Co-Editors

Ira Bogotch is a professor of educational leadership at Florida Atlantic University. He has a master's degree in teaching English as a second language (Teachers College, Columbia University) and has taught in New York City, Guatemala City, and Washington, D.C. He also has a master's degree in philosophy (The New School) and an educational leadership doctorate (Florida International University). In the 1990s, Ira facilitated the development of leadership standards in the state of Louisiana. He is the Associate Editor of the *International Journal of Leadership in Education*. He has been writing on the topic of leadership for social justice for over 10 years beginning with a 2002 article titled "Educational leadership and social justice: Practice into Theory" published in the *Journal of School Leadership*. He also co-authored *Radicalizing Educational Leadership*: *Dimensions of Social Justice.* Recently, he has taken his social justice platform titled "social justice as an educational construct" to Malaysia, Scotland, England, and Australia. Ira believes that this Handbook goes beyond rhetorical support for social justice and its publication must be a continuing step in the worldwide struggles to recenter education around the concepts, methods and actions for social change and justice.

Dr. Carolyn M. Shields is professor and dean of the College of Education at Wayne State University, Detroit, Michigan. Previously she was a professor of leadership in the Department of Educational Organization and Leadership at the University of Illinois at Urbana Champaign and the University of British Columbia. She is past president of the Canadian Association for Studies in Educational Administration, and former Canadian representative to the Board of the Commonwealth Council for Educational Administration and Management. Her teaching is in the area of transformative leadership, deep democracy, equitable policy, social justice, and research methodology. Her research focuses on how educational leaders can create learning environments that are deeply democratic, socially just, inclusive of all students' lived experiences, and that prepare students for excellence and citizenship in our global society. These interests are reflected in her presentations and publications—over 100 articles, numerous chapters, hundreds of conference and keynote presentations, and nine books—the most recent of which is *Transformative Leadership in Education: Equitable Change in an Uncertain and Complex World*, published by Routledge. She has received recognition for both her teaching and her career contributions to the field of educational leadership.

Acknowledgements

From the beginning, our intent was to promote new socially conscious educational ideas and practices from around the world. That objective in itself is not original. The idea that educators ought to be involved in the lives of adults and children not just in terms of teaching basic reading and mathematical skills has been central to establishing free, yet compulsory public school systems around the world. Too often, in too many places, educational services have to compete for funding and support with other economic, social, and political institutions. And too often, educational inequities persist—inequities in teacher quality, in access for male and female students, in opportunities for those from certain ethnic or cultural groups. Often these educational inequities reflect larger historical, social, cultural, economic, and political divisions within societies. For us, because of a firm belief that education offers a way forward, that it provides opportunities for individual and collective development and for the enhancement of civil society, each of these disparities requires an educational response and presents a challenge to educational leaders everywhere.

With this *International Handbook on Educational Leadership and Social (In) Justice*, we wanted to integrate the growing literature bases on social justice across teaching, learning, and leadership, before the ideas hardened into fixed disciplinary categories as so many other generative ideas have done in the multiple fields of education. While we recognize a place for professional identities based on specialization, we believe, with others, that the primary identity should be that of educator and only secondarily to the subfields of special education, counselor education, health education, administration, etc. If the concept of social justice means anything substantively, it must transcend the petty divides created by specializations in education and become foundational to the work of all educators.

The significance of an International Handbook is that it has the potential to disrupt the dominance of English and primacy of Western ideas as if they communicate adequately and explain the whole of human educational experiences. It is here that we hope future readers/authors will carry forward, challenge, reflect on, and extend, the ideas presented here. We are grateful to the educational researchers, advocates, and activists who see economic, political, and cultural possibilities for societal change in education around the world. This handbook, therefore, is not an historical recording of reviews of literature, but rather a forward looking call for more research, more advocacy, and more activism among all educators. We hope that even those who chose not to join us in this handbook but who clearly share our broader concerns for public education will continue to speak out and make their voices heard in the quest for more equitable education for all.

Together, we (Ira and Carolyn) want to acknowledge the trust extended to us by Yoka Janssen, Publishing Editor of Springer Publishers. She quickly grasped the fact that although this work is part of the long tradition of Springer International Handbooks, the topic of social justice is still in its infancy and that such a handbook is worthwhile even in communities and nations where the term social justice may be forbidden or put its author in danger. This publication is also about justification and legitimacy of new ideas and new educational research methods. If social justice communicates new visions, then it requires new methods of presentation and study as well.

We also want to acknowledge the participation of all of the authors who contributed to this handbook. It is rare that such a large collection of authors is so committed to revising their work, meeting timelines, and answering the editors' many queries. We appreciate the dedication that shines through each chapter, indicating that these are not simply additional chapters for the authors' vitae but contributions that embody a singular belief in the need for, and power of, leadership for social justice. To each of you, we offer our thanks. We also acknowledge the editorial support provided us by Dr. Erica Mohan, a former doctoral student of Carolyn's.

Ira would first like to thank co-editor Carolyn Shields who as a researcher and colleague has exemplified the values and practices of social justice. The two of us have been part of a small community among educational leaders that has been supported by the American Educational Research Association Special Interest Group, Leadership for Social Justice, and its founding Chair, Professor Catherine Marshall. Ira also wants to thank four individuals who held extensive conversations on social justice, Floyd Beachum, Jackie Blount, Jeffery Brooks and Fenwick English. These conversations culminated in the co-authored text, *Radicalizing Educational Leadership: Dimensions of Social Justice* (Sense Publishers, 2007). My (Ira) own development as a critical scholar has been advanced by engaging and reading the works of Luis Miron, Spencer Maxcy, William Foster, Gert Biesta, Gary Anderson, and more recently Catherine Lugg, Autumn Tooms, Dilys Schoorman, and Christa Boske. At home, I am surrounded by a diverse group of educators. My wife, a physician-educator dispenses life lessons as well as medical advice. Her pre-medical school background as a 6th grade teacher in Brooklyn and an English as a Second Language instructor in Puerto Rico is what inspired me to become an educator. She still inspires me to become a better person. My daughter, lead science educator at a local science museum, is the master teacher in the family interacting comfortably with children of all ages who walk through the museum's doors. My son, recently accepted into Teach For America, lives social justice every day of his life in his approach to finding solutions and his leadership. He has already changed many lives for the better.

Carolyn likewise wants to begin by acknowledging the inspiration of co-editor Ira Bogotch whose enthusiasm, commitment, and insights have made this handbook a reality. He is the real force behind the work in addition to being a wonderful scholar and friend. Carolyn could not begin to identify the scholarly influences on her work, except to say that they represent many disciplines and cross boundaries of time and place (Buber, Bakhtin, Delpit, Foster, Wheatley, and so on). I (Carolyn) have also learned much from all of my students over the years, so many of them dedicated practitioners whose daily work has inspired my thinking. Specifically, I want to acknowledge the students and colleagues with whom I have written and published in the past—Erica, Mark, Anish, Ann, John, Andre, Russell, and many others. This handbook, and my own growth, owe much to all of you. To my son Martin, whose diplomatic career has not only taken him around the world, but provided me opportunities to learn from his involvement, insights, and colleagues and to experience new places, I owe a debt of gratitude. Similarly, my own education has been enhanced by my son Geoff and his extended family that always includes exchange students from many parts of the world; to them I am also grateful.

Most particularly, Ira and Carolyn want to thank those educational leaders (not simply those who hold formal roles) who work on a daily basis to promote the ideas found in the pages of this handbook. For their advocacy, activism, and dedication in the face of ongoing challenges—sometimes even at risk of their careers or worse—we cannot say a strong enough “Thank You.” Our gratitude to all of you, although inadequately expressed, is heartfelt and profound.

Contents for Volume 1

1 Introduction: Do Promises of Social Justice Trump Paradigms of Educational Leadership? 1
Ira Bogotch and Carolyn M. Shields

Part I Conceptualizing Social Justice: More Than A Definition

2 The Place of "Social Justice" in the Field of Educational Administration: A Journals-Based Historical Overview of Emergent Area of Study 15
Izhar Oplatka

3 "Creating Smooth Spaces in Striated Places": Toward a Global Theory for Examining Social Justice Leadership in Schools 37
Katherine Cumings Mansfield

4 Educational Theory: The Specific Case of Social Justice as an Educational Leadership Construct 51
Ira Bogotch

5 Ethics and Social Justice: Strangers Passing in the Night? 67
Robert J. Starratt

6 Social and Cognitive Justice: The Social Relevance of the Higher Education in Latin America 81
Alejandra Montané López, Judith Naidorf, and António Teodoro

7 A Grid and Group Explanation of Social Justice: An Example of Why Frameworks Are Helpful in Social Justice Discourse 97
Edward L. Harris

8 **Who Among Us May Be Literate? Closing the Gap Between Literacy and Diversity** 117
Charles Dukes and Kavin Ming

Part II Approaches to Knowing/Studying Social Justice

9 **Researching Leadership for Social Justice: Are Some Methods Better than Others?** 141
Robert Donmoyer

10 **Transforming (Un)Just Institutions: A Reflection on Methodology** 161
Colleen L. Larson

11 **Narrative Inquiry (NI) as an Exemplary Method for Social Justice Leadership** 183
Alexandre Ibongya-Ilungu Muzaliwa and Mary E. Gardiner

12 **A Bricolage of Voices: Lessons Learned from Feminist Analyses in Educational Leadership** 199
Whitney Sherman-Newcomb

13 **How Should Researchers Act in the Context of Social Injustice? Reflections on the Role of the Researcher as a Social Justice Leader** 217
Dilys Schoorman

14 **Social Justice in Education: Joy in Education and Education for Joy** 233
Morwenna Griffiths

15 **Critical Evocative Portraiture: Feminist Pathways to Social Justice** 253
Linda L. Lyman, Angeliki Lazaridou, and Jane Strachan

16 **LeaderPAR: A Participatory Action Research Framework for School and Community Leadership** 275
Gary L. Anderson and Erika Bernabei Middleton

17 **Critical Reflective Practices: Connecting to Social Justice** 289
Christa Boske

18 **Projects from the Heart: For Educational Leaders** 309
Lourdes Diaz Soto

Part III Leadership for Social Justice

19 **Leadership for Social Justice Education: A Critical Transformative Approach** 323
Carolyn M. Shields

20 The Spatial Nature of Justice: A Scholar–Practitioner Perspective 341
Patrick M. Jenlink

21 Promoting Inclusive Leadership in Diverse Schools 359
James Ryan

22 Toward a Framework of Research and Practice for Social Justice Leadership: The Case of Cyprus 381
Michalinos Zembylas and Sotiroula Iasonos

23 Challenging Dominant Discourses of Home–School Partnerships in Indigenous Communities 397
Greer Johnson and Neil Dempster

24 Socially Just, Inclusive School Environments in the United States: Creating Spaces for Dialogue 423
Courtney L. Orzel

25 Narrative Dialogue and Teacher Leadership for Social Justice: Re-Storying to Understand 447
Lindsayanne Insana, Daniel Johnson Mardones, Hilarie Welsh, and Marilyn Johnston-Parsons

26 Re-conceptualising Teacher Leadership Through Curriculum Inquiry in Pursuit of Social Justice: Case Study from the Canadian Context 465
Ann E. Lopez

27 Disrupting the Hegemonic Construction of Student Achievement: Diasporic Spaces 485
Marva McClean

28 School Leadership, Literacy and Social Justice: The Place of Local School Curriculum Planning and Reform 509
Annette Woods, Karen Dooley, Allan Luke, and Beryl Exley

29 Leading for Social Justice in South African Schools: Where Have All the Activists Gone? 521
Carolyn (Callie) Grant

Part IV Advocacy/Advocates for Social Justice

30 Community Leadership: Seeking Social Justice While Re-creating Public Schools in Post-Katrina New Orleans 543
Brian R. Beabout

31 Making a Difference: The Balance of Stance and Strategy for Social Justice Advocacy 571
Phil Hunsberger and Phyllis Balcerzak

32 Confronting Social Injustices in the Praxis Wetlands Where Research, Policy, and Activism Integrate 593
Louise Gonsalvez

33 Schools for Capitalism, Corporativism, and Corruption: Examples from Turkey and the USA 619
Duncan Waite, Selahattin Turan, and Juan Manuel Niño

34 The Courageous Conversations Project: Interrogating Perspectives and Perceptions of Race, Poverty, and Schooling in South Africa and the United States 643
Arnold Dodge and Berte van Wyk

35 Schools for Justice in the United States 667
Ivan Greenberg

Contents for Volume 2

Part V Socio-Cultural Representations of Social Injustices

36 Moving Beyond the Injustices of the Schooled Healthy Body 687
Erin Cameron, Jan Oakley, Gerald Walton, Constance Russell, Lori Chambers, and Teresa Socha

37 Social [In]Justices of Women as School Principals in Lebanon 705
Bassel Akar and Maha Mouchantaf

38 Searching for Social Justice: An Examination of the Views of Alternative School Educators in the San Joaquin Valley of California 729
Monty J. Thornburg

39 Living with the Legacy of Conquest and Culture: Social Justice Leadership in Education and the Indigenous Peoples of Australia and America 751
Bronwyn Fredericks, Priscilla Maynor, Nereda White, Fenwick W. English, and Lisa Catherine Ehrich

40 Corrupting Children: The Regulation of Children's Gender Presentations and Identities and Implications for Educators and School Administrators 781
Gerald Walton

41 Zimbabwean Women Primary School Heads 799
Irene Muzvidziwa

42 Leadership, Educational Development, and Social Development 819
Joaquín Gairín and David Rodríguez-Gómez

43 Dominance Without Hegemony: Unmasking Social Injustice Leadership in University Education in Zimbabwe 845
Munyaradzi Hwami

Part VI Glocal Policy Interventions

44 **Inclusive Education for Children with Special Needs: The Case of Lebanon** 871
Ahmad Oweini and Heyam Lutfi El Zein

45 **Education Policy in Cyprus: From Decision-Making to Implementation** 895
Christina Hajisoteriou and Panayiotis Angelides

46 **The Role of Academicians' Networks in Latin America: The Fight Against Social Injustices. An Institutional Challenge** 911
José Antonio Ramirez-Diaz, Jesús Ruiz-Flores, and Antonio Teodoro

47 **Dilemmas and Challenges in Forging Social Cohesion Through Education: Emerging Struggles in Social Justice in Post-conflict Education in Sri Lanka** 939
Damaris Wikramanayake

48 **A Glimpse into Homelessness in the United States** 953
Amy L. Warke

49 **Reducing Socioeconomic Inequity by Improving the Equity of Education** 971
Ned Van Steenwyk

50 **The Overpowering Role of Policies in Constructing Social Identities of Children with Disabilities** 993
Maha Damaj

51 **Leadership for Social Justice Throughout Fifteen Years of Intervention in a Disadvantaged and Multicultural Canadian Urban Area: *The Supporting Montréal Schools Program*** 1023
Jean Archambault and Chantale Richer

52 **Research for Social Justice in Contexts of Student and Family Homelessness** 1047
Peter M. Miller

53 **Towards an Understanding of Social Justice in Our Schools: Globalization, Inclusive Leadership and the Transformation of Schooling** 1063
Robert E. White and Karyn Cooper

54 **The State's Responsibility to Fund Basic Education in Public Schools** 1081
Raj Mestry

Part VII Leadership Preparation as Intervention

55 Clarifying Conceptual Foundations for Social Justice in Education 1105
Susan B. Feldman and Kersti Tyson

56 Issues of Social Justice and Fairness in the Development of Aspiring Head Teachers: I Had Not Really Thought About My Values Before... 1125
Christine Forde

57 Cultural Dialogue as Social Justice Advocacy Within and Beyond University Classrooms 1145
Carol A. Mullen, J.Kenneth Young, and Sandra Harris

58 Beyond the Colorblind Perspective: Centering Issues of Race and Culture in Leadership Preparation Programs in Britain and the United States 1169
Lauri Johnson and Rosemary Campbell-Stephens

59 Modeling Social Justice Educational Leadership: Self-Assessment for Equity (SAFE) 1187
Zorka Karanxha, Vonzell Agosto, and Aarti Bellara

60 Inserting Inclusivity and Social Justice into Conceptualizations of Leadership for Early Childhood: Theoretical Anchors and Postfoundational Pedagogies for Inspiring Provocations in the Field 1207
Julie Nicholson

61 At the Intersections of Black and White: Defining Social Justice from Different Perspectives 1229
Gretchen Givens Generett, Jill A. Perry, and James E. Henderson

Part VIII Afterword

62 The Way Forward 1249
Carolyn M. Shields and Ira Bogotch

Contributors

Vonzell Agosto is Assistant Professor in the Department of Educational Leadership and Policy Studies at the University of South Florida. Her research agenda is comprised of two overlapping strands focused through curriculum and pedagogy: anti-oppressive education and educator preparation (i.e., teachers, administrators).

Bassel Akar is Assistant Professor at the Faculty of Humanities at Notre Dame University – Louaize, Lebanon. He completed his doctorate in education at the Institute of Education, University of London. His research focuses on learning and teaching for active citizenship in the context of Lebanon and other countries in reconstruction. Bassel has a strong interest in consulting young people for education research and development. In the field, he carries out consultative work with international and local NGOs in developing supplemental learning resource material for the civics, history, and geography classrooms in Lebanon. He has also worked closely with UN agencies as an education research consultant on projects including "School-related gender-based violence" (UNESCO, Beirut), "Lebanon country review on peacebuilding and education" (UNICEF, Headquarters) and "Promoting civic values and life skills for adolescents through education" (UNESCO, Iraq). Bassel is a member-elect of the Executive Committee of the Lebanese Association of Educational Studies (LAES) and currently works on the Citizenship Education reform plan at the Ministry of Education and Higher Education. His social justice agenda is to promote equality and justice and deconstruct gendered roles and responsibilities. He wants his daughters and sons to enjoy a life of balanced responsibilities between work, play and, if they choose, raising a family without the socially gendered expectations and constructions of what men and women ought to do.

Gary L. Anderson's research focuses on action and participatory research methods and new policy networks that are promoting neoliberal school reforms. He is a Professor of educational leadership and policy in the Department of Administration, Leadership and Technology in the Steinhardt School of Culture, Education and Human Development at New York University. He also blogs for the Huffington Post.

Panayiotis Angelides is Professor and the head of the department of education at the University of Nicosia, Cyprus. Previously he served as an elementary school teacher. His research interests are in school improvement, inclusive education, school cultures, teacher development and qualitative research methods. He has published widely in his areas of interest. His latest book is entitled *Pedagogies of Inclusion.*

Jean Archambault is an Associate Professor of educational administration, Faculté des sciences de l'éducation, Université de Montréal. He earned an M.A. degree (1978) in clinical psychology from the Université du Québec à Montréal and a Ph.D. (1992) in psychopedagogy from the Université de Montréal. He works in the preparation programs for school leaders, and has created a course on leading schools in disadvantaged areas where issues of learning and of social justice are addressed. He was formerly a pedagogy counselor in the Montreal School Board and in the Supporting Montreal Schools Program for low socioeconomic status schools of Québec Ministry of Education. At the end of the 1990s, he was at the forefront of Québec's educational reform, working in a target school where implementation was experimented. He has published three books in French: with Chantale Richer, *Une école pour apprendre* (2007), Montréal: Chenelière Éducation, with Roch Chouinard, *Vers une gestion éducative de la classe*, 3e édition (2009), Boucherville: Gaëtan Morin, and with France Dumais, *Des données pour diriger. Utiliser ou produire des données et prendre des décisions* (2012), Montréal : UEMPT (MELS) et Université de Montréal.

Phyllis Balcerzak, Associate Director of the Institute for School Partnership at Washington University in St. Louis, is a senior researcher in education. She designs programs that target the specific needs of teachers in underperforming schools. Balcerzak's research examines the ways teachers transfer new knowledge and skills from professional development experiences to students in the classroom. She is the lead evaluator on several national educational initiatives, among these is the "Leadership in Racism Program" featured in this Handbook.

Brian Beabout is an Assistant Professor of Educational Leadership at the University of New Orleans. His work has been published in the *Journal of Educational Change, Multicultural Education, The Journal of Education for Students Placed At-Risk, The School-Community Journal,* and *The Journal of Thought.* He is an Associate Editor of *Complicity: An International Journal of Complexity and Education*. His work in the areas of educational change, urban school leadership, and school-community relations has been heavily influenced by his earlier work as a teacher at Abramson High School in New Orleans and by his study and participation in the rapid reforms of New Orleans schools during the post-Katrina period. Brian was a founding board member of the Morris Jeff Community School in New Orleans and was the host of the *Five Years of Post-Katrina Educational Reform Research Conference* in September 2010.

Aarti Bellara is a visiting professor in the department of Measurement and Research at the University of South Florida. Her research interests focus on investigating the behavior and utility of different statistical methods used to measure educational effectiveness.

Erika Bernabei Middleton's research focuses on how place and geography connect to the education of poor students of color in the current New York City school choice system and potential policy implications for the goal of equitable education. She is a Ph.D. candidate at New York University in the Educational Leadership program and has an M.A. in the Politics of Education from Teachers College. Bernabei Middleton also works as a Program Associate with the Promise Neighborhoods Institute at PolicyLink and leads the Institute's work on developing a data infrastructure and framework for comprehensive community change efforts across the country.

Christa Boske is an Associate Professor in Educational Administration at Kent State University. She works to encourage school leaders to promote humanity in schools, especially for disenfranchised children and families. Christa is currently working with several regional organizations and schools to promote culturally responsive practices by reconsidering pedagogy, curriculum, school-community relations, and school policy. Christa's recent work is published in the *Journal of School Leadership*, *Planning and Changing*, *Journal of Research on Leadership Education*, *Multicultural Education and Technology Journal*, and the *Journal of Curriculum Theorizing*. She recently edited the book (2012) titled *Educational Leadership: Building Bridges Among Ideas, Schools, and Nations* (Information Age Publishing), co-edited the book with Sarah Diem (2012) *Global Leadership for Social Justice: Taking it from the Field to Practice* (Emerald Publishing), and the book *Bridge leadership: Connecting Educational Leadership and Social Justice to Improve Schools* with Autumn K. Tooms in 2010 (Information Age Publishing).

Erin Cameron is a Ph.D. student in the Faculty of Education at Lakehead University in Thunder Bay, Canada. As a retired professional athlete, public speaker on health and wellness, and lecturer in a physical education teacher education program, Erin's specializes in social justice education in the fields of sport, health, and physical education. Her dissertation focus is on creating safe learning spaces for all students, regardless of size, and developing anti-bullying practices that disrupt obesity intolerance, insensitivity, and discrimination.

Rosemary Campbell-Stephens is the Director of RMC UK Ltd. She is a former headteacher and OFSTED inspector who developed Investing in Diversity (IiD) for the London Centre for Leadership in Learning, Institute of Education, University of London. Within the broad field of leadership, race equality, equity, and social justice, her particular interests lie in not only diversifying the face of leadership, but enabling a new cadre of leaders to lead radically differently across sectors with a particular focus on education and health.

Lori Chambers is a Professor in the Department of Women's Studies at Lakehead University in Thunder Bay, Canada, specializing in human rights as they apply to women.

Karyn Cooper is a Professor in the department of Curriculum, Teaching and Learning, University of Toronto. For the past 12 years, Karyn's research, teaching, and writing have been in the areas of literacy education, curriculum studies, teacher education, interpretive and critical approaches to research, and the study of digital technology for a democratic curriculum. At the heart of her work is the belief that looking critically at a variety of personal and ethical issues may support and enhance inclusion, equity and democratic practice. Some of her books include *Qualitative Research in the Postmodern Era: Contexts of Qualitative Research. Volume I.* Springer 2012), *Critical Literacies in Action: Social Perspectives and Teaching Practice.* Volume 34 in S. Steinberg and J. Kincheloe (Series Editors) *Transgressions: Cultural Studies and Education.* (Sense Publishers 2008) and *Burning Issues: Foundations of Education* (ScarecrowEducation 2004). Her current research gathered in a two-volume set of texts features video interviews with many of the giants in the field of qualitative research and/or critical perspectives across the social sciences and humanities. Zygmunt Bauman, Noam Chomsky, Helene Cixous, Clifford Geertz, and Maxine Greene are but a few who share their perspectives providing an opportunity to compress the history of qualitative and critical research paradigm development into a rich overview. Through the development of a website select video clips from these texts may be viewed at <cooperwhite.com>. Future website work involves developing *the digital scholar network* to further a global dialogue on qualitative research across the social sciences and humanities.

Maha Damaj has been working in community development and rights issues for the past 15 years, specifically in the areas of child protection, non-discrimination, the involvement of children and youth in decision making, and disability and inclusion. The latter was the subject of her doctoral research, which inspired this chapter. She has worked in academia as well as with local, regional, and international NGOs and UN agencies where she was involved in strategic planning, policy development, the development and management of programs, as well as research and evaluation, technical training, and the development of manuals and resources. Based primarily in Lebanon, her experience spans several countries in the Middle East region, as well as a year in South-East Asia managing post-emergency programs with UNICEF.

Neil Dempster, a foundation member of the Griffith Institute for Educational Research (GIER), is an Adjunct Professor of Griffith University and has been a member of staff for more than 20 years. He works internationally in the field of educational leadership particularly in leadership for learning, school governance and the role of professional development in leadership, policy implementation and institutional change. His scholarship is evident in publications and grant success, his academic leadership externally and within the university. His research publication record includes a number of books and many book chapters and refereed journal articles. Professor Dempster has served Griffith as Head of School, Dean of Education and Research Centre Director. He has taught a wide variety of courses in Education with many post-graduate supervisions in educational leadership. Since 2000, he has supervised 34 doctoral research students to completion. He continues to serve the external educational community through invitations to conduct professional learning for school leaders and teachers.

José Antonio Ramírez Díaz is a psychologist certified by the Western Institute of Technology and Higher Education (ITESO) and received his Master in Organizational Development from ITESO and Ph.D. in Education from the University of Guadalajara. He was the Head of the Department of Welfare and Sustainable Development, University of Guadalajara (CUNorte) (2005–2008) and Professor of the Department of Education, University of Guadalajara (CUCSH), Professor Promep Profile (2007–2010 and 2010–2013) by the Ministry of Education. He is also Member I of the National Research System of CONACYT and Member of the Mexican Council of Educational Research (COMIE). His areas of research include: Educational policies, international and institutional changes. In the Iberoa-merican Network of Educational Policies Research (RIAIPE) he is the Coordinator for University of Guadalajara. He is the author of the books: "La universidad ante la globalización" (Deauno, Argentina, 2008) and "Equidad en la educación superior en México" (Deauno, Argentina, 2012). He is also a speaker and panelist in Buenos Aires, Santiago de Chile, Barcelona, Brazil, Cuba, San Jose Costa Rica and Mexico.

Arnold Dodge, Ph.D., is chairperson of the Department of Educational Leadership and Administration at LIU-Post. He retired from the public schools in August 2007 after serving as superintendent, curriculum administrator, principal and teacher. In his 43rd year in education, Dr. Dodge's research interests focus on the impact of high-stakes testing on teachers and students and issues of race, poverty and schooling. With a colleague from Yale University, he collaborated on a large scale study regarding the social/emotional consequences of high stakes testing, focusing on teacher stress factors. He travels each fall to South Africa to continue work on an investigation into the effects of race and poverty on schooling in both South Africa and the USA. A joint venture of Stellenbosch University, near Cape Town South Africa, and Long Island University, this project has expanded to include virtual communities between educators and students in both countries. Dr. Dodge has moderated and participated in symposia on international schooling, most recently regarding his visits to schools in China and Finland. His published work centers on the relationship between public policy and constructed discourse.

Robert Donmoyer is currently Professor of Leadership Studies at the University of San Diego. Prior to moving to the University of San Diego, Dr. Donmoyer worked for 20 years as a Professor at the Ohio State University. During his final years at Ohio State, Dr. Donmoyer served as Director of the School of Educational Policy and Leadership. Dr. Donmoyer's publications have focused on educational leadership and leadership education, educational reform, research methodology, and research utilization issues. One research utilization issue that Dr. Donmoyer has written about is the potential for ostensibly empirical research to reinforce inequality through the framing of research topics and questions, a process that predates and often impacts in significant ways the empirical components of a study. A recent paper for the Annual Meeting of the American Educational Research Association, which was co-authored with first nations scholar Pat Makokis and Dr. Donmoyer's former doctoral student, Julia Buchanan, adapted the Cree nation's talking circle procedure to explore, through a multiple perspectives dialogue, the problems with and the possibilities of non-indigenous people studying indigenous groups. The study was grounded in Dr. Buchanan's attempts to do her dissertation research on indigenous views of leadership on the Saddle Lake Reserve in Canada where Dr. Makokis lives and works. Dr. Donmoyer chaired the dissertation.

Karen Dooley is an Associate Professor in the Faculty of Education, Queensland University of Technology. She teaches in primary English. She is interested in literacy education for young people in linguistically and culturally diverse schools and in after school clubs and programs.

Charles Dukes is Associate Professor and doctoral coordinator in the Department of Exceptional Student Education at Florida Atlantic University where he teaches courses in general special education, disability studies, and applied behavior analysis. Dr. Dukes is an active member of the Council for Exceptional Children and TASH. He is the current editor of the TASH publication, *TASH Connections*, a professional magazine published by TASH for researchers, practitioners, families, and self-advocates interested in issues related to persons with severe disabilities. He believes that social justice permeates virtually every aspect of the education process, as all humans regardless of ability deserve the right to exert personal choice and take part in all parts in life. Dr. Dukes' research interests include linking multicultural and special education, social and intimate relationships for persons with severe disabilities, concept maps as a research and assessment tool, and educational supports for persons with severe disabilities.

Lisa Catherine Ehrich is an Associate Professor in the School of Learning and Professional Studies, Faculty of Education, at Queensland University of Technology (QUT), Australia. She has 20 years' experience working in higher education and 2.5 years' teaching experience in secondary schools in Queensland. She is the Area of Interest Co-ordinator for Leadership and Management in the Masters of Education degree program and, for many years, worked as a member of a teaching team responsible for the Doctor of Education program. She has considerable international teaching experience and has taught school leaders and administrators in countries such as Papua New Guinea, Singapore, the Philippines and China. At QUT, she has coordinated and taught short programs on leadership development for higher education students, school teachers and leaders, and university academics from many countries in South East Asia. While her research areas are eclectic since she has published in fields as diverse as phenomenology, mentoring, affirmative action for women, and micropolitics, her substantive research area is leadership. With Neil Cranston, she has written two books on leadership: *What Is This Thing Called Leadership?: Prominent Australians Tell Their Stories* and *Australian School*

Leadership Today (both published by Australian Academic Press). In 2012, with academics from QUT and the University of Manchester, she was awarded an Australian Research Council Linkage Grant to explore ethical leadership in a time of evidence-based reform.

Heyam Loutfi El Zein has a doctorate in Educational Management from the University of Leicester–England, Master of Arts in Educational Psychology, Graduate Diploma in Youth and ECE from the University of Victoria–Canada, and Bachelor of Arts in Psychology from American University–Beirut. She is an Associate Professor in Educational Management at Rafic Hariri University. Dr. Loutfi has conducted numerous teacher training workshops on ECE, Peace Education and Children's Rights, Conflict Transformation, and Teacher's Empowerment in Lebanon and across the region. She has published in international journals and presented papers in regional and international conferences.

Fenwick W. English is the R. Wendell Eaves Senior Distinguished Professor of Educational Leadership in the School of Education at the University of North Carolina at Chapel Hill. He is the author or co-author of 35 books including *Educational Administration: The Human Science* (1992); *Theory in Educational Administration* (1994); *The Art of Educational Leadership* (2008); *Anatomy of Professional Practice* (2008); *Restoring Human Agency to Educational Administration* (2010) and *Turnaround Principals for Underperforming Schools* (2011) with Rosemary Papa. He has presented his work over two decades at the American Educational Research Association Divisions A and L; National Council of Professors of Educational Administration; University Council of Educational Administration; British Educational Leadership and Management Society; and the Commonwealth Council for Educational Administration. He was the editor of *The Encyclopedia of Educational Leadership and Administration* (2006) two volumes for Sage; the editor of a four-volume series *Library of Educational Thought and Practice: Educational Leadership and Administration* (2009) for Sage; and the editor of *The Second Handbook of Educational Leadership* (2011) for Sage. He was the President of NCPEA (2011–2012) and of UCEA (2006–2007) respectively. As an educational practitioner he has held the positions of middle school principal (California); assistant superintendent of schools (Florida); superintendent of schools (New York); associate executive director of the AASA (Virginia); National Practice Director of Elementary and Secondary Education for Peat, Marwick, Mitchell & Co. (Washington, D.C.); Department Chair-University of Cincinnati (Ohio); Dean, School of Education at Indiana University-Purdue University in Fort Wayne and later Vice-Chancellor of Academic Affairs.

Beryl Exley is a Senior Lecturer in the Faculty of Education, Queensland University of Technology. She teaches in English and literacy and educational sociology. Her research relates to literacy across the curriculum, school reform and teacher knowledge.

Susan B. Feldman is an Assistant Professor, Lewis and Clark Graduate School for Educational Leadership and School Counseling, in Portland Oregon and the Director of the Research Center for Learning and Leadership at Education Service District 112, in Vancouver, Washington, where she works on pressing and persistent problems of practice with school leaders. Sue is a mixed methods researcher. Sue combines her background in cognitive psychology and education leadership and policy to form an interdisciplinary research agenda focused on leadership and policy conditions for equity policies. She is a recent Ph.D. graduate from the University of Washington, Education Leadership and Policy Studies program. Her dissertation, "Inquiry-focused reform: How teachers learn new practices from their current practice," was completed in 2010. Sue's work on injustice in education began in her K-5 classrooms where she practiced critical pedagogy as a classroom teacher. As a faculty member at the Evergreen State College Master in Teaching program and as Academic Director of Teacher Education at Pacific Oaks College Northwest, Sue continued to work on designing pre-service experiences to prepare new teachers to work for social justice in their classrooms. Working currently with school and school district leaders Sue continues to focus on the complex pressing and persistent injustices in education.

Jesús Ruiz Flores, Ph.D. in Education, specialized in Education and Labor. He is a Psychologist and Master in Higher Education Planification and Professor of University of Guadalajara (México) at the Department of Politics and Society. He is also a Member of the Research Group "Education, Public Policy and Regional Development" and Researcher of the networks "Poverty and Urban Development" and "Cooperation and Development Ibero American Centers". He is a Coordinator at the Western Social Science Association of the Latin American Section (USA) and Observatorio Ciudadano de la Educación-Jalisco Chapter (México), Seminar on educational processes and labor markets (México). He is author of the book "Educación, formación profesional y mercados de trabajo" (UNAM, UdeG, IMCED, México, 2008), and has coauthored with Rogelio Raya and Rosalía López "Procesos formativos y estructuración de mercados de trabajo" (Universidad de Guadalajara, México, 2010) and "Región y globalización. Articulaciones sociales de los mercados laborales" (Editorial Académica Española, España, 2012). He makes research visits to: University of Guanajuato (México), Autonomous University of Aguascalientes (México), Autonomous University of Barcelona, and Complutense University of Madrid.

Christine Forde is a Professor of Leadership and Professional Learning in the School of Education at the University of Glasgow, UK. In the leadership preparation programs she has developed, leadership is constructed as a values-based practice where leaders need to both articulate and appraise their practice in terms of equality, social justice and fairness for all learners. This work in leadership development, equality and social justice draws from her interest in feminist theory and the possibilities offered by feminist scholarship in reconceptualizing the concept of gender with educational policy and practice. She has published books and articles in the area of gender and feminist perspectives in education including *Feminist Utopianism and Education* (Sense, 2008). One of her current areas of research is an exploration of ideologies of gender and the feminization of the teaching profession, particularly the construction of “teacher as mother” in educational theory. A critical issue for her is the relationship between theoretical explorations of gender, the discourses of femininity and masculinity and the achievement of pupils (*Tackling Gender Inequality: Raising Pupil Achievement*, Dunedin 2008).

Bronwyn Fredericks is a Murri Australian woman from South-east Queensland (Ipswich/Brisbane region), Australia. She is a Professor and the Pro Vice-Chancellor (Indigenous Engagement) and the BMA Chair in Indigenous Engagement at CQUniversity Australia. In 2012, she became CQUniversity’s President of Academic Board, and in doing so became the first Aboriginal Australian to hold such a role in an Australian university. Bronwyn is an Alumnus of CQUniversity Australia, Queensland University of Technology and the University of Tasmania. She was awarded her Ph.D. in 2004 and has since been awarded a National Health and Medical Research Council Post-Doctoral Fellowship at Monash University and an Australian Endeavour Award, which saw her spend time with the University of Auckland and Te Whare Wananga o Awanuiarangi, Whakatane, New Zealand. Becoming a secondary home economics and history teacher in the 1980s, Bronwyn was last in a school classroom in 2007. She is often invited to school awards nights, and to spend time with school and university students in a range of settings. Bronwyn is committed to equity at all levels: from increasing Indigenous access to supporting Indigenous participation across the success continuum. She attempts to motivate all people to utilize education and training as a tool and a vehicle to “be what they want to be!”

Joaquín Gairin is a Professor of Teaching and Educational Administration, Director of the Organisational Development Research Group (EDO) and international advisor. He is former Director of Educational Sciences Institute, former Dean of the Faculty of Education and, currently, Director of the Applied Pedagogy Department at the Universitat Autònoma de Barcelona. Recently, he has finished two projects for promoting educational management and leadership in Latin America, funded by Spanish Agency for International Development Cooperation. He is currently leading a project for widening access to higher education for underrepresented groups as well as for nontraditional learners in Latin America. His research interest includes educational administration and leadership, knowledge management, organizational development and professional development.

Mary E. Gardiner/Henry, Ph.D., an immigrant to the USA from Australia, is currently a Professor of Educational Leadership, University of Idaho, Boise. She is interested in the social and cultural dimensions of learning and leadership, social justice leadership, and leadership praxis for democracy. She co-authored a chapter in the book *Social Justice Leadership for a Global World* (2012), a chapter in the book *Breaking Into the All-Male Club* (2009, SUNY Press); and has authored books *Latino Dropouts in Rural America* (2008, SUNY Press), *Coloring Outside the Lines*: *Mentoring Women into Educational Leadership* (2000, SUNY) and articles.

Gretchen Givens Generett, Ph.D. has spent the last 15 years in academia researching and teaching on issues of teacher professional development, educational leadership, and cultural diversity. Currently the Associate Dean for Graduate Studies and Research at Duquesne University, Dr. Generett is also the Co-director of the University Council for Educational Administration Center for Educational Leadership and Social Justice. Her teaching and research are designed to enhance the skills and habits of mind necessary for educators to effectively teach students from diverse populations. Dr. Generett's has published extensively in peer-reviewed journals and edited volumes in the field of education. She is the co-editor of the book *Black Women in the Field: Experiences Understanding Ourselves and Others through Qualitative Research* published by Hampton Press and has served as the guest editor for the journals *Educational Foundations*, *Educational Studies*, and *Journal of Cases in Educational Leadership.* Dr. Generett earned undergraduate degree at Spelman College and her doctorate at the University of North Carolina at Chapel Hill.

Louise Gonsalvez. As a scholar activist I am always seeking systemic injustices to identify, critically reflect upon, analyze, confront and overcome. This picture was taken at Machu Picchu, in Peru, after I completed two research/capacity building projects in Ecuador. One project took place in the coastal mangrove wetlands and the other on the Galapagos Islands. As I stand betwixt a sacred Inca gateway, atop Andean peaks, upon a world famous UNESCO World Heritage Site, I feel transformed by my recent experiences in Ecuador and restored by this sacred site. I am prepared to carry on my social justice research and work in that fused metaphysical place I call the praxis lands.

Carolyn Grant is a Senior Lecturer in Education Leadership and Management in the Faculty of Education at Rhodes University, Grahamstown, South Africa. She teaches on the Honours, master's and Ph.D. programs in Education Leadership and Management and is also involved in the research design courses. Her research interests span both the schooling sector and the terrain of higher education. Her research in the schooling sector includes teacher leadership as one manifestation of a distributed perspective on leadership, leadership for social justice as well as school resilience. More recently, she has concentrated on her own teaching, research and supervision in the Higher Education sector and has begun to theorize in the areas of teaching, learning and assessment at the master's and doctoral levels.

Ivan Greenberg. My interest in the work and political cultures of adult learners derives from several years of teaching American labor history to electrical apprentices from Local 3 of the International Brotherhood of Electrical Workers (IBEW) in New York City. I taught in a partnership program run by Empire State College, SUNY, and discovered that adult students expressed greatest educational interest when the subject matter was connected to their everyday lives. They proved eager to learn the history of strikes, worker control movements, as well as labor culture. The introduction of complex ideas succeeded when made "relevant" to contemporary concerns. My background was suited to such engagement. I wrote my doctoral dissertation in labor and social history at the CUNY Graduate Center, published several articles on education and workers, and participated as an activist on the margins of several social justice movements. Recently, I keenly am interested in the treatment of political dissidents in American society and published two books – *The Dangers of Dissent* (2010) and *Surveillance in America* (2012) – on the history of social movements, civil liberties, and state surveillance.

Morwenna Griffiths is the Chair of Classroom Learning in the Moray House School of Education at Edinburgh University. She has taught in primary schools in Bristol, and at the University of Isfahan, Iran, at Christ Church College HE in Canterbury, and at Oxford Brookes, Nottingham and Nottingham Trent Universities. Her recent research has included philosophical theorizing and empirical investigation, related to social justice, influencing policy makers through theory, epistemology of auto/biography, public spaces, the nature of practice, feminization and creativity. Her books include *Action for Social Justice in Education: Fairly Different*; *Educational Research for Social Justice,* and *Feminisms and the Self;* and *the Web of Identity*. She takes the view that social justice is best understood as dynamic, and further that any specific formulation is always revisable. Her current research is focused on two main philosophical concerns. The first concern is the development of an understanding of pedagogical relations viewed as embodied, context-dependent and temporal. Such an understanding will have implications for what it is to be a socially just leader and teacher. The second concern focuses on extending social justice concerns beyond human relations: on how to act justly in a world which is constituted of the more-than-human as well as the human.

Christina Hajisoteriou received her M.Phil. in Educational Research from the University of Cambridge, UK. She was also awarded the Degree of the Doctor of Philosophy by the University of Cambridge, UK. Her research interests relate to intercultural education, migration, Europeanization, identity politics and social justice.

Edward L. Harris is Professor and Williams Chair of Educational Leadership at Oklahoma State University and Administrator for the Brock International Prize in Education. He earned his Ph.D. from Texas A&M University, and his teaching, research and service activities focus on understanding and improving school culture. He can be reached at ed.harris@okstate.edu.

Sandra Harris is a Professor of Educational Leadership and has been a superintendent, principal, and teacher. She is the Dissertation Coordinator of Doctoral Studies at Lamar University in Texas, USA. She is past President of the National Council of Professors of Educational Administration. Her expertise is in personal cultural transformation and the role of cultures of inquiry in changing leadership understandings. Her research and teaching focus on cultural influences and relationships for leaders. She has published or co-published 17 books in school leadership. Examples are *BRAVO Principals: Building Relationships with Actions that Value Others* (Eye on Education, 2004) and *Challenges of No Child Left Behind: Understanding the Issues of Excellence, Accountability, and Choice* (Rowman & Littlefield Education, 2007). She is co-editing a book titled *Critical Social Justice Issues for Practitioners* (NCPEA Press, forthcoming).

Dr. James E. Henderson has served since 1992 as Professor of Educational Leadership and Director of the Interdisciplinary Doctoral Program for Educational Leaders in the Duquesne University School of Education. Jim also served as Dean of the School from 1995 until 2003. In 2009 he was named as the Founding Director of the UCEA Center for Educational Leadership and Social Justice and currently serves as Co-Director. In addition to his work with Duquesne, Jim was named a Distinguished Visiting Scholar at Union Institute & University in Cincinnati in 2007. Prior to his most recent posts, Jim served 22 years as a schoolteacher and administrator, the last 13 of which were in the school superintendency. Jim is a Senior Associate in Hazard, Young, Attea & Associates, Ltd., one of the premier educational consulting firms in the USA. His recognitions include selection as the recipient of the Award of Achievement for Service to the Profession by the Pennsylvania Association of School Administrators; the Junior Achievement National Silver Leadership Award; for the Rutgers University Distinguished Service Award; as a Kellogg National Fellow; and as a member of the *Executive Educator 100* jointly sponsored by AASA and NSBA. Jim took his bachelor's degree in Social Psychology from Princeton University, and his master's and doctoral degrees in Educational Administration from Rutgers University.

Phil Hunsberger is Senior Partner with Educational Equity Consultants, a firm focused upon dismantling racism in public education. He is a retired educator with 37 years of service as a teacher, administrator, central office administration, and Executive Director of two Illinois State funded reform initiatives. He served on the faculty of the National Conference of Community and Justice annual Dismantling Racism Institute for Educators and as the Director of the International Network of Principal Centers. In 1994, the National Association of Elementary School Principals selected him as the National Distinguished Principal from Illinois. He has authored a number of articles on school leadership, published journals for the *New Directions for School Leadership* and *Reading Research Quarterly* of the International Reading Association.

Munyaradzi Hwami, Ph.D., is a part-time lecturer in Educational Policy Studies, Faculty of Education, at the University of Alberta. Before coming to Alberta, he was with the Great Zimbabwe University where he was a lecturer in Sociology of Education and Research Methods and Statistics. His research experience is in higher education, post-colonial developments, and social justice issues. He is an author of several journal articles and book chapters on higher education in Zimbabwe. His most recent publications are entitled *Settlers, Sell-outs and Sons of the Soil: The Creation of Aliens in Zimbabwe and the Challenge for Higher Education* and *Neocolonialism, Higher Education and Student Union Activism in Zimbabwe.*

Sotiroula Iasonos is a primary school teacher in Cyprus and a doctoral candidate at the Open University of Cyprus. Her research interests are in social justice education, intercultural education and educational leadership.

Lindsayanne Insana is a doctoral student in Curriculum & Instruction at the University of Illinois at Urbana-Champaign. Her research interests include teacher education program reform and collaboration within higher education institutions. She currently works as a research assistant with the University of Illinois' College of Education redesign efforts. Lindsayanne's initial interest in social justice began when she worked as an elementary school teacher and recognized the discrepancies in post-program mentoring and induction services from state to state.

Patrick M. Jenlink is Professor of doctoral studies in the Department of Secondary Education and Educational Leadership and Director of the Educational Research Center at Stephen F. Austin State University. His experience includes classroom teacher, K-12 counselor, building administrator, and school district superintendent. Dr. Jenlink's teaching emphasis in doctoral studies at Stephen F. Austin State University includes courses in ethics and philosophy of leadership and scholar–practitioner models of leadership. His research interests include identity politics, democratic education and leadership, and social injustice in educational settings. In particular, the focus on injustice animates his philosophical position on social justice leadership, acknowledging that in the absence of a socially just practice injustices persist to the detriment of democratic society. He has authored numerous articles, guest edited journals, authored or co-authored numerous chapters in books, and edited or co-edited several books. Currently Dr. Jenlink serves as editor of *Teacher Education & Practice* and co-editor of *Scholar-Practitioner Quarterly*, both refereed journals. Books published include *Dialogue as a Means of Collective Communication*, Kluwer Academic/Plenum Publishing, *Equity Issues for Today's Educational Leaders: Meeting the Challenge of Creating Equitable Schools for All*, Rowman & Littlefield, and *Dewey's Democracy and Education Revisited: Contemporary Discourses for Democratic Education and Leadership*, Rowman & Littlefield. Dr. Jenlink's current book projects include *Ethics and the Educational Leader: A Casebook of Ethical Dilemmas* (forthcoming from Rowman & Littlefield Publishing Group), and *Educational Advancing Moral Literacy in Educational Leadership: Understanding the Dispositions of Moral Leaders* (forthcoming from Rowman & Littlefield Publishing Group).

Greer Johnson is Professor of language and literacy education and Director of the Griffith Institute for Educational Research. Her recent research takes a non-deficit approach to language and literacy education in disadvantaged communities, especially in Australian schools and communities with large Indigenous populations. Her focus is on facilitating "both-way" knowledge partnerships between school principals, Indigenous teachers and communities to achieve better outcomes for students. She has recently co-edited a book about productive pathways for at risk students in transitioning from school to post-school options: *Experience of School Transitions: Policies, Practice and Participants*.

Lauri Johnson is an Associate Professor and Program Coordinator of Educational Leadership at Boston College. She researches how White educators conceptualize race, historical and contemporary studies of community activism, and culturally responsive leadership in national and international contexts. Her writings have appeared in several journals, including the *Journal of Teacher Education, Journal of School Leadership, Leadership and Policy in Schools, Journal of Educational Administration, Urban Education,* and in three books: *Dealing With Diversity Through Multicultural Fiction: Library-Classroom Partnerships* (ALA, 1993), *Urban Education With an Attitude* (SUNY Press, 2005), and *Multicultural Policies in Canada and the United States* (Joshee & Johnson, UBC Press, 2007) which won the 2008 AESA Critics' Choice Award.

Marilyn Johnston-Parsons is a Professor in the Department of Curriculum and Instruction at the University of Illinois at Urbana-Champaign. Her major interested are teacher education reform, collaborative programs between schools and universities, and social studies education. She has a long history of working in alternative and urban school contexts and her commitment to issues of social justice come from experiences of working with diverse students and in low SES schools. A recent book written collaboratively with teachers leaders in a densely urban school is entitled: *Success Stories from a Failing School.*

Zorka Karanxha is Assistant Professor in the Department of Educational Leadership and Policy Studies at the University of South Florida. Her research agenda focuses on policies that positively influence marginalized communities through continued investigation of two interwoven conceptual strands: (1) social justice leadership praxis to reduce educational inequities; and, (2) social justice leadership to reduce inequities in legal education policy and policy implementation. These two research strands are guided by an overarching ethical leadership framework pillared by conceptions of justice, care, critique, and equity. Her intellectual inquiries and professional actions are designed to engage multiple paradigms of social justice with the understanding that educational leaders can be developed into individuals who contribute to the reduction of historical patterns of inequity.

Colleen Larson is Department Chair of Administration, Leadership and Technology in the Steinhardt School of Culture, Education, and Human Development at New York University. Her interests are rooted in the philosophy of social science, the methodologies of interpretive inquiry, and the sociopolitical theories of equity and opportunity underpinning social and institutional reform in schools serving low-wealth and immigrant communities of color. A member of the Educational Leadership, Politics and Advocacy Program and Interdepartmental Research Studies Faculty in Humanities and Social Science, she teaches courses in the politics of multicultural communities and approaches to interpretive inquiry methodology.

Angeliki Lazaridou is an Assistant Professor at the University of Thessaly, Greece. She has a B.Ed. and an after-degree diploma in Special Education-Early Intervention from the University of Athens, and an M.Ed. in Early Childhood/Special Education, and Ph.D. in Educational Administration and Leadership both from the University of Alberta, Canada. Her teaching and research interests focus on school administration and leadership, particularly on issues of effectiveness, ethics and values, gender, women, and learning communities.

Social Justice Platform

- Social justice leadership is authentic leadership focused on praxis that fuels change by unearthing issues of injustice, prejudice, inequity, oppression, and cultural misunderstandings.
- Social justice leadership is the vehicle to turn ordinary school into democratic learning communities of shared knowledge and practice.
- Social justice leadership begins with the reflection on our self-identities and involves the adoption of a multicultural lens to view the world.
- Social justice leadership flourishes in an ethos of cooperation and integration that empowers members of the organization to challenge conventional wisdom and to adopt a more cultural just worldview.
- Social justice leadership is rooted in humanitarian and cosmopolitan views of the world.

Ann E. Lopez teaches at the Ontario Institute for Studies in Education of the University of Toronto in the Department of Leadership, Higher and Adult Education. She is the program coordinator of the Concurrent Teacher Education Program. Prior to taking a university position, Dr. Lopez worked for 15 years as a secondary teacher and school administrator. She teaches foundation courses in teacher education as well as courses on educational administration and school leadership. She engages in research on culturally relevant teaching, teacher leadership, diversity and equity and social justice.

Allan Luke is a Research Professor at Queensland University of Technology. His research has had local, national and international impact across the fields of literacy, school reform and social justice. His latest work has involved him in an evaluation of a large scale reform program aimed at improving school outcomes for Indigenous students in Australian schools.

Linda L. Lyman is a Professor in the Department of Educational Administration and Foundations at Illinois State University. She has a B.A. in English from Northwestern University, and M.A.T. from Harvard University, and a Ph.D. in administration, curriculum, and instruction from the University of Nebraska-Lincoln. In 2005 she spent 6 months in Greece as a Fulbright Scholar, where she taught about women's leadership in American culture at Aristotle University in Thessaloniki. Her scholarship and publications, including four books, focus on leadership with an emphasis on issues of caring, gender, poverty, women, and social justice.

Social Justice Platform

- Retrace any path of justice and one discovers caring at its source.
- Justice supports the universal love of humankind undivided by gender, race, ethnicity, creed, nationality or sexual orientation.

- Social justice means that all people have the opportunity to earn a living wage.
- Social justice requires domestic violence against women to be eliminated.
- Social justice leadership crosses borders and builds bridges by challenging stereotypes and deficit thinking.
- Social justice leadership creates welcoming communities that embrace freedom and promote the democratic process in human organizations.
- *Critical evocative portraiture* promotes understanding, acceptance, and celebration of differences.
- Justice is a right of the essence of a person to be respected.

Katherine Cumings Mansfield, Assistant Professor at Virginia Commonwealth University, holds a Ph.D. in Educational Policy and Planning and a Doctoral Portfolio in Women's and Gender Studies from The University of Texas at Austin. Mansfield's interdisciplinary scholarship focuses on the history and politics of education and the relationship of class, gender, race/ethnicity, and religion on educational and vocational access and achievement. Mansfield has presented at: American Educational Research Association (AERA); *National Summit on Interdistrict Desegregation* at Harvard Law School; *Legal and Policy Options for Racially Integrated Education in the South and the Nation* at University of North Carolina-Chapel Hill School of Law; and University Council for Educational Administration (UCEA). Mansfield is published in*: International Journal of Urban Educational Leadership*, *Journal of Educational Administration*, *Journal of Research on Leadership Education*, and *Journal of School Leadership*. In 2012, Mansfield was awarded the "Leadership for Social Justice Dissertation Award," sponsored by AERA's Leadership for Social Justice Special Interest Group (SIG) and the "Selma Greenberg Outstanding Dissertation Award," sponsored by AERA's Research on Women and Education SIG. Mansfield's social justice agenda is informed by her lived experiences, including: growing up in lower socioeconomic circumstances, studying education as a first-generation college student, serving diverse populations throughout the preschool to postsecondary pipeline for over 20 years, and a lifetime of exploring justice issues as they relate to ethics and spirituality across cultures.

Daniel Johnson Mardones is a Ph.D. student in the Department of Curriculum and Instruction at the University of Urbana-Champaign, and has a Master in Curriculum and Educational Community from the University of Chile. His work has been focused on biographical approaches in curriculum theory and teacher education. His commitment to social justice comes from his early life experiences and was important in his decision to become a history teacher.

Dr. Priscilla Maynor is a member of the Lumbee Tribe. She is an Executive Vice President at the Center for Educational Leadership and Technology and leads the Shared Learning Systems and Leadership Development unit. She has more than 27 years of progressive leadership in public education and a solid background in education policy and reform, organizational development and change management. Dr. Maynor began her career as a special education teacher and administrator in the

Public Schools of Robeson County. Her state level experience includes various leadership roles with the North Carolina Department of Public Instruction (NCDPI). With NCDPI, she led several mid to large-scale statewide initiatives including the implementation of early childhood programs and a regional service delivery model to support transformation of the state's lowest performing districts and schools. Dr. Maynor also led strategic initiatives in communications, data management, professional development and research and evaluation. Her motivation is to increase access and educational opportunities for all students, particularly Native Americans. Dr. Maynor served on the North Carolina State Advisory Council of Indian Education for more than 10 years leading efforts to improve the education of the state's eight tribes. Her work with the State Council in collaboration with Native tribes significantly improved coordination, communication and support for schools, districts and Title VII American Indian and Alaska Native education programs. Dr. Maynor holds master's degrees in Special Education and School Administration and Supervision and a doctorate in Educational Leadership from the University of North Carolina at Chapel Hill. She is a William E. Friday Fellow for Leadership in Human Relations, a Barbara Jackson Scholar and a member of the National Indian Education Association.

Marva McClean is a literacy researcher and curriculum developer who specializes in international education, critical literacy, and the intersection of race, language, and leadership in the classroom. She is a cultural and community activist who explores issues confronting the Caribbean diaspora and in particular, social justice and equity in the society and in schools. She is currently researching and writing about the central position Nanny of the Maroons and Anancy, the West African spider occupy in the West Indian ideology of resistance, subterfuge and empowerment and the implications for transformative literacy leadership and learning.

Raj Mestry began teaching in 1973 as a post level 1 teacher and passed through the ranks of Deputy Principal and Principal at primary and secondary schools. He completed the B. Comm. (Hons), and obtained a *cum laude* in the M. Ed. (Education Management) degree. In 1999 he completed his D. Ed. in Education Management. In 2002, he joined the University of Johannesburg as senior lecturer and currently holds the position of Professor in the Department of Education Leadership and Management. He is actively engaged in the Education Leadership Institute (UJ-Harvard Graduate School of Education partnership) training school managers. This agenda has been extended to the training of school managers nationally as well as in the African continent (Namibia). He has successfully supervised numerous M. Ed. and Ph.D. students and has published extensively in both national and international accredited journals, written a chapter for an international book commissioned by the Commonwealth Secretariat, and co-authored four books in the field of education management and leadership in education. Raj serves on the executive committee of the Education Association of South Africa (EASA) and South African Education Law Association (SAELA). Until recently, he served as co-editor of the South African Education Management and Leadership Journal, and the editorial committee of the *South African Journal of Education*. The South

African education landscape has been severely hampered as a consequence of the apartheid policies and pertinent issues addressing social justice and equity are foregrounded in his research agenda.

Peter Miller completed his doctoral studies at the University of Utah and currently is on the faculty in the School of Education at the University of Wisconsin-Madison. His research and teaching focus on cross-sector collaboration in service of traditionally marginalized students and families. Much of his work unfolds on contexts of poverty and homelessness. Previously, Peter worked as a high school teacher in Montgomery, Alabama, and South Bend, Indiana.

Kavin Ming is currently an Assistant Professor of literacy in the Department of Curriculum and Pedagogy at Winthrop University, in Rock Hill, SC. Dr. Ming earned a B.A. in English, an M.Ed. in Special Education from Florida State University, and an Ed.D. in Special Education from Florida Atlantic University. Dr. Ming has been preparing future teachers for the past 5 years. Prior to entering higher education, Dr. Ming spent 8 years in the Florida public school system. During her tenure as a public school teacher, Dr. Ming advocated for children and parents in need of assistance to realize the full benefit of public education. Her research interests include: improving the academic success of students at risk for reading failure, using literacy strategies in content area learning, using technology to aid in literacy instruction, and using effective multicultural practices in classrooms.

Alejandra Montané López holds a Ph.D. in Pedagogy from the University of Barcelona (UB) and Bachelor of Philosophy and Science Education (UB) and master's degree in Education and Training the Trainers from the Autonomous University of Barcelona (UAB). She is a teacher at the Department of Teaching and Learning and Educational Organization (UB) and teaches in Social Studies Education (specialization Human Rights and Legal Subjects) and in studies of Pedagogy since 1997. She is also a teacher in the doctoral Ph.D. in the area of "Complexity, society and education". She has been visiting doctoral and post doctoral universities, among them the UQAM (University of Quebec in Montreal, Canada) and Lusophone University of Portugal. She is author of numerous publications in books and magazines as well as member of the editorial board and referee of several Spanish, Portuguese and Latin American specialized periodical publications. She is member of the consolidated research group Esbrina, Subjectivitats i Entorns Educatius Contemporanis dedicated to the study of the conditions and current changes in education in the world; member of CECACE (Centre for the Study of Change in Culture and Education – Scientific Park of Barcelona) as well as member of several national and international scientific associations.She is currently coordinator of the team of the University of Barcelona in the Ibero-American Network of Educational Policy Research (RIAIPE), which develops the project of the European Commission Alfa called "Inter-University Framework Programme for Equity and Social Cohesion Policies in Higher Education". Her last publication (2012) coauthored with J. Beltran is Исследования по социология образования в Испании (Research in the sociology of education: an overview of the situation in Spain) in Ivanova, A.M. Osipov. Veliky "Global Sociology of Education", NovSU; Moscow.

Maha Mouchantaf is the chairperson of the Department of English, Translation and Education and an Assistant Professor at Notre Dame University – Louaize, Lebanon. She holds a Ph.D. in Educational Management from Université de Corse – France, an M.A. in Educational Management from Lebanese American University and a B.A. in Communication Arts, Journalism and Radio/T.V. production from the same university. Her main research has focused on exploring gender differences, cultural diversity, and leadership styles in administration. She has a rich experience in school management and her research interests continue to center on issues related to "Shaping better Leaders" as well as on "Bridging the gaps in the Lebanese Educational System." She has conducted several trainings and workshops on leadership and management and has several publications on Female Leadership in Lebanon and on the issues pertaining to gender differences in school administration.

Carol A. Mullen is a Professor of Educational Leadership, Director of the School of Education, and Associate Dean for Professional Education of the College of Liberal Arts and Human Sciences at Virginia Tech, Blacksburg, Virginia, USA. Her inquiries focus on democratic and critical explorations of mentoring leadership theory and practice in K-12 and university settings. She served as President of the National Council of Professors of Educational Administration from 2012 to 2013. She was Chair of the Educational Leadership and Cultural Studies Department from 2007 to 2012. She is the long-term former Editor of *Mentoring & Tutoring: Partnership in Learning* (Routledge). Her authorships encompass more than 200 refereed journal articles and book chapters, 15 special issues of journals, and 16 books. Recent books are *The SAGE Handbook of Mentoring and Coaching in Education* (Sage, 2012); *Educational Leadership at 2050: Conjectures, Challenges, and Promises* (Rowman & Littlefield Education, 2012), and *From Student to Professor: Translating a Graduate Degree into a Career in Academia* (R&L, 2012). Her awards for scholarship, doctoral mentoring, and teaching include a book award from the American Educational Research association.

Alexandre Ibongya-Ilungu Muzaliwa, (Alex) Ed.D., an adjunct faculty for the University of Idaho, was originally a refugee to the USA from the Democratic Republic of the Congo (DRC). Dr. Muzaliwa is interested in how self-inquiry advances social justice, equity, and democracy. He earned his doctoral degree in Educational Leadership, University of Idaho, Boise. A former school principal, Alexandre also taught high school French and Social Studies. He published a chapter in the book *Social Justice Leadership for a Global World* (2012). His dissertation (University of Idaho, 2011) was entitled *Teaching and leading for diversity and social justice through narrative inquiry in secondary schools*.

Dr. Irene Muzvidziwa is a senior lecturer in the School of Education, University of KwaZulu Natal Pietermaritzburg campus. She is a holder of a diploma in Education from the University of Zimbabwe, B.Ed. and M.Ed. degrees from the Waikato University, New Zealand, and in addition, she holds a doctorate in educational leadership from Rhodes University South Africa. Irene's interest in teaching dates back to 1981 when she briefly worked as a pre-service teacher in a rural school in Southern Zimbabwe. Her university teaching experience started at the Waikato

University in 1998/1999 when she was appointed as one of the tutors in the School of Education. She was appointed lecturer and taught at the Zimbabwe Open University and the University of Zimbabwe before she joined the University of KwaZulu Natal. She has taught and successfully supervised students at both undergraduate and post-graduate levels. Her early experiences have had a bearing on her interest in understanding issues of women and education as she started as a school secretary, bursar and later registry clerk in the Ministry of the Public Service. She is very passionate about gender and education. Her area of specialization is educational leadership and management of change in education. She has researched and published book chapters and articles in scholarly journals on issues pertaining to educational leadership, culture and educational change. She has researched on the experiences of women school principals, the impact of principalship and the senior management team on school development and learner achievement.

Judith Naidorf is a Doctor of the University of Buenos Aires (UBA), Faculty of Arts, Educational Sciences Area, Bachelor of Science in Education (UBA) CONICET Researcher based in the Research Institute of Educational Sciences (ICSI-UBA), and Regular teacher "Education I. Systematic analysis of processes and educational activities" of the Department of Educational Sciences (UBA). Clacso earned scholarships in the "Higher Education in Latin America and the Caribbean" in 2002. During 2002 and 2008 Faculty Research Grant Program International Council for Canadian Studies. Fellow Secyt stimulus-UBA (1999) and CONICET doctoral (2001) and postdoctoral (2006). Judith has authored several books such as *The Changes in the Academic Culture of the Public University* (Eudeba, 2009) and co-authored with Llomovatte, Juarros and Guelman (2006) "the university-business. Glances reviews from the public university" (Miño and Davila, 2006). UBACYT project Director (2008–2010). She studies the social relevance of the university as academic cultures in Argentina, Brazil, Mexico and Canada and is currently Director of the PIP Project (CONICET) 2012–2014,titled "Current Intellectual production conditions and their impacts on the creativity of academics Argentine public universities" under the Programme for Research in Sociology of Education by Silvia Llomovatte. She has taught graduate seminars and lectures at universities in Argentina and abroad.

Julie Nicholson, Ph.D. is a Visiting Assistant Professor at Mills College in Oakland, California. A former preschool and elementary school teacher, she completed her master's and Ph.D. in Early Childhood Education from the University of Michigan. Dr. Nicholson directs the Leadership Program in Early Childhood, a graduate program with a strong emphasis in social justice and equity, international scholarship, feminist post-structural and critical theoretical perspectives, and inquiry and collegiality as the foundations for influencing positive change for children and families. Dr. Nicholson works with graduate students to learn about the policy process in ECE and to gain strategies for working in the spirit of Debra Meyerson's description of the "Tempered Radical" to work within systems as they exist while also effectively inspiring changes to include individuals at decision-making tables whose voices have been traditionally marginalized from leadership and policymaking. Dr. Nicholson is an active member of the Oakland Education Cabinet's Prenatal to Eight committee, Chair of the Bay Area Coalition for Play and an Advisory Member for Alameda County's Race to the Top Early Learning committee developing a Quality Rating and Improvement System for ECE programs. Dr. Nicholson is Principle Investigator on several research projects including: Making Inclusive Leadership Visible in Early Childhood: Stories from the Field of Leading for Social Justice and Equity, the Global Play Memories and Child Play Narratives Projects and a new project documenting a professional learning community in a large urban school district for teachers working in California's newest grade, transitional kindergarten.

Juan Manuel Niño earned a Ph.D. in School Improvement from Texas State University-San Marcos and is currently a Assistant Professor at the University of Texas – San Antonio. Juan has extensive experience in urban public education, and he has served in numerous capacities, including substitute teacher, academic and athletic coach, classroom teacher, assistant principal, and district level administrator. As such, Juan understands the complexity of the public educational system, the accountability movement, and he has written extensively on the unintended consequences of standardized testing as a means to measure students' knowledge. His research interests center on challenging the "best practices" approach and helping educational leaders understand that schools are evolving and living organizations. Subsequently, Juan centers the notion of school improvement as a continual process, not a product. Other interests that guide his research include leadership preparation programs for social justice leaders, especially the preparation of assistant principals and superintendents. He is currently working on multiple projects researching instructional supervision for diverse students, instructional leadership, and intersectionality.

Jan Oakley is a contract lecturer in the Faculty of Education and Department of Women's Studies at Lakehead University in Thunder Bay, Canada. Her research and teaching interests include social justice pedagogies, critical theory, feminist theory, and humane and environmental education.

Izhar Oplatka holds a Ph.D. from The Hebrew University of Jerusalem. He is Professor of educational administration and head of the Executive Program of Educational Administration and Leadership at The School of Education, Tel Aviv University, Israel. Professor Oplatka's research focuses on the lives and career of school teachers and principals, educational marketing, gender and educational administration, and the foundations of educational administration as a field of study. His most recent books include *The Legacy of Educational Administration: A Historical Analysis of an Academic Field* (2010, Peter Lang Publishing); *The Essentials of Educational Administration* (2010, Pardes Publisher, in Hebrew); *Women Principals in a Multicultural Society* (2006, Sense Publisher, with Rachel Hertz Lazarowitz). Professor Oplatka's publications have appeared in varied international journals including *Educational Administration Quarterly, Journal of Educational Administration, Educational Management Administration & Leadership, Comparative Education Review, Teacher College Record, Canadian Journal of Education Administration and Policy, International Journal of Leadership in Education,* *Journal of Education Policy, School Leadership & Management, Urban Education, International Journal of Educational Management,* and so forth.

Courtney L. Orzel, Ed.D. currently serves as Superintendent of Forest Ridge Elementary School District, in Oak Forest, Illinois. She is an experienced educator with 14 years of experience in public education, having worked as a middle school teacher, high school teacher, assistant principal, and principal. Dr. Orzel recently received her Doctorate in Education from the University of Illinois at Urbana-Champaign. Her current research interests examine the notions of transformative leadership, equity and access in schools, inclusive leadership, social justice, and dialogue.

Ahmad Oweini is an Associate Professor of Education at the Lebanese American University and former Chairperson of the Department of Education (2007–2010). His educational background includes psychological counseling, higher education student advisement and orientation, and special education (learning disabilities). He has co-authored two high school textbooks in English and is active on the lecture circuit, giving talks and workshops to parents and teachers on issues related to intelligence, homework, study skills and behavioral management. Ahmad is certified by the City of New York as a trilingual educational evaluator. He is the founder of several Lebanese NGOs, namely Lebanese Psychological Association, Dyslexia Lebanon and Center for Arab Research and Development. His experiences with social justice started with a project in collaboration with Dyslexia International to adapt to Arabic an online dyslexia course to make it available to all students so that special education would help disenfranchised students in Lebanon and the Arab world and not be an elitist service.

Jill A. Perry is a Research Faculty member in the Department of Foundations and Leadership at Duquesne University. She is also the Director for the Carnegie Project on the Education Doctorate. A graduate of the University of Maryland, she received her Ph.D. in International Educational Policy. Dr. Perry's research focuses on professional doctorate preparation in education, organizational change in higher education, and faculty leadership in higher education. She has over 20 years of experience in leadership and program development in education and teaching experience at the elementary, secondary, undergraduate, and graduate levels in the USA and abroad. She is a Fulbright Scholar (Germany) and a returned Peace Corps Volunteer (Paraguay).

Chantale Richer is an elementary school principal in Montréal's downtown area. She has been a preschool and an elementary teacher for 17 years, a school principal at the secondary and the elementary level and was a lecturer at the Université de Sherbrooke. More recently she was coordinator of the Supporting Montréal Schools Program of the Ministère de l'Éducation, du Loisir et du Sport du Québec. She is a lecturer in teacher preparation and in leader preparation at the Faculté des sciences de l'éducation, Université de Montréal. She earned an M.A. degree in didactics from the Université de Montréal. She was the leader of a target school for the implementation of Québec's educational reform. As a principal she leads her school to promote equity and social justice. She has published one book in French with Jean Archambault, *Une école pour apprendre* (2007), Montréal: Chenelière Éducation.

David Rodríguez-Gómez is a lecturer in Teaching and Educational Admini-stration at the Applied Pedagogy Department of the *Universitat Autònoma de Barcelona*, and member of the Organisational Development Research Group (EDO). Recently, he has finished one project for promoting educational management and leadership in Latin America (http://www.redage.org), funded by Spanish Agency for International Development Cooperation. He is currently coordinating a project for widening access to higher education for underrepresented groups as well as for nontraditional learners in Latin America. His research interest includes knowledge management, educational administration and leadership, organizational learning, organizational development, ICT in Education and university drop-out.

Constance Russell is Associate Professor and Chair of Graduate Studies and Research in the Faculty of Education, Lakehead University, Canada. She is also the editor of the *Canadian Journal of Environmental Education* and co-editor of the forthcoming *Environmental Education Reader* and the book series, *(Re)Thinking Environmental Education* (both Peter Lang). Growing up poor on a family farm outside a small village in Canada, in many ways she had an idyllic childhood surrounded by a loving extended family in a landscape she knew intimately. But she also experienced sexism, classism, and fat bullying, and witnessed racism, homophobia, and the mistreatment of other animals, both wild and domestic. In retrospect, these childhood experiences spurred a lifelong commitment to social and environmental justice. Her university teaching has included courses in critical pedagogy, environmental education, outdoor education, nature and society, foundations of education, qualitative research methods, and proposal writing. She has researched and written on topics such as critical environmental and humane education (where, for example, she has used insights from feminism, ecofeminism, queer theory, fat theory, environmental thought, and critical animal studies), wildlife tourism, interdisciplinary collaboration, and qualitative research methodology. Her overarching goal in all that she does – in her teaching, her research and her service both within and outside the academy – is to work with others to help create the conditions in which all of us, human and more-than-human alike, can flourish.

James Ryan is a Professor in the Department of Leadership, Higher and Adult Education and co-director of the Centre for Leadership and Diversity at the Ontario Institute for Studies in Education of the University of Toronto. He has been teaching children and adults in various capacities since 1976. He came to OISE in 1991 after stints as a teacher and administrator in schools in northern Canada, and as a Professor of education at Lakehead University in Thunder Bay. His current research and teaching interests revolve around leadership, inclusion and social justice. His books include *Race and Ethnicity in Multiethnic Schools*, *Leading Diverse Schools* and

Inclusive Leadership, *Struggling for Inclusion: Leadership in Neo-Liberal Times*. He is currently conducting research into the political aspects of promoting inclusion and social justice.

Dilys Schoorman earned her Ph.D. in Curriculum and Instruction at Purdue University, IN. A native of Sri Lanka, she views herself as a transnational whose experiences in each national context inform and enrich her work and interactions in the other. She is currently a Professor in the Department of Curriculum, Culture and Educational Inquiry at Florida Atlantic University where she teaches courses in Multicultural/Global Education, Curriculum and Instruction, and Critical Theory. She is particularly interested in and concerned about the experiences of recent immigrant populations and the de-professionalization of teachers at a time when there is a critical need for innovative and creative teaching among our increasingly under-served populations. Committed to the notion of critical praxis, she challenges herself and her students to move beyond teaching and learning as compliance, towards experiencing teaching and learning as joyful, rigorous and transformative. Her scholarship is grounded in the conceptualization of "research as service" where "good" research is defined by its service to the public good rather than a matter of individual accomplishment. Her scholarship is informed by her work with preliterate Maya immigrants and their struggles for equitable education for their children in school systems where teachers' creative potential is hampered by testing regimes; and her collaboration with teachers, in the USA and in Sri Lanka, committed to serving the needs of diverse populations despite institutional and social challenges. She is grateful to such communities of practice among under-served groups that foster her continued education as a university professor.

Whitney Sherman-Newcomb is currently an Associate Professor in the Department of Educational Leadership at Virginia Commonwealth University in Richmond, Virginia, USA. Her research interests include: leadership preparation and mentoring; women's issues in leadership; social justice in leadership; and ethical leadership. Dr. Newcomb's work has been featured in journals including: *Educational Administration Quarterly*; the *Journal of School Leadership*; the *Journal of Educational Administration*; *Educational Policy*; and the *Journal for Research on Leadership Education*. She received the 2011 Distinguished Scholarship Award for VCU's School of Education for her contribution to research and the 2012 Distinguished Teaching Award for excellence in teaching. She serves on the editorial boards of *Educational Administration Quarterly*, the *Journal of School Leadership*, and the *Journal for Research on Leadership Education*. Dr. Newcomb is also a co-editor for a book series on educational leadership for social justice published by Information Age. She was presented with the Emerald Literati Award for Excellence for the Outstanding Special Issue of 2011 for her work as guest editor of "Globalization: Expanding Horizons in Women's Leadership," a special issue of the *Journal of Educational Administration*. Dr. Newcomb also received the 2011 Social Justice Teaching Award from the Leadership for Social Justice SIG of the American Educational Research Association "for work that represents exemplary commitment to teaching that promotes social justice, equity, diversity, and inclusion in the field of educational administration."

Teresa Socha, Ph.D., is an Associate Professor and Chair, Undergraduate Studies in Education in the Faculty of Education at Lakehead University, where she teaches and researches in the areas of health and physical education.

Lourdes Diaz Soto is the former Goizueta Endowed Chair at the University System of Georgia and recently retired as a Professor at Florida Atlantic University in the department of Culture, Curriculum, and Educational Inquiry. She was the Director of the award winning Bilingual-ECE project while teaching at The Pennsylvania State University; and, was also the Director of Bilingual-Bicultural Education at The University of Texas at Austin. An international and national scholar in the fields of Early Childhood Education and Bilingual/Bicultural Education with numerous refereed publications, book chapters and books including *Making A Difference in the Lives of Bilingual/Bicultural Children*, *Childhoods: A Handbook*, *Teaching Bilingual/Bicultural Children: Teachers Talk about Language and Learning*, and *Latina/o Hope.*

Robert J. Starratt is Professor of Educational Leadership at Boston College. His work with schools has taken him to various states in the USA, as well as to Australia, Canada, Ireland, Sweden, India, and various countries on the Pacific Rim. His recent publications have focused on ethical leadership in education and the moral character of teaching and learning. He received the Donald Willower Award for lifetime achievement in the field of Ethics and Educational Leadership, as well as the Roald Campbell Award for lifetime achievement in Educational Leadership from the University Council for Educational Administration.

Jane Strachan retired in December 2011 from her position as an Associate Professor at the University of Waikato in Hamilton, New Zealand. Her teaching and research interests focused on educational leadership, social justice, gender, women, policy development, and Pacific education. For 10 years she lived and worked in Vanuatu and the Solomon Islands assisting the government with Education and Women's human rights policy development, teacher education, and research. She has published widely on these subjects.

Social Justice Platform

- I believe that greed, hatred and the abuse of power by individuals and by governments profoundly disadvantage, oppress and cause misery.
- Feminism is the guiding philosophy for my social justice activism.
- Feminism is a commitment to support, to take action and to advocate for and with others.
- Feminism has a very broad social justice agenda based on human rights and fairness.
- Feminism is social justice work that takes place in many contexts.
- Feminist social justice work is lifelong.
- Feminist social justice work is work in partnership with others.
- Economically developed countries have a moral obligation to financially assist and provide expertise to economically developing nations.

António Teodoro is a Full Professor of Sociology of Education and Comparative Education at Lusophone University, at Lisbon. He is Director of Institute of Education and Research Center CeiEF, and Editor of *Revista Lusófona de Educação* (Lusophone Journal of Education). He was born on May 7, 1950, in Azores, Portugal. He has a Ph.D. and a master's degree in Educational Sciences. He is a founder of free teacher trade unionism in Portugal after the Portuguese Revolution in April 1974 and was the first general-secretary of FENPROF, the most representative Portuguese teacher union since 1994. Antonio was also Chief Inspector of Primary Education (1974–1975), member of National Council of Education (1988–1994), and Advisor of Minister Council from Education, Science, Culture and Employment (1995–1999). He is an International Adviser from the Paulo Freire Institute, in Sao Paulo, and co-founder of Portuguese Paulo Freire Institute. After 2007, he took on as the general coordinator of RIAIPE (Ibero-American Network of Education Policies Research) leading an Inter-University Framework Program for Equity and Social Cohesion Policies in Higher Education, funded by the EU Alfa Program.

Monty Thornburg in 1968, after graduation from Golden Gate University, San Francisco, Monty moved to the Black Belt Region of Alabama as a teacher corps intern. His participation in the events surrounding that historic and "turbulent" time for "Social Justice" has inspired him since. The teacher corps program led at Livingston University by Dr. Robert Brown saw interns actively participate in voting rights and other civil rights activities. A memorial event, April 4, 1969 for the slain Dr. Martin Luther King, Jr. was one of many events near the birthplace of the civil rights movement, Selma and Montgomery, Alabama. He learned firsthand of the racist elements affiliated with the KKK, and in the week of April 4, 1969, Governor George Wallace tried to stop any participation in a Selma to Montgomery Memorial March for the slain Dr. King. Those events forced him to leave and begin work in New Orleans as he continued to "Search for Social Justice." Monty earned his Ph.D. in Educational Leadership at the University of New Orleans in 2001. He now works in K-12 education in the San Joaquin Valley Region of California as a "demoted" administrator and as a community activist on behalf of "at-risk" and displaced students. With this handbook chapter he continues to pursue his dream to research and write.

Selahattin Turan is a Professor in the department of educational sciences at Eskisehir Osmangazi University, Turkey, and is currently the Dean of the College of Education. He received his B.A. from Ankara University in 1990, M.A. in 1993, and Ph.D. in 1998 from the Ohio University and joined Eskisehir Osmangazi University College of Education faculty in 1998. His professional interests are educational policy and leadership, the organizational psychology of organizations, and alternative perspectives in education. He co-authored five books in educational studies and is the editor of *Journal of Education and Humanities: Theory and Practice* and he is on the editorial board of the Turkish *Journal of Educational Administration.* He is the president-designate of Economic Cooperation Organization (ECO) Educational Institute in Ankara.

Kersti Tyson is an Assistant Professor in Teacher Education at the University of New Mexico. Kersti taught middle school students mathematics in Taos, NM, and as part of an interdisciplinary team in Santa Fe, NM. Upon earning her master's in intercultural communication, Kersti spent 4 years working for the State of New Mexico on Teacher Quality Policies. She also taught in the alternative teacher licensure program at the Santa Fe Community College. In her doctoral studies at the University of Washington, she worked in the Elementary Education Program to implement and study the placement of pre-service teachers in community organizations as a part of their field service. In 2011 she completed her dissertation, *Listening Matters: Developing Listening Spectra for Engaging in Education.* As a learning scientist, Kersti is guided by the questions, "what makes learning work and for what purposes?" Kersti studies the roles of listening in teaching and learning interactions. She is particularly interested in who is heard in the classroom and how that matters, especially in light of persistent inequities in our educational practices.

Ned Van Steenwyk received his bachelor's and master's degrees at Wayne State College in Nebraska. Ned taught history and economics at Lakeview High School in Columbus, Nebraska, the American School of Asuncion in Paraguay, and the International School in Santiago, Chile.

Completing his studies for a Doctorate in International Education Development at Teachers College, Columbia University, he served as an education advisor in Honduras with the United Church Board for World Ministries and in 2010 retired from a 30-year career as a contractor and foreign service officer with the United States Agency for International Development (USAID), designing and implementing USAID education and work force development projects in Peru, Costa Rica and Honduras, conducting studies and project evaluations on basic and alternative education, and work force development for USAID in Columbia, Panama, Nicaragua, Guatemala, El Salvador, Honduras, Dominican Republic, Jamaica, and Barbados. During 2011, Dr. Van Steenwyk and Dr. Rolando Sierra Fonseca completed a study for the German International Development Agency (GTZ/GIZ) on the supply and demand for technical education in Honduras. Ned is currently semi-retired and working part-time with the family's renewable energy business in Tegucigalpa.

Berte van Wyk, Ph.D., is an Associate Professor in Philosophy of Education in the Department of Education Policy Studies, Stellenbosch University. He is rated as a social scientist by the National Research (NRF) in South Africa. His research focuses on three areas: African philosophy, higher education, and institutional culture. On African philosophy: he has published on several areas such as the African university, the future of university research in Africa, and the curriculum in an African context. Work in progress includes an edited book on indigenous concepts in education. This book invites philosophical, sociological, as well as political perspectives on how indigenous communities develop concepts which serves as drivers for (the) education that articulate their aspirations. On higher education, his research focuses on the form and direction which higher education should take and what new approaches and relevant paradigms are worth pursuing. Relevant publications here relate to: political consciousness, affirmative action, the transformation of university teaching and learning, and democracy and social justice. Institutional culture is an under-studied concept, and his doctoral students are researching the cultures of the higher education landscape in South Africa, such as Traditional Universities, Universities of Technology and Comprehensive Universities.

Duncan Waite is a Professor in the Education and Community Leadership Program at Texas State University. He earned a B.A. in philosophy from The University of Michigan and an M.A. and Ph.D. from The University of Oregon, the latter in Curriculum and Supervision. He is a qualitative research methodologist and has published extensively on instructional supervision, qualitative research, leadership, organizational theory, and both the macro and micro forces in/of education and educational leadership, all from a critical socio-cultural perspective. His recent work includes that done on corruption and abuse of power (especially in educational administration), the shortcomings of our organizational forms, imperial hubris, and corporativism. He is the founding editor of *The International Journal of Leadership in Education* (Routledge). Duncan believes – as his work demonstrates – that social justice work is also done in the exhumation and interrogation of the structures and processes which serve to subjugate us, our brothers and our sisters.

Gerald Walton is an Associate Professor in the Faculty of Education at Lakehead University in Thunder Bay, Ontario. Raised in working class in military communities across Canada during the 1970s and early 1980s, Walton survived on-going bullying during his childhood and "ex-gay" Christian ministry involvement during his 20s. Later, having acquired his Ph.D. from Queen's University in Kingston Ontario in 2006, he became a scholar, instructor, and public speaker on the implications of gender and sexuality diversity for society and education. His privilege as a white male provides him with the standpoint from which to teach and continue to learn about being an ally for people of color and women. His social position as queer and gender stereotypical, on the other hand, provides him with an outsider vantage point from which to "see" straight privilege. He raises the challenge to straight people, including pre-service and current teachers, to be allies of people who are marginalized on the basis of sexuality and gender minority status. Walton shares his personal experiences, research, and scholarship with a wide variety of audiences, including academics, social activists, students in schools, and the public at large. He has published his work in academic journals, professional periodicals, newspapers, and blogs. His edited collection called *The Gay Agenda: Claiming Space, Identity, and Justice* will be published by Peter Lang in 2013.

Amy L. Warke, Ed.D., currently serves as an Assistant Superintendent of Learning and Instruction in the suburbs of Chicago, Illinois. She is an experienced educator with 19 years of experience in public education, having worked as a special education teacher, assistant principal, principal, and assistant superintendent. Dr. Warke recently received her Doctorate in Education from the University of Illinois at Urbana-Champaign. Her current research interests include equity and access in schools, social justice, transformative leadership, and homelessness.

Hilarie Welsh earned her Ph.D. in Curriculum and Instruction from the University of Illinois in 2012. She is currently an Assistant Professor at Loras College. Her research interests include the involvement of teacher preparation programs in novice teacher induction, the promising practices and improvement of teacher education programs, and the collaboration between Pk-12 schools and teacher education programs. Hilarie's passion for social justice was ignited when she became a high school English teacher. Although she did not learn about terms such as "social justice" and "othering" until graduate school, her work in the public schools helped her realize her passion for these topics. She continues to keep social justice at the heart of her work as she prepares future teachers at Loras College.

Damaris Wikramanayake received her Ph.D. in Education from the University of Sydney in 2010 with a thesis focusing on education policy and planning in Sri Lanka, in the context of economic globalization. Her research analyzed policy making over a period of 10 years to identify the influence of historical legacy, policy environments and the role of donors on the direction of education reform. Damaris also obtained a master's degree in Educational Administration from Michigan State University and received a Phi Kappa Phi award for her achievement in this course. Her first love has always been the Classics. Obtaining a First Class Honours Degree in Western Classical Culture, she started her career in education first as a Secondary school teacher and later served as an administrator. She brings to her research a wealth of both teaching and administrative experience. Damaris, at present, is an Education Consultant to the World Bank in Colombo, Sri Lanka, working on the Transforming School Education Project. Her focus here is the Program for School Improvement which promotes the idea of School Based Management and School Based Teacher Development. More recently her work has focused on social cohesion and how this could be achieved through education, especially in the Sri Lankan context in the aftermath of war. Damaris has authored a paper on "The Promotion of Social Cohesion through Education in Sri Lanka" for the World Bank.

Nereda White is an Aboriginal academic and Director of the Centre for Indigenous Education and Research at the Australian Catholic University. She is from the Gooreng Gooreng people, the traditional owners of the Bundaberg area of Queensland. Over 20 years, Nereda has devoted her energies to supporting the life aspirations of Indigenous Australians who continue to be severely disadvantaged in every area of life. She has made a significant contribution to Indigenous Higher Education in Australia through her teaching, scholarship, leadership and community engagement; by encouraging many Indigenous people on their learning journeys; and by fostering reconciliation between Indigenous and non-Indigenous Australians. In recognition of her leadership, Nereda has received two national university teaching awards: a Citation for outstanding contribution to student learning (2006) and the Neville Bonner award for Indigenous Higher Education (2007). She is committed to the inclusion of holistic approaches to student learning in keeping with traditional Indigenous ways; the incorporation of Indigenous knowledge in the curriculum; supporting the leadership capacity of Indigenous people in teaching, learning, research and governance and developing shared leadership through partnerships between schools and Indigenous communities. Nereda's hope is for a socially inclusive society where her grandchildren can grow up and be educated in a community that supports them in their Aboriginal heritage and allows them along with other Indigenous children to develop to their full potential and have the opportunity to participate fully in the life of Australian society.

Robert E. White is Associate Professor in the Faculty of Education at St. Francis Xavier University in Nova Scotia, Canada. Born in Montreal, Dr. White has taught extensively in public school systems in Manitoba and British Columbia, before receiving his doctorate from the University of Toronto. Research interests include leadership and policy analysis, curriculum and teacher development, qualitative research methods and critical pedagogy. Professor White has authored *How Corporate Business Practices Are Transforming Education: Case Studies of Five Canadian Secondary Schools* (2009). He and Dr. K. Cooper, of the University of Toronto, have co-authored *Qualitative Research in the Postmodern Era: Contexts of Qualitative Research. Volume I.* (2012) and *Burning Issues: Foundations of Education* (2004). Co-edited volumes with Dr. Cooper include *Principals in Succession: Transfer and Rotation in Educational Administration* in Dr. K. Leithwood's Series *Studies in Educational Leadership, Vol. 13* (2011), *Critical Literacies in Action: Social Perspectives and Teaching Practice* in Drs. S. Steinberg and J. Kincheloe's Series *Transgressions: Cultural Studies and Education. Volume 34* (2008), and *The Practical Critical Educator: Critical Inquiry and Educational Practice* (2006). Drs. White and Cooper are currently authoring two volumes, *Qualitative Research in the Postmodern Era: Interpretive and Critical Approaches, Volume II* and an as yet untitled volume on critical literacy and teacher development. In addition, Dr. White is assistant and Associate Editor of the *International Journal of Leadership in Education.* Professor White has also taught courses in leadership at the Royal University of Bhutan and has co-edited a textbook series in Beijing, China.

Annette Woods is an Associate Professor in the Faculty of Education, Queensland University of Technology. She researches and teaches literacy, school reform, social justice and curriculum and pedagogy. Her current research is investigating teachers' enactment of curriculum, school reform of low SES and culturally diverse schools, and school reform networks.

J. Kenneth Young is an Assistant Professor of Educational Leadership Studies at Lamar University in Texas, USA, and specializes in adult learning theory, research design, and cognitive epidemiology. He has served as co-editor for *Learning for Democracy: An International Journal of Thought and Practice.* In addition to co-authoring a chapter with Sandra Harris on mentoring graduate students in *The SAGE Handbook of Mentoring and Coaching in Education* (Fletcher & Mullen, 2012), other publications of his within this scope include an article in the *Learning for Democracy* journal.

Michalinos Zembylas is Associate Professor of Education at the Open University of Cyprus. His research interests are in the areas educational philosophy and curriculum theory, and his work focuses on exploring the role of emotion and affect in curriculum and pedagogy. He is particularly interested in how affective politics intersect with issues of social justice pedagogies, intercultural and peace education, and citizenship education.

Chapter 1
Introduction: Do Promises of Social Justice Trump Paradigms of Educational Leadership?

Ira Bogotch and Carolyn M. Shields

Our commitment and responsibility as educators is to explicitly and publicly combat ignorance. In so doing, we enter into public discourses to justify our purpose, words, and actions. That is what the authors in the handbook mean to do—not as philosophers, sociologists, anthropologists, economists, political scientist, or artists but as educators explicitly. In other words, who we are professionally ought to inform how we act as citizens in the world and vice versa. Our professional selves ought to be aligned with our citizenship.

As educators, and here as editors, we present this handbook in the spirit of inclusiveness (see Ryan, Chap. 21 in this volume). We mean this literally. That is, we do not write or think about social justice as if it is a specific delimited topic of interest. For this reason, social justice cannot fall outside an educator's research agenda or even reside on the margins; rather, social justice is a necessary and fundamental assumption for all educators committed to combating ignorance and becoming more informed global citizens. Just as Jack Culbertson from the USA reached out to William Walker from Australia in 1963 about the possibilities of staging an international conference for discussions on educational administration, we, too, continue to reach out internationally to readers across all fields of education. Our intent is not to impose one way of knowing, thinking, or interpreting histories—which is why we chose the format of an international handbook in the first place.

An international handbook lets readers choose which chapters to download and read. Readers from all backgrounds can reframe their approaches to social justice independently. Every chapter builds an historical and contemporary social justice

bridge across professions, disciplines, research methods, and theories. To assist readers in navigating the two volumes of the handbook, we provide a table of contents, brief author bios, abstracts, and key words.

Bringing together the purposes of education with citizenship is not original. John Dewey (1915, 1938) for over a half century approached the gaps between school and society through his progressive ideas on experiences in learning school subjects, democratic human relationships, and scientific problem-solving. His comparative analyses of traditional practices found in schools contrasted with his critical and reflective methods on reconstructing knowledge for improving society. These constructs were, at heart, pathways for educators working towards social justice (Bogotch, 2002). Dewey's ideas were not reducible to convergent thinking, either-or polarized thinking, standardization, or best practices. Yet today, in too many contexts throughout the world, perhaps most notably inside the school reform movements in the USA (e.g., No Child Left Behind/Race to the Top), educational leaders find themselves on an unsettling middle passage journey to what Dewey would call amoral actions and miseducative practices (Bogotch, 2012a; Bogotch & Roy, 1997). Good people, hardworking people, and well-intentioned people committed to improving schools find themselves in frustrating positions where the only pathways they can see are too often ones prescribed and scripted by others, where educators are not free to create policies and programs which meet the needs of children and communities. A recent large-scale empirical study in the United States entitled the *Snapshots of School Leadership in the 21st Century* (2012), edited by Acker-Hocevar, Ballenger, Place, and Ivory, based on 27 focus groups, painfully described the negative impact of externally driven policies on implementing school-level reforms. Others, in many countries, describe similar phenomena. The above book is a cautionary tale for the rest of the world to read, and it is our hope that this international handbook will provide twenty-first-century educational leaders with alternatives ideas and pathways that are far more educative going forward.

As both Raymond Callahan in the Education and the Cult of Efficiency (1962) and Tyack (1974) in One Best System documented several decades ago, education and educational leaders are still often swallowed up by dominant business and governmental interests which today often represent global, corporate, and capitalistic (see Waite, Turan, and Nino, Chap. 33 in this volume) interests gone awry. Mainstream educational policies and practices eschew critical and culturally relevant pedagogies (Ladson-Billings, 1995), culturally relevant leadership (Beachum, 2011; McCray & Beachum, 2011; Weaver, 2009), and culturally responsive methodologies (Tillman, 2002). Educational leadership is still dominated by technical approaches to efficiency and effectiveness. The authors in this handbook join with those just cited and many others in describing how educational leadership for social justice must be deliberately focused on disturbing, if not disrupting, conventional wisdom and dominant school practices. In organizing the sections of the handbook, the editors chose to interpret traditionally named practices such as research methods, leadership theories, educational policies, professional development, and leadership preparation, as interventions so as to create spaces to actively build bridges to socially just practices within and beyond schools and universities.

Each chapter in this handbook—all 62, not just a handful—defines the meanings of social justice within a specific context or seeks to undo the legacies of injustices within a specific cultural context before articulating a way forward (see Chap. 62). In this sense, the handbook goes from today's "state of the art" based on confining social justice to a single prong of the field of educational leadership or as comprising a single chapter inside a large volume (see English, 2011; Murphy, 2002) to a thorough re-centering of educational leadership as a field that is directly responsible for addressing social, political, and economic injustices around the world. For many mainstream empirical researchers, this position goes well beyond what the paradigms of school improvement and organizational science assert. Instead, here every chapter deconstructs the conceptual and methodological limitations of school improvement and reform by acknowledging and learning from histories (Blount, 2008) and engaging in political discourse grounded in unique local contexts (e.g., Beabout, Chap. 30 in this volume). That is, the where-when-how-to-proceed related to social justice will always be focused on redressing wrongs and overcoming inequities, but it will always also be different in different settings, for history and contexts matter, and, it is past time that our theorizing, research designs and methods catch up with today's complex contextual realities and break with traditionally inscribed and restrictive research procedures and protocols.

The histories and current events of nations of conflict, in particular, whether Cyprus (Chaps. 21 and 45), Sri Lanka (Chaps. 13 and 47), or Lebanon (Chaps. 37 and 44), are unfolding differently, thus necessitating that their citizens engage in nation-specific social constructions of socially just futures, regardless of what the International Monetary Fund (IMF) or World Bank prescribe as the way forward (see Sen, 1999; Stiglitz, 2006). For example, the window for educational and economic change in Honduras in Central America, described in this volume by a former USAID contractor (Chap. 49), does not necessarily apply to its neighbors, let alone to how either South Africa or Zimbabwe (Chaps. 29, 34, 41, and 54) might need to define their way forward. In that sense, we all are living metaphorically in the "praxis wetlands" (see Gonsalvez, Chap. 32) where local contexts and experiences determine next steps in activist research. Wherever vestiges of sexism, racism, and genocide intersect, then awareness, consciousness, apologies, restorative justice, and rectification (Roberts, 2005), while necessary, are never sufficient. We believe counternarratives, advocacy, and activism open up new spaces (Mansfield, Chap. 3; Jenlink, Chap. 20; McClean, Chap. 27) for social and political actions to be initiated by educational leaders.

The chapters in the handbook are divided into the following parts: Conceptualizing Social Justice (Part I, Volume 1), Research Approaches to Knowing/Studying Social Justice (Part II), Leadership for Social Justice (Part III), Advocacy/Advocates for Social Justice (Part IV), Sociocultural Representations of Social Injustices (Part V, Volume 2), Glocal Policy Interventions (Part VI), and Leadership Preparation as a Social Justice Intervention (Part VII). Although the handbook prioritizes leadership in each and every part, the order of the parts reflects how we approached social (in)justice, first in terms of conceptualizing the constructs, second in terms of knowing/studying systematically, and then third as leadership for social justice. The idea that each part would not only reflect how traditional topics could be transformed into deliberate interventions but also how each topic would describe a sustainable process contextually. The first volume concludes with the part on advocacy/advocates, a topic that often has been relegated to the margins by mainstream academic discourses. From our editorial perspectives, the order of handbook parts was as much a political decision as it was epistemological—which is how we see all of education.

The arguments presented here view social justice interventions as sufficiently robust constructs for breaking down barriers and borders, even the borders from part to part. It is these spaces and bridges that allow us to learn how to creatively and joyfully fill those spaces with lived experiences, professional development, and lessons learned. We, therefore, invite you to discover, as we have, the numerous ways in which spaces and bridges metaphorically interact to transform educational leadership into imagined spaces where the poor and powerless have voices along with privileged and advantaged citizens of the world. As with all concepts here, it is for every generation in every region of the world to decide on the contextual meanings and subsequent actions. It is up to you as readers to contextualize the narratives and reinvent theories/actions so that policies, advocacy, and practices can be implemented locally, nationally, and internationally.

Writing about social justice, democracy, equity, inclusiveness, or any of the over 60 reforms and theories presented here will not make social justice a lived reality for all students, teachers, administrators and their communities. But our communications and community building are two places for us to begin again. Unlike traditional handbooks written by the respected community of established senior scholars, this International Handbook of Educational Leadership and Social (In)Justice is unique in that it is not primarily a retrospective synthesis of leadership for social justice nor a snapshot of where we have been. While you will find many prominent names in these two volumes, some as authors, many others as citations, we designed the handbook invitationally, seeking scholars from special education, health education, urban education, and literacy, learning, and teacher leadership, as well as educational leadership. We viewed our task in terms of connecting educators, rather than promoting experts in specialized fields of study. And what we asked of our contributors was for them to connect their ideas, reforms, research methods, and programs to both educational leadership and contextual meanings of social (in)justice.

We used the term (in)justice in the title of this handbook deliberately. Too often, the term social justice is used to imply a soft and nebulous notion of caring about someone or something beyond our borders. Sometimes it refers to creating more accessible and inclusive educational systems without attention to the quality of such systems. Sometimes it refers to a change that has been achieved through negotiation that results in a win-win solution—one that leaves the fundamental injustice in place even as it tweeks an aspect of it in some way. Yet, injustice is always concrete, palpable for those who suffer it and for those who encounter it. It cannot be overlooked, glossed over, or ignored. For that reason, we asked our authors to specifically consider injustice in their contexts and to develop a robust concept of leadership that could address it.

Over 100 researcher-authors have shared their social justice ideas. Only about 15 % are non-Western, and so we know we must continue to reach out to scholars around the world. While the handbook is international, it is not representative of peoples everywhere. About 25 % of the authors do not write or speak English as their first language. In a special issue on “Who Controls Our Knowledge” in the International Journal of Leadership in Education (Bogotch, 2012b), the phrase “linguistic imperialism” is mentioned not just as a methodological limitation but in terms of how our knowledge loses local contexts and local problems when researchers have to write in English for Western journals. From Malaysia, we read

> …the domination of the English language in the reputable international journals creates difficulties for scholars and universities that do not use English…This is a perpetual concern among local policy-makers and to nationalists that there will be less commitment to the use of the national language and to publication in less prestigious local journal as researchers conform to the interests of prestigious English dominant journals in order to want their work published. (Tie, 2012, p. 445)

From Brazil, we read that

> With regard to social problems,… journals driven by powerful companies – with some exceptions – are not much interested in publishing what is contextualized in Brazil or what the health problems are in Brazil. This particular form of intellectual colonization subjugates what in many countries and regions, like Latin America, is recognized as strong production…. (Bosi, 2012, p. 455)

From Spain,

> So far, we have identified two main forms of oppression: … the impact of the dominance of English as a scientific lingua franca in the life of academic individuals, for whom the subordination to English may signify limitation and impoverishment (Siguan, 2001, p. 69); and,… a more political impact of the phenomenon, that is, on problems such as the difficulty in sharing information with other colleagues who do not use English as an academic language, the separation from our objects of study and the fractured dialogue with local authorities responsible for local policies. (Suarez-Ortega, Garcia-Mingo, & Ruiz San-Roman, 2012, p. 476)

Although the emphasis on social justice asks us as educator-citizens to look at macro-level injustices, we professionally also need to be much more critical of our own practices which continue to subjugate certain individuals and knowledge bases (local and contextual). We acknowledge these faults and limitations in this handbook, while as coeditors, we find it hopeful that about 36 % of the authors represent tomorrow’s generation of social justice scholars—a fact that speaks to how we chose to meet the challenges of intergenerational legitimacy (Rawls, 1971) for social justice theories. We are grateful for the young and not-so-young scholars who chose to contribute their original ideas here in this first of its kind reference book. The next steps, in terms of dissemination, however, are still to be decided.

Also, with respect to representation, we acknowledge that many places in the world are so hostile to education or to free speech that it would be unrealistic as well as dangerous for their works to be included. Schoorman (Chap. 13 in this volume) states this explicitly with respect to her home country, Sri Lanka. Unnamed authors wrote to us during the Arab Spring apologizing for their inability to carry out the studies/research they had originally proposed. Such is the state of the world and its effects on schools, teachers, administrators, and researchers. At the same time, there are economic and political ideologies which thrive on promoting a particular kind of education which thwarts opportunities for learning and/or promotes hatred of particular racial, tribal, and ethnic groups. In the West, free public education is often taken for granted as a default stance where we ignore the power of education to win the hearts and minds of a nation's population. Only when education is threatened is there a clear sense of urgency which challenges the idea of education as business as usual. In dangerous situations, schools are not sanctuaries or safe havens for children or adults. Moreover, in contexts that seem calm and safe, schools are still not safe havens for many children and adults, especially those who may be in some ways "different" from the dominant population. We must protect schools and education if we are to save communities and nations. That is how John Dewey saw schooling, that is, as practices which protect democracy as a way of life, not as governmental structures. Default business-as-usual educational stances are unacceptable anytime, anywhere when educators care about children and adults in difficult and unjust circumstances.

That said, we see the content in these two volumes as both safe and dangerous—safe in the sense that social justice educators have joined together here in struggle as a loosely coupled community and dangerous in the sense of providing the impetus and encouragement to speak out and enact socially just interventions. Interventions by design are meant to transform ordinary practices of schooling into processes which deliberately question, challenge, and create spaces and bridges to success for those who are struggling.

By the time you come to Chap. 62, the conclusion, which is titled The Way Forward, we hope socially just political, social, and economic ideas will be viewed as part of educational leaders' ordinary practices and responsibilities (Boske, 2012; Marshall & Oliva, 2006; Tooms & Boske, 2010). There we will emphasize that the way forward is also about the injustices and legacies of the past. The way forward requires that we honor histories rather than forget historical and educational facts as if new educational reforms and programs are acceptable as ahistorical and acontextual. We understand that the world is more complicated and technologically connected through social media than ever before and that schools must change pedagogically and structurally, and that means our theories, methods, policies, and programs must also reflect our changing times. This is particularly true for how we conduct research going forward. And lest we never forget, what we are striving for is also to recapture the joys of education as articulated by Griffiths (Chap. 14 in the volume).

While each chapter author pays tribute to her/his legacy in the 62 reviews of literature, we, too, want to acknowledge a few of the researchers on whose intellectual and ethical shoulders we now stand. Our focus will not be on great minds from other academic disciplines who inform and challenge us to think broader and deeper but will draw from the wide and eclectic field of education in general. Other disciplinary ideas can always serve us, but not as ideas divorced from education. Dewey and his colleagues, whether at the University of Michigan, the University of Chicago, or Columbia University, were influenced by him to see that educational facts and ideas stand alongside philosophical, social, religious, industrial, and commercial facts and ideas, each sustaining the other. It is interdisciplinary linkages, not discrete disciplines that we believe to be the proper role of education as part of and central to the knowledge base. Our purpose here was to create a handbook that honors our past and present so as to redefine educational leadership to advocate and help to create our future as more socially just for all around the world. While we are critical of academic discourses as communication silos, we now ask you to join us in viewing APA (American Psychological Association) citations as a way of saying "thank you" to members of the academic community, past and present, who have helped us to think more clearly and guide us forward on our social justice journey.

Thank You to …

In a seminal book titled *The knowledge base in educational administration* (1995) edited by Donmoyer, Imber, and Scheurich, 20 chapter authors (some of whom are authors in the handbook or are cited here) presented thoughtful and often introspective views on where educational administration/leadership was headed. Not all of the authors were optimistic that the field would have a scholarly future. We believe it fair to say that in 1995, the field of educational leadership was in the words of William Foster (1995), on a contested terrain. We must thank William Foster for shaping these debates in his 1986 book Paradigms and promises: New approaches to educational administration. The title of our first chapter here is an acknowledgement that we wish to uphold Foster's ideas that promises trump paradigms.

We also believe it is fair to ask as did a leading critic of the field of educational leadership, Fred Hess (1995), the unasked question, namely, "Should the discipline of educational administration be transforming itself or should it be going out of existence?" (p. 68)

But the debates on the knowledge base ignored other obvious questions, most frequently defining a "knowledge base" quite narrowly. For example, how is it that entire scholarly volumes in education, entire library shelves on diverse topics ranging from the needs of special children to counselor education, curriculum and instruction, multicultural education, etc. do not have one single citation from the field of educational leadership? Even the exemplary *Handbook in Social Justice in Education* edited by Ayers, Quinn, and Stovall (2009) omits any mention of school leadership. Leadership is not even in its index. Similarly the first edition of Springer's *International Handbook of Educational Leadership and Administration*, edited by Ken Leithwood in 1989, there was no mention whatsoever of social justice, although by 2002, the term does appear. In other words, peer-reviewed literatures which advance education's knowledge base are able to ignore entire fields of study and still call themselves comprehensive reviews of literature.

Another instructive historical treatment on the problems of education was written by Ellen Condliffe Lagemann (2000): An elusive science: The troubles of educational research. The book literally reads like a multigenerational family feud in the tradition of the Columbian epic novelist Gabriel Garcia Marquez, as it carefully documents how education defined itself professionally, as fields of specialization, in terms of research methodologies, theory(ies), and policymakers era by era. Each historical turn was characterized by its epistemological and methodological debates and subsequent struggles for power and recognition. In her own shorthand version, Condliffe Lagemann concluded that the disciples of Edward Thorndike's psychological test and measurement theories and methods won out over John Dewey's progressive, experimental, and experiential approach to education as a human science.

According to Reavis (1938), the use of statistical investigations in educational administration can be traced to Thorndike in the first decade of the twentieth century. Thorndike's work was instrumental in advancing statistical analyses of school problems.

> The influence of Thorndike … on educational administration was far-reaching. Superintendents began to employ statistical methods in the analysis of school facts. Their annual reports took on a new character. Statistical tables were presented showing the age-grade distribution of pupils, the percentage of failures and withdrawals by grades, and other pertinent findings. They quickly discovered that statistical analysis was essential to clear thinking when quantitative data had to be dealt with. With this method of investigation administrative officers could find a rational basis for policies in both organization and internal administration. Departments of education in universities developed courses of instruction in statistical methods for the training of administrative officers and technicians in this type of research. Professor Thorndike contributed a text on mental and social measurement for use in such courses. (p. 25)

Whether that justifies why and how testing regimes (e.g., PISA, TIMMS, NAEP) in public schools today focus more on a narrow informational knowledge base than on addressing the needs of the whole child, her/his families, and their communities are still matters for debate. But one consequence not at all debatable is that the enacted structures and knowledge base of schooling has maintained the privileges of certain citizens, specific disciplinary subjects, and specific research designs and methods over others that might be taught and studied more inclusively. These emphases on test and measurement dominated research in the field of education, including that of educational leadership. Moreover, the predominance of quantitative studies and statistical analyses in many countries illustrates its strong and continuing impact. The tightly closed circle of testing emphasizes statistical analyses as both practice and research over other types of research that seeks in-depth understanding of local school members and their communities often written off pejoratively as small sample case studies, local contexts, ethnographies, single subject designs, and other methods characterized as "non-empirical position papers" (see Donmoyer, Chap. 9 in this volume).

Although we have described this handbook as international, we recognize that educational administration and leadership are primarily a Western concept—one that has recently been gathering momentum in Eastern and in developing countries, even though several languages, including French and Spanish, have no specific term for "leadership." In the United States, it is likely fair to say that the aforementioned strong emphasis on empiricism, facts, data, and rationality by both school superintendents and by scholars influenced the development of the discipline of educational administration (now more often called educational leadership). This origin of educational administration as a discipline is often traced in the United States to what has become known as the Chicago School—named after a landmark meeting held in Chicago in 1957. Culbertson (1995) explains that "more than fifty professors from twenty leading universities travelled by car, train, and plane to Chicago on November 10, 1957 to take part in a seminar" (p. 34) entitled Administrative Theory in Education. From this seminar, the influential movement that has become known as the "theory movement" in educational administration was born.

The concept of theory adopted at the time helps to explain what are still pervasive notions of decontextualized practices in educational leadership, quests for "best practice," and generalizable solutions, inside what we have described as strongly contextualized challenges and situations. From 1957 to this day, leadership studies, whether labeled administration, management, or supervision, periodically have been the subject of numerous handbooks, encyclopedia, and yearbooks. The majority of these have focused on administration, leadership, or policy narrowly defined, without examining how the broader educational subdisciplines could inform leadership practice.

It is interesting to note, however, that Culbertson documents how two centuries ago, Charles Payne, superintendent of schools in Adrian, Michigan, argued that

> Educational organizations are not "objective" phenomena regulated by general laws, rather they are mental constructs that reflect the perceptions and interpretations of their members. (Culbertson, 1995, p. 3)

Through his concept of educational organizations as mental constructs, Payne foreshadows Thomas Barr Greenfield's later rejection of positivistic views and calls for an understanding of educational administration that emphasized social theory, social practice, and values—all elements of leadership for social justice you will find in the chapters in this handbook.

Bridge Builders

In every generation, there have been progressive educational activists and researchers as well as those who serve to maintain the status quo. Within both camps, however, there have been and still are individuals whose research serves to build bridges to school improvement as well as to social and political progress: Brazil's education minister, Paulo Freire (1970), as a government official and as author/teacher in the *Pedagogy of the Oppressed*; Linda McNeil's (1986) research in Contradiction of Control; Henry Giroux's incorporation of cultural studies into both teacher education and educational leadership; Carolyn Shields (Chap. 19, in this volume) on transformative leaders; Jerry Starratt (Chap. 5) on why critique, care, and justice matter together; Dilys Schoorman (Chap. 13) who sees research and service as a scholarly commitment; and Christa Boske (Chap. 17) whose ideas from social work are translated into social justice leadership in education.

All of these educators and the other authors in this handbook are bridge builders who stand on the shoulders of other scholars like John Dewey, Alice Miel, William Foster, Richard Bates, and Catherine Marshall.

By 2006, the increasing number of books, articles, and programs dedicated to promoting social justice led Catherine Marshall and Michelle Young, the Executive Director of UCEA (in Marshall & Oliva, 2006), to write the following "bold assertion":

> … individuals who are unable or unwilling to purposefully, knowledgeably and courageously work for social justice in education should not be given the privilege of working as a school or district leader. (p. 308)

In some ways, this assertion sums up the underlying message of this handbook. We believe educational leadership and social justice are, and must be, inextricably interconnected. While this bold assertion is more rhetoric than reality, it clearly opens the way for researcher-advocates of social justice to build both research and action agendas in the ongoing struggles for making this bold argument a reality. The struggles will likely be unending as we move from studying issues of diversity, literacy, equity, democracy, and specific injustices to actions based on social justice, not as a singular construct but rather as socially constructed ideas designed to fit and address local and national problems in and out of schools and universities. Indeed, it may take years to see the fruits of our labors, yet we must persevere.

The challenge facing educational leaders in every nation-state in the world is to reprioritize leadership practices so as to address the pragmatic need to successfully lead schools, school systems, and universities effectively and efficiently while, at the same time, to ensure, despite the business of their lives, that they address the difficult challenges posed by social, political, and economic realities, by issues of disparity, poverty, oppression, conflict, and prejudice, and by inappropriate uses of power. We agree with Mick Dodson, then Aboriginal and Torres Strait Islander Social Justice Commissioner, as cited in Fredericks, Maynor, White, English, and Ehrich (Chap. 39 in this volume):

> Social justice is what faces you in the morning. It is awakening in a house with adequate water supply, cooking facilities and sanitation. It is the ability to nourish your children and send them to school where their education not only equips them for employment but reinforces their knowledge and understanding of their cultural inheritance. It is the prospect of genuine employment and good health: a life of choices and opportunity, free from discrimination. (Dodson, 1993, p. 1)

And we also agree that holding difficult conversations has to be facilitated, nurtured, and sustained within schools. As educational leaders for social justice, how do we do this "without falling prey to the readily available formulae of school and curricular reform that – with all good intentions – seeks out simple causal explanations of school reform, renewal and improvement"? (Woods, Dooley, Luke, and Exley, Chap. 28). How do we do this conceptually, methodologically, as teacher-leaders and activists, as administrators, as professional developers, as policy advocates, as professors in higher education preparing the next generation? We read, we write, we teach, we make a difference. We hope you enjoy the first step here, reading.

Part I

Conceptualizing Social Justice: More than a Definition

Chapter 2

The Place of "Social Justice" in the Field of Educational Administration: A Journals-Based Historical Overview of Emergent Area of Study

Izhar Oplatka

Since the establishment of educational administration (EA) as a field of study, it has been characterized by intellectual struggles and ferments as well as reflections on its nature, purposes, boundaries, methodologies, and knowledge base. The field's contents and research foci have consistently changed, and the field "lost" some topics while at the same time "adopting" new ones (Oplatka, 2010; Ribbins, 2006). This is strongly related to the lack of clear boundaries and cumulative knowledge base in the field (Donmoyer, Imber, & Scheurich, 1995).

The blurring of any field's boundaries is associated with research at the innovative frontier of fields and points of view and methods of related disciplines; permeation occurs across the span of discipline, from frontier to core (Klein, 1993). In other words, a field of knowledge is essentially open ended as there is never-ending proliferation of new disciplinary and subdisciplinary fields (Hoskin, 1993; Rodgers & Rodgers, 2000). The field of EA is no exception. It has extended boundaries, i.e., multiple paradigms and a tremendous variety of topics and subject areas published in the field's texts.

The purpose of this chapter, then, is to trace the place of "social justice" in the field's discourse since early 1960s, the decade in which the first academic journals of the field appeared. More specifically, the chapter aims at (1) presenting the emergence of "social justice" as an area of study in the field's journals from a historical perspective and (2) analyzing the major topics related to this area of study and its types of publication.

Historical analysis offers a new approach to understanding an area of study by charting according to date the main research contributions over a precisely defined period (Gray, 2001). Likewise, it allows some meta-epistemological reflection of a relatively new area of study and, as Humes and Bryce (2001) noted, tries to make

the field "more cumulative in character" (p. 342). Thus, this chapter is intended to enable scholars to grasp the unique development of "social justice" in the field of EA and make sense of its theoretical and applied knowledge cumulatively and systematically.

Likewise, the decision to base this overview on journal articles emanated from the assumption that academic journals are an arena where dialogue about knowledge production and the nature of the field takes place (Gunter, 2002), as well as reflecting and defining lines of inquiry developed by those in the field (Thomas, 2010).

The rest of this chapter is organized as follows: the first section displays the literatures on academic disciplines and their growth and on EA as a field of study. Then, it goes on to discuss the methodology I used to analyze the journal articles. The third section, the major part of this chapter provides an historical analysis of "social justice" in the field's journals in each of the last five decades. Some concluding comments end this chapter.

The Fragmentation of the Academic Discipline

Most of the knowledge production processes take place in university-based disciplines that perform the essential function of systematizing, regulating, and unifying the flow of social and technical practices at the heart of knowledge production, employment structures, and training programs (Lenoir, 1993) and are commonly assumed to be an inevitable part of the professionalization of scientific work (Whitley, 1983).

Disciplines have recognizable identities, demarcated areas of academic territory, and particular cultural attributes, underpinned by common norms of enquiry, familiar educational training, and shared rules of function and technical procedure (Becher, 1989; Bridges, 2006; Lenoir, 1993). They are distinguished by scholarly boundaries required by the nature of knowledge itself and intensified by unique methodologies and conjectures that are not translatable into those of any other discipline (Hausman, 1979).

Most members of a given discipline engage in the practice of differentiation (boundary-work) and, through it, recognize just who they are and what they do (Lenoir, 1993). This practice refers to a set of differentiating activities that attribute selected characteristics of particular branches of knowledge on the basis of differing methods, values, citation procedures, and styles of organization (Whitley, 1984).

Despite many efforts invested in disciplinary boundary-work, a process of permeation is widely evident, making boundaries ambiguous, flexible, historically changing, contextually variable, internally inconsistent, and sometimes disputed (Klein, 1993). One result of this process is the proliferation of subfields that tend to weaken disciplinary control and fragment cognitive structures. The discipline is highly differentiated into relatively autonomous subunits and methods that provide specialist identities, goals, and techniques (Whitley, 1983) and establish new connections with other disciplines (Hausman, 1979).

Several factors are attributed to the fragmentation and the boundaryless nature of many disciplines in our era, among them the massive increase in the number of university researchers resulting in a proliferation of competing theoretical systems and research topics (Whitley, 1983), influences of related disciplines' paradigms and methods (Klein, 1993), and the fragmentation and dislocation of social institutions in the postmodern society (Henkel, 2005).

The fragmentation process is more appropriate to applied fields, such as education, that draw on soft, applied knowledge as a means of understanding the complexity of human endeavors with the intention of enhancing the quality of personal and social life (Becher, 1989). Inherent in these fields is what Knudsen (2003) called "the fragmentation trap" characterized by a search for new theories coming to prevail upon the activity of extending and elaborating a research program. This "trap" is likely to emerge in fields with too much conceptual pluralism embedded with many new theories and models proposed at too fast a pace in order for the scientific community to be able to evaluate each contribution properly and to integrate them into a reasonable coherent knowledge structure.

Related to the above is the great extent of permeation that characterizes soft applied fields. New ideas and streams of research penetrate the field and change its foci along its intellectual history. As a soft science, EA is no exception, and its history is replete with the permeation of new areas of study and the demise of others.

The Dynamic Nature of the Field of EA

Historical accounts of the field have seen the last quarter of the nineteenth century as the beginning of EA as a profession and later on as a field of study in universities in the USA. The rapid growth of school districts coupled with the search for efficiency in education spurred the development of EA preparations in higher education institutions, intended to prepare the growing number of principals/school head-candidates in USA for their impending role (Callahan, 1962).

Two new interconnected "ideologies" heading the social and professional discourses of both education and management had much influence upon the field's construction in the early 1900s. The first, borrowed from Taylor's principles of scientific management, highlighted concepts such as efficiency and effectiveness in the workplace. Excellence in EA was related to know exactly what you want the subordinates to do, the incorporation of modern business methods into preparation programs, and to the idea that EA is a profession distinct from teaching.

The second "ideology," grounded in the glorification of the modern science, stressed the need for a scientific approach to school administration in order to understand the art of running school systems and schools (Culbertson, 1988). Founders of EA were convinced that science was the basis upon which a new generation of school leaders could be developed (English, 2003), although the scope of their inquiry, as Culbertson noted, was as broad as civilization, past and present.

In light of paradigmatic shifts in organization studies, scientific management, with its stress on impersonal authority, was replaced by many field members in the human relations perspective that stressed personal interaction and was viewed as the counter-thesis of the second era. Above all, however, a pragmatic view dominated the field in those years (Culbertson, 1988). EA was substantially oriented to normative concerns, taught by senior educators (superintendents, senior principals) who had retired and delivered their practical knowledge and wisdom to prospective administrators. This was to be replaced by positivistic views of science, penetrating into the field by what is usually called "the theory movement." Science had to re-lead the scholarship of EA for several decades, and concepts such as objectivity, reliability, and validity had dominated the field's discourse.

It was only during the 1970s that what is usually called in the field's textbooks as "the Greenfield revolution" allowed the expansion of the field to combine multiple perspectives of knowledge production in its knowledge base. Knowledge production was no longer limited to robust scientific quantitative methodologies or "pure" scientific perspectives. In contrast, more and more qualitative reports, grounded in varied methodological and theoretical perspectives, have appeared in the field's knowledge base. Thus, a task force appointed in early 1990s by the UCEA (University Council of Educational Administration) identified seven areas that constitute essential knowledge for EA: social and cultural influences on schooling, teaching and learning processes, organizational studies, leadership and management processes, policy and political studies, legal and ethical dimensions of schooling, and economic and financial dimensions of schooling (Hoy, 1994).

The field's contents and research foci have consistently changed since its foundation, and it "lost" some topics (e.g., classroom management) while at the same time "adopting" new ones. Review of the field's knowledge base conducted during the last 40 years enables us to gain some impression of the field's wealth of areas of interest and theoretical perspectives. Campbell (1979), for instance, found that the topics of articles published in the US journal, Educational Administration Quarterly (EAQ), from 1965 to 1978 most mentioned were as follows: politics-policymaking, school finance, decision-making, motivation-satisfaction, preparation programs, leadership, administrative behavior, authority-bureaucracy, collective bargaining, and organizational structure. In 1990, Swafford analyzed the papers published during the first 25 years of the Australian Journal of Educational Administration (JEA) and found a wide variety of topics such as organizational structure, the principalship, leadership, organizational climate, politics of education, and change and innovation.

A host of research topics were found also in the field's conferences. For example, the conference of the British Society of EA (BELMAS) was replete with presentations in areas such as educational change and improvement, career issues, partnership, leadership and collaboration, leaders' attitudes, leadership development, and headship (Oplatka, 2008). A similar trend was observed also in the conferences of the Commonwealth Council for EA (CCEAM) (Oplatka, 2009).

The corollary, then, is of extended boundaries, i.e., multiple paradigms and a tremendous variety of topics and subject areas published in the field's texts. While some areas of study have consistently received much attention in the field throughout the years, others appeared in the field for a short period of time and faded. For the purpose of this chapter, I am interested in understanding the place of “social justice” and related concepts in the field’s knowledge base. In the next pages, I elaborate on the methods I used to feed my curiosity.

The Reviewing Method

The primary methodology I employed to trace the place of “social justice” in the field’s journals was qualitative content analysis (QCA) because a journal paper is seen as a document susceptible to textual analysis (Altheide, 1996). QCA combines both quantitative and qualitative content analysis. It involves collecting numerical and narrative data, i.e., the emphasis is on simultaneously obtaining categorical and unique data for every text studied.

Thus, QCA provides a way of obtaining data to measure the frequency and extent of messages following a serial progression of category construction-sampling-data collection and coding. It is the reflexive and highly interactive nature of the investigator, concepts, data collection, and analysis that is unique in this method. Besides providing numerical information, it is important to expose the reader to descriptive, interpretive information, thereby illustrating the usefulness of constant comparison for discovering emergent patterns, emphases, and themes in an analysis of documents and texts. Likewise, QCA enables researchers to refer not only to categories and variables that initially guide the study but also to others which emerge throughout the study, including the use of constant comparison of relevant textual parts, image, meanings, and nuances (Glaser & Strauss, 1967).

Sample

For this chapter, I reviewed the abstract of papers about “social justice” published between 1962 and 2010 in seven dominant refereed journals in the area of EA – *Journal of Educational Administration* (JEA), *International Journal of Leadership in Education* (IJLE), *International Journal of Educational Management* (IJEM), *Educational Administration Quarterly* (EAQ), *Leadership and Policy in School* (LPS), *Educational Management*, *Administration & Leadership* (EMAL), and *School Leadership & Management* (SLM). While the three first journals are more internationally oriented, the next four others are more nationally focused (USA and the UK, respectively), which, in turn, allow ample comparison among countries.

Only papers focusing on “social justice” were chosen for this review. Their identification was based on two criteria: (1) the terms “social justice,” “diversity,” “gender,” “sex,” “equity,” “equality,” “moral,” or “racism” or their adjectives appear in their abstract, and (2) the abstract contains some reference to issues of leadership and/or education explicitly and implicitly.

The Method of Analysis

The analysis was organized around two central issues: the topics addressed in every paper and the type of work (i.e., empirical, scholarly). Each paper was coded on four variables: topic, type of paper (empirical, comment, conceptual, etc.), subjects and methodology (if available), and the number of occurrences of the emergent categories was counted. A similar procedure has been commonly used in the field's reviews (e.g., Murphy et al., 2007; Oplatka, 2007).

Note, this analysis was not conducted by someone from an Anglo-American nation (I live and work in Israel and English is my second language). This position made me "remote" in some sense from the contextual and cultural determinants that influenced the authors of many of the reviewed papers, on one hand, and allowed me to connect many of the insights/findings to an international audience.

The 1960s and the 1970s: No Signs for "Social Justice"

In 1962, the first academic journal of the field, JEA, has been founded in Australia, and a year later the American academic journal, EAQ, appeared. The British journal – EMAL – published its first volume in 1972. Their appearance symbolizes the academization of the field, its boundary-work and scholarly identity-building. This process occurred in a time of a growing distrust of social institution, an increasing federal funding for administrator training programs, and the dominance of the welfare state ideology in many Western countries.

The field's discourse was still dominated by notions of "pure" positivist science and robust methodologies put forward by advocates of the "theory movement," although the "Greenfield revolution" during mid-1970s set the stage for impending shifts in this dominance and in its implications for the penetration of new spirits and ideas in the field (for more information about this developmental phase in the field, see Oplatka (2010)). Yet, in the first two decades of the field's academic journals, the study of leadership revolved around narrow aspects, such as leader-follower relations, leadership behavior, and the role description of some school leaders, all of which areas of study that were widespread in the business literature of this time. Evidently, a search for "justice," "diversity," and "racism" in the journals of those years found no papers using these terms in their abstracts. Educational leadership and social issues have simply not been juxtaposed in these two decades.

It is not to say, however, that "social" issues have not been referred to in the field's journals. A thorough reading of the abstracts reveals some reference to equality, educational opportunities, democratic leadership, and even gender, albeit this attention seems to be connected, only partially, to educational leadership (except the topic of democratic leadership). Many of the publications in these topics, grounded in sociology, have been published in the field's journals regardless of their relevance to principalship, management, or leadership. I elaborate on this issue in the next paragraphs.

One should bear in mind that the first professors of EA came from the social science disciplines, and chiefly from sociology. They brought with them concepts and theories developed out of the educational system. Yet, although many of them "moved" from studying "pure" sociological areas of study to pondering "educational" issues, few seem to have remained "committed" to their basic discipline and continued focusing on issues of discrimination, social equality, integration, and so on.

Apart from very few papers that focused on political socialization of students or determinants of aspiration in secondary school students, admittedly, the kind of work we no longer expect to read in the field's journal nowadays, some works analyzed the concept of inequality from multiple points of view. But, the focus was not on educational leaders or teachers but on the nation or the students. For example, authors illuminated federal interventions to achieve equity and overcome disparities among students, or discussed the influence of increasing public tuition in higher education on equity. Illustrative of this stream of scholarly work is Guthrie et al.'s (1970) paper:

> The authors contend that children from lower socio-economic status homes are systematically discriminated against in the delivery of school services. Data from Michigan are employed to demonstrate that state aid equalization arrangements not only do not alleviate this discrimination, but, in fact, actually tend to reinforce it.

Clearly, the topics indicated above remind us that major concerns addressed by sociologists of education are entirely unrelated to issues of educational leadership and management. This characterizes also papers that considered tuition fee discrimination, educational opportunities for students in African countries, social stratification and the role of State Departments of Education, and social integration in state legislation.

For the readers of the field's journals during the 1960s and the 1970s, then, issues of segregation, diversity, inequality, social injustice, pluralism, racist discrimination, and desegregation were not alien. Yet, EA readers could be exposed to these topics also in journals of sociology of education which means that the field's journal had not necessarily added new perspectives to the major streams of thought in sociology.

Leadership for social justice, as we will see in the analysis of this concept in later decades, is related conceptually by some scholars to democratic values. In the 1960s and the 1970s, democratic leadership received most attention within the papers about leadership, as EA scholars pondered the application of democratic leadership in schools (e.g., Catholic schools), contrasted bureaucratic and democratic basic principles, and analyzed participative decision-making. Broadly, advocates of democratic leadership have emphasized its positive consequences for staff moral, ethical judgments, and low levels of staff disillusion.

Likewise, democratic leadership (and shared decision-making) was studied from rational-organizational perspectives whose main goals were to improve the school's efficiency and effectiveness by proposing contingent models of leadership or examining the effects of shared decision-making on varied dependent variables.

Put differently, participative decision-making or democratic leadership were means to achieve the school's aims, not a moral engagement for its own sake.

Perhaps, the seeds of an impending change were, however, planted in these decades in the form of a small number of papers that have inculcated the gender concept into the field's discourse. Be it a study of decision congruence and the gender of school administrators, the executive role of women in New Zealand education, for example, a comparison of female and male professors on participation in decision-making, or public prejudice against women school administrators, this new stream of research symbolizes the awareness of some field members of the weakness of "pure" rational models which were based on white men in different roles. EA (both in schools and HE institutions) was no longer parallel to white male-based cultural scripts and arrangement solely. Women were there too.

The 1980s: The Appearance of "Leadership" and "Gender"

In 1980s, the phenomenon of school leadership had penetrated into the field's discourse beyond the model of "democratic leadership." Articles using the word "leadership" in their title began to appear, stressing the role of school leaders in the lives of teachers and pupils and presenting models and views of leadership imported from cognitive or practical points of view. They were accompanied by a few works devoted to studying the potential impact of leadership upon varied teachers' perceptions and behaviors and studied that examined the relation between leaders' styles and varied variables (e.g., teacher morale, administrative authority).

But it was the model of instructional leadership that caught the attention of several scholars, i.e., the ways by which school leaders develop and maintain instructional activities, rather than the moral aspects of leadership. Only one conceptual paper out of the hundreds published during the 1980s in the field's journals referred to moral aspects of educational leadership. William Greenfield, an American EA scholar, wrote in 1985 about the moral socialization of school administrators:

> The study of administrator preparation programs, processes, and associated outcomes has proceeded in a theoretical vacuum, and has focused primarily on technical knowledge and skill associated with the school administrator's role. This article presents a theoretical framework for the study of preparation practices and outcomes, and discusses the moral socialization of school administrators, a neglected but critical dimension of administrator preparation.

This neglected dimension had to wait for the 1990s to be "revealed" in the field. Meanwhile, readers of the field's journals in the 1980s were now reading about issues of equality, equity, desegregation, equal of opportunity, and other "sociological" issues in separation from leadership. Book reviews published in the English journal – EMAL – presented sociological writings about "educational policy and educational inequality," "the redefinition of equality of opportunity," or "educational disadvantage." One paper, written by Fisher in 1987, an English scholar, linked principal preparation programs and cultural diversity within schools:

> Two major approaches to manager development in schools are identified. The first provides a tool kit for purposive action; the second is aimed at helping managers cope with the pressures and dilemmas of the job. The need for the sharing and coping style of manager development is traced to the cultural diversity that can exist within schools…A framework of manager development which tries to synthesize both approaches within a single perspective is developed.

Above all, however, “old” topics connected explicitly and implicitly to current conceptualizations of leadership for social justice – democratic leadership and gender – continued to be published in the field’s journals. But, by this time, EA readers were now being exposed to papers about racism and race. Scholars and researchers were still concerned, however, with issues of participative decision-making, the involvement of teachers and middle managers in managerial decisions, centralization of power within educational systems, and many other democracy-related topics. Democratic leadership was viewed positively, and its impact upon different aspects of school and schooling has been examined. In today’s terms, democracy was parallel to justice, equity, and care for teachers’ needs and concerns, although no author used these terms explicitly. Their time in the field’s discourse had not come yet.

In contrast, references to gender and feminist concepts have gradually but steadily increased in the field. But in the 1980s, EA authors were more focused on gender differences in EA, women in managerial positions, and women’s career in education. They acknowledged the need to explore women’s career distinctively from that of men and conceptualized their career in new, alternative terms, i.e., resisted the masculine nature of many theories, models, and studies in EA. Thus, we find papers about the career paths of female school heads in England, men and women’s access to superintendency, gender differences in teachers’ preferences for primary school leadership, role perceptions of deputy heads, and so on.

Yet, what seems to be most relevant to our discussion of leadership for social justice are works emphasizing the gender gap in EA, gender barriers to leadership position in education, androcentric bias in EA, sexism in principal preparation programs, and sex stereotypes in schools. Two works from that time illustrate this kind of works. The first, written in 1981 by Stockard and Kempner, deals with women’s representation in school administration:

> Earlier studies have noted sex discrimination in professional inter actions, graduate school enrolments, and hiring in school administration. The results of this study indicate some changes in these areas. There has been an increase in women’s representation on the programs of a state, but not the national, meetings of administrators; an increase in women’s representation in educational administration graduate programs, and an increase in women’s representation in administrative jobs. However, women graduate students are more often in degree rather than credential programs, and women administrators are more often in low-level as opposed to high-level positions....

The second work, written also by American researchers, Frasher and Frasher (1980), focused on sex bias in the evaluation of administrators:

> Using a set of in-basket materials that suggest specific leadership styles, 135 graduate students in educational administration evaluated hypothetical superintendents who

> were depicted as female or male and rule bound or flexible. Overall, the fictitious female superintendent was rated as less fair and less flexible than her male counterpart…When these results were viewed in the context of a body of literature that shows women administrators to be fully as effective as men and in the context of the small number of women in educational leadership positions, they strongly suggest that sex bias has operated to the disadvantage of women and the education profession.

These and related works symbolize, in my view, the initial acknowledgment of EA researchers in the irrational nature of EA and the need to analyze it from multiple perspectives, including gender. Put another way, by "discovering" the gender influence upon educational leadership, field members seem to have opened the gate for broader views of EA, in that it is not necessarily been conceptualized in terms of masculine terms (e.g., middle-class white men for middle-class white children, technical competencies) but rather as an holistic phenomenon of varied dimensions.

In this sense, during the second part of the 1980s, we observe three works that refer, even indirectly, to issues of race and racism. Thus, authors reviewed the research on equity and minorities and women in EA, explored Hispanic Apartheid in American public education, and analyzed the history and ideology of the Education Reform Act in England to understand its threat to antiracist initiatives. Although, these works are not related explicitly to educational leadership, they signal new waves of intellectual thoughts in the field.

The 1990: Initial Debates About Leadership and Social Issues

Education caught the national political attention in the 1990s as it never had before in many Western countries, as more and more right-wing governments adopted neoliberal policies of privatization, accountability, and marketization in order to "save" the country's education and raise students' academic achievements (Weiner, 2000). This policy change had much influence upon the discourse of EA as a field of study. It is evident that more EA scholars than in previous decades had begun to study issues of morality, social justice, social diversity, equality, and racism in relation to the school, in general, and to educational leadership, in particular.

Before I extend the debate on these new streams of study, some comparisons to preceding decades are warranted to better understand the scholarly breakthroughs during the 1990s. As noted above, during the three decades since the foundation of the first journals in the field, these journals were an outlet for works grounded in sociology of education. This yielded concomitantly research reports and book reviews about equity, equality, and equal opportunities in education regardless of EA or leadership, a kind of writings that decreased considerably in the 1990s. In this decade, there are very few works that associated between these concepts and education policy, reforms, schooling, and even principal preparation programs. For instance, Perry (1997) aimed at identifying stakeholders' attitudes regarding the effectiveness of school in providing intellectually challenging environments for a diverse population and provided recommendations for improving educational leadership training to include strategies dealing with issues of equity and inclusion. Another example comes from the work of Fowler (1995) who analyzed the neoliberal value shift and its implications for federal education policy in the USA. She wrote:

> With Clinton's election to the presidency, the neoliberal wing of the Democratic party came to power. This change has important implications for education policy. This study, based on a content analysis of neoliberal political communication, concludes that the policy values most emphasized by neoliberals are economic growth and community. Equity, with a focus on class issues, is also an important neoliberal value. An analysis of the Clinton administration's education policy in 1993 and early 1994 suggests that it generally reflects these neoliberal values. This represents a shift away from both the recent conservative emphasis on efficiency and liberty and the earlier emphasis on equality which characterized the liberalism of the 1960s and early 1970s.

EA researchers continued to study and write about participative leadership (what used to be "democratic leadership"). But, while the vast majority of authors interested in this form of leadership continued writing about topics of participative decision-making, shared governance of schools, teacher involvement in school management, collegial management of schools, and management teams, one paper that called for the preparation of school principals for ethno-democratic leadership merits highlighting. Maxcy (1998) claimed that because school leadership nearly always operates within a multicultural setting and complex social dynamic, "we must relocate race and culture to the heart of democracy, embracing a new vision of democracy as a personal-social way of living…." In doing so, he illuminated the association between race and democracy, a new understanding of democratic leadership in that time.

