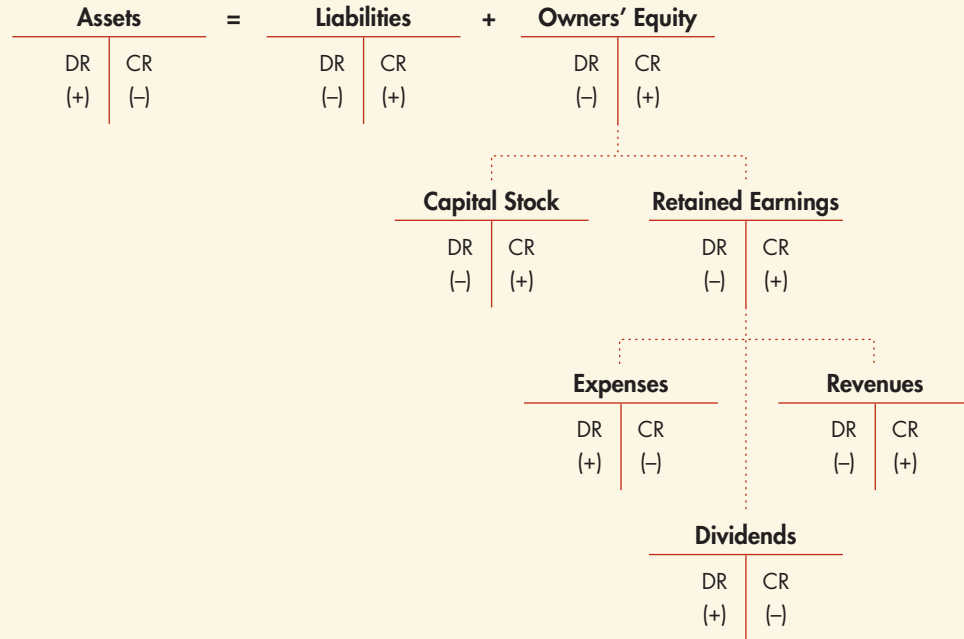

Journal entries provide a systematic method for summarizing a business event's effect on the accounting equation. Every **journal entry** involves a 3-step process:

1. Identify the accounts involved with an event or transaction.
2. Determine whether each account increased or decreased (this information, coupled with the answer to step 1, will tell you if the account was debited or credited).
3. Determine the amount by which each account was affected.

This 3-step process, properly applied, will always result in a correct journal entry. Note that this process is used whether the accounting is being done manually or with a computer.

## EXHIBIT 2-2

## Debit and Credit Relationships of Accounts

Purchasing groceries at your local supermarket is a common example of a business transaction. Can you identify the accounts involved with this transaction?

Photodisc/Getty Images

To illustrate double-entry accounting, consider the transactions and journal entries shown in Exhibit 2-3 and their impact on the accounting equation. In studying this illustration, you should note that for each transaction, total debits equal total credits. Therefore, the equality of the accounting equation is maintained.

To summarize, you should remember the following important features of double-entry accounting:

1. Assets are increased by debits and decreased by credits.
2. Liability and owners' equity accounts are increased by credits and decreased by debits.
3. Owners' equity for a corporation includes capital stock accounts and the retained earnings account.
4. Revenues, expenses, and dividends relate to owners' equity through the retained earnings account.
5. Expenses and dividends are increased by debits and decreased by credits because they reduce owners' equity.
6. Revenues are increased by credits and decreased by debits.
7. The difference between total revenues and total expenses for a period is net income (loss), which increases (decreases) owners' equity through the retained earnings account.

## caution

Note in Exhibit 2-2 that dividends reduce retained earnings, but they are not classified as an expense and are not reported on the income statement.

## EXHIBIT 2-3

## Double-Entry Accounting: Illustrative Transactions and Journal Entries

Three-Step Process					
Transaction	(1) Identify Accounts.	(2) Increase or Decrease?	(1) and (2) together indicate whether an account is debited or credited.	(3) By How Much?	Journal Entry
Investment by shareholder in a corporation, \$10,000	Cash Capital Stock	Increase Increase	Asset ↑ = debit Owners' equity ↑ = credit	\$10,000 \$10,000	Cash                    10,000 Capital Stock                    10,000
Purchase of supplies on account, \$5,000	Supplies Accounts Payable	Increase Increase	Asset ↑ = debit Liability ↑ = credit	\$5,000 \$5,000	Supplies                    5,000 Accounts Payable                    5,000
Payment of wages expense, \$2,500	Cash Wages Expense	Decrease Increase	Asset ↓ = credit Expenses ↑ = debit	\$2,500 \$2,500	Wages Expense                    2,500 Cash                                    2,500
Collection of accounts receivable, \$1,000	Cash Accounts Receivable	Increase Decrease	Asset ↑ = debit Asset ↓ = credit	\$1,000 \$1,000	Cash                            1,000 Accounts Receivable                    1,000
Payment of account payable, \$500	Cash Accounts Payable	Decrease Decrease	Asset ↓ = credit Liability ↓ = debit	\$500 \$500	Accounts Payable                    500 Cash                                    500
Sale of merchandise on account, \$20,000	Accounts Receivable Sales	Increase Increase	Asset ↑ = debit Revenues ↑ = credit	\$20,000 \$20,000	Accounts Receivable                    20,000 Sales                                    20,000
Purchase of equipment: \$15,000 down payment plus \$40,000 long-term note	Cash Equipment Notes Payable	Decrease Increase Increase	Asset ↓ = credit Asset ↑ = debit Liability ↑ = credit	\$15,000 \$55,000 \$40,000	Equipment                    55,000 Cash                                    15,000 Notes Payable                    40,000
Payment of cash dividend, \$4,000	Cash Dividends	Decrease Increase	Asset ↓ = credit Dividends ↑ = debit	\$4,000 \$4,000	Dividends                    4,000 Cash                                    4,000

With this brief overview of the accounting equation and journal entries, we are now ready to proceed through the steps in the accounting process.

## Analyzing Business Documents

The recording phase begins with an analysis of the documentation showing what business activities have occurred. Normally, a **business document**, or **source document**, is the first record of each transaction. Such a document offers detailed information concerning the transaction. The business documents provide support for the data to be recorded in the journals. Copies of sales invoices, for example, are the evidence in support of sales transactions; canceled checks provide data concerning cash disbursements; and the corporation minutes book supports entries authorized by action of the board of directors. Documents underlying each recorded transaction provide a means of verifying the accounting records and thus form a vital part of the information and control systems.

## Journalizing Transactions

Once the information provided on business documents has been analyzed, transactions are recorded in chronological order in the appropriate **journals**. In some small businesses,

all transactions are recorded in a single journal. Most business enterprises, however, maintain various special journals designed to meet their specific needs as well as a general journal. A **special journal** is used to record a particular type of frequently recurring transaction. Special journals are commonly used, for example, to record each of the following types of transactions: sales, purchases, cash disbursements, and cash receipts. A **general journal** is used to record all transactions for which a special journal is not maintained. As illustrated below, a general journal shows the transaction date and the accounts affected and allows for a brief description of each transaction. Special journals are illustrated and explained in the Web Material associated with this chapter (see [www.cengage.com/accounting/stice](http://www.cengage.com/accounting/stice)).

GENERAL JOURNAL					Page 24
Date	Description	Post. Ref.	Debit	Credit	
2011 July 1	Dividends Dividends Payable <i>Declared semiannual cash dividend on common stock.</i>	330 260	25,000	25,000	
10	Equipment Notes Payable <i>Issued note for new equipment.</i>	180 220	7,500	7,500	
31	Payroll Tax Expense Payroll Taxes Payable <i>Recorded payroll taxes for month.</i>	418 240	2,650	2,650	

## Posting to the Ledger Accounts

An **account** is used to summarize the effects of transactions on each element of the expanded accounting equation. For example, the cash account is used to provide detail for all transactions involving the inflow (debit) and outflow (credit) of cash. A **ledger** is a collection of accounts maintained by a business. The specific accounts required by a business unit vary depending on the nature of the business, its properties and activities, the information to be provided on the financial statements, and the controls to be employed in carrying out the accounting functions.

Information recorded in the journals is transferred to appropriate accounts in the ledger. This transfer is referred to as **posting**. Note that posting is a copying process; it involves no new analysis. Ledger accounts for Equipment and Notes Payable are presented by illustrating the posting of the July 10 transaction from the preceding general journal. The posting reference (J24) indicates that the transaction was transferred from page 24 of the general journal. Note that the account numbers for Equipment (180) and Notes Payable (220) are entered in the Posting Reference column of the journal.

GENERAL LEDGER					
Account EQUIPMENT			Account No. 180		
Date	Item	Post. Ref.	Debit	Credit	Balance
2011 July 1	Balance				10,550
10	Purchase Equipment	J24	7,500		18,050

Account NOTES PAYABLE			Account No. 220		
Date	Item	Post. Ref.	Debit	Credit	Balance
2011 July 1	Balance				5,750
10	Purchase Equipment	J24		7,500	13,250

## stop & think

The computer is very valuable in the posting process because it reduces the types of errors that can be made. Which of the following posting errors could a person make that a computer would not?

- a) Posting to the wrong account
- b) Posting the wrong amount
- c) Posting a debit to a specific account instead of a credit
- d) A well functioning computer would not make any of these mistakes

It is often desirable to establish separate ledgers for detailed information in support of balance sheet or income statement items. The **general ledger** includes all accounts appearing on the financial statements, and separate **subsidiary ledgers** afford additional detail in support of certain general ledger accounts. For example, a single accounts receivable account is usually carried in the general ledger, and individual customer accounts are recorded in a subsidiary accounts receivable ledger. The general ledger account that summarizes the detailed information in a subsidiary ledger is known as a control account. Thus, Accounts Receivable is considered a **control account**. Subsidiary ledger accounts are illustrated in the Web Material associated with this chapter (see [www.cengage.com/accounting/stice](http://www.cengage.com/accounting/stice)).

Depending primarily on the number of transactions involved, amounts may be posted to ledger accounts on a daily, weekly, or monthly basis. If a computer system is being used, the posting process may be done automatically as transactions are recorded. At the end of an accounting period, when the posting process has been completed, the balances in the ledger accounts are used for preparing the trial balance.

## Reporting Phase

**3** Make adjusting entries, produce financial statements, and close nominal accounts.

**WHY** Adjusting entries are required at the end of an accounting period to update accounts so that the data are current and accurate. Closing entries are required so that each new accounting period can be accounted for independent of other periods.

**HOW** Adjusting entries are made at the end of an accounting period prior to preparing the financial statements for that period. Generally, the required adjustments are the result of analysis rather than based on new transactions. At the end of each accounting cycle, the nominal or temporary accounts must be transferred through the closing process to real or permanent accounts. The nominal accounts are left with a zero balance and are ready to receive transaction data for the new accounting period. The real accounts remain open and carry their balances forward to the new period.

As noted earlier, the objective of the accounting process is to produce financial statements and other reports that will assist various users in making economic decisions. Once the recording phase is completed, the data must be summarized and organized into a useful format. The remaining steps of the accounting process are designed to accomplish this purpose. These steps will be illustrated using data from Rosi, Inc., a hypothetical merchandising company, for the year ended December 31, 2011.

### Preparing a Trial Balance

After all transactions for the period have been posted to the ledger accounts, the balance for each account is determined. Every account will have either a debit, credit, or zero balance. A **trial balance** is a list of all accounts and their balances. The trial

fyi

A fundamental difference between the trial balance and the financial statements is that no external users ever see the trial balance. Most managers have never seen a trial balance. It serves as the basis for the preparation of the financial statements but is not an information source to either management or external users.

balance, therefore, indicates whether total debits equal total credits and thus provides a general check on the accuracy of recording and posting. When debits equal credits in a trial balance, however, it is no guarantee that the accounts are correct. For example, a journal entry involving a debit to Accounts Receivable could have been incorrectly posted as a debit to the notes receivable account. The trial balance would indeed balance, but the accounts would be in error. Thus, a balanced trial balance provides no guarantee of accuracy. However, a trial balance that does not balance indicates

that we needn't go further into the reporting phase of the accounting process. An error exists somewhere and must be detected and corrected before proceeding. If we elect to proceed without correcting the error, we have one guarantee—the financial statements will contain errors. The trial balance for Rosi, Inc., is presented below.

**Rosi, Inc.**  
**Trial Balance**  
**December 31, 2011**

	<u>Debit</u>	<u>Credit</u>
Cash .....	\$ 83,110	
Accounts Receivable .....	106,500	
Allowance for Bad Debts .....		\$ 1,610
Inventory .....	45,000	
Prepaid Insurance .....	8,000

Totals .....	<u>\$962,770</u>	<u>\$962,770</u>

## Preparing Adjusting Entries

As discussed in the previous section, transactions generally are recorded in a journal in chronological order and then posted to the ledger accounts. The entries are based on

the best information available at the time. Although the majority of accounts are up to date at the end of an accounting period and their balances can be included in the financial statements, some accounts require adjustment to reflect current circumstances. In general, these accounts are not updated throughout the period because it is impractical or inconvenient to make such entries on a daily or weekly basis. At the end of each accounting period, in order to report all asset, liability, and owners' equity amounts properly and to recognize all revenues and expenses for the period on an accrual basis, accountants are required to make any nec-

**fyi**

Disney's 1998 balance sheet included in its annual report did not balance. The preparers of that balance sheet transposed two numbers, and the result was a \$9 (million) error. The balance sheet in the 1998 10-K that was filed with the SEC did not contain the transposition error.

essary adjustments prior to preparing the financial statements. The entries that reflect these adjustments are called **adjusting entries**.

One difficulty with adjusting entries is that the need for an adjustment is not signaled by a specific event such as the receipt of a bill or the receipt of cash from a customer. Rather, adjusting entries are recorded on the basis of an analysis of the circumstances at the close of each accounting period. This analysis involves just two steps:

1. Determine whether the amounts recorded for all assets and liabilities are correct. If not, debit or credit the appropriate asset or liability account. In short, fix the balance sheet.
2. Determine what revenue or expense adjustments are required as a result of the changes in recorded amounts of assets and liabilities indicated in step 1. Debit or credit the appropriate revenue or expense account. In short, fix the income statement.

It should be noted that these two steps are interrelated and may be reversed. That is, revenue and expense adjustments may be considered first to fix the income statement, indicating which asset and liability accounts need adjustment to fix the balance sheet. As you will see, each adjusting entry involves at least one income statement account and one balance sheet account. T-accounts are helpful in analyzing adjusting entries and will be used in the illustrations that follow.

The areas most commonly requiring analysis to see whether adjusting entries are needed include the following:

Transactions where cash will be exchanged in a future period

1. Unrecorded assets
2. Unrecorded liabilities

Transactions where cash has been exchanged in a prior period

3. Prepaid expenses
4. Unearned revenues

Transactions involving estimates

For most transactions, the revenue or expense recognition and the flow of cash occur in the same accounting period. For those transactions, no adjustments are necessary as the entire transaction is accounted for in one accounting period. In some instances, the recognition of revenues and expenses and the flow of cash may occur in different accounting periods. In those instances, an adjusting entry is required to ensure that the proper amount of revenue and/or expense is recorded in each accounting period.

As we illustrate and discuss adjusting entries, remember that the basic purpose of adjustments is to make account balances current in order to report all asset, liability, and owners' equity amounts properly and to recognize all revenues and expenses for the period on an accrual basis. This is done so that the income statement and the balance sheet will reflect the proper operating results and financial position, respectively, at the end of the accounting period.

The adjusting entry part of the accounting process is illustrated using the adjusting data for Rosi, Inc., presented as follows.

---

**Adjusting Data for Rosi, Inc.  
December 31, 2011**

---

**Unrecorded Assets:**

- (a) Interest on notes receivable, \$250.

**Unrecorded Liabilities:**

- (b) Salaries and wages, \$2,150.  
 (c) Interest on bonds payable, \$5,000.  
 (d) Federal and state income taxes, \$8,000.

**Prepaid Expenses:**

- (e) Prepaid insurance remaining at year-end, \$3,800.

**Unearned Revenues:**

- (f) Unearned rent revenue remaining at year-end, \$475.

**Estimates:**

- (g) Depreciation Expense for buildings, 5% per year.  
 (h) Depreciation Expenses for furniture and equipment, 10% per year.  
 (i) The Allowance for Bad Debts is to be increased by \$1,100.
- 

## Transactions Where Cash Will Be Exchanged in a Future Period

In cases where work is performed in the current period but cash does not flow until a future period, an adjusting entry must be made to ensure that revenue is recognized (if you are the one who did the work) in the current period or that an expense is recognized (if the work was done on your behalf) in the current period. These adjusting entries are referred to as accrual entries, and there are generally two types: unrecorded (or accrued) receivables and unrecorded (or accrued) liabilities.

**Unrecorded Assets** In accordance with the revenue recognition principle of accrual accounting, revenues should be recorded when earned, regardless of when the cash is received. If revenue is earned but not yet collected in cash, a receivable exists. To ensure that all receivables are properly reported on the balance sheet in the correct amounts, an analysis should be made at the end of each accounting period to see whether there are any revenues that have been earned but have not yet been collected or recorded. These **unrecorded receivables** are earned and represent amounts that are receivable in the future; therefore, they should be recognized as assets.

In recording unrecorded assets, an asset account is debited and a revenue account is credited. The illustrative entry recognizing the unrecorded receivable (and the accrued revenue) for Rosi, Inc., is as follows:

(a) Interest Receivable .....	250	
Interest Revenue .....		250
<i>To record accrued interest on notes receivable.</i>		

After this adjusting entry has been journalized and posted, the receivable will appear as an asset on the balance sheet, and the interest revenue will be reported on the income statement. Through the adjusting entry, the asset (receivable) accounts are properly stated and revenues are appropriately reported.

**Unrecorded Liabilities** Just as assets are created from revenues being earned before they are collected or recorded, liabilities can be created by expenses being incurred prior to being paid or recorded. These expenses, along with their corresponding liabilities, should be recorded when incurred, no matter when they are

paid. Thus, adjusting entries are required at the end of an accounting period to recognize any **unrecorded liabilities** in the proper period and to record the corresponding expenses. As the expense is recorded (increased by a debit), the corresponding liability is also recorded (increased by a credit), showing the entity's obligation to pay for the expense. If such adjustments are not made, the net income measurement for the period will not reflect all appropriate expenses and the corresponding liabilities will be understated on the balance sheet.

The adjusting entries to record unrecorded liabilities (and accrued expenses) for Rosi, Inc., are as follows:

(b) Salaries and Wages Expense .....	2,150	
Salaries and Wages Payable .....		2,150
<i>To record accrued salaries and wages.</i>		
(c) Interest Expense .....	5,000	
Interest Payable .....		5,000
<i>To record accrued interest on bonds.</i>		
(d) Income Tax Expense .....	8,000	
Income Taxes Payable .....		8,000
<i>To record income taxes.</i>		

## Transactions Where Cash Has Been Exchanged in a Prior Period

For some transactions, cash has changed hands before the revenue is earned or the expense is incurred. If the revenue is not earned or the expense is not incurred prior to the end of the period, then an adjusting entry to reflect that fact is required.

**Prepaid Expenses** Payments that a company makes in advance for items normally charged to expense are known as **prepaid expenses**. An example would be the payment of an insurance premium for three years. Theoretically, every resource acquisition is an asset, at least temporarily. Thus, the entry to record an advance payment should be a debit to an asset account (Prepaid Expenses) and a credit to Cash, showing the exchange of cash for another asset.

An expense is the using up of an asset. For example, when supplies are purchased, they are recorded as assets; when they are used, their cost is transferred to an expense account. The purpose of making adjusting entries for prepaid expenses is to show the complete or partial consumption of an asset. If the original entry is to an asset account, the adjusting entry reduces the asset to an amount that reflects its remaining future benefit and at the same time recognizes the actual expense incurred for the period.

For the unrecorded assets and liabilities discussed earlier, there was no original entry; the adjusting entry was the first time these items were recorded in the accounting records. For prepaid expenses, this is not the

case. Because cash has already been paid (in the case of prepaid expenses), an original entry has been made to record the cash transaction. Therefore, the amount of the adjusting entry is the difference between what the updated balance should be and the amount of the original entry already recorded.

The method of adjusting for prepaid expenses depends on how the expenditures were originally entered in the accounts. They could have been recorded originally as debits to (1) an asset account or (2) an expense account. Both methods, if consistently applied, result in the same end result. Thus, both methods are equally correct. An individual company would choose one method or the other and apply it each period.

**Original debit to an asset account.** If an asset account was originally debited (Prepaid Insurance in this example), the adjusting entry requires that an expense account be debited for the amount applicable to the current period and the asset

## caution

Prepaid Expenses is a tricky name for an asset. Assets are reported in the balance sheet. Don't make the mistake of including Prepaid Expenses with the expenses on the income statement.

account be credited. The asset account remains with a debit balance that shows the amount applicable to future periods. An adjusting entry for Prepaid Insurance for Rosi, Inc., illustrates this situation as follows:

(e) Insurance Expense .....	4,200	
Prepaid Insurance .....		4,200
<i>To record expired insurance (\$8,000 - \$3,800 = \$4,200).</i>		

Because the asset account Prepaid Insurance was originally debited, as shown in the trial balance, the amount of the prepayment (\$8,000) must be reduced to reflect only the \$3,800 that remains unexpired. The following T-accounts illustrate how this adjusting entry, when posted, would affect the accounts.

Prepaid Insurance				Insurance Expense			
Beg. Bal.	8,000			Beg. Bal.	0		
		Adj. (e)	4,200	Adj. (e)	4,200		
End. Bal.	3,800			End. Bal.	4,200		

**Original debit to an expense account.** If an expense account was originally debited (Insurance Expense in this example), the adjusting entry requires that an asset account be debited for the amount applicable to future periods and the expense account be credited. The expense account then remains with a debit balance representing the amount applicable to the current period. For example, if Rosi, Inc., had originally debited Insurance Expense for \$8,000, the adjusting entry would be as follows:

Prepaid Insurance .....	3,800	
Insurance Expense .....		3,800
<i>To record prepaid insurance (\$8,000 - \$4,200 = \$3,800).</i>		

The following T-accounts illustrate the effect that this adjusting entry would have on the relevant accounts.

Prepaid Insurance				Insurance Expense			
Beg. Bal.	0			Beg. Bal.	8,000		
Adj.	3,800			Adj.	3,800		
End. Bal.	3,800			End. Bal.	4,200		

Note that regardless of which method is used, the ending balance in each account is the same. In this example, using either method results in an ending balance in Prepaid Insurance and Insurance Expense of \$3,800 and \$4,200, respectively.

**Unearned Revenues** Amounts received before the actual earning of revenues are known as **unearned revenues**. They arise when customers pay in advance of the receipt of goods or services. Because the company has received cash but has not yet given the customer the purchased goods or services, the unearned revenues are in fact liabilities. That is, the company must provide something in return for the amounts received. For example,

a building contractor may require a deposit before proceeding on construction of a house. Upon receipt of the deposit, the contractor has unearned revenue, a liability. The contractor must construct the house to earn the revenue. If the house is not built, the contractor will be obligated to repay the deposit.

The method of adjusting for unearned revenues depends on whether the receipts for undelivered goods or services were recorded originally as credits to (1) a revenue account or (2) a liability account.

## caution

The original debit to an asset account makes more sense conceptually. Remember, however, that the account balances reported in the financial statements are what matter; the working balances that exist in the accounting records on a day-to-day basis are not as important.

**Original credit to a revenue account.** If a revenue account was originally credited (Rent Revenue in this example), this account is debited and a liability account is credited for the revenue applicable to a future period. The revenue account remains with a credit balance representing the earnings applicable to the current period. As indicated in the trial balance for Rosi, Inc., rent receipts are recorded originally in the rent revenue account. Unearned revenue at the end of 2011 is \$475, and it is recorded as follows:

(f)	Rent Revenue .....	475	
	Unearned Rent Revenue .....		475
	<i>To record unearned rent revenue.</i>		

The following T-accounts illustrate the effect that this adjusting entry would have on the related accounts.

Unearned Rent Revenue			Rent Revenue		
	Beg. Bal.	0	Adj. (f)	475	
	Adj. (f)	475		2,550	
	End. Bal.	475		2,075	

**Original credit to a liability account.** If a liability account was originally credited (Unearned Rent Revenue), this account is debited and a revenue account is credited for the amount applicable to the current period. The liability account remains with a credit balance that shows the amount applicable to future periods. For example, if Rosi, Inc., had originally credited Unearned Rent Revenue for \$2,550, the adjusting entry (along with affected T-accounts) would be as follows:

Unearned Rent Revenue .....		2,075	
Rent Revenue .....			2,075
	<i>To record rent revenue (\$2,550 – \$475).</i>		

Unearned Rent Revenue			Rent Revenue		
	Beg. Bal.	2,550		0	
Adj.	2,075		Adj.	2,075	
	End. Bal.	475		2,075	

Again, note that using either method results in exactly the same balances for the income statement and balance sheet accounts.

### Transactions Involving Estimates

In addition to timing differences associated with cash flows and the recognition of revenues and/or expenses, a third type of adjusting entry involves estimates. Accountants must constantly use judgment when applying the accrual accounting model. Questions such as for how many periods will a machine generate revenues or how many of our credit customers will not pay must be answered and reflected in the financial statements. The answers to these questions involve estimates. Two common types of these adjusting entries involve depreciation and bad debts.

**Asset Depreciation** Charges to operations for the use of buildings, furniture, and equipment must be recorded at the end of the period. In recording asset depreciation, operations are charged with a portion of the asset’s cost, and the carrying value of the asset is reduced by that amount. A reduction in an asset for depreciation is usually recorded by a credit to a contra account, Accumulated Depreciation. A **contra account** (or offset account) is set up to record subtractions from a related account.

Adjustments at the end of the year for depreciation for Rosi, Inc., are as follows:

(g) Depreciation Expense—Buildings .....	7,800	
Accumulated Depreciation—Buildings .....		7,800
<i>To record depreciation on buildings at 5% per year.</i>		
(h) Depreciation Expense—Furniture & Equipment .....	1,900	
Accumulated Depreciation—Furniture & Equipment .....		1,900
<i>To record depreciation on furniture and equipment at 10% per year.</i>		

**Bad Debts** Invariably, when a business allows customers to purchase goods and services on credit, some of the accounts receivable will not be collected, resulting in a charge to income for bad debt expense. Under the accrual concept, an adjustment should be made for the estimated expense in the current period rather than when specific accounts actually become uncollectible in later periods. This practice produces a better matching of revenues and expenses and therefore a better income measurement. Using this procedure, operations are charged with the estimated expense, and receivables are reduced by means of a contra account, Allowance for Bad Debts. To illustrate, the adjustment for Rosi, Inc., at the end of the year, assuming the allowance account is to be increased by \$1,100, would be as follows:

(i) Bad Debt Expense .....	1,100	
Allowance for Bad Debts .....		1,100
<i>To adjust for estimated bad debt expense.</i>		

We should emphasize two characteristics of adjusting entries. First, adjusting entries made at the end of an accounting period *do not involve cash*. Cash has either changed hands prior to the end of the period (as is the case with prepaid expenses or unearned revenues), or cash will change hands in a future period (as is the case with many unrecorded receivables and unrecorded liabilities). It is precisely because cash is not changing hands on the last day of the accounting period that most adjusting entries must be made.

Second, each adjusting entry involves a balance sheet account and an income statement account. In each case requiring adjustment, we are either generating an asset, using up an asset, recording an incurred but unrecorded expense, or recording revenue that has yet to be earned. Knowing that each adjusting entry has at least one balance sheet and one income statement account makes the adjustment process a little easier. Once you have determined that an adjusting entry involves a certain balance sheet account, you can then focus on identifying the corresponding income statement account that requires adjustment.

## Preparing Financial Statements

Once all accounts have been brought up to date through the adjustment process, financial statements are prepared. Financial statements can be prepared directly from the data in the adjusted ledger accounts. The data must only be organized into appropriate sections and categories so as to present them as simply and clearly as possible. The following process describes how the financial statements are prepared from the information taken from the trial balance:

1. Identify all revenues and expenses—these account balances are used to prepare the income statement.
2. Compute net income—subtract expenses from revenues.
3. Compute the ending retained earnings balance—Retained Earnings from the previous period is the starting point. Net income (computed in step 2) is added to the beginning retained earnings balance and dividends for the period are subtracted.
4. Prepare a balance sheet using the balance sheet accounts from the trial balance and the modified retained earnings balance computed from step 3.

Once the financial statements are prepared, explanatory notes are written. These notes clarify the methods and assumptions used in preparing the statements. In addition, the auditor must review the financial statements to make sure they are accurate, reasonable, and in accordance with generally accepted accounting principles. Finally, the financial statements are distributed to external users who analyze them in order to

fyi

No account on the trial balance shows up on both the income statement and the balance sheet.

caution

Students often make the mistake of using the beginning retained earnings balance on the end-of-year balance sheet. As we shall see in the next section, the ending retained earnings balance is arrived at when the books are closed for the year.

learn more about the financial condition of the company.

How long does it take for large corporations to complete the accounting process to the point at which financial statements are available? For December 31 year-end firms, financial statement preparation is usually completed in February. The date of Disney's audit opinion (a rough measure of when financial statement preparation is essentially complete) for the fiscal year ended September 29, 2007, is November 21, 2007. For firms with publicly traded shares, the SEC requires the annual financial statements to be released within 60 days of fiscal year-end. The data used to prepare financial statements can be taken directly from the adjusted account balances in the ledger, or a spreadsheet may be used. Financial statements are prepared by determining which accounts go on which financial statement, appropriately listing those accounts, and summing to obtain totals.

## Using a Spreadsheet

An optional step in the accounting process is to use a spreadsheet (also called a work sheet) to facilitate the preparation of adjusting entries and financial statements. The availability of computer spreadsheets, such as Microsoft® Excel, makes the preparation of a spreadsheet quite easy. Remember, however, that preparing a spreadsheet is not a required step. As indicated, financial statements can be prepared directly from data in adjusted ledger account balances.

When a spreadsheet is constructed, trial balance data are listed in the first pair of columns. The adjusting entries are listed in the second pair of columns. Sometimes a third pair of columns is included to show the trial balance after adjustment. Account balances, as adjusted, are carried forward to the appropriate financial statement columns. A spreadsheet for a merchandising enterprise includes a pair of columns for the income statement accounts and a pair for the balance sheet accounts. There are no columns for the statement of cash flows because this statement requires additional analysis of changes in account balances for the period. A spreadsheet for Rosi, Inc., is shown on page 66. All adjustments illustrated previously are included.

## Closing the Nominal Accounts

Once adjusting entries have been formally recorded in the general journal and posted to the ledger accounts, the books are ready to be closed in preparation for a new accounting period. During this closing process, the **nominal (temporary) account** balances are transferred to a **real (permanent) account**, leaving the nominal accounts with a zero balance. Nominal accounts include all income statement accounts plus the dividends account for a corporation. The real account that receives the closing amounts from the nominal accounts is Retained Earnings. Because it is a real account, this and all other balance sheet accounts remain open and carry their balances forward to the new period.

The mechanics of closing the nominal accounts are straightforward. All revenue accounts with credit balances are closed by being debited; all expense accounts with debit balances are closed by being credited. This process reduces these temporary accounts to a zero balance. The difference between the closing debit amounts for revenues and the credit amounts for expenses is net income (or net loss) and is an increase (or decrease) to Retained Earnings. Dividends are also closed at the end of each period. The closing of Dividends serves to reduce Retained Earnings. Thus, the closing entries for revenues, expenses, and Dividends can be made directly to Retained Earnings, as shown at the top of page 67.

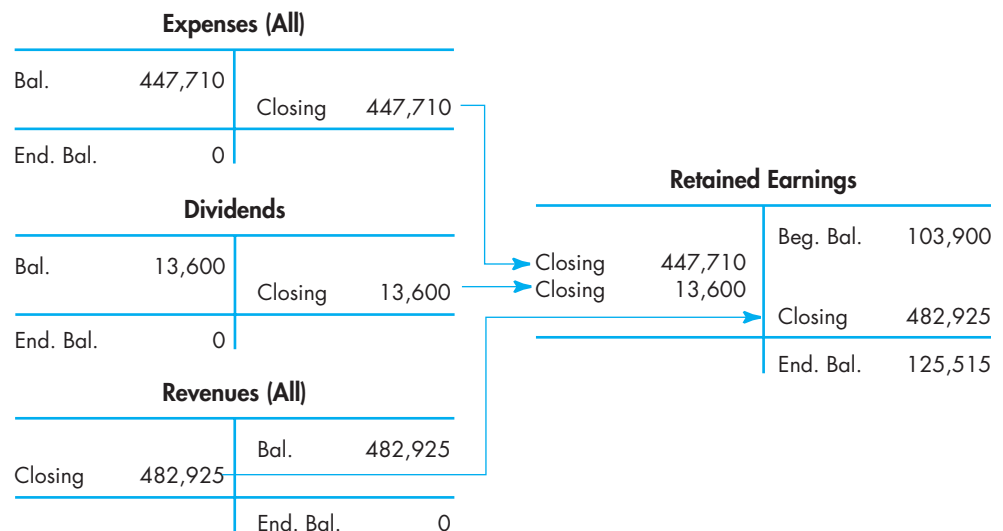

<b>Rosi, Inc.</b> <b>Trial Balance</b> <b>December 31, 2011</b>									
	Trial Balance		Adjustments			Income Statement		Balance Sheet	
	Debit	Credit	Debit		Credit	Debit	Credit	Debit	Credit
Cash	83,110							83,110	
Accounts Receivable	106,500							106,500	
Allowance for Bad Debts		1,610		(i)	1,100				2,710
Inventory	45,000							45,000	
Prepaid Insurance	8,000			(e)	4,200			3,800

						<u>482,925</u>	<u>482,925</u>	<u>541,260</u>	<u>541,260</u>

Revenues .....	xx	
Retained Earnings .....		xx
<i>To close revenues to Retained Earnings.</i>		
Retained Earnings .....	xx	
Expenses .....		xx
<i>To close expenses to Retained Earnings.</i>		
Retained Earnings .....	xx	
Dividends .....		xx
<i>To close Dividends to Retained Earnings.</i>		

The **closing entries** for Rosi, Inc., follow.

Closing Entries			
2011			
Dec. 31	Sales .....	479,500	
	Interest Revenue .....	1,350	
	Rent Revenue .....	2,075	
	Retained Earnings .....		482,925
	<i>To close revenue accounts to Retained Earnings.</i>		
31	Retained Earnings .....	447,710	
	Cost of Goods Sold .....		159,310
	Salaries and Wages Expense .....		174,600
	Heat, Light, and Power .....		32,480
	Payroll Tax Expense .....		18,300
	Advertising Expense .....		18,600
	Bad Debt Expense .....		1,100
	Depreciation Expense—Buildings .....		7,800
	Depreciation Expense—Furniture & Equipment .....		1,900
	Insurance Expense .....		4,200
	Interest Expense .....		21,420
	Income Tax Expense .....		8,000
	<i>To close expense accounts to Retained Earnings.</i>		
31	Retained Earnings .....	13,600	
	Dividends .....		13,600
	<i>To close Dividends to Retained Earnings.</i>		

The following T-accounts (revenues and expenses have each been combined into one account for illustrative purposes) illustrate the effect the closing process has on the nominal accounts and Retained Earnings.

## Preparing a Post-Closing Trial Balance

After the closing entries are posted, a **post-closing trial balance** can be prepared to verify the equality of the debits and credits for all real accounts. Recall that real accounts are only those accounts shown on the balance sheet. The post-closing trial balance represents the end of the accounting cycle. The post-closing trial balance for Rosi, Inc., follows:

Rosi, Inc. Post-Closing Trial Balance December 31, 2011		
	Debit	Credit
Cash .....	\$ 83,110	
Accounts Receivable .....	106,500	
Allowance for Bad Debts .....		\$ 2,710
Inventory .....	45,000	
Prepaid Insurance .....	3,800	
Interest Receivable .....	250	
Land .....	114,000	
Buildings .....	156,000	
Accumulated Depreciation—Buildings .....		46,800
Furniture & Equipment .....	19,000	
Accumulated Depreciation—Furniture & Equipment .....		5,700
Accounts Payable .....		37,910
Unearned Rent Revenue .....		475
Salaries and Wages Payable .....		2,150
Interest Payable .....		5,000
Income Taxes Payable .....		8,000
Dividends Payable .....		3,400
Bonds Payable .....		140,000
Common Stock, \$0.10 par .....		150,000
Retained Earnings .....		125,515
Totals .....	\$527,660	\$527,660

## Accrual Versus Cash-Basis Accounting

**4** Distinguish between accrual and cash-basis accounting.

**WHY** The FASB has indicated that accrual accounting generally provides a better basis for financial reports, especially in reporting earnings, than does information showing only cash receipts and disbursements.

**HOW** Accrual accounting recognizes revenues when they are earned, not necessarily when cash is received. Similarly, expenses are recognized and recorded under accrual accounting when they are incurred, not necessarily when cash is paid. Some organizations (and most individuals) use cash-basis accounting, which recognizes revenues when cash is received and expenses when cash is paid. However, both the FASB and SEC require a statement of cash flows to be presented along with an accrual-based income statement and a balance sheet as the primary financial statements of an enterprise.

The procedures described in the previous sections are those required in a double-entry system based on accrual accounting. **Accrual accounting** recognizes revenues as they are earned, not necessarily when cash is received. Expenses are recognized and recorded when they are incurred, not necessarily when cash is paid. Accrual accounting provides for a better matching of revenues and expenses during an

accounting period and generally results in financial statements that more accurately reflect a company's financial position and results of operations.<sup>2</sup>

Some accounting systems are based on cash receipts and cash disbursements instead of accrual accounting. **Cash-basis accounting** procedures frequently are found in organizations not requiring a complete set of double-entry records. Such organizations might include small, unincorporated businesses and some nonprofit organizations. Professionals engaged in service businesses, such as CPAs, dentists, and engineers, also have traditionally used cash accounting systems. Even many of these organizations, however, periodically use professional accountants to prepare financial statements and other required reports on an accrual basis.

Discussion continues as to the appropriateness of using cash accounting systems, especially as a basis for determining tax liabilities. The FASB, in *Concepts Statement No. 1*, indicates that accrual accounting provides a better basis for financial reports than does information showing only cash receipts and disbursements.

The AICPA's position, however, is that the cash basis is appropriate for some small companies and especially for companies in the service industry. Accordingly, accountants will continue to be asked on occasion to convert cash-based records to generally accepted accrual-based financial statements. The procedures involved are illustrated in the Web Material associated with this chapter (see [www.cengage.com/accounting/stice](http://www.cengage.com/accounting/stice)).

## Computers and the Accounting Process

**5** Discuss the importance and expanding role of computers to the accounting process.

**WHY** Computers play an increasing role in today's business environment as well as society in general.

**HOW** In the past, many companies used manual systems to record, classify, summarize, and report accounting data. Today, most companies use computers and electronic technology as an integral part of their accounting systems. In the future, technological advances will continue to significantly impact the accounting process of recording and reporting data for decision-making purposes.

As an organization grows in size and complexity, its recording and summarizing processes become more involved, and it seeks for improving efficiency and reducing costs. Some enterprises could find that a system involving primarily manual operations is adequate in meeting their needs. Most find that information-processing needs can be handled effectively only through the use of computers.

The computer revolution has rapidly changed society and along with it the way business is conducted and, therefore, the way accounting functions are performed. The 1990s are referred to as the *Decade of Networking*, indicating that the PCs on people's desks in the 1980s were increasingly being interconnected. The new millennium has seen increased use of the Internet, with business-to-business (B2B) and business-to-consumer (B2C) applications proliferating. The opportunities for information exchange have expanded exponentially. However, despite their tremendous capabilities, computers cannot replace skilled accountants. A computer, for example, does not know the difference between inventory and supplies until someone (the accountant) specifies the accounts involved in the transaction. Instead of reducing the responsibilities of accountants, the existence of computers places increased demands on them in directing the operations of the computer systems to ensure the use of appropriate procedures. For example, a poorly designed computer system may leave no document trail with which

<sup>2</sup> In *Concepts Statement No. 6*, the FASB discusses the concept of accrual accounting and relates it to the objectives of financial reporting. *Statement of Financial Accounting Concepts No. 6*, "Elements of Financial Statements" (Stamford, CT: Financial Accounting Standards Board, December 1985).

to verify accounting records. Although all arithmetical operations can be assumed to be done accurately by computers, the validity of the output data depends on the adequacy of the instructions given the computer. Unlike a human accountant, a computer cannot think for itself but must be given explicit instructions for performing each operation. Computers have certain advantages in that the accountant can be sure every direction will be carried out precisely. On the other hand, computers place a great responsibility on the information systems designer to anticipate any unusual situations that will require special consideration or judgment by an accountant.

A recent development in the use of computers in financial reporting is the spread of XBRL. XBRL, which stands for eXtensible Business Reporting Language, is a method of embedding computer-readable tags in financial report documents. With these XBRL tabs, a company's financial statements can be downloaded directly into a spreadsheet where they can be compared to the financial statements of other companies which have also been downloaded. The use of XBRL will greatly simplify the process of analyzing financial statement data. The SEC has proposed requiring the use of XBRL for all financial statements filed by public companies.

The question to be asked is this: If computers now take care of all of the routine accounting functions, why does an accounting student need to know anything about debits, credits, journals, posting, T-accounts, and trial balances? Good question. First, even though computers now do most of the routine work, the essence of double-entry accounting is unchanged from the days of quill pens and handwritten ledgers. Thus, the understanding of the process explained in this chapter is still relevant to a computer-based accounting system. Second, with or without computers, the use of debits, credits, and T-accounts still provides an efficient and widespread shorthand method of analyzing transactions. At a minimum, all businesspeople should be familiar enough with the language of accounting to understand, for example, why a credit balance in the cash account or a debit balance in Retained Earnings is something unusual enough to merit investigation. Finally, an understanding of the accounting cycle—analyzing, recording, summarizing, and preparing—gives one insight into how information flows within an organization. Great advantages accrue to those who understand information flow.

### SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. *If a customer could not tell if a deposit was made to their account, they would be unable to tell if the checks they had written would clear their account. If a bank cannot confirm for a customer that a deposit had been made, then the customer would search for a bank that could provide that basic service.*
2. *The burden of proof for tax payments would shift to the taxpayer. They would have to provide evidence that tax payments had been made. Currently, employers typically provide that evidence. The government would then need to have a system to match payments received from taxpayers with specific taxpayers. Fortunately for us, this system is already in place.*

### SOLUTIONS TO STOP & THINK

1. *(Page 52) The correct answer is C. Accountants and analysts interpret the accounting results for an accounting period.*
2. *(Page 57) The correct answer is D. If a computer is programmed properly, it will not post incorrect amounts, it will not post to incorrect accounts, and it will not mix its debits and credits.*

## REVIEW OF LEARNING OBJECTIVES

### 1 Identify and explain the basic steps in the accounting process (accounting cycle).

The accounting process, often referred to as the *accounting cycle*, generally includes the following steps in a well-defined sequence: analyze business documents, journalize transactions, post to ledger accounts, prepare a trial balance, prepare adjusting entries, prepare financial statements (using a spreadsheet or working from the adjusted individual accounts), close the nominal accounts, and prepare a post-closing trial balance. This process of recording, classifying, summarizing, and reporting of accounting data is based on an old and universally accepted system called *double-entry accounting*.

### 2 Analyze transactions and make and post journal entries.

Transactions are events that transfer or exchange goods or services between or among two or more entities. Business documents, such as invoices, provide evidence that transactions have occurred as well as the data required to record the transaction in the accounting records. The data are recorded with journal entries using a system of double-entry accounting. The journal entries are subsequently posted to ledger accounts.

### 3 Make adjusting entries, produce financial statements, and close nominal accounts.

Adjusting entries are made at the end of an accounting period prior to preparing the financial statements for that period. Adjusting entries are often required to update accounts so that the data are current and accurate. Generally, the required adjustments are the result of analysis rather than based on new transactions. Once adjusting entries are journalized and posted, the balance sheet, income statement, and statement of cash flows can be prepared and reported.

At the end of each accounting cycle, the nominal or temporary accounts must be trans-

ferred through the closing process to real or permanent accounts. The nominal accounts (all income statement accounts plus dividends) are left with a zero balance and are ready to receive transaction data for the new accounting period. The real (balance sheet) accounts remain open and carry their balances forward to the new period.

### 4 Distinguish between accrual and cash-basis accounting.

Accrual accounting recognizes revenues when they are earned, not necessarily when cash is received. Similarly, expenses are recognized and recorded under accrual accounting when they are incurred, not necessarily when cash is paid. Some organizations (and most individuals) use cash-basis accounting, which recognizes revenues when cash is received and expenses when cash is paid. The FASB has indicated that accrual accounting generally provides a better basis for financial reports, especially in reporting earnings, than does information showing only cash receipts and disbursements. However, both the FASB and SEC require a statement of cash flows to be presented along with an accrual-based income statement and a balance sheet as the primary financial statements of an enterprise.

### 5 Discuss the importance and expanding role of computers to the accounting process.

Computers play an increasing role in today's business environment as well as society in general. In the past, many companies used manual systems to record, classify, summarize, and report accounting data. Today, most companies use computers and electronic technology as an integral part of their accounting systems. In the future, technological advances will continue to significantly impact the accounting process of recording and reporting data for decision-making purposes.

## KEY TERMS

Account 56	Contra account 63	Ledger 56	Special journal 56
Accounting cycle 50	Control account 57	Nominal (temporary) account 65	Subsidiary ledgers 57
Accounting process 50	Credit 53	Post-closing trial balance 68	Transactions 53
Accounting system 50	Debit 53	Posting 56	Trial balance 57
Accrual accounting 68	Double-entry accounting 53	Prepaid expenses 61	Unearned revenues 62
Adjusting entries 59	General journal 56	Real (permanent) account 65	Unrecorded liabilities 61
Business document 55	General ledger 57	Source document 55	Unrecorded receivables 60
Cash-basis accounting 69	Journal entry 53		
Closing entries 67	Journals 55		

## QUESTIONS

- What types of reports are generated from the accounting system?
- What are the main similarities and differences between a manual and an automated accounting system?
- Distinguish between the recording and reporting phases of the accounting process.
- List and describe the steps in the accounting process. Why are these steps necessary? Are any steps optional?
- Under double-entry accounting, what are the debit/credit relationships of accounts?
- Distinguish between (a) real and nominal accounts, (b) general journal and special journals, and (c) general ledger and subsidiary ledgers.
- Explain the nature and the purpose of (a) adjusting entries and (b) closing entries.
- As Beechnut Mining Company's independent certified public accountant, you find that the company accountant posts adjusting and closing entries directly to the ledger without formal entries in the general journal. How would you evaluate this procedure in your report to management?
- Give three common examples of contra accounts. Explain why contra accounts are used.
- Payment of insurance in advance may be recorded in either (a) an expense account or (b) an asset account. Which method would you recommend? What periodic entries are required under each method?
- Describe the nature and purpose of a work sheet.
- What effect, if any, does the use of a work sheet have on the sequence of the reporting phase of the accounting process?
- From the following list of accounts, determine which ones should be closed and whether each would normally be closed by a debit or by a credit entry.

Cash	Land
Rent Expense	Interest Revenue
Depreciation Expense	Advertising Expense
Sales	Notes Payable
Retained Earnings	Dividends
Capital Stock	Accounts Payable
Accounts Receivable	
- Distinguish between accrual and cash-basis accounting.
- Is greater accuracy achieved in financial statements prepared from double-entry accrual data as compared with cash data? Explain.
- What are the major advantages of computers as compared with manual processing of accounting data?
- One of your clients overheard a computer manufacturer sales representative saying that the computer will make the accountant obsolete. How would you respond to this comment?

## PRACTICE EXERCISES

## Practice 2-1

**Journalizing**

LO2

Make the journal entry (or entries) necessary to record the following transaction: Sold merchandise costing \$8,000 for \$14,000. Of the \$14,000, \$4,000 was received in cash and the remainder was on account. Assume a perpetual inventory system, meaning that the inventory reduction is recorded at the time of the sale.

## Practice 2-2

**Journalizing**

LO2

Make the journal entry (or entries) necessary to record the following transaction: Purchased equipment with a fair market value of \$100,000. Paid \$10,000 cash as a down payment and signed two notes for the remaining cost—a 6% note for \$20,000 that must be repaid (with interest) in six months and an 8% note for \$70,000 that must be repaid (with interest) in two years.

## Practice 2-3

**Journalizing**

LO2

Make the journal entry (or entries) necessary to record the following transaction: Sold land that had an original cost of \$50,000. Received \$40,000 cash. Also received a piece of equipment with a fair value of \$75,000.

## Practice 2-4

**Journalizing**

LO2

Make the journal entry (or entries) necessary to record the following transaction: Declared and paid a \$12,000 cash dividend to shareholders.

## Practice 2-5

**Journalizing**

LO2

Make the journal entry (or entries) necessary to record the following transaction: Gave land to an employee. The land originally cost \$52,000, and it had that same value on the date it was given to the employee. This land was given in exchange for services rendered by the employee.

## Practice 2-6

**Posting**

LO2

The beginning balance in the cash account was \$10,000. During the month, the following four journal entries (involving cash) were recorded:

a. Cash .....	2,775	
Sales .....		2,775
b. Accounts Payable .....	1,500	
Cash .....		1,500
c. Utilities Expense .....	6,200	
Cash .....		6,200
d. Cash .....	3,450	
Gain .....		1,500
Land .....		1,950

Create a Cash T-account and post the entries to this account. Compute an ending balance.

## Practice 2-7

**Posting**

LO2

The beginning balance in the accounts payable account was \$8,000. During the month, the following four journal entries (involving accounts payable) were recorded:

a. Inventory .....	2,700	
Accounts Payable .....		2,700
b. Accounts Payable .....	6,500	
Cash .....		6,500
c. Accounts Payable .....	200	
Inventory .....		200
d. Inventory .....	3,000	
Cash .....		450
Accounts Payable .....		2,550

Create an Accounts Payable T-account and post the entries to this account. Compute an ending balance.

**Practice 2-8****Trial Balance**

Use the following account balance information to construct a trial balance:

**LO3**

Cost of Goods Sold	\$ 9,000
Accounts Payable	1,100
Paid-In Capital	2,000
Cash	400
Sales	10,000
Dividends	700
Retained Earnings (beginning)	1,000
Inventory	4,000

**Practice 2-9****Trial Balance**

Use the following account balance information to construct a trial balance:

**LO3**

Salary Expense	\$24,000
Unearned Service Revenue	1,600
Paid-In Capital	3,000
Cash	3,500
Service Revenue	32,000
Rent Expense	5,300
Retained Earnings (beginning)	1,200
Prepaid Rent Expense	5,000

**Practice 2-10****Income Statement**

Prepare two income statements, one using the information in Practice 2–8 and the other using the information in Practice 2–9.

**LO3****Practice 2-11****Balance Sheet**

Prepare two balance sheets, one using the information in Practice 2–8 and the other using the information in Practice 2–9.

**LO3****Practice 2-12****Adjusting Entries**

Make the adjusting journal entry necessary at the end of the period in the following situation: Equipment depreciation for the year was computed to be \$5,500.

**LO3****Practice 2-13****Adjusting Entries**

Make the adjusting journal entry necessary at the end of the period in the following situation: Bad debts created by selling on credit during the year are estimated to be \$1,200. So far, none of these accounts have been specifically identified and written off as uncollectible.

**LO3****Practice 2-14****Adjusting Entries**

Make the adjusting journal entry necessary at the end of the period in the following situation: On August 1, the company borrowed \$10,000 under a 1-year loan agreement. The annual interest rate is 12%. As of the end of the year, no entry has yet been made to record the accrued interest on the loan.

**LO3****Practice 2-15****Adjusting Entries**

Make the adjusting journal entry necessary at the end of the period in the following situation: On August 1, the company paid \$3,600 in advance for 12 months of rent, with the rental period beginning on August 1. This \$3,600 was recorded as Prepaid Rent. As of the end of the year, no entry has yet been made to adjust the amount initially recorded.

**LO3**

**Practice 2-16**

**Adjusting Entries**

**LO3**

Make the adjusting journal entry necessary at the end of the period in the following situation: On February 1, the company received \$4,800 in advance for 12 months of service to be provided, with the service period beginning on February 1. This \$4,800 was recorded as Unearned Service Revenue. The service is provided evenly throughout the year. As of the end of the year, no entry has yet been made to adjust the amount initially recorded.

**Practice 2-17**

**Closing Entries**

**LO3**

Make the closing entry (or entries) necessary to close the following accounts:

Cost of Goods Sold	\$ 7,000
Accounts Payable	900
Paid-In Capital	1,500
Cash	3,200
Sales	11,000
Dividends	900
Retained Earnings (beginning)	1,200
Inventory	3,500

**Practice 2-18**

**Closing Entries**

**LO3**

Make the closing entry (or entries) necessary to close the following accounts:

Salary Expense	\$18,000
Unearned Service Revenue	4,700
Paid-In Capital	2,000
Cash	800
Service Revenue	20,000
Rent Expense	6,400
Retained Earnings (beginning)	1,500
Prepaid Rent Expense	3,000

**EXERCISES**

**Exercise 2-19**

**Recording Transactions in T-Accounts**

**LO2, LO3**

Georgia Supply Corporation, a merchandising firm, prepared the following trial balance as of October 1:

	<u>Debit</u>	<u>Credit</u>
Cash .....	\$150,000	
Accounts Receivable .....	21,540	
Inventory .....	32,680	
Land .....	15,400	
Building .....	14,000	
Accounts Payable .....		\$ 9,190
Mortgage Payable .....		23,700
Common Stock .....		140,000
Retained Earnings .....		60,730
Totals .....	<u>\$233,620</u>	<u>\$233,620</u>

Georgia Supply engaged in the following transactions during October 2011. The company records inventory using the perpetual system.

- Oct. 1 Sold merchandise on account to the Tracker Corporation for \$12,000; terms 2/10, n/30, FOB shipping point. Tracker paid \$350 freight on the goods. The merchandise cost \$6,850.
- 5 Purchased inventory costing \$10,250 on account; terms n/30.
- 7 Received payment from Tracker for goods shipped October 1.

- Oct. 15 The payroll paid for the first half of October was \$22,000. (Ignore payroll taxes.)
- 18 Purchased a machine for \$8,600 cash.
- 22 Declared a dividend of \$0.45 per share on 45,000 shares of common stock outstanding.
- 27 Purchased building and land for \$125,000 in cash and a \$225,000 mortgage payable, due in 30 years. The land was appraised at \$150,000 and the building at \$300,000.

1. Prepare T-accounts for all items in the October 1 trial balance and enter the initial balances.
2. Record the October transactions directly to the T-accounts.
3. Prepare a new trial balance as of the end of October.

**Exercise 2-20****LO3****Adjusting Entries**

In analyzing the accounts of Sydney Corporation, the adjusting data listed below are determined on December 31, the end of an annual fiscal period.

- (a) The prepaid insurance account shows a debit of \$6,000, representing the cost of a 2-year earthquake insurance policy dated July 1.
  - (b) On August 1, Rent Revenue was credited for \$9,450, representing revenue from subrental for a 7-month period beginning on that date.
  - (c) Purchase of advertising materials for \$3,550 during the year was recorded in the advertising expense account. On December 31, advertising materials costing \$500 are on hand.
  - (d) On November 1, \$4,200 was paid for rent for a 6-month period beginning on that date. The rent expense account was debited.
  - (e) Miscellaneous Office Expense was debited for office supplies of \$950 purchased during the year. On December 31, office supplies of \$125 are on hand.
  - (f) Interest of \$534 has accrued on notes payable.
1. Give the adjusting entry for each item.
  2. What sources would provide the information for each adjustment?

**Exercise 2-21****LO3****Adjusting and Correcting Entries**

Upon inspecting the books and records for Wernli Company for the year ended December 31, 2011, you find the following data:

- (a) A receivable of \$640 from Hatch Realty is determined to be uncollectible. The company maintains an allowance for bad debts for such losses.
- (b) A creditor, E. F. Bowcutt Co., has just been awarded damages of \$3,500 as a result of breach of contract by Wernli Company during the current year. Nothing appears on the books in connection with this matter.
- (c) A fire destroyed part of a branch office. Furniture and fixtures that cost \$12,300 and had a book value of \$8,200 at the time of the fire were completely destroyed. The insurance company has agreed to pay \$7,000 under the provisions of the fire insurance policy.
- (d) Advances of \$950 to salespersons have been previously recorded as sales salaries expense.
- (e) Machinery at the end of the year shows a balance of \$19,960. It is discovered that additions to this account during the year totaled \$4,460, but of this amount, \$760 should have been recorded as repairs. Depreciation is to be recorded at 10% on machinery owned throughout the year but at one-half this rate on machinery purchased or sold during the year.

Record the entries required to adjust and correct the accounts. (Ignore income tax consequences.)

Exercise 2-22

**Reconstructing Adjusting Entries**

For each situation, reconstruct the adjusting entry that was made to arrive at the ending balance. Assume statements and adjusting entries are prepared only once each year.

LO3

1. Prepaid Insurance:

Balance beginning of year	\$4,300
Balance end of year	3,600

During the year, an additional business insurance policy was purchased. A 1-year premium of \$1,200 was paid and charged to Prepaid Insurance.

2. Accumulated Depreciation:

Balance beginning of year	\$103,400
Balance end of year	106,100

During the year, a depreciable asset that cost \$10,700 and had a carrying value of \$5,300 was sold for \$6,000. The disposal of the asset was recorded correctly.

3. Unearned Rent:

Balance beginning of year	\$ 8,000
Balance end of year	12,000

Warehouse quarterly rent received in advance is \$14,000. During the year, equipment was rented to another company at an annual rent of \$6,000. The quarterly rent payments were credited to Rent Revenue; the annual equipment rental was credited to Unearned Rent.

4. Salaries Payable:

Balance beginning of year	\$36,540
Balance end of year	29,480

Salaries are paid biweekly. All salary payments during the year were debited to Salaries Expense.

Exercise 2-23

**Adjusting and Closing Entries and Post-Closing Trial Balance**

Accounts of Pioneer Heating Corporation at the end of the first year of operations showed the following balances. In addition, prepaid operating expenses are \$4,000, and accrued sales commissions payable are \$5,900. Investment revenue receivable is \$1,000. Depreciation for the year on buildings is \$4,500 and on machinery, \$5,000. Federal and state income taxes for the year are estimated at \$18,100.

LO3

	<u>Debit</u>	<u>Credit</u>
Cash .....	\$ 39,000	
Inventory .....	50,000	
Investment .....	50,000	
Land .....	70,000	
Buildings .....	180,000	
Machinery .....	100,000	
Accounts Payable .....		\$ 65,000
Common Stock .....		320,000
Additional Paid-In Capital .....		40,000
Sales .....		590,000
Cost of Goods Sold .....	230,000	
Sales Commissions .....	200,000	
General Operating Expenses .....	101,000	
Investment Revenue .....		5,000
Totals .....	<u>\$1,020,000</u>	<u>\$1,020,000</u>

1. Prepare the necessary entries to adjust and close the books.
2. Prepare a post-closing trial balance.

## Exercise 2-24

## Adjusting and Closing Entries and Post-Closing Trial Balance

Below is the trial balance for Boudreaux Company as of December 31.

## LO3

	Debit	Credit
Cash .....	\$ 72,000	
Accounts Receivable .....	365,000	
Inventory .....	52,000	
Prepaid Expenses .....	36,000	
Land .....	70,000	
Plant and Equipment .....	1,254,000	
Other Assets .....	1,275,000	
Accounts Payable .....		\$ 154,000
Wages, Interest, and Taxes Payable .....		218,000
Unearned Revenue .....		42,000
Long-Term Debt .....		1,190,000
Other Liabilities .....		297,000
Common Stock .....		195,000
Retained Earnings .....		915,000
Dividends .....	211,000	
Sales .....		2,762,000
Interest Revenue .....		29,000
Costs of Goods Sold .....	1,565,000	
Selling, General, and Administrative Expenses .....	615,000	
Interest Expense .....	82,000	
Income Tax Expense .....	205,000	
Totals .....	<u>\$5,802,000</u>	<u>\$5,802,000</u>

Consider the following additional information:

- (a) Boudreaux uses a perpetual inventory system.
  - (b) The prepaid expenses were paid on September 1 and relate to a 3-year insurance policy that went into effect on September 1.
  - (c) The unearned revenue relates to rental of an unused portion of the corporate offices. The \$42,000 was received on April 1 and represents payment in advance for one year's rental.
  - (d) Plant and Equipment includes \$15,000 for routine equipment repairs that were erroneously recorded as equipment purchases. The repairs were made on December 30.
  - (e) Other Assets include \$7,000 for miscellaneous office supplies, which were purchased in mid-October. An end-of-year count reveals that only \$4,200 of the office supplies remain.
  - (f) Selling, General, and Administrative Expenses incorrectly includes \$13,000 for office furniture purchases (Other Assets). The purchases were made on December 30.
  - (g) Inventory erroneously includes \$7,500 of inventory that Boudreaux had purchased on account but that was returned to the supplier on December 28 because of unsatisfactory quality.
1. Record the entries necessary to adjust the books.
  2. Record the entries necessary to close the books. Assume the adjustments in (1) do not affect Income Tax Expense.
  3. Prepare a post-closing trial balance.

## Exercise 2-25

## Analysis of Journal Entries

For each of the following journal entries, write a description of the underlying event.

## LO2

1. Cash .....	300	
Accounts Receivable .....		300
2. Accounts Payable .....	400	
Inventory .....		400

3. Cash .....	5,000	
Loan Payable .....		5,000
4. Cash .....	200	
Accounts Receivable .....	700	
Sales .....		900
Cost of Goods Sold .....	550	
Inventory .....		550
5. Prepaid Insurance .....	200	
Cash .....		200
6. Dividends .....	250	
Dividends Payable .....		250
7. Retained Earnings .....	1,000	
Dividends .....		1,000
8. Insurance Expense .....	50	
Prepaid Insurance .....		50
9. Inventory .....	600	
Cash .....		150
Accounts Payable .....		450
10. Allowance for Bad Debts .....	46	
Accounts Receivable .....		46
11. Interest Expense .....	125	
Interest Payable .....		125
12. Wages Payable .....	130	
Wages Expense .....	75	
Cash .....		205
13. Accounts Payable .....	500	
Cash .....		490
Purchase Discounts .....		10

**Exercise 2-26****LO3****Adjusting Entries**

The following accounts were taken from the trial balance of Cole Company as of December 31, 2011:

Sales	\$70,000
Interest Revenue	3,000
Equipment	52,000
Accumulated Depreciation—Equipment	8,000
Inventory	23,000
Advertising Expense	1,500
Selling Expense	7,500
Interest Expense	2,000

Given the information below, make the necessary adjusting entries.

- The equipment has an estimated useful life of ten years and a salvage value of \$4,000. Depreciation is calculated using the straight-line method.
- Of selling expense, \$1,500 has been paid in advance.
- Interest of \$800 has accrued on notes receivable.
- Of advertising expense, \$440 was incorrectly debited to Selling Expense.

**Exercise 2-27****LO3**

SPREADSHEET

**Adjusting Entries**

The following data were obtained from an analysis of the accounts of Noble Distributor Company as of March 31, 2011, in preparation of the annual report. Noble records current transactions in nominal accounts. What are the appropriate adjusting entries?

- Prepaid Insurance has a balance of \$14,100. Noble has the following policies in force:

Policy	Date	Term	Cost	Coverage
A	1/1/11	2 years	\$ 3,600	Shop equipment
B	12/1/10	6 months	1,800	Delivery equipment
C	7/1/10	3 years	12,000	Buildings

- (b) Unearned Subscription Revenue has a balance of \$56,250. The following subscriptions were collected in the current year. There are no other unexpired subscriptions.

Effective Date	Amount	Term
July 1, 2010	\$27,000	1 year
October 1, 2010	22,200	1 year
January 1, 2011	28,800	1 year
April 1, 2011	20,700	1 year

- (c) Interest Payable has a balance of \$825. Noble owes a 10%, 90-day note for \$45,000 dated March 1, 2011.
- (d) Supplies has a balance of \$2,190. An inventory of supplies revealed a total of \$1,410.
- (e) Salaries Payable has a balance of \$9,750. The payroll for the 5-day workweek ended April 3 totaled \$11,250.

### Exercise 2-28

#### LO3

#### Analyzing Adjusting Entries

Guidecom Consulting Company initially records prepaid items as assets and unearned items as liabilities. Selected account balances at the end of the current and prior year follow. Accrued expenses and revenues are adjusted only at year-end.

	Adjusted Balances, December 31, 2010	Adjusted Balances, December 31, 2011
Prepaid Rent	\$ 5,100	\$3,400
Salaries and Wages Payable	2,100	4,700
Unearned Consulting Fees	18,200	7,800
Interest Receivable	800	2,100

During 2011, Guidecom Consulting paid \$14,000 for rent and \$40,000 for wages. It received \$112,000 for consulting fees and \$3,200 as interest.

1. Provide the entries that were made at December 31, 2011, to adjust the accounts to the year-end balances shown above.
2. Determine the proper amount of Rent Expense, Salaries and Wages Expense, Consulting Fees Revenue, and Interest Revenue to be reported on the current-year income statement.

### Exercise 2-29

#### LO3

#### Closing Entries

An accountant for Jolley, Inc., a merchandising enterprise, has just finished posting all year-end adjusting entries to the ledger accounts and now wishes to close the appropriate account balances in preparation for the new period.

1. For each of the accounts listed, indicate whether the year-end balance should be (a) carried forward to the new period, (b) closed by debiting the account, or (c) closed by crediting the account.

(a) Cash	\$ 25,000
(b) Sales	75,000
(c) Dividends	3,500
(d) Inventory	7,500
(e) Selling Expenses	7,900
(f) Capital Stock	100,000
(g) Wages Expense	14,400

(h) Dividends Payable	\$ 4,000
(i) Cost of Goods Sold	26,500
(j) Accounts Payable	12,000
(k) Accounts Receivable	140,000
(l) Prepaid Insurance	16,000
(m) Interest Receivable	1,500
(n) Sales Discounts	4,200
(o) Interest Revenue	6,500
(p) Supplies	8,000
(q) Retained Earnings	6,500
(r) Accumulated Depreciation	2,000
(s) Depreciation Expense	1,800

2. Give the necessary closing entries.
3. What was Jolley's net income (loss) for the period?

**Exercise 2-30****Closing Entries****LO3**

Dylan's Taxidermy Corporation reports revenues and expenses of \$142,300 and \$91,500, respectively, for the period. Give the remaining entries to close the books assuming the ledger reports Additional Paid-In Capital of \$400,000 and Retained Earnings of \$125,000. Dividends during the year amounting to \$29,200 were recorded in a dividends account.

**Exercise 2-31****Determining Income from Equity Account Analysis****LO3**

An analysis of Goulding, Inc., disclosed changes in account balances for 2011 and the following supplementary data. From these data, calculate the net income or loss for 2011. (*Hint:* Net income can be thought of as the increase in net assets resulting from operations.)

Cash	\$18,000	increase
Accounts Receivable	5,000	decrease
Inventory	14,000	increase
Equipment	58,000	increase
Accounts Payable	2,000	increase

Goulding sold 4,000 shares of its \$5 par stock for \$8 per share and received cash in full. Dividends of \$20,000 were paid in cash during the year. Goulding borrowed \$40,000 from the bank and made interest payments of \$5,000. Goulding had no other loans payable. Interest of \$2,000 was payable at December 31, 2011. There was no interest payable at December 31, 2010. Equipment of \$15,000 was donated by stockholders during the year.

**Exercise 2-32****Accrual Errors****LO3**

Spilker Aviation, Inc., failed to make year-end adjustments to record accrued salaries and recognize interest receivable on investments over the last three years as follows:

	2009	2010	2011
Accrued salaries	\$21,000	\$17,500	\$26,000
Interest receivable	8,500	11,400	12,100

What impact would the correction of these errors have on the net income for these three years? Ignore income taxes.

## PROBLEMS

## Problem 2-33

## LO2

## Journal Entries

Selfish Gene Company is a merchandising firm. The following events occurred during the month of May. (*Note:* Selfish Gene maintains a perpetual inventory system.)

- May 1 Received \$40,000 cash as new stockholder investment.  
 3 Purchased inventory costing \$8,000 on account from Dawkins Company; terms 2/10, n/30.  
 4 Purchased office supplies for \$500 cash.  
 4 Held an office party for the retiring accountant. Balloons, hats, and refreshments cost \$150 and were paid for with office staff contributions.  
 5 Sold merchandise costing \$7,500 on account for \$14,000 to Richard Company; terms 3/15, n/30.  
 8 Paid employee wages of \$2,000. Gross wages were \$2,450; taxes totaling \$450 were withheld.  
 9 Hired a new accountant; agreed to a first-year salary of \$28,000.  
 9 Paid \$1,500 for newspaper advertising.  
 10 Received payment from Richard Company.  
 12 Purchased a machine for \$6,400 cash.  
 15 Declared a cash dividend totaling \$25,000.  
 18 Sold merchandise costing \$13,000 for \$3,000 cash and \$21,000 on account to Feynman Company; terms n/30.  
 19 Paid Dawkins Company account in full.  
 22 Company executives appeared on the cover of a national newsmagazine. Related article extolled Selfish Gene's labor practices, environmental concerns, and customer service.  
 23 Market value of Selfish Gene's common stock rose by \$150,000.  
 25 Purchased a building for \$15,000 cash and a \$135,000 mortgage payable.  
 29 Paid dividends declared on May 15.

## Instructions:

- Record the preceding events in general journal form.
- Which event do you think had the most significant economic impact on Selfish Gene Company? Are all economically relevant events recorded in the financial records?

## Problem 2-34

## LO2, LO3

SPREADSHEET

## Account Classification and Debit/Credit Relationship

**Instructions:** Using the format provided, identify for each account:

- Whether the account will appear on a balance sheet (B/S), income statement (I/S), or neither (N)
- Whether the account is an asset (A), liability (L), owners' equity (OE), revenue (R), expense (E), or other (O)
- Whether the account is real or nominal
- Whether the account will be "closed" or left "open" at year-end
- Whether the account normally has a debit (Dr.) or a credit (Cr.) balance

Account Title	(1) B/S, I/S, N	(2) A, L, OE, R, E, O	(3) Real or Nominal	(4) Closed or Open	(5) Debit (Dr.) or Credit (Cr.)
Example: Cash	B/S	A	Real	Open	Dr.

- |                           |                      |
|---------------------------|----------------------|
| (a) Unearned Rent Revenue | (d) Accounts Payable |
| (b) Accounts Receivable   | (e) Prepaid Rent     |
| (c) Inventory             | (f) Mortgage Payable |

- (g) Sales
- (h) Cost of Goods Sold
- (i) Dividends
- (j) Dividends Payable
- (k) Interest Receivable
- (l) Wages Expense
- (m) Interest Revenue
- (n) Supplies
- (o) Accumulated Depreciation
- (p) Retained Earnings
- (q) Discount on Bonds Payable
- (r) Goodwill
- (s) Additional Paid-In Capital

**Problem 2-35**

LO3

**Adjusting Entries**

On December 31, Trinkets Supply Company noted the following transactions that occurred during 2011, some or all of which might require adjustment to the books.

- (a) Payment of \$4,300 to suppliers was made for purchases on account during the year and was not recorded.
- (b) Building and land were purchased on January 2 for \$190,000. The building's fair value was \$141,000 at the time of purchase. The building is being depreciated over a 30-year life using the straight-line method, assuming no salvage value.
- (c) Of the \$52,000 in Accounts Receivable, 5% is estimated to be uncollectible. Currently, Allowance for Bad Debts shows a debit balance of \$200.
- (d) On September 1, \$80,000 was loaned to a customer on a 12-month note with interest at an annual rate of 11%.
- (e) During 2011, Trinkets Supply received \$15,200 in advance for services, 80% of which will be performed in 2012. The \$15,200 was credited to Sales Revenue.
- (f) The interest expense account was debited for all interest charges incurred during the year and shows a balance of \$2,300. However, of this amount, \$300 represents a discount on a 60-day note payable, due January 30, 2012.

**Instructions:**

- 1. Give the necessary adjusting entries to bring the books up to date.
- 2. Indicate the net change in income as a result of the foregoing adjustments.

**Problem 2-36**

LO3

**Analysis of Adjusting Entries**

The accountant for Save More Company made the following adjusting entries on December 31, 2011.

(a) Prepaid Rent .....	1,800	
Rent Expense .....		1,800
(b) Advertising Materials .....	1,700	
Advertising Expense .....		1,700
(c) Rent Revenue .....	900	
Unearned Revenue .....		900
(d) Office Supplies .....	1,000	
Office Supplies Expense .....		1,000
(e) Prepaid Insurance .....	1,050	
Insurance Expense .....		1,050

Further information is provided as follows:

- (a) Annual rent is paid in advance every October 1.
- (b) Advertising materials are purchased at one time (June 1) and are used evenly throughout the year.
- (c) Annual rent is received in advance every March 1.
- (d) Office supplies are purchased every July 1 and used evenly throughout the year.
- (e) Yearly insurance premium is payable each August 1.

**Instructions:** For each adjusting entry, indicate the original transaction entry that was recorded.

## Problem 2-37

## LO3

SPREADSHEET

**Adjusting Entries**

The bookkeeper for Joe's Hardware Co. records all revenue and expense items in nominal accounts during the period. The following balances, among others, are listed on the trial balance at the end of the fiscal period, December 31, 2011, before accounts have been adjusted:

	Dr. (Cr.)
Accounts Receivable .....	\$123,000
Allowance for Bad Debts .....	(2,700)
Interest Receivable .....	3,200
Discount on Notes Payable .....	300
Prepaid Real Estate and Personal Property Tax .....	1,600
Salaries and Wages Payable .....	(7,600)
Discount on Notes Receivable .....	(1,800)
Unearned Rent Revenue .....	(5,200)

Inspection of the company's records reveals the following as of December 31, 2011:

- Uncollectible accounts are estimated at 4% of the accounts receivable balance.
- The accrued interest on investments totals \$3,900.
- The company borrows cash by discounting its own notes at the bank. Discounts on notes payable at the end of 2011 are \$1,200.
- Prepaid real estate and personal property taxes are \$1,600, the same as at the end of 2010.
- Accrued salaries and wages are \$8,300.
- The company accepts notes from customers, giving its customers credit for the face of the note less a charge for interest. At the end of each period, any interest applicable to the succeeding period is reported as a discount. Discounts on notes receivable at the end of 2011 are \$1,300.
- Part of the company's properties had been sublet on September 15, 2010, at a rental of \$2,100 per month. The arrangement was terminated at the end of one year.

**Instructions:** Give the adjusting entries required to bring the books up to date.

## Problem 2-38

## LO3, LO4

DEMO PROBLEM

**Cash to Accrual Adjusting Entries and Income Statement**

Gee Enterprises records all transactions on the cash basis. Greg Gee, company accountant, prepared the following income statement at the end of the company's first year of operations:

Gee Enterprises Income Statement For the Year Ended December 31, 2011	
Sales .....	\$252,000
Selling and administrative expenses:	
Salaries expense .....	\$78,000
Rent expense .....	45,000
Commission expense .....	37,800
Equipment .....	30,000
Utilities expense .....	29,000
Insurance expense .....	6,000
Interest expense .....	3,000
Net income .....	<u>228,800</u> <u>\$ 23,200</u>

You have been asked to prepare an income statement on the accrual basis. The following information is given to you to assist in the preparation:

- Amounts due from customers at year-end were \$28,000. Of this amount, \$3,000 will probably not be collected.
- Salaries of \$11,000 for December 2011 were paid on January 5, 2012. Ignore payroll taxes.

- (c) Gee rents its building for \$3,000 a month, payable quarterly in advance. The contract was signed on January 1, 2011.
- (d) The bill for December's utility costs of \$2,700 was paid January 10, 2012.
- (e) Equipment of \$30,000 was purchased on January 1, 2011. The expected life is five years, no salvage value. Assume straight-line depreciation.
- (f) Commissions of 15% of sales are paid on the same day cash is received from customers.
- (g) A 1-year insurance policy was issued on company assets on July 1, 2011. Premiums are paid annually in advance.
- (h) Gee borrowed \$50,000 for one year on May 1, 2011. Interest payments based on an annual rate of 12% are made quarterly, beginning with the first payment on August 1, 2011.
- (i) The income tax rate is 40%. No prepayments of income taxes were made during 2011.

**Instructions:**

1. Prepare adjusting entries to convert the books from a cash to an accrual basis.
2. Prepare the income statement for the year ended December 31, 2011, based on the entries in (1).

**Problem 2-39****LO3****Adjusting and Closing Entries**

Account balances taken from the ledger of Builders' Supply Corporation on December 31, 2011, before adjustment, follow information relating to adjustments on December 31, 2011:

- (a) Allowance for Bad Debts is to be increased to a balance of \$3,000.
- (b) Buildings are depreciated at the rate of 5% per year.
- (c) Accrued selling expenses are \$3,840.
- (d) There are supplies of \$780 on hand.
- (e) Prepaid insurance relating to 2012 totals \$720.
- (f) Accrued interest on long-term investments is \$240.
- (g) Accrued real estate and payroll taxes are \$900.
- (h) Accrued interest on the mortgage is \$480.
- (i) Income taxes are estimated to be 20% of the income before income taxes.

Cash .....	\$ 24,000
Accounts Receivable .....	72,000
Allowance for Bad Debts .....	1,380
Inventory .....	87,570
Long-Term Investments .....	15,400
Land .....	69,600
Buildings .....	72,000
Accumulated Depreciation—Buildings .....	19,800
Accounts Payable .....	35,000
Mortgage Payable .....	68,800
Capital Stock, \$10 par .....	180,000
Retained Earnings, December 31, 2010 .....	14,840
Dividends .....	13,400
Sales .....	246,000
Sales Returns .....	4,360
Sales Discounts .....	5,400
Cost of Goods Sold .....	114,370
Selling Expenses .....	49,440
Office Expenses .....	21,680
Insurance Expense .....	1,440
Supplies Expense .....	5,200
Taxes—Real Estate and Payroll .....	7,980
Interest Revenue .....	660
Interest Expense .....	2,640

**Instructions:**

1. Prepare a trial balance.
2. Journalize the adjustments.
3. Journalize the closing entries.
4. Prepare a post-closing trial balance.

(Note: Although not required, the use of a spreadsheet is recommended for the solution of this problem.)

**Problem 2-40****LO3****Adjusting and Closing Entries and Post-Closing Trial Balance**

Data for adjustments at December 31, 2011, are as follows:

- (a) Taipei International uses a perpetual inventory system.
- (b) An analysis of Accounts Receivable reveals that the appropriate year-end balance in Allowance for Bad Debts is \$750.
- (c) Equipment depreciation for the year totaled \$32,000.
- (d) A recheck of the inventory count revealed that goods costing \$5,600 were wrongly excluded from ending inventory. The goods in question were not shipped until January 3, 2012. A related receivable for \$8,200 was also mistakenly recorded.
- (e) Interest on the note payable has not been accrued. The note was issued on March 1, 2011, and the interest rate is 12%.
- (f) The balance in Insurance Expense represents \$3,000 that was paid for a 1-year policy on October 1. The policy went into effect on October 1.
- (g) Dividends totaling \$7,800 were declared on December 25. The dividends will not be paid until January 15, 2012. No entry was made.

**Taipei International Corporation**  
**Unadjusted Trial Balance**  
**December 31, 2011**

	<u>Debit</u>	<u>Credit</u>
Cash .....	\$ 31,500	
Accounts Receivable .....	25,000	
Allowance for Bad Debts .....		\$ 250
Inventory .....	41,700

**Instructions:**

1. Journalize the necessary adjusting entries. (Ignore income tax effects.)
2. Journalize the necessary closing entries.
3. Prepare a post-closing trial balance.
4. Can a company pay dividends in a year in which it has a net loss? Can a company owe income taxes in a year in which it has a net loss?

## Problem 2-41

## LO3

## Preparation of Work Sheet

Account balances taken from the ledger of High Flying Logistics Co. on December 31, 2011, follow:

Cash .....	\$ 42,000
Accounts Receivable .....	86,000
Allowance for Bad Debts .....	2,400
Inventory .....	97,000
Long-Term Investments .....	31,500
Land .....	62,300
Buildings .....	142,500
Accumulated Depreciation—Buildings .....	32,560
Accounts Payable .....	51,800
Mortgage Payable .....	122,500
Capital Stock, \$5 par .....	200,000
Retained Earnings, December 31, 2010 .....	26,950
Dividends .....	40,540
Sales .....	431,000
Sales Returns .....	9,560
Sales Discounts .....	8,440
Cost of Goods Sold .....	203,420
Selling Expenses .....	58,300
Office Expenses .....	44,200
Insurance Expense .....	12,000
Supplies Expense .....	5,100
Taxes—Real Estate and Payroll .....	15,800
Interest Revenue .....	750
Interest Expense .....	9,300

Information relating to adjustments on December 31, 2011, follows:

- Allowance for Bad Debts is to be increased by \$2,200.
- Buildings have a salvage value of \$7,500. They are being depreciated at the rate of 10% per year.
- Accrued selling expenses are \$9,300.
- There are supplies of \$850 on hand.
- Prepaid insurance relating to 2012 totals \$3,800.
- Total interest revenue earned in 2011 is \$1,900.
- Accrued real estate and payroll taxes are \$3,550.
- Accrued interest on the mortgage is \$1,980.
- Income tax is estimated to be 40% of income.

**Instructions:** Prepare a work sheet showing the net income and balance sheet totals for the year ending December 31, 2011.

## Problem 2-42

## LO3

SPREADSHEET

## Preparation of Work Sheet and Adjusting and Closing Entries

The following account balances are taken from the general ledger of Whitney Corporation on December 31, 2011, the end of its fiscal year. The corporation was organized January 2, 2005.

Cash .....	\$ 40,250
Notes Receivable .....	16,500
Accounts Receivable .....	63,000
Allowance for Bad Debts (credit balance) .....	650
Inventory, December 31, 2011 .....	94,700
Land .....	80,000
Buildings .....	247,600
Accumulated Depreciation—Buildings .....	18,000
Furniture and Fixtures .....	15,000
Accumulated Depreciation—Furniture and Fixtures .....	9,000
Notes Payable .....	18,000
Accounts Payable .....	72,700
Common Stock, \$100 par .....	240,000
Retained Earnings .....	129,125
Sales .....	760,000

Sales Returns and Allowances .....	\$ 17,000
Cost of Goods Sold .....	465,800
Utilities Expense .....	16,700
Property Tax Expense .....	10,200
Salaries and Wages Expense .....	89,000
Sales Commissions Expense .....	73,925
Insurance Expense .....	18,000
Interest Revenue .....	2,600
Interest Expense .....	2,400

Data for adjustments at December 31, 2011, are as follows:

- (a) Depreciation (to nearest month for additions): furniture and fixtures, 10%; buildings, 4%.
- (b) Additions to the buildings costing \$150,000 were completed June 30, 2011.
- (c) Allowance for Bad Debts is to be increased to a balance of \$2,500.
- (d) Accrued expenses: sales commissions, \$700; interest on notes payable, \$45; property taxes, \$6,000.
- (e) Prepaid expenses: insurance, \$3,200.
- (f) Accrued revenue: interest on notes receivable, \$750.
- (g) The following information is also to be recorded:
  - (1) On December 30, the board of directors declared a quarterly dividend of \$1.50 per share on common stock, payable January 25, 2012, to stockholders of record January 15, 2012.
  - (2) Income taxes for 2011 are estimated at \$15,000.
  - (3) The only charges to Retained Earnings during the year resulted from the declaration of the regular quarterly dividends.

**Instructions:**

1. Prepare an 8-column spreadsheet. There should be a pair of columns each for trial balance, adjustments, income statement, and balance sheet.
2. Prepare all the journal entries necessary to record the effects of the foregoing information and to adjust and close the books of the corporation.

## CASES

### Discussion Case 2-43

#### Where Is Your Cash Box?

Consider the following account of a veterinarian attempting to hire his first bookkeeper:

Miss Harbottle, the prospective bookkeeper, paused at the desk, heaped high with incoming and outgoing bills and circulars from drug firms with here and there stray boxes of pills and tubes of udder ointment.

Stirring distastefully among the mess, she extracted the dog-eared old ledger and held it up between finger and thumb. "What's this?"

Siegfried trotted forward. "Oh, that's our ledger. We enter the visits into it from our day book, which is here somewhere." He scabbled about on the desk. "Ah, here it is. This is where we write the calls as they come in."

She studied the two books for a few minutes with an expression of amazement that gave way to grim humor. She straightened up slowly and spoke patiently. "And where, may I ask, is your cash box?"

"Well, we just stuff it in there, you know." Siegfried pointed to the pint pot on the corner of the mantelpiece. "Haven't got what you'd call a proper cash box, but this does the job all right."

Miss Harbottle looked at the pot with horror. Crumpled cheques and notes peeped over the brim at her; many of their companions had burst out on the hearth below. "And you mean to say that you go out and leave that money there day after day?"

“Never seems to come to any harm.” Siegfried replied.

“And how about your petty cash?”

Siegfried gave an uneasy giggle. “All in there, you know. All cash—petty and otherwise.”

(Excerpted from James Herriot, *All Creatures Great and Small*, New York: St. Martin’s Press, 1972.)

Situations similar to the one described here are not unusual for small businesses. How does a business survive with such bad bookkeeping?

### Discussion Case 2-44

#### To Record or Not to Record

Explain why each of the following hypothetical events would not be recorded in a journal entry.

1. A famous and much-beloved movie star is secretly filmed by an investigative news team using your company’s product when she in fact has an endorsement contract with your company’s major competitor.
2. Two of your firm’s top vice presidents have a bitter argument and will probably never speak to each other again.
3. Your company’s chief research chemist is killed in a plane crash.
4. Because of unfavorable economic news, consumer confidence is shaken, and the stock market falls by 10%.
5. You, a small business owner, buy a sofa for your home. You pay with a check drawn on your personal, not your business, checking account.
6. **Disney** decides to build the next Walt Disney World near a large piece of property you own.

### Discussion Case 2-45

#### Is It Time to Revolutionize the Recording of Business Events?

Jim Price and Elaine Bijard are taking an accounting systems course at their local university. They are intrigued with the rapid advances in technology and communication that are occurring in the computer world. Today’s lecture was especially thought provoking. Professor Hansen stated that it is no longer necessary or even desirable to record business events in sequential order as has been traditionally done in accounting journals. The better approach is to capture all data related to a business event in a computer database, including accounting, marketing, and production data, and to prepare reports for many different users from a single source. The database would be a management information database, not just one for accounting reports.

Jim argues that such an approach would make it more difficult for accountants to keep control of input and ensure the integrity of their financial reports, but Elaine feels that the sooner the accountants recognize the potential, the better they can serve management’s varied needs. What advantages and disadvantages do you see coming from a database approach to recording? How can Jim’s objections be met?

### Discussion Case 2-46

#### When Cash Basis Is Different from Accrual Basis

Alice Guth operates a low-impact aerobics studio. Alice has been in business for three years and has always had her financial statements prepared on a cash basis. This year, Alice’s accountant has suggested that accrual-based financial statements would give a more accurate picture of the performance of the business. Alice’s friend Frank Geller tells her that, in his experience, accrual-based financial statements tell pretty much the same story as cash-basis statements.

Under what circumstances would the cash basis and the accrual basis of accounting yield quite different pictures of a firm’s operating performance? Under what circumstances would the cash basis and the accrual basis show approximately the same picture?

### Discussion Case 2-47

#### The Impact of Computers on Financial Reporting

Computers have drastically altered the way accounting records are maintained. Almost all businesses now keep at least some of their accounting records on computers. However, the most visible output of the accounting system, the financial information

included in the annual report, is still prepared and disseminated the old-fashioned way—on paper. What types of changes in companies' annual reports are likely to occur over the next 10 to 15 years as a result of the increasingly widespread use of computers?

**Discussion**  
**Case 2-48**

**But I Need More Timely Information!**

Julie is successful in her position as a consultant for Worldwide Enterprises. She has selectively invested her money in stocks of several companies. She receives the annual reports and faithfully analyzes them as she was taught in her university accounting class. She is concerned, however, with the impact that events have on the financial reports between years. Julie understands that quarterly reports are available from the companies upon request but that they are not audited and thus may not be reliable. She wonders whether they can be trusted. Even quarterly reports might not be frequent enough. Wouldn't it be useful if she could use her computer to interrogate the company's computer and obtain information anytime she wanted it?

She decides to write for advice from the chief accountants of the companies in which she holds stock. As chief accountant, how would you address Julie's concerns?

**Case 2-49**

**Deciphering Financial Statements (Lockheed Martin Corporation)**

Locate the 2006 financial statements for **Lockheed Martin Corporation** on the Internet.

Reconstruct the company's adjusted trial balance as of December 31, 2006.

**Case 2-50**

**Writing Assignment (I am going to be an accountant—not a bookkeeper!)**

Some accounting students feel that the mechanics of accounting (journal entries and T-accounts) are for bookkeepers. Because these students are training to be accountants, they see no need to spend a great deal of time studying these mechanics.

In one page, explain why accountants must have a thorough understanding of journal entries and T-accounts, even though these tools are mostly the domain of bookkeepers.

**Case 2-51**

**Researching Accounting Standards**

To help you become familiar with the accounting standards, this case is designed to take you to the FASB's Web site and have you access various publications. Access the FASB's Web site at <http://www.fasb.org>. Click on "Pronouncements & EITF Abstracts."

For this case, we will use *Statement of Financial Accounting Concepts No. 6*. Open *Concepts Statement No. 6*.

1. Read paragraph 137. Based on the information in this paragraph, what is a transaction?
2. Read paragraph 139. What is the difference between transactions with "cash consequences" and transactions involving "cash"?
3. Read paragraph 141. Based on the information in this paragraph, what is the primary difference between an accrual and a deferral?

**Case 2-52**

**Ethical Dilemma (The art of making adjusting entries)**

Refer back to the section of the chapter entitled "Preparing Adjusting Entries." Who determines how long buildings and furniture and equipment are to last? Who determines the dollar amount of accounts receivable that are doubtful?

Suppose we were to change our asset depreciation on the buildings and the furniture and equipment from 5% and 10%, to 4% and 8%, respectively. What would be the effect on net income? Would it increase or decrease? Likewise, suppose our estimate of the balance in Allowance for Bad Debts was reduced to \$1,000. What would be the effect on net income?

Is the adjusting entry process an exact science where accountants can determine exactly how well a company has done for a period? Or is accounting an art that requires significant judgment on the part of the accountant?

What are the dangers for the accountant when making an estimate in an area (like Bad Debts) where significant judgment is required?

## Case 2-53

SPREADSHEET

**Cumulative Spreadsheet Analysis**

Beginning with Chapter 2, each chapter in this text will include a spreadsheet assignment based on the financial information of a fictitious company named Skywalker Enterprises. The assignments start out simple—in this chapter you are not asked to do much more than set up financial statement formats and input some numbers. In succeeding chapters, the spreadsheets will get more complex so that by the end of the course you will have constructed a spreadsheet that allows you to forecast operating cash flows for five years in the future, adjust your forecast depending on the operating parameters that you think are most reasonable, and analyze the impact of a variety of accounting assumptions on the reported numbers.

So, let's get started with the first spreadsheet assignment.

- The following numbers are for Skywalker Enterprises for 2011.

Short-Term Loans Payable .....	\$ 30
Unearned Revenue .....	35
Interest Expense .....	27
Paid-In Capital in Excess of Par .....	150
Cash .....	30
Other Long-Term Liabilities .....	253
Dividends .....	0
Accumulated Depreciation .....	27
Other Long-Term Assets .....	40
Inventory .....	459
Cost of Goods Sold .....	1,557
Long-Term Debt .....	621
Investment Securities (current) .....	70
Income Tax Expense .....	12
Retained Earnings (as of January 1, 2011) .....	93
Receivables .....	81
Long-Term Investments .....	250
Sales .....	2,100
Accounts Payable .....	222
Other Equity .....	72
Property, Plant, and Equipment .....	597
Other Operating Expenses .....	480

Your assignment is to create a spreadsheet containing a balance sheet and an income statement for Skywalker Enterprises.

- Skywalker is wondering what its balance sheet and income statement would have looked like if the following numbers were changed as indicated.

	Change	
	From	To
Sales	\$2,100	\$2,190
Cost of Goods Sold	1,557	1,650
Other Operating Expenses	480	495

Create a second spreadsheet with the numbers changed as indicated. (*Note:* After making these changes, your balance sheet may no longer balance.) Eliminate any discrepancy by increasing or decreasing Short-Term Loans Payable as much as necessary.

C H A P T E R

3

THE BALANCE SHEET AND NOTES  
TO THE FINANCIAL STATEMENTS

“Every man in uniform gets a bottle of Coca-Cola for 5 cents, wherever he is and whatever it costs.” So said Robert Woodruff, **Coca-Cola** chairman, as U.S. soldiers entered the fighting in World War II. By 1941, Coca-Cola was such a part of U.S. life that Coke also became part of the war machine. In 1943, General Dwight Eisenhower requested the necessary equipment and bottles to refill 10 million Coca-Colas for soldiers in the European theater. Allied Headquarters in North Africa operated 64 bottling plants during the war.

From its beginnings in Atlanta, Georgia, in which 1886 sales averaged nine drinks per day, to its current worldwide presence in which 2007 sales averaged 1.5 billion servings per day, Coca-Cola has grown to the point that it is now the most recognizable trademark on the planet—with sales in over 200 countries around the world.

Pharmacist Dr. John S. Pemberton mixed the first kettle of Coca-Cola in his backyard in 1886. Frank Robinson, Pemberton's bookkeeper and partner, named the drink and came up with the unique script that is Coke's signature. Bottled Coke (in contrast to Coca-Cola served at a soda fountain) was first offered in 1894, and five years later, Joseph Whitehead and Benjamin Thomas purchased the exclusive rights to bottle Coca-Cola for \$1. Within 20 years, 1,000 bottlers around the world were bottling Coke. In 1915, the contoured bottle that symbolizes Coca-Cola was developed, and its shape was finally granted a patent in 1977.

With Coca-Cola's remarkable success, one must wonder what company executives were thinking in 1985 when they made a historic blunder. In April of that year, the company changed its secret formula, terminated the original Coke, and introduced “new” Coke. The public reaction was overwhelmingly negative, with consumers organizing and calling for the return of the original. After four months, the company reintroduced the original formula as Coca-Cola Classic.

Today, over 17,000 soft drink servings from The Coca-Cola Company are consumed around the world every second of every day.

Owning the most valuable brand name in the world (**Interbrand**, an international brand valuation company, estimated the value of the Coca-Cola brand name in 2007 at \$65.324 billion), one might expect Coca-Cola's balance sheet to contain a significant amount assigned to this asset. One look at the company's balance sheet (see Exhibit 3-1), however, reveals that very little is recorded on Coke's balance sheet related to its intangible assets.

As illustrated with the brand name example, Coke's balance sheet is interesting as much for what it excludes as for what it includes. As an additional example, Coke owns approximately 35% of **Coca-Cola Enterprises**, a bottling company. Coca-Cola Enterprises has \$18.7 billion in liabilities; however, because The Coca-Cola Company does not own a controlling interest (more than 50%) of this bottler, none of these liabilities are reported in Coke's balance sheet. Coke also owns significant percentages (but less than 50%) of other bottlers, which together report approximately \$17.5 billion in liabilities. Again, Coke reported none of these liabilities in its balance sheet.

Coke's balance sheet appears relatively simple—deceptively simple. Although we are each comfortable with accounts such as Cash, Inventory, Accounts Payable, and Reinvested (or Retained) Earnings, a firm's balance sheet becomes much more complex as its business gets more complex. It is important that we understand what the balance sheet tells us, what it does not tell us, and the role that the financial statement notes play in assisting us in interpreting the financial statements.

## LEARNING OBJECTIVES

- 1 Describe the specific elements of the balance sheet (assets, liabilities, and owners' equity), and prepare a balance sheet with assets and liabilities properly classified into current and noncurrent categories.
- 2 Identify the different formats used to present balance sheet data.
- 3 Analyze a company's performance and financial position through the computation of financial ratios.
- 4 Recognize the importance of the notes to the financial statements, and outline the types of disclosures made in the notes.
- 5 Understand the major limitations of the balance sheet.

## QUESTIONS

1. As stated above, the Coca-Cola trademark has been estimated to be worth \$65.324 billion. The value of this trademark is NOT reported in the Coca-Cola balance sheet in Exhibit 3-1, but trademarks valued at \$2.045 billion are reported in 2006. What do you think is the difference between these trademarks and the original Coca-Cola trademark?
2. The liabilities of the Coca-Cola bottlers of which The Coca-Cola Company owns a significant percentage total \$36.2 billion. As stated above, NONE of these liabilities is included in the balance sheet of The Coca-Cola Company. Look at Exhibit 3-1—what amount of total liabilities does The Coca-Cola Company report as of December 31, 2006?
3. Look at Exhibit 3-1. As of December 31, 2006, which amount is greater—total current assets or total current liabilities? If you were a banker making a short-term loan to a company, would you prefer that company to have more current assets or more current liabilities?

Answers to these questions can be found on page 123.

Coca-Cola's balance sheet, like the balance sheet of any company, lists the organization's accounting assets and liabilities. However, this does not mean that the balance sheet includes complete, up-to-date information about all of the organization's economic resources and obligations. As described in Chapter 1, the choice of how to include information in the financial statements is often a trade-off between relevance and reliability. The balance sheet has been criticized for being *too* reliable, with too many assets being recorded at historical cost instead of market value, and with many important economic assets (such as **Microsoft's** management or **Intel's** market dominance) not being recorded at all. A characteristic of recent FASB statements is an effort to improve the relevance of the balance sheet.

Even with its limitations, the balance sheet is still *the* fundamental financial statement. In fact, the income statement and statement of cash flows can be thought of as simply providing supplemental information about certain balance sheet accounts: The income statement gives a detailed description of some of the yearly changes in retained earnings, and the statement of cash flows details the reasons for the change in the cash balance.

This chapter focuses on the strengths and limitations of the balance sheet and describes how companies report their assets, liabilities, and owners' equity. The chapter also introduces some financial ratios used to analyze the balance sheet and outlines the type of information contained in the notes to the financial statements.

## Elements of the Balance Sheet

**1** Describe the specific elements of the balance sheet (assets, liabilities, and owners' equity), and prepare a balance sheet with assets and liabilities properly classified into current and non-current categories.

**WHY** Identification and measurement of assets and liabilities is fundamental to the practice of accounting. Assets and liabilities are usually separated into current and noncurrent categories so that a financial statement user can assess the firm's ability to meet its obligations as they come due.

**HOW** Conceptual definitions, traditional accounting practice, and, in some cases, specific accounting standards determine when economic items should be reported as accounting assets or liabilities. Current items are those expected to be used or paid within one year. When classifying assets and liabilities, the key considerations are how management intends to use an asset and when it expects to pay a liability.

Twenty years after his victory at the Battle of Hastings in 1066, William the Conqueror commissioned a royal survey of all the property in England. The survey was described as follows by one of the defeated Anglo-Saxons:

He sent his men all over England into every shire and had them find out how many hundred hides there were in the shire, or what land and cattle the king himself had in the country, or what dues he ought to have in twelve months from the shire. Also, he had a record made of how much land his archbishops had, and his bishops and his abbots and his earls, and what or how much everybody had who was occupying land in England, in land or cattle, and how much money it was worth.

The survey thoroughly frightened the people of England, and it was called “Domesday [or Domesday] Book” because it caused them to think of the final reckoning at the Last Judgment.<sup>1</sup>

Had the original Domesday Book also included a listing of all the obligations, or liabilities, of the people of England, it would have comprised a balance sheet for England as of the year 1086. A **balance sheet** is a listing of an organization’s **assets** and **liabilities** as of a certain point in time. The difference between assets and liabilities is called **equity**. Equity can be thought of as the amount of the assets that the owners of the organization can really call their own, the amount that would be left if all the liabilities were paid. The balance sheet is an expression of the basic accounting equation<sup>2</sup>:

$$\text{Assets} = \text{Liabilities} + \text{Owners' equity}$$

The three elements found on the balance sheet were precisely defined in Chapter 1. These definitions are repeated in Exhibit 3-2.

Text not available due to copyright restrictions

These definitions contain several key words and phrases that are briefly discussed here.

- *Probable*. Contrary to popular belief, accounting is not an exact science. Business is full of uncertainty, and this is acknowledged by the inclusion of the word *probable* in the definitions of assets and liabilities.
- *Future economic benefit*. Although the balance sheet summarizes the results of past transactions and events, its primary purpose is to help forecast the future. Hence, the only items included as assets and liabilities are those with implications for the future.

<sup>1</sup> Elizabeth M. Hallam, *Domesday Book Through Nine Centuries* (Thomas and Hudson, 1986), pp. 16, 17.

<sup>2</sup> In abbreviated form, the basic accounting equation can be expressed as  $A = L + E$ . This can be rearranged algebraically to yield  $E = A - L$ . Notice the similarity with Einstein’s famous equation:  $E = mc^2$ . Researchers thus far have had no luck in finding an underlying connection that would unify the fields of physics and accounting.

- *Obtained or controlled.* Accountants have a phrase, “substance over form,” meaning that financial statements should reflect the underlying economic substance, not the superficial legal form. If a company economically controls the future economic benefits associated with an item, that item qualifies as an asset whether it is legally owned or not.
- *Obligation.* This term includes legal commitments as well as moral, social, and implied obligations. Again, the phrase “substance over form” applies.
- *Transfer assets or provide services.* Most liabilities involve an obligation to transfer assets in the future. However, an obligation to provide a service is also a liability. For example, having received your tuition check, your college or university now has a liability to you to provide top-notch education.
- *Past transactions or events.* Assets and liabilities arise from transactions or events that have already happened. Consider a company that promises in May to pay a student \$4,000 for a summer internship starting in June. If the company declares bankruptcy, does the student get to collect the \$4,000? No, because the transaction, the actual summer internship work, has not yet occurred.<sup>3</sup>

Assets include financial items such as cash, receivables, and investments in financial instruments. Assets also include costs that are expected to provide future economic benefits. For example, expenditures made for inventories, equipment, and patents are expected to help generate revenues in future periods. Most assets are measured in terms

of historical cost. As mentioned in Chapter 1 and as outlined later in this chapter, however, some assets are measured in terms of replacement cost, market value, net realizable value, or discounted present value.

Liabilities include obligations with amounts denominated in precise monetary terms, such as accounts payable and long-term debt. The amounts of other liabilities must be estimated based on expectations about future events. These types of liabilities include warranties, pension obligations, and environmental liabilities.

The total liability amount measures the amounts of the assets of the company that are claimed by various creditors. Owners’ equity measures the amounts of the total assets of the company that remain and are thus claimed by the ownership group. Owners’ equity equals the net assets of a company, or the difference between total assets and total liabilities. Owners’ equity arises from investment by owners and is increased by net income and decreased by net losses and distributions to owners. Other items that can impact owners’ equity are outlined later in the chapter.

## stop & think

Alternatively, *asset* could be defined as everything legally owned by a company, and *liability* defined as all legal obligations. Which ONE of the following would NOT be a problem of these legalistic definitions?

- Companies would be tempted to hire teams of lawyers to carefully craft contracts in order to obtain favorable accounting classification of assets and liabilities.
- Companies could use legal technicalities in order to hide their economic liabilities in legally separate companies.
- These law-based definitions of assets and liabilities would put too much power into the hands of the FASB.
- The identification of accounting assets and liabilities would be greatly influenced by changing governmental standards of ownership.

## Classified Balance Sheets

Although there are no standard categories that must be used, the general framework for a balance sheet shown in Exhibit 3-3 is representative and will be used in this chapter. Balance sheet items are generally classified as current (or short-term) items and non-current (or long-term) items. How long is *current*? For most companies, *current* means

<sup>3</sup> Whether the transaction has already occurred is sometimes difficult to determine. For example, if the student signs a summer internship contract guaranteeing payment of \$4,000 whether or not any work is done, the contract signing itself might be viewed as creating an asset for the student and a liability for the company. This exact issue is important in determining the proper accounting treatment for long-term leases.

## EXHIBIT 3-3

## Categories of a Classified Balance Sheet

**ASSETS**

## Current assets:

- Cash
- Investment securities
- Accounts and notes receivable
- Inventories
- Other current assets, such as prepaid expenses

## Noncurrent assets:

- Investments
- Property, plant, and equipment
- Intangible assets
- Other noncurrent assets, such as deferred income tax assets

**LIABILITIES**

## Current liabilities:

- Accounts and notes payable
- Accrued expenses
- Current portion of long-term obligations
- Other current liabilities, such as unearned revenues

## Noncurrent liabilities:

- Long-term debt, such as notes, bonds, and mortgages payable
- Long-term lease obligations
- Deferred income tax liabilities
- Other noncurrent liabilities, such as pension obligations

**OWNERS' EQUITY**

## Contributed capital:

- Capital stock
- Additional paid-in capital

## Retained earnings

- Other equity, such as treasury stock (a subtraction)
- Accumulated other comprehensive income

one year or less. Accordingly, assets expected to be used and liabilities expected to be paid or otherwise satisfied within a year are current items. When assets and liabilities are so classified, the difference between current assets and current liabilities may be determined. This difference is referred to as the company's **working capital**—the liquid buffer available in meeting financial demands and contingencies of the near future.

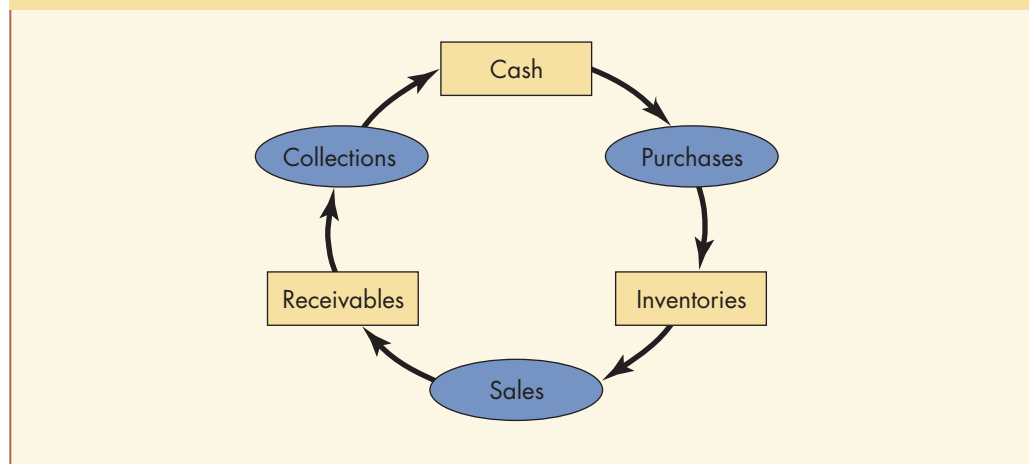

The division of assets and liabilities into just two categories—current and noncurrent—is in some sense an arbitrary partition. Users of financial statements could desire a different partition. For example, some users exclude inventory when evaluating a company's working capital position. Users are certainly free to recast the balance sheet in whatever manner they wish. However, although there is some arbitrariness in the current/noncurrent classifications, its popularity among users as an indication of liquidity suggests that the classification does meet the test of decision usefulness.

## Current Assets

The most common **current assets** are cash, receivables, and inventories. As depicted in Exhibit 3-4, the normal operating cycle involves the use of cash to purchase

## EXHIBIT 3-4

## Operating Cycle

inventories, the sale of inventories resulting in receivables, and ultimately the cash collection of those receivables. In some industries, such as lumber and shipbuilding, this normal operating cycle is longer than one year. When the operating cycle is longer than a year, the length of the operating cycle should be used in defining current assets and liabilities. In practice, almost all companies use the 1-year period.<sup>4</sup>

In addition to cash, receivables, and inventories, current assets typically include prepaid expenses and investments in certain securities. Prepaid items are a bit different from other current assets in that they are not expected to be converted into cash within a year. Instead, their expiration makes it possible to conserve cash that otherwise would have been required. Prepayments for periods extending beyond a year should be reported as noncurrent assets.

Debt and equity securities (often called bonds and stocks) that are purchased mainly with the intent of reselling the securities in the short term are called **trading securities**. Trading securities are classified as current assets. Other investments in debt and equity securities are classified as current or noncurrent depending on whether management intends to convert them into cash within one year or one operating cycle, whichever is longer.<sup>5</sup>

The reported amounts for current assets are measured in a variety of ways. Cash and receivables are reported at their net realizable values. Thus, current receivable balances are reduced by allowances for estimated uncollectible accounts. Investments in debt and equity securities are reported, in most cases, at current market value. Inventories are reported at cost (FIFO, LIFO, etc.) or on the lower-of-cost-or-market basis. Prepaid expenses are reported at their historical costs.

Current assets are normally listed on the balance sheet before the noncurrent assets and in the order of their liquidity, with the most liquid terms (those closest to cash) first. This ordering is a tradition, not a requirement. Most utilities and insurance companies reverse the order and report their longer-lived assets first. In addition, as illustrated later,

non-U.S. companies frequently start their balance sheets with their long-term assets.

Some exceptions to the normal classification of assets should be noted. If management intends to use an asset for a noncurrent purpose, that asset should be classified as noncurrent in spite of the usual classification. For example, cash that is restricted

## caution

As illustrated with current assets, a balance sheet is not restricted to reporting historical cost.

<sup>4</sup> In classifying items not related to the operating cycle, a 1-year period is always used as the basis for current classification. For example, a note receivable due in 15 months that arose from the sale of land held as an investment would be classified as noncurrent even if the normal operating cycle exceeds 15 months.

<sup>5</sup> *Statement of Financial Accounting Standards No. 115*, "Accounting for Certain Investments in Debt and Equity Securities" (Norwalk, CT: Financial Accounting Standards Board, 1993), par. 17.

to a noncurrent use (e.g., for the acquisition of noncurrent assets or for the liquidation of noncurrent debts) should not be included in current assets. Similarly, land that is held for resale within the coming year should be classified as current. The overriding criterion is management intent.

## Noncurrent Assets

Assets not qualifying for presentation under the current heading are classified under a number of noncurrent headings. Noncurrent assets may be listed under separate headings, such as Investments; Property, Plant, and Equipment; Intangible Assets; and Other Noncurrent Assets.

**Investments** Investments held for such long-term purposes as regular income, appreciation, or ownership control are reported under the heading Investments. Debt and equity securities purchased as investments that management does not intend to sell in the coming year are classified as long-term investments. Acquisitions of the stock of other companies made in order to exert influence or control over the actions of those companies are accounted for using the equity method, which is explained in Chapter 14. These investments are classified as long-term investments. The Investments heading also includes other miscellaneous investments not used directly in the operations of the business, such as land held for investment purposes. Many long-term investments are reported at cost. However, more and more long-term assets are being reported at current market values. These deviations from cost will be discussed in later chapters.

fyi

When an investment in another company represents majority ownership of that company, no single investment amount is reported in the balance sheet. Instead, all of the individual assets and liabilities of the other company are included, or consolidated, in the balance sheet.

## Property, Plant, and Equipment

Properties of a tangible and relatively permanent character that are used in the normal business operations are reported under Property, Plant, and Equipment or other appropriate headings, such as Land, Buildings, and Equipment. Land, buildings, machinery, tools, furniture, fixtures, and vehicles are included in this section of the balance sheet. If an asset, such as land, is being held for speculation, it should be classified as an investment rather than under the

heading Property, Plant, and Equipment. Tangible properties, except land, are normally reported at cost less accumulated depreciation. If the current value of a tangible property is less than its depreciated cost, the asset is said to be impaired. Guidelines for when and how to recognize asset impairments are given in Chapter 11.

**Intangible Assets** The long-term rights and privileges of a nonphysical nature acquired for use in business operations are often reported under the heading Intangible Assets. Included in this class are items such as goodwill, patents, trademarks, franchises, copyrights, formulas, leaseholds, and customer lists. Intangible assets are an increasingly important part of most companies' economic value; accordingly, the FASB has placed more emphasis on the accounting for intangibles. Some intangible assets are depreciated, or amortized, in the same way as tangible assets. However, many intangible assets, including goodwill, are not amortized on a systematic basis. Instead, these intangible assets are regularly tested to determine whether their value has been impaired. The details of accounting for intangibles are in Chapters 10 and 11.

**Other Noncurrent Assets** Those noncurrent assets not suitably reported under any of the previous classifications may be listed under the general heading "Other Noncurrent Assets" or may be listed separately under special descriptive headings. Such assets include, for example, long-term advances to officers, long-term receivables, deposits made with taxing authorities and utility companies, and deferred income tax assets. **Deferred income tax assets** arise when taxable income exceeds reported income for

PhotoDisc/Getty Images

Properties used in normal business operations, such as the printing press shown here, are classified as “property, plant, and equipment” on the balance sheet.

the period and the difference is expected to “reverse” in future periods. One common source of deferred income tax assets is large restructuring charges (including write-downs in asset values and recognition of relocation obligations) that are not yet deductible for income tax purposes; the deferred income tax asset reflects the expected future tax benefits that will arise when the elements of the restructuring charge become tax deductible in the future. The computation and reporting of deferred income tax assets is somewhat complex as well as interesting (as will be explained in Chapter 16).

## Current Liabilities

**Current liabilities** are those obligations that are reasonably expected to be paid using current assets or by creating other current liabilities. Generally, if a liability is reasonably expected to be paid within 12 months, it is classified as current. As with receivables, payables arising from the normal operating activities may be classified as current even if they are not to be paid within 12 months as long as they are to be paid within the operating cycle, which may exceed 12 months.

In addition to accounts payable and short-term borrowing, current liabilities also include amounts for accrued expenses. Common accruals include salaries and wages, interest, and taxes. The Current Liabilities section also includes amounts representing the portion of the long-term obligations due to be satisfied within one year.

The current liability classification generally does not include the following items that normally would be considered current.

- *Debts to be liquidated from a noncurrent sinking fund.* A **sinking fund** is comprised of cash and investment securities that have been accumulated for the stated purpose of repaying a specific loan. If the sinking fund is classified as a noncurrent asset, the associated loan is also classified as noncurrent.
- *Short-term obligations to be refinanced.* If a short-term loan is expected to be refinanced (either with a new long-term loan or with the issuance of equity) or paid back with the proceeds of a replacement loan, the existing short-term loan will not require the use of current assets even though it is scheduled to mature within a year. To reflect the economic substance of this situation, the existing loan is not classified as current as long as (1) the intent of the company is to refinance the loan on a long-term basis and (2) the company’s intent is evidenced by an actual refinancing after the balance sheet date but before the financial statements are finalized or by the existence of an explicit refinancing agreement.<sup>6</sup>

fyi

The international standard for classification of short-term obligations to be refinanced is slightly different. According to IAS 1, for the obligation to be classified as long term the refinancing must take place by the balance sheet date, not the later date when the financial statements are finalized. The FASB is considering adopting this more stringent condition.

**Callable Obligations** Classification problems can arise when an obligation is callable by a creditor because it is difficult to determine exactly when the obligation will be paid. A **callable obligation** is one that is payable on demand and thus has no specified due

<sup>6</sup> *Statement of Financial Accounting Standards No. 6, “Classification of Short-Term Obligations Expected to Be Refinanced”* (Stamford, CT: Financial Accounting Standards Board, 1975).

date. If the terms of an agreement specify that an obligation is due on demand or will become due on demand within one year from the balance sheet date, the obligation should be classified as current.<sup>7</sup>

A loan can become callable because the debtor violates the provisions of the debt agreement. Loan agreement clauses that identify specific deficiencies (e.g., missing two consecutive interest payments) that can cause a loan to be immediately callable are referred to as **objective acceleration clauses**. If these specific deficiencies exist as of the balance sheet date, the associated liability should be classified as current unless the lender has agreed to waive the right to receive immediate payment or the deficiency has been fixed (e.g., an interest payment made) by the time the financial statements are issued.

In some cases, the debt agreement does not specifically identify the circumstances under which a loan will become callable, but it does indicate some general conditions that permit the lender to accelerate the due date. This type of provision is known as a **subjective acceleration clause** because the violation of the conditions cannot be objectively determined. Examples of the wording in such clauses are “if the debtor fails to maintain satisfactory operations . . .” or “if a material adverse change occurs. . .” If invoking of the clause is deemed probable, the liability should be classified as a current liability. If invoking of the clause is considered to be reasonably possible but not probable, only a note disclosure is necessary, and the liability continues to be classified as noncurrent.<sup>8</sup>

fyi

Large banks have entire “compliance” departments that verify whether borrowers are following the terms of their loan agreements.

Examples of the wording in such clauses are “if the debtor fails to maintain satisfactory operations . . .” or “if a material adverse change occurs. . .” If invoking of the clause is deemed probable, the liability should be classified as a current liability. If invoking of the clause is considered to be reasonably possible but not probable, only a note disclosure is necessary, and the liability continues to be classified as noncurrent.<sup>8</sup>

## Noncurrent Liabilities

Obligations not reasonably expected to be paid or otherwise satisfied within 12 months (or within the operating cycle if it exceeds 12 months) are classified as *noncurrent liabilities*. Noncurrent liabilities are generally listed under separate headings, such as Long-Term Debt, Long-Term Lease Obligations, Deferred Income Tax Liability, and Other Noncurrent Liabilities.

**Long-Term Debt** Long-term notes, bonds, mortgages, and similar obligations not requiring the use of current funds for their retirement are generally reported on the balance sheet under the heading Long-Term Debt.

Long-term debt is reported at its discounted present value, which is initially measured by the proceeds from the debt issuance. When the amount borrowed is not the same as the amount ultimately required to be repaid, called the *maturity value*, a discount or premium is included as an adjustment to the maturity value to ensure that the debt is reported at its discounted present value. A discount should be subtracted from the amount reported for the debt, and a premium should be added to the amount reported for the debt.

When a note, a bond issue, or a mortgage formerly classified as a long-term obligation becomes payable within a year, it should be reclassified and presented as a current liability except when the obligation is to be refinanced, as discussed earlier, or is to be paid out of a fund classified as noncurrent.

**Long-Term Lease Obligations** Some leases of property, plant, and equipment are financially structured so that they are essentially debt-financed purchases. The FASB has established criteria to determine which leases are to be accounted for as purchases, or capital leases, rather than as ordinary operating leases. In accounting for capital leases, the present value of the future minimum lease payments is recorded

<sup>7</sup> *Statement of Financial Accounting Standards No. 78*, “Classification of Obligations That Are Callable by the Creditor” (Stamford, CT: Financial Accounting Standards Board, 1983), par. 5.

<sup>8</sup> *FASB Technical Bulletin, 79-3*, “Subjective Acceleration Clauses in Long-Term Debt Agreements” (Stamford, CT: Financial Accounting Standards Board, December 1979), par. 3.

as a long-term liability. That portion of the present value due within the next year is classified as a current liability. The long-term lease obligation reported by some firms is often more interesting for what it doesn't include than for what it does include. For example, as of February 2, 2006, the present value of future minimum lease payments for capital leases for **Albertson's, Inc.**, a supermarket chain, was \$856 million. At the same time, the present value of future minimum lease payments for operating leases (an amount not reported in the balance sheet) was approximately \$5.1 billion. Be patient; in Chapter 15, you will learn more about leases than you ever wanted to know.

**Deferred Income Tax Liability** Almost all large companies include a **deferred income tax liability** in their balance sheets. This liability can be thought of as the income tax expected to be paid in future years on income that has already been reported in the income statement but which, because of the tax law, has not yet been taxed. The liability is valued using the enacted income tax rates expected to prevail in the future when the income is taxed. However, because the liability is not reported at its present (discounted) value, some analysts disregard it when evaluating a company's debt position. The accounting for deferred income taxes is very complex and controversial and has been the subject of considerable debate.

**Other Noncurrent Liabilities** Those noncurrent liabilities not suitably reported under the separate headings outlined earlier may be listed under this general heading or may be listed separately under special descriptive headings. Examples of such long-term liabilities are pension plans and obligations resulting from advance collections on long-term contracts.

**Contingent Liabilities** Past activities or circumstances may give rise to possible future liabilities although obligations do not exist on the date of the balance sheet. These possible claims are known as **contingent liabilities**. They are potential obligations involving uncertainty as to possible losses. As future events occur or fail to occur, this uncertainty will be resolved. A good example of a contingent liability is the cosigner's obligation on a co-signed loan. The cosigner has no existing obligation but may have one in the future, depending on whether the borrower defaults on the loan.

Contingent liabilities are accounted for according to the judgment of management about the probability of the contingent obligation's becoming an actual obligation. If a future payment is considered probable, the liability should be recorded by a debit to a loss account and a credit to a liability account. If future payment is possible, the contingent nature of the loss is disclosed in a note to the financial statements. If future payment is remote, no accounting action is necessary.<sup>9</sup>

A contingent liability is distinguishable from an estimated liability. An **estimated liability** is a definite obligation with only the amount of the obligation in question and subject to estimation at the balance sheet date. Examples of estimated liabilities are pensions, warranties, and deferred taxes. Some liabilities combine the characteristics of contingent and estimated liabilities. A good example is a company's obligation for environmental cleanup costs. In many cases, a company is not certain it is liable for environmental damage

until the obligation is confirmed in the courts. However, even after the cleanup obligation is verified, estimating its amount is quite difficult; the cleanup typically extends over several years, the amount of the cost to be shared by other polluting companies is

## caution

This description makes it sound as if accounting for contingencies is cookbook simple, but the words "probable" and "possible" represent very complex concepts. For example, when exactly does a future event (such as a thunderstorm tomorrow) stop being possible and start being probable?

<sup>9</sup> *Statement of Financial Accounting Standards No. 5, "Accounting for Contingencies"* (Stamford, CT: Financial Accounting Standards Board, 1975), pars. 8–13.

## stop & think

The current/noncurrent classification scheme is only one way to split assets and liabilities into two groups. Below are three alternate 2-way classification schemes. Which one would be most useful for: (1) A financial analyst trying to compare the company's core business with the core businesses of similar companies? (2) A U.S. congressperson concerned about the relocation of operations overseas? (3) An analyst trying to estimate the current market value of a company?

- Located in the United States and located in a non-U.S. country
- Used in the primary line of business and used in secondary lines of business
- Measured at current fair value and measured on some other basis

uncertain, and governmental environmental regulations can change at any time. If no reasonable estimate of an obligation can be made, it is not recognized as a liability in the balance sheet, but the nature of the obligation is disclosed in the financial statement notes. Chapter 19 contains more details on the accounting for contingent and estimated liabilities.

### Owners' Equity

The method of reporting the owners' equity varies with the form of the business unit. Business units are typically divided into three categories: **proprietorships**, **partnerships**, and **corporations**.<sup>10</sup> In the case of a proprietorship, the owner's equity in assets is reported by means of a single capital account. The balance in this account is the cumulative result of the owner's investments and withdrawals as well as past earnings and losses. In a partnership, capital accounts are established for each partner.

Capital account balances summarize the investments and withdrawals and shares of past earnings and losses of each partner and thus measure the partners' individual equities in the partnership assets.

In a corporation, the difference between assets and liabilities is referred to as **stockholders' (shareholders') equity** or *owners' equity*. In presenting the owners' equity on the balance sheet, a distinction is made between the equity originating from the stockholders' investments, referred to as **contributed capital** or **paid-in capital**, and the equity originating from earnings, referred to as **retained earnings**.

Most financial statement analysis calculations use total stockholders' equity and do not distinguish between contributed capital and retained earnings. However, for some purposes the distinction can be very important. Historically, companies could legally pay cash dividends only in an amount not exceeding the retained earnings balance. This legal restriction has been relaxed in most states, but the retained earnings amount is still viewed as an informal limit to cash dividend payments.

**Contributed Capital** Contributed (or paid-in) capital is generally reported in two parts: (1) **capital stock** and (2) **additional paid-in capital**. The amount reported on the balance sheet as capital stock usually reflects the number of shares issued multiplied by the par value or stated value per share. Historically, par value was the market value of the shares at the time of their issue. In cases where shareholders invested less than the par value of the stock, courts sometimes held that the shareholders were contingently liable for the difference if corporate resources were insufficient to satisfy creditors. Today, most stocks are issued with low or no par values; par value no longer has much significance.

The two types of capital stock are **preferred stock** and **common stock**. In general, preferred stockholders are paid a fixed annual cash dividend and have a higher

<sup>10</sup> In addition to these three general categories, there are many hybrids. Some of these are limited partnerships, S corporations, and limited liability companies (LLCs). In general, these organizations are taxed as partnerships but have some of the limited liability advantages of a corporation. All of the large accounting firms are organized as limited liability partnerships (LLP) to insulate uninvolved partners from client lawsuits directed at individual partners. According to IRS records, about 72% of U.S. businesses are organized as sole proprietorships.

likelihood of recovering their investment if the company goes bankrupt.<sup>11</sup> Common stockholders are the real owners of the corporation; they vote for the board of directors and have legal ownership of the corporate assets after the claims of all creditors and preferred stockholders have been satisfied. For accounting purposes, when a corporation has issued more than one class of stock, the stock of each class is reported separately.

Additional paid-in capital represents investments by stockholders in excess of the par or stated value of the capital stock. Additional paid-in capital is also affected by a whole host of diverse transactions such as stock repurchases, stock dividends, share retirements, and stock conversions. In a sense, additional paid-in capital is the “dumping ground” of the Equity section.

**Retained Earnings** The amount of undistributed earnings of past periods is reported as retained earnings. An excess of dividends and losses over earnings results in a negative retained earnings balance called a **deficit**. As detailed in Chapter 13, retained earnings can also be reduced as a result of stock retirements and the issuance of stock dividends. A sample of large positive and negative retained earnings balances for U.S. companies is given in Exhibit 3-5.

**EXHIBIT 3-5** Large Positive and Negative Retained Earnings Balances for the Year 2007 (in millions)

Company Name	Retained Earnings
ExxonMobil	\$228,518
Citigroup	121,920
General Electric	117,362
Qwest Communications	-43,084
JDS Uniphase	-67,451
Time Warner	-88,579

Source: Standard and Poor's COMPUSTAT.

Portions of retained earnings are sometimes reported as restricted and unavailable as a basis for cash dividends. This ensures that a company does not distribute cash dividends to shareholders to the extent that the ability to repay creditors or make other planned expenditures comes into question. Retained earnings restrictions can be part of a loan agreement or can be voluntarily adopted by a company (called an *appropriation*). These restrictions are usually disclosed in a financial statement note.

**Other Equity** In addition to the two major categories of contributed capital and retained earnings, the Equity section can include a couple of other items: treasury stock and accumulated other comprehensive income. These are described in detail in later chapters, but they are briefly discussed here.

<sup>11</sup> In essence, preferred stock is an investment that has some of the characteristics of a loan: fixed periodic payment, no vote for the board of directors, and higher priority than common stock in case of bankruptcy liquidation. Increasingly, finance wizards are creating securities that combine characteristics of both debt and equity. The accounting question is where to put these creations. Distinguishing between debt and equity is addressed more fully in Chapter 13.

fyi

For those interested in stock tips, buy the stocks of companies that announce treasury stock purchases. Those companies tend to outperform the market in the three to four years following the announcement.

**Treasury stock.** When a company buys back its own shares, accountants call the repurchased shares **treasury stock**. Treasury shares can be retired, or they can be retained and reissued later. When the shares are retained, the amount paid to repurchase the treasury stock is usually shown as a subtraction from total stockholders' equity. In essence, a treasury stock purchase returns funds to shareholders.

**Accumulated other comprehensive income.** Beginning in 1998, the FASB required companies to summarize changes in owners' equity exclusive of net income and contributions by and distributions to owners. This summary, termed **other comprehensive income**, is typically provided by companies as part of their statement of stockholders' equity. The corresponding balance sheet item reflecting the cumulative total of these items over the years is titled Accumulated Other Comprehensive Income. The three most common components are certain unrealized gains and losses on investments, foreign currency adjustments, and certain unrealized gains and losses on derivative contracts.

**Unrealized gains and losses on available-for-sale securities.** Available-for-sale securities are those that were not purchased with the immediate intention to resell but also are not meant to be held permanently. These securities are reported in the balance sheet at their current market values. The unrealized gains and losses from market value fluctuations are not included in the income statement but are instead shown as a separate equity item.<sup>12</sup>

**Foreign currency translation adjustments.** Almost every U.S. multinational corporation has a foreign currency translation adjustment in its Equity section. This adjustment arises from the change in the equity of foreign subsidiaries (as measured in terms of U.S. dollars) that occurs during the year as a result of changes in foreign currency exchange rates. These adjustments are discussed in Chapter 22.

**Unrealized gains and losses on derivatives.** A **derivative** is a financial instrument, such as an option or a future, that derives its value from the movement of a price, an exchange rate, or an interest rate associated with some other item. For example, an option to purchase a stock becomes more valuable as the price of the stock increases, and the right to purchase foreign currency at a fixed exchange rate becomes more valuable as that foreign currency becomes more expensive. As will be discussed in Chapter 19, companies often use derivatives in order to manage their exposure to risk stemming from changes in prices and rates. Some of the unrealized gains and losses from the fluctuations in the value of derivatives are reported as part of accumulated other comprehensive income.

<sup>12</sup> One never knows where controversy and compromise will rear their ugly heads. Accounting purists hoped to include these unrealized gains and losses in the income statement. Companies (particularly banks) fearful of the volatility that this would add to the income statement opposed the treatment. This equity item is the FASB's compromise.

**Minority interest.** When one company owns controlling interest (more than 50%) of the common stock of one or more other companies, the financial results of this group of companies are combined into a set of consolidated financial statements. The objective of consolidated financial statements is to reflect in one set of financial statements the results of all companies owned or controlled by the parent corporation. In the consolidated balance sheet, **minority interest** is the amount of equity investment made by outside shareholders to consolidated subsidiaries that are not 100% owned by the parent. For example, if the parent owns 80% of the subsidiary, then the minority interest is the amount of financing provided by the outside shareholders who own the other 20% of the subsidiary. This minority interest is reported as part of owners' equity, but it is clearly listed separately from the parent's owners' equity.<sup>13</sup>

**International reserves.** The first thing one notices about the Equity portion of the balance sheets of many foreign companies, particularly those from countries influenced by the British accounting tradition, is the extended description of the company's "reserves." In familiar terms, reserves are merely different equity categories similar in nature, depending on the reserve, to additional paid-in capital or to restricted retained earnings. Reserve accounting is very important because in many foreign countries the legal ability to pay cash dividends is strictly tied to the balances in various reserve accounts. Common reserve category titles are revaluation reserve and capital redemption reserve. Reserves are discussed in more detail in Chapter 13, which is devoted to the Equity section.

## Offsets on the Balance Sheet

As illustrated in the preceding discussion, a number of balance sheet items are reported at gross amounts not reflecting their actual values, thus requiring the recognition of offset balances in arriving at proper valuations. In the case of assets, for example, an allowance for bad debts is subtracted from the sum of the customer accounts in reporting the net amount estimated as collectible; accumulated depreciation is subtracted from the related buildings and equipment balances in reporting the costs of the assets still assignable to future revenues. In the case of liabilities, a loan discount is subtracted from the maturity value of the loan in reporting the loan at its discounted present value. In the Stockholders' Equity section of the balance sheet, treasury stock is deducted in reporting total stockholders' equity.

The types of offsets described here, utilizing contra accounts, are required for proper reporting of particular balance sheet items. In addition, accounting rules require some assets and liabilities to be offset against one another, resulting in just one net amount being reported in the balance sheet. For example, a company's pension obligation is offset against the assets in the pension fund, and only the net number goes into the balance sheet. Deferred tax assets and liabilities are also offset against each other.

The cases just described are the exceptions. The general rule is that assets, liabilities, and equities should not be offset when compiling the balance sheet. Offsetting, or netting, can significantly reduce the information value of the balance sheet. If offsetting were taken to its extreme, the balance sheet would be just one line, total equity, embodying total liabilities offset against total assets.

## Format of the Balance Sheet

**2** Identify the different formats used to present balance sheet data.

**WHY** The arrangement of items within the balance sheet is meant to emphasize certain items and to highlight important relationships.

**HOW** In most industries, assets and liabilities are listed in order of their liquidity with cash first, followed by the other current items. For some industries, particularly those with large investments in long-term assets, property, plant, and equipment items are listed first.

When preparing a balance sheet, the order of asset and liability classifications may vary, but most businesses emphasize working capital position and liquidity, with assets and liabilities presented in the order of their liquidity. An exception to this order is generally found in the Property, Plant, and Equipment section where the more permanent assets with longer useful lives are listed first. The balance sheet of The Coca-Cola Company, reproduced in Exhibit 3-1, is an example of current assets and of current liabilities being listed first.

As mentioned earlier, in some industries, such as the utility industry, the investment in plant assets is so significant that these assets are placed first on the balance sheet. Also, because long-term financing is so important in these industries, the equity capital and long-term debt obtained to finance plant assets are listed before current liabilities. To illustrate this type of presentation, the 2006 balance sheet for **Consolidated Edison** is given in Exhibit 3-6. Consolidated Edison, established in 1884, provides electric service to almost all of New York City.

As seen in the Consolidated Edison illustration in Exhibit 3-6, balance sheets are generally presented in comparative form. With comparative reports for two or more dates, information is made available concerning the nature and trend of financial

changes taking place within the periods between balance sheet dates. Currently, a minimum of two years of balance sheets and three years of income statements and cash flow statements are required by the SEC to be included in the annual report to shareholders.

### Format of Foreign Balance Sheets

Foreign balance sheets are frequently presented with property, plant, and equipment and intangibles listed first. In addition, foreign balance sheets frequently list the current assets and the current liabilities together and label the difference between the two as net current assets or working capital. This manner of reporting the current items reflects the business reality that a person starting a company needs to get long-term financing (long-term debt and equity) to finance the acquisition of long-term assets as well as to finance the portion of current assets that can't be acquired by incurring current liabilities. For example, if a company can acquire all of its inventory through credit purchases (accounts payable) and if the supplier will wait for payment until the

inventory is sold and the cash collected, no long-term financing is needed to purchase the initial stock of inventory.

An example of a typical foreign balance sheet is provided in Exhibit 3-7, which contains the March 31, 2007, balance sheet of **British Telecommunications**. In addition to the format difference already mentioned, this balance sheet also reflects several other differences between a U.S. balance sheet and the balance sheet of a foreign company. The most obvious of these differences is in terminology. However, with some thought and a little accounting intuition, one can deduce that the item “ordinary shares” is what we would call

## stop & think

From the information in Exhibit 3-7, compute total assets for **British Telecommunications** as of March 31, 2007.

- £18,559 million
- £43,099 million
- £24,540 million
- £21,052 million
- £32,630 million

“common stock,” “share premium” is “additional paid-in capital,” and so forth. More substantive differences, which aren’t apparent just from looking at Exhibit 3-7, arise from international differences in accounting methods. For example, the £1,683 million deferred tax liability (included in “provisions for liabilities and charges”) is computed based on the deferred-tax items that are expected to become payable in the foreseeable future. If British Telecommunications had used U.S. GAAP, an additional £74 million in deferred tax liability would have been recognized for items expected to become

Minority interests . . . . .	34
<b>Total equity</b> . . . . .	<b>22,364</b>
	<b>£32,630</b>

payable after this “foreseeable” time horizon. As another example, because of differences in accounting for sale and leaseback transactions between international accounting standards and U.S. GAAP, British Telecommunications excludes from its liabilities £1,095 million in lease obligations (associated with sale and leaseback transactions), which would have to be reported under U.S. GAAP. The details of these differences, and many others, will be discussed in subsequent chapters. The important point to note here is that foreign balance sheets differ from U.S. balance sheets in both format and in the accounting methods used in computing the balance sheet numbers.

## Balance Sheet Analysis

**3** Analyze a company’s performance and financial position through the computation of financial ratios.

**WHY** A financial statement number, in isolation, tells you very little. To really understand the financial statements, you must look at relationships among the numbers.

**HOW** Computing a financial ratio is simply a matter of dividing one financial statement number by another. Ratios of balance sheet numbers reveal information about financing choices and liquidity. Ratios of a balance sheet and an income statement number tell you about how efficiently an asset is being managed.

The purpose of classifying and ordering balance sheet items is to make the balance sheet easier to use. Look at Exhibit 3-8 and compare the two balance sheets for the fictitious company Techtronics Corporation. The balance sheet on the left is just a list of assets, liabilities, and equities in alphabetical order, like a simple account listing. The balance sheet on the right uses the classification and ordering format described in the previous section. You decide which is easier to interpret.

The Techtronics numbers will be used to illustrate standard balance sheet analysis techniques. The simple techniques described in this overview will probably not help you to pick “winning” stocks and become a millionaire, but they are a start. It is said that Warren Buffett (worth about \$52 billion at last count) picks his investments only after “a careful balance sheet analysis.”<sup>14</sup>

Balance sheet information is analyzed in two major ways:

1. Relationships between balance sheet amounts
2. Relationships between balance sheet and income statement amounts

In general, relationships between financial statement amounts are called **financial ratios**.

### Relationships Between Balance Sheet Amounts

Financial ratios comparing one balance sheet amount to another yield information about the operating and financial structure of a business. Three examples, which are discussed here, are liquidity, overall leverage, and asset mix.

**Liquidity** The relationship between current assets and current liabilities can be used to evaluate the liquidity of a company. **Liquidity** is the ability of a firm to satisfy its short-term obligations. Many companies with fantastic long-run potential have been killed by short-run liquidity problems.

A common indicator of the overall liquidity of a company is the current ratio. The **current ratio** is computed by dividing total current assets by total current liabilities. For Techtronics, the current ratio is computed as follows:

$$\text{Current ratio: } \frac{\text{Current assets}}{\text{Current liabilities}} = \frac{\$812,600}{\$499,500} = 1.63$$

Historically, the rule of thumb has been that a current ratio below 2.0 suggests the possibility of liquidity problems. However, advances in information technology have enabled companies to be much more effective in minimizing the need to hold cash,

inventories, and other current assets. As a result, current ratios for successful companies these days are frequently less than 1.0. Note that this is just a rule of thumb; proper evaluation of a company's liquidity involves comparing the current year's current ratio to current ratios in prior years and comparing the company's current ratio to those for other companies in the same industry.

Minimum current ratio requirements are frequently included in loan agreements. A typical agreement might state that if the current ratio falls below a certain level, the lender can declare the loan in default and require immediate repayment. This type of minimum current ratio restriction forces the borrower to maintain its liquidity and gives the lender an increased assurance that the loan will be repaid. When **loan covenant** restrictions are violated, the lender usually waives the right to immediate repayment, sometimes in exchange for a renegotiation of the loan at a higher interest rate. Exhibit 3-9 contains the 2006 current ratios for selected companies. Note that **eBay** and Microsoft have higher current ratios relative to the other companies. This is an indication of the need for liquidity in technology industries. As technology changes, companies in that industry need to be able to quickly adapt, and that ability requires liquidity. Note also **Disney's** low current ratio. At first glance you might think that 0.9 is dangerously low. Before jumping to that conclusion, think about what Disney's current assets are. Disney has cash and accounts receivable but very little inventory. They make movies and they run theme parks and these ventures require very little inventory. Therefore, the "secret" for Disney's low current ratio is its ability to collect its receivables quickly and reinvest the money into long-term productive assets.

Another ratio used to measure a firm's liquidity is the **quick ratio**, also known as the **acid-test ratio**. This ratio is computed as total *quick assets* divided by total current liabilities, where quick assets are defined as cash, investment securities, and net receivables. For Techtronics, the quick ratio is computed as follows:

$$\text{Quick ratio: } \frac{(\text{Cash} + \text{Securities} + \text{Receivables})}{\text{Current liabilities}} = \frac{\$483,700}{\$499,500} = 0.97$$

The quick ratio indicates how well a firm can satisfy existing short-term obligations with assets that can be converted into cash without difficulty. For a bank considering a 3-month loan or for a supplier considering selling to a company on short-term credit, the quick ratio yields information about the likelihood it will be repaid. Techtronics' quick ratio indicates it has \$0.97 in quick assets for every \$1.00 in current liabilities.

A lender wants to lend on a short-term basis to a company with high current and quick ratios, thus ensuring repayment. However, maintaining an excessively high current ratio is an inefficient use of company resources. Having excess investment securities will increase a company's current and quick ratios, giving comfort to lenders, but the resources used to buy those excess securities might be better utilized by buying trucks or buildings, paying off debts, or if nothing else, returning the cash

## EXHIBIT 3-9

## Selected 2006 Ratios

	McDonald's	Microsoft	Disney	Coca-Cola	eBay
Current ratio	1.2	2.2	0.9	0.9	2.0
Debt ratio	46.7%	42.4%	47.0%	43.5%	19.2%
Asset mix—PP&E*	71.8%	4.4%	28.6%	23.0%	7.4%
Asset turnover	0.74	0.64	0.57	0.80	0.44
Return on assets	12.2%	18.1%	5.6%	17.0%	8.3%
Return on equity	22.9%	31.4%	10.6%	30.0%	10.3%

\* PP&E = property, plant, and equipment

to the owners for their personal use. A common characteristic of almost all financial ratios is that a ratio that deviates too much from the norm, either above or below, indicates a possible problem.<sup>15</sup>

## caution

A current ratio that is too high can also indicate trouble. Excess current assets, resulting in a high current ratio, can represent an inefficient use of resources. Cash management and just-in-time inventory systems are designed to keep current asset levels low.

**Overall Leverage** Comparing the amount of liabilities to the amount of assets held by a business indicates the extent to which borrowed funds have been used to **leverage** the owners' investments and increase the size of the firm. One frequently used measure of leverage is the **debt ratio**, computed as total liabilities divided by total assets. The debt ratio is frequently used as an indicator of the overall ability of a company to repay its debts. An intuitive interpretation of the debt ratio is that it represents the proportion

of borrowed funds used to acquire the company's assets. For Techtronics, the debt ratio is computed as follows:

$$\text{Debt ratio: } \frac{\text{Total liabilities}}{\text{Total assets}} = \frac{\$1,098,700}{\$1,952,600} = 0.56$$

In other words, Techtronics borrowed 56% of the money it needed to buy its assets. The higher the debt ratio, the higher the likelihood that some of the debt might not be repaid. The general rule of thumb is that debt ratios should be below 50%. Again, this varies widely from one industry to the next. A bank, for example, could easily have a debt ratio in excess of 95%.

See Exhibit 3-9; eBay has the lowest debt ratio, with each of the other companies having a debt ratio around 50%. As a general rule, companies in mature industries have a higher amount of debt than in newer industries because the proven track records of the companies make lenders willing to provide more debt financing.

**Asset Mix** A large fraction of a bank's assets is in financial investments, either loans receivable or securities. Property, plant, and equipment (PP&E) compose only a small fraction of a bank's assets. By comparison, the bulk of the assets of an electric utility is property, plant, and equipment. A company's **asset mix**, the proportion of total assets in each asset category, is determined to a large degree by the industry in which the company operates.

Asset mix is calculated by dividing each asset amount by the sum of total assets. For example, to determine what fraction of Techtronics' assets is buildings and equipment, perform the following calculation:

$$\frac{\text{Buildings and equipment}}{\text{Total assets}} = \frac{\$732,900}{\$1,952,600} = 0.38$$

Techtronics holds 38% of its assets in the form of buildings and equipment. To determine whether this proportion is appropriate requires looking at the comparable number for other firms in Techtronics' industry. We can tell, for example, that Techtronics is probably not an electric utility, since property, plant, and equipment are 69% ( $\$18,445,000,000/\$26,699,000,000$ ) of the total assets of Consolidated Edison in 2006 (see Exhibit 3-6). Similar computations and comparisons can be done with any of the asset categories.

Not surprisingly, **McDonald's** has a large amount of its assets invested in property, plant, and equipment as shown in Exhibit 3-9. It is also not surprising that Microsoft and eBay have very little invested in these long-term assets. What is somewhat surprising

<sup>15</sup> Working capital management involves making sure a company does not have excess resources tied up in the form of cash, receivables, and inventory. An example is a just-in-time inventory system. An excess \$1 million in working capital implicitly increases finance charges by \$100,000 per year if the interest rate on borrowing is 10%.

is Coca-Cola's low level of investment in PP&E. As mentioned at the beginning of the chapter, however, many of Coca-Cola's bottling facilities are owned by subsidiaries and are not reported on Coca-Cola's balance sheet.

## Relationships Between Balance Sheet and Income Statement Amounts

Financial ratios comparing balance sheet and income statement amounts reveal information about a firm's overall profitability and about how efficiently the assets are being used. For this discussion, the following income statement data will be assumed for Techtronics: sales, \$4,000,000; net income, \$150,000.

**Efficiency** The balance sheet of Techtronics reveals that Techtronics has \$1,952,600 in assets. Are those assets being used efficiently? A financial ratio that gives an overall measure of company efficiency is called **asset turnover** and is computed as follows:

$$\text{Asset turnover: } \frac{\text{Sales}}{\text{Total assets}} = \frac{\$4,000,000}{\$1,952,600} = 2.05$$

Techtronics' asset turnover ratio of 2.05 means that for each dollar of assets, Techtronics is able to generate \$2.05 in sales. The higher the asset turnover ratio, the more efficient the company is at using its assets to generate sales.

As indicated in Exhibit 3-9, Coca-Cola is the most efficient of the five companies in using assets to generate sales. Every dollar of Coke's assets generates \$0.80 in annual revenue.

Similar computations can be made for specific assets. The general principle is that in measuring whether a company has too much or too little of an asset, the amount of that asset is compared to an income statement item indicating the amount of business activity related to that asset. For example, evaluating the level of inventory involves comparing the inventory level to cost of goods sold for the year. Specific efficiency ratios for accounts receivable, inventory, and fixed assets will be described in the appropriate chapters later in the text.

**Overall Profitability** Techtronics' net income was \$150,000. Is that a lot? It depends. If Techtronics is a small backyard computer-repair business, net income of \$150,000 is a lot. If Techtronics is a multinational consumer electronics firm, net income of only \$150,000 is terrible. To appropriately measure profitability, net income must be compared to some measure of the size of the investment. Two financial ratios used to assess a firm's overall profitability are **return on assets** and **return on equity**. Companies purchase assets with the intent of using them to generate profits. Return on assets is computed as follows:

$$\text{Return on assets: } \frac{\text{Net income}}{\text{Total assets}} = \frac{\$150,000}{\$1,952,600} = 7.7\%$$

Techtronics' return on assets of 7.7% means that one dollar of assets generated 7.7 cents in net income. As with all ratios, this number must be evaluated in light of Techtronics' return on assets in previous years and the ratios for other firms in the same industry.

Note from Exhibit 3-9 that Microsoft and Coca-Cola stand out in terms of profitability, with Disney bringing up the rear. The 18.1% return on assets earned by Microsoft and the 17.0% return on assets earned by Coca-Cola are unusually high.

One important factor not included when using return on assets to evaluate profitability is the effect of leverage. The stockholders of Techtronics did not have to invest the entire \$1,952,600 needed to purchase the assets; they leveraged their investment through borrowing. Return on equity (ROE) measures the percentage return on the actual investment made by stockholders and is computed as follows:

$$\text{Return on equity: } \frac{\text{Net income}}{\text{Stockholder's equity}} = \frac{\$150,000}{\$853,900} = 17.6\%$$

Techtronics stockholders earned 17.6 cents for each dollar of equity investment. Computing return on equity is like taking a child's temperature: This one number is a summary indicator of the health of the entity. As a rule of thumb, companies with return on equity significantly below 15% are doing poorly. Companies with return on equity consistently above 15% are doing well.

## caution

A low ROE tells you only that a company is sick. Other financial ratios are the diagnostic tools used to pinpoint the exact nature of the illness.

Coca-Cola demonstrates how the effective use of debt can be of benefit to shareholders. Coca-Cola's shareholders earned a 30.0% return on their investment in 2006 (Exhibit 3-9). Contrast that with eBay's return of 10.3%. Also note that because eBay has a small debt ratio, there is a relatively small difference between the company's return on assets and its return on equity.

## Notes to the Financial Statements

**4** Recognize the importance of the notes to the financial statements, and outline the types of disclosures made in the notes.

**WHY** The notes to the financial statements contain information relating to assumptions made, accounting methods applied, and other information relevant to those using the financial statements. Users must understand this information in order to properly interpret the numbers contained in the financial statements.

**HOW** The following important information is included in the financial statement notes: A description of the accounting policies, details of summary totals, disclosure of significant items that fail to meet the recognition criteria, and supplemental information required by FASB and SEC standards.

The basic financial statements do not provide all of the information desired by users. Among other things, creditors and investors need to know what methods of accounting were used by the company to arrive at the balances in the accounts. Sometimes the additional information desired is descriptive and is reported in narrative form. In other cases, additional numerical data are reported. To interpret the numbers contained in the financial statements and make useful comparisons with other companies, one must be able to read the notes and understand the assumptions applied.

The following types of notes are typically included by management as support to the basic financial statements.

- Summary of significant accounting policies.
- Additional information (both numerical and descriptive) to support summary totals found on the financial statements, usually the balance sheet. This is the most common type of note used.
- Information about items that are not reported on the basic statements because the items fail to meet the recognition criteria but are still considered to be significant to users in their decision making.
- Supplementary information required by the FASB or the SEC to fulfill the full disclosure principle.

These notes are considered to be an integral part of the financial statements and, unless specifically excluded, are covered by the auditor's opinion.

## Summary of Significant Accounting Policies

GAAP requires that information about the accounting principles and policies followed in arriving at the amounts in the financial statements be disclosed to the users. The Accounting Principles Board concluded in *APB Opinion No. 22*:

. . . When financial statements are issued purporting to present fairly financial position, cash flows, and results of operations in accordance with generally accepted accounting principles, a description of all significant accounting policies of the reporting entity should be included as an integral part of the financial statements.<sup>16</sup>

Examples of the required disclosures of accounting policies include those relating to subsidiaries that have been included in the consolidated statements, depreciation methods (is straight-line used?), inventory valuation method (FIFO, LIFO, or something else?), implementation of any accounting changes, and special revenue recognition practices. This information is usually included as the initial note or as a separate summary preceding the notes to the financial statements. The summary of significant accounting policies for The Walt Disney Company is presented in Note 2 to the company's 2006 financial statements. Much of the discussion is devoted to new accounting standards released by the FASB during the preceding year. Companies are required to outline the new standards that they are adopting for the first time. For example, in 2006 Disney examined the provisions of *FIN No. 48* on accounting for uncertainty in income taxes; this fact is described in the note. In addition, companies are required to outline what impact, if any, the future adoption of new accounting standards will have on their financial statements.

## Additional Information to Support Summary Totals

In order to prepare a balance sheet that is brief enough to be understandable but complete enough to meet the needs of users, notes are added that provide either quantitative or narrative information to support the postretirement amounts. For example, only summary totals for property, plant, and equipment and long-term debt are given in the balance sheet itself; the breakdown of these two items by category is usually given in the notes. Most large firms also have extended notes relating to leases, income taxes, and postemployment benefits. If a firm has entered into long-term leases, the length of the leases and the required future payments are outlined in a note. The income tax note identifies the major areas of difference between a company's financial accounting and tax accounting records. The tax note is also the place one has to look to find out what

a company's actual income tax bill is. The postretirement benefit note describes a company's pension plan and plan for coverage of retiree medical benefits. Examination of this note reveals the large amount of information that underlies the single summary numbers recognized in the balance sheet. Examples of these are Note 8 (income taxes) and Note 9 (pensions) to Disney's 2006 financial statements. Disney also includes notes detailing the summary totals for other assets (Note 12) and borrowings (Note 7).

fyi

Financial statements in the United Kingdom are usually much more condensed than U.S. financial statements. For example, all current assets and current liabilities are often summed and reported as one net number. The details are given in the notes.

## Information About Items Not Included in Financial Statements

As discussed in Chapter 1, items included in the financial statements must meet certain recognition criteria. Even though an item might not meet the criteria for recognition in the statements, information concerning the item might be relevant to users.

<sup>16</sup> *Opinions of the Accounting Principles Board, No. 22, "Disclosure of Accounting Policies"* (New York: American Institute of Certified Public Accountants, 1972), par. 8, as amended.

Loss contingencies are good examples of this type of item. As discussed earlier, if the probability of paying a contingent liability is estimated as “possible” or if the contingent liability is “probable but not reasonably estimable,” the contingency should not be recognized but should be disclosed in the notes to the financial statements. The information provided should include as much data as possible to assist the user in evaluating the risk of the loss contingency.<sup>17</sup> Along these lines, most large companies have an interesting note describing the lawsuits outstanding against them.

Conceptually, disclosure should not be an alternative to recognition. In other words, if an item meets the recognition criteria given in Chapter 1, it should be included in the financial statements themselves, not just disclosed in a note. However, recall that the FASB’s standard-setting process has been described as a “balancing act” between conceptual purity and business practicality. One of the tools in this balancing act is disclosure. Two examples are the accounting for stock-based compensation and for derivative financial instruments.

- In 1993, the FASB tentatively decided to require firms to recognize as compensation expense the value of stock options given to employees. This decision caused an angry uproar in the business community. After deliberation, the FASB decided to use note disclosure as a compromise; recognition of the stock option values was not required; the values needed only be disclosed in a note. After this experience with disclosure, in 2004 the FASB again decided to require firms to recognize a stock option expense (starting in 2006).<sup>18</sup>
- With derivative financial instruments (e.g., options, futures, swaps, and other exotic financial contracts), the FASB responded to a public demand (backed by requests from the SEC) for more information about derivatives by requiring extensive disclosure.<sup>19</sup> This disclosure standard was a stopgap measure while the FASB studied the issue further with the view of establishing a recognition standard (which was accomplished with FASB *Statement No. 133*).

## stop & think

In analyzing a company, do users care whether they get the information from the financial statements themselves or from the notes? The answer to this question is “yes, in some circumstances.” To understand this better, identify in which **ONE** of the following circumstances the financial analyst would be **MOST LIKELY** to prefer recognition over disclosure.

- The analyst is performing a detailed financial statement analysis on a single company.
- The analyst is performing a detailed financial statement comparison of two companies.
- The analyst is performing a summary analysis of 50 different companies in 12 different industries.

One of the accounting controversies involved in the **Enron** scandal that exploded in 2001 and 2002 (outlined in Chapter 1) was the inadequacy of the disclosure in the notes to Enron’s financial statements. For example, the existence of the controversial LJM2 investment partnerships, which were used to “hedge” (some would say “hide”) \$1 billion in Enron investment losses, was not disclosed anywhere in Enron’s financial statements notes and was outlined in just three brief paragraphs in the company’s proxy statement (which is sent to all shareholders in advance of the annual shareholder meeting).

## Supplementary Information

The FASB and SEC require that supplementary information must be reported in separate schedules. For example, the FASB requires the disclosure of quarterly information for

<sup>17</sup> Companies sometimes emphasize the importance of contingent liabilities by showing a category for them on the balance sheet with a zero balance and a reference to the contingent liabilities note.

<sup>18</sup> *Statement of Financial Accounting Standards No. 123* (revised 2004), “Share-Based Payment” (Norwalk, CT: Financial Accounting Standards Board, 2004) and *Statement of Financial Accounting Standards No. 123*, “Accounting for Stock-Based Compensation” (Norwalk, CT: Financial Accounting Standards Board, 1995).

<sup>19</sup> *Statement of Financial Accounting Standards No. 119*, “Disclosure about Derivative Financial Instruments and Fair Value of Financial Instruments” (Norwalk, CT: Financial Accounting Standards Board, 1994).

certain companies. While the information in these notes is important to the users, it may not be covered by the auditors' opinion. A note that is not covered by the opinion is marked "unaudited."

Another category of supplementary information is business segment information. For companies with geographically dispersed operations, this segment information outlines the results for the different geographic segments. For example, Coca-Cola reports that only 29.1% of its net operating revenues come from North America. For firms with diverse product lines (such as **PepsiCo**, with substantial operations in soft drinks and snack foods), segment information for the different product lines is presented.<sup>20</sup>

In addition to FASB requirements, the SEC also requires the disclosure of supplemental information about financial statement information for those publicly traded firms falling under the SEC's jurisdiction. For example, if the level of property, plant, and equipment is significant, the SEC requires a firm to provide details about changes in gross property, plant, and equipment and about changes in accumulated depreciation. The SEC also requires disclosure of the details of the changes in short-term borrowing and the average interest rate on short-term loans during the period.

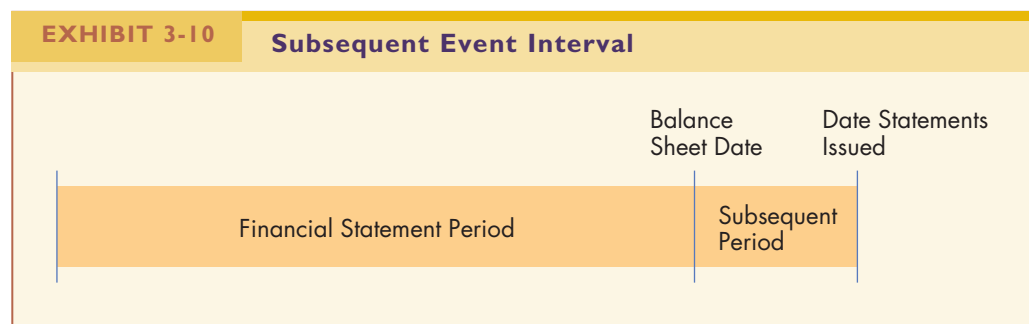

## Subsequent Events

Although a balance sheet is prepared as of a given date, it is usually between one and three months before the financial statements are issued and made available to external users. For example, the SEC requires large publicly traded companies to file their financial statements within 60 days of the fiscal year-end. During this time, the accounts are analyzed, adjusting entries are prepared, and for most companies, an independent audit is completed. During this "subsequent period," business doesn't shut down while the accountants huddle over the books. Business continues, and events could take place that have an impact upon the balance sheet and the other basic financial statements for the preceding year. Some of these events could even affect the amounts reported in the statements. These events are referred to in the accounting literature as **subsequent events** or **post-balance sheet events**. This subsequent period is illustrated in Exhibit 3-10.

Two different types of subsequent events require consideration by management and evaluation by the independent auditor.<sup>21</sup>

- Those that require retroactive recognition and thus affect the amounts to be reported in the financial statements for the preceding accounting period.
- Those that do not require recognition but should be disclosed in the notes to the financial statements.

The first type of subsequent event usually provides additional information that affects the amounts included in the financial statements. The reported amounts in

<sup>20</sup> *Statement of Financial Accounting Standards No. 131*, "Disclosures about Segments of an Enterprise and Related Information" (Norwalk, CT: Financial Accounting Standards Board, 1997).

<sup>21</sup> *AICPA Statement on Auditing Standards No. 1, Codification of Auditing Standards and Procedures, Section 560*, "Subsequent Events," pars. .02–.05.

several accounts, such as Allowance for Bad Debts, Warranty Liability, and Income Taxes Payable, reflect estimates of the expected value. These estimates are based on information available as of a given date. If a subsequent event provides new information that shows that the conditions existing as of the balance sheet date were different from those assumed when making the estimate, a change in the amount to be reported in the financial statements is required.

To illustrate this type of event, assume that a month after the balance sheet date, the company learns that a major customer has filed for bankruptcy. This information was not known as of the balance sheet date, and only ordinary provisions were made in determining the Allowance for Bad Debts. In all likelihood, the customer was already in financial difficulty at the balance sheet date, but it was not general knowledge. The filing of bankruptcy reveals that the conditions at the balance sheet date were different than those assumed in preparing the statements, and a further adjustment to both the balance sheet and income statement is indicated.

The second type of subsequent event does not reveal a difference in the conditions as of the balance sheet date but involves an event that is considered so significant that its disclosure is highly relevant to readers of the financial statements. These events usually affect the subsequent year's financial statements and thus may affect decisions currently being made by users. Examples of such events include a casualty that destroys material portions of a company's assets, acquisition of a major subsidiary, sale of significant amounts of bonds or capital stock, and losses on receivables when the cause of the loss occurred subsequent to the balance sheet date. Information about this type of event is included in the notes to the financial statements and serves to notify the reader that the subsequent event could affect the predictive value of the statements.

The most common types of subsequent events reported by companies include events associated with debt refinancing, debt reduction, or incurring significant amounts of new debt; post-balance sheet developments associated with litigation; and changes in the status of a proposed merger or acquisition. Of course, many business events that occur during this subsequent period are related only to the subsequent year and therefore have no impact on the preceding year's financial statements.

As an example of the types of disclosure associated with subsequent events, the following items were included in Note 28 to **Ford Motor Company's** financial statements dated December 31, 2006:

- During the first quarter of 2007, management committed to sell all or part of Aston Martin Lagonda Group Limited, a wholly owned subsidiary, through a stock sale expected to be completed in the first half of 2007.
- Also during the first quarter of 2007, management committed to sell Automobile Protection Corporation, a wholly owned subsidiary, and expects the sale to be completed in the first half of 2007.
- Hourly employees in Ford North America who accepted an early retirement or separation package are expected to leave the Company by September 2007, though employees have an opportunity to rescind acceptance until the time of separation. Subsequent to year-end, there have been approximately 1,700 rescissions, which would have reduced the 2006 pre-tax charge by about \$150 million.

**International Accounting for Subsequent Events** The International Accounting Standards Board (IASB) has released a standard, *IAS 10*, dealing specifically with the accounting for subsequent events. This standard, which was originally issued in September 1974 and was revised in December 2003, is essentially the same as the accounting employed in the United States. Specifically, *IAS 10* requires that companies adjust the reported amounts of assets and liabilities if events occurring after the balance sheet date provide additional information about conditions that existed at the balance sheet date. In addition, *IAS 10* requires that disclosure be made of significant subsequent events even if those events do not impact the valuations reported in the balance sheet.

## Limitations of the Balance Sheet

**5** Understand the major limitations of the balance sheet.

**WHY** Before users can appropriately use the information contained in the balance sheet, they must understand what the information implies and, just as importantly, what it does not imply.

**HOW** The balance sheet often does not provide an accurate reflection of the value of a business. Reasons for this include the use of historical cost instead of current values, omission of some economic assets from the balance sheet, and failure to make adjustments for inflation. The difference between balance sheet value and market value is captured in the book-to-market ratio (book value of equity divided by market value of equity), which is usually less than 1.0.

Notwithstanding its usefulness, the balance sheet has some serious limitations. External users often need to know a company's worth. The balance sheet, however, does not generally reflect the current value of a business. A favorite ratio among followers of the stock market is the book-to-market ratio, computed as total book value of common equity divided by total market value of common equity. The **book-to-market ratio** reflects the difference between the balance sheet value of a company and the company's actual market value.<sup>22</sup> A company's book-to-market ratio is almost always less than 1.0 because many assets are reported at historical cost, which is usually less than market value, and other assets are not included in the balance sheet at all. In addition, many intangible economic assets, such as a reputation for superior products or customer service, are not recognized in the balance sheet. Accordingly, the balance sheet numbers often very poorly reflect what a company is worth.

The graph in Exhibit 3-11 shows the average book-to-market ratio, from 1924 through 2008, of the 30 companies making up the Dow Jones Industrial Average. Note the fairly steady decrease from an average book-to-market ratio of about 1.0 in 1980 to about 0.3 in 2008. This means that, in 2008, the accounting book value of the equity of the average company included in the Dow Jones Industrial Average was just 30% as large as the market value of the equity of that company. This low book-to-market ratio reflects the increasing importance of unreported, intangible assets as service and technology companies have become a more significant part of the U.S. economy.

A related problem with the balance sheet is the instability of the dollar, the standard accounting measuring unit in the United States. Because of general price changes in the economy, the dollar does not maintain a constant purchasing power, yet the historical costs of resources and equities shown on the balance sheet are not adjusted for changes in the purchasing power of the measuring unit. The result is a balance sheet that reflects assets, liabilities, and equities in terms of unequal purchasing power units. Some elements, for example, may be stated in terms of 1980 dollars and some in terms of current-year dollars. The variations in purchasing power of the amounts reported in the balance sheet make comparisons among companies, and even within a single company, less meaningful.

An additional limitation of the balance sheet, also related to the need for comparability, is that all companies do not classify and report all like items similarly. For example, titles and account classifications vary; some companies provide considerably more detail than others; and some companies with apparently similar transactions

<sup>22</sup> Research into the behavior of stock prices has found that firms with high book-to-market ratios tend to outperform the market in future years. See Eugene F. Fama and Kenneth R. French, "The Cross-Section of Expected Stock Returns," *The Journal of Finance*, June 1992, p. 427. No one is sure why high book-to-market-ratio firms outperform the market. One suggestion is that the accounting numbers partially reflect fundamental underlying value, and a high book-to-market ratio indicates that the market is currently undervaluing a company.

## EXHIBIT 3-11

## Average Book-to-Market Ratio of Companies Listed in the Dow Jones Industrial Average: 1924–2008

Source: *The Wall Street Journal*, March 30, 1999, p. C14. The original source has been augmented with data from [www.djindexes.com](http://www.djindexes.com).

report them differently. Such differences make comparisons difficult and diminish the potential value of balance sheet analysis.

As mentioned, some entity resources and obligations are not reported on the balance sheet. For example, as mentioned at the beginning of the chapter in connection with Coca-Cola, the company's reputation and worldwide market presence are among its most valuable resources, yet those economic assets are not shown on the balance sheet because measuring them in monetary terms is quite difficult. The assumptions of the traditional accounting model identified in Chapter 1, specifically the requirements of arm's-length transactions or events measurable in monetary terms, add to the objectivity of balance sheet disclosures but at the same time cause some information to be omitted that is likely to be relevant to certain users' decisions.

One other limitation of the balance sheet is the increasing use of off-balance-sheet financing. In fact, a key aspect of the Enron accounting scandal was Enron's creative use of financing arrangements (with exotic names such as Rhythms and Raptor) to avoid reporting large amounts of debt in the company's balance sheet. In an off-balance-sheet financing arrangement, a company borrows money to purchase an asset or to fund an activity (such as research), but is able to take advantage of the accounting rules to avoid reporting a balance sheet obligation for the borrowed funds. For example, a section in Chapter 12 describes how companies use joint ventures to achieve off-balance-sheet financing. In addition, Chapter 15 demonstrates how companies can use leases to finance asset purchases through borrowing but avoid showing the associated debt on the balance sheet.

## SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. *The original Coca-Cola trademark is a "homegrown" intangible asset. Traditional accounting in the United States does not report an estimated value for homegrown intangibles in the balance sheet. The*

*trademark values that are reported in the balance sheet of The Coca-Cola Company are values for trademarks that the company has purchased over the years, such as Minute Maid.*

2. *Total liabilities as of December 31, 2006, are \$13.043 billion (\$8.890 billion for current liabilities + \$1.314 billion for long-term debt + \$2.231 billion for other liabilities + \$0.608 billion for deferred income taxes). Note that this amount of reported liabilities is much smaller than the amount of unreported liabilities of the Coca-Cola bottlers of which The Coca-Cola Company owns a substantial percentage.*
3. *As of December 31, 2006, current assets total \$8.441 billion, and current liabilities total \$8.890 billion. All other things being*

*equal, a banker making a short-term loan to a company would prefer current assets of that company to be more than current liabilities. If this were the case, the banker would have a greater likelihood of having the short-term loan repaid because the borrowing company already has enough current assets to be able to repay all of its existing current liabilities. In the case of Coca-Cola, with a long history of generating cash from operations, a banker would take some comfort from its track record.*

### SOLUTIONS TO STOP & THINK

1. *(Page 97) The correct answer is C. Actually, defining assets and liabilities in terms of legal statutes would severely limit the FASB's influence. One of the key roles of the FASB is to apply the definitions in the conceptual framework to determine when assets and liabilities should be recognized. Legalistic definitions would take this exercise out of the FASB's hands and transfer it to the lawmakers responsible for contract law.*
  2. *(Page 104)*
    - (a) *A financial analyst trying to compare the company's core business with the core businesses of similar companies—Classification (b). This classification allows the analyst to compare the assets and liabilities associated with the primary lines of business of various companies.*
    - (b) *A U.S. congressperson concerned about the relocation of operations overseas—Classification (a). This classification allows the congressperson to see how much of a company's assets and liabilities are located outside the United States. The congressperson would also be able to see the trend over time.*
    - (c) *An analyst trying to estimate the current market value of a company—Classification (c). This classification*
- allows the analyst to see what fraction of a company's assets is not reported at current fair value. This gives the analyst an idea of how much the company's market value might vary from its reported balance sheet value.*
3. *(Page 110) The correct answer is B. Total assets is the sum of current assets and long-term (fixed) assets. For British Telecommunications as of March 31, 2007, the amount of total assets is £43,099 million (£18,559 million + £24,540 million). Note that this is not the same total amount shown in the balance sheet—the balance sheet amount is total assets minus current liabilities.*
  4. *(Page 119) The correct answer is C. When the analyst is doing a detailed analysis of one or two companies, then he or she can make any desired financial statement adjustments using note disclosure. Such adjustments might be necessary to make a company comparable to some benchmark or to make the financial statements of two different companies comparable. However, these detailed adjustments using note disclosure become expensive and time consuming when many companies are involved. In such a case, the analyst prefers to have all of the relevant data summarized and recognized in the financial statements themselves.*

## REVIEW OF LEARNING OBJECTIVES

- 1** Describe the specific elements of the balance sheet (assets, liabilities, and owners' equity), and prepare a balance sheet with assets and liabilities properly classified into current and noncurrent categories.

A balance sheet is a listing of a company's assets, liabilities, and equities as of a certain point in time.

- Assets are probable future economic benefits obtained or controlled as a result of past transactions or events.
- Liabilities are probable future sacrifices of economic benefits arising from present obligations to transfer assets or provide services in the future as a result of past transactions or events.
- Equity is the net assets of an entity, that is, the amount that remains after total liabilities have been deducted from total assets.

For balance sheet reporting, assets and liabilities are often separated into current and noncurrent categories. Current items are those expected to be used or paid within one year or within the normal operating cycle, whichever is longer.

When classifying assets and liabilities, the key considerations are how management intends to use an asset and when it expects to pay a liability.

Equity arises from owner investment, is increased by net income, and is decreased by losses and by distributions to owners. Equity is also impacted by stock repurchases, unrealized security gains and losses, and foreign exchange rate fluctuations.

- 2** Identify the different formats used to present balance sheet data.

In most industries in the United States, assets and liabilities are listed in order of their liquidity with current items first. For some industries, particularly those with large investments in long-term assets, current items are not listed first. In addition, in other countries, the format of the balance sheet can vary widely.

- 3** Analyze a company's performance and financial position through the computation of financial ratios.

Balance sheet information is most often analyzed by looking at relationships between different balance sheet amounts and relationships between balance sheet and income statement amounts. Relationships between financial statement amounts are called *financial ratios*.

- 4** Recognize the importance of the notes to the financial statements, and outline the types of disclosures made in the notes.

The information in the financial statements is supported by explanatory notes. The notes include a description of the accounting policies, details of summary totals, disclosure of significant items that fail to meet the recognition criteria, and supplemental information required by FASB and SEC standards.

Note disclosure also sometimes relates to subsequent events. *Subsequent events* are significant events occurring between the balance sheet date and the date the financial statements are issued. Subsequent events come in two varieties: those requiring immediate retroactive recognition in the financial statements and those requiring only note disclosure.

- 5** Understand the major limitations of the balance sheet.

The balance sheet often does not provide an accurate reflection of the value of a business. Reasons for this include the use of historical cost instead of current values, omission of some assets from the balance sheet, and failure to make adjustments for inflation. The balance sheet does not measure the market value of a company. The difference between balance sheet value and market value is captured in the book-to-market ratio (book value of equity divided by market value of equity), which is usually less than 1.0.

## IASB SUMMARY

Topic	U.S. GAAP	IASB Standard
Classification of short-term obligations to be refinanced	<i>SFAS No. 6</i> A short-term obligation to be refinanced as of the balance sheet date is classified as long term IF the actual refinancing (or an explicit refinancing agreement) is finalized before the financial statements are issued.	<i>IAS 1</i> For a short-term obligation to be refinanced to be classified as long term, the refinancing must take place by the balance sheet date.
Equity reserves	The Equity section in a U.S. balance sheet does NOT include reserves.	Equity reserve accounting is very important in many non-U.S. countries (especially those influenced by the British tradition) because the legal ability to pay cash dividends is strictly tied to the balances in various reserve accounts.
Format of balance sheet	A U.S. balance sheet typically shows current assets and long-term assets grouped together with current liabilities, long-term liabilities, and then equity grouped together.	Some non-U.S. balance sheets (especially those influenced by the British tradition) show long-term assets and working capital (current assets minus current liabilities) grouped together, and then long-term liabilities and equity grouped together.
Subsequent events	<i>AICPA SAS No. 1, Section 560</i> <ul style="list-style-type: none"> <li>Adjust the reported amounts of assets and liabilities if events occurring after the balance sheet date provide additional information about conditions that existed at the balance sheet date.</li> <li>Disclose significant subsequent events even if those events do not impact the valuations reported in the balance sheet.</li> </ul>	<i>IAS 10</i> Same as U.S. standard

## KEY TERMS

Acid-test ratio 114	Current liabilities 101	Liquidity 112	Retained earnings 104
Additional paid-in capital 104	Current ratio 113	Loan covenant 114	Return on assets 116
Assets 96	Debt ratio 115	Minority interest 107	Return on equity 116
Asset mix 115	Deferred income tax assets 100	Objective acceleration clause 102	Sinking fund 101
Asset turnover 116	Deferred income tax liability 103	Other comprehensive income 106	Stockholders' (shareholders') equity 104
Balance sheet 96	Deficit 105	Paid-in capital 104	Subjective acceleration clause 102
Book-to-market ratio 122	Derivative 106	Partnerships 104	Subsequent events 120
Callable obligation 101	Equity 96	Post-balance sheet events 120	Trading securities 99
Capital stock 104	Estimated liability 103	Preferred stock 104	Treasury stock 106
Common stock 104	Financial ratios 112	Proprietorships 104	Working capital 98
Contingent liabilities 103	Leverage 115	Quick ratio 114	
Contributed capital 104	Liabilities 96		
Corporations 104			
Current assets 98			

## QUESTIONS

1. What three elements are contained in a balance sheet?
2. What is the importance of the term *probable* in the definition of an asset?
3. “Liabilities are obligations denominated in precise monetary terms.” Do you agree or disagree? Explain.
4. What does the difference between current assets and current liabilities measure?
5. What criteria are generally used (a) in classifying assets as current? (b) in classifying liabilities as current?
6. Indicate under what circumstances each of the following can be considered noncurrent: (a) cash and (b) receivables.
7. How can expected refinancing impact the classification of a liability?
8. (a) What is a subjective acceleration clause? (b) What is an objective acceleration clause? (c) How do these clauses in debt instruments affect the classification of a liability?
9. Distinguish between contingent liabilities and estimated liabilities.
10. How do the Equity sections of proprietorships, partnerships, and corporations differ from one another?
11. What are the three major categories in a corporation’s Equity section?
12. Under what circumstances may offset balances be properly recognized on the balance sheet?
13. In what order are assets usually listed in the balance sheet?
14. What are financial ratios?
15. Explain how the asset turnover ratio provides a measure of a company’s overall efficiency.
16. What one financial ratio summarizes everything about the performance of a company? How is it computed?
17. What are the major types of notes attached to the financial statements?
18. How has the FASB used note disclosure as a tool of compromise?
19. What are some examples of supplementary information included in the notes to financial statements?
20. Under what circumstances does a subsequent event lead to a journal entry for the previous reporting period?
21. “The balance sheet does not reflect the value of a business.” Do you agree or disagree? Explain.

## PRACTICE EXERCISES

### Practice 3-1

#### Working Capital

Using the following information, compute *working capital*:

#### LO1

Cost of Goods Sold .....	\$ 9,000
Accounts Payable .....	2,400
Paid-In Capital .....	1,950
Cash .....	700
Sales .....	10,000
Accrued Wages Payable .....	150
Dividends .....	500
Retained Earnings (beginning) .....	1,000
Inventory .....	2,500

### Practice 3-2

#### Current Assets

Using the following information, compute total *current assets*:

#### LO1

Goodwill .....	\$ 9,000
Prepaid Expenses .....	1,100
Paid-In Capital .....	1,750
Cash .....	400
Property, Plant, and Equipment .....	10,000
Investment Securities (trading) .....	250
Accounts Receivable .....	700
Retained Earnings .....	1,000
Inventory .....	4,000

**Practice 3-3****Current Liabilities**

Using the following information, compute total *current liabilities*:

**LO1**

Accrued Income Taxes Payable .....	\$ 9,000
Notes Payable (due in 14 months) .....	1,100
Paid-In Capital .....	1,750
Treasury Stock .....	400
Current Portion of Long-Term Debt .....	10,000
Unearned Revenue .....	250
Accounts Payable .....	700
Retained Earnings .....	1,000
Additional Paid-In Capital .....	4,000

**Practice 3-4****Classification of Short-Term Loans to Be Refinanced**

The company has the following three loans payable scheduled to be repaid in June of next year. As of December 31 of this year, identify which of the three should be classified as current and which should be classified as noncurrent.

**LO1**

- The company intends to repay Loan A when it comes due in June. In the following September, the company intends to get a new loan of equal amount from the same bank.
- The company intends to refinance Loan B when it comes due. The refinancing contract will be signed in May *after* the financial statements for this year have been released.
- The company intends to refinance Loan C when it comes due. The refinancing contract will be signed in January *before* the financial statements for this year have been released.

**Practice 3-5****Callable Obligations**

The company has the following three loans. As of December 31 of this year, identify which of the three should be classified as current and which should be classified as noncurrent.

**LO1**

- On July 15 of next year, Loan A will become payable on demand.
- Loan B is scheduled to be repaid in three years. In addition, the loan agreement specifies that if the company's current ratio falls below 1.5, the loan becomes payable on demand. On December 31, the current ratio is 1.8.
- Loan C is scheduled to be repaid in three years. In addition, the loan agreement specifies that if the company's "general financial condition deteriorates significantly," the loan becomes payable on demand. As of December 31, it is reasonably possible that this clause will be invoked.

**Practice 3-6****Contingent Liabilities**

The company has the following three potential obligations. Describe how each will be reported in the financial statements.

**LO1**

- The company has promised to make fixed pension payments to employees after they retire. The company is not certain how long the employees will work or how long they will live after they retire.
- The company has been sued by a group of shareholders who claim that they were deceived by the company's financial reporting practices. It is possible that the company will lose this lawsuit.
- The company is involved in litigation over who must clean up a toxic waste site near one of the company's factories. It is probable, but not certain, that the company will be required to pay for the cleanup.

**Practice 3-7****Stockholders' Equity**

Using the following information, compute: (a) total contributed capital, (b) ending retained earnings, and (c) total stockholders' equity:

**LO1**

Additional Paid-In Capital, Common .....	\$8,200
Accounts Payable .....	1,300
Total Expenses .....	5,650
Preferred Stock, at par .....	3,450
Common Stock, at par .....	300
Sales .....	9,700
Treasury Stock .....	375
Dividends .....	950
Retained Earnings (beginning) .....	6,500
Additional Paid-In Capital, Preferred .....	150

**Practice 3-8****Stockholders' Equity****LO1**

Using the following information, compute (a) total contributed capital, (b) total accumulated other comprehensive income, and (c) total stockholders' equity:

Additional Paid-In Capital, Common .....	\$9,000
Common Stock, at par .....	400
Cumulative Translation Adjustment (equity reduction), ending .....	2,000
Treasury Stock .....	700
Retained Earnings (post closing, or ending) .....	1,500
Cumulative Unrealized Gain on Available-for-Sale Securities, ending .....	1,100

**Practice 3-9****Format of Foreign Balance Sheet****LO2**

Following is a balance sheet presented in standard U.S. format. Rearrange this balance sheet to be in standard British format. Don't worry about differences in terminology; use the U.S. labels, but present the information in the British format.

Current Assets:	
Cash .....	\$ 500
Inventory .....	2,000
Total current assets .....	<u>\$ 2,500</u>
Noncurrent Assets:	
Property, plant, and equipment .....	\$ 8,000
Long-term investments .....	1,700
Total noncurrent assets .....	<u>\$ 9,700</u>
Total assets .....	<u>\$12,200</u>
Current Liabilities:	
Accounts payable .....	\$ 300
Short-term loans payable .....	1,100
Total current liabilities .....	<u>\$ 1,400</u>
Noncurrent Liabilities:	
Long-term debt .....	<u>\$ 3,000</u>
Stockholders' Equity:	
Common stock, at par .....	\$ 50
Additional paid-in capital .....	2,000
Retained earnings .....	5,750
Total stockholders' equity .....	<u>\$ 7,800</u>
Total liabilities and stockholders' equity .....	<u>\$12,200</u>

**Practice 3-10****Current Ratio****LO3**

Use the following information to compute the current ratio:

Accounts Payable .....	\$3,700
Paid-In Capital .....	3,650
Cash .....	750
Sales .....	9,500
Accrued Wages Payable .....	150
Inventory .....	6,300

**Practice 3-11****Quick Ratio**

Use the following information to compute the quick ratio:

LO3

Long-Term Loan Payable .....	\$ 1,100
Accounts Receivable .....	1,750
Cash .....	400
Cost of Goods Sold .....	10,000
Accrued Wages Payable .....	250
Inventory .....	4,000

**Practice 3-12****Debt Ratio**

Use the information in Practice 3-3 to compute the debt ratio. Assume that the list includes all liability and equity items.

LO3

**Practice 3-13****Debt Ratio**

Use the information in Practice 3-7 to compute the debt ratio. Assume that the list includes all liability and equity items.

LO3

**Practice 3-14****Asset Mix**

Use the information in Practice 3-9 to compute the proportion of total assets in each of the following asset categories.

LO3

- (a) Inventory
- (b) Property, Plant, and Equipment

**Practice 3-15****Asset Mix**

Use the information in Practice 3-2 to compute the proportion of total assets in each of the following asset categories. Assume that the list contains all the asset items.

LO3

- (a) Inventory
- (b) Property, Plant, and Equipment

**Practice 3-16****Measure of Efficiency**

Refer to Practice 3-9. Sales for the year totaled \$50,000. Compute asset turnover.

LO3

**Practice 3-17****Return on Assets**

Refer to Practice 3-9. Net income for the year totaled \$3,600. Compute return on assets.

LO3

**Practice 3-18****Return on Equity**

Refer to Practice 3-9. Net income for the year totaled \$2,000. Compute return on equity.

LO3

**Practice 3-19****Accounting for Subsequent Events**

On December 31, the warranty liability was estimated to be \$100,000. On January 16 of the following year, results of a study done before December 31 were received. These study results indicate that products would require a much larger amount of warranty repairs than expected; total warranty repairs will be \$175,000 instead of the estimated \$100,000. The financial statements were issued on February 20. What amount should be reported as warranty liability in the December 31 balance sheet?

LO4

**Practice 3-20****Accounting for Subsequent Events**

On December 31, the warranty liability was estimated to be \$100,000. On January 16 of the following year, it was learned that one week before, on January 9, poor-quality materials were introduced into the production process. This mistake is expected to create an additional \$87,000 in warranty repairs. The financial statements were issued on February 20. What amount should be reported as warranty liability in the December 31 balance sheet?

LO4

**Practice 3-21****Book-to-Market Ratio**

Refer to Practice 3-9. As of the end of the year, the total market value of shares outstanding was \$10,000. Compute the book-to-market ratio.

LO5

## EXERCISES

## Exercise 3-22

**Balance Sheet Classification**

A balance sheet contains the following classifications:

## LO1

- |                                    |                                  |
|------------------------------------|----------------------------------|
| (a) Current assets                 | (g) Long-term debt               |
| (b) Investments                    | (h) Other noncurrent liabilities |
| (c) Property, plant, and equipment | (i) Capital stock                |
| (d) Intangible assets              | (j) Additional paid-in capital   |
| (e) Other noncurrent assets        | (k) Retained earnings            |
| (f) Current liabilities            |                                  |

Indicate by letter how each of the following accounts would be classified. Place a minus sign (–) for all accounts representing offset or contra balances.

1. Discount on Bonds Payable
2. Stock of Subsidiary Corporation
3. 12% Bonds Payable (due in 6 months)
4. U.S. Treasury Notes
5. Income Taxes Payable
6. Sales Taxes Payable
7. Estimated Claims under Warranties for Service and Replacements
8. Par Value of Stock Issued and Outstanding
9. Unearned Rent Revenue (6 months in advance)
10. Long-Term Advances to Officers
11. Interest Receivable
12. Preferred Stock Retirement Fund
13. Trademarks
14. Allowance for Bad Debts
15. Dividends Payable
16. Accumulated Depreciation
17. Trading Securities
18. Prepaid Rent
19. Prepaid Insurance
20. Deferred Income Tax Asset

## Exercise 3-23

**Balance Sheet Classification**

State how each of the following accounts should be classified on the balance sheet.

## LO1

- (a) Treasury Stock
- (b) Retained Earnings
- (c) Vacation Pay Payable
- (d) Foreign Currency Translation Adjustment
- (e) Allowance for Bad Debts
- (f) Liability for Pension Payments
- (g) Investment Securities (Trading)
- (h) Paid-In Capital in Excess of Stated Value
- (i) Leasehold Improvements
- (j) Goodwill
- (k) Receivables—U.S. Government Contracts
- (l) Advances to Salespersons
- (m) Premium on Bonds Payable
- (n) Inventory
- (o) Patents
- (p) Unclaimed Payroll Checks
- (q) Income Taxes Payable
- (r) Subscription Revenue Received in Advance

- (s) Interest Payable
- (t) Deferred Income Tax Asset
- (u) Tools
- (v) Deferred Income Tax Liability

**Exercise 3-24****Asset Definition**

Using the definition of an asset from FASB *Concepts Statement No. 6*, indicate whether each of the following should be listed as an asset by Ingalls Company.

**LO1**

- (a) Ingalls has legal title to a coal mine in a remote location. Historically, the mine has yielded more than \$25 million in coal. Engineering estimates suggest that no additional coal is economically extractable from the mine.
- (b) Ingalls employs a team of five geologists who are widely recognized as world-wide leaders in their field.
- (c) Several years ago, Ingalls purchased a large meteor crater on the advice of a geologist who had developed a theory claiming that vast deposits of iron ore lay underneath the crater. The crater has no other economic use. No ore has been found, and the geologist's theory is not generally accepted.
- (d) Ingalls claims ownership of a large piece of real estate in a foreign country. The real estate has a current market value of over \$225 million. The country expropriated the land 35 years ago, and no representative of Ingalls has been allowed on the property since.
- (e) Ingalls is currently negotiating the purchase of an oil field with proven oil reserves totaling 5 billion barrels.

**Exercise 3-25****Liability Definition**

Using the definition of a liability from FASB *Concepts Statement No. 6*, indicate whether each of the following should be listed as a liability by Pauli Company.

**LO1**

- (a) Pauli was involved in a highly publicized lawsuit last year. Pauli lost and was ordered to pay damages of \$125 million. The payment has been made.
- (b) In exchange for television advertising services that Pauli received last month, Pauli is obligated to provide the television station with building maintenance service for the next four months.
- (c) Pauli contractually guarantees to replace any of its stain-resistant carpets if they are stained and can't be cleaned.
- (d) Pauli estimates that its total payroll for the coming year will exceed \$35 million.
- (e) In the past, Pauli has suffered frequent vandalism at its storage warehouses. Pauli estimates that losses due to vandalism during the coming year will total \$3 million.

**Exercise 3-26****Balance Sheet Preparation**

From the following list of accounts, prepare a balance sheet showing all balance sheet items properly classified. (No monetary amounts are to be recognized.)

**LO1**

Accounts Payable  
 Accounts Receivable  
 Accumulated Depreciation—Buildings  
 Accumulated Depreciation—Equipment  
 Advertising Expense  
 Allowance for Bad Debts  
 Bad Debt Expense  
 Bonds Payable  
 Buildings  
 Cash

Common Stock  
 Cost of Goods Sold  
 Deferred Income Tax Liability  
 Depreciation Expense—Buildings  
 Dividends  
 Equipment  
 Estimated Warranty Expense Payable (current)  
 Gain on Sale of Investment Securities  
 Gain on Sale of Land  
 Goodwill  
 Income Tax Expense  
 Income Taxes Payable  
 Interest Receivable  
 Interest Revenue  
 Inventory  
 Investment in Subsidiary  
 Investment Securities (Trading)  
 Land  
 Loss on Purchase Commitments  
 Miscellaneous General Expense  
 Net Pension Asset  
 Notes Payable (current)  
 Paid-In Capital from Sale of Treasury Stock  
 Paid-In Capital in Excess of Stated Value  
 Patents  
 Premium on Bonds Payable  
 Prepaid Insurance  
 Property Tax Expense  
 Purchase Discounts  
 Purchases  
 Retained Earnings  
 Salaries Payable  
 Sales  
 Sales Salaries  
 Travel Expense

**Exercise 3-27****LO1****Computation of Working Capital**

From the following data, compute the working capital for Hales Shipping Co. at December 31, 2011.

Cash in general checking account .....	\$ 34,000
Cash in fund to be used to retire bonds in 2015 .....	59,000
Cash held to pay sales taxes .....	18,000
Notes receivable—due February 2013 .....	113,000
Accounts receivable .....	113,000
Inventory .....	81,000
Prepaid insurance—for 2012 .....	15,000
Vacant land held as investment .....	350,000
Used equipment to be sold .....	9,000
Deferred tax asset—to be recovered in 2013 .....	12,000
Accounts payable .....	79,000
Note payable—due July 2012 .....	27,000
Note payable—due January 2013 .....	18,000
Bonds payable—maturity date 2015 .....	219,000
Salaries payable .....	11,000
Sales taxes payable .....	23,000
Goodwill .....	54,000

## Exercise 3-28

## LO1, LO2

**Preparation of Corrected Balance Sheet**

The following balance sheet was prepared for Jared Corporation as of December 31, 2011.

<b>Jared Corporation Balance Sheet December 31, 2011</b>			
<b>Assets</b>		<b>Liabilities and Owners' Equity</b>	
Current assets:		Current liabilities:	
Cash .....	\$ 12,500	Accounts payable .....	\$ 3,400
Investment securities .....	8,000	Other current liabilities .....	2,000
Accounts receivable, net .....	21,350	Total current liabilities .....	\$ 5,400
Inventory .....	31,000	Long-term liabilities .....	32,750
Other current assets .....	14,200	Total liabilities .....	\$ 38,150
Total current assets .....	<u>\$ 87,050</u>		
Noncurrent assets:		Owners' equity:	
Property, plant, and equipment, net .....	\$ 64,800	Common stock .....	\$ 50,000
Treasury stock .....	4,500	Retained earnings .....	81,800
Other noncurrent assets .....	13,600	Total owners' equity .....	\$131,800
Total noncurrent assets .....	<u>\$ 82,900</u>		
Total assets .....	<u>\$169,950</u>	Total liabilities and owners' equity.....	<u>\$169,950</u>

The following additional information relates to the December 31, 2011, balance sheet.

- Cash includes \$4,000 that has been restricted to the purchase of manufacturing equipment (a noncurrent asset).
- Investment securities include \$2,750 of stock that was purchased in order to give the company significant ownership and a seat on the board of directors of a major supplier.
- Other current assets include a \$4,000 advance to the president of the company. No due date has been set.
- Long-term liabilities include bonds payable of \$10,000. Of this amount, \$2,500 represents bonds scheduled to be redeemed in 2012.
- Long-term liabilities also include a \$7,000 bank loan. On May 15, the loan will become due on demand.
- On December 21, dividends in the amount of \$15,000 were declared to be paid to shareholders of record on January 25. These dividends have not been reflected in the financial statements.
- Cash in the amount of \$19,000 has been placed in a restricted fund for the redemption of preferred stock in 2012. Both the cash and the stock have been removed from the balance sheet.
- Property, plant, and equipment includes land costing \$8,000 that is being held for investment purposes and that is scheduled to be sold in 2012.

Based on the information provided, prepare a corrected balance sheet.

## Exercise 3-29

## LO1

**Balance Sheet Relationships**

On the Clark and Company Inc. balance sheet, indicate the amount that should appear for each of the items (a) through (n) on the balance sheet.

SPREADSHEET

**Clark and Company Inc.**  
**Consolidated Balance Sheet**  
**December 31, 2011**

**Assets**

Current assets:			
Cash .....		\$ 24,250	
Investment securities .....		(a)	
Accounts and notes receivable .....	\$ (b)		
Allowance for doubtful accounts and notes receivable .....	7,851	121,664	
Inventories .....		197,682	
Other current assets .....		14,227	
Total current assets .....			\$ (c)
Noncurrent assets:			
Property, plant, and equipment .....	\$694,604		
Accumulated depreciation .....		(d) \$398,832	
Other noncurrent assets .....		13,217	
Total noncurrent assets .....			412,049
Total assets .....			<u>\$792,514</u>

**Liabilities and Owners' Equity**

Current liabilities:			
Accounts payable .....		\$ (e)	
Payable to banks .....		34,236	
Income taxes payable .....		9,211	
Current installments of long-term debt .....		6,341	
Accrued expenses .....		7,100	
Total current liabilities .....			\$ (f)
Noncurrent liabilities:			
Long-term debt .....		\$ (g)	
Deferred income tax liability .....		41,218	
Minority interest in subsidiaries .....		4,201	
Total noncurrent liabilities .....			205,410
Total liabilities .....			<u>\$350,782</u>
Contributed capital:			
Preferred stock, no par value (authorized 1,618 shares; issued 1,115 shares) .....		\$ 12,392	
Common stock, \$1 par value per share (authorized 60,000 shares; issued 21,842 shares) .....	\$ (h)		
Additional paid-in capital .....	(i)	(j)	
Total contributed capital .....		\$ (k)	
Retained earnings .....		390,625	
Total contributed capital and retained earnings .....		\$ (l)	
Less: Treasury stock, at cost (1,229 shares) .....		27,038	
Total owners' equity .....			\$ (m)
Total liabilities and owners' equity .....			<u>\$ (n)</u>

**Exercise 3-30**

**LO1, LO3**

SPREADSHEET

**Balance Sheet Schedules**

In its annual report to stockholders, Hakobe Inc. presents a condensed balance sheet with detailed data provided in supplementary schedules.

- From the adjusted trial balance of Hakobe, prepare the following sections of the balance sheet, properly classifying all accounts as to balance sheet categories:
 

(a) Current assets	(e) Current liabilities
(b) Property, plant, and equipment	(f) Noncurrent liabilities
(c) Intangible assets	(g) Owners' equity
(d) Total assets	(h) Total liabilities and owners' equity

2. Compute the current ratio and debt ratio for Hakobe.

<b>Hakobe Inc.</b> <b>Adjusted Trial Balance</b> <b>December 31, 2011</b>		
	<b>Debit</b>	<b>Credit</b>
Cash .....	\$ 43,700	
Investment securities (trading) .....	15,000	
Notes receivable—trade debtors .....	22,000	
Accrued interest on notes receivable .....	2,100	
Accounts receivable .....	79,500	
Allowance for doubtful accounts .....		\$ 4,600
Inventory .....	59,300	
Prepaid expenses .....	8,200	
Accounts payable .....		57,600
Notes payable—trade creditors .....		11,000
Accrued interest on notes payable .....		950
Land .....	103,000	
Buildings .....	192,000	
Accumulated depreciation—buildings .....		21,000
Equipment .....	37,000	
Accumulated depreciation—equipment .....		5,900
Patents .....	85,000	
Franchises .....	82,110	
Bonds payable, 8%—issue 1 (mature 12/31/13) .....		65,000
Bonds payable, 12%—issue 2 (mature 12/31/17) .....		125,000
Accrued interest on bonds payable .....		7,500
Premium on bonds payable—issue 1 .....		2,500
Discount on bonds payable—issue 2 .....	12,500	
Mortgage payable .....		72,000
Accrued interest on mortgage payable .....		4,320
Capital stock, par value \$1; 10,000 shares authorized; 5,000 shares issued .....		5,000
Additional paid-in capital .....		123,700
Retained earnings .....		251,340
Treasury stock—at cost (500 shares) .....	16,000	
	<u>\$757,410</u>	<u>\$757,410</u>

**Exercise 3-31****Computation of Financial Ratios**

The following data are from the financial statements of Riverton Company.

**LO3**

Current assets .....	\$ 55,000
Total assets .....	125,000
Current liabilities .....	25,000
Total liabilities .....	95,000
Net income .....	18,000
Sales .....	\$275,000

Compute Riverton's current ratio, debt ratio, asset turnover, return on assets, and return on equity.

**Exercise 3-32****Computation of Financial Ratios**

Schlofman Company has the following assets.

**LO3**

Cash .....	\$ 20,000
Accounts receivable .....	60,000
Inventory .....	105,000
Property, plant, and equipment .....	220,000
Total assets .....	<u>\$405,000</u>

Companies in Schlofman's industry typically have the following asset mix: cash, 7%; accounts receivable, 15%; inventory, 18%; property, plant, and equipment, 60%.

Compared to other companies in its industry, Schlofman has too much of one asset. Which one? Show your computations.

**Exercise 3-33****LO4**

DEMO PROBLEM

**Classification of Subsequent Events**

The following events occurred after the end of the company's fiscal year but before the annual audit was completed. Classify each event as to its impact on the financial statements, that is, (1) reported by changing the amounts in the financial statements, (2) reported in notes to the financial statements, or (3) does not require reporting. Include support for your classification.

- Major customer went bankrupt due to a deteriorating financial condition.
- Company sustained extensive hurricane damage to one of its plants.
- Company lost a major lawsuit that had been pending for two years.
- Increasing U.S. trade deficit may have impact on company's overseas sales.
- Company sold a large block of preferred stock.
- Preparation of current year's income tax return disclosed that an additional \$25,000 is due on last year's return.
- Company's controller resigned and was replaced by an audit manager from the company's audit firm.

**Exercise 3-34****LO4****Reporting Financial Information**

For each of the following items, indicate whether the item should be reflected in the 2011 financial statements for Tindall Company. If the item should be reflected, indicate whether it should be reported in the financial statements themselves or by note disclosure.

- As of December 31, 2011, the company holds \$12.1 million of its own stock that it purchased in the open market and is holding for possible reissuance.
- As of December 31, 2011, the company was in violation of certain loan covenants. The violation does not cause the loans to be callable immediately but does increase the interest charge by 2.0%.
- The company's reported Provision for Income Taxes includes \$4.2 million in current taxes and \$7.8 million in deferred taxes.
- As of December 31, 2011, accounts receivable in the amount of \$7.1 million are estimated to be uncollectible.
- The Environmental Protection Agency is investigating the company's procedures for disposing of toxic waste. Outside consultants have estimated that the company may be liable for fines of up to \$10 million.
- During 2011, the company had a gain on the sale of manufacturing assets.
- During 2011, a long-term insurance agreement was signed. The company paid five years of insurance premiums in advance.
- The company uses straight-line depreciation for all tangible, long-term assets.
- During 2011, the company hired three prominent research chemists away from its chief competitor.
- Reported long-term debt is composed of senior subordinated bonds payable, convertible bonds payable, junior subordinated bonds payable, and capital lease obligations.
- Early in 2012, a significant drop in raw material prices caused the company's stock price to rise in anticipation of sharply increased profits for the year.

**Exercise 3-35****LO4****Preparation of Notes to Financial Statements**

The following information was used to prepare the financial statements for Delta Chemical Company. Prepare the necessary notes to accompany the statements.

Delta uses the LIFO inventory method on its financial statements. If the FIFO method were used, the ending inventory balance would be reduced by \$50,000 and net income for the year would be reduced by \$35,000 after taxes. Delta depreciates its equipment using the straight-line method. Revenue is generally recognized when inventory is shipped unless it is sold on a consignment basis. The current value of the equipment is \$525,000, as contrasted to its depreciated cost of \$375,000.

Delta has borrowed \$350,000 on a 10-year note at 14% interest. The note is due on July 1, 2018. Delta's equipment has been pledged as collateral for the loan. The terms of the note prohibit additional long-term borrowing without the express permission of the holder of the note. Delta is planning to request such permission during the next fiscal year.

The board of directors of Delta is currently discussing a merger with another chemical company. No public announcement has yet been made, but it is anticipated that additional shares of stock will be issued as part of the merger. Delta's balance sheet will report receivables of \$126,000. Included in this figure is a \$25,000 advance to the president of Delta, \$30,000 of notes receivable from customers, \$10,000 in advances to sales representatives, and \$70,000 of accounts receivable from customers. The reported balance reflects a deduction for anticipated collection losses.

**Exercise 3-36****LO5****Book-to-Market Ratio**

The following information relates to two companies, designated Company A and Company B. One of the companies is a traditional steel manufacturer. The other is a successful Internet retailer. Using the following information, identify which is which, and explain your answer.

	Reported Stockholders' Equity	Total Market Value of Equity
Company A .....	\$15,000	\$82,000
Company B .....	15,000	11,000

**PROBLEMS****Problem 3-37****LO1, LO3****Computing Balance Sheet Components**

Denton Equipment Inc. furnishes you with the following list of accounts.

Accounts Payable .....	\$ 66,000
Accounts Receivable .....	40,000
Accumulated Depreciation .....	44,000
Advances to Salespersons .....	10,000
Advertising Expense .....	72,000
Allowance for Bad Debts .....	10,000
Bonds Payable .....	80,000
Cash .....	22,000
Certificates of Deposit .....	16,000
Common Stock (par) .....	100,000
Deferred Income Tax Liability .....	46,000
Equipment .....	215,500
Inventory .....	55,000
Investment in Rowe Oil Co. Stock (40% of outstanding stock owned for control purposes) .....	76,500
Investment in Siebert Co. Stock (trading securities) .....	21,000
Paid-In Capital in Excess of Par .....	42,500
Premium on Bonds Payable .....	6,000
Prepaid Insurance .....	6,000
Rent Revenue .....	37,000
Rent Revenue Received in Advance (4 months) .....	12,000
Retained Earnings .....	97,500
Taxes Payable .....	10,000
Tools .....	52,000

**Instructions:**

- From the preceding list of accounts, determine working capital, total assets, total liabilities, and owners' equity per share of stock (75,000 shares outstanding).
- Assume net income of \$20,000. Compute current ratio, debt ratio, and return on equity.

Notes Receivable (current) .....	32,960
Preferred Stock, \$5 par .....	285,000
Prepaid Insurance .....	3,900
Retained Earnings .....	11,410
Salaries and Wages Payable .....	15,700

**Instructions:**

1. Prepare a properly classified balance sheet.
2. Assume net income of \$300,000 and sales of \$7,000,000. Compute the current ratio, debt ratio, and asset turnover.

## Problem 3-39

LO1, LO4

**Classified Balance Sheet—Including Notes**

Adjusted account balances and supplemental information for Brockbank Research Corp. as of December 31, 2011, are as follows:

Accounts Payable .....	\$ 32,160
Accounts Receivable—Trade .....	57,731
Accumulated Depreciation—Leasehold Improvements and Equipment .....	579,472
Additional Paid-In Capital .....	265,000
Allowance for Bad Debts .....	1,731
Automotive Equipment .....	132,800
Cash .....	25,600
Cash Fund for Bond Retirement .....	3,600
Common Stock .....	35,000
Deferred Income Tax Liability .....	45,000
Dividends Payable .....	37,500
Franchises .....	12,150
Furniture, Fixtures, and Store Equipment .....	769,000
Insurance Claims Receivable .....	120,000
Inventories .....	201,620
Investment in Unconsolidated Subsidiary .....	80,000
Land .....	6,000
Leasehold Improvements .....	65,800
7 ½%–12% Mortgage Notes Payable .....	200,000
Notes Payable—Banks (due in 2012) .....	12,000
Notes Payable—Trade .....	63,540
Patent Licenses .....	57,402
Prepaid Insurance .....	5,500
Profit Sharing, Payroll, and Vacation Payable .....	40,000
Retained Earnings .....	225,800

Supplemental information is as follows:

- (a) Depreciation is provided by the straight-line method over the estimated useful lives of the assets.
- (b) Common stock is \$1 par, and 35,000 of the 100,000 authorized shares were issued and are outstanding.
- (c) The cost of an exclusive franchise to import a foreign company's ball bearings and a related patent license are being amortized on the straight-line method over their remaining lives: franchise, 10 years; patents, 15 years.
- (d) Inventories are stated at the lower of cost or market; cost was determined by the specific identification method.
- (e) Insurance claims based on the opinion of an independent insurance adjustor are for property damages at the central warehouse. These claims are estimated to be two-thirds collectible in the following year and one-third collectible thereafter.
- (f) The company leases all of its buildings from various lessors. Estimated fixed-lease obligations are \$50,000 per year for the next 10 years. The leases do not meet the criteria for capitalization.
- (g) The company is currently in litigation over a claimed overpayment of income tax of \$13,000. In the opinion of counsel, the claim is valid. The company is contingently liable on guaranteed notes worth \$12,000.

**Instructions:** Prepare a properly classified balance sheet. Include all notes and parenthetical notations necessary to properly disclose the essential financial data.

### Problem 3-40

LO1, LO4

#### Classification of Liabilities

The accountant for Sierra Corp. prepared the following schedule of liabilities as of December 31, 2011.

Accounts payable .....	\$ 65,000
Notes payable—trade .....	19,000
Notes payable—bank .....	80,000
Wages and salaries payable .....	1,500
Interest payable .....	14,300
Mortgage note payable—10% .....	60,000
Mortgage note payable—12% .....	150,000
Bonds payable .....	200,000
Total .....	<u>\$589,800</u>

The following additional information pertains to these liabilities.

- (a) All trade notes payable are due within six months of the balance sheet date.
- (b) Bank notes payable include two separate notes payable to First Interstate Bank.
  1. A \$30,000, 8% note issued March 1, 2009, payable on demand. Interest is payable every six months.
  2. A 1-year, \$50,000, 11½% note issued January 2, 2011. On December 30, 2011, Sierra negotiated a written agreement with First Interstate Bank to replace the note with a 2-year, \$50,000, 10% note to be issued January 2, 2012.
- (c) The 10% mortgage note was issued October 1, 2008, with a term of 10 years. Terms of the note give the holder the right to demand immediate payment if the company fails to make a monthly interest payment within 10 days of the date the payment is due. As of December 31, 2011, Sierra is three months behind in paying its required interest payment.
- (d) The 12% mortgage note was issued May 1, 2005, with a term of 20 years. The current principal amount due is \$150,000. Principal and interest are payable annually on April 30. A payment of \$22,000 is due April 30, 2012. The payment includes interest of \$18,000.
- (e) The bonds payable are 10-year, 8% bonds, issued June 30, 2002.

**Instructions:** Prepare the Liabilities section of the December 31, 2011, classified balance sheet for Sierra Corp. Include notes as appropriate. Assume the interest payable accrual has been computed correctly.

**Corrected Balance Sheet**

The following balance sheet was prepared by the accountant for Midway Company.

<b>Midway Company Balance Sheet June 30, 2011</b>	
<b>Assets</b>	
Cash .....	\$ 44,500
Investment securities—Trading (includes long-term investment of \$275,000 in stock of Bahen Builders) .....	328,700
Inventories (net of amount still due suppliers of \$50,000) .....	585,100
Prepaid expenses (includes a deposit of \$25,000 made on inventories to be delivered in 18 months) .....	66,000
Property, plant, and equipment (excluding \$60,000 of equipment still in use, but fully depreciated) .....	270,000
Goodwill (based on estimate by the president of Midway Company) .....	85,000
Total assets .....	<b>\$1,379,300</b>
<b>Liabilities and Owners' Equity</b>	
Notes payable (\$95,000 due in 2013) .....	\$ 150,000
Accounts payable (not including amount due to suppliers of inventory—see above) .....	190,000
Long-term liability under pension plan .....	49,000
Retained earnings restricted for building expansion .....	112,000
Accumulated depreciation .....	90,000
Taxes payable .....	37,000
Bonds payable (net of discount of \$25,000) .....	300,000
Deferred income tax liability .....	71,000
Common stock (15,000 shares, \$1 par) .....	15,000
Additional paid-in capital .....	227,200
Unrestricted retained earnings .....	138,100
Total liabilities and owners' equity .....	<b>\$1,379,300</b>

**Instructions:** Prepare a corrected classified balance sheet using appropriate account titles.

**Problem 3-42**

LO1

**Classified Balance Sheet**

The financial position of St. Charles Ranch is summarized in the following letter to the corporation's accountant.

Dear Dallas:

The following information should be of value to you in preparing the balance sheet for St. Charles Ranch as of December 31, 2011. The balance of cash as of December 31 as reported on the bank statement was \$43,825. There were still outstanding checks of \$9,320 that had not cleared the bank, and cash on hand of \$10,640 was not deposited until January 4, 2012.

Customers owed the company \$40,500 at December 31. We estimated 6% of this amount will never be collected. We owe suppliers \$37,000 for poultry feed purchased in November and December. About 75% of this feed was used before December 31.

Because we think the price of grain will rise in 2012, we are holding 10,000 bushels of wheat and 5,000 bushels of oats until spring. The market value at December 31 was \$3.50 per bushel of wheat and \$1.50 per bushel of oats. We estimate that both prices will increase 15% by selling time. We are not able to estimate the cost of raising this product.

St. Charles Ranch owns 1,850 acres of land. Two separate purchases of land were made as follows: 1,250 acres at \$200 per acre in 1991 and 600 acres at

\$400 per acre in 1996. Similar land is currently selling for \$800 per acre. The balance of the mortgage on the two parcels of land is \$250,000 at December 31; 10% of this mortgage must be paid in 2012.

Our farm buildings and equipment cost us \$176,400 and on the average are 40% depreciated. If we were to replace these buildings and equipment at today's prices, we believe we would be conservative in estimating a cost of \$300,000.

We have not paid property taxes of \$5,500 for 2012 billed to us in late November. Our estimated income tax for 2011 is \$18,500. A refund claim for \$2,800 has been filed relative to the 2009 income tax return. The claim arose because of an error made on the 2009 return.

The operator of the ranch will receive a bonus of \$9,000 for 2011 operations. It will be paid when the entire grain crop has been sold.

As you may recall, we issued 14,000 shares of \$1 par stock upon incorporation. The ranch received \$290,000 as net proceeds from the stock issue. Dividends of \$30,000 were declared last month and will be paid on February 1, 2012.

The new year appears to hold great promise. Thanks for your help in preparing this statement.

Sincerely,

Frank K. Santiago  
President, St. Charles Ranch

**Instructions:** Based on this information, prepare a properly classified balance sheet as of December 31, 2011.

### Problem 3-43

#### LO1

SPREADSHEET

### Corrected Balance Sheet

The bookkeeper for Chordwise Music, Inc., reports the following balance sheet amounts as of June 30, 2011.

Current assets .....	\$295,300
Other assets .....	630,600
Current liabilities .....	167,420
Other liabilities .....	200,000
Owners' equity .....	558,480

A review of account balances reveals the following data.

(a) An analysis of current assets discloses the following:

Cash .....	\$ 59,500
Investment securities—trading .....	40,000
Accounts receivable .....	68,300
Inventories, including advertising supplies of \$3,500 .....	127,500
	<u>\$295,300</u>

(b) Other assets include the following:

Property, plant, and equipment:	
Depreciated book value (cost, \$775,000) .....	\$554,500
Deposit with a supplier for merchandise ordered for August delivery .....	10,700
Goodwill recorded on the books to cancel losses incurred by the company in prior years .....	65,400
	<u>\$630,600</u>

(c) Current liabilities include the following:

Payroll payable .....	\$ 12,550
Taxes payable .....	8,870
Rent payable .....	7,700
Accounts payable	
Total owed to suppliers on account .....	\$111,300
Less: 6-month note received from a supplier who purchased some used equipment on June 29, 2011 .....	5,000
Notes payable .....	<u>32,000</u>
	<u>\$167,420</u>

(d) Other liabilities include the following:

10% mortgage on property, plant, and equipment, payable in semiannual installments of \$20,000 through June 30, 2016 .....	<u>\$200,000</u>
--	------------------

(e) Owners' equity includes the following:

Preferred stock: 15,000 shares outstanding (\$20 par value) .....	\$300,000
Common stock: 175,000 shares at \$1 stated value .....	175,000
Additional paid-in capital .....	83,480
	<u>\$558,480</u>

(f) Common shares were originally issued for \$495,000, but the losses of the company for the past years were charged against additional paid-in capital.

**Instructions:** Using the account balances and related data, prepare a corrected balance sheet showing individual asset, liability, and owners' equity balances properly classified.

### Problem 3-44

#### LO1

DEMO PROBLEM

### Corrected Balance Sheet

The following balance sheet is submitted to you for inspection and review.

Appalachian Freight Company Balance Sheet December 31, 2011	
<b>Assets</b>	
Cash .....	\$ 45,050
Accounts receivable .....	112,500
Inventories .....	204,000
Prepaid insurance .....	8,800
Property, plant, and equipment .....	376,800
Total assets .....	<u>\$747,150</u>
<b>Liabilities and Owners' Equity</b>	
Miscellaneous liabilities .....	\$ 3,600
Loan payable .....	76,200
Accounts payable .....	75,250
Capital stock .....	134,000
Paid-in capital .....	458,100
Total liabilities and owners' equity .....	<u>\$747,150</u>

In the course of the review, you find the following data:

- (a) The possibility of uncollectible accounts on accounts receivable has not been considered. It is estimated that uncollectible accounts will total \$4,800.
- (b) The amount of \$45,000 representing the cost of a large-scale newspaper advertising campaign completed in 2011 has been added to the inventories because it is believed that this campaign will benefit sales of 2012. It is also found that inventories include merchandise of \$16,250 received on December 31 that has not yet been recorded as a purchase.
- (c) The books show that property, plant, and equipment have a cost of \$556,800 with depreciation of \$180,000 recognized in prior years. However, these balances include fully depreciated equipment of \$85,000 that has been scrapped and is no longer on hand.
- (d) Miscellaneous liabilities of \$3,600 represent salaries payable of \$9,500, less noncurrent advances of \$5,900 made to company officials.
- (e) Loan payable represents a loan from the bank that is payable in regular quarterly installments of \$6,250.
- (f) Tax liabilities not shown are estimated at \$18,250.
- (g) Deferred income tax liability arising from temporary differences totals \$44,550. This liability was not included in the balance sheet.

- (h) Capital stock consists of 6,250 shares of preferred 6% stock, par \$20, and 9,000 shares of common stock, stated value \$1.
- (i) Capital stock had been issued for a total consideration of \$283,600; the amount received in excess of the par and stated values of the stock has been reported as paid-in capital. Net income and dividends were recorded in Paid-In Capital.

**Instructions:** Prepare a corrected balance sheet with accounts properly classified.

### Problem 3-45

#### LO1

#### Corrected Balance Sheet

The accountant for Delicious Bakery prepares the following condensed balance sheet.

Delicious Bakery Condensed Balance Sheet December 31, 2011	
Current assets .....	\$53,415
Less: Current liabilities .....	29,000
Working capital .....	\$24,415
Add: Other assets .....	75,120
	<u>\$99,535</u>
Less: Other liabilities .....	3,600
Investment in business .....	<u>\$95,935</u>

A review of the account balances disclosed the following data.

- (a) An analysis of the current asset grouping revealed the following:

Cash .....	\$10,600
Accounts receivable (fully collectible) .....	12,500
Notes receivable (notes of customer who has been declared bankrupt and is unable to pay anything on the obligations) .....	1,000
Investment securities—trading, at cost (market value \$2,575) .....	4,250
Inventory .....	20,965
Cash surrender value of insurance on officers' lives .....	4,100
Total current assets .....	<u>\$53,415</u>

The inventory account was found to include supplies costing \$425, a delivery truck acquired at the end of 2011 at a cost of \$2,100, and fixtures at a depreciated value of \$10,400. The fixtures had been acquired in 2005 at a cost of \$12,500.

- (b) The total for other assets was determined as follows.

Land and buildings at cost of acquisition, July 1, 2009 .....	\$92,000
Less balance due on mortgage, \$16,000, and accrued interest on mortgage, \$880 (mortgage is payable in annual installments of \$4,000 on July 1 of each year together with interest for the year at that time at 11%) .....	<u>16,880</u>
Total other assets .....	<u>\$75,120</u>

It was estimated that the land at the time of the purchase was worth \$30,000. Buildings as of December 31, 2011, were estimated to have a remaining life of 17½ years.

- (c) Current liabilities represented balances that were payable to trade creditors.
- (d) Other liabilities consisted of withholding, payroll, real estate, and other taxes payable to the federal, state, and local governments. However, no recognition was given the accrued salaries, utilities, and other miscellaneous items totaling \$350.
- (e) The company was originally organized in 2004 when 5,000 shares of no-par stock with a stated value of \$5 per share were issued in exchange for business assets that were recognized on the books at their fair market value of \$55,000.

**Instructions:** Prepare a corrected balance sheet with the items properly classified.

## Problem 3-46

## LO1

**Classified Balance Sheet**

Blake Matthews incorporated his paper manufacturing operations on January 1, 2011, by issuing 5,000 shares of \$1 par common stock to himself. The following balance sheet for the new corporation was prepared.

<b>Looseleaf Corporation</b>	
<b>Balance Sheet</b>	
<b>January 1, 2011</b>	
Cash .....	\$ 15,000
Accounts receivable .....	55,000
Inventory .....	105,000
Equipment .....	110,000
<b>Total</b> .....	<b>\$285,000</b>
Accounts payable—suppliers .....	\$ 85,000
Capital stock, \$1 par .....	5,000
Additional paid-in capital .....	195,000
<b>Total</b> .....	<b>\$285,000</b>

During 2011, Looseleaf Corporation engaged in the following transactions.

- (a) Looseleaf Corporation produced paper costing \$395,000. Paper costs consisted of the following: \$307,000, raw materials purchased; \$48,000, labor; and \$40,000, overhead. Looseleaf Corporation paid the \$85,000 owed to suppliers as of January 1 and \$210,000 of the \$307,000 of raw materials purchased during the year. All labor, except for \$6,000, and recorded overhead were paid in cash during the year. Other operating expenses of \$8,500 were incurred and paid in 2011.
- (b) Paper costing \$320,000 was sold during 2011 for \$390,000. All sales were made on credit, and collections on receivables were \$350,000.
- (c) Looseleaf Corporation purchased machinery (fair market value = \$245,000) by trading in old equipment costing \$140,000 and paying \$105,000 in cash. There is no accumulated depreciation on the old equipment as it was revalued when the new corporation was formed.
- (d) Looseleaf Corporation issued an additional 15,000 shares of common stock for \$10 per share and declared a dividend of \$1.75 per share to all stockholders of record as of December 31, 2011, payable on January 15, 2012.
- (e) Depreciation expense for 2011 was \$45,000. The allowance for bad debts after year-end adjustments is \$4,000.

**Instructions:** Prepare a properly classified balance sheet for Looseleaf Corporation as of December 31, 2011.

## Problem 3-47

## The Ten Largest Companies in the United States

*Forbes* annually provides a list of the most valuable companies in the world. The top 10 most valuable companies in the United States, from the 2007 Forbes 2000, follow.

(In billions of U.S. dollars)

Company Name	Industry	Market Value	Total Assets	Net Income
ExxonMobil	Oil & gas operations	\$410.65	\$ 223.95	\$39.50
General Electric	Conglomerates	358.98	697.24	20.83
Microsoft	Software & services	275.85	66.37	11.91
Citigroup	Banking	247.42	1,884.32	21.54
AT&T	Telecommunications services	229.78	270.63	7.36
Bank of America	Banking	226.61	1,459.74	21.13
Wal-Mart	Retailing	201.36	151.19	11.29
Procter & Gamble	Household & personal products	200.34	137.30	9.67
Johnson & Johnson	Drugs & biotechnology	182.12	70.56	11.05
Pfizer	Drugs & biotechnology	179.97	108.59	19.34

As an analyst for a securities broker, you are asked the following questions concerning some of the figures.

1. **Microsoft** has total assets of \$66 billion but a stock market value of \$276 billion. How can a company be worth more than its total assets?
2. Compute for each company the ratio of total assets to total market value. What factors must the market be considering in valuing these companies that are not captured on the companies' balance sheets?
3. The price-earnings ratio, often called the *P/E ratio*, is defined as market price per share divided by earnings per share. Alternatively, the P/E ratio can be computed as total market value divided by net income. Compute the P/E ratios for the preceding companies. What factors do you think influence P/E ratios?

Discussion  
Case 3-49

## Which Company Is Which?

Following are summaries of the balance sheets of five companies. The amounts are all stated as a percentage of total assets. The five companies are

- **BankAmerica**, a large bank
- **Kelly Services**, a firm that provides temporary employees
- **Yahoo!**, an Internet company
- **McDonald's**, a fast-food company
- **Consolidated Edison**, a utility serving New York City

	A	B	C	D	E
Receivables .....	59.1	4.0	4.0	62.9	3.1
Inventories .....	0.0	1.9	0.0	0.0	0.4
Other current assets .....	20.6	1.8	71.1	23.8	3.2
Land, buildings, and equipment .....	11.7	79.3	2.4	1.5	81.1
Other long-term assets .....	8.6	13.1	22.4	11.8	12.3
Short-term payables .....	42.1	6.6	12.9	26.8	8.5
Other current liabilities .....	0.0	1.3	0.0	57.8	4.1
Long-term liabilities .....	0.0	48.4	0.9	8.0	39.5
Equity .....	57.9	43.6	86.2	7.4	47.8

Match each balance sheet summary (A–E) with the appropriate company. Justify your choices.

**Discussion  
Case 3-50****We've Got You Now!**

The Piedmont Computer Company has brought legal action against ATC Corporation for alleged monopolistic practices in the development of software. The claim has been pending for two years, with both sides accumulating evidence to support their positions. The case is now ready for trial. ATC Corporation has offered to settle out of court for \$500,000, but Piedmont is asking for \$5,000,000.

If financial statements must be issued prior to the court action, how should ATC reflect this contingent claim?

**Discussion  
Case 3-51****How Can We Live with Debt Covenant Requirements?**

Bohr Company has a credit agreement with a syndicate of banks. In order to impose some limitations on Bohr's financial riskiness, the credit agreement requires Bohr to maintain a current ratio of at least 1.4 and a debt ratio of 0.55 or less.

The following summary data reflect a projection of Bohr's balance sheet for the coming year-end.

Current assets .....	\$1,200,000
Long-term assets .....	1,800,000
Current liabilities .....	900,000
Long-term liabilities .....	800,000
Equity .....	1,300,000

The following information has also been prepared.

- If Bohr were to use FIFO instead of LIFO for inventory valuation, ending inventory would increase by \$50,000.
- The amounts listed for long-term assets and liabilities include the anticipated purchase (and associated mortgage payable) of a building costing \$100,000, or Bohr can lease the building instead. The lease would qualify for treatment as an operating lease.
- Projected amounts include a planned declaration of cash dividends totaling \$40,000 to be paid next year. Bohr has consistently paid dividends of equivalent amounts.

As a consultant to Bohr, you are asked to respond to the following two questions.

- What steps can Bohr take to avoid violating the current ratio constraint?
- What steps can Bohr take to avoid violating the debt ratio constraint? Of the steps that you propose, which ones do you think the banks had in mind when they imposed the loan covenants? If you had assisted the banks in drawing up the loan covenants, how would you have written them differently to avoid unintended consequences?

**Discussion  
Case 3-52****Are Current Values Necessary for Valuing Investment Assets?**

First Federal Finance Co. has a large investment securities portfolio. In the "old days," First Federal was allowed to value these securities at the lower of cost or market. *Statement of Financial Accounting Standards No. 115* now requires current market valuation on the balance sheet for most securities. As a banker, you do not consider current value reporting to be necessary. Indeed, you feel it unfairly harms your reported performance.

As a banker, why would current value accounting be threatening to you? How would you respond to these concerns if you were a member of the FASB?

**Discussion  
Case 3-53****What Should We Tell the Stockholders?**

Technology Unlimited, Inc., uses a fiscal year ending June 30. The auditors completed their review of the 2011 financial statements on September 8, 2011. They discovered the following subsequent events between June 30 and September 8.

- Technology split its common stock 2 for 1 on August 15. Prior to the split, Technology had outstanding 100,000 shares of \$1 par common stock.

- (b) A major customer, Diatriide Company, declared bankruptcy on August 1. The customer owed Technology \$75,000 on June 30. No payment had been received as of September 8. It is estimated that creditors will receive only 15% of outstanding claims.
- (c) Technology completed negotiations to purchase Liston Development Labs on July 18. The purchase price was \$525,000 cash and a 4-year, \$250,000, 10% note.
- (d) A \$750,000 lawsuit against Technology was filed on August 15. It is too early to measure the loss potential.
- (e) A general decline in stock market values for technology stocks occurred during the first week of September. Technology Unlimited's market value per share dropped from \$42.50 to \$28.00 in this week.

The auditors have requested that you prepare the subsequent event note that should accompany the financial statements for the year ending June 30, 2011. Only those events that require disclosure should be included in your note. Justify the exclusion of any events from your note.

### Discussion Case 3-54

#### What Does this British Balance Sheet Mean?

Jonathan Atwood, a student from England, shows you the following balance sheet from his father's British company. Jonathan knows that you are studying accounting and asks you to look at the statement. You immediately recognize some differences between this statement and the ones you have been studying in your textbook.

	NOTES	Group		Company	
		31 December 2011	2010	31 December 2011	2010
		£m	£m	£m	£m
Fixed Assets					
Intangibles .....	13	304.0	307.4	—	—

1. Identify the differences that exist between this British statement and those prepared using the standards and conventions of the United States.
2. Evaluate the differences, identifying strengths and weaknesses of each nation's approach.

**Discussion**  
**Case 3-55**

**Why Is Our Book-to-Market Ratio So High?**

Aiga Company is a leading manufacturer of household plumbing materials. Aiga does not make the high-profile faucets and fixtures; instead, it makes the pipes and other connections that are usually out of sight under kitchen and bathroom sinks. You are Aiga Company's chief financial officer. You are scheduled to meet with an irate group of stockholders. These stockholders read a recent business press article that explained that the average book-to-market ratio for the 10 most valuable companies in the United States is below 0.10. The article then claimed that companies with book-to-market ratios above 0.50 are probably run by mediocre managers who are unable to inspire market confidence in their companies. Aiga has a book-to-market ratio of 0.65. What will you say to the irate stockholders?

**Case 3-56**

**Deciphering Financial Statements (The Walt Disney Company)**

Locate the 2007 financial statements for **The Walt Disney Company** on the Internet.

1. Compute a current ratio for Disney as of September 29, 2007. How does this current ratio compare with the prior year's current ratio?
2. Compute Disney's asset turnover for 2007. Was the company more or less efficient in 2007 compared to 2006?
3. What method of inventory valuation does Disney use?
4. What method of depreciation does Disney use?
5. What material commitments and contingencies does Disney report in the notes to its 2007 financial statements?
6. What percentage of Disney's 2007 operating income was generated in the "United States and Canada" geographic segment?

**Case 3-57**

**Deciphering Financial Statements (Boston Celtics)**

With all due respect to Michael Jordan and the **Chicago Bulls**, the **Boston Celtics** are the most successful team in professional basketball history. Teams led by Bill Russell, Dave Cowens, John Havlicek, and Larry Bird have won a total of 17 NBA championships. The Celtics are also an unusual professional sports team because ownership shares in the Celtics were at one time publicly traded (on the New York Stock Exchange as "Boston Celtics Limited Partnership"). As such, the Celtics were required to file financial statements with the SEC each quarter. The June 30, 2001, balance sheet of "Celtics Basketball Holdings" follows.

<b>Boston Celtics Limited Partnership and Subsidiaries Consolidated Balance Sheets</b>		
	<b>June 30, 2001</b>	<b>June 30, 2000</b>
<b>ASSETS</b>		
CURRENT ASSETS		
Cash and cash equivalents .....	\$12,572,324	\$14,941,632
Accounts receivable .....	3,250,212	5,799,898
Prepaid expenses and other current assets .....	601,184	636,551
TOTAL CURRENT ASSETS .....	16,423,720	21,378,081
PROPERTY AND EQUIPMENT, net .....	1,200,556	1,144,785
NATIONAL BASKETBALL ASSOCIATION FRANCHISE, net of amortization of \$2,776,318 in 2001 and \$2,622,078 in 2000 .....	3,393,263	3,547,503
INVESTMENT IN NBA MEDIA VENTURES, LLC .....	5,018,420	4,263,420
OTHER ASSETS .....	125,060	776,815
	<u>\$26,161,019</u>	<u>\$31,110,604</u>

	June 30, 2001	June 30, 2000
<b>LIABILITIES AND PARTNERS' CAPITAL (DEFICIT)</b>		
CURRENT LIABILITIES		
Accounts payable and accrued expenses .....	\$23,506,664	\$24,478,303
Deferred game revenues .....	6,498,726	9,204,607
Deferred compensation—current portion .....	1,226,316	1,278,410
TOTAL CURRENT LIABILITIES .....	31,231,706	34,961,320
NOTES PAYABLE TO BANK .....	50,000,000	50,000,000
DEFERRED COMPENSATION—noncurrent portion .....	5,182,821	6,369,646
OTHER NONCURRENT LIABILITIES .....		708,000
PARTNERS' CAPITAL (DEFICIT)		
Celtics Basketball Holdings, LP—General Partner .....	1,015	1,008
Celtics Pride GP—Limited Partner .....	(29,111,174)	(29,437,209)
Castle Creek Partners, LP—Limited Partner .....	(31,144,430)	(31,493,235)
	(60,254,589)	(60,929,436)
Celtics Basketball, LP—General Partner .....	1,081	1,074
TOTAL PARTNERS' CAPITAL (DEFICIT) .....	(60,253,508)	(60,928,362)
	<u>\$26,161,019</u>	<u>\$31,110,604</u>

1. From June 2000 to June 2001, the Celtics' total assets decreased by approximately \$5 million. What assets accounted for most of the decrease? Of course, total liabilities and equity also decreased by \$5 million; what liability or equity items accounted for most of the decrease?
2. As of June 30, 2001, the Celtics have their NBA franchise recorded, net of amortization, at approximately \$3.393 million. What original value was recorded for the NBA franchise? Over how many years is the NBA franchise being amortized? In what year was the NBA franchise originally recorded?
3. Partners' capital as of June 30, 2001, is about negative \$60.3 million. How can partners' capital become negative?
4. The Celtics reported a liability for deferred compensation totaling \$6,409,137 (\$1,226,316 + \$5,182,821). However, the notes to the financial statements revealed the following: "Celtics Basketball has employment agreements with officers, coaches, and players of the Boston Celtics basketball team. Certain of the contracts provide for guaranteed payments which must be paid even if the employee is injured or terminated." The Celtics then disclose that the total amount of these guaranteed payments is \$254.585 million. Explain the vast difference between the \$6.4 million deferred compensation liability reported in the balance sheet and the \$254.585 million compensation obligation disclosed in the notes.

### Case 3-58

#### Deciphering Financial Statements (Safeway, Albertson's, and A&P)

**Safeway** operates 1,761 supermarkets in the United States and Canada. In the United States, Safeway is located principally in the Western, Southwestern, Rocky Mountain, Midwestern, and Mid-Atlantic regions. **Albertson's** operates 2,471 stores in 37 Northeastern, Western, Midwestern, and Southern states. **The Great Atlantic & Pacific Tea Company (A&P)** operates 406 stores in the Northeast and in Canada. Selected financial statement information for 2006 for these three companies follows (in millions of U.S. dollars).

	Safeway	Albertson's	A&P
Inventory .....	\$ 2,643	\$ 3,036	\$ 405
Total current assets .....	3,568	4,355	1,210
Property, plant, and equipment .....	9,773	9,903	898
Total assets .....	16,274	17,871	2,499
Total current liabilities .....	4,601	3,880	610
Total liabilities .....	10,607	12,164	1,827
Sales .....	40,185	40,358	8,740
Cost of goods sold .....	28,604	29,038	6,235
Net income .....	871	446	393

- For each of the three companies, compute the following ratios:
  - Current ratio
  - Debt ratio
  - Asset turnover
  - Return on equity
- Which company uses its inventory most efficiently? Which company uses its property, plant, and equipment most efficiently?
- What dangers might there be in making ratio comparisons without viewing the financial statement notes for the individual companies?

## Case 3-59

**Deciphering Financial Statements (Diageo)**

**Diageo** is a United Kingdom (UK) consumer products firm, best known in the United States for the following brand names: Smirnoff, Johnnie Walker, J&B, Gordon's, Seagram's, and Guinness. Diageo's 2007 consolidated balance sheet follows.

<b>Diageo</b>	
<b>Consolidated Balance Sheet</b>	
<b>30 June 2007</b>	
<b>(In millions of pounds)</b>	
<b>Non-current assets</b>	
Intangible assets .....	4,383
Property, plant and equipment .....	1,932
Biological assets .....	12
Investments in associates .....	1,436
Other investments .....	128
Other receivables .....	17
Other financial assets .....	52
Deferred tax assets .....	771
Post employment benefit assets .....	38
	<u>8,769</u>
<b>Current assets</b>	
Inventories .....	2,465
Trade and other receivables .....	1,759
Other financial assets .....	78
Cash and cash equivalents .....	885
	<u>5,187</u>
Total assets	<u>13,956</u>
<b>Current liabilities</b>	
Borrowings and bank overdrafts .....	(1,535)
Other financial liabilities .....	(43)
Trade and other payables .....	(1,888)
Corporate tax payable .....	(673)
Provisions .....	(60)
	<u>(4,199)</u>
<b>Non-current liabilities</b>	
Borrowings .....	(4,132)
Other financial liabilities .....	(104)
Other payables .....	(38)
Provisions .....	(274)
Deferred tax liabilities .....	(582)
Post employment benefit liabilities .....	(457)
	<u>(5,587)</u>
<b>Total liabilities</b> .....	<u>(9,786)</u>
<b>Net assets</b> .....	<u>4,170</u>
<b>Equity</b>	
Called up share capital .....	848
Share premium .....	1,341
Other reserves .....	3,186
Retained deficit .....	(1,403)
<b>Equity attributable to equity shareholders of</b>	
<b>the parent company</b> .....	3,972
Minority interests .....	198
<b>Total equity</b> .....	<u>4,170</u>

Re-create Diageo's June 30, 2007, balance sheet using U.S. terminology and a standard U.S. format. (*Note:* The other reserves item has no counterpart in the United States. For purposes of this exercise, add the other reserves to "called up share capital.")

**Case 3-60****Deciphering Financial Statements (Consolidated Edison)**

Refer to the 2006 balance sheet for **Consolidated Edison**, reproduced in Exhibit 3-6 on pages 108–110.

1. Compute the following financial ratios for Consolidated Edison for 2006:
  - (a) Debt ratio (total liabilities/total assets)
  - (b) Current ratio (current assets/current liabilities)
  - (c) Long-term debt as a percentage of total capitalization
  - (d) Long-term debt as a percentage of "net plant"
2. For Consolidated Edison, which of the four ratios computed in part (1) is the most informative? The least informative? Explain.

**Case 3-61****Writing Assignment (Unrecorded assets should stay unrecorded)**

You are a member of the most popular student club on campus, the Accounting Antidefamation Organization. Recently, the field of accounting was savagely attacked in an article written by a militant economics student group and published in the student newspaper. The article charged that the balance sheet is stupid, outdated, and useless and cited as an example the accounting practice of not recognizing many intangible assets. As a specific illustration, the article claimed that the name recognition, reputation, and goodwill of the **Coca-Cola** trademark are worth over \$67 billion, but these assets are not recorded in Coca-Cola's balance sheet.

You have been asked by the editor of the student newspaper to respond in writing to this vicious assault by the economics students. Don't cave in to the pressure—argue persuasively why these unrecorded assets should stay unrecorded.

**Case 3-62****Researching Accounting Standards**

To help you become familiar with the accounting standards, this case is designed to take you to the FASB's Web site and have you access various publications. Access the FASB's Web site at <http://www.fasb.org>. Click on "Pronouncements & EITF Abstracts."

In the chapter, we discussed the classification of short-term debt that is expected to be refinanced. For this case, we will use *Statement of Financial Accounting Standards No. 6*. Open *FAS No. 6*.

1. Read paragraph 2. What are short-term obligations?
2. Read paragraph 6. The FASB prides itself on following due process and making sure that all decisions are allowed input by interested parties. What unusual event relating to due process is associated with the issuance of this standard?
3. Read paragraph 12. When short-term debt is being reclassified because it is being refinanced, what is the limit on the amount of short-term debt that can be reclassified?

**Case 3-63****Ethical Dilemma (Dodging a loan covenant violation)**

You are on the accounting staff of Chisos Manufacturing Company. Chisos has a \$100 million loan with Rio Grande National Bank. One of the covenants associated with the loan is that Chisos must maintain a current ratio greater than 1.5.

As of January 20, 2011, preliminary financial statement numbers for the year ended December 31, 2010, have been compiled. It looks like Chisos will violate the current ratio loan covenant. Violation could be very costly in two ways. First, Rio Grande National Bank has historically raised the interest rate one-half of a point on loans with covenant violations. Second, a violation will increase the perceived riskiness of Chisos and make future borrowing more costly.

The 2010 financial statement numbers are just preliminary, and the senior accounting staff of Chisos has discussed the following two options to avoid violation:

1. Reclassify “long-term investment property” as “short-term property held for sale.” Doing this would require a statement from management that the intention is to sell the property within one year. Actually, Chisos intends to hold the property for several more years, and the property classification would be changed back to long-term next year when the threat of covenant violation has hopefully disappeared.
2. Reclassify certain short-term loans as long-term on the basis that Chisos will refinance the loans. Technically, this is true. However, Chisos has no formal refinancing commitment and will not have one until some time in June.

You have been chosen to present the findings of the accounting staff to the board of directors. What points will you emphasize in your presentation?

### Case 3-64

### Cumulative Spreadsheet Analysis

This spreadsheet assignment is a continuation of the spreadsheet assignment given in Chapter 2. If you completed that assignment, you have a head start on this one.

1. Refer back to the financial statement numbers for Skywalker Enterprises for 2011 (given in part 1 of the Cumulative Spreadsheet Analysis assignment in Chapter 2). Revise those financial statements by making the following changes:
  - Change the paid-in capital amount from \$150 to \$200.
  - In the Equity section of the balance sheet, insert a treasury stock amount of  $-\$60$ .

The remaining amount of the “other equity” mentioned in Chapter 2 is accumulated other comprehensive income.

- Increase amount of long-term debt from \$621 to \$671.
- In the Asset section of the balance sheet, insert an intangible asset amount of \$100.

Using the revised balance sheet and income statement, create spreadsheet cell formulas to compute and display values for the following ratios.

- Current ratio
  - Debt ratio
  - Asset turnover
  - Return on assets
  - Return on equity
2. Determine the impact of each of the following transactions on the ratio values computed in Question 1. Treat each transaction independently; that is, before determining the impact of each new transaction you should reset the financial statement values to their original amounts. The transactions that follow are assumed to occur on December 31, 2011.
    - (a) Collected \$60 cash from customer receivables.
    - (b) Purchased \$90 in inventory on account.
    - (c) Purchased \$300 in property, plant, and equipment. The entire amount of the purchase was financed with a mortgage. Principal repayment for the mortgage is due in 10 years.
    - (d) Purchased \$300 in property, plant, and equipment. The entire amount of the purchase was financed with new stockholder investments.
    - (e) Borrowed \$60 with a short-term loan payable. The \$60 was paid out as a dividend to stockholders.
    - (f) Received \$60 as an investment from stockholders. The \$60 was paid out as a dividend to stockholders.
    - (g) The long-term debt amount of \$671 includes \$90 in short-term loans payable that Skywalker hopes to refinance. Skywalker has no explicit agreement with the bank to refinance the loan and does not expect to finalize the refinancing until the last quarter of 2012.
    - (h) During the first week in January 2012, Skywalker learned that, of the \$459 reported as inventory as of December 31, 2011, \$45 is completely obsolete and worthless. The inventory had become obsolete during the last quarter of 2011, but the facts had not been verified until early 2012.

C H A P T E R

4

THE INCOME STATEMENT

**E**liza Grace Symonds was an accomplished pianist, a feat additionally notable because she was deaf. Eliza met and married Melville Bell, who was the son of a famous elocutionist, Alexander Graham Bell. Melville's career followed that of his father. Eliza and Melville had three sons; the second son was named Alexander Graham Bell after his paternal grandfather. Young Alexander Graham Bell demonstrated an early interest in speech. In 1871, at the age of 24 Bell began teaching deaf children to speak at the Boston School for Deaf Mutes. Bell's approach was somewhat unorthodox because, at the time, it was common practice to teach deaf mutes only to sign or to simply institutionalize them. Mabel Hubbard, who would become Bell's wife, was one of his students.

Bell's interest in speech caused him to try to develop what he called the "harmonic telegraph." Samuel Morse completed his first telegraph line in 1843, allowing communication using Morse code between two points, and Bell was interested in transmitting speech in a similar way.

fyi

Long after inventing the telephone, Bell continued his work with the deaf. In gratitude for his work, Helen Keller dedicated her autobiography to him.

At an electrical machine shop, Bell met Thomas Watson. At the time, Watson was a repair mechanic and model maker who was regularly assigned to work with inventors. As Watson learned more of Bell's "harmonic telegraph," the two formed a partnership. In 1876, Bell, while working on their invention, spilled some battery acid and uttered those now-famous words, "Mr. Watson, come here. I want you!" On March 7, 1876, Bell was issued patent number 174,465, covering: "the method of, and apparatus for, transmitting vocal or other sounds telegraphically . . . by causing electrical undulations, similar in form to the vibrations of the air accompanying the said vocal or other sounds."

The **Bell Telephone Company** immediately presented immense competition to the **Western Union Telegraph Company**, which was developing its own telephone technology. Western Union hired Thomas Edison to develop a competing system, forcing the Bell Company to sue Western Union for patent infringement—and win. The Bell Company would be forced in subsequent years to defend its patent in more than 600 cases.

Alexander Graham Bell had little interest in the day-to-day operations of his company. Instead, he preferred studying science and nature. In 1888 he founded the National Geographic Society. Upon his death on August 2, 1922, in a tribute to their inventor, all the phones in the nation were silent for one minute.

The Bell Telephone Company was to become **American Telephone and Telegraph Company (AT&T)** in 1899. AT&T first transmitted the human voice across the Atlantic Ocean in 1915, and in 1927, AT&T introduced commercial transatlantic phone service at a cost of \$75 for five minutes. Numerous AT&T inventions followed, including the transistor (1947), the first microwave relay system (1950), the laser (1958), and the first communications satellite (1962).

## LEARNING OBJECTIVES

- 1 Define the concept of income.
- 2 Explain why an income measure is important.
- 3 Explain how income is measured, including the revenue recognition and expense-matching concepts.
- 4 Understand the format of an income statement.
- 5 Describe the specific components of an income statement.
- 6 Compute comprehensive income and prepare a statement of stockholders' equity.
- 7 Construct simple forecasts of income for future periods.

AT&T functioned as a regulated monopoly until January 1, 1984, when after an 8-year legal battle with the U.S. federal government, AT&T agreed to get out of the local telephone service business by divesting itself of its regional Bell operating companies. On that day, AT&T shrunk from 1,009,000 employees to 373,000. In an interesting twist, one of the original seven regional Bell companies, **Southwestern Bell**, changed its name to **SBC Communications** and then eventually bought up three of the other regional companies and finally bought the original parent, AT&T, as well. The combination of these companies now uses the “AT&T” name. Exhibit 4-1 outlines the fate of the other regional Bells.

In recent years, all of this merger activity at AT&T has been accompanied by an increase in profitability. For

example, AT&T’s 2006 financial statements reported the following income numbers (in millions):

	2006	2005	2004
Revenue .....	\$63,055	\$43,764	\$40,733
Operating income .....	10,288	6,168	5,901
Income from continuing operations .....	7,356	4,786	4,979
Net income .....	7,356	4,786	5,887
Comprehensive income .....	7,407	4,762	6,469

In your parents’ young adult years, they knew only one phone company—AT&T, or “Ma Bell” as it was sometimes called back then. These days, you have a confusing array of phone services, including AT&T, to choose from. And by the time your children enter college, AT&T might be just a historical curiosity.

EXHIBIT 4-1 Fate of the Pieces from the 1984 AT&T Breakup	
1984 Breakup	Where Are They in 2008?
<u>Companies comprising “AT&amp;T” in 2008:</u>	
original AT&T	Purchased by SBC Communications in 2005
Ameritech	Purchased by SBC Communications in 1999
Bell South	Purchased by new AT&T in 2006
Pacific Telesis	Purchased by SBC Communications in 1997
Southwestern Bell	Renamed SBC Communications
<u>Companies included in Verizon in 2008:</u>	
Nynex	Purchased by Bell Atlantic in 1997
Bell Atlantic	Merged with GTE to form Verizon in 2000
<u>Company included in Qwest in 2008:</u>	
U S West	Purchased by Qwest in 2000

**QUESTIONS**

1. *By what percentage did AT&T’s revenue increase from 2004 to 2006?*
2. *By what percentage did AT&T’s net income increase from 2004 to 2006?*
3. *Operating income for 2005 was higher than for 2004 yet income from continuing operations was lower for 2005 than for 2004. What are the major expenses that appear in the income statement between operating income and income from continuing operations?*

**Answers to these questions can be found on page 189.**

**I**n this chapter, we focus on one of the primary financial statements, the income statement. By analyzing the various components of the income statement, you will understand how the performance of a business is reported to financial statement users and how reported performance can change over time as a company changes the nature of its operations. In addition, we will discuss the format of the income statement, its more common components, and ways in which income statements from around the world differ as to the information they contain and the presentation of that information.

# Income: What It Is and What It Isn't

**1** Define the concept of income.

**WHY** Income provides the best accounting measure of a firm's economic performance.

**HOW** Income measures the amount that an entity could return to its investors and still leave the entity as well-off at the end of the period as at the beginning. The FASB has chosen to measure income using the financial capital maintenance concept.

Individuals often confuse income with cash flows. Is income equal to the amount of cash generated from the successful operations of a business? No. For a variety of reasons, most of them related to accrual accounting, income and cash flows from operations are seldom the same number. Because both income and cash flows provide measures of a firm's performance, which provides the best measure? The FASB, in its conceptual framework, stated that "information about earnings and its components measured by accrual accounting generally provides a better indication of enterprise performance than information about current cash receipts and payments."<sup>1</sup> Information regarding cash flows is important. In fact, Chapter 5 focuses entirely on the statement of cash flows. Research supports the FASB's assertion, however, that the best indicator of a firm's performance is income.<sup>2</sup> So, an understanding of income, what it measures, and its components is essential in understanding and interpreting a firm's financial situation.

So, what is **income**? All of the varying ways to measure income share a common basic concept: Income is a return over and above the investment. One of the more widely accepted definitions of income states that it is the amount that an entity could return to its investors and still leave the entity as well-off at the end of the period as it was at the beginning.<sup>3</sup> What does it mean, however, to be "as well-off," and how can this be measured? Most measurements are based on some concept of capital or ownership maintenance. The FASB considered two concepts of capital maintenance in its conceptual framework: financial capital maintenance and physical capital maintenance.

## Financial Capital Maintenance Concept of Income Determination

The **financial capital maintenance** concept assumes that a company has income "only if the dollar amount of an enterprise's net assets (assets — liabilities or, in other words, owners' equity) at the end of a period exceeds the dollar amount of net assets at the beginning of the period after excluding the effects of transactions with owners."<sup>4</sup> To illustrate, assume that Kreidler, Inc., had the following assets and liabilities at the beginning and at the end of a period.

<sup>1</sup> *Statement of Financial Accounting Concepts No. 1*, "Objectives of Financial Reporting by Business Enterprises" (Stamford, CT: Financial Accounting Standards Board, 1984), par. 44.

<sup>2</sup> For example, see Gary C. Biddle, Robert M. Bowen, and James S. Wallace, "Does EVA® Beat Earnings? Evidence on Associations with Stock Returns and Firm Values," *Journal of Accounting and Economics*, December 1997, p. 301.

<sup>3</sup> Although many economists and accountants have adopted this view, a basic reference is J. R. Hicks' widely accepted book, *Value and Capital*, 2nd ed. (Oxford University Press, 1946).

<sup>4</sup> *Statement of Financial Accounting Concepts No. 5*, "Recognition and Measurement in Financial Statements of Business Enterprises" (Stamford, CT: Financial Accounting Standards Board, 1984), par. 47.

	Beginning of Period	End of Period
Total assets .....	\$510,000	\$560,000
Total liabilities .....	430,000	390,000
Net assets (owners' equity) .....	<u>\$ 80,000</u>	<u>\$170,000</u>

If there were no investments by owners or distributions to owners during the period, income would be \$90,000, the amount of the increase in net assets. Assume, however, that owners invested \$40,000 in the business and received distributions (dividends) of \$15,000. Income for the period would be \$65,000, computed as follows:

Net assets, end of period .....	\$170,000
Net assets, beginning of period .....	80,000
Change (increase) in net assets .....	\$ 90,000
Deduct investment by owners .....	(40,000)
Add distributions (dividends) to owners .....	15,000
Income .....	<u>\$ 65,000</u>

### Physical Capital Maintenance Concept of Income Determination

Another way of defining capital maintenance is in terms of **physical capital maintenance**. Under this concept, income occurs “only if the physical productive capacity of the enterprise at the end of a period . . . exceeds the physical productive capacity at the beginning of the same period, also after excluding the effects of transactions with owners.”<sup>5</sup> This concept requires that productive assets (inventories, buildings, and equipment) be valued at fair market values. Productive capital is maintained only if the current costs of these capital assets are maintained. Consider the beginning net asset value of \$80,000 in the previous example. Now assume that, because of rising prices of buildings, inventory, equipment, and so forth, in order to maintain the same productive capacity the company would have to have \$100,000 in net asset value by the end of the year. If the ending net asset value were \$170,000, as before, and new investments and dividends were as shown, income would be \$45,000 rather than \$65,000. The \$20,000 difference would be the amount necessary to “maintain physical productive capacity” and would not be part of income.

The FASB considered carefully these two ways of viewing income, and it adopted the financial capital maintenance concept as part of its conceptual framework.

The acceptance of the financial capital maintenance concept rescued accountants from the difficult task of trying to measure productive capacity. Measuring income using the concept of financial capital maintenance, however, still leaves the question of how to value the net asset balance. Many suggest that net assets should be measured at their unexpired historical cost values as is often done. Others believe that replacement values or disposal values should be used. Some would include as assets intangible resources, such as human resources, goodwill, and geographic location, that have been attained over time without specifically identified payments. Others believe that only resources that have been acquired in arm's-length exchange activities should be included.

Likewise, controversy has developed over the recognition and measurement of liabilities. Should future claims against the

## stop & think

It would seem that the physical capital maintenance concept would provide the best theoretical measure of “well-offness.” However, use of the physical capital maintenance concept of measuring income involves many practical difficulties. Identify **ONE** of those practical difficulties from the list below.

- Difficulty in estimating depreciation lives
- Difficulty in implementing internal control procedures
- Difficulty in providing cash flow information
- Difficulty in obtaining fair market values of assets and liabilities

<sup>5</sup> Ibid.

entity for items such as pensions, warranties, and deferred income taxes be valued at their discounted values, at their future cash flow values, or eliminated completely from the financial statements until events clearly define the existence of a specific liability? The reported income under the financial maintenance concept varies widely depending on when and how the assets, liabilities, and changes in the valuation of assets and liabilities are measured. As it stands currently, a combination of historical costs, current values, present values, and other valuation measures are used to measure a firm's "well-offness."

## Why Is a Measure of Income Important?

**2** Explain why an income measure is important.

**WHY** Income measurement is important to business and economic decisions that result in the allocation of resources, which in turn contributes to the standard of living in society.

**HOW** Accrual accounting rules in general, and the financial accounting standards established by the FASB in particular, establish the rules of accounting income measurement in the United States. As such, these rules and standards have the power to impact the allocation of societal resources.

The recognition, measurement, and reporting (display) of business income and its components are considered by many to be the most important tasks of accountants. The users of financial statements who must make decisions regarding their relationship with the company are almost always concerned with a measure of its success in using the resources committed to its operation. Has the activity been profitable? What is the trend of profitability? Is it increasingly profitable, or is there a downward trend? What is the most probable result for future years? Will the company be profitable enough to pay interest on its debt and dividends to its stockholders and still grow at a desired rate? These and other questions all relate to the basic question: What is income?

Information about the components of income is important and can be used to help predict future income and cash flows. Not only can this information be helpful to a specific user, but also it is of value to the economy. As discussed in Chapter 1, many groups utilize accounting information, and accountants play a key role in providing information that will assist in allocating scarce resources to the most efficient and effective organizations or groups.

In the United States, the FASB has specified that financial accounting information is designed with investors and creditors in mind at the same time recognizing that many other groups will find the resulting information useful as well. Of course, accrual-based financial accounting information is not suited for every possible use. For example, governments, both federal and state, rely heavily on income taxes as a source of their revenues. The income figure used for assessing taxes is based on laws passed by Congress and regulations applied by the IRS and various courts. The income determined for financial reporting, however, is determined by adherence to accounting standards (GAAP) developed by the accounting profession. Thus, the amount of income reported to creditors and investors may not be the same as the income reported for tax purposes. Many items are the same for both types of reporting, but there are some significant differences. Most of these differences relate to the specific purposes Congress has for taxing income. Governments use an income figure as a base to assess taxes, but they must use one that relates closely with the ability of the taxpayer to pay the computed tax. For example, accrual accounting requires companies to defer recognition of revenues that are received before they are earned. Income tax regulations, however, often require these unearned revenues to be reported as income as soon as they are received in cash.

As mentioned in previous chapters, the increasing globalization of business is providing the impetus for a movement toward a unified body of International Accounting

Standards. However, because financial accounting information plays different roles in different countries, it is probably not reasonable to assume that one set of standards can fit the business, legal, and cultural settings of every country in the world. For example, countries can be separated, broadly speaking, into two groups: code law countries and common law countries.<sup>6</sup> In code law countries, such as Germany and Japan, accounting standards have historically been set by legal processes. In such an environment, financial accounting numbers serve a variety of functions, including the determination of the amount of income tax and cash dividends to be paid. In a common law country, such as the United States and the United Kingdom, accounting standards are set in response to market forces. In a common law setting, financial accounting numbers are used more for informational purposes, not for deciding how the economic pie gets split among taxes, dividends, wages, and so forth. Given the significantly different roles played by financial accounting numbers in code law and common law countries, it may be unreasonable to expect one set of standards to work worldwide.

Accounting standards also play a different role in developing economies as compared to developed economies. In China, for example, the rudimentary state of the auditing and legal infrastructure makes the application of judgment-based accounting standards extremely problematic.<sup>7</sup> In a developing economy, it may be more important for financial reporting to satisfactorily fulfill its essential bookkeeping function rather than attempt to provide sophisticated investment information relevant for only a small set of companies trying to attract foreign investment. The fundamental question is this: How are accounting standards designed for use by international financial analysts going to help a domestic Chinese company with no plans to seek foreign investment and with a desire only to improve the monitoring of managers and the allocation of resources?

This text focuses on principles of accounting that are the supporting foundation for financial accounting and reporting as practiced in the United States. Income for tax purposes will be discussed, but only as it is used to determine the income tax expense and other tax-related amounts reported in the financial statements. Differences between U.S. and foreign accounting practices will be discussed where appropriate throughout the text.

## How Is Income Measured?

**3** Explain how income is measured, including the revenue recognition and expense-matching concepts.

**WHY** The recognition of revenue begins the process of computing income. Expenses are then matched with revenues when those revenues are recognized.

**HOW** Income is measured as the difference between resource inflows (revenues and gains) and outflows (expenses and losses) over a period of time. Revenues are recognized when (1) they are realized or realizable and (2) they have been earned through substantial completion of the activities involved in the earning process. Expenses are matched against revenues directly, in a systematic or rational manner, or are immediately recognized as a period expense.

Comparing the net assets at two points in time, as was done previously in introducing the concept of financial capital maintenance, yields a single net income figure. However, this procedure discloses no detail concerning the components of income. To provide this detail, accountants have adopted a **transaction approach** to measuring income that stresses the direct computation of revenues and expenses. As long as

<sup>6</sup> Ray Ball, S. P. Kothari, and Ashok Robin, "The Effect of International Institutional Factors on Properties of Accounting Earnings," *Journal of Accounting and Economics*, February 2000, p. 1.

<sup>7</sup> Bing Xiang, "Institutional Factors Influencing China's Accounting Reforms and Standards," *Accounting Horizons*, June 1998, p. 105.

Text not available due to copyright restrictions

the same measurement method is used, income will be the same under the transaction approach as with a single income computation.

The transaction approach, sometimes referred to as the *matching method*, focuses on business events that affect certain elements of financial statements, namely, revenues, expenses, gains, and losses. Income is measured as the difference between resource inflows (revenues and gains) and outflows (expenses and losses) over a period of time. Definitions for the four income elements are presented in Exhibit 4-2 as an aid to the following discussion.

As studying these definitions will indicate, by defining gains and losses in terms of changes in equity after providing for revenues, expenses, investments, and distributions to the owners, income determined by the transaction approach will be the same income as that determined under financial capital maintenance. However, by identifying intermediate income components, the transaction approach provides detail to assist in predicting future cash flows.

The key problem in recognizing and measuring income using the transaction approach is deciding when an “inflow or other enhancements of assets” has occurred and how to measure the “outflows or other ‘using up’ of assets.” The first issue is identified as the revenue recognition problem, and the second issue is identified as the expense recognition, or expense-matching problem.

## Revenue and Gain Recognition

The transaction approach requires a clear definition of when income elements should be recognized, or recorded, in the financial statements. Under the GAAP of accrual accounting, **revenue recognition** does not necessarily occur when cash is received. The FASB’s conceptual framework identifies two factors that should be considered in deciding when revenues and gains should be recognized: realization and the earnings process. Revenues and gains are generally recognized when

## stop & think

Take a close look at Exhibit 4-2. Why is it important to disclose separately revenues and gains?

- To distinguish between the profits generated by a company’s core business and the profits generated by secondary, or peripheral, activities.
- To distinguish between profits generated through selling goods and profits generated through selling services.
- To distinguish between profits generated through business activities and profits generated through investments by owners.
- To distinguish between profits generated through the enhancement of assets and profits generated through the settlement of liabilities.

fyi

Most firms specify their revenue recognition policies in the notes to the financial statements. For example, the notes to Disney's financial statements disclose the corporation's revenue recognition policies for movie tickets, video sales, movie licensing, TV advertising, Internet advertising, merchandise licensing, and theme park sales.

1. they are realized or realizable, and
2. they have been earned through substantial completion of the activities involved in the earnings process.<sup>8</sup>

Put in simple terms, revenues are recognized when the company generating the revenue has provided the bulk of the goods or services it promised (substantial completion) for the customer and when the customer has provided payment or at least a valid promise of payment (realizable) to the company. That is, the company has lived up to its end of an agreement, and the customer has the intention of paying.

In order for revenues and gains to be realized, inventory or other assets must be exchanged for cash or claims to cash, such as accounts receivable. Revenues are realizable when assets held or assets received in an exchange are readily convertible to known amounts of cash or claims to cash. The earnings process criterion relates primarily to revenue recognition. Most gains result from transactions and events, such as the sale of land or a patent, that involve no earnings process. Thus, being realized, or realizable, is of more importance in recognizing gains.

Application of these two criteria to certain industries and companies within these industries has resulted in recognition of revenue at different points in the revenue-producing cycle. This cycle can be a lengthy one. For a manufacturing company, it begins with the development of proposals for a certain product by an individual or by the research and development department and extends through planning, production, sale, collection, and finally expiration of the warranty period. Consider, for example, the revenue-producing cycle for **Ford Motor Company**. Engineers develop plans and create models and prototypes. Actual production of vehicles then occurs, followed by delivery to dealers for sale to customers. All new vehicles are warranted against defect, in some cases for several years. All of these steps, which can take more than 10 years, are involved in generating sales revenue. If a failure occurs at any step, revenue may be seriously curtailed or even completely eliminated, yet there is only one aggregate revenue amount for the entire cycle, the selling price of the product.

For a service company, the revenue-producing cycle begins with an agreement to provide a service and extends through the planning and performance of the service to the collection of the cash and final proof through the passage of time that the service has been adequately performed. As an example, consider the revenue-producing cycle of **PricewaterhouseCoopers (PwC)**, one of the large accounting firms. For a typical audit, much of the planning and preparation occurs before the actual on-site visit. The on-site visit is then followed by an accumulation of data and the preparation of an audit report. And with increasing legal actions being taken against professionals, such as doctors and accountants, one could argue that the revenue-producing cycle does not end until the possibility of legal claims for services performed is remote, a period that extends until years after the actual service is provided.

Photodisc/Getty Images

Construction contracts are an example of revenue that is recognized as services are performed.

<sup>8</sup> *Statement of Financial Accounting Concepts No. 5*, par. 83.

Although some accountants have argued for recognizing revenue on a partial basis over these extended production or service periods, the prevailing practice has been to select one point in the cycle that best meets the revenue recognition criteria. Both of these criteria are generally met at the point of sale, which is generally when goods are delivered or services are rendered to customers and payment or a promise of payment is received. Thus, revenue for automobiles sold to dealers by Ford Motor Company will be recognized when the cars are shipped to the dealers. Similarly, PwC will record its revenue from audit and tax work when the services have been performed and billed. In both examples, the earnings process is deemed to be substantially complete, and the cash or receivable from the customer meets the realization criterion. Although the “point-of-sale” practice is the most common revenue recognition point, there are notable variations to this general rule.<sup>9</sup> The following discussion is merely an introduction to the subtleties associated with revenue recognition. A more complete treatment is given in Chapter 8.

### Earlier Recognition

1. If a market exists for a product so that its sale at an established price is practically ensured without significant selling effort, revenues may be recognized at the point of completed production. Examples of this situation may occur with certain precious metals and agricultural products that are supported by government price guarantees.<sup>10</sup> In these situations, revenue is recognized when the mining or production of the goods is complete because the earnings process is considered to be substantially complete and the existence of a virtually guaranteed purchaser provides evidence of realizability. An example of this method of revenue recognition is provided by a Canadian mining company, **Kinross Gold Corporation**; the appropriate note from Kinross’ financial statements is reproduced in Exhibit 4-3. According to the note, Kinross recognizes revenue prior to the point of sale with the expected sales price to be received being recorded in a current

## stop & think

Why do you think Kinross waits to recognize revenue from the sale of Kubaka gold until the gold is actually sold?

- a) Revenue from the sale of a product can never be recognized until after the product is actually sold.
- b) Uncertainty surrounds the ultimate shipment and sale of gold produced in the remote regions of eastern Russia.
- c) Revenue from the sale of a product can never be recognized until after the cash from the sale is actually collected.
- d) GAAP forbids the recognition of any revenue at the time of production.

#### EXHIBIT 4-3

#### Kinross Gold Corporation Revenue Recognition Note Disclosure

Gold and silver poured, in transit and at refineries, are recorded at net realizable value and included in bullion settlements and other accounts receivable, with the exception of Kubaka bullion. The estimated net realizable value of Kubaka bullion is included in inventory until it is sold.

<sup>9</sup> Accounting Principles Board, *Statement No. 4*, “Basic Concepts in Accounting Principles Underlying Financial Statements of Business Enterprises” par. 152, October 1970. In 1999, the SEC released *SAB No. 101*, which gives specific guidance about when to recognize revenue. *SAB 101* is discussed in Chapter 8. In 2002, the FASB began a “Revenue Recognition” project in which the earnings and realization criteria would be replaced with an emphasis on the creation and extinguishment of assets and liabilities. As of May 2008, that project was still ongoing.

<sup>10</sup> Companies in these industries may recognize revenue prior to the point of sale, but a survey of revenue recognition policies for companies in these industries reveals that the vast majority recognize revenue at the point of sale. For example, Kinross Gold, which is used as an illustration, changed its accounting policy for revenue recognition effective January 1, 2001, so that revenue is now recognized upon shipment and passage of title to the customer. The provisions of the SEC’s *SAB No. 101* frown on the recognition of revenue before delivery to a customer has taken place.

asset account, Bullion Settlements. Note that Kinross accounts for Kubaka bullion differently from its other ores; revenue recognition for Kubaka bullion occurs when it is sold. The Kubaka gold is produced in eastern Russia. For international purposes under *IAS 41*, gains and losses from increases and decreases in the fair value of biological assets (such as cows) and agricultural produce (such as harvested wheat) are recognized when they occur, without waiting until the items are subsequently sold.

2. If a product or service is contracted for in advance, revenue may be recognized as production takes place or as services are performed, especially if the production or performance period extends over more than one fiscal year. The percentage-of-completion and proportional performance methods of accounting have been developed to recognize revenue at several points in the production or service cycle rather than waiting until the final delivery or performance takes place. This exception to the general point-of-sale rule is necessary if the qualitative characteristics of relevance and representational faithfulness are to be met. Construction contracts for buildings, roads, and dams, and contracts for scientific research are examples of situations in which these methods of revenue recognition occur. In all cases when this revenue recognition variation is employed, a firm, enforceable contract must exist to meet the realizability criterion, and an objective measure of progress toward completion must be attainable to measure the degree of completeness. As an example of this type of revenue recognition, **The Boeing Company** indicates in its notes (see Exhibit 4-4) that a portion of its revenues are recognized prior to the point of sale.

#### EXHIBIT 4-4

#### The Boeing Company Note on Revenue Recognition

Sales related to contracts with fixed prices are recognized as deliveries are made, except for certain fixed-price contracts that require substantial performance over an extended period before deliveries begin, for which sales are recorded based on attainment of performance milestones.

### Later Recognition

3. If collectibility of assets received for products or services is considered doubtful, revenues and gains may be recognized as the cash is received. The install-

Photodisc/Getty Images

Losses from natural disasters, such as earthquakes, are recognized immediately.

ment sales and cost recovery methods of accounting have been developed to recognize revenue under these conditions. Sales of real estate, especially speculative recreational property, are often recorded using this variation of the general rule. In these cases, although the earnings process has been substantially completed, the questionable receivable fails to meet the realization criterion. For example, **Rent-A-Center** operates rent-to-own stores where consumers can obtain furniture, televisions, and other consumer goods on a rent-to-own basis. A big concern for Rent-A-Center is collecting the full amount of cash due under a

rental contract. In fact, Rent-A-Center states that approximately 25% of its customers complete the full term of their agreement. With such a high likelihood of customers stopping payments on their rental agreements, Rent-A-Center recognizes revenue from a specific contract only gradually as the cash is actually collected. The general point-of-sale rule will be assumed for examples in this text unless specifically stated otherwise. Variations on this rule are discussed fully in Chapter 8.

## Expense and Loss Recognition

In order to determine income, not only must criteria for revenue recognition be established, but also the principles for recognizing expenses and losses must be clearly defined. Some expenses are directly associated with revenues and can thus be recognized in the same period as the related revenues. Other expenditures are not recognized currently as expenses because they relate to future revenues and therefore are reported as assets. Still other expenses are not associated with specific revenues and are recognized in the time period when paid or incurred. **Expense recognition**, then, is divided into three categories: (1) direct matching, (2) systematic and rational allocation, and (3) immediate recognition.

**Direct Matching** Relating expenses to specific revenues is often referred to as the **matching** process. For example, the cost of goods sold is clearly a direct expense that can be “matched” with the revenues produced by the sale of goods and reported in the same time period as the revenues are recognized. Similarly, shipping costs and sales commissions usually relate directly to revenues.<sup>11</sup>

Direct expenses include not only those that have already been incurred but also include anticipated expenses related to revenues of the current period. After delivery of goods to customers, there are still costs of collection, bad debt losses from uncollectible receivables, and possible warranty costs for product deficiencies. These expenses are directly related to revenues and should be estimated and matched against recognized revenues for the period.

**Systematic and Rational Allocation** The second general expense recognition category involves assets that benefit more than one accounting period. The cost of assets such as buildings, equipment, patents, and prepaid insurance are spread across the periods of expected benefit in some systematic and rational way. Generally, it is difficult, if not impossible, to relate these expenses directly to specific revenues or to specific periods, but it is clear that they are necessary if the revenue is to be earned. Examples of expenses that are included in this category are depreciation and amortization.

**Immediate Recognition** Many expenses are not related to specific revenues but are incurred to obtain goods and services that indirectly help to generate revenues. Because these goods and services are used almost immediately, their costs are recognized as expenses in the period of acquisition. Examples include most administrative costs, such as office salaries, utilities, and general advertising and selling expenses.

Immediate recognition is also appropriate when future benefits are highly uncertain. For example, expenditures for research and development may provide significant future benefits, but these benefits are usually so uncertain that the costs are written off in the period in which they are incurred.

Most losses also fit in the immediate recognition category. Because they arise from peripheral or incidental transactions, they do not relate directly to revenues. Examples

<sup>11</sup> *Statement of Financial Accounting Concepts No. 6*, “Elements of Financial Statements” (Stamford, CT: Financial Accounting Standards Board, December 1985), par. 144.

include losses from disposition of used equipment, losses from natural catastrophes such as earthquakes or tornadoes, and losses from disposition of investments.

## Gains and Losses from Changes in Market Values

An exception to the transaction approach in the recognition of gains and losses arises when gains or losses are recognized in the wake of changes in market values. For example, some investment securities, called trading securities (as explained fully in Chapter 14), are purchased by a company with the express intent of making money on short-term price fluctuations. Accordingly, even in the absence of a transaction to sell the trading securities, a gain (if the price of the securities has increased) or a loss (if the price of the securities has decreased) is recognized. Similarly, when a long-term asset such as a building has decreased substantially in value, a loss is recognized even though the building has not been sold and no transaction has occurred. (These impairment losses are explained in Chapter 11.)

The transaction approach is deeply ingrained in accounting practice. A primary attraction of the transaction approach is its reliability—increases and decreases in asset values can be verified by observing the transaction prices. However, as with the case of the trading securities mentioned in the preceding paragraph, many important economic factors influence a company even in the absence of explicit transactions. Because of the information relevance of these changes in market values, more and more of these market value gains and losses are being recognized as part of income. As described more fully in Chapter 8, the FASB is currently working on a “revenue recognition” project that may go even further in stepping away from the transaction approach to instead embrace a focus on changes in values of assets and liabilities.

## Form of the Income Statement

**4** Understand the format of an income statement.

**WHY** Companies can use various formats when presenting income. The resulting income figure will be the same, regardless of the format used. However, the level of detail and the ability to compare will be influenced by the format chosen.

**HOW** The general format of an income statement is to subtract cost of goods sold and operating expenses from operating revenues to derive operating income. Gains and losses are then included to arrive at income from continuing operations. Irregular and extraordinary items are reported separately to determine net income.

All income statements prepared in accordance with GAAP report the same basic type of information and have certain common display features. Some sections of the income statement, especially irregular and extraordinary items, are specified by FASB pronouncements. Others have become standardized by wide usage.

Traditionally, the income from continuing operations category has been presented in multiple-step form. With the **multiple-step form**, the income statement is divided into separate sections (referred to as “intermediate components” in FASB *Concepts Statement No. 5*), and various subtotals are reported that reflect different levels of profitability. The income statement of **IBM**, Exhibit 4-5, illustrates a multiple-step income statement. With the multiple-step form, the costs are partitioned so that intermediate components of income are presented. For example, IBM discloses gross profit, income before taxes, and net income in its income statements.

\*Reflects implementation of FASB Interpretation No. 47.

For discussion purposes, we will use the multiple-step income statement for Techtronics Corporation. This hypothetical income statement contains more categories and more detail than is usually found in actual published financial statements. It has become common practice to issue highly condensed statements, with details and supporting schedules provided in notes to the statements. The potential problem with this practice is that the condensed statements may not provide as much predictive and feedback value as statements that provide more detail about the components of income directly on the statement.

**Techtronics Corporation**  
**Income Statement**  
**For the Year Ended December 31, 2011**

Revenue:			
Sales .....		\$800,000	
Less: Sales returns and allowances .....	\$ 12,000		
Sales discounts .....	8,000	20,000	\$780,000

Earnings per common share:			
Income from continuing operations .....			\$1.57
Discontinued operations .....			(0.71)
Extraordinary gain .....			0.25
Net income .....			\$ 1.11

The Techtronics income statement differs from most published statements in other ways. For example, to simplify the illustration of the various income components, only one year is presented for Techtronics. To comply with SEC requirements, income statements

of public companies are presented in comparative form for three years (see Exhibit 4-5). **Comparative financial statements** enable users to analyze performance over multiple periods and identify significant trends that might impact future performance. Also note that the Techtronics income statement is for a single business entity, but public companies often present **consolidated financial statements** that combine the financial results of a “parent company,” such as IBM, with other companies that it owns, called *subsidiaries*.

All actual company statements illustrated in this chapter are consolidated statements.<sup>12</sup>

## Components of the Income Statement

**5** Describe the specific components of an income statement.

**WHY** Through careful grouping and sequencing of the income statement items, important business relationships are highlighted, and the results of the continuing core operations of the company are emphasized.

**HOW** Most companies will include some or all of the following specific components in the income statement: Revenue, Cost of goods sold, Gross profit, Operating expenses, Operating income, Other revenues and gains, Other expenses and losses, Income from continuing operations before income taxes, Income taxes on continuing operations, Income from continuing operations, Discontinued operations, and Extraordinary items.

In the following sections, the content of the income statement will be discussed and illustrated using the statement for Techtronics Corporation. Variations in current reporting practices will be examined and illustrated with income statements of actual companies. Finally, the requirement to supplement reported net income with a measure of comprehensive income will be discussed.

### Income from Continuing Operations

The Techtronics Corporation income statement has two major categories of income: (1) income from continuing operations and (2) irregular or extraordinary items. **Income from continuing operations** includes all revenues and expenses and gains and losses arising from the ongoing operations of the firm. In the Techtronics example, income from continuing operations includes six separate sections as follows.

1. Revenue
2. Cost of goods sold
3. Operating expenses
4. Other revenues and gains
5. Other expenses and losses
6. Income taxes on continuing operations

Also, a review of the Techtronics income statement discloses several subtotals in the income from continuing operations category. These subtotals are identified as follows.

1. Gross profit (Revenue – Cost of goods sold)
2. Operating income (Gross profit – Operating expenses)

<sup>12</sup> Throughout this text, we will use many actual companies to illustrate financial reporting concepts and practices. You will observe many variations in statement titles, terminology, level of detail, and other aspects of reporting. As a result, you will develop an appreciation of the diversity in financial reporting and the ability to understand financial information presented in a wide variety of terms and formats.

3. Income from continuing operations before income taxes (Operating income + Other revenues and gains – Other expenses and losses)
4. Income from continuing operations (Income from continuing operations before income taxes – Income taxes on continuing operations)

Each of these major sections and related subtotals is discussed separately as a way to help you better understand current practices in reporting income from continuing operations. Then, we will examine the irregular and extraordinary components of income.

**Revenue** Revenue reports the total sales to customers for the period less any sales returns and allowances or discounts. This total should not include additions to billings for sales taxes and excise taxes that the business is required to collect on behalf of the government. These billing increases are properly recognized as current liabilities instead of as revenues because the sales tax and excise tax amounts must be forwarded to the appropriate government agency. Sales returns and allowances and sales discounts should be subtracted from gross sales in arriving at net sales revenue. When the sales price is increased to cover the cost of freight to the customer and the customer is billed accordingly, freight charges paid by the company should also be subtracted from sales in arriving at net sales. Freight charges not passed on to the buyer are recognized as selling expenses.

**Cost of Goods Sold** In any merchandising or manufacturing enterprise, the cost of goods relating to sales for the period must be determined. As illustrated in the Techtronics Corporation income statement, cost of goods available for sale is first determined. This is the sum of the beginning inventory, net purchases, and all other buying, freight, and storage costs relating to the acquisition of goods. (The net purchases balance is developed by subtracting purchase returns and allowances and purchase discounts from gross purchases, not shown.) Cost of goods sold is then calculated by subtracting the ending inventory from the cost of goods available for sale.

When the goods are manufactured by the seller, additional elements enter into the cost of goods sold. Besides material costs, a company incurs labor and overhead costs to convert the material from its raw material state to a finished good. A manufacturing company has three inventories rather than one: raw materials, goods in process, and finished goods. Techtronics Corporation is a merchandising company. The cost of goods sold for a manufacturing company is illustrated in Chapter 9.

**Gross Profit** For most merchandising and manufacturing companies, cost of goods sold is the most significant expense on the income statement. Because of its size, firms pay particular attention to changes in cost of goods sold relative to changes in sales. **Gross profit** is the difference between revenue from net sales and cost of goods sold; **gross profit percentage**, computed by dividing gross profit by revenue from net sales, provides a measure of profitability that allows comparisons for a firm from year to year. For **General Motors**, gross profit is the difference between the cost to manufacture a car and the price GM charges to dealers who buy cars. In a supermarket, gross profit is the difference between retail selling price and wholesale cost.

Gross profit is an important number. If a company is not generating enough from the sale of a product or service to cover the costs directly associated with that product or service, that company will not be able to stay in that line of business for long. For example, if IBM sells a mainframe computer for \$126,000 and the materials, labor, and overhead costs associated with producing that computer are \$139,000, the gross profit of negative \$13,000 suggests that IBM is in serious difficulty. After all, with a negative gross profit, IBM would not be able to pay for advertising, executive salaries, interest expense, and so forth.

For example, using information from IBM's income statement in Exhibit 4-5, we can compute a gross profit percentage for each type of revenue.

<b>IBM Corporation</b>			
<b>Gross Profit Percentage</b>			
	<b>2006</b>	<b>2005</b>	<b>2004</b>
Global services.....	27.5%	26.0%	24.2%
Hardware.....	37.0	35.1	29.4
Software.....	85.2	84.9	84.6
Global financing.....	50.3	54.7	59.9
Other.....	(13.8)	44.9	(51.5)
Overall gross profit.....	41.9	40.1	36.9

This analysis reveals that IBM's overall gross profit percentage has increased over the 3-year period from 2004 to 2006. This increase can be attributed to the increases in the gross profit percentage of the global services, hardware, and software segments.

**Operating Expenses** Operating expenses may be reported in two parts: (1) selling expenses and (2) general and administrative expenses. Selling expenses include items such as sales salaries and commissions and related payroll taxes, advertising and store displays, store supplies used, depreciation of store furniture and equipment, and delivery expenses. General and administrative expenses include officers' and office salaries and related payroll taxes, office supplies used, depreciation of office furniture and fixtures, telephone, postage, business licenses and fees, legal and accounting services, contributions, and similar items. For manufacturers, charges related jointly to production and administrative functions should be allocated in an equitable manner between manufacturing overhead and operating expenses.

**Operating Income** **Operating income** measures the performance of the fundamental business operations conducted by a company and is computed as gross profit minus operating expenses. A general rule of thumb is that all expenses are operating expenses except interest expense and income tax expense. Accordingly, another name for operating income is *earnings before interest and taxes (EBIT)*.

Operating income tells users how well a business is performing in the activities unique to that business, separate from the financing and income tax management policies that are handled at the corporate headquarters level. For example, operating income allows you to evaluate **Wal-Mart's** overall ability to choose store locations, establish pricing strategies, train and retain workers, and manage relations with its suppliers. Operating income does not tell you anything about the interest cost of Wal-Mart's loans or how successful Wal-Mart's tax planners have been at structuring and locating operations to minimize income taxes.

**Other Revenues and Gains** This section usually includes items identified with the peripheral activities of the company. Examples include revenue from financial activities, such as rents, interest, and dividends, and gains from the sale of assets such as equipment or investments. A gain reported on the income statement represents a net amount, that is, the difference between selling price and cost. This differs from revenues, which are reported in total separately from related expenses.

**Other Expenses and Losses** This section is parallel to the previous one but results in deductions from, rather than increases to, operating income. Examples include interest expense and losses from the sale of assets. Losses, like gains, are reported at their net amounts.

A particularly controversial type of loss arises when companies propose a restructuring of their operations. A restructuring typically causes some assets to lose value because they no longer fit in a company's strategic plans. A restructuring also creates additional costs associated with the termination or relocation of employees. For example, in the notes to its financial statements, AT&T disclosed that its operating

expenses for 2000 included a **restructuring charge** of \$7.029 billion resulting from a combination of asset impairment charges (write-downs) and other one-time restructuring and exit costs to make the company more cost efficient in the future. The controversy over restructuring charges stems from the fact that companies exercise considerable discretion in determining the amount of a restructuring charge. The fear is that companies can use this discretion as a tool for manipulating the amount of reported net income. For example, companies that are already faced with the prospect of poor reported performance for a year may intentionally overstate the cost of a restructuring. The motivation for this so-called big-bath approach is that, if a company is going to report poor results anyway, it makes sense to gather up all the bad news in the company and report it at the same time, thus diluting the effect of any single bad news item. Historically, if this approach was followed, reported performance in the years following the big-bath year would appear much improved, in large part because the restructuring charge resulted in many expenses of future years being estimated and reported as one lump sum in the big-bath year. In 2002, the FASB issued a clarifying standard to reduce the flexibility companies have to strategically estimate and recognize big-bath restructuring charges.<sup>13</sup>

fyi

In a speech given on September 28, 1998, Arthur Levitt, chairman of the SEC, identified five popular areas of accounting “hocus-pocus” used by companies to manipulate reported earnings. Number one on that list was big-bath restructuring charges.

The largest restructuring charge (to date) was recognized by **Time Warner** (then called AOL Time Warner) in 2002. The company recognized a total of \$99.737 billion in restructuring charges, almost all of which related to write-downs of goodwill associated with the AOL and Time Warner merger in early 2001. This astronomical restructuring charge also contributed to Time Warner having the distinction of reporting the largest single-year net loss in history, \$98.696 billion (on revenues of \$40.961 billion!).

**Income from Continuing Operations Before Income Taxes** Subtracting other revenues and gains and other expenses and losses from operating income results in income from continuing operations before taxes.

**Income Taxes on Continuing Operations** Income tax expense is the sum of all the income tax consequences of all transactions undertaken by a company during a year. Some of those tax consequences may occur in the current year, and some may occur in future years. When transitory, irregular, or extraordinary items are reported, total taxes for the period must be allocated among the various components of income. One income tax amount is reported for all items included in the income from continuing operations category; it is presented as the last section in the category. In contrast, each item in the transitory, irregular, or extraordinary items category is reported net of its income tax effect, referred to as “net of income tax.” This separation of income taxes into different sections of the income statement is referred to as **intraproduct income tax allocation**. The Web Material ([www.cengage.com/accounting/stice](http://www.cengage.com/accounting/stice)) associated with Chapter 16 includes extensive coverage of intraperiod income tax allocation.

For example, in 2006 IBM generated enough taxable income to require it to pay \$2.068 billion in income taxes for the year. However, in 2006 IBM also entered into transactions creating tax liabilities that the company will pay in future years. Even though those taxes will not be paid until future years, they are recognized as an expense in the period in which they are incurred. So, as seen in Exhibit 4-5, IBM reports income tax expense of \$3.901 billion for 2006, which represents the net tax effects, both now and in the future, of all transactions entered into during the year.

<sup>13</sup> *Statement of Financial Accounting Standards No. 146*, “Accounting for Costs Associated with Exit or Disposal Activities” (Norwalk, CT: Financial Accounting Standards Board, 2002).

## caution

Keep in mind that while a transaction may result in a gain or loss for one company, that same transaction may be treated differently for another. For example, if an office supplies store sells its delivery truck to a used car dealer, a gain or loss occurs for the office supplies store. However, when the used car dealer sells the delivery truck, the proceeds will be considered revenue. Why the different treatment? In the first instance, the sale of the truck is a peripheral activity. In the second case, the sale of the truck results from the dealer's ongoing operations.

In the Techtronics illustration, an income tax rate of 30% was assumed. Thus, the amount of income tax related to continuing operations is \$33,585 ( $\$111,950 \times 0.30$ ). The same tax rate is applied to all income components in the Techtronics example. In practice, however, intraperiod income tax allocation may involve different rates for different components of income. This results from graduated tax rates and special, or alternative, rates for certain types of gains and losses.

### Income from Continuing Operations

A key purpose of financial accounting is to provide interested parties with information that can be used to predict how a company will perform in the future. Therefore, financial statement users desire an income

amount that reflects the aspects of a company's performance that are expected to continue into the future. This is labeled Income from Continuing Operations. Income from continuing operations is computed by subtracting interest expense, income tax expense, and other gains and losses from operating income.

### Transitory, Irregular, and Extraordinary Items

Components of income that are reported separately after income from continuing operations are sometimes called below-the-line items. These items arise from transactions and events that are not expected to continue to impact reported results in future years. Reporting these items and their related tax effects separately from continuing operations provides more informative disclosure to users of financial statements, helping them assess the income and cash flows the reporting company can be expected to generate in future years. Two types of transactions and events are reported in this manner: (1) discontinued operations and (2) extraordinary items. In addition to these two items, the effects of changes in accounting principles, changes in estimates, and changing prices also influence the income statement and related disclosures. Each of these items is discussed in turn.

**Discontinued Operations** A common irregular item involves the disposition of a separately identifiable component of a business either through sale or abandonment. The component of the company disposed of may be a major line of business, a major class of customer, a subsidiary company, or even just a single store with separately identifiable operations and cash flows. The size of the discontinued activity is not the factor that determines whether it is reported as a discontinued operation. Instead, to qualify as **discontinued operations** for reporting purposes, the operations and cash flows of the component must be clearly distinguishable from other operations and cash flows of the company, both physically and operationally, as well as for financial reporting purposes. For example, closing down one of five product lines in a plant in which the operations and cash flows from all of the product lines are intertwined would not be an example of a discontinued operation. Similarly, shifting production or marketing functions from one location to another would not be classified as a discontinued operation.

Management may decide to dispose of a component of a business for many reasons, such as the following:

- The component may be unprofitable.
- The component may not fit into the long-range plans for the company.

- Management may need funds to reduce long-term debt or to expand into other areas.
- Management may be fearful of a corporate takeover by new investors desiring to gain control of the company.

As companies constantly seek to fine-tune their strategic focus, they sometimes seek to sell peripheral operational components, especially unprofitable ones, and to consolidate the company around its principal business operations. AT&T provides an example of this strategy. In early 2000, AT&T elected to divest itself of its Broadband division and its wireless division. In addition, AT&T was still dealing with some environmental cleanup costs associated with its spin-off of **NCR** in 1996. AT&T's 2003 income statement (shown in Exhibit 4-6) shows the effect of these transactions, which are disclosed "below-the-line."

Regardless of the reason that a company sells a business component, the discontinuance of a substantial portion of company operations is a significant event. Therefore, information about discontinued operations should be presented explicitly to readers of financial statements.

**Reporting requirements for discontinued operations.** When a company discontinues operating a component of its business, future comparability requires that all elements that relate to the discontinued operation be identified and separated from continuing operations. Thus, in the Techtronics Corporation income statement illustrated earlier in this chapter, the first category after income from continuing operations is discontinued operations. The category is separated into two subdivisions: (1) the current-year income or loss from operating the discontinued component, in this case a \$35,000 loss, plus any gain or loss on the disposal of the component, in this case a \$16,000 loss, and (2) disclosure of the overall income tax impact of the income or loss associated with the component, in this case a tax benefit of \$15,300. As previously indicated, all below-the-line items are reported net of their respective tax effects. If the item is a gain, it is reduced by the tax on the gain. If the item is a loss, it is deductible against other income and thus its existence saves income taxes. The overall company loss can thus be reduced by the tax savings arising from being able to deduct the loss from otherwise taxable income.

Frequently, the disposal of a business component is initiated during the year but not completed by the end of the fiscal year. To be classified as a discontinued operation for reporting purposes, the ultimate disposal must be expected within one year of the period for which results are being reported. Accordingly, if a company made a decision in 2011 to dispose of a business component in April 2012, in the 2011 income statement the results of the operations of that business component should be reported as discontinued operations.

To illustrate the reporting for discontinued operations, consider the following example. Thom Beard Company has two divisions, A and B. The operations and cash flows of these two divisions are clearly distinguishable, and so they both qualify as business components. On June 20, 2011, Thom Beard decides to dispose of the assets

**EXHIBIT 4-6****AT&T Discontinued Operations—From Its 2003 Income Statement**

(dollars in millions)	2003	2002	2001
Income (loss) from continuing operations .....	\$1,863	\$ 963	\$(2,640)
Net (loss) from discontinued operations (net of income tax benefits of \$0, \$6,014 and \$3,715) .....	(13)	(14,513)	(4,052)
Gain on disposition of discontinued operations (net of income tax benefit of \$61 in 2002) .....	—	1,324	13,503
Income (loss) before cumulative effect of accounting changes .....	1,850	(12,226)	6,811
Cumulative effect of accounting changes (net of income taxes of \$(9), \$530 and \$(578)) .....	15	(856)	904
Net income (loss) .....	<u>\$1,865</u>	<u>\$(13,082)</u>	<u>\$ 7,715</u>

and liabilities of Division B; it is probable that the disposal will be completed early next year. The revenues and expenses of Thom Beard for 2011 and for the preceding two years are as follows:

	2011	2010	2009
Sales—A .....	\$10,000	\$9,200	\$8,500
Total nontax expenses—A .....	8,800	8,100	7,500
Sales—B .....	7,000	8,100	9,000
Total nontax expenses—B .....	7,900	7,500	7,700

During the later part of 2011, Thom Beard disposed of a portion of Division B and recognized a pretax loss of \$4,000 on the disposal. The income tax rate for Thom Beard Company is 40%. The 2011 comparative income statement would appear as follows:

	2011	2010	2009
Sales .....	\$ 10,000	\$9,200	\$8,500
Expenses .....	8,800	8,100	7,500
Income before income taxes .....	\$ 1,200	\$1,100	\$1,000
Income tax expense (40%) .....	480	440	400
Income from continuing operations .....	\$ 720	\$ 660	\$ 600
Discontinued operations:			
Income (loss) from operations (including loss on disposal in 2011 of \$4,000) .....	(4,900)	600	1,300
Income tax expense (benefit)—40% .....	(1,960)	240	520
Income (loss) on discontinued operations .....	(2,940)	360	780
Net income .....	\$ (2,220)	\$ 1,020	\$ 1,380

fyi

According to *International Financial Reporting Standard (IFRS) 5* (issued in March 2004), companies with discontinued operations must disclose the following: the amounts of revenue, expenses, and pretax profit or loss attributable to the discontinued operations and related income tax expense. In addition, separate disclosure of the assets, liabilities, and cash flows of the discontinued operations should be made.

Notice that this method of reporting allows users to distinguish between the part of Thom Beard's business that will continue to generate income in the future and the part that will not. This reporting format makes it much easier for financial statement users to attempt to forecast how Thom Beard will perform in subsequent years.

The reporting requirements for discontinued operations are contained in FASB *Statement No. 144*, "Accounting for the Impairment or Disposal of Long-Lived Assets."<sup>14</sup> On the balance sheet, assets and liabilities associated with discontinued components that have not yet been completely disposed of as of the balance sheet date are

to be listed separately in the asset and liability sections of the balance sheet. Also, in addition to the summary income or loss number reported in the income statement, the total revenue associated with the discontinued operation should be disclosed in the financial statement notes. The objective of these disclosures is to report information that will

<sup>14</sup> *Statement of Financial Accounting Standards No. 144*, "Accounting for the Impairment or Disposal of Long-Lived Assets" (Norwalk, CT: Financial Accounting Standards Board, 2001).

assist external users in assessing future cash flows by clearly distinguishing normal recurring earnings patterns from those activities that are not expected to continue in the future yet are significant in assessing the total results of company operations for the current and prior years.

The reporting practices with respect to discontinued operations in the United Kingdom represent an interesting alternative to the U.S. approach. For example, in complying with *Financial Reporting Standard (FRS) 3* of the Accounting Standards Board in the United Kingdom, **British Telecommunications (BT)** provided the following information in its 2002 profit and loss account (income statement).

(In millions of £)	2002
Total turnover (sales)	
Ongoing activities .....	£21,815
Discontinued activities .....	2,827
Total operating profit	
Ongoing activities .....	(1,489)
Discontinued activities .....	(371)

This approach provides more information to financial statement users than does the U.S. approach because it allows for a comparison of the relative size and operating profitability of the continuing and discontinued operations.

**Extraordinary Items** According to APB Opinion No. 30, **extraordinary items** are events and transactions that are both unusual in nature and infrequent in occurrence. Thus, to qualify as extraordinary, an item must “possess a high degree of abnormality and be of a type clearly unrelated to, or only incidentally related to, the ordinary and typical activities of the entity . . . [and] be of a type that would not reasonably be expected to recur in the foreseeable future. . . .”<sup>15</sup>

The intent of the APB was to restrict the items that could be classified as extraordinary. The presumption of the Board was that an item should be considered ordinary and part of the company’s continuing operations unless evidence clearly supports its classification as an extraordinary item. The Board offered examples of gains and losses that should *not* be reported as extraordinary items. These include the following:

- The write-down or write-off of receivables, inventories, equipment leased to others, or intangible assets.
- The gains or losses from exchanges or remeasurement of foreign currencies, including those relating to major devaluations and revaluations.
- The gains or losses on disposal of a segment of a business.
- Other gains or losses from sale or abandonment of property, plant, or equipment used in the business.
- The effects of a strike.
- The adjustment of accruals on long-term contracts.

For example, companies have reported as extraordinary items litigation settlements and write-offs of assets in foreign countries where expropriation risks were high.

Some items may not meet both criteria for extraordinary items but may meet one of them. Although these items do not qualify as extraordinary, they should be disclosed separately as part of income from continuing operations, either before or after operating income. Examples of these items include strike-related costs, obsolete inventory write-downs, and gains and losses from liquidation of investments. Most of

<sup>15</sup> *Opinions of the Accounting Principles Board No. 30*, “Reporting the Results of Operations” (New York: American Institute of Certified Public Accountants, 1973), par. 20.

us would consider the costs created by the September 11, 2001, World Trade Center attack to be the ultimate extraordinary item. However, these costs were *not* reported as extraordinary in 2001 income statements. The Emerging Issues Task Force determined that the economic effects of the World Trade Center attack were so pervasive as to make it impossible to separate the direct costs stemming from the attack from the economic costs (including lost revenue) created by the transformation of the economic landscape created by the attack.

In 2000 and 2001, **Verizon's** financial statements exhibited examples of restructuring charges, extraordinary items, and catastrophic items that seemed extraordinary but were accounted for as part of ordinary operations. In 2001, Verizon reported a restructuring charge of \$1.596 billion related to employee severance costs in the wake of the **Bell Atlantic-GTE** merger that created Verizon. In 2000, Verizon reported a \$1.027 billion extraordinary loss (net of tax) stemming from the FCC-mandated sale of overlapping wireless services. See Exhibit 4-7 for Verizon's disclosure regarding costs created by the World Trade Center attack.

fyi

Before 2002, all gains and losses resulting from the early extinguishment of debt were reported as extraordinary. This classification was ended with the release of SFAS No. 145; these gains and losses are now considered ordinary, subject to the normal criteria for extraordinary items.

**Changes in Accounting Principles** Although consistency in application of accounting principles increases the usefulness and comparability of the financial statements, the conditions of some occasions justify a change from one accounting principle to another. Occasionally a company will change an accounting principle (such as from LIFO to FIFO) because a change in economic conditions suggests that an accounting change will provide better information. More frequently, a change in accounting principle occurs because the FASB issues a new pronouncement requiring a change in principle; if GAAP is to be followed, the company has no choice but to change to conform with the new standard.

When there is a change in accounting principle or method, a company is required to determine how the income statement would have been different in past years if the new accounting method had been used all along. To improve comparability, income statements for all years presented (for example, for all three years if three years of comparative data are provided) must be restated using the new accounting method. The beginning balance of Retained Earnings for the oldest year presented reflects an adjustment for the

#### EXHIBIT 4-7

#### Verizon Disclosure Regarding September 11, 2001, World Trade Center Attack

##### **Note 2: Accounting for the Impact of the September 11, 2001, Terrorist Attacks**

The terrorist attacks on September 11th resulted in considerable loss of life and property, as well as exacerbate weakening economic conditions. Verizon was not spared any of these effects, given our significant operations in New York and Washington, D.C.

The primary financial statement impact of the September 11th terrorist attacks pertains to Verizon's plant, equipment and administrative office space located either in, or adjacent to the World Trade Center complex, and the associated service restoration efforts. During the period following September 11th, we focused primarily on service restoration in the World Trade Center area and incurred costs, net of estimated insurance recoveries, totaling \$285 million pretax (\$172 million after-tax, or \$.06 per diluted share) as a result of the terrorist attacks.

Verizon's insurance policies are limited to losses of \$1 billion for each occurrence and include a deductible of \$1 million. As a result, we accrued an estimated insurance recovery of approximately \$400 million in 2001, of which approximately \$130 million has been received. The costs and estimated insurance recovery were recorded in accordance with Emerging Issues Task Force *Issue No. 01-10*, "Accounting for the Impact of the Terrorist Attacks of September 11, 2001."

cumulative income effect of the accounting change on the net incomes of all preceding years for which a detailed income statement is not presented.

As an illustration of the accounting for a change in accounting principle, consider the following example. Brandoni Company started business in 2009. In 2011, the company decided to change its method of computing cost of goods sold from FIFO to LIFO. To keep things simple, assume that Brandoni has only two expenses: cost of goods sold and income tax expense. The income tax rate for all items is 40%. The following sales and cost of goods sold information are for 2009–2011:

	2011	2010	2009
Sales .....	\$8,000	\$8,000	\$8,000
Cost of goods sold—old method (FIFO) .....	5,600	6,100	7,500
Cost of goods sold—new method (LIFO) .....	4,500	4,500	4,500

The first impact of the change in inventory valuation method is to reduce cost of goods sold in 2011. The \$4,500 cost of goods sold under the new method would be reported in the normal fashion in the income statement, and the \$1,100 (\$5,600 – \$4,500) current-year impact of the accounting principle change would be disclosed in the notes to the financial statements. The 2011 comparative income statement would appear as follows:

	2011	2010	2009
Sales .....	\$8,000	\$8,000	\$8,000
Cost of goods sold .....	4,500	4,500	4,500
Income before income taxes .....	\$3,500	\$3,500	\$3,500
Income tax expense (40%) .....	1,400	1,400	1,400
Net income .....	<u>\$2,100</u>	<u>\$2,100</u>	<u>\$2,100</u>

One drawback of this retroactive restatement approach is that the comparative income statements for 2009 and 2010 that are presented in the 2011 financial statements do NOT report the same 2009 and 2010 cost of goods sold and net income that were reported in the original 2009 and 2010 income statements. However, this drawback is more than compensated by the interyear comparability that is provided through retroactive restatement.

The approach described above for reporting the impact of a change in accounting principle is derived from *International Accounting Standard (IAS) 8*, which was revised and issued in December 2003. Formerly, the FASB required companies to report the cumulative income effect (for all past years) of an accounting change as a single item in the current year's income statement. To increase international comparability of financial statements, the FASB decided in 2005 to change U.S. GAAP to conform with the international standard.<sup>16</sup> The accounting for changes in accounting principles is discussed more fully in Chapter 20.

**Changes in Estimates** In reporting periodic revenues and in attempting to properly match those expenses incurred to generate current-period revenues, accountants must continually make judgments. The numbers reported in the financial statements reflect these judgments and are based on estimates of such factors as the number of years of useful life for depreciable assets, the amount of uncollectible accounts expected, and the amount of warranty liability to be recorded on the books. These and other estimates are made using the best available information at the statement

<sup>16</sup> *Statement No. 154*, “Accounting Changes and Error Corrections—A Replacement of APB Opinion No. 20 and FASB Statement No. 3” (Norwalk, CT: Financial Accounting Standards Board, May 2005).

date. However, conditions may subsequently change, and the estimates may need to be revised. Naturally, changing either revenue or expense amounts affects the income statement. The question is whether the previously reported income measures should be revised or whether the changes should impact only current and future periods.

Changes in estimates should be reflected in the current period (the period in which the estimate is revised) and in future periods, if any, that are affected. No retroactive adjustments are to be made for a change in estimate. These changes are considered a normal part of the accounting process, not errors made in past periods.

To illustrate the computations for a change in estimate, assume that Springville Manufacturing Co., Inc., purchased a milling machine at a cost of \$100,000. At the time of purchase, it was estimated that the machine would have a useful life of ten years. Assuming no salvage value and that the straight-line method is used, the depreciation expense is \$10,000 per year ( $\$100,000/10$ ). At the beginning of the fifth year, however, conditions indicated that the machine would be used for only three more years. Depreciation expense in the fifth, sixth, and seventh years should reflect the revised estimate, but depreciation expense recorded in the first four years would not be affected. Because the book value at the end of four years is \$60,000 ( $\$100,000 - \$40,000$  accumulated depreciation), annual depreciation charges for the remaining three years of estimated life would be \$20,000 ( $\$60,000/3$ ). The following schedule summarizes the depreciation charges over the life of the asset:

Year	Depreciation
1	\$ 10,000
2	10,000
3	10,000
4	10,000
5	20,000
6	20,000
7	20,000
Total (accumulated) depreciation	<u>\$100,000</u>

**Effects of Changing Prices** The preceding presentation of revenue and expense recognition has not addressed the question of how, if at all, changing prices are to be recognized under the transaction approach. As indicated in Chapter 1, accountants have traditionally ignored this phenomenon, especially when gains would result from recognition. When an economy experiences high rates of inflation, users of financial statements become concerned that the statements do not reflect the impact of these changing prices. When the inflation rates are lower, this user concern decreases. When the price change rates are increasing, added pressure to adjust the financial statements is exerted by users of the income statement. Many foreign countries with high inflation rates require adjustments to remove the inflation effects. **McDonald's** addresses the effects of inflation in its 10-K filed with the SEC. This note disclosure (included in Exhibit 4-8) indicates that McDonald's is able to deal with inflation through a quick turnover of inventory and by increasing prices in those locations where costs change rapidly.

**EXHIBIT 4-8****McDonald's—Note Disclosure**

The Company has demonstrated an ability to manage inflationary cost increases effectively. This is because of rapid inventory turnover, the ability to adjust menu prices, cost controls and substantial property holdings—many of which are at fixed costs and partly financed by debt made less expensive by inflation.

FASB *Statement No. 33* required certain large publicly held companies to disclose selected information about price changes on a supplemental basis. The Board did not require this recognition to be reported in the basic financial statements but in a supplemental note to the financial statements that did not have to be audited.

Subsequently, some of the disclosure requirements were eliminated in *Statement No. 82*, and all price-level disclosures were made voluntary with *Statement No. 89*.

## Net Income or Loss

Income or loss from continuing operations combined with the results of discontinued operations and extraordinary items provides users a summary measure of the firm's performance for a period: net income or net loss. This figure is the accountant's attempt to summarize in one number a company's overall economic performance for a given period. In the absence of any irregular items, net income is the same as income from continuing operations.

From the preceding discussion, you can see that when someone refers to a company's "income" or "profit," the person could be referring to any one of a host of numbers: gross profit, operating income, income from continuing operations, or net income. It is important to learn to be very specific when discussing a company's income. After all, comparing one company's net income to another company's operating income would be like comparing apples to oranges.

In order to compare this period's results with prior periods or with the performance of other firms, net income is divided by net sales to determine the **return on sales**. This measurement represents the net income percentage per dollar of sales. For example, **The Walt Disney Company** reported the following returns on sales.

	2007	2006	2005
Return on sales.....	13.2%	10.0%	8.1%

Compare these results with a sample of returns on sales from various companies in different industries, shown in Exhibit 4-9.

When computing the return on sales, keep in mind that net income may include extraordinary or irregular items that can distort the results and hamper comparability. Adjustments may be needed in the analysis to account for such items.

**Earnings per Share** An individual shareholder is interested in how much of a company's net income is associated with his or her ownership interest. As a result, the income statement reports **earnings per share (EPS)**, which is the amount of net income associated with each common share of stock. For example, in Exhibit 4-5 basic EPS for IBM in 2006 was \$6.20. This means that an owner of 100 shares of IBM stock has claim on \$620 ( $\$6.20 \text{ EPS} \times 100 \text{ shares}$ ) of the \$9.492 billion in IBM net income available to common shareholders for 2006.

EXHIBIT 4-9

### Return on Sales

	2006	2005	2004
AT&T	11.7%	10.9%	14.4%
McDonald's	16.4	13.1	12.3
IBM	10.4	8.7	7.8
Microsoft	28.4	30.8	22.2

To illustrate the importance of earnings per share, consider the following example. For the years 2009–2011, James Caird Company had net income, average shares outstanding, and earnings per share as follows:

	2011	2010	2009
Net income .....	\$10,000	\$6,000	\$2,500
Average shares outstanding .....	10,000	5,000	1,000
Earnings per share (EPS) .....	\$1.00	\$1.20	\$2.50

Note that if one looks only at the growth in net income, it appears that the shareholders of James Caird are doing very well, with net income growth rates of 140% in 2010 and 67% in 2011. However, a look at the data on shares outstanding reveals that this growth in net income has been driven by a substantial increase in the size of the company as evidenced by the large increases in shares outstanding. When viewed on a per-share basis, performance was actually steadily declining from 2009 to 2011; one of the original shareholders who earned \$2.50 for each share owned in 2009 earned only \$1.00 for each of those same shares in 2011.

Companies often disclose two earnings-per-share numbers. Basic EPS reports earnings based solely on shares actually outstanding during the year. Basic earnings per share is computed by dividing income available to common shareholders (net income less dividends paid to or promised to preferred shareholders) by the average number of common shares outstanding during the period.

Diluted earnings per share reflects the existence of stock options or other rights that can be converted into shares in the future. For example, in addition to having shares outstanding, a company could also have granted stock options that allow the option holders to buy shares of stock at some predetermined price. At present, the option holders don't own shares of stock, but they can acquire them from the company at any time. In other cases, a company might borrow money but also give the right to the lender to exchange the loan for shares of stock at some predetermined price. Diluted EPS is computed to give financial statement users an idea about the potential impact on EPS of the exercise of existing stock options or other rights to acquire shares.

IBM reports basic earnings per share and diluted earnings per share in 2006 of \$6.20 and \$6.11, respectively (see Exhibit 4-5). If all options and other convertible items that are likely to be converted were in fact converted into shares of IBM stock, the effect on IBM's earnings per share would be to reduce it by \$0.09. A small difference of \$0.09 (about 1.5% of basic EPS) indicates that IBM does not have many options and convertible securities outstanding. On the other hand, there was a 94% difference between **Altra Holdings, Inc.** reported basic and diluted EPS in 2006 and a difference of 50% for **Tyson Foods**. These differences indicate that Altra and Tyson have a higher percentage of stock options outstanding that could possibly dilute earnings per share.

Historically, the accounting rules in the United States governing the computation of EPS have been unnecessarily complex. In the mid-1990s, the FASB initiated a project, in conjunction with the IASB, to both improve U.S. accounting practice with respect to EPS and to increase international agreement on this important accounting issue. In 1997, the FASB and IASB issued almost identical standards prescribing the methods of computing the basic and diluted EPS numbers outlined earlier. This represented not only a big improvement in U.S. accounting practice but also was a milestone in that it was the first time that the FASB and the IASB worked jointly to issue an accounting standard.

When presenting EPS figures, separate earnings-per-share amounts are computed by dividing income from continuing operations and each irregular or extraordinary item by the weighted average number of shares of common stock outstanding for the reporting period.<sup>17</sup>

<sup>17</sup> *Statement of Financial Accounting Standards No. 128, "Earnings per Share"* (Norwalk, CT: Financial Accounting Standards Board, 1997).

For example, the Techtronics Corporation income statement shows earnings per common share of \$1.57 for income from continuing operations, a \$0.71 loss from discontinued operations, and \$0.25 for extraordinary gain, for a total of \$1.11 for net income. These figures were derived by dividing each identified component of net income by 50,000 shares of common stock outstanding during the period. When a company has only common stock outstanding, computing EPS is very straightforward. The computations become more complex, however, when a company has certain types of securities outstanding, such as convertible stock and stock options. These and other types of securities are discussed in Chapter 13, and more detail on the computation of earnings per share is given in Chapter 18.

Earnings per share is often used to calculate a firm's **price-earnings (P/E) ratio**. This ratio expresses the market value of common stock as a multiple of earnings and allows investors to evaluate the attractiveness of a firm's common stock. The price-earnings ratio is computed by dividing the market price per share of common stock by the annual basic EPS. Instead of using the average market value of shares for the period covered by earnings, the latest market value is normally used. *The Wall Street Journal* reports P/E ratios for most listed companies on a daily basis. Assuming that Techtronics Corporation's stock closed with a market value of \$14.25 per share on December 31, 2011, its P/E ratio would be computed as follows:

$$\text{P/E ratio} = \frac{\text{Market value of per share}}{\text{Earnings per share}} = \frac{\$14.25}{\$1.11} = 12.8$$

To get an idea of how price-earnings ratios vary across time, consider the information contained in Exhibit 4-10. This exhibit summarizes data for thousands of companies over a 20-year period. The companies included in the analysis are the largest publicly traded companies in the United States, determined each year by ranking all publicly traded companies by market value and then computing the P/E ratios for the half with the largest market values. Note that over this 20-year period, P/E ratios tended to increase.

In general, the following types of firms have *higher* than average P/E ratios.

- Firms with strong future growth possibilities
- Firms with earnings for the year lower than average because of a nonrecurring event (e.g., a large write-off, a natural disaster)

EXHIBIT 4-10

## P/E Ratios Over Time for Large, Publicly Traded U.S. Companies

- Firms with substantial unrecorded assets (e.g., appreciated land, unrecorded goodwill)
- In general, the following types of firms have *lower* than average P/E ratios.
- Firms with earnings for the year higher than average because of a nonrecurring event (e.g., a one-time gain)
- Firms perceived as being very risky

## Comprehensive Income and the Statement of Stockholders' Equity

**6** Compute comprehensive income and prepare a statement of stockholders' equity.

**WHY** In its conceptual framework, the FASB suggests reporting comprehensive income reflecting all changes in equity during a period except those resulting from investments by owners and distributions to owners. Comprehensive income is the number used to reflect an overall measure of the change in a company's wealth during the period.

**HOW** In addition to net income, comprehensive income includes items that, in general, arise from changes in market conditions unrelated to the business operations of a company. Most companies include a report of comprehensive income as part of the statement of stockholders' equity. The statement of stockholders' equity also includes changes in equity other than those related to income.

Since 1998, the FASB has required companies to provide an additional measure of income: comprehensive income. This measure of a company's performance includes items in addition to those included in net income. Companies can either provide this additional information in a separate financial statement or include it as a part of the statement of stockholders' equity. In this section, we discuss both comprehensive income and the statement of stockholders' equity.

### Comprehensive Income

Recall from the beginning of this chapter that a general definition of income is the increase in a company's wealth during a period. The wealth of a company is impacted in a variety of ways that have nothing to do with the business operations of the company. For example, changes in exchange rates can cause the U.S. dollar value of a company's foreign subsidiaries to increase or decrease. **Comprehensive income** is the number used to reflect an overall measure of the change in a company's wealth during the period. In addition to net income, comprehensive income includes items that, in general, arise from changes in market conditions unrelated to the business operations of a company. These items are excluded from net income because they are viewed as yielding little information about the economic performance of a company's business operations. However, they are reported as part of comprehensive income because they do impact the value of assets and liabilities reported in the balance sheet.

fyi

The FASB allows, even encourages, a separate statement of comprehensive income. However, almost all companies report comprehensive income in the statement of changes of stockholders' equity.

The FASB discussed the concept of comprehensive income in its conceptual framework. However, it wasn't until 1998 that the concept was placed into practice with the issuance of FASB *Statement No. 130*. Exhibit 4-11 provides an example (**Coca-Cola**) of a statement of comprehensive income that is included as part of a statement of stockholders' equity. Three of the more common adjustments made in arriving

**EXHIBIT 4-11 Coca-Cola's Statement of Stockholders' Equity for 2006**

	Number of Common Shares Outstanding	Common Stock	Capital Surplus	Reinvested Earnings	Accumulated Other Comprehensive Income	Treasury Stock	Total
(In millions, except per share data)							
BALANCE DECEMBER 31, 2005	2,369	\$877	\$5,492	\$31,299	\$(1,669)	\$(19,644)	\$16,355

\* Common stock purchased from employees exercising stock options numbered approximately zero shares, 0.54 shares and 0.4 shares for the years ended December 31, 2006, 2005, and 2004, respectively.

Refer to Notes to Consolidated Financial Statements

at comprehensive income are (1) foreign currency translation adjustments, (2) unrealized gains and losses on available-for-sale securities, and (3) deferred gains and losses on derivative financial instruments.

**Foreign Currency Translation Adjustment** During 2006, there was an increase in the value of the currencies (relative to the U.S. dollar) in the countries where Coca-Cola has foreign subsidiaries. Thus, the U.S. dollar value of the net assets of those subsidiaries increased \$603 million during the year. This increase was not the result of good business performance by Coca-Cola; it was simply a function of the ebb and flow of the worldwide economy. This “gain” is not reported as part of net income but is included in the computation of comprehensive income. **PepsiCo**, Coca-Cola's major competitor, was exposed to similar market conditions during the year and reported an increase in comprehensive income for foreign currency changes of \$465 million.

**Unrealized Gains and Losses on Available-for-Sale Securities** To maintain a liquid reserve of assets that can be converted into cash if needed, most companies purchase an investment portfolio of stocks and bonds. For example, as of December 31, 2006, Coca-Cola owned \$471 million in securities that had been classified as “available for sale,” meaning Coca-Cola does not intend to actively trade the securities in this portfolio but has them available to be sold if the need for cash arises. These securities are reported in the balance sheet at their current market value. As the market value of these securities fluctuates, Coca-Cola experiences “unrealized” gains and losses. An unrealized gain or loss is the same as what is sometimes called a paper gain or loss, meaning that because the security has not yet been sold, the gain or loss is only on paper.

Because available-for-sale securities are not part of a company's operations, the associated unrealized gains and losses are excluded from the computation of net income and are instead reported as part of comprehensive income. During 2006, Coca-Cola recorded a \$43 million gain on its available-for-sale portfolio; this amount was reported as an increase in comprehensive income.

**Deferred Gains and Losses on Derivative Financial Instruments** Companies frequently use derivative financial instruments to hedge their exposure to risk stemming from changes in prices and rates. As prices and rates change, the value of a derivative based on that price or rate also changes. As with available-for-sale securities, these value changes give rise to unrealized gains and losses. In some cases, these unrealized gains and losses on derivatives are included in net income and offset gains or losses on the items that were being hedged. In other cases, the reporting of the unrealized gains and losses on derivatives in net income is delayed until a subsequent year; in the meantime, the unrealized gains and losses are reported as part of comprehensive income. In 2006, Coca-Cola reported unrealized derivative losses of \$26 million as part of comprehensive income. Additional discussion of derivatives is given in Chapter 19.

A few other comprehensive income items exist in addition to the three just described. For example, in 2006 Coca-Cola reported an increase of \$46 million in comprehensive income stemming from a reduction of Coca-Cola's reported pension liability. The key point to remember is that these items represent changes in assets and liabilities reported in the balance sheet that are not deemed to reflect a company's own economic performance and are therefore excluded from the computation of net income. The net effect of each of these adjustments is to report a total comprehensive income of \$5.746 billion in 2006, a net increase of \$666 million from the reported amount of net income.

## The Statement of Stockholders' Equity

Most companies include a report of comprehensive income as part of the statement of stockholders' equity. This is not the required method of disclosure, but it appears to be the disclosure chosen by most companies.

The statement of stockholders' equity also includes changes in equity other than those related to income. As the Coca-Cola example in Exhibit 4-12 illustrates, new share issues, treasury stock repurchases, dividends declared, and miscellaneous other transactions related to the equity of a company are disclosed in this statement. A more detailed discussion of the different types of equity transactions is included in Chapter 13.

Also included in this statement (or as a separate statement of retained earnings) are adjustments to Retained Earnings. The two general types of retained earnings adjustments are (1) prior-period adjustments and (2), as indicated earlier, adjustments arising from some changes in accounting principles. **Prior-period adjustments** arise primarily when an error occurs in one period but is not discovered until a subsequent period. Prior-period adjustments are discussed in Chapter 20.

## Forecasting Future Performance

**7** Construct simple forecasts of income for future periods.

**WHY** An important use of an income statement is to forecast income in future periods.

**HOW** Good forecasting requires an understanding of what underlying factors determine the level of a revenue or an expense. Most financial statement forecasting exercises start with a forecast of sales, which establishes the expected scale of operations in future periods. Some balance sheet and income statement items increase naturally as the level of sales increases. Other balance sheet and income statement items change in response to a company's long-term strategic plans. Examples include property, plant, and equipment and depreciation expense.

Financial statements report past results, but financial statement users are often interested in what will happen in the future. Therefore, an important skill for financial statement users to develop is using past financial statements to predict the future. This section presents a simple demonstration of how to use historical financial statement information to forecast a future income statement and balance sheet.

The key to a good financial statement forecast is identifying which underlying factors determine the level of a certain revenue or expense. For example, the level of cost of goods sold is closely tied to the level of sales, whereas the level of interest expense is only weakly tied to sales and is instead a direct function of the level of interest-bearing debt.

Most forecasting exercises start with a forecast of sales. The sales forecast indicates how fast the company is expected to grow and represents the general volume of activity expected in the company. This expected volume of activity influences the amount of assets that are needed to do business, which in turn determines the level of financing required. In short, for the resulting forecasted financial statements to be reliable, an accurate projection of sales is critical. The starting point for a sales forecast is last year's sales, with an addition for expected year-to-year growth based on the average sales growth experienced in previous years. This crude sales forecast should then be refined using as much company-specific information as is available. For example, in forecasting McDonald's sales, one should try to determine how many new outlets McDonald's expects to open during the coming year. The resulting sales forecast is the basis on which to forecast the remainder of the balance sheet, income statement, and statement of cash flows information.

Exhibit 4-12 contains financial statement information for the hypothetical Derrald Company. This information will be used as the basis for a simple forecasting exercise. The 2011 information for Derrald Company is historical information.

## Forecast of Balance Sheet Accounts

Not all balance sheet accounts change according to the same process. Some items increase naturally as sales volume increases. Others increase only in response to specific long-term expansion plans, and other balance sheet items change only in response

### EXHIBIT 4-12

### Historical Financial Data for Derrald Company

<b>Balance Sheet</b>	<b>2011</b>
Cash .....	\$ 10
Other current assets .....	250
Property, plant, and equipment, net .....	300
Total assets .....	<u>\$ 560</u>
Accounts payable .....	\$ 100
Bank loans payable .....	300
Total stockholders' equity .....	160
Total liabilities and stockholders' equity .....	<u>\$ 560</u>
<b>Income Statement</b>	
Sales .....	\$1,000
Cost of goods sold .....	700
Gross profit .....	\$ 300
Depreciation expense .....	30
Other operating expenses .....	170
Operating profit .....	\$ 100
Interest expense .....	30
Income before taxes .....	\$ 70
Income taxes .....	30
Net income .....	<u>\$ 40</u>

to specific financing choices made by management. How these different processes impact the forecast of a balance sheet is outlined next.

**Natural Increase** If Derrald Company plans to increase its sales volume by 40% in 2012, it seems logical to assume that Derrald will need about 40% more cash with which to handle this increased volume of business. In other words, the increased level of activity itself will create the need for more cash. The same is true of other current assets, such as accounts receivable and inventory, and of current operating liabilities, such as accounts payable and wages payable. In short, a planned 40% increase in the volume of Derrald's business means that, in the absence of plans to significantly change its methods of operation, Derrald will also experience a 40% increase in the levels of its current operating assets and liabilities. These forecasted natural increases are reflected in the forecasted balance sheet contained in Exhibit 4-13.

**Long-Term Planning** Long-term assets, such as property, plant, and equipment, do not increase naturally as sales volume increases. Instead, the addition of a new factory building, for example, occurs only as the result of a long-term planning process. Thus, a business anticipating an increase of sales in the coming year of only 10% may expand its productive capacity by 50% as part of its long-term strategic plan. Similarly, a business forecasting 25% sales growth may plan to use existing excess capacity to handle the entire sales increase without any increase in long-term assets. In short, forecasting future levels of long-term assets requires some knowledge of a company's strategic expansion plan. It is assumed that we know that Derrald Company plans to increase its property, plant, and equipment from \$300 in 2011 to \$500 in 2012. This forecasted increase is reflected in Exhibit 4-13.

**Financing Choices** The levels of long-term debt and of stockholders' equity are determined by management's decisions on how to best obtain financing. In fact,

## EXHIBIT 4-13

## Forecasted Balance Sheet and Income Statement for Derrald Company

Balance Sheet	2012		Basis for Forecast
	2011	Forecasted	
Cash .....	\$ 10	\$ 14	40% natural increase
Other current assets .....	250	350	40% natural increase
Property, plant, and equipment, net .....	300	500	management decision
Total assets .....	<u>\$560</u>	<u>\$864</u>	
Accounts payable .....	\$100	\$140	40% natural increase
Bank loans payable .....	300	524	management decision
Total stockholders' equity .....	160	200	management decision
Total liabilities and stockholders' equity .....	<u>\$560</u>	<u>\$864</u>	
Income Statement	2012		Basis for Forecast
	2011	Forecasted	
Sales .....	\$1,000	\$1,400	40% increase
Cost of goods sold .....	700	980	70% of sales, same as last year
Gross profit .....	\$ 300	\$ 420	
Depreciation expense .....	30	50	10% of PPE, same as last year
Other operating expenses .....	170	238	17% of sales, same as last year
Operating profit .....	\$ 100	\$ 132	
Interest expense .....	30	52	10% of bank loans, same as last year
Income before taxes .....	\$ 70	\$ 80	
Income taxes .....	30	34	43% of pretax, same as last year
Net income .....	<u>\$ 40</u>	<u>\$ 46</u>	

management often uses forecasted financial statements, prepared under a variety of different financing scenarios, to help determine financing choices. Because detailed treatment of the field of corporate finance is beyond the scope of this discussion, we will merely assume that Derrald is planning to finance its operations in 2012 by increasing its bank loans payable from \$300 to \$524 and by increasing stockholders' equity from \$160 to \$200. These forecasted increases are shown in Exhibit 4-13. Notice that the forecasted balance sheet for 2012 has total assets of \$864 and total liabilities and stockholders' equity of \$864. The numerical discipline imposed by the structure of the balance sheet ensures that the forecasted asset increases are consistent with Derrald Company's plans for additional financing.

## Forecast of Income Statement Accounts

The amount of some expenses is directly tied to the amount of sales for the year. Derrald Company's sales are forecasted to increase by 40% in 2012, so it is reasonable to predict that cost of goods sold will increase by the same 40%. Another way to perform this calculation is to assume that the ratio of cost of goods sold to sales remains constant from year to year. Thus, because cost of goods sold was 70% of sales in 2011 ( $\$700/\$1,000 = 70\%$ ), cost of goods sold should increase to \$980 ( $\$1,400 \times 0.70$ ) in 2012, as shown in Exhibit 4-13. Similarly, other operating expenses, such as wages and shipping costs, are also likely to maintain a constant relationship with the level of sales.

The amount of a company's depreciation expense is determined by how much property, plant, and equipment the company has. In 2011, Derrald Company had \$30 of depreciation expense on \$300 of property, plant, and equipment, that is, depreciation was 10% ( $\$30/\$300$ ). If the same relationship holds in 2012, Derrald can expect to report depreciation expense of \$50 ( $\$500 \times 0.10$ ).

Interest expense depends on how much interest-bearing debt a company has. In 2011, Derrald Company reported interest expense of \$30 with bank loans payable of \$300. These numbers imply that the interest rate on Derrald's loans is 10% ( $\$30/\$300$ ). Because the bank loans payable are expected to increase to \$524 in 2012, Derrald can expect interest expense for the year of \$52 ( $\$524 \times 0.10 = \$52$ ).

As shown in Exhibit 4-13, the assumptions made so far imply that Derrald's income before taxes in 2012 will total \$80. Income tax expense is determined by how much pretax income a company has. The most reasonable assumption to make is that a company's tax rate, equal to income tax expense divided by pretax income, will stay constant from year to year. Derrald's tax rate in 2011 was 43% ( $\$30/\$70$ ), which when applied to the forecasted pretax income of \$80 for 2012, implies that income tax expense in 2012 will total \$34 ( $\$80 \times 0.43$ ).

The complete forecasted income statement for 2012 indicates that Derrald Company's income for the year will be \$46. The quality of this forecast is only as good as the assumptions that underlie it. To determine how much impact the assumptions can have, it is often useful to conduct a sensitivity analysis. This involves repeating the forecasting exercise using a set of pessimistic and a set of optimistic assumptions. Thus, one can construct worst-case, standard-case, and best-case scenarios to use in making decisions with the forecasted numbers.

Financial statement forecasting is used to construct an estimate of how well a company will perform in the future. This forecasting exercise is useful for bankers worried about whether they can recover their money if they make a loan to a company and for investors who want to determine how much to invest in a company. Forecasted financial statements are also useful to company management for evaluating alternate strategies and determining whether the planned operating, investing, and financing activities appropriately mesh together. The Derrald Company example used in this chapter will also be used in Chapter 5 to illustrate how to forecast a company's statement of cash flows.

## Concluding Comments

This chapter highlights the need for users of the income statement to use care with terminology. For example, income can mean gross profit, operating income, income from continuing operations, net income, or comprehensive income. One must be very careful with accounting terminology.

The income statement summarizes a firm's performance in its primary business activities (operating income) as well as peripheral activities (income from continuing operations). The income statement also includes two "below-the-line" items that are treated somewhat differently than other items included on the income statement. These are summarized in Exhibit 4-14.

The statement of stockholders' equity includes other changes in a company's equity and often includes comprehensive income. Comprehensive income is a relatively new operational measure, and it will be interesting to see how the financial community uses this information in making investment decisions.

### EXHIBIT 4-14

#### Summary of Procedures for Reporting Irregular, Nonrecurring, or Unusual Items\*

Where Reported	Category	Description	Examples
Part of income from continuing operations.	Changes in estimates.	Normal recurring changes in estimating future amounts. Included in normal accounts.	Changes in building and equipment lives, changes in estimated loss from uncollectible accounts receivable, changes in estimate of warranty liability.
	Unusual gains and losses, not considered extraordinary.	Unusual or infrequent, but not both. Related to normal operations. Material in amount. Shown in other revenues and gains or other expenses and losses.	Gains or losses from sale of assets, investments, or other operating assets. Write-off of inventories as obsolete.
On income statement, but after income from continuing operations.	Discontinued operations.	Disposal of completely separate business component. Include gain or loss from sale or abandonment.	Sale by conglomerate company of separate line of business, such as milling company selling restaurant segment.
	Extraordinary items.	Both unusual and infrequent. Not related to normal business operations. Material in amount.	Material gains and losses from some casualties or legal claims if meet criteria.
As adjustments to retained earnings on the balance sheet	Prior-period adjustments and changes in accounting principles.	Material correction of errors; earliest retained earnings balance reported when a retroactive adjustment is made.	Failure to depreciate fixed assets; mathematical error in computing inventory balance; retroactive adjustment for new FASB standard.

\*This chart describes the usual case. Exceptions to the descriptions occasionally do occur.

## SOLUTIONS TO OPENING SCENARIO QUESTIONS

- $54.8\% = (\$63,055 - \$40,733)/\$40,733$ .  
*This is a sharp increase.*
- $25\% = (\$7,356 - \$5,887)/\$5,887$ .  
*Revenues grew much faster than net income indicating an increase in expenses.*
- The major expense categories between operating income and income from continuing operations are interest expense and income tax expense. AT&T had over \$400 million more in interest expense for 2005 when compared to 2004.*

## SOLUTIONS TO STOP &amp; THINK

1. (Page 158) The correct answer is D. Measuring physical well-offness would require firms to obtain fair market value measures of each of their assets and liabilities each period. The difficulties of obtaining these measures along with the associated costs would, in most cases, cause the costs of the information to exceed its benefits.
  2. (Page 161) The correct answer is A. Revenues and expenses are associated with what a business does. That is, they relate to a company's central activities. An investor or creditor would want to evaluate a business's performance in its central activities.
- Additional information relating to gains and losses associated with the peripheral activities of a business would be useful but should not be combined with revenues and expenses for reporting purposes.*
3. (Page 163) The correct answer is B. Recall that revenue recognition at the time of production is acceptable when sale at an established price is practically assured. For the gold produced by Kinross in eastern Russia, enough uncertainty surrounds the shipment and sale of the gold that revenue is not recognized until the actual sale occurs.

REVIEW OF  
LEARNING OBJECTIVES**1** Define the concept of income.

*Income* is a return over and above the investment of the owners. It measures the amount that an entity could return to its investors and still leave the entity as well off at the end of the period as at the beginning. Two concepts can be used to measure “well-offness”: financial capital maintenance (the dollar amount of net assets) and physical capital maintenance (physical productive capacity). The FASB has chosen to use the financial capital maintenance concept in measuring income.

**2** Explain why an income measure is important.

Many consider the recognition, measurement, and reporting of income to be among the most important tasks performed by accountants. Many individuals use this measure for business and economic decisions that result in the allocation of resources, which in turn contributes to the standard of living in society.

**3** Explain how income is measured, including the revenue recognition and expense-matching concepts.

Income is measured as the difference between resource inflows (revenues and gains) and outflows (expenses and losses) over a period of time. Revenues are recognized when (1) they are realized or realizable and (2) they have been earned through substantial completion of

the activities involved in the earning process. Usually, this is at the point of sale of goods or services. Expenses are matched against revenues directly, in a systematic or rational manner, or are immediately recognized as a period expense.

**4** Understand the format of an income statement.

The general format of a multiple-step income statement is to subtract cost of goods sold and operating expenses from operating revenues to derive operating income. Gains and losses are then included to arrive at income from continuing operations. Regardless of the format, irregular and extraordinary items are disclosed separately to determine net income.

**5** Describe the specific components of an income statement.

Most companies will report on some or all of the following specific components of an income statement:

- Revenue
- Cost of goods sold
- Gross profit
- Operating expenses
- Operating income
- Other revenues and gains

- Other expenses and losses
- Income from continuing operations before income taxes
- Income taxes on continuing operations
- Income from continuing operations
- Discontinued operations
- Extraordinary items

### 6 Compute comprehensive income and prepare a statement of stockholders' equity.

In its conceptual framework, the FASB suggests reporting comprehensive income reflecting all changes in equity during a period except those resulting from investments by owners and distributions to owners. Comprehensive income is the number used to reflect an overall measure of the change in a company's wealth during the period. In addition to net income, comprehensive income includes items that, in general, arise from changes in market conditions unrelated to the business operations of a company. Most companies include a report of comprehensive income as part of the statement of stockholders' equity. The statement of stockholders' equity also includes changes in equity other than those related to income.

### 7 Construct simple forecasts of income for future periods.

An important use of an income statement is to forecast income in future periods. Good forecasting requires an understanding of what underlying factors determine the level of a revenue or an expense. Most financial statement forecasting exercises start with a forecast of sales, which establishes the expected scale of operations in future periods. Some balance sheet items increase naturally as the level of sales increases; examples of such accounts are cash, accounts receivable, inventory, and accounts payable. Other balance sheet items, such as property, plant, and equipment, change in response to a company's long-term strategic plans. Finally, the amounts of the balance sheet items associated with financing, such as long-term debt and paid-in capital, are determined by the financing decisions made by a company's management.

Some income statement items, such as cost of goods sold, maintain a constant relationship with sales. Depreciation expense is more likely to be related to the amount of a company's property, plant, and equipment. Interest expense is tied to the balance in interest-bearing debt. Finally, income tax expense is typically a relatively constant percentage of income before taxes.

## IASB SUMMARY

Topic	U.S. GAAP	IASB Standard
Change in accounting principle	<i>SFAS No. 154</i> In this area, U.S. GAAP was recently changed to be in harmony with international standards.	<i>IAS 8</i> Income statements for all years presented are restated. The beginning balance of Retained Earnings for the oldest year presented is adjusted for the cumulative income effect of the accounting change on the net incomes of all preceding years.
Revenue recognition before sale	<i>SAB 101 and 104</i> In almost all circumstances, no revenue is recognized until a sale and delivery have occurred. This is discussed in detail in Chapter 8.	<i>IAS 41</i> Gains and losses from increases and decreases in the fair value of biological assets (such as cows) and agricultural produce (such as harvested wheat) are recognized when they occur, without waiting until the items are subsequently sold.
Reporting results of discontinued operations	<i>SFAS No. 144</i> Assets and liabilities associated with discontinued components that have not yet been completely disposed of as of the balance sheet date are to be listed separately. Total revenue associated with discontinued operations should be disclosed in the financial statement notes.	<i>IFRS 5</i> In addition to the disclosures required under U.S. GAAP, separate disclosure of the cash flows of the discontinued operations should be made.

## KEY TERMS

Comparative financial statements 169	Extraordinary items 176	Intraperiod income tax allocation 172	Prior-period adjustments 185
Comprehensive income 183	Financial capital maintenance 157	Losses 161	Restructuring charge 172
Consolidated financial statements 169	Gains 161	Matching 165	Return on sales 180
Discontinued operations 173	Gross profit 170	Multiple-step form 166	Revenue recognition 161
Earnings per share (EPS) 180	Gross profit percentage 170	Operating income 171	Revenues 161
Expense recognition 165	Income 157	Physical capital maintenance 158	Transaction approach 160
Expenses 161	Income from continuing operations 169	Price-earnings ratio (P/E ratio) 182	

## QUESTIONS

1. FASB *Concepts Statement No. 1* states, “The primary focus of financial reporting is information about an enterprise’s performance provided by measures of earnings and its components.” Why is it unwise for users of financial statements to focus too much attention on the income statement?
2. After the necessary definitions and assumptions that support the determination of income have been made, what are the two methods of income measurement that may be used to determine income? How do they differ?
3. What different measurement methods may be applied to net assets in arriving at income under the capital maintenance approach?
4. Income as determined by income tax regulations is not necessarily the same as income reported to external users. Why might there be differences?
5. What is the difference between a code law country and a common law country?
6. How are revenues and expenses different from gains and losses?
7. What two factors must be considered in deciding the point at which revenues and gains should be recognized? At what point in the revenue cycle are these conditions usually met?
8. Name three exceptions to the general rule that assumes revenue is recognized at the point of sale. What is the justification for these exceptions?
9. What guidelines are used to match costs with revenues in determining income?
10. What are some possible disadvantages of a multiple-step income statement?
11. Identify the major sections (components of income) that are included in a multiple-step income statement.
12. What are restructuring charges, and why do they generate controversy?
13. What is the meaning of “intraperiod” income tax allocation?
14. Pop-Up Company has decided to sell its lid manufacturing division even though the division is expected to show a small profit this year. The division’s assets will be sold to another company at a loss of \$10,000. What information (if any) should Pop-Up disclose in its financial reports with respect to this division?
15. Which of the following would not normally qualify as an extraordinary item?
  - (a) The write-down or write-off of receivables.
  - (b) Major devaluation of foreign currency.
  - (c) Loss on sale of plant and equipment.
  - (d) Gain from early extinguishment of debt.
  - (e) Loss due to extensive flood damage to an asphalt company in Las Vegas, Nevada.
  - (f) Loss due to extensive earthquake damage to a furniture company in Los Angeles, California.
  - (g) Farming loss due to heavy spring rains in the Northwest.
16. Explain briefly the difference in accounting treatment of (a) a change in accounting principle and (b) a change in accounting estimate.
17. Under IASB standards, how is the cumulative effect of a change in accounting principle reported?
18. What is the general practice in reporting earnings per share?
19. Define *comprehensive income*. How does it differ from net income?
20. What is the starting point for the preparation of forecasted financial statements?
21. Describe the process one should use in forecasting depreciation expense.

**PRACTICE EXERCISES**

**Practice 4-1 Financial Capital Maintenance**

**LO1**

The company had the following total asset and total liability balances at the beginning and the end of the year:

	<u>Beginning</u>	<u>Ending</u>
Total assets .....	\$400,000	\$625,000
Total liabilities .....	230,000	280,000

During the year, the company received \$100,000 in new investment funds contributed by the owners. Using the financial capital maintenance concept, determine the company's income for the year.

**Practice 4-2 Physical Capital Maintenance**

**LO1**

Refer to Practice 4-1. Assets with the same productive capacity as the assets comprising the \$400,000 beginning asset balance had a current cost of \$465,000 at the end of the year. Using the physical capital maintenance concept, determine the company's income for the year.

**Practice 4-3 Computation of Income Using Matching**

**LO3**

The company sells custom-designed engineering equipment. During the most recent year, the company received the following customer orders:

- For Machine A, selling price = \$125,000, production cost = \$67,000
- For Machine B, selling price = \$235,000, production cost = \$140,000
- For Machine C, selling price = \$72,000, production cost = \$41,000
- For Machine D, selling price = \$370,000, production cost = \$150,000

Machines A and C were completed and shipped during the year; the total revenue from the sale of these machines will be reported in the income statement for the year. Machines B and D have not yet been completed; the total production cost incurred so far for these two machines is \$240,000. The revenue from the sale of these two machines will *not* be reported in the income statement for the year. Using the transaction approach (the matching method), compute the company's income for the year.

**Practice 4-4 Revenue Recognition**

**LO3**

The following information describes the company's sales for the year:

- (a) A sale for \$100,000 was made on March 23. As of the end of the year, all work associated with the sale has been completed. Unfortunately, the customer is a significant credit risk and the collection of the cash for the sale is very uncertain. No cash has been collected as of the end of the year.
- (b) A sale for \$130,000 was made on July 12. The \$130,000 cash for the sale was collected in full on July 12. The work associated with the sale has not yet begun but is expected to be completed early next year.
- (c) A sale for \$170,000 was made on November 17. No cash has been collected as of the end of the year, but all of the cash is expected to be collected early next year. As of the end of the year, all of the work associated with the sale has been completed.

How much revenue should be recognized for the year?

**Practice 4-5 Expense Recognition**

The following information describes the company's costs incurred during the year:

**LO3**

	Amount of Cost	Expense Recognition Method	Length of Allocation Period	Matched Revenue Recognized?
(a)	\$30,000	Direct matching	Not applicable	Yes
(b)	70,000	Immediate recognition	Not applicable	Not applicable
(c)	15,000	Rational allocation	3 years	Not applicable
(d)	27,000	Immediate recognition	Not applicable	Not applicable
(e)	45,000	Rational allocation	5 years	Not applicable
(f)	50,000	Direct matching	Not applicable	No

How much expense should be recognized for the year?

**Practice 4-6 Multiple-Step Income Statement**

Using the following information, prepare a multiple-step income statement.

**LO4**

Cost of goods sold	\$ 6,000
Interest expense	1,100
Selling and administrative expense	750
Cash	400
Sales	10,000
Extraordinary gain (net of income taxes)	250
Dividends	700
Retained earnings (beginning)	1,000
Income tax expense (on continuing operations)	1,200

**Practice 4-7 Multiple-Step Income Statement**

Using the following information, prepare a multiple-step income statement.

**LO4**

Cost of goods sold	\$ 8,000
Interest expense	900
Selling and administrative expense	1,000
Cash	600
Sales	13,000
Accrued wages payable	320
Dividends	500
Retained earnings (beginning)	700
Income tax expense	1,000

**Practice 4-8 Computation of Gross Profit Percentage**

Refer to the **IBM** information in Exhibit 4-5. Compute the overall gross profit percentage for 2004, 2005, and 2006.

**LO5****Practice 4-9 Income from Continuing Operations**

Refer to the **IBM** information in Exhibit 4-5. Compute income from continuing operations as a percentage of total revenue for 2004, 2005, and 2006.

**LO5****Practice 4-10 Computation of Income from Continuing Operations**

Use the following information to compute *income from continuing operations*. Assume that the income tax rate on all items is 40%.

**LO5**

Cost of goods sold	\$ 5,000
Interest expense	900
Income (loss) from discontinued operations	(1,500)
Selling and administrative expense	1,450
Extraordinary loss	(350)
Sales	12,000
Dividends	750
Loss on sale of discontinued operations	(300)

**Practice 4-11 Computation of Income from Discontinued Operations**

Fleming Company has two divisions, E and N. Both qualify as business components. In 2011, the firm decides to dispose of the assets and liabilities of Division N; it

**LO5**

is probable that the disposal will be completed early next year. The revenues and expenses of Fleming for 2010 and 2011 are as follows:

	2011	2010
Sales—E	\$5,000	\$4,600
Total nontax expenses—E	4,400	4,100
Sales—N	3,500	5,100
Total nontax expenses—N	3,900	4,500

During the later part of 2011, Fleming disposed of a portion of Division N and recognized a pretax loss of \$2,000 on the disposal. The income tax rate for Fleming Company is 30%. Prepare the 2011 comparative income statement.

**Practice 4-12**

**Computation of Income from Discontinued Operations**

LO5

Refer to the data in Practice 4-11. Repeat the exercise, assuming that Division E is being discontinued. Also assume that instead of a \$2,000 pretax loss on the disposal, there was a \$1,500 pretax gain.

**Practice 4-13**

**Gains and Losses on Extraordinary Items**

LO5

Use the following information to compute *income from continuing operations* and *net income*. Assume that the income tax rate on all items is 40%.

Cost of goods sold	\$14,000
Interest expense	2,400
Loss from an unusual but frequent event	(3,000)
Selling and administrative expense	2,250
Loss from an unusual and infrequent event	(800)
Sales	25,000
Gain from a normal but infrequent event	1,350
Dividends	1,000

**Practice 4-14**

**Cumulative Effect of a Change in Accounting Principle**

LO5

The company started business in 2009. In 2011, the company decided to change its method of computing oil and gas exploration expense. The company has only two expenses: oil and gas exploration expense and income tax expense. The following sales and oil and gas exploration expense information are for 2009–2011:

	2011	2010	2009
Sales	\$5,000	\$3,000	\$2,000
Oil and gas exploration expense—old method	1,000	600	400
Oil and gas exploration expense—new method	700	1,200	1,500

Prepare the 2011 comparative income statement. The income tax rate for all items is 30%.

**Practice 4-15**

**Accounting for Changes in Estimates**

LO5

A building was purchased for \$100,000 on January 1, 2006. It was estimated to have no salvage value and to have an estimated useful life of 20 years. On January 1, 2011, the estimated useful life was changed from 20 years to 30 years. Compute depreciation expense for 2011. Use straight-line depreciation.

**Practice 4-16**

**Return on Sales**

LO5

Use the following information to compute return on sales.

Earnings per share	\$1.67
Cost of goods sold	\$10,000
Cash	\$550
Sales	\$13,000
Market price per share	\$20
Net income	\$200
Total stockholders' equity	\$6,700

**Practice 4-17 Earnings per Share**

LO5

For the years 2009–2011, Robbins Soccer Company had net income and average shares outstanding as follows:

	2011	2010	2009
Net income .....	\$12,250	\$9,000	\$5,500
Average shares outstanding .....	3,500	3,000	2,000

What was the percentage of change in earnings per share (EPS) in 2010? In 2011?

**Practice 4-18 Price-Earnings (P/E) Ratio**

LO5

Refer to Practice 4-16. Use that information to compute the price-earnings ratio.

**Practice 4-19 Comprehensive Income**

LO6

Use the following information to compute *net income* and *comprehensive income*. For simplicity, ignore income taxes.

Income from continuing operations .....	\$ 9,000
Unrealized loss on available-for-sale securities .....	(1,700)
Dividends .....	850
Extraordinary loss .....	(1,200)
Foreign currency translation adjustment (equity increase) .....	1,500

**Practice 4-20 Forecasted Balance Sheet**

LO7

The following balance sheet asset information is for 2011:

Cash .....	\$ 100
Accounts receivable .....	500
Inventory .....	1,000
Land .....	2,500
Plant and equipment (net) .....	5,000

Sales are expected to increase by 25% in 2012. No new land will be needed to support this increased level of sales. This sales increase will require significantly expanded production capacity; net plant and equipment will increase by 40%. Prepare a forecast of the Assets section of the 2012 balance sheet.

**Practice 4-21 Forecasted Income Statement**

LO7

The following balance sheet information represents actual data for 2011 and forecasted data for 2012:

	Actual 2011	Forecasted 2012
Current assets .....	\$2,000	\$2,600
Property, plant, and equipment (net) .....	5,000	6,000
Accounts payable .....	500	650
Long-term debt .....	4,000	5,000
Total stockholders' equity .....	2,500	2,950

The actual income statement for 2011 is as follows:

Sales .....	\$10,000
Cost of goods sold .....	6,000
Depreciation expense .....	1,000
Interest expense .....	400
Income before income taxes .....	\$ 2,600
Income tax expense .....	910
Net income .....	<u>\$ 1,690</u>

Sales are expected to increase by 30% in 2012. Prepare a forecasted income statement for 2012.

## EXERCISES

## Exercise 4-22

**Calculation of Net Income**

LO3

Changes in the balance sheet account balances for the Bubble Bobble Co. during 2011 follow. Dividends declared during 2011 were \$15,000. Calculate the net income for the year assuming that no transactions other than the dividends affected retained earnings.

	Increase (Decrease)
Cash .....	\$ 38,500
Accounts Receivable .....	57,000
Inventory .....	(32,500)
Buildings and Equipment (net) .....	160,000
Patents .....	(4,000)
Accounts Payable .....	(45,000)
Bonds Payable .....	135,000
Capital Stock .....	25,000
Additional Paid-In Capital .....	35,000

## Exercise 4-23

**Revenue Recognition**

LO3

For each of the following transactions, events, or circumstances, indicate whether the recognition criteria for revenues and gains are met and provide support for your answer.

- An order of \$25,000 for merchandise is received from a customer.
- The value of timberlands increases by \$40,000 for the year due to normal growth.
- Accounting services are rendered to a client on account.
- A 1991 investment was made in land at a cost of \$80,000. The land currently has a fair market value of \$107,000.
- Cash of \$5,600 is collected from the sale of a gift certificate that is redeemable in the next accounting period.
- Cash of \$7,500 is collected from subscribers for subscription fees to a monthly magazine. The subscription period is 2 years.
- You owe a creditor \$1,500, payable in 30 days. The creditor has cash flow difficulties and has agreed to allow you to retire the debt in full with an immediate payment of \$1,200.

## Exercise 4-24

**Revenue Recognition**

LO3

Indicate which of the following transactions or events gives rise to the recognition of revenue in 2011 under the accrual basis of accounting. If revenue is not recognized, what account, if any, is credited?

- On December 15, 2011, Howe Company received \$20,000 as rent revenue for the 6-month period beginning January 1, 2012.
- Monroe Tractor Co., on July 1, 2011, sold one of its tractors and received \$10,000 in cash and a note for \$50,000 at 12% interest, payable in one year. The fair market value of the tractor is \$60,000.
- Oswald, Inc., issued additional shares of common stock on December 10, 2011, for \$30,000 above par value.
- Balance Company received a purchase order in 2011 from an established customer for \$10,200 of merchandise. The merchandise was shipped on December 20, 2011. The company's credit policy allows the customer to return the merchandise within 30 days and a 3% discount if paid within 20 days from shipment.
- Gloria, Inc., sold merchandise costing \$2,000 for \$2,500 in August 2011. The terms of the sale are 15% down on a 12-month conditional sales contract, with title to the goods being retained by the seller until the contract price is paid in full.
- On November 1, 2011, Jones & Whitlock entered into an agreement to audit the 2011 financial statements of Lehi Mills for a fee of \$35,000. The audit work began on December 15, 2011, and will be completed around February 15, 2012.

**Exercise 4-25****Expense Recognition****LO3**

For each of the following items, indicate whether the expense should be recognized using (1) direct matching, (2) systematic and rational allocation, or (3) immediate recognition. Provide support for your answer.

- Johnson & Smith, Inc., conducts cancer research. The company's hope is to develop a cure for the deadly disease. To date, its efforts have proven unsuccessful. It is testing a new drug, Ebzinene, which has cost \$400,000 to develop.
- Sears** offers warranties on many of the products it sells. Although the warranty periods range from days to years, Sears can reasonably estimate warranty costs.
- Stocks Co. recently signed a 2-year lease agreement on a warehouse. The entire cost of \$15,000 was paid in advance.
- John Clark assembles chairs for the Stone Furniture Company. The company pays Clark on an hourly basis.
- Hardy Co. recently purchased a fleet of new delivery trucks. The trucks are each expected to last for 100,000 miles.
- Taylor Manufacturing Inc. regularly advertises in national trade journals. The objective is to acquire name recognition, not to promote a specific product.

**Exercise 4-26****Change in Estimate****LO5**

Borgquist Corporation purchased a patent on January 2, 2008, for \$400,000. Its original life was estimated to be 10 years. However, in December of 2011, Borgquist's controller received information proving conclusively that the product protected by the Borgquist patent would be obsolete within three years. Accordingly, the company decided to write off the unamortized portion of the patent cost over four years beginning in 2011. How would the change in estimate be reflected in the accounts for 2011 and subsequent years?

**Exercise 4-27****Classification of Income Statement Items****LO4, LO5**

Where in a multiple-step income statement would each of the following items be reported?

- Purchase discounts
- Gain on early retirement of debt
- Interest revenue
- Loss on sale of equipment
- Casualty loss from hurricane
- Sales commissions
- Loss on disposal of business component
- Income tax expense
- Gain on sale of land
- Sales discounts
- Loss from long-term investments written off as worthless
- Direct labor cost
- Vacation pay of office employees
- Ending inventory

**Exercise 4-28****Analysis and Preparation of Income Statement****LO5****SPREADSHEET**

The selling expenses of Caribou Inc. for 2011 are 13% of sales. General expenses, excluding doubtful accounts, are 25% of cost of goods sold but only 15% of sales. Doubtful accounts are 2% of sales. The beginning inventory was \$136,000, and it decreased 30% during the year. Income from operations for the year before income taxes of 30% is \$160,000. Extraordinary gain, net of tax of 30%, is \$21,000. Prepare an income statement, including earnings-per-share data, giving supporting computations. Caribou Inc. has 130,000 shares of common stock outstanding.

**Exercise 4-29**

**Intraperiod Income Tax Allocation**

Nephi Corporation reported the following income items before tax for the year 2011:

LO5

Income from continuing operations before income taxes .....	\$260,000
Loss from operations of a discontinued business component .....	70,000
Gain from disposal of a business component .....	40,000
Extraordinary gain .....	110,000

The income tax rate is 35% on all items. Prepare the portion of the income statement beginning with Income from continuing operations before income taxes for the year ended December 31, 2011, after applying proper intraperiod income tax allocation procedures.

**Exercise 4-30**

**Discontinued Operations**

LO5

On May 31, 2011, top management of Stafford Manufacturing Co. decided to dispose of an unprofitable business component. An operating loss of \$210,000 associated with the component was incurred during the year. The plant facilities associated with the business segment were sold on November 30, and a \$23,000 gain was realized on the sale of the plant assets.

- (a) Assuming a 30% tax rate, prepare the discontinued operations section of Stafford Manufacturing Co.'s income statement for the year ending December 31, 2011.
- (b) What additional information about the discontinued segment would be provided by Stafford Manufacturing if it were reporting using the accounting standards of the United Kingdom?

**Exercise 4-31**

**Discontinued Operations**

LO5

DEMO PROBLEM

Jason Bond Company operates two restaurants, one in Valencia and one in Saugus. The operations and cash flows of each of the two restaurants are clearly distinguishable. During 2011, Jason Bond decided to close the restaurant in Saugus and sell the property; it is probable that the disposal will be completed early next year. The revenues and expenses of Jason Bond for 2011 and for the preceding two years are as follows:

	2011	2010	2009
Sales—Valencia .....	\$60,000	\$48,000	\$40,000
Cost of goods sold—Valencia .....	26,000	22,000	18,000
Other expenses—Valencia .....	14,000	13,000	12,000
Sales—Saugus .....	23,000	30,000	52,000
Cost of goods sold—Saugus .....	14,000	19,000	20,000
Other expenses—Saugus .....	17,000	16,000	15,000

The other expenses do not include income tax expense. During the later part of 2011, Jason Bond sold much of the kitchen equipment of the Saugus restaurant and recognized a pretax gain of \$15,000 on the disposal. The income tax rate for Jason Bond is 35%.

Prepare the 3-year comparative income statement for 2009–2011.

**Exercise 4-32**

**Change in Accounting Principle**

LO5

In 2011, Compliance Industries changed its method of inventory valuation. The summary effect of those changes is as follows:

	Old Method	New Method
Cost of goods sold—2011 .....	\$25,000	\$19,000
Cost of goods sold—2010 .....	29,000	21,000
Cost of goods sold—2009 .....	31,000	24,000
Cost of goods sold—2008 and before .....	51,000	38,000

Net income was \$128,000, \$119,000, and \$98,000 for 2011, 2010, and 2009, respectively. The income tax rate is 30%.

1. Compute the reported net income for each year if three years of financial statements are issued at the end of 2011.
2. Compute the amount of adjustment that would be made to Retained Earnings as of January 1, 2009.

### Exercise 4-33

#### Reporting Items on Financial Statements

Under what classification would you report each of the following items on the financial statements?

#### LO5

- (a) Revenue from sale of obsolete inventory.
- (b) Loss on sale of the fertilizer production division of a lawn supplies manufacturer.
- (c) Loss stemming from expropriation of assets by a foreign government.
- (d) Gain resulting from changing asset balances to adjust for the effect of excessive depreciation charged in error in prior years.
- (e) Loss resulting from excessive accrual in prior years of estimated revenues from long-term contracts.
- (f) Costs incurred to purchase a valuable patent.
- (g) Net income from the discontinued dune buggy operations of a custom car designer.
- (h) Costs of rearranging plant machinery into a more efficient order.
- (i) Error made in capitalizing advertising expense during the prior year.
- (j) Gain on sale of land to the government.
- (k) Loss from destruction of crops by a hailstorm.
- (l) Additional depreciation resulting from a change in the estimated useful life of an asset.
- (m) Gain on sale of long-term investments.
- (n) Loss from spring flooding.
- (o) Sale of obsolete inventory at less than book value.
- (p) Additional federal income tax assessment for prior years.
- (q) Loss resulting from the sale of a portion of a business component.
- (r) Costs associated with moving a U.S. business to Japan.
- (s) Loss resulting from a patent that was recently determined to be worthless.

### Exercise 4-34

#### Multiple-Step Income Statement

From the following list of accounts, prepare a multiple-step income statement in good form showing all appropriate items properly classified, including disclosure of earnings-per-share data. (No monetary amounts are to be reported.)

#### LO4, LO5

Accounts Payable  
 Accumulated Depreciation—Office Building  
 Accumulated Depreciation—Office Furniture and Fixtures  
 Advertising Expense  
 Allowance for Bad Debts  
 Bad Debt Expense  
 Cash  
 Common Stock, \$1 par (10,000 shares outstanding)  
 Depreciation Expense—Office Building  
 Depreciation Expense—Office Furniture and Fixtures  
 Dividend Revenue  
 Dividends Payable  
 Dividends Receivable  
 Extraordinary Gain (net of income taxes)  
 Federal Unemployment Tax Payable  
 Freight-In  
 Goodwill  
 Income Tax Expense  
 Income Taxes Payable

- Insurance Expense
- Interest Expense—Bonds
- Interest Expense—Other
- Interest Payable
- Interest Receivable
- Interest Revenue
- Inventory—beginning
- Inventory—ending
- Loss from Discontinued Operations (net of income taxes)
- Miscellaneous General Expense
- Miscellaneous Selling Expense
- Office Salaries Expense
- Office Supplies
- Office Supplies Expense
- Officers' Salaries Expense
- Property Taxes Expense
- Purchase Discounts
- Purchase Returns and Allowances
- Purchases
- Retained Earnings
- Royalties Received in Advance
- Royalty Revenue
- Salaries and Wages Payable
- Sales
- Sales Discounts
- Sales Returns and Allowances
- Sales Salaries and Commissions
- Sales Taxes Payable

**Exercise 4-35**

**Multiple-Step Income Statement and Statement of Retained Earnings**

LO4, LO6

Jacksonville Window Co. reports the following for 2011:

Retained earnings, January 1 .....	\$335,200
Selling expenses .....	\$290,200
Sales revenue .....	\$1,420,000
Interest expense .....	\$14,100
General and administrative expenses .....	\$224,800
Cost of goods sold .....	\$772,000
Dividends declared this year .....	\$40,000
Tax rate for all items .....	40%
Average shares of common stock outstanding during the year .....	30,000

Prepare a multiple-step income statement (including earnings-per-share data) and a statement of retained earnings for Jacksonville.