Along the same lines, whereas researchers (mostly women) increased their interest in understanding gender differences in teaching and principalship in the 1990s, very few of them (mostly in the USA) began focusing on gender or feminist issues not only separately but rather in relation to cultural diversity and race. Cultural diversity, for example, was explored through the lens of an African-American feminism, and "race" was juxtaposed with gender, equality, and class. Young, Place, Rinehart, Jury, and Baits's (1997) paper exemplifies this new stream of research:

> Race (Black and White) and sex of applicants and of organizational representatives were systematically manipulated to produce demographically similar and dissimilar pairings. Vacancy characteristics associated with teacher positions were manipulated through recruitment messages…Contents of recruitment messages were found to interact with sex of an organizational representative and race of an applicant. Black applicants preferred female organizational representatives presenting recruitment messages emphasizing either work environment attributes or work itself attributes. White applicants preferred male organizational representatives presenting recruitment messages stressing only work environment attributes.

Note, however, that "social injustice" was referred, by and large, to sex discrimination (e.g., salary discrimination, unequal career advancement) or gender inequality, i.e., the focus of most gender-oriented studies was on women regardless of their race, class, or social position.

But, for a new group of researchers, issues of social justice and moral engagements deserved a particular attention through the construction of moral leadership.

In their view, the antitype of the technical, rational models of educational leadership was the educational leader whose main concerns are not only student achievement and measurement. This kind of leader has been conceptualized in terms of ethical reasoning, moral responsibility, value system, justice, care, and authenticity. The "moral" ferment in the field came in the form of scholarly and empirical papers published in the field's journals as well as in a special reports published in the British journal (EMAL) in 1993 on the work of Christopher Hodgkinson (the moral art of educational leadership). Two scholarly works published in two different journals and in a time space of 5 years seem to have brought the news of the moral revolution in educational leadership:

> With the demise of the empiricist theory of knowledge and the increased prominence of postempiricist and hermeneutical perspectives, it is clear that various aspects of our social lives – including educational leadership – should no longer be thought of in terms of technological or instrumental rationality and technical expertise. Although the current philosophical ferment allows for different ways to rethink leadership, this article examines the implications of one school of thought – philosophical hermeneutics – for the research on, and especially the practice of, educational leadership. The central point is that this perspective, when interpreted in terms of how we think of ourselves as persons, results in a conceptualisation of leadership as a predominantly practical and moral activity. (Smith & Blase, 1991)

> Are 'scientific' theories of educational management compatible with the goals of an education service whose local and individual beneficiaries enjoy autonomy? Recent theories of educational administration are discussed, with particular attention to their implications for social justice and educational diversity. Examples from the work of Elster and others in social-choice theory are applied to problems of resourcing the curriculum and school organization. The potentially contradictory requirements of efficiency and equity raise difficult questions of professional accountability. Resolving them will require effective community participation and collaboration. (Strain, 1996)

Indeed, contemporary authors wrote extensively about how school members negotiate rather than reconcile the ethics of care and justice in actual practice, analyzed the ethical dimension of educational leadership, and connected leadership with authenticity, intentionality, spirituality, and sensibility. Catherine Marshall, one of the pioneers in this new area of study, further elaborated on the components of moral leadership in a paper published in 1996 (with Patterson, Rogers, and Steele). Based on their empirical works with career assistant principals in the USA, the authors suggested that the ethic of care may alternate traditional perspectives of EA.

For the purpose of this historical overview, three concepts need further highlighting – social justice, race, and diversity. While the two first concepts received limited attention in the field's journals during the 1990s, the third one caught the attention of many EA scholars in that decade. Thus, three papers included some reference to social justice or injustice in educational leadership, criticizing the leadership theory and research, claiming for the failure of traditional leadership models to create school systems that enact social justice, or exploring the implications of "scientific" theories of EA for social justice and educational diversity. One study, furthermore, examined Australian principals' attitudes toward inclusive education, a kind of education that is philosophy based, according to the authors, on social justice (Bailey & du Plessis, 1997).

Conversely, the five papers revolving around issues of racism and race elucidated scant, if any, reference to educational leadership. Researchers asked how far ethnic minority support staffs working in schools are treated as professionals; illustrated how school district's reform efforts replicated the unequal distribution of knowledge, power, and resources by race and class; analyzed critical race theories in feminist thoughts; or investigated the political and conceptual underpinnings of opportunity-to-learn standards among African-American students. Race was still observed in relation to reform, feminism, equality, and policy, and the part of practical implications for school leaders was marginal in these works.

Finally, the issue of social diversity has received more attention in the 1990s, as more scholars and researchers wrote about choice and diversity, inclusive schools, or school curriculum. For example, Canadian researchers (MacKinnon & Brown, 1994) reported on schools' attempts to accommodate students with widely diverse needs in regular classrooms, while Australian researchers (Stone & Harrold, 1990) concluded that any principals who are determined to adapt their schools' operations to better serve the educational needs of their students are, however, unlikely to be prevented by central, system-level directives. Yet, the paper that retrospectively seems to acknowledge and legitimate the permeation of social issues into the discourse of educational leadership and administration is a paper that displays an initiative to map the knowledge base in EA conducted by the University Council for EA in the USA. Lomotey (1995) summarized the main elements of this initiative:

> In 1994, the University Council for Educational Administration (UCEA) published the first part of its knowledge base in educational administration. The council set forth to establish 7 domain overviews, to compile key articles and bibliographies, and to create taxonomies and case studies. In the domain overview for social and cultural influences on schooling, the authors argue that (a) illegitimate forms of exclusion provide the foundation of the social and cultural influences on schools; (b) the focus needs to be on the creation of a true democracy; (c) schools are local national and public entities; and (d) efforts should be directed at alleviating the disenfranchisement of students in schools. Implications for practice include the fact that teacher and administrator training programs should pay closer attention to the failure to prepare educators to deal with diverse student bodies….

This report paved the way, I believe, to future works about context and leadership, in general, and about educational leadership and minority students or underprivileged communities, in particular. Issues of social justice, moral leadership, diversity, and race will penetrate into the field's discourse in a larger scope in the first decade of the third millennium.

The 2000s: The Era of Moral Leadership and Justice

A stark distinction between the 2000s and the previous decades in respect to the interest given in the field to issues of "social justice," "cultural diversity," and moral aspect of leadership is clearly observed. In this sense, readers of the field's journals in the last decade have witnessed a considerable increase in the publication of papers about moral leadership and leadership for social justice as never happened before in the field.

Of the 385 papers about leadership published in the field's journals during the 2000s, 81 handled issues of moral leadership, including leadership and social justice, race, and diversity. This was the leadership model that has received most attention during the first decade of the third millennium followed by 39 about participative leadership and 30 about the model of distributed leadership. The number of papers about instructional and transformational models of leadership was far behind.

Thus, field members from the four corners of the earth paid much attention to ethical aspects of educational leadership (e.g., defining the best interests of students, the ethic of care, ethical dilemmas in daily school practice), authentic leadership practices (e.g., the effects of structured self-reflection on the development of authentic leadership practices, leader authenticity in intercultural school contexts), and moral dimensions in EA (e.g., managerialism and moral disenchantment in education, moral and reflective constructs in leadership development programs, the factors of moral engagement in school). Two papers illustrate this stream of writing:

> This article proposes that effective leadership in intercultural schools requires authentic understanding and related action; and that this can only be sought through a dedication to ongoing leadership learning…The major theme running through related discussion is that authentic intercultural leadership is particularly attuned to the values, beliefs and behavioural uniqueness of the students, teachers and others which comprise the community. In other words, it aims to acquire intercultural understanding on an ongoing basis and use this to inform leadership beliefs and practice…. (Walker & Shuangye, 2007)

> This paper explores the moral and ethical dimension of indeterminacy in EA within the context of the managerialization of education. Drawing on Max Weber's seminal work on rationalization, disenchantment, and the ethic of responsibility and the ethic of conviction, the author discusses the conflict between accountability and educational autonomy. While this conflict constitutes a key dilemma of educational leadership, educational theorists all too often attempt to resolve the conflict in favor of accountability over commitment consistent with managerial principles. By contrast, it is argued that mature educational leadership is characterized by an appreciation that conflicting ethical orientations are irreconcilable and that sound educational policy and practice must reflect practical realities and demands without sacrificing educational ideals. (Samier, 2002)

The permeation of moral and ethical issues into the field's discourse has been "justified" as in the previous decade by the overemphasis given in the 2000s to technical aspects of educational leadership denoted by terms such as accountability, efficiency, and effectiveness. Special issues aimed at contrasting between Taylorite notions of scientific management and moral aspects of leadership and at putting forward the need to explore more thoroughly these and related aspects in EA, especially in our multicultural and diverse societies.

Their calls have been "responded" to by reviews of books about the management of values in school, the moral imperative of school leadership, ethical leadership and decision making in schools, a practical guide to moral and ethical school leadership, and moral literacy in school. A special issue in SLM from 2007 presented works from different countries about school leadership and equity in which researchers describe how schools respond to cultural diversity and changing demographics in their own country. Similarly, IJLE published a special issue in 2001 multiple perspectives on values and ethical leadership in education, publishing works such as Chinese culture and leadership and an Indian perspective on moral leadership in education.

To this point, the reader could notice the wide variety of concepts and dimensions underlying the new stream of thought, and study in that moral leadership is viewed from multiple perspectives and analyzed in relation to ethics, values, and system. For the purpose of this chapter, though, I elaborate on three major concepts – social justice, diversity, and race – three concepts that are tightly interconnected to each other and to the construction of moral leadership in the last decade.

Leadership for Social Justice

While the term "social justice" has appeared only rarely in 1990s, it appeared in 43 works published in the field's journals (including 5 published in *Journal of School Leadership*) a decade after, perhaps due to the foundation of new journals whose aims included the extension of our knowledge about educational leadership (IJLE, LPS). In 2002, a paper published in EMAL seems retrospectively to have sharpened the debate about social justice and educational leadership and set the stage for further investigations in this area:

> This paper provides a philosophical and methodological analysis which aims to support research on social justice in educational organizations. It traces a path from Thomas Greenfield's ethical formulations to the moral philosophy of Jurgen Habermas and does so in order to query the ethical implications of following Greenfield in imagining educational organizations as 'moral orders'. It argues that such a metaphor is problematic for guiding research with a social justice focus because it does not adequately conceive its own ethical basis, and thus cannot address (or redress) moral authority in organization. It claims that Greenfield's metaphor requires substantial revision, such that organizations are better regarded as moral communities…. (Milley, 2002)

Later writings discussed the interaction between social justice or injustice and educational leadership, by exploring the career and values of leaders who strive for social justice in their work, policy implications for social justice in school district consolidation, African-American leadership, and the struggle for social justice and successful leadership and by suggesting ways to prepare educational leaders to be committed to social justice and equity. A dramatic increase in the interest of field members in leadership and social justice is evident in the second part of the 2000s, as scholars wrote about inclusive education and its implications for social justice, the ways to promote social justice in school or superintendent perspectives and practice of social justice. Some reviewed the first books about leadership for social justice published by field members and debated the means by which this kind of leadership is used in practice.

But a large portion of the knowledge production about leadership and social justice came up in the form of special issues. In 2002, Margaret Grogan edited a special issue in JSL about leadership for social justice, the first special issue in this area.

This issue included articles about the tensions between the pluralism of postmodernist thinking and modernist notions of social justice that produce "predicaments" for school leaders (Blackmore, 2002) and a case study of a leader who fosters authentic participation for advancing social justice in an urban community center in Venezuela (Goldfarb & Grinberg, 2002). One paper proposed a framework for understanding the moral and political possibilities of educational leadership that contradicts between two educational leadership paths; the first illustrates how an educational leader continuously builds a just school community under changing demographic conditions, and the second illustrates how single-minded visions for a just school society emerge through the heroic efforts of individual leaders (Bogotch, 2002).

Two years later, Catherine Marshall edited a special issue of EAQ about social justice challenges to EA whose aim was to explore issues of cultural diversity, equity, and democracy. In one paper, critical pedagogy was used to analyze the discourse of social justice in the field of EA, while other papers offered practical models or guidelines for preparing school leaders committed to social justice and equity or helping current leaders leading for social justice (e.g., Brown, 2004).

Similarly, a special issue of JEA in 2006 focused almost entirely on the application of social justice perspective in leadership development programs. Scholars proposed a framework for preparing leaders for social justice, reported on a doctoral program intended to promote social justice leadership, and examined whether emerging school leaders are prepared to face the challenge posed by George Counts' classic 1932 speech in which he asked "dare the school build a new social order?" (e.g., Hoff, Yoder, & Hoff, 2006). At the same year, LPS published several papers, in which authors connected between inclusive leadership and social justice for schools, the politics and emotions of leading for social justice, and the story of the first African-American woman principal in New York City, as an example, according to Johnson (2006) for the need to analyze leadership for social justice in light of historical, political, and social contexts in which it is practices.

The final issue devoted to leadership for social justice was published in JEA in 2007, edited by Anthony Normore. This issue was composed of works from different parts of the world (e.g., England, Tonga, Hong Kong), thereby enabling the reader to be exposed to varied conceptualizations of social justice and their cultural and social determinants. Illustrative of this issue is Fua's paper about social justice and leadership conceptualizations from Tonga:

> This article aims to explore Tongan conceptualizations of social justice and leadership from a cultural perspective. The approach taken is from a cultural perspective based on evidence that culture influences our thinking and consequently our behaviors, and the argument that social justice is about recognizing our values, philosophies, processes and structures in our education system and that theorizing social justice should be founded on our knowledge systems that are embedded in our cultures. By conceptualizing social justice from a cultural perspective, an alternative understanding is brought forward and a more global perspective is evident.

Notably, the different journals have published papers proposing conceptualizations of leadership for social justice, illuminating the connection between this type of leadership and leadership development programs, and emphasizing the need to conceptualize educational leadership in terms of social justice in our era of accountability and efficiency in education. This topic represents, in my view, the incipient stages of epistemological development in which the debate about leadership for social justice is positioned and, in turn, the need to gain academic legitimacy for its permeation into the field's discourse.

Cultural Diversity

Eighteen papers referred to cultural diversity in their analysis of educational leadership, a term that has supplanted sociological terms such as equity and equal opportunity used in the past. Researchers examined leadership in inclusive schools; deconstructed cultural, religious, and ethnic diversity discourses in the field of EA; or offered insights into developing school leadership to engage with wider diversity in complex multicultural schools. An example of the research on diversity is Lumby's (2006) study:

> This article uses the theoretical framework of broad and narrow ways of conceptualizing diversity, the latter focusing primarily on those characteristics that are likely to lead to disadvantage, ethnicity, gender and disability, and the broader encompassing many more characteristics of 'difference', such as educational background, leadership style. It analyses evidence from 10 organizations in the Learning and Skills Sector in England…Their orientation coverts 'managing diversity', derived from human resources theory, from its intended aim of increasing equity, to a conceptual sleight of hand for sidestepping uncomfortable issues. Staffs are shown both to create an 'other' than the norm, an 'outgroup' particularly in relation to black and ethnic minority potential leaders, and to homogenize those who have entered leadership to delete any 'other'.

Much reference has been elucidated to construct models of leadership in intercultural contexts and, in turn, to produce knowledge that "acknowledges" the existence of unprivileged indigenous and ethnic groups suffering from alienation, exclusion, and disadvantage in the modern society. Scholars pondered on the ways by which educational leaders ought to or could facilitate access to schools for all children, the means to increase principal-candidates' awareness of diversity; considered the impact of a curriculum focused on issues of gender and diversity on leadership development programs; or examined European-American and African-American administrators' responses to intergroup conflict arising from cultural incongruities in desegregated suburban US schools, as did Mabokela and Madsen (2005). Others wrote critical essays about the Western ethnocentric notions of leadership and suggested new frameworks to analyze school leadership. For example, Shields, Larocque, and Oberg (2002) hoped "to model the type of debate that might occur in schools to help educational leaders better understand how to creat a sense of community in multicultural contexts" (p. 116). In these essays, then, diversity has been juxtaposed with gender, equality, equity, social justice, and race. The last concept came to the fore in the field's discourse more than ever before.

Race and Racism

Nineteen papers focused on inequality by race, principals and racism, and the lives and career of African-American male and female principals from a race theory. Very few attempted to summon scholars in the essentials of critical race theory to analyze race as an issue in educational leadership and schooling. Note, however, that race issues have not been written in light of educational leadership only but rather in relation to many aspects, including accountability, school culture, educational change, and education policy.

But, for the purpose of this historical overview, two topics merit highlighting. First, some papers focused on the school leader and his/her attitudes toward race and racism. For example, Evans (2007) examined the ways in which school leaders defined and made sense of issues of race and demographic change in their school, and Rusch and Horsford (2009) mulled over the dispositions and skills educational leaders need to break the silence and engage in constructive talk about race across color lines. Similarly, others called for intensifying the discourse of race equality in leadership development programs, or provided evidence of women principal living and working in ethnic minority groups (e.g., Hispanic, indigenous New Zealanders). Young and Brooks (2008) represented the attempts that had been made by field members during the last decade to promote ethnic equality and race awareness in leadership development programs, attempts that have been observed also in respect to social justice and cultural diversity:

> The purpose of this study was to identify strategies that faculty members and institutions employ to support graduate students of color. The authors were also interested in understanding challenges that face individuals and institutions as they seek to provide such support. Findings suggested that effective support for graduate students of color in EA preparation programs entails proactive yet thoughtful, individual, and institutional work in four areas: (a) recognizing and engaging issues of race in educational administration preparation programs, (b) effective and race-sensitive mentorship….

The second group of papers centered upon the career of the African-American administrator, who lives in single-race communities and attend single-race schools. The purposes of this writings were to broaden our theory of leadership to include the views of African-American practitioners, to investigate how race and race relations influence school leadership practice, to study superintendent search and selection practices in terms of equity for people of color, or to understand black female superintendents' persistence in their position. Two papers explored the career of Hispanic or Asian principals in the USA, a kind of population that might receive much interest in the field's journal during the next decade.

Concluding Comments

The history of "social justice" (including equality, race, diversity) can be depicted by a line on a graph that begins on the bottom of the left side and rises slowly but steadily up and up to the right side in the top of the graph. Indeed, the interest in “social justice” (and related social topics) moved from a very minor aspect in the field’s discourse, expressed mainly by sociological writings concerning issues of equality, equity, and equal opportunities regardless to educational leadership, to many studies and essays debating and researching forms of leadership for social justice and promoting the discourses of race, diversity, and equality in the field.

In the last decade, though, field members have only commenced to evoke some interest in understanding leadership for social justice that is an antitype for the sort of leadership advocated by neoliberal thoughts, i.e., the one that is preoccupied, almost entirely, with issues of accountability and achievements. Many authors seem to have set the stage for a more thorough debate in the components, factors, contexts, and outcomes of leadership for social justice. Yet, much work is needed to conceptualize this form of leadership and probe into its varied aspects and benefits for our multicultural society. This will probably be the task of scholars in the second decade of the third millennium.

Chapter 3
"Creating Smooth Spaces in Striated Places": Toward a Global Theory for Examining Social Justice Leadership in Schools

Katherine Cumings Mansfield

The purpose of this chapter is to share an original social justice framework that emerged in conjunction with conducting a 2-year ethnography studying the culture of an urban all-girls' secondary school. I refer to this new interpretive lens as "Facilitating social justice by creating smooth spaces in striated places" or the striated-smooth construct. The meaning-making that occurred during and after the study did not follow a firm temporal chronology or emerge linearly within tidy categorical disciplines. Essentially, my pathway of learning was a porous and rhizomatic interlacing of past, present, and future – germinating from the intellectual, spiritual, and corporeal – scaffolding upon knowledge, faith, and lived experience. In short, this theory-building experience was more akin to dialogue between mind, soul, and body.

To convey my sensemaking, I first describe my readings of St. Pierre (2000) and the concepts of "striated" and "smooth" spaces. Then, the ancient spiritual words of Isaiah (c. 792 BCE) are explored and compared to the teachings of modern-day prophetic voices such as Martin Luther King, Jr. (Washington, 1986) and Mahatma Gandhi (Fischer, 1962). These constructs are then considered alongside the modern educational-philosophical works of Paulo Freire (1970) and Patti Lather (1991). Thereafter, I situate my empirical study as illustrating the new framework as well as show how the striated-smooth construct relates to prior theory. Finally, I explain how the striation-smooth construct goes beyond prior theory toward a new global theory for examining social justice leadership in schools that has potential to move the field forward as well as be applied to other societal contexts. Rather than "own"

this theory of social justice and explicitly detail a list of "rules" one must follow, I offer this inspiration as just one conception of social justice that might be used to facilitate the creative thinking of others.

The Striated-Smooth Construct

Elizabeth A. St. Pierre (2000) wrote of her desire to study "how women construct their subjectivities within the limits and possibilities of the discourses and cultural practices that are available to them" (p. 260) and the importance of confronting "the constraining framework of one's past." To wit, St. Pierre emphasized the necessity of learning to what extent one is able to free oneself from the subjectivities embedded in one's history, thus enabling the self to "think differently" and form a new future (p. 260). St. Pierre highlighted the process of de-identifying with destructive subjectivities and the revolutionary re-identification that must occur when confronting the past and present in the attempts to build a new future. According to St. Pierre, this revolutionary process includes deep internal reflection that reveals knowing where you stand to enable one to judge where you are and thereby construct where you might rather be (p. 260).

Contemporary political discourse often engages two opposing arguments: the "pull yourself up by the bootstraps" mentality versus the notion that outside forces engulf our identities and mold us into something that we cannot control. Rather than entertain either argument, St. Pierre (2000) encouraged us to consider these apparent dichotomies as interacting energies. For instance, forces in specific places provide "especially fertile conditions, exquisitely dynamic intensities, that make us 'available' to a transformation of who we are, a contestation which compels us to rethink our selves, a reconfiguration of our 'place' and our 'ground'" (p. 260). In other words, there is a negotiation between internal and external – or there is reciprocal influence between self and place – and "if we wish to practice identity improvisation, attention to places may be required" (p. 260).

St. Pierre (2000) noted, through Game (1991), her interest in the "practices of space": Certain places make certain practices possible; consequently, certain places also close off opportunity (p. 261). She described how Deleuze and Guattari differentiated between striated space and smooth space (p. 263): Striated space is bordered and restricted where individuals might have innate determination, but their movement in striated space is defined in advance, and the relationship between person and space may be structurally impenetrable. Striated spaces place limitations on people and are often the result of centuries of prejudice (St. Pierre).

Within "smooth space," people's identities and roles as well as access to knowledge and other forms of social capital are not defined in advance but are constantly in flux. There are no binding patterns or fixed roles and identities in smooth space. While St. Pierre (2000) did not assert that smooth space is enough to "save us," she did affirm that smooth space allows more freedom for the individual to "deterritorialize" than striated space does.

Ancient Wisdom Poetry and Contemporary Mystic Activists

While contemplating what St. Pierre had to say, I was reminded of a phrase that has appeared in popular culture for almost 3,000 years:

> Every valley shall be exalted
> and every mountain and hill made low;
> The crooked straight,
> and the rough places plain.

The ancient words first appeared in the servant songs of Isaiah (c. 792 BCE) in the Hebrew Scriptures, were famously interpreted by Georg Friedrich Händel's 1742 production of the *Messiah* (Swafford, 1992), and subsequently used as a revolutionary call to action by modern-day prophet and civil rights leader, Dr. Martin Luther King, Jr. in the 1960s:

> I have a dream that my four little children will one day live in a nation where they will not be judged by the color of their skin but by the content of their character…I have a dream that one day *every valley shall be exalted, every hill and mountain shall be made low, the rough places shall be made plain, and the crooked places shall be made straight…* This is the faith that I go back to the South with. (Washington, 1986, p. 219, italics added)

In the memorable 1968 "I Have a Dream" speech, Dr. Martin Luther King, Jr. conjured the words of ancient writers as he pointed to the ways "the life of the Negro is still sadly crippled by the manacles of segregation and the chains of discrimination" (p. 217) and how "the Negro lives on a lonely island of poverty in the midst of a vast ocean of material prosperity" (p. 217). Dr. King was very cognizant of the existing striations that needed to be broken down and transformed into smooth spaces.

Mahatma Gandhi, born in India, was a contemporary of Dr. King, albeit his civil rights agenda started about a decade earlier in South Africa. Though both leaders and their followers maintained discourse, they were never able to complete a face-to-face meeting as they both so greatly desired (Fischer, 1962; Washington, 1986).

Like King, Gandhi's spirit was sensitive to the plight of people who had no voice; thus, he would not be satisfied until freedom and justice were accomplished for all people: "My soul refuses to be satisfied so long as it is a helpless witness of a single wrong or a single misery" (Fischer, 1962, p. 271). Gandhi added that he felt great responsibility to protect the least powerful from the most dominant: "I hold that the more helpless a creature, the more entitled it is to protection by [people] from the cruelty of [people]" (p. 52, more inclusive language added). Within this view from the margins, Gandhi was well aware of the geographic and social striations that existed for the African people he was working alongside:

> If you think of the vast size of Africa, the distance and natural obstacles separating its various parts, the scattered condition of its people and the terrible divisions among them, the task might well appear to be hopeless. But there is a charm which can overcome all these handicaps. The moment the slave resolves [to] no longer be a slave, [the] fetters fall. [The person frees oneself] and shows the way to others. (p. 282, more inclusive language added)

Again, akin to Isaiah millennia earlier, humanity's refrain speaks to the obstacles and restraints – the loneliness and isolation – of oppression. However, Gandhi was a great believer in the power of education to lift people to new thoughts, actions, and ways of being. Gandhi was able to use both his privilege *and* his minority status to speak to both sides of the conflicts in which he engaged. He emphasized to the colonists that those colonized loved their children, too, and had "the same dislike to have any slight upon them. [Furthermore,] there is no place on earth and no race, which is not capable of producing the finest types of humanity, given suitable opportunities and education" (p. 69).

Like King, Gandhi believed in a "spirit force" that could not be squelched. It took *both sides of the divide working together* to achieve the greatest good for all:

> I do not believe in the doctrine of the greatest good for the greatest number. It means in its nakedness that in order to achieve the supposed good of fifty-one per cent the interest of forty-nine per cent may be, or rather should be, sacrificed. It is a heartless doctrine and has done harm to humanity. The only real, dignified, human doctrine is the greatest good of all, and this can be achieved only by uttermost self-sacrifice. (p. 265)

Gandhi continued:

> The force of the spirit is ever progressive and endless. Its full expression makes it unconquerable in the world…What is more, that force resides in everybody, man, woman and child, irrespective of the color of the skin. Only in many it lies dormant, but it is capable of being awakened by judicious training. (p. 293)

Moreover, Gandhi emphasized the importance of those in a position of strength to constantly examine their labors on behalf of others:

> When you are in doubt, or when the self becomes too much with you, apply the following test. Recall the face of the poorest and the weakest [person] whom you may have seen, and ask yourself if the step you contemplate is going to be of any use to *[them]*. Will [they] gain anything by it? Will it restore [them]? Then you will find your doubts and self melting away. (p. 275, italics in original, more inclusive language added)

Contemporary Educational Activists

Further reflection on striated and smooth space channeled memories of Patti Lather's (1991) book, *Getting Smart*, wherein she stated: "given enabling conditions, every woman has something important to say about the disjunctures in her own life and the means necessary for change" (p. xviii). Lather wrote of "clearing out a semiotic space" by "challenging disciplines at the level of the basic categories and methods involved in the possibilities for knowledge" (p. 34). Lather's words are prescient of St. Pierre's notion of creating "smooth mental spaces" and "smooth textual space," making sense of our educations, religions, and other ways of knowing and learning. Important, for me, Lather's term of "clearing out" elicited a picture of strong women (Lather is a feminist after all) forging through thick brush, using effectual tools such as machetes, rather than a polite clearing of the tea set off the dining table. During the theory-building process, there was a constant cycling back and forth between

St. Pierre's work, the ancient servant songs, and contemporary activists. My reading of Lather's description of "clearing out" is reminiscent of Isaiah's ancient description of justice work as intense labor:

> I will break down gates of bronze
> And cut through bars of iron…
> …I will turn the darkness into light before them
> And make the rough places smooth.

Importantly, Lather (1991), like Gandhi before her, noted the difficulties in "speaking for others" or "doing for others." She promoted a "shift" in the role that "critical intellectuals" play, from "universalizing spokespersons to *cultural workers who do what they can* to *lift the barriers* which prevent people from speaking for themselves" (p. 47, italics added). Again, Lather's choice of words reflect the intense justice labor depicted in the servant songs of Isaiah as well as in St. Pierre's call for dismantling striated – and creating smooth – spaces.

Additionally, Lather (1991) spoke to the "politics of empowerment" and cautioned researchers to clarify what they meant by "empowerment." She found distasteful the notion that empowerment is "individual self-assertion, upward mobility and the psychological experience of feeling powerful" (p. 3). Instead, Lather defined empowerment as "analyzing ideas about the causes of powerlessness, recognizing systemic oppressive forces, and acting both individually and collectively to change the conditions of our lives" (p. 4). She added that "empowerment is a process one undertakes for oneself; it is not something done 'to' or 'for' someone…" (p. 4). In other words, while justice laborers may come alongside "others" as allies to craft the conditions necessary for change, they do not entertain the notion that they can somehow change a person or be prideful when change occurs. This type of "servant leadership" inherently requires an attitude of humility (Greenleaf, 2002).

Patti Lather's and other critical scholars' educational philosophy clearly follow Paulo Freire's (1970) earlier, seminal work, *Pedagogy of the Oppressed,* which reflected a similar approach: The "radical, committed to human liberation" does not consider oneself as a hero or liberator, but rather a servant that comes alongside the oppressed (p. 39). The struggle of liberation is found primarily in the educational processes that enable "the vocation of becoming more fully human" (p. 44). Collectively, people work to diminish barriers and create breathing space to accomplish full, human creativity and capacity. "Freedom is not an ideal located outside of [a person]; nor is it an idea which becomes a myth. It is rather the indispensable condition for the quest for human completion" (p. 47).

According to Freire (1970), oppressive conditions are those which one must criticize, reject, struggle against, and transform. Dismantling striations is a *laborious process* which is born when the oppressed "discover within themselves the yearning to be free" and the transformation of this yearning into reality through action. Freire even described liberation as an act *as painful as childbirth* in which the individual "emerges [as] a new person" (p. 49). But, in order for the oppressed to "wage the struggle for their liberation, they must perceive the reality of oppression not as a closed world from which there is no exit, but as a limiting situation which they can transform" (p. 49).

Striations and Smooth Spaces in Schools

The concepts of striated and smooth spaces are important to research on school cultures because schools often unintentionally perpetuate inequality in the ways they structure their organizations (Oakes, 2005; Oakes, Wells, Jones, & Datnow, 1997). As such, particular aspects of the school culture directly influence student outcomes in positive or negative ways (Garza, Reyes, & Trueba, 2004; Mansfield, 2011; Paredes Scribner, 1999; Valencia, 2002a; Valenzuela, 1999; Welton, 2011; Wyn & Wilson, 1997; Zigarelli, 1996).

For example, it is well known that organizations that configure curricular offerings based on tracking pupils more often than not deny minority students participation in gifted and talented (GT) programs and advanced placement (AP) coursework (Mansfield, 2011; Oakes, 2005; Oakes & Wells, 1998; Oakes et al., 1997; Southworth & Mickelson, 2007; Valencia, 2002a; Valencia & Suzuki, 2001; Welton, 2011). Research has indicated that opening up GT and AP opportunities to all interested students, and providing support systems such as mentoring and tutoring, facilitates academic excellence in elementary and secondary schooling and access to future higher education and career opportunities to students who otherwise would be locked out of these networks (Mansfield, 2011; Margolin, 1994; McKenzie & Scheurich, 2004; Oakes, 2005; Oakes & Wells, 1998; Oakes et al., 1997; Pallais & Turner, 2007; Southworth & Mickelson, 2007; Valencia, 2002b; Welton, 2011). The practice of tracking is just one illustration of an organizational striation that must be dismantled in schools, while providing supportive networks facilitates the development of smooth space.

In addition, aspects of the school culture (such as whether female students have an advocate from an adult school representative) often determine whether minority female students are able to penetrate upper-level math, science, and/or computer courses (Margolis & Fisher, 2002; Spears, 2008). An organizational culture that includes mentorship demonstrates smooth space by encouraging girls to take upper-level science, technology, engineering, and math (STEM) coursework, whereas the absence of such support could be considered a striation. While it is difficult to prove a direct cause-effect relationship between adult advocacy and student success, I propose the dismantling of striations and promotion of smooth space enables the conditions necessary to facilitate social justice in schools. Studies have shown that many teens – especially those negotiating a variety of identities such as socioeconomic status, race, and gender – need active adult encouragement and other interventions to view taking upper-level STEM coursework as means to achieve future goals of college and career and to improve educational outcomes overall (American Association of University Women [AAUW], 2002a, 2002b; Gilson, 2002; Kirst, 2007; Margolis & Fisher, 2002; Mickelson, 2003; Parker, 1997; Pipher, 1994; Sadker, 1999; Spears, 2008; Tyack & Hansot, 1992; Wyn & Wilson, 1997).

Finally, school leaders and teachers who endeavor to develop an organizational culture committed to developing high levels of trust between school personnel and families, as well as among relationships within the school, experience greater levels of parent participation, higher levels of student achievement, and enhanced teacher collegiality (Bryk & Schneider, 2002; Scribner, Young, & Pedroza, 1999;

Tschannen-Moran, 2004; Zigarelli, 1996). A principal and faculty implementing specific practices to develop trusting relationships at school is another example of creating smooth space in organizations. Ignoring this aspect of organizational culture can act as a striation because organizations that lack caring and/or elicit distrust often aid high teacher turnover and poor student attitudes among other difficulties (Bryk & Schneider, 2002; Deal & Peterson, 2009; Leithwood & Mascall, 2008; Scribner et al., 1999; Valenzuela, 1999; Zigarelli, 1996).

The Empirical Setting

The purpose of the original ethnography was to capture the story of the implementation of one major US city's first and only single-sex public school and the consequent shaping of the school culture according to its unique context (please, see Mansfield 2011; Mansfield, 2013a, b, in press for additional details). The secondary school Young Women's Leadership School (YWLS) is located in Southtown Independent School District (SISD) in one of ten largest urban centers in the USA and was founded to meet the specific needs of racial and ethnic minority girls living in lower economic circumstances. For decades, urban schools in the USA, Texas, and Southtown have struggled with racial and economic segregation and isolation such that inequality perpetuates throughout the preschool to postsecondary pipeline. In addition to a high incidence of teen pregnancy, a soaring dropout rate, and a leaky college pipeline of poor and minority students, SISD has continued to experience significant enrollment decreases as families relocate to the suburbs and exurbs.

Findings, collected over a 25-month period of ethnographic field work, substantiated the complex interface between historical, political, and sociocultural contexts; stakeholder decision making in the ethnographic present; and the enactment and negotiation school culture vis-à-vis the intersectionalities of student identities. A comprehensive literature review demonstrated student identities matter. Race, socioeconomic status, gender, sexuality, and other contextual factors are important considerations when probing educational access and achievement and the development of school cultures. Moreover, organizational elements matter. Educational leaders – their individual attributes and the cultures they create – are key to understanding and interrogating equitable practices in schools.

Archives and oral history interviews highlighted a variety of complex reasons local constituents favored the development of single-sex public options including a robust history of single-sex parochial schools in the region, a record of racial segregation of students of Mexican descent, acute enrollment decreases due to "white flight," and increases in teen pregnancy and dropout rates. Interviews with district administration indicated that the new single-sex magnet school helped them address a plethora of complex needs. The USDOE changes to Title IX were viewed as an invitation to establish single-sex schools and served as a means to repurpose empty school buildings, bolster enrollment, and curtail school closures. Additionally, supporters believed that female student outcomes would significantly improve as a result of the design and implementation of this all-female school. Interviews with parents revealed that families viewed the single-sex schooling options as a form of resistance whereby students and families could place identities such as race, class, and gender front and center to better negotiate future possibilities for their daughters. Taken as a whole, providing a single-sex public option was viewed by state and local stakeholders as a symbol of providing “the best” for their children.

Findings also showed that the teachers and leaders at the school were leading and laboring for equity and excellence in very specific material, intellectual, and emotional ways. While their inspiration emanated from a variety of sources, all were committed to making a difference for their students. Although their efforts did meet with some resistance, it was clear that the principal and teachers were committed to making this uncommon school exceptional for more reasons than merely being the first and only single-sex public school in a major urban center in Texas. Findings also indicated that the efforts of leadership and faculty did not go unnoticed by those their actions were meant to serve: parents and students. The girls and their families extolled the caring and sacrificial attitudes and actions of the teachers and building administration. Parents and students were able to iterate specific ways the professional staff was working to enact and negotiate a culture conducive to meeting the needs of students. The voices, taken together, describe a place devoted to learning and flourishing, a place where people respected each other, grew, and learned together. The story, in its entirety, described how leading for equity and excellence permeated all relationships inside the school.

Examples of Striations in the Current Context

While pondering the inspiration of striated and smooth spaces, I reflected on the findings of my study and began to recognize patterns and ask pertinent questions: Are there striated spaces in Southtown? If so, what policies and practices create(d) them? As I considered findings garnered via archives and interviews concerning the historical racism, housing policies and poverty in Southtown, as well as the specific needs of this particular group of young women, I was reminded again by St. Pierre (2000) that “Nothing is innocent, particularly places striated from centuries of patriarchy and racial prejudice and unremarked poverty” (p. 268). Thus, the students attending YWLS came to the educational setting with an inheritance their parents did not earn or wish to pass on. Parents were very clear in interviews that they viewed the creation of YWLS as a form of resistance against societal roadblocks to opportunity. Parents believed that attending this alternative prep school would endow their daughters with the tools they needed to combat barriers to opportunity due to their situated subjectivities such as their race/ethnicity, sex, and humble backgrounds. Conversations with parents and students as well as the principal and teachers revealed their belief that poverty was a key striation that would likely hold the girls back unless specific steps were taken by families and educators to smooth their way, to make alternatives visible and achievable. It was not just a matter of lack of financial resources for food, clothing, or ultimately college tuition. Parents and students clearly indicated that they saw the school and the social justice laborers within the school as those possessing important nonmonetary capital that could and would be shared within this safe space, thus paving the way for a brighter future for the students.

Illustrations of Smooth Space That Is Being Created

Considering St. Pierre's (2000) belief that smooth spaces facilitate self-regeneration, I observed numerous ways the participants at YWLS were attempting to construct smooth spaces for the girls. There were specific leadership practices, curriculum, pedagogy, health, and nutrition programs that were an attempt to create smooth spaces facilitating the freedom the girls needed to "deterritorialize." It was clear that some of the actions taken by faculty and administration were understood and supported, such as providing a rigorous college prep curriculum and strict behavioral codes. But certain attempts to create smooth space by faculty caused consternation among some parents – for example, some teachers' attempts to discuss racism and sexism in the classroom. These educators believed that teaching girls to think critically about the constraints they may face in society due to their intersecting identities (female, poor, Latina), along with identifying specific actions to overcome these constraints, was essential to bringing up a generation of strong, successful women. Ironically, some parents felt their daughters were too fragile or sensitive to learn about particular topics notwithstanding the fact that such knowledge might ultimately strengthen their abilities make more mature decisions in the future.

Ensuing conflict notwithstanding, the faculty and administration did take specific steps to create smooth space for the girls. For example, girls were offered self-defense classes to combat possible physical attacks. The girls also had access to seminars on public speaking from how to effectively introduce themselves in a professional environment to practicing research presentations in a university forum on a local university campus. Students participated in leadership training as well as workshops that bolstered their math, science, and technological skills.

In addition to college prep coursework, students and their families visited postsecondary campuses and attended clinics that detailed the college application, financial aid, and college entrance exams processes. The faculty and administration believed sharing this information and coming alongside family and student in the college admission process were appropriate and caring form of assistance that smoothed the girls' paths for future opportunities.

Connections with Prior Theory

As I pondered the striation-smooth construct and the pertinence of my observations in the research setting, I was reminded of Pierre Bourdieu's (1979/1984, 1990) work on cultural capital and social reproduction theory. Reminiscent of Bourdieu, I reject the notion that students and families lack cultural capital: Striations are situated outside human beings in societal contexts. Similar to Bourdieu, I acknowledge that the families and students I observed do indeed possess cultural capital. However, what they possess may or may not be recognized by the dominant society as a valid form of currency within certain contexts. Since certain settings value certain cultural capital differently, social justice workers at YWLS deemed it necessary to teach what is valued in certain fields or contexts to show students how they, too, can acquire negotiable currency to gain entrance and navigate new contexts (e.g., higher education). Ultimately, YWLS is also addressing Bourdieu's idea of *habitus* which is defined by Winkle-Wagner and McKinney (2010) as "the sets of actions that one sees as available" based on one's location and outlook and the accumulations of one's cultural capital (p. 5). Habitus entails the socialization process which, according to Bourdieu, functions below the surface of consciousness that prompt individuals in regard to the rules of interaction as well as the actions and opportunities that one views as available and obtainable.

This connects with the striation-smooth construct when YWLS faculty view the girls' new socialization processes as learning the "rules of the game," that is, knowing the expectations of college students as well as encouraging the girls to critically examine their social location due to their intersecting identities. They also share the numerous opportunities available to the girls and facilitate goal setting. Then, the faculty mentor students as they craft a plan of action to reach those goals. They smooth space by practicing new skills (e.g., dining etiquette and making research presentations). Rather than denouncing their students' existing cultural capital, they help the girls *add* to their existing cultural capital.

The literature on leading schools for social justice resonates with the current discussion. Blount (2008), Dantley and Tillman (2009), and Walker (2006) purported building an organizational culture committed to achieving just outcomes for all students requires specific, political, personal, and professional steps: If the goal of public education is the "full and equal participation of all groups in society, where resources are distributed equitably, members are physically and psychologically safe, and members interact in a self-determining and interdependent manner" (Walker, p. 115), then a major effort is needed to transform our school cultures by leaders who are "democratic, participatory, and inclusive" and who help others recognize "issues of inequality, inequity, and oppression" (Walker) due to intersecting identities in historical context (Blount).

Specifically, Dantley and Tillman (2009) forwarded the notion that school leaders recognize context and understand students' realities. Moreover, according to Shields (2004), if the school director forefronts student identities while developing their leadership practices, a more caring pedagogy will emerge. Further, the five specific characteristics of social justice leadership forwarded by Dantley and Tillman dovetail with the new striation-smooth social justice theory, namely, leaders for social justice show an awareness of the broader socio-politico-cultural contexts of schooling, actively critique marginalizing behaviors and attitudes, profess and practice democratic leadership, demonstrate a moral obligation to students to balance knowledge of negative probabilities with hopeful possibilities, and commit to laboring for social justice for students rather than merely talking about it.

Going Beyond Prior Theory

While considering the generation of theory building promoted by "Facilitating social justice by creating smooth spaces in striated places," it is important to note the ways in which this new construct goes beyond what has come before. While Bourdieu's (1979/1984, 1990) theories are helpful for understanding and identifying the ways inequities are socially reproduced in our society – especially in educational contexts – it does not help us explain how school leaders might resist socially reproduced inequities or come alongside students as coworkers of resistance. Similarly, Dantley and Tillman's (2009) description of what leadership for social justice in schools should entail was useful toward (re)imagining what specific steps might be taken by faculty and administrators for facilitating social justice in their schools.

The construct I forward here scaffolds upon prior theory by additionally detailing specific ways school workers labor for social justice in their schools and hopefully presents a catalyst for future researchers to improve upon my ideas. Rather than "own" this new theory of social justice and explicitly detail a list of "rules," I wish to share my ideas to facilitate the creative thinking of others. Thus, as a summary of the striation-smooth construct, I list questions that may act as a framework to scaffold future research concerning educational inequalities and how school workers might come alongside students and families in their activism. First, reflecting on the ideas of St. Pierre (2000):

1. What are examples of how the students' lives are "coded, defined, bounded" where they have agency, yet their movement is defined in advance?
2. How are stakeholders constructing their subjectivities within the limits and possibilities available to them?
3. How are students confronting the constraints of the past and learning to what extent they can free themselves from subjectivities embedded in their history, and thus, form a new future?
4. What are examples of deep, internal reflection that reveal the students are learning to know where they stand to enable them to judge where they are and construct where they might rather be?

Secondly, reflecting on the ideas of Lather (1991):

5. How are stakeholders facilitating Lather's idea of empowerment?
6. Are stakeholders analyzing ideas about the causes of powerlessness, recognizing oppression, and acting collectively and individually to change conditions?
7. In examining a specific school site, what are some examples of allies coming alongside students?
8. Is the concept of humility present? If so, how? If not, how is an opposing attitude manifest?

Thirdly, considering Freire's (1970) work:

9. How are stakeholders collectively working to diminish barriers while creating breathing space to accomplish full, human creativity and capacity?

10. How are stakeholders facilitating conditions that encourage the quest for human completion?
11. What are some examples of liberation being as painful as childbirth?
12. How are stakeholders struggling to recognize realities of oppression without succumbing to a fatalistic mindset; rather identifying transformational opportunities?

While specific striations may be historically and geographically constituted, and tools for crafting smooth space is context – and individual – dependent, the theory presented here has potential to be translated globally in a variety of circumstances. In addition to researching educational organizations, the above questions can be asked in other societal settings. Researchers in other fields such as political science, sociology, and urban planning can interrogate the striations that may exist in their particular contexts and how policy and practice can be used to break down existing striations as well as to create smooth space. The framework shared here can be used to scaffold future research in other social contexts and help a wide variety of "cultural workers" (Lather, 1991), from civil rights attorneys to real estate agents, problematize inequalities and how they, too, might come alongside those facing oppressive obstacles.

Conclusion

The purpose of this chapter was to share an original social justice framework that emerged during a long-term empirical study of an urban all-girls' secondary school. Drawing insights from social justice laborers radiating from five continents, the striated-smooth construct is a new interpretive lens that builds upon prior theory. Importantly, this framework reaches beyond prior theory toward a new global theory for examining social justice leadership in schools that has potential to move the field forward as well as well as be applied to other societal contexts.

I am optimistic that the questions above will inspire other educational leadership scholars interested in analyzing school cultures vis-à-vis social (in)justice intent, actions, and/or outcomes. I look forward to seeing how my colleagues around the world might use and expectantly improve upon my meaning-making as they come alongside the communities and schools they love and aspire to serve, thus further scaffolding our knowledge together as a global community to pave the way for *smooth spaces in striated places*.

Chapter 4
Educational Theory: The Specific Case of Social Justice as an Educational Leadership Construct

Ira Bogotch

Argument Overview

The intent of this chapter is to put forth a series of arguments for why social justice is grounded in the educational realities of human growth and development anywhere in the world. To paraphrase Biesta and Safstrom (2011), educators need to find ways to speak as educators, not through other disciplinary ways of knowing. In so doing, educators will not just speak *about* or *for* education, but, as educators, speak directly to, engage with, and challenge the dominant discourses in the world. The intent here is to relocate the place of education as education. William Pinar (2001), a curriculum theorist, "encourages a person's development through knowledge, learning as a form of self-encounter and encounter with what is other and different" (p. 6).Curriculum is one educational pathway that connects the relationships among self, society, and subject matter. To which, educational leadership has been inserted here as a specific case because of its distinctive features with respect to adult learning and its access, abuses, and moral uses of power.

Thus, if education is to have a specific role in understanding and promoting social justice, then educators themselves need to mentor intellectual and political thought (Lugg, 2012, personal communication), across selves and societies. Further, I will argue that the necessary relationships of education to social, political, and economic discourses are grounded in quality of life indicators (e.g., UNESCO, Human Development Index), rather than studied empirically as a series of bivariate correlations with political, economic, and social indicators. It is education per se that translates into civic and vocational opportunities, the pursuits of happiness, and

the joys inherent in learning. These translations, however, are always contingent upon diverse conditions throughout the world, some of which can only be called *horrific*. For this reason, social justice as educational theories and practices can never be guaranteed as the world remains imperfect, unpredictable, and unstable.

Why insert educational leadership? There are distinctive features in the field of educational leadership which contribute to its specific moral responsibilities. Educational leaders have a moral and political responsibility to educate (attend to) others – both children and adults – about the dynamics of power. This leadership responsibility is pedagogical, meaning that educational leaders inform others of their own sources of power and the possibilities for using power. Thus, the relationship between educational leadership and others is reciprocal, translating the lessons of power so as to create opportunities for others to better their lives. Social justice outcomes have to be accountable for every generation in order for injustice not to extend beyond a person's lifetime; for, unless social justice is self-evident to today's generation, then the conditions for future changes in people's lives will not be seen as real. In cases where social justice is delayed beyond a generation, then it must give way – eventually – to social revolution.

This place of educational leadership comes with its own advantages and privileges, internally. However, within the wider international communities, all educators, including formal educational leaders, speak as a disadvantaged, underprivileged, and minority voice when interacting with dominant discourses such as those communicated by the vocations of science, law, religion, economics, medicine, genetics, computer science, telecommunications, etc. The place of educational leadership turns on its ability to re-engage with these dominant discourses so as to critically challenge the latter's truth claims (i.e., the validity of experts).

Trust in the predictions of experts, in any discipline, can be misplaced. What percentage of accuracy is found in the science of weather forecasts? Political science?

> It's an open secret in my discipline: in terms of accurate political predictions (the field's benchmark for what counts as science), my colleagues have failed spectacularly and wasted colossal amounts of time and money. The most obvious example may be political scientists' insistence, during the cold war, that the Soviet Union would persist as a nuclear threat to the United States. In 1993, in the journal *International Security*, for example, the cold war historian John Lewis Gaddis wrote that the demise of the Soviet Union was "of such importance that no approach to the study of international relations claiming both foresight and competence should have failed to see it coming." And yet, he noted, "None actually did so." (Stevens, June 23, 2012 http://www.nytimes.com/2012/06/24/opinion/sunday/political-scientists-are-lousy-forecasters.html?pagewanted=all)

Economics?

> "I'm not good at math, I don't know a lot of econometrics, and I also don't know how to do theory. If you ask me about whether the stock market's going up or down, if you ask me whether the economy's going to grow or shrink, if you ask me whether deflation's good or bad, if you ask me about taxes – I mean, it would be total fakery if I said I knew anything about any of those things." (Levitt & Dubner, 2005, p. xxiv)

It is not just the disciplines of weather, political science, or economics that concern us. What concerns us is education's relationship to all disciplinary ways of knowing and how as educators we can re-center the PLACE of education. To that objective, we know the significance that making mistakes play in continuous learning, that is, if we are educated to think reflectively and critically in the spirit of John Dewey, especially his ideas of laboratory learning (see below), we learn from mistakes so as to improve people's conditions in life. But even inside education, the idea of rethinking theory and practice – admitting past and ongoing errors – is not as transparent as it needs to be. Educational leadership researchers will need to turn their critical methods onto their own truth claims made by those who promote their own conceptual frameworks and methods and which delimit the many alternative possibilities for education in terms of theories, practices, and methods. To reiterate, the legitimacy of social justice as an educational construct lies in making tangible differences in other people's lives, not in how we, as educators, practice education, good, bad, or indifferently. To quote Eisner (2002), "the function of schooling is not to enable students to do better in school. The function of schooling is to enable students to do better in life" (p. 369).

Operationalizing Social Justice as an Educational Construct

A decade before the ideas of social justice became central to my conceptual framework, I was engaged in numerous empirical studies (1988–2001), focusing on the discretionary behaviors of school leaders, their language use, modes of communications, and the differences found in these variables of interest across school settings and contexts of leadership. I was never able to assert my empirical findings in any definitive manner as the statistical significance or variations that were explained always suggested the presence of "don't know" responses and "untold stories." It was as if the findings *could be otherwise*.

In one series of studies, I named this phenomenon "the contexts of partial truths" (Bogotch & Roy, 1997). What's more, I began to see contexts as more than the discretely named variables of race, class, gender, sexual orientation, geography, etc. The variables, when they were combined, became plots or "storylines" as part of multiple narratives that communicated (or not) meanings and truths (Bogotch, Keaster, Baldwin, &Wonycott, 1995). At first, I tried to make the organizational arrangement of site-based management/shared decision-making fit how school leaders were operating best within schools (Bauer & Bogotch, 2001). And while school-based management appealed to me as a way to share power and decision-making, I always "knew" that something was missing from the analysis. For me, that something emerged years later as social justice, as a deliberate purpose for educational leadership. It was social justice as a concept that opened the school doors beyond developing and excelling at the many complex tasks of teaching, learning, and leading. In other words, in addition to the variables interacting as contextual storylines, I began to think that education needed to be part of a larger, necessary conversation, one worthy of the words education and leadership.

From 1999 to my first publication on the relationship between educational leadership and social justice in 2002 (Bogotch, 2002), I hypothesized two pathways to social justice in education, one for individuals and the other for individuals working within communities. The data came from already published life stories of teachers and leaders. What I found to be significant, but not at all original, was that (1) some educators are attuned to changes in the world and adapt their leadership practices, school curriculum, and pedagogies to those beyond-school changes, and (2) the two pathways could potentially lead to material differences in the lives of students and their families. The conditional verb tense here is key. That is, organizational outcomes and professional relationships were found to be fleeting and fragile, respectively. And so, even with the necessity to pursue better living conditions among peoples of the world, positive outcomes were never a guarantee despite good intentions and good work. Social justice as a practice, while seemingly necessary, was not sufficient.

There were two other key findings from this work: (1) the operating principles of social justice which emerged from the study came as much from my analysis of data as it did from my literature reviews and conceptual frameworks, and (2) social justice as a deliberate intervention was analogous to Dewey's "laboratory learning." As a result of the first insight, I changed the subtitle of the 2002 article from "theory into practice" to "practice into theory" (Bogotch, 2002). In terms of laboratory learning, the meanings of social justice were experiential reconstructions of existing ideas that translated into new ideas. Laboratory learning was the developmental process leading to new knowledge, rather than delimited to the transmission of already existing knowledge. For me, social justice added a purposefulness even as it could not be guaranteed as an outcome of educational practices. As such, social justice became a moral responsibility in terms of how educational leaders used their power. Retelling this storyline points out that I never intended to become an educational leader for social justice. Rather, I followed the data which told me initially that it *could be otherwise* and that it was up to educators themselves to create spaces, bridges, and the PLACE for social justice inside the field of educational leadership.

This transition from empirical researcher to a leader-researcher for social justice was a 10-year scholarly journey. For me, the notion of postmodern conditions merged with an appreciation for critical theory approaches used to interpret educational policies, programs, reforms, and research methods. During this period, I was mostly influenced by the works, among others, of Luis Miron, Spencer Maxcy, William Foster, Carolyn Shields, Jill Blackmore, Patti Lather, Gert Biesta, Catherine Lugg, Jackie Blount, Fenwick English, and Jonathan Jansen. These authors, and others, helped me to see how social justice is a purposeful goal of education in terms of vision, processes, and activities connecting school work to community activities locally and beyond.

From 2004 to 2008, I was fortunate to be part of a small group of scholars willing to have an extended conversation on leadership for social justice. The members included Jeffrey Brooks, Floyd Beachum, Jackie Blount, and Fenwick English. These conversations marked by conference presentations culminated in a theoretical discussion of the meanings of social justice titled *Radicalizing Educational Leadership: Dimensions of Social Justice* (2008). The intent of the book was to establish that "theory matters," but it left open to continuous debate which theories toward social justice might matter more (or less). What I was able to conclude, however, was that (1) social justice as an educational construct was *much more* than what we currently call democratic schooling and community education and *much less* than what we hold out as the ideals of progressing toward a just and democratic society and a new humanity worldwide, and (2) educators needed to become *more political* internationally, nationally, and locally, *more active* socially in their communities and organizations, and *more critical* of existing educational theories and practices.

It was also during these years that the practices of good teaching, standards, accountability, and moral leadership began to coalesce into one predominant category framed by teaching, research, and service in higher education, while the social injustices of poverty and horrific life and death circumstances emerged as a separate category of problems. The question would be whether this latter category of problems fell within the professional domain of educational leaders. Problems such as poverty represent what might be called the "hard" truths, that is, intractable problems often addressed by leading scholars in other disciplines such as economics, politics, policy, health fields, but not central to the work of educators. As discussed in Chap. 1 of the *handbook*, the first category highlights research on reform, school improvement, and implementation issues, while the so-called hard truths within the second category are identified in the literature as dilemmas, paradoxes, and contradictions facing educational leaders.

This division of categorical problems raises another question, that is, whether dilemmas, paradoxes, and contradictions are anomalies that are tenable realities to the field of educational leadership or, instead, untenable realities to be addressed head on by educational leaders. In other words, can you and I live with social, economic, educational, and political injustices, or are they unacceptable, thus requiring our attention? What this question asks is whether education can continue to ignore the sociocultural influences on education. It is this political and ethical crossroad that redefines leadership for social justice in terms of research agendas, professional development, policy initiatives, interventions, and preparing future educational leaders (see Schoorman & Bogotch, 2010).

The leadership challenge raised by the above synopsis revolves around the PLACE of education with respect to the dominant discourses in the world and how educational leadership as both theory and practice is able to engage in social, economic, and political theory debates. My response here is to posit the following operating principles for your consideration:

1. Social justice is both necessary and contingent with respect to education, that is, social justice can never be guaranteed or sustained without continuous efforts, including work within difficult – undemocratic- circumstances.
2. Social justice, as a deliberate intervention, is different from good teaching and moral leadership.

3. Educational researchers come to know social justice through consequences experienced by participants, not by:
    (a) A priori theoretical concepts
    (b) Well-intentioned dispositions of researchers
    (c) Researcher awareness of inequities
    (d) A diagnosis of problems by researchers
4. As such, social justice is defined by participants and validated by researchers post hoc.

Operating Principles 1–4: Social Justice Is Both Necessary and Contingent with Respect to Education

The words “necessary,” “sufficient,” and “contingent” speak to the meaning of theory, in this particular instance, the meaning of *social justice*. On the one hand, we assume that unless we know upfront the meaning of the terms “social” and “justice,” and the phrase “social justice,” we cannot have an intelligent conversation on this topic. There are many educational researchers who not only hold this position but who also dismiss social justice as beyond the scope of educational leadership research and practice. Other researchers state their own definitions of social justice at the beginning of the study as follows: “for purposes of this study, social justice means….” In their design and conduct of the research, data are analyzed to determine whether the data fit the specified definition. If so, then the researcher concludes that social justice was found (rarely not) through this particular empirical study. For me this describes one “state of the art” in terms of educational leadership for social justice research and teaching.

In contrast, there are researchers who believe that words have multiple meanings depending upon when, where, and how the term is being used. To this point, words are understood “in context.” Thus, the idea that a word or a phrase can be both necessary and contingent is not only possible, but likely. Such is the nature of social justice; it is not one thing, one program, one policy, and one anything, which includes how to understand the findings from empirical studies as *it could be otherwise*.

As educators, our task is to inquire after the different meanings of social justice. In so doing, we ask questions related to teaching, learning, leadership, and sociocultural influences on educational practices. For example, we might ask, are individuals, groups, or even nations capable of creating socially just conditions for others? How do the meanings of social justice vary across cultures? Moreover, we ask questions in order to advance knowledge beyond what we currently know and understand. Therefore, while definitions are helpful, leading us to ask more probing questions, that is not the whole or end of any educational discussion. Definitions, regardless of how logical or rational the consensus, do not constitute the whole of human reality. We should be skeptical, therefore, when we read or hear a single definition of social justice in a strict semantic sense.

We should also be skeptical when a researcher tells us that they "found" social justice in practice. My argument has been that social justice as an educational construct is *validated* by outcomes and opportunities experienced *by others* and, thus, are known by community members, research participants, organizational followers, or worldwide citizens prior to the knowledge gained by researchers. It is in collaboration between the researchers and participants that the self and the other become mutually engaged in social justice work – within and beyond educational institutions.

As such, educational leadership theory is at a crossroads: does it focus on variables of school improvement that can be "controlled" or does educational theory need to be extended and translated beyond school-based contexts? The response of this *handbook* is to translate traditional meanings of educational terms such as curriculum and pedagogy to be viewed as interventions (i.e., practices, policies, preparation, advocacy, activism) for addressing social injustices every day and everywhere. Thus, the major argument being put forth in this chapter focuses on how to engage and re-center the educational discourses within and beyond "operational concerns" (Weiss, 1991) whether in schools or universities. Among the many operational concerns are ongoing educational reforms, the improvement of schools/universities, and participation in international rankings, all of which constrain the possibilities inherent in the powers of education. Thus, the scope and dimensions of education are far wider than the so-called comprehensive models or scaled-up models of educational reformers who delimit their research designs to the functioning and outcomes of educational institutions, schools/universities (e.g., Leithwood, 2009). On the individual level of action, the scope of education goes beyond on-the-shelf mission statements, formally written job descriptions, organizational and individual fit, and endless "to-do" lists of school and university administrators.

When educational theory and practice are subjected to critical interrogations through the specific case of social justice as an educational leadership construct, the very meanings and purposes of education must be rethought. In terms of language, the words curriculum, pedagogy, administration, leadership as well as "social" and "justice" are powerful and in play but with broader social and political emphases. Thus, in terms of schooling and specifically curriculum content, every subject matter taught in schools/universities has social, political, and economic connections to life outside the classroom lesson and classroom interactions. Educational theory is about improving the quality of people's lives, not just focused on organizational topics such as school-age grade levels and promotions, reading and math instruction, raising standardized test scores, or securing higher international rankings. Given the very real and ongoing inequities around the globe, many of which are horrific, social justice as an educational construct needs to be considered alongside the political and economic distributions of resources that occupy the attention of policymakers.

Each of the 190 plus nations is challenged to re-center how it defines educational quality to meet the needs of its nation's citizens, not just constitutionally. As a result social justice itself is made relevant contextually across geographic locations around the world. Rawls' (1971) principle of difference when applied not just to economics and politics but also to education makes sense. That is, closing gaps has to be about meaningful social and political differences mediated by education, and not measured solely by either national income levels or international test score rankings. In so doing, however, there is consternation that "difference" has been taken too far.

The multiplicity of circumstances and problems around the world means that social justice as an educational construct cannot be associated exclusively with democracy and democratic practices. While there is a body of research that correlates democracy with peace, which qualifies as a preferable state of social justice, there are also studies that correlate democracy with social unrest, ethnic violence, and street crimes. Not every attempt at overthrowing an authoritarian regime leads to democracy (e.g., the Arab Spring). In fact, democratic states are clearly in the minority in the world according to Freedom House. But if you recall Dewey's definition of democracy, it had less to do with governmental institutions than with social relationships. In other words, we can and should hypothesize the possibilities of social justice in all communities and states regardless of how they are ranked by Freedom House or any other international organization. The question is how should educational leaders and researchers intervene when the conditions of social justice are not evident in a community or society? Unless we are willing to ask and answer this question with research participants, then the work of educators will remain as spectators, not participants in the world

The Leadership Challenge: To Engage the Dominant Discourses

The above discussion on necessary and contingent conditions for social justice brings us to the educational leadership challenge of how educators can engage the dominant discourses so as to disrupt the *status quo* and power of disciplinary definitions of social justice. Considering education as a minority status and subjugated knowledge, the question is how education relates to the two levels of dominant discourses. The first dominant discoursal level revolves around transcendent ideas and beliefs. Transcendent ideas posit fixed, if not dogmatic, abstract, and universal principles, all having the qualities of necessity or *it could* not *be otherwise* thinking. The second discoursal level revolves around disciplinary knowledge bases with status and power in Western societies, namely, the fields of law, medicine, especially genetics, and all natural and physical sciences. History and philosophy put these dominant discourses into perspective.

Looking Back Over the History of Ideas

Historically and philosophically, there are various lines of thought ranging from social justice as matter of brute, physical, and psychological force, akin to Thomas Hobbes' state of nature to the many motivations for developing a social contract.

It was the motive of fear, however, that led Sigmund Freud to assert in *Civilization and Its Discontents* that justice is the first principle of civilization."The development of civilization imposes restrictions on [individual liberty], and justice demands that no one shall escape these restrictions." But to understand the meaning of justice in itself, as a pure, ideal construct, we must go back to Plato (translated Cornford, 1945/1964). Bertram Russell (1912/1970), the British philosopher, believed that Plato intended justice to be a pure form of knowledge, and thus:

> If we ask ourselves what justice is, it is natural to proceed by considering this, that, and the other just act, with a view to discovering what they have in common. They must all, in some sense, partake of a common nature, which will be found in whatever is just and in nothing else. This common nature, in virtue of which they are all just, will be justice itself, the pure essence the admixture of which with facts of ordinary life produces the multiplicity of just acts (p. 91–92).

From this epistemological approach, Plato in the *Republic* deconstructs many meanings of justice and injustice until he reaches his systemic conclusion, that is, the certain structures of a rationally just society. Yet, he, too, begins his argument with the psychology of fear and intimidation. In Book 1 (338c), Thrasymachus states: "I affirm that justice is nothing else than the advantage of the stronger." Whether in a democracy or in an autocracy, rulers proclaim what is just for followers, and anyone who deviates from this "law" is punished. However, Plato, through Socrates, points out that rulers are not infallible, and therefore, they and their followers may act in ways that do not lead to advantages (339b-e). Socrates then argues that "advantages" themselves should not be the ends of just acts (341d-342), and even if they were, should not the advantages be focused on followers (346e-347) rather than rulers?

At this point, the question of justice evolved into a discussion of who benefits more, the just or the unjust person? Because the purpose of the above argument was to establish that justice is a virtue, a matter of good conduct for individuals and the state, Socrates has already won the day, and the rest of Book I and the *Republic* was meant to establish the proper role of citizens in a just society and the coming of the philosopher-king.

It is the philosopher-king who knows justice completely and who is charged with bringing justice to society. Thus, justice has both an epistemological dimension – in this case, rational, certain, and absolute knowledge as truth along with a political dimension – that is, to rule and regulate a just society. In the political theories of Plato, Hobbes, Hegel, and Marx, the rules of justice were abstract and universal or, in other words, necessary.

Conversely, there are definitions of social justice that oppose universality and are based on principles of difference. For example, Frederick Hayek (1976) argues that "In a spontaneous order the position of each individual is the resultant of the actions of many other individuals and nobody has the responsibility or the power to assure that these separate actions of many will produce a particular result for a certain person." Hayek goes so far as to call social justice "a mirage," holding that the dangers inherent in state actions threaten liberty and freedom.

In his preface to Volume 2, Hayek (1976) wrote:

> The more I tried to give it [i.e., social justice] a definite meaning, the more it fell apart—the intuitive feeling of indignation which we undeniably often experience in particular instances proved incapable of being justified by a general rule such as the conception of justice demands. (p. xi)

Hayek's epistemology is pluralistic and his politics are decidedly libertarian, favoring the individual's basic constitutional rights of civil liberties, i.e., "the freedom of choosing ends of one's activities" (p. 9) over state authority and state interventions. He argues that we live in a spontaneous order where it is impossible, given our present knowledge, to predict the future. Therefore, we must continuously adapt to situations and events. "The action, or the act of will, is always a particular, concrete, and individual event, while the common rules which guide it are social, general, and abstract" (p. 12). Thus, "a whole system of rules can therefore never be reduced to a purposive construction for known purposes, but must remain to us the inherited system of values guiding that society" (p. 5).

It is not that Hayek does not see a role for government, rather he limits the role of government to generic, basic constitutional protections which include a system of laws against unjust actions as well as a pool of resources similar to what John Rawls (1971) calls a "social minimum" for all. Nevertheless, Hayek considers it logically impossible and politically unjust to use abstract rules to govern particular, free acts of individuals. In quoting David Hume, "a single act of justice is frequently contrary to public interest…" (Hayek, p. 16): echoing the words and actions of John Dewey, Martin Luther King, and Michel Foucault.

According to Iris Young (1990), it is within everyday life that decision-makers engage in realities. She argues that it is not possible to use transcendental reasons to justify political decisions as being just because such transcendent decisions ignore differences among people and differences in contexts. Transcendent decisions which impose its dominant power over people do not fit the circumstances of cultures and differences. She further argues that universalizing one limited aspect of justice such as distribution can never achieve social justice because justice itself is more than the distribution of resources. This view is similar to the arguments offered by the economist Amartya Sen (1999) who injects quality of life as education into economic matters. For Young, justice includes opportunity, self-respect, autonomy, decision-making, cultural capital, and rights. Thus, it is about "participation in deliberation and decision-making" (p. 34) in the real world of politics and economics. At the same time, there are ideals which drive our decisions, and thus Young's critique asks how can we work toward the ideals of community without destroying the [real] possibilities that emerge from such ideals? Her answer is that we should use ideals to inspire us and imagine alternatives to life as it is given.

Turning to the status of dominant discourses, the educational leadership challenge calls for educated peoples to intelligently question, reason, and debate the many scientific religious, social, political, and economic issues of our time. It is a wonder that this has been so difficult given lackluster results of both political and economic predictions. Couple this with the numerous errors or limitations in outcomes and practices associated with dominant fields (e.g., the development of synthetic medicines which cannot keep pace with the mutations of viruses and bacteria, the limitations of laws and punitive sentences which are historically rooted in injustices such as determining who can vote or own property), why has this not shaken the public's confidence in these fields in the same way that problematic educational outcomes have led to questioning the legitimacy of public education – at least in the USA. If the role of science is about truth and the role of philosophy is about meaning, then the role of education is about truth/meaning.

Experience tells us that challenging dominant discourses do not happen by circumstance, accident, or by nature. Speaking out and intervening in all social injustices is a matter for educational leadership – which is a corollary to the Marshall and Young's (2006) bold assertion quoted in Chap. 1 of this volume and repeated here:

> … individuals who are unable or unwilling to purposefully, knowledgeably and courageously work for social justice in education should not be given the privilege of working as a school or district leader. (p. 308)

Further, bold assertions, intelligent questions, and debates are not to be limited to Western and developed societies (Hayden, 2002), but must be extended around the world. What this means is that the assumptions of a Western, liberal democracies which tend to underlie many of the theoretical conceptions/definitions of social justice need to be recontextualized and then reconceptualized. Specifically, Young (1990) argues that the concepts of "marginalization, powerlessness, and violence must be rethought, and perhaps recombined" (p. 258). And the meanings/truths would not be the same internationally. Luis Miron (2006) argued that "in colonized settings, be they national or otherwise ….these subjects cannot speak, and therefore, may lose their agency or become relegated to acts of resistance as passing moments in time…. Silence may be imperative" (p. 12). Silent defiance may be "the only form of dignified resistance to tyranny…. [W]e could by our silence show our indifference to the regime's demands" (Nafisi, 2004, p. 210). Or, as Fanon (1968) concluded, we must search for "unexpected meanings…[a] knowledge of the practice of action" (pp. 146–147). To ignore how the world as a whole – with all of its differences – sees and lives social justice makes no sense educationally. What is clear, however, to me, is that Plato was wrong on this point. Social justice is not for the philosopher-king alone to know fully; social justice is for people to experience contextually with the help of education and educational leaders.

Beginning Again

The arguments made by the operating principles address the necessary and contingent nature of social justice with respect to education as both leadership and research practices. I have argued that leadership for social justice must privilege consequences, not dispositions or theoretical concepts, and it is on these criteria that we ought to hold ourselves accountable. But should we take on social, political, and economic conditions as our professional responsibility? Aren't our plates already overcommitted and overloaded institutionally with operating concerns and organizational functions/tasks? What are the moral responsibilities of being an educational leader? What are our researcher responsibilities with respect to designs and findings that *could be otherwise?*

Rather than answers to these questions, I have argued that the challenge is to participate as educators, pedagogically, in social, political, economic, and even scientific debates. Our theories grounded in laboratory learning make our arguments dynamic and relevant to how individuals relate to their professional knowledge bases and the world. As educators we bring new ideas to policy tables beyond the transmission of static, domesticated, traditional, and balanced ideas. In that sense educational leaders disrupt the *status quo*. Social justice as an educational practice is inclusive of all members of the world's population regardless of governmental structures, cultures, or ideologies, and it accounts for innumerable contingencies of life-influencing individual outcomes or unpredictable consequences of our actions.

Research Issues in Education Leadership Related to the Study of Social Justice

We live in an imperfect world where resources – natural and man-made – and the status of human rights have been inequitably distributed. Thus, the first question for any researcher is to decide whether such inequities have any relationship to education. If the researcher's answer is yes, then, secondly, the educational researcher has to figure out how to insert her/himself into the lived experiences of those suffering from sociopolitical-economic inequities. Unless educators wrestle and participate in the world, we leave "the public and its problems" (Dewey, 1927/1954) to others within the dominant discourses to debate and resolve. The third question has to do with how we practice our profession. Is the state of our methodological practices sufficient to address the inequitable distribution of opportunities and resources?

Previously, I argued that single definitions of complex and contextual terms make no sense educationally. But, *it could be otherwise*. For this reason, it is important for educational researchers to enter into the definitional black holes of social justice and struggle reflexively, analytically, and dialectically. In these discussions, there will be aspects of universal principles, abstract ideas, underlying assumptions, and related concepts – on the one hand. At the same time, there will be arguments, data, and subjective principles that link social justice to concrete situations, local conditions, and specific behaviors. This universal-particularistic complexity is a reflection of the internal and external dynamics that are necessary conditions for studying social justice. These interactions make the study of social justice/educational leadership difficult to validate, even post hoc, if not impossible to generalize. Educational researchers have to develop new methods to meet challenges in a timely manner whenever they arise. Research, at present, does not happen in real time, yet the social injustices affecting children and adults are untenable situations today. How then can our research designs and methods ameliorate social injustices? Should they?

It is said that educational leadership researchers, like educational leadership practices, need to find the "will" to act in terms of methods and treatments. In the specific cases of social justice, where some measure of urgency is warranted, the treatments have to be adjusted continuously in intensity and duration. That is, the methods researchers choose have to be capable of addressing, assessing, treating, and mediating problems directly and continuously. There are no one-way, one-time treatments. If the meanings of social justice convey any real sense of urgency, then the treatments should reflect the actual living conditions creating opportunities to grow and develop.

Finding the Political Will?

In a 2007 University Council of Education Administration symposium addressing what was referred to as the backlash against social justice leadership and research, I spoke about the lessons to be learned from reading the biblical parable of Jonah. The storyline goes as follows:

> In the Old Testament, God commands Jonah to bring a message to the Ninevites to repent for their socially unjust deeds against others. Jonah knew of these people's cruelties, yet rejects God's command – that is, he has no will to do such work. And besides, there has always been cruelty in the world, pitting people of different tribes against one another. Why forgive the Ninevites? The issues drive Jonah to run away from his mission. He goes to sea hoping to become anonymous among strangers. He does not succeed. God brings storms threatening the boat he is on. The seamen first single out Jonah and then throw him overboard to save themselves. What follows, as many children and adults have been taught, is that Jonah is swallowed by a big fish. He remains alive in the fish's stomach. While pondering his fate, he had time to think and reflect. The fish then deposits Jonah on shore near Nineveh, where he grudgingly carries out God's command. The Ninevites repent and are forgiven by God, though not by Jonah, for their past deeds.

Does this Biblical story have moral lessons for us as educational leaders? I looked first for lessons in terms of motivations/dispositions to become leaders for social justice. My conclusion was that unjust acts do not necessarily lead ordinary men and women to act as leaders for social justice. In other words, kindness and forgiveness may not be the first human emotions we have when learning about social injustices. Instead, we may experience feelings of anger and, if perhaps, thoughts of revenge.

I saw also in the parable of Jonah that it may be easier to run away from social injustices given that there are so many social injustices, past and present, in this imperfect world populated by strangers. We can become immune to hearing about social injustices or as suggested in this chapter, our work as educators is so overwhelming in terms of daily tasks (e.g., routines) that we become swallowed up whole and are left with little or no time for reflections and critiques of our lives and the lives of others. If that is so, then even the task of being a good teacher/moral leader may one day too soon become beyond the norm or expectation.

What's more, we can leave the "hard truths" of horrific social injustices to God, God's Will, luck fate, or whatever we may believe in so as to salve our consciences. And if not left to transcendental discourses, then surely our legal systems, international and national institutions, all elected officials, and many others in societies far more able than we to address these problems. For, we are only educators. We can only do what we can do – and working in educational institutions all day is more than sufficient; it is a good in itself, right? I think not.

Jonah did not forgive the perpetrators of social injustice, but he was a necessary and contingent participant in bringing about social justice in one small part of the world. He did his social justice work against his will however, but his actions, the consequences, saved the lives of others. Thus, the notion that what is lacking in the world is the political will to do social justice is not a *sufficient* answer to ameliorating social injustices. There will always be reasons not to help strangers and not to go beyond written job descriptions. Today educational standards, benchmarks, and accountability measures all confirm this within-school reality. That is, just do these tasks well and we have mastered the truths of schooling. As for the "hard truths" of discrimination, poverty, and oppression, well these are realities in the world that have been so for our entire lives, and they are not listed either as benchmarks or course objectives. Again, there are no shortages of discussions on the subject called justice, whether as law, fairness, distribution, recognition, rectification, etc., but everyone of these well-reasoned accounts delimits the role of learning and education, thus reducing the PLACE of education in the world.

The planet earth is our big fish. But all it takes is one good sneeze (viz. Katrina, Ivan, Sandy, Bopha, etc.) for problems experienced by others to become our problems – whether we want to do social justice work or not. Shouldn't we as citizen-educators be prepared and ready to do our share?

Chapter 5
Ethics and Social Justice: Strangers Passing in the Night?

Robert J. Starratt

Introduction

This chapter is partly autobiographical, the result of my own scholarly journey. That journey began in doctoral studies in an attempt to craft a dissertation in curriculum theory grounded in an epistemology of felt knowledge, the complementarity of imagination and abstract reasoning, and the learners' search for personal significance. That work in curriculum led to an invitation from Tom Sergiovanni, my faculty advisor, to team up on a book on instructional supervision (Sergiovanni & Starratt, 2006), a project that continues today toward its ninth edition. The work in supervision led, oddly enough, to an exploration of the cognitive moral development of teachers as a significant contributor to their teaching efficacy. The research on cognitive moral development led toward two further research agendas, one dealing with the larger perspectives on human development in which cognitive development takes place (Starratt, 2011, 2012) and the other dealing with the larger field of ethics in which moral development is grounded (Starratt, 1994, 2012). The work in ethics led to its application in ethical leadership and the ethics of teaching. The scholarly work in ethics led to years of publications exploring the complexities of ethical leadership and the ethical character of the teaching and learning process (Starratt, 2004, 2005, 2006, 2007, 2008, 2009, 2012). That brings me to the threshold of this chapter, because all that work was carried on while the repeated refrain of "education for social justice" drifted in over the transom of my consciousness. While attempting over the years to keep current with the literature on education for social justice, I have been puzzled by the relatively scant connections made in the literature between social justice in education and ethics in education. In this chapter,

I. Bogotch and C.M. Shields (eds.), *International Handbook of Educational Leadership and Social (In)Justice*, Springer International Handbooks of Education 29,
DOI 10.1007/978-94-007-6555-9_5, © Springer Science+Business Media Dordrecht 2014

therefore, I want to explore some of the reasons why those two bodies of scholarship tend not to link up and why it might be beneficial for scholars in both schools to explore more thoughtfully how their separate agendas might be enriched by stronger connections between both concerns. Initially, I'll attempt some clarifications of my understanding of terminology and perspectives that might prove helpful to the construction of my argument.

Multiple Focal Points in Education for Social Justice

Marilyn Cochran-Smith (2010) has recently called attention to the multiplicity of uses of the terminology of teaching for social justice, or education for social justice, as well as to its inadequate theoretical grounding. In the recent *Handbook on Social Justice in Education* (Ayers, Quinn, & Stovall, 2009), for example, the chapter headings deal with topics such as educating the democratic citizen, Black civil rights, gender issues, beyond the justice of the market, race, ethnicity, language, voice and identity, sexual preference and security, making space for diversity, disability classification, and curriculum exclusion. The book includes a chapter on critical theory, but it is not clear that that is the theoretical grounding for all the other chapters. Among these essays it would be hard to find an explicit reference to ethical theory. Another edited book (Chapman & Hobbel, 2010) provides some excellent treatments of social justice pedagogy across the curriculum. The book contains preliminary historical and theoretical chapters, each informative in its own way but still pointing out the multiple—and not necessarily complimentary—perspectives from critical theory, post-structuralism, feminist, and multicultural theory that indicate the diversity of potential sources for developing a notion of social justice. Kevin Kumashiro (2009) offers another insightful treatment of social justice pedagogy across the disciplines. Much of the book is limited to examples, insightful, to be sure, from his own efforts to connect the academic disciplines with social justice perspectives. Another recent edited book, *Social Justice, Peace, and Environmental Education: Transformative Standards* (Andrzejewski, Baltodano, & Symcox, 2009) argues for new curriculum standards that would provide for a greater focus on human rights, peace and nonviolence, social responsibility, and environmental education. The arguments throughout the book appear to issue from a critical theory perspective and are weighted with the rhetoric of that tradition.

Barry Bull's book, *Social Justice in Education, An Introduction* (2008), grounds his work in a political theory of liberty and democracy. Within that framework he takes up issues such as equal opportunity, personal liberty, the financing of education, and multicultural and civic education. He does not attempt to relate political theory to ethical theory as a foundation for social justice in education. Catherine Marshall, an influential figure in mobilizing social justice advocacy among educational scholars, has edited a book with Maricela Oliva on educational leadership for social justice (2006). The book has useful chapters on leaders' advocacy for social justice in schools and school systems. The book argues well for educational leaders in the field to embrace a more activist level of advocacy on behalf of underserved communities. Again, the emphasis is more on political advocacy with little or no mention of the ethical dimension of such advocacy. Another recent book, *Critical Race, Feminism, and Education: A Social Justice Model,* by Menah A.E Pratt-Clark (2010), advocates a critical pedagogy for African American students, especially females, but appears to lack an explicit grounding in ethical theory.

Without claiming that those books exhaust or constitute a fair sample of recent scholarly efforts to bring social justice issues to the conduct of schooling, I nonetheless want to point out that none of these books appear to mention the scholarly field of ethics as offering a potential justification or grounding for their critique and positive proposals. They all take up important issues where one group or another is disadvantaged by the way schools are presently run, where arguments from ethics could bolster their argument.

The many essays one might cite dealing with social justice in education or teaching for social justice could be grouped under a diverse collection of focal points, including the following: race, gender issues, women's voice, class, poverty and distributive justice, political theory, the development of human capabilities, power, personal autonomy and freedom, peace and nonviolence, liberation from class oppression, disability, pedagogy across the curriculum, diversity, a pedagogy of caring and hope, deculturalization, indigenous peoples, and environmental sustainability.

The dominant perspective tends to highlight these social justice issues from a political point of view as issues of rights and constitutional law. Some theoretical sources for these publications on social justice in education include references to neo-Marxism, post-structuralism, critical theory, postmodernism, or Deweian democratic pragmatism.

The literature is sometimes addressed to educators encouraging social justice activism in their civil communities, sometimes to educators encouraging and illustrating social justice advocacy within the classroom and sometimes to educators of educators reporting on examples of social justice advocacy within graduate school courses to be addressed by the practitioners in the field. The influence of members of this broad audience of educators and stakeholders in promoting education for social justice appears to be diluted by the fragmented perspectives of subgroups who are advocating for social justice for their subgroup, without emphasizing the larger issue of social justice for all.

Ethicians, Ethics, and Morality

Turning attention now to the field of ethics, scholars of ethics—whom I call ethicians (some call them ethicists)—and morality, it will be helpful to indicate how I understand what those terms mean, thus indicating where points of difference and convergence might lie between ethics in education and social justice in education.

I understand the term ethics to refer to a traditional branch of philosophy that explores the intelligibility of moral choices and actions and why one would consider some choices and actions good and some bad, some right and some wrong. Ethicians usually connect their concerns with ethics with other aspects of their philosophy, namely, their study of ontology, epistemology, and philosophical anthropology.

That study of the intelligibility behind labeling some actions and choices good or bad often leads to a formulation of ethical principles that form a coherent ethical code to guide human behavior. Some ethical principles label certain actions always and everywhere bad, such as the sexual abuse of children or forms of torture. Other ethical principles label actions such as the taking of another's life as justifiable under certain circumstances such as in warfare or self-defense, but wrong under other circumstances. Those ethical codes or individual principles contained therein sometimes are supported by civil laws that prohibit and punish certain actions.

Often, various professions such as that of medicine or law adopt an ethical code of conduct to guide the practice of the profession. These codes of conduct sometimes provide reasons or principles, but most often the codes simply present prohibitions and recommendations that represent the encouragement of moral behaviors consistent with the integrity of the professional practice.

Another school of ethics is called virtue ethics. Virtue ethics is not so much concerned with providing the intelligibility behind prohibitions against what are considered unethical actions and choices, as it is with arguing the intelligibility of why certain choices and actions are considered virtuous and why they contribute to interpersonal and community flourishing. Often virtue ethics presents the ideal, the constant practice of which eludes the best of us, but which we can often imperfectly realize, despite the admixture of self-interest involved.

Ethics is sometimes understood as providing the motive for acting ethically. In reality, ethics is more concerned with arguing the goodness or badness of an action or decision after the fact. Ethics is not primarily concerned with motivating people to be good. That is the role of parents, teachers, preachers, the police, and civic leaders. Ethics is concerned more with providing those motivators with a reasonable argument for encouraging or discouraging certain decisions and actions. Ethicians might be expected by their followers to be perfectly ethical themselves, to practice what they preach. That is hardly ever the case, however, for ethicians are as prone to make stupid and bad decisions as anyone else. They are probably better ethicians because the experience of their own ethical frailty showed them how the results of bad decisions usually lead to some unwanted consequences, consequences quite the contrary of felicity and flourishing.

Ethics as Historical and Cultural

Ethicians are usually members of the community of philosophers within a particular culture. Theirs is the task of analyzing how certain actions contribute to human felicity and flourishing and others violate the personal integrity of human beings, actions that are totally inconsistent with the common understanding of what constitutes a human being, as well as what constitutes a human community. On the other hand, ethicians are situated in history, in a culture, and often in a religion. Their situatedness leads them to take certain things as natural to human life, as thoroughly consistent with the human condition. These assumptions and certainties will influence how they make sense out of what is good or bad, right or wrong. What other cultures, or their own culture at a later date in its history, would consider ethically unacceptable does not occur to them. This frequent criticism of certain ethical codes does not lead necessarily to ethical relativism. Rather, it leads to an appreciation that all ethical codes and systems are incomplete or flawed and that ethical codes are improved by the struggle of people against ingrained traditions of injustice and oppression, whether we are speaking about slavery, denial of the vote, exclusion of women from most aspects of public life, the divine right of kings, or usury.

Scholarship in ethics may be roughly categorized as grounded in three philosophical perspectives: the classical philosophy of Greeks, later interpreted by Arab scholars, and then taken up in the Middle Ages by European Scholasticism; the European philosophers of the Enlightenment whose perspectives were influenced by the power of the emerging empiricism and mathematical logic in the physical sciences, as well as a humanism that highlighted the rational powers and political rights of the individual, all considered to have ushered in the Age of Modernism; and those philosophers who are seen as espousing postmodernism or late modernism, or reflexive modernism, depending how severely they criticize the glorification of rationality, self-interested individualism, the exercise of power cloaked by the false claim of legitimate superior knowledge by elites and the state, and the physical and symbolic colonization of peoples by claims of superior culture and civilization, often backed by religious justifications.

One may point to contemporary ethicians who write about the ethics of teaching and of the established institution of public schooling primarily from a classical philosophical perspective, others from a modernist philosophical perspective, and still others from a postmodern (of some kind) philosophical perspective. Thus, I would describe the ethical scholarship of David Carr (2000; Carr and Steutel, 1999), as predominantly reflective of a classical perspective in his treatment of virtue ethics from an Aristotelian point of view, and modernist in his ethics applied to contemporary issues in education. His work is not therefore to be discounted. On the contrary, his work has always exhibited careful reasoning and positive kinds of explorations of ethical issues in education.

I would likewise describe the ethical scholarship of Kenneth Strike (2007; with Soltis and Haller, 1998; with Soltis, 1985) as largely reflective of a modernist perspective applied to contemporary issues in education. His more recent work (2007) highlights the central good promoted by an ethical life as human flourishing in a self-governing society, which for Strike equates with a liberal democratic society. Thus, he emphasizes the importance of community in the schooling process and frames many ethical issues in the enactment of the schooling process around democratic principles highlighted in the U.S. Constitution and Bill of Rights. The liberal side of his liberal democracy would tend to favor some forms of possessive individualism, or the social contract theory of self-interested individuals pursuing their interests while respecting the rights of other self-interested individuals to pursue their interests. This view of the "natural" dispositions of humans to focus on their self-interest tends to downplay the "natural" altruistic side of an ethical life. More than a few developmental psychologists, however, would argue that their research on human development tends to identify the focus on self-interest as characteristic of children and adolescents and immature adults, with the achievement of adulthood reflecting an increasingly open disposition toward mutuality and care for others. Thus, adulthood tends to espouse altruism (however imperfectly), while an expressly habitual pursuit of self-interest in adults is criticized as "childish."

On the other hand, he stresses the importance of community, where members come together to debate issues that concern the common good of the community. Here is where Strike would highlight the constitutional constraints imposed by protections of free speech, freedom of religion, freedom to own property, the freedom of equal opportunity as principles to be supported in the conduct of schooling. Though he doesn't mention it expressly, he seems to assume that the "hidden hand" of free market choices will somehow result in human flourishing. Furthermore, although Strike's writings on ethics in education are rich with examples of the complexity of ethical decision making while attempting to promote quality learning for all students, he argues against any strong criticism about the ways schools reflect the biases found in mainstream society in their institutionalized structures and practices, as he has done in an earlier book (1989).

Having pointed out some limitations that I find in Strike's work, he nonetheless is, in my opinion, the best scholar writing about ethics from the classical liberal perspective. As with the work of Carr, educators can learn much about the application of ethics to the teaching and learning process and the leadership of the same.

I would describe the scholarship of contemporary social justice advocates as grounded in one or more schools of thought that might generally be considered postmodernism. My understanding of the historical development of these schools of ethics is that the modernists rejected much of the ontology of the ancients in favor of more scientifically justified perspectives of what was really real and how we can come to know it, as well as much of the philosophical political theory of the ancients—certainly of the feudal divine right of kings and the chain of being that justified that right—in favor of a more constitutional shaping of government to represent the rights of the people who were being governed. Subsequently, in the light of the collapse of empires and horrific wars, there emerged in the twentieth century a questioning of the role of reason and science that were supposed to lead to the advance of civilization. Furthermore, the postmoderns attempted an exposure of the illegitimate power of the state, as well as the elites who supported that illegitimate power, to control the masses through laws and a minimal share in the welfare of the state and powerful corporations. The postmoderns engaged in a critique of just about all that modernism espoused including the privileged status of reason and science, the objectivity of knowledge, the legitimacy and abuses of power and authority, the posturing of European civilization and culture as superior to all others, as well as the political economy that supported the gathering of wealth by the rich and their corporations, while the masses were effectively excluded from a decent share of their prosperity.

Ethics as Problematic

In much of the philosophy coming out of Europe in the last century, the legitimacy of ethics has been questioned. In some cases it has been cast aside altogether as tool of the state and of religion for the control of the masses, justifying the necessity of laws while concealing their grounding in power relations (Bauman, 1993). Others have cast it as a reflection of local culture and tradition, unsupportable by reason and universal logic. The rejection of ethics has included philosophical arguments against the epistemology that supported traditional ethics, either as grounded in religious revelation or in rational analysis by individual actors. While conceding the underlying thrust of these arguments, I side with others who maintain that the search for a grounding of human moral integrity nonetheless still remains a necessary and legitimate intellectual endeavor. Given the critique of the misuse of ethics to support what now appear as unjustifiable claims and assumptions (supporting or tolerating slavery, oppression of women, grossly unequal class systems, the divine rights of rulers, the brutalities of warfare, etc.), that search must necessarily be carried out within the acknowledged limits to certainty and unquestioned loyalty to principle—that is, with an awareness of the strength and proclivity of self-interest to overcome altruism or to cloak self-interest in altruistic rhetoric.

While contemporary ethics may pursue the intelligibility of human integrity, it does so knowing that integrity is almost always compromised in one way or another. Ethicians, therefore, must also pursue the critique of those compromises—compassionately, to be sure, but thoroughly. I say compassionately because, in the complexity of contemporary life, making ethical choices often means making a choice between what appear to be two or more ethical "goods" or between two or more ethical "bads." Despite efforts to develop ethical sensitivity that might better enable educators to perceive the ethical issues embedded in a situation, that sensitivity does not necessarily lead to a clear priority of one decision over another. Nevertheless, these efforts to cultivate ethical sensitivity encourage educators to examine ethically charged situations from multiple perspectives (Langlois, 2011; Leeman & Wardekker, 2011; Nash, 2002). Still, educators have to live with the realization that some ethical decisions end up hurting or are perceived as hurting one of the parties involved in the decision (Strike, 2007).

Along with the human and social sciences and the humanities, ethics can, despite our awareness of its limitations, contribute to the self-knowledge of the human community, a self-knowledge that reminds humans of the horrors, the messes, as well as the goodness they are capable of. Knowing of the abuses that systems of ethics have provided justification for, ethicians have continually to critique one another's work for its own compromised rationalizations and the misuses they are put to serve the self-interests of the powerful and of religious extremists (Bauman, 1993).

Distinctions Between "Ethical," "Moral," and "Morality"

The adjective ethical, on the other hand, is used in a much looser fashion. One speaks of a person being an ethical person, or a transaction as an ethical transaction, or a decision as an ethical decision. The person, transaction, or decision is sometimes called ethical because it seemed intuitively to be the right thing to do or may have been called that by one's parents. If asked to provide the intelligible argument for why something or someone is ethical, the person might not be able to provide the "ethical" explanation, and simply say, "Well, everyone would say that it was so." Often the adjective "moral" is used as the equivalent of the adjective "ethical."

When I use the term ethical, I usually mean that I not only recognize something as ethical but that I could present a reasoned argument why it was consistent or inconsistent with human felicity and flourishing. I might want to distinguish between a *moral* decision or action and an *ethical* decision or action and mean by that distinction that I want to separate a decision made out of *conformity* to a law or a person in authority, from a decision made out of concern for another, a decision that went beyond self-interest to investment in something bigger than my self-concern.

I would distinguish between a preethical disposition to follow the rules imposed by a community (acting morally) from a *personally chosen* ethical disposition to act on behalf of others because that is the person I choose to be (acting ethically). Ethical choices, for me, indicate the involvement of the full self in self-donation on behalf of the other or the community. These kinds of ethical decisions might be less frequent than the decisions made out of a routine performance of my role in any given circumstance, which might be recognized as moral by others, but not involve my full attention to the specifics of the situation or the persons involved in that situation. Nevertheless, I will often use the adjectives ethical and moral interchangeably, partly out of sloppiness and partly because that is the way those adjectives tend to be used in the literature.

"Morality" and "morals" are often used as the abstract term to describe the consistent pattern of moral acts, either conceived as following the rules or grounded in a consistent sense of ethical principles. Morality does not refer, as does ethics, to *the study of the intelligibility* behind calling certain acts moral or immoral. Rather, the term morality or morals is used to name an observable pattern of what a culture or tradition view as moral acts, as being good or bad, right or wrong. Moral education tends to be conceived as a training in developing "moral habits," that is, the repetition of a pattern of moral choices and actions. Sometimes that training involves obedience to rules that are connected to ethical principles but with the stress on obedience, rather than on the good which the principle upholds.

Turiel (1983) distinguishes between obedience to moral principles (telling the truth, respecting people's property) and obedience to other culturally approved traditions such as good manners and correct pronunciation. He provides evidence that children early on can distinguish between them, even though violations in either realm may be considered disobedience and worthy of parental punishment. That distinction points to the awareness that certain acts should always be avoided whether or not anyone else is looking, whereas other acts may be permissible when authorities are not around. Damon's research (1988) has shown a divide between those adults who obey the rules and laws out of respect for the ethical principles they uphold, whereas a significant percent of the adult population see nothing wrong with disobeying the rules and laws when no one else is looking, especially those in authority. Unfortunately, the news media carries examples of the latter almost on a daily basis.

What to Make of This?

The above ruminations and distinctions may have helped to lay out the geography of the concerns of education for social justice advocates and the concerns of the ethics of education advocates. The former tend to see their work as primarily political, calling attention to the reality that education is not politically neutral, but rather that it tends to reflect and reproduce the political, cultural, and economic ideologies of the political, cultural, and financial elites of a society in the interests of maintaining their privileged status in society. Social just advocates view the schools as legitimizing, through the school's representation of how the world works in its curriculum and organizational procedures, the political, cultural, and financial status quo. Advocates for education as social justice see this arrangement of the schooling process as denying those communities of children and their parents their rights as citizens, guaranteed in most cases by law, to an equal opportunity to participate fully in the life of the community. The children not belonging to the political, cultural, and financial elite families find their cultural heritage, their class, and their language disparaged, if only by omission from the curriculum, as well as by administrative procedures. They are encouraged to think, speak, dress, and behave like the children of the elite, and when they do not, they are shunted off into remedial or special programs for children who do not meet the school's norms. That communicates that they are not considered normal; they have failed to aspire to or at least conform to the lifestyle and ideology of the elites. Advocates for education for social justice see this situation as unjust and as institutionalized injustice. However, they tend to see this as politically unjust, not ethically unjust. At least from my reading, they tend to express their opposition to this state of affairs as a political violation of the citizen rights of these children.

The scholars who advocate for a socially just education for these children often cite philosophers and social theorists from the European philosophical traditions of post-structuralism (Foucault), critical theory (Habermas, Marcuse), postmodernism (Bauman, Lyotard), or the Brazilian philosopher, Paulo Freire, a humanist, sometimes neo-Marxist. All of these philosophers have broken new ground in exploring the tensions, contradictions, and complexities of late modernity or postmodernity. They are way ahead of most American ways of thinking about the complexities of life in this new century. One problem for American educators who are introduced to their philosophies, however, is that they employ a new vocabulary that is foreign to most teachers, administrators, superintendents, and policy makers in America.

Most American teachers, administrators, superintendents, and policy makers are quite thoroughly embedded in modernist ideologies derived from the European Enlightenment—explicitly or often tacitly espousing individualism over community, technological rationality over substantive or hermeneutical rationality, capitalism over the welfare state, nationalism over globalism, Anglo-Saxon American cultural superiority over all other cultures, and American military and financial hegemony as the ground for foreign policy. Even with well-intentioned, open-minded, and idealistic students, the language and rhetoric of the above-mentioned philosophical sources that stand behind many university scholars and professors advocating for socially just education seems unintelligible, over inflated, or radical.

Many generations of Americans stand far removed from the exhaustion of the peoples of Europe by the horrors of two world wars, their shattered dreams of modernity as leading the way into a bright, more civilized realization of the human journey. Europeans have had to acknowledge the arrogant and empty claim to Empire through the colonization and enslavement of the rest of the world's peoples. They have lived much closer to the awful recognition that the world's superpowers had at their fingertips (an still do) the "mutual assured destruction" of the human race through thermonuclear weaponry. While Europe has been digging itself out of the rubble of their destroyed dreams, the United States grew enormously prosperous and powerful, confident in its future as the protector and cultivator of democracy, a kind of secular version of salvation. Wrapped in the flag and its ideologies of capitalism and a democracy enacted by a political economy of welfare for the elites and rugged individualism for the poor, it had no cause to critique its own brand of racism, exercised at home through racist laws and abroad through racist foreign policies and its own brand of colonization of small island nations. Though it has failed in its efforts to spread the blessings of its brand of democracy through recent wars, it remains wedded to its self-image of the "best nation in the world," as the present President of the country has proclaimed, while struggling to rescue the country from a deep recession brought on by the rationale of profit at all costs.

My argument is that most Americans are not ready to consider the somewhat apocalyptic pronouncements from European philosophers. Advocates for social justice education are correct in their advocacy. They are not correct, I believe, in voicing that advocacy in the language and rhetoric of the philosophers they cite—not because those philosophers are misguided in their analysis of their experience but because American educators, reflecting the American public, are not ready to receive the critique of their schools voiced in the vocabulary and rhetoric of the Europeans. While continuing to study the rich contributions of the Europeans, American scholars need to translate their message in language and rhetoric that Americans can understand and, with a clear sense of the mission of democratic schooling, begin to address the problems the social justice educators are calling attention to. I believe the use of the political argument for social justice, while framed in less inflammatory or esoteric language, can be far more effective if it is framed from the perspectives of ethics as its ground, with the political and constitutional argument for civil rights as a complementary perspective. Political advocacy can be dismissed as ideological; a critique that addresses abuses as unethical is much more difficult to discount.

Furthermore, there is ample evidence from the psychological research on learning and on teacher effectiveness that the ethics of care provides a necessary ground for exercising a focused application of the ethic of justice in responding to the needs of young learners of whatever race, language community, class, sexual preference, disability, gender, learning style, or religious background. Research on successful urban schools points to the absolute essential of a culture of trust that characterizes all successful schools, no matter the size, or the makeup of the student and teacher communities. Trust so obviously emerges from the experience of caring and being cared for. While educators concerned for social justice obviously work from an ethic of care, they need to refer to that essential ground in their arguments for social justice.

I would argue that educators need to conduct the daily routines of schooling from a multiperspective of three ethics, the ethics of care, justice, and critique (Starratt, 1994, 2012). Each ethic tends to complement the other. Justice without caring can be quite impersonal; care can be fruitless without justice; the acts of both caring and justice may be naïve without confronting through the ethic of critique the silent, structured injustice and the tacit power relations ingrained in the way schools are organized and administered. Conducting the general affairs of the schools guided by the ethic of care, justice, and critique corresponds to what I call the general ethics expected in all varieties of institutional life, whether we are talking about how to run hospitals, government agencies, banks, gas stations, clothing stores, or schools.

Education is also a profession, and as with all professions, the practice of a profession is guided by professional ethics. The professional ethics are concerned with promoting the good intrinsic to the practice: for medicine, health; for law, justice; for architecture, both utility and aesthetics; and for education, the good of learning. Educators for social justice need to look critically at the activity of learning that the school promotes. Too often, it seems, there is an assumption that if children have an adequate opportunity to learn the lessons being taught, to learn the material they will be tested on by the state standardized tests, justice will be served. Of course, educators should also be concerned that the students will have an adequate opportunity to succeed on the test in the language in which it is administered—a point often lost when considering the experience of second language learners who might know the material, but not be able to perform that knowledge due to struggles with the vocabulary and syntax in which test questions are framed.

What I want to emphasize here, however, has to do with the quality of the learning as it is related to the student's understanding of the knowledge in relationship to real life, to its application to multiple issues and problems in the community, and to its coherence with the imagined trajectory of her or his own life. Educators need to be concerned that what the student learns is authentic rather than make-believe or superficial. One might learn how to give back "right" answers to exam questions, answers that correspond to definitions or information provided by the textbook, without that answer having any personal meaning.

Educators who seek to promote the good intrinsic to the activity of learning will always push the students to express or perform what the learning means to them and how it might illuminate or raise issues that involve some aspect of their own life. Students who survive life in schools by giving back right answers without ever taking that knowledge inside, without ever perceiving how that knowledge helps them understand their membership in the worlds of culture, nature, and society, are engaged in a colossal waste of their time, a charade that gets them through the make-believe routines but never touches them where they live. Schools that promote and are satisfied with that kind of make-believe learning are violating the ethics of their profession and are violating the integrity of what they supposedly profess.

Educators for social justice need to get down to this level of ethical critique, for it is there where their advocacy will get at the essential work that schools must engage with their students. It is at that level that the many students who are disadvantaged by the way schools are run really need them. Working at that level with their students, they can help them to confront the world in its promise and in its brokenness, help them to participate in the world either by resisting the world's stereotypes of them and their culture or by exploring the opportunities and the gifts that their culture provides them for making a contribution to the world where they live, by connecting their anticipated future with notions of competence and integrity, creativity, and commitment.

Involvement with their students at this level means designing learning opportunities that connect them with the realities of their lives, enable them to dialogue with those realities, interrogate them, explore them, and navigate them. That is the quality of learning that really promotes the good intrinsic to learning, namely, the discovery of a self in relation to the world, of how to make a contribution of one's gifts and talents to enrich the life of the community.

My argument is that the struggle of educators for social justice could be more effective if it embraced the ethics caring as well as the ethics of caring, along with the language of politics. Insights from philosophers need to be translated into a language of educators, keeping close to the integrity of the learning process and the integrity of the knowledge that is surfaced through the curriculum of the school.

We do not need to be professional ethicians, either, lest we fall into self-righteous posturing of people who have all the answers. Rather, we need to stay close to our roots as educators, applying what we know through our own scholarship as educators and our experience as practitioners of the profession. We certainly need to continue developing ethical sensitivities and analytical ethical frameworks that will help us to articulate how issues and situations that arise in the conduct of our profession carry ethical weight that must be attended to. Integrating an ethical sensitivity with our core values as educators enables us to respond to and cultivate the integrity of our work on behalf of all the children that enter our schools and our classrooms, to see that they are cared for and know it, to see that they are respected for who they are and for the potential that they bring to the work of learning, and to see that the way we organize and operate the school provides advantages to all to do their best.

We cannot indoctrinate them into a political philosophy, however passionately we embrace our own. We have to trust that if in their engagement with the academic as well as the social curriculum of the school we help them to develop both a hopeful and a critical perspective on how the world works, help them explore who they are and who they want to be, so that they will continue to learn how to engage the politics of the world with their own personal integrity.

Our work as educators cannot be politically neutral, but neither should it be doctrinaire. Rather our political philosophy should be large enough to believe and assert that freedom means not the freedom to do whatever you feel like, but that freedom means being free enough to love, free enough to collectively choose the common good more often than choosing narrow self-interests, and free enough to know that our humanity is enriched most when we share it with those who need it at the moment. That seems to me to be the better way we can be ethical and socially just as educators.

Summary

My argument is that educators, both scholars and practitioners, need to ground their advocacy for a socially just educational system in an ethical analysis of how socially unjust school environments violate not only the political rights of students but *violates their persons*. Often schools violate persons through organizational sorting mechanisms that limit their opportunities for a quality education. They also violate the *integrity* of authentic learning—the moral good of the practice of teaching—through a curriculum divorced from the moral agenda of learners to construct themselves through engaging with the realities of their lives while exploring, through the academic curriculum, how they may participate more fully as members of their communities. From those arguments, political advocacy can become stronger, grounded in such ethical analyses, and then ethical analysis can issue in practical responses joined to political engagement. Let the dialogue begin.

Chapter 6
Social and Cognitive Justice: The Social Relevance of the Higher Education in Latin America

Alejandra Montané López, Judith Naidorf, and António Teodoro

Introduction

Latin America, characterized by being a multicultural and multiethnic region, has become in these early years of the new millennium a demonstration of creativity and social innovation while a laboratory of experiments in privatization and marketing raised to the degree, product of neoliberal policies that plagued the state from the Chilean coup of 1973 onwards. Currently the region is drawn through the coexistence of the worst social inequality with self-organization of complex social justice experiences carried out both by minority groups as movements that have arrived to state power.

The development of renewable forms of democracy present in Latin American countries strengthened since the second half of the twentieth century and the processes of integration of countries in the region that, since the end of this millennium, have taken more autonomous courses while being integrated are demanding forms of social justice to expand and reach those sectors that still lag behind.

The report *The Social Panorama of Latin America* 2008 (CEPAL, 2008) noted as positive elements in the region a significant and continuous rise in economic growth

since 2002, a strong reduction in poverty in the region since 1990, as well as a slight improvement in income distribution from the first decade of 2000. The same report notes that there are still significant groups of the population which remain in poverty or who have entered in new forms in which it is manifested and that the region remains the most unequal in the world, although not the poorest.

These inequalities affect social cohesion defined as the dialectic between established mechanisms of social inclusion/exclusion and responses, perceptions, and attitudes of the citizenship against the way they operate (CEPAL/EUROsociAL, 2007: 13) and is built on three pillars: gaps, institutions, and relevance (CEPAL/EUROsociAL: 39).

Historical gaps for reasons of ethnicity, gender, and territory are aggravated by inequalities in education, social protection, and productivity. In Latin America, there are currently 522 indigenous peoples ranging from Patagonia and Easter Island to northern Mexico through different geographical areas such as Expanded Chaco, the Amazon, Orinoco, the Andes, the Pacific Coastal Plain, the Continental Caribbean, Lower Central America, and Mesoamerica.[1] Mexico, Bolivia, Guatemala, Peru, and Colombia consist of 87 % of indigenous peoples of Latin America and the Caribbean.

In rural communities there are the highest rates of poverty and extreme poverty and the highest rate of illiteracy; they have less social protection and restricted access to justice and politics. Territorial inequalities are also reflected in urban segregation, given that poor neighborhoods are precarious and have restricted access to services (schools with the greatest needs, crowded environments, increased exposure to violence, less job offers, precarious jobs, poorer health services, and less access to social welfare and security).

The persistent inequality in Latin American societies instills in the population such perceptions that the production system not only produces inequalities, but the institutions themselves incorporate its principles and its practices, the unequal treatment as a criterion at the expense of the weaker. The feeling of exclusion and loss of adherence to such institutions and principles which are determined by the

---

[1] Bolivia, Guatemala and Belize stand out as countries where indigenous people represent higher percentages of the total population, with 66.2 %, 39.9 % and 16.6 % respectively. In contrast, countries like El Salvador, Brazil, Argentina, Costa Rica, Paraguay and Venezuela record a low percentage of indigenous population (between 0.2 and 2.3 %). However, in most Latin American countries the indigenous population ranges from 3 to 10 % of all citizens. Mexico, Bolivia, Guatemala, Peru and Colombia gather 87 % of indigenous population in Latin America and the Caribbean with a population that ranges from a maximum of 9.5 million (Mexico) and a minimum of 1,300,000 inhabitants (Colombia). The remaining 13 % of the indigenous population resides in 20 different States. Five indigenous towns, as the most numerous among them, are the Quechua, Nahua, Aymara, Yucatec Maya, and Ki'che ', and six, the Mapuche, Maya Qeqchí, Cakchiquel, Mam, Mixtec and Otomi, with populations between half and one million. According to official censuses made between 2000 and 2008 the total identifiable indigenous population in Latin America is 28,858,580, while in Latin America there live 479,824,248 people. This is an identified percentage of indigenous population of 6.01 %. However, the publication highlights that the number of indigenous people in Latin America is usually set at 10 % of the total population, according to estimates made in 2004 by the United Nations Program for Development (UNPD).

Plan for Equal Opportunities (2008) of, for example, Bolivia is determined as "internal colonialism"[2] stating that "these new settlers will build their structures of privileges as part of an illusory modern nation-state which did not reach the whole territory or the Bolivian society." Internal colonialism, besides enriching the coffers of multinationals and the oligarchies with the product of the cheap labor of workers without benefits, also daily subsidizes the low cost of agricultural products coming from the work of peasant communities (*Plan for Equal Opportunities*, 2008: 7). And it is precisely Bolivia, one of the contemporary leading laboratories for social justice in Latin America, that proclaimed in the Constitution (2008) *a Unitary Social State with Community Pluri-national Law, free, independent, sovereign, democratic, intercultural decentralized and with autonomous regions. Bolivia is based on plurality and political, economic, legal, cultural and linguistic pluralism within the integration process of the country.*[3]

---

[2] The definition of *internal colonialism* is originally linked to phenomena of conquest, where native populations are not exterminated and are part of, first, of the colonial state, and then of the state that acquires a formal independence, what initiates a process of freedom, of transition to socialism, or recolonization and return to neoliberal capitalism. Peoples, minorities, or colonized nations by the nation-state suffer similar conditions to those that characterize colonialism and neocolonialism at an international level: they live in a territory with no self-government and are in an unequal position facing the elite of the dominant ethnic groups and the classes within them, their administration and legal and political responsibility concerning the dominant ethnic groups, the bourgeoisie and oligarchies of the central government, or the allies and subordinates of the same; their inhabitants do not participate at the highest political and military positions of the central government, except as "assimilated"; the rights of its people and its economic, political, social, and cultural development are regulated and enforced by the central government; in general, the colonized within a nation-state belong to a "race" other than the one that dominates the national government, which is considered "inferior" or, at best, is converted into a "liberating" symbol that is part of the state demagogy; most of the colonized are part to a different culture and speak a language other than the "national" (González Casanova, Pablo. *Colonialismo interno. Una redefinición.* www.bibliotecavirtual.clacso.org.ar/).

[3] *Article 1.* Bolivia is a Unitary Social State with Community Pluri-national Law, free, independent, sovereign, democratic, intercultural, decentralized and with autonomous regions. Bolivia is based on plurality and political, economic, legal, cultural, and linguistic pluralism within the integration process of the country.

Article 2. Given the precolonial existence of nations and peasant indigenous population and their ancestral domain over their territories, their self-determination within the framework of the unity of the state is ensured, which consists in their right to autonomy, to self-government, to their culture, to the recognition of their institutions, and to the consolidation of their territorial units, under this constitution and the law.

Article 3. The Bolivian nation is made up of all the Bolivians, nations and peasant indigenous peoples, the intercultural communities, and Afro-Bolivian which together constitute the Bolivian people.

Article 4. The State respects and guarantees freedom of religion and spiritual beliefs, according to their worldviews. The state is independent of religion.

Article 5. I. The official languages of the State are the Castilian and all the languages of the nations and peasant indigenous peoples, which are the Aymara, Araona, Baur, Besir, Canichana, Cavineño, Cayubaba, Chaacs, Shaman, Ejja, Guarani, Guarasu'we, Guarayu, Itonama, Leco, Machajuyai-Kallawaya, Machineries, Maropa, Mojeñotrinitario, Mojeño-Ignatian, Moré, Mosetén, Movima, Pacawara, Puquina, Quechua, SirionoTacana, Tapiete, Toromona, Uru-Chipaya, Weenhayek, Yaminawa, Yuki, Yuracaré, and Zamuco.

The current challenge is to find integration strategies that respect the local values and redeem them and that different Latin American institutional forms continue to reflect on them without imposing exogenous models in order to recover its rich history as well as to transform the education policies that lead to a fairer society and find ways to integrate, which based on rigorous social research, and propose new forms of engagement with the society to be. The present social and innovative experiences in Latin America have the potential to be key contributions to the renewal of social theory: the access of workers to the presidency, indigenous leaders, creation of multiethnic and multinational states, female-headed presidency, among others.

Although as stated by the writer Julio Cortázar in 1983 with the power of his words until today, "the reality of the southern hemisphere countries is not uniform: in every Latin American country nuances are so great that uniform comparisons are a failure. As the attempt to export models A in the country B are a failure." The "not uniform" study we are part[4] and the respect and appreciation of diversity allow us to understand the common (social cohesion is by us understood as a joint project) and think we can do it within the desirable future.

Higher Education and Social Cohesion in Latin America

The very democratic development in Latin American countries, as already mentioned, reinforced from the second half of the twentieth century led to a significant development of higher education in Latin America.

As happened all over the world, the welfare state and social policies that expanded the so-called medium "layers" of society led to a growth in enrollment in higher education product of the expectations placed upon this institution as a form of social advancement.

Between 1975 and 2005, enrollment in higher education in Latin America practically quadrupled exceeding 16 million students. At the beginning of the century, higher education systems in Latin America continue to expand at annual rates that go from nearly 3 to 7 %, with the exception of Brazil which grows at a rate close to 12 % (Higher Education Report in Latin America, 2007).

This spectacular development, completed with new and innovative social practices and closer to models of educational development, coexists with high levels of exclusion, poverty, and inequality that act as barriers that limit access to opportunities for progress and facilitate more people in improving the material conditions that emerged in the last 60 years.

Basic imbalance of equity tends to increase the selective nature of universities and other institutions of higher education (Report Higher Education in Latin America, 2007) and produce undesirable effects on the redistribution of knowledge increasingly necessary for the performance of responsible citizenship.

---

[4] The authors of this chapter are members of the Ibero-American Network of Educational Policy Research (Red Ibero-Americana de Investigación en PolíticasEducacionales – RIAIPE).

In a general way, we can determine that the various problem areas in relation to higher education are determined by the inequalities and can be grouped into the following:

1. Access to higher education is distributed differently in the various regions and within Latin American countries themselves. There is a trend in higher education institutions to persistent problems of access for vulnerable groups (women, indigenous population, the poor and urban vulnerable groups) to a higher education of quality at universities in Latin America.
2. The permanence as indicated in Report on *Higher Education in Latin America and the Caribbean* (IESALC, 2001–2005) that the process of abandonment (dropouts) of college students, especially at the end of the first years of the course is a priority issue of concern to all stakeholders in the system. Social exclusion is detected in vast majorities who cannot stay in the university system.
3. The mobility of students and researchers in Latin America is clearly insufficient, so higher education does not integrate fully at the international level. According to the report "Education in Latin America 2007," Latin America offers enrollment for just 3 % of the world's mobile students studying abroad and contributes 7 % of mobile students to study outside their country of origin.
4. Current processes of transformation of higher education in Latin America are conducted by a regional coordination between higher education institutes (HEIs) to stimulate social development and more balanced and equitable development of the region.
5. Higher education institutions in Latin America have built an internal operating logic which in some cases separates them from the solution of real problems of society, so that the vast majority does not have impact on the overall development of societies where they are located.
6. Traditional curricula and associated educational practices of Latin American universities tend to offer programs that do not always meet the needs of the region and support the development of communities. There is the need for greater relevance of its mission and functioning with society. In this sense, the curriculum becomes a relevant field of negotiation of equity and social cohesion.
7. The potential development of a common area of higher education in the HEIs should promote their role and be proactive in their participation in policy.
8. Policies and practices should respond to a territorial logic placed to overcome the unequal progress of inclusion, participation, and greater equity. This means that terms of reference have to do with the expectations and goals of the societies in relation to what they expect from their universities and the role they should play in supporting the development of their societies.
9. While there are HEIs in LA which have built good relations with society and enhance the development of the societies in which they are embedded, there are still areas in which universities in the region, public and private, are disconnected from social issues. The crisis is manifested in terms of the existence or

lack of viable options and educational opportunities for people seeking access to the HEIs. Unfortunately, it is the more vulnerable populations that ultimately cannot afford higher education studies of high quality in many Latin American countries.

10. The exclusion of indigenous peoples and their knowledge of higher education is a matter to be resolved. Indigenous peoples have suffered exclusion at all levels and dimensions and have erupted in recent decades in regional politics with just demands for an intercultural higher education, based in principles of autonomy and relevance.[5]

The Power of Theory Applied to Specific Practice Settings

Education, its practices, and specific theories have relevant characteristics when thinking about building a continuous theory of social justice as stated in Bogotch et al. (2008). On the way to the establishment of a theory of social justice in education, the specific practices that are currently performed in some institutions in Latin America (also called by some groups the *best practices*) are an important input almost never taken into account when programming educational policy measures for the region. The failure of constrictor recipes that are "recommended" through loans from international organizations as well as the best intentions by foreign institutions is an important object of analysis and reflection for future judgments and statements of education policy. A theory of social justice in education yet to be defined should definitely fix those errors from a new perspective to build conceptual and analytical tools that compose it.

Among the best practices for social justice in universities, we can highlight *the color policies* in Brazil and the practices linked to the social commitment that some Argentinian universities have made with renewed features after the 2001 crisis, such as re-centering of the extension policies they had opened around 1918. Other examples are found in the Aymara indigenous university "Tupac Katari," the Quechua university "Casimiro Huanca," and the Guarani indigenous university "APIAGUAIKI TUPA" included in the Bolivian national educational system or Intercultural Indigenous University which through its operation network covers the 22 member countries of the Indigenous Fund, although at an early stage they have been structured with universities in nine countries: Bolivia, Chile, Costa Rica, Ecuador, Guatemala, Colombia, Mexico, Nicaragua, and Peru.

In this context and from the identification of problems and specific issues of higher education in LA, we have discussed the meaning of the conceptualization of social cohesion.

At the international level, the analysis of the role of higher education in social cohesion implies that "Higher Education plays a vital role in driving social cohesion and Economic Growth" (James et al., 2008) has taken special relevance. This requires a special conceptualization in the context of social justice thinking.

---

[5] Examples: Certain higher education experiences in Ecuador, Colombia, and Bolivia; Kallawaya medical school in Bolivia; the project KawsayUnik of indigenous peoples of the Andean countries.

Social cohesion as a topic of study is developed from the 1980s of the last century until finally joining the interests of political, social, and research agents. Globalization and global crises have revived the need to refer to social cohesion in all aspects within the framework of a social theory that supports it.

CEPAL/EUROsociAL (2007) states that in Latin America and the Caribbean, there are strong mutations linked to globalization and technological revolution. In this context, social cohesion is becoming increasingly important, given that its foundations can be eroded by new forms of exclusion, which must be addressed. In fact, several phenomena have been threatened during the neoliberal era, such as the social cohesion in the region, the deepening of the social gap, the economic and cultural trends towards the weakening of the public, and then the exogenous intervention that aims to support the "governance" of states as is the case of Haiti as well as the "better management" of natural resources (water, forest).

Social cohesion is not easily defined, observed, or measured. Andy Green, with Germen Janmaat and Christine Han, in his text *Regimes of Social Cohesion* determines various characteristics related to the difficulty of determining the nature of the concept of social cohesion. First, including both a "normative" dimension and the limits that this normative regulation involves in the analysis[6] adding to the difficulties of assuming social cohesion is always "a good thing".[7] Second, they note that in many cases the term is used synonymously with what is socially desirable, such as tolerance, trust, and citizenship, generating an unjustified isomorphism cannot substitute the rigorous analysis of the concept. Third, they note that social cohesion cannot be defined by its causes (e.g., social equality) or its effects (e.g., greater human development).[8]

The relationship between higher education and social cohesion must be based upon a conceptual determination of the second. We choose to discard the definition of social cohesion associated to forms of consensus and seek to understand it by its quality of perception belonging to a project or common situation. The determination of the dimensions implied involves judgments. As already stated, the dialectic established mechanisms of social inclusion/exclusion and its responses, perceptions, and attitudes of citizenship against the way they operate defines social cohesion (CEPAL/EUROsociAL, 2007: 13).

---

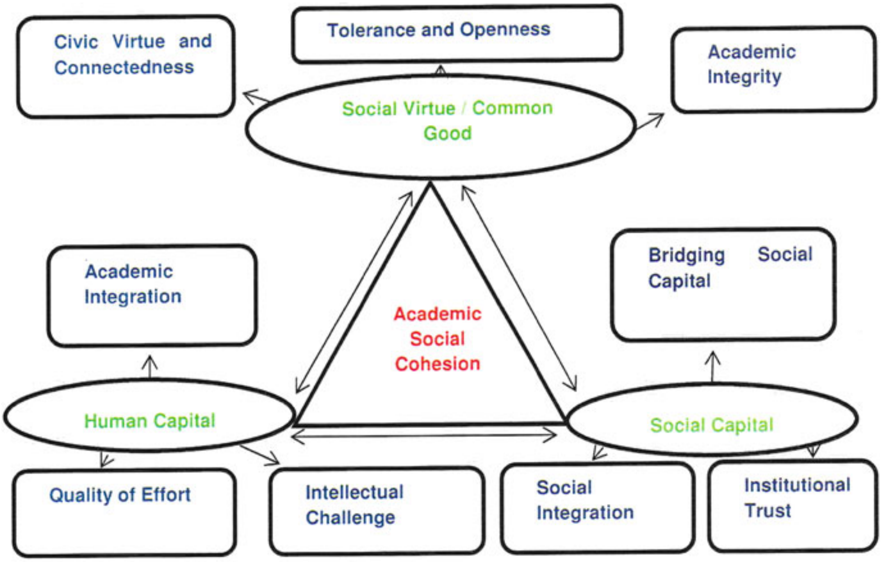
[6] It is almost always used in a normative fashion – that is to say as a signifier for a positive condition for which we ought to strive. This, as with all normative terminology in social science, creates problems for objective analysis, even within a critical realist epistemology that recognizes that subjective beliefs and ideological forces are constitutive of the reality which we seek to understand and which exists independently of our perceptions of it. On the one hand, where social cohesion is defined in a particular normative fashion, according to the political preferences of the researcher or policy analyst, this preempts analysis of the whole phenomenon, including the different forms of social cohesion which may exist in the real world (Green, p-5).

[7] Too much cohesion can, arguably, lead to social insularity and backwardness (Banfield, 1958), economic sclerosis (Olson, 1971), or to a failure to address substantive injustices in society (cf Marx on religion as the "opium of the people" in his "Critique of Hegel's Philosophy of Rights," 1973).

[8] This is problematic not only, again, because it narrows the range of phenomena that may be analyzed as possible incidents of social cohesion but also because it then prevents any analysis of the causes and effects which are already endogenous to the definition. Including causes and effects in the definition amounts to arguing by definition – a logical fallacy which philosophers call "petitio principii" (Durkheim, 1982).

The World Conferences on Higher Education (WCHE) since 1998 to 2009 gave a new thrust to UNESCO's higher education program at a time when a need for change and adjustment to a new paradigm in higher education was strongly felt by decision makers. In the different World Declarations on Higher Education for the Twenty-First Century, they provided an international framework for action both at the systems and institutional levels. A particular focus was placed on broadening access and strengthening higher education as a key factor of development; enhancing quality, relevance, and efficiency through closer links to society and the world of work; securing adequate funding resources, both public and private; and fostering international cooperation and partnerships. One spin-off of the World Conference was the UNESCO Forum on Higher Education, Research and Knowledge, an open platform forum encouraging research and intellectual debate. Within these general orientations and delivery mechanisms, research on trends in higher education remains at the heart of UNESCO's preoccupations, along with the question of higher education and social cohesion (Burnett, 2007: 287–289 en Mendes, 2011).

Within the broad discussion on social cohesion, some authors have opted for the academic analysis of social cohesion in higher education, as is the case of Heuser (2007) who proposes a synthesis model that highlights the main dimensions in the academic social cohesion within higher education.



Source: Heuser (2007:295)

Academic social cohesion in higher education

This model responds to a mono-logical perspective, which gets a great review for the inclusion of the term "social capital" as determined by Somers (2008). They refer to market models.[9]

From our perspective, higher education policy requires a proposal of analysis based on justice and social relevance that is connected to frameworks for social cohesion. Cohesion policy in Latin America could only start from a series of social pacts that enable equity and governance (Machinea & Uthoff, 2005). Along these lines, proposals for a social cohesion covenant are framed which provide four pillars: macroeconomic, labor market, social protection and education, and social cohesion contract (CEPAL/SEGIB, 2007, p. 135), which aims to "seal the deal" and the political commitment around that goal and have the economic resources, political, and institutional resources that make it viable. In the latter case it is to legitimate social cohesion as an object of public policy and promote the institutional conditions necessary for its achievement (CEPAL/EUROsociAL, 2007).

Grammar of Debate: Social Justice and the Relevance of Higher Education – RHEs (Pertinencia de la Educación Superior – PSEs)

The ability of higher education institutions to improve social cohesion in the region, which includes the various mechanisms of inclusion and the perception that they have on their people and that determine their sense of social "belonging," is called *social relevance.*

The term *relevance* was introduced by UNESCO (World Conference on Higher Education 1995, 1998, 2009) in the glossary of higher education, science, and technology policy from the claim that the relevance of higher education must be evaluated in terms of the *appropriateness* between what society expects of institutions and what they do. Special attention must be paid to the roles of higher education to serve society and more specifically to activities aimed at eliminating poverty, intolerance, violence, illiteracy, hunger, environmental degradation, and disease, and activities aimed at promoting peace through an interdisciplinary and transdisciplinary planning (UNESCO, 1998).

---

[9] Mendes (2011) critique of the concept of social capital as a public good and its underlying assumptions was put forward by Margaret Somers (2005, 2008). Somers argues that the equation "social + capital" equals the evacuation of the social. Social capital refers to the economic value produced by social relationships. To achieve the practices and institutions of trust, communication, and reciprocity convened in the concept of social capital requires abandoning its constitutive postulates of localism, acquisition, individualism, the market model of efficiency, the marketization of the social, and the radical autonomy from power and politics (Somers, 2008: 235).

In this analysis the RHEs is thought of as a formula that exceeds the established conception of the adaptation of higher education to market requirements and is conceived within the framework of systemic thinking and from the complexity of the needs of all sectors of society and in particular the requirements that apply to the most disadvantaged sectors.

Therefore, the conceptual relevance of the term starts from the consideration that social justice in all its dimensions affects the functions of higher education as a social institution.

To approach the concept of social justice as a key dimension of the RHEs through the definition of inequity and inequality, HEIs work together in their identification, based on a review of different conceptions of social justice to then settle the concept of relevance of higher education.

First we highlight the distributive conception of justice that equates social justice as redistributive action and reallocation of assets and resources, mainly economic, and whose main representatives are John Rawls and Ronald Dworkin. This concept is built on three pillars: the *principle of equal liberty* (where all fundamental freedoms are guaranteed), *the principle of fair equality of opportunities* (equal access chance regardless of social background), and the *difference principle* (referring to the social structure). In the context of this third axis of distributive justice model, we find the justice of "recognition" that involves more than one axis while for some authors it is a true paradigm. This recognition paradigm that has its origins in the phenomenology of consciousness recovers the notion of recognition, as stated by Fraser (2008) of the Hegelian thesis, often considered opposed to liberal individualism.

In a simplified way, we can say that the redistribution paradigm focuses on injustices that have a socioeconomic basis; the recognition paradigm, as we said, is one of the axis of the distribution paradigm which focuses its attention on the injustices primarily interpreted as cultural rooted in social patterns of representation, interpretation, and communication (mainly through the analysis of cultural domination, ethnic, racial, gender differences, sexuality, or generally what happens with other stigmatized groups). Marion Young insists that a redistribution policy that emphasizes the focus on differences also can reinforce injustice, giving more power to dominant groups (Fraser 2008).

From critical social theory, Fraser (2008) and others have advocated the need to integrate in a coherent way redistribution and recognition, understood as primitive and irreducible dimensions but interdependent of social justice with equal impact on sociological approach. Thus, we believe that analyzing the forms of injustice, complaints, and possible actions from the intersection of the two perspectives particularly in relation to the axes of subordination associated with gender and race (considered "bivalent collectivities," "hybrid categories," or "two-dimensional social differentiations") in turn subordinated to the social class inequalities. Moreover, this two-dimensional explanatory approach involves the following aspects: (a) understand the ways that injustice is conveyed, (b) assess the justified claims that are reported, and (c) identify and generate effective solutions in accordance with the normative criterion of participatory parity.

The concern for distributive justice simultaneously with the importance of recognition is a relatively new aspect that some authors link with the era of globalization. The emergence of social movements, the claims of minorities, multiculturalism, and feminist movements in the center of gravity were the ones which forced the recognition of the importance of both aspects of a common problem. The displacement of the national framework for the territorial causes that the thinking about justice transcends national claims requiring a "critical theory of justice in the era of globalization" (Fraser & Honneth, 2003).

They will not have the ability to be heard, to be taken into consideration, and to make the appropriate claims as members who may have enough strength to make their voices be heard, that is, subjects who are not adequately represented in accordance with the procedures that structure public processes of confrontation and decision-making mechanisms, matters concerning the political sphere of justice and representation forms.

From this perspective, what makes a group of people to become subjects of justice is not geographic proximity, but their co-nesting in a common structural or institutional framework, which sets the basic rules that govern their social interaction, "thus setting their life chances as patterns of advantage and disadvantage" (Fraser, 2008: 55).

Cognitive Justice as a Privileged Form of Social Justice

We have referred to the importance of the recognition of *otherness*, the struggle for inequality within the framework of respect for differences that can be done by HE daily practice, its role as a builder of theories that have as a goal social justice within the framework of cognitive justice, and the need to recover critically the category of social relevance and responsibility to rethink the future of the HE.

There are objectives that logically the HE cannot accomplish without appealing to other institutions that would meet the objectives related to the coverage of basic needs in a short and long term. But there is an endogenous aspect, not less, in line with major objectives of social justice that can be addressed within HEIs, and that is the link to cognitive justice as recognition and equi-potency given to the old and new knowledge that has never been able to enter the HEIs and that causes real injustice.

Latin America, overflowing with wealth of this old and new "alternative" knowledge became a prime setting to explore new paths that also lead to regional solutions and dialogue with those who want to work with these institutions.

The real ability to exercise cognitive justice practices is also the way to find its own path, linked to local needs with local responses, consistent in their creation of knowledge (primary function of the HEIs) that departs from real bases, concrete, and also identified by members of the HEIs as an exercise of democracy, which society values.

Higher Education Institutions can and should give priority to recognize the sources of injustice and test solutions in addition to being an example of social innovation and propose to build explanatory theories and looking for a more just society.

About the Commitment of Higher Education and the Concept of Relevance

The inclusion of the key dimension of social justice in developing the concept of relevance involves some debate about the social responsibility of HE. This term, used by the business sector as noted by Dupas, "dilute the public and political references in an attempt to reduce social injustice." These practices are unable to resolve the serious problems of social exclusion and also depoliticize (Dupas, 2005: 121 and 123). But from our perspective, the social responsibility means to produce socially significant knowledge and training professionals with citizen awareness and contribute to the culture and the transformation of reality in which educational institutions are active.

That is why we must rethink the institutions from within, not only from a work of bureaucratic and administrative reorganization but from the deep ongoing reflection on their meaning and their role in the construction of the civilizing process in these new contexts.

The relevance must have a dimension that includes social justice as a dimension that compromises HE and which also permits setting new quality standards. The quality is not understood as an exclusive value, or *for a few* as it was the attempt to redefine it in the 1990s, it needs to recover a social, public commitment to the communities in which educational institutions are inserted. Consequently, the processes of assessment and accreditation in Latin America and the Caribbean should give primacy to uncontested indicators of relevance and social relevance as well as policies and actions that create more equality and prosperity for all (Dias Sobrinho & Goergen, 2006).

Although the social relevance is a misleading category (Naidorf, 2007), our analysis aims to highlight the aspects related to the social function of the university and equal opportunities which potentially have to increase not only the access to higher education level to which we referred but also to enrich society through the specific contribution of the university as a space for creation and dissemination of socially relevant knowledge.

And for higher education to be a practice of freedom, universities must be thought as public goods. And the notion here of public implies four questions, as rightly put by Craig Calhoun (2006): (1) where does the money come from? (2), who governs? (3), who benefits? And (4) how is knowledge produced and circulated?

On the other hand, the thought of Amaryta Sen (1999) concerning social justice is essential to understand the "skills" in the sense of *agency or empowerment*, of individuals introducing an ethical conscience in the economy and a new concept of human development based on freedom. Justice is based at the same time in the coverage of basic needs which are also basic skills that must be met in a short term with other needs or skills that, when absent, also involve injustice in long-term consequences.

Proposals for the Analysis and Reflection on the Relevance of the University

The idea of justice as an essential component of social relevance is necessary to consider the public sense of higher education, despite the pressures posed by the current marketing and its own structures. In this context, it is where a theory of social justice makes sense that takes into account both redistribution and recognition (the inequalities and differences) with an axis in higher education as a privileged arena for attention to both challenges.

Higher education as a public asset		
Relevance of higher education based on Social justice	Distributive justice	(a) Financial, social, and cultural resources (b) Equality of access (c) Equality of survival (d) Equality of output (e) Equality of outcome
	Recognition justice	(a) Curricular flexibility (b) Transfer of knowledge (c) Research and extension (d) Inclusion (e) Collaboration between universities (indigenous, etc.)
	Cognitive justice	Recognition and inclusion of local knowledge (languages, customs, nondominant cultural codes)
	Institutional links	(a) Institutional strengthening (b) Networking (c) Cooperation

Considering the inequality and exclusion as determinants of the tendency of equity and inclusion policies in higher education in the region of Latin America, it is necessary to address the issue with a view *from inside the national higher education systems* to focus the eyes on inclusion policies in higher education institutions, systems of governance, relevance of university programs, mandatory projects, and the need to maintain a high degree of collaboration between HEIs to recognize the different dimensions of the problem such as lack of a common agenda for equity, common policies, and standards but adapted to each context, the implementation of parallel thematic diagnostic activities, and the collaborative forms aimed at achieving social objectives defined by the institutions themselves in dialogue with society. Overcoming inequality and exclusion as a strategy to reach the road to sustainable development of societies is the most urgent and important challenge of our time for countries, and HEIs in LA have a role in this challenge.

It should contribute to institutional strengthening and regional or subregional integration, through skills development, institutional learning, improving of processes, and increasing not only the link with the sectors that can provide additional resources as a counterpart (link to companies) but mainly to increase the links to the most disadvantaged sectors organized most of the time over what should inspire the revision of its function. It will aim to reinforce the actions and activities aimed at promoting linkages and joint activities between universities and with other sectors of the societies to those where the universities provide their specific contribution in terms of achieving more just societies.

Regional and interregional integration oriented to sustainable development and reducing social inequality has been taking various renewed impulses through new forms of social integration supported both by spaces such as MERCOSUR, Latin American goals of exchanges and cooperation, which tend to join forces in a broad-based but possible target of achieving the common good for the majority.

Promoting social cohesion cooperation among universities in Latin America and other parts of the world, from a distant link model of "transplanted recipes" and to others applied vertically, allows creating a space for communication and discussing strategies that promote institutional actions aimed at social development equitable integration and collaboration.

As one of the objectives for the achievement of social equity, expanding access should simultaneously pursue the successful conclusion of the studies, while ensuring that the time spent at university is an ideal opportunity for civic education with social meaning, expanding horizons, creation and recreation of knowledge, respect for differences, and also of social cohesion as mentioned above, i.e., far beyond the individual career to achieve accreditation.

This effort should include appropriate financial and educational support for the students who come from poor and marginalized communities (UNESCO, 1998) in as many positive actions as possible so that it allows at least one common initial base in the access and support for those with unfavorable conditions for the classic courses established by the universities.

The former is a way to redefine previous institutional objective, but at a long term it should not *level from below* in order to be a university best suited to the needs of Latin America, as it is supposed to be.

Among the issues concerning justice and a true recognition, cognitive justice at the university cannot be kept away knowledge that for almost 500 years has been disregarded in the educational systems of Latin America as the Aboriginal habits and traditions and the not Aboriginal, but local, born and developed in this region of the world that has not been considered as valid knowledge to be studied by the educational system in particular and by Latin American culture in general. It has been known as folklore sometimes pejorative or disregarded in their value, while white culture, Western or European culture, was presented as the one to transmit, integrate, and disseminate. A cognitive act of justice to which the education system can contribute at a high degree of impact and success is to recognize in their universities what Boaventura de Sousa Santos called the ecology of knowledge (De Sousa Santos, 2005).