**Exercise 4-36**

**Correction of Retained Earnings Statement**

LO6

J. Mair has been employed as a bookkeeper at Problems Inc. for a number of years. With the assistance of a clerk, Mair handles all accounting duties, including the preparation of financial statements. The following is a statement of earned surplus prepared by Mair for 2011:

Problems Inc.	
Statement of Earned Surplus for 2011	
Balance at beginning of year .....	\$ 76,843
Additions:	
Change in estimate of 2011 amortization expense .....	\$ 3,100
Gain on sale of land .....	17,420
Interest revenue .....	3,900
Profit and loss for 2011 .....	12,760
Total additions .....	37,180
Total .....	\$114,023

Deductions:	
Increased depreciation due to change in estimated life .....	\$ 6,400
Dividends declared and paid .....	12,000
Loss on sale of equipment .....	2,490
Loss from major casualty (extraordinary) .....	<u>25,310</u>
Total deductions .....	<u>46,200</u>
Balance at end of year .....	<u>\$ 67,823</u>

**Instructions:**

1. Prepare a schedule showing the correct net income for 2011. (Ignore income taxes.)
2. Prepare a retained earnings statement for 2011.
3. Explain why you have changed the retained earnings statement.

**Exercise 4-37****Statement of Comprehensive Income**

Svedin Incorporated provides the following information relating to 2011:

**LO6**

Net income .....	\$17,650
Unrealized losses on available-for-sale securities .....	1,285
Foreign currency translation adjustment .....	287
Deferred loss on derivatives .....	<u>315</u>

The foreign currency adjustment resulted from a weakening in the currencies of Svedin's foreign subsidiaries relative to the U.S. dollar. The deferred loss on derivatives required the recognition of a liability with a resulting decrease in equity. (*Note:* These items represent the results of events occurring during 2011, not the cumulative result of events in prior years.)

1. Determine the effect that each of these items would have when computing comprehensive income for 2011. Explain your rationale.
2. Prepare a statement of comprehensive income for Svedin Incorporated for 2011.

**Exercise 4-38****Forecasted Income Statement**

Romney and Associates wishes to forecast its net income for the year 2012. Romney has assembled balance sheet and income statement data for 2011 and has also done a forecast of the balance sheet for 2012. In addition, Romney has estimated that its sales in 2012 will rise to \$3,600. This information is summarized in the following table.

**LO7**

Balance Sheet	2011	2012 Forecasted
Cash .....	\$ 40	\$ 48
Other current assets .....	450	540
Property, plant, and equipment (net) .....	500	700
Total assets .....	<u>\$ 990</u>	<u>\$1,288</u>
Accounts payable .....	\$ 190	\$ 228
Bank loans payable .....	500	400
Total stockholders' equity .....	<u>300</u>	<u>660</u>
Total liabilities and stockholders' equity .....	<u>\$ 990</u>	<u>\$1,288</u>

Income Statement	2011	2012 Forecasted
Sales .....	\$3,000	\$3,600
Cost of goods sold .....	<u>1,200</u>	
Gross profit .....	\$1,800	
Depreciation expense .....	100	
Other operating expenses .....	<u>1,440</u>	
Operating profit .....	\$ 260	
Interest expense .....	<u>50</u>	
Income before taxes .....	\$ 210	
Income taxes .....	<u>84</u>	
Net income .....	<u>\$ 126</u>	

**Instructions:**

Prepare a forecasted income statement for 2012. Clearly state what assumptions you make.

**Exercise 4-39**

**Forecasted Balance Sheet and Income Statement**

Ryan Company wishes to prepare a forecasted income statement and a forecasted balance sheet for 2012. Ryan’s balance sheet and income statement for 2011 follow.

**LO7**

Balance Sheet	2011
Cash .....	\$ 10
Other current assets .....	250
Property, plant, and equipment, net .....	800
Total assets .....	<u>\$1,060</u>
Accounts payable .....	\$ 100
Bank loans payable .....	700
Total stockholders' equity .....	260
Total liabilities and stockholders' equity .....	<u>\$1,060</u>

Income Statement	2011
Sales .....	\$1,000
Cost of goods sold .....	750
Gross profit .....	\$ 250
Depreciation expense .....	40
Other operating expenses .....	80
Operating profit .....	\$ 130
Interest expense .....	70
Income before taxes .....	\$ 60
Income taxes .....	20
Net income .....	<u>\$ 40</u>

In addition, Ryan has assembled the following forecasted information regarding 2012:

- (a) Sales are expected to increase to \$1,500.
- (b) Ryan expects to become more efficient at utilizing its property, plant, and equipment in 2012. Therefore, Ryan expects that the sales increase will not require any increase in property, plant, and equipment. Accordingly, the year 2012 property, plant, and equipment balance is expected to be \$800.
- (c) Ryan’s bank has approved a new long-term loan of \$200. This loan will be in addition to the existing loan payable.

**Instructions:**

Prepare a forecasted balance sheet and a forecasted income statement for 2012. Clearly state what assumptions you make.

**PROBLEMS**

**Problem 4-40**

**Single-Step Income Statement**

**LO4, LO6**

McGrath Co. on June 30, 2011, reported a retained earnings balance of \$1,475,000 before closing the books. The books of the company showed the following account balances on June 30, 2011:

Sales .....	\$2,870,000
Inventory: July 1, 2010 .....	150,000
June 30, 2011 .....	175,000
Sales Returns and Allowances .....	120,000
Purchases .....	1,542,000
Purchase Discounts .....	32,000
Dividends Declared .....	300,000
Selling and General Expenses .....	283,000
Interest Revenue .....	72,000
Income Taxes .....	270,900

**Instructions:**

Prepare a multiple-step income statement and a retained earnings statement. McGrath Co. has 275,000 shares of common stock outstanding.

**Problem 4-41****LO3, LO5****Revenue Recognition and Preparation of Income Statement**

Manchester Company manufactures and sells robot-type toys for children. Under one type of agreement with the dealers, Manchester is to receive payment upon shipment to the dealers. Under another type of agreement, Manchester receives payments only after the dealer makes the sale. Under this latter agreement, toys may be returned by the dealer. Manchester's president desires to know how the income statement would differ under these two methods over a 2-year period.

The following information is made available for making the computations:

Sales price per unit:	
If paid after shipment .....	\$7
If paid after sale, with right of return .....	\$8
Cost to produce per unit (assume fixed quantity of toys is produced) .....	\$4
Expected bad debt percentage of sales if revenue recognized at time of shipment .....	4%
Expected bad debt percentage of sales if revenue recognized at time of sale .....	1%
Selling expenses—2011 .....	\$30,000
Selling expenses—2012 .....	\$21,000
General and administrative expenses—2011 and 2012 .....	\$16,000

**Quantity Shipped and Sold**

	2012	2011
Units shipped to dealers .....	38,000	32,000
Units sold by dealers .....	28,000	18,000

**Instructions:**

1. Prepare comparative income statements for 2011 and 2012 for each of the two types of dealer agreements assuming the company began operations in 2011.
2. Discuss the implications of the revenue recognition method used for each of the dealer agreements.

**Problem 4-42****LO3, LO4****Revenue and Expense Recognition**

On December 31, 2011, Hadley Company provides the following pre-audit income statement for your review:

Sales .....	\$185,000
Cost of goods sold .....	(94,000)
Gross profit .....	\$ 91,000
Rent expense .....	(18,000)
Advertising expense .....	(6,000)
Warranty expense .....	(8,000)
Other expenses .....	(15,000)
Net income .....	<u>\$ 44,000</u>

The following information is also available:

- (a) Many of Hadley's customers pay for their orders in advance. At year-end, \$18,000 of orders paid for in advance of shipment have been included in the sales figure.
- (b) Hadley introduced and sold several products during the year with a 30-day, money-back guarantee. During the year, customers seldom returned the products. Hadley has not included in revenue or in cost of goods sold those items sold within the last 30 days that included the guarantee. The revenue is \$16,000, and the cost associated with the products is \$7,500.
- (c) On January 1, 2011, Hadley prepaid its building rent for 18 months. The entire amount paid, \$18,000, was charged to Rent Expense.
- (d) On July 1, 2011, Hadley paid \$24,000 for general advertising to be completed prior to the end of 2011. Hadley's management estimates that the advertising will benefit a 2-year period and, therefore, has elected to charge the costs to the income statement at the rate of \$1,000 a month.

- (e) Hadley has collected current cost information relating to its inventory. The cost of goods sold, if valued using current costing techniques, is \$106,000.
- (f) In past years, Hadley has estimated warranty expense using a percentage of sales. Hadley estimates future warranty costs relating to 2011 sales will amount to 5% of sales. However, during 2011, Hadley elected to charge costs to warranty expense as costs were incurred. Hadley spent \$8,000 during 2011 to repair and replace defective inventory sold in current and prior periods.

**Instructions:**

1. For each item of additional information, identify the revenue or expense recognition issue.
2. Prepare a revised income statement using the information provided.

**Problem 4-43**

LO5

**Intraperiod Income Tax Allocation**

The following information relates to Spiker Manufacturing Inc. for the fiscal year ended July 31, 2011. Assume that there are no tax rate changes, a 30% tax rate applies to all items reported in the income statement, and there are no differences between financial and taxable income.

Taxable income, year ending July 31, 2011 .....	\$1,015,000
Nonoperating items included in taxable income:	
Extraordinary gain .....	121,000
Loss from disposal of a business component .....	(130,000)
Prior-year error resulting in income overstatement for fiscal year 2010;	
tax refund to be requested .....	90,000
Retained earnings, August 1, 2010 .....	2,520,000

**Instructions:**

Prepare the income statement for Spiker Manufacturing Inc. beginning with Income from continuing operations before income taxes and the retained earnings statement for the fiscal year ended July 31, 2011. Apply intraperiod income tax allocation procedures to both statements.

**Problem 4-44**

LO5, LO6

**Reporting Special Income Items**

Plush Textiles Inc. shows a retained earnings balance on January 1, 2011, of \$580,000. For 2011, the income from continuing operations was \$225,000 before income tax. Following is a list of special items:

Income from operations of a discontinued textiles division .....	\$22,000
Loss on the sale of the textiles division .....	60,000
Extraordinary gain .....	31,000
Correction of sales understatement in 2010 (net of income taxes of \$17,500	
to be paid when amended 2010 return is filed) .....	32,500
Omission of depreciation charges of prior years (a claim has been filed for	
an income tax refund of \$6,400) .....	16,000

Income taxes paid during 2011 were \$87,200, which consisted of the tax on continuing operations, plus \$8,800 resulting from operations of the discontinued textiles division and \$12,400 from the extraordinary gain, less a \$24,000 tax reduction for the loss on the sale of the textiles division. Dividends of \$45,000 were declared by the company during the year (30,000 shares of common stock are outstanding).

**Instructions:**

Prepare the income statement for Plush Textiles Inc. beginning with Income from continuing operations before income taxes. Include an accompanying retained earnings statement.

**Problem 4-45**

LO5

**Discontinued Operations in Process**

In 2011, Laetner Industries decided to discontinue its Laminating Division, a separately identifiable component of Laetner's business. At December 31, Laetner's year-end, the division has not been completely sold. However, negotiations for the final and complete sale are progressing in a positive manner, and it is probable that the disposal will be completed within a year. Analysis of the records for the year disclosed the following relative to the Laminating Division.

Operating loss for the year .....	\$89,900
Loss on disposal of some Laminating Division assets during 2011 .....	5,000
Expected operating loss in 2012 preceding final disposal .....	45,000
Expected gain in 2012 on disposal of division .....	20,000

**Instructions:**

Assuming a 35% tax rate, prepare the Discontinued Operations section of Laetner Industries' income statement for the year ending December 31, 2011.

**Problem 4-46****Financial Statement Analysis—Ratios**

The following financial statement information for Tronics Inc. is available:

**LO5**

(In thousands)	2011	2010	2009
Sales .....	\$6,041	\$5,872	\$5,324
Cost of goods sold .....	3,202	2,877	2,396
Operating expenses .....	1,991	1,779	1,578
Income taxes .....	165	222	280

The following information relates to the firm's common stock for the same period:

	2011	2010	2009
Shares outstanding .....	1,000	1,000	1,000
Market value per share at year-end .....	\$8.13	\$12.25	\$15.32

**Instructions:**

- For each year compute
  - Gross profit percentage.
  - Return on sales.
  - Price-earnings ratio.
- Do you notice any significant trends as a result of this analysis?

**Problem 4-47****Income and Retained Earnings Statements**

Selected account balances of Connell Company for 2011 along with additional information as of December 31 are as follows:

**LO4, LO5, LO6****SPREADSHEET**

Bad Debt Expense .....	\$ 32,000
Delivery Expense .....	425,000
Depreciation Expense—Delivery Trucks .....	29,000
Depreciation Expense—Office Building .....	25,000
Depreciation Expense—Office Equipment .....	10,000
Depreciation Expense—Store Equipment .....	25,000
Dividend Revenue .....	35,000
Dividends .....	150,000
Employee Pension Expense .....	190,000
Freight-In .....	145,000
Gain on Sale of Office Equipment .....	8,000
Income Taxes, 2011 .....	427,425
Interest Revenue .....	10,000
Inventory, January 1, 2011 .....	775,000
Loss on Sale of Investment Securities .....	20,000
Loss on Write-Down of Obsolete Inventory .....	75,000
Miscellaneous General Expenses .....	45,000
Miscellaneous Selling Expenses .....	50,000
Officers' and Office Salaries .....	550,000
Property Taxes Expense .....	100,000
Purchase Discounts .....	47,700
Purchases .....	4,633,200
Retained Earnings, January 1, 2011 .....	550,000
Sales .....	8,125,000
Sales Discounts .....	55,000
Sales Returns and Allowances .....	95,000
Sales Salaries .....	521,000

(a) Inventory was valued at year-end as follows:

Cost .....	\$825,000
Write-down of obsolete inventory .....	75,000
	<u>\$750,000</u>

(b) Number of Connell shares of stock outstanding: 60,000

**Instructions:**

Prepare a multiple-step income statement and statement of retained earnings for the year ended December 31, 2011.

**Problem 4-48**

LO4, LO5

DEMO PROBLEM

**Corrected Income Statement**

A newly hired staff accountant prepared the pre-audit income statement of Be Fit Recreation Incorporated for the year ending December 31, 2011.

Net revenues .....	\$645,000
Cost of goods sold .....	<u>305,200</u>
Gross profit .....	\$339,800
Expenses:	
Sales salaries and commissions .....	\$116,400
Officers' and office salaries .....	121,000
Depreciation .....	64,000
Advertising expense .....	18,700
Other general and administrative expenses .....	<u>16,300</u>
	336,400
Income from continuing operations .....	\$ 3,400
Discontinued operations:	
Gain on disposal of business segment .....	<u>32,000</u>
Income before income taxes .....	\$ 35,400
Income taxes (30%) .....	<u>10,620</u>
Net income .....	<u>\$ 24,780</u>
Earnings per common share (10,000 shares outstanding) .....	<u>\$ 2.48</u>

The following information was obtained by Be Fit's independent auditor.

(a) Net revenues in the income statement included the following items.

Sales returns and allowances .....	\$ 8,700
Interest revenue .....	5,300
Interest expense .....	9,400
Loss on sale of short-term investment .....	2,800
Extraordinary gain .....	13,300

- (b) Of the total depreciation expense reported in the income statement, 40% relates to stores and store equipment, 60% to office building and equipment.
- (c) At the beginning of 2011, management decided to close one of Be Fit's retail stores. Be Fit is a large company and does not attempt to prepare complete financial reports for each individual store. The inventory and equipment were moved to another Be Fit store, and the land and building were sold on July 1, 2011, at a pretax gain of \$32,000. This amount has been reported under discontinued operations.
- (d) The income tax rate is 30%.

**Instructions:**

Prepare a corrected multiple-step income statement for the year ended December 31, 2011.

**Problem 4-49**

LO4, LO5

SPREADSHEET

**Analysis of Income Items—Multiple-Step Income Statement Preparation**

On December 31, 2011, analysis of Sayer Sporting Goods' operations for 2011 revealed the following.

- (a) Total cash collections from customers, \$105,260.
- (b) December 31, 2010, inventory balance, \$12,180.
- (c) Total cash payments, \$92,450.

- (d) Accounts receivable, December 31, 2010, \$22,150.
- (e) Accounts payable, December 31, 2010, \$10,830.
- (f) Accounts receivable, December 31, 2011, \$18,920.
- (g) Accounts payable, December 31, 2011, \$7,120.
- (h) General and administrative expenses total 25% of sales. This amount includes the depreciation on store and equipment.
- (i) Selling expenses of \$12,352 total 20% of gross profit.
- (j) No general and administrative or selling expense liabilities existed at December 31, 2011.
- (k) Wages and salaries payable at December 31, 2010, \$4,450.
- (l) Depreciation expense on store and equipment total 12% of general and administrative expenses.
- (m) Shares of stock issued and outstanding, 5,000.
- (n) The income tax rate is 40%.

**Instructions:**

Prepare a multiple-step income statement for the year ended December 31, 2011.

**Problem 4-50****LO4, LO5, LO6****Corrected Income and Retained Earnings Statements**

Selected pre-adjustment account balances and adjusting information of Sunset Cosmetics Inc. for the year ended December 31, 2011, are as follows:

Retained Earnings, January 1, 2011 .....	\$440,670
Sales Salaries and Commissions .....	35,000
Advertising Expense .....	16,090
Legal Services .....	2,225
Insurance and Licenses .....	8,500
Travel Expense—Sales Representatives .....	4,560
Depreciation Expense—Sales/Delivery Equipment .....	6,100
Depreciation Expense—Office Equipment .....	4,800
Interest Revenue .....	700
Utilities Expense .....	6,400
Telephone and Postage Expense .....	1,475
Supplies Inventory .....	2,180
Miscellaneous Selling Expenses .....	2,200
Dividends .....	33,000
Dividend Revenue .....	7,150
Interest Expense .....	4,520
Allowance for Bad Debts (Cr. balance) .....	370
Officers' Salaries Expense .....	36,600
Sales .....	495,200
Sales Returns and Allowances .....	11,200
Sales Discounts .....	880
Gain on Sale of Assets .....	18,500
Inventory, January 1, 2011 .....	89,700
Inventory, December 31, 2011 .....	20,550
Purchases .....	173,000
Freight-In .....	5,525
Accounts Receivable, December 31, 2011 .....	261,000
Gain from Discontinued Operations (before income taxes) .....	40,000
Extraordinary Loss (before income taxes) .....	72,600
Shares of common stock outstanding .....	39,000

**Adjusting information:**

- (a) Cost of inventory in the possession of consignees as of December 31, 2011, was not included in the ending inventory balance. .... \$33,600
- (b) After preparing an analysis of aged accounts receivable, a decision was made to increase the allowance for bad debts to a percentage of the ending accounts receivable balance. .... 3%
- (c) Purchase returns and allowances were unrecorded. They are computed as a percentage of purchases (not including freight-in). .... 6%

(d)	Sales commissions for the last day of the year had not been accrued.	
	Total sales for the day .....	\$3,600
	Average sales commissions as a percent of sales .....	3%
(e)	No accrual had been made for a freight bill received on January 3, 2012, for goods received on December 29, 2011.....	\$800
(f)	An advertising campaign was initiated November 1, 2011. This amount was recorded as prepaid advertising and should be amortized over a 6-month period. No amortization was recorded. ....	\$1,818
(g)	Freight charges paid on sold merchandise and not passed on to the buyer were netted against sales. Freight charge on sales during 2011 .....	\$4,200
(h)	Interest earned but not accrued .....	\$690
(i)	Depreciation expense on a new forklift purchased March 1, 2011, had not been recognized. (Assume that all equipment will have no salvage value and the straight-line method is used. Depreciation is calculated to the nearest month.)	
	Purchase price .....	\$7,800
	Estimated life in years .....	10
(j)	A "real" account is debited upon the receipt of supplies. Supplies on hand at year-end .....	\$1,600
(k)	Income tax rate (on all items) .....	35%

**Instructions:**

Prepare a corrected multiple-step income statement and a retained earnings statement for the year ended December 31, 2011. Assume all amounts are material.

**Problem 4-51**

LO6

**Comprehensive Income Statement**

The following information for the year ending December 31, 2011, has been provided for Calle Company.

Sales .....	\$530,000
Cost of goods sold .....	305,600
Foreign translation adjustment (net of income taxes) .....	51,000
Selling expenses .....	76,200
Extraordinary gain (net of income taxes) .....	36,800
Correction of inventory error (net of income taxes) .....	33,460
General and administrative expenses .....	57,300
Income tax expense .....	20,100
Gain on sale of investment .....	10,800
Proceeds from sale of land at cost .....	81,000
Dividends .....	11,200

**Instructions:**

Prepare a statement of comprehensive income for Calle Company. *Note:* Both the foreign translation adjustment and the correction of the inventory error involve a reduction in equity.

**Problem 4-52**

LO7

**Forecasted Balance Sheet and Income Statement**

Lorien Company wishes to prepare a forecasted income statement and a forecasted balance sheet for 2012. Lorien's balance sheet and income statement for 2011 follow.

Balance Sheet	2011
Cash .....	\$ 40
Other current assets .....	350
Property, plant, and equipment, net .....	1,000
<b>Total assets .....</b>	<b>\$1,390</b>
Accounts payable .....	\$ 100
Bank loans payable .....	1,000
Paid-in capital .....	100
Retained earnings .....	190
<b>Total liabilities and stockholders' equity .....</b>	<b>\$1,390</b>

Income Statement	2011
Sales .....	\$1,000
Cost of goods sold .....	350
Gross profit .....	\$ 650
Depreciation expense .....	200
Other operating expenses .....	250
Operating profit .....	\$ 200
Interest expense .....	120
Income before taxes .....	\$ 80
Income taxes .....	20
Net income .....	\$ 60

In addition, Lorien has assembled the following forecasted information regarding 2012:

- Sales are expected to increase to \$1,200.
- Lorien does not expect to buy any new property, plant, and equipment during 2012. (*Hint:* Think about how depreciation expense in 2012 will affect the net reported amount of property, plant, and equipment.)
- Because of adverse banking conditions, Lorien does not expect to receive any new bank loans in 2012.
- Lorien plans to pay cash dividends of \$15 in 2012.

**Instructions:**

- Prepare a forecasted balance sheet and a forecasted income statement for 2012. Clearly state what assumptions you make.
- If you construct your forecasted balance sheet in (1) correctly, total forecasted paid-in capital for 2012 should be negative. Is this possible? Explain.

**Problem 4-53**

**LO5**

**Sample CPA Exam Question**

During January 2011, Doe Corp. agreed to sell the assets and product line of its Hart division. The sale was completed on January 15, 2012; on that date, Doe recognized a gain on disposal of \$900,000. Hart's operating losses were \$600,000 for 2011 and \$50,000 for the period January 1 through January 15, 2012. The income tax rate is 40%. What amount of net gain (loss) from discontinued operations should be reported in Doe's comparative 2012 and 2011 income statements?

	2012	2011
a. ....	\$ 0	\$ 150,000
b. ....	150,000	0
c. ....	510,000	(360,000)
d. ....	540,000	(390,000)

**CASES**

**Discussion  
Case 4-54**

**How Can My Company Have Income but No Cash?**

Max Stevenson owns a local drug store. During the past few years, the economy has experienced a period of high inflation. Stevenson has had the policy of withdrawing cash from his business equal to 80% of the company's reported net income. As the business has grown, he has had a CPA prepare the company's financial statements and tax returns. The following is a summary of the company's income statement for the current year:

Revenue .....	\$565,000
Cost of goods sold (drugs, etc.) .....	395,000
Gross profit on items sold .....	\$170,000
Operating expenses (including taxes) .....	110,000
Net income .....	\$ 60,000

Even though the business has reported net income each year, it has experienced severe cash flow shortages. The company has had to pay higher prices for its inventory as the company has tried to maintain the same quantity and quality of its goods. For example, last year's cost of goods sold had a historical cost of \$250,000 and a replacement cost of \$295,000. The current year's cost of goods sold has a replacement cost of \$440,000. Stevenson's personal cash outflows have also grown faster than his withdrawals from the company due to increasing personal demands.

Stevenson asks you as a financial advisor how the company can have income of \$60,000 yet he and the company still have a shortage of cash.

**Discussion  
Case 4-55**

**When Should Revenue Be Recognized?**

Stan Crowfoot is a renowned sculptor who specializes in Native American sculptures. Typically, a cast is prepared for each work to permit the multiple reproduction of the pieces. A limited number of copies are made for each sculpture, and the mold is destroyed after the number is reached. Limiting the number of pieces enhances the price, and most of the pieces have initially sold for \$2,000 to \$4,000. To encourage sales, Stan has a liberal return policy that permits customers to return any unwanted piece for a period of up to one year from the date of sale and receive a full refund.

Do you think Stan should recognize revenue (1) when the piece is produced and cast in bronze, (2) when the goods are delivered to the customer, or (3) when the period of return has passed? Justify your answer in terms of the FASB conceptual framework.

**Discussion  
Case 4-56**

**We Just Changed Our Minds**

Management for Marlowe Manufacturing Company decided in 2010 to discontinue one of its unsuccessful product lines. (The product line does not meet the definition of a business component.) The planned discontinuance involved obsolete inventory, assembly lines, and packaging and advertising supplies. It was estimated that a loss of \$250,000 would result from the decision, and this estimate was recorded as a restructuring charge in the 2010 income statement. In 2011, new management was appointed, and it was decided that the unsuccessful product line could be turned around with a more aggressive marketing policy. The change was made, and indeed the product began to make money. The new management wants to reverse the adjustment made the previous year and remove the liability for the estimated loss.

How should the 2010 estimated loss be reported in the 2011 income statement? How should the 2011 reversal of the 2010 action be reported in the 2011 financial statements?

**Discussion  
Case 4-57**

**The Sure-Fire Computer Software**

Flexisoft Company has had excellent success in developing business software for computers. Management has followed the accounting practice of deferring the research costs for the software until sufficient sales have developed to cover the software cost. Because of past successes, management believes it is improper to charge software research costs directly to expense as current GAAP requires.

What are the pros and cons of immediately deferring or expensing these costs?

**Discussion  
Case 4-58**

**Accrual Accounting**

Near the end of the fiscal year, preliminary financial results revealed that Stancomb Wills Company was in danger of not meeting corporate performance goals. According to an article in the business press, top executives at Stancomb Wills responded by deferring many expenses "beyond accepted accounting norms, and revenue was inappropriately booked far in advance." These practices had the effect of "making the current quarter look more profitable." The top executives of Stancomb Wills were hoping that an upturn in the economy would spur sales that would provide additional profits to cover the deceptive accounting practices.

1. How are expenses deferred and revenues booked (recorded) in advance? What would the journal entries be?
2. Why would top executives encourage these misleading accounting practices?
3. None of the top executives who ordered the misstatements actually made the journal entries. If you were Stancomb Wills' accountant, what would you have done?
4. Is the independent auditor responsible for detecting these types of misstatements?

**Discussion  
Case 4-59****Financial Statement Analysis—Ratios**

Shawn O'Neil owns two businesses, a drug store and a retail department store.

	Drug Store	Department Store
Net sales .....	\$1,050,000	\$670,000
Cost of goods sold .....	950,000	560,000
Other expenses .....	39,500	66,500

Which business earns more income? Which business has the higher gross profit percentage? Return on sales? Which business would you consider more profitable?

**Case 4-60****Deciphering Financial Statements (Pfizer)**

**Pfizer** is one of the largest pharmaceutical and consumer healthcare products companies in the world. Familiar products sold by Pfizer include Sudafed®, Zantac®, Benadryl®, Listerine®, and Viagra®. The company's highest selling product is Lipitor, which is designed to help reduce high cholesterol. Pfizer's income statement for 2006 follows.

**Pfizer Inc. and Subsidiary Companies

The following information came from Pfizer’s statement of stockholders’ equity and Note 8 dealing with other comprehensive income:

Dividends .....	\$7,276	\$ 5,969	\$5,251
Currency translation adjustment and other .....	1,114	(1,481)	2,014
Net unrealized gain/(loss) on derivative financial instruments .....	81	(106)	(53)
Net unrealized gain/(loss) on available-for-sale securities .....	13	(183)	128
Minimum pension liability .....	(16)	(29)	(6)

In addition, in the notes to its financial statements, Pfizer reports that advertising expenses in 2004, 2005, and 2006 were approximately \$2.7 billion, \$2.7 billion, and \$2.6 billion, respectively. Advertising expense is reported as part of selling, informational, and administrative expenses.

1. Compute the following for each of the years 2004–2006:
  - (a) Net income/Revenues
  - (b) Cost of sales/Revenues
  - (c) Research and development expenses/Revenues
  - (d) Advertising expense/Revenues
2. Comment on the ratios you computed in part (1). Make particular mention of any trends.
3. Compute Pfizer’s effective tax rate (on continuing operations) for each year.
4. For 2006, estimate the average number of basic and diluted shares outstanding.
5. Compute comprehensive income for each of the years 2004–2006.

**Case 4-61**

**Deciphering Financial Statements (The Walt Disney Company)**

Locate the 2007 financial statements for **The Walt Disney Company** on the Internet.

1. Did Disney have any below-the-line items in 2007? Explain.
2. Disney’s net income increased from \$3,374 million in 2006 to \$4,687 million in 2007. Identify the major reasons for the increase.
3. Imagine that you are a financial analyst asked to generate a forecast of Disney’s net income for 2008. You know that generally the best place to start in forecasting next year’s net income is this year’s net income. Given this starting point, look at the items in Disney’s 2007 income statement and make a forecast of 2008 net income.
4. What was Disney’s comprehensive income for 2007?
5. Of Disney’s four major segments—media networks, parks and resorts, studio entertainment, and consumer products—which generated the most revenue in 2007? The most operating income? Which had the highest operating profit margin (operating income/revenue)?
6. What percent of total revenue does Disney generate within the United States and Canada?
7. How does Disney recognize revenue from broadcast advertising? From advance theme park ticket sales?
8. Does Disney expense its film and television costs using direct matching, systematic and rational allocation, or immediate recognition?
9. How does Disney expense its parks, resorts, and other properties?

**Case 4-62**

**Deciphering Financial Statements (Coca-Cola)**

The computation of comprehensive income for 2006 for **Coca-Cola** is presented in Exhibit 4-11 on page 184.

1. Which is greater in 2006—Coca-Cola’s net income or comprehensive income?
2. With respect to the currencies in the countries where Coca-Cola has foreign subsidiaries—did those currencies get stronger or weaker, relative to the U.S. dollar, in 2006? Explain.
3. Did Coca-Cola’s available-for-sale securities portfolio increase or decrease in value during 2006? Explain.

## Case 4-63

## Deciphering Financial Statements (Wells Fargo &amp; Company)

**Wells Fargo & Company** is the sixth largest bank in the U.S. (based on consolidated assets as of September 30, 2007). Its consolidated statement of income follows.

<b>Wells Fargo &amp; Company and Subsidiaries</b>			
<b>Consolidated Statement of Income</b>			
(in millions, except per share amounts)	For the Years Ended December 31		
	2006	2005	2004
<b>INTEREST INCOME</b>			
Trading assets .....	\$ 225	\$ 190	\$ 145

1. How is this income statement different from all the other income statements illustrated in this chapter?
2. For a merchandising firm, gross profit represents sales less cost of goods sold. For Wells Fargo, what component of the income statement would be similar to gross profit?
3. Compute the following ratios for each of the years 2004–2006: (a) Total interest expense/Total interest income, (b) Incentive compensation/Salaries, and (c) Employee benefits/Salaries.

4. Comment on the ratios you computed in part (3), particularly any trends.
5. The average loans receivable balance for Wells Fargo during 2006 was \$311,159 million. The average amount of deposits during 2006 was \$312,347 million. Using the income statement data, comment on the average interest rate Wells Fargo pays to its depositors, the average interest rate Wells Fargo earns on its loans receivable, and the spread between these two rates.
6. The market value of Wells Fargo's stock at the end of each year was \$35.56, \$31.42, and \$31.08 for the years 2006, 2005, and 2004, respectively. Compute the firm's price-earnings ratio for each year. Use diluted earnings per share. Is it increasing or decreasing over time?

Case 4-64

**Deciphering Financial Statements (Apple Inc.)**

**Apple Inc.** is one of the country's most successful computer technology companies. The company designs, manufactures, and sells computers, digital music devices, communication devices, and various software products. The company's net income has increased each year since 2002, and in 2007, Apple sold 1.463 million computers and 51.630 million iPods. Information relating to the company's business segments can be found in the company's annual report, an excerpt of which follows.

Apple Inc.			
(in millions)	Years Ended September 29, 30, and 24		
	2007	2006	2005
<b>NET SALES</b>			
Americas .....	\$11,596	\$ 9,415	\$ 6,658
Europe .....	5,460	4,096	3,073
Japan .....	1,082	1,211	924
Retail .....	4,115	3,246	2,278
Other Segments .....	1,753	1,347	998
Total Net Sales .....	<u>\$24,006</u>	<u>\$19,315</u>	<u>\$13,931</u>
<b>OPERATING INCOME</b>			
Americas .....	2,949	1,899	970
Europe .....	1,348	627	465

Retail .....	875	600	396
Other Segments .....	388	235	118
Other Corporate Expenses, net .....	(1,141)	(953)	(404)
Stock-based Compensation Expense .....	(242)	(163)	(49)
Total Operating Income .....	<u>\$ 4,409</u>	<u>\$ 2,453</u>	<u>\$ 1,643</u>
<b>ASSETS</b>			
Americas .....	\$ 1,497	\$ 896	\$ 705
Europe .....	595	471	289
Japan .....	159	181	165
Retail .....	1,085	651	589
Other Segments .....	252	180	133
Corporate .....	21,759	14,826	9,635
Total Assets .....	<u>\$25,347</u>	<u>\$17,205</u>	<u>\$11,516</u>

1. Where does Apple generate most of its revenues? Its profits?
2. The profitability of each dollar of revenue is measured by the ratio (Operating income/Net sales). Compute this ratio for each of Apple's five operating segments in 2007. Which segment has the highest profitability per dollar of revenue?
3. The extent to which a segment uses its assets to efficiently generate revenues is measured by the ratio (Net sales/Assets). Compute this asset turnover ratio for each of Apple's five operating segments in 2007. Which segment has the highest number of dollars of revenue generated for each dollar of assets?
4. The return on assets ratio (Operating income/Assets) measures how well a segment combines profitability and efficiency to generate profits with the existing assets. Compute return on assets for each of Apple's five operating segments in 2007. Which segment has the highest operating profit generated for each dollar of assets?

- Based on your answers to parts (1) and (2), how critical is Apple's Retail segment to the company's overall success? Before you answer this question, think about how the company is able to sell and promote its computers and other products.

**Case 4-65****Deciphering Financial Statements (Ford Motor Company)**

The consolidated statement of income for **Ford Motor Company** appears below.

<b>Ford Motor Company and Subsidiaries</b>			
<b>Consolidated Statement of Income</b>			
(in millions)	For the Years Ended December 31		
	2006	2005	2004
<b>AUTOMOTIVE</b>			
Sales .....	\$143,307	\$153,474	\$147,119

- What do you notice about the way revenues and expenses are partitioned?
- For the Automotive division, compute the ratio (Cost of sales/Sales) for each of the three years presented. Interpret the results.
- Look at the operating results for the Automotive division. Is there any good news for Ford in these results?
- Depreciation expense is reported by the Financial Services division but not by the Automotive division. Explain why this is so.
- Which of the company's two divisions seems to be performing better over time?
- Is Ford a car company that finances autos or a finance company that makes cars?

**Case 4-66****Writing Assignment (What are the benefits of a restructuring charge?)**

One of the five techniques of accounting hocus-pocus identified by former SEC Chairman Arthur Levitt in his famous 1998 speech is the big-bath restructuring charge. Write a 1-page paper identifying the benefits, both from an economic and a financial reporting perspective, that a company might reap through recognizing a big-bath restructuring charge.

## Case 4-67

**Researching Accounting Standards**

To help you become familiar with the accounting standards, this case is designed to take you to the FASB's Web site and have you access various publications. Access the FASB's Web site at <http://www.fasb.org>. Click on "Pronouncements & EITF Abstracts."

In the chapter, we discussed the statement of comprehensive income. For this case, we will use *Statement of Financial Accounting Standards No. 130*, "Reporting Comprehensive Income." Open *FAS No. 130*.

1. Read paragraph 15. Is comprehensive income intended to replace net income?
2. Read paragraph 22. Is a separate statement of comprehensive income required to be provided by companies?
3. Read paragraph 26. Net income is closed to Retained Earnings on the balance sheet. Where is other comprehensive income closed at the end of a period?

## Case 4-68

**Ethical Dilemma**

Far from being an exact science, accounting involves estimation and judgment. Consider the case of Dwight Nelson, chief financial officer of Pilot Enterprises. Pilot is a relatively young, privately held company with thoughts of going public in the near future. The owners of the business would like to include in the prospectus (a document containing information about the company and its past performance) financial statements that support their assertion that Pilot is a successful company with a bright future.

The problem is the income statement for the past year shows a slight decrease in income from the prior period. When Dwight presented this information to the board of directors, he was told to revise the income statement. He was specifically counseled to review his estimates associated with bad debt expense, warranty expense, and estimated useful life of depreciable assets. He was invited to present his "revised" income statement to the board when it showed a 5% increase over last period's net income—anything less would not do.

After reviewing the assumptions made regarding uncollectibles, warranties, and depreciation, Dwight found that he could revise his estimates and obtain the 5% target increase in income. But he did not feel that the revised income statement properly reflected the performance of Pilot for the period.

1. What are the risks to Dwight of revising the income statement to meet the target?
2. What are the risks to Dwight of not revising the income statement?

## Case 4-69

SPREADSHEET

**Cumulative Spreadsheet Analysis**

This spreadsheet assignment is a continuation of the spreadsheet assignment given in Chapter 3. If you completed that assignment, you have a head start on this one. Refer back to part (1) of the Cumulative Spreadsheet Analysis assignment in Chapter 3. Clearly state any additional assumptions that you make.

Skywalker wishes to prepare a *forecasted* balance sheet and a *forecasted* income statement for 2012. Use the financial statement numbers for 2011 [given in part (1) of the Cumulative Spreadsheet Analysis assignment in Chapter 3] as the basis for the forecast, along with the following additional information.

- (a) Sales in 2012 are expected to increase by 40% over 2011 sales of \$2,100.
- (b) In 2012, Skywalker plans to acquire new property, plant, and equipment for \$240.
- (c) The \$480 in operating expenses reported in 2011 breaks down as follows: \$15 depreciation expense and \$465 other operating expenses.
- (d) No new long-term debt will be acquired in 2012.
- (e) No cash dividends will be paid in 2012.
- (f) New short-term loans payable will be acquired in an amount sufficient to make Skywalker's current ratio in 2012 exactly equal to 2.0.
- (g) Skywalker does not plan to repurchase any additional shares of stock in 2012.
- (h) Because changes in future prices and exchange rates are impossible to predict, Skywalker's best estimate is that the balance in accumulated other comprehensive income will remain unchanged in 2012.
- (i) Assume that investment securities, long-term investments, other long-term assets, and intangible assets will increase at the same rate as sales (40%) in 2012.
- (j) In the absence of more detailed information, assume that other long-term liabilities will increase at the same rate as sales (40%) in 2012.

STATEMENT OF CASH FLOWS  
AND ARTICULATION

## LEARNING OBJECTIVES

**K**arl Eller started out in the billboard business. After his company was acquired by **Gannett**, he sat on the firm's board and was one of a group of directors who opposed Gannett's risky plan to start up the first U.S. national daily newspaper, *USA Today*. He left Gannett and went to **Columbia Pictures**, where he was one of the driving forces behind the purchase of Columbia by **Coca-Cola**. (Columbia Pictures was subsequently purchased again, this time by **Sony** in one of the most overpriced Hollywood deals of all time—but that is another story.) In 1983, Mr. Eller went into the convenience store business and took on the challenge of transforming **Circle K** from a regional 1,200-store convenience store chain centered in Arizona into the second-largest chain in the United States (behind **7-Eleven**). At its peak, Circle K operated 4,685 stores in 32 states.

Circle K's rapid expansion was financed through long-term borrowing. Its long-term debt increased from \$41 million in 1983, when Mr. Eller took over, to \$1.2 billion in 1990. The interest on this large debt, along with increased price competition from convenience stores operated by oil companies, combined to squeeze Circle K's profits.<sup>1</sup> Net income dropped from a record high of \$60 million in 1988 to \$15 million in 1989. For the year ended April 30, 1990, Circle K reported a loss of \$773 million. In May 1990, Circle K filed for Chapter 11 bankruptcy protection.

As illustrated in Exhibit 5-1, at the same time it was reporting the disastrous \$773 million loss, Circle K was reporting a record high positive cash flow from operations of more than \$100 million. How could Circle K report positive cash flow at the same time it was reporting a record-breaking net loss? There are many causes for a difference between accrual net income and cash flow; these causes are discussed in this chapter. In Circle K's case, there were three primary contributing factors:

- Much of the reported loss was due to a \$639 million restructuring charge. For example, goodwill previously recorded as a \$300 million asset was written off. This drastically reduced net income but did not affect cash flow.
- Circle K added \$75 million to its estimated liability for environmental cleanup charges resulting from leaky underground gasoline storage tanks. Again, this charge reduced income but did not involve an immediate cash outflow.
- Financial distress forced Circle K to make its operations more efficient. One result was that Circle K reduced its inventory by \$65 million in 1990. This action increased cash flow because \$65 million in cash was liberated that otherwise would have been tied up in the form of gasoline, beer, and Twinkies®.

In 1991, Circle K again showed positive cash flow from operations while reporting a large net loss. In an interesting twist, this positive cash flow was partially a result of the bankruptcy filing. When a company files for Chapter 11 bankruptcy, the courts allow the company to cease making interest payments on its old debts. During the fiscal year ended April 30, 1990, the year before the bankruptcy filing, Circle K paid more than \$100 million in interest. In 1991, after the filing, Circle K paid only \$6 million in interest. In addition, the bankruptcy filing strengthened the willingness of suppliers to sell to Circle K on credit because bankruptcy laws place postbankruptcy lenders near the top

- 1 Describe the circumstances in which the cash flow statement is a particularly important companion of the income statement.
- 2 Outline the structure of and information reported in the three main categories of the cash flow statement: operating, investing, and financing.
- 3 Compute cash flow from operations using either the direct or the indirect method.
- 4 Prepare a complete statement of cash flows and provide the required supplemental disclosures.
- 5 Assess a firm's financial strength by analyzing the relationships among cash flows from operating, investing, and financing activities and by computing financial ratios based on cash flow data.
- 6 Demonstrate how the three primary financial statements tie together, or articulate, in a unified framework.
- 7 Use knowledge of how the three primary financial statements tie together to prepare a forecasted statement of cash flows.

<sup>1</sup> Roy J. Harris Jr., "Karl Eller of Circle K, Always Pushing Luck, Now Lives to Regret It," *The Wall Street Journal*, March 28, 1990, p. A1.

EXHIBIT 5-1

## Circle K Income vs. Cash Flow

of the creditor priority list. As a result, Circle K's accounts payable increased \$80 million in 1991. This accounts payable increase freed up cash that otherwise would have been used to pay current bills.

Because of this positive cash flow from operations, Circle K was able to stay in business while its management devised a reorganization plan. As part of its bankruptcy restructuring, Circle K replaced Karl Eller as chief executive officer (CEO) in 1990. Following a lengthy debate among the creditors, Circle K's bankruptcy reorganization plan was formally approved by a federal bankruptcy court judge, and in 1993 Circle K was purchased for \$400 million by a diverse group of private investors from Barcelona, Kuwait, and Pittsburgh. Subsequently, Circle K was taken over by **Tosco**, the largest independent refiner and marketer of petroleum products in the United States.<sup>2</sup> In September 2001, Tosco itself was acquired by **Phillips Petroleum**, temporarily combining the Circle K brand under the same umbrella as 76 and Phillips 66. In 2003, Circle K was acquired

by a Canadian company, **Alimentation Couche-Tard**. And finally, in 2006, Alimentation Couche-Tard formed a franchising agreement with **ConocoPhillips** which led to some ConocoPhillips stores being turned into Circle K stores.

And what about Mr. Eller, who started this whole thing? Well, you can't keep a good entrepreneur down. Karl Eller returned to his roots and became CEO of **Eller Media**, the largest billboard company in the United States.<sup>3</sup> On April 10, 1997, Eller Media was acquired by **Clear Channel Communications**, which has billboards across the United States and in the United Kingdom and operates radio and TV stations in the United States, Mexico, Australia, and New Zealand. Mr. Eller served on the board of directors of Clear Channel until his retirement in 2001 at age 73. As of May 2008, Mr. Eller, a long-time sports fan, was serving on the NCAA Leadership Advisory Board of Directors along with other luminaries such as Peyton Manning and George M. Steinbrenner. How is that for landing on your feet?

<sup>2</sup> Jonathan Auerbach and Louise Lee, "Circle K Pact Gives Tosco Fuel Injection," *The Wall Street Journal*, February 20, 1996, p.A4. (Interestingly, Tosco's corporate headquarters were in Stamford, Connecticut, the same city where the FASB was formerly located—small world.)

<sup>3</sup> William P. Barrett, "The Phoenix of Phoenix," *Forbes*, January 1, 1996, p. 44.

## QUESTIONS

1. How was Circle K able to report a record amount of positive operating cash flow at the same time it was reporting an income statement loss of \$773 million?
2. How did filing for Chapter 11 bankruptcy help Circle K's cash flow situation?
3. In what kind of business did Karl Eller both start and end his business career?

Answers to these questions can be found on page 248.

The Circle K case illustrates that cash flow data sometimes reveal aspects of operations not captured by earnings. In addition, recall that assessing the amounts, timing, and uncertainty of future cash flows is one of the primary objectives of financial reporting.<sup>4</sup> The statement that provides information needed to meet this objective is a statement of cash flows. This chapter provides an overview of reporting cash flows and outlines the techniques for preparing and analyzing a cash flow statement.

## What Good Is a Cash Flow Statement?

**1** Describe the circumstances in which the cash flow statement is a particularly important companion of the income statement.

**WHY** In many situations, the income statement gives an incomplete picture of a company's economic performance. In those situations, a statement of cash flows provides another assessment of a firm's performance.

**HOW** Operating cash flow provides a reality check in cases in which earnings are of questionable value such as when a company has reported large one-time noncash expenses or when earnings management may have been used to inflate reported earnings. The cash flow statement also offers a 1-page summary of the results of a company's operating, investing, and financing activities for the period.

The key question is whether a cash flow statement tells us anything we don't already know from the balance sheet and income statement. This is a legitimate question because the conceptual framework says that the primary focus of financial reporting is earnings, and earnings information is a better indicator of a firm's ability to generate cash in the future than is current cash flow information.

To answer the question: Yes, we need the cash flow statement. Some of the important reasons discussed in this chapter follow.

- Sometimes earnings fail.
- Everything is on one page.
- It is used as a forecasting tool.

<sup>4</sup> *Statement of Financial Accounting Concepts No. 1*, "Objectives of Financial Reporting by Business Enterprises" (Stamford, CT: Financial Accounting Standards Board, 1978), par. 37.

## Sometimes Earnings Fail

In some situations, net income does not give us an accurate picture of the economic performance of a company for a certain period. Three such scenarios are illustrated here by reference to actual company examples: (1) the Circle K scenario, (2) the Home Depot scenario, and (3) the KnowledgeWare scenario.

### caution

Note that the heading to this section says that “sometimes” earnings fail. In most cases, net income is the single best measure of a firm’s economic performance.

**The Circle K Scenario** When a company reports large noncash expenses, such as write-offs, depreciation, and provisions for future obligations, earnings may give a gloomier picture of current operations than is warranted. As discussed in the opening scenario of the chapter, Circle K reported record losses in the same years it was reporting record positive cash flow from operations. In such cases, cash flow from operations is

a better indicator of whether the company can continue to honor its commitments to creditors, customers, employees, and investors in the near term. Don’t misunderstand this to mean that a reported loss is nothing to worry about as long as cash flow is positive; the positive cash flow indicates that business can continue for the time being, but the reported loss may hint at looming problems in the future.

**The Home Depot Scenario** Rapidly growing firms use large amounts of cash to expand inventory. In addition, cash collections on the growing accounts receivable often lag behind the need to pay creditors. In these cases, reported earnings may be positive, but operations are actually consuming rather than generating cash. This can make it difficult to service debt and satisfy investors’ demands for cash dividends. For example, in the mid-1980s, **The Home Depot** was faced with a crisis as exponential sales growth necessitated operating cash infusions every year in spite of the fact that earnings were positive.<sup>5</sup> The lesson is this: For high-growth companies, positive income is no guarantee that sufficient cash flow is there to service current needs.

**The KnowledgeWare Scenario** Accounting assumptions are the heart of accrual accounting. For companies entering phases in which it is critical that reported earnings look good, those assumptions can be stretched—sometimes to the breaking point. Such phases include just before making a large loan application, just before the initial public offering of stock (when founding entrepreneurs cash in all those years of struggle and sweat), and just before being bought out by another company. In these cases, cash flow from operations, which is not impacted by accrual assumptions, provides an excellent reality check for reported earnings. For example, in 1994, **KnowledgeWare**, an Atlanta-based software company, was acquired by **Sterling Software**. Negotiations over the purchase price were thrown into chaos when it was disclosed that KnowledgeWare had been overly optimistic with its revenue recognition assumptions. At the time, one accounting professor commented: “Cash from operations is the critical number investors should be looking at when evaluating one of these companies.”<sup>6</sup>

## Everything Is on One Page

As discussed in more detail later, the cash flow statement includes information on operating, investing, and financing activities. In essence, everything you ever wanted to know about a company’s performance for the year is summarized in this one statement. How successful were operations for the year? Look at the Operating Activities section.

<sup>5</sup> The cash flow problems of Home Depot in 1985 are the subject of a very popular Harvard Business School case written by Professor Krishna Palepu.

<sup>6</sup> Timothy L. O’Brien, “KnowledgeWare Accounting Practices Are Questioned,” *The Wall Street Journal*, September 7, 1994, p. B2.

What new investments were made in property, plant, and equipment? Look in the Investing Activities section. Where did the money come from this year to finance all this stuff? See the Financing Activities section. If you were stuck on a desert island and could receive only a single financial statement each year (by bottle floated in on the waves), you would probably choose the cash flow statement.

## It Is Used as a Forecasting Tool

When forecasting the future, a cash flow statement is an excellent tool to analyze whether the operating, investing, and financing plans are consistent and workable. To do this, one constructs a pro forma, or projected, cash flow statement. A **pro forma cash flow statement** is a prediction of what the actual cash flow statement will look like in future years if the operating, investing, and financing plans are implemented. For example, most lenders would be reluctant to loan money to a company to finance new investing activities when the pro forma cash flow statement indicates that there will be no positive operating cash flow to repay the loan. Construction of a pro forma cash flow statement is illustrated later in this chapter.

## Structure of the Cash Flow Statement

**2** Outline the structure of and information reported in the three main categories of the cash flow statement: operating, investing, and financing.

**WHY** The statement of cash flows is divided into three sections to allow users to determine how the company is both generating and using cash in each general activity of the business.

**HOW** A financial statement user can gain much insight into the current state of a company by comparing the magnitudes of cash flows from operating, investing, and financing activities. For young companies, operating cash flow is sometimes negative. For mature, successful “cash cows,” operating cash flow is more than enough to pay for investing activities.

A **statement of cash flows** explains the change during the period in cash and cash equivalents. A **cash equivalent** is a short-term, highly liquid investment that can be converted easily into cash. To qualify as a cash equivalent, an item must be<sup>7</sup>:

1. Readily convertible to cash
2. So near to its maturity that there is insignificant risk of changes in value due to changes in interest rates

Generally, only investments with original maturities of three months or less qualify as cash equivalents. Original maturity in this case is determined from the date an investment is acquired by the reporting entity, which often does not coincide with the date the security is issued. For example, both a 3-month U.S. Treasury bill and a 3-year Treasury note purchased three months prior to maturity qualify as cash equivalents. However, if the Treasury note were purchased three years ago, it would not qualify as a cash equivalent during the last three months prior to its maturity.<sup>8</sup> In addition to U.S. Treasury obligations, cash equivalents can include items such as money market funds and commercial paper. Investments in marketable equity securities (common and preferred stock) normally would not be classified as cash equivalents because such securities have no maturity date.

Not all investments qualifying as cash equivalents need be reported as such. Management establishes a policy concerning which short-term, highly liquid investments

<sup>7</sup> *Statement of Financial Accounting Standards No. 95*, “Statement of Cash Flows” (Stamford, CT: Financial Accounting Standards Board, November 1987), par. 8.

<sup>8</sup> *Ibid.*

are to be treated as cash equivalents. Once a policy is established, management should disclose which items are being treated as cash equivalents in presenting its cash flow statement. Any change in the established policy should be disclosed. For example, in 1993 **General Motors** disclosed that **GMAC** (GM's financing subsidiary) had changed its definition of cash equivalents to include short-term liquid investments. This change had the effect of increasing GM's reported cash and cash equivalents by 42%, or \$3.3 billion.

### Three Categories of Cash Flows

In the statement of cash flows, cash receipts and payments are classified according to three main categories:

- Operating activities
- Investing activities
- Financing activities

Exhibit 5-2 summarizes the major types of cash receipts and cash payments included in each category and includes the income statement and balance sheet accounts that are typically related to each category in the statement of cash flows.

**Operating Activities** **Operating activities** include those transactions and events associated with the revenues and expenses that enter into the determination of net income. Cash receipts from selling goods or from providing services are the major cash inflows for most businesses. Other cash receipts come from interest, dividends,

#### EXHIBIT 5-2

#### Major Cash Receipts and Payments by Category

##### Operating Activities

Cash receipts from:  
 Sale of goods or services  
 Sale of trading securities\*  
 Interest revenue  
 Dividend revenue

Cash payments for:  
 Inventory purchases  
 Wages and salaries  
 Taxes  
 Interest expense  
 Other expenses (e.g., utilities, rent)  
 Purchase of trading securities\*

Related items: income statement; current operating assets; current operating liabilities; some long-term operating assets and liabilities

\*Cash flows associated with trading securities are usually, but not always, classified as operating activities.

##### Investing Activities

Cash receipts from:  
 Sale of plant assets  
 Sale of a business segment  
 Sale of nontrading securities  
 Collection of principal on loans

Cash payments for:  
 Purchase of plant assets  
 Purchase of nontrading securities  
 Making loans to other entities

Related items: property, plant, and equipment; long-term investments; other long-term assets

##### Financing Activities

Cash receipts from:  
 Issuance of stock  
 Borrowing (e.g., bonds, notes, mortgages)

Cash payments for:  
 Cash dividends  
 Repayment of loans  
 Repurchase of stock (treasury stock)

Related items: short-term and long-term debt; common stock; treasury stock; dividends

and similar items. Major cash outflows include payments to purchase inventory and to pay wages, taxes, interest, utilities, rent, and similar expenses. The net amount of cash provided or used by operating activities is the key figure in a statement of cash flows. In the same way that net income is used to summarize everything in an income statement, net cash from operations is the “bottom line” of the cash flow statement.

## caution

Whether an activity is an operating activity depends upon the nature of the business. The purchase of machinery is an investing activity for a manufacturing business, but it is an operating activity for a machinery sales business.

Although cash inflows from interest or dividends logically might be classified as investing or financing activities, the FASB decided to classify them as operating activities. The guiding principle is that the Operating Activities section contains the cash flow effects of revenues and expenses included in the income statement.

**Investing Activities** The primary investing activities are the purchase and sale of land, buildings, equipment, and other assets

not generally held for resale. In addition, **investing activities** include the purchase and sale of financial instruments not intended for trading purposes, as well as the making and collecting of loans. These activities occur regularly and result in cash receipts and payments, but they are not classified as operating activities because they relate only indirectly to the central, ongoing operation of a business.

**Financing Activities** **Financing activities** include transactions and events whereby cash is obtained from or repaid to owners (equity financing) and creditors (debt financing). For example, the cash proceeds from issuing stock or bonds would be classified under financing activities. Similarly, payments to reacquire stock (treasury stock) or to retire bonds and the payment of dividends are considered financing activities.

The nature of financing activities is the same no matter what industry a company is in, but operating and investing activities differ considerably across industries. For example, the operating and investing activities of a supermarket chain are quite different from those of a sand and gravel company. However, for both companies, the process of borrowing money, selling stock, paying cash dividends, and repaying loans is almost the same.

**Cash Flow Pattern** The normal pattern of positive inflows or negative outflows of cash reported in the cash flow statement is as follows:

- Cash from operating activities, +
- Cash from investing activities, –
- Cash from financing activities, + or –

Most companies (73% in the United States in 2006) generate positive cash flow from operations. In fact, several periods of negative cash from operations is a sure indicator of financial trouble. In normal times, most companies use cash to expand or enhance long-term assets, so cash from investing activities is usually negative

## stop & think

There is conceptual difficulty in categorizing some cash flow items into just one of the three cash flow activities specified by the FASB. Two items that the FASB insists be classified as operating activities can be classified in other ways, or even in their own categories, according to the IASB. Look at the list below and identify these two problematic items.

- a) Payment of wages and payment for inventory purchases
- b) Payment of rent and payment of insurance
- c) Payment of interest and payment of income taxes
- d) Payment of utilities and payment for repairs

fyi

Boeing is an example of a mature, successful, “cash cow” company. In 2007, Boeing’s operating cash flow of \$9.584 billion was enough to pay for its investing activities (\$3.822 billion), repay debt (\$1.406 billion), pay cash dividends (\$1.096 billion), and repurchase stock (\$2.775 billion).

(83% of the time in the United States in 2006). A company with positive cash flows from investing activities is selling off its long-term assets faster than it is replacing them.

No general statements can be made about cash flows from financing activities; in healthy companies the number can be either positive or negative. As an example, positive cash flows from financing activities can be a sign of a young company that is expanding so fast that operations cannot provide enough cash to finance the expansion. Hence, additional cash must come from financing. Negative cash flows from

financing activities might be exhibited by a mature company that has reached a stable state and has surplus cash from operations that can be used to repay loans or to pay higher cash dividends. Accordingly, a company’s cash flow pattern is a general reflection of where the company is in its life cycle. As shown in Exhibit 5-3, a young or rapidly growing company requires cash inflows from financing activities in order to pay for its capital expansion (investing activities) and to subsidize negative operating cash flow resulting from a buildup in inventories and receivables. In a company that has stopped growing and is focused on maintaining its position, cash from operations is sufficient to finance the replenishment of long-term assets and to pay dividends to the investors. Finally, a mature, successful company (sometimes called a *cash cow*) generates so much cash from operations that it can pay for capital expansion and have cash left over to repay loans, pay cash dividends, and even repurchase shares of stock.

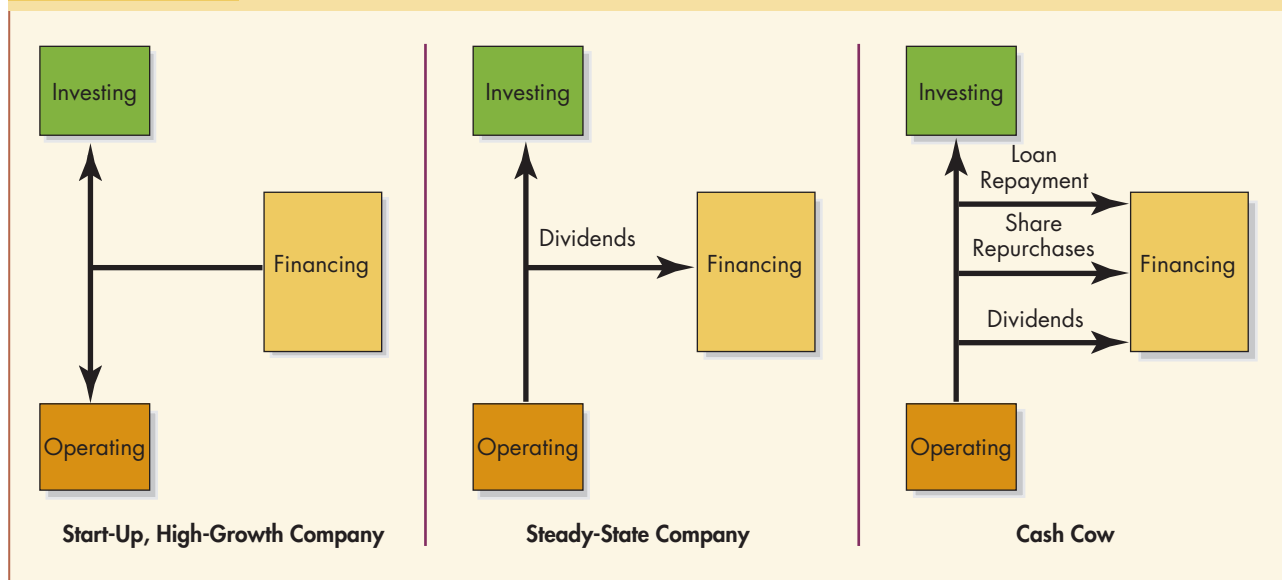

Further discussion of the interpretation of the cash flow pattern is in a later section of this chapter.

## Noncash Investing and Financing Activities

Some investing and financing activities affect an entity’s financial position but not the entity’s cash flow during the period. For example, equipment may be purchased with a note payable, or land may be acquired by issuing stock. Such **noncash investing and financing activities** should be disclosed separately, either in the notes to the

EXHIBIT 5-3

### Cash Flow Patterns Over the Life of a Company

financial statements or in an accompanying schedule, but not in the cash flow statement itself.<sup>9</sup> For example, when **Chevron Corporation** acquired a 50% interest in a joint venture with Kazakhstan to develop the Tengiz oil field, the \$709 million deferred portion of the acquisition price was disclosed in the notes to Chevron's financial statements as a noncash transaction.

## Cash Flow Categories under IAS 7

A cash flow statement has been required under IFRS since 1992. The provisions of *IAS 7, Statement of Cash Flows*, are more flexible than the U.S. rules contained in *SFAS No. 95*. Total cash flow, operating plus investing plus financing, is the same under both sets of rules, but a few common types of cash flows can be classified in different categories depending on whether U.S. GAAP or IFRS is used to make the categorization. A summary of those differences is given below.

Type of Cash Flow	U.S. GAAP— <i>SFAS No. 95</i>	IFRS— <i>IAS 7</i>
Cash paid for interest (associated with interest expense)	Operating activity	Operating or financing activity
Cash paid for income taxes (associated with income tax expense)	Operating activity	Usually operating activity, but can be split among operating, investing, and financing depending on the nature of the transaction giving rise to the tax payment
Cash received from interest (associated with interest revenue)	Operating activity	Operating or investing activity
Cash received from dividends (associated with dividend revenue)	Operating activity	Operating or investing activity
Cash paid for dividends (not an income statement item)	Financing activity	Financing or operating activity

The key number in a cash flow statement is total operating cash flow. As you can see from the table above, total operating cash flow for a company using IFRS could be greater than, less than, or the same as what the same company would report under U.S. GAAP, depending on the classification choices made under IFRS.

The particulars for computing operating cash flow, as illustrated in the next section, are slightly different under IFRS if some of the items above are classified differently from what is required under U.S. GAAP. Those slight differences are demonstrated in Chapter 21 when we revisit the statement of cash flows.

## Reporting Cash Flow from Operations

**3** Compute cash flow from operations using either the direct or the indirect method.

**WHY** The accounting standards allow for two different ways of reporting cash from operations—the indirect and the direct method. Both methods result in the same amount.

**HOW** The direct method is a recap of the income statement with the objective of reporting how much cash was received or disbursed in association with each income statement item. The indirect method starts with net income and then reports adjustments for operating items not involving cash flow.

<sup>9</sup> FASB *Statement No. 95*, par. 32.

## EXHIBIT 5-4

General Format for a Statement of Cash Flows—  
Intel Corporation 2007 (Amounts in millions)

Cash provided by (or used for):	
Operating activities .....	\$12,625
Investing activities .....	(9,926)
Financing activities .....	(1,990)
Net increase (decrease) in cash and cash equivalents .....	\$ 709
Cash and cash equivalents at beginning of year .....	6,598
Cash and cash equivalents at end of year .....	<u>\$ 7,307</u>

Exhibit 5-4 illustrates the general format, with details and amounts omitted, for a statement of cash flows using data from **Intel's** statement of cash flows. The statement should report the net cash provided by or used in operating, investing, and financing activities and the net effect of total cash flow on cash and cash equivalents during the period. The information is to be presented in a manner that reconciles beginning and ending cash and cash equivalent amounts.<sup>10</sup>

The preparation of the Investing and Financing Activities sections of the statement of cash flows is straightforward. The Operating Activities section, however, is more complex. Operating cash flow is actually a simple concept: It is merely the difference between cash

received and cash disbursed for operating activities. The computation of operating cash flow is difficult because accounting systems are designed to adjust cash flow numbers to arrive at accrual net income. Computing operating cash flow requires undoing all the accrual accounting adjustments. This is illustrated in Exhibit 5-5.

Two methods may be used in calculating and reporting the amount of net cash flow from operating activities: the indirect method

and the direct method. The most popular method used in reported financial statements is the indirect method; it is used by approximately 95% of large U.S. corporations.

The **direct method** is essentially a reexamination of each income statement item with the objective of reporting how much cash was received or disbursed in association with the item. For example, for the item sales in the income statement, there is a corresponding item in the cash flow statement called *cash collected from customers*. For cost of goods sold, the corresponding item is *cash paid for inventory*. To prepare the Operating Activities section using the direct method, one must adjust each income statement item for the effects of accruals.

The **indirect method** begins with net income as reported on the income statement and adjusts this accrual amount for any items that do not affect cash flow. The adjustments are of three basic types.

- Revenues and expenses that do not involve cash inflow or outflow.
- Gains and losses associated with investing or financing activities.
- Adjustments for changes in current operating assets and liabilities that indicate noncash sources of revenues and expenses.

Both methods produce identical results—that is, the same amount of net cash flow provided by (or used in) operations. The indirect method is favored and used by

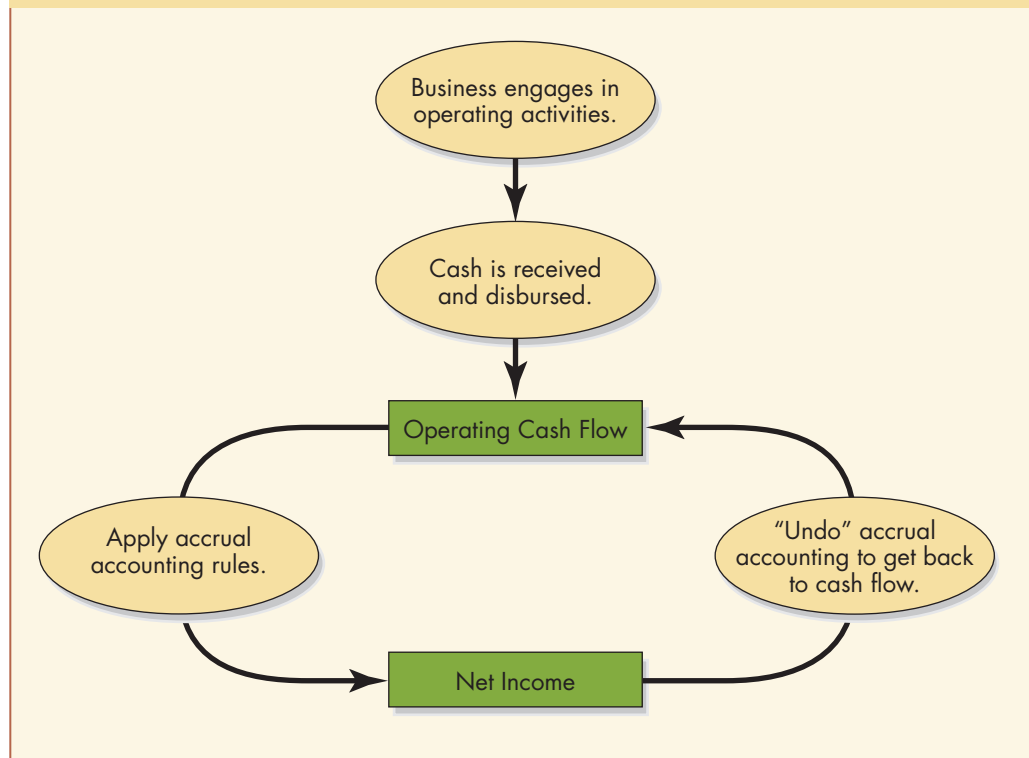

## caution

The choice of the direct or indirect method is not a way to manipulate the amount of reported cash flow from operations. Both methods yield the same number.

<sup>10</sup> Additional disclosures are required in reconciling the change in cash and cash equivalents for a company that has subsidiaries located in foreign countries. Because of changes in exchange rates, the U.S. dollar equivalent of foreign cash balances can change during the year even if the foreign subsidiary enters into no transactions. If the amount is material, the effect of this change is shown as a separate line in the cash flow statement of U.S. multinationals.

## EXHIBIT 5-5

## Relationship Between Net Income and Operating Cash Flow

most companies because it is relatively easy to apply and it reconciles the difference between net income and the net cash flow provided by operations. Many users of financial statements favor the direct method because it reports directly the sources of cash inflow and outflow without the potentially confusing adjustments to net income. The FASB considered the arguments for both methods, and although the Board favored the clarity of the direct method, it finally permitted either method to be used.<sup>11</sup>

The choice of the indirect or direct method affects only the Operating Activities section. The Investing and Financing Activities sections are exactly the same regardless of which method is used to report cash flow from operations.

### Operating Activities: Simple Illustration

The following data for Orchard Blossom Company are used to illustrate both the direct and the indirect methods:

Orchard Blossom Company Selected Balance Sheet and Income Statement Data		
	End of Year	Beginning of Year
Balance sheet:		
Cash .....	\$ 25	\$ 15
Accounts receivable .....	60	40
Inventory .....	75	100
Wages payable .....	10	7
Income statement:		
Sales .....	\$150	
Cost of goods sold .....	(80)	
Wages expense .....	(25)	
Depreciation expense .....	(30)	
Net income .....	<u>\$ 15</u>	

<sup>11</sup> FASB Statement No. 95, pars. 27–28.

**Direct Method** The best way to do the direct method is to systematically go down the list of income statement items and calculate how much cash is associated with each item.

**Sales and cash collected from customers.** The beginning accounts receivable balance, along with sales for the year, constitutes potential collections from customers. The ending accounts receivable balance represents accounts not collected. Thus, cash collected from customers is computed as follows:

Beginning accounts receivable .....	\$ 40
+ Sales .....	150
= Cash available for collection .....	\$190
– Ending accounts receivable .....	60
= Cash collected from customers .....	<u>\$130</u>

Note that a faster way to do this is to adjust the \$150 sales amount by the \$20 change in accounts receivable. The question is whether to add or subtract the \$20. An increase in accounts receivable means less cash, so subtract the \$20 increase ( $\$150 - \$20 = \$130$ ).

**Cost of goods sold and cash paid for inventory.** The ending inventory balance, along with cost of goods sold for the year, represents the total amount of inventory the company must have purchased some time in the past. The beginning inventory balance represents inventory purchased in prior years. Thus, inventory purchased this year is computed as follows:

Ending inventory .....	\$ 75
+ Cost of goods sold .....	80
= Required inventory .....	\$155
– Beginning inventory .....	100
= Inventory purchased this year .....	<u>\$ 55</u>

Alternatively, adjust the \$80 cost of goods sold amount by the \$25 change in inventory. Should you add or subtract the \$25? First, remember that in the absence of any inventory changes, the \$80 in cost of goods sold would have represented an \$80 OUTFLOW to replenish the inventory that was sold. A decrease in inventory during the year means that you purchased less than you sold, so less cash was paid to replenish the inventory. Accordingly, add the decrease in inventory ( $-\$80 + \$25 = -\$55$ ) to arrive at the net \$55 outflow for inventory purchased during the year.

Note that in this simple illustration, all inventory is paid for in cash. A subsequent illustration in this chapter will show how to make adjustments for accounts payable.

**Wages expense and cash paid for wages.** The beginning wages payable balance, along with wages expense for the year, constitutes the total obligation to employees. The ending wages payable balance represents the amount of that obligation not yet paid. Thus, cash paid to employees for wages is computed as follows:

Beginning wages payable .....	\$ 7
+ Wages expense .....	25
= Total obligation to employees .....	\$32
– Ending wages payable .....	10
= Cash paid for wages .....	<u>\$22</u>

## caution

Students who try to prepare cash flow statements solely by memorization of rules (e.g., add all decreases) usually end up getting only 50% of their computations correct. The best approach is to stop and use your business intuition.

This can also be computed by adding the \$3 increase in wages payable to the \$25 cash outflow represented by wages expense ( $-\$25 + \$3 = -\$22$ ). You ADD the \$3 increase because the increase represents wages that were not paid in cash during the year.

**Depreciation expense.** Here’s a trick question: How much cash is paid for depreciation? None, because depreciation is a noncash expense.

The Operating Activities section of Orchard Blossom’s cash flow statement, using the direct method, appears as follows:

Orchard Blossom Company Statement of Cash Flows Operating Activities: Direct Method	
Cash collected from customers .....	\$130
Cash paid for inventory .....	(55)
Cash paid for wages .....	(22)
Cash paid for depreciation .....	0
Net cash from operating activities .....	<u>\$ 53</u>

Of course, in a proper cash flow statement, there would be no line for cash paid for depreciation. It is included here only to remind you that no cash is paid for depreciation.

**Indirect Method** With the indirect method, we start with net income, which incorporates the net effect of all the income statement items, and then report the adjustments necessary to convert all income statement items into cash flow numbers. Only the adjustments themselves are reported. As with the direct method, the best way to perform the indirect method is to go right down the income statement, item by item.

**Sales.** What adjustment is necessary to convert this item to a cash flow number? The \$20 increase in accounts receivable means that cash collected is \$20 less than the \$150 sales number indicates. So, the necessary adjustment to convert net income into cash flow is to subtract the \$20 increase in accounts receivable.

**Cost of goods sold.** The \$25 decrease in inventory means that although cost of goods sold of \$80 is included in the income statement, less cash was used to purchase inventory than is suggested by the cost of goods sold number. Therefore, add the \$25 inventory decrease to convert net income into cash flow.

**Wages expense.** The income statement includes a \$25 subtraction for wages expense. However, the \$3 increase in wages payable indicates that not all of that \$25 wages expense was paid in cash. Accordingly, the \$3 increase in wages payable is added to net income.

**Depreciation expense.** The \$30 depreciation expense is a noncash expense. Because it was subtracted in computing net income, it must be added back to net income in computing cash flow. Add the \$30 depreciation expense to net income.

The Operating Activities section of Orchard Blossom’s cash flow statement, using the indirect method, follows.

Orchard Blossom Company Statement of Cash Flows Operating Activities: Indirect Method	
Net income .....	\$15
Plus: Depreciation .....	30
Less: Increase in accounts receivable .....	(20)
Plus: Decrease in inventory .....	25
Plus: Increase in wages payable .....	3
Net cash from operating activities .....	<u>\$53</u>

Note that net cash from operating activities, commonly referred to as *cash flow from operations*, is the same, \$53, whether the direct or the indirect method is used. Also note that depreciation is the first item listed after net income. This is the traditional presentation. This ordering is unfortunate because it reinforces two wrong ideas.

- Depreciation is a source of cash. *Wrong.*
- Cash flow is equal to net income plus depreciation. *Wrong.*

Depreciation is not a source of cash.<sup>12</sup> Depreciation is added back to net income to offset the effect of subtracting depreciation expense in the original computation of net income. The net effect is to eliminate depreciation in the computation of cash flow.

The definition “cash flow equals net income plus depreciation” is widely used. A quick look at Orchard Blossom’s indirect method Operating Activities section shows, however, that the “net income plus depreciation” definition ignores all of the changes in current assets and current liabilities. Sometimes the changes in current items cancel (as they almost do in Orchard Blossom’s case), so “net income plus depreciation” can be a good estimate of true cash from operations. However, many times, particularly with rapidly expanding firms, the current item changes do not cancel out. In those situations, true cash from operations is much lower than the “net income plus depreciation” definition would indicate. The “net income plus depreciation” definition is used widely in finance, and many finance professors believe it with all their hearts. Don’t let them deceive you.

**fyi**

One advantage of the indirect method is that it highlights how cash flow can be improved in the short run by adjusting operating procedures. In the Orchard Blossom example, both cutting back on inventory levels and slowing payments of wages increased the amount of cash generated by operations.

Sometimes the changes in current items cancel (as they almost do in Orchard Blossom’s case), so “net income plus depreciation” can be a good estimate of true cash from operations. However, many times, particularly with rapidly expanding firms, the current item changes do not cancel out. In those situations, true cash from operations is much lower than the “net income plus depreciation” definition would indicate. The “net income plus depreciation” definition is used widely in finance, and many finance professors believe it with all their hearts. Don’t let them deceive you.

**Comparison of Direct and Indirect Methods** The computations of Orchard Blossom’s net income and operating cash flow are compared as follows:

Income Statement		Adjustments		Cash Flows from Operations	
Sales	\$150	– 20	(increase in accounts receivable)	\$130	Cash collected from customers
Cost of goods sold	(80)	+ 25	(decrease in inventory)	(55)	Cash paid for inventory
Wages expense	(25)	+ 3	(increase in wages payable)	(22)	Cash paid for wages
Depreciation expense	(30)	+ 30	(not a cash flow item)	0	
Net income	<u>\$ 15</u>	<u>+ 38</u>	net adjustment	<u>\$ 53</u>	Cash flows from operations

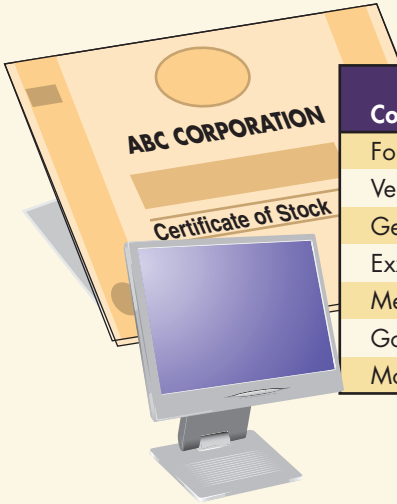

With the direct method of reporting cash from operations, each of the individual cash flow items is reported. The Operating Activities section of a statement of cash flows prepared using the direct method is, in effect, a cash-basis income statement and involves reporting the shaded information from the following work sheet.

Income Statement		Adjustments		Cash Flows from Operations	
Sales	\$150	– 20	(increase in accounts receivable)	\$130	Cash collected from customers
Cost of goods sold	(80)	+ 25	(decrease in inventory)	(55)	Cash paid for inventory
Wages expense	(25)	+ 3	(increase in wages payable)	(22)	Cash paid for wages
Depreciation expense	(30)	+ 30	(not a cash flow item)	0	
Net income	<u>\$ 15</u>	<u>+ 38</u>	net adjustment	<u>\$ 53</u>	Cash flows from operations

<sup>12</sup> Depreciation is not a source of cash in a financial accounting context. However, when income taxes are considered, the depreciation tax deduction lowers the income tax liability. Thus, when analyzing the cash flow of a business or a project, the depreciation tax deduction is a source of cash to the extent that it lowers the amount of income taxes paid. This issue is covered in most textbook discussions of capital budgeting.

## EXHIBIT 5-6

### Large Differences Between Income and Cash from Operations for the Year 2006 (in millions of U.S. dollars)

Company Name	Cash from Operations	Net Income	Difference
Ford Motor	\$ 9,609	\$(12,613)	\$(22,222)
Verizon	24,106	6,197	(17,909)
General Electric	30,646	20,829	(9,817)
ExxonMobil	49,286	39,500	(9,786)
Merrill Lynch	(39,414)	7,499	46,913
Goldman Sachs	(47,617)	9,537	57,154
Morgan Stanley	(60,803)	7,472	68,275

With the indirect method, only net income and the adjustments are reported. Therefore, the Operating Activities section of the statement of cash flows for Orchard Blossom includes the shaded information in the following table.

Income Statement		Adjustments		Cash Flows from Operations	
Sales	\$150	- 20	(increase in accounts receivable)	\$130	Cash collected from customers
Cost of goods sold	(80)	+ 25	(decrease in inventory)	(55)	Cash paid for inventory
Wages expense	(25)	+ 3	(increase in wages payable)	(22)	Cash paid for wages
Depreciation expense	(30)	+ 30	(not a cash flow item)	0	
Net income	<u>\$ 15</u>	<u>+ 38</u>	net adjustment	<u>\$ 53</u>	Cash flows from operations

Both methods of reporting operating cash flow have advantages. The primary advantage of the direct method is that it is very straightforward and intuitive. The primary advantage of the indirect method is that it highlights the factors that cause net income and cash from operations to differ. As mentioned earlier, almost all large U.S. companies use the indirect method. Some actual examples of the large differences that can exist between income and cash from operations are given in Exhibit 5-6.

## Preparing a Complete Statement of Cash Flows

**4** Prepare a complete statement of cash flows and provide the required supplemental disclosures.

**WHY** A complete statement of cash flows summarizes all of the important activities—operating, investing, and financing—undertaken by a company during a given period.

**HOW** Basic information to prepare the three sections of the cash flow statement comes from the balance sheet and income statement, as follows:

- **Operating**—income statement adjusted for changes in current operating assets and liabilities.
- **Investing**—changes in long-term assets.
- **Financing**—changes in long-term liabilities and in owners' equity.

In this section, we will expand the Orchard Blossom Company example into a comprehensive problem in order to illustrate the preparation of a complete statement of cash flows. For this example, we will need complete balance sheet data as of the beginning and end of the year, as well as income statement data for the year. These data are as follows:

<b>Orchard Blossom Company</b>		
<b>Complete Balance Sheet and Income Statement Data</b>		
	<u>End of Year</u>	<u>Beginning of Year</u>
<b>Balance Sheet:</b>		
Cash .....	\$ 25	\$ 15
Accounts receivable .....	60	40
Inventory .....	75	100
Land .....	120	105
Buildings .....	200	160
Accumulated depreciation .....	(66)	(50)
Total assets .....	<u>\$414</u>	<u>\$370</u>
Accounts payable .....	\$ 50	\$ 37
Wages payable .....	10	7
Long-term debt .....	169	190
Paid-in capital .....	100	60
Retained earnings .....	85	76
Total liabilities and equity .....	<u>\$414</u>	<u>\$370</u>
<b>Income Statement:</b>		
Sales .....	\$150	
Gain on sale of building .....	10	
Cost of goods sold .....	(80)	
Wages expense .....	(25)	
Depreciation expense .....	(30)	
Interest expense .....	(10)	
Net income .....	<u>\$ 15</u>	

Before proceeding with this example, please note three changes from the original Orchard Blossom data used in the preceding section. These changes are made to enrich the example so that it will illustrate all of the major items you need to learn at this point with respect to preparing a complete statement of cash flows.

- Accounts payable have been added to the balance sheet. This will change the operating cash flow calculation done previously. We will assume that all of these accounts payable relate to inventory purchases.
- Interest expense has been added to the income statement. This will change the operating cash flow calculation done previously.
- A gain on sale of building has been added to the income statement. From supplemental information (not found in the balance sheet or income statement), we learn that buildings with an original cost of \$36 and a book value of \$22 were sold for a total of \$32, resulting in the reported gain of \$10 (\$32 sales price – \$22 book value). The sale of a building is an investing activity, yet the gain is shown as part of net income, which we use as our basis for computing operating cash flow. We will have to be careful how we handle this gain.

The following 6-step process outlines a systematic method that can be used in analyzing the income statement and comparative balance sheets in preparing a statement of cash flows:

1. Compute how much the cash balance changed during the year. The statement of cash flows is not complete until the sum of cash from operating, investing, and financing activities exactly matches the total change in the cash balance during the year.

2. Convert the income statement from an accrual-basis to a cash-basis summary of operations. This is done in three steps.
  - (a) Eliminate expenses that do not involve the outflow of cash, such as depreciation expense.
  - (b) Eliminate gains and losses associated with investing or financing activities to avoid counting these items twice.
  - (c) Adjust for changes in the balances of current operating assets and operating liabilities because these changes indicate cases in which the operating cash flow associated with an item does not match the revenue or expense reported for that item.

The final result of these adjustments is that net income is converted into cash flow from operating activities.

3. Analyze the long-term assets to identify the cash flow effects of investing activities. Changes in property, plant, and equipment may indicate that cash has either been spent or received.
4. Analyze the long-term debt and stockholders' equity accounts to determine the cash flow effects of any financing transactions. These transactions include borrowing or repaying debt, issuing or buying back stock, and paying dividends. Also, examine changes in short-term loan accounts; borrowing and repaying under short-term arrangements are also classified as financing activities.
5. Make sure that the total net cash flow from operating, investing, and financing activities is equal to the net increase or decrease in cash as computed in step 1. Then, prepare a formal statement of cash flows by classifying all cash inflows and outflows according to operating, investing, and financing activities. The net cash flows from each of the three main activities should be highlighted.
6. Prepare supplemental disclosure, including the disclosure of any significant investing or financing transactions that did not involve cash. This disclosure is done outside the cash flow statement itself. The types of transactions disclosed in this way include the purchase of land by issuing stock and the retirement of bonds by issuing stock. In addition, supplemental disclosure of cash paid for interest expense and taxes is required.

We will illustrate this 6-step process using the expanded information from the Orchard Blossom example. Because we will prepare the statement of cash flows without reference to the detailed cash flow transaction data, we are going to have to make some informed inferences about cash flows by examining the balance sheet and income statement accounts.

### Step 1. Compute How Much the Cash Balance Changed During the Year.

Orchard Blossom began the year with a cash balance of \$15 and ended with a cash balance of \$25. Thus, our target in preparing the statement of cash flows is to explain why the cash account increased by \$10 during the year.

### Step 2. Convert the Income Statement from an Accrual-Basis to a Cash-Basis Summary of Operations.

Recall that converting accrual net income into cash from operations involves eliminating noncash expenses, removing the effects of gains and losses, and adjusting for the impact of changes in current operating asset and liability balances. These adjustments are shown in the work sheet, Exhibit 5-7, and are explained below. Many of the adjustment are the same as those illustrated in the simple Orchard Blossom example in the previous section.

**Depreciation expense (adjustment A1).** The first adjustment involves adding the amount of depreciation expense. As explained previously, because depreciation expense does not involve an outflow of cash, and because depreciation was initially subtracted to arrive at net income, this adjustment effectively eliminates depreciation from the computation of cash from operations. It can be seen in the far right column of the work sheet in Exhibit 5-7 that adjustment A1 results in a \$0 ( $-\$30 + \$30 = \$0$ ) cash flow effect from depreciation.

## EXHIBIT 5-7

## Adjustments to Convert Orchard Blossom's Accrual Net Income to Cash from Operations

	Income Statement	Adjustments			Cash Flows from Operations
Sales	\$150	C1	\$(20)	Increase in accounts receivable	\$130
Gain on sale of building	10	B1	(10)	Investing activity item	0
Cost of goods sold	(80)	C2	25	Decrease in inventory	(42)
		C3	13	Increase in accounts payable	
Wages expense	(25)	C4	3	Increase in wages payable	(22)
Depreciation expense	(30)	A1	30	Not a cash flow item	0
Interest expense	(10)			No interest payable balance	(10)
Net income	<u>\$ 15</u>		<u>\$ 41</u>		<u>\$ 56</u>

**Gain on sale of building (adjustment B1).** Adjustment must also be made for any gains or losses included in the computation of net income. Orchard Blossom sold buildings during the year and recorded a gain of \$10 on the sale. The \$32 cash flow effect of the building sale (mentioned above) will be shown in the Investing Activities section of the cash flow statement. To avoid counting any part of the \$32 sales amount twice, the gain should be excluded from the Operating Activities section. However, the gain has already been added in the computation of net income. In order to exclude the gain from the Operating Activities section, it must be subtracted from net income. If there had been a loss on the building sale, that loss would be added back to net income in the Operating Activities section so that it would not impact cash flows from operations. The full \$32 cash flow impact of the sale of this building (to be analyzed later) is reported in the Investing Activities section.

**Changes in current assets and liabilities.** The remaining adjustments (C1–C4 in Exhibit 5-7) are needed because the computation of accrual net income involves reporting revenues and expenses when economic events occur, not necessarily when cash is received or paid. The timing differences between the receipt or payment of cash and the earning of revenue or the incurring of an expense are reflected in the shifting balances in the current operating assets and liabilities. This is illustrated through a discussion of each of Orchard Blossom's current operating asset and liability accounts.

*Accounts receivable (adjustment C1).* Recall from our analysis earlier in the chapter that the amount of cash Orchard Blossom collected from customers during the year differed from sales for the period. The \$20 increase in accounts receivable is subtracted, as shown in Exhibit 5-7.

*Inventory (adjustment C2).* The statement of cash flows should reflect the amount of cash paid for inventory during the year, which is not necessarily the same as the cost of inventory sold. Orchard Blossom's inventory decreased by \$25 during the year, indicating that the amount of inventory purchased during the year was less than the amount of inventory sold. Accordingly, in the computation of cash from operations we must reduce the cost of goods sold number to reflect the fact that part of the inventory sold this period was actually purchased last period. To reduce cost of goods sold (which is subtracted in the computation of net income), the adjustment involves adding \$25, as shown in Exhibit 5-7. This addition of \$25 represents an increase in cash flow because less cash was used to replenish inventory during the year.

*Accounts payable (adjustment C3).* The balance in Orchard Blossom's accounts payable account increased by \$13 during the year. This increase occurred because

Photodisc/Getty Images

A company's statement of cash flows must reflect the amount of cash paid for inventory during the year. For example, in the computation of cash from operations, Reebok must reduce the cost of goods sold number to reflect that part of the inventory sold in the current period was actually purchased in the prior period.

Orchard Blossom paid for less than it bought from its suppliers during the year. The adjustment necessary to reflect this reduction in cash outflow is to add \$13 in computing cash from operations, shown as adjustment C3 in Exhibit 5-7. As seen in the exhibit, total cash paid to purchase inventory during the year was \$42.

*Wages expenses (adjustment C4).* The balance in Orchard Blossom's wages payable account increased by \$3 during the year. This increase occurred because Orchard Blossom did not pay all wages due to its employees during the year. The adjustment necessary to reflect this reduction in cash outflow for wages is to add \$3 in computing cash from operations, shown as adjustment C4 in Exhibit 5-7. Again, when the wages payable account increases, the company has more cash because cash was conserved and not used to pay its operating obligations.

*Interest expense.* Because an interest payable account does not exist, we can safely assume that all interest expense was paid for in cash. Therefore, there is no need for an adjustment. If there were an interest payable account, the reasoning used when analyzing the accounts payable and wages payable accounts would apply.

Note that the total cash inflow from operating activities is \$56, which is \$3 more than the \$53 we computed in the earlier example. The \$3 difference arises because in this expanded example we included \$10 in interest expense (which reduces operating cash flow by \$10) and also included a \$13 increase

in the accounts payable balance (which increases operating cash flow by \$13). The net effect is to increase operating cash flow by \$3 relative to the previous simple example.

### Step 3. Analyze the Long-Term Assets to Identify the Cash Flow Effects of Investing Activities.

Orchard Blossom reports two long-term asset accounts.

- Land
- Buildings

We will analyze each of these in turn to determine how much cash flow was associated with each during the year.

**Land.** The land account increased by \$15 ( $\$120 - \$105$ ) during the year. This could be a combination of purchases and sales of land. Because there is no indication of land sales during the year, we conclude that the \$15 represents the price of new land purchased during the year.

**Buildings.** The balance in Orchard Blossom's buildings account increased by \$40 ( $\$200 - \$160$ ) during the year. In the absence of any other information, this increase would suggest that Orchard Blossom purchased buildings with a cost of \$40. However, in this case, additional information mentioned above is available indicating that buildings were sold for \$32 during the year. This \$32 cash proceeds from the sale is a cash inflow from investing activities. This building sale complicates our calculations so that we aren't yet sure how much was paid to purchase new buildings during the year.

A useful way to summarize all of the purchase and sale information for buildings is to reconstruct the T-accounts for both the buildings account and the associated accumulated depreciation account. Those T-accounts appear as follows:

Buildings				Accumulated Depreciation			
Beg. Bal.	160					50	Beg. Bal.
Purchases	76	36	Historical cost of items sold	Accum. dep. on items sold	14	30	Dep. exp.
End. Bal.	200					66	End. Bal.

The amounts in boxes (amount of purchases and amount of accumulated depreciation associated with the items sold) can be inferred given the other information. With this information, we can compute whether the sale of buildings resulted in a gain or in a loss as follows:

Cash proceeds (given earlier).....	\$32
Book value of items sold (\$36 – \$14).....	22
Gain on sale of buildings.....	<u>\$10</u>

The existence of a \$10 gain is confirmed in the Orchard Blossom income statement. Note that with the income statement information and the amounts inferred using the T-accounts above, we could have traced backward and computed the cash proceeds from the sale of the buildings and equipment. The T-accounts are very useful devices for structuring the information that we have so that we can infer the missing values needed to complete the statement of cash flows.

#### Step 4. Analyze the Long-Term Debt and Stockholders' Equity Accounts to Determine the Cash Flow Effects of Any Financing Transactions.

Long-term debt accounts increase when a company borrows more money—an inflow of cash—and decrease when the company pays back the debt—an outflow of cash. In the case of Orchard Blossom, we observe that the company's balance in Long-Term Debt decreased by \$21 (\$190 – \$169) during the year. Accordingly, we can infer that Orchard Blossom repaid \$21 in loans during the year. This \$21 loan repayment represents cash used by financing activities. The same analysis would apply to short-term debt. The \$40 (\$200 – \$160) increase in Orchard Blossom's paid-in capital account during the year represents a cash inflow from the issuance of new shares of stock. This cash inflow is reported as part of cash from financing activities.

The retained earnings account increases from the recognition of net income (an operating activity), decreases as a result of net losses (also an operating activity), and decreases through the payment of dividends (a financing activity). In the absence of detailed information, it is possible to infer the amount of dividends declared by identifying the unexplained change in the retained earnings account balance. An efficient way to do this is to recreate the retained earnings T-account as follows:

Retained Earnings			
		76	Beg. Bal.
Dividends	6	15	Net income
		85	End. Bal.

So, the amount of dividends paid during the year was \$6. Of course, it is usually the case that the amount of dividends paid is disclosed somewhere in the financial statements. However, you never know the level of detailed information to which you will have access. And, after all, it is a relatively simple (and fun!) analytical exercise.

**Step 5. Prepare a Formal Statement of Cash Flows.** Based on our analyses of the income statement and balance sheet accounts, we have identified all inflows and outflows of cash for Orchard Blossom for the year, and we have categorized those cash flows based on the type of activity. The resulting statement of cash flows (prepared using the indirect method, which is by far the more common method of presentation) is shown in Exhibit 5-8. Note that the statement indicates that the total

## EXHIBIT 5-8

## Complete Statement of Cash Flows for Orchard Blossom Company

Orchard Blossom Company Statement of Cash Flows For the Year Ended December 31		
Cash flows from operating activities:		
Net income .....		\$ 15
Adjustments:		
Add: Depreciation expense .....	\$ 30	
Subtract: Gain on sale of building .....	(10)	
Subtract: Increase in accounts receivable .....	(20)	
Add: Decrease in inventory .....	25	
Add: Increase in accounts payable .....	13	
Add: Increase in wages payable .....	3	41
Net cash provided by operating activities .....		<u>\$ 56</u>
Cash flows from investing activities:		
Sold buildings .....	\$ 32	
Purchased land .....	(15)	
Purchased buildings .....	(76)	
Net cash used by investing activities .....		(59)
Cash flows from financing activities:		
Issued stock to shareholders .....	\$ 40	
Repaid long-term debt .....	(21)	
Paid dividends .....	(6)	
Net cash provided by financing activities .....		<u>13</u>
Net increase in cash .....		<u>\$ 10</u>
Beginning cash balance .....		<u>15</u>
Ending cash balance .....		<u><u>\$ 25</u></u>

change in cash for the year is an increase of \$10, which matches the \$10 increase (from \$15 to \$25) shown on the balance sheet.

**Step 6. Prepare Supplemental Disclosure.** Two categories of supplemental disclosure are associated with the statement of cash flows. These are as follows:

- Cash paid for interest and income taxes
- Noncash investing and financing activities

**Cash paid for interest and income taxes.** FASB *Statement No. 95* requires separate disclosure of the cash paid for interest and for income taxes during the year. When the direct method is used, the amounts of cash paid for interest and for income taxes are part of the Operating Activities section, so no additional disclosure is needed. When the indirect method is used, these amounts must be shown separately, either at the bottom of the cash flow statement, or in an accompanying note. In the case of Orchard Blossom (which has no income taxes), the supplemental information might be presented as follows:

Supplemental Disclosure:	
Cash paid for interest .....	\$10

**Noncash investing and financing activities.** When a company has significant noncash transactions, such as purchasing property, plant, and equipment by issuing debt or in exchange for shares of stock, these transactions must be disclosed in the notes to the financial statements. Orchard Blossom did not have any of these noncash transactions, so no additional disclosure is necessary in this case.

This Orchard Blossom example includes all the common items that are encountered in preparing a statement of cash flows. In Chapter 21, we will revisit the statement of cash flows and learn how to handle some more complex items.

## Using Cash Flow Data to Assess Financial Strength

**5** Assess a firm's financial strength by analyzing the relationships among cash flows from operating, investing, and financing activities and by computing financial ratios based on cash flow data.

**WHY** Patterns of positive and negative cash flow in the three categories of operating, investing, and financing yield insights into the health and current strategy of a business.

**HOW** Data from the cash flow statement can be used in conjunction with balance sheet and income statement data to compute financial ratios.

Various analytical techniques are used to assess a company's financial strength. Key variables are profitability, efficiency, leverage, and liquidity. By tradition, analysts have concentrated on the relationships captured in the income statement and the balance sheet. More and more emphasis is now placed, however, on cash flows and the relationships of data reported on the cash flow statement in conjunction with the income statement and the balance sheet.

### Cash Flow Patterns

It is possible to gain useful insights about a company by analyzing the relationships among the three cash flow categories. Exhibit 5-9 shows the eight different possible

**EXHIBIT 5-9**

#### Analysis of Cash Flow Statement: Patterns

	CF from Operating	CF from Investing	CF from Financing	General Explanation
#1	+	+	+	Company is using cash generated from operations and from sale of assets and from financing to build up pile of cash—very liquid company—possibly looking for acquisition.
#2	+	–	–	Company is using cash flow generated from operations to buy fixed assets and to pay down debt or pay owners.
#3	+	+	–	Company is using cash from operations and from sale of fixed assets to pay down debt or pay owners.
#4	+	–	+	Company is using cash from operations and from borrowing (or from owner investment) to expand.
#5	–	+	+	Company's operating cash flow problems are covered by sale of fixed assets and by borrowing or by shareholder contributions.
#6	–	–	+	Company is growing rapidly but has shortfalls in cash flow from operations and from purchase of fixed assets financed by long-term debt or new investment.
#7	–	+	–	Company is financing operating cash flow shortages and payments to creditors and/or stockholders via sale of fixed assets.
#8	–	–	–	Company is using cash reserves to finance operation shortfall and pay long-term creditors and/or investors.

Source: Michael T. Dugan, Benton E. Gup, and William D. Samson, "Teaching the Statement of Cash Flows," *Journal of Accounting Education*, Vol. 9, 1991, p. 36.

patterns. Patterns 1 and 8 are unusual. Pattern 1 might exist when a firm is experiencing positive cash flows from all three activities and is seeking to significantly increase its cash position for some strategic reason. Pattern 8 shows negative cash flows from all activities and could exist, even in the short-term, only if a company had existing cash reserves to draw upon. Patterns 2 through 4 show positive operating cash flows that are sufficient by themselves (pattern 2) or are supplemented by investing (pattern 3) or financing (pattern 4) activities to settle debt, pay owners, or expand the business. Patterns 5 through 7 are not healthy over the long term, because operating cash shortfalls have to be covered by selling long-term assets and/or by securing external financing.

These cash flow patterns stress the importance of operating cash flows. A positive operating cash flow allows a company to pay its bills, its creditors, and its shareholders and to grow and expand. A negative operating cash flow means a company has to look at other sources of cash, which eventually dry up if operations are not successful.

fyi

**Most courses in financial statement analysis still make only passing mention of cash flow ratios. Familiarity with the ratios discussed in this section is a quick and easy way to set oneself apart from the crowd.**

### Cash Flow Ratios

The data from a cash flow statement also can be used to compute selected ratios that help determine a company’s financial strength. If such ratios are compared for the same company over a period of time or with other companies in the same industry, they can be helpful in evaluating relative performance. To illustrate the computation of selected cash flow ratios, selected data

from Circle K’s 1989 and 1988 financial statements (before Circle K’s disastrous year in 1990) will be used (Exhibit 5-10).

**Cash Flow to Net Income** Perhaps the most important cash flow relationship is the relationship between cash from operations and reported net income. The **cash-flow-to-net-income ratio** reflects the extent to which accrual accounting assumptions and adjustments have been included in computing net income. The formula is cash from operations divided by net income. For Circle K, computation of the cash-flow-to-net-income ratios is as follows:

	1989	1988
Cash from operations .....	\$57,767	\$84,333
Net income .....	÷15,414	÷60,411
Cash-flow-to-net-income ratio .....	3.75	1.40

In general, the cash-flow-to-net-income ratio has a value more than 1.0 because of the existence of significant noncash expenses (such as depreciation) that reduce reported net income but have no impact on cash flow. For a given company, the

**EXHIBIT 5-10 Selected Cash Flow Data for Circle K for 1988 and 1989**

(In thousands of dollars)	1989	1988
Net income .....	\$ 15,414	\$ 60,411
Cash from operations .....	57,767	84,333
Cash paid for capital expenditures .....	193,338	233,087
Cash paid for acquisitions .....	68,139	147,500
Cash paid for interest .....	89,928	49,267
Cash paid for income taxes .....	11,233	28,439

cash-flow-to-net-income ratio should remain fairly stable from year to year. A significant increase in the ratio, such as that reported by Circle K in 1989, indicates that accounting assumptions were instrumental in reducing reported net income. This ratio reveals that, from the standpoint of management concerned about being able to pay the bills and creditors concerned about timely repayment of loans, Circle K's performance in 1989 was actually somewhat better than indicated by just looking at net income. From the numbers reported earlier in the chapter, it is apparent that the same was true in 1990 when the reported net loss was \$773 million but the cash generated by operations was \$108 million.

**Cash Flow Adequacy** As defined earlier, a *cash cow* is a business that is generating enough cash from operations to completely pay for all new plant and equipment purchases with cash left over to repay loans or to distribute to investors. The **cash flow adequacy ratio**, computed as cash from operations divided by expenditures for fixed asset additions and acquisitions of new businesses, indicates whether a business is a cash cow. Computation of the cash flow adequacy ratio for Circle K is as follows:

	1989	1988
Cash from operations .....	\$ 57,767	\$ 84,333
Cash paid for capital expenditures .....	\$193,338	\$233,087
Cash paid for acquisitions .....	68,139	147,500
Cash required for investing activities .....	\$261,477	\$380,587
Cash flow adequacy ratio .....	0.22	0.22

fyi

Cash paid for dividends is sometimes added to the denominator of the cash flow adequacy ratio. With this formulation, the ratio indicates whether operating cash flow is sufficient to pay for both capital additions and regular dividends to stockholders.

The calculations indicate that in both 1988 and 1989, Circle K's cash from operations fell well short of being able to pay for its expansion. This means that Circle K was forced to seek substantial amounts of external financing, either new debt or additional funds from investors, during both years.

**Cash Times Interest Earned** Because interest payments must be made with cash, an informative indicator of a company's interest-paying ability compares cash generated by operations to cash paid for interest. This **cash times interest earned ratio** is computed for Circle K as follows:

	1989	1988
Cash from operations .....	\$ 57,767	\$ 84,333
Cash paid for interest .....	89,928	49,267
Cash paid for income taxes .....	11,233	28,439
Cash before interest and taxes .....	\$158,928	\$162,039
Cash paid for interest .....	÷ 89,928	÷ 49,267
Cash times interest earned ratio .....	1.77	3.29

Pretax cash flow is used because interest is paid before any taxes are deducted. From this calculation, we can see that Circle K's creditors experienced a significant drop in security in 1989 because Circle K's operations generated only 1.77 times the amount of cash that was needed in order to make its required interest payments. Ultimately, the inability to continue making its interest payments forced Circle K into bankruptcy.<sup>13</sup>

<sup>13</sup> For additional cash flow ratios, see Don E. Giacomino and David E. Mielke, "Cash Flows: Another Approach to Ratio Analysis," *Journal of Accountancy*, March 1993, p. 57.

## Articulation: How the Financial Statements Tie Together

**6** Demonstrate how the three primary financial statements tie together, or articulate, in a unified framework.

**WHY** Complete understanding and intelligent use of financial statements requires familiarity with how the three primary financial statements are quantitatively linked.

**HOW** The essence of financial statement articulation is summarized in these three relationships.

- a. **Balance sheet and income statement**—The income statement for the year details the change in the retained earnings balance (less dividends) for the year.
- b. **Balance sheet and statement of cash flows**—The statement of cash flows details the change in the cash balance for the year.
- c. **Income statement and statement of cash flows**—The important accrual adjustments made during the year explain the difference between the income statement and the Operating section of the statement of cash flows.

In an accounting context, **articulation** means that the three primary financial statements are not isolated lists of numbers but are an integrated set of reports on a company's financial health. The statement of cash flows contains the detailed explanation for why the balance sheet cash amount changed from beginning of year to end of year. The income statement, combined with the amount of dividends declared during the year, explains the change in retained earnings shown in the balance sheet. Cash from operations in the statement of cash flows is transformed into net income through the accounting adjustments applied to the raw cash flow data. These relationships are illustrated in Exhibit 5-11 using the financial statement numbers from the Orchard Blossom Company example in the preceding section.

The balance sheet can be viewed as the mother of all financial statements, with the statement of cash flows merely giving some details about changes in the cash balance in the balance sheet and the income statement merely giving some details about changes in the retained earnings balance. Of course, before we get too carried away in our admiration of the balance sheet, we should remind ourselves that these “mere changes” in the cash balance and the retained earnings balance capture much of what business is all about.

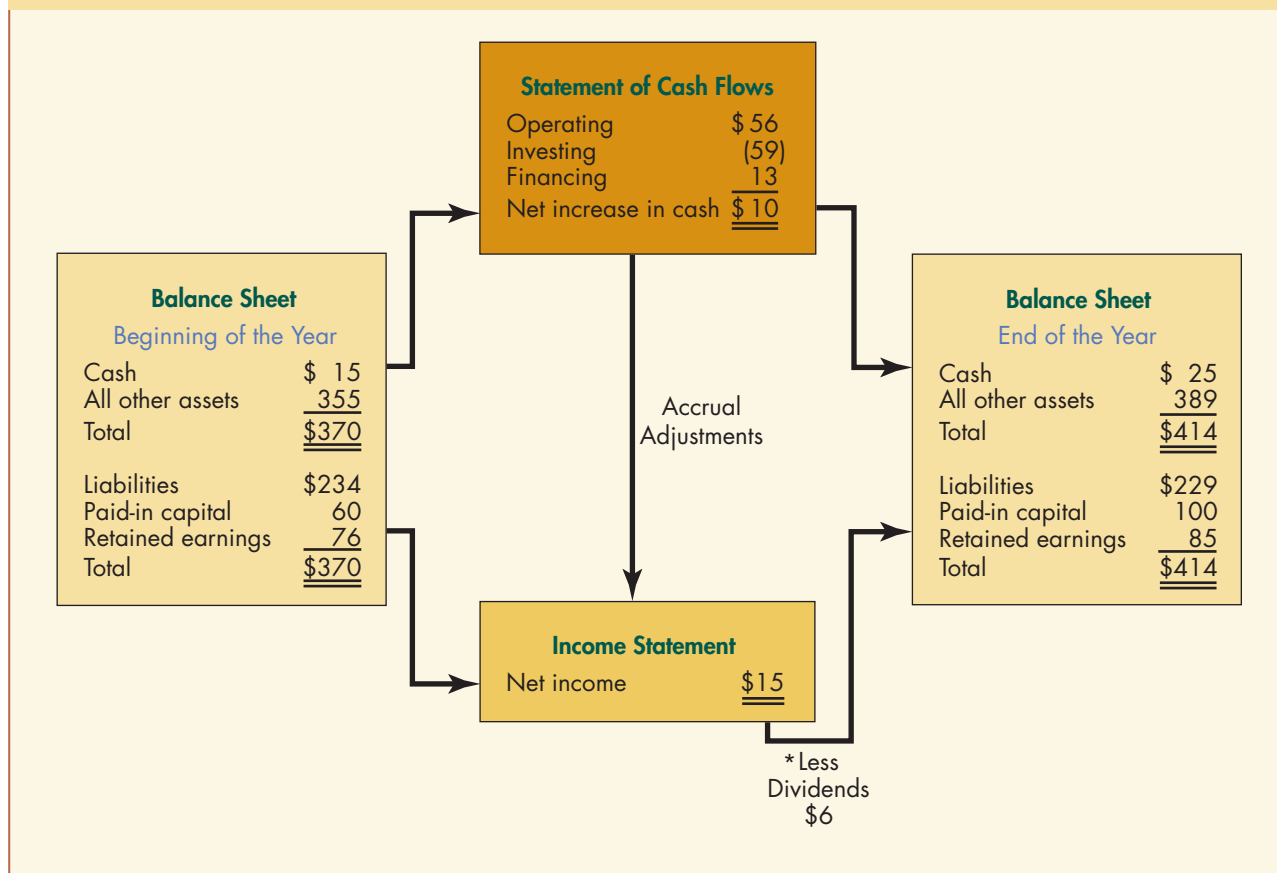

Now let's take a detailed look at Exhibit 5-11. Note that the \$10 increase in cash during the year, from a beginning balance of \$15 to an ending balance of \$25, is explained by the sum of the cash flows from operating, investing, and financing activities reported in the statement of cash flows. The \$9 increase in the retained earnings balance during the year, from a beginning balance of \$76 to an ending balance of \$85, is explained by the \$15 net income, reported in the income statement, less the \$6 paid in dividends. The link between the statement of cash flows (or, more precisely, the Operating section of the statement of cash flows) and the income statement is the accrual adjustments made during the year. One of the beauties of the indirect method of reporting cash flow from operating activities is that these accrual adjustments are summarized in one place. Look back at Exhibit 5-8 and see that the body of the Operating Activities section is a listing of the net effects of the operating accrual adjustments made during the year.

The articulation diagram in Exhibit 5-11 gives just a glimpse of the interrelationships among the financial statements. As you saw when we prepared the Investing Activities section of the Orchard Blossom Company statement of cash flows, the beginning and ending balances in the buildings and accumulated depreciation accounts, along with reported Depreciation Expense from the income

## EXHIBIT 5-11

## Articulation of the Financial Statements

statement, combine to indicate the amount of cash flow from investing activities as reported in the statement of cash flows. Similarly, the changes in long-term debt and paid-in capital are explained in the Financing Activities section of the statement of cash flows. Look again at Exhibit 5-11 and imagine a complex web connecting the beginning and ending balance sheets with the income statement and the statement of cash flows; this web represents the complete articulation of the financial statements.

The articulation of the three primary financial statements is perhaps the most beautiful, and useful, aspect of the financial accounting model. The constraints of this articulation framework require that all of the recorded transactions and the accrual assumptions for a company for a year must fit together and add up. In Chapter 6, we will discuss some of the practices of earnings management that are attempted by desperate managers seeking to make their company look better on paper. Earnings management can deceive financial statement users for a limited time, but the inexorable requirements of financial statement articulation mean that ultimately any deception practiced in the income statement will show up as increasingly unlikely amounts in the balance sheet and increasingly disturbing differences between net income and operating cash flow.

Similarly, the articulation of the financial statements is an important disciplinary tool in making financial forecasts. In the concluding section of this chapter, you will learn how to prepare a forecasted statement of cash flows. Because the financial statements must articulate, you will be able to clearly see that assumptions about building purchases and dividend payments ripple through all three financial statements, and no financial plan is complete until all of these ripple effects have been analyzed, recorded, and articulated.

## Forecasted Statement of Cash Flows

**7** Use knowledge of how the three primary financial statements tie together to prepare a forecasted statement of cash flows.

**WHY** The cash flow projection allows a company to plan ahead as far as timing of new loans, stock issuances, long-term asset acquisitions, and so forth. Projected cash flow statements also allow potential lenders to evaluate the likelihood that their loan will be repaid and allow potential investors to evaluate the likelihood of receiving cash dividends in the future.

**HOW** Using the techniques demonstrated earlier in this chapter, a projected cash flow statement can be constructed using information from a projected balance sheet and projected income statement.

The tools we developed and used in Chapter 4 for forecasting an income statement and a balance sheet are also useful in forecasting cash flows. In fact, we can prepare a forecasted statement of cash flows using the same data given in Chapter 4. Recall from Chapter 4 that we were provided the 2011 balance sheet and income statement for the hypothetical Derrald Company. We then assumed that Derrald's sales would increase by 40% in 2012 and used our knowledge of the relationship among financial statement amounts, along with a few assumptions, to forecast an income statement and a balance sheet for Derrald for the year 2012. The resulting financial statements are reproduced in Exhibit 5-12.<sup>14</sup> Using the same 6-step process for preparing a statement of cash flows that was described earlier in the chapter, we can use the data in Exhibit 5-12 to construct a forecasted statement of cash flows for Derrald Company for 2012.

### EXHIBIT 5-12

#### Forecasted Balance Sheet and Income Statement for Derrald Company

Balance Sheet	2011	2012 Forecasted	Basis for Forecast
Cash .....	\$ 10	\$ 14	40% natural increase
Accounts receivable .....	100	140	40% natural increase
Inventory .....	150	210	40% natural increase
Property, plant, and equipment, net .....	300	500	management decision
Total assets .....	<u>\$560</u>	<u>\$864</u>	
Accounts payable .....	\$100	\$140	40% natural increase
Bank loans payable .....	300	524	management decision
Paid-in capital .....	50	50	management decision
Retained earnings .....	110	150	plus net income less dividends
Total liabilities and stockholders' equity .....	<u>\$560</u>	<u>\$864</u>	
<b>Income Statement</b>	<b>2011</b>	<b>2012 Forecasted</b>	<b>Basis for Forecast</b>
Sales .....	\$1,000	\$1,400	40% increase
Cost of goods sold .....	700	980	70% of sales, same as last year
Gross profit .....	\$ 300	\$ 420	
Depreciation expense .....	30	50	10% of PP&E, same as last year
Other operating expenses .....	170	238	17% of sales, same as last year
Operating profit .....	\$ 100	\$ 132	
Interest expense .....	30	52	10% of bank loan, same as last year
Income before taxes .....	\$ 70	\$ 80	
Income taxes .....	30	34	43% of pretax, same as last year
Net income .....	<u>\$ 40</u>	<u>\$ 46</u>	

<sup>14</sup> In Chapter 4, Accounts Receivable and Inventory were grouped under one heading, Other Current Assets, to simplify the analysis. These two accounts are shown separately here. In addition, Total Stockholders' Equity has been split into its paid-in capital and retained earnings components.

**Step 1. Compute the Change in Cash.** Cash is forecasted to increase by \$4 (\$14 – \$10) from 2011 to 2012. Hence, we know that the sum of cash from operating, investing, and financing activities in the forecasted statement of cash flows must be \$4.

**Step 2. Convert the Income Statement from an Accrual Basis to a Cash Basis.**

Beginning with the forecasted income statement, the following adjustments are necessary:

	Income Statement	Adjustments	Cash Flows from Operations
Sales .....	\$1,400	A. –40	\$ 1,360
Cost of goods sold .....	(980)	B. –60	(1,000)
		C. +40	
Depreciation expense .....	(50)	D. +50	0
Other operating expenses .....	(238)	E. 0	(238)
Interest expense .....	(52)	F. 0	(52)
Income taxes .....	(34)	G. 0	(34)
Net income .....	<u>\$ 46</u>		<u>\$ 36</u>

**Adjustment A.** Accounts Receivable is forecasted to increase by \$40 (\$140 – \$100) during 2012, indicating that more sales will be made during the year than will be collected in cash. To compute cash collected from customers, sales must be reduced by the amount of the \$40 forecasted increase in Accounts Receivable.

**Adjustment B.** Inventory is forecasted to increase by \$60 (\$210 – \$150), indicating that more inventory will be purchased than will be sold. This \$60 Inventory increase represents an additional cash outflow.

**Adjustment C.** Accounts Payable is forecasted to increase by \$40 (\$140 – \$100), signifying that not all inventory that will be purchased on account during 2012 will be paid for during 2012. Thus, the Accounts Payable increase represents a cash savings.

**Adjustment D.** Forecasted depreciation expense of \$50 does not involve cash and must be added back in computing cash from operating activities.

**Adjustments E through G.** For this example, we are assuming that the accounts payable account relates strictly to the purchase of inventory and that all other expenses involving the outflow of cash are paid for immediately. As a result, there are no payable accounts relating to other operating expenses, interest, or taxes. If payable accounts relating to these expenses were to exist, the analysis would be similar to that conducted for Accounts Payable: Increases would be added (indicating a cash savings by allowing the payable to increase) and decreases would be subtracted (indicating an additional outflow of cash to reduce the payable balance).

The resulting Operating section of the forecasted statement of cash flows indicates that Derrald Company will generate \$36 from operations in 2012.

**Step 3. Analyze the Long-Term Asset Accounts.** The only long-term asset account is Property, Plant, and Equipment (PP&E). PP&E is forecasted to increase from \$300 to \$500 in 2012. Note that the PP&E amount is reported “net,” meaning that accumulated depreciation is subtracted from the reported PP&E amount rather than being shown as a separate amount. As a result, the “net” PP&E amount can be affected by any of three events: purchase of new PP&E (an addition), sale of old PP&E (a subtraction), and depreciation of existing PP&E (a subtraction). Using the forecasted information, and assuming that no old PP&E will be sold during 2012, we can conclude the following.

Beginning PP&E .....	\$300
PP&E to be sold during the year .....	0
– PP&E depreciation .....	(50)
= Ending PP&E without purchase of new PP&E .....	<u>\$250</u>

The fact that the projected ending PP&E balance is \$500 implies that Derrald Company expects to purchase \$250 ( $\$500 - \$250$ ) in new PP&E during 2012. This \$250 forecasted purchase represents cash to be used for investing activities.

**Step 4. Analyze the Long-Term Debt and Stockholders' Equity Accounts.** The bank loans payable account is projected to increase from \$300 to \$524. This difference of \$224 represents a cash inflow from financing. Because Paid-In Capital is projected to remain at \$50, Derrald Company is not expecting to raise any new cash by issuing shares of stock during 2012.

The \$40 ( $\$150 - \$110$ ) projected increase in Retained Earnings must be analyzed in light of expected net income for 2012. Because Derrald Company is expected to have net income of \$46 in 2012, it must also be expecting to pay dividends of \$6 to result in the net increase in Retained Earnings of \$40. The \$6 forecasted dividend payment is reported as a cash outflow from financing activities.

**Step 5. Prepare the Statement of Cash Flows.** All information necessary to prepare the forecasted statement of cash flows is now assembled. The forecasted statement is shown in Exhibit 5-13, with forecasted operating cash flows being reported using the indirect method. Note that the sum of the forecasted operating, investing, and financing cash flows ( $\$36 - \$250 + \$218$ ) is equal to the total forecasted change in cash of \$4.

**Step 6. Disclose Any Significant Noncash Activities.** Derrald Company does not anticipate any significant noncash activities during 2012, so the forecasted cash flow statement completely summarizes the important events that are expected to occur.

From the forecasted cash flow statement, we can see that Derrald's expected operating cash flow will not be nearly enough to pay for the additional PP&E it expects to acquire during 2012. As a result, Derrald plans to make up the shortfall with a significant \$224 increase in its bank loan payable account. When used internally, the projected statement of cash flows allows Derrald Company to plan ahead; Derrald can start investigating the likelihood of obtaining such a large new loan. Alternatively, Derrald could consider scaling back the expansion plans if obtaining the required financing doesn't appear feasible. An external user, such as a bank, can use the forecasted cash

**EXHIBIT 5-13****Forecasted Statement of Cash Flows for Derrald Company for 2012**

Derrald Company Forecasted Statement of Cash Flows For the Year Ended December 31, 2012	
Cash flows from operating activities:	
Net income .....	\$ 46
Adjustments:	
Add depreciation .....	\$ 50
Subtract increase in accounts receivable .....	(40)
Subtract increase in inventory .....	(60)
Add increase in accounts payable .....	40
	<u>(10)</u>
Net cash provided by operating activities .....	\$ 36
Cash flows from investing activities:	
Purchase of property, plant, and equipment .....	\$(250)
Net cash used in investing activities .....	(250)
Cash flows from financing activities:	
Borrowing (bank loan payable) .....	\$ 224
Payment of dividends .....	(6)
Net cash provided by financing activities .....	<u>218</u>
Net increase in cash .....	\$ 4
Beginning cash balance .....	10
Ending cash balance .....	<u>\$ 14</u>

flow statement to see whether it seems likely that Derrald can continue to meet its existing obligations. An investor can use the projected cash flow statement to evaluate the likelihood that Derrald will be able to continue making dividend payments. In summary, construction of a full set of projected financial statements—a balance sheet, an income statement, and a statement of cash flows—allows the financial statement user to see whether a company's strategic plans concerning operating, investing, and financing activities are consistent with one another.

## Conclusion

This chapter has been an overview of the statement of cash flows. Along with the balance sheet and the income statement, the statement of cash flows is one of the three primary financial statements. However, because it is relatively new (required only since 1988), it sometimes does not receive the emphasis that it deserves. Cash flow variables and ratios are only now starting to make it into the mainstream of financial statement analysis. You are now a cash flow statement expert; be patient with those who have not yet caught the vision.

All basic aspects of cash flow reporting and disclosure have been covered in this chapter. Additional complexities are introduced in later chapters as appropriate. An expanded discussion, incorporating these complexities, is provided in Chapter 21. You might start thinking now about how that will be affected by revenue recognition assumptions, FIFO and LIFO, capitalize or expense decisions, operating leases, bonds issued at a discount, stock splits, and dividends. Chapter 21 also includes material on international differences in the statement of cash flows.

### SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. *Some of the expenses included in Circle K's \$773 million loss were noncash expenses. Two examples are the \$300 million write-off of goodwill and the \$75 million expense recorded for estimated future environmental cleanup costs. In addition, Circle K reduced its inventory level by \$65 million, which doesn't affect the computation of net income but does free up \$65 million in cash.*
2. *Under Chapter 11 bankruptcy protection, Circle K was able to reduce the cash it paid for interest in 1991 by \$100 million. In addition, collection protection given to new creditors allowed Circle K to increase its accounts payable by \$80 million, freeing up a substantial amount of cash.*
3. *Karl Eller started and ended his business career in the billboard business.*

### SOLUTION TO STOP & THINK

1. *(Page 225) The correct answer is C. Conceptually, payment of interest can be thought of as a financing activity. And because income taxes relate to all activities (for example, income tax must be paid on a gain from the sale of land, which is an investing activity), one could argue that categorization of the payment of income taxes depends on the underlying activity that gave rise to these income taxes. The IASB provides flexibility in the classification of the payment of interest and income taxes. In addition, as explained in this chapter, although the FASB requires these items to be classified as operating activities, it also requires that these two specific items be separately disclosed so that financial statement users can reclassify them, if desired, to meet their own needs.*

## REVIEW OF LEARNING OBJECTIVES

### 1 Describe the circumstances in which the cash flow statement is a particularly important companion of the income statement.

A cash flow statement is an important companion to the income statement. When noncash expenses are high, earnings gives an overly pessimistic view of a company's performance; cash flow from operations could give a better picture. In addition, the operations of rapidly growing companies can consume cash even when reported net income is positive. Finally, the cash flow statement provides a reality check in situations in which companies have an incentive to bias the accrual accounting assumptions.

The cash flow statement offers a one-page summary of the results of a company's operating, investing, and financing activities for the period. A pro forma, or projected, cash flow statement is an excellent tool to analyze whether a company's operating, investing, and financing plans are consistent and workable.

### 2 Outline the structure of and information reported in the three main categories of the cash flow statement: operating, investing, and financing.

The three sections of a cash flow statement are operating, investing, and financing. Significant noncash investing and financing transactions must also be disclosed.

- *Operating.* For purposes of preparing a cash flow statement, operating activities are those activities that enter into the calculation of net income. Net cash provided by operating activities is the "bottom line" of the cash flow statement.
- *Investing.* The primary investing activities are the purchase and sale of land, buildings, equipment, and nontrading financial instruments.
- *Financing.* Financing activities involve the receipt of cash from and the repayment of cash to owners and creditors. An exception is that the payment of interest is considered an operating activity.
- *Noncash investing and financing transactions.* These include the purchase of long-term assets in exchange for the issuance of debt or stock.

### 3 Compute cash flow from operations using either the direct or the indirect method.

There are two ways to present cash flow from operations: the direct method and the indirect method. The direct method is more intuitive;

the indirect method emphasizes a reconciliation between net income and cash flow. Almost all companies use the indirect method.

The direct method is a recap of the income statement with the objective of reporting how much cash was received or disbursed in association with each income statement item.

The indirect method starts with net income and then reports adjustments for operating items not involving cash flow. The three types of adjustments are

- Revenues and expenses that do not involve cash inflows or outflows
- Gains and losses associated with investing or financing activities
- Adjustments for changes in current operating assets and liabilities that indicate noncash sources of revenues and expenses

Net cash from operations is the same whether it is computed using the direct method or the indirect method.

### 4 Prepare a complete statement of cash flows and provide the required supplemental disclosures.

Basic information to prepare the three sections of the cash flow statement comes from the following portions of the balance sheet and the income statement:

- Operating—income statement and current assets and liabilities
- Investing—long-term assets
- Financing—long-term liabilities and owners' equity

A complete cash flow statement is not prepared until each income statement item has been considered, all changes in balance sheet items have been explained, and the net change in cash has been exactly reconciled.

Six steps to preparing a cash flow statement are as follows:

1. Determine the change in cash (including cash equivalents). This is the target number.
2. Operating activities—analyze each income statement item and the changes in all current operating assets and operating liabilities.
3. Investing activities—analyze the changes in all noncurrent assets, such as land, buildings, and so forth.

4. Financing activities—analyze the changes in all noncurrent liabilities, all owners' equity accounts, and all nonoperating current liabilities.
5. Prepare a formal statement of cash flows, reconciling the beginning and ending cash balances. If the sum of operating, investing, and financing activities does not equal the total balance sheet change in cash, something in the cash flow statement is wrong. Fix it.
6. Prepare supplemental disclosure, including the disclosure of any significant investing or financing transactions that did not involve cash.

**5 Assess a firm's financial strength by analyzing the relationships among cash flows from operating, investing, and financing activities and by computing financial ratios based on cash flow data.**

Patterns of positive and negative cash flow in the three categories of operating, investing, and financing yield insights into the health and current strategy of a business. Most companies have positive cash from operations and negative cash from investing activities.

Data from the cash flow statement can be used in conjunction with balance sheet and income statement data to compute financial ratios.

**6 Demonstrate how the three primary financial statements tie together, or articulate, in a unified framework.**

Complete understanding of financial statements requires familiarity with how the three

primary financial statements are linked together. This linkage is called financial statement articulation. The essence of financial statement articulation is summarized in these three relationships.

- (a) Balance sheet and income statement—The income statement for the year details the change in the retained earnings balance (less dividends) for the year.
- (b) Balance sheet and statement of cash flows—The statement of cash flows details the change in the cash balance for the year.
- (c) Income statement and statement of cash flows—The important accrual adjustments made during the year explain the difference between the income statement and the Operating section of the statement of cash flows.

**7 Use knowledge of how the three primary financial statements tie together to prepare a forecasted statement of cash flows.**

A projected cash flow statement can be constructed using information from a projected balance sheet and income statement. The cash flow projection allows a company to plan ahead as far as timing of new loans, stock issuances, long-term asset acquisitions, and so forth. Projected cash flow statements also allow potential lenders to evaluate the likelihood that the loan will be repaid and allow potential investors to evaluate the likelihood of receiving cash dividends in the future.

## IASB SUMMARY

Type of Cash Flow	U.S. GAAP—SFAS No. 95	IFRS—IAS 7
Cash paid for interest (associated with interest expense)	Operating activity	Operating or financing activity
Cash paid for income taxes (associated with income tax expense)	Operating activity	Usually operating activity, but can be split among operating, investing, and financing depending on the nature of the transaction giving rise to the tax payment
Cash received from interest (associated with interest revenue)	Operating activity	Operating or investing activity
Cash received from dividends (associated with dividend revenue)	Operating activity	Operating or investing activity
Cash paid for dividends (not an income statement item)	Financing activity	Financing or operating activity

## KEY TERMS

Articulation 243	Cash times interest earned ratio 242	Investing activities 225	Pro forma cash flow statement 223
Cash equivalent 223	Direct method 228	Noncash investing and financing activities 226	Statement of cash flows 223
Cash flow adequacy ratio 242	Financing activities 225	Operating activities 224	
Cash-flow-to-net-income ratio 241	Indirect method 228		

## QUESTIONS

- Under what circumstances does cash flow from operations offer a clearer picture of a company's performance than does net income?
- What criteria must be met for an item to be considered a cash equivalent in preparing a statement of cash flows?
- What are the three categories in a statement of cash flows? What types of items are included in each?
- What is the normal pattern of cash flow (positive or negative) for operating, investing, and financing activities?
- Either the direct method or the indirect method may be used to report cash flows from operating activities. What is the difference in approach for the two methods?
- Why do many users prefer the direct method? Why do the majority of preparers prefer the indirect method?
- How is depreciation expense handled when the direct method is used? The indirect method?
- What is wrong with the statement, "Cash flow is equal to net income plus depreciation"?
- Why does the FASB in *Statement No. 95* treat interest payments as an operating activity rather than as a financing activity?
- When preparing a cash flow statement, what is the "target number"?
- When using the direct method, what items must be considered in the calculation of cash paid for inventory purchases?
- How is a loss on the sale of a long-term asset treated when using the direct method? The indirect method?
- Is the purchase of securities an operating activity or an investing activity? Explain.
- What supplemental disclosures are required by FASB *Statement No. 95* if a company elects to use the direct method in preparing its statement of cash flows? What disclosures are required if the indirect method is used?
- How are significant noncash investing and financing transactions reported in connection with a statement of cash flows?
- How is interest paid classified in a statement of cash flows under the provisions of FASB *Statement No. 95*?
- On average, which number is larger, net income or cash from operations? Explain.
- What does it mean when the value of a company's cash flow adequacy ratio is less than 1.0?
- The income statement provides detail as to transactions that occurred during the period relating to what balance sheet account? The statement of cash flows provides detail as to the transactions that occurred during the period relating to what balance sheet account?
- A forecasted statement of cash flows allows management to plan ahead. What information is contained in the statement that can be used for planning purposes?
- How can external users use a forecasted statement of cash flows?

## PRACTICE EXERCISES

## Practice 5-1

## Cash and Cash Equivalents

## LO2

A company reports the following information as of the end of the year. Using the information, determine the total amount of cash and cash equivalents.

- Investment securities of \$10,000. These securities are common stock investments in 30 companies that compose the Dow Jones Industrial average. As a result, the stocks are very actively traded in the market.

- (b) Investment securities of \$5,700. These securities are U.S. government bonds. The bonds are 30-year bonds; they were purchased on December 31 at which time they had two months to go until they mature.
- (c) Cash of \$3,400 in the form of coin, currency, savings accounts, and checking accounts.
- (d) Investment securities of \$6,600. These securities are commercial paper (short-term IOUs from other companies). The term of the paper is nine months; they were purchased on December 31 at which time they had four months to go until they mature.

**Practice 5-2****Three Categories of Cash Flows**

Using the following information, compute cash flow from operating activities, cash flow from investing activities, and cash flow from financing activities.

LO2

	Cash Inflow (Outflow)
(a) Cash received from sale of a building	\$ 4,200
(b) Cash paid for interest	(600)
(c) Cash paid to repurchase shares of stock (treasury stock)	(1,100)
(d) Cash collected from customers	13,400
(e) Cash paid for dividends	(930)
(f) Cash paid for income taxes	(1,850)

**Practice 5-3****Cash Flow Patterns**

Identify which of the following cash flow patterns most likely belongs to (1) a start-up, high-growth company, (2) a steady-state company, and (3) a cash cow.

LO2

	Operating Cash Flow	Investing Cash Flow	Financing Cash Flow
Company A	\$(10,000)	\$(27,000)	\$ 40,000
Company B	40,000	(27,000)	(10,000)
Company C	30,000	(27,000)	(1,500)

**Practice 5-4****Noncash Investing and Financing Activities**

Combining the following information, compute the total amount of (1) cash flow from investing activities and (2) cash flow from financing activities.

LO2

- (a) Purchased a building for \$120,000. Paid \$40,000 and signed a mortgage with the seller for the remaining \$80,000.
- (b) Executed a debt-equity swap: replaced a \$67,000 loan by giving the lender shares of common stock worth \$67,000 on the date the swap was executed.
- (c) Purchased land for \$100,000. Signed a note for \$35,000 and gave shares of common stock worth \$65,000.
- (d) Borrowed \$56,000 under a long-term loan agreement. Used the cash from the loan proceeds as follows: \$15,000 for purchase of additional inventory, \$30,000 to pay cash dividends, and \$11,000 to increase the cash balance.

**Practice 5-5****General Format for a Statement of Cash Flows**

Organize the following summary information into the proper format for a statement of cash flows.

LO3

Cash balance, beginning of year .....	\$ 2,800
Cash flow from financing activities .....	5,000
Total stockholders' equity, end of year .....	24,300
Cash flow from operating activities .....	6,200
Cash balance, end of year .....	4,600
Cash flow from investing activities .....	(9,400)
Total stockholders' equity, beginning of year .....	21,500

**Practice 5-6****Cash Collected from Customers**

Using the following information, compute cash collected from customers.

LO3

Sales .....	\$10,000
Cost of goods sold .....	5,300
Operating expenses .....	3,800

	End of Year	Beginning of Year
Prepaid operating expenses .....	\$1,000	\$ 700
Accounts payable .....	1,350	1,200
Inventory .....	2,500	2,100
Accounts receivable .....	1,400	1,375

**Practice 5-7****Cash Paid for Inventory Purchases**

Refer to the information in Practice 5-6. Compute cash paid for inventory purchases. (Note: All Accounts Payable relate to inventory purchases.)

LO3

**Practice 5-8****Cash Paid for Operating Expenses**

Refer to the information in Practice 5-6. Compute cash paid for operating expenses.

LO3

**Practice 5-9****Direct Method**

Using the following income statement and cash flow adjustment information, prepare the Operating Cash Flow section of the statement of cash flows using the *direct* method.

LO3

Sales .....	\$7,800
Cost of goods sold .....	3,100
Interest expense .....	450
Depreciation expense .....	600
Net income .....	<u>\$3,650</u>

Adjustments:

- Interest payable *increased* by \$80.
- Accounts receivable *decreased* by \$320.
- Inventory *decreased* by \$180.
- Accounts payable *decreased* by \$210. (Note: All accounts payable relate to inventory purchases.)

**Practice 5-10****Indirect Method**

Refer to Practice 5-9. Prepare the Operating Cash Flow section of the statement of cash flows using the *indirect* method.

LO3

**Practice 5-11****Complete Statement of Cash Flows from Detailed Data**

Using the following information, prepare a complete statement of cash flows.

LO4

(a) Cash balance, beginning	\$ 1,500
(b) Cash paid to purchase inventory	7,800
(c) Cash received from sale of a building	5,600
(d) Cash paid for interest	450
(e) Cash paid to repay a loan	1,000
(f) Cash collected from customers	10,000
(g) Cash balance, ending	?
(h) Cash received from issuance of new shares of common stock	1,200
(i) Cash paid for dividends	780
(j) Cash paid for income taxes	1,320
(k) Cash paid to purchase machinery	1,950

**Practice 5-12 Operating Cash Flow: Gains and Losses**

LO3

Using the following information, compute cash flow from operating activities. (*Note:* With the limited information given, only the indirect method can be used.)

Increase in accounts receivable .....	\$ 300
Decrease in income taxes payable .....	170
Depreciation .....	1,000
Net income .....	250
Gain on sale of equipment .....	440
Loss on sale of building .....	210

**Practice 5-13 Operating Cash Flow: Restructuring Charges**

LO3

Using the following information, compute cash flow from operating activities. (*Note:* With the limited information given, only the indirect method can be used.)

Decrease in inventory .....	\$ 300
Increase in wages payable .....	170
Restructuring charge .....	2,300
Depreciation .....	1,000
Net income .....	500

The restructuring charge consists of two elements: (1) \$1,500 for the write-down in value of certain assets and (2) \$800 for recognition of an obligation to relocate employees; none of the relocation has yet taken place.

**Practice 5-14 Operating Cash Flow: Deferred Income Taxes**

LO3

Using the following information, compute cash paid for income taxes.

Reported income tax expense .....	\$32,000
-----------------------------------	----------

	End of Year	Beginning of Year
Income taxes payable .....	\$ 2,950	\$ 2,560
Deferred income tax liability .....	32,100	28,600

**Practice 5-15 Operating Cash Flow: Deferred, or Unearned, Sales Revenue**

LO3

Using the following information, compute cash collected from customers.

Sales .....	\$10,000
-------------	----------

	End of Year	Beginning of Year
Accounts receivable .....	\$1,250	\$1,430
Deferred sales revenue .....	1,000	750

**Practice 5-16 Operating Cash Flow: Prepaid Operating Expenses**

LO3

Using the following information, compute cash paid for operating expenses.

Operating expenses:	
Depreciation .....	\$10,000
Insurance .....	7,500
Wages .....	14,600
Total operating expenses .....	<u>\$32,100</u>

	End of Year	Beginning of Year
Prepaid insurance .....	\$1,500	\$1,430
Wages payable .....	600	750

**Practice 5-17****Computing Cash Paid to Purchase Property, Plant, and Equipment**

Using the following information, compute cash paid to purchase property, plant, and equipment.

**LO4**

Depreciation expense ..... \$13,000

	End of Year	Beginning of Year
Property, plant, and equipment .....	\$134,000	\$124,000
Accumulated depreciation .....	32,000	41,000

During the year, property, plant, and equipment with an original cost of \$28,000 was sold for a gain of \$6,500.

**Practice 5-18****Computing Cash Received from the Sale of Property, Plant, and Equipment**

Refer to Practice 5-17. Compute the amount of cash received from the sale of the property, plant, and equipment.

**LO4****Practice 5-19****Computing Cash Paid for Dividends**

Using the following information, compute cash paid for dividends.

**LO4**

Net income ..... \$10,000

	End of Year	Beginning of Year
Retained earnings .....	\$112,000	\$106,000
Paid-in capital .....	50,000	44,000
Cash .....	1,300	1,000
Dividends payable .....	200	450

**Practice 5-20****Computing Cash Flow Ratios**

Using the following information, compute the following ratios: (1) cash-flow-to-net-income, (2) cash flow adequacy, and (3) cash times interest earned.

**LO5**

Net income ..... \$18,000  
 Cash flow from operating activities ..... 21,000  
 Cash paid for capital expenditures ..... 23,500  
 Cash paid for acquisitions ..... 11,000  
 Cash paid for interest ..... 3,800  
 Cash paid for income taxes ..... 6,700

**Practice 5-21****Articulation**

Use the following information to answer the questions listed below:

**LO6**

Dividends declared and paid ..... \$ 8,000  
 Cash from investing activities ..... (25,000)  
 Cash from financing activities ..... (8,000)

	End of Year	Beginning of Year
Cash .....	\$ 21,000	\$ 12,000
Other assets .....	210,000	227,000
Liabilities .....	105,000	117,000
Common stock .....	21,000	21,000
Retained earnings .....	105,000	?

Compute the (a) cash from operating activities and (b) net income.

## Practice 5-22

## Preparing a Forecasted Statement of Cash Flows

The following balance sheet and income statement information includes actual data for 2011 and forecasted data for 2012:

## LO7

	Actual 2011	Forecasted 2012
Cash .....	\$ 100	\$ 130
Accounts receivable .....	600	780
Inventory .....	1,300	1,690
Property, plant, and equipment (net) .....	5,000	6,300
Accounts payable .....	500	650
Long-term debt .....	4,000	5,000
Paid-in capital .....	1,000	1,400
Retained earnings .....	1,500	1,850
Sales .....	\$10,000	\$13,000
Cost of goods sold .....	6,000	7,800
Depreciation expense .....	1,000	1,200
Interest expense .....	400	500
Income before income taxes .....	\$ 2,600	\$ 3,500
Income tax expense .....	910	1,225
Net income .....	<u>\$ 1,690</u>	<u>\$ 2,275</u>

Prepare a forecasted statement of cash flows for 2012. Use the indirect method of reporting cash flow from operating activities.

## EXERCISES

## Exercise 5-23

## Classification of Cash Flows

Indicate whether each of the following items would be classified as (1) an operating activity, an investing activity, or a financing activity or (2) as a noncash transaction or noncash item.

## LO2

- Cash collected from customers.
- Cash paid to suppliers for inventory.
- Cash received for interest on a nontrade note receivable.
- Cash received from issuance of stock.
- Cash paid for dividends.
- Cash received from bank on a loan.
- Cash paid for interest on a loan.
- Cash paid to retire bonds.
- Cash paid to purchase stock of another company as a long-term investment.
- Cash received from the sale of a business segment.
- Cash paid for property taxes.
- Cash received for dividend revenue.
- Cash paid for wages.
- Cash paid for insurance.
- Preferred stock retired by issuing common stock.
- Depreciation expense for the year.
- Cash paid to purchase machinery.
- Cash received from the sale of land.

## Exercise 5-24

## Cash Flow Analysis

State how each of the following items would be reflected on a statement of cash flows.

## LO2

- Securities classified as available for sale were purchased for \$4,200.
- Buildings were acquired for \$210,000, the company paying \$60,000 cash and signing an 11% mortgage note, payable in five years, for the balance.

- (c) Cash of \$54,200 was paid to purchase a business whose assets consisted of inventory, \$16,700; furniture and fixtures, \$8,400; land and buildings, \$20,100; and goodwill, \$9,000.
- (d) A cash dividend of \$2,600 was declared in the current period, payable at the beginning of the next period.
- (e) Accounts Payable shows a decrease for the period of \$1,250.

**Exercise 5-25****LO2****Cash Receipts and Cash Payments**

The accountant for Alpine Hobby Stores prepared the following selected information for the year ended December 31, 2011:

	Dec. 31, 2011	Dec. 31, 2010
(a) Equipment .....	\$55,000	\$62,000
(b) Accumulated Depreciation .....	13,900	12,800
(c) Long-Term Debt .....	20,000	25,000
(d) Common Stock .....	16,000	12,000

Equipment with a book value of \$18,000 was sold for \$16,000 cash. The original cost of the equipment was \$21,000.

Determine the cash inflows and outflows during 2011 associated with each of the accounts listed. Indicate how the cash flows for each item would be presented on the statement of cash flows.

**Exercise 5-26****LO3****Preparing the Operating Activities Section of the Statement of Cash Flows**

Anakin, Inc., provides the following account balances for 2011 and 2010:

	Dec. 31, 2011	Dec. 31, 2010
Accounts Receivable .....	\$ 18,700	\$15,500
Inventory .....	25,440	27,200
Accounts Payable .....	21,650	22,400
Salaries Payable .....	1,500	1,350
Sales .....	278,700	
Cost of Goods Sold .....	197,000	
Depreciation Expense .....	16,700	
Salaries Expense .....	35,200	
Other Expenses .....	24,300	

Using the format presented in the chapter, prepare the Operating Activities section of the statement of cash flows and present that information using (a) the direct method and (b) the indirect method.

**Exercise 5-27****LO3****Preparing the Operating Activities Section of a Statement of Cash Flows**

Norrington Trading Co. provides the following income statement for 2011:

Sales .....	\$675,400
Cost of goods sold .....	243,500
Gross margin .....	\$431,900
Depreciation expense .....	51,000
Salaries expense .....	124,600
Interest expense .....	11,300
Other expenses .....	98,700
Income taxes expense .....	44,000
Net income .....	<u>\$102,300</u>

In addition, the following balance sheet information is available:

	Dec. 31, 2011	Dec. 31, 2010
Accounts receivable .....	\$52,000	\$47,000
Inventory .....	78,100	72,300
Prepaid other expenses .....	5,600	6,700
Accounts payable .....	53,600	52,300
Interest payable .....	800	1,200
Income taxes payable .....	5,200	3,400

Using the format presented in the chapter, prepare the Operating Activities section of the statement of cash flows and present that information using (a) the direct method and (b) the indirect method.

### Exercise 5-28

LO3, LO4

#### Format of Statement of Cash Flows with Indirect Method

From the following information for Carter Corporation, prepare a statement of cash flows for the year ended December 31, 2011, using the indirect method.

Amortization of patent .....	\$ 4,000
Depreciation expense .....	7,000
Issuance of common stock .....	25,000
Issuance of new bonds payable .....	30,000
Net income .....	55,000
Payment of dividends .....	22,500
Purchase of equipment .....	33,200
Retirement of long-term debt .....	40,000
Sale of land (includes \$6,000 gain) .....	35,000
Decrease in accounts receivable .....	2,100
Increase in inventory .....	1,200
Increase in accounts payable .....	1,500
Increase in cash .....	56,700
Cash balance, January 1, 2011 .....	82,800

### Exercise 5-29

LO3

#### Cash Flow from Operations—Indirect Method

The following information was taken from the books of Tapwater Company. Compute the amount of net cash provided by (used in) operating activities during 2011 using the indirect method.

	Dec. 31, 2011	Dec. 31, 2010
Accounts receivable .....	\$18,900	\$16,750
Accounts payable .....	11,500	14,000
Accumulated depreciation (no plant assets retired during year) .....	29,000	22,000
Inventories .....	24,500	20,000
Other current liabilities .....	5,000	3,000
Prepaid insurance .....	1,200	2,000
Net income .....	35,500	—

### Exercise 5-30

LO3

#### Cash Flow from Operations—Direct Method

A summary of revenues and expenses for Norwalk Company for 2011 follows:

Sales .....	\$7,200,000
Cost of goods manufactured and sold .....	3,500,000
Gross profit .....	\$3,700,000
Selling, general, and administrative expenses .....	2,300,000
Income before income taxes .....	\$1,400,000
Income taxes .....	500,000
Net income .....	\$ 900,000

Net changes in working capital accounts for 2011 were as follows:

	Debit	Credit
Cash .....	\$104,000	
Trade Accounts Receivable .....	420,000	
Inventories .....		\$110,000
Prepaid Expenses (selling and general) .....	15,000	
Accrued Expenses (75% of increase related to manufacturing activities and 25% to general operating activities) .....		48,000
Income Taxes Payable .....		54,000
Trade Accounts Payable .....		170,000

Depreciation on plant and equipment for the year totaled \$700,000; 60% was related to manufacturing activities and 40% to general and administrative activities.

Prepare a schedule of net cash provided by (used in) operating activities for the year using the direct method.

### Exercise 5-31

#### LO3

#### Cash Flow from Operations—Indirect Method

The following information was taken from the comparative financial statements of Tulip Corporation:

Net income for year .....	\$ 75,000
Sales revenue .....	450,000
Cost of goods sold (except depreciation) .....	275,000
Depreciation expense for year .....	50,000
Amortization of intangible assets for year .....	20,000
Interest expense on short-term debt for year .....	5,200
Dividends declared and paid during year .....	35,000

Selected account balances:

	Beginning of Year	End of Year
Accounts Receivable .....	\$22,000	\$15,000
Inventory .....	35,000	40,000
Accounts Payable .....	47,500	52,000
Interest Payable .....	1,200	400

Using the indirect method, compute the net amount of cash provided by (used in) operating activities for the year.

### Exercise 5-32

#### LO3

#### Cash Flow from Operations—Direct Method

Based on the information given in Exercise 5-31 and using the direct method, compute the net amount of cash provided by (used in) operating activities for the year.

### Exercise 5-33

#### LO3, LO4

#### Cash Computations

A comparative balance sheet, income statement, and additional information for Shillig Doors Inc. follow.

#### Shillig Doors Inc. Condensed Comparative Income Statement For the Years Ended December 31, 2011 and 2010

	2011	2010
Net sales .....	\$3,946,000	\$3,112,000
Cost of goods sold .....	2,385,000	2,364,000
Gross profit .....	\$1,561,000	\$ 748,000
Expenses .....	792,000	506,000
Net income .....	<u>\$ 769,000</u>	<u>\$ 242,000</u>

**Shillig Doors Inc.**  
**Comparative Balance Sheet**  
**December 31, 2011 and 2010**

	2011	2010
<b>Assets</b>		
Current assets:		
Cash .....	\$ 131,000	\$ 102,000
Available-for-sale securities .....	400,000	—
Accounts receivable .....	409,000	372,000
Inventory .....	289,000	304,000
Prepaid expenses .....	36,000	24,000
Total current assets .....	<u>\$1,265,000</u>	<u>\$ 802,000</u>
Property, plant, and equipment .....	\$ 656,000	\$ 541,000
Accumulated depreciation .....	(81,000)	(42,000)
	<u>\$ 575,000</u>	<u>\$ 499,000</u>
Total assets .....	<u>\$1,840,000</u>	<u>\$1,301,000</u>
<b>Liabilities and Stockholders' Equity</b>		
Current liabilities:		
Accounts payable .....	\$ 191,000	\$ 174,000
Accrued expenses .....	124,000	110,000
Dividends payable .....	165,000	100,000
Total current liabilities .....	<u>\$ 480,000</u>	<u>\$ 384,000</u>
Notes payable—due 2013 .....	210,000	106,000
Total liabilities .....	<u>\$ 690,000</u>	<u>\$ 490,000</u>
Stockholders' equity:		
Common stock .....	\$ 625,000	\$ 600,000
Retained earnings .....	525,000	211,000
Total stockholders' equity .....	<u>\$1,150,000</u>	<u>\$ 811,000</u>
Total liabilities and stockholders' equity .....	<u>\$1,840,000</u>	<u>\$1,301,000</u>

Additional information for Shillig:

- (a) All accounts receivable and accounts payable relate to trade merchandise.
- (b) The proceeds from the notes payable were used to finance plant expansion.
- (c) Capital stock was sold to provide additional working capital.

Compute the following for 2011:

- Cash collected from accounts receivable, assuming all sales are on account.
- Cash payments made on accounts payable to suppliers, assuming that all purchases of inventory are on account.
- Cash payments for dividends.
- Cash receipts that were not provided by operations.
- Cash payments for assets that were not reflected in operations.

### Exercise 5-34

LO3, LO4

SPREADSHEET

### Statement of Cash Flows—Indirect Method

Following is information for Goulding Manufacturing Company:

- (a) Long-term debt of \$500,000 was retired at face value.
- (b) New machinery was purchased for \$62,000.
- (c) Common stock with a par value of \$100,000 was issued for \$160,000.
- (d) Dividends of \$22,000 declared in 2010 were paid in January 2011, and dividends of \$30,000 were declared in December 2011, to be paid in 2012.

- (e) Net income was \$450,700. Included in the computation were depreciation expense of \$70,000 and intangible assets amortization of \$10,000.

	Dec. 31, 2011	Dec. 31, 2010
Current assets:		
Cash and cash equivalents .....	\$189,200	\$130,000
Accounts receivable .....	175,000	156,000
Inventory .....	178,000	160,000
Current liabilities:		
Accounts payable .....	64,000	87,400
Dividends payable .....	30,000	22,000
Interest payable .....	12,900	7,000
Wages payable .....	24,000	17,000

Prepare a statement of cash flows for the year ended December 31, 2011, using the indirect method.

### Exercise 5-35

#### LO6

### Articulation

The following information is available for Kelsey Inc. *Note:* All inventory is purchased on account, and Accounts Payable relates only to the purchase of inventory.

	Dec. 31, 2011	Dec. 31, 2010
Accounts receivable .....	\$ ?	\$75,000
Inventory .....	72,000	83,000
Accounts payable .....	56,000	44,000
Sales .....	540,000	
Cost of goods sold .....	?	
Cash collected from customers .....	551,000	
Cash paid for inventory .....	?	
Inventory purchased on account .....	279,000	

Compute the following for 2011:

1. The ending balance in accounts receivable
2. The amount of cash paid for inventory
3. The amount of cost of goods sold

### Exercise 5-36

#### LO6

### Articulation

The following information is available for Santiago Inc.:

	Dec. 31, 2011	Dec. 31, 2010
Cash .....	\$ 141,000	\$ 97,000
Retained earnings .....	665,000	543,000
Cash from operating activities .....	?	
Cash from investing activities .....	(483,000)	
Cash from financing activities .....	(287,000)	
Dividends declared and paid .....	47,000	
Net income .....	?	

Compute the following for 2011:

1. Net income
2. Cash from operating activities

**Exercise 5-37****Cash Flow Ratios**

Following are data from the financial statements for Houma Company.

**LO5**

<b>Houma Company</b>		
<b>Selected Financial Statement Data</b>		
<b>For the Years Ended December 31, 2011 and 2010</b>		
	<b>2011</b>	<b>2010</b>
Net income .....	\$34,000	\$ 65,200
Cash from operating activities .....	28,900	158,130
Cash paid for purchase of fixed assets .....	42,000	156,000
Cash paid for interest .....	26,000	24,000
Cash paid for income taxes .....	15,000	25,670

Compute the following for both 2010 and 2011:

1. Cash-flow-to-net-income ratio
2. Cash flow adequacy ratio
3. Cash times interest earned ratio

**Exercise 5-38****Forecasted Income Statement and Statement of Cash Flows**

(Note: This exercise uses the same information used in Exercise 4-38.) Romney and Associates wishes to forecast its net income for the year 2012. In addition, for planning purposes Romney intends to construct a forecasted statement of cash flows for 2012. Romney has assembled balance sheet and income statement data for 2011 and has forecast a balance sheet for 2012. In addition, Romney has estimated that its sales in 2012 will rise to \$3,600 and does not anticipate paying any dividends in the coming year. This information is summarized here.

**LO7**

<b>Balance Sheet</b>	<b>2011</b>	<b>2012 Forecasted</b>
Cash .....	\$ 40	\$ 48
Other current assets .....	450	540
Property, plant, and equipment (net) .....	500	700
Total assets .....	<u>\$990</u>	<u>\$1,288</u>
Accounts payable .....	\$190	\$ 228
Bank loans payable .....	500	400
Total stockholders' equity .....	300	660
Total liabilities and stockholders' equity .....	<u>\$990</u>	<u>\$1,288</u>

<b>Income Statement</b>	<b>2011</b>	<b>2012 Forecasted</b>
Sales .....	\$3,000	\$3,600
Cost of goods sold .....	1,200	
Gross profit .....	<u>\$1,800</u>	
Depreciation expense .....	100	
Other operating expenses .....	1,440	
Operating profit .....	\$ 260	
Interest expense .....	50	
Income before taxes .....	<u>\$ 210</u>	
Income taxes .....	84	
Net income .....	<u>\$ 126</u>	

**Instructions:**

1. Prepare a forecasted income statement for 2012. Clearly state what assumptions you make.

2. Prepare a forecasted statement of cash flows for 2012. Use the indirect method of reporting cash from operating activities. (*Hint:* In computing cash paid to purchase new property, plant, and equipment, don't forget to consider the effect of depreciation expense in 2012.)

**Exercise 5-39****LO7****Forecasted Balance Sheet, Income Statement, and Statement of Cash Flows**

(*Note:* This exercise uses the same information used in Exercise 4-39.) Ryan Company wishes to prepare a forecasted income statement, balance sheet, and statement of cash flows for 2012. Ryan's balance sheet and income statement for 2011 follow:

Balance Sheet	2011
Cash .....	\$ 10
Other current assets .....	250
Property, plant, and equipment, net .....	800
Total assets .....	<u>\$1,060</u>
Accounts payable .....	\$ 100
Bank loans payable .....	700
Total stockholders' equity .....	<u>260</u>
Total liabilities and stockholders' equity .....	<u>\$1,060</u>

Income Statement	2011
Sales .....	\$1,000
Cost of goods sold .....	750
Gross profit .....	\$ 250
Depreciation expense .....	40
Other operating expenses .....	80
Operating profit .....	<u>\$ 130</u>
Interest expense .....	70
Income before taxes .....	\$ 60
Income taxes .....	20
Net income .....	<u>\$ 40</u>

In addition, Ryan has assembled the following forecasted information regarding 2012.

- (a) Sales are expected to increase to \$1,500.
- (b) Ryan expects to become more efficient at utilizing its property, plant, and equipment in 2012. Therefore, Ryan expects that the sales increase will not require any overall increase in property, plant, and equipment. Accordingly, the year 2012 property, plant, and equipment balance is expected to be \$800.
- (c) Ryan's bank has approved a new long-term loan of \$200. This loan will be in addition to the existing loan payable.
- (d) Ryan Company does not anticipate paying any dividends in the coming year.

**Instructions:**

1. Prepare a forecasted balance sheet for 2012. Clearly state what assumptions you make.
2. Prepare a forecasted income statement for 2012. Clearly state what assumptions you make.
3. Prepare a forecasted statement of cash flows for 2012. Use the indirect method of reporting cash from operating activities. (*Hint:* In computing cash paid to purchase new property, plant, and equipment, don't forget to consider the effect of depreciation expense in 2012.)

## PROBLEMS

## Problem 5-40

**Preparing the Operating Activities Section of the Statement of Cash Flows**

Podracer Productions provides the following income statement for the year ended December 31, 2011:

## LO3

Sales .....	\$1,530,600
Cost of goods sold .....	895,400
Gross margin .....	\$ 635,200
General expenses .....	255,400
Depreciation expense .....	23,500
Salaries expense .....	114,300
Operating income .....	\$ 242,000
Interest revenue .....	17,250
Interest expense .....	(12,500)
Loss on sale of equipment .....	(9,500)
Income before income taxes .....	\$ 237,250
Income tax expense .....	85,500
Net income .....	\$ 151,750

In addition, Podracer provides the following balance sheet information:

	Dec. 31, 2011	Dec. 31, 2010
Accounts receivable .....	\$250,400	\$225,400
Interest receivable .....	2,100	2,250
Inventory .....	74,300	59,550
Prepaid general expenses .....	17,600	14,000
Accounts payable .....	39,500	46,300
Accrued general expenses .....	19,500	21,750
Interest payable .....	900	1,100
Income taxes payable .....	11,500	9,750
Salaries payable .....	9,850	5,400

**Instructions:** Using the simultaneous analysis matrix illustrated in the text, prepare the Operating Activities section of the statement of cash flows using (1) the direct method and (2) the indirect method.

## Problem 5-41

**Statement of Cash Flows—Indirect Method**

## LO3, LO4

Comparative balance sheet data for Tanzanite Imporium follow. In addition, new equipment was purchased for \$60,000, payment consisting of \$40,000 cash and a long-term note for \$20,000. The short-term note payable was arranged with a supplier to finance inventory purchases on credit. Cash dividends of \$15,000 were paid in 2011; all other changes to retained earnings were caused by the net income for 2011, which amounted to \$92,200.

	Dec. 31, 2011	Dec. 31, 2010
Cash and cash equivalents .....	\$ 42,000	\$ 33,000
Accounts receivable .....	84,000	77,000
Inventory .....	95,700	131,000
Property, plant, and equipment .....	560,000	500,000
Accumulated depreciation—property, plant, and equipment .....	(231,500)	(210,000)
Total assets .....	\$ 550,200	\$ 531,000

	Dec. 31, 2011	Dec. 31, 2010
Short-term notes payable .....	\$ —	\$ 30,000
Accounts payable .....	81,000	69,000
Long-term notes payable .....	110,000	90,000
Bonds payable .....	60,000	120,000
Common stock, \$1 par .....	35,000	35,000
Additional paid-in capital .....	165,000	165,000
Retained earnings .....	99,200	22,000
Total liabilities and stockholders' equity .....	<u>\$550,200</u>	<u>\$531,000</u>

**Instructions:** Prepare a statement of cash flows for the year ended December 31, 2011, using the indirect method.

### Problem 5-42

LO3, LO4

#### Statement of Cash Flows—Indirect Method

The following information was taken from the records of Glassett Produce Company for the year ended June 30, 2011.

Borrowed on long-term notes .....	\$15,000
Issued capital stock .....	45,000
Purchased equipment .....	18,000
Net income .....	32,000
Purchased treasury stock .....	5,000
Paid dividends .....	29,000
Depreciation expense .....	21,000
Retired bonds payable .....	65,000
Patent amortization .....	3,000
Sold long-term investment (at cost) .....	7,200
Increase in cash .....	13,300
Decrease in inventories .....	6,300
Increase in accounts receivable .....	9,200
Increase in accounts payable .....	10,000
Cash balance, July 1, 2010 .....	22,000

#### Instructions:

- From the information given, prepare a statement of cash flows using the indirect method.
- Briefly explain what an interested party would learn from studying the cash flow statement for Glassett Produce Company.

### Problem 5-43

LO3, LO4

#### Statement of Cash Flows—Indirect Method

The following information was obtained from analysis of selected accounts of Orlando Company for the year ended December 31, 2011.

Increase in long-term debt .....	\$ 57,000
Purchase of treasury stock .....	52,000
Depreciation and amortization .....	197,000
Gain on sale of equipment (included in net income) .....	6,000
Proceeds from issuance of common stock .....	184,000
Purchase of equipment .....	434,000
Proceeds from sale of equipment .....	20,000
Payment of dividends .....	49,000
Net income .....	375,000
Increase (decrease) in working capital accounts:	
Cash .....	45,000
Accounts receivable .....	229,000
Inventories .....	275,000
Trade notes payable .....	167,000
Accounts payable .....	124,000
Income taxes payable .....	(34,000)
Cash balance, January 1, 2011 .....	120,000

**Instructions:** From the information given, prepare a statement of cash flows using the indirect method.

**Problem 5-44**

LO3, LO4

**Statement of Cash Flows—Direct Method**

Based on an analysis of the cash and other accounts, the following information was provided by the controller of Black Iron, Inc., a manufacturer of wood-burning stoves, for the year 2011.

- (a) Cash sales for the year were \$210,000; sales on account totaled \$240,000.
- (b) Cost of goods sold was 50% of total sales.
- (c) All inventory is purchased on account.
- (d) Depreciation on equipment was \$86,000 for the year.
- (e) Amortization of patent was \$9,000.
- (f) Collection of accounts receivable was \$98,000.
- (g) Payments on accounts payable for inventory equaled \$123,000.
- (h) Rent expense paid in cash was \$42,000.
- (i) Cash of \$580,000 was obtained by issuing 40,000 shares of \$10 par stock.
- (j) Land worth \$425,000 was acquired in exchange for a \$400,000 bond.
- (k) Equipment was purchased for cash at a cost of \$287,000.
- (l) Dividends of \$115,000 were declared.
- (m) Dividends of \$52,000 that had been declared the previous year were paid.
- (n) A machine used on the assembly line was sold for \$26,000. The machine had a book value of \$19,000.
- (o) Another machine with a book value of \$2,300 was scrapped and was reported as an ordinary loss. No cash was received on this transaction.
- (p) The cash account had a balance of \$79,000 on January 1, 2011.

**Instructions:** Use the direct method to prepare a statement of cash flows for Black Iron, Inc., for the year ended December 31, 2011.

**Problem 5-45**

LO3, LO4

**Statement of Cash Flows—Indirect Method**

Comparative balance sheet data for the partnership of Bond and Wallin follow.

	Dec. 31, 2011	Dec. 31, 2010
Cash .....	\$ 15,000	\$ 12,500
Accounts receivable .....	24,200	27,000
Inventory .....	105,400	91,000
Prepaid expenses .....	4,100	5,350
Furniture and fixtures .....	65,500	41,000
Accumulated depreciation .....	(40,250)	(25,250)
Total assets .....	<u>\$173,950</u>	<u>\$151,600</u>
Accrued expenses .....	\$ 9,000	\$ 6,700
Accounts payable .....	22,425	32,875
Long-term note .....	21,300	—
Ryan Bond, capital .....	69,350	56,150
Trent Wallin, capital .....	51,875	55,875
Total liabilities and stockholders' equity .....	<u>\$173,950</u>	<u>\$151,600</u>

Net income for the year was \$22,000, and this was transferred in equal amounts to the partners' capital accounts. Additional changes in the capital accounts arose from additional investments and withdrawals by the partners. The change in the furniture and fixtures account arose from a purchase of additional furniture; part of the purchase price was paid in cash, and a long-term note was issued for the balance.

**Instructions:** Using the indirect method, prepare a statement of cash flows for 2011.

**Problem 5-46**

LO3, LO4

**Statement of Cash Flows—Indirect Method**

Sparkling Cleaner Company reported net income of \$7,450 for 2011 but has been showing an overdraft in its bank account in recent months. The manager has contacted you as the auditor for an explanation. The comparative balance sheet was given to you for examination, along with the following information.

- (a) Equipment was sold for \$1,700, its cost was \$3,000, and its book value was \$800. The gain was reported as Other Revenue.
- (b) Cash dividends of \$4,870 were paid.

<b>Sparkling Cleaner Company</b>			
<b>Comparative Balance Sheet</b>			
	Dec. 31, 2011	Dec. 31, 2010	
<b>Assets</b>			
Current assets:			
Cash .....	\$ (1,100)	\$ 3,950	
Accounts receivable .....	4,100	2,300	
Inventory .....	3,250	1,150

Total liabilities and stockholders' equity .....	<u>\$47,490</u>	<u>\$49,060</u>	

**Instructions:** Prepare a statement of cash flows using the indirect method.

### Problem 5-47

#### LO3, LO4

### Statement of Cash Flows—Direct Method

The table below shows the account balances of Novations, Inc., at the beginning and end of the company's accounting period.

Debits	Dec. 31, 2011	Jan. 1, 2011
Cash and Cash Equivalents .....	\$176,400	\$ 58,000
Accounts Receivable .....	32,000	26,600
Inventory .....	21,000	25,400
Prepaid Insurance .....	5,600	4,000
Long-Term Investments (at cost) .....	6,000	16,800
Equipment .....	80,000	66,000
Treasury Stock (at cost) .....	10,000	20,000
Cost of Goods Sold .....	368,000	
Operating Expenses .....	185,000	
Income Tax Expense .....	37,600	
Loss on Sale of Equipment .....	1,000	
Total debits .....	<u>\$922,600</u>	<u>\$216,800</u>

Credits	Dec. 31, 2011	Jan. 1, 2011
Accumulated Depreciation—Equipment .....	\$ 19,000	\$ 18,000
Accounts Payable .....	7,000	11,200
Interest Payable .....	1,000	2,000
Income Taxes Payable .....	12,000	8,000
Notes Payable—Long-Term .....	16,000	24,000
Common Stock .....	110,000	100,000
Paid-In Capital in Excess of Par .....	32,000	30,000
Retained Earnings .....	19,600*	23,600
Sales .....	704,000	
Gain on Sale of Long-Term Investments .....	2,000	
Total credits .....	<u>\$922,600</u>	<u>\$216,800</u>

\* Preclosing balance.

The following additional information is available:

- (a) All purchases and sales were on account.
- (b) Equipment costing \$10,000 was sold for \$3,000; a loss of \$1,000 was recognized on the sale.
- (c) Among other items, the operating expenses included depreciation expense of \$7,000; interest expense of \$2,800; and insurance expense of \$2,400.
- (d) Equipment was purchased during the year by issuing common stock and by paying the balance (\$12,000) in cash.
- (e) Treasury stock was sold for \$4,000 less than it cost; the decrease in owners' equity was recorded by reducing Retained Earnings. No dividends were paid during the year.

**Instructions:**

1. Prepare a statement of cash flows for the year ended December 31, 2011, using the direct method of reporting cash flows from operating activities.
2. Comment on the lack of dividend payment. Does a “no-dividend” policy seem appropriate under the current circumstances for Novations, Inc.?

**Problem 5-48**

**Income Statement and Statement of Cash Flows—Indirect Method**

Refer to the data for Novations, Inc., in Problem 5-47.

LO3, LO4, LO6

**Instructions:**

1. Prepare an income statement for Novations, Inc., for the year ended December 31, 2011.
2. Prepare a statement of cash flows for the year ended December 31, 2011, using the indirect method.

**Problem 5-49**

**Articulation**

The following data are for Ernst Company. *Note:* All inventory is purchased on account, and Accounts Payable relates only to the purchase of inventory.

LO6

	Dec. 31, 2011	Dec. 31, 2010
<b>BALANCE SHEET DATA (partial)</b>		
Accounts receivable .....	\$ 72,000	\$65,000
Inventory .....	54,000	41,000
Prepaid rent .....	?	8,000
Accounts payable .....	44,000	52,000
Wages payable .....	23,000	?

**INCOME STATEMENT DATA**

Sales .....	\$485,000
Cost of goods sold .....	?
Wages expense .....	?
Rent expense .....	22,000
Other expenses .....	121,000
Net income .....	?

**CASH FLOW DATA**

Net income .....	?
+/- Change in accounts receivable .....	(7,000)
+/- Change in inventory .....	(13,000)
+/- Change in accounts payable .....	(8,000)
+/- Change in prepaid rent .....	?
+/- Change in wages payable .....	6,000
Cash from operating activities .....	?

**OTHER DATA**

Cash collected from customers .....	?
Cash paid for inventory .....	?
Inventory purchased on account .....	230,000
Cash paid for rent .....	27,000
Cash paid for wages .....	81,000
Cash paid for other expenses .....	121,000

**Instructions:** Compute the following:

1. The ending balance in the prepaid rent account.
2. The beginning balance in the wages payable account.
3. The amount of Cost of Goods Sold for 2011.
4. The amount of Wages Expense for 2011.
5. The amount of reported Net Income for 2011.
6. The amount of cash collected from customers during 2011.
7. The amount of cash paid for inventory during 2011.

**Problem 5-50****LO5****Analysis of Cash Flow Data**

The following summary data are for Gwynn Company:

	2011	2010	2009
Cash .....	\$ 85,000	\$ 75,000	\$ 70,000
Other current assets .....	480,000	420,000	390,000
Current liabilities .....	325,000	270,000	290,000
Depreciation expense .....	57,000	51,000	44,000
Net income .....	59,000	50,000	45,000

All current assets and current liabilities relate to operations.

**Instructions:**

1. Compute net cash provided by (used in) operating activities for 2010 and 2011.
2. How would the numbers you computed in (1) change if Gwynn had decided to delay payment of \$40,000 in accounts payable from late 2010 to early 2011? This will increase both Cash and Accounts Payable as of December 31, 2010; the December 31, 2011, amounts will be unaffected.
3. Ignore the change described in (2). How would the numbers you computed in (1) change if Gwynn had decided to delay purchase of \$40,000 of inventory for cash from late 2010 to early 2011? This will increase cash but decrease inventory as of December 31, 2010; the December 31, 2011, amounts will be unaffected.
4. Can net cash from operations be manipulated? Explain your answer.

## Problem 5-51

## Definitions of Cash Flow

The following summary information is for Numbers Company:

## LO3

	2011	2010	2009	2008
Net income .....	\$ 90	\$ 90	\$ 90	\$ 90
Depreciation expense .....	40	40	40	40
Change in accounts receivable .....	+15	-30	0	+20
Change in inventory .....	+10	-25	+15	-5
Change in accounts payable .....	+30	0	-20	+15

## Instructions:

1. Compute net cash provided by (used in) operating activities for Numbers Company for the years 2008 through 2011.
2. One definition of *cash flow* often used in financial analysis is “net income + depreciation.” Use this definition to compute cash flow for Numbers Company for the years 2008 through 2011.
3. Under what circumstances is the “net income + depreciation” measure of cash flow a good estimate of actual cash flow from operations? Under what circumstances is it a particularly misleading measure?

## Problem 5-52

## Cash Flow Analysis

Following are data from the financial statements for Drury Lane Company:

## LO5

**Drury Lane Company**  
**Selected Financial Statement Data**  
**For the Years Ended December 31, 2011 and 2010**  
(In millions of dollars)

	2011	2010
Sales .....	\$ 90,000	\$85,000
Total assets .....	105,000	98,000
Stockholders' equity .....	34,000	32,000
Net income .....	9,200	8,500
Cash from operations .....	12,300	19,800
Cash paid for capital expenditures .....	13,100	12,900
Cash paid for acquisitions .....	2,800	900
Cash paid for interest .....	1,800	1,500
Cash paid for income taxes .....	3,300	3,000

## Instructions:

1. Compute the following for 2010 and 2011.
  - (a) Return on sales
  - (b) Return on assets
  - (c) Return on equity
  - (d) Cash-flow-to-net-income ratio
  - (e) Cash flow adequacy ratio
  - (f) Cash times interest earned ratio
2. In which year did Drury Lane Company perform better, 2010 or 2011? Explain your answer.
3. Drury Lane Company intends to sell a large block of newly issued stock to the public in the first half of 2012. Given your computations in (1), what questions would you like to ask of Drury Lane's management before investing in the newly issued stock?

## Problem 5-53

## Forecasted Balance Sheet, Income Statement, and Statement of Cash Flows

(Note: This problem uses the same information used in Problem 4-52.) Lorien Company wishes to prepare a forecasted income statement, a forecasted balance

## LO7

sheet, and a forecasted statement of cash flows for 2012. Lorien's balance sheet and income statement for 2011 follow:

Balance Sheet	2011
Cash .....	\$ 40
Other current assets .....	350
Property, plant, and equipment, net .....	1,000
Total assets .....	<u>\$1,390</u>
Accounts payable .....	\$ 100
Bank loans payable .....	1,000
Paid-in capital .....	100
Retained earnings .....	190
Total liabilities and stockholders' equity .....	<u>\$1,390</u>

Income Statement	2011
Sales .....	\$1,000
Cost of goods sold .....	350
Gross profit .....	\$ 650
Depreciation expense .....	200
Other operating expenses .....	250
Operating profit .....	\$ 200
Interest expense .....	120
Income before taxes .....	\$ 80
Income taxes .....	20
Net income .....	<u>\$ 60</u>

In addition, Lorien has assembled the following forecasted information for 2012.

- (a) Sales are expected to increase to \$1,200.
- (b) Lorien does not expect to buy any new property, plant, and equipment during 2012. (*Hint:* Think about how depreciation expense in 2012 will affect the reported amount of property, plant, and equipment.)
- (c) Because of adverse banking conditions, Lorien does not expect to receive any new bank loans in 2012.
- (d) Lorien plans to pay cash dividends of \$15 in 2012.

**Instructions:**

1. Prepare a forecasted balance sheet, a forecasted income statement, and a forecasted statement of cash flows for 2012. Clearly state what assumptions you make. Use the indirect method for reporting cash from operating activities.
2. If you have constructed your forecasted cash flow statement correctly, you will see that Lorien plans to distribute cash to shareholders through two different means in 2012. Which of these methods involves distributing an equal amount of cash for each share owned? Which of these methods channels the cash to shareholders who are the least optimistic about the prospects of the company?

**Problem 5-54**

**LO3**

**Sample CPA Exam Questions**

1. Accounts Receivable has a beginning balance of \$425,000 and an ending balance of \$437,000. Cash collected from customers during the period was \$1,263,000. Sales for the period were:
  - (a) \$1,251,000.
  - (b) \$1,263,000.
  - (c) \$1,275,000.
  - (d) \$1,287,000.

2. Ruse Inc. reported net income for 2011 of \$174,000. Ruse also reported the following related to its current assets and liabilities:

	Dec. 31, 2011	Dec. 31, 2010
Accounts receivable .....	\$ 84,000	\$ 86,000
Inventory .....	117,000	101,000
Accounts payable .....	150,000	140,000

What amount should be reported by Ruse Inc. as cash provided by operating activities in the statement of cash flows?

- (a) \$150,000  
 (b) \$170,000  
 (c) \$178,000  
 (d) \$198,000
3. In the statement of cash flows (using the indirect method), an increase in interest payable should be presented as a(n):
- (a) subtraction from net income in the Operating Activities section.  
 (b) addition to net income in the Operating Activities section.  
 (c) subtraction in the Financing Activities section.  
 (d) addition in the Financing Activities section.

## CASES

### Discussion Case 5-55

#### Is Depreciation a Source of Cash?

Brad Berrett and Jim Wong are roommates in college. Berrett is an accounting major, and Wong is a finance major. Both recently studied the statement of cash flows in their classes. Wong's finance professor stated that depreciation is a major source of cash for some companies. Berrett's accounting professor indicated in class that depreciation cannot be a source of cash because cash is not affected by the recording of depreciation.

Berrett and Wong wonder which professor is correct. Explain the positions taken by both professors and indicate which viewpoint you support and why.

### Discussion Case 5-56

#### Where Does All the Money Go?

Price Auto Parts has hired you as a consultant to analyze the company's financial position. One of the owners, DeeAnn Price, is in charge of the company's financial affairs. She makes all deposits and pays the bills but has an accountant prepare a balance sheet and an income statement once a year. The business has been quite profitable over the years. In fact, two years ago Price opened a second store and is now considering a third outlet. The economy has slowed, however, and the company's cash position has become very tight. The company is having an increasingly difficult time paying its bills. DeeAnn has not been able to explain satisfactorily to her partners what is happening. What factors should you consider, and what recommendations might you make to Price?

### Discussion Case 5-57

#### Why Do We Have More Cash?

Hot Lunch Delivery Service has always had a policy to pay stockholders annual dividends in an amount exactly equal to net income for the year. Joe Alberg, the company's president, is confused because the Cash balance has been consistently increasing ever since Hot Lunch began operations five years ago in spite of its faithful adherence to the dividend policy. Assuming no errors have been made in the bookkeeping process, explain why this situation might occur.

**Discussion  
Case 5-58**

**Which Method Should We Use: The Direct or the Indirect Method?**

As the assistant controller of Do-It-Right Company, you have been given the assignment to study FASB *Statement No. 95* and make recommendations on how the company should prepare its statement of cash flows. Specifically, you are to indicate which method—the direct or the indirect—should be used in reporting cash flows from operating activities. Which method do you recommend and why?

**Discussion  
Case 5-59**

**Some Accountant You Are!**

Early in the year 2012, John Roberts, a recent graduate of Southeast State College, delivers the financial statements shown below to Laura Dennis of Dennis, Inc. After a quick review, Dennis exclaims, “What do you mean I had net income of \$20,000? I borrowed \$40,000 from the bank and my cash balance decreased by \$2,000. I must have had a loss! Some accountant you are!” How should Mr. Roberts answer Ms. Dennis?

Dennis, Inc. Comparative Balance Sheet December 31, 2011 and 2010		
	2011	2010
<b>Assets</b>		
Cash .....	\$ 3,000	\$ 5,000
Accounts receivable .....	18,000	8,000
Inventory .....	20,000	15,000
Equipment (at cost) .....	52,000	20,000
Accumulated depreciation .....	(10,000)	(5,000)
Total assets .....	<u>\$83,000</u>	<u>\$43,000</u>
<b>Liabilities and Stockholders' Equity</b>		
Accounts payable .....	\$ 4,000	\$ 9,000
Notes payable—long-term .....	40,000	—
Common stock, \$1 par .....	2,000	2,000
Additional paid-in capital .....	18,000	18,000
Retained earnings .....	19,000	14,000
Total liabilities and stockholders' equity .....	<u>\$83,000</u>	<u>\$43,000</u>

Dennis, Inc. Combined Statement of Income and Retained Earnings For the Year Ended December 31, 2011		
Sales .....		\$240,000
Cost of goods sold .....	\$150,000	
Operating expenses (including depreciation of \$5,000) .....	70,000	220,000
Net income .....		\$ 20,000
Add: Retained earnings, January 1, 2011 .....		14,000
Deduct: Dividends paid .....		(15,000)
Retained earnings, December 31, 2011 .....		<u>\$ 19,000</u>

**Discussion  
Case 5-60**

**The Secret of Cash Flow Patterns**

Kara Nemrow, a security analyst for Primer Mead & Co., asserts that she can tell more about a company's financial condition by looking at the trends of the negative or positive cash flows in the three categories than from other information found in the financial statements. She illustrates her theory with the following pattern of cash flows for Atlas Security over the past three years.

	2011	2010	2009
Net income .....	-	+	+
Cash flows from:			
Operating activities .....	-	-	+
Financing activities .....	+	+	+
Investing activities .....	+	+	+

How do you think Kara would analyze this pattern? Do you agree that analyzing cash flow patterns provides superior analytical information?

### Discussion Case 5-61

#### W. T. Grant: What Is “Cash Flow”?

The case of **W. T. Grant** is a classic in cash flow analysis. During the 1960s and 1970s, Grant was one of the largest retailers in the United States, with more than 1,200 stores nationwide. Grant was a stable New York Stock Exchange firm that had paid cash dividends every year since 1907. However, the inability of Grant’s operations to generate positive cash flow indicated the existence of serious problems. From 1966 through 1973, while Grant’s net income was steady at about \$35 million per year, cash flow from operations was negative in every year except 1968 and 1969, and even in those years the positive cash flow generated was insignificant in amount. The results for the fiscal year ended January 31, 1973, are the most striking. Net income for the year was \$38 million. A frequently used measure of “cash flow” (net income and depreciation) suggested that W. T. Grant’s operations generated \$48 million in cash. However, actual cash flow generated by operations for the year was a negative \$120 million. In October 1975, Grant filed for bankruptcy, and by early 1976, the company was liquidated and ceased to exist.

What might have caused the “net income + depreciation” measure of cash flow to be positive when in fact actual cash flow from operations was negative? Under what circumstances is the “net income + depreciation” measure of cash flow a good estimate of actual cash flow from operations? When is it a bad measure?

SOURCES: James A. Largay III and Clyde P. Stickney, “Cash Flows, Ratio Analysis and the W. T. Grant Company Bankruptcy,” *Financial Analysts Journal*, July/August 1980, pp. 51–54; and *Moody’s Handbook of Common Stocks*, 2nd quarterly ed. (1973).

### Case 5-62

#### Deciphering Financial Statements (InfoSonics)

**InfoSonics Corporation** is a rapidly growing provider of wireless handsets and accessories in the United States and Latin America. The company distributes products for many important manufacturers, including **Samsung**, **LG**, and **Novatel**. InfoSonics’ consolidated comparative statement of cash flows for 2004, 2005, and 2006 follows.

For the year ended December 31,	2006	2005	2004
<b>CASH FLOWS FROM OPERATING ACTIVITIES</b>			
Net Income .....	\$ 2,538,822	\$ 2,707,122	\$ 38,096
Adjustments to reconcile net income from operations to net cash provided by (used in) operating activities			
Depreciation and amortization .....	154,479	93,658	28,390
Loss on disposal of fixed assets .....	—	2,334	2,017
Provision for bad debt .....	126,560	302,993	(109,990)
Provision for obsolete inventory .....	5,031	108,390	62,606

Income tax liabilities .....	17,100	—	(821,982)
Cash used in continuing operations .....	(7,498,515)	(5,730,126)	(2,267,023)
Cash provided by (used in) discontinued operations .....	14,722	(531,463)	1,082,834
<b>Net cash used in operating activities .....</b>	<b>\$ (7,483,793)</b>	<b>\$ (6,261,589)</b>	<b>\$ (1,184,189)</b>

CASH FLOWS FROM INVESTING ACTIVITIES			
Purchase of property and equipment .....	\$ (342,747)	\$ (291,306)	\$ (230,920)
Sale of property and equipment .....	—	6,250	—
<b>Net cash used in investing activities .....</b>	<b>\$ (342,747)</b>	<b>\$ (285,056)</b>	<b>\$ (230,920)</b>
CASH FLOWS FROM FINANCING ACTIVITIES			
Bank overdraft .....	—	—	(867,555)
Borrowings from line of credit .....	188,423,458	93,922,834	48,404,847
Payments on line of credit .....	(172,774,844)	(86,486,949)	(51,077,191)
Payments on subordinated notes payable—related parties .....	—	—	(30,000)
Offering costs .....	(1,005,582)	—	(1,887,686)
Cash received from stock, options and warrants .....	15,722,850	1,639,799	12,054,000
<b>Net cash provided by financing activities .....</b>	<b>\$ 30,365,882</b>	<b>\$ 9,075,684</b>	<b>\$ 6,596,415</b>
Effect of exchange rate changes on cash .....	(8,865)	—	—
Net increase in cash and cash equivalents .....	22,530,477	2,529,039	5,181,306
<b>Cash and cash equivalents, beginning of period .....</b>	<b>7,712,915</b>	<b>5,183,876</b>	<b>2,570</b>
<b>Cash and cash equivalents, end of period .....</b>	<b>\$ 30,243,392</b>	<b>\$ 7,712,915</b>	<b>\$ 5,183,876</b>
Cash paid for interest .....	324,383	353,233	136,144
Cash paid for income taxes .....	2,216	545,915	1,285,798

1. For each year reported InfoSonics reports a profit, and each year cash flow from operating activities is negative. Identify the primary reason for the negative cash from operating activities.
2. How is InfoSonics compensating for the negative cash from operating activities?
3. In your opinion, is InfoSonics' negative cash from operating activities sustainable over the long term?

### Case 5-63

#### Deciphering Financial Statements (The Walt Disney Company)

Locate the 2007 financial statements for **The Walt Disney Company** on the Internet and consider the following questions:

1. Does Disney use the direct method or the indirect method? Explain.
2. Analyze Disney's overall cash flow picture for 2005, 2006, and 2007 in light of the positive or negative cash flow patterns for the three categories of cash flows.
3. In the notes to Disney's financial statements, *cash and cash equivalents* is defined. What is that definition?
4. What is the largest dollar item in the Operating Activities section of Disney's 2007 statement of cash flows? Explain exactly what is represented by this item.
5. What would Disney's operating cash flow have been in 2007 if interest and taxes paid were not considered to be operating items?
6. Companies often compute earnings before interest, taxes, depreciation, and amortization (EBITDA). This number is used as an approximation of operating cash flow before interest and taxes. Using the information in Disney's income statement and statement of cash flows, compute EBITDA for 2007. Compare EBITDA to your answer in (5), and explain why there is a difference.

### Case 5-64

#### Deciphering Financial Statements (Lockheed Martin Corporation)

**Lockheed Martin Corporation** is a well-known producer of advanced aircraft, missiles, and space hardware. Lockheed Martin is most famous for its super-secret research and development division, nicknamed the "Skunk Works." Among the high-tech aircraft developed at the Skunk Works are the SR-71 Blackbird spy plane and the F-117A Stealth fighter.

The consolidated statement of cash flows from Lockheed Martin's 2006 annual report is reproduced on page 276.

When investors and analysts use the term *cash flow*, they can mean a variety of things. Some common definitions of cash flow are as follows:

- (a) Net income + Depreciation
- (b) Cash flow from operating activities

- (c) Cash flow from operating activities + Cash paid for interest + Cash paid for income taxes
- (d) Cash flow from operating activities – Capital expenditures – Dividends

**Lockheed Martin Corporation**  
**CONSOLIDATED STATEMENT OF CASH FLOWS**

(in millions)	Year ended December 31,		
	2006	2005	2004
<b>Operating Activities</b>			
Net earnings .....	\$ 2,529	\$ 1,825	\$ 1,266
Adjustments to reconcile net earnings to net cash provided by operating activities:			
Depreciation and amortization .....	600	555	511
Amortization of purchased intangibles .....	164	150	145
Deferred income taxes .....	75	24	(58)
Changes in operating assets and liabilities:			
Receivables .....	94	(390)	(87)
Inventories .....	(530)	(39)	519
Accounts payable .....	217	239	288
Customer advances and amounts in excess of costs incurred .....	475	296	(228)
Other .....	159	534	568
Net cash provided by operating activities .....	3,783	3,194	2,924
<b>Investing Activities</b>			
Expenditures for property, plant, and equipment .....	(893)	(865)	(769)
Acquisition of businesses/investments in affiliates .....	(1,122)	(564)	(91)
Divestitures of businesses/investments in affiliates .....	180	935	279
Sale (purchase) of short-term investments, net .....	48	(33)	(156)
Other .....	132	28	29
Net cash used for investing activities .....	(1,655)	(499)	(708)
<b>Financing Activities</b>			
Issuances of common stock and related amounts .....	756	406	164
Repurchases of common stock .....	(2,115)	(1,310)	(673)
Common stock dividends .....	(538)	(462)	(405)
Premium and transaction costs for debt exchange .....	(353)	—	—
Repayments of long-term debt .....	(210)	(133)	(1,089)
Long-term debt repayment costs .....	—	(12)	(163)
Net cash used for financing activities .....	(2,460)	(1,511)	(2,166)
Net (decrease) increase in cash and cash equivalents .....	(332)	1,184	50
Cash and cash equivalents at beginning of year .....	2,244	1,060	1,010
Cash and cash equivalents at end of year .....	\$ 1,912	\$ 2,244	\$ 1,060
Supplemental Disclosure Information Cash paid during the year for:			
Interest .....	\$ 337	\$ 356	\$ 420
Taxes .....	859	599	363

**Instructions:**

- Using the data from Lockheed's statement of cash flows, compute values for the four measures of *cash flow* defined above for 2004, 2005, and 2006. Use net earnings as *net income*. For *capital expenditures*, use expenditures for property, plant, and equipment.
- One of the definitions (a) through (d) is sometimes given the title *free cash flow* because it indicates the amount of discretionary cash generated by a business. Free cash flow is thought of as the amount of cash that an owner can remove from a business without harming its long-term potential. Which of these four definitions do you think applies to free cash flow? Explain.
- A leveraged buyout (LBO) is the purchase of a company using borrowed money. The idea behind an LBO is to borrow the money, buy the company, and then repay the loan using the cash flow generated by the purchased company. Which of the four definitions of cash flow do you think would be particularly useful to someone considering an LBO? Explain.

## Case 5-65

**Deciphering Financial Statements (The Coca-Cola Company)**

The following data were obtained from the cash flow statements (prepared using the indirect method) of **The Coca-Cola Company** from 2003 through 2006. All amounts are in millions of U.S. dollars.

	2006	2005	2004	2003
Net income .....	\$ 5,080	\$ 4,872	\$ 4,847	\$ 4,347
Cash from operating activities .....	5,957	6,423	5,968	5,456
Cash from investing activities .....	(1,700)	(1,496)	(503)	(936)
Cash from financing activities				
Issuances of debt .....	617	178	3,030	1,026
Payments of debt .....	(2,021)	(2,460)	(1,316)	(1,119)
Issuances of stock .....	148	230	193	98
Purchases of stock for treasury .....	(2,416)	(2,055)	(1,739)	(1,440)
Dividends .....	(2,911)	(2,678)	(2,429)	(2,166)
At January 1, 2003, the following items had the indicated balances:				
Cash .....				\$ 2,260
Paid-In Capital from Common Stock (includes par value and additional paid-in capital) .....				4,730
Retained Earnings .....				24,506
Treasury Stock .....				14,389

**Instructions:**

- Using the information given, estimate the December 31, 2006, balances in the following accounts.
  - Cash
  - Paid-In Capital from Common Stock
  - Retained Earnings
  - Treasury Stock
- Comment on the size of the December 31, 2006, balance in the paid-in capital from common stock account in relation to the balance in the treasury stock account.

## Case 5-66

**Writing Assignment (Where is your statement of cash flows?)**

You are a senior credit analyst for Far West Bank. The president of Moran Auto Sales has asked you for a loan of \$2,000,000. Moran's accountant has compiled and submitted a current balance sheet and income statement. Moran has had moderate income over the past three years but has found itself short of cash and therefore in need of the loan.

After receiving the statements, you call Moran's accountant and indicate that the financial statements are not complete; you need to see a statement of cash flows. The accountant argues, "Everything on a statement of cash flows comes from the other two statements. Why make me do the additional work? Just analyze what we sent."

Your task now is to write a memo to the president of Moran Auto Sales convincing her that a statement of cash flows is essential for you to properly evaluate Moran's loan application.

## Case 5-67

**Researching Accounting Standards**

To help you become familiar with the accounting standards, this case is designed to take you to the FASB's Web site and have you access various publications. Access the FASB's Web site at <http://www.fasb.org>. Click on "Pronouncements & EITF Abstracts."

The topic of this chapter was the statement of cash flows. For this case, we will use *Statement of Financial Accounting Standards No. 95*, "Statement of Cash Flows." Open *FASB Statement No. 95*.

- Read paragraph 8. What investments would qualify as cash equivalents?
- Read paragraph 33. What is the FASB's ruling regarding the reporting of cash flow per share?

3. Read the dissenting opinion that begins on page 12 of the statement. How many of the seven members of the FASB voted against the issuance of FASB *Statement No. 95*? For those who dissented, what issue did they raise with regard to the classification of interest received and paid and of dividends paid?

### Case 5-68

#### Ethical Dilemma (Is the price right?)

You are a finance and accounting analyst for Bunsicar Company and have been with the firm for five years. Bunsicar is a closely held corporation—all of the shares are owned by the founder, Ryan Brown, and by other long-time employees. Bunsicar is preparing to issue stock for the first time in an initial public offering (IPO). Of great interest is the initial selling price of the stock because that will determine how much Brown and the others will reap from the sale of their shares.

The board of directors has put together an analysis proposing that the initial selling price be set at \$15 per share. Because Brown and the other insiders intend to sell 10 million shares, this price will bring them \$150 million. The analysis relies heavily on the trend in Bunsicar's earnings, which have grown sharply, particularly in the past year.

You have the reputation of possessing the best presentation skills in the company. The board of directors has asked you to present the \$15-per-share proposal to the investment banking firm that will handle Bunsicar's IPO. This is your big chance.

As you review the board's analysis in preparing your presentation, you notice that no mention is made of Bunsicar's cash flow from operations (CFO). CFO has been fairly steady for the past few years; at the same time, earnings have more than doubled. In the past year, when earnings increased 65%, CFO actually declined slightly. After some investigation, you find that Bunsicar has become very loose in its assumptions about when revenue should be recognized. In fact, putting the revenue and cash flow numbers together, you conclude that most of Bunsicar's earnings increase has come from questionable revenue that probably will never be collected in cash. It seems clear to you that Bunsicar's accounting assumptions have been manipulated to make reported income look as good as possible to increase the IPO selling price.

Your presentation is scheduled for the day after tomorrow. What should you do?

### Case 5-69

#### SPREADSHEET

#### Cumulative Spreadsheet Analysis

This spreadsheet assignment is a continuation of the spreadsheet assignments given in earlier chapters. If you completed those assignments, you have a head start on this one.

Refer back to the instructions for preparing the revised financial statements for 2011 as given in part (1) of the Cumulative Spreadsheet Analysis assignment in Chapter 3.

1. Skywalker wishes to prepare a *forecasted* balance sheet, a *forecasted* income statement, and a *forecasted* statement of cash flows for 2012. Use the financial statement numbers for 2011 as the basis for the forecast, along with the following additional information.
  - (a) Sales in 2012 are expected to increase by 40% over 2011 sales of \$2,100.
  - (b) In 2012, Skywalker expects to acquire new property, plant, and equipment costing \$240.
  - (c) The \$480 in operating expenses reported in 2011 breaks down as follows: \$15 depreciation expense and \$465 other operating expenses.
  - (d) No new long-term debt will be acquired in 2012.
  - (e) No cash dividends will be paid in 2012.
  - (f) New short-term loans payable will be acquired in an amount sufficient to make Skywalker's current ratio in 2012 exactly equal to 2.0.
  - (g) Skywalker does not anticipate repurchasing any additional shares of stock during 2012.
  - (h) Because changes in future prices and exchange rates are impossible to predict, Skywalker's best estimate is that the balance in accumulated other comprehensive income will remain unchanged in 2012.

- (i) In the absence of more detailed information, assume that investment securities, long-term investments, other long-term assets, and intangible assets will all increase at the same rate as sales (40%) in 2012.
- (j) In the absence of more detailed information, assume that other long-term liabilities will increase at the same rate as sales (40%) in 2012.

(*Note:* The forecasted balance sheet and income statement were constructed as part of the spreadsheet assignment in Chapter 4; you can use that spreadsheet as a starting point if you have completed that assignment.) In addition, assume the following:

- (k) The investment securities are classified as available for sale. Accordingly, cash from the purchase and sale of these securities is classified as an investing activity.
- (l) Transactions impacting other long-term assets and other long-term liabilities accounts are operating activities.

[*Hint:* Construction of the forecasted statement of cash flows for 2012 involves analyzing the forecasted income statement for 2012 along with the balance sheets for 2011 (actual) and 2012 (forecasted).]

2. Repeat (1) with the following change in assumptions:
  - (a) Sales growth in 2012 is expected to be 25%.
  - (b) Sales growth in 2012 is expected to be 50%.
3. Comment on the forecasted values of cash from operating activities in 2012, assuming that sales will grow at 25%, 40%, and 50%, respectively.

C H A P T E R

EARNINGS MANAGEMENT

XEROX SQUARE

Chester Carlson was a patent attorney. He was frustrated at the time and expense involved in producing copies of patent documents. Copies of text documents could be produced by retyping them with carbon paper inserted between multiple sheets of blank typing paper. Drawings were reproduced by sending them out to be professionally photographed. Carlson pondered how he might make single copies of any sort of document right in the office with just the push of a button. Carlson had a technical background, having graduated from Cal Tech and worked at **Bell Labs** for a time. Accordingly, he was aware of the fairly recent discovery of the photoconductivity of some materials. These materials, when exposed to light, were transformed from electrical insulators to electrical conductors. Carlson combined the phenomena of photoconductivity and static electricity to devise a process for making copies; he applied for his first patent in 1937.

Patent application notwithstanding, Chester Carlson didn't have the necessary engineering skills to bring his copying process to life. Accordingly, he hired a young engineer, and the two of them worked on the process in a backroom behind a beauty parlor in Astoria, Long Island. They made their first successful copy on October 22, 1938; the text of the copy was "10-22-38 Astoria." Carlson called the process "electrophotography." This was later changed to *xerography*, from the Greek words for dry (*xeros*) and writing (*graphein*). The five steps in xerography are outlined in Exhibit 6-1; as you can tell from the description and from your experience with copy machines today, the general xerography process is the same today as it was back in 1938.

Chester Carlson approached 20 companies with his new process, but none were interested. For several years, **IBM** considered buying the patent from Carlson but ultimately decided against it. Finally, in 1944 Carlson was able to convince **Batelle Memorial Institute** of Columbus, Ohio, to commercially develop his xerography process. Batelle was to get 60% of the proceeds, leaving Carlson with 40%. The progress of Batelle scientists was slow initially because of their continuing work on war-related research. By 1946, after the conclusion of World War II, the Batelle researchers had refined xerography to the point at which it was commercially viable. On January 2, 1947, Batelle licensed the process to **Haloid Company**, a producer of photographic paper based in Rochester, New York, for \$50,000 plus royalties on sales. When this

## LEARNING OBJECTIVES

- 1 Identify the factors that motivate earnings management.
- 2 List the common techniques used to manage earnings.
- 3 Critically discuss whether a company should manage its earnings.
- 4 Describe the common elements of an earnings management meltdown.
- 5 Explain how good accounting standards and ethical behavior by accountants lower the cost of obtaining capital.

### EXHIBIT 6-1

#### The Five Key Steps in Xerography

1. A plate (or drum) made of a photoconductive material is charged with positive static electricity. The original material used by Chester Carlson was sulfur; commonly used photoconductive materials now are selenium, germanium, and silicon.
2. The plate is exposed to light reflected from the page to be copied. Where the light falls on the photoconductive material, the material becomes an electrical conductor and the positive charge is dissipated. In the shadows (corresponding to the image to be copied), the positive static charge remains.
3. The plate is dusted with a negatively charged powder, the toner. The toner particles stick to the positively charged areas of the plate, duplicating the image to be copied.
4. A piece of paper that has been supercharged with positive static electricity is placed over the plate. The negatively charged toner is attracted away from the plate by the supercharged paper.
5. The paper is heated, melting the toner and fusing the image onto the paper.

deal was signed, Chester Carlson quit his job as a patent attorney and prepared to sit back and let the sales royalties roll in. He soon realized that there was still much work to be done before Haloid could mass-produce xerography machines; Carlson was back at his job within a month. Ultimately, Chester Carlson wound up with \$2 million and 150,000 shares of Haloid stock.

Haloid produced its first xerography machine, the Xerox Model A, in 1949. This initial model required the user to perform 14 steps and took 45 seconds to make a single copy. Between 1949 and 1961, Haloid invested more than \$90 million in improving its xerography machines. In 1959, Haloid released the Xerox 914. Following the practice of renting, rather than selling, its machines made popular by IBM, Haloid was able to place 20,000 Xerox 914 machines by 1962. Each machine produced yearly rental revenue averaging \$4,000, and it had cost Haloid just \$2,500 to manufacture each machine. Haloid became the original high-tech, high-flying glamour stock; the company had a price-earnings ratio of over 100 in 1961. In that same year, Haloid changed its name to **Xerox**.

Through the 1960s and 1970s, Xerox continued to be a very profitable company known for its innovative products. In 1970, the company opened its Palo Alto Research Center (PARC) near Stanford University. During the 1970s, many of the products developed at PARC were truly 20 years ahead of their time. For example, by 1974 PARC researchers had developed a personal computer, the Alto, that employed a Windowslike screen, allowed the user to execute commands by pointing and clicking with a mouse, and was networked with other machines through Ethernet. In 1977, PARC researchers were able to add the computer industry's first laser printer to this networked configuration. Unfortunately for Xerox, the traditional East Coast executives of the company didn't share the enthusiasm for personal computers expressed by the West Coast PARC researchers. The Alto (and its successor,

fyi

**On March 17, 1988, Apple Computer brought suit against Microsoft, claiming that Windows 2.03 illegally copied the “look and feel” of the Apple Macintosh graphical user interface. Reportedly, Bill Gates’ response was that both he and Apple cofounder Steve Jobs had taken the idea from PARC.**

the Star) were never fully embraced by either customers (because of their relatively high price) or the Xerox sales force. Xerox stopped producing personal computers in the early 1980s.

In the 1980s, Xerox faced stiff competition from Japanese copy machine makers such as **Canon** and **Ricoh**. Xerox was able to maintain its profitability through aggressive cost cutting and improvement in quality. Then in the 1990s, Xerox faced another threat as companies focused more on “digital documents,” calling into question the need for large-scale paper copy machines. Xerox fought back again with its digital and color copiers and its slogan, “The Document Company.” Through mid-1999, the Xerox business strategy seemed to be working. In July 1999, the company's shares were trading for \$50.00 each, and financial analysts were expecting the next year (fiscal 2000) to be a record-breaking one, with earnings forecasted to top \$3.00 per share (compared to the \$2.67 per share expected to be reported in fiscal 1999).

Unknown to analysts and investors in July 1999, the favorable revenue and earnings numbers reported by Xerox from 1997 through 1999 were more the result of accounting manipulations than effective business practices. As revealed through a subsequent SEC investigation, Xerox had accelerated the recognition of revenue and boosted reported earnings through the use of both non-GAAP (generally accepted accounting principles) accounting practices and changes in GAAP accounting practices that were not disclosed to financial statement users. Some of these practices follow:

**Lease discount rates in Brazil.** Xerox sometimes accounts for the lease of a copy machine as a sale, with financing provided by Xerox. This is entirely acceptable and is discussed in Chapter 15 in the section on sales-type leases. A sales-type lease involves both initial sales revenue and interest revenue over the life of the lease. An accounting assumption about the appropriate interest rate associated with the financing aspect of the lease

fyi

**Xerox has been so successful in the copy machine business that the company has had difficulty preserving the trademark status of the word xerox. Like the words *aspirin*, *escalator*, and *zipper*, which were once the trade names of specific products, the word xerox runs the risk of passing into generic usage and losing its legal protection.**

determines the mix between initial sales revenue and subsequent interest revenue. For example, assume that a copy machine is leased for 10 years with annual lease payments of \$1,000. Over the life of the lease, total revenue of \$10,000 (10 years  $\times$  \$1,000) will be recognized. If it is assumed that the appropriate interest rate is 6%, immediate sales revenue is \$7,360 (the present value of \$1,000 per year for 10 years at a 6% discount rate), and interest revenue over the life of the lease is \$2,640 (\$10,000 – \$7,360). In contrast, if the appropriate interest rate is assumed to be 25%, immediate sales revenue is \$3,571, and subsequent interest revenue is \$6,429. The key difference between sales revenue and interest revenue is that the sales revenue is reported immediately whereas the interest revenue is spread over the life of the lease. To increase reported revenue in its Brazilian subsidiary, Xerox's accounting staff assumed interest rates as low as 6% when accounting for its leases. This assumption was made even though Xerox's own borrowing rate in Brazil was in excess of 25%. Xerox did not disclose details about this key accounting assumption to financial statement users.

**Income tax refund receivable in the United Kingdom.** In 1995, Xerox won a tax dispute in the United Kingdom. As a result, the company was entitled to a refund of \$237 million in overpaid taxes. Xerox recorded this victory by debiting tax refund receivable. However, instead of crediting income for the entire \$237 million immediately, as required by GAAP, Xerox deferred much of the income to be recognized in future periods. As explained later in the chapter, this is known as creating a "cookie jar reserve." Basically, through this accounting procedure Xerox was free to recognize the \$237 million in income in whatever quarter it needed in order to meet performance targets or analyst expectations.

**Bad debts and sales returns at Xerox Mexico.** In the mid-1990s, the managers of Xerox Mexico relaxed credit standards for customers in order to increase sales to meet revenue targets set by corporate headquarters. This practice did increase immediate sales, but it also increased the estimated amount of bad debts by \$127 million. To avoid recognizing this \$127 million in bad debts, the managers of Xerox Mexico renegotiated the credit terms, lengthening payment periods for delinquent accounts to maintain the appearance that the accounts were actually collectible. In addition, Xerox Mexico received \$27 million in sales returns from 1996 through 2000. To avoid recording this return of merchandise (and associated reduction in net sales), secret warehouses were rented to store the returned merchandise. Again, these activities were done in order to allow the managers of Xerox Mexico to meet the aggressive targets imposed by Xerox company headquarters.

In total, Xerox accelerated the reporting of more than \$6 billion in revenue in the period 1997–2000 and increased reported earnings by \$1.4 billion during the same period. At the peak of the earnings manipulation in 1998, more than 30% of Xerox's reported earnings stemmed from undisclosed changes in accounting practices. An SEC investigation uncovering Xerox's accounting abuses resulted in a \$10 million fine for the company; at the time, this was the largest fine ever imposed for misleading financial reporting.

Until 2001, Xerox's auditor was **KPMG**. KPMG required Xerox to make many adjustments to its financial statements over the 1997–2000 period. For example, when Xerox proposed the creation of an off-balance-sheet entity dubbed "Project Mozart," KPMG stood firm against the plan because it appeared to be a blatant attempt to transfer reported losses from the Xerox income statement to the Project Mozart income statement. In addition, in early 2000, KPMG refused to sign off on the 1999 audit until Xerox had completed an internal investigation of its accounting practices and had made a number of restatements. As a result of this firm stance by KPMG, the Xerox financial statements for the year ended December 31, 1999, were not released until June 7, 2000. However, many businesspeople and regulators argue that KPMG was not tough enough. In response to the KPMG claim that the vast majority of the \$6 billion overstatement in revenue by Xerox stemmed from honest differences in accounting judgment and estimates, Lynn E. Turner, at the time an accounting professor at Colorado State University and former chief accountant of the SEC, said, "As I tell my students, they will flunk if they can't get the answers on their homework any closer than to the nearest billion dollars." In April 2005, KPMG agreed to pay \$22 million to settle a civil suit filed by the SEC stemming from the Xerox audit.

## QUESTIONS

1. *What business events of the 1980s and 1990s put pressure on Xerox's reported profits?*
2. *What was done by the managers of Xerox Mexico to avoid reducing reported net sales for \$27 million in returned merchandise?*
3. *What happened to KPMG as a result of its work auditing the financial statements of Xerox?*

**Answers to these questions can be found on page 308.**

The final outcomes of this exercise in earnings and revenue management at Xerox are all negative. By August 2002, after all of the public revelations and accounting restatements had been assimilated by the market, Xerox's total market value had fallen to \$5 billion. Xerox also bore a tarnished reputation that will take years to restore; by May 2008, the company's market value had only risen back to \$13 billion, a far cry from its \$46 billion peak in 1999. The CEO and CFO who presided over Xerox during the accounting manipulations were let go, and a group of six former Xerox executives agreed to personally pay more than \$20 million to settle SEC charges. KPMG has lost the Xerox audit engagement, with the \$60 million in fees earned by the successor auditor in 2001 alone. The biggest loser, however, is the U.S. economy. The crisis in investor confidence sparked by the relentless barrage of accounting scandals in 2001 and 2002 helped lower stock values in the United States by more than 20%, eliminating in excess of \$2 trillion in wealth for U.S. investors.

This chapter explores the topic of earnings management. Because accounting numbers are so important in so many decisions, there is a predictable tendency of managers to try to manipulate the reported numbers to be as favorable as possible. And because financial accounting involves so many judgments and estimates, such manipulation is possible. In this chapter we will discuss the common techniques used to manage earnings, as well as the difficult issue of whether it is in the best interest of a company to try to manage its reported earnings. We will also walk through the typical sequence of events associated with an earnings management catastrophe. The Xerox case that started the chapter is an accurate model of the mess that can result from managers trying to manipulate reported accounting numbers to try to compensate for lackluster operating performance. The chapter ends with a discussion of the great value that can be added to an economy by good accounting standards and ethical accountants.

## Motivation for Earnings Management

**1** Identify the factors that motivate earnings management.

**WHY** Understanding the economic motivations behind earnings management allows the financial statement preparer, the auditor, and the financial statement user to identify circumstances in which reported earnings are more likely to have been managed.

**HOW** Four factors typically motivate managers to manage reported earnings: attempts to meet internal targets, to meet external expectations, to smooth reported income, and to window dress the financial statements in advance of an IPO or a loan application.

Numbers are very important in framing peoples' opinions. Rarely do we question how the numbers are computed. For example, the too-close-to-call U.S. presidential election of 2000 resulted in very close scrutiny of the voting process in Florida. This close scrutiny made all of us aware that rather than just take vote totals as a given, we should instead exercise more care and healthy skepticism about vote tabulation in future elections. As another example, U.S. federal government budget decisions are not made based on some theoretical "real economic" budget surplus or deficit but are based on the reported surplus or deficit. Pressure to raise or lower taxes, to increase or cut spending, to elect different representatives, and so forth, are based on that one reported number, and hardly anyone delves into how the number is computed. In the government budgetary arena, the following statement, though perhaps a bit overstated, still contains a grain of truth:

Perception dictates policy,  
accounting determines perception,  
therefore, accounting rules the world.

Reported numbers have a similar power to frame opinions in the corporate arena. Because reported net income is the number that receives the most attention, it is also the number that corporate managers might be most tempted to manipulate. This section describes four reasons for managing reported earnings. These aren't necessarily good reasons, as illustrated in the Xerox opening scenario and as discussed more fully later in the chapter. However, they do reflect the forces that are often spoken of as pushing managers to manipulate reported earnings. These four reasons are as follows:

1. Meet internal targets.
2. Meet external expectations.
3. Provide income smoothing.
4. Provide window dressing for an IPO or a loan.

Each of these earnings management motivations will be discussed in turn in this section.

## Meet Internal Targets

As discussed in the Xerox scenario at the beginning of the chapter, managers in Xerox Mexico felt pressured by corporate earnings and revenue targets and resorted to relaxing credit standards, biasing estimates of bad debts, and finally fraudulently concealing sales returns. One of the most notorious examples of accounting manipulation to meet internal goals is the **MiniScribe** case from 1989. To meet the nearly impossible earnings targets set by the flamboyant and volatile CEO, employees of MiniScribe, a seller of disk drives, reportedly resorted to shipping disk drive boxes filled with bricks to meet sales targets at the end of a quarter.

**Internal earnings targets** represent an important tool in motivating managers to increase sales efforts, control costs, and use resources more efficiently. As with any performance measurement tool, however, it is a fact of life that the person being evaluated will have a tendency to forget the economic factors underlying the measurement and instead focus on the measured number itself. If you doubt this tendency, consider whether during this intermediate accounting course you have maintained your focus solely on learning financial accounting or whether you have occasionally concentrated primarily on scoring points to get a good grade.

Academic research has also confirmed that the existence of earnings-based internal bonuses contributes to the incidence of earnings management. For example, research has demonstrated that managers subject to an earnings-based bonus plan are more likely to manage earnings upward if they are close to the bonus threshold and are also more likely to manage earnings downward if reported earnings are substantially in excess of the maximum bonus level.<sup>1</sup> This latter tendency basically means

<sup>1</sup> P. Healy, "The Effect of Bonus Schemes on Accounting Decisions," *Journal of Accounting and Economics*, 1985, p. 85.

that managers have a tendency to defer some earnings “for a rainy day,” which could occur the next period when operating results are not as favorable. This tendency has been found using company-level information as well as using earnings reported by managers of divisions of companies.<sup>2</sup> Because the existence of an earnings-based bonus plan increases the incentive of managers to manipulate the reported numbers, auditors consider such plans a risk factor as they plan the nature and extent of their audit work.

## Meet External Expectations

A wide variety of external stakeholders has an interest in a company’s financial performance. For example, employees and customers want a company to do well so that it can survive for the long run and make good on its long-term pension and warranty obligations. Suppliers want assurance that they will receive payment and, more important, that the purchasing company will be a reliable purchaser for many years into the future. For these stakeholders, signs of financial weakness, such as reporting negative earnings, are very bad news indeed. Accordingly, we shouldn’t be surprised that in some companies when the initial computations reveal that a company will report a net loss, the company’s accountants are asked to go back to the accrual judgments and estimates to see whether just a few more dollars of earnings can be squeezed to obtain positive earnings. If this scenario is true, we should expect that there should be a lower-than-expected number of companies with earnings

just a little bit negative and a higher-than-expected number of companies with earnings just a little bit positive. This result should occur because any company that has a small negative earnings number has a strong incentive to try to use accounting assumptions to nudge the earnings into positive territory. This intuition is verified by the earnings distribution information reproduced in Exhibit 6-2. As seen in the diagram, annual net income for an average company is equal to about 7% of the company’s market value. And except around zero, the numerical distribution of companies that have net income above and below that average amount follows the familiar bell-shaped curve. However, just below zero you can see a trough in the distribution, indicating that the number of companies with earnings just below zero is significantly lower than expected. In addition, there is a lump on the distribution just above zero, indicating that the number of companies with earnings just above zero is significantly greater than expected. This simple picture provides strong evidence that companies manage earnings to avoid reporting losses and disappointing external stakeholders.

fyi

As China prepared to apply for World Trade Organization (WTO) membership, the official Chinese government target was 8% economic growth in 1998. Government officials biased the reported numbers upward, concealing the fact that actual growth was just 4%. See Nicholas R. Lardy, “Integrating China into the Global Economy,” Brookings Institution Press, 2002.

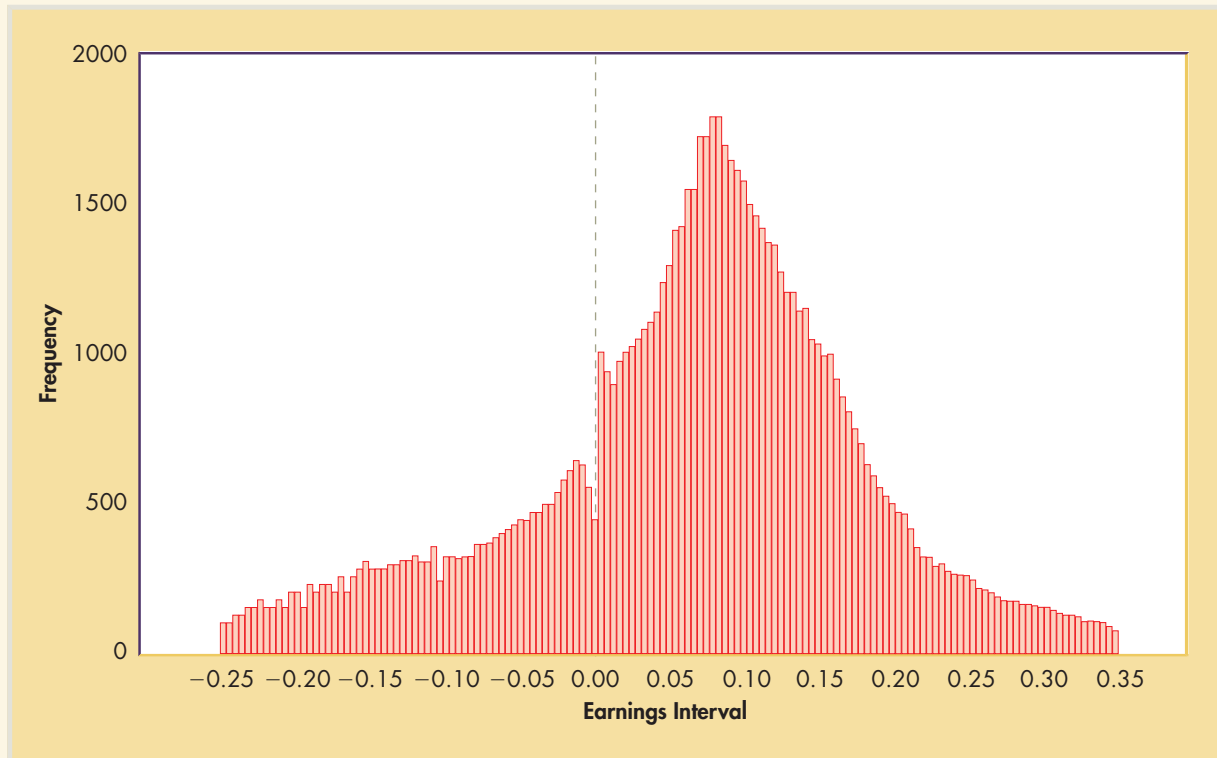

fyi

According to *CFO.com*, chief financial officer (CFO) turnover among the Fortune 500 increased by 21% from 2003 to 2004. Failing to meet analysts’ earnings expectations and the pressure to comply with Sarbanes-Oxley were cited as the most frequent causes for the turnover of CFOs. See Lisa Yoon, “CFO Resignations Soared in 2004,” *CFO.com*, April 5, 2005.

EXHIBIT 6-2

## Standardized Distribution of Annual Net Income

Observations are computed as net income divided by beginning-of-year market value. For example, 0.05 represents net income that is 5% of market value. "Frequency" is the number of observations in a given earnings interval.

Source: D. Burgstahler and I. Dichev, "Earnings Management to Avoid Earnings Decreases and Losses," *Journal of Accounting and Economics*, 1997, p. 99. The diagram is from Figure 3 on page 109.

Financial analysts are a very important set of external financial statement users. In addition to making buy and sell recommendations about shares of a company's stock, financial analysts also generate forecasts of company earnings. Extensive research has shown that announcing net income less than the income forecast by analysts results in a drop in stock price. As a result, companies have an incentive to manage earnings to make sure that the announced number is at least equal to the earnings expected by analysts.

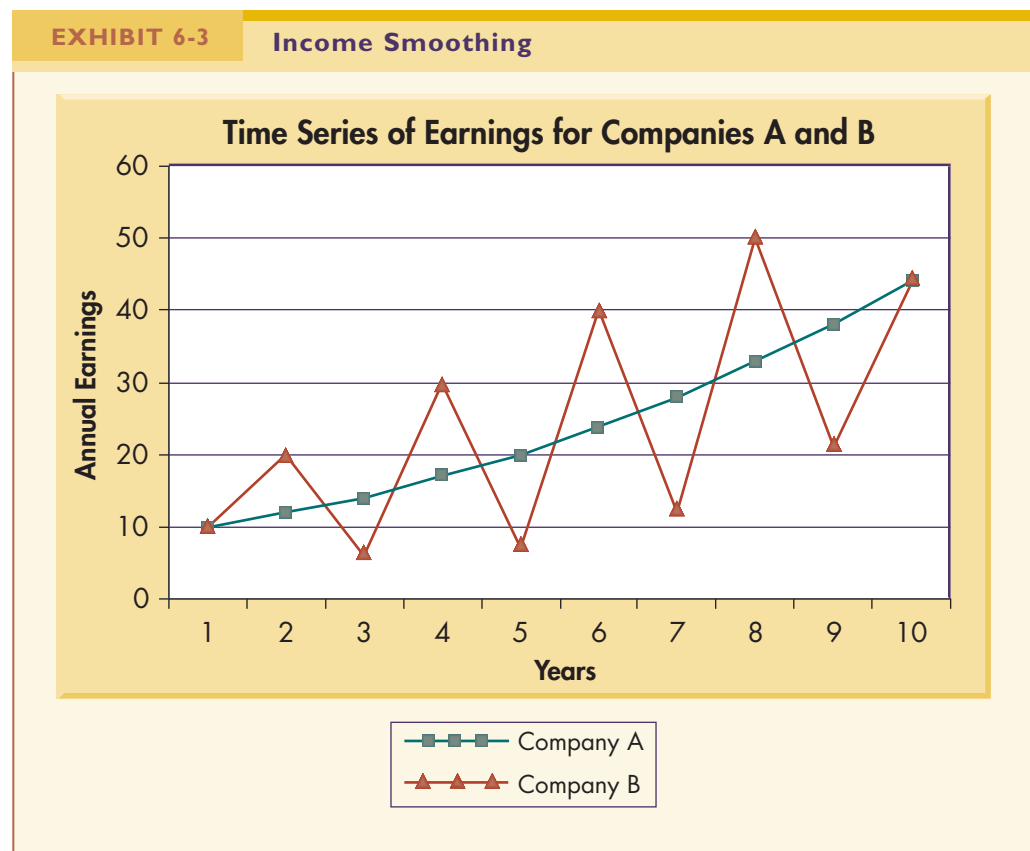

The uncanny ability of many companies to consistently meet analysts' earnings expectations would not be possible unless those companies were practicing at least some earnings management. For example, until the unexpected earnings decline associated with the September 11, 2001, World Trade Center attack, **General Electric** had met or exceeded analysts' earnings expectations for 29 consecutive quarters. Microsoft met or exceeded analysts' expectations for 52 quarters in a row, a streak that ended in the first quarter of 2000. Streaks like this defy the laws of probability. If analysts make an unbiased forecast of earnings and if companies don't make any efforts to manage earnings to reach the forecasted level, reported earnings should exceed the forecast half the time and fall short of the forecast half the time. In this setting, a string of 52 quarters in a row of meeting or beating analysts' forecast has a 1-in-4.5 quadrillion chance of occurring randomly. Research has demonstrated that managers not only manage earnings to

make sure they meet analysts forecasts but also provide overly pessimistic “guidance” to analysts to ensure that the forecasts made are not too high to reach.<sup>3</sup>

## Provide Income Smoothing

Examine the time series of earnings for Company A and Company B shown in Exhibit 6-3. For Company A, the amount of earnings increases steadily for each year from Year 1 through Year 10. For Company B, the earnings series is like a roller coaster ride. Companies A and B have the same earnings in Year 1, the same earnings in Year 10, and the same total earnings over the 10-year period included in the graph. At the end of Year 10, if you were asked which company you would prefer to loan money to or to invest in, you would almost certainly choose Company A. The earnings stream of Company A gives you a sense of stability, reliability, and reduced risk.

Now imagine yourself as the chief executive officer of Company B. You know that through aggressive accounting assumptions, you can strategically defer or accelerate the recognition of some revenues and expenses and smooth your reported earnings stream to be exactly like that shown for Company A. Would you be tempted to do so? Of course you would. The practice of carefully timing the recognition of revenues and expenses to even out the amount of reported earnings from one year to the next is called **income smoothing**. By making a company appear to be less volatile, income smoothing can make it easier for a company to obtain a loan on favorable terms and easier to attract investors.<sup>4</sup>

<sup>4</sup> See R. Dye, “Earnings Management in an Overlapping Generations Model,” *Journal of Accounting Research*, 1988, p. 195; and B. Trueman and S. Titman, “An Explanation for Accounting Income Smoothing,” *Journal of Accounting Research* (supplement), 1988, p. 127. For a more general discussion of earnings management, see K. Schipper, “Commentary on Earnings Management,” *Accounting Horizons*, December 1989, p. 91.

The champion of all income-smoothing companies is General Electric. In fact, GE's ability to report steadily increasing earnings is legendary. As of the end of 2001, General Electric had reported 105 consecutive quarters of earnings growth (a streak that ended in 2002). GE's business structure is particularly well suited to earnings management because of the company's large number of diverse operating units (financial services, heavy manufacturing, home appliances, and so forth). A large one-time loss reported by one business unit can frequently be matched with an offsetting gain reported by another unit. By carefully timing the recognition of these gains and losses, GE can avoid reporting earnings that bounce up and down from year to year. For example, in its press release announcing results for the fourth quarter of 2001, GE reported that its **GE Capital Services** subsidiary reported a \$642 million after-tax gain from the restructuring of its investment in a global satellite partnership. During the same quarter, GE Capital Services reported a \$656 million after-tax loss associated with its exit from certain unprofitable insurance and financing product lines. The timing of one of these transactions could have been delayed so that it would have occurred in the first quarter of 2002, but by making sure that they were both recognized in the same quarter, General Electric was able to show a more smooth earnings stream. In 1994, an article in *The Wall Street Journal* accused General Electric of income smoothing.<sup>5</sup> Shortly after the article came out, one of GE's financial executives was speaking to a group of accounting professors, one of whom was brazen enough to ask if it were true that GE practiced income smoothing. The GE executive quietly smiled and responded, "Well, the timing of the recognition of some of our gains and losses has been rather fortuitous"—the implication of the response being that, of course, GE did all that it could, within the accounting rules, to smooth reported earnings.

## Provide Window Dressing for an IPO or a Loan

As mentioned in Chapter 5, for companies entering phases in which it is critical that reported earnings look good, accounting assumptions can be stretched—sometimes to the breaking point. Such phases include just before making a large loan application or just before the initial public offering (IPO) of stock. Many studies have demonstrated the tendency of managers in U.S. companies to boost their reported earnings using accounting assumptions in the period before an IPO.<sup>6</sup> A study of IPOs done in China found that even socialist managers in Chinese state-owned enterprises manipulate reported earnings in advance of shares of the company being sold to the public.<sup>7</sup> If both capitalist managers in the United States and socialist managers in China are engaged in the same pattern of **window dressing** before an IPO, the phenomenon is truly a universal one.

An interesting case of reverse window dressing was discovered through an examination of companies applying to the U.S. International Trade Commission (ITC) for relief from the importation of competing foreign products. Important pieces of evidence that U.S. companies can submit when petitioning for import-barriers are financial statements showing a reduction in profitability corresponding to an increase in the import of competing foreign products. In this setting, a company would have an incentive to make pessimistic accounting assumptions and report the lowest earnings possible, within the accounting rules. Research has shown that this tendency does in fact exist.<sup>8</sup>

This section has outlined a number of settings in which managers have strong economic incentives to manipulate reported earnings. Whether a manager should attempt to manage earnings is the topic of a later section in this chapter.

## Earnings Management Techniques

**2** List the common techniques used to manage earnings.

**WHY** Maintaining the credibility of the financial reporting model involves constant adaptation by regulators, standard setters, auditors, and financial statement preparers because managers under pressure (aided by accountants) are constantly inventing and perfecting new earnings management techniques.

**HOW** Earnings management generally involves a series of increasingly aggressive steps. Those steps include strategic matching of one-time gains and losses, change in methods or estimates with full disclosure, change in methods or estimates with little or no disclosure, non-GAAP accounting, and fictitious transactions.

With all of the incentives to manage earnings mentioned in the previous section, it isn't surprising that managers occasionally do use the flexibility inherent in accrual accounting to actually manage earnings. The more accounting training one has, the easier it is to see ways in which accounting judgments and estimates can be used to "enhance" the reported numbers. In fact, there have been nationwide seminars on exactly how to effectively manage earnings. One popular seminar sponsored by the National Center for Continuing Education in 2001 was "How to Manage Earnings in Conformance with GAAP." The target audience for the 2-day seminar was described as CFOs, CPAs, controllers, auditors, bankers, analysts, and securities attorneys.

Using the concepts of accrual accounting and the accounting standards that have been promulgated, accountants add information value by using estimates and assumptions to convert the raw cash flow data into accrual data. However, the same flexibility that allows accountants to use professional judgment to produce financial statements that accurately portray a company's financial condition also allows desperate managers to manipulate the reported numbers. The following sections describe the common techniques used in managing earnings.

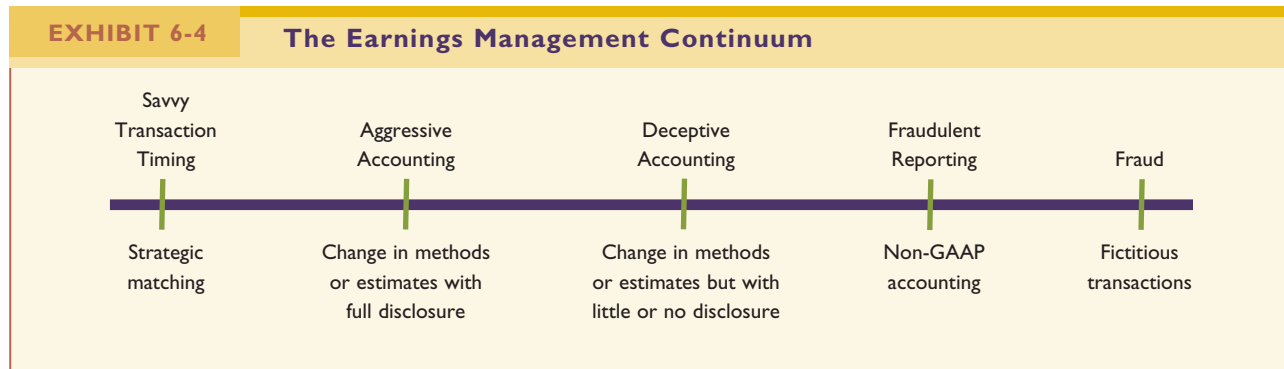

fyi

In the wake of the accounting scandals that occurred in 2001 and 2002, the National Center for Continuing Education decided to change the title of the earnings management seminar to "How to Detect Manipulative Accounting Practices." However, the course outline was exactly the same as the original "How to Manage Earnings" seminar.

### Earnings Management Continuum

Not all earnings management schemes are created equal. The continuum in Exhibit 6-4 illustrates that earnings management can range from savvy timing of transactions to outright fraud. This section provides examples of each activity on the **earnings management continuum**. Keep in mind that in most companies, earnings management, if it is practiced at all, does not extend beyond the savvy transaction timing found at the left end of the continuum in Exhibit 6-4. However, because of the importance and economic significance of the catastrophic reporting failures that are sometimes associated with companies that engage in more elaborate earnings management, the entire continuum is discussed here.

**Strategic Matching** As mentioned in the earlier discussion of income smoothing, General Electric is the acknowledged master at timing its transactions so that large one-time gains and losses occur in the same quarter, resulting in a smooth upward trend in reported earnings. Through awareness of the benefits of consistently meeting earnings targets or of reporting a stable income stream, a company can make extra efforts to ensure that certain key transactions are completed quickly or delayed so that they are recognized in the most advantageous quarter.

**Change in Methods or Estimates with Full Disclosure** Companies frequently change accounting estimates respecting bad debts, return on pension funds, depreciation lives, and so forth. For example, in 1998 **Delta Air Lines** increased the depreciation life for some of its aircraft from 20 to 25 years, reducing depreciation expense and increasing pretax income by \$92 million. Although such changes are a routine part of adjusting accounting estimates to reflect the most current information available, they can be used to manage the amount of reported earnings. Because the impact of such changes is fully disclosed, any earnings management motivation could be detected by financial statement users willing to do a little detective work.

**Change in Methods or Estimates with Little or No Disclosure** In contrast to the accounting changes referred to in the preceding paragraph, other accounting changes are sometimes made without full disclosure. For example, the Xerox opening scenario reported that the company changed the estimated interest rate used in recording sales-type leases without describing the change in the notes to the financial statements. One might debate whether the new estimated interest rate was more appropriate, but what is certain is that failing to disclose the impact of the change misled financial statement users. These users evaluated the reported earnings of Xerox under the incorrect assumption that the results were compiled using a consistent set of accounting methods and estimates and could therefore be meaningfully compared to prior-year results. As indicated by the label in Exhibit 6-4, this constitutes deceptive accounting.

**Non-GAAP Accounting** Toward the right end of the earnings management continuum lies the earnings management tool that can be politely called “non-GAAP accounting.” A more descriptive label in many cases is “fraudulent reporting,” although non-GAAP accounting can also be the result of inadvertent errors. For example, a brief description of some of **Enron’s** special-purpose entities (SPEs) was given in Chapter 1. It is clear that some (although certainly not all) of these SPEs were established for the express purpose of hiding information from financial statement users. In so doing, Enron violated the spirit of the accounting standards. In some cases, Enron also violated the letter of the standards by using SPE accounting when it was not allowed under GAAP. As another example, it was revealed in 2002 that **WorldCom** had capitalized (i.e., recognized as an asset) \$3.8 billion in expenditures for local phone access charges that should have been reported as operating expenses. By the way, when the smoke finally cleared on the WorldCom scandal, the estimate of the total amount of accounting fraud climbed to \$11 billion.

**Fictitious Transactions** The opening scenario for this chapter mentioned that managers at Xerox Mexico rented secret warehouses in which to store returned merchandise to avoid recording the returns. This is an example of outright fraud, which

is the deceptive concealment of transactions (like the sales returns) or the creation of fictitious transactions. A classic example of the latter is the famous **ZZZZ Best** case. The founder of ZZZZ Best, a carpet cleaning and fire damage restoration business, started inventing sales contracts to meet increasing operating performance expectations by banks and investors. For example, ZZZZ Best claimed to have a contract for a \$2.3 million restoration job on an 8-story building in Arroyo Grande, California, a town that had no buildings over three stories.

The five items displayed in Exhibit 6-4 also mirror the progression in earnings management strategies followed by individual companies. These activities start small and legitimately and really reflect nothing more than the strategic timing of transactions to smooth reported results. In the face of operating results that fall short of targets, a company might make some cosmetic changes in accounting estimates to meet earnings expectations but would fully disclose these changes to avoid deceiving serious financial statement users. If operating results are far short of expectations, an increasingly desperate management might cross the line into deceptive accounting by making accounting changes that are not disclosed or by violating GAAP completely. Finally, when the gap between expected results and actual results is so great that it cannot be closed by any accounting assumption, a manager who is still fixated on making the target number must resort to out-and-out fraud by inventing transactions and customers. The key things to remember are that the forces encouraging managers and accountants to manage earnings are real and that if one is not aware of those forces, it is easy to gradually slip from the left side of the earnings management continuum to the right side.

### Chairman Levitt's Top Five Accounting Hocus-Pocus Items

On September 28, 1998, then-SEC Chairman Arthur Levitt gave a speech at the New York University Center for Law and Business.<sup>9</sup> The title of Chairman Levitt's remarks was "The Numbers Game." He chose this occasion to proclaim the SEC's dismay over the increasing practice of earnings management. Mr. Levitt's comments at the banquet were so blunt and hit so close to home that it was reported that "first, people put down their forks, . . . then they pulled out notepads."<sup>10</sup> Mr. Levitt described five techniques of "accounting hocus-pocus" that summarized the most blatant abuses of the flexibility inherent in accrual accounting. A description of these five techniques follows. The discussion includes both a description of the abuses that prompted Chairman Levitt's comments as well as a description of how accounting standards and practices have been changed to address these abuses.

**Big-Bath Charges** Examine the time series of earnings for Company C and Company D shown in Exhibit 6-5. For Company C, the amount of earnings increases steadily until Year 5 when the trend turns around and earnings decrease steadily thereafter. For Company D, earnings drop dramatically in Year 5 but then are steady at \$15 each year thereafter. Companies C and D have the same total earnings over the 10-year period included in the graph. At the end of Year 10, if you were asked which

company you would prefer to loan money to or to invest in, you would almost certainly choose Company D. Any problems that Company D may have had appear to have been put behind it in Year 5, and the recent earnings picture exudes stability. In contrast, Company C's problems seem to be continuing without end. The big drop in earnings in Year 5 for Company D is an example of a "big bath." The concept

fyi

Traditionally, companies have sometimes timed a big bath to coincide with a change in management. In this way, the "bath" year can be blamed on past management.

<sup>9</sup> A text of this entire landmark speech can be found at <http://www.sec.gov/news/speech/speecharchive/1998/spch220.txt>.

<sup>10</sup> Carol Loomis, "Lies, Damned Lies, and Managed Earnings," *Fortune*, August 2, 1999, p. 74.

EXHIBIT 6-5 A Big Bath

behind a **big bath** is that if a company expects to have a series of hits to earnings in future years, it is better to try to recognize all of the bad news in one year, leaving future years unencumbered by continuing losses. One way to execute a big bath is through a large restructuring charge, as discussed in Chapter 4. As part of a restructuring charge, assets are written off and the expenses associated with future restructuring obligations are recognized immediately. Since Mr. Levitt's speech in 1998, the FASB has substantially limited the flexibility a company has to recognize a big-bath restructuring charge by adopting *SFAS No. 144* on impairment losses and *SFAS No. 146* on the timing of the recognition of restructuring obligations.

**Creative Acquisition Accounting** A key accounting task after one company has acquired another is the allocation of the total purchase price to the individual assets of the acquired company. This process is described in Chapter 10. A practice common at the time Mr. Levitt gave his speech was that of allocating a large amount of a purchase price to the value of ongoing research and development projects. As described in Chapter 10, the cost assigned to "purchased in-process R&D" is expensed immediately in accordance with the mandated U.S. GAAP treatment of all R&D expenditures. The net result is similar to a big bath in that a large R&D expense is recorded in the acquisition year, and expenses in subsequent years are lower than they would have been if the purchase price had been allocated to a depreciable asset. Since 1998, *SFAS Nos. 141* and *142* have been adopted; these standards give more extensive guidelines on how the purchase price in a business acquisition should be allocated. In addition, the SEC staff have informed companies that they would be very skeptical in their review of the accounting for any business acquisition in which a large portion of the purchase price was allocated to in-process R&D.

**Cookie Jar Reserves** We are all familiar with the advice that in good times we should save for a rainy day. Companies sometimes follow this advice with respect to

earnings. For example, by recognizing very high bad debt expense this year, when earnings are high even with the extra expense, a company has the flexibility of recognizing lower bad debt expense in future years when the earnings picture might not be so bright. Similarly, by recognizing some cash received as unearned revenue instead of revenue, a company is basically saving revenue for a rainy day or a future year or quarter in which there might be a threat that earnings would fall short of market expectations. Microsoft has been accused of doing exactly this. An SEC investigation into Microsoft's accounting for deferred revenue resulted in a 2002 order to "cease and desist" any further improper accounting practices. Since 1998, the SEC has released *Staff Accounting Bulletins (SAB) 101* and *104*, identifying more carefully the circumstances in which it is appropriate for a company to defer revenue.

**Materiality** As discussed in Chapter 1, auditors have traditionally used arbitrary quantitative benchmarks to define how big an amount must be to be considered material. Examples of such benchmarks are 1% of sales, 5% of operating income, or 10% of stockholders' equity. However, in this era of increasingly refined analyst expectations, falling short of the market's expectation of earnings by just one penny per share can cause a company to lose literally billions of dollars in market value. Thus, Chairman Levitt urged auditors to rethink their ideas about what is material and what is not. In particular, consider a company that uses a questionable accounting technique that changes reported earnings by a small amount, just 1%. Historically, the auditor would not withhold a favorable audit opinion based on this questionable accounting practice because the amount was deemed to be immaterial. However, assume that the use of the questionable accounting practice allows the company to meet analysts' earnings expectations. According to Chairman Levitt, the impact of that technique should be considered material. Thus, the auditor should not sign off on the audit opinion until the company had changed the practice or convinced the auditor that it was in accordance with GAAP. In 1999, the SEC released *SAB 99* that outlines this more comprehensive definition of materiality.

**Revenue Recognition** More common than Microsoft's efforts to defer revenue are the efforts of companies to accelerate the reporting of revenue. In particular, start-up companies, eager to show operating results to lenders and potential investors, would like to report revenue when contracts are signed or partially completed rather than waiting until the promised product or service has been fully delivered. For example, the opening scenario for Chapter 8 describes the rise and fall of **MicroStrategy**, a software firm. When the operating performance of the company fell short of analysts' expectations in the third quarter of 1999, the company recognized \$17.5 million in revenue from a \$27.5 million multiyear licensing agreement that was signed very near the end of the quarter. Given that the company had not really provided any of the promised service in the short time that had elapsed since the signing of the contract, it would have been more appropriate not to report any revenue at all. However, to do so would have resulted in MicroStrategy's reporting a loss for the quarter on revenues that were 20% lower than revenues reported the quarter before. As mentioned earlier, the SEC has now released *SAB 101*, which reduces the flexibility companies have in the timing of revenue recognition. The revenue recognition guidance contained in *SAB 101* is described in detail in Chapter 8. Because of the importance of revenue recognition, the FASB is currently undertaking a comprehensive review of this crucial accounting topic.

As mentioned earlier, action has been taken to reduce the incidence of each of these five hocus-pocus items. However, this list is still a useful starting point to see how companies attempt to manage earnings. As new accounting standards and SEC regulations reduce or eliminate one particular type of earnings management, rest assured that resourceful managers and accountants will invent new ones, but these new techniques will be variations on the general theme shared by all of Chairman Levitt's hocus-pocus items. The exercise of judgment inherent in the accrual process gives desperate managers the ability to accelerate or defer the reporting of profit to best suit their purposes.

## Pro Forma Earnings

An interesting twist in the practice of earnings management is the reporting of pro forma earnings. A **pro forma earnings number** is the regular GAAP earnings number with some revenues, expenses, gains, or losses excluded. The exclusions are made because, companies claim, the GAAP results do not fairly reflect the company's performance. For example, in January 2001, **Corning** announced pro forma earnings for the fourth quarter of 2000 of \$315 million. This pro forma number was substantially larger than the reported GAAP earnings, primarily because of \$323 million in purchased research and development. According to GAAP, this \$323 million must be reported as an expense immediately. However, Corning viewed this accounting treatment as overly pessimistic, so financial statement users were given the pro forma number to reflect what Corning's earnings would have been if the purchased R&D had been accounted for more appropriately, in Corning's view, as an asset acquisition rather than as an expense.

The concern with pro forma earnings is that companies can abuse the practice and report pro forma earnings merely in an effort to make their results seem better than they actually were. In fact, pro forma earnings have been labeled as "EBS," or "everything but the bad stuff."<sup>11</sup> There are many examples of questionable pro forma earnings reporting. For example, on August 8, 2001, **Waste Management** announced its earnings for the second quarter of 2001. Reported GAAP earnings were \$191 million, somewhat short of analysts' expectations. However, pro forma earnings were \$212 million for the quarter, beating analysts' expectations. The difference between GAAP earnings and pro forma earnings resulted because, on a pro forma basis, Waste Management decided to exclude \$1 million in truck-painting costs and \$30 million in consulting costs from the operating expenses. Waste Management's claim was that the trucks were painted early, making the paint job economically equivalent to a capital expenditure (an asset) rather than an expense. The consulting costs were part of a strategic improvement initiative; again, Waste Management claimed that these costs were more appropriately reported as an asset rather than as an expense as required under GAAP.<sup>12</sup>

The key question with respect to pro forma earnings is whether the number helps financial statement users better understand a company or whether it is a blatant attempt to cover up poor performance. Research on this issue has revealed that both answers are correct. For many companies, such as the preceding Corning example, the pro forma earnings number is in fact a better reflection of the underlying economic performance than is GAAP net income. Thus, a manager can use the flexibility of pro forma earnings reports to reveal additional, useful information. On the other hand, there is also evidence that some managers use a pro forma earnings release in an attempt to hide poor operating performance. A study of 1,149 pro forma earnings announcements made from January 1998 through December 2000 found that while only 38.7% of the announcing companies had GAAP earnings that met or exceeded analysts' expectations, the pro forma earnings numbers reported by these same companies met or exceeded analysts' expectations 80.1% of the time.<sup>13</sup>

One way to view the flexible reporting options a manager has in choosing what to report as "pro forma earnings" is that these options are just an exaggerated version of the options the same manager has in reporting GAAP earnings. If the manager is trustworthy, the GAAP earnings are reliable, and the manager can reveal even better information about the underlying economics of the business through appropriate adjustments in computing pro forma earnings. This advantage of pro forma earnings is offset (some would say swamped) by the opportunity that reporting pro forma earnings gives a desperate

fyi

The first SEC cease and desist order with respect to pro forma earnings was issued to **Trump Hotels & Casino Resorts**. For the third quarter of 1999, Trump had a GAAP loss of \$67 million. However, by excluding a one-time charge of \$81 million, Trump was able to report pro forma earnings of \$14 million, exceeding the prevailing analyst forecast of \$12 million. What Trump deceptively failed to mention is that the \$14 million in pro forma earnings included a \$17 million one-time gain. See Securities and Exchange Commission, *Accounting and Auditing Enforcement Release No. 1499*, Administrative Proceeding File No. 3-10680, January 16, 2002.

manager seeking to gloss over operating problems by reporting deceptively positive pro forma results. This potential for misleading reporting of pro forma earnings prompted the Financial Executives International (FEI) and the National Investor Relations Institute in April 2001 to recommend that firms give a reconciliation to GAAP net income whenever reporting pro forma numbers. This reconciliation highlights the adjustments made by management in reporting pro forma earnings. In December 2001, the SEC encouraged this practice of providing a reconciliation between GAAP and pro forma earnings. An example of one such reconciliation is reproduced in Exhibit 6-6. This illustration is for **Quantum Corporation**, a provider of data storage and network protection systems based in Milpitas, California. Note that the largest two adjustments (a goodwill write-down associated with *SFAS No. 142*, which

will be explained in Chapter 10, and an investment write-down of the type discussed in Chapter 14) are both noncash items that do not relate to the company's core operating performance.

This section has discussed the earnings management continuum, which illustrates how a company can imperceptibly slide from intelligent transaction timing to unquestionably fraudulent deception in its attempts to report the most attractive earnings possible. The five accounting hocus-pocus techniques are examples of the accounting tactics companies use to manage earnings. Finally, pro forma earnings announcements can be either an effort by management to add information value to the reported GAAP numbers or a last-ditch attempt to meet earnings targets that were not attainable using generally accepted accounting principles. Keep in mind that accounting standards and SEC enforcement activities will undoubtedly change in the future to eliminate some earnings management techniques that are common now. However, desperate managers will continue to work with creative accountants to develop new ways for companies to manage their reported results.

## EXHIBIT 6-6

## Reconciliation of Pro Forma Earnings to GAAP Earnings

Quantum Corporation GAAP to Pro Forma Net Loss Reconciliation	
	Three Months Ended June 30, 2002
GAAP net loss .....	\$(130,883)
Adjusting items:	
Cumulative effect of an accounting change (SFAS No. 142 adjustment) .....	94,298
Write-down of equity investment portfolio .....	17,061
Special charges .....	4,885
Amortization of intangible assets .....	4,092
Income tax benefit .....	(3,411)
Pro forma net loss .....	<u>\$ (13,958)</u>
Pro forma net loss per share .....	<u>\$ (0.09)</u>

## Pros and Cons of Managing Earnings

**3** Critically discuss whether a company should manage its earnings.

**WHY** Financial reporting is a normal part of a company's overall public relations effort. As such, a responsible manager should consider what impact the financial statements will have on the company's ability to satisfy the needs of its stakeholders.

**HOW** We know that a company **CAN** manage its earnings; the question is whether a company **SHOULD** manage its earnings. An important guiding principle is that it is wrong to intentionally try to deceive others.

The preceding two sections have discussed why and how a company manages earnings. This section explores the difficult issue of whether a company *should* manage earnings. The perfect-world response that a company should never manage earnings under any circumstances is both naïve in today's financial reporting environment and is also not necessarily correct. On the other hand, there can be great risk in starting down the slippery slope of managing reported results.

### Financial Reporting as a Part of Public Relations

In the Web sites of most publicly traded companies, the financial statements can be found under the heading "Investor Relations." In essence, financial reporting is just a subcategory of public relations. A financial statement is one of a large number of vehicles that managers of a company use to communicate information about the company to the public. And as with other forms of corporate communications, a company must balance its desire to frame information in the best light possible with the need to maintain credibility with company stakeholders.

In the context of financial statements being one way for a company to communicate with the public, consider your answers to the following questions:

**QUESTION** Does a manager have an ethical and fiduciary responsibility to carefully manage the resources of a publicly traded company in order to maximize the value to the shareholders?

**Answer.** *Yes. In fact, this is the very definition of the responsibility of a corporate manager.*

**QUESTION** Does the public perception of a company impact the company's success in terms of finding customers, securing relationships with suppliers, attracting employees, and obtaining cooperation from elected officials and regulators?

**Answer.** *Certainly. It is impossible to rally people to put their time and money behind a company unless they are convinced that the company can be successful.*

fyi

Of course, a manager who spends too much time managing earnings, at the expense of pushing forward the strategic efforts of the company, is wasting corporate resources. One CEO estimated that 35% of his/her time was spent considering preliminary financial reports and providing earnings guidance to analysts and company stakeholders.

**QUESTION** Does the amount of reported earnings impact the public's perception of a company?

**Answer.** *Absolutely. Accounting net income is not the only piece of information relevant to assessing a company's viability, but it certainly is one influential data point.*

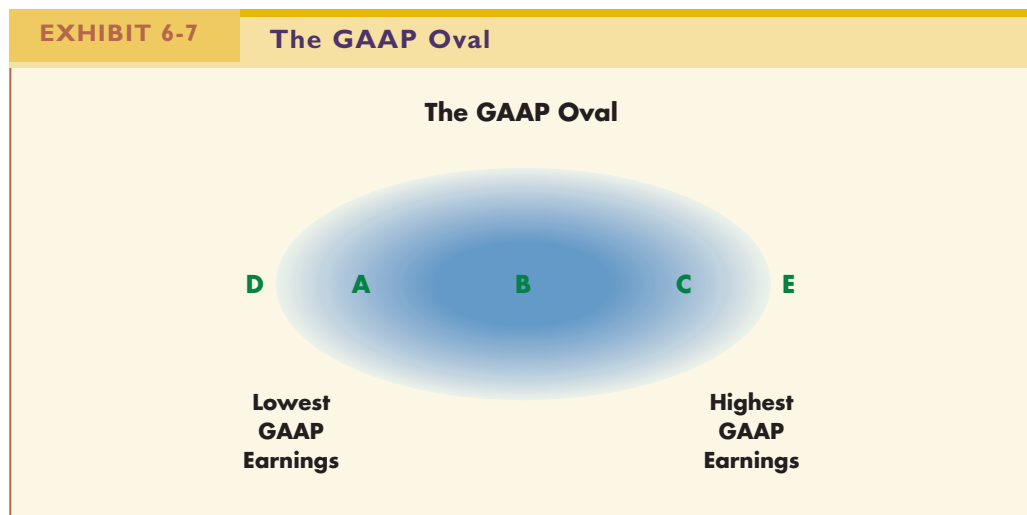

**QUESTION** Does a manager have a responsibility to manage reported earnings, within the constraints of generally accepted accounting principles?

**Answer.** *It is difficult to answer no to this question. In light of the answers to the preceding questions, it would be an irresponsible manager indeed who did not do all possible, within the constraints of GAAP, to burnish the company's public image.*

## Is Earnings Management Ethical?

Refer back to Exhibit 6-4. Everyone agrees that the creation of fictitious transactions, at the far right side of the earnings management continuum, is unethical. But there the universal agreement ends with respect to what is and is not ethical. For example, managers and their auditors frequently disagree about what constitutes fraudulent, non-GAAP reporting. In the WorldCom example mentioned earlier, the company's CFO vigorously defended the capitalization rather than the expensing of the disputed \$3.8 billion in local phone access charges. The CFO reiterated this defense, based on his understanding of the appropriate accounting standards, in a multi-day series of meetings with the external auditor and the audit committee.<sup>14</sup> In the view of the CFO, this "fraudulent reporting" was both ethical and in conformity with GAAP. As one moves even further to the left on the earnings management continuum, disagreement about whether a certain act is or is not ethical increases. For example, when a company makes an accounting change, how can a bright line be drawn between sufficient and deceptive disclosure? Who is to judge whether the strategic timing of gains and losses by General Electric is unethical or just prudent business practice?

Exhibit 6-7 contains a figure titled "The GAAP Oval." This oval represents the flexibility a manager has, within GAAP, to report one earnings number from among many possibilities based on different methods and assumptions. Clearly, reporting a number corresponding with points D or E, which are both outside the **GAAP oval**, is unethical. The difficult ethical question is whether the manager has a responsibility to try to report an earnings number exactly in the middle of the possible range, point B in Exhibit 6-7. Or does the manager have a responsibility to report the most conservative, worst-case number, point A in the exhibit? Is it wrong for the manager to try to use accounting flexibility to report an earnings number corresponding with point C, which is the highest possible earnings number that is still in conformity with GAAP? What cost is there, in terms of credibility, for a manager who makes a conservative set of accounting assumptions one year, perhaps when overall operating performance is good, and an aggressive set of assumptions the next year, perhaps to try to hide lackluster operating performance? Finally, note that the boundary of the oval is fuzzy, so it sometimes is not clear whether a certain set of computations is or is not in conformity with GAAP.

<sup>14</sup> Jared Sandberg, Deborah Solomon, and Rebecca Blumenstein, "Inside WorldCom's Unearthing of a Vast Accounting Scandal," *The Wall Street Journal*, June 27, 2002, p. A1. WorldCom's CFO, Scott Sullivan, later pleaded guilty to charges of conspiracy, securities fraud, and filing false statements.

## ARTHUR ANDERSEN: A TALE OF TWO CHOICES

As with any company that has a long history, **Arthur Andersen** has a number of internal legends that helped define its character over the years. One of these legends, included in the official history covering the firm's first 50 years, is as follows:

About 1915, Mr. [Arthur] Andersen [the founder of the firm] was confronted with a difficult situation with respect to the financial statements of a mid-western interurban railway company. The company had distorted its earnings by deferring relatively large charges that properly should have been absorbed in current operating expenses. Mr. Andersen was insistent that the financial statements to which he attached his report should disclose the facts. The president of the company . . . came to Chicago and demanded that Mr. Andersen issue a report approving the company's procedure in deferring these operating charges. Mr. Andersen informed the president that there was not enough money in the city of Chicago to induce him to change his report. We lost the client, of course, at a time when the small firm was not having easy sailing, and the loss of a client was almost a life and death matter. The soundness

of Mr. Andersen's judgment in this case was clearly indicated when, a few months later, the company was forced to file a petition in bankruptcy.

Contrast this account with the behavior of Arthur Andersen personnel associated with the Enron scandal. In connection with the Enron engagement, Andersen helped Enron structure special-purpose entities that were used to improve the reported accounting numbers of the Enron parent company. Andersen partners also failed to warn Enron's board of directors of their concerns about Enron's accounting. And finally, Andersen professionals shredded documents in a desperate attempt to cover up the firm's involvement in Enron's accounting deception. These questionable actions, taken without careful consideration of their long-term consequences, ultimately brought down the firm started by Mr. Andersen back in 1913.

### Question:

1. In what specific ways can a reputation for unbending integrity help an audit firm? A manufacturing firm? A service firm?

Source: Arthur Andersen & Co., "The First Fifty Years: 1913–1963," Chicago, 1963, pp. 19–20.

Of course, whether a manager actually does manage earnings and whether he or she crosses the line and violates GAAP to do so is partially a function of the fear (and costs) of getting caught and of the general ethical culture of the company. It is also a function of the manager's personal ethics and ability to recognize that fraudulent and deceptive financial reporting is part of a continuum that starts with innocent window dressing but can end with full-scale fraud. There is no neon sign giving a final warning saying, "Beware: Don't cross this line!" Thus, each individual must be constantly aware of where he or she is with respect to the earnings management continuum in Exhibit 6-4 and the GAAP oval in Exhibit 6-7. Boards of directors and financial

statement preparers should also be aware that, as a group, managers are notoriously overoptimistic about the future business prospects of their companies. A company policy of having a consistently conservative approach to accounting is a good counterbalance to managers who might try to justify optimistic accounting assumptions on the basis of a business turnaround that is "just around the corner."

### Personal Ethics

Personal ethics is not a topic one typically expects to study in an intermediate financial accounting course. However, the large

fyi

Nonaccountants are under the impression that there is no GAAP oval. Instead, they believe that there is only a GAAP point, a single quantity that represents the one, true earnings number. Managers must be aware that this attitude can cause the public to be very unforgiving of companies that are found to have "innocently" managed earnings.

fyi

In an effort to increase the personal cost to company executives of allowing a company to report earnings that violate GAAP, the SEC in 2002 began requiring CEOs and CFOs to submit sworn statements asserting that they had personally confirmed that their company's financial statements contained no materially misleading items.

number of accounting scandals in 2001 and 2002 demonstrated that personal ethics and financial reporting are inextricably connected. The GAAP oval shown in Exhibit 6-7 illustrates that companies can report a range of earnings numbers for a year and still be in strict conformity with GAAP. In other words, earnings management can and does occur without any violation of the accounting rules. If one takes a strictly legalistic view of the world, then it is clear that managers should manage earnings, when they have concluded that the potential costs in terms of lost credibility are out-

weighed by the financial reporting benefits, because earnings can be managed without violating any rules.

A contrasting view is that the practice of financial accounting is not a matter of simply applying a list of rules to a set of objective facts. Management intent often enters into the decision of how to report a particular item. For example, land is reported as a long-term asset in the balance sheet unless management intends to sell the land within one year of the balance sheet date. In the context of earnings management, an important consideration is whether savvy transaction timing or changes in accounting methods or estimates are done to better communicate the economic performance of the business to financial statement users or whether the earnings management techniques are used with the intent to deceive. And if earnings management is done to deceive, whom is management trying to deceive? If management is trying to deceive potential investors, lenders, regulatory authorities, employees, or other company stakeholders, then managing earnings poses a real risk of lost credibility in the future. One final important item should be considered—most people believe that intentionally trying to deceive others is wrong, regardless of the economic consequences.

## Elements of Earnings Management Meltdowns

**4** Describe the common elements of an earnings management meltdown.

**WHY** An earnings management meltdown does not occur in one step. A company goes through a lengthy process where a series of poor decisions eventually results in a bad outcome for the company, its investors, and the economy.

**HOW** An earnings management meltdown involves seven steps: downturn in business, pressure to meet expectations, attempted accounting solution, auditor's calculated risk, insufficient user skepticism, regulatory investigation, and massive loss of reputation.

Since the start of the new millennium, astounding numbers of catastrophic accounting failures have occurred. The list includes, but is not limited to, Xerox, Enron, WorldCom, **HealthSouth**, **Freddie Mac**, and undoubtedly many more by the time you read this chapter. Of course, the details of each failure are different, but they all stem from unsuccessful attempts to manage earnings, and they all have common elements. These common elements are outlined in the timeline in Exhibit 6-8 and are discussed in this section.

**EXHIBIT 6-8****Seven Elements of an Earnings Management Meltdown**

1	2	3	4	5	6	7
Downturn in business	Pressure to meet expectations	Attempted accounting solution	Auditor's calculated risk	Insufficient user skepticism	Regulatory investigation	Massive loss of reputation

**Downturn in Business**

Excessive earnings management almost always begins with a downturn in business. When operating results are consistently good, the need for earnings management is not as great. For example, the first step along the path to accounting scandal for Xerox was a slowdown in sales associated with the increased use of digital documents in the United States and general business woes in the company's Mexican and Brazilian subsidiaries. WorldCom was caught in the massive collapse of the telecommunications companies. From 1997 through 2002, telecom companies spent \$4 trillion (with a t!) laying fiber optic cable in the expectation of doubling or tripling of data traffic every quarter. When this volume of traffic didn't materialize, the aggregate market values of telecom companies dropped by \$2.5 trillion.<sup>15</sup> In this industry setting, WorldCom was bound to feel some earnings pressure. For Enron, the company's rapid revenue growth (illustrated in Exhibit 1-1 in Chapter 1) partially masked a substantial decline in operating profitability. Exhibit 6-9 displays the return on assets (operating income/assets) of Enron's largest segment from 1996 through 2000. Recall that the Enron accounting scandal did not break until late in 2001. You should note that return on assets was not only declining but it was also at a very low absolute level of less than 2%. This dwindling profitability increased the pressure on Enron's management to manage earnings.

**EXHIBIT 6-9****Enron's Declining Operating Profitability**

<sup>15</sup> Geoffrey Colvin, "When Scandal Isn't Sexy," *Fortune*, June 10, 2002.

## Pressure to Meet Expectations

As mentioned earlier, a powerful factor motivating managers to manage earnings is the desire to continue to meet expectations, both internal and external. According to the SEC, without the accounting manipulations outlined at the beginning of the chapter, Xerox would have failed to meet analysts' earnings expectations in 11 of the 12 quarters in 1997, 1998, and 1999. As it was, Xerox met or exceeded expectations in each of the 12 quarters. As described in Chapter 8, when MicroStrategy fell short of market expectations in March 2000, the company's stock price started into a tailspin that reduced the value of the company by 99.9% within 16 months.

fyi

In 1993, the CFO for Daimler-Benz was concerned that the company was using loopholes in the German accounting standards to manage earnings and hide the company's poor operating performance, allowing management to delay making the tough decisions needed to fix the company. See Case 22-8 (and the associated solution) to find out what happened.

## Attempted Accounting Solution

One response to a downturn in business and a looming failure to meet market expectations is to go back to the drawing board and try to improve the business. For example, as described in the opening scenario for Chapter 23, Home Depot was in exactly this situation at the beginning of 1986. The company's earnings had dropped and a disappointed market had reduced the value of Home Depot's stock by 23%. Home Depot's response in 1986 was to more efficiently manage inventory, cut overhead, and aggressively collect its outstanding accounts

receivable. This approach propelled Home Depot to years of double-digit sales and earnings growth. Alternatively, when the accountants, instead of the operations or marketing people, are asked to return a company to profitability through earnings management, the solution is a temporary one at best. At worst, the counterproductive mentality associated with papering over a company's problems through earnings management can ultimately lead to even larger business problems.

## Auditor's Calculated Risk

A useful view of the financial statements is that they represent a negotiated settlement between the management of the company and the company's auditor. As described throughout this chapter, management has many incentives to use the financial statements to paint the best picture possible. On the other hand, the audit firm wishes to preserve its reputation and to avoid investor lawsuits, so the audit firm has an incentive to push back against any accounting treatment that appears overly optimistic. As management and the auditor discuss the appropriate accounting treatment of items when a difference of opinion exists, they eventually reach agreement on a set of financial statements that both management and the auditor can sign and release to the public.

As you can imagine, an auditor is frequently required to decide whether to accept a debatable accounting treatment, engage in further discussions to try to convince management to abandon the treatment, or, as a final resort, withdraw from the audit. In making this decision, the auditor must balance

fyi

Companies that pay more nonaudit fees (such as for tax work) to auditors more frequently meet or just beat analysts' expectations through the use of accounting accruals. This is evidence that companies with more extensive economic ties with their auditor tend to manage earnings more. See R. Frankel, M. Johnson, and K. Nelson, "The Relation between Auditors' Fees for Non-Audit Services and Earnings Quality," Presented at the American Accounting Association Quality of Earnings Conference, January 2002.

the multiyear future revenues from continuing as a company's auditor with the potential costs of being swept up in an accounting scandal, losing valuable reputation, and perhaps losing a large lawsuit. Thus, the decision to sign the audit opinion is always a calculated risk.

One lesson we can learn from the Enron case is that all auditors, not just Arthur Andersen, have been underweighting the potential cost of signing an audit opinion on financial statements that contain questionable accounting. In the case of Enron and Arthur Andersen, this calculated risk by Andersen's Enron audit team resulted in the rapid demise of a venerable firm with the loss of the jobs of tens of thousands of Andersen employees along with billions of dollars in partners' equity. Probably more than any new regulation from the SEC or new law from Congress, this huge economic loss resulting from Andersen's calculated risk with respect to the Enron audit has caused other audit firms to be more careful and less willing to compromise on accounting treatments as the negotiated settlement over the financial statements is reached.

## Insufficient User Skepticism

With the benefit of hindsight, it is often very easy to look back and see advance warning signs of an impending accounting scandal. For example, as we look now at Enron's declining return on asset numbers in Exhibit 6-9, we wonder why more people weren't skeptical about the company's fundamental operating performance before accounting scandal engulfed the company. In fact, in October 2001, just before the Enron earnings restatement that led to the company's bankruptcy less than two months later, 11 of the 13 financial analysts following Enron recommended the company's stock as a "buy" or "strong buy." Again, with the benefit of hindsight, it seems that even though Enron's published financial statements were misleadingly positive, there were still indications in those financial statements that should have led a skeptical analyst and investment community to question the company's fundamental business model.

The question of why financial statement users have historically not exhibited enough healthy skepticism is an interesting one without a definitive answer. One contributing factor is similar to the calculated risk idea mentioned earlier with respect to auditors. Financial statement users have usually accepted companies' financial statements at face value with the realization that there was some risk of deceptive reporting but without being sufficiently aware of the massive losses that might stem from that

deception. Just as auditors are now weighing their risks in a new light after the large losses stemming from the Enron, WorldCom, and other accounting scandals, financial statement users are now exercising a greater degree of skepticism about reported financial results.

Another reason that analysts and the investment community have not exhibited enough financial statement skepticism is that these parties often stand to benefit economically as companies obtain loans, issue stock, set up complicated financing vehicles, and engage in merger and acquisition activity. As mentioned in Chapter 1, Wall Street investment firms such as GE Capital, **J.P. Morgan Capital**, **Merrill Lynch**, and **Morgan Stanley** all benefited as investors in the special-purpose entities that Enron used to keep some information off its balance sheet.

An extreme example of financial analysts intentionally overlooking poor performance comes in the case of the \$100 million fine levied by the state of New York

fyi

An analysis of 26,000 analysts' recommendations as of April 2, 2001, revealed that only 0.3% of the recommendations were a "strong sale." By comparison, 67.7% of the recommendations were "buy" or "strong buy." See Lynn E. Turner, "The State of Financial Reporting Today: An Unfinished Chapter III," SEC Chief Accountant, Remarks at Glasser LegalWorks Third Annual SEC Disclosure & Accounting Conference, San Francisco, California, June 21, 2001.

against Merrill Lynch. Investigation revealed that at the same time that the Merrill Lynch analysts were publicly recommending stocks as a “buy,” they were internally circulating highly negative comments about those same stocks. For example, one stock, **InfoSpace**, was listed on Merrill Lynch’s “Favored 15” buy list for four months in 2000 even though the firm’s analysts were internally saying that InfoSpace was a “powder keg” and a “piece of junk” and that the analysts had received many “bad smell comments” about the company.<sup>16</sup> The motivation behind this public recommendation of stocks that the analysts privately were very skeptical about was as follows: “The research analysts were acting as quasi-investment bankers for the companies at issue, often initiating, continuing, and/or manipulating research coverage for the purpose of attracting and keeping investment banking clients.”

## Regulatory Investigation

Just as New York investigated the Merrill Lynch analyst team as described above, investigations are often conducted when companies are suspected of passing outside the boundary of the GAAP oval in Exhibit 6-7 into the area of fraudulent financial reporting. As described at the beginning of the chapter, the SEC launched an investigation of Xerox and uncovered evidence of systematic financial misrepresentation, resulting in a \$10 million fine and a \$22 million civil judgment being levied against Xerox. The SEC frequently investigates questionable accounting and requires the offending company to sign an order agreeing to “cease and desist” its misleading accounting practices.

In addition to regulatory investigations, fraudulent financial reporting can also lead to criminal charges. In the Enron case, for example, Arthur Andersen was convicted of obstruction of justice for its destruction of audit work papers.<sup>17</sup> Some Enron executives pleaded guilty to criminal charges, and one of the former CEOs of the company is currently sitting in a federal prison. As mentioned earlier, the CFO of WorldCom pleaded guilty to charges of fraud, and the CEO of WorldCom was found guilty of fraud in a highly publicized trial.

## Massive Loss of Reputation

The final step in an earnings management meltdown is the huge loss of credibility experienced by the company that has been found to have manipulated its reported earnings. This loss of credibility harms all of the company’s relationships and drastically impairs its economic value. As mentioned earlier, the SEC imposed \$32 million in penalties on Xerox for its improper reporting practices. However, the amount of these penalties pales in comparison to the \$764 million in market value that Xerox shareholders lost on April 3, 2001, the day after the company announced that it was delaying the release of its 2000 financial statements pending an additional review by the company’s auditor. Overall, from the peak of the earnings manipulation in 1999 to the final resolution of the accounting scandal in June 2002, Xerox shareholders lost approximately \$40 billion in market value.

From 1997 through 2002, four major periods of decline in worldwide stock prices occurred. The first, in 1997, was touched off by a concern about the reliability of banking and financial information in a number of Asian countries. The second, in 2000, was primarily a return to reality after initial euphoria about the business possibilities associated with the Internet. The third decline occurred in 2001 in the wake

<sup>16</sup> Affidavit in Support of an Inquiry by Eliot Spitzer, Attorney General of the State of New York, Pursuant to Article 23-A of the General Business Law of the State of New York with regard to the acts and practices of Merrill Lynch & Co., Inc., and others, April 2002.

<sup>17</sup> In a strange twist to the Enron and Arthur Andersen story, the U.S. Supreme Court later overturned the Arthur Andersen conviction because of erroneous instructions given by the judge to the jury. Unfortunately for Arthur Andersen, the firm’s operations had long since ceased because of the loss of its reputation stemming from the conviction.

## EXHIBIT 6-10

## Seven Elements of an Earnings Management Meltdown

1	2	3	4	5	6	7
Downturn in business	Pressure to meet expectations	Attempted accounting solution	Auditor's calculated risk	Insufficient user skepticism	Regulatory investigation	Massive loss of reputation

Through stage 5, the public is unaware of an earnings management meltdown.

of the political and economic uncertainty created by the September 11, 2001, attack on the World Trade Center. The fourth broad-based decline in stock values occurred in 2002 and was largely fueled by widespread uncertainty about the credibility of the financial reports of U.S. corporations. This credibility crisis has graphically illustrated the real economic value of high-quality and transparent (i.e., easy to understand) financial reporting.

We close this section with one final thought about earnings management meltdowns. Refer to Exhibit 6-10, which repeats the seven elements of an earnings management meltdown. If we had been discussing this topic in 1999, the Xerox meltdown would have been at stage 5, meaning that the earnings management manipulations were in full swing, the auditor had made a calculated risk and signed off on past financial statements, and the investment community was bullish on Xerox's stock and pleasantly unaware of the catastrophe that was waiting to happen. Similarly, as you are reading this chapter, it is certain that some major corporations are at stage 5 of an earnings management meltdown about which the public is as yet completely oblivious. Accordingly, an attitude of healthy skepticism about financial reports is always appropriate, whether you are an accountant, an auditor, a financial analyst, a regulator, a private investor, or just a conscientious citizen.

## Transparent Financial Reporting: The Best Practice

**5** Explain how good accounting standards and ethical behavior by accountants lower the cost of obtaining capital.

**WHY** High-quality accounting standards and vigorous regulatory enforcement activity reduce information risk, thereby lowering a company's cost of capital.

**HOW** The more reliable the information provided by a company, the more confidence potential investors can place in that information. High-quality information allows for better decision making. The ability to make better decisions reduces the risk to potential investors and creditors and thus reduces the cost of capital to a company.

An important fact often forgotten by financial statement preparers and users is that the entire purpose of accounting, both financial and managerial, is to lower the cost of doing business. A good managerial accounting system allows managers more efficient access to the information needed to make good business decisions. Good financial accounting reduces the information uncertainty surrounding a company so that external parties, such as lenders and investors, do not bear as much risk when they provide financing to the company. This section explains how transparent financial reporting, even in a setting in which there are great incentives for managers to manipulate earnings in the short run, represents the best business practice for the long run.

## What Is the Cost of Capital?

The **cost of capital** is the cost a company bears to obtain external financing. The **cost of debt financing** is simply the after-tax interest cost associated with borrowing the money. The **cost of equity financing** is the expected return (both as dividends and an increase in the market value of the investment) necessary to induce investors to provide equity capital. A company often computes its **weighted-average cost of capital**, which is the average of the cost of debt and equity financing weighted by the proportion of each type of financing.

A company's cost of capital is critical because it determines which long-term projects are profitable to undertake. In a capital budgeting setting, the cost of capital can be thought of as the *discount rate* or *hurdle rate* used in evaluating long-term projects. The higher the cost to obtain funds, the fewer long-term projects are profitable for the company to undertake. A project that makes economic sense to a company

with a low cost of capital could very well be unprofitable to a company with a higher cost of capital.

A key factor in determining a company's cost of capital is the risk associated with the company. For a very risky company, lenders and investors are going to require a higher return to induce them to provide capital to the company. Thus, the more risk associated with a company, the higher its cost of capital. One risk factor is the information risk associated with uncertainty about the company's future prospects. A company produces financial statements to better inform lenders and investors about its past performance; they can then use this information to make better forecasts of the

company's future performance. Consequently, good financial statements reduce the uncertainty of lenders and investors so that they will provide financing at a lower cost. However, when the financial statements lose their credibility, they do nothing to reduce the information risk surrounding a company, and the company's cost of capital is higher.

## The Role of Accounting Standards

Chapter 1 introduced you to the organizations important in setting accounting standards: the FASB, the AICPA, the SEC, and the IASB. In the context of our discussion here, it is useful to view each of these organizations as helping to lower the cost of capital. The FASB and the AICPA help lower the U.S. cost of capital by promulgating uniform recognition and disclosure standards for use by companies in the United States. In spite of the accounting scandals that have been discussed in this chapter, the financial reporting system in the United States is still viewed as being the best in the world. Put another way, the extensive and high-quality accounting standards used in the United States result in financial statements that reduce information risk more than do the statements prepared under the standards used anywhere else in the world.

According to the SEC, its "primary mission . . . is to protect investors and maintain the integrity of the securities markets." In terms of financial reporting, this protection of investors means that the SEC monitors the accounting standard-setting process of the FASB, requires publicly traded companies to make quarterly financial statements available to investors on a timely basis, and, as in the case of Xerox, investigates (and punishes) cases of deceptive financial reporting. All of these actions increase

fyi

Financial statements that have no credibility can actually be worse than no financial statements at all. When managers are willing to try to deceive lenders and investors through misleading financial reporting, those same lenders and investors naturally wonder what other types of deception the managers are attempting. This is called the "cockroach theory": If you discover one deceptive practice, there are likely to be more.

the reliance that capital providers can place on the financial statements of companies trading on U.S. securities markets. Thus, the SEC's actions contribute toward reducing information risk and lowering the cost of capital.

The IASB is playing an increasingly important role in enhancing the credibility of international financial reporting. In the international arena, transparent and reliable financial reports are extremely important to providers of capital because the company requiring the investment capital may be in a different business environment and a different culture than those providing the capital. Therefore, the important efforts of the IASB also serve to lower the cost of capital by lowering information risk.

However, not everyone agrees that the mandated adoption of IFRS by U.S. companies will lower the cost of capital for those companies. U.S. GAAP is famous for containing detailed accounting rules. In contrast, IFRS is known for being based on general principles, with the detailed application being left up to the professional judgment of the accountant. By some counts, U.S. GAAP contains about 25,000 pages and IFRS contains just 2,500 pages; those extra 22,500 pages allow for a lot of detailed U.S. GAAP accounting guidance that doesn't exist under IFRS. The question being considered in the U.S. business community is whether principles-based accounting standards will work in the U.S. legal environment? Accountants and auditors are concerned that they can never be sure their application of the accounting "principle," without the detailed guidance of rules, will bear up under the after-the-fact scrutiny of trial lawyers, juries, and judges. And financial statement users are concerned that this increased reliance on accounting judgment will make the reported numbers under IFRS more vulnerable to management manipulation, increasing information risk and thus increasing the cost of capital. These are issues that will be played out over the next few years as the SEC guides the U.S. transition to IFRS.

## The Necessity of Ethical Behavior

A nagging question concerns why accounting scandals continue to occur in the United States even when we have high-quality accounting standards supplemented by an active regulatory system. The answer to this question has been mentioned over and over in this chapter: Managers have strong economic incentives to report favorable financial results, and these incentives can lead to deceptive or fraudulent reporting. But managers also have strong incentives to maintain a reputation for credibility for both their company and for themselves personally. This existence of conflicting forces is not unique to the area of financial reporting. We are all faced with situations in which we have incentives to deceive or commit fraud. For example, the income tax collection system in the United States works reasonably well only because the vast majority of taxpayers honestly report their taxable income, even though they could benefit economically by understating their income. Without this voluntary compliance, the Internal Revenue Service would find it prohibitively costly to audit and investigate every Form 1040 to enforce tax compliance.

As all college students know, good grades make it easier to secure a spot on the interview schedules of campus recruiters. Thus, there are some incentives to cheat when writing papers or taking exams. As a result, the internal control systems surrounding the security of exams on some campuses are truly impressive. Other universities have found that an honor code, or a code of conduct, is a less costly way to reduce the incidence of cheating. For example, at Rice University in Houston, Texas, incoming students commit to abide by the university's Honor System. Under this system, class instructors are specifically prohibited from monitoring students during an examination. In place of this external monitoring, each student is required to write the following statement on his or her exam: "On my honor, I have neither given nor received any aid on this examination."

Accountants have their own honor system; it is called the *AICPA Code of Professional Conduct*. An important concept from this code of conduct is contained in the following paragraph:

In discharging their professional responsibilities, members may encounter conflicting pressures. . . . In resolving those conflicts, members should act with integrity, guided by the precept that when members fulfill their responsibility to the public, clients' and employers' interests are best served.<sup>18</sup>

In essence, this paragraph says that ethical behavior is also the best long-run business practice. To illustrate that this is so, consider again the Xerox scenario that started this chapter. The deceptive accounting practices undertaken at Xerox to hide poor operating performance merely delayed the inevitable. When these problems were eventually revealed, the economic loss suffered by all Xerox stakeholders—investors, lenders, customers, employees—was greatly magnified because of the accounting deception. The company lost economic value not just because of reduced opinions about its operating performance but also because the company had lost its credibility. Xerox researchers and marketers may soon design and promote products that will reverse the company's operating woes, but the impairment of the company's credibility will not be reversed for many, many years.

In a perfectly rational world, efforts to manipulate public perception through earnings management would be fruitless because appropriately skeptical users of the financial data would be aware of the potential for earnings management and would perfectly adjust the reported numbers using alternative sources of information to remove any bias. However, the world is not perfectly rational. Rarely do financial statement users have the time or resources to unravel the potential manipulations in every set of numbers that they see. Instead, financial statement users rely on the soundness of the accounting standards, the integrity of the managers who prepared the numbers, and the skills and thoroughness of the auditors. One of the disappointing lessons stemming from the accounting scandals of 2001 and 2002 is that financial statement users probably placed too much unquestioning reliance on the reported financial statement numbers of some companies. Because of the large amounts of money lost by investors and creditors, they will be more skeptical in the future. Hopefully, one of the positive lessons drawn from these same scandals will be that society at large will see the massive impact that credible (or questionable) financial reporting can have on the economy. Hopefully, both users and preparers of financial statements will insist on transparency in reporting in order to reduce information risk and lower the cost of capital. And hopefully individual managers, accountants, and financial statement users will be reminded again that ethical behavior really is the best long-run business practice.

## SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. *In the 1980s, Xerox faced stiff competition from Japanese copy machine makers. In the 1990s, Xerox faced another threat as companies focused more on "digital documents," calling into question the need for large-scale paper copy machines.*
2. *To avoid recording \$27 million in sales returns, the Xerox Mexico managers rented*
3. *secret warehouses to store the returned merchandise.*
3. *In April 2005, KPMG agreed to pay \$22 million to settle a civil suit filed by the SEC stemming from the Xerox audit. In addition, KPMG lost the Xerox audit account, resulting in lost audit fees of tens of millions of dollars per year.*

<sup>18</sup> AICPA Code of Professional Conduct, Section 53–Article II: The Public Interest, par. 02 (New York: AICPA, 19).

## REVIEW OF LEARNING OBJECTIVES

### 1 Identify the factors that motivate earnings management.

Four factors that motivate managers to manage reported earnings follow:

- Meet internal targets.
- Meet external expectations.
- Provide income smoothing.
- Provide window dressing for an IPO or a loan.

### 2 List the common techniques used to manage earnings.

The earnings management continuum contains the following five items:

- Strategic matching of one-time gains and losses
- Change in methods or estimates with full disclosure
- Change in methods or estimates with little or no disclosure
- Non-GAAP accounting
- Fictitious transactions

The five techniques of accounting hocus-pocus identified by then-Chairman Arthur Levitt of the SEC in 1998 are as follows:

- Big bath charges
- Creative acquisition accounting
- Cookie jar reserves
- Materiality
- Revenue recognition

A pro forma earnings number is the regular GAAP earnings number with some revenues, expenses, gains, or losses excluded. Managers can use the flexibility of pro forma disclosures to reveal better information about a company's underlying economic performance. However, pro forma disclosures can also be used in an attempt to hide poor performance.

### 3 Critically discuss whether a company should manage its earnings.

Financial reporting is a normal part of a company's overall public relations effort. As such, a responsible manager should consider what

impact the financial statements will have on the company's ability to satisfy the needs of its stakeholders. There is no "true" earnings number, and a manager is not necessarily expected to report earnings that are somewhere in the middle of the possible range of numbers. Computing earnings using non-GAAP methods is clearly unethical, but the boundary between GAAP and non-GAAP treatment is not always a bright line. If the intent in using earnings management techniques is to deceive, then most people would consider the earnings management wrong, independent of whether it was in strict conformity with GAAP.

### 4 Describe the common elements of an earnings management meltdown.

The seven stages in an earnings management meltdown are as follows:

- Downturn in business
- Pressure to meet expectations
- Attempted accounting solution
- Auditor's calculated risk
- Insufficient user skepticism
- Regulatory investigation
- Massive loss of reputation

At any given time, at least a few large corporations are somewhere in the middle of an earnings management meltdown that has not yet been publicly revealed.

### 5 Explain how good accounting standards and ethical behavior by accountants lower the cost of obtaining capital.

By reducing information risk, good financial reporting can lower a company's cost of capital. High-quality accounting standards and vigorous regulatory enforcement activity alone cannot ensure the credibility of financial reports. Without ethical behavior by individual managers and accountants, the regulatory cost to ensure credible financial statements would be prohibitively high. Because of the high value of a company's reputation, ethical financial reporting is also a good long-run business practice.

**IASB SUMMARY**

Topic	U.S. GAAP	IASB Standard
General characterization of the standards	Rules oriented. U.S. GAAP contains about 25,000 pages with lots of detailed guidance.	Principles oriented. IFRS contains just 2,500 pages with many detailed accounting decisions left up to the professional judgment of the accountant.

**KEY TERMS**

Big bath 293	Earnings management continuum 290	Internal earnings target 285	Weighted-average cost of capital 306
Cost of capital 306	GAAP oval 298	Pro forma earnings number 295	Window dressing 289
Cost of debt financing 306	Income smoothing 288		
Cost of equity financing 306			

**QUESTIONS**

- What are the four factors that might motivate a manager to attempt to manage earnings?
- (a) What is the purpose of internal earnings targets?  
(b) What is the risk associated with internal earnings targets?
- What has academic research shown with respect to earnings-based bonus thresholds?
- How do auditors react to the existence of an earnings-based bonus plan in the company being audited?
- Explain the significance of the figure in Exhibit 6-2.
- Explain the significance of a company meeting or beating analysts' earnings forecasts for many quarters in a row.
- What does the term *income smoothing* mean?
- General Electric** has long been known as a company that smoothes its reported earnings. What is it about General Electric that makes it possible for the company to smooth earnings?
- Research has discovered a phenomenon common to both capitalist managers in the West and socialist managers in China. What is this phenomenon?
- Describe one setting in which a manager might have an incentive to manipulate the accrual assumptions so that lower earnings are reported.
- The flexibility that is a key part of the estimates and judgments inherent in accrual accounting allows desperate managers to manipulate the reported numbers. Why not do away with this flexibility and just require companies to report raw cash flow data without any assumptions about bad debt percentage, depreciation life, estimated future warranty repairs, and so forth?
- What are the five labels in the earnings management continuum (see Exhibit 6-4), and what general types of actions are associated with each label?
- Is there anything wrong with using a different accounting estimate this year compared to last year so long as both estimates fall within a generally accepted range for your industry?
- What are two potential causes of non-GAAP accounting?
- Company A has created fictitious transactions to report more favorable earnings. Is it likely that this is the only action Company A has taken to manage earnings? Explain.
- In 1998, then-SEC Chairman Arthur Levitt gave a speech in which he identified five techniques of accounting hocus-pocus. List those five techniques.
- What is the benefit of "taking a big bath"?
- What accounting actions have been taken since Chairman Levitt's speech in 1998 to limit the use of big-bath charges to manage earnings?
- In what way can a company "take a bath" when recording the acquisition of another company?
- What type of company would be most likely to establish a cookie jar reserve?
- In what way is the concept of materiality contained in *SAB 99* different from the traditional concept of materiality?
- What major accounting action has been taken since Chairman Levitt's speech in 1998 to limit the abuse of revenue recognition to manage earnings?
- What is a pro forma earnings number?
- What is a benefit of a company's reporting a pro forma earnings number? What is a danger with pro forma earnings numbers?

25. With respect to pro forma earnings numbers, what recommendation made by the Financial Executives International (FEI) and the National Investor Relations Institute did the SEC endorse?
26. In what sense is financial reporting part of a company's general public relations effort?
27. Refer to the GAAP oval in Exhibit 6-7.
  - (a) In what important way is point E different from point C?
  - (b) In what important way is point A different from point C?
28. What factors influence whether a manager actually violates GAAP in an effort to manage earnings?
29. What is one way to distinguish between earnings management that is ethically right and earnings management that is ethically wrong?
30. What are the seven elements of an earnings management meltdown?
31. A manager being pressured to meet expectations in the face of a downturn in operating performance can be tempted to turn to an accounting solution and use accrual estimates and judgments to manage reported earnings. How else might the manager respond to this pressure?
32. What costs and risks is an auditor balancing when signing an audit opinion?
33. What economic incentives do financial analysts sometimes have for overlooking a company's glaring deficiencies and continuing to recommend it to investors as a "buy"?
34. When the SEC launches an investigation against a company and finds evidence of misleading financial reporting, historically what type of punishments has the SEC used?
35. The text of the chapter includes discussion of seven stages in an earnings management meltdown. At what stage does the earnings management meltdown become public knowledge?
36. What does the *cost of capital* mean?
37. How does financial reporting impact a company's cost of capital?
38. How do accounting standards impact the cost of capital?
39. According to the AICPA Code of Professional Conduct, what precept should guide members of the AICPA as they encounter conflicting pressures among their clients, investors, the business community, the government, and so forth?
40. What is the best long-run business practice?

## CASES

### Discussion Case 6-1

#### Should We Implement an Earnings-Based Bonus Plan?

Benjamin Vincent is the chief financial officer (CFO) of Annie Company. The company's chief executive officer (CEO) has asked Benjamin to design an incentive scheme that will motivate employees to focus more on the company's bottom-line results. Benjamin is considering a plan that will give each employee a bonus based on the company's reported net income for the year. Each employee will receive an amount equal to the company's earnings per share multiplied by either 10,000 times, 50,000 times, or 200,000 times, depending on the employee's level in the company. Last year, Annie Company's earnings per share was \$1.32. Benjamin Vincent has asked you for your advice. In particular, he wants you to explain the *disadvantages* of having an earnings-based bonus system.

### Discussion Case 6-2

#### We Only Need Another \$100,000!

Chris Titera is the chief financial officer (CFO) for Dallas Company. It is January 10, and Chris has just finished compiling the preliminary financial results for the most recent fiscal year, which ended on December 31. The preliminary results indicate that Dallas lost \$100,000 during the year. Dallas is a large company (with assets in excess of \$1 billion), so the \$100,000 loss is essentially the same as zero. However, the board of directors thinks that it conveys a very negative image for Dallas Company to report a loss for the year, even if the loss amount is very small. As a result, it has instructed Chris to look at the numbers again and see if he can turn this loss into a profit. What things can Chris do, as the CFO, to turn this loss into a profit? What concerns should Chris have?

### Discussion Case 6-3

#### Are Financial Analysts Rational?

Stella Valerio is a financial analyst who follows Olsen Company and other companies in the same industry. You have just done a historical analysis of Stella's earnings forecasts for Olsen Company and noticed that its earnings have exceeded Stella's forecasted amount for 27 quarters in a row. You are wondering whether this is just a coincidence, whether Stella is an exceptionally bad forecaster, or whether other factors may be at work here.

**Discussion  
Case 6-4**

**Income Smoothing and an IPO**

You are an analyst for an investment fund that invests in initial public offerings (IPOs). You are looking at the financial statements of two companies, Clark Company and Durfee Company, that plan to go public soon. Net income for the past three years for the two companies has been as follows (in thousands):

Year	Clark Net Income	Durfee Net Income
2008 .....	\$10,000	\$17,000
2009 .....	14,000	1,000
2010 .....	20,000	26,000

If both companies issue the same number of shares and if the initial share prices are the same, which of the two companies appears to be a more attractive investment? Explain your reasoning. What alternate sources of data would you look at to find out whether the reported earnings amounts accurately portray the business performance of these two companies over the past three years?

**Discussion  
Case 6-5**

**Who Benefits When a State-Owned Enterprise Goes Public?**

Dalian Company is a Chinese state-owned enterprise. This means that ownership of the company rests in one of the ministries of the Chinese central government. Ministry officials have decided to sell a portion (40%) of the government's ownership interest in Dalian to outside investors, including foreign investors. The proceeds from this initial public offering (IPO) will flow into the operating budget for the ministry.

Zhang Tianfu is Dalian Company's senior manager. He is preparing for the IPO. Among other things, he is working with the company's accountants to get the financial statements for the past three years ready for use by external investors. With respect to these financial statements, what conflicting incentives face Mr. Zhang as he prepares for the IPO?

**Discussion  
Case 6-6**

**If It Isn't Fraud, Then It's Ethical**

Cruella DeVil is the chief financial officer (CFO) of a local publicly traded company. She was recently invited to speak to accounting students at the local university. One of the students asked Cruella whether she thought earnings management was ethical. Cruella laughed and responded that her view was that anything that was not explicitly prohibited by the accounting standards or by government regulations was ethical. What do you think of Cruella's opinion?

**Discussion  
Case 6-7**

**Managing Earnings in the Jubilee Year**

Heidelberg Company has been in business for 100 years. The past three years have been trying ones for the company, which has reported operating losses in each of those three years. The board of directors is planning a huge, year-long celebration of the company's centennial year. The board has informed the company's controller that the company *must* report a profit in each quarter of the centennial year. The board has not told the controller how this is to be done, but the implication is that if the operating results are not enough to generate a profit, the controller must use accounting assumptions to push the company over the top. The controller has identified three areas in which Heidelberg Company has some flexibility in its accounting assumptions: depreciation, bad debts, and pension accounting. Describe specifically how the controller can use accounting assumptions in these three areas to improve Heidelberg's reported earnings. Also describe which set of financial statement users is most likely to be influenced by this earnings management in the centennial year financial statements.

**Discussion  
Case 6-8****I Didn't Do It on Purpose!**

You are a senior staff member in the office of the Chief Accountant of the Securities and Exchange Commission (SEC). You have been supervising a case brought against an audit firm. The audit client used non-GAAP accounting practices that allowed it to report annual earnings of \$47.3 million instead of a loss of \$15.0 million. Earnings in the preceding three years averaged \$10 million per year. The auditor explains that this non-GAAP accounting practice was not detected during the audit because of innocent mistakes made by staff auditors. Your thorough investigation has not turned up any evidence that the audit firm intentionally allowed the client to use this non-GAAP practice. You must decide whether to formally sanction the audit firm or whether to drop the case because of lack of evidence of wrongful intent. What should you do?

**Discussion  
Case 6-9****Earnings Management, Inc.**

John Sleaze and Mary Scum run Earnings Management, Inc., a consulting business. They have the following items in their product line:

1. A database that lists types of depreciable assets and the minimum and maximum depreciation lives that have been accepted by auditors for each type of asset. The listing can be sorted by audit firm, so a client can know the minimums and maximums accepted by each individual audit firm.
2. A detailed analysis of the SEC's *Staff Accounting Bulletin (SAB) 101* on revenue recognition. The analysis reveals loopholes in *SAB 101* that companies can use to strategically time the recognition of revenue.
3. A comprehensive list of all accounting issues for which there is no generally accepted standard. This list can be viewed as an identification of all of the fuzzy areas of accounting that a company might exploit if it desired to conduct earnings management.
4. A list of the local offices for each major audit firm that appear to have been the most "flexible" in signing off on aggressive accounting treatments by clients. In some cases, the list includes specific audit partners who have a reputation for being accommodating when a client firm wishes to use aggressive earnings management techniques.

You are an FBI agent investigating Earnings Management, Inc., for possible indictment on securities fraud and racketeering charges. Comment on whether you think John and Mary have committed any indictable offenses.

**Discussion  
Case 6-10****I'm New Here; I Think I'll Take a Bath**

Frank Elsholz is the new chief executive officer (CEO) of Kearn Street Company. You are the controller for Kearn Street; you have been with the company for 15 years. In connection with the preparation of this year's financial statements (the first prepared since the departure of the old management team), Frank has asked you to bring him a list of all long-term assets, both tangible and intangible, that have any chance of becoming impaired within the next three years. Some of Kearn Street's long-term assets have appreciated substantially since they were acquired, so there is little chance that they will be impaired in the foreseeable future. However, other assets could become impaired in the next three years, depending on what happens to local business conditions. If a long-term asset becomes impaired, its carrying value is written down and a loss is recognized, as explained in Chapter 11. You are curious about why the new CEO wants you to compile this list. Speculate on what you think Frank has in mind.

**Discussion  
Case 6-11****Loading Up the Cookie Jar!**

Lily Company has historically reported a bad debt expense amount of between 1% and 4% of sales. The percentage for any given year is a function of both the business conditions for the year and whether recent experience suggests that the estimates

in past years have been too high or too low. For example, if estimates in past years have been too high, a lower amount of bad debt expense is recognized in the current year. Lily Company's board of directors has met to review the preliminary financial statements for the just-completed fiscal year. Assume that the board will decide on a bad debt estimate of either 1% or 4% of sales. Consider the following two scenarios:

*Scenario 1.* The preliminary earnings number for the year is very high, far higher than expected. However, Lily's board is concerned about future years; there is some indication of unsettled business conditions ahead.

*Scenario 2.* The preliminary earnings number for the year is quite low, lower than expected. The board has reason to be optimistic that Lily's operating performance will turn around next year.

What estimate (1% or 4%) do you think Lily's board will choose in each of the two scenarios? Explain your choices. What risks are there to Lily Company if the bad debt estimate is chosen using only the type of information given here?

### Discussion Case 6-12

#### I Need to Recognize the Revenue Now!

The H.K. Clark Health Club sells lifetime memberships for \$5,000 each. These memberships entitle a person to unlimited access to the club's weight room, exercise equipment, swimming pool, and sauna. Once a lifetime membership fee is paid, it is not refundable for any reason. According to the provisions of *SAB 101*, revenue from the sale of a lifetime membership must be deferred and recognized over the average expected time that a member will continue to use the club facilities. However, if the terms of the membership agreement are interpreted very favorably, a substantial portion of the \$5,000 initial fee might be able to be recognized as revenue immediately. Kristen Qi and her partners own the health club. To overcome a cash shortage, they intend to seek a new loan from their bank. Kristen and her partners are meeting with their accountant to provide information for preparation of financial statements. What incentives would Kristen and her partners have for recognizing the entire amount of the lifetime membership fee as revenue at the time it is collected? Since the entire amount will ultimately be recognized anyway, what difference does the timing make? Do Kristen and her partners have any *economic* incentive to go ahead and defer the membership revenue in accordance with *SAB 101*?

### Discussion Case 6-13

#### How Should I Interpret the Pro Forma Number?

Worthington Company and Millward Company both reported pro forma earnings numbers in conjunction with their release of results for the most recent quarter. Both announcements included a reconciliation to GAAP earnings. These reconciliations are reproduced here.

Worthington Company Pro Forma Earnings	
(in thousands)	
GAAP earnings .....	\$ 50,000
Add back amount expensed for the purchase of in-process R&D .....	35,000
Subtract a one-time gain from the sale of a building .....	(17,000)
Pro forma earnings .....	<u>\$ 68,000</u>

Millward Company Pro Forma Earnings	
(in thousands)	
GAAP earnings .....	\$ 50,000
Add back expenses associated with a strategic realignment initiative .....	10,000
Add back employee training expenses .....	8,000
Pro forma earnings .....	<u>\$ 68,000</u>

Which of the two pro forma earnings disclosures do you find to be the more informative? Explain.

**Discussion  
Case 6-14****I'm an Accountant, Not a Public Relations Person!**

Jacob Marley is the controller for Dickens Company. Marley has been with Dickens for more than 30 years. Marley is a dedicated employee and prides himself on the efficiency of his accounting department staff. Over the years, Marley has received many inquiries and suggestions from the board of directors of Dickens Company about appropriate accounting treatments, the magnitude of certain accounting estimates, and so forth, but he has never paid the slightest attention to any of the suggestions. Marley's view is that the process of generating the financial statement numbers is simply a matter of rigidly applying certain predetermined mathematical rules, and he does not welcome the input of the board of directors or anyone else. Marley also refuses to communicate with analysts, pension fund managers, and business press reporters who call to make inquiries about Dickens. Marley believes that the financial statements speak for themselves and need no clarification or amplification. Comment on the costs and benefits of Jacob Marley's approach to financial reporting to Dickens Company.

**Discussion  
Case 6-15****GAAP Is a Point, Not an Oval!**

You are the chief financial officer (CFO) of Lorien Company, which is publicly traded. At the annual shareholders' meeting you discussed the company's recent reported results. As part of your presentation, you illustrated the minimum and maximum values for net income that Lorien could have reported using a range of accounting assumptions other companies in your industry use. Your statement prompted a cry of outrage from one of the shareholders present at the meeting, who accused you of being an unprincipled liar. This shareholder stated that any suggestion that there is a range of possible net income values for a given company in a given year indicates an overly liberal approach to financial reporting. This shareholder has moved that your employment contract be immediately terminated because of an apparent lack of moral character. The shareholder's arguments have been persuasive to a large number of people at the meeting. What can you say to defend yourself?

**Discussion  
Case 6-16****Is It Easier to Fix My Business if I'm a Private Company?**

Tooele Company is publicly traded. However, its chief executive officer (CEO), Kara Brown, is considering taking the company private in a leveraged buyout (LBO). One of the primary motivations for the LBO is dissatisfaction with the amount of time Kara must spend each quarter giving guidance to analysts about what reported earnings will be, meeting with the accounting staff to see whether the company will meet its earnings targets, and then explaining the reported quarterly results to the business press. Comment on Kara's motivation for taking Tooele Company private.

**Discussion  
Case 6-17****Do All Analysts Have the Same Incentives?**

There are two general types of financial analysts:

- *Buy-side analyst.* An analyst employed by an entity, such as a mutual fund, which invests on its own accounts. Unlike that of the sell-side analysts employed by brokerage firms, research produced by buy-side analysts is usually unavailable outside the firm that hired the analyst.
- *Sell-side analyst.* An analyst employed by a brokerage firm or another firm that manages client accounts. Unlike that of the buy-side analysts employed by mutual funds, research produced by sell-side analysts is usually available to the public.

These definitions come from <http://www.investorwords.com>.

Some financial analysts have been criticized for making optimistic forecasts of the earnings of potential clients in order to curry favor with those potential clients. Do you think that this criticism is directed at buy-side analysts or sell-side analysts? Explain.

**Discussion  
Case 6-18****Who Would Report if Reporting Were Voluntary?**

Tarazania is a country with a small but active stock market. However, the country has no accounting standards; in fact, the issuance of financial statements is illegal. This odd law stems from the fact that the founding king of Tarazania once took

an intermediate accounting course and was so overwhelmed by the chapter on the statement of cash flows that he vowed he would never view another financial statement again. As a result, none of the 100 companies with publicly traded stocks in Tarazania have ever made financial statements available to the public. Of course, each of these companies has prepared financial statements and other reports for use internally for years. Last week Tarazania's founding king died. His eldest daughter has now ascended to the throne. Her Majesty has been a secret aficionado of financial statements for years. One of her first official acts was to make the public release of financial statements legal but not mandatory. Of the 100 publicly traded companies in Tarazania, which will be the first to release its financial statements to the public? Will all 100 companies do so?

### Discussion Case 6-19

#### Does It Pay to Lie?

Joseph Han has \$10 million that he wishes to invest. He has identified two candidate companies: Company A and Company B. Both companies are privately held and have never yet released external financial statements. Joseph Han has some familiarity with the use of financial statements, but his knowledge is not perfect and he can be fooled. However, he has the ability to recognize blatant financial statement manipulation. As Companies A and B prepare their financial statements, they must consider the following three scenarios:

- *Scenario 1.* Both prepare transparent financial statements that faithfully reflect their underlying business performance. Joseph Han is impressed with both companies and invests \$5 million in each.
- *Scenario 2.* One of the companies prepares deceptive financial statements. These financial statements look so good compared to the transparent financial statements prepared by the other company that Joseph Han instantly decides to invest \$8 million in the deceptive company and nothing in the truthful company. To avoid putting all of his eggs in one basket, Joseph Han holds back \$2 million and puts it in a bank savings account.
- *Scenario 3.* Both companies prepare deceptive financial statements. In carefully comparing these two glowing sets of financial statements, Joseph Han realizes that both sets of financial statements have been manipulated. He decides to invest \$1 million in each company, as a speculation, and to put the remaining \$8 million in a bank savings account.

Given these three scenarios, what is the best strategy for Companies A and B—to lie or to tell the truth? Will your answer change if Joseph Han announces his intention to make this same \$10 million investment decision with respect to these two companies each year for the next 30 years?

### Case 6-20

#### Deciphering Financial Statements (The Walt Disney Company)

In the press release announcing **Disney's** results for the first fiscal quarter of 2008 ending December 29, 2007, the company stated the following:

The Walt Disney Company today reported earnings for its first fiscal quarter ended December 29, 2007. Diluted earnings per share (EPS) for the quarter were \$0.63 . . . EPS in the prior-year quarter . . . were \$0.79.

The prior-year quarter's EPS of \$0.79 included \$1.1 billion gains on the sales of Disney's interests in E! Entertainment and Us Weekly and a \$48 million equity-based compensation plan modification charge. In aggregate, these items increased the prior-year quarter's EPS by \$0.29.

1. By what percentage did Disney's EPS decrease from the end of its first fiscal quarter in 2007 to the end of its first fiscal quarter in 2008?
2. Suppose none of the non-operating transactions disclosed in the second paragraph had occurred in the first fiscal quarter of 2007. Compute the percentage change in EPS.

## Case 6-21

**Deciphering Financial Statements (Xerox)**

As indicated in the case at the beginning of this chapter, **Xerox** was manipulating income between the years 1997 through 1999. Below are revenue, gross profit, net income, and operating cash flow data for Xerox for the years 1997 through 2000.

(in millions)	2000	1999	1998	1997
Revenues .....	\$18,701	\$19,228	\$19,447	\$18,144
Gross profit .....	7,601	9,003	9,580	9,036
Net income (loss) .....	(257)	1,424	395	1,452
Operating cash flow .....	(663)	1,224	(1,165)	472
Proceeds from securitization of finance receivables .....	0	1,495	0	0

The securitization of the finance receivables represents the sale of receivables to a third party. The cash inflow from the sale was shown in the Operating Activities section of the statement of cash flows.

Using these data, identify evidence that proves Xerox was managing its reported earnings during this period.

## Case 6-22

**Writing Assignment (Why did we manage earnings?)**

You are the controller for Cam-Ry Industries. Your company has recently received a large amount of unfavorable publicity because an SEC investigation uncovered a systematic 2-year effort by Cam-Ry's management to manipulate reported earnings. The primary motivation for this earnings management scheme was to consistently meet analysts' earnings expectations in order to keep the opinion of your company high in advance of an additional share offering that was to take place next year. The SEC has now formally sanctioned your company and fined it \$350,000, and the investor backlash has lowered the company's share price and resulted in the cancellation of the planned share offering next year.

As controller, you were aware of the earnings management scheme. You failed to actively oppose the effort. However, the driving force behind the scheme was the former chief executive officer (CEO) who has now been replaced. Your former auditor has also been fired. The new CEO is attempting to mend all of the stakeholder relationships that have been strained because of the SEC revelation of the earnings management activity. The new CEO has assigned you to repair relations with Yosef Bank. The bank has provided a line of credit to Cam-Ry for over 15 years. You have personally represented Cam-Ry in its dealings with the bank. For the past five years, you have met frequently with DeeAnn Martinez who is a senior vice president with the bank and the person assigned to the Cam-Ry account. Through mutual friends, you have heard that Martinez feels personally betrayed by you and no longer trusts you.

You are scheduled to meet with DeeAnn Martinez next week to discuss Cam-Ry's line of credit. In advance of that meeting, you have decided to write a 1-page memo to Martinez in an attempt to mend your relationship. Write a draft of that memo.

## Case 6-23

**Researching Accounting Standards**

To help you become familiar with the accounting standards, this case is designed to take you to the FASB's Web site and have you access various publications. Access the FASB's Web site at <http://www.fasb.org>. Click on "Pronouncements & EITF Abstracts."

In this chapter, we discussed earnings management and how companies might be tempted to inappropriately increase earnings by either overstating revenues or by understating expenses. For this case, we will use *Statement of Financial Accounting Standards No. 48*, "Revenue Recognition When Right of Return Exists." Open FASB *Statement No. 48*.

1. Read paragraph 4. If a customer returns an item that is defective, do the provisions of this accounting standard apply?

2. Read paragraph 6. Part (f) of this paragraph indicates that the amount of future returns must be reasonably estimable if revenue is to be recognized. However, footnote 3 indicates that certain returns are not considered returns as far as this standard is concerned. What types of returns are excluded?
3. Read paragraph 8. Future returns must be estimable. This paragraph identifies instances when a reliable estimate may be unavailable. Identify two instances where the ability to estimate returns would be impaired.

**Case 6-24****Ethical Dilemma (What should you do with unpleasant and unwelcome audit evidence?)**

You are a manager with Doman & Detmer, a mid-sized local accounting firm. You have been with the firm for six years. Currently, you are working on the McMahon Company audit engagement. You are supervising a team of seven staff and senior accountants. Your direct supervisor, Giff Nielsen, is the partner in charge of the engagement. You were involved with the economic analysis of McMahon Company that was undertaken during the audit planning stage. A number of indicators suggest that McMahon has suffered a substantial downturn in its business this year. Accordingly, you are being very careful to see whether this downturn is properly reflected in the reported financial statement numbers.

In scrutinizing McMahon's sales near the end of the fiscal year, your audit team has detected a number of suspicious transactions. It appears that McMahon has shipped goods without receiving customer purchase orders. In addition, in several cases in which McMahon has received purchase orders, the goods shipped were two or three times the quantity ordered. Your audit team thinks that McMahon has been engaging in "channel stuffing," which is the shipment of excess goods to customers in order to boost reported sales in the current period.

You have taken the findings of your audit team to Giff Nielsen, the partner in charge of the audit, and have suggested that substantial additional audit tests be conducted to find out whether McMahon has in fact engaged in channel stuffing. Nielsen instructed you to ignore the channel stuffing evidence and proceed with the rest of the audit program. Nielsen is concerned about keeping the staff hours under budget on this engagement. In addition, Nielsen doesn't want to upset the senior management team of McMahon. McMahon's controller has already expressed some concern over the level of detailed testing that the Doman & Detmer audit team has conducted this year. McMahon's controller has hinted that McMahon is shopping around for a new auditor for next year. Because McMahon is one of the largest clients of Doman & Detmer, Giff Nielsen is afraid that his future with Doman & Detmer will be bleak if he loses McMahon as a client.

What should you do with the channel stuffing evidence assembled by your audit team?

# TIME VALUE OF MONEY REVIEW

The concept of the time value of money is very important in today's business world. No doubt you have studied this concept previously in basic accounting, finance, and business math classes. This module is intended as a review of the subject and includes illustrations of common applications.

## The Time-Value-of-Money Concept

Decision makers, whether sports figures, entertainers, business executives, or parents saving for their children's college education, must try to adjust for the impact of interest and changing economic prices. Consider the following illustrative situations:

- You are in the market for a used car. A newspaper advertisement offers the vehicle you want with two payment options. You can choose between an immediate cash price of \$22,500 or a 6% financing option with payments over five years of \$395 at the end of each month. Which alternative purchase plan should you choose?
- You intend to provide income for your retirement. If you are 20 years old, how much must you invest now in order to establish a fund large enough to pay for your retirement in 45 years?
- Every month, millions of individuals make mortgage payments on their homes. Because part of each payment is interest, and therefore tax-deductible, a method is needed for calculating the interest portion of each payment. What are the procedures for determining the interest and principal portions of each payment over the life of the mortgage?

In each of the preceding situations, decisions must be made regarding inflows and outflows of money over an extended period of time. Making correct financial decisions requires that the time value of money be taken into account. This means that dollars to be received or paid in the future must be “discounted” or adjusted to their **present value**. Alternatively, current dollars may be “accumulated” or adjusted to their **future values** so that comparisons of dollar amounts at different time periods can be meaningful.

In the first example, you must decide whether to pay \$22,500 cash now or make 60 monthly payments of \$395. Assuming you have sufficient cash, wouldn't it be better to pay \$22,500 for the car now instead of \$23,700 (60 payments of \$395) under the monthly payment plan? The answer to that question is, “Not necessarily.” This decision requires that the alternatives be made comparable in terms of the time value of money, that is, the two alternatives must be stated at their respective present values.

The present value of the first alternative, the cash purchase, is simply the amount of cash to be paid currently, or \$22,500. The present value of the second alternative is equal to the present value of each of the 60 payments, as illustrated below.

The total present value of the 60 payments of \$395 each discounted to the date of purchase at 6% interest is approximately \$20,432.<sup>1</sup> This amount is less than the \$22,500 cash price the dealer is willing to accept. Therefore, assuming no other factors are relevant to your decision, you should purchase the car on the monthly payment plan. This conclusion and the other examples in the chapter ignore any tax implications, which may modify the decision in actual practice.

There are many business situations where present or future value techniques must be used in making financial decisions. Common applications in accounting include the following categories:

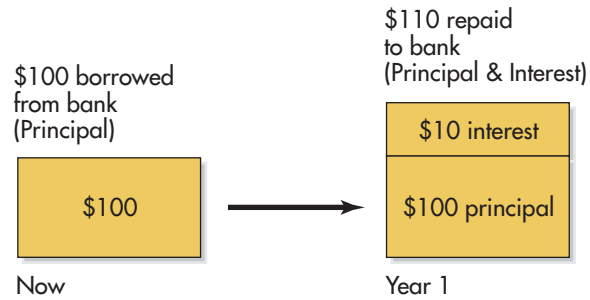

1. Valuing long-term notes receivable and payable where there is no stated rate of interest or where the stated rate does not reflect existing economic conditions.
2. Determining bond prices and using the effective-interest method for amortizing bond premiums or discounts.
3. Determining appropriate values for long-term capital leases and measuring the amount of interest expense and principal applicable to the periodic lease payments.
4. Accounting for pension funds, including interest accruals and amortization entries.
5. Analyzing investment alternatives.
6. Establishing amortization schedules for mortgages and measuring periodic payments on long-term purchase contracts.
7. Determining appropriate asset, liability, and equity values in mergers and business combinations.
8. Computing the amount that should be recorded for an impairment loss.
9. Estimating the fair value of intangible assets.

Because future and present value techniques are commonly used in business and have become increasingly important for accountants, this module explains these techniques and provides several illustrations of their use. The emphasis in the module is on present value techniques, because most applications in accounting require future amounts to be discounted to the present. Before future and present value techniques can be explained, however, the concept of interest must first be reviewed.

## Computing the Amount of Interest

Money, like other commodities, is a scarce resource, and a payment for its use is generally required. This payment (cost) for the use of money is **interest**. For example, if \$100 is borrowed, whether from an individual, a business, or a bank, and \$110 is paid back, \$10 in interest has been paid for the use of the \$100. Thus, interest represents the excess cash paid or received over the amount of cash borrowed or loaned, as illustrated on the following page.

<sup>1</sup> As will be explained later, the \$20,432 is determined by discounting an annuity of \$395 for 60 months at an interest rate of 6% compounded monthly.

## Simple Interest

Generally, interest is specified in terms of a percentage rate for a period of time, usually a year. For example, interest at 8% means the annual cost of borrowing an amount of money, called the **principal**, is equal to 8% of that amount. If \$100 is borrowed for a period of one year at 8% annual interest, the total to be repaid is \$108—the amount of the principal, \$100, and the interest for a year, \$8 ( $\$100 \times 0.08 \times 1$ ). Interest on a \$1,000 note for six months at an annual rate of 8% is \$40 ( $\$1,000 \times 0.08 \times 6/12$ ). In this case, the annual rate of 8% is multiplied by 6/12 (or 1/2 year) because interest is being computed for less than one year. Thus, the formula for computing **simple interest** is:

$$i = p \times r \times t,$$

where:

$i$  = Amount of simple interest

$p$  = Principal amount

$r$  = Interest rate (per period)

$t$  = Time (number of periods)

## The Difference Between Simple and Compound Interest

The preceding formula applies to the computation of simple interest. Most transactions, however, involve **compound interest**. This means that the amount of interest earned for a certain period is added to the principal for the next period. Interest for the subsequent period is computed on the new amount, which includes both principal and accumulated interest.

The difference between simple and compound interest can be quite significant, particularly over a long period of time. Consider, for example, the case of Christopher Columbus. On October 12, 1492, Columbus landed in the Americas and (although this is not well known) his first action was to deposit \$100 in the First Bank of the Americas. The annual interest rate was 5%. On October 12, 2011, Columbus' heirs went to the bank to check the status of their ancestor's account. The bank manager informed them that certain records had been lost, and it was unknown whether Mr. Columbus had selected a simple or compound interest account. The heirs were given the option of making that choice now. After a few calculations, the heirs elected compound interest. Why? Using simple interest, the balance in Columbus' account had increased by \$5 per year ( $\$100 \times 0.05$ ) to a current total of \$2,695 (\$100 principal + \$2,595 interest). Using compound interest, the money in Columbus' account (which had been earning interest on the interest) totaled approximately \$9.9 trillion.

**Computing Compound Interest** To illustrate the computation of compound interest, assume that \$100 is deposited in a bank and left for two years at 6% annual interest. At the end of the first year, the \$100 has earned \$6 interest ( $\$100 \times 0.06 \times 1$ ). At the end of the second year, \$6 has been earned for the first year, plus another \$6.36 interest (6% on the \$106 balance at the beginning of the second year). Thus, the total interest earned is \$12.36 rather than \$12 because of the compounding effect. The table at the top of the next page, based on the foregoing example, illustrates the computation of simple and compound interest for four years.

Year	Simple Interest			Compound Interest		
	Computation	Interest	Total	Computation	Interest	Total
1	$(\$100 \times 0.06)$	\$6	\$106	$(\$100.00 \times 0.06)$	\$6.00	\$106.00
2	$(\$100 \times 0.06)$	6	112	$(\$106.00 \times 0.06)$	6.36	112.36
3	$(\$100 \times 0.06)$	6	118	$(\$112.36 \times 0.06)$	6.74	119.10
4	$(\$100 \times 0.06)$	6	124	$(\$119.10 \times 0.06)$	7.15	126.25

**The Effect of Compounding Periods** The interest rate used in compound interest problems is the **effective rate of interest** and is generally stated as an annual rate, sometimes called “per annum.” However, if the compounding of interest is for periods other than a year, the stated rate of interest must be adjusted. A comparable adjustment must be made to the number of periods. The interest rate per period equals the stated interest rate divided by the number of compoundings per period. And the number of periods equals the number of years times the number of compoundings per year. Thus, the adjustments required to the interest rate (*i*) and to the number of periods (*n*) for semiannual, quarterly, and monthly compounding of interest are as follows:

Example	Annual Compounding	Semiannual Compounding	Quarterly Compounding	Monthly Compounding
1.	$i = 6\%, n = 10$	$i = 3\%, n = 20$	$i = 1.5\%, n = 40$	$i = 0.5\%, n = 120$
2.	$i = 12\%, n = 5$	$i = 6\%, n = 10$	$i = 3\%, n = 20$	$i = 1\%, n = 60$
3.	$i = 24\%, n = 3$	$i = 12\%, n = 6$	$i = 6\%, n = 12$	$i = 2\%, n = 36$

As shown in the table, the semiannual compounding of interest requires the annual interest rate to be reduced by half and the number of periods to be doubled. Quarterly compounding of interest requires use of one-fourth the annual rate and four times the number of periods, and so forth. Because of this compounding effect, more interest is earned by an investor with semiannual interest than with annual interest, and more is earned with quarterly compounding than with semiannual compounding. Monthly compounding of interest is even better than quarterly compounding, from an investor’s perspective.

## Future and Present Value Techniques

Because money earns interest over time, \$100 received today is more valuable than \$100 received one year from today. Future and present value analysis is a method of comparing the value of money received or expected to be received at different time periods.

Analyses requiring comparisons of present dollars and future dollars may be viewed from one of two perspectives, the future or the present. If a future time frame is chosen, all cash flows must be accumulated to that future point. In this instance, the effect of interest is to increase the amounts or values over time so that the future amount is greater than the present amount. For example, \$500 invested today will accumulate to a future value of \$1,079 (rounded) in 10 years if 8% annually compounded interest is paid on the investment.

If, on the other hand, the present is chosen as the point in time at which to evaluate alternatives, all cash flows must be discounted from the future to the present. In this instance, the discounting effect reduces the amounts or values. To illustrate, if an investor is earning 10% annual interest on a note receivable that will pay \$10,000 in three years, what might the investor accept today in full payment, i.e., what is the present value of that note? The amount the investor should be willing to accept,

assuming a 10% interest rate is satisfactory and that other considerations are held constant, is \$7,513, which is the discounted present value of the note. The rationale for the investor is that if the \$7,513 could be invested at 10%, compounded annually, it would accumulate to \$10,000 in three years.

As just illustrated, the future and present value situations involving single payments are essentially reciprocal relationships, and both future and present values are based on the concept of interest. Thus, if interest can be earned at 8% per year, the future value of \$100 one year from now is \$108. Conversely, assuming the same rate of interest, the present value of a \$108 payment due in one year is \$100 [ $\$108 \div (1 + 0.08)$ ]. Similarly, \$100 to be received in one year, at an 8% annual interest rate, is worth \$92.59 today ( $\$100 \div 1.08$ ), because \$92.59 invested at 8% will grow to \$100 in one year.

## Use of Formulas

There are four common future and present value situations, each with a corresponding formula. Two of the situations deal with one-time, single payments or receipts<sup>2</sup> (either future or present values), and the other two involve annuities (either future or present values). An **annuity** consists of a series of equal payments over a specified number of equal time periods. For example, a contract calling for three annual payments of \$3,000 each would be an annuity. However, a similar contract requiring three annual payments of \$2,000, \$3,000, and \$4,000, respectively, would not be an annuity because the payments are not equal.

Without going into the derivations, the formulas for the four common situations are as follows:

1. Future Value of a Single Payment:  $FV = P(1 + i)^n$  where:

FV = Future value  
 P = Principal amount to be accumulated  
 i = Interest rate per period  
 n = Number of periods

**Example.** To calculate the future value of \$1,500 to be accumulated at 10% annual interest for five years.

$$\begin{aligned} FV &= \$1,500 (1 + 0.10)^5 \\ FV &= \underline{\underline{\$2,416}} \text{ (rounded)} \end{aligned}$$

2. Present Value of a Single Payment:  $PV = A \left[ \frac{1}{(1 + i)^n} \right]$  where:

PV = Present value  
 A = Accumulated amount to be discounted  
 i = Interest rate per period  
 n = Number of periods

**Example.** To calculate the present value of \$2,416 to be discounted at 10% annual interest for five years.

$$\begin{aligned} PV &= \$2,416 \left[ \frac{1}{(1 + 0.10)^5} \right] \\ PV &= \underline{\underline{\$1,500}} \text{ (rounded)} \end{aligned}$$

3. Future Value of an Annuity:  $FV_n = R \left[ \frac{(1 + i)^n - 1}{i} \right]$  where:

$FV_n$  = Future value of an annuity  
 R = Annuity payment to be accumulated  
 i = Interest rate per period  
 n = Number of periods

<sup>2</sup> Hereafter in this module, the terms *payments* and *receipt* will be used interchangeably. A payment by one party in a transaction becomes a receipt to the other party and vice versa.

**Example.** To calculate the future value of an annuity of \$2,000 for 10 years to be accumulated at 12% annual interest.

$$FV_n = \$2,000 \left[ \frac{(1 + 0.12)^{10} - 1}{0.12} \right]$$

$$FV_n = \underline{\underline{\$35,097}} \text{ (rounded)}$$

4. Present Value of an Annuity:  $PV_n = R \left[ \frac{1 - \frac{1}{(1 + i)^n}}{i} \right]$  where:

$PV_n$  = Present value of an annuity

$R$  = Annuity payment to be discounted

$i$  = Interest rate per period

$n$  = Number of periods

**Example.** To calculate the present value of an annuity of \$5,000 for three years to be discounted at 11% annual interest.

$$PV_n = \$5,000 \left[ \frac{1 - \frac{1}{(1 + 0.11)^3}}{0.11} \right]$$

$$PV_n = \underline{\underline{\$12,219}} \text{ (rounded)}$$

## Use of Tables

In the previous examples, formulas were used to make the computations. As illustrated later, this is easily accomplished with a business calculator or with Excel. Alternatively, future and present value tables have been developed for each of the four situations. These tables, such as those provided on pages TVM-21 to TVM-26, are based on computing the value of \$1 for various interest rates and periods of time. Consequently, future and present value computations can be made by multiplying the appropriate table value factor for \$1 by the applicable single payment or annuity amount involved in the particular situation. Thus, the formulas for the four situations may be rewritten as follows:

### 1. Future Value of a Single Payment:

$$FV = P(1 + i)^n \text{ or } FV = P(FVF_{\bar{n}|i}) \text{ or simply}$$

$$FV = P(\text{Table I factor})$$

where:

$FVF_{\bar{n}|i}$  = Future value factor for a particular interest rate ( $i$ ) and for a certain number of periods ( $n$ ) from Table I.

**Example.** (from example 1, previously illustrated):

$$FV = \$1,500 (1.6105 = \text{Factor from Table I; } n = 5; i = 10\%)$$

$$FV = \underline{\underline{\$2,416}} \text{ (rounded)}$$

### 2. Present Value of a Single Payment:

$$PV = A \left[ \frac{1}{(1 + i)^n} \right] \text{ or } PV = A(PVF_{\bar{n}|i}) \text{ or simply}$$

$$PV = A(\text{Table II factor})$$

where:

$PVF_{\bar{n}|i}$  = Present value factor for a particular interest rate ( $i$ ) and for a certain number of periods ( $n$ ) from Table II.

**Example.** (from example 2, previously illustrated):

$$PV = \$2,416 (0.6209 = \text{Factor from Table II; } n = 5; i = 10\%)$$

$$PV = \underline{\underline{\$1,500}} \text{ (rounded)}$$

## 3. Future Value of an Annuity:

$$FV_n = R \left[ \frac{(1+i)^n - 1}{i} \right] \text{ or } FV_n = R(\text{FVAF}_{\bar{n}|i}) \text{ or simply}$$

$$FV_n = R(\text{Table III factor})$$

where:

FVAF $_{\bar{n}|i}$  = Future value annuity factor for a particular interest rate (i) and for a certain number of periods (n) from Table III.

**Example.** (from example 3, previously illustrated):

$$FV_n = \$2,000 (17.5487 = \text{Factor from Table III; } n = 10; i = 12\%)$$

$$FV_n = \underline{\underline{\$35,097}} \text{ (rounded)}$$

## 4. Present Value of an Annuity:

$$PV_n = R \left[ \frac{1 - \frac{1}{(1+i)^n}}{i} \right] \text{ or } PV_n = R(\text{PVAF}_{\bar{n}|i}) \text{ or simply}$$

$$PV_n = R(\text{Table IV factor})$$

where:

PVAF $_{\bar{n}|i}$  = Present value annuity factor for a particular interest rate (i) and for a certain number of periods (n) from Table IV.

**Example.** (from example 4, illustrated previously):

$$PV_n = \$5,000 (2.4437 = \text{Factor from Table IV; } n = 3; i = 11\%)$$

$$PV_n = \underline{\underline{\$12,219}} \text{ (rounded)}$$

Note that the answers obtained in the examples by using the tables are the same as those obtained using the formulas.

## Business Calculator Keystrokes

The same future and present values computed in the previous examples can be obtained using a business calculator. The necessary keystrokes are illustrated below. (*Note:* The exact sequences of keystrokes illustrated are for a **Hewlett-Packard** business calculator; the keystrokes for other business calculators are similar if not exactly the same.)

## 1. Business Calculator Keystrokes for Future Value of a Single Payment:

1500—Press **PV** (this is the initial, or present, amount)

5—Press **N** (number of periods)

10—Press **I** (interest rate per period; do *not* use decimals)

Press **FV** for the answer = \$2,415.7650 = \$2,416 (rounded)

## 2. Business Calculator Keystrokes for Present Value of a Single Payment:

2416—Press **FV** (this is the future amount)

5—Press **N**

10—Press **I**

Press **PV** for the answer = \$1,500.1459 = \$1,500 (rounded)

## 3. Business Calculator Keystrokes for Future Value of an Annuity:

2000—Press **PMT** (this the equal periodic payment)

10—Press **N**

12—Press **I**

Press **FV** for the answer = \$35,097.4701 = \$35,097 (rounded)

caution

A common source of errors with business calculators is to forget to “Clear” the previous inputs before attempting a new present or future value computation.

4. Business Calculator Keystrokes for Present Value of an Annuity:  
 5000—Press **PMT**  
 3—Press **N**  
 11—Press **I**  
 Press **PV** for the answer  
 = \$12,218.5736  
 = \$12,219 (rounded)

## Excel Spreadsheet Functions

Future and present values can also be computed using Microsoft Excel<sup>®</sup>. The relevant functions and inputs are illustrated below.

1. Excel Inputs for Future Value of a Single Payment:

Push the “Insert Function,” or  $f_x$  button, in Excel, and you can scan the menu of “Financial” functions and find the FV function. The function arguments for the FV function are as follows:

Excel Label	Your Input
Rate	Interest rate—enter 10% as “.10”
Nper	Number of periods
Pmt	The amount of each annuity payment
Pv	The single initial amount
Type	Indication of whether the cash flows occur at the beginning or the end of the periods. If the future cash flows occur at the end of the periods, leave this field blank or insert a zero. If the future cash flows occur at the beginning of the periods, this is indicated by entering a 1 in this field.

To illustrate with the example used above, input the following into the FV function.

Excel Label	Your Input
Rate	.10
Nper	5
Pmt	0—there is no annuity amount in this case, only an initial lump sum
Pv	1500
Type	0

Press “Enter” to see the answer of \$2,416. Actually, the answer displayed is negative \$2,416. Excel always returns negative numbers in its time value of money calculations. If this bothers you, a minus sign in front of the FV function converts these numbers to positive. Usually, you don’t have to worry about the signs of the inputs and outputs of the Excel functions. The few cases where you do have to pay attention are illustrated later.

2. Excel Inputs for Present Value of a Single Payment:

Push the “Insert Function,” or  $f_x$  button, in Excel, and you can scan the menu of “Financial” functions and find the PV function. The function arguments for the PV function are as follows:

Excel Label	Your Input
Rate	Interest rate—enter 10% as “.10”
Nper	Number of periods
Pmt	The amount of each annuity payment
Fv	The single future cash flow
Type	Indication of whether the cash flows occur at the beginning or the end of the periods. If the future cash flows occur at the end of the periods, leave this field blank or insert a zero. If the future cash flows occur at the beginning of the periods, this is indicated by entering a 1 in this field.

To illustrate with the example used above, input the following into the PV function.

Excel Label	Your Input
Rate	.10
Nper	5
Pmt	0—there is no annuity amount in this case, only an initial lump sum
Fv	2416
Type	0

Press “Enter” to see the answer of \$1,500.

3. Excel Inputs for Future Value of an Annuity:  
Using the FV function:

Excel Label	Your Input
Rate	.12
Nper	10
Pmt	2000
Pv	0—there is no initial amount in this case, only an annuity
Type	0

Press “Enter” to see the answer of \$35,097.

4. Excel Inputs for Present Value of an Annuity:  
Using the PV function:

Excel Label	Your Input
Rate	.11
Nper	3
Pmt	5000
Fv	0—there is no final lump sum amount in this case, only an annuity
Type	0

Press “Enter” to see the answer of \$12,219.

## Business Applications

The following examples demonstrate the application of future and present value computations in solving business problems. Additional applications are provided in later sections as well as in the exercises at the end of the module.

**Example 1—Future Value of a Single Payment** Marywhether Company loans its president, Celia Phillips, \$45,000 to purchase a car. Marywhether accepts a note due in four years with interest at 10% compounded semiannually. How much cash does Marywhether expect to receive from Phillips when the note is paid at maturity?

**Solution.** This problem involves a single payment to be accumulated four years into the future. In many present and future value problems, a time line is helpful in visualizing the problem. *Note:* Because of rounding, the sum of the interest amounts in the time line don’t add precisely to the accumulating balance in each case.

The \$45,000 must be accumulated for four years at 10% compounded semiannually. Table I may be used, and the applicable formula is:

$$FV = P(FVF_{\overline{n}|i})$$

where:

FV = The future value of a single payment

P = \$45,000

n = 8 periods (4 years × 2)

i = 5% effective interest rate per period (10% ÷ 2)

FV = \$45,000 (Table I<sub>8|5%</sub>)

FV = \$45,000 (1.4775)

FV = \$66,488 (rounded)

In four years, Marywhether will expect to receive \$66,488, consisting of \$45,000 principal repayment and \$21,488 interest.

*Business Calculator Keystrokes:*

45,000—Press **PV**

8—Press **N**

5—Press **I**

Press **FV** for the answer = \$66,485.49497 = \$66,485 (rounded)

*Excel Spreadsheet Function:*

Using the FV function:

Excel Label	Your Input
Rate	.05
Nper	8
Pmt	0
Pv	45000
Type	0

Press “Enter” to see the answer of \$66,485.

**Example 2—Present Value of a Single Payment** Edgemont Enterprises holds a note receivable from a regular customer. The note is for \$22,000, which includes principal and interest, and is due to be paid in exactly two years. The customer wants to pay the note now, and both parties agree that 10% is a reasonable annual interest rate to use in discounting the note. How much will the customer pay Edgemont Enterprises today to settle the obligation?

**Solution.** The single future payment must be discounted to the present value at the agreed upon annual rate of interest of 10%. Since this involves a present value computation of a single payment, Table II is used, and the applicable formula is:

$$PV = A(PVF_{\overline{n}|i})$$

where:

PV = The present value of a single payment

A = \$22,000

n = 2 periods

i = 10% effective interest rate per period

PV = \$22,000 (Table II<sub>2|10%</sub>)

PV = \$22,000 (0.8264)

PV = \$18,181 (rounded)

The customer will pay approximately \$18,181 today to settle the obligation.

*Business Calculator Keystrokes:*

22000—Press **FV**  
 2—Press **N**  
 10—Press **I**  
 Press **PV** for the answer = \$18,181.8182 = \$18,182 (rounded)

*Excel Spreadsheet Function:*

Using the PV function:

Excel Label	Your Input
Rate	.10
Nper	2
Pmt	0
Fv	22000
Type	0

Press “Enter” to see the answer of \$18,182.

**Example 3—Present Value of Series of Unequal Payments** Casper Sporting Goods Co. is considering a \$1 million capital investment that will provide the following expected net receipts at the end of each of the next six years.

Year	Expected Net Receipts
1	\$195,000
2	457,000
3	593,000
4	421,000
5	95,000
6	5,000

Casper will make the investment only if the rate of return is greater than 12%. Will Casper make the investment?

**Solution.** A series of unequal future receipts must be compared with a present single-payment investment. For such a comparison to be made, all future cash flows must be discounted to the present.

If the rate of return on the investment is greater than 12%, then the total of all yearly net receipts discounted to the present at 12% will be greater than the amount invested. Since the future receipts are not equal, this situation does not involve an annuity. Each receipt must be discounted individually. Table II is used, and the applicable formula is:  $PV = A(PVF_{\bar{n}|i})$  where:

(1) Year = n	(2) A (Net Receipts)	(3) Table II $\bar{n} 12\%$	(2) × (3) = (4) PV (Discounted Amount)
1	\$195,000	0.8929	\$ 174,116
2	457,000	0.7972	364,320
3	593,000	0.7118	422,097
4	421,000	0.6355	267,546
5	95,000	0.5674	53,903
6	5,000	0.5066	2,533
			Total <u>\$1,284,515</u> (rounded)

The total discounted receipts are greater than the \$1 million investment; thus, the rate of return is more than 12%. Therefore, other things being equal, Casper will invest. (Note: The problem is approached in the same way if a business calculator or an Excel spreadsheet is used. Computations similar to those in Example 2 are performed.)

**Example 4—Future Value of an Annuity** Boswell Co. owes an installment debt of \$1,000 per quarter for five years. The creditor has indicated a willingness to accept an equivalent single payment at the end of the 5-year period instead of the series of equal payments made at the end of each quarter. If the money is worth 16% compounded quarterly, what is the equivalent single payment at the end of the contract period?

**Solution.** The equivalent single payment can be found by accumulating the quarterly \$1,000 payments to the end of the contract period. Since the payments are equal, this is an annuity. Table III is used, and the applicable formula is:

$$FV_n = R(FVAF_{ni})$$

where:

- $FV_n$  = The unknown equivalent lump-sum payment
- $R$  = \$1,000 quarterly installment to be accumulated
- $n$  = 20 periods (5 years  $\times$  4 quarters)
- $i$  = 4% effective interest rate per period (16%  $\div$  4)
- $FV_n$  = \$1,000 (Table III<sub>20|4%</sub>)
- $FV_n$  = \$1,000 (29.7781)
- $FV_n$  = \$29,778 (rounded)

The \$29,778 paid at the end of five years is approximately equivalent to the 20 quarterly payments of \$1,000 each plus interest.

*Business Calculator Keystrokes:*

1000—Press **PMT**

20—Press **N**

4—Press **I**

Press **FV** for the answer = \$29,778.0786 = \$29,778 (rounded)

*Excel Spreadsheet Function:*

Using the FV function:

Excel Label	Your Input
Rate	.04
Nper	20
Pmt	1000
Pv	0
Type	0

Press “Enter” to see the answer of \$29,778.

**Example 5—Present Value of an Annuity** Mary Sabin, proprietor of Sabin Appliance, received two offers for her last deluxe-model refrigerator. Jerry Sloan will pay \$6,500 in cash. Elise Jensen will pay \$7,000 consisting of a down payment of \$1,000 and 12 monthly payments of \$500. If the installment interest rate is 24% compounded monthly, which offer should Sabin accept?

**Solution.** In order to compare the two alternative methods of payment, all cash flows must be accumulated or discounted to one point in time. As illustrated by the following time line, the present is selected as the point of comparison.

Sloan's offer is \$6,500 today. The present value of \$6,500 today is \$6,500. Jensen's offer consists of an annuity of 12 payments, plus \$1,000 paid today, which is not part of the annuity. The annuity may be discounted to the present by using Table IV and the applicable formula:

$$PV_n = R(PVAF_{\overline{n}|i})$$

where:

$$PV_n = \text{Unknown present value of 12 payments}$$

$$R = \$500 \text{ monthly payment to be discounted}$$

$$n = 12 \text{ periods (1 year} \times 12 \text{ months)}$$

$$i = 2\% \text{ effective interest rate per period (24\%} \div 12)$$

$$PV_n = \$500 \text{ (Table IV}_{\overline{12}|2\%})$$

$$PV_n = \$500 (10.5753)$$

$$PV_n = \underline{\underline{\$5,288}}$$

Present value of Jensen's payments	\$5,288
------------------------------------	---------

Present value of Jensen's \$1,000 down payment	1,000
--	-------

Total present value of Jensen's offer	<u>\$6,288</u>
---------------------------------------	----------------

Therefore, Sloan's offer of \$6,500 cash is more desirable than Jensen's offer.

*Business Calculator Keystrokes:*

500—Press **PMT**

12—Press **N**

2—Press **I**

Press **PV** for the answer = \$5,287.6706 = \$5,288 (rounded)

*Excel Spreadsheet Function:*

Using the PV function:

Excel Label	Your Input
Rate	.02
Nper	12
Pmt	500
Fv	0
Type	0

Press "Enter" to see the answer of \$5,288.

## Determining the Number of Periods, the Interest Rate, or the Amount of Payment

So far, the examples and illustrations have required solutions for the future or present values, with the other three variables in the formulas being given. Sometimes business problems require solving for the number of periods, the interest rate,<sup>3</sup> or the amount of payment instead of the future or present value amounts. In each of the formulas, there are four variables. If information is known about any three of the variables, the fourth (unknown) value can be determined. The following examples illustrate how to solve for these other variables.

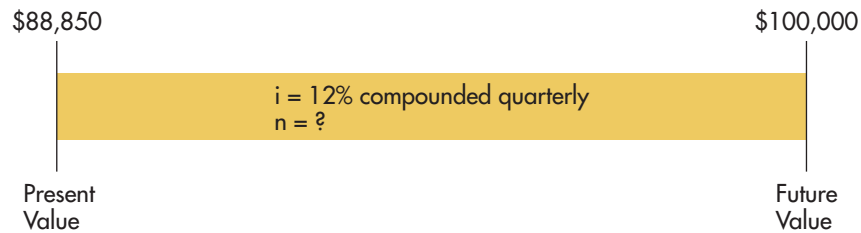

**Example 6—Determining the Number of Periods** Rocky Mountain Survey Company wants to purchase new equipment at a cost of \$100,000. The company has \$88,850 available in cash but does not want to borrow the other \$11,150 for the purchase. If the company can invest the \$88,850 today at an interest rate of 12%

<sup>3</sup> When the interest is not known, it is properly called the *implicit rate of interest*, that is, the rate of interest implied by the terms of a contract or situation. (See Examples 7 and 10 in this module.)

compounded quarterly, how many years will it be before Rocky Mountain will have the \$100,000 it needs to buy the equipment?

**Solution.** As illustrated below, Rocky Mountain Survey Company can invest \$88,850 now at 12% interest compounded quarterly and needs to know how long it will take for this amount to accumulate to \$100,000.

In this situation, involving both present values and future values, either Table I or Table II may be used. If Table I is used, the applicable formula is:

$$\begin{aligned} FV &= P(FVF_{\overline{ni}}) \\ FV &= P(\text{Table I factor}) \end{aligned}$$

The problem may be solved as follows:

$$\frac{FV}{P} = \text{Table I factor}$$

$$\frac{\$100,000}{\$88,850} = 1.1255$$

Reading down the 3% column ( $12\% \div 4$ ) in Table I, the factor value of 1.1255 is shown for  $n = 4$ . Therefore, it would take four periods (quarters) or one year for Rocky Mountain to earn enough interest to have \$88,850 accumulate to a future value of \$100,000.

If Table II is used, the applicable formula is:

$$\begin{aligned} PV &= A(PVF_{\overline{ni}}) \\ PV &= A(\text{Table II factor}) \end{aligned}$$

Solving,

$$\frac{PV}{A} = \text{Table II factor}$$

$$\frac{\$88,850}{\$100,000} = 0.8885$$

Reading down the 3% column in Table II, the factor of 0.8885 corresponds with  $n = 4$  (quarters) or one year. This illustrates again the reciprocal nature of future and present values for single payments.

*Business Calculator Keystrokes:*

–88850—Press **PV** (enter as a negative number, signifying an initial cash outflow)  
 100000—Press **FV**  
 3—Press **I**  
 Press **N** for the answer = 3.9995 periods = 4 periods (rounded)

*Excel Spreadsheet Function:*

Solving for the number of periods requires the use of a new Excel function called NPER. Push the “Insert Function,” or  $f_x$  button, in Excel, and you can scan the menu of “Financial” functions and find the NPER function. The function arguments for the NPER

function are quite similar to those we have been using. Using the NPER function, make the following inputs:

Excel Label	Your Input
Rate	.03
Pmt	0
Pv	-88850 (input as a negative number to signify an initial cash outflow)
Fv	100000
Type	0

Press “Enter” to see the answer of 3.9995 periods.

**Example 7—Determining the Interest Rate** The Hughes family wishes to purchase a used grand piano. The cost of the piano one year from now will be \$5,800. If the family can invest \$5,000 now, what annual interest rate must they earn on their investment to have \$5,800 at the end of one year?

**Solution.** The Hughes family can invest \$5,000 now and needs it to accumulate to \$5,800 in one year. The rate of annual interest they need to earn can be computed as shown below.

If Table I is used, the applicable formula is:

$$FV = P(FVF_{mi})$$

$$FV = P(\text{Table I factor})$$

$$\frac{FV}{P} = \text{Table I factor}$$

$$\frac{\$5,800}{\$5,000} = 1.1600$$

Reading across the  $n = 1$  row, the factor value 1.1600 corresponds to an annual effective interest rate of 16%. Therefore, the Hughes family would have to earn 16% annual interest to accomplish their goal. The same result is obtained if Table II is used to solve this problem.

*Business Calculator Keystrokes:*

-5000—Press **PV** (enter as a negative number, signifying an initial cash outflow)

5800—Press **FV**

1—Press **N**

Press **I** for the answer = 16.0000% = 16% (rounded)

*Excel Spreadsheet Function:*

Solving for the interest rate requires the use of a new Excel function called RATE. Push the “Insert Function,” or  $f_x$  button, in Excel, and you can scan the menu of “Financial” functions and find the RATE function. The function arguments for the RATE function are quite similar to those we have been using. Using the RATE function, make the following inputs:

Excel Label	Your Input
Nper	1
Pmt	0
Pv	-5000 (input as a negative number to signify an initial cash outflow)
Fv	5800
Type	0

Press “Enter” to see the answer of 16.0%.

**Example 8—Determining the Amount of Payment** Provo 1st National Bank is willing to lend a customer \$75,000 to buy a warehouse. The note will be secured by a 5-year mortgage and carry an annual interest rate of 12%. Equal payments are to be made at the end of each year over the 5-year period. How much will the yearly payment be?

**Solution.** This is an example of an unknown annuity payment. Since the present value (\$75,000) is known, as well as the interest rate (12%) and the number of periods (5), the annuity payment can be determined using Table IV. The applicable formula is:

$$\begin{aligned}
 PV_n &= R(PVAF_{\bar{n}|i}) \\
 PV_n &= R(\text{Table IV factor}) \\
 \$75,000 &= R(3.6048) \text{ (for } n = 5 \text{ and } i = 12\%) \\
 \frac{\$75,000}{3.6048} &= R \\
 \underline{\underline{\$20,806}} \text{ (rounded)} &= R
 \end{aligned}$$

The payment on this 5-year mortgage would be approximately \$20,806 each year.

*Business Calculator Keystrokes:*

75000—Press **PV**  
 5—Press **N**  
 12—Press **I**  
 Press **PMT** for the answer = \$20,805.7299 = \$20,806 (rounded)

*Excel Spreadsheet Function:*

Solving for the payment amount requires the use of a new Excel function called PMT. Push the “Insert Function,” or  $f_x$  button, in Excel, and you can scan the menu of “Financial” functions and find the PMT function. The function arguments for the PMT function are quite similar to those we have been using. Using the PMT function, make the following inputs:

Excel Label	Your Input
Rate	.12
Nper	5
Pv	75000
Fv	0—this amount would represent a final balloon payment to be made at the end of the loan period, in addition to the regular payments
Type	0

Press “Enter” to see the answer of \$20,806. Again, don’t be distracted by the fact that the answer is a negative number.

## Ordinary Annuity vs. Annuity Due

The illustrations up to this point have been fairly straightforward. In practice, however, complexities can arise that make it somewhat more difficult to perform future and present value calculations. One of these complexities involves the difference between an ordinary annuity and an annuity due.

Annuities are of two types: ordinary annuities (annuities in arrears) and annuities due (annuities in advance). The periodic receipts or payments for an **ordinary annuity** are made at the end of each period, and the last payment coincides with the end of the annuity term. The periodic receipts or payments for an **annuity due** are made at the beginning of the period, and one period of the annuity term remains after the last payment. These differences are illustrated below.

Ordinary Annuity of \$1  
 for Three Years (10% annual  
 interest)

Therefore, assuming a 10% annual interest rate, the present value of an annuity of \$1 per year to be received at the end of each of the next three years is \$2.49 (\$0.91 + \$0.83 + \$0.75). Notice that the last \$1 is received on the maturity date, or the end of the annuity term.

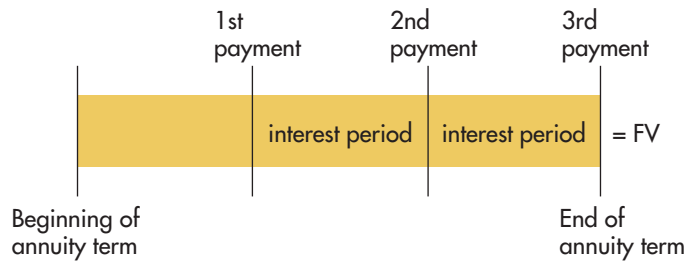

Again assuming a 10% annual interest rate, the present value of an annuity of \$1 per year to be received at the beginning of each of the next three years is \$2.74 (\$1.00 + \$0.91 + \$0.83). Notice here that the last payment is received one year prior to the maturity date.

Annuity Due of \$1 for Three Years (10% annual interest)

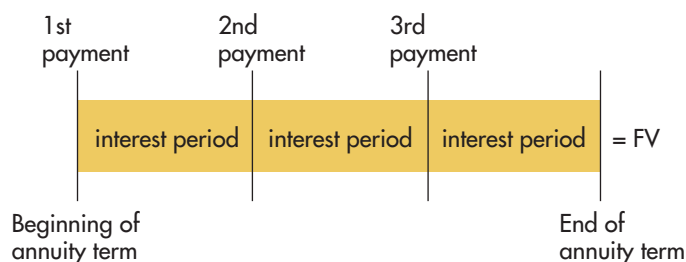

The difference in the two annuities is in the timing of the payments, and, therefore, how many interest periods are involved. As shown below, both annuities require three payments. However, the ordinary annuity payments are at the end of each period, so there are only two periods of interest accumulation; the annuity-due payments are in advance or at the beginning of the period, so there are three periods of interest accumulation.

Accumulation of Ordinary Annuity for Three Years

Accumulation of Annuity Due for Three Years

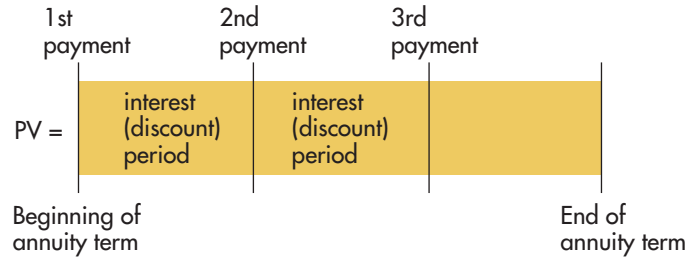

The preceding situation is exactly reversed when viewed from a present value standpoint. The ordinary annuity has three interest or discount periods, while the annuity due has only two periods, as shown below.

Present Value of Ordinary Annuity for Three Years

Present Value of Annuity Due for Three Years

Even though most future and present value annuity tables are computed for ordinary annuities (payments at the end of the periods), these tables can be used for solving annuity-due problems where the payments are in advance. However, the following adjustments will be required:

- To find the **future value of an annuity due** using ordinary annuity table values (Table III), select the appropriate table value for an ordinary annuity for one additional period ( $n + 1$ ) and subtract the extra payment (which is 1.0000 in terms of the table value for \$1.00). The formula is:  

$$FV_n = R(FVAF_{n+1|i} - 1)$$
- To find the **present value of an annuity due** using ordinary annuity table values (Table IV), select the appropriate table value for an ordinary annuity for one less period ( $n - 1$ ) and add the extra payment (1.0000). The formula is:  

$$PV_n = R(PVAF_{n-1|i} + 1)$$

By making the above adjustments, when payments are in advance, ordinary annuity tables may be used for all annuity situations. For example, the table value (Table III) for the future amount of an annuity due for three periods at 10% is:

(1) Factor for future value of an ordinary annuity of \$1 for 4 periods ( $n + 1$ ) at 10% .....	4.6410
(2) Less one payment.....	1.0000
(3) Factor for future value of an annuity due of \$1 for 3 periods at 10%.....	3.6410

The table value (Table IV) for the present value of an annuity due for three periods at 10% is:

(1) Factor for present value of an ordinary annuity of \$1 for 2 periods ( $n - 1$ ) at 10% .....	1.7355
(2) Plus one payment.....	1.0000
(3) Factor for present value of an annuity due of \$1 for 3 periods at 10%.....	2.7355

As noted, ordinary annuity tables can be converted for use with annuity-due situations. There are annuity-due tables available, however, that make these conversions unnecessary. Table V and Table VI are provided for annuity-due factor values. Note that these table values are the same as those for Tables III and IV if annuity-due adjustments are made, as previously described.

Annuity-due calculations are very easy with a business calculator. The calculator has a toggle button, usually labeled “BEG/END.” The default assumption is that the payments occur at the END of the period (an ordinary annuity). If this toggle button is pushed, the assumption is changed and the payments are assumed to occur at the beginning (BEG) of the period (an annuity due). Pushing the toggle button again restores the original assumption of payments occurring at the END of the period.

Annuity-due calculations are also very easy using Excel spreadsheet functions. For each function that we have used, all you have to do is to input a “1” instead of a “0” in the “Type” field.

The following examples illustrate the application of annuity-due calculations.

**Example 9—Calculating Annuity-Due Values for Future Amounts** Porter Corporation desires to accumulate funds to retire a \$200,000 bond issue at the end of 15 years. Funds set aside for this purpose can be invested to yield 8%. What annual payment, starting immediately, would provide the needed funds?

**Solution.** Annuity payments of an unknown amount, to be paid in advance, are to be accumulated toward a specific dollar amount at a known interest rate. Because the first payment is to be made immediately, all payments will fall due at the beginning of each period and an annuity due is used. Therefore, Table V is used. The appropriate formula is the same as that presented previously for an ordinary annuity, the only difference being the table in which the annuity factor is found.

$$FV_n = R(\text{FVAF}_{\overline{n}|i})$$

where:

$$FV_n = \$200,000$$

$$R = \text{Unknown annual payment}$$

$$n = 15 \text{ periods}$$

$$i = 8\% \text{ annual interest}$$

$$\$200,000 = R(\text{Table V}_{\overline{15}|8\%})$$

$$\$200,000 = R(29.3243)$$

$$\frac{\$200,000}{29.3243} = R$$

$$\$6,820 = R$$

Porter Corporation must deposit \$6,820 annually, starting immediately, to accumulate \$200,000 in 15 years at 8% annual interest.

*Business Calculator Keystrokes:*

Toggle so that the payments are assumed to occur at the beginning (BEG) of the period.

200000—Press **FV**

15—Press **N**

8—Press **I**

Press **PMT** for the answer = \$6,820.2861 = \$6,820 (rounded)

*Excel Spreadsheet Function:*

Using the PMT function:

Excel Label	Your Input
Rate	.08
Nper	15
Pv	0—this amount would represent a separate, initial payment in addition to the initial regular payment
Fv	200000
Type	1—the “1” in this field represents the assumption that the first payment will occur immediately

Press “Enter” to see the answer of \$6,820.

**Example 10—Calculating Annuity-Due Values for Present Values** Utah Corporation has completed negotiations to lease equipment with a fair market value of \$45,897. The lease contract specifies semiannual payments of \$3,775 for 10 years beginning immediately. At the end of the lease, Utah Corporation may purchase the equipment for a nominal amount. What is the implicit annual rate of interest on the lease purchase?

**Solution.** This is a common application of an annuity-due situation in accounting since most lease contracts require payments in advance, i.e., at the beginning of the period rather than at the end of the period. The implicit interest rate must be computed for the present

value of an annuity due. The present value is the fair market value of the equipment, and the payment is the lease payment. Table VI is used, and the applicable formula is:

$$PV_n = R(PVAF_{\overline{n}|i})$$

where:

$$PV_n = \$45,897$$

$$R = \$3,775$$

$$n = 20 \text{ periods (10 years} \times 2 \text{ payments per year)}$$

$$i = \text{The unknown semiannual interest rate}$$

$$\$45,897 = \$3,775 (\text{Table VI}_{\overline{20}|i})$$

$$\frac{\$45,897}{\$3,775} = 12.1581 = \text{Table VI}_{\overline{20}|i}$$

$$i = \underline{6\%}$$

Examination of Table VI for 20 periods and a factor of 12.1581 shows  $i = 6\%$ . The implicit annual interest rate is twice the semiannual rate, or  $2 \times 6\% = 12\%$ .

#### *Business Calculator Keystrokes:*

Toggle so that the payments are assumed to occur at the beginning (BEG) of the period.

−45897—Press **PV** (enter as a negative number)

3775—Press **PMT**

20—Press **N**

Press **I** for the answer =  $5.9999665\% = \underline{6\%}$  (rounded)

#### *Excel Spreadsheet Function:*

Using the RATE function, make the following inputs:

Excel Label	Your Input
Nper	20
Pmt	3775
Pv	−45897 (input as a negative number to signify an initial cash outflow)
Fv	0—this amount would represent a final balloon payment to be made at the end of the lease period, in addition to the regular payments
Type	1

Press “Enter” to see the answer of 6.0%.

## Concluding Comment

As noted in Chapter 1, the FASB’s conceptual framework allows for various measurement attributes, one of which is discounted present values. This measurement attribute has received additional attention from the FASB. In February 2000, the FASB released *Statement of Financial Accounting Concepts No. 7*, “Using Cash Flow Information and Present Value in Accounting Measurement.”

The work of the FASB on this topic is in response to the need for a comprehensive study of present-value-based measurements. The FASB has addressed the following issues: (1) under what circumstances an amount should be recognized in financial statements based on the present value of estimated future cash flows; (2) when is it appropriate to use the effective interest method in accounting allocations over the life of an asset or liability; (3) when the interest element involved with present-value-based measurements should be recognized as interest revenue or expense, and (4) how to reflect uncertainty in the calculation of present values.

This module has illustrated a few of the many business applications of present and future value measurement techniques. The application of these techniques in the computation of fair values for accounting purposes is illustrated in the Fair Value Module in this textbook.

Table I Future Value of a Single Payment

	1%	2%	3%	4%	5%	6%	7%	8%	9%	10%	11%	12%	14%	16%	20%
1	1.0100	1.0200	1.0300	1.0400	1.0500	1.0600	1.0700	1.0800	1.0900	1.1000	1.1100	1.1200	1.1400	1.1600	1.2000
2	1.0201	1.0404	1.0609	1.0816	1.1025	1.1236	1.1449	1.1664	1.1881	1.2100	1.2321	1.2544	1.2996	1.3456	1.4400

**EXERCISES****Exercise M-1****Simple and Compound Interest**

Dietrick Corporation borrowed \$30,000 from its major shareholder, the president of the company, at an annual interest rate of 12%.

- Assuming simple interest,
  - How much will Dietrick have to pay to settle its obligation if the loan is to be repaid in 12 months?
  - How much of the payment is interest?
  - How much will Dietrick have to pay if the loan is due in 18 months?
- If the loan is paid off in 18 months and interest is compounded annually, how much will the company have to pay?
- Compare the answers for (1c) and (2) and explain why they differ.

**Exercise M-2****Reciprocal Relationships: Future and Present Values**

Determine the amount that would accumulate for the following investments:

- \$10,050 at 10% per annum, compounded annually for six years.
- \$650 at 12% per annum, compounded quarterly for 10 years.
- \$5,000 at 16% per annum, compounded annually for four years, and then reinvested at 16% per annum, compounded semiannually for four more years.
- \$1,000 at 8% per annum, compounded semiannually for five years, an additional \$1,000 added and then the entire amount reinvested at 12% per annum, compounded quarterly for three more years.

**Exercise M-3****Reciprocal Relationships: Future and Present Values**

Determine the amount that must be deposited now at compound interest to provide the desired sum for each of the following:

- Amount to be invested for 10 years at 6% per annum, compounded semiannually, to equal \$17,000.
- Amount to be invested for  $2\frac{1}{2}$  years at 8% per annum, compounded quarterly, to equal \$5,000.
- Amount to be invested for 15 years at 12% per annum, compounded semiannually, then reinvested at 16% per annum, compounded quarterly, for five more years to equal \$25,000.
- Amount to be invested at 8% per annum, compounded semiannually for three years, then \$5,000 more added and the entire amount reinvested at the same rate for another three years, compounded semiannually, to equal \$12,500.