Surely cognitive justice is a form of social justice while also recognizing other cultural codes of the dominant code (Bernstein & Cook-Gumperz, 1973; Bourdieu, 1991), while the HEI as a privileged laboratory for experimentation and institutional and social laboratory recognize other codes being also valid (Fraser 2008).

Chapter 7

A Grid and Group Explanation of Social Justice: An Example of Why Frameworks Are Helpful in Social Justice Discourse

Edward L. Harris

Social Justice: Ubiquitous Theme but Elusive Meaning

While social justice is increasingly becoming a topic of interest in professional and popular literature, definitions and understandings of social justice remain elusive and vary significantly. Critics often echo the notions of Hayek (1976) who over four decades ago argued that innumerable scholarly battles have been fought over social justice without offering a suitable definition; moreover, "the people who habitually employ the phrase simply do not know themselves what they mean by it, and just use it as an assertion that a claim is justified without giving a reason for it" (p. xi).

One can see the disparities in the various philosophical and ethical underpinnings of social justice. For instance, Rawls (1971/1999, 2003) offers objective standards and draws comprehensively on utilitarian, Lockean, and Kantian ethical theories (Zajda, Majhanovich, & Rust, 2006). Social justice also has religious explanations, such as Judaism's notion of *tikkun olam*, or repairing the world, Buddhism's compassion for all sentient beings, and Christianity's call to help the poor (Mayer, 2007; Sacks, 2007). And still other perspectives frame social justice as a universal concept representing a way to live rather than a concept to be defined (Griffin, 1988, 1990).

One explanation for these disparate views of and approaches to social justice can be found in cultural theory, which describes principals and practices of justice as social constructs. That is, views of social justice are inextricably linked to social contexts within which models of justice make sense to the people involved. Thus, various conceptions of social justice can be interpreted and manifested differently in different settings (Alwy & Schech, 2007; Douglas, 1996). By reformulating the

question, "What is social justice?" to "What are the constructions of social justice in particular environments?" the concept of social justice can be more aptly fitting as a subject of inquiry.

Cultural Theory and Social Justice

Social justice is inextricably linked to sociocultural life and values. Bankston (2010) posits that on a societal level, contemporary notions of justice stem from cultural perspectives shaped by two societal developments of the last century: mass consumption and human rights advocacy. The Industrial Revolution sparked substantial rise in mass production and consumption, which resulted in concerns over resource scarcity issues for the disadvantaged and ways to improve their circumstances through equitable redistribution. The civil rights movement framed these resource scarcity and redistribution concerns in terms of human rights of underrepresented populations. Bankston explains that the first cultural development "fueled a growing preoccupation with wealth distribution, and the latter provided an energizing myth that animated the redistributive ethic" (p. 165).

On any level, societal or contextual, preferences and practices about the pattern of justice are couched in "cultural relationships and value systems of people belonging to the distinctive groups" (Tansey & O'Riodan, 1999, p. 71). Social anthropologist Mary Douglas (1982/2011) has developed a typology that helps consider the cultural constructs of particular social groups. Her typology of grid and group, also referred to as cultural theory (Thompson, Ellis, & Wildavsky, 1990), brings order to experience and provides a common language to explain behaviors and interactions in social settings. As an added benefit, since social justice has become a global concern, Douglas's theory has been used extensively in international contexts (Ellis, 1996; Fardon, 1999; Douglas, 1996).

In previous publications, I have explained the salient features of cultural theory as well as examined its usefulness in a variety of domestic and international educational contexts (Harris, 1995, 2005, 2006). As clarified in many of these publications, Douglas's thoughts on the theory gradually altered over the years. For instance, being heavily influenced by Levi-Strauss and Durkheim, Douglas's earlier versions of grid and group had a decisive structuralist tone and attempted to analyze behavior in terms of definable components, signs, or structures. She always, however, remained adamant that her theory was not a linear determinant, as social interaction is highly variable and difficult to predict. Over time, as Spickard (1989) notes, she made a philosophical move "from structuralism to ethnomethodology (p. 152)," which attempts to understand how people make sense of, explain, and carry out day-to-day life (Patton, 2002).

Cultural theory offers explanations of fairness, justice, and other values in specific social contexts (Thompson et al. 1990). According to the typology, there are neither innumerable contextual meanings of social justice nor vast possibilities that characterize cultural experience. Rather, there are four, and only four, distinctive social contexts in which one may find him or herself and only two dimensions, grid and group, which define each of those four prototypes as well as explain contextual meanings (Harris, 2005, 2006).

Grid Dynamics

In Douglas's frame, grid refers to the degree to which individual autonomy and actions are constrained within a social system by compulsory role and role prescriptions. For instance, in some schools, prescribed bureaucratic rules restrain personal freedoms, and in other schools, nominal regulations allow for autonomy in most educational processes. Also, in any setting, ideas and practices of fairness related to compensation, distribution of goods, and perks of the job are often related to implicit or explicit rules, individual roles, and relative status in the organization (Harris, 2005, 2006).

Grid strength can be plotted on a continuum of weak to strong. At the weak end of the continuum, few role distinctions exist, few institutional rules restrain autonomy, and individuals are valued for their skills, behaviors, and abilities. In weak-grid contexts, members are neither isolated nor insulated from each other by respective job responsibilities or departmental units. In these environments, leadership status is not considered superior to other roles. Rather, he or she is regarded as one whose skills, abilities, and personal history are more in tune with administration or organizational leadership than with other roles. In many cases in weak-grid schools, the school leader will emerge from the midst of the teaching ranks as one considered the best leader among equals.

At the strong end of the grid continuum, role and rule dominate patterns of labor, and an explicit set of institutional regulations order personal interactions. In strong-grid schools, teachers typically are not at liberty to select their own curriculum and textbooks, and many decisions are made by upper administration. Strong-grid environments also contain many role distinctions at the teaching and staff levels, with proportionately fewer, yet more prestigious, distinctions further up the organizational ladder.

Understanding Power Structures, Social Justice, and Grid

Organizations use power and authority to direct behavior of their members as well as to control the level and type of involvement of their participants. In the most basic sense, two power derivations, positional and personal, define leadership practice in an organization. Positional power refers to influence and authority derived from a particular organizational office, status, or rank. Personal power refers to influence and authority derived from subordinates in an organization and achieved over time.

Grid is closely akin to these concepts of power and authority. In strong-grid environments, authority structures are highly centralized and power is typically positional. School leaders are granted more administrative power than teachers because of the position they hold in the school. In weak-grid schools, authority is decentralized and administrative power is typically personal, earned over time, and based on how they are viewed in relationship with other school members.

While inequalities can be found in both strong- and weak-grid settings, they are often more evident in strong-grid. For example, in a classic strong-grid school system, the superintendent or headmaster is at the pinnacle of a regulated chain of command. Significant power and authority is delegated by a governing board of directors to this leader and from him or her to those in lower echelons.

Organizational units, whether academic departments or grade levels, can be virtually obscured in the midst of complex hierarchy and often have specific communication procedures that often insulate them from other layers and positions. Teacher autonomy is often hampered by rules regulating their position and activities, and they generally have little voice in most areas of the educational process. One of their few opportunities for self-governance may be in the refuge of their classroom. However, even there they may be under the close scrutiny of authoritative superiors (Harris, 2005, 2006).

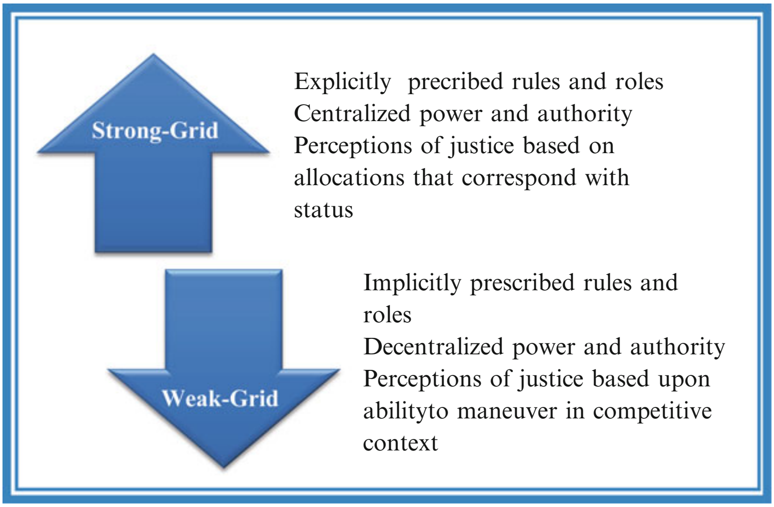
Much like Rawls' (1999) conception of social contract, whereby people can either freely agree on principles of social cooperation that benefit everyone or choose principles that promote inequities, cultural theory contends that rules can be both the cause and cure for social injustice. In institutions where role and rule dominate, perceptions and practices of justice and fairness vary explicitly among the hierarchical layers and are often dependent upon equity-based allocations that correspond with role and status (Lansberg, 2006). Upper levels may view the organization as just and fair, as they may be insulated from unfair practices that may occur in subordinate rungs. Lower-level members' perceptions of fairness depend upon their respective pay, and often they envy those above them whose pay is more for apparently less work. To some degree, this is akin to Adams' (1965) equity theory, which hypothesizes that in any exchange, fairness is dependent on the extent to which individuals consider their rewards to be in concert with their role, service, and contribution.

While injustices may be more vividly apparent in strong-grid environments, they exist, nonetheless, in weak-grid contexts as well. For example, weak-grid contexts are extremely competitive and promote a survival-of-the-fittest mentality. There are always those less strong or less competitive, and they often experience injustices through lack of participation or lack of resources. Passively allowing the strong to improvise self-serving principles of social justice can pose inequities for the less strong. Some of the salient features of grid can be seen in Fig. 7.1.

Group Dynamics

In cultural theory, the notion of group refers to the holistic social incorporation and degree of commitment to the larger social unit. Like grid, group can be plotted on a continuum from weak to strong.

Weak-group environments place little emphasis on group-focused activities and relationships. Members of social and working subgroups tend to focus on



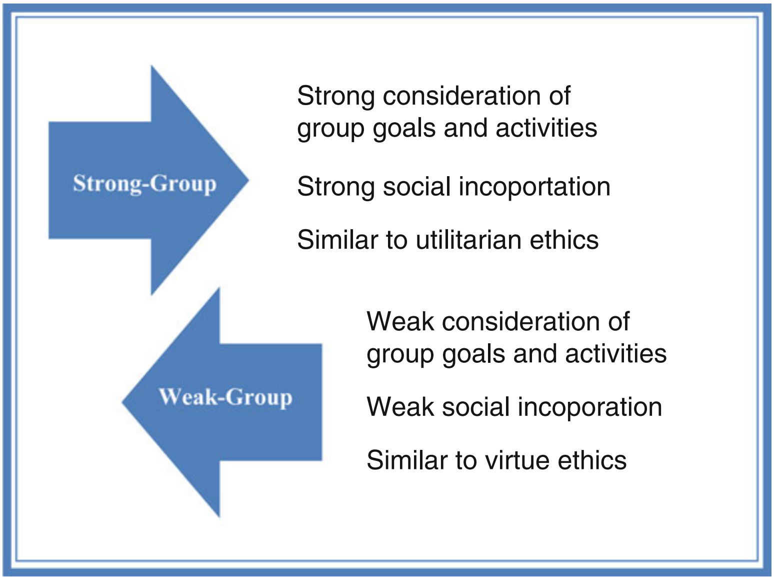
Strong-Grid
Explicitly precribed rules and roles
Centralized power and authority
Perceptions of justice based on allocations that correspond with status
Weak-Grid
Implicitly prescribed rules and roles
Decentralized power and authority
Perceptions of justice based upon abilityto maneuver in competitive context

Fig. 7.1 Grid dynamics and social justice

short-term activities rather than long-term corporate objectives, and group allegiance is minimal. The ethical system most embodied in these contexts is virtue ethics, which emphasizes internal moral codes and strength of character over traditional norms. An example of weak-group can be seen in schools that do not have entrenched traditions or where the social system is in constant flux due to recurring teacher or administrator turnover. In these settings, individual interests override what few corporate goals exist.

In strong-group social settings, explicit pressures influence group relationships, and members rely on the larger unit for social support. Collective survival is more important than individual survival, and insider-outsider norms regulate group membership. Private schools provide good illustrations of insider-outsider membership criteria with their explicit admission requirements. However, there are also many public schools with implicit criteria for group membership through such features as exclusive neighborhood locations. For instance, some public schools are located in elite, influential neighborhoods. While open attendance laws may allow any student to attend the district schools, generally only those who live in the elite neighborhoods actually do attend. There are, in effect, de facto membership criteria for the school because the poorer families typically cannot or will not transport their children to those schools.

Another example of strong-group can be seen in Rawl's (1999) use of utilitarianism ethics, which hypothesizes that in an array of options, the best choice is the alternative that achieves the greater good for the most people. Similarly, in strong-group contexts, group goals override individual goals, activities and actions are directed toward a common purpose, and whatever is best for the group is ultimately best for all (Harris, 2005).



Strong-Group
Strong consideration of group goals and activities
Strong social incoportation
Similar to utilitarian ethics
Weak-Group
Weak consideration of group goals and activities
Weak social incoporation
Similar to virtue ethics

Fig. 7.2 Group dynamics and social justice

Strong-group can also be found in institutions where allegiance, entrenched traditions, and norms are carefully preserved and passed from generation to generation. In terms of social fairness, these norms can be either just or unjust. Like many countries, the United States has social justice values and practices we can proudly extol, such as public education and religious freedom. We also have some ideologies that mar our nation's history, such as slavery of African Americans and exploitation of Native Americans. Due to strong-group mindsets, such social injustices were once tolerated and traditionally perpetuated from generation to generation. Even after the regulated abolishment of such practices, strong-group repercussions of racism and social prejudice as well as inequitable opportunities for underrepresented groups still plague our society (Butler, 2010). Figure 7.2 depicts some pertinent features on the group continuum.

Social Games and Social Justice

Grid and group dynamics are simultaneously at work in any social setting. When grid and group coalesce over time, certain themes and dominant patterns of thought and behavior tend to define a particular setting. These patterns are, in effect, prevailing mindsets that influence the entire cultural environment.

While Douglas referred to these prevailing mindsets as cultural bias (Douglas, 1982/2011), Lingenfelter (1996) dubs them "social games" (p. 24), because they define the character of social life people carry out or "play" in a particular setting.

In the organizational theory literature, these prevailing mindsets are similar to Deal and Kennedy's (2000) "rules of the game, the way things are done around here" (p. 4). Douglas and Lingenfelter add specific terminology to the organizational cultural vernacular, as they describe different prototypes of "the way things are done around here" and explain that each social game embraces a particular notion about justice and other dimensions of social value.

In Douglas's typology, there is not an endless number of prototypical mindsets that characterize contextual meanings and practices of social justice. Rather, there are four prototypes, which are defined by the four possible ways of grid and group life (Harris, 2005).

Individualist (Weak-Grid, Weak-Group) Environments and Individualism

Due to lack of imposed formal rules and traditions, individualist environments promote unconstrained relationships and individual experiences. Role status and rewards are competitive and contingent upon temporal standards, few insider-outsider screens exist, and little value is placed on group goals or social incorporation. The predominant social game in this environment is "individualism," which encourages members to make the most of individual opportunities, seek risks that result in personal gain, as well as be competitive and proactive in securing resources and charting their life goals.

Bureaucratic (Strong-Grid, Weak-Group) Environments and Authoritarianism

Bureaucratic contexts offer minimal individual autonomy due to explicit classifying criteria, which emphasize such factors as division of labor and specialization, ethnicity, gender, or family heritage. Roles are fully defined and without ambiguity. Meaningful relationships and life-support networks are often found outside of the group, and like weak-group individualism, minimal value is placed on group goals and incorporation. The social game in this environment is "authoritarianism," which often promotes limited opportunity for advancement and opportunity, compliance to rules and procedures, lack of control of group goals and rewards, and autocratic rule by administrators.

Corporate (Strong-Grid, Strong-Group) Environments and Hierarchy

In corporate contexts, group goals take priority over individual goals. Labor, behavior, and interpersonal relationships are influenced by group norms and social incorporation. Roles and responsibilities are fixed within a stratified chain of command.

Upper management roles are limited to a small number of experts, and numerous role distinctions are dispersed throughout the middle and bottom rungs of the pecking order. The social game valued in this environment is “hierarchy,” because group members understand that in a hierarchical system, what is good for the corporation is good for the individual. In hierarchical schools, central-office administration, site administration, teachers, students, and parents work cohesively in an integrated system for the benefit of the whole. Opportunities and risks are shared by all, but levels of reward and resource allocation are dependent upon placement in the hierarchy.

Collectivist (Weak-Grid, Strong-Group) Environments and Egalitarianism

Collectivist contexts have many of the strong-group features of corporate hierarchy, including emphasis on group goals and social incorporation. However, the weak-grid aspect allows for more equitable and many fewer role distinctions. Weak-grid also makes role status competitive, yet due to strong-group influences, rules for status are more stable than in individualist societies. The social game of collectivists is “egalitarianism,” which places a high value on unity, equal distribution of resources, suspicion of those outside the community who may want to help, conformity to collective norms, as well as rejection of mindsets associated with strong-grid authoritarianism and hierarchy.

A *kibbutz* illustrates egalitarian mindsets of justice and equity, for in this kind of Israeli community, collectively ownership is valued, labor compensation is in equitable distribution of goods and services, and most member needs are met through community affiliation. Figure 7.3 categorizes the four social games with their respective grid and group environments.

Social justice implications for the four grid and group prototypes are overt, especially in terms of economic distribution, power, and prestige, which often define fairness and social advantage within social hierarchy. In discussing various social disparities and injustices particularly in Kenya and in general, throughout the world, Alwy and Schech (2007) note that levels of social benefits are determined by inherent status in almost any social structure. Examples include socioeconomic groups, racial/ethnic groups, or groups defined by gender, sexual orientation, age, and other characteristics. In essence, social advantages and disadvantages are “distributed along these lines virtually everywhere in the world” (p. 133).

As previously stated, cultural theory posits that social game prototypes originate in the symbiotic interaction of grid and group. Thompson et al. (1990) state that these consequent cultural games dramatically effect preferences and practices in matters such as economic wealth, resource scarcity, blame, envy, and other dimensions of social value “that any social theory worth its salt should address” (p. 59). The following are brief descriptions of some of these social values as well as their importance to social justice.

- Group
+ Group
Individualist
Social Game: Individualism
Collectivist
Social Game: Egalitarianism
- Grid

Fig. 7.3 The four environments and their respective social games

Resource Scarcity and Abundance

In a world of limited or scarce resources, fair distribution of those available resources to meet seemingly unlimited societal needs is at the heart of twenty-first-century social justice as well as authentic educational reform (Crank, 2003; Homer-Dixon, 1999). Resources can be economic, natural, or human, as in labor resources. In demonstrating the connection of resources and social justice, Bankston (2010) weaves two complementary threads of thought. First, resource scarcity is often associated with the have-nots, and one aspect of social justice is the equitable redistribution of available resources to improve their situation. Second, this redistribution is often shaped in terms of rights of the disadvantaged, who along with special interest groups lay claims on the rest of society to correct inequities.

An example of this can be seen in the recent debates in the United States regarding the relative inequitable health-care resources. The argument moved rather quickly from a discussion of the inequities to the right of every American citizen to have health care. Bankston's notions are also demonstrated in Darling-Hammond's (2010) call to systematically address education's inequitable human resource problem by creating inclusive and equitable infrastructures that facilitate teacher development for all student communities.

Cultural theory illumines these discussions, as each social game embraces certain values about resource scarcity. Individualists reject the idea of resource scarcity and see resources as raw materials to be competed for in an open system. Authoritarians are fatalistic in their view of resources, viewing scarcity as part of life in an environment which one has little control.

Hierarchists typically view scarcity as positive, as it can be a source for power, control, and group gain. For egalitarians, the depletion of resources is the fault of those outside their enclave, and any other distribution other than equitable allocation is unacceptable. To summarize the varying scarcity social games, the individualist's aim is to use up the raw material while it is still worth something, the authoritarian tries to preserve what little he or she has, the hierarchist seeks administrative control, and the egalitarian tries to make natural resources last for eternity (Thompson et al., 1990).

Blame

Folger and Cropanzano's (2001) fairness theory illustrates the relationship of blame and social justice by explaining that when people in a particular group declare an instance of unjust or unfair treatment, someone must be accountable for that action or inaction that causes the injustice. Conversely, "if no one is to blame, there is no social injustice, (thus), the process of accountability, or how another social entity comes to be considered blameworthy is fundamental to justice" (p. 1).

Individualists often attribute blame for social inequities on the victims themselves. Everyone should be able to pick themselves up by the bootstraps and rise above their circumstances. If not, it's because of bad luck, personal incompetence, or a combination thereof.

Authoritarians have the ubiquitous bureaucracy itself to blame. Blame can also be credited to destiny or fate, as illustrated in a caste system. In a stratified caste system, strong-grid rules regulate life in each layer of social order, which is established and preserved by the higher laws of providence. Thompson and his coauthors (1990) explain that, unlike the strong-group populace, authoritarians do not have a collective to hold responsible. Rather, blame is "diffused onto the amorphous entity, 'fate'" (p. 60).

Hierarchists are quite adept at blame shedding, passing off the culpability of injustice among the various hidden layers of corporate structure. For egalitarians, the ever-present outside system, "the man," is to blame for the cause and perpetuation of injustices (Douglas, 1994).

Envy

Like blame, envy plays a vital role in conceptualizing social justice (Douglas, 1996). Syndicated columnist Richard Reeves (2003) refers to envy as a friend to social progress and "the midwife of social justice… one man's envy is another's sense of justice" (para. 3).

Although envy is often associated with the "have-nots" who desire what the "haves" possess, the lower echelons of society do not hold a monopoly on this vice. Fonagy (2008) notes, for example, that the privileged can also be carriers of unresolved envious feelings and are often fearful of losing their prestige.

Individualists embrace envy, for it spurs ambition and competition, which in their view are vital to a progressive society. Simple subsistence is not for them, as their way of life is dependent upon getting ahead and expanding their wealth. For authoritarians, those in the lower rungs of social stratification often envy those in the upper, but are ever aware that rather than human action, fate and just plain luck are the primary culprits of social predicament.

In hierarchical settings, stratification within a pecking order often creates a system where those in superior positions desire to maintain their status and those who are in inferior positions desire to improve their condition by moving up the ladder. For those in authority, controlling envy is important, because the absence of envy could possibly place long-held norms and overall group control in jeopardy.

In hierarchical mindsets, envy is deflected by arguing for the appropriateness of role specializations. Experts at each level of specialization know what is best, and the elite, the top of the hierarchical structure, can live somewhat ostentatiously, for they know what is best for the entire group. In contrast to the ostentatious elite hierarchists and ambitious individualists, egalitarians prefer the uncomplicated life and unpretentious housing and clothing. In this manner of living, they endeavor to control envy by minimizing role distinctions (de Pottel, 2010).

Economic Wealth

Wealth is a useful notion when discussing social justice. Some scholars actually define social justice primarily in terms of economy and power (Zajda, Majhanovich, & Rust, 2006). In terms of cultural theory, individualists seek to create new wealth through ambition and capitalism. For authoritarians, the higher the status in the bureaucracy, the more wealth is available. All hierarchists can grow economically if the corporations itself grows. As for egalitarians, equal distribution is more important than individual growth (Douglas & Waldavsky, 1982). Table 7.1 highlights the various social games and their corresponding social justice constructs.

Social Justice and the Production and Distribution

Central to the interrelationship of economic wealth and social justice are concepts of production and distribution. While Reaves posits that envy is social justice's midwife, Hillebrand (2011) argues that economic wealth is its battlefield. In terms of production and distribution, we Westerners often advocate from a market mindset heavily influenced by the industrial revolution. As such, we can miss the mark of helping our fellow global citizens adapt principles and practices of justice to their

Table 7.1 Social justice factors and social games

	Social justice factor			
Social games	Resource scarcity	Blame	Envy	Economic wealth
Individualists	Competition for resources is cure for scarcity	Bad luck, personal incompetence, or both	Envy spurs ambition and competition	Seek to create new wealth; innovation in individual profit
Authoritarians	Scarcity is part of life; individual preservation of resources is the best one can do	Blame and give credit to fate, destiny	Good luck and bad luck are main culprits	Wealth is for those at top
Hierarchists	Scarcity and opportunity for control, power, and corporate gain	Shed blame to hidden layers of corporate structure	Institutionalized inequalities control envy	Flow of wealth to top for corporate investment and growth
Egalitarians	Collective preservation and equal distribution of resources	"External system" or "the man" is to blame for injustices	Modest living controls internal envy	Equal distribution is more important than individual growth

environments, because they may approach justice from completely different production and distribution paradigms. In a sense, without understanding varied economic cultural nuances of a context, many well-intentioned advocates could propagate a form of social justice colonialism as well as create inequitable relationships both inside and outside indigenous populations.

Economic anthropologists have found it useful to define economic systems into three broad categories: industrial market, peasant agriculture and commerce, and tribal subsistence. Relying on Douglas's typology, Lingenfelter (1996) demonstrates the usefulness of understanding and explaining the expression of cultural bias in each of the three systems. He states that the three categories of economic systems are important, but "they oversimplify significant social distinctions that occur in each level of economic complexity" (p. 32). The discussion that follows builds on Lingenfelter's argument.

An industrial market economy is a consumer-based system, which relies heavily on complex technologies that help supply consumers' demands, choices, and consumption. This system is comprised of businesses that purchase goods and services for the production of other goods and services that are subsequently sold, leased, or supplied to others. In grid and group terms, industrial market systems have specific social justice dynamics. For example, authoritarians construct complex divisions of labor and specialization that dominate the workforce. Individualists seek to profit from abundant personal investment capital, which is more readily available in these systems than in others. Domestic egalitarian human rights organizations work for fair distribution or goods and services, and large-scale production by corporations ensures a ready supply of those commodities. The United States and other capitalist societies fall in this category.

The study of peasant economies is most commonly associated with Russian economist Alexander Chayanov's (1927/1991) theory on the topic. Peasant economies are agriculturally and subsistence based. Either the family unit or family co-op is the primary unit of production. Authoritarian mindsets are seen in very simple divisions of labor, which are based on one's ability to farm or make crafts. Peasant tenants often farm property owned by much wealthier landowners. As Lingenfelter (1996) emphasizes, "craft specialization and surplus agriculture production feed a wider commercial economy, in which the rulers enhance their personal lifestyle and splendor of their kingdom or states" (p. 32). Families range in size, from multigenerational extended families to single-unit parent–child households. In peasant economies, individualists possess little personal investment capital, and social justice advocacy often comes from egalitarian nongovernment organizations (NGOs). Examples of peasant economies can be found in almost every developing country.

Tribal subsistence economies are characterized by basic technology, simple division of labor, as well as small-scale units of production. The social unit of production, distribution, and consumption is limited to the family. While all four social games are present in tribal subsistent economies, they are much more integrated into the fabric of society, and it is more difficult to differentiate one from the other. These family-based economic systems have little or no investment capital, and barter is often the medium of exchange. Custom and ritual are important factors in making choices about egalitarian and equitable exchanges of goods and services. Justice norms are derived from tradition, and like peasant societies, any additional social justice advocacy comes from NGOs. Examples of this type of system include Aborigines, most African tribes, and other tribal systems.

Social game prototypes provide opportunities to explain the variation in social games and consequent social justice implications in each of the three economic levels. In spite of economic differences, the four social games are dynamically manifested in each system and provide a realistic basis for just and fair resource distribution.

Social Justice, Cultural Theory, and Implications for Research, Theory, and Practice

Implications for Theory

Douglas (1993) explains that those who seek to explain social justice via "virtues and vices, *ad hoc*, without a systematic theory…are naïve" (p. 501). Her typology helps in understanding contextual meanings and manifestations. It provides a classifying matrix that allows for explaining contextual values, beliefs, and behaviors as well as explains the interrelationship among these variables and social justice. Further, it offers a vocabulary to discuss and explain contextual nuances.

However, while grid and group typology is extremely useful, I hasten to mention that it is not the string theory or Holy Grail of frameworks. Categorizing can be misleading. Grid and group analysis should not be viewed as a rigid schema for classification, but rather one means to explain the dynamics and interdependence of social interaction. A theoretical frame, *any* theoretical frame, should not be viewed as a panacea for all predicaments, but rather, to provide a lens to view the world and bring multifaceted concepts into focus. As with any lens, a theoretical frame magnifies as well as alters sensory perceptions.

Nonetheless, as Douglas reminds above, theories like grid and group are extremely useful in explaining social justice. Cultural theory has parallels and offers a complementary addition to other useful theories for understanding human behavior with which educators may be familiar with. Examples of these are the following:

1. Critical theories, which are diverse approaches that have been a primary resource for scholars and practitioners concerned with social justice. Critical theories adopt a critical orientation toward processes and practices in which power and oppression are enacted, seeking to ask questions about common practices, to raise consciousness about inequities, to identify and interrupt exploitation, and to contribute to the transformation of society. Specific forms of critical theory include critical pedagogy, critical race theory, queer theory, and some forms of feminist, poststructuralist, and postcolonial theory.
2. Feminist approaches, which are directly concerned with developing knowledge that leads to social change (Bailey, 2007). These assorted theories represent a wide range of approaches concerned with social critique and social justice for the disenfranchised, including:
    (a) Liberal feminism, which focuses on policy, education, and law as vehicles for achieving equity
    (b) Critical race feminism, which focuses on the intersectionality of race/gender
    (c) Poststructuralist feminism, which focuses on language, notions of subjectivity, and other equity factors
3. Social system theories, which view organizations as complex social systems. One example is Getzels-Guba's model, which portrays cultural meaning, roles, expectations, and behavior through the interaction of the personal (idiographic) and organizational (nomothetic) dimensions of a cultural context (Getzels & Guba, 1957; Hoy & Miskel, 2008). This model can help in understanding how organizational role expectations and rules of social justice behaviors can over time become institutionalized.

Implications for Practice

Bogotch and his associates (2008) posit that for successful twenty-first-century educational practice, social justice requires innovative leadership. On international, national, and institutional levels, cultural theory can help educators appropriately adapt leadership practices to varied environments as well as contextualize pertinent social justice strategies to those environments. Rather than passively conforming to existing circumstances or aggressively imposing principles that are contextually incompatible, adaptive leadership strategies can proactively and positively make needed societal changes.

For instance, one important leadership task of the twenty-first century is to promote safe, orderly, and equitable learning environments. It is useful to know that there are not enumerable social environments in which one must be aware in order to effectively contextualize social justice values. Knowledge of the different social games can help educators resolve conflicts and promote safe and fair learning environments.

In understanding prevailing social mindsets, educators can identify roles and relationships in a particular setting, understand how those roles and relationships affect social justice views, as well as explain why members engage in and prefer particular activities. I have found that many school leaders identify with the explanations of how roles and rules affect individual autonomy and how collective participation is deemed either essential or marginal to effective school improvement. The structure and vernacular inherent in the theory help educators recognize and clarify the dissonance, complexity, and practicality of everyday school life (Harris, 2006).

Another complex issue twenty-first-century educators face is power and resource inequities. Smith (2010) warns that those with less power should be considered at risk for injustice. An example of this can be seen in variations of voice in policy development activities. Those with minimal voice often have little influence and power in policy formation and decision-making processes. Those with more voice have more power to make significant societal changes and see those changes through completion, while those with lesser authority must live with whatever those developments and decisions may be. History reveals that not only injustices take place but also abject, inhumane cruelty can occur to those with lesser power and influence. Thus, those with inherently more decision-making authority must be more mindful of the have-nots and take proactive measures to empower them, as well as include them and their views in policy development processes. Also, in a particular setting, understanding the interrelationship of such social justice values as scarcity and power, blame and envy can help leaders to articulate power relations and propose context appropriate solutions.

On a global level, approximately three billion people live on less than $2.50 a day, over 55,000 die daily due to hunger as well as other diseases due to resource scarcity, and furthermore, many of these global citizens do not have the power base to rise above their conditions. Education has an important role in addressing these issues, and cultural theory can help leaders collaborate with other social sectors to reduce these power and resource inequities. For example, regarding resource inequity, cultural theory indicates that individualism's emphasis on personal rights and competition, authoritarianism's fatalistic notions of allocation and distribution, hierarchy's views on control and elitism, and egalitarian's notions of collective preservation and equitable distribution are simultaneously and dynamically at work in any society.

Cultural theory helps focus social justice interactions on viewpoints of both contributor and recipient. Focusing on systemic practices creates modes of operation that are ecologically appropriate as well as logically sound for all stakeholders. Thus, in understanding cultural prototypes, all parties can be in concert with such concepts as Deal and Kennedy's (2000) notion of the way things are done around here or and in Rawl's (2003) idea of social cooperation for cultural sustainability.

Implications for Research

In cultural theory, the unit of analysis can be exceedingly broad or extremely narrow. Grid and group analysis has been used to explain a wide variety of perspectives – from American political cultures to primitive communities and from internationally based university departments to individual preferences (Ellis, 1996; Fardon, 1999; Harris, 2005). In sum, it has the versatility to aid researchers in understanding either an expansive collection of individuals (e.g., a Ministry of Education or the University Council for Educational Administration), a single unit (e.g., school site, department, or task force), or one individual's social preference.

This adaptability allows for a wide array of contextual exploration, yet offers specific language to explain multiple variations. For example, researchers will likely find varying aspects of social justice being practiced at different times and in different educational contexts. However, this variation has underlying structures, which we can study, compare with other structures, and formulate specific applications for context-specific school improvement. These variations and applications are not as copious as the potential number of units of analysis. Rather, they can be narrowed and focused to the four grid and group prototypes. The frame has been used to research environmental and climate issues, risk perceptions, US and international educational environments, as well as policy development (Harris, 2006).

Cultural theory allows leaders to understand how contextual meanings are uniquely constructed and transformed as well as comprehend the interrelationships among cultural members and their environment. As mentioned above, by formulating the basic question, "What are the constructions of social justice in particular environments?" the concept of social justice can be suitably considered as a subject of inquiry.

Concluding Thoughts

Social justice is a ubiquitous concept with an elusive meaning. In some ways, Hayek was correct in stating that battles have been fought over social justice without offering a suitable definition for the concept. However, there is a reason for social justice's anomalous quality. We live in a pluralistic global community. Even in 1948, the emerging global community saw the need to draft some type of social justice document, which is referred to as the Universal Declaration of Human Rights and states in part that "the inherent dignity (of all people) is the foundation of freedom, justice and peace in the world…."

Douglas (1993) is the first to point out the futility in attempting to arrive at one theory of justice that addresses this noble goal or "describes the person, or the citizen, in terms that will be agreed" (p. 501). While in theory, research, and practice the dimensions of grid and group are continuous, interactive, and symbiotic, as well as extremely useful in explaining social justice, social justice is larger than life. Because like education, social justice not only shapes society but comprises the very form of society, educational leaders will have much to do throughout the twenty-first century.

Chapter 8
Who Among Us May Be Literate? Closing the Gap Between Literacy and Diversity

Charles Dukes and Kavin Ming

The world has become increasingly more global, and with this globalization has come the demand for basic human rights (Basok, Ilcan, & Noonan, 2006). In spite of this expectation, nearly one in five adults worldwide is illiterate, and more than one in four are illiterate in the developing world (Andersen & Kooij, 2007). In 24 nations, the adult literacy rate is under 50 % (Maddox, 2008). In the United States, one of the contributing factors to this worldwide illiteracy rate is the failure of students to complete high school. According to a 2011 report by the United States Department of Education's National Center for Education Statistics (NCES), in October 2009, approximately 3.0 million 16- through 24-year-olds in the United States were not enrolled in high school and had not earned a high school diploma or alternative credential (Chapman, Laird, Ifill, & KewalRamani, 2011). In dissecting this number along race lines, the Asian/Pacific Islander dropout rate was 3.4 %, the White dropout rate was 5.2 %, the Black dropout rate was 9.3 %, and the Hispanic dropout rate was 17.6 %. While dropping out of high school does not necessarily indicate illiteracy, at minimum, a high school diploma provides foundational reading, writing, and numeracy skills that are necessary for a meaningful future, and when 3.0 million school-aged children fail to access these foundational skills, it leads to a diminished way of living.

Within the context of this heightened globalization, imagine a world without racism, poverty, or injustices of any kind. Might this world be ideal and for whom? Does the absence of injustice constitute a just society? Perhaps social justice for all

requires more than the absence of injustice. Conceivably, it is not the absence or elimination of particular wrongs but the conceptualization and promotion of just acts that leads to a just society. This thought experiment is intended to illustrate the illusive nature of social justice and highlight the difficulty associated with defining its true nature. The structure of and efforts to create a just society have been contemplated for years, and in spite of classic commentary on the subject, there is still much debate about how such a feat might be accomplished (see Rawls, 1971 and Skinner, 1971 for two contrasting views on the construction of just societies). In one sense, the meaning of social justice may seem relatively straightforward, with deference to civil rights and fulfillment of basic needs. For example, "respect for human rights and identity," (Marshall & Oliva, 2009, p. 3) could easily imply a great many goals worthy of pursuit. Similarly, Brundrett and Anderson de Cuevas (2008) argue for the implementation of efforts that will ultimately "ameliorate current conditions for marginalized groups" (p. 256), ideally resulting in the creation of authentic opportunities for those groups who have been ostracized by mainstream society. Whether social justice is defined as efforts to eradicate conditions impeding some members of society from realizing a quality of life (Barry, 2005) or as a justifiable mission to redistribute resources, taking from the more privileged and giving to the less privileged (Riddell et al., 2005), a simple definition is difficult and seemingly inappropriate.

The complexity of social justice is most likely better understood not as a concept with one singular meaning, but instead as a concept with multiple meanings. We suggest social justice be understood as both a noun—a *disposition* in which the injustices of society are best categorized as philosophical constructs used to characterize the shortcomings of an unjust society —and a verb, a *process* manifest in the creation of public policy, economic restructuring, mass education efforts, and the like. This distinction may somewhat complicate any definition offered for social justice, as most people would prefer a much simpler distinction. Humans are pattern seeking and in many cases appreciate clear distinctions that can be made without confusing gradations or double meanings (Ehrlich, 2000). Similar to discussions—read as raging debates—about nature-nurture, there is no easy resolution to issues that have such far-reaching implications for the human condition. Also similar to the nature-nurture debates, this characterization of social justice may be more easily understood as a compromise of sorts that declares no side a victor, but rather claims a partial victory for both sides, lending itself not to a single interpretation but rather a gradient that requires serious consideration of both disposition and process, applied based on stated goals, population in question, as well as geographic, economic, and social conditions. Placing social justice at the front and center of an informed agenda for society and more specifically institutions within society (e.g., schools) will require a deep appreciation for the distinction between and integration of social justice as a noun and social justice as a verb. A discussion about a social justice agenda that is appropriate for all aspects of society is beyond the scope of this chapter, but we believe that the notions expressed about social justice have applicability beyond schools and serve serious consideration for all aspects of society, as the marginalization and outright denial of basic human rights to any member of society is unacceptable.

An attempt to create a viable framework from which to define social justice has been proposed previously. Bell McKenzie and colleagues (2008) argued for a "non-essentialized" conceptualization of social justice in which the context is paramount to setting a socially just agenda in schools. These authors suggest that social justice be linked to academic achievement, critical consciousness, and inclusive practices. The interesting point here is that the proposed social justice agenda actually uses the term as both noun and verb. This is not inherently a problem, but without a clear distinction made between what should be understood as conceptual and what should be understood as action, it is possible that neither dispositions nor processes will be well developed or understood. Thus, defining social justice with a simple single meaning is not preferable or in our estimation helpful. In contrast, it is helpful to use a multiple-meaning framework and distinguish between social justice as a noun and as a verb. This distinction is an effective way in which to sift through the many commentaries on social justice. The literature on social justice is quite vast and includes perspectives from a number of different scholars representing a great many disciplines. The unifying factor seems to be the consideration of the human condition and how this condition can be improved for those most in need. This is often balanced with the notion that a just society is most desirable for all members of society. Clearly, any pursuit toward such a society requires that attention be paid to virtually every aspect of the society. For purposes here, the focus will be on education in general and schools in particular, as educating children is one of the fundamental services provided to the public and is almost always a point of contention with regard to setting a social justice agenda (Kauffman & Hung, 2009; Rioux & Pinto, 2010). Education and social justice are in no way estranged and better described as intimately involved. In the United States and other industrialized countries as well, a number of efforts have been and continue to be enacted to ensure adequate education for most children (Williams, 2010). For the remainder of the chapter, we will use the distinction of social justice as noun and verb and focus on specific events within schools to help illustrate a stark example of the failures that occur far too often to specific segment of society, those with disabilities. Clearly, this discussion only includes a small portion of the picture, but we believe that it provides a more than adequate example that allows for contemplation about a social justice using a unique framework and hopefully a socially just informed agenda for schools. The relationship between education and social justice will be described next.

Social Justice as a Collective Responsibility

The noun and verb distinction is helpful but only provides a portion of the framework for understanding social justice. There are a number of factors that can be considered critical to a social justice agenda. The claim here is that education for all children regardless of ability, including children with the most severe disabilities, is essential to any social justice agenda and embodies the true nature of social justice as a noun (social justice as a verb defining actions to implement an agenda will be discussed later). In the United States, the Federal Government sparked a movement toward education for all with the passage of legislation in 1974 (Education for All Handicapped Children Education Act, P.L. 94-142), requiring that children with disabilities in the United States have access to a free and appropriate public education (FAPE). This legislation is not the only example but serves as a starting point in time that spawned a fundamental shift in thinking about a more inclusive definition of diversity (at least in the United States, clearly this movement cannot be credited as the sole catalyst for similar movements in other industrialized nations) that includes all children. Governments around the world and international organizations have issued proclamations about the education of children with disabilities (e.g., World Health Organization (WHO) and the United Nations Education, Scientific and Cultural Organization (UNESCO); see Polat (2011) for a description of these proclamations and related efforts). These various pieces of legislation and proclamations have acted as a catalyst for the promotion of inclusive education, and although the progression of events is not exactly linear, there is a recognizable sequence: legislation to inclusive education to a social justice agenda. This progression is tentative, as perhaps perceived injustices in general inspired an examination of schools and inspired change. Each aspect of the previously described progression probably acts a feedback loop in which each factor influences the other, and it may be difficult, if not impossible, to decipher where the progression actually begins. Whatever the case, caution is in order, as much more time is spent espousing a "social justice as a noun" agenda that seems heavy on dispositions that should be adopted to the exclusion of actions necessary to create schools in which all children have authentic opportunities to benefit from a comprehensive education.

In the United States, parallels are often drawn between efforts to racially integrate schools and efforts to include children with disabilities. While this comparison is not inappropriate, the comparison can only be taken so far, as the agenda to include children with disabilities is riddled with questions about the necessity to educate children with the most severe disabilities. In short, there were, and continue to be, questions about children who are "worth" educating (Kauffman & Hung, 2009; Kliewer & Biklen, 2001, 2007, but see Barclay (2011) for a contrasting view on society's obligation to offer social services to all people with disabilities). Social justice has long been associated with education, and many efforts to achieve social justice include direct efforts to ensure an educated populace. Specifically, several proposals to provide a comprehensive education have made reference to the need for literacy instruction (Beswick, Sloat, & Willms, 2008; Morgan & Moni, 2008). This is not surprising, as literacy is one of the key elements to a social justice informed education agenda. Why might this be the case? The answer is simple, but the implications are vast. Literacy is essential to uncloaking virtually every aspect of society. Specifically, the availability of the World Wide Web and information about the people and events in almost every part of the world not only allows people to be informed, it creates the need to be informed about those people and events. On an individual level, it is essential to gain access to information about goods and services necessary to navigate daily life. For example, government documents that allow one to seek employment in particular professions (e.g., credentials to operate machinery or work in a particular profession) or the location of freshwater are only some of the examples that require one to be literate in a number of different ways (Bartlett, Jayaram, & Bonhomme, 2011; Street, 2011). These examples may seem obvious on the surface and seem to lead to a rather simple conclusion—most, if not all, people need to be literate on some level in order to live. While the conclusion is quite logical, there is more to be said. Who among us should be literate? How might resources be allocated in order to reach those that should be literate, and does literacy mean the same for everyone, in spite of ability or capacity to learn? These are the questions that continue to plague a far-reaching social justice agenda that for some is obvious and for others too broad and ambitious to make sense of (Barclay). Preparation for adulthood is not the only purpose of education, and of course, there is more to schooling than simply learning to read, the most basic conceptualization of literacy. Educating children involves the learning of content, problem-solving, socialization, as well as a number of other purposes. But, the process of learning should not be overshadowed by the outcomes of learning, for it is the mechanisms necessary to facilitate the process, specifically reading or literacy, that are all important to reaching outcomes.

A Literate Citizenship

Who Among Us Is Literate?

It is estimated that, in the United States, one of out every three children who enters the first grade lacks the basic skill and motivation necessary for success in school (Morrow, Rueda, & Lapp, 2009). It is apparent that children have different experiences before entering school. What is not so apparent is how these differentiated experiences impact a child's ability and motivation to acquire basic reading skills. Many factors, including history of familial reading problems, exposure to books in the home, and socioeconomic status, potentially impact a child's readiness to read. This can be problematic, as some children do not reach proficiency and are unable to make adequate progress in school. Literacy—the ability to read and write—is one of the most important skills in modern culture. Educational and occupational success depends on reading proficiency. Clearly, reading and the larger issue of literacy is critical to education, particularly at a time when teacher accountability and high-stake assessment are lauded as the only viable gauge for student progress.

Yet, conversations about skill areas, like literacy, are generally not mentioned in the same breath as multicultural education or diversity. It seems that, for many, there is a clear separation between the two. Could it be that sensitizing people to particular issues or promoting inclusive education for all children, including children with disabilities, has nothing to do with building academic skill? Undoubtedly, this is not the case. Diversity is not a deficit, only a difference. Yet, many children from diverse backgrounds, including children with disabilities, are often assumed incompetent. Historically, efforts to educate professionals about diversity or multicultural education have largely focused on attitudinal changes, limited to acceptance. This is inefficient and may limit school reform efforts or targeted programs to notions about eliminating discrimination or reducing bias. Instead, a comprehensive social justice agenda calls for children, all children, to receive an education that instills knowledge, skills, and dispositions, preparing them to engage and transform their world.

Literacy as a Basic Human Right

Disproportionate literacy rates illustrate grave inequalities and have been demonstrated to be a barrier to healthy human development (Maddox, 2008; Meier, 2007). The call for literacy for all is not a new phenomenon. Article 26 of the 1948 Universal Declaration of Human Rights, adopted by the United Nations General Assembly, indicates that everyone has the right to an elementary-think basic education (Humphrey, Cassin, Chang, Malik, & Roosevelt, 1948). The implication of this proclamation is that individuals should have a foundational education, meaning enough to function effectively in society. This education should be focused on the full development of human capacity and hopefully lead to the strengthening of respect for human rights and fundamental freedoms. Similarly, Article 24 of the United Nations Convention on the Rights of Persons with Disabilities of 2007 specifies that individuals with disabilities have the right to an equal opportunity education and without discrimination. The creators of these articles saw that being able to read, write, and compute is the key to a respectable and meaningful life. Furthermore, improved literacy rates are crucial to the fight against violence, gender disparity, and poverty (Motakef, 2007). This is because educated individuals have more opportunities open to them as it pertains to career paths and other choices pertaining to life experiences. A knowledgeable society may not be possible without free access to information (Lor & Britz, 2007), but information is not accessible in any manner without an educated citizenry that has the basic ability to read. Without education, access to basic life opportunities may be virtually nonexistent.

Amartya Sen, the Nobel Prize winning Economist, speaks explicitly about the connection between literacy and human rights. The inabilities to read, write, count, communicate, or function in a meaningful way in society pose an incredible deficit in an individual's life. This deficit can manifest itself in the individual's inability to take care of basic human needs, including nourishment, daily hygienic necessities, and adequate living conditions. When someone's quality of life is impacted by illiteracy and innumeracy, insecurity and shame may result. In addition, this level of defenselessness could cause something terrible to happen, although, ironically, something terrible has already happened (Sen, 2003). Here, Sen is suggesting that the fact that an individual is illiterate is highly undesirable and a serious injustice as a basic human right has been withheld. The history of discrimination in the United States as well as other industrialized nations provides a number of examples of large portions of a society systematically denied an education based on race, ethnic, and language differences. What is not quite as evident, but just as relevant, is the history of people with disabilities and the systematic denial of services, including academic instruction that has paralleled the history of racial and ethnic groups. The outcome—discrimination and denial of basic rights—is largely the same. In contrast, the intent and manifestation of the discrimination are fundamentally different. The perspectives some hold about racial, ethnic, or more broadly multicultural issues may be shaped by local demographic factors (e.g., number of diverse students in the school), past experiences (e.g., positive or negative experiences with diverse populations), and/or prior training and education (e.g., specific course work in multicultural education). These contextualized viewpoints may actually hinder teachers from thinking about and convening a more global "picture" about a broader social justice agenda (Schoorman & Bogotch, 2010). In one sense, discrimination is discrimination, but in another, disability is seen somewhat differently than racial, ethnic, and language differences resulting in a different sort of discrimination. The fundamental difference relates to one of the core aspects of human nature—intelligence. In other words, people with disabilities are quite often assumed incompetent, and discrimination rests not just in differences in color of the skin or languages spoke but in assumptions about the incapacity of people with disabilities (Smart, 2001). People with disabilities, practically those with the most significant disabilities (i.e., severe intellectual disability; see reference, Schalock et al., 2007 for a discussion about the history of the label), are assumed to have inherent deficits that may not be amenable to remediation. Thus, some might contend that there are some people who simply do not need to be educated, and there is no reason to invest in their education, as they lack the intellectual capacity to be educated. This sets people with disabilities apart from others who have been denied access to education based on race or ethnicity and, as such, serves as a prime example of the need for an expanded social justice agenda. Next, we turn to a discussion on the connection between social justice and literacy.

Connecting Social Justice and Literacy

Social justice is a basic commitment to equality issues. For years, equal opportunity to participate in experiences that foster literacy acquisition has been a particular challenge for minority populations. Decades of unfair practices toward underrepresented groups have left behind a local legacy of poverty and academic achievement gaps (Golod, 2008). The educational quality of predominantly minority schools, especially in urban areas and poor rural neighborhoods, is not comparable to that of predominantly White schools. Students in schools with the highest concentrations of poor students (over 24 %) have especially low achievement (Verstegen & Ward, 1991). This typically leads to poor graduation rates for such groups. According to a 2009 report by the United States Alliance for Excellent Education, one-third of students leave high school without a diploma, and low graduation rates are largely found across minority populations. Within the 69 % of students who graduate, the distribution of graduates is as follows: Asians, 79 %; Whites, 76 %; Hispanics, 55 %; African Americans, 51 %; and Native Americans, 50 %.

The outcome of such disparity and inequalities in graduation rates, which has affected the economic stance of minority groups, is evident from the preschool years and continues throughout the intermediate grades. It has been established that emergent literacy skills are important for children's academic achievement and many preschool children from low socioeconomic and minority backgrounds have limited access to experiences that allow them to acquire these essential skills. As a result, many elementary school children in the United States are approximately 2 years behind their peers in literacy development (Clark & Kragler, 2005). Limited literacy experiences may be limited by print material in the home, oral reading experiences, adult oral interaction, and opportunities to engage with text in community settings. According to Potter (2007), children born in a context where there are inadequate literacy experiences do not see or feel print as significant in their lives, and as a result, it will not be meaningful in their everyday experiences. This detachment from text results in slow development of language skills and limited letter knowledge and phonological sensitivity at the preschool level, and insufficient decoding skills and less familiarity with words at the elementary level (Gettinger & Stoiber, 2007; Whitehurst & Lonigan, 1998).

Literacy for All

There is little doubt that students from diverse backgrounds, with disabilities, and speakers of English as a second language have experienced less success in schools in comparison to other students. The relationship between inadequate resources, disability status, race, cultural background, native language, and subpar academic achievement is well documented (Gregory, Skiba, & Noguera, 2010; Skiba et al., 2011; Skiba, Poloni-Staudinger, Simmons, Feggins-Azziz, & Chung, 2005). Yet, association or correlation does not imply causation, and it is difficult to delineate the casual factors responsible for such disparities. In spite of incomplete evidence supporting one hypothesis or another, if educators are to teach all children, the factors that contribute to underachievement must be identified and isolated and specific methods must be developed to eliminate or change these factors for the better. Traditionally, the deficit model has framed this discussion (see Valencia, 2010 for a comprehensive discussion of this model). The assumption that deficits are inherent to the child may account for some of the documented differential treatment that many children of color receive in schools (Byrnes & Wasik, 2009; Harry & Klinger, 2007). At issue here is how the past trends can be altered and past conditions associated with failure and underachievement can be changed. All of these issues are heavily intertwined with social justice. It is not just that particular children are not achieving or that educators should work toward quality education for all, there is more to consider. There should be little tolerance for the current conditions in both the developed and developing countries of mass student underachievement. An educated citizenry, to the greatest extent possible, should be a basic expectation for society. Why should large proportions of the population be denied access or opportunity to gain from a quality education? The answer seems to be obvious; this should not be the case. Achievement gaps, academic underachievement, and the like often fall victim to frivolous dichotomies that oversimplify the issue as the plight of an underclass of people that simply cannot or will not achieve.

According to Howe (1997), to ensure that students achieve their maximum potential, educational opportunities should be equal. That is, all students should have similar access to qualified personnel, resources, and experiences that will help them achieve their highest potential. Equality, he notes, does not mean the same thing as sameness. To say that every child should have the same experiences would be to expose students to “cookie-cutter” teaching practices. Teachers can ensure equality by adapting the curriculum to coincide with the differing experiences, abilities, and interests that students bring to the classroom, as this will allow them to pursue and refine their individual areas of strengths. Before a democratic and just educational system can be put in place, however, group differences in educational attainment that are linked to tangible resources such as employment and income must be considered. Because all groups do not have equal access to such resources that directly affect educational opportunities, it cannot be used as a determining factor for access. Howe indicates that in situations where tangible resources are unequal across groups, the public institution of education becomes responsible for intervening and “leveling the playing field” by providing the necessary resources for all students to have access to high-quality education. Clearly, the situation requires a more complex understanding of the issues with focus on a number of different problems requiring a host of solutions. There is no reason to believe that one single solution will lead to equal school experiences for all children, but this is not the point. Instead, there should be an open discussion about comprehensive schooling that promotes an informed social justice agenda that is directed toward academic and social development for all children. Here, we argue for a specific focus on literacy for all children, as a number of children are denied access to a number of opportunities in school, and face even less opportunity and support after leaving the educational system if literacy opportunities are below average or nonexistent. Literacy is a basic requirement for any semblance of survival in a modern world requiring everyone to access information in multiple formats. The call for teaching literacy naturally coincides with a call for how such an agenda might be implemented in schools. Such efforts require school leaders to consider literacy along with a number of other priorities all requiring attention and resource. Thus, leading schools with a distinct focus on promoting literacy for all students will be discussed next.

Leading for Literacy

In defining social justice as a verb, there are several elements (public policy, economic restructuring, and mass education efforts) that have been outlined as key factors in the consideration of this construct. We will now speak specifically to the necessity of education reform efforts. School leadership can be challenging, and there is a seemingly never-ending list of tasks school leaders must concern themselves with to meet the needs of students, parents, teachers, and other school staff. In a time when student academic achievement is paramount and accountability is the order of the day, school leaders are encouraged, even directed, to ensure that students meet standards (e.g., United States Department of Education's No Child Left Behind Act of 2008). While there is little or no recognition for making adequate academic progress, severe punishment may be levied for student academic failure. Thus, schools are now monitored more closely than ever, requiring school leaders to make every effort to help students achieve. Clearly, school leaders desire the best for students and there is no ill intent, but nevertheless, ensuring adequate achievement for all, including those with the most severe disabilities, is a challenge. Comprehensive schooling is by no means a new idea, and much has been asked of educators with regard to assisting students not only with basic academic skill but with character education and the like (see Counts, 1932 for some of the earliest ideas on this topic). The more that is asked of school leaders, the more school leaders must ask of themselves and others. The ever-increasing responsibilities of school leaders are analogous to a balancing act. Jean Piaget's conception of equilibrium can help illustrate this point (see Flavell, 1963 for an accessible introduction to a number of Piaget's concepts). Equilibrium is the search for balance between the "self" and the world and is only achieved through assimilation of new information and adaptation to the ever-changing environment. Piaget offered his theory of cognitive development to explain how children "see" the world and describe what they do with that information. Similarly, school leaders have a number of experiences (e.g., developing inclusive education programs and conducting teacher evaluations) and must take in new information (e.g., federal regulations and district initiatives). With each, school leaders must maintain a balance, not allowing one initiative or task to overtake another, causing an imbalance. Ensuring that the school remains in equilibrium is an ongoing task that requires not only a strong leader but also a comprehensive plan.

How is social justice related? Like any other call for change, social justice must be considered in the context of everything else. This is where the distinction between social justice as noun and verb is most critical. Social justice as a noun dictates that school leaders adopt a particular disposition and seek an understanding of social justice that can guide the vision or purpose for the school. Additionally, social justice as a verb must be well delineated, leading to a clear mission or direction for the school. In other words, it is not desirable or appropriate for social justice to be seen as an add-on in the context of any school. Fortunately, there is no need to see any change initiative, as yet another programmatic change requiring the shifting of resources with additional layers of programming that may be next to impossible to balance with all other existing initiatives, if implemented. Scaling up or implementing programmatic change across an entire school now has a history, and there a number of examples that provide some evidence that such efforts can be done and with some success. School-wide positive behavior support has been implemented in a number of schools across the country. This collection of systematic research-based behavioral interventions has served a number of schools well to make large-scale changes, improving student behavior for the better (e.g., Horner, Sugai, & Anderson, 2010). There have been efforts to investigate a possible connection between low academic achievement and misbehavior. The idea is that students who engage in frequent misbehavior may do so as a result of skill deficit or low motivation levels. In either case, there is reason to believe that each can be remediated using instructional and behavior support with both having strong empirical support (Simonsen, Fairbanks, Briesch, Myers, & Sugai, 2008). A general orientation toward positive empirically supported interventions has led some to think about the possible connection between general student need and comprehensive programming that might accommodate those needs without creating an unwieldy school program that pulls school leaders and school staff in a number of different directions. For example, both reading and behavioral screeners have been used as a means to help identify those students who might need additional support beyond the general programming available in classrooms (McIntosh, Horner, Chard, Boland, & Good, 2006). This allows programming to be targeted to those students with the most need, ensuring that resources are used most effectively. The connections between academic achievement and social behavior are receiving more attention, and there is evidence that a systematic approach based on a few empirical principles can provide the foundation for comprehensive programs that meet the needs of students, parents, teachers, and other school staff (Algozzine, Wang, & Violette, 2011).

School leaders are charged with creating a comprehensive school plan that meets the needs of students, parents, teachers, and other school staff. What is social justice leadership, and how might this kind of leadership be applied to efforts to create a school program that includes literacy for all? We address this question, with the intent to describe guidelines for creating and sustaining a social justice agenda that incorporates literacy. General discussions about social justice leadership can be found in other chapters of this volume. The "social justice challenge" pits a number of competing agendas against each other, inevitably requiring consideration of how to portion resource (Marshall & Oliva, 2009). In this case, resource should be understood more broadly than simply monetary funds; resource may also include time, person power (formerly manpower), professional development, and other factors. This, in part, creates the challenge for school leaders, as a socially just agenda almost certainly requires a consideration of how resources are currently allocated and how those resources might be reallocated. This challenge is a concern for both in-service and preservice school leaders, as understanding how one should create and sustaining a social justice agenda is not an easy task (McKenzie et al., 2008). There are several considerations for social justice leadership that includes literacy. Each of these considerations fits within the previously mentioned distinctions of social justice as noun and social justice as verb and is often inextricably linked. Each consideration will be discussed in turn.

The first consideration in this process is that social justice is in part a disposition or attitude about people, specifically children. Might this disposition be taught in a preservice course or conveyed in a professional development session, or might school leaders need to enter the profession with such beliefs? Preferably, both hold promise and might serve as viable avenues when promoting a socially just agenda or when recruiting professionals to preservice programs preparing future school leaders. Similar to other change efforts, social justice must begin with self-examination. As simple as self-examination may sound on the surface, the process is quite involved. There is virtually no one better equipped to deceive than the self (Smith, 2004; von Hippel & Trivers, 2011). It is quite easy to be convinced that one's personal views are in line with the mainstream and free of any bias that might be discriminatory toward a particular group. This is certainly the preferred position and one of the reasons why encouraging people to revealing their real feelings about traditionally marginalized groups can be a difficult task. School leaders must self-examine and adopt a specific disposition, one that includes an orientation toward educating all students, including those with the most severe disabilities. If the self-examination is limited to a consideration of traditionally marginalized groups and how those groups might be mainstreamed or included in existent programs, there is a real danger in further alienating these students, as many programs are designed based on deficit model thinking and often times require major overhauls (Brundrett & Anderson de Cuevas, 2008). Clearly, there is no incentive to openly admit racial or ethnic bias or any other socially undesirable position about any particular group. So, why is self-examination so critical to the process? The answer is actually quite simple. The process, if done with intention of learning about personal disposition, can be one of the most revealing exercises available to school leaders and other school staff. Just as it is quite easy for humans to deceive themselves, it is also possible for humans to use deep self-examination as a mechanism toward adopting genuinely different feelings. It is this process that can pave the way toward adopting social justice as a noun associated with the attitudes necessary to do the work associated with social justice as a verb. A process that begins with self-examination is the first toward building a culture of caring in which school leaders can include literacy for all students.

Second, school leaders must gain an understanding of how school staff thinks about different issues related to social justice. This is possible by creating unique assessment tools, surveys, or other tools. For example, Bustamante and colleagues (2009) created the Schoolwide Cultural Competence Observation Checklist (SCCOC) to determine how well schools respond to the needs of diverse students. No matter how information is gathered, the point is that school leaders will need to have some sense of how the school staff thinks about the school program. There certainly may be some aspects of the school plan that are invariant and cannot be changed, but this does not eliminate the need to understand the current climate and gauge how teachers may respond to a reframing of the plan. An assessment may also reveal some general sentiments that are already in line with future directions. Programmatic changes that are in line with the daily work responsibilities of teachers most likely have a better chance of success. Specifically, if teachers are asked to improve on instruction and receive support for improving instruction, there is a greater likelihood that this request is much better received than a request that requires teachers to come out of their comfort zones and perform duties that may not be in line with their daily routines.

The third consideration is professional development. Although school leaders must have a strong hold on policy development (Walker, 2006), there is also a need for helping teachers understand what needs to be done and how it is to be done. This is most often done through professional development. In this sense, professional development should not be understood as "one size fits all" or even as expert dissemination of information to teachers on a limited basis. Instead, there are clear examples of professional development that are better suited to meet the needs of teachers. For example, Kose (2009) describes a qualitative study in which three urban principals and their staff are followed for five months. In the study, Kose provides detailed examples of how each principal provides professional learning opportunities for their staff that included attention to social justice. In some cases, principals were solely responsible for providing the infrastructure for professional learning (e.g., release time for teachers), while in others, teachers had the opportunity to be more self-directed and choose materials (e.g., Internet-based experiences). This example exemplifies the need for a broad consideration of what it means to professionally develop teachers and how this may relate to a social justice agenda. In addition to professional development opportunities, any time that content is a focus and specifically when teachers are asked to make sustainable revisions to their pedagogy, specific professional development will need to be provided to support the transition from what was done previously to what should be done in the future. Literacy is a special case school leaders need to provide a number of examples of in order to help teachers understand how their pedagogy might change and how this can be done for students who have been traditionally considered unteachable. Fortunately, there are a number of examples that can serve as a starting point for reframing literacy for all children. Kliewer and Biklen (2007) provide an example of a young student with autism who was presumed incompetent by most teachers in his school, until a fundamentally different understanding of literacy was promoted, based on communication, which includes symbolic language (e.g., picture icons) that can be used to teach and promote literacy (see Kliewer & Biklen, 2001 for more similar examples). The point here is not to provide a comprehensive converge of the literature on literacy for children with severe disabilities but rather to highlight the fundamental shift that must be made to move toward a social justice informed agenda that includes literacy. In the final section, we discuss social justice as verb and delineate some of the actions we feel are necessary for school leaders to ensure literacy for all.

In sum, social justice requires a reconsideration of highly engrained thinking about education and particularly, school programming. There is little doubt that most school leaders appreciate the need for a balanced school program that meets the needs of students, including those traditionally marginalized based on race, ethnicity, or language. Often, these responses have been quite conventional and unimpressive upon closer examination, as much of the work has focused on attitudinal change and acceptance of difference. In many cases, difference was seen as a deficit, constraining the way educators and school leaders responded to calls for reform. In contrast, an informed social justice agenda calls for consideration of three critical factors: disposition, insight into current notions about student need, and professional development. These considerations are not outside of the current purview of current reform efforts. What is different here is the call for a comprehensive approach that incorporates a consideration of programming that requires a reconsideration of some core notions that may have impeded progress in the past. In short, an informed social justice agenda requires a willingness to question virtually every notion about educating children—all children. To this point, the discussion has focused on social justice as noun. The balance of the discussion will offer some specific recommendations that incorporate the previous discussion and describe a possible vision for social justice as a verb or more succinctly, social justice action.

Toward an Informed Evidence-Based Practice

Just agreeing that social justice is important is not enough; social justice must be practiced. Within the context of education, social justice must challenge the dynamics of oppression and privilege and must recognize those societal views that may be detrimental to student progress, and more specifically, current school practices are rooted in social stratification along the lines of race, class, gender, sexual orientation, and ability. Such historical practice of injustice toward specific groups has contributed to policies and practices that negatively impact the daily lives of some groups more than others. This has led to disparities in literacy rates, standardized test scores, and graduation and dropout rates between the minority and majority cultural groups. It has also helped to shape our conceptions of self and others in conscious and unconscious ways. Thus, social justice within the education system must be confronted and addressed in deliberate ways (North, 2009; Sensoy & DiAngelo, 2009). Here are specific ways that educator preparations programs, educators, and administrators can improve social justice awareness, acceptance, and integration in the education system:

1. *In teacher-preparation programs, teach teacher candidates about diversity and social justice*. Teaching for social justice begins long before a teacher enters the classroom. A teacher becomes competent in promoting social justice in the classroom when he or she has been taught about the importance of social justice in a teacher-preparation program. Two ways in which a teacher-preparation program can encourage social justice in the classroom are through service-learning opportunities and explicitly teaching about the impact of words in strengthening or demoralizing cultural groups. Teacher educators can build into their curriculum service-learning projects that will require teacher candidates to simultaneously learn content while engaging in service-learning experiences that reinforce their new knowledge. Students can engage in the following experiences: (1) working with children who are disabled, who live in poverty, and who are from underrepresented groups; (2) tutoring adults who are working to receive their General Educational Development (GED)/high school diplomas; and (3) traveling abroad to teach English or participate in building construction.

These opportunities help teacher candidates to reflect on the new insight they have gained as a result of working with these groups, confront their beliefs about diverse populations, reevaluate their feelings about such groups, and celebrate the differences that these individuals contribute to the larger society (Baldwin, Buchanan, & Rudisill, 2007; Johnson, 2007).

As an elementary school teacher (second author), encountered two teachers from the majority culture who had low expectations for the African American students with whom they worked, and they used their words to voice their internal feelings. They expressed thoughts such as, "*I can't work with these kinds of students,*" *These kids can't learn,* and "*I just don't get these kids and their culture.*" Thus, explicit instruction in how words are powerful agents in empowering or destroying specific cultural groups should also be explicitly taught in teacher-preparation courses to help candidates become introspective and identify possible biases. This knowledge is particularly relevant to those teacher candidates who will be teaching in English language arts classrooms. This is because this group will teach students about the impact of spoken and written words. Activities that are germane to the English language arts classroom that teachers can use to emphasize the importance and impact of words include small group and class-wide discussions, journal and free writing, reading literature, and interpreting film (Staples, 2008). Once teachers have actively engaged students in this kind of work, careful action must be taken by teachers and students to counter the effect of hurtful words. These actions can include substituting new words for demeaning ones, placing oneself in scenarios to develop empathy for disenfranchised groups, and actively drawing attention to the historical, social, and political stimuli of devaluing words (Staples, 2010).

2. *At the school level, ensure that educational leaders address the need for social justice.* According to Rothstein (2004), social class is a strong predictor of academic achievement in students' standardized performance, and school reform is not enough to narrow the achievement gap between White, middle-class students and their minority, lower-class peers. Additionally, Lalas and Morgan (2006) indicate that the inequity exists along the lines of assessment, standards, and curriculum. Thus, educational leadership for social justice involves the emphasis of equity, care, respect, and concern for all groups. As administrators govern the school body, they must instill the need for culturally responsive teachers, the importance of multiple assessments to inform instruction, and the significance of providing equal opportunities for all cultural groups (Picower, 2007; Stone, 2000).

   To foster culturally responsive teaching, administrators can provide professional development opportunities for teachers by giving them culturally relevant reading material, allowing them to participate in professional development workshops, encouraging them to share in professional book club sessions, and offering mentors. Because of the differing backgrounds and experiences of students, they come to school with different ways of learning and demonstrating their knowledge. Thus, administrators must set before their teachers the expectation that students must be assessed using multiple measures to ensure that their strengths are not overlooked. The use of multiple measures will also ensure that minority populations are being given the opportunity to participate in advanced placement and gifted programs, are not being tracked into lower-performing classrooms, and are not being overrepresented in special education programs (Anderson & Harry, 1994; Booker & Mitchell, 2011; Ming & Dukes, 2006; Townsend, 2002).

3. *In the classroom, confront life experiences through poetry writing and multicultural literature*. Educators can help students to confront their life experiences through poetry writing. In doing so, this will help them to be aware of the role that culture plays in literacy development and enable them to make deliberate decisions about striving for literacy. Poetry writing is a medium for telling the truth, which makes it a powerful tool for helping students to face their cultural experiences and situations and reflect on it. With poetry writing, students must ask themselves key questions as they grapple with the complexity of culture and what it means for their literacy development. Some of these questions include the following: What is my purpose for writing this poem? Am I sharing my truth as I have experienced it? Will I help a reader confront his or her own truth? When students reflect on their experiences, it allows them to take charge of their future, which includes striving for academic success, of which literacy development is a part (Jocson, 2009). As it pertains to specific literacy development, poetry writing leads to literacy development in the area of composition as students refine their use of the writing process (prewriting, drafting, revising, editing, and publishing) and integrate it with the six traits of writing (ideas, organization, voice, word choice, sentence fluency, and conventions) to make their ideas clear.

   Like poetry writing, the use of multicultural literature in the classroom can help both educators and students to address life experiences and reflect upon them. For educators, multicultural literature serves to enhance their personal and professional development. Because educators will work with students from diverse cultural backgrounds, it is incumbent upon them to have a deep understanding of the history of these groups, how they function, and what their attitudes are toward literacy in order to have the highest expectations for them and provide them with effective instruction. Reading professionally and personally will also help to dispel misconceptions that could bias them in working with these diverse groups. For students, multicultural literature opens up a world of experiences and introduces them to cultures with which they may not have had opportunities to interact. In helping to promote social justice, teachers can incorporate multicultural literature in the teaching of their lessons. This will help diverse populations to identify with and take pride in the accomplishments of their culture and will expose the majority population to other cultures, as well as help students to see the interconnectedness across cultural groups. To foster specific literacy development, the reading of multicultural literacy increases students' vocabularies and general knowledge about the world, and it helps to improve their decoding skills (Ming & Dukes, 2006; Szecsi, Spillman, Vásquez-Montilla, & Mayberry, 2010).

4. *In the classroom*, *use discussion forums to address social concerns*. Curriculum guides bind curriculum in many classrooms, high-stake testing, and standards-based outcomes. Because of this, the inclusion of social justice topics is often

relegated to the "back burner," as they are not deemed critical to students' yearly performance and progress. Focusing on the academic curriculum to the exclusion of the social curriculum can prove to be harmful to those groups who have been marginalized because when there is incongruence between the majority and minority groups, the teaching of the curriculum is less effective in stimulating the latter group's learning (Brooks & Thompson, 2005). Thus, educators can helps students understand the importance of respecting each other's beliefs, lifestyles, and practices by promoting the discourse of social issues in the classroom setting. These forums can occur within designated periods of time on specified days of the week. In this setting, the teacher acts as a facilitator and allows students to lead the discussion. The teacher provides appropriate prompting to the discussion leaders by reminding them not to ignore, transpose, or marginalize participants' points of view (Brooks & Thompson). Topics can include issues such as sexual orientation, gender access to school activities and organizations, religious practices within the school setting, and acceptance of various cultural groups. Students are encouraged to demonstrate fidelity to the agreements that are made about the various topics. With regard to specific literacy development, discussion forums help to strengthen students' oral communication skills. They learn how to voice their opinions in meaningful ways, learn how to be receptive to others' point of view, learn how to identify and name a problem publicly, and learn how to make persuasive arguments when proposing solutions to problems (North, 2009).

Conclusion

There is little value in equating social justice with the simple proclamation, justice for all. Rather, social justice for all students, including those with the most severe disabilities, is much more than the absence of injustice. An informed social justice agenda is informed by an understanding of social justice as a noun referring to a particular disposition that requires school leaders and school staff to think about comprehensive schooling that includes school-wide efforts to educate and nurture children. Additionally, an informed agenda requires the consideration of social justice as verb, or the direct actions that must inevitably emanate from dispositions directed toward social justice for all children. Literacy serves as an excellent example to illustrate the importance of an expanded agenda that speaks to comprehensive schooling for all children. Reducing bias or attitudinal shifts are simply not enough in the wake of a global world that requires an educated citizenry that must be literate.

Part II

Approaches to Knowing/Studying Social Justice

Chapter 9
Researching Leadership for Social Justice: Are Some Methods Better than Others?

Robert Donmoyer

This chapter focuses on the relationship between research methods, on the one hand, and leadership for social justice, on the other. The chapter contains two sections. In the first section of the chapter, I will view the relationship between social justice concerns in education and research methodology from an historical perspective. Among other things, this section of the chapter will explain why certain researchers reject the use of quantitative methods for studying social justice-related issues. In the second section, I will challenge some of the thinking outlined in the first section and argue that there is nothing *inherently* problematic with using quantitative methods to explore the empirical aspects of a social justice agenda in education, in general, or leadership for social justice, in particular.

Historical Perspectives on Empirical Research and the Social Justice Agenda in Education

Using Education to Promote a Social Justice Agenda During the First Half of the Twentieth Century

Anthropologists remind us that formal education normally serves as a vehicle that societies use to transmit the existing culture to new generations and socialize the culture's young into already well-established cultural norms, social structures, and ways of operating (Spindler, 2000). This cultural transmission game plan is not

always followed, however. During the twentieth century, for example, leaders of new countries that were, in essence, colonial creations often employed education for nation-building purposes (Konyeaso, 1975). Their goal was not to *transmit* an already established culture; rather, they attempted to use formal education to supplant local or tribal cultures that had been in existence for generations with a relatively recent (and, in most cases, an artificially generated) national culture.

Cultural transformation also has been embraced by some as a goal for education in already developed nations. Within the United States—the country that will serve as a focal point for most of this chapter[1]—for instance, an interest in using education to transform society and promote social justice can be traced back to the progressive education movement that flourished during the first part of the twentieth century.

To be sure, during the early twentieth century, there were many different types of progressive educators, and the different types varied with respect to their commitment to using education to promote social justice. For example, as their name implies, the so-called social reconstructionists were not at all shy about trying to use the school curriculum to radically transform what they believed was an inequitable and, consequently, an unjust society. This lack of reticence in promoting what today would be characterized as a leftist agenda should be obvious to anyone who reviews the contents of the widely used history textbook series written by social reconstructionist progressive Harold Rugg (Carbone, 1977). It also would be obvious to anyone who reads *Dare the Schools Create a New Social Order?,* the influential book written by another social reconstructionist progressive, economist George Counts (1978, c1932). Indeed, any reader of Counts' book quickly understands that, for Counts, the question that served as his book's title was rhetorical rather than real. For Counts, in other words, there never was a question; the schools most certainly should attempt to transform society and make it more equitable and just.

Certain other progressives shared the social reconstructionists' social justice goals but not, necessarily, their tactics. John Dewey (1916, c1997, 1938), for example, was concerned that education did not become indoctrination, and, consequently, he emphasized developing students' thinking and inquiry abilities through engaging them in problem solving and communication within the context of democratically organized classrooms. These sorts of activity, Dewey argued, would develop in students the kinds of knowledge, skills, and dispositions that eventually would lead citizens in a democratic society to choose to create and live in a more just and equitable society.

A third type of progressive educator that was influential during the first half of the twentieth century was the group that historian David Tyack (1979) labeled the *administrative progressives.* This group, led intellectually, at least, by Stanford

---

[1] United States culture is the focal point here because it is my culture and, consequently, the culture I know best. Although I have lived elsewhere for periods of time and studied what is happening in other countries and cultures, I simply do not have adequate expertise to write a handbook chapter about other places. So, this chapter's focus on the United States has everything to do with my inadequacies and nothing to do with any claims that the United States should serve as a model for the rest of the world.

University professor, Elwood P. Cubberly (1909), often referred to as the father of the Educational Administration field within the universities and colleges, at times borrowed some of the rhetoric of other progressives, most notably John Dewey. But in translating Dewey's ideas into the organizational dimensions of schooling, they also introduced a new element into the progressive movement as well as a new goal that often undermined earlier social justice concerns. The new element was bureaucracy; the new goal was the promotion of efficiency (Callahan, 1964). By the middle of the twentieth century, this efficiency goal and the bureaucracies that administrative progressives established to promote it frequently trumped other progressives' commitment to using the schools to promote social justice.

Social Justice Concerns and the Debate About Educational Research During the Second Half of the Twentieth Century

The interest in using education to promote social justice did not completely disappear during the second half of the twentieth century in the United States. An interest in promoting social justice both within and outside of schools, for example, was kept alive by the civil rights movement that began in earnest in the 1950s and the feminist movement that can be traced back at least to the 1960s. Indirect support for continuing to focus on social justice concerns during the second half of the twentieth century also came from another somewhat surprising source: the debate about research methods that was being carried out in earnest within the educational research field during the final three decades of the century.

The Conception of Educational Research Prior to the 1970s

Prior to the final three decades of the twentieth century, the educational research community spent little time debating what research methods its members should use to study educational phenomena, including the phenomena of educational leadership and management. There was general agreement, for example, that educational research entailed quantification of one sort or another.

Within the educational administration field, for example, the quantitative research that was conducted during the first three quarters of the twentieth century tended to involve questionnaires and survey designs. Researchers in the educational administration field could do this, according to Bridges (1982), because researchers within the field had little interest in directly examining organizational outcomes or systematically exploring which organizational and leadership variables had produced particular outcomes. In the field of educational psychology, however, outcomes—and the linking of outcomes with process variables—were major concerns. Consequently, there was an emphasis on doing experimental—or at least quasi-experimental—studies that compared those members of a group who had experienced a particular educational intervention (the so-called experimental group) with those who did not (i.e., the control group) (Campbell & Stanley, 1971, c1963). The goal, in short, was to develop the sort of knowledge that would enable educators to predict and, ultimately, control what would happen in (and also out of) schools. In 1910, for example, E. L. Thorndike wrote, in the inaugural issue of the *Journal of Educational Psychology*, that a

> complete science of psychology would tell every fact about everyone's intellect and character and behavior, would tell the cause of every change in human nature, would tell the result which every educational force—every act of every person that changed any other or the agent himself [or herself]—would have. It would aid us to use human beings for the world's welfare with the same surety of result that we now have when we use falling bodies or chemical elements. In proportion as we get such a science we shall become masters [and mistresses] of our own souls as we are now masters of heat and light. *Progress toward such a science is being made.* (p. 6, emphasis added)

While researchers in the subfield of educational administration field did not, themselves, normally employ the sort of experimental and quasi-experimental research designs that educational psychologists like Thorndike advocated using, they certainly were aware of and alluded to the experimental work that was going on in other parts of the educational research field (Cubberly, 1909). Indeed, the idea that educational researchers could and would uncover "the cause of every change in human nature…[and] ever act that changed any other or the agent himself [or herself]" (Thorndike, 1910, p. 6) helped legitimate the educational administration field's emerging faith in bureaucracy: If educational researchers would soon tell us, with certainty, what to do to produce desired results, there was a need for school leaders to create the sorts of educational organizations that could insure—through well-established standard operating procedures and appropriate rewards and sanctions, for example—that the right things got done in schools.

There is an implicit point in the previous paragraph that needs to be made explicit: The influence of Thorndike and his disciples on the educational administration field—and on education, generally—had much more to do with rhetoric than results (Donmoyer, 2005). Indeed, throughout the first three quarters of the twentieth century in the United States, Thorndike's rhetoric had a major impact on educational practice, in part, because it helped justify the bureaucratization of schooling. The empirical research that Thorndike and his followers conducted, however, provided little in the way of definitive or useful results. One highly touted finding that took nearly a half a century to produce, for example, was about time on task: Students who spent more time engaged in a certain kind of task, researchers informed us, were more likely to learn how to do the task than students who spent less time practicing the task. Clearly, this finding was, in effect, little more than a statement of the obvious. The same could be said of other "findings" produced by research associated with the Thorndike conception of educational research.

Members of the Research Community Recognize a Problem

The results that had been produced after many decades of research that attempted to implement Thorndike's vision of what researchers should do, in fact, were so limited that, by the 1970s, a number of scholars were rethinking the form and function of educational research. One of these scholars was the eminent twentieth-century educational psychologist and statistical analysis guru, Lee Cronbach. In the mid-1950s, Cronbach (1957) had stood in front of an audience at the annual meeting of the American Psychological Association and declared that educational psychologists could finally achieve what Thorndike had promised decades before if they stopped focusing on the impact of treatments on individuals, in general, and instead, focused on how treatments impacted individuals with particular characteristics (or, to use Cronbach's terminology, different *aptitudes)*. By the mid 1970s, however, after spending twenty-plus years searching for what Cronbach called "aptitude x treatment interaction" effects and producing "inconsistent findings coming from roughly similar inquiries" (Cronbach, 1975, p. 119), Cronbach once again stood before attendees at an American Psychological Association annual meeting and, this time, declared:

> Once we attend to interactions, we encounter a hall of mirrors that extends to infinity. No matter how far we carry our analysis—to third order or fifth order or any other—untested interactions of a still higher order can be envisioned. (Cronbach, 1975, p. 119)

In his speech in the mid-1970s, Cronbach (1975) actually endorsed supplementing the quantitative procedures traditionally used in interaction effect studies with the sorts of qualitative research procedures employed by ethnographers in the discipline of anthropology. Like anthropologists such as Geertz (1973), Cronbach spoke of the need for *thick description*. According to Cronbach, thick description could be used to explore, ex post facto, what had happened in a study when things did not turn out as expected (and as they did in another similar study).

Cronbach was not the only educational researcher at that time to look to the qualitative methods used by ethnographers for new methodological options. A number of evaluators of educational programs both inside the United States (see, e.g., Stake, 1975) and in other countries (see, e.g., Parlett & Hamilton, 1977) also had become frustrated by the fact that the educational research community's traditional experimental methods failed to detect program outcomes that they believed had been produced; they also were frustrated by the fact that traditional experimental designs did not provide an opportunity to explore obvious—and obviously important—unanticipated outcomes. They, too, looked to ethnography for methodological options to use in the evaluation studies they conducted.

Very quickly, other members of the educational research community, not just educational evaluators, began using ethnographic and other types of qualitative methods. In time, major educational research journals began publishing qualitative studies, and studies that employed qualitative rather than quantitative methods became commonplace on research conference programs.

New Methods and Their Meaning

Many of the educational researchers and evaluators who began to use qualitative methods during the final quarter of the twentieth century were only interested in finding methodological alternatives to either supplement or supplant the field's quantitative methods that they believed were inadequate for studying educational phenomena (Miles & Hubberman, 1999, c 1984). Others, however, began to view the educational research field's growing interest in qualitative methods as something akin to the paradigm revolutions that Kuhn (1996, c. 1970, 1962) had indicated occurred periodically in the physical sciences. More often than not, social justice concerns were at least implicit in the thinking of this latter group.

Arguably, the leaders of the new-paradigm group were Lincoln and Guba. In their influential book, *Naturalistic Inquiry*, for example, Lincoln and Guba (1985) associated the use of qualitative methods with visions of knowledge, reality, and ethics that were totally different than—and, according to Lincoln and Guba, incommensurable with—the thinking of traditional quantitative researchers. Indeed, consistent with what they believed was Kuhn's description of paradigm revolutions in the physical sciences, Lincoln and Guba wrote that what they were articulating was "an entirely new paradigm, not reconcilable with the old…" just as "the world is round cannot be added to the idea that the world is flat" (p. 33).

Thus, Lincoln and Guba (1985) argued that traditional researchers (a group they labeled *positivists*) and adherents to their new paradigm (who they referred to, in their 1985 book, as *naturalists* and later called *constructivists*) embrace distinctly different (and, according to Lincoln and Guba, logically incompatible) ideas about the nature of reality. While positivists embrace an ontology that assumes that "reality is single, tangible, and fragmentable," Lincoln and Guba wrote, constructivists assume that "realities are multiple, constructed and holistic." (Lincoln & Guba, p. 37).

These different views of reality also have significant epistemological and methodological implications, according to Lincoln and Guba (1985). When one views the world through Lincoln and Guba's naturalistic/constructivist paradigm, for example, knowledge is no longer discovered. This claim had major ethical implications, since researchers bear far more responsibility for the impact of their findings if they have at least partially constructed them rather than simply discovered a picture of reality that they had no influence on creating.

In addition, while E. L. Thorndike and others who are under the spell of the positivist paradigm assume that "every action can be explained as the result (effect) of a real cause that precedes the effect temporally (or at least is simultaneous with it)," Lincoln and Guba (1985) argued that adherents to the new naturalistic/constructivist paradigm embrace a conception of reality or ontology that envisions a world that is not a world of predictable cause and effect relationships; rather, human beings construct (and constantly reconstruct) the social world through ongoing social interaction. "All entities are in a state of mutual simultaneous shaping," Lincoln and Guba wrote, "so that it is impossible to distinguish causes and effects" (p. 38).

Consequently, for Lincoln and Guba's (1985) constructivists, the only legitimate type of research is case study research that can provide thick descriptions (Geertz, 1973) of social life. Thick description, among other things, focuses on the way those being studied make sense of the world and the meaning they, themselves, construct; it also portrays social phenomena as being interrelated and describes them in context rather than by translating social phenomena into discrete and decontextualized variables.

Much of what Lincoln and Guba and their intellectual allies wrote about was not new. As has already been noted, scholars like Lincoln and Guba (1985) borrowed (and, in some cases, adapted) the concept of thick description, as well as most of the methods they advocated using, from anthropology. Furthermore, the argument that researchers should focus their attention on socially constructed meaning can be traced back to the writings of Wilhelm Dilthey (2002) during the advent of the social sciences in the nineteenth-century Europe, and in the twentieth century, to the symbolic interactionist (Blumer, 1969) and ethnomethodology (Garfinkel, 1967) subgroups within sociology.

What was unique in Lincoln and Guba's writings, however, was their claim that social constructivist thinking represented a distinct paradigm that was incommensurable with other ways of thinking about and doing research (Donmoyer, 2011). There was also an ethical emphasis in Lincoln and Guba's work that distinguished their thinking from what came before and that also resonated with social justice concerns. As one of Guba's students, Patti Lather (1986), later argued, from the perspective of the new research paradigm, all empirical research requires the sort of a priori framing that insures that it is ideological and serves the interests of some groups while it disadvantages others.

Thus, according to Lather (1986), the relevant distinctions are (a) whether research is openly or clandestinely ideological and (b) whether a researcher chooses language and frames her or his research questions and research design in conventional, commonsensical ways that almost invariably serve the interests of those who already are part of a society's advantaged group or whether the researcher frames her or his research in a way that challenges the privileged and serves the interests of those who are currently disadvantaged.

Lather (1986) was clear that she was engaged in openly ideological research that was explicitly designed to serve the interests of the less privileged members of society. She even developed a research strategy inspired, in part, by feminist consciousness raising sessions that she dubbed *research as praxis.* The research-as-praxis strategy entails having a researcher work collaborative with some of the least privileged members of society to help them—and, also, the researcher—understand what is happening and how inequities might be overcome.[2]

Guba, Lincoln, and their former students such as Lather were not the only voices articulating and advocating for a social constructivist paradigm within the research field during the final quarter of the twentieth century. Within the educational administration field, for example, Canadian Thomas Greenfield (1975, 1978, 1980; see, also, Greenfield & Ribbins, 1993) was articulating ideas that were strikingly similar to the ideas being articulated by Lincoln and Guba. The major difference is that Greenfield's ideas were directed at the field of educational administration and specifically focused on rethinking the nature of educational organizations. Culbertson, for example, noted in 1988 that Greenfield "argued that educational organizations are not 'objective" phenomena regulated by general laws. Rather they are mental constructs that reflect the perceptions and interpretations of the members" (p. 3.).

---

[2] Later in her career, Lather discovered postmodernism and this turn resulted in the development of research strategies that not only had researchers working collaboratively with their research participants but also had researchers intentionally undermining their authority. For examples of this genre of work, see Lather, 1991 and Lather & Smithies, 1997.

Some significant variations on the Greenfield/Lincoln and Guba type of paradigm talk also surfaced during the final quarter of the twentieth century. Critical theorists both inside (see, e.g., Foster (1986) and Bates (1980, 1982, 1987, 1989)) and outside (see, e.g., for example, Lather 1986; Sharp & Green, 1975) of the educational administration field, for example, emphasized how macro-forces within the larger society reproduced social inequality. These scholars often criticized scholars such as Lincoln and Guba and Greenfield for failing to attend to how these macro-forces influenced and, in fact, constrained the social construction of reality through face-to-face interaction.

In 1986, for instance, Anderson advocated using an approach to research he labeled *critical ethnography*. Critical ethnography looked not only at social interaction within schools and other organizations but also at how macro-forces set the stage for and often choreographed the sorts of social constructivist process that both Lincoln and Guba and Greenfield described. (For a recent update of Anderson's position, see Anderson & Scott, 2011.)

Summary

In this part of the chapter, I have demonstrated that there was an extensive debate about research methods and their meaning within the educational research community during the final quarter of the twentieth century. What may be less clear at this point, however, is what the new thinking about research that was articulated during the final quarter of the twentieth century has to do with leadership for social justice. That is the focus for the final part of this first section of the chapter designed to provide an historical perspective on the relationship between research methodology and leadership for social justice.

The Significance of the Methodological Debate for Leadership for Social Justice

Qualitative Studies Expose Within-School Mechanisms for Promoting Social Inequality

The most obvious relationship between the debate about research methodology that was conducted during the final quarter of the twentieth century, on the one hand, and leadership for social justice, on the other, is that the debate about research methods ended up legitimating qualitative studies that allowed researchers to look closely at what happens in schools and see close-up how those who work in schools can help produce—and reproduce—social inequality. This research, in short, provided a manual of sorts about what school leaders interested in promoting social justice should attend to in the schools and school districts they head.

One of the earliest of these studies was Ray Rist's (1973) *The Urban School: A Factory for Failure.* In this book, Rist documented how a kindergarten teacher sorted her students into a winner and a loser group within the first few days of the school year and how the groups remained virtually the same as he followed the students throughout the kindergarten year and during the next two years of schooling.

This consistency over three grades of schooling with three different teachers should not be surprising, according to Rist (1973), because he documents how the winners and losers received both different types and different amounts of instruction. Indeed, Rist's data suggest that the kindergarten teacher provided very little instruction to the loser group, so there is no reason to believe that any member of this group should have been able to transcend the initial classification during the kindergarten year or that they would not be behind the members of the winner group when they entered the next grade. Adding to the tragedy Rist describes is the fact that the initial classification of students seemed to be based primarily on nonacademic indicators such as the quality of the clothing children wore.

There have been countless other studies over the years that have presented a similar scenario to the one found in Rist's (1973) *The Urban School: A Factory for Failure*. At times, the scenario has been a bit more complex. In Willis' (1977) classic *Learning to Labor*, for example, the British working-class secondary students he focused on and studied actually contributed to their own marginalization in the academic world as a way of asserting and preserving their cultural identity.

Ogbu's (1978; see, also, *Anthropology and Education Quarterly*, 1996) ethnographic studies of African-American students in the United States present a strikingly similar story line. A more recent example of roughly the same scenario—albeit with another setting (British Columbia, Canada) and a different cast of nonmainstream-culture characters (South Asian teenagers)—can be seen in the study that recently won the American Educational Research Association Division A Outstanding Dissertation Award, Sayani's (2010) *Pathologies and complicities: How School and the Identities of Disaffected South Asian "Brown Boys."*

These studies—and many others like them that used qualitative methods to get a closeup look at schooling—have rather obvious implications for school leaders. For example, the stunning and rather horrific events that Rist (1973) and others recounted should sensitize school leaders to the sorts of things to listen for when interviewing and hiring prospective staff as well as to what to look for when they supervise those staff members they do hire. The Rist study as well as the Sayani study also suggest the need for attitude adjustment-oriented professional development initiatives for teachers, since, clearly, if teachers believe that certain types of students are incapable of learning very much, they will structure their classrooms in such a way that members of these group have little opportunity to learn very much.

To be sure, the implications for social justice-oriented school leaders of studies that portray students as being, in essence, complicit in the less than equitable outcomes schools produce are a bit less obvious. But these studies, at the very least, suggest the areas in which school leaders could focus their attention. The Willis

(1977) study, for example, suggests that school leaders should work hard to break down the mental work/physical labor binary that, in the current era, is not all that appropriate anyway. The growing number of programs that attempt to blend academic education with vocational programs may provide at least a blueprint for social justice-oriented leaders to use in redesigning the school environment and making it less alienating for certain kinds of students. Certainly, Shirley Brice Heath's (1999, c1983) qualitative study reported in the now classic book *Ways With Words* demonstrates that school employees, if they wish to do so, can adjust to culturally different students rather than requiring that culturally different students adjust to the mainstream culture reflected in the organizational culture (Schein, 2004) of most schools.

To summarize, qualitative studies of the production of social inequality provide a catalogue of quite specific and exceedingly concrete actions that promote social *injustice*. This catalogue can be used by school leaders as warning signs that prompt intervention. Even if the critical theorists (see, e.g., Anderson & Scott, 2011; Bates, 1980, 1982, 1987, 1989; Foster, 1986) are correct when they indicate that those who promote social inequality within schools are simply playing roles and enacting scripts created by macro-forces within the larger society, school leaders can still lead a resistance movement in the environments for which they are responsible. Studies like the ones referenced here suggest where school leaders should target their resistance.

The Impact of the New Ways of Thinking About Research and Social Life

The findings of qualitative studies like the studies by Rist (1973), Willis (1977), Sayani (2010), and Heath (1999, c1983) that were discussed, albeit briefly, in the prior section can be exceedingly useful to school leaders committed to promoting social justice in the schools they head. The new ways of thinking about social reality that surfaced during the methodological debates during the final quarter of the twentieth century, however, may be even more influential and important than specific research findings. To state this point another way: Just as Thorndike's rhetoric was more influential than the results of studies inspired by his rhetoric (Donmoyer, 2005), the same might be said about the rhetoric of the twentieth-century advocates of qualitative research (even though, in this case, the results of studies are hardly meager, as the above discussion of a handful of representative studies demonstrates).

Here I want to discuss two implications for school leaders of the new ways of thinking about research and social life that social constructivists such as Lincoln and Guba and Greenfield, on the one hand, and critical-theory-oriented scholars such Bates (1980, 1982, 1987, 1989), Sharp and Green (1975), and Anderson (1986) articulated during the debates about research methods that occurred in the educational research field during the final quarter of the twentieth century. The first implication relates to thinking that portrays social life as a social construction.

Among other things, constructivist thinking should free school leaders interested in promoting social justice in their schools to create the sorts of school cultures that treat all students fairly and equitably. Once we see the world as being socially constructed, we no longer live in the sort of deterministic world described by Thorndike and his disciples, and the primary task of school leaders, therefore, is no longer to create a “one best system” of schooling that corresponds to the “natural” order of things (Tyack, 1979). Rather, school leaders, along with other educators in the schools that leaders head, can construct—and, if need be, reconstruct—the always idiosyncratic school cultures in which they work with an eye toward promoting rather than inhibiting the fair and equitable treatment of all of their schools’ students. After all, even critical theorists—who suggest that a form of social determinism is always operating in society and, consequently, in society’s schools—talk about the phenomenon of resistance (Kincheloe & McClaren, 2002). In short, the new ways of thinking about both research and social life that emerged during the final quarter of the twentieth century remind school leaders that they have the ability to challenge societal forces that reproduce social inequality and, along with their staffs, construct learning environments that are oriented toward obliterating rather than reproducing social inequality.

The second implication I want to discuss involves the fact that constructivists’ claim that knowledge is constructed at least as much as it is discovered demystifies even *quantitative* research studies, including quantitative research studies that, in the past, have been vehicles for legitimating social inequality. In the past, for example, many researchers studied a group of failing students they characterized as *culturally deprived* rather than simply as *culturally different.* The *culturally deprived* language, in effect, identified the source of the problem before any data were collected and, in many cases, before a study was even designed. The culturally deprived label, for example, assumes that the students and their families are the source of difficulty. Consequently, researchers who studied “culturally deprived students” never even entertained the idea that—much less collected data about whether—inadequacies in the schools these students attended contributed to their inability to do well in school. They certainly were not inclined to ask how, specifically, schools should modify their ways of operating to accommodate culturally different students as was done in the Heath (1999, c1983) study alluded to above.

Now, the constructivist conception of social life that was articulated in the debates about research that occurred during the final quarter of the twentieth century reminds us that no empirical study is entirely empirical. Rather, the way an “empirical” study is framed determines what counts—and what gets counted—and, consequently, has a major impact on a study’s “empirical” results. In short, the constructivist’s view of social life encourages a healthy skepticism about “empirical” studies, including quantitative studies about “culturally disadvantaged students.”

Before moving on, let me provide one other contemporary example to illustrate the second implication I am discussing here. The example involves what I, personally, think about when I review the results of the psychometrically sophisticated standardized tests developed and administered by state governments.

I currently live in California, a state with a large Mexican-American population. For many Mexican-American students, English is a second language; consequently, many Mexican-American students do not do as well in school—or on state tests—as many of their Anglo counterparts do.

To function in a school—and in the society beyond the school walls—however, most Mexican-American students eventually learn English and eventually become, in effect, bilingual. Their English skills, might not quite measure up to the English skills of native speakers, but they, still, would be coded by most people as being bilingual. Because I have been sensitized to the fact that even "scientific" knowledge is more a construction than a discovery, I periodically remind myself that the state-mandated standardized tests California students must take do not assess a student's ability to communicate in two languages, even though bilingualism is highly prized in certain high-prestige segments of society such as international business or the diplomatic corps. I have little doubt that, if the tests were changed to include an assessment of bilingualism, many of the current winners in the testing game would be losers and certainly some of the current losers would emerge as winners. This realization keeps test results in the proper perspective for me, and I believe it would do the same thing for school leaders and even thoughtful policymakers (whether or not they had an a priori commitment to promoting social justice) who understand the different paradigms of research that got articulated during the final three decades of the twentieth century.

Summary

In this first section of this chapter, I have discussed the debate about research methods that occurred within the field of educational research during the final quarter of the twentieth century and the implications of this debate for leadership for social justice. Among other things, I described the emergence of a new research paradigm that emphasized the use of qualitative research methods and case study research designs. I also discussed the social justice implications for school leaders of both the case studies that were produced and the new thinking that legitimated the use of case study methodology. In the next section of this chapter, I will argue that some of the proponents of using qualitative research methods and employing case study research designs were wrong when they also rejected the use of traditional *quantitative* methodologies.

Quantitative Methods and Leadership for Social Justice

The question to be addressed in this section, then, is whether the views of research discussed in the previous section—views that both legitimated the use of qualitative research and helped keep social justice concerns in the foreground of many US educators' thinking—require that researchers, especially those interested in promoting social justice, in general, and leadership for social justice, in particular, must eschew the use of quantitative research methods. This certainly has been the conclusion of some social justice advocates. Here, however, I want to suggest that there is nothing *inherently* problematic with social justice-oriented researchers using quantitative methods to study educational phenomena, including phenomena that have social justice implications.

I will make this case by developing three arguments. First, I will argue that many of the negative social justice-oriented critiques of quantitative methods are really critiques of researchers' inappropriate use of quantitative procedures rather than of the procedures themselves; I will argue, in short, that social justice advocates have tended to misdiagnose the problem when critiquing quantitative studies. Second, I will suggest that those interested in promoting social justice actually need *descriptive* statistics to learn about and demonstrate to others the extent of social injustice. Third, I will argue that even quantitative research oriented toward exploring cause and effect relationships can be justified and is potentially quite useful for leaders interested in promoting social justice, despite the naturalistic/constructivist paradigm's dismissal of the notion of causation.

The Misdiagnosing-the-Problem Problem

Empirical Studies Are Never Entirely Empirical

It is certainly the case that quantitative studies in the past have often ended up legitimating the status quo and insuring that groups that are privileged continue to be privileged. Shakeshaft (1989), for example, years ago demonstrated that, historically, the educational administration field promoted male-oriented approaches to leadership that did not fit most female leaders' ways of leading. They did this, in part, because the quantitative research that was used to help define desirable leadership practice almost exclusively focused on male leaders. What we have here, however, is not an inherent problem with quantitative methods. Rather, what we have is a sampling or an overgeneralization problem. In other words, members of the field misapplied the methods they were using and drew conclusions that ignored the rules—in this case, rules about sampling and drawing conclusions that had external validity—of the quantitative research game they were playing.

Shakeshaft (1989), in fact, went on to use the same sort of quantitative methods that earlier researchers had used to study male leaders in her studies of female leaders, and these quantitative methods produced results that allowed her to make a convincing case that, at the aggregate level, at least, female leaders' ways of operating were quite different than the ways of operating employed by most men. Much the same thing could be said about the studies of the so-called cultural disadvantaged youth alluded to in an earlier part of this chapter. While it is certainly the case that the a priori framing of these empirical studies constrained what was looked at and considered and, in essence, predetermined the study's findings about the source of the difficulty, this bias was introduced before any counting began and, consequently, can hardly be used to indict quantitative methods per se.

The problem, here, is that no empirical study is totally empirical. Before we can count, we must determine what counts and, consequently, what to count. None of this means, however, that counting, per se, is inherently problematic. What is problematic is the failure of most consumers of quantitative research to critically examine the way studies were framed and designed and how a priori framing and/or design features skewed the results and the interpretation of results.

Caveats

To be sure, quantification often discourages critique since quantification, in modern societies, often serves to mystify matters (Donmoyer, 2005), even though quantitative researchers claim it is an antidote to mystification and intuition (Antonakis et al., 2004). We are seduced by supposedly scientifically generated reading scores and forget to ask whether the tests used to generate them operationally defined reading in a way that is totally consistent with what we mean by *reading.* Similarly, we ignore the fact that the vast majority of quantitative studies use convenience samples and simply assume that a study's findings generalize to a population, even though there is no logical reason that we should assume anything of the sort when a convenience sample is employed.

And, of course, there is an almost inevitable built-in conservatism associated with quantitative studies that attempt to describe the way the world is, a conservatism that becomes highly problematic when quantitative descriptions of the world turn into prescriptions about the way the world should be. After all, the early educational administration researchers whose work Shakeshaft (1989) criticized for being biased against female leaders undoubtedly did not intentionally discriminate against female leaders and consciously remove them from the samples of leaders they studied. They studied samples dominated by male school leaders because virtually all school leaders, at the time their studies were conducted, were male.

This problem, however, is not a problem for quantitative studies alone. After all, the seminal qualitative study in the educational leadership field at the time, Harry Wolcott's (2003, c1973) *The Man in the Principal Office,* as its title suggests, focused on a man. Furthermore, all of the other principals in the central figure's district who were part of the story Wolcott told also were male. There was not a female in sight in the *The Man in the Principal's Office* because there were no female principals in the district at the time Wolcott conducted his study.

The Bottom-Line Argument About Misdiagnosing the Problem

For a number of reasons, then, it is important that we always *critically* examine all empirical findings—whether they were generated by quantitative, qualitative, or mixed-methods research designs—before we use the findings to make decisions about what ought to happen. At the start of my career, I developed and explored empirically a way of doing this in the form of an alternative approach to evaluation, an approach I characterized as *evaluation-as-deliberation* (Donmoyer, 1991). The approach involved assembling a diverse group of stakeholders who initially viewed a program being evaluated in different ways to help design and, if possible, execute parts of the evaluation study and, ultimately, to translate the study's results into recommendations for policy and practice.

When the approach was piloted in an elementary school, for example, the assembled stakeholder group, among other things, examined the school's reading test scores, but the stakeholder group also examined the tests that had been used to generate them to determine whether they were likely to measure the things that stakeholders associated with the concept of *reading*. (The conclusion, by the way, was that there was minimal overlap between stakeholders' conceptions and the conception of reading that the test-makers apparently had used.) For various reasons, my research agenda headed in a somewhat different direction and I never promoted this approach to evaluation. Unfortunately, our field has created few if any other forums in which the nonempirical aspects of empirical research are critically examined. Such forums are badly needed.

Our failure to critique the nonempirical aspects of quantitative studies, however, is hardly a reason for those concerned with providing leadership for social justice to cavalierly reject the use of quantitative methods. Indeed, as I will argue in the next section of this chapter, there are obvious reasons for social justice advocates to embrace at least some quantitative research designs.

The Importance of Descriptive Statistics for Social Justice-Oriented Leaders

A case study of a gay teenager who has been bullied and driven to suicide understandably tugs at most hearts and makes most people angry. But before action is taken to limit such bullying in other contexts, we normally need to have some sense of whether others have experienced the same problem, and, ideally, we would want to have a systematically generated estimate of how many "others" are having or have had similar experiences.

To make a compelling case for large-scale action, in other words, we normally need descriptive statistics. Consequently, despite what some influential proponents of the naturalistic/constructivist paradigm (see, e.g., Lincoln & Guba, 1985) have suggested in the past, case study research is not the only type of research in which those concerned with social justice research should engage. We certainly need to know about particular contexts qualitatively; but, normally, we also need to know whether what is happening in one context also is happening elsewhere and whether similar occurrences are frequent or infrequent.

In short, those who wish to exercise leadership to promote social justice need quantitative as well as qualitative data. Indeed, it is hard to imagine how social justice advocates could make the case for taking large-scale action to correct problems that lead to social injustice if they did not use descriptive statistics to demonstrate the extent of the problem that needs to be corrected.

The Case for Quantitative Research About Causal Relationships

Making the case for the use of descriptive statistics was relatively easy. After all, even in 1985, Lincoln and Guba cautioned against mixing paradigms, not, necessarily, methods. In addition, researchers who currently are critical of the growing interest in mixed-methods research designs (see, e.g., Denzin & Lincoln, 2005) tend to situate their critiques more at the paradigmatic than the methodological level, and consequently, they seem to leave the door open for descriptive forms of quantitative research. Indeed, it is now commonplace for many qualitative researchers to use quantitative survey results to triangulate their qualitative data (Donmoyer & Galloway, 2010).

It is a bit more difficult, however, to justify the use of inferential statistics and certain types of quantitative research designs that are associated with inferential analysis. I am thinking, for example, of experimental and quasi-experimental research designs that purportedly can reveal cause-effect relationships as well as designs that use modeling and statistical analysis procedures (e.g., multiple regression and hierarchical linear modeling analysis) to systematically estimate the relative contributions that different independent variables make to producing particular effects (i.e., the so-called dependent variables).

The bottom-line problem here for adherents to the constructivist paradigms is the claim that such research designs can produce knowledge of causal relationships (or, in the case of modeling strategies, a reasonable facsimile of causal knowledge). This is a problem, of course, because, as was noted in the first part of this chapter, one of the hallmarks of the naturalistic/constructivist paradigm is the rejection of causal explanations of social phenomena on essentially ontological grounds: The new paradigm, in short, assumes that social action is constructed (and constantly reconstructed), not caused (Lincoln & Guba, 1985).

Here I want to argue that a commitment to constructivism does not require a wholesale rejection of causal thinking and, by implication, a rejection of quantitative research designs geared to exploring causal relationships or to estimating the amount of variance in a dependent variable that a certain independent variables explain. I will ground my case for not rejecting all talk of cause and effect relationships on a comment made by Peter Cohen (1968) years ago while critiquing Peter Winch's (2007; c. 2003, 1990, 1958) classic little book, *The Idea of a Social Science.*

In his book, Winch (2007; c. 2003, 1990, 1958) made the same sort of ontological argument against causal explanation in social science research that scholars like Lincoln and Guba (1985) articulated several decades later. Cohen's (1968) critique did not so much reject Winch's ontological argument; Cohen, in fact, conceded that "one would have to agree that the use of the term 'causation' does not have as precise a reference in the social world as it does in the natural world" (p. 416). Rather, he made an instrumental argument: "If one is to use such criteria," Cohen wrote, "one wonders what is to be offered in place of 'causation'.…In fact, one begins to wonder how social policy would be possible without some idea of causation" (p. 416).

To state Cohen's point another way: The notion of causality can be thought of as a functional (and, in fact, an indispensible) fiction within the policy arena and in many other parts of social life, as well. After all, how could teachers thoughtfully plan lessons or other sorts of educational experiences for their students if they do not, at least at times, think in cause-effect terms.

And more to the point, here: It is difficult to exercise leadership designed to promote social justice if we banish thinking that links leaders' actions with the anticipated effects of leaders' actions. Interestingly, those who came to qualitative research by way of critical or feminist theory have always seemed to understand this point, at least intuitively. This is hardly surprising since it is difficult to support the concept of oppression without, in some way, talking about cause and effect relationships.

Thus, the litmus test for whether we use findings from quasi-experimental or similar types of studies is not whether such studies provide an ontologically correct picture of the social world.[3] Rather, the test must be a heuristic one: Do they suggest ways of leading that are useful, which, in the context of this chapter and the book in which the chapter appears, would mean useful in promoting more equitable and just educational environments? The relevant question, in other words is the following: Even if quantitative researchers are writing fiction, is it a functional fiction?

I would be the first to admit that we do not yet know whether quasi-experimental or statistical modeling types of studies can produce useful knowledge for leaders' intent on promoting social justice. The paradigmatic prohibition against conducting such studies if one is a social justice-minded constructivist has led to a dearth of such studies. Consequently, we do not yet know whether the social world that is constructed (and frequently reconstructed) is sufficiently patterned—or whether the patterns that do exist are sufficiently similar across contexts—to judge whether quantitative studies that attempt to predict relationships between leaders' actions and their effects will provide knowledge that is more helpful than commonsense inferences about cause and effect relationships. What does seem obvious, however, is that there should not be a paradigmatic prohibition against trying to find out whether causal or causal-like quantitative studies are useful as long as we acknowledge that cause and effect accounts of the social world are, at best, functional fictions rather than ontological descriptions of the way the world really is.

---

[3] Elsewhere (see, Donmoyer, 2011) I have argued that it makes little sense to even talk about the way the world really is when we assume that reality is always socially constructed. Epistemology, in other words, trumps ontology.

Conclusion

In this chapter, I have attempted to link a concern with social justice, in general, and leadership for social justice, in particular, with choices about research methodology. In the first part of the chapter, I noted that the methodological debate about qualitative and quantitative research that occurred, at least in the United States, during the final three decades of the twentieth century helped keep a concern for promoting social justice front and center in debates about education in the United States.

Furthermore, legitimating of the use of qualitative methods also had two more direct benefits: First, it opened the door for conducting important qualitative studies that documented how social injustice gets reproduced in schools and classrooms and, in the process, alerted educational leaders of things to look for when supervising their staffs and things to listen for when interviewing *potential* members of their staff. Second, the paradigm talk that was used to justify the use of qualitative methods also encourages the notion that social injustice is not natural and inevitable and that leaders and their staffs can remake reality in ways that promote social justice rather than mindlessly reproduce the injustices of the past.

In the second part of the chapter, I suggested that the juxtaposing of qualitative and quantitative methods during the final three decades of the twentieth century and the demonizing of quantitative methods that often accompanied this juxtaposition was more than a little problematic. I developed a three-part argument to support this claim. First, I noted that many of the critiques of quantitative methods were more critiques of their inappropriate use rather than of the methods themselves. Second, I demonstrated that descriptive statistics, at least, are required to learn about the extent of social injustice problems and make a compelling case that some sort of action is required.

Finally, I suggested that even studies that attempt to provide causal explanations (or reasonable facsimiles of causal explanations) could possibly be useful if we think of the results of these studies as potentially functional fictions rather than as ontological statements about the social world. Because few studies of this sort have been conducted to date, the utility of such work for social justice-oriented leaders cannot be assessed at this time. It seems clear, however, that any leader who wants to impact an organization must use some variant of causal thinking to do her or his work.

Chapter 10
Transforming (Un)Just Institutions: A Reflection on Methodology

Colleen L. Larson

> What is left for us then in this positivist, media-dominated, and self-centered time? How, with so much acquiescence and so much thoughtlessness around us, are we to open people to the power of possibility? How…are we to move them to perceive alternatives, to look at things as if they could be otherwise?
>
> (Greene, *Dialectics of Freedom*, 1988, p. 55)

What role can social justice research play in shedding needed light on the real obstacles that limit the opportunities and life chances of impoverished children and youth? Although the specific obstacles to educational opportunity in the lives of economically disenfranchised people vary widely from one country to the next, this concern for creating real opportunities for poor populations unites many researchers, educators, and policymakers around the world. What role can our research methodologies play in opening people up to what Maxine Greene calls "the power of possibility?"

In the United States, universal access to education is often portrayed as the great equalizer for enhancing opportunity in life. Education is held up as the medium for making the race to obtain prestigious jobs and acquire wealth in a free and open society a fair one. Because all children in the United States have the opportunity to receive government-funded education through high school, many politicians, philanthropists, and policymakers assert that all children in the USA have an equal opportunity to achieve. Therefore, when children do not succeed in this country, their failure is often attributed to differences in individual abilities or ambitions and, more recently, to the incompetence of administrators and teachers, not to vast disparities in *real* opportunities to learn stemming from enduring social and structural systems of injustice. Social justice researchers recognize, however, that the material conditions of children's lives can powerfully limit the real opportunities and freedoms that children have to live lives they want to live.

Opportunities: Real and Imagined

About 10 years ago, I was asked to write a review of literature on leadership for social justice with my colleague, Khaula Murtadha (Larson & Murtadha, 2002). While mapping the literature on social justice, we came across two books by Amartya Sen, a developmental economist, titled: *Development as Freedom* (1999) and *Inequality Reexamined* (1992). These books pushed our thinking about issues of social justice and the methodologies we use to understand disparities in achievement and lack of opportunity in education in new directions.

Sen challenges the utilitarian assertion that all people are free to choose what they want to do in life. He argues that due to vast disparities in real freedom to pursue the lives they want to live, focusing on achievement (outcomes) alone will never lead to real opportunities for poor populations. Instead, he suggests that social justice researchers ought to examine what people are free or not free to do and then choose policies and practices with the intention of expanding people's actual freedoms to take advantage of available opportunities. People must have both freedom and real opportunity to pursue the lives they want to live.

Sen's argument immediately captured my attention because it so thoroughly resonated with what I was witnessing in my own research and in that of my colleagues. However, I never framed the problems that poor families and their children were confronting as problems of freedom. When I read Sen, I realized how central this notion of freedom is to the United States strong yet largely unexamined belief that all people are free to achieve if they are willing to work hard. This pull-yourself-up-by-your-bootstraps ethic of rugged individualism was launched in US economic theory with full force during the Reagan years under the tutelage of Milton Friedman (1980), an economist and a strong advocate for free unregulated markets and laissez-faire economics. To Friedman, true freedom can only thrive in societies that allow the market to generate wealth. He sees the wealth that people acquire as earned, overlooking inherited wealth entirely, and claims that in an open society, all people can acquire wealth if they choose to do so. Toward that end, Friedman believed that all people should have an opportunity to compete; however, he paid little attention to how large inequalities in material conditions undermine the actual freedom that individuals have to pursue available opportunities.

This belief in equality of opportunity underpins much of current education policy in the United States, including the "*No Child Left Behind*" legislation and more recently the "*Race to the Top"* competition. Both of these initiatives emphasize creating greater equality of opportunity through increased accountability and universal achievement standards while ignoring vast disparities in the actual freedoms that children and youth have to achieve.

Challenging Friedman, Sen argues that the utilitarian notion of freedom as non-interference is often good for wealthy people; however, for the poor, it is problematic. He argues that when the needs of poor people are at issue, freedom requires more than the absence of interference from the federal government or from their state or local institutions; rather, it requires creating more suitable conditions so people have greater freedom to pursue available opportunities.

At the time I was reading Sen's book, I remember feeling frustrated by the stories my students, many of whom are teachers, administrators, and policymakers in education, were telling me about their work in schools. I struggled to make sense of federal educational policies and local practices that were forcing many impoverished and immigrant children and youth of New York City into an appallingly emaciated form of education centered on high-stakes testing, pushing many of them into a vicious cycle of remediation, failure, and retention. Children who have been in this country for just 1 year and do not speak English are now required to take standardized, high-stakes tests in English, while others are forced into taking tests that their teachers know they cannot pass. This city's obsessive use of tests and teaching practices that focus on outcomes has reduced classroom activities in most schools serving impoverished and immigrant children to test preparation and to learning how to take tests rather than actually learning. Rather than increasing many children's freedoms and opportunities to learn, these policies are now blocking teachers from engaging their students in more compelling and pedagogically meaningful ways.

Anybody who spends any period of time observing children and talking with teachers in schools serving poor and immigrant children in NYC schools today can quickly surmise that this focus on equality of achievement while ignoring enormous inequalities in social, cultural, economic, and political conditions is problematic; Sen's work helped me to see how central the issue of freedom and unfreedom is to creating *real* rather than imagined opportunities for poor populations.

Sen's capability approach coupled with Martha Nussbaum's elaboration of this approach through child well-being, which I discuss later in this chapter, offers methodological guidance for examining issues of social justice in education. Increasingly, researchers are turning to the capability approach to understand what human beings really need if they are to have meaningful opportunities to learn and pursue lives they want to live. However, most of the research on the capability approach has been done in economics, employing quantitative measures to examine issues of freedom and capability.

In education, quantitative research is important for capturing and measuring disparities in outcomes (achievement); however, it is less useful for capturing how the freedoms or unfreedoms in children's lives may limit academic achievement, resulting in massively disparate outcomes. For example, a quantitative study may find that poor black children perform poorly on standardized reading tests when compared with their white peers, highlighting differences in test performance (outcomes); however, it provides no significant insight into how the lives that children live in low-wealth neighborhoods or how the institutional structures and practices of the schools they attend either enhance or undermine children's *real* freedoms and opportunities to achieve. To capture the processes that produce or impede freedoms to achieve, we need in-depth ethnographic and case study research.

The capability approach is valuable for illuminating how the lives that children live affect their sense of agency, well-being, social identity, aspirations, and freedoms to achieve. It also reveals the choices they make as well as the choices they are free to make. These are just a few of the key concepts within the capability approach.

Ethnography and case study projects focusing on individuals, schools, and communities can reveal how prevailing discourses, policies, and practices actually enhance an individual's freedom to choose what they want to do, which increases real opportunity, which can be converted into actual capabilities which lead to enhanced functioning in society.

Background and Purpose

Over the past 10 years, I have explored several paths to operationalizing the capability approach. As I watched my doctoral students struggle to use this framework, I recognized the need to clarify central methodological concepts in the capabilities approach like "capability," "freedoms," "unfreedoms," "agency," "choice," "deformed choice," "child well-being," "bodily integrity," and "functionings," to name a few. Because I believe that Sen and Nussbaum's focus on issues of freedom, capability, and well-being is so central to social justice research, my research team and I have worked together to make these concepts clearer and more accessible to other social justice researchers (Larson, forthcoming). I have found this lens useful in my own research and in my work with a cadre of doctoral students who have joined me in this effort to examine issues of freedom, choice, and opportunity in education.

However, like Gareth Morgan (1997) I recognize that "A way of seeing is a way is also a way of not seeing." This means that any inquiry approach or process we choose will help us to see some things and prevent us from seeing others. In this chapter, I demonstrate how a way of seeing can also be a way of not seeing by revisiting a case study that I did almost 15 years ago, prior to learning anything about the capability approach, and raise questions about my methodological choices in light of the capability approach. I examine how my methodological choices might have been different had I been using the capability approach to make meaning of what occurred in that study. I show how the capability approach, with its emphasis on child well-being, directs the researcher's attention to the children that often get silenced in critical studies focusing on systems of power and discuss how a greater attention the embodied child might have changed what I considered important to pay attention to in this study. I suggest that the capability approach provides a powerful and compatible methodology to use in combination with other critical research frameworks and keeps the researchers' eye appropriately focused on what is happening to children in our schools.

This chapter, I portray the capability approach for social justice and discuss why this framework is useful for researchers who are pursuing social justice issues for children and youth. Next, I discuss the methodologies that I have used to guide case study and ethnographic research prior to using the capability approach and show how this lens frames shifts the lens of inquiry in interesting and important ways. This portrayal shows how the capability approach aids researchers in exploring questions and areas of social justice that are often overlooked in social justice projects.

Finally, I examine what I have learned, in collaboration with my colleagues, about using the capability approach as a process for creating a greater conscious awareness of what is happening in schools and discuss research processes that make participants allies in unpacking the controlling discourses that often unconsciously shape professional practice. I also discuss how my colleagues and I have operationalized a few of the key concepts in the capability approach and offer illustrative examples from current projects.

Education as Development: The Capability Approach and Social Justice Research

In this section, I discuss the capability approach to social justice and portray some key concepts that ground this inquiry. The writings of Amartya Sen (1992, 1999, 2004) and Martha Nussbaum (1999, 2000), who elaborates Sen's work by focusing on the ethical dimensions of social justice and child well-being, are central to this discussion.

In *Inequality Reexamined* (1992), Sen argues that an individual's position in any social arrangement can be assessed in two distinct ways: (1) actual achievement and (2) freedom to achieve. "Achievement" is what an individual accomplishes or, said differently, the measurable outcome. However, having the "freedom to achieve" requires having the *real opportunity* to do what one has reason to value.

Sen's focus on freedoms to achieve directs the researcher's attention to what he calls the "freedoms and the unfreedoms" in the lives and daily realities of poor families and their children. By examining the unfreedoms that children and their families endure, researchers can shed better light on the *real* choices available to impoverished people. Sen argues that these choices can be severely limited, often leaving them with nothing more than what Nussbaum calls a "deformed choice" or, said differently, no choice. When people can see no way to accomplish or do what they really want to do, they often change their goals, making "adaptive choices," or what they perceive as more realistic goals given the realities of their situation. By identifying the unfreedoms that prevent many impoverished children and their families from doing what they would do if they had a real choice, social justice researchers can methodologically shed needed light on the often taken for granted belief that all people are free to choose the lives they want to live, if they are willing to work hard.

Some children in the United States are born into enormous wealth and privilege, while others live in conditions of considerable deprivation. Economic inequality in the United States is now greater than it has ever been in this country (Wolff, 2009). Wealth, just like health, political freedom, and physical safety, gives human beings greater freedom to choose and pursue what they want to do in life. Financial resources, for example, afford privileged children who aspire to college the freedom to focus on educational achievement without needing scholarships or work to support their studies.

Sen points out that the varying advantages and disadvantages that individuals possess impact the freedom they have to do what they want to do. He reminds us that when analyzing opportunity, economic resources like wealth and income are important to examine but so too are other indicators like health, human connection, human rights, and quality of life to name a few. The choice of evaluative space, or what we choose to pay attention to, is crucial to analyzing inequality and to developing public policy that is geared toward enhancing greater *freedoms to achieve* for people whose freedom can be severely diminished by the economic, social, political, and/or cultural context of their lives. Sen's focus on *freedoms to achieve*, rather than on achievement or outcomes alone as a path to human development, has clear ramifications for how we examine issues of social justice in education.

When researchers focus on a child's freedom to achieve and not just on the level of achievement, they can surface the disparities in *freedom* that lead to inequalities in educational achievement. For example, when a child's single mother loses her job and her family is forced out of their home in search of a new one, both the mother and the child's freedom to focus on education is severely diminished.

Poor families are often thrown into survival mode in a volatile secondary labor market where parents work two and three jobs and without benefits to support their families. These parents do not have the same freedom to focus on education, support their children academically, or provide opportunities that lead to the levels of achievement that parents in the professional and primary labor markets, typically, enjoy. Similarly, children whose families are new to this country and do not speak English, generally, have diminished opportunities to develop the skills they need prior to taking high-stakes tests in a language they are just beginning to learn. Nevertheless, because immigrant children are required to take all achievement tests in English after being in this country for just 1 year, despite the fact that research has shown that it takes several years to learn and use a new language, federal policy has essentially limited the real freedom that many children have to learn. Through these examples, we see that although all children may share the desire to do well in school, they do not all enjoy the same freedoms to achieve; children who are economically advantaged and have parents who are educated and speak English, typically, have far greater opportunities to succeed in school and develop the capabilities they need to create the lives they want to live.

Coming from an ethical rather than an economic perspective, Martha Nussbaum (2000) argues that insufficient attention to important aspects of individual lives also leads to harmful policies and practices. The outcomes-based approach to improving education in the USA today, for example, places absolute emphasis on test preparation and high-stakes testing, particularly in low-wealth communities where children are most likely to fail tests that were never written with them in mind. From a capability perspective, universal testing and uniform standards are problematic because the contexts of children's lives are neither universal nor equal. This insight is particularly important in education.

This nation's push for greater generalizability in research has resulted in decontextualizing children's lives and proceeding as if their minds can be educated without paying attention to the physical, emotional, or cultural realities of their life world.

Rather than seeing children as human beings in much of our research, children are forced into social scientific categories that measure their intellect and ability but deny their humanity as children in need of social, emotional, physical, and material support.

Concerned with child well-being and capability development, Martha Nussbaum (2000) argues that emotional and bodily integrity and the well-being of children and their families ought to be central in research efforts seeking to understand and enhance learning opportunities for impoverished youth; these issues are undeniably central to enhancing not only the educational achievement of children, but also to enhancing their overall life chances.

Nussbaum points out that how researchers frame and address the problems that limit children's opportunities to do well in school can be crucial to either expanding or narrowing their life options. For example, in schools, Nussbaum encourages researchers to ask: How do the lives that children and their families live affect their *real* opportunities to focus on education? How do the school, the government, and the broader society frame the problems that poor children and their families are experiencing? What social and educational policies are emerging from these ways of framing the problems of impoverished families? And how is this framing of these problems affecting their education, well-being, and life chances?

Nussbaum's theory of social justice and capability development encourages people to understand and respond to the injustices they see in a morally just way. Like Sen, Nussbaum argues that insufficient attention to cultural differences and the particular features of individual lives results in unjust and harmful policies and practices. Therefore, she compels researchers and practitioners to consider how the capabilities of individuals ought to be supported through social and educational policy and institutional practice. In schools, for example, this requires seeing children and their families as human beings first, not simply as students and parents. When we label people and confine them to institutionally assigned roles as parents, students, administrators, or teachers, for example, we diminish their humanity as well as our own by limiting our interactions in role-specific ways, rather than seeing others and ourselves as *human beings*.

Noddings reminds us that when people assume roles in institutions, they also tend to narrow how they see what is expected of them. For example, when educators become principals or teachers in schools, they often adopt role-orientated ways of being that limit how they think about their relationships with others in the context of their work. People often become less willing to engage with people as human beings. Noddings asks us to consider: How would our work in schools be different if we thought about what we did as entering relationships with children and families rather than as assuming roles as teachers and administrators? For example, if a child's family suddenly becomes homeless and the child misses several days of school, educators focused on attendance requirements may see this problem in institutionally narrow ways, framing the problem as the *student* is missing school, rather than the *child's* family is in serious trouble and needs support. Our institutional framing of societal problems can often fail to recognize and address the most serious problems confronting the lives of children and their families. The reality is that human beings, both children and adults, have social and material needs that must be met if children are to thrive in school as well as in life.

The Well-Being of Children and Youth

A capability researcher, then, is interested in what people are actually free to do and become. Nussbaum directs our attention to the lives of people as embodied beings. She reminds us that the minds of children, for example, cannot be educated when their bodies are threatened. This means that the physical, social, and emotional lives of children and adults are important to address in any serious effort to examine and enhance the life chances of children and youth.

Nussbaum argues that in a just society, people should be able to live a human life of normal length, without fear of dying prematurely in gang-controlled communities or in situations where they feel their lives are no longer worth living. She asserts that a person should be able to enjoy good health, good nutrition, and adequate shelter. They should be free to move from one place to another without overwhelming fear for their safety.

In education, Nussbaum points out that: "Children should be able to use their imaginations and their senses, to imagine, think, and reason—and to do these things in a truly human way, informed and cultivated by an excellent education that spurs imaginative and critical thought and opportunities to experience and produce inspiring, artistic, creative, and transformative works."

She also sees the importance of developing capabilities for understanding and coping with human emotion. She points out that being able to develop attachments to others, and loving those who love and care for us, is vital to healthy human growth and development. Human beings also need to be able to grieve when they cannot be with those they love and to experience longing, gratitude, and justified anger. Injustice, she suggests, arises when an individual's opportunity for emotional development is thwarted by overwhelming fear and anxiety, as well as by traumatic incidents of abuse or neglect. These insights, are crucial for educators who work with students who often experience enormous grief and loss in an educational context that pushes all things human beyond the classroom doors in an effort to increase time on task and raise test scores.

Finally, Nussbaum reminds us that in a just society, a person should be capable of practical reason. This means that people ought to be able to imagine living a life they have reason to value and be capable of engaging in critical reflection about the planning of that life. If children are to live full lives, they must learn to care about other human beings. They must be capable of engaging comfortably in a variety of social situations. Nussbaum states that: "They must have opportunities to laugh, to play, to enjoy recreational activities, and to be capable of imagining the situation of another and having compassion for that person. They must also have the ability to form and sustain meaningful and supportive relationships. Finally, children and their families, no matter what their material circumstances in life, need the social footing that allows them to develop self-respect and the experience of being treated as people of equal worth and dignity" (Nussbaum, p. 12).

Nussbaum's list of capabilities that children need to come into full well-being is motivating and inspiring. Certainly, children must also be able to read, write, and do math. However, as she points out, they need much more than this if they are to reach for full and happy lives. Nussbaum's robust list of what children need to know and be able to do awakens us to just how thoroughly we have narrowed the purposes of education and what we believe children ought to be able to know and do over the last three decades. But it is important to recognize that we have not narrowed the capabilities we want to develop for everyone, just for the children of the poor.

Unlike public schools, private schools have a choice in the students they will accept. In elite private schools, acceptance weighs heavily on family name and money rather than on academic ability, and the curriculum is not driven by the confining federal mandates of *No Child Left Behind;* rather, it focuses on what is needed to help one live the life one chooses: For example, a child attending the new elite Avenues School in Manhattan (http://www.avenues.org/world-school?adidnum=g_new_ws&gclid=CNGrwfKJ0a4CFYuK4Aod-zEJgA) will enjoy a curriculum that "recognizes the importance of educating children who are well rounded human beings, capable of living in today's world and free to explore their unique gifts and talents." Their mission is to:

> Graduate students who are accomplished in the academic skills one would expect; at ease beyond their borders; truly fluent in a second language; good writers and speakers one and all; confident because they excel in a particular passion; artists no matter their field; practical in the ways of the world; emotionally unafraid and physically fit; humble about their gifts and generous of spirit; trustworthy; aware that their behavior makes a difference in our ecosystem; great leaders when they can be, good followers when they should be; on their way to well-chosen higher education; and, most importantly, architects of lives that transcend the ordinary. (See Website)

Why, I wonder, isn't this the mission driving the capabilities we seek to develop within all children? Payne and Biddle (1999) rightly point out that because the life choices for disadvantaged groups can be severely limited by poverty, and I would add by the impoverished education that we are giving poor children, the United States has a glaring economic divide in opportunities and capabilities.

If researchers and policymakers recognized the importance of these capabilities and the roles they play in enhancing the real freedom that children have to focus on educational opportunity, how would this shape the way we do research and design social and educational policy? In the next section, I discuss what I have learned in collaboration with my doctoral students and colleagues about using the capability approach to shed greater light on social justice issues in education and pose some questions about normative methodological practices in social justice research.

Putting Freedom and Choice at the Center of Inquiry: Reflections on Methodological Choices

Over the past 10 years, I have used several approaches for guiding students in thinking through the methodology they use in light of the capability approach. Over time, I began seeing how the capability approach significantly aligned with other social justice methodologies I used, previously, and raised new questions and triggered important insights within these social justice projects. Because the capability methodology for social justice has not been used in field-based studies, I became more attentive to seeing how my preferred methodologies helped me or limited me in examining social justice issues from a capability perspective.

When I began doing studies of equity and opportunity in schools and communities, I was drawn to Norman Denzin's (2001) methodology, interpretive interactionism. Based on the writings of C. Wright Mills, this framework illuminates the difficulties that people often encounter in the institutions that exist to serve them.

Denzin's constructivist methodology synthesizes symbolic interactionism, hermeneutics, and biography. Although Denzin's approach to inquiry speaks directly to how alcoholics are treated by the social service agencies that exist to help them, this methodology is very applicable to examining issues of social justice in education. Denzin suggests that interpretive interactionism is most useful when examining "the relationships between personal troubles (such as wife battering or alcoholism) and the public policies and public institutions that have been created to address those troubles" (p. 2). However, from a capability perspective, I have found that the freedoms and unfreedoms that poor children and their families encounter in schools are, also, illuminated in important ways using this framework.

Denzin's interest in focusing on the individual to understand personal troubles aligns well with Sen's insistence that the lives of individuals, rather than groups, are most important for understanding issues of freedom, opportunity, and choice. The notion that individual problems are often rooted in how they are perceived by people working on behalf of institutions is central to this framework. Using this methodology, researchers can reveal how administrators and educators frame the problems they encounter with impoverished children and their families as well as how this framing determines whether children's real opportunities and life chances are helped or harmed by the actions of policymakers and school officials. Although schools exist to increase a child's opportunities and life chances, this is not always what happens.

This framework, then, is particularly useful for capturing how the policies and practices of those who work in schools can diminish or enhance the life chances of many children. Researchers must pay attention to how institutions help children as well as how they may hamper their real freedoms to achieve.

Like Nussbaum, Denzin asserts that the problems that many people encounter in institutions emanate from a gap in understanding between what the people designing policy think people need and what they really need. He focuses researchers' attention on how people come up against problematic policies and practices that often create injustice in institutions rather than enhance opportunity and freedom.

This approach to inquiry stresses the importance of capturing deeply personal and contextualized accounts of the troubles that people encounter in institutions. Denzin argues that because of the emphasis on personal biography and thick description of lived experience, this approach helps researchers to understand programs and the educational experience from the point of view of the persons most directly affected by them—the clients.

To Denzin, personal narratives drawn from the local context are central to understanding human intention and action. By illuminating gaps in understanding between the institution and those they are trying to help, people working in institutions can become more conscious of why their failure to take into account the lived realities, perspectives, and problems of the people they serve often results in ineffective, harmful, and unjust policies and practices.

The researcher's goal in interpretive interactionism is to capture the in-depth, biographical experiences of individuals who rely upon an institution, like a school, for support and to understand how they make sense of their experiences with the institution and with those who work on its behalf. A second goal of this approach is to understand how those who work in the institution make sense of the problems they encounter with the people they serve and to see how this framing shapes the experiences, freedoms, and life chances of those they serve.

Denzin values capturing the deeply contextualized experiences of those who rely upon institutions in-depth, arguing that public and institutional policies will fail if they do not correctly identify the real needs of the people these policies are designed to help. He reminds us that:

> Troubles are always biographical. Public issues are always historical and structural. Biography and history thus join the interpretive process. This process always connects an individual life and its trouble to a public historical social structure…strategically, the researcher locates epiphanies in those interactional situations where personal troubles become public issues. (p. 38)

Strategically, then, while talking with people about their lives and the difficulties they are experiencing, researchers encourage participants to recall epiphanic moments that they encountered in their interactions with people who work on behalf of institutions. An epiphanic moment is a time of crisis or awakening. It is a turning point in one's life that often makes it impossible for the individual to see life in quite the same way again. Denzin suggests that epiphanic moments have the "potential to create transformational experiences" (p. 34). Therefore, through this methodological framework, researchers can capture the stories that shape the lives and life chances of people as well as the role that institutions play in helping or harming them.

Looking Back: Reframing the Land of Oz

Long before I discovered the capability approach, Denzin's focus on epiphanic moments compelled me to use his framework in an article titled: "The Land of Oz: A Sociopolitical Study of School Community Conflict" (Larson, 1997). The conflict in this community arose when several young black students protested against racial injustice in their high school and were suspended for doing so. Jefferson Heights High School, a historically white school community, suspended the students for performing an unauthorized act at the talent show; however, in their defense, the young men argued that, despite repeated efforts to do so, they could not get the teachers or administrators to pay attention to their concerns about racist practices in the school. This protest became a moment of crisis or, as Denzin suggests, an epiphanic moment that awakened a previously cooperative black community to school practices that marginalized and demeaned their children in the school—practices they would no longer tolerate. In this case study, this protest and how people made meaning of that event became the pivotal issue in a political conflict between the administrators and leaders of the black community.

By talking in-depth with people who worked in the school as well as with those who sent their children to the school, I captured two very different but coalescing ways of framing this protest. The administrators saw the protest as bad behavior by troublesome students, and the black community saw it as a justifiable response to racial injustice in the school.

When I look back at this study today in light of the capability approach, I realize that the voices of students, the ones who truly came up against the system in this school, are clearly missing. Although I did discuss how the young men's real freedoms were diminished by the choices the administrators made to suspend them, this study focused largely on the political battle between adults, the administrators, and the black community. As a result, the young men are talked about, but their experiences and voices are largely silenced in this study of political struggle.

In looking back at this study, I realize that if I had used the capability approach to analyze this story, I would have paid more attention to the young people who participated in the protest. Instead, this study focused on how the black community and the religious leaders came up against the administrators of Jefferson Heights High School.

In reflection, I realize that the adults drew me into this political struggle, and they quickly framed this conflict as a problem between them, which pushed the students to the sideline and essentially silenced the students' voices. In revisiting this study in light of the capability approach, I recognize that the way I told the story of Jefferson Heights captures one possible story line, but it also fails to capture another critically important story.