**Exercise M-4****Choosing between Alternative Investments**

Heather Company has \$10,000 to invest. One alternative will yield 10% per year, compounded annually for four years. A second alternative is to deposit the \$10,000 in a bank that will pay 8% per year, compounded quarterly for four years. Which alternative should Heather select?

**Exercise M-5 Unknown Annuity Amount**

Ryan Henry wants to buy his son a car for his 21st birthday. If Ryan's son is turning 16 today, and interest is 8% per annum, compounded semiannually, what would Ryan's semiannual investment need to be if the car will cost \$26,000 and the first payment is made six months from today?

**Exercise M-6 Unknown Investment Periods**

Determine the number of periods for which the following amounts would have to be invested, under the terms specified, to accumulate to \$10,000. Convert the number of periods to years.

1. \$5,051 at 10% per annum, compounded semiannually.
2. \$5,002 at 8% per annum, compounded annually.
3. \$5,134 at 16% per annum, compounded quarterly.

**Exercise M-7 Unknown Interest Rates**

Determine the annual interest rate that is needed for the following investments to accumulate to \$50,000.

1. \$10,414 for 20 years, interest compounded semiannually.
2. \$7,102 for 10 years, interest compounded quarterly.
3. \$33,778 for 10 years, interest compounded annually.

**Exercise M-8 Unknown Investment Periods—Annuities**

Determine the number of periods for which the following annuity payments would have to be invested to accumulate to \$20,000. Assume payments are made at the end of each period. Convert the number of periods to years.

1. Annual payments of \$5,927 at 12% per annum, compounded annually.
2. Semiannual payments of \$3,409 at 16% per annum, compounded semiannually.
3. Quarterly payments of \$4,640 at 20% per annum, compounded quarterly.

**Exercise M-9 Unknown Interest Rates—Annuities**

Determine the annual interest rate that is needed for the following annuities to accumulate to \$25,000. Assume payments are made at the end of each period.

1. Annual payments of \$4,095 for five years, interest compounded annually.
2. Semiannual payments of \$5,715 for two years, interest compounded semiannually.
3. Quarterly payments of \$1,864 for three years, interest compounded quarterly.

**Exercise M-10 Determining Ordinary Annuity Payments**

Determine the amount of the periodic payments needed to pay off the following purchases. Payments are made at the end of the period.

1. Purchase of a waterbed for \$1,205. Monthly payments are to be made for one year with interest at 24% per annum, compounded monthly.
2. Purchase of a motor boat for \$26,565. Quarterly payments are to be made for four years with interest at 8% per annum, compounded quarterly.
3. Purchase of a condominium for \$65,500. Semiannual payments are to be made for 10 years with interest at 10% per annum, compounded semiannually.

**Exercise M-11 Determining Unknown Quantities**

Determine the unknown quantity for each of the following independent situations using the appropriate interest tables:

1. Jeff and Nancy want to start a trust fund for their newborn son, Mark. They have decided to invest \$5,000 today. If interest is 8% compounded semiannually, how much will be in the fund when Mark turns 20?

- Nixon Corporation wants to establish a retirement fund. Management wants to have \$1,000,000 in the fund at the end of 40 years. If fund assets will earn 12%, compounded annually, how much will need to be invested now?
- How many payments would Star, Inc., need to make if it purchases a new building for \$100,000 with annual payments made at the end of each year of \$16,401.24 and interest of 16%, compounded annually?
- An investment broker indicates that an investment of \$10,000 in a CD for 10 years at the current interest rate will accumulate to \$21,589. What is the current annual rate of interest if interest is compounded annually?

**Exercise M-12****Determining Unknown Quantities**

Determine the unknown quantity for each of the following independent situations using the appropriate interest tables:

- Sue wants to have \$10,000 saved when she begins college. If Sue enters college in four years and interest is 8% compounded annually, how much will Sue need to save each year assuming equal deposits at the end of each year?
- XYZ Company has obtained a bank loan to finance the purchase of an automobile for one of its executives. The terms of the loan require monthly payments at the end of each month of \$585. If the interest rate is 18% compounded monthly and the car costs \$15,850, for how many months will XYZ have to make payments?
- Diaz Company is offering the following investment plan. If deposits of \$250 are made semiannually for the next nine years, \$7,726 will accrue. If interest is compounded semiannually, what is the approximate annual rate of interest on the investment?
- Jack wants to buy a rental unit. For how many periods will he have to make annual deposits of \$5,000 in order to accumulate \$50,445, the price of the rental unit, if interest is 12% compounded annually? Assume deposits are made at the end of each year.

**Exercise M-13****Determining the Implicit Interest Rate**

Valley Technical College needs to purchase some computers. Because the college is short of cash, Computer Sales Company has agreed to let Valley have the computers now and pay \$2,500 per computer six months from now. If the current cash price is \$2,404, what is the rate of interest Valley would be paying?

**Exercise M-14****Choosing between Purchase Alternatives**

Foot Loose, Inc., needs to purchase a new shoelace-making machine. Machines Ready has agreed to sell Foot Loose the machine for \$22,000 down and four payments of \$5,700 to be paid in semiannual installments for the next two years. Do-It-Yourself Machines has offered to sell Foot Loose a comparable machine for \$10,000 down and four semiannual payments of \$9,000. If the current interest rate is 16%, compounded semiannually, which machine should Foot Loose purchase?

**Exercise M-15****Choosing between Rent Payment Alternatives**

Park City Construction is building a new office building, and management is trying to decide how rent payments for the office space should be structured. The alternatives are as follows:

Plan A Annual payment of \$15,000 at the end of each year.

Plan B Monthly payments of \$1,200 at the end of each month.

Assuming an interest rate of 12% compounded monthly, which payment schedule should Park City use?

**Exercise M-16****Computing Mortgage Payments with the Use of Formulas**

George and Barbara Shrub would like to purchase a large white house and are evaluating their financing options. Bank A offers a 10-year mortgage at 12% annual interest, compounded monthly, with payments made at the end of each month.

Bank B is offering a 10-year mortgage at 13% annual interest, compounded annually, with payments made at the end of each year. The purchase price of the white house is \$250,000.

1. Use formulas to compute the following amounts:
  - (a) The monthly payment for the Bank A mortgage.
  - (b) The annual payment for the Bank B mortgage.
2. Which financing alternative would you advise the Shrubs to select?

**Exercise M-17****Choosing among Alternative Payment Plans**

The following payment plans are offered on the purchase of a new freezer:

Plan A \$375 cash.

Plan B 8 monthly payments of \$55.

Plan C \$100 cash down and six monthly payments of \$50.

Which payment plan would you choose if interest is 24% annually, compounded monthly, if you are the purchaser? If you are the seller? (Assume ordinary annuities where applicable.)

**Exercise M-18****Determining Purchase Price**

Big Company purchased a machine on February 1, 2011, and will make seven semi-annual payments of \$14,000 beginning five years from the date of purchase. The interest rate will be 12%, compounded semiannually. Determine the purchase price of the machine.

# FAIR VALUE

## LEARNING OBJECTIVES

- 1 Understand the need for fair values in financial reporting.
- 2 Identify where fair values are used in the financial statements.
- 3 Define “fair value” and describe the valuation concepts used in determining fair value.
- 4 Use a variety of valuation models.
- 5 Prepare the Level 1, Level 2, and Level 3 fair value disclosures required under *SFAS No. 157*.

## The Need for Fair Values

- 1 Understand the need for fair values in financial reporting.

**WHY** The use of fair values in financial reporting is increasing. Accountants and users of financial statements can no longer pretend that financial reports are based completely on historical cost and ignore the practice of and principles behind valuation.

**HOW** Fair values are more common in financial reports because fair values have increased in business importance in recent years. Increasingly elaborate financial instruments and risk management practices have created financial statement elements for which historical cost is almost irrelevant, and fair value, and fluctuations in fair value, are extremely relevant.

Most observers of accounting, and even most accountants, have the mistaken view that financial reporting has always been firmly based on the foundation of historical cost. This is not true. For example, for a period of 10 years, the FASB, under the provisions of *SFAS No. 33*, required large companies to report the current value of noncurrent operating assets in a note to the financial statements. This requirement was rescinded in 1986 by *SFAS No. 89*. As an earlier example, before the formation of the SEC in 1934, it was common for U.S. companies to report the upward revaluation of property and equipment so that these long-term assets would be reported at their estimated fair values. However, by 1940 the SEC had effectively eliminated this practice, not by explicitly banning it, but through informal administrative pressure. Much of the suspicion about asset revaluations stemmed from a Federal Trade Commission investigation, completed in 1935, that uncovered a number of cases in the public utility industry in which a utility

had improperly revalued assets upward to boost its rate base. This same issue remains a concern that many hold regarding fair value reporting today—can scheming managers manipulate reported fair value numbers to mislead banks, boards of directors, suppliers, customers, employees, and current and potential investors?

On the other hand, many financial statement users have complained for years about the *lack* of fair values in the financial statements. For example, in the late 1980s, the absence of advance warning of the \$500 billion collapse of the savings and loan (S&L) industry was blamed in part on the failure of S&Ls to report the fair values of their loan portfolios. Reexamination of the accounting for financial institutions led to *SFAS No. 115*, which requires most investment securities to be reported at their fair values. The requirement in *SFAS No. 133* that derivatives be reported at their fair values caused increased awareness and scrutiny of these financial instruments which had historically been poorly understood and often overlooked.

So, the debate about reporting historical cost or fair value is not new. But it has heated up in recent years. Consider the two polar opposite views expressed below.

“I recommend that FASB, with help from the SEC and from federal and state banking and insurance regulators, proceed to require fair-value measurements in all balance sheets for all assets and liabilities as soon as possible. When that happens, FASB will be able to dissolve, for we no longer will need accounting rules, much less a mountain of complex accounting rules such as we have today, and there will be no need for FASB.”<sup>1</sup>—Walter P. Schuetze. Mr. Schuetze is the former chief accountant of the SEC and a charter member of the FASB.

“[I]n the real world we are dealing with human beings who can (and will) be pressured and often tempted to manipulate accounting data. Thus what continues to be needed is an objective, transaction-based model with . . . historical cost as a control point. Accountants should not attempt to provide financial statements to meet the presumed needs of the short-term speculator, but instead should seek to meet the needs of the long-term shareholder and investor with reliable reports based on transactions, not guesses about values.”<sup>2</sup>—Eugene H. Flegm. Mr. Flegm spent 28 years as an accountant at **General Motors**, 10 of those years as assistant comptroller.

There are at least two reasons for the increased interest regarding fair values in financial statements. First, the nature of global business has changed substantially in the past 20 years. Investing, financing, and risk management activities are much more elaborate and sophisticated. Computer-monitored risk management systems are constantly making automated trades and entering into derivative contracts in order to manage the complex jumble of risks to which modern corporations are exposed. As explained in Chapter 19, some of those risks are price risk (uncertainty about the future price of an asset), credit risk (uncertainty over whether other people or companies will do what they have agreed to do), interest rate risk (uncertainty about future interest rates), and exchange risk (uncertainty about future foreign exchange rates). Other risks include liquidity risk, theft risk, competitive risk, and business cycle risk. As quantitative techniques have improved and have allowed for the creation of complex financial instruments that aid in mitigating these risks, financial statement preparers and users have become aware that only the reporting of fair values accurately reflects the economic effects of these risk mitigation activities. For example, the historical cost focus of traditional accounting is misplaced with derivatives because derivatives often have little or no up-front historical cost. With derivatives, the subsequent changes in prices or rates are critical to determining the fair value of the derivative, yet these changes have frequently been ignored in traditional accounting.

Another reason for the increased interest regarding fair values in the financial statements is that intangible assets have increased dramatically in importance, so the computation of fair values upon a business acquisition is more difficult. As stated by former

<sup>1</sup> Walter P. Schuetze, “In Defense of Fair Value,” *The CPA Journal*, February 2006.

<sup>2</sup> Eugene H. Flegm, response to Walter P. Schuetze (*The CPA Journal*, February 2006), and *Accounting: How to Meet the Challenges of Relevance and Regulation* (Elsevier Ltd., 2004, Foreword).

Federal Reserve Chairman Alan Greenspan: “Virtually unimaginable a half-century ago was the extent to which concepts and ideas would substitute for physical resources and human brawn in the production of goods and services.”<sup>3</sup> As shown in Exhibit 3-11 in this textbook, the relation between the book value of a company and that company’s market value has changed dramatically since 1980. Exhibit 3-11 illustrates that before 1980, between 60% and 80% of a company’s market value was reflected in the reported asset and liability amounts in the balance sheet. Since 1995, balance sheets have reflected only about 20% of a company’s market value. The difference stems, in large part, from the increased economic importance of intangible assets. The push for fair values in financial reporting is, in some sense, an early step in the effort to prevent financial statements from becoming an irrelevant historical curiosity.

In response to the forces described above as well as the demands of financial statement users, the FASB and IASB have determined that fair value is the most relevant measurement attribute for many assets and liabilities. Fair value is defined as “the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants.”<sup>4</sup> Because accounting has long been founded on a backbone of historical cost, the FASB and IASB are transitioning cautiously, item by item, to fair value.

A key step in this transition is the issuance of *SFAS No. 157*, which standardizes the definition of fair value and substantially expands the quality and quantity of fair value disclosures. These disclosures are explained and illustrated in this module. Following the issuance of *SFAS No. 157*, with the issuance of *SFAS No. 159*, the FASB took a bold step toward increased use of fair value by allowing companies a fair value option for the reporting of financial assets and liabilities.<sup>5</sup> As explained in Chapter 12, under the provisions of *SFAS No. 159*, a company has the option to report, at each balance sheet date, any or all of its financial assets and liabilities at their fair values on the balance sheet date. The number of financial reporting standards that require or permit the recognition of fair values will only increase in the future.

## Where Are Fair Values Used in Financial Statements?

**2** Identify where fair values are used in the financial statements.

**WHY** Creating a list of the financial statement items for which fair value reporting is required or allowed brings home the pervasiveness of fair values in financial reporting.

**HOW** *SFAS No. 157* standardizes the use of fair values in existing accounting standards. Those standards impact many of the financial reporting areas addressed in this textbook. Those areas, and the location of the relevant coverage in this text, are summarized in this section.

The purpose of this section of this fair value module is simple—to illustrate how widespread the use of fair value already is in financial statements. On the next page is a list of the financial statement uses of fair values. The list includes the item, a brief description of how fair value is used with that item, a U.S. GAAP reference (where appropriate), and the location of relevant coverage in this textbook.<sup>6</sup>

<sup>3</sup> Alan Greenspan, quoted in *Cracking the Value Code: How Successful Businesses Are Creating Wealth in the New Economy* [Richard E. S. Bolton, Barry D. Libert, and Steve M. Samek (HarperCollins, 2000)].

<sup>4</sup> *Statement of Financial Accounting Standards No. 157*, “Fair Value Measurements” (Norwalk, CT: Financial Accounting Standards Board, September 2006), par. 5.

<sup>5</sup> *Statement of Financial Accounting Standards No. 159*, “The Fair Value Option for Financial Assets and Financial Liabilities—Including an amendment of FASB Statement No. 115” (Norwalk, CT: Financial Accounting Standards Board, February 2007).

<sup>6</sup> Many of the items in this list are derived from Appendix E in *SFAS No. 157*.

<b>Financial Statement Item</b>	<b>Description of Use of Fair Value</b>	<b>U.S. GAAP Reference</b>	<b>Chapter Reference for this Textbook</b>
Investment securities	Investment securities classified as trading or available for sale are reported in the balance sheet at their fair value on the balance sheet date.	<i>SFAS No. 115</i>	Chapter 14
Financial assets accounted for using the fair value option	Companies have the option of reporting almost any financial asset at its fair value in the balance sheet. Associated unrealized gains and losses are reported in the income statement.	<i>SFAS No. 159</i>	Chapters 12 and 14
Long-term receivables	Long-term receivables are initially recorded at the discounted value of the future contractual cash receipts under the terms of the receivable. With the correct specification of the discount rate, this approximates the fair value, or the amount for which the receivable could be sold.	<i>APB Opinion No. 21</i>	Chapter 7
Pension plan assets	Pension plan assets are reported at their fair value on the balance sheet date. This fair value, along with the projected benefit obligation, are netted against each other, and a single amount is reported in the balance sheet.	<i>SFAS No. 87, SFAS No. 158</i>	Chapter 17
Assets acquired in a business combination	Assets acquired in a business combination are recorded in the books of the acquiring company at their fair value on the acquisition date.	<i>SFAS No. 141</i>	Chapter 10
Long-lived tangible assets that are impaired	If a long-lived tangible asset is determined to be impaired, is it written down to its fair value.	<i>SFAS No. 144</i>	Chapter 11
Intangible assets and goodwill that are impaired	If a long-lived intangible asset, including goodwill, is determined to be impaired, is it written down to its fair value.	<i>SFAS No. 142</i>	Chapter 11
Derivative instruments (asset or liability)	The fair value of all derivatives is recognized and reported in the balance sheet.	<i>SFAS No. 133</i>	Chapter 19
Financial liabilities accounted for using the fair value option	Companies have the option of reporting almost any financial liability at its fair value in the balance sheet. Associated unrealized gains and losses are reported in the income statement.	<i>SFAS No. 159</i>	Chapter 12
Long-term payables	Long-term payables are initially recorded at the discounted value of the future contractual cash payments under the terms of the payable. With the correct specification of the discount rate, this approximates the fair value, or the amount which could be paid to transfer the payable obligation to a third party.	<i>APB Opinion No. 21</i>	Chapter 12
Liabilities assumed in a business combination	Liabilities assumed in a business combination are recorded in the books of the acquiring company at their fair value on the acquisition date.	<i>SFAS No. 141</i>	Chapter 10
Asset retirement obligation	An asset retirement obligation is recognized at its fair value at the time the obligation is incurred, and that same fair value is added to the cost of the long-term operating asset being acquired.	<i>SFAS No. 143</i>	Chapters 10 and 11
Valuation of non-monetary items received such as assets or services	Nonmonetary assets or services are recorded at the fair value of the asset or service received or the asset or service given up, whichever is more clearly determinable.	<i>APB Opinion No. 29</i>	Chapter 10

As you can see from this list, fair values are already widely used in financial statements. *SFAS No. 157* does not require additional use of fair value beyond what is required in other statements. Instead, *SFAS No. 157* standardizes the definition of fair value, as explained in the next section.

## What Is “Fair Value”?

**3** Define “fair value” and describe the valuation concepts used in determining fair value.

**WHY** A key reason for the issuance of *SFAS No. 157* is that a number of related, but different, definitions of “fair value” in the accounting standards had been created over the years.

**HOW** There are many possible ways to define “fair value” for financial reporting purposes. The FASB chose to define fair value as the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date.

Consider the following hypothetical example. In addition to her regular job as an accountant and financial analyst at a mid-sized local company, Lorien Franklin also buys and sells real estate. Specifically, she closely monitors land sales in the area, buys a plot of land when the price is right, holds on to the land while she carefully waits for the right buyer to come along (usually between six months and a year), and then sells the land. She has been doing this for 15 years and has many contacts and information sources in the local real estate market.

Lorien has decided to prepare a personal balance sheet and is considering the amount at which she should report the one piece of land that she currently owns. She has assembled the following facts about the land:

- (a) One year ago when she purchased the land, she paid \$220,000.
- (b) Real estate prices have increased dramatically in the past year. Analysis of current land prices in the area indicates that Lorien would have to pay \$260,000 to buy an equivalent piece of land now. Remember, however, that Lorien is an exceptionally skilled buyer; other market participants would probably have to pay more to buy that same piece of land.
- (c) Lorien has assembled land sales data for the past three months for comparable pieces of land in the area. The sales prices have averaged \$21.55 per square foot, with the low being \$20.06 per square foot and the high being \$24.78 per square foot. For general market transactions (not involving Lorien and her special skills), the price of \$21.55 per square foot is a good indication of what a piece of land would sell for. Lorien’s land contains 13,000 square feet.
- (d) Based on her historical track record for selling land, Lorien will be able to sell this land for \$310,000. It will cost her about \$20,000 in various fees to finalize the sale.
- (e) Lorien has determined that this land can be rented for \$20,000 per year. Lorien has also determined that this rent revenue stream can be expected each year for the next 20 years. At the end of 20 years, Lorien estimates that the land can be sold for \$400,000. The appropriate interest rate to use in valuing these future cash flows is 8%.

Lorien can use only a single number to report the value of the land in her balance sheet; at what value should Lorien report the land?

In *Statement of Financial Accounting Concepts No. 5*, the FASB describes five measurement attributes.<sup>7</sup> The amounts at which Lorien’s land would be reported under each of these five measurement attributes are given below.

- *Historical cost*: Amount paid to acquire an asset (adjusted for depreciation). According to existing U.S. accounting rules, Lorien would report her land at its historical cost of \$220,000. This number has the advantage of being verifiable and objective. However, it also has the disadvantage of being the least relevant of the five numbers.

<sup>7</sup> *Statement of Financial Accounting Concepts No. 5*, “Recognition and Measurement in Financial Statements of Business Enterprises” (December 1984), par. 67. In *SFAC No. 5*, the concept of “fair value” is called “current market value.”

- *Replacement cost*: Amount that would have to be paid to acquire the same or an equivalent asset. If Lorien were to report the land at \$260,000, its replacement cost, she would be reflecting the general rise in land prices in the area. The \$260,000 number is similar to the \$220,000 number in that it is an entry price meaning that it reflects the cost to Lorien to purchase the land. This \$260,000 replacement cost can be viewed as merely an updated purchase price. The disadvantage of the replacement cost number is that it is hypothetical. The more active the real estate market, the more reliable is this hypothetical replacement cost.
- *Fair value*: The price that would be received to sell an asset in an orderly transaction between market participants.<sup>8</sup> The fair value of \$280,150 (\$21.55 average selling price per square foot × 13,000 square feet) reflects the amount that the land would be expected to sell for between two unrelated market participants. This hypothetical selling price is a general market price and does not factor in Lorien's above-average ability to negotiate in this market.
- *Net realizable value*: Amount of cash into which an asset is expected to be converted in due course of business less direct costs, if any, necessary to make that conversion. The net realizable value is \$290,000 (\$310,000 selling price less \$20,000 in expected selling costs). This net realizable value of \$290,000 is higher than the \$280,150 fair value because it reflects Lorien's individual market skill in making land sales happen.
- *Present value of future cash flows*: Present or discounted value of future cash inflows into which an asset is expected to be converted. The present value of the future cash inflows is \$282,182 ( $N = 20, I = 8\%, PMT = \$20,000, FV = \$400,000 \rightarrow PV = \$282,182$ ). One can argue that, conceptually, the present value of future cash flow is the fair value of an asset or a liability, and that market participants implicitly do present value calculations when settling on transaction prices in markets. In *SFAS No. 157*, the FASB confirms that present value techniques are one way of estimating fair value (see paragraphs B1 and C58 through C61).

Which one number should Lorien include in her personal balance sheet? Well, if she wants to follow U.S. GAAP, she should report the land at its historical cost of \$220,000. The \$280,150 fair value (using the square footage estimation) reflects what the land would sell for between two random but informed market participants in an orderly transaction conducted today. At a minimum, this fair value number is extremely relevant. In fact, as companies and even whole national economies respond ever more rapidly to new information, the current data reflected in fair values will become increasingly relevant.

In paragraph 5 of *SFAS No. 157*, the FASB defines "fair value" as follows:

Fair value is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date.

Note that the fair value definition in *SFAS No. 157* covers both assets and liabilities. The introductory discussion in this module will focus on the fair value of assets.

In *SFAS No. 157*, the FASB explains the key concepts associated with valuation. These concepts have been used for years by professional appraisers, and it certainly is not the intent of the FASB that all accountants become appraisers. However, with the increasing use of fair values in financial reporting, all accountants, auditors, and financial statement users should understand the key concepts used in defining and estimating fair values. These key concepts are as follows:

- The hypothetical transaction
- The principal (or most advantageous) market
- Market participants
- Highest and best use
- Valuation techniques
- Inputs to valuation techniques

<sup>8</sup> *Statement of Financial Accounting Standards No. 157, "Fair Value Measurements"* (September 2006), par. 5.

## The Hypothetical Transaction

Fair value is based on the price that would be received to sell an asset (or paid to transfer a liability) in a hypothetical transaction on the date of the measurement.<sup>9</sup> This hypothetical transaction is assumed to be an orderly one meaning that it is not a forced or hasty sale. In addition, this hypothetical transaction is assumed to occur between two unrelated, informed market participants. Thus, as a company seeks to determine the fair value of an asset it holds, it does not focus on the price it could receive in selling the asset; that amount is essentially equivalent to the net realizable value in the Lorien example given earlier. Instead, the company must determine what price would be acceptable to a seller without that particular company's special skills or unique handicaps.

## The Principal (or Most Advantageous) Market

As explained in the paragraph above, the hypothetical transaction is an orderly market transaction. Well, a natural question is: Which market? For some assets, there is a principal market in which that asset is typically traded. This principal market would be associated with the largest trading volume for the asset in question. For example, if the asset in question is a share of **Microsoft** stock, then the principal market is the NASDAQ market, and the relevant price in determining the fair value of the share of stock is the price at which a shareholder could sell the share in the NASDAQ market on the measurement date. Similarly, the principal market for trading pork belly futures is the Chicago Mercantile Exchange. If there is no one principal market in which a company could sell the asset, then the fair value should be determined using the price that could be obtained in the most advantageous market of those available.<sup>10</sup>

## Market Participants

As mentioned earlier, the price of the hypothetical transaction used to determine the fair value of an asset is the price that would occur between two unrelated, informed market participants. Specifically, the hypothetical market participants are knowledgeable about the asset in question, have the financial resources to buy and sell the asset, and are interested in buying or selling the asset.<sup>11</sup> For example, neither you nor the authors of this text have much knowledge of pork belly futures, so any price that we might agree to would not be appropriate to use in determining the fair value of a pork belly future because we are not knowledgeable, we probably don't have the necessary financial resources, and we are also probably not interested in buying or selling pork belly futures.

## Highest and Best Use

A key assumption in appraising an asset is that in an unconstrained market with ample time given for market participants to consider whether they want to buy an asset, the asset will be sold to the market participant who will use that asset in the most valuable way and who will pay the highest price for the asset. In shorthand terms, it is assumed that the asset in question will be put to its "highest and best use."<sup>12</sup> For most financial assets, such as a share of stock, the "highest and best use" is on a stand-alone basis. For example, a share of Microsoft stock is not worth more or less if you also own a piece of undeveloped real estate and a license to operate a steel mill. In this case, it is said that the highest and best use of the share of Microsoft stock is "in exchange" meaning that the way to get the most value out of the share of stock is to exchange it, or sell it. In contrast, for many nonfinancial assets, such as a steel furnace used in producing raw steel, the highest and best use is "in use" meaning that the

<sup>9</sup> SFAS No. 157, par. 7.

<sup>10</sup> SFAS No. 157, pars. 8–9.

<sup>11</sup> SFAS No. 157, pars. 10–11.

<sup>12</sup> SFAS No. 157, pars. 12–14.

asset is most valuable when used in concert with other, related assets. Accordingly, a steel furnace is probably not of much worth to you or to the authors of this text, but it would be of great worth to a company that also owns a piece of undeveloped real estate and a license to operate a steel mill. When the highest and best use of an asset is “in use,” in determining the fair value of the asset, it is assumed that the hypothetical market participant who would purchase the asset also owns the related assets that would allow it to maximize the “in use” value of the purchased asset.

## Valuation Techniques

In the field of asset appraisal, there are three primary asset valuation techniques: the market approach, the income approach, and the cost approach.<sup>13</sup> Each of these approaches is explained briefly here using the example of the determination of the fair value of a piece of commercial real estate.

**Market Approach** The market approach uses data from market prices for identical or similar assets. For example, in determining the fair value of a piece of commercial real estate, it is natural to look to the recent selling prices of similar pieces of real estate.

**Income Approach** The income approach is the general heading given to valuation techniques based directly or indirectly on discounted cash flow analysis. To use an income approach in estimating the fair value of a piece of commercial real estate, you would estimate the annual net cash flows to be generated by the property plus the amount for which the real estate could be sold at some terminal period. All of these cash flows would then be discounted to the present using an appropriate interest rate. Examples of discounted cash flow analysis are given later in this module.

**Cost Approach** The cost approach is based on the replacement cost of the asset. Often, the replacement cost is estimated based on what it would cost to replace the asset new, and then an adjustment is made for wear and tear to reflect the fact that the asset is used. The cost approach involves a subtle shift from the underlying concept of fair value because the cost approach is based on an entry price (the cost to buy) instead of an exit price (the price at which the asset can be sold). The cost approach might be used with commercial real estate if there are no other similar properties that have recently changed hands. For example, assume that the real estate involves the land, a building, and a surrounding parking lot. The cost approach would involve estimating how much it would cost to buy similar land and then the cost of constructing the building and the parking lot.

Illustrations of different applications of each of these approaches will be given later in this module.

## Inputs to Valuation Techniques

All of the valuation techniques outlined above require data inputs in estimating a fair value. Some data inputs are independently verifiable such as market prices for shares of stock or selling prices for comparable pieces of commercial real estate. These are called *observable inputs*. In the absence of observable inputs based on market data, a company must use its own assumptions to generate reasonable estimates of the cash flow forecasts, discount rate assumptions, or other valuation inputs that would be used by market participants. These are called *unobservable inputs*. SFAS No. 157 states that companies should maximize the use of observable inputs when estimating fair values.<sup>14</sup>

Examples of various valuation models, along with inputs to these models, are given in the next section.

<sup>13</sup> SFAS No. 157, pars. 18–20.

<sup>14</sup> SFAS No. 157, par. 21.

## Examples of Valuation Models

**4** Use a variety of valuation models.

**WHY** Preparers and users of financial statements do not necessarily need to be experts in valuation. However, anyone associated with financial reports containing fair values should understand the valuation process and the connection between the inputs to and outputs from common valuation models.

**HOW** Valuation models employ the use of both observable and unobservable inputs. Models that employ observable inputs focus on the adjustments necessary to convert the observed market data into a fair value for the asset in question. Models that employ unobservable inputs, such as models using the income approach, exhibit much greater sensitivity to the possible model inputs.

The following simple valuation models are illustrated in this section:

- Market multiples
- Matrix pricing
- Discounted cash flows, finite period
- Discounted cash flows, infinite period
- Adjusted replacement cost

Keep in mind that the objective of this module is not to train you to be a professional appraiser. Instead, you need a general understanding of common valuation models so that you can be an intelligent user of the fair value information you receive from expert appraisers for use in preparing financial reports, auditing financial reports, or interpreting financial reports.

### Market Multiples

As part of a business acquisition, Taraz Company purchased two buildings. The buildings are to be reported in Taraz's books at their fair values on the purchase date. Each of the buildings is unique, so Taraz cannot look to other building sales to directly determine how much each building would bring in a sales transaction. However, Taraz has assembled the following market data, based on commercial real estate sales in the area in the past six months, which can be used to indirectly estimate the selling price of each of the buildings Taraz purchased.

Selling Price		Square Feet				
		10,000	20,000	30,000	40,000	50,000
Capitalization Rate						
7%	.....	\$700,000	\$1,425,000	\$2,000,000	\$2,500,000	\$3,000,000
8%	.....	625,000	1,250,000	1,750,000	2,250,000	2,625,000
9%	.....	550,000	1,100,000	1,550,000	2,000,000	2,300,000
10%	.....	500,000	1,000,000	1,400,000	1,800,000	2,100,000

Taraz has learned that the selling price of a building is related to both its size (shown in the table above in square feet) and by the expected stability in the rental income that the building could generate if it were rented. This expected stability is represented by the "capitalization rate" which is the amount of rental income that the building can generate divided by the building's price. A higher capitalization rate indicates that market participants view the future income stream as being more risky. This riskiness is related to location, nature of surrounding properties, and so forth.

For the two buildings it purchased, Taraz has measured the size and estimated a capitalization rate based on location and surrounding properties. These estimates for the two buildings are as follows:

	Square Feet	Capitalization Rate
Building 1 .....	15,000	9%
Building 2 .....	22,000	10%

The fair value of the two buildings can be estimated as follows:

#### Building 1

- Look at the 9% capitalization rate row.
- Based on square footage, Building 1 is exactly halfway between \$550,000 and \$1,100,000.
- Estimated fair value of Building 1 = \$825,000 = \$550,000 + 0.5(\$1,100,000 – \$550,000)

#### Building 2

- Look at the 10% capitalization rate row.
- Based on square footage, Building 2 is 20% of the way from \$1,000,000 to \$1,400,000.
- Estimated fair value of Building 2 = \$1,080,000 = \$1,000,000 + 0.2(\$1,400,000 – \$1,000,000)

## Matrix Pricing

Han Company has purchased two corporate bonds as temporary investments. The bond investments are to be reported in Han's books at their fair values on the balance sheet date. Each of the bonds has unique terms, and the bonds are not traded in active markets, so Han cannot look to quoted market prices to directly determine how much each bond would bring in a sales transaction. However, Han has assembled the following matrix of bond price data for actively traded bonds which can be used to indirectly estimate the selling price of each of Han's bonds.

Bond Prices (% of par)					
	Bond Ratings				
Term (in years)	AAA	AA	A	BBB	BB
2 .....	103.85	103.56	102.71	102.37	100.29
5 .....	103.66	102.53	101.45	100.17	98.50
10 .....	101.64	100.29	99.56	98.54	91.98
20 .....	95.66	91.49	90.00	89.31	82.06

Han has learned that the selling price of a bond is related to both its term (the number of years until the bond matures) and to the underlying riskiness of the company that issued the bond. (*Note:* Another important valuation variable is the coupon interest rate on the bond. In this example, that rate is assumed to be the same for all bonds and so is ignored in this analysis.) This underlying riskiness is represented by the “bond rating” which is a label attached to a bond by a bond rating agency such as **Standard & Poor's**. The rating agency assigns the rating after an analysis of the bond issuing company's finances and the strength of its industry. A lower bond rate (AAA is the highest in the table and BB is the lowest) indicates that rating agency views the bond issuing company as being more risky. The higher this risk, the lower the bond price if everything else is held constant. Also, somewhat independent of the underlying riskiness of the bond issuing company, the longer time until a bond matures the more risk is associated with the bond. Thus, holding all else constant, bonds with longer times to maturity have lower prices.

For the two bonds it purchased, Han has determined the time to maturity and has also looked up the bond rating from Standard & Poor's. These data for the two bonds are as follows:

	Term	Bond Rating
Bond 1 .....	15	AA
Bond 2 .....	6	BBB

The fair value of each of the two bonds can be estimated as follows. *Note:* The par value of each of the bonds is \$1,000, and the numbers given in the matrix of bond prices are expressed in terms of a percentage of par value.

### Bond 1

- Look at the AA bond rating column.
- Based on the term of the bond, Bond 1 is exactly halfway between 100.29 and 91.49.
- Estimated bond price as a percent of par =  $95.89 = 100.29 - 0.5(100.29 - 91.49)$
- Estimated price of Bond 1 =  $0.9589 \times \$1,000 = \$958.90$

### Bond 2

- Look at the BBB bond rating column.
- Based on the term of the bond, Bond 2 is 20% of the way from 100.17 to 98.54.
- Estimated bond price as a percent of par =  $99.844 = 100.17 - 0.2(100.17 - 98.54)$
- Estimated price of Bond 2 =  $0.99844 \times \$1,000 = \$998.44$

## Discounted Cash Flows, Finite Period

As described in FASB *Concepts Statement No. 7*, the present value of future cash flows can be used to estimate fair value in one of two ways. In the traditional approach, which is often used in situations in which the amount and timing of the future cash flows are determined by contract, the present value is computed using a risk-adjusted interest rate that incorporates expectations about the uncertainty of receipt of the future contractual cash flows. In the expected cash flow approach, a range of possible outcomes is identified, the present value of the cash flows in each possible outcome is computed (using the risk-free interest rate), and a weighted-average present value is computed by summing the present value of the cash flows in each outcome, multiplied by the estimated probability of that outcome. To illustrate the traditional and the expected cash flow approaches, consider the following two examples.<sup>15</sup>

**Traditional Approach** Intangible Asset A is the right to receive royalty payments in the future. The future royalty cash flows are \$1,000 at the end of each year for the next five years. The risk-free interest rate is 5%; the receipt of these royalty cash flows is not certain, so a risk-adjusted interest rate of 12% is used in computing their present value. The fair value of Intangible Asset A is estimated as follows:

Business calculator keystrokes:

$$\begin{aligned}
 N &= 5 \text{ years} \\
 I &= 12\% \\
 PMT &= \$1,000 \\
 FV &= \$0 \text{ (there is no additional payment at the end of five years)} \\
 PV &= \$3,605
 \end{aligned}$$

This \$3,605 amount is the estimated fair value of the intangible asset.

<sup>15</sup> These examples are also found in the text of Chapter 10.

**Expected Cash Flow Approach** Intangible Asset B is a secret formula to produce a fast-food cheeseburger that contains 25 essential vitamins and minerals, reduces cholesterol levels, and replenishes the ozone layer. Future cash flows from the secret formula are uncertain; the following estimates have been generated, with the associated probabilities.

- Outcome 1    10% probability of cash flows of \$5,000 at the end of each year for 10 years
- Outcome 2    30% probability of cash flows of \$1,000 at the end of each year for 4 years
- Outcome 3    60% probability of cash flows of \$100 at the end of each year for 3 years

In the expected cash flow approach, the uncertainty of the future cash flows is not reflected in a risk-adjusted interest rate but is incorporated through the assessment of the various possible outcomes and the probabilities of each. Thus, the risk-free interest rate (5% in this case) is used in computing the present value of the cash flows in each outcome.

	Present Value	Probability	Probability Weighted Present Value
Outcome 1 .....	\$38,609	0.10	\$3,861
Outcome 2 .....	3,546	0.30	1,064
Outcome 3 .....	272	0.60	163
Total estimated fair value .....			<u>\$5,088</u>

This \$5,088 amount is the estimated fair value of the intangible asset.

## Discounted Cash Flows, Infinite Period

Rockmimi Company has purchased a taxi cab company in Winnemucca, Nevada, at the beginning of Year 1. One of the assets of the acquired company is an operating license issued by the city of Winnemucca. These licenses are quite valuable, but they trade infrequently, and the last separate sale of a similar license was 15 years ago. Accordingly, Rockmimi has determined that an income approach is necessary to determine the fair value of the acquired operating license. Because similar licenses are sometimes sublicensed, or rented, in exchange for a royalty fee based on total taxi revenue, Rockmimi can use a “relief from royalty” method to estimate the fair value of the license. Rockmimi has determined that the prevailing market royalty rate for such an arrangement is 6.0%. Using this approach, the fair value of the license is the present value of the after-tax royalties that Rockmimi is avoiding by owning the license instead of being forced to rent it from someone else.

Rockmimi has generated the following inputs for use with the “relief from royalty” method:

- Royalty rate: 6.0% of total taxi cab revenue (before subtracting any expenses)
- Discount rate: 11.0%
- Expected taxi cab revenue in Year 1: \$1,000
- Expected growth rate in taxi cab revenue each year for Years 2 through 5: 20.0%. Rockmimi expects rapid revenue growth for the next five years, but then the growth will slow to a sustainable long-term level.
- Expected long-term growth rate in cab revenue each year after five years (Year 6 and beyond): 4.0%
- Income tax rate: 40%

As you can see, most of the inputs into this valuation model are unobservable with the important exception of the royalty rate of 6.0%, which is an observable input

determined by reference to other similar royalty arrangements. Using these data, the fair value of the license is estimated to be \$817, computed as follows:

	Year 1	Year 2	Year 3	Year 4	Year 5	Growth 4.0% Years 5+
Total annual revenue .....	\$1,000	\$1,200	\$1,440	\$1,728	\$2,074	
Pretax royalty (6%) .....	\$ 60	\$ 72	\$ 86	\$ 104	\$ 124	
Income taxes (40%) .....	24	29	34	42	50	
After-tax royalty .....	\$ 36	\$ 43	\$ 52	\$ 62	\$ 74	\$1,057
Discounted cash flow .....	\$ 32	\$ 35	\$ 38	\$ 41	\$ 44	
Sum of discounted cash flow .....	\$ 190					
Present value of "perpetuity" .....	627					
Total present value of cash flows .....	\$ 817					

One number, \$627, in this computation deserves extra explanation. The cash flows in Year 6 and after constitute an infinite series. This infinite series is not exactly a perpetuity because the payments are not equal but are instead growing at 4.0% per year. The \$1,057 value is computed using the Gordon growth model that is illustrated in Chapter 23.

$$\text{Present Value} = \frac{\text{Beginning Cash Flow}}{r - g}$$

where  $g$  is the expected growth rate and  $r$  is the discount rate. In this case, the calculation is as follows:

$$\text{Present Value of Year 5+ Cash Flows} = \$74 \div (0.110 - 0.040) = \$1,057$$

This \$1,057 is the present value of the infinite series of cash flows as of one year before the first cash flow occurs. The first cash flow in this series occurs at the end of Year 6, so the \$1,057 value is as of the end of Year 5. This amount must be discounted back five more years to the beginning of Year 1; this yields the \$627 amount identified as the present value of the "perpetuity."

To a person unfamiliar with valuation models, the reporting of the \$817 estimated fair value of the license gives the illusion that the fair value is a precise number. One reason it is useful to learn about the basics of valuation is to learn how sensitive some fair value estimates can be to changes in the inputs, especially unobservable inputs. For example, in this case, changes in the values of the discount rate and the post-Year 5 growth rate yield estimated fair values ranging from \$453 to \$5,490, as shown below.

Estimated Fair Value of License	Discount Rate				
	7%	9%	11%	13%	15%
Post-Year 5 Growth Rate					
2% .....	\$1,269	\$ 888	\$ 678	\$545	\$453
3% .....	1,533	1,002	739	582	477
4% .....	1,973	1,163	817	626	505
5% .....	2,852	1,403	922	682	538
6% .....	5,490	1,804	1,068	754	579

You can see that to assess the reliability of reported fair value numbers it is important for an accountant, an auditor, or a financial statement user to understand the basics of valuation.

## Adjusted Replacement Cost

Kamaraz Company has purchased the site of a ski resort for \$10 million. Kamaraz must now estimate the fair values of the assets acquired in the purchase in order to properly record the acquisition. One of the assets is a ski lift system that is still fully functional. Because ski lift systems are of necessity tied to specific resorts and the contours of the resort's ski runs, there is no practical way to directly determine

a selling price for this particular system. However, Kamaraz can estimate how much it would cost to duplicate the system with new construction. That cost is \$1,200,000. The existing system has been in use for five years, and such systems are typically assumed to have useful lives of 20 years with a 10% salvage value. In a process exactly analogous to the computation of depreciated book value, we can estimate a “depreciated” replacement cost of \$930,000. The computations are as follows:

- $(\$1,200,000 - \$120,000) \div 20 \text{ years} = \$54,000$  “depreciation” per year
- $5 \text{ years} \times \$54,000$  “depreciation” per year = \$270,000 total “depreciation”
- $\$1,200,000$  replacement cost new – \$270,000 “depreciation” = \$930,000 adjusted replacement cost

This \$930,000 adjusted replacement cost is a cost-based estimate of the fair value of the ski lift system.

It bears repeating again that the objective of this module is *not* to train you to be a professional appraiser. Instead, you must be familiar with the common valuation models so that you can better understand the valuations provided by professional appraisers and be better prepared to ask questions about the critical and influential inputs into the models.

## Fair Value Disclosures

**5** Prepare the Level 1, Level 2, and Level 3 fair value disclosures required under SFAS No. 157.

**WHY** The reliability of inputs into valuation models is not the same in all circumstances and for all models. As a result, the output from the models can vary substantially in reliability. SFAS No. 157 requires disclosures that help financial statement users assess the reliability of the fair values used in preparing the financial statements.

**HOW** Level 1 inputs are the most reliable and are quoted prices in active markets for identical assets or liabilities. Level 2 inputs are of intermediate reliability and are prices for similar (but not identical) assets or liabilities or observable market inputs used in a valuation model. Level 3 inputs are unobservable inputs such as internal cash flows forecasts, discount rate estimations, and so forth.

In SFAS No. 157 (par. 21), the FASB states that fair value measurements are generated with a combination of observable and unobservable inputs. Consider the example of Company A estimating the fair value of its investment in the common stock of Company B. Examples of observable inputs are the quoted price of Company B stock and market multiples (such as price-to-sales ratio, price-earnings ratio, and price-to-book ratio) for Company B and other companies in its industry. Examples of unobservable inputs are Company A’s own estimate of the future cash flows to be generated by its investment in Company B and its estimate of the appropriate rate of return to use in valuing those cash flows. In using valuation techniques to generate fair values, the FASB requires companies to maximize the use of observable inputs and minimize the use of unobservable inputs.

The FASB has refined this observable/unobservable dichotomy into a 3-way “fair value hierarchy,” as follows:

- Level 1 inputs—quoted prices in active markets for identical assets (or liabilities)
- Level 2 inputs—observable inputs other than quoted prices in active markets for identical assets (or liabilities)
- Level 3 inputs—unobservable inputs

In generating fair values, Level 1 inputs are preferable to Level 2 inputs, which in turn are preferable to Level 3 inputs. Back to the Company A valuation of its investment

in Company B mentioned above, Company A should use the quoted price of Company B stock if such a price exists. In the absence of such a price, Company A should maximize its use of market multiples and other market data for similar companies. Finally, if no market-corroborated data exist relative to the fair value of Company B, then Company A should use its own internally generated cash flow and required rate of return estimates.

Clearly, a fair value generated with Level 1 inputs is more reliable and involves less uncertainty than a fair value generated with Level 3 inputs. Accordingly, under *SFAS No. 157*, a company is required to provide quantitative disclosure about the source of the inputs into its fair value computations.

These fair value disclosures fall into two categories. The first category is for assets (and liabilities) that are measured at fair value on a recurring basis. Examples are trading securities, available-for-sale securities, and derivatives. These items are reported at their fair values on every reporting date. For items measured at fair value on a recurring basis, the first required valuation input disclosure is a simple table with the assets as the rows and the three input levels as the columns. The example below is copied from *SFAS No. 157*, par. A34.

(\$ in 000s)		Fair Value Measurements at Reporting Date Using		
		Quoted Prices in Active Markets for Identical Assets (Level 1)	Significant Other Observable Inputs (Level 2)	Significant Unobservable Inputs (Level 3)
Description	12/31/XX			
Trading securities .....	\$115	\$105	\$10	
Available-for-sale securities .....	75	75		
Derivatives .....	60	25	15	\$20
Venture capital investments .....	10			10
Total .....	<u>\$260</u>	<u>\$205</u>	<u>\$25</u>	<u>\$30</u>

To illustrate what additional information this disclosure provides beyond the summary fair value measurements, consider the values reported for the available-for-sale securities (\$75) and the venture capital investments (\$10). The data in this table tell the financial statement user that there is a large difference in the reliability of these two numbers even though both are reported as “fair value” numbers in the balance sheet. The \$75 number is extremely reliable because, as noted in the table heading, it comes from “quoted prices in active markets for identical assets.” In contrast, the \$10 number is not as reliable because it stems from internal judgments and estimates that have not been corroborated by independent market observations.

The preceding paragraph highlights that the greatest concern regarding fair value numbers is with the numbers generated using Level 3 inputs. As a result, further disclosure is required for these fair values. An example is given in the table below.

(\$ in 000s)		Fair Value Measurements Using Significant Unobservable Inputs (Level 3)		
		Derivatives	Venture Capital Investments	Total
Beginning balance .....		\$14	\$11	\$25
Total gains or losses (realized/unrealized)				
Included in earnings (or changes in net assets) ...		11	(3)	8
Included in other comprehensive income .....		4		4
Purchases, issuances, and settlements .....		(7)	2	(5)
Transfers in and/or out of Level 3 .....		(2)	0	(2)
Ending balance .....		<u>\$20</u>	<u>\$10</u>	<u>\$30</u>

This table presents a beginning and ending balance reconciliation, or rollforward, for the fair values generated using Level 3 inputs. In summary, for items measured

at fair value on a recurring basis, an overall table is presented showing the relative magnitudes of fair values computed using Level 1, Level 2, and Level 3 inputs. In addition, a more detailed table is provided for the values generated using Level 3 inputs showing an explanation of the change in the fair value amounts from the beginning of the period to the end of the period.

Most balance sheet items are NOT reported at fair value on a recurring basis but are occasionally reported at fair value. A common example is impaired assets. The required disclosure for assets reported at fair value on a nonrecurring basis is given below. This table is copied from *SFAS No. 157*, par. A36.

Description	Year Ended 12/31/XX	Fair Value Measurements Using			Total Gains (Losses)
		Quoted Prices in Active Markets for Identical Assets (Level 1)	Significant Other Observable Inputs (Level 2)	Significant Unobservable Inputs (Level 3)	
Long-lived assets held and used	\$75		\$75		\$(25)
Goodwill	30			\$30	(35)
Long-lived assets held for sale	26		26		(15)
					<u>\$(75)</u>

You should first notice that with items reported at fair value on a nonrecurring basis, it is unlikely that Level 1 inputs will be available. Also, note that the final column, containing the gains and the losses, is a very condensed version of the second table, the rollforward table, required for the items that are reported at fair value on a recurring basis.

The Level 1, Level 2, and Level 3 disclosures required under *SFAS No. 157* help accountants, auditors, and financial statements users assess the reliability of the fair value numbers used in preparing the financial statements. Remember that the strong point of fair values is that they are very relevant, but the downside is that they sometimes lack reliability. The *SFAS No. 157* disclosures enable the assessment of that reliability.

**EXERCISES**

**Exercise FV-1**

**LO4**

**Use of Market Multiples**

Polly Company purchased three buildings. Polly has assembled the following market data, based on commercial real estate sales in the area in the past six months, which can be used to indirectly estimate the selling price of each of the buildings Polly purchased.

Capitalization Rate	Selling Price				
	10,000	20,000	30,000	40,000	50,000
7%	\$700,000	\$1,425,000	\$2,000,000	\$2,500,000	\$3,000,000
8%	625,000	1,250,000	1,750,000	2,250,000	2,625,000
9%	550,000	1,100,000	1,550,000	2,000,000	2,300,000
10%	500,000	1,000,000	1,400,000	1,800,000	2,100,000

For the three buildings it purchased, Polly has measured the size and estimated a capitalization rate based on location and surrounding properties. These estimates for the three buildings are as follows:

	Square Feet	Capitalization Rate
Building 3 .....	38,000	7%
Building 4 .....	41,000	8%
Building 5 .....	46,000	10%

Estimate the fair value of each of the three buildings.

**Exercise FV-2**

**Use of Market Multiples**

**LO4**

Pockey Company has assembled the following market data, based on commercial real estate sales in the area in the past six months, which can be used to indirectly estimate the selling price of a building the company purchased.

**Selling Price**

Capitalization Rate	Square Feet				
	10,000	20,000	30,000	40,000	50,000
7% .....	\$700,000	\$1,425,000	\$2,000,000	\$2,500,000	\$3,000,000
8% .....	625,000	1,250,000	1,750,000	2,250,000	2,625,000
9% .....	550,000	1,100,000	1,550,000	2,000,000	2,300,000
10% .....	500,000	1,000,000	1,400,000	1,800,000	2,100,000

The building purchased by Pockey Company, which is called “Building Z,” has 32,000 square feet and a capitalization rate of 9.3%.

What is the fair value of Building Z?

**Exercise FV-3**

**Use of Matrix Pricing for Bonds**

**LO4**

Below is a bond pricing matrix.

**Bond Prices (% of par)**

Term (in years)	Bond Ratings			
	AAA	AA	A	BBB
2 .....	104	103	102	101
5 .....	103	102	101	100
10 .....	101	100	99	98
20 .....	96	91	90	89

Company H owns a bond with a 13-year term and an AA rating. What is the fair value of this \$1,000 bond? *Note:* The par value of each of the bonds is \$1,000, and the numbers given in the matrix of bond prices are expressed in terms of a percentage of par value.

**Exercise FV-4**

**Use of Matrix Pricing for Bonds**

**LO4**

Bodie Company has purchased three corporate bonds as temporary investments. Bodie has assembled the following matrix of bond price data for actively traded bonds which can be used to indirectly estimate the selling price of each of Bodie’s bonds.

**Bond Prices (% of par)**

Term (in years)	Bond Ratings				
	AAA	AA	A	BBB	BB
2 .....	103.85	103.56	102.71	102.37	100.29
5 .....	103.66	102.53	101.45	100.17	98.50
10 .....	101.64	100.29	99.56	98.54	91.98
20 .....	95.66	91.49	90.00	89.31	82.06

For the three bonds it purchased, Bodie has determined the time to maturity and has also looked up the bond rating from **Standard & Poor’s**. These data for the three bonds are as follows:

	Term	Bond Rating
Bond 3 .....	3	AAA
Bond 4 .....	18	BB
Bond 5 .....	9	A

Estimate the fair value of each of the three bonds. *Note:* The par value of each of the bonds is \$1,000, and the numbers given in the matrix of bond prices are expressed in terms of a percentage of par value.

**Exercise FV-5**

**LO4**

**Expected Cash Flow Approach**

As part of a business combination, Mother Ryan Company acquired a customer list and a franchise agreement. Mother Ryan uses the expected cash flow approach for estimating the fair value of these two intangibles. The appropriate interest rate is 8%. The potential future cash flows from the two intangibles, and their associated probabilities, are as follows:

*Customer List*

- Outcome 1    20% probability of cash flows of \$40,000 at the end of each year for five years
- Outcome 2    30% probability of cash flows of \$18,000 at the end of each year for four years
- Outcome 3    50% probability of cash flows of \$9,000 at the end of each year for three years

*Franchise Agreement*

- Outcome 1    10% probability of cash flows of \$450,000 at the end of each year for 10 years
- Outcome 2    20% probability of cash flows of \$12,000 at the end of each year for four years
- Outcome 3    70% probability of cash flows of \$500 at the end of each year for three years

Using the expected cash flow approach, estimate the fair value of the customer list and of the franchise agreement.

**Exercise FV-6**

**LO4**

**Discounted Cash Flows, Infinite Period**

Sophie Zincmann Company has purchased an auto repair business in Tucson, Arizona, at the beginning of Year 1. One of the assets of the acquired company is a business license issued by the city of Tucson. These licenses are valuable, but they trade infrequently, and the last separate sale of a similar license was 10 years ago. Accordingly, Sophie Zincmann has determined that an income approach is necessary to determine the fair value of the acquired business license. Because similar licenses are sometimes sublicensed, or rented, in exchange for a royalty fee based on total repair shop revenue, Sophie Zincmann can use a “relief-from-royalty” method to estimate the fair value of the license. Sophie Zincmann has determined that the prevailing market royalty rate for such an arrangement is 2.0%. Using this approach, the fair value of the license is the present value of the after-tax royalties that Sophie Zincmann is avoiding by owning the license. Sophie Zincmann has generated the following inputs for use with the “relief-from-royalty” method:

- Royalty rate: 2.0% of total repair shop revenue (before subtracting any expenses)
- Discount rate: 15.0%
- Expected repair shop revenue in Year 1: \$300,000

- Expected growth rate in repair shop revenue each year for Years 2 through 5: 10.0%. Sophie Zincmann expects rapid revenue growth for the next five years, but then the growth will slow to a sustainable long-term level.
- Expected growth rate in repair shop revenue each year after five years (Year 6 and beyond): 3.0%
- Income tax rate: 30%

Using these data, estimate the fair value of the business license.

### Exercise FV-7

#### LO4

#### Adjusted Replacement Cost

Burton Dee Company has purchased the site of a gravel pit for \$10 million. Burton Dee must now estimate the fair values of the assets acquired in the purchase in order to properly record the acquisition. One of the assets is a rock crushing system. This system includes a crusher, a conveyer belt, and a control room. Because rock crushing systems such as this are tailor made for the pit in which they are located, there is no practical way to directly determine a selling price for this particular system. However, Burton Dee can estimate how much it would cost to duplicate the system with new construction. That cost is \$800,000. The existing system has been in use for seven years, and such systems are typically assumed to have a useful life of 16 years with a 5% salvage value.

Using these data, estimate the fair value of the rock crushing system.

### Exercise FV-8

#### LO5

#### Disclosures for Items Reported at Fair Value on a Recurring Basis

Didericksen Company has an investment portfolio containing three securities. Details about each of the securities are given below.

- *Security 1:* 1,000 shares purchased last year for \$20 per share. At the beginning of this year, the shares were trading at \$25 per share. At the end of this year, the shares were trading at \$27 per share. The shares of Security 1 trade actively on the New York Stock Exchange. Didericksen holds these securities with the intent to make money through short-term fluctuations in price; they are classified as trading securities.
- *Security 2:* 30 bonds (\$1,000 face value) purchased last year at 98.5. At the beginning of this year, the bonds were trading at 101.4. The bonds are thinly traded, so no quoted price is available near the end of this year. However, use of matrix pricing based on the trading prices of similar bonds indicates that the estimated price of the bonds is 97.8 at the end of this year. Didericksen classifies these securities as available for sale.
- *Security 3:* 500 shares in a real estate investment trust. Didericksen purchased 300 shares last year for \$15 per share. At the beginning of this year, the estimated fair value of these shares was \$18. During the year, Didericksen purchased another 200 shares at \$16 per share. Didericksen classifies this as an available-for-sale investment. The shares in this real estate investment trust are privately held, and transactions are infrequent. As of the end of the year, Didericksen has used its own analysis to estimate the price per share to be \$12.

Prepare the Level 1, Level 2, and Level 3 disclosures required under *SFAS No. 157*.

### Exercise FV-9

#### LO5

#### Disclosures for Items Reported at Fair Value on a Nonrecurring Basis

During the year, Nelson Company conducted an impairment analysis for three assets: a building, an operating license, and goodwill. The carrying values of the assets as of the beginning of the year were as follows: building, \$20,000; operating license, \$38,000; goodwill, \$120,000. It was found that each one of the assets was impaired. Impairment losses were recognized as follows: building, \$4,000; operating license, \$23,000; goodwill, \$94,000. The year-end fair values of all three of these assets were determined using internally generated data.

Prepare the Level 1, Level 2, and Level 3 disclosures required under *SFAS No. 157*.

## CASES

This module concludes with two cases.

- Sprint Nextel 2007
- China Telecommunications Industry 2008

These cases allow you to explore various issues associated with asset valuation and fair value disclosures. These cases focus on the estimation of fair values of nonfinancial assets. Both cases are for companies in the telecommunications industry. The fact that companies in this industry have many intangible assets leads to interesting valuation questions.

### Case FV-10

#### Fair Value and Impairment

Both **Sprint** and **Nextel** started business on the competitive fringes of the telecommunications industry. Until 1984, the phone business was dominated by the **AT&T** monopoly that stretched back to the time of Alexander Graham Bell. When founded in 1987, Nextel was originally called “Fleetcall” because it utilized wireless frequencies that had historically been used by taxi dispatchers. Sprint was formed from the combination of several companies including a local telephone company, founded in 1899, that had competed against AT&T in its monopoly days as well as a company that made wireless transmissions using the track right-of-way communication system of the **Southern Pacific Railroad**. Sprint and Nextel were formally united on August 12, 2005.

From a technology standpoint, the Sprint-Nextel merger presented a serious challenge. There are three common digital wireless technologies used around the world: GSM, CDMA, and iDEN. These different technologies vary based on, among other things, how they deal with the technical challenge of transmitting several calls at once. GSM (which was developed in Europe; the “GSM” stands for Groupe Spécial Mobile) is by far the most common mobile phone technology used worldwide. In the United States, GSM is used by AT&T and **T-Mobile**. CDMA (which stands for code division multiple access) is used in the United States by **Verizon** and, historically, by Sprint. iDEN (integrated digital enhanced network) was developed by **Motorola** and has been used for years by Nextel. These three technologies are mutually incompatible, so a cellular phone built to use CDMA doesn’t work with a network designed around iDEN. Thus, when Sprint and Nextel merged, a huge issue was how to get the CDMA and iDEN systems of the two companies to work together. As of early 2008, Sprint Nextel was still using both technologies which the company described in its 2007 10-K filing as a continuing risk, as follows: “Our wireless networks provide services utilizing CDMA and iDEN technologies. Wireless subscribers served by these two technologies represent a smaller portion of global wireless subscribers than the subscribers served by wireless networks that utilize GSM technology. As a result, our costs with respect to both CDMA and iDEN network equipment and handsets may continue to be higher than the comparable costs incurred by our competitors who use GSM technology, which places us at a competitive disadvantage.”

The Sprint-Nextel merger also presented organizational behavior challenges. Sprint’s management approach was described as “bureaucratic” in contrast to the “aggressive, entrepreneurial” approach of Nextel.<sup>1</sup> Many joint meetings “ended with Nextel employees storming out, leaving the Sprint side baffled. Sprint people thought Nextel made reckless decisions and spent money impulsively. Nextel people felt stifled by Sprint’s process-oriented pace.”

During 2007, it became apparent that the honeymoon was over at Sprint Nextel. Signs of distress included the following:

- Operating income in each quarter in 2007 was down compared to the same quarter in 2006. For the first three quarters, the total decrease was 63%.

<sup>1</sup> Kim Hart, “No Cultural Merger at Sprint Nextel,” *Washington Post*, November 24, 2007, p. D01.

- Average revenue per user (ARPU) declined during each quarter in 2007 compared to the same quarter in 2006. Sprint Nextel explained the decline as follows: “The decline in our average monthly voice revenue is primarily due to the loss of subscribers with higher priced service plans, while new subscribers and the subscribers acquired from the PCS Affiliates have lower priced service plans.”
- The market value of the company, which had held steady at about \$55 billion during the first three quarters of 2007, began on a long slide in the fourth quarter, dropping to \$44 billion by the end of November and \$37 billion by the end of the year.

This financial distress triggered a careful impairment analysis. This analysis included consideration of the recoverability of the cost of long-lived assets, both tangible and intangible, as well as an assessment of potential impairment of goodwill. The data underlying those analyses are detailed below.

*Note:* These data are adapted from the 2007 10-K filing of Sprint Nextel; they represent an approximation of the actual data used in the internal impairment analysis conducted by Sprint Nextel.

### Impairment Analysis of Property, Plant, and Equipment

As described above, the impairment concerns center on the Wireless segment. Data on the property, plant, and equipment for the Wireless segment as of December 31, 2007, are as follows. (All numbers are in millions.)

Land .....	\$ 277
Network equipment .....	30,764
Buildings and improvements .....	4,054
Non-network software, office equipment .....	2,844
Less: Accumulated depreciation .....	<b>(18,545)</b>
	19,394
Construction in progress .....	3,488
Property, plant, and equipment, net .....	<u>\$ 22,882</u>

For purposes of an impairment test, Sprint Nextel groups property, plant, and equipment at the lowest organizational level for which the cash flows of the group “are largely independent of the cash flows of other groups of assets and liabilities.” Sprint Nextel has determined that the segment level is the appropriate level at which to conduct this analysis.

Sprint Nextel is involved in an active market for the leasing of “cell and switch sites, real estate, information technology and network equipment and office space.” Data from this active leasing market can be used to generate cash flow estimates for the property, plant, and equipment of the Wireless segment. Estimated annual lease payments for the property, plant, and equipment currently being used by the Wireless segment are as follows:

	Estimated Annual Lease Payment
Land .....	\$ 30
Network equipment .....	2,840
Buildings and improvements .....	299
Non-network software, office equipment .....	437
Construction in progress* .....	1,073

\*This estimated annual lease payment is for a completed asset. Construction in progress is 60% complete.

According to *SFAS No. 144*, par. 18, “the remaining life of an asset group shall be based on the remaining useful life of the primary asset of the group.” The primary asset is the depreciable asset “that is the most significant component asset from which the asset group derives its cash-flow-generating capacity.” For the property, plant, and equipment of the Wireless segment, this asset is the network equipment which has, on average, a remaining useful life of eight years.

**Impairment Analysis of Goodwill**

Before any impairment charges, the net book value of the Wireless segment as of December 31, 2007, is \$52,808, computed as follows:

Current assets .....	\$ 7,414
Property, plant, and equipment, net .....	22,882
Intangible assets:	
Goodwill .....	30,664
FCC licenses .....	21,123
Customer relationships, net .....	4,203
Other definite-lived intangibles .....	1,835
Other assets .....	733
<b>Total Wireless assets .....</b>	<b>88,854</b>
Current liabilities .....	\$ 7,793
Long-term debt .....	17,521
Deferred tax liabilities .....	7,438
Other liabilities .....	3,294
<b>Total Wireless liabilities .....</b>	<b>\$36,046</b>
<b>Net book value of Wireless segment .....</b>	<b>\$52,808</b>

The total market value of Sprint Nextel at the end of each quarter during 2007 was as follows:

	<b>Market Capitalization (in billions)</b>
January 1, 2007 .....	\$54.2
March 31, 2007 .....	53.8
June 30, 2007 .....	58.8
September 30, 2007 .....	54.1
December 31, 2007 .....	37.4

All of Sprint Nextel's reported goodwill relates to the Wireless segment. The process used by Sprint Nextel to estimate the fair value of the Wireless segment is described as follows: "We [reduce] our stock price by the estimated value per share of our Wireline reporting unit and then [add] a control premium, as permitted by FASB guidance, to determine an estimate of the equity value of the wireless reporting unit."

One way to estimate the fair value of the Wireline segment is using a market-based approach based on price-to-sales and price-to-EBITDA ratios for publicly traded companies with similar operations. Data for this analysis are included below.

	<b>Market Capitalization</b>	<b>Operating Revenues</b>	<b>EBITDA*</b>
Qwest .....	\$8.29	\$13.73	\$4.61
Level 3 .....	4.96	4.31	0.76
Embarq .....	6.79	6.35	2.67
Windstream .....	6.00	3.26	1.67
Centurytel .....	3.80	2.70	1.37
Sprint Nextel Wireline segment .....	?	6.46	1.07

All numbers are for 2007 and are in billions.

\*EBITDA = Earnings before interest, taxes, depreciation, and amortization

The "control premium" mentioned by Sprint Nextel is the additional value, above the value based on reported sales or cash flows, that accrues to an entity that controls a business operation. In this case, the control premium is that additional value from owning, or controlling, the Wireless segment and thus being able to make strategic decisions with respect to the use of the resources of the segment. Estimates in the academic literature place the magnitude of this premium at 5 to 10%.

Sprint Nextel also estimates the fair value of the Wireless segment through an income approach which involves the computation of the present value of an estimate of the cash flows to be generated by the segment. Data used in that analysis are as follows:

**For computing weighted-average cost of capital**

Risk-free rate (12/31/2007) .....	4.0%
Equity premium .....	7.0%
Industry-average Beta .....	1.55
Interest rate on debt .....	7.0%

**5-year growth forecast**

Annual growth in OIBDA* .....	13.0%
Annual growth in capital expenditures .....	10.0%

\*OIBDA = Operating income before depreciation and amortization; this is equivalent to after-tax segment earnings.

Terminal growth rate (after 5 years) .....	6.0%
Income tax rate for all years .....	38.0%

**Reported amounts for 2007**

Segment earnings .....	\$9,914
Capital expenditures .....	5,067

*Note:* Total liabilities for Sprint Nextel as of December 31, 2007, were \$42.1 billion.

**Estimation of Fair Value of Non-Goodwill Intangible Assets**

As part of its Wireless segment goodwill impairment analysis, Sprint Nextel estimated the fair value of its intangible assets which are also associated with the Wireless segment. Data for Sprint Nextel's FCC licenses and customer relationships are given below.

*Note:* For this analysis, assume that book value approximates fair value for the "other definite-lived intangibles" and "other assets" reported for the Wireless segment.

*FCC Licenses*

Sprint Nextel owns a number of FCC licenses. These licenses are essential to Sprint Nextel. The company wrote the following in its 2007 annual report: "We hold several kinds of FCC licenses to deploy our wireless services: 1.9 GHz personal communications services, or PCS, licenses utilized in our CDMA network, 800 MHz and 900 MHz licenses utilized in our iDEN network and 2.5 GHz licenses that we use for first generation wireless Internet access services. We also hold 2.5 GHz, 1.9 GHz and other FCC licenses that we currently do not utilize in our networks or operations. As long as we act within the requirements and constraints of the regulatory authorities, the renewal and extension of our licenses is reasonably certain at minimal cost. FCC licenses authorize wireless carriers to use radio frequency spectrum. That spectrum is a renewable, reusable resource that does not deplete or exhaust over time. We are not aware of any technology being developed that would render spectrum obsolete. Currently, there are no changes in the competitive or legislative environments that would put in question the future need for spectrum licenses."

One way to estimate the fair value of Sprint Nextel's FCC licenses is the "relief-from-royalty" approach. This method uses market royalty rates charged for the use of licenses similar to those owned by Sprint Nextel. Using this approach, the fair value of the licenses is the present value of the after-tax royalties that Sprint Nextel is avoiding by owning the licenses.

Of course, a key variable in this analysis is the royalty rate. A search in a proprietary royalty rate database revealed rates ranging from 2% to 8% with an average of 4.2%. The royalty is based on revenue, before the subtraction of any expenses.

Another key variable in the analysis is the average revenue per user, or ARPU. Sprint Nextel reports in its 2007 10-K filing that its ARPU for the fourth quarter of 2007 was \$58 per month, down from \$63 per month in the fourth quarter of 2005. Because of brisk competition among wireless service providers, Sprint Nextel expects ARPU to continue to decrease.

A summary of the data used in the relief-from-royalty valuation analysis is as follows:

Royalty rate .....	4.2%
Beginning monthly ARPU .....	\$58
ARPU annual growth rate .....	-1.0%
Number of customers, 12/31/2007 (in millions) .....	40,751
Income tax rate .....	38%

**For the next five years:**

Annual growth rate in number of customers .....	13.0%
Terminal growth rate (after five years) .....	6.0%

*Customer Relationships*

As of December 31, 2007, Sprint Nextel had almost 41 million wireless customers. These customers represent an existing base of users that will continue to generate cash flows in the future. Assuming no new customers and normal attrition among these existing customers, the discounted present value of these after-tax cash flows, after removing a reasonable return on other assets employed, represents an estimate of the fair value of the customer relationships as of December 31, 2007.

A key variable in the value of the existing customer relationships is Sprint Nextel's normal monthly "churn rate" which is the percentage of customers who leave the company in a normal month. In its 2007 10-K filing, Sprint Nextel disclosed that its churn rate in the fourth quarter of 2007 was 2.3%. This rate has been fairly stable for the past three years, ranging from a high of 2.5% in the first quarter of 2005 to a low of 2.0% in the second quarter of 2007.

Another important factor in valuing Sprint Nextel's wireless customer relationships is the contribution margin associated with wireless revenue. Defining variable cost as the "cost of services and products" reported in Sprint Nextel's income statement, the overall company contribution margin percentage was 56.4% in 2005, 59.1% in 2006, and 57.2% in 2007. For the valuation analysis, a weighted average of the 2006 and 2007 percentages is used, with the 2007 percentage being given double weight. This weighted average contribution margin percentage is 57.8%.

To isolate the value associated with the customer relationships, it is necessary to subtract an estimate of the income generated by identifiable other assets. These assets include both the reported assets (less goodwill) of the Wireless segment of \$58,190 (\$88,854 - \$30,664) plus the fair value in excess of book value of any of the recorded assets. The rate of the return is the company's weighted average cost of capital.

A summary of the data used in the customer relationship valuation analysis is as follows:

Monthly churn rate .....	2.3%
Beginning monthly ARPU .....	\$58
ARPU annual growth rate .....	-1.0%
Variable cost as a percent of revenue .....	42.2%
Income tax rate .....	38%

*Note:* In this customer relationship valuation analysis, the economic life of the relationship is assumed to extend as far into the future as the excess cash flows are positive. With a monthly churn rate of 2.3%, this will probably be three or four years.

**Questions**

1. Before any impairment write-down, the net recorded amount of Sprint Nextel's Wireless segment property, plant, and equipment as of December 31, 2007, is \$22,882. Is the Wireless segment's property, plant, and equipment impaired? If so, what is the amount of any necessary impairment write-down?
2. Before any impairment write-down, the net recorded amount of Sprint Nextel's goodwill as of December 31, 2007, is \$30,664. Is Sprint Nextel's goodwill impaired? If so, what is the amount of any necessary impairment write-down?
3. With respect to the Wireless segment's long-lived assets (tangible and intangible) described in the data given above, what *SFAS No. 157* fair value disclosures are necessary for the year ended December 31, 2007?

4. Refer to Question 1. How will your answer change if the discount rate you use is *increased* by 0.5% (50 basis points)? *Decreased* by 0.5%? Comment.
5. Refer to Question 2. How will your answer change if the discount rate you use is *increased* by 0.5% (50 basis points)? *Decreased* by 0.5%? Comment.
6. In conducting the goodwill impairment analysis, you used several different valuation techniques.
  - Wireless segment valuation using price-to-sales and price-to-EBITDA data for the Wireline segment
  - Wireless segment valuation using discounted cash flow analysis
  - FCC license valuation using a “relief-from-royalty” approach
  - Customer relationship valuation using discounted cash flow analysis

Which one of these valuation techniques seems most *reliable* to you? Explain.

### Case FV-11

#### Asset Values<sup>2</sup>

##### “Industry Shakeup Creates 3 Telecom Giants,” *China Daily*, 25 May 2008

In a brave industry shake-up, Beijing has ordered its six telecom companies to merge assets and create three hi-tech conglomerates that will compete with each other to offer fixed, mobile, broadband, and future telecom services. The overhaul is expected to have a long-lasting effect on a massive and rapidly growing market. China, with 1.3 billion people, is already the world leader in mobile phone and Internet users. The central government will issue three third-generation wireless licenses to the three mega companies after the overhaul is completed, sources told [chinadaily.com.cn](http://chinadaily.com.cn).

Under the plan revealed by Beijing over the weekend, the parent of **China Telecom Corporation** will buy a mobile phone network from **China Unicom Ltd**’s parent, which in turn will merge with the company that controls **China Netcom Corporation**. Industry analysts said that the reform will help China Telecom and China Netcom expand their operations to compete against **China Mobile Ltd**. The \$105 billion industry has room to expand because six out of 10 people still don’t own mobile phones and 82% of the population lacks Web connections. The reform is designed to foster “healthy market competition and prevent a monopoly by any,” according to a joint statement, issued by the Ministry of Information Industry, Ministry of Finance, and the National Development and Reform Commission.

**China Mobile Communications Corp.**, the state-owned parent of China Mobile Ltd, which is listed in Hong Kong, will take control of fixed-line operator **China Tietong Telecommunications Corporation**. China Telecom, China’s biggest fixed-line company, will acquire Unicom’s smaller mobile phone network, which provides services to 43 million customers based on the code-division multiple access technology used in Japan and South Korea. China Telecom will also get **China Satellite Communications Corporation**’s phone assets.

**China Network Communications Corporation** will merge with Unicom’s parent to offer fixed-line and mobile-phone services based on the global system for mobile communications technology that is used in most of the world. Unicom had 125.4 million GSM customers as of the end of April, according to the company. Netcom, the nation’s second-largest fixed-line company, had 108 million phone users.

China Mobile, which accounts for more than two-thirds of the nation’s mobile phone users as customers, will take control of unlisted Tietong. Tietong, which means “railway telecom” in Chinese, had assets of 55.3 billion yuan as of the end of 2006. China Mobile, with 399.6 million customers as of April 30, posted a profit of 87.1 billion yuan last year. The company’s dominance of China’s wireless market helped its stock triple in the past two years, overtaking **General Electric** and **Microsoft** to become the world’s fourth-largest company by market value.

<sup>2</sup> Prepared by Professor Earl K. Stice with the cooperation of the School of Accountancy at The Chinese University of Hong Kong.

Chinese regulators aim to boost competitiveness at fixed-line operators before the nation rolls out 3G high-speed wireless services, which will require billions of dollars in investments for network equipment. The government has said it plans to offer 3G during the Olympic Games in August. China had 583.5 million mobile phone users at the end of April, exceeding the combined populations of the United States and Japan.

### Brief History of the Telecommunications Industry in China

When the People's Republic of China was proclaimed on October 1, 1949, the condition of the telecommunications system in China was primitive. Much of the pre-existing infrastructure had been destroyed during World War II and its aftermath. The first priority was to establish telephone lines linking Beijing with the large cities in China and then with the provincial capitals.<sup>3</sup> For many years, telecommunications services in China were provided through a government monopoly, China Telecom. In 1994, the Ministry of Information Industry (then called the Ministry of Electronic Industry) established China Unicom to provide paging and mobile phone services, with China Telecom maintaining its monopoly over fixed-line service. In 1999, China Telecom was split into three pieces: China Telecom which would continue with the monopoly fixed-line system, China Mobile to compete with China Unicom in the mobile phone sector, and China Satcom to offer satellite communications service. Then in 2002, the Chinese government split the monopoly fixed-line operations of China Telecom, creating China Netcom out of the fixed-line operations of China's 10 northern provinces (30% of the fixed-line network). China Telecom continued to operate fixed-line service in China's 21 southern provinces (70% of the fixed-line network). In the middle of all of this, in 2000, China Tietong was created out of the far-flung railway communications system in China.<sup>4</sup>

### Mobile Phone Technology

There are three common digital wireless technologies used around the world: GSM, CDMA, and iDEN. These different technologies vary based on, among other things, how they deal with the technical challenge of transmitting several calls at once. GSM (which was developed in Europe; the "GSM" stands for Groupe Spécial Mobile) is by far the most common mobile phone technology used worldwide. In the United States, GSM is used by **AT&T** and **T-Mobile**; GSM is also the technology used by China Mobile. CDMA (which stands for code division multiple access) is used in the United States by **Verizon** and by **Sprint**. In China, China Unicom uses both GSM (74% of its subscribers) and CDMA (26% of its subscribers). iDEN (integrated digital enhanced network) was developed by **Motorola** and has been used for years by **Nextel**. These three technologies are mutually incompatible, so a cellular phone built to use CDMA doesn't work with a network designed around GSM.

### Summary Data for 2007

Summary performance data for the four publicly traded China telecommunications companies are given below. China Satcom and China Tietong are not publicly traded, so financial accounting data are not available.

	December 31, 2007	Fiscal 2007	Fiscal 2007	Fiscal 2007	Fiscal 2007	December 2007	December 2007
(billions of RMB)	Market Capitalization	Sales	Operating Profit	EBITDA	Net Income	Lines/ Subscribers (millions)	State Ownership
China Mobile	2,523.4	357.0	124.1	194.0	87.1	369.3	74.3%
China Telecom	466.6	178.7	37.0	89.3	23.7	256.0	70.9%
China Unicom	220.2	99.5	10.3	32.4	9.3	162.5	48.3%
China Netcom	141.9	84.0	18.6	41.2	12.1	130.6	74.1%

<sup>3</sup> See the Wikipedia entry for "Communications in the People's Republic of China" at [http://en.wikipedia.org/wiki/Communications\\_in\\_the\\_People%27s\\_Republic\\_of\\_China](http://en.wikipedia.org/wiki/Communications_in_the_People%27s_Republic_of_China).

<sup>4</sup> In the United States, Sprint was formed from the combination of several companies including a company that made wireless transmissions using the track right-of-way communication system of the **Southern Pacific Railroad**.

### Terms of the Restructuring

On June 2, 2008, the following terms were released regarding the China telecommunications restructuring announced on May 25:

- China Unicom would acquire China Netcom for 165 billion yuan. This acquisition would be accomplished through a swap of 1.508 China Unicom shares for each China Netcom share.
- China Telecom would buy China Unicom's CDMA network and operations for 110 billion yuan. China Unicom had 42 million CDMA subscribers as of December 31, 2007. During 2007, China Unicom's CDMA business generated net income (after tax) of 0.8 billion yuan on total sales of 27.7 billion yuan.

### Recording the Unicom/Netcom Business Combination

A crucial accounting issue regarding the acquisition of China Netcom by China Unicom is determining the amounts at which the acquired assets and liabilities of China Netcom will be initially recorded in the books of China Unicom. According to *IFRS 3* as well as *SFAS No. 141R*, acquired assets and liabilities are to be recognized in the books of the acquiring company at their fair values.

As of December 31, 2007, the recorded assets and liabilities of China Netcom are as follows (in millions of yuan):

Cash .....	5,395
Accounts receivable .....	8,458
Inventories .....	287
Prepayments .....	1,021
Due from holding companies .....	347
Fixed assets .....	156,948
Construction in progress .....	3,990
Lease prepayments .....	2,494
Intangible assets .....	1,552
Deferred tax assets .....	2,693
Other noncurrent assets .....	<u>3,243</u>
Total assets .....	<u>186,428</u>
Total liabilities .....	<u>104,376</u>

For simplicity, assume that the fair value of all recorded assets and liabilities of China Netcom is equal to their December 31, 2007, balance sheet value EXCEPT for the following:

- Accounts receivable
- Fixed assets
- Intangible assets

Detailed data for use in determining the fair values of these three asset categories are given below.

Disclaimer: The detailed data presented below are generally consistent with telecommunication company valuation practices. However, they are hypothetical and almost certainly bear only a general resemblance to the actual data that China Unicom may use in estimating the fair values of the assets, both tangible and intangible, it acquires in the combination with China Netcom.

### *Valuation Analysis of Accounts Receivable*

There is some evidence that the net carrying amount for accounts receivable as reported in the December 31, 2007, balance sheet may overstate the fair value of the receivables. A detailed aging analysis of the accounts receivable is as follows:

	Amount	Uncollectible Estimate
0–30 days .....	3,546	1.0%
31–60 days .....	1,639	3.0%
61–90 days .....	1,363	15.0%
91–150 days .....	1,763	40.0%
Over 150 days .....	1,545	80.0%
Total .....	<u>9,856</u>	

#### *Valuation Analysis of Fixed Assets*

China Netcom purchases, rather than leases, the large majority of its fixed assets. However, there exists an active worldwide market for the leasing of telecommunications network equipment. In addition, there are markets in China for the leasing of both buildings and office furniture and equipment. Estimated annual lease payments for the fixed assets currently being used by China Netcom are as follows:

(in millions of RMB)	Estimated Annual Lease Payment
Buildings .....	2,670
Telecom networks and equipment .....	25,780
Furniture and other equipment .....	2,130

In the notes to its financial statements, China Netcom discloses the following with respect to the estimated useful lives of its fixed assets:

Buildings .....	8 to 30 years
Telecommunications networks and equipment .....	5 to 10 years
Furniture, fixture, motor vehicles and other equipment .....	5 to 10 years

#### *Valuation Analysis of Intangible Assets*

China Netcom has recorded intangible assets with a book value of 1.552 billion yuan. Assume that this recorded amount is equal to the fair value of these recorded intangibles. China Netcom also has important unrecorded intangibles, as explained below.

#### **Licenses**

In its 2007 20-F filing with the Securities and Exchange Commission (SEC) in the United States, China Netcom explained the regulatory restrictions under which it operates. “The Group’s operations are subject to the supervision of and regulation by the PRC Government. The Ministry of Information Industry (MII), pursuant to the authority delegated by the PRC’s State Council, is responsible for formulating the policies and regulations for the telecommunications industry in China, including granting licenses, allocating frequency spectrum, formulating interconnection and settlement arrangements between telecommunications operators, enforcing industry regulations and reviewing tariffs for domestic services.” The licenses granted by the MII are essential to China Netcom. The company wrote the following in its 20-F filing: “If these approvals or licenses were revoked or suspended, our business and operations would be materially and adversely affected.” In summary, among the most valuable economic assets of China Netcom are the operating licenses it holds to offer fixed-line telephone services. However, because these licenses were acquired at zero or only nominal cost, their value is not reflected in China Netcom’s 2007 balance sheet.

One way to estimate the fair value of China Netcom’s operating licenses is the “relief-from-royalty” approach. This method uses market royalty rates charged for the use of licenses similar to those held by China Netcom. Using this approach, the fair value of the licenses is the present value of the after-tax royalties that China Netcom is avoiding by holding the licenses.

Of course, a key variable in this analysis is the royalty rate. A search in a proprietary royalty rate database revealed rates ranging from 2% to 8% with an average of 4.2%. The royalty is based on revenue, before the subtraction of any expenses.

Another key variable in the analysis is the average revenue per user, or ARPU, which is a common measure in the telecommunications industry. China Netcom had a *monthly* ARPU of ¥53.6, down from ¥54.6 in 2006. This decrease represents the offsetting effects of an increase from a shift from fixed-line to broadband customers and a decrease from an overall, worldwide decline in telecommunications prices to consumers. China Netcom expects these trends to continue into the foreseeable future (i.e., the next five years). However, total users (fixed-line plus broadband) increased slightly from 128.4 million at the end of 2006 to 130.6 million at the end of 2007; this slightly increasing trend is also expected to continue as customers continue to switch away from fixed-line phones to mobile phones but as the number of broadband customers increases.

A summary of the data to be used in the relief-from-royalty valuation analysis is as follows:

Discount rate .....	10.0%
Royalty rate .....	4.2%
Beginning monthly ARPU .....	¥53.6
ARPU annual growth rate .....	-1.8%
Dec. 31, 2007 lines/subscribers (millions) .....	130.6
Income tax rate .....	25%

**For the next five years:**

Annual growth rate in number of customers .....	1.7%
Terminal growth rate (after five years) .....	0.0%

**Customer Relationships**

As of December 31, 2007, China Netcom had 110.8 million fixed-line customers (this established customer relationship analysis ignores the 19.8 million relatively new broadband customers). These fixed-line customers represent an existing base of users that will continue to generate cash flows in the future. Assuming no new customers and normal attrition among these existing customers as these customers continue to migrate from fixed-line to mobile phones, the discounted present value of these after-tax cash flows, after removing a reasonable return on other assets employed, represents an estimate of the fair value of the customer relationships as of December 31, 2007.

A key variable in the value of the existing customer relationships is China Netcom's normal "churn rate" which is the percentage of fixed-line customers who leave the company. In its 2007 annual report, China Netcom disclosed that its churn rate in 2007 was 2.8%. This rate is expected to continue for the foreseeable future.

Another important factor in valuing China Netcom's fixed-line customer relationships is the contribution margin associated with fixed-line revenue. Fixed-line revenue totaled 59.2 billion yuan in 2007. Variable cost was 46% of revenue.

To isolate the value associated with customer relationships, it is necessary to subtract an estimate of the income generated by identifiable other assets. These assets include both the reported assets of China Netcom of 186.4 billion yuan plus the fair value in excess of book value of any of the recorded assets plus the fair value of any unrecorded intangibles such as licenses. For simplicity, the rate of the return is assumed to be 10%.

A summary of the data used in the customer relationship valuation analysis is as follows:

Discount rate .....	10.0%
Annual churn rate .....	-2.8%
Beginning monthly ARPU .....	¥53.6
ARPU annual growth rate .....	-1.8%
Variable cost as a percent of revenue .....	46.0%
Income tax rate .....	25%

*Note:* In this customer relationship valuation analysis, because of the volatile nature of the telecommunications industry, the economic life of the existing fixed-line relationships is assumed to be three years.

**Questions**

1. Briefly outline the effect of the China telecommunications industry restructuring announced in May 2008. In particular, explain how this restructuring will condense six companies into three, and list the business segments that will end up in each of the remaining three.
2. How will this restructuring into three mega-companies foster “healthy market competition and prevent a monopoly by any”?
3. For each of the four Chinese telecommunications companies with publicly available data, compute price-to-sales, price-to-EBITDA, and price-to-earnings ratios as of December 31, 2007. Also compute the market capitalization per subscriber. Comment.
4. Discuss why fixed-line subscribers and profits have different valuation multiples than do mobile phone subscribers and profits.
5. Evaluate the 165 billion yuan price tag for the acquisition of China Netcom by China Unicom. Do you think the price is too high or too low? Defend your answer.
6. Evaluate the 110 billion yuan price tag for the purchase of China Unicom’s CDMA network and operations by China Telecom. Do you think China Telecom is paying too much or too little? Defend your answer.
7. What evidence would a company use to generate the type of uncollectible accounts percentages given in the case? Given those percentages, what is the fair value of China Netcom’s accounts receivable? Ignore the time value of money.
8. Using the lease payment data in the case material, estimate the fair value of each of China Netcom’s three fixed asset categories. For simplicity, assume that the appropriate discount rate to use in computing the fair value of the fixed assets is 10% for each of the asset categories.
9. Estimate the fair value of China Netcom’s operating licenses.
10. Estimate the fair value of China Netcom’s fixed-line customer relationships.
11. Compute the amount of goodwill that China Unicom should recognize when it records the acquisition of China Netcom.

THE REVENUE/RECEIVABLES/  
CASH CYCLE

**A.** P. Giannini was born in 1870 in San Jose, California. When Giannini was seven, his father was killed. His mother remarried, and the family moved to San Francisco where Giannini's stepfather started a fruit wholesaling business. Giannini worked full-time in the business and by age 19 was made a junior partner in what was by then the most successful fruit wholesaling firm on the West Coast. He invested his profits in San Francisco real estate and by age 31 was financially secure enough to retire.

Giannini's retirement was an active one. He continued to manage his real estate portfolio, and he was a member of the board of directors of **Columbus Savings & Loan Association**, which was San Francisco's first Italian-owned bank. In spite of its immigrant roots, Columbus Savings followed the practice of the other area banks, lending only a portion of the deposits it took in to a few large local businesses and sending the rest to the money center banks in New York and Chicago. Giannini was disturbed to see that the farmers, merchants, and workers he was accustomed to dealing with were not able to get loans. When he was unable to get Columbus to change the policy, he quit the board and vowed to start his own bank. On October 17, 1904, A. P. Giannini, a man with no prior experience as a banker, embarked on a second career by opening the Bank of Italy in a converted saloon in San Francisco.

By April 1906, Giannini's bank was still an obscure little bank in the Italian section of town. On the morning of April 18, 1906, San Francisco was rocked by the worst earthquake in its history. About one-third of the town was destroyed, and 500 people were killed. In the quake's aftermath, many local business and civic leaders advocated a slow rebuilding, with a moratorium on all building loans for six months. Giannini disagreed strongly: "Gentlemen, you are making a vital mistake. The time for doing business is right now. Tomorrow morning I am putting a desk on Washington Street wharf with a Bank of Italy sign over it. Any man who wants to rebuild San Francisco can come there and get as much cash as he needs to do it."

Giannini's little bank would eventually grow to become one of the largest banks in the world—**Bank of America**. As of December 31, 2007, Bank of America reported total assets exceeding \$1.7 trillion, making it the second largest commercial bank in the United States in terms of assets (behind **Citigroup**). Bank of America's largest asset is its loan portfolio, which totals over \$876 billion; Bank of America's loan portfolio alone is almost four times as large as **ExxonMobil**'s entire asset base (at \$242 billion). As you can imagine, with a loan portfolio of this size, Bank of America is continually dealing with customers who don't pay. In 2007, Bank of America recognized an expense of over \$8.3 billion for loans that it does not expect its customers to repay.

## LEARNING OBJECTIVES

- 1 Explain the normal operating cycle of a business.
- 2 Prepare journal entries to record sales revenue, including the accounting for bad debts and warranties for service or replacement.
- 3 Analyze accounts receivable to measure how efficiently a firm is using this operating asset.
- 4 Discuss the composition, management, and control of cash, including the use of a bank reconciliation.
- 5 Recognize appropriate disclosures for presenting sales and receivables in the financial statements.

## EXPANDED MATERIAL

- 6 Explain how receivables may be used as a source of cash through secured borrowing or sale.
- 7 Describe proper accounting and valuation of notes receivable.
- 8 Understand the impact of uncollectible accounts on the statement of cash flows.

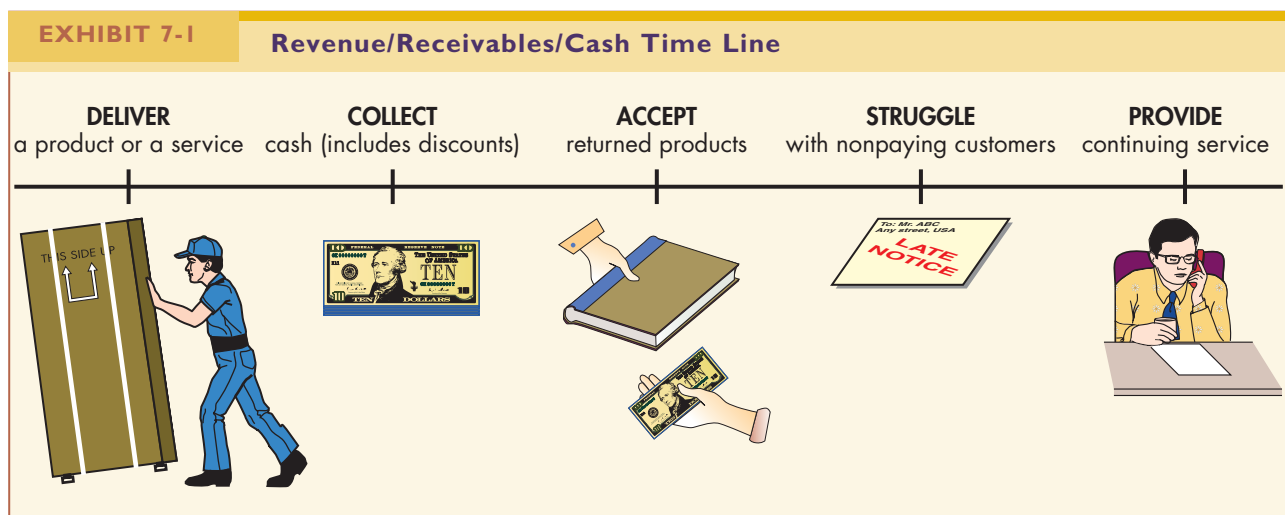

## QUESTIONS

1. *What do you think is a bank's largest revenue category? Its largest expense category?*
2. *Loans made by banks can be lumped into two general categories: consumer loans and commercial, or business, loans. Bank of America had total loans outstanding of \$876 billion as of the end of 2007. Do you think most of these loans were to individuals (consumer loans) or to businesses (commercial loans)?*
3. *Bank of America reports a "net charge-off ratio" for each major loan category. This ratio is computed as the amount of loans in a category that were written off during the year, divided by the average daily loan balance in that category during the year. The four largest categories of consumer loans for Bank of America in 2007 were residential mortgages, home equity loans, direct/indirect consumer loans, and domestic credit cards. Which one of these four loan categories do you think had the lowest net charge-off ratio? The highest net charge-off ratio?*

**Answers to these questions can be found on page 356.**

**O**ur discussion of the income statement in Chapter 4 focused our attention on the importance of net income in the decisions made by investors and creditors. In this and the subsequent chapter, we focus on the event that begins the income-producing process—the sale. Because the financial statements are interrelated, a study of the sale contained in the income statement is also a study of the resulting accounts receivable and/or cash contained in the balance sheet.

Exhibit 7-1 illustrates the time line associated with the revenue/receivables/cash cycle. The chapter will begin with a discussion of the events relating to this time line. We will first discuss the journal entries that result from the sale of goods or services. With this background, we then introduce additional complexities associated with sales—sales discounts, sales returns and allowances, bad debts, and warranties—and their effect on the financial statements. As illustrated by the large amount of bad debt expense recognized by Bank of America in 2007, proper recognition of revenues and the valuation of receivables can have a very significant impact on the financial statements.

Once we discuss the events relating to the revenue/receivables/cash cycle, we also present and discuss methods for monitoring accounts receivable, cash management and control, and the presentation of sales, receivables, and cash on the financial statements. In the Expanded Material section of this chapter, we discuss how receivables can be used as a source of cash. The chapter concludes with a discussion of the impact of bad debt expense on computing cash flows from operations. Chapter 8 contains a further discussion of the important issues surrounding revenue recognition.

## The Operating Cycle of a Business

**1** Explain the normal operating cycle of a business.

**WHY** Because the operating cycle is the lifeblood of every business, understanding a company’s operating cycle is the first step in appropriately accounting for the company’s operations.

**HOW** The sale of goods or services results in the receipt of cash and/or the recording of an account receivable. The account receivable is then collected, the resulting cash is reinvested in the business, and the operating cycle begins again.

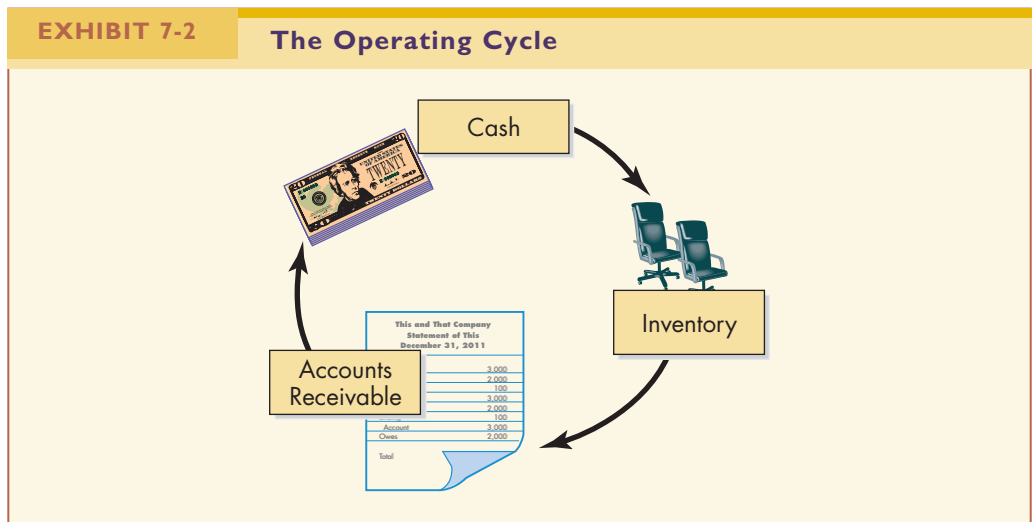

The normal operating cycle of a business involves purchasing inventory (using either cash or credit), which is then sold, often on account. Once the receivable is collected, the cycle begins again. This cycle, illustrated in Exhibit 7-2, continually repeats itself and is the lifeblood of any business enterprise. An understanding of this operating cycle (which involves the recognition of revenue, the recording of a receivable, and the subsequent collection of cash) is critical if you are to understand how businesses operate and the role of accounting information in that business. Thus, we begin our

detailed discussion of accounting with a look at the revenue/receivables/cash cycle.

The recognition of **revenue** is generally related to the recognition of **accounts receivable**. Because revenues are generally recorded when the earning process is complete and a valid promise of payment (or payment itself) is received, it follows that a receivable arising from the sale of goods is generally recognized when title to the goods passes to a bona fide buyer. The point at

fyi

When a company accepts another company’s credit card (such as **VISA, MasterCard, and American Express**) as payment, the credit card company charges a service fee. This fee is recognized as an expense by the seller.

which title passes may vary with the terms of the sale; therefore, it is normal practice to recognize the receivable when goods are shipped to the customer. It is at this point in time that the revenue recognition criteria are normally satisfied. Revenue should not be recognized for goods shipped on approval when the shipper retains title until there is a formal acceptance, or for goods shipped on consignment when the shipper retains title until the goods are sold by the consignee. Receivables for services to customers are properly recognized when the services are performed. It is worth again mentioning that the complexities of revenue recognition (and there are many) are discussed in Chapter 8.

The entry for recognizing revenue and a receivable from the sale of goods or services is as follows:

Accounts Receivable .....	xx	
Sales .....		xx

When the amount is collected, Accounts Receivable is credited, and Cash is debited as follows:

Cash .....	xx	
Accounts Receivable .....		xx

For department stores and major oil and gas companies that have their own credit cards, a significant portion of revenues arises from sales using these credit cards. For example, in fiscal year 2007, **Neiman Marcus, Inc.**, one of the leading luxury retailers in the United States, generated approximately 55% of its \$4.4 billion in revenues from customers using the company's own proprietary credit cards. The company estimates it has close to 3 million customers who hold one of its credit cards. The recognition of such revenue and the resulting receivables is similar to that illustrated earlier.

## stop & think

Consider the question of why a company would sell on account in the first place. In other words, why not just have a policy of "all sales are for cash"? Which **ONE** of the following is the most reasonable explanation for why companies sell on account?

- Allowing customers to buy on credit attracts more customers.
- The creation of accounts receivable allows a company to more precisely manage its asset mix.
- An excess of cash sales can overwhelm a company's cash management system.
- State incorporation laws require businesses with more than \$100,000 in total assets to allow customers to buy on credit.

Before we move on and introduce some additional aspects of sales, let's take a moment and discuss the different types of receivables that are typical. In its broadest sense, the term *receivables* is applicable to all claims against others for money, goods, or services. For accounting purposes, however, the term is generally employed in a narrower sense to designate claims expected to be settled by the receipt of cash.

In classifying receivables, an important distinction is made between trade and nontrade receivables. **Trade receivables**, generally the most significant category of receivables, result from the normal operating activities of a business, that is, credit sales of goods or services to customers. Trade receivables may be evidenced by a formal written promise to pay and classified as **notes receivable**. In most cases, however, trade receivables are unsecured "open accounts," often referred to simply as *accounts receivable*.

Accounts receivable represent an extension of short-term credit to customers.

Payments are generally due within 30 to 90 days. The credit arrangements are typically informal agreements between seller and buyer supported by such business documents as invoices, sales orders, and delivery contracts. Normally, trade receivables do not involve interest, although an interest or service charge may be added if payments are not made within a specified period. Trade receivables are the most common type of receivable and are generally the most significant in total dollar amount.

Photodisc/Getty Images

Companies must pay a fee for accepting another company's credit card. What do you think this fee is for?

**Nontrade receivables** include all other types of receivables. They arise from a variety of transactions, such as (1) the sale of securities or property other than inventory; (2) deposits to guarantee contract performance or expense payment; (3) claims for rebates and tax refunds; and (4) dividends and interest receivable. Nontrade receivables should be summarized in appropriately titled accounts and reported separately in the financial statements. Another way of classifying receivables relates to the current or short-term versus noncurrent or long-term nature of receivables. As indicated in Chapter 3, the *current assets* classification, as broadly conceived, includes all receivables identified as collectible within one year or the normal operating cycle, whichever is longer. Thus, for classification purposes, all trade receivables are considered current receivables; each nontrade item requires separate analysis to determine whether it is reasonable to assume that it will be collected within one year. Noncurrent receivables are reported under the Investments or Other Noncurrent Assets caption or as a separate item with an appropriate description.

In summary, receivables are classified in various ways, for example, as accounts or notes receivable, as trade or nontrade receivables, and as current or noncurrent receivables. These categories are not mutually exclusive. For example, accounts receivable are trade receivables and are current; notes receivable may be trade receivables and therefore current in some circumstances, but they may be nontrade receivables, either current or noncurrent, in other situations. The classifications used most often in practice and throughout this book will be simply *accounts receivable*, *notes receivable*, and *other receivables*.

## Accounting for Sales Revenue

**2** Prepare journal entries to record sales revenue, including the accounting for bad debts and warranties for service or replacement.

**WHY** Once a sale is recorded, the matching principle requires that expenses associated with the sale, such as estimated bad debt and warranty expenses, be recorded in the period of the sale.

**HOW** Bad debts are estimated using one of two methods: percentage of sales or percentage of receivables. Each of these methods involves estimating the likelihood that some receivables will not be collected. The warranty obligation is quantified by estimating, based on past experience, the probable amount of future warranty costs; this amount is recognized as an expense in the period of the associated sale.

The amount of sales or revenues is always the largest item on the income statement (if it's not, the company has bigger problems to worry about than how to account for transactions), and accounts receivable is typically one of the largest current assets on a company's balance sheet. The large magnitude of these two account balances should not, however, cause us to overlook some additional aspects of sales transactions. Although these items are significantly smaller when compared to sales and receivables, a knowledge of them is critical in properly accounting for the transactions of a company. The items we will examine in this section include the following:

- *Discounts*—Discounts are offered at the time of the sale or at the time of payment.
- *Sale Returns and Allowances*—Returns and allowances occur subsequent to the sale and can occur before or after payment has been made.

- *Accounting for Bad Debts*—Once a credit sale is made, the issue of collection remains. Bad debts must be estimated in any period in which credit sales are made or accounts receivable are outstanding.
- *Warranties for Service or Replacement*—Long after a sale occurs and collection is made, a warranty period associated with that sale may still be in place.

## Discounts

Many companies bill their customers at a gross sales price less an amount designated as a **trade discount**. The discount may vary by customer, depending on the volume of business or size of order from the customer. In effect, the trade discount reduces the *list* sales price to the *net* sales price actually charged the customer. This net price is the amount at which the receivable and corresponding revenue should be recorded; the list price is merely the starting point in the price negotiation between buyer and seller.

Another type of discount is a **cash (sales) discount** offered to customers by some companies to encourage prompt payment of bills. Cash discounts may be taken by the customer only if payment is made within a specified period of time, generally 30 days or less. Receivables are generally recorded at their gross amounts, without regard to any cash discount offered. If payment is received within the discount period, Sales Discounts (a contra account to Sales) is debited for the difference between the recorded amount of the receivable and the total cash collected. This method (called the *gross method*), which is simple and widely used, is illustrated as follows with credit terms of 2/10, n/30 (2% discount if paid within 10 days, net amount due in 30 days).

Cash (Sales) Discounts—Gross Method		
Sales of \$1,000; terms 2/10, n/30:		
Accounts Receivable .....	1,000	
Sales .....		1,000
Partial payment of \$300, received within discount period:		
Cash .....	294	
Sales Discounts .....	6	
Accounts Receivable .....		300
Payment of the remaining \$700, received after discount period:		
Cash .....	700	
Accounts Receivable .....		700

The net method of accounting for sales discounts records the sale and the receivable net of the discount. Using the preceding example, the receivable and the sale would be recorded at \$980 ( $\$1,000 \times 0.98$ ). If payment is not made within the discount period, the additional amount paid by the customer through failure to take the sales discount would be recorded in a revenue account. Illustrations of the journal entries using the net method follow.

Cash (Sales) Discounts—Net Method		
Sales of \$1,000; terms 2/10, n/30:		
Accounts Receivable .....	980	
Sales .....		980
Partial payment of \$294, received within discount period:		
Cash .....	294	
Accounts Receivable .....		294
Payment of the remaining \$700, received after discount period:		
Cash .....	700	
Sales Discounts Not Taken .....		14
Accounts Receivable ( $\$700 \times 0.98$ ) .....		686

fyi

Contra accounts are used because they often yield valuable information. For example, suppose Firm A and Firm B both have net sales of \$10,000. Firm A has gross sales of \$1,000,000 and sales returns of \$990,000. Firm B has gross sales of \$10,000 and no sales returns. Might this information affect decisions made about these two firms?

## Sales Returns and Allowances

In the normal course of business, some goods will be returned by customers and some allowance will have to be made for factors such as goods damaged during shipment, spoiled or otherwise defective goods, or shipment of an incorrect quantity or type of goods. When an allowance is necessary, net sales and accounts receivable are reduced. To illustrate, assume that red sweaters costing \$600 are sold to a customer for \$1,000. The customer calls and states that green sweaters were ordered and should have been shipped. Rather than return the sweaters, the customer

agrees to keep the sweaters in return for a reduction in the price—an allowance—of \$200. The entry to record this sales allowance is as follows:

Sales Returns and Allowances .....	200	
Accounts Receivable .....		200

Although the debit could be made directly to Sales, reducing the Sales amount, the use of a separate contra account preserves the information about the original amount of Sales. Knowledge of the amount of Sales Returns and Allowances relative to total Sales may be useful to management.

Suppose that instead of an allowance, the customer elects to return the sweaters. The return is recorded as follows:

Sales Returns and Allowances .....	1,000	
Accounts Receivable .....		1,000
Inventory .....	600	
Cost of Goods Sold .....		600

As will be discussed in Chapter 9, management must ensure that inventory is not recorded in the books at more than its current value. This lower-of-cost-or-market test is especially important for damaged inventory, as is often the case with returned inventory.

## The Valuation of Accounts Receivable—Accounting for Bad Debts

Theoretically, all receivables should be valued at an amount representing the **present value** of the expected future cash receipts. Because accounts receivable are short term, usually being collected within 30 to 90 days, the amount of interest is small relative to the amount of the receivable. Consequently, the accounting profession has chosen to ignore the interest element for these trade receivables.<sup>1</sup>

Instead of valuing accounts receivable at a discounted present value, they are reported at their **net realizable value**, that is, their expected cash value. This means that accounts receivable should be recorded net of estimated uncollectible items. The objective is to report the receivables at the amount actually expected to be collected in cash.

**Uncollectible Accounts Receivable** Invariably, some receivables will prove uncollectible. The simplest method for recognizing the loss from these uncollectible accounts is to debit an expense account, such as Doubtful Accounts Expense, Bad Debt Expense, or Uncollectible Accounts Expense, and credit Accounts Receivable at the time it is determined that an account cannot be collected. This approach is called the **direct write-off method** and is often used by small businesses because of its simplicity. Although the recognition of uncollectibles in the period of their discovery is simple and convenient, this method does not provide for the matching of expenses

<sup>1</sup> See *Opinions of the Accounting Principles Board No. 21*, “Interest on Receivables and Payables” (New York: American Institute of Certified Public Accountants, 1971), par. 3(a).

fyi

The direct write-off method of accounting for bad debts is the method required by the IRS in most cases when computing taxable income.

with current revenues and does not report receivables at their net realizable value. Therefore, use of the direct write-off method is not allowed under generally accepted accounting principles. The following sections describe the procedures used in estimating uncollectibles with the **allowance method**, which is required by GAAP.

**Establishing an allowance for bad debts.** When using the allowance method, the amount of receivables estimated to be uncollectible is recorded by a debit to Bad Debt Expense and a credit to Allowance for Bad Debts. The terminology for these account titles may vary somewhat. For example, other possibilities for Allowance for Bad Debts include Allowance for Uncollectible Accounts and Allowance for Doubtful Accounts. The expense account title usually is consistent with that of the allowance account.

The allowance for bad debts account is a contra asset account that is offset against Accounts Receivable, resulting in the Accounts Receivable balance being reported at its net realizable value. The credit side of the allowance account represents estimated future uncollectible accounts. The debit side of the account reflects verified uncollectible accounts. If a large credit balance builds up in the account over time, this indicates that estimated bad debts are running higher than actual bad debts and that the estimation technique being used may need to be revised.

A typical entry to recognize bad debt expense, normally made as an end-of-the-period adjustment, is as follows:

Bad Debt Expense .....	xx	
Allowance for Bad Debts .....		xx
To record estimated uncollectible accounts receivable for the period.		

The expense would be reported as a selling or general and administrative expense, and the allowance account would be shown as a deduction from Accounts Receivable, thereby reporting the net realizable amount of the receivables.

**Writing off an uncollectible account under the allowance method.** When positive evidence is available concerning the partial or complete worthlessness of an account, the account is written off by a debit to the allowance account, which was previously established, and a credit to Accounts Receivable. Positive evidence of a reduction in value is found in the bankruptcy, death, or disappearance of a debtor, failure to enforce collection legally, or barring of collection by the statute of limitations. Write-offs should be supported by evidence of the uncollectibility of the accounts from appropriate parties, such as courts, lawyers, or credit agencies. The entry to write off an uncollectible receivable is as follows:

Allowance for Bad Debts .....	xx	
Accounts Receivable .....		xx
To record the write-off of an uncollectible account.		

Note that no entry is made to Bad Debt Expense at this time. That entry was made when the allowance was established. The expense was thus estimated and recorded in the period when the sale was made, not necessarily in the period when a particular account was verified as being uncollectible.

Occasionally, an account that has been written off as uncollectible is unexpectedly collected. Entries are required to reverse the write-off entry and to record the collection. Assuming an account of \$1,500 was written off as uncollectible but was subsequently collected, the following entries would be made at the time of collection.

Accounts Receivable .....	1,500	
Allowance for Bad Debts .....		1,500
To reverse the entry made to write off the account.		
Cash .....	1,500	
Accounts Receivable .....		1,500
To record collection of the account.		

## EXHIBIT 7-3

## Bank of America's Note Disclosure Relating to Recoveries

(In millions)	2007	2006	2005
Balance on January 1	\$ 9,016	\$ 8,045	\$ 8,626
Adjustment due to the adoption of SFAS 159	(32)	—	—
LaSalle balance, October 1, 2007	725	—	—
U.S. Trust Corporation balance, July 1, 2007	25	—	—
MBNA balance, January 1, 2006	—	577	—
Loans and leases charged off	(7,730)	(5,881)	(5,794)
Recoveries of loans and leases previously charged off	1,250	1,342	1,232
Net charge-offs	(6,480)	(4,539)	(4,562)
Provision for loan and lease losses	8,357	5,001	4,021
Other, net	(23)	(68)	(40)
Balance on December 31	<u>\$11,588</u>	<u>\$ 9,016</u>	<u>\$ 8,045</u>

For many companies, the issue of collection of accounts previously written off is not significant. For companies in some industries, however, it is a multimillion-dollar issue. For example, in 2007, Bank of America recovered \$1.25 billion of loans that had been previously written, or charged, off. Exhibit 7-3 provides the note from Bank of America's 2007 10-K filing, which illustrates that over the preceding three years, Bank of America recovered over \$3.8 billion in accounts previously charged off.

To summarize using a T-account, the allowance account typically increases (with a credit) as estimates of bad debts are made and recognized as an expense, and decreases (with a debit) as actual bad debts are identified and written off. In addition, the allowance account will increase if accounts that had previously been written off are subsequently recovered; the reason for this increase is that, if the original bad debt estimate was correct, the recovery of one would-be bad debt means that there must still be another bad debt out there somewhere.

## Allowance for Bad Debts

Actual bad debts written off	Estimated bad debt expense
	Recovery of previously written off bad debts

**Estimating uncollectibles based on percentage of sales.** The estimate for uncollectible accounts may be based on sales for the period or the amount of receivables outstanding at the end of the period. When a sales basis is used, the amount of uncollectible accounts in past years relative to total sales provides a percentage of estimated uncollectibles. This percentage may be modified by expectations based on current experience. Because doubtful accounts occur only with credit sales, it is logical to develop a percentage of doubtful accounts based on credit sales of past periods. This percentage is then applied to credit sales of the current period.

However, because extra work may be required in maintaining separate records of cash and credit sales or in analyzing sales data, the percentage is frequently developed in terms of total sales. Unless there is considerable periodic fluctuation in the proportion of cash and credit sales, the percentage-of-total-sales method will normally give satisfactory results.

To illustrate, if 2% of sales is considered doubtful in terms of collection and sales for the period are \$100,000, the

fyi

For a firm in a steady state, that is, one that has been in business for a number of years and has a stable level of accounts receivable, bad debt expense estimated on current year's credit sales will be approximately the same as actual write-offs.

charge for Bad Debt Expense would be 2% of the current period's sales, or \$2,000. Note that any existing balance in the allowance account resulting from past period charges to Bad Debt Expense is ignored. The entry for this period is simply as follows:

Bad Debt Expense .....	2,000	
Allowance for Bad Debts .....		2,000
To record estimated bad debt expense for the period		
(\$100,000 × 0.02 = \$2,000).		

The percentage-of-sales method for estimating bad debts is widely used in practice because it is simple to apply. Companies often use this method to estimate bad debts periodically during the year and then adjust the allowance account at year-end in relationship to the Accounts Receivable balance, as explained in the next section.

**Estimating uncollectibles based on Accounts Receivable balance.** Instead of using a percentage of sales to estimate bad debts, companies may base their estimates on a percentage of total accounts receivable outstanding. This method emphasizes the relationship between the Accounts Receivable and the Allowance for Bad Debts balances. For example, if total Accounts Receivable are \$50,000 and it is estimated that 3% of those accounts will be uncollectible, the allowance account should have a balance of \$1,500 ( $\$50,000 \times 0.03$ ). If the allowance account already has a \$600 credit balance from prior periods, the current-period adjusting entry is as follows:

Bad Debt Expense .....	900	
Allowance for Bad Debts .....		900
To record estimated bad debt expense for the period		
(\$1,500 required balance – \$600 current balance = \$900 adjustment).		

After posting this entry, the balance in the allowance account would be \$1,500, or 3% of total Accounts Receivable. Note that this method adjusts the existing balance to the desired balance based on a percentage of total receivables outstanding. If, in the example, the allowance account had a \$200 debit balance caused by writing off more bad debts than had been estimated previously, the adjusting entry would be for \$1,700 in order to bring the allowance account to the desired credit balance of \$1,500, or 3% of total receivables.

The most commonly used method for establishing an allowance based on outstanding receivables involves **aging receivables**. Individual accounts are analyzed to determine those not yet due and those past due. Past-due accounts are classified in terms of the length of the period past due. An analysis sheet used in aging accounts receivable is shown below.

Overdue balances can be evaluated individually to estimate the collectibility of each item as a basis for developing an overall estimate. An alternative procedure is to develop a series of estimated loss percentages and apply these to the different receivables classifications. ICO Products' calculation of the allowance on the latter basis is illustrated below.