Although, Denzin's framework is very useful for social justice research, I see now that the capability approach would have directed my attention as a researcher much more unswervingly on how students' capabilities were being developed or diminished in the school. Schools exist, after all to develop the capabilities and enhance the life chances of children and youth. If I had been guided by the capability approach while doing this study, I would have been more in tune with talking to the young men who had organized and participated in the protest. I see how the capability approach would have helped me to examine the choices as well as the deformed choice they felt forced into making as students in a school that did not welcome them. The capability approach would also shed greater light on how their relationships and interactions with teachers and administrators shaped their opportunities, life chances, freedom, and sense of agency, to name a few.

Looking back, I see missed opportunities for capturing the voices of these students and for creating a greater conscious awareness of the daily lived experiences of young people, many of whom were being bused into this white suburban community from the nearby city. I see how I could have mapped the choices, deformed choices, and adapted choices that these young people made as they struggled to be seen by their teachers, culminating in a protest at the school talent show.

Although I did capture students' voices in snippets, their stories and their voices did not have center stage, even though they deserved it. For example, at the public forum where the black community gathered to air their concerns about the school system, the words of one young woman haunts me still, hearing her say to her teachers "You don't love us." The capability approach directs researchers' attention to the very human, relational, emotional, and intellectual well-being of children and youth. In light of the capability approach, I realize that I didn't tell the story of the young people who had the courage to protest against racism in their school in Jefferson Heights. Instead, I told the political story of how their parents and community fought the way the school framed the student's actions. This story was also important and interesting, but when I methodologically reframe this study, I realize that I lost something very important in not focusing more on the stories of these young people and what they were experiencing in their school.

Although interpretive interactionism and the capability approach are both methodologies rooted in concerns for social justice, the capability approach offers researchers a much more robust portrayal of how to see injustice in the life and life circumstances of an individual child. Nevertheless, these two frameworks work very well together, and I still find Denzin's framework very useful, but Nussbaum's focus on child well-being fully shifts the social justice analysis to the needs and lived realities of children and youth and I think this is appropriate. If our current federal policies and the thinking of teachers and administrators are to change, the stories of children need to be told. Children's stories reveal their feelings of belonging and connectedness in schools or their feelings of rejection and isolation. These feelings are critical for capturing what makes children feel a part of or a part from their schools.

Researchers, who are concerned about improving the lives of economically disenfranchised children and youth, focus on economic, social, cultural, and political systems of oppression, which are critically important to engaging in social justice research. However, in examining those systems, the capability approach, with its emphasis on freedom and well-being, reminds researchers not to lose the voices and experiences of individuals, particularly the children in our studies of systemic inequality. Ethnographies and case studies that capture the embodied experiences of children in education are needed.

In the next section, I discuss embodied inquiry, and provide insight into how the capability approach enhances researchers' abilities to understand the deeply contextualized notion of "opportunity" in the lives of impoverished children and youth.

Making Bodily and Emotional Integrity Central to Inquiry

In recent years, my colleagues and I have used the capability approach to capture the voices of children in greater depth. These stories shed important light on why educational policy decisions are often so problematic in the lives of poor children and their families. Yet, policymakers tend to see their policy decisions as educationally sound and eminently rational. For example, New York City's Mayor Michael

Bloomberg argues that children who cannot read at appropriate levels in English should not be socially promoted to the next grade. Although this argument often enjoys popular public appeal, researchers know that retention is problematic because of the extreme emotional and relational trauma that it inflicts on children and their families. However, research did not deter the mayor from passing a mandatory retention policy affecting any child that failed to pass the third grade standardized tests in Math and ELA.

In a study focusing on children in New York City who were retained in third grade based on this policy, we learned just how profoundly children's lives were affected by this decision. Guided by the capability approach, this study takes an embodied look at children's experiences with retention (Wells & Larson, forthcoming). For illustrative purposes, I portray a brief excerpt from the story we tell about Marcus, one of the children who was retained:

> Marcus is an only child. He is the only person in his family who speaks English. His parents are first generation immigrants from Honduras, making Marcus a first generation Honduran-American whose parents came to the United States for better opportunities. Marcus has absorbed his parent's high aspirations, saying confidently:
>
> > I want to be a doctor, because doctors are smart and they type in the computer fast, and they know what medicine to give you. And when people got dandruff they give them a special shampoo.
>
> Marcus enjoys talking about his dreams for the future. He welcomes the opportunity to being transported in time to another place because his life, now, particularly, in school, makes him sad. He recalls that his life took a bad turn when he was told that he would not be promoted to third grade.
>
> When we asked Marcus how his parents responded to the news that he had to repeat the third grade, he closes his eyes tight, trying to hold back his tears, but soon they are spilling rapidly down his cheeks. Using the cuffs of his shirt, he quickly wipes them away. Marcus is now a fourth grader, and although he eventually passed his third grade test and he was promoted to fourth grade well over a year ago, the emotional memory of failing third grade quickly brings him to tears. Marcus remembers how he was told that he had failed his English Language Proficiency (ELA) test and that he would have to repeat the third grade:
>
> > They sent my father a letter in the mail. It said, 'Marcus repeats the third grade.' That is when I got a two in math and a one in ELA. I was mad at ELA. I ran into the hallway, and I was crying. My mom hit me in my face because she does not like it when I cry. Every time I get left back I cry and then my mom and dad hit me. They hit me with a belt and that hurts. I went into my room and I was crying and she was yelling to my father about me in Spanish.
>
> Marcus and his parents learned through the mail that he had failed 3rd grade and had been targeted for retention. The school system treated the retention of 1,500 third grade children as a business transaction, generating form letters and sending them to parents as if the news delivered in these envelopes was unproblematic. Marcus's teacher did not call them, nor was there a request for a special meeting to discuss either the issue of retention or Marcus's performance in 3rd grade. The letter revealed only that Marcus had received the lowest score possible, a one, on his English Language Assessment (ELA). As the only person in his family who speaks English as a first language, Marcus failed his English language test.
>
> Marcus remembers crying when he learned that he had failed 3rd grade. To his Mother and Father, crying about failing was as big of an offense to the family as failing. Like most Latin American countries, Honduran culture embraces a standard of hyper-masculinity

> for boys. This means that any sign of weakness in boys can be treated harshly. Marcus was hit by both parents that day not only because he failed, but because he cried about failing. He confides, "I do not think my father loves me anymore." Marcus' interactions with his parents since the letter arrived in his home make him feel that he is no longer wanted. He says in a sad, low voice:
>
>> It feels like I do not even live in my own house. Like I am left out, like I am lonely, and I have nobody. That is how I feel.
>
> Marcus is clearly in a fragile and emotionally raw place. One assumption underpinning mandatory retention is that if children are held accountable for their own education, they will work harder to improve their academic skills. However, Marcus's story, which is only told briefly here, reveals that as a child of immigrant parents, he does not lack the will to do well. He is trying hard to do his best. But being retained in third grade was a much more profoundly humiliating experience for him and his parents than Mayor Bloomberg could ever envision given his view of retention as unproblematic in light of his greater concern for avoiding social promotion. Now, even though Marcus is in fourth grade, his previous retention continually haunts him, and he fears failing again.
>
> Increasing pressures to achieve are not increasing Marcus' abilities to perform well on timed tests. Marcus can recall a time when he loved reading in second grade, but now he hates reading and freezes whenever he takes timed tests. His teacher is not hopeful that Marcus will pass his fourth grade tests. Marcus remembers that he once enjoyed school, but that is no longer the case. Although he is just 11 years old, his experiences in school are not good, making him feel rejected, unloved and defeated.

Children suffer enormously when institutions, like schools, harm rather than help them, and yet their voices, which can reveal so much about problematic policies and practices, are often silenced even in studies focusing on issues of social justice. Through Marcus' story, we achieve critical insight into the limitations of policies and practices that ignore the importance of embodied sensemaking.

Denzin's framework does not address issues of bodily integrity. However, Nussbaum points out that human beings interpret their lives in embodied ways. Because we are embodied beings, there are no human thoughts that are not mediated, first, by the human body. Reasoning, thinking and sense making, then, are not disembodied processes, rather our mind and body are unavoidably linked, and sense making occurs from an inseparable comingling of our brains, bodies, and embodied experiences. Lakoff and Johnson (1999) point out that these insights are coming from congnitive science and they are not "the innocuous and obvious claim that we need a body to reason; rather, it is the striking claim that the very structure of reason itself comes from the details of our embodiment, including our emotion (p. 4)." In light of this framework, it's interesting to note that leadership literature tends to frame the actions of school leaders in rational and disembodied ways. However, this way of framing the actions of school leaders overlooks how powerfully the body and fear of bodily harm or professional failure, for example, influences the actions of school leaders and educators.

When I look back at the narratives of the administrators and teachers in "The Land of Oz" study, for example, I am struck by the differences between the administrators disembodied "role stories" and their very embodied human stories of what they were experiencing during the political conflict with the leaders of the black community. When I compared the stories that I was told early in this study to those

I captured later in the study, I saw how the language shifted from rational mind states of order and control such as "we stopped," "we punished," and "we suspended," to, over time, more embodied feelings of chaos and the emotions of fear such as "it was frightening," "I felt threatened," and "we were afraid."

Carl Rodgers, a central figure in existential psychology, once said that there are really only two emotions: love and fear. All other human emotions are derivative of these two emotions. Anger, guilt, and revenge, for example, are all forms of fear. Rodgers argues that if people are not acting out of love, they are acting out of fear. Because our dominant patriarchal image of the high school principal is still one of a strong, stoic male figure, not unlike leaders in the military, researchers, and I include myself in this, still tend to focus on the disembodied mind states of those who lead our schools. It's not surprising then that research studies that examine the embodied stories of school principals who fear for their own physical safety or who fear failing as a leader in the building are difficult to find. And even though many leaders working in today's schools harbor these fears, they seldom express them. Researchers may also be complicit in producing images of disembodied school leaders because we fail to examine how the very human, relational, emotional, and physical aspects of our humanity shape our way of being in the world. In light of Nussbaum's framework, I see that embodied feelings of fear, for example, are important for understanding how principles, teachers, and students interact with others and how these interactions shape the choices they make.

Denzin's framework helps researchers to capture rich and revealing portraits of the many gaps between what children and their families need and what policymakers, educators, or social service providers think they need. I have found that, for the most part, the capability approach, which examines issues of freedom, choice, and opportunity, for example, enhances Denzin's framework in very compatible and important ways.

For example, in a study of an upward bound program (CAI), we used Denzin's framework to examine why many young men were leaving the program prior to graduation (Anderson & Larson, 2009). How were these young men experiencing the program that existed to help them graduate from high school and go on to college? In this study, we saw young men reaching for the opportunity to succeed in school and go on to college, but they often found themselves in difficult circumstances that demanded their attention. Nussbaum points out that deformed choices often force people into doing what they really do not want to do and what they would not do, if they had a real choice in the matter. In this study, we met Miguel a confident, capable, and motivated Dominican student who was eager to finish school and go on to college. However, his school plans were disrupted when family problems sidetracked him from that goal. He recalls:

> My mom was real sick. She had a tumor in her uterus and she had to get it taken out. So she was in the hospital for a while, and then she was home because she couldn't work. She was real tired and had to stay in bed. So I had to bring her stuff and cook for us. She had to go to the doctor a lot so I was picking up my little brother from school and taking care of him, and my dad had to work a lot. I was tired all the time. Plus I had schoolwork. I went from a B in one class to a D in only a few weeks. I was also missing CAI a lot. People were

> asking me, “Yo Miguel why didn’t you come yesterday? And it was too much. I really wanted to come, but I just didn’t have time….I tried to come a couple of Saturdays, but it was too hard. I was just sinking. You know how quicksand is? It takes you under.

When Miguel’s Mother became ill, the family needed to depend on him to take over his Mother’s duties, cooking, cleaning, caring for his little brother, as well as taking care of his ill Mother. His dad worked long hours to make up for his wife’s lost wages, so the burden of caring for the family fell to Miguel. Poor families can ill afford medical emergencies. Many families in this country are just one medical emergency or one job loss away from homelessness. Given that many families lack needed resources during times of unanticipated illness or job loss, poor families often have to lean on older children to care for younger ones when illness or unemployment strikes. This is just one of the illustrative examples of the many ways that poor children and their families get caught in difficult life circumstance that take away their *real* freedoms to focus on learning and going to college.

In the next section, I discuss another methodological lens that makes a valuable and needed contribution to the analytic palette of critical researchers, institutional ethnography, and show how the capability approach can also enhance researchers’ lenses of inquiry in these research projects.

The Freedoms of Educators and the New Social Organization of Schools

In using Denzin’s methodological framework and the capability approach, my colleagues and I have captured the in-depth life stories of children and parents as well as those of teachers and administrators, illuminating how the freedoms and opportunities of children and youth are enhanced or limited by their life circumstances at home or by normative institutional practices in schools. When our studies illuminated troubling policies and practices in schools and classrooms, we provided a needed critique of local practices that were narrowing rather than expanding children’s opportunities to learn; this is what critical scholars do. However, in working with administrators and teachers in the field, we began to notice that many of the teachers and administrators who participated in these studies also felt troubled and conflicted about the work they were doing in their schools and classrooms. Through conversations with our participants, we began to see how powerfully the practices of NYC educators at the local level were, increasingly, being shaped by societal discourses and texts beyond the school level, or what Dorothy Smith calls the “trans-local” and “ruling relations” that shape what people think and do.

We began to see just how disempowered many NYC educators were feeling in this *No Child Left Behind* era of educational reform. We witnessed the growing sense of futility that many administrators and teachers were experiencing in their efforts to make a meaningful difference in the lives of many children in today’s schools. These educators told stories that helped us to understand that much of what they felt they ought to be doing in schools was no longer in their hands. Increasingly, the work of these teachers, particularly, those serving poor immigrant children of color, was being managed and legislated beyond school doors.

This realization helped us to see that children were not the only ones whose freedoms were being thwarted in today's schools. The difficulties these educators expressed helped us to see that if educators are to help children realize their own sense of agency on their quest for greater freedom, choice, and well-being in their own lives, then these educators needed to do that, first, for themselves. Therefore, we saw value in using research processes that not only allowed educators to tell their stories but also engaged them in inquiry processes that provided a needed time and space to reflect upon those experiences through shared dialogical processes. Freedom can only be achieved in a context of a community that enables us to see ourselves and our experiences in new ways, which can give rise to a greater consciousness of purpose and a stronger awareness of our own agency and what we are capable of doing.

The capability approach is rooted in a social, emotional, and relational approach for understanding human experience and enhancing well-being. This concern for the individual as *an embodied being* has relevance for the inquiry processes we use with participants in our studies. The reach for greater freedom always requires an individual and a social quest, which suggests a need for a participative approach to critical scholarship, engaging participants in processes as potential allies in social justice. Through a willingness to see social phenomena from multiple and competing perspectives, we become wide-awake to the social world we are creating, not only for others but for ourselves as well, and more consciously aware of the roles we are playing in increasing or diminishing real freedoms in the lives of others as well as in our own.

Through engaged inquiry processes and a close analysis of texts, documents, and policies driving what people do in institutions, researchers and project participants can collaboratively unpack the dominant discourses that are shaping teachers' and administrators' thinking. Through our own collaborative research projects, we found great value in combining Denzin's call for capturing in-depth personal narratives, specifically focusing on freedoms to achieve and child well-being, with Smith's concern for examining how people's work and lives are, increasingly, shaped by ruling relations (1990, 2005, 2009).

For Smith, ruling relations are visible in the official texts that structure and control what people recognize as "institutional knowledge." However, we came to realize that personal biography always plays a significant role in how participants make sense of and respond to institutional discourses. Through a collaborative approach to inquiry, researchers can work with project participants to consciously examine the discourses that are shaping work processes in the school and trace how these prevailing discourses are impacting the educational freedoms and opportunities of children and their families.

The value of this methodological fusion seemed particularly important given what was happening in New York City at the time. For example, when Mayor Bloomberg charged that low standards and social promotion were to blame for low achievement in NYC schools, he disseminated this message broadly and then, singly, pushed through an unpopular third grade retention policy by firing three of his appointees to the policy board, knowing that they were going to vote against mandatory retention. When people balked at the mayor's usurpation of the democratic process and the last minute firing of the board members, he retorted, "This is what mayoral control means."

Although the mayor has no background in education, he argued that setting higher standards would make both teachers and students work harder and that this would lead to greater academic achievement. Wells (2004) followed the chain of action set in motion by the mayor's press conference, and she began tracing the policy and documents that the press conferences generated and then followed these documents to see how they shaped and coordinated the work of the principal and, then, how the principal's responses to these documents shaped teacher's work with children who were directly affected by the policy. By linking what was said at a high powered press conference to written policy documents and by seeing how these documents shaped what happened at the local level, Wells brought people who would never meet (the mayor, the principal, the teachers, and children who failed their third grade tests) together into social relationships connected through institutional documents; such linkages between those who design policy and those who implement it are seldom traced and too rarely held up for purposes of accountability, top-down but also bottom-up accountability.

Wells' study captured personal narratives with children, teachers, and administrators, examining how teaching and learning was being shaped by a persistent discourse of "work harder" and "no excuses." Her study revealed how badly this policy played out at the school level. Wells found that the teachers were forced into retaining children, who in their professional judgment should not be retained. The teachers also felt that the mayor was disrespecting their professional judgment by making the test the only thing that mattered in the promotion decision. They expressed feeling silenced and handcuffed by a high-stakes testing process that they saw as educationally unsound and harmful to children, particularly to immigrant and other ELL students who did not speak sufficient English to be tested in the language. Further, the teachers noted that although some children failed the tests, they actually performed very well in class, producing classroom papers and assignments that showed that their abilities matched and even exceeded the classroom performance of other children who had passed the assessments but performed poorly in class. The teachers did their best to advocate for students like Marcus, who performed well in class but who froze on his timed tests for reasons that were more attributable to emotional upset during testing rather than to academic ability. Nevertheless, he was retained.

Marcus' freedoms to achieve were significantly diminished in this school, but it was not his teachers' actions that undermined his overall well-being. The capability approach directs the researcher's attention to both *freedom to achieve* and overall *child well-being,* and through this study, we learned that for Marcus, both were severely weakened. This was a tragic story with a very sad outcome for this little boy. He was no longer a happy child at school. He no longer liked school and "hates reading." Marcus was retained in third grade and, yet, again in fourth grade. Being retained once doubles a child's risk of dropping out of school, and children who repeat two grades have an 80–90 % chance of dropping out of school. The capability approach provides considerable insight into why children like Marcus are getting left behind in this achievement-focused era in education, reminding researchers and policymakers that if we hope to enhance the lives and life options of children, we must pay closer attention to their overall social, physical, and emotional well-being in our policy decisions and our everyday practices.

Conclusion

This chapter introduces readers to the capability approach to social justice in education. By placing this methodology alongside other critical methodological frameworks, I suggest that this approach to inquiry provides a powerful compatible framework for social justice researchers using other social, political, cultural, or economic methodologies in their work.

Sen, Nussbaum and Denzin's lenses are, particularly, helpful for capturing the experiences that impact achievement, freedom, opportunity, and choice in schools and in the communities they serve. More importantly, they provide social justice researchers and practitioners with a needed *human and humanizing* lens for understanding today's educational policy arena and for examining how the assumptions underpinning current utilitarian approaches to education are impacting school practices and the experiences and outcomes of many children.

Politicians, policymakers, educators, and social justice researchers all take positions on individual opportunity and freedom; however, the assumptions underpinning these positions are rarely examined sufficiently. At the heart of the debate that rarely occurs, there is a question: Are *all* children truly free to achieve, or is this just a story America tells itself to feel better about children and families who live at the marginalized edges of this nation?

In this chapter, my colleagues and I have seen that the most pressing obstacles to educational achievement and to the well-being of many children living in low-wealth communities are not academic only; Rather, many children's troubles in schools arise from a complex intermingling of social, emotional, and bodily needs that are not recognized or addressed by current educational policies or school reform strategies. Our disembodied view of academic achievement and our failure to recognize the broader needs of children have resulted in a "no excuses" approach to academic achievement and overly simplistic policies like mandatory retention, which ends up blaming children and shaming teachers and administrators for not producing desired results.

Sen and Nussbaum help us to see that a child's freedom to achieve is not simply a matter of will. Rather, children need adequate support to grow academically, socially, emotionally, and physically if they are to come into full being. The problem we have, particularly in the western world, is that we have come to believe our social science categories, assuming that we can isolate and focus on the academic child and ignore his or her social, physical, and emotional well-being. However, the stories we tell in this chapter challenge that belief.

The capability approach directs the researcher's attention to what children are able to be and do. It provides a methodological framework for putting the child at the center of inquiry and then rethinking the systems, policies, and processes used to increase educational opportunity based on the *real* needs of children and youth.

Some might argue that the capability framework is too broad and that the focus on child well-being is too inclusive of social problems that extend beyond the academic walls and concerns of schools. Nevertheless, the real problems that children face in their homes and communities do not disappear upon entering school door, and how policymakers and educators frame the problems they see results in policies and practices that have enormous power to either increase or diminish children's real freedoms to achieve.

The capability approach brings scholars who care about the needs of poor children around the world together. The Human Development and Capability Association and conference arose from a growing recognition of the need for cross-disciplinary examinations of social and educational problems and a call for a long overdue collaboration among researchers and practitioners across disciplines and work sites, focusing on the social, emotional, and academic well-being of children. This same need is being expressed in growing calls for a greater integration of social and educational services to meet the multiple and intricately interwoven needs of, particularly, poor and vulnerable immigrant children of color. The capability approach, then, is a path toward that end.

Chapter 11
Narrative Inquiry (NI) as an Exemplary Method for Social Justice Leadership

Alexandre Ibongya-Ilungu Muzaliwa and Mary E. Gardiner

Introduction

Immigration and refugee issues are not unique to Idaho, USA, but a global phenomenon. A valuable approach to enhance one's self-knowledge to connect with immigrants and refugees and ultimately embrace a social justice perspective is through narrative inquiry (NI). While NI as a research method has a long tradition, educators in the USA have typically not been engaged in NI throughout their education. The method of NI offers the potential for transformation of the inquirer toward social justice. Social justice leaders are defined as agents who are called to initiate change in classrooms, school buildings, districts, and communities toward equity and inclusion. Social justice leadership addresses injustices in ways that are replicable by the students and communities in which educators live (Muzaliwa, 2011).

Social justice leaders share certain characteristics (Fraturra & Cappa, 2007). These characteristics include: (a) leaders who hold the core belief that all students should be educated in heterogeneous settings; (b) leaders who possess the knowledge and skills to put this belief into action; (c) leaders who are able to imagine schools where all students belong and are not segregated to have their learning needs met; (d) leaders who are able to see similarities among student differences; (e) leaders who advocate for students who struggle in school; (f) leaders who are not defensive about their limitations, honest about where they are in the process, and determined to push ahead; (g) leaders who are continually educating themselves about the areas of equity and diversity that they may lack knowledge in; and (h) leaders who are continuously developing and sustaining their ethical core so they are able to withstand the pressure to do otherwise.

Narrative research came to us out of a passion for justice for students who were not mainstreamers, some of whom were native-born Americans outside the dominant structure, and some who had come from other countries regarded by western society as the "Third World." As naturally storied people, narration gave us, as researchers, a vehicle for studying a phenomenon that other methodology or theory could not (Barone & Eisner, 1997; Clandinin, 2006). The narrative method is a continual "researching, a searching again, continual formulation of an inquiry" (Clandinin and Connelly, p. 124). While there is no guarantee the reader of the narrative will gain the perspective that is intended by the narrator (Atkinson, 2010), NI offers the potential for growth toward social justice leadership as illustrated in this chapter.

The context for the inquiry, an urban school district in Idaho, has witnessed growth in the immigration of people from sub-Saharan Africa, Middle East, Central Asia, Central Europe, Mexico, and Latin America. The children of these immigrants and refugees have backgrounds different from those of their predominantly white educators. The social injustice addressed in this study was the isolation and marginalization of diverse students in predominantly white schools and the need for their educators to grow in self-knowledge, understanding, and connection with their students and families. School districts in Idaho have a history of a perceived lack of diversity and racism associated with white privilege. The Aryan Nations, a white supremacist group, had a foothold in Idaho until 2000, and vestiges of racism remain. Some of our most promising students in Idaho experience racism on entering their schools (see Anderson, 2006; Canfield-Davis, Gardiner, & Joki, 2009; Hondo, Gardiner, & Sapien, 2008; Idaho Statesman 2008, 2009, 2011; Vogt, 2003). Educator self-knowledge and interaction between educators and their "foreign" or "othered" students was a study of interest. The lead author was a refugee and the authors were immigrants to the USA; both families currently have African-American children in secondary schools. However, the second author was in a privileged position as a university faculty and the lead author a doctoral student; thus, our own research collaboration offered the opportunity for learning from each other. We were interested in the research question: What were educators' understandings of social justice, and how did they change through narrative? We interrogated educators' experiences and our own, seeking answers to this critical question.

Social justice means creating equitable schooling and education, focusing on groups that are most often underserved, underrepresented, and undereducated and that face various forms of oppression (Jean-Marie, 2008) and addressing and eliminating marginalization (Dantley and Tillman, 2010; Theoharis, 2007). Social justice leadership is thus concerned with antiracist and anti-oppressive education (Kumashiro, 2000). Earlier studies in Idaho investigated how a social justice leader engaged in transforming a community besieged by a hate group (Canfield-Davis, et al., 2009), how school principals engaged in multicultural leadership (Gardiner & Enomoto, 2006), and the tension for principals working with multicultural diversity issues in school systems concerned with testing and accountability (Gardiner, Canfield-Davis, & Anderson, 2009). This chapter argues for an additional point of view that the research method of narrative inquiry itself, not just the issues studied, is a means to advance social justice leadership.

Theoretical Framework

Narrative inquiry (NI) from a social justice perspective, specifically a Freirean-based theory, served as the framework for this study. The power of stories is to bring people of diverse origins together and unite them as they work toward a common goal. We followed Purpel's (1999) definition of social injustice. He refers to, "The horrors of poverty, disease, war, and bigotry whose origins and possibilities of resolution are basically human. The sufferings that emerge from human greed, hostility, and ignorance" (p. 11). Many people seem unable or unwilling to recognize the extent of injustice that exists, but social justice leadership could be a way forward. The intention of our forefathers to create a country based on equal rights for all has not proved to be achievable to date. The social and economic system is based on a power structure that promotes competition and perpetuates greed, hostility, and animosity (Freire, 2005; Giroux, 2010; Hooks, 2003). Not all segments of the population in this country in particular, and in the world in general, have equal access to status, rights, and resources (Banks, 2010; Darling-Hammond, 2009, 2010; Delpit, 2008). Some school children in this country and elsewhere in this world are subjected to injustice for a variety of reasons including economic status, skin color, ability, gender, sexual orientation, ethnicity, and religion (Cochran-Smith, 2004). Although poverty is just one of the many manifestations of injustice, it is insidious because poverty is not easily rectified. All poverty is unjust. Where there is abundance, but some go hungry, there is injustice (Gollnick & Chinn, 2002). Leadership for social justice from a Freirean perspective means radical social change and advocacy for people from a standpoint of reconceptualized dialectical and horizontal relationships rooted in "humility, faith, hope, critical thinking, and solidarity" (Miller, Brown, & Hopson, 2011, p. 1090).

Narrative Inquiry for Social Justice Leadership

Narrative inquiry is a self-reflective process, which builds on the professional experience of the researcher (Chan, 2006). NI was used to research educators' experience with diverse students and how they came to understand social justice. The meanings created by the participants were part of a process of inquiry where participant stories were interpreted by the researchers but left intact as much as possible to enhance research rigor (Bullough & Pinnegar, 2001; Feldman, 2003).

The connection between social justice and narrative has been well established as a teaching strategy in the literature (see Marshall & Oliva, 2010; Nieto & Bode, 2008; Noguera, 2010). However, only recently has narrative research begun to emerge as a *research method* that advances *social justice* (Brooks, 2008; Muzaliwa, 2011; Phillion, 2006). In other words, the *process* of the research has the potential to transform not only the participants in the study but also the researchers themselves. While there are no guarantees that readers will interpret the stories with the intended message (Atkinson, 2010), participants who engage in NI can transform themselves. Participants can then influence their communities through teaching, colleagueship, and community engagement toward social justice.

Procedures for data collection in the narrative inquiry involved two semi-structured interviews of approximately 45–60 min in length conducted with each of the three participants. Interviews were digitally recorded and transcribed. All transcripts and notes taken during interviews and class observations were member-checked with participants. Data included the semi-structured interviews, nonparticipant observation, and collection of documents, such as curriculum and reflective memos. Analysis of data was ongoing and began with the transcription of interviews and the digitalization of observation field notes. Interim texts were then written which were descriptions or stories not intended necessarily for the public but which served as a bridge to the final product. Final products were research texts or stories of experience such as the one presented in this chapter of Patricia, the educator, which has embedded within it, Yahya's story. Readers can discuss, share, and ideally learn and develop empathy from the stories in order to lead for social justice. What the research does in the process of studying a particular phenomenon is shift from living stories with participants to actually retelling those stories in a manner that makes a contribution to the world by critically answering the questions: "So what?" "Who cares?" Because all texts are *plurivocal* (Rabinow & Sullivan, 1987, p. 12) and subject to different interpretation by different readers as well as by the same reader under different circumstances, it was crucial that through the analytic process the discourse did not get fragmented. For details on the design and procedures of the dissertation study, see Muzaliwa (2011).

Narrative inquiry (NI) brings full meaning to an experience, enhancing the understanding of an event. The narrative process as described in the story of Patricia in this chapter is not simply the recollection of events as they happened. Narrative as a self-reflective process synthesized emotions, values, feelings, ideals, physical, and bodily demonstrations that made the process meaningful and the experience worthwhile (Clark & Keefe, 2002; Ellis, 2002). NI was an evocative act exploring the innermost corner of our souls in search of how an experience affected and changed us. We ask what is the value to you, the reader, of Patricia's story, Yahya's story? Our stories?

The Idaho Setting Where Narrative Inquiry Was Transformative

Even today, with 89.1 % of its population being white (United States Census Bureau 2010), Idaho unfortunately has the image of being one of the most non-diverse states in the nation (see Vogt, 2003; Newart, 1999). The setting for this study was secondary, public schools in an urban school district in Idaho. The district housed 50 public schools in grades K to 12, with a total of approximately 30,000 students and 2,000 teachers. In the USA, Idaho is situated in the northwestern part of the country in the Rocky Mountains. Idaho state's population of 1,545,801 (United

States Census Bureau, 2010) is mostly white 89.1%. The main issue the state has faced is redefining itself as a welcoming and diverse state.

The context of a history of racism associated with the state bolsters our efforts to chart a new direction. According to Canfield-Davis, et al. (2009), between 1983 and 2000, the Aryan Nations "had tarnished the image of a community, tried to intimidate many, and committed over 100 crimes from 1983 to 2000. Ultimately, the Aryan Nations was named as a defendant in the case Keenan v. Aryan Nations (District Court of the First Judicial District, Idaho, Kootenai County [CV-99-441]). In 2000, the jury returned a $6.2 million judgment against Richard Butler and the Aryan Nations. In order to avoid paying the full damages, Butler declared bankruptcy. His property was confiscated by the federal court and awarded to the Keenans (family who had been the victim of a hate crime). Today, it is used as a public peace park." Several examples of the remnants of racism in Idaho can be found reported in the newspaper, *The Idaho Statesman*. On Wednesday, November 19, 2008, the Idaho Statesman reported second and third graders on a Madison School District bus in Eastern Idaho chanted "Assassinate Obama," and the school district spokesperson brushed aside concerns stating that "the children didn't understand what they were saying" (p. 18). On Sunday, April 19, 2009, the Idaho Statesman reported that "a leader for the white supremacist group" said that President Obama was the "greatest recruiting tool ever" (p. A10), and the Aryan Nations group was once again recruiting members in Idaho. In nearby, Spokane, Washington, January 2011, on the MLK Day march, a bomb was left on a seating bench en route for parade marchers; the bomb had the potential to kill or maim dozens of people (Idaho Statesman, 2011). Within this context of efforts for human rights and social justice in Idaho, two high schools and one middle school were chosen for the project utilizing NI.

Educators Who Were Transformed Through Narrative Inquiry (NI)

The educators in the study, using pseudonyms to provide for confidentiality, were:

Patricia White (A high school) – This high school teacher was a white female from a European background in her 50s, who had been teaching for over twenty-five years. Her socioeconomic family background was upper middle class. She was teaching tenth, eleventh, and twelfth grades.

Alvarez Fernando (B high school) – This 40-year-old teacher was seen by others as Hispanic/Latino, but self-described himself as a white male with a Puerto Rican background. He had been teaching for more than ten years. Alvarez's teaching was enriched by a poverty background in Puerto Rico, which gave him empathy for low-income students and families. He was teaching ninth, tenth, eleventh, and twelfth grades.

Amanda Brooks (C middle school) – This sixth, seventh, and eighth grade teacher was a female teacher of mixed heritage (Native American and European/Romanian heritage) in her 30s who had been teaching for more than seven years. Amanda's family background was self-described as middle class.

The researcher's themselves gained self-knowledge and through interaction, reflexivity, and engagement with each other and developed an increased empathy for students in our schools and a renewed vision for social justice leadership in the state which includes NI.

Alexandre (Ilungu). Having seen the prevalence of injustice in the system of education in the Democratic Republic of the Congo, DRC, Kenya, and today in the USA, I felt the necessity and importance of social justice in the educational system. Relocated as a refugee from my home country DRC to Nampa, Idaho, USA, a number of incidents took place in my new country that led me to look to narrative. In 1998, I traveled to Chicago for a friend's wedding. I still have the vivid memory of how people, both black and white, were wondering how could I, a black person, be living in such a state where the gospel of hate was being preached!

When we arrived from Africa, my family and I were sponsored by the First Presbyterian Church in Nampa, Idaho. Refugees as we were, we had no means of transportation. It needs to be noted here that the town of Nampa to this day does not have public transportation. According to policy for new refugees, I was volunteering at the Nampa public library while receiving food stamps. The city of Nampa made arrangement with the Nampa School District for the driver of the Head Start bus to pick me up for the library volunteer work every morning and take me back home every evening. The driver did that for one week then refused to give me the ride. He stated that the reason was that I was black, and he didn't want a black to be riding in his bus.

On another occasion, one of my sponsors came to visit us at home during a beautiful summer evening. We took a walk outside to see the neighborhood. Our sponsor, who was also a Pastor, introduced me to one of my neighbors who was standing in his driveway. The sponsor introduced me to him saying, "This is Mr. Muzaliwa who just arrived from Africa as a refugee; he and his family are living two houses down the road." The person replied, "What did he come to do here? He should have stayed in Africa; we don't need them here."

Around the same period, one of our daughters had a white friend from school who happened to be the daughter of one of our neighbors. Their house was across the street of ours. They were of the same age. They were daily playing together and visiting each other. But one day the girl told my daughter that she could no longer continue to play with her, and that her mom didn't want her in their house because she was a "stinky black." The mother didn't appreciate a friendship between her daughter and a black girl. That was the sad end of their friendship.

My own experiences have left me with a painful awareness of the extent of injustice. It has been told over and over in this country, especially to children in schools and to newcomers, that if you work hard enough, anyone can be successful, but it is not true. For many children, the obstacles are too great to overcome. Many speak of injustice, but how many are willing to dedicate their lives to ending injustice?

Mary. My African-American son attending Idaho schools for over a decade makes my passion for social justice personal. From a mother's love came my urgent commitment to educating myself and others on ways to work together to enhance student enjoyment of school and school success. I have felt my son's struggle in school and know it is not right. Why is school perceived so differently by my two sons? Could it be the continued lack of narratives of diversity in the school, not to mention lack of diverse faculty? For years I have worked with immigrant and African-American students, such as Ilungu, and have also felt their struggles as they try to acculturate into a predominantly white university culture, yet also retain their own cultures. I have learned through narrative I can begin from a position that I know very little in the area of social justice, but through my parenting, teaching, and friendships listen better and learn. Narrative inquiry offered a vehicle to connect with Ilungu and hear his stories and those of the educators' and perhaps even their students' stories, providing a vehicle for my own struggles and stories as a single parent raising teen boys.

From this perspective of social justice, we explored educators' experiences, inquiring how they perceived the role diversity played in their lives and work as educators. It was not the purpose of this research to attempt to discover a theory of, or solution to, the problem of injustice, but rather to come to a greater understanding of how NI as a traditional qualitative research tool may be drawn upon in a new way for social justice. We used personal experience as the foundation for the research, drawing upon the experience of the educators in the study and our own. The findings can be seen as a mosaic of experiences. We report here one educator's story, that of Patricia, as told to Alexandre (Ilungu).

The Central Narrative: Patricia's Story

I am a teacher and a parent, an educated woman descended from white settlers, living in a wealthy country. I have taught in elementary school, middle school, and secondary school. When I began graduate studies, I was a middle-year language arts teacher. There are some things that all these students have in common. They are keenly aware of fairness and unfairness and seem to watch for slight injustices as they see them committed by their administrators and teachers.

The small town I was raised in was populated entirely by white Christian people. There were no reserves nearby; we knew very little about Native American people. The only time we saw "Indians" was when we were in the mall in Sioux Falls, South Dakota. I remember my friend's mom telling us to stay away from "those girls" because they belonged to gangs. This was during my adolescence. I did not know any different and I stayed away from Native American people until I moved away from home. Then, I was not really surprised to find out that none of the Native American people belonged to gangs. Now I know that they are not scary people, just people who (like me) are part of a community of friends and family.

Our white community was run by the cooperation of its members. The people within looked after each other and did not have much to do with those outside of their town and their families, especially if they were of a different color, "the others." Now, we need to be more aware of our global community. We are the rich neighbors who need to do our part.

My father is the first-generation American. His father was born in Romania. It was very important to my grandpa that his descendents speak English and get an education. My grandparents on both sides were rural people who worked hard for everything they had. They wanted their children and their children's children to be educated so that their lives would be easier. I was raised with the idea that my most important job was to get an education.

As a new parent, I want to make sure that my own children are aware of the wider world. I want them to be generous in their lives and to share with those who have less than they do. We have so much that we may not be aware of how much we have. We live in a community of wealth and that gives us the opportunity and the obligation to help others.

My history, my experiences, and my current situation as a parent and teacher, all lead me to want to make social justice a more prominent focus in my work as an educator. How do we teach children about those who live in poverty and live in unsafe circumstances and help young people find ways to help those in need? When I reflect on my chosen work, I see ways that I can improve my own teaching methods. The people I have met and the reading I have done have changed some of my beliefs about my own teaching.

Reading on the topic of critical theory and particularly critical literacy (in the course on multicultural diversity) has helped me to realize I was showing students examples of injustice, but I was not engaging them in asking the hard questions. With my whitish-made mind, I was not taking them to the root cause of the injustice so that we could contribute to transformation. This is important work in our world.

I was appalled by the story of one of my students in our high school, a few years ago. She was in eleventh grade; her name is Yahya. Yahya was an expressive young Kenyan who arrived in the USA in 2002. Her school experiences were colored by an event that took place during her first classes in high school in the USA. In her history class, she recalled that the teacher asked everyone to introduce himself/herself, telling the class about the family background and future goals. She remembers that she was the only African student in class that day. When it was her turn, she introduced herself as a native of Kenya, Africa, and as someone who was interested in receiving as much education as possible. She explained that she believed in diversity and the importance of learning from other cultures about things she might not be familiar with. She said her uncle, in Africa, was a university science professor, and that she was looking forward to graduating with a higher degree in science and serving as an astronaut.

"I remember that when I mentioned the name *Africa*, she explained, there was a little giggling and laughing among the students. But I did not know the implications of that kind of response at that time." When she finished introducing herself, some of the other students immediately began asking her about animals in her village. They asked if she talked to giraffes and antelopes in a certain language and how she was able to fend off attacks from lions, leopards, hyenas, and chimpanzees. They asked her if she grew up wearing no clothes and shoes, and if she ever saw cars and computers before she arrived in America. She could not determine whether their questions were sincere efforts to learn about her African environment or just derogatory remarks on what they might have watched on television.

Yahya said she was embarrassed that she did not know which questions to answer first. When she began answering the questions, some of the students continued laughing as if they were dismissing her honest responses. "I don't mind answering any questions, but there were two things that made me angry. First, they were not interested in my answers. That tells me that the questions were meant to mock me and my background." She confessed that she subsequently decided not to give any more answers since no one was listening. "Second," she continued, "I realized that no one seemed to pay attention to the content of my introduction; that is, everything I said about my educated uncle and my own educational dreams of being an astronaut." She was, therefore, offended that the most important thing they wanted to talk about in relation to her was animals, clothing, and her perceived lack of access to modern technology.

During my interview with Yahya, she reiterated that she was not worried about the condescending questions from her classmates. Her main disappointment was the inability of the teacher to intervene while she was being belittled as a person from the jungle. She expected the teacher to call the students to order and redirect their attention to the contents of her introduction. Instead, the teacher stood by as they derided her African heritage, her native land, and her culture. "Don't you expect the teacher to, at least, remind the students to respect other people's cultures, even if they disagreed with them?" she queried rhetorically.

"The funny part of the whole thing," Yahya explained, "was that I was born and brought up in an African city and never saw animals except when I visited the zoos with some family members and friends. That is no different from the experience of a regular American kid here." She felt that her peers were not looking for an honest answer, but for information to support their preconceived and biased views about Africa. Since she was unable to provide the kind of juicy answers they were expecting about cohabiting with animals, she felt she consequently got a rude and dismissive response from her classmates. Patricia said for herself as an educator in the public schools, knowing Yahya and hearing her story prompted her to become more active to leading and teaching for social justice. Many students tend to focus on their own problems. I want to help my students to recognize the problems of other people. It is important to provide them with an opportunity to consider unfairness and social justice beyond their own situations (Freire, 1970). I want to give students a positive forum through which they can identify and understand injustice and then choose how to act on the injustice. Yahya's story as generated through Patricia's narrative made Patricia better understand as an educator that she had the responsibility to lead and teach for social justice, starting in her own classroom. Social justice was no longer an abstract concept, but became a living narrative and influence, which energized her to teach and lead for social justice.

Implications of Narrative Inquiry Research Method for Social Justice Leadership

My own story (Ilungu) as a refugee who came to Idaho only to find not all people embraced my story, even if they knew nothing of it, can also provide a mirror for the reader to reflect on their own story. In Patricia's story and our own, we see that narrative is no longer a methodology that uses the distant observer and the observed. Narrative became a quest for understanding personal experiences as researchers, observers, and protagonists.

Administrators, teachers, and students must inquire within about their own educational and life experiences, and their voices be heard and given legitimate recognition. Narrative has the potential to transform the perspective of individuals and influence schools. The researcher becomes aware of the transcendental effects of one's actions. It means understanding what we have lived and how that lived story shapes our lives (Clandinin, 2006). The path to greater understanding and leadership for social justice is through self-discovery of an educator's own self-knowledge to improve the nature and specifics of their work. The administrator or teacher must become an active participant in changing and transforming their classrooms and schools. One path toward self-knowledge or self-discovery involves the use of NI. Narratives, in this context, are messages developed by the author to tell the particulars of an act or occurrence in someone's life. Narrative allows the examination of one's life in social context. It proposes the opportunity to explore a person's meaning about himself/herself in the world. As narratives of individuals are shared, the barriers disappear. Students and educators alike develop an understanding of one another.

It was necessary in Patricia's narrative to consider the cultural experiences of underrepresented groups. Students' perceptions of success and opportunities in the society determine their reactions. Carter believes that some culturally diverse students (in terms of socioeconomic status, culture, language, gender, race, religion) may react in oppositional ways to education, to distance themselves from who they are and their home cultures in order to succeed. Immigrant and refugee students operating under this frame of reference will often give up their home language, culture, ethnic values, and other identifying ways of life. Other disenfranchised students may instead practice resistance to assimilate the dominant group's culture and practice disengagement as a form of resistance or cultural inversion (Ogbu, 2003). African-American students can develop defensive mechanisms by choosing cultural behaviors that differentiate them from the majority to combat the perceived attacks on their language and culture (Carter, 2007; Nieto, 2000; Ogbu, 2003). These students may feel that acting white and the adoption of mainstream culture are also not a guarantee to success and not only will they still be unsuccessful due to racism in the dominant culture, but it only serves to alienate them from their own cultures (Chavez-Chavez, 1999). Yahya's experiences awakened in her teacher Patricia the sense of outrage and commitment necessary to fuel change in ourselves and our classrooms. Through the student's story and her own, Patricia came to new understandings of privilege, power, and oppression.

These considerations matter. Postman (1995) asserted that educators have a duty to help create a sense of purpose for students. This is the reason why administrators and teachers must be attuned to students who have not traditionally been well served by public schools and also specifically immigrant and refugee students. Public schools purpose, Postman argues, is to create new worlds for their children to grow in, to build intelligence, to create beauty, to guide their passions on the hopes of the future, to inspire in others the sense of purpose, and to change that which many found impossible. Educators must assist students to find their purpose within the walls of education using cultural and ethnic narratives. From a Freirean perspective this means centering love, hope, and trust in the community (Miller, et al., 2011) so that educators, students, and their families know and trust each other. Narrative can help in examination and analysis of who we are, where we are, where we came from, and where we are headed. Narrative is about connecting voices (Ellis, 2002). The voices help educators understand themselves, connecting their work to the rest of their lives (Ellis).

In our global village, social justice leaders must be engaged in "transformative leadership" (Shields, 2003) by, first, developing a heightened and critical awareness of oppression, exclusion, and marginalization (Brooks & Miles, 2008); that is, they must recognize and understand how institutional power arrangements and practices favor some groups to the detriment of others. Social justice leaders must work for substantive change in their schools. Leaders for social justice resist, dissent, rebel, subvert, possess oppositional imaginations, and are committed to transforming oppressive and exploitative social relations in and out of schools (Brooks & Miles, 2008; Furman, 2012; Jean-Marie, 2008).

Howard (2007) describes a five-phase process socially just school leaders implement when creating inclusive and equitable schools, and we see a role for NI to enhance this process. The Howard process requires a firm commitment from educational leaders. In the first phase, leaders build trust by inspiring a climate of constructive collaboration among colleagues. In the second phase, school leaders promote professional development in cultural competence. Howard defines cultural competence as a clearly defined set of values and principles that support policies, practices, behaviors, attitudes, and structures that enable educators to work effectively across the cultures the students represent. In the third phase of creating inclusive and equitable schools, leaders confront social dominance and social justice. Howard states the central purpose of this phase is to inform, inspire, and sustain educators in their work without shame or blame. During this phase, schools develop an equity vision statement that guides all future reforms toward making a school more inclusive and equitable. The fourth phase transforms instructional practices. In the name of social justice, this phase transforms pedagogy and curriculum to develop culturally responsive teaching that forms authentic relationships with all students, honors each student's culture, meets diverse learning needs, communicates respect, and holds consistent and high expectations for all learners. Howard defines this step as crucial, because it is here that school leaders and other school professionals stop blaming students and their families for gaps in academic achievement. In the last phase, leaders engage the entire school community, meaning all stakeholders. All have a powerful role in setting an inclusive climate for students and parents. We believe narrative inquiry (NI) in higher education and public schools has a role in each of these stages because not every educator begins their work from a position of being or becoming a social justice leader, but all have the potential to become social justice advocates through story and friendships that can be created through NI.

To engage in dialogue through NI is one of the simplest ways to begin as scholars to cross boundaries and make connections (Hooks, 1994). As we began to transform ourselves through the reconstruction of our stories, narrative method taught us the purpose of writing is not a technical one, but rather a social justice one (Adams & Kirova, 2006; Cai, 2005; Cochran-Smith, 2004, 2009; Moraga & Anzaldua, 2002). Narrative inquiry gave us a vehicle for studying ourselves and the phenomenon and invigorated social justice leadership.

Conclusion

Narrative inquiry allowed the researcher and participants to come to better understand themselves, and the other, through emotions, ethics, context, and concern for self and others. Educators changed their perspective after becoming more sensitized to issues of "othering" inclusion/exclusion and privilege/oppression. Educator participation in the narrative research project provided them with the opportunity for self-inquiry and self-reflection around specific issues targeted by the research problem of social injustice in schools. The research was able to draw attention to educators' own narratives as a way to enhance understanding of themselves and others to produce a view of who you are in me and I am in you. Increased attention given to social justice, whether in specific diversity and social justice courses, in core courses, or in internship and service learning experiences, brings to fore a focus on the moral purposes of leadership in schools and how to achieve these purposes (Furman, 2012). As Evans (2007) observed, educational leaders have a social and moral obligation to foster equitable school practices, processes, and outcomes for learners of different racial, socioeconomic, gender, cultural, disability, and sexual orientations backgrounds (p. 250).

Our view supports Purpel (1999) who spoke with passion and moral outrage over social injustice: "We must come to see social justice [leadership] as more like a conflagration than a fire, more like a world war than a skirmish, more like an issue of cultural survival than one of social adaptation" (p. 14). Narrative appears to be a critical method in the struggle for social justice. Greene (1998) stated, "A general inability to conceive a better order of things can give rise to a resignation that paralyzes and prevents people from acting to bring about change. To call for reflective capacity is to work for the ability to look at things as if they could be otherwise. Doing so, a person may become freed to glimpse what might be; to form notions of what should be and what is not yet" (p. 19).

Recognition that the role of school leaders is at least in part to advocate on behalf of traditionally marginalized and poorly served students carries a corollary contention that traditional power structures must be deconstructed and reconfigured (Allen, 2006; Lugg and Shoho, 2006; Scheurich and Skrla, 2003). The political work of principals for social justice leadership has been explored by Ryan (2010) who asserts that besides political acumen, principals need qualities such as courage, boldness, and care to assert social justice agendas. We argue in this chapter an underexplored and vital tool in the fight for social justice is the power of NI as a research method and a means to provide for inclusion and equity. School leaders must increase their awareness of various explicit and implicit forms of oppression, develop intent to subvert the dominant paradigm, and act as a committed advocate for educational change that makes a meaningful and positive change in the education and lives of traditionally oppressed students (Allen, 2006; Freire, 1970, Fullan, 2010). Researchers and participants alike can do all these things through self-discovery in narratives of themselves and others. If educational leaders "can sufficiently increase their stock of courage, intelligence, and vision, they might become a social force of some magnitude" (Counts, 1978, p. 29) and extend their scope of influence. School leaders are potentially the architects and builders of a society wherein traditionally disadvantaged people have the same opportunities and, by extension social opportunities, as traditionally advantaged people (Fullan, 2009).

What makes NI an exemplary method for social justice leadership? First, *self-knowledge* can be gained through storytelling which allows us to explore who we are, where we've come from, and where we're going. By connecting with our own struggles and fears, we might better be able to stand in another's shoes and reclaim our humanity through connection with others. Second, *universality* of stories makes NI a vehicle for connecting across cultures. Everyone has stories and experience that can be a replicable tool for leveraging efforts in social justice in any school or community. Third, implementation is *cost-effective* and requires little more than a commitment to change on the part of the educator integrating NI into existing curricula or programs.

We employed a traditional research method but invigorated it with social justice sensibilities, including self-knowledge and reflective dialogue and commitment to improving students' conditions and strengthening school culture and community. By telling stories and listening to her student's story, Patricia came to discover herself, just as we also understood ourselves in a deeper and more critical manner. Applying theory to practice, by situating learning in an experience, educators can draw from the strengths and weaknesses of students to create a positive community for learning. Educators who are social justice leaders must challenge the status quo in research of a dominance of quantitative methods. Researchers for social justice leadership can begin by breaking the rule of quantitative research being the "gold standard" and insisting on funding and support for the methodology of NI. The power of stories for social justice is to bring people of diverse origins together and unite them as they work toward a common goal. Narrative has a critical and emergent role, as a vehicle for social justice leadership.

Chapter 12
A Bricolage of Voices: Lessons Learned from Feminist Analyses in Educational Leadership

Whitney Sherman-Newcomb

I entered the educational leadership professoriate in 2002 as a feminist scholar who pointedly chose to make gender a "useful category of analysis" (Scott, 1987) in her mission to serve the field as a social justice researcher and teacher. I made this choice to be a feminist scholar and to engage in feminist teaching and research fully informed (*thanks to a great mentor because it always eases the blow of disappointment to know what your obstacles are going to be up front*) and with eyes wide open of the knowledge that the path I chose may be difficult; awards and grants might be scant or absent for research on women (*they were and still are*), reviews of my writing and research might be unfavorable (*some were…the most biting was the review I received stating my use of feminist poststructuralism was like a jelly and ketchup sandwich and the most ridiculous was when I was asked to change my feminist interpretation of a set of data to a human resource framework because of editorial discomfort with a feminist analysis*), and many might question the validity of studying women (*some did and still do*). Regardless, I entered this world of creating a purposeful presence of social justice in educational leadership at my own risk and, honestly, never looked back. The purpose of this chapter is to illustrate the lessons I learned from a decade of studying women in or aspiring to educational leadership positions and to determine whether gender has actually been a useful category of analysis. Have I learned my lessons well? How have I, personally, come to consciousness as a researcher? What story do the varying images and counter narratives of women educational leaders collectively tell? And how can I best express this story?

In art, collage is a technique of pasting materials together, a type of makeshift handiwork, that changes the nature of a creation as a whole. According to Stern (2008), collages have been used for centuries to "enhance the texture of their

offerings" and have strong connections to other art forms that attempt to transform two-dimensional forms into three dimensions. In literature, collage, often referred to as bricolage, is a piece of work created from diverse sources and is the use of words as an artistic form of expression. Bricolage offers readers an assemblage of forms, or stories, that create a new whole. The weaving of stories together also facilitates a connection between the viewer (reader) and creator (writer). According to Denzin and Lincoln (1994), a researcher who brings together multiple perspectives is, herself, a bricoleur or quiltmaker (Denzin & Lincoln, 2000) as she pieces together a body of perspectives that, together, help readers understand a complex problem that cannot be explained by one of the perspectives alone (p. 4). Hence, bricolage, because of its very nature, allowed me the creative freedom to piece together what follows as a type of literary art that has both practical and political significance.

Further, because this bricolage is also autobiographical in nature, as I discuss my own work and experiences as a feminist researcher, it allowed me to critically perceive the world in which I have immersed myself in the past decade and, thus, come to see this piece as a reality in process (Freire, 1993). According to Ellis and Bochner (2000), autoethnography is an autobiographical genre of writing that makes the experiences of the researchers "a topic of investigation in its own right" (p. 733) and that "displays multiple layers of consciousness, connecting the personal to the cultural" (p. 739). It places the self within a social context, for the purposes of this chapter, feminist research in educational leadership, and allows the self (me) or selves (the participants of multiple studies) to serve as the vantage point (Cole & Knowles, 2001). Autoethnographers "ask their readers to feel the truth of their stories and to become coparticipants, engaging the storyline morally, emotionally, aesthetically, and intellectually" (p. 745). This chapter is a collection of the findings (stories, perspectives, voices) of the studies of women I have engaged in over a decade and is my attempt to transform them into a piece of art that is multidimensional, an autoethnographical bricolage, and that moves beyond perspectives from different studies in isolation to reflecting upon them as a whole and considering what significance they hold together. Uniquely, the readers themselves can also become part of the bricolage as they construct their own meaning-making of the content, much as art aficionados do when observing and discussing paintings and sculptures.

The Foundation upon Which the Pieces Were Laid

The foundation upon which an artist creates a masterpiece holds vital importance as it sets the tone for all that can imaginatively follow. Research that addresses biases experienced by women in educational leadership (or who wish to advance in educational leadership) (Bjork, 2000; Blount, 1998; Chase & Bell, 1994; Grogan, 2000; Shakeshaft, 1989; Skrla, Reyes, & Scheurich, 2000; Young & Skrla, 2003) framed my work for the past 10 years and, in essence, this bricolage. According to Tallerico and Blount (2004),

> These factors [biases] include ideologies about appropriate sex roles, social stereotypes about who looks and acts like a leader, the socialization of children consistent with such stereotypes and norms, the bureaucratization of schooling that was built on separate spheres for women (teaching) and men (leadership), the conceptualization of schooling and its leadership in ways that emphasize competition and authority (stereotypically masculine strengths) rather than collaboration and service, administrative employment practices that present higher barriers for women than for men, and the greater proportion of men than women earning graduate degrees in educational administration up until the mid-1980's. (p. 640)

While affirmative action policies (programs that seek to redress past discrimination) in the United States have spurred advances in career opportunities for women, gender conflicts have remained static for the principalship due to the expectations that women should perform to male standards of leadership while also continuing to be responsible for duties at home. Askari, Liss, Erchull, Staebell and Axelson (2010) explored young adults' (single men and women ages 18–41) expectations about future household and childcare chores and division of labor. Though both women and men reported egalitarian relationships to be ideal, their expectations of reality were more skewed and, in fact, gender imbalanced. Women reported believing that though they wanted to do fewer household and childcare chores than previous cohorts of women, they would ultimately end up being responsible for more chores than they wanted to do. Furthermore, Orrange (2002) found in a similar study that though men report wanting wives who are career oriented, they expect them to sacrifice their careers for children if needed. Simply put, women's increased entrance into the workforce (and, specifically, school leadership positions) did not transform expectations of gender roles at home (Hochschild, 1989) because the root cause of gender discrimination has not been addressed (Schor, 1991); the problem has been merely patched.

Changes in hiring practices and policies are not enough if unspoken rules warn women not to utilize family policies that have been implemented to protect them and if women, once gaining positions, are still expected to adopt the same working patterns as men and continue to be forced to choose between having a family and leadership aspirations. Furthermore, as expectations for school and district leaders have increased, the number of hours required to perform the job has increased (Read, 2000), creating second (Hochschild, 1989) and third shifts for women who must find the time somewhere in the hours of a day to carry out the duties of a principal, wife, and mother simultaneously. This "gendered time" (Hantrais, 1993) often weeds women out of the leadership applicant pool. Women often deny their differences and live double and triple days by assimilating and multitasking to survive because they have less social power (Marshall, 1993).

While many reasons exist in the form of both internal and external barriers for the lack of women in top leadership positions, I have spent much of the past decade trying to gain a deeper understanding of these factors and how they impact women in both similar and contrasting ways. Mentoring has been of particular interest to me as it seems that the act has potential for moving women forward in the field if studied and implemented in purposive ways that advance equity. Readers will note themes related to mentoring emerged often from the data I collected. Readers will also note that I consciously chose to promote a collaborative approach to the scholarship I engaged in as my own way of "activating" feminism. The majority of works featured in this bricolage were co-constructed with other women. This choice was deliberate and the method I enacted to "pay it forward" to women was new to the field of educational leadership. Some of the projects were conducted with my own doctoral students, some were conducted with doctoral students across the country that I was asked to formally mentor, some were conducted with colleagues new to the field and who struggled to create research agendas and records of scholarship, and some were conducted with colleagues who were positioned to challenge me in my own growth as a scholar. In essence, this bricolage was formed from a network of methodological mentoring.

The intersectionality that young women and women from ethnic backgrounds experience has also been a source of inspiration for me as the literature on women's experiences from multiple backgrounds is more sparse than literature on women in general (White, middle-class women). My intent has been to add to the body of literature on women leaders with the specific purpose of providing as much new information as possible to move the field forward by questioning the processes and socialization embedded in the preparation of leaders and leadership practice and by giving voice to many who have been unheard.

The Laying of the Bricolage

As I considered how best to lay the pieces of the bricolage of the feminist analyses I have engaged in over the past decade, it seemed most natural to lay them piece by piece from the beginning of my career. I vacillated back and forth as I wondered whether it made most sense to lay them down in chronological order or by subtheme and finally decided that by providing readers with a chronological order of selected works, they would best see the development of my growing consciousness as a scholar. What follows is an accounting of these selected works. I begin the description of each body of work with a quote from a participant that represents a theme central to the findings.

The Bricolage

> I guess in a lot of ways it's [the reason I'm not perceived as a leader] because I'm a real soft person…Like my father, he was a natural leader. He was in the military and people followed and respected him without question. (Sherman, 2005, p. 729)

In 2001–2002, I conducted my first study of women in leadership as my dissertation research (see Sherman, 2005). As I dialogued with my dissertation chair about how I might make a contribution to the field, it became clear that while there had been a movement to understand the processes of informal mentoring in relationship to women in educational leadership, little was known about the processes of formal mentoring. Thus, I focused my study on women's experiences with a formal mentoring program; one that was district-based and couched as a "grow your own" leaders initiative. The proposed major advantages of formal mentoring programs at the time were that a greater number of aspiring administrators might be reached and the needs of a more diverse population of prospective administrators might be met (Fleming, 1991). Informal mentoring had come under scrutiny because of the reproductive element attached to the process (ritualized behaviors to protect and maintain a status quo) (Darwin, 2000) and its reported inaccessibility to women and minorities (Mertz, 2004; Smulyan, 2000) leading to the reduction of their chances of attaining principalships.

I conducted a survey of men and women's experiences with one district's formal aspiring leaders program and, based on survey responses, followed up to gain a greater understanding of women's meaning-making through interviews. Findings indicated that the program promoted the district's (superintendent's) view of leadership, which according to participants was more hierarchical than collaborative in nature as touted by the district and the leadership program itself; women participants were more comfortable imagining themselves in curriculum leadership roles because these roles did not conflict with "female-appropriate" roles; and women had not negotiated new discourses or paths to leadership positions. I wrote:

> The majority of participants spent numerous years in the classroom before ever considering moving into administration. These women had not conceived of alternative routes to administrative positions other than continuing to "play the game" and following the traditional path to leadership positions. They struggled to gain concrete experiences considered to give them credibility with those in powerful positions while also fulfilling their responsibilities as mothers, wives, and teachers, even with full awareness that men are not always required to follow the same path. (p. 727)

Furthermore, women participants felt that they had to take the initiative to ask for admittance into the program, while men were tapped automatically and asked to complete the program as an "afterthought" because many of them were already in leadership positions in the district.

One of the most interesting findings surrounded the notion of networking. Many of the women interview participants who had not gained leadership positions after participating in the aspiring leaders program did not understand that networking when aspiring to an educational leadership position involves establishing key connections and contacts with current leaders who hold positions of power in the district. The majority of the women, instead, conveyed the misconception that networking means getting along with and working collaboratively with their colleagues. They were unaware of the connection between networking and power (because the discourse available to them was limited based on prior experience or lack of experience with mentoring) and lacked the understanding that the act of mentoring can sometimes be equated with the gaining of power.

Applying a feminist poststructural (Davies, 1994; Lather, 1992; Weedon, 1997) analysis of the findings allowed me to understand that socially produced assumptions guided most women participants to believe that they were best suited for curriculum leadership positions because these types of positions did not conflict with the "nurturing" roles they had learned to accept and they could be "soft" leaders who were not expected to be "dictatorial" in nature. It was also apparent that a type of covert screening for the leadership program occurred as those people who were not informally mentored by current administrators in the district tended to be screened out of the process before they even began to think about participating in the program because they could not see themselves as true candidates for administrative positions in the first place and, thus, hesitated to participate in the program. According to Weedon (1997), common sense notions, or perceived "truths," such as the above (women are best suited to curriculum positions; leaders must be loud and militant), are constructed from social meanings that favor particular groups. This "fixed" wisdom in educational administration, based on the White male experience, left many of the women participants out as they questioned their fit in the aspiring leaders program, struggled to find leadership positions to no avail after participating in the program, and wondered whether they were suited to leadership positions in the first place while also being responsible for duties at home that were in conflict with commonsense notions of leadership.

> Male Principal
>
> I saw opportunities opened and doors opened for me to step into leadership positions – and I mean doors [really] opened – and I was very blessed to have had the types of mentors that I've had and I've applied for certain positions and I was able to obtain those. Before I knew it, I was in this [principal] role. (Sherman, Clayton, Johnson, Skinner, & Wolfson, 2008, p. 67)
>
> Female Principal
>
> I applied 14 times to be an assistant principal and felt I wasn't being looked at fairly for this role. I continued to ask if there was anything more I could do to improve myself and my understanding of the position… (Sherman, Clayton et al., 2008, p. 67)

Despite the body of literature that placed the act of mentoring under scrutiny, many practitioners and researchers agree that the benefits (or potential benefits) of mentoring are significant (Browne-Ferrigno & Muth, 2004; Daresh, 2003, 2004; Ehrich, Hansford, & Tennent, 2004; Gardiner, Enomoto, & Grogan, 2000; Hubbard & Robinson, 1998; Mertz, 2004). And some have found that women leaders who identified mentors advanced to leadership positions more often than women who did not (Gardiner et al., 2000). Thus, the purpose of the next study I engaged in with several of my doctoral students at the time was to examine the experiences of both women and men principals across four different school districts related to their pathways to their leadership positions and to find out whether mentoring served as a critical brick on the leadership pathway for participants (see Sherman, Clayton et al., 2008). And, rather than focusing on formal mentoring alone, the focus for this study was on mentoring of any form.

Neither the men nor the women participants found participation in formal district-led mentoring programs to be helpful. In fact, both felt that participation in the program was more of an activity to check off a list of things they were supposed to do. In contrast, informal mentoring was described by both men and women as a significant step on the path to the principalship. Every male interviewed identified that he had been encouraged by a mentor (usually a supervisor) to begin a path into administration. Mentoring, for the males, was unsolicited. However, women principals did not report any form of encouragement by supervisors that was unsolicited. Each described having to approach a supervisor to express an interest in future leadership positions. Throughout the interviews, women used language that indicated a frustration with the status quo and an unspoken requirement for assertiveness in obtaining leadership opportunities. This frustration spanned across the act of seeking a principalship to their tenure as principals. Men, however, chose words like "blessed," "opportunities," and "open doors" when they described their pathways to leadership roles. This contrast in discourse indicates that mentoring worked to the advantage of men participants and the overall lack of mentoring had caused a broken pathway to the principalship for women.

> If there is a crisis, I know I have had more than a few…what's really good, we call each other. Everybody kind of like, fixes it. And it's really cool because we might have all different kinds of perspectives and then we talk about it, collaborate, come up with solutions, and then we do it. All of us…it's not just…nobody feels like their own island…which, I really like. (Sherman & Crum, 2008, p. 115)

Some studies have shown that women hold more leadership positions in organizations led by other women (Chen & Addi, as cited in Addi-Raccah, 2006), that women who have advanced to leadership roles are more likely to have worked for women principals in their tenures as teachers (Riehl & Byrd, 1997), and that women empower other women (Lee, Smith, & Cioci, 1993). Continuing to understand the strengths and the shortcomings of mentoring and to make sense of how mentoring (or the lack of) impacts women leaders, a colleague of mine and I studied the empowerment of women leaders by analyzing focus group conversations of the women leaders of a district that had a large number of women serving in leadership positions at the time (see Sherman & Crum, 2008). These women, of multiple ethnic backgrounds, served in numerous leadership roles at all levels and spanned in age from 26 to 61 years.

One of the most interesting themes that emerged from the data was the creation of networks of support that acted like mentoring "bodies" or groups for these women. One young African American assistant principal talked about mentoring in familial terms when she said:

> Funny that you say that [ask about mentoring] because I am sitting across from my little mentoring group and I always use to call them my aunties. They were very encouraging. Always encouraging. Still encouraging. Always saying, "You can do this. You can step out there. You can try to put your stuff out there." Sometimes it is not what you think. You may run into disappointments along the way…They were always there for the rebound saying, "You can pick yourself up. You can do it." And that was encouraging for me. And it wasn't just one person, it was a group of encouraging administrators. (p. 115)

The women participants in this study worked to lift one another up and, thus, took pride in one another's accomplishments. These women also had a keen understanding of networking, in contrast to women participants from other studies, and, furthermore, understood the visibility that having powerful mentorship afforded to them. Finally, due to the value these women placed on mentoring and networking one another, the act of "paying it forward" or creating a "pyramid effect" was critical to maintaining the foothold they had gained in leadership roles in their district.

> But I think little by little we are finding a few women who do have that capacity to mentor. I think another thing is that we've never seen ourselves in those roles because we've never had the experience…because how can you mentor if you do not have the experience [because you can't get a leadership position]? So now, when I find myself with 33 years of experience, surely I should have something to offer. But do you have to wait to get all this experience [before you can mentor]? (Sherman, Muñoz, & Pankake, 2008, p. 251)

After studying the influence of mentoring on leadership trajectories, it made sense to try to understand more about the act of mentoring itself. Instead of studying women principals' perspectives, two of my colleagues and I decided to probe the experiences and thinking of women who had made it to the superintendency, reasoning that these women would have had ample time as they moved up their career ladders to top leadership positions to experience some form of mentoring (see Sherman et al., 2008). Not surprisingly, all of the women interviewed were able to identify mentors who had played significant roles in their career advancement. However, when probed, they struggled to describe them in concrete, action-oriented ways supporting the notion that women have less developed mentoring systems (Glass, 2000). In actuality, while the women talked about people who had encouraged them to seek leadership roles, they served more as "voices" of inspiration rather than individuals who were willing to take action for these women. Definitions of mentoring indicate that it is active and deliberate rather than passive, including descriptors of the process such as teaching, coaching, advising, promoting, directing, protecting, and guiding (Brunner, 2000; Gardiner et al., 2000; Grogan, 1996; Kochan, 2002) leading us to question whether these women were authentically mentored.

Additional themes that emerged from the data included the lack of women role models (the fact that men hold the majority of top leadership positions places women at a disadvantage for mentoring), the isolationism of women who hold top district positions (many were the only women superintendents in their areas), the importance of simple "confidence boosters" (while probing the women about mentoring, we learned that "hearing" about their worthiness was vital to these women to gain confidence), and the challenge of being denied access to critical information, as indicated by the following comment:

> …Information is power and an organization that doesn't keep people [all people] informed or doesn't even want them to be informed, that is cruelty in first order. It shows that you don't trust them, that you don't respect them. If you really want to keep someone from growing or getting promoted, don't let them know what is going on. Keep the information away from them. (p. 251)
>
> I believe I lead differently than the traditional man that I replaced. I respect him greatly and we have really great conversations. But, I know I'm a different leader than he was. He is very physical with the kids…A very physical kind of guy who grew up in the hood and he's kind of rough and tumbles with the kids on a regular basis. That's the kind of thing I could never do as the 5 foot Asian woman that I am. The person I replaced used to stand in the hallway and on the streets with a bull horn just going nuts, you know…doing his thing. And, that's something I don't think I could do. He'd just stand over…and teachers say this with some measure of pride and love, he'd stand over in the middle of the hallway kind of surveying his plantation as they called it. And, that's something like, okay, that's not something I would do or feel comfortable with. (Wrushen & Sherman, 2008, p. 461)

After gaining perspective on women's pathways to leadership positions, whether through formal or informal mentoring opportunities (or sheer desire and willpower), and learning of common difficulties shared by women such as balancing home and work lives and building leadership confidence, I was compelled to learn more about practicing women leaders from varying ethnic backgrounds and to make sense of the intersectionality of gender and race. So, a doctoral student and I designed a study (see Wrushen & Sherman, 2008) to examine multicultural women secondary principals' experiences (Note: Identifying and locating secondary women principals was difficult enough. Adding ethnicity into the mix made for a difficult sampling process). For minority women, though the intersection of race and gender doubly complicated their leadership experiences, gender worked more effectively against their success as leaders for most of the women. They described difficulties with stereotypical comparisons between their styles of leadership and that of their predecessors based on gendered perceptions of how principals should look and act. They also indicated a discomfort with the power inherent in their secondary principalships. The women tended to disown their power and preferred to describe themselves as servant leaders, facilitators, and team players. This propensity for "power with" strategies rather than "power over" tactics (Brunner, 2000) resulted from the belief that power is contradictory to servant leadership and inhibited them from owning their power and using it to enhance the success of their schools.

While gender was more often the most prominent challenge for the women participants, several comments were shared that indicated race was, indeed, an added challenge for some. One of the African American principals put it this way:

> Being a Black female in a leadership role is difficult in itself. Every position that I went into it seems like I was always the first [African-American in that role]. I was paving the way and, based on my actions, whether or not the door would be open for anyone [coming after] me. To me that was added pressure to do a good job because I wanted to make sure that since I was the first, I would not be the last. (p. 462)

While this woman experienced a complicated intersectionality while serving as a principal, another described her intersection as one that took prominence at a much younger age and impacted the very idea of whether she would even be allowed to obtain an advanced degree:

> My dad was Lebanese and my mom is Hispanic, so I was raised in a culture that is very conservative…The understanding of my dad was not as receptive when it came to pursuing anything beyond my bachelor's degree. He thought, "why do you need to continue?" (p. 459)
>
> I like to jump into classrooms and kind of co-teach along with the teachers and demystify some of the looks on kids' faces when they're not getting it. It's hard to go from that to demystifying this aloof leader that people want you to be. I do think as years go on, the principal role will be seen very differently. We all kind of grew up with this expectation of what a principal is supposed to be and I think that as we kind of change and smudge some of those edges, things will improve. Until then, people will struggle. (Sherman & Wrushen, 2009, p. 183)

So much data were collected from the study of multicultural women secondary principals that my colleague and I reported our findings in two separate articles (the one mentioned directly above and the one summarized here – see Sherman & Wrushen, 2009). The women unanimously described themselves as relational and collaborative leaders who took caution not to abuse their power and, instead, used it to empower those that surround them. They were proud of who they were as leaders, but struggled to break traditional leadership molds. In addition, while all of the women shared beliefs of a "greater power" beyond themselves, the Hispanic and African American women described themselves as specifically religious and spoke candidly about prayer to ground themselves and make good decisions.

Unique to these women's perspectives was the operationalization of their mentoring experiences (counter to the Sherman et al., 2008, study). In our opinion, this validated them as more authentic. Even more distinct was their report that these relationships were experienced with other women rather than men. The women described themselves as continuous learners who were servant and collaborative leaders. They spoke of being members of larger leadership teams who took the time to develop caring relationships with their school communities. This "activist mothering" (Naples, 2003) existed for these women, across ethnicity, as part of their caretaking roles as mothers, sisters, daughters, and wives. According to Harding (1991), emotional work has been relegated to women because of historical divisions and separation of labor between men and women. While emotional work was expected of them because of the historical separation between men and women (Harding), the fact that these women actually embraced this notion and strove to be relational leaders revealed their attempt to push traditional leadership paradigms outside of traditional masculine styles of leadership.

Finally, most of the women reported roadblocks to their success as leaders. According to Harding (1991), feminist standpoints are derived from perspectives on daily life. For these women, these obstacles were part of the "dailiness" of their lives as secondary school leaders. Distinct to this study was the finding that these roadblocks consistently came from other women leaders. One principal put it this way when describing the obstacles she had encountered:

> Another thing is not giving up information. And, I'll tell you that is one of the things…that not sharing of information is, I think, one of the most destructive things to leadership and shared leadership and healthy environments where you have to work with a number of administrators. And, I think that is frequently a tool that women use against one another. I spent my entire time to undo, supervise, monitor, and correct that one person instead of running the school. It was a nightmare. (p. 188)

Her frustration with having to combat sabotage lodged at her from an assistant principal was apparent. In summary, the women's individual standpoints formed a collective whole in most instances, meaning their experiences as practicing leaders were more similar than different across instances of both gender and ethnicity.

> Principal in Mid-30s
>
> After meeting me, the superintendent told my principal that he could not hire me because I was too youthful. My principal pointed out that I was the most qualified applicant and that the district had hired several APs at the high school who had been younger than me. His reply was, "But they were men." (Sherman & Beaty, 2010, p. 24)

In my continued research on women and attempt to understand women's experiences from a multitude of perspectives, it became apparent to me that it might be telling to study women leaders across generations. Therefore, my colleague and

I shaped a study to examine women's experiences in the principalship across generations in the USA to capture perspectives of participants who were born around the same time and share similar historical experiences and to compare these with women born around different times and social experiences (see Sherman & Beaty, 2010). We framed our understanding of the data with feminist phase theory (Tetreault, 1985) which had been previously used to study how feminist thought was integrated into curricula. We interviewed young women principals, middle-aged women principals, and veteran principals at varying levels of school leadership. Though we expected that their experiences would be captured in the stages of feminist phase theory according to their cohorts, we found that the ages of the women were not always prevalent, as indicated by the following quotes from women of all ages in the study:

> I am much more of a nurturer than I believe is appreciated at the secondary level. I have found that my style of leadership is much more valued at the elementary level—with regard to students and teachers—by the board and the community. (p. 25)
>
> This job is very demanding. There are days that I don't get home until nine o'clock at night. My husband is very supportive but I can tell it is wearing on him. I have started going home by six so that I can be 'Mommy' through dinner, homework and bedtime and then I get out my computer or paperwork and it's back to business. Honestly, I don't sleep a lot anymore. (p. 30)
>
> My mother always wanted me to go to college but my daddy never really saw any value in that. It's not that he really cared if I went, he just did not see the need for me to do so. (p. 23)
>
> I graduated from high school and was set to attend [Research One University]—already had a room reserved. Then, for some reason, decided at the last minute to get married instead. After my first two children were born, I decided to go back to school. I loved math and wanted to major in accounting but my husband thought that education was a better choice for me because it worked better with the children's schedule. So that's what I did. I became an elementary math teacher. (p. 23)

We heard from veteran and middle-aged women that their husbands' careers dictated their career choices. We heard from all women the struggle to balance work and home expectations as women's role expectations have remained unchanged. And we heard very few instances where the women described making meaning of their leadership roles on their own terms. The women in this study, whether young or old, continued to struggle with stereotypical assumptions about leadership and balancing work and private lives indicating that while opportunities for leadership positions have increased, the expectation that women will perform to male standards has remained intact.

> I will tell you when I first started out, Dr. X used to call me little girl. I was like, "If she calls me little girl one more time…" I style my hair to look older, believe it or not, because my first secretary…they always thought she was the principal. Sometimes my looks will deceive people so I try to always have on a suit. (Sherman & Grogan, 2011, p. 16)

Women in educational leadership have been studied for years longer than the decade I have been in academia. The collection of literature that exists has helped us to better understand many of the challenges and motivations that define the work of women in positions that have been largely held by White men in the past. Yet, young women in these roles have not been well studied to date. In fact, the existing literature provides almost no data on young women's experiences in the principalship.

And the study I conducted on women leaders across generations yielded little difference in experiences with stereotypical assumptions and behaviors. With such a small sample of young women leaders in the study outlined above, I wanted to identify a larger group of young women principals to better understand how young women view the world and to look for any signs of a changing landscape in educational leadership. If young women see the world differently from their mothers and grandmothers, my colleague and I thought we might find some signs of differences in the way they go about the work of leadership, or at least some differences in what they hope to achieve with the power in that position. However, we also knew we might find that the discourse of educational leadership is so steeped in tradition that regardless of the way they see themselves, young women, like those women that have led schools and districts before them, feel the need to conform to certain norms and expectations that leave little room for self-expression or for putting their own stamp on leadership. Therefore, the purpose of this study (see Sherman & Grogan, 2011) was to seek out young women's experiences (40 years of age and younger) in the principalship in an attempt to understand and make sense of how gender impacts a new generation of women leaders.

At the time of the writing of this chapter, though my colleague and I continued to be immersed in data collection, several themes had begun to emerge. Women reported surviving the first years of their principalships only to emerge as stronger instructional leaders, community leaders, and models for other leaders in their districts, despite their young ages. Their community leadership was at an unprecedented level as they attended local churches and organizational meetings, served on the boards of the low-income housing projects that surrounded their schools, and established open-door policies for the parents of their students. Not surprisingly, they reported continuing to struggle with balancing their work and home lives. However, what we heard from these young women was that, unlike women leaders before them, the push to choose between having a work and home life (as experienced by many veteran women) was a nonissue. They reported having full knowledge of the difficulties that would face them and went full steam ahead and got married, had children, and sought leadership positions at young ages. They talked about the exhaustion they experienced because of juggling so many roles at once and, several reported significant health problems as a result of the stress.

One interesting theme that emerged from the preliminary data analysis was that all of the first six women we interviewed were African American women who were serving at-risk school populations. Furthermore, none of these women had experienced difficulty gaining their principalships despite their young ages, gender, and ethnicity. Instead, they served as "healers" in their districts and were moved from challenged school population to challenged school population, never having the chance to enjoy the fruits of their labor. Their mission was to "fix" one school and then move on to another. And this mission was forced upon them as the women reported exhaustion from this process and not being given the opportunity to turn down moves to multiple school environments (i.e., three schools in five years). As my colleague and I continued to identify young women principals and interview them for the ongoing study, simultaneous with the writing of this chapter, we knew we would need to modify our interview protocol and interview process to better probe the thinking and understanding of women principals and to ask questions as a result of the first data we collected such as: Are there more young women principals who are African American than of other ethnicities? Are African American young women principals abused as they are required to move to multiple at-risk school environments that other leaders refuse to take on? What will be the implications for young women who have developed health issues in their early years as principals if they remain in the profession?

Giving Significance to the Bricolage

According to Stern (2008), collage, or, for the purposes of this chapter, bricolage, influences the perception of the viewer (reader), making the relationship between the observer and the piece of work more meaningful. Returning to the questions I posed at the beginning of the chapter: Has gender been a useful category of analysis (Scott, 1987) in my scholarship? And what significance does this collection of counter narratives hold? Without question, mentoring impacts self-confidence, leadership trajectories, and leadership practice (Note: The meaning I attempt to make here is bounded to the population of participants of the studies outlined in this chapter). Almost all of the participants of these studies recognized the importance of having mentors and validated the practice of mentoring as an important influence on the pathway to leadership positions. However, men and women experienced mentoring in different ways. Men were more often encouraged to apply for leadership positions and tapped as individuals to promote as principals. Women were not often encouraged to apply for leadership positions and suffered from an overall lack of women role models and mentors. Women struggled to identify mentoring that was action-oriented in most cases. Those who were the exceptions often spoke of mentoring as a network of “activist mothering” (Naples, 2003) that helped them pay it forward and, perhaps, negate competition among themselves by taking ownership of the success of other women leaders and aspiring leaders. This notion of “activist mothering” can be applied to the higher education setting by veteran women scholars taking ownership of the success of women new to the field, much as I have tried to do in my efforts to help women doctoral students and colleagues new to the field establish themselves through research endeavors (for more information on women’s experiences in higher education, see Newcomb, Beaty, Sanzo, & Peters-Hawkins, 2013; Sherman, 2010; Sherman, Beaty, Crum, & Peters, 2010). In regard to formal mentoring, few participants valued these leadership preparation programs and were suspicious of their intentions, indicating that this form of mentoring has not escaped the weaknesses identified in informal mentoring processes. These programs fell prey to promoting the status quo and were not found to promote more women into leadership positions.

Being denied access to information was as detrimental as the lack of access to mentoring for women. Information is power. Whether women were denied information/recognition (confidence boosters) about their potential as future leaders, whether they were never explained the hidden rules of the leadership process of a district, or whether they were actively sabotaged by others in their districts, the lack of access to knowledge was effective at keeping the numbers of women in leadership positions down. One of the most concrete examples of the lack of access to information was the misunderstanding that many women had of networking. The fact that men knew how to network for power and positioning with those in leadership positions in districts (and had, indeed, been networked themselves) and, instead, women spoke of networking in relation to getting along with fellow teachers spoke volumes about hidden rules that kept women aloof from pathways to leadership positions.

Without a doubt, women of all ethnicities and ages struggled to gain a balance between their work and home lives. They worked their first shifts as school and district leaders and then took on second shifts when they got home and filled gendered expectations for their roles as wives and mothers. The women wore multiple hats to demonstrate their capabilities as future and practicing leaders and practiced a “never let them see you sweat” mentality. However, behind closed doors, the women admitted exhaustion from their daily efforts to be “superwomen” and described consequences such as broken marriages and poor health.

Curriculum leadership was a strength for the women, and, for the most part, they embraced relational work – and were good at it – by making connections with students, parents, teachers, and their surrounding communities. However, many of the women expressed explicit discomfort with the inherent power of their leadership positions and struggled with the binary oppositions that held their roles as leaders and wives/mothers in competition. They expressed desires to change notions of power and to associate new language with their leadership styles such as “collaborative” and “servant.” For women in the university setting, this means creating research networks with other women scholars across national and international settings and empowering one another through collaboration (collaborative power being more comfortable for many women rather than singular power).

While intersectionalities between ethnicity and gender complicated many women’s experiences as leaders, biases related to gender were recognized and described as most prominent by these women. Some women failed to recognize biased behaviors when asked about their experiences with them, but, in deeper discussions with me, described instances where they had been explicitly impacted by stereotypical assumptions and behaviors. Sadly, across generations, women’s descriptions of their leadership experiences varied only minimally, indicating that policies sometimes failed to bring about changes in practice (and certainly not changes in beliefs or assumptions). And, at the time of the writing of this chapter, data that were collected on young women leaders pointed toward serious health consequences from holding principalship positions for young African American women who may have been abused by their districts as they were expected to reform the most difficult of schools repeatedly.

In short, gender has been, and continues to be, a useful category of analysis for myself and for other feminist scholars. Countless voices have been added to the leadership "story" that may have remained silent without this work. These women's counternarratives have both practical and political significance for those of us who hope to move the study of women forward for the purpose of increasing their numbers and successes in educational leadership roles. We know a good deal about women's ways of leading from existing research. We have less information on how collaborative and relational leadership is linked, through empirical studies, to student achievement and school success. And it is not clear how we can move beyond the "gendered" language of leadership to that which focuses on best practice rather than "feminine" and "masculine" styles of leadership. We must expand our ideas of what leadership can and should look like and promote these reconceptualizations of leadership in our preparation programs so that when our graduates move into practical settings, leadership practice and notions of leadership will be transformed.

We know that women have struggled, and continue to struggle, balancing their home and work lives. This has not changed across time in the literature on women leaders. Why are we still talking about this? Because nothing has changed. And why has nothing changed? Because the reconceptualization of men and women's societal roles have, largely, remained unchanged. It is difficult to transform leadership practice and role expectations in education when resocialization is needed on a more global level. Can gender and leadership be redefined without social restructuring? Until such a time, we might work smarter and more diligently toward investigating notions of job sharing in school leadership (i.e., coprincipals) as well as forcing policies that make on-campus childcare a mandatory option for women principals who are also primary caretakers of their children. At the very least, we need to know more about how affirmative action and family policies have been implemented and how they have or have not been useful.

We know that many women have been left out of both formal and informal mentoring opportunities. We must now take this knowledge and work specifically to actively promote and recruit women into top leadership positions (in both K-12 and university settings). We must make ourselves and the women we study active participants in an agenda for change. We can and should create networks of support for ourselves, both feminist scholars and practicing women leaders, if for no other reason than to ensure our own survival! This requires specific efforts toward mentor pairing between prospective/new and veteran women leaders, professional development for those who will be engaged in the work of mentoring and for districts needing to operationalize best mentoring practices to "grow their own," the study of expanded notions of mentoring through greater networking actions, the promotion of mentoring practice by those who are involved in leadership preparation at the university setting (mentoring should be included in course/program content so that graduates can enter leadership positions ready to mentor and bring others along the leadership continuum), and pointed efforts at feminist research collaborations between women scholars in the university.

Finally, we should ask whether our research methods have best accommodated women and their stories. Are these same methods best for understanding the experiences of a new generation of women leaders and how they make sense of and define leadership? Do young women make meaning of leadership the same way their mothers and grandmothers did? Do we need to expand our methods for understanding? Are we asking the right questions so that our investigations yield a new history (Scott, 1987)? Should we look at old questions from new perspectives or frame new questions for new perspectives? Should we continue to look across our work and create larger bricolages? Perhaps we need to continue our efforts in some cases but expand our "samples" of women to better gauge what women's experiences are from an increased multicultural and global perspective. Perhaps universities should reconsider tenure structures than value single-author research over collaborative efforts at research. Furthermore, the fight for equity is much more advanced in the USA when compared to many other countries that are still struggling to make the education of girls a possibility and priority. How can we, as US feminist scholars, become more politically active to expand our fight for social justice to ensure the survival of girls and women worldwide?

It was my hope that the words of the women participants of my studies would give voice to many who have not been heard and inspire additional research on women leaders. It has also been my hope that more women will learn to claim rather than receive their leadership roles (Rich, as cited in Martin, 1985) and, eventually, help the field of education lay claim to best leadership practice through consciousness raising, the setting and attainment of new goals, and the integration of new scholarship (Martin, 1985). Much has been left unheard. And, as long as more is to be learned and the devaluation and exclusion of women in leadership continues, an appreciation can be gained from women who have managed to achieve and thrive in school and district leadership positions (Harding, 1991). We must now be more pointed in our research on women and build upon that which we already know. We need to identify where change can be initiated and take place. Our work must now be politically directed toward change, and figuring out how best to do this is the challenge for the next generation of feminist scholars working side by side with veteran women scholars.

Chapter 13
How Should Researchers Act in the Context of Social Injustice? Reflections on the Role of the Researcher as a Social Justice Leader

Dilys Schoorman

Critical scholars, community activists, and journalists remind us that there is injustice in the world. In turn, *many* of us, professors in colleges of education, establish this fact in our teaching. We draw attention to a wide range of disparities and inequities such as governmental overreach and abuse of human rights in diverse contexts, the lack of equal opportunities and access to basic services, and the deliberate cultural, social, political, and economic marginalization of particular groups. In the USA, recognizing the potential role of education in ameliorating or exacerbating these conditions, we urge our students – especially teachers, principals, counselors, and educational administrators – that they can and should make a tangible difference in the lives of students and families who have been marginalized by social structures (that privilege the wealthy 1 %, and middle-class White Americans who remain the normative "mainstream" (Christensen, 2000, 2009; Oakes & Lipton, 2003; Wink, 2004)). In *some* courses we address the international/global dimensions of social (in)justice focusing on the ravages of globalization, conflict, environmental degradation, poverty, political corruption, intra-national and international disparities in human rights, opportunities and access (Au & Apple, 2004; Bigelow & Peterson, 2002). Or we contemplate how some countries have moved toward greater parity on some of these aspects. It is in this multicultural and/or global contextualization of these courses that we are able to begin the conversations about social justice locally or globally.

Yet, in the previous paragraph you will noticed that I italicized the words "many" and "some" to underscore that multicultural or global contextualizations and, by extension, discussions of social justice are neither routine, inevitable, nor commonplace. Indeed, courses that address such ideas are – still – somewhat marginalized

in the USA, even within colleges of education. And yet, one cannot escape the link between social (in)justice and the role of education/educators in our global history. Our perspectives on research have been significantly shaped by the recognition that the atrocities of Nuremburg were committed by those deemed educated. Education has been as central to the establishment of social justice as in the access to education for African Americans in antebellum and postbellum USA and for girls and women in many nations around the world, just as education/educators have served the purposes of injustice as an agent of deculturalization and colonization (Spring, 2010). This history reminds us of the central role of the educator in the context of social justice, as emphasized in this note to teachers[1]:

> Dear Teacher:
> I am the survivor of a concentration camp. My eyes have seen what no one should witness:
> Gas chambers built by *learned* engineers.
> Children poisoned by *educated* physicians.
> Infants killed by *trained* nurses.
> Women and babies shot and burned by *high school* and *college graduates*.
> So I am suspicious of education.
> My request is: Help your students become human. Your efforts must never produce learned monsters, skilled psychopaths, educated Eichmanns.
> Reading, writing, arithmetic are important only if they serve to make our children more human.

This applies as much, perhaps even more particularly, to those of us who teach educational research. To echo Bogotch (2008), educational researchers need "to become *more political* internationally, nationally and locally, *more active* socially in their communities and organizations, and *more critical* of existing educational theories and practices" (p. 80).

Is Social Justice Central to Our Roles as Educational Researchers?

I was fortunate to attend a presentation by Paul Rusesabagina, whose courage during the Rwandan genocide was highlighted in the film *Hotel Rwanda*. In his presentation he voiced his surprise and puzzlement about being hailed as a hero and noted that he was simply doing his job – as a hotel manager (see also Crockett, n.d.). So, if a hotel manager could find a way to frame his courage and heroism in the context of terror as "simply doing his job," how might educators, and particularly educational researchers, consider social justice praxis as "simply doing our job"?

As suggested previously, we first need to be conscious about the existence of social injustice, be committed to the principles of social justice in order to actively participate in addressing such injustice. Even as we work hard to help our students acquire critical consciousness about a variety of social injustices, and their own positions of privilege in the perpetuation of that reality, we are also similarly challenged to examine our own roles in perpetuating systems of power and privilege.

Do we expect our students to engage in activities that are justice-oriented within school and community settings, but remain satisfied that our classroom conversations about injustice are an adequate contribution for us to be making? How do we respond to the fact that social justice-oriented curriculum remains marginalized in our programs – and has made little movement beyond these margins? For those of us in nations/contexts where social justice pedagogy does not amount to treason or a death threat, what is our obligation to our colleagues in places where it is?

How should educational researchers act in the context of social injustice? This chapter will focus on the manner in which we can become leaders for social justice in this often-neglected arena: our role as researchers. I will explore my own struggle with this question and the insights that have emerged in my professional journey. No doubt, researcher positionality will emerge as significant, whether in my role as a full professor now and the attendant obligations that such a rank brings (in my view) to the social justice project, as a critical multicultural educator whose philosophical grounding in critical pedagogy offers a logical linkage to my conceptualization of the obligations of a social justice researcher, or as a transnational whose annual trips to the nation of my birth is grounded in an obligation to "give back" as well to be "reminded again" of the unique challenges of critical education and justice-oriented work in international settings. This chapter seeks to trouble our received epistemologies, research ethics, and our conscience as researchers, to begin a conversation on new and bold pathways for research that matters – especially within communities that have been marginalized by research practices.

Being Leaders as Researchers

For many of us, our education as researchers required us to be dutiful followers, not epistemological leaders. As Burdick and Sandlin (2010) note, most acceptable educational research imposed by colleges of education and scholarly review processes offer a bounded possibility of what counts, "collapsing the very concept of *education* into the practice of *schooling*" (p. 350). Regardless of whether we used quantitative or qualitative data, a positivist or constructivist paradigm, "good" research was defined in terms of methodological precision and fidelity (Hostetler, 2005; Yanchar, Gantt, & Clay 2005). Furthermore, "ethical" research required that we minimized harm and left the researched untouched by the research, and researcher bias or positionality was viewed as a weakness to be minimized. As students, we rarely questioned these positions. Instead, we typically appointed to our doctoral committees a "methodologist" who would make sure that we knew and followed the rules of educational research as a requisite for graduation.

As a consequence, when it comes to leadership for social justice, we do have too few *research* leaders among our programs and colleges of education. Even when studies of leadership itself engage significant issues of social injustice, it is unclear if the researchers have been able to escape the "followership" mentality in which they were schooled methodologically. Quoting Roberts, Yanchar, Gantt & Clay (2005), warned about such "methodolatry" (p. 351), where research became "the habitual application of some formulaic mode of inquiry to a set of quasi-problems chosen chiefly because of their compatibility with the adopted method" (p. 28). Instead, drawing on Villaverde, Kincheloe and McLaren (2005) advocate research that attains and retains a "a vision of not yet" (p. 309). To accomplish this, our first step as research leaders for social justice is to face up to the observation that "mainstream research practices are generally, although most often unwittingly, implicated in the reproduction of systems of class, race, and gender oppression" (Kincheloe & McLaren, p. 304). Indigenous scholars have viewed research as a dirty word, arguing that "it is time to dismantle, deconstruct and decolonize Western epistemologies from within" (Denzin & Lincoln, 2008, p. ix.) To what extent is our own research implicated in these criticisms?

What if we, as a scholarly community, reframed educational research as counter-hegemonic praxis and made such a stance more central, rather than peripheral, to the discourse on educational research? Might we ask this of ourselves and of the next generation of scholars that we mentor? To what extent have we begun this process in our spheres of influence? A central commitment to leadership for social justice is our willingness and ability to forge new pathways for research that view epistemology and methodology in terms of their emancipatory potential.

Critical Pedagogy, Social Justice, and the Research Undertaking

The writings of Freire (2000), elaborated on by McLaren, Giroux, Kincheloe, and Sleeter, have served as the basis of critical pedagogy for multicultural educators and remind us that education – including courses and discourses about research methodology – have emancipatory and oppressive potentialities. In *Pedagogy of the Oppressed*, Freire makes us all critically aware of how the traditional processes of education serve to perpetuate hegemonic structures that privilege the oppressors and marginalize the oppressed. Central to this process is the "banking approach" where generations of students are taught to be passive, obedient, and unquestioning of teacher-centered instructional approaches. Scholars of critical pedagogy remind us that our scholarly pursuits must be understood as political and, in the context of social injustice, can hardly be viewed as "neutral"; indeed, the pursuit of equity and social justice should be central to any educational endeavor. Critical pedagogy calls for educators to facilitate a process of conscientization among the community of learners where particularly the marginalized are able to acquire critical consciousness about the processes and structures that limit their power. Freire notes that education should be humanizing, thus making the scholar one who is more in touch with his/her humanity and those of others. Critical pedagogy as problem-posing dialogue, occurring between/among teacher-learners and learner-teachers, in a generative praxis of reflection and action, draws into question the parallel role of researcher as expert vis-à-vis the researched. Ultimately, our scholarly endeavors must be undertaken as liberatory praxis for all involved.

The implications of Freire's work for those of us educated as researchers through pedagogies that were oppressive are significant. Our epistemologies could be either scholarly straightjackets that constrain and fetter our work or they could offer a generative impulse to free the researcher and the researched to engage in scholarly pursuits that are inherently and/or potentially emancipatory. Too often, however, our "schooling" as researchers reinforces the "banking" approach to our own scholarly investigations, resulting in an unfortunate failure to use our knowledge as researchers within a problem-posing context. So what *should* it mean to do critical or social justice research?

One must necessarily be cautious about the claim of doing social justice research. Following the argument of Montano, Lopez-Torres, and DeLissovoy (2002) with regard to teachers who are social justice activists, it is useful to distinguish between research that is inspired by concerns about social injustice or beliefs in social justice and those that are, in *effect*, social justice undertakings. To this end I advocate the following list of characteristics that encompass the intent, process, and outcomes of a research project, as an *ideal* conceptualization of social justice research. It is a research undertaking where:

- The rationale for the study is grounded in extant social injustices.
- The goals/purpose of the study is to minimize/eliminate the injustices or the conditions that gave rise to them.
- The research questions emerge from the interests of the researched who are marginalized by the injustices.
- The underlying epistemological stance is one that reflects research *with* the researched not simply research *on* them.
- Research design and methodologies reflect multiple loci of expertise (where the researchers are not perceived as the sole "experts" and where community members' value as co-researchers is recognized).
- Participation in the research process is viewed as beneficial or emancipatory by both the researcher and the researched.
- The outcome of the research process is the alleviation, amelioration, or elimination of a facet of the injustice that gave rise to the study.

Granting that this is my idealized notion of what social justice research *should* be and, concomitantly, how I should conduct myself as a researcher, I will now reflect on how I have come to these ideas in my own work/journey as a scholar.

For most of my life as a scholar, my research has focused on issues of critical significance; that is, I have always been preoccupied by issues of power and privilege, at some level. Like many multicultural educators, the work that I did as a teacher educator spilled over into my research agenda. I adopted critical theoretical frameworks, asked questions about rhetoric vs. action, framed analyses in terms of divergent ideological perspectives, investigated the concerns of specific marginalized groups, and engaged in reflexivity as a researcher. Yet, I have been cautious about claiming any of this work as "social justice" research.

Commenting on our use of "multicultural/social justice" in a previous paper, we note, "While we are confident that critical multiculturalism is exemplified in our perspectives, social justice is sometimes a goal to which we aspire … hence the use of both terms to signify from whence we come (philosophically) and where we hope to go" (Schoorman & Bogotch, 2010, p. 250). There are two issues embedded here. The first is a reluctance about false claims. I did not want to tout myself as a social justice researcher when I was not. The second is a question of intent. If I did not set out to engage in social justice research, is it even possible to imagine my research as social justice praxis? The assertion that I make here, as a contribution to our ongoing debate and discussion, is that we need to be intentionally social justice researchers and not engage in such scholarship by accident or by default. After all, leadership is intentional and conscious, right?

The characteristics of my "ideal" conceptualization of social justice research derive from the work of researchers within the critical paradigm and advocates of critical pedagogy and social justice pedagogy in multicultural education. As Oakes and Lipton (2003) note of the purpose of critical pedagogy, "identifying the rawest social sores and refusing to be polite about them" (p. 289) is in itself a noble task. However, writing *about* social injustices is merely a starting point for movement toward social justice; the process and outcomes of such research matter as well. In outlining a new paradigm for educational research, Anyon (2005) urges us to document and describe oppression, study the powerful, assess efforts of urban communities to create power and opportunity, study social movements, study student activists, and investigate ways to make schools movement-building spaces. As implied by the progression of recommendations in this list, we cannot be satisfied by the topics and focus of our research. We must be concerned about the broader, public purpose and impact of our work.

This concern was central to my work with a Maya immigrant community in a family literacy program. As a multicultural educator, my writing about this underrepresented group could well have been valued within the research community for its exoticizing potentiality, with little impact on the group or its staff. Concerned about the potential that my work would unwittingly "recolonize" the Maya, I entered the relationship with this community with explicit requests and directions. I provided the staff a document that discussed principles of family literacy research in which Taylor (1997) noted the following:

- Questions need to be asked about the extent to which academic research on families and literacy is conducted for personal gain in the form of financial and/or professional advancement.
- Questions should also be asked about the relevance of the research to the everyday lives of families who participate in literacy studies.
- The family's well-being and personal needs and interests should always override the personal needs and interests of the researcher (p. 70).

We agreed that, outside of an initial evaluation of the program, all research publications would contain the name(s) of appropriate members of the community, that all "data" related to the community would be housed and owned by the program, that the development of research papers and authorship would always be explicitly discussed, and that all research would be primarily in the interest of the families and the program, especially with regard to vulnerability. It is primarily my 7-year experience with this group, including a sabbatical, that has given rise to my "ideal" conceptualization of social justice research. This rethinking of the purpose and impact of research is aptly summarized by Ladson-Billings (2005):

> The work we have to do must be done in the public interest.… The questions we pursue, the projects we choose, the agenda we champion have to be about more than career advancement. If educational research is going to matter, then we have to make it matter in the lives of people around real issues (p. 10).

Just as critical multiculturalists have raised questions about *whose* knowledge is central to school curriculum, and to the politics of the knowledge construction process, we must pay attention to how our own research questions are derived. In a recent study that drew less than expected enthusiasm among our research participants who were teachers, we came to the conclusion that in order to engage local communities of practice in collaborative research, we needed to ask questions that were of interest to them. Instead of entering the research *on* others with a priori questions, research *with* others begins with the questions relevant to the community, casting the research undertaking as the researcher's service to the community. "As most of our projects emerged from our service work, we have now re-conceptualized our research as service. 'Research as service' emphasizes the notion that such an activity needs to serve a greater good than merely the urgency to 'get another paper out' within a 'publish or perish' institutional context" (Schoorman & Bogotch, 2010, p. 261). This was an idea I reinforced in my written self-evaluation and oral presentation to our college's promotion and tenure committee, in an effort to begin the conversation and the reconceptualization among the key decision makers on what we value as educational research.

Freire's (2000) notion of dialogic instruction is instructive in the research context as well. Instead of the traditional model of researcher-centered investigations, collaborative research that engages the researched in mutual investigation of a community problem could enhance the catalytic validity (Lather, 1986) of the study: "the reality-altering impact of the research process itself (where) respondents gain self-understanding and, ideally, self-determination through research participation" (p. 67). Collaboration with communities to whom the research is most salient is more likely to enhance the potential of the investigation to make a difference in the lives of the researched and the context of the injustice. Up for debate is who should be able to claim the title of "social justice" to describe the results of a study: Is it appropriate that the researcher makes this claim, or is it something that those who experience the injustice must acknowledge?

Collaboration between the researcher and the researched also minimizes the potential for researcher to act as sole "expert" or engage in missionary or rescuer roles where the researched are viewed as passive and helpless. Such collaboration underscores the need for the researchers to be immersed in communities of practice so that they may learn more deeply about the injustices that they investigate and their role in perpetuating or challenging the power dynamics that result in injustice. To this end, critical reflexivity is central to the entire research process.

Research Leadership for Social Justice in International Contexts

Conducting research in international contexts calls for heightened reflexivity among researchers. In addition to the concerns about the intent, benefit, process, and effect of research, we must recognize that the contours of injustice in diverse contexts make research not merely counter-hegemonic but also life-threatening. Thus, it is important that my own list of characteristics for desired research practice not impede the potential for researchers to lead in unique and unusual ways. It is at this juncture that I currently find myself professionally.

I left Sri Lanka, the country of my birth, as an adult, at a time of conflict that was both ethnic and political. My reconnection with the country as a professional began in the same way as much of my community-based research in the USA: a commitment to serve. Over the past 5 years, I have returned to Sri Lanka to offer teacher-training workshops free of charge in school and university settings. Granted, these are in settings where I have personal connections and in Colombo, the capital, where teachers and students are the "best off" in all dimensions of educational opportunity. I do not claim that this is social justice work; however, it has allowed me to come to the important insights about international work in the context of social justice.

It was vital to me that I offered my expertise – but listened very carefully to what the leaders in each context told me that they needed. While many indicated that they were starved for any kind of meaningful professional development, that they were very interested in learning about "what we did" in the USA, it was important to me to establish that the west did not have all the answers, and that we experienced similar struggles about engaging all learners, avoiding "teaching to the test," and addressing the pressures of standardized high-stakes testing and stilted curriculum. Operating in my favor was a healthy stance of insider-outsider positioning. I worked with local colleagues who served as critical friends to ensure that I had not "lost touch" with my local roots and whetted my US-based ideas for local implementation; with my audiences I highlighted the strengths of local practice that had helped me in my own professional journey. Thus, in a postcolonial context where attitudes toward the USA (the west in general) ranged from "the west knows best" to a suspicion of anything western, establishing a stance of mutuality was important.

Yet, there were topics that were strictly out of bounds. Although as a multicultural educator in the USA I had become comfortable talking openly and explicitly about the politics of race, language, class, and gender, these remained largely taboo topics among my audiences. Although principals and education directors acknowledged this as an important issue to address, and we did manage to conduct one highly choreographed workshop on race with a carefully selected group of teachers, it is work that is distinctly problematic. My work in Sri Lanka has yielded many such "danger zones." While it is not always clear exactly where the danger lies, how it will be realized, or whether it is perceived or real, the caution of my critical friends is tangible. What, then, does a responsible researcher do? Should one write about it under an assumed name, so as to protect family members or informants who might be tracked down? Should one make sure that one's writing "helps the country and the children" (as one informant hoped) and not write until one was sure that the primary beneficiary of such scholarship would be the marginalized? What does one do with the litany of injustices that an informant provided about education in the country but who declined to be acknowledged as an author? How does one record for a 'western' audience the data collection processes, when your sources would rather not be identified? What does it mean to be research leaders in such a context?

An example from the world of journalism might prove instructive, even if too extreme for some. In January 2009, when governmental pressure against the media was high and the civil war was taking its toll on the nation's patience, the outspoken editor of an independent Sri Lankan newspaper, The Sunday Leader, was assassinated. His newspaper had been a refreshing and courageous voice against governmental overreach. Ironically, the weekend after his death, the paper published his final editorial, which he had written in anticipation of his death (see: http://www.thesundayleader.lk/20090111/editorial-.htm). Lasantha Wickrematunge's last editorial is a succinct reminder to all journalists and students of journalism of what it means to be a leader for social justice in his profession. It was a choice that he consciously made; he had other options. He knew this work was dangerous and could cost him his life. This is what leadership often looks like in some parts of the world. How might educational leaders, especially those that seek to be leaders in social justice research, learn from Wickrematunge's example? Is there anything to be learned?

While as a Sri Lankan I find the entire editorial instructive, I'd like to discuss a few quotations and their links to our work as educators, educational researchers, and leaders in diverse international contexts.

> No other profession calls on its practitioners to lay down their lives for their art save the armed forces and, in Sri Lanka, journalism.

There are (and have been) situations around the world where educators are at similar risk for engaging in their professional practice. The educators of Afghan girls who dare to seek an education who are threatened each day for what they do (Nelson, 2009), the members of the semiunderground Baha'i Institute for Higher Education who are committed to providing an education to students of the Baha'i faith currently banned from a university education in Iran (see educationunderfire.com), and the educators in Iraq for whom simply showing up at work was an act of courage (Beaumont, 2006) are a few examples. Many activists use their positions within political structures to advocate for better educational opportunities, or who work to undermine political corruption (where the public's 'rights' to an education are interpreted as favors and often come only at the expense of a bribe). The question is: What is the response of the educational researcher to such a context? To what extent have we, as educational researchers, entered such "danger zones," and how have they made us better (i.e., more responsible and responsive) researchers?

Wickrematunge (2009) notes:

> But there is a calling that is yet above high office, fame, lucre and security. It is the call of conscience.… The investigative articles we print are supported by documentary evidence thanks to the public-spiritedness of citizens who at great risk to themselves pass on this material to us…. But if we do not speak out now, there will be no one left to speak for those who cannot…

As a journalist, he saw it as important to write. Does the same apply to us, as educational researchers? While journalism seeks to bring about public awareness, what is the purpose of the writing of educational researchers? How do we manage the danger in which we place others, as well as ourselves? While the social justice research leader might be a person willing to risk his/her own life for a cause, how should that endangerment be viewed in the context of others' welfare and that of the cause?

These are some of the struggles and insights of my experiences, including the invitation to write in this handbook. While writing about injustice could well be an act of courage in some instances, my own assessment is that I should not write in a manner that places others at greater risk than I place myself. Furthermore, operating in a culture where one is constantly told to publish or perish, or to "write up" practically everything they experience, I find that the deliberate choice not to publish is an act of leadership. It is important to me that I commit to *not* write about the perils of others simply to burnish my own credentials as a scholar. Instead, I re-commit to more creative and diligent service, operating 'under the radar' to address the injustices for which international colleagues risk their lives, professions and family wellbeing.

A second example from public discourse on injustice in Sri Lanka more directly linked to education is a newspaper article that provides a detailed overview of the concerns of many students in many countries (see http://sinhale.wordpress.com/2010/05/08/p-a-ruwan-nandika-is-next-big-threat-to-the-regime/). The case presented by Seneviratne (2010) in this letter addresses the meaningfulness of the General Certificate of Education Ordinary Level Examination that is taken at the end of tenth grade and is the gateway to Advanced Level study that leads to university entrance.

> Pitipana Arachchige Ruwan Nandika is 17 years old. He is one of the 272,640 children who sat for the GCE O/L Examination in December 2009. Let's be more specific. He is one of the 129,640 (47 %) who failed to qualify for the A/Ls. He is one of the 57 per cent who failed Mathematics. He attended one of the 27 schools that did not have a single student qualifying for the A/L. He is one of the 63 per cent who failed English and one of the 52 per cent who failed Science. He is one of the 21,813 who failed all subjects. Needless to say, he also belongs to that strange club of the 90 per cent who failed to solve the 'compulsory' geometry problem in the Mathematics paper.

Despite the particulars of the context and the statistics, what is presented here is, sadly and increasingly, familiar to many around the world. It is clear that the educational system has failed this and many other students. The roots of the failure encompass a tangle web of limited resources, ineffective decision-making and policy structures, political pressure and gamesmanship, inadequate teacher education, and carelessly written textbooks. How does the social justice researcher "enter" this context? How might she/he provide leadership?

It might be worthwhile for us to ask ourselves at which point the numbers cited above become "acceptable"; when do they cross the line from "injustice" to something we can accept as reasonable? If a 47 % failure rate is unacceptable, what would be acceptable? How do we justify our own choices of acceptable numbers?

At which point do we express our outrage about the national state of educational achievement and opportunity, and where do we place blame and responsibility for its status? Yet, we must also recognize that the failure rate is not the important statistic on which to focus; that is too easily resolved by lowering the passing grade. We must, instead, examine the context within which failure occurs. The fact that a child like Nandika did not appear to have a chance the minute he entered his school, one of 27 schools where no student passed the examination, must concern all of us. There are too many Nandikas around the world and in our own backyards.

Addressing the challenges of leadership for social justice within an international context draws our attention to both the unique conditions within which social injustices emerge and must be addressed, as well as the underlying commonalties that surface across contexts. Although it is likely that an educational researcher might feel ineffective in the struggle toward social justice, there are many insights that emerge from such struggle that could advance research in general and social justice research in particular.

Perhaps, analogous to our recommendation of study abroad for undergraduates, it might be instructive for all educational researchers to experience a social justice struggle with a group of people and to engage in authentic problem solving *unrelated to a publication opportunity*. Freeing oneself from the pressures to publish as one enters such experiences has been important to me; it protects the host community from researcher overreach and exploitation and emancipates the researcher to learn and serve without the specter of narrow accountability measures of the publication-obsessed professional world in which we live. Just like study abroad, we enter into a world where the rules (and life) are different – and that is the point of the experience. I have undoubtedly grown as an educator and researcher since my sabbatical among the Maya when I was welcomed to "the university of the poor" in "the Third World in the First World." Yet, I also remember being extremely worried at the end of the sabbatical that I had not written as much as I intended to, initially seeing my experience as a failure rather than the transformative opportunity that it really was.

Leading the Next Generation of Social Justice Researchers

Throughout this chapter, I have underscored the need for us to be research leaders in the context of social justice. As someone not schooled in an educational leadership program, let me explain what I mean. It means going where others have not been before, forging new pathways, and, in so doing, paving the way for others to follow and – perhaps – create further paths. Leadership occurs in the micro contexts of daily professional interactions, in the classroom, mentoring relationships, committee meetings, dissertation defenses, and program design, as much as it occurs in decisions about our own research agendas. I see my role as a faculty member as great opportunity for such leadership. I now see such leadership as a responsibility.

An international handbook of social justice leadership requires that we place our work within a broader global context; we learn from this broader global context but return to do our work in very local and particular contexts. Thus, the imperative to "think globally, act locally" while clichéd is also imperative. As researchers, we cannot think globally unless we travel – either to different countries or different worlds within our own communities. It is through such relocation that we move out of the proverbial ivory tower to engage with communities in current struggles that need the leadership and collaboration of university researchers. In an international context, where universities in nations such as the USA host so many researchers from around the world, it makes sense that we view a desired global shift toward justice-oriented research as beginning with our own programs.

Regardless of our choices about stepping out of our comfort zones and into "foreign" territories where we unlearn, relearn, and sharpen skills as researchers, we do have responsibilities to the students we teach and mentor. We can hardly have students read about the social injustices perpetuated within education (global) and emulate the same oppressive practices ourselves, as educators (local). Furthermore, we have an obligation to ensure that we do not perpetuate in the graduate education of the next generation of scholars, a hegemonic approach to research, especially research that involves marginalized populations. Whether we like it or not, we must be leaders within this context.

I conclude this chapter with a statement of commitments I wish to make – to my students, in particular, and to my colleagues, more generally – as I contemplate my potential/emerging role as a research leader in social justice.

Lead/Teach/Research by Example

It is extremely important that our students see us practicing what we preach. I recently offered a new doctoral course that focused on critical theory in educational research. What I found was that I was able to explain much of the theory critical research through my own field experiences. My 7-year relationship with a community-based education program that offered family literacy to preliterate Guatemalan Maya immigrant women was particularly instructive in understanding the theory and the practice of critical ethnography, collaborative research, critical interviews and case study, bricolage, standpoint theory, reflexivity, and catalytic validity.

I have also learned that leading as a researcher is not only engaging in/with specific communities of practice, teaching, or engaging in scholarship on social justice; it is about owning the label "social justice" as attached to your work and discussing it in terms of your ability to live up to its central tenets. As I note earlier, it is a label that I have been reticent to use, because I have been intimidated about being unable to live up to its promise. While it might be professionally dangerous for some to use this label, that is not the case for me; so it is important that I am open about my work and let students and colleagues know that there are allies in this work.

That said, leading by example is an ongoing challenge, especially as we work in contexts where it is easier to be a follower or to focus on what ought to be done instead of doing it. Our institutional criteria for exemplary practice frequently marginalize the types of research, and the publication outlets for social justice work and minimize the community practice that is central to such a research agenda. As a faculty member who no longer has the pressures of promotion and tenure (at least in my current institution), I must – by example – actively commit to reframing social justice work as rigorous, relevant, and valid in all institutional contexts within which "acceptability" of research is discussed: promotion and tenure guidelines, dissertation proposals, peer review of journal articles and conferences, and competitions for research awards.

Create Spaces for Social Justice Research

My proposal for the new course on critical theory in educational research received some opposition from colleagues who were "research methodologists" – an indication that the course was simultaneously threatening in some way but also deemed irrelevant or unnecessary. I suspect that this is likely to be typical in many graduate programs. In such a climate, it is important for senior professors to create spaces for graduate students to engage in this scholarship. The creation of a course that required thinking about social justice concerns in research, and an imperative to engage in research that was counter hegemonic praxis, provided a license for students to think beyond the methodological constraints of the traditional qualitative and quantitative research methods. Furthermore, it offered some students an extension to their coursework in critical pedagogy, allowing them to link their critical theoretical frameworks and topics with critical research designs and methodology.

Creating space is not limited to adding new courses to an existing structure of traditional offerings. It also requires the transformation of existing coursework to accommodate the needs of students with justice-oriented agendas. Students must be able to see a consistent and systematic pathway for the development of their scholarly praxis, and this has been central to my own role as an advisor. Also central to supporting students' work in social justice is our ability to build coalitions among like-minded faculty. Forging these networks ourselves with colleagues across the university and the profession is a precursor to then introducing our students to a broader support system beyond the confines of a program.

Engage Persuasively with Colleagues

As suggested previously, work in the critical paradigm and especially research that is oriented toward social justice is typically marginalized within many colleges of education. Variously labeled "biased," "advocacy," and distinctly "not research" to the extent that reviewers on our university's institutional review board have begun to think about classifying this work as "quality improvement" projects as opposed to "research," a social justice research agenda baffles the traditional researcher. It is likely that the first leadership action of those of us interested in social justice research is to engage persuasively with our colleagues on why and how this work should no longer be deemed marginal but should be considered integral to a college's research vision.

Yet, the process for such discussions must exemplify the communication skills of social justice praxis. Leadership within this context embodies the building of consensus and coalition through the establishment of common ground. The movement away from the margins should not be a proxy for alternate marginalization. The task of thinking globally and acting locally is pertinent here. As we consider the acts of courage of individuals who have to use their wit and patience to negotiate, reconcile, or coexist with (once) hostile enemies (see http://www.coexistdocumentary.org/coexist; Acquaro & Landesman, 2003; Truth and Reconciliation efforts in South Africa, see http://gbgm-umc.org/nwo/99ja/different.html), we must ask what inroads have we been able to make in the safety of our universities across philosophical borders? If we truly believe that the work we do advances the causes of social justice, shouldn't it be part of our agenda as leaders to make that work more central, more "normal," less strange, and less threatening, with no question of its merit or rigor? And should we also – as social justice researchers – work to be framed as central, not peripheral or marginal, colleagues in the day-to-day operation and decision-making of our programs?

View Research as an Act of Courage

I am a member of the National Association of Multicultural Education (NAME) in the USA. The association's logo is an inverted red triangle derived from the symbolism used by Hitler to identify political dissidents and "wrong thinkers." NAME's deliberate choice of this logo inspires educators to think differently, speak out, and speak truth to power. While this might be dangerous for professors who are not tenured or promoted (although this should not be an excuse), it is particularly important for full professors to take up this challenge. This is especially salient for those of us in states where academic freedom and/or tenure are under attack. In a recent conversation where faculty were explaining the importance of academic freedom and tenure to a state-level decision maker, the question was posed: "What is the controversial research that you do, for which you need this protection?" As I reflected on this question, I realized that I could not name too many colleagues who did "controversial" research, for whom their role as a researcher was an act of courage. And yet, I could name many teachers, several of whom were my own students, for whom every lesson each day was an act of courage, as they defied standardization and accountability pressures to teach to the test, drill and kill, or teach only the test worthy.

How, then, can we ignore the responsibility to be leaders? Why isn't it that more of us are not conducting the kind of research that could free our teachers and students from the bonds of pseudoscience that is currently being rammed down? How might we say that our research is being used in schools to further the cause of social justice? Can oppressed principals, teachers, students, or their families carry our own research into school board meetings to demonstrate "evidence-based practice" that supports equity pedagogy and principles of social justice? And for those of us for whom this is true, why are we still the exception, not the rule in our programs, colleges, and universities?

This chapter has noted that in historical and contemporary contexts, social justice praxis has been exemplified in national and local arenas by ordinary citizens, hotel managers, teachers, and journalists (see also Kennedy Cuomo & Adams, 2000). This chapter draws specific attention to the role of educational researchers in the explicit engagement of a social justice agenda as a facet of their everyday praxis. This chapter was a public challenge and commitment – first to myself, then to my students, then my colleagues, institution, and ultimately to the community of social justice activists around the world – to remain consciously involved and deliberately leading in ordinary and everyday ways to make the work we do as educational researchers on a local basis, matter at a more macro level.

Chapter 14
Social Justice in Education: Joy in Education and Education for Joy

Morwenna Griffiths

Introduction

This chapter is intended to show why educational leadership is properly characterised as leadership for social justice and, therefore, for joy from learning and joy in learning. I argue that educational leaders should always be mindful of the role that they play in making the world a good place to live, within their institutions of education (be they preschools, schools, colleges, or universities) and then beyond them. I consider that 'a good place to live' is necessarily one which is characterised by both justice and by joy. To say this is to use a thin concept of justice (Walzer, 1994). That is, I believe that while we can argue about what exactly we understand by 'good', 'justice', and 'joy', there would be broad agreement that a good life is a flourishing, happy one.

In this chapter I summarise my position by thickening the concept of social justice and, in doing so, lose some of the broad agreement. I begin by stating the view that individual well-being is not achieved at the expense of others and, so, more contentiously, that the well-being of the majority is not achieved at the expense of the minority. Further and in brief, I will argue that while English uses a noun, 'social justice', it would be more helpful to think of social justice as a verb. Thus, it is always an attempt to act in ways which make the world a good place to live and in which good lives are lived. But such attempts are always made in the knowledge that all understanding and actions are founded on imperfect, provisional judgements made in specific contexts of learning and diversity. These judgements are difficult precisely because they require attention to a number of related principles while remaining mindful of how social contexts are always in a state of change. In these circumstances the comforts of certainty are not available. This brief summary has,

so far, been written in abstract, academic terms, based on theoretical principles. However, it is sometimes helpful to translate these abstractions into slogans, all using verbs:

> Start where you (you all, we all) are. Do what you (you all, we all) can for the best. Be happy. Be careful of other people's happiness. Enjoy the good times. Roll with the bad times. Keep an open mind and keep learning. Keep on, because it matters.

In order to explain my conclusions about educational social justice, I have constructed a kind of critical, philosophical autoethnography. It helps to show how I have come to my current understanding of social justice, as a result of nearly 40 years in education as a teacher, leader and researcher. Over that time, my understanding of social justice has developed considerably. It is, I now believe, an irreducibly complex concept. Smooth, simple formulations have their place, but only if they are continually brought into contact with the uneven awkwardness of the changing contexts of real classes, schools, colleges and universities.

In the next section of the chapter, I explain what I mean by a critical, philosophical autoethnography. I go on to construct one in the following section using examples from my own experience to illuminate and interrogate ideas and practices. Finally, in the concluding section, I draw together the different strands into a very general overview of what I hope is a practical, theoretically informed, approach to social justice for educational leaders.

Critical Philosophical Autoethnography: A Question of Method

I use the term 'autoethnography' because it gestures in the direction of the methodology I want to use. It is a term which covers a family of research approaches which use personal narrative to illuminate or interrogate personal experiences within a framework of social or cultural theory. The different approaches within the family all seek to reinstate the particular within a generalising tendency in academic research towards increasingly (Burdell & Swadener, 1999, p. 22):

> "hyper-theoretical" writing [which] has been criticized for having the effect of disconnecting the experiences and daily lives of those to whom the authors would give "voice." A lack of accessibility in some of these texts has been described as perpetuating a colonizing or "othering" discourse that serves to separate theory from classroom praxis.

Autoethnography is also part of a movement which challenges the assumption that educational research should be like research in the earth sciences and so share identical concerns over validity, objectivity and generalisability. Most autoethnographic approaches emphasise the significance of reflexivity. Reflexivity gives readers information to help them make judgements about the writer's positionality and truthfulness (in terms of both sincerity and accuracy). (Some of these issues of validity, truth and reflexivity are explored further in Griffiths and Macleod, 2008.) My own approach in this chapter shares both these features, reinstating the both particular, and reflexivity. I am keen to connect everyday experiences to philosophical abstractions about social justice; I am also trying to give you, the reader, enough material for you to evaluate my judgements about the events I describe.

Autoethnographers share a concern to provoke change, to move their readers to action. However, there are family differences in how far this concern is foremost and in how far that change should be political: that is, change related to power, equality and voice. I have used the term 'critical' to align myself to approaches that have an intention to provoke political change. Further, I align myself with Denzin (2006) who argues passionately for autoethnography which is 'folded into' critical pedagogy and which 'challenges, contests, or endorses the official, hegemonic ways of seeing and representing the other' (p. 422). My autoethnography folds into my educative practices and into an intention to work for social justice.

Probably the most widely recognised family difference is between analytic autoethnography and evocative autoethnography. The former is most concerned to improve understanding of social phenomena, within the tradition of Wright Mills' notion of the sociological imagination which seeks to understand the links between private troubles and public issues (Anderson, 2006). The latter is most concerned to evoke emotional responses in the audience with the intention of moving the audience to action (Jones, 2005). However, my intentions here are not quite of either of these. I have signalled this by using the term 'philosophical'. I use an autoethnographic approach in order to interrogate educational practices in relation to social justice but also to have those practices interrogate current philosophical concepts of social justice. This is an exercise in a practical philosophy of education (Griffiths, 2003) rather than in social science or in the arts of literature, performance or other evocations of a life. It is intended to explain the theoretical complexities of social justice as they interrelate with the practical concerns of leading, teaching and researching. It should also show why I think these three terms are always connected, though they remain analytically separable.

Constructing a personal narrative of conceptual development is a valuable exercise. It is all too easy to abstract ideas from the particular contexts in which new understandings were provoked, leaving them easily misunderstood by other educators whose contexts may be very different. It is all too easy to assume that we know what abstractions signify, at least until we try to work cooperatively using them. In relation to social justice, in particular, central concepts such as equality, freedom, power and voice are all 'hurrah' concepts; that is, they are espoused by most people – who often do not realise how profoundly they may differ in how they understand any of these terms.

I have chosen to construct my narratives as autoethnography rather than as autobiography. There would be an autobiographical, linear story to be told. My understanding and practices have developed – and continue to develop – over the whole of my career in education, from my very first experiences of teaching as an untrained, volunteer school-leaver in an inner-city primary school to my current position as Chair of Classroom Learning at Edinburgh university: still thinking, still puzzled, still making mistakes, still learning. However, it would be difficult to avoid the usual genres of autobiography in which the narrator is the hero (or antihero) of the story.

So it would be difficult not to tell an autobiography of heroic success or of heroic failure, and in doing so, to highlight my own agency rather than contexts and structures. Perhaps in an attempt to avoid those possibilities, I could tell a story of gathering ideas as I meandered about in a series of responses to the situations in which I found myself. However, this would have the opposite problem in that it would highlight contexts and structures rather than agency. The attempt to overcome these problems might be worthwhile if the interaction of my own agency and structure were my primary concern. However, my interest is more in the details of the specific events which led me to rethink.

Expanding Understanding, Changing Practice

In this section I use my own remembered experiences to show and then reflect on my own developing understanding. To begin, I give a brief outline of my career so that these events are put into historical and institutional context. I then go on to write three personal narratives drawn from different stages in my working life as a leader, researcher and teacher. Each narrative is focused on a theme which I now consider significant in understanding social justice. I have taken care not to recount them in the chronological order they occurred, partly to emphasise that this is not an autobiography.

Brief Outline of My Life in Education

My career in education has been characterised by many moves of institution, town and country, first as a pupil and then as a teacher. As a teacher I moved not only between institutions, towns and countries but also across age-phase, responsibilities and focus of teaching. I was a British colonial child growing up in the last few years of Empire. I lived my first 10 years in East Africa where I attended a boarding school (all white) children, from age 7. My secondary education was in England, first at boarding school, and then, in a new school, as a day pupil; in both cases they were middle-class, largely selective, girls' schools with good academic reputations. In a gap year before university, I spent some months volunteering in an infant school (ages 5–7) in a working class, poor area of an inner city in the English Midlands, where there was a high proportion of recent immigrants from the Caribbean and from the Indian subcontinent.

After university and after obtaining a teaching certificate, I taught for 2 years in a suburban, mostly white, junior school (ages 7–11) and then moved to an inner-city school in the same town, in an area much like the one where I had volunteered – except that by now Caribbean and Asian children were more likely to be the children of immigrants than immigrants themselves. I then spent nearly 2 years teaching English at a university in Iran. When I returned to Britain, I went back into full-time education, studying first for a Master's and then for a PhD.

As a result, I was appointed to what was the first of a number of positions in Education Faculties in various institutions of Higher Education: a College and four different universities. During this time I continued to keep contact with schools, sometimes working alongside a class teacher, sometimes as a tutor for initial teacher education students on placement in school, sometimes in the course of various research projects. At the same time, I was expanding my academic interests. The Masters and PhD were in philosophy of education, and I helped to set up the British Society for Women in Philosophy. As well as philosophy, though drawing on it, I carried out some survey work on gender and computers in primary schools, became committed to reflective practice (sometimes describable as action research, sometimes self-study, sometimes participative enquiry) and experimented with visual and arts-based methods of enquiry. Naturally, as an academic in university, I have taught throughout that time, on a range of courses, both undergraduate and postgraduate, and have had the pleasure of supervising a number of doctoral students. I have also taken on various leadership roles, in relation to co-coordinating teams of colleagues on large courses, to promoting social justice in the institution and to supporting colleagues in their research.

The brief summary of my working life in education will serve as a backdrop to my reflections on my growing understanding of social justice and of how it affected – and was affected by – my practical actions as a leader, researcher and teacher. I present below three autoethnographic reflections, under the broad themes of (1) the sites in which social justice (or injustice) is particularly salient, (2) practical philosophy as a research endeavour which tries to bring philosophical abstractions into conversation with everyday practicalities and (3) the point of education.

Leading on Social Justice: Creating Alliances Across Sites of (In)Justice

My first reflection deals with leadership. It is focused on the question of what is at stake in issues of justice. In such a widely valued, deeply contested and complex matter, where should attention be focused and how should priorities be established?

The title of my new job was 'Lecturer in Equal Opportunities'. Lucky me, I thought. The subject was one I was more than happy to develop, given my then current self-identification as a socialist feminist. The professors in the university would be supportive: the most senior of them had created the new post, precisely because of his commitment to the area. Another of them was somebody I had known and liked since the time I had studied for my postgraduate teaching certificate. The rest of the staff seemed friendly and welcoming. Reality, I soon saw, was much more complex. 'Lucky me', indeed, but lucky because I was enabled to understand some of the tricky, insidious workings of injustice and also to be in a position to do something about them.

When I arrived in the new job, I thought I knew what 'equal opportunities' meant. I soon discovered that it was one of those phrases that shift, shrink and expand depending on who was using it and for what purposes. I thought it meant attention to gender, race, sexuality, special needs and social class. As I started my new job, I found my understanding was fine, as far as it went, but it soon became clear that such a view was too narrow.

The realisation grew that ‘equal opportunities’ was a contested concept in this university. Worse, the term could be misleading and often was. On the one hand I found when I spoke to my new colleagues that they oversimplified it, assuming I meant just ‘gender’ or ‘race’ – but less often, ‘social class’ or, very occasionally, ‘sexuality’. Even those who did not jump to such conclusions tended to privilege one of these groups over another (as did much educational and social theory at the time). On the other hand, these very broad distinctions were inadequate to describe the injustices which my new colleagues perceived, especially those they felt personally. These injustices, I found, underlay the apparently happy, consensual surface I had seen when I first arrived. I heard about them in a number of ways, one of which I recount next.

A dozen of the women in the Faculty responded to my invitation to a ‘women and lunch’ meeting. We sat around tables in one of the teaching rooms, with our sandwiches. It took a little time for the conversation to start the only agenda was to see what, if anything, might come of meeting like this, which would be of relevance to equal opportunities or to ‘social justice’ as I was beginning to call it. Moreover, it was probably the first time that academic and support staff had attended a meeting as equals. It was this situation that provided a topic for discussion. We uncovered some of the many ways that university structures divided us by status and role. To our joint wonderment, we uncovered the many rules the library used to determine which of the university staff could borrow how many books and for how long. It mattered whether you were support or academic staff. Why, we wondered, did the university want to ensure that support staff find use of the books in the library more difficult? It mattered whether you were permanent or temporary, full time or temporary, and what your pay grade was. All of this discrimination was in place for all library use, not just for books in constant demand.

Our joint amazement at the fine structure of categorisation led into a discussion of what issues of justice most concerned us. It became clear that there was plenty lurking below that happy, consensual surface that I had seen when I first arrived. One topic that arose very quickly was sexual harassment. It was first raised by members of the support staff. The academic women, too, had some related concerns, mostly focused on inappropriate sexist remarks. But they seemed to be less aware of larger problems of harassment. When I first arrived, I had wondered if such problems existed in this university, having previously had to deal with the problem of male staff making approaches to students. My question at an induction meeting to the academic responsible for research students had been met with puzzlement. I had asked what his policy was about harassment in relation to doctoral supervision. He looked at me in bewilderment. ‘Well, I’m against it!’ he said, closing the discussion. The women and lunch meeting showed that there was a culture in which such things were not reported to those in authority. We all understood why not, given the power differentials between research supervisors and their doctoral students. However, among the support staff, it was common knowledge exactly which academics had wandering hands and the dilemmas faced by all those – students, support staff or junior academics – who found the hands unwelcome. Some of the perpetrators were senior, well-respected academics.

It was clear that 'social justice' was indeed a better term than 'equal opportunities'. Concepts of opportunity, and even equality, are too narrow to catch the wrongs described during that lunch. It was also clear that terms like gender or social class were far too broad to be helpful in the particular circumstances of this university staff. The discriminations employed by the library demonstrated this, as did the differential knowledge of harassment between support staff and academic staff. Yes, we had used gender as an organising factor but in doing so had uncovered the significance of the many articulations of gender depending on other differences.

Of course we tried to take action as a result of the meeting. We tried to raise the issue and tried to put a proper policy into place. Our attempts ran up against a further problem. It was entirely foreseeable – in hindsight anyway. In general, most people were deeply concerned about injustices they felt inflicted on themselves. They were happy enough to give some support to initiatives to prevent injustices to others, elsewhere. They were reluctant to acknowledge their own part – however unintentional – in creating structures or acting in ways that were unjust. They were deeply resistant to acknowledging their own collusion in maintaining injustices which benefited them personally. Few senior members of Faculty provided an exception to these generalities. Moreover, they had more to lose because of the way structures are operated to benefit those with more power, power which they could – and often did – deploy to their own advantage.

Those who had been so pleased to create my position and who had welcomed me began to find me awkward: difficult, obstructive, a nuisance. One of them described me (to a mutual friend) with exasperation: 'Every time I try to do something, she says, "But that is not democratic".' With hindsight, this situation was not a bad one. Ironically, the focus on me as the main agent facilitated strategies to address injustices such as harassment. Yes, I felt very uncomfortable. Sometimes I had sleepless nights. Sometimes I even wept. But there were substantial compensations. I found common cause with some members of the Faculty, and these alliances sustained me. Most significantly, I knew that my visibility reduced their visibility.

A kind of invisible community was created which occasionally surfaced, sometimes to good effect. We learnt to communicate across differences and our new knowledge sometimes meant we could outmanoeuvre opposition or sometimes simply get things done without provoking disagreement. It also meant that we could give encouragement and support for anyone who wanted to deal with their own projects for justice in the Faculty. One secretary developed a clever, devious plan to persuade finance to install deaf loops and an expensive lift, although at that time these measures were not thought to be spending priorities. An academic member of the staff became able to make issues of gay and lesbian sexuality more openly discussed in teaching all our courses from undergraduate to postgraduate levels. When a new senior member of staff was appointed who seemed to be sympathetic to our concerns, the alliances in place made it easier first to identify him as sympathetic and then to inform him of how he could help.

Researching Social Justice for Leadership: Practical Philosophy

My second reflection deals with research. It focuses on how theorising and practising social justice can become better interrelated to the benefit of both. It is important to note that I do not identify theorising with academics and practice with teachers, policy makers or educational advisors. I assume that academics and practitioners both theorise and practise.

The room was beautiful, well proportioned and attractively furnished. The 12 of us sat round the polished wood table. The big windows looked out on the sunny campus, with its lawns and big trees. The leaves were the fresh green of late spring. Coffee and biscuits circulated. In the week this lovely building was the place where academic staff could relax over lunch or drinks. We were there, that weekend, as a group of mostly middle-level educational leaders from schools and advisory bodies, all of us with a commitment to finding ways to improve education for the dispossessed, in policy and practices as well as by talking and theorising. I felt a subversive pleasure in bringing hands-on educators (so-called practitioners) into the comfortable surroundings reserved for university Faculty (so-called academics).

We had all met as a group just once before, a month or two previously. This group were my collaborators in a project to 'generate a theoretical framework adequate for developing effective practice with regard to improving social justice in education', or so I had put it in my bid for research funds. They included a number of heads and deputy heads from nursery, primary and secondary schools who came from a range of ethnic heritages. They were all British, born in Britain but were variously of African Caribbean, Eastern European and English heritage. There were an equal number of advisors from organisations with an interest in social justice/equal opportunities: the educational psychology service, the race relations council, gay/lesbian rights and a manager in the school effectiveness service of a Local Education Authority. We certainly did not have a consensus about social justice or equal opportunities. On the contrary, we had a range of different, sometimes clashing positions. One of them, for instance, disliked the very term 'social justice', for the good reason that she thought:

> It is a soft option. As we move on in society people try to bring in different terms…People see it as more acceptable. But, in using 'social justice', people forget race.

Yet somehow, in spite of such heartfelt disagreements, the discussion felt comfortable. It was energetic, even impassioned on occasion, but never awkward. Or so I remember it. Certainly the excellent lunches we had at both meetings were very convivial.

The discussions were hugely challenging for me intellectually. I had thought, probably naively, that we would have the sort of theoretically based seminar I was used to participating in or leading. I had assumed that we would, between us, co-construct a theory of social justice which would be informed by my colleagues' joint extensive experiences of dealing with a range of social injustices in educational settings (gender, race, sexuality, special needs and social class). I had outlined the process in the research bid. I had proposed spending a few months on developing my some ideas of my own, based on my readings in philosophy, social theory and education. I would then ask each of the participants how their own interest in all this had developed (partly to see what they included in ‘all this’), how they dealt with it, professionally and personally, and whether they had a view of the significance of social justice in education for our society as a whole. I would transcribe what they had said and then attempt to mirror their views back to them, at the same time engaging and sometimes arguing with them, challenging both them and me to rethink our views. All that had been in writing. Thus, they had had a chance to articulate their personal theories before meeting. My job then was to rough out a first draft theory which we would all refine.

The discussion was not much like a seminar. It was not focused on details of concepts, nor did we end up with a tidy model or theory, as I had hoped. As I came to understand, the tidiness of model was less important than its usefulness in all the many complexities of the different educational settings in which my colleagues worked. The conversation was indeed based on yet another iteration of my attempt to draw together our joint understandings into a kind of framework which would be relevant for senior managers in schools. However, my colleagues preferred to talk about actions rather than to deconstruct and reconstruct theory. We were all focused on practicalities and we were all thinking hard using reasons, evidence and examples. However, they, with their practical focus, were in the habit of acting while thinking about the actions, while I, with my academic focus, was more likely to be thinking while acting on my thinking. I would emphasise here that this difference was only one of our different roles in these circumstances. The group included two other professional academics, and as I have shown in other parts of this chapter, my own focus is not always primarily on theorising.

For me the process worked well. I discovered that rather than a neat model or theoretical framework, social justice was something dynamic, never finished, always a matter of making judgements based on sometimes competing principles and always dependent on a wise appreciation of the full context. I wondered, however, if the others had found their participation had been significant. So 2 years later I contacted them all again and asked. The result was interesting and I learnt from it. For me, it was the end point which was the most significant part of the process. The rest of it – the beautiful room, the lovely lunches, the coffee – was just a small gesture of reciprocation. In the dry language of the research bid, it was merely ‘hospitality for a day seminar’. I was right in one sense. The outcome – the model – was important.

The outcome was not all that was important. I had missed a significant feature about the worth of the process, as I came to realise. To my surprise and initial consternation, my research collaborators remembered aspects of the process at least as clearly as they remembered any outcomes. It was clear that there was still a general agreement with the principles we had jointly devised. Some remembered specific details of the discussion. But, as the excerpts from the transcripts of those later interviews show, they also remembered, sometimes vividly, the processes of reaching the principles. They talked with appreciation about the place, the food, the company, the conduct of discussions and the shared commitment:

> A big window we were sitting in a room and talking to each other. A really lovely window. (Prakash)
>
> I do remember a really nice lunch we had with strawberries. (Carol)
>
> I remember…really enjoying listening… Because everyone was coming from different directions. That was quite remarkable. It felt like a learning experience. I think everybody there was learning. (Sue)
>
> Well, one of the things it shows me is that, unlike what the average person in the street would think, that there were a lot of people who look at the areas of the not so favourable in society, and would love to do something about it. Which is empowering in a sense. (Syble)

I had thought the initial interviews were merely a starting point, but they also seemed to have been significant:

> There's one aspect where discussions were supporting me in tracking where I'd come from, and perhaps why particular issues were important to me. I think that made quite an impact in terms of recognising that, perhaps a bit more explicitly than I had done before. (Nada)
>
> Basically, what I remember about it, it gave me a chance to reflect on where I had come from. Particularly that initial interview you did with me, when I talked about all sorts of things in my background which I was aware of, but it clarified for me why I thought what I did about certain things. (David)

I was astonished by this appreciation of the opportunity to articulate a position. After all, I had chosen my collaborators partly and precisely because they were influential, articulate people. I had thought that the chance to express their views to me would be nothing special.

My surprise and consternation were useful. I was motivated to reassess what we had been doing during that research project. The enjoyment of the occasions was memorable. The affirmation of belonging to a network of people with similar broad ideals was significant. Participants had wanted to tell their stories to a listener who would pay attention. It could simply be that we were all people working in contexts where we were trying to deal with injustice, often feeling isolated and always feeling that there was so much more to do that it is impossible to let up. I am sure much of that was true. However, I now think there were at least two aspects of social justice that had been missed. Firstly, making the process enjoyable, we had been enacting social justice even while we were discussing how to deal with social injustice. Social justice is about finding ways to live well, to have good lives. Secondly, I realised that we had not sufficiently emphasised provisionality. Its significance was brought home to me as I was impelled to use my consternation to rethink what had happened and to reconsider what I thought I knew.

Teaching: What Is the Point of It All?

My third and last reflection deals with teaching. It is focused on the question of the point of education. Why should anyone think that teaching is a worthwhile endeavour? What rationale can be given to students who do not want to learn what formal education offers them? These questions become especially pressing when the class rejects what the teacher offers.

Who would have thought it was so hard to control a class full of 9-year-olds? After all, I had already taught for 2 years, and had, I thought, learnt the basics. The 9-year-olds at the suburban school I had just left had been much easier. It is not as if I was a teacher who required calm, quiet order all the time or, contrariwise, who expected to work in a continual noise and bustle. I still remember, with pleasure, times of both stillness and bustle at that suburban school. There was the time I was reading the chapter in *The Hobbit* in which Bilbo is about to challenge the jewel-studded dragon. From the children came not a whisper, not a fidget, not a rustle, only absorbed stillness. (Their silence was somehow enhanced by the scuffling of the two guinea pigs in their cage in the corner.) Equally, there was the time when the class purposefully but noisily made a mural half the size of one wall of the classroom. It was created using paint and collage and depicted Marco Polo's journey to China. We were all proud of it. Neither of these happy activities was possible in my new class in the inner city.

Fair enough, this class had had an extraordinarily disrupted school life. Builders had been in the school for several years, first taking walls out and then putting them back in. It was unfortunate for the children that their early school careers had coincided with a short-lived fashion for open-plan classrooms. Teachers had come and gone too, often in the middle of a school year. The class had a reputation as being a particularly difficult one, in a school full of difficult classes. I had no intention of going – but what was I to do if I stayed?

I was determined that the children would learn something worthwhile. I was sure that I wanted to be a teacher. I was not a social worker or a play leader. Nor was I willing to act as an expensive childminder for the government. I wanted them to learn – to become fully engaged with – those matters which I was sure were worthwhile: literacy, mathematics, an appreciation of science and the arts, a love of stories. I thought my job was basically one focused on the intellect and the pleasures of the intellect. I tried all the usual tricks of the trade. I was well prepared, had clear expectations about behaviour, praised good behaviour whenever I saw it and so on.

The class and I soon became locked in a pointless game in which I tried to assert my authority while they experimented to see how far they could flout it. Even the few children who were plainly keen to learn did not stand a chance of getting enough of my attention and made little progress. My attention was fully focused on trying to maintain some sort of order.

Happily, by the end of the year, I was sorry when they left my class. And yes, I think that some children, at least, had made progress in all those worthwhile matters I wanted them all to learn. I hope so. I, myself had made progress. I learnt a great deal about education and about myself as a member of a school community. I knew at the time that I had learnt a lot but it has taken years to understand that entirely commonplace scenario of a young, inexperienced, enthusiastic teacher learning to develop a working pedagogical relationship with her class of disaffected students and what helped her achieve it.

The reasons that a working, pedagogical relationship was achieved were, and are, instructive. The ones obvious to me at the time were about my agency. They concerned my decisions and reactions. For instance, about a month into the school year, when I and the class had become locked into struggle, I was blessed with the idea of telling them it was my birthday and presenting each one of them with a small bar of chocolate to celebrate it. It felt like a turning point. It was then, it seemed to me, that we began, very slowly, to develop a working relationship. Was it that they began to see me as more than just another authority figure sent to bother them? Was it perhaps that I had begun to make the relationship into a more human one by drawing on the deep, social meanings of sharing food? A little while later I organised the first of various trips out of the classroom to the grounds of a grand house on the outskirts of the city. The children had space and permission to run and shout. They were taken through the woodlands by an engaging and knowledgeable guide who understood what might captivate 9-year-olds. I was able to have some quiet talks with the less boisterous children. When we got back to class, the children rewarded me by completing some careful writing about the trip. 'We did see some bluebells and they did stink' was one memorable offering from an able boy whose education had, so far, failed him badly and who spent most of his time acting out his frustrations. It was his first tentative step to a level of literacy he should have reached long before.

We built on all of this as a class. We went on more trips. Sometimes this was as a whole class. We went to a museum, we took a train trip to the next town (with screams as it went through a tunnel) and we joined a multi-class trip to the seaside. Sometimes the expeditions were of small groups who had been members of the after-school clubs I had set up. The five children in the music club went with me (and four of my friends) to hear Prokoviev's *Peter and the Wolf* at the city concert hall. It was their first ever visit to such a place. They stood out, of course. There were no other black children in the audience. In school, I went on paying attention to them not only as developing intellects but as whole persons – bodies, minds, hearts and spirits – and they began to study and learn. I bought cushions for the classroom, for instance, and walked home with any who invited me, to say hello to their parents.

My agency was obvious to me. What I did not notice then were some of the other factors that enabled what success there was. Yes, the school was a difficult one. That was well known and obvious. Less obvious was the way my efforts to learn were supported by the other teachers. Their wisdom and kindness must have been crucial, even if I took it for granted at the time. As significant was the willingness of the local parents to respond to my inexpert efforts to involve them. In general, my efforts in the classroom were supported by the wider educational relationships already established with and through the school community as a whole. Moreover of course the sociological and political context of the time had its effect. It is worth remembering that all this was taking place in a not atypical, inner-city, school in 1970s England, just beginning to move from an assimilation approach to immigration and ethnicity towards considering integration and multiculturalism. Also, Britain was just moving out of the period of overall upward social mobility in the 1960s, and it was in the very early stages of second wave feminism.

So what was the point of all that effort? At the time I thought it was the achievement of some worthwhile learning including not only what was needed instrumentally (such as functional literacy and numeracy) but also the riches of books, mathematics and the rest of the curriculum. I also saw that part of the point was bound up with the significance of relationships with the children beyond the strictly teacherly but always teacherly. In other words I had been right that the pedagogical relationship is one of learning – but not entirely right. It is also one characterised by mutual respect, of the kind that I think I demonstrated partly by my commitment and recognition of the children's full humanity, partly by showing my own full humanity – a person with birthdays, who had a life beyond the classroom, who took a pleasure in museums, train rides, classical music and the seaside. This understanding of mine developed later into my current view which is that learning is a facet of a rich, worthwhile good life while also always being a useful tool to obtain other facets of that good life. Therefore, it is not just contingently connected to personal and community relationships and ways of living but logically interconnected with them. The point of education, then, is nothing less than the co-construction and maintenance of a good life for each and every one of us.

Practical Theory

Reflections on the Themes: A Growing Web of Theory

In this section I reflect on how the narratives contribute to the growing web of theory which makes up my current understanding of social justice in education. Between them the reflections cover only about 8 years – maybe about a fifth of my working life as a professional educator. My aim has not been to trace all the roots of the ideas that feature in my current understanding of social justice, only the development of some of them, in specific complex episodes. I consider how my ideas are grounded in experience: how my current understanding of what constitutes social justice springs from – but also contributes to – my practices of leadership, research and teaching. However, it has not sprung fully formed from episodes and events like the ones which I have described. It is the early growth that can be discerned there. In that sense, what has been presented might be describable as an exercise in genealogy. However, I prefer to describe the process as autoethnography, because a genealogy is always a descent, while in this case, I have returned to the memories of the events, as I do here, to reassess them. So they have contributed to the development of my thinking about social justice again and again.

I described the exercise as a critical philosophical autoethnography, although, so far, I have not mentioned any philosophy or, indeed, any theory at all. Yet it has been extremely influential. I have taken myself to be trying to follow Arendt's well-known advice (1958, p. 5):

> What I propose is very simple: it is nothing more than to think what we are doing.

As Arendt very well knew, 'simple' does not mean easy. And it is significant that she uses the pronoun 'we', referring to the thinking as well as to the doing. The influence of others, whether through the literature or in person, has been crucial to the evolution of my current understanding. The methodology of philosophical educational research can be described as the (difficult, exciting) process of thinking, while reading, while listening, while talking, while writing, while trying to do something practical. Sometimes one of these of activities dominates but all are vital. To put it another way, each activity is necessary but none is sufficient.

The last 40 years have been intellectually very exciting, as new forms of theorising have engaged with a number of sociopolitical movements of liberation. Educational philosophy and theory has been part of that process. It means that there are now a huge range of theoretical approaches which may inform educational research and practices. The bibliographies in the books and articles I have written over the years show that I draw on a number of different areas: philosophy (including feminist, analytic, postmodern and philosophy of education), social theory (especially theories of difference, most especially feminist theories), personal narrative (including auto/biography, autoethnography, phenomenological accounts), research methodology literature and reflective practice (including action research and self-study). The bibliographies show something of my reading, but not the equally significant discussions, conferences and networks which support and are supported by it. Beyond this, I read both for pleasure (including poetry, fiction, auto/biographies, politics and newspapers) and also to support my teaching or leadership roles. It might be possible to trace what has most influenced me as my ideas developed, by using the reference lists of my publications. For instance, my earlier publications draw largely on feminist philosophers and educational reflective practitioners (Griffiths, 1988; Griffiths and Davies, 1993; Griffiths & Smith, 1989).

A central motivation for me has always been to bring abstract theory into conversation with educational practices (Griffiths, 1995, 2006; Griffiths, Berry, Holt, Naylor, & Weekes, 2006; Griffiths & Tann, 1992). All my theorising has drawn on my experiences in events like the ones that I have described. Sometimes theories helped me to understand what was happening, but just as often they did not match up to what I was experiencing, and this helped me think through my own position more acutely. This can be seen in the account I titled 'Leading on Social Justice: Creating Alliances Across Sites of (In)Justice' attempts to identify what I call 'sites of (in)justice'. As I have already remarked, when I arrived in my new post, I had been much involved in feminist philosophy and theory and believed that large-scale political structures of gender, race, social class and disability were the major features of injustice. I learnt that while these categories remain significant, they are so broad that they always need refining. Firstly, these structures do not exhaust political structures that need naming – and given how political circumstances change, it is impossible ever to create a definitive list. An 'etc.' is needed at the end of a list which must always be understood as provisional. Feminist and antiracist theory helped this rethinking, as differences between women – even the existence of the category 'woman' – became issues of concern (Griffiths, 1995). Secondly, in order to find what is significant in specific circumstances, it is important to listen to others, carefully and with respect, and to be prepared to adapt ideas accordingly (Griffiths, 1997). At that stage I had not read Nancy Fraser's essay on 'recognition' (Fraser, 1997), but it was noticeable that giving respect to people seemed to help in efforts to get them to act collectively. The experience of trying to do that showed me the significance of having a 'public space' which is not universally public (Greene & Griffiths, 2003; Griffiths & Ross, 2008). It also showed me some of the contradictions and compromises that underlie the easy words, 'collaboration' and 'partnership' (Griffiths, 2000), and it was then I first began to try and theorise them. At the same time, I noticed how that kind of public space was often characterised by enjoyable acts of subversion and transgression. I have enjoyed turning that experience into an inaugural lecture and then academic articles on why naughtiness – playfulness, mischievousness – is so often necessary when working for social justice (Griffiths, 2007; Griffiths & Peters, 2012).

My interest in connecting philosophical abstractions with the everyday was key to the processes described in the account titled 'practical philosophy', which is the phrase that I used to describe the idea later on (Griffiths, 2003). Indeed, the way I had conceptualised the research I describe came about precisely because of my efforts to match widely used theories of justice with the dilemmas faced by educators. As I stated in the research bid:

> Decisions about education are, inescapably, also decisions about social justice. A new theoretical framework for effective practice is urgently needed because the old frameworks no longer serve, (a) Existing frameworks have been seriously questioned by postmodernists, poststructuralists and commutarians. (b) Even if existing frameworks successfully resist such attacks, they have been based on considerations of welfare, and do not easily apply to education.

The research was also strongly influenced by my continuing interest in reflective practice, understood as a continuing iteration of thinking and action (Cotton & Griffiths, 2007; Griffiths, 2009; Griffiths & Woolf, 2009). My view that a new kind of framework was needed was reinforced by the research. I argued that an alternative was needed to overarching theories, whether they were like the elegant formulation by Rawls (1971) or the complex irony of Plato's *Republic* (Plato). I proposed a more postmodern alternative, arguing that it was already imminent in the discourses of education (Griffiths, 1998a) and that it could be understood as a set of principles to guide the judgements of educators (Griffiths, 1998b). My argument relies not only on an acceptance of all understanding as being provisional but also on a readiness to rethink by encouraging dialogue with others – in all their personal, social and political differences (Griffiths, Bass, Johnston, & Perselli, 2004). In my reflection I describe my discomfort when the interviews with my research colleagues took an unexpected turn. Encounters at conferences led to my being able to use that discomfort to re-theorise social justice, using the concept of 'little stories' (Griffiths 2002, 2003) and also drawing on debates then current, about the concepts of voice and empowerment (2003). These ideas all contributed to an argument for a dynamic model of social justice, which included disruptive, dissenting voices as a way of emphasising its imperfection and provisionality and also as way of instantiating respect for and engagement with the perspectives of others in all their lovely diversity (Griffiths, 2003). Many of these ideas were a development of my earlier thinking about auto/biography and the relationship between an 'I' and a 'we' (Griffiths, 1995). At that time I had been taken myself to be developing a feminist theory of the self. I had not thought I was concerned with promoting educational social justice, even though at the time I was thinking and publishing on it (Griffiths & Davies, 1993, 1995; Griffiths & Troyna, 1995).

My last reflection, 'What is the point of it all?', goes back to the start of my career, yet it is relevant to thinking further about another set of themes which I have been working for the last few years. My current focus on the delights and joys of teaching and learning has led me to return to my experiences of teaching throughout my career, from its very beginning. At the same time I have been engaging with a number of other ideas, drawn from experiences not presented in this chapter. The focus developed as I noticed the mismatch between much of the discourse of education and experiences of it. On the one hand, there is a proper anger among many educators about an increasing instrumentalism and managerialism in educational policies, together with a continuing pressing need to draw attention to the many injustices perpetrated both in and as a result of the institutions of education. On the other hand, it is clear that involvement in teaching and learning is routinely felt as enjoyable, worthwhile, energising and even delightful. At least that is what I have noticed in all the institutions of education where I have worked. I have also noticed how such experiences within education in the arts can enhance social justice (Griffiths et al., 2006; Griffiths & Ross, 2008; Griffiths & Woolf, 2009). As I thought further about this, I was able to start theorising about the fundamental connections between social justice and a good life found in philosophers as diverse as Plato, Aristotle, Rawls and Lyotard. The concept of a good life is of a life which includes occasions of joy, delight, happiness and well-being. As Robin Richardson put it (1996, p. 20):

> Not that justice is an end in itself. Its purpose is to make the world safer for hope, love and rejoicing. Justice and joy: each is the ground and the fruit of the other.

My own experiences as a teacher illuminated my thinking. In my reflections I noted that social justice is grounded in happy, if difficult, personal and community relationships; similarly my account shows, I think that the same is true for the classroom: that 'education for all', as social justice demands, is grounded in the kinds of personal and community relations that sustain learners and teachers alike, as they create a good life together (Griffiths, 2012).

Social Justice for Leaders

I have moved a long way from what I see now as the simplicity of my early thinking. Over the years, as I have understood the issues in greater complexity, I have tried to find ways of encapsulating them in a way that could move others to act on them. This endeavour has been made even more difficult by the provisionality at the heart of the theory. This provisionality is, I now see, always going to be present not only because contexts change and understanding grows but also because of 'natality', as Arendt calls it (1958, 1968). She is referring to the way that each human being brings newness into the public world and so may affect our collective actions.

However, if the point is to both inform and move others to work for social justice, then a way has to be found to explain what can be done. If the model of social justice is a dynamic one – if social justice is a verb – then it has to be made clear enough not only to show why actions are needed but also *what* actions might be taken. Further, while it would be misleading to make it seem that it is only a simple matter of following a few guidelines, it would be counterproductive to make it seem so difficult as to inhibit the attempt.

In this last section I outline one possible approach, using the metaphor of a forest. Like social justice, the different parts of a forest are distinct, though still recognisably part of the same forest. Equally, while still being the 'same' forest, it is always changing and always growing. New species are introduced from time to time. The climate may change. The question facing any leader is how to introduce people to the forest and then encourage them to live there.

One way of introducing the forest is to fly over it or to watch a film summarising its main features. Seeing the whole broad picture of the social justice forest may well be a good start. The introduction can be made very simple indeed, as the slogans in the introduction show. However, a good place to start is a bad place to end. In order to understand the social justice forest and live in it, it is necessary to enter it and deal with its complexity. Progress can be made by encouraging some understanding of the range of concepts which are relevant, including not only diversities, equality and fairness but also voice and empowerment, and then remembering some of the many sociopolitical-cultural reasons for diversity and discrimination. Further, it may be helpful to consider the ways in which (in)justice manifests itself, especially locally, in terms of distribution and recognition (Fraser, 1997) and association (Gewirtz 1998, 2006; Young, 2000). With that basic understanding, it will become possible to explore the kinds of dynamic connections made in *Fairly Different* between different factors which come together if action is to be taken for social justice: self-esteem, public spaces, action, collaboration and empowerment. In this chapter I have also drawn attention to the relevance of joy, naughtiness, laughter and pedagogical relationships. Which of these are relevant depends on the local context.

Paradoxically, the sheer size of the forest can also be helpful once we have the courage to face it with modesty as well as determination. Knowing that it is impossible to attend to every injustice, let alone to fix them all, can liberate us from trying to do any such thing. The impossibility of finding perfection means that it is acceptable to be wrong as well as right. After all it is only by making mistakes that anyone can learn how to reframe their understanding and values. It may be helpful to exercise what I have called mindfulness by continuing to challenge ourselves using questions which can remind us what our own best purposes are and have become (Griffiths, 2009). We will certainly make mistakes as we find pathways through the trees, but as long as we remember our reasons for being there, we can usually recover from them. It takes courage to admit mistakes. Especially, perhaps, for leaders. However, discovering (and rediscovering) such courage liberates us to learn from our mistakes and so to stay open-minded and wholly alive – to find more, to explore – instead of becoming fearfully closed down and quiescent. Especially so, when we see that there is no need to be solemn or self-sacrificing. On the contrary, enjoyment, satisfaction and laughter along the way only help in the high purpose of constructing a satisfying working life dealing, with justice, with human individuals in all their wonderful complexity.

Chapter 15
Critical Evocative Portraiture: Feminist Pathways to Social Justice

Linda L. Lyman, Angeliki Lazaridou, and Jane Strachan

In this handbook chapter we have documented the underlying purpose and phases of work involved in turning a research question about women leaders' personal and professional experiences into a book titled *Shaping Social Justice Leadership: Insights of Women Educators Worldwide* (Lyman, Strachan, & Lazaridou, 2012). The book explores how social justice leadership is defined by actions (Bogotch, 2002; Rapp, 2002) and presents evocative portraits of 23 women researchers and educational leaders from around the world whose actions are shaping social justice leadership. Representing 14 countries, these featured members of a research group called *Women Leading Education Across the Continents* (WLE) portray the complexity of twenty-first century leadership in narratives woven from their own words.

In this chapter, our focus is on methodology, specifically how we conducted the research that we are calling *critical evocative portraiture*. We offer this method as another way, a decidedly feminist pathway, to study leadership for social justice. Quoting from one reviewer, Ira Bogotch, "What they (the authors) have done is to marry feminist theories to narrative methods and the result is a new methodological

genre for studying social justice." And so, to elaborate, in this chapter we (1) summarize the phases involved in transforming a research question into a book, (2) ground the methodology in existing scholarship, (3) clarify how critical evocative portraiture differs from other narrative inquiries, (4) consider feminist pathways to social justice leadership, and (5) reflect on the power of critical evocative portraiture and its effects on us personally and professionally. The book was written to show what social justice leadership looks like in the work of women educational leaders worldwide. The same three coauthors of the book have collaborated on this chapter.

Transforming a Research Question into a Book

At the first international conference of *Women Leading Education Across the Continents* (WLE) in Rome in July 2007, 33 women leaders came together to share papers based on their individual work concerning gender and equity issues associated with opportunities for women to lead and girls' access to education around the world. The group included 22 invited scholars and 10 discussants. The conference convener and host was Helen Sobehart who, at that time, was Associate Provost/Academic Vice-President at Duquesne University in Pittsburgh, Pennsylvania. Having met for two more biennial conferences in 2009 and 2011, WLE is the first ongoing international research group focused on the important topic of women's leadership in education. Today, the membership of WLE also includes several men and numbers around 70 persons from 24 different countries.

The Research Question

At the first conference in 2007, the primary goal, apart from sharing research, was to develop collaborative research teams that would explore questions of common interest across our cultures and countries. A number of topics were identified. One centered on the research question, "*How have the lived experiences of conference participants influenced their lives and their professional/leadership decisions?*" Several women suggested that members of WLE write and share stories about their personal and/or professional lives and so keep in touch and come to know each other better before the next conference.

In late August founding chair Helen Sobehart sent a WLE listserv message asking us to let her know which of the research focus groups interested us. Linda Lyman was the first, and Jane Strachan the second, to express an interest in collecting narratives of the personal and professional journeys of conference participants. Within a day, five others had volunteered: Angeliki Lazaridou (Greece), Anastasia Athanasoula-Reppa (Greece), Esther Sui-chu Ho (Hong Kong-China), Sister Hellen Bandiho (Tanzania), and Pamela Lenz (USA). Following up, in an August 28 listserv message, Helen Sobehart asked Linda to become chair of the Sharing Our Stories research group.

The Participants

In October, unprompted, Alice Merab Kagoda from Uganda sent in her story, which was circulated on the listserv. In response, members of the Sharing Our Stories research group emailed among themselves about how to put out an official "call for stories" and finally decided that the purpose of the project was best served by not asking for a particular structure. Accordingly, using the listserv, on November 5, 2007, they sent out a call for each participant to submit "the story of your personal and/or professional journey in whatever format and with whatever emphasis makes sense and is comfortable for you." The personal narratives submitted began a 5-year research process that led to the writing of *Shaping Social Justice Leadership: Insights of Women Educators Worldwide* and subsequently to this handbook chapter on *critical evocative portraiture*.

Data Gathering and Analysis

The process of transforming the collection of stories into a book was led by Linda Lyman, with the assistance of coauthors Jane Strachan and Angeliki Lazaridou. The data collection and analysis processes that resulted in the book emerged from the first conference in summer 2007 and extended to summer 2012. The process unfolded in four phases.

Phase One: Exploratory Data Analysis and Presentations

The first presentation about the stories, given by Linda Lyman as part of a panel at the October 2008 University Council of Educational Administration (UCEA) Annual Meeting in Orlando, was based on analysis of seven stories received from participants representing six countries. This initial data analysis was conducted using a combination of content analysis and constant comparative methodology (Glaser & Strauss, 1967; Merriam, 2001). Five themes running through the majority of narratives were identified:

1. Life experiences resulted in an awakening to gender and other social justice issues.
2. Childhood challenges included limited financial resources.

3. Balancing career and a family/personal life was an ongoing challenge or struggle.
4. Parents and grandparents supported and encouraged education.
5. At all levels, education for girls was a privilege requiring sacrifice.

The second presentation was delivered at the February 2009 American Association of School Administrators (AASA) National Conference on Education in San Francisco by Helen Sobehart and Linda Lyman. By that time three more stories had been submitted, so this presentation was based on ten stories from seven countries, with the entire data set reanalyzed using the same process. This time six themes were reported. Four of these themes had been identified in the first analysis; one previously identified theme ("At all levels, education for girls was a privilege requiring sacrifice") no longer applied to a majority of cases, and two themes were new. The two new themes were:

1. Education was recognized as an important pathway to an enhanced life.
2. Personal and professional journeys intertwined, involved "leaving home."

Following their AASA presentation, the idea for a book based on the personal narratives was born in a conversation between Helen and Linda when Helen said "I think there is a book in this."

Phase Two: A Keynote Address

After the February 2009 AASA presentation, Linda Lyman was invited to give a keynote based on the stories at the second WLE conference in September 2009 in Augsburg, Germany. Three additional stories were submitted bringing the total to 13. In preparation for the keynote and discussion of a possible book, Linda reanalyzed the data, taking the same approach but this time using the NVivo 8 computer application. She did not include her own narrative in this reanalysis. The 12 stories featured represented 9 countries.

The invited keynote and 89 page supporting paper were titled "Personal and Professional Journeys of Women Leaders: Comparing Places, Passages, and Pathways." The paper began with brief (approximately 600 word) profiles of the 12 who were featured. The regularities and patterns in the data that emerged this time were more complex. Ten themes were identified and organized according to three passages common to women's experiences. This use of the word passage connotes a journey featuring challenge and resulting in growth. Themes presented in Educational Passages were (1) family support, (2) leaving home, (3) financial challenges, and (4) confronting expectations. Themes featured in Career Passages were (5) complexity of place, (6) multiplicity of career paths, and (7) dilemmas in balancing career and family. Themes detailed in Intellectual Passages were (8) facing cultural gender realities, (9) developing gender awareness through education, and (10) experiencing gender issues in careers.

Using illuminating details from the participants' stories, Linda concluded the paper with evidence of four converging pathways among the 12 participants: Scholarship, Introspection, Activism, and Mentoring. These pathways described the ways participants focused and manifested their social justice work in the world. The keynote presentation focused on these pathways, with the 12 women's stories divided equally according to which women best illustrated each of the pathways. The argument developed in the keynote was that the most challenging passages can become pathways, leading to new directions for ourselves and others. The themes of the keynote paper have been presented in this chapter in some detail because they became the foundation from which the book developed. It was the brief profiles in the keynote paper that eventually grew into longer and more detailed (i.e., intimate) portraits of women leaders.

The keynote was given on the first day of the conference. When the research groups met on the final day, the Sharing Our Stories group concluded that the keynote should be developed into book-length format, with Linda leading the research. In a following plenary session, the conference participants concurred and directed Linda to seek IRB approval from her university and begin the research project. The Sharing Our Stories group was renamed "Narrative Illuminations" and the project was officially launched. Linda invited Jane Strachan and subsequently Angeliki Lazaridou to be coauthors—reasoning that a book about women from around the world needed an international team of authors.

Phase Three: Developing the Proposal

Phase Three began in October 2009 with story submissions continuing until June 2010 when actual writing of the proposal began. After the September conference, Jane and Linda exchanged emails about frameworks and ideas. In October, Linda explored ideas with several publishers and found interest in a book which would focus on how to make a difference through social justice leadership, with a strong element of critique but also offering hope and inspiration. In December 2009, Jane and Linda had the opportunity to meet in person in New Zealand to consider possible themes and structures. They decided that the focus would be challenges and accomplishments of women leaders' social justice commitments and actions, including how the women approached and endured given the difficulty of such work. By early spring, Angeliki Lazaridou formally joined the coauthor writing team.

Linda took responsibility for writing the proposal, with regular input from Jane and Angeliki. As additional stories arrived, Linda continued to use NVivo 8 to recode and reanalyze the stories with a focus on how women's experiences contribute to defining social justice. In total, 23 stories were submitted, representing 14 countries—Australia, Brazil, Hong Kong-China, Ghana, Greece, Jamaica, New Zealand, Pakistan, South Africa, Tanzania, Thailand, Uganda, USA, and the United Kingdom. A total of 56 NVivo coded data files resulted from the reanalysis.

The themes detected in the stories suggested that the proposal's nine-chapter framework would be appropriate, with the chapters arranged to progressively develop the thesis that social justice leadership is defined in the actions of individuals. Accordingly major themes were framed and assigned to particular chapters, together with stories that were most representative of facets of these themes. Here, for example, is the proposal description of Chapter 5:

> Chapter 5 – Skillful Authentic Leadership
> In writing about their personal journeys, 21 of the participants commented directly on acquiring or using leadership skills. These insights from the narratives will be shared and the particular applicability of the composite set of their skills/approaches to social justice leadership will be developed. Some participants described what they learned about leadership from their early experiences within their families. Others wrote about things learned through positive and negative experiences as they progressed through education. Still others described on-the-job learning. The themes in their approaches to leadership will be shared along with their advice for other women who would lead for the purpose of advancing social justice. Many offered favorite meaningful quotations that have served to guide their thinking. These also will be shared.
>
> Featured Leaders: Sister Helen Bandiho, Tanzania
> Pamela Lenz, USA
> Rachel McNae, New Zealand
>
> Relevant NVivo Coding = Leadership skills (20); Leadership roles (13); Quotations (11); Power (11); Strength/Strong (16); Single sex schools (8); Father (18); Mother (17); Grandparents (9); Family of origin (8); Family (22); Intellectual passages (18); Spiritual passages (9); School performance (12); Unique circumstances (13); Cultural barriers (10); Support (17); Mentors (9); Motivation/Values (22); Religious influences (9)

Phase Four: The Writing Process

Linda assumed responsibility for developing the proposal and two sample chapters. The three coauthors divided the remaining chapters based on their previous research interests. Linda then sent the thematically relevant NVivo data files to Jane and Angeliki so that each could do additional analysis to crystalize themes and subthemes that they would illustrate using the narratives assigned to their chapters. For example, Angeliki developed three subthemes for Chapter Five—Skillful Authentic Leadership. These subthemes and the leaders whose stories illustrated them were *Growing into Authenticity*, Sister Dr. Hellen Bandiho, Tanzania; *Developing Phronesis* (Practical Wisdom), Dr. Pamela Lenz, United States; and *Leading for Eudaimonia* (Well-Being), Dr. Rachel McNae, New Zealand. The writing process was recursive. The proposal chapter descriptions served as starting points, but new insights emerged as the chapters were written.

For example, the actual Chapter Five introduced "authentic leadership as a root concept of social justice leadership" (Lyman et al., 2012, p. 101), headed by the epigraph "The authentic self is the soul made visible." The portrait of Sister Hellen illustrated *growing into authenticity* and was filled with details of her life "as the second born of eight children to parents who were ‘small-scale farmers’ in an area ‘dominated by hills and valleys’ and surrounded by banana plantations” (p. 104).

> Her father was determined to get his daughters educated, and so at the age of ten, Sister Hellen left home for this boarding school run by the Sisters of St. Therese. She and her father, and all her belongings, got a motorbike ride from the parish pastor, and all three set off to what would be her new home, located about fifteen miles from her village. This turning point event was described by Sister Hellen as “a beginning to a new life” through which she would be able to fulfill her career and life goals. “She never looked back either academically or at the route of life she had decided to take.”(p. 105)

Now a university administrator in Tanzania, Sister Hellen wrote, “There are many paths to the top of the mountain but the view is always the same.… Having arrived where we had dreamed of reaching, we are challenged to pave ways for younger women who may be struggling to make it.… Let us play our part” (p. 108).

When each coauthor finished a chapter, she sent it to the others for feedback and edits. This was a valuable part of the process and strengthened the writing. Through emails and Skype sessions, the coauthors discussed the refinement of subthemes and other writing issues and challenges. Linda continued to serve as the general editor. After each draft chapter had been revised, it was sent to the women who were featured in the chapter for their responses, which could include clarifications, corrections, and suggestions. This process often involved several back and forth emails and ultimately ended when each person profiled in a chapter gave us written permission to publish her story as written in the final draft.

Critical Evocative Portraiture: Grounding the Methodology

We now call our methodology *critical evocative portraiture*, but had no name when we began. Jonathan Janzen, another reviewer, noted that we had not presented “mere stories.” Rather, he wrote, “each narrative is deeply grounded within theory and data that emerge naturally from the life-experiences of those who lead in difficult contexts and, quite often against the grain of an androcentrism afflicting scholarship and practice on education leadership that remains susceptible to corporate models of how to lead.” But what exactly was this narrative method and how did it differ from “narrative interpretation” or “self-narrative interpretation”?

We thought of using “collaborative narrative bricolage,” and that did get at the underlying processes—but what did it mean? Was it accessible enough? According to Denzin and Lincoln (2011), “we are all interpretive *bricoleurs* stuck in the present, working against the past, as we move into a politically charged and challenging future” (p. xiii). The next thought was that we had written “feminist self-narrative portraiture.” However, a difference between our portraits and other examples of self-narratives is that we did not use participants’ complete original self-narratives. Rather we turned their self-narratives into portraits, taking a clearly feminist approach as we portrayed the women in the context of their own lives.

Having introduced the concept of feminism, and discovering the evocative narrative terminology (Ellis & Bochner, 2000), we considered “feminist evocative narratives,” before moving briefly to “feminist evocative portraiture.” Finally, we settled on “critical evocative portraiture,” believing that the term “critical” carried connotations of feminism and was the best description not only of the product we had created, but the process by which we had created it. To offer a preliminary brief summary, when it was time to write the chapters for the book we began with the evocative narratives submitted by the WLE members, gave each chapter a critical frame, and then turned the original narratives into portraits, each with its own critical frame.

Critical

Support for using the term critical in describing a research methodology comes from the work of Elliot Eisner (1998). Eisner defended use of the term criticism in his underlying approaches to seeing intelligently and with feeling in qualitative inquiry and evaluation. He wrote in the introduction to *The Enlightened Eye* (1998), “Criticism suffers from its association with negativism. Unfortunately many people think of negative commentary when they hear or read the word criticism. But this too is not a necessary or intended meaning.… Criticism can be laudatory. Its aim is to illuminate a situation or object so that it can be seen or appreciated” (p. 7). Specifically Eisner further elaborated the importance of critical frames when he wrote, “Criticism is an art of saying useful things about complex and subtle objects and events so that others less sophisticated, or sophisticated in different ways, can see and understand what they did not see and understand before.… In this sense, educational critics and critics of the arts share a common aim: To help others see and understand” (p. 3). He explained that “every act of criticism is a reconstruction” (p. 86).

Eisner highlighted four dimensions of educational criticism to be *description, interpretation, evaluation*, and *thematics* (1998, p. 88). How we structured our work honors each of these dimensions. In each portrait a *description* of the leader’s reality is drawn in visibly accessible language using her words. In placing each portrait within a chapter centered on a particular major theme, we *evaluate* that aspect of the story as meaningful, even though each story could have illustrated several of the major themes. We *interpret* the theme by placing portraits in subtheme sections, each containing insights that can be drawn from the portrait. Finally, the *thematic* structures at the macro level, and within each chapter at micro levels, contribute to its power.

For example, the Chapter Five portrait of Pamela Lenz, USA, illustrates *developing phronesis,* the subtheme. Interpreting and evaluating, the chapter author wrote, “Evidence of Pam’s leading with *phronesis* [practical wisdom] is her awareness of her strengths and weaknesses (intrapersonal intelligence), her confidence in her abilities, and her setting of appropriate goals” (Lyman et al., 2012, p. 114). She is described as an “existentially intelligent person,” who introduces authenticity as the norm of self-identity. Her authenticity is reflected in what she said when asked about her social justice work. Pam responded by referring to Mother Teresa's words:

> When asked about her work, Mother Teresa said, "One thing I have done which I believe is important: I have helped people to talk to the poor and not just about the poor." Pam applied these words to herself, saying: "[I hope] that I don't just talk about social justice issues, but that what I do from one day to the next contributes to improving the lives and understandings of others." (p. 115)

Pam struggles with questions such as "What do I want my legacy to be? Her pursuit of social justice by leading authentically with *phronesis* is a work in progress, 'bringing the unconscious to consciousness, so we intentionally create more equitable opportunities for all'" (p. 113).

To summarize, each chapter introduction clarifies the chapter theme. Each portrait illustrates and develops a facet or aspect (subtheme) of the chapter theme. Each portrait is followed by *Insights* gleaned from the narrative by the chapter author. The final pieces of critical framing guiding readers to view the portraits through scholarly lenses are the *Selected Scholarship* section and then the *Concluding Thoughts* that end each chapter.

Evocative

From the book's launch at the WLE conference in Germany, we had twin purposes—to inform by offering the wisdom of practice and to inspire. Evocative, to call forth, is associated with empathy and feelings of inspiration. The coding of the themes in the narratives, the details presented in the portraits, and the direct quotations from the individual narratives were all choices influenced by the desire to achieve an inspirational purpose. An example of an evocative passage comes from the Chapter Five portrait of Rachael McNae, New Zealand. The subtheme Rachel's story illustrates is *leading for eudaimonia* [well-being]. Her narrative contains vignettes describing important events in her life. Titles of these include: "Wanting ripples but creating waves"; "Is it because we are so good at what we do, that we want to have it all?"; and "Wonderwoman? Or wondering why I am doing this?" As a new academic, wife, and mother, she experiences being pulled in different directions. Having left her son at the nursery school, she describes the tension. "Why did I make these choices? Am I doing the right thing? … What is it that makes me believe that working … is so much more important than caring for my son, teaching my son?" The ending of her narrative captures "important depths in her understanding of leadership's labyrinth:"

> I know envy, I know what it feels like to seek and crave. I know guilt, the weight of a heart, a tear in the eye, and a hand in my hand. I know influence, what not to do. I know a shifting identity. I know experience, privileges, pathways, and what opportunity provides or takes away. (Lyman et al., 2012, p. 120)

Ellis and Bochner (2000) introduced the phrase evocative personal narratives in the context of autoethnography, describing it as a form of reflexive ethnography practiced by social scientists who have recently begun to study themselves. In an in-text "conversation" between the coauthors, Bochner stated about these social scientists that they "write evocative personal narratives specifically focused on their academic as well as their personal lives. Their primary purpose is to understand a self or some aspect of a life lived in a cultural context.… The goal is to write meaningfully and evocatively about topics that matter and may make a difference, to include sensory and emotional experience" (pp. 741–742). Bochner called such personal stories evocative narratives. He focused on their expressive and dialogic goals, in contrast to more traditional social science goals. Other differences include first-person narration, focus on a single case, a storytelling mode, highlighting of emotional text, and others (p. 744). "Evocative stories activate subjectivity and compel emotional response" (p. 744), in summary.

In writing each portrait, we were re-working self-narratives, with similar goals of expressive language. In naming our methodology the word evocative seemed to fit. We wanted the readers to be in dialogue with the texts of each other's lives, to be inspired. Metaphoric language in many of the original narratives added to their evocative quality. We spoke of the power of story and metaphors from the beginning, and we deliberately created a subtext of metaphor—for example, using Bateson's (1989) "composing a life" and others—to reinforce the evocative quality of the narratives as submitted.

Portraiture

Sara Lawrence-Lightfoot and Jessica Davis's (1997) book on the art and science of portraiture remains the primary source for understanding its processes and components as a form of qualitative research. They argued that "the negotiation of balance in works of art and research portraits relies on the artist's or researcher's judgment—the manipulating of elements to find what is right, what works, and the equally important experience of deciding what doesn't fit and what needs to be reconsidered or excluded" (p. 33). In constructing our own portraits, space limitations and a desire to balance the words given to each of the 23 portraits were among foremost considerations. What could be eliminated without distorting the portrait, and what details and words were essential to include? We tried to always create a physical frame, with attention to the ecological context, descriptions of the geography of the country or city, for example. "A reader should feel as if he or she is *there*" (p. 44). In skillfully written portraits, such contextual details in the opening paragraphs are "selections shaped by the central themes of the portrait that she wants to foreshadow" (p. 45). As described by Lawrence-Lightfoot and Davis, the writer of the portrait is an observer, usually an interviewer who creates the entire portrait based on observational and interpretive skill and using a variety of narrative devices including imagery and symbols.

For each woman we featured, we created portraits based on close reading of the self-narratives or stories the women had submitted. Some included rich descriptive details but others were sparse by comparison. We gathered more detailed information from some women by asking questions through email messages. In some cases we had access to their previously published writings as an additional data source in creating a portrait linked with the chapter's theme and subthemes. The portraits were framed in the chapter theme, as well as "matted" with the particular aspect of the framing subtheme they had been chosen to illustrate. Once framed, details of country and childhood served as foreground for unfolding personal and professional journey stories glimpsed in the texts of the portrait. The use of the author's own words added authentic tone and color to each portrait. Insights following each portrait reflected or depended on the perspective of the chapter author, functioning as an appreciative critic.

A most important similarity of the portraits we created and those described in the Lawrence-Lightfoot and Davis book is the focus on goodness, on "what is happening here, what is working, and why." The focus is on "underscoring what is healthy and strong" (p. 142). We have depicted goodness in the spirit of portraiture. Lawrence-Lightfoot and Davis again provide guidance: "The researcher must ask, What in this life would have resonance in other lives? How might this individual experience inform others like it?" (p. 153). It is important to understand that "the emergent themes identified in a specific portrait are not the only themes that resonate throughout an individual site or story" (p. 230). Weaving the portraits, without having known the terms, we gave attention to the forms Lawrence-Lightfoot and Davis advocated: *conception, structure, form,* and *cohesion* (p. 247). Attention was given to *conception* in the placement of the stories within particular thematic chapters. The portrait must first fit within the "overarching story" (p. 247). "Like the novelist the portraitist searches for the overarching vision, the embracing gestalt that will give the narrative focus and meaning" (p. 248). Then *structure* "serves as a scaffold for the narrative—the themes that give the piece a frame, a stability, and an organization" (p. 252). The elements of structure must relate to the theme. *Form*, on the other hand, is "a kind of 'mysterious phenomenon' that captures emotion and movement" (p. 254). They explained that "form gives life and movement to the narrative" (p. 254). Finally, because of *coherence*, pieces of the portrait fall into place and have an order and a unity. The voice and perspective of the researcher contribute to coherence. Sometimes the researcher is heard in terms of "voice as witness," other times becoming "voice as interpretation" (p. 259).

The power of *critical evocative portraiture* emerges both from a combination of the content details chosen for the portrait and how it is critically presented and framed. Each portrait chapter was constructed around major themes uncovered in the data analysis process. The portraits were then interpreted in terms of themes and subthemes, through highlighting insights from each portrait and subsequent selected scholarship in each chapter. By working from self-narratives, we have developed portraits primarily from the words of the person portrayed, a different way of developing portraits than explained by Lawrence-Lightfoot and Davis. Our portraits have the same dimensions—but perhaps are not subject to the same criticism of portraiture that was offered by English (2000). Our portraits are clearly offered from a point of view, whereas English criticizes Lawrence-Lightfoot's portraiture for what he calls her "failure to interrogate what it conceals, i.e., the politics of vision" (p. 21).

How Critical Evocative Portraiture Differs

Critical evocative portraiture illustrates a new method for studying leadership that differs from the general narrative inquiry approach or narrative interpretation approach. Our improvised process, best captured by *critical evocative portraiture*, was based on analysis of life journey self-narratives volunteered by a group of academically focused women with mutual commitments to social justice leadership. The approach could be used for studies of men. As previously described, when we turned to the question of what our approach might be called, we first considered various forms of narrative interpretation.

Within this genre several distinct approaches to illuminating the meaning of lived experiences have developed. Chase (2011) identifies four. In one, attention is focused on the relationship between people's stories and the quality of their life experiences. The emphasis is on what people's stories are about—an important end goal of the researcher is to collaborate with the participants to improve the quality of their everyday experiences. In another approach, narrative researchers are interested in not only the *what* of people's stories but also how they narrate their experiences, paying attention to linguistic phenomena. In particular, their goal is to show "how narrators make sense of personal experience in relation to cultural discourses" (p. 422). In yet another approach, researchers focus on "the relationship between people's narrative practices and their local narrative environments (p. 422). In this approach ethnographic methods are used to get a deeper understanding of the narrative environments in which the stories unfold. Last, according to Chase, is the narrative approach in which the researcher's and the other's stories are merged to "explore a topic or research question more fully by including the researcher's experience of it" (p. 422). Autoethnography is a version of this approach. Using Chase's language, our stories are not merged with those of the participants. However, we three coauthors also submitted narratives as members of the group and our portraits are included. We could be called complete-member researchers which is a term coined by Adler and Adler "to refer to researchers who are fully committed to and immersed in the groups they study" (1987, as cited in Ellis & Bochner, 2000, p. 741). The approaches Chase described, though distinct in certain ways, share some common elements. They all involve a close relationship between the researcher, the participants, and their stories and in-depth interviews as "the most common source of narrative data" (Bell, 2009 as cited in Chase, 2011, p. 423).

At first glance, the process we followed for our investigation seems to have a lot in common with narrative inquiry, especially autoethnography. But it has important distinguishing features. The most notable is that the researchers came into the scene only after the stories had been written and submitted for sharing. The second is that each individual was free to construct her story with no specific research questions to guide her, except for the loosely expressed invitation to authentically reveal her life journey toward being a promoter of social justice. With only this loose parameter, individuals were free to determine how they would make their contributions. The purpose was to know each other better. Because each member of the group grounded her story in the social context where her life unfolded, and was encouraged to use personal, creative ways to represent herself, we obtained not a homogeneous set of stories but a bricolage of assorted portraits of individuals leading for social justice. A bricolage has its benefits.

Close examination of each chapter's set of portraits (clustered in terms of common related themes) develops an ethnography, a bricolage if you will, for each set of stories, with the chapters becoming "a pieced-together set of representations that are fitted to the specifics of a complex situation" (Denzin & Lincoln, 2011, p. 4). We also did some piecing together of the portraits—using as resources the self-narratives, emails, conversation at conferences, and previous professional writing. A synthesis of the resultant ethnographies or portraits in each chapter exposes the total picture of the chapter theme in a deeper way than if only one person had been portrayed.

A third distinguishing feature of our approach is that this book project was initiated with a very important preexisting condition: trust engendered by our common commitments to social justice even before the research project officially was launched. A level of trust began to build at the first WLE conference in Rome and contributed to the submission of the stories collected during Phase One. Trust grew rapidly during and after the WLE group's second meeting in Augsburg. Trust was also nourished in the two meetings by the group's very open discussions and the free exchange of ideas, personal experiences, and expertise in the area of leadership and social justice. Due to the small size of those gatherings, close and personal relationships unfolded among the group members; this, in turn, contributed to the desire to get to know each other better. In addition, at the second meeting in Augsburg, the women came to feel even more comfortable about sharing details of their lives after Linda presented a sensitive and insightful analysis of the first 12 stories. As a result of that increased trust, more of the women went away feeling at ease with writing their personal journeys and exposing them to the rest of the group.

A final distinguishing feature of our approach was the open circulation of all stories on the WLE group's listserv. The stories were submitted over a 2-year period, during which a person reading a story could become influenced by what another had done, leading to cumulative encouraging of trust. This phenomenon aligned with our purpose in sharing the stories—to get to know each other and to show how our life journeys have informed and influenced our work for social justice within the parameters of our particular cultural contexts. As each one of us read the story of another, we could relate better to that person, be inspired by the other woman's life, and be encouraged to continue pursuing our goals for social justice. All of these factors led to a level of detail and personalization that interviewing cannot capture. In conclusion, our approach generated powerful, emotional energy that coursed among the group members throughout the process of collecting, analyzing, and presenting the results. This sustained energy flow influenced how we came to see each other and how we behaved—both collectively and individually. Clearly each portrait carries the power to teach, to bind individuals together, to provide meaning, and to incite action that promotes a more just world. Because evocative portraits are emotionally rich, they become memorable parts of our shared humanity.

Feminist Pathways to Social Justice

We came to the writing process and developing *critical evocative portraiture* from different personal and professional backgrounds. Our teaching and scholarly interests have different focuses, but commitment to equity is an underlying commonality. The following individual statements—about our history as researchers and scholars and our engagement with the concepts of feminism, leadership, and social justice—illustrate differences as well as that underlying commonality. If we start from bell hooks's (2000) definition of feminism as "a movement to end sexism, sexist exploitation, and oppression" (p. 1)—and imagine living in a world … "where a vision of mutuality is the ethos shaping our interaction" (p. x)—then each coauthor has at some level been on a feminist pathway to social justice.

Linda

Professionally, I came to my position as an academic late in life, one could say. It was a new beginning after living through the 1960s and 1970s with the sense that the women's movement and feminism did not have much to do with me. That was before I had tried to do anything unconventional, however. My dissertation research was an analytic historical case study of board of education decision-making processes in which I had participated as the board of education president. Pseudonyms were used for all participants and the community. The board decisions under study were those made in response to the conviction of the superintendent of schools of the sexual assault of a student. On many levels it was the beginning of my feminism. So I have been both outside and inside the women's movement, but resisted labels.

Having been a leader in high school and college years, in my communities, and now in my academic role, women's leadership has been a lifelong interest. I have taught courses on women's leadership in the USA and in Greece and published articles and books featuring women leaders. Social justice leadership has been a passion developed since I moved to Peoria, Illinois, in 1990. Peoria is a small city with major urban problems. It has been the site of my social justice education. I have been particularly drawn to issues of poverty, race, and gender in my teaching and research. I have experienced success as a professor in positively affecting students' deficit-thinking attitudes toward people living in low-income families.

Professionally, based on my four books, I am comfortable with describing myself as a storyteller. Most of my research has been qualitative and focused on leadership. Looking back, each of my earlier books has a social justice purpose and contains elements of critical evocative portraiture. Featured participants have been identified by their real names and settings, rather than fictionalized or presented anonymously. In that way, my major work has gone against conventions of the field. My first book (Lyman, 2000) was created as a portrait, an extended single case study of caring leadership conducted over a 3-year period. The book was directly inspired by the scholarship and encouragement of Nel Noddings. When I invited her to speak at Bradley University in Peoria, she graciously took the time to review my 1995 AERA paper about a caring leader and told me that I could turn it into a book. She said that nothing like what I proposed existed—i.e., to show what caring leadership looked like—and she gave me the name of her publisher to contact, suggesting that I use her as a reference for the inquiry. Part of my purpose in that book was to degender the concept of caring leadership, which is typically ascribed to women.

In constructing this book-long portrait of Ken Hinton, at that time an African American early childhood center principal in Peoria, Illinois, I was also influenced by and cited the work of Sara Lawrence-Lightfoot and Davis (1997) on portraiture as a mirror of goodness and Elliot Eisner (1998) on evaluation and qualitative inquiry. I was attracted by his educational connoisseurship concept and his insistence that the researcher's voice must be heard. Eisner also drew from the practice of criticism, describing it from an artistic perspective as being about enabling others "to experience qualities and meaning" (p. 3) of a work of art. He wrote, "A word about voice. I have tried in this book, as in all of my writing, to keep a sense of voice present. I want readers to know that this author is a human being and not some disembodied abstraction who is depersonalized through linguistic conventions that hide his signature" (pp. 3–4). In my books I also have kept my voice present.

My second book (Lyman & Villani, 2004), which Christine Villani and I were invited to write, was a comparative case study of two successful minority women leaders, one African American and the other Hispanic, in high poverty elementary schools, one in Peoria, Illinois, and the other in Bridgeport, Connecticut. It presented portraits of these two outstanding principals, with the focus on their leadership practices and effects of their leadership on learning/achievement, parent satisfaction, and effectiveness. The research was motivated by personal commitment to promote social justice leadership that can mitigate the effects of poverty on learning by children living in low-income families. The book also reflects my ongoing interest in women leaders. Data was gathered through on-site observation for over a year, a series of interviews with the principal, and interviews with representative staff and faculty. The ending of the book focuses on leadership approaches to influencing and eliminating attitudes and beliefs that maintain deficit thinking.

My third book (Lyman, Ashby, & Tripses, 2005) was a coauthored multi-case study of leadership practices of outstanding women leaders from Illinois. The research was the product of a statewide woman's organization, Illinois Women Administrators, for which I was Executive Director for 4 years. The collaborative feminist research project began with the collection of 18 narrative/transcripts from interviewees identified by a reputational group process. The interviews were conducted by 18 different women using a collaboratively developed interview guide. The purpose was to look for commonalities in the leadership practices of these outstanding women leaders. The major themes were developed in the book, with in-depth profiles of five women used to illustrate the major themes.

A definition of feminism important to me, and one that has inspired my work with gender issues in my classes, was shared by Astin and Leland (1991), who called feminism "a system of ideas and practices which assumes that men and women must share equally in the work, in the privileges, in the defining and the dreaming of the world (Lerner, 1984, p. 33)" (p. 19). I am a storyteller who paints portraits in words. My aim as a teacher and a writer is to reflect their own goodness back to people in a way that helps them achieve their dreams and build a more just world.

Jane

Some equate feminism with and mistake it for fanaticism. Some believe feminists are rabid men haters and destroyers of family. I do not; I hold family very dear and have two sons I would die for. For me feminism offers a guiding philosophy, one that embraces social justice and has a very broad agenda. Yes women's human rights are central to that agenda but so are the human rights of other oppressed peoples. My career in education, which has spanned 48 years, has enabled me to engage in the activism that is central to feminism. For without a commitment to support, to take action, and to advocate for and with others feminism does not walk the talk, it is hollow and useless. Feminism is activism.

I have often wondered where my passion for social justice came from. My comfortable middle class background seems an unlikely breeding ground for my activism. However, even as a child I remember feeling profoundly sad when I witnessed unfairness or was on the receiving end of what I perceived to be unfairness. Yet, it was not until much later when as a new teacher I developed a broader and more sophisticated understanding of poverty and discrimination and how they can limit and hurt. In the early 1970s I began to engage with and debate the ideas of feminism. After two failed marriages, I experienced firsthand discrimination and the disapproval some expressed for "single/divorced mothers" and realized that if as a well-educated middle class woman I was experiencing discrimination how much worse would it be for those trapped in poverty, or the abused, or indigenous peoples?

However, there was no momentous event that catapulted me into an awareness that the world was a very unfair place. It was a gradual awakening that greed and the abuse of power by individuals and by governments profoundly disadvantaged and oppressed. I also felt a real urgency to try and do something about that. Recently at my retirement celebration, friends and colleagues were asked if they wished to say something about me. A friend I had worked with for 5 years as a high school counselor stood up to speak. He said "At staff meetings when we were discussing issues and what to do about them you could guarantee that Jane would ensure we understood how that might affect, including disadvantage, others. She always gave the social justice perspective." I do remember that. I also remember the compulsion I felt to speak and how I had to pluck up the courage, how my heart raced, how my hands sweated, and how my face flushed. I knew that at times I was taking an unpopular stand and would be on the receiving end of the disapproval of others, yet I was compelled to speak out.

Further study and meeting women and men who were similarly concerned provided me with ideas and the support I needed to take action. After 22 years teaching and counseling in high schools, I embarked on an unplanned academic career in a university that enabled and encouraged me to follow my social justice passion. My teaching, research, and activism focused on social justice in education, and feminism was the theoretical and practical tool I used to guide my work. My PhD thesis focused on how feminist high school principals enacted a social justice agenda in a right-wing political climate. My supervisors were both feminists, one of them was the Dean of the Faculty of Education. She knew my work and my commitment to advancing the life chances and choices for women, so when I wanted to take 2 years leave without pay from my tenured faculty position to go as a volunteer adviser to the Director of Women's Affairs in Vanuatu, she generously granted me the leave.

My experiences in Vanuatu were life changing. Vanuatu is a small south west Pacific island nation. The status of women is very low. My role was to support the staff in establishing an effective government department with strong organizational structures and processes that supported the government's policy directions for women. What a privilege it was to work alongside women in shaping Vanuatu's human rights policies for women. I was able to walk the talk of feminism, although the word feminism was not used in Vanuatu culture as it was considered too radical and anti-Christian. My experiences in Vanuatu showed me the international disparities for women. In comparison to women in New Zealand, the women of Vanuatu have few human rights. These experiences shaped my academic career on my return to New Zealand.

For the final 8 years of my academic career, I was able to continue to walk the talk of feminism. My social justice work mainly, but not solely, focused on Pacific education. I directed a large teacher education contract in the Solomon Islands, a neighbor of Vanuatu. I am convinced that economically developed nations like New Zealand have a moral obligation to support and aid economically developing countries, not as colonizers but as partners sharing decisions, wealth, and expertise.

Angeliki

As a relatively young academic, I came into the field of researching school administration, leadership, and management with a formal preparation that provided a rather constrained lens for conducting research. Qualitative research methods had received considerable attention in my graduate courses, but they were often overshadowed by the apparently more powerful and objective quantitative approaches. Squeezed by this tension, my first research endeavor—my dissertation—featured a merging of the two approaches, an effort to strike a balance and to explore them both in greater depths. This continued after my graduation when I started my journey into the field of academic research. In this ethos my main objective was to identify the necessary skills, knowledge, attitudes, and behaviors that would turn an everyday school administrator into a *leader*.

Through my academic work and closer engagement with schools and school leaders, it became apparent that school leaders who aspired to transforming their schools would have to pay attention to issues of values, beliefs, equity, individual and collective cultural identities, stereotypes, and cultural misunderstandings. Without critically reflecting on such issues, and creating the time and space for others to do the same, school leaders cannot hope to see their organizations evolve into democratic communities of shared knowledge and practice.

It also became apparent to me that traditional modes of researching, and traditional ways of preparing school administrators, could not provide adequate guidance regarding such issues. If future school leaders are to promote equity and social justice, they have to be able to reflect on their self-identities and to adopt multiple cultural lenses when analyzing and solving problems. Moreover, they must heed Delpit's (1995) admonition to "consciously and voluntarily make our cultural lenses apparent" (p. 151).

With these insights, I began to think of social justice as being achieved through the processes of *reflecting* and critically examining ourselves and others through multiple cultural lenses and *acting* to alleviate injustices and to improve relationships at all levels—micro, meso, and macro.

The need to infuse educational administration with more social justice is paramount and is increasingly recognized by researchers, theoreticians, and practitioners. For example:

> Recent conversations and presentations at the annual conferences of the American Educational Research Association (AERA) and the University Council of Educational Administration (UCEA) have identified social justice as a new anchor for the entire profession, servant leadership as a new metaphor, and equity for all as a new mantra. (Brown, 2004, p. 80)

This development in thinking about the needs of administrators has spurred searching for new methods for investigating issues related to equity, values, and cultural differences. The more established qualitative research methods—based almost exclusively on in-depth interviews, content analysis, and conventional narrative inquiry—cannot adequately describe and explain the complexities that attend those issues. New, unconventional methods for triggering, provoking, and encouraging the new generation of transformative school leaders to think critically and to reflect systematically on social justice issues are urgently needed. Brown (2004), for example, has advocated

> approaches that focus on skill and attitude development, such as cultural autobiographies, life histories, prejudice reduction workshops, cross-cultural interviews, educational plunges, diversity panels, reflective analysis journals, and activist assignments at the micro, meso, and macro levels … to help students and professors develop their capacity to reflect and act more effectively. (p. 81)

For the past few years, therefore, my thinking and academic work have centered on such alternative approaches, with an emphasis on praxis. Praxis is the constant interplay of critical reflections and subsequent actions. Because change cannot be achieved through reflection alone, we are called to adopt what Freire has named policy praxis, which, based on dialogue, targets the “dismantling of oppressive structures and mechanisms prevalent both in education and society” (Freire & Macedo, 1995, p. 383). Along those lines, I see my role as similar to Socrates’s method of challenging, provoking, and pushing school leaders’ patterns of thinking beyond their comfort levels so that they become better able to unearth, examine, and eventually implement actions that work for justice and social change within their unique cultural contexts.

Up until recently I was using dialogue as the primary means to achieving these goals, in tandem with reflective journal writing as a way to help future leaders become critical and stay focused on the issues under discussion. Because dialogue is a social act, and requires the cooperation and willingness of participants to make it successful, I came to the notion of quantum leadership. This genre of leadership flourishes in an ethos of cooperation and integration. Members of a group are co-creative partners, acting as catalysts for changes within their organization. As Foster (1986) stated, “Leadership is an act that enables *others* and allows them, in turn, to become enablers” (p. 187; emphasis added). Enablers, I believe, are what we need to make social justice praxis within our school systems.

Although my investigation of quantum leadership is at an early stage (Lazaridou & Fris, 2008), I use metanarrative inquiry as the primary method for collecting information. Irvin and Klenke (2005) described this as

> a qualitative method that integrates historical, psychological, and cultural perspectives and offers a highly developed body of self-knowledge depicting the narrator’s self-interpretation that reflects the ontological integrity of meaningful experiences in the individual’s life. (p. 6)

In this perspective, metanarratives are treated as “depositories of meaning” rather than mere descriptions, and they reflect people’s *telos*—sense of ultimate purpose in life; *chronos*, understanding of the past, not for the sake of the past but for what historical understanding can do in the present (Klenke, 2004, pp. 15–17); and *hermeneia*—worldview (Irvin & Klenke, 2005, pp. 14–19).

Conclusion

For the study of social justice leadership and study of leadership generally, we believe *critical evocative portraiture* is a methodology that releases and honors the complexity of powerful leadership in difficult contexts. We offer it as a research approach that can provide insight into the leadership challenges of the times. The book *Shaping Social Justice Leadership: Insights of Women Educators Worldwide* offers a point of view and integrates a critical perspective, connecting practice to relevant selected scholarship. Working from the power of women’s stories and using portraiture, we demonstrate scholarship as a feminist pathway for social justice leadership. We were each personally affected by this writing process.

Linda

The book for me became that larger story I have been preparing my whole life to write. In college I dreamed of working at the United Nations and making a contribution to world peace. I gave up that big picture vision for a domestic life when my children were young, but the dream of contributing to world peace emerged again when I was selected to be a Fulbright Scholar in 2005. The transformative 6 months my husband and I spent in Greece was a body/mind/spirit odyssey that led directly to my participation in the *Women Leading Education Across the Continents* research group. I have lived since then with an enlarged sense of the world and developed a deeper commitment to social justice. My life has been immeasurably enriched by the WLE group members and the privilege of writing this book. The stories of my WLE friends are interwoven and intertwined in my heart. Their stories give me strength to continue on my path as a dream weaver and bridge builder, working to make a difference.

Jane

Writing *Shaping Social Justice Leadership* with Linda and Angeliki, my first book, has afforded me the opportunity to reflect on my social justice platform, to learn from the women who feature in the book, and to plan my social justice work in my retirement. Social justice work is lifelong and does not end when formal employment ends; it is in your bones!

Writing *Shaping Social Justice Leadership* has been both a surprise—I thought I never would write a book—and inevitable, a book waiting to happen. So why now? A number of things came together at the right time. I was at the end of my career and so had a body of social justice work to reflect back on. Being invited to attend the first WLE conference in Rome introduced me to women scholars who shared my passion for social justice leadership. I met Linda who invited and encouraged Angeliki and myself to join her in writing the book. Her previous experience as a published author was invaluable. She knew how to navigate the publishing process.

Social justice leadership work is hard work and can be exhausting and lonely. Meeting the women featured in *Shaping Social Justice Leadership* and writing the book with Linda and Angeliki has helped me to find the energy and courage to continue social justice leadership work and to feel supported and inspired in that work.

Angeliki

My involvement with the book *Shaping Social Justice Leadership: Insights of Women Educators Worldwide* advanced my thinking and ways of researching. The power of the self-narrative portraitures that I developed for the book made me realize that this method provides a profoundly convincing way to show how acts of social justice take place in various cultural contexts and in unique personal circumstances.

I do not identify myself as a feminist, and my research has not focused exclusively on promoting feminist issues; nevertheless, I was greatly affected by the complexities, misfortunes, conflicts, and injustices experienced by the individuals portrayed in the book, as well as the courage, faith, and strength they mustered to pursue their dream of a more just world. I believe that if their examples speak to the hearts of everyone—men and women, boys and girls, leaders and followers—then small acts of justice may start appearing around the world. I see my role as helping to make this happen in my part of the world by striving to release the potential for leadership that exists at all levels in the world of education—in students, teachers, principals, higher office personnel, and other stakeholders.

Chapter 16
LeaderPAR: A Participatory Action Research Framework for School and Community Leadership

Gary L. Anderson and Erika Bernabei Middleton

In the early 1980s, studies of schools as workplaces portrayed a school professional culture of isolation in which norms of collegiality were rare (Lieberman and Miller, 2008; Little, 1982, 1990). The professional development of teachers still followed a traditional in-service model. The effective schools research of that time cast the principal as a key figure in creating effective schools by providing strong management and instructional leadership (Edmonds, 1982). Over time, movements promoting collaborative action research (Somekh, 2010), professional learning communities (Lave & Wenger, 1991), and other forms of professional learning became more prominent and began to shift the professional development of teachers toward more school-based, collaborative forms. To the extent that these professional learning communities were authentic, they often resulted in teachers engaging in deep and honest reflection on their practice and the school and community as a context for teaching and learning (Lieberman & Miller, 2008). By the late 1990s, academic leadership theory in education was moving from images of heroic leaders at the top of a hierarchy to the notion of leadership as distributed across multiple members of an organization (Gronn, 2000; Spillane, Halverson, & Diamond, 2004). While diffuse notions of leadership among school professionals became popular, such diffusion typically ended at the school door.

In this chapter, we offer both a methodology and a stance toward school leadership that draws on a long tradition of community-based, participatory action research (PAR). Many paternalistic approaches to schooling—particularly many inner-city charter schools—view communities as problematic and attempt to "make over" students (Whitman, 2008). This is perhaps understandable since

many poor communities, divested of jobs and infrastructure, are living at a survival level in which basic issues of strictness, discipline, and basics are paramount (Wilson, 2009). However, as Gold, Simon, and Brown (2004) and Shutz (2006) point out, there is as much, if not more, of a need to build community capacity in many inner-city and rural areas as there is to build school professional capacity. Without fostering both school and community capacity, through building both human and economic capital, students who live in areas of concentrated poverty are not likely to experience upward social mobility in spite of a discourse of *no excuses* and *no child left behind*. A PAR stance for educational leadership would bring a deep commitment to personal and community empowerment and a methodology based on respect for a community's strengths and assets.

A PAR approach to leadership (LeaderPAR) does not limit its attention to school professionals and organizational learning, although professional capacity building and organizational learning are part of a PAR approach to leadership. Thus a central focus of LeaderPAR is to bring greater balance between school and community-based approaches to school capacity building and social change. There are three primary foci to LeaderPAR: (1) the professional capacity building and organizational learning focus of a distributed leadership framework within schools (Spillane et al., 2004), (2) a focus on authentic, appreciative school *and* community-based inquiry that is not data driven (Halverson et al., 2005), but rather data supported (Herr & Anderson, 2005), and (3) leadership frameworks that focus more explicitly on democratic governance and community organizing (Gold et al., 2004; Goodman, Baron, & Myers, 2004; Woods, 2004). In the rest of this chapter, we will first provide an overview of participatory action research for those who may be unfamiliar with it as a methodology or stance toward research and practice. We will then address the three central foci described above and how they might impact notions of leadership and school reform.

PAR: A Methodology and Stance for Leadership

The current popularity of distributed leadership and learning communities as guides to research and practice are an improvement over a "correlates of effectiveness" approach to school improvement (Edmonds, 1982; Leithwood, Day, Sammons, Harris, & Hopkins, 2006). However, by limiting its focus to work redesign and building school-level professional capacity, it fails to address participatory reforms that promise greater school-community congruence (Gonzalez, Moll, & Amanti, 2005), more additive and antiracist pedagogies (Valenzuela, 1999), and public forms of accountability that are community driven (Gold et al., 2004).

In this section, we will explore participatory action research (PAR) as a stance toward school and community-based inquiry, facilitated by school leaders, that provides leaders, teachers, students, and community members with an approach that is more process oriented, more inclusive, and less hierarchical. PAR challenges the framework (or subverts the framework) of traditional research on school leadership by moving school professionals toward an engaged, cyclical relationship with communities to define, examine, and develop action steps to their own problems. Unlike more narrow data-driven approaches, PAR continually loops through a set of questions, analyses, solutions, and back again, ensuring that the process is grounded, situated, and fulfills the goal to develop both solutions and empowerment.

There are many traditions of PAR that have grown out of different academic fields and different approaches to change and they sometimes go by different terms. In public health, PAR is called community-based participatory research (CBPR) (Minkler and Wallerstein, 2003). In education, it is often called merely action research or practitioner research, but tends to lack the community perspective. There are also traditions of organizational learning and workplace democracy that tend to use participatory action research (Whyte, 1991). PAR is also used in international development and adult education.

Although some traditions see Kurt Lewin as the founder of PAR, more social justice-oriented forms of PAR tend to view Paulo Freire (1970) as their greatest influence.

Although his focus was on adult literacy, Freire's legacy is his claim that social inquiry should promote research *with* participants rather than *on* them and the use of what he called "generative themes" that grow out of the problems that a community perceives as the most crucial. The Freirian concept of "limit situation" also speaks to the need for communities to transcend immediate limits to envision a more just future. PAR supports the community-grounded empowerment that combats feelings of defeat around limit situations and pushes communities toward transformation.

Freire's views on the transformative power of this form of inquiry are powerfully stated when he writes that "the silenced are not just incidental to the curiosity of the researcher but are the masters of inquiry into the underlying causes of the events in their world" (Freire, 1982, p. 30). A Freirian approach, which is grounded in popular education and adult literacy, insists on the ability to read the word and the world. For school leaders, this translates as the ability to deal with the day to day while also understanding the big picture forces that influence and partially constitute the day to day. De Schutter and Yopo (1981) have provided a useful list of characteristics of PAR focusing on reading the word and the world:

- The point of departure for participatory research is a vision of social events as contextualized by macrolevel social forces.
- Social processes and structures are understood within a historical context.
- Theory and practice are integrated.
- The subject-object relationship is transformed into a subject-subject relationship through dialogue.
- Research and action (including education itself) become a single process.
- The community and researcher together produce critical knowledge aimed at social transformation.
- The results of research are immediately applied to a concrete situation (De Schutter & Yopo, 1981, p. 68).

The Columbian Orlando Fals-Borda has also had an important influence on PAR, and he also emphasizes the need to understand the relationship between micro- and macrolevel forces. According to Fals-Borda (1991), “PAR induces the creation of its own field in order to extend itself in time and space, both horizontally and vertically, in communities and regions. It moves from the micro to the macro level as if in a spiral, and thus acquires a political dimension. The final evaluation or applied criterion of the methodology revolves on this political dimension and the opportunity that it offers for making theory concomitant with action” (p. 6). Fals-Borda sees PAR as an “experiential methodology” using reliable information to empower poor and oppressed communities. The goals of PAR for Fals-Borda are

> (l) to enable oppressed groups and classes to acquire sufficient creative and transforming leverage as expressed in specific projects, acts and struggles; and (2) to produce and develop sociopolitical thought processes with which popular bases can identify. (Fals-Borda, 1991, pp. 3–4)

Fals-Borda’s work resonates with Freire’s own statement that “In this context research becomes a means of moving them beyond silence into a quest to proclaim the world” (Freire, 1982, p. 30).

Some approaches to PAR make the community a more explicit focus of their research. For instance, practitioners of public health have long used an approach they refer to as community-based participatory research (CBPR). Minkler speaks to the community-oriented ways that CBPR engages in research that focuses on health issues and health disparities.

> Together with community demands for authentic partnerships in research that are locally relevant and “community based” rather than merely “community placed,” this frustration has led to a burgeoning of interest in an alternative research paradigm. Community-based participatory research (CBPR) is an overarching term that increasingly is used to encompass a variety of approaches to research that have as their centerpiece three interrelated elements: participation, research, and action. (Minkler, 2005, p. ii3)

While CBPR, like other forms of inquiry, can take on more traditional and data-driven forms, at its best, it is an inquiry process that takes time, relationship building, and power sharing in order to come up with questions and answers that best connect to community priorities in public health.

Appreciative inquiry, another PAR approach, is an assets-oriented process to create organizational or community change. As opposed to a deficit orientation toward communities, appreciative inquiry looks to community assets in developing questions and solutions. Kretzmann and McKnight (1993) think of it as community transformation from the inside out—beginning with the wealth of experience and knowledge in a community and developing empowering and relevant structures to make use of those assets (p. 6).

Michelle Fine views PAR as “practiced within community-based social action projects with a commitment to understanding, documenting, or evaluating the impact that social programs, social problems, or social movements bear on individuals and communities. At its core it articulates a recognition that knowledge is produced in collaboration and in action” (Fine et al., 2003, p. 173). Fine’s work on YouthPAR is of particular pertinence to this discussion as it shows how PAR can provide traditionally "silenced" people, in this case youth, a venue that enables them "to interrogate and denaturalize the conditions of their everyday oppression (inspiring) a process of community and knowledge building" (Torre & Fine, 2006, p. 271). In a powerful way, LeaderPAR can contribute to the development of space and power sharing with silenced communities to develop meaningful policies that speak to the needs of students and families.

While it is important to maintain the community-grounded nature of PAR, feminist and antiracist scholars have begun to push for using PAR methodology with a more intentional structural racism or feminist critique (van der Meulen, 2011). Bell (2001) writes about the history of the Black Nationalist and civil right movements as deeply grounded in PAR using action techniques to break down structures of racial oppression. However, these movements have not been recognized as part of the PAR tradition—requiring the development of Feminist Anti-Racist PAR (FARPAR) to connect what these scholars view as disconnected methodology to practice and the history of structural oppression in the United States (van der Meulen). Feminist Action Research's purpose is to locate issues and questions in the context of "the diverse and often disparate ways that poor women negotiate their lives, and to respond to social injustices through advocating collective action and social change" (Reid & Frisby, 2004, p. 2). In the context of school-community relationships, a stance that identifies a particular oppressive construct like racism could be a bridge between the isolated school and the leadership that makes decisions inside of that isolated school from which PAR methodology can organically stem.

LeaderPAR: Making School Leadership More Community Based and Participatory

Since the 1980s, research on leadership has demonstrated the inauthenticity of most participatory and shared governance proposals for school leadership. More than a decade ago, coauthor Anderson (1998) made the following evaluation of experiments with participatory forms of leadership.

There are signs that the participatory reform movement in education is running into problems. For example, several case studies have suggested that shared governance structures may not result in significant participation in decisions (Malen & Ogawa, 1988) but, instead, result in contrived collegiality (Hargreaves, 1994), reinforce privilege (Lipman, 1997), and even create a tighter iron cage of control for participants. There is also evidence that they may be costly to service, waste members' time, delay important decisions, and lead to inefficiency and lower productivity (Beare, 1993). From the grassroots level, teachers in schools are increasingly complaining that participation is often bogus, takes time from their interactions with students, and intensifies an already heavy workload leading in many cases to teacher burnout (Gitlin & Margonis, 1995).

In industry, workers are becoming increasingly aware that, while they are being empowered on the shop floor through participation in selected work-related decisions, their unions are being busted, their companies downsized, their jobs moved overseas, and their salaries and benefits slashed (Brecher et al., 2000). Many participants are reporting a sense of disempowerment rather than empowerment from so-called participatory reforms and, in the case of education, are increasingly calling for more authentic ways to participate in the governance of their schools. School practitioners are less and less willing to give time to participation schemes they see as inauthentic. Meanwhile, a growing coalition of poor and minority parents and communities, home schoolers, and the religious right are giving up on achieving more authentic forms of participation in decisions that affect their children and are turning instead to a growing voucher movement that will allow them to choose their own schools (pp. 572–573).

Not much has changed since this was written. With mayoral control, authentic citizen input in many urban districts is nonexistent. School-based decision-making and inquiry are even more circumscribed and co-opted by scripted curricula, high stakes testing, and testing data (Scherer, 2008/2009). An education industry has grown exponentially, leading to greater commodification and commercialization of professional development (Anderson & Herr, 2008, 2011; Burch, 2009). The term “empowerment” is still used to describe teacher and principal autonomy, even while their decisions are driven by testing pressures, they are blamed for school and societal failures, and salaries, benefits, and pensions of public workers are under attack. What is needed is a framework with a stance toward participation and democracy capable of recognizing the difference between authentic and inauthentic forms of participation.

The reason that stances like distributed leadership—and its predecessor, school-based management (SBM)—end at the school door is largely because they are primarily a workplace redesign model aimed at building professional capacity and increasing production. As Herr and Anderson (2008), Hatcher (2005), and Woods (2004) argue, current notions of distributed leadership or professional communities do not address democratic theory or theories of power. This is not to say that we have not come a long way since the 1980s in developing greater professional capacity in schools, but embedded as they are in new managerial and neoliberal practices, such models are increasingly co-opted and distorted in numerous ways (Arellano-Gault, 2010).

In this section, we will briefly address the three foci of LeaderPAR described above: (1) a method for building professional and community *capacity* and *participation*; (2) authentic, appreciative school and community-based *inquiry* that is not data driven, but rather data supported; and (3) *leadership* frameworks that focus more explicitly on democratic governance and community organizing. Each of these need to be further developed conceptually and they need to frame new research in the field of educational leadership, so that we can obtain empirical evidence of the viability of LeadPAR and its limitations.

Building Professional and Community Capacity Through Participation

In spite of attempts by high stakes accountability and a growing private sector school improvement industry (Burch, 2009) to commodify school-based inquiry, there is a growing consensus in research on school improvement that school leadership should be about creating "smart systems" (Rothman, 2009) that build communities of inquiry and distribute leadership across the school community (Leithwood et al., 2006). However, to the extent that these smart systems of distributed leadership limit inquiry to school professionals, they may be merely reproducing the very system that they claim to change. This is especially true when they move beyond functionalist, productivity claims to also make social justice claims.

Distributing leadership beyond the school may seem impractical given that the principal's role expectation has traditionally been to buffer teachers from parents and keep the community at arm's length. Distributing leadership to students is also anathema in most schools, which is why most YouthPAR is done in communities, not in schools (Cammarota & Fine, 2008). However, if we look at the progress that has been made in shifting teacher culture from one of isolation to one of visiting each other's classrooms and engaging in learning communities, there is no reason why we cannot change this aspect of principal and teacher culture as well. There is a growing recognition that in order to have successful schools, we need to build professional capacity within the schools, but we also need to build greater capacity in communities—however, this is defined—so that children come to school ready to learn and so that communities can hold their schools accountable.

Within our conceptualization of LeaderPAR, notions of accountability shift from top-down, outside-in accountability through testing and markets to greater public accountability—i.e., community and parent accountability. Within a PAR framework, leaders recognize that relationships, power sharing, and active engagement are the substance of accountability. Understanding schools as embedded in community shifts the construct away from leadership as managerial and closer toward empowering relationships with community. Gold et al. (2004) write about the importance of parental engagement from a community organizing lens—a deeply empowered process of trust building within a social justice framework. Connecting community organizing and parent engagement envisions adult roles in schools as more than supportive of an individual child's success, instead "extend(ing) beyond the needs of their own children to the needs of all children in their community" (Gold et al., p. 242).

While there is currently much talk about principal and teacher autonomy, simply providing principals with more control over their budgets to hire vendors is not necessarily an empowering practice. Professional autonomy in countries like Finland is complemented by a major investment in teacher education and development and eschews high stakes standardized testing and zero tolerance policies that too often undercut the very professional autonomy that is sought (Sahlberg, 2007).

PAR's concern with understanding microlevel practices within macrolevel policies brings a much-needed dimension to not only educational leadership but also school reform movements.

As long as distributed leadership is primarily focused on a school-based, work redesign model, it will have only limited success. LeaderPAR seeks to build on the progress made through shared leadership approaches by extending them beyond the school house door. It also insists that the process of capacity building cannot be separated from broader citizen participation in decision-making. In this sense, what must be distributed is not only professional expertise and information but also the power of citizens to have input into decision-making. Where this has been successful, schools and communities have been able to sort out those areas that are best left to professional expertise, although most curriculum developers will agree that a good curriculum is informed by a community's funds of knowledge and is designed with input from a local community (Gonzalez et al., 2005).

Many variants of PAR are synonymous with community organizing in which data is gathered in order to further the goals of social change. Building community capacity and power is a goal of community organizing, and it has been successfully used to leverage forms of school reform that respond to community needs (Rogers & Terriquez, 2009; Shirley, 1997; Warren & Mapp, 2011). As noted above, Gold et al. (2004) view building community capacity and power through grassroots leadership development as creating a form of public accountability for schools and districts. The point here is not that we should train principals as community organizers but that principals can make links to empowered communities to promote a balanced approach to improving the education of their students in ways communities feel are important.

Authentic, Appreciative School and Community-Based Inquiry

Movements for teacher research and learning communities in schools have emphasized the importance of using "data" to make collaborative decisions in schools, although what counts as data has often been contested (Anderson & Herr, 2005; Cochran-Smith & Lytle, 1993). The advent of accountability systems in many states in the 1990s that used high stakes testing forced teachers to define data largely as the results of standardized tests, and spreadsheets of student outcomes replaced other, more qualitative and collaborative, forms of data. Because of this shift to an emphasis on test data, it has become less clear whether learning communities are meant to build habits of inquiry and promote equity throughout the school or whether they are mainly a strategy to implement the new assessment databases their districts are purchasing to meet NCLB's Annual Yearly Progress targets (Means, Chen, Debarger, & Padilla, 2011; Wayman & Springfield, 2006). "Data-driven decision-making" led by venture philanthropy, business, and politicians is viewed by many as co-opting authentic forms of school-based, professional inquiry (Cochran-Smith & Lytle, 1993; Herr & Anderson, 2008)

Leaders using a PAR stance, while supporting multiple forms of accountability, would recognize and reject narrow forms of accountability based on current business models such as data-driven decision-making and "continuous improvement," concepts associated with the popularity of Total Quality Management approaches of the 1980s. Business approaches tend to be popular and require quantitative statistical data that aids in the elimination of product variance, resulting in product quality based on uniformity. Such approaches, when translated to education, tend to reinforce hierarchical arrangements of experts and nonexperts and the definition of "data" as largely quantitative and test oriented. It also stresses outcome data over process data and organizational outputs over inputs (testing without investing). A PAR approach to inquiry not only broadens data gathering to include students and the community whenever feasible but also focuses data gathering on issues of equity within the school, district, and community.

LeadPAR as a Leadership Framework

What makes LeadPAR unique is that it provides a leadership framework that combines school and community capacity building, participatory inquiry, micro- and macrolevel advocacy, and a social justice orientation. Our aim here is not to promote one more leadership theory, but rather to push distributed leadership theories beyond the school and toward more critical and inclusive notions of learning communities. While most leadership theories in educational administration have a functionalist orientation, there are some that have broken ground in terms of promoting greater democracy and social justice. Foster's (1986) and Bates' (1980) early work opened up the possibility of theorizing educational leadership in more radical ways. More recently, Theoharis (2007) has made inclusion central to educational leadership, defining inclusion beyond special education, but not beyond the school. Woods (2004) and Hatcher (2005) have provided a direct critique of distributed leadership theory and Barros (2010) has critiqued new public management through his notion of emancipatory leadership. Moving outside schools, Ospina and Foldy (2005) have developed a theory of social action leadership that is based on empirical data of social action organizations.

Conclusion

In schools today, parental choice and mayoral control are replacing authentic forms of community input into their schools. The system world of high stakes accountability regimes for both students and teachers has colonized a life world of collaborative internal forms of accountability and community input (Sergiovanni, 2000). A leadership framework is needed that can build on—not undermine—the authentic movements since the 1980s that have led to reculturing schools around norms of collegiality and professional learning communities. The idea of community schools is not a new one. Samuel Everett (1938) promoted community schools in the 1930s and principal Leonard Covello created a community school at Benjamin Franklin High School in East Harlem (Johanek & Puckett, 2007). Some aspects of Geoffrey Canada's Harlem Children's Zone incorporate some aspects of the community school tradition, although typically what remains of the movement today is the client-oriented notion of integrating services through full service schools. There is little attention to the empowering, democratic dispositions that Leonard Covello sought to instill in students. Johanek and Puckett describe how Covello linked being a high school principal to local community organizing and the development of political and civic development in the young adults under his charge.

> Through its behaviors—notably, the East Harlem housing campaign—it modeled the dispositions of engaged public work citizenship. Franklin [high school], especially in its prewar heyday, conveyed "civic ideas" and "civic mindedness" across classrooms. The thought that "we would be able to participate in something bigger than ourselves" was a galvanizing sentiment for many Franklin students (p. 257).

These are precisely the dispositions that atrophy when high stakes testing drives such concerns out of the curriculum and when parents as consumers choosing schools replace the notion of empowered citizens holding schools accountable and viewing schools as central community organizations that belong to them. These civic dispositions cannot be reclaimed if school leaders are trained to be entrepreneurs within a marketplace of industry venders and school choice. Venture philanthropists like Eli Broad have used their personal fortunes for decades to successfully promote this entrepreneurial framework for school leaders (Saltman, 2009). It will be up to progressive scholars and courageous leaders in the field to return us to the tradition that Leonard Cavello pioneered. A PAR framework can perhaps be useful in this endeavor.

Chapter 17
Critical Reflective Practices: Connecting to Social Justice

Christa Boske

Leading for social justice is a highly emotional endeavor requiring courage, integrity, imaginative possibilities, and self-awareness. It is important to also acknowledge the ongoing debate and tensions regarding multiple meanings for *social justice*, what it means to *lead for social* justice, and *pedagogies that encourage and support school leaders to lead for social justice*. The purpose of this chapter is to examine how critical reflection promotes a connective process that precedes meaningful learning centered on a change of self, and ultimately, changing ways of knowing and responding to the world. My voice, throughout this chapter, is that of a school social worker, inner-city school leader, and tempered radical—a marginalized voice missing from debates centered on preparing school leaders for social justice.

Educational leadership is at the center of unprecedented attention. School leaders are often perceived as pivotal players in making systemic changes in the pursuit of equity (Boske, 2011a, 2011b, 2013; Boske & McEnery, 2010; Marshall & Oliva, 2010; Tooms & Boske, 2010). However, for school leaders to have the capacity, willingness, and courage to interrupt oppressive practices, they need to be afforded spaces for renewed discussions, critical self-reflection, and experiential learning centered on broadening, deepening, and enriching their school leadership identity. Such efforts have the potential to provide school leaders with spaces to make shifts in their ways of understanding and responding to those they serve, especially for those who live on the margins (Boske, 2011a, 2011b).

Deepening new ways of understanding and knowing is not an easy process for educators and school leaders. There is a tendency to perpetuate oppressive school practices, because those in positions of power feel pressured to preserve the status quo (Oakes, Quartz, Ryan, & Lipton, 2000). Therefore, the implications of school reform often reproduce rather than transcend societal inequities (Bastian & Greer, 1985).

Those who serve in school leadership positions should recognize economic, political, and social disparities between Blacks, Latino/as, Native Americans, Asians, and their White counterparts *still* remain consistent in the USA, especially within public schools. Those highest at risk of being marginalized in the USA are Children of Color, who disproportionately live in poverty as compared to their White counterparts. Those who live in poverty often experience significant disparities in the number of resources, quality teachers, pedagogical practices, and rigorous curriculum in their schools (see Orfield & Lee, 2005) and live within urban and rural school communities.

School leaders must also have the capacity to scrutinize the complexities of oppression in order to formulate questions that inquire about *whose* interests are actually served (Marshall & Ward, 2004). These examinations appear rhetorical at best. School leaders must understand the influence of larger cultural/political systems in order to advance social justice issues for *all* students. There is growing concern, however, by scholars preparing school leaders. They question to what extent, if any, school leaders are prepared to interrupt oppressive practices and lead for social justice (Lopez, 2003). Some professors and educational administration programs remain ill-prepared to address issues of equity. Considering the long-term disparities that continue to impact the lives of children and families, standing still is no longer an option for scholars and school leaders to commit to understanding how to lead for social justice in public schools (Marshall & Ward, 2004). There is a need for school leaders to internalize values of equity and justice if they are expected to systemically permeate hegemonic school practices. In order to afford school leaders with spaces to uncover ways to engage in practices aligned with social justice work, they need to engage in critically thinking about the relation of self to others, especially those who live on the margins (Boske, 2011a, 2011b, 2013; Terrell & Lindsey, 2009). By deepening their understanding of power and privilege, they can begin to unpack how systems and individuals who work within these systems perpetuate oppressive practices. These spaces afford school leaders with opportunities to reflect on how their sense of self is essential to developing equity consciousness (Boske, 2011a, 2011b; Boske & McEnery, 2012) and how this deepened sense of self encourages them to apply equity-oriented practical knowledge into practice in order to overcome formidable resistance (Marshall & Oliva, 2010; Theoharis, 2007).

What is at the heart of discussions centered on leading for social justice is the need, willingness, and commitment to improve the lived experiences of those who are marginalized—“Social justice, like education, is the deliberate intervention that requires the moral use of power” (Bogotch, 2002, p. 2). The word *deliberate* is the cornerstone for this chapter. As a former practitioner, I often wonder why those who prepare school leaders tend to overlook the significance of *what* knowledge is shared, *how* candidates learn, and *which* learning is used for the purpose of improving the lives of children and families in schools. These questions are rarely raised during college, department, or program meetings, and when they are raised, there seems to be a *deliberate* attempt to dismiss their urgency. Such experiences encourage me to respond to my colleagues by asking *why have transformative pedagogical practices that encourage a change in self omitted from discussions of leading for social justice in schools?*

I contend the first step to engaging school leaders in social justice work centers on critical reflection of both faculty and school leaders. Why? Faculty choose pedagogies that hopefully promote aspiring school leaders to reconsider the way in which they understand and respond to the world around them, especially for those from underserved populations, and school leaders, because they are in need of spaces to understand and apply their understandings to improve the lives of those who are marginalized. Critical reflection centers on *doing* and *being deliberate*—intentional practices centered on being critically aware of how and why presuppositions constrain the way in which people understand, respond, and feel about the world, in addition to revisiting how such assumptions permit inclusive, discriminating, and integrative perspectives in making decisions or acting on new ways of knowing.

Critical pedagogies offer educators spaces to deepen their understanding regarding the well-being of those they serve—the social, emotional, and ecological places children and families inhabit. This process can be played out in multiple ways, which center on increasing awareness and understanding of the lived experiences of marginalized populations. This deepened understanding includes, but is not limited to, addressing decreasing dropout rates for marginalized children (Hodgkinson, 1999), improving school practices for children receiving special education services (Sapon-Shevin & Zollers, 1999), embracing the lesbian/gay/bisexual/transgender/queer (LGBTQ) community in schools (Bochenek & Brown, 2001; Koschoreck & Slattery, 2010; Koschoreck & Tooms, 2009), eliminating the achievement gap between mainstream and marginalized children (Scheurich & Skrla, 2003), welcoming English language learners and immigrant children and their families (López, Gonzalez, & Fierro, 2005; Moll, 1992; Moll, Amanti, Neff, & Gonzalez, 1992; Portes & Rumbaut, 2006), or promoting gender equity (Klein et al., 1994).

Also essential to this understanding the role of critical reflection and leading for social justice is affording spaces for people to engage in recent debates on what social justice *is*, the *role* school leaders play in leading for social justice, and *how* school leaders will contribute to something larger than themselves to improve the lived experiences of those they serve. Some scholars contend social justice is committing to the moral use of power (Bogotch, 2002), while others believe it fosters critical inquiry (Brown, 2004, 2006) and promotes social action (Marshall & Oliva, 2010; Tooms & Boske, 2010).

As school leaders engage in critical reflective practices, they have spaces to become more aware of long-standing issues of marginalization within US public schools. They may also discover aspects of schooling to which they had previously not attended, such as fundamental structural inequities (Darling-Hammond, 2005; Ladson-Billings, 2006), insufficient school funding (Kozol, 1991, 2006), and lack of highly qualified school personnel within urban and rural communities (Darling-Hammond, 2005). As their awareness increases, so do tensions among their sense of self, school leadership identity, and actions taken. Individuals often utilize these spaces to look within and question to what extent, if any, they perpetuate these lived realities for those they serve (Boske, 2011a, 2011b; Boske & McEnery, 2010; Terrell & Lindsey, 2009).

Throughout the critical reflective process, school leaders recognize how often children and families are exposed to the effects of inequities through the perpetuation of hegemonic school practices, which reproduce and reinforce cultural and educational traditions of White, middle-class, English-speaking, Christian, heterosexual communities (e.g., Gonzalez, Moll, & Amanti, 2005; Marshall & Oliva, 2010; Tooms & Boske, 2010). The impact of social justice and equity issues on the lives of underserved populations is so profound that it often encourages those who prepare school leaders to reconsider how their academic content and pedagogy provide spaces for school leaders to recognize, analyze, and respond to systemic inequities in meaningful and authentic ways (e.g., Boske, 2011a, 2011b, 2013; Boske & Diem, 2012; Boske & Tooms, 2010; Brown, 2004, 2006; Ladson-Billings, 2006; Marshall & Oliva, 2010).

Context Matters

The US educational system has a serious crisis on their hands when considering students who live on the margins do not often have teachers who want to teach, students who seem to avoid learning, to learn, and leaders who are not compelled to address the biases that shape their ways of knowing and responding to underserved populations (hooks, 1994). For many students, their world outside of school is vastly differently from the world promoted within public schools, which often expects students to cross specific borders and align their behaviors as such in order to attain academic success (Alston, 2004). These daily border crossings place students in unknown contexts in which they are expected to navigate what they know, what they do not know, and how they will transition from one context to the other, which often leaves students, especially those from marginalized populations, with school practices (i.e., curricular activities, pedagogy, values, beliefs, assumptions) that are not congruent with their lived experiences (Alston, 2004). Overcoming such perceptions entails a shift in thinking how school leaders are prepared. Addressing issues of social justice is paramount to consciously act on ensuring education is just, democratic, and stressing academic excellence for *all* children (Shields, 2003). Leading for social justice requires school leaders to engage in actions that support the learning of *all* children. Their ability and willingness to disrupt unjust educational practices is critical to interrupting oppressive practices (Marshall & Oliva, 2010).

What is needed are school leaders who engage in realistically confronting the lived realities of those they serve through courageous dialogue centered on the grave injustices perpetuated within schools (Grogan & Shakeshaft, 2010). These injustices include multiple exclusionary practices such as post-Civil Rights era disintegration schooling (Horsford, 2010), decreasing dropout rates for marginalized children (Hodgkinson, 1999), improving school practices for children receiving special education services (Sapon-Shevin & Zollers, 1999), embracing lesbian/gay/bisexual/transgender/queer/intersex/ally (LGBTQIA) communities (Bochenek & Brown, 2001; Koschoreck & Slattery, 2010; Koschoreck & Tooms, 2009), eliminating achievement gaps between mainstream and marginalized children (Scheurich & Skrla, 2003), acknowledging and valuing English language learners and immigrant children and their families (Moll et al., 1992; Portes & Rumbaut, 2006), or promoting gender equity (Klein et al., 1994).

Some school leaders hold onto deeply ingrained and dysconscious racial perceptions, which often deem the existing order of things as appropriate practice. Although school leaders may assert their ideologies have good intentions (Shields, 2003), they often become frustrated and point fingers at underserved populations, perceiving their differences as cultural inadequacies (Terrell & Lindsey, 2009). Because these assumptions and beliefs are so ingrained in how school leaders understand and respond to the world, they often fail to recognize how much they structure and shape personal and professional lives (Tooms & Boske, 2010). Deepening their understanding and considering social, cultural, economic, and political contexts will be essential school leaders to address and improve the educational experiences of historically disenfranchised populations (Bogotch, 2002; Boske, 2010; Boske & McEnery, 2010; Marshall & Oliva, 2010; Theoharis, 2007).

School leaders need to draw on their ability to promote a shared vision and actions philosophically grounded in care and relationships (Enomoto, 1997; Starratt, 1991). Addressing these issues will encourage a change in how teachers and school leaders learn, as well as the need to discover ways to utilize schools as spaces for new thinking and growth (Alston, 2004; hooks, 1994). The urgency to promote critical reflection occurs at a time when US public school leaders face increasing demands to eliminate historical achievement gaps between mainstream populations and children who live on the margins (Hoy & Miskel, 2008). Because of these increased demands, they tend to distance themselves from holistic and humanistic approaches to schooling children, which include human stories—conversations with children, families, and teachers about their lived experiences—and fostering meaningful relations between self and others, especially individuals from disenfranchised populations due to race, class, ability (mental and physical), sexual identity, gender, religion, immigration status, and language (see Boske, 2011a, 2011b; Boske & McEnery, 2012). The time has come for school leaders to redefine, recast, and revise notions of otherness, marginalization, and difference in an effort to promote imaginative possibilities and commit to making it better for school communities across the USA, especially for those who bear the social costs of the present (Grogan & Shakeshaft, 2010; West, 2000).

Contemplating What Social Justice *Is*

Sometimes, conversations about social justice center on the dangers of promoting assimilation models with increasing numbers of Children of Color in public schools or on school policies that fail to serve marginalized student populations due to gender, race, class, sexuality, and ability (Marshall, 1993; Marshall & Gerstyl-Pepin, 2005). And other times, these discussions focus on *which* students are served and the long-standing achievement gap between mainstream and marginalized children in public schools (Apple, 1993; Darling-Hammond, 1997; Marshall & Oliva, 2010). The belief that some groups of children are intrinsically more able than other groups of children because of class, skin color, language, sexual identity, and gender is wrong (Marshall & Oliva, 2010; Shields, 2003). School leadership is a powerful intervening variable in determining whether children from diverse backgrounds are successful or not (Reyes, Scribner, & Parades-Scribner, 1999; Scheurich & Skrla, 2003). Examining what it means to lead for social justice opens up doors and puts up mirrors within schools for leaders and faculty to see, which reflects the cotemporary realities lived by underserved populations.

Exploring how school leaders understand the lived experiences of marginalized populations in schools is central to my research. Some of my research centers on the lived experiences of underserved children and families and how to prepare school leaders to improve their lived experiences. This examination is significant to understanding what it means to lead for social justice, because for marginalized populations, individual choices are limited in US public schools, specifically for those who reside in urban and rural communities (see Kozol, 1991, 2006). Long-standing injustices such as this continue to inspire me as a former practitioner and scholar to commit myself to understanding social justice as an evolving educational construct.

Understanding the significance of context is essential to deepening understanding of what social justice *is*. Although my research as well as the research referenced throughout this chapter originated in the USA, findings are transferable to other settings of comparable demographics/profiles and cultural contexts (i.e., if school is a place where young people and adults explore deep understandings of culture and power and where they recognize and celebrate diversity within the community of difference). Those who prepare school leaders will need to continuously negotiate and renegotiate, as well as construct and reconstruct ways of knowing about community, political ideals, history, leadership, and what is meant by the "social justice" within specific contexts. Social justice, most would agree, attempts to build bridges between individuals, groups, and communities (e.g., Merchant & Shoho, 2010; Tooms & Boske, 2010); however, it is a messy and complex process with overarching principles striving for visibility. In an effort to build bridges with these principles in mind, specific stances will take precedence over others and will play a pivotal role in where, with whom, and for whom they are built. Therefore, conceptualizing universality with social justice leadership may be difficult, because individuals or groups advocate for and from their particular viewpoints, which are often embedded within cultural, political, and societal norms.

Leading for social justice is not only context specific; the process of leading in socially just ways also has implications for how school leaders promote this work—leading in transformative ways. Although some people refer to the terms *transformational* and *transformative* as synonyms, there are subtle, but significant, differences between them. Transformational leadership centers on collective interests of groups (Leithwood & Jantzi, 1990) and places the leader at the heart of shared decision making, fostering consensus, and building a productive school culture that encourages participation in school decisions. Words such as *liberation*, *emancipation*, and *equality* are central to transformative leadership, which focuses on exhibiting value-based leadership (Astin & Astin, 2000), working with others toward higher levels of engagement, and advocating morality, in order to foster social justice work in schools (Shields, 2003). The promotion of such practices often raises issues for faculty to consider, including programmatic climate, ability and willingness to address oppressive practices associated with underserved populations, and commitment to engaging students in transformative work in schools (Boske & Tooms, 2010; Brown, 2004, 2006; Marshall & Oliva, 2010; Tooms & Boske, 2010).

Leaders for social justice need spaces to learn how to make connections among significantly improving students' academic achievement, increase critical their consciousness, and respond to underserved populations by engaging in inclusive school practices (Boske, 2013). As school leaders increase their awareness regarding the lived experiences of underserved populations, they describe a deeper sense of empathy, ethic of care, and willingness to take seriously the need to safeguard democratic practices (Boske, 2011a, 2011b; Boske & McEnery, 2010, 2012). Such efforts not only protect those who live on the margins, but they are essential to transformative school leaders engaging and sustaining social justice and equity work in schools (Kouzes & Posner, 1999). It is along these lines critical reflection has the potential of breaking new ground in understanding what it means for school leaders to lead for social justice. This practice calls for those who prepare school leaders to pay close attention to the sensorial—to understanding how ways of knowing and responding to those who are underserved are critically embodied experiences versus a common set of universally understood assumptions, beliefs, and practices. How school leaders make meaning from their lived experiences, what they do with these new ways of knowing, and how others respond to these new ways of knowing are critical to understanding how school leaders make sense of their world. This inquiry is significant to exploring relationships among critical reflection as sense-making and understanding through the senses, which is similar to recent interests discussed in curriculum studies (e.g., Ellsworth, 2005; Gershon, 2011; Kumashiro, 2008; Springgay, 2008; Urmacher, 2009).

Critical Reflection as Sense-Making

People think and learn through multilayered lived experiences. Because we are storytelling organisms who, individually and collectively, lead storied lives, our ways of knowing and responding to the world are essential to understanding the ways people think and learn. Therefore, critical reflection is central to understanding how school leaders understand how their prior ways of knowing are justified under present circumstances they face in US public schools (see Mezirow, 1990). People's lives and how they are composed are of interest to educators and school leaders as well as those who prepare them to serve in schools. Their inquiry tends to center on understanding learning and teaching, how it takes place, as well as undertaking different beliefs, values, and assumptions within diverse contexts in an effort to find links to learning, teaching, and leading. From this perspective, experience is the starting point for understanding people and their relation of self to others and to their environment (e.g., Dewey, 1934, 1938, 1961).

School leaders and teachers concerned with student learning recognize the need to pay closer attention to the impact of the nation's deepening cultural texture, racial tensions, and increasing percentage of students from historically disenfranchised populations (U.S. Bureau of Census, 2010) and the influence such changes will continue to have on the nation's schools, colleges, and universities (Gay, 2010). Scholars—including Sonia Nieto, Geneva Gay, Jeffrey Brooks, Lisa Delpit, Gerardo Lopez, Patrick Slattery, Michael Dantley, Linda Tillman, and Gloria Ladson-Billings—are concerned about the serious academic achievement problems among children and families who live on the margins. Their underachievement calls for systemic, holistic, authentic, comprehensive, and curriculum transformative interventions in US public schools (e.g., Gay, 2010; Henderson & Gornik, 2007; Sleeter & Grant, 2009). This broad-based and systemic curriculum reform requires deeper and more comprehensive analysis of schools, which needs to be collectively addressed with transformative curriculum leaders who focus on raising consciousness (Burns, 1978; Eisner, 1994; Noddings, 1984). Given these connections, my focus here on questions of equity and access is applicable to some strands in the field that not only focus on questions of teachers as leaders (e.g., Henderson & Gornik) but also, and perhaps more importantly, speak to core questions that remain central to curriculum studies (e.g., Kridel, 2010; Malewski, 2009). In sum, the arguments made here regarding school leaders are simultaneously discussions germane to central questions in curriculum studies.

School leaders are not often prepared to engage in transformative curriculum leadership. Instead, they are traditionally trained as managers of people versus leaders who actively engage in deepening their empathic responses and connections with school communities. This chapter seeks to push at utilizing sense-making and artmaking to afford school leaders with spaces to engage in critical reflection. These spaces afford school leaders with opportunities to understand relationships between their sense of self and leading for social justice through the senses—ways in which school leaders perceive their lived experiences and relation to others.

Sense-making is the process by which school leaders draw meaning from their lived inquiries while engaging in complex reflective processes. One means of encouraging school leaders to deepen their ways of understanding is through artmaking and audio/video technology. These play an essential role in critical reflection, because they are possible tools available that provide school leaders with spaces to construct meaning-making through the senses. Such spaces afford them to deepen their ways of knowing and responding to the needs of those they serve, especially for those who live on the margins due to race, class, gender, and other differences from the mainstream. Because of inherent challenges in preparing school leaders to take a more critically conscious stance toward deepening their empathic responses toward children and their communities, especially with issues centered on social justice and equity (Lopez, 2003; Marshall & Oliva, 2010; Tooms & Boske, 2010), school leaders need opportunities to engage in sense-making, by which school leaders give meaning to their experiences (Brown, 2004, 2006).

Utilizing the senses (sight and sound) encourages school leaders to give *feeling to form* and *form to feeling* (Langer, 1953). As leaders *come to know* and *live their inquiries*, which center on social justice and equity issues facing US public schools, their ways of understanding move from the abstract to the *being* and *living* their ways of knowing. The interconnectedness between the senses affords school leaders spaces to create multiple meanings centering on an evolving school leadership identity. They make connections between what they see, hear, and experience by connecting their emotion-laden experiences through artmaking, directly impacting their ways of *knowing* (Langer, 1982). This sense-making process guides them through a process in which their senses transform their consciousness (Eisner, 2002), deepen their understanding of their beliefs and attitudes toward power, and create spaces centered on an ethic of care through imaginative possibilities (Greene, 1995; Noddings, 1984). Therefore, the real significance of learning appears when school leaders begin to reevaluate their lives, ways of knowing, and pathways to remake them. When school leaders engage in reflection on assumptions and predispositions, especially about oneself, their sense-making may lead to transformative learning of self (see Mezirow, 1990).

Programs that emphasize the need for sense-making as a pathway toward transformative leadership require school leaders to engage in critical thought and reflection. This critical reflection emphasizes the need to look within and examine personal beliefs, lived experiences, and cultural identity. School leaders build the capacity to deliver policies and practices that address the lived realities of disenfranchised populations. Sometimes, such transformations include addressing disparities facing Children of Color, school policies that fail to serve marginalized populations (Marshall, 1993; Marshall & Gerstyl-Pepin, 2005), or long-standing achievement gaps between mainstream and marginalized children in US public schools (Apple, 1993; Darling-Hammond, 1997; Marshall & Oliva, 2010).

School leaders who lead for social justice need must come to better understand how to interrupt practices that perpetuate the belief that some groups of children are intrinsically more able than other groups of children due to class, skin color, language, sexual identity, or gender (Shields, 2003). In light of this, the leader in training should be made aware of leadership as a powerful intervening variable in determining whether children from diverse backgrounds are successful or not (Reyes et al., 1999; Scheurich & Skrla, 2003). Such practices encourage faculty to reconsider how programmatic decisions influence curriculum content and pedagogy to foster transformational experiences for school leaders (see Boske & Tooms, 2010). One means of promoting the courage and skill set necessary to sustain social justice and equity work in schools is to provide them with safe spaces to reflect on the impact of sense-making on their school leadership identity.

Although school leaders make meaning from engaging with their environments, those who prepare school leaders have not considered to what extent the senses (i.e., sight, smell, sound, taste, and touch) influence how they understand the influence of the senses impacting community norms, attitudes, and values as preferences. The way school leaders make sense of their environments is derived from these senses, which are embedded throughout school practices, curriculum, pedagogy, and policy. Therefore, sense-making can be understood as a political act, engaging school leaders in assuming that what makes sense to them is but one possible interpretation among a myriad of possibilities.

There is an urgency to deepen understanding regarding how to create spaces in which school leaders promote and address issues of social justice and equity in US public schools. This increased attention is aligned with arts-based principles centered on understanding sensory ways of *knowing*. Artmaking is recognized as an experiential mode of inquiry that reveals insights and ways of understanding that impact our capacities for knowing (e.g., Cahnmann-Taylor & Siegesmund, 2008; Dewey, 1934; Eisner, 2008). Utilizing artmaking for *making sense* of our lived experiences through sensory exploration creates spaces for school leaders to consider their actions and reflect upon their impact (e.g., Ellsworth, 2005; Springgay, 2008). Understanding sense-making as an essential component of critical reflection is significant to furthering the extant literature because it examines ways of understanding through the senses. Specifically, it does so through the use of auditory and reflections in an effort to create spaces for school leaders to shift their sense-making from text to audio/visual artmaking—a formal curricular decision grounded in the recognition of rich meanings and imaginative possibilities embedded in non-text-based, sensual understandings.

Leading for Social Justice Through Bridge Building

Limited extant literature centered on building bridges (i.e., Culbertson, 1995; Tooms & Boske, 2010) alludes to an epistemology in which leaders understand their work as connecting spaces among people, community, and school. Building bridges finds its roots across disciplines including, but not limited to, social and political sciences. The work of Jane Addams (1911), a social worker who opened the Hull House in Chicago, Illinois, in 1889, professed the need for bridge building between those in positions of power and those from impoverished neighborhoods. She contended these bridges were essential to empowering those who lived on the margins through social networking. Furthermore, bridge leadership has roots throughout the Civil Rights era. Grassroots organizations worked diligently to create ties between the community and the social movement for the purpose of transformation. Men and Women of Color worked collaboratively to evoke community, justice, and voices often silenced within the political mainstream. For Jane Addams and civil rights leaders, these bridge-building efforts were transformative stepping stones. Together, they bridged the lived realities of disenfranchised populations and those in positions of power and privilege. These early efforts of bridge leadership utilized formidable barriers between their personal lives and public life as members of organizations to challenge existing relationships with local, state, and societal institutions in the name of social justice.

The urgency to promote bridge leadership comes at a time when US public school leaders face increasing demands to eliminate historical achievement gaps between mainstream populations and children who live on the margins (Hoy & Miskel, 2008). These increased demands place school leaders in spaces in which they are asked to focus on standardized testing, annual yearly progress, and test-taking strategies versus building meaningful connections within the school community. In an effort to pay closer attention to increasing student performance, US school leaders tend to distance themselves from holistic and humanistic approaches in order to meet the needs of those they serve. These needs include what I contend is at the core of leadership—human stories (Boske, 2011a, 2011b). I define human stories as conversations with children, families, and teachers about their lived experiences. These interactions have the potential to foster authentic, meaningful relations between self and others. This is especially critical when considering how to build bridges between self and individuals from disenfranchised populations.

I assert school leaders will need to reconsider how they define, cast, and understand notions of otherness, marginalization, and difference in an effort to promote bridge building. Those who engage in bridge building will need to shift thinking of bridge building as an internal, private, or individual endeavor toward a public movement. Therefore, promoting bridge building as a public movement affords school leaders with opportunities to nest ideas, relations, and actions beyond rigid school community boundaries (Boske, 2013). These new ways of knowing suggest bridge building is a public movement affording people with spaces to collectively attend to imaginative possibilities and commitments. Such efforts encourage leaders to make schools better places for children, especially for those who bear the social costs of the present (e.g., Grogan & Shakeshaft, 2010; West, 2000).

Despite rising standards for excellence and equity, increasing demands on teachers and school leaders, and the push for schools to achieve equal educational outcomes, US public schools are still more racially segregated today than during *Brown v. Board*. Furthermore, public schools have not eliminated long-standing achievement gaps that tend to silence those who live on the margins due to race, class, gender, religion, immigration status, ability (both mental and physical), family structure, and sexual identity (Kozol, 2006; Marshall & Oliva, 2010). Given US schools continuing pressure to serve increasing culturally diverse populations, school leaders will need the knowledge, skill set, and courage to engage in culturally responsive practices that reject color-blind and oppressive ideologies (i.e., Boske, 2012, 2013; Furman & Shields, 2005; Gay, 2010; Shields, 2003; Tooms & Boske, 2010).

School leaders are traditionally prepared to be managers of systems rather than advocates engaging in practices that deepen empathic responses that make meaningful connections with school communities. School leaders who engage in leadership practices embedded in leading for social justice or promoting equity are referred to as transformative leadership (Shields, 2003). These leaders conceptualize leading for social justice and equity-oriented work as more than resistance. Those compelled to making meaning connections between self and others center on liberation, emancipation, and social justice (e.g., Brown, 2004, 2006; Shields, 2003).

Conceptualizing bridge leadership encompasses a myriad of perspectives ranging from (a) engaging in cross-disciplinary and subdisciplinary boundaries to (b) creating spaces in which all stakeholders come together, to (c) internalizing school leadership qualities and dispositions rooted in the commitment to improve the education of all children (Merchant & Shoho, 2010), to (d) embarking on a conceptual exploration for educational administrators and scholars (Culbertson, 1995), to (e) building the capacity for school leaders and communities to work together to improve teaching and learning, and to (f) sharing chronicled narratives of scholars conducting bridge-building work across international contexts within the field of educational leadership (Tooms & Boske, 2010), to creating a common language to forward educational leadership theory. Despite scholars' intentions to center their inquiries on bridge leadership, there are limited spaces for vigorous dialogue and empirically validated conceptual models. School leaders and professors might rethink bridge leadership as an epistemology in which all school community members (i.e., children, families, community members, teachers, and school leaders) understand communal work as being rooted in authentic, meaningful storied connections between people and the spaces in which they live.

School leaders might want to consider experience and meaning-making as a continual process of questioning ways of knowing, the way in which knowledge is constructed, evaluated, and used (Boske, 2012, 2013; Cochran-Smith & Lytle, 2009). Building bridges centers on understanding learning and teaching. It also emphasizes the need to reconsider how to build bridges when considering different beliefs, values, and assumptions within diverse contexts. The goal of building bridges centers on discovering links between learning, teaching, and leading. Recognizing experience as the starting point for understanding bridge leadership for school leaders and their relation of self to others and to their environment is central to broadening understanding of this working concept.

Bridge building connects self and others. It is duo directional, because the process encourages school leaders, faculty, and communities to facilitate authentic responses among self, school, and community. Throughout bridge building, relationships are nonhierarchical, which suggests one group does not possess more power than another. Together, groups work diligently to uphold democratic practices, honoring the rights of those they serve and advocating for those who have been silenced. Bridge builders work collectively to respond authentically to the needs of children, community, and school. Those who construct, extend, and sustain the bridge are committed to meeting the needs of the community at large.

The strength of the bridge depends on an individual's ability, willingness, and capacity to empathically respond to making schools better places for all children. To do this requires bridge builders to rethink what it means to authentically make connections between self and others and to meet the needs of the community through collective meaning-making. This process involves the creation of spaces in which members deepen their ways of knowing and responding to the world. The concept of meaning-making builds on fields such as anthropology, sociology, and other social sciences. At the core of meaning-making is the belief people constantly seek to understand the world around them. The imposition of meaning-making functions as a site of contestation—the moral understandings of what is right and wrong, true and false, what is alike and different, as well as social understandings of identity and difference, what is deemed attractive and appalling, and any other understandings to identify meaning-making.

This collective action informs bridge builders' values, beliefs, and purpose for their work in schools. Therefore, the act of bridging reframes the work done in schools by using bridges as opportunities for personal, school, and community growth. Engaging in bridge building relies heavily on the concept for collective actions, collective identity, and collective understanding for empowerment. The bridge affords builders with a sense of their surroundings, what their surroundings mean, the influence of the structure, and how the structure affords multiple worldviews. Building bridges affords people the capacity to enhance the way in which people understand, build upon, and improve the lived experienced of others. This concept suggests building bridges is ever changing. It is a process that is available to function as a social movement. That is, from the point of a bridge builder, the way in which their collective actions make sense and are shaped by the ideas of the organization, its members, and larger context that are meaningful within a given situation.

Bridge building may be of particular interest to those interested in understanding collective meaning-making, extensions of self and others, and developing meaningful connections as a process that foregrounds resistance to the dominant norms or ways of being (Boske, 2012, 2013; Tooms & Boske, 2010). Those involved in the process may raise questions about the capacity for imaginative possibilities including alternative ways of knowing and doing in schools. These bridges offer spaces to challenge builders to rethink meanings, interactions, and ways of knowing that are often taken for granted. This suggests bridge building is a social movement, a way to engage school leaders, communities, and faculty in actively making meaning to challenge established meanings, ways of knowing, and ways of responding, especially toward marginalized populations (Boske, 2012, 2013).

The bridge suggests the need for building a new generation of scholars and practitioners toward a social movement. Such efforts encourage dual loyalties to both the field of educational leadership and activism in schools. It is therefore perceived as a social action or public movement. School leaders, teachers, and faculty, who have the capacity to function as bridge builders, are in pivotal positions to engage local communities, marginalized populations, and organizations in emerging as intensified movement centered on issues of justice (Boske, 2013). Their personal histories are vital to understanding the repercussions of their wakefulness. Their emotional responses are critical to deepening empathic responses and moving in ways that are authentic and meaningful. How school leaders and those who prepare them understand the complex process of identity formation influences how individuals come to understand the world and build a unique constellation of lived experiences that thematically link their ways of knowing and responding across issues such as race, class, gender, and otherness. Their narratives play a critical role in understanding the construction and reconstruction of their lived realities. Bridge building urges those who engage in this type of work to increase their consciousness, their wakefulness, and their awareness of cultural, historical, economic, and political contexts. They become catalysts interested in utilizing their new ways of knowing and responding to make transformative changes in schools (Boske). Bridging emphasizes the need for those who lead to be aware of the power of story selves, and how stories give voice, and, in some cases, silence nameless others who have impacted the way they see the world. The position here is that there is an inherent logic, ideal, and purpose in bridge building. The process involves transforming frames of reference through critical reflection, bridging, and sense-making.

Sense-Making and Leading for Social Justice as a Catalyst

How we think and learn through multilayered lived experiences. Because people are storytelling organisms who, individually and collectively, lead storied lives, our ways of knowing and responding to the world are essential to understanding the ways people think and learn. My current research centers on school leaders' notions of making sense not only centers on deepening understanding of sensory exploration, they also engage in actions aligned with revelations from their reflective processes (Boske, 2012). These new responses encourage understanding the interconnectedness between sense of self, school practices, and impact of responses (Schön, 1983). Understanding the implications of this reflective process ranges from using text as a way of knowing to understanding the significance of sight and sound to deepening their beliefs as school leaders. These spaces serve to uncover the influence of lived experiences as well as marginalized voices through storytelling (Barone, 2002). The process functions as a release, promoting imaginative possibilities centered on understanding their role in interrupting oppressive school practices (Greene, 1995). In these ways, sense-making pushes students' rigid conceptual boundaries of what it means to lead to understanding how their senses influence their ways of knowing, recognizing structural inequities, and ability to challenge cultural and educational superiority of the dominant culture (i.e., White, middle-class, English-speaking, Christian, heterosexual communities) to interrupt oppressive school practices (Gonzalez et al., 2005; Marshall & Oliva, 2010; Tooms &

Boske, 2010). The impact of sense-making transforms their school leadership identities from narrowly defined roles, attitudes, and beliefs to new ways of knowing and responding to the world, especially for underserved populations.

My current research centers on understanding the intersections of critical reflections, sense-making, and school leadership identity encourage school leaders to identify themselves as catalysts to actively engage in improving the lives of underserved populations. This process-oriented growth model builds on extant literature centered on promoting social justice (e.g. Blackmore, 2002; Bogotch, 2002; Dantley, 2002; Larson & Murtadha, 2002; Marshall & Oliva, 2010; Marshall & Ward, 2004) and examines the degree to which school leaders embody new ways of knowing and responding to those who live on the margins by measuring the impact of lived experiences, which are embedded within social justice-oriented work. What emerged from my current research (see Boske, 2012) was the significance of school leaders internalizing themselves as catalysts who developed the capacity, ability, and determination to interrupt oppressive practices within their school districts. School leaders understood the impact of repressive conditions on their ability to promote such work and the need to transform themselves and practices in a critical sense (Kincheloe & McLaren, 2005; Lather, 1986). The process of employing a catalytic perspective began with school leaders who believed social justice and equity *were* possible and that their journey toward engaging in such work began from within. This comprehensive critical reflective process transformed school leaders' sense of selves from managerial roles to advocates, to activists, and to catalysts for systemic change. I named this self-transformation as internalizing a *catalytic perspective.* The naming suggests this process employs a self-examination that offers new ways of understanding and responding to the world all in an effort to align continuously evolving school leadership identities with social justice work.

The degree to which school leaders deepened their understanding of self and ways in which they experienced these transitions was essential to their reflective experience and transformation. Developing a catalytic perspective was a continuous process. School leaders renewed their leadership identities through actively engaging in social justice work in schools. This holistic growth-oriented process encouraged school leaders to cultivate new multidimensional school leadership identities (see Terrell & Lindsey, 2009).

The process of undergoing self-transformation is rooted in scholars such as Jack Mezirow (1990, 1991, 1997, 2000), who conceptualizes critical reflection as knowledge. He focuses on the need for transformative curriculum, which centers on *how* decisions are made, emphasizing the need for learning to center on self-understanding, social reconstruction, and engaging in pedagogical actions that reconceptualize school practices. Margaret Wheatley (2006) also offers a lens for understanding transformation by describing the creation of new identities through an intimate engagement with *disorder*. This disorder emphasizes the need for catalysts in order to establish *new* order, which, in this case, is deemed necessary to awaken imaginative possibilities. Furthermore, bell hooks (1994) also asserts people as catalysts "confront one another across differences means that we must change ideas about how we learn; rather than fearing conflict we have to find ways to use it as a *catalyst* for new thinking, for growth" (p. 113). And Patti Lather (1986) emphasizes *catalysts* serve as a lens to understanding the validity of meanings in human interactions.

These ways of understanding suggest *catalysts* have the potential to be the indicators of personal transformation. Because school leaders identified their lived experiences as *catalysts* (Boske, 2011a, 2011b), they are, in turn, inherently valid. The catalysts served as spaces for school leaders to "retell" their newly lived experiences through both reflective and reflexive experiences. The "retelling" or "restorying" of their school leadership identities indicated a transition from old school leadership identities to newly shaped school leadership identities. Because identities are shaped by how school leaders interpret and internalize their catalysts, school leadership identities can be understood as being constructed within a story-shaped world (see Boske, 2011a, 2011b). This understanding supports the notion that school leaders' lives are also storied and narratively constructed, emphasizing the need for school leaders to deepen their understanding of the interconnectedness between their professional identities and their work toward promoting social justice and equity in schools.

Concluding Remarks

One defining condition of being human is the process in which we come to understand our world through experiences. For some school leaders, we learn to make individual interpretations versus acting solely on the purpose, beliefs, and judgments of others—which frame a reference for understanding, meaning-making, and bridging oneself with those we serve. It is precisely through this complex integration of sense-making, self-transformation, and catalytic perspectives we come to understand what it means to embody critical reflection. Such spaces afford school leaders with opportunities for critically questioning and interrupting assumptions, beliefs, and practices centered on leading for social justice. In doing so, critical reflection work replaces the *doing* of traditional school leadership managerial work with *being* sensual. This new focus stresses to explore what seems most familiar with new lenses that render renewed visions and imaginative possibilities. Critical reflection is essential to expanding a school leader's self-consciousness, basic worldviews, and specific capacities of self for transformation. Through this process, school leaders begin to explore what it means *to understand*, *to become*, and *to know* social justice work.

Chapter 18
Projects from the Heart: For Educational Leaders

Lourdes Diaz Soto

May we do work that matters (Anzaldua, 2005, p. 102).

Introduction

Projects from the heart (Soto, 2010) are transformative projects with ameliorative intentions. Projects from the heart are capable of leading to social justice and moving away from oppression and becoming living testimony as the practice of freedom. The purpose of this essay is to provide examples of projects from the heart with related theoretical underpinnings while highlighting sister fields that have taken up the work of decolonizing and reconceptualizing in order to move closer to the work of social justice.

Taking an opportunity to reconceptualize and decolonize, a field can be challenging and can appear insurmountable. However, when transformative projects and imaginative possibilities are respected, the possibilities are endless. Several fields including early childhood education (see Chap. 60 by Nicholson, this volume) and social work (see Chap. 17 by Boske, this volume) have reflected and taken stock of their current condition in order to highlight the need for projects reflecting social justice. Social work has been at the forefront of the project by infusing its mission and ethics statements and by its willingness to work collaboratively within community.

The field of social work (Denzin 2002) has taken up this work of reconceptualizing on behalf of social justice. The field is clearly intent on ameliorative intentions. The primary mission of the social work profession is to enhance human wellbeing and help meet the basic human needs of all people, with particular attention to the needs and empowerment of people who are vulnerable, oppressed, and living in poverty.

An historic and defining feature of social work is the profession's focus on individual wellbeing in a social context and the wellbeing of society. Fundamental to social work is attention to the environmental forces that create, contribute to, and address problems in living.

An excerpt from the Code of Ethics of the National Association of Social Workers states in part

> Social workers promote social justice and social change with and on behalf of clients. 'Clients' is used inclusively to refer to individuals, families, groups, organizations, and communities. Social workers are sensitive to cultural and ethnic diversity and strive to end discrimination, oppression, poverty, and other forms of social injustice. These activities may be in the form of direct practice, community organizing, supervision, consultation administration, advocacy, social and political action, policy development and implementation, education, and research and evaluation. Social workers seek to enhance the capacity of people to address their own needs. Social workers also seek to promote the responsiveness of organizations, communities, and other social institutions to individuals' needs and social problems. (Approved by the 1996 NASW Delegate Assembly and revised by the 2008 NASW Delegate http://www.socialworkers.org/pubs/code/code.asp)

The mission of the social work profession is rooted in a set of core values. These core values, embraced by social workers throughout the profession's history, are the foundation of social work's unique purpose and perspective:

- Service
- Social justice
- Dignity and worth of the person
- Importance of human relationships
- Integrity
- Competence

This constellation of core values reflects what is unique to the social work profession. Core values, and the principles that flow from them, must be balanced within the context and complexity of the human experience.

For the field of early childhood education, Soto and Swadener (2002) shared the struggle:

> As we begin to leave the scientifically driven epistemologies as the grounding for early childhood education, we can begin to pursue more personal, liberating, democratic, humanizing, participatory, action-driven, political, feminist, critically multicultural, decolonizing perspectives. How we summon our imaginations to formulate, envision, and implement a liberating praxis that integrates theoretical understandings, critique, and transformative action will help determine what happens to young children growing up in a postmodern context. As we begin to recognize that ours is a struggle toward humanistic and emancipatory goals, we can also begin to chart a path of solidarity that, as Paulo Freire (2000) noted, is dialectical, moving from action to reflection and from reflection to new action. (pp. 51–2)

Relations to Educational Administration

The question here is how do these political, ethical, and aesthetic core values relate to the field of educational administration? In a historical overview of educational administration since the 1960s, Oplatka (2008 and Chap. 2, this volume) identifies salient periods and scholars who have contributed to the field's inquiry, theory, and practices. The 1960s is portrayed as a time when the social sciences and their accompanying methodologies were glorified. In the 1980s, there was a call for attention to more educational topics and an expansion of the field's boundaries. The 1990s brought topics such as policy studies, learning and teaching, and leadership helping the field to define its purposes more clearly. Nevertheless, Oplatka concludes, "Fifty years of scholarly writing and the many dusty periodicals reviewed show we have not removed many of the field's stumbling blocks (p. 28)."

Hart (1999) claims that perhaps "those who work with and study the children of others will never be able to be revolutionary, but will continue to care deeply about educational outcomes… (p. 333)." With all due respect, I would like to add, that at this historical moment, caring is not enough! What we are calling for is transformative, public, and critical professionals who can continue to better the human condition.

> In my view, the current battle about how to prepare student for life in the twenty first century revolves around question of the degree and significance of human differences, whether change or stasis is the natural state of society, and to what extent struggle shapes the course of human events (Rosaldo, 1993, p. 224).

Bogotch (2000) shared his vision for educational leadership as "a deliberate intervention that requires the moral use of power (p. 2)." He challenged the field to integrate social justice as an integral part of the practices of educational leadership, while Marshall's (2004) introduction to a special issue of the *Educational Administration Quarterly* challenged the field to take an activist and prosocial stance. She stated, "Traditional training for educational leadership reflects a culture that has marginalized issues and concerns of social justice (p. 4)." Theoharis (2007) argued that the social justice leader goes beyond good leadership by recasting good leadership as "leadership for social justice." For some of us, rethinking and reconceptualizing the field of leadership in this manner with ameliorative intentions can only help to enhance, if not also transform, leadership projects.

Theoharis found that the principals related that preparation programs did not help them to understand how to lead for social justice. Similarly, Brown (2004) observed that current models of preparation are not able to prepare educational leaders "who are conscious of and committed to diminishing the inequities of American life (p. 81)." Brown recommended alternative approaches focused on skill and attitude development based on a tripartite theoretical model. Relying on Henry Giroux and Christine Sleeter, she maintained that "[t]hese are transformative intellectuals who are both active, reflective scholars and practitioners who engage in political interests that are emancipatory in nature" (p. 99). While it is evident that the educational leadership scholars highlighted here have not been afraid to cite multiculturalists and curricular theorists, the same cannot be said for critical theorists, curricular inquirers, special educators, early childhood educators, and others outside of educational leadership who fail to cite educational leadership. How might we – all educators – begin to learn from one another inside education? How might we immerse ourselves in "borderlands" activities?

One suggested way comes from Gloria Anzaldua:

> Necesitamos teorías that will rewrite history using race, class, gender and ethnicity as categories of analysis, theories that cross borders, that blur boundaries – new kinds of theories with new theorizing methods (Anzaldúa, 1999, p. 25).

Symbolically, the borderlands represent a third space that begins to inform our work as educators. As educational colleagues in the borderlands, we begin to view the larger sociocultural perspectives and provide our sister fields with possibilities that we may not have dreamed about before or on our own. The idea here is to revisit our "dreamspace of social justice and equity" because it matters not what our specialized fields may be, but rather what matters is our work on behalf of learners in societies.

In 2007, I asked,

> Can we envision an early childhood education that is liberating, anti-racist, feminist, critical and revolutionary? We can no longer afford to allow the sacred Western lenses to "govern our very souls". Our experimental and newly evolving paradigms will mean that we are traveling creative paths, as architects, as builders, as wisdom keepers, as healers who discover build and chart newly liberating spaces of hope and possibility. … Only when we dream our dreams in solidarity will our with multiple voices will diverse children, families, and communities experience social justice and equity in our lifetimes. (Soto, 2005, p. 208)

Shields (2004) acknowledged the complexities faced by educational leaders and proposed a transformative leadership model based upon dialogue and strong relationships that afford children opportunities for learning in socially just and democratic communities. She observed how the "blame game" and essentializing "others" have led to pathologies of silence. She called for acknowledging the wide variety of lived experiences. Citing Astin and Astin (2000), Shields emphasized how transformative educational leaders "believe that the value ends of leadership should be to enhance equity, social justice, and the quality of life (p. 11)."

My reading the "word/world" (a la Freire), as a scholar in a sister field, is that leaders and early childhood educators are exploring similar territory and that as the poet reminded us, we can organically build our road as we are walking on it:

> "Caminante, son tushuellas el camino y nada más;
> caminante, no hay camino, se hacecamino al andar."
> Antonio Machado, "Cantares."
> http://www.poemhunter.com/poem/cantares/

We face formidable challenges, yet we are clinging to outdated and unrealistic constructions of representations within an elitist western canon, while at the same time, we are beginning to notice multiple forms of oppression, issues of power, and the politics of our fields. There is ample evidence that decades of western ways of seeing the world have not led us to a more peaceful society. "How we address our concerns … will determine the kind of world we create".

Is social justice and educational administration mutually exclusive? Karpinski and Lugg (2006) ask this question and comment:

> Contemporary educational administration seems almost rife with concern for issues of social justice. In hope of ensuring better academic and social outcomes for all students, today's principals, superintendents, and especially researchers are exploring the historically

> neglected issues of race, ethnicity, religion, sex, gender, sexual orientation, dis/ability, and class as they relate to the welfare of children and their public school experiences. (p. 278)

Yet they also note that educational administration has historically been at odds with social justice if not totally in direct opposition. They recount the struggle of J. Rupert Picott who embraced social justice, while his colleagues clung to Ellwood P. Cubberley and other "founding fathers." Cubberley (1919) himself is cited as stating that "one bright child can be worth more to the National life than thousands of those low mentality (cited in Karpinski & Lugg, p. 279)." The goal of "leading for social justice," Karpinski and Lugg note, is a departure from the history of a profession that clung to hierarchical and business models. J. Rupert Picott demonstrated courage while working during the Jim Crow, Virginia, thereby disrupting the Cubberley model. He became a true leader for educational equity and an advocate for justice. He developed a network of allies in both the African American and Anglo American communities. The legacy of managerialism and the current calls for accountability and economic competitiveness will certainly challenge proponents of social justice and equity today, but is it a greater challenge than what J. Rupert Picott faced?

Our willingness to cross boundaries leads us to a brilliant piece by Blakesley (2010) who exemplifies the possibilities for educational administration research (and other fields) as it draws away from Eurocentric conceptions that have limited the roles that gender, race, and culture play in leadership. Blakesley relies on storytelling as an insightful tool for understanding the indigenous Yukon context. He demonstrates hope for what he refers to as a dynamic field as he recounts how identity has been marginalized in educational leadership programs that have emphasized management and administrative aspects. Citing Murphy (2002), we can understand how school leaders have been miseducated at research universities that have constructed programs at the "warehouse of academe" (p. 16). Examining the transformative nature of learning, Blakesley cites Mezirow, Freire, and Brookfield, adult education scholars, who have contributed to our understanding of transformative learning. The storytelling tool used in this study reveals a method of reaching spaces of transformative liberation that may serve as a guide to the field.

As educational scholars continue the journey of crossing borders, we can find inspiration in Patti Lather's (1991, 1993); (Lather and Smithies, 1997) impressive scholarship, demonstrating the idea that social and educational inquiry can have ameliorative intention. She has taught us that as inquirers, we can contribute to improving people's existing and future lives. As scholars, we can no longer afford to sit as ossified mannequins and limit ourselves to speaking to other professionals. Our silence will only support the continued draconian neoliberal and global hyper capitalistic policies that are impacting learners' and families' daily lived reality.

Examples of Projects from the Heart

What will it mean if we move from ameliorative to transformative projects? What challenges will we encounter?

In Nashville, Tennessee, scholars crossed borders to a community action research project with a nonprofit human service organization that blended ameliorative and transformative approaches. The ameliorative project focused on intervention with families and individuals while the transformative project moved to include systems in the community affecting personal, interpersonal, and collective wellness. These scholars model for us both the ameliorative and the transformative aspects so that we, too, may begin to reconceptualize schooling that meets both needs of individuals and also includes a more macro perspective of community needs (Evans & Hanlin, 2007).

Within the field of school leadership, Radd (2008) described research dilemmas she encountered while analyzing the data from observations, reflections, memos, and interviews conducted with school leaders who led with a social justice agenda. This study highlights the need for inclusivity in theoretical orientations as the researcher began with a Marxist lens and found that Dewey's pragmatism was also helpful in analyzing the data. The analysis demonstrated that the leaders interviewed were committed to anti-oppression, supportive network with like-minded allies for decision making, and the effective leaders saw themselves as leaders with agency. Even when school leadership is reduced to technical tasks and managerial duties, the "school leaders for social justice can and must imagine and use methods that engage our most deeply held ideals for human connection, interaction, and learning (p. 285)."

Elements of Projects from the Heart: A Critical Genre

Neutrality and objective perspectives no longer serve a complex context that is increasingly demonstrating its inhumanity. Remembering Howard Zinn's documentary, "You can't be neutral on a moving train" (June, 2004), may help us to reconsider our current situation. Who stands to benefit from so-called "objective" stances that do not voice the indignation about the current state of education (or lack thereof), the demonization of educators, micro–macro racist projects, marginalization of "others," and increased profits for the "haves" with blatant poverty for everyone else? Who will continue to line the dusty shelves of our libraries with their scholarship and who will you take up the courage to ameliorate, eliminate, and transform oppressive dehumanizing situations?