ICO Products, Inc. Analysis of Receivables December 31, 2011								
Customer	Amount	Not Yet Due	Not More Than 30 Days Past Due	31–60 Days Past Due	61–90 Days Past Due	91–180 Days Past Due	181–365 Days Past Due	More Than One Year Past Due
A. B. Andrews	\$ 450			\$ 450				
B. T. Brooks	300				\$100	\$200		
B. Bryant	200		\$ 200					
L. B. Devine	2,100	\$ 2,100						
K. Martinez	200						\$200	
~~~~~								
M. A. Young	<u>1,400</u>	<u>1,000</u>		<u>100</u>	<u>300</u>			
Total	<u>\$47,550</u>	<u>\$40,000</u>	<u>\$3,000</u>	<u>\$1,200</u>	<u>\$650</u>	<u>\$500</u>	<u>\$800</u>	<u>\$1,400</u>

**ICO Products, Inc.**  
**Estimated Amount of Uncollectible Accounts**  
**December 31, 2011**

Classification	Balances	Uncollectible Accounts Experience Percentage	Accounts Estimated Amount of Uncollectible
Not yet due	\$40,000	2%	\$ 800
Not more than 30 days past due	3,000	5	150
31–60 days past due	1,200	10	120
61–90 days past due	650	20	130
91–180 days past due	500	30	150
181–365 days past due	800	50	400
More than one year past due	1,400	80	1,120
	<u>\$47,550</u>		<u>\$2,870</u>

Just as with the previous method based on a percentage of total receivables outstanding, Bad Debt Expense is debited and Allowance for Bad Debts is credited for an amount bringing the allowance account to the required balance. Assuming uncollectibles estimated at \$2,870 as shown in the ICO Products calculation and a credit balance of \$620 in the allowance account before adjustment, the following entry is made:

Bad Debt Expense .....	2,250	
Allowance for Bad Debts .....		2,250
To record bad debt expense for the period		
(\$2,870 required balance – \$620 current balance = \$2,250 adjustment).		

The aging method provides the most satisfactory approach to the valuation of receivables at their net realizable amounts. Furthermore, data developed through aging receivables may be quite useful to management for purposes of credit analysis and control.

**Corrections to allowance for bad debts.** As previously indicated, the Allowance for Bad Debts balance is established and maintained by means of adjusting entries at the close of each accounting period. If the allowance provisions are too large, the allowance account balance will be unnecessarily inflated and earnings and accounts receivable will be understated; if the allowance provisions are too small, the allowance account balance will be inadequate, and both accounts receivable and earnings will be overstated.

Care must be taken to see that the allowance balance follows the credit experience of the particular business. The process of aging receivables at different intervals may be employed as a means of checking the allowance balance to be certain that it is being maintained satisfactorily. Such periodic reviews may indicate a need for a correction in the allowance as well as a change in the rate or in the method employed.

When the uncollectible accounts experience approximates the estimated losses, the allowance procedure may be considered satisfactory, and no adjustment is required. When it appears that there has been a failure to estimate uncollectible accounts accurately, resulting in an allowance balance that is clearly inadequate or excessive, an adjustment is in order. The effect of this change in accounting estimate would be reported in the current and future periods as an ordinary item on the income statement, usually as an addition to or subtraction from Bad Debt Expense.

## caution

The most common error when computing bad debt expense is to confuse the two methods—percentage of sales and percentage of receivables. Remember that when you are using the percentage-of-sales method, bad debt expense is computed and the balance in the allowance account is then determined. When you are using the percentage-of-receivables method, the balance in the allowance account is computed, and then the amount of bad debt expense for the period is determined.

The actual write-off of receivables as uncollectible by debits to the allowance account and credits to the receivables account may temporarily result in a debit balance in the allowance account. A debit balance arising in this manner does not mean necessarily that the allowance is inadequate; debits to the allowance account simply predate the end-of-period adjustment for uncollectible accounts. Once an adjustment is made, the allowance account will have a credit balance. Think about what it would mean if, after adjustment, the allowance account still had a debit balance—when combined with the balance in Accounts Receivable, it would mean that you expect to receive more than you are owed, which is a very low probability event.

## Warranties for Service or Replacement

As you have just read, bad debts must be estimated so that proper expenses can be matched with revenues in the period in which the revenues were earned. The same is true in the case of **warranties**. Many companies agree to provide free service on units failing to perform satisfactorily or to replace defective goods. When these agreements, or warranties, involve only minor costs, such costs may be recognized in the periods incurred.

When these agreements involve significant future costs and when experience indicates that a definite future obligation exists, estimates of such costs should be made and matched against current revenues.

Such estimates are usually recorded by a debit to an expense account and a credit to a liability account. Subsequent costs of fulfilling warranties are debited to the liability account and credited to an appropriate account, for example, Cash or Inventory. As was the case with the allowance for bad debts account, the debit side of the estimated liability under warranties account tracks actual warranty costs while the credit side of the account represents estimated costs.

**fyi**

Many companies that sell items such as electronics or appliances make large amounts of profits by selling *maintenance agreements*. Because of the high profit margins associated with these agreements, salespersons are often given big incentives to sell them. Some consumer magazines have warned readers that these maintenance agreements are not cost effective and should not be purchased.

To illustrate accounting for warranties, consider the following example. MJW Video & Sound sells compact stereo systems with a 2-year warranty. Past experience indicates that 10% of all systems sold will need repairs in the first year and 20% will need repairs in the second year. The average repair cost is \$50 per system. The number of systems sold in 2010 and 2011 was 5,000 and 6,000, respectively. Actual repair costs were \$12,500 in 2010 and \$55,000 in 2011; it is assumed that all repair costs involved cash expenditures.

2010	Warranty Expense .....	75,000	
	Estimated Liability under Warranties .....		75,000
	To record estimated warranty expense based on systems sold (5,000 × 0.30 × \$50 = \$75,000).		
	Estimated Liability under Warranties .....	12,500	
	Cash .....		12,500
	To record cost of actual repairs in 2010.		
2011	Warranty Expense .....	90,000	
	Estimated Liability under Warranties .....		90,000
	To record estimated warranty expense based on systems sold (6,000 × 0.30 × \$50 = \$90,000).		
	Estimated Liability under Warranties .....	55,000	
	Cash .....		55,000
	To record cost of actual repairs in 2011.		

Periodically, the warranty liability account should be analyzed to see whether the actual repairs approximate the estimate. Adjustment to the percentages used in estimating future warranty obligations will be required if experience differs materially from the estimates. These adjustments are changes in estimates and are reported prospectively,

that is, in current and future periods. If sales and repairs in the preceding example are assumed to occur evenly through two years, analysis of the liability account at the end of 2011 shows that the ending balance of \$97,500 (\$75,000 + \$90,000 - \$12,500 - \$55,000) is reasonably close to the predicted amount of \$100,000 based upon the 10% and 20% estimates. (Note: Assuming that sales occur evenly throughout the year is mathematically the same as assuming that all of the sales occur halfway through the year.)

Computation:

2010 sales still under warranty for 6 months:	
\$50 × [5,000 units × (6/12 × 0.20)] .....	\$ 25,000
2011 sales still under warranty for 18 months:	
\$50 × [6,000 units × (6/12 × 0.10) + 6,000 units × (12/12 × 0.20)] .....	75,000
Total .....	<u>\$100,000</u>

On occasion, an estimate may differ significantly from actual experience. Misleading financial statements may result if an adjustment is not made. In those instances, an adjustment is made to the liability account in the current period. Continuing the previous example, assume that warranty costs incurred in 2011 were only \$35,000. Then the ending balance of \$117,500 would be much higher than the \$100,000 estimate. If the \$17,500 difference was considered to be material, an adjustment to warranty expense would be made in 2011 as follows:

Estimated Liability under Warranties .....	17,500	
Warranty Expense .....		17,500
To record adjustment of estimate for warranty repairs.		

## Monitoring Accounts Receivable

**3** Analyze accounts receivable to measure how efficiently a firm is using this operating asset.

- WHY** The effective management of accounts receivable is critical to the operation of any business that sells on credit.
- HOW** The most commonly used tool to monitor receivables is the average collection period, which reflects the average number of days that lapse between the time a sale is made and the time cash is collected.

Managers as well as external users of financial information need to measure how efficiently a firm is utilizing its operating assets, particularly significant working capital elements such as receivables, inventories, and accounts payable. The most common relationship used to monitor receivables is the average collection period.

### Average Collection Period

Average receivables are sometimes expressed in terms of the **average collection period**, which reflects the average number of days that elapse between the time that a sale is made and the time that cash is collected. Average receivables outstanding divided by average daily sales gives the average collection period. This measure is computed for the WS Corporation as illustrated here.

	2011	2010
Average receivables .....	\$397,500	\$354,250
Net sales .....	\$1,425,000	\$1,650,000
Average daily sales (net sales/365) .....	\$3,904	\$4,521
Average collection period (average receivables/average daily sales) .....	102 days	78 days

This same measurement can be obtained by dividing the number of days in the year by the receivables turnover. **Accounts receivable turnover** is determined by dividing net sales by the average trade accounts receivable outstanding during the

year. In developing an average receivables amount, the average of the beginning-of-year and end-of-year balances is normally used; however, a better measure of the average balance can be obtained using quarterly or monthly balances.

Accounts receivable turnover rates for WS Corporation for 2011 and 2010 are computed as follows:

	2011	2010
Net sales .....	\$1,425,000	\$1,650,000
Net receivables:		
Beginning of year .....	\$375,000	\$333,500
End of year .....	\$420,000	\$375,000
Average receivables [(beginning balance + ending balance)/2] .....	\$397,500	\$354,250
Receivables turnover for year .....	3.6 times	4.7 times

The value computed for receivables turnover represents the average number of revenue/receivables/cash cycles completed by the firm during the year.

In some cases, instead of computing the average collection period for the entire year, it may be more useful to report the average collection period for the receivables existing at the end of the period. This information would be significant in evaluating current position and, particularly, the receivable position as of a given date. This information for WS Corporation is computed as follows:

	2011	2010
Receivables at end of year .....	\$420,000	\$375,000
Average daily sales .....	\$3,904	\$4,521
Average collection period (end of year) .....	108 days	83 days

What constitutes a reasonable average collection period varies with individual businesses. For example, if merchandise is sold on terms of net 45 days, a 40-day average collection period would be reasonable, but if terms are net 30 days, a receivable balance equal to 40 days' sales would indicate slow collections. The average collection period for a number of companies is given in Exhibit 7-4. Notice the difference between the 73-day average collection period of **Caterpillar**, a company that makes its money selling and financing heavy equipment, and the 11-day average collection period of **Home Depot**, which emphasizes the sales of inventory and devotes relatively little effort to credit issues. Also, note the relatively short 6-day average collection period for **Sears**. Before Sears sold its in-house credit card business to **Citicorp** in 2003, Sears routinely had an average collection period in excess of 200 days, driven by the long time period that Sears credit card customers took to pay for their credit purchases.

Sales activity just before the close of a period should be considered when interpreting accounts receivable measurements. If sales are unusually light or heavy just

**EXHIBIT 7-4**      **Average Collection Period for 2007**

Company	Average Collection Period
Caterpillar	73.31
ExxonMobil	30.57
Home Depot	10.57
McDonald's (franchise fees)	54.99
Microsoft	73.73
Sears	5.74

before the end of the fiscal period, this affects total receivables as well as the related measurements. When such unevenness prevails, it may be better to analyze accounts receivable according to their due dates, as was illustrated earlier in the chapter.

The problem of minimizing accounts receivable without losing desirable business is important. Receivables often do not earn interest revenue, and the cost of carrying them must be covered by the profit margin. The longer the accounts are carried without interest being earned, the smaller will be the percentage return realized on invested capital.

To attract business, credit frequently is granted for relatively long periods. The cost of granting long-term credit should be considered. Assume that a business has average daily sales of \$5,000 and average accounts receivable of \$250,000, which represents 50 days' sales. If collections and the credit period can be improved so that accounts receivable represent only 30 days' sales, accounts receivable will be reduced to \$150,000. Assuming a total cost of 10% to carry and service the accounts, the \$100,000 decrease would yield annual savings of \$10,000.

## Cash Management and Control

**4** Discuss the composition, management, and control of cash, including the use of a bank reconciliation.

**WHY** Because cash is the most liquid of assets, safeguards must be in place to ensure the proper handling of and accounting for it.

**HOW** A common cash control is the use of a bank reconciliation. A bank reconciliation requires accountants to reconcile the bank statement's cash balance with the balance recorded on the company's books. Any differences are identified, and appropriate adjusting entries and corrections are made.

To this point, our focus has been primarily on revenues and receivables. However, revenues and receivables have value because they will eventually be converted to cash. **Cash** is important because it provides the basis for measurement and accounting for all other items. Another reason that cash is so important is that individuals, businesses, and even governments must maintain an adequate liquidity position; that is, they must have a sufficient amount of cash on hand to pay obligations as they come due if they are to remain viable operating entities. In the early stages of its conceptual framework project, the FASB identified the need to report information on cash and liquidity as one of the key objectives of financial reporting. This emphasis eventually led to the requirement of providing a statement of cash flows as one of the primary financial statements.

In striking contrast to the importance of cash as a key element in the liquidity position of an entity is its unproductive nature. Because cash is the measure of value, it cannot expand or grow unless it is converted into other properties. Cash kept under a mattress, for example, will not grow or appreciate, whereas land may increase in value if held. Excessive balances of cash on hand are often referred to as *idle cash*. Efficient cash management requires available cash to be continuously working in one of several ways as part of the operating cycle or as a short-term or long-term investment. The management of cash is therefore a critical business function.

Because cash is the most liquid of all assets, it is also the one that needs to be safeguarded the most. Thus, we will spend some time discussing cash and its equivalents as well the most common safeguard—a bank reconciliation—often employed to ensure the proper accounting for cash.

### Composition of Cash

Cash is the most liquid of current assets. To be reported as “cash,” an item must be readily available and not restricted for use in the payment of current obligations. A general guideline is whether an item is acceptable for deposit at face value by a bank or other financial institution.

Items that are classified as cash include coin and currency on hand and unrestricted funds available on deposit in a bank, which are often called **demand deposits**, because they can be withdrawn upon demand. Demand deposits include amounts in checking, savings, and money market deposit accounts. Petty cash funds or change funds and negotiable instruments, such as personal checks and cashiers' checks, are also items commonly reported as cash. The total of these items plus undeposited coin and currency is sometimes called *cash on hand*. In addition, many companies report investments in very short-term, interest-earning securities (such as 3-month U.S. Treasury securities) as **cash equivalents** in the balance sheet. Deposits that are not immediately available for withdrawal or have other restrictions are sometimes referred to as **time deposits**. These deposits are sometimes separately classified as *temporary investments*. Examples of time deposits include certificates of deposit (CDs) and money market savings certificates. CDs, for example, generally may be withdrawn without penalty only at specified maturity dates.

Deposits in foreign banks that are subject to immediate and unrestricted withdrawal generally qualify as cash and are reported at their U.S. dollar equivalents as of the date of the balance sheet. However, cash in foreign banks that is restricted as to use or withdrawal should be designated as receivables of a current or noncurrent nature and reported subject to appropriate allowances for estimated uncollectibles.

Some items do not meet the "acceptance at face value on deposit" test and should not be reported as cash. Examples include postage stamps (which are office supplies) and postdated checks, IOUs, and not-sufficient-funds (NSF) checks (all of which are, in effect, receivables).

Cash balances specifically designated by management for special purposes should be reported separately. An example would be cash set aside specifically for the purpose of retiring a bond issue in the future; this cash is called a *sinking fund*. Restricted cash should be reported as a current item only if it is to be applied to some current purpose or obligation. Classification of the cash balance as current or noncurrent should parallel the classification applied to the liability.

A credit balance in the cash account resulting from the issuance of checks in excess of the amount on deposit is known as a **cash overdraft** and should be reported as a current liability.

In summary, cash is a current asset comprising coin, currency, and other items that (1) serve as a medium of exchange and (2) provide the basis for measurement in accounting. Most negotiable instruments (e.g., checks, bank drafts, and money orders) qualify as cash because they can be converted to currency on demand or are acceptable for deposit at face value by a bank. For many companies, the bulk of "cash" is held in the form of short-term, interest-earning securities. Components of cash restricted as to use or withdrawal should be disclosed or reported separately and classified as an investment, a receivable, or other asset. Exhibit 7-5 summarizes the

**EXHIBIT 7-5****Classification of Cash and Noncash Items**

Item	Classification
Undeposited coin and currency	Cash
Unrestricted funds on deposit at bank (demand deposits)	Cash
Petty cash and change funds	Cash
Negotiable instruments, such as checks, bank drafts, and money orders	Cash
Company checks written but not yet mailed or delivered	Cash
Restricted deposits, such as CDs and money market savings certificates (time deposits)	Investment
Deposits in foreign banks:	
Unrestricted	Cash
Restricted	Receivables
Postage stamps	Office supplies
IOUs, postdated checks, and not-sufficient-funds (NSF) checks	Receivables
Cash restricted for special purposes	Restricted cash*
Cash overdraft	Current liability

\* Separately reported as current or noncurrent asset depending on the purpose for which it is restricted.

classification of various items that have been discussed. The objective of disclosure is to provide the user of financial statements with information to assist in evaluating the entity's ability to meet obligations (i.e., its liquidity and solvency) and in assessing the effectiveness of cash management.

## Compensating Balances

In connection with financing arrangements, it is common practice for a company to agree to maintain a minimum or average balance on deposit with a bank or other lending institution. These **compensating balances** are defined by the SEC as “that portion of any demand deposit (or any time deposit or certificate of deposit) maintained by a corporation . . . which constitutes support for existing borrowing arrangements of the corporation . . . with a lending institution. Such arrangements would include both outstanding borrowings and the assurance of future credit availability.”<sup>2</sup>

Compensating balances provide a source of funds to the lender as partial compensation for credit extended. In effect, such arrangements raise the interest rate of the borrower because a portion of the amount on deposit with the lending institution cannot be used. These balances present an accounting problem from the standpoint of disclosure. Readers of financial statements are likely to assume the entire cash balance is available to meet current obligations when, in fact, part of the balance is restricted.

The solution to this problem is to disclose the amount of compensating balances. The SEC recommends that any “legally restricted” deposits held as compensating balances be segregated and reported separately. If the balances are the result of short-term financing arrangements, they should be shown separately among the “cash items” in the Current Assets section; if the compensating balances are in connection with long-term agreements, they should be classified as noncurrent, either as investments or “other assets.” In many instances, deposits are not legally restricted, but compensating balance agreements still exist as business commitments in connection with lines of credit. In these situations, the amounts and nature of the arrangements should be disclosed in the notes to the financial statements, as illustrated in Exhibit 7-6 for **Taser International** in 2001. The company describes its primary products as follows: “Our weapons use compressed nitrogen to shoot two small, electrified probes up to a maximum distance of 21 feet. After firing, the probes discharged from our cartridges remain connected to the weapon by high-voltage insulated wires that transmit electrical pulses into the target.”

fyi

The effective interest rate on a loan can be thought of as  $(\text{interest} \div \text{“take home” amount of loan})$ . Because a compensating balance requirement reduces the amount of the loan that can be “taken home” while still requiring that interest be paid on the entire loan, it would increase the effective interest rate.

### EXHIBIT 7-6

#### Taser International—Disclosure of Compensating Balance

Cash and cash equivalents include funds on hand and short-term investments with original maturities of three months or less. At December 31, 2001, cash and cash equivalents included \$4.9 million deposited in highly liquid certificates of deposit and money market funds. These accounts earned interest at an average rate of 1.86% during 2001. Of the \$4.9 million, \$1.5 million of cash and cash equivalents are required to be maintained as a compensating balance under the Company's line of credit agreement.

<sup>2</sup> Securities and Exchange Commission, *Accounting Series Release No. 148*, “Disclosure of Compensating Balances and Short-Term Borrowing Arrangements” (Washington, DC: U.S. Government Printing Office, 1973). Currently listed in *SEC Regulation S-X*, Rule 5-02, Caption 1.

## Management and Control of Cash

As noted earlier, a business enterprise must maintain sufficient cash for current operations and for paying obligations as they come due. Any excess cash should be invested temporarily to earn an additional return for the shareholders. Effective cash management also requires controls to protect cash from loss by theft or fraud. Because cash is the most liquid asset, it is particularly susceptible to misappropriation unless properly safeguarded.

The system for controlling cash must be adapted to a particular business. It is not feasible to describe all features and techniques employed in businesses of various kinds and sizes. In general, however, systems of cash control deny access to the accounting records to those who handle cash. This reduces the possibility of improper entries to conceal the misuse of cash receipts and cash payments. The probability of misappropriation of cash is greatly reduced if two or more employees must conspire in an embezzlement. Furthermore, systems normally provide for separation of the receiving and paying functions. The basic characteristics of a system of cash control are as follows:

1. Specifically assigned responsibility for handling cash receipts
2. Separation of handling and recording cash receipts
3. Daily deposit of all cash received
4. Voucher system to control cash payments
5. Internal audits at irregular intervals
6. Double record of cash—bank and books, with reconciliations performed by someone outside the accounting function

These controls are more likely to be found in large companies with many employees. Small companies with few employees generally have difficulty in totally segregating accounting and cash-handling duties. Even small companies, however, should incorporate as many control features as possible.

To the extent that a company can incorporate effective internal controls, it can reduce significantly the chances of theft, loss, or inadvertent errors in accounting for and controlling cash. Even the most elaborate control system, however, cannot totally eliminate the possibilities of misappropriations or errors. The use of periodic bank reconciliations can help identify any cash shortages or errors that may have been made in accounting for cash. Another common cash control, a petty cash fund, is discussed in the Web Material associated with this chapter. The text support Web site is [www.cengage.com/accounting/stice](http://www.cengage.com/accounting/stice).

Employees who are responsible for handling cash in a company should not be involved in accounting activities involving the cash account.

## Bank Reconciliations

When daily receipts are deposited and payments are made by check, the bank's statement of its transactions with the depositor can be compared with the record of cash as reported on the depositor's books. A comparison of the bank balance with the balance reported on the books is usually made monthly by means of a summary known as a **bank reconciliation**. A bank reconciliation is prepared to disclose any errors or irregularities in either the records of the bank or those of the business unit. It is developed in a form that points out the reasons for discrepancies in the two balances. It should be prepared by an individual who neither handles nor records cash because if a person who was embezzling from the cash account also was in charge of the reconciliation, it would be too easy to cover his or her tracks.

When the bank statement and the depositor's records are compared, certain items may appear on one but not the

other, resulting in a difference in the two balances. Most of these differences result from temporary timing lags and are thus normal. Four common types of differences arise in the following situations:

1. A deposit made near the end of the month and recorded on the depositor's books is not received by the bank in time to be reflected on the bank statement. This amount, referred to as a **deposit in transit**, has to be added to the bank statement balance to make it agree with the balance on the depositor's books.
2. Checks written near the end of the month have reduced the depositor's cash balance but have not cleared the bank as of the bank statement date. These **outstanding checks** must be subtracted from the bank statement balance to make it agree with the depositor's records.
3. The bank sometimes charges a monthly fee for servicing an account. The bank automatically reduces the depositor's account balance for this **bank service charge** and notes the amount on the bank statement. The depositor must deduct this amount from the recorded cash balance to make it agree with the bank statement balance. The return of a customer's check for which insufficient funds are available, known as a **not-sufficient-funds (NSF) check**, is handled in a similar manner.
4. An amount owed to the depositor is paid directly to the bank by a third party and is added to the depositor's account. Upon receipt of the bank statement (assuming prior notification has not been received from the bank), this amount must be added to the cash balance on the depositor's books. Examples include a direct payroll deposit by an individual's employer and interest added by the bank on a savings account. Similarly, the depositor may have items deducted from the account by a third party (such as transfers to savings plans). These items must be deducted from the depositor's cash balance.

## caution

In preparing a bank reconciliation, it is essential to know how the bank handled a transaction (e.g., the entry made, if any, on an NSF check) so that a proper reconciliation can be made from the company's books' perspective.

## caution

Adjustments to the book balance should reflect new information learned upon receiving the bank statement. Adjustments to the bank balance should reflect checks written and deposits made that the bank doesn't know about yet.

If, after considering these items, the bank statement and the book balances cannot be reconciled, a detailed analysis of both the bank's records and the depositor's books may be necessary to determine whether errors or irregularities exist on the records of either party.

**Preparing a Bank Reconciliation** An illustration of a common form of bank reconciliation follows. This form is prepared in two sections, the bank statement balance

being adjusted to the corrected cash balance in the first section, and the book balance being adjusted to the same corrected cash balance in the second section. Any items not yet recognized by the bank (e.g., deposits in transit or outstanding checks) as well as any errors made by the bank are recorded in the first section. The second section contains any items the depositor has not yet recognized (e.g., direct deposits, NSF checks, or bank service charges) and any corrections for errors made on the depositor's books.

The reconciliation of bank and book balances to a corrected balance has two important advantages: It develops a corrected cash figure, and it shows separately all items requiring adjustment on the depositor's books.

An alternative form of reconciliation would be to reconcile the bank statement balance to the book balance. This form would not develop a corrected cash figure,

however, and would make it more difficult to determine the adjustments needed on the depositor's books.

<b>Svendsen, Inc.</b>		
<b>Bank Reconciliation</b>		
<b>November 30, 2011</b>		
Balance per bank statement, November 30, 2011 .....		\$2,979.72
Add: Deposits in transit .....	\$ 658.50	
Charge for interest made to depositor's account by bank in error .....	12.50	671.00
		<u>\$3,650.72</u>
Deduct outstanding checks:		
No. 1125 .....	\$ 58.16	
No. 1138 .....	100.00	
No. 1152 .....	98.60	
No. 1154 .....	255.00	
No. 1155 .....	192.07	703.83
Corrected bank balance .....		<u>\$2,946.89</u>
Balance per books, November 30, 2011 .....		\$2,952.49
Add: Interest earned during November .....	\$ 98.50	
Check No. 1116 to Ace Advertising for \$46 recorded by depositor as \$64 in error .....	18.00	116.50
		<u>\$3,068.99</u>
Deduct: Bank service charges .....	\$ 3.16	
Customer's check deposited November 25 and returned marked NSF .....	118.94	122.10
Corrected book balance .....		<u>\$2,946.89</u>

After preparing the reconciliation, the depositor should record any items appearing on the bank statement and requiring recognition on the company's books as well as any corrections for errors discovered on its own books. The bank should be notified immediately of any bank errors. The following entries would be required on the books of Svendsen, Inc., as a result of the November 30 reconciliation:

Cash .....	98.50	
Interest Revenue .....		98.50
To record interest earned during November.		
Cash .....	18.00	
Advertising Expense .....		18.00
To record correction for check in payment of advertising recorded as \$64 instead of the actual amount, \$46.		
Accounts Receivable .....	118.94	
Miscellaneous General Expense .....	3.16	
Cash .....		122.10
To record customer's uncollectible check and bank charges for November.		

After these entries are posted, the cash account will show a balance of \$2,946.89. If financial statements were prepared at November 30, this is the amount that would be reported as cash on the balance sheet. It should be noted that the bank reconciliation is not presented to external users. It is used as a control procedure and as an accounting tool to determine the adjustments required to bring the cash account and related account balances up to date.

## stop & think

Suppose that after employing the procedures outlined here, a company's bank and book balances are not the same. Further suppose that the corrected bank balance is *greater than* the corrected book balance. Which **ONE** of the following errors could cause this type of difference?

- A deposit in transit made the last day of the month was omitted from the bank reconciliation. The deposit was recorded in the company's books.
- The company mistakenly recorded a check it made out to one of its suppliers as being for \$50 instead of \$500. The bank cleared the check at the correct amount of \$500.
- The company mistakenly recorded a deposit made in the middle of the month as \$500 instead of \$50. The bank recorded the deposit at the correct amount of \$50.
- A check written three months ago, which has still not cleared the bank, was omitted from the outstanding checks list in the bank reconciliation.

## Presentation of Sales and Receivables in the Financial Statements

**5** Recognize appropriate disclosures for presenting sales and receivables in the financial statements.

**WHY** Disclosures of sales and receivables in the financial statements vary from company to company. Sales and receivables information will be in both the financial statements and in the accompanying notes.

**HOW** In the body of the financial statements, sales are generally reported net of discounts and allowances. Receivables are often reported net of their allowance account with supplemental information provided in the notes to the financial statements.

Companies often provide a breakdown of the sources of their revenues in the body of the income statement. For example, Note 1 of **The Walt Disney Company's** financial statements indicates four sources of revenues: media networks, parks & resorts, studio entertainment, and consumer products. As another example, **McDonald's** provides information in the notes to its financial statements partitioning revenues, operating income, and identifiable assets by geographical area (see Exhibit 7-7). This information is useful to users of the financial statements as they determine future sources of a firm's revenue. This information also allows users to determine how efficiently assets are being used to generate revenues and profits. In the case of McDonald's, we can compute the percentage of revenues generated from each geographical area and conclude that the percentage of revenues generated in Europe has increased slightly over time (from 37% in 2005 to 39% in 2007). In computing the amount of revenue dollars generated in the United States per dollar of assets, we note that the amount has increased slightly over time (from 0.78 in 2005 to 0.79 in 2007). That amount has increased for McDonald's European operations also, from 0.75 in 2005 to 0.78 in 2007. With this analysis, we can see that the European operations are almost generating the same revenue dollars per dollar of assets as their American counterparts.

Total assets ....	<u>\$29,391.7</u>	<u>\$28,974.5</u>	<u>\$29,988.8</u>

Receivables qualifying as current items may be grouped for presentation on the balance sheet in the following classes: (1) notes receivable—trade debtors, (2) accounts receivable—trade debtors, and (3) other receivables. Alternatively, trade notes and accounts receivable can be reported as a single amount. The detail reported for other receivables depends on the relative significance of the various items included. Valuation accounts are deducted from the individual receivable balances or combined balances to which they relate. Any long-term trade and nontrade receivables would be reported as “other noncurrent assets” on the balance sheet. A company should also disclose whether restrictions have been placed on any receivables, such as when receivables have been set aside to satisfy a specific obligation or have been pledged as collateral on a loan. Finally, a company should disclose any significant concentrations of credit risk relating to its receivables. For example, if a significant percentage of a company’s sales (and corresponding receivables) are with one debtor, that would represent a concentration of credit risk and should be disclosed.

As is explained in the Expanded Material later in the chapter, when receivables have been sold or used as collateral for loans, the details associated with the sale or borrowing transaction should be disclosed. Disclosure would include factors such as the terms of the agreement, the value of the receivables involved, and the recourse available to the lender.

Accounts and notes receivable as presented by Caterpillar, Inc., in its 2007 10-K filing are shown in Exhibit 7-8. In Exhibit 7-8, Caterpillar’s note disclosure relating to

**EXHIBIT 7-8****Reporting Receivables—Caterpillar Note Disclosure****Contractual maturities of outstanding finance receivables (millions of dollars):**

Balance at end of year	<u>\$ 351</u>	<u>\$315</u>	<u>\$ 302</u>

its finance receivables is presented. Information relating to maturity dates of receivables, residual values of leased equipment, and credit loss estimates are presented. Notice that Caterpillar's estimates for credit losses are more than the actual write-offs over the 3-year period presented (\$257 million in estimates compared to \$216 million in actual write-offs).

## EXPANDED MATERIAL

In the first part of this chapter, we focused on the central activity of a business—selling a product or service and collecting the resulting receivable. We also discussed other events or activities related to this revenue/receivables/cash cycle. In this section of the chapter, we address the issue of using accounts receivable as a source of cash. Often, for a variety of reasons, a company will have an immediate need for cash. A number of methods are available to a company to convert its receivables into cash without waiting for payment from the customer. The most common of those methods are discussed here. We also discuss notes receivable and how they are valued and used as a source of cash. The Expanded Material also includes a brief discussion of the impact of uncollectible accounts on the statement of cash flows.

## Receivables as a Source of Cash

**6** Explain how receivables may be used as a source of cash through secured borrowing or sale.

**WHY** A company can accelerate the cash collection process by selling its receivables or by using its receivables as collateral in obtaining a loan. The method employed and the cost to the company depend on the degree of risk to which the company wishes to expose itself.

**HOW** In the case of secured borrowing, the company is simply pledging the receivable as collateral on a loan. Receivables can also be sold to a third party, usually a bank or other financial institution. When a receivable is sold with recourse, the selling company must quantify and recognize the expected payout that will be made as a result of the recourse provision.

As stated previously, receivables are a part of the normal revenue/receivables/cash operating cycle of a business. Frequently, this cycle takes several months to complete. Sometimes companies need immediate cash and cannot wait for completion of the normal cycle. At other times companies are not in financial stress but want to accelerate the receivables collection process, shift the risk of credit and the effort of collection to someone else, or merely use receivables from customers as a source of financing.

Receivables may be converted to cash in one of two ways: as a sale (either with or without recourse) or as a secured borrowing. The FASB specified in *Statement No. 140* the conditions that must be met if a transfer of receivables is to be accounted for as a sale. Those conditions are as follows:

1. The transferred assets have been isolated from the transferor. That is, the transferor and its creditors cannot access the assets.
2. The transferee has the right to pledge or exchange the transferred assets.
3. The transferor does not maintain effective control over the assets through either (a) an agreement to repurchase them before their maturity or (b) the ability to cause the transferee to return specific assets.

These three conditions are designed to carefully define cases in which the transfer of a financial asset is being made with no substantial strings attached. If there are no strings attached, meaning that the transferor does not have the right to get the assets back and the transferee has the right to use the assets in any way desired, then the transfer is accounted for as a sale. If these three conditions are not met, then the transfer of receivables is accounted for as a secured borrowing. In the sections that follow, we discuss both the sale of receivables and their use as collateral in a borrowing arrangement.

## Sale of Receivables without Recourse

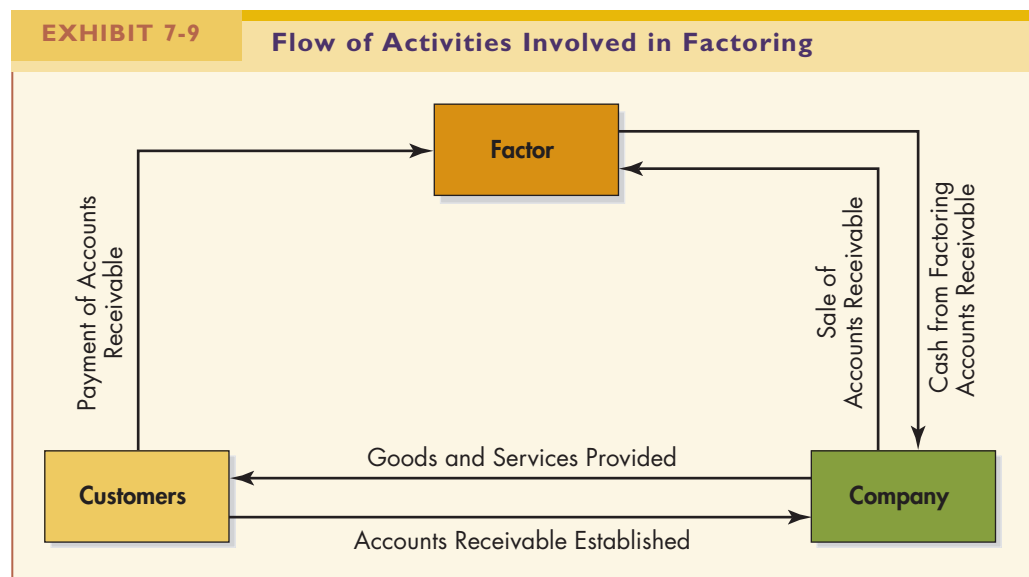

Certain banks, dealers, and finance companies purchase receivables from companies. In many cases, these purchases are done without recourse, meaning that the purchaser assumes the risks associated with the collectibility of the receivables. If the terms of the sale are with recourse, then if the receivables are not collected, the purchaser has the right to collect from the company that originally sold the receivable. A sale of accounts receivable without recourse<sup>3</sup> is commonly referred to as **accounts receivable factoring**, and the buyer is referred to as a *factor*. Customers are usually notified that their bills are payable to the factor, and this party assumes the burden of billing and collecting accounts. The flow of activities involved in factoring is presented in Exhibit 7-9.

In many cases, factoring involves more than the purchase and collection of accounts receivable. Factoring frequently involves a continuing agreement whereby a financing institution assumes the credit function as well as the collection function. Under such an arrangement, the factor grants or denies credit, handles the accounts

receivable records, bills customers, and makes collections. The business unit is relieved of all these activities, and the sale of goods provides immediate cash for business use. Because the factor absorbs the losses from bad accounts and frequently assumes credit and collection responsibilities, the charges associated with factoring generally exceed the interest charges on

fyi

**Student loans are often factored to specialized loan servicing companies.**

<sup>3</sup> Recourse is defined by the FASB as “the right of a transferee of receivables to receive payment from the transferor of those receivables for (a) failure of the debtors to pay when due, (b) the effects of prepayments, or (c) adjustments resulting from defects in the eligibility of the transferred receivables.” *Statement of Financial Accounting Standards No. 140, “Accounting for Transfers and Servicing of Financial Assets and Extinguishments of Liabilities: A Replacement of FASB Statement No. 125,”* September 2000, Appendix E.

a loan with receivables used as collateral. Often, the factor will charge a fee of 10% to 30% of the net amount of receivables purchased, except for credit card factoring where the rate is 3% to 5%. The factor may withhold a portion of the purchase price for possible future charges for customer returns and allowances or other special adjustments. Final settlement is made after receivables have been collected.

When receivables are sold outright, without recourse, Cash is debited, receivables and related allowance balances are closed, and a loss account is debited for factoring charges. When part of the purchase price is withheld by the factor, a receivable from the factor is established pending final settlement. Upon receipt of the total purchase price from the bank or finance company, the factor receivable account is eliminated. To illustrate, assume that \$10,000 of receivables are factored, that is, sold without recourse, to a finance company for \$8,500. An allowance for bad debts equal to \$300 was previously established for these accounts. This amount will need to be written off along with the accounts receivable being sold. The finance company withheld 5% of the purchase price as protection against sales returns and allowances. The entry to record the sale of the accounts is as follows:

Cash .....	8,075	
Receivable from Factor .....	425	
Allowance for Bad Debts .....	300	
Loss from Factoring Receivables .....	1,200	
Accounts Receivable .....		10,000

To record the factoring of receivables. Computations:  
 Cash = \$8,500 - \$425 = \$8,075; Factor receivable =  
 \$8,500 × 0.05 = \$425; Factoring loss =  
 (\$10,000 - \$300) - \$8,500 = \$1,200.

The loss from factoring is determined by comparing the book value of the receivables (\$10,000 - \$300) to the proceeds to be received (\$8,500). Assuming there were no returns or allowances, the final settlement would be recorded as follows:

Cash .....	425	
Receivable from Factor .....		425

To record the final settlement associated with previously factored receivables.

### Sale of Receivables with Recourse

Cash can be obtained by selling receivables with recourse. This is different from factoring, which generally is on a nonrecourse basis. **Selling receivables with recourse** means that a purchaser (bank or finance company) advances cash in return for receivables but retains the right to collect from the seller if debtors (seller's customers) fail to make payments when due.

With FASB *Statement No. 140*, the seller is required to estimate the value of the recourse obligation and recognize that liability. That is, the seller must estimate the amount that will be paid to the purchaser as a result of default on the receivables that were sold. Continuing the previous example, assume that the receivables were sold with recourse and the recourse obligation

has an estimated fair value of \$500. In this instance, the loss to be recognized on the transaction is \$1,700 and is computed as follows:

Cash received .....	\$ 8,500
Estimated value of recourse obligation .....	(500)
Net proceeds .....	<u>\$ 8,000</u>
Book value of the receivables .....	\$ 9,700
Net proceeds to be received .....	(8,000)
Loss on sale of receivables .....	<u>\$ 1,700</u>

fyi

The estimation of the recourse obligation essentially involves a reexamination of the receivables being sold to determine whether the allowance for bad debts associated with those receivables is sufficient.

The entry to record the sale of receivables with recourse would be as follows:

Cash .....	8,075	
Receivable from Factor .....	425	
Allowance for Bad Debts .....	300	
Loss on Sale of Receivables .....	1,700	
Accounts Receivable .....		10,000
Recourse Obligation .....		500

## stop & think

Why would a company ever factor receivables with recourse when it could factor those same receivables without recourse?

- Factoring receivables without recourse is illegal in many states.
- FASB *Statement No. 140* does not apply when receivables are factored with recourse.
- The fee paid to the factor is lower when factoring receivables with recourse.
- The recourse obligation is always exactly equal to the allowance for bad debts.

If in the future the estimate of the recourse obligation turns out to have been incorrect, then the company will recognize income if the actual amount paid relating to the recourse obligation is less than \$500 and will recognize an additional loss if the amount turns out to be greater than \$500.

*Statement No. 140* superseded *Statement No. 125*, which was issued in June 1996. Although *Statement No. 140* did not change the main criteria for accounting for the transfer of receivables as a sale, it did modify the requirements for which a special-purpose entity (SPE) could be considered to be a bona-fide separate, independent entity and thus a qualified transferee. This seemingly minor change had a major impact on some companies for which the transfer of receivables was a significant business activity. For example, the change resulted in Sears being required to recognize approximately

\$8.1 billion of credit card receivables that had previously been accounted for as being “sold” to a special-purpose entity.

As mentioned earlier, the recourse provisions of a receivable transfer may leave the transferor with such a large degree of control over or large amount of risk from the transferred receivables that the receivables should remain on the books of the transferor. Specifically, if the three conditions mentioned earlier are not met, then the transfer of receivables is accounted for as a secured borrowing, as illustrated in the next section.

## Secured Borrowing

Loans are frequently obtained from banks or other lending institutions by assigning or pledging receivables as security. The loan is evidenced by a written note that provides for either a general assignment of receivables or an assignment of specific receivables. With an **assignment of receivables**, no special accounting problems are involved. The books simply report the loan (a debit to Cash and a credit to Notes Payable) and subsequent settlement of the obligation (a debit to Notes Payable and a credit to Cash). However, disclosure should be made on the balance sheet, by a parenthetical comment or a note, of the amount and nature of receivables pledged to secure the obligation to the lender.

The procedures involved are illustrated in the following example. It is assumed that the assignor (the borrower) collects the receivables, which is often the case.

On July 1, 2011, Provo Mercantile Co. assigns receivables totaling \$300,000 to Salem Bank as collateral on a \$200,000, 12% note. Provo Mercantile does not notify its account debtors and will continue to collect the assigned receivables. Salem assesses a 1% finance charge on assigned receivables in addition to the interest on the note. Provo is to make monthly payments to Salem with cash collected on assigned receivables. The entries shown on page 347 would be made.

fyi

Packaging and transfer of receivables is sometimes called *securitization*. In this context, when you see the term *securitization*, think of it as the process of turning receivables into cash immediately.

If in the following example Salem Bank assumes responsibility for collecting the assigned receivables, the account debtors would have to be notified to make their payments to the bank. Salem would then use a liability account (e.g., Payable to Provo Mercantile) to account for cash collections during the period. Because the receivables are still owned by Provo Mercantile, the bank would not record them as assets. Upon full payment of the note plus interest, the bank would

remit to Provo Mercantile any cash collections in excess of the note, along with any uncollected accounts.

### Illustrative Entries for Assignment of Specific Receivables

Provo Mercantile Co.		Salem Bank	
<i>Issuance of note and assignment of specific receivables on July 1, 2011:</i>			
Cash .....	197,000	Notes Receivable .....	200,000

*(\$21,000 × 0.12 × 1/12)			
†(\$200,000 – \$179,000)			

In summary, receivables provide an important source of cash for many companies. The transfer of receivables to third parties in return for cash generally takes the form of secured borrowing (borrowing with the receivables pledged as collateral) or factoring (a sale without recourse). The financing arrangements are often complex and may involve a transfer of receivables on a recourse basis. Each transaction must be analyzed carefully to see if in form and substance it is a borrowing transaction or a sales transaction and treated accordingly.

## Derecognition of Receivables: IAS 39

IASB standards address the transfer of receivables in *IAS 39*. *IAS 39* covers a lot of ground such as the accounting for investment securities, the accounting for derivatives, and the accounting for the transfer of financial assets such as receivables. As seen above in the discussion of *SFAS No. 140*, the key accounting issue with the transfer of receivables is whether the transfer should be recorded as a sale, with the receivable then removed from the books of the transferor, or whether the transfer should be accounted for as a secured loan with the receivable remaining on the books of the transferor. The IASB uses the term “derecognition” to signify the removal of the receivable from the books of the transferor.

Recall that the purpose of the three conditions in *SFAS No. 140* is to identify receivable transfers in which economic ownership of the receivable has been transferred. *IAS 39* contains the same concept but applied slightly differently. *IAS 39* contains a 2-step test for derecognition.

1. Determine whether the receivable transfer involves a transfer of “substantially all the risks and rewards of ownership of the [receivable].” If so, the transfer should be accounted for as a sale of the receivable, as illustrated previously. If not, go on to Step 2.
2. If the receivable transfer does not involve the transfer of substantially all the risks and rewards of ownership, determine whether control of the receivable has been transferred. If so, account for the receivable transfer as a sale. If not, the transfer is accounted for as a secured loan, as illustrated previously.<sup>4</sup>

The *IAS 39* 2-step test emphasizes the question of whether the risks and rewards of ownership have been transferred. With respect to receivables, the risks and rewards of ownership are the receipt, or nonreceipt, of cash depending on whether the customer who owes the receivable amount ultimately pays. For example, a transferor of a receivable who receives a nonrefundable fixed cash payment in exchange for the receivable has transferred the risks and rewards of ownership because the transferor gets to keep the nonrefundable fixed cash payment whether the customer pays the receivable amount or not. In contrast, if the transferor receives an upfront cash payment but then agrees to give back some of the cash, or to receive extra cash, depending on how much the customer ultimately pays, then the risks and rewards of ownership have not been transferred.

Compare the three criteria in *SFAS No. 140* with the 2-step test contained in *IAS 39*. As is typically the case, the U.S. standard is more detailed and the international standard is more conceptual. In the large majority of cases, the two standards will result in the same accounting treatment for a receivable transfer.

## Notes Receivable

**7** Describe proper accounting and valuation of notes receivable.

**WHY** Notes receivable represent a more formal obligation than does an account receivable. Notes receivable usually involve the payment of interest and a specific due date.

**HOW** Notes receivable are valued by computing the present value of the principal and interest to be received. Problems can arise in the valuation of notes receivable when the note is exchanged for goods or services and the fair market value of those goods and services is difficult to determine.

A **promissory note** is an unconditional written promise to pay a certain sum of money at a specified time. The note is signed by the maker and is payable to the order of a specified payee or bearer. Notes usually involve interest, stated at an annual rate

<sup>4</sup> *International Accounting Standard 39*, “Financial Instruments: Recognition and Measurement” (London: International Accounting Standards Board, August 18, 2005), par. 20.

and charged on the face amount of the note. Most notes are **negotiable notes** that are legally transferable by endorsement and delivery.

For reporting purposes, trade notes receivable should include only negotiable short-term instruments acquired from trade debtors and not yet due. Trade notes generally arise from sales involving relatively high dollar amounts when the buyer wants to extend payment beyond the usual trade credit period of 30 to 90 days. Also, sellers sometimes request notes from customers whose accounts receivable are past due. Most companies, however, have relatively few trade notes receivable.

Nontrade notes receivable should be separately designated on the balance sheet under an appropriate title. For example, notes arising from loans to customers, officers, employees, and affiliated companies should be reported separately from trade notes.

## Valuation of Notes Receivable

Notes receivable are initially recorded at their present value, which may be defined as the sum of future receipts discounted to the present date at an appropriate rate of interest.<sup>5</sup> In a lending transaction, the present value is the amount of cash received by the borrower. When a note is exchanged for property, goods, or services, the present value equals the current cash selling price of the items exchanged. The difference between the present value and the amount to be collected at the due date or maturity date is a charge for interest.

All notes arising in arm's-length transactions between unrelated parties involve an element of interest. However, a distinction as to form is made between interest-bearing and non-interest-bearing notes. An **interest-bearing note** is written as a promise to pay **principal** (or **face amount**) plus interest at a specified rate. In the absence of special valuation problems discussed in the next section, the face amount of an interest-bearing note is the present value upon issuance of the note.

A **non-interest-bearing note** does not specify an interest rate, but the face amount includes the interest charge. Thus, the present value is the difference between the face amount and the interest included in that amount, sometimes called the **implicit** (or **effective**) **interest**.

In recording receipt of a note, Notes Receivable is debited for the face amount

of the note. When the face amount differs from the present value, as is the case with non-interest-bearing notes, the difference is recorded as a premium or discount and amortized over the life of the note. In the example to follow, a note receivable is established with credits to sales and discount on notes receivable accounts. The amount of discount is the implicit interest on the note and will be recognized as interest revenue as the note matures.

To illustrate, assume that High Value Corporation sells goods on January 1, 2011, with a price of \$1,000. The buyer gives High Value a promissory note due December 31, 2012. The maturity value of the note includes interest at 10%. Thus, High Value will receive \$1,210 ( $\$1,000 \times 1.21$ )<sup>6</sup> when the note is paid. The entries on page 350 show the accounting procedures for an interest-bearing note and one written in a non-interest-bearing form.

At December 31, 2011, the unamortized discount of \$110 on the non-interest-bearing note would be deducted from Notes Receivable on the balance sheet. If the non-interest-bearing note were recorded at face value with no recognition of the

<sup>5</sup> See the text module, Time Value of Money Review, for a discussion of present value concepts and applications.

<sup>6</sup> The future value of \$1 to be received two years from now, if the interest rate is 10% compounded annually, is \$1.21.

fyi

Another name for Discount on Notes Receivable is Unearned Interest Revenue.

interest included therein, the sales price and profit to the seller would be overstated. In subsequent periods, interest revenue would be understated. Failure to record the discount would also result in an overstatement of assets.

### Illustrative Entries for Notes

<b>Interest-Bearing Note</b>				<b>Non-Interest-Bearing Note</b>	
<b>Face Amount = Present Value = \$1,000</b>				<b>Face Amount = Maturity = \$1,210</b>	
<b>Stated Interest Rate = 10%</b>				<b>No Stated Interest Rate</b>	
<i>To record note received in exchange for goods selling for \$1,000:</i>					
2011					
Jan. 1	Notes Receivable .....	1,000		Notes Receivable .....	1,210
	Sales .....		1,000	Sales .....	1,000
				Discount on Notes Receivable .....	210
<i>To recognize interest earned for one year, \$1,000 × 0.10:</i>					
Dec. 31	Interest Receivable .....	100		Discount on Notes Receivable .....	100
	Interest Revenue .....		100	Interest Revenue .....	100
<i>To record settlement of note at maturity and recognize interest earned for one year, (\$1,000 + \$100) × 0.10:</i>					
2012					
Dec. 31	Cash .....	1,210		Cash .....	1,210
	Notes Receivable .....		1,000	Discount on Notes Receivable .....	110
	Interest Receivable .....		100	Notes Receivable .....	1,210
	Interest Revenue .....		110	Interest Revenue .....	110

Although the proper valuation of receivables calls for the amortization procedure just described, exceptions may be appropriate in some situations due to special limitations or practical considerations. The Accounting Principles Board (APB) in *Opinion No. 21* provided guidelines for the recognition of interest on receivables and payables and the accounting subsequently to be employed. However, the Board indicated that this process is not to be regarded as applicable under all circumstances.

Among the exceptions are the following:

“ . . . receivables and payables arising from transactions with customers or suppliers in the normal course of business which are due in customary trade terms not exceeding approximately one year.”<sup>7</sup>

Accordingly, short-term notes and accounts receivable arising from trade sales may be properly recorded at the amounts collectible in the customary sales terms without separately recording the implicit interest embedded in those amounts.

Notes, like accounts receivable, are not always collectible. If notes receivable comprise a significant portion of regular trade receivables, a provision should be made for uncollectible amounts and an allowance account established using procedures similar to those for accounts receivable already discussed.

## Special Valuation Problems

APB *Opinion No. 21* was issued to clarify and refine existing accounting practice with respect to receivables and payables. The opinion is especially applicable to nontrade long-term notes, such as secured and unsecured notes, debentures (bonds), equipment obligations, and mortgage notes. Examples are provided for notes exchanged for cash and for property, goods, or services.

<sup>7</sup> *Opinions of the Accounting Principles Board No. 21, “Interest on Receivables and Payables.”*

**Notes Exchanged for Cash** When a note is exchanged for cash and no other rights or privileges are involved, the present value of the note is presumed to be the amount of the cash proceeds. The note should be recorded at its face amount, and any difference between the face amount and the cash proceeds should be recorded as a premium or discount on the note. The premium or discount should be amortized over the life of the note as illustrated previously for High Value Corporation. The total interest is measured by the difference in actual cash received by the borrower and the total amount to be received in the future by the lender. Any unamortized premium or discount on notes is reported on the balance sheet as a direct addition to or deduction from the face amount of the receivables, thus showing their net present value.

**Notes Exchanged for Property, Goods, or Services** When a note is exchanged for property, goods, or services in an arm’s-length transaction, the present value of the note is usually evidenced by the terms of the note or supporting documents. There is a general presumption that the interest specified by the parties to a transaction represents fair and adequate compensation for the use of borrowed funds.<sup>8</sup> Valuation problems arise, however, when one of the following conditions exists:<sup>9</sup>

1. No interest rate is stated.
2. The stated rate does not seem reasonable, given the nature of the transaction and surrounding circumstances.
3. The stated face amount of the note is significantly different from the current cash equivalent sales price of similar property, goods, or services, or from the current market value of similar notes at the date of the transaction.

Under any of the preceding conditions, APB *Opinion No. 21* requires accounting recognition of the economic substance of the transaction rather than the form of the note. The note should be recorded at (1) the fair value of the property, goods, or services exchanged or (2) the fair value of the note, whichever is more clearly determinable. The difference between the face amount of the note and the recorded value is recognized as a discount or premium and is amortized over the life of the note.

To illustrate, assume that on July 1, 2011, Timberline Corporation sells a tract of land purchased three years ago at a cost of \$250,000. The buyer gives Timberline a 1-year note with a face amount of \$310,000, bearing interest at a stated rate of 8%. An appraisal of the land prior to the sale indicated a market value of \$300,000, which in this example is considered to be the appropriate basis for recording the sale as follows:

**caution**

Make sure you are comfortable with the time value of money concepts discussed in the text module before proceeding with this example.

2011		
July 1	Notes Receivable .....	310,000
	Discount on Notes Receivable .....	10,000
	Land .....	250,000
	Gain on Sale of Land .....	50,000

<sup>8</sup> Ibid., par. 12.

<sup>9</sup> Ibid.

## SELLING A NOTE RECEIVABLE: WHAT'S IT WORTH?

As discussed earlier in the chapter, accounts and notes receivable can be used as an immediate source of cash by selling them to a factor. When a note receivable is sold, the value of the receivable depends on several factors including the interest rate on the note, the interest rate charged by the factor, and the time period involved.

Suppose for a moment that you are a bank official. What factors will affect the amount you are willing to pay to a company that wants to discount (sell) a note? First and foremost will be the creditworthiness of the maker; a second factor will be the length of time you must wait to get the money; and a third factor will be how much money you are going to receive when the note matures. Each of these factors will be reflected in your computation of the present value of that note. The steps to determine the amount to be received by the bank (the proceeds) are as follows:

1. Determine the maturity value of the note.

Maturity value = Face amount + Interest

Interest = Face amount  $\times$  Interest rate  $\times$   
Interest period

Interest period = Date of note to date of maturity

The maturity value is the amount you will receive when the note matures.

2. Determine the amount of discount.

Discount = Maturity value  $\times$  Discount rate  $\times$   
Discount period

Discount period = Date of discount to date of  
maturity

Once the maturity value is determined, the second factor comes into play: how long you have to wait to get the money. This time period is termed the *discount period*. Finally, the creditworthiness of the maker enters into the equation. The riskier the maker, the higher the discount rate will be. Also affecting the discount rate are general economic variables.

3. Determine the proceeds.

Proceeds = Maturity value – Discount

Once the proceeds are determined, the transaction can be recorded, recognizing the applicable liability and net interest revenue or expense (if a borrowing transaction) or the gain or loss (if a sales transaction).

Consider the following example. Meeker Corporation received a 3-month, \$5,000, 10% note from a customer on September 1 to settle a past due accounts receivable. One month later, the note is discounted at a bank at a discount rate of 15%. The amount received from the bank would be computed as follows:

Maturity value of the note = \$5,000 + (\$5,000  $\times$   
0.10  $\times$  3/12) = \$5,125

Amount of discount = \$5,125  $\times$  0.15  $\times$  2/12  
= \$128.13

Proceeds = \$5,125 – \$128.13 = \$4,996.87

In this instance, Meeker would recognize a loss of \$3.13 (\$5,000 – \$4,996.87) as a result of discounting the note.

When the note is paid at maturity, Timberline will receive the face value (\$310,000) plus stated interest of \$24,800 (\$310,000  $\times$  0.08), or a total of \$334,800. The interest to be recognized, however, is \$34,800—the difference between the maturity value of the note and the market value of the land at the date of the exchange. Thus, the effective rate of interest on the note is 11.6% (\$34,800/\$300,000).

Assuming straight-line amortization of the discount and that Timberline's year-end is December 31, the following entries would be made to recognize interest revenue and to record payment of the note at maturity:

2011			
Dec. 31	Interest Receivable .....	12,400*	
	Discount on Notes Receivable .....	5,000	
	Interest Revenue .....		17,400
	*\$310,000 $\times$ 0.08 $\times$ 6/12 = \$12,400		
2011			
June 30	Cash .....	334,800	
	Discount on Notes Receivable .....	5,000	
	Notes Receivable .....		310,000
	Interest Receivable .....		12,400
	Interest Revenue .....		17,400

The unamortized discount balance of \$5,000 would be subtracted from Notes Receivable on the December 31, 2011, balance sheet.

**Imputing an Interest Rate** If there is no current market price for either the property, goods, or services or the note, then the present value of the note must be determined by selecting an appropriate interest rate and using that rate to discount future receipts to the present. The **imputed interest rate** is determined at the date of the exchange and is not altered thereafter.

The selection of an appropriate rate is influenced by many factors, including the credit standing of the issuer of the note and prevailing interest rates for debt instruments of similar quality and length of time to maturity. APB *Opinion No. 21* states the following:

In any event, the rate used for valuation purposes should be the rate at which the debtor can obtain financing of a similar nature from other sources at the date of the transaction. For purposes of this Opinion, the objective is to approximate the rate that would have resulted if an independent borrower and an independent lender had negotiated a similar transaction under comparable terms and conditions with the option to pay the cash price upon purchase or to give a note for the amount of the purchase which bears the prevailing rate of interest to maturity.<sup>10</sup>

To illustrate the process of imputing interest rates, assume that Horrocks & Associates surveyed 800,000 acres of mountain property for Mountain Meadow Ranch. On December 31, 2011, Horrocks accepted a \$45,000 note as payment for services. The note is non-interest-bearing and comes due in three yearly installments of \$15,000 each, beginning December 31, 2012. Assume there is no market for the note and no basis for estimating objectively the fair value of the services rendered. After considering the current prime interest rate, the credit standing of the ranch, the collateral available, the terms for repayment, and the prevailing rates of interest for the issuer's other debt, a 10% imputed interest rate is considered appropriate. The note should be recorded at its present value and a discount recognized. The computation is based on the present value calculations as follows:

Face amount of note .....	\$45,000
Less present value of note:	
PV <sub>n</sub> : PMT = \$15,000; N = 3; i = 10% .....	37,303*
Discount on note .....	<u>\$ 7,697</u>

\*Rounded to nearest dollar.

The entry to record the receipt of the note would be:

2011			
Dec. 31	Notes Receivable .....	45,000	
	Discount on Notes Receivable .....		7,697
	Service Revenue .....		37,303
	<i>To record a non-interest-bearing note receivable at its present value based on an imputed interest rate of 10% per year.</i>		

A schedule showing the amortization of the discount on the note follows. This type of computation is commonly referred to as the *effective interest amortization method*.

	(1) Face Amount Before Current Installment	(2) Unamortized Discount	(3) Net Amount (1) – (2)	(4) Discount Amortization 10% × (3)	(5) Payment Received
Dec. 31, 2012	\$45,000	\$7,697	\$37,303	\$3,730	\$15,000
Dec. 31, 2013	30,000	3,967*	26,033	2,603	15,000
Dec. 31, 2014	15,000	1,364†	13,636	1,364	15,000
				<u>\$7,697</u>	<u>\$45,000</u>

\*\$7,697 – \$3,730 = \$3,967

†\$3,967 – \$2,603 = \$1,364

<sup>10</sup> Ibid., par. 13 as amended by SFAS No. 157, par. E1b.

At the end of each year, an entry similar to the following would be made:

2012			
Dec. 31	Cash .....	15,000	
	Discount on Notes Receivable .....	3,730	
	Interest Revenue .....		3,730
	Notes Receivable .....		15,000
	<i>To record the first year's installment on notes receivable and recognize interest earned during the period.</i>		

By using these procedures, at the end of the three years the discount will be completely amortized to interest revenue, the face amount of the note receivable will have been collected, and the appropriate amount of service revenue will have been recognized in the year it was earned. At the end of each year, the balance sheet will reflect the net present value of the receivable by subtracting the unamortized discount balance from the outstanding balance in Notes Receivable.

It is necessary to impute an interest rate only when the present value of the receivable cannot be determined through evaluation of existing market values of the elements of the transaction. The valuation and income measurement objectives remain the same regardless of the specific circumstances: to report notes receivable at their net present values and to record appropriate amounts of interest revenue during the collection period of the receivables.

## Impact of Uncollectible Accounts on the Statement of Cash Flows

**8** Understand the impact of uncollectible accounts on the statement of cash flows.

**WHY** The accounts **Allowance for Bad Debts** and **Bad Debt Expense** must be interpreted with care when determining the amount of operating cash flows related to receivables.

**HOW** When the indirect method is used, the best way to make the appropriate cash flow adjustment for changes in the receivables balance is to incorporate the change in **NET** receivables (gross receivables less the allowance). When the direct method is used, recall that bad debt expense represents a reduction in net receivables that does **NOT** constitute a collection of cash.

As noted in Chapter 5, the amount of reported sales or net income on an accrual basis must be adjusted for the change in the accounts receivable balances to derive the corresponding amount of cash flow from operations. The establishment of a provision for bad debts with a corresponding allowance for bad debts and the subsequent writing off of uncollectible accounts will impact the adjustments made, depending on whether the analysis considers gross or net accounts receivable balances.

To this point, we have assumed that any decrease in accounts receivable represents a payment received on account. Actually, two possibilities are associated with a decrease in receivables: Customers pay or customers never pay and the account is written off. Thus, a decrease in receivables may reflect a receipt of cash, or it may reflect the writing off of an account.

To illustrate the adjustments required for accounts receivable when preparing a statement of cash flows, consider the following information:

	Beginning Balances	Ending Balances
Accounts receivable .....	\$20,000	\$25,000
Allowance for bad debts .....	4,000	4,800
Net accounts receivable .....	<u>\$16,000</u>	<u>\$20,200</u>

Sales for the year .....	\$1,000,000
Net income for the year .....	100,000
Bad debt expense for the year .....	2,000
Write-off of uncollectible amounts for the year .....	1,200
Cash expenses for the year .....	898,000

In order to focus on the impact of uncollectible accounts, the illustration assumes that all operating expenses other than bad debt expense were paid in cash. Also, it is assumed that—with the exception of accounts receivable—there were no changes in the amounts of current assets and current liabilities.

In T-account form, the receivables account and the associated allowance account appear as follows:

Accounts Receivable		Allowance for Bad Debts	
Beg. bal. 20,000			Beg. bal. 4,000
1,000,000		1,200	2,000
	993,800		End. bal. 4,800
	1,200		
End. bal. 25,000			

The accounts receivable account increased from \$20,000 to \$25,000. Given sales of \$1,000,000, credits to Accounts Receivable must have totaled \$995,000, but this \$995,000 does not relate entirely to cash collections. A portion of the decline, \$1,200, relates to the fact that some cash will never be collected and is no longer an asset; it must be written off. Therefore, cash collections total \$993,800.

How is this information reflected in the statement of cash flows? Using the format discussed in Chapter 5, we will begin with the income statement and make adjustments as follows:

Income Statement	Adjustments		Cash Flows from Operations	
Sales	\$1,000,000	\$(5,000)	\$ 995,000	Cash collected from customers
Bad debt expense	(2,000)	800	(1,200)	
Cash expenses	(898,000)	0	(898,000)	Cash paid for expenses
Net income	<u>\$ 100,000</u>	<u>\$(4,200)</u>	<u>\$ 95,800</u>	Cash from operations

The first adjustment of (\$5,000) reflects the increase in the accounts receivable account resulting from sales (the debit side of the receivables account) exceeding credits to the accounts receivable account (cash collections and actual bad debts). The second adjustment converts the accrual basis measure, the bad debt expense (the credit side of the allowance account), to its cash flow counterpart, actual bad debts (the debit side of the allowance account). These two adjustments, considered together, tell us that \$993,800 (\$995,000 – \$1,200) was collected from customers during the period.

Using the preceding information, the net cash flow provided by operations during the period is as follows:

Direct Method	
Cash collected from customers .....	\$ 993,800
Cash expenses .....	(898,000)
Net cash flow provided by operations .....	<u>\$ 95,800</u>

Indirect Method	
Net income .....	\$ 100,000
Less: Increase in accounts receivable .....	(5,000)
Add: Increase in allowance for bad debts .....	800
Net cash flows provided by operations .....	<u>\$ 95,800</u>

Often, accounts receivable will be presented net of the bad debt expense. Take a look at the following T-account in which “netting” occurs.

Accounts Receivable (net)			
Beg. bal.	16,000		
Sales	1,000,000		
		Collections	993,800
		Bad debt expense	2,000
End. bal.	20,200		

What happened to the \$1,200 related to the amounts written off as uncollectible? Because that amount appeared as a credit in the receivables account and a debit in the allowance account, it will net out to \$0 when the two accounts are combined.

The statement of cash flows, when net accounts receivable are presented, can be prepared from the following information.

Income Statement		Adjustments		Cash Flows from Operations	
Sales	\$1,000,000	\$(4,200)	\$ 995,800	}	Cash collected from customers
Bad debt expense	(2,000)	0	(2,000)		
Cash expenses	(898,000)	0	(898,000)		Cash paid for expenses
Net income	<u>\$ 100,000</u>	<u>\$(4,200)</u>	<u>\$ 95,800</u>		Cash from operations

Sales is simply adjusted for the change in the net receivables account. Why is there no adjustment to Bad Debt Expense in this case? Because when the two accounts are netted together, all adjustments are netted together as well and result in the \$4,200 adjustment.

Using net receivables, the net cash flows provided by operations during the period is presented as follows:

Direct Method	
Cash collected from customers .....	\$ 993,800
Cash expenses .....	(898,000)
Net cash flow provided by operations .....	<u>\$ 95,800</u>

Indirect Method	
Net income .....	\$ 100,000
Less: Increase in accounts receivable .....	(4,200)
Net cash flows provided by operations .....	<u>\$ 95,800</u>

In the vast majority of cases, net receivables are presented and the indirect method is used. In these instances, the only adjustment required relates to the change in the net accounts receivable balance.

## SOLUTIONS TO OPENING SCENARIO QUESTIONS

- The largest revenue amount for a bank is interest revenue on its loans. In 2007, Bank of America reported interest revenue on its loans of \$55.7 billion. In addition, Bank of America reported interest revenue from investments of an additional \$31.6 billion. The largest expense amount for a bank is its interest expense. In 2007, Bank of America reported interest expense of \$52.9 billion of which \$18.1 billion was interest paid to depositors.
- As of December 31, 2007, Bank of America had consumer loans outstanding of \$551 billion and commercial loans outstanding of \$325 billion. By far the largest loan category was residential mortgages at \$275 billion.

3. *The net charge-off ratio for the residential mortgage loans was just 0.02%. For home equity loans the net charge-off ratio was slightly higher at 0.28%. The net charge-off ratio for direct/indirect consumer loans was 1.95%, and the net charge-off ratio for domestic credit card loans was 5.29%.*

## SOLUTIONS TO STOP & THINK

- (Page 324) The correct answer is A. The use of credit allows businesses to attract customers. A policy of “cash only” may cause customers to shop elsewhere, especially if all of a company’s competitors are offering credit terms.*
- (Page 340) The correct answer is D. If an outstanding check is omitted from the outstanding check list in the reconciliation, the corrected bank balance will be greater than the corrected book balance. When a bank reconciliation does not reconcile, it is good practice to look at the reconciliation for the preceding month to see whether all outstanding checks listed in that month have subsequently cleared the bank. The other potential errors listed (a, b, and c) would all cause the corrected bank balance to be less than the corrected book balance.*
- (Page 346) The correct answer is C. The factor would charge a fee based on the risk he or she is assuming. Factoring without recourse involves the factor assuming all the risk associated with collections. To assume that risk, the factor will charge a higher fee. If the risk of collection remains with the company (with recourse), then the factor would be willing to charge a lower fee.*

## REVIEW OF LEARNING OBJECTIVES

### 1 Explain the normal operating cycle of a business.

The operating cycle is the lifeblood of almost every business. The critical event for a business is the sale of goods or services. This sale often results in recording an account receivable. The account receivable is then collected, the resulting cash is reinvested in the business, and the cycle begins again.

### 2 Prepare journal entries to record sales revenue, including the accounting for bad debts and warranties for service or replacement.

A sale is recorded with a credit to Sales Revenue and a debit to either Accounts Receivable or Cash. The matching principle requires that expenses associated with the sale be recorded in the period of the sale. As a result, items such as bad debts and warranties must be estimated and recorded.

Bad debts are estimated using one of two methods: percentage of sales or percentage of receivables. Each of these methods involves

estimating the likelihood that some receivables will not be collected. The journal entry involves a debit to Bad Debt Expense and a credit to Allowance for Bad Debts. The allowance account is a contra asset account that, when offset against the accounts receivable account, values the asset at its net realizable value.

Warranties are quantified by estimating, based on past experience, the probable amount of future warranty costs and are recorded with a debit to Warranty Expense and a credit to a liability account. When the warranty claim is presented, the liability account is reduced and a credit is made to cash, parts, labor, and so forth.

### 3 Analyze accounts receivable to measure how efficiently a firm is using this operating asset.

The effective management of accounts receivable is critical to the cash flows of any business. The most common tool used to monitor receivables is the average collection period,

which reflects the average number of days that lapse between the time a sale is made and cash is collected. First, the accounts receivable turnover ratio is computed by dividing sales by average accounts receivable. The resulting number is divided into 365 (the number of days in a year) to compute the average collection period.

**4 Discuss the composition, management, and control of cash, including the use of a bank reconciliation.**

Cash management and control are critical to the success of every business. Because cash is the most liquid of assets, safeguards must be in place to ensure that cash is properly handled and accounted for. A common control involves the use of a bank reconciliation. A bank reconciliation requires the accountant to reconcile the bank's balance for cash with the company's balance. Any discrepancies are identified and appropriate corrections are made.

**5 Recognize appropriate disclosures for presenting sales and receivables in the financial statements.**

Disclosure of sales and receivables in the financial statements vary from company to company. In the body of the financial statements, sales are generally reported net of discounts and allowances. Receivables are often reported net of their allowance account with supplemental information provided in the notes to the financial statements.

### EXPANDED MATERIAL

**6 Explain how receivables may be used as a source of cash through secured borrowing or sale.**

In most cases, a receivable is converted into cash when a customer, in the normal cycle of business, pays the company. However, companies

can accelerate the cash collection process by using accounts receivable to assist in obtaining a loan. The method employed and the cost to the firm depend on the degree of risk to which the company wishes to expose itself. In the case of secured borrowing, the company is simply pledging the receivable as collateral on a loan. Receivables can also be sold to a third party, usually a bank or other financial institution. When a receivable is sold with recourse, the selling company must quantify the expected payout that will be made as a result of the recourse provision.

**7 Describe proper accounting and valuation of notes receivable.**

Notes receivable represent a formal borrowing arrangement between two parties. A note receivable typically specifies an interest rate and a payment date. Notes receivable are valued using techniques that compute the present value of the principal and interest to be received. Problems can arise in the valuation of notes receivable when the note is exchanged for goods or services and the fair market value of those goods and services is difficult to determine. In some instances, an effective interest rate for the note must be imputed.

**8 Understand the impact of uncollectible accounts on the statement of cash flows.**

The accounts Allowance for Bad Debts and Bad Debt Expense must be interpreted with care when determining the amount of cash flows related to receivables for a certain period. Different adjustments are made to the statement of cash flows, depending on whether the direct or indirect method is being used. The objective of these adjustments is to correctly identify cash collections from customers for the period.

## IASB SUMMARY

Topic	U.S. GAAP	IASB Standard
Derecognition of receivables	<i>SFAS No. 140</i> The transfer of a financial asset is recorded as a sale if economic ownership of the asset passes from the transferor to the transferee.	<i>IAS 39</i> The transfer of a financial asset is recorded as a sale if the risks and rewards associated with the cash flows from the financial assets pass from the transferor to the transferee.

KEY TERMS

Accounts receivable 323	Cash overdraft 336	Revenue 323	Implicit (effective) interest 349
Accounts receivable turnover 333	Compensating balances 337	Time deposits 336	Imputed interest rate 353
Aging receivables 330	Demand deposits 336	Trade discount 326	Interest-bearing note 349
Allowance method 328	Deposit in transit 339	Trade receivables 324	Negotiable notes 349
Average collection period 333	Direct write-off method 327	Warranties 332	Non-interest-bearing note 349
Bank reconciliation 338	Net realizable value 327	<b>EXPANDED MATERIAL</b>	Principal (face amount) 349
Bank service charge 339	Nontrade receivables 325		Promissory note 348
Cash 335	Notes receivable 324	Accounts receivable factoring 344	Selling receivables with recourse 345
Cash equivalents 336	Not-sufficient-funds (NSF) check 339	Assignment of receivables 346	
Cash (sales) discount 326	Outstanding checks 339		
	Present value 327		

QUESTIONS

1. Explain how each of the following factors affects the classification of a receivable: (a) the form of a receivable, (b) the source of a receivable, and (c) the expected time to maturity or collection.
2. (a) Describe the methods for establishing and maintaining an allowance for bad debts account.  
(b) How would the percentages used in estimating uncollectible accounts be determined under each of the methods?
3. In accounting for uncollectible accounts receivable, why does GAAP require the allowance method rather than the direct write-off method?
4. An analysis of the accounts receivable balance of \$8,702 on the records of Jorgenson, Inc., on December 31 reveals the following:
 

Accounts from sales of last three months (appear to be fully collectible) .....	\$7,460
Accounts from sales prior to October 1 (of doubtful value) .....	1,312
Accounts known to be worthless .....	320
Dishonored notes charged back to customers' accounts .....	800
Credit balances in customers' accounts .....	1,190

  - (a) What adjustments are required?
  - (b) How should the various balances be shown on the balance sheet?
5. Why should a company normally account for product warranties on an accrual basis?
6. (a) How is accounts receivable turnover computed?  
(b) How is average collection period computed?  
(c) What do these two measurements show?
7. Why is cash on hand necessary yet potentially unproductive?
8. The following items were included as cash on the balance sheet for Lawson Co. How should each of the items have been reported?
  - (a) Demand deposits with bank
  - (b) Restricted cash deposits in foreign banks
  - (c) Bank account used for payment of salaries and wages
  - (d) Cash in a special cash account to be used currently for the construction of a new building
  - (e) Customers' checks returned by the bank marked "Not Sufficient Funds"
  - (f) Customers' postdated checks
  - (g) IOUs from employees
  - (h) Postage stamps received in the mail for merchandise
  - (i) Postal money orders received from customers not yet deposited
  - (j) Notes receivable in the hands of the bank for collection
  - (k) Special bank account in which sales tax collections are deposited
  - (l) Customers' checks not yet deposited
9. Melvin Company shows in its accounts a cash balance of \$66,500 with Bank A and an overdraft of \$1,500 with Bank B on December 31. Bank B regards the overdraft as, in effect, a loan to Melvin Company and charges interest on the overdraft balance. How would you report the balances with Banks A and B? Would your answer be any different if the overdraft arose as a result of certain checks that had been deposited and proved to be uncollectible and if the overdraft was cleared promptly by Melvin Company at the beginning of January?

10. Mills Manufacturing is required to maintain a compensating balance of \$15,000 with its bank to maintain a line of open credit. The compensating balance is legally restricted as to its use. How should the compensating balance be reported on the balance sheet and why?
11. (a) Give at least four common sources of differences between depositor and bank balances.  
(b) Which of the differences in (a) require an adjusting entry on the books of the depositor?
- (b) Describe the accounting procedures to be followed in each case.
14. According to FASB *Statement No. 140*, what three conditions must be met to record the transfer of receivables with recourse as a sale?
15. Describe the 2-step test required under the provisions of *IAS 39* to determine whether a receivable should be derecognized.
16. (a) When should a note receivable be recorded at an amount different from its face amount?  
(b) Describe the procedures employed in accounting for the difference between a note's face amount and its recorded value.
17. Explain what special accounting procedures are required when receivables are assigned as collateral for a secured loan.
18. What is meant by *imputing a rate of interest*? How is such a rate determined?

### EXPANDED MATERIAL

12. How are attitudes regarding the financing of accounts receivable changing? Why do you think this is so?
13. (a) Distinguish between the practices of (1) selling receivables and (2) using receivables as collateral for borrowing.

## PRACTICE EXERCISES

### Practice 7-1

#### Simple Credit Sale Journal Entries

Credit sales for the year were \$100,000. Collections on account were \$88,000. Make the necessary summary journal entries to record this information.

LO2

### Practice 7-2

#### Sales Discounts: Gross Method

On January 16, two credit sales were made, one for \$300 and one for \$400. Terms for both sales were 3/15, n/30. Cash for the \$300 sale was collected on January 25; cash for the \$400 sale was collected on February 14. Make all journal entries necessary to record both the sales and the cash collections. Use the gross method of accounting for sales discounts.

LO2

### Practice 7-3

#### Sales Discounts: Net Method

Refer to Practice 7-2. Make all journal entries necessary to record both the sales and the cash collections. Use the net method of accounting for sales discounts.

LO2

### Practice 7-4

#### Sales Returns and Allowances

On July 15, goods costing \$7,000 were sold for \$10,000 on account. The customer returned the goods before paying for them. Make the journal entry or entries necessary on the books of the seller to record the return of the goods. Assume that the goods are not damaged and can be resold at their normal selling price. Also assume that the selling company uses a perpetual inventory system.

LO2

### Practice 7-5

#### Basic Bad Debt Journal Entries

Bad debt expense for the year was estimated to be \$12,000. Total accounts written off as uncollectible during the year were \$8,100. Make the necessary summary journal entries to record this information.

LO2

### Practice 7-6

#### Recovery of an Account Previously Written Off

Because of the extreme deterioration in the financial condition of a customer, the customer's account in the amount of \$7,500 was written off as uncollectible on July 23. By November 1, the customer's financial condition had improved such that the customer was able to pay the account in full. Make the journal entries necessary to write the account off on July 23 and then to record the collection of the account on November 1.

LO2

**Practice 7-7****Bad Debts: Percentage-of-Sales Method****LO2**

Bad debt expense is estimated using the percentage-of-sales method. Total sales for the year were \$500,000. The ending balance in Accounts Receivable was \$100,000. Historically, bad debts have been 3% of total sales. The economic circumstances of credit customers this year are about the same as they have been in past years. Total accounts written off as uncollectible during the year were \$13,700. Make the necessary summary journal entries to record this bad debt-related information.

**Practice 7-8****Bad Debts: Percentage-of-Accounts-Receivable Method****LO2**

Bad debt expense is estimated using the percentage-of-accounts-receivable method. Total sales for the year were \$600,000. The ending balance in Accounts Receivable was \$200,000. An examination of the outstanding accounts at the end of the year indicates that approximately 14% of these accounts will ultimately prove to be uncollectible. Before any adjustment, the balance in Allowance for Bad Debts is \$900 (credit). Total accounts written off as uncollectible during the year were \$16,600. Make the necessary summary journal entries to record this bad debt-related information.

**Practice 7-9****Aging Accounts Receivable****LO2**

The following aging of accounts receivable is as of the end of the year:

	Overall	Less Than 30 Days	31–60 Days	61–90 Days	Over 90 Days
Ken Nelson	\$ 10,000	\$ 8,000		\$1,000	\$1,000
Elaine Anderson	40,000	31,000	\$ 4,000		5,000
Bryan Crist	12,000	3,000	4,000	2,000	3,000
Renee Warner	60,000	50,000	10,000		
Nelson Hsia	16,000	10,000	6,000		
Stella Valerio	25,000	20,000		5,000	
Total	<u>\$163,000</u>	<u>\$122,000</u>	<u>\$24,000</u>	<u>\$8,000</u>	<u>\$9,000</u>

Historical experience indicates the following:

Age of Account	Percentage Ultimately Uncollectible
Less than 30 days .....	2%
31 to 60 days .....	10
61 to 90 days .....	30
Over 90 days .....	75

Compute the appropriate amount of Allowance for Bad Debts as of the end of the year.

**Practice 7-10****Estimation and Recognition of Warranty Expense****LO2**

Historically, warranty expenditures have been equal to 4% of sales. Total sales for the year were \$650,000. Actual warranty repairs made during the year totaled \$29,000. Make the necessary summary journal entries to record this warranty-related information.

**Practice 7-11****Comparison of Actual and Expected Warranty Expense****LO2**

The company offers a 1-year warranty to its customers. Warranty expenditures are estimated to be 4% of sales. Sales occur evenly throughout the year. The following information relates to the company's first two years of business:

Sales—Year 1 .....	\$100,000
Actual warranty repairs—Year 1 .....	3,000
Sales—Year 2 .....	\$150,000
Actual warranty repairs—Year 2 .....	6,500

(1) Compute the balance in the warranty liability account at the end of Year 2. (2) Evaluate whether that balance is too high or too low given the company's experience.

**Practice 7-12****Average Collection Period**

LO3

Sales for the year were \$400,000. The Accounts Receivable balance was \$50,000 at the beginning of the year and \$65,000 at the end of the year. Compute the average collection period using (1) the average accounts receivable balance and (2) the ending accounts receivable balance.

**Practice 7-13****Computation of Cash Balance**

LO4

Using the following information, compute the cash balance.

Restricted deposits in foreign bank accounts .....	\$ 5,200
Cash overdraft .....	(1,000)
Postdated customer checks .....	750
Savings account balance .....	10,000
Coin and currency .....	2,300

**Practice 7-14****Bank Reconciliation**

LO4

The company received a bank statement at the end of the month. The statement contained the following:

Ending balance .....	\$9,500
Bank service charge for the month .....	65
Interest earned and added by the bank to the account balance .....	45

In comparing the bank statement to its own cash records, the company found the following:

Deposits made but not yet recorded by the bank .....	\$2,700
Checks written and mailed but not yet recorded by the bank .....	3,900

Before making any adjustment suggested by the bank statement, the cash balance according to the books is \$8,320. What is the correct cash balance as of the end of the month? Verify this amount by reconciling the bank statement with the cash balance on the books.

**EXPANDED MATERIAL****Practice 7-15****Sale of Receivables without Recourse**

LO6

Cammo Company sold receivables (without recourse) for \$53,000. Cammo received \$50,000 cash immediately from the factor (the company to whom the receivables were sold). The remaining \$3,000 will be received once the factor verifies that none of the receivables is in dispute. The receivables had a face amount of \$60,000; Cammo had previously established an Allowance for Bad Debts of \$2,500 in connection with these receivables. Make the journal entry necessary on Cammo's books to record the sale of these receivables.

**Practice 7-16****Sale of Receivables with Recourse**

LO6

Refer to Practice 7-15. Assume that the sale of the receivables was done *with* recourse. The estimated value of the recourse obligation is \$1,300. Make the journal entry necessary on Cammo's books to record the sale of these receivables with recourse.

**Practice 7-17****Accounting for a Secured Borrowing**

LO6

Refer to Practice 7-15. Assume that Cammo received the entire \$53,000 in cash immediately. Also assume that the transfer of receivables did *not* satisfy the three conditions contained in *SFAS No. 140*. Make the journal entry necessary on Cammo's books to record the transfer of these receivables.

**Practice 7-18****Journal Entries for Interest-Bearing Note****LO7**

As payment for services rendered, the company received an 18-month note on January 1. The face amount of the note is \$3,000, and the stated rate of interest is 9%, compounded annually. The 9% rate is equal to the market rate. The full amount of the note, including accrued interest, will be received at the end of the 18-month period. Make *all* journal entries necessary on the books of the recipient of the note during the 18-month life of this note. Don't forget any necessary year-end adjusting entry.

**Practice 7-19****Journal Entries for Non-Interest-Bearing Note****LO7**

As payment for services rendered, the company received a 24-month note on January 1. The face amount of the note is \$1,000; the note is non-interest-bearing. The cash price of the services rendered is \$857. The market rate of interest is 8%, compounded annually. The \$1,000 face amount of the note will be received at the end of the 24-month period. Make *all* journal entries necessary on the books of the recipient of the note during the 24-month life of this note. Don't forget any necessary year-end adjusting entry. The cash will be received on December 31 of the second year.

**Practice 7-20****Note Exchanged for Goods or Services****LO7**

In exchange for land, the company received a 12-month note on January 1. The face amount of the note is \$2,000, and the stated rate of interest is 12%, compounded annually. The 12% rate is equal to the market rate. The original cost of the land was \$2,450. The full amount of the note, including accrued interest, will be received at the end of the 12-month period, on December 31. Make *all* journal entries necessary on the books of the recipient of the note during the 12-month life of this note.

**Practice 7-21****Effective Interest Amortization Method****LO7**

As payment for services rendered, the company received a 36-month note on January 1. The face amount of the note is \$1,000; the note is non-interest-bearing. There is no reasonable basis for determining the cash price of the services rendered. The market rate of interest is 10%, compounded annually. The \$1,000 face amount of the note will be received at the end of the 36-month period. Make *all* journal entries necessary on the books of the recipient of the note during the 36-month life of this note. Don't forget any necessary year-end adjusting entries.

**Practice 7-22****Bad Debts and the Direct Method****LO8**

	Ending Balances	Beginning Balances
Accounts receivable .....	\$ 9,500	\$13,000
Allowance for bad debts .....	3,100	3,000
Sales for the year .....	75,000	
Net income for the year .....	20,000	
Bad debt expense for the year .....	2,000	
Write-off of uncollectible amounts for the year .....	700	
Cash expenses for the year .....	53,000	

Prepare the Operating Activities section of the statement of cash flows using the direct method.

**Practice 7-23****Bad Debts and the Indirect Method****LO8**

Refer to Practice 7-22. Prepare the Operating Activities section of the statement of cash flows using the indirect method.

**EXERCISES****Exercise 7-24****Classifying Receivables****LO1**

Classify each of the following items as: (A) Accounts Receivable, (B) Notes Receivable, (C) Trade Receivables, (D) Nontrade Receivables, or (E) Other (indicate nature of item). Because the classifications are not mutually exclusive, more than one classification may be appropriate. Also indicate whether the item would normally be reported as a current or noncurrent asset assuming a 6-month operating cycle.

1. **MasterCard** or **VISA** credit card sale of merchandise to customer
2. Overpayment to supplier for inventory purchased on account
3. Insurance claim on automobile accident
4. Charge sale to regular customer
5. Advance to sales manager
6. Interest due on 5-year note from company president, interest payable annually
7. Acceptance of 3-year note on sale of land held as investment
8. Acceptance of 6-month note for past-due account arising from the sale of inventory
9. Claim for a tax refund from last year
10. Prepaid insurance—four months remaining in the policy period
11. Overpayment by customer of an account receivable

**Exercise 7-25****Computing the Accounts Receivable Balance****LO1**

The following information from Tiny Company's first year of operations is to be used in testing the accuracy of Accounts Receivable. The December 31, 2011, balance is \$28,300.

- (a) Collections from customers, \$48,000.
- (b) Merchandise purchased, \$74,000.
- (c) Ending merchandise inventory, \$31,500.
- (d) Goods sell at 60% above cost.
- (e) All sales are on account.

Compute the balance that Accounts Receivable should show and determine the amount of any shortage or overage.

**Exercise 7-26****Sales Discounts****LO2**

On November 1, Rosario Company sold goods on account for \$7,000. The terms of the sale were 3/10, n/40. Payment in satisfaction of \$3,000 of this amount was received on November 9. Payment in satisfaction of the remaining \$4,000 was received on December 9.

1. How much cash did Rosario Company collect from this \$7,000 account?
2. Using the gross method, what journal entries would Rosario make on November 9 and December 9?
3. Using the net method, what journal entries would Rosario make on November 9 and December 9?

**Exercise 7-27****Sales Returns****LO2**

On July 23, Louie Company sold goods costing \$3,000 on account for \$4,500. The terms of the sale were n/30. Payment in satisfaction of \$3,000 of this amount was received on August 17. Also on August 17, the customer returned goods costing \$1,000 (with a sales price of \$1,500). The customer reported that the goods did not meet the required specifications.

1. Make the journal entry necessary on July 23 to record the sale. Louie uses a perpetual inventory system.
2. Make the journal entry necessary on August 17 to record the cash collection.
3. Make the journal entry necessary on August 17 to record the return of the goods.
4. What question exists with respect to the valuation of the returned inventory?

**Exercise 7-28**

LO2

**Estimating Bad Debts**

Accounts Receivable of the Chalet Housing Co. on December 31, 2011, had a balance of \$550,000. Allowance for Bad Debts had a \$4,500 debit balance. Sales in 2011 were \$3,450,000 less sales discounts of \$51,000. Give the adjusting entry for estimated Bad Debt Expense under each of the following independent assumptions.

1. Of 2011 net sales, 2.5% will probably never be collected.
2. Of outstanding accounts receivable, 4% are doubtful.
3. An aging schedule shows that \$16,700 of the outstanding accounts receivable are doubtful.

**Exercise 7-29**

LO2

**Journal Entries for Receivable Write-Offs**

McGraw Medical Center has received a bankruptcy notice for Phillip Hollister. Hollister owes the medical center \$1,350. The bankruptcy notice indicates that the medical center can't expect to receive payment of any of the \$1,350.

1. Make the journal entry necessitated by receipt of the bankruptcy notice.
2. Six months after the medical center received the bankruptcy notice, Hollister appeared requesting medical treatment. He agreed to pay his old bill in its entirety. Make the journal entry or entries necessary to record receipt of the \$1,350 payment from Hollister.

**Exercise 7-30**

LO2

**Aging Accounts Receivable**

Blanchard Company's accounts receivable subsidiary ledger reveals the following information:

Customer	Account Balance Dec. 31, 2011	Invoice Amounts and Dates
Allison, Inc. ....	\$ 8,795	\$3,500 12/6/11 5,295 11/29/11
Banks Bros. ....	5,230	3,000 9/27/11 2,230 8/20/11
Barker & Co. ....	7,650	5,000 12/8/11 2,650 10/25/11
Marrin Co. ....	11,285	5,785 11/17/11 5,500 10/9/11
Ring, Inc. ....	7,900	4,800 12/12/11 3,100 12/2/11
West Corp. ....	4,350	4,350 9/12/11

Blanchard Company's receivable collection experience indicates that, on average, losses have occurred as follows:

Age of Accounts	Uncollectible Percentage
0–30 days .....	0.7%
31–60 days .....	1.4
61–90 days .....	3.5
91–120 days .....	10.2
Over 120 days .....	60.0

The Allowance for Bad Debts credit balance on December 31, 2011, was \$2,245 before adjustment.

1. Prepare an accounts receivable aging schedule.
2. Using the aging schedule from (1), compute the Allowance for Bad Debts balance as of December 31, 2011.
3. Prepare the end-of-year adjusting entry.
4. (a) Where accounts receivable are few in number, such as in this exercise, what are some possible weaknesses in estimating bad debts by the aging method?  
(b) Would the other methods of estimating bad debts be subject to these same weaknesses? Explain.

**Exercise 7-31****Analysis of Allowance for Bad Debts**

The Intercontinental Publishing Company follows the procedure of debiting Bad Debt Expense for 2% of all new sales. Sales for four consecutive years and year-end allowance account balances were as follows:

**LO2**

Year	Sales	Allowance for Bad Debts End-of-Year Credit Balance
2008	\$1,500,000	\$22,300
2009	1,425,000	30,800
2010	1,800,000	41,400
2011	1,970,000	61,500

1. Compute the amount of accounts written off for the years 2009, 2010, and 2011.
2. The external auditors are concerned with the growing amount in the allowance account. What action do you recommend the auditors take?

**Exercise 7-32****Warranty Liability**

In 2010, Carver Electronics Co. began selling a new computer that carried a 2-year warranty against defects. Based on the manufacturer's recommendations, Carver projects estimated warranty costs (as a percentage of dollar sales) as follows:

**LO2**

First year of warranty	4%
Second year of warranty	7%

Sales and actual warranty repairs for 2010 and 2011 are as follows.

	2011	2010
Sales	\$850,000	\$700,000
Actual warranty repairs	30,750	18,500

1. Give the necessary journal entries to record the liability at the end of 2010 and 2011.
2. Analyze the warranty liability account as of the year ended December 31, 2011, to see if the actual repairs approximate the estimate. Should Carver revise the manufacturer's warranty estimate? (Assume sales and repairs occur evenly throughout the year.)

**Exercise 7-33****Extended Service Contract**

Hitech Appliance Company's accountant has been reviewing the firm's past television sales. For the past two years, Hitech has been offering an extended service contract on all televisions sold. With the purchase of a television, the customer has the right to purchase a 3-year service contract for an extra \$75. Information concerning past television and warranty contract sales follows.

**LO2****DEMO PROBLEM**

Plasma-All Model II Television	2011	2010
Television sales in units	700	590
Sales price per unit	\$900	\$800
Number of service contracts sold	420	380
Expenses relating to television warranties	\$8,250	\$4,240

Hitech's accountant has estimated from past records that the pattern of repairs has been 32% in the first year after sale, 40% in the second year, and 28% in the third year. Give the necessary journal entries related to the service contracts for 2010 and 2011. In addition, indicate how much profit on service contracts would be recognized in 2011. Assume sales of the contracts are made evenly during the year.

**Exercise 7-34**

LO3

**Analyzing Accounts Receivable**

Trend Industries Company reported the following amounts on its 2010 and 2011 financial statements:

	2011	2010
Accounts receivable .....	\$ 235,000	\$ 210,000
Allowance for bad debts .....	12,000	8,000
Net sales .....	1,430,000	1,260,000
Cost of sales .....	1,067,000	856,000

1. Compute the accounts receivable turnover for 2011.
2. What is the average collection period during 2011? (Use 365 days.)

**Exercise 7-35**

LO4

**Reporting Cash on the Balance Sheet**

1. Indicate how each of the following items below should be reported using the following classifications: (a) cash, (b) restricted cash, (c) temporary investment, (d) receivable, (e) liability, or (f) office supplies.

(1) Checking account at First Security .....	\$ (20)
(2) Checking account at Second Security .....	350
(3) U.S. savings bonds .....	650
(4) Payroll account .....	100
(5) Sales tax account .....	150
(6) Foreign bank account—restricted (in equivalent U.S. dollars) .....	750
(7) Postage stamps .....	22
(8) Employee's postdated check .....	30
(9) IOU from president's brother .....	75
(10) Credit memo from a vendor for a purchase return .....	87
(11) Traveler's check .....	50
(12) Not-sufficient-funds check .....	18
(13) Petty cash fund (\$16 in currency and expense receipts for \$84) .....	100
(14) Money order .....	36

2. What amount would be reported as unrestricted cash on the balance sheet?

**Exercise 7-36**

LO4

**Restricted Cash**

Baltic Group, Inc., operates Baltic Group resorts in the United States, Mexico, the Caribbean, Asia, the South Pacific, and the Indian Ocean Basin. Baltic Group routinely receives payment in advance from vacationers. In some countries, Baltic Group is required by law to deposit cash received as payment for future vacations in special accounts. Cash in these accounts is restricted as to its use.

Assume that on December 31, Baltic Group received cash totaling \$7,450,000 as payment in advance for vacations at one of its resorts. The resort is in a country that requires that the cash be deposited in a special account.

1. Prepare the journal entry necessary to record receipt of the \$7,450,000.
2. Explain how the \$7,450,000 would be disclosed in the December 31 balance sheet.

**Exercise 7-37**

LO4

**Composition of Cash**

Ortiz Company had the following cash balances at December 31, 2011:

Undeposited coin and currency .....	\$ 29,500
Unrestricted demand deposits .....	1,375,000
Company checks written (and deducted from the demand deposits amount) but not scheduled to be mailed until January 2 .....	265,000
Time deposits restricted for use (expected use in 2012) .....	2,500,000

In exchange for a guaranteed line of credit, Ortiz has agreed to maintain a minimum balance of \$225,000 in its unrestricted demand deposits account. How much should Ortiz report as Cash in its December 31, 2011, balance sheet?

**Exercise 7-38****Correct Cash Balance**

LO4

Sterling Company's bank statement for the month of March included the following information:

Ending balance, March 31 .....	\$28,046
Bank service charge for March .....	130
Interest paid by bank to Sterling for March .....	107

In comparing the bank statement to its own cash records, Sterling found the following:

Deposits made but not yet recorded by the bank .....	\$3,689
Checks written and mailed but not yet recorded by the bank .....	6,530

In addition, Sterling discovered that it had erroneously recorded a check for \$46 that should have been recorded for \$64. What is Sterling's correct Cash balance at March 31?

**Exercise 7-39****Correct Cash Balance**

LO4

Lewiston Corporation's bank statement for the month of April included the following information:

Bank service charge for April .....	\$110
Check deposited by Lewiston during April was not collectible and has been marked "NSF" by the bank and returned .....	350

In comparing the bank statement to its own cash records, Lewiston found:

Deposits made but not yet recorded by the bank .....	\$1,674
Checks written and mailed but not yet recorded by the bank .....	677

All the deposits in transit and outstanding checks have been properly recorded in Lewiston's books. Lewiston also found a check for \$275, payable to Lewiston Corporation, that had not yet been deposited and had not been recorded in Lewiston's books. Lewiston's books show a bank account balance of \$7,842 (before any adjustments or corrections). What is Lewiston's Corporation's correct Cash balance at April 30?

**Exercise 7-40****Bank Reconciliation and Adjusting Entries**

LO4

The accounting department supplied the following data in reconciling the September 30 bank statement for Clegg Auto.

Ending cash balance per bank .....	\$18,972.67
Ending cash balance per books .....	16,697.76
Deposits in transit .....	3,251.42
Bank service charge .....	20.00
Outstanding checks .....	4,163.51
Note collected by bank including \$50 interest (Clegg not yet notified) .....	2,150.00
Error by bank—check drawn by Gregg Corp. was charged to Clegg's account .....	713.18

A sale and deposit of \$1,628.00 were entered in the sales journal and cash receipts journal as \$1,682.00.

1. Prepare the September 30 bank reconciliation.
2. Give the journal entries required on the books to adjust the cash account.

**Exercise 7-41****Bank Reconciliation—Analysis of Outstanding Checks**

LO4

The following information was included in the bank reconciliation for Bryant, Inc., for June. What was the total of outstanding checks at the beginning of June? Assume all other reconciling items are listed.

Checks and charges recorded by bank in June, including a June service charge of \$35 .....	\$16,320
Service charge made by bank in May and recorded on the books in June .....	30
Total of credits to Cash in all journals during June .....	21,705

Customer's NSF check returned as a bank charge in June (no entry made on books) .....	\$ 200
Customer's NSF check returned in May and redeposited in June (no entry made on books in either May or June) .....	275
Outstanding checks at June 30 .....	11,470
Deposits in transit at June 30 .....	500

### EXPANDED MATERIAL

#### Exercise 7-42

#### LO6

#### Accounting for the Sale of Accounts Receivable

On July 15, Mann Company sold \$600,000 in accounts receivable for cash of \$500,000. The factor withheld 10% of the cash proceeds to allow for possible customer returns or account adjustments. An Allowance for Bad Debts of \$80,000 had previously been established by Mann in relation to these accounts.

1. Make the journal entry necessary on Mann's books to record the sale of the accounts.
2. Make the journal entry necessary on Mann's books to record final settlement of the factoring arrangement. No customer returns or account adjustments occurred in relation to the accounts.

#### Exercise 7-43

#### LO7

#### Accounting for a Non-Interest-Bearing Note

Zobell Corporation sells equipment with a book value of \$8,000, receiving a non-interest-bearing note due in three years with a face amount of \$10,000. There is no established market value for the equipment. The interest rate on similar obligations is estimated at 12%. Compute the gain or loss on the sale and the discount on notes receivable, and make the necessary entry to record the sale. Also, make the entries to record the amortization of the discount at the end of the first, second, and third year using effective-interest amortization. (Round to the nearest dollar.)

#### Exercise 7-44

#### LO7

#### Accounting for an Interest-Bearing Note

Abacus, Inc., purchased inventory costing \$95,000. Terms of the purchase were 3/10, n/30. Abacus uses a perpetual inventory system. In order to take advantage of the cash discount, Abacus borrowed \$75,000 from Commercial First Bank, signing a 2-month, 8% note. The bank requires monthly interest payments. Make the entries to record the following:

1. Initial purchase of inventory on account
2. Payment to the supplier within the discount period
3. Loan from the bank
4. First month's payment to the bank
5. Second and final payment to the bank

#### Exercise 7-45

#### LO8

#### Receivables and the Statement of Cash Flows

The following selected information is provided for Lynez Company. All sales are credit sales and all receivables are trade receivables.

Accounts receivable, January 1 net balance .....	\$125,000
Accounts receivable, December 31 net balance .....	165,000
Sales for the year .....	800,000
Uncollectible accounts written off during the year .....	14,000
Bad debt expense for the year .....	24,000
Cash expenses for the year .....	681,000
Net income for the year .....	95,000

Using the format illustrated in the chapter and the preceding information, answer the following questions:

1. Using the *direct* method, what is the net cash flow from operations that Lynez Company would report in its statement of cash flows?
2. Assuming the use of the *indirect* method, what adjustments to net income would be required in reporting net cash flow from operations?

**PROBLEMS****Problem 7-46****LO2****Accounting for Receivables—Journal Entries**

The following transactions affecting the accounts receivable of Wonderland Corporation took place during the year ended January 31, 2011:

Sales (cash and credit) .....	\$591,050
Cash received from credit customers, all of whom took advantage of the discount feature of the corporation's credit terms 4/10, n/30 .....	303,800
Cash received from cash customers .....	210,270
Accounts receivable written off as worthless .....	5,250
Credit memoranda issued to credit customers for sales returns and allowances .....	63,800
Cash refunds given to cash customers for sales returns and allowances .....	13,318
Recoveries on accounts receivable written off as uncollectible in prior periods (not included in cash amount stated above) .....	8,290

The following two balances were taken from the January 31, 2010, balance sheet.

Accounts Receivable .....	\$95,842
Allowance for Bad Debts .....	9,740 (credit)

The corporation provides for its net uncollectible account losses by crediting Allowance for Bad Debts for 1.5% of net credit sales for the fiscal period.

**Instructions:**

1. Prepare the journal entries to record the transactions for the year ended January 31, 2011.
2. Prepare the adjusting journal entry for estimated uncollectible accounts on January 31, 2011.

**Problem 7-47****LO2****Accounting for Cash Discounts**

Stockton Company sold goods on account with a sales price of \$70,000 on August 17. The terms of the sale were 2/10, n/30.

**Instructions:**

1. Record the sale using the gross method of accounting for cash discounts.
2. Record the sale using the net method of accounting for cash discounts.
3. Assume that the payment is received on August 25. Record receipt of the payment using both the gross method and the net method.
4. Assume that payment is received on September 15. Record receipt of the payment using both the gross method and the net method. Is the account used for the net method an asset, liability, revenue, or expense?
5. Which method makes more theoretical sense—the gross method or the net method? Why? Why don't more firms use the net method?

**Problem 7-48****LO2****Estimating Bad Debt Expense; Sales Method vs. Receivables Method**

During 2011, Lacey Enterprises had gross sales of \$247,000. At the end of 2011, Lacey had accounts receivable of \$83,000 and a credit balance of \$5,600 in Allowance for Bad Debts. Lacey has used the percentage-of-sales method to estimate the bad debt expense. For the past several years, the amount estimated to be uncollectible has been 3%.

**Instructions:**

1. Using the percentage-of-gross-sales method, estimate the bad debt expense and make any necessary adjusting entries.
2. Assuming that 6% of receivables are estimated to be uncollectible and that Lacey decides to use the percentage-of-receivables method to estimate the bad debt expense, estimate the bad debt expense and make any adjusting entries.
3. Which of the two methods more accurately reflects the net realizable value of receivables? Explain.

## Problem 7-49

**Estimating Uncollectible Accounts by Aging Receivables**

Rainy Day Company, a wholesaler, uses the aging method to estimate bad debt losses. The following schedule of aged accounts receivable was prepared at December 31, 2011.

## LO2

DEMO PROBLEM

Age of Accounts	Amount
0–30 days .....	\$478,600
31–60 days .....	172,300
61–90 days .....	79,200
91–120 days .....	21,300
Over 120 days .....	8,300
	<u>\$759,700</u>

The following schedule shows the year-end receivables balances and uncollectible accounts experience for the previous five years.

SPREADSHEET

Year	Year-End Receivables	0–30 Days	31–60 Days	61–90 Days	91–120 Days	Over 120 Days
2010	\$780,700	0.3%	0.9%	8.7%	52.1%	84.1%
2009	750,400	0.5	0.8	9.0	49.2	80.3
2008	681,400	0.4	1.1	9.5	53.7	82.0
2007	698,200	0.4	1.0	9.9	51.3	78.5
2006	723,600	0.2	1.1	8.9	49.9	85.2

The unadjusted Allowance for Bad Debts balance on December 31, 2011, is \$30,124.

**Instructions:** Compute the correct balance for the allowance account based on the average loss experience for the last five years and prepare the appropriate end-of-year adjusting entry.

## Problem 7-50

**Warranty Liability**

Sound Portal Corporation sells stereos under a 2-year warranty contract that requires Sound Portal to replace defective parts and provide free labor on all repairs. During 2010, 1,290 units were sold at \$950 each. In 2011, Sound Portal sold an additional 1,100 units at \$980. Based on past experience, the estimated 2-year warranty costs are \$25 for parts and \$30 for labor per unit. It is also estimated that 40% of the warranty expenditures will occur in the first year and 60% in the second year. Actual warranty expenditures were as follows:

## LO2

SPREADSHEET

	2011	2012
Stereos sold in 2010 .....	\$28,500	\$37,800
Stereos sold in 2011 .....	—	28,200

**Instructions:** Assuming that sales occurred on the last day of the year for both 2010 and 2011, give the necessary journal entries for the years 2010 through 2012. Analyze the warranty liability account for the year ended December 31, 2012, to see whether the actual repairs approximate the estimate. Should Sound Portal revise its warranty estimates?

## Problem 7-51

**Warranty Liability**

Lafayette Corporation, a client, requests that you compute the appropriate balance of its estimated liability for product warranty account for a statement as of June 30, 2011.

Lafayette Corporation manufactures television components and sells them with a 6-month warranty under which defective components will be replaced without charge. On December 31, 2010, Estimated Liability for Product Warranty had a balance of \$620,000. By June 30, 2011, this balance had been reduced to \$120,400 by debits for estimated net cost of components returned that had been sold in 2010.

## LO2

SPREADSHEET

The corporation started out in 2011 expecting 7% of the dollar volume of sales to be returned. However, due to the introduction of new models during the year, this estimated percentage of returns was increased to 10% on May 1. It is assumed that no components sold during a given month are returned in that month. Each component is stamped with a date at time of sale so that the warranty may be properly administered. The following table of percentages indicates the likely pattern of sales returns during the 6-month period of the warranty, starting with the month following the sale of components.

Month Following Sale	Percentage of Total Returns Expected
First .....	30%
Second .....	20
Third .....	20
Fourth through sixth—10% each month .....	30
	<u>100%</u>

Gross sales of components were as follows for the first six months of 2011:

Month	Amount	Month	Amount
January .....	\$4,200,000	April .....	\$3,250,000
February .....	4,700,000	May .....	2,400,000
March .....	3,900,000	June .....	1,900,000

The corporation's warranty also covers the payment of freight cost on defective components returned and on the new components sent out as replacements. This freight cost runs approximately 5% of the sales price of the components returned. The manufacturing cost of the components is roughly 70% of the sales price, and the salvage value of returned components averages 10% of their sales price. Returned components on hand at December 31, 2010, were thus valued in inventory at 10% of their original sales price.

**Instructions:** Using the data given, prepare a schedule for arriving at the balance of the estimated liability for product warranty account as of June 30, 2011, and give the proposed adjusting entry.

### Problem 7-52

#### LO2, LO4, LO5

### Journal Entries and Balance Sheet Presentation

The balance sheet for The Itex Corporation on December 31, 2010, includes the following cash and receivables balances.

Cash—First Security Bank .....		\$45,000
Currency on hand .....		16,000
Petty cash fund .....		1,000
Cash in bond sinking fund .....		15,000
Notes receivable (including notes discounted with recourse, \$15,500) .....		36,500
Accounts receivable .....	\$85,600	
Less: Allowance for bad debts .....	<u>4,150</u>	81,450
Interest receivable .....		525

Current liabilities reported in the December 31, 2010, balance sheet included:

Obligation on discounted notes receivable .....	\$15,500
-------------------------------------------------	----------

Transactions during 2011 included the following:

- Sales on account were \$767,000.
- Cash collected on accounts totaled \$576,500, including accounts of \$93,000 with cash discounts of 2%.
- Notes received in settlement of accounts totaled \$82,500.
- Notes receivable discounted as of December 31, 2010, were paid at maturity with the exception of one \$3,000 note on which the company had to pay the bank \$3,090, which included interest and protest fees. It is expected that recovery will be made on this note early in 2012.

- (e) Customer notes of \$58,500 were discounted with recourse during the year, proceeds from their transfer being \$58,500. (All discounting transactions were recorded as loans.) Of this total, \$48,000 matured during the year without notice of protest.
- (f) Customer accounts of \$8,720 were written off during the year as worthless.
- (g) Recoveries of bad debts written off in prior years were \$2,020.
- (h) Notes receivable collected during the year totaled \$27,000 and interest collected was \$2,450.
- (i) On December 31, accrued interest on notes receivable was \$630.
- (j) Uncollectible accounts are estimated to be 5% of the December 31, 2011, Accounts Receivable balance.
- (k) Cash of \$35,000 was borrowed from First Security Bank with accounts receivable of \$40,000 being pledged on the loan. Collections of \$19,500 had been made on these receivables [included in the total given in transaction (b)], and this amount was applied on December 31, 2011, to payment of accrued interest on the loan of \$600, and the balance to partial payment of the loan.
- (l) The petty cash fund was reimbursed (meaning that cash was removed from the bank account and placed in the petty cash fund) based on the following analysis of expenditure vouchers:

Travel expense .....	\$112
Entertainment expense .....	78
Postage expense .....	93
Office supplies expense .....	173
Cash short and over (a revenue account) .....	6

- (m) Cash of \$3,000 was added to a bond retirement fund.
- (n) Currency on hand at December 31, 2011, was \$12,000.
- (o) Total cash payments for all expenses during the year were \$680,000. Charge to General Expenses.

**Instructions:**

1. Prepare journal entries summarizing the preceding transactions and information.
2. Prepare a summary of current cash and receivables for balance sheet presentation.

**Problem 7-53**

LO4

**Compensating Balance and Effective Interest Rates**

Krebsbach Company is negotiating a loan with FIS Bank. Krebsbach needs \$900,000. As part of the loan agreement, FIS Bank will require Krebsbach to maintain a compensating balance of 15% of the loan amount on deposit in a checking account at the bank. Krebsbach currently maintains a balance of \$50,000 in the checking account. The interest rate Krebsbach is required to pay on the loan is 12%; the interest rate FIS pays on checking accounts is 4%.

**Instructions:**

1. Compute the amount of the loan.
2. Determine the effective interest rate on the loan. (*Hint:* Compute the net interest paid on the loan per year and the “take-home” amount of the loan.)

**Problem 7-54**

LO4

**Bank Reconciliation**

The cash account of Abstract, Inc., disclosed a balance of \$16,348.82 on October 31. The bank statement as of October 31 showed a balance of \$19,711.75. Upon comparing the statement with the cash records, the following facts were developed.

- (a) Abstract’s account was charged on October 26 for a customer’s uncollectible check amounting to \$1,927.
- (b) A 2-month, 8%, \$1,350 customer’s note dated August 25, discounted on October 12, was dishonored October 26 and the bank charged Abstract \$1,374.91, which included a protest fee of \$6.91.

- (c) A customer's check for \$580 was entered as \$530 by both the depositor and the bank but was later corrected by the bank.
- (d) Check No. 661 for \$1,838.00 was entered in the cash disbursements journal at \$1,383.00 and Check No. 652 for \$47.50 was entered as \$475.00. The company uses the voucher system.
- (e) Bank service charges of \$54.81 for October were not yet recorded on the books.
- (f) A bank memo stated that C. Castro's note for \$1,800 and interest of \$74.20 had been collected on October 29, and the bank charged \$15.00. (No entry was made on the books when the note was sent to the bank for collection.)
- (g) Receipts of October 29 for \$5,450 were deposited November 1.

The following checks were outstanding on October 31:

No. 620 .....	\$1,075.00	No. 671 .....	\$ 567.55
No. 621 .....	2,199.98	No. 673 .....	337.99
No. 632 .....	2,765.25	No. 675 .....	375.80
No. 670 .....	1,776.89	No. 676 .....	1,189.49

**Instructions:**

1. Prepare a bank reconciliation as of October 31.
2. Give the journal entries required as a result of the preceding information.

**Problem 7-55**

LO4

**Reconciliation of an Individual's Bank Account**

The following data were taken from Tyrone Tardieff's check register for the month of April. Tyrone's bank reconciliation for March showed one outstanding check, Check No. 78 for \$57.00 (written on March 23), and one deposit in transit, Deposit No. 10499 for \$96.00 (made on March 30).

Date	Item	Checks	Deposits	Balance
2011				
April 1	Beginning Balance .....			\$175.00
1	Deposit No. 10500 .....		\$451.61	626.61
1	Check No. 79 .....	\$ 15.00		616.61
4	Check No. 80 .....	261.32		355.59
27	Deposit No. 10501 .....		247.28	602.87
29	Check No. 81 .....	214.35		389.52

The following is from Tyrone's bank statement for April:

April 1	Beginning Balance .....			\$136.00
3	Check No. 79 .....	\$ 15.00		121.00
3	Deposit No. 10499 .....		\$ 96.00	217.00
5	Check No. 80 .....	261.32		(44.32)
5	Automatic Loan .....		132.00	87.68
5	Deposit No. 10500 .....		457.61	545.29
20	NSF Check .....	20.00		525.29
20	Service Charge .....	15.00		510.29
30	Interest .....		1.21	511.50

**Instructions:** Prepare a reconciliation of Tyrone's bank account as of April 30. Show both a corrected balance per bank and a corrected balance per books. Assume that any errors or discrepancies you find are Tyrone's fault, not the bank's.

**EXPANDED MATERIAL**

**Problem 7-56**

LO6

**Accounting for Assignment of Accounts Receivable**

On July 1, 2011, McEnroe Company used receivables totaling \$150,000 as collateral on a \$100,000, 15% note from Standard One Bank. The transaction is not structured such that receivables are being sold. McEnroe will continue to collect the assigned

receivables. In addition to the interest on the note, Standard One also receives a 2.5% finance charge, deducted in advance on the \$100,000 value of the note. Additional information for McEnroe Company is as follows:

- July collections amounted to \$91,000, less cash discounts of \$575.
- On August 1, paid bank the amount owed for July collections plus accrued interest on note to August 1.
- McEnroe collected the remaining accounts during August except for \$425 written off as uncollectible.
- On September 1, paid bank the remaining amount owed plus accrued interest.

**Instructions:** Prepare the journal entries necessary to record the preceding information on the books of both McEnroe Company and Standard One Bank.

### Problem 7-57

#### LO6

#### Assigning and Factoring Accounts Receivable

During its second year of operations, Shank Corporation found itself in financial difficulties. Shank decided to use its accounts receivable as a means of obtaining cash to continue operations. On July 1, 2011, Shank sold \$75,000 of accounts receivable for cash proceeds of \$69,500. No bad debt allowance was associated with these accounts. On December 17, 2011, Shank assigned the remainder of its accounts receivable, \$250,000 as of that date, as collateral on a \$125,000, 12% annual interest rate loan from Sandy Finance Company. Shank received \$125,000 less a 2% finance charge. Additional information is as follows:

Allowance for Bad Debts, 12/31/11 .....	\$3,200 (credit)
Estimated Uncollectibles, 12/31/11 .....	3% of Accounts Receivable
Accounts Receivable (not including factored and assigned accounts), 12/31/11 .....	\$50,000

None of the assigned accounts has been collected by the end of the year.

**Instructions:**

- Prepare the journal entries to record the receipt of cash from the (a) sale and (b) assignment of the accounts receivable.
- Prepare the journal entry necessary to record the adjustment to Allowance for Bad Debts.
- Prepare the Accounts Receivable section of Shank's balance sheet as it would appear after the above transactions.
- What entry would be made on Shank's books when the sold accounts have been collected?

### Problem 7-58

#### LO6

#### Selling Receivables

Freemont Factors provides financing to other companies by purchasing their accounts receivable on a nonrecourse basis. Freemont charges its clients a commission of 15% of all receivables factored. In addition, Freemont withholds 10% of receivables factored as protection against sales returns or other adjustments. Freemont credits the 10% withheld to Client Retainer and makes payments to clients at the end of each month so that the balance in the retainer is equal to 10% of unpaid receivables at the end of the month. Freemont recognizes its 15% commissions as revenue at the time the receivables are factored. Also, experience has led Freemont to establish an Allowance for Bad Debts of 4% of all receivables purchased.

On January 4, 2011, Freemont purchased receivables from Detmer Company totaling \$1,500,000. Detmer had previously established an Allowance for Bad Debts for these receivables of \$35,000. By January 31, Freemont had collected \$1,200,000 on these receivables.

**Instructions:**

- Prepare the entries necessary on Freemont's books to record the preceding information. Freemont makes adjusting entries at the end of every month.
- Prepare the entries on Detmer's books to record the preceding information.

**Problem 7-59****Accounting for a Non-Interest-Bearing Note****LO7**

On January 1, 2011, Rapid River Realty sold a tract of land to three doctors as an investment. The land, purchased 10 years ago, was carried on Rapid River's books at a value of \$210,000. Rapid River received a non-interest-bearing note for \$275,000 from the doctors. The note is due December 31, 2012. There is no readily available market value for the land, but the current market rate of interest for comparable notes is 11%.

**Instructions:**

1. Give the journal entry to record the sale of land on Rapid River's books.
2. Prepare a schedule of discount amortization for the note with amounts rounded to the nearest dollar.
3. Give the adjusting entries to be made at the end of 2011 and 2012 to record the effective interest earned.

**Problem 7-60****Note with Below-Market Interest Rate****LO7**

On January 1, 2011, Denver Company sold land that originally cost \$400,000 to Boise Company. As payment, Boise gave Denver a \$600,000 note. The note bears an interest rate of 4% and is to be repaid in three annual installments of \$200,000 (plus interest on the outstanding balance). The first payment is due on December 31, 2011. The market price of the land is not reliably determinable. The prevailing rate of interest for notes of this type is 14%.

**Instructions:** Prepare the entries required on Denver's books to record the land sale and the receipt of each of the three payments. Use the effective-interest method of amortizing any premium or discount on the note.

**Problem 7-61****Bad Debt Expense—Cash Flows****LO8**

Strata Company had a \$275,000 balance in Accounts Receivable on January 1. The balance in Allowance for Bad Debts on January 1 was \$68,000. Sales for the year totaled \$2,100,000. All sales were credit sales. Bad debts expense is estimated to be 3% of sales. Write-offs of uncollectible accounts for the year were \$58,000. The debit balance in Accounts Receivable on December 31 was \$335,000. All receivables are trade receivables. Strata uses the direct method in preparing its statement of cash flows.

**Instructions:** What is the amount of cash collected from customers?

**Problem 7-62****Sample CPA Exam Questions****LO2, LO4, LO6**

1. At December 31, 2011, Kale Co. had the following balances in the accounts it maintains at First State Bank:

Checking account No. 001 .....	\$175,000
Checking account No. 201 .....	(10,000)
Money market account .....	25,000
90-day certificate of deposit, due February 28, 2012 .....	50,000
180-day certificate of deposit, due March 15, 2012 .....	80,000

Kale classifies investments with original maturities of three months or less as cash equivalents. In its December 31, 2011, balance sheet, what amount should Kale report as cash and cash equivalents?

- (a) \$190,000
  - (b) \$200,000
  - (c) \$240,000
  - (d) \$320,000
2. When the allowance method of recognizing uncollectible accounts is used, the entry to record the write-off of a specific account would:
    - (a) decrease both accounts receivable and the allowance for uncollectible accounts.
    - (b) decrease accounts receivable and increase the allowance for uncollectible accounts.

- (c) increase the allowance for uncollectible accounts and decrease net income.
  - (d) decrease both accounts receivable and net income.
3. Gar Co. factored its receivables without recourse with Ross Bank. Gar received cash as a result of this transaction, which is best described as a:
- (a) loan from Ross collateralized by Gar's accounts receivable.
  - (b) loan from Ross to be repaid by the proceeds from Gar's accounts receivable.
  - (c) sale of Gar's accounts receivable to Ross, with the risk of uncollectible accounts retained by Gar.
  - (d) sale of Gar's accounts receivable to Ross, with the risk of uncollectible accounts transferred to Ross.

## CASES

### Discussion Case 7-63

#### Should a Company Sell on Credit?

Olin Company currently makes only cash sales. Given the number of potential customers who have requested to buy on credit, Olin is considering allowing credit sales. What factors should Olin consider in making the decision whether to allow credit sales?

### Discussion Case 7-64

#### Accounting for Potential Sales Returns

Ultimate Corporation is a computer products supplier. Ultimate sells products to dealers who then sell the products to the end users. Most of the company's competitors require dealers to pay for shipments within 45 to 60 days. Ultimate has followed a more relaxed policy; in 2011 the average length of time it took the company to collect its receivables was 158 days. (This average collection period can be computed as average accounts receivable balance/average daily sales.) It has been suggested that in return for this lax collection policy, dealers allowed Ultimate to ship more product than the dealers needed, allowing Ultimate to recognize the excess shipments as sales. In 2012, Ultimate attempted to reduce the level of its accounts receivable by stepping up collection efforts. As a result, product returns from dealers increased significantly.

1. Assume that Ultimate's sales for the year were \$1,000 with cost of sales being \$600. For simplicity, also assume that all of the sales occurred on December 31 and that, on average, Ultimate expects about 15% of products sold to be returned by dissatisfied dealers or dealers who are unable to sell the products. What adjusting entry, if any, should be made at year-end to reflect the likelihood of future sales returns?
2. An allowance for sales returns is analogous to an allowance for bad debts. Most companies disclose an allowance for bad debts but very few disclose an allowance for sales returns. Why not?
3. What other more conservative accounting treatment is possible in regard to the potential sales returns?

### Discussion Case 7-65

#### Accounting for Uncollectibles

During the audit of accounts receivable of Montana Company, the new CEO, Joe Frisco, asked why the company had debited the current-year expense for bad debts on the assumption that some accounts will become uncollectible next year. Frisco believes that the financial statements should be based on verifiable, objective evidence. In his opinion it would be more objective to wait until specific accounts become uncollectible before the expense is recorded. What accounting issues are involved? Which method of accounting for uncollectible accounts would you recommend and why?

### Discussion Case 7-66

#### Cash Management

Jackie Wilson, manager of Expert Building Company, is a valued and trusted employee. She has been with the company from its start two years ago. Because of the demands of her job, she has not taken a vacation since she began working. She is in charge of recording collections on account, making the daily bank deposits, and reconciling the bank statement.

Early this year, clients began complaining to you, the president, about incorrect statements. As president, you check into this matter. Jackie tells you there is nothing to worry about. She asserts, “The problem is due to the slow mail; customers’ payments and statements are crossing in the mail.” However, because clients were not complaining last year, you doubt that the mail is the primary reason for the problem.

What might be some of the reasons for the delay? What are some other problems that might begin to occur? What can be done to remedy the problem? What should be done to make sure the problems are avoided in the future?

**Discussion**  
**Case 7-67**

**Allocation of Cash and Near-Cash Assets**

Bruno Johnson, chief financial officer of Tollerud Company, has determined that Tollerud should keep on hand \$35 million in cash or near-cash assets in order to maintain proper liquidity. Bruno is now trying to determine how to allocate the \$35 million among the checking account, certificates of deposit, and treasury notes. What factors should influence Bruno’s decision?

**Discussion**  
**Case 7-68**

**Did I Hide It Well Enough?**

Jonathan Mitchell is the accountant for Mantua Service Company. Due to heavy investments in lottery tickets, Jonathan found himself short of cash and decided to “borrow” funds from Mantua. Jonathan received and deposited cash receipts, recorded the checks written in the cash disbursements journal, and reconciled the bank account. He made the reconciliation balance by manipulating outstanding checks in the bank reconciliation. Would this type of embezzlement be detected with a proper reconciliation of the checking account? Justify your answer.

**EXPANDED MATERIAL**

**Discussion**  
**Case 7-69**

**Accounts Receivable as a Source of Cash**

Assume you are the treasurer for Fullmer Products Inc. and one of your responsibilities is to ensure that the company always takes available cash discounts on purchases. The corporation needs \$150,000 within one week in order to take advantage of current cash discounts. The lending officer at the bank insists on adequate collateral for a \$150,000 loan. For various reasons, your plant assets are not available as collateral, but your accounts receivable balance is \$205,000. What alternatives would you consider for obtaining the necessary cash?

**Case 7-70**

**Deciphering Financial Statements (The Walt Disney Company)**

Locate the 2007 financial statements for **The Walt Disney Company** on the Internet. Use the information contained in these statements to answer the following questions:

1. Review The Walt Disney Company’s note disclosure to determine how the company recognizes revenue from its various sources.
2. Based on what you know about Disney, estimate what you think is the length of its average collection period. Once you have made that estimate, use the company’s financial statements to compute the number. How does your estimate compare with the actual results?
3. Review the information relating to Disney’s segment data. Which segment generates the most revenue for the company? Which segment’s revenue grew the most from 2005 to 2007? Which segment generates the most operating income?
4. Using information from the various financial statements, compute the amount of cash collected from customers for the 2007 fiscal year.
5. How does Disney define *cash and cash equivalents*?

**Case 7-71**

**Deciphering Financial Statements (Wal-Mart Stores, Inc.)**

Use the financial information for **Wal-Mart Stores, Inc.**, given on page 379, to answer the following questions:

1. For the most recent year given, compute Wal-Mart's average collection period.  
*Hint:* Use 'Net Sales' in the computation.
2. For the most recent year given, what percentage of total current assets is accounts receivable for Wal-Mart?
3. For the most recent year given, determine the percentage of Wal-Mart's revenues that is derived from sources other than sales.

**Case 7-72****Deciphering Financial Statements (Harley-Davidson, Inc.)**

From the notes of the 2007 annual report for **Harley-Davidson, Inc.**, we find the following information relating to Allowance for Bad Debts:

Balance at beginning of year .....	\$27,283
Provision for finance credit losses .....	11,252
Charge-offs, net of recoveries .....	(8,240)
Balance at end of year .....	30,295

**Instructions:**

1. What do the terms *provision* and *charge-offs* represent?
2. Reconstruct the journal entries that resulted in the above changes in Allowance for Bad Debts.
3. Why do you think there is such a difference between the amount being expensed for the period and the amount being written off?

**Case 7-73****Writing Assignment (Foreign loan write-offs)**

In July 1990, U.S. federal regulators ordered U.S. banks to write off 20% of their \$11.1 billion in loans to Brazil and also 20% of their \$2.9 billion in loans to Argentina. The action significantly affected the loan loss reserves, that is, Allowance for Bad Debts, of the banks. For example, **Citicorp** was ordered to write off loans totaling \$780 million, compared to Citicorp's total loan loss reserve of \$3.3 billion. However, it was reported that "the action won't automatically have any impact on bank earnings." Prepare a short report answering the following questions:

1. Why won't the ordered write-offs automatically impact bank earnings?
2. Might the ordered write-offs have an indirect impact on future bank earnings?
3. What effect would you expect to see on bank stock prices in response to this announcement?

SOURCE: Robert Guenther, "Federal Regulators Order Banks to Take Write-Offs on Loans to Brazil, Argentina," *The Wall Street Journal*, July 12, 1990, p. A3.

**Case 7-74****Researching Accounting Standards**

To help you become familiar with the accounting standards, this case is designed to take you to the FASB's Web site and have you access various publications. Access the FASB's Web site at <http://www.fasb.org>. Click on "Pronouncements & EITF Abstracts."

In this chapter, we discussed estimations of both bad debt expense and warranty expense. For this case, we will use *Statement of Financial Accounting Standards No. 154*, "Accounting Changes and Error Corrections." Open *FASB Statement No. 154*.

1. Read the paragraph in the summary titled "Reasons for Issuing this Statement." What is cited as the primary reason behind the issuance of this accounting standard?
2. Read paragraph 19. If a firm, in the normal course of business, revises its estimate of bad debt expense from one year to the next, should the firm provide pro forma information so that users will be able to tell what bad debt expense would have been if prior estimates had been used?
3. Read paragraph 22. What is the one instance in which a change in the estimate of uncollectible accounts would be required to be disclosed?

**Case 7-75****Ethical Dilemma**

You recently graduated from college with your accounting degree. Your father's best friend is the director of the accounting department of a small manufacturing firm in the area, and you accepted a position on his staff. After a month on the job, you have noticed several deficiencies in the cash controls for the company. For example, the individual making the daily deposits at the bank is also in charge of updating accounts receivable. You also notice that the petty cash fund is under general control of everyone in the office (that means that no one person has ultimate responsibility) and that vouchers are seldom completed when cash is removed from the fund. You bring your concerns to the attention of your boss, your father's friend, and he comments:

"I appreciate your concerns. I knew when we hired you that you were sharp, but you need to understand that not everything is done by the book here. We trust our employees. If we were to enforce rigid controls on cash, it would create a nontrusting work environment. We don't want that. Sure, a little money may turn up missing now and then, but it is a small price to pay. Now, don't you worry about it anymore."

What do you do now? Would you be comfortable working in an environment where there is a lack of control on cash? If a significant sum of money were to turn up missing and the control system was unable to determine who was responsible, what would that do to the trusting work environment? And remember, big sums of money never turned up missing until you came to work at the company.

### Case 7-76

SPREADSHEET

### Cumulative Spreadsheet Analysis

This spreadsheet assignment is a continuation of those given in earlier chapters. If you completed those assignments, you have a headstart on this one. Refer to the instructions for preparing the revised financial statements for 2011 as given in part (1) of the Cumulative Spreadsheet Analysis assignment in Chapter 3.

1. Skywalker wishes to prepare a forecasted balance sheet, a forecasted income statement, and a forecasted statement of cash flows for 2012. Clearly state any additional assumptions that you make. Use the financial statement numbers for 2011 as the basis for the forecast, along with the following data:
  - (a) Sales in 2012 are expected to increase by 40% over 2011 sales of \$2,100.
  - (b) In 2012, Skywalker expects to acquire property, plant, and equipment for \$240.
  - (c) The \$480 in operating expenses reported in 2011 breaks down as follows: \$15 depreciation expense and \$465 other operating expenses.
  - (d) No new long-term debt will be acquired in 2012.
  - (e) No cash dividends will be paid in 2012.
  - (f) New short-term loans payable will be acquired in an amount sufficient to make Skywalker's current ratio in 2012 exactly equal to 2.0.
  - (g) Skywalker does not expect to repurchase additional shares of stock in 2012.
  - (h) Because changes in future prices and exchange rates are impossible to predict, Skywalker's best estimate is that the balance in accumulated other comprehensive income will remain unchanged in 2012.
  - (i) In the absence of more detailed information, assume that investment securities, long-term investments, other long-term assets, and intangible assets will all increase at the same rate as sales (40%) in 2012.
  - (j) In the absence of more detailed information, assume that other long-term liabilities will increase at the same rate as sales (40%) in 2012.

(Note: The forecasted balance sheet and income statement were constructed as part of the spreadsheet assignment in Chapter 4; you can use that spreadsheet as a starting point if you have completed that assignment.) In addition, assume the following:

- (k) The investment securities are classified as available-for-sale. Thus, cash from the purchase and sale of these securities is classified as an investing activity.
- (l) Transactions impacting other long-term assets and other long-term liabilities accounts are operating activities. [*Hint:* Construction of the forecasted statement of cash flows for 2012 involves analyzing the forecasted income statement for 2012 along with the balance sheets for 2011 (actual) and 2012 (forecasted).]

For this exercise, the current assets are expected to behave as follows:

- (m) Cash, investment securities, and inventory will increase at the same rate as sales.
  - (n) The forecasted amount of accounts receivable in 2012 is determined using the forecasted value for the average collection period (computed using the end-of-period accounts receivable balance). The average collection period for 2012 is expected to be 14.08 days.
2. Repeat (1), with the following changes in assumptions:
    - (a) Average collection period is expected to be 9.06 days.
    - (b) Average collection period is expected to be 20 days.
  3. Comment on the differences in the forecasted values of cash from operating activities in 2012 under each of the following assumptions about the average collection period: 14.08 days, 9.06 days, and 20 days.

8

REVENUE RECOGNITION

## LEARNING OBJECTIVES

The rise and fall of **MicroStrategy** encapsulates the boom and bust, sprinkled with accounting scandal, associated with the high-tech economy from 1998 through 2002. At its peak, MicroStrategy was worth \$31.1 billion and was trading at a price-to-sales ratio of 152 and a price-to-earnings ratio of 2,220. But in a sell-off precipitated by a revenue-related accounting restatement, the shares reached a low of \$0.45 on July 26, 2002, down from their peak of \$333.00 on March 10, 2000 (a 99.9% drop). In the wake of this price collapse, MicroStrategy's CEO was fined by the SEC, and the company's auditor was sued by outraged investors. An outline of MicroStrategy's rise and fall follows.

Many people have described MicroStrategy's CEO Michael Saylor as the smartest person they know.<sup>1</sup> He grew up outside Dayton, Ohio, the son of an Air Force sergeant, and entered MIT on an ROTC scholarship, intending to become an Air Force pilot. While at MIT, Saylor developed skills in computer simulation, and he wrote his undergraduate thesis using a computer simulation to model the reactions of different types of government systems to catastrophes such as wars or epidemics. Since a heart murmur had cut short his chances of becoming a pilot, Saylor became a computer modeler for **DuPont**.

In 1989, Saylor started his own computer modeling business, called MicroStrategy, in partnership with his MIT roommate, Sanju Bansal. The foundation of MicroStrategy's product line has been its corporate data mining program. The program combs through terabytes of data in an unwieldy corporate database, looking for interesting relationships. For example, MicroStrategy customers **McDonald's** and **Wal-Mart** could use the program to detect customer buying trends on, say, Monday afternoons in the summer in California compared to Texas to help in targeting local marketing efforts. This data mining program was very successful, and MicroStrategy doubled its revenues each year from 1994 through 1998, growing from 1994 revenues of \$4.98 million to 1998 revenues of \$106.43 million. The company went public on June 11, 1998, with the shares opening at \$12 per share and ending the first day of trading at \$21 per share.

In early 1999, MicroStrategy was a solid software company with an impressive record of revenue and profit growth. However, the company's price-to-sales ratio was just 12, compared to ratios routinely more than 100 for dot.com companies. This was because MicroStrategy was not benefiting from any of the "Internet halo" that seemed to surround all companies that were in any way affiliated with the Web in those days. And Michael Saylor had a vision of making his company much more than a software company. This vision is captured in the company motto: "Information like water." Saylor wanted to place the power of the data mining software that MicroStrategy provided to corporations into the hands of individuals. Accordingly, in July 1999 MicroStrategy launched Strategy.com, which promised to make personalized information available to individuals by email, through the Web, and by wireless phone. Subscribers could receive tailored messages about finance, news, weather, sports, and traffic, and that was just the beginning. By the end of 1999, Strategy.com had not yet generated a single dollar of revenue for MicroStrategy, but the initiative had brought the aura of the Internet to the valuation of MicroStrategy's stock, causing the price-to-sales ratio to increase from 12 to 150. In January 2000,

- 1 Identify the primary criteria for revenue recognition.
- 2 Apply the revenue recognition concepts underlying the examples used in *SAB 101/104*.
- 3 Describe the two asset-and-liability approaches to revenue recognition that are currently being considered by the FASB and IASB: the customer consideration model and the measurement model.
- 4 Record journal entries for long-term construction-type contracts using percentage-of-completion and completed-contract methods.
- 5 Record journal entries for long-term service contracts using the proportional performance method.
- 6 Explain when revenue is recognized after delivery of goods or services through installment sales, cost recovery, and cash methods.

<sup>1</sup> Mark Leibovich, "MicroStrategy's CEO Sped to the Brink," *The Washington Post*, January 6, 2002, p.A01. This article was the first in a 4-part series by Mr. Leibovich that ran January 6–9, 2002, in *The Washington Post*. All four articles serve as source material for this brief history of MicroStrategy.

while all 1,600 MicroStrategy employees were on a company cruise in the Cayman Islands, the company's stock increased in value by 19% on one day, and Michael Saylor's holdings alone increased in value by \$1 billion. "We should go on cruises more often," joked Saylor.

A price-to-sales ratio of 150 means that investors expect substantial sales growth (and ultimately substantial profit and cash flow growth) in the future. It also means that any stumbling on the part of the company can result in a catastrophic drop in stock price. For example, if a company has a market value of \$30 billion with a price-to-sales ratio of 150, like MicroStrategy in early 2000, then negative news about the future that causes the price-to-sales ratio to drop to a lower but still respectable level of, say, 6 (which was the price-to-sales ratio for **Coca-Cola** in early 2000) would cause the company's stock price to drop 96% to \$1.2 billion. This type of precarious valuation puts huge pressure on managers to continue to report revenue growth that meets or exceeds the market's expectation. In the face of this pressure, MicroStrategy, like many firms before and many since, broke the accounting rules governing when sales can be reported.

On March, 12, 2000, MicroStrategy's chief financial officer (CFO) received a call from the partner in charge of the company's audit. The audit firm, **PricewaterhouseCoopers** (PwC), had been reviewing MicroStrategy's revenue recognition practices and believed that a restatement was necessary. This investigation had been initiated in part in response to a March 6, 2000, *Forbes* article by reporter David Raymond questioning MicroStrategy's reporting of sales.<sup>2</sup> MicroStrategy's board of directors was reluctant to restate revenue because preliminary revenue numbers for 1999 had already been announced, helping to drive the company's stock price to its all-time high. However, with the board finally convinced of the necessity, a press release was drafted explaining that MicroStrategy was lowering its 1999 revenues from the previously announced \$205 million to between \$150 and \$155 million. The news announcement was issued at 8:06 A.M. on Monday, March 20, 2000. MicroStrategy's stock opened the day trading at \$226.75 per share; by the end of the day, the shares had dropped 62% to \$86.75 per share.

Subsequent SEC investigation confirmed that MicroStrategy had overstated its revenue, and the inquiry uncovered a number of questionable practices.<sup>3</sup> Two samples are given below.

- *Contract signing.* The final report on MicroStrategy from the SEC included the following: "To maintain maximum flexibility to achieve the desired quarterly

financial results, MicroStrategy held, until after the close of the quarter, contracts that had been signed by customers but had not yet been signed by MicroStrategy. Only after MicroStrategy determined the desired financial results were the unsigned contracts apportioned, between the just-ended quarter and the then-current quarter, signed and given an 'effective date.' In some instances, the contracts were signed without affixing a date, allowing the company further flexibility to assign a date at a later time."

- *The NCR deal.* On October 4, 1999, MicroStrategy announced that it had sold software and services to **NCR** for \$27.5 million under a multiyear licensing agreement. Although the deal was announced four days after the end of the third quarter and although the licensing agreement extended for several years, MicroStrategy recognized over half the amount as revenue immediately (and perhaps retroactively) and added \$17.5 million to third quarter revenue. Without this \$17.5 million in revenue, MicroStrategy's reported revenue for the third quarter would have been down 20% from the quarter before. The reported profit for the quarter would have instead been a loss. And perhaps worst of all, MicroStrategy would have fallen well short of analysts' expectations, sending the stock price spiraling downward. As it was, MicroStrategy's stock price soared 72% during the month of October 1999.

The aftermath of the MicroStrategy meltdown was bad for all of the principal characters involved. Michael Saylor was judged by the SEC to have committed fraud. He paid a fine of \$350,000 and was required to forfeit an additional \$8.3 million in gains from stock sales. As of June 2008, his stake in MicroStrategy was worth just \$219 million, down from \$14 billion at his company's pinnacle. In May 2001, PricewaterhouseCoopers agreed to pay \$55 million to settle a class-action lawsuit brought by MicroStrategy shareholders who accused the audit firm of negligence in allowing MicroStrategy's financial reporting to go uncorrected for so long. And in August 2003, the SEC announced that it had settled a suit with the PwC partner in charge of the MicroStrategy audit, with the partner agreeing to be barred from auditing public clients. MicroStrategy itself is slowly recovering from the bursting of its revenue bubble. The company reported losses in three of the four years from 2000 through 2003, but the company has reported positive net income in each year from 2004 through 2007. And as of June 2008, the company's price-to-sales ratio was 2.63, up from its low point of just 0.25 in the wake of the revenue recognition scandal, but still a far cry from its pre-scandal peak of 152.

<sup>3</sup> Securities and Exchange Commission, *Accounting and Auditing Enforcement Release No. 1350*, Administrative Proceeding File No. 3-10388: In the Matter of MicroStrategy, Inc., December 14, 2000.

## QUESTIONS

1. *Why do you think the price-to-sales ratio (as opposed to the price-earnings ratio) is often used in valuing the stocks of start-up technology companies, especially those related to the Internet?*
2. *On Monday, March 20, 2000, MicroStrategy issued a press release stating that revenues for the year 1999 were about \$155 million, not \$205 million as previously announced. This represented a drop of 24% in reported revenue. Why did a drop of just 24% in reported revenue result in a stock price drop of 62%? In other words, why wasn't the drop in stock price also 24%?*
3. *In early March 2000, MicroStrategy's board of directors received word that the company's auditor was requesting a revenue restatement. The board was reluctant to go forward with the restatement because of fears (justified, as it turns out) that the restatement would hurt the company's stock price. List and explain two or three arguments that you, as a member of the board, could have made in support of the restatement.*

**Answers to these questions can be found on page 421.**

In the MicroStrategy case, both the boom and the bust are tied to the accounting rules for revenue recognition. With high-growth companies boasting price-to-sales ratios of 150 or higher, a delay in reporting revenue from a \$10 million contract can easily lead to losses in market value in excess of \$1 billion. Because so much rides on how much revenue a company reports, many companies have succumbed to the temptation to either manage reported revenue or to commit outright fraud in boosting reported revenue. Because revenue recognition is such an important issue in today's economy, the SEC released *Staff Accounting Bulletin (SAB) No. 101*, "Revenue Recognition in Financial Statements," in December 1999, followed by *SAB 104*, "Revenue Recognition, corrected copy" in December 2003. *SAB 101/104* has been one of the most influential, and controversial, accounting pronouncements in the last 15 years. The FASB has also undertaken a comprehensive examination of the accounting standards related to revenue recognition. As investors struggle to guide their investment capital to its most valuable use in the uncertain, high-tech business playing field, reliable financial reporting with respect to revenue recognition is critical.

This chapter will proceed as follows. The first section includes a review of the general principles associated with revenue recognition. The next section uses *SAB 101/104* as a framework and provides illustrations of difficult revenue recognition issues. The concluding sections cover specific revenue recognition practices and illustrate the percentage-of-completion, proportional performance, and installment sales methods of accounting.

# Revenue Recognition

**1** Identify the primary criteria for revenue recognition.

**WHY** The recognition of revenue begins the process of measuring income. Once revenue has been recognized, then expenses can be matched. In addition, without recognizing revenue, a company can't hope to report any profit. Accordingly, company accountants are typically under great pressure to recognize revenue as soon as possible.

**HOW** Revenue is typically recognized when two criteria have been met. The first criterion is realizability, which means that the seller has received payment or a valid promise of payment from the purchaser. The second criterion is met when the earnings process is substantially complete.

**Recognition** refers to the time when transactions are recorded on the books. The FASB's two criteria for recognizing revenues and gains, articulated in FASB *Concepts Statement No. 5*, were identified in Chapter 4 and are repeated here for emphasis. Revenues and gains are generally recognized when:

1. They are realized or realizable.
2. They have been earned through substantial completion of the activities involved in the earnings process.

Both of these criteria generally are met at the point of sale, which most often occurs when goods are delivered or when services are rendered to customers. Usually, assets and revenues are recognized concurrently. Thus, a sale of inventory results in an increase in Cash or Accounts Receivable and an increase in Sales Revenue. However, assets are sometimes received before these revenue recognition criteria are met. For example, if a client pays for consulting services in advance, an asset, Cash, is recorded on the books even though revenue has not been earned. In these cases, a liability, Unearned Revenue, is recorded. When the revenue recognition criteria are fully met, revenue is recognized and the liability account is reduced.

Exhibit 8-1 illustrates the time line associated with revenue recognition. At the point of sale, both revenue recognition criteria are typically satisfied. That is, the company has provided a product or service (criterion 2), and the customer has provided payment or a valid promise of payment (criterion 1). But as pointed out in the exhibit, exceptions exist, and revenue can be recognized before the point of sale, or in some conditions, the recognition of revenue must be deferred until after the point of sale.

In general, revenue is not recognized prior to the point of sale because either (1) a valid promise of payment has not been received from the customer or (2) the company has not provided the product or service. An exception occurs when the customer provides a valid promise of payment and conditions exist that contractually guarantee the sale. The most common example of this exception occurs in the case of long-term contracts where the two parties involved are legally obligated to fulfill the terms of the contract. In this case, revenue (or at least a portion of the total contract price) may be recognized prior to the point of final sale.

Another exception to the general rule occurs when either of the two revenue recognition criteria is not satisfied at the point of sale. In some cases, a product or service may

be provided to the customer without receiving a valid promise of payment. In these instances, revenue is not recognized until payment or the valid promise is received. Now you are saying to yourself, "Why would anyone provide a product or service to a customer without receiving a valid promise of payment?" A common example is a family doctor who frequently provides treatment first and then tries to collect payment

**fyi**

"Realized" or "realizable" can be interpreted as having received cash or other assets or a valid promise of cash or other assets to be received at some future time.

EXHIBIT 8-1 Revenue Recognition Time Line and Criteria			
	Before the Point of Sale	Point of Sale	After the Point of Sale
	<b>EXCEPTION:</b> Revenue can be recognized prior to the point of sale <i>if</i> :	<b>NORMAL:</b> Revenue is generally recognized at this point in time.	<b>EXCEPTION:</b> The recognition of revenue must be deferred <i>if</i> :
Criterion 1: Realized	Customer provides a valid promise of payment AND	Criterion 1 is typically satisfied at this point.	Customer does not provide a valid promise at time of receipt of product or service OR
Criterion 2: Substantially complete	conditions exist that contractually guarantee subsequent sale.	Criterion 2 is typically satisfied at this point.	significant effort remains on contract.

later.<sup>4</sup> Also, if a customer provides payment yet substantial services must still be provided by the company, then the recognition of revenue must be postponed until those services are provided. In any case, if both of the two revenue recognition criteria are

met prior to the point of sale, revenue may be recognized. If either of the two criteria is not met at the point of sale, then the recognition of revenue must wait.

Although the point-of-sale rule has dominated the practice of revenue recognition, there have been notable variations to this rule. In fact, the cases in the far right column in Exhibit 8-1—in which revenue should be recognized after the point of sale—have

proved to be very controversial. As illustrated in the MicroStrategy scenario at the beginning of the chapter, pressure to meet market and analyst revenue expectations has made companies, especially startup companies, reluctant to defer the recognition of revenue past the point of sale.

In addition, the timing of revenue recognition has become more complicated as business arrangements have become more complex. Companies frequently enter into multi-faceted transactions that specify one overall transaction price but require delivery of several different elements of value to the customer. For example, a technology services company may sign a contract, with one single overall price, with a customer to provide hardware, software, installation, service, and off-site data backup for two years. Accounting for these transactions involving “multiple deliverables” is a focus of much study and debate by both the FASB and the IASB. Multiple-deliverable arrangements will be discussed in detail later in the chapter.

Because every income statement begins with total revenue, the measurement of revenue is fundamental to the practice of accrual accounting. As you can imagine, the topic of revenue recognition has been studied very thoroughly through the years. The FASB has commissioned a number of studies on the topic of revenue recognition.<sup>5</sup>

<sup>4</sup> Anyone who has visited a doctor recently can attest to the fact that most medical personnel now do all they can to secure payment or a valid promise (generally through insurance) prior to providing the service. They have learned the hard way.

<sup>5</sup> In the early 1980s, the FASB issued three research reports dealing with revenue recognition. These reports were used by the FASB in its deliberations leading to *Concepts Statement No. 5* and several of the special industry standards. The reports were (1) Yuji Ijiri, *Recognition of Contractual Rights and Obligations* (Stamford, CT: Financial Accounting Standards Board, 1980); (2) Henry R. Jaenicke, *Survey of Present Practice in Recognizing Revenues, Expenses, Gains and Losses* (Stamford, CT: Financial Accounting Standards Board, 1981); (3) L. Todd Johnson and Reed K. Storey, *Recognition in Financial Statements: Underlying Concepts and Practical Conventions* (Stamford, CT: Financial Accounting Standards Board, 1982).

fyi

The notes to **Walt Disney's** financial statements provide an example of how one firm might have several different revenue recognition policies, depending on what is being sold.

The AICPA has also compiled many specific guides to help in the application of the revenue recognition criteria to specific industries. In fact, AICPA *Statement of Position (SOP) 97-2*, “Software Revenue Recognition,” has been very influential in guiding revenue recognition practices in high-tech companies. In *SOP 97-2* companies are given more guidance in applying the two general revenue recognition criteria through a checklist of four factors that amplify the two general criteria:<sup>6</sup>

- (a) Persuasive evidence of an arrangement exists.
- (b) Delivery has occurred.
- (c) The vendor’s fee is fixed or determinable.
- (d) Collectibility is probable.

In general, the first two items relate to whether revenue has been earned, and the last two items relate to the realizability of the revenue. Although these four items were developed in the context of software revenue recognition, the principles have been extended to many other contexts. In fact, the SEC used these four items as the framework for discussion of revenue recognition in *SAB 101*. Accordingly, these four items will be discussed in more detail in the next section.

From this discussion, you should get the sense that the FASB has lost the lead in establishing the concepts and standards that define appropriate revenue recognition. This is a troubling development because other bodies such as the SEC and the AICPA tend to approach accounting standards from a practical, problem-solving viewpoint as compared to the conceptual approach preferred by the FASB. The problem-solving viewpoint is great for quick action, but it results in a set of standards that has no unifying conceptual underpinning. The FASB’s approach, although sometimes excruciatingly slow, gives more predictability and logical structure to accounting standards. The FASB is currently (June 2008) engaged in a revenue recognition project in conjunction with the IASB. The FASB has tentatively decided to move away from the realizability and substantial completion criteria described above and to instead emphasize an asset-and-liability approach that is consistent with the FASB’s conceptual framework. The implementation details of this approach are still unsettled, so it is premature to cover this approach in any detail here. However, two potential forms of an asset-and-liability approach, called the measurement approach and the customer consideration approach, will be described later in the chapter.

## SAB 101/104

**2** Apply the revenue recognition concepts underlying the examples used in *SAB 101/104*.

**WHY** *SAB 101* was released to curtail specific abuses in revenue recognition practices. The guiding principle behind *SAB 101* is that companies should not be granted the flexibility to decide to accelerate or delay the recognition of revenue. Instead, the economic characteristics of the transaction itself should determine when the revenue is to be recognized.

**HOW** Companies must not recognize revenue before both legal and economic ownership of goods have passed. Up-front fees should be recognized as revenue over the life of a service agreement, generally on a straight-line basis. In a multiple element transaction, the revenue associated with any specific element can be recognized separately only if that element can be sold separately. In cases in which customers can receive a refund, no revenue is recognized until the end of the refund period except in well-defined circumstances.

<sup>6</sup> American Institute of Certified Public Accountants Accounting Standards Executive Committee Statement of Position 97-2, “Software Revenue Recognition,” October 27, 1997, par. 08.

*SAB 101* is a very interesting document. It is in a question-and-answer format. Most of the questions follow the pattern: “May a company recognize revenue in the following situation?” The answers given in *SAB 101* are invariably “No.” *SAB 101* arose in response to specific abuses seen by the SEC staff. As illustrated with the MicroStrategy scenario at the beginning of the chapter, these abuses were often driven by the desire of high-flying companies to maintain their aura of invincibility by continuing to report astronomical revenue growth each quarter.

fyi

When the SEC releases accounting guidance, it is in response to an immediate need to safeguard investors from what the SEC views as faulty, and perhaps deceptive, financial reporting practices. In these cases, the SEC sometimes grows impatient with the long deliberative process that the FASB follows before releasing a standard.

Because *SAB 101* was released to curtail specific abuses, it should not be seen as a comprehensive treatise on the entire area of revenue recognition. Remember that the vast majority of companies apply the revenue recognition criteria in a very straightforward way with no questions from their auditor, from the SEC, or from investors. But it is precisely in the financial reporting of high-growth, start-up companies doing innovative transactions where reliable and transparent accounting practices add greatest value. Thus, the revenue recognition issues covered in *SAB 101* may not be comprehensive, but they are extremely

important. The question-and-answer format of *SAB 101* follows the framework of the four revenue recognition criteria laid out in *SOP 97-2*.<sup>7</sup>

The release by the SEC of *SAB 101* caused quite a stir in the accounting community. *SAB 101* deals with a fundamental accounting topic (revenue recognition), is blunt in its provisions, and was released without the years of discussion and lobbying typically involved in the release of an FASB statement. As a result, *SAB 101* was like a bomb going off. In the aftermath of this bomb, the FASB has undertaken a comprehensive review of the topic of revenue recognition, as mentioned above. In addition, an influential EITF consensus opinion has been reached (*EITF 00-21*, described below) which impacts revenue recognition. Also, the SEC released an interesting “Frequently Asked Questions” document relative to *SAB 101*. In December 2003, four years after the release of *SAB 101*, the SEC released *SAB 104*, which includes a revised version of *SAB 101*, adapted to incorporate developments in revenue recognition accounting that occurred in the intervening four years. The discussion below reflects all of this material.

## Persuasive Evidence of an Arrangement

The best evidence of a sale is that the seller and buyer have concluded a routine, arm’s-length agreement that is conducted entirely according to the normal business practices of both the seller and the buyer. The first two *SAB 101* questions highlight areas in which a seller might bend the revenue recognition rules to strategically time the reporting of a sale. Without a reliable internal control system, it is easier for the management of a seller to manipulate the timing of the reporting of a sale. Also, when the seller enters into side agreements with the buyer, a transaction that appears to be a sale on the surface can be transformed into a consignment arrangement.

**SAB 101, Question 1** Company A requires each sale to be supported by a written sales agreement signed by an authorized representative of both Company A and of the customer. May Company A recognize revenue in the current quarter if the product is delivered before the end of the quarter but the sales agreement is not signed by the customer until a few days after the end of the quarter?<sup>8</sup>

<sup>7</sup> An *SAB 101* implementation guide prepared by PricewaterhouseCoopers was useful in preparing the material for this section. See “Revenue Recognition: SEC Staff Accounting Bulletin 101 and Related Interpretations, Version 1.0,” PricewaterhouseCoopers, January 10, 2001.

<sup>8</sup> Each of the 10 *SAB 101* questions covered in this section has been simplified and adapted from its original wording. The original wording is available at <http://www.sec.gov>.

If a company does not have a reliable, systematic, predictable procedure in place for processing customer contracts, then it becomes much easier for company executives to succumb to temptation at the end of a quarter and strategically accelerate the booking of revenue. Thus, even though *SAB 101* Question 1 seems narrowly focused, it should instead be seen as encouraging companies to implement good internal controls surrounding revenue recognition. Companies with such controls are much less likely to be called into question about their revenue recognition practices. This emphasis on internal control is a precursor to the expanded emphasis embodied in the Sarbanes-Oxley Act of 2002. Section 404 of Sarbanes-Oxley instructs the SEC to require all publicly traded companies to provide a report on the condition of the company's internal control over the financial reporting process. These financial reporting controls include company procedures to ensure that all transactions are recorded so that the public financial statements are not rendered irrelevant by secret side agreements. Proper internal controls also include procedures to ensure that no transaction takes place unless it is approved by proper authority. In addition, a good internal control system establishes procedures to safeguard the value of the company's assets.

As explained in the opening scenario of the chapter, MicroStrategy executives deliberately delayed signing customer contracts near the end of a quarter until it was determined how many of the contracts were needed to meet revenue targets for the quarter.

**SAB 101, Question 2** Company Z delivers product to a customer on a consignment basis. May Company Z recognize revenue upon delivery of the product to the customer?

Question 1 deals with internal control surrounding revenue recognition, and Question 2 addresses the issue of circumventing those controls through side agreements with customers. On its face, the answer to Question 2 is straightforward: no, revenue should not be recognized on consignment arrangements because no sale has taken place. The broader issue is that a seller can convert a "sale" into a consignment arrangement through side agreements with the customer. For example, the seller can "sell" a product to the buyer but also can guarantee a liberal return policy and not require the buyer to pay for the product until the buyer in turn sells it to a customer. Or the seller "sells" a product to the buyer but agrees to repurchase the product at the same price and provides interest-free financing to the buyer. In both of these instances, the seller may have followed the letter of its internal control policy regarding revenue recognition and contracts, but the side agreements between the seller and the buyer have transformed the deal into a consignment rather than a sale.

To illustrate the appropriate accounting for a consignment, assume that Seller Company ships goods costing \$1,000 on consignment to Consignee Company. The retail price of the goods is \$1,500. No sale should be recorded. However, there may be a journal entry made to reclassify the inventory, as follows:

Inventory on Consignment .....	1,000	
Inventory .....		1,000

**The Coca-Cola Company** was found by the SEC to have engaged in "channel stuffing" in its Japan subsidiary. On April 18, 2005, the SEC made the following statement: "The Commission found that, at or near the end of each reporting period between 1997 and 1999, Coca-Cola implemented an undisclosed 'channel stuffing' practice in Japan known as 'gallon pushing' for the purpose of pulling sales forward into a current period. To accomplish gallon pushing's purpose, Japanese bottlers were offered extended credit terms to induce them to purchase quantities of beverage concentrate the bottlers otherwise would not have purchased until a following period. . . . This practice contributed approximately \$0.01 to \$0.02 to Coca-Cola's quarterly earnings per share and was the difference in 8 out of the 12 quarters from 1997 through 1999 between Coca-Cola meeting and missing analysts' consensus or modified consensus earnings estimates."

## Delivery Has Occurred or Service Has Been Rendered

One of the two general revenue recognition criteria is that the earnings process must be substantially completed. *SAB 101* contains four questions that relate to this issue. Questions 3 and 4 examine the notion of transfer of effective ownership of goods, and Questions 5 and 6 relate to the recognition of revenue when there are several steps in the earnings process.

**SAB 101, Question 3** May Company A recognize revenue when it completes production of inventory for a customer if it segregates that inventory from other products in its warehouse? What if Company A ships the completed inventory to a third-party warehouse (but retains legal title to the inventory)?

**SAB 101, Question 4** Company R is a retailer that offers “layaway” sales to its customers. A customer pays a portion of the sales price, and Company R sets the merchandise aside until the customer returns, pays the remainder of the sales price, and takes possession of the merchandise. When should Company R recognize revenue from a layaway sale?

Both of these questions center on so-called “bill-and-hold” arrangements. A *bill-and-hold* arrangement is exactly what the label implies: The seller bills the buyer for a purchase but holds the goods for later shipment. In general, revenue should *not* be recognized in a bill-and-hold arrangement until the seller has transferred both legal ownership, evidenced by the buyer taking title to the goods, and economic ownership, meaning that the buyer accepts responsibility for the safeguarding and preservation of the goods.

The transfer of legal title occurs in accordance with the shipping terms: Legal title passes at shipment if the terms are FOB shipping point and at customer receipt if the terms are FOB destination. Thus, in the situation described in Question 4, a layaway “sale” is not really a sale because the seller still has custody of and legal title to the goods. Accordingly, revenue from a layaway sale is not recognized until the goods are delivered to the customer.

To illustrate the appropriate accounting for a layaway sale, assume that Seller Company receives \$100 cash from a customer. The \$100 payment is a partial payment for goods costing \$1,000 with a total retail price of \$1,500. The journal entries to record the receipt of the cash and the subsequent delivery of the goods when the remaining \$1,400 is collected are as follows.

Receipt of \$100 cash as initial layaway payment:

Cash .....	100	
Deposits Received from Customers .....		100

Receipt of the final \$1,400 cash payment and delivery of goods to customer:

Cash .....	1,400	
Deposits Received from Customers .....	100	
Sales .....		1,500
Cost of Goods Sold .....	1,000	
Inventory .....		1,000

**Whitehall Jewelers** operates jewelry stores in shopping malls around the country. Before *SAB 101*, the company described its accounting practice with respect to layaway sales as follows: “Layaway receivables include those sales to customers under the Company’s layaway policies that have not been collected fully as of the end of the year. Layaway receivables are net of customer payments received to date, and net of an estimate for those layaway sales which the Company anticipates will never be consummated. This estimate is based on the Company’s historical calculation of layaway sales that will never be completed.” In 2000, Whitehall changed its revenue recognition practice to defer recognition of layaway sales until the merchandise is delivered to the customer.

As you consider the situation in Question 3, you can see why the SEC is concerned with cases such as this. Without strict revenue recognition guidelines for bill-and-hold arrangements, a seller wishing to boost revenue near the end of a quarter could simply push some goods to the side of its warehouse and claim that the goods had been sold to a buyer and were being held for shipment. To recognize revenue in a bill-and-hold arrangement, a seller must be able to demonstrate that the goods are ready to ship, that they are segregated in fact and cannot be used to fill other orders, and most importantly, that that buyer has requested, in writing, the bill-and-hold arrangement. This is true whether the bill-and-hold goods are kept in the seller's warehouse or are shipped to an intermediate, third-party location such as a warehouse owned by a storage company.<sup>9</sup> In connection with the idea of the transfer of both legal and economic ownership, the seller should not recognize revenue from a sale of goods until all customer acceptance provisions have been satisfied. For example, the sales agreement for sophisticated equipment usually includes a provision that the equipment must be delivered to the buyer's location, installed, and tested to the buyer's satisfaction. In cases like this, no revenue is to be recognized until the customer acceptance provisions of the sales agreement are satisfied. The underlying idea is that the acceptance provisions must be important to the buyer or else they wouldn't have been included in the sales agreement in the first place. Accordingly, the seller has not completed the earnings process until the customer acceptance provisions have been satisfied.

To illustrate the appropriate accounting for customer acceptance provisions, assume that Seller Company receives \$1,500 cash from a customer as payment in full for equipment costing \$1,000. The sale is not complete until the equipment is installed at the customer's place of business. The journal entries to record the receipt of the cash and the subsequent completion of the installation follow.

*Receipt of \$1,500 cash as payment in full for equipment:*

Cash .....	1,500	
Advance Payments Received from Customers .....		1,500

*Customer acceptance of the installed equipment is recorded:*

Advance Payments Received from Customers .....	1,500	
Sales .....		1,500
Cost of Goods Sold .....	1,000	
Inventory .....		1,000

Before *SAB 101*, **Levitz Furniture** recognized revenue from a furniture sale when the sales order was written if the merchandise was in stock. In response to *SAB 101*, Levitz changed its revenue recognition practice so that no sale was recorded until the customer took delivery of the furniture.

**SAB 101, Question 5** Company H requires customers to pay an up-front, nonrefundable fee in addition to monthly payments for its services. When should Company H recognize the revenue from this up-front, nonrefundable fee?

**SAB 101, Question 6** Company A provides its customers with computer-based services over an extended period. Customers are required to prepay the entire fee for the extended service. Company A performs initial setup activities to get a customer entered into its system, and the remaining service is automated. When should Company A recognize revenue for this service?

<sup>9</sup> In some non-U.S. jurisdictions, sellers must retain legal title to goods sold on credit in order to be able to enforce return of the goods if the customer doesn't pay. In Question 3 of part 2 (persuasive evidence of an arrangement) in *SAB 104*, the SEC states that this retention of title merely as a tool to enforce payment on a credit sale does NOT block a company from recognizing revenue at the time of a credit sale made in such a non-U.S. jurisdiction.

The situations described in Questions 5 and 6 relate to the recognition of revenue when service periods cover extended periods and when there are several different activities that the seller must perform in providing the service. The concern in cases such as this is that sellers will wish to front-load the recognition of revenue; in the extreme, the seller would like to recognize all of the revenue immediately. The guidance given in *SAB 101* is that, in general, revenue should be recognized on a straight-line basis over the life of the contract and that recognition of an extra chunk of revenue for completion of a specific service act under the contract can be justified only if that service can be sold as a separate product.

In the situation described in Question 5, immediate recognition of the nonrefundable up-front fee as revenue cannot be justified because no customer would pay separately to simply be “signed up” for a service. Instead, the sign-up and payment of the up-front fee are integral parts of the entire service arrangement, and the entire package should be accounted for as a unit. An example given in *SAB 101* is the nonrefundable initiation fee paid when a customer buys a lifetime membership to a health club. The initiation fee and the subsequent monthly payments should be accounted for as a unit because no customer would pay a separate fee merely to sign up for the club without the expectation of using the club in the future. This general approach has been approved and codified by the EITF in *EITF 00-21*, “Revenue Arrangements with Multiple Deliverables.” The terminology used in *EITF 00-21* is that in a business arrangement with several components, revenue is recognized separately for each “unit of accounting” where a “unit of accounting” is defined as a component that has “value to the customer on a standalone basis.”

**ITT Educational Services** offers technology-oriented degree programs to more than 30,000 students in the United States. *SAB 101* impacted the company’s revenue recognition policy as follows: “Effective January 1, 2000, we implemented *SAB 101* and changed the method by which we recognize the laboratory and application fees charged to a student as revenue. We began recognizing those fees as revenue on a straight-line basis over the average student’s program length of 24 months. Previously, we recognized the quarterly laboratory fee as revenue at the beginning of each academic quarter and the application fee as revenue when we received the fee.”

In the situation described in Question 6, the seller might agree to spread the recognition of revenue over the life of the service contract but desire to recognize a disproportionate amount of revenue at the beginning of the contract because of the completion of the initial setup activities. Again, no customer would pay for the setup activities as a separate product, so revenue cannot be assigned specifically to the completion of that part of the agreement. Using the terminology of *EITF 00-21*, the initial setup activities are not a separate “unit of accounting.” In addition, *SAB 101* also states that extra revenue cannot be recognized at the beginning of the arrangement just because proportionately more of the cost is expended during the setup activities. The recognition of revenue should be based on the amount of the expected service that has been provided, not the amount of the cost that has been incurred. Unless there is strong evidence to the contrary, revenue should be recognized on a straight-line basis, independent of the amount of cost incurred. In addition, no revenue should be recognized before the term of the agreement begins. For example, if a licensing agreement is signed on December 10 but doesn’t begin until January 1, revenue recognition should not begin until January 1.

To illustrate the appropriate accounting for a service provided over an extended period, assume that Seller Company receives \$1,000 cash from a customer as the initial sign-up fee for a service. In addition to the initial sign-up fee, the customer is required to pay \$50 per month for the service. The expected economic life of this service agreement is 100 months. The journal entries to record the receipt of the initial

sign-up fee, the receipt of the first monthly payment, and partial revenue recognition for the initial fee after the first month are as follows:

<i>Receipt of \$1,000 cash as the initial sign-up fee:</i>		
Cash .....	1,000	
Unearned Initial Sign-up Fees .....		1,000
<i>Receipt of the first monthly payment of \$50:</i>		
Cash .....	50	
Monthly Service Revenue .....		50
<i>Partial recognition of the initial sign-up fee as revenue (\$1,000/100 months):</i>		
Unearned Initial Sign-up Fees .....	10	
Initial Sign-up Fee Revenue .....		10

**Genentech, Inc.**, is a large biotechnology company dedicated to discovering and developing pharmaceutical products. The company explains the impact of *SAB 101* as follows: “[W]e previously recognized nonrefundable, upfront product license fees as revenue when the technology was transferred and when all of our significant contractual obligations relating to the fees had been fulfilled. Effective January 1, 2000, we changed our method of accounting for nonrefundable upfront product license fees and certain guaranteed payments to recognize such fees over the term of the related development collaboration when, at the execution of the agreement, the development period involves significant risk due to the incomplete stage of the product’s development, or over the period of manufacturing obligation when, at the execution of the agreement, the product is approved for marketing, or nearly approvable, and development risk has been substantially eliminated. Deferred revenue related to manufacturing obligations will be recognized on a straight-line basis over the longer of the contractual term of the manufacturing obligation or the expected period over which we will supply the product.”

**More About EITF 00-21** The focus of *EITF 00-21* is on the “unit of accounting.” A *delivered* element of a multiple-element arrangement is considered to be a unit of accounting if that delivered element has standalone value and if the fair value of any *undelivered* elements can be objectively and reliably determined. A delivered element has standalone value if it is sold separately (by anyone, not necessarily the seller) or if the customer can resell it.

To illustrate the accounting for a multiple-element arrangement under *EITF 00-21*, assume that Lily Kay Company sold elements A and B to a customer for a single price of \$1,000. Also assume that Lily Kay has delivered element A. There are three possible revenue recognition scenarios under *EITF 00-21*.

1. Both A and B have objectively and reliably determinable fair values. In this case, revenue is recognized for A, the delivered item, based on relative fair values. If A has a fair value of \$300 and B has a fair value of \$800, the amount of revenue that is recognized upon the delivery of A is \$273  $\{ \$1,000 \times [ \$300 / ( \$300 + \$800 ) ] \}$ .
2. Only the fair value of B, the undelivered element, can be determined. In this case, the revenue associated with A, the delivered element, is recognized and is computed using the residual method. Again, assume that the fair value of the undelivered element B is \$800. With the residual method, the revenue associated with the delivered element A is \$200, computed by subtracting the fair value of the undelivered element B from the total transaction price of \$1,000  $( \$200 = \$1,000 - \$800 )$ .
3. Only the fair value of A, the delivered element, can be determined. In this case, no revenue is recognized for the separate delivery of A. The rationale behind

the prohibition of using a “reverse residual method” is that the total transaction price of \$1,000 cannot be reliably assigned to the delivered and undelivered elements of the arrangement if there is no reliable measure of the fair value of the undelivered element. Accordingly, the entire \$1,000 in revenue would be recognized when both elements A and B have been delivered.

## Price Is Fixed or Determinable

Revenue recognition criterion (c) from *SOP 97-2* (included in the list of four criteria shown earlier) is that no revenue should be recognized until the transaction price can be definitely determined. Two key accounting issues are involved here. The first issue is that it is difficult to argue that an arm’s-length market transaction has occurred when the parties have not even agreed upon the final price. The second issue is that until a transaction price is fixed, there is substantial uncertainty about how much cash the seller will ultimately receive, and thus measurement of the value of the transaction is problematic. If measurement uncertainty is too great, then the information is not reliable enough for recognition and inclusion in the financial statements. *SAB 101* Questions 7, 8, and 9 involve situations in which the transaction price might not yet be fixed or determinable.

**SAB 101, Question 7** Company M is a discount retailer. Company M charges its customers an annual membership fee. The fee is collected in advance, but a customer can cancel and receive a full refund at any time during the year of membership. May Company M recognize the entire initial membership fee as revenue at the beginning of the year? Should Company M recognize the membership fee as revenue on a straight-line basis over the course of the membership year?

First, note that this situation is different from the estimation and recognition of bad debt expense. With bad debts, there is a legal obligation on the part of the buyer to pay the seller, and the seller estimates the dollar amount of such legal obligations that will not be paid. In the situation described in Question 7, the buyer can legally reclaim the membership fee at any time during the year because the contract defines circumstances in which the buyer is not legally required to pay. Because the final transaction amount is not known until the refund period is over, *SAB 101* stipulates that no revenue should be recognized until the end of the year. Viewed in another way, the seller does not know until the end of the year whether the liability recorded when the membership fee was received in cash will be satisfied through providing a service or by refunding the cash. *SAB 101* does allow recognition of the membership fee as revenue month-by-month during the membership year if the seller can make a reliable estimate of the number of refunds that customers will request. *SAB 101* indicates that these reliable estimates are possible only under the following limited circumstances:

- The seller has been entering into these transactions long enough (at least two years) to have built up sufficient historical data on which to base the estimate.
- The estimate is made based on a large pool of transactions that are essentially the same.
- Past estimates have not been materially different from actual experience.

To illustrate the appropriate accounting for a refundable membership fee, assume that Seller Company receives \$1,200 cash from each customer as a fully refundable, one-year membership fee. It is estimated that the cost to Seller Company to provide the membership service to each customer will be \$360 for one year (incurred evenly, in cash, throughout the year). Seller Company can reliably estimate that 40% of customers will request refunds during the year; assume that all of these refunds occur at the end of the year so that the entire \$360 must be expended to service each customer. The total number of customers who paid the \$1,200 cash fee on January 1 is 1,000. The journal entries to record the receipt of the membership fees, the recognition of

revenue at the end of the first month, and the full refund to 40% of the customers (as expected) on December 31 are as follows:

<i>Receipt of cash as the refundable membership fee (1,000 × 1,200):</i>		
Cash .....	1,200,000	
Customers' Refundable Fees (40%) .....		480,000
Unearned Membership Fees (60%) .....		720,000
<i>Recognition of revenue and costs incurred after one month:</i>		
Unearned Membership Fees (\$720,000/12 months) .....	60,000	
Membership Fee Revenue .....		60,000
Cost of Membership Fee Revenue (60%) .....	18,000	
Administrative Expense (40%) .....	12,000	
Cash [(\$360/12 months) × 1,000 customers] .....		30,000
<i>Customer refunds (in the amount expected) on December 31:</i>		
Customers' Refundable Fees .....	480,000	
Cash .....		480,000

Note that in the monthly entry, the \$12,000 cost of servicing customers who are expected to ask for a refund is classified separately from the cost of servicing memberships. Instead of Administrative Expense, a more descriptive account title, such as Cost of Servicing Refunded Memberships, could be used.

**MemberWorks** operates a number of membership programs through which customers can access discount prices for fitness products, insurance, prescription drugs, and consumer electronics service. *SAB 101* had the following impact on the company's revenue recognition policy: "SAB 101 establishes the [SEC] Staff's preference that membership fees should not be recognized in earnings prior to the expiration of refund privileges. Notwithstanding the Staff's preference . . . , it is also stated in SAB 101 that the Staff will not object to the recognition of refundable membership fees, net of estimated refunds, as earned revenue over the membership period (the Company's current method of accounting) in limited circumstances where all of certain criteria set forth in SAB 101 have been met. The Company plans to voluntarily adopt the full deferral method of accounting for membership fee revenue for all of the Company's membership programs having full refund privileges effective July 1, 2000. Consequently, membership fees having full refund privileges . . . will no longer be recognized on a prorate basis over the corresponding membership periods, but instead will be recognized in earnings upon the expiration of membership refund privileges."

**SAB 101, Question 8** Company A owns a building and leases it to a retailer. The annual lease payment is \$1.2 million plus 1% of all the retailer's sales in excess of \$25 million. It is probable that sales during the year will exceed \$25 million. Should Company A estimate and recognize revenue associated with the 1% of sales over \$25 million on a straight-line basis throughout the year?

In the situation described in Question 8, the buyer has no fixed or determinable legal obligation to make a payment in excess of \$1.2 million until the \$25 million sales level has been reached. Because no determinable legal obligation exists until then, *SAB 101* requires that none of this extra revenue be estimated and recognized in advance. This situation illustrates the subtle but important difference between estimating the future impact of past events (such as sales of products with a warranty) and estimating the future impact of future

fyi

In at least one case, accountants do estimate and recognize the future impact of future events. As explained in Chapter 16, recognition of a deferred income tax asset requires that one assume that the company will generate enough taxable income in the future to be able to utilize future tax deductions.

events (such as the level of future sales). Accountants routinely do the former, but rarely do the latter.

To illustrate the appropriate accounting for a contingent rental, assume that on January 1 Owner Company signs a 1-year rental for a total of \$120,000, with monthly payments of \$10,000 due at the end of each month. In addition, the renter must pay contingent rent of 10% of all annual sales in excess of \$3,000,000. The contingent rent is paid in one payment on December 31. On January 31, Owner Company receives the first rental payment. At that time, sales for the renter had reached \$700,000. On July 31, Owner Company received the regular monthly rental payment; by the end of July, the renter had reached a sales level of \$3,150,000. On December 31, Owner received the final monthly rental payment as well as the contingent rental payment. The renter's sales for the year totaled \$5,000,000, of which \$1,000,000 occurred in December. The journal entries necessary on the books of Owner Company on January 31, July 31, and December 31 are as follows:

January 31:

Cash .....	10,000	
Rent Revenue .....		10,000

July 31:

Cash .....	10,000	
Rent Revenue .....		10,000
Contingent Rent Receivable .....	15,000	
Contingent Rent Revenue .....		15,000
(\$3,150,000 - \$3,000,000) × 0.10 = \$15,000		

December 31:

Cash .....	10,000	
Rent Revenue .....		10,000
Contingent Rent Receivable .....	100,000	
Contingent Rent Revenue .....		100,000
\$1,000,000 × 0.10 = \$100,000		
Cash .....	200,000	
Contingent Rent Receivable .....		200,000
(\$5,000,000 - \$3,000,000) × 0.10 = \$200,000		

**Kimco Realty** is one of the largest owners and operators of community shopping centers in the United States. Some of the company's rental contracts call for additional rent if the tenant reaches a certain level of sales. Kimco describes its revenue recognition policy as follows: "Base rental revenues from rental property are recognized on a straight-line basis over the terms of the related leases. Certain of these leases also provide for percentage rents based upon the level of sales achieved by the lessee. These percentage rents are recorded once the required sales level is achieved."

**SAB 101, Question 9** According to FASB *Statement No. 48*, a company may not recognize revenue on a sale for which the customer has the right of return if the company cannot reasonably forecast the amount of product returns. What factors would make it so that a company could not reasonably forecast returns?

The issue of product returns addressed in Question 9 is similar to the issue of prepayment refunds in Question 7. In both cases, there is substantial uncertainty over whether, when all the smoke clears, a sales transaction will have actually taken place. This issue is emphasized in Question 9 because of SEC concern about "channel stuffing," which is the practice of a manufacturer selling more to customers than they really want near the end of a quarter to report increased sales for the quarter. Channel stuffing in one quarter cannibalizes reported sales in the next quarter, but companies that engage in channel stuffing are typically worried only about weathering the current crisis, confident that sales will pick up in the next quarter. Without guidelines in place regarding the ability to estimate product returns, companies are more likely to engage in channel stuffing to recognize revenue in the current quarter, hoping that they might just go ahead without negative consequences and record the product returns in the next quarter.

FASB *Statement No. 48* outlines conditions in which a company cannot reasonably forecast the amount of its product returns:<sup>10</sup>

- The product is subject to wide swings in demand or is susceptible to rapid obsolescence.
- The return period is long.
- The company has no specific historical experience with similar products and circumstances.
- The return estimate is not being made in a setting of a large volume of relatively similar transactions.

Based on the recent experience of the SEC staff, *SAB 101* expands on these conditions contained in FASB *Statement No. 48*. These additional conditions in which there may be an inability to reliably estimate product returns include the following:

- Significant increases in inventory, either in the hands of the seller or of the seller's customers. (*Note:* These increased inventories would be direct evidence of channel stuffing.)
- Poor information systems such that it can't be known whether the inventory in the hands of the seller's customers has increased.
- New products, or expected introduction of new replacement or competing products.

If a seller cannot make a reasonable estimate of product returns, based on the conditions identified in both FASB *Statement No. 48* and *SAB 101*, no revenue should be recognized until after the return period has expired.

**Palm** is the maker of the Palm Pilot. In the quarter ended March 2, 2001, the company reported revenues of \$471 million, down from \$522 million the quarter before. Announcement of this drop in revenue caused the company's share price to fall 50% in one day. At the same time, some analysts were saying that the news was even worse than it seemed. These analysts suspected that Palm had engaged in channel stuffing. The suspicions were at least partially confirmed when reported sales for the following quarter, ending June 1, 2001, plunged to just \$165 million.

## Collectibility Is Reasonably Assured

Because collectibility is one of the two fundamental criteria for revenue recognition, it is mentioned in *SAB 101* for completeness. However, *SAB 101* does not include any specific discussion of cases or situations that offer further guidance on assessing collectibility. As mentioned at the outset of this discussion, *SAB 101* was released to curtail specific abuses, and it should not be seen as a comprehensive treatise on the entire area of revenue recognition. Accounting for revenue when collectibility is not reasonably assured is discussed later in this chapter in the section on installment sales accounting.

## Income Statement Presentation of Revenue: Gross or Net

Question 10 of *SAB 101* does not deal with when revenue should be recognized but instead with how the revenue should be reported in the income statement.

**SAB 101, Question 10** Company A operates an Internet site through which customers can order the products of traditional Company T. Company T ships the products directly to the customers, and Company A never takes title to the product. The typical sales price is \$175 of which Company A receives \$25. Should Company A report revenue of \$175 with cost of goods sold of \$150, or should Company A merely report \$25 in commission revenue?

<sup>10</sup> *Statement of Financial Accounting Standards No. 48*, "Revenue Recognition When Right of Return Exists" (Stamford, CT: Financial Accounting Standards Board, June 1981), par. 8.

The issue dealt with in Question 10 is labeled “gross vs. net” revenue reporting. In gross reporting, Company A reports the total sales price as revenue, and the difference between the \$25 proceeds to Company A and the \$175 sales price is reported as cost of goods sold. Before *SAB 101*, this was the preferred accounting treatment by Internet brokers. The alternative is the net method in which Company A merely reports the \$25 it receives as commission revenue. The reason that Internet companies preferred the gross presentation is illustrated by referring back to the MicroStrategy story. Recall that with MicroStrategy there was frequent reference to the company’s price-to-sales ratio. Because most companies report losses in their early years, earnings-based valuation methods don’t work. An alternative approach is to value the company based on its reported sales under the assumption that as the company becomes established, those sales will eventually generate positive earnings and cash flows. But a revenue-based valuation model also gives companies an incentive to maximize their reported revenue, even if there is no impact on bottom-line earnings. Thus, the gross method is preferred over the net method by companies wishing to boost reported revenue.

*SAB 101* makes clear that the gross method (reporting \$175 in revenue and \$150 in cost of goods sold in the Question 10 example) is inappropriate when a company merely serves as an agent or broker and never takes legal and economic ownership of the goods being sold. This same issue is addressed in more detail in *EITF No. 99-19*, where characteristics of a transaction in which a company should report revenue on a net basis are given as follows:

- The company does not maintain an inventory of the product being sold but simply forwards orders to a supplier.
- The company is not primarily responsible for satisfying customer requirements, requests, complaints, and so forth; those requirements are satisfied by the supplier of the goods.
- The company earns a fixed amount, or a fixed percentage, and doesn’t bear the risk of fluctuations in the margin between the selling price and the cost of goods sold.
- The company does not bear the credit risk associated with collecting from the customer; that risk is borne by the supplier.

As described in Chapter 1, **Enron** shot to Number 5 in the *Fortune* 500 list for 2002 by virtue of its reported revenue of \$139 billion. Using a gap in the accounting rules with respect to revenue reporting for energy trading companies, Enron reported its energy trades using gross reporting instead of net reporting. To illustrate, assume that Enron brokered a deal between a natural gas supplier and a local utility. Enron guaranteed a selling price of \$1,000,000 to the natural gas supplier and guaranteed a purchase price of \$1,050,000 to the local utility. When the natural gas supplier then provided the natural gas to the utility, Enron would keep the \$50,000 excess. Because of the lack of a definite standard for revenue reporting for energy trading, Enron was able to report revenue of \$1,050,000 (with cost of goods sold of \$1,000,000) rather than the more appropriate reporting of simply \$50,000 in commission revenue.

It was mentioned at the beginning of this section that *SAB 101* was not intended to be a comprehensive treatise on the topic of revenue recognition. In December 2003, the SEC released *SAB 104*, which embodies much of *SAB 101* as well as including discussion of issues and questions that arose in response to the release of *SAB 101*. And as mentioned previously, the FASB has initiated a comprehensive review of the existing standards and existing practice related to revenue recognition.

The IASB standards for revenue recognition are generally consistent with, but much less detailed than, U.S. GAAP. The primary international standard is *IAS 18*, “Revenue Recognition.” As described in the next section, the asset-and-liability

approach to revenue recognition that is currently being developed is a joint effort of the FASB and the IASB.

## An Asset-and-Liability Approach to Revenue Recognition

**3** Describe the two asset-and-liability approaches to revenue recognition that are currently being considered by the FASB and IASB: the customer consideration model and the measurement model.

**WHY** Revenue recognition practices have arisen in a patchwork fashion over the years through the application of a general notion of “earnings process.” The FASB and IASB wish to simplify revenue recognition accounting and, at the same time, make the accounting for revenue consistent with the asset-and-liability focus of the conceptual frameworks of the two Boards.

**HOW** The FASB and IASB are considering two different asset-and-liability models. The customer consideration model uses the relative amounts of the estimated separate selling prices of the various elements in a contractual arrangement in estimating the fair value of the performance obligations the seller bears in the transaction. The measurement model uses direct estimates of the fair values of various performance obligations borne by the seller.

Both the FASB and IASB have conceptual frameworks that have long directed their standard setting. Key elements in these frameworks are the definitions of assets and liabilities. Both standard setters focus on correct reporting of assets and liabilities in any new standard that they contemplate. This asset-and-liability focus is at the heart of the joint FASB/IASB project on revenue recognition.<sup>11</sup>

With this asset-and-liability focus, the FASB and the IASB have agreed that revenue arises when assets increase or liabilities decrease in conjunction with enforceable arrangements or contracts with customers. Although this asset-and-liability approach will not change the end result of accounting for revenue in many common situations, the new approach does represent a substantial conceptual shift from the historic focus on reflecting the results of a company’s earnings processes. The intent is to make the model robust enough to be used in a wide variety of settings for which there now exists a patchwork of situation-specific and industry-specific revenue recognition practices.

To illustrate the asset-and-liability approach to revenue recognition, consider the example of Wilks Company selling a plasma TV screen and 2-year warranty to a customer for a joint price of \$2,000. For simplicity, assume that Wilks collects all of the cash up front on the contract-signing date. Wilks Company has generated the following information regarding sales of this type.

- Cost of plasma TV screen, \$1,500
- Sales price of plasma TV screen if sold separately, \$1,785
- Sales price of 2-year warranty if sold separately, \$315
- Amount that Wilks would have to pay to a TV wholesaler to accept the responsibility of providing the plasma TV screen to the customer, \$1,650
- Amount that Wilks would have to pay to a TV screen service company to accept the responsibility for providing the two years of warranty service, \$240

<sup>11</sup> See the Revenue Recognition Project summary at [http://www.fasb.org/project/revenue\\_recognition.shtml](http://www.fasb.org/project/revenue_recognition.shtml) (June 2008).

The FASB and IASB are considering two different asset-and-liability models. One, the **customer consideration model**, uses the total transaction price as the anchor point to be used in estimating the fair value of the various obligations the seller bears in the transaction. This estimation is done by looking at the relative amounts of the estimated separate selling prices of the various elements in the arrangement. The **measurement model** uses direct estimates of the fair values of various transaction obligations borne by the seller. As seen below, the most interesting difference between the two models is that the measurement model can result in revenue being recognized on the day that a contract is signed even if no product has been delivered and no traditional item of service has been provided.

### Customer Consideration Model

Remember that the customer consideration model is an asset-and-liability approach to revenue recognition. When the customer signs the contract to buy the plasma TV screen and 2-year warranty from Wilks Company, Wilks has created an asset, cash, of \$2,000. Wilks has also created two performance obligations that should be recognized as liabilities: the obligation to deliver the plasma TV screen and the obligation to provide two years of warranty service. The difficulty is in measuring the liabilities for the TV delivery and warranty service. The customer consideration model addresses this difficulty by using a procedure that has long been used and which was illustrated earlier in the discussion of *EITF 00-21*—allocation of the total contract price based on the separate selling prices of the elements of the transaction. The computations, using the separate selling prices of the TV screen and the warranty, are as follows:

$$\begin{array}{l}
 \text{TV screen delivery obligation} \quad \$1,700 \quad = \$2,000 \times [\$1,785/(\$1,785 + \$315)] \\
 \text{Warranty service obligation} \quad \quad \$300 \quad = \$2,000 \times [\$315/(\$1,785 + \$315)]
 \end{array}$$

These two quantities, \$1,700 and \$300, are estimates of the fair value of the two performance obligations Wilks Company accepted when signing the contract. These two obligations are balanced by the asset, \$2,000 in cash, that Wilks received. The journal entry to record this asset and these two liabilities created at the contract signing is as follows:

Cash .....	2,000	
Contract Liability—TV Screen .....		1,700
Contract Liability—Warranty .....		300