Transformative projects, projects from the heart, are those that can improve the human condition for our learners, teachers, and families. By pursuing issues of social justice and equity, human rights, families' well-being, we can begin to present a differing perspective of daily lived realities. Bell Hooks noted, "The moment we choose to love, we begin to move against domination, against oppression. The moment we choose to love, we begin to move toward the freedom to act in ways that liberate others and ourselves. That action is the testimony of love as the practice of freedom" (p. 163).

Our critical genre continues to move away from paradigms that have encouraged the objective, the essentializing, the distant, and the abstract. Ruth Behar (1996) in her book (from the field of anthropology) describes the process and projects that helped her to recognize what it means to be a vulnerable observer and how to deal with anthropology that breaks your heart: “Call it sentimental, call it Victorian and nineteenth century, but I say that anthropology that doesn’t break your heart just isn’t worth doing anymore” (p. 177). These “critical genre,” “projects from the heart,” involve deep transformative processes which include our (a) ethics, (b) self-conscientization, and (c) the struggle with ideology. These three areas are paramount in this historical context if we are serious in our quest for social justice. First, our ethics is a component of solidarity comprised of our basic moral compass, our better nature, that leads us to choose this profession in the first place. Secondly, Freire’s (2000) notion of self-conscientization helps us to examine our privileged existence as scholars, our world view, an honest intention to better understand the world and the word, and to move beyond our colonized minds. Finally, the struggle with ideology, in our present historical context, can guide us to see beyond mean-spirited draconian agendas and thereby pursue the betterment of the human condition.

We can rely on theories that include solidarity and social action in liberating collaborative spaces. In the past, I have called on teacher educators (Soto, 2009) to extend social action projects that include community within a framework of participatory action research. More specifically, I share the evolution of what I term “critical emancipatory mezcla (hybrid) praxis” as well as accompanying examples of several hope-filled projects graduate students and I have pursued over a span of 8 years in New York City and Texas. The idea of mezcla (hybrid) can also be related to Kincheloe and McLaren’s (1994) descriptions of “bricoleurs” as we carefully choose a mix of methodologies and analytical tools to make sense of our work. “In the active bricolage, we bring our understanding of the research context together with our previous experience with research methods (p. 317).” This is a reflexive process that includes not only looking at ourselves in the roles of researchers and practitioners but also in an equitable dialogue with community.

Affording opportunities for the practice of freedom within the context of teacher education and educational administration can lead to projects that are humanizing while at the same time reaching for Freire’s (2000) notion of concientization (consciousness raising). This means engaging in continued, deliberate, consistent, persistent praxis helping educational-social action projects to emerge from a feminist decolonizing perspectives that respect existing linguistic-cultural-socioeconomic traditions of our community members.

Remembering

In this section, I will relay projects that my students and I have designed and implemented with social justice as our focus.

In Austin, Texas, my graduate students and I embarked on a journey that led to the publication entitled “The xicana sacred space: a communal circle for educational researchers” (Soto, Cervantes-Soon, Villareal, & Campos, 2010). For us, the Xicana Sacred Space functioned as a decolonizing tool capable of displacing patriarchal and Western linear notions of research. We found the ability to reclaim indigenous ways of knowing while working in conjunction with the mestiza consciousness (Anzaldúa, 1999). The piece explained how the Xicana Sacred Space evolved in a higher/teacher education context and held possibilities as a method or tool in participatory action research. Our experience taught us about the importance of Freire's (2000) notion of conscientization and Delgado Bernal's (2002) notion of cultural intuition. We also learned about the importance of examining positionalities/standpoints as well as how to strengthen scholarship among those of us interested in conducting decolonial, emancipatory, and feminist research. Anzaldúa's call for new theories with new theorizing methods was the starting point for our journey.

This feminist epistemology examines the influence of border crossing issues on immigration and migration, language, and power. It validates the mestiza consciousness of living in hybrid cultures, races, languages, and spiritualities while navigating competing powers. In the same way, scholars interested in working with communities can place the particular community at the center as experts of their own experiences. Our society can no longer continue to choose stereotypical children's identities, as hybridity becomes the norm.

In the "Xicana Sacred Space," we propose that the idea can be used by others as a collective pedagogical tool or research method. Inserted into projects with emancipatory and decolonial intentions, the xicana sacred space may lead to powerful possibilities. Resembling indigenous circles (Smith, 1999), the sacred space displaces androcentric and Western, linear notions of research, reclaiming indigenous and organic ways of knowing. This has been our idea of a collective third space that can have ameliorative intentions. Gloria Anzaldúa and Cherrie Moraga (1981) elaborated on the emergence of a third space feminism in which there is a "diversity of perspectives, linguistic styles, and cultural tongues" (p. xxiv). This third space has a decolonizing goal capable of raising conscientization (a la Freire) embraces hybridity and unites forces against oppression.

In New York City, my students and I found that one of the more blatant examples of the need for social justice was the catastrophic incident of 911. This became a moment where graduate students and I were teaching in New York City (Soto, 2005) and had to move beyond transformative intellectuals to becoming transformative healers. In our Freirian seminar, we relied on Freire's (1985) idea that "to transform the world is to humanize it." We struggled with the curriculum, with children's depictions of 911, and teacher narratives. The space of transformative healers integrated the complexities of the self which included the intellectual, the emotional, the physical (the body), and the spiritual nature of our own beings. This space required that we reach out to each other, to ourselves, and to others in a moment of love and compassion. The teachers were summoned to engage their courageous wisdom to deal with the tragedy as it affected themselves, children, and the local and international communities. Their deep love and compassion helped them to best meet the needs of the children they were teaching every day in their classrooms.

Most of this work has included "projects from the heart" especially when working with young children (Soto, 2002; Soto & Garza, 2011; Soto & Lasta, 2005). The first modest slice of work took place in Steeltown, PA, where 13 young children drew pictures and described their perceptions of what it meant to be bilingual/biliterate. Their drawings and conversations led me to understand altruistic feelings from children who described the "gift of bilingualism" as affording the possibility to help family members and others. In New York City, we gathered drawings and conversations from 4 to 5-year-old kindergartners who demonstrated Alfie Kohn's (1992) idea of the "brighter side of human nature" when the major theme of the desire to help others emerged. Tracy, a 4 year old told us, "It feels nice (to help someone) … sometimes if feels a little cold in the inside and hot in the outside … that way you make them feel better … I found it all by myself" (Soto & Lasta).

In a more recent slice of this work in South Texas (Soto & Garza, 2011), we interviewed fifth graders in the hopes that their voices could help to inform teachers and policy makers about the needs of immigrant children. In their drawings and conversations, the children surprised us with their knowledge about immigration, the historical context, the family struggles including deportations, the dangers associated with immigrating from *Mejico*; they understood issues of power and questioned elements of historical freedom. They shared their hope, filled with possibility of sharing power. They understood the historical elements of colonization.

Miguel told us,

> I saw the movie, "A day without a Mexican"… Food starts lowering because there are no Mexicans to pick the food. No more houses being built and there is nothing to eat…. Immigration is not only messed up, but also screwed up…. Sure mess with the people that do most of the work … to make matters worse they cross the river, walk through a desert and risk their lives just to get here … in a free country. Miguel Z. (Soto & Garza, 2011)

The children inspired me to write a piece recently, entitled, "Latina/o Hope" (Soto, 2011) viewing the immigration experience from a variety of lenses. Perhaps our biggest challenge to date is to decolonize our minds. Poka Laenui (2000) teaches us about the process of decolonization with the goal of action-reaching consensus, "The process of colonization and decolonization deserves closer consideration in attempting to refashion societies. Otherwise, we may find that we are merely entrenching ourselves deeper in the systems, values, and controls put in place by the colonizer (p. 157)."

Conclusion

We are standing in the seventh moment according to Denzin and Lincoln (2000). They describe the possibility of imagining a new future as we note that we are not the only scholars calling for more responsive scholarship. In our case, how we view praxis and how we translate the idea of projects from the heart will depend on many variables including the complexity of the field, the culture of the field, and the willingness ("ganas") to undertake such projects. It may mean differing visions for different players as well as differing theoretical lenses and ideologies.

As we summon our imaginations to consider the complexities of schooling and education, we can begin to understand the dialectical process that includes our own understandings, our ethical understandings, and our abilities to forge deep human connections that will provide clarity for building new paths. The dialectic process can guide the possibilities for our creativity leading to transformative and liberating projects. By reflection, action, and reflection (Freire, 2000), the process becomes continuous and evolves organically based upon the needs of our community. In humility, we can ask for what is needed and, with a soft touch, act as consultants and fellow workers in solidarity.

Going forward, Pepa (2011) proposes a method for transformative research which includes five distinct steps: first, translation, the propositionalization of a phenomenon/event; second, hermeneutics/interpretation, the abstracting intellectualization of phenomenon/event; third, analysis, an investigation into the salient components; fourth, pragmatization, operationalization into the human experience; and fifth, evaluation, assessment of the transformative worth of the project. This multi-procedural cycle of progression, according to Pepa, can lead to transcendence and renewal.

The faces of educational leaders vary tremendously from principals to superintendents, to teachers, to scholars, and to policy makers with issues of power at the forefront. Considering the ideas of transformative projects (projects from the heart), however, initiated by educational leaders can have far-reaching effects. The interdisciplinary possibilities are endless. Keeping in mind the idea of ameliorative intentions can help us to reach a space that will change the face of contemporary education. The challenge to engage in transformative projects, projects from the heart, is yours. How might a liberating praxis benefit the daily lived realities of children and families? How can educational leaders implement social justice projects that will improve the lives of others, that will address issues of equity that will demonstrate our love for each other first within the fields of education and then outside with our communities.

Part III
Leadership for Social Justice

Chapter 19
Leadership for Social Justice Education: A Critical Transformative Approach

Carolyn M. Shields

As we think about the topic of educational leadership and social justice, we must first acknowledge that each of these concepts is what some have called a "shifting signifier." The definitions and connotations vary widely and shift constantly. And yet, at a time of incessant calls for educational reform, for new structures, programs, and standards, the role of the educational leader often seems neglected in the discourse. In this handbook, our premise is that educational leadership is critically important. Moreover, we believe that there is no "one size fits all approach," and no "one best model" that will hold true in all times and all places. At the same time, there are some essential principles which we have learned can make or break a leader's work to transform schools to adequately (and excellently) serve all students.

Thus, with most of the scholars whose work is represented in this handbook, we are convinced that context matters. Educational leaders might operate differently in a homogeneous and relatively wealthy community than they do in a highly diverse, relatively impoverished community. The former might pay considerable attention to parents' booster groups; to attending community activities, extracurricular or sporting events; and generally to showing support for what is already occurring in the school and/or community. The latter, in addition, will need to attend to the provision of breakfast or lunch programs, to provide a safe and structured approach that offers stability to many students whose home lives are chaotic, and to ensure that teachers hold all students to high expectations while, at the same time, being sensitive to diverse cultural backgrounds and expectations. Thus, just as the role of the leader differs from place to place, so does the emphasis on social justice. In an affluent community, the leader may find herself challenging entrenched power and privilege and a sense of entitlement that is often present while the leader's task in a less

affluent area might focus on the elimination of deficit thinking. Both are essential if we are to work to eliminate social injustice in the world.

As a starting point, in today's climate of high stakes testing and increased accountability in many countries, educational leaders must ask themselves if they are satisfied with the status quo. They must ask whether the schools in which they work are actually meeting the needs of all students, whether they are writing off certain groups of students who come from historically less dominant socioeconomic, religious, or ethnic groups or whether all students are actually achieving to similar high levels. Then, educational leaders must ask themselves whether they want to maintain the status quo, introduce educational reform, or actually *transform* their schools.

Theoretical Considerations

As one reflects on the answers to the above questions, one's thoughts of necessity turn to reflection on the nature of the leadership necessary, and one quickly becomes aware of the myriad of theories and approaches available—theories ranging from what were historically known as "great man theories" that attempted to determine whether certain personal characteristics could be associated with good leadership to more recent theories related to such things as servant, instructional, or distributive leadership. In between are a host of approaches ranging from the leadership wisdom of Sun Tsu, Machiavelli, and Napoleon to that of Lincoln, Colin Powell, Gandhi, and even Jesus Christ. Some theories emphasize personal qualities; others focus on process; while still others emphasize the desired goals. And, although there may be no one right way to think about leadership, there are some approaches, and guidelines for adopting a form of leadership appropriate to the task at hand.

It is fair to say that reflecting on one's organization is the first step towards determining the kind of leadership necessary to successfully attain one's goals. As a leader considers first what the organization is doing well and where change is necessary, he or she might first determine that stability and maintenance of the status quo is what is desirable. If this is the case, a transactional form of leadership may suffice—one in which the leader may offer small concessions (a particular class schedule, for example) in exchange for support of a specific policy or practice (perhaps a discipline policy related to gum chewing or hat wearing). Should the leader recognize the need for reform in the structure or operating procedures of the operation, then a reform-oriented approach such as transformational leadership (Leithwood, 2011) might be desirable. This popular form of leadership is aimed at the smooth and efficient operation of the organization in order for it to attain its goals—including high academic performance of students. In general, it identifies attending to various organizational processes such as developing a clear vision or ensuring support of all personnel. Thus, transformational leadership is most appropriate when a need for internal change has been identified and when the student population is relatively homogeneous.

On the other hand, if, when examining what needs to change, a leader determines that the very nature of the school and its relationship with the wider community requires transformation, then the form of leadership known as transformative leadership may be called for. Here the leader will recognize the need to become more inclusive of all children and their families and less exclusionary; he or she may determine that the power of the dominant cultural groups in the school has been used to marginalize and exclude some others rather than to welcome and support them and hence, traditional leadership activities will need to be expanded to address a wider and perhaps more complex array of issues.

Purpose

In this chapter, I argue that if leaders wish their schools to be excellent they will also need to be socially just. One cannot argue for the excellence of a school, regardless of test scores, if there are some groups of children who are misplaced in low-level special education classes; if certain groups of students are over represented in suspensions, dismissals, or dropouts; if parental wealth determines class or program placement; or if the curriculum is narrow and sterile and focused on test attainment rather than learning. These *injustices* in actuality prevent a school from being both socially just and academically excellent. The two go hand in hand. In fact, I would argue strongly that one cannot truly have one without the other. Thus, I also argue that educational leaders will need to focus on transformation rather than tinker with lesser reforms that do not fundamentally change the power relationships and hegemonic norms of many schools and educational systems. This premise, therefore, supports the inextricable link between leadership for social justice and what has emerged as a leadership theory known either as *transformative leadership* or as *critical transformative leadership for social justice*. (In general, I do not distinguish between them, for transformative leadership is inherently and incontrovertibly critical at its roots and foundation.)

Despite the different tasks and policies associated in various sites with educational leadership, here I explicate the concept of transformative leadership and demonstrate how its principles promote education that is socially just and inherently excellent in all contexts. It is not a prescriptive approach to leadership—but one that calls the leader to a deep examination of his or her beliefs, values, and principles and to ground his or her practice in responses to some deep, difficult, and often controversial questions. Transformative leadership is not a gimmick, it is not a new approach to leadership, and it is not simply a name applied to leadership after one or two small studies to promote the career of a specific scholar.

Transformative leadership has its origins in the work of James McGregor Burns (1978) and has been developed (as we shall see later in this chapter) by theorists working throughout the last 35 years including Foster (1986), Quantz, Rogers, and Dantley (1991), Shields (2009, 2011, 2013), Starratt (2011), Blackmore (2011), and many, many others. It is a theory with a starting point that is quite different from that of other theories in that it does not begin with either the leader or the organization but with an examination of the wider society and the material realities (including disparities and inequities) that impinge upon the ability of individuals to succeed within the organization and on the organization's ability to attain its goals. Hence, if the goal is to ensure that all students in a school reach their potential and succeed to high levels of academic attainment, understanding the socioeconomic and cultural realities of the students is the starting point. One cannot, for example, determine the appropriate programs, structures, curricula, and pedagogies for homeless children unless one understands their daily realities; similarly if a student body has a large number of former refugee children who have experienced trauma and lack of formal educational opportunities, the instructional starting point will be different from a school in a relatively homogeneous, middle-class, stable environment. Because transformative leadership's goal is to transform both the experiences and outcomes of schooling and the inequities in the wider society, it is the educational leadership theory that many have found to be most appropriate as a vehicle for advancing social justice goals—goals that the theory deems to be foundational to attaining high intellectual and academic goals as well (and, as stated previously, not oppositional to them).

This chapter will, therefore, provide a synthesis of the two concepts, social justice education and transformative leadership, and show clearly the inextricable interrelationships between them. It will situate the discussion in some of the North American controversies about social justice and also provide some global examples of what I understand by social justice education. Most importantly this chapter will elaborate how transformative leadership addresses the most complex and challenging circumstances faced by educational leaders.

Diametrically Opposed Concepts or Confusing Verbiage

In education, language quickly becomes co-opted, new theories become fads, fads become passé, and one is left wondering where to rest, even as on a temporary scaffolding. For example, Iris Marion Young (1997) suggested that community had come to mean little and suggested the metaphor of the urban city with its diverse range of passengers using public transit as a possibly productive way of thinking about the increased diversity in society. And yet, for most of us, the concept of community is not similar to that of city, and the suggested replacement has not taken root as passengers on a bus rarely interact and are not always even very tolerant of one another. The same is true, to a large extent, of the concepts of social justice and educational leadership. They rarely intersect and fail to underscore any commonalities as their proponents juggle for prominence. However, despite the myriad definitions, innumerable associated theories, and never-ending debates about their meanings and connotations, the terms themselves are robust. We understand that *social* implies intersections of various groups and communities. *Justice* and *injustice*, although playing out differently in different communities, tend to be easily recognized, if not easily addressed. Here, therefore, I discuss some of the conflicts and controversies but ultimately choose to continue to use the terms.

When I completed my doctorate in 1991 and entered academia, few leadership programs (then mostly called administration programs) introduced the term social justice at all—and even fewer, if any, used it as an organizing term. I recall first being introduced to Marx's concept of the iron cage and railing against the suggestion that all workers were oppressed. I remember the first academic conferences I attended, where I was told by more senior and better established professors that "ethics has nothing to do with educational administration" and that my interest in social context, social justice, and equity was not at all central to educational leadership but, indeed, "totally fringe." Yet, by 2009, the American Educational Research Association's (AERA's) Division A, "Administration" had become "administration, organization, and leadership," and "social justice" appeared everywhere on the programs of major research organizations such as the University Council for Educational Administration (UCEA).

By 2012, "social justice" had become one of five key program areas of AERA and an interest in social justice almost "de rigueur" for proposal acceptance, conferring a rite of passage for those in academic leadership preparation programs. As often happens, as everyone was adopting the term, each person tended to put his or her own ideological spin on it, depending on whether their background included a Rawlsian, Deweyian, and Marxist, other way of thinking about the purposes of education. In American education, accrediting organizations and those charged with overseeing the development and assessment of standards engaged in vicious battles over whether social justice should be included or whether its aims were too ideological for education—a field still (inaccurately) purporting to uphold objectivity and scientific approaches.

In 2006, for example, Wasley announced in a banner headline, "Accreditor of Education Schools Drops Controversial 'Social Justice' Standard for Teacher Candidates." The article informed its readers that the National Council for Accreditation of Teacher Education (NCATE) had won a key endorsement in its quest for continued federal approval of its accrediting power after announcing that it would drop language relating to "social justice" from its accrediting standards for teacher-preparation programs. Wasley (2006, para. 10) also reported that Stephen H. Balch, then president of the National Association of Scholars, responded that he was "delighted" by NCATE's decision to "strike the concept of social justice." Similarly, Greg Lukianoff, president of the Foundation for Individual Rights in Education, applauded the change as a "step in the right direction" (Wasley, para. 11). Others asked themselves how one could possibly be against the concept of a socially just education. What, they wondered, did people want?—a socially *injust* education?

An article in the Summer 2006 edition of *City Journal,* entitled "The Ed Schools' Latest—and Worst—Humbug", helped to clarify the conflict. Sol Stern (2006) argued that teaching for "social justice" was a cruel hoax on disadvantaged kids. His claim was that scholars and academics, because of their advocacy of social justice, attempted to address systemic inequalities and issues of equity by introducing activities that were “a frivolous waste of precious school hours, especially for poor children, who start out with a disadvantage.” He continued, “School is the only place where they are likely to obtain the academic knowledge that could make up for the educational deprivation they suffer in their homes” (para. 55). In other words, Stern equated social justice with frivolous “touchy feeling” activities and conversations that drew attention and time away from a high-quality education. For Sol Stern and many others, social justice and a high-quality education were diametrically opposed and centered on fluff rather than wrestling with difficult and controversial perspectives and practices that promote or maintain injustice.

For me, and others who clearly advocate for leadership for social justice, there is nothing oppositional about justice and quality. A socially just learning environment is the pre requisite for enabling all students to achieve to their full potential and attain a high-quality education. A focus on social justice is the way to assist students to make sense of the content they are learning and to take their places in a world that still calls out for equity and inclusion for all. A socially just education must counteract the injustices perpetrated on children who live in substandard housing, who go to bed hungry at night, or who live in war zones and fear for their lives or those of their family, by offering a better, more stable, and more peaceful future for all. Fortunately, however, in some countries, at least, where access to education is truly universal, schools can provide a haven from injustices, even though too often, children from disadvantaged families experience inappropriate placement in lower level classes, out dated textbooks, and indifferent teachers. These, however, are only a few of the inequities that exist in societies—advantaged and disadvantaged. Moreover, they suggest the need to address (in)justice where and whenever possible.

A social justice education, therefore, offers similar opportunities for intellectual development and high achievement to girls and boys, to students from rich or poor families to those from mainstream or marginalized social groups, to those from powerful and well-positioned families, and to those whose families, appear to have little political or social power, whose voices are rarely heard. Thus, it is clear that there is nothing arbitrary or optional about social justice.

A Critical Distinction

Thinking about leadership and social justice education has led me to several intersecting starting points: the first is the need to distinguish between what is sometimes called a “socially just education” and that which might be more accurately termed “social justice education.” The second is to invite reflection on what kind of leadership might be required to truly promote the kind of social justice education I believe necessary for the complex, rapidly changing, and uncertain world in which we live and to make the argument explicit that (critical) transformative leadership *is* a theory for social justice education. Here critical is enclosed in parentheses because it seems to me it is inherent in the very concept of transformative leadership, although some authors (Dantley, 2003; Quantz et al., 1991) have used the two terms together to emphasize the fundamentally critical nature of transformative leadership.

Burns (1978), in talking about what has subsequently become transformative leadership, wrote about revolution—again a fundamentally critical concept implicit in the theory itself; he wrote: "revolution is a complete and pervasive transformation of an entire social system" (p. 202) and later emphasized the need for "*real change*—that is, a transformation to the marked degree in the attitudes, norms, institutions, and behaviors that structure our daily lives" (p. 414). This paper will provide a synthesis of the two concepts, social justice education and transformative leadership, showing clearly the inextricable inter relationships between them.

Social Justice Education

When one raises the topic of social justice education in the United States, Canada, England, or other developed countries, one often hears talk of test scores, achievement gaps, high stakes testing, accountability, and ensuring that all sub groups of students have been able to achieve the basic standards (i.e., to pass the same tests). In other words, test-passing has not only been discussed as a socially just outcome, but it has (unfortunately) become the goal of educational leaders. This approach, although extremely limited, might be termed a *socially just education*—ensuring, at minimum, that all students have a similar opportunity for equitable access and equitable educational outcomes. If, however (as I have often done), one asks a school principal focused on test-passing what social justice would look like in a more homogeneous, more affluent school, one receives puzzled looks, an uncomfortable pause, and a stammered response to the effect that "those kids would have problems too." In other words, a socially just education, in many places, has somehow become equated in the minds of many educational leaders over the years, with overcoming problems in such a way as to permit all students to achieve the minimum standard determined by the test. In other countries a socially just education is simply associated with providing access to education to all children and youth, and even quality outcomes are still too often illusive.

A different way of thinking about social justice in education might be to provide a *social justice education*—in other words an education that begins with, promotes, and requires a more complete understanding of the social (in)justice issues in the school, the community, and the world in which students live now and in which they will work as thoughtful, contributing adults. Here, for example, instead of focusing on test scores or what is commonly called, in the United States, the "achievement gap" between White, African American, and Latino youth, it would be important to situate the educational experiences of each group in its socio cultural history, instead of simply addressing test scores.

In the former approach, well known by most educators around the world, achievement on whatever benchmark has been set by the legislative jurisdiction is seen as the primary purpose of schooling. In the second, the test is seen simply as one of many indications of progress towards broader and more inclusive goals that include both the private and the public purposes of education. Although educators emphasizing a socially just education may seem puzzled by questions about what social justice education would be like in an affluent, homogeneous school, educators taking the latter approach, social justice education, would emphasize the importance of addressing issues of power and privilege, of hegemony and cultural capital, of helping students understand the socio cultural historical realities of their communities and their country, and of promoting a consciousness of injustice and how to address it in the wider global community.

Thus, for example, in the United States, one could prompt dialogue about ways in which the history of slavery, reconstruction, and racism continue to affect how society and its institutions are structured today and of possible alternative explanations for the "achievement gap" related to the legacy of colonization and oppression. One might raise the issue of Mexican citizenship, colonization, "Manifest Destiny," and so forth and engage students in research and discussion of how the current situation of Latino students parallels this history of marginalization and oppression.

In Canada, student protests over a 3-month period in 2012 in Quebec about the costs of higher education the quality of education, and student debt might prompt similar discussion about the role of Franco-Canadians in the wider society. Similarly, the situation of the indigenous population of Attawapiskat and other communities brought to the attention of the general public in the winter of 2012 should be cause for sober reflection about Canada's true record of civil rights and the attendant lack of educational attainment of its First Nations populations. Residents of the Attawapiskat First Nation declared an emergency in October 2011, because 25 families were living in housing too flimsy to face the harsh winter. In November 2011, the Huffington Post posted a blog that emphasized that asked, "What if they declared an emergency and no one came?" and in which the claim was made that "What we are witnessing is the inevitable result of chronic under-funding, poor bureaucratic planning and a discriminatory black hole that has allowed First Nations people to be left behind as the rest of the country moves forward" (Angus, 2011).

Similar questions come to mind in other countries: how do we respond to emergencies affecting the wealth, and do we respond in similar ways to crises affecting the least advantaged sectors of the population? How does the general cultural approach to the rights and position of women affect the educational attainment of girls and women in countries like Somalia, Pakistan, or Iran? In what ways does the history of conquest continue to adversely affect those of indigenous ancestry in countries as diverse as New Zealand, Australia, Nicaragua, or Sweden? How does the UN declaration about sustainable development privilege those who focus on the development of natural resources for their own profit and how might it disadvantage those who live and work in South American rain forests or the Arctic? Why is it that garbage dumps, nuclear plants, and toxic waste disposal areas are never near the more affluent communities of the dominant cultural groups? Why do so many of the world's children still suffer from preventable diseases? Why, when so much of the earth's surface is water, do so many people not have clean, safe water to drink?

The questions are endless. The point is that a social justice education does not begin and end with the standard formal curriculum of a state but helps all students understand their place in the wider community and world—a place of power and privilege or one of marginalization and oppression. It helps all students, regardless of their current positioning, understand their own agency and their responsibility, not only to their immediate family or socio cultural group but to the wider community.

A social justice education therefore teaches students about the world in which they live, prepares them to become fully participating citizens in that world, and helps them to take proactive positions for justice, equity, dignity, and human rights. In order to accomplish this, of course, students must succeed within their own systems of education. They must learn to read, write, compute, think critically, and so forth. They will have to pass the prescribed tests and be able to proceed through whatever career path they choose, to a fulfilling career. The difference is in the clarity about goals, means, and ends. Passing a test, attaining a degree and being part of an institution that achieves what is called in the USA, "adequate yearly progress," are simply means to the desirable end of becoming a healthy, happy, and active citizen in a global society.

Leading for Social Justice Education

The task of leading any school begins with asking is like, "What is the purpose of the school?" and "What is the role of the leader in accomplishing that purpose?" If the response is that the goal is to support the status quo; to run an effective and efficient organization, as in transformational leadership (Leithwood, 2011); or to ensure the school meets adequate yearly progress while remaining within its budget, then leadership remains a technical task requiring little more than good managerial skills.

Nevertheless, in recent years, so many alternative approaches to leadership have arisen that it is difficult to keep track of them all. A simple categorization in terms of theories may be helpful. Some focus on the leaders' *traits* and *characteristics* (such as authenticity, authoritarian, charismatic, humorous), yet none of this research successfully identifies successful leadership with a specific set of traits. Another group emphasizes *processes* of leadership (hierarchical, collaborative, distributed, distributive, democratic, dialogue, and so on), with the general consensus being that leaders need multiple strategies and processes to accomplish complex tasks. Still others focus on the *purposes* or *goals* of leadership (instruction, learning, inclusion, equity, transformation). These, in part, must determine how the leader proceeds. Hence, my contention is that a leader must first identify his or her goals and then select the necessary processes, characteristics, and skills of the leadership team to be able to accomplish the desired purposes.

Given the significant diversity in any student body—diversity of race and ethnicity, culture and religious belief, ability and disability, sexual orientation, and socioeconomic status—a leader must also reflect on how differences among students in terms of their backgrounds, prior knowledge, and abilities might affect the attainment of the institutional goals. Sometimes educators and educational leaders determine that in order to be successful, they must fix, remediate, or even eliminate some of the students, interpreting their differences as deficits and introducing a variety of strategies and approaches to mitigate or overcome the deficiencies. Thus, in many schools, the predominant strategies include test preparation classes, extra help and tutoring, after-school and Saturday classes, elimination of physical activity, elective “frills,” or even recess. Here the leader is likely to accept the current structures and organizations of schooling, perhaps tinkering around the edges, introducing a new program or curriculum, identifying a slightly different schedule or even administrative structure, adding new opportunities for parental involvement, but not questioning or attempting to change the very fabric of the school itself. These activities may, in fact, increase test scores but do little, if anything, to advance equity or social justice education.

If a leader elects to take a different approach, identifying a mismatch between the knowledge and skills students bring into the classroom and that which is currently valued in the curriculum or the structures of schooling, he or she may decide that more radical change is necessary. Then transformation is called for and the question becomes transformation from what to what?

If the leader identifies the need to transform the school from a hierarchical institution where those with traditional power and privilege are advantaged and included and those with different forms of cultural capital, from less dominant cultural or economic backgrounds, are disadvantaged, even marginalized or excluded, then the response, however it is worded, implies the need to transform the educational institution from one of social injustice to one of social justice. And if the goal is also to transform the curriculum to one that teaches students about the world in which they live, how decisions are made, who has the power to influence the process, and so on, then the task requires a leader who adopts a transformative stance. Moreover, if one desires to effect transformation that creates a more level playing field, a more inclusive school culture, a curriculum that questions and critiques current approaches and interpretations, and preparation to take one’s place as a citizen and advocate for a more just global society, then leadership that promotes social justice, academic excellence, and deep transformation is called for.

Transformative Leadership: An Overview

The theory of transformative leadership responds to this latter need to create schools that are equitable and inclusive, as well as to provide learning experiences that teach students about, and prepare them for life in, the wider global community. It begins by taking seriously Foster’s (1986) comment that ends of educational leadership “must be critically educative; it can not only look at the conditions in which we live, but it must also decide how to change them” (p. 185). If one is an educational leader, it begins by recognizing the lived realities of those who make up the student body, acknowledging that their backgrounds affect their ability to be successful and the ability of the institution (school or even university) to provide a high-quality education. It requires accepting the diverse knowledge, experiences, and skills brought into the school by the students, not bemoaning their lack of middle-class cultural capital but starting where they are.

The tenets of transformative leadership are sometimes delineated using the following eight bullets:

- The mandate to effect deep and equitable change
- The need to deconstruct and reconstruct knowledge frameworks that perpetuate inequity and injustice
- A focus on emancipation, democracy, equity, and justice
- The need to address the inequitable distribution of power
- An emphasis on both private and public (individual and collective) good
- An emphasis on interdependence, interconnectedness, and global awareness
- The necessity of balancing critique with promise
- The call to exhibit moral courage (Shields, 2009, 2011, 2012).

Deep and Equitable Change

It is clear that a desire to understand and overcome social injustice and to promote social justice comprises a mandate to effect deep and equitable change. Adding a new program or involving more parents in the decision-making process may make the school more effective, but truly changing admissions standards, programs, practices, and attitudes may be necessary. Once there is recognition, for example, of a lack of inclusion in gifted programs, of overrepresentation of African America males in special education programs, or of barriers to the equal education of male and female students, the need for deep and more equitable change becomes obvious.

Deconstructing and Reconstructing Knowledge Frameworks

Here, the starting point is the necessity of deconstructing knowledge frameworks that perpetuate hierarchy and exclusion, such as attitudes that blame students, their parents, or their circumstances for lack of achievement. Accepting diversity as it is, without attempting to “fix” those who are not “like us” is the beginning of both a socially just and a social justice education. This will require the educational leader’s rejection of deficit thinking (Valencia, 1997, 2010), challenging of pathologizing practices (Shields, Bishop, & Mazawi, 2005), and reconstructing curricula and support structures that are inclusive and that build on the multiple forms of cultural capital that children from diverse backgrounds bring into the school environment.

Emancipation, Equity, and Justice

To achieve equity and social justice education requires drawing on approaches, attitudes, and assumptions that more closely resemble theories like Sen's (1992) or Nussbaum's (2006) capabilities approach. In fact, emancipation, equity, and justice begin with the kind of revolution that Burns (1978) emphasized—one that "transforms to a marked degree, the attitudes, norms, institutions, and behaviors that structure our daily lives" (p. 313). This may require dismantling programs that are not representative of all groups of students in a school or ensuring that the best and most experienced teachers, smallest classes, and the more resources are assigned to those children most in need of support, instead of (as is traditional in America) allocating them to the "top" groups of students.

Addressing Inequitable Uses of Power

This transformation includes recognition that democracy itself needs a revolution—one that, as Quantz et al. (1991) argued, will diminish "*undemocratic power relationships*" (p. 102, italics in original). Hence, the focus on emancipation also requires overturning the ways in which we often think about and (mis)use power. Indeed, as Quantz et al. suggest, transformative educational leaders must also learn to use their "power to transform present social relations" (p. 103). Weiner, too, emphasized the interconnections among power, justice, democracy, and leadership, saying "transformative leadership is an exercise of power and authority that begins with questions of justice, democracy, and the dialectic between individual accountability and social responsibility" (2003, p. 89). This may require, for example, a change in one's administrative team to ensure more representation of underrepresented groups. It may require taking a strong stand against an affluent group of parents in a school community who are used to having the leader's ear and working to ensure that the needs of those whose parents cannot as easily advocate for them are equally served.

Emphasizing Both Public and Private Good

Focusing only on what is good for individuals or subgroups, without regard for the greater good, emphasizes only the private good aspects of education—benefits that emphasize the better career opportunities, health benefits, or lifetime earning possibilities of those who complete higher levels of formal education. Without the foregoing concepts of deep and equitable change at the forefront of educational leadership and decision-making, it is all too easy to identify public good with the good of the majority, or at least, as often seems to be the case in political decision-making, with the good of those who currently hold the power. Examples of this misuse of power abound and one need only consider many of the recent legislative battles in the USA related to raising or eliminating taxes on the most wealthy to understand this concept. Education, however, can benefit the whole community when we are careful to educate all children—reducing the costs of prisons and incarceration, health care, and so on and increasing everyone's ability to participate in all aspects of civil society.

Interdependence, Interconnectedness, and Global Awareness

I earlier made the claim that a social justice education not only helps all students learn in an inclusive and equitable environment, holding them all to high expectations, but teaches them about the world in which they live. It requires educators and students alike to understand our interdependence and interconnectedness, as well as our responsibility to dismantle societal structures that perpetuate disadvantage for those in our neighborhood as well as people in faraway nations. Barrett (2012) recently conducted a study of how school leaders in affluent schools thought about public good and social justice, only to find that these leaders denied the extent of their privilege and wealth, always comparing their school to one down the road that had something they did not have. If this is the attitude of the educational leaders, how can we expect their students to understand how their wealth perpetuates power and privilege that many others will never experience? If, in North America, we focus solely on the common but misguided notion of "exceptionalism," how will our children understand that many countries also safeguard the very practices and freedoms we claim are only possible in America. How will our youth come to understand that stealth bombs in Yemen have killed so many villagers that instead of making our world safer by eliminating Al Qaeda in the Arabian Peninsula, they may be having the effect of uniting all Yemese against America? How can we help students understand that fighting to keep waste from being deposited in their neighborhood simply reallocates the dangerous elements to someone else's backyard and encourage them to work to eliminate, rather than relocate, dangerous goods and commercial by-products?

Balancing Critique with Promise

These questions lead, of necessity, to the tenet of advocating both critique and promise. To truly safeguard freedoms, educators must combine the promise of a prosperous and peaceful future for their citizens with critique of how actions in the rest of the world not only diminish similar opportunities elsewhere but attenuate the possibilities at home as well. Critique, for transformative educational leaders, may well begin with a critical examination of current practices of assessment and the excessive emphasis on standardized testing that marginalizes and stigmatizes so many children whose backgrounds differ from those of middle-class citizens. Leaders will want to ask whose backgrounds, cultures, and knowledges are being tested and whose excluded. Critique and promise will extend to elimination of transmissive pedagogical practices that exclude the voices and experiences of many children from immigrant, refugee, and low socioeconomic families, offering instead, the promise of dialogue, inclusive sense-making opportunities, and co-construction of more inclusive pedagogies. Critique will include fiscal policies that introduce fees that only some students can pay, reducing the opportunities of less affluent students to text books, higher education, or even to field trips or extracurricular activities and finding ways to value and include the contributions of every student and family and to provide them with equal opportunities. Promise may need to resist the efforts of policy makers to reduce financial aid to students in need, instead encouraging them to find ways to mitigate the incredible debt burden that too often accompanies the academic success of children from less affluent families. And in teaching students the art of deconstructing and critique political arguments, economic premises, and cultural assumptions, they will learn to understand not only why the world is full of inequities (unfulfilled promises Maxine Greene, 1998, would say) but how to begin to offer redress.

Exhibit Moral Courage

Each of these stances calls for the educational leader, who wants to be transformative, to exhibit moral courage. It is not easy to take a stand that is not particularly popular in the community in which one works, to critique a policy of those who have hired you, or to de-emphasize the very tests that can bring your institution additional funding and job security. In 2003, Weiner noted that transformative leaders always experience the challenge of having “one foot in the dominant structures of power and authority” even as they may be attempting to change them. Where this is not the case, he acknowledged, they would not likely have attained the formal recognition as leaders that casts them as “willing subjects of dominant ideological and historical conditions” (p. 91). At the same time, transformative educational leaders must be able to work from within dominant social formations to exercise effective oppositional power, to resist courageously, to be activists and voices for change and transformation. Again, this may look very different in different contexts. In Afghanistan, arguing for a broader curriculum that includes art or music might bring repercussions. In many countries, advocating for equal education for girls and boys or opening educational institutions to both sexes might be personally dangerous. In still others, being willing to protect the rights of children from same-sex relationships may raise the wrath of the local community. The details will differ, but the transformative leader will summon moral courage to ensure inclusion and equal opportunities for a safe and challenging educational environment for all students.

Conclusion

Taken together, the tenets suggested here as central components of the theory of transformative leadership provide guidance for the educational leader wanting to promote both socially just education and social justice education. They focus not simply on running an effective and efficient organization but on those elements of an organization that are truly educational and educative. This is important because too often we think about the similarities between leading *educational* organizations and others like nonprofits or businesses. The two are distinct in that in educational leadership, there is no product but the goal of educating all students to take an active role to ensure a better, more equitable, and more peaceful world for all. Educational leadership focuses on organizations and structures, politics and policies, finances, and human relations; but it also focuses, as we have seen, on pedagogy, curriculum, attitudes, beliefs, and perhaps most importantly on relationships—on knowing the material realities and disparities of those within one's organization and working to eliminate such inequities.

The need for a leader to have moral courage cannot be overestimated. One cannot enter into a leadership position without knowing clearly what guides and what grounds you, what you want to accomplish, and knowing what your "nonnegotiables" are. Only then can you decide at any given instance if a specific battle is worth fighting for, if it represents the hill one is willing to die on. Patience and persistence are valuable attributes, but only when they are grounded in a clear vision of the goal and in the need to take steps (even if small) to advance.

It is primarily *because* of the challenges inherent in educational leadership—and particularly in contexts that are themselves unstable and complex—that I believe transformative leadership provides guidance and some necessary touchstones for advancing an inclusive, equitable, and socially just agenda that leads to high expectations and achievement for all. The actions and activities I have described above are not unique. Nevertheless, attending to all eight tenets of transformative leadership ensures that one is not caught up in the day-to-day activities, meetings, discussions, and problems that confront every educational leader. Together, they can provide a constant reminder of the need for democracy and justice, for change to be inclusive and equitable and for existing norms to be constantly revisited and challenged when necessary. As educational leaders, we are cognizant that current practices are not adequate to ensure a high-quality and equitable education for all children, youth, and adults throughout the world. We are aware that to address this century's challenges, changing demographics, and changing socioeconomic and cultural conditions, educational institutions must also change. It is my firm belief that Oakes, Rogers, and Lipton (2006) are absolutely correct that traditional technical change is inadequate to meet the challenge. Hence, it is for that reason I posit the utility of a critical leadership theory—that of transformative leadership—as one way to remain focused on the goals of inclusion, efficacy, and excellence that all institutions seek. Having a conceptual framework that permits discussion and insights across cultural and national contexts about issues of immediate and growing importance is necessary to help the field and discipline of educational leadership and governance to keep pace with the significant demographic and social demands of our time.

Here, I have argued for a more careful and more robust articulation of both social justice education and of transformative leadership. I have tried to show that whether or not one includes the term "critical" in a discussion of social justice education or of transformative leadership, both are inherently and necessarily critical—in the sense of attending to the needs, backgrounds, and voices of those most neglected, most marginalized, and most oppressed in our society as it is currently constituted and in the systems of education that it perpetuates. (Critical) transformative educational leadership has proven to be a framework that can help a leader to make a significant difference amidst the challenges presented the twenty-first century.

Two decades ago, Quantz et al. (1991), writing about the kind of leadership that would bring about the kinds of social change called for by Burns, Foster, and so many others, argued that traditional theories of leadership were inadequate for democratic empowerment and that "only the concept of transformative leadership appears to provide an appropriate direction" (p. 96). Although the choice of a theory may be less important than the selected goals of the educational leader and the strategies adopted to attain them, I have, for some time, been perplexed at the continued separation in both scholarship and practice between the emphasis on social justice and the discussion of transformative leadership. At times, this separation has led to a somewhat frivolous use of both terms—sometimes implying that a leader who implements a structure for learning communities in his or her organization is fundamentally transformative, sometimes arguing that because a school has met the test benchmarks, it is socially just. The implementation of a learning community structure may well one strategy of the transformative leader but requires careful consideration of what kind of learning, for what purpose, and of how it will help to transform the institution from one of inequity to one of justice and equity. Attaining benchmarks may require considerable effort to support students whose home language is not English or who have little opportunity outside of school to study in a quiet and conducive environment; but it may also simply be a reflection of the overall levels of affluence and educational attainment predominant in the wider community.

We have not come very far since Burns called for revolution almost 35 years ago. Neither have we made much progress on Foster's (1986) appeal for education to be "critically educative." It is my hope that by carefully attending to both the processes of educational leadership and to the ends of our endeavor—both social justice and high-quality academic outcomes—as critically transformative educational leaders, we will be able to move forward on an agenda that truly includes, supports, and educates all students from all social, cultural, and economic groups. Our students, indeed our world, deserve nothing less.

Chapter 20
The Spatial Nature of Justice: A Scholar–Practitioner Perspective

Patrick M. Jenlink

Introduction

> We must be insistently aware of how spaces can be made to hide consequences from us, how relationships of power and discipline are inscribed into the apparently innocent spatially of social life, how human geographies are filled with power and ideology. (Soja, 1989, p. 25)

Henri Lefebvre (1974/1991), in *Production of Space*, writes that social space is the "outcome of past actions, social space is what permits fresh actions to occur, while suggesting others, while prohibiting yet others" (p. 73). Therefore, space is an active and heterotopic condition that can be engaged by using analogous approaches as spaces "interpenetrate one another and/or superimpose themselves upon one another" (p. 86). Space may depict many states of being: emotional, linguistic, pedagogical, aesthetic, cognitive, cultural, economic, ideological, etc. In this sense, the educational setting remains an uneven tapestry of ever-changing spaces, juxtaposed, and overlapped, in which no space "ever vanishes utterly, leaving not trace" (p. 164). Social space is a product of past actions, a product of historical injustices as much as it is a product of current structural injustices placed in action by social discourse and practice.

Conceptualizing leadership concerned with social injustices as spatial practice rests, in part, with the conceptualization of power and identity or political subjectivity as defining elements of place and space. Massey (1995) carefully articulates matters of spatial practices as she argues that what is at issue "is the construction of *spatial* difference (and thus, for instance, the nature of differentiated places) through

the articulation of *spatialised* social relations" (p. 284). Engaging in spatial practices that work to make space a practiced place—transforming the space of school as democratically practiced place—requires "that the purely constructed nature of social relations finds its complement in the purely pragmatic grounds of the claims to power legitimacy" (Mouffe, 2000, p. 100).

Conceptualizing leaders as scholar–practitioners as set forth in this chapter is concerned with examining a path to leadership as critical praxis for social justice. The argument is made that schools, as political spaces, are also practiced places wherein social injustices can be addressed. It is in understanding the spatial nature of schools that conceptualizing scholar–practitioner leadership is undertaken. The chapter is organized into four primary sections. The common theme that interfaces the sections is scholar–practitioner leadership and the spatial nature of social justice.

The first section addresses the politics of space and the practiced place of schools. The second section discusses the spatial practices necessary for scholar–practitioner leaders to take a stance on social justice and democracy. The next section examines the *matter of justice* as a basis for articulating scholar–practitioner leadership as critical praxis. The concluding section presents final reflections on scholar–practitioner leadership as spatial practice for justice.

Space and the Practiced Place of Schools

> Spaces are organized to keep a whole range of 'others' 'in their place' and can be seen as texts that convey to certain groups that they are 'out of place'…. (Morgan, 2000, p. 279)

The nature of the scholar–practitioner's work, the daily actions, takes place within time and space; there is both a temporality and spatial quality that draws into question how social space affects reasoning and practice. The scholar–practitioner is concerned with the implication of social space on historical reasoning, in particular questioning "…how cultural and political meanings are produced, sustained and interpreted?" (Epstein, 1999, p. 294). The politics of space and the practiced nature of place define the scholar–practitioner's work, in part. The school is a place that shapes and is shaped by space and social practices—spatial practices. Michel de Certeau (1984), in *The Practice of Everyday Life*, distinguishes between "place" and "space," when he writes, "*space is a practiced place*" (p. 117, italics in original). Thus, the school building mechanically defined by an architect is transformed into a space by teaching and learning activity. The school as a space is a practiced place, that is, a location demarcated by specific discursive or disciplining practices (de Certeau, 1984; Foucault, 1980, 1982). The school is a practiced place defined through the daily actions of those who populate its space, transforming it through the daily practices that define the work of educators and students.

Scholar–practitioners understand the importance of how spatial practices contribute to cultural and political affiliations and result in cultural meaning in relation to the political and ideological patterns that shape discursive patterns and influence social practice. The work of scholar–practitioners is necessarily concerned with how positioning, the placement of individuals within a social system, is concretized by cultural practices. Of particular importance are those cultural practices animated by ideology and politics, which present issues of injustice that work to marginalize or disadvantage or subordinate individuals within society. The scholar–practitioner seeks to question cultural codes and to explore social and political affiliations, poststructurally examining the disciplining discourses (Anderson & Grinberg, 1998; Foucault, 1980, 1982) and practices that transform "spaces into places and places into spaces" (de Certeau, 1999, p. 118). When space is transformed into place, it is defined by a concrete realization of political order.

Scholar–Practitioner Work as Spatial Practice

The work of the scholar–practitioner is spatial in nature, that is, it is bound in a temporality and a locality by a historical reasoning and political and cultural affiliations. As spatial practice, the scholar–practitioner's work is concerned, in a poststructural sense of place, with the historical origins of meaning. Such work is also concerned, in a poststructural sense, with the discursive disciplining of cultural practices. As Lefebvre (1974/1991) writes, the "spatial practice of a society secretes that society's space; it propounds and presupposes it, in a dialectical interaction; it produces it slowly and surely as it masters and appropriates it … the spatial practice of a society is revealed through the deciphering of its space" (p. 38). The scholar–practitioner's work, then, as spatial practice, is that of deciphering the space of school, the "practiced place" (de Certeau, 1999) in which teachers, students, and other cultural workers live their practiced lives.

Understanding the educational space of the school as a "practiced place" means discerning what makes such space a practiced place—i.e., instructional practice, learning practice, and leadership practice—and why a practiced place is political in nature. As (de Certeau 1991) notes, a place is "the order (of whatever kind) in accord with which elements are distributed in relationships of coexistence …. The law of the 'proper' rules in the place: the elements taking into consideration … each in its own 'proper' and distinct location" (p. 117). Therein, the conditions of discourse and practice are conditioned quite differently, depending on the "rules in the place" and therefore the nature of the relationships, i.e., whether there is a hierarchical nature or a symmetrical nature of the relationships. Power becomes a defining element of the practiced nature of place.

The scholar–practitioner, with respect to his or her work as spatial practice, must consider critically the pragmatic consequences of discourse and practice. This is important when we reflectively consider that a *place* may be understood as a configuration of positions. The practiced nature of *place* connotes a sense of fixedness that often works in conflicting ways for different individuals and groups. The scholar–practitioner's work as spatial practice is concerned with how space and place are defined through practice, made political, and why. The transformation of space into place, and relatedly place into space, is political in nature. Therein, the scholar–practitioner is concerned with spatial practices that work to advantage all individuals and groups, making "*space a practiced place*" that is more just and equitable for all.

Spatial Practices as Stance: Toward Social Justice and Democracy

> For too long the relationship between social justice and social injustice has been misunderstood. It is not a case of social injustice being the lack or violation of social justice…. Instead, the opposite is closer to the truth: social justice is the absence of social injustice. (Bufacchi, 2012, p. 1)

A fundamental concern for social justice and democracy is at the heart of scholar–practitioners' work in education. Inseparably linked with this concern is the question of whether schools are to serve and reproduce the existing society or to adopt a more critical role of challenging the dominant social order so as to develop and advance society's democratic imperatives (Giroux, 1992, 1994). The scholar–practitioner recognizes, as Neibuhr (1946) argued, that as a society our "capacity for justice makes democracy possible; but [our] inclination to injustice makes democracy necessary" (Neibuhr, p. xi). A more passive role lends to reproduction of the existing society, with its injustices, whereas a critical active role that challenges dominant social orders lends to transformation and the realization of a just, democratic society.

Within education, and more specifically within schools, all too often there are hierarchies of participation ingrained, ideologically dominated forms of social control that dictate to individuals how and whether they are to participate in what constitutes learning and other activities in the educational setting. The scholar–practitioner's work, in part, is to illuminate and interrogate injustices—such as those created by hierarchies of participation and forms of social control. The scholar–practitioner interrogates social structures and cultural practices that contribute to injustice, bringing democratic practices to bear so as to mediate cultural dominance, political ideologies, and asymmetries of power that work to reproduce cultures and social structures that foster injustices and inequities in educational settings.

Importantly, the scholar–practitioner understands that she/he occupies objective positions within a variety of contexts and that from these objective positions she/he must necessarily take a stance on differing social issues. Such distinction is informed by a realization of the interconnectedness of position and stance; acknowledging that a particular stance, critical or otherwise, is ineffective without accounting for one's position within different social contexts. Being in a position and taking a stance—position in contrast to position-taking—from that position is concerned with recognizing one's situatedness within the social issues (Bourdieu & Wacquant, 1992) and at the same time realizes that in order to affect justice, equity, or advance democracy, the scholar–practitioner must maintain her/his position within the educational setting in order to bring voice to social issues through one's stance on justice and democracy.

The scholar–practitioner understands that when social justice and democracy are central to the purpose of education, then schools enable the widest diffusion of teaching and learning as "a model of cultural renewal, in effect, to support something peculiarly consonant with the democratization of culture" (Scheffler, 1960, p. 57), democratization that mediates social inequities and injustices reflective of deeply entrenched social issues in society. The scholar–practitioner recognizes, as did Dewey (1916, 1927), the importance of making political and moral considerations an integral element of their practice, distinguishing between education as a function of society and society as a function of education. A scholar–practitioner stance is grounded in an understanding of theories of social justice and democracy, an awareness of the principles upon which justice and democracy are founded and the practices through which they are lived.

A Scholar–Practitioner Stance

Stance suggests an interrelatedness of both positional (position in situ) and orientation (position-taking) to convey physical positions of the person and the intellectual activities and perspectives carried over time and across different contexts. In this sense, stance makes visible and problematic the various perspectives through which scholar–practitioners frame their questions, illuminations, interrogations, and actions. A scholar–practitioner stance is, in part, a disposition through which the scholar–practitioner reflects upon his or her own actions and those presented by others. Rather than passively accepting information or embracing a false consciousness instructed by dominant ideologies, the scholar–practitioner takes a much more active role in leading, learning, and reflecting upon her/his relationship with her/his practice and the social context in which the practice is situated.

A scholar–practitioner stance on social justice and democracy is an ethical, moral, and political position-taking (Bourdieu & Wacquant, 1992) within a larger complexity of social, political, and cultural contexts. Such position-taking on the part of the scholar–practitioner is concerned with Dewey's (1916) argument that "the conception of education as a social process and function has no definite meaning until we define the kind of society we have in mind" (p. 97). If what we want is a democratic society, we must work to define that society, in part through our education systems and schools and through the social practices that animate the educational system and schools on a daily basis. A scholar–practitioner stance observes, as Maxine Greene (1986) explains, that the type of community, society, and world that

> …we cherish is not an endowment, … it must be achieved through dialectical engagements with the social and economic obstacles we find standing in our way…. We cannot neglect the fact of power. But we can undertake a resistance, a reaching out toward becoming persons among persons. (p. 440)

In this sense, scholar–practitioners must be *transformative intellectuals*, working within the cultural–historical contexts in which schools are situated, intellectual and cultural workers seen through the "ideological and political interests that structure the nature of discourses, classroom social relations, and values that they legitimate in their teaching" (Giroux, 1988, p. 127). This requires that the scholar–practitioner takes a critical stance, a further definition of stance through concerns for social justice, equity, diversity, caring, and democracy.

A critical stance for the scholar–practitioner is undergirded by a perception of reality that considers the world and our place within it as incomplete, becoming, and subject to our own projections. It is a critical encounter in which such issues as what counts as knowledge or practice become subject to individuals' own histories, ideals, practices, and perceptions (Freire, 1998, pp. 73–80). The critical stance does not simply acquiesce in or absorb new knowledge or practice but rather encounters it as a claim that exists alongside many alternative possibilities and therefore must struggle to retain its legitimacy (Curzon-Hobson, 2003). A scholar–practitioner who embraces a critical stance subjects his or her knowledge and practice to a variety of frameworks that he or she has encountered and reflects upon this practice or knowledge in social contexts characterized by tensions and conflicts.

The notion of scholar–practitioner stance is underpinned by a sense of fragility and openness in the social context; the positions one has in contrast to the position-taking one engages in give way to the fragility and openness. Importantly, the scholar–practitioner recognizes the value that is gained within a social context that is exploited by all in order to reflect upon and imagine anew what is presented and the perceptions of our interrelationships (Freire, 1985, p. 44). The scholar–practitioner often brings to question and introduces conflict to bear on the object of inquiry through his or her practice. Freire (1994) explains this process as "epistemological encircling" in which "new ideas—through dialogical inquiry—conflict with and challenge what is considered absolute and show the learner that things can be different" (p. 53). Thus, in mediating injustices and inequities within the educational setting, the scholar–practitioner works to create a more democratic culture while fostering a sense of becoming, both in herself or himself, as well as in others with whom she/he interacts. This creates a symmetry in the relationships and practices, participation and power, wherein the scholar–practitioner is working alongside others toward defining a socially just and democratic society. Defining a socially just society requires that the scholar–practitioner know what stance to take on social justice.

Social Justice

In *Rethinking Social Justice in Schools: How Will We Recognize it When We see it?*, Gale (2000) articulates a plural conception of social justice by identifying three categories: distributive, redistributive, and recognitive justice. It is important to fostering a scholar–practitioner stance that the distinctions be explored between the three categories; knowing how each works in relation to whether a stance on distributive, retributive, or recognitive justice is better aligned to fostering a more democratic educational setting. This is particularly important in relation to the scholar–practitioner's concern for social justice and democracy as central to transforming society and creating a more democratic society based on diversity through democratic processes populated by individuals that represent diversity of culture, ethnicity, race, language, economic means, sexual orientation, etc.

Distributive Justice

Distributive justice refers to the principles by which goods are distributed in society. Rawls (1971, p. 7) defined this form of justice as concerning the way in which the major social institutions distributed fundamental rights and duties and how they determined the distribution of advantages from social cooperation. Rawls argued that social justice involves two central principles: liberty, or individual freedom, and the equal distribution of material and social goods. The exception to the principle of freedom was the extent to which an individual's freedom was compatible with the freedoms of others. The exception to equal distribution was when unequal distribution would contribute to the well-being of those who have unfavorable starting positions.

This notion of social justice invokes what is often termed a "deficit model" of social justice, based on the idea that all individuals have the same basic needs. Relatedly, a liberal–democratic solution to an equality imbalance suggests the need to normalize disadvantaged individuals by providing them with basic material and social goods. From this perspective, the disadvantaged are those who are viewed as wanting in what society claims to be the educational, social, and cultural basics. In contrast, Walzer (1983) has argued social justice from a "complex equality" position, which takes the position that individuals do not have the same basic needs or the same resources at their disposal. Argued here is the need not for unequal distribution of social goods but rather a distribution of different social goods for different people. These two opposing views of distributive justice present competing guidelines for educational practice (Gale, 2000, pp. 254–255).

Retributive Justice

Retributive justice is primarily concerned with fairness in the competition for social goods (capitalist markets provide a referent example). In educational settings, academic merit is an example of "just desserts" or entitlements premised on academic performance. Here the translation may be made to students whose high performance equates to entry to privileged positions in schooling, employment, and access to positions of status within society. This view of social justice, as Apple (1988) notes, favors "property rights" over "person rights," thus creating a narrow sense of liberty.

In a market economy, the extent to which individuals have power in social relationships is a function of their property holdings rather than their membership in society (Gale, 2000, p. 257). Hierarchical participation as a form of social control within schools evidences how students are positioned in relation to their cultural and social capital. Limited property rights therefore results in limited power to participate; it works to silence voice and marginalize individuals and groups. When individuals attempt to cross boundaries established by forms of social control, this may be interpreted as "illegitimately infringing on the rights and freedoms of others" (Carr & Hartnett, 1996, p. 28). When a negative influence on social justice exists, such as punishing those who infringe on the rights and freedoms of others, this translates as retribution. Retributive justice is useful in naming the implicit perspectives legitimization of the retribution meters out to individuals. Narrow liberties of some foster inequities and injustices, ensuring that hierarchies of participation remain and that equity in participation is distorted (Gale, p. 257).

Recognitive Justice

Recognitive justice is concerned with rethinking social arrangements thought to be just, valuing a positive regard of group differences and acknowledging democratic processes based on group representation. It is a social justice premised on recognizing diversity and how social justice contributes to a recognition of difference, enabling the formation of individual and collective identities through democratic processes, processes that recognize the individual as having value. Relatedly, Berlin (1969) is instructive in understanding recognitive justice, advocating three necessary conditions: (1) fostering respect for different social groups through self-identification, (2) opportunities for groups' self-formation, and (3) the participation of groups in decision making that affects their lives directly.

Recognitive justice is concerned with cultural domination, being subjected to patterns of interpretation and communication associated with another culture which conflicts with one's own culture. Recognitive justice is also concerned with nonrecognition, being rendered invisible by means of authoritative and normative practices that distance and silence. Equally important, recognitive justice is concerned with how individual and group identity may be controlled and/or shaped through asymmetries of power and ideological dominance, scripting the identity of individuals and groups in such way as to socially position into them into social categories that marginalize or otherwise disadvantage.

The Distinctions

Distributive and retributive justice both appear to be more concerned with individuals' material wealth; both demonstrate a confinement of perspective to economic rather than cultural politics of social institutions, such as schools (Gale, 2000). Recognitive justice, in contrast, is concerned with cultural politics and the participation of individuals and groups in decisions and activities that affect their lives and/or impact on their social well-being. Herein social justice becomes problematic for the scholar–practitioner, as she/he struggles with identifying with a perspective and its role in the construction of one's stance. Importantly, if the image of the society we seek is that of a just democracy, then the stance on social justice must necessarily align with more democratic practices, benefiting all individuals.

Importantly, the scholar–practitioner understands that in contemporary society, identity formation of individuals and groups is connected to Dewey's (1927) notions of the public, and his acknowledgement of how the small publics (schools, parent organizations, etc.) contribute to the development of a larger democratic public. Importantly, the scholar–practitioner stance recognizes a "definite ideal of the place and function of the school in the ongoing process of society, local and national" and requires a "definite point of view, firmly and courageously adhered to in practice" (Dewey, 1985, p. 68). A scholar–practitioner stance on social justice grounded in a recognitive justice perspective advances the principles of democracy while engendering a concern for the identity of individuals and groups.

Democracy

In *Democracy and Education*, Dewey (1916) identified the "widening of the area of shared concerns, and the liberation of greater diversity of personal capacities" (p. 87) as hallmarks of democracy. He noted that only after "greater individualization on one hand, and a broader community of interest on the other have come into existence" (p. 87), only could these characteristics be sustained by voluntary disposition and interest, which must be made possible by means of education. Dewey further stated that a democratic society "makes provision for participation for the good of all its members on equal terms and which secures flexible readjustment of its institutions through the interaction of the different forms of associated life" (p. 105).

The scholar–practitioner understands that democracy is not an all-or-nothing affair but a definition of degree; societies and institutions can vary in both the extent and the intensity of their commitment to democratic practice. Therefore, there are many degrees and definitions of democracy, each marked by an idiosyncratic nature within particular cultural–political contexts. The scholar–practitioner recognizes that the "foundation of democracy is faith in the capacities of human nature; a faith in human intelligence" (Dewey, 1937, p. 458). Democracy is belief in freedom, "the basic freedom of mind and of whatever degree of freedom of action and experience is necessary to produce freedom of intelligence" (p. 459).

A scholar–practitioner stance on democracy reflects an ethical, moral, and political position-taking that ensures freedom of "expression, general diffusion of knowledge, the marketplace of ideas, and open pursuit of truth so that citizens continuously educate themselves to participate, learn, and govern beyond the limited ideas of individuals" (Glickman, 2003, p. 274). Importantly, the scholar–practitioner works to mediate the "politics of reality" for many individuals (Scheurich, 2003), politics that marginalize and distance her/him from authentic participation and at the same time silences her/his voices from being heard in decisions that affect her/his lives.

The scholar–practitioner's work, then, in part, is to foster a sense of freedom of mind and freedom of actions. In part, the scholar–practitioner's work is also to invoke in others in the educational setting to retain a sense of incompleteness and becoming; democracy is never achieved, rather it is in a continuous process of becoming. Maintaining a sense of incompleteness and becoming, a just and democratic society is the result of the individual's will—teacher and student—and the scholar–practitioner's encouragement to critically question, challenge, and overcome in full recognition of the imaginative possibilities of a world beyond the human will to objectify individual lives (Curzon-Hobson, 2003).

The *Matter of Justice* as Critical Praxis

> … human beings, as subjects, are not objectively determined in their existential condition by universal laws of nature, but they are phenomenal 'happenings' as a consequence of a plurality of socio-historical effective forces, mindful purposes, and cultural traditions. (Lum 1993, p. 39)

The existential philosopher Jean-Paul Sartre (1949) wrote: "… if I am given this world with its injustices, it is not so I might contemplate them coldly, but that I might animate them with my indignation, that I might disclose them and create them with their nature as injustices, that is, as abuses to be suppressed" (p. 62). These few words acknowledge the difficult, perduring challenges for those who would transform a world into one defined more so by its advancements of social justice. These same words speak to the moral responsibility of the scholar–practitioner leader in today's educational setting.

For the scholar–practitioner, in Sartre's world of injustices, the obvious, yet profound, implication of leading defined by social justice is that justice is neither a simple nor an ever-finished responsibility. Justice is at once a process, linked to a goal democratic society met by moral responsibility, and at the same time justice is a way of life that defines one's individual humanity and at the same time directs one's contribution to society. And with respect to the nature of the relationship a scholar–practitioner must have with the public, social justice defines, in part, the scholar–practitioner's identity as moral agent of a society seeking to be increasingly more just and democratic. As educators experience all too often upon entering their first and subsequent assignments, injustices and oppressive practices define classrooms and schools, amplifying the level of disadvantage for the less privileged and marginalized populations.

When injustices pervade an individual's life, they also pervade the lives of those closest to him or her. The scholar–practitioner understands that experiencing injustice of any kind leaves an imprint on the individual, and in turn that imprint shapes social interactions with others. This is particularly important for scholar–practitioner leaders and the individuals they interact with in the educational setting. Who one is as a person, as an educator and the notions he or she has about social justice animates the nature of the individual's relationship with students, teachers, parents, and the larger public. The scholar–practitioner understands that when an individual allows injustice to pervade his or her life (inside or outside of the educational setting) or to manifest around him or her in the lives of others (students, parents, colleagues), the individual allows a part of one's self and a part of society as a whole to be diminished, devalued. The devaluing has an incalculable social and moral impact on all persons in society. Either directly or indirectly, by an individual's experiencing injustice, the factor of experiential consequence grows, exponentially, and speaks to a devaluing of the one, the many, or the whole of society. Experiencing injustices – indifference, inequity, oppression, false consciousness, ideological domination, etc. – diminishes the whole of society, one person or one group at a time.

As moral agent, the scholar–practitioner understands that injustices reflect social disrespect—or absence of political and moral positionings upon which a just and fair society is premised. Such disrespect is not confined by particular social boundaries. Rather, it pervades all aspects of political and social life. To counter injustices in society, scholar–practitioners must take an activist role in educational settings, fighting against injustices of any kind and at the same time fighting for social respect and just treatment. It may well be that we have to reconceive the preparation of educational leaders to the end of freeing them first from the valances of an unjust society, free them so they may resist marginality (Greene, 1973) and rebuild a social order in schools that rests on visible, tangible grounds. As Sartre (1947) explains of freedom, "in wanting freedom we discover that it depends entirely on the freedom of others, and that the freedom of others depends on ours…" (p. 53).

The *Matter of Justice* in Scholar–Practitioner Leadership[1]

> If inequities undermine social cohesion, whether they stem from historical injustices or contemporary events, these injustices ought to be addressed if we are to establish a just society. (Streich, 2002, p. 540)

The *matter of justice* is connected, deeply, to the very nature of who one is as a human being and as a scholar–practitioner. There is an obligation, on the part of the scholar–practitioner, to reflect, critically, on the meanings he or she, himself or herself, has internalized in the course of growing up and becoming educated (Greene, 1973). This is particularly important in that the scholar–practitioner, as an individual, is being and/or will be asked to create learning experiences in which students and teachers will be able to articulate what they take for granted and/or consider natural common sense.[2] The importance this holds for educating students and how this translates for the teacher and student might be stated so: "What is taken for granted as a given and never questioned may become a mode of oppression for some, a mode of dehumanization for others" (Greene, p. 184). In the process of becoming an activist for social justice, the scholar–practitioner's responsibility is, in part, to work with students and teachers in a conjoined effort to probe and to clarify and to examine the inner workings, so to speak, of what defines the individual in terms of his or her beliefs and understandings about justice versus injustice.

Spiraling deeper into the *matter of justice*, scholar–practitioners need to necessarily understand that the *what*, *how*, and *why* of leading cannot be separated from the basic conditions under which teachers and students engage in the educational experience on a daily basis, conditions of external and internal political forces at play, conditions of economic stress and poverty, and conditions of ideological domination. Given these conditions, learning, as Greene (1973) explains, "involves a willingness to pose disturbing questions, to take risks, to look through new perspectives upon the familiar life-world" (p. 184). This means rethinking how social practices in educational settings function as a form of pedagogical work defined by social justice within "ubiquitous relations of power and how schooling can be addressed as a crucial site for struggle" (Giroux, 2003, p. 11).

Consequently, the fundamental challenge facing scholar–practitioners within the current age of neoliberalism is to provide the conditions for teachers and students to address how knowledge is related to power of both self-definition and social agency. The *matter of justice* is a political matter, a matter of class, culture, race, and difference against a backdrop of neoliberal attacks on education and the de-democratizing of schools. Here Giroux (2003) is worth quoting:

> Central to such a challenge is providing students with the skills, knowledge, and authority they need to inquire into and act upon what it means to live in a radical multicultural democracy, to recognize antidemocratic forms of power, and to fight deeply rooted injustices in a society and world founded on systemic economic, racial, and gender inequalities. (pp. 11–12)

This requires, with no small amount of work, that scholar–practitioners address the practical consequences of their work in the broader society, simultaneously providing for all within the educational setting authentic and critically oriented learning experiences that enable the learner (student and teacher alike) to make "connections to those too often ignored institutional forms, social practices, and cultural spheres that powerfully influence young people outside of schools, especially within the ongoing and constantly changing landscape of popular culture" (Giroux, 2003, p. 12). It is within the changing landscape of education that injustices hide and manifest in the lives of teachers and students and by extension the society at large. That means it is within this same changing landscape that scholar–practitioners must necessarily consider the *matter of justice* in leading and consequently situate the work of leading the educational enterprise toward a realization of social justice in the reality of an all too often unjust society.

The *Matter of Justice* in Leader Practice as Spatial Justice

> Time does not heal the wounds of injustice when it leaves in place the institutions and practices that embody that injustice. (Williams, 1998, p. 197)

Space encodes power; it restricts and "decides" what activities can take place. As Henri Lefebvre (1974/1991) writes, "Space lays down the law because it implies a certain order – and hence a certain disorder…. Space commands bodies" (p. 142). As for the "readability" of space, Lefebvre reminds us that the interpretation of space “comes last in the genesis of space itself … space was produced before it was read,” produced in order “to be *lived* by people with bodies” (pp. 142–143, emphasis in original). Space by its nature as social may be foster justice or injustice in and between the actions of individuals, groups, and a culture or society. The nature of injustice resides in the nature of individuals’ actions. This is true for the scholar–practitioner just as it is for those with whom he or she works.

Where scholar–practitioners leaders are concerned, the question of injustice in society is one directed internally, that is, it is a question for the individual and for his or her practice and concerns what is justice in the context of social injustice. The responsible answer is a decision to undertake leadership practices that characterize leaders as critical, principled, ethical human beings—that is, moral agents, as scholar–practitioners who rage against inequity and indifference. Foster (1989) is instructive when he states: “Leadership must be ethical. It carries a responsibility not just to be personally moral, but to be a cause of ‘civic moral education’ which leads to both self-knowledge and community awareness” (p. 284). Leader practitioners must see the import of being moral leaders who embrace social justice, who take the battle against injustice into schools and classrooms across the country, and who see the promise of a just and democratic society for all.

The *matter of justice* in leader practice is best defined as a deeply seated moral responsibility, a responsibility that concerns the practiced place of schools and the spatial nature of practices that give way to justice or injustice. Leaders, as moral agents for social justice, must understand leading for social justice is a process and a way of life. This way of life, it is argued, must respond to injustices in society by leader exerting new efforts to continuously work to recreate themselves as responsible moral agents in educational settings, in schools, classrooms, and all the related social spaces of education. Leaders, as agents against social injustice have a responsibility to examine, critically, and articulate the reasons for what they are doing as they work within educational communities. Thus, by creating themselves as moral agents of justice, leaders in turn translate this social agency for justice into the curricular and pedagogical underpinnings of that define the social space of schools into practiced places of justice and democracy. Leaders, too, must take a stand against the political and the normative, against the illusion of a world represented as acceptable, reaffirming, as that world may seem. Freire (1994) offers insight in this respect with his call for *conscientizacao* (critical consciousness); leaders must learn “to perceive social, political, and economic contradictions, and to take action against the oppressive elements of reality” (p. 17). Leaders must use this *conscientizacao* to examine their world; they must be provoked to look at what is familiar and comfortable in leader practice, through new and critically aligned perspectives and examine anew the preconceptions, accommodations, and injustices hidden beneath the veil of mystification and common sense.

Drawn into specific relief, leaders, in interrogating and illuminating injustices and advocating for social justice, must provoke the educators and cultural workers within schools and educational setting into a “heightened sense of agency” by being connected to their life-worlds and by being encouraged to “recover their own landscapes” (Greene, 1995, p. 48). At the same time the leaders and cultural workers must be provoked into a heightened sense of reality concerning injustices in society. This raises the question, who or what provides that provocation? Without providing a template, Greene explains, "we have to be there in the first person … eager to tell our stories and listen to others, eager to attend to the changing culture's story in which so many narratives intermesh" (p. 37). The provocation comes from within the individual, but as an individual aware of others and of the impact of self on others. This necessarily requires leaders to reconceive leader practice so that it is aligned with the *matter of justice* as critical praxis. And this means that provocation originates within and through leaders who are wide awake to the reality of injustices that plague society. Herein the importance of Freire's (1994) *conscientizacao* comes into play as a factor in both preparation and provocation.

Final Reflections

Leadership in any endeavor is a moral responsibility. This is as true for Sartre's (1949) world of injustices as it is for the educational settings of today. The scholar–practitioner understands this point, and he or she understands the moral imperative of leading and learning to lead defined by a concern for social justice. That said there must be a willingness, on the part of both the leader educator and the student of leadership, to critically question the actions of himself or herself and others, to take risks in his or her respective educational settings. And it requires a willingness to look through new, as yet unexperienced, perspectives upon the familiar, yet all too often taken-for-granted world, a world, as Sartre wrote, defined by injustices not to be contemplated coldly. Necessarily, it should also involve, as a priority of practice, an examination, critically, of cultural assumptions, as well as a conscious effort to make coherent sense of experiences, past and present. These efforts must be identified as hallmarks of the scholar–practitioner leader's praxis.

The *matter of justice*, as emphasis leader practice, is best understood, in large part, as a form of critical praxis defined by a moral imperative for social justice, and therein it is performative. As praxis, leading "for the sake of arousing the kinds of vivid, reflective, experiential responses that might move [individuals—students, teachers, the larger public] to come together in serious efforts to understand what social justice actually means and what it might demand" (Greene, 1998, p. xxx). Leadership, as critical praxis in the educational setting, in this sense, becomes performative and highlights considerations of power, politics, and ethics fundamental to any form of socially just and morally responsible practice.

In the end, the *matter of justice* as critical praxis in leading will be dependent, largely, on the degree to which the *matter of justice* directs the design and conduct of leader preparation, the nature of curriculum, pedagogical practice, and authentic experiences in learning. Perhaps the most difficult challenge confronting leader educators and practitioners, and society at large, is that we must confront injustices that reside within ourselves and within our social institutions. We must look into the abyss and embrace what it is that looks back at us. That means, simply put, that the *matter of justice* in leader practice must be performative and at the same time a way of life. This cannot be optional if the goal of a just and democratic society is to be realized. This is the *matter of social justice* in scholar–practitioner leadership.

The *space* of school, and relatedly the *place* of colleges of education, as socially produced, is shaped by spatial discourses and practices. The *spatial* nature of the educational setting draws into specific relief the importance of scholar practitioner–leadership, as critical praxis, being concerned with the spatial nature of injustice, and the historical as well as contemporary structural injustices that pervade educational institutions. The scholar–practitioner understands that when external entities attempt to shape the spatial practices, they introduce practices encoded with political and ideological agendas and beliefs, accompanied with narratives that work to make such practices appear common sense, or "real life." Shaping practice in fixed or rigidly narrow fashion limits space and limits the imaginative and creative potential of practitioners and students. Such shaping of space through external political agendas is a form of mystification. Mystifications "disguise or transpose … real life" (Lefebvre, 1974/1991, p. 146) by providing explanations which achieve the status of common sense and yet mask injustices. The scholar–practitioner works to disclose such mystifications, to make visible the relationship between appearance and reality, distinguishing between politicizing education and making education political.

The *place* of school and relatedly the *place* of colleges of education, historically as well as in the current stream of discourse, are characterized by a "sense of place" that generates conflict and is made conflicting by external forces that work to redefine educational practice through differing discourses of power and disciplining practices (Foucault, 1980). Importantly, the scholar–practitioner is concerned with identifying the political agendas that animate political issues and which make problematic the work of individuals, such as students or teachers, who work within a particular place, such as the school or college classroom. Mediating the politics of place is central to the work of making the *place* of school more equitable, just, caring, and democratic.

A challenging reality for all who are responsible for leading the educational enterprise as well as for those who are responsible for preparing morally responsible leaders is that the work of social justice will come neither easy nor without a cost. All concerned must be committed to rage against injustices on any and all levels; they must confront injustices in politics, policies, program curriculum, and pedagogical practices.

Notes

1. Here I draw from Maxine Greene's (1973) conception of justice as it relates to teaching, set forth in her work, "The Matter of Justice." For additional insight, see her article in Teachers College Record.
2. Common sense as used herein from this point forward reflects a more formal, distancing concept, used adjectivally not substantively, to indicate the naturalization

> or taken-for-grantedness of popular beliefs. Actually, the great need, at this moment of transition, and indeed today, is for a politics that can root itself in the lived contexts of differently subordinated social groups, starting—but not ending—with commonsense understandings. Common sense or "the profane everyday" (Johnson, 2007, p. 101) reflects the work of hegemonic forces—the actions of dominant ideologies—and exists in the dynamics of culture and power, understood in a Gramscian (1971) way. Common sense is understood as both "a ground or starting point of political practice, and, renovated, is its product" (p. 101).

Chapter 21
Promoting Inclusive Leadership in Diverse Schools

James Ryan

Years ago when I was a junior faculty member and just beginning my leadership and diversity research program, I received a review of my work that was hard to forget (see Ryan & Rottmann, 2007). I had submitted a proposal to present a conference paper, and one of the reviewers questioned the value of leadership and diversity topic that I had intended to explore. This reviewer felt that there was no point in writing a paper in an area that had already been thoroughly covered. She/he noted that a colleague had already addressed the leadership and diversity issue, and that there was no point in traversing the same ground. Apparently, the colleague had said everything that needed to be said about the area. At the time I had a pretty good sense of the literature in the area—or rather lack of it—but did not recognize the leadership and diversity expert that the reviewer cited. And try as I might, I could not find any subsequent reference to this particular individual. Although puzzling at the time, the reference to the nonexistent expert did not influence the acceptance of the proposal. As it turned out, the paper was accepted, probably due more to the fact that I knew the program chair than to the lukewarm sentiments of the reviewers.

This kind of reaction was not unique. I have received a number of these kinds of responses over the years. I suspect that many others who have worked in diversity-related areas have also encountered similar reactions. My point here is that only a few years ago leadership and diversity was not acknowledged as a legitimate area of inquiry and practice in the field of educational administration, despite the fact that schools around the world were becoming increasingly diverse. Even with these obvious changes, champions of the traditional canon in education administration saw fit not to acknowledge this diversity and, if they did, believed that they did not warrant different approaches to administration and leadership. Instead, they continued to insist that long-standing generic models of administration were more than

DOI 10.1007/978-94-007-6555-9_21, © Springer Science+Business Media Dordrecht 2014

capable of providing an appropriate basis for the administration of schools. Diversity was but a minor distraction, the complications of which could be solved by a decisive research study or two in the area.

Thankfully, circumstances have changed in the intervening years. Issues of diversity and leadership are now considered a legitimate area of study, at least in some communities of inquiry. This handbook is just one example of this change. This shift reflects the tendency of scholars and practitioners in educational administration to take diversity issues more seriously. They are doing so because they recognize the significance of these differences for student experience. More pointedly, they acknowledge that the ways in which these differences are configured—interpreted, valued, and judged—can have a decisively positive or negative impact on how students learn in school. For example, differences associated with culture, ethnicity, race, social class, sexual orientation, gender, and ability can mean the difference between success and failure, enrichment and impoverishment, and hope and despair for students. In most contemporary schools in the Western world, nonwhite, female, gay, lesbian, poor, and differently abled students frequently do not have as positive an educational experience as their white, male, straight, middle-class, and physically able counterparts. Many of the former tend to achieve at lower levels, drop out in greater numbers, and are less likely to attend postsecondary institutions than the latter (see, for example, Bennett, 2001; Darling-Hammond, 1995; Natriello, McDill, & Pallas, 1990; Orfield, 1995; Paquette, 1990). Of course, not all students in the aforementioned groups follow this path. But even those who perform well academically suffer from other significant consequences of this differential evaluation. Like their comrades, they are systemically subjected to harassment, exclusion, and discrimination both in school and later, when they leave to go out into the working world (see, for example, Datnow, 1998; Lugg, 2003; McFarland, 2001; Orenstein, 2002; Ryan, 2006a; Stein, 2002). Difference makes a difference for students and their parents.

The unfortunate way that these differences play out has shaped how many scholars pursue leadership and diversity. Most are not content to be idle or neutral bystanders or merely describe what they study in a clinical or detached manner. They care deeply about what is happening to already-marginalized groups in schools and are determined to do something about it. These sentiments figure prominently in their approaches to inquiry. Many believe that their work in areas like leadership can provide the foundation for action that can rectify these unfair practices. Only comparatively recently, though, have individuals within the field of educational administration come to use the term "social justice" to describe what they do, despite the fact that the term social justice has been around for some time. In the past, those in the field of educational administration concerned with the plight of the marginalized—few as they were—tended to associate with other monikers, like "critical theorist," "feminist," "neo-Marxist," or "poststructuralist." Many continue to identify with these traditions, but many also now employ the term, social justice, to position themselves in the field of inquiry. In doing so, they distinguish themselves by their uniquely critical approach to social justice, which differs in important respects from classic liberal perspectives, like that of the often cited Rawls (1972).

It is difficult to say why these critically minded scholars now also identify with the social justice perspective. One possible reason may be associated with the problem of focusing on only one axis of disadvantage, like sexism. It is becoming increasingly difficult to understand and do something about sexism without acknowledging the many different ways that it interacts with other oppressive structures like racism, classism, and homophobia. It could well be that scholars find the social justice umbrella appealing because it points to a wider scope of study and practice—one that moves beyond a unique focus on just sexism or racism, for example. Another possible reason for this move to social justice is that critical scholars are recognizing and appreciating the similarities they share with their colleagues in the wake of increasing and alarming threats to already-marginalized populations in their schools and communities. The social justice platform may be acting as a rallying point for critical scholars, educators, and community members wishing to challenge the recent waves of inequitable policies by providing a discourse that enables them to collectively understand and contest wide-ranging oppressive practices associated with the current social context.

As the social justice movement has evolved, its disciples have conceptualized social justice in a number of ways. One of these is inclusion. A number of advocates look to the idea and practice of inclusion as one way to promote social justice. This preoccupation with inclusion has also found its way into the theory and practice of leadership. This chapter explores the idea and practice of leadership and inclusion. In particular it examines how administrators of diverse schools endeavor to make their schools inclusive places. It begins with an account of the relationship between social justice and inclusion, followed by a description of leadership and inclusion. Next, I explore the ways in which administrators of diverse schools have attempted to make their schools more inclusive. Toward this end, I describe some of the challenges associated with the promotion of inclusion. This is followed by a depiction of how administrators employ communication practices, use critical learning strategies, foster school-community relationships, and exercise strategic advocacy.

Social Justice and Inclusion

Social justice is not an easy concept to pin down. Most commentators on social justice, though, concede that it is about legitimacy, fairness, and welfare. In this vein, promoters of social justice emphasize the idea of distribution (Rawls, 1972) and recognition (Fraser & Honneth, 2003). Distribution and recognition are, in turn, closely associated with inclusion. When people are included, they tend to be part of just distribution practices and recognized or valued in positive ways.

Rawls (1972) was one the first scholars to comprehensively address the issue of social justice. For him, social justice was associated with distribution. He maintained that that social justice can only be achieved with the equal distribution of goods, rights, and responsibilities. Issues with Rawls' liberal individualistic view aside, social justice involves more than resource distribution and economics. It is also about recognition (Fraser & Honneth, 2003). Recognition is important because injustice arises in situations where certain groups are not accorded the same value—the recognition—that others receive. Achieving social justice requires that those marginalized by virtue of their particular identities—frequently related to gender, race, ethnicity, ability, and sexual orientation—receive the same recognition as others. Promoting social justice, then, requires attention to both distribution and recognition. Among other things, seeing social justice in terms of recognition as well as distribution allows advocates to view the pursuit of social justice as a process rather than strictly an outcome.

Distribution and recognition figure into the ways in which scholars have approached inclusion over the years. These include scholars who have explored poverty and those who are concerned with the education of the differently abled. Researchers studying poverty—the distribution of wealth—in Europe have used the terms inclusion and exclusion (Byrne, 1999; Madanipour, Cars, & Allen, 1998; Munck, 2005). They perceive social injustice not just as a form of poverty but also as a multidimensional process comprised of a number of forms of exclusion. They have explored the ways in which people have access to current social, economic, political, or cultural systems, to participation in decision-making and political processes, to employment and material resources, and to integration in common cultural processes like education (Madanipour et al., 1998; Ryan, 2012; Walker & Walker, 1997). Within this perspective, men, women, and children are excluded when they are not able to obtain particular kinds of food, to partake in desired activities, or to simply live their lives like others do. This view emphasizes the structural nature of peoples' misfortunes and avoids blaming individuals. Proponents contend that structural processes rather than individuals and groups create barriers that prevent the inclusion of the poor, disempowered, and oppressed (Ryan).

Education scholars have also been concerned with inclusion and, in particular, the education of "special needs," "exceptional," or "differently abled" students (Ainscow, 2005; Booth, 1996; Lupart, 1998; Slee, 2001). Inclusion has become an issue because of the way in which educators and experts have understood, recognized, and valued those with exceptionalities. With few exceptions over the years, the latter blamed the difficulties that some students had with increasing standardizing school conventions on what they saw as their defective physical, behavioral, and cognitive abilities. In their view, school institutions were not the problem; the reason that these students were not performing well was because they were "backward," "slow," or "defective" (Slee). Their solution was to identify, segregate, and treat (fix) these students. This segregation has, however, not worked out for these students. It has neither equipped them to exercise their rights as citizens nor to accept their responsibilities (Slee). Instead, this segregation excludes these students from the best of what schools have to offer. This is why many advocate that school systems abandon this segregation and include exceptional students in the regular stream schooling (Ryan, 2010b).

Other scholars who are concerned with the troubles of students with exceptionalities have also recognized that they are not the only ones who are excluded from traditionally organized school systems; others are systemically excluded because of the ways in which they are recognized. Those who look at the issue from an international perspective have acknowledged that students can be excluded by virtue of their association with categories other than exceptionality (Ainscow, 2005; UNESCO, 2003). Ainscow, for example, notes that students can be excluded as a consequence of race, social class, ethnic, religious, and gender relationships, in addition to ability. In order to counter these debilitating relationships, he contends that school communities need to welcome diversity among all learners, and not just focus on those with exceptionalities. Lupart (1998) refers to this perspective as the "minority group" concept. It also coincides with the view of other inclusive-minded scholars in education who recognize that race, class, gender, etc., relationships can also be exclusive (Dei, James, Karumancherry, James-Wilson, & Zine, 2000; Riley & Rustique-Forrester, 2002; Ryan, 2006a, 2006c).

Inclusion is intimately associated with issues of recognition and distribution. Individuals or groups are included (or excluded) by virtue of the ways in which they are recognized as well as the extent to which they have access to goods, rights, and responsibilities. In the spirit of these views then, it is useful to think of inclusion in education as a process that (1) targets exclusive systemic practices, such as ableism, classism, sexism, racism, and homophobia; (2) emphasizes the importance of access, participation, recognition, and achievement of all students; and (3) advocates for the meaningful participation of all members of school communities in the decision- and policy-making activities of schools and school systems (Ryan, 2010b, 2012). Leadership has an important part to play in these processes.

Leadership and Inclusion

The idea and practice of leadership is not always consistent with inclusion. Of course, the extent of this consistency depends on the way in which leadership is conceived. Some views of leadership mesh nicely with inclusion, while others do not. Many of the more traditional management-oriented perspectives, for example, are at odds with inclusion. Their inherent hierarchies draw a distinction between those in positions of responsibility and those who are not. The former are imbued with power, while the latter are divested of it. This means that those who are not in administrative positions are routinely excluded from organizational functions like decision-making. Proponents of these perspectives believe that this exclusion is appropriate, assuming that these individuals do not have the capacity to engage in these practices in a way that would benefit organizations (Ryan, 2012). Management-oriented tendencies to promote efficiency and productivity are also not consistent with inclusion and social justice (Blackmore, 1999; Marshall, 2004). Their preoccupation with the former values deflects attention away from efforts to promote inclusion.

Not all leadership perspectives are at odds with inclusion. Indeed, a number of leadership approaches go a long way in promoting inclusion. Their proponents rightly take issue with the hierarchies that accompany bureaucratic forms of organization. Corson (1996), for example, contends that these hierarchies both reflect and reinforce wider societal hierarchies and injustices. Others have pointed out class and gender hierarchies in organizations (Blackmore, 1989; Grace, 2008). They contend that hierarchical divisions of labor in organizations revolve around class and gender distinctions and that these are also tied to a corporate management view that strives for power and control (Blackmore, 1999; Grundy, 1993; Ozga, 1993). These scholars emphasize that hierarchies impede inclusion. Inclusive forms of leadership, on the other hand, foster equitable, heterarchical, and horizontal relationships that transcend global race, class, and gender divisions and hierarchies (Ryan, 2012).

Inclusion-friendly leadership perspectives are consistent with collective enterprises. This tendency contrasts with a common view that assumes that leadership naturally rests with particular individuals. There are a number of problems with this individualistic approach to leadership. The first and most obvious is that it is exclusive. Investing leadership in the hands of one individual excludes others who are not considered leaders (Foster, 1989; Ryan, 2003a, 2003b, 2006a). Another difficulty with this individualistic perspective is that when powerful leaders move on to other organizations, they leave power vacuums and accompanying problems behind (Hargreaves & Fink, 2006). Still others point out that it does not make sense to rely on single individuals when their influence is generally limited. These scholars contend that leadership power is distributed or "stretched over" a range of artifacts, tools, language, people, and relationships (Spillane & Orlina, 2005). Proponents of what has come to be known as distributed leadership contend that significant change in organizations generally occurs not as a consequence of single individuals working alone, but from the efforts of a variety people working in different capacities and using a range of resources (Gronn, 2002; Leithwood, Jantzi, & Steinbach, 1999; Pounder, Ogawa, & Adams, 1995; Smylie, Conley, & Marks, 2002; Spillane & Orlina, 2005). Distributed leadership perspectives are inclusive in the sense that they see value in including a variety of people in the leadership process.

But distributed and other similar approaches to leadership, like some versions of teacher leadership, do not go far enough in ensuring inclusion. In this regard, they fail to attend to the ends for which leadership is organized. While distributed leadership argues for a collective approach, it nevertheless fails to specify the ends for which these collective enterprises should strive. Other leadership perspectives are more inclusive in this regard. Emancipatory leadership proponents (Foster, 1989; Marshall, 2004), for example, believe that leadership is only one element in the pursuit of social justice and inclusion. They feel that leadership-related activities, like decision- and policy-making, are only one part of a larger enterprise that looks to make the world a just place. Leadership scholars who work in the area of the differently abled also make a case for attending to a specific inclusive goal (Keys, Hanley-Maxwell, & Capper, 1999). They openly advocate for the inclusion of differently abled students in school activities. The bottom line here is that leadership can never be truly inclusive unless the ends for which it is organized are also inclusive (Ryan, 2012). Over the years, administrators of diverse schools have employed a number of practices to promote inclusive practices in their schools.

The Practice of Inclusive Leadership

Scholars and other experts have much to say about leadership and inclusion. But they are not the only ones who recognize the value of inclusion. Many practitioners—teachers and administrators as well as students, parents, and community members—also promote the idea and practice of inclusive leadership. But unlike many scholars, they are intimately involved in the practice of it. Putting these inclusive practices into place, however, does not come easily; many struggle in their efforts to promote inclusion (Ryan, 2010a). These struggles emerge as members of school communities attempt to promote inclusion in the ways they communicate with others, look critically at their environments, work with their communities, use their political skills to advocate for inclusion, and work to change exclusive structures. Understanding these struggles, however, requires an understanding of the obstacles that advocates of inclusion encounter.

Obstacles to Inclusive Leadership

It is not always easy to put inclusive practices into place. This is because, as mentioned above, many obstacles can get in the way. These obstacles can take many forms, including policies, practices, and the attitudes of many men and women. Most of these exclusive practices, however, are associated with the exclusive cultural context in which education occurs. Exclusion and privilege have been with us for some time—from feudal times to the present. These enduring disparities between rich and poor, privileged and marginalized, and included and excluded shape the fortunes of students in contemporary education systems. Most obviously, these differences have not served the children of the marginalized well. They perform less well, are more likely to drop out of school before graduation, and are less likely to go on to postsecondary than their more privileged counterparts. Those who do end up attending postsecondary institutions tend to enroll in vocational institutions or 2-year programs (Coleman et al., 1966; Natriello et al., 1990).

Over the past few decades, differences between the privileged and marginalized have increased even more, despite the mid-twentieth-century improvements in life conditions in the Western world (Tabb, 2003). This is due, in large part, to the recent introduction of neoliberal policies and practices that are geared to liberate "individual entrepreneurial freedoms and skills within an institutional framework characterized by strong property rights, free markets and free trade" (Harvey, 2005, p. 2). The neoliberal preoccupation with market principles shows up in education in a number of policies and practices. Some of these revolve around corporatization, marketization, and privatization initiatives (Anderson, 2009). Perhaps the most pervasive neoliberal policies/practices, however, have been those that involve the standardizing of curricula and pedagogy and, most importantly, testing.

Inclusive-minded leaders will encounter significant obstacles to inclusion in contemporary accountability and testing regimes. This is because these practices and policies are inherently exclusive. Contemporary standardized testing excludes already-marginalized students. To begin with, the tests themselves are often exclusive. Most are designed from a Eurocentric perspective and include items that presume that test-takers will possess knowledge that people who live in the Western world would normally take for granted (Ryan, 2006a, 2006c, 2012). Exclusion also occurs as schools prepare for the tests. Intense pressure to ensure that students do well on these tests often compels teachers to desert pedagogy designed to help marginalized students and to redirect their efforts to mid-level students whom they believe are capable of passing the tests (Hursh, 2007). Students are also excluded as schools maneuver to show well on the tests. Among other things, schools will exempt the poorest performing students from the tests by labeling them as "special education." They also prevent poorly performing students from moving up to the grade level where testing takes place. Many of these students give up and drop out of school (Darling-Hammond, 2010).

Inclusive-minded educators also find it challenging to promote inclusion in the hierarchical organizations in which they work. In most schools in the Western world, policy dictates that responsibility for what happens in the building rests exclusively with principals or head teachers. They are generally responsible not only for schedules, budgets, and student safety but also for more trivial matters, like ensuring that the drink machine in the cafeteria is working. These administrators will bear the brunt of the blame when things go wrong, so it is not always easy for them to trust others to make decisions in areas for which they are responsible (Ryan, 2006a). Recent managerial approaches, sometimes referred to as the new managerialism, only reinforce these hierarchies, moving meaningful decisions away from supposedly untrustworthy lower-echelon administrators and teachers who are expected to enforce policies, but not design, interpret, or question them (Gewirtz & Ball, 2000).

Inclusive-minded educators sometimes identify the people with whom they work as the source of obstacles to inclusion (Griffiths, 2010; Ryan, 2010a, 2010b, 2012; Theoharis, 2007). Principal among these resistors are teachers. Griffiths (2010), Ryan (2010a, 2010b), and Theoharis (2007), for example, contend that teachers may routinely oppose inclusive initiatives, such as including differently abled students in mainstream classrooms, including students and parents in decision-making, and various initiatives designed to address racism and sexism. Resistance to inclusion also can come from the parent community, particularly the more affluent white middle-class element (Theoharis). These parents may oppose initiatives that they perceive may not work for their own children, even though they may assist other less privileged children. Resistance also originates in the district and beyond. Leaders may find themselves up against unsupportive central office administrators, inflexible bureaucracies, hostile colleagues, a lack of resources, harmful government politics, and uninspired administrator preparation (Theoharis). Finally, resistance may also often come from inclusive-minded leaders themselves. They may unwittingly support initiatives and practices that undermine their own inclusive agendas (Ryan, 2012).

Administrators must do their work in the context of this resistance. While these obstacles may often make it challenging to achieve inclusive goals, many inclusive-minded administrators persist. They engage in a number of practices that they believe will promote inclusion in their schools. Communication is one area that they target.

Communicating with Others

Inclusive-minded leaders look to communication strategies to help them with their efforts to promote inclusion in their schools. While communication is important in any school, it is particularly crucial in the increasingly diverse school settings around the world. It is not always easy for administrators to understand others who see the world in different ways, and help them participate fully in communication practices and in school activities in these contexts. So leaders need to communicate in ways that provide bridges that bring together disparate and different communities and enable them to overcome the powerful barriers that prevent them from sharing in what schools and communities have to offer. Among other things, the right communication practices can help overcome language and cultural differences and the variations in worldviews, values, and power that generally accompany diversity.

Administrators speak about inclusive communication strategies in a least two ways (Ryan, 2002a, 2003a, 2007, 2011, 2012; Ryan & Rottmann, 2009). One is in terms of communication practices themselves and the other is in the ends for which communication is employed. Many recognize the challenges that accompany communication efforts, particularly in diverse settings, and work to ensure that school communication practices are inclusive. In this regard, the type of communication many favor is dialogue. Many inclusive-minded leaders believe that communication with their various constituencies is best achieved when everyone is meaningfully included in the two-way interchange characteristic of dialogue. For these administrators, dialogical interaction is the first step in achieving more comprehensive inclusion within the school community.

Administrators do a number of things to encourage meaningful dialogue within their schools and school communities. Among other things, they work at establishing relationships, understanding others, and listening to people. Administrators acknowledge that they need first of all to provide the groundwork—the conditions—that makes dialogical interchanges possible. This requires that they cultivate relationships with people. This involves connecting with others in the school communities and developing and maintaining informal networks with various groups and individuals. In order to do this, administrators maintain that they have to make themselves visible and approachable. They have to take the initiative to put themselves in places where they will encounter others—this means coming out of their offices and meeting people in the halls, in classrooms, on the school grounds, and out in the community. It also means that they will have to present themselves in ways that will prompt others to want to engage in dialogue with them and to get others to trust, respect, appreciate, and like them (see also Burbules, 1993). To do this, administrators do such things as displaying their caring nature, vulnerability, and sense of humor (Ryan, 2012; Ryan & Rottmann, 2009).

Inclusive dialogue also requires that the partners understand one another. Administrators see understanding in two related ways: as knowledge of particular groups and as efforts to comprehend what others are saying in face-to-face conversations (Ryan, 2012; Ryan & Rottmann, 2009). One type of understanding complements the other. Administrators say that they do a number of things to understand the various groups that are part of their school communities. These include circulating surveys; consulting with staff members, parents, and community groups; and talking to various individuals in the community. Doing so enables them to build a picture of the groups so that they can be in a better position to decode what the latter attempt to communicate, particularly with regard to the groups whose first language is not English. In conversations with students, for example, knowledge of the group to which the student belongs allows administrators to read both verbal and nonverbal cues in order to ascertain whether they and their conversation partners have understood one another. Once the partners have understood one another, they can exchange information that enables them to gain more knowledge of the other.

Inclusive-minded leaders also pay particular attention to listening to what others have to say (Ryan, 2002a, 2006a). They recognize the importance of giving other people space to talk and do what they can to ensure that this happens. Administrators maintain that there are a number of things that they do. These include establishing eye contact, keeping in mind that this will not be appropriate in certain situations, and taking up a suitable distance from the audience. They also say that listeners also should avoid interrupting the speaker, compare the speaker's experience to their own, and ask questions. They also refrain from speaking too much. Levine-Rasky (1993) also cautions that in situations where there is a power difference between speakers, the more advantaged speaker needs to provide as much comfort as possible for the other partner so that they will be able to say what they have to. She goes on to say that listening in these situations should involve (1) a displacement of oneself as knower and evaluator, (2) abandoning the desire to assign relative worth to observations, (3) self-refection on privilege, (4) suspending personal authority, (5) a willingness to admit one's ignorance, and (6) abandoning temporarily one's identity.

The other way in which administrators speak of inclusion and communication is in the ways in which the latter can be used to promote inclusion. Many believe that the right communication practices can be used to expose and resist exclusive practices like sexism, racism, and classism. But administrators are positioned in ways that dictate that they also employ communication practices to achieve many other goals. Some of these goals are compatible with inclusion, but others are not. One of the positions that administrators frequently find themselves in is mediator (Ryan, 2007). This identity can support inclusion, but it can also impede it. For example, refereeing conflict can provide administrators with opportunities to even out unequal relationships. But the mediator position also carries with it a responsibility to legitimate the school's practices (Anderson, 1990). And so administrators may find themselves overriding their inclusive philosophies by prioritizing efforts to ensure harmony in their schools; doing such things as withholding information from teachers, students, and parents;

and (sometimes unwittingly) filtering this information when they do decide to share it. There are also times when administrators may attempt to impose meanings on communities for blatantly exclusive ends (Ryan, 2011).

Given the value that many administrators place on harmonious school environments, they may also use communication strategies to control what happens in schools, sometimes at the expense of inclusive practices. Indeed the quasi-markets in which some schools operate may impel administrators to use exclusive controlling practices to survive in these systems. Take the case of City Secondary School (Ryan & Rottmann, 2009). Faced with threats of school closure because of declining enrolment, it sought to attract students beyond its normal community boundaries by developing and advertising unique programs. As part of a reimaging campaign, it also sought to change the school's former unsavory reputation by instituting a new behavior policy. Toward this end, the inclusive-minded administrators employed a number of communication strategies. They circulated written documents, like newsletters, posters, signs, memos, surveys, and report cards, and employed technological devices like computers, phones and the public announcement (PA) system. They also employed dialogical approaches. At the beginning of the year, and at other times when the need arose, students and teachers would talk about the code. There were limits to the discussion, however. The discussion was not intended to pave the way for changes to the behavior code. Instead, it was seen as something that was carved in stone, and nothing that occurred in these discussions would change it. The code was not meant to accommodate the views or various perspectives of students' body or community members, and the purpose of the discussion was to make sure that students understood the school rules so that they would obey them and thus project an image of the school that would attract potential students.

Administrators also look to critical learning to promote inclusion.

Promoting Critical Learning

Learning is an important part of inclusion, particularly in diverse school settings. This is because administrators, teachers, students, and parents often know little about each other; about exclusive practices like racism, classism, and sexism; and about how to approach and implement inclusive practices (Ryan, 2003a, 2006a). In inclusive schools, everyone ideally acquires new knowledge, understandings, and attitudes, assuming the roles of both teacher and learner. In these roles, educators help students and parents understand the school, community, and existing opportunities, and students and parents help educators learn about students and their communities.

Educators engage in many types of learning activities to learn about the communities they serve and about the dynamics of inclusion. Many, though, admit that they do most of this type of learning informally. They say that this informal learning occurs on the job, mostly through their experience in schools, from their colleagues and from community members, and not as much from so-called expert sources and individuals from district offices and elsewhere (Ryan, 2003a). Administrators also value informal learning over formal training, although some maintain that they have acquired useful knowledge in workshops and conferences that connect directly with their day-to-day experiences. Unfortunately, university programs that attempt to make these kinds of connections in the area of inclusion are rare. Those programs that do manage to make these links generally display features like in-depth field-work, internships, and real-life situations (Herrity & Glassman, 1999). Other kinds of local- or school-based session that bring teachers and parents together to share their respective areas of experiences tend to generate more useful knowledge (Ryan, 2006a). Organization learning is another way to generate school-wide learning (Senge et al., 2000).

Other formal professional development activities designed specifically to help teachers deliver various kinds of inclusive education have had mixed results. They generally have a limited impact on teachers' ability to deliver such programs (Sleeter, 1993) and have had mixed results in changing their attitudes (Robertson, 1998). The success of these programs often depends on things like support for the program and the respective climates in the teachers' schools. Other programs favor methods that minimize confrontation (Gillborn, 1995). Advocates believe that confrontational tactics designed to combat racism, for example, tend to reinforce the guilt of many well-meaning whites, paralyzing them when issues of race arise, burying racism, creating resentment and anger, and putting an end to any meaningful discussion. The best results are achieved in schools that manage to find a balance that maintains pressure to reflect on current assumptions and practices without being confrontational in a way that merely reproduces and amplifies current conflict. This strategy acknowledges that people make mistakes and that these mistakes should be acknowledged and discussed in a constructive manner (Ryan, 2003a).

The type of education and understandings that school members acquire is also important. If they are to understand what needs to be done to promote inclusion, then administrators, teachers, students, and parents need to develop a form of critical consciousness (Ryan, 2003a, 2006a, 2006b). Critical understandings can help everyone understand the social circumstances in which they find themselves and, in particular, exclusive practices that are not always easy to identify. The latter are often so ingrained in daily life that educators may not pay much attention to them (Taylor, 2006). Indeed, it is not uncommon for teachers and administrators, for example, to display color, spiritual, and class blindness (Larson & Ovando, 2001; Shields, 2003). Critical skills can assist people to understand the basis of claims, the assumptions underlying assertions, and interests that motivate people to promote certain positions. They can help people to recognize unstated, implicit, and subtle points of view and the often-invisible or taken-for-granted conditions that provide the basis for exclusive stances and practices.

Developing a critical consciousness requires that school communities reflect on their ideas and practices. Critical reflecting involves consciously pausing, stepping back from daily routines, and inquiring into one's own and others' thoughts and actions. It is first and foremost a social activity, not just an act of an individual looking at his or her private self. Critical reflection involves critiques of social arrangements, but it, somewhat ironically, also necessarily occurs within these same social arrangements. The problem is that reflectors need to think in new and different ways, but they must do so by employing the resources that this social environment provides them with. The way for educators to break out of this confinement is to engage others—particularly different others—in critical conversations (Ryan, 2003a, 2006a). Such conversations can help school communities acknowledge, recognize, critique, and change the often-invisible practices that impede inclusion.

Administrators do a number of things to promote critical conversations (Ryan, 2006a). First, they can support an atmosphere that encourages critique. Members of school communities will be more willing to look critically at things if it is the norm, that is, part of the school's culture. Administrators can also help members critically reflect by sponsoring activities specifically designed for such purposes. These involve testing out platforms with diverse others, modeling, maintaining records of meetings and policy deliberations, examining case records and studies, utilizing two-column analyses that involve comparisons, employing various scenarios analyses, and participating in simulations and value audits (Coombs, 2002). Various arts-based methods, including a "jujitsu" technique (Ryan, 1999), can also be useful. Administrators can also stimulate critical conversations by asking questions like: "What is happening here?" "Who says this is the way things should be?" "What other purposes are being served?" "Whose voices are being excluded, denied and silenced?" "What prudent action can be adopted?" "Who can we enlist to support us?" (Smyth, 1996).

Administrators also focus their inclusive efforts on school-community relationships.

Fostering Inclusive School-Community Relationships

For schools to be truly inclusive, they need to include the wider community in their various activities. This is a particularly challenging task in diverse communities (Ryan, 2002b, 2003a). Inclusive-minded educators are not the only ones committed to this end, however. Many others also embrace the idea of including parents and community members. Rejecting past practices that endorsed the separation of school and community, both conservative and progressive proponents of recent school reform, for example, have sponsored changes that have paved the way for parents and community members to take up roles and responsibilities formerly assumed by professional educators. Many administrators also favor such practices. They do so in one of two ways—as a form of enablement or a type of empowerment (Lewis & Nakagawa, 1995). Advocates of the former look to give parents a voice in governance arrangements by altering structural arrangements. Proponents of the latter, on the other hand, do not see power differentials or unfair structures as a problem. Instead they believe that it is up to educational professionals to reach out to the community, providing incentives for parents to become involved in their children's education.

Overall principals in Ontario tend to be more concerned with enabling rather than empowering parents and community members (Ryan, 2002b, 2003a). Most attempt to make contact with individuals and groups, understand, and encourage them to become involved in their children's education in whatever way they can. They are less concerned with including parents in governance matters. The reason that principals concentrate on getting parents to participate is because of the gulf they see between schools' culture and the culture of many of the community groups. These mostly Anglo principals often know little of their languages, values, cultural practices, and attitudes toward education. Many community groups, on the other hand, frequently find the school culture puzzling. As a result, administrators believe that exchanging information with the community is vitally important.

Administrators employ a number of strategies to exchange information with their diverse communities (Ryan 2002b, 2003a). Some use handbooks and newsletters. Handbooks generally contain information about such things as school personnel, school programs, schedules, rules, and regulations. Most are employed at the high school level, generally sent home with students at the beginning of the year. Some high schools generate school newspapers, which, although directed at students, also prove to be a useful source of knowledge for parents. Elementary schools tend to use newsletters to heighten parents' awareness of the school. While many schools recognize the value of second (and third)-language newsletters, many do not have the resources to employ a language other than English. Schools also acquire information about the community by sending out questionnaires and surveys. They employ them to get a sense of their communities and to do other things, such as, create a school vision.

Administrators also speak of the value of directly interacting with parents. They do many things to forge relationships with parents and community members and organizations. Administrators learn that they need to be aware of interactional protocols and to approach key figures—"those in charge" with some communities or "elders" in others (Ryan, 2002b, 2003a). Initiating interactions is also important. Administrators do such things as waiting to interact with parents before and after school, going out into the community to see parents, and encouraging teachers to do the same. They also attempt to establish connections with religious, cultural, social service, and business groups. Perhaps the groups that they seek out most are the religious and cultural groups because connections with these groups can help them get to know the community better and vice versa.

Administrators employ a number of strategies for bringing parents and community members into contact with the school (Ryan, 2003a, 2006a). The most obvious is the traditional parent-teacher nights. Many administrators, however, find that these events tend not to attract many parents, particularly at the high school level. A few administrators employ other tactics, doing things like including students at these events. Others introduce other sorts of activities to attract parents who would not normally attend parent nights. These include orientation barbecues at the beginning of the school years and education sessions to help parents better understand the workings of the school. Administrators also claim that providing translation services, drop-in centers, and coffee hours also encourages parents to come to school.

Other initiatives include inviting parents to come into the school to help out with various tasks, such as, checking out library books, helping with lunch hour supervision, accompanying students on field trips, and using parents for their various areas of expertise. Finally, schools that offer English as a Second Language (ESL) tend to have a measure of success in bringing parents into the school to learn. The best way to get parents involved in the school is to have parental presence as a part of everyday activities; in these scenarios parents are comfortable coming and going as they like, becoming a natural part of the school landscape (May, 1994).

Administrators admit that it is more challenging to empower parents and community members than it is to enable them (Ryan, 2002b, 2003a). Most of those who do encourage parents to become involved in governance activities report poor results. They maintain, for example, that they have difficulty convincing parents to participate in school councils, particularly those parents from diverse cultural backgrounds (Hatcher, Troyna, & Gewirtz, 1996; Ryan, 2003a; Wang, 1995). Another issue that concerns administrators is school council influence issues. Councils tend to be dominated by middle-class Anglos (Chambers, 2001; Hatcher et al., 1996; Ryan, 2003a) and educators, including administrators, who possess more background knowledge and are able to master the abstract language used in these settings better than most parents (Leithwood et al., 1999; Malen & Ogawa, 1992). A final issue concerns the influence of the councils. In Ontario, for example, these councils only have an advisory role. Even so, some administrators maintain that they attempt to honor decisions taken by these councils.

Administrators also promote inclusion by advocating in strategic ways.

Exercising Strategic Advocacy

It is not always easy to encourage or implement inclusive practice in schools. This is because, as mentioned above, advocates of inclusive practice often encounter resistance. This is why advocates need to be prepared to actively promote inclusion. There are a number of things that leaders can do to advocate for inclusion and for those who are often excluded. These include imposing it, persuading people, and maneuvering and establishing links with marginalized groups. It is also important to advocate in strategic ways.

Administrators do many things to advocate for inclusion. One tactic is making inclusion nonnegotiable (Ryan, 2006a). In certain situations administrators may have no option but to insist that members of their school communities adhere to inclusive policies and practices (Keys et al., 1999). Imposing inclusion in an authoritative manner, however, is not an ideal strategy, even though there may be few other options in certain circumstances. To begin with, this sort of insistence contradicts the inclusive mandate; it is decidedly exclusive. Another problem with this path is that an administrator can only do this effectively when he or she has the power to do so. While administrators may hold a certain amount of positional power, this does not always translate to an ability to influence everything that goes on in schools.

The other related issue with this tactic is that it may nurture resistance where there was none before. Some people may decide to resist forceful overtures, and this can turn out to be a problem in cases where the person or people advocating for inclusion do not have the power to enforce it. A more ideal strategy is to have people embrace inclusion on their own.

One way to get people to voluntarily accept inclusive initiatives is to persuade them. To do so, administrators employ various techniques to convince school or community members of the value of equity programs or prompt central office administrators to support a policy initiative or give them much needed resources. They use various information-circulating techniques, modes of prompting, guided discussions, questioning, and provoking and adopt various arguments to get their points across (Ryan, 2010a). Administrators also supply academic articles and student performance data for educators to mull over and make available stories, videos, and people's experiences to get their teachers, parents, and students to buy into their ideas about equity. Many note that it is important to use appropriate language and that the best way of getting their points across is not to preach but to present their positions in ways that their audiences accept them on their own.

Another way to promote inclusive agendas is to establish links with like-minded groups and individuals. This is not always easy to do in a neoliberal world that values individualism and market competition and sets people against one another (Ryan, 2012). Even so, inclusive-minded administrators will be more likely to be open to various overtures, requests, and new initiatives if they have good working relationships with people with whom they work. People will also be more likely to listen to and embrace inclusive ideas from administrators whom they trust. Inclusive-minded educators are likely to find like-minded individuals among disadvantaged groups. So it is in their interests to work with these groups to adopt strategies associated with social movements, including creating networks that support local activism, framing stories about the network's identity and purpose, and developing means to acquire resources necessary to advance the group's goals (Oakes & Lipton, 2002).

As ideal as the former strategies may be, it may not always be possible to persuade people to embrace inclusion. In these cases, it may be necessary to do more than present lucid cases to resisters. Administrators will need to adopt other more aggressive strategies. These include trading and bargaining. They may find that in order to get what they want, they will have to give something up. Other strategies of this sort include stalling and maneuvering. Stalling make be necessary in instances when exclusive policies are foisted on school communities. Delaying can give those who are involved time to plan and mount campaigns to resist such practices. It can also give them time to explore alternate paths and explore other options (Ryan, 2006a).

While advocating is a key element in promoting inclusion, it needs to be done in a particular way in order to be successful. In other words, advocates of inclusion need to be strategic in the moves that they make. This requires them to be "political," that is, they need to engage in the micropolitics of their respective organizations (Ryan, 2010a). If they choose to ignore this side of institutional life, they risk being marginalized, ignored, or, at the very least, unsuccessful in their inclusive initiatives. Administrators tend to fall into three groups when it comes to approaching micropolitics: some refuse, ignore, or are ignorant of them; others say that they prefer not to engage in micropolitics, but actually do so; the third group actively participates. Participating in micropolitics means that politically aware administrators are aware of the political environment around them and put this awareness strategically into practice.

Coming to an awareness of organizational micropolitics involves acquiring knowledge of organization dynamics. In this regard, it is crucial for administrators to understand school cultures, community dynamics, and the wider system idiosyncrasies. Understanding these realms requires that they come to know, or know about, the people who work in the system—teachers, parents, and central office people—and their values and priorities. This includes understanding the not-always-obvious system conventions and the people who occupy significant positions in the system. Political astute administrators say that it is important to know who has power, what kind of power they possess, and how they are likely to use this power. But power is not necessarily associated just with a person's formal organizational position, however. Instead, it is often a product of the kind of relationship people have with others. So, it is important for administrators to understand these kinds of relationships and the relationships that they have with these powerful others in order to know who is likely to support their initiatives and interests. For administrators one particularly effective strategy for getting to know people across school districts is to sit on district-wide committees (Ryan, 2010a).

Being strategic means carefully assessing situations before deciding what strategies to employ, when to use them, and when to pull back. Politically minded leaders consider a number of factors before making the decision to act. These include, among other things, considering the history of the issue, who is involved at the time, whether the situation is "readable," and how much they can "push." They also recognize that there are situations where they need to pull back. Many administrators admit that they learn how to act strategically through their experience. Even so, some are more prepared to learn than others. More experienced principals are generally more tuned into their political environments and have a more acute sense of what to do to get their desired ends. Many of these administrators have learned a great deal over the years, much of it from the mistakes that they have made. Some have strategies for dealing with tricky situations. These include making notes of challenging events, storing them away, and consulting them when challenging situations arise.

Changing School Institutions

The task for inclusive-minded educational administrators and educators is a formidable one. They face many challenges in their quest to make schools more inclusive places. Perhaps the biggest challenge is changing the very structures that generate the obstacles to inclusion. Exclusion is deeply embedded in school structures; racism, sexism, classism, homophobia, and ableism, for example, continue to find their ways into schools and classrooms. But other structures also get in the way of inclusive changes. Long-standing organizational hierarchies and more recent quasi-market environments can exclude individuals and groups from decision-making processes and from various opportunities that schools have to offer. If schools are to change their exclusive structures, then they will need to move beyond the superficial changes on which many educators prefer to focus. They will need to change not just the obvious, more formal structures, like policies and rules, but also the more subtle, taken-for-granted, and informal exclusive patterns and practices that pervade schools. This, however, is not an easy thing to do.

There are things that administrators can do to promote inclusive practices in their schools. As this chapter has illustrated, they can employ communication practices, use critical learning strategies, foster school-community relationships, and exercise strategic advocacy. There are also other measures that they can employ to facilitate the transition to more inclusive institutions. Research (Blase & Blase, 1997, 1999, 2002; Bredeson, 1989; Crockenberg & Clark, 1979; Datnow & Castellano, 2001; Epp & MacNeil, 1997; Leithwood et al., 1999; Ryan, 2006a, 2006b, 2006c; Short & Greer, 1997) indicates that transition to inclusive arrangements moves along a little smoother if the following conditions are in place. These include: decision- and policy-making arrangements that give teachers, parents, and students real power; locally controlled processes that allow school members to frame a definition of empowerment; roles that are clearly specified, but not overly constraining; a climate that supports risk taking; processes for helping participants solve problems and manage conflict; a mechanism for providing adequate resources; schedules that allow everyone the extra time they need to participate in leadership activities; and an ongoing process for educating participants. There will be no guarantee that the presence of these conditions will enable a change to a more inclusive school environment, but the chances are that they will make such a transition more possible and less painful.

The other element that change-minded inclusive educators need to keep in mind is that school institutions are intimately associated with the local and global communities in which they are embedded. What happens outside school walls can, and most often will, have an impact on what goes on within schools. Neoliberal sensibilities, for example, continue to dominate economic practices on the international stage and to penetrate schools; racist, sexist, classist, etc., practices flourish around the world and in classrooms; and hierarchies abound everywhere. The consequence of this is that for enduring changes to happen in schools, the world outside will also have to change. And so educators have to also work on these external changes. They will have to educate their students to go forth and change the communities in which they live in, and they also need to do their own work with others to formulate and enact plans to resist the exclusive world around them. Only in this way can they bring about the desired inclusive changes in their own institutions.

Chapter 22

Toward a Framework of Research and Practice for Social Justice Leadership: The Case of Cyprus

Michalinos Zembylas and Sotiroula Iasonos

Introduction

School leaders in the Republic of Cyprus (henceforth Cyprus), like those in many other countries, face the new reality of working with children who speak a variety of languages and bring with them different cultural values and practices. With increased migration in Europe and around the world, diversity creates new challenges in schools and has a major impact on the work of school leaders (Billot, Goddard, & Cranston, 2007). Existing scholarship draws attention to the important role that school leaders play and emphasizes the need for leadership studies that "identify the particularity and diversity of cultural and contextual conditions within which leadership takes place" (Dimmock & Walker, 2005, p. 2). However, recent calls by a number of scholars in educational leadership point out the scarcity of studies that investigate issues of diversity and multiculturalism, particularly in relation to *social justice* concerns (e.g., see Coleman & Cardno, 2006; Goddard, 2007; Marshall, 2004; Theoharis, 2009).

During the past two decades, the term "social justice" has often appeared in numerous publications in the field of education (North, 2006). The fact that education has taken interest in the notion of social justice, points out North, is the result of recognizing that social justice issues are directly relevant to fundamental changes that are taking place in society and in schools. These changes include the growing diversity of school populations, the increasingly documented issue of gap between the performance of minority children and that of children belonging to the majority culture, as well as the proliferation of social inequalities and economic disparities as those unfold in schools on a daily basis (Bates, 2006). As it is pointed out, the meaning of social justice changes, depending on the different perspectives and social theories

in which understandings of social justice are grounded (Zajda, Majhanovich, & Rust, 2006). As further noted by Rizvi (1998), there isn't a single meaning of social justice, but rather social justice "is embedded within discourses that are historically constituted and that are sites of conflicting and divergent political endeavors" (p. 47). Not surprisingly, the different interpretations of social justice reflect "the contested and competing interpretation of the term in a culturally and ideologically diverse world" (Zajda et al., p. 13).

This chapter seeks to explore the lack of engagement with the notion of "educational leadership for social justice" in Cyprus. It may sound surprising that there has not been any research on educational leadership for social justice in Cyprus so far, but some explanations will be discussed in consideration of the social and political circumstances of this country. Cyprus remains a deeply divided society since 1974, when Turkey invaded and still occupies the north part of the country. In addition, the increasing number of immigrants during the last few years adds another complexity in the social and political reality in Cyprus. Although one might expect that issues of educational leadership for social justice would be taken up as an important line of research and practice—e.g., issues of justice, equality, and human rights could also be raised in relation to the unresolved political problem of Cyprus and increasing immigration—the reality has been rather different. Therefore, our goal is to seek some understanding of why social justice leadership has not been explored so far in the context of Cyprus and then to develop an initial theoretical framework and a plan of action that can promote research and practice for social justice leadership in the future.

The first part of the chapter reviews briefly how we perceive the notion of social justice (education) and its link to educational leadership, particularly in relation to issues of multiculturalism. The next part of the chapter focuses on how the link between multiculturalism and school leadership is manifest in Cyprus and discusses the prospects of "social justice leadership" in the context of a divided society. The final part of the chapter describes our suggested framework to advance research and practice on social justice leadership in light of the social and political circumstances in this society.

Social Justice (Education), Educational Leadership, and Multiculturalism

Many definitions of "social justice" refer to an "egalitarian society that is based on the principles of equality and solidarity, that understands and values human rights, and that recognizes the dignity of every human being" (Zajda et al., 2006, p. 10). Social justice is "democratic and participatory, inclusive and affirming of human agency and human capacities for working collaboratively to create change" (Bell, 1997, p. 4) with the objective of "full and equal participation of all groups in a society that is mutually shaped to meet their needs" (ibid, p. 3). Given that in every society the principles of solidarity, equality, human rights, and political participation are manifest differently(Artiles, Bal, & Thorius, 2010; Loewen & Pollard, 2010), we adopt the idea that social justice is not a fixed state, time, or place to "arrive" at (Quin, 2009) but rather a *process* and an *objective* that is contextually based.

If the meaning of social justice is largely contextual, then achieving social justice is very much related to the social and political circumstances that exist within a particular setting (Quin, 2009). The influence of social and political challenges—such as, for example, ethnic or religious conflict and/or increasing immigration in a society—is evident not only in the everyday practices of division and marginalization of certain groups but also in the "unconscious reactions, habits and stereotypes that reproduce the oppression" of these groups (Young, 1990, p. 150) and prevent forms of empowerment and inclusion of others (Ahmed, 2004). These forms of disempowerment and exclusion may not leave much room for the success of educational activities that encourage equal participation, knowledge of social injustice, and action to promote principles of solidarity, equality, and human rights. Although the notion of "social justice" is often utilized by educators, educational researchers, and school leaders in their talk and writing, there is not always a reflection on its social, cultural, economic, and political significance and implications (North, 2006).

In particular, *social justice education* is the education that acknowledges the social, cultural, economic, and political significance of social justice and serves as a foundation of providing opportunities for students which have two aims: first, social justice education equips students with knowledge and skills to strengthen their struggle against social inequality and exclusion, and second, it encourages the students' active engagement with the social and political problems of their society so that they participate in the solutions of these problems (Indrašienė & Merfeldaitė, 2010). Social justice education, as further noted by North (2006), "should both teach students how to examine critically and in sustained ways the relationships among and consequences of White supremacy, patriarchy, and advanced capitalism and help them translate these critiques into collective, transformative political action" (p. 515).

Carlisle, Jackson, and George (2006) write that under the principles of social justice education the school, and especially school leaders, must promote inclusion and equality within the school setting and the wider community and must address all forms of social oppression being encountered. A socially just school leader provides a diverse and challenging learning environment that supports learning development, maintaining high expectations for the entire student population. Moreover, a socially just school follows a system-wide approach, whereby "the mission, resource allocation structures, policies and procedures, and physical environment, exemplify its commitment to creating and sustaining a socially just environment between and among various constituency groups and in all areas of the system" (ibid, p. 57). According to Quin (2009), for social justice education to become reality, the school leaders, teachers, and students need to be empowered and enabled to act in anti-oppressive ways toward social justice, not act justly or fairly only.

Particularly in relation to issues of diversity and multiculturalism, social scientists and educators argue that schools, teachers, and educational leaders should be responsive to diversity within their communities (Day, Harris, Hadfield, Tolley, & Beresford, 2003). Despite this seemingly progressive stance, the discourse of diversity and multiculturalism “has been mobilized and operationalized in educational policy and practice within market and managerialist frames that tend to limit the possibilities of delivering its promise of more inclusive and equitable schooling” (Blackmore, 2006, p. 182). According to Blackmore, neoliberal managerialist discourses have a negative effect on multicultural approaches in schools because neoliberal discourses privilege learning for self-interest and leadership as an individual accomplishment rather than a collective practice. Consequently, dominant discourses of multicultural education reforms in Western societies are more in alignment with the deregulatory aspects of the increasingly managerial and market orientation of schooling, dismissing social concerns about social justice, transformation, and the reduction of inequality (Gewirtz & Ball, 2000). The standards movement, the privatization of education, and the growing achievement gap between privileged and underprivileged students are only few of the issues affecting leadership in relation to multiculturalism and social justice (Cambron-McCabe, & McCarthy, 2005). It is these issues that have gradually constituted multiculturalism a “risky business” for school leaders favoring high scores in student outcomes as evidence of success (Blackmore, 2006).

The different discourses on educational leadership in relation to multiculturalism and diversity may be classified under two main approaches. On one hand, there is the discourse of *managing diversity* and multiculturalism that is based on maximizing individual potential so that recognizing and using diversity/multiculturalism adds value in terms of students’ learning (Blackmore, 2006; Gunter, 2006). The aim is to assimilate differences through celebratory practices of diversity, multiculturalism, and heterogeneity. The structural inequalities and disadvantages are not recognized and concerns about social justice, equity, and care are put aside (Gewirtz & Ball, 2000). School management through funding based on enrolments and a market focus on comparable national and international performances as measured by standardized educational outcomes are indications of the commoditization of education and the inability of school leaders to deliver equity (Blackmore). This market radicalism and the reduction of funding in education ignores equity implications, increases accountability demands for compliance on outcomes, and loosens compliance with regard to equity and social justice (Gewirtz, 2002). Such policies tend to promote a trend for “like” students to concentrate in particular schools and thus promote social exclusion. As Blackmore writes: “Diversity framed by neo-liberal discourse of choice is thus reduced to meeting the preferences of individual choosers in terms of offering a diversity of schools and programs, while ignoring how some have more choices, or how choice facilitates any disposition to be with those ‘like themselves’” (p. 188).

On the other hand, there is the discourse premised on *social justice* and critical transformative perspectives on multiculturalism as values placed at the heart of educational leadership (Gewirtz, 1998; Greenfield & Ribbins, 1993; Hodgkinson, 1991). In their review of literature on educational leadership and social justice, Larson and Murtadha (2002) call for school leaders to collectively work toward *social justice leadership*. Social justice leadership means that school leaders make issues of social inclusion and multiculturalism (race, class, gender, disability, and other historically marginalized conditions) central to their leadership practice and vision (Theoharis, 2007, 2009). Taking this approach enables questions to be asked about how social, cultural, political, and economic advantages and disadvantages are replicated in school organizational structures and cultures. The purpose for school leaders from this standpoint is to achieve more equitable outcomes for all (Blackmore, 2006). Contrary to managing diversity discourse's assimilationist view, social justice leadership does not simply recognize and respect difference rather than assimilating it but also struggles for more equitable redistribution of resources (see also Gewirtz, 1998; Theoharis, 2007).

This brief review on how social justice (education), multiculturalism, and educational leadership are entangled forms an important theoretical background for the study of social justice leadership in the social and political context of Cyprus. We particularly want to highlight two aspects of this entanglement: first, educational leadership for social justice within a society that is not only increasingly multiculturalist but also ethnically divided can and should be viewed as an important vehicle for enhancing the capabilities of school leaders to promote ideas and practices based on equality, solidarity, and human rights for all, and second, educational leadership for social justice within such a society needs to work toward a vision that encourages school leaders, teachers, and students to take an active stance and to take responsibility for social change on the basis of these common values (i.e., equality, solidarity, and human rights for all). The following part of the chapter discusses the link between multiculturalism and educational leadership in Cyprus and evaluates the prospects of social justice leadership in light of the particular social and political challenges in a troubled society.

Multiculturalism, Ethnic Conflict, and Educational Leadership in Cyprus: The Prospects of Social Justice Leadership

Cyprus has traditionally been a country of out-migration throughout the twentieth century, especially after the 1974 Turkish invasion that divided Cyprus into its north part (still occupied by Turkey) and its south part (the government-controlled area). However, migration of labor to the Republic of Cyprus started in the 1990s as a result of the relatively quick economic boom that has turned Cyprus into a host country for immigrants (Spyrou, 2009). Although there are no official figures, it is now estimated that migrant workers from different ethnic and racial backgrounds total between 60,000 and 80,000 (Trimikliniotis & Demetriou, 2009). The issue of growing immigration, however, is further complicated by the unresolved political problem—known as the "Cyprus Issue"—that raises serious security and other concerns. Cyprus remains a deeply divided and segregated society due to the protracted nature of the historical conflict between the two larger communities on the island, that is, the Greek Cypriots and the Turkish Cypriots. The ongoing division of the island since 1974 and the resulting consequences at the sociopolitical, economic, psychological, and other levels influence all aspects of everyday life in Cyprus. Although there has been a partial lift of restrictions in movement between the north part and the south part of Cyprus since 2003, the challenges of resolving the Cyprus Issue and reuniting the country remain.

The recent population differentiation in the Greek-Cypriot society as a result of increasing immigration has not come without a price. In the recently published fourth report of the European Commission for Cyprus against Racism and Intolerance (ECRI, 2011), there are many references to increasing xenophobia and racist attitudes toward immigrants, asylum seekers, and refugees expressed more openly than in the past in political discourses, the media, the workplace, schools, and everyday life. These references are also characterized by significant racial discrimination and exploitation with respect to housing as well as clear evidence of racist and xenophobic tendencies in the healthcare system. Along the same lines are the findings of the European Social Survey of 2007, which records the change or continuation in attitudes, behaviors, and values of European citizens in a range of social, political, and cultural issues, depicting Greek-Cypriot society as xenophobic and racist, with its citizens believing that the presence of people from other countries undermines the cultural life and traditions of the island.

Within this complex social and political context, the Greek-Cypriot educational system has not remained unaffected. Having always been based on a single culture as a result of the historical separation of education in the two ethnic communities, the Greek-Cypriot educational system has been affected by the great demographic changes which resulted in the profiles of the schools being changed as a consequence. The rise of immigrant students is reflected in the annual reports of the Ministry of Education and Culture over the last 15 years. While the percentage of "nonnative" students during the 1995–1996 school year was 4.41 %, this rate rose gradually to 13 % by 2011–2012; as a result, there is a growing number of "multicultural schools" (Zembylas, 2010b).

Despite the potential for local intervention and development of special programs at each school in the context of multicultural education, the Greek-Cypriot educational system is so centralized (Pashiardis, 2004) that for any substantive multicultural efforts to succeed, there has to be political will, funding, and direction from the Ministry of Education and Culture (Trimikliniotis, 2004). As Johnson et al. (2011) point out, "To date, the principal's role in Cyprus has mainly been conceptualized in terms of their influence on the mainstream student population" (p. 155) and further add:

> The reality is that most of the 455 school principals in Cyprus have had little formal preparation to understand and respond to the needs and perspectives of students and their families from culturally diverse backgrounds. This is particularly true in those schools with a small percentage of ethnic minority students because the policy on intercultural education does not provide for the introduction of special professional development in these settings. (ibid.)

A review of previous work on educational leadership in Cyprus suggests that there is little research activity investigating principals' approaches to cultural diversity, inclusion, and particularly social justice. Although there have been numerous investigations exploring school leadership models in Cyprus (e.g., Kythreotis, Pashiardis, & Kyriakides, 2010) and their relation to student achievement (e.g., Brauckmann & Pashiardis, 2011), very little work has been done to link leadership practices that promote inclusive education in Greek-Cypriot schools (for an exception see Angelides, 2011; Angelides, Antoniou, & Charalambous, 2010). However, none of this work makes any explicit connections between leadership and social justice.

Nevertheless, previous research findings lay the ground for further investigation and a possible combination of a model-building approach to leadership and social justice in the context of Cyprus. Pashiardis (2004), for instance, mentions that one of the characteristics of a successful leadership style is creating a democratic, egalitarian school that accommodates all students, regardless of their background. Also, there is evidence that inclusion can be promoted in Greek-Cypriot schools, if there are systematic efforts by principals toward developing a collaborative, participative, and inclusive school culture (Angelides, 2011; Angelides et al., 2010). A broad understanding of inclusive education in terms of efforts to overcome obstacles that prevent the participation of all children in schools, regardless of race, gender, social background, sexuality, disability, or attainment (Ainscow, Booth, & Dyson, 2006), reflects social justice concerns (Lingard & Mills, 2007). Once again, however, there is no empirical evidence in Cyprus that *shows* the relationship between social justice leadership and inclusive education.

In our own work (e.g., Zembylas, 2010c; Zembylas & Iasonos, 2010), we have suggested that there is inadequate leadership preparation for cultural diversity and social justice in Cyprus. A qualitative research study that we conducted with 17 school principals of multicultural primary schools in Cyprus during the 2008–2009 school year investigated primary school principals' approaches to diversity and multiculturalism and the relationship of these approaches to the principals' leadership styles. The study found that there was a close relationship between a conservative approach to multiculturalism and transactional leadership, a finding representing approximately half of the sample. The study also discovered that the pursuit of uniformity and maintenance of the status quo was an important aspect of this group of principals' understanding of conservative approach to multiculturalism and transactional leadership.

There are a number of reasons why the majority of school principals may adopt conservative ideas in Cyprus when it comes to issues of multiculturalism. Firstly, the centralized educational system of Cyprus seems to encourage a transactional model of leadership (see Pashiardis, 2007), and so it appears that the application of assimilationist policies creates a restrictive environment for school leaders and teachers alike. The underlying assumptions of these policies appear to be politically conservative, and thus it is not surprising that a large number of principals adopt conservative multiculturalism attitudes (see Aveling, 2007). This assimilationist view of multiculturalism is clearly associated with the approach of "managing diversity" that has been discussed earlier. In addition, the Greek-Cypriot educational system may not have at the moment some of the concerns that trouble Western societies (e.g., the standards movement), yet the achievement gap between native and ethnic minority students (see Theodosiou-Zipiti, West, & Lambrianou, 2011) and the increasing privatization of education provide serious obstacles in efforts to reduce inequality and discrimination.

Rizvi (1993) explains that most administrative work takes place in a conservative context that does not encourage radical reforms, especially when it comes to issues of diversity and multiculturalism. Most schools strive to find ways to get everyone to meet common goals and purposes (Ryan, 2003); after all, many principals in our study emphasized that minority students should "follow the curriculum of the country that hosts them temporarily." Even though many schools may on the surface promote values of diversity, democracy, and inclusion, "they actually operate under conditions that embody a competing set of values, like obedience, compliance, routine, conformity and homogeneity" (Ryan, p. 160). As Ryan maintains, the effects of this process into which school principals are socialized are enhanced by the investment they have in the system that have made it possible for them to acquire their current comparatively elite positions. Therefore, it is unlikely that they entertain any considerations of radical change. Likewise, many principals in Cyprus do not seem comfortable with diversity and the fundamental changes to a system and a society in which they have an investment. Most principals are more likely to attribute problems to the presence of non-indigenous families in the society.

In addition, the unresolved political problem of Cyprus seems to create much uncertainty and skepticism among many Greek Cypriots, so they see immigrants, asylum seekers, and in general anyone who is not Greek-Cypriot through a very hostile lens (Zembylas, 2010a, b). The priority of Greek-Cypriot concerns for issues of human rights violations of their "own" community exclusively also prevents opportunities for solidarity and inclusion of other communities, including the immigrants and Turkish Cypriots (Spyrou, 2009; Zembylas, 2011). Unavoidably, the culture of avoidance to raise these issues for other groups and communities may add to our understanding why there is lack of interest for social justice matters in educational leadership. Additionally, the lack of public and educational discourses on social justice leadership may also be related to its leftist connotations and the fairly conservative political landscape in Cyprus (Zembylas, 2008); thus, it is possible that social justice leadership might be viewed suspiciously by conservative political parties and teacher organizations as an effort by the leftist political parties to impose their agenda in education.

On the other hand, it is encouraging that there is some evidence of a few school leaders who adopt critical perspectives and social justice leadership concerns (Zembylas, 2010c; Zembylas & Iasonos, 2010). These school leaders are open to change and more fundamentally embrace its prospect in terms of capitalizing on students' diversity. They see themselves as transformational agents who can make schooling an experience that enhances the social and academic development of all students. These principals also emphasize the importance of acknowledging social injustice and racism and critically analyzing their implications. They also maintain the need to teach empathy and critical thinking aimed at achieving understanding of differences in positive ways (Shields, 2004). This position is in line with the discourse premised on social justice and critical transformative approaches on multiculturalism and school leadership (Theoharis, 2009). The principals who adopt this discourse provide an important basis to explore the prospects of social justice leadership in Cyprus. Our goal in the remainder of this chapter is to offer readers our framework for a more systematic approach to research and practice of social justice leadership in Cyprus.