When the plasma TV screen is delivered to the customer, that performance obligation has been satisfied and the associated liability has decreased to zero. Under the asset-and-liability approach, revenue is recognized when a liability created as part of a contractual arrangement with a customer has decreased. The journal entry (assuming a perpetual inventory system) is as follows:

Contract Liability—TV Screen .....	1,700	
Sales Revenue .....		1,700
Cost of Goods Sold .....	1,500	
Inventory .....		1,500

Additional revenue will be recognized as the performance obligation associated with the warranty services is reduced. This reduction may be in a straight-line fashion, or the obligation may be reduced more, say, in the first year than in the second year; if this is true, more warranty revenue will be recognized in the first year than in the second year.

The customer consideration model has the benefits of being easy to understand, relatively easy to use, generally consistent with past practice, and verifiable. In fact, in this simple example the customer consideration model may seem so much like existing practice that it doesn't seem worth the bother. However, the shift from an earnings process focus to a focus on the creation of assets and the satisfaction of performance obligation liabilities makes this revenue recognition approach both consistent with the conceptual frameworks of the FASB and IASB and flexible enough to be applied in a wide variety of settings.

## Measurement Model

With the measurement model, the fair values of the performance obligation liabilities created at a contract signing are estimated directly rather through a process of allocation of the contract price as in the customer consideration model. This seemingly simple difference has very interesting implications, as illustrated in the journal entries below. The journal entry to record the cash asset and the two performance obligation liabilities created at the contract signing is as follows:

Cash .....	2,000	
Contract Liability—TV Screen .....		1,650
Contract Liability—Warranty .....		240
Revenue .....		110

With the measurement model, the performance obligation liabilities are reported at their fair values defined as the amount it would cost to get a third party to accept the responsibility of the performance obligation. First, let's focus on the performance obligation associated with the delivery of the plasma TV screen. Why would a third party be willing to accept this obligation in exchange for \$1,650 when in the previous example we saw that the separate selling price for the TV screen is \$1,785? Well, this difference reflects the reality that an important part of selling a product or service to a customer is getting the customer in the door and convincing the customer that he or she wants to buy your product or service and not an identical product or service of a competitor. This pre-contract effort involves advertising, salesmanship, and some luck. In the TV screen example, a generic TV screen provider would be happy to have Wilks Company do all the work of attracting the customers and getting them to sign sales contracts; the generic provider would receive \$1,650 for accepting the responsibility of fulfilling these contracts which could then be done by delivering a TV screen costing \$1,500. Similarly, a generic service company would accept \$240 to fulfill a warranty contract that, on average, could be satisfied by spending a lower amount to perform warranty repairs. With the measurement model, the \$110 in revenue associated with these pre-contract efforts is recognized at the time the arrangement is signed.

So, the big difference between the customer consideration model and the measurement model is that when using the measurement model revenue can be recognized on the day that the contract is signed. Accounting professionals and standard setters call this "Day One" revenue. Another important difference between the two models is that with the customer consideration model, the performance obligations are not remeasured after being initially recorded at the contract signing date; whereas with the measurement model, these obligations are subsequently remeasured, resulting in additional revenue if the fair value of the obligations decreases and a subtraction from revenue if the fair value of the obligations increases.

As of June 2008, the FASB and the IASB were preparing to release a joint "Preliminary Views" document seeking comment on the relative merits of the customer consideration and measurement models. At this point, it is not possible to predict which one of these two models, or perhaps a hybrid of the two, will form the conceptual basis of the general revenue recognition standard ultimately to be released by the FASB and IASB. Stay tuned.

## Revenue Recognition Prior to Delivery of Goods or Performance of Services

**4** Record journal entries for long-term construction-type contracts using percentage-of-completion and completed-contract methods.

**WHY** In some instances, revenue may be recognized prior to the actual delivery of goods or services. The most common example of this is a long-term contract. The objective is to show financial statement users the economic activity of a company during the period being reported.

**HOW** Revenue may be recognized prior to delivery if four criteria are met: (1) estimates can be made of the amount of work remaining, (2) a contract exists outlining each party's responsibilities, (3) the buyer can be expected to fulfill the contract, and (4) the seller can be expected to fulfill the contract.

At this point, it is important to remember that the asset-and-liability approaches to revenue recognition discussed in the previous section are currently merely discussion items at the FASB and the IASB. Revenue recognition under current U.S. GAAP is still based on the historical focus on the earnings process. The next three sections explain how this general approach to revenue recognition works in three different settings.

Under some circumstances, revenue can be meaningfully reported prior to the delivery of the finished product or completion of a service contract. For example, under *IAS 41*, biological assets, such as cattle, fruit trees, and lumber forests, are recorded in the balance sheet at their fair value (less estimating selling costs) as of the balance sheet date. Increases in this fair value are recognized as gains, and decreases are recognized as losses. Accordingly, under international accounting standards, a lumber company would report the timber in its forests at fair value (less selling cost) in each balance sheet during, say, the 30-year period the timber is growing. The yearly increases or decreases in fair value would be reported in the income statement as gains or losses before the timber is ever sold or delivered to a customer. This approach is not currently allowed under U.S. GAAP.

Under U.S. GAAP, the most common occurrence of revenue recognition before final delivery is when the construction period of the asset being sold or the period of service performance is relatively long, that is, more than one year. In these cases, if a company waits until the production or service period is complete to recognize revenue, the income statement may not report meaningfully the periodic achievement of the company. Under this approach, referred to as the **completed-contract method**, all income from the contract is related to the year of completion, even though only a small part of the earnings may be attributable to effort in that period. Previous periods receive no credit for their efforts; in fact, they may be penalized through the absorption of selling, general and administrative, and other overhead costs relating to the contract but not considered part of the inventory cost.

**Percentage-of-completion accounting**, an alternative to the completed-contract method, was developed to relate recognition of revenue on long-term construction-type contracts to the activities of a firm in fulfilling these contracts. Similarly, the **proportional performance method** has been developed to reflect revenue earned on service contracts under which many acts of service are to be performed before the contract is completed. Examples of such service contracts include contracts covering maintenance on electronic office equipment, correspondence schools, trustee services, health clubs, professional services such as those offered by attorneys and accountants, and servicing of mortgage loans by mortgage bankers. Percentage-of-completion accounting and proportional performance accounting are similar in their application. However, some special problems arise in accounting for service contracts. The

Copier repair is accounted for using the proportional performance method, which allows for revenue of service contracts to be spread over the length of the contracts.

contract, the actual costs incurred are charged to inventory. The amount of profit earned each period also is charged to this asset account. Thus, the inventory account is valued at its net realizable value: the sales (or contract) price less the cost to complete the contract and less the unearned profit on the unfinished contract. (See

Chapter 9 for a review of the concepts and computations associated with net realizable value.) If a company projects a loss on the contract prior to completion, the full amount of the loss should be recognized immediately. This loss recognition results in a write-down of the asset to its estimated net realizable value. If only a percentage of the loss were recognized, the asset value would exceed the net realizable value. This would violate the lower-of-cost-or-market rule discussed more fully in Chapter 9.

## stop & think

Which **ONE** of the following is **NOT** a good way to measure a contract's percentage of completion?

- The cost expended on contract work so far, relative to the estimate of the total cost to be expended on the contract.
- The percentage of revenue that will result in the company meeting its revenue and profit goals for the period.
- An engineer's estimate of the percentage of the work that has been completed.
- The amount of output produced under the contract (such as the number of feet of roadway completed on a highway construction job), relative to the estimated total amount of output to be produced under the contract.

discussion and examples in the following sections relate first to long-term construction-type contracts and then to the special problems encountered with service contracts.

## General Concepts of Percentage-of-Completion Accounting

Under the percentage-of-completion method, a company recognizes revenues and costs on a contract as it progresses toward completion rather than deferring recognition of these items until the contract is completed. The amount of revenue to be recognized each period is based on some measure of progress toward completion. This requires an estimate of costs yet to be incurred. Changes in estimates of future costs arise normally, and the necessary adjustments are made in the year the estimates are revised. Thus, the revenues and costs to be recognized in a given year are affected by the revenues and costs already recognized. As work progresses on the

Chapter 9 for a review of the concepts and computations associated with net realizable value.) If a company projects a loss on the contract prior to completion, the full amount of the loss should be recognized immediately. This loss recognition results in a write-down of the asset to its estimated net realizable value. If only a percentage of the loss were recognized, the asset value would exceed the net realizable value. This would violate the lower-of-cost-or-market rule discussed more fully in Chapter 9.

## Necessary Conditions to Use Percentage-of-Completion Accounting

Most long-term construction-type contracts should be reported using the percentage-of-completion method. The guidelines presently in force, however, are not specific as to when a company must use the percentage-of-completion method and when it must use

the alternative completed-contract method. The accounting standards that still govern this area were issued by the Committee on Accounting Procedure in 1955.<sup>12</sup> In 1981, the Construction Contractor Guide Committee of the Accounting Standards Division of the AICPA issued *Statement of Position 81-1*, “Accounting for Performance of Construction-Type and Certain Production-Type Contracts.” In this SOP, the committee strongly recommended which of the two common methods of accounting for these types of contracts should be required, depending on the specific circumstances involved. The committee further stated that the two methods should not be viewed as acceptable alternatives for the same circumstances. The committee identified several elements that should be present if percentage-of-completion accounting is to be used.<sup>13</sup>

1. Dependable estimates can be made of contract revenues, contract costs, and the extent of progress toward completion.
2. The contract clearly specifies the enforceable rights regarding goods or services to be provided and received by the parties, the consideration to be exchanged, and the manner and terms of settlement.
3. The buyer can be expected to satisfy obligations under the contract.
4. The contractor can be expected to perform the contractual obligation.

The completed-contract method should be used only when an entity has primarily short-term contracts, when the conditions for using percentage-of-completion accounting are not met, or when there are inherent uncertainties in the contract, beyond the normal business risks. By the way, under *IAS 11*, the completed-contract method is not allowed under international financial reporting standards.

For many years, income tax regulations permitted contractors wide latitude in selecting either the percentage-of-completion or completed-contract method. Beginning with the Tax Reform Act of 1986, the tax laws have limited the use of the completed-contract method and have required increased use of the percentage-of-completion method. This results in accelerated revenues from taxes without increasing the tax rates, and it also results in similar revenue recognition treatment for both taxes and financial reporting.

## Measuring the Percentage of Completion

Various methods are currently used in practice to measure the earnings process. They can be conveniently grouped into two categories: input and output measures.

**Input Measures** **Input measures** are made in relation to the costs or efforts devoted to a contract. They are based on an established or assumed relationship between a unit of input and productivity. They include the widely used cost-to-cost method and several variations of efforts-expended methods.

**Cost-to-cost method.** Perhaps the most popular of the input measures is the **cost-to-cost method**. Under this method, the degree of completion is determined by comparing costs already incurred with the most recent estimates of total expected costs to complete the project. The percentage that costs incurred bear to total expected costs is applied to the contract price to determine the revenue to be recognized to date as well as to the expected net income on the project in arriving at earnings to date. Some of the costs incurred, particularly in the early stages of the contract, should be disregarded in applying this method because they do not relate directly to effort expended on the contract. These include such items as subcontract costs for work that has yet to be performed and standard fabricated materials that have not yet been installed. One

<sup>12</sup> *Committee on Accounting Procedure, Accounting Research Bulletin No. 45, “Long-Term Construction-Type Contracts”* (New York: American Institute of Certified Public Accountants, 1955).

<sup>13</sup> *Construction Contractor Guide Committee of the Accounting Standards Division, AICPA, Statement of Position 81-1, “Accounting for Performance of Construction-Type and Certain Production-Type Contracts”* (New York: American Institute of Certified Public Accountants, 1981), par. 23.

of the most difficult problems in using this method is estimating the costs yet to be incurred. Engineers are often consulted to help provide estimates as to a project's percentage of completion. However difficult the estimation process may be, it is required in reporting income, regardless of how the percentage of completion is computed.

To illustrate, assume that in January 2010 Strong Construction Company was awarded a contract with a total price of \$3,000,000. Strong expected to earn \$400,000 profit on the contract, or in other words, total costs on the contract were estimated to be \$2,600,000. The construction was completed over a 3-year period, and the cost data and cost percentages shown below were compiled during that time.

Note that the cost percentage is computed by dividing cumulative actual costs incurred by total cost, an amount that is estimated for the first two years.

Year	(1) Actual Cost Incurred	(2) Estimated Cost to Complete	(3) Total Cost (1) + (2)	(4) Cost Percentage (1)/(3)
2010 .....	\$1,040,000	\$1,560,000	\$2,600,000*	40
2011 .....	910,000			
Total .....	\$1,950,000	650,000	2,600,000*	75
2012 .....	650,000			
Total .....	<u>\$2,600,000</u>	0	2,600,000†	100

\* Estimated total contract cost.

† Actual total contract cost.

**Efforts-expended methods.** The **efforts-expended methods** are based on some measure of work performed. They include labor hours, labor dollars, machine hours, or material quantities. In each case, the degree of completion is measured in a way similar to that used in the cost-to-cost approach: the ratio of the efforts expended to date to the estimated total efforts to be expended on the entire contract. For example, if the measure of work performed is labor hours, the ratio of hours worked to date to the total estimated hours would produce the percentage for use in measuring income earned.

**Output Measures** **Output measures** are made in terms of results achieved. Included in this category are methods based on units produced, contract milestones reached, and values added. For example, if the contract calls for units of output, such as miles of roadway, a measure of completion would be a ratio of the miles completed to the total miles in the contract. Architects and engineers are sometimes asked to evaluate jobs and estimate what percentage of a job is complete. These estimates are, in reality, output measures and usually are based on the physical progress made on a contract.

## Accounting for Long-Term Construction-Type Contracts

For both the percentage-of-completion and the completed-contract methods, all direct and allocable indirect costs of the contracts are charged to an inventory account. The difference in recording between the two methods relates to the timing of revenue and expense recognition; that is, when the estimated earned income is recognized with its related effect on the income statement and the balance sheet. During the construction period, the annual reported income under these two accounting methods will differ. However, after the contract is completed, the combined income for the total construction period will be the same under each method of accounting. The balance sheet at the end of the construction and collection periods also will be identical.

Usually, contracts require progress billings by the contractor and payments by the customer on these billings. The billings and payments are accounted for and reported in the same manner under both methods. The amount of these billings usually is specified by the contract terms and may be related to the costs actually incurred.

Generally, these contracts require inspection before final settlement is made. The billings are debited to Accounts Receivable and credited to a deferred account, Progress Billings on Construction Contracts, that serves as an offset to the inventory account, Construction in Progress. The billing of the contract thus transfers the asset value from inventory to receivables, but because of the long-term nature of the contract, the construction costs continue to be reflected in the accounts.

To illustrate accounting for a long-term construction contract, we will continue the Strong Construction Company example mentioned earlier. Recall that construction was completed over a 3-year period and the contract price was \$3,000,000. The direct and allocable indirect costs, billings, and collections<sup>14</sup> for 2010, 2011, and 2012 are as follows:

Year	Direct and Allocable Indirect Costs	Billings	Collections
2010 .....	\$1,040,000	\$1,000,000	\$ 800,000
2011 .....	910,000	900,000	850,000
2012 .....	650,000	1,100,000	1,350,000

The following entries for the three years would be made on the contractor’s books under either the percentage-of-completion or the completed-contract method.

	2010	2011	2012
Construction in Progress .....	1,040,000	910,000	650,000
Materials, Cash, etc. ....		910,000	650,000
<i>To record costs incurred.</i>			
Accounts Receivable .....	1,000,000	900,000	1,100,000
Progress Billings on Construction Contracts .....		900,000	1,100,000
<i>To record billings.</i>			
Cash .....	800,000	850,000	1,350,000
Accounts Receivable .....		850,000	1,350,000
<i>To record cash collections.</i>			

No other entries would be required in 2010 and 2011 under the completed-contract method. In both years, the balance of Construction in Progress exceeds the amount in Progress Billings on Construction Contracts; thus, the latter account would be offset against the inventory account in the balance sheet.

fyi

The reason these entries are the same under either revenue recognition method is because they are a function of the terms of the contract that specifies when payment will be made.

Before proceeding further, let’s examine the relationship between the accounts Construction in Progress and Progress Billings on Construction Contracts. Amounts recorded in Construction in Progress represent the costs that have been incurred to date relating to a specific contract. If the customer has not been billed, then the entire cost represents a probable future benefit to the company and should be disclosed on the balance sheet as an asset. If,

however, the customer has been billed for a portion of these costs, then the company has in effect traded one asset for another. In place of inventory, the company now has a receivable (or cash if the receivable has been collected).

<sup>14</sup> As a protection for the customer, long-term contracts frequently provide for an amount to be retained from the progress payments. This retention is usually a percentage of the progress billings, for example, 10% to 20%, and is paid upon final acceptance of the construction. Thus, the amount collected is often less than the amount billed in the initial years of the contract.

# stop & think

**Progress Billings on Construction Contracts is offset against the construction in progress account. What does the resulting net figure represent?**

- a) The estimated fair market value of the portion of the construction that has been completed.
- b) The amount of cash that has been collected under the contract.
- c) The value of the completed construction for which the customer has not yet been billed.
- d) The estimated amount of uncollectible accounts associated with the construction project.

Thus, if the balance in Construction in Progress exceeds the balance in Progress Billings on Construction Contracts, the excess represents the amount of the construction costs<sup>15</sup> for which the customer has not been billed. The amount for which the customer has been billed is included in either Accounts Receivable or Cash. If Progress Billings on Construction Contracts is greater than Construction in Progress, the difference represents a liability because the customer has been billed (and a receivable has been recorded) for more than the costs actually incurred.

Because the operating cycle of a company that emphasizes long-term contracts is usually more than one year, all of the preceding balance sheet accounts would be classified as current. The balance sheet at the end of 2011 under the completed-contract method would disclose the following balances related to the construction contract:

		Current assets:	
Accounts receivable .....			\$250,000
Construction in progress .....	\$1,950,000		
Less: Progress billings on construction contracts .....	<u>1,900,000</u>		50,000

If the billings exceeded the construction costs, the excess would be reported in the Current Liability section of the balance sheet.

Under the completed-contract method, the following entries would be made to recognize revenue and costs and to close out the inventory and billings accounts at the completion of the contract, that is, in 2012.

Progress Billings on Construction Contracts .....	3,000,000		
Revenue from Long-Term Construction Contracts .....			3,000,000
Cost of Long-Term Construction Contracts .....	2,600,000		
Construction in Progress .....			2,600,000

The first entry represents the billings on the contract that, at the end of the contract, equal the total revenue from the contract. The second journal entry transfers the inventoried cost from the contract to the appropriate expense account on the income statement. The income statement for 2012 would report the gross revenues and the matched costs, thus recognizing the entire \$400,000 profit in one year.

## Using Percentage-of-Completion Accounting: Cost-to-Cost Method

If the company used the percentage-of-completion method of accounting, the \$400,000 profit would be spread over all three years of construction according to the estimated percentage of completion for each year. The information provided previously details Strong's estimated cost to complete the contract at the end of 2010 and 2011 as well as the total actual costs at the end of 2012. Recall that the percentage of completion for each year, determined on a cost-to-cost basis, is as follows:

	2010	2011	2012
Percentage of completion to date .....	40%	75%	100%

<sup>15</sup> As we will soon learn, under the percentage-of-completion method, Construction in Progress includes both costs and the portion of expected gross profit earned to date.

Digital Vision/Getty Images

Since spacecraft like the *Endeavour* space shuttle may take many years to build, aerospace companies must account for this construction using the percentage-of-completion method.

These percentages may be used to determine directly the gross profit that should be recognized on the income statement; that is, the income statement for 2010 would report only the gross profit from construction contracts in the amount of \$160,000 (estimated gross profit—2010, \$400,000 × 0.40 = \$160,000). Preferably, the percentages should be used to determine both revenues and costs. The income statement will then disclose revenues, costs, and the resulting gross profit, a method more consistent with normal income statement reporting. The *AICPA Audit and Accounting Guide for Construction Contractors* recommended this proportional procedure, and the presentations in this chapter will reflect that recommendation.<sup>16</sup> The procedures are as follows:

1. Cumulative revenue to date should be computed by multiplying total estimated contract revenue by the percentage of completion. Revenue for the current period is the difference between the cumulative revenue at the end of the current period and the cumulative revenue recognized in prior periods.
2. Cumulative costs to date should be computed in a manner similar to revenue and should be equal to the total estimated contract cost multiplied by the percentage of completion on the contract. Cost for the current period is the difference between the cumulative costs at the end of the current period and the cumulative costs reported in prior periods.
3. Cumulative gross profit is the excess of cumulative revenue over cumulative costs, and the current period gross profit is the difference between current revenue and current costs.

If the cost-to-cost method is used to estimate earned revenue, the proportional cost for each period will typically equal the actual cost incurred.

To illustrate, for 2010, 40% of the fixed contract price of \$3,000,000 would be recognized as revenue (\$1,200,000) and 40% of the expected total cost of \$2,600,000 would be reported as cost (\$1,040,000). The following revenue recognition entries would be made for each of the three years of the contract. These entries are in addition to the transaction entries illustrated previously.

	2010	2011	2012
Cost of Long-Term Construction Contracts*	1,040,000	910,000	650,000
Construction in Progress	160,000	140,000	100,000
Revenue from Long-Term Construction Contracts	1,200,000	1,050,000 <sup>†</sup>	750,000 <sup>‡</sup>

\* Actual costs.  
<sup>†</sup> (\$3,000,000 × 0.75) - \$1,200,000 = \$1,050,000.  
<sup>‡</sup> \$3,000,000 - \$1,200,000 - \$1,050,000 = \$750,000.

<sup>16</sup> *Construction Contractor Guide Committee of the Accounting Standards Division, AICPA, "AICPA Audit and Accounting Guide for Construction Contractors"* (New York: American Institute of Certified Public Accountants, 1999).

The gross profit recognized each year is added to the construction in progress account, thereby valuing the inventory on the books at its net realizable value. Note that the procedures used in recognizing revenue under the percentage-of-completion method do not affect the progress billings made or the amount of cash collected. These amounts are determined by contract and not by the accounting method used.

Because the construction in progress account contains costs incurred plus recognized profit (the two together equaling total revenues recognized to date), at the completion of the contract the balance in this account will exactly equal the amount in Progress Billings on Construction Contracts, because the progress billings account reflects the contract price (or total revenues). The following closing entry would complete the accounting process:

Progress Billings on Construction Contracts .....	3,000,000	
Construction in Progress .....		3,000,000

## Using Percentage-of-Completion Accounting: Other Methods

If the cost-to-cost method is not used to measure progress on the contract, the proportional costs recognized under this method may not be equal to the actual costs incurred. For example, assume in 2010 that an engineering estimate measure was used, and 42% of the contract was assumed to be completed. The gross profit recognized would therefore be computed and reported as follows:

Recognized revenue (42% of \$3,000,000) .....	\$1,260,000
Cost (42% of \$2,600,000) .....	<u>1,092,000</u>
Gross profit (42% of \$400,000) .....	<u>\$ 168,000</u>

Because some accountants believe that the amount of cost recognized should be equal to the costs actually incurred, an alternative to the preceding approach was included in *SOP 81-1*.<sup>17</sup> Under this actual cost approach, revenue is defined as the actual costs incurred on the contract plus the gross profit earned for the period on the contract. Using the data from the previous example, the revenue and costs to be reported on the 2010 income statement would be as follows:

Actual cost incurred to date .....	\$ 1,040,000
Recognized gross profit (42% of \$400,000) .....	<u>168,000</u>
Recognized revenue .....	<u>\$1,208,000</u>

This contrasts with the \$1,260,000 revenue using the proportional cost approach. Both approaches report gross profit as \$168,000.

In a footnote to this discussion in the SOP, the committee made it clear that the actual cost approach and the proportional cost approach are equally acceptable. However, because the actual cost approach results in a varying gross profit percentage from period to period whenever the measurement of completion differs from that which would occur if the cost-to-cost method were used, the authors feel that the proportional cost approach is preferable. Unless a different method is explicitly stated, text examples and end-of-chapter material will assume the *proportional cost approach*.

## Revision of Estimates

In the previous example, it was assumed that the estimated cost did not vary from the beginning of the contract. This rarely would be the case. As estimates change, catch-up adjustments are made in the year of the change. To illustrate the impact of changing estimates, assume that at the end of 2011, it was estimated that the remaining cost to complete the construction was \$720,000 rather than \$650,000. This would increase the

<sup>17</sup> *SOP 81-1*, pars. 80 and 81.

total estimated cost to \$2,670,000, reduce the expected profit to \$330,000, and change the percentage of completion at the end of 2011 to 73% (\$1,950,000/\$2,670,000).

The following analysis shows how this change would affect the revenue and costs to be reported each year, assuming that the actual costs incurred in 2012 were \$700,000.

	2010	2011	2012
Contract price .....	\$3,000,000	\$3,000,000	\$3,000,000
Actual cost incurred to date .....	\$1,040,000	\$1,950,000	\$2,650,000
Estimated cost to complete .....	1,560,000	720,000	0
Total estimated cost .....	\$2,600,000	\$2,670,000	\$2,650,000
Total expected gross profit .....	\$ 400,000	\$ 330,000	\$ 350,000
Percentage of completion to date .....	40%	73%	100%

	To Date	Recognized— Prior Years	Recognized— Current Year
<b>2010:</b>			
Recognized revenue (\$3,000,000 × 0.40) .....	\$1,200,000	0	\$1,200,000
Cost (actual cost) .....	1,040,000	0	1,040,000
Gross profit .....	\$ 160,000		\$ 160,000
<b>2011:</b>			
Recognized revenue (\$3,000,000 × 0.73) .....	\$2,190,000	\$1,200,000	\$ 990,000
Cost (actual cost) .....	1,950,000	1,040,000	910,000
Gross profit .....	\$ 240,000	\$ 160,000	\$ 80,000
<b>2012:</b>			
Recognized revenue .....	\$3,000,000	\$2,190,000	\$ 810,000
Cost (actual cost) .....	2,650,000	1,950,000	700,000
Gross profit .....	\$ 350,000	\$ 240,000	\$ 110,000

The entries to record revenue and cost for the three years, given the assumed estimate revision, would be as follows:

	2010	2011	2012
Cost of Long-Term Construction Contracts .....	1,040,000	910,000	700,000
Construction in Progress .....	160,000	80,000	110,000
Revenue from Long-Term Construction Contracts .....	1,200,000	990,000	810,000

## stop & think

What circumstances would give rise to a loss being reported this year on a contract that is profitable overall?

- a) Underestimates of the percentage completed in this period.
- b) Overestimates of the percentage completed in this period.
- c) Underestimates of the percentage completed in prior periods.
- d) Overestimates of the percentage completed in prior periods.

In some cases, an increase in total estimated cost can result in recognition of a loss in the year of the increase. Revising the preceding example, assume that at the end of 2011 the estimated cost to complete construction was \$836,000, and this was the actual cost incurred in 2012. The following analysis shows how this change in estimated cost would reduce the percentage of completion at the end of 2011 to 70%, and the cumulative profit at the end of 2011 to \$150,000. Because \$160,000 was already recognized as gross profit in 2010, a loss of \$10,000 would be recognized in 2011.

	2010	2011	2012
Contract price .....	\$3,000,000	\$3,000,000	\$3,000,000
Actual cost incurred to date .....	\$1,040,000	\$1,950,000	\$2,786,000
Estimated cost to complete .....	1,560,000	836,000	0
Total estimated cost .....	\$2,600,000	\$2,786,000	\$2,786,000
Total expected gross profit .....	\$ 400,000	\$ 214,000	\$ 214,000
Percentage of completion to date .....	40%	70%	100%

	To Date	Recognized— Prior Years	Recognized— Current Year
2010:			
Recognized revenue (\$3,000,000 × 0.40) .....	\$1,200,000	0	\$1,200,000
Cost (actual cost) .....	1,040,000	0	1,040,000
Gross profit .....	\$ 160,000		\$ 160,000
2011:			
Recognized revenue (\$3,000,000 × 0.70) .....	\$2,100,000	\$1,200,000	\$ 900,000
Cost (actual cost) .....	1,950,000	1,040,000	910,000
Gross profit .....	\$ 150,000	\$ 160,000	\$ (10,000)
2012:			
Recognized revenue .....	\$3,000,000	\$2,100,000	\$ 900,000
Cost (actual cost) .....	2,786,000	1,950,000	836,000
Gross profit .....	\$ 214,000	\$ 150,000	\$ 64,000

The entries to record revenue and cost for the three years, given the assumed loss estimate in 2011, would be as follows:

	2010	2011	2012
Cost of Long-Term Construction Contracts .....	1,040,000	910,000	836,000
Construction in Progress .....	160,000	10,000	64,000
Revenue from Long-Term Construction Contracts .....	1,200,000	900,000	900,000

## Reporting Anticipated Contract Losses

In the example above, an increase in estimated total cost resulted in recognition of a loss in the year the estimate was revised; but overall, the contract resulted in a profit. In some cases, an increase in estimated total cost is so great that a loss on the entire contract is anticipated; that is, total estimated costs are expected to exceed the total revenue from the contract. When a loss on the total contract is anticipated, GAAP requires reporting the loss in its entirety in the period when the loss is first anticipated. This is true under either the completed-contract or the percentage-of-completion method.

For example, assume that in the earlier construction example, the estimated cost to complete the contract at the end of 2011 was \$1,300,000. Because \$1,950,000 of costs had already been incurred, the total estimated cost of the contract would be \$3,250,000 (\$1,950,000 + \$1,300,000), or \$250,000 more than the contract price. Assume also that actual costs equaled expected costs in 2012.

### caution

Do not confuse a loss on an entire contract with a loss for a period on a profitable contract. The accounting for these two possibilities is entirely different.

	2010	2011	2012
Contract price .....	\$3,000,000	\$3,000,000	\$3,000,000
Actual cost incurred to date .....	\$1,040,000	\$1,950,000	\$3,250,000
Estimated cost to complete .....	1,560,000	1,300,000	0
Total estimated cost .....	\$2,600,000	\$3,250,000	\$3,250,000
Total expected gross profit (loss) .....	\$ 400,000	\$ (250,000)	\$ (250,000)
Percentage of completion to date .....	40%	60%	100%

Using this example, accounting for a contract loss is illustrated first for the completed-contract method and then for the percentage-of-completion method.

fyi

Because the construction in progress inventory account is used to accumulate actual construction costs under the completed-contract method, this journal entry will ensure that at the end of the contract, the inventory account is not reported at an amount higher than the contract price.

### Anticipated Contract Loss: Completed-Contract Method

If the completed-contract method is used, the recognition of an anticipated contract loss is simple. The amount of the loss is debited to a loss account, and the inventory account, Construction in Progress, is credited by that amount to reduce the inventory to its expected net realizable value. To record the anticipated loss of \$250,000 on the construction contract, the following entry would be made at the end of 2011:

Anticipated Loss on Long-Term Construction Contracts .....	250,000	
Construction in Progress .....		250,000

### Anticipated Contract Loss: Percentage-of-Completion Method

Recognition of an anticipated contract loss under the percentage-of-completion method is more complex. To properly reflect the entire loss in the year it is first anticipated, the cumulative cost to deduct from cumulative recognized revenue cannot be the actual cost incurred but must be the cumulative recognized revenue plus the entire anticipated loss. Thus, continuing the construction contract example, the cumulative recognized revenue at the end of 2011 would be \$1,800,000 ( $60\% \times \$3,000,000$ ), and the cumulative cost at the same date would be \$2,050,000 ( $\$1,800,000 + \$250,000$ ). Because the example assumes that \$160,000 profit was recognized on this contract in 2010, the total loss to be recognized in 2011 is \$410,000 ( $\$160,000 + \$250,000$ ). The analysis that follows reflects the amounts to be reported for each of the three years of the contract life under the anticipated loss assumption.

	To Date	Recognized— Prior Years	Recognized— Current Year
2010:			
Recognized revenue ( $\$3,000,000 \times 0.40$ ) .....	\$1,200,000	0	\$1,200,000
Cost (actual cost) .....	1,040,000	0	1,040,000
Gross profit .....	<u>\$ 160,000</u>		<u>\$ 160,000</u>
2011:			
Recognized revenue ( $\$3,000,000 \times 0.60$ ) .....	\$1,800,000	\$1,200,000	\$ 600,000
Cost (recognized revenue plus entire anticipated loss) .....	2,050,000	1,040,000	1,010,000
Gross profit (loss) .....	<u>\$ (250,000)</u>	<u>\$ 160,000</u>	<u>\$ (410,000)</u>
2012:			
Recognized revenue .....	\$3,000,000	\$1,800,000	\$1,200,000
Cost .....	3,250,000	2,050,000	1,200,000
Gross profit .....	<u>\$ (250,000)</u>	<u>\$ (250,000)</u>	<u>\$ 0</u>

The entry to record the revenue, costs, and adjustments to Construction in Progress for the loss in 2011 would be as follows:

Cost of Long-Term Construction Contracts .....	1,010,000	
Revenue from Long-Term Construction Contracts .....		600,000
Construction in Progress .....		410,000

Note that the construction in progress account under both methods would have a balance of \$1,700,000 at the end of 2011, computed as shown below.

Completed-Contract Method Construction in Progress			
2010 cost	1,040,000	2011 loss	250,000
2011 cost	910,000		
Balance	1,700,000		

Percentage-of-Completion Method Construction in Progress			
2010 cost	1,040,000	2011 loss	410,000
2010 gross profit	160,000		
2011 cost	910,000		
Balance	1,700,000		

## Accounting for Long-Term Service Contracts: The Proportional Performance Method

**5** Record journal entries for long-term service contracts using the proportional performance method.

**WHY** To show financial statement users the economic activity of a company during the period being reported, revenue from long-term service contracts is often recognized prior to the completion of the entire contract.

**HOW** For long-term service contracts, revenue is recognized prior to the completion of the entire contract. Estimates of completion are made based on the percentage of identical acts completed or the relative sales value of the acts completed. The amount of revenue to be recognized is computed by multiplying this ratio by the contract price.

Thus far, the discussion in this chapter has focused on long-term construction-type contracts. As indicated earlier, another type of contract that frequently extends over a long period of time is a service contract. When the service to be performed is completed as a single act or over a relatively short period of time, no revenue recognition problems arise. The revenue recognition criteria previously defined apply, and all direct and indirect costs related to the service are charged to expense in the period the revenue is recognized. However, when several acts over a period of time are involved, the same revenue recognition problems illustrated for long-term construction-type contracts arise.

As explained in the earlier discussion of *SAB 101*, partial recognition of revenue under a multiple-element service contract is appropriate only if each element of the contract constitutes a service that can be sold separately. This approach is confirmed in *EITF 00-21*. If a contract involves a specified number of identical or similar acts, for example, the playing of a sports contest under a season ticket arrangement, then each sports contest represents a separate product and proportional performance accounting is appropriate. In such a case, revenue should be recognized by relating the number

of acts performed to the total number of acts to be performed over the contract life. If a contract involves a specified number of defined but not identical acts, revenue should be recognized using the relationship of the sales value of the individual acts to the total sales value of the service contract. If no pattern of performance can be determined, or if a service contract involves an unspecified number of similar or identical acts with a fixed period for performance, for example, a maintenance contract for electronic office equipment, the straight-line method, that is, recognizing revenue equally over the periods of performance, should be used. In Exhibit 8-2, **Microsoft's** revenue recognition note provides an example of how a company recognizes revenue for services when a lengthy time period is involved.

Of course, proportional revenue recognition is applicable only if cash collection is reasonably assured and if losses from nonpayment can be objectively determined.

The cost recognition problems of service contracts are somewhat different from those of long-term construction-type contracts. Most service contracts involve three different types of costs: (1) initial direct costs related to obtaining and performing initial services on the contract, such as commissions, legal fees, credit investigations, and paper processing; (2) direct costs related to performing the various acts of service; and (3) indirect costs related to maintaining the organization to service the contract, for example, general and administrative expenses. Initial direct costs generally are charged, that is, matched, against revenue using the same measure used for revenue recognition. Direct costs usually are charged to expense as incurred because they relate directly to the acts for which revenue is recognized. Similarly, all indirect costs should be charged to expense as incurred. As is true for long-term construction-type contracts, any indicated loss on completion of the service contract is to be charged to the period in which the loss is first indicated. If collection of a service contract is highly uncertain, revenue recognition should not be related to performance but to the collection of the receivable using one of the methods described in the latter part of this chapter.

<b>EXHIBIT 8-2</b>	<b>Microsoft's Revenue Recognition Note—Partial</b>
Revenue from multi-year licensing arrangements is accounted for as subscriptions, with billings recorded as unearned revenue and recognized as revenue ratably over the billing coverage period. Certain multi-year licensing arrangements include rights to receive future versions of software product.	

To illustrate accounting for a service contract using the proportional performance method, assume a correspondence school enters into 100 contracts with students for an extended writing course. The fee for each contract is \$500, payable in advance. This fee includes many different services such as providing the text material, evaluating written assignments and examinations, and awarding of a certificate. The total initial direct costs related to the contracts are \$5,000. Direct costs for the lessons actually completed during the first period are \$12,000. The separate sales value of the lessons completed during the first period is \$24,000; if sold separately, the total sales value of all the lessons would be \$60,000. The following entries would be made to record these transactions:

Cash .....	50,000	
Deferred Course Revenue (liability account) .....		50,000
Deferred Initial Costs (asset account) .....	5,000	
Cash .....		5,000
Contract Costs (expense account) .....	12,000	
Cash .....		12,000
Deferred Course Revenue .....	20,000*	
Recognized Course Revenue .....		20,000
Contract Costs .....	2,000†	
Deferred Initial Costs .....		2,000

\* Relative sales value percentage:  $\$24,000/\$60,000 = 40\%$ ;  $\$50,000 \times 0.40 = \$20,000$

†  $\$5,000 \times 0.40 = \$2,000$

The gross profit reported on these contracts for the period would be \$6,000 (\$20,000 – \$12,000 – \$2,000). The deferred initial cost and deferred course revenues would normally be reported as current balance sheet deferrals, because the operating cycle of a correspondence school would be equal to the average time to complete a contract or one year, whichever is longer.

## Revenue Recognition After Delivery of Goods or Performance of Services

**6** Explain when revenue is recognized after delivery of goods or services through installment sales, cost recovery, and cash methods.

**WHY** When a valid promise of payment has not been received, it is not appropriate to recognize revenue at the point of sale. In those instances, the recognition of revenue is deferred until cash is collected.

**HOW** Several methods exist for recognizing revenue when ultimate cash collection is in substantial doubt. The most common method, the installment sales method, results in profit being recognized based on the gross profit percentage. Under the installment sales method, a portion of every dollar collected is recorded as profit based on the gross profit percentage.

One of the FASB's two revenue recognition criteria, listed at the beginning of this chapter, states that revenue should not be recognized until the earnings process is substantially completed. Normally, the earnings process is substantially completed by the delivery of goods or performance of services. Collection of receivables is usually routine, and any future warranty costs can be reasonably estimated. In some cases, however, the circumstances surrounding a revenue transaction are such that considerable uncertainty exists as to whether payments will indeed be received. This can occur if the sales transaction is unusual in nature or involves a customer in such a way that default carries little cost or penalty. Under these circumstances, the uncertainty of cash collection suggests that revenue recognition should await the actual receipt of cash.

There are at least three different approaches to revenue recognition that depend on the receipt of cash: installment sales, cost recovery, and cash. These methods differ as to the treatment of costs incurred and the timing of revenue recognition. They are summarized and contrasted with the full accrual method in the table below.

These methods are really not alternatives to each other; however, the guidelines for applying them are not well defined. As the uncertainty of the environment increases, GAAP would require moving from the full accrual method to installment sales, cost recovery, and, finally, a strict cash approach. The cash method is the most conservative approach, because it would not permit the deferral of any costs but would charge them to expense as those costs are paid. In the following pages, each of these revenue recognition methods will be discussed and illustrated.

Method	Timing of Revenue and/or Income Recognition	Treatment of Product Costs or Direct Costs under Service Contracts
Full accrual	At point of sale.	Charge against revenue at time of sale or rendering of service.
Installment sales	At collection of cash. Usually a portion of the cash payment is recognized as income.	Defer to be matched against a part of each cash collection. Usually done by deferring the estimated profit.
Cost recovery	At collection of cash, but only after all costs are recovered.	Defer to be matched against total cash collected.
Cash	At collection of cash.	Charge to expense as incurred.

## Installment Sales Method

Traditionally, the most commonly applied method for dealing with the uncertainty of cash collections has been the **installment sales method**. Under this method, profit is recognized as cash is collected rather than at the time of sale. The installment sales method is used most commonly in cases of real estate sales where contracts may involve little or no down payment, payments are spread over 10 to 30 or 40 years, and a high probability of default in the early years exists because of a small investment by the buyer in the contract and because the market prices of the property often are unstable. Application of the accrual method to these contracts frequently overstates income in the early years due to the failure to realistically provide for future costs related to the contract, including losses from contract defaults. The FASB considered these types of sales and concluded that accrual accounting applied in these circumstances often results in “front-end loading,” that is, a recognition of all revenue at the time of the sales contract with improper matching of related costs. Thus, the Board has established criteria that must be met before real estate and retail land sales can be recorded using the full accrual method of revenue recognition. If the criteria are not fully met, then the use

of the installment sales method, or in some cases the cost recovery or deposit methods, is recommended to reflect the conditions of the sale more accurately.<sup>18</sup> **General Growth Properties, Inc.**, a real estate development firm, provides disclosure, shown in Exhibit 8-3, relating to its revenue recognition policy. Note that General Growth Properties uses one of four revenue recognition policies (full accrual, installment, cost recovery, or percentage of completion) for its transactions, depending on whether or not the transaction meets established revenue recognition criteria.

### caution

Do not confuse installment sales with the installment sales method of accounting. Remember that most installment sales are accounted for using accrual accounting. Only those sales with a high degree of uncertainty as to collection are accounted for using the installment sales method.

#### EXHIBIT 8-3

#### General Growth Properties' Revenue Recognition Note

Revenues from land sales are recognized using the full accrual method provided that various criteria relating to the terms of the transactions and our subsequent involvement with the land sold are met. Revenues relating to transactions that do not meet the established criteria are deferred and recognized when the criteria are met or using the installment or cost recovery methods, as appropriate in the circumstances. For land sale transactions in which we are required to perform additional services and incur significant costs after title has passed, revenues and cost of sales are recognized on a percentage of completion basis.

### fyi

The installment sales method is frequently used for income tax purposes. The primary rationale for allowing its use in that setting is that when the cash is collected over an extended period, at the time the sale is made the taxpayer does not have the wherewithal to pay all of the income tax due on the total profit.

Accounting for installment sales using the deferred gross profit approach requires determining a gross profit rate for the sales of each year and establishing an accounts receivable and a deferred gross profit account identified by the year of the sale. As collections are made of a given year's receivables, a portion of the deferred profit equal to the gross profit rate times the collections made is recognized as income. To keep things relatively simple, the following

<sup>18</sup> *Statement of Financial Accounting Standards No. 66*, “Accounting for Sales of Real Estate” (Stamford, CT: Financial Accounting Standards Board, October 1982).

examples of transactions and journal entries will illustrate the installment sales method assuming the sale of merchandise.

**Installment Sales of Merchandise** Assume that the Riding Corporation sells merchandise on the installment basis and that the uncertainties of cash collection make the use of the installment sales method necessary. The following data relate to three years of operations. To simplify the presentation, interest charges are excluded from the example.

	2010	2011	2012
Installment sales .....	\$ 150,000	\$200,000	\$300,000
Cost of installment sales .....	100,000	140,000	204,000
Gross profit .....	\$ 50,000	\$ 60,000	\$ 96,000
Gross profit percentage .....	33.333%	30%	32%
Cash collections:			
2010 sales .....	\$ 30,000	\$ 75,000	\$ 30,000
2011 sales .....		70,000	80,000
2012 sales .....			100,000

The entries to record the transactions for 2010 would be as follows:

*During the year:*

Installment Accounts Receivable—2010 .....	150,000	
Installment Sales .....		150,000
Cost of Installment Sales .....	100,000	
Inventory .....		100,000
Cash .....	30,000	
Installment Accounts Receivable—2010 .....		30,000

*End of year:*

Installment Sales .....	150,000	
Cost of Installment Sales .....		100,000
Deferred Gross Profit—2010 .....		50,000
Deferred Gross Profit—2010 .....	10,000*	
Realized Gross Profit on Installment Sales .....		10,000

\* \$30,000 × 33.33%

The sales and costs related to sales are recorded in a manner identical to the accounting for sales discussed in Chapter 7. At the end of the year, however, the sales and cost of sales accounts are closed to a deferred gross profit account rather than to Retained Earnings. The realized gross profit is then recognized by applying the gross profit percentage to cash collections. All other general and administrative expenses are normally written off in the period incurred.

For 2010, the income statement would begin with sales from which is subtracted deferred gross profit and to which is added realized gross profit for the year to arrive at a net figure. Cost of sales would then be subtracted along with other operating expenses (assumed to be \$5,000 in this example) as illustrated:

Sales .....	\$ 150,000
Less: Deferred gross profit .....	(50,000)
Add: Realized gross profit .....	10,000
	\$ 110,000
Less: Cost of installment sales .....	(100,000)
Other operating expenses .....	(5,000)
Operating income .....	\$ 5,000

Entries for the next two years are summarized in the schedule below.

	2011	2012
<i>During the year:</i>		
Installment Accounts Receivable—2011 .....	200,000	
Installment Accounts Receivable—2012 .....		300,000
Installment Sales .....	200,000	300,000
Cost of Installment Sales .....	140,000	204,000
Inventory .....	140,000	204,000
Cash .....	145,000	210,000
Installment Accounts Receivable—2010 .....	75,000	30,000
Installment Accounts Receivable—2011 .....	70,000	80,000
Installment Accounts Receivable—2012 .....		100,000
<i>End of year:</i>		
Installment Sales .....	200,000	300,000
Cost of Installment Sales .....	140,000	204,000
Deferred Gross Profit—2011 .....	60,000	
Deferred Gross Profit—2012 .....		96,000
Deferred Gross Profit—2010 .....	25,000*	10,000 <sup>†</sup>
Deferred Gross Profit—2011 .....	21,000 <sup>‡</sup>	24,000 <sup>§</sup>
Deferred Gross Profit—2012 .....		32,000 <sup>#</sup>
Realized Gross Profit on Installment Sales .....	46,000	66,000

\*  $\$75,000 \times 0.33333 = \$25,000$

<sup>†</sup>  $\$30,000 \times 0.33333 = \$10,000$

<sup>‡</sup>  $\$70,000 \times 0.30 = \$21,000$

<sup>§</sup>  $\$80,000 \times 0.30 = \$24,000$

<sup>#</sup>  $\$100,000 \times 0.32 = \$32,000$

## caution

Note that a separate deferred gross profit account is kept for each year and that accounts receivable collections must be accounted for by year. This is to ensure that the appropriate gross profit percentage is applied to the cash collected.

## stop & think

What does the \$80,000 net amount represent?

- The cost of the inventory associated with the \$120,000 installment accounts receivable.
- The amount of cash expected to be ultimately collected from the \$120,000 installment accounts receivable.
- The net present value of the installment accounts receivable amount of \$120,000.
- The current portion of the installment accounts receivable amount of \$120,000.

If a company is heavily involved in installment sales, the operating cycle of the business is normally the period of the average installment contract. Thus, the currently accepted definition of current assets and current liabilities requires that the receivables and their related deferred gross profit accounts be reported in the Current Assets section of classified balance sheets. The deferred gross profit accounts should be reported as an offset to the related accounts receivable. Thus, at the end of 2010, the Current Assets section would include the following account balances:

Installment accounts receivable.....	\$120,000	
Less: Deferred gross profit.....	40,000	\$80,000

**Complexities of Installment Sales of Merchandise** In the previous example, no provision was made for interest. In reality, installment sales contracts always include interest, either expressed or implied. The interest portion of the contract payments is recognized as income in the period in which cash is received, and the balance of the payment is treated as a collection on the installment sale. Thus, if in the example discussed previously, the \$75,000 collection of 2010 sales in 2011 included interest of

\$40,000, only \$35,000 would be used to compute the realized gross profit from 2010 sales. The resulting journal entries made in 2011 relating to the \$75,000 collection of 2010 sales would be as follows:

Cash .....	75,000	
Interest Revenue .....		40,000
Installment Accounts Receivable—2010 .....		35,000
Deferred Gross Profit—2010 .....	11,666*	
Realized Gross Profit on Installment Sales .....		11,666

\*  $\$35,000 \times 0.33333 = \$11,666$

Additional complexities can arise in installment sales accounting in providing for uncollectible accounts. Because of the right to repossess merchandise in the event of nonpayment, the provision for uncollectible accounts can be less than might be expected. Only the amount of the receivable in excess of the current value of the repossessed merchandise is a potential loss. Accounting for repossessions is discussed in Chapter 9. Theoretically, a proper matching of estimated losses against revenues would require allocating the expected losses over the years of collection. Practically, however, the provision is made and charged against income in the period of the sale. Thus, the accounting entries for handling estimated uncollectible accounts are the same as illustrated in Chapter 7. However, normally the impact of accounting for bad debts with respect to installment sales is not great because revenue and receivables are not recognized until the probability of cash collection is quite high.

## Cost Recovery Method

Under the **cost recovery method**, no income is recognized on a sale until the cost of the item sold is recovered through cash receipts. All cash receipts, both interest and principal portions, are applied first to the cost of those items sold. Then all subsequent receipts are reported as revenue. Because all costs have been recovered, the recognized revenue after cost recovery represents income. This method is used only when the circumstances surrounding a sale are so uncertain that earlier recognition is impossible.

Using the information from the Riding Corporation example, assume that collections are so uncertain that the use of the cost recovery method is deemed appropriate. While the entries to record the installment sale, the receipt of cash, and the deferral of the gross profit are identical for both the installment sales and cost recovery methods, the entry for recognizing gross profit differs.

In 2010 no gross profit would be recognized, because the amount of cash collected (\$30,000) is less than the cost of the inventory sold (\$100,000). The cash collections in 2011 relating to 2010 sales result in total cash receipts exceeding the cost of sales (\$30,000 + \$75,000 > \$100,000). Thus, in 2011 gross profit of \$5,000 would be recognized on 2010 sales. The journal entry to recognize this gross profit in 2011 follows:

Deferred Gross Profit—2010 .....	5,000	
Realized Gross Profit on Installment Sales .....		5,000

Because the cash collected in 2011 for 2011 sales (\$70,000) is less than the cost of inventory sold (\$140,000), no gross profit would be recognized in 2011 on 2011 sales. In 2012 the \$30,000 collected in cash from the 2010 sales would all be recognized as gross profit. The cash collected relating to 2011 sales, \$80,000, when added to the cash received in 2011, \$70,000, exceeds the cost of the 2011 sales of \$140,000. Thus, \$10,000 of gross profit that was deferred in 2011 will be recognized in 2012. The journal entry to recognize gross profit in 2012 would be:

Deferred Gross Profit—2010 .....	30,000	
Deferred Gross Profit—2011 .....	10,000	
Realized Gross Profit on Installment Sales .....		40,000

Comparing the amount of gross profit that is recognized using the various revenue recognition methods for the period 2010–2012 indicates how the income statement can be materially impacted by the method used.

Gross Profit Recognized			
Revenue Recognition Method	2010	2011	2012
Full accrual .....	\$50,000	\$60,000	\$96,000
Installment sales .....	10,000	46,000	66,000
Cost recovery .....	0	5,000	40,000

## Cash Method

If the probability of recovering product or service costs is remote, the **cash method** of accounting could be used. Seldom would this method be applicable for sales of merchandise or real estate because the right of repossession would leave considerable value to the seller. However, the cash method might be appropriate for service contracts with high initial costs and considerable uncertainty as to the ultimate collection of the contract price. Under this method, all costs are charged to expense as incurred, and revenue is recognized as collections are made. This extreme method of revenue and expense recognition would be appropriate only when the potential losses on a contract cannot be estimated with any degree of certainty.

## SOLUTIONS TO OPENING SCENARIO QUESTIONS

1. First, start-up companies, particularly Internet start-ups, often have not yet reported any earnings. Thus, the price-earnings ratio is virtually worthless in estimating appropriate stock values. Second, the Internet has been, and still is, characterized by huge upside potential but great uncertainty about which Internet-related business models will ultimately succeed. In this uncertain setting, the best measure of a company's future Internet-related profitability is the size of its Internet presence now. This is measured by volume of business, or sales.
2. Here are two contributing factors.

  - a. Change in expected growth trend: MicroStrategy's stock price was based on investors' forecasts of future sales and profits. Investors had extrapolated past growth trends into the future. So, the restatement of revenue not only lowered the level of revenue, but also drastically lowered the expected future growth trend.
  - b. Cockroach theory: When you see one cockroach in your kitchen, what do you know? You know that there are others. The announcement of the revenue restatement called into question everything that MicroStrategy was doing. All of the company's past statements were now being reevaluated in light of this newly discovered lack of credibility.
3. Here are three possibilities.

  - a. This is the ethical thing to do. All public figures should feel a fiduciary responsibility to see that those who don't have access to information are not deceived. The big guys (the banks, the institutional investors, and so forth) can take care of themselves. The small guys, who have to rely on the integrity of the big guys, are the ones who should be watched after.
  - b. From a crisis management standpoint, we have seen over and over (Watergate, Enron, and any other scandal that you can think of) that the fallout from a mistake is worse if a company has tried to cover up the mistake. Just take your medicine, tell all of the bad news up front, take your lumps, and move on.
  - c. Companies with more transparent reporting and with a reputation for integrity will, in the long run, have a lower cost of capital. These companies are trusted, so there is less information risk.

## SOLUTIONS TO STOP &amp; THINK

1. (Page 404) The correct answer is B. The other three methods are all acceptable ways to measure a contract's percentage of completion. Because this percentage can greatly influence a company's reported profits, the percentage must be arrived at objectively to avoid management pressure to bias the estimated percentage completed in order to meet profit targets.
2. (Page 408) The correct answer is C. When the progress billings on construction contracts account is netted against the construction in progress account, the resulting net figure represents the amount of the construction (which includes costs as well as a portion of expected profits) for which the customer has not yet been billed.
3. (Page 411) The correct answer is D. If estimates in prior periods were overstated by a significant amount, too much revenue (and profit) could end up being reported in the early periods. This error would require a loss to be recorded for this period so that the revenue (and profit) recognized to date would be correct.
4. (Page 419) The correct answer is A. The \$80,000 amount represents the cost of the inventory associated with the \$120,000 in sales that is reflected in the accounts receivable balance. Because collection of the receivable balance is uncertain, it is recorded at a lesser amount. This \$80,000 number assumes that if worse came to worst and customers didn't pay, the seller could at least get the inventory back.

## REVIEW OF LEARNING OBJECTIVES

**1** Identify the primary criteria for revenue recognition.

Revenue is typically recognized and recorded when two criteria have been met. The first criterion is realizability, which means that the seller has received payment or a valid promise of payment from the purchaser. The second criterion is met when the earnings process is substantially complete. Substantial completion means that the seller has provided the product or service (or a large portion of the product or service) to the purchaser.

**2** Apply the revenue recognition concepts underlying the examples used in SAB 101/104.

SAB 101 was released in 1999 by the SEC staff to curtail specific abuses in revenue recognition practices. SAB 101 requires companies to implement better internal control processes so that the records about the timing of sales transactions are reliable. Companies must

not recognize revenue before both legal and economic ownership of goods has passed. In addition, up-front fees should be recognized as revenue over the life of a service agreement, generally on a straight-line basis. In cases in which customers can receive a refund, no revenue is recognized until the end of the refund period except in well-defined circumstances. Finally, revenue for most Internet broker arrangements should be reported net instead of gross. SAB 104 includes much of the content of SAB 101 along with discussion of issues and questions that arose in response to the release of SAB 101.

**3** Describe the two asset-and-liability approaches to revenue recognition that are currently being considered by the FASB and IASB: the customer consideration model and the measurement model.

With respect to revenue recognition, the FASB and IASB are considering two different

asset-and-liability models which are more consistent with the underlying conceptual framework of accounting standards than is the patchwork of approaches, focused on the earnings process, that have arisen over time. The customer consideration model uses the relative amounts of the estimated separate selling prices of the various elements in the arrangement to measure the performance obligations created when a contractual arrangement with a customer is entered into. The measurement model uses direct estimates of the fair values of the various transaction obligations borne by the seller. The measurement model can result in revenue being recognized on the day that a contract is signed even if no product has been delivered and no traditional item of service has been provided.

**4 Record journal entries for long-term construction-type contracts using percentage-of-completion and completed-contract methods.**

In some instances, revenue may be recognized prior to the actual delivery of goods or services. The most common example of this is a long-term contract. In this case, revenue may be recognized prior to delivery if four criteria are met: (1) estimates can be made of the amount of work remaining, (2) a contract exists outlining each party's responsibilities, (3) the buyer can be expected to fulfill the contract, and (4) the seller can be expected to fulfill the contract. If these conditions are met, revenue may be recognized prior to the point of sale and the revenue recognition method is termed *percentage of completion*. With this method, revenue is recognized based on an estimate of the degree to which the contract is complete. Using the cost-to-cost method for estimating the degree of completion results in matching actual contract costs with estimated revenues. With long-term contracts, journal entries are required to record costs incurred, billings made to customers, and collections from customers. These entries are the same for both the percentage-of-completion

method and the completed-contract method. An additional journal entry is made each period under the percentage-of-completion method to record the recognition of revenue and related expenses for the period. The amount of revenue recognized is a function of the percentage of the work completed to date. With the completed-contract method, revenue is recognized only when the contract has been completed.

**5 Record journal entries for long-term service contracts using the proportional performance method.**

With long-term service contracts, revenue can be recognized prior to completion based on the degree to which the contract is completed. Estimates of completion are made based on the percentage of identical acts completed or the relative sales value of the acts completed. The amount of revenue to be recognized is computed by multiplying this ratio by the contract price.

**6 Explain when revenue is recognized after delivery of goods or services through installment sales, cost recovery, and cash methods.**

In some cases, it is not appropriate to recognize revenue at the point of sale when a valid promise of payment has not been received. In these instances, the recognition of revenue is deferred until cash is actually received. Several methods exist for recognizing revenue. The installment sales method recognizes profit based on a gross profit percentage. Of every dollar collected, a portion is recorded as profit based on the gross profit percentage. With the cost recovery method, cash collections are first considered to be a recovery of the costs associated with the sale. Once costs are recovered, each subsequent dollar received is recorded as profit. When the cash method is employed, profit is determined by comparing the cash received from customers with the cash expended during the period relating to inventory or services.

## IASB SUMMARY

Topic	U.S. GAAP	IASB Standard
Revenue recognition	Contained in a variety of standards that have been developed over the years. Two influential recent standards are <i>SAB 101/104</i> and <i>EITF 00-21</i> .	<i>IAS 18</i> Generally consistent with U.S. GAAP although the guidance is not nearly so detailed. In fact, U.S. GAAP is often referenced when detailed revenue recognition guidance is needed.
Asset-and-liability approach to revenue recognition	The FASB and IASB are jointly working on a revenue recognition standard that focuses on asset and liability increases and decreases resulting from contractual arrangements with customers.	Same
Revenue recognition before sale	<i>SAB 101/104</i> In almost all circumstances, no revenue is recognized until a sale and delivery have occurred.	<i>IAS 41</i> Gains and losses from increases and decreases in the fair value of biological assets (such as cows) and agricultural produce (such as harvested wheat) are recognized when they occur, without waiting until the items are subsequently sold.
Completed-contract method	<i>ARB No. 45 and SOP 81-1</i> The completed-contract method is the preferred method in some circumstances.	<i>IAS 11</i> The completed-contract method is not allowed.

## KEY TERMS

## QUESTIONS

1. What are the two general revenue recognition criteria?
2. What four revenue recognition factors are identified in AICPA *Statement of Position (SOP) 97-2*, and how do these four factors relate to the two general revenue recognition criteria?
3. Why did the SEC issue *Staff Accounting Bulletin (SAB) 101*?
4. Why does Question 1 in *SAB 101* emphasize the proper signing of a sales agreement?
5. What types of side agreements can turn a sale into a consignment?
6. What is a bill-and-hold arrangement? Under what circumstances may a seller recognize revenue before shipment on a bill-and-hold arrangement?
7. What is the significance of customer acceptance provisions?
8. In general, why are up-front, nonrefundable fees not recognized as revenue immediately?

9. Under *EITF 00-21*, when is a delivered element of a multiple-element arrangement considered to be a unit of accounting?
10. Under *EITF 00-21*, what is the difference between the “residual method” and the “reverse residual method”?
11. Why shouldn’t revenue be recognized until the transaction price can be definitely determined?
12. Under what circumstances can a refundable fee be recognized as revenue month-by-month before the refund period is over?
13. Why can’t contingent rents be estimated and recognized on a straight-line basis over the course of a year?
14. Under what circumstances can a company reliably estimate product returns?
15. Why would a company prefer gross revenue reporting over net revenue reporting?
16. Briefly describe the two asset-and-liability revenue recognition models currently being considered by the FASB and IASB.
17. Which of the two asset-and-liability revenue recognition models currently being considered by the FASB and IASB is more similar to current practice?
18. Under what conditions is percentage-of-completion accounting recommended for construction contractors?
19. Distinguish between the cost-to-cost method and efforts-expended method of measuring the percentage of completion.
20. Output measures of percentage of completion are sometimes preferred to input measures. What are some examples of commonly used output measures?
21. What is the relationship between the construction in progress account and the progress billings on construction contracts account? How should these accounts be reported on the balance sheet?
22. When a measure of percentage of completion other than cost-to-cost is used, the amount of cost charged against revenue using the percentage of completion usually will be different from the costs incurred. How do some AICPA committee members recommend handling this situation so that the costs charged against revenue are equal to the costs incurred?
23. The construction in progress account is used to accumulate all costs of construction. What additional item is included in this account when percentage-of-completion accounting is followed?
24. The gross profit percentage reported on long-term construction contracts often varies from year to year. What is the major reason for this variation?
25. How are anticipated contract losses treated under the completed-contract and percentage-of-completion methods?
26. What input and output measures usually are applicable to the proportional performance method for long-term service contracts?
27. The proportional performance method spreads the profit over the periods in which services are being performed. What arguments could be made against this method of revenue recognition for newly formed service-oriented companies?
28. Distinguish among the three different approaches to revenue recognition that await the receipt of cash. How does the treatment of costs incurred vary depending on the approach used?
29. Under what general conditions is the installment sales method of accounting preferred to the full accrual method?
30. The normal accounting entries for installment sales require keeping a separate record by year of receivables, collections on receivables, and the deferred gross profit percentages. Why are these separate records necessary?
31. Installment sales contracts generally include interest. Contrast the method of recognizing interest revenue from the method used to recognize the gross profit on the sale.
32. Under what conditions would the cash method of recognizing revenue be acceptable for reporting purposes?

## PRACTICE EXERCISES

### Practice 8-1

#### Basic Journal Entries for Revenue Recognition

#### LO1

The company collected \$1,000 cash in advance from a customer for services to be rendered. Subsequently, the company rendered the services. Make the journal entries necessary to record (1) the receipt of the cash and (2) the subsequent completion of the services.

**Practice 8-2 Journal Entries for a Consignment**

LO2

Company S shipped goods costing \$12,000 to Company T on consignment. The sales agreement states that Company T has 90 days to either sell the goods and pay Company S \$18,000 for them or to return the goods to Company S. Make the journal entries necessary on the books of Company S to record (1) the original shipment of the goods to Company T and (2) the expiration of the 90-day period without the goods being returned by Company T. Company S uses a perpetual inventory system.

**Practice 8-3 Journal Entries for a Layaway**

LO2

On January 1, the company received layaway payments from two customers. Each customer paid \$50. On December 24, the layaway period expired. On that date, the company received \$300 from Customer 1 and delivered the promised merchandise (costing \$200). Customer 2 did not return to make the final payment and thus forfeited the initial \$50 layaway payment. Make the journal entries necessary to record (1) the receipt of the initial layaway payments, (2) the receipt of the final layaway payment and the delivery of the goods to Customer 1, and (3) the forfeit of the layaway payment by Customer 2. The company uses a perpetual inventory system.

**Practice 8-4 Journal Entries for an Up-Front, Nonrefundable Fee**

LO2

The company sells satellite phone service. Customers are required to pay an initial fee of \$360, followed by continuing service fees of \$50 per month. The initial fee is not refundable. The company's best estimate is that the average customer will continue the service for three years. On January 1, the company signed up 200 new customers. Make the journal entries necessary to record (1) the receipt of the initial fees from these 200 customers, (2) the receipt of the first monthly payment from the 200 customers, and (3) the partial recognition of the initial fees as revenue after the first month.

**Practice 8-5 Journal Entries for an Up-Front, Refundable Fee**

LO2

The company operates a travel club through which subscribers can access low rates for air fares, hotel rooms, and rental cars. Each year, subscribers pay a refundable fee of \$2,000 that allows them access to the company's services for that year. A customer may receive a full refund of this fee at any time during the year with no questions asked. The cost to service a customer's account for a year is \$240; these costs are incurred in cash evenly throughout the year. The company can reliably estimate that 25% of customers will ask for a full refund of their subscription fee. On January 1, the company received payments from 2,000 subscribers. Make the journal entries necessary to record (1) the receipt of the subscription fees from these 2,000 customers, (2) the partial recognition of the subscription fees as revenue after the first month (with the associated service cost for the first month), and (3) final recognition of revenue (and associated service cost) for the month of December as well as the payment of full refunds to 25% of the customers (as expected).

**Practice 8-6 Revenue in a Multiple-Element Arrangement under EITF 00-21**

LO2

On June 4, Seller Company signed a sales agreement with Buyer Company to deliver and install a piece of factory equipment. The total contract price is \$300,000. Customers usually buy an equipment/installation package, but Seller Company does sell equipment without installation and also installs equipment sold by other companies. The selling price of the equipment without installation is \$290,000. The separate price for installation of this piece of equipment is \$20,000. (1) How much revenue should be recognized by Seller Company when the equipment is delivered but before it is installed? (2) Now repeat (1) assuming that there is no market for separate installation. In other words, assume that no fair value of the separate installation service can be reliably determined. *Note:* This Practice Exercise is based on Example 3 in *EITF 00-21*.

**Practice 8-7 Journal Entries for Contingent Rent**

LO2

On January 1, Owner Company signed a 1-year rental for a total of \$480,000, with monthly payments of \$40,000 due at the end of each month. In addition, the

renter must pay contingent rent of 2% of all sales in excess of \$50 million annually. The contingent rent is paid in one payment on December 31. On January 31, Owner Company received the first rental payment. At that time, sales for the renter had reached \$10 million. On May 31, Owner Company received the regular monthly rental payment; by the end of May, the renter had reached a sales level of \$55 million. On December 31, Owner received the final monthly rental payment as well as the contingent rental payment. The renter's sales for the year totaled \$80 million, of which \$12 million occurred in December. Make the journal entries necessary on the books of Owner Company on (1) January 31, (2) May 31, and (3) December 31.

**Practice 8-8****LO2****Reporting Revenue Gross and Net**

Shop-at-Home Company operates a Web grocer. Customers submit their orders online to Shop-at-Home Company; Shop-at-Home then forwards the orders to a national grocery chain. The grocery chain arranges for assembly and shipment of the order. Shop-at-Home Company receives 3% of the retail value of all orders it takes. During January, Shop-at-Home Company received orders for groceries with a retail selling price of \$400,000. These groceries cost the grocery store chain \$280,000. The grocery store chain collected cash of \$400,000 from the customers and paid the appropriate commission in cash to Shop-at-Home Company. Based on this information, make all journal entries necessary in January (1) on the books of Shop-at-Home Company and (2) on the books of the grocery store chain. Assume that the grocery store chain uses a perpetual inventory system.

**Practice 8-9****LO3****Journal Entries under the Customer Consideration and Measurement Models**

On June 4, Seller Company signed a sales agreement with Buyer Company to deliver and install a piece of factory equipment. The total contract price is \$300,000. Customers usually buy an equipment/installation package, but Seller Company does sell equipment without installation and also installs equipment sold by other companies. The selling price of the equipment without installation is \$290,000. The separate price for installation of this piece of equipment is \$20,000. Seller Company could pay \$280,000 to another equipment company to accept the obligation to provide and deliver the equipment to Buyer. Seller could pay \$17,000 to an installation company to accept the obligation of installing the equipment. (1) Using the customer consideration model, make the journal entry necessary on the date the sales agreement is signed. Assume that Buyer Company paid all of the \$300,000 in cash when the agreement was signed. (2) Repeat (1) using the measurement model.

**Practice 8-10****LO4****Cost-to-Cost Method**

The company signed an \$800,000 contract to build an environmentally friendly access trail to South Willow Lake. The project was expected to take approximately three years. The following information was collected for each year of the project—Year 1, Year 2, and Year 3:

	Cost Expended during the Year	Expected Additional Cost to Completion	Support Timbers Laid during the Year	Additional Support Timbers to Be Laid	Trail Feet Constructed during the Year	Additional Trail Feet to Be Constructed
Year 1	\$100,000	\$450,000	150	850	3,000	15,200
Year 2	150,000	280,000	300	520	7,500	8,200
Year 3	250,000	0	500	0	8,000	0

The company uses the percentage-of-completion method of computing revenue from long-term construction contracts. Assume that the company employs the cost-to-cost method of estimating the percentage of completion. Compute the amount of revenue to be recognized in (1) Year 1, (2) Year 2, and (3) Year 3.

**Practice 8-11 Efforts-Expended Method**

LO4

Refer to Practice 8-10. Assume that the company employs the efforts-expended method of estimating the percentage of completion. In particular, the company measures its progress by the number of support timbers laid in the trail. Compute the amount of revenue to be recognized in (1) Year 1, (2) Year 2, and (3) Year 3.

**Practice 8-12 Percentage of Completion Based on Output Measures**

LO4

Refer to Practice 8-10. Assume that the company employs an output measure to estimate the percentage of completion. In particular, the company measures its progress by the number of trail feet that have been completed. Compute the amount of revenue to be recognized in (1) Year 1, (2) Year 2, and (3) Year 3.

**Practice 8-13 Basic Construction Journal Entries**

LO4

Refer to Practice 8-10. In addition to the percentage-of-completion information, the following information is available regarding billing and cash collection for the project:

	Year 1	Year 2	Year 3
Progress billings .....	\$200,000	\$200,000	\$400,000
Cash collections .....	180,000	170,000	450,000

Make the journal entries necessary to record the construction cost, the progress billings, and the cash collections in (1) Year 1, (2) Year 2, and (3) Year 3.

**Practice 8-14 Completed-Contract Journal Entries**

LO4

Refer to Practice 8-10 and Practice 8-13. Assume that the company uses the completed-contract method. Make the journal entries necessary in Year 3 to recognize revenue and costs for the completed project.

**Practice 8-15 Percentage-of-Completion Journal Entries**

LO4

Refer to Practice 8-10 and Practice 8-13. Assume that the company uses the percentage-of-completion method and uses a cost-to-cost approach in estimating the percentage of completion. Make the journal entries to record revenue and cost for the construction project in (1) Year 1, (2) Year 2, and (3) Year 3.

**Practice 8-16 Construction Contracts: Balance Sheet Reporting**

LO4

Refer to Practice 8-10, Practice 8-13, and Practice 8-15. Indicate how, and in what amount, the following accounts will be reported in the company's balance sheet for Year 1, Year 2, and Year 3: (1) Accounts Receivable, (2) Progress Billings, and (3) Construction in Progress. Assume that as of the end of Year 3, the progress billings and construction in progress accounts have not yet been closed.

**Practice 8-17 Multiple Years of Revenues and Costs: Cost-to-Cost Method**

LO4

The company signed a \$1,800,000 contract to build an environmentally friendly access trail to Timpanogas Caves. The project was expected to take approximately three years. The following information was collected for each year of the project, Year 1, Year 2, and Year 3:

	Cost Expended during the Year	Expected Additional Cost to Completion	Trail Feet Constructed during the Year	Additional Trail Feet to Be Constructed
Year 1 .....	\$280,000	\$760,000	9,800	20,300
Year 2 .....	390,000	380,000	10,200	10,000
Year 3 .....	370,000	0	10,000	0

The company uses the percentage-of-completion method of computing revenue from long-term construction contracts. Assume that the company employs the cost-to-cost method of estimating the percentage of completion. Make the journal entries to record revenue and cost for the construction project—(1) Year 1, (2) Year 2, and (3) Year 3.

**Practice 8-18**

**Multiple Years of Revenues and Costs: Output Measure**

LO4

Refer to Practice 8-17. Assume that the company uses the percentage of trail feet constructed in estimating the percentage of completion. Make the journal entries to record revenue and cost for the construction project in (1) Year 1, (2) Year 2, and (3) Year 3.

**Practice 8-19**

**Multiple Years of Revenues and Costs: Anticipated Loss**

LO4

The company signed a \$1,500,000 contract to build an environmentally friendly access trail to Stansbury Peak. The project was expected to take approximately three years. The following information was collected for each year of the project—Year 1, Year 2, and Year 3:

	Cost Expended during the Year	Expected Additional Cost to Completion
Year 1 .....	\$200,000	\$1,150,000
Year 2 .....	350,000	1,020,000
Year 3 .....	900,000	0

The company uses the percentage-of-completion method of computing revenue from long-term construction contracts, and the company employs the cost-to-cost method to estimate the percentage of completion. Make the journal entries to record revenue and cost for the construction project in (1) Year 1, (2) Year 2, and (3) Year 3.

**Practice 8-20**

**Journal Entries for the Proportional Performance Method**

LO5

The Washington Blue Sox is a minor league baseball team. The team has 55 home games during a season and sells season tickets for \$600 each. For the most recent season, the Blue Sox sold 1,900 season tickets. The total initial direct costs (in cash) related to the season tickets (including product giveaways for signing up early, costs of processing the transactions, and so forth) were \$180,000. Direct costs (in cash) are \$3 per customer per game. The team’s fiscal year ends on June 30. As of that date, 21 of the home games have been played. Make the journal entries necessary to record (1) the receipt of the cash for the 1,900 season tickets sold, (2) the payment (in cash) for the initial direct costs, and (3) the recognition of all season ticket revenues and expenses for the fiscal year.

**Practice 8-21**

**Installment Sales: Basic Journal Entries**

LO6

The company had sales during the year of \$350,000. The gross profit percentage during the year was 20%. Cash collected during the year related to these sales was 40% of the sales. Give all journal entries necessary during the year, assuming use of the installment sales method.

**Practice 8-22**

**Installment Sales: Financial Statement Reporting**

LO6

Refer to Practice 8-21. Indicate how the installment sales receivable would be reported in the balance sheet at the end of the year.

**Practice 8-23**

**Installment Sales: Interest on Receivables**

LO6

Transistor Electronics makes all of its sales on credit and accounts for them using the installment sales method. For simplicity, assume that all sales occur on the first day of the year and that all cash collections are made on the last day of the year. Transistor

Electronics charges 18% interest on the unpaid installment balances. Data for Year 1 and Year 2 are as follows:

	Year 1	Year 2
Sales .....	\$200,000	\$220,000
Cost of goods sold .....	110,000	130,000
Cash collections (principal and interest):		
From Year 1 sales .....	90,000	100,000
From Year 2 sales .....	0	100,000

Prepare *all* necessary journal entries for (1) Year 1 and (2) Year 2.

### Practice 8-24

#### Cost Recovery Method: Basic Journal Entries

#### LO6

The company had installment sales in Year 1 of \$350,000, in Year 2 of \$270,000, and in Year 3 of \$210,000. The gross profit percentage of each year, in order, was 20%, 25%, and 30%. Past history has shown that 40% of total sales are collected in the year of the sale, 50% in the year after the sale, and no collections are made in the second year after the sale or thereafter. Because of uncertainty about cash collection, the company uses the cost recovery method. Make all necessary journal entries for (1) Year 1, (2) Year 2, and (3) Year 3.

## EXERCISES

### Exercise 8-25

#### Consignment Accounting

#### LO2

In 2011, Rawlings Wholesalers transferred goods to a retailer on consignment. The transaction was recorded as a sale by Rawlings. The goods cost \$45,000 and normally are sold at a 30% markup. In 2012, \$12,000 (cost) of merchandise was sold by the retailer at the normal markup, and the balance of the merchandise was returned to Rawlings. The retailer withheld a 15% commission from payment. Prepare the journal entry in 2012 to correct the books for 2011 (assuming that the books for 2011 are already closed), and prepare the correct entries relative to the consignment sale in 2012.

### Exercise 8-26

#### Accounting for a Bill-and-Hold Arrangement

#### LO2

On December 30, Shady Company segregated goods costing \$530,000 for future shipment to one of its customers, Point Company. Point was billed \$890,000. Make the journal entry necessary on Shady's books to record this action in each of the following situations. Treat each situation independently.

- Point is a regular customer, and Shady has been expecting an order for the past two weeks. To make sure that sufficient goods are available when the order from Point finally does come, Shady has segregated the goods.
- Normal procedure is for the purchasing agent for Point to sign a formal sales agreement as part of each purchase. That agreement is then countersigned by Shady's sales manager. The segregation of goods was arranged over the phone; Shady plans to take care of the formal paperwork next week.
- Point has requested, in writing, that Shady segregate the goods. Point is conducting temporary repairs to its storage warehouse, so Point has arranged to make its shipments directly from Shady's warehouse for the duration of the repairs. The goods have been carefully separated so that Shady employees don't accidentally ship them to another customer.
- The sales agreement between Shady and Point requires that all goods be subjected to a quality control test by Point engineers. That quality control test is not expected to occur until early January.

**Exercise 8-27**

LO2

**Journal Entries for an Up-Front, Nonrefundable Fee**

BodyTone Company sells lifetime health club memberships. For one up-front, nonrefundable fee, a customer becomes a lifetime member of BodyTone’s network of health clubs. The fee is \$2,000. The fee includes full access to all of the club facilities plus an initial comprehensive physical, mental, and spiritual wellness evaluation. The wellness evaluation is frequently sold separately for \$400. Occasionally, BodyTone sells lifetime memberships without the wellness evaluation; the price is \$1,750. BodyTone can reliably estimate that the average customer will use the health club facilities for five years. On January 1, 2011, BodyTone received lifetime membership payments from 300 new customers. The direct cost of providing a wellness evaluation is \$70, and the direct cost of providing health club access for one person for one year is \$250. All of the wellness evaluations were completed during 2011. Make all of the journal entries necessary in 2011 in connection with these 300 new memberships. Assume that all costs were incurred in cash.

**Exercise 8-28**

LO2

**Journal Entries for an Up-Front, Refundable Fee**

AccounTutor Company operates a nationwide online tutorial service for college students taking intermediate financial accounting. Subscribers to the service pay an up-front, refundable fee of \$200 that allows them access to the company’s services for one year. A subscriber may receive a full refund of this fee at any time during the year. Because the subscribers are accounting students with high ethics, AccounTutor has no concern about unscrupulous students using the service for a year and then brazenly asking for a full refund. The initial setup cost (incurred in cash) associated with each subscriber is \$40. The direct cost to service a subscriber’s account for a year is \$80; these costs are incurred in cash evenly throughout the year. The company can reliably estimate that 20% of subscribers will ask for a full refund of their subscription fee. On January 1, 2011, the company received payments from 20,000 subscribers. No refunds were requested until the end of the fourth quarter of the year when 3,800 subscribers requested and received full refunds. Costs associated with the subscribers who are expected to request refunds are expensed as incurred. Other direct costs are deferred and matched with the associated revenues. Make all summary journal entries necessary:

1. On January 1, 2011.
2. At the end of the first quarter.
3. At the end of the second quarter.
4. At the end of the third quarter.
5. At the end of the fourth quarter.

**Exercise 8-29**

LO4

**Completed-Contract Method**

On June 1, 2011, bids were submitted for a construction project to build a new municipal building and fire station. The lowest bid was \$5,130,000, submitted by the Shannon Construction Company. Shannon was awarded the contract. Shannon uses the completed-contract method to report gross profit. The following data are given to summarize the activities on this contract for 2011 and 2012. Give the entries to record these transactions using the completed-contract method.

Year	Cost Incurred	Estimated Cost to Complete	Billings on Contract	Collections of Billings
2011 .....	\$1,930,000	\$2,420,000	\$2,100,000	\$1,800,000
2012 .....	2,290,000	0	3,030,000	3,330,000

**Exercise 8-30**

LO4

**Percentage-of-Completion Analysis**

Espiritu Construction Co. has used the cost-to-cost percentage-of-completion method of recognizing revenue. Tony Espiritu assumed leadership of the business after the recent death of his father, Howard. In reviewing the records, Tony finds the following

information regarding a recently completed building project for which the total contract was \$2,000,000.

	2010	2011	2012
Gross profit (loss) .....	\$ 75,000	\$140,000	\$ (20,000)
Cost incurred .....	360,000	?	820,000

Espiritu wants to know how effectively the company operated during the last three years on this project and, because the information is not complete, has asked for answers to the following questions.

1. How much cost was incurred in 2011?
2. What percentage of the project was completed by the end of 2011?
3. What was the total estimated gross profit on the project by the end of 2011?
4. What was the estimated cost to complete the project at the end of 2011?

### Exercise 8-31

#### LO4

SPREADSHEET

### Percentage-of-Completion Accounting

Perfectionist Construction Company was the low bidder on an office building construction contract. The contract bid was \$9,000,000, with an estimated cost to complete the project of \$7,000,000. The contract period was 30 months starting May 1, 2010. The company uses the cost-to-cost method of estimating earnings. Because of changes requested by the customer, the contract price was adjusted downward to \$8,600,000 on May 1, 2011.

A record of construction activities for the years 2010–2013 is as follows:

Year	Actual Cost— Current Year	Progress Billings	Cash Receipts
2010 .....	\$1,900,000	\$2,500,000	\$1,900,000
2011 .....	3,600,000	3,400,000	3,100,000
2012 .....	1,670,000	2,700,000	2,500,000
2013 .....			1,100,000

The estimated cost to complete the contract as of the end of each accounting period is:

2010	\$5,150,000
2011	1,600,000
2012	0

Calculate the gross profit for the years 2010–2012 under the percentage-of-completion method of revenue recognition.

### Exercise 8-32

#### LO4

### Percentage-of-Completion Analysis

Smokey International Inc. recently acquired the Kurtz Builders Company. Kurtz has incomplete accounting records. On one particular project, only the information below is available.

	2010	2011	2012
Costs incurred during year .....	\$200,000	\$250,000	?
Estimated cost to complete .....	450,000	190,000	\$ 0
Recognized revenue .....	220,000	?	?
Gross profit on contract .....	?	10,000	(10,000)
Contract price .....	850,000		

Because the information is incomplete, you are asked the following questions assuming the percentage-of-completion method is used, an output measure is used

to estimate the percentage completed, and revenue is recorded using the actual cost approach.

1. How much gross profit should be reported in 2010?
2. How much revenue should be reported in 2011?
3. How much revenue should be reported in 2012?
4. How much cost was incurred in 2012?
5. What are the total costs on the contract?
6. What would be the gross profit for 2011 if the cost-to-cost percentage-of-completion method were used rather than the output measure? (*Hint:* Ignore the revenue amount shown for 2010 and gross profit amount reported for 2011.)

**Exercise 8-33**

**Reporting Construction Contracts**

LO4

Kylee Builders Inc. is building a new home for Cassie Proffit at a contracted price of \$170,000. The estimated cost at the time the contract is signed (January 2, 2011) is \$115,000. At December 31, 2011, the total cost incurred is \$60,000 with estimated costs to complete of \$59,000. Kylee has billed \$80,000 on the job and has received a \$55,000 payment. This is the only contract in process at year-end. Prepare the sections of the balance sheet and the income statement of Kylee Builders Inc. affected by these events assuming use of (1) the percentage-of-completion method and (2) the completed-contract method.

**Exercise 8-34**

**Percentage of Completion Using Architect's Estimates**

LO4

Southern California Builders Inc. entered into a contract to construct an office building and plaza at a contract price of \$30,000,000. Income is to be reported using the percentage-of-completion method as determined by estimates made by the architect. The data below summarize the activities on the construction for the years 2010–2012. For the years 2010–2012, what entries are required to record this information, assuming the architect's estimate of the percentage completed is used to determine revenue (proportional cost approach)?

Year	Actual Cost Incurred	Estimated Cost to Complete	Percentage Completed—Architect's Estimate	Project Billings	Collections on Billings
2010 .....	\$7,600,000	\$18,400,000	30%	\$ 9,500,000	\$ 9,000,000
2011 .....	9,700,000	8,900,000	80	11,500,000	10,300,000
2012 .....	8,800,000	0	100	9,000,000	10,700,000

**Exercise 8-35**

**Completed-Contract Method**

LO4

On January 1, 2010, the Kobe Construction Company entered into a 3-year contract to build a dam. The original contract price was \$21,000,000 and the estimated cost was \$19,400,000. The following cost data relate to the construction period.

Year	Cost Incurred	Estimated Cost to Complete	Billings	Cash Collected
2010 .....	\$7,200,000	\$12,500,000	\$7,200,000	\$6,500,000
2011 .....	6,700,000	7,800,000	6,500,000	6,400,000
2012 .....	7,900,000	0	7,300,000	8,100,000

Prepare the required journal entries for the three years of the contract, assuming Kobe uses the completed-contract method.

**Exercise 8-36**

**Percentage-of-Completion Method with Change Orders**

LO4

The Build-It Construction Company enters into a contract on January 1, 2011, to construct a 20-story office building for \$42,000,000. During the construction period, many change orders are made to the original contract. The following schedule summarizes the changes made in 2011.

	Cost Incurred— 2011	Estimated Cost to Complete	Contract Price
Basic contract .....	\$8,000,000	\$28,000,000	\$42,000,000
Change Order 1 .....	50,000	50,000	125,000
Change Order 2 .....	0	50,000	0
Change Order 3 .....	300,000	300,000	Still to be negotiated; at least cost.
Change Order 4 .....	125,000	0	100,000

Compute the revenues, costs, and gross profit to be recognized in 2011, assuming use of the cost-to-cost method to determine the percentage completed. (Round percentage to two decimal places.)

**Exercise 8-37**

LO5

DEMO PROBLEM

**Service Industry Accounting**

The Spectrum Fitness Club charges a nonrefundable annual membership fee of \$1,200 for its services. For this fee, each member receives a fitness evaluation (value \$200), a monthly magazine (annual value \$25), and two hours' use of the equipment each week (annual value \$1,100). Each of the three elements of the annual membership can be purchased separately. The initial direct costs to obtain the membership are \$180. The direct cost of the fitness evaluation is \$100, and the monthly direct costs to provide the other services are estimated to be \$25 per person. Give the journal entries to record the transactions in 2011 relative to a membership sold on May 1, 2011.

**Exercise 8-38**

LO6

SPREADSHEET

**Installment Sales Accounting**

Jordan Corporation had sales in 2010 of \$150,000, in 2011 of \$180,000, and in 2012 of \$225,000. The gross profit percentage of each year, in order, was 26%, 29%, and 32%. Past history has shown that 20% of total sales are collected in the first year, 40% in the second year, and 20% in the third year. Assuming these collections are made as projected, give the journal entries for 2010, 2011, and 2012, assuming the installment sales method. Ignore provisions for bad debts and interest.

**Exercise 8-39**

LO6

**Installment Sales Analysis**

Complete the following table.

	2010	2011	2012
Installment sales .....	\$50,000	\$80,000	\$ (7)
Cost of installment sales .....	(1)	(5)	91,800
Gross profit .....	(2)	(6)	28,200
Gross profit percentage .....	(3)	25%	(8)
Cash collections:			
2010 sales .....	(4)	25,000	10,000
2011 sales .....		20,000	50,000
2012 sales .....			45,000
Realized gross profit on installment sales .....	1,100	10,500	(9)

**Exercise 8-40**

LO6

**Cost Recovery Method**

K. B. Sayer Furnishings Inc. had the following sales and gross profit percentages for the years 2010–2013.

	Sales	Gross Profit Percentage
2010 .....	\$60,000	55%
2011 .....	65,000	51
2012 .....	72,000	56
2013 .....	76,000	57

Historically, 60% of sales are collected in the year of the sale, 25% in the following year, and 10% in the third year. Assuming collections are as projected, give the journal entries for the years 2010–2013, assuming the cost recovery method. (Ignore provision for bad debts.) Prepare a table comparing the gross profit recognized for 2010–2013 using the full accrual method and the cost recovery method.

**Exercise 8-41**

**Cost Recovery Analysis**

LO6

Hatch Enterprises uses the cost recovery method for all installment sales. Complete the following table.

	2010	2011	2012
Installment sales .....	\$92,000	\$103,000	\$ (1)
Cost of installment sales .....	(2)	62,830	74,750
Gross profit percentage .....	36%	(3)	35%
Cash collections:			
2010 sales .....	27,200	48,300	12,200
2011 sales .....		36,600	(4)
2012 sales .....			43,450
Realized gross profit on installment sales .....	(5)	(6)	19,250

**PROBLEMS**

**Problem 8-42**

**Consignment Accounting**

LO2

Tingey Industries sells merchandise on a consignment basis to dealers. The selling price of the merchandise averages 25% above cost of merchandise. The dealer is paid a 10% commission on the sales price for all sales made. All dealer sales are made on a cash basis. The following consignment sales activities occurred during 2011.

Manufacturing cost of goods shipped on consignment .....	\$250,000
Sales price of merchandise sold by dealers .....	220,000
Payments made by dealers after deducting commission .....	139,000

**Instructions:**

1. Prepare summary entries on the books of the consignor for these consignment sales transactions.
2. Prepare summary entries on the books of the dealer consignee, assuming there is only one dealer involved.
3. Prepare the parts of Tingey Industries' financial statements at December 31, 2011, that relate to these consignment sales.

**Problem 8-43**

**Contingent Rental**

LO2

On January 1, Reschke Company signed a 1-year rental for a total of \$90,000, with quarterly payments of \$22,500 due at the end of each quarter. In addition, the renter must pay contingent rent of 3% of all sales in excess of \$1,200,000. The contingent rent is paid in one payment on December 31. On March 31, Reschke Company received the first rental payment. At that time, sales for the renter had reached \$450,000. The same renter has used the building for the past five years, and in each of those years the renter reached the contingent rent threshold of \$1,200,000 in sales. Accordingly, the accountant for Reschke Company recognized total rent revenue of \$27,000 for the first quarter—\$22,500 collected in cash and another \$4,500 in estimated contingent rent. The contingent rent estimate was based on the excess of sales in the quarter over one quarter of the \$1,200,000 threshold  $[(\$450,000 - \$300,000) \times 0.03]$ . Sales for the quarter ended June 30 were \$350,000, and the accountant for Reschke Company followed the same procedure regarding the contingent rent. Sales in the third quarter were \$390,000. However, in the third quarter the accountant for Reschke Company

learned that contingent rentals should not be estimated, but instead should be recognized only after the threshold has been reached. The accounting was done correctly in the third quarter, and the appropriate entry was made to correct the mistakes made in the first and second quarters. Sales by the renter in the fourth quarter were \$500,000.

**Instructions:**

Recreate the journal entries made by Reschke Company:

1. In the first quarter.
2. In the second quarter.
3. In the third quarter.
4. In the fourth quarter.

Your entries should include the incorrect entries made in the first and second quarter and the correcting entry made in the third quarter.

**Problem 8-44**

**Construction Accounting**

**LO4**

Zamponi's Construction Company reports its income for tax purposes on a completed-contract basis and income for financial statement purposes on a percentage-of-completion basis. A record of construction activities for 2011 and 2012 follows:

Project	Contract Price	Cost Incurred— 2011	Estimated Cost to Complete	Cost Incurred— 2012	Estimated Cost to Complete
A .....	\$1,450,000	\$840,000	\$560,000	\$480,000	\$ 0
B .....	1,700,000	720,000	880,000	340,000	650,000
C .....	850,000	160,000	480,000	431,500	58,500
D .....	1,000,000			280,000	520,000

General and administrative expenses for 2011 and 2012 were \$60,000 for each year and are to be recorded as a period cost.

**Instructions:**

1. Calculate the income for 2011 and 2012 that should be reported for financial statement purposes.
2. Calculate the income for 2012 to be reported on a completed-contract basis.

**Problem 8-45**

**Construction Accounting**

**LO4**

SPREADSHEET

The Rushing Construction Company obtained a construction contract to build a highway and bridge over the Snake River. It was estimated at the beginning of the contract that it would take three years to complete the project at an expected cost of \$50,000,000. The contract price was \$60,000,000. The project actually took four years, being accepted as completed late in 2012. The following information describes the status of the job at the close of production each year.

	2009	2010	2011	2012	2013
Actual cost incurred .....	\$12,000,000	\$18,160,000	\$14,840,000	\$10,000,000	\$ 0
Estimated cost to complete .....	38,000,000	27,840,000	10,555,555	0	0
Collections on contract .....	12,000,000	13,500,000	15,000,000	15,000,000	4,500,000
Billings on contract .....	13,000,000	15,500,000	17,000,000	14,500,000	0

**Instructions:**

1. What is the revenue, cost, and gross profit recognized for each of the years 2009–2013 under (a) the percentage-of-completion method and (b) the completed-contract method?

- Give the journal entries for each year assuming that the percentage-of-completion method is used.

**Problem 8-46****Construction Accounting****LO4**

Uptown Builders Company commenced doing business in January 2011. Construction activities for the year 2011 are summarized in the following table.

Project	Total Contract Price	Contract Expenditures to Dec. 31, 2011	Estimated Additional Costs to Complete Contracts	Cash Collections to Dec. 31, 2011	Billings to Dec. 31, 2011
A .....	\$ 420,000	\$340,000	\$ 30,000	\$270,000	\$310,000
B .....	440,000	22,500	325,500	75,000	105,000
C .....	500,000	390,000	0	405,000	500,000
D .....	400,000	105,500	314,500	0	80,000
	<u>\$1,760,000</u>	<u>\$858,000</u>	<u>\$670,000</u>	<u>\$750,000</u>	<u>\$995,000</u>

The company is your client. The president has asked you to compute the amounts of revenue for the year ended December 31, 2011, that would be reported under the completed-contract method and the percentage-of-completion method of accounting for long-term contracts.

The following information is available:

- Each contract is with a different customer.
- Any work remaining to be done on the contracts is expected to be completed in 2012.
- The company's accounts have been maintained on the completed-contract method.

**Instructions:**

- Prepare a schedule computing the amount of revenue, cost, and gross profit (loss) by project for the year ended December 31, 2011, to be reported under (a) the percentage-of-completion method and (b) the completed-contract method. (Round to two decimal places on percentages.)
- Prepare a schedule under the completed-contract method, computing the amount that would appear on the company's balance sheet at December 31, 2011, for (a) costs in excess of billings and (b) billings in excess of costs.
- Prepare a schedule under the percentage-of-completion method showing the computation of the amount that would appear on the company's balance sheet at December 31, 2011, for (a) costs and estimated earnings in excess of billings and (b) billings in excess of costs and estimated earnings.

**Problem 8-47****LO4**

DEMO PROBLEM

**Construction Accounting**

The Pierson Construction Corporation contracted with the City of Plaquemine to construct a dam on the bayou at a price of \$14,000,000. Pierson expects to earn \$1,270,000 on the contract. The percentage-of-completion method is to be used, and the completion stage is to be determined by estimates made by the engineer. The following schedule summarizes the activities of the contract for the years 2010–2012.

Year	Cost Incurred	Engineer's Estimated Cost to Complete	Estimate of Completion	Billings on Contract	Collection on Billings
2010 .....	\$4,300,000	\$8,560,000	33%	\$4,000,000	\$3,600,000
2011 .....	4,100,000	4,700,000	62	5,000,000	5,100,000
2012 .....	4,550,000	0	100	5,000,000	5,300,000

**Instructions:**

1. Prepare a schedule showing the revenue, cost, and the gross profit earned each year under the percentage-of-completion method, using the engineer's estimate as the measure of completion to be applied to revenues and costs.
2. Prepare all journal entries required to reflect the contract.
3. Prepare journal entries for 2012, assuming the completed-contract method is used.
4. How would the journal entries in (2) differ if the actual costs incurred were used to estimate the percentage completed for the period instead of the engineer's estimate?

**Problem 8-48****LO4****Construction Accounting**

Jana Crebs is a contractor for the construction of large office buildings. At the beginning of 2011, three buildings were in progress. The following data describe the status of these buildings at the beginning of the year:

	Contract Price	Costs Incurred to Jan. 1, 2011	Estimated Cost to Complete as of Jan. 1, 2011
Building 1 .....	\$ 4,000,000	\$2,070,000	\$1,380,000
Building 2 .....	9,000,000	6,318,000	1,782,000
Building 3 .....	13,150,000	3,000,000	9,000,000

During 2011, the following costs were incurred.

Building 1	\$930,000 (estimated cost to complete as of December 31, 2011, \$750,000)
Building 2	\$1,800,000 (job completed)
Building 3	\$7,400,000 (estimated cost to complete as of December 31, 2011, \$2,800,000)
Building 4	\$800,000 (contract price, \$2,500,000; estimated cost to complete as of December 31, 2011, \$1,200,000)

**Instructions:**

1. Compute the total revenue, costs, and gross profit in 2011. Assume that Crebs uses the cost-to-cost percentage-of-completion method. (Round to two decimal places for percentage completed.)
2. Compute the gross profit for 2011 if Crebs uses the completed-contract method.

**Problem 8-49****LO4****Construction Accounting**

The Kirby Construction Company was the low bidder on a specialized equipment contract. The contract bid was \$5,400,000 with an estimated cost to complete the project of \$4,800,000. The contract period was 34 months, beginning March 1, 2010. The company uses the cost-to-cost method to estimate profits.

A record of construction activities for the years 2010–2013 follows:

Year	Actual Cost— Current Year	Progress Billings	Cash Receipts
2010 .....	\$2,800,000	\$2,600,000	\$2,200,000
2011 .....	2,200,000	2,100,000	1,900,000
2012 .....	600,000	700,000	700,000
2013 .....	0	0	600,000

The estimated cost to complete the contract at the end of each accounting period is:

2010	\$2,200,000
2011	500,000
2012	0

**Instructions:**

1. What are the revenue, cost, and gross profit recognized for each of the years 2010–2012 under the percentage-of-completion method?
2. Give the journal entries for each of the years 2010–2012 to record the information from (1).
3. Give the journal entries in 2013 to record any collections and to close out all construction accounts.

**Problem 8-50**

**LO4**

**Construction Accounting**

Tuscany Boatbuilders was recently awarded a \$17,000,000 contract to construct a luxury liner for Queen Cruiseliners Inc. Tuscany estimates it will take 42 months to complete the contract. The company uses the cost-to-cost method to estimate profits.

The following information details the actual and estimated costs for the years 2010–2013.

Year	Actual Cost— Current Year	Estimated Cost to Complete
2010 .....	\$6,400,000	\$8,700,000
2011 .....	5,200,000	4,600,000
2012 .....	4,100,000	1,500,000
2013 .....	1,000,000	0

**Instructions:**

1. Compute the revenue, cost, and gross profit to be recognized for each of the years 2010–2013 under the percentage-of-completion method.
2. Give the journal entries for each of the years 2010–2013 to record the information from (1).

**Problem 8-51**

**LO6**

**Installment Sales Accounting**

London Corporation has been using the cash method to account for income since its first year of operation in 2011. All sales are made on credit with notes receivable given by the customers. The income statements for 2011 and 2012 included the following amounts:

	2011	2012
Revenues—collection on principal .....	\$32,000	\$50,000
Revenues—interest .....	3,600	5,500
Cost of goods purchased* .....	45,200	52,020

\* Includes increase in inventory of goods on hand of \$2,000 in 2011 and \$8,000 in 2012.

The balances due on the notes at the end of each year were as follows:

	2011	2012
Notes receivable (gross)—2011 .....	\$62,000	\$36,000
Notes receivable (gross)—2012 .....	0	60,000
Unearned interest revenue—2011 .....	7,167	5,579
Unearned interest revenue—2012 .....	0	8,043

**Instructions:** Give the journal entries for 2011 and 2012 assuming the installment sales method was used rather than the cash method.

**Problem 8-52**

**LO6**

**Installment Sales**

Potter’s Home Goods sells furniture and electronic items. The majority of its business is on credit, and the following information is available relating to sales transactions for 2010, 2011, and 2012.

	2010	2011	2012
Installment sales (net of interest) .....	\$124,000	\$138,000	\$145,000
Gross profit percentage .....	36%	39%	38%
Cash collections on installment sales:			
Principal—2010 .....	\$59,300	\$38,200	\$18,500
Principal—2011 .....		65,400	33,700
Principal—2012 .....			73,450
Interest—2010 .....	7,100	12,400	1,250
Interest—2011 .....		6,150	15,600
Interest—2012 .....			6,400

**Instructions:** Prepare the journal entries for the years 2010–2012 assuming Potter’s uses the installment sales method for revenue recognition and records receivables net of interest.

**Problem 8-53**

LO4, LO6

**Revenue Recognition Analysis**

The Wasatch Construction Company entered into a \$4,500,000 contract in early 2011 to construct a multipurpose recreational facility for the city of Helper. Construction time extended over a 2-year period. The table below describes the pattern of progress payments made by the city of Helper and costs incurred by Wasatch Construction by semiannual periods. Estimated costs of \$3,600,000 were incurred as expected.

Period	Progress Payments for Period	Progress Cost for Period
(1) Jan. 1–June 30, 2011 .....	\$ 750,000	\$ 900,000
(2) July 1–Dec. 31, 2011 .....	1,050,000	1,200,000
(3) Jan. 1–June 30, 2012 .....	1,950,000	1,080,000
(4) July 1–Dec. 31, 2012 .....	750,000	420,000
Total .....	<u>\$4,500,000</u>	<u>\$3,600,000</u>

The Wasatch Construction Company prepares financial statements twice each year, June 30 and December 31.

**Instructions:**

- Based on the foregoing data, compute the amount of revenue, costs, and gross profit for the four semiannual periods under each of the following methods of revenue recognition:
  - Percentage of completion
  - Completed contract
  - Installment sales (gross profit only)
  - Cost recovery (gross profit only)
- Which method do you feel best measures the performance of Wasatch on this contract?

**Problem 8-54**

LO2, LO4

**Sample CPA Exam Questions**

- Which of the following is used in calculating the income recognized in the fourth and final year of a contract accounted for by the percentage-of-completion method?

	Actual Total Cost	Income Previously Recognized
(a)	Yes	Yes
(b)	Yes	No
(c)	No	Yes
(d)	No	No

2. When should a lessor recognize in income a nonrefundable lease bonus paid by a lessee upon signing an operating lease?
  - (a) When received
  - (b) At the inception of the lease
  - (c) At the expiration of the lease
  - (d) Over the life of the lease

## CASES

### Discussion Case 8-55

#### Recognizing Revenue on a Percentage-of-Completion Basis

As the new controller for Enclave Construction Company, you have been advised that your predecessor classified all revenues and expenses by project, each project being considered a separate venture. All revenues from uncompleted projects were treated as unearned revenue, and all expenses applicable to each uncompleted project were treated as “work in process” inventory. Thus, the income statement for the current year includes only the revenues and expenses related to projects completed during the year.

What do you think about the use of the completed-contract method by the previous controller? What alternative approach might you suggest to company management?

### Discussion Case 8-56

#### Let's Spread Our Losses, Too!

The Abbott Construction Company has several contracts to build sections of free-ways, bridges, and dams. Because most of these contracts require more than one year to complete, the accountant, Dave Allred, has recommended use of the percentage-of-completion method to recognize revenue and income on these contracts. The president, Kathy Bahr, isn't quite sure how the accounting method works, and she indicates concern about the impact of this decision on income taxes. Bahr also inquires as to what happens when a contract results in a loss. When told by Allred that any estimated loss must be recognized when it is first identified, Bahr becomes upset. “If it is a percentage-of-completion method and we are recognizing profits in part as we go along, why shouldn't we be able to do the same for losses?”

How would you, as the accountant, answer Bahr's concerns?

### Discussion Case 8-57

#### When Is the Membership Fee Earned?

The Superb Health Studio has been operating for five years but is presently for sale. It has opened 50 salons in various cities in the United States. The normal pattern for a new opening is to advertise heavily and sell different types of memberships: 1-year, 3-year, and 5-year. For the initial membership fee, members may use the pool, exercise rooms, sauna, and other recreational facilities without charge. If special courses or programs are taken, additional fees are charged; however, members are granted certain privileges, and the fees are less than those charged to outsiders. In addition, \$10-a-month dues are charged to all members. Nonmembers may use the facilities; however, they must pay a substantial daily charge for services they receive.

Your client, Dickson Inc., is considering purchasing the chain of health studios and asks you to give your opinion on its operations. You are provided with financial statements that show a growing revenue and income pattern over the 5-year period. The balance sheet shows that the physical facilities are apparently owned rather than leased. But you are aware that health studios, like all service institutions, have some challenging revenue recognition problems.

What questions would you want answered in preparing your report for Dickson?

### Discussion Case 8-58

#### When Is It Revenue?

Hertzel Advertising Agency handles advertising for clients under contracts that require the agency to develop advertising copy and layouts and place ads in various media, charging clients a commission of 15% of the media cost as its fee. The agency makes advance billings to its clients of estimated media cost plus its 15% commission.

Adjustments to these advances usually are small. Frequently, both the billings and receipt of cash from these billings occur before the period in which the advertising actually appears in the media.

A conference meeting is held between officers of the agency and the new firm of CPAs recently engaged to perform annual audits. In this meeting, consideration is given to four possible points for measuring revenue: (1) at the time the advanced billing is made, (2) when payment is received from the client, (3) in the month when the advertising appears in the media, and (4) when the bill for advertising is received from the media, generally in the month following its appearance. The agency has been following the first method for the past several years on the basis that a definite contract exists and the revenue is earned when billed. When the billing is made, an entry is prepared to record the estimated receivable and liability to the media. Estimated expenses related to the contract are also recorded. Adjusting entries are made later for any differences between the estimated and actual amounts.

As a member of the CPA firm attending this meeting, how would you react to the agency's method of recognizing revenue? Discuss the strengths and weaknesses of each of the four methods of revenue recognition, and indicate which one you would recommend for the agency to follow.

### Discussion Case 8-59

#### Which Method Is Appropriate?

Green Brothers Furniture sells discount furniture and offers easy credit terms. Its margins are not large, but it deals in heavy volume. Its customers are often low-income individuals who cannot obtain credit elsewhere. Green Brothers retains the title to the furniture until full payment is received, and it is not uncommon to have 20% of sales be uncollectible.

Green Brothers is considering expansion and has hired an independent auditor to review its financial statements prior to obtaining outside funding. The auditor questions the use of accrual accounting as a method for recognizing revenue and suggests that Green Brothers use the installment sales method. The auditor justifies this by stating that because of the high rate of uncollectibles, the earnings process is not substantially complete at the point of sale. Financial statements adjusted to the installment sales method result in a 17% decrease in net income for the fiscal year just ended.

The chief financial officer for Green Brothers counters that if uncollectibles can be estimated, even if that estimate is high, the use of the accrual method is appropriate. The accountant also notes that restated financial statements showing the lower net income figure will make obtaining external funding much more difficult.

Which method of revenue recognition would you argue that Green Brothers should use? Why? Remember that your decision could affect this company's ability to obtain favorable external financing.

### Discussion Case 8-60

#### College Bound Was Bankruptcy Bound

High school students know how important it is to perform well on the educational tests required by many colleges and universities as part of the admissions process. In fact, an entire industry has developed to prepare students to take these tests. One company in this industry was **College Bound Inc.** It was a fast-growing company that claimed to be the largest educational counseling firm in the United States with 150 test centers nationally. College Bound was founded by George and Janet Ronkin because they could not find a facility that, in their opinion, could adequately prepare their own son to take the college entrance exams.

The company went public in 1988 as a penny stock, and the price of the stock soared to a high of \$24 per share in August 1991. In the early months of 1992, however, the SEC began to question many of College Bound's accounting practices. As a result of its investigations, the SEC determined that much of the rapid growth in revenues reported by College Bound came as a result of "churning bank accounts." This practice involved transferring funds from the home office's bank account to various test centers and then back to the home office. College Bound was recognizing as revenue the funds being transferred back from the test centers. The money used for the "churning" was obtained via a convertible note offering in Europe.

The result of these practices was to overstate pretax profits for the fiscal year ended August 1991 by 2.5 times, or \$5.2 million. The SEC alleged that the Ronkins were transferring large amounts of company money to their personal accounts. In addition to their compensation of \$153,846 each, the Ronkins were said to have transferred over \$500,000 to Swiss bank accounts during 1991. The court-appointed receiver, Joseph Del Raso, who was asked by the courts to monitor College Bound during bankruptcy proceedings, determined that most of the company's 150 test centers were not profitable by industry standards and closed over 100 centers in May 1992.

1. How would College Bound recognize revenue by simply transferring money from a test center to the home office? What would the journal entry be when the money was transferred from the test centers to the home office?
2. How would the accountant at the home office determine if money being received from a test center was to be recorded as revenue or as repayment of a loan?

SOURCES: Michael J. McCarthy, "College Bound Inc., Target of SEC Suit, Files for Bankruptcy Law Protection," *The Wall Street Journal*, April 30, 1992, p. A4; and Daniel Pearl, "U.S. Judge Freezes Assets of Founders of College Bound," *The Wall Street Journal*, April 24, 1992, p. C19.

**Discussion  
Case 8-61**

**Keep Shipping, We Need the Revenue**

Datarite, a maker of computer hardware systems, sells its products to dealers who in turn sell to the final customer. Datarite offers very liberal credit terms and allows its dealers to take up to 90 days to pay. These terms allow dealers to hold larger inventories. As the end of the fiscal year nears, Datarite needs to increase its current ratio and decrease its debt-to-equity ratio to avoid violating its debt covenants. The president of the company has asked that all dealers be shipped extra inventory. This will increase both sales and accounts receivable, thereby allowing Datarite to remain in compliance with its debt covenants. The chief financial officer remarks that shipping inventory that has not been ordered should be accounted for as consigned inventory rather than revenue.

Should the inventory shipments be accounted for as sales or as consigned inventory? Debt covenants exist to protect the interests of creditors. In this instance, are debt covenants effective in monitoring the company's activities?

**Discussion  
Case 8-62**

**I Think They're Sales!**

The Rain-Soft Water Company distributes its water softeners to dealers upon their request. The contract agreement with the dealers is that they may have 90 days to sell and pay for the softeners. Until the 90-day period is over, any softeners may be returned at the dealer's expense and with no further obligation on the dealer's part. If the water softeners are damaged while in the hands of a dealer, Rain-Soft agrees to accept the return of the damaged softeners with no obligation to the dealer. Past experience indicates that 75% of all softeners distributed on this basis are sold by the dealer. In June, 100 units are delivered to dealers at an average billed price of \$800 each. The average cost of the softeners to Rain-Soft is \$600. Based on the expected sales, Rain-Soft reports profit of \$15,000.

You are asked to evaluate the income statement for its compliance with GAAP. What recommendations would you make?

**Case 8-63**

**Deciphering Financial Statements (The Walt Disney Company)**

Locate the 2007 financial statements for **The Walt Disney Company** on the Internet.

1. Locate Disney's note on revenue recognition. What is Disney's revenue recognition policy for the various business segments?
2. Relating to video and video game sales, what other points in the revenue cycle (other than when video units are made widely available for sale by retailers) could Disney have used to recognize revenue?
3. Relating to motion pictures, what other points in the revenue cycle (other than when motion pictures are exhibited) could Disney have used to recognize revenue?

## Case 8-64

**Deciphering Financial Statements (Siskon Gold Corporation)**

Review the following note relating to revenue recognition for **Siskon Gold Corporation**, a company “engaged in the business of exploring, acquiring, developing, and exploiting precious mineral properties, principally gold.”

## 2. SIGNIFICANT ACCOUNTING POLICIES

*Revenue recognition*—Revenue from gold production is recognized when the finished product is poured based upon estimated weights and assays at current market prices.

1. What is the critical revenue recognition event for Siskon?
2. Is the company justified in recognizing revenue prior to the point of an actual sale? Why?
3. What potential risks exist when revenue is recognized prior to the point of sale?

## Case 8-65

**Deciphering Financial Statements (Ben & Jerry’s Homemade, Inc.)**

**Ben & Jerry’s Homemade, Inc.**, an ice cream manufacturer, was acquired by **Unilever** in 2000. Before that, Ben & Jerry’s was a publicly traded company. Below is the revenue recognition note for Ben & Jerry’s from its 1998 annual report:

**Revenue Recognition**

The Company recognizes revenue and the related costs when product is shipped. The Company recognizes franchise fees as income for individual stores when services required by the franchise agreement have been substantially performed and the store opens for business. Franchise fees relating to area franchise agreements are recognized in proportion to the number of stores for which the required services have been substantially performed. Franchise fees recognized as income and included in net sales were approximately \$708,000, \$553,000, and \$301,000 in 1998, 1997, and 1996, respectively.

1. What is the critical event for Ben & Jerry’s sale of ice cream?
2. What is the critical event for Ben & Jerry’s recognition of franchise fee revenue? Note that Ben & Jerry’s deals with two different types of franchise fees.

## Case 8-66

**Deciphering Financial Statements (Lockheed Martin Corporation)**

**Lockheed Martin Corporation** “principally researches, designs, develops, manufactures, integrates, operates and sustains advanced technology systems and products, and provides a broad range of management, engineering, technical, scientific, logistic and information services” within its four business segments: Aeronautics, Electronic Systems, Information Systems & Global Services, and Space Systems. As a result, Lockheed has many long-term contracts. The following note is taken from Lockheed’s 2007 annual report and provides a good summary of the concepts associated with revenue recognition and long-term contracts.

*Sales and earnings*—We record sales and anticipated profits under long-term fixed-price design, development and production contracts on a percentage of completion basis, generally using units-of-delivery as the basis to measure progress toward completing the contract and recognizing revenue. We include estimated contract profits in earnings in proportion to recorded sales. We record sales under certain long-term fixed-price development and production contracts which, among other factors, provide for the delivery of minimal quantities or require a substantial level of development effort in relation to total contract value, upon achievement of performance milestones or using the cost-to-cost method of accounting where sales and profits are recorded based on the ratio of costs we incur to our estimate of total costs at completion. We record sales and an estimated profit under development and production cost-reimbursement-type contracts as costs are incurred. We include applicable estimated profits in earnings in the proportion that incurred costs bear to total estimated costs. When

adjustments in estimated contract revenues or estimated costs at completion are required, any changes from prior estimates are recognized by recording adjustments in the current period for the inception-to-date effect of the changes on current and prior periods. We record sales of products and services provided under essentially commercial terms and conditions upon delivery and passage of title.

We consider incentives or penalties related to performance on design, development and production contracts in estimating sales and profit rates, and record them when there is sufficient information to assess anticipated contract performance. We also consider estimates of award fees in estimating sales and profit rates based on actual awards and anticipated performance. We generally do not recognize incentive provisions which increase or decrease earnings based solely on a single significant event until the event occurs. We only include amounts representing contract change orders, claims or other items in sales when they can be reliably estimated and realization is probable.

We record revenue under contracts for services other than those associated with design, development or production activities either as services are performed or when a contractually required event has occurred, depending on the contract. This methodology is primarily used by our Information Systems & Global Services (IS&GS) segment. We generally record revenue under such services contracts on a straight-line basis over the period of contract performance, unless evidence suggests that the revenue is earned or the obligations are fulfilled in a different pattern. Costs we incur under these services contracts are expensed as incurred, except that we capitalize and recognize initial “set-up” costs over the life of the agreement. Incentives and award fees related to our performance on services contracts are recognized when they are fixed and determinable, generally at the date of award.

1. How does Lockheed measure its percentage of completion on most of its long-term contracts?
2. For the remaining long-term contracts, how does Lockheed recognize revenue and profits?
3. If a change in the contract is made, when is that change reflected in revenues?
4. How does Lockheed normally account for revenue under its service contracts not associated with design, development, or production activities?
5. Is Lockheed’s method of accounting for costs incurred under these service contracts the same as its method for recording revenue? Explain.

#### Case 8-67

#### Writing Assignment (Credit Terms and Revenue Recognition)

Many large electronics manufacturers offer very easy credit terms when a customer purchases their products. For example, **Mitsubishi** often offers its customers a “\$0 down, no payments for 12 months” payment option when purchasing a big-screen television. In a case such as this, when would Mitsubishi recognize revenue—at the point of sale, when payments are begun (in 12 months), or proportionally as payments are made? In no more than one page, discuss the pros and cons of each possible revenue recognition point and provide a conclusion as to when you believe a company, like Mitsubishi in this example, should recognize revenue.

#### Case 8-68

#### Researching Accounting Standards

To help you become familiar with the accounting standards, this case is designed to take you to the FASB’s Web site and have you access various publications. Access the FASB’s Web site at <http://www.fasb.org>. Click on “Pronouncements & EITF Abstracts.”

In this chapter, we discussed the principle of revenue recognition. For this case, we will use *Statement of Financial Accounting Concept No. 5*, “Recognition and Measurement in Financial Statements of Business Enterprises.” Open *Concept Statement No. 5*.

1. Read paragraph 83a. When are revenues realized? That is, what event or events have to take place?
2. Read paragraph 83b. When it comes to the earnings process, what is the difference between revenues and gains?

**Case 8-69****Ethical Dilemma (Recognizing Revenue from Gold in the Ground)**

You are the president and founder of Gold Strike Inc., a mining company that acquires land and mines gold. The success of your company is largely dependent on finding large deposits of gold. To do this requires expensive geological surveys and testing. You have used an engineering firm in the past that has proven quite reliable in its estimates of gold quality and quantity.

Because of recent events around the world, the price of gold has declined approximately 15% in the past 6 months. Accounting practice allows your company to recognize revenue when the gold is mined and processed rather than waiting until it is actually sold. Because of the recent unexpected decline in gold prices, you find that your revenue has suddenly declined even though the quality and quantity of the gold being produced have been maintained.

To avoid arousing investor concerns about your business's future, you consider the following option. The engineering firm assures you that, based on its tests, large amounts of gold still exist in your mines. Because you can recognize revenue when the gold is mined and you know it is in the ground (based on your engineer's assurances), could you recognize revenue for the gold that is in the ground but has not yet been mined? Now remember, you are not talking about accounting for fictitious gold. This gold does exist (again, based on your engineer's estimates).

**Case 8-70****Cumulative Spreadsheet Analysis**

For the purpose of this spreadsheet assignment, assume that Skywalker is in the long-term construction business. As of the end of 2011, Skywalker has five active contracts (designated A through E). Information about each of the contracts, including forecasted information for 2012, is given below.

	A	B	C	D	E	Total
Contract price .....	\$4,000	\$1,000	\$500	\$1,500	\$2,000	\$9,000
Cumulative costs incurred, end of 2011 .....	200	140	240	0	0	580
Estimated cost to complete, end of 2011 .....	2,320	560	60	1,200	1,800	5,940
Estimated cost to be incurred during 2012 .....	892	100	60	200	928	2,180
Cumulative progress billings, end of 2011 .....	180	100	178	0	0	458
Estimated progress billings during 2012 .....	1,300	130	120	240	966	2,756
Cumulative cash collected, end of 2011 .....	170	80	127	0	0	377
Estimated cash to be collected during 2012 .....	1,270	135	150	230	939	2,724

**SPREADSHEET**

1. Using the information given, construct a spreadsheet that will compute the following. (Note: Skywalker uses the cost-to-cost method in estimating the percentage of completion.)
  - (a) Total accounts receivable, end of 2011
  - (b) Total inventory, end of 2011
  - (c) Total estimated revenue to be recognized in 2012
  - (d) Total estimated cost of goods sold to be recognized in 2012
  - (e) Total estimated accounts receivable, end of 2012
  - (f) Total estimated inventory, end of 2012
2. Repeat (1) with the following changes with respect to the estimated cost to be incurred in 2012.

	A	B	C	D	E	Total
Estimated cost to be incurred during 2012 .....	\$750	\$120	\$60	\$200	\$1,050	\$2,180

3. Refer back to the original information in (1). Repeat (1) with the following changes with respect to the estimated progress billings during 2012.

	A	B	C	D	E	Total
Estimated progress billings during 2012 .....	\$1,270	\$160	\$140	\$240	\$946	\$2,756

4. Refer back to (2) and (3). One of the changes results in a change in the estimated gross profit for 2012; the other change does not affect estimated gross profit for 2012. Explain this difference.

CHAPTER

9

INVENTORY AND COST OF  
GOODS SOLD

Let's go back to 1974. America was captivated by the Watergate investigation culminating in the resignation of President Nixon in August. In the spring, Hank Aaron hit his 715th career home run and broke Babe Ruth's long-standing record. Rock 'n' roll had fallen into the doldrums with best-selling songs for the year including forgettable numbers such as "Billy, Don't Be a Hero" by Bo Donaldson and the Heywoods and "Seasons in the Sun" by Terry Jacks. To add insult to injury, the first "disco" hit—"Rock the Boat" by The Hues Corporation—came out in 1974. At the movies, Americans were lining up to see disaster pictures such as *Earthquake* and *The Towering Inferno*.

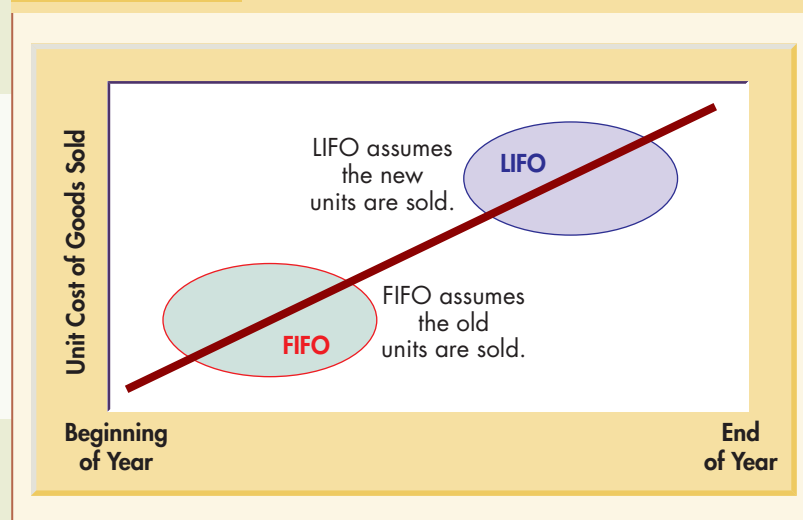

From an accounting standpoint, 1974 was an interesting year because it was the first year since World War II in which consumer price inflation in the United States exceeded 10%. High inflation wreaks havoc on the reliability of historical cost financial statements. In fact, the high inflation experienced throughout the latter half of the 1970s caused the FASB to experiment with inflation-adjusted financial statements.

High inflation also magnifies the difference between the FIFO (first in, first out) and LIFO (last in, first out) inventory methods. In times of rising prices, FIFO results in low cost of goods sold because the old, lower-cost inventory is assumed to be sold. Similarly, LIFO results in high cost of goods sold because the new, higher-cost inventory is assumed to be sold. This is illustrated in Exhibit 9-1. As an example of the FIFO/LIFO difference caused by the high inflation in 1974, the 1974 cost of goods sold of **DuPont** was \$600 million higher using LIFO than it would have been if DuPont had used FIFO.

By the way, 1974 happened to be the year that DuPont switched from FIFO to LIFO. DuPont was not alone—over 700 U.S. companies adopted LIFO in 1974. Why did these companies voluntarily adopt LIFO and subject themselves to higher cost of goods sold and lower reported profits? The one-word answer is *taxes*. The IRS requires firms using LIFO for income tax purposes to also use LIFO for financial reporting. So, if a company wants to get a reduction in taxes through higher LIFO cost of goods sold, the company must also accept a lower reported net income.<sup>1</sup> In DuPont's case, the adoption of LIFO in 1974 saved over \$250 million in taxes but lowered DuPont's reported net income by over \$300 million.

#### EXHIBIT 9-1

#### LIFO and FIFO in Times of Inflation

<sup>1</sup> This "LIFO conformity rule" is an exception—in most cases, the choice of a tax accounting method does not necessarily dictate the same choice for financial reporting.

## LEARNING OBJECTIVES

- 1 Define inventory for a merchandising business, and identify the different types of inventory for a manufacturing business.
- 2 Explain the advantages and disadvantages of both periodic and perpetual inventory systems.
- 3 Determine when ownership of goods in transit changes hands and what circumstances require shipped inventory to be kept on the books.
- 4 Compute total inventory acquisition cost.
- 5 Use the four basic inventory valuation methods: specific identification, average cost, FIFO, and LIFO.
- 6 Explain how LIFO inventory layers are created, and describe the significance of the LIFO reserve.
- 7 Choose an inventory valuation method based on the trade-offs among income tax effects, bookkeeping costs, and the impact on the financial statements.
- 8 Apply the lower-of-cost-or-market (LCM) rule to reflect declines in the market value of inventory.
- 9 Use the gross profit method to estimate ending inventory.
- 10 Determine the financial statement impact of inventory recording errors.
- 11 Analyze inventory using financial ratios, and properly compare ratios of different firms after adjusting for differences in inventory valuation methods.

## EXPANDED MATERIAL

- 12 Compute estimates of FIFO, LIFO, average cost, and lower-of-cost-or-market inventory using the retail inventory method.
- 13 Use LIFO pools, dollar-value LIFO, and dollar-value LIFO retail to compute ending inventory.
- 14 Account for the impact of changing prices on purchase commitments.
- 15 Record inventory purchase transactions denominated in foreign currencies.

A question that has intrigued accounting researchers is whether investors viewed the 1974 LIFO adoptions as good news or bad news—good news because of the LIFO tax savings or bad news because of the reduction in reported net income. The answer to this question provides insight into whether investors are sophisticated in their knowledge of accounting. A sophisticated investor would view a LIFO adoption in a time of high inflation as good news, realizing that the adopting firm was focusing on real cash savings (lower taxes) and not worried about just looking good in the reported financial statements. An unsophisticated investor is fixated on reported earnings and would view LIFO adoption as bad news because it lowers net income.

In 1982, Professor William E. Ricks published a study suggesting that the LIFO adoptions were viewed as bad

news, implying that investors back in 1974 were unsophisticated in their understanding of LIFO and FIFO.<sup>2</sup> He found that the market value of firms adopting LIFO dropped an average of 2% in the week surrounding the public announcement of 1974 earnings. Many studies have reexamined this result, and the overall conclusion is that it isn't clear exactly what caused this market value drop. After a careful analysis of competing explanations, Professor John R. M. Hand concluded: "[Negative] stock returns at 1974 LIFO adoption dates appear to reflect both sophisticated and unsophisticated responses to information on LIFO adopters. It is hard to disentangle the two responses. . . ."<sup>3</sup>

Your job is to study this chapter and make sure that your understanding of inventory accounting puts you in the set of sophisticated users of financial statements.

## QUESTIONS

1. *What causes a big difference between LIFO and FIFO?*
2. *What prompted so many U.S. companies to switch from FIFO to LIFO in 1974?*
3. *On what does an unsophisticated investor focus?*

**Answers to these questions can be found on page 503.**

**T**he time line in Exhibit 9-2 illustrates the business issues involved with inventory. The accounting questions associated with the items in the time line are as follows:

- When is inventory considered to have been purchased—when it is ordered, when it is shipped, when it is received, or when it is paid for?
- Similarly, when is the inventory considered to have been sold?
- Many costs are associated with the “value-added” process—which of these costs are considered to be part of the cost of inventory and which are simply business expenses for that period?
- How should total inventory cost be divided between the inventory that was sold (cost of goods sold) and the inventory that remains (ending inventory)?

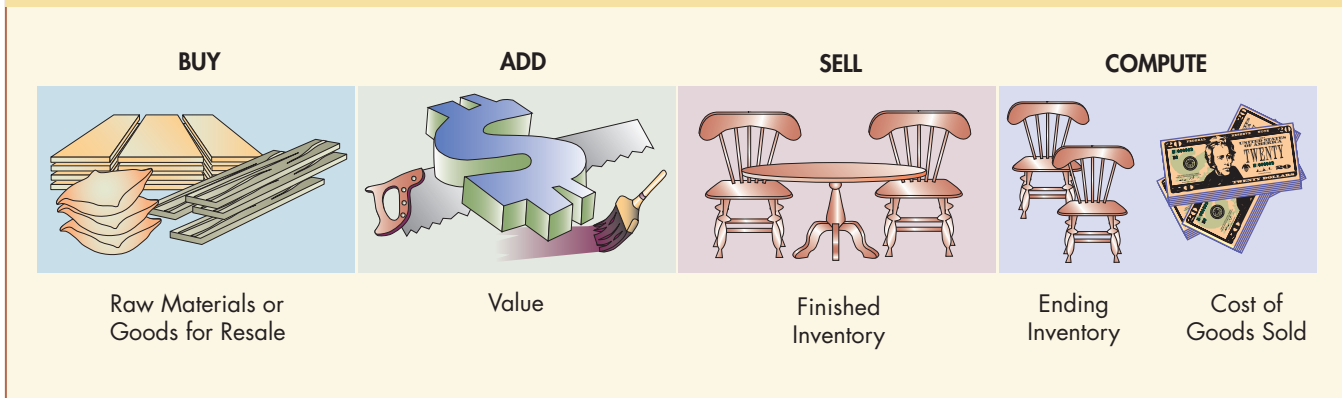

Determining what items should be included in inventory involves more than recognizing inventory when you see it. Some inventory that should be included in a company's balance sheet cannot be found in the company's warehouses but instead is in transit in trucks, trains, or ships or is temporarily in the custody of some other company. A proper physical determination of how much inventory a company owns as of a certain date is one of the most daunting tasks of an independent external auditor.

<sup>2</sup> William E. Ricks, “The Market's Response to the 1974 LIFO Adoptions,” *Journal of Accounting Research*, Autumn 1982, p. 367.

<sup>3</sup> John R. M. Hand, “1974 LIFO Excess Stock Return and Analyst Forecast Error Anomalies Revisited,” *Journal of Accounting Research*, Spring 1995, p. 175.

## EXHIBIT 9-2

## Time Line of Business Issues Involved with Inventory

Attaching the proper costs to inventory is one of the primary functions of a cost accounting system. Advances made since 1980 in the practice of cost accounting have turned the sleepy topic of overhead allocation into a key element of product pricing and marketing focus. The important area of cost accounting is briefly covered in this chapter, but detailed treatment is left to a cost accounting course. The majority of the chapter is devoted to the topic of inventory valuation. Almost all companies in the United States use one or more of three basic inventory valuation methods: FIFO (first in, first out), LIFO (last in, first out), and average cost. The objective of inventory valuation is to divide the total cost of goods available for sale during the period into two categories: the cost associated with goods that were sold (cost of goods sold) and the cost associated with goods that still remain (ending inventory). Coverage of the LIFO inventory valuation method takes up a large proportion of the chapter because the apparently simple assumption of last in, first out introduces all kinds of interesting twists into inventory accounting.

The chapter continues with a discussion of the accounting treatment required when the market value of inventory declines. We then discuss a common technique used to estimate inventory—the gross profit method. In addition to providing a means of determining the amount of inventory lost in a fire or flood, the gross profit method is also used with periodic inventory systems to provide ending inventory estimates for preparing monthly or quarterly financial statements when a full physical inventory count is not feasible. Inventory estimates are also compared to perpetual inventory records to provide an early warning of unusual inventory shrinkage. Finally, external auditors and the IRS use inventory estimates to test the reasonableness of reported trends in cost of goods sold. In the Expanded Material, a more elaborate method of inventory estimation is introduced, and accounting for purchase commitments and for foreign currency inventory purchases is discussed.

## What Is Inventory?

**1** Define inventory for a merchandising business, and identify the different types of inventory for a manufacturing business.

**WHY** Because companies hold inventory for the sole purpose of selling it, the accounting procedures for assets classified as inventory differ from those for assets that may be similar in nature but that are held to be used.

**HOW** Items held for resale in the normal course of business are classified as inventory. For a manufacturing firm, a broad array of production costs is included as part of the cost of inventory.

The term **inventory** designates goods held for sale in the normal course of business and, in the case of a manufacturer, goods in production or to be placed in production. The nature of goods classified as inventory varies widely with the nature of business activities and in some cases includes assets not normally thought of as inventory. For example, land and buildings held for resale by a real estate firm, partially completed buildings to be sold in the future by a construction firm, and investment securities held for resale by a stockbroker are all properly classified as inventory by the respective firms in those industries.

For some businesses, inventory represents the most active element in business operations, being continuously acquired or produced and resold. A large part of a company's resources can be invested in goods purchased or manufactured. However, advances in information technology have made it possible for companies to more efficiently manage their inventory levels. As illustrated in Exhibit 9-3, inventory for the 50 largest companies in the United States declined from 15.8% of total assets in 1979 to 5.2% of total assets in 2006. Actually, this trend is a combination of two factors: more efficient management of inventory and a decrease in the prominence of old-style smokestack industries that carried large inventories. Companies in the growth industries of service, technology, and information often have little or no inventory.

The term *inventory* (or *merchandise inventory*) is generally applied to goods held by a merchandising firm, either wholesale or retail, when such goods have been acquired in a condition for resale. The terms *raw materials*, *work in process*, and *finished goods* refer to the inventories of a manufacturing enterprise.

## Raw Materials

**Raw materials** are goods acquired for use in the production process. Some raw materials are obtained directly from natural sources. More often, however, raw materials are purchased from other companies and represent the finished products of the suppliers. For example, high-quality acid-free paper (like that used for this book) is the finished product of a paper mill but represents raw material to a textbook publishing company.

Although the term *raw materials* can be used broadly to cover all materials used in manufacturing, this designation is usually restricted to materials that will be physically incorporated in the products being manufactured. Because these materials are used directly in the production of goods, they are frequently referred to as **direct materials**. The term **indirect materials** is then used to refer to auxiliary materials, that is, materials that are necessary in the production process but are not directly incorporated in the products. Oils

EXHIBIT 9-3

### How Much Inventory Do Companies Have?

Source: Standard and Poor's COMPUSTAT.

and fuels for factory equipment, cleaning supplies, and similar items fall into this grouping because these items are not incorporated in a product but simply facilitate production.

Although indirect materials may be summarized separately, they should be reported as a part of a company's inventories since they ultimately will be consumed in the production process. Supplies purchased for use in the delivery, sales, and general administrative functions of the enterprise should not be reported as part of the inventories, but as selling and administrative supplies. Remember, *inventory* is the label given to assets to be sold in the normal course of business or to assets to be incorporated, directly or indirectly, into goods that are manufactured and then sold.

## Work in Process

**Work in process**, alternately referred to as *goods in process*, consists of materials partly processed and requiring further work before they can be sold. This inventory includes three cost elements.

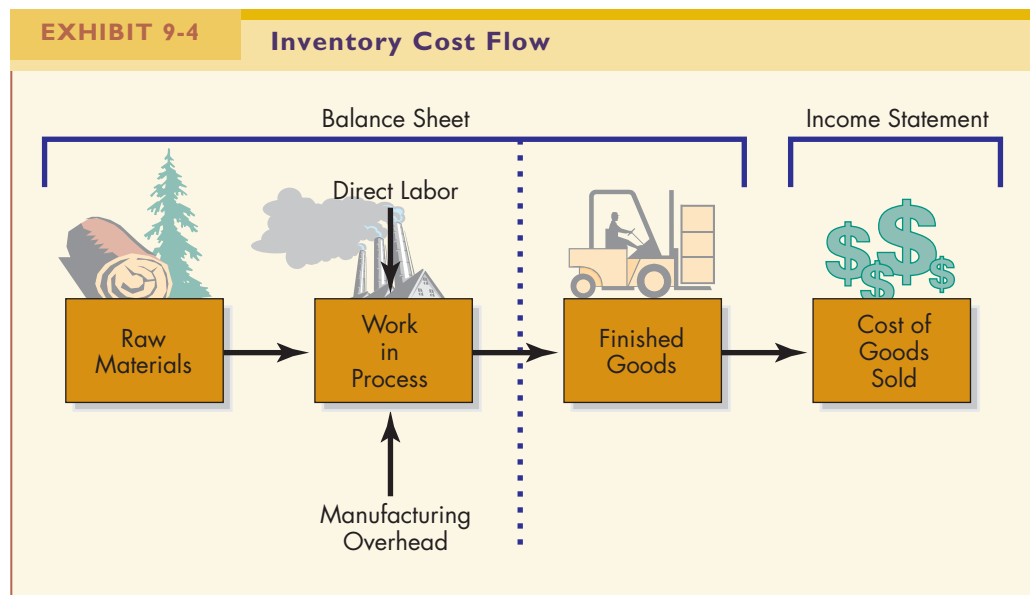

1. *Direct materials*—the cost of materials directly identified with goods in production
2. *Direct labor*—the cost of labor directly identified with goods in production
3. *Manufacturing overhead*—the portion of factory overhead assignable to goods in production

**Manufacturing overhead** consists of all manufacturing costs other than direct materials and direct labor. It includes factory supplies used and labor not directly identified with the production of specific products. It also includes general manufacturing costs such as depreciation, maintenance, repairs, property taxes, insurance, and light, heat, and power, as well as a reasonable share of the managerial costs other than those relating solely to the selling and administrative functions of the business.

## Finished Goods

**Finished goods** are the manufactured products awaiting sale. As products are completed, the costs accumulated in the production process are transferred from Work in Process to the finished goods inventory account. The diagram in Exhibit 9-4 illustrates the basic flow of product costs through the inventory accounts of a manufacturer.

Note the vertical dotted line in Exhibit 9-4 separating Work in Process from Finished Goods. This line represents the factory wall. Historically, the rule of thumb was that costs incurred inside the factory wall were allocated to inventory, and costs incurred outside the factory wall (e.g., in the finished goods warehouse) were expensed as incurred. This simple rule doesn't always work because the IRS adopted

inventory cost capitalization rules in 1986 that require some outside-the-factory costs to be capitalized as part of inventory cost. Although IRS rules do not govern financial accounting treatment, in this case some companies use the IRS rules for financial reporting to reduce the cost of maintaining separate records.<sup>4</sup>

## Inventory Systems

**2** Explain the advantages and disadvantages of both periodic and perpetual inventory systems.

**WHY** Understanding the costs and benefits of the periodic and perpetual inventory systems allows companies to determine which system will best fill their needs.

**HOW** A periodic inventory system is simple and inexpensive to operate but also provides relatively low-quality information. Using a perpetual inventory system can require costly technology, but the quality of the information generated by the system is high.

Consider the last time you made a purchase. Did the business where you made the purchase keep a record of what item it sold you, or did it just record the selling price? With a traditional cash register system, the seller records only the sales price; the seller has no record of how many units of a particular inventory item have been sold. Accountants call this type of system a **periodic inventory system** because the only way to verify what inventory has been sold and what remains is to do a periodic physical count.

The alternative to a periodic system is a **perpetual inventory system** in which both the selling price and the type of item sold are recorded for each sale. A bar code scanning system is an example of a perpetual inventory system. With a perpetual system, the seller knows the number of each item sold and the number that should still be in inventory. With a perpetual system, periodic physical inventory counts are useful in revealing the amount of inventory “shrinkage”—inventory lost, stolen, or spoiled.

To illustrate the differences between periodic and perpetual inventory systems, assume the following transactions occurred during the period for CyBorg Incorporated.

Beginning inventory .....	50 units @ \$10	\$ 500
Purchases during the period .....	300 units @ \$10	3,000
Sales during the period .....	275 units @ \$15	4,125
Ending inventory (physical count) .....	70 units @ \$10	700

The journal entries to record these purchases and sales for both periodic and perpetual inventory systems are as follows:

Periodic Inventory System		Perpetual Inventory System	
<i>Purchases during the period</i>		<i>Purchases during the period</i>	
Purchases .....	3,000	Inventory .....	3,000
Accounts Payable .....	3,000	Accounts Payable .....	3,000
<i>Sales during the period</i>		<i>Sales during the period</i>	
Accounts Receivable .....	4,125	Accounts Receivable .....	4,125
Sales .....	4,125	Sales .....	4,125
		Cost of Goods Sold .....	2,750
		Inventory .....	2,750

There are two differences between these two sets of journal entries. First, with a perpetual system an additional entry is made upon the sale of inventory to record the cost of goods sold. With a periodic system, cost of goods sold data are not known (or at least are

<sup>4</sup> The Emerging Issues Task Force (EITF) discussed whether the capitalization of an inventory cost for tax purposes requires that the same cost be included in inventory for financial reporting purposes. The EITF reached a consensus that the tax treatment should be considered but should not dictate the financial accounting treatment. See *EITF 86-46*, “Uniform Capitalization Rules for Inventory under the Tax Reform Act of 1986” (Stamford, CT: Financial Accounting Standards Board, 1986).

not recorded) at the time of the sale. The second difference is that with the periodic system the debit for the inventory purchase is to Purchases instead of to Inventory. The purchases account is a temporary holding tank for inventory costs that are allocated between Inventory and Cost of Goods Sold at the end of the period. Under a periodic system, to debit Inventory directly for the amount of purchases during the period would yield misleading information about the level of inventory because the inventory account is not reduced for the cost of goods sold during the period. With a periodic system, the inventory account remains untouched until a physical inventory count is done at the end of the period.

When a perpetual inventory system is employed, the company knows how much inventory should be on hand at any point in time. Comparing the inventory records to the result of a physical count allows the company to track discrepancies in inventory totals. Thus, even when a perpetual system is employed, physical counts of units on hand should be made at least once a year to confirm the balances on the books. The frequency of physical inventories varies depending on the nature of the goods, their rate of turnover, and the degree of internal control.<sup>5</sup> A plan for continuous counting of inventory items on a rotation basis is frequently employed.

Variations may be found between the recorded amounts and the amounts actually on hand as a result of recording errors, shrinkage, breakage, theft, and other causes. The inventory accounts should be adjusted to agree with the physical count when a discrepancy exists. To illustrate, cost of goods sold in the CyBorg example is computed as follows:

	Periodic System	Perpetual System
Beginning inventory .....	\$ 500	\$ 500
+ Purchases .....	3,000	3,000
= Cost of goods available for sale .....	\$3,500	\$3,500
- Ending inventory .....	700 (count)	750 (records)
= Preliminary cost of goods sold .....	\$2,800	\$2,750 (records)
+ Cost of missing inventory .....	Unknown	50 (\$750 - \$700)
= Reported cost of goods sold .....	<u>\$2,800</u>	<u>\$2,800</u>

With the perpetual system, the accounting records contain amounts for ending inventory and cost of goods sold before the physical count is ever done. The physical count serves to verify the accounting records. And in this case, it appears that CyBorg has lost \$50 in inventory: the difference between the \$750 inventory recorded in the books and the \$700 physically counted. The entry to adjust the perpetual system inventory account for this **shrinkage** would be as follows:

Cost of Goods Sold .....	50	
Inventory .....		50

As indicated, this type of inventory adjustment for shrinkage and breakage would typically be included as part of cost of goods sold on the income statement.

With the periodic system, ending inventory is known only from the physical count. In addition, cost of goods sold can be computed only after the physical count is done. No shrinkage calculation is possible with a

## stop & think

If perpetual inventory systems have so many clear advantages, why aren't they used by all companies?

- a) A perpetual inventory system can increase the level of a company's bad debts.
- b) Perpetual inventory systems are illegal in most countries outside the United States.
- c) A perpetual inventory system is more costly to operate than a periodic system.
- d) A perpetual inventory system is only appropriate for businesses with low-value identical items with a high turnover.

<sup>5</sup> While paying for gas and soft drinks at a mini-convenience store, one of the authors noticed the cashier marking the soft drink purchases on an inventory sheet. Aha, thought the author, this place uses a perpetual inventory system. When asked how often a physical count was done to verify the inventory records, the cashier replied, "At the end of every shift." Obviously, the store manager was using the combination of a perpetual inventory system and frequent physical counts to minimize shoplifting by customers and pilferage by employees.

periodic system because the accounting records contain no indication of how much inventory should be found in the physical count. In fact, with a periodic system, the label “cost of goods sold” might be better replaced by “cost of goods sold, stolen, lost, and spoiled”—all that is known is that the goods are gone. For external reporting purposes, both the periodic and perpetual systems yield the same reported cost of goods sold. However, for internal purposes, the perpetual system divides that number into cost of goods sold and cost of inventory shrinkage.

Practically all large trading and manufacturing enterprises and many small organizations have adopted perpetual inventory systems. With the costs of computers and point-of-sale systems so low, perpetual inventory systems are now more economical and, in today’s fast-moving world, almost a necessity. These systems offer a continuous check and control over inventories. Purchasing and production planning are facilitated, adequate on-hand inventories are ensured, and losses incurred through damage and theft are fully disclosed.

## Whose Inventory Is It?

**3** Determine when ownership of goods in transit changes hands and what circumstances require shipped inventory to be kept on the books.

**WHY** In general, a company reports on its balance sheet all inventory to which it holds legal title. Legal title is not necessarily determined by who has physical custody of the inventory on the balance sheet date. Accordingly, figuring out what inventory a company owns on the balance sheet date can be a challenge.

**HOW** Goods in transit belong to the seller if the shipping terms are **FOB destination** and to the buyer if shipping terms are **FOB shipping point**. Goods on consignment do **NOT** belong to the company with physical custody of the goods.

As a general rule, goods should be included in the inventory of the business holding legal title. The *passing of title* is a legal term designating the point at which ownership changes. When the rule of passing title is not observed, statements should include appropriate disclosure of the special practice followed and the factors supporting such practice. Application of the legal test under a number of special circumstances is described in the following paragraphs.

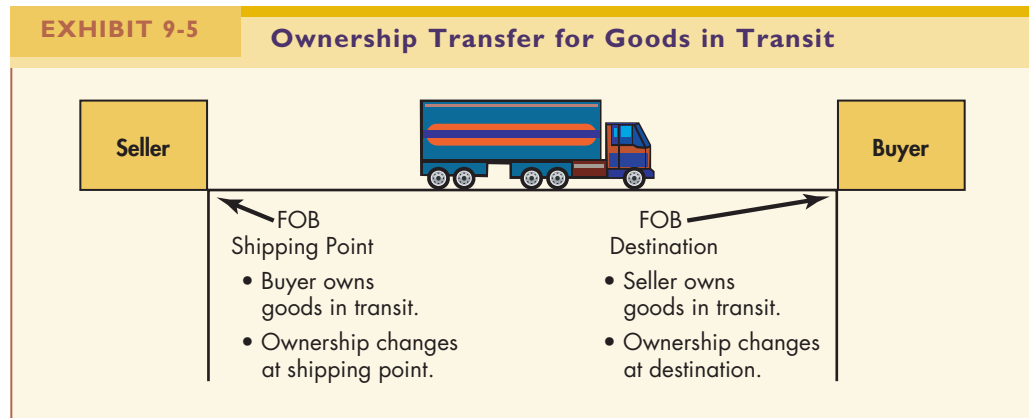

### Goods in Transit

When goods are in transit from the seller to the buyer, who owns them? The answer depends on the terms of the sale. When terms of sale are **FOB (free on board) shipping point**, title passes to the buyer with the loading of goods at the point of shipment. Because title passes at the shipping point, goods in transit at year-end should be included in the inventory of the buyer even though the buyer hasn’t received them yet.

When terms of a sale are **FOB destination**, legal title does not pass until the goods are received by the buyer. Even though it can be difficult to determine whether goods have reached their destination by the end of the period, when the terms are FOB destination the seller should not recognize a sale, and a corresponding inventory decrease, until the goods are received by the buyer.

To summarize, when goods are shipped FOB shipping point, they belong to the buyer while they are in transit and should normally be included in the buyer’s inventory while in transit. When goods are shipped FOB destination, they belong to the seller while in transit and are normally included in the seller’s inventory. The impact of shipping terms on the ownership of goods in transit is summarized in Exhibit 9-5.

In some cases, title to goods may pass before shipment takes place. For example, if goods are produced on special customer order, they may be recorded as a sale as soon as they are completed and segregated from the regular inventory. If the sale is

recognized upon segregation by the seller, the goods should be excluded from the seller's inventory. The buyer could recognize the goods as part of inventory as soon as they are separated.

Keep in mind that the shipping terms related to inventory are only an issue at the end of an accounting period. For most shipments, the goods will be shipped by the seller and received by the buyer in the same accounting period, thereby presenting no accounting problems.

## Goods on Consignment

Goods are frequently transferred to a dealer or customer on a consignment basis. The shipper retains title and includes the goods in inventory until their sale or use by the dealer or customer. For example, **NN, Inc.**, a company that makes precision steel balls and rollers for use in manufacturing antifriction bearings, provides goods on consignment to some of its major customers. Through this arrangement, the customers are able to maintain low inventory levels. NN, Inc., benefits from this consignment arrangement because this added service improves customer satisfaction and, hopefully, increases sales. **Consigned goods** are properly reported by the shipper at the sum of their costs and the handling and shipping costs incurred in their transfer to the dealer or customer. The goods may be separately designated on the shipper's balance sheet as merchandise on consignment. Alternatively, the amount of inventory on consignment may be disclosed in the financial statement notes. For example, in the notes to its December 31, 2007, financial statements, NN, Inc., disclosed that \$5.7 million of its \$51.8 million in inventory was inventory on consignment. The dealer or customer does not own the consigned goods; hence, neither consigned goods nor obligations for such goods are reported on the dealer's or customer's financial statements. Recall that revenue recognition accounting for consignments was discussed in Chapter 8.

Other merchandise owned by a business but in the possession of others, such as goods in the hands of salespersons and agents, goods held by customers on approval, and goods held by others for storage, processing, or shipment also should be shown as a part of the ending inventory of the business that owns the goods.

Auditing consigned inventory presents the auditor with a special set of problems. Inventory that is on the premises may not belong to the company because the company is holding it on consignment, yet inventory that is located with a vendor on consignment, hundreds of miles away, still belongs to the company. Imagine an auditor walking out into a warehouse and seeing row upon row of inventory. "That's not ours, we are just holding it on consignment," quips the warehouse

fyi

Twenty years ago, when auditors got together, they exchanged "war stories" about difficult inventory audits. These days you are more likely to hear auditors complaining about lawsuits and nasty computer systems.

manager. Then the warehouse manager leads the auditor to the shipping platform. “See that truck just leaving the gate? That truck and hundreds more just like it contain inventory that is still ours but has been shipped on consignment. Audit that!”

## Conditional Sales, Installment Sales, and Repurchase Agreements

Conditional sales and installment sales contracts may provide for a retention of title by the seller until the sales price is fully recovered. Under these circumstances, the seller, who retains title, may continue to show the goods on its records, reduced by the buyer’s equity in such goods as established by collections; the buyer, in turn, can report an equity in the goods accruing through payments made. However, in the usual case when the possibilities of returns and defaults are very low, the seller, anticipating completion of the contract and the ultimate passing of title, recognizes the transaction as a regular sale and removes the goods from reported inventory at the time of the sale; the buyer, intending to comply with the contract and acquire title, recognizes the transaction as a regular purchase. Revenue recognition accounting for installment sales also was discussed in Chapter 8.

As a creative way to obtain cash on a short-term basis, firms sometimes sell inventory to another company but at the same time agree to repurchase the inventory at some future date. The repurchase price typically includes the original selling price

of the inventory plus finance and holding charges. In essence, the “selling” company has used inventory to secure a short-term loan but agrees to buy back the inventory later. For those familiar with such things, this is similar to how a pawnshop works. The FASB has decided that these arrangements should be accounted for according to their economic substance—no sale is recorded, the inventory is not removed from the selling company’s balance sheet, and the seller must record a liability for the proceeds received in the “sale.”<sup>6</sup>

fyi

In some countries, it is common for the seller to retain legal title of goods until the buyer pays for them. The SEC has stated (in SAB 104) that in cases like this, it is appropriate to assume that accounting ownership changes hands at delivery if the seller’s title is limited to the right to ensure recovery of the goods if payment is not made.

## What Is Inventory Cost?

**4** Compute total inventory acquisition cost.

**WHY** The cost of inventory often includes much more than just the cost of the physical materials that make up the inventory. Properly accounting for inventory costs ensures that both assets and expenses are reported correctly.

**HOW** Computing the cost of inventory, particularly inventory that is being manufactured, requires that various costs in addition to costs of the physical product be accounted for properly. In the case of manufactured inventory, material, labor, and overhead costs are assigned to inventory being produced and expensed when the inventory is sold.

After the goods to be included as inventory have been identified, the accountant must assign a dollar value to the physical units. Both U.S. and international accounting standards agree that historical cost should normally be used in valuing inventory.

<sup>6</sup> *Statement of Financial Accounting Standards No. 49, “Accounting for Product Financing Arrangements”* (Stamford, CT: Financial Accounting Standards Board, 1981).

Attention is directed in this section to identifying the elements that comprise inventory cost.

## Items Included in Inventory Cost

Inventory cost consists of all expenditures, both direct and indirect, relating to inventory acquisition, preparation, and placement for sale. In the case of raw materials or goods acquired for resale, cost includes the purchase price, freight, receiving, storage, and all other costs incurred to the time goods are ready for sale. Certain expenditures can be traced to specific acquisitions or can be allocated to inventory items in some equitable manner. Other expenditures may be relatively small and difficult to allocate. Such items are normally excluded in the calculation of inventory cost and are recognized as expenses in the current period. These items are called **period costs**.

The charges to be included in the cost of manufactured products have already been mentioned. These costs are called **product** or **inventoriable costs**. Proper accounting for materials, labor, and manufacturing overhead items and their identification with goods in process and finished goods inventories are achieved through a cost accounting system. Certain costs relating to the acquisition or the manufacture of goods may be considered abnormal and may be excluded in arriving at inventory cost. For example,

costs arising from idle capacity, excessive spoilage, and reprocessing are usually considered abnormal and are expensed in the current period.<sup>7</sup> Only those portions of general and administrative costs that are clearly related to procurement or production should be included in inventory cost.

Inventory costing is important for financial reporting purposes, but it is absolutely critical for making production, pricing, and strategy decisions. For example, if competitive pressures dictate that a business can

sell a product for no more than \$10 per unit, it is essential to that business to know whether it costs \$8 or \$11 to produce the unit. As mentioned earlier in the chapter, recent advances in techniques for allocating manufacturing overhead have greatly improved cost accounting systems.

Traditionally, manufacturing overhead costs have been allocated to products based on the amount of direct labor required in production. This allocation scheme often fails because direct labor can be a small part of the cost of a product that actually causes a large amount of manufacturing overhead through requiring frequent machine maintenance, lots of invoice paperwork, heavy administrative supervision, and so forth. **Activity-based cost (ABC) systems** strive to allocate overhead based on clearly identified **cost drivers**—characteristics of the production process (e.g., number of required machine reconfigurations or average frequency of production glitches requiring management intervention) that are known to create overhead costs. The real benefit of a good inventory costing system is seen in better information for internal decision making. As such, this important topic is covered fully in managerial accounting courses.

A schedule of cost of goods manufactured is often prepared by manufacturing companies to illustrate how various costs affect inventories and, ultimately, cost of goods sold. An illustration of this schedule is presented in Exhibit 9-6.<sup>8</sup>

### caution

One last warning—don't let the short coverage of overhead allocation here deceive you. This is a vital topic that has spawned arguments, textbooks, and lots of consulting revenue for the experts.

<sup>7</sup> *Statement of Financial Accounting Standards No. 151*, "Inventory Cost: An Amendment of ARB No. 43, Chapter 4" (Norwalk, CT: Financial Accounting Standards Board, November 2004). The intent of *SFAS No. 151* is to clarify the identification of inventory costs and to make the FASB identification consistent with that outlined by the IASB.

<sup>8</sup> To make this schedule more intuitive for the financial accounting audience using this text, the actual manufacturing overhead costs are shown. In a proper schedule of cost of goods manufactured, this total would be adjusted for the amount of over- or underapplied overhead such that the amount of applied (instead of actual) manufacturing overhead would be included in the computation of total manufacturing costs.

## EXHIBIT 9-6

## Schedule of Cost of Goods Manufactured

<b>Bartlett Corporation</b>		
<b>Schedule of Cost of Goods Manufactured</b>		
<b>For the Year Ended December 31, 2011</b>		
Direct materials:		
Raw materials inventory, January 1, 2011	\$ 21,350	
Purchases	107,500	
Cost of raw materials available for use	\$128,850	
Less: Raw materials inventory, December 31, 2011	22,350	
Raw materials used in production		\$106,500
Direct labor		96,850
Manufacturing overhead:		
Indirect labor	\$ 40,000	
Factory supervision	29,000	
Depreciation—factory buildings and equipment	20,000	
Light, heat, and power	18,000	
Factory supplies	15,000	
Miscellaneous manufacturing overhead	12,055	
		134,055
Total manufacturing costs		\$337,405
Add: Work in process inventory, January 1, 2011		29,400
		\$366,805
Less: Work in process inventory, December 31, 2011		26,500
Cost of goods manufactured		<u>\$340,305</u>

In practice, companies take different positions in classifying certain costs. For example, costs of the purchasing department, costs of accounting for manufacturing activities, and costs of pensions for production personnel may be treated as inventoriable costs by some companies and period costs by others.

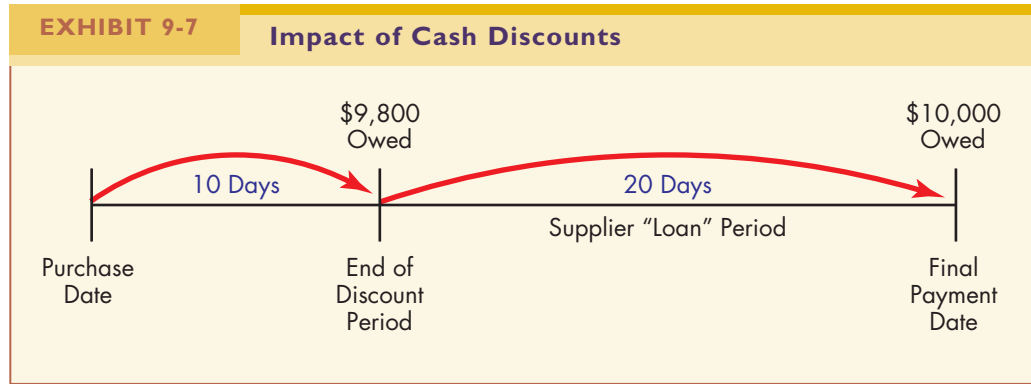

## Discounts as Reductions in Cost

Discounts associated with the purchase of inventory should be treated as a reduction in the cost assigned to the inventory. **Trade discounts** refer to the difference between a catalog price and the price actually charged to a buyer. *Cost* is defined as the list price less the trade discount. No record needs to be made of a trade discount, and the purchases should be recorded at the net price.

**Cash discounts** are discounts granted for payment of invoices within a limited time period. Cash discounts are usually stated as a certain percentage to be allowed if the invoice is paid within a certain number of days, with the full amount due within another time period. For example, 2/10, n/30 (two ten, net thirty) means that 2% is allowed as a cash discount if the invoice is paid within 10 days after the invoice date but the full or “net” amount is due within 30 days.

Theoretically, inventory should be recorded at the discounted amount (i.e., the gross invoice price less the allowable discount). This **net method** reflects the fact that discounts not taken are in effect a finance charge incurred for failure to pay within the discount period. Discounts not taken are recorded in the discounts lost account and reported as a separate item on the income statement. Discounts lost usually represent a relatively high rate of interest. To illustrate, assume a purchase of \$10,000 provides for payment on a 2/10, n/30 basis. This purchase and the payment options are illustrated in Exhibit 9-7.

If the buyer pays for the purchase by the 10th day, only \$9,800 must be paid. Twenty days later the full \$10,000 is due. Thus, an additional \$200 must be paid in exchange for delaying payment for an extra 20 days. In essence, this is a 20-day “loan” from the supplier to the purchaser. The effective interest rate on this 20-day “loan” is 2.04% ( $\$200/\$9,800$ ). Because there are about eighteen 20-day periods in a year, the annual interest cost on this “loan” exceeds 36%, suggesting that missing a cash discount

is a very costly mistake. Failure on the part of management to take a cash discount usually represents carelessness in considering payment alternatives. If cash discounts are accounted for using the net method, the \$200 cost of a missed discount is not included as part of the inventory cost but is expensed immediately as a finance charge.

Under the **gross method**, cash discounts are booked only when they are taken. While the net method tracks discounts not taken, the gross method provides no such information, and inventory records are maintained at the gross unit price. When a periodic system is used, cash discounts taken are reflected through a contra purchases account, Purchase Discounts. With a perpetual inventory system, discounts are credited directly to Inventory.

The net method of accounting for purchases is strongly preferred; however, many companies still follow the historical practice of recognizing cash discounts only as payments are made. The entries required for both the gross and net methods are illustrated in the following table. A perpetual inventory method is assumed.

Transaction	Purchases Reported Net		Purchases Reported Gross	
Purchase of merchandise priced at \$10,000 along with a cash discount of 2%.	Inventory .....	9,800	Inventory .....	10,000
	Accounts Payable .....	9,800	Accounts Payable .....	10,000
(a) Assuming payment of the invoice within discount period.	Accounts Payable .....	9,800	Accounts Payable .....	10,000
	Cash .....	9,800	Inventory .....	200
			Cash .....	9,800
(b) Assuming payment of the invoice after discount period.	Accounts Payable .....	9,800	Accounts Payable .....	10,000
	Discounts Lost .....	200	Cash .....	10,000
	Cash .....	10,000		
(c) Required adjustment at the end of the period assuming that the invoice has not been paid and the discount period has lapsed.	Discounts Lost .....	200	No entry required	
	Accounts Payable .....	200		

The difference in the two methods is that the net method shows the cost of missed discounts as a separate finance charge (Discounts Lost), whereas the gross method lumps this finance charge into the inventory cost. This result is the same if a periodic inventory system is used. The difference in journal entries with a periodic system is that Purchases, instead of Inventory, is debited to record the original purchase. In addition, Purchase Discounts, instead of Inventory, is credited under the gross method when payment is within the discount period.

### Purchase Returns and Allowances

Adjustments to invoice cost are also made when merchandise either is damaged or is of a lesser quality than ordered. Sometimes the merchandise is physically returned to the supplier. In other instances, a credit is allowed to the buyer by the supplier

to compensate for the damage or the inferior quality of the merchandise. A purchase allowance of \$400 given for defective merchandise would be recorded as follows:

Periodic Inventory System		Perpetual Inventory System	
Accounts Payable .....	400	Accounts Payable .....	400
Purchase Returns and Allowances .....	400	Inventory .....	400

Purchase Returns and Allowances is a contra purchases account.

The computation of total inventory acquisition cost is summarized as follows:

- Invoice cost plus freight, storage, and preparation cost
- Cash discounts (only cash discounts taken if using the gross method)
- Purchase returns and allowances
- = Inventory cost

## Inventory Valuation Methods

**5** Use the four basic inventory valuation methods: specific identification, average cost, FIFO, and LIFO.

**WHY** In most instances, the allocation of the costs of inventory between the balance sheet and the income statement requires an assumption regarding the flow of costs. That cost flow assumption can significantly affect the numbers reported on the income statement and the balance sheet.

**HOW** The specific identification method involves matching the actual cost of inventory with the revenue generated when the product is sold. The other valuation methods—LIFO (last-in, first-out), FIFO (first-in, first-out), and average—systematically match costs with revenues based on an assumption regarding timing.

At the end of an accounting period, total inventory cost must be allocated between inventory still remaining (to be reported on the balance sheet as an asset) and inventory sold during the period (to be reported on the income statement as the expense “cost of goods sold”). Numerous methods have evolved to make this allocation between cost of goods sold and inventory. The most common methods are as follows:

- Specific identification
- Average cost
- First-in, first-out (FIFO)
- Last-in, first-out (LIFO)

Each of these methods has certain characteristics that make it preferable under certain conditions. All four methods have in common the fact that inventory cost is allocated between the income statement and the balance sheet. Only the specific identification method determines the cost allocation according to the physical inventory flow. Unless individual inventory items, such as automobiles, are clearly definable, inventory items are exchangeable. Thus, the emphasis in inventory valuation usually is on the accounting cost allocation, not the physical flow.

FIFO is by far the most common inventory valuation method in the United States. Exhibit 9-8 reports the frequency of use of inventory valuation methods by U.S. companies in both 1979 and 2006. The percentages sum to more than 100%, indicating that many companies use more than one inventory method, applying different methods to different classes of inventory. Recall from the opening scenario of the chapter that LIFO generates income tax savings in times of inflation. The reduction in the rate of inflation in the United States from 1979 to 2006 is probably the cause of the overall decline in usage of LIFO. Finally,

EXHIBIT 9-8 Frequency of Inventory Valuation Method Use			
Frequency of Use of Inventory Valuation Methods U.S. Companies 1979 and 2006			
Inventory Method	1979 All Companies	2006 All Companies	2006 Large Companies
FIFO .....	75.6%	67.8%	62.2%
LIFO .....	25.8	13.1	26.8
Average cost .....	20.8	31.7	45.6
Specific identification .....	3.7	4.7	3.8

Source: Standard and Poor's COMPUSTAT.

notice the difference in usage of LIFO between large and small firms. This is probably the consequence of the potentially sizable bookkeeping costs of maintaining a LIFO system.

There have been few guidelines developed by the profession to assist companies in choosing among these alternative inventory valuation methods. Some argue that cost flow should mirror the physical flow of goods. Others think that inventory valuation should concentrate on matching current costs with current revenues. Still others think that the emphasis should be on the proper valuation of inventory on the balance sheet. The following discussion of the allocation methods demonstrates how each method relates to these different viewpoints.

The four methods will be illustrated using the following simple example for Dalton Company. Dalton has no beginning inventory for 2011.

	Number of Units	Unit Cost	Total Cost
Purchases:			
January 1 .....	200	\$10	\$ 2,000
March 23 .....	300	12	3,600
July 15 .....	500	11	5,500
November 6 .....	100	13	1,300
Total purchases .....	<u>1,100</u>		<u>\$12,400</u>

Sales: 700 units at \$15 per unit. For simplicity, assume that all sales occurred on December 31.

### Specific Identification

Costs may be allocated between goods sold during the period and goods on hand at the end of the period according to the actual cost of specific units. This **specific identification method** requires a way to identify the historical cost of each individual unit of inventory. With specific identification, the flow of recorded costs matches the physical flow of goods.

From a theoretical standpoint, the specific identification method is very attractive, especially when each inventory item is unique and has a high cost. However, when inventory is composed of a great many items or identical items acquired at different times and at different prices, specific identification is likely to be slow, burdensome, and costly. Even a computer tracking system won't answer all these practical concerns. Consider the task of implementing a specific identification inventory system in a do-it-yourself hardware store with the requirement to specifically track all costs associated with each screwdriver, each bolt, each piece of lumber, and each can of paint.

Apart from practical concerns, when units are identical and interchangeable, the specific identification method opens the door to possible profit manipulation through the selection of particular units for delivery. Consider the Dalton Company example. If Dalton Company wants to minimize its cost of goods sold for 2011 (and thus

maximize reported net income), it can strategically choose to ship the 700 units with the lowest cost. Cost of goods sold would be computed as follows:

Dalton Company Specific Identification Method Shipment of the Lowest Cost Units Cost of Goods Sold Computation			
	Number of Units	Unit Cost	Total Cost
Batch purchased on:			
January 1 .....	200	\$10	\$2,000
July 15 .....	500	11	5,500
Total cost of goods sold .....	<u>700</u>		<u>\$7,500</u>

The specific identification method is the least common of the four methods discussed in this chapter. Exhibit 9-8 indicates that in 2006 it was used by only 4.7% of U.S. companies. **Amazon.com** is one company that has used the specific identification method. The company has an extremely sophisticated inventory tracking system, and this same system makes it easy to implement the specific identification method. Exhibit 9-9 provides the company's note disclosure relating to its inventory valuation method.

However, as of January 1, 2002, Amazon.com changed its inventory valuation method from specific identification to FIFO, reflecting the continuing shift away from the specific identification method for financial reporting purposes. Note that this does not mean that Amazon.com changed the way it actually tracks its goods; the switch from the specific identification method merely represents a change in assumption for financial reporting purposes.

#### EXHIBIT 9-9

#### Amazon.com—Inventory Valuation Method

Inventories, consisting of products available for sale, are recorded using the specific-identification method and valued at the lower of cost or market value.

## Average Cost Method

The **average cost method** assigns the same average cost to each unit. This method is based on the assumption that goods sold should be charged at an average cost, with the average being weighted by the number of units acquired at each price. Using the cost data for Dalton Company, the weighted-average cost of each unit would be computed as follows:

$$\begin{aligned} \text{Total purchases: } & 1,100 \text{ units at a total cost of } \$12,400 \\ \text{Weighted-average cost: } & \$12,400/1,100 \text{ units} = \$11.27 \text{ per unit (rounded)} \end{aligned}$$

Using the average cost method, cost of goods sold is simply the number of units sold multiplied by the average cost per unit: \$7,890 (700 units  $\times$  \$11.27 per unit, rounded).

The average cost method can be supported as realistic and as paralleling the physical flow of goods, particularly where there is an intermingling of identical inventory units. Unlike the other inventory methods, the average cost approach provides the same cost for similar items of equal utility. The method does not permit profit manipulation. A limitation of

fyi

When Western accounting practices were first introduced into the former Soviet Union, Soviet accountants complained that LIFO and FIFO didn't make any sense. They were attracted by the logic of the average cost method.

the average cost method is that inventory values may lag significantly behind current prices in periods of rapidly rising or falling prices.

### First-In, First-Out Method

The **first-in, first-out (FIFO) method** is based on the assumption that the units sold are the oldest units on hand. For Dalton Company, FIFO cost of goods sold is computed as follows:

Dalton Company FIFO Method Cost of Goods Sold Computation			
	Number of Units	Unit Cost	Total Cost
Batch purchased on:			
January 1 .....	200	\$10	\$2,000
March 23 .....	300	12	3,600
July 15 .....	200	11	2,200
Total cost of goods sold .....	<u>700</u>		<u>\$7,800</u>

Note that only 200 units from the July 15 batch are assumed to be sold; the remaining 300 units from that batch are assumed to be in ending inventory.

FIFO can be supported as a logical and realistic approach to the flow of costs when it is impractical or impossible to achieve specific cost identification. FIFO assumes a cost flow closely paralleling the usual physical flow of goods sold. Expense is charged with costs considered applicable to the goods actually sold. FIFO affords little opportunity for profit manipulation because the assignment of costs is determined by the order in which costs are incurred. In addition, with FIFO the units remaining in ending inventory are the most recently purchased units, so their reported cost would most closely match end-of-period replacement cost.

### Last-In, First-Out Method

The **last-in, first-out (LIFO) method** is based on the assumption that the newest units are sold. For Dalton Company, LIFO cost of goods sold is computed as follows:

Dalton Company LIFO Method Cost of Goods Sold Computation			
	Number of Units	Unit Cost	Total Cost
Batch purchased on:			
November 6 .....	100	\$13	\$1,300
July 15 .....	500	11	5,500
March 23 .....	100	12	1,200
Total cost of goods sold .....	<u>700</u>		<u>\$8,000</u>

## caution

There is no required connection between the actual physical flow of goods and the inventory valuation method used.

Note that only 100 units from the March 23 batch are assumed to be sold; the remaining 200 units from that batch are assumed to be in ending inventory.

LIFO is frequently criticized from a theoretical standpoint. It does not match the usual flow of goods in a business (although it does unfortunately match the flow of food in and out of a college student’s refrigerator—with

nasty implications for “ending inventory”). As seen in the following sections, LIFO results in old values on the balance sheet and can yield very strange cost of goods sold numbers when inventory levels decline. However, LIFO is the best method at matching current inventory costs with current revenues. The difficulties and quirks of maintaining a LIFO inventory system are detailed later in the chapter.

## Comparison of Methods: Cost of Goods Sold and Ending Inventory

Recall that the purpose of an inventory valuation method is to allocate total inventory cost between cost of goods sold and inventory. For Dalton Company, total inventory cost for 2011 is \$12,400. The allocation of this cost between cost of goods sold and ending inventory is shown in Exhibit 9-10 for each of the four inventory valuation methods. Note that the average cost method differs from the other three methods in that no assumption is made about the sale of specific units. Instead,

EXHIBIT 9-10		Comparison of Inventory Valuation Methods			
Dalton Company Comparison of Four Inventory Valuation Methods Cost of Goods Sold and Ending Inventory					
	Unit Cost	Specific Identification	Average Cost*	FIFO	LIFO
<b>Purchased on:</b>					
January 1.....	\$10	200	200	200	200
March 23.....	12	300	300	300	100
July 15.....	11	500	500	200	500
November 6.....	13	100	100	100	100
			Units sold <span style="border: 1px solid red; display: inline-block; width: 20px; height: 10px;"></span>		Units remaining <span style="border: 1px solid blue; display: inline-block; width: 20px; height: 10px;"></span>
<b>Cost of goods sold (700 units):</b>					
		200 × \$10 = \$ 2,000	700 × \$11.27 = \$ 7,890 <sup>†</sup>	200 × \$10 = \$ 2,000	100 × \$13 = \$ 1,300
		500 × \$11 = 5,500		300 × \$12 = 3,600	500 × \$11 = 5,500
		<u>7,500</u>	<u>7,890</u>	<u>2,200</u>	<u>1,200</u>
				<u>\$ 7,800</u>	<u>\$ 8,000</u>
<b>Ending inventory (400 units):</b>					
		300 × \$12 = \$ 3,600	400 × \$11.27 = \$ 4,510 <sup>†</sup>	300 × \$11 = \$ 3,300	200 × \$10 = \$ 2,000
		100 × \$13 = 1,300		100 × \$13 = 1,300	200 × \$12 = 2,400
		<u>4,900</u>	<u>4,510</u>	<u>4,600</u>	<u>4,400</u>
<b>Total inventory cost:</b>					
		<u>\$12,400</u>	<u>\$12,400</u>	<u>\$12,400</u>	<u>\$12,400</u>

\*With the average cost method, no assumption is made about the sale of specific units. The average cost per unit is computed as follows:  
\$12,400/1,100 units = \$11.27 per unit, rounded.

<sup>†</sup>Rounded.

all sales are assumed to be of the hypothetical “average” unit at the average cost per unit.

Use of FIFO in a period of rising prices matches oldest low-cost inventory with rising sales prices, thus expanding the gross profit margin. In a period of declining prices, oldest high-cost inventory is matched with declining sales prices, thus narrowing the gross profit margin. Using average cost, the gross profit margin tends to follow a similar pattern in response to changing prices. On the other hand, use of LIFO in a period of rising prices relates current high costs of acquiring goods with rising sales prices. Thus, LIFO tends to have a stabilizing effect on gross profit margins.

In using FIFO, inventories are reported on the balance sheet at or near current costs. With LIFO, inventories are reported at the cost of the earliest purchases. If LIFO has been used for a long time, the disparity between current value of inventory and reported LIFO cost can grow quite large. Use of the average method generally provides inventory values similar to FIFO values, because average costs are heavily influenced by current costs. Specific identification can produce any variety of results depending on which particular units are chosen for shipment.

When the prices paid for merchandise do not fluctuate significantly, alternative inventory methods may provide only minor differences in the financial statements. However, in periods of steadily rising or falling prices, the alternative methods may produce material differences.

## Complications with a Perpetual Inventory System

In the Dalton Company example, the simplifying assumption was made that all 700 units were sold on December 31. In essence, this is the assumption made when a periodic inventory system is used. Computation of average cost and LIFO under a perpetual system is complicated because the average cost of units available for sale changes every time a purchase is made, and the identification of the “last-in” units also changes with every purchase. The complications of a perpetual system are illustrated in Exhibit 9-11, in which Dalton Company’s cost of goods sold and ending inventory for 2011 are computed assuming that 300 units were sold on June 30 and 400 units were sold on December 31.

Examine Exhibit 9-11 and consider the following observations:

- Even in this more complicated example, the net result of each of the inventory valuation methods is to allocate the total inventory cost of \$12,400 between cost of goods sold and ending inventory.
- For FIFO, cost of goods sold and ending inventory are the same whether a periodic system (all sales assumed to occur at year-end) or a perpetual system (sales occur throughout the year) is used. Compare Exhibits 9-10 and 9-11. This is so because no matter when in the year the sales are assumed to occur, the oldest units (first in) are always the same ones.
- Because the newest units (last in) as of June 30 are not the same as the newest units on December 31, applying LIFO on a perpetual basis gives a different cost of goods sold and ending inventory than if a periodic system is used.
- Similarly, the average cost of units in inventory on June 30 (\$11.20) is not the same as the average cost of all units purchased for the year (\$11.27). Thus, applying average cost on a perpetual and a periodic basis yields different results.

Because of the unnecessary complications of perpetual LIFO and perpetual average cost, many businesses that use average cost or LIFO for financial reporting use a simple FIFO assumption in the maintenance of their day-to-day perpetual inventory records. These perpetual FIFO records are then converted to periodic average cost or LIFO for the financial reports.

## EXHIBIT 9-11

## Inventory Valuation Methods and a Perpetual Inventory System

Dalton Company  
Complications of a Perpetual Inventory System

	Unit Cost	Average Cost*	FIFO	LIFO
<b>300 units sold on June 30:</b>

		Units sold	Units remaining	
<i>Cost of goods sold (400 units):</i>				
	$400 \times \$11.30 = \$4,520$	$200 \times \$12 = \$2,400$	$100 \times \$13 = \$1,300$	
		$200 \times \$11 = 2,200$	$300 \times \$11 = 3,300$	
	<u>\$4,520</u>	<u>\$4,600</u>	<u>\$4,600</u>	
<i>Ending inventory (400 units):</i>				
	$400 \times \$11.30 = \$4,520$	$300 \times \$11 = \$3,300$	$200 \times \$10 = \$2,000$	
		$100 \times \$13 = 1,300$	$200 \times \$11 = 2,200$	
	<u>\$4,520</u>	<u>\$4,600</u>	<u>\$4,200</u>	
<i>Total inventory cost:</i>				
Sold on June 30 . . . . .	\$ 3,360		\$ 3,200	\$ 3,600
Sold on December 31 . . . . .	4,520		4,600	4,600
Total cost of goods sold . . . . .	\$ 7,880		\$ 7,800	\$ 8,200
Inventory on December 31 . . . . .	4,520		4,600	4,200
Total inventory cost	<u>\$12,400</u>		<u>\$12,400</u>	<u>\$12,400</u>

\*With the average cost method, no assumption is made about the sale of specific units. The average cost per unit is computed as follows:

$$[(200 \times \$10) + (300 \times \$12)] / 500 \text{ units} = \$11.20 \text{ per unit}$$

$$†[(200 \times \$11.20) + (500 \times \$11) + (100 \times \$13)] / 800 \text{ units} = \$11.30 \text{ per unit}$$

## More About LIFO

**6** Explain how LIFO inventory layers are created, and describe the significance of the LIFO reserve.

**WHY** Over the course of several years, the creation of LIFO layers can result in a substantial difference between the current market value of inventory and the reported LIFO cost of the inventory. Accordingly, it is extremely important to understand all of the financial statement implications for a company using the seemingly innocent LIFO inventory valuation assumption

**HOW** The LIFO assumption results in “layers” of inventory being created in each year in which purchases exceed sales. In an inflationary period, the difference between the old LIFO layer costs and the current cost of inventory is called the LIFO reserve and can be thought of as an accumulated inventory holding gain. When a LIFO layer is liquidated, the associated inventory holding gain acts to artificially reduce reported cost of goods sold for the period.

In the simple Dalton Company example of the previous section, the LIFO calculations did not seem any more difficult than the calculations using the other three methods. In a more involved example, the complexities of LIFO become apparent. In this section, a multiyear example is used to illustrate LIFO layers and LIFO liquidation. The advantages of using LIFO pools and dollar-value LIFO to reduce the recordkeeping burden associated with LIFO are illustrated later in the chapter.

### LIFO Layers

The following data are for Ryanes Company for the first three years of its existence:

	2008	2009	2010
Purchases .....	120 units @ \$ 5	150 units @ \$10	160 units @ \$15
Sales .....	100 units @ \$10	120 units @ \$15	120 units @ \$20

## caution

Pay close attention to this part of the chapter. You may think you understand LIFO, but until you work through the wrinkles and quirks presented here, you don't.

At the end of 2008, 20 units with a total cost of \$100 (20 units × \$5 per unit) remain in ending inventory. Are these units sold in 2009? If a FIFO assumption is made, the answer is yes. Under FIFO, the 120 units sold in 2009 are the oldest available units: the 20 units left over from 2008 plus 100 units purchased in 2009. However, if a LIFO assumption is made, the 20 units left over at the end of 2008 are not sold in 2009. Instead, the newest units are sold, and those

are 120 of the units purchased in 2009. Using LIFO, cost of goods sold and ending inventory for each of the three years are as follows:

	2008	2009	2010
LIFO cost of goods sold .....	100 × \$5 = \$500	120 × \$10 = \$1,200	120 × \$15 = \$1,800
Ending inventory:			
Year units purchased			
2008 .....	20 × \$5 = \$100	20 × \$5 = \$100	20 × \$5 = \$ 100
2009 .....		30 × \$10 = 300	30 × \$10 = 300
2010 .....			40 × \$15 = 600
Ending inventory .....	<u>20</u> units <u>\$100</u>	<u>50</u> units <u>\$400</u>	<u>90</u> units <u>\$1,000</u>

Notice that each year in which the number of units purchased exceeds the number of units sold, a new **LIFO layer** is created in ending inventory. As long as inventory continues to grow, a new LIFO layer is created each year and the old LIFO layers remain untouched.

The creation of LIFO layers illustrates one of the drawbacks of LIFO in that after a few years, the LIFO assumption results in ending inventory containing old inventory at old prices. In the Ryanes example, 2010 ending inventory is assumed to contain inventory purchased back in 2008. And, because inventory costs have increased during the period, the \$1,000 amount reported for 2010 ending inventory does not represent the current value of the 90 units of inventory. For example, if FIFO were used, the 90 units in 2010 ending inventory would be valued using the 2010 purchase price of \$15 per unit, giving them a value of \$1,350 (90 units  $\times$  \$15 per unit). The difference between the LIFO ending inventory amount and the amount obtained using another inventory valuation method (like FIFO or average cost) is called the *LIFO reserve*. In this example, the LIFO reserve is \$350 (\$1,350 FIFO ending inventory – \$1,000 LIFO ending inventory).

Exhibit 9-12 contains the note disclosure of DuPont's **LIFO reserve** from the company's 2007 annual report. Note that DuPont uses the average cost method for maintaining its accounting records during the year and then adjusts its inventory to the LIFO method for financial reporting purposes.

Many companies that use LIFO report the amount of their LIFO reserve, either as a parenthetical note in the balance sheet or in the notes to the financial statements. The size of the LIFO reserve for several large U.S. companies is given in Exhibit 9-13. These LIFO reserve disclosures can aid financial statement users in comparing companies that use different inventory valuation methods. The disclosures can be used to recalculate LIFO ending inventory and cost of goods sold on a FIFO or average cost basis. To illustrate, the following data can be used to calculate FIFO cost of goods sold for Ryanes for 2010.

	2009	2010
LIFO ending inventory .....	\$ 400	\$1,000
LIFO reserve .....	100	350
LIFO cost of goods sold .....	1,200	1,800

The FIFO calculation can be done as follows:

LIFO		FIFO	
\$ 400	Beginning inventory	\$ 500	(\$400 + \$100 LIFO reserve)
2,400	+ Purchases	2,400	(160 units $\times$ \$15; same for LIFO and FIFO)
\$2,800	= Cost of goods available	\$2,900	
1,000	– Ending inventory	1,350	(\$1,000 + \$350 LIFO reserve)
<u>\$1,800</u>	= Cost of goods sold	<u>\$1,550</u>	

#### EXHIBIT 9-12

#### DuPont's LIFO Reserve Note

##### 9. Inventories

December 31	2007	2006
Finished products .....	\$3,043	\$3,075
Semifinished products .....	1,865	1,616
Raw materials, stores and supplies .....	1,000	804
Total .....	\$5,908	\$5,495
Adjustment of inventories to a LIFO basis .....	(630)	(554)
	<u>\$5,278</u>	<u>\$4,941</u>

Inventory values, before LIFO adjustment, are generally determined by the average cost method, which approximates current cost. Inventories, excluding seeds and stores and supplies, are valued under the LIFO method and comprised 80 percent of consolidated inventories before LIFO adjustment for the periods ended December 31, 2007 and 2006.

EXHIBIT 9-13

Size of LIFO Reserve for Selected U.S. Companies—2007

U.S. Companies with the Largest LIFO Reserves for the Year 2007 (in millions of U.S. dollars)

Company Name	Reported LIFO Inventory	LIFO Reserve
General Motors	\$14,939	\$1,423
Caterpillar	7,204	2,617
Ford Motor Company	10,121	1,100
Deere & Co.	2,337	1,233
General Electric	12,834	623

## stop & think

Refer to the original Ryanes Company data and compute the FIFO cost of goods sold for 2008, 2009, and 2010.

- a) 2008 = \$500; 2009 = \$1,200; 2010 = \$1,550
- b) 2008 = \$100; 2009 = \$400; 2010 = \$1,550
- c) 2008 = \$500; 2009 = \$1,100; 2010 = \$1,550
- d) 2008 = \$100; 2009 = \$1,100; 2010 = \$1,550

In this simple example, purchases can be computed from the original data. Alternatively, purchases can be inferred from the beginning inventory, ending inventory, and cost of goods sold amounts. The important insight is that purchases are the same whether LIFO or FIFO is used.

### LIFO Liquidation

Continuing the Ryanes Company example, assume purchases and sales for 2011 are as follows:

Purchases .....	60 units @ \$20
Sales .....	150 units @ \$25

Because the number of units purchased does not exceed the number sold, no new LIFO layer is added in 2011. In fact, because 2011 purchases are so low, inventory in the old LIFO layers must be sold. This is called *LIFO liquidation*. Computation of 2011 LIFO cost of goods sold is as follows:

Year Units Purchased		
2011 .....	60 units @ \$20	\$1,200
2010 .....	40 units @ \$15	600
2009 .....	30 units @ \$10	300
2008 .....	20 units @ \$ 5	100
Total .....	<u>150 units</u>	<u>\$2,200</u>

LIFO liquidation causes old LIFO layer costs to flow through cost of goods sold, sometimes with bizarre results. In this example, if Ryanes had not reduced inventory during 2011, LIFO cost of goods sold would have been \$3,000 (150 units × \$20 per unit). Thus, the impact of reducing inventory levels and dragging old LIFO layers into cost of

Photodisc/Getty Images

Retail stores must account for interim inventory reductions due to the seasonal fluctuation of inventory levels.

goods sold is to reduce reported cost of goods sold by \$800 (\$3,000 – \$2,200). This **LIFO liquidation** effect would be disclosed in the notes to the financial statements.

Drastic inventory reductions can be caused by work stoppages, a slowdown in business, or financing problems. When a company has used LIFO during a period of rising prices (as illustrated in the Ryanes example), the odd result of an unfortunate inventory reduction is that LIFO liquidation causes cost of goods sold to go down and net income to go up. The potential for this LIFO liquidation effect is one reason given in some countries for banning the use of LIFO.

**Interim LIFO Liquidation** Frequently, a company experiences a decline in inventory at an interim reporting date but fully expects to replenish the inventory by the end of the fiscal year. This would be common, for example, in any business with seasonal fluctuations in inventory levels. For companies using LIFO, temporary interim inventory reductions are not viewed as the liquidation of LIFO layers. To maintain the recorded historical

cost of the LIFO layers, a temporary provision account is established and then reversed when the inventory is replenished.<sup>9</sup>

To illustrate the appropriate journal entry, assume that the LIFO liquidation for Ryanes for 2011 had actually occurred at the end of the first quarter of 2011 and that the inventory was expected to be replenished by year-end. The \$800 LIFO liquidation effect would be recorded as follows:

Cost of Goods Sold .....	800	
Provision for Temporary Decline in LIFO Inventory .....		800

The provision account represents a liability to replace the inventory at a cost exceeding its recorded LIFO amount. This provision account is recorded only for interim reports; a LIFO liquidation is recorded at the end of the fiscal year whether a year-end inventory decline is temporary or not.

## LIFO and Income Taxes

The LIFO inventory method was developed in the United States during the late 1930s as a method of reducing income taxes during periods of rising prices. However, when Congress authorized the use of LIFO for income tax purposes, a unique provision was attached to the law. This provision has become known as the **LIFO conformity rule** and specifies that only those taxpayers who use LIFO for financial reporting purposes may use it for tax purposes. LIFO is the only accounting method that must be reported the same way for tax and book purposes. In the early years, the LIFO conformity rule was strictly applied, and companies were not permitted to report inventory values using any other method, either in the body of the financial statements or in the attached notes. In 1981, the IRS regulations were relaxed by permitting companies to provide supplemental non-LIFO disclosures (such as the LIFO reserve disclosures discussed previously) as long as the information is not presented on the face of the income statement.<sup>10</sup>

<sup>9</sup> See *Opinions of the Accounting Principles Board No. 28, "Interim Financial Reporting"* (New York: American Institute of Certified Public Accountants, May 1973), par. 14b.

<sup>10</sup> The IRS LIFO conformity relaxation went so far as to state that, as far as the IRS is concerned, companies that use LIFO for tax purposes can prepare financial statements for external users using FIFO for inventory valuation on the balance sheet provided that LIFO cost of goods sold is reported on the income statement. However, this mismatch between the balance sheet and the income statement would be a violation of U.S. GAAP.

caution

**LIFO is the exception! In every other case, companies are not required to use the same accounting methods in the financial statements as they use for income tax purposes. Therefore, a financial accounting decision usually has no impact on income taxes payable—LIFO is the exception.**

Prior to the relaxation of the LIFO conformity rule, the income tax regulations governed the detailed application of LIFO for financial reporting purposes as well. And in fact, the IRS rules are still very important in determining how companies apply LIFO for financial reporting. However, both the SEC and the AICPA have issued guidelines outlining how proper application of LIFO for financial reporting might differ from the IRS regulations concerning LIFO.<sup>11</sup> The FASB has never addressed the issue of LIFO, deciding that the AICPA and SEC guidelines on the topic are sufficient.

To illustrate how LIFO reduces taxes in times of inflation, refer back to the data for Ryanes Company. For simplicity, assume that cost of goods sold is the only expense and that the tax rate is 40%. Calculation of income taxes using both LIFO and FIFO is given in Exhibit 9-14.

From 2008 through 2010, with prices and inventory levels rising, the use of LIFO saves a total of \$140 in income taxes [(\$280 - \$240) + (\$340 - \$240)]. Because sales, collections, purchases, and payments are all the same whether LIFO or FIFO is used, the only cash flow difference between using LIFO and using FIFO is in cash paid for income taxes. Therefore, by the end of 2010, Ryanes will have additional cash of \$140 (from tax savings) if LIFO is used.

<b>EXHIBIT 9-14</b>	<b>Ryanes Example: Comparison of Income Taxes Using LIFO and FIFO</b>							
<b>LIFO:</b>	<b>2008</b>		<b>2009</b>		<b>2010</b>		<b>2011</b>	
Sales . . . . .	100 @ \$10	\$1,000	120 @ \$15	\$1,800	120 @ \$20	\$2,400	150 @ \$25	\$3,750
Cost of goods sold . . . .	100 @ \$5	500	120 @ \$10	1,200	120 @ \$15	1,800	60 @ \$20 40 @ \$15 30 @ \$10 20 @ \$5	<u>2,200</u>
Gross profit . . . . .	<u>\$ 500</u>		<u>\$ 600</u>		<u>\$ 600</u>		<u>\$1,550</u>	
Income taxes (40%) . . .	<u>\$ 200</u>		<u>\$ 240</u>		<u>\$ 240</u>		<u>\$ 620</u>	
<b>FIFO:</b>	<b>2008</b>		<b>2009</b>		<b>2010</b>		<b>2011</b>	
Sales . . . . .	100 @ \$10	\$1,000	120 @ \$15	\$1,800	120 @ \$20	\$2,400	150 @ \$25	\$3,750
Cost of goods sold . . . .	100 @ \$5	500	20 @ \$5 100 @ \$10	<u>1,100</u>	50 @ \$10 70 @ \$15	<u>1,550</u>	90 @ \$15 60 @ \$20	<u>2,550</u>
Gross profit . . . . .	<u>\$ 500</u>		<u>\$ 700</u>		<u>\$ 850</u>		<u>\$1,200</u>	
Income taxes (40%) . . .	<u>\$ 200</u>		<u>\$ 280</u>		<u>\$ 340</u>		<u>\$ 480</u>	

<sup>11</sup> See *Issues Paper*, "Identification and Discussion of Certain Financial Accounting and Reporting Issues Concerning LIFO Inventories" (New York: American Institute of Certified Public Accountants, 1984); and *Staff Accounting Bulletin (SAB) 58 (Topic 5.L.)* (Washington, DC: Securities and Exchange Commission, March 1985).

Note also that this cumulative tax savings is exactly equal to the LIFO reserve at the end of 2010 (computed to be \$350 in the previous section) multiplied by the tax rate ( $\$350 \times 0.40 = \$140$ ). Recall that the LIFO reserve represents the difference between the value of FIFO ending inventory and the value of LIFO ending inventory. Another way to think of the LIFO reserve is that it represents an inventory holding gain—an increase in the value of inventory because of price increases. In essence, when FIFO is used, this inventory holding gain becomes taxable income as it occurs, whereas with LIFO the inventory holding gain is not taxed until the inventory is liquidated, which happens in 2011 in this example.

The inventory liquidation in 2011 also illustrates that the use of LIFO for tax purposes results in tax deferral, not tax reduction. But because many companies have a low probability of liquidating their inventories in the foreseeable future, use of LIFO can defer payment of taxes on inventory holding gains for a long time.

## LIFO Pools and Dollar-Value LIFO

As a means of simplifying the valuation process and extending its applicability to more items, the IRS developed the technique of establishing **LIFO inventory pools** of substantially identical goods. The purpose of forming LIFO pools is to simplify the LIFO calculations associated with large numbers of products. The simplification results in an estimate of what cost of goods sold would be if LIFO were applied strictly and laboriously.

Even the grouping of substantially identical items into quantity pools does not produce all the benefits desired from the use of LIFO. To further simplify the record-keeping associated with LIFO and to eliminate the issues associated with new products replacing old products, the **dollar-value LIFO** inventory method was developed. Under this method, LIFO layers are determined based on total dollar changes rather than quantity changes. LIFO pools and dollar-value LIFO are discussed in detail in the Expanded Material section of this chapter.

## Overall Comparison of FIFO, LIFO, and Average Cost

**7** Choose an inventory valuation method based on the trade-offs among income tax effects, bookkeeping costs, and the impact on the financial statements.

**WHY** When GAAP allows several alternative accounting treatments, the prudent manager must consider all of the effects of an accounting method choice. The choice of an inventory valuation method is especially important because there are potential cash flow effects in addition to the financial statement effects.

**HOW** There are a variety of advantages and disadvantages to each of the inventory valuation methods. Tax effects, bookkeeping costs, and appropriate revenue/expense matching are a few of the factors that must be considered when selecting an inventory valuation method.

The chart in Exhibit 9-15 gives a summary comparison of the advantages and disadvantages of FIFO and LIFO. Average cost can be viewed as being somewhere between these two.

So, which inventory valuation method should a company pick? Circumstances differ from firm to firm, and the decision would be based on an analysis of the following four factors:

- Income tax effects
- Bookkeeping costs
- Impact on financial statements
- Industry comparison

## Income Tax Effects

If a company has large inventory levels, is experiencing significant inventory cost increases, and does not anticipate reducing inventory levels in the future, LIFO gives substantial cash

## EXHIBIT 9-15

## Summary Comparison of FIFO and LIFO

	FIFO	LIFO
<b>Income Statement</b>	<p><b>Advantage:</b></p> <ul style="list-style-type: none"> <li>Usually corresponds with the physical flow of goods.</li> </ul> <p><b>Disadvantages:</b></p> <ul style="list-style-type: none"> <li>Can cause older costs to be matched with current revenues.</li> <li>Inventory holding gains and losses are included as part of gross profit.</li> </ul>	<p><b>Advantages:</b></p> <ul style="list-style-type: none"> <li>Matches current costs with current revenues.</li> <li>Excludes inventory holding gains and losses from gross profit.</li> </ul> <p><b>Disadvantages:</b></p> <ul style="list-style-type: none"> <li>Usually does not correspond with the physical flow of goods.</li> <li>Potential LIFO liquidation means old costs in LIFO layers can be drawn into cost of goods sold.</li> </ul>
<b>Balance Sheet</b>	<p><b>Advantage:</b></p> <ul style="list-style-type: none"> <li>Ending inventory balance agrees closely with current replacement cost.</li> </ul>	<p><b>Disadvantage:</b></p> <ul style="list-style-type: none"> <li>Ending inventory balance is composed of old costs in LIFO layers and can be substantially lower than current replacement cost. This is partially offset by supplemental disclosure.</li> </ul>
<b>Income Taxes</b>	<p><b>Disadvantage:</b></p> <ul style="list-style-type: none"> <li>Yields higher taxable income in times of inflation if inventory levels are stable or increasing.</li> </ul>	<p><b>Advantage:</b></p> <ul style="list-style-type: none"> <li>Yields lower taxable income in times of inflation if inventory levels are stable or increasing.</li> </ul> <p><b>Disadvantage:</b></p> <p>LIFO liquidation can result in greatly increased tax payments when inventory levels decline.</p>

flow benefits in terms of tax deferral. This is the primary reason for LIFO adoption by most firms. For the many firms with small inventory levels or with flat or decreasing inventory costs, LIFO gives little, if any, tax benefit. Such firms are unlikely to use LIFO.

## Bookkeeping Costs

As seen in this chapter, the bookkeeping associated with LIFO is a bit more complicated than with FIFO or average cost. In dollars and cents, a LIFO system costs more to operate. For this reason, LIFO is less common among small firms where any LIFO tax benefits can be swamped by increased bookkeeping costs. However, with improved information technology and with the simplifications of LIFO pools and dollar-value LIFO (discussed in the Expanded Material associated with this chapter), the incremental LIFO bookkeeping costs can be minimized.