Toward a Framework for Research and Practice of Social Justice Leadership in Cyprus

As noted so far, existing research in Cyprus has documented multiple social and political challenges of educational leadership in an increasingly multicultural society with an unresolved ethnic conflict. As Blair (2002) suggests, strong leadership in multicultural contexts "implies the strength to deal with difficult and contentious issues and to critically examine those practices that are routinized or institutionalized in the school and to ask the crucial question, 'who is falling through the net or who is being served by our taken-for-granted ways of doing things'" (p. 185). Along similar lines, Giroux (1993) urges educational leaders to create a new language capable of asking new questions, raising new issues, and generating more critical leadership practices. In light of the added complexity of the political situation in Cyprus, future research and practice is needed in a number of areas, if a "grounded theory" of social justice leadership is going to be developed in this setting.

In adding to the growing body of literature on leadership for social justice in other countries, existing research and practice in Cyprus can be strengthened along a two-pronged framework:

1. The development of research that explores the complexities of the relationship between educational leadership and justice both in its political and its social dimensions; that is, it needs to be examined how social justice is viewed in Cyprus and how this view changes the role of educational leadership in preparing students to live as critical citizens.
2. The preparation and professional development of Greek-Cypriot school leaders needs to ensure that school leaders are equipped to support learning in heterogeneous, inclusive environments; that is, preparing school leaders to enact a social justice agenda in a divided society suggests that they acquire the knowledge and skills to enact resistance against the marginalization of particular students.

Table 22.1 shows a view of the framework which is analyzed and discussed below in more details.

Research Dimension

What clearly makes the context of Cyprus different from other countries is the unresolved ethnic conflict in combination with increasing multiculturalism that influences all aspects of social and political life. As noted by McGlynn (2008) and

Table 22.1 A framework for research and practice on social justice leadership in Cyprus

Dimension	New questions
Research	*How is (social) "justice" viewed in the context of Cyprus? Why?* *What dispositions and practices are needed to enact social justice leadership in an ethnically divided country?* *In which ways can school leaders reconcile the foundational objectives of the Greek-Cypriot educational system with the inclusion of multiple other diversities and issues of tension?*
Practice	*In what ways can school leaders participate in field-based inquiry on oppression and discrimination?* *How can successful principals of social justice be used as exemplary case studies?* *On which ideas should curricula and pedagogies be grounded to become more inclusive without putting aside contentious issues?* *How can school leaders acquire the knowledge and skills to enact resistance against racism and nationalism in schools?*

McGlynn and London (2011), there is evidence that ethnic or religious conflict adds several layers of complexity when it comes to educational leadership issues. For example, hegemonic racialization and nationalization practices within a divided society often prevent other concerns (e.g., social justice, solidarity for others who don't belong to the same religious or ethnic group) from finding their well-deserved place into school discourses and everyday practices. However, further research on how social justice leadership is enacted to sustain inclusive practices in a divided society can create "small openings" and "cracks" (Zembylas, 2008) that raise new questions (see Table 22.1) framed in social justice terms. Addressing these questions can inform our understanding of how school leaders may reconcile the foundational objectives of the Greek-Cypriot educational system—which seems to perpetuate opposing ethnic or religious identities (e.g., see Spyrou, 2009)—with the inclusion of multiple diversities, including children from the "enemy" community in Cyprus (i.e., the Turkish Cypriots).

In light of the suggested framework for Cyprus, there should be systematic research on the characteristics and practices of Greek-Cypriot school leaders who enact social justice leadership. It is important to identify principals who enact leadership for social justice, both successfully and unsuccessfully, while taking into consideration concerns about issues of identity, culture, and conflict in Cyprus. In this way, the characteristics of social justice leadership will be "localized" within the existing realities of the Greek-Cypriot educational system. For example, our framework recognizes the potential tensions between understandings of "justice"—viewed through the lens of the ongoing violation of human rights in divided Cyprus—and the goal of *social* justice as the requirement to live in heterogeneous, inclusive cultures. Some unresolved questions emanating from previous studies (see Zembylas, 2011) are, for instance: Should school leadership policy and practice be grounded on the basis of violations of human rights or should it be guided by principles of solidarity and social justice? Who decides this and how should an educational system handle issues of contentious interpretations around justice, social justice, inclusion, and political conflict? How can school leaders respond in ways that do not further paralyze themselves to act in (socially) just ways?

In planning to implement this framework in the near future, our goal is to identify school leaders who enact social justice leadership through conducting initial interviews and questionnaires with school principals of multicultural schools in Cyprus. Also, ethnographic observations and individual and group interviews will be conducted, and various documents will be reviewed and analyzed within each school setting. Once the principals who enact social justice leadership are identified, the next stage will be the development of case studies in order to highlight the characteristics of each principal within the workplace in which he/she performs his/her duties (e.g., the practices and discourses utilized), including the collection of data from various other groups such as teachers, students, parents, and members of the wider communities. The case studies will be used to write up short stories, scenarios, and other documents, identifying the "best practices" of social justice leadership so that they can inform professional development programs for all school leaders in Cyprus.

Practice Dimension

To promote a social justice agenda for educational leadership preparation programs in Cyprus, future school leaders need to be provided with explicit opportunities to critically reflect on their values and practices as well as their impact on the communities living in this setting (cf. Scheurich & Skrla, 2003). For example, these opportunities may include a range of ideas: participating in field-based inquiry on oppression and discrimination in Cyprus, identifying successful principals in schools in which social justice is at the center of learning and leadership, organizing workshops that recognize the contentious issues in the context of divided Cyprus and analyze how to respond to incidents of racism and nationalism in schools, and facilitating the creation and/or adaptation of inclusive curricula and pedagogies that respond to the complexities of the local context (cf. Billot et al., 2007; Pounder, Reitzug, & Young, 2002). In other words, what is needed in educational leadership preparation programs in Cyprus is to prepare a new type of school leader who is strongly committed to achieving social justice and draws on many fields (e.g., curriculum, instruction, political theory, cultural studies, peace education) to enable this goal (Cambron-McCabe & McCarthy, 2005).

There are various professional development models from the literature that can be adapted and used together with local case studies of exemplary social justice school leaders. For example, one of these models is the one suggested by Capper, Theoharis, and Sebastian (2006) for preparatory programs that rely on both *horizontal* and *vertical* dimensions. The horizontal dimension refers to what school leaders must believe, know, and do to lead socially just schools; that is, it comprises of knowledge and skills that are necessary to develop critical citizens in the context of Cyprus. The vertical dimension refers to the curricula, pedagogies, and assessment methods that need to be developed to create socially just schools in Cyprus. Both dimensions are important aspects to have in mind when putting together professional development programs for social justice leadership in the context of a divided society.

All in all, we share the view that a professional development program is “not the starting point to each person’s journey as leader for equity and social justice, though it would likely be an important milestone” (Rodriguez & Baum, 2006, p. 134). Therefore, there should be a systematic effort to continue each professional program at each school setting, within which the school leader will be supported by the system’s mechanisms to tackle the different needs and problems faced in each case. Action research can be particularly helpful to understand the realities in which school leaders in Cyprus perform their duties, analyze and diagnose specific problems, and explore particular ways of resolving them in context in order to improve leadership practices of social justice (see Rizvi, 1998). Needless to say, the implementation of an action plan—for example, adapting the curriculum, changing assessment methods to make them more sensitive to minority groups, and implementing school projects to cultivate social justice values and practices—cannot be done by the school leader alone; rather it is a collaborative effort that involves teachers, students, parents, specialists, and all interested groups and communities (Angelides, 2011).

At both the systemic and the micro-school levels in Cyprus, processes must be established to facilitate conversations leading to reconceptualizing social justice leadership in light of the local complexities. Putting equity on the policy agenda; examining how present curricula, disciplinary policies, and enrolment strategies exclude some students; developing inclusive school cultures and organizations; enacting in everyday practices the values of fairness, justice, and solidarity; developing the school staff to nurture the development of all students; and establishing strong links between the school, parents, and the wider communities are some recommendations that can be promoted (see also Blackmore, 2006; Dimmock & Walker, 2005; Walker, 2005).

At the personal level, it is important to provide ongoing opportunities for critical reflexivity in which school leaders in Cyprus reflect and take responsibility on the impact of their actions on students and the wider communities. Through a new language and practice of critique, school leaders in Cyprus should gradually shape a new discourse with profound implications for social justice, diversity, and multiculturalism. In particular, we refer to the process of reflection in which the leaders will tackle specifically the challenge of linking accountability to equality (Allen, 2006), but also engage with critical self-assessment of the power they can exercise to challenge the social and political status quo (Zembylas, 2008).

A social justice leadership framework such as the one suggested here can prove valuable in the context of Cyprus to assess the impact of race, ethnicity, class, gender, poverty, and disability in the educational outcomes of all students (see Lalas & Valle, 2007). In fact, the concerns of social justice leadership with issues of equality, participation, solidarity, and human rights are similar to those expressed in the Greek-Cypriot literature regarding the unresolved political situation in

Cyprus (e.g., see Pashardis, 2007). Therefore, a framework of social justice leadership can help Greek-Cypriot school leaders gain valuable knowledge and skills on how to deal with different forms of inequalities and injustices in order to improve the learning performance of all students. Within such a framework, we believe that everyday school problems related to multiculturalism and social justice issues can be critically addressed and possibly ameliorated. We refer to problems associated with lack of genuine understanding and sensitivity on the part of teachers and "native" students (ECRI, 2011); the use of difference-blind ideology (Theodorou, 2011), including stereotyping, prejudice, and cultural misunderstandings (Papamichael, 2009); and the racialization and nationalization practices that marginalize students from other social, ethnic, and cultural backgrounds (Zembylas, 2010a, b). In this case, the problems will not be solved by the leaders who "attain degrees, licenses, and skills for top positions" (Marshall, 2004, p. 7) but also by those who have "the values stance and critical reasoning to blow the whistle when policies and programs cause harm" (ibid.), endorsing the fact that social justice as a perspective recognizes and respects differences rather than assimilates them (Blackmore, 2006).

Conclusion

This chapter has made an attempt to sketch a framework that could advance social justice leadership through research and practice in Cyprus. The basic principles on which this framework is grounded are the following: the development of school and community research and development projects that promote critical consciousness and deeper understandings of diversity, structural inequalities, and social injustices; the identification and recruitment of school leaders who possess a commitment to social justice; the systematic inclusion of social justice leadership ideas in leadership preparation programs; and the encouragement of school leaders to challenge the status quo in collaboration with their teachers, students, and the rest of the communities and to seek ways to promote solidarity, equal participation, and human rights for all.

The major barriers to social justice leadership in Cyprus have been the centralized educational system and the dominance of the public and educational agenda by the unresolved ethnic conflict. The uniqueness of the context of Cyprus is that it raises new questions about how social justice leadership can be enacted in a context of ethnic conflict. These questions may often situate justice and human rights concerns (as understood "locally") in opposition to social justice agendas, because "justice" is framed mostly in political rather than in social terms too; therefore, Cyprus provides a unique context to explore the challenges of how to reconcile the foundational goals of political justice in an ethnically divided society with the agenda of social inclusion. However, if Greek-Cypriot school leaders are convinced that there is convergence between the principles of social justice leadership and those of justice, solidarity, and human rights, then this would constitute an important first step toward social justice leadership.

Chapter 23
Challenging Dominant Discourses of Home–School Partnerships in Indigenous Communities

Greer Johnson and Neil Dempster

Introduction

School leadership has taken an explicit turn towards leadership for learning in recent years (Swaffield & MacBeath, 2009). The latter concept moves towards a much more inclusive approach to teaching and learning than that implied by the term "instructional leadership", opening up possibilities for strong challenges to dominant discourses on leadership learning beyond the usual assumption that "schools know and do best". This alternative approach is generated from an understanding that social justice is a social activity. It begins with the knowledge that it looks different in various contexts. Intrinsically, social justice is not just the good intentions of morally mindful citizens, educators or families. Its distinguishing feature is that socially just actions are measurable by assessing the material differences evident in the lives of the people most impacted by unjust social practices.

This chapter reports on the project, *Principals as Literacy Leaders with Indigenous Communities*. This project offers new opportunities for Indigenous educators, families and communities to engage in a socially just approach to leadership for learning with their schools to make a difference in closing the divide between home and school learning. It is well known that Indigenous and low-socioeconomic families in general are least likely to be engaged in their children's formal schooling, for a range of reasons (Hanafin & Lynch, 2002; Jeynes, 2005; OECD, 2008). However, empirical evidence shows significant academic benefits when they are engaged (Bishop, 2011). We argue that in the Australian Indigenous schools and communities in which we are working, a leadership for learning model for assisting children to read in standard Australian English offers the prospect of better whole of life

outcomes for the children involved. The focus of the chapter is to outline a new methodology whereby Indigenous Leadership Partners (henceforth ILPs) partner with primary school principals in 45 Australian schools to enable Indigenous students to read well. The model includes Literacy Leadership Mentors (LLMs; all former principals) who provide support for principals and ILPs to gather evidence about their current home–school contexts, plan a response to the most pressing issues found and then implement an evidence-based Reading Action Project (henceforth RAP) designed to change dominant patterns of leadership and to increase levels of reading in their schools.

Central to the success of this project is the acknowledgement of capacity in members of Indigenous communities to develop new ways of leading learning. The recognition by the project of the ILPs especially is particularly important, as those involved take up opportunities to encourage more Indigenous families to learn along with their children in their schools, homes and communities. In a project aimed at raising aspirations in a low-socioeconomic community in the United Kingdom, it was found to be important that those in traditional positions of leadership are prepared to enter into a model of shared leadership with community members (Waterhouse, 2010). A key point of difference between this approach and many others that have tried to change ways of leading to enhance student outcomes in Indigenous communities, both internationally and in Australia, is the pivotal place of agency afforded to the ILPs working at the interface between homes and schools: with school principals, teachers and families. We argue that in the opportunity for agency built into the role of the ILPs lies the possibility for sustained gains from the project well after its formal conclusion.

As a background to our work, we first provide an overview of literature that underpins the design of the project before we discuss examples of progress on this kind of work.

Leadership, Learning and Partnerships

Internationally, low-socioeconomic parents remain least likely to be involved in schools (Hanafin & Lynch, 2002; Jeynes, 2005; OECD, 2008). For Indigenous parents, underrepresentation in schools is even more pronounced. Many strategies to provide more access for families to schools have been based on foundational work conducted by Epstein (1995). Pushor and Murphy (2004) argue that comprehensive parent involvement in school frameworks generated from the key principles developed by Epstein have inadvertently perpetuated a deficit view of what marginalised families and communities have to offer in home–school partnerships. An early Australian example of a strategy to include marginalised families in home–school partnerships was the *Australian Disadvantaged Schools Program* (DSP), enacted from the Karmel Report (1973). This programme aimed at facilitating new opportunities for parents and communities to input into school curriculum design and implementation. For many non-mainstream families, this led to a hollow partnership in which schools set about educating those parents seen not to meet white, middle-class values and the expectations of the school system (McCaleb, 1994). This is an example of a deficit approach to addressing educational disadvantage.

A recent report, the *Australian Family–Schools Partnerships Framework* (Department of Education, Employment and Workplace Relations [DEEWR], 2008), prompts further critique of well-intentioned attempts to build home–school partnerships, especially in disadvantaged communities. The framework outlines 11 principles for schools looking to establish equitable partnership with families to support children's learning. Importantly, this framework not only acknowledges the importance of valuing knowledge that children bring to school from their homes and communities but also stresses the importance of parents' leadership in building, maintaining and renewing home–school partnerships. It is one of very few attempts by policymakers to reconsider the notion that "schools know best".

Supporting the policy shift evident in the Australian framework is an emergent home–school partnership research base (Saulwick Muller Social Research, 2006). For example, Spry and Graham (2009) have noted in particular, Catholic Education's attempts to move to more socially just, activist, home–school partnerships by focusing on parent leadership capacities across the social and educational spectrum. Internationally, for example, in New Zealand (Bull, Brooking, & Campbell, 2008), Canada (Clandinin, Pushor, & Murray Orr, 2007) and the United Kingdom (Harris & Goodall, 2007), there is an emerging shift from a focus on mainstream parents as corporate partners in school governance to various alternative forms of less academically able parental engagement, at school and in homes. In the United States, there is emerging evidence whereby socially just leadership has effectively disrupted dominant discourses of leadership and literacy. Central to progress, in developmental work with the Guatemalan Maya preliterate women in Lake Worth, Florida, has been the premise that the teaching of functional literacy in Spanish and English (so that the women could assist their children's schooling) was only part of emancipatory social action (Sena, Schoorman, & Bogotch, 2013). At least as important as "reading the word" were opportunities for the women to learn to "read the world", based on the tenets of critical literacy (Freire & Macedo, 1995). Accordingly, in reading their worlds, the women were encouraged to challenge the community's assumptions about health risks associated with HIV/AIDS. Further, the women were encouraged to lead others in their community through knowledge sharing with adults and children.

Such an example "engage[s] critically with the voices of the least represented beneficiaries … in the construction of reflexive alternatives" (Smyth, 2010, p. 113). This literature shows the beginnings of a more equitable approach to school partnerships with families, involving new ideas for shared leadership and responsibility for children's learning. The turn in the assumptions underpinning families' partnership with schools provides a counter-attack on deficit approaches through which marginalised families are seen as poor relatives in such partnerships.

The circumstances and terms upon which parents, especially those from low-socioeconomic zones, are expected to engage with schools have received little scrutiny (Warren, Hong, Rubin, & Uy, 2009). Furthermore, there is a lack of intervention research internationally about equitable and sustainable models for engaging low-socioeconomic parents authentically in schools and learning. Research and development is beginning to rely on distributed leadership (Bishop, 2011; Spillane, Halverson, & Diamond, 2001), parent leadership (Pushor & Ruitenberg, 2005), and principals' capacity to lead literacy in schools (Dempster & Johnson, 2006; Dempster et al., 2012). The Principals as Literacy Leaders with Indigenous Communities (PALLIC) Project to which we refer builds on research evidence to construct a sustainable model whereby Indigenous parents partner and share with schools the methods of improving student outcomes in reading in English.

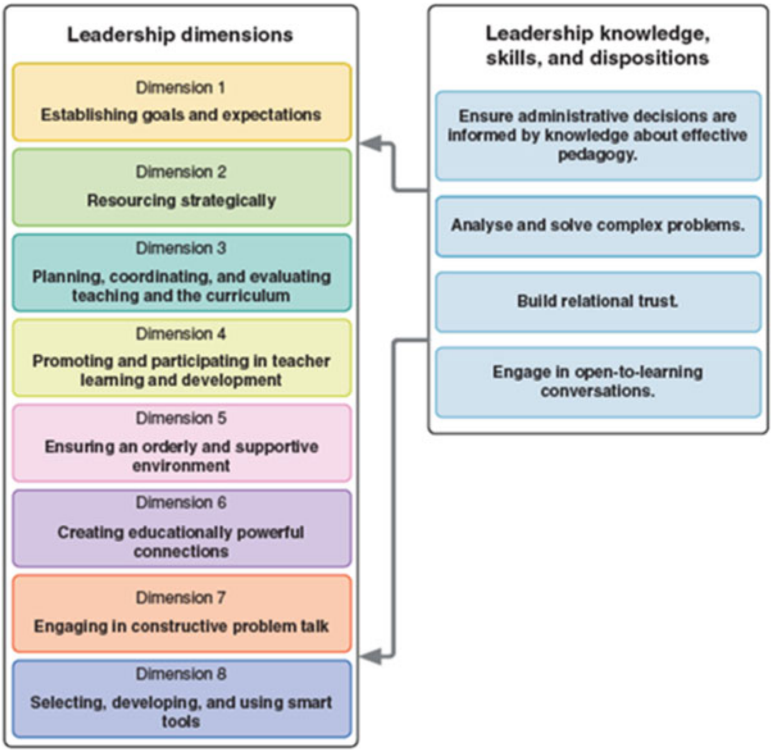
The PALLIC Project as the means of bringing about such a partnership is the key focus of the chapter. We first outline some of the research in leadership on which the initiative is based. Second, we move to a discussion of the salient contributions from the research outlining what works in learning to read in Indigenous communities. Third, we provide a description of the PALLIC Project, explaining its design through reference to the pivotal relationship between the central trio of principals, ILPs and LLMs, before outlining the five professional learning modules through which the trio worked together with academics over 12 months during 2011 and 2012. Included in the third section is a discussion of a shared research agenda. In this agenda, principals, ILPs and the academic team will collaborate to evaluate the impact that the PALLIC strategy has had on building equitable family–school partnerships intent on progressing reading in 45 Indigenous sites. Fourth, we provide a snapshot of some of the emerging good news stories from the project to this point. Finally, we return to the methodology and initial outcomes from the project. We confirm our position that the project design, generated as it is from what the literature says works for leadership, parent engagement in schools and the teaching of reading in Indigenous communities, argues for projects such as PALLIC as a viable methodology for a socially just means of sustaining family–school partnerships: partnerships that might be applied to learning needs beyond the teaching of reading.

Section 1: Research in Leadership to Support PALLIC

Before describing the PALLIC Project as a positive strategy in Section 3, we first outline some of the research in social justice leadership and reading on which the project is based.

An Informing Position on Social Justice Leadership Research

A clear emphasis in the literature of the last decade has been on leadership defined not as a position, but as activity involving human beings working together on a



Leadership dimensions
Dimension 1
Establishing goals and expectations
Dimension 2
Resourcing strategically
Dimension 3
Planning, coordinating, and evaluating teaching and the curriculum
Dimension 4
Promoting and participating in teacher learning and development
Dimension 5
Ensuring an orderly and supportive environment
Dimension 6

Ensure administrative decisions are informed by knowledge about effective pedagogy.
Analyse and solve complex problems.
Build relational trust.
Engage in open-to-learning conversations.

Fig. 23.1 Leadership dimensions, knowledge skills and dispositions. From *The dimensions of effective leadership, together with the associated knowledge, skills, and dispositions* by Robinson et al. (2009), *School leadership and student outcomes*: *Identifying what works and why*. *Best evidence synthesis iteration*, p. 49 (Copyright 2009 by Ministry of Education, Wellington)

common purpose (Frost, 2009; Spillane, 2006). Added to this general position on leadership is the compelling research finding that the enhancement of capabilities to link leadership action with improvements in learning can lead to enhanced student achievement (Leithwood, Day, Sammons, Harris, & Hopkins, 2006; MacBeath & Dempster, 2009; Masters, 2009; OECD, 2008; Robinson, Hohepa, & Lloyd, 2009). The work of Robinson et al. on the New Zealand Best Evidence Synthesis on leadership research identifies eight dimensions the work of school leaders should address if they are to influence student learning and achievement more powerfully. Figure 23.1 shows the eight dimensions together with the related knowledge, skills and dispositions leaders need if they are to take helpful action in each dimension.

The accumulating research evidence on working for improvement in Indigenous communities shows that it requires shared leadership with members from those communities able to act as “boundary crossers” between the school, families and the wider community. Leadership partnerships that enhance community capacity in a sustainable way have emerged as critical to long-term improvement in many aspects of Indigenous community life (Bishop, Berryman, Wearmouth, & Peter, 2011; McNaughton & Lai, 2009).

Russell Taylor, former head of the Australian Institute of Aboriginal and Torres Strait Islander Studies, has provided a clear description of the space that needs to be created for leaders from different cultures to work together. Taylor uses the term "intercultural" to describe a space he defines as:

> the 'meeting of two distinct cultures' through processes and interactions which retain the distinctive integrity and difference of both cultures and which may involve a blending of elements of both cultures but never the domination of one over the other. (Cited in Priest, King, Nagala, Nungurrayi Brown, & Nangala, 2008, p. 45)

Taylor's view relies on an understanding that Indigenous peoples are experts in their fields and that any kind of improvement should build on this expertise and strength. A helpful example of leadership within intercultural space comes from the work of Priest et al. (2008) after a comprehensive study of support for learning amongst the Indigenous peoples of the great Australian Western Desert. The substantive outcome from this work is the concept of "leadership both ways" – a practical expression of the collaborative and shared approach to leadership adopted in the design of the PALLIC Project.

Analysis of research findings on the professional learning of leaders has shown that authentic learning takes place over time, supported by mentors or coaches through specific tasks designed to link research with practice in local settings; in short, learning through action on the job, but learning supported by credible others (Dempster, Lovett, & Fluckiger, 2011; Huber, 2011). These dimensions of leadership are clearly aligned to notions of social justice, known in the literature as social justice leadership (Bogotch, 2002).

Our approach to social justice leadership recognises the "parity of participation" principle (Fraser, 2007) applied to economic, cultural and political justice where all participate as peers in social life. It is viewed as the "capability to function" and addresses the question – What are the central capabilities which will provide people with the ability to maximise their well-being unrestricted by discrimination or disadvantage?

When applied to Indigenous education and "Closing the Gap" strategies of which the PALLIC Project is an integral part, this version of social justice leadership includes economic justice (redistribution with a focus on basic services, facilities and infrastructure), political justice (representation by committing to engagement and partnerships with Indigenous Australians) and cultural justice (recognition emphasising the connection of policies to and by building on Indigenous culture) (Gilbert, Keddie, Lingard, Mills, & Renshaw, 2011).

More specifically, the PALLIC Project adopts the "Engoori" Leadership Strategy: It begins by honouring people and identity – who we are and what we value. This perspective provides a "strengths-based platform" to move forward. It counters deficit thinking which often starts with the question: What are the issues or problems here? (Gorringe & Spillman, 2008). A more socially just position starts with the positives and solutions that the so-called deficit group brings to the phenomenon.

This position is grounded in tapping into the strengths of Indigenous peoples to lead learning with their communities.

To sum up, the essence of the leadership research base supporting the PALLIC Project lies in shared leadership in intercultural space in which equal partners articulate common purposes to which each brings particular perspectives from which shared approaches to reading improvement are created.

Section 2: Research Informing PALLIC's Position on Learning to Read

We now move to a discussion of salient contributions from the research into Indigenous children learning to read. There is ample evidence to show that Indigenous children worldwide are at risk of difficulties in learning to read (Lonigan, 2004; Zubrick et al., 2006). Although there have been various attempts to apply different methods of teaching reading to Indigenous children, literacy wars have persisted for over 30 years, fuelled by various assumptions and beliefs about what counts as literacy, for whom and for what purposes. Indigenous children in general continue to fall below national and international benchmarks for literacy achievement. What "counts" in practice is not always evidence based, with undeserved consequences for those most in need. A key concern progressing the literacy wars into the present is the debate about what, and how, children are considered to be at risk of experiencing difficulties in learning to read. National and international studies have confirmed that explicit teaching of key skills (the "what" of literacy) to all children who are learning to read builds a solid foundation (Konza, 2006; Louden et al., 2005; Rowe & National Inquiry into the Teaching of Literacy Australia, 2005). This is especially so for children who live in communities with low English literacy skills and for those who are not progressing at least at average rates for their age level.

In Australia, the *Teaching Reading* Report (Rowe & National Inquiry into the Teaching of Literacy Australia, 2005) provided clear evidence of strategies for enhancing the literacy development of all children. Systematic, explicit phonics instruction is essential to alphabetic code-breaking skills required for foundational reading proficiency, an integrated approach to reading based on strategies to enhance oral language, vocabulary, grammar, reading fluency, comprehension and new technologies and effective support from the child's home. *Teaching Children to Read*, the US report of the National Reading Panel (2000), found that alphabetic/phonemic awareness or letter–sound training does not constitute a complete reading programme. Phonics, especially synthetic phonics/letters to sounds or phonemes and then blending sounds into words, benefits students with learning disabilities and low-achieving students and improves spelling. Guided repeated oral reading by teachers, parents and peers had significant positive impact on word recognition, fluency and comprehension across all grade levels. Vocabulary instruction leads to gains in comprehension if methods are age appropriate. Text comprehension is increased when readers relate ideas in texts to personal experience.

In the United Kingdom, the Independent Review of the Teaching of Early Reading (Rose, 2006) advised on the role that school leaders must take in leading the teaching of reading. It showed that school leaders should ensure that teachers give priority to the teaching of phonics in the teaching of beginner readers; the teaching of phonics is a priority in training and professional development for staff; at least one member of staff is fully able to lead on literacy, especially phonics work; monitoring arrangements are in place to assure the quality and consistency of phonics work; and staff receive constructive feedback about their practice.

In a turn from the what to the "how" in the teaching of reading, Rose (2004) argues for the explicit teaching of literacy skills, but he also points out that the continuation of unequal outcomes for Indigenous students can be traced back to patterns of classroom discourse in institutionalised schooling. This is not to argue that the explicit teaching of literacy skills in traditional classrooms is problematic per se for Indigenous students; rather, his research demonstrates that traditional methods of instruction, using the familiar western discourse pattern of teacher question, student response, followed by teacher evaluation (also known as IRE [Mehan, 1979]) extends the cultural divide between Indigenous students' ways of knowing that they bring to school and how they are expected to learn literacy using non-Indigenous ways in classrooms (Culican, 2005). From Rose's research (2004), the use of IRE patterns in teaching reading privileges experienced white middle-class readers who can recognise, predict and recall patterns with which they have become familiar from an early age. Reporting in his submission to the National Inquiry into the Teaching of Literacy, conducted by the Department of Education, Science and Training, Rose (2005) argued further that "we consider the failure to explicitly teach reading skills associated with each stage of schooling to be the primary mechanism for producing inequality of educational outcomes in the Australian education system" (p. 3).

Taking into account the research directives for the explicit teaching of key skills when teaching reading with Indigenous children, the PALLIC Project has adopted a skills-based approach. Integral to this approach is the explicit teaching of the "Big Six" (Dempster et al., 2012), comprised of five skills identified as phonological awareness, letter-sound knowledge (phonics), fluency, vocabulary and comprehension, overlaid with a sixth element acknowledging the need for oral language development as a vital entry and continuing support when learning to read. A more specific explanation of what comprises the Big Six is outlined in a later section of the chapter along with an explanation of how the professional learning programme for school and Indigenous leaders included evidence-based advice on incorporating "two-way" pedagogic practices in the learning to read programme in schools.

There is increasing evidence that Indigenous families need to be fully engaged with their children as they learn to read. Importantly, this is not to argue that families need to duplicate schools' literacy programmes or to abandon their first languages. Freeman and Bochner (2008) partnered with an Australian Catholic Education Indigenous Unit to conduct a home-book reading programme to bridge the gap between Indigenous children's experiences with books at home and reading instruction at school:

> The children were given books and the family members were shown how to read these books [through games and other literacy related activities] with children. The program also provided an opportunity for effective links to be developed between Indigenous parents and school based Educational assistants. (p. 9)

Key findings from that programme are that although most of the children in the programme still lagged behind national averages for their ages, there were some important improvements in abilities in reading skills. For example, children who in a pretest achieved a mean percentage score on the test of phonemic awareness (24 items) of 73 % increased their scores to 92.5 % on the posttest (Freeman & Bochner, 2008, p. 13). Furthermore, in the posttest interview, parents described a more complex set of strategies for reading with their children at home than they had used beforehand.

In the research that informs PALLIC's learning to read programme, we note that critical literacy (Johnson, 2002) is not foregrounded. This might appear unusual in a project that claims to enact a social justice perspective in leadership for learning. The skills-based approach to literacy seen in the five professional development modules aims first at assisting the principals and ILPs to learn how to assist teachers and families to teach children to read. There is no plan over the longer term to exclude critical literacy in further research and development. At this point in literacy education history in Australia, many Indigenous communities are demanding higher levels of literacy, especially reading, for their children. One of the key concerns is that low levels of functional literacy are precluding many Indigenous children from participating in secondary, higher and further education. We concur with Sena, Schoorman, and Bogotch (2013) that in the longer term, a socially just approach to leading literacy with Indigenous communities should enable the children to read not only the word (skills) but also their world (critical literacy). Such a bifold approach to literacy makes a material difference through greater life opportunities for those who are intergenerationally educationally disadvantaged.

Having established the leadership and reading research base upon which the PALLIC Project has been designed and developed, we now move to a description and discussion of its implementation.

Section 3: Principals as Literacy Leaders with Indigenous Communities (PALLIC)

The Principals as Literacy Leaders with Indigenous Communities (PALLIC) Project is funded by the Commonwealth of Australia, Department of Education, Employment and Workplace Relations, in an initiative called "Closing The Gap" – Expansion

Of Intensive Literacy And Numeracy Programs For Underachieving Indigenous Students. The project is designed to enhance the leadership capabilities of principals and school community leadership teams to work with teachers in partnerships with parents and families to improve reading in Indigenous community schools and schools with significant proportions of Indigenous children. It is being conducted in 45 schools, many of them in remote Indigenous communities in Queensland, South Australia and the Northern Territory. Forty-five school principals, approximately 90 ILPs, that is, 2 per school, 6 LLMs and 4 researchers actively engaged during 2011 and 2012.

The project will enable principals and leadership teams to:

(a) Examine school, system and community data for the purpose of evaluating performance and developing intensive strategies for improvement in literacy learning (reading) and achievement
(b) Build partnerships with Indigenous school community leaders, parents and families to support the literacy learning (reading) of their children

It will also generate evidence to understand the factors that contribute to improved reading in different Indigenous community environments, including parent partnerships, in order to use the findings to inform future project up-scaling in comparable school communities.

The outcomes of action on these objectives will be:

(a) Evidence of improved levels of reading
(b) Evidence of productive partnerships between school, Indigenous leaders and families

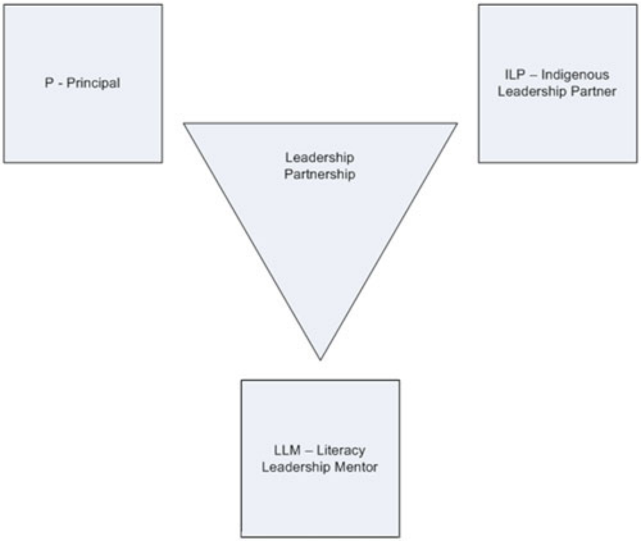
The model of delivery uses five professional development modules each of one day's duration involving the principals from each of the participating schools and local Indigenous community partners. Most aspects of the modular learning are provided together while options for some to be undertaken separately are available.

The professional learning in each module leads to follow-up activities in the school and its community. The principals and the ILPs are directly supported by an LLM working with school communities on an approximate ratio of 1–10.

The indicators of the project's success will be evidence of:

1. Improved levels of reading for students in schools involved in the project
2. Productive partnerships developed and enhanced between schools, Indigenous leaders and families
3. Improved capabilities of principals to lead reading improvement across the whole school

Intervention action in reading will be implemented by all schools involved in the project. The interventions will involve principals taking action with their ILPs to develop partnership roles with other Indigenous school community members, parents and families. Specific strategies will be explained, developed and utilised to teach students to read through explicit teaching. Some of these strategies are available from an earlier pilot project, Principals as Literacy Leaders (PALL), conducted during 2009–2010 (Dempster et al., 2012).



P - Principal
ILP – Indigenous Leadership Partner
Leadership Partnership
LLM – Literacy Leadership Mentor

Fig. 23.2 The relationship between principals, indigenous leadership partners and literacy leadership mentors

The design of the PALLIC Project is explained further through reference to the relationship between the principals, ILPs and LLMs, the trio central to the objectives of the project. This is followed by explanations of the professional learning modules used to stimulate in-school and community tasks leading directly to the planning of improvement action in reading and ultimately the evaluation of the effects of those improvement actions.

Principals, ILPs and Literacy Leadership Mentors

Figure 23.2 illustrates the relationship between school principals, ILPs and Literacy Leadership Mentors. The role of each in the project differs, but together they form a supportive leadership team.

Five Professional Learning Modules

A brief overview of each of the five modules demonstrates a consistent focus on principals and ILPs working collaboratively to lead the teaching of reading with Indigenous students and their communities.

Integral to the collaborative work is the role of the Literacy Leadership Mentors. Mentoring is now understood as an initiative tied to professional development programmes and projects to address social exclusion (Colley, 2003), in Britain, North America and increasingly in Australia. Definitions of mentoring are linked to expectations and assumptions about particular roles and relationships to be enacted between mentor and mentee/s. In the PALLIC Project, six mentors were selected by the three state education jurisdictions participating in the project, based on backgrounds of successful principalship in Australian primary schools. These principals were taken offline (i.e., away from their regular system positions) for the duration of the project. Expertise in literacy teaching was not a requirement. Their brief was to attend the professional development modules and assist the principals and the ILPs to complete expected follow-up activities. The mentors were briefed before each of the meeting days and had a chance to contribute to the drafts of each of the modules. In the periods between Modules 4 and 5, they also came together on a fortnightly basis for teleconferences with other mentors in the project, the project managers and researchers. The purpose of the teleconferences was to maintain the momentum of the project "in the field" and for the group to learn from each other in the lead up to the next module meeting. Their roles approximate that of a "critical friend" or a professional learning catalyst (Swaffield, 2008). An important aspect of this role is to assist ILPs and principals to understand and enact the concept of boundary-crossing in intercultural space to raise critical consciousness and a mutual knowledge base about what it takes to connect Indigenous families and school staff.

Three meetings took place in Cairns, in far north Queensland, as the venue was considered accessible for the 45 principals, their ILPs, the LLMs, the researchers and the project managers. The distances to be travelled were vast but less problematic if Cairns remained the destination for all three meetings. Five modules were delivered over three, 2-day meetings between July 2011 and June 2012. Follow-up activities were undertaken by teams consisting of a principal and ILPs working with an LLM, after each meeting, in preparation for the next module. The follow-up tasks were designed to facilitate reflective practice and empirical data collection in school and community sites and to build knowledge to support the overall aims and projected outcomes of the project.

Following Module 5, the leadership teams complete an evaluation of their improvement action or intervention in reading and report on the effects that action has had, adding to the data set from the project.

Details of each of the professional learning modules follow.

Module 1: Leading Learning: What Does It Take?

This module describes what constitutes effective leadership for learning based on recent meta-analyses of leadership research. It then applies that knowledge to leading learning in Indigenous community contexts by drawing on recent relevant Indigenous research. The purpose of participation was to arm principals and their partner Indigenous community members (who took on roles as ILPs), with necessary knowledge to enable them to take action together in key priority areas known to help in leading learning effectively. The anticipated outcome of discussion and activity with participating principals and ILPs was a commitment to ascertaining how key leadership priority areas can be identified, highlighted, shared and applied with a concentration on reading in their schools and communities.

Module 2: Leading Learning to Read: What Does It Take?

This module describes an evidence-based position on what school principals and ILPs need to know to understand and assist with enhancing children's literacy learning in schools and homes. Key areas of research were discussed to support the overall position that explicit teaching is necessary to enhance phonological awareness, letter-sound knowledge, vocabulary, fluency and comprehension, and that the development of the Big Five is premised on keen attention to early oral language development (the Big Six). The module provided school principals and ILPs with knowledge of key debates about the teaching of reading, so they could more readily gather and analyse data about the literacy practices that were already happening in their school contexts. These data underpinned ongoing "disciplined dialogue" between principals, ILPs, teachers and families about what might be planned, implemented and evaluated to assist in continuing to enhance reading in Indigenous schools and communities. The implications of significant literacy research for remote Indigenous schools and students were emphasised throughout the module.

Following Modules 1 and 2, the leadership teams were required to work on two follow-up activities. The first task required principals and ILPs to develop a local version of the Literacy Practices Guide with teachers for use in the school. The goal was for leaders to work together to gather and analyse data so as to understand more fully what was happening in their schools with regard to the teaching of reading in particular. The second task required principals and ILPs to work together to discuss the relationship between home and school with teachers and parents. The goal was to engage a small group of parents and family members as future "learning catalysts" who could help children learning to read.

Module 3: Leading Data Gathering and Analysis for Literacy Learning: What Does It Take?

This module[1] provided information about the kinds of leadership partnerships, data and evidence that can be used to inform improvements in learning to read with Indigenous communities. It used the *Leadership for Literacy Learning Blueprint* as its point of reference to emphasise *the leadership dimensions* that influence teachers' and children's learning and achievement. Participants encountered a number of diagnostic assessment tools directed at gathering sound evidence *about children's engagement with the Big Six* in learning to read as well as instruments to gather data about the leadership dimensions which contribute to improvements in reading. In addition, the purpose of a distributed model of leadership, as it is foreshadowed in the roles of ILPs and principals, was expanded to embrace the way parents and family members can become connected as *Leaders of Reading* for their children. In doing so, two actions important to the PALLIC Project were to be implemented: (1) the creation by principals and ILPs of a group of *Leaders of Reading* from family and community members and (2) the gathering and use of sound evidence on which to plan future reading improvement inside and outside the school.

---

[1] In the production of the modules, the work of the universities which contributed to the original Principals as Literacy Leaders (PALL) Pilot Project is gratefully acknowledged: Griffith University, Edith Cowan University and the Australian Catholic University.

Module 4: Planning Reading Action Projects

The purpose of Module 4 was to examine the actions principals and ILPs together need to take to plan and implement effective Reading Action Projects (RAPs). The hoped-for outcomes of discussion and activity with participating principals and ILPs were:

1. An enhanced capacity to lead and commit to localised school planning based on sound evidence related to three levels of activity conceived as "waves" of improvement action
2. A capacity to use the *Leadership for Learning Blueprint* (as described in Module 1) as a key reference point in applying resources and supporting activity in RAPs
3. A commitment to the implementation of a Home Reading Practices Guide and strategies which engage *Leaders of Reading* from families and the community in RAPs

This module continued the structured conversations with ILPs about features of helpful literacy families, the role of *Leaders of Reading* and how they might be included in supporting children's reading. Underpinning this aspect of the methodology was an evidence base that demonstrates how families might become involved in their children's reading in a variety of ways.

Most families want to help children to learn, but many families are not confident that they have the skills to do so. The research shows that when schools, homes and communities combine resources to help students to learn to read, there is an improvement in student performance. Family input is especially important in Indigenous communities. The PALLIC Project's recognition of this is evident. Moreover, the project endorses the finding that Indigenous leadership is paramount for the success of reading programmes for Indigenous students. Early input by all parents into reading at home is essential to increased school performance. For example, the US Department of Education's Longitudinal Evaluation of School Change and Performance (2001) found that in the poorest schools, grades were 50 % higher for those students who had high levels of early parental outreach.

There are a variety of partnerships between schools, homes and communities based on a belief in shared leadership for learning to read. Goos, Lowrie, and Jolly (2007) describe partnerships as four types: top-down, top-down-supported, school-generated and home–community-generated. The four types of partnership are not discrete, and, therefore, the PALLIC Project encourages partnerships that combine elements from all four as suited to particular contexts. The four types outlined by Goos et al. are described as follows:

1. Top-down partnerships are those initiated and sponsored by an education system with uniform goals and processes across schools. For example, *The Literacy Keys to Learning Framework for Action* 2006–2008 (Johnson, Wyatt-Smith, Colbert, & Klieve, 2011) aimed at upskilling all teachers and some principals on the literacy requirements from Prep to Year 9 in all Queensland state schools.
2. Top-down-supported partnerships rely on an education system for some overall sponsorship or coordination, but schools design and control the programme. For example, Darling (2005) outlines some strategies that families can use at home to extend the classroom teaching of phonemic awareness, phonics, fluency, vocabulary, text comprehension, print concepts and writing.
3. School-generated partnerships are initiated by a school independent of an education system, although they may involve resources available from the system and families. For example, Kennedy (2008) reports on the *Home Instruction for Parents of Pre-School Youngsters* (HIPPY) which is designed to support parents helping their child to read. The distinctive feature of this strategy is that although a Family Literacy Program might be run by community centres, libraries or school boards, a trained parent assistant from the same community visits home and works with parents to enable them to participate in parent–child literacy activities. Each parent assistant works with 10–15 families. A programme has a coordinator who oversees the work for every 12 parent assistants. Literacy resources focus on language and reading with children. Although HIPPY is for any parent who wants educational enrichment for his/her child, the model was designed to remove barriers to participation, due to lack of education, poverty, social isolation and other issues.
4. Home–community-generated partnerships are those that are driven outside schools, by families and communities.

There is evidence that programmes that are community driven to a greater or lesser extent have worked well internationally. The following examples from the research demonstrate some ideas that were discussed during Module 4 with a view to principals and ILPs designing RAPS for implementation in their schools and communities.

It is well known that early input into children's literacy is primarily by mothers. Showcasing an alternative approach, Ortiz's (2001) study in the United States focuses on fathers' contributions using environmental print and recreational materials with their young children, for example, road signs, maps, magazines, comic strips in newspapers, instructions for board (electronic) games, religious materials, homework instructions and crossword puzzles. Indigenous families can be helpful as their children learn to read in at least three ways. First, it is important that they recognise that families and carers are the most important influence on children's learning (Timmons, Walton, O'Keefe, & Wagner, 2008; Willms, 2003). Even absent fathers should be encouraged to contribute to children's reading activities at home via technology. The StoryBookDads (and more recently Mums) Project (Storybook Dads, n.d.) was first run as a registered charity in Her Majesty's Prison Dartmoor, in the United Kingdom. Accordingly, parents make CDs of their reading bedtime stories to send to their children at home. The initiative encourages some of the prisoners to be formally trained as editors to edit out mistakes in reading and add sound effects to enhance the quality of the finished story. Those prisoners complete an Open College Network qualification at level 2 in sound and audio production. The project is now running in Acacia Prison, Western Australia's only privately run prison. At-home fathers' literacy activities with children are not always about reading a story or homework tasks. The functional, household and environmental print needs of children matter also, for example, signs and labels (Ortiz). Older generations and extended family members are also important in teaching children to read.

In the Western Desert Lands in Australia – Warrki Jarrinjaku – in an Aboriginal Child Rearing Strategy, the older women lead such an initiative by telling and recording stories of child-rearing practices "so the little kids can learn all the rules, like ceremony and marriage". The recording is done in a combination of the women's written language and English to describe their vision, and a way forward, to improve the health of their families and children's well-being (Priest et al., 2008).

A second means of families helping children learn to read in the community includes families' informing schools how to support Indigenous students learning to read English in conventional school classrooms. The families teach non-Indigenous principals and teachers essential Indigenous knowledge to stop their making erroneous cultural assumptions about students' classroom behaviours as they learn to read. The Indigenous Literacy Foundation in Australia aims at raising literacy levels and improving the lives and opportunities of Indigenous Australians living in remote and isolated regions. This is done by providing books and literacy resources to Indigenous communities and by raising broad community awareness of Indigenous literacy issues, for example, *The Naked Boy and the Crocodile* stories by children from remote Indigenous Communities (Griffiths, 2011).

Module 5: Evaluating the Effects of Reading Action Projects

The final module was delivered over a 2-day final meeting. The primary purpose of Day 1 was to enable principals and ILPs to learn from each other about the actions taking place in their schools, classrooms and communities to improve children's reading. A second purpose was to explain the research tasks which follow the completion of Module 5 and to introduce the research team to principals and ILPs from whom approval for school and community visits was sought. The purpose of

Day 2 was to enable principals and ILPs to lead the evaluation of the effects of the RAPs being implemented in their schools, classrooms and communities. Participants were exposed to practical tools to assist in leading the evaluation, determining its purposes, the way information and evidence about impact and effects are to be gathered and who would be involved interculturally in the discussion of the information gained. Ultimately, the outcomes of the evaluation process feed forward into new strategies and to the continuation of strategies known to work to improve reading. How the leadership partnership between principals, ILPs and community Leaders of Reading contributed to improvement is an essential element of this overall process.

Evaluating the Impact of PALLIC

It is too early at this point to tell the overall impact the PALLIC Project has had on the schools, families, communities and students involved, as the research agenda we referred to earlier is yet to be completed. That agenda is shared with the principals, ILPs and the academic team. Collaboratively, the three will document the impact that the PALLIC strategy has had in building equitable family–school partnerships, especially its focus on progressing reading in the 45 Indigenous communities across Australia in which we are working.

In this chapter, our particular interest is in understanding the perspectives and actions that ILPs bring to their roles in the project. Of similar importance is the consideration of how partnerships between the principals, the ILPs and Indigenous families are emerging. As designers of the research, our approach to gaining such insights is motivated by the view that it is through storytelling and conversations that human beings make sense of who we are (Andrews, 2007). It approximates voiced research described by Smyth and Hattam (2001) as an appropriate means of addressing differently what up until now might have appeared as intractable educational problems in disadvantaged sites. It affords those most impacted by a problem, the chance to tell their stories from a critically reflexive perspective with a view to reshaping their futures.

Throughout the project, the ILPs have taken up opportunities at the module meetings to have informal conversations with the research team, their colleagues and the principals about their aspirations, expectations and progress in their roles. A summary of key themes from the first meeting illustrates their thoughtfulness about the role, a perspective that does not deny the precarious nature of the tasks at hand as they work at the interface between school and families.

Written records of the conversations demonstrate the ILPs' understandings of Indigenous families' dreams for their local school to offer the best possible educational outcomes for their children, including:

- More cultural sensitivity on the part of teachers
- More cultural activities and content embedded in curriculum

- School-based work placements
- Leadership roles for Indigenous students and families
- Aspirations for Indigenous children to believe and dream of a better future
- Equal rights and opportunities but not such that they are "spirit killers"

Particularly pertinent questions asked by the ILPs during conversations about the roles of principals and teachers included:

Why do teachers and principals have low expectations of Indigenous students in remote schools?
What do the data say about our school and our level of literacy for Indigenous students?
Why aren't our kids achieving to the same degree as non-Indigenous kids, knowing that often their attendance is consistently above 90 %?
What are the beliefs about Indigenous learning that teachers have – and how might we influence those beliefs?
How can we support parents to do more than they currently do?
What do teachers come to know about the language backgrounds of the students in their classrooms?
Why don't our families want to come to school to engage in our kids' learning? Why don't they feel comfortable?
How can we show teachers how our children learn best?

Discussion with the ILPs showed the extent to which they recognised particular strengths necessary to pursue their roles effectively. Some recurring themes were patience, perseverance, encouragement, respect and recognition, communication skills, commitment, values and beliefs, local knowledge of country and a realistic timeframe. They also expressed the need for support from school and parents and an engaged community and support from members from other agencies, Elders and Dreamtime Stories, if they were to carry out their roles effectively.

Finally, the ILPs expressed a vision at the beginning of the project that their work would be successful if, after a realistic period of time, they saw at least some of the following activities happening in their schools and communities:

- Cultural programmes happening across the school
- Both-ways communication
- Parents and families participating in their children's learning
- Principals and teachers being active in the community
- Good results and attendance for students
- Leadership roles being undertaken by students
- Equal opportunities for all children at the school
- Children wanting to come to school
- A happy community
- Awards given to act as role modelling
- Sporting and cultural events as part of school community activities

The summaries of these initial conversations between the ILPs and members of the PALLIC Project research team demonstrate the high level of commitment that the ILPs had to the project from its early stages. Integral to the inclusion of conversation time with the ILPs is the notion of voiced research. Critical consideration of voice is a significant aspect in our project as it challenges assumptions that disadvantaged families' and communities' roles in schools are primarily to be silent or managed. The first module opens the way for ILPs to engage proactively with those in positions of power in schools from the start (Smyth, 2009). The methodological design questions the basis on which disadvantaged parents are under-represented in school involvement internationally (MacBeath et al., 2007). It defines an appropriate position from which to challenge deficit research designs that purport to alleviate disadvantage. In contrast, this methodology supports a section of the school community which might have remained silent, reactive or managed by schools in the past. Finally, it "speaks back" to a discourse of blaming such community members for their lack of involvement and engagement in the schooling enterprise (Mills & Gale, 2004). In the main, these conversations empowered the ILPs to begin to believe in the project's aspiration for an equitable partnership within schools and between schools and their communities.

Evidence of how the collaboration between the ILPs, the principals and families is emerging is best judged by the RAPs that are currently being implemented in each of 45 home–school sites, across three Australian states and territories. Four schools responded to the call to publicly present the work they are doing in teaching the Big Six skills approach to reading and to show how this focus on reading in the school has impacted parents working at home. It appears from the teleconference conversations held with the LLMs that the greater action in schools has focussed on teaching and learning the Big Six. There is, however, evidence of change in parent, family and community interactions around education more generally. In one school, the ILP has engaged several other "leaders" who support the educational efforts at school from outside. For example, in that school, an Indigenous park ranger engages the children in environmental literacy by visiting important Aboriginal sites and discussing flora and fauna in English and the local Indigenous language.

Section 4: How the Home–School Partnerships Are Emerging: Good News Stories

We now provide a snapshot of emerging progress made in the PALLIC partnerships by recalling some of the good news stories that are beginning to point towards building capacity for children's reading through an innovative approach to family–school connections with Indigenous communities in Australia. The good news stories are extracted from schools' reports to the project managers. They relate to the changes that have occurred in the participating schools in regard to the teaching of reading and/or increased community involvement that has occurred as a result of the PALLIC Project professional development programme. The following stories feature schools that involve the principal, ILPs and the Big Six approach to teaching reading, since they have become involved in the project. The stories show the crucial role that ILPs are playing in linking homes and schools in the teaching of reading. For privacy purposes and in compliance with ethical approval for the research, the schools are not identified.

Example 1. It was not until the second Cairns meetings (for Modules 2 and 3) that the focus on reading started to have some traction. At these workshops, the principal brought along two ILPs. The second person to come was an experienced community representative with a knowledge of how schools operate. This addition to the team strengthened the resolve of the community to focus on reading. This was the first breakthrough for the school. The principal was able to appoint a new assistant principal for support and as a team with the ILPs to address the "intervention problems that have dominated" and to focus on a whole-school approach to reading.

Example 2. PALLIC has become one of the key factors in extending community involvement in the school. The ILP has developed a "We B- Look U" Bar-B-Q approach. This started small with three parents and has now increased to an average of 23 parents meeting regularly as part of the Bar-B-Q approach. The method is to use a "yarning circle" to hear what parents want to see in the school and to engage them in supporting the approach to reading.

Example 3. PALLIC was the catalyst to involve Indigenous members of the community as Literacy Leaders. At the first sessions, which involved Modules 1 and 2, the person who was invited to attend as the ILP was already an employee at the school. The second sessions involved another ILP who was a parent. The impetus from these sessions enabled the ILPs to come back and establish a Parent Reference Group. A small group of five parents with an extra community member formed the nucleus for this group. The focus has been on "What can we do better?" with Aboriginal and Torres Strait Islander families to engage them in the school and with their children's learning. One initiative was the establishment of a "Rainbow Room" where parents can drop in and meet regularly. PALLIC was the centre-piece to start making community connections. The links are being made because of the raised profile of ILPs in the school.

Example 4. Half way through term 3, every teacher had been involved in professional development on the teaching of reading focusing on each year level. This was followed up with a moderation activity on reviewing student work carried out during a student-free day in October this year. By the middle of October, each teacher had engaged in a disciplined dialogue with their line manager on the collection and use of data in reading. These aims have been to develop consistency in methodology, a balanced reading programme based on the Big Six and the teaching of reading across subject disciplines. Shared understanding and the development of teacher confidence have been the major priorities. The reading programme was supported by the establishment of a Parent Reference Group – called "Yubu-Yunga". This was developed with the ILP and the principal. The emphasis has been on building strong networks. One of the focus areas has been on early reading experiences and the development of a Home Reading Practices Guide.

These vignettes display the bridging work that is necessary before Indigenous communities and schools can work together to enhance children's learning. The ILPs who feature in these examples are a vital link in the partnership between schools and families. The success of the ILPs in initiating two Parent Reference Groups shows a level of participatory action that is not often seen in the research literature. More familiarly, partnerships between homes and schools are driven by the schools' agenda, leaving those parents whose assumptions and values do not match those of the schools, to falter. There is an alternative possibility here in that the members of the reference groups will likely become future leaders of reading in their communities as they find appropriate ways to work with the ILPs and the staff in their schools. What we see is some movement from the good intentions of the project brief towards socially just differences in the way home–school collaborations are forming. The more important tests of the impact of the project will become visible in assessing material differences in the lives of Indigenous children through learning to read in standard Australian English.

Concluding Comments

The methodology we have described as underpinning the PALLIC Project is supported by theory and practices of social justice expressed through leadership for learning which moves from a deficit view of Indigenous family and community capacity to equitable engagement in children's learning to read. Central to the enactment of the methodology is an understanding that tripartite collaboration between principals, ILPs and Leaders of Reading from the community, assisted by LLMs, has the capacity to increase Indigenous children's ability to learn to read. We have aligned our investment in this approach to the Engoori Leadership Strategy used in the work being carried out in Dr Chris Sarra's Smarter Stronger Institute that provides a "strengths-based platform" to move forward (Gorringe & Spillman, 2008).

Sustainability is a constant concern for large-scale learning initiatives such as the PALLIC Project. Providers rightfully ask how to build and ensure sustainability during and beyond the life of the initiative. For accountability purposes, measures for sustainability are aimed at ensuring measurable and continuing change for the financial and human effort expended. The sustainability factor for the PALLIC Project lies in the parts played by the ILPs in leading families and communities to connect with schools in an equitable partnership to help children learn to read. The initial evidence we have discussed shows promise that progress made so far may be sustained over time.

We began with the premise that all children risk educational disadvantage when families are disengaged in their learning to read. Indigenous families currently are least well positioned to assist their children in English literacy, and this impacts negativity on their children's chances of benefiting from educational opportunities.

Unless the gap in school performance between disadvantaged children and those who are more affluent is addressed, the consequences for Australia and other nations where disadvantage is a growing concern will remain as a “blot” on the social landscape. This research and development rests confidently on the premise that strong family–school partnerships ensure better opportunities for children’s learning. This provides a firmer basis than is currently available to examine a causal connection between parent involvement and student achievement. The findings will greatly assist disadvantaged schools with a cost-effective, equitable means of implementing policies such as the *Family–School Partnerships Framework* (DEEWR, 2008) to enhance student learning. This project is a viable attempt to have disadvantaged students better served by their education systems. The flow-on effects for disadvantaged children who graduate from school are seen in greater chances of employment and well-being (Bishop & Berryman, 2006). This is a stated long-term aspiration for those ILPs involved in the PALLIC Project.

The PALLIC Project has been designed mindful of prior research that sought to improve the lives of Indigenous populations around the world, through a focus on education, and often more particularly, literacy/learning to read. So far, we have learnt that collaborations between Indigenous homes and schools benefit from a designated “go-between”/Indigenous Leadership Partner who understands “both ways” of learning and living and from the eagerness of the go-between to enlist others from the Indigenous community to input into the collaboration – to lead, not just listen. Finally, such a venture benefits from a common understanding that material and social change will come with persistence over the longer term. The underlying aim of the PALLIC Project is to challenge dominant discourses held about the place of education in Indigenous communities. The challenge to a dominant “deficit” discourse of Indigenous-led education is threefold: Indigenous communities’ engagement in educating their children to read in Standard Australian English facilitates economic, political and cultural justice.

The methodology we have described as underpinning the PALLIC Project is supported by theory and practices of social justice expressed through leadership for learning which moves from a deficit view of Indigenous family and community capacity to equitable engagement in children’s learning to read.

Chapter 24

Socially Just, Inclusive School Environments in the United States: Creating Spaces for Dialogue

Courtney L. Orzel

Introduction

As educators we have failed to create schools that are just, excellent, inclusive, and deeply democratic. ~ Shields and Edwards (2005)

> *Ahmad: Mrs. Orzel, what do you do when people are racist?*
> *Mrs. Orzel: Why? Has someone been racist to you?*
> *Ahmad: You know I'm Arabic, right?*
> *Mrs. Orzel: Yes. Why?*
> *Ahmad: People are calling me terrorist and suicide bomber.*
> *Mrs. Orzel: Who?*
> *Ahmad: I can't say who. It happens all of the time—all day, every day.*

Historically and recently, education is a debated topic. In fact, many argue that education is in crisis (Barber, 2001; Bode, 2001; Giroux, 2002) and reform is needed. Such crises have driven educational reform efforts around the world for decades. In the United States, reform efforts, like the No Child Left Behind Act of 2001 (NCLB), are at the forefront of discussion and debate. NCLB, the most recent of reform efforts in The United States, is a reauthorization of the Elementary and Secondary Education Act of 1965 (ESEA). Driven by direct accountability for individual student learning, NCLB claims to advocate for all students, yet the achievement gap still exists. As a result, many students, like Ahmad, are excluded from programs and curricula because their backgrounds, including their home language, religion, or ethnicity, are dissimilar from those of the predominantly White middle-class children still seen as today's typical students.

In the United States, federal mandates narrowly frame accountability through standardized testing processes and perpetuate hierarchical, inequitable learning processes

I. Bogotch and C.M. Shields (eds.), *International Handbook of Educational Leadership and Social (In)Justice*, Springer International Handbooks of Education 29,
DOI 10.1007/978-94-007-6555-9_24, © Springer Science+Business Media Dordrecht 2014

while limiting educational opportunities, narrowing the curriculum, marginalizing students' access to diverse experiences and curricula, and ultimately silencing necessary dialogue in schools. Inequities created by such reform efforts exacerbate educational disparities and leave school leaders, especially principals, facing monumental challenges when trying to create an inclusive school. Dr. Carolyn Shields, a leading researcher in the area of social justice, and the Dean of the College of Education at Wayne State University in Detroit, Michigan, states, "…inequities are unacceptable in deep conceptions of democratic schooling…educational leaders need to find ways to overcome disparity and to provide more equitable learning environments for all students" (Shields, 2009, p. 25). Thus, the educational disparity is evident and drives current school reform efforts, which claim to create inclusive school communities, yet ultimately create failing schools and eliminate critical dialogue.

Until recently, minimal attention has been focused toward inclusive leadership practices which address the unintended exclusion of some students. Recent literature indicates, and federal mandates substantiate, that issues of school reform cannot be separated from inclusive practices focused on dialogue, equity, and democratic principles. According to Shields (2009):

> We need to recognize the forces that prevent social institutions from creating inclusive communities in which all educators and students can safely bring the totality and complexity of their identities as a basis for their learning. We must create learning environments in which all children can build on their personal experiences, the values of their cultures, and the languages they speak at home, in order to make sense of what they are learning. (p. 32)

This chapter will explore how educational leaders can use dialogic practices to create socially just school environments. For the purposes of this chapter, while I will bring in the school community, I am delimiting my definition of social justice to the school and its practices. First, I will explore the challenges associated with school reform efforts and socially just environments. Next, I will provide an overview of definitions and the scholarship in the areas of social justice and dialogic practices of educational leadership. Next, using my doctoral work as a backdrop, I will explore the challenges educational leaders face when trying to create a socially just environment. Finally, I will provide practical examples for school leaders, specifically, school principals, to use dialogic practices in order to create socially just, inclusive school environments.

School Reform Challenges

Mrs. Orzel: Ahmad, how does it make you feel when students call you terrorist and suicide bomber?
Ahmad: I feel horrible. I just feel like I don't belong here.

Recent accountability and standards-driven movements draw attention to inequities in educational opportunities for various groups of students and place the burden on educational leaders, specifically school principals, and policy makers. Similarly, teachers face challenges to meet all students' needs while meeting stringent achievement expectations. Due to these reform efforts, teachers are deskilled, and students lose opportunities in the classroom to participate in engaging dialogue and rich curriculum.

Although school reform efforts in the United States claim to advocate for more inclusive and equitable outcomes, routine, technical, managerial, and scientific approaches in education are still prevalent and often utilized in school systems. And while schools continue to become more diverse each year, school leaders and school structures remain stagnant in many cases. Not only do principals face challenges meeting the federal and state demands placed upon them, they also have diversity in all aspects of their school buildings. Diversity is present in ethnicity, culture, socioeconomic status, gender differences, ability, and class; principals must lead inclusive schools which encompass all aspects of their diverse, multifaceted communities.

Creating socially just, democratic school environments is not an easy task for school principals. Shields (2009) argues that schools need to be both socially just and deeply democratic—there cannot be one without the other. Yet, educational leaders, specifically principals, are bombarded and pressured by state and federal mandates. While federal reform efforts are designed to measure accountability, academic gains and progress are measured by a single, standardized test, leaving school leaders to face a daunting and overwhelming challenge to meet these federal and state mandates while providing a democratic, socially just, inclusive learning environment. As an example, schools are expected to meet Adequately Yearly Progress (AYP) targets under NCLB guidelines, and 100 % of students are expected to be "proficient" by the year 2014. By mandating a 100 % proficiency rate, states actually lower their standards and dumb down the curriculum. Diane Ravitch, a Research Professor of Education at New York University, speaks to this challenge and adds that such targets have "stigmatized schools that could not meet this unrealistic expectation." To that end, the most recent national tests show that no improvement has been made in 8th grade reading since 1998. Needless to say, with the hope of No Child Left Behind dwindling, reform efforts in the United States have been heavily debated in the past few years.

Consequently, under this model, many schools end up labeled as "failing schools" even though they have made academic progress. To that end, principals face a great deal of responsibility for ensuring that students are learning and making Adequate Yearly Progress; therefore, school leaders tend to take control over situations and perpetuate the routines and hierarchy in schools which ultimately diminishes their participation in and creation of socially just, democratic, inclusive practices like dialogue and collaborative, shared decision-making processes (Ryan, 2006a). Ravitch (2010) explains why the term "failing schools" should be eliminated. She states:

> We should stop using the term "failing schools" to describe schools where test scores are low…Among its students may be many who do not speak or read English, who live in poverty, who miss school frequently because they must baby-sit while their parents look for work, or who have disabilities that interfere with their learning. These are not excuses for their low scores but facts about their lives. (p. 1)

Here, Ravitch stresses the importance of diversity in schools by highlighting the point that students come from various backgrounds and bring different perspectives to school. Thus, in order to create a socially just environment, educators must understand the disparities in educational achievement related to students' abilities, home lives, and personal experiences.

Many scholars argue that educational disparities are prevalent in today's educational system. Social, cultural, economic, and political disparities are evidenced in the nation's achievement data. Shields (2009) speaks to such disparities and suggests:

> …there are systemic barriers in terms of both structures and attitudes- fiscal resource allocation, school facilities, teacher training- as well as discrimination that prevent all students from achieving at similar levels or from having similar opportunities for life choices and chances beyond school. These disparities can no longer be ignored. (p. 20)

School leaders must understand such disparities in order to address individual students' needs.

Defining Social Justice

For the purposes of this chapter, it is important to understand the term "social justice" and its relevance to school leadership. In order to create communities in schools where every single teacher, student, parent, and community member feels safe, secure, respected, and valued, school leaders must understand social justice.

Social justice requires that everyone in the learning community (students, parents, teachers, community) have access, opportunities, and a voice in the learning and decision-making processes within a school. Socially just environments require that members of the community examine inequitable practices that eliminate power imbalances of minoritized students and parents and allow everyone in the community to feel welcome. Socially just schools expect and hold high expectations for students while purposefully creating opportunities for diverse perspectives within an inclusive environment. Thus, one must understand how the notions of inclusive community, power, exclusionary practices, and dialogue play a critical role into a bigger picture of socially just school environments.

Defining Inclusive School Community

One way some scholars advocate to address challenges associated with limited dialogue in schools is through the implementation of an "inclusive school community." An inclusive school community is one in which "people come together, acknowledging the intrinsic worth of each member of the community, in playful, creative, and empowering interactions" (Shields & Edwards, 2005, p. 7). Using dialogue as the foundation of community, an inclusive school community is one which is deeply democratic, equitable, and one that treats individuals with "absolute regard" (Starratt, 1991). Therefore, through a social justice lens, inclusive communities promote dialogue and equitable opportunities for all students, especially those who have been traditionally underserved and marginalized.

Inclusive Leadership

Many argue that education is in crisis (Barber, 2001; Bode, 2001; Giroux, 2002; Lipman, 1998; Peck, 1993) and reform is needed. Exclusionary practices are deeply rooted in today's educational system, as racism, classism, and sexism continue to plague American students' school experiences. Despite No Child Left Behind's surface attempt to engage marginalized students, routinized school system approaches to standardized testing procedures perpetuate these patterns of exclusionary practices. Students who need engaging, rich, and diverse curriculum are often the same students who receive the "drill-and-kill" rote curriculum. This next section will discuss the importance of inclusive leadership in schools and how that leadership connects to the larger context of building community.

Power

Within school systems, power and hierarchical school structures present barriers to inclusive schools. Those in power, usually school leaders, control who has a voice in the school's decision-making processes, leaving minority and low-income parents and students to feel silenced in the school setting. As a result of such power hierarchies, parents and students who struggle with school the most are often the group who is left out of such decision-making processes. For example, parents and students who speak another language or parents who work more than one job find it difficult to engage in the school. Thus, school leaders face significant challenges to find opportunities for these marginalized groups to engage in decision-making processes. However, James Ryan, a leading researcher in the area of inclusive leadership and professor in the Department of Theory and Policy Studies at the Ontario Institute for Studies in Education at the University of Toronto, reminds us that critics of inclusive practices argue that such shared decision-making practices and collaborative processes "will waste people's time, delay important decisions, raise operating costs, and increase workloads. But if hierarchies remain, efforts at inclusion will also be fake…" (Ryan, 2006a, p. 13).

Exclusionary Practices in Schools and Leadership Challenges

> *Mrs. Orzel: Teachers, are you aware that our Arabic students are being called terrorists and suicide bombers?*
> *Teacher: No, I am not. I have never heard that before, and I have worked here for years. Is it everyone or is it just one kid?*

> *Mrs. Orzel: Does it matter if it is just one student? Isn't one student who has to face that type of racist comment enough to address it as a school?*
> *Teacher: I don't have time to talk about this in class. We have so much to cover in class that there isn't time for things like this.*
> *Mrs. Orzel: If we have students who are being called "terrorists" and "suicide bombers," then they most likely aren't focusing on your content as it is. Why don't you try to open the dialogue and see what happens?*

Exclusionary practices in education marginalize and impact all students, but especially those from minoritized backgrounds. School programs and curriculum exclude and marginalize students because of external, uncontrollable factors such as gender, ethnicity, and poverty. Students from disadvantaged backgrounds are repeatedly excluded, denied educational opportunities, and silenced in the school setting (Ryan, 2006b; Shields, 2009).

School leaders face significant challenges to address academic, social, and emotional needs of all students. In many cases, school leaders perpetuate exclusive practices by falling victim to federal mandates and ultimately limiting dialogue in schools. In turn, crucial dialogue does not occur unless spaces for dialogue exist. Hence, school leaders face an overwhelming, yet necessary, challenge to create inclusive communities which promote—and expect—spaces for necessary dialogue to occur.

Notions of equity and access present another challenge to creating inclusive schools. In many schools, curricula and programs suffer as a result of federal mandates. For example, art, music, and foreign language programs are often eliminated and replaced with more math and reading programs to meet Adequate Yearly Progress requirements. Consequently, teachers are deskilled, and the curriculum becomes a drill-and-kill model of reading and mathematics, essentially marginalizing disadvantaged students (Ravitch 2010).

Students are also excluded from the learning process in a subtle manner. As an example, Bourdieu's (1991) notion of "cultural capital" or "valued resources" (Ryan, 2006a) plays a role in exclusionary practices in schools. Students who can conform to the normed values of the organization are often rewarded for exhibiting those behaviors in school; those who cannot conform are often excluded. Often, school excludes students because students do not know the norms and culture of the school itself. Therefore, social class hierarchy and privileges afforded to middle-class students impact students' experiences in school (Bourdieu, 1991; Hallinger & Heck, 1998; Ryan, 2006a, 2006b). In other words, students from middle-class backgrounds who possess certain kinds of "cultural capital" and can act, think, and talk in certain ways have an advantage of those students who cannot. As Ryan states, "…schools exclude some students from activities by requiring them to have attributes or resources associated with cultural capital that they do not possess" (p. 25).

Lack of Dialogue

> …the entire social arrangement called "school" should be designed around this purpose of introducing children to the life of dialogue (Sidorkin, 1999, p. 4).

> *Teacher: Mrs. Orzel, you won't believe this. I had the conversation with my students this morning. Every single student said that they had heard students in our building called terrorists and suicide bombers.*
> *Mrs. Orzel: Really? So what did you do?*
> *Teacher: We spent the entire period discussing it. Did you know that many of our Arabic students are being called this? Did you know that our Arabic students don't want to come to school because of these comments?*
> *Mrs. Orzel: I can imagine. It's horrible. So what did your class say about it?*
> *Teacher: We are going to make time weekly to discuss it, but we all agreed that as a school we need to talk about it. Do you think we could make it part of our Advisory lessons next week since it appears to be impacting the school? So many of my students said they feel awful about it but don't know how to address it. I think we need to help them.*
> *Mrs. Orzel: Sounds great. Why don't you put something together for the staff and we can continue the discussion next week in Advisory?*
> *Teacher: Great, but I really want the students to help me. Is that ok?*
> *Mrs. Orzel: I think it's a great idea. Thanks for your leadership.*

Dialogue is severely lacking in today's schools and classrooms. Consequently, at the forefront of educational policies and reform efforts are centralized curriculum and testing processes which minimize classroom conversations. Teachers and administrators must ask themselves: "How much time is the teacher talking in class versus allowing opportunities for students to dialogue and make meaning through dialogue?"

A strong need for dialogue exists in today's school systems. Yet, as a result of mandates, many schools eliminate critical conversations in the classroom. Sidorkin (1999) suggests that "it is the lack of language for describing what works in schools that…prevents educators from turning every school into a good place to spend one's childhood" (p. 2). Similarly, Shields (2009) supports the notion of dialogue and connects the idea to educational leadership when she states, "As educational leaders, we must be present through initiating and facilitating the dialogue that permits all voices to be heard" (p. 111). Thus, a strong need for dialogue is evident, and school leaders need to provide spaces for critical conversations to occur.

Challenges Facing School Leaders

Schools as institutions are isolated, tightly controlled organizations which leave little room for dialogue and diversity. To support that notion, Shields (2009) states, "When we think of schools as institutions, we tend not only to deskill teachers, but also to destroy their sense of agency and personal control. In turn…students are also deskilled and dehumanized" (p. 131). In order to provide collaborative relationships instead of traditional hierarchies, leaders must provide equitable, caring, and fluid relationships to foster dialogue. Ryan (2006a) suggests:

> The task for leadership…is to raise the consciousness of people so that they can recognize widespread and harmful exclusive practices like racism and sexism and do something about them. This requires that school communities perpetually raise questions about what they do and about the wider context within which learning and schooling occurs. (p. 58)

Principals face significant challenges in creating inclusive schools. In order to promote inclusive leadership in schools, principals must not only promote academic achievement but also prepare students for a pluralistic, democratic society. Astin and Astin (2000) support that notion and state, "…the value ends of leadership should be to enhance equity, social justice, and the quality of life" (p. 6). Several other scholars would also support the idea that leadership should value equity and social justice, yet these notions are rarely considered the purpose of school leaders in today's educational field. For example, Moller (2009) discusses a shift in process to a shift in outcomes and accountability. He states, "However, by this shift in focus there is a risk of ignoring some of the most critical purposes of public schooling, for example preparation for participation in a democratic society or processes that creates and sustains social justice…" (p. 40). Similarly, Shields (2009) suggests that those in formal positions of leadership "must choose to exercise their power in moral ways to intervene in the processes and content of schooling to create learning environments that include all children" (p. 152). Similarly, Frattura and Capper (2010) call for "revolutionary strategies" in rethinking leadership practices to address diverse needs of students (p. 4). As a result, in order for school leaders to become inclusive leaders, they must incorporate these "revolutionary strategies" and include both the academic excellence component of education and be socially just leaders. Rarely do school leader job descriptions discuss or define "socially just" expectations. However, if a principal is to create an inclusive school community, leadership must involve aspects of social justice.

Challenges to creating and leading a socially just, inclusive school are evident. Diverse school populations coupled with inequitable access to school programs, opportunities, and curricula create barriers to socially just environments; however, while increasing diversity is a prevalent topic for school leaders, it is ultimately the educational system's policies and structures that create the inequities in the school (Frattura & Capper, 2010). Thus, inclusive leaders must face the challenge to move beyond the discussion of challenges in education and become activists for caring communities where relationships are central. Dantley and Tillman (2010) suggest that creating socially just schools starts with educational leaders. They state, "We must move from passive discourse and involvement to conscious, deliberate, and proactive practice in educational leadership that will produce socially just outcomes for all children" (p. 31). Therefore, scholars argue that socially just and deeply democratic outcomes are vital for inclusive leadership approaches.

Inclusive Leadership Approaches

Leadership styles and approaches are varied, and not all approaches promote inclusive leadership. Some forms of leadership can be viewed as one-sided and may actually promote power imbalances in school settings. Ryan (2003) suggests that inclusive leadership practices show more promise and are more communal versus exclusive. He states, "…inclusive forms of practice and attention to global forms of power and justice, critique, action and dialogue will help, rather than hinder opportunities and life chances of traditionally marginalized groups" (p. 59). Therefore, inclusive school leaders play a critical role and must pay attention to opportunities and power to provide access to marginalized students.

The role of the principal in creating an inclusive school is vital. To support that point, Ryan (2003) suggests, "Principals are in ideal positions to promote inclusion… Moreso than perhaps any other individual, they have the power to shape leadership practices that are consistent with inclusion" (p. 171). In the same sense, Shields asserts that "the task of the leader is to have a clear vision, to express it articulately and symbolically in ways that attract others, and then to help people work together to create an inclusive and deeply democratic school" (p. 146). As a result, through inclusive principal leadership practices, the literature suggests the key to creating inclusive communities is to provide access for all students. Capper (1993) supports that notion and claims, "…administrators…have a responsibility not only to provide an education that is inclusive of, and meaningful to, all students in the district…but to be sure students have access to information about identities and cultures representative of the diversity of society" (p. 292). Thus, principals possess a great deal of influence to provide access and opportunities for all students.

Finally, the role of the educational leader must be to create inclusive communities which promote deep democracy. Moller (2004) suggests that the role of the principal is to the democratic citizen. Similarly, Green's (1999) notion of deep democracy enables leaders to think deeply and critically about creating democratic citizens. Green suggests that "a limited, formal conception of democracy contrasts with a *deeper conception of democracy* that expresses the experienced-based possibility of more equal, respectful, and mutually beneficial ways of community life" (p. vi) and "sustainable transformation requires the development of a deeper democracy" (p. 202). To that end, Shields (2009) asserts that education must be both deeply democratic and socially just. She encourages educational leaders to "prepare students to live in a democracy by teaching the skills and dispositions to live in mutually beneficial relations with others…it requires educators to give students opportunities to *practice* democracy" (p. 6). As a result, leaders must keep deep democracy as a central focus to overcome the dichotomy between academic excellence expectations and conceptions of social justice, equity, and access.

Equity and Access

Inclusive leadership practices provide equitable access to resources, curriculum, programs, and opportunities. Darling-Hammond (1997) highlights the disparities in education by drawing attention to affluent communities and resources and across states. She cautions that such disparities are a threat to the foundation of a democratic society and claims, "The victims of social inequality and education inadequacy are trapped in a growing underclass…Ultimately, everyone pays, financially and socially, the resulting costs to the broader society" (p. 262).

Consequently, educational leadership is a challenge in today's schools; in fact, some leaders shy away from conflict and from the difficult conversations which must occur in order to move the organization forward. However, Glass (2003) discusses the role of conflict in a pluralistic society and says that conflict should be expected. Similarly, Shields (2009) asserts, "…it is…important for leaders to understand the critical positive role that conflict can play" (p. 139). In other words, in order to lead, leaders must understand conflict, challenge the status quo, and create opportunities for open dialogue and communication. To that end, leaders in a democratic society are faced with the challenge of creating dialogic, inclusive communities. Thus, the literature suggests community building as a critical role of the inclusive school leader. Through dialogue, a sense of community is established, which leads into the next section of the literature review, a focus on community.

Focus on Community

Building upon the inclusive leadership literature, school leaders must envision, create, and sustain a strong parent and community focus when creating an inclusive school community. Thus, parent and community involvement is a crucial piece of inclusive leadership. At its most surface level, parent involvement involves volunteering in classrooms, yet some school leaders reach beyond the surface to involve parents in dialogue surrounding policy and decision-making processes to promote inclusive school communities. The connection between inclusive leadership, social justice, community, and relationships is strong. As Riehl (2000) suggests:

> When wedded to a relentless commitment to equity, voice, and social justice, administrators' efforts in the tasks of sensemaking, promoting inclusive cultures and practices in schools, and building positive relationships outside of the school may indeed foster a new form of practice. (p. 71)

Building positive relationships, as Riehl suggests, is important to building community; however, little research has focused on how the various perspectives of school leaders contribute to a "better understanding of the concept of a community of difference" (Shields, 2002, p. 145). While the gap in the literature exists, there appears to be a strong connection between inclusive leadership and community.

School leaders must realize that schools are a critical element within the larger community that influence and shape students' lives. Oliva, Anderson, and Byng (2010) support that notion and suggest that school leaders must "…vigilantly monitor their interaction with stakeholders in the broader community out of schools" (p. 285). Without a strong community focus, inclusive leadership appears superficial, yet the aspect of community is vital. Peck (1993) argues the need for community when he states that there are very few "true communities" (p. 276). Thus, this next section will build on the idea of inclusive leadership and explore the notion of community.

Connecting Student Learning and Community

Community members, especially parents, express concerns about student learning. Inclusive leaders should make the connection between inclusive practices, the community, and student learning. Educating the community about inclusive practices is vital, and school leaders must provide inclusive practices which also emphasize student learning and improvement to teaching practices. School leaders must establish clear goals, collaborate often, take risks, and monitor the progress of students. Ryan (2006a) posits:

> Research is clear on the best ways of delivering curriculum in inclusive ways…it has found that students are generally included when the school honors different ways of knowing and different sources of knowledge, when it allows students to write and speak in their own vernacular, and when it employs culturally compatible communication styles. (p. 123)

In other words, school leaders must educate both the community and teachers on inclusive practices which will have an impact on student learning.

Inclusive leaders must educate their school communities on what fair and comprehensive assessment should entail. As previously mentioned, most school systems continue to operate under hierarchical, routinized structures because education reforms use evaluation tools which are exclusive instead of inclusive, which ultimately deskills teachers while excluding and marginalizing students. By understanding these processes, communities must work around these systems to include multiple, fair, and equitable assessments to measure student learning and progress (Ravitch 2010; Ryan, 2006a). As a result, by deskilling teachers and creating a high-stakes testing atmosphere, students who need the most support, low-income and minority students, have been marginalized (Shields, 2009). Lewis and Macedo (1996) suggests that power in education can impact marginalized students, and he discusses how students are "flung to the margins." If schools only focus on reading and math by the top-down, efficiency, bureaucratic notions of the past will not be able to move forward and progress to create democratic, inclusive communities.

In order for school communities to become more inclusive, they must be directly involved and engage in policy and decision-making processes. Ryan (2006a) suggests that all stakeholders are represented and that they have an "equal and fair opportunities to influence the outcome of the processes" (p. 128). However, Ryan also cautions that while some communities welcome this collaboration, some stakeholders do not wish to engage in decision-making at the school level because they feel powerless or silenced. Inclusive school leaders must get to know the community, find ways to give all stakeholders a voice into decision-making, and see the world from different points of view (Ryan).

Inclusive leadership practices are largely impacted by creating a sense of community. As community is developed in an inclusive school, differences are accepted as trust, safety, and belonging are fostered. Therefore, a strong connection between inclusive leadership, community, and democratic principles exists which incorporate the next piece of the literature review, dialogue.

Dialogue as a Foundation for Inclusive Schools

Inclusive leaders provide socially just and deeply democratic environments for all students. Through inclusive leadership, community is transformed and created to support inclusive practices. For both inclusive leadership and building community, one key element is essential, dialogue. "Dialogue is the very act of developing relationships with other people and with the subject matter itself…it represents a flowing through of ideas to promote reflection, critical analysis, and ultimately, democratic action" (Shields, 2009, p. 159). To build inclusive schools, leaders must recognize that dialogue is critical and the foundation for building such relationships. This next section will connect inclusive school leadership, community, and dialogue.

Understanding Dialogue

Dialogue seems, in its most simple sense, easy to understand; however, the notion of dialogue is intricate, complex, and transcends beyond the meaning of words or having a conversation with another person. Dialogue is not a new concept; in fact, scholars have long been completing significant research in the field of dialogue. However, competing viewpoints exist about the notion of dialogue. As an example, Burbules (1993) suggests:

> …the status of dialogue as a source of knowledge and understanding, as a medium for interpersonal discourse, and as a pedagogical relation has been a central topic of interest and dispute. Specifically, among various writers on education and society, especially those writing from contemporary "postmodern" perspectives, dialogue has been a focal point for debating broader conceptions of language, epistemology, ethics, and politics. (p. 2)

As a result, some scholars view dialogue as ontological, while others view it as a "relation we *enter into*" (Burbules, 1993) or as a tool for teaching and learning.

One such notion of dialogue stems from an ontological viewpoint. For example, Buber (1970) suggests dialogue as a fundamental way of life and supports the idea that dialogue is a relational ontology when he states, "All actual life is an encounter" (p. 62). He suggests the need to know one's students and community and to educate people through relationships for community (Buber, 1939). "Engaging in genuine dialogue enhances the possibilities for meaningful community, and for realizing our unique wholeness" (Kramer, 2003, p. 3). In other words, there is a strong connection between relationships, dialogue, and community. Bakhtin (1984a) also supports that connection and provides insight into dialogue as a way of understanding or a way of life. He states:

> To live means to participate in dialogue…In this dialogue a person participates wholly and throughout his whole life: with his eyes, lips, hands, soul, spirit, with his whole body and deeds. He invests his entire self in discourse, and this discourse enters into the dialogic fabric of human life. (p. 293)

Shields (2007) explains Bakhtin's philosophy of dialogue and states, "…for Bahktin dialogue is ontological- a way of living life in openness to other who are different from oneself, of relating to people and ideas that remain separate and district from our own" (p. 65). Similarly, Sidorkin (1999) refers to dialogue in an ontological sense that it refers to "human existence." Supporting the notions of Buber and Bakhtin, Sidorkin speaks to dialogue being the center of relationships. He states, "…we are truly human only when we are in a dialogical relation with another… Dialogue becomes the goal in itself, the central purpose of human life" (Sidorkin, p. 12). Therefore, these scholars view dialogue as a foundation of being.

On the other hand, some scholars view dialogue from a different perspective and do not treat it as ontological. As an example, Burbules (1993) takes a slightly different approach and describes dialogue as a social relation and a basis for teaching when he states:

> A successful dialogue involves a willing partnership and cooperation in the face of likely disagreements, confusions, failures, and misunderstandings. Persisting in this process requires a relation of mutual respect, trust, and concern- and part of the dialogical interchange often must relate to the establishment and maintenance of these bonds. (p. 125)

To that end, Burbules (1993) suggests "standards" or "rules" for successful dialogue which include participation, commitment, and reciprocity. Participation involves including all members so that people feel a part of the dialogue. Burbules explains, "Any participant should be able to raise topics, pose questions, challenge other points of view, or engage in any of the other activities that define the dialogical interaction" (p. 80). Commitment involves coming to an understanding, not necessarily an agreement, especially when conversation might be difficult. Finally, reciprocity suggests that dialogue is respected and "cannot assume that people will speak the same way, mean the same things, or share the same concerns when they speak" (Burbules, p. 37). In addition, reciprocity also encompasses "a spirit of mutual respect and concern, and must not take for granted roles of privilege or expertise" (Burbules, p. 82). Nevertheless, Burbules reminds us that these "rules" are beneficial but only take us "part of the way toward understanding" dialogue.

While scholars discuss dialogue through both ontological and non-ontological perspectives, the importance of dialogue in schools is clear. Similar to several other scholars, Shields and Edwards (2005) caution that "Dialogue is not just talk." Thus, the point in sharing different perspectives of dialogue is to understand that dialogue is not a new term, concept, or phrase; rather, it is a "way for us to understand something or someone who is in some way different than ourselves, who has a different perspective, alternative lens, varied history…" (Shields & Edwards, p. 15).

Power and Dialogue

Power hierarchies and structure plague school systems and influence dialogic relations. Therefore, the literature suggests that dialogue is vital to understanding and examining inclusive leadership, community building, school change, and educational reform. For example, Sidorkin (1999) suggests the importance of dialogue in schools and states, "…it is the lack of language for describing what works in schools that among other things prevents educators from turning every school into a good place to spend one's childhood" (p. 2). To support that point, Ryan (2006a) urges that school leaders provide inclusive schools which give students a voice. He states, "Everyone must have an equal opportunity to speak and must respect other members' right to speak out to feel safe to talk; all ideas must be tolerated and subjected to fair assessment" (p. 120). For schools to become inclusive, scholars suggest that dialogue must be at the heart of inclusive leadership practices, and power imbalances must be minimized or eliminated.

Power structures are not only prevalent in inclusive leadership practices but they also influence dialogue in the school setting, where marginalized groups are often silenced because of power and dominance. Delpit (1988) examined "silenced dialogue" and the culture of power that exists in society today and analyzed five rules of power that impact African American students and students from poverty. These five rules of power are as follows:

1. Issues of power are enacted in classrooms.
2. A culture of power exists—there are rules to participate in power.
3. The rules of the culture of power are a reflection of the rules of the culture of those who have power.
4. If you are not already a participant in the culture of power, being told explicitly the rules of that culture makes acquiring power easier.
5. Those with power are frequently least aware of—or least willing to acknowledge—its existence. Those with less power are often most aware of its existence (p. 283).

Although Delpit analyzes these rules to show educators power structures within the classroom and their impact on learning, Delpit's culture of power becomes relevant to inclusive school communities as well. As an example, Delpit stresses the importance of all educators, White or minority, acknowledging that power is prevalent in society and in our classrooms when she asserts, "to act as if power does not exist is to ensure that the power status quo remains the same." Furthermore, Delpit challenges educators to work with African American parents, teachers, and members of poverty-stricken communities when she says:

> I am suggesting that appropriate education for poor children and children of color can only be devised in consultation with adults who share their culture. Black parents, teachers of color, and members of poor communities must be allowed to participate fully in the discussion of what kind of instruction is in their children's best interest. Good liberal intentions are not enough. (p. 296)

In this way, Delpit stresses the importance of dialogue as a means to better understand the needs of marginalized populations. Although Delpit's ideas are specific to the classroom, she addresses power and inclusivity in a broader sense when she asserts:

> The dilemma is not really in the debate over instructional methodology, but rather in communicating across cultures and in addressing the more fundamental issue of power, of whose voice gets to be heard in determining what is best for poor children and children of color. (p. 296)

Delpit's ideas are critical to examine in light of this study because they directly relate to how power structures can ultimately silence marginalized groups of individuals. Thus, Delpit argues the idea that successful relational dialogue is directly related to notions of power structures and inclusivity.

Bakhtin's notion of *carnival* suggests an avenue to break down hierarchical barriers and power inequities. Rather than applying rules to situations, Bakhtin's approach to carnival suggests ways of viewing alternatives to power hierarchies. For example, Bakhtin (1984a) states:

> Carnival is the place for working out, in a concretely sensuous, half-real and half-play acted form, *a new mode of interrelationship between individuals*, counterposed to the all-powerful socio-hierarchical relationships of non-carnival life. (p. 123)

In a school sense, power structures, hierarchies, and titles are suspended. He states, "…one might say that carnival celebrated temporary liberation from the prevailing truth and from the established order; it marked the suspension of all hierarchical rank" (Bakhtin, 1984b, p. 10). Carnival provides school leaders with an option to suspend power so true dialogic relations may occur.

In order to challenge power structures and hierarchies in schools, all stakeholders' voices must be heard. Ryan (2006a) suggests, "At its best, dialogue encourages the inclusion of voices not normally heard" (p. 122). He provides suggestions for school leaders and suggests dominant individuals, or those in power, abandon their influence when participating in dialogic settings. However, he cautions:

> It would be naïve to think that dialogue in itself, however, can ensure that the marginalized will overturn the entrenched power relationships that exclude them from many of the advantages that others enjoy. Relationships among classed, raced, and gendered students, educators, and parents are difficult to overcome in the classroom and the school. (p. 122)

In other words, educators should be aware that challenges exist when power imbalances are prevalent in school systems, but they should also promote and encourage dialogue to suppress such barriers. On the other hand, some scholars, like Burbules (1993), suggest authority has "legitimacy," and that "a dialogical relation should be aimed toward making authority superfluous; but authority, properly conceived and sensitively exercised, can be a helpful element in attaining that end" (p. 35).

Inclusive school leaders strive to diminish power imbalance while creating inclusive practices in school settings. Shields (2009) acknowledges such barriers and issues of power and calls upon educators to "engage in dialogue that promotes understanding of the ways in which [power issues] create barriers to equal democratic citizenship" (p. 95). As a result, leaders must understand the power imbalances prevalent in school systems and use a dialogic framework to create communities of difference in inclusive schools. This next section provides practical applications of inclusive practices for school leaders.

Practical Application of Inclusive Practices for School Leaders

I often find myself asking, "How can we 'do school' better?" Most recently, I attended a school musical for my 3-year-old son. It was my first experience at a school as a parent, and not as a teacher or administrator. As I looked around the room, I noticed excited parents, siblings, and family members, all waiting for preschoolers and kindergarteners to take the stage. As each group of 3- to 5-year-olds performed, I watched their enthusiasm for learning and performing. I had to ask myself, "Every single one of these children love school. What happens from now until 4th, 5th, 8th, and 10th grade when we see students disengage from learning?" Many blame parents. Some blame the students. But how often are we looking in the mirror and asking, "How are our current school structures negatively impacting our students?"

Thus, school leaders are faced with a myriad of challenges in their daily work. In order to create an environment of academic excellence, principals must focus on principles of social justice. I argue that school leaders, including teacher leaders, must expect that schools have both academic excellence and equity in order to create and sustain school systems which engage students—from preschool through university. This next section will infuse theory and practice and will provide some practical examples of how notions of dialogue, access, equity, and opportunity are connected to the ideas of inclusive school communities.

While some of these practices are common in schools, I am choosing to highlight certain areas to point out their importance when striving to create an inclusive community focused on dialogic relations. As you read these next sections, I invite you to rethink my practices in your own context of education and issues surrounding social justice in schools.

Faculty Meetings

For school principals, faculty meetings are a common practice and can be an opportunity for collaboration, dialogue, and communication. However, the day of the mundane faculty meeting where the principal provides an agenda and reads dates to the faculty is a thing of the past. Shields (2009) reminds us that we must bring dialogue into our schools when she states, "As educational leaders, we must be present through initiating and facilitating the dialogue that permits all voices to be heard" (p. 111). Thus, in order to create an inclusive environment focused on principles of social justice, school leaders must change the way they have historically structured faculty meetings and should focus on school improvement and professional development.

In an inclusive school community, faculty meetings are opportunities for staff to collaborate, communicate, and dialogue about a variety of topics. It is at this common practice within schools that a principal can begin to create community. Within an inclusive structure, the agenda of a faculty meeting is created by the staff, not the principal. In other words, the staff drives the agenda by providing the principal with agenda items prior to the meeting. While the principal still has an active role, the staff is held responsible to create the agenda. At the meetings, the principal serves as a facilitator of the discussion and is part of the whole discussion within the community, not the sole leader of the staff.

In keeping with that philosophy, a collaborative meeting focused on dialogue allows for opportunities of reflection as well. At each meeting, staff is asked to provide feedback for reflection. As an example, staff members are given Post-it Notes on their tables and are asked to provide questions, suggestions, concerns, and kudos for the topics discussed at the meeting. After the meeting ends, the principal examines the feedback, makes comments as necessary, and sends the feedback out to the staff. A process such as this provides continuous dialogue and feedback from staff to staff and opens the lines of communication for school improvement. Those individuals who are less likely to speak in front of large group of peers are more likely to voice their opinion when able to write their feedback anonymously on a Post-it Note.

Faculty meetings are also an opportunity for school principals and teachers to present current research and have dialogue about topics which are not often discussed in schools. Sidorkin (1999) reminds us of the need to include dialogue in schools when he says that "it is the lack of language for describing what works in schools that…prevents educators from turning every school into a good place to spend one's childhood" (p. 2). As an example, principals often utilize faculty meeting time to analyze student data. When analyzing the data, oftentimes, schools see achievement gap data relative to Caucasian students and minority students. While staff then knows and understands the gap exists, rarely do we ask questions such as: *Why does this gap exist? What is causing the gap in our school? What are the bigger implications to this type of an achievement gap?* In a school focused on principles of social justice, educators will try to understand the root of the problem just as much as they try to find solutions to the problem.

School Leadership Teams

Many schools in the United States have school or building leadership teams. It is important to understand the structure of the leadership team and how that structure either enhances or prohibits dialogue, equity, and access. Ryan (2006a) reminds us that critics argue that shared decision-making and collaborative processes "will waste people's time, delay important decisions, raise operating costs, and increase workloads. But if hierarchies remain, efforts at inclusion will also be fake…" (p. 13). Thus, creating leadership teams that are truly inclusive are a critical role of a school principal.

Many leadership teams are comprised of administration and teachers, and while the relationship between staff and principals is necessary and encouraged, it does not include all stakeholders in the learning community. Therefore, a school leadership team should be comprised of teacher representation from all grade levels and subject areas, administrative representation, support staff representation, student representation (all grade levels), and parent representation. Student and parent representation should reflect the school's demographics as well. In other words, in a school with 50 % minority students, the parent representation should not be only Caucasian parents. In addition, agendas should be driven by the members of the leadership team, not the school administration. When the administration and teachers are the only individuals who set the agenda, students and parents from disadvantaged backgrounds can be excluded, denied educational opportunities, and silenced in the school setting (Ryan, 2006b; Shields, 2009).

Student Focus Groups

While it is important to include students into the leadership team, it is also important to give students a voice into every aspect of the school community. One way to provide a voice for students is through Student Focus Groups. Student Focus Groups are comprised of groups of students who meet with the building leadership on a monthly basis to give feedback about the school. Each month, a random group of students are selected to have lunch with the principal. Ryan (2006a, 2006b) suggests that the task for leaders "is to raise the consciousness of people so that they can recognize widespread and harmful exclusive practices like racism and sexism and do something about them. This requires that school communities perpetually raise questions about what they do and about the wider context within which learning and schooling occurs" (p. 58). Such questions should not only be posed to teachers, as students can benefit from questions which raise their own consciousness. For example, during focus group meetings, students are asked questions such as the following: *What do you like about our school? What do you dislike about our school? What would you tell other students who don't attend here about our school? If you could make any changes to our school, what would they be and why? What do you think about our curriculum and courses? Do you ever see people treated unfairly? If so, when and where? What do you think about our homework policy? What do you think about our school policies, rules, and procedures? What ideas do you have to make our school better?*

Students are encouraged to answer freely, openly, and honestly during the process. No student names are written during the focus groups, yet notes are collected and distributed to staff and parents. As a result, school improvement efforts are focused on student needs, and students feel that they have a "voice" into the school community, thus challenging the structures in school which create silence for marginalized parents and students.

Engaging Parents and Community

Oftentimes, educators become frustrated with the lack of parent engagement and communication; however, it is the school's responsibility to actively engage parents into the learning and decision-making processes at schools. For many schools, Open House and Back to School Night are the most heavily attended evenings in the school. During Open House, the school principal has a responsibility to actively engage parents and set the tone for parent engagement and involvement throughout the year. Ryan (2003) reminds us that "Principals are in ideal positions to promote inclusion…Moreso than perhaps any other individual, they have the power to shape leadership practices that are consistent with inclusion" (p. 171).

At Open House evening, schools should open the dialogue to hear from parents what they like, or dislike, about the school system, including providing anonymous opportunities to share their feedback about curricula, programs, operations, activities, and communication. This process can easily be accomplished by giving parents a survey when they enter the building. The next step would include the leadership team to analyze the results and then create a plan of action to address parental needs and concerns. Finally, the plan should be communicated back to the parents, so they know their voice was heard and that concerns were taken seriously.

For schools with high percentages of minority students and for schools in high poverty communities, it is imperative that principals plan accordingly to prepare for such events. As an example, transportation should be provided for parents who cannot provide their own, translators should be on-site, and principals should communicate in the parents' home language about translation services, transportation, and childcare prior to the evening. In addition, principals should take time during the summer months to call parents personally and invite them to Open House evening and welcome them back to the school year. While principals may not be able to make calls to every single family for large schools, they can provide phone blast calls to go out to parents as reminders.

During Open House, gaining feedback from parents about what their children need is a critical component to creating an inclusive environment. A quick and easy way to get feedback is to put posters up in the building with sticky notes below for parents to give suggestions. Parents can provide input about curriculum, school programs, transportation, operations and procedures, activities, clubs, sports, extracurricular opportunities, and communication. Parents should be asked what the school is doing well and what can be improved. Data received from these events should be discussed and analyzed by school leadership team members, and communication should go back out to the stakeholders about next steps. Follow-up communication is a vital piece of the process.

Additionally, principals must actively engage parents by communicating with them on a routine basis. Principals should have parent and community e-mail lists to send out reminders and pertinent information. Similarly, school leaders must be active and engaged within the larger context of the community itself. Presence at community events, communicating with local agencies, and being visible in the community are all vital roles for principals striving to create an inclusive environment focused on principles of social justice.

Home Visits

Parents are critical members of the school community. Riehl (2000) reminds us of the impact of a school administrator's role of fostering a new form of practice when committed to the notion of social justice when she says:

> When wedded to a relentless commitment to equity, voice, and social justice, administrators' efforts in the tasks of sensemaking, promoting inclusive cultures and practices in schools, and building positive relationships outside of the school may indeed foster a new form of practice. (p. 71)

Thus, home visits to families are a necessary practice in order to build community. In today's economic downturn, we have parents who work several jobs to make ends meet for their family, or other parents might have had a negative school experience when they were in school. For these parents, coming to school functions and events can be difficult due to work schedules or due to anxiety from their own contextual experiences. Therefore, another strategy for school leaders seeking to create inclusive schools is to complete home visits. Home visits are opportunities for school leaders to visit the home of a student within the school community and visit with several parents at one time to better understand the needs of the community.

One way to maximize the impact of home visits is to structure it to a specific group of parents. As an example, if a school has an English Language Learner (ELL) population of students whose parents do not speak English as their first language, the principal can set up a visit to their home and bring a translator. I have completed a similar visit and found that parents have a deep and profound respect for our schools. Many of them indicated that they completed research prior to moving because of their love of education and the importance of it for their children. Similarly, parents attended the home visit and had never attended a school event prior to that time, other than Open House. When asked why they only attend Open House and not other events, like parent/teacher conferences, they responded that they attend Open House because the "teachers talk to them, and they can understand English." They shared that they did not attend other events like conferences because "we can't speak good English, so it's embarrassing." Some parents also indicated that they did not call their children in sick to school because they know that the secretaries will not understand them. They impressed upon us that they care deeply about their children's education but that they do not know how to navigate the school system itself. Without making the efforts to reach out to families, school principals and teachers make assumptions about families and are not able to truly understand families' needs and expectations unless they take the time to reach out and complete home visits.

Conclusion

I have had the privilege to present with colleagues at several conferences in the past few years, and through that experience, I have found that educators, especially teachers, are eager to hear about topics of social justice and dialogue in schools. Often, after presentations where, as a principal, I make comments such as "If students are being called 'terrorists,' they don't care about your math or science test, so we need to address the social concerns of our school in order to have high quality, academic excellence," I am bombarded with questions from teachers about how they can infuse more dialogue into their schools and classrooms.

As educators, we have the most difficult and most important job in the world. We are faced with great challenges. I argue that we must stop limiting our students' opportunities by archaic school structures and, instead, open our hearts and minds to engaging practices in schools which open—and expect—equitable access for each and every student. Students, like Ahmad, are counting on us to provide the most quality educational experience for them.

We are at a critical time in education, yet this could be one of the most exciting times in education. Federal reform efforts continue to be at the forefront of agendas for politicians, educators, and parents, and principals continue to feel under pressure to meet the demands; however, the seeds of hope in education are in the notion of including dialogue into our schools and classrooms. This chapter has sought to provide information about inclusive school communities that are focused on principles of social justice. I have argued that schools must be both academically excellent and socially just to be considered inclusive environments, yet most schools lack opportunities for dialogue to occur. In order to provide opportunities for students and parents, principals are charged with the task of creating spaces for dialogue among all stakeholders.

Practical application strategies have been provided in the chapter as specific examples of ways in which principals can create spaces for dialogic practices to occur. I call upon all educators to rethink my practical application practices in your school contexts and to have the moral courage to stand up to marginalizing structures and practices in our schools in order to meet the needs of all students, especially students like Ahmad, who come to school not just wanting to feel safe but also to be heard.

Chapter 25
Narrative Dialogue and Teacher Leadership for Social Justice: Re-Storying to Understand

Lindsayanne Insana, Daniel Johnson Mardones, Hilarie Welsh, and Marilyn Johnston-Parsons

> Our stories are the masks through which we can be seen, and with every telling we stop the flood and swirl of thought *so someone can get a glimpse of us,* and maybe catch us if they can. (Elbow, 1986, p. 69)

The stories we tell ourselves and others are always subject to change because we continue to live our lives. Telling our stories is a way for us to "catch" ourselves in a moment in time and reflect on who we are; also, as we choose how to narrate our lives for others, they catch a glimpse of us in the stories we tell them.

In this chapter, we use narrative dialogue both to demonstrate a method of inquiry and to advocate for a narrative approach to develop teacher leaders for social justice. Two of us (Lindsayanne and Hilarie) wrote narratives that we re-storied (Clandinin & Connelly, 2004) as we engaged in an extended dialogue about our narratives for the purpose of writing this chapter. In this process we came to new understandings about ourselves as leaders for social justice.

The four of us knew each other well before we began this narrative dialogue. As three doctoral students and an adviser (Marilyn), we had talked about our lives as teachers and doctoral students. We were comfortable talking about teaching and academic ideas; yet, we had quite different backgrounds. Lindsayanne was beginning her second year as a doctoral student after having taught 7 years; Hilarie was writing her dissertation in her fourth year of the doctoral program and had previously taught for 6 years; Daniel was a first-year doctoral student from Concepción, and had completed a master's thesis using narrative life histories; and Marilyn was a professor with research interests in collaboration research and teacher education. In spite of these differences, we enthusiastically embraced this project of writing about teacher leadership.

Telling Stories

We began working on this chapter with Lindsayanne and Hilarie writing narratives about their individual experiences as teachers.[1] We weren't inclined to label these as stories of leadership; we thought of them more as stories of "jobs" Lindsayanne and Hilarie took on within their teacher roles.

We (the authors) began an extended dialogue about our narratives in light of the goals of this chapter—teacher leadership for social justice. In the process, we re-storied our narratives as examples of teacher leadership and later of teacher leadership for social justice. The dialogic process led to new understandings of the same events.

Talking about *teacher leadership for social justice* took us on a journey into a field largely dominated by a focus on principals. As we read and noticed the gap, we wondered if the emphasis on principal leadership was a result of teachers not considering themselves as school leaders, especially not as leaders for social justice. We also wondered whether other teachers are also working as teacher leaders without identifying their work as such. It is also true that studying and valuing teacher leadership is a fairly recent phenomenon. Our approach to it is unique because we are using narrative dialogue and this contrasts with the logical-deductive view, which has long dominated the study of educational leadership.

Literatures That Informed Our Understanding

Readings in several areas helped us situate our narratives within the literature related to leadership, social justice, dialogue, and narrative. Each of these literatures influenced our work on this chapter.

Leadership

The literature on educational leadership has evolved over the last few decades. It began with a focus on *theories* of leadership and has gradually included studies of actual educational leadership and empirical evidence for its theories. However, it has been difficult to capture the complexity of the phenomena that it studies (Young & Lopez, 2011). This limitation is related to its concentration on the principal's leadership, a narrow methodological approach, and ignoring the social context in which schooling and educational leadership takes place (Young & Lopez). Until the 1980s, issues of social justice were marginalized, if not completely absent. None of the main theories of educational leadership, such as transactional leadership (Burns, 1978), distributed leadership (Leithwood, 2001), collaborative leadership (Sergiovanni, 1992, 2007), and transformational leadership (Bass, 1985; Leithwood, 2001), explicitly address issues of social justice.

---

[1] As a collaborative effort using narrative writing, pronoun use is complicated. In particular, I/we distinctions are not always easy to determine. We sometimes write using a plural "we" meaning the four of us as authors, indicated by "the authors." We spent a lot of time talking and came to some shared understandings of the two narratives we chose as examples for this chapter. At other times the "we" means only the specific narrative author(s) (Lindsayanne or Hilarie). In this case, we include their names.

Leadership for Social Justice

Leadership for social justice was born as a way to fill this gap. Recently, some have argued for social justice as a moral imperative of school and professional practice, including it in approaches such as transformative leadership (Shields, 2004a, 2010), dialogic leadership (Brown, 2004), Freirean leadership (Miller, Brown, & Hopson, 2011), and leadership for social justice (Theoharis, 2007). A number of current studies have focused on how to develop programs for leadership for social justice (Bell et al., 2008; Printy, 2008; Tillman, 2005). These newer approaches tend to use the terms *transformative, social justice, and dialogic* interchangeably, and Paulo Freire's influence is common in this literature (Bell et al., 2008; Printy, 2008; Tillman, 2005).

Shields (2009) attempts to clarify the concept of transformative leadership, arguing that it goes well beyond the traditional understandings of leadership for school improvement. It also goes beyond rational and technical approaches to educational change, in that its focus is on "promoting a form of education that may achieve its transformative potential" (p. 5). Shields differentiates transformative leadership from transactional and transformational leadership, emphasizing their distinct starting points, foundations, emphases, processes, key values, goals, power, concepts of leadership, and related theories (Shields, 2009, 2010).

The concept of dialogue is central in many of these theories; some of them talk specifically of dialogic leadership (Brown, 2004; Shields, 2004b). Personal relationships, moral dialogue, and sensemaking processes are acknowledged to be central in a socially just school. Also central are daily conversations about issues of power, race, social inequality, and gender, and especially giving voice to those who are frequently marginalized socially and educationally. Miller et al., (2011) propose a theory of leadership based on Freire's concept of dialogue, identifying his concepts of humility, faith, hope, critical thinking, and solidarity as key characteristics.

Theoharis (2007) prefers to talk simply of "social justice leadership" where "principals make issues of race, class, gender, disability, sexual orientation, and other historically and currently marginalizing conditions in the United States central to their advocacy, leadership practice, and vision" (p. 223). For Theoharis, the focus of leadership for social justice is facing and eliminating marginalization in schools. Overall, scholarship that marries leadership and social justice is relatively new, and most of this work is oriented to school administrator leadership or programs to develop school principals (Shoho, Merchant, & Lugg, 2011).

Teacher Leadership for Social Justice

Beginning in the 1980s, the concept of teacher leadership emerged as fundamental to school reform and educational change (Fullan, 2001; Smylie, 1997). An increasing body of research on teacher leadership evolved but few included issues of social justice. Smylie analyzed 208 research studies on teacher leadership and divided them into four areas of investigation: lead and master teachers, career ladders, teacher mentoring, and participation in decision making. He concluded that this body of work does not provide a satisfactory definition of teacher leadership. The absence of a clear definition has often been mentioned in the literature, even in the 2000s (Angelle & DeHart, 2011; York-Barr & Duke, 2004).

York-Barr and Duke (2004) define teacher leadership as a "process by which teachers, individually or collectively, influence their colleagues, principals, and other members of school communities to improve teaching and learning practices with the aim of increased student learning and achievement" (pp. 787–788). Silva, Gimbert, and Nolan (2000) define the evolution of teacher leadership as a three-wave process, beginning from the moment in which a teacher assumes the formal role or position of teacher leader, primarily as manager of a system already in place; followed by a second wave when the teacher leader is primarily focused on instructional knowledge, team leadership, and staff development positions; and finally a third wave in which teachers develop a culture of collaboration and learning. Silva, Gimbert, and Nolan found teachers with third-wave skills and approaches were "unable to rally the skills and spaces necessary for effective leadership to occur" (p. 799).

The distinction between formal and informal roles for teacher leaders is much discussed in the literature. Also much discussed is the existence of participation spaces as a requirement to develop teacher leadership. Murphy (2007) has pointed out that organizational structure, professional and organizational culture, norms about teaching and learning, and the nature of leadership work can all function as barriers to teacher leadership. On the other hand, clear values and expectations, training, resources, incentives, recognition, and role clarity can support it.

There is an evolving literature on the ways in which Communities of Practice (CoPs) and Professional Learning Communities (PLCs) nurture teacher leadership (DuFour & Eaker, 2005; Fullan, 1993; Lambert, 1988). In these communities, teachers work collaboratively to promote change (Lieberman & Miller, 2004; Louis & Marks, 1998). Leadership is distributed and fluid as teachers take on shifting roles without institutional role designations (Spillane & Diamond, 2007). Cochran-Smith and Lytle (2009) argue that "… they [PLC and practitioner inquiry approaches] recognize the central role of teachers and practitioners in shaping the life of schools and as agents in transforming the work of schools" (p. 53).

While the research and writing on teacher leadership significantly informed our work, there was little to help us in the area of teacher leadership for social justice. Here we depend on adapting work in social justice leadership with principals.

Social Justice

Defining social justice in the context of teacher leadership is challenging. We found the approach taken by Shoho et al. (2011) appealing and fit our experience of using narrative to uncover our understandings of teacher leadership for social justice. Shoho and colleagues found a *process* more important than a definition:

> In attempting to define social justice, we discovered that the process may be more important than the outcome. Although a precise conceptual definition could not be constructed, the framework for a common language and shared understanding was developed. (p. 61)

In our work, we found some underlying concepts that guided our process. For us, understanding social justice was dependent on two other interdependent concepts—*dialogue* and *difference*. Both of these were critical to the development of our narrative and our collaboration in writing this chapter; they are both in our recommendations at the end of this chapter.

Dialogue is more than comfortable conversation and more about learning than solving problems. It is the process we used to interrogate our work as teachers and as teacher leaders. Shields and Edwards, in *Dialogue is Not Just Talk* (2005), define dialogue as “a dynamic force that holds us in relation to others and deepens understanding” (p. 4). Dialogue requires equity among discourse partners and openness, including a willingness to welcome differences as opportunities for learning rather than personal affronts to individuals. It feeds on differences in ideas and interpretations, rather than requiring consensus. Differences help us think better about our own ideas as we learn from those whose perspectives differ from ours.

Dialogue and difference within a democratic context nurture social justice. Shields (2004a) calls this kind of dialogue a “moral dialogue”; it requires leaders to provide “opportunities for all children to learn in school communities that are socially just and deeply democratic” (p. 110).

Bakhtin (1981) writes about dialogue this way:

> A dialogised word can never be zaverseno (completed). The resonance or oscillation of possible meanings within it is not only not resolved (nezaverseno), but must increase in complexity as it continues to live. (p. 426)

For Bakhtin, we continue to learn as contradictions and complexity keep resonating during an ongoing process of creating meaning. Complexity interrupts comfortable interpretations of our stories. As we face contradictions, dialogue allows us, sometimes requires us, to re-story our narratives. We used dialogue to uncover the hidden layers of meanings in our narratives.

Narrative Dialogue

We used narrative dialogue to (a) develop the narrative writing and ideas for this chapter, (b) analyze our stories of teacher leadership for social justice, and (c) make recommendations for professional development of teacher leaders. To do this we depended on the literature on narrative in general (Davies & Harre, 1990; Gergen & Gergen, 1986; Polkinghorne, 1988; Ricoeur, 1983) and, more importantly, teacher narratives within educational contexts (Clandinin & Connelly, 2004; Florio-Ruane, 1986, 2001; Johnston & PDS Colleagues, 1997; Johnston-Parsons & PDS Colleagues, 2012; Olssen, 1990; Witherell & Noddings, 1991). Bruner (1990) argues that the power of narrative is that it renders "the exceptional and the unusual into comprehensible form" (p. 47); Ricoeur sees stories as models for redescribing the world. Connelly and Clandinin (1990) claim that we all live "storied lives" and, in particular, that narrative is a typical way that teachers describe and make sense of their professional lives.

Narrative as a Process of Re-Storying

> Any story one may tell about anything is better understood by considering other possible ways in which it can be told. (Bruner, 2004, p. 709)

We began our work for this chapter by telling stories of our teaching experiences. We did not initially call them "teacher leader" stories; rather, they were things we did as teachers that we thought were important. As we wrote, talked, rewrote, and talked again, we came to see these narratives as instances of leadership with deeply embedded issues of social justice. Here are our re-storied narratives.

Lindsayanne's Story

I credit my first-year teacher mentor with the longevity of my teaching career. Without her, I would have quit teaching after my first year on the job. I was hired at a diverse, Title I school, next to the projects of Fairfield, California. On the second day of school, my classroom door opened and five men and women dressed in suits walked in to observe my teaching. Apparently, my school was failing (a fact that was not shared with me when I was hired) and the state had taken over. The suits were California state board members and they were there to assess my teaching skills and the behavior of the students and to gain an overall picture of the "problems" at my school. I remember thinking at the end of the first week, "How am I going to get through a whole year of this?"

Over the next few weeks, my colleagues and I were introduced to various consultants, academic coaches, and trainers who I saw in my classroom more often than my administrators. Because I was a first-year teacher, it was easy for the administration and the academic coaches to come down hard on me. After all, I was brand new; what did I know? The constant evaluating, assessing, and critiquing would leave me in tears, often minutes before my students returned to the classroom. The physical, stress-related pain was one thing, but the daily emotional turmoil was soul crushing. The absolute worst part of this first year of teaching was the constant reminders that I was not worthy of being in front of the class and educating these young children.

It was around this time that I was introduced to my beginning teacher support provider, Mary Brown (pseudonym). She was hired by the California Department of Education and the Commission on Teacher Credentialing as a full-time mentor to support me and the other first- and second-year teachers. Although her primary job was to help me fulfill the requirements of the California Multiple Subject Credential, she far exceeded that. Mary provided support in the form of warm advice, creative lesson ideas, chocolate, tissues, and hugs. Her all-inclusive support made me realize that I was not a bad teacher; I was simply in the wrong environment. I left that school after a year, moved to southern California, and blossomed as a young teacher. I never forgot about the encouragement and assistance Mary gave to me. I carry it with me still.

When I moved to Tennessee 3 years later, one of the first things I noticed about the district was the lack of support for new teachers. During my first week, an instructional facilitator, who came to observe me and offer some limited resources, approached me. I found out later that she was one of three people hired to service over 1,500 elementary teachers in the district. The lack of new teacher support was shocking to me.

During my first year in Tennessee, nine teachers were hired at my school, three of who were first-year teachers. At the end of that year, only one of the three first-year remained on the job. Of the two that left, one left by choice and the other was not asked back. Memories of my first difficult year came flooding back. The lack of beginning teacher support was leaving its ugly mark and I could no longer ignore it.

At the beginning of the next year, my fifth year as a teacher, I approached my principal, with whom I had a great relationship. I expressed my concern about the lack of new teacher support at the district level and suggested that we implement a mentoring program at our school. I would volunteer as the program's coordinator and also offer my services as a mentor. I felt strongly that the new teacher attrition rate would continue if we did not offer some kind of support service. Mary Brown made such an impact on my teaching career that I felt compelled to "pay it forward."

The new teachers at my school, and their students, were at a disadvantage because they were not provided with mentoring services. I was convinced that a well-organized, teacher-centered mentoring program would help both the new teachers and their students. My principal was excited about the idea and asked how he could support me. I suggested a survey to assess the beginning teachers' needs, pairing each new teacher with an experienced mentor (preferably in the same grade level) and conducting regular meetings on topics generated by the new teachers and the principal. I approached two teachers to ask if they would become mentors for our new teachers; they both agreed. I became the third mentor. As a group, the mentors and I collaboratively defined our roles and responsibilities. We agreed to meet once a month with our mentees to discuss topics such as communication with parents, assessment, and organization. I also asked both the beginning teachers and mentors to record their responses to their meetings with their mentors and to give them to our principal and me. This provided regularity and accountability for both the mentors and the mentees. Additionally, the mentors agreed to check in with the mentees informally, at least once a week, about matters ranging from behavior issues to balancing work life with personal life.

At the end of the school year, I asked the beginning teachers to reflect on their experiences of being the "guinea pigs" of our mentoring program. All three reported positive experiences. One of them said that she had no idea how she would have survived her first year without the support of her mentor. I also viewed my experience of leading this mentoring program positively. If I could encourage at least one teacher to be the best teacher she can be, I felt I had succeeded.

When I first shared this story with our writing group, I thought of it as a job that I more or less assigned myself to help out the new teachers. Initially I was skeptical that this was a teacher leader story and I had no inkling that it was a narrative about teacher leadership for social justice. It took some time before I felt attached to either of these descriptors.

Hilarie's Story

I was pleasantly surprised during the summer before my third year of teaching when the school's instructional coach asked if I would be chairperson of the 9th grade Small Learning Community (SLC). I considered 9th graders to be a fairly marginalized group because their voices were not as valued as the older students' and teachers often tried not to "get stuck" teaching the youngest students in the school. Students of color were especially marginalized. It was an all black school before desegregation, and a Visual Performing Arts (VPA) magnet program was created to diversify it. Nevertheless, we were a segregated school. Black and Latino students populated lower tracked classes, while honors courses were composed almost entirely of White students in the VPA program. I looked forward to my new role as SLC chairperson and hoped to advocate for the 9th grade class as a whole, knowing that our services were particularly critical for students of color.

This "small school" idea was new to the district and was designed to help ensure the 9th graders' academic and social success. The SLC space consisted of 9th grade classrooms and a central office housing workspace for students, an administrative assistant, guidance counselors, and reliable volunteers. Our 9th grade administrator was located in the central administrative building, but he spent much of his time in the SLC area. Some of the changes associated with the SLC were not welcomed. Because not enough teachers volunteered to teach in the SLC, the principal assigned them, and some of them felt it was a punishment. Plus, the 9th grade teachers sensed resentment from upper level teachers who thought we were babying the 9th graders. Teachers of upper level students asked what would happen when 9th graders were promoted to 10th grade and did not have the same supports. They said that while the 9th grade failure rate might decrease, the students would fail during 10th grade.

As a third-year teacher, I was still new to the profession. While none of my colleagues were overtly rude to me, I was aware that some teachers quietly questioned why I was chosen to lead the SLC endeavor. More experienced teachers, some of whom held graduate degrees in leadership, a degree I had just begun, were especially grudging. While these attitudes placed extra pressure on me, I did not overly concern myself with the naysayers; rather, I acted confidently (even when I was not) to create a community that would improve the success of the 9th grade students. During this experience, I always kept the students' best interests in mind.

Because the SLC concept was new to the school and my role as chairperson was ill defined, many of my early decisions were made in collaboration with the 9th grade guidance counselors and administrator. Due to some teacher resistance, we decided that the first official SLC meeting would serve as an informal icebreaker. While the teachers visited with each other, the 9th grade administrator prepared Cuban sandwiches, a local favorite. The informal get-together seemed to relieve some of the tension, paving the way for the formal, monthly meetings that would follow.

Early in the year, our meetings focused on troublesome student behaviors, and situations such as truancy, gang involvement, and pregnancy. During our meetings, I made it clear that I was not interested in changing the way teachers instructed or assessed; rather, our goal was to open lines of communication between parents, students, and teachers and to create supports and interventions to help promote success. We spent time looking at student attrition and course failure data, which conveyed the importance of our work. As the teachers realized that changes in their classrooms would not be imposed, resistance slowly resided.

Conversations at our meetings shifted focus during the fifth week of school, just after progress reports were distributed. The 9th grade counselors identified students with failing grades, and I drafted letters to inform their teachers and parents. I assigned students a tutor when needed, they received extra counseling, and other interventions were put in place as necessary. For example, we decided that if a student was failing classes due to time spent in In-School Suspension, I worked with the 9th grade administrator so that he could give a penalty other than In-School Suspension to that student with behavior issues. Further, teachers communicated with each other to ensure students' success. For example, if a student performed well in my English class but struggled in science, I would periodically send the student to his or her science teacher during English class to catch up on work or to get extra help. Because I was aware when students struggled in classes other than my own, I was able to check with students on their progress and provide motivation. The 9th grade teachers were working together in ways that had rarely been seen at our high school. Even those who were initially resistant slowly embraced the community concept because they saw it working.

The positive results were numerous. Students who at one time chronically skipped classes began to attend more consistently. I remember one student telling me that he no longer skipped class because his teachers bothered him so much if he missed class. He was referring to his afternoon teachers asking him daily if he made it to his morning classes, to the phone calls home, and to the full-time volunteer who would knock on the door of his home if he didn't show up to first period on time.

Skipping school for him became more of a nuisance than it was worth. His case was not an exception. Students who had gotten used to barely getting by or passed through the grade levels due to age or social promotion were academically successful. Most importantly, they understood that their teachers cared about their success, and they recognized that failure was not an option. They became empowered and proud of the success they achieved.

We had data to prove that the SLC was a success. Discipline referrals and suspensions decreased, grade point averages increased, and absences and tardies were significantly lower when compared to 9th graders from previous years, who had not participated in the SLC. During lunch, between classes, and before and after school, I overheard teachers who were previously unaccustomed to collaboration talk about lesson plans, cross-curricular activities, and breakthroughs with students. There was a palpable excitement flowing through the 9th grade part of campus. Teachers who, in the past had resisted teaching 9th graders, expressed interest in joining the SLC. And our SLC model was spreading. Teachers of 10th, 11th, and 12th graders began to meet to discuss implementing SLCs at the higher-grade levels. Word of our success spread to schools around the state and beyond. We regularly had teachers, guidance counselors, and administrators from other schools tour our SLC, hoping to implement something similar at their schools.

After 2 years of SLC success, my principal told me about the plans to disband the 9th grade SLC, which would be replaced by a new district initiative. I was saddened and expressed my disappointment. I could not understand why the district would force us to abandon an initiative that was unarguably successful for students. My principal, who would retire the next year and who I respected immensely, gave me this advice: “You’re too young to be resistant to change. Education is all about change. You might as well get used to it.” At that time, I believed that my principal was right: education is all about change. However, I did not realize that her words were disempowering. Now I wish I would have fought to keep our SLC intact.

Analyzing Our Narratives

We (Lindsayanne and Hilarie) joined the writing group because we were intrigued with the idea of teacher leadership and wanted to learn more. We imagined doing literature reviews and learning what others had to say. But when we met, Marilyn asked us to think about our own examples of teacher leadership. We dutifully wrote some stories about things we had done as teachers, but we were reticent to call them examples of leadership.

Before beginning our work on this chapter, neither of us (Lindsayanne and Hilarie) thought of ourselves as teacher leaders. We were doing “teacher jobs”—either a job created on our own because we saw a need (Lindsayanne) or a job we accepted when asked to do so by an administrator (Hilarie). We were doing what good teachers do—they take on additional work to make schools a better place for teachers and students.

Ongoing dialogue in a supportive group often challenges old ideas as well as provides new options. This is what happened to us. Eventually we came to see our narratives first as stories of leadership and then as stories of leadership for social justice.

Narrative researchers have tools at their disposal if their desire is to address issues of social justice. As Chase (2011) points out "some [researchers] study how narratives make change happen and some collect and present narratives to make change happen. In either case, there is a sense of urgency, of the need for personal and social change" (p. 427). In both of our narratives, we were exploring what we were urgent to change. Writing narratives about our leadership initiatives led us to consider issues of social justice. Lindsayanne's narrative reflected urgency for social change in several ways: the urgency of speaking, the urgency of being heard, the urgency of collective stories, and the urgency of public dialogue. Hilarie felt urgent to address the discrimination and negative attitudes toward the ninth graders in her school. When narrative inquiry focuses on personal or social change, the relation between narrator and audience becomes central (Chase, 2011) and affords avenues for dialogue about social justice.

As we wrote and rewrote our narratives within a dialogue about social justice issues, we re-storied our teacher leader narratives.

On the Way to Transformative Leadership

In the literature we (the authors) read together, we found some categories about leadership that were helpful to thinking about Lindsayanne and Hilarie's leadership as we together explored issues of social justice. These categories challenged us (Lindsayanne and Hilarie) to rethink our narratives. We debated how to fit our experiences into these categories and we changed our minds back and forth in the process. The categories themselves became tools for dialogue and helped us uncover ways in which our teacher leadership roles included social justice and ways in which our leadership might have been extended toward more social justice opportunities.

In Shield's (2010) article, "Transformative Leadership: Working for Equity in Diverse Contexts," she defines these categories in this way: *Transactional* leadership focuses on reciprocation or the exchange of goods or services. This may mean accepting a leadership role because of the promise of extra pay. *Transformational* leadership "focuses on improving organizational qualities, dimensions, and effectiveness" (p. 564). End values and results are key motivators in transformational leadership. *Transformative* leadership "begins with questions of justice and democracy" and "critiques inequitable practices and offers the promise not only of greater individual achievement, but of a better life lived in common with others" (p. 559). Shield proposes that transformative leadership holds the most promise for social justice leadership.

Reflection on Our Narratives and Social Justice

Initially, we (Lindsayanne and Hilarie) were unaware of the idea of leadership for social justice. This was not how we framed our initial teaching stories and the language of "social justice" was unfamiliar to us. However, sharing our stories within a nurturing and critical dialogue helped us to see ways that issues of injustice, previously invisible, were deeply embedded in our experiences as teachers.

Lindsayanne's Reflection

I never thought of my initiation of a teacher-mentoring program as an example of teacher leadership for social justice. Because of my difficult first year of teaching, I was simply doing what I thought was right to support the new teachers at my Tennessee school. I felt that the new teachers in Tennessee needed to be on a level playing field with new teachers in other states that provided mandatory mentoring and induction services. It was my moral obligation to support these beginning teachers, since I was so well supported my first year. It wasn't until the dialogue in our writing group that I realized that I had been a teacher leader for social justice.

My Tennessee school was an ideal place to begin a mentoring program. Thankfully, when I approached my principal and the veteran teachers, they were supportive. While I am quite proud of my school-wide mentoring program, I wonder now why my efforts ceased at the school level. What stopped me from pursuing this program at the district level? At the state level? At the time, it never crossed my mind. If I had, this would have been one of the differences between transformational leadership and transformative leadership. In order to consider my leadership as *transformative* using Shield's definition, change would have to occur on a larger scale. I would have needed to think beyond my immediate context to consider beginning teachers more broadly.

Hilarie's Reflection

The most profound realization I had during our dialogue was when one of our dialogue group members suggested that my principal's statement that I should "face the fact that education is all about change" was disempowering. As a young, novice teacher, I took my principal's words to heart without question. Until writing my narrative, I had not thought much about that conversation with my principal.

Nearly 10 years have passed since the disbandment of the SLC, and since then I have completed a master's degree and I'm nearing the end of my doctoral program. These experiences, coupled with new knowledge and the process of dialogue and writing about this example, have led me to think about how I might have handled the conversation with my principal differently. My emerging understanding of teacher leadership for social justice gives me insights into how I might have moved many aspects of my SLC leadership endeavor from the transactional and transformational categories to the transformative category.

To consider my leadership as transformative, change would have to occur on a larger scale. Given that the SLC only lasted 2 years, widespread change was impossible; thus, my first step would have been to work to keep the SLC intact within my school. When my principal told me that our SLC was disbanded, I should have collaborated with my colleagues and SLC leaders from the other district high schools, to pool our collective data to prove that the program was too valuable to abandon. I should have taken our data to the district level. I should have presented it to the school board. I like to think that such advocacy would have extended the life of the SLC.

Over time, our SLC might have fostered societal change for the community in which I taught. Located in a poor neighborhood in which gang activity and crime were the highest in the city, high school dropout rates were a serious concern. Community meetings often centered on the young people, mostly males, who were jobless and turned to crime to fill their time and their pockets. Given the necessary time, I believe our SLC would have lowered our school's dropout rates, possibly leading to lower crime in the neighborhood. Additionally, the curriculum in our SLC focused on the needs of our at-risk students, and teachers worked hard to help them examine possibilities for their future. We invited college and career counselors to speak to the students, and the students researched career possibilities and set goals to help them achieve their career aspirations.

As an SLC, we worked to lower attrition but we also worked to help neighborhood kids see beyond limitations. We never ignored the circumstances from which they came; but we explored issues of poverty and crime through books and current events and we encouraged candid discussions about them. We were addressing social justice issues in the curriculum.

We had begun to see teachers of higher grades embrace the SLC concept. With more time and further SLC development, students might have felt supported and nurtured for all 4 years of high school, not just in 9th grade. While the SLC leaders felt good about the impact we saw, our impact was greatly hampered by the program's short duration.

Through dialogue with my coauthors, I better understand and can articulate my leadership style and the role I played in the creation of the SLC. More challenging, however, is reflecting on what I could have done differently to shift from mostly a transformational leader to a transformative leader. I did not have the knowledge or experience to truly be a teacher leader for social justice then, but I believe that I have the capacity to do so now.

Narrative Epilogue

As a dialogue group, we learned through the process of developing these narrative examples. We use this experience to make recommendations for teacher leadership for social justice.

The narratives here became stories of teacher leadership as we reframed them in light of new ideas and frameworks that called into question our previous interpretations. As we read different ideas about leadership and social justice, we were presented with varied possibilities for re-storying. Some of the questions were more uncomfortable than others. A trusting group and dialogue, which challenged but did not threaten, supported us in these struggles. We (Lindsayanne and Hilarie) couldn't change what happened in the past, but we have talked a lot about how things might have gone differently if we'd had an orientation toward teacher leadership for social justice. No one ever talked this way in our schools so these ideas were not available to us.

All four of us have been teachers in elementary and secondary schools. As we talked about teacher leadership, we were situated as teachers, a vantage point quite different from that of principals. All of us had principals ask us to do things during our careers, usually on a voluntary basis, that is, without released time to compensate for the work. The projects described in our narratives all took significant volunteer hours. Although Hilarie got a "stipend," it in no way compensated for the extra time she spent.

We've all had positive experiences as teachers working on projects and reform initiatives of one kind or another. Our leadership positions presented us with choices, both whether to participate and how to proceed. We could easily have chosen otherwise and our lives would have been less busy, yet the autonomy we had as leaders in these initiatives supported our professional development. The autonomy we experienced, as research has shown (Ingersoll, 2001; Renzulli, Macpherson Parrott, & Beattie, 2011), also led to increased job satisfaction.

While we didn't think of our actions as related to social justice per se, we uncovered ways in which our leadership experiences were motivated by injustices. Based on our own teaching experiences, we think teachers are often concerned about the injustices they see in their classrooms and schools but do not have the language of social justice to think about them and/or the support to deal with them. Leadership "opportunities" may often be related to issues of social justice that teachers do not understand in this way. Making this explicit through re-storying might help teachers, as it helped us, to see ways to address issues of social justice.

Through our dialogue and writing of these narratives, we have gained a new set of categories and language to support an increased sense of advocacy and vision. This happened because we had an open and challenging dialogue about our leadership experiences. Reading about social justice presented a new set of ideas against which we examined our narratives. Lindsayanne responded to the virtual abandonment of new teachers as they were left to survive their first year of teaching on their own, and Hilarie saw injustice in the attitudes and treatment of the 9th graders. We unearthed these embedded injustices as we narrated and interrogated our experiences through our group dialogue.

As authors we acknowledge that some of what we are discussing runs contrary to school norms in general and we wonder how often teacher leadership for social justice would really be possible. Schools are often weary of controversy and differences of opinion, yet dialogue is all about confronting differences in order to learn.

Furthermore, many principals are not all that happy with teacher leadership because it makes running the school more complicated and less easily managed in traditional ways. Lindsayanne and Hilarie's principals were happy to have them do extra work, but we're not clear whether they would have been happy if they had pushed for a mentoring program that would have required more resources and work on the principal's part (Lindsayanne's case) or raised the moral issues related to the arbitrary cancellation of a successful school project (Hilarie's case).

Our Recommendations for Supporting Teacher Leadership for Social Justice

We would like to make the following recommendations for developing teacher leadership for social justice:

1. Gather teachers together who are willing to talk honestly about their classrooms and experiences. Encourage teachers to share their stories. Honor each other's narratives as a way to open up a dialogue about the challenges and issues you see around you and your response to them. Share stories about when have you taken action to solve a problem or address an issue.
2. Explicitly talk about dialogue, what it takes and how to talk in ways that bring different perspectives to the table. In the beginning, it doesn't need to be a large group; it *does* need to be a place where differences are respected. Remember that this is a time for critique, not polite conversation. In addition to sharing your narratives, read about dialogue, and discuss its norms and possibilities.
3. Use your narrative sharing, what Connelly and Clandinin call "narrative inquiry," to think about yourself as a teacher leader. Where can you take the initiative to make changes, even small changes? What are changes that require more collective and assertive efforts? Where can you get support from others? Invite each other to narrate your experiences around issues and injustices you care about.
4. Share and write narratives about the "jobs" you have been asked to do, about the things you wished had happened that didn't, about how your experiences led you to consider some issues as more important than others, or about injustices you wished you'd addressed but didn't. The category of "jobs" typically leads to examples of teacher leadership, even if you don't initially think about them this way.

   Related to this, you might talk about the typical expectation that teachers should *work hard* but *resist little*, and/or the expectation that teachers should "do what they are told" rather than make informed professional decisions. The point is not to create a revolution nor be disruptive; the point is that there are many inequities in schools and teachers both know what they are and are well positioned to advocate for change. Yet we often don't consider this as a possibility. Talking about these possibilities in a group provides direction and support.

5. As you gather together more and more stories of teacher leadership, consider these in light of the categories of leadership we used earlier (transactional, transformational, and transformative, Shields, 2010). What categories would your experiences fit into? In what ways could you extend what you are doing to include addressing inequities in your classroom, school, and/or district?

The steps we recommend here mirror our experience in narrative dialogue that promoted new understandings of ourselves as teacher leaders for social justice. If we (Lindsayanne and Hilarie) had carried our present understandings about leadership with us during our previous work, we would have taken on stronger advocacy roles as leaders. It took dialogue and re-storying our narratives to even realize that we had been *teacher leaders* and, further, teacher leaders *for social justice.*

This was not something we (Lindsayanne and Hilarie) would have likely come to on our own, and our recommendations here reflect how narrative dialogue promoted this reimaging of ourselves as leaders for social justice. Most of us know well how teachers are isolated in their classrooms with few opportunities for serious dialogue about social injustices in schools. Moreover, teachers often lack the models or concepts that would support developing our abilities to be teacher leaders for social justice. It is also difficult to be a teacher leader, especially a teacher leader for social justice, if principal support is lacking.