## Impact on Financial Statements

While LIFO gives tax benefits, it also gives reduced reported income and reduced reported inventory. These negative financial statement effects can harm a company by scaring off stockholders, potential investors, and banks. One way around this is to provide supplemental disclosure to allow users to see what the financial statements would look like if FIFO or average cost were used.

## Industry Comparison

Although financial statement users should be sophisticated in their understanding of inventory accounting, they often are not. They ignore supplemental LIFO disclosures and just compare the unadjusted numbers. If other companies in an industry use FIFO, the reported performance of a LIFO company can look poor by comparison.

## stop & think

Why wouldn't it be possible to use LIFO for the income statement and FIFO for the balance sheet?

- The amount of income taxes paid would double.
- The ending inventory amount and the amount of cost of goods sold would always be equal.
- Gross profit would always be negative.
- Without a special adjustment, the balance sheet wouldn't balance.

## International Accounting and Inventory Valuation

The International Accounting Standards Board (IASB) has waffled in its opinion about LIFO. In its initial standard on inventory (*IAS 2*), the IASB identified LIFO, along with FIFO, average cost, and something called the base stock method (an extreme form of LIFO), as allowable inventory valuation methods. In 1989, the IASB proposed eliminating the base stock method, and in 1991, it tentatively decided to eliminate both the base stock method and LIFO. In 1992, the IASB decided to officially endorse FIFO and average cost, to kill the base stock method, and to let LIFO live on as a second-class "allowed alternative treatment." Finally, in December

2003 the IASB adopted a revised version of *IAS 2* and did away with LIFO once and for all.

## Inventory Accounting Changes

When a company changes its method of valuing inventory, the change is accounted for as a change in accounting principle. If the change is to average cost or FIFO, both the beginning and ending inventories can usually be computed on the new basis. Thus, the effect of changing inventory methods can be determined and reported in the financial statements, as explained in Chapter 20. If the change is to LIFO from another method, however, a company's records are generally not complete enough to reconstruct the prior years' inventory layers. Therefore, the base-year layer for the new LIFO inventory is the opening inventory for the year in which LIFO is adopted (also the ending inventory for the year before LIFO is adopted). There is no adjustment to the financial statements to reflect the change to LIFO. However, the impact of the change on income for the current year must be disclosed in a note to the statements. In addition, the note should explain why there is no effect on the financial statements. Required disclosures for a change to LIFO are illustrated in Exhibit 9-16 in a description from the 2001 10-K filing of **Duane Reade**, the largest drugstore chain in New York City. Note the company's forthright description of the income tax benefits of using LIFO when inventory costs are rising.

When inventories are a material item, a change in the inventory method by a company may impair comparability of that company's financial statements with prior years' statements and with the financial statements of other entities. Such changes require careful

### EXHIBIT 9-16

### Duane Reade: Disclosure of Change to LIFO Method

#### Accounting Change

During the first quarter of 2002, we plan to adopt a change in accounting method to convert from our current retail dollar based first-in, first-out ("FIFO") method of inventory valuation to an item specific cost based last-in, first-out ("LIFO") method of inventory valuation. This change is expected to result in a separate one-time non-cash after tax charge of approximately \$9.0 million to be recorded in the first quarter. In addition, expected 2002 inflation in inventory acquisition costs will likely result in increased charges to cost of goods to be sold during 2002. We estimate that a 1.0% inflation in the annual inventory acquisition costs in 2002 would approximate a \$1.2 million reduction in fiscal 2002 net earnings. Adoption of the specific cost LIFO method will result in the recognition of the latest item costs in our reported gross margins, and will make our results more comparable to other major retailers in our industry. In an inflationary period, the LIFO method also has the added favorable impact of increasing cash flow through reduced income taxes.

consideration and should be made only when management can clearly demonstrate the preferability of the alternative method. This position is emphasized in *APB Opinion No. 20*: “The burden of justifying other changes rests with the entity proposing the change.”<sup>12</sup>

## Inventory Valuation at Other than Cost

**8** Apply the lower-of-cost-or-market (LCM) rule to reflect declines in the market value of inventory.

**WHY** The lower-of-cost-or-market (LCM) rule reflects the conservative tradition underlying accounting. Conservatism in this context means that we quickly write down inventory when it has declined in value, but we do not recognize inventory holding gains when inventory increases in value.

**HOW** To use the lower-of-cost-or-market rule, the historical cost of the ending inventory is compared with the inventory’s market value. In this context, “market value” is defined as the inventory’s replacement cost, constrained by a ceiling and a floor. If market value is less than historical cost, ending inventory is written down to the market value.

The basic procedures for allocating total cost of goods available for sale between ending inventory and cost of goods sold were explained in the previous sections. In some cases, these cost allocation procedures result in inventory cost that exceeds the current market value of the inventory. The following section discusses how to determine when inventory should be “written down” to reflect a decline in its market value. The section concludes with a discussion of inventory valuation when inventory is acquired in a nonmarket transaction (e.g., the return of defective merchandise) and a value must be assigned.

### Lower of Cost or Market

One of the traditional concepts of accounting is conservatism, sometimes summarized as “when in doubt, recognize all unrealized losses, but don’t recognize any unrealized gains.” When applied to asset valuation, conservatism results in the rule of **lower of cost or market (LCM)**, meaning that assets are recorded at the lower of their cost or their market value.<sup>13</sup> LCM has the effect of recognizing unrealized decreases in the value of assets but not unrealized increases.<sup>14</sup>

In applying the lower-of-cost-or-market rule, the cost of the ending inventory, as determined under an appropriate cost allocation method, is compared with market value at the end of the period. If market is less than cost, an adjusting entry is made to record the loss and restate ending inventory at the lower value.<sup>15</sup>

**What Is “Market”?** The term **market** in “lower of cost or market” is interpreted as meaning **replacement cost**, with potential adjustments for a ceiling and a floor value. Replacement cost, sometimes referred to as **entry cost**, includes the purchase price of the product or raw materials plus all other costs incurred in the acquisition or manufacture of goods. Replacement cost is frequently a good measure of the amount of future economic benefit embodied in inventory because declines in acquisition costs (entry cost) usually indicate a decline in selling prices (**exit value**). However, selling prices do not always respond immediately and in proportion to changes in replacement costs.

<sup>12</sup> *Opinions of the Accounting Principles Board No. 20*, “Accounting Changes” (New York: American Institute of Certified Public Accountants, 1971), par. 16. The same sentiment is expressed in *SFAS No. 154*, par. 13.

<sup>13</sup> Historically, investment securities, inventory, and property, plant, and equipment have all been recorded at the lower of cost or market. With the adoption of *FASB Statement No. 115* in 1993, most investment securities are now recorded at their current market value whether that amount is lower or higher than cost.

<sup>14</sup> For a time, the FASB required firms to make supplemental disclosure of the replacement cost of inventory. This requirement (*FASB Statement No. 33*) was a response to the high inflation of the late 1970s that frequently caused reported historical inventory cost to be much lower than current replacement cost. When inflation abated, interest in this supplemental disclosure waned and *Statement No. 33* was repealed.

<sup>15</sup> No adjustment to LIFO cost is permitted for tax purposes. Application of LCM to LIFO inventories for financial reporting purposes does not violate the “LIFO conformity” rule if IRS approval is obtained.

Accordingly, the following ceiling and floor constraints are placed on the use of replacement cost as the measure of the market value of inventory:<sup>16</sup>

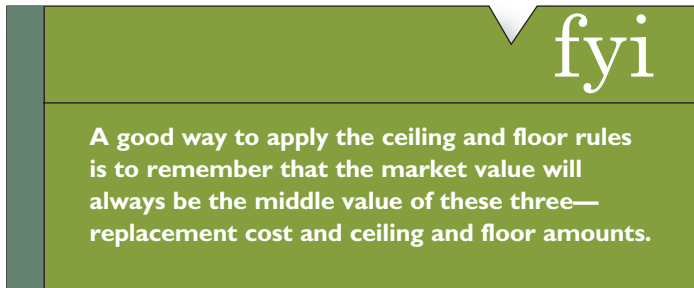

- **Ceiling.** The market value of inventory is not greater than the net realizable value of the inventory. Net realizable value (NRV) is equal to the estimated selling price of the inventory minus any normal selling costs. The reasoning behind this ceiling is that the market value of inventory could never reasonably be considered to be more than the net amount that can be received upon sale of the inventory.
- **Floor.** The market value of the inventory is not less than net realizable value minus a normal profit margin. If inventory is recorded below this floor amount, then the inventory can be sold in the future netting a return that is more than the normal profit margin.

In summary, market value of inventory is never less than the floor value, is never more than the ceiling value, and is equal to replacement cost when replacement cost is between the floor and the ceiling. These relationships are summarized in Exhibit 9-17.

**Applying the Lower-of-Cost-or-Market Method** Application of the LCM rule to determine the appropriate inventory valuation may be summarized in the following steps:

1. Define pertinent values: historical cost, floor (NRV-normal profit), replacement cost, ceiling (NRV).
2. Determine “market” (replacement cost as constrained by ceiling and floor limits).
3. Compare cost with market (as defined in step 2 above), and select the lower amount.

To illustrate these steps, assume that Fezzig Company sells six products identified with the letters A through F. For each product, the selling price per unit is \$1.00, selling expenses are \$0.20 per unit, and the normal profit is 25% of sales, or \$0.25 per unit. The historical cost and the current replacement cost are different for each product. The

#### EXHIBIT 9-17

#### Market Value Equals Replacement Cost, Constrained by the Ceiling and the Floor

<sup>16</sup> *Accounting Research and Terminology Bulletins—Final Edition, No. 43*, “Restatement and Revision of Accounting Research Bulletins” (New York: American Institute of Certified Public Accountants, 1961), Ch. 4, Statement 6.

lower-of-cost-or-market valuation for each product is shown below with the appropriate “market” value highlighted.

Item	Historical Cost	Floor	Replacement Cost	Ceiling	Market	Lower of Cost or Market
A	\$0.65	\$0.55	\$0.70	\$0.80	\$0.70	\$0.65
B	0.65	0.55	0.60	0.80	0.60	0.60
C	0.65	0.55	0.50	0.80	0.55	0.55
D	0.50	0.55	0.45	0.80	0.55	0.50
E	0.75	0.55	0.85	0.80	0.80	0.75
F	0.90	0.55	1.00	0.80	0.80	0.80

- A: Market is equal to replacement cost; historical cost is less than market.
- B: Market is equal to replacement cost; market is less than historical cost.
- C: Market is equal to the floor; market is less than historical cost.
- D: Market is equal to the floor; replacement and historical costs are less than market.
- E: Market is equal to the ceiling; historical cost is less than market.
- F: Market is equal to the ceiling; market is less than historical and replacement costs.

For products A and B, the replacement cost is between the floor and the ceiling, so the market value is the replacement cost. For products C and D, replacement cost is below the floor, so the market value is the floor value. For products E and F, replacement cost is greater than the ceiling, so the market value is the ceiling value.

## caution

Don't get carried away—remember that an actual adjusting entry is made only if market value is less than historical cost. For products A, D, and E, no LCM adjustment is needed.

To see the wisdom in using the floor and ceiling values in calculating market value, consider products C and F. Without the floor, the market value for product C would be \$0.50 and the inventory would be written down from the cost of \$0.65 to the market value of \$0.50. But this \$0.50 value is too low because it would result in extra profits being recorded next period when the inventory is sold. For example, selling price of \$1.00 minus selling costs of \$0.20

minus recorded inventory amount of \$0.50 leaves a reported profit of \$0.30 per unit, whereas the normal profit is just \$0.25 per unit. Without the floor, product C would be written down too much this period, resulting in unusually high profits next period.

For product F, without the ceiling value the market value would be the \$1.00 replacement cost. Because this exceeds the cost of \$0.90, the inventory would continue to be recorded at cost. However, the ceiling amount suggests that the maximum that can be expected to be realized upon sale of units of product F is the net realizable value of \$0.80. In this case, the ceiling amount ensures that the inventory cost is written down so that reported inventory does not exceed the amount expected to be realized upon sale of the inventory.

The lower-of-cost-or-market method may be applied to each inventory item, to the major classes or categories of inventory items, or to the inventory as a whole. Application of LCM to the individual inventory items will result in the lower inventory value because increases in the market value of some inventory items are not allowed to offset decreases in the value of other items.<sup>17</sup>

<sup>17</sup> The IRS requires application of the LCM rule to individual products. To reduce the burden of keeping two sets of inventory records, companies frequently use this same method for financial reporting purposes. Many disputes have arisen between taxpayers and the IRS through the years as to what constitutes a recognizable decline in inventory value. An important tax case in this area was settled by the U.S. Supreme Court in 1979. The taxpayer, **Thor Power Tool Co.**, had followed the practice of writing down the value of spare parts inventories that were being held to cover future warranty requirements. Although the sales prices did not decline, the probability of the parts being sold, and thus their net realizable value, decreased as time passed. The write-down to reflect the current decline in value is consistent with the accounting principle of recognizing declines in value as they occur. The Supreme Court, however, ruled that for tax purposes the reduction must await the actual decline in the sales price for the parts in question.

To illustrate the difference in valuation applications, assume that Fezzig Company's inventory includes 1,000 units each of products A through F. The table below illustrates how the lower-of-cost-or-market valuation of Fezzig's inventory would differ, depending on whether the LCM rule is applied individually to each product or to the inventory as a whole.

If the individual product method is used, the lower-of-cost-or-market rule is applied separately to products A through F, resulting in a total LCM inventory valuation of \$3,850. If the LCM rule is applied to the inventory as a whole, the aggregate market value of \$4,000 is compared to the aggregate cost of \$4,100, and the inventory is recorded at \$4,000.

Product	Number of Units	Total Cost	Total Market	Total LCM
A	1,000	\$ 650	\$ 700	\$ 650
B	1,000	650	600	600
C	1,000	650	550	550
D	1,000	500	550	500
E	1,000	750	800	750
F	1,000	900	800	800
	<u>6,000</u>	<u>\$4,100</u>	<u>\$4,000</u>	<u>\$3,850</u>

The journal entry to record the write-down of the inventory on an individual item basis is usually made as follows:

Loss from Decline in Value of Inventory	250	
Inventory		250
(\$4,100 – \$3,850)		

The loss on the decline in market value may be shown as a separate item on the income statement, or included as part of cost of goods sold. Separate reporting of the loss has the advantage of providing readers with increased information to forecast operations and cash flows. As an example, **Cisco Systems** recognized an inventory write-down of \$2.77 billion in 2001 “due to a sudden and significant decrease in demand for the Company's products.”<sup>18</sup>

Once an individual item is reduced to a lower market price, the new market price is considered to be the item's cost for future inventory valuations; cost reductions once made are not restored. Thus, inventory records must be adjusted to reflect the new values.

Rather than reducing the inventory directly, the inventory account can be maintained at cost, and an allowance for inventory decline can be used to record the decline in value. This method would generally be used when inventory is valued on a category or entire inventory basis. The entry to record the write-down on an entire inventory basis and using an allowance account would be as follows:

Loss from Decline in Value of Inventory	100	
Allowance for Decline in Value of Inventory		100
(\$4,100 – \$4,000)		

The allowance account would be reported as an offset to the inventory account on the balance sheet. The question then arises of what to do with this allowance in subsequent years. Assume that in the subsequent year, Fezzig Company sells its entire existing inventory of products A through F. The allowance is no longer needed because the inventory to which the allowance applied has been sold. The adjusting entry necessary in the subsequent year is as follows:

Allowance for Decline in Value of Inventory	100	
Cost of Goods Sold		100

The credit is entered appropriately to Cost of Goods Sold, rather than to a gain, for the following reasons:

- The recorded cost of the old inventory sold during the year, \$4,100, is an overstatement of the carrying amount of the inventory. The net carrying amount is only \$4,000 (\$4,100

<sup>18</sup> According to *Emerging Issues Task Force (EITF) 96-9*, “Classification of Inventory Markdowns and Other Costs Associated with a Restructuring,” inventory write-downs such as that made by Cisco should be classified as an increase in cost of goods sold.

cost – \$100 allowance), and Cost of Goods Sold has been overstated by the amount of the allowance.

## caution

No gains are recorded on inventory market value recoveries.

- Recording a gain gives the misleading impression that recoveries of inventory market values are recognized as gains. On the contrary, once a particular inventory item or group of items is written down, no subsequent market value increases for those items are recognized.

The inventory at the end of the subsequent year is then evaluated to determine whether the establishment of a new Allowance for Decline in Value of Inventory is needed.<sup>19</sup>

### Assigned Inventory Value: The Case of Returned Inventory

In some cases, the ceiling and floor values discussed provide guidance in assigning an appropriate inventory value when inventory cost is difficult to determine. As an illustration, consider the following data on defective inventory returned to Inigo Company by angry customers.

- Number of defective units returned: 1,000
- Selling price of normal units: \$5
- Cost of normal units: \$3
- Normal gross profit percentage:  $(\$5 - \$3)/\$5 = 40\%$
- Scrap selling price of units returned as defective: \$2
- For simplicity, assume that there are no extra expenses associated with the scrap sale of units that have been returned as defective.

In this case, it is clearly wrong to record the defective inventory units at their historical cost of \$3 per unit because they can be sold for only \$2 per unit. No replacement cost number can be used to determine the appropriate lower-of-cost-or-market write-down because no supplier will quote a price on entire batches of defective units. Thus, the appropriate inventory valuation is somewhere between the ceiling and the floor:

Ceiling: \$2 selling price – \$0 selling costs = \$2 net realizable value  
 Floor: \$2 net realizable value – \$0.80 normal gross profit ( $\$2 \times 40\%$ ) = \$1.20

If the inventory is written down to the ceiling value of \$2, the loss on the write-down is \$1,000 [ $(\$3 - \$2) \times 1,000$  units]. If the inventory is written down to the floor value, the write-down loss is \$1,800 [ $(\$3 - \$1.20) \times 1,000$  units]. The write-down loss, and profit on subsequent scrap sale of defective units, is summarized as follows:

	Write-Down to Ceiling	Write-Down to Floor
Loss on write-down .....	\$(1,000)	\$(1,800)
Scrap sales of defective units .....	\$2,000	\$2,000
Cost of goods sold .....	<u>2,000</u>	<u>1,200</u>
Gross profit on scrap sales .....	0	800
Total loss on defective units .....	<u><u>\$(1,000)</u></u>	<u><u>\$(1,000)</u></u>

In the absence of a reliable replacement cost number, should the returned inventory be recorded at the ceiling value, the floor value, or somewhere in between? Or does

<sup>19</sup> The two adjusting entries eliminating the allowance from the previous year and creating a new allowance can be combined into one entry that merely changes the net balance in the allowance account. However, making the two entries separately greatly clarifies the reasoning underlying the entries.

fyi

These same issues arise when assigning values to used items given in trade for new items. For example, how does a car dealer value the used car inventory accepted in trade for new cars?

it make any difference? You might contend that it makes no difference because the total loss on defective units is \$1,000 in all cases. However, if you are the manager in charge of scrap sales and your annual bonus is based on the profit generated by your department, which inventory valuation number would you prefer? You would prefer the floor value because this lowers your cost of goods sold and allows your department to show a profit.

The general point of the illustration is this:

When there is some leeway in the assigning of inventory values, the assigned value can be very important in determining how profits and losses associated with the inventory are allocated among different reporting units within the business.

In summary, the absence of a reliable measure of entry values (historical cost or replacement cost) means that an inventory value must be assigned based on exit values (net realizable value and normal selling profit). The decision of what inventory value to choose within the floor-to-ceiling interval can be an interesting exercise in intracompany bargaining as managers try to set the inventory values to maximize the reported profits in their departments and push losses off to other departments. This is the same issue that arises in the context of transfer pricing (assigning inventory values to goods “sold” from one division of a company to another) and is discussed at length in courses on cost accounting.<sup>20</sup>

## Accounting for Declines in Inventory Values: IAS 2

The inventory write-down rule under *IAS 2* can best be labeled “lower of cost or net realizable value.” This net realizable value is the same as described earlier: estimated selling price of the inventory minus any normal selling costs. Under *IAS 2*, if the selling price of inventory has declined enough (or if the normal selling costs have increased enough) that the cost of the inventory cannot be recovered, then the inventory is written down to the net realizable value. This approach is much easier to apply than the U.S. GAAP “lower-of-cost-or-market” rule—there is no ceiling, no floor, and no replacement cost. Instead, the *IAS 2* rule involves a simple comparison between cost and net realizable value. The write-down journal entry is the same as illustrated earlier.

One additional difference in the provisions of *IAS 2* is that if the depressed selling price of written-down inventory subsequently recovers, the inventory write-down loss is reversed. This reversal would probably be reported as a decrease in cost of goods sold resulting in an increase in gross profit.

## Gross Profit Method

**9** Use the gross profit method to estimate ending inventory.

**WHY** The gross profit method allows ending inventory and cost of goods sold to be approximated without performing an actual physical count.

**HOW** Using historical information, a gross profit percentage is estimated and applied to the current period’s sales figure to obtain an estimate of cost of goods sold. This estimated cost of goods sold is subtracted from cost of goods available for sale to compute an estimate of ending inventory.

<sup>20</sup> As illustrated, assigned inventory values can determine where within a company profits and losses are reported. Imagine how important this issue is in the context of tax reporting for multinational companies. Assigned inventory values determine whether a taxable profit is reported (and taxed) in a foreign subsidiary or in the U.S. parent company.

Inventory estimation techniques are used to generate inventory values when a physical inventory count is not practical and to provide an independent check of the validity of the inventory figures generated by the accounting system. The simplest inventory estimation technique is the gross profit method. The **gross profit method** is based on the observation that the relationship between sales and cost of goods sold is usually fairly stable. The **gross profit percentage** [(Sales – Cost of goods sold)/Sales] is applied to sales to estimate cost of goods sold. This cost of goods sold estimate is subtracted from the cost of goods available for sale to arrive at an estimated inventory balance.

To be useful, the gross profit percentage used must be a reliable measure of current experience. In developing a reliable rate, reference is made to past rates, and these are adjusted for changes in current circumstances. For example, the historical gross profit percentage would be adjusted if the pricing strategy has changed (e.g., because of increased competition), if the sales mix has changed, or if a different inventory valuation method has been adopted (e.g., a switch from FIFO to LIFO).

To illustrate the application of the gross profit method, consider the following information for Rugen Company.

Beginning inventory, January 1 .....	\$25,000
Sales, January 1–January 31 .....	50,000
Purchases, January 1–January 31 .....	40,000
Historical gross profit percentages:	
Last year .....	40%
Two years ago .....	37%
Three years ago .....	42%

Rugen wishes to prepare financial statements as of January 31 and wants to use an estimate of ending inventory rather than performing a physical inventory count. Last year’s gross profit percentage of 40% is considered to be a good estimate of the current gross profit percentage.

The inventory estimate is a 2-step process: An assumed gross profit percentage is used to determine estimated gross profit, which then allows computation of estimated cost of goods sold. That number is then used to estimate ending inventory.

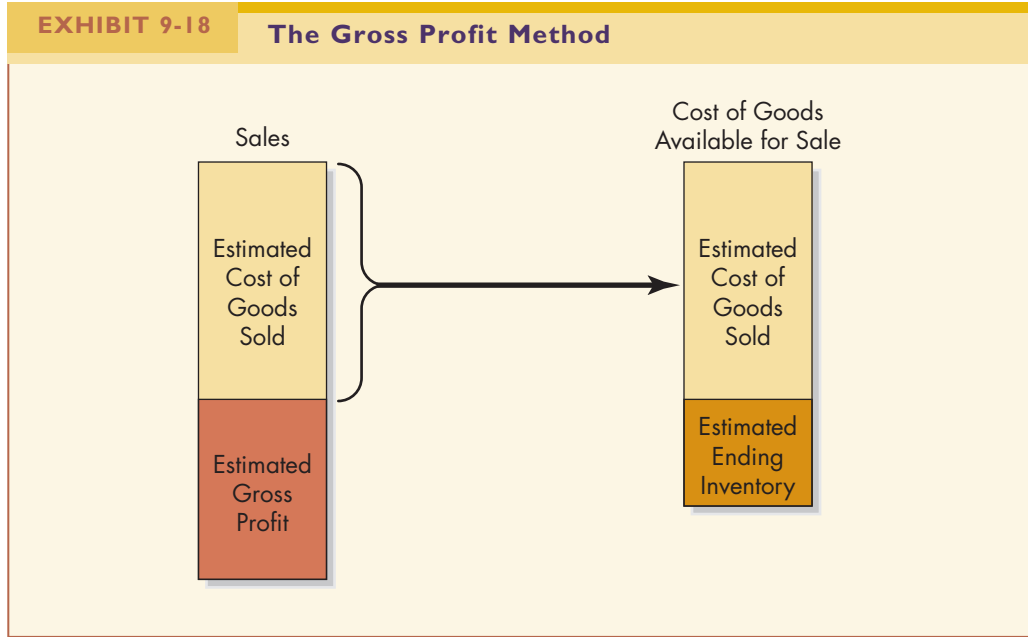

Sales (actual) .....	\$50,000	100%
Cost of goods sold (estimate) .....	30,000	60%
Gross profit (estimate) .....	<u>\$20,000</u>	<u>40%</u>
Beginning inventory (actual) .....		\$25,000
+ Purchases (actual) .....		40,000
= Cost of goods available for sale (actual) .....		\$65,000
– Ending inventory (estimate) .....		<u>35,000</u>
= Cost of goods sold (estimate) .....		<u>\$30,000</u>

This ending inventory estimate can now be used in the January 31 financial statements or can be compared to perpetual inventory records if they exist, or can be used as the basis of an insurance reimbursement if the inventory on January 31 is destroyed in an accident. This 2-step process is illustrated in Exhibit 9-18.

Assume that Rugen does a physical inventory count indicating that January 31 inventory is \$32,000, compared to the \$35,000 estimate computed above. Is this a reasonable difference, or is there reason for further investigation? One way to make this determination is to see what range of ending inventory estimates is possible given the differences observed in historical gross profit percentages. These calculations are given on the following page.

The range of estimates for January 31 inventory is from \$33,500 to \$36,000. The \$32,000 value derived from the physical count is outside this range. Possible explanations are:

- This year’s gross profit percentage is outside the historically observed range, suggesting that there has been a significant change in pricing strategy or product mix.
- Inventory shrinkage has occurred.
- Sales have been underreported. The IRS sometimes uses the gross profit method to detect underreporting of sales to avoid income taxes.

**Gross Profit Percentage**

	<u>40%</u>	<u>37%</u>	<u>42%</u>
Sales (actual) .....	\$50,000	\$50,000	\$50,000
Cost of goods sold (estimate) .....	30,000	31,500	29,000
Gross profit (estimate) .....	<u>\$20,000</u>	<u>\$18,500</u>	<u>\$21,000</u>
Beginning inventory (actual) .....	\$25,000	\$25,000	\$25,000
+ Purchases (actual) .....	40,000	40,000	40,000
= Cost of goods available for sale (actual) .....	<u>\$65,000</u>	<u>\$65,000</u>	<u>\$65,000</u>
- Ending inventory (estimate) .....	35,000	33,500	36,000
+ Cost of goods sold (estimate) .....	<u>\$30,000</u>	<u>\$31,500</u>	<u>\$29,000</u>

## stop & think

Assume that the actual amount of inventory is much lower than the estimated amount. Which ONE of the following is NOT a possible explanation?

- a) The estimation process is flawed.
- b) The actual amount of purchases was greater than the reported amount of purchases.
- c) The missing inventory was lost or stolen.
- d) The missing inventory was sold, but the sales were not reported.

Sometimes the hardest part of applying the gross profit method is deciphering language about the relationship between sales and cost of goods sold. In the example just completed, the sales/cost of goods sold relationship was summarized by saying that the gross profit percentage is 40%. The same relationship could be described in at least two other ways:

1. Sales are made at a markup of 40% of the selling price.
2. Sales are made at a markup of 66<sup>2</sup>/<sub>3</sub>% of cost. (Gross profit/Cost = 66<sup>2</sup>/<sub>3</sub>%)

Be careful.

Like the gross profit method, the retail inventory method can be used to generate a reliable estimate of inventory position whenever desired. This method, like the

gross profit method, permits the estimation of an inventory amount without the time and expense of taking a physical inventory or maintaining detailed perpetual inventory records. The retail inventory method is more flexible than the gross profit method in that it allows estimates to be based on FIFO, LIFO, or average cost assumptions, and it even permits estimation of lower-of-cost-or-market values. The retail inventory method is covered in detail in the Expanded Material associated with this chapter.

## Effects of Errors in Recording Inventory

**10** Determine the financial statement impact of inventory recording errors.

**WHY** Inventory errors are more than a financial statement nuisance. Because an overstatement of ending inventory artificially boosts profits in the current period, many companies have used intentional inventory “errors” to meet profit targets or to hide poor operating performance.

**HOW** Because the ending inventory of one period becomes the beginning inventory of the next period, undetected inventory errors affect two consecutive accounting periods. For example, an overstatement of ending inventory reduces cost of goods sold in the current period and increases cost of goods sold in the following period.

Failure to correctly report inventory results in misstatements on both the balance sheet and the income statement. The effect on the income statement is sometimes difficult to evaluate because of the different amounts that can be affected by an error. Analysis of the impact is aided by recalling the simple computation:

$$\begin{aligned} &\text{Beginning inventory} \\ &+ \text{Purchases} \\ &= \text{Goods available for sale} \\ &- \text{Ending inventory} \\ &= \text{Cost of goods sold} \end{aligned}$$

fyi

Because inventory errors reverse themselves in the following year, persons using inventory fraud to overstate income must create larger and larger amounts of fictitious inventory in succeeding years to maintain the bogus income growth. This escalation is often what causes the fraud to be detected.

For example, an overstatement of the beginning inventory will result in an overstatement of goods available for sale and cost of goods sold. Because the cost of goods sold is deducted from sales to determine the gross profit, the overstated cost of goods sold results in an understated gross profit and finally an understated net income.

Sometimes an error may affect two of the amounts in such a way that they offset each other. For example, if a purchase in transit is neither recorded as a purchase nor included in the ending inventory, the understatement of purchases results in an

understatement of goods available for sale; however, the understatement of ending inventory subtracted from goods available for sale offsets the error and creates a correct cost of goods sold, gross profit, and net income. Inventory and accounts payable, however, will be understated on the balance sheet.<sup>21</sup>

Because the ending inventory of one period becomes the beginning inventory of the next period, undetected inventory errors affect two accounting periods. If left undetected, the errors will offset each other under a FIFO or average method. Errors in LIFO layers, however, may perpetuate themselves until the layers are eliminated.

It is unwise to try to memorize the impact a particular type of inventory error has on the financial statements. It is preferable to analyze each situation. Analysis of the following three typical inventory errors provides further practice.

1. Overstatement of ending inventory through an improper physical count
2. Understatement of ending inventory through an improper physical count
3. Understatement of ending inventory through delay in recording a purchase until the following year.

<sup>21</sup> This analysis is strictly true only if the FIFO inventory valuation method is used. With both LIFO and average cost, end-of-period purchases impact the calculation of cost of goods sold.

## stop & think

Why might a manager risk his or her reputation by fraudulently overstating inventory in light of the fact that the resulting income increase is completely counterbalanced in the following year?

- The manager is confident that operating profits next year will be strong enough to cover the impact of the counterbalancing inventory error.
- The manager knows that not all inventory errors are counterbalancing.
- The manager knows that inventory errors do not have any impact on reported operating profit.

The impact of the three errors on the income statement and the balance sheet in the year of the error and the following year is summarized in Exhibit 9-19.

Error 1, overstatement of ending inventory, sometimes results when a company fraudulently manipulates its inventory count. As seen in Exhibit 9-19, this ending inventory overstatement reduces cost of goods sold and increases net income in the year of the error. A counterbalancing reduction in net income occurs in the following year because beginning inventory is overstated.

Error 2, understatement of ending inventory, is the opposite of Error 1 and results in a reduction in net income in the error year. As with Error 1, a counterbalancing error occurs in the following year.

Error 3, delay recording purchase or understatement of ending inventory and purchases, commonly occurs when a company fails to consider end-of-period goods in transit

as part of purchases and inventory. As seen in Exhibit 9-19, this error has no impact on net income but does cause inventory and payables to be understated in the year of the error.

The correcting entry for each of these errors depends on when the error is discovered. If it is discovered in the current year, adjustments can be made to current accounts and the reported net income and balance sheet amounts will be correct. If the error is not discovered until the subsequent period, the correcting entry qualifies as a prior-period adjustment if the net income of the prior period was misstated. The error to a

**EXHIBIT 9-19** Analysis of Inventory Errors

	#1 Overstatement of Ending Inventory		#2 Understatement of Ending Inventory		#3 Delay Recording Purchase	
	Error Year	Next Year	Error Year	Next Year	Error Year	Next Year

prior year’s income is corrected through Retained Earnings. To illustrate these entries, assume that an incorrect physical count has resulted in an overstatement of ending inventory by \$1,000 (Error 1). The correcting entry required, depending on when the error is discovered, would be as follows:

<i>Error discovered in current year:</i>		
Cost of Goods Sold .....	1,000	
Inventory .....		1,000
<i>Error discovered in subsequent year:</i>		
Retained Earnings .....	1,000	
Inventory .....		1,000

## Using Inventory Information for Financial Analysis

**11** Analyze inventory using financial ratios, and properly compare ratios of different firms after adjusting for differences in inventory valuation methods.

**WHY** Care must be used in interpreting the results of inventory-related ratio analysis because the use of different inventory methods can make comparisons difficult.

**HOW** The inventory turnover ratio and the number of days’ sales in inventory reflect the size of the inventory relative to the amount of inventory being sold. Interpretation of these ratios yields insight into the appropriateness of a company’s inventory management practices.

The inventory balances contained in the financial statements are often used to measure how efficiently the company is utilizing its inventory. The amount of inventory carried frequently relates closely to sales volume. The inventory position and the appropriateness of its size may be evaluated by computing the **inventory turnover**. The inventory turnover is measured by dividing cost of goods sold by average inventory [(beginning balance + ending balance) ÷ 2].

Consider the financial information relating to inventories for **Deere & Co.** provided below.

Deere & Co. Major Classes of Inventories (Dollars in millions)		
	2007	2006
Raw materials and supplies .....	\$ 882	\$ 712
Work-in-process .....	425	372
Finished machines and parts .....	2,263	2,013
Total FIFO value .....	\$ 3,570	\$3,097
Adjustment to LIFO value .....	1,233	1,140
Inventories .....	\$ 2,337	\$1,957
Cost of sales .....	\$16,252.8	—

The inventory turnover rate for Deere & Co. would be computed as follows:

$$\frac{\text{Cost of goods sold}}{\text{Average inventory}^*} = \frac{\$16,252.8}{\$2,147} = 7.57 \text{ times}$$

Calculation:

\* 2007: (\$2,337 + \$1,957)/2 = \$2,147

Inventory turnover of 7.57 times means that if Deere & Co. were to completely use up all of its inventory, and then instantaneously replace it, this process would be repeated 7.57 times during the year. The higher the inventory turnover number, the faster a company is using its inventory.

Using total inventory, this example has been simplified. If separate turnovers were computed for raw materials, work in process, and finished goods, the appropriate numerators for each computation would be raw materials used in production, cost of

goods manufactured, and cost of goods sold, respectively. Note that total sales is never appropriate to use in inventory turnover calculations because sales numbers are stated in terms of selling prices, whereas inventory is stated in terms of acquisition or production cost. For example, in a retail setting, sales is a retail number and inventory is a wholesale number. Mixing them in the same calculation seriously impairs the interpretation of the inventory turnover ratio.<sup>22</sup>

Deere & Co. uses LIFO. From the disclosure about Deere's LIFO reserve, FIFO values for inventory and cost of goods sold can be calculated. If Deere & Co. had used FIFO instead of LIFO, inventory turnover for 2007 would have been 4.85 (instead of 7.57 under LIFO), computed as follows:

$$\frac{\text{FIFO cost of goods sold}^*}{\text{FIFO average inventory}^\dagger} = \frac{\$16,159.8}{\$3,333.5} = 4.85 \text{ times}$$

Calculations:

\*  $\$16,252.8 + (\$1,140 - \$1,233) = \$16,159.8$

†  $(\$3,570 + \$3,097)/2 = \$3,333.5$

This calculation illustrates that the ratios of two companies that are essentially the same will differ if one uses LIFO and the other uses FIFO. In any serious comparative ratio analysis, one must first make the necessary adjustments for differences in accounting methods to ensure that the accounting numbers are comparable.

Average inventories are sometimes expressed as number of days' sales in inventories. Information is thus provided concerning the average time it takes to turn over the inventory. The number of days' sales in inventory is calculated by dividing average inventory by average daily cost of goods sold. The **number of days' sales in inventory** also can be obtained by dividing the number of days in the year by the inventory turnover rate. The latter procedure for Deere & Co. is illustrated below, using the originally reported LIFO numbers:

Inventory turnover for the year .....	7.57 times
Number of days' sales in inventory (365/inventory turnover) or [average inventory/(cost of goods sold/365)] .....	48.2 days

Number of days' sales in inventory of 48.2 days means that, on average, Deere & Co. has enough inventory to continue operations for 48.2 days using just its existing inventory.

With an increased inventory turnover, the investment necessary for a given volume of business is smaller, and consequently, the return on invested capital is higher. This assumes a company can acquire goods in smaller quantities (with more frequent orders) without paying a higher price. If merchandise must be bought in very large quantities to get favorable prices, then the savings on quantity purchases must be weighed against the savings of carrying lower inventory. Inventory investments and turnover rates vary among industries, and each business must be judged in terms of its financial structure and operations. Management must establish an inventory policy that avoids the extremes of a dangerously low stock, which may impair sales, and an overstocking of goods, which involves a heavy capital investment along with risks of spoilage, obsolescence, and price declines.

Exhibit 9-20 contains a listing of the number of days' sales in inventory of several large companies for 2007. As you can see, the numbers vary widely both across and within industries.

<sup>22</sup> In spite of the incomparability of sales and inventory, in practice many inventory turnover calculations are done using sales. Obviously, not everyone in the financial community has studied this textbook yet.

## caution

Anyone can compute and compare a bunch of financial ratios. What sets you apart from someone without an accounting background is that you can clean up the accounting numbers, making adjustments for accounting method differences, before you compute the ratios.

EXHIBIT 9-20

## Number of Days' Sales in Inventory for Selected Companies, 2007

Company	Number of Days' Sales in Inventory
IBM	17.51
Dell	6.79
General Motors	31.68
Ford Motor Company	25.78
Nike, Inc.	83.60
K Swiss	101.28
Wal-Mart Stores, Inc.	43.86
Target	56.78

### Required Disclosures Related to Inventories

The balance sheet typically contains a single amount for a firm's inventory. For a manufacturing firm, the breakdown of inventory into raw materials, work in process, and finished goods is detailed in the financial statement notes. Merchandising firms also sometimes provide note disclosure of the quantities of major classes of inventory. The basis of valuation (such as cost or lower of cost or market), together with the inventory valuation method (LIFO, FIFO, average, or other method), must be disclosed either in a parenthetical note in the balance sheet or in the accompanying notes. A special note is included when a firm changes its valuation method. This note describes the change, the reason for the change, and the quantitative effect of the change on the financial statements.

The amount of write-downs of inventory to lower of cost or market is also disclosed in the notes. As mentioned earlier, the amount of the write-down should be included in cost of goods sold. If significant inventory price declines take place between the balance sheet date and the date the financial statements are issued, no adjustment of the financial statements is needed, but the declines should be disclosed as a subsequent event.

When inventories have been pledged as security on loans from banks, finance companies, or factors, the amounts pledged should be disclosed either parenthetically in the Inventory section of the balance sheet or in the notes.

#### EXPANDED MATERIAL

## Retail Inventory Method

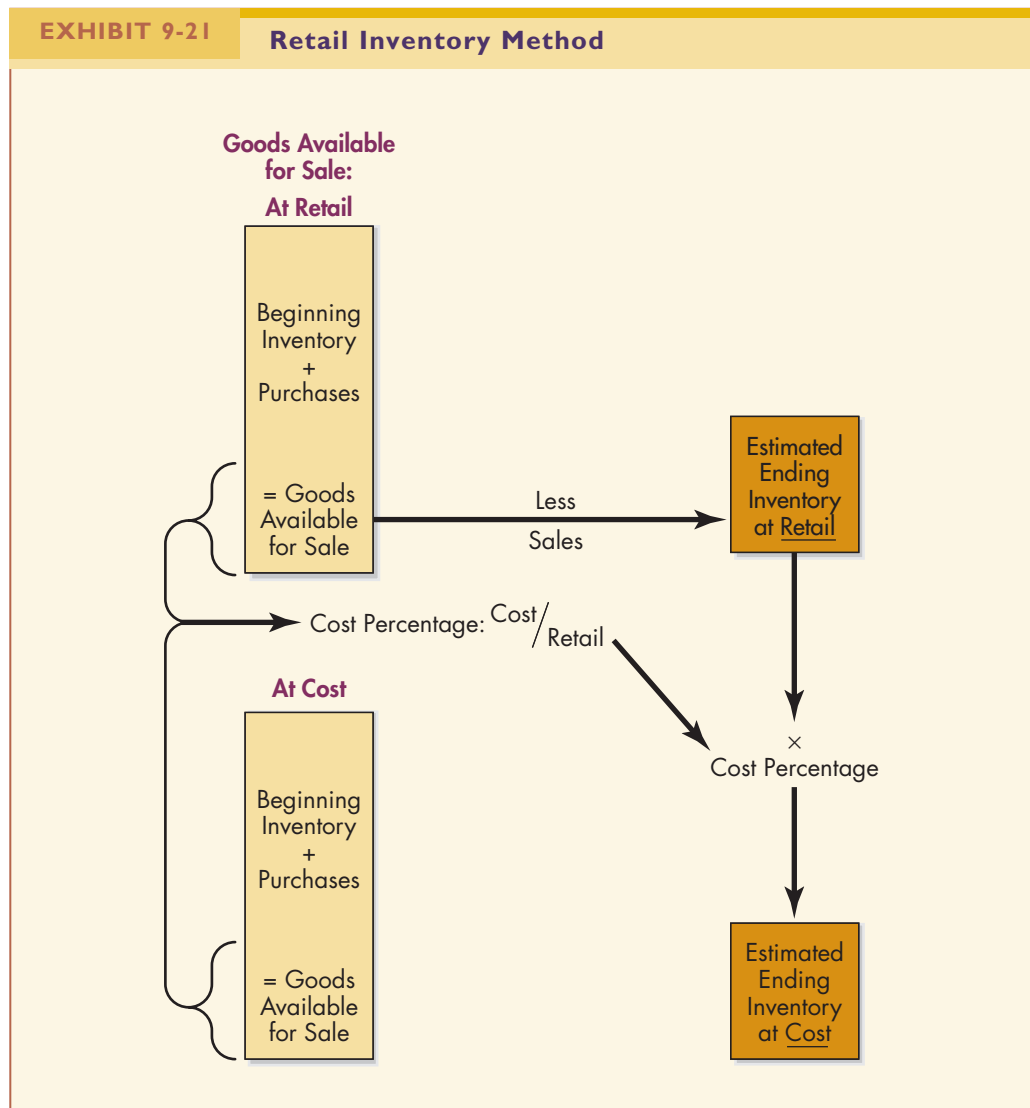

**12** Compute estimates of FIFO, LIFO, average cost, and lower-of-cost-or-market inventory using the retail inventory method.

**WHY** The retail inventory method is a flexible inventory estimation technique. The gross profit method is simple and intuitive, but it fails to allow for differences in inventory valuation method. The retail inventory method is a more elaborate version of the gross profit method, which can be used to estimate inventory under any of the standard valuation assumptions.

**HOW** Depending on the inventory valuation assumption, ending inventory is assumed to come from purchases made during the period, beginning inventory, or an average mixture of the two. By carefully tracking the relationship between inventory cost and retail selling price, ending inventory can be estimated under a FIFO, LIFO, or average cost assumption. In addition, by carefully handling retail price markdowns, an estimate of lower-of-cost-or-market (LCM) inventory can be generated.

The **retail inventory method** is widely employed by retail firms to arrive at reliable estimates of inventory position whenever desired. This method, like the gross profit method, permits the estimation of an inventory amount without the time and expense of taking a physical inventory or maintaining detailed perpetual inventory records. The retail inventory method is more flexible than the gross profit method in that it allows estimates to be based on FIFO, LIFO, or average cost assumptions, and it even permits estimation of lower-of-cost-or-market values. The retail inventory method also offers the advantage that when a physical inventory is actually taken for financial statement purposes, the inventory can be taken at retail and then converted to cost without reference to individual costs and invoices, thus saving time and expense.<sup>23</sup>

When the retail inventory method is used, records of goods purchased are maintained at two amounts—cost and retail. Computers have made it feasible to maintain cost records for the thousands of items normally included in a retail inventory. A **cost percentage** is computed by dividing the goods available for sale at cost by the goods available for sale at retail. This cost percentage can then be applied to the ending inventory at retail, an amount that can be readily calculated by subtracting sales for the period from the total goods available for sale at retail. This process is illustrated in Exhibit 9-21.

<sup>23</sup> The retail inventory method is acceptable for income tax purposes, provided the taxpayer maintains adequate and satisfactory records supporting inventory calculations and applies the method consistently on successive tax returns.

The computation of retail inventory at the end of January is illustrated with the example for Wesley Company. The simple process illustrated in this example is based on an average cost assumption because beginning inventory and purchases are lumped together to compute one cost percentage.

	Cost	Retail
Inventory, January 1 .....	\$30,000	\$50,000
Purchases in January .....	30,000	40,000
Goods available for sale .....	<u>\$60,000</u>	<u>\$90,000</u>
Cost percentage ( $\$60,000 \div \$90,000$ ) = 66.7%		
Deduct sales for January .....		65,000
Inventory, January 31, at retail .....		<u>\$25,000</u>
Inventory, January 31, at estimated cost ( $\$25,000 \times 66.7\%$ ) .....	<u>\$16,675</u>	

FIFO and LIFO assumptions can be incorporated by computing different cost percentages for beginning inventory and purchases, as shown in the table below.

	Cost	Retail
Inventory, January 1 .....	\$30,000	\$50,000
Purchases in January .....	30,000	40,000
Goods available for sale .....	<u>\$60,000</u>	<u>\$90,000</u>
Cost percentage:		
Beginning inventory ( $\$30,000 \div \$50,000$ ) = 60.0%		
Purchases ( $\$30,000 \div \$40,000$ ) = 75.0%		
Deduct sales for January .....		65,000
Inventory, January 31, at retail .....		<u>\$25,000</u>
Inventory, January 31, at estimated cost:		
FIFO ( $\$25,000 \times 75.0\%$ ) .....	<u>\$18,750</u>	
LIFO ( $\$25,000 \times 60.0\%$ ) .....	<u>\$15,000</u>	

With a FIFO assumption, the retail inventory is converted to cost using the cost percentage applicable to the most recently acquired goods (purchases). With a LIFO assumption, the retail-to-cost conversion for ending inventory is done using the old cost percentage (beginning inventory).

## Retail Inventory Method: Lower of Cost or Market

Frequently, retail prices change after they are originally set. The following terms are used to describe these changes.

- **Original retail**—the initial sales price, including the original increase over cost referred to as the **initial markup**.
- **Markups**—increases that raise sales prices above original retail.
- **Markdowns**—decreases that reduce sales prices below original retail.

To illustrate the use of these terms, assume that merchandise costing \$4 a unit is marked to sell at \$6, which is the original retail price. If the retail price is subsequently increased to \$7.50, this represents a retail price markup of \$1.50. If the goods originally marked to sell at \$6 are reduced to a sales price of \$5, this represents a markdown of \$1.

Retail price changes can occur because of a change in pricing strategy or because of a change in the value of the underlying inventory. These two causes of retail price changes underlie two different methods of applying the retail inventory method. To illustrate, assume that, in addition to the information given earlier, Wesley Company had retail price markups of \$30,000 and markdowns totaling \$20,000 during the month of January.

	Average Cost		Lower of Cost or Market	
	Cost	Retail	Cost	Retail
Inventory, January 1 .....	\$30,000	\$ 50,000	\$30,000	\$ 50,000
Purchases in January .....	30,000	40,000	30,000	40,000
	<u>\$60,000</u>	<u>\$ 90,000</u>	<u>\$60,000</u>	<u>\$ 90,000</u>
Markups .....		30,000		30,000
Markdowns .....		(20,000)		—
		<u>\$100,000</u>		<u>\$120,000</u>
Cost percentage:				
Average cost: $(\$60,000 \div \$100,000) = 60.0\%$				
Lower of cost or market: $(\$60,000 \div \$120,000) = 50.0\%$				
Markdowns .....		—		(20,000)
Goods available for sale .....		<u>\$100,000</u>		<u>\$100,000</u>
Deduct sales for January .....		65,000		65,000
Inventory, January 31, at retail .....		<u>\$ 35,000</u>		<u>\$ 35,000</u>
Inventory, January 31, at estimated cost:				
Average cost: $(\$35,000 \times 60.0\%)$ .....	<u>\$21,000</u>			
Lower of cost or market: $(\$35,000 \times 50.0\%)$ .....			<u>\$17,500</u>	

## caution

The only difference between the average cost and the lower-of-cost-or-market estimates is in the treatment of markdowns.

Operationally, the simple difference between the two estimates is in when the markdowns are subtracted—before computation of the cost percentage or after. And this simple computational difference reflects the two different assumptions about the cause of markups and markdowns. Subtracting the markdowns before calculation of the cost percentage is equivalent to assuming that the markdowns result

from a change in pricing strategy. Under this assumption, all markups and markdowns should be reflected in the computation of the cost percentage. The resulting calculation gives an estimate of the average cost of ending inventory. Subtracting the markdowns after calculation of the cost percentage reflects the assumption that the markdowns are the result of a decline in the value of the inventory. As a result, markdowns do not affect the normal cost percentage but are instead reflected as a direct decline in the recorded value of inventory. This assumption yields an estimate of inventory at lower of cost or market.

The illustrations in this section demonstrate the flexibility of the retail inventory method. The retail inventory method can be used to estimate ending inventory using FIFO, LIFO, average cost, and lower of cost or market.

## LIFO Pools, Dollar-Value LIFO, and Dollar-Value LIFO Retail

**13** Use LIFO pools, dollar-value LIFO, and dollar-value LIFO retail to compute ending inventory.

**WHY** Because of the complexities associated with LIFO layers, variations of the LIFO method have been developed to allow companies to approximate the cost of their ending inventory.

**HOW** LIFO methods have been developed that compute inventory based on pools of inventory, dollar amounts of inventory, or inventory retail prices. These methods require the use of cost percentages and price indexes.

With large and diversified inventories, application of LIFO procedures to specific goods can be extremely burdensome. In addition, if LIFO layers are defined in terms of specific products, frequent LIFO liquidations can occur as demand for individual products declines. Two approaches have been developed to simplify the application of LIFO: LIFO pools and dollar-value LIFO. Also, the retail inventory method can be combined with the dollar-value LIFO inventory method to use retail costs to estimate LIFO ending inventory values.

### LIFO Pools

As a means of simplifying the valuation process and extending its applicability to more items, the IRS developed the technique of establishing LIFO inventory pools of substantially identical goods. At the end of a period, the quantity of items in the pool is determined, and costs are assigned to those items. Units equal to the beginning quantity in the pool are assigned the beginning unit costs. If the number of units in ending inventory exceeds the number of beginning units, the additional units are regarded as an incremental layer within the pool.

To illustrate the formation of LIFO pools, the following data will be used for Elohar Company, a seller of fine neckties:

Beginning inventory:			
	Wide ties	1,000 units @ \$10 =	\$10,000
	Narrow ties	1,500 units @ \$ 8 =	12,000
		<u>2,500 units</u>	<u>\$22,000</u>
Purchases:			
January 16	Wide	800 units @ \$13 =	\$10,400
	Narrow	1,000 units @ \$11 =	11,000
December 19	Wide	1,500 units @ \$15 =	22,500
	Narrow	<u>2,000 units @ \$16 =</u>	<u>32,000</u>
		5,300 units	<u>\$75,900</u>
Sales:			
December 31	Wide	1,700 units	
	Narrow	3,200 units	
Ending inventory:			
	Wide	1,600 units	
	Narrow	1,300 units	

If the two types of neckties are accounted for separately, computations of LIFO ending inventory and cost of goods sold are as follows:

LIFO ending inventory:

<b>Wide Ties</b>	<b>Narrow Ties</b>
1,000 units @ \$10 = \$10,000	<u>1,300 units @ \$8 = \$10,400</u>
600 units @ \$13 = 7,800	
<u>1,600 units</u> <u>\$17,800</u>	

LIFO cost of goods sold:

	Wide Ties	Narrow Ties
Beginning inventory .....	\$10,000	\$12,000
+ Purchases .....	10,400	11,000
	<u>22,500</u>	<u>32,000</u>
= Cost of goods available .....	\$42,900	\$55,000
– Ending inventory .....	<u>17,800</u>	<u>10,400</u>
= Cost of goods sold .....	<u>\$25,100</u>	<u>\$44,600</u>
Total cost of goods sold: \$25,100 + \$44,600 = \$69,700		

Rather than account for the wide ties and narrow ties separately, they can be combined into one LIFO pool. This will simplify the accounting (as illustrated below)

and also makes conceptual sense because the two types of ties form a natural business group. Similarly, a large appliance wholesaler might form a pool of all major kitchen appliances such as refrigerators, freezers, and ovens.

The data requirements for computing LIFO cost of goods sold with the two types of ties forming one LIFO pool are few. The three items below are all that are needed:

- Total beginning inventory: 2,500 units with a total cost of \$22,000
- Number of units in the new LIFO layer: 400 units (2,900 ending – 2,500 beginning)
- Average cost per unit of ties purchased during the year: \$14.32 (\$75,900/5,300 units)

LIFO ending inventory using a LIFO pool is computed as follows:

Beginning inventory .....	2,500 units	= \$22,000
New LIFO layer .....	400 units @ \$14.32	= 5,728
		<u>\$27,728</u>

LIFO cost of goods sold is then:

	LIFO Pool
Beginning inventory .....	\$22,000
+ Purchases .....	<u>75,900</u>
= Cost of goods available .....	\$97,900
– Ending inventory .....	<u>27,728</u>
= Cost of goods sold .....	<u>\$70,172</u>

Remember that the purpose of forming LIFO pools is to simplify the LIFO calculations associated with large numbers of products. The simplification results in an estimate of what cost of goods sold would be if LIFO were applied strictly and laboriously. In this example, the LIFO pool cost of goods sold estimate (\$70,172) differs from the total of the individual LIFO calculations (\$69,700) because of the simplifying assumption of using the average cost of purchases to value the new LIFO layer.<sup>24</sup>

LIFO pooling was originally developed as part of the IRS regulations but was quickly adopted as acceptable for financial reporting as well. Although it is not necessary for companies to use the same pools for tax and financial reporting purposes, most companies do, even when the IRS regulations require more pools than might be necessary for accounting purposes.<sup>25</sup>

Because companies can choose to have many LIFO pools or, in the extreme, just one pool, what factors determine the choice of the optimal number of pools? Focusing on the income tax effect, the conventional wisdom is that the fewer pools, the better, with one pool being the best of all. This is because lumping all inventories together into one LIFO pool allows decreases in the inventory of one product to be offset by increases in another product, making it less likely that a LIFO liquidation will result in a sudden increase in income taxes. This conventional wisdom emphasizes avoidance of LIFO liquidations but ignores the primary purpose of LIFO, which is the deferral of income taxes in normal times. Choosing the number of pools that gives maximum tax deferral in normal times (i.e., in times of steady or rising inventory levels) requires careful analysis and depends partly on whether different categories of inventory have different rates of price change.<sup>26</sup>

<sup>24</sup> The unit cost assigned to the items in the new layer may be based on any one of the following measurements:

- The weighted-average cost of acquisitions within the period
- Actual costs of earliest acquisitions within the period (LIFO)
- Actual costs of the latest acquisitions within the period (FIFO)

<sup>25</sup> James M. Reeve and Keith G. Stanga, “The LIFO Pooling Decision: Some Empirical Results from Accounting Practice,” *Accounting Horizons*, June 1987, p. 27.

<sup>26</sup> William R. Cron and Randall B. Hayes, “The Dollar-Value LIFO Pooling Decision: The Conventional Wisdom Is Too General,” *Accounting Horizons*, December 1989, p. 57.

## Dollar-Value LIFO

Even the grouping of substantially identical items into quantity pools does not produce all the benefits desired from the use of LIFO. For example, technological advances and marketing developments are constantly causing specific products to be phased out and replaced by something new that fills the market niche of the old product. The music store business has seen its inventory change from vinyl albums to eight-track tapes to cassettes to CDs to digital files in the past 30 years. The accounting question is whether old LIFO layers should be liquidated whenever a new product replaces an old one. To address this question, and also to further simplify the recordkeeping associated with LIFO, the dollar-value LIFO inventory method was developed. Under this method, LIFO layers are determined based on total dollar changes rather than quantity changes. The dollar-value method has become the most widely used adaptation of the LIFO concept. In a survey of LIFO users, Professors Reeve and Stanga found that 95% of the 206 companies responding to their survey used some version of the dollar-value method.<sup>27</sup>

With dollar-value LIFO, the unit of measurement is the dollar. All goods in the inventory pool to which dollar-value LIFO is to be applied are viewed as though they are identical items. To determine if the dollar quantity of inventory has increased during the year, it is necessary to value the ending inventory in a pool at base-year prices (i.e., those in effect when LIFO was first adopted by the company) and compare the total with that at the beginning of the year, also valued at base-year prices. If the end-of-year inventory at base-year prices exceeds the beginning-of-year inventory at base-year prices, a new LIFO layer is created. If there has been a decrease, the most recent LIFO layer (or layers) is reduced.

Dollar-value LIFO calculations are illustrated using the same Elohar Company example from the previous section.

First, the replacement cost of ending inventory is computed using prices prevailing at the end of the period. In this example, the end-of-period prices come from the December 19 purchase. For Elohar Company, the replacement cost of ending inventory is:

Ending inventory at ending prices:		
Wide ties	1,600 units @ \$15 =	\$24,000
Narrow ties	1,300 units @ \$16 =	20,800
		<u>\$44,800</u>

Since beginning inventory was only \$22,000, it appears that there was an increase in inventory during the period, suggesting that a new LIFO layer should be added. However, the increase in inventory may be a result of price increases rather than an actual increase in the quantity of inventory. To make this determination, computation is made of what the value of beginning inventory would be at ending prices:

Beginning inventory at ending prices:		
Wide ties	1,000 units @ \$15 =	\$15,000
Narrow ties	1,500 units @ \$16 =	24,000
		<u>\$39,000</u>

After adjusting for price increases during the year, we can see that the dollar value of inventory increased by \$5,800:

Ending inventory at ending prices	\$44,800
– Beginning inventory at ending prices	<u>39,000</u>
Dollar value of new LIFO layer, at ending prices	<u>\$ 5,800</u>

Finally, dollar-value LIFO ending inventory is computed as follows:

Beginning inventory, at base-year prices	\$22,000
New LIFO layer, at ending prices	<u>5,800</u>
LIFO ending inventory	<u>\$27,800</u>

This LIFO ending inventory is then used in the computation of LIFO cost of goods sold.

<sup>27</sup> James M. Reeve and Keith G. Stanga, “The LIFO Pooling Decision: Some Empirical Results from Accounting Practice,” *Accounting Horizons*, June 1987, p. 2.

To summarize, the dollar-value LIFO computations are:

1. Compute ending inventory at ending prices.
2. Compute beginning inventory at ending prices.
3. Compute the difference. An increase represents a new LIFO layer.
4. LIFO ending inventory is beginning inventory at base-year prices plus the new LIFO layer.

In the example, the new LIFO layer was valued at ending prices. This is acceptable but is somewhat inconsistent with the LIFO assumption. In fact, this approach essentially results in the new layer being valued using a FIFO assumption. Alternatively, the new LIFO layer can be valued using average prices for the period, or by using the prices of the first purchases of the period. The only computational difference is that “ending prices” are replaced by “first purchase prices” or “average prices” in steps (1) and (2) above. The computations using first purchase prices to value the new LIFO layer are given below. The first purchase made during the period was on January 16.

Ending inventory at first purchase prices:

Wide ties .....	1,600 units @ \$13 =	\$20,800
Narrow ties .....	1,300 units @ \$11 =	14,300
		<u>\$35,100</u>

Beginning inventory at first purchase prices:

Wide ties .....	1,000 units @ \$13 =	\$13,000
Narrow ties .....	1,500 units @ \$11 =	16,500
		<u>\$29,500</u>

Ending inventory at first purchase prices .....	\$35,100
– Beginning inventory at first purchase prices .....	29,500
Dollar value of new LIFO layer, at first purchase prices .....	<u>\$ 5,600</u>
Beginning inventory, at base-year prices .....	\$22,000
New LIFO layer, at first purchase prices .....	5,600
LIFO ending inventory .....	<u>\$27,600</u>

## Use of an Index

The dollar-value LIFO illustration just completed required a record of base-year prices and end-of-year prices for each individual inventory item. This technique is called the **double extension** method. Imagine how messy the computations would be with several thousand products. Recall that the purpose of LIFO pools and dollar-value LIFO is to reduce the bookkeeping costs associated with LIFO. Dollar-value LIFO is greatly simplified if a price index is used in place of the double extension method.

A **price index** is simply an overall measure of how much prices have increased during the year. A common example is the Consumer Price Index (CPI). The CPI measures how much consumer prices increase in the United States during a given period. If the CPI goes up from 100 to 103 during a year, we say that prices for the year increased by 3%, or in other words, inflation for the year was 3%.

A price index in the Elohar Company example can be computed by comparing beginning inventory at beginning prices to beginning inventory at ending prices:

Beginning inventory at ending prices:

Wide ties .....	1,000 units @ \$15 =	\$15,000
Narrow ties .....	1,500 units @ \$16 =	24,000
		<u>\$39,000</u>

Beginning inventory at beginning prices:

Wide ties .....	1,000 units @ \$10 =	\$10,000
Narrow ties .....	1,500 units @ \$ 8 =	12,000
		<u>\$22,000</u>

End-of-year price index:  $\$39,000/\$22,000 = 1.77$ , or 177

With the beginning-of-year index being 100, an end-of-year-index of 177 means that prices increased an average of 77% during the year. This index would be used in the following work sheet to compute ending inventory for Elohar Company using dollar-value LIFO:

Inventory at End-of-Year Prices	Year-End Price Index	Inventory at Base-Year Prices	Layers in Base-Year Prices	Incremental Layer Index	Dollar-Value LIFO Cost
\$44,800	÷ 1.77 =	\$25,311	\$22,000	× 1.00 =	\$22,000
			3,311	× 1.77 =	5,860
			<u>\$25,311</u>		<u>\$27,860</u>

This ending inventory of \$27,860 differs from the \$27,800 computed earlier (with the new layer valued at ending prices) only because the index is rounded at 1.77 (instead of carrying it out to 1.7727272727 . . .).

Note that the index calculations in the work sheet result in the new layer being valued at ending prices. In order to value the new layer at first purchase prices, an additional index must be computed:

Beginning inventory at first purchase prices:

Wide ties .....	1,000 units @ \$13 =	\$13,000
Narrow ties .....	1,500 units @ \$11 =	16,500
		<u>\$29,500</u>

First purchase price index: \$29,500/\$22,000 = 1.34

The first purchase price index would be used to value the new LIFO layer as follows:

Inventory at End-of-Year Prices	Year-End Price Index	Inventory at Base-Year Prices	Layers in Base-Year Prices	Incremental Layer Index	Dollar-Value LIFO Cost
\$44,800	÷ 1.77 =	\$25,311	\$22,000	× 1.00 =	\$22,000
			3,311	× 1.34 =	4,437
			<u>\$25,311</u>		<u>\$26,437</u>

To recap, the new LIFO layer can be valued using a year-end price index, a first purchase price index, or an average price index.

### Dollar-Value LIFO: Multiyear Example

One more illustration of dollar-value LIFO is given below. This example illustrates how dollar-value LIFO works when LIFO layers are liquidated.

Assume the index numbers and inventories at end-of-year prices for Hsu Wholesale Co. are as follows:

Date	Year-End Price Index*	Inventory at End-of-Year Prices
December 31, 2007 .....	1.00	\$38,000
December 31, 2008 .....	1.20	\$54,000
December 31, 2009 .....	1.32	\$66,000
December 31, 2010 .....	1.40	\$56,000
December 31, 2011 .....	1.25	\$55,000

\* Many published indexes appear as percentages without decimals, e.g., 100, 120, 132, 140, 125.

The work sheet in Exhibit 9-22 shows the calculation of LIFO ending inventory for Hsu for each year.

## EXHIBIT 9-22

## Dollar-Value LIFO: Multiyear Example

Date	Inventory at End-of-Year Prices	Year-End Price Index	Inventory at Base-Year Prices	Layers in Base-Year Prices	Incremental Layer Index	Dollar-Value LIFO Cost
December 31, 2007	\$38,000	÷ 1.00	= \$38,000	<u>\$38,000</u>	× 1.00	= <u>\$38,000</u>
December 31, 2008	\$54,000	÷ 1.20	= \$45,000	\$38,000	× 1.00	= \$38,000
				<u>7,000</u>	× 1.20	= <u>8,400</u>
				<u>\$45,000</u>		<u>\$46,400</u>
December 31, 2009	\$66,000	÷ 1.32	= \$50,000	\$38,000	× 1.00	= \$38,000
				<u>7,000</u>	× 1.20	= <u>8,400</u>
				<u>5,000</u>	× 1.32	= <u>6,600</u>
				<u>\$50,000</u>		<u>\$53,000</u>
December 31, 2010	\$56,000	÷ 1.40	= \$40,000	\$38,000	× 1.00	= \$38,000
				<u>2,000</u>	× 1.20	= <u>2,400</u>
				<u>\$40,000</u>		<u>\$40,400</u>
December 31, 2011	\$55,000	÷ 1.25	= \$44,000	\$38,000	× 1.00	= \$38,000
				<u>2,000</u>	× 1.20	= <u>2,400</u>
				<u>4,000</u>	× 1.25	= <u>5,000</u>
				<u>\$44,000</u>		<u>\$45,400</u>

The following items should be observed in the example:

- *December 31, 2008*—With an ending inventory of \$45,000 in terms of base prices, the inventory has increased in 2008 by \$7,000; however, the \$7,000 increase is stated in terms of base-year prices and needs to be restated in terms of 2008 year-end prices which are 120% of the base level.
- *December 31, 2009*—With an ending inventory of \$50,000 in terms of base prices, the inventory has increased in 2009 by another \$5,000; however, the \$5,000 increase is stated in terms of base-year prices and needs to be restated in terms of 2009 year-end costs which are 132% of the base level.
- *December 31, 2010*—When the ending inventory of \$40,000 (expressed in base-year dollars) is compared to the beginning inventory of \$50,000 (also expressed in base-year dollars), it is apparent that the inventory has been decreased by \$10,000 in base-year terms. Under LIFO procedures, the decrease is assumed to take place in the most recently added layers, reducing or eliminating them. As a result, the 2009 layer, priced at \$5,000 in base-year terms, is completely eliminated, and \$5,000 of the \$7,000 layer from 2008 is eliminated. This leaves only \$2,000 of the 2008 layer, plus the base-year amount. The remaining \$2,000 of the 2008 layer is multiplied by 1.20 to restate it to 2008 dollars and is added to the base-year amount to arrive at the ending inventory amount of \$40,400.
- *December 31, 2011*—The ending inventory of \$44,000 in terms of the base prices indicates an inventory increase for 2011 of \$4,000. This increase requires restatement in terms of 2011 year-end prices which are 125% of the base level.

In some cases, the index for the first year of the LIFO layers is not 1.00. This is especially true when an externally generated index is used. When this occurs, it is simpler to convert all inventories to a base of 1.00 rather than to use the index for the initial year of the LIFO layers. The computations are done in the same manner as in the previous example except the inventory is stated in terms of the base year of the index, not the first year of the inventory layers. To illustrate, assume the same facts as stated earlier except that the

base year of the external index is 2003; in 2007, the index is 1.20; and in 2008, it is 1.44. The schedule showing the LIFO inventory computations would be modified as follows for the first two years. Note that the inventory cost is the same under either situation.

Date	Inventory at End-of-Year Prices		Year-End Price Index	=	Inventory at Base = 1.00 (2003 Prices)	Layers in Base = 1.00 (2003 Prices)		Incremental Layer Index	=	Dollar-Value LIFO Cost
December 31, 2007	\$38,000	÷	1.20	=	\$31,667	\$31,667	×	1.20	=	\$38,000
December 31, 2008	\$54,000	÷	1.44	=	\$37,500	\$31,667	×	1.20	=	\$38,000
						5,833	×	1.44	=	8,400
						\$37,500				\$46,400

### Dollar-Value LIFO Retail Method

The dollar-value LIFO procedures described in the preceding section can be combined with the retail inventory method described earlier in developing LIFO inventory values. With the **dollar-value LIFO retail method**, LIFO layers are stated in terms of retail values. After the LIFO retail layers have been identified and priced using a price index, a further adjustment is needed to state the inventory at cost. This is done by multiplying the retail inventory of each layer by the appropriate cost percentage.

One thing to keep in mind when computing cost percentages for the dollar-value LIFO retail method is that beginning inventory values are ignored. When LIFO is used, a new inventory layer is converted from retail to cost using the cost percentage applicable to current year purchases.

The following LIFO retail layer data for Miracle Max Department Store as of December 31, 2010, are used to illustrate the computations associated with the dollar-value LIFO retail method.

Layer Year	Year-End Price Index	Incremental Cost Percentage	Inventory at End-of-Year Retail Prices
2007 .....	1.00	0.60	\$60,000
2008 .....	1.05	0.62	69,300
2009 .....	1.10	0.64	77,000
2010 .....	1.12	0.65	71,120

Assume that the 2011 year-end price index is 1.08. The incremental cost percentage and 2011 ending inventory at end-of-year retail prices are computed as follows.

	Cost	Retail
Beginning inventory, December 31, 2010 .....	—	\$ 71,120
Purchases .....	\$59,780	\$ 98,000
Incremental cost percentage: (\$59,780 ÷ \$98,000) = 61%		
Goods available for sale .....		\$169,120
Deduct: Sales .....		90,820
Ending inventory at retail (year-end prices) .....		\$ 78,300

From these data, a work sheet similar to that illustrated earlier for dollar-value LIFO can be constructed to determine the LIFO retail inventory layers. One additional column is necessary to record the incremental cost percentage that will convert the retail inventory to cost. It is important to note that the incremental cost percentage is used only if an incremental layer is added to the inventory in the current period. In the example, no layer was added in 2010, so the cost percentage applicable to purchases made in 2010 is not used. As seen with the dollar-value LIFO method, when an inventory layer is eliminated, it is not reintroduced in subsequent years when layers

are added. This is illustrated in the example when, in 2010, the \$4,000 layer formed in 2009 is eliminated. In 2011, the 2009 \$4,000 layer is not resurrected. Instead, the new layer is comprised of 2011 percentages.

Date	End-of-Year Retail Prices	Year-End Price Index	Base-Year Retail Prices	Layers	Incremental Layer Index	Incremental Cost Percentage	Dollar-Value LIFO Retail Cost
December 31, 2007	\$60,000	÷ 1.00	= \$60,000	\$60,000	× 1.00	× 0.60	= \$36,000
December 31, 2008	\$69,300	÷ 1.05	= \$66,000	\$60,000	× 1.00	× 0.60	= \$36,000
				6,000	× 1.05	× 0.62	= 3,906
				<u>\$66,000</u>			<u>\$39,906</u>
December 31, 2009	\$77,000	÷ 1.10	= \$70,000	\$60,000	× 1.00	× 0.60	= \$36,000
				6,000	× 1.05	× 0.62	= 3,906
				4,000	× 1.10	× 0.64	= 2,816
				<u>\$70,000</u>			<u>\$42,722</u>
December 31, 2010	\$71,120	÷ 1.12	= \$63,500	\$60,000	× 1.00	× 0.60	= \$36,000
				3,500	× 1.05	× 0.62	= 2,279*
				<u>\$63,500</u>			<u>\$38,279</u>
December 31, 2011	\$78,300	÷ 1.08	= \$72,500	\$60,000	× 1.00	× 0.60	= \$36,000
				3,500	× 1.05	× 0.62	= 2,279*
				9,000	× 1.08	× 0.61	= 5,929*
				<u>\$72,500</u>			<u>\$44,208</u>

\*Rounded to nearest dollar

## Purchase Commitments

**14** Account for the impact of changing prices on purchase commitments.

**WHY** When a firm commitment is made to purchase inventory in the future, the purchasing company is subject to the risk of a drop in price after a firm purchase price has already been set. Proper accounting for this risk reports any economic losses from such price drops in the period in which the price decline occurs.

**HOW** When price declines take place after a purchase commitment has been made, a loss is recorded in the period of the price decline. This loss is similar in nature to a lower-of-cost-or-market write-down.

Extreme fluctuations in the price of inventory purchases can expose a company to excessive risk. Of the different ways to manage this risk, the simplest is a **purchase commitment** that locks in the inventory purchase price in advance. For example, rather than being exposed to the ups and downs of oil prices, an airline can contract in advance to purchase its next month's fuel at a set price.

The first accounting issue raised by purchase commitments is whether the company committing to the future purchase should record an asset (for the inventory to be

received) and a liability (for the payment obligation) at the commitment date. This type of contract is an exchange of promises about future actions and is known as an *executory contract*. Another example of an executory contract is an employment agreement in which a firm and an employee agree to employment terms for a future period. Accounting rules require some

fyi

As you will see in Chapter 19, a purchase commitment is very similar to one type of derivative called a *forward contract*.

PhotoDisc/Getty Images

To manage their risk, airlines often contract in advance to purchase fuel at a set price.

executory contracts to be recognized in the financial statements.<sup>28</sup>

With purchase commitments, no journal entry is required to record the commitment prior to delivery of the goods. However, in an adaptation of the lower-of-cost-or-market rule, when price declines take place subsequent to such a commitment and the commitment is outstanding at the end of an accounting period, the loss is recorded just as losses on goods on hand are recognized. A decline is recorded by a debit to a special loss account and a credit to either a contra asset account or an accrued liability account, such as Estimated Loss on Purchase Commitments. Acquisition of the goods in a subsequent period is recorded by a credit to Accounts Payable, a debit canceling the credit balance in the contra asset or accrued liability account, and a debit to Purchases for the difference.

To illustrate the accounting for purchase commitments, we'll use the following example. Rollins Oat Company entered into a purchase commitment on November 1, 2010, for 100,000 bushels of wheat at \$3.40 per bushel to be delivered in March 2011. At the end of 2010, the market price for wheat had dropped to \$3.20 per bushel. The entries to record this decline in value and the subsequent delivery of the wheat would be as follows:

2010			
Dec.	31	Loss on Purchase Commitments .....	20,000
		Estimated Loss on Purchase Commitments .....	20,000
		<i>(100,000 bushels × \$0.20 per bushel)</i>	
2011			
Mar.	31	Estimated Loss on Purchase Commitments .....	20,000
		Purchases .....	320,000
		Accounts Payable .....	340,000

The loss is thus assigned to the period in which the inventory price decline took place. Current loss recognition would not be appropriate when commitments can be canceled, when commitments provide for price adjustment, or when declines do not suggest reductions in sale prices. If, prior to delivery, the market price increases, the estimated loss on purchase commitments account would be reduced and a gain would be recorded. The amount of gain to be recognized is limited to the amount of loss previously recorded.

## Foreign Currency Inventory Transactions

**15** Record inventory purchase transactions denominated in foreign currencies.

**WHY** Foreign currency transactions expose companies to exchange rate risk during the time between the purchase and the payment of the foreign currency obligation.

**HOW** Gains or losses resulting from exchange rate changes are recognized in the period in which the exchange rate changes occur.

<sup>28</sup> A lease is a good example of an executory contract. A lease is an exchange of promises about the future—the lessor promises to provide the use of an asset (like a building) and the lessee promises to pay for the use of the asset. As discussed in Chapter 15, some leases are recognized in the financial statements (capital leases) and some are not (operating leases).

The discussion of inventories thus far has centered around the purchase and valuation of inventories in a domestic environment, that is, within the United States. As noted in Chapter 1, business has become increasingly global. Exports and imports of materials and finished goods are a significant part of many companies' purchases and sales. Depending on how a purchase transaction is structured, additional gains or losses may occur in foreign inventory transactions because of fluctuations in the currency exchange rates between two countries.

Not all international transactions involve foreign currency risk. Only transactions denominated in currencies other than the U.S. dollar are **foreign currency transactions** for U.S. companies. For example, if a U.S. company buys inventory from a German firm, the transaction is a normal purchase (for the U.S. company) if the inventory price is set in U.S. dollars. But if the price is set in euros, the U.S. company is exposed to foreign currency exchange risk during the period the account payable is outstanding.

## caution

If the transaction contract is written in terms of U.S. dollars, there is no foreign currency risk whether the other company is based in Azerbaijan or Zimbabwe.

To illustrate the complexities associated with foreign currency transactions, assume that on November 1, 2010, Washington Company purchased inventory from Swiss Company and that the invoice was denominated in Swiss francs with a purchase price of 50,000 francs. At the time of the purchase, the exchange rate was 5 francs per U.S. dollar. This rate is called the **spot**

**rate**, the rate at which the two currencies can be exchanged right now. Washington Company would make the following journal entry to record the purchase:

2010			
Nov.	I	Inventory .....	10,000
		Accounts Payable (fc) .....	10,000
		(50,000 francs/5 = \$10,000)	

The (fc) designation is used for convenience to indicate those items that are denominated in a foreign currency. It is important to recognize, however, that the amounts in Washington's journal entry represent U.S. dollars.

The impact of a foreign currency inventory purchase is recognized when the liability is paid. If the terms call for payment of the liability on February 1, 2011, Washington Company will have to credit cash on that date, but for how much? Recall that the invoice requires payment in francs, not in dollars. Washington Company will have to purchase 50,000 francs from a foreign currency broker. How much will the company be required to pay the broker? The answer depends on the spot rate on that date. If the spot rate is 4.7 francs per U.S. dollar on February 1, 2011, then Washington Company will have to pay \$10,638 (50,000/4.7) to purchase 50,000 francs. The journal entry to record the payment to Swiss Company is as follows:

2011			
Feb.	I	Accounts Payable (fc) .....	10,000
		Exchange Loss .....	638
		Cash .....	10,638

Washington Company incurs a loss in this situation because it had a liability denominated in a currency (francs) that increased in value—the number of francs required to purchase one U.S. dollar declined. On November 1, 2010, Washington Company would have had to pay only \$10,000 to purchase 50,000 francs. However, to purchase the same number of francs on February 1, 2011, requires \$10,638. The exchange loss would be included as an expense in the income statement in the period incurred.

This situation could just as easily have resulted in an exchange gain for Washington Company. If the franc had weakened relative to the dollar, then fewer dollars would have been required to purchase 50,000 francs. Suppose the exchange rate for Swiss francs had been 5.1 per U.S. dollar on February 1, 2011. Washington Company would have recorded the following journal entry and recognized an exchange gain:

2011			
Feb.	1	Accounts Payable (fc) .....	10,000
		Exchange Gain .....	196
		Cash (50,000 francs/5.1) .....	9,804

If a balance sheet date occurs while a foreign currency asset or liability is outstanding, the asset or liability is valued at the spot rate on the balance sheet date.<sup>29</sup> Continuing the initial example, suppose that Washington Company’s fiscal year ends on December 31 and the exchange rate on December 31, 2010, is 4.8 francs per U.S. dollar. On that date, Washington Company would make the following adjusting entry to record the change in the amount of cash required to pay the liability:

2010			
Dec.	31	Exchange Loss .....	417
		Accounts Payable (fc) .....	417
		[(50,000 francs/4.8) – \$10,000 = \$417]	

This journal entry adjusts the liability to its value of \$10,417, given the balance sheet date spot rate, and allocates the exchange rate loss to the period in which the change in exchange rates occurred. When the liability is subsequently paid on February 1, 2011, and the spot rate is 4.7 francs per dollar, the journal entry would be as follows:

2011			
Feb.	1	Accounts Payable (fc) .....	10,417
		Exchange Loss .....	221
		Cash (50,000 francs/4.7) .....	10,638

Note that the exchange losses of \$417 and \$221 recorded on December 31 and February 1, respectively, total \$638, which is the same amount that is obtained if no adjusting entry is made. The adjusting entry simply allocates the exchange loss to the appropriate accounting periods.

An obvious question at this point is, why didn’t Washington Company avoid the exchange loss and pay the liability early? If Washington knew that the franc was going to become more expensive, it probably would have. However, predicting the direction and amount of change in the exchange rate for a particular currency is as difficult as predicting whether the price of a specific stock on the New York Stock Exchange is going to rise or fall, and by how much.

Foreign currency exchange risk is another form of price risk. And, just like domestic price risk, foreign currency exchange risk can be hedged. *Hedging* involves contracting with a foreign currency broker to deliver or receive a specified foreign currency at a specified future date and at a specified exchange rate. A fully hedged transaction results in no exchange gain or loss to the company. The cost of hedging is the fee charged by the broker. For that fee, the broker assumes all of the risks associated with exchange rate changes. Accounting for foreign currency hedging is discussed in Chapter 19. For coverage of how multinational companies combine the financial statements of subsidiaries located in different countries, see Chapter 22.

<sup>29</sup> Statement of Financial Accounting Standards No. 52, “Foreign Currency Translation” (Stamford, CT: Financial Accounting Standards Board, 1981), par. 16b.

**SOLUTIONS TO OPENING SCENARIO QUESTIONS**

1. High inflation causes a big difference between the ending inventory and cost of goods sold numbers produced by LIFO and FIFO. Drastic deflation would do the same, in the opposite direction.
2. The high inflation of 1974 made it so that LIFO cost of goods sold was much greater than FIFO cost of goods sold. By adopting LIFO, companies could report higher cost of goods sold, leading to lower payment of income taxes.
3. An unsophisticated investor focuses on reported earnings without paying attention to the accounting methods and assumptions used in computing those reported earnings.

## SOLUTIONS TO STOP &amp; THINK

1. (Page 455) The correct answer is C. Choosing between two acceptable accounting procedures is an exercise in cost-benefit analysis. Perpetual inventory systems provide better information, but they also usually cost more to operate. For some businesses, the costs exceed the benefits, so those businesses use

a periodic system. Businesses most likely to use a periodic system are those with lots of low-value identical items with a high turnover. In addition, very small businesses, because they don't make much profit, are less likely to be able to afford a computer inventory system.

2. (Page 471) The correct answer is C, computed as follows:

	2008	2009	2010
FIFO cost of goods sold:	$100 \times \$5 = \$500$	$20 \times \$5 = \$100$ $100 \times \$10 = 1,000$ <u>\$1,100</u>	$50 \times \$10 = \$500$ $70 \times \$15 = 1,050$ <u>\$1,550</u>
Ending inventory:	$20 \times \$5 = \$100$	$50 \times \$10 = \$500$	$90 \times \$15 = \$1,350$

3. (Page 476) The correct answer is D. Use of LIFO for the income statement and FIFO for the balance sheet would result in a cost allocation discrepancy. In essence, the FIFO inventory valuation on the balance sheet includes inventory-holding gains, but the LIFO gross profit on the income statement excludes those holding gains. Unless this discrepancy is handled appropriately, the balance sheet will not balance. A possible way to handle this discrepancy is to create a special equity item, perhaps a new type of accumulated other comprehensive income. This equity item would normally have a credit balance (unrecognized inventory holding gain), reflecting the fact that FIFO ending inventory is typically greater than LIFO ending inventory.
4. (Page 484) The correct answer is B. An understatement of the amount of purchases would cause the actual amount of inventory to be greater than the estimated amount. If the actual amount of inventory is much lower than the estimated amount, there are three possible explanations:

(1) the estimation process is flawed, (2) inventory was lost or stolen, or (3) the missing inventory was sold but the sales were not reported. A clever fraud artist can cover his or her tracks by making sure that the reported gross profit percentage is close to industry norms and by avoiding any large swings in the level of unreported sales from one year to the next. Like anything else, successful fraud requires consistent, patient effort over the course of many years.

5. (Page 486) The correct answer is A. All managers are confident that any current difficulties are only temporary. They think that if they can just get past their immediate problems, business will turn around in the future. Thus, managers don't worry about the counterbalancing impact of inventory errors because they know (or think they know) that business will be better next year. In addition, when a manager is facing termination for missing this year's profit target, concerns about the counterbalancing effort of any inventory error next year are of no significance.

## REVIEW OF LEARNING OBJECTIVES

### 1 Define inventory for a merchandising business, and identify the different types of inventory for a manufacturing business.

For a merchandising firm, inventory is the label given to assets sold in the normal course of business. The types of items included in the inventory of a merchandising company are determined by the nature of the business, not the nature of the items. For example, a truck is a fixed asset for an overnight mail delivery company but is inventory for a truck dealership. For a manufacturing firm, there are three types of inventory.

- *Raw materials* are goods obtained for use in the manufacturing process. Direct materials are incorporated directly into the manufactured product (e.g., steel in an automobile, wood in furniture) and indirect materials are used to facilitate production (e.g., lubricant for factory equipment, factory cleaning supplies).
- *Work in process* consists of materials only partly processed that require further work before they can be sold. The three categories of costs that go into work in process are direct materials, direct labor, and manufacturing overhead.
- *Finished goods* are the manufactured products awaiting sale. Upon sale, the cost of finished goods becomes cost of goods sold. A rough rule of thumb is that costs incurred inside the factory are assigned to the cost of inventory, and costs incurred outside the factory are classified as selling, general, or administrative expenses.

### 2 Explain the advantages and disadvantages of both periodic and perpetual inventory systems.

The following chart summarizes the differences between periodic and perpetual inventory systems:

Periodic	Perpetual
<b>Inventory</b>	
Known only after an end-of-period physical count.	Known on a day-to-day basis.
<b>Cost of Goods Sold</b>	
Known only after an end-of-period physical count.	Known on a day-to-day basis.
<b>Inventory Shrinkage</b>	
Can't be calculated.	Can be calculated by comparing inventory records with physical count.

#### Journal Entries

- No entry made to record cost of goods sold until the end of the period.
- Inventory purchases debited to a temporary purchases account.
- Cost of goods sold entry made in association with each sale.
- Inventory purchases debited directly to the inventory account.

#### Quality of Information vs. Cost to Operate

Lower quality of information but less costly to operate.	Higher quality of information but more costly to operate.
----------------------------------------------------------	-----------------------------------------------------------

### 3 Determine when ownership of goods in transit changes hands and what circumstances require shipped inventory to be kept on the books.

With a few exceptions, goods should be included in the reported inventory of the business that owns them, regardless of the physical location of the inventory.

- *Goods in transit.* Goods shipped FOB shipping point belong to the buyer while in transit. Goods shipped FOB destination belong to the seller while in transit.
- *Goods on consignment.* Goods on consignment should be included in the consignor's inventory. The consignee does not include the goods in inventory even though the consignee has physical possession of the goods.
- *Installment sales and conditional sales.* Even though the seller may retain legal title to the inventory until the end of the installment period, the seller should remove the goods from inventory at the time of sale if successful completion of the contract is anticipated.
- *Repurchase agreements.* When the seller promises to buy back goods at a specified price at a future date, the goods should not be removed from the seller's reported inventory. In addition, a liability is recorded for the "sales" proceeds.

### 4 Compute total inventory acquisition cost.

For purchased goods, the recorded inventory amount includes all costs related to purchase, receipt, and preparation of the goods. For manufactured inventory, cost includes direct materials, direct labor, and manufacturing overhead.

The cost of purchased inventory is summarized as follows:

$$\begin{aligned}
 &\text{Invoice cost plus freight, storage, and preparation cost} \\
 &\quad - \text{Cash discounts} \\
 &\quad - \text{Purchase returns and allowances} \\
 &= \text{Inventory cost}
 \end{aligned}$$

The two ways to account for cash discounts are the net method and the gross method. With the net method, the cost of missed discounts is reported as a separate financing expense. With the gross method, missed cash discounts are included as part of the cost of inventory.

The most difficult part of computing the cost of manufactured inventory is allocating manufacturing overhead. Traditionally, overhead allocation has been proportioned on the amount of direct labor associated with a product. An activity-based cost (ABC) system allocates overhead based on clearly identified cost drivers—characteristics of the production process known to create overhead costs.

**5 Use the four basic inventory valuation methods: specific identification, average cost, FIFO, and LIFO.**

Inventory valuation methods allocate total inventory cost between inventory remaining and inventory sold. The four most common methods are specific identification, average cost, first-in, first-out (FIFO), and last-in, first-out (LIFO).

- *Specific identification.* The actual physical units sold are specifically identified and their aggregate cost is reported as cost of goods sold.
- *Average cost.* The same average cost is assigned to each unit. Cost of goods sold is computed by multiplying units sold by the average cost per unit.
- *FIFO.* The units sold are assumed to be the oldest units on hand.
- *LIFO.* The units sold are assumed to be the newest units on hand.

With a perpetual inventory system, computation of average cost and LIFO is more complicated because the average cost of goods available and the identification of the newest units change with each purchase and sale. In practice, perpetual records are usually maintained on a FIFO basis and then converted to average cost or LIFO for the financial reports.

**6 Explain how LIFO inventory layers are created, and describe the significance of the LIFO reserve.**

A LIFO inventory layer is created in each year in which purchases exceed sales. The difference between LIFO inventory value and FIFO or average cost is called the *LIFO reserve*.

The LIFO assumption means that all sales are made from current purchases as long as purchases are greater than or equal to sales. Thus, inventory acquired in previous years remains on the books in LIFO layers.

When inventory levels decline, inventory in LIFO layers is sold, starting with the most recently created layer. In times of rising prices, these old LIFO layer costs are lower than current replacement cost. Consequently, LIFO liquidation often results in lower cost of goods sold and higher net income.

Companies using LIFO are allowed to disclose the difference between the inventory cost in old LIFO layers and the current replacement cost (approximated by FIFO or average cost inventory). These LIFO reserve disclosures can be used to compute what cost of goods sold and ending inventory would have been if the company had used FIFO (or average cost) instead of LIFO.

The primary motivation for a company to adopt LIFO is to defer payment of income taxes on inventory holding gains.

**7 Choose an inventory valuation method based on the trade-offs among income tax effects, bookkeeping costs, and the impact on the financial statements.**

**FIFO**

- *Advantages:* corresponds with physical flow of goods; ending inventory balance is close to current replacement cost
- *Disadvantages:* matches older costs with current revenues; inventory holding gains and losses are part of gross profit; no income tax deferral

**LIFO**

- *Advantages:* matches current costs with current revenues; excludes inventory holding gains from gross profit; income tax deferral
- *Disadvantages:* does not correspond with the physical flow of goods; potential LIFO liquidation can draw old costs into cost of goods sold; ending inventory balance can be much lower than current replacement cost

The cash flow benefits of LIFO income tax deferral must be weighed against increased bookkeeping costs and poorer reported financial statement performance. For firms with small inventory levels or low inventory cost increases, the tax deferral benefits of LIFO

are probably insignificant. Currently, the LIFO method is not acceptable under IASB standards.

**8 Apply the lower-of-cost-or-market (LCM) rule to reflect declines in the market value of inventory.**

The lower-of-cost-or-market (LCM) rule results in recognition of decreases in the market value of inventory. Applying the LCM rule requires careful specification of the “market” value. To use the lower-of-cost-or-market rule, the cost of the ending inventory is compared with its market value. If market is less than cost, ending inventory is written down to the market value.

The market value of inventory is equal to its replacement cost, subject to floor and ceiling constraints. The ceiling constraint is that the market value of inventory is not greater than net realizable value. The floor constraint is that the market value of the inventory is not less than net realizable value minus a normal profit margin. In summary, market value of inventory is never less than the floor value, is never more than the ceiling value, and is equal to replacement cost when replacement cost is between the floor and the ceiling.

The comparable inventory write-down rule under *IAS 2* can be labeled “lower of cost or net realizable value.” Under *IAS 2*, inventory write-downs can be subsequently reversed if the inventory selling price recovers.

**9 Use the gross profit method to estimate ending inventory.**

The gross profit method is a simple technique for estimating ending inventory. Inventory estimates are used to confirm the accounting records and to substitute for inventory counts when a physical count is not practical. The gross profit method is as follows:

- Estimate a gross profit percentage  $[(\text{Sales} - \text{Cost of goods sold})/\text{Sales}]$  based on historical values adjusted for significant changes in pricing policy and sales mix.
- Apply the gross profit percentage to sales to estimate cost of goods sold.
- Subtract the cost of goods sold estimate from the cost of goods available for sale to arrive at an estimated ending inventory balance.

**10 Determine the financial statement impact of inventory recording errors.**

Undetected inventory recording errors impact financial statements in both the year of the error and the subsequent year. Depending on the nature of the error, income can be understated or overstated.

Analysis of inventory errors is aided by recalling the simple computation:

$$\begin{aligned} &\text{Beginning inventory} \\ &+ \text{Purchases} \\ &= \text{Goods available for sale} \\ &- \text{Ending inventory} \\ &= \text{Cost of goods sold} \end{aligned}$$

Because the ending inventory of one period becomes the beginning inventory of the next period, undetected inventory errors affect two accounting periods. A common error is the overstatement of ending inventory. This error has the effect of reducing cost of goods sold and increasing net income in the year of the error. A counterbalancing reduction in net income occurs in the following year.

**11 Analyze inventory using financial ratios, and properly compare ratios of different firms after adjusting for differences in inventory valuation methods.**

Inventory ratios provide information on whether the level of inventory is appropriate for the volume of sales.

Inventory turnover is computed as cost of goods sold divided by average inventory, in which average inventory is usually the simple average of beginning and ending inventory. This ratio is the number of times a business completely uses and replaces its inventory during the year.

Number of days' sales in inventory is 365 divided by inventory turnover. This ratio is the number of days a firm can continue in business without buying/manufacturing additional inventory.

These ratios can differ significantly, depending on whether a company uses FIFO, LIFO, or average cost. Use the LIFO reserve disclosures to convert a company's LIFO numbers before comparing them to another company's FIFO or average cost numbers.

## EXPANDED MATERIAL

### 12 Compute estimates of FIFO, LIFO, average cost, and lower-of-cost-or-market inventory using the retail inventory method.

When the retail inventory method is used, records of goods purchased are maintained at both cost and retail amounts. A cost percentage is computed by dividing the goods available for sale at cost by the goods available for sale at retail. This cost percentage is then applied to the ending inventory at retail to get an estimate of the cost of ending inventory.

Variations on the computation of the cost percentage yield inventory estimates for a variety of valuation assumptions, such as:

- *FIFO*. The cost percentage is based on current purchases.
- *LIFO*. The cost percentage is based on beginning inventory, adjusted for the addition of any new LIFO layers.
- *Average cost*. The cost percentage is computed using both beginning inventory and current purchases and includes the effects of both markups and markdowns.
- *Lower of cost or market*. The cost percentage is computed using both beginning inventory and current purchases and includes the effects of markups but not of markdowns.

### 13 Use LIFO pools, dollar-value LIFO, and dollar-value LIFO retail to compute ending inventory.

Use of LIFO pools simplifies LIFO by eliminating the need to keep detailed LIFO layer information on many different products. When the quantity of items in a LIFO pool increases during a year, a new LIFO layer is added. Decreases in the quantity of some items can be offset by increases in other items, reducing the frequency of LIFO liquidations. Choosing the correct number of LIFO pools to maximize the tax deferral benefits of LIFO involves analysis of the probability of LIFO liquidation and the comparative rate of price increases for different categories of inventory.

Dollar-value LIFO further simplifies LIFO bookkeeping. With dollar-value LIFO, the dollar value of inventory (instead of the physical quantity) is the basic unit of measurement.

Dollar-value LIFO is applied as follows:

- Compute the value of ending inventory using ending prices.
- Convert this value to base-year prices by dividing by the end-of-period price index.
- Compare this number to the beginning inventory (in base-year prices) to determine whether a new LIFO layer has been added.
- All LIFO layers are then converted from base-year prices using the appropriate price index from the year in which the layer was created. New layers can be valued using an end-of-period price index (a FIFO assumption), an average price index (an average cost assumption), or a first purchase price index (a LIFO assumption).

Almost all retail companies that use LIFO employ the dollar-value LIFO retail method. The dollar-value LIFO retail method is used as follows:

- A cost percentage for the current year is computed using cost and retail information for current purchases.
- A price index is used to determine whether a new LIFO layer has been created.
- The retail values of all LIFO layers are converted to cost using the appropriate cost percentages.

### 14 Account for the impact of changing prices on purchase commitments.

With a purchase commitment, a company locks in the cost of inventory before the inventory is actually purchased. The LCM rule is applied if prices decline between the commitment date and the purchase date. No journal entry is made to record the commitment. However, when price declines take place after a purchase commitment has been made, a loss is recorded in the period of the price decline.

### 15 Record inventory purchase transactions denominated in foreign currencies.

Transactions denominated in currencies other than the U.S. dollar are foreign currency transactions for U.S. companies. Foreign currency transactions expose companies to exchange rate risk during the time between the purchase and the payment of the foreign currency obligation. Gains or losses resulting from exchange rate changes are recognized in the period in which the exchange rate changes occur.

## IASB SUMMARY

Topic	U.S. GAAP	IASB Standard
LIFO	Acceptable under U.S. GAAP. According to the LIFO conformity rule, a company that uses LIFO for income tax purposes must also use it for financial reporting purposes.	IAS 2 LIFO is not acceptable under the December 2003 revision of IAS 2.
Lower of cost or market	ARB No. 43 Inventory is recorded at the lower of cost or market. In this context, "market value" is defined as the inventory's replacement cost, constrained by a ceiling and a floor. If market value is less than historical cost, ending inventory is written down to the market value.	IAS 2 Inventory is recorded at the lower of cost or net realizable value. Unlike U.S. GAAP, inventory write-down losses can be reversed if the inventory value subsequently recovers.

## KEY TERMS

Activity-based cost (ABC) system 459  
 Average cost method 464  
 Cash discount 460  
 Ceiling 478  
 Consigned goods 457

## QUESTIONS

- What four questions are associated with the accounting for inventory?
- General Motors'** finished goods inventory is composed primarily of automobiles. Are automobiles always classified as "inventory" on the balance sheets of all companies? Explain.
- What is the difference between direct materials and indirect materials?
- (a) What are the three cost elements entering into work in process and finished goods?  
(b) What items enter into manufacturing overhead?
- What is the general rule for distinguishing between inventory-related costs that should be included in the cost of inventory and those that should be expensed as incurred?
- A campus bookstore has a computerized inventory system. Is it more likely that the system is a periodic system or a perpetual system? Explain.
- Would you expect to find a perpetual or a periodic inventory system used in each of the following situations?
  - Diamond ring department of a jewelry store
  - Computer department of a college bookstore
  - Candy department of a college bookstore
  - Automobile dealership—new car department
  - Automobile dealership—parts department
  - Wholesale dealer of small tools
  - A plumbing supply house—plastic fittings department

8. How is inventory shrinkage computed under a perpetual inventory system?
9. Under what conditions are goods in transit legally reported as inventory by the (a) seller? (b) buyer?
10. How should (a) consigned goods and (b) installment sales be treated in computing year-end inventory costs?
11. What is the appropriate way to account for inventory sold under a repurchase agreement?
12. What is an activity-based cost (ABC) system?
13. (a) What are the two methods of accounting for cash discounts? (b) Which method is generally preferred? Why?
14. What objections can be raised to the use of the specific identification method?
15. What advantages are there to using the average cost method of inventory valuation?
16. Which better matches the normal physical flow of goods—FIFO or LIFO? Which better matches current costs and current revenues?
17. Why are LIFO and average cost more complicated with a perpetual inventory system than with a periodic system?
18. (a) Under what conditions is a LIFO layer created? (b) What is meant by “LIFO reserve”?
19. (a) What is the LIFO conformity rule? (b) How has the rule changed since it was first adopted?
20. Assume there is no change in the physical quantity of inventory for the current accounting period. During a period of rising prices, which inventory valuation method (LIFO or FIFO) will result in the greater dollar value of ending inventory? The lower payment of income taxes?
21. What kinds of companies would be *least* likely to use LIFO? Explain.
22. What is the current status of LIFO under IASB standards?
23. The use of lower of cost or market is an unnecessary continuation of the tradition of conservative accounting. Comment on this view.
24. Why are ceiling and floor limitations on replacement cost considered necessary?
25. What differences result from applying lower of cost or market to individual inventory items instead of to the inventory as a whole?
26. Why would a manager care about the value assigned to inventory transferred in from another department?
27. How do the provisions of *IAS 2* differ from the lower-of-cost-or-market rule contained in U.S. GAAP?
28. What information is needed to develop a reliable gross profit percentage for use with the gross profit method?
29. State the effect of each of the following errors made by Clawson Inc. on the income statement and the balance sheet (1) of the current period and (2) of the succeeding period:
  - (a) The ending inventory is overstated as a result of a miscount of goods on hand.
  - (b) The company fails to record a purchase of merchandise on account, and the merchandise purchased is not recognized in recording the ending inventory.
  - (c) The ending inventory is understated as a result of a miscount of goods on hand.
30. Company A has an inventory turnover ratio of 8.0 times. Company B has an inventory turnover ratio of 10.0 times. Both companies are in the same industry. Which company manages its inventory more efficiently? Explain.

## EXPANDED MATERIAL

31. What advantages does the retail inventory method have over the gross profit method?
32. How can FIFO and LIFO assumptions be incorporated into the retail inventory method?
33. (a) How are markdowns treated when estimating average cost using the retail inventory method? (b) How are markdowns treated when estimating lower of cost or market using the retail inventory method?
34. What factors should a company consider in identifying the appropriate number of dollar-value LIFO pools?
35. What are the major advantages of dollar-value LIFO?
36. Indexes are used for two different purposes in computing the cost of LIFO layers with dollar-value LIFO. Clearly distinguish between these uses and describe how the indexes are applied.
37. Identify three different indexes that can be used in valuing a new LIFO layer with dollar-value LIFO. Which index is most consistent with the LIFO assumption?
38. When applying the dollar-value LIFO retail method: (a) How do beginning inventory values impact the computation of the cost percentage? (b) How are markdowns treated?
39. What journal entry is made when a purchase commitment is originally entered into? Explain.
40. Are all transactions with foreign companies classified as foreign currency transactions? If not, what determines if a transaction is a foreign currency transaction?
41. Why is an adjustment made on the balance sheet date to reflect exchange rate changes?

## PRACTICE EXERCISES

## Practice 9-1

**Perpetual and Periodic Journal Entries**

LO2

During the month the company purchased inventory on account for \$3,000. Sales (all on account) during the period totaled \$10,000. The items sold had a cost of \$4,500. Cash collections on account during the period totaled \$9,000. Make the journal entries necessary to record these transactions using (1) a periodic inventory system and (2) a perpetual inventory system.

## Practice 9-2

**Perpetual and Periodic Computations**

LO2

Beginning inventory for the period was \$220,000. Purchases for the period totaled \$720,000 and sales were \$1,250,000. A physical count of ending inventory revealed inventory of \$145,000. (1) Compute cost of goods sold assuming that a periodic system is used and (2) make the journal entry to record inventory shrinkage assuming that a perpetual system is used and cost of goods sold according to the system was \$710,000.

## Practice 9-3

**Goods in Transit and on Consignment**

LO3

The company counted its ending inventory on December 31. *None of the following items were included when the total amount of the company's ending inventory was computed:*

- \$15,000 in goods located in the company's warehouse that are on consignment from another company.
- \$20,000 in goods that were *sold* by the company and shipped on December 30 and were in transit on December 31; the goods were received by the customer on January 2. Terms were FOB destination.
- \$30,000 in goods that were *purchased* by the company and shipped on December 30 and were in transit on December 31; the goods were received by the company on January 2. Terms were FOB shipping point.
- \$40,000 in goods that were *sold* by the company and shipped on December 30 and were in transit on December 31; the goods were received by the customer on January 2. Terms were FOB shipping point.

The company's reported inventory (before any corrections) was \$200,000. What is the correct amount of the company's inventory on December 31?

## Practice 9-4

**Schedule of Cost of Goods Manufactured**

LO4

The company reported the following information for the year:

Ending work-in-process inventory .....	\$100,000
Depreciation on factory building .....	32,000
Salespersons' salaries .....	27,000
Beginning raw materials inventory .....	40,000
Direct labor .....	198,000
Factory supervisor's salary .....	56,000
Depreciation on company headquarters building .....	21,000
Beginning work-in-process inventory .....	76,000
Ending raw materials inventory .....	34,000
Indirect labor .....	36,000
Advertising costs .....	50,000
Purchases of raw materials .....	230,000

Prepare a schedule of cost of goods manufactured for the year.

## Practice 9-5

**Accounting for Purchase Discounts**

LO4

On May 23, the company purchased \$450,000 in inventory on account. The purchase terms are 2/10, n/30. Make the journal entries to record the purchase of and subsequent payment for these goods assuming: (1) the company uses the net method and paid for the goods on June 1, (2) the company uses the net method and paid for the goods on June 15, (3) the company uses the gross method and paid for the goods on June 1, and (4) the company uses the gross method and paid for the goods on June 15. Assume a perpetual inventory system.

**Practice 9-6 Inventory Valuation: FIFO, LIFO, and Average**

The company reported the following inventory data for the year:

**LO5**

	Units	Cost per Unit
Beginning inventory .....	300	\$17.50
Purchases:		
March 23 .....	900	18.00
September 16 .....	1,200	18.25
Units remaining at year-end .....	400	

Compute (1) cost of goods sold and (2) ending inventory assuming (a) FIFO inventory valuation, (b) LIFO inventory valuation, and (c) average cost inventory valuation. The company uses a periodic inventory system.

**Practice 9-7 Inventory Valuation: Complications with a Perpetual System**

Refer to Practice 9-6. Assume that the sales occurred as follows:

**LO5**

	Units Sold
January 16 .....	100
July 15 .....	600
November 1 .....	1,300
Total .....	<u>2,000</u>

Compute (1) cost of goods sold and (2) ending inventory assuming (a) FIFO inventory valuation, (b) LIFO inventory valuation, and (c) average cost inventory valuation. The company uses a *perpetual* inventory system.

**Practice 9-8 LIFO Layers**

The company started business at the beginning of Year 1. Inventory purchases and sales during the first four years of the company's business are as follows:

**LO6**

	Units Purchased	Cost per Unit	Units Sold
Year 1 .....	50	\$2.50	40
Year 2 .....	80	3.00	65
Year 3 .....	90	3.40	90
Year 4 .....	130	4.00	100

Compute the company's ending inventory as of the end of Year 4. The company uses LIFO inventory valuation.

**Practice 9-9 LIFO Reserve and LIFO Liquidation**

Refer to Practice 9-8. Compute the following:

**LO6**

- LIFO reserve at the end of Year 4.
- Cost of goods sold for Year 4.
- Cost of goods sold for Year 4 assuming that units purchased had been 75 instead of 130.

**Practice 9-10 LIFO and Income Taxes**

Refer to Practice 9-8. Assume that the company has no expenses except for cost of goods sold, the selling price per unit is \$6 in each year, and that the income tax rate is 40%. Compute the total amount of income taxes owed for Year 1 through Year 4 assuming that (1) the company uses LIFO inventory valuation and (2) the company uses FIFO inventory valuation.

**LO7**

**Practice 9-11****Lower of Cost or Market**

The following information pertains to the company's ending inventory:

**LO7**

	Original Cost	Selling Price	Selling Cost	Replacement Cost	Normal Profit
Item A	\$ 575	\$ 700	\$ 50	\$ 600	\$100
Item B	700	820	80	550	150
Item C	1,180	1,250	100	1,100	300

Apply lower-of-cost-or-market accounting to each inventory item individually. What *total* amount should be reported as inventory in the balance sheet?

**Practice 9-12****Lower of Cost or Market: Individual vs. Aggregate**

Refer to Practice 9-11. Apply lower-of-cost-or-market accounting to the inventory as a whole. What *total* amount should be reported as inventory in the balance sheet?

**LO8****Practice 9-13****Lower-of-Cost-or-Market Journal Entries**

The company started business at the beginning of Year 1. The company applies the lower-of-cost-or-market (LCM) rule to its inventory as a whole. Inventory cost and market values as of the end of Year 1 and Year 2 were as follows:

**LO8**

	Cost	Market Value
Year 1 .....	\$1,000	\$ 800
Year 2 .....	1,700	1,650

The market value numbers already include consideration of the replacement cost, the ceiling, and the floor. Make the journal entry necessary to record the LCM adjustment at the end of (1) Year 1 and (2) Year 2. The company uses an allowance account for any LCM adjustments.

**Practice 9-14****Returned Inventory**

The company sells large industrial equipment. A piece of equipment with an original cost of \$250,000 and an original selling price of \$390,000 was recently returned. It is expected that the equipment will be able to be resold for just \$225,000. The company normally earns a gross profit of 35.9% of the selling price. How much loss is recorded when the inventory is returned and how much gross profit will be reported when the equipment is resold assuming that the returned inventory is recorded at (1) its original cost, (2) its net realizable value, and (3) its net realizable value minus a normal gross profit?

**LO8****Practice 9-15****Gross Profit Method**

On July 23, the company's inventory was destroyed in a hurricane-related flood. For insurance purposes, the company must reliably estimate the amount of inventory on hand on July 23. The company uses a periodic inventory system. The following data have been assembled:

**LO9**

Inventory, January 1 .....	\$1,000,000
Purchases, January 1–July 23 .....	3,700,000
Sales, January 1–July 23 .....	5,000,000
Historical gross profit percentages:	
Last year .....	60%
Two years ago .....	55%

Estimate the company's inventory as of July 23 using (1) last year's gross profit percentage and (2) the gross profit percentage from two years ago.

**Practice 9-16****Inventory Errors**

At the beginning of Year 1, the company's inventory level was stated correctly. At the end of Year 1, inventory was overstated by \$2,000. At the end of Year 2, inventory was

**LO10**

understated by \$450. At the end of Year 3, inventory was correctly stated. Reported net income was \$3,000 in Year 1, \$3,000 in Year 2, and \$3,000 in Year 3. Compute the correct amount of net income in (1) Year 1, (2) Year 2, and (3) Year 3. Ignore income taxes.

**Practice 9-17****Computing Inventory Ratios**

The company reported the following information for the year:

**LO11**

Beginning accounts receivable .....	\$2,000
Sales .....	8,000
Ending inventory .....	3,000
Ending accounts receivable .....	2,400
Cost of goods sold .....	4,200
Beginning inventory .....	2,600

Compute (1) inventory turnover and (2) number of days' sales in inventory.

**EXPANDED MATERIAL****Practice 9-18****Retail Inventory Method**

The company reported the following information for the month:

**LO12**

	Cost	Retail
Inventory, January 1 .....	\$20,000	\$30,000
Purchases in January .....	20,000	35,000

Sales for the month totaled \$47,000. Compute the estimated cost of inventory on hand at the end of the month using the average cost assumption.

**Practice 9-19****Markups and Markdowns**

The company reported the following information relating to inventory for the month of April:

**LO12**

	Cost	Retail
Inventory, January 1 .....	\$25,000	\$ 50,000
Purchases in January .....	40,000	70,000
Markups .....		30,000
Markdowns .....		(25,000)

Sales for the month totaled \$80,000. Compute the estimated cost of inventory on hand at the end of the month using the average cost assumption.

**Practice 9-20****LIFO Pools**

The company has one LIFO pool. Information relating to the products in this pool is as follows:

**LO13**

Beginning inventory, January 1 .....	25 units @ \$20 each
Purchase, February 12 .....	30 units @ \$22 each
Purchase, February 28 .....	45 units @ \$26 each
Purchase, March 15 .....	60 units @ \$28 each
Sales for the first quarter .....	120 units

Compute the ending LIFO inventory value for the first quarter assuming new layers are valued based on a LIFO cost assumption.

**Practice 9-21****Dollar-Value LIFO**

The company manufactures a single product and has decided to adopt the dollar-value LIFO inventory method. The inventory value on that date using the newly adopted dollar-value LIFO method was \$100,000. Inventory at year-end prices was \$120,000, and the year-end price index was 1.05. Compute the inventory value at year-end assuming incremental layers are valued at year-end prices.

**LO13**

## Practice 9-22

**Dollar-Value LIFO Retail**

The company compiled the following information concerning inventory for the current year:

## LO13

Date	Year-End Price Index at Retail	Incremental Layer Index	Incremental Cost Percentage	Inventory at Retail
Jan. 1	1.00	1.00	65%	\$ 80,000
Dec. 31	1.10	1.05	70%	110,000

Compute the inventory cost at year-end using the dollar-value LIFO retail method.

## Practice 9-23

**Purchase Commitments**

## LO14

On November 17 of Year 1, the company entered into a commitment to purchase 250,000 ounces of gold on February 14 of Year 2 at a price of \$310.20 per ounce. On December 31 of Year 1, the market price of gold is \$275.10 per ounce. On February 14, the price of gold is \$292.00 per ounce. Make the journal entries necessary to record (1) the November 17 purchase commitment, (2) any necessary adjustment at December 31, and (3) the actual purchase (for cash) on February 14. The company uses a perpetual inventory system.

## Practice 9-24

**Foreign Currency Inventory Purchases**

## LO15

On November 6 of Year 1, the company purchased inventory (on account) from a supplier located in Indonesia. The purchase price is 100,000,000 Indonesian rupiah. On November 6, the exchange rate was 8,700 rupiah for 1 U.S. dollar. On December 31, the exchange rate was 10,000 rupiah for 1 U.S. dollar. The company paid the account on March 23 of Year 2. On that date, the exchange rate was 9,100 rupiah for 1 U.S. dollar. Make the journal entries necessary on (1) November 6, (2) December 31, and (3) March 23. The company uses a perpetual inventory system.

## EXERCISES

## Exercise 9-25

**Identification of Inventory Costs and Categories**

## LO1

The records of Burtone Company contain the following cost categories. Burtone manufactures exercise equipment and iron weights.

- Cost of materials used to repair factory equipment
- Depreciation on the fleet of salespersons' cars
- Cost to purchase iron
- Salaries of the factory supervisors
- Cost of heat, electricity, and insurance for the company office building
- Wages of the workers who shape the iron weights
- Property taxes on the factory building
- Cost of oil for the factory equipment
- Salary of the company president
- Pension benefits of workers who repair factory equipment

For each category, indicate whether the cost is an inventory cost (I) or if it should be expensed as incurred (E). For each inventory cost, indicate whether the cost is part of direct materials (DM), direct labor (DL), or manufacturing overhead (MOH).

## Exercise 9-26

**Perpetual and Periodic Inventory Systems**

## LO2

The following inventory information is for Stevenson Company.

Beginning inventory .....	200 units @ \$8
Purchases .....	350 units @ \$8
Ending inventory .....	100 units

Sales for the year totaled \$5,900. All sales and purchases are on account.

1. Make the journal entries necessary to record purchases and sales during the year assuming a periodic inventory system.
2. Assume that a periodic inventory system is used. Compute cost of goods sold.
3. Assume that a perpetual inventory system is used. The perpetual records indicate that the sales of \$5,900 represent 400 units with a total cost of \$3,200. Make the journal entries necessary to record purchases, sales, and inventory shrinkage for the year.

**Exercise 9-27****Computing Cash Expenditure for Inventory**

Using the following data, compute the total cash expended for inventory in 2011.

**LO2**

Accounts payable:	
January 1, 2011 .....	\$ 350,000
December 31, 2011 .....	525,000
Cost of goods sold—2011 .....	1,080,000
Inventory balance:	
January 1, 2011 .....	\$ 600,000
December 31, 2011 .....	540,000

**Exercise 9-28****Passage of Title**

The management of Kauer Company has engaged you to assist in the preparation of year-end (December 31) financial statements. You are told that on November 30, the correct inventory level was 150,000 units. During the month of December, sales totaled 50,000 units including 25,000 units shipped on consignment to Towsey Company. A letter received from Towsey indicates that as of December 31, it had sold 20,000 units and was still trying to sell the remainder. A review of the December purchase orders to various suppliers shows the following:

**LO3**

Purchase Order Date	Invoice Date	Number of Units	Date Shipped	Date Received	Terms
12/2/10	1/3/11	10,000	1/2/11	1/3/11	FOB shipping point
12/11/10	1/3/11	8,000	12/22/10	12/24/10	FOB destination
12/13/10	1/2/11	13,000	12/28/10	1/2/11	FOB shipping point
12/23/10	12/26/10	12,000	1/2/11	1/3/11	FOB shipping point
12/28/10	1/10/11	10,000	12/31/10	1/5/11	FOB destination
12/31/10	1/10/11	15,000	1/3/11	1/6/11	FOB destination

Kauer Company uses the “passing of legal title” for inventory recognition. Compute the number of units that should be included in the year-end inventory.

**Exercise 9-29****Passage of Title**

The Anson Manufacturing Company reviewed its year-end inventory and found the following items. Indicate which items should be included in the inventory balance at December 31, 2011. Give your reasons for the treatment you suggest.

**LO3**

- (a) A packing case containing a product costing \$1,210 was standing in the shipping room when the physical inventory was taken. It was not included in the inventory because it was marked “Hold for shipping instructions.” The customer’s order was dated December 21, but the case was shipped and the customer billed on January 8, 2012.
- (b) Merchandise costing \$545 was received on December 28, 2011, and the invoice was recorded. The invoice was in the hands of the purchasing agent; it was marked “On consignment.”
- (c) Merchandise received on January 4, 2012, costing \$905 was entered in the purchase register on January 5. The invoice showed shipment was made FOB shipping point on December 31, 2011. Because it was not on hand during the inventory count, it was not included.

- (d) A special machine, fabricated to order for a particular customer, was finished and in the shipping room on December 30. The customer was billed on that date and the machine was excluded from inventory although it was shipped January 2, 2012. The customer had requested, in writing, that the special machine be held for shipment until January 2012.
- (e) Merchandise costing \$1,960 was received on January 3, 2012, and the related purchase invoice was recorded January 5. The invoice showed the shipment was made on December 29, 2011, FOB destination.
- (f) Merchandise costing \$2,400 was sold on an installment basis on December 15. The customer took possession of the goods on that date. The merchandise was included in inventory because, technically, Anson still holds legal title in order to enforce payment. Historical experience suggests that full payment on installment sales is received approximately 99% of the time.
- (g) Goods costing \$1,730 were sold and delivered on December 20. The goods were included in inventory because the sale was accompanied by a repurchase agreement requiring Anson to buy back the inventory in February 2012.

**Exercise 9-30**

**Cost of Goods Manufactured Schedule**

The following quarterly cost data have been accumulated for Oakeson Mfg. Inc:

LO4

Raw materials—beginning inventory (Jan. 1, 2011) .....	90 units @ \$7.00
Purchases .....	75 units @ \$8.00
	120 units @ \$8.50

Transferred 195 units of raw materials to work in process:

Work in process—beginning inventory (Jan. 1, 2011) .....	53 units @ \$14.00
Direct labor .....	\$3,100
Manufacturing overhead .....	\$2,950
Work in process—ending inventory (Mar. 31, 2011) .....	47 units @ \$14.25

Prepare a cost of goods manufactured schedule for Oakeson Mfg. Inc. for the quarter ended March 31, 2011. Assume the use of FIFO for raw materials inventory.

**Exercise 9-31**

**Cash Discounts**

LO4

Olavssen Hardware regularly buys merchandise from Dawson Suppliers. Olavssen uses the net method to record purchases and discounts. On August 15, Olavssen Hardware purchased material from Dawson Suppliers. The invoice received from Dawson showed an invoiced price of \$15,536 and payment terms of 2/10, n/30. Payment was sent to Dawson Suppliers on August 28. Prepare entries to record the purchase and subsequent payment assuming a periodic inventory system. (Round to nearest dollar.)

**Exercise 9-32**

**Net and Gross Methods—Entries**

LO4

SPREADSHEET

On December 3, Ainge Printing purchased inventory listed at \$7,400 from Craig Paper Supply. Terms of the purchase were 3/10, n/20. Ainge Printing also purchased inventory from Tippetts Ink Wholesale on December 10 for a list price of \$10,300. Terms of the purchase were 3/10, n/30. On December 16, Ainge paid both suppliers for these purchases. Ainge does not use a perpetual inventory system.

1. Give the entries to record the purchases and invoice payments assuming that (a) the net method is used and (b) the gross method is used.
2. Assume that Ainge has not paid either of the invoices at December 31. Give the year-end adjusting entry if the net method is used.

**Exercise 9-33**

**Recording Purchase Returns**

LO4

On July 23, Stevensonville Company purchased goods on account for \$6,000. Stevensonville later returned defective goods costing \$450.

Record the purchase and the return of the defective goods assuming (1) a periodic inventory system and (2) a perpetual inventory system.

**Exercise 9-34**

**Inventory Computation Using Different Cost Flows**

The Webster Store shows the following information relating to one of its products.

LO5

SPREADSHEET

Inventory, January 1 .....	300 units @ \$17.50
Sales, January 8 .....	200 units
Purchases, January 10 .....	900 units @ \$18.00
Sales, January 18 .....	800 units
Purchases, January 20 .....	1,200 units @ \$19.50
Sales, January 25 .....	1,000 units

What are the values of ending inventory under a periodic inventory system assuming a (1) FIFO, (2) LIFO, and (3) average cost flow? (Round unit costs to three decimal places.)

**Exercise 9-35**

**Inventory Computation Using Different Cost Flows**

Brooklyn Corporation had the following transactions relating to product X during September.

LO5

SPREADSHEET

Date		Units	Unit Cost
September 1	Balance on hand .....	600 units	\$1.50
6	Purchase .....	200 units	2.00
12	Sale .....	400 units	
13	Sale .....	100 units	
18	Purchase .....	250 units	3.00
20	Purchase .....	150 units	3.50
25	Sale .....	300 units	

Determine the ending inventory value under each of the following costing methods:

1. FIFO (perpetual)
2. FIFO (periodic)
3. LIFO (perpetual)
4. LIFO (periodic)

**Exercise 9-36**

**Comparison of Inventory Methods**

Dutch Truck Sales sells semitrailers. The current inventory includes the following five semitrailers (identical except for paint color) along with purchase dates and costs:

LO5

Semitrailer	Purchase Date	Cost
1	April 3, 2011	\$73,000
2	April 10, 2011	70,000
3	April 10, 2011	71,000
4	May 4, 2011	77,000
5	May 12, 2011	78,500

On May 20, 2011, a trucking firm purchased semitrailer 3 from Dutch for \$86,000.

1. Compute the gross margin on this sale assuming Dutch uses:
  - (a) FIFO inventory method
  - (b) LIFO inventory method
  - (c) Specific identification method
2. Which inventory method do you think Dutch should use? Why?

**Exercise 9-37**

**LIFO Inventory Computation**

White Farm Supply's records for the first three months of its existence show purchases of commodity Y2 as follows:

LO6

	Number of Units	Cost
August .....	5,500	\$28,050
September .....	8,000	41,600
October .....	5,100	27,030

The inventory of commodity Y2 at the end of October using FIFO is valued at \$36,390.

1. Assuming that none of commodity Y2 was sold during August and September, what value would be shown at the end of October if LIFO cost was assumed?
2. If White Farm uses LIFO, what disclosure could it make in its October 31 quarterly report concerning the FIFO value of inventory?

**Exercise 9-38**

LO4, LO5

**Inventory Computation from Incomplete Records**

A flood recently destroyed many of the financial records of Yak Manufacturing Company. Management has hired you to re-create as much financial information as possible for the month of July. You are able to find out that the company uses an average cost inventory valuation system. You also learn that Yak makes a physical count at the end of each month in order to determine monthly ending inventory values. By examining various documents, you are able to gather the following information:

Ending inventory at July 31 .....	60,000 units
Total cost of units available for sale in July .....	\$145,210
Cost of goods sold during July .....	\$116,410
Cost of beginning inventory, July 1 .....	\$0.40 per unit
Gross profit on sales for July .....	\$93,590

July purchases:

Date	Units	Unit Cost
July 5 .....	55,000	\$0.51
11 .....	53,000	0.50
15 .....	45,000	0.55
16 .....	47,000	0.53

You are asked to provide the following information.

1. Number of units on hand, July 1
2. Units sold during July
3. Unit cost of inventory at July 31
4. Value of inventory at July 31

**Exercise 9-39**

LO4, LO5

**Computation of Beginning Inventory from Ending Inventory**

The Atlas Company sells product T. During a move to a new location, the inventory records for product T were misplaced. The bookkeeper has been able to gather some information from the sales records and gives you the data shown below.

July sales:

82,100 units at \$9.00

July purchases:

Date	Quantity	Unit Cost
July 5 .....	17,000	\$4.50
9 .....	17,800	5.25
12 .....	18,100	5.00
25 .....	19,000	5.50

On July 31, 24,000 units were on hand with a total value of \$129,500. Atlas has always used a periodic FIFO inventory costing system. Gross profit on sales for July was \$358,100. Reconstruct the beginning inventory (quantity and dollar value) for the month of July.

**Exercise 9-40**

LO6

**Impact on Profit of Failure to Replace LIFO Layers**

Harrison Lumber Company uses a periodic LIFO method for inventory costing. The following information relates to the plywood inventory carried by Harrison Lumber.

Plywood inventory:

Date	Quantity	LIFO Costing Layers
May 1	600 sheets	300 sheets at \$ 8.00 225 sheets at \$11.00 75 sheets at \$13.00

Plywood purchases:

May 8		115 sheets at \$14.00
17		95 sheets at \$15.00
29		200 sheets at \$14.50

All sales of plywood during May were at \$20 per sheet. On May 31, there were 360 sheets of plywood in the storeroom.

1. Compute the gross profit on sales for May, as a dollar value and as a percentage of sales.
2. Assume that because of a lumber strike, Harrison Lumber is not able to purchase the May 29 order of lumber until June 10. Assuming sales remained the same, recompute the gross profit on sales for May, as a dollar value and as a percentage of sales.
3. Compare the results of (1) and (2) and explain the difference.

#### Exercise 9-41

#### LO6

#### Computation of Beginning Inventory

A note to the financial statements of Highland Inc. at December 31, 2011, reads as follows:

Because of the manufacturer's production problems for our Humdinger Limited line, our inventories were unavoidably reduced. Under the LIFO inventory accounting method currently being used for tax and financial accounting purposes, the net effect of all the inventory changes was to increase pretax income by \$1,000,000 over what it would have been had the inventory of Humdinger Limited been maintained at the normal physical levels on hand at the start of the year.

The unit purchase price of the merchandise was \$25 per unit during the year. Highland Inc. uses the periodic inventory system. Additional data concerning Highland's inventory were as follows:

Date	Physical Count of Inventory	LIFO Cost of Inventory
January 1, 2011	500,000 units	\$ ?
December 31, 2011	400,000 units	\$3,600,000

1. What was the unit average cost for the 100,000 units sold from the beginning inventory?
2. What was the reported value for the January 1, 2011, inventory?

#### Exercise 9-42

#### LO7

#### Income Differences—FIFO vs. LIFO

First-in, first-out has been used for inventory valuation by the Bartlett Co. since it was organized in 2008. Using the data that follow, redetermine the net incomes for each year on the assumption of inventory valuation on the last-in, first-out basis:

	2008	2009	2010	2011
Reported net income—FIFO basis	\$22,300	\$42,400	\$ 61,350	\$ 58,200
Reported ending inventories—FIFO basis	44,300	89,900	112,000	125,000
Ending inventories—LIFO basis	35,100	65,300	80,000	113,000

#### Exercise 9-43

#### LO7

#### Gross Margin Differences—FIFO vs. LIFO

Assume the Bullock Corporation had the following purchases and sales of its single product during its first three years of operation.

Year	Purchases		Sales	
	Units	Unit Cost	Units	Unit Price
1 .....	10,000	\$10	8,000	\$14
2 .....	9,000	12	9,000	17
3 .....	8,000	15	10,000	18
	<u>27,000</u>		<u>27,000</u>	

Cost of goods sold is Bullock's only expense. The income tax rate is 40%.

1. Determine the net income (after tax) for each of the three years assuming FIFO historical cost flow.
2. Determine the net income (after tax) for each of the three years assuming LIFO historical cost flow.
3. Compare the total net income over the life of the business. How do the different cost flow assumptions affect net income and cash flows over the life of the business? From a cash flow perspective, which cost flow assumption is better? Explain.

### Exercise 9-44

#### Lower-of-Cost-or-Market Valuation

Determine the proper carrying value of the following inventory items.

### LO8

Item	Cost	Replacement Cost	Sales Price	Selling Expenses	Normal Profit
Product 431 .....	\$2.50	\$2.60	\$3.20	\$0.45	\$0.20
Product 432 .....	1.12	1.00	1.28	0.32	0.07
Product 433 .....	0.54	0.50	0.68	0.13	0.10
Product 434 .....	0.75	0.85	1.07	0.23	0.04
Product 435 .....	1.69	1.60	1.86	0.18	0.04
Product 436 .....	2.03	1.95	2.26	0.26	0.30

### Exercise 9-45

#### Lower-of-Cost-or-Market Valuation

The following inventory data are available for Nordic Ski Shop at December 31.

### LO8

1. Determine the value of ending inventory using the lower-of-cost-or-market method applied to (a) individual items and (b) total inventory.
2. Prepare any journal entries required to adjust the ending inventory if lower of cost or market is applied to (a) individual items and (b) total inventory.

	Cost	Market
Skis .....	\$55,000	\$62,000
Boots .....	42,500	38,000
Ski equipment .....	18,000	16,500
Ski apparel .....	10,000	12,000

### Exercise 9-46

#### Lower-of-Cost-or-Market Valuation

Newcomer, Inc., values inventories using the lower-of-cost-or-market method applied to total inventory. Inventory values at the end of the company's first and second years of operation follow.

### LO8

	Cost	Market
Year 1 .....	\$58,000	\$53,000
Year 2 .....	75,000	73,800

1. Prepare the journal entries necessary to reflect the proper inventory valuation at the end of each year. (Assume Newcomer uses an inventory allowance account.)
2. For Year 1, assume sales were \$510,000 and purchases were \$440,000. What amount would be reported as cost of goods sold on the income statement for Year 1 if: (a) the inventory decline is reported separately and (b) the inventory decline is not reported separately?

**Exercise 9-47****Comparison of Inventory Valuation Methods****LO7, LO8**

The Crevier Corporation began business on January 1, 2011. The following table shows information about inventories, as of December 31, for three consecutive years under different valuation methods. Assume that purchases are \$60,000 each year. Using this information and assuming that the same method is used each year, you are to answer each of the questions that follow.

	LIFO	FIFO	Market	Lower of Cost or Market*
2011	\$12,300	\$15,100	\$14,800	\$14,500
2012	10,400	11,600	8,800	11,500
2013	11,600	13,400	13,000	12,900

\* FIFO cost, item-by-item valuation.

1. Which inventory basis would result in the highest net income for 2011?
2. Which inventory basis would result in the highest net income for 2012?
3. Which inventory basis would result in the lowest net income for the three years combined?
4. For the year 2012, how much higher or lower would net income be on the FIFO cost basis than on the lower-of-cost-or-market basis?

**Exercise 9-48****Valuation of Return****LO8**

Napali Inc. sells new equipment with a \$5,300 list price. A dissatisfied customer returned one piece of equipment. Napali determines that the returned equipment can be resold if it is reconditioned. The expected sales price of the reconditioned equipment is \$4,500; the reconditioning expenses are estimated to be \$600; and normal profit is 35% of the sales price.

1. Prepare the journal entry to record the sale of the reconditioned equipment for cash assuming that the floor value is used to record the returned equipment.
2. Prepare the journal entry to record the sale of the reconditioned equipment for cash assuming that the original list price is used to record the returned equipment.
3. Evaluate the entries.

**Exercise 9-49****Inventory Loss—Gross Profit Method****LO9**

On August 15, 2011, a hurricane damaged a warehouse of Rheinart Merchandise Company. The entire inventory and many accounting records stored in the warehouse were completely destroyed. Although the inventory was not insured, a portion could be sold for scrap. Through the use of the remaining records, the following data are assembled:

Inventory, January 1	\$ 375,000
Purchases, January 1–August 15	1,385,000
Cash sales, January 1–August 15	225,000
Collection of accounts receivable, January 1–August 15	2,115,000
Accounts receivable, January 1	175,000
Accounts receivable, August 15	265,000
Salvage value of inventory	5,000
Gross profit percentage on sales	32%

Compute the inventory loss as a result of the hurricane.

**Exercise 9-50****Inventory Loss—Gross Profit Method****LO9**

On June 30, 2011, a flash flood damaged the warehouse and factory of Magna Corporation, completely destroying the work-in-process inventory. There was no damage to either the raw materials or finished goods inventories. A physical inventory taken after the flood revealed the following valuations:

Finished goods .....	\$123,000
Work in process .....	0
Raw materials .....	46,100

The inventory on January 1, 2011, consisted of the following:

Finished goods .....	\$109,000
Work in process .....	103,000
Raw materials .....	49,300
	<u>\$261,300</u>

A review of the books and records disclosed that the gross profit margin historically approximated 42% of sales. The sales for the first six months of 2011 were \$584,000. Raw materials purchases were \$88,000. Direct labor costs for this period were \$130,000, and manufacturing overhead has historically been applied at 70% of direct labor.

Compute the value of the work-in-process inventory lost on June 30, 2011.

### Exercise 9-51

#### LO10

#### Correction of Inventory Errors

Annual income for the Stoker Co. for the period 2007–2011 appears below. However, a review of the records for the company reveals inventory misstatements as listed. Calculate corrected net income for each year.

	2007	2008	2009	2010	2011
Reported net income (loss) .....	\$18,000	\$13,000	\$2,000	\$(5,800)	\$16,000
Inventory overstatement, end of year .....		5,500			3,600
Inventory understatement, end of year .....	4,500			10,500	

### Exercise 9-52

#### LO10

#### Effect on Net Income of Inventory Errors

The Martin Company reported income before taxes of \$370,000 for 2010 and \$526,000 for 2011. A later audit produced the following information:

- The ending inventory for 2010 included 2,000 units erroneously priced at \$5.90 per unit. The correct cost was \$9.50 per unit.
- Merchandise costing \$17,500 was shipped to the Martin Company, FOB shipping point, on December 26, 2010. The purchase was recorded in 2010, but the merchandise was excluded from the ending inventory because it was not received until January 4, 2011.
- On December 28, 2010, merchandise costing \$2,900 was sold to Deluxe Paint Shop. Deluxe had asked Martin in writing to keep the merchandise for it until January 2, when it would come and pick it up. Because the merchandise was still in the store at year-end, the merchandise was included in the inventory count. The sale was correctly recorded in December 2010.
- Craft Company sold merchandise costing \$1,500 to Martin Company. The purchase was made on December 29, 2010, and the merchandise was shipped on December 30. Terms were FOB shipping point. Because the Martin Company bookkeeper was on vacation, neither the purchase nor the receipt of goods was recorded on the books until January 2011.

Assume that all amounts are material and a physical count of inventory was taken every December 31.

- Compute the corrected income before taxes for each year.
- By what amount did the total income before taxes change for the two years combined?
- Assume all errors were found in February 2011, just after the books were closed for 2010. What journal entry would be made? Martin uses a periodic inventory system.

**Exercise 9-53****Correction of LIFO Inventory**

The Manwaring Products Company's inventory record appears below.

**LO10**

	Purchases		Sales
	Quantity	Unit Cost	Quantity
2009 .....	8,200	\$4.30	5,800
2010 .....	8,900	4.80	9,200
2011 .....	6,800	5.10	6,300

The company uses a LIFO cost flow assumption. It reported ending inventories as follows for its first three years of operations:

2009 .....	\$10,320
2010 .....	9,630
2011 .....	12,120

Determine if the Manwaring Products Company has reported its inventory correctly. Assuming that 2011 accounts are not yet closed, make any necessary correcting entries.

**Exercise 9-54****Inventory Turnover**

The Rigby Supplement Company showed the following data in its financial statements.

**LO11**

	2011	2010
Cost of goods sold .....	\$1,400,000	\$1,125,000
Beginning inventory .....	275,000	175,000
Ending inventory .....	405,000	275,000

1. Compute the number of days' sales in average inventory for both 2010 and 2011. What can you infer from these numbers?
2. How would you interpret the answer to (1) if this company were in the business of selling fresh fruits and vegetables? What if the company sold real estate?

**EXPANDED MATERIAL****Exercise 9-55****Retail Inventory Method**

The Evening Out Clothing Store values its inventory using the retail inventory method. The following data are available for the month of November 2011:

**LO12**

	Cost	Retail
Inventory, November 1 .....	\$ 53,800	\$ 80,000
Purchases .....	154,304	220,000
Sales .....		244,000

Compute the estimated inventory at November 30, 2011, assuming:

1. FIFO
2. LIFO
3. Average cost

**Exercise 9-56****Retail Inventory Method**

The Help-U-Succeed Bookstore recently received a shipment of accounting textbooks from the publisher. Following the receipt of the shipment, the FASB issued a major new accounting standard that related directly to the contents of one chapter of the text. Portions of this chapter became "obsolete" immediately as a result of the FASB's action. In order to sell the books, the bookstore marked down the selling price and offered a separate supplement covering the new standard, which was provided at no cost by the publisher. Information relating to the cost and selling price of the text for the month of September is given below.

**LO12**

	Cost	Retail
Beginning inventory .....	\$ 2,400	\$ 3,000
Purchases .....	27,000	36,000
Freight-in .....	1,800	
Markdowns .....		2,600
Sales .....		31,200

Based on the data given, compute the estimated inventory at the end of the month using the retail inventory method and assuming:

1. Lower-of-cost-or-market valuation
2. Average cost valuation

**Exercise 9-57****LO12****Retail Inventory Method**

Carmel Department Store uses the retail inventory method. On December 31, 2011, the following information relating to the inventory was gathered:

	Cost	Retail
Inventory, January 1, 2011 .....	\$ 26,550	\$ 45,000
Sales .....		430,000
Purchases .....	309,000	435,000
Purchase discounts .....	4,200	
Freight-in .....	5,250	
Markups .....		30,000
Markdowns .....		40,000
Sales discounts .....		5,000

Compute the ending inventory value at December 31, 2011, using:

1. the average cost method.
2. the lower-of-cost-or-market method.

**Exercise 9-58****LO13****Computing Inventory Using LIFO Pools**

Miller Mfg. has one LIFO pool. Information relating to the products in this pool is as follows:

Beginning inventory, January 1 .....	60 units @ \$10 each
Purchase, February 12 .....	45 units @ \$12 each
Purchase, February 28 .....	75 units @ \$18 each
Purchase, March 15 .....	65 units @ \$12.50 each
Sales for the first quarter .....	135 units

Compute the ending LIFO inventory value for the first quarter assuming new layers are valued based on:

1. A FIFO assumption
2. A LIFO assumption
3. An average cost assumption

**Exercise 9-59****LO13****Dollar-Value LIFO Inventory Method**

The Wernli Manufacturing Company manufactures a single product. The managers, Brandon and Chris Wernli, decided on December 31, 2008, to adopt the dollar-value LIFO inventory method. The inventory value on that date using the newly adopted dollar-value LIFO method was \$700,000. Additional information follows:

Date	Inventory at Year-End Prices	Year-End Price Index
Dec. 31, 2009 .....	\$803,000	1.10
Dec. 31, 2010 .....	806,400	1.12
Dec. 31, 2011 .....	894,000	1.20

Compute the inventory value at December 31 of each year using the dollar-value method, assuming incremental layers are valued at year-end prices.

**Exercise 9-60****Dollar-Value LIFO Inventory Method****LO13**

Jennifer Inc. adopted dollar-value LIFO on December 31, 2008. Data for 2008–2011 follow:

*Inventory and index on the adoption date, December 31, 2008:*

Dollar-value LIFO inventory .....	\$250,000
Price index at year-end (the base year) .....	1.00

*Inventory information in succeeding years:*

Date	Inventory at Year-End Prices	Year-End Price Index	Average Price Index
Dec. 31, 2009 .....	\$314,720	1.12	1.04
Dec. 31, 2010 .....	361,800	1.20	1.14
Dec. 31, 2011 .....	353,822	1.27	1.20

1. Compute the inventory value at December 31 of each year under the dollar-value method, assuming new layers are valued using the average price index.
2. Compute the inventory value at December 31, 2011, assuming that dollar-value procedures were adopted at December 31, 2009, rather than in 2008. The beginning layer is the December 31, 2009, balance.

**Exercise 9-61****Dollar-Value LIFO Retail Method****LO13**

On February 15, 2012, Rooker, Madras & Associates compiled the following information concerning inventory for five years. They used the dollar-value LIFO retail inventory method.

Date	Year-End Price Index at Retail	Incremental Layer Index	Incremental Cost Percentage	Inventory
Dec. 31, 2007 .....	1.00	1.00	71%	\$155,000
Dec. 31, 2008 .....	1.04	1.02	72	188,600
Dec. 31, 2009 .....	1.14	1.09	64	192,500
Dec. 31, 2010 .....	1.12	1.11	63	194,200
Dec. 31, 2011 .....	1.16	1.12	67	195,800

Compute the inventory cost at the end of each year under the dollar-value LIFO retail method. (Round all dollar amounts to the nearest dollar.)

**Exercise 9-62****Loss on Purchase Commitments****LO14**

On October 1, 2011, Sloan Oil Inc. entered into a 6-month, \$650,000 purchase commitment for a supply of oil. On December 31, 2011, the market value of oil had fallen to \$552,500. Make the journal entries necessary on December 31, 2011, and on March 31, 2012, assuming that the market value of the inventory on March 31 is \$430,000.

**Exercise 9-63****Foreign Currency Purchase****LO15**

Wittenbecher's, a German company that supplies your firm with a necessary raw material, recently shipped 15,000 units of the material to your production facility.

1. Prepare the necessary journal entries to record the purchase of the goods and the subsequent payment 30 days later if the selling price on the invoice is \$3 per unit.
2. Prepare the necessary journal entries to record the purchase of the goods and the subsequent payment 30 days later if the selling price on the invoice is 6 euros per unit. On the date of purchase, 1 euro is worth \$0.50, and the rate on the date of payment is \$0.60.

## Exercise 9-64

**Foreign Currency Purchase**

## LO15

Kyoto Manufacturing produces automobile mufflers, which are then sent to the United States where they are installed in domestically built cars. Truck Inc., a U.S. auto company, received a shipment of mufflers on December 15, 2010. The mufflers were subsequently paid for on January 30, 2011. The invoice was denominated in Korean won and totaled 4,500,000 won. The number of Korean won required to purchase 1 U.S. dollar fluctuated as follows:

	Exchange Rates
December 15, 2010 .....	1,000
December 31, 2010 .....	900
January 30, 2011 .....	880

Provide the necessary journal entries for Truck Inc. to record the above transactions assuming Truck Inc.'s fiscal year-end is December 31.

## PROBLEMS

## Problem 9-65

**Computing Cost of Goods Sold for a Manufacturing Firm**

## LO1, LO4

The following information is available for Granite Inc.

	Products in Sample Inventory		
	2011	2010	2009
Raw materials:			
Beginning inventory .....	\$ 125	\$ ?	\$ 96
Purchases .....	372	410	?
Materials available to use .....	\$ ?	\$ ?	\$ 463
Ending inventory .....	136	?	?
Raw materials used .....	\$ ?	\$ 379	\$ 369
Direct labor .....	318	?	307
Manufacturing overhead .....	398	401	?
Total manufacturing costs .....	\$ ?	\$ 1,093	\$ 1,059
Work in process, January 1 .....	78	?	74
	\$ 1,155	\$ ?	\$ ?
Work in process, December 31 .....	?	78	?
Cost of goods manufactured .....	\$ ?	\$ ?	\$ 1,052
Finished goods, January 1 .....	?	90	83
	\$ 1,167	\$ ?	\$ ?
Finished goods, December 31 .....	?	110	?
Cost of goods sold .....	\$ 1,067	\$ 1,076	\$ ?

**Instructions:** Compute the missing amounts.

## Problem 9-66

**Whose Inventory Is It?**

## LO3

Streuling Inc. is preparing its 2011 year-end financial statements. Prior to any adjustments, inventory is valued at \$76,050. The following information has been found relating to certain inventory transactions:

- Goods valued at \$11,000 are on consignment with a customer. These goods are not included in the \$76,050 inventory figure.
- Goods costing \$2,700 were received from a vendor on January 5, 2012. The related invoice was received and recorded on January 12, 2012. The goods were shipped on December 31, 2011, terms FOB shipping point.
- Goods costing \$8,500 were shipped on December 31, 2011, and were delivered to the customer on January 2, 2012. The terms of the invoice were FOB shipping point. The goods were included in ending inventory for 2011 even though the sale was recorded in 2011.

- (d) A \$3,500 shipment of goods to a customer on December 31, terms FOB destination, was not included in the year-end inventory. The goods cost \$2,600 and were delivered to the customer on January 8, 2012. The sale was properly recorded in 2012.
- (e) An invoice for goods costing \$3,500 was received and recorded as a purchase on December 31, 2011. The related goods, shipped FOB destination, were received on January 2, 2012, and thus were not included in the physical inventory.
- (f) Goods valued at \$6,500 are on consignment from a vendor. These goods are not included in the year-end inventory figure.
- (g) A \$10,500 shipment of goods to a customer on December 30, 2011, terms FOB destination, was recorded as a sale in 2011. The goods, costing \$8,200 and delivered to the customer on January 6, 2012, were not included in 2011 ending inventory.

**Instructions:**

- Determine the appropriate accounting treatment for each of the preceding items. Justify your answers.
- Compute the proper inventory amount to be reported on Streuling Inc.'s balance sheet for the year ended December 31, 2011.
- By how much would net income have been misstated if no adjustments were made for the above transactions? Ignore income taxes.

**Problem 9-67****LO5****Inventory Computation Using Different Cost Flows**

The Gidewall Corporation uses part 210 in a manufacturing process. Information as to balances on hand, purchases, and requisitions of part 210 is given in the following table:

Date	Quantities Received	Issued	Balance	Unit Purchase Price
January 8 .....	—	—	200	\$1.55
January 29 .....	200	—	400	1.70
February 8 .....	—	80	320	—
March 20 .....	—	160	160	—
July 10 .....	150	—	310	1.75
August 18 .....	—	110	200	—
September 6 .....	—	75	125	—
November 14 .....	250	—	375	2.00
December 29 .....	—	100	275	—

**Instructions:** What is the closing inventory under each of the following pricing methods? (Round unit costs to three decimal places.)

- Perpetual FIFO
- Periodic FIFO
- Perpetual LIFO
- Periodic LIFO
- Perpetual average
- Periodic average

**Problem 9-68****LO5****DEMO PROBLEM****Inventory Computation Using Different Cost Flows**

Records of the Swain New Products Co. show the following data relative to Product M:

March	2	Inventory .....	450 units at \$26.00
	3	Sale .....	400 units at \$33.00
	6	Purchase .....	350 units at \$27.50
	13	Purchase .....	300 units at \$28.00
	20	Sale .....	300 units at \$34.50
	25	Purchase .....	100 units at \$27.00
	28	Sale .....	200 units at \$35.00

**Instructions:** Calculate the inventory balance and the gross profit on sales for the month on each of the following bases.

- Perpetual FIFO
- Periodic FIFO

3. Perpetual LIFO
4. Periodic LIFO
5. Perpetual average (Carry calculations to four decimal places and round to three.)
6. Periodic average

**Problem 9-69****LO5****Inventory Calculations—LIFO and FIFO**

The Marci Manufacturing Co. was organized in 2009 to produce a single product. The company's production and sales records for the period 2009–2011 are summarized below.

	Units Produced		Sales	
	No. of Units	Production Costs	No. of Units	Sales Revenue
2009 .....	330,000	\$198,000	250,000	\$200,000
2010 .....	310,000	201,500	300,000	255,000
2011 .....	290,000	179,800	270,000	210,000

All units produced in a given year are assigned the same average cost.

**Instructions:** Calculate the gross profit for each of the three years assuming that inventory values are calculated in terms of:

1. LIFO
2. FIFO

**Problem 9-70****LO4, LO5****Computation of Inventory from Balance Sheet and Transaction Data**

A portion of the Stark Company's balance sheet appears as follows:

	December 31, 2011	December 31, 2010
Assets:		
Cash .....	\$353,300	\$100,000
Notes receivable .....	0	25,000
Inventory .....	?	199,875
Liabilities:		
Accounts payable .....	?	75,000

Stark Company pays for all operating expenses with cash and purchases all inventory on credit. During 2011, cash totaling \$471,700 was paid on accounts payable. Operating expenses for 2011 totaled \$220,000. All sales are cash sales. The inventory was restocked by purchasing 1,500 units per month and valued by using periodic FIFO. The unit cost of inventory was \$32.60 during January 2011 and increased \$0.10 per month during the year. Stark sells only one product. All sales are made for \$50 per unit. The ending inventory for 2010 was valued at \$32.50 per unit.

**Instructions:**

1. Compute the number of units sold during 2011.
2. Compute the December 31, 2011, accounts payable balance.
3. Compute the beginning inventory quantity.
4. Compute the ending inventory quantity and value.
5. Prepare an income statement for 2011 (including a detailed Cost of Goods Sold section and ignoring income taxes).

**Problem 9-71****LO6****Impact of LIFO Inventory System**

Norsk Corporation sells household appliances and uses LIFO for inventory costing. The inventory contains 10 different products, and historical LIFO layers are maintained for each of them. The LIFO layers for one of the products, Cook Right, were as follows at December 31, 2010:

2009 layer .....	4,600 @ \$75	2000 layer .....	2,300 @ \$58
2004 layer .....	4,100 @ \$65	1998 layer .....	5,000 @ \$50

**Instructions:**

1. What was the value of the ending inventory of Cook Right at December 31, 2010?
2. How did the December 31, 2010, quantity of Cook Right compare with the December 31, 2009, quantity?
3. What is the value of the ending inventory of Cook Right at December 31, 2011, if there are 15,600 units on hand?
4. How would net income in (3) be affected if, in addition to the quantity on hand, 950 units were in transit to Norsk Corporation at December 31, 2011? The shipment was made on December 26, 2011, terms FOB shipping point. Total invoice cost was \$78,850. Ignore income taxes. Assume that all units purchased during 2011 were purchased at the same unit price as these 950 units.

**Problem 9-72****LO7****Change from FIFO to LIFO Inventory**

The Greenriver Manufacturing Company manufactures two products: Raft and Float. At December 31, 2010, Greenriver used the FIFO inventory method. Effective January 1, 2011, Greenriver changed to the LIFO inventory method. The retroactive effect of this change is not determinable, and as a result, the ending inventory for 2010 for which the FIFO method was used is also the beginning inventory for 2011 for the LIFO method. Any layers added during 2011 should be costed by reference to the first acquisitions of 2011.

The information below was available from Greenriver inventory records for the two most recent years:

	Raft		Float	
	Units	Unit Cost	Units	Unit Cost
2010 purchases:				
January 7 .....	5,000	\$4.00	22,000	\$2.00
April 16 .....	12,000	4.50		
November 8 .....	17,000	5.00	18,500	2.50
December 13 .....	10,000	6.00		
2011 purchases:				
February 11 .....	3,000	7.00	23,000	3.00
May 20 .....	8,000	7.50		
October 15 .....	20,000	8.00		
December 23 .....			15,500	3.50
Units on hand:				
December 31, 2010 .....	15,000		14,500	
December 31, 2011 .....	16,000		13,000	

**Instructions:** Compute the effect on net income for the year ended December 31, 2011, resulting from the change from the FIFO to the LIFO inventory method. Ignore income taxes.

**Problem 9-73****LO8****Lower-of-Cost-or-Market Valuation**

Witte Inc. carries four items in inventory. The following per-unit data relate to these items at the end of 2011:

	Units	Cost	Replacement Cost	Estimated Sales Price	Selling Cost	Normal Profit
Category 1:						
Commodity A .....	2,500	\$10.50	\$10.00	\$13.00	\$1.25	\$2.00
Commodity B .....	1,850	7.00	6.50	9.75	0.75	1.10
Category 2:						
Commodity C .....	4,000	3.00	2.25	4.65	0.75	0.60
Commodity D .....	2,950	6.50	7.00	7.25	1.25	1.50

**Instructions:**

1. Calculate the value of the inventory under each of the following methods:
  - (a) Cost
  - (b) The lower of cost or market applied to the individual inventory items
  - (c) The lower of cost or market applied to the inventory categories
  - (d) The lower of cost or market applied to the inventory as a whole
2. Prepare any journal entries necessary to reflect the proper inventory valuation assuming inventory is valued at:
  - (a) Cost
  - (b) The lower of cost or market applied to the individual inventory items
  - (c) The lower of cost or market applied to the inventory categories (*Hint: Use a valuation allowance.*)
  - (d) The lower of cost or market applied to the inventory as a whole

**Problem 9-74**

LO5, LO8

**Lower-of-Cost-or-Market Valuation**

Far East Sales Co. uses the first-in, first-out method in calculating cost of goods sold for three of the products that Far East handles. Inventories and purchase information concerning these three products are given for the month of March.

On March 31, Far East’s suppliers reduced their prices from the most recent purchase prices by the following percentages: product X, 15%; product Y, 12%; product Z, 9%. Accordingly, Far East decided to reduce its sales prices on all items by 10%, effective April 1. Far East’s selling cost is 10% of sales price. Products X and Y have a normal profit (after selling costs) of 25% on sales prices, while the normal profit on product Z (after selling cost) is 8% of sales price.

		Product X	Product Y	Product Z
Mar. 1	Inventory .....	8,000 units at \$7.00	4,000 units at \$10.50	7,100 units at \$1.60
Mar. 1–15	Purchases .....	10,000 units at \$8.00	6,300 units at \$11.00	3,400 units at \$2.10
Mar. 16–31	Purchases .....	5,000 units at \$9.00		
Mar. 1–31	Sales .....	17,000 units	7,000 units	5,200 units
Mar. 31	Sales price .....	\$9.00 per unit	\$12.00 per unit	\$3.00 per unit

**Instructions:**

1. Calculate the value of the inventory at March 31, using the lower-of-cost-or-market method (applied to individual items).
2. Calculate the FIFO cost of goods sold for March and the amount of inventory write-off due to the market decline.

**Problem 9-75**

LO9

**Trade-Ins and Repossessed Inventory**

The Jamison Appliance Company began business on January 1, 2010. The company decided from the beginning to grant allowances on merchandise traded in as partial payment on new sales. During 2011, the company granted trade-in allowances of \$64,035. The wholesale value of merchandise traded in was \$40,875. Trade-ins recorded at \$39,000 were sold for their wholesale value of \$27,000 during the year. The following summary entries were made to record annual sales of new merchandise and trade-in sales for 2011.

Accounts Receivable .....	439,890	
Trade-In Inventory .....	64,035	
Sales .....		503,925
Cash .....	27,000	
Loss on Trade-In Inventory .....	12,000	
Trade-In Inventory .....		39,000

When a customer defaults on the accounts receivable contract, the merchandise is repossessed. During 2011, the following repossessions occurred:

	Original Sales Price	Unpaid Contract Balance
On 2010 contracts .....	\$37,500	\$15,600
On 2011 contracts .....	24,000	17,800

The wholesale value of these goods is estimated as follows:

- Goods repossessed during year of sale are valued at 50% of original sales price.
- Goods repossessed in later years are valued at 20% of original sales price.

**Instructions:**

- At what values should Jamison Appliance report the trade-in and repossessed inventory at December 31, 2011?
- Give the entry that should have been made to record the repossessions of 2011.
- Give the entry that is required to correct the trade-in summary entries.

**Problem 9-76**

**LO8**

**Inventory Transactions—Journal Entries**

The Hansen Company values its inventory at the lower of FIFO cost or market. The inventory accounts at December 31, 2010, had the following balances:

Raw materials .....	\$ 92,000
Work in process .....	140,510
Finished goods .....	195,350

The following are some of the transactions that affected the inventory of the Hansen Company during 2011.

- Feb. 10 Hansen Company purchases raw materials at an invoice price of \$20,000; terms 3/15, n/30. Hansen Company values inventory at the net invoice price.
- Mar. 15 Hansen Company repossesses an inventory item from a customer who was overdue in making payment. The unpaid balance on the sale is \$220. The repossessed merchandise is to be refinished and placed on sale. It is expected that the item can be sold for \$350 after estimated refinishing costs of \$90. The normal profit for this item is considered to be \$65.
- Apr. 1 Refinishing costs of \$75 are incurred on the repossessed item.  
10 The repossessed item is resold for \$350 on account, 30% down.
- May 30 A sale on account is made of finished goods that have a list price of \$670 and a cost of \$410. A reduction of \$100 off the list price is granted as a trade-in allowance. The trade-in item is to be priced to sell at \$90 as is. The normal profit on this type of inventory is 25% of the sales price.
- Dec. 31 The following information is available to adjust the accounts for the annual statements.  
(a) The raw materials inventory account has a cost balance of \$105,700. Current market value is \$99,700.  
(b) The finished goods inventory account has a cost balance of \$180,250. Current market value is \$195,480.

**Instructions:** Record this information in journal entry form, including any required adjusting entries at December 31, 2011.

**Problem 9-77**

**LO9**

**DEMO PROBLEM**

**Inventory Fire Loss**

Reagan Manufacturing began operations five years ago. On August 13, 2011, a fire broke out in the warehouse destroying all inventory and many accounting records relating to the inventory. The information available is presented below. All sales and purchases are on account.

	January 1, 2011	August 13, 2011
Inventory .....	\$128,400	
Accounts receivable .....	152,640	\$148,520
Accounts payable .....	91,320	105,600
Collection on accounts receivable, January 1–August 13 .....		797,300
Payments to suppliers, January 1–August 13 .....		463,800
Goods out on consignment at August 13, at cost .....		29,300

Summary of previous years' sales:

	2008	2009	2010
Sales .....	\$842,000	\$765,000	\$820,000
Gross profit on sales .....	336,800	290,700	344,400

**Instructions:** Determine the inventory loss suffered as a result of the fire.

**Problem 9-78**

**Interim Inventory Computation—Gross Profit Method**

The following information was taken from the records of Prairie Company.

**LO9**

	Jan. 1, 2010–Dec. 31, 2010	Jan. 1, 2011–Sept. 30, 2011
Sales .....	\$2,500,000	\$1,500,000
Beginning inventory .....	420,000	785,000
Purchases .....	2,152,000	1,061,000
Freight-in .....	116,000	72,000
Purchase discounts .....	30,000	15,000
Purchase returns .....	40,000	13,000
Purchase allowances .....	8,000	5,000
Ending inventory .....	785,000	?
Selling and general expenses .....	450,000	320,000

**Instructions:** Using the gross profit method, compute the value to be assigned to the inventory as of September 30, 2011, and prepare an income statement for the 9-month period ending on this date.

**Problem 9-79**

**Inventory Theft Loss**

In December 2011, JB Masterpiece Merchandise Inc. had a significant portion of its inventory stolen. The company determined the cost of inventory remaining to be \$32,400. The following information was taken from the records of the company:

**LO9**

	Jan. 1, 2011 to Date of Theft	2010
Purchases .....	\$141,670	\$156,430
Purchase returns and allowances .....	7,250	6,580
Sales .....	275,600	283,300
Sales returns and allowances .....	3,400	2,900
Salaries .....	10,100	12,900

	Jan. 1, 2011 to Date of Theft	2010
Rent .....	\$ 5,340	\$ 7,120
Insurance .....	1,030	1,340
Utilities .....	1,115	1,435
Advertising .....	4,925	3,741
Depreciation expense .....	1,890	2,106
Beginning inventory .....	74,620	69,780

**Instructions:** Estimate the cost of the stolen inventory.

**Problem 9-80**

**Inventory Error Correction**

The Sonntag Corporation has adjusted and closed its books at the end of 2010. The company arrives at its inventory position by a physical count taken on December 31 of each year. In March of 2011, the following errors were discovered:

**LO10**

- (a) Merchandise that cost \$2,500 was sold for \$3,400 on December 29, 2010. The order was shipped December 31, 2010, with terms of FOB shipping point. The merchandise was not included in the ending inventory. The sale was recorded on January 12, 2011, when the customer made payment on the sale.

- (b) On January 3, 2011, Sonntag Corporation received merchandise that had been shipped to it on December 30, 2010. The terms of the purchase were FOB shipping point. Cost of the merchandise was \$1,750. The purchase was recorded and the goods included in the inventory when payment was made in January 2011.
- (c) On January 8, 2011, merchandise that had been included in the ending inventory was returned to Sonntag because the consignee had not been able to sell it. The cost of this merchandise was \$1,200 with a selling price of \$1,800.
- (d) Merchandise costing \$750, located in a separate warehouse, was overlooked and excluded from the 2010 inventory count.
- (e) On December 26, 2010, Sonntag Corporation purchased merchandise costing \$1,175 from a supplier. The order was shipped December 28 (terms FOB destination) and was still “in transit” on December 31. Because the invoice was received on December 31, the purchase was recorded in 2010. The merchandise was not included in the inventory count.
- (f) The corporation failed to make an entry for a purchase on account of \$835 at the end of 2010, although it included this merchandise in the inventory count. The purchase was recorded when payment was made to the supplier in 2011.
- (g) The corporation included in its 2010 ending inventory merchandise with a cost of \$1,350. This merchandise had been custom built and was being held according to the customer’s written request until the customer could come and pick up the merchandise. The sale, for \$1,825, was recorded in 2011.

**Instructions:** Give the entry in 2011 (2010 books are closed) to correct each error. Assume that the errors were made during 2010, all amounts are material, and the periodic inventory system is used.

### Problem 9-81

#### LO11

### Inventory Turnover Analysis

The following information for Whittier Technologies was taken from the company’s financial statements (amounts in thousands):

	2011	2010	2009	2008
Sales .....	\$60,000	\$51,000	\$39,000	\$30,000
Cost of goods sold .....	41,200	34,900	26,500	22,200
Inventory .....	3,000	2,700	2,200	1,800
Accounts receivable .....	5,600	5,200	5,100	4,700
Accounts payable .....	2,500	2,100	1,900	2,400
Net income .....	7,260	6,540	4,950	4,100

### Instructions:

1. Compute the inventory turnover and the number of days’ sales in inventory for the years 2009–2011. Use average inventory in your calculations.
2. Evaluate Whittier’s inventory turnover trend.

## EXPANDED MATERIAL

### Problem 9-82

#### LO13

### Computation of LIFO Inventory with LIFO Pools

The Bergman Company sells three different products. Five years ago, management adopted the LIFO inventory method and established three specific pools of goods. Bergman values all incremental layers of inventory at the average cost of purchases within the period. Information relating to the three products for the first quarter of 2011 is given on the following page.

	Product 400	Product 401	Product 402
Purchases:			
January .....	1,000 @ \$12.00	500 @ \$25	5,000 @ \$5.30
February .....	1,500 @ \$12.50	250 @ \$26	4,850 @ \$5.38
March .....	1,200 @ \$12.25	—	3,500 @ \$5.45
First quarter sales (units) .....	2,850	775	10,750
January 1, 2011, inventory .....	950 @ \$11.50	155 @ \$24	3,760 @ \$5.00

**Instructions:** Compute the ending inventory value for the first quarter of 2011. (Round unit inventory values to the nearest cent and final inventory values to the nearest dollar.)

### Problem 9-83

#### LO13

#### Dollar-Value LIFO Inventory Method

Bob's Repair Shop began operations on January 1, 2006. After discussing the matter with his accountant, Bob decided dollar-value LIFO should be used for inventory costing. Information concerning the inventory of Bob's Repair Shop is shown below.

Date	Inventory at Year-End Prices	Year-End Index
Dec. 31, 2006 .....	\$32,400	1.00
Dec. 31, 2007 .....	43,100	1.16
Dec. 31, 2008 .....	61,300	1.34
Dec. 31, 2009 .....	52,900	1.20
Dec. 31, 2010 .....	79,700	1.68
Dec. 31, 2011 .....	70,800	2.10

**Instructions:** Compute the inventory value at December 31 of each year under the dollar-value LIFO inventory method, assuming incremental layers are valued using the year-end price index.

### Problem 9-84

#### LO13

#### Dollar-Value LIFO Retail Inventory Method

In 2008, Van Hover Inc. adopted the dollar-value LIFO retail inventory method. The January 1, 2008, price index was 1.00. The following data are available for the 4-year period ending December 31, 2011.

	Cost	Retail
2008:		
Inventory, January 1 .....	\$148,050	\$235,000
Purchases .....	393,700	635,000
Sales .....		590,000
Year-end price index .....		1.12
2009:		
Purchases .....	\$363,000	\$550,000
Sales .....		579,170
Year-end price index .....		1.08
2010:		
Purchases .....	\$377,000	\$650,000
Sales .....		641,955
Year-end price index .....		1.09
2011:		
Purchases .....	\$504,000	\$800,000
Sales .....		762,500
Year-end price index .....		1.12

**Instructions:** Calculate the inventories to be reported at the end of 2008, 2009, 2010, and 2011. Incremental layers are costed at end-of-year prices.

## Problem 9-85

**Purchase Commitments**

## LO14

On November 17, 2011, Antarctic Airlines entered into a commitment to purchase 3,000 barrels of aviation fuel for \$150,000 on March 23, 2012. Antarctic entered into this purchase commitment to protect itself against the volatility in the aviation fuel market. By December 31, the purchase price of aviation fuel had fallen to \$43 per barrel. However, by March 23, 2012, when Antarctic took delivery of the 3,000 barrels, the price of aviation fuel had risen to \$54 per barrel.

**Instructions:**

1. Make the journal entry necessary on November 17, 2011, to record the purchase commitment.
2. Make any adjusting entry necessary on December 31, 2011.
3. What type of account (e.g., asset, liability, revenue) is Estimated Loss on Purchase Commitments?
4. Make the journal entry to record the purchase on March 23, 2012. Antarctic uses a periodic inventory system.

## Problem 9-86

**Foreign Currency Transactions**

## LO15

Charles & Sons, a U.S. computer supplies firm, had the following transactions with foreign companies during December 2010:

- (a) Goldstar Co., Ltd., a South Korea-based firm, sold 5,000 computer hard drives to Charles & Sons for 100,000 won per drive on December 12, 2010. Charles & Sons paid the bill on January 13, 2011.
- (b) Charles & Sons sold 2,000 computer hard drives to a Swiss firm, Lockner Inc., on December 21, 2010. Lockner Inc. agreed to pay \$135 per hard drive. Payment was received by Charles & Sons on February 4, 2011.
- (c) Charles & Sons sold 2,400 computer hard drives to Geopacific, Inc., a company with headquarters in Canada, on December 28, 2010. Geopacific was billed 148 Canadian dollars per drive. Payment was received on January 10, 2011.
- (d) Charles & Sons received 1,000 printers from Printco, a Japanese company, on December 28, 2010. Printco billed Charles & Sons 45,000 yen per printer. Charles & Sons paid the liability on January 14, 2011.

Exchange rates for the above transactions are as follows:

U.S. Dollar Value of 1 Unit of Foreign Currency			
	As of Date of Sale or Purchase	As of Balance Sheet Date	As of Date of Payment or Receipt
South Korean won .....	\$0.00103	\$0.00112	\$0.00115
Swiss franc .....	0.670	0.632	0.655
Canadian dollar .....	0.910	0.935	0.905
Japanese yen .....	0.0075	0.0069	0.0073

**Instructions:** Prepare the journal entries necessary for Charles & Sons to record each of the above transactions for the following: (1) date of the original transaction, (2) balance sheet date, and (3) date of payment or receipt of cash.

## CASES

Discussion  
Case 9-87**Should We Adopt LIFO?**

You are the controller of the Ford Steel Co. The economy enters a period of high inflation. Although profits are higher this year than last, you realize that the cost to replace inventory is also higher. You are aware that many companies are changing to the LIFO inventory method to save taxes in the current year, but you are concerned

that what goes up will eventually come down, and when prices decline, the LIFO method will result in higher taxes. Because declining prices are usually equated with economic recession, it is likely that the higher taxes will have to be paid at a time when revenues are declining.

What factors should you consider before making a change to LIFO? Based on the above considerations, what would you recommend?

**Discussion Case 9-88**

**Which Method Shall We Use?**

The White Wove Corporation began operations in 2011. A summary of the first quarter appears below.

	Units	Total Cost	
<b>Purchases:</b>			
January 2 .....	250	\$23,250	
February 11 .....	100	9,500	
February 20 .....	400	38,400	
March 21 .....	200	19,600	
March 27 .....	225	22,275	
<b>Other data:</b>			
	Sales in Units	Sales Price per Unit	Operating Expenses
January .....	200	\$140	\$9,575
February .....	225	142	7,820
March .....	350	145	7,905

The White Wove Corporation used the LIFO perpetual inventory method and correctly computed an inventory value of \$38,300 at the end of the first quarter. Management is considering changing to a FIFO costing method. It has also considered using a periodic system instead of the perpetual system presently being used. You have been hired to assist management in making the decision. What would you advise?

**Discussion Case 9-89**

**Can I Use Both LIFO and FIFO?**

Many countries around the world do not allow use of the LIFO method. The harmonization of accounting standards across countries may require a compromise on the use of LIFO concepts. Some accountants in the United States are suggesting the use of a LIFO/FIFO system that would use LIFO on the income statement and FIFO on the balance sheet. This method would not be a cost allocation method because in most cases it would not result in a clean allocation of cost of goods available for sale into ending inventory and cost of goods sold.

What theoretical arguments can be made in favor of this hybrid LIFO/FIFO system? One practical problem that would arise from using different methods for the income statement and the balance sheet is that the balance sheet wouldn't balance. How would you suggest solving this problem?

**Discussion Case 9-90**

**How Well Am I Really Doing?**

Fay Stocks sells oriental rugs. She uses the FIFO method of inventory costing. The inventory available for sale for a particular style of rug is as follows:

Inventory Date	Current Inventory	Cost
June 14 .....	4	@ \$1,200 each
June 21 .....	3	@ \$1,500 each
July 5 .....	6	@ \$1,700 each

On July 31, a wealthy customer purchases three rugs paying \$2,600 for each. Fay immediately replaces those rugs with three new rugs at a cost of \$2,300 apiece. In addition, Fay immediately pays income tax on the sale at a rate of 40%. (Assume that she has no other expenses.) What is Fay's net income (after taxes) from the sale of

the rugs? What is Fay's net cash flow from the sale of the rugs, the payment of income taxes, and the subsequent purchase of three new rugs? Why is there a substantial difference between net income and cash flow? What other circumstances can lead to differences like those illustrated in this case?

**Discussion**  
**Case 9-91**

**Have We Really Had a Loss?**

The Destro Company is experiencing an unusual inventory situation. The replacement cost of its principal product has been declining, but because of a unique market condition, Destro has not had to reduce the selling price of the item. Eric Dona, company controller, is aware that GAAP requires the valuation of inventory at the lower of cost or market. He considers market to be replacement cost, and he is concerned that to reduce the ending inventory to replacement cost will improperly reduce net income for the current period. Has an inventory loss occurred? Discuss.

**Discussion**  
**Case 9-92**

**But They Won't Buy Ducks Anymore!**

The Bright-Lite Shirt Company buys wholesale sweatshirts, nightshirts, T-shirts, and other clothing items and, using a novel 4-color processing system, imprints hundreds of designs on the items. The printed shirts are marketed widely to sports stores, department stores, college campus outlets, variety stores, vacation shops, and so on. Gordon Smith, marketing manager, likes to have a wide variety of products on hand so orders can be promptly met. As the number of designs has grown, so has the inventory. However, the designs often exhibit "fad" characteristics, and the demand for ducks, bears, flowers, or sports heroes can change fairly rapidly.

Beverly Patton, the controller, has expressed dismay at the growing inventory and especially the issue of inventory obsolescence. Beverly is now preparing for a meeting with Bright-Lite's external auditor. The auditor is sure to ask for a write-down of inventory to the lower of cost or market. Beverly has sent a report to Gordon urging him to reduce his inventory and change his production concept. Gordon is reluctant to change because Bright-Lite has developed an excellent reputation for meeting emergency requests for inventory.

As Bright-Lite's president, which position will you support: Gordon's or Beverly's? Explain.

**Discussion**  
**Case 9-93**

**Inventory Valuation without Records**

The Ma & Pa Grocery Store has never kept many records. The proceeds from sales are used to pay suppliers for goods delivered. When the owners, Donald and Alicia Wride, need some cash, they withdraw it from the till without any record of it. The Wrides realize that eventually tax returns must be filed, but for three years, "they just haven't got around to it." Finally, the IRS catches up with the Wrides, and an audit of the company records is conducted. The auditor requests the general ledger, special journals, inventory counts, and supporting documentation—very little of which is available. Records of expenditures are extremely sketchy because most expenses are paid in cash. If you were the IRS auditor, what might you do to make a reasonable estimate of income for the company?

**EXPANDED MATERIAL**

**Discussion**  
**Case 9-94**

**Silver's Ups and Downs**

In 1979 and 1980, the Hunt brothers from Texas attempted to corner the world's silver market. Their hope was to own enough silver to be able to dictate world prices. They made purchase commitments, which locked in the price they would pay for silver. For a while, their plan worked. The price of silver rose, and the Hunt brothers used the silver they owned as collateral to purchase more silver.

Their plans were shattered when the price of silver started to decline. From a high in January 1980 of \$50.35 an ounce, the price of silver fell to \$10.80 in just two months. The silver they were using as collateral decreased in value, requiring the Hunt brothers to provide additional collateral. This collateral was in the form of oil, sugar, and real estate, each of which was faring poorly at the time of the silver crash. At the same

time, the purchase commitments they had made required them to buy silver at prices higher than the current market value of silver. The Hunt brothers sought protection in bankruptcy court, and the scheme eventually cost them approximately \$4 billion.

1. What are the risks associated with making purchase commitments?
2. Why do accounting standards require that price declines subsequent to the purchase commitment but prior to the actual purchase be recorded immediately?
3. Can firms take any action to reduce their exposure to changing prices?

**Discussion Case 9-95**

**Can We Avoid Losses from Exchange Rate Changes?**

Smith & Sons routinely purchases inventory from Matsutoshi Corp. Because of unpredictability in the foreign currency markets, transactions denominated in yen leave Smith & Sons exposed to the risks associated with exchange rate changes. Identify and discuss methods by which Smith & Sons can reduce its exposure to foreign currency losses.

**Case 9-96**

**Deciphering Financial Statements (The Walt Disney Company)**

The 2007 financial statements for The **Walt Disney Company** can be found on the Internet. Locate those financial statements and consider the following questions.

1. What inventory valuation method does Disney use?
2. How did the change in the level of inventory from September 2006 to September 2007 impact the statement of cash flows?
3. It isn't possible to compute the number of days' sales in inventory for Disney. Why not? Comment on the appropriateness of the level of detail presented in Disney's income statement.

**Case 9-97**

**Deciphering Financial Statements (Circle K)**

**Circle K** was once one of the largest convenience store chains in the United States. Circle K separated its products into two major categories: gasoline and merchandise (Twinkies, beef jerky, soda pop, etc.). Selected financial statement data for the year ended April 30, 1994, follow. (*Note:* More current financial statement data are no longer available because Circle K is now a subsidiary of a larger company. See the opening scenario for Chapter 5.)

	Gasoline	Merchandise
Sales .....	\$1,562.5 million	\$1,710.3 million
Cost of goods sold .....	1,372.1 million	1,192.6 million
End-of-year inventory .....	26.6 million	93.9 million

1. Compute gross profit percentage for both gasoline and merchandise. Given these numbers, what do you think the attitude of convenience stores is toward automatic pump payment systems that eliminate the need to go into the store to pay for gas?
2. Compute inventory turnover (based on end-of-year inventory) for both gasoline and merchandise.
3. Compute number of days' sales in inventory for both gasoline and merchandise. Why do you think the number of days' sales in gasoline inventory is so much lower than for merchandise?

Selected Circle K financial statement data for the years 1988 and 1993 follow. All numbers are in millions of dollars.

	1993	1988
Sales:		
Gasoline .....	\$1,504.1	\$ 964.6
Merchandise .....	1,541.8	1,649.2
Cost of goods sold:		
Gasoline .....	1,354.5	862.4
Merchandise .....	1,054.5	1,030.8
Ending inventory—total .....	131.2	191.0

For 1994, Circle K had total sales of \$3,272.8. Purchases for 1994 were \$2,554.0.

4. Which set of numbers—1988 or 1993—is likely to give a better estimate of the 1994 gross profit percentage? Explain.
5. Using the gross profit method, estimate Circle K's inventory as of the end of 1994.

### Case 9-98

#### Deciphering Financial Statements (3M: Minnesota Mining and Manufacturing Company)

The **Minnesota Mining and Manufacturing Company (3M)** gives the following description of its business:

3M is a diversified technology company with a global presence in the following businesses: industrial and transportation; health care; display and graphics; consumer and office; safety, security and protection services; and electro and communications. 3M is among the leading manufacturers of products for many of the markets it serves. Most 3M products involve expertise in product development, manufacturing and marketing . . .

Familiar 3M products include Scotch tape and the ubiquitous Post-it notes.

Inventory data from 3M's 2007 10-K report are as follows (in millions of U.S. dollars):

	2007	2006
Cost of goods sold .....	\$12,735	\$11,713
Inventories:		
Finished goods .....	\$ 1,349	\$ 1,235
Work in process .....	880	795
Raw materials and supplies .....	623	571
Total inventories .....	<u>\$ 2,852</u>	<u>\$ 2,601</u>

1. Compute cost of goods manufactured for 2007.
2. Compute total manufacturing costs for 2007.
3. Compute number of days' sales in inventory for 2007 (use average inventory). Make the calculation using:
  - (a) Total inventory
  - (b) Finished goods inventory
4. Of the two numbers you computed in (3), which is more meaningful? Explain.

### Case 9-99

#### Deciphering Financial Statements (Caterpillar and Ford Motor)

**Ford Motor** (automotive) and **Caterpillar** (heavy equipment) both use the LIFO inventory valuation method. Caterpillar uses it for 75% of its inventories and Ford for 25% of its inventories. Data from the 2007 10-K filings of these two companies follow (in millions of U.S. dollars):

	Ford	Caterpillar
Cost of goods sold .....	\$142,587	\$32,626
LIFO inventory, beginning .....	10,017	6,351
LIFO inventory, ending .....	10,121	7,204
LIFO reserve, beginning .....	1,015	2,403
LIFO reserve, ending .....	1,100	2,617

1. For both companies, as of the end of 2007, the existence of a LIFO reserve demonstrates that LIFO inventory is less than it would have been if FIFO had been used. For both companies, compute the ratio of LIFO inventory/FIFO inventory for 2007 ending inventory. Comment on the resulting numbers.
2. For Caterpillar, compute what 2007 cost of goods sold would have been if FIFO had been used.
3. What might have caused Caterpillar's LIFO reserve to be so much larger than Ford's?
4. If a company uses FIFO, can you use financial statement data to compute what its cost of goods sold would be using LIFO? Explain.

## Case 9-100

**Deciphering Financial Statements (British Petroleum)**

**British Petroleum (BP)** is one of the world's largest oil exploration, refining, and petrochemical firms. (British Petroleum and Amoco merged in December 1998.) The following data are adapted from BP Amoco's 2007 annual report. All numbers are in millions of U.S. dollars.

	2007	2006
Sales and other operating revenues .....	\$284,365	\$265,906
Purchases (COGS at historical cost) .....	200,766	187,183
Historical cost gross profit .....	\$ 83,599	\$ 78,723
Inventory holding gain (loss) .....	3,558	(253)
Replacement cost gross profit .....	\$ 87,157	\$ 78,470

In the financial statement notes, BP Amoco explains that inventory holding gains and losses represent the difference between the replacement cost of sales and the historical cost of sales (calculated using FIFO). Replacement cost reflects the average cost of goods acquired during the year.

1. Consider the relationships among replacement cost of sales, LIFO cost of sales, and FIFO cost of sales. Estimate what BP Amoco's gross profit for 2007 and for 2006 would be using LIFO. Explain your calculations.
2. Estimate what BP Amoco's gross profit for 2007 and for 2006 would be using FIFO. Explain your calculations.

## Case 9-101

**Deciphering Financial Statements (ExxonMobil)**

On December 31, 2000, the aggregate replacement cost of all of **ExxonMobil's** crude oil and natural gas inventory was approximately \$13.9 billion. By December 31, 2001, the aggregate replacement cost of ExxonMobil's inventory had fallen to \$10.9 billion. This reduction in replacement cost was primarily the result of a decline in the price of crude oil. The average crude oil sales price per barrel was \$21.10 in 2001, compared to \$25.59 in 2000.

In spite of this \$3.0 billion decline in the replacement cost of inventory, ExxonMobil was not required to make a lower-of-cost-or-market adjustment in 2001.

**Instructions:** Explain why you think this is so.

## Case 9-102

**Writing Assignment (This is not the time for "Just in Time.")**

You are the assistant controller of Duo-Therm Company and are in charge of preparing the financial statements and tax returns. One of your colleagues, the assistant controller in charge of working capital management, has just returned from a 3-day seminar on just-in-time (JIT) inventory. JIT reduces inventory carrying costs by having arrangements with suppliers to deliver inventory just as it is needed for production or sale. Your colleague is excited about implementing JIT, but you are concerned that not all factors are being considered. Your company has been using LIFO for about 25 years. Prepare a memo to the controller outlining why you think just-in-time might be a bad idea.

## Case 9-103

**Researching Accounting Standards**

To help you become familiar with the accounting standards, this case is designed to take you to the FASB's Web site and have you access various publications. Access the FASB's Web site at <http://www.fasb.org>. Click on "Pronouncements & EITF Abstracts."

In this chapter, we discussed issues relating to inventory. For this case, we will use *Statement of Financial Accounting Standards No. 151*, "Inventory Costs." Open *FASB Statement No. 151*.

1. Read the summary at the beginning of the statement. Previous accounting standards required "idle facility expense, excess spoilage, double freight" etc., to be expensed in the current period if such costs were considered abnormal. How are these costs to be handled with this new accounting standard?
2. In the second paragraph of the summary, the FASB states the primary reason for addressing these inventory costing issues. What is the reason stated?

## Case 9-104

**Ethical Dilemma (LIFO and the strategic timing of inventory purchases)**

You have risen fast in Lam Tin Industries and are now in charge of purchasing for the entire company. Lam Tin is a privately held company, and negotiations are currently under way for Lam Tin to be acquired by Kwun Tong Company, a large publicly held firm. It is December, and the final negotiations with Kwun Tong, including the setting of the purchase price, will take place in February after the release of Lam Tin's audited financial statements for the year ended December 31.

You are puzzling over a strange request you received earlier today from Lam Tin's vice president of finance. She visited your office and asked you to delay your normal December inventory purchases until the first week in January. You explained that this would result in a reduction of year-end inventories to less than half their normal year-end level. The vice president of finance seemed pleased with this information when she left your office.

This request seemed fishy, and you pulled out your copy of Lam Tin's annual report to check a hunch. Just as you suspected, Lam Tin has been using LIFO for many years and has built up a large LIFO reserve. If you delay the December purchases until January, Lam Tin will liquidate a large portion of its old LIFO layers, resulting in a big increase in reported profit for the year. It is possible that this artificial boost in Lam Tin's profits might increase the price offered by Kwun Tong in the purchase of Lam Tin.

Should you talk over your suspicions with the vice president of finance? With Lam Tin's independent auditors? With the negotiation team from Kwun Tong? Explain.

## Case 9-105

## SPREADSHEET

**Cumulative Spreadsheet Analysis**

This spreadsheet assignment is a continuation of the spreadsheet assignments given in earlier chapters. If you completed those assignments, you have a head start on this one.

Refer back to the instructions for preparing the revised financial statements for 2011 as given in (1) of the Cumulative Spreadsheet Analysis assignment in Chapter 3.

1. Skywalker wishes to prepare a *forecasted* balance sheet, a *forecasted* income statement, and a *forecasted* statement of cash flows for 2012. Use the financial statement numbers for 2011 as the basis for the forecast, along with the following additional information.
  - (a) Sales in 2012 are expected to increase by 40% over 2011 sales of \$2,100.
  - (b) In 2012, Skywalker expects to acquire new property, plant, and equipment costing \$240.
  - (c) The \$480 in operating expenses reported in 2011 breaks down as follows: \$15 in depreciation expense and \$465 in other operating expenses.
  - (d) No new long-term debt will be acquired in 2012.
  - (e) No cash dividends will be paid in 2012.
  - (f) New short-term loans payable will be acquired in an amount sufficient to make Skywalker's current ratio in 2012 exactly equal to 2.0.
  - (g) Skywalker does not anticipate repurchasing any additional shares of stock during 2012.
  - (h) Because changes in future prices and exchange rates are impossible to predict, Skywalker's best estimate is that the balance in accumulated other comprehensive income will remain unchanged in 2012.
  - (i) In the absence of more detailed information, assume that the balances in the investment securities, long-term investments, other long-term assets, and intangible assets accounts will all increase at the same rate as sales (40%) in 2012.
  - (j) In the absence of more detailed information, assume that the balance in the other long-term liabilities account will increase at the same rate as sales (40%) in 2012.
  - (k) The investment securities are classified as available-for-sale securities. Accordingly, cash from the purchase and sale of these securities is classified as an investing activity.

- (l) Assume that transactions impacting other long-term assets and other long-term liabilities accounts are operating activities.
- (m) Cash and investment securities accounts will increase at the same rate as sales.
- (n) The forecasted amount of accounts receivable in 2012 is determined using the forecasted value for the average collection period. The average collection period for 2012 is expected to be 14.08 days. To make the calculations less complex, this value of 14.08 days is based on forecasted end-of-year accounts receivable rather than on average accounts receivable.

(Note: These forecasted statements were constructed as part of the spreadsheet assignment in Chapter 7; you can use that spreadsheet as a starting point if you have completed that assignment.)

For this exercise, add the following additional assumptions.

- (o) The forecasted amount of inventory in 2012 is determined using the forecasted value for the number of days' sales in inventory. The number of days' sales in inventory for 2012 is expected to be 107.6 days. To make the calculations easier, this value of 107.6 days is based on forecasted end-of-year inventory rather than on average inventory.
- (p) The forecasted amount of accounts payable in 2012 is determined using the forecasted value for the number of days' purchases in accounts payable. The number of days' purchases in accounts payable for 2012 is expected to be 48.34 days. To make the calculations easier, this value of 48.34 days is based on forecasted end-of-year accounts payable rather than on average accounts payable.

Clearly state any additional assumptions that you make.

- 2. Repeat part (1), with the following changes in assumptions:
  - (a) Number of days' sales in inventory is expected to be 66.2 days.
  - (b) Number of days' sales in inventory is expected to be 150.0 days.
- 3. Comment on the differences in the forecasted values of cash from operating activities in 2012 under each of the following assumptions about the number of days' sales in inventory: 107.6 days, 66.2 days, and 150.0 days.
- 4. Is there any impact on the forecasted level of accounts payable when the number of days' sales in inventory is changed? Why or why not?
- 5. What happens to the forecasted level of short-term loans payable when the number of days' sales in inventory is reduced to 66.2 days? Explain.

A Dallas Cowboys quarterback, wearing a white jersey with blue and silver accents and a silver helmet with a blue star, is running with the football. He is in a dynamic, forward-leaning pose on a green field. Other players in similar uniforms are visible in the background, slightly out of focus.

C H A P T E R

10

INVESTMENTS IN NONCURRENT  
OPERATING ASSETS—ACQUISITION

## LEARNING OBJECTIVES

Jerry Jones didn't win many friends in Texas when one of his first acts after buying the **Dallas Cowboys** in 1989 was to fire Tom Landry, who had been the head coach of the Cowboys ever since the team entered the NFL. Jones became even less popular when the Cowboys lost 15 of 16 games in their first year under new head coach Jimmy Johnson.<sup>1</sup> In those days, the Cowboys stunk as a football team but looked like a pretty shrewd business investment. When Jones, an Arkansas oil man, purchased the Cowboys for \$150 million, he acquired a diverse array of assets. These assets included miscellaneous football equipment, stadium leases, radio and TV broadcast rights, cable TV rights, luxury stadium suites, player contracts, a lease on the Cowboys' luxurious Valley Ranch training facility, and the Cowboys' NFL franchise rights.

Allocating the purchase price among these assets and defining their useful lives were difficult and strategic tasks. When H. R. "Bum" Bright, Jones' predecessor, bought the Dallas Cowboys for \$85 million in 1984, he was able to allocate half the purchase price to players' contracts. These were amortizable assets that, for tax purposes, were written off over four years.<sup>2</sup> Jones received a similar tax break when he acquired the Cowboys.

But entrepreneurs like Jerry Jones don't get rich by relying solely on depreciation tax breaks. Jones quickly set about putting the Cowboys' finances back in the black—in 1988 the Cowboys had lost \$9.5 million. Jones encouraged the team's treasurer to look for ways to cut expenses—renegotiate insurance policy premiums, seek competitive bids for printing tickets and providing training room supplies, and remove the floodlights from the parking lot of the training center. Jones also moved to increase revenues by signing leases for 99 unleased luxury boxes (generating an extra \$8.5 million per year in revenue) and then building an additional 68 luxury boxes. By 1992, the Cowboys were again profitable with net income of \$20.6 million.<sup>3</sup>

The on-field performance of the Cowboys matched their financial success. In 1990, the Cowboys improved their record to 7 and 9, and in 1991 they made the playoffs, advancing to the second round. The Cowboys' return to glory was capped in January 1993 when they returned to the Super Bowl for the first time since 1978 and routed the Buffalo Bills, 52–17. In January 1996, the Cowboys became the first NFL franchise to win three Super Bowls in a 4-year time period. The subsequent so-so on-field performance of the team (it has not been back to the Super Bowl since 1996 and made the playoffs just six times from 1996 through 2007, winning a total of just one playoff game in that span) has not seemed to hurt its financial performance. (See Exhibit 10-1.) In a 2007 estimate by *Forbes*, the Cowboys were rated one of the most valuable sports franchises in North America with an estimated value of \$1.5 billion.<sup>4</sup>

- 1 Identify those costs to be included in the acquisition cost of different types of noncurrent operating assets.
- 2 Properly account for noncurrent operating asset acquisitions using various special arrangements, including deferred payment, self-construction, and acquisition of an entire company.
- 3 Separate costs into those that should be expensed immediately and those that should be capitalized, and understand the accounting standards for research and development and oil and gas exploration costs.
- 4 Recognize intangible assets acquired separately, as part of a basket purchase, and as part of a business acquisition.
- 5 Discuss the pros and cons of recording noncurrent operating assets at their fair values.
- 6 Use the fixed asset turnover ratio as a general measure of how efficiently a company is using its property, plant, and equipment.

<sup>4</sup> Go to <http://www.forbes.com> and look under "Lists" for the current valuation of professional sports franchises.

EXHIBIT 10-1

Time Line of the Dallas Cowboys' Franchise Value, 1991–2007

## QUESTIONS

1. From an accounting standpoint, what difficult asset valuation exercise is necessary when buying an entire business such as the Dallas Cowboys?
2. Why do buyers of a sports franchise wish to allocate as much of the purchase price as possible to the asset “players’ contracts”?

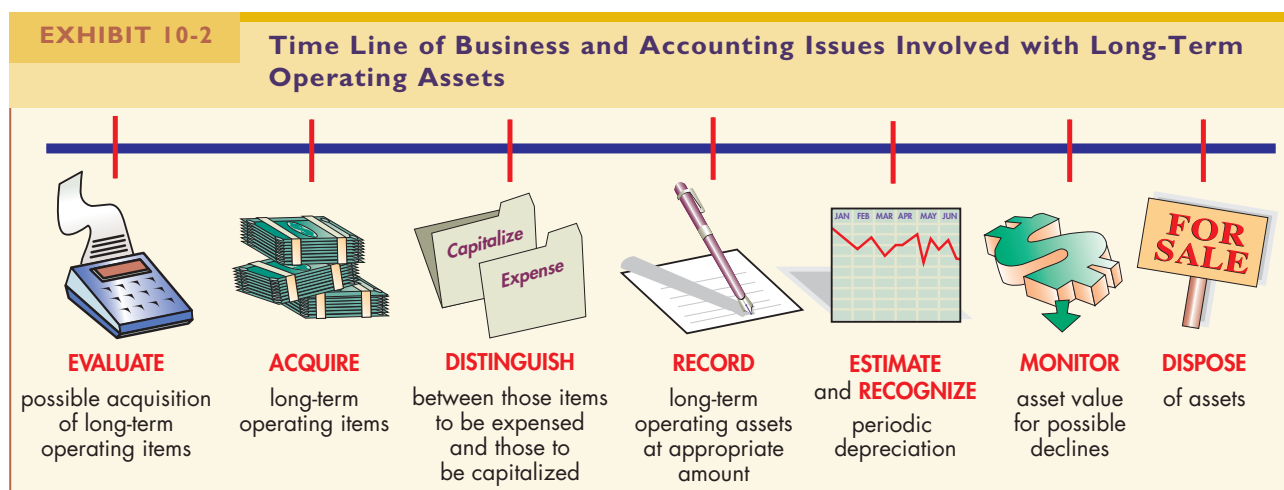

Answers to these questions can be found on page 584.

**M**any billions of dollars are invested each year in new property, plant, and equipment and increasingly in intangible assets as well. A time line of the business and accounting issues associated with property, plant, and equipment is shown in Exhibit 10-2.

One of the keys to successful business is correctly choosing which long-term assets to buy. Capital budgeting and discounted cash flow analysis are essential elements in making the best choices. In addition to the difficult financial decisions surrounding long-term assets, many accounting questions are introduced when long-term items are acquired. These accounting issues include the following:

- Which costs should be capitalized as assets and which ones should be expensed?
- What costs should be included in the acquisition cost of a long-term asset?
- How should intangible assets be recorded?
- At what amounts should long-term assets be recorded when the financing of the purchase is more complex than a simple cash payment?
- How should expenditures made subsequent to acquisition be recorded?
- What recognition should be given to changes in the market value of long-term assets?

This chapter discusses these general issues and describes many of the historic controversies that have led to changes in the accounting standards over the years. The chapter also discusses the controversial decision by the FASB to require all research and development costs to be expensed immediately (a decision that may soon be revised in order to harmonize with the international standard), the embarrassing flip-flop the FASB was forced to make on oil and gas accounting, the historical roots of the capitalization of interest, and the question of historical cost vs. current cost. Chapter 11 will address the important issues of recognizing depreciation on long-term operating assets, recording impairment losses when asset values have significantly declined, and recording the disposal of long-term operating assets.

## What Costs Are Included in Acquisition Cost?

**1** Identify those costs to be included in the acquisition cost of different types of noncurrent operating assets.

**WHY** Costs incurred are either expensed or recorded as an asset. How these costs are classified can significantly affect both the income statement and the balance sheet.

**HOW** Noncurrent operating assets are recorded at their original purchase price plus any expenditures required to obtain and prepare the asset for its intended use. Most costs associated with internally-generated intangible assets are expensed whereas the cost of externally-purchased intangibles is generally recorded as an asset.

**Noncurrent operating assets** are recorded initially at cost—the original bargained or cash sales price. In theory, the maximum price a company should be willing to pay for an operating asset is the present value of the net benefit the company expects to obtain from the use and final disposition of the asset. In a competitive economy, the market value or cost of an asset at acquisition is assumed to reflect the present value of its future benefits.

The cost of property includes not only the original purchase price or equivalent value but also any other expenditures required in obtaining and preparing the asset for its intended use. Any taxes, freight, installation, and other expenditures related to the acquisition should be included in the asset's cost. Postacquisition costs—costs incurred after the asset is placed into service—are usually expensed rather than added to the acquisition cost. Exceptions to this general rule apply to some major replacements or improvements and will be discussed later in the chapter.

### caution

Classification of an asset as a noncurrent operating asset depends on how management intends to use the asset. For example, land held for long-term investment purposes is not an operating asset; land held for resale within a year is a current asset.

Although most noncurrent operating asset categories have similar acquisition costs, over time accounting practice has identified some specific costs that are included for different asset categories. Exhibits 10-3 and 10-4 summarize the types of costs normally included as acquisition costs for each major noncurrent asset category.

#### EXHIBIT 10-3

#### Acquisition Costs of Tangible Noncurrent Operating Assets

<b>Land</b>	Realty used for business purposes.	<b>COST:</b> Purchase price, commissions, legal fees, escrow fees, surveying fees, clearing and grading costs, street and water line assessments.
<b>Land improvements</b>	Items such as landscaping, paving, and fencing that improve the usefulness of property.	<b>COST:</b> Cost of improvements, including expenditures for materials, labor, and overhead.
<b>Buildings</b>	Structures used to house business operations.	<b>COST:</b> Purchase price, commissions, reconditioning costs.
<b>Equipment</b>	Assets used in the production of goods or in providing services. Examples include automobiles, trucks, machinery, patterns and dies, and furniture and fixtures.	<b>COST:</b> Purchase price, taxes, freight, insurance, installation, and any expenditures incurred in preparing the asset for its intended use (e.g., reconditioning and testing costs).

## EXHIBIT 10-4

## Acquisition Costs of Goodwill and Other Intangible Assets

<b>Patent</b>	An exclusive right granted by a national government that enables an inventor to control the manufacture, sale, or use of an invention. In the United States, legal life is 20 years from patent application date.	<b>COST:</b> Purchase price, filing and registry fees, cost of subsequent litigation to protect right. Does not include internal research and development costs.
<b>Trademark</b>	An exclusive right granted by a national government that permits the use of distinctive symbols, labels, and designs (e.g., McDonald's Golden Arches, Nike's Swoosh®, Apple Computer's name and logo). Legal life is virtually unlimited.	<b>COST:</b> Same as patent.
<b>Copyright</b>	An exclusive right granted by a national government that permits an author to sell, license, or control his or her work. In the United States, copyrights expire 50 years after the death of the author.	<b>COST:</b> Same as patent.
<b>Franchise agreement</b>	An exclusive right or privilege received by a business or individual to perform certain functions or sell certain products or services.	<b>COST:</b> Expenditures made to purchase the franchise. Legal fees and other costs incurred in obtaining the franchise.
<b>Acquired customer list</b>	A list or database containing customer information such as name, address, past purchases, and so forth. Companies that originally develop such a list often sell or lease it to other companies unless prohibited by customer confidentiality agreements.	<b>COST:</b> Purchase price when acquired from another company. Costs to internally develop a customer list are expensed as incurred.
<b>Goodwill</b>	Miscellaneous intangible resources, factors, and conditions that allow a company to earn above normal income with its identifiable net assets. Goodwill is recorded only when a business entity is acquired by a purchase.	<b>COST:</b> Portion of purchase price that exceeds the sum of the current market value for all identifiable net assets, both tangible and intangible.

Some of these illustrations are taken from SFAS No. 141R, "Business Combinations," Appendix A.

#### Five Largest Land Accounts<sup>5</sup> 2006 (in millions)

## Tangible Assets

**Land** Because land is a nondepreciable asset, costs assigned to it should be those costs that directly relate to land's unlimited life. Together with clearing and grading costs, costs of removing unwanted structures from newly acquired land are considered part of the cost to prepare the land for its intended use and are added to its purchase price. Government assessments for water lines, sewers, roads, and other such items are considered part of the land's cost because maintenance of these items is the responsibility of the government; thus, to the landowner, they have unlimited life. These types of improvements are distinguished from similar costs for landscaping, parking lots, and interior sidewalks that are installed by the owner and must be replaced over time. The improvements that owners are responsible for are generally classified as land improvements and depreciated.

**Buildings** The cost of purchased buildings includes any reconditioning costs necessary before occupancy. Because self-constructed buildings have many unique costs, a separate discussion of self-constructed assets is included later in this chapter.

**Equipment** Equipment costs include freight and insurance charges while the equipment is in transit and any expenditures for testing and installation. Costs for reconditioning purchased used equipment are also part of the asset cost.

## Intangible Assets

**Intangible assets** are defined as those assets (not including financial assets) that lack physical substance. Many intangible assets arise from contractual or governmental rights. A well-known example of this type of intangible asset is the right to operate a taxicab in a metropolitan area, such as New York City. Although this right is evidenced by a physical object, the taxicab medallion, it is the legal right itself that is valuable. Other intangible assets are not created by a specific contract or legal right. The existence of these intangibles is evidenced by the fact that they are bought, sold, or licensed, either separately or in conjunction with a broader assortment of assets. A good example of this type of intangible is a customer list. Magazine subscription companies, Web travel services, and real estate listing services all generate substantial revenues by selling or “leasing” their customer lists. In addition, a purchaser must pay a premium when buying an existing business location because of the value of the customer list (and customer relationships) that is tied to the business; the value of this premium should be reported as a separate intangible asset.

The most important distinction in intangible assets for accounting purposes is between those intangible assets that are internally generated and those that are externally purchased. This distinction is important because the transfer of externally purchased intangible assets in an arm’s-length market transaction provides reliable evidence that the intangibles have probable future economic benefit. Such reliable evidence does not exist for most internally generated intangibles. Accordingly, most costs associated with generating and maintaining internally generated intangibles are expensed as incurred.<sup>6</sup> Only the actual legal and filing costs are included as part of the intangible asset cost for these internally developed items. Any costs to defend the rights in court are added to the intangible asset cost if the action is successful. If it is not successful, all asset costs related to the rights are written off as expenses.

Most externally obtained intangible assets arise in transactions involving other assets. For example, the purchase of the tangible assets of a factory building and its associated machinery also might involve the acquisition of the intangible assets of the operating permit for the factory, the water rights tied to the property, and the customer relationships developed by the prior factory owner. Accounting for this kind of “basket purchase” of assets will be discussed later in the chapter. A short description of some of the common types of intangible assets follows.

**Trademark** A **trademark** is a distinctive name, symbol, or slogan that distinguishes a product or service from similar products or services. Well-known examples include Coke®, Windows®, Yahoo!®, and the Nike Swoosh®. As shown in Exhibit 10-10 later in the chapter, the value of the Coca-Cola trademark was estimated in 2007 to be in excess of \$65 billion. Because the Coca-Cola trademark is an internally generated intangible asset, it is not reported in **The Coca-Cola Company’s** balance sheet. However, the company has purchased other trademarks (such as Minute Maid®), with a total cost of \$2.0 billion; these are reported in The Coca-Cola Company’s balance sheet, as shown in Chapter 3.

The original Coca-Cola bottling franchise sold for \$1.

**Franchises** Franchise operations have become so common in everyday life that we often don’t realize we are dealing with them. In fact, these days it is difficult to

<sup>6</sup> *Statement of Financial Accounting Standards No. 142*, “Goodwill and Other Intangible Assets” (Norwalk, CT: Financial Accounting Standards Board, 2001), par. 10; this standard references *APB Opinion No. 17*, par. 24.

find a nonfranchise business in a typical shopping mall. When a business obtains a franchise, the recorded cost of the franchise includes any sum paid specifically for the franchise right as well as legal fees and other costs incurred in obtaining it. Although the value of a franchise at the time of its acquisition may be substantially in excess of its cost, the amount recorded should be limited to actual outlays. For example, approximately 65% of **McDonald's** locations are operated under franchise agreements. A McDonald's franchisee must contribute an initial cash amount of around \$250,000, which is used to buy some of the equipment and signs and to pay the initial franchise fee. The value of a McDonald's franchise alone is much more than \$250,000, but the franchisee would only record a franchise asset in his or her financial statements equal to the cost (not value) of the franchise. However, if a franchise right is included when one company purchases another company, presumably the entire value is included in the purchase price, and the fair value attributable to the franchise right is recorded as an intangible asset in the acquirer's books.

**Order Backlog** To some companies, especially capital equipment manufacturers, the order backlog is a key economic asset. The *order backlog* is the amount of orders the company has received for equipment that has not yet been produced or delivered. Note that these orders do not constitute sales because they do not satisfy the revenue recognition requirement that the product be completed and shipped. However, this order backlog does represent future valuable economic activity, and the contractual right to these backlogged orders constitutes an important intangible asset. In its 2007 10-K filing, **Boeing** reported the following about its order backlog:

**Contractual Backlog (unaudited, in millions)**

Years ended December 31,	2007	2006	2005
Commercial Airplanes .....	\$255,176	\$174,276	\$124,132
Integrated Defense Systems:			
Precision Engagement and Mobility Systems .....	\$ 22,957	\$ 24,739	\$ 21,630
Network and Space Systems .....	9,167	7,838	6,324
Support Systems .....	9,664	9,714	8,551
Total Integrated Defense Systems .....	\$ 41,788	\$ 42,291	\$ 36,505
Total Contractual Backlog .....	\$296,964	\$216,567	\$160,637

As with other intangible assets, this internally generated order backlog would not be recognized as an intangible asset on Boeing's balance sheet. However, if another company were to buy Boeing, part of the purchase price would be identified with the economic value of the order backlog, and a corresponding intangible asset would be recognized in the books of the acquiring company.

fyi

The most important recent development in accounting for intangibles is the FASB's emphasis on companies reporting separate amounts for all of the individual intangible assets that can be identified. Previously, these assets were typically tossed in with goodwill.

**Goodwill** Goodwill represents the business contacts, reputation, functioning systems, staff camaraderie, and industry experience that make a business much more than just a collection of assets. As mentioned earlier, if these factors are the result of a contractual right or are associated with intangibles that can be bought and sold separately, the value of the factor should be reported as a separate intangible asset. In essence, goodwill is a residual number, the value of all of the synergies of

a functioning business that cannot be specifically identified with any other intangible factor. Goodwill is recognized only when it is purchased as part of the acquisition of another company. In other words, a company's own goodwill, its homegrown goodwill, is not recognized. Goodwill will be defined and discussed more in depth later in the chapter.

## Acquisitions Other Than Simple Cash Transactions

**2** Properly account for noncurrent operating asset acquisitions using various special arrangements, including deferred payment, self-construction, and acquisition of an entire company.

**WHY** All subsequent accounting for a noncurrent operating asset depends on the amount initially recorded as the cost of that asset. Measuring that initial cost can be difficult when an acquisition involves more than a simple cash purchase.

**HOW** Conceptually, the acquisition cost of a noncurrent operating asset should reflect the cash equivalent of whatever consideration is given in exchange for the asset. Measurement of this cash equivalent sometimes involves present value calculations, estimates of fair values, and/or estimates of total self-construction cost.

When an asset is purchased for cash, the acquisition is simply recorded at the amount of cash paid, including all outlays relating to its purchase and preparation for intended use. Assets can be acquired under a number of other arrangements, however, some of which present special problems relating to the cost to be recorded. The acquisition of assets is discussed under the following headings:

1. Basket purchase
2. Deferred payment
3. Leasing
4. Exchange of nonmonetary assets
5. Acquisition by issuing securities
6. Self-construction
7. Acquisition by donation or discovery
8. Acquisition of an asset with significant restoration costs at retirement
9. Acquisition of an entire company

### Basket Purchase

In some purchases, a number of assets may be acquired in a **basket purchase** for one lump sum. For example, the opening scenario of this chapter described how Jerry Jones acquired football equipment, cable TV rights, player contracts, and the Cowboys' NFL franchise rights when he purchased the Dallas Cowboys. To account for the assets on an individual basis, the total purchase price must be allocated among the individual assets. When part of a purchase price can be clearly identified with specific assets, such a cost assignment should be made and the balance of the purchase price allocated among the remaining assets. When no part of the purchase price can be related to specific assets, the entire amount must be allocated among the different assets acquired. Appraisal values or similar evidence provided by a competent independent authority should be sought to support the allocation.

To illustrate the allocation of a joint asset cost, assume that land, buildings, and equipment are acquired for \$160,000. Assume further that a professional appraiser valued each of the assets at the acquisition date. The cost allocation is made as follows.

Assigned to	Appraised Values	Cost Allocation According to Relative Appraised Values	Cost Assigned to Individual Assets
Land	\$ 56,000	$56,000/200,000 \times \$160,000$	\$ 44,800
Buildings	120,000	$120,000/200,000 \times \$160,000$	96,000
Equipment	24,000	$24,000/200,000 \times \$160,000$	19,200
	<u>\$200,000</u>		<u>\$160,000</u>

The entry to record this acquisition, assuming a cash purchase, is as follows.

Land .....	44,800	
Buildings .....	96,000	
Equipment .....	19,200	
Cash .....		160,000

This cost allocation of a basket purchase price is not merely a theoretical exercise. Some assets in the group may be depreciable, others nondepreciable. Depreciable assets may have different useful lives. Periodic depreciation expense can be significantly impacted by the proportion of the purchase price that is allocated to assets with relatively long useful lives.

## caution

In this example, each semiannual payment declines since the interest is calculated on a declining balance in Notes Payable. For example, on January 1, 2012, the total payment would be just \$8,000 (\$5,000 + \$3,000 interest). Alternatively, a contract can provide for a constant payment, or annuity. With an annuity, the amount applied to the note principal increases (and the Interest Expense decreases) each period as the liability decreases.

## Deferred Payment

The acquisition of real estate or other property frequently involves deferred payment of all or part of the purchase price. The buyer signs a note or a mortgage that specifies the terms of settlement of the obligation. The debt contract may call for one payment at a given future date or a series of payments at specified intervals. Interest charged on the unpaid balance of the contract should be recognized as an expense.