We found three things important to our (the authors') growth (a) dialogue within a trusting and ongoing group, (b) Shield's categories of leadership, and (c) narrative inquiry. These became tools for understanding our past experiences more deeply and seeing opportunities for leadership for social justice in those experiences. We offer these suggestions as a means to promote teacher leadership for social justice in schools.

Chapter 26

Re-conceptualising Teacher Leadership Through Curriculum Inquiry in Pursuit of Social Justice: Case Study from the Canadian Context

Ann E. Lopez

> Good teachers have always known how to be educationally subversive. They have refused to underestimate their own sense of agency and have been able to perceive the scope for radical change within their own classroom and within their own schools. They refuse to collude with the victim mentality that relinquishes initiative, self-belief and a sense of urgency (Galton & MacBeath, 2008).

The changing demographics and social realities in schools have precipitated calls for social justice education and have garnered the attention of educational leaders, researchers and school-based scholars.[1] Demands from communities and parents that schools become more responsive to the needs of the students who have traditionally been underserved have placed social justice leadership at the centre of debates on school improvement. Despite these calls, there still remains a lack of consensus among educational leaders on what defines social justice. Shoho, Merchant, and Lugg (2005) suggest that social justice is a politically loaded and elusive construct. Bogotch (2002, 2005) maintains that social justice has no fixed or predictable meanings, while scholars such as Dantley and Tillman (2006), Marshall and Olivia (2006), and Furman and Gruenewald (2004) urge those engaging in conversations about social justice to seek to identify some shared understandings. While not offering a definition of social justice, I would argue that social justice in schools is all about students seeing themselves in the curriculum being taught and having teachers who include and value the knowledge of students and their communities and school leaders who create an environment where injustices and practices that marginalise some students and privilege others can be challenged and disrupted. Notwithstanding the ongoing debate, recognising that social injustice cannot go unchallenged, educators in pursuit of improved educational outcomes

I. Bogotch and C.M. Shields (eds.), *International Handbook of Educational Leadership and Social (In)Justice*, Springer International Handbooks of Education 29,
DOI 10.1007/978-94-007-6555-9_26, © Springer Science+Business Media Dordrecht 2014

have advanced social justice as a worthwhile educational goal for diversified, minoritised and traditionally underserved students (Aboriginal students, students of colour, students from lower-income groups, immigrants and students whose first language is not English, among others).

This chapter emanates from my own questioning and reflection on what leadership for social justice might look like in classrooms and teacher leadership in particular. It locates the conversation on social justice leadership and teacher leadership within the context of teachers' curriculum work in their classrooms and seeks to make explicit links between social justice, teacher leadership and curriculum inquiry. As Galton and Macbeath (2008) argue in the quote above, teachers have refused to underestimate their own sense of agency and the scope for radical change in their classrooms. I was challenged to think differently by an important question posed by Bogotch (personal communication, October 19, 2011) who asked in his response to earlier drafts of this chapter 'When curriculum is taken from local educators then there cannot be teacher leadership, or can there be'? This question opened up new ways of thinking for me as I reflected on teacher leadership and how it might be conceptualised differently, within a framework of curriculum inquiry located in the work of teachers in their classrooms as they pursue improved educational outcomes for students, particularly those who have been traditionally underserved. I see this pursuit as social justice. The chapter builds on my previous work and research and draws on previous publications of some of the findings in Rolheiser, Evans, and Gambhir (2011) and Lopez (2011a, 2011b). Utilising a case study approach, I theorise an alternative framework for teacher leadership at the intersection of social justice and curriculum inquiry that highlights activist bottom-up leadership. It starts with a review of the literature on curriculum inquiry; I then share some of the social and political realities of education within the Canadian context. Next, I situate my arguments and analysis within one teacher's activism and agency (Audrey[2]), in her classroom as an example of the kind of teacher leadership that I advocate. Lastly, I discuss Audrey's activism, agency and teacher leadership that I advocate and its implications for curriculum inquiry and social justice (Ladson-Billings, 1995a, 1995b). By examining one teacher's choices and actions around curriculum, it is the hope that we can begin to understand how teachers construct new epistemologies grounded in the experiences of their students who come from diverse communities and what we can learn that might inform school improvement plans and ways in which schools are organised. In looking at this kind of inquiry within the Canadian context, I draw on the work of Cynthia Chambers, Ted Aoki and other Canadian curriculum theorists that have examined alternative forms of knowledge in pursuit of more just schooling. Chambers (2003) suggested that curriculum is inherently political and curriculum in Canada through texts and practices reinforces the 'normative definitions of gender, sexuality…as well as racial categories, stereotypes and class distinctions in the society at large…thus Canadian curriculum has a great deal with in common with curriculum internationally' (p. 223). It is for these reasons that curriculum must be seen as an engine for change in challenging hegemonic practices and reducing injustices in schools.

Importance of Teacher Leadership Within Educational Leadership Discourse

Much of the research on educational leadership has focused on the role of principals and school administration with little emphasis on teacher leadership. According to York-Barr and Dyke (2004) and Murphy (2005), research on the leadership work of teachers in their classrooms within educational leadership requires greater attention as efforts to highlight teacher leadership within educational organisational systems have not gained much success despite teachers' importance to school reform and school improvement. Educational scholars such as Fullan (1993) and Ornstein and Hunkins (2004) have argued that limited engagement of teachers in meaningful decision-making has been a major flaw in educational reform efforts.

Like social justice, leadership remains a seductive and elusive concept (Leo & Barton, 2006) and continues to be contested and researched. Within these discourses and contestations, teacher leadership is even less defined. Harris (2005) has found that there are conflicting and competing definitions of teacher leadership. In the school leadership literature, conceptions of teacher leadership vary from support for principals and mentors to other teachers (Moir & Bloom, 2003), taking on middle management positions (Gronn, 2000), and instructional leaders focusing on pedagogy (Blase & Blase, 2000). While it is generally perceived that teachers have an impact on student outcomes, the connection between teacher leadership and student outcomes has not been established in the research (Leithwood & Jantzi, 1999, 2000). Harris in a review of the literature on teacher leadership found that there are many advantages to teachers and schools in building and acknowledging teachers' leadership capacities but that the literature is not as convincing in the relationship between teacher leadership and student learning outcomes. According to Handler (2010) the literature provides little consideration of professional knowledge, specifically knowledge of curriculum theory and critical pedagogy as an underlying reason for the failure of teachers to successfully fulfil meaningful leadership roles supportive of improved student outcomes. This aspect of teacher leadership I believe is critical as discourses on leadership broaden to include issues of social justice (Bogotch, 2002; Jean-Marie, Normore, & Brooks, 2009). I believe that teachers are integral to leadership and policy discourses on school improvement as they make curriculum and pedagogical choices daily that impact greatly student outcomes. Young and Lopez (2005) advocate for broader leadership frameworks that include alternative theories and practices and disrupt taken-for-granted assumptions of what leadership is, what it can do and what purposes it serves.

How Might Curriculum Inquiry Inform Teacher Leadership?

Schwab (1983) suggested in his seminal piece that educators focus on the practical and suggested that teachers play a significant role in curricula decision-making given their roles as implementers of curriculum and their understanding of students in their classrooms. The implementation of large-scale curriculum and the impact of policymakers in the development of curriculum that is forced on teachers and learners were of concern to Schwab (Kitchen & Parker, 2011). Curriculum theorists such as Maxine Greene, William Pinar, William Schubert, Gloria Ladson-Billings, Ted Aoki and others have helped educational leaders, researchers and school-based scholars to understand the sociocultural and hegemonic power that schools hold in the organisation of society, which has implications for those pursuing social justice leadership. Clandinin and Connelly (1992) built on Schwab's ideas of seeing teachers as curriculum makers actively working alongside their students and suggested that teachers should be empowered to be curriculum makers to enhance the learning of students (Craig, 2011). In other words, discourses on teacher leadership should include curriculum development and inquiry. This type of teacher leadership however runs counter to the current ethos of standardisation, teacher testing and performance for pay that is slowly defining the role and work of teachers in the United States and elsewhere. Goodwin (2012) suggests that teacher education programmes and educational policymakers in general across the globe are borrowing bankrupt ideas from one another and this is cause for concern.

Schwab (1972) in arguing for the practical in curriculum suggested that, 'it is a discipline concerned with choice and action' (p. 4). Teachers' choices and actions impact the daily lives of students, which I consider to be fundamental to social justice praxis. Good curriculum work is democratic curriculum-based pedagogy. Teachers engage in good curriculum work when they examine multiple modes of curriculum inquiry and commit themselves to ethical fidelity and practical artistry that link curriculum inquiry to classroom practices (Schubert, 2009). I interpret this to mean how the curriculum is used to challenge what is posited as knowledge and the pedagogical approach of teachers. Curriculum inquiry and decision-making takes place when environments are created where teachers, students and parents or community members are able to question the underlying assumptions of circulating discourses about curriculum and mobilise their own agency (Ylimaki, 2011). Curriculum deliberations are complicated discussions requiring balanced attention to students, subject matter, the milieu and teachers (McCutcheon, 1995). This comprehensive approach to curriculum decision-making I believe constructs teachers as leaders in their classrooms. Scholars and practitioners alike are 'curriculum workers' who must take leadership in providing informed alterations to the 'curriculum of scarcity' exemplified by the current discourses on standardisation in education and the one-size-fits-all approach (Pinar, 2007). In supporting this notion, Reyes-Guerra and Bogotch (2012) argue that teacher leaders and others engage in curriculum inquiry that seek to build curriculum knowledge, based on learners' local communities and societal needs, and exit the 'canned' curricula and established canons. They also argue for repositioning curriculum inquiry within educational leadership discourses. Teachers can no longer be bystanders in the current climate that measures achievement not on the development of the whole child to function in a democracy, but prescribed outcomes measured by various standardised tests, and curriculum decisions that are taken out of the hands of teachers.

Curriculum is ‘complicated conversation’ made even more complicated by the present social realties in schools (Pinar, 2005). Critical transformative leadership (Shields, 2010) that I assert in this chapter is not about business as usual; it is working for social change and social justice (Ayers, Hunt, & Quinn, 1998; Cochran-Smith, 1998). If social justice is to be more than an organising concept, action is required which is the essence of praxis as argued by Friere (1970). This type of transformative leadership based on dialogue and strong relationships can provide opportunities for all children to learn in school communities that are socially just and deeply democratic (Shields, 2003, 2004). I suggest that choice and action around curriculum are central to teacher leadership, but discourses on teacher leadership have not explicitly made this connection. Pinar (2007) urges that we engage in *internationalisation* and take the opportunity to become engaged with each other to sustain the work and reconstruct through curriculum as we advance values of peace, ecological sustainability and social justice. Pinar’s call for *internationalisation* has great significance for me as an educator who lives and works in Canada, one of the most diverse countries in the Western world where equity education is at the forefront of the educational discourse. Ryan (2010a, 2010b) and Ryan and Rottman (2007) advocate that equity-minded educators find ways to make their schools and communities better places to work and live and employ political skills to better understand how those who advocate social justice principles can accomplish their goals. I extend the notion of equity-minded educators to equity-lived educators who not only employ political skills but model agency and critical praxis in their classrooms and schools. It is important as we advance new philosophies on ways to better meet the needs of an ever-growing diverse student population that we learn from varying contexts. Below I share examples from the Canadian context, specifically Southern Ontario, which is home to one of the largest diverse populations in Canada, in the hopes of what we might learn to add to our body of knowledge on ways to better serve the needs of diverse students across the globe. As population shifts in search of better lives, more and more countries are becoming increasingly more diverse racially, ethnically, religiously and linguistically.

The Canadian Schooling Context

Classrooms in Canada today reflect the globalised nature of society within a context of immigration and globalisation, where students’ identities are transnational, emerging and rooted both inside and outside Canada. Many students while not immigrants themselves come from immigrant communities that reflect various races, languages, cultures and religions. The Canadian social landscape has changed with immigration and demographic shifts. By 2031 between 29 and 32 % of Canada’s population could be members of a ‘visible minority’[3] (Statistics Canada 2010). What does this mean for teachers and how do they respond? What kind of activist, equity-lived teacher leadership is necessary to act and how? Within this social and political reality, how do teachers weave and advance curriculum that addresses the needs of diverse learners? Canada is a diverse country of provinces and territories; as such I am not positioning this work as reflective of all of Canada, but located within the Southern Ontario context. Southern Ontario includes the city of Toronto and the Greater Toronto area (suburbs that surround Toronto) that have seen its population transformed with the influx of a large number of immigrants from every corner of the globe.

Canada is known for its official multiculturalism[4] policy and diversity of the population; however, there still exist homelessness and poverty, particularly among the Aboriginal, racialised and low-income populations, and continued disengagement from the school system of racialised youths. Between 35 and 45 % of Black, Hispanic, Portuguese and Aboriginal students drop out of school before graduation (Toronto District School Board, 2010). Ontario's Ministry of Education (2009) was formulated to address some of these issues, but there is much work to be done. The strategy recognises that 'while Canadians embrace multiculturalism, human rights and diversity as fundamental values, there is ongoing discrimination in society that requires attention…Ontario is Canada's most diverse province and must find solutions to these concerns' (p. 1). Ontario cannot afford for its economic development and economic prosperity not to address these concerns. The growth of the immigrant and visible minority groups has shifted the makeup of Ontario's large urban centres, and research has shown that immigrants face significant income disparities and have the highest proportion of unemployment (Ontario Trillium Foundation 2009/2010). Addressing issues of exclusion, marginalisation, disengagement and 'push-out' in Ontario's school system will assist in the process reducing current disparities faced by immigrant and racialised groups.

Within the Canadian and Ontario context, it is imperative that we ask how curricula and bottom-up activist teacher leadership can be at the forefront in carving out new experiences for our students. In this regard, Aoki (1990), Hunsberger (1989), and Sumara (1996) call for distinction to be made between 'curriculum as lived' and 'curriculum as planned' and invite teachers to centre experiences that students bring to the classroom in interpreting the curriculum that is given and find new ways to engage. They conceive of curriculum as an interaction between teacher and student, questioning texts, pedagogies and voices that are included and excluded.

In the case study below, I analyse the curriculum choices Audrey made in her grade nine applied[5] English class in a secondary school in Southern Ontario to disrupt the Eurocentric curricula and bring the lived experiences of the diverse students in her class into the curriculum as well as build cross-cultural understanding. I examine how her curriculum choices might inform what we know about teacher leadership in pursuit of social justice. Through collaborative action research grounded in critical and culturally responsive teaching (Gay, 2000; Ladson-Billings, 1995a, 1995b), Audrey disrupted the 'given curriculum' in her English class, challenged the 'canons' and engaged in Freiran problem-posing pedagogy to advance a social justice educational agenda in her classroom. Through the use of a culturally relevant text, Audrey engaged in a form of activist bottom-up leadership that challenged the existing norms and ways of teaching the English curriculum in her grade nine applied English class at Greenville Secondary School.

The Case of Audrey as Curriculum Worker and Teacher Leader

Audrey is an African Canadian teacher with over 20 years of teaching experience in the Caribbean[6] and Canada. She used her experiences as an immigrant to theorise on ways that the English curriculum was being delivered and taught at Greenville Secondary School. Greenville Secondary School is located in the very diverse community of Ridgeton in Southern Ontario home to a large immigrant population that is ethnically, racially, religiously and linguistically diverse. Ridgeton over the years has transformed demographically and has a large and growing and South Asian population. It is predominantly a lower- to middle-income community. The community's diversity reflects the demographic shifts occurring in Southern Ontario with large populations of immigrants and minoritised people.

Data were collected through classroom observations, interviews, inquiry groups and reflection journals over the course of 1 year from two grade nine applied English classes. Two semi-structured face-to-face interviews were conducted (Creswell, 2003) that allowed for the elaboration and the construction of meaning. The interview at the start of the study gathered information on Audrey's understanding of culturally responsive and critical teaching. The interview conducted at the end of the study focused on the impact and effectiveness of culturally responsive and critical teaching strategies, tensions and challenges and the impact of the study on her professional learning. Critical teaching strategies included the examination of texts for voices that are excluded, supporting students to examine societal issues that continue to privilege some groups and marginalise others, and ways that they can become involved in social action. Aoki (1993) suggests that when we examine curriculum, we start in the 'curricular landscapes of practicing teachers and their students' (p. 255). Below I describe and analyse Audrey's role as a teacher leader and her pursuit of social justice for her students through the interrogation of her grade nine English curriculum. The following questions guided the research:

1. How does culturally relevant curriculum and teaching through the use of alternative [culturally relevant] texts impact student learning, engagement and achievement in diverse English classrooms?
2. How do such practices inform teachers' professional learning?

Challenging the Canons and Asserting Student Voices

Canadian researchers Holloway and Greig (2011) noted that it is inconceivable that little, if any, work has examined how teachers choose texts within the Canadian context from a critical perspective, given the changing demographics in schools and at a time when educators, school officials and policymakers across North America are challenged to look for new ways to meet the needs of the growing diverse population. It is this glaring omission that prompted me as a school-based scholar and researcher to engage in collaborative action research with Audrey to explore the use of alternative, culturally relevant texts in the English curriculum grounded in the lived experiences of her students. The English department at Greenville Secondary School where Audrey taught as an English teacher for many years like many secondary schools in Ontario privileged the use of Shakespeare for novel study in the English curriculum. Audrey decided to break with tradition and choose for the novel study unit in her grade nine applied English classes a novel by Suzanne Fisher Staples, called S*habanu Daughter of the Wind* set in Pakistan, which narrates the experiences and struggles of a young South Asian girl as she moves into adulthood. The choice of the novel was significant as a large percentage of students in Audrey's class self identified as South Asians, either immigrants or second generation. Given the established tradition of using Shakespeare for the novel study unit, some students questioned Audrey about her choice of text and needed to know 'why we are not studying Shakespeare like the other classes'. Some teachers in the English department expressed uneasiness at Audrey's choice of text for the novel study. Audrey's choice was not an easy one and required bold activist action. She had the support of the head of the department and the tacit support of the principal. Audrey had to operate on many levels in this bold action of leadership and agency to disrupt the existing curriculum. She spent many hours planning to ensure that the expectations of the Ontario curriculum were met while at the same time offering her students this new experience. She had to create new activities, formative assessments and summative assessment.

Focusing on the needs of the community and her students, Audrey made changes to the English curriculum that foregrounded the knowledge of the community and students in the teaching of English. Morrell (2005) argues that critical English education must be explicit in disrupting existing power relations and develops in students the skills to deconstruct the canonical literature and media texts while allowing them to create their own critical texts. The Ontario English curriculum guideline, which many would say is a progressive one, recognises the importance of a critical approach to the English curriculum and urges teachers to engage in critical literacy that 'involves asking questions and challenging the status quo, and leads students to look at issues of power and justice in society' (Ontario Ministry of Education, 2007, p. 34). However, as Holloway and Greig (2011) point out, it is up to the teachers to take a leadership role in teaching a wider range of contemporary texts that enable students to move outside traditional boundaries and extend their intellectual opportunities.

Holloway and Greig (2011) found in a review of the research in Canada that there are no research studies that focus on English teachers' selection of literacy works in high school classrooms. This gap in the extant literature makes this effort worthwhile, and I agree with Holloway and Grieg's notion that it is interplay between teacher agency and the contexts of their work that will bring about real change. This kind of curriculum work requires teachers to see curriculum as operating within societal, political and cultural contexts, recognising that schools are political sites of cultural and social reproduction, where what is taught is as important as how it is taught and where there are constant contestations, tensions and struggles over curriculum and pedagogy (Giroux, 2002). Audrey in keeping with

Dewey's notion that experiences are central to the teaching and learning process presented her students with curriculum and pedagogy that shifted their thinking and co-constructed new knowledge. Aoki (1993) summed up the work of teachers as curriculum workers this way:

> …solving curriculum development problems [involves] …being engaged consciously or otherwise in the construction of meaningful human and social reality….simultaneously engaged in self-reflection as he [she] turns over in his [her] mind that he [she] is taking for granted in the way of cognitive interests, his [her] assumptions about the world and approached to that world. In such a reflective activity, we can see the possibility of the curriculum builder being conscious of …the program designed for students (p. 51).

Given the context of Greenville Secondary School, the community of the Ridgeton and the Ontario discourse on equity and diversity, teacher leadership in curriculum decision-making is not only warranted but also urgent. It is important to view curriculum as a tool to disrupt essentialising concepts of culture and ethnic identities (Sleeter, 2011) and challenge students to think critically. Essentialising culture means a fairly fixed and homogeneous conception of the culture of a minoritised group, with an assumption that students who are members of that group identify with that conception of who they are (Sleeter). Sleeter suggests also that it is important to recognise forms of oppression in discourses on culture; seeing the curriculum as a way of disrupting the status quo and what is posited as knowledge in the teaching of English, Audrey created activities that involved the students in examining and challenging stereotypes and worked with her students to develop critical perspectives.

Challenging Stereotypes

Audrey engaged in dialogue with her students to unpack and deconstruct stereotypes and assumptions in the media and other places about South Asian culture. The students in her class were ethnically, linguistically and religiously diverse (most of the students in the class identified as Black, South Asian and White). She utilised a problem-posing dialectic approach that as she describes it 'created space for students to reflect on and dialogue with each other about issues that they would otherwise ignore and just not bother to think deeply about'. Audrey started this dialogic conversation by asking the students to write down their responses to questions such as: What do you think the book is about? How would you describe the representation of South Asian culture in the media? Support your answer with examples where possible.

The students discussed their responses in pairs and then shared their responses with the class as a whole. At the end of each class and section, the students were asked to write down in their journals two pieces of new knowledge they had learned and again discuss in pairs, literature circles and the class as a whole. This exercise excavated some of the stereotypes the students held about South Asian culture and created a good opportunity for Audrey to deconstruct new knowledge with her students and learn from them. Audrey noted that this critical dialogue 'opened up spaces for conversations about stereotypes of other cultures in ways that did not essentialize, romanticize and othered'. Like all contested classroom spaces, there were moments of tension as the students tackled the difficult issues. One student wrote in his reflective journal at the start of the unit 'I do not see why this is necessary…why are we reading this book?' In conversations with the students one-on-one, in their small groups and with the class as a whole, Audrey talked with her students about the benefits of exploring multiple perspectives and valuing other forms of literacy knowledge as a way of learning about people who are different from them. She also engaged her students in conversations about the literary contributions of the 'canonical' texts while imploring them to look at other forms of writing that are not usually included as required readings in the English curriculum. This Audrey said 'moved the students to examine their thinking about knowledge that is valued and why that is important in a diverse society like Canada to have books like *Shabanu Daughter of the Wind* in the English curriculum'. During the discussion of the book and classroom activities, some of the South Asian students took on lead roles in teaching the class about their culture from their own lived experiences, drawing on their funds of knowledge (Gonzalez, Moll, & Amanti, 2005). Audrey noted, 'the leadership of the South Asian students in talking to other students about their culture and disrupting stereotypes was an eye-opener for me. They talked about how they felt and they ways in which they are represented in the media'.

By building an environment of inquiry that validated the students' experiences and relinquishing some of her authority in the classroom as the central figure with all knowledge, Audrey engaged in bottom-up curriculum making. When teachers act in pursuit of social justice, they relinquish some of their authority in the classroom in an effort to centre the experiences of students (Marshal & Gerstl-Pepin, 2005). Audrey tackled current conversations that were of relevance to the students, such as understanding the cultural practice of arranged marriages that did not reduce or essentialise the South Asian culture and disrupted stereotypes, misconceptions and misrepresentations some students held. This validated the knowledge and experiences of the South Asian students in the class who as Audrey described it 'felt safe given the environment of inquiry that was established to speak about their culture respectfully'. Sharma (2008) suggests that in discussing people of colour and particularly South Asian culture, teachers should avoid focusing the discussion on the traditional, religious and patriarchal, as these characteristics are not unique to what is labelled South Asian culture, but focus instead on how people of colour are represented. This was important not only to South Asian students who got the opportunity through the curriculum to speak about their culture, but it was important for Black students in the class who engaged in dialogue that disrupted negative and stereotypical representations of what it means to be Black and homogeneity of Black people as a group. White students in the class through the cross-cultural dialogues developed deeper understanding and knowledge about culture and for some began the journey of understanding that Whites do have a culture.

Developing Critical Perspectives

By *examining*, *critiquing* and *experimenting*, students critically engaged with the text and connections to their own lives and experiences. They examined the author's perspectives and viewpoints as a White woman writing about South Asian culture and highlighted areas of disagreement with the author. To ensure meaningful critiques by her students of the book, Audrey engaged in strategies to build her students' critical thinking skills. Audrey in her journal wrote 'it took time to reconstruct the curriculum in my applied English class as this is a level of critical thinking that some students are not exposed to in other applied classes'. Audrey spent time teaching the students how to examine texts from a critical perspective by asking questions such as: What was the dominant voice in the text? Were their voices missing? Could you relate to the text? Did anything bother you about the text? How would you change or re-write it? Students had to justify their answers. The students got very involved in discussing whether or not the author 'thoughtfully represented the South Asian culture and lifestyle'. Audrey felt that this alternative curriculum and way of teaching 'got the students involved in ways that they were not involved before… they became empowered and displayed the characteristics of empowered members of a community'.

The students wrote their thoughts about the book, reaction to classroom activities and dialogue, as well as relevant information for the completion of their summative assessment in their journals. Audrey felt that 'it was important for students to reflect on the process and write down their thoughts and feelings as it validates the students' learning'. For example, students were asked to reflect on 'new knowledge they had learned about another culture and how this changed their views of their classmates and the community'. Ladson-Billings (1995a, 1995b) asserts that students are capable of critical reflection and make meaning of their experiences when given the chance. One student wrote in her journal at the end of the novel study:

> At first I was not really interested in reading the book because I am also a Muslim girl and from Pakistan…. However I was pleased to see other students in my class that were not from the same religion or country research and get more information about it…. I hope that the school continues to do this but not just with Islam and Pakistani, but also with other religions and countries around the world, so everyone gets to see how different things and people are around the world (Sumaya).

Another student said that at first she felt uncomfortable talking about cultures that she was not familiar with, but as she read the novel, she grew to understand more about it:

> I really did not like the idea of not doing Shakespeare in my English class. All the other classes were doing Shakespeare and my mom wanted to know why my class was not reading it. I really was not happy, but as I read more about Shabanu I connected with her life as a teenager and got to understand their culture a little better. I even shared the story with my mom.

This was the first time that Audrey had not used Shakespeare for the novel study in her grade nine applied English class and she felt that it was important as she noted to 'reflect on what I have learned about my teaching, the curriculum, my students and my own professional journey as a teacher'. Audrey mentioned that it was important to examine curriculum choices as a means of disrupting what she describes as the 'formal curriculum' and what Aoki (1993) referred to as 'curriculum as planned'. Audrey reflected:

> I had to document possible ways to disrupt the formal curricula while at the same time meeting expectations of the official curriculum. It is important for students to be able to identify the literary elements in a novel and make connections to the curriculum expectations as given by the Ministry of Education. This is also important for me as I continue this work and include culturally relevant text in my English curriculum.

In the English curriculum 'canons' have traditionally been elevated to positions of importance that both teachers and students have difficulties disrupting. They hold positions and value in our education and lives that everyone believes students and teachers should know and revere (Nicol, 2008). Audrey's work indicates ways that teachers can and must find space in the given curriculum to challenge existing norms and requires a kind of bottom-up activist teacher leadership that this chapter articulates. Audrey said she felt 'empowered' by the work she was doing and 'felt embolden to take steps in examining the power relations in schools more closely and how some students continue to be marginalized':

> The more I think about this research the more I think about power relations in institutions such as schools and how intimidated some kids are by the dominant culture and the materials and books being used. It is important to understand that some students cannot function in classrooms as they are set up and negotiate the teacher's power and authority…. Some students are sometimes intimidated by the dominant culture of the teacher….

While research suggests limited connections between teacher leadership and student achievement and outcomes (Leithwood & Jantzi, 2000), Audrey noted from the examination of the summative assessments given in her class that 'the students' overall grades improved, they were more engaged and there were no failures'. Audrey felt that this was achieved 'because the curriculum and pedagogy connected to the students' lives'. This has prompted me to question if researchers are looking for large-scale systems connections between teacher leadership and student achievement, it might reside instead in the classrooms of individual teachers and the commonsensical approach to curriculum decision-making? Audrey noted:

> The research proved what I believed instinctively and knew intuitively about connecting with the lives, interests and cultures of the students to the curriculum. My reason for participating in the research is my frustration with the curriculum. It is not connecting with the students and cause classroom management issues. The books they are forced to read are always left lying around in the classroom…. When they see themselves in the curriculum the students are more engaged and produce higher quality work.

Audrey also saw improvements among the emerging learners in her classroom who needed literacy support. They became 'interested in the context of the book, asked more questions, gained confidence in sharing their ideas and overall produced higher quality work'. The students in their feedback said that they felt valued because they were given the opportunity to learn about their culture and the culture of others. Audrey suggested that:

> The students' interest in the cultural context of the book was reflected in their overall achievement in the course. Their work reflected a keen understanding of the elements of literature, as they were able to use their imagination to create literary pieces that reflected a different culture. They asked more questions in class and were more eager to volunteer answers. Their grades improved overall, and all the students passed the course, achieving levels 3 and 4. Most significantly, the striving students produced a higher calibre of work than they normally produced. The students became more empowered and showed greater participation and interest… they felt valued as they shared knowledge of their culture and were able to clarify issues for students where there were misconceptions and became resource persons throughout the study of the unit. For students who were not South Asian a new set of knowledge was created and they were eager to learn about other cultures.

In one of my classroom observations I saw students in literature circles engaging in discussions on various topics and issues relating to the novel. As I moved around the various groups I noticed that the students were engaged, talking back and forth and having fun. We sometimes forget that fun is an important aspect of students' learning. During another classroom observation, Audrey invited a former South Asian student of hers who was still a student at the school as a guest speaker to her class to speak about 'what it is like growing up South Asian in Canada'. In an effort to bring the voice of the community into the curriculum, parents were also invited as guest speakers. A South Asian parent commented during a parent/teacher interview on how 'happy' she was to 'see such a book being used'. 'I am happy to see such a book being used, it is the first time. I am very happy'. The English curriculum remains dominated by texts that are about the lives of dead White male authors (Holloway & Greig, 2011) and there is the need for change. This change can happen if teachers exert leadership and agency in curriculum choices and development.

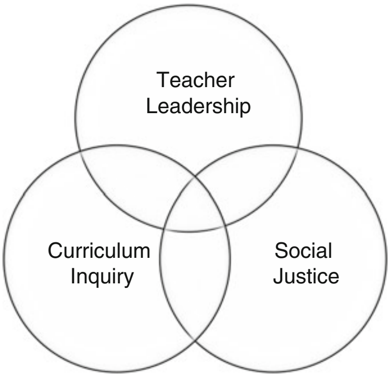
Rupturing the Situatedness of Curriculum Inquiry and Planning Outside of Teachers' Work in Classrooms

Ylimaki (2011) posits that 'familiar curriculum leadership processes such as teacher supervision and textbook selection are difficult to examine because they are inherently commonsensical and contextual' (p. 196), which prompts us to ask; has educational leadership and social justice discourses overlooked the obvious and commonsensical? The metanarratives of traditional curriculum delegitimise the discourses of the lived experiences of students that are central to the stories told and the language spoken (Aoki, 1993). Curriculum becomes the site on which generations struggle to define themselves and the world (Ylimaki, 2012). Aoki suggested that traditional curriculum discourses be decentred to make room for the practical wisdom of teachers' everyday experiences with their students in the classroom. The problematic nature of power relations in schools makes critical teacher leadership and working for social justice through alternative culturally relevant texts challenging at times. It requires navigating spaces with entrenched norms and contesting the given curriculum. The hope is that by examining teachers' leadership role in developing curricula in their classrooms, school-based scholars, researchers and those invested in education might learn something that will assist in re-conceptualising teacher leadership and see teachers as curriculum leaders. Given current sociocultural and political contexts of schools and the need to respond to the diversity represented in classrooms today, curriculum leadership requires that teachers have the ability to recognise the need for the best design and implementation of techniques of a broad range of instructional approaches (Handler, 2010). Unlike Handler, however, I contend that decisions around assessments, choice of texts and lesson design represent curriculum decision-making choices by teachers and are not merely lesson decision-making strategies. I agree with Ylimaki (2011) who posits curriculum leadership as 'individual and collective influence on cultural politics as well as the content and pedagogy of education – what is taught, how it is taught, and to whom' (preface). By examining teacher leadership within a framework of curriculum inquiry, we might better understand how to create schools that provide education that advances all children and prepares leaders who have a deep understanding of curriculum in relation to broader cultural politics. Teachers who are engaged curriculum leaders use their understanding of curriculum theory and inquiry to develop culturally relevant, authentic and rigorous curricula that contribute to holistic achievement on various kinds of assessments (Ylimaki).

Jean-Marie, Normore, and Brooks (2009) argue for social justice leadership that extends to inquiry born in other disciplines. The idea that curriculum inquiry can be a vehicle for change is not new, as curriculum theorists have led a path of inquiry, research and scholarship. This work brings together what Henderson and Gornik (2007) see as deliberative artistry in curriculum decision-making that combines designing, planning, teaching, evaluating and organising decisions. It points to teacher agency and leadership in the face of systemic and structural barriers in the advancement of a progressive curriculum that reflects the lives of students and their interests. For too long teacher leadership discourse has been around assuming more managerial roles in schools and taking on middle level management responsibilities. In this chapter I have repositioned teacher leadership at the intersection of social justice and curriculum inquiry acted on teachers' classrooms (Fig. 26.1).

This model represents my conception of teacher leadership and social justice anchored in the curriculum work on teachers' classrooms. The overlapping circles represent the interconnectedness and intersection of teacher leadership, curriculum inquiry and social justice and indicate that all three are necessary to create and bring about changes for students. These three constructs come together as teacher leadership represents the agency of teachers to disrupt existing norms and as social justice represents the pursuit of more equitable schooling, moving away from what I refer to as laminated equity and policies. These constructs are informed by and implemented through curriculum as inquiry enacted in classrooms as 'curriculum as lived', not as 'planned' or 'scripted'. Students and communities occupy the overlapping areas as all three constructs affect them as we seek to implement social change, remove injustices and improve the lives and experiences of students. Pinar (2004), in looking back at Ted Aoki's work, one of Canada's foremost scholars on curriculum

Fig. 26.1 Teacher leadership social justice: An alternative approach



inquiry, noted that Aoki urged teachers to be reflective and see curriculum as a form of praxis. For a long time school administrators and those who advocate systems reform have predicated change and improvement on change from the top-down with buy-in from teachers who assume various responsibilities in distributed leadership models but rarely articulated through curriculum change initiated in classrooms by teachers. Audrey's bold actions as an activist teacher leader and curriculum worker might help us to understand teacher leadership for social justice not only in terms of pedagogy but in the choice of curriculum.

The demographic shifts in Canada and elsewhere call for curricula that are reflective of more diverse cultures and views, one that is inherently created from the bottom-up. Teachers have a great role to play in advancing this agenda through research and practice. Chambers (2003) contends that curriculum scholars in Canada are like the many immigrants to Canada who must find ways of placing their knowledge within the discourses, within a nation that continues to search for its own identity. She suggests that many Canadian curriculum scholars are 'braiding languages and traditions, stories and fragments, desires and repulsions, arguments and conversations, tradition and change, hyphens and slashes, mind and body, …texts and images, local and global…into something that is perhaps as Canadian under the circumstances' (p. 246).

It is not the intent of the chapter to suggest that this kind of curriculum work is without challenges. It is time-consuming and requires negotiations with students, creation of new resources, assessment and evaluations, defending choice with other members of staff and living in the world of the unknown of questioning and uncertainty. One of the challenges that Audrey faced was getting other teachers in the English department to use this alternative text or seek out other culturally relevant texts. She suggests, 'it is important to make connections with like minded-teachers… there are two other teachers that I can count on to think about this work with me'. At the time of the study, there were 13 teachers in the English department; one decided to use the book Audrey used in the following semester for the novel study unit in her English curriculum. Audrey's experience raises the importance of curriculum development and decisions and how to implement curriculum changes in the best interest of students. Where curriculum decisions should lie as well as the role of the administrators and teachers in this complex journey of creating more just and equitable schooling for all students, in particular those who have been excluded and marginalised by the system is important.

There is a growing body of research that suggests that teachers can make a difference to their own professional journey and learning and the organisational structures and cultures of their school (Frost & Durrant, 2002). This kind of research points to ways that teacher leaders can engage in social justice in action and contribute to the wider professional discourse and knowledge on leadership. This kind of research agency, praxis and leadership is unlikely to happen without support given the problematic nature of schools and existing power relations and status quo (Lopez, 2005). As Audrey noted in her reflection, ‘feeling supported was important for me’. This support creates space for critical dialogue to occur and tensions to be teased out. Teachers must be encouraged to see leadership and curriculum work in their classrooms as inextricably linked.

Education that is socially just and equitable becomes an imperative as we pursue a more socially just world, where society comes to understand that it is made richer by the diversity of its people. Those who work with culturally diverse students have an ethical duty and moral responsibility to take on leadership roles and engage in teaching that interrogates what is, examines who is excluded and foregrounds new possibilities in diverse ways, including examining the texts that are used and taken-for-granted practices. A diverse population is now one of the distinctive features not only of Canadian society but much of the Western world and indeed many economically emerging states.

This chapter highlights the conscious and reflective practices that are essential for teachers to engage in bottom-up leadership and curriculum making and points to what is possible as teachers engage in critical praxis and accept the challenges of leadership. This is relevant not only to scholars, teachers and researchers in Canada but all countries with diverse populations as we seek to learn from contexts other than our own. It is important for researchers and school-based scholars around the world to heed Pinar’s (2007) call for ‘internationalisation’, to be engaged with each other and to reconstruct curriculum as we advance values of social justice and peace. Jean-Marie, Normore, and Brooks (2009) argue that socially just educators focus on research to understand more about what social justice leadership might look like in diverse countries in an effort to understand how we fully capture the impact of issues such as gender, race and culture on leadership. Teacher leaders steeped in an activist approach to social justice leadership grounded in their classroom practices will provide a cadre of aspiring school administrators who understand how to meet the needs of diverse learners and ease the conundrum of retraining and training current school leaders and administrators who do not bring these experiences. Audrey’s agency and leadership points to what is possible when teachers are located at the centre of curriculum inquiry and curriculum decision-making and when curriculum is not imposed on them. I now return to Bogotch (2011) question asked at the start of this chapter. I would contend that based on the research conducted at Greenville Secondary School and Audrey’s narrative that when curriculum is taken from teachers, teacher leadership will be severely curtailed.

Notes

1. I use the term school-based scholars instead of practitioners to represent educators who carry out their work in schools, whose practice is informed by research and who theorise about schooling from their daily lived experiences in schools.
2. The name of the participant, school and community are pseudonyms.
3. The Canadian Employment Equity Act defines visible minorities as ‘persons other than Aboriginal persons, who are non-Caucasian in race or non-White in colour’. This is a contested term, as some believe that it furthers the marginalisation of racialised Canadians. In this chapter I use the term ‘people of colour’ and diverse students to refer to Canadians other than Aboriginal peoples who are not White.
4. The Canadian Multiculturalism Act, an Act for the preservation and enhancement of multiculturalism in Canada, became law on July 21, 1988. The Act acknowledges the contributions of Canadians of all origins and their communities to the building of Canada and outlines the rights and responsibilities of citizenship set out in Canadian legislation. It encourages all of us to work together to build a society in which the principles of multiculturalism are fully realised in practice.
5. In Ontario students are streamed into three pathways to university, college and the workplace. Students on a pathway to college are placed in applied classes. Hands-on approaches are advocated for students in the applied stream who are being prepared to enter community colleges. In Ontario universities are degree-granting institutions, while colleges provide skilled training and diplomas. Some colleges have partnered with universities to offer joint degrees.
6. Caribbean country not named for anonymity.

Chapter 27
Disrupting the Hegemonic Construction of Student Achievement: Diasporic Spaces

Marva McClean

Introduction

Framing the Issue: Seeking to Transform Classroom Oppression

I have seen from research and my own experience that schooling as it exists in North America is not serving the interests of all students, particularly students from diverse ethnic, cultural, and linguistic backgrounds (Apple, 1998b; Love, 2008; McLaren, 1998; Sleeter, 1996). In addition, educational failure continues to be a reality for many students across the globe and diverse students in particular. Strong criticism has emerged from critical scholars whose definitive body of critical research has highlighted the deleterious effects of standardization on children's academic achievement, especially in urban settings populated by students from diverse backgrounds (Apple, 1998b; Love, 2008; Noguera, 2008a; Sleeter, 1996). This body of scholarship criticizes the dichotomous perspective that has been framed by policies such as the US No Child Left Behind Act (NCLB) which identifies certain methods of instruction as suitable and others as unsuitable, upholding notions of successful students and others as failures.

Despite the outcry and a call to disrupt this pattern of schooling, state departments of education and school districts have yielded to political pressure and continue to embrace an ideology of standardization, which advocates uniformity in educational reform and ignores contextual realities such as poverty, linguistic imperialism, and racism. This ideology of standardization presents school problems as if they can be solved simply by using particular methods and programs (Apple, 2003; Kincheloe & Steinberg, 1997) such as institutionalized reading and standardized testing. Such

programs place limits on the creativity of teachers constraining them from enacting the critical literacies that should prove useful to press for the educational advancement and success of many students. This has resulted in the academic failure of many students (Flores-Gonzalez, 2003), and in particular, diverse students, many of whom have become disengaged and disconnected and have opted to drop out.

These discourses of efficiency and accountability that characterize public education in the United States have extended across the globe as countries seek to address economic recession, placing the social justice and equity agenda at risk locally and internationally. Bogotch (2008) calls attention to the globalization of schooling where "issues of achievement, equity, and excellence have been subsumed under the assumptions of centralized authorities, politically and economically (p. 1)." Kanu (2006) echoes this perspective by emphasizing that globalization has led to a reorganization of economic models that assert an educational agenda tied to a framework of business management and efficiency standards (p. 23). I believe that this push toward standardization in the face of increasing evidence of the underachievement of some students creates injustice and inequities in education. However, even in the midst of the criticisms of the state of public education, scholars such as Kanu offer encouragement in the assertion that the emerging global realities of this post-colonial era open up space for educational leaders to seize the moment to work as interpreters of culture and curriculum rather than mere transmitters and managers (p. 22).

In line with the perspective of these critical scholars, I argue for the charting of new routes within the field of education, seeking innovative, experimental, and non-traditional methods of teaching and learning to replace outdated Eurocentric models that ignore students' multiple ways of knowing and, in particular, ignore or discredit their funds of knowledge as viable resource for classroom instruction. Like Starratt (as cited in Reyes-Guerra & Bogotch, 2011), I believe that educational leadership, including teacher leadership, must confront dilemmas, paradoxes, and structural barriers in schools and work deliberately to disrupt existing leadership paradigms that ignore the contextual specificity of schools.

In this chapter I argue that standardization fails because it does not take into account the diverse identities and needs that students bring to the classroom as well as the many forms of oppression that they continue to face (Kanu, 2006; Love, 2008). Pointing to the possibilities suggested by Kanu, I assert that addressing this need provides the opportunity for educators with a social justice agenda to step in and take action that may become transformative (Shields, 2010). Such transformative leaders, I believe, provide counter narratives that serve to disrupt the hegemonic construction of student achievement in schools where standardization is the dominant discourse.

I explore research that focuses on the notions of transformative leadership, including the implementation of critical pedagogy, connecting this to my own experience as a child educated within a post-colonial community where educators worked intentionally to create communities of practice that honored the legacy of our heritage (Nieto, 1996). I then present the classroom narrative of a teacher leader in the United States, who, through her agentive work, connects to my definition of a transformative leader, and I argue for the implementation of critical literacy as a step toward achieving social justice and equity in classrooms across the United States and, indeed, the world (Steiner et al. 2000). I write to legitimate the classroom practices of this teacher who worked purposefully to ensure that her students “are critically conscious of inequities that persist in our society and that they have the necessary knowledge, abilities, and opportunities, to redress these inequities” (Sayani, 2011, p. 73).

To strengthen my argument, I connect the teacher’s work conceptually to the notion of grassroots leadership enacted by the national heroes of Jamaica, who, although marginalized by the dominant society, subverted hegemony and attained freedom from oppressive colonial forces. I recommend that this form of grassroots leadership be utilized by social justice educators who dare to transform the society through risk-taking and the application of critical literacy. This perspective becomes the framework for the ideology on which this chapter is grounded.

Autobiography, Identity, and Civic Responsibility

Sowing the Seeds of Literacy: The Jamaican Diaspora

Apple (1998a, 1998b) speaks of the critical role of autobiography in the work of the educational leader, while Love (2008) emphasizes the significance of socially engaged instruction with diverse students. In my experience, I have seen educational leaders such as teachers, principals, curriculum specialists, and literacy researchers advocate for social justice and equity at schools pushing against the confinement of standardization to assert the right of the student to a just and equitable education through pedagogy that is embedded within the tenets of critical literacy.

In drawing parallels between my biographical data and the experiences of Diasporic students in North America, I point to my situated identities and experiences as a racialized and gendered educational leader who has traversed borders and boundaries and has witnessed firsthand the devastating impact of classroom injustices on the lives of immigrant and diverse students. I position my experiences as classroom teacher, curriculum developer, and Diasporic scholar from a critical position that seeks to disrupt existing arrangements of classroom settings where continued student failure and lack of engagement demand our attention, outcry, and action.

I locate my narrative experiences within the context of Diaspora, and I make reference to the very challenges I have faced navigating the school space as outsider. I am aware that the Diaspora cannot be essentialized nor is it homogeneous, and as such, I do not purport to speak for all, but I am aware that some experiences are common within hegemonic communities.

As a member of the Caribbean and, more specifically, the Jamaican Diaspora, I come to the field of education with a strong orientation in the value of education in shaping one’s life. At both the grade school and tertiary levels, my teachers utilized a strong sociocultural constructivist mode (Brooke & Brooke, 1999; Vygotsky, 1978) to embrace cooperative activities, dramatizations, debates, and rhetorical arguments as the core of our everyday classroom instruction, where our lived experiences were incorporated as valuable instructional material. My classrooms were environments rich with children from rural, urban, low-income, middle-class, and single-parent families where parenting was not limited to mothers and fathers but the entire communal family. This multiplicity of experiences was harnessed to fit into the instructional approach where cultural heritage became an active factor in fostering a community of practice (Wegner, 1998). These classrooms were made rich with the stories of our national heroes including Nanny of the Maroons and Paul Bogle (McClean, 2010) who engaged in subversive activities that countered the hegemonic construction of leadership through grassroots struggles that eventually led to the end of slavery.

In the classrooms of my childhood, these role models were incorporated into the curriculum as literary texts in a platform we would identify today as critical literacy. Nanny of the Maroons was presented to us as an allegory of strength and an indomitable will to face oppression with unwavering determination to disrupt its course. From our national folk history, we learned that Nanny, an Ashanti warrior from Ghana, was captured into slavery and taken to Jamaica. With fierce determination to claim the rights of freedom, she fled to the mountains of Jamaica to stage warfare against the British and undermine their authority and power in such an unprecedented manner that she became known as the thorn in the side of the British. Both the history and the mythology of Nanny converge to convey an image of a multifaceted individual whose multiple realities defied the boundaries imposed by colonialism. Through her inspiring leadership she attracted freedom fighters to the hills of Jamaica, at a site later named Nanny Town, and built up a fierce army, schooled in the intimate terrains of the land and subverted and thwarted the colonial forces of the British army.

Freedom fighter, Paul Bogle, used his platform as a Baptist deacon to galvanize the community, spreading his ideology of resistance and empowerment. In 1865, he organized the Morant Bay Rebellion, calling for the end to the oppressive leadership that had persisted after emancipation. Although Bogle was captured and hung, like Nanny, he had stirred up the winds of resistance against hegemony and ignited fires that would not be extinguished. Bogle became a folk hero during his time and, later, a national hero revered for his intuitive leadership and bravery. My teachers applied the use of imaginative language to provide insights into ways in which the daily activities of our community of practice could be connected to the work of leaders like Nanny and Bogle, asserting their story as guideposts for the journey we would undertake. I learned from my early experiences the power of potential and the motivational impact of symbolic figures in the lives of children (McClean, 2010).

It is of significance in talking about my history and identity that I note that I came of age during a time of great political upheaval and change in both our local community of Jamaica and in the broader sphere of international development, where the Civil Rights Movement sparked global awareness of the devastating consequences of disenfranchisement, oppression, and racism. From this early beginning, the act of becoming a critical thinker was set in motion for life (Bahruth, 2000). The strong winds of social change and the demand for independence in Jamaica during the 1960s engendered a climate of pro-activism, with education at its center. Later, at the University of the West Indies, critical scholars like Rex Nettleford, Maureen Warner-Lewis, and Trevor Munroe pushed us to be habitually critical, always questioning the status quo, careful to examine our own positions and ways in which we might be complicitous in undermining the development of our country (McClean, 2010). The Manley era of democratic socialism reinforced the country's vision of education as a critical factor in human development, putting children's rights at the forefront. Through the framework of democratic socialism, Prime Minister Michael Manley (1972–1980) established a policy of free education for school children where formerly education beyond elementary school was privileged and exclusive, restricted to those who had the financial resources to pay.

The beneficiary of these revolutionary changes, I uphold a strong commitment and accountability to ensuring that all children have access to a just and equitable education, regardless of their location. From this background I have come to the field with an unwavering perspective about hegemonic discourses based on my lived experiences, an awareness of the value of education as an agent of social mobilization and transformation. In my native Jamaica, I gained access to higher education as a result of the transformative work of radical leaders who were "not afraid to confront, to listen, to see the world transformed (Freire, 1970/1993, p. 21)." Today, I envision the educational leader as someone with such a profile of militancy, willing to grasp power within any available space and utilize this on behalf of disenfranchised children within the school system. The story of the teacher that is presented later in this chapter was selected because her agency for change met this criterion of militancy that I advocate is necessary at the school site where it is most essential for change to occur.

In asserting a worldview of critical praxis, I acknowledge the intensity of the challenges that teachers face daily, recognizing that reorganization of classroom instruction and pedagogy is just one aspect of the systemic changes needed. My focus is on ways to instruct children to improve the quality of learning and increase their chances of success in life (Torres and Noguera, 2008). As McLaren (1995) advocates, I envision the teacher as a political agent of change working within the classroom to implement a pedagogy of conscientization that will have a lasting impact on the lives of students as it prepares them for their role as citizens within the global environment.

Discourses of Resistance

Envisioning the Possibility of a Better World

A number of studies over the past decades have emphasized that children learn in unstandardized ways that are often unfairly measured by standardized testing (Darling-Hammond, 1995; Love, 2008; Sleeter, 1996). These studies dispel the notions that teaching and learning can be fitted within neat constructs of standardization. Students who are marginalized as persistent failures in school and who do not see themselves or their lived experiences reflected in the curriculum often experience alienation and become disengaged. The miseducation of these students is an injustice to the extent that the resulting impact is a deprivation of their life's chances of success. It is an *injustice* not to prepare students to fully participate in a globalized world and deliberately deprive them of the opportunity to become active members of the society. If we do not take action based on critical ideas and agentive work, we will continue to contribute to the unemployment of many diverse children and their inability to function as productive citizens in a democracy. This, then, must become an essential argument in the social justice discourse and one that must be taken up by a leader who is committed to disrupt the status quo.

While many speak of diverse students, I deliberately speak of Diasporic students: students who are newcomers to the United States and other regions of North America, bringing with them vestiges of their cultural heritage, including their language and multiple ways of knowing. Their heritage of colonization, economic turbulence, and social stratification places them in a Diasporic space where issues of race, ethnicity, language, and socioeconomic status intersect, calling our attention to the ravages of neocolonialism (Kanu, 2006; Love, 2008). These are the children that some call the visible minorities, children that the federal government and state and local school districts label as *others* and often, *at risk*, whether their ancestral roots connect to the Caribbean, Africa, Asia, or they are Native Americans who have been displaced on their own soil. In keeping with my ideological stance, I choose to reject these terms, laced with pejorative connotations, and select to use instead the term Diasporic which I also interchange with the term diverse throughout the chapter.

I define social justice as actions by educational leaders that confront and disrupt existing arrangements in schools and center the lives and experiences of Diasporic learners in the teaching and learning process. In this definition of social justice, educators engage in pedagogical actions that provide varied and multilayered experiences for all students (including students whose ways of learning have been normalized into the curriculum) and disrupt the hegemonic construction of student achievement. The intended outcome is that students value their contribution and come to understand how systems of meaning and power shape their lives (Apple, 1998b; McLaren, 1998).

Explorations into Social Justice: Resistance and Empowerment

In problematizing the condition of education in the United States, I apply a sociocultural perspective (Gee, 2004; Gonzalez, Moll, & Amanti, 2009; Lee & Smagorinsky, 2000) and connect my historical knowledge to the changes that I advocate should take place in the classroom through the agentive action of a transformative leader. To do so, I rely on the framework of transformative leadership espoused by Shields (2003, 2010, 2011). Shields (2010) identifies a transformative leader as one who works assiduously to study the environment in which she works in order to understand the particular needs of the community. She notes that “transformative leadership emphasizes the need for education to focus on both academic excellence and on social transformation” (p. 2). Shields (2011) further states that this leader creates a learning context that centers on democracy, equity, and justice, an environment, she emphasizes, that is necessary to foster “high achievement for all students as well as for the fulfilment of requisite accountability measures” (pp. 2–3). I find this particular framework to be most useful in my own considerations of the type of transformative leadership that is necessary to disrupt the patterns of inequity and injustice that prevails within our school system.

As Shields (2010) emphasizes, a transformative leader will remove the ceiling that constrains instruction and use the students’ background, skills, and funds of knowledge to build a richer and more diverse curriculum (Gonzalez et al. 2009). Within this setting, the child becomes a collaborator, rather than an antagonist (Noguera, 2008b). Through carefully crafted instruction, the leader holds up the world to the student and extends to her the possibility to make a connection to her reality. The transformative leader does this in a way that encourages and facilitates the child’s engagement, curiosity, and creativity. Reyes-Guerra and Bogotch (2011) add to this advocacy for transformative leadership by asserting that the curriculum must be critical and context specific. They posit the notion that an imported curriculum that is forced on the constituents is likely to fail as it may not address the particularities of that community’s needs.

Reyes-Guerra and Bogotch (2011) present a compelling argument for the need to embed curriculum inquiry at the heart of educational leadership programs. They assert that this is necessary in order to ensure that educational leaders are adequately prepared to become critical thinkers with an understanding of the diverse approaches they may apply in handling the fluid, chaotic, and pluralistic nature of schools. It is this awareness, the authors assert, which will prepare school leaders to begin that journey into the heart of a system that is crying out for mindful leadership based on the reciprocity between schools and the communities in which they are located. The authors pose a provocative question: *How are we preparing to meet the needs of our students?*

Interestingly, such a question highlights the very nature of schooling, regardless of the level or age in which it takes place. The reference establishes, for me, a clear analogy between the teaching in university classrooms and the teaching in our public school system. The point is well made. Education is at the heart of preparing minds (Eisner, 1994) to function effectively in the communities of practice in which they live. Reyes-Guerra and Bogotch explore the conceptual underpinnings of education as a force that shapes human beings, providing them with the scope to become productive members of the society. In pushing forth this perspective, they call attention to civic engagement in the community of practice and the ongoing agency to safeguard the freedom and democracy of the members of that society. This argument is central to the notion of social justice and equity in public schools. For the leader must see it as his/her civic responsibility to create an environment in which children can practice these freedoms, experience democracy as the platform of their daily classroom journey, and engage in activities that enable their growth as productive members of that society.

This perspective rejects the narrow conceptions of education that is perpetuated by standardization and the inhibitive curriculum that school districts mandate in their efforts to comply with state and federal mandates (McClean, 2004). The reciprocity that Reyes-Guerra and Bogotch (2011) speak of embraces the sociocultural and political-historical perspectives that diverse children bring to school with them, making room in the curriculum for such unstandardized and challenging material as instructional text. Reyes-Guerra and Bogotch recommend that educators begin by looking at the scope for creativity within core curriculum subjects such as science, numeracy, and language arts. *In other words, how can educators locate and evoke the wonder or awe within a subject matter and still meet the mandates, that of necessity, they must?*

Citing Shields (2003, 2010), Reyes-Guerra and Bogotch assert the moral responsibility of addressing the inequities that exist in schools. They argue that transformative leaders investigate how they might build school environments that are rooted in a strong commitment to freedom and democracy. They express the hope that "educational leadership programs will create transformative leaders and they, in turn, will bring these same teachings to the schools and systems they lead to develop democratic and relevant teaching, curricula, and citizens" (p. 152).

The message of hope that evolves from this discussion connects to the promise in children that Noguera (2008b) addresses. He declares that when educators act upon restraints with creativity and resolve, they can do much to work with children to realize their potential, reversing the identity of failure that has been ascribed to so many school children. In questioning the rampant failure that has been the experience of far too many children of color in the United States, he offers advice to educators to create an atmosphere of invitation that motivates young people to join the conversation and share their perspective and have their voices heard. According to Noguera, the instructional leader has the potential to turn lives around and give children a purpose to achieve.

Indeed, as Diasporic children move across the globe and settle in classrooms (Giroux, 1990, 1992), there must be critical consideration of their needs, their sociocultural background, and the type of schooling that will encourage their successful performance. Critical researchers such as Pacheceo (2010), Mulcahy (2008), and McLaren (1995) add to the international discourse on student achievement, emphasizing literacy as a sociocultural activity that cannot be separated from the communities in which it is practiced. They call for a focus on the students' cultural heritage as an essential component of curriculum design and pedagogy, noting that issues of language, ideology, and culture must be embedded within the curriculum design. Highlighting the imperative of a social justice agenda, Love (2008) points out how essential it is for a teacher to guide students in ways to "disrupt power imbalances" in schools (p. 33). Kincheloe and Steinberg (1997) add emphasis to this perspective by stating that people who are serious about social justice must declare their position and actively seek ways to maximize learning for diverse students who learn in unstandardized ways.

Critical Literacy and the Pedagogy of Possibility

This imperative to address the needs of the unstandardized child can be immediately connected to critical literacy (McLaren, 1995, 1998, 2000; McLaren & Kincheloe, 1997), an ideology of schooling which centers the child as a key player in the development and implementation of the curriculum (Ladson-Billings, 1995a, 1995b). Critical literacy is the most suitable framework to push the boundaries of possibilities (Vygotsky, 1978) through situated learning that establishes socially organized instruction such as oral storytelling, dramatizations, creative writing, and conversations that will have a strong impact on mean making that shapes student identity (Bakhtin, 1981; Wertsch, 2004) and intellectual development.

Social justice principles are embedded in critical literacy and teaching practices. Teachers facilitate literacy and step back as the classroom authority to create an intellectually engaging environment where the students' voice is dominant. This involves students using language to exercise power, to enhance everyday life in school, and to question practices of privilege and injustice (Giroux, 1993; Love, 2008). Within this critical framework, students explore figurative language: metaphors, idioms, and the proverbs of their ancestral and social life as they question diverse texts (both oral and written), asking questions such as motive of the author, whose voice is left out, and how might the narrative be told differently to include their funds of knowledge. In a manner consistent with Freire's conscientization, they hold discussions about the way texts represent cultural positions, ideologies, and discourses and their own place in history.

This is the kind of environment, Arias (2008) declares, that builds communities of respect, tolerance, and acceptance of diversity in schools. With its thrust on student-centered teaching, critical literacy encourages the incorporation of historical/political knowledge in classroom texts (Gee, 1990). This should strengthen students' awareness of the ways they can resist hegemony and assert their voices to change the classroom experience. McLaren's (2000) assertion that "schools in the United States need to provide students with a Freirean language of criticism and a language of hope that prepare students to conceptualize systematically and systemically the relationship among their private dreams and desires and the collective dreams of the larger social order" (p. 9) resonates with hope of the possibilities that social justice education can achieve on behalf of our students.

To Confront, to Listen, to See the World Transformed

I have applied some of the key principles espoused by social justice scholars such as Shields (2003, 2010, 2011), McLaren (1995, 2000), Reyes-Guerra and Bogotch (2011), and Sleeter (1996) to craft a definition of a transformative leader as one who grasps power and does not wait for power to be assigned to him or her within the hierarchy of the educational system. This leader has "a clear sense of the values and beliefs that undergird his or her own identity, [is] willing to take stands that may require moral courage, to live with tension, and to some degree, to engage in activism and advocacy" (Shields, 2011, p. 3). This definition certainly connects to the philosophical landscape of Paulo Freire (1970/1993, 1985a, 1985b, 1998) who speaks of the potential of the individual who works intentionally to subvert the status quo by collaborating with others to liberate them from hegemonic conditions. Like Shields (2011) and Reyes-Guerra and Bogotch (2011) advocate, such an educational leader is intentional in the building of an inclusive community that promotes democratic processes and social activism for social justice (Foster, 1986; Levine, 2007). As Freire and Macedo (1987) declare, for such a teacher leader, "this means being sensitive to the actual historical, social and cultural conditions that contribute to the forms of knowledge and meaning that children bring to school" (p. 15). This leader utilizes critical literacy to change the school environment as she recognizes that feelings of displacement and dislocation in school settings (Gay, 2000; hooks, 1994; Noguera, 2008a) can undermine student socialization and academic achievement.

The following questions have guided my inquiry: Can the teaching of language arts become a critical tool in preparing Diasporic students to function in the global environment and achieve academic success? How can educators, including teacher leaders, specialists, and administrators, resist social pressures and develop the courage and creative capacity to implement critical pedagogy in schools established on a framework of standardization? Might classroom teachers push against the boundaries of standardization and assume leadership that will disrupt the status quo within classrooms, empowering students to become lifelong critical thinkers with the tools to confront and counteract hegemony?

I observed a teacher leader during a 9-week research sabbatical and engaged in a program of collaborative inquiry with her in which I collected data through reflective journals, logs, classroom observations, and extended conversations and reflections that allowed me to critique my own practice as well, careful to [re]consider what it meant to engage in transformative work at school sites. During weekly visits to her classroom, I documented her journey and her pedagogical stance in embracing teaching as a political act of resistance and empowerment.

Social Justice in Action: Narrative from the Classroom

Grassroots Leadership: Social Activism at the School Site

Shields (2011) has stated, "Transformative leadership is a robust way of thinking about leadership that requires multiple styles and strategies" (p. 385). In the section below, I highlight how Christine (all names are pseudonyms), a teacher leader, utilized grassroots leadership practices to confront the injustices she encountered and dared to transform classroom literacy. She engaged in literacy work that emphasized the fundamental role that children's funds of knowledge play in their literacy development. In her interpretation of literacy, she extended her outreach beyond the classroom to include colleagues, parents, and the community. She demonstrated the courage to assert her ideology even in the midst of scrutiny and resistance to create a sociocultural environment for the students that empowered them as change agents themselves (McLaren, 1998). This action resonated with me as it reminded me of the role my early educators played in sowing the seeds of literacy that have lighted my own pathway in educational leadership.

At the time of the study, Christine taught language arts at Panther Middle School located in a large city in the southern United States. The student population was made up largely of immigrants from the Caribbean Diaspora (Jamaica, Haiti, and Puerto Rico) and African Americans. Recognizing how standardization has impacted schools and shaped the identity of children, Christine worked with a group of students who had been placed in her class based on low Florida Comprehensive Assessment Test (FCAT) scores and a prediction of low performance. Her task was to remediate the students by teaching identified benchmarks, utilizing an instructional calendar that included specific dates to teach certain task items, weekly measurement of those items, and a charting of the students' performance on each test to determine their marginal improvement in preparation for the looming FCAT test date.

The FCAT is the center of Florida's accountability system for student and school improvement. It was administered for the first time in January 1998 to students in grade 4 (Reading), grade 5 (Mathematics), and grades 8 and 10 (Reading and Mathematics) and was later expanded to assess students in grades 3–11 in the subject areas of reading, mathematics, science, and writing (Florida Department of Education, 2012). The FCAT consists of criterion-referenced assessments in these subjects and measures student progress toward meeting the Sunshine State Standards (SSS; recently revised as the Next Generation Sunshine State Standards, NGSSS) benchmarks. The focus is on skills competencies and grade level expectations of what students must learn along the hierarchy of the K12 school structure. The skills and competencies outlined in the Standards are embedded in the material of the student's core classes.

Student achievement data from the FCAT are used to report educational status and annual progress for individual students, schools, districts, and the State. Florida's school grades are currently based on the percent of students meeting high standards and the percent of students who make learning gains. Elementary and middle schools are assigned a school grade based primarily on student achievement data from the FCAT. Based on FCAT results, school districts mandate policies that direct teachers to instruct students focusing on specific standards and prove their mastery through this series of state scheduled tests.

Asserting Students' Funds of Knowledge as Counter Narratives

Christine, a racialized immigrant to the United States who had experienced racism firsthand, was in her tenth year of teaching. Her ideology of teaching was nurtured by her experiences as an immigrant and her pursuit of graduate studies where she read the work of Freire, Giroux, and other critical pedagogues. She was particularly inspired by the philosophy of Freire whose work she had been introduced to in her native country. She was frustrated by the negative learning environment prevalent in the school as well as in her classroom where students openly resisted the official curriculum in which they did not see themselves or their experiences. She knew that the placement of the students in her class signaled the academic identity the administration had assigned them as well as the limiting curriculum she was expected to teach. She considered herself accountable to “help her students analyze their own experiences” (McLaren, 1998, p. 217) and guide them in ways to use the tools of critical literacy to question dominant discourses and then respond through social action (Giroux, 1990). For such changes to occur, she realized, she would have to subvert the scripted program assigned to her.

Within the framework of FCAT, committed teachers like Christine are faced with the dilemma of meeting or appearing to meet increasingly oppressive performance criteria that are often in conflict with the background and learning styles of their students as well as their pedagogical stance. *How did Christine make space for her resistance within this setting of standardization?* Christine understood that power cannot be given by those in authority; it must first come from within (Kincheloe & Steinberg, 1997). During her years at the school, she (and the other teachers as well) had experienced a decrease in autonomy about what to teach, how, and when. She found herself being asked to teach utilizing practices and content material she did not agree with. Within the school district, the consequences for not complying could include increased supervision, discipline, and, possibly, job loss for both administrators and teachers. At Panther Middle School, it was a common occurrence for district personnel to turn up unannounced at the school, visit classrooms, and hold conferences with the administration about their observations. Having decided to take action to initiate the process of resistance and change, Christine began a dialogue at departmental meetings, pointing to ways to “deconstruct social-cultural knowledge frameworks that generate inequity and reconstruct them in more equitable ways” (Shields, 2011, p. 384).

She pointed to strategies teachers could use to incorporate the students’ personal experiences into the curriculum and still meet the district’s mandates. In this way, she opened up space for teachers to consider ways in which they could actively resist standardization and maximize learning for their ethnically diverse students (Boykin and Noguera, 2011; Lopez-Robertson et al. 2010). In addition to the contribution to the discussion at department meetings, she spearheaded parent workshops and professional development trainings at the school site and was well known and respected for the critical edge she took to classroom instruction. She was well aware that while she did not have the open support of the principal, she had his respect.

Resisting the Ideology of Standardization

While the principal adhered to the mandates from the state and district, he was cognizant of the needs of the students and the circumstances of their social lives. In faculty meetings he had shared the circumstances of his own working class background. But like many other administrators in the system, he was cautious about criticizing and resisting district policies in ways that might impede his own professional growth and achievement. In keeping with the School Improvement Plan that had been submitted (on demand) to the district office, teachers were required to write lesson plans that clearly stated the instructional objectives from the school-wide plan and have these written daily on the board. The requirement was that lessons must be stated in the plan with the specific district strategies indicated. In Christine's case, she matched the alternative texts she utilized with the district goals, objectives, and mandated benchmarks. She extended her pedagogy further by including the involvement of parents in the curriculum, a practice that was sought after by the district as part of its strategic plan in a county beleaguered with social discontent. When the principal questioned her use of nontraditional texts such as the folk literature she used instead of the texts identified by the district, she was prepared to point specifically to ways in which these texts met the criteria of the Sunshine State Standards.

A member of the teacher's union and a graduate student, Christine was motivated and open to evaluating her practice, taking risks in an effort to make positive change in her classroom and influence her peers to take action as well. I saw her work as a radical departure from the scripted curriculum implemented at the school and one undertaken in line with the subversive approach of grassroots leaders I referenced from my Jamaican background.

In a manner, delineated by Shields (2011) as transformative leadership, she gave thoughtful consideration to the tools and activities that would be most effective in creating the sociocultural environment that she sought to enact. In keeping with Wigfield's and Guthrie's (1997) assertion that student involvement in reading is undoubtedly influenced by the kinds of reading materials schools provide and spurred by her own immigrant experience, Christine selected folktales as the genre for a literature unit and worked to validate the rich reservoir of knowledge that the students brought to the classroom (Freire & Macedo, 1995). Like Banks (2003), she felt strongly that students are more engaged in literature that reflects their background and heritage. Committed to push against the limits imposed by the district, she negotiated the curriculum and strategically inserted the oral presentation of the tales as a respectful acknowledgment of the central position orality plays in the lives of children from the Diaspora.

In this bold move to assert her respect for her students' background, she centered the unit of study on their native heritage and guided them to participate in a critical analysis of the ideology of FCAT and the acknowledgment that the texts of their heritage had a valid place in the classroom (Freire and Macedo, 1995). She asked the students to bring to school stories pulled from their background of largely Caribbean and African American culture. In some instances, stories were pulled from the section on folktale from the classroom reading anthology. The majority of tales, however, were pulled from stories the students had heard over and over again in their homes, family tales used by parents and grandparents as a way of teaching lessons on social behavior and to confirm their world and extend their experience. Anancy stories of resistance and subterfuge, from the West African folklore genre, were a particular favorite in this classroom where the teacher guided the students in critiquing characterization, plot development, and language usage of their ancestral stories, allowing them to create a site to “revisit past, present, and projected histories and identities” (Medina & Costa, 2010, p. 57). Students interviewed their parents, teachers, and community members to add to the narrative of their tales which was enriched with contextualized meanings and culturally based expressions. This form of experiential pedagogy connected the children’s out of school life to classroom instruction, adding complexity and fluidity of meaning as it reflected their identity within the literature of the classroom.

Literature as a Tool for Exploring Multiple Realities

Christine applied her awareness of the historical political knowledge of the school community to frame their discussion around questions related to race, culture, character traits, and themes. She guided the students in critiquing the knowledge they had of these folktales and the sources from which they were retrieved and to identify and discuss examples of people they knew who exhibited qualities similar to the hero/heroine of the tale. They considered how the folktales positioned the character as part of the oral practices in their community, substantiating their comments and responses with specific details from their texts posed against their own perspectives. By enacting this sociopolitical stance, the teacher demonstrated to the students how their ordinary family stories had value in the world of the literature studied at school (Lankshear and McLaren, 1993).

Respecting the cognitive diversity in the classroom and concerned with ensuring that all students were appropriately oriented to the task, Christine posed questions along a continuum of low to medium to high cognitive complexity as evidenced below. By using this approach, she met the basic requirement of the school’s standardized curriculum and maintained her professional obligation before moving on to more robust, critical questions which reflected her perspective that a rigorous process of inquiry is needed for all students beyond the boundaries of FCAT-type “bubble in the one best answer.” She worked to ensure that the students utilized the skills of summarization, analysis, and evaluation, an important phase in the process of becoming critically conscious and proficient in language arts skills (Johnson & Friedman, 2005).

Probing Questions

1. Who is the main character of this story? What special qualities or behavior does he/she exhibit?
2. Describe his/her circumstances. Discuss the character’s behavior in this story.
3. Does he/she remind you of anyone that you know? Explain the similarities or differences. What would you say to this character if you should meet him/her?
4. What is the moral/lesson in this story?

5. Explain how the writer uses the portrayal of the main character to convey the moral of the story.
6. To what extent is this figure representative of your parents' country/history?
7. What might have been some factors that led to the creation of this tale?

As the discussion ensued, the cognitive complexity of the probing increased, accelerating to a level of intensity and deep reflection very much reflective of the approach advocated by critical scholars like McLaren (1998) and Freire (1985a) who state that sociopolitical discourses are necessary in schools to build communities of inquiry. I observed that Christine sought to guide her students to dig beneath the surface and examine multiple approaches to getting at meaning as she pushed them to become independent thinkers (National Council of Teachers of English, 2012). This dialogic stance, a recurring theme in the seminal work of Freire, placed the lesson in a larger sociocultural frame which pushed the children to examine the text from multiple perspectives as they grew in understanding that the literature they studied is ideological.

The students readily explored connections between Anancy and members of their community, touching on issues of creativity, perseverance, and survival. Some students described the Anancy character as being street-smart and cunning, with the ability to use wits to survive in any situation, while others viewed Anancy as deceptive and malicious, ready to use his wits to gain an advantage over others. Christine exploited this opportunity to push forward a nuanced discussion of the West African folk hero, Anancy, as a symbolic figure within the Diasporic imagination of subterfuge and liberation. She pushed the discussion further, urging the students to think about the ways oral practices of their heritage/community positioned the hero/heroine, juxtaposing this against their own perspectives. What was striking about this assignment was the fact that it involved the children's parents in the learning event, situating both parents and children as experts in the literature study that was linked to their personal histories and identities (Focault, 1990).

Literacy as Social Practice: Folktales Invoked Cultural Values

Christine's subversion of the curriculum became even more evident, in the next assignment where she requested that the students use the stories of their family heritage as a guide to author folktales that reflected their contemporary culture and current experiences. As they crafted their tales, she guided them, pushing their thinking with a plethora of questions including "*who or what is being represented or misrepresented?" "What are your reasons for positioning your main character this way?" "What stereotypes are being reinforced?"* For the duration of the unit, she provided feedback, giving the students the opportunity to revise and modify their work before the final submission. By extending the lesson with this creative writing activity, she allowed for more adequate considerations of the use of time in the classroom, applying a flexible schedule that gave the children room to reflect on their performance with the opportunity to work on improving the quality of their work.

Using the original stories as their model, they gave their unique interpretation to the concept of folk literature and put their individual stamp of creativity in publishing an eclectic mix of contemporary folktales supported by highly colorful and interesting visuals using web-based videos, PowerPoint presentations, booklets, and poster boards. Through these multimedia presentations the students redesigned the tales, repositioning the characters from their perspectives, giving them a richly contextualized flavor. At the end of the unit, a cultural heritage presentation was staged in the school's media center with a display of the students' work. The media specialist, the drama, and art teachers all lent a hand. This participatory program included drumming by a young adult from a local university, presentations by a cultural activist, and storytelling by one of the students' parents, a professor from the African New World studies department from a local university. The students' response was one of great delight and they seemed empowered by the notion that one of their peers had an *important* parent.

This well-planned storytelling lesson took the students outside of the classroom extending the space for the teacher and students to learn about each other over time. Activities such as interviews and recording of oral history were designed to involve family members in the lesson and to foster students' interaction with other people in the community. This provided a unique opportunity to help the students make connections with others, establish a common ground for understanding, and to celebrate cultural diversity as well as the unique attributes of people and ethnicities. It showed students the value of knowing about their roots while they unleashed their creative impulses through music, dramatizations, writing, and other creative expressions. I interpreted it as work toward transformation, liberation, emancipation, democracy, equity, and excellence that demonstrated moral courage and activism (Shields, 2011, p. 384).

Nieto (2000) recommends that teachers encourage students to talk about their culture, to attain visibility, and have their voices heard. Within this context, the classroom becomes a space for cultural validation, identity formation, and academic achievement. Christine negotiated the space for her students to appropriate multiple cultural locations of their background and (re)create new forms of literature which emphasized their voices and demonstrated their ability to read, critique texts, and create work samples in the genres they studied. This allowed them to tap into their political historical knowledge, placing them at the center of classroom pedagogy where they became expert knowledge producers (Saavedra, 2011). There is a strong political and agentive thrust in such a pedagogical stance which personalizes knowledge and allows students to connect the stories of their oral tradition (Medina & Costa, 2010) to the pedagogy of grade level literature. This conscientization (Freire, 1970/1993) of the curriculum gives efficacy to storytelling and its central role in the lives of children from the Diaspora, welding together their inner experiences and the outer world (Posner, 1998), as it extends their scope for academic achievement, providing them with lifelong skills of critical analysis.

As I stated earlier, this pedagogical stance reflects the ideology I hold that the curriculum need not be mandated material imposed from outside; of necessity, it should be co-constructed with the students, giving consideration to their background, interests, and learning styles, establishing multiple ways of being successful within the English language arts. This teacher leader astutely met the mandated expectations yet concurrently subverted the restrictions and engaged in a sociopolitical discourse that legitimated the students' funds of knowledge.

When spaces are not given, transformative leaders have a duty to create that space especially within the limits of existing structures such as standardized curriculum. This certainly reinforces Saavedra' s (2011) statement that, "the very act of asking immigrant children to remember their stories, narratives, and histories becomes a political journey to recover and offer new possibilities for decolonizing our pedagogy, theory, and body" (p. 268).When teachers focus on students, acknowledge their strengths, and scaffold instruction to meet their needs, they are lifting up their voices amid the cacophony of school reform (Neely, 2011; Nystrand, 1997) to subvert failure.

Decolonizing Pedagogy

As Kanu (2006) states that educators should, Christine worked as an interpreter of culture and curriculum rather than a mere transmitter and manager. She expanded her expectations of the children with authentic texts that tapped into the range of sociopolitical knowledge they possessed. Christine's narrative highlights the work of a teacher leader who is not afraid to confront and see the world transformed (Freire, 1970/1993). She implemented critical practices that countered scripted curricular and deficit-oriented narratives about the performance capabilities of children from the Diaspora, guiding them in the process of interpreting as well as creating texts: academic skills tabled at the highest level of cognitive complexity. Simply stated, she empowered them with both the skills and the realization that they can take action to influence their future. As Gee (2004) emphasizes, teachers can take this sociocultural stance as an invaluable resource for teaching diverse children, exploiting the opportunity to transform both the individual and the situated environment (Freire, 1970/1993). The exemplary work of teachers like Christine can assist other teachers to integrate critical literacies in their practice, perhaps pushing the administrators at their school sites to take notice and take action as well. There is the realization that change can take place from the bottom-up, that there is no one best way to challenge existing norms and power relations in schools. After reviewing this exemplary case, a key question has emerged: *How do we sustain this type of teaching practice?*

Phelan and Davidson (1993) contend that "in classrooms where students flourish, teachers know the students well, are attuned to their needs, and show personal concern for their lives. These teachers are aware of their students' precarious academic status and incorporate various pedagogical methods to ensure student involvement" (p. 85). The reciprocity that is fostered in this sociocultural environment allows for wide open spaces to create a big classroom conversation inclusive of ethnicity, gender, and national origin. This method of teaching gives children ownership over their work and performance as they are not passive receptors of other people's knowledge (Freire, 1970/1993) but critically engaged readers, writers, researchers, stage managers, and performers: active stakeholders in the production of knowledge.

Researchers have expressed the concern about how reading and achievement influences the distribution of rewards and perks in school and the society (Flores-Gonzalez, 2003), persistently marginalizing certain groups of school children. Both research and anecdotal evidence demonstrate that standardization tends to reject certain forms of literacy that diverse children bring with them, orality, for example. The example of Christine's pedagogical stance highlights an educational response to oppressive power relations and inequities in schools. The success of this classroom had much to do with the teacher merging both literate and oral instructional frameworks that bridged the link between social experiences and cognition, taking into account the classroom demographics. This approach is so central to my concept of how teachers should teach diverse/Diasporic students that I choose to highlight it as a viable approach to teach for social justice and equity.

This form of teaching is consistent with Freire's (1985a) articulation of conscientization as the process by which human beings participate in transformative acts. I therefore push for three central concepts to inform the action of educators working to disrupt the hegemonic construction of student achievement, those who believe that despite the current atrocities, there is the hope that we can transform (Green, 1983, p. 2). Such teachers assume a pedagogical stance that can revolutionize belonging, identity, and citizenship as central to our language arts curricula (Saavedra, 2011). This view is validated in the statement by Krank and Steiner (2000): "The time to adjust the culture of education to fit the learner has arrived (p. xii)." I offer the following as critical strategies to do so.

1. Assert a Sociocultural Theory of Learning in Classrooms

Implementing a sociocultural worldview in the classroom is essential in addressing the needs of Diasporic students. When educators problematize the curriculum using a situated and embodied approach, they allow space for diverse forms of knowledge such as storytelling, performances, and creative writing to be accepted. Such pedagogical actions create and provide varied and multilayered experiences rooted within the context of the children's history and social background; the outcome of which is their empowerment and an understanding of their agency in changing their educational circumstances and, indeed, their world. This stance guides students to interrogate the goals of education and the practices of the classroom. There is the affirmation that schooling is much more than achievement on tests; its larger purpose is to assist students to position themselves in history and accept their responsibility to work to change the society not to accept it as it is, or simply survive in it.

2. Empower Students as Classroom Leaders: Critical Literacy and the Pursuit of Social Justice

The articulation of political historical knowledge is recommended as a method to guide students in ways they can appropriate their funds of knowledge as classroom pedagogy. Teachers can use this to offer them a framework where they can ask critical questions and assert their ideology. They will appropriate this critical awareness to the diverse texts they encounter in the experiences of their school life. In situations with other teachers, they can request the inclusion of diverse texts in the curriculum and advocate for diverse forms of assessments, for they have learned how to transform their knowledge and subjectivities through the creation or production of literary texts such as those created by Christine's students.

3. Transformative Possibilities of Collaboration and Narrative Inquiry

Engaging in transformative leadership is challenging and absorbing work. Without supportive strategies and guiding principles, it can be overwhelming. I believe that it is important for teacher leaders to have a group of critical friends (Reyes-Guerra & Bogotch, 2011) with whom they can share ideas and collaborate. This is particularly important in the demanding realm of standardization. Love (2008) points to the challenges facing teachers who desire to bring a critical perspective to their practice. He states that, "the environment of teaching has become more and more hostile to critical education" (p. 31). Educators can strengthen their advocacy for social justice education by sharing experiences: mentoring, coaching, and critiquing each other. Such focused behavior offers guidelines for agentive work that improves the quality of teaching and learning (Mulcahy, 2008).

In addition, instructional leadership that is a shared enterprise in schools may encourage educators to examine why children fail and how their beliefs, assumptions, and practices may contribute to patterns of inequity (Friedrich & McKinney, 2010, p. 240). Under these conditions, educators search for that critical edge and make deeper changes more quickly than if working alone. There is renewed energy that comes with conversation across borders, recognizing that there is no one truth to be found, that literacy is contextually bound and embedded within language, culture, and ideology (Mulcahy, 2008, p. 22). This international perspective is essential as we move forward in the twenty-first century.

Conclusion

In this chapter I have profiled an instructional leader who is an agent of social change, aware of the opportunity cost to students and their community when injustice is perpetuated. I have presented examples of how a teacher leader works in a setting where support from school administrators is marginal at best yet manages to carve out spaces to create change. She analyzed the demographics of her classroom and re-contextualized the restrictive instructional approach to expand space for her students' intellectual development in such a manner that fostered their engagement, dialogue, and a sense of purpose (Damon, 2008). As Saavedra (2011) affirms, "If we really listen, if we really hear, we can turn language arts on its head, decenter our adult conceptions of language/literacy, and create new possibilities for teaching and learning in the language arts curricula" (p. 265). The present sociopolitical environment demands no less.

My approach to literacy education has been deeply influenced by the way I was schooled, my cultural history, and intimate knowledge of hegemony, ideologies into which I was socialized as part of my early schooling. I believe that "critical pedagogy leaves no possibility of a neutral educational process" (Krank & Steiner, 2000, p. xii); curriculum and teaching is a political act, regardless of one's position and location. Activists for critical literacy use the curriculum as a medium to break down boundaries and cross borders asserting everyday knowledge as legitimate and essential to students' classroom discourse. I assert the voices of children from the Diaspora as essential to this reconceptualized classroom discourse.

Chapter 28

School Leadership, Literacy and Social Justice: The Place of Local School Curriculum Planning and Reform

Annette Woods, Karen Dooley, Allan Luke, and Beryl Exley

Much of the North American debate over literacy and social justice has been dominated by the state and regional implementation of centralised curriculum programmes via *No Child Left Behind* and *Race to the Top* legislation. Yet a decade into this approach to ‘closing the gap’ in linguistic/cultural minority and working class schools, there is ample evidence that centralised curriculum dictates and neoliberal accountability measures have had at best mixed results and indeed in many instances negative effects (e.g. Nichols & Berliner, 2007; Luke & Woods, 2009). The school reform literature paints a very different picture, showing that school leadership with a strong focus on curriculum and pedagogy can generate sustainable gains on conventional indicators by students from linguistic/cultural minority and working class backgrounds (e.g. Newmann & Associates, 1996; Ladwig & Gore, 2005). This chapter reviews current work we are undertaking in Queensland, Australia, where some school communities are developing and implementing school-based whole-school literacy programmes. We document the response of one school community to test-driven accountability pressures. In the approach described here, teachers and researchers worked with the ‘four resources model’ of literacy (Freebody & Luke, 1990), ‘multiliteracies’ and digital and media arts pedagogies (New London Group, 1996) while building substantive links to community knowledge, locally relevant Indigenous knowledge and traditional school subject knowledge.

School reform is a matter of both redistributive social justice and recognitive social justice. Following the work of philosopher Nancy Fraser (1997), we begin from a philosophical and political commitment to the more equitable redistribution of resources, knowledge, credentials and access to educational pathways for students from linguistic/cultural minority and working class backgrounds. The community we describe here is one where access, achievement and participation have historically

been judged according to lower expectations than the system norms and benchmarks set for other students by middle class and dominant culture communities. At the same time, we argue that the recognition of these students and their communities' lifeworlds, values, knowledges and experiences in the curriculum and in classroom teaching and learning relations is both a means and an end: a means towards improved achievement according to conventional measures and an end goal for reform and revision of mainstream curriculum knowledge and what is made to count as valued knowledge and practice.

The work that we report is based on an ongoing 4-year project,[1] nominally a design experiment, where a team of university teacher educators and researchers have partnered with school leadership and staff and Indigenous education leaders, with the support of a federally funded grant and the state teachers' union. The intervention, known as the URLearning project, coincided with the appointment of a new principal who had an explicit focus on social justice and equity. Her stated goal was reforming the school to achieve improved student learning outcomes. The context in Queensland, and Australia more generally, is one of increased systemic high-stakes accountability measures from state and federal governments. The development and implementation of the first national Australian Curriculum for subjects English, Mathematics, Science and History has heightened tensions around teacher professionalism and deskilling, test-driven accountability and scripted teaching. In response, the Queensland state education system has provided teachers with highly prescriptive units and lesson plans. While not mandated, these units and lesson plans are being used under the aegis of 'quality assurance' in many schools, raising questions about potential impact on professionalism in a state with a long tradition of school-based curriculum development. Our work in the school has focused instead on collaborative planning and teaching with the aim of demonstrating and documenting teacher professionalism and quality teaching with students from linguistic/cultural minority and working class backgrounds.

In this chapter we begin by stating our position on social justice. We then move to describe the research context of the URLearning project, discuss our approach and detail some early trends and findings about leadership and socially just reform. Using the idea of 'distributed leadership', which was a key focus at this school, we highlight the enabling effects of leadership by both school administrators and teachers. We recognise that teachers are the most important in-school factor in student outcomes. Our research in other areas (see Luke et al., 2011; Woods, 2009) has demonstrated that shifting pedagogic relations in the classroom is crucial to social justice reform and achieving improved outcomes for all students. For this reason we discuss teachers' attempts to shift pedagogy as they worked in collegial relationships with researchers on our project team. We highlight the importance of making substantive links to the lives of young people and to local and more global events and disciplinary content as part of any curriculum reform process. We make the argument that social justice must be framed from both a recognitive as well as a redistributive perspective.

---

[1] This chapter reports data collected as part of an Australian Research Council-funded research project. We thank the teachers, administrators and students and the parents, elders and community members, who are our research partners on this project. We acknowledge the partnership of the school, the Queensland Teachers' Union, and the Indigenous community of and around the school, along with the support of the Australian Research Council. Our colleagues on the project are Michael Dezuanni, Vinesh Chandra, John Davis, Amanda Levido, Kathy Mills, Katherine Doyle and Wendy Mott of Queensland University of Technology and John McCollow and Lesley MacFarlane of the Queensland Teachers' Union. We also acknowledge Adrienne McDarra for her input into the project.

Social Justice in School Improvement

The term 'social justice' is used so frequently in Australian education and schools that the concept risks losing definition and purpose. We take as our starting point the notion that the goal of socially just education is to create educational contexts that 'empower historically marginalised peoples and challenge inequitable social arrangements and institutions' (Hytten & Bettez, 2011, p. 8). To achieve the aim of meaningful education for all students, the literature foregrounds the importance of working towards an equitable allocation of resources and provision of opportunities, as well as providing educational contexts where diversity is recognised in positive and ethical ways. In her seminal work, Fraser (1997, 2003) discusses this as relating to recognitive and redistributive social justice. Recognitive social justice recognises the importance of making diverse languages, values, lives and experiences visible in education. Fraser (2003) describes the goal of approaches from this perspective as being about producing a 'difference friendly world' (p. 7). Recognitive social justice insists that a variety of ways of knowing and of representing knowledge must be central within the curriculum and the pedagogic relations of classrooms. Redistributive social justice, on the other hand, highlights the need for a 'more just distribution of resources and wealth' (Fraser, p. 7). From this way of thinking, social justice is about the provision of funds, resources and supports to the education of traditionally marginalised cohorts of students. Such egalitarian redistributive claims about the provision of funds and resources 'have supplied the paradigm case for social justice theorising over the past few decades' (Fraser, p. 7). A point of difference in the more recent context is that these resourcing shifts have been linked to increasing prescription and accountability.

Redistributive and recognitive ways of understanding social justice are often described as being from separate or even opposing conceptual paradigms (Hytten & Bettez, 2011). However, like Fraser (1997, 2003), we argue that approaches that emphasise one way of understanding socially just education at the expense of the other are likely to be inadequate, especially in our current climate of increasing diversity within schools and other education contexts. Our view is that school reform for equity is a matter of both redistributive and recognitive social justice. Balancing a focus on the equitable redistribution of resources and ensuring there is recognition of the lifeworlds, experiences, values and beliefs of all children and their communities are the ways to progress towards the goal of a high-quality, high-equity education system. We take this framework into our investigation of one school, now in the third year of a reform cycle aimed at improving school outcomes for students.

Towards a Narrative Account of Collaborative Agency and Action

The school in which we work is located in a satellite city, which forms part of the urban sprawl of Brisbane, the capital city of Queensland. It is in one of the lowest socioeconomic areas of South East Queensland. The majority of the 600 students enrolled at the school live close by, with very few travelling from more distant locations. Accommodation in the local area is a mix of public housing, private rentals and some owner-occupier dwellings. The school has a significant population of Indigenous students, with somewhere between 11 and 15 % of the overall student body identifying as Aboriginal and/or Torres Strait Islander. A further 14 % of the student cohort is from varied Pacific Island cultures. In all, children from 23 different cultural backgrounds attend the school. Approximately 6 % of the school population meets stringent state system criteria for the English as a Second Language (ESL) programme. These are primarily migrants from Russia and Korea and students who arrived on humanitarian visas from Burma, the Democratic Republic of the Congo and Afghanistan. Additionally, a large proportion of the student population has been ascertained as requiring some form of behavioural and/or learning support at some time during their school career. According to one of the special education teachers, all ascertainment categories for special education support are filled to allowable limits, with about a quarter of the early childhood cohort identified as needing specialist assistance for speech and hearing problems, behavioural problems and so forth.

The suburb in which the school is located is in the lowest quartile of communities by combined indicators of socioeconomic position. With a very high percentage of the families having incomes below the official government poverty line (approximately AUD $24,000 per annum), making ends meet is difficult for many families. This has been complicated by recent government ‘reforms’ in social welfare which have made school attendance a condition for receipt of family welfare payments. In summary this school was a paradigm case of a school whose students were impacted by the effects of poverty, pushed to confront a press for demonstrable gains in student achievement. This push became even more intense after increased funding was made available through the National Partnership Agreements.[2]

---

[2] During this time, the school became a target for large amounts of funding as part of the Federal Australian Government’s ‘Closing the Gap’ policies. National Partnership Schools (low SES) were the recipients of resourcing through increases to general funds, principal bonuses and targeted staffing options.

We have been working with the school leadership and staff, the local Indigenous community and the state teachers' union in a 4-year project to investigate what is required to turn around the performance of a school providing education for students from linguistic/cultural minorities and working class backgrounds. Our aim is to describe how enhanced teacher professionalism, realised through school-level curriculum planning for literacy, a focus on digital media arts, multiliteracies pedagogies, an Indigenous after-school cultural/homework programme and an Indigenous language revitalisation programme can generate improved outcomes for students *sans* the test- and standards-driven, scripted curriculum models (e.g. Luke, Woods, & Dooley, 2011). Specifically, we are looking for indirect and direct effects upon conventionally measured achievement, outcome and performance indicators. In theoretical terms, our emphasis is on teacher professionalism and recognitive social justice, which we introduced in a policy and school environment where the emphasis had been on redistributive justice and more highly prescribed approaches to curriculum and pedagogy.

As the reform process began, behaviour management, truancy and disengagement with the pedagogy and curriculum, or even school refusal, were daily issues for staff and students. Special education interventions focused on dealing with the large number of students who were difficult to educate within classrooms, while a values programme attempted to bring some cohesion and whole-of-school consistency. The first task for the new administration team, dealing with behaviour issues and disengagement, was addressed by engaging the professionalism of the teachers and making moves to engage the local community, parents and local Indigenous elders and education leaders. Core to this approach was the implementation of a school-wide positive behaviour support programme. Funds and teaching resources were shifted to enable this to happen.

Once these first shifts began to demonstrate positive effects, the second approach was to enhance distributed leadership across the teaching staff in two ways: firstly, by providing opportunities for teachers to work with administration members to lead reform in particular areas and, secondly, to support all teachers as pedagogical leaders in their own classrooms through transparency in planning, pedagogy and assessment. Our team was also involved with capacity building through collegial curriculum planning relationships (see as an example Dezuanni & Levido, 2011) built on the foundation of whole-school reform and professional development that consistently required teachers to audit their practices and the assumptions on which they were building their practice (for a more detailed understanding of this professional development approach see Luke, Dooley, & Woods, 2011). Some of our planning and teaching techniques were modelled as we worked alongside teachers and made decisions with the teachers in the best interests of the students.

With effective behaviour management and attendance interventions in place, there had been a shift from deficit talk about students, families and communications in the staffroom. The after-school MediaClub (see Chandra, Woods, & Levido, 2013) and the Indigenous Cultural/Homework Hub programme (Davis-Warra, Dooley, & Exley, 2011) were flourishing. However, in the midst of all this activity, the school was struggling to show any substantive academic gains. There continued to be little attention to substantive intellectual demand, to real-world knowledge and to meaningful engagement with the students' outside classroom worlds. Outside the school gates, exploding volcanoes halted air travel; Queensland had endured its worst floods in 100 years; debates about climate change and immigration dominated national and international media; and Australia's Indigenous peoples were renegotiating a new cultural and political accord. Yet much of the work in classrooms continued to focus on test preparation (Exley & Singh, 2011), basic skills acquisition, orchestrating the complex provision of special education services and everyday classroom management. Students and teachers appeared to be doing everything except 'reading and writing the world' with their students.

With the principal's green light, we had a long, difficult and somewhat prickly discussion in a staff meeting. The issue, we explained, was one of 'intellectual demand' (Ladwig, 2007) – of upping the ante under the expectation that students from diverse cultural and linguistic backgrounds, some who were still struggling with learning basic skills, were ready and able to discuss 'big ideas', to engage with discussions and talk about the world around them, and about field and disciplinary knowledge. We made an empirical case that while basic skills (e.g. phonemic awareness and recall) were necessary for improved achievement, they were not sufficient (cf. Freebody & Luke, 1990; Paris, 2005). We explained that sustained engagement and improved outcomes for the most at risk urban learners required intellectual demand, connectedness to the world and sustained conversation (Ladwig, 2007; cf. Hattie, 2008; Newmann & Associates, 1996). Finally, we concluded with illustrations about the use of web-based and print media resources to engage students in substantive content and to teach specialised discourses of science (Exley & Luke, 2009) and the arts. To study the storms and flooding across our state, for example, we modelled the use of newspaper and newscast weather reports (for content-rich examples of scaffolded classroom talk, see Dudley-Marling & Michaels, 2012). We worked with the teachers to consider ways to shift curriculum to more visibly account for the students' lives and experiences. We encouraged teachers to shift beyond pirates and giants as assumed content for curriculum plans.

These open and robust conversations marked the beginning of some real changes to the curriculum for some teachers. (see for example as reported in Mills and Levido (2011), some teachers embraced the digital component of the URLearning project and worked with the researchers to shift unit content to 'About Me' web pages (autobiographies) constructing web logs about their home life and community interests and sharing these with a local and global community). As one of the researchers worked alongside one of the grade 5 teachers in a unit about 'healthy places in my community', there were multiple opportunities to discuss the issues. On one occasion the two were walking with the students through the local shopping mall. The students were interviewing community members for their videographies on 'healthy places'. The teacher turned to the researcher and said, 'You should hear the discussions we're having now, the questions they're asking, and their understandings of the world'. The same researcher also recalled a long talk with a quiet 10-year-old boy, a recent migrant from Russia, who had been working on his video for this same unit. Before telling the researcher that both of his (university-educated) parents were having trouble finding work because of their English, the student proceeded with a detailed comparison of health and weather conditions in Siberia *vis-à-vis* Australia. It was a classic case of a student's rich funds of knowledge coming to the fore in an educational context that otherwise would, in Bourdieu and Passeron's (1992) terms, 'misrecognise' his life experience and cultural background knowledge. The pedagogical approach in this unit aimed at the production of videographies not only provided opportunities for students' backgrounds and interests to permeate the curriculum in important ways but also engaged students in substantive discussions about issues important to their communities and the lives of those around them. This is a case where social justice was being addressed as a recognitive issue in the curriculum within the classroom.

Centralising recognitive elements of social justice in the reform of curriculum practice remained a challenge. For some teachers as they worked to up the ante on intellectual rigour in the curriculum, the default position was to focus on explicit attempts at distributing the linguistic resources of power and dominance across all students – to teach more basic skills or to be more explicit in their requirement of students to learn and use metalanguage, and these shifts had less to do with social justice in a recognitive sense. Of course these elements are an important part of the curriculum, but we have taken the stance that allowing for the lives, experiences and outside classroom capacities of all the students to be visible in the curriculum is equally important in school reform for children and young people such as those who attend this school.

Even for some of those teachers who displayed recognitive dispositions in their approach to engaging students, it continued to be more difficult to make these elements central to curriculum content selections. As an example of this, we will briefly discuss the early reform solutions trialled by one of the early childhood teachers who worked with us in a variety of ways while she taught at the school. This teacher had obvious recognitive dispositions. The classroom environment of her Year 1 class was one where expressions of diverse linguistic, racial and cultural identities were sought and welcomed. Regular classroom routines such as greetings and transitions were times when students and adults were encouraged to use a variety of languages. This same teacher engaged with diversity during breaks and after school. She was one of the most frequent teacher visitors to the weekly Indigenous Culture/Homework Hub and was the initiator of a lunchtime group to celebrate and build the cultural identity of co-ethnic females in the school. But while working with this teacher on curriculum planning, one of the researchers reflected that a redistributive focus on explicitly teaching dominant linguistic resources did take precedence over building the curriculum on the skills and experiences that the young students brought to the classroom.

This reflection came from collaborative teaching work conducted by the teacher and researcher. The collaboration was the result of the teacher's engagement in a Prep to Year 3 research discussion group facilitated by the research team members. The aim of the group was to provide a structured process for teachers to undertake self-identified investigations into aspects of literacy education, their pedagogy and their students' learning. Through regular meetings of the whole group and grade and classroom level meetings and classroom work, the teachers selected, designed and implemented their investigations. For her project, this teacher decided to work on the language of narrative with her Year 1 students. Rather than focus on bringing the students' narratives into the curriculum, she extended students' repertoires of linguistic practice to literate forms such as those assessed in the Year 3 writing task of the national literacy and numeracy tests. Her concern was with the capacity of her students, who spoke culturally and class-inflected variants of English, to produce standard Australian English in high-stakes school literacy tasks. Accordingly, she decided to infuse a previously planned, integrated curriculum unit on pirates with oral language activities. The unit was to culminate in a written narrative produced for summative assessment under test conditions and an oral narrative performed for classmates. As the term progressed the focus sharpened on topic-specific vocabulary and the schematic structure of the narrative genre.

This teacher's approach to curriculum reform came from a distinctly redistributive claim, that of the importance of explicitly teaching students to acquire the linguistic resources of power and dominance, as opposed to leaving the acquisition of these resources to chance for those already being disadvantaged by a dominant education system. In many ways the decision to take this approach was vindicated, and the students performed well during the literacy tasks. Results on assessment items demonstrated that most of the students in the class seemingly understood and could use the metalanguage for describing narrative structure. The teacher reflected that she hadn't 'dumbed it down', instead she had used the technical metalanguage with her young students, and as a consequence of the students' achievements, the teacher reported that she had been telling other teachers not to underestimate the language learning capabilities of their students. In short, while pursuing redistributive goals in a high-stakes accountability environment, the teacher's approach had raised an aspect of the intellectual quality of her pedagogy and was challenging deficit discourses. This was consistent with our project goals. But the project sought also to encourage more substantive and respectful links to the students' communities and outside class lives while upping the ante on substantive disciplinary content and on the inclusions of local and global issues of importance. In the press to improve outcomes, the essence of this teacher's approach to engaging students' lives in the classroom was shifted to more routine spaces – morning talk and floor time – with the core curriculum calling on pirates as a medium for learning about skills and language mastery. The potential of recognitive understandings of social justice reform through more substantive links to the outside classroom lives of students was not always realised. Our approach to collaborative planning and working with teachers to research their pedagogical practice allowed teachers such as this Year 1 teacher to reflect on the issues related to these curriculum decisions within supportive relationships. Assumptions were challenged and for some this led to continued renewal of practices.

Now, in the fourth year of the reform cycle, we are able to report on progress to date and to reflect on the embedded nature of redistributive and recognitive social justice practice. Simply, the school performance has improved in several key areas; daily attendance is up, and behavioural incidents are approximately half what they were when we first connected to the school. Parents are now more visible in the school across the school day, and there are tangible improvements to the general school climate and ethos. Students and their teachers are engaged in programmes based in learning and knowledge and are not so focused on behaviour management. Test score achievement is showing some signs of improvement, with gain scores and individual student tracking providing evidence that students are learning and improving their achievement targets. There remains much to achieve in relation to traditional outcome measures; however, there is a genuine drive and expectation that all students have a right and the capacity to achieve outcomes that will provide them with future pathways.

Funds from the National Partnership Agreements initiatives have been spent on developing capacity of teachers, and the results of this can be seen in the fact that, for most teachers, the recent system-based reforms that have raised levels of curriculum prescription have generally been met in professional ways, with the teachers remaining in control of the curriculum. Additionally, professional development sessions are now run by teachers and curriculum leaders based at the school. These sessions provide the opportunity for teachers to share practices and strategies. Other teachers have started to publish articles about their practices with members of the research team in professional association journals. One teacher has presented a lecture at the university and another teacher has lodged a submission to present her work at a state teaching and learning conference. Teacher professionalism is evident in these practices. The resources brought to the school by our project and used to purchase some computer hardware, cameras and audio recorders to be used as tools in media arts and literacy teaching and learning are matched by a school computer budget that means the sustainable replacement of equipment for this purpose is not reliant on outside resourcing. With respect to recognitive justice, many teachers are raising the level of substantive content within the curriculum. And the visibility of Indigenous students, their communities and concerns are visible and tangible in many of the school's practices. The Indigenous Cultural/Homework Club (Davis-Warra, Dooley, & Exley, 2011) caters to large numbers of students on a weekly basis; the school has an Indigenous language programme under its LOTE (Language Other Than English) component for students from Years 4–7, and the cultural studies component is provided to all students by an Indigenous Australian teacher. The school's Indigenous dance troop is active and has performed at significant events at the school and by invitation elsewhere, and the school choir, which comprises Indigenous and non-Indigenous students, recently sang the national anthem in the local Indigenous language at a reconciliation celebration at the school. At this same event, both the Australian and the Indigenous flag flew above the two Indigenous senior students who opened the ceremony by acknowledging the traditional owners of the land in local Indigenous language. This case supports Fraser's (2003) assertion that what is required to produce great schools for culturally diverse and working class students is a 'two-dimensional conception of justice that can accommodate both defensible claims for social equality and defensible claims for recognition of difference' (p. 9). There are elements of both recognitive and redistributive social justice in this school's approach to reform, with neither on its own being adequate to shift outcomes at the school. The reform remains very much in process, but signs of improved academic achievement, recognition of difference and equitable resourcing are evident and provide hope for continued reform towards a more socially just education for the students involved.

A Concluding Comment

Buffeted by waves of demand for accountability, quantitative indicators of ‘outputs’ and ‘performance’, leadership ‘targets’ and so forth, this school and others like it are left to navigate many mandated interventions that masquerade as reform measures. The logic and coordination of these state- and federal-level moves often seem unfathomable to teachers and principals, much less students, their families and community elders at the ground level. As a direct result of the overwhelming number of reforms targeted at the school, we observed the leaders acting as human shields, deflecting bureaucratic noise and a mountain of accountability-driven red tape away from the core business of classroom teaching and learning. This leadership approach has provided space for teaching leadership to be the focus of reform.

What our investigation of this case has borne out are several of the axioms of the school reform literature. Sustainable gains in achievement take time, at least a 3–5-year cycle that can accommodate and generate cultural and discourse change in the staffroom and classroom, professional development and local development of a whole-school literacy curriculum plan, in the context of engagement with the culturally and linguistically diverse community. During our time at the school and as part of a complex, consolidated suite of reforms, we have focussed on three keys to improved literacy and language education: (1) the gradual elimination of deficit talk in staffroom culture, teacher planning and teachers’ work (Comber & Kamler, 2004); (2) substantive and intellectually demanding teaching and learning about how to ‘read the world’; and, correspondingly, (3) rich, scaffolded classroom talk around matters of substance and weight. Ironically, in the context of an intervention focused on digital arts, popular cultural forms and new multiliteracies, our work repeatedly returns us to core issues of ‘reading the world’ and providing substantive links to the lives of the students and their communities.

Thankfully, in this case, the combined efforts of the leadership team, teachers, students, extended community and researchers show signs of success. The school has succeeded in starting to shift standardise test scores but, perhaps more importantly, has won public recognition and awards from the community, the state system and Aboriginal elders. In our view, it was the push towards intellectual demand and substance and to making connections to the students’ lives and experiences that supported the shifts in teaching and learning and classroom talk. However, we do not claim to have ‘caused’ these positive signs of improvement through our relationship and involvement in any linear or causal fashion. Instead, the view that we present is that – contrary to the most naive approaches to evidence-based policy and to the strict parameters of quasi-experimental inventions – the outcomes of research in complex school ecologies are not the direct result of our inventions – or any other element of the reform process. One of the great ironies of school reform is its perpetual search for single causal explanations for improvement of student achievement. This is in part a legacy of the historical roots of the industrial school, where the early-twentieth-century language of agricultural crop yields, Taylorist industrial surveillance of work, and behaviourist stimulus/response models established a methodological and systemic bias towards explanation and improvement via singular pedagogical/curricular 'treatments'. The result is a policy tendency to blame 'failure' or inertia on failed 'treatments' or the incompatibility of student populations to benefit from them or teachers to implement them. Thus, the education context is left to continuously seek improvement via searches for new or innovative treatments – the Holy Grail of school reform.

In conclusion, our view is that school reform and its associated goal of improvement are attributable to complex and subtle changes in the social and professional ecology of schools. At this school, the shifts have entailed strong, instructionally focused leadership and multiple catalytic researcher/teacher partnerships that result in changed teaching/learning relationships in classrooms and in after-school settings. 'Social justice' for these students and their communities can be improved via concentrated professional development and conversations that do not lose sight of the goal to mobilise, enhance and exchange teachers' professional knowledge, capacities and professional repertoires in ways that, in turn, enable the mobilisation of intellectual and discourse resources by students. In this, our final year on site, we are currently studying the sustainability of such an approach without the intensive input of teacher educators and research partners. We are also interested to consider if it is possible to expect that teachers will sustain collegial curriculum relationships with each other in the fray of practice, without at least first experiencing those facilitated by external educational enthusiasts. Part of our next challenge is documenting the complex and multiple interactions that enable and facilitate such conversations and collegial relations, without falling prey to the readily available formulae of school and curricular reform that – with all good intentions – seek out simple causal explanations of school reform, renewal and improvement.

Chapter 29

Leading for Social Justice in South African Schools: Where Have All the Activists Gone?

Carolyn (Callie) Grant

Background and Context

The political nature of education is often ignored. However, as Smyth rightly contends, 'learning is situated in and reproduced by a particular history and context of power relations' (1989, p. 194). This is particularly so in South Africa (SA) with its history of colonialism and apartheid in which government legislation of the times perpetuated social inequality based primarily on race but also class, gender and language. The Christian National Education Policy (1948), the Bantu Education Act (1953) and the Education Policy Act (1967) were intentionally designed to segregate the people of South Africa along racial and ethnic lines. The Group Areas Act (1950) was introduced to separate urban residential and business areas according to race in order to ensure that white South Africans had access to the most developed areas. Under this Act, African, Coloured and Indian people were 'forcibly removed to racially exclusive residential zones' (Durrheim, Mtose, & Brown, 2011, p. 4).

In keeping with this racist logic, schools were also classified along racial lines, and the funding of schools differed accordingly. Schools that accommodated white South African learners were appropriately funded and well resourced, whilst African, Indian and Coloured South African learners were relegated to schools which were under-resourced and poorly funded. Thus, the Bantu Education Act was successful in that it laid the basis for 'underfunded and under-resourced mass education in the black communities, with poorly trained teachers as the educational leaders' (Bloch, 2009, p. 91). The purpose of this system of education, as Porteus argues, was to serve 'both the interests of capital (in producing a low skilled and underpaid industrial working class) and apartheid political interest (in producing a subservient and unmobilised rural population)' (2008, p. 11). To this end, control of

education was centralised and firmly located within the white departments of education (Christie, 1998). The outcome of this system of social exclusion was a 'large degraded black sector on the one hand and an administratively and pedagogically privileged white sector on the other' (Soudien, 2007, p. 185).

However, throughout this period of colonialism and apartheid, there were waves of resistance. In particular, the resistance was led by the African National Congress (ANC) and a range of other political organisations against all forms of inequality and oppression. The field of education was one of the key sites of resistance. Schools became powerful places of struggle, a struggle for a less discriminatory and more equally just society – a struggle for the right of all to learn. The 1976 Soweto Uprising, for example, epitomised this resistance through a massive and heroic student protest which is now represented for perpetuity in the iconic image of Hector Pieterson being carried in the arms of Mbuyisa Mmakhubo, another student.

Apartheid ended in 1994 when South Africa's first democratic government came into power and the explicit intention of the state was to transform the country into a nonracist, equal and just society. The values underpinning this new democracy were captured in the new Constitution of the Republic of South Africa (Act 108 of 1996) which was built on the values of non-racialism and non-sexism in a human rights framework and which included the right to human dignity and the right to a basic education. The former racially separate departments were 'merged with responsibility to provincial ministries' (Pather, 2008, p. 61). Whilst the language of apartheid was exclusionary and authoritarian, the language of the new dispensation, Soudien and Sayed explain, allows for 'inclusion, recognition and the making of solidarity around the themes of a common humanity' (2008, p. 43). Post 1994, there was a proliferation of education policies which reflected the new government's commitment to change and its determination to 'construct an inspirational and viable vision of post-apartheid South Africa's education and training system' (Parker, 2003, p. 18). In particular, the South African Schools' Act, 84 of 1996, the National Norms and Standards for School Funding Bill (1998), the Government Gazette of the Norms and Standards for Educators (2000) as well as the Education White Paper Six on Special Needs Education (2001), as the policy text, framed the schooling context. In relation to issues of school leadership and management, the Task Team Report on Education Management Development (1996) was produced to guide schools in reviewing their authoritarian and top-down management practices, in order to develop 'participative, 'democratic' management, collegiality, collaboration, schools as open systems and learning organisations, and, importantly, site-based management' (van der Mescht, 2008, p. 14).

Yet, as Howell and Lazarus remind us, we cannot forget the importance of 'the social, political and economic context into which the policy is being implemented' (2008, p. 29). Thus, despite this array of expansive and seemingly sound and inclusive policies, their implementation has been sluggish, and the gap between educational policy and implementation in the SA context has been well documented (see Harley, Barasa, Bertram, & Mattson, 1998; Jansen, 2000; Mattson & Harley, 2002; Soudien & Sayed, 2008; Bloch, 2009). Notwithstanding these well-intentioned policies, the damaging legacy of colonialism and apartheid continues to haunt the

South African education system. In this regard, Bloch describes how ‘the strands laid by Bantu Education – of bad mass schooling, poor teaching and conflicted classrooms – have pervaded much of the present terrain’ (2009, p. 89). Thus, we live in a country wracked by poverty, illiteracy, HIV/AIDS, vastly varying sociocultural practices and rampant inequality in economic circumstances and educational provision.

This level of inequality in economic and educational provision has resulted in two different education systems operating, with the first system well resourced and successful and the second poorly resourced and struggling (Bertram & Hugo, 2008; Soudien, 2007). Unfortunately, the minority of schools are located in the first system, whilst the majority (about 85 %) find themselves in the second system. Thus, the second system constitutes the numeric norm, and Christie, Butler and Potterton (2007) refer to this numeric norm of schools as ‘the mainstream’ and, in so doing, challenge us to recognise that privileged schools in South Africa are not the mainstream – they are in the minority. Instead, the mainstream schools are the disadvantaged black schools of our apartheid legacy which need to be held in focus because they are ‘important in finding strategies to achieve equity and quality for all’ (2007, p. 100). The primary job of government is therefore ‘to attend to the mass of pupils who find themselves in non-performing township and rural schools, pupils from the poorer schools, whose poor education reinforces their desperate state of exclusion and marginalisation in a democratic country’ (Bloch, 2009, p. 109).

As members of the ‘mainstream’, learners in rural and township schools have little access to economic and social capital, unlike their nonmainstream counterparts. The majority of these mainstream schools are not racially integrated; they are linguistically homogenous and currently still serve Black South African learners (Porteus, 2008). For this mainstream, the major challenges faced are most often directly related to context. Challenges in these schools arise directly from the poor socioeconomic conditions and include, but are not limited to, health issues (HIV/AIDS-related illnesses, effects of malnutrition), poverty issues (hungry learners, illiterate parents, under-resourced schools), family issues (lack of parental involvement, child-headed households), problems with management and administration (weak and unaccountable authority structures, lack of systems and processes) as well as issues related to the profession (curriculum overload, teacher demotivation, under qualified teachers). These ‘unfreedoms’ (Sen, 1999 in Porteus, 2008) can be overwhelming and can undermine the capacity for leadership and positive social action.

Schools in the first system are the ‘nonmainstream’ schools, and a different set of challenges faces these schools, the urban schools in SA. These schools, because of their history of privilege, are generally more affluent and more functional than their counterparts. However, because of the migration of people from the rural areas and the townships to the urban areas, post 1994, in many of these nonmainstream schools, ‘the demographics of student intake have shifted dramatically’ (Bloch, 2009, p. 129). Thus, nonmainstream schools have become what Ranson (2000) calls ‘communities of difference’ because they are increasingly characterised by cultural, racial, ethnic and religious diversity, and this is where the leadership challenge in these schools lies.

This two-tier education system in the SA context serves not only to perpetuate but, sadly, to 'accelerate historic patterns of social inequalities' (Porteus, 2008, p. 19). As Bloch explains, 'the cycle of exclusion and marginalisation is reproduced and deepened through the schooling system itself, with the most negative effects on poor schools and pupils who can least afford it' (2009, p. 124). So against this backdrop, how do we go about breaking the cycle of exclusion and marginalisation? Where do we begin? What do we do? In response to these questions, I contend that a useful starting point is to look at the transformation of schools through the lens of critical education leadership. My research leads me to believe that a critical education leadership perspective offers us the tools to think about issues of leadership, transformation and inclusion in our country differently, and it is to this argument that I now turn.

'Education Leadership': A Contested Terrain

Like many concepts in the field of education, the concept of 'leadership' is a contested term, and its 'usage varies at different times, in different countries and in different professional cultures' (Coleman, 2005, p. 6). In an attempt to understand the contested terrain of education leadership in SA, I would like to take the reader back to the seminal work of William Foster. Foster (1986, 1989) argues that before the concept 'leadership' can be understood and used, it is essential to tease out two particular traditions of leadership research, the political-historical and the bureaucratic-managerial. For Foster, on the one hand, the study of leadership through the political-historical lens is 'a study of power, politics and historical fact' (1989, p. 40) which focuses on the task of important individuals throughout history who have played a pivotal role in transforming their social situation through the use of their power and the resources at their disposal. In the SA context, these 'symbolic heroes' (Watkins, 1989) or 'great' individuals (Foster, 1989) in the struggle against difficult odds include icons such as Nelson Mandela, Lillian Ngoyi, Steve Biko and Albertina Sisulu.

On the other hand, the study of leadership through the bureaucratic-managerial lens assumes that leadership is 'a function of organisational position; the 'leader' is a person of superior rank in an organisation' (Foster, 1989, p. 43). The bureaucratic-managerial model connects the leadership process to a hierarchical division of labour, managerialist discourse and management pedagogies such as 'the reduction and standardisation of knowledge; the measurement of attainment against predetermined objectives and standards; and the allocation of teaching resources so as to maximise output' (Smyth, 1989, p. 197). This notion of leadership is instrumental in nature and based on functionalist assumptions (Rizvi, 1989) which, as Angus argues, 'largely ignore political and ideological influences on organisation and administration' (1989, p. 75). In addition, this functionalist leadership perspective operates authoritatively to support those in positions of 'administrative power, thereby conserving and reproducing the status quo' (Watkins, 1989, p. 9). Watkins further contends that it is therefore able to 'sanitise the unequal power relations within an organisation' (p. 11). In this bureaucratic-managerial tradition, leadership is conflated with management and any power the concept of leadership presents us with is rendered powerless.

However, for the purpose of this chapter, I align myself with Foster and Smyth who challenge the bureaucratic-managerial model of leadership and adopt instead a political-historical lens. Positioned in this way, I contend that leadership cannot be conflated with management. Leadership is not powerless, and it cannot be reduced to a 'how-to manual for aspiring managers' (Foster, 1989, p. 46). Instead, it is powerful and situated in its social, historical and cultural context (Watkins, 1989; Spillane, Halverson, & Diamond, 2004). Leadership is like energy, and in an organisation dedicated to democracy, it should emerge organically (Rizvi, 1989). It is infinite, not limited by formal authority and it permeates a healthy school culture (Lambert, 1995). It can spring from anywhere and 'is an act not bounded in space and time; it is an act that enables others and allows them, in turn to become enablers' (Foster, 1986, p. 187). Said slightly differently, leadership is educative because it enables the 'best' ideas to emerge in an informed and participatory process which ensures that all voices 'be adequately heard regardless of class, race, gender or position in the formal hierarchy of the school' (Smyth, 1989, p. 191). Thus, whilst 'management' seeks to control and maintain the status quo of current organisational arrangements in the most effective way possible, 'leadership' is more fluid and critical and seeks to challenge the status quo in order to enable change and social inclusion. In other words, it is transformative of social conditions and ethical in focus (Foster, 1989; Shields, 2006).

Understood in this way, leadership as a critical practice offers individuals a critical lens through which they 'can better understand structures of oppression, domination and exclusion in society' (Muthukrishna, 2008, p. 3). It focuses on the extent to which the power which permeates our socially constructed world gives 'force to the human agency of people in organisations' (Watkins, 1989, p. 26). Here human agency can be defined as 'the thoughts and actions people take – individually and collectively – to change their worlds to navigate better lives and a better world' (Porteus, 2008, p. 13). People are active and knowledgeable, and as agents, they can either surrender to or rise above the social structures and the 'unfreedoms' they face. In line with this thinking, Rizvi (1989) reminds us that transformation can only be achieved when the people who belong to a particular organisation can see the reason for changing. Having framed this chapter with Foster's bureaucratic-managerial and political-historical models as well as his work on the critical aspect of leadership, I now move on to outline the empirical studies which underpin this chapter.

The Doctoral Study

This chapter draws on a doctoral thesis by publication which was designed around seven published academic journal articles and one book chapter. These eight pieces of work are referred to in the thesis and in this chapter as chronicles to capture both the narrative of events as well as the chronology of the research process underpinning them. The broad aim of the doctoral study was to 'trouble' the terrain of teacher leadership – at the level of both theory and praxis, in the South African mainstream schooling context. The thesis was retrospectively driven by three research questions: (1) How is teacher leadership understood and practised by educators in mainstream South African schools? (2) What are the characteristics of contexts that either support or hinder the take-up of teacher leadership? (3) How can we theorise teacher leadership within a distributed leadership framing? I was particularly interested in the leadership practices of teachers in terms of their potential as 'agents of change' in schools and specifically the post level one teacher who was classroom based and did not hold a formal management position. In addition, I included in the category of 'teacher as leader' the School Management Team (SMT) member because for me, teacher leadership can be defined in terms of both informal and formal leadership roles that are undertaken.

In relation to context, the studies which informed the doctoral thesis were primarily located in mainstream schools in KwaZulu-Natal (KZN), schools in SA's second education system. This was because I did not want in any way to sketch an unrealistic picture of teacher leadership in the province, and so I deliberately targeted educators who had experience of teaching in historically disadvantaged schools in relatively poor socioeconomic circumstances. These schools are strikingly similar to what MacBeath, Gray, Cullen, Frost, Steward and Swaffield term 'schools on the edge', that is, 'schools living on the precarious edge between success and failure' (2007, p. 1). Schools like these are socially and economically disadvantaged, and, as a result, they 'face a constant struggle to forge a closer alignment between home and school, parents and teachers, and between the formal world of school and the informal world of neighbourhood and peer group' (MacBeath et al., 2007, p. 1). Whilst in first world countries like England, these schools are on the periphery of the social mainstream, in SA these schools, by virtue of their majority, are 'the social mainstream'. And, as I argued earlier, it is these schools that must be the focus of our research if we hope to find strategies to achieve equity and quality for all.

Six studies (five qualitative and one quantitative), beginning in 2004 and ending in 2008, informed the publication of the eight chronicles (see Table 29.1, Appendix). The initial qualitative study (on which Chronicle One was based) explored the perceptions of 11 South African tutor-educators at the University of KwaZulu-Natal. The study was designed as a tutor self-reflective journaling process over a 6-month period. It was the initial study conceptualising teacher leadership through a grounded theory approach. The second study (on which Chronicle Two was based) concerned the fact that 'while the findings of the first study contributed to knowledge production on teacher leadership in SA, there was almost no mention of teacher leadership as it related to issues of gender'. This silence led to studying the relationship between gender and teacher leadership. Here a focus group interview process with 18 KZN educators was adopted.

Chronicles Three and Four were part of the third study, a larger National Research Foundation (NRF) Project aimed at mapping barriers to education experienced by children and adults in the context of the HIV/AIDS pandemic in a small country town in KZN. A colleague and I examined the voices of the SMT members and the District Official on their views regarding HIV/AIDS as one of the major barriers to basic education for learners in schools. Using an interpretive research design, we obtained rich, detailed accounts of the SMT's perspectives and experiences of leading and managing schools in the context of the HIV/AIDS pandemic. The fourth study (on which Chronicle Five was based) was also located within a larger research project which arose from a partnership established between the University of KwaZulu-Natal, South Africa and Bridgewater State College, Massachusetts, in the United States. The goal of the project was 'to develop and research a replicable and effective school-based model of professional development for teachers in KwaZulu-Natal' (Chronicle 5, p. 90). I explored, using a qualitative case study approach, the leadership roles that educators across four schools enacted in the take-up of the new learning in their classrooms and schools and the particular leadership challenges they faced in negotiating this new pedagogic learning.

The fifth study (on which Chronicle Six was based) was designed as a small qualitative study and implemented in two previously disadvantaged urban primary schools in KZN. It aimed to explore notions of distributed leadership within the two schools in order to determine whether the SMT either promoted or posed a barrier to the development of teacher leadership. At each of the two schools, the participants included members of the SMT and post level one teachers. Multiple data collection methods were adopted in an attempt to gain a rich picture of teacher leadership from the different participants. The sixth study and the only quantitative strand (the basis for Chronicle Seven) was designed as a postgraduate student group research project under my coordination and leadership. It aimed to teach and support Bachelor of Education Honours students in doing research using quantitative methods. It involved survey research and the use of self-administered, closed questionnaires to 1055 teachers to obtain their perceptions and experiences of teacher leadership.

Discussion of Findings

Leadership: A Confused Nomenclature

'Leadership', conceptualised through a critical lens to incorporate human agency in the transformation of society, was actively opposed during the apartheid era in SA, in a bid to control and manipulate the education system. Thus, when the term was used, it was conceptualised as a means of control and understood in terms of 'position, status and authority' (Chronicle 1, p. 512). In direct contrast, present-day policy rhetoric calls for leadership which is transformative and which will confront instances of social injustice and discrimination in SA schools. However, an analysis of a text such as the Task Team Report on Education Management Development (1996) reveals that the phrase 'education management' is used in preference to 'education leadership', and although the authors state that they 'make a distinction between management and leadership' (Department of Education [DoE], 1996, p. 28), the distinction is not made explicit. This ambiguity in the report signals 'either a potential slippage in usage of the two terms or an emphasis on management processes at the expense of leadership' (Chronicle 6, p. 289). I argue the importance of differentiating between these two fundamentally different concepts in order to retain 'any power the idea of leadership offers to us' (Foster, 1989, p. 48).

My studies revealed that, whilst educators engaged with the rhetoric of participatory forms of leadership (Chronicle 6; Chronicle 7), at the level of practice, educators worked from a 'faulty premise that leadership means headship' (Chronicle 2, p. 56). Leadership was primarily understood 'in relation to headship, equating principal with leader' (Chronicle 1, p. 518), and, as one educator commented, leadership 'often remains located in the person of the principal who is sometimes unwilling to relinquish power to teachers' (Chronicle 2, p. 55). Similarly, another educator explained how the power and decision-making at her school was centralised 'firmly in the hands of the principal and deputy principal at the top of the pyramid' (Chronicle 5, p. 101). In these situations, educators argued, principals 'simply rely on their senior management team to support them in leadership and decision-making, regardless of the expertise, or lack thereof, of their senior members of staff' (Chronicle 2, pp. 55–56). Thus, the data portrayed a dominant understanding of leadership as headship across the studies, predictable given South Africa's authoritarian political and cultural heritage. This form of authoritarianism in my studies expressed itself in hierarchical social relationships which were defined 'by seniority in terms of the positions people occupy as well as by age' (Ramphele, 2008, p. 115). However, whilst principals are accountable to the Department of Education by virtue of their formal management positions, the data further revealed that this 'does not necessarily make them good leaders and neither does it give them the monopoly in issues of leadership' (Chronicle 8, p. 183).

Whilst the 'leadership as headship' conceptualisation was dominant across my studies, there were instances where leadership was viewed as a shared activity. However, as a shared activity, it was frequently understood within a hierarchy of social relationships, as the following excerpt attests: 'I believe a leader may be part of every hierarchy in the school – right down to the classroom teacher' (Chronicle 1, p. 518). Where teacher leadership was acknowledged, it was often discussed 'within a discourse of delegation' (Chronicle 6, p. 295) and restricted to a minority of staff, selected 'on the criteria of experience, seniority and expertise' (Chronicle 6, p. 297). Thus, the SMTs, in the majority of cases, firmly controlled the leadership and decision-making processes, as suggested in the following quotation: 'So you would basically use them and their expertise and appoint them as leaders so they will coordinate and take over this activity' (Chronicle 6, p. 295). Another teacher explained how 'we have freedom with consultation or with his approval' (Chronicle 5, p. 100). However, there were times when this imposed practice was rejected by teachers because it involved 'unwanted [managerial and administrative] tasks being passed down the hierarchy to the teacher' (Chronicle 6, p. 296).

Implicit in this discussion of 'leadership as headship' is the issue of gender, and it is important, at this juncture, to reflect on this as a potentially discriminatory practice. Rural communities in SA, within which the majority of mainstream schools are located, remain largely patriarchal (Magwaza, 2001), and, in many of these communities, 'male dominance is still a fact of life at all levels' (Ramphele, 2008, p. 239).

In line with this thinking, one of the qualitative studies found that 'in KwaZulu-Natal, both the Xhosa and Zulu cultures are extremely traditional and patriarchal with power being vested in the position of the male' (Chronicle 1, p. 526). Here patriarchy is understood as 'the male hierarchical ordering of society, preserved through marriage and the family via the sexual division of labour' (Clarricoates, 1980 in Ball, 2004, p. 7). This division of labour between the sexes, Bourdieu argues, 'gives politics to the man, just as it gives him the outside, the public arena, paid work outside the home, etc., whereas it assigns woman to the domestic interior, unrecognised work, and also psychology, feeling, the reading of novels, and so on' (1993, p. 161). Through this patriarchal lens, men are viewed as leaders in public institutions such as schools, a view endorsed in another of the qualitative studies: 'Effective education leadership is the domain of the man' (Chronicle 2, p. 48). Because women are not authorised to speak on issues of leadership, they therefore had 'very little credibility as leaders' (ibid, p. 47) and had to work 'twice as hard' (p. 49) as their male counterparts to earn the respect of their communities. Where women were permitted to lead, their leadership was often restricted, based on a gendered interpretation of their abilities and roles. For example, in one of the qualitative studies, it was suggested that 'cultural committees and catering committees are largely the domains of women while sports committees are the homes of men' (Chronicle 2, p. 53). Furthermore, in meetings 'the task of writing the minutes' (ibid, p. 53) was, in some instances, the role of women, whilst financial matters were often dealt with by men.

It is apparent from the findings across the studies that the bureaucratic-managerial model has influenced and continues to influence our SA education system. The evidence reveals that leadership is primarily articulated within a discourse of managerialism and is commonly understood within a hierarchical division of labour. Thus, it posits a notion of leadership which is instrumental in nature and which reproduces, rather than challenges, the status quo. In this bureaucratic-managerial tradition, leadership is conflated with management and any power the concept of leadership presents us with is sadly rendered powerless. Furthermore, teachers are 'domesticated into existing power structures' (Gunter, 2001, p. 60) rather than being enabled to operate as social activists in schools.

Leadership in the Zone of the Classroom

Despite the profound focus on 'leadership as headship' within a hierarchy of social relationships, my studies did reveal some level of shared leadership activity, enacted in the form of teacher leadership. In line with the thinking of Harris and Lambert, I agree that teacher leaders are, in the first place, 'expert teachers, who spend the majority of their time in the classroom but take on leadership roles at times when development and innovation is needed' (2003, p. 44). It follows therefore that the centrality of the classroom is crucial to an understanding of teacher leadership, and we should not fall into the trap of thinking that only activities outside the classroom constitute leadership. Within the classroom, a critical role of a teacher leader is that they continue to teach and improve their own teaching.

This focus on increased teacher knowledge and teacher learning as teacher leaders became more expert in their knowledge and practice within the confines of the classroom (Zimpher, 1988) is unsurprising given the emphasis on curriculum reform in SA over the past 15 years. South African teachers have had to engage with a number of iterations of the national school curriculum over a relatively short space of time: Curriculum 2005 (1997), the National Curriculum Statements (2002) and, most recently, the Curriculum and Assessment Policy Statements (2011). In order to keep abreast with the many curriculum changes, teachers have been exposed to a range of professional development initiatives and Department of Education workshops on how to teach the new curriculum.

Given the national obsession on curriculum reform in SA, the findings from across my studies in relation to classroom-based teacher leadership are not unexpected. In the quantitative study, the highest percentages of teacher leadership examples emanated from the classroom (Chronicle 7). In one of the qualitative studies, there were examples of teachers from across four schools 'taking up leadership in their classrooms and experimenting with some of the new pedagogic learning from the courses in order to improve their own teaching' (Chronicle 5, p. 94). In another study, there was a sense that 'teachers are the designated leaders. They set the goals, implement procedures, instruct, guide, facilitate, mobilize learners, motivate and inspire learners and model behaviour' (Chronicle 1, p. 519). Chronicle 5 was replete with examples such as 'I understand it now and love to teach' (p. 94), 'I worked with the learners at their level and got better results' (p. 94) and 'I found that absolutely fascinating, and we saw how the children themselves ordered and re-ordered and they actually learnt …' (p. 94). This increased knowledge resulted in 'an increased professional identity and confidence in teaching' (p. 95). The reflective role of a teacher leader was also evident in the following excerpt: 'I used to teach and rush to complete the lesson I am teaching. But I noticed that now when you teach, you must go steady. You teach, you observe the learners, the things they are doing, like the structures. It was an ongoing process; step-by-step-by-step' (Chronicle 5, p. 94).

These findings tentatively suggest that, in the context of the SA schooling system, we have much to be hopeful about. In the private space of the classroom, examples of knowledge competence, teacher commitment and care coupled with innovative teaching practices strongly suggest the existence of teacher leadership. This is a major shift from the apartheid days when, in the majority of mainstream schools, teacher compliance was encouraged at the expense of innovation and autonomy.

Teacher Leadership: Collaboration with Other Teachers

Retaining the political and pedagogical value of improved teacher knowledge and learning within the classroom, my studies also provided examples of teacher leaders working collaboratively with colleagues in order to expand their subject knowledge and pedagogic content knowledge. The quantitative study revealed 'that 32.2 % of the teachers often or always led outside the classroom by providing curriculum development knowledge to their colleagues' (Chronicle 7, p. 411). Teacher leaders operated as 'curriculum leaders, grade heads, leaders of various committees' as they worked collaboratively with their colleagues 'to develop new curriculum methods and planning jointly' in their schools (Chronicle 6, p. 295). Collaboration was evidenced in the establishment of 'grade committees' (Chronicle 1, p. 520) or phase meetings where 'there were discussions on the different methods' as well as a sharing of 'ideas with other teachers in her grade' (Chronicle 5, p. 96). The data further revealed that teachers were actively involved in 'the planning of extra-mural activities in their schools (47 % often or always) and in the selection of textbooks and instructional materials for their grade or learning area (71.6 % often or always)' (Chronicle 7, p. 411). These examples of teacher collaboration in mainstream schools are both impressive and essential in the context of the 'curriculum flux' in SA since 1997. They suggest that despite the low teacher morale in the country, there are teachers who have not given up hope; teachers who are committed to their learners and who are passionate about their work. It is these teachers who need to be nurtured; it is their practices which need to be the focus of our research, and it their stories of success despite the overwhelming odds which should be broadcast for the country to hear. In this way we will be able to build a more socially just and inclusive education system in our country.

Whilst the take-up of teacher leadership was fairly convincing in the provision of the curriculum/extra-curriculum role across my studies, the role of leading in-service education did not emerge as a strong indicator of teacher leadership. But this is not surprising given that SA has a history of teacher education professional development being led by government. Although policy rhetoric supports the notion of school-based leadership and professional development (DoE, 1996, p. 29), in practice teacher professional development remains centralised. In support of this assertion, in the quantitative study, 'a mere 19.2 % of the teachers in this study claimed to often or always provide in-service training to their colleagues whilst 31.2 % of the teachers said they sometimes provided in-service training to assist other educators' (Chronicle 7, p. 411). In two of the schools in one of the qualitative studies, there was some evidence of this in-service training role, as the following excerpt illustrates: 'some teachers were offering informal in-service education by sharing new methods and operating as leaders in developing work plans for the grades' (Chronicle 5, p. 97). Furthermore, in relation to this role, there was mention of the informal mentoring of beginning teachers (Chronicle 6, p. 295), perhaps more correctly termed induction. Whilst mention was made, in the fifth chronicle, of informal 'discussion, reflection and mentoring' (p. 96), there was no reference to a formal-mentoring or peer-coaching role (Joyce & Showers, 1982).

Despite it being an integral aspect of the 'Integrated Quality Management System' and 'Whole-School Evaluation' (DoE, 2001b), performance evaluation of teachers was not a strong indicator of teacher leadership across my studies. In the quantitative study, there was reference to the occurrence of performance evaluation:

'only 38.4 % of teachers often or always participated in the performance evaluation of their colleagues' (p. 411). In one of the qualitative studies, 'peer observation' (Chronicle 6, p. 295), an aspect of performance evaluation, was mentioned. However, in another qualitative study, peer observation did not seem to take place, as the following excerpt indicates: 'As an HOD, I am a full-time teacher. There is very little chance that I get to go out and observe and to see how it's being implemented' (Chronicle 5, p. 96). This excerpt speaks to 'overload' as a recent feature of the SA education system. The post-apartheid 'curriculum flux' has resulted in 'policy overload' (Chisholm, 2005) of teachers and SMT members alike and serves to inhibit the take-up of teacher leadership.

Thus, the findings suggest the existence of teacher leadership across the studies as teachers worked collaboratively with colleagues, primarily in formal committee work. Formal committee structures included grade or learning area committees, extracurricular committees and phase meetings. Here we see the influence of the bureaucratic-managerial tradition on educators' understandings of teacher leadership across the studies. Educators, when talking about teacher leadership, often described the concept in terms of management structures, processes and discourses and, in so doing, conflated leadership with management. Thus, their experiences of teacher leadership were restricted in nature (Harris & Muijs, 2005) and limited to individual teacher agency. Authentic leadership, which is organic and organisational and which is not limited by formal authority, was the exception rather than the norm across the studies. From the evidence presented, it can be concluded that politics and history continue to have a powerful influence on present-day leadership practices in SA.

Teacher Leadership and Decision-Making in Issues of Whole School Development

Teacher leadership is often promoted in the literature to nurture a more democratic, communal or communitarian social system for schools and schooling (see, e.g. Hart, 1995). This is because, as Harris and Muijs rightly argue, teacher leadership is primarily concerned with 'enhanced leadership roles and decision-making powers to teachers' (2005, p. 16). In relation to the leadership of teachers and their participation in decision-making, and of particular relevance to the SA context today, I contend that the greater the participation of teachers in decision-making, the more chance there is of initially engaging with the structures of oppression and exclusion and, thereafter, rising above them to bring about a better school.

However, South Africa's policy of apartheid excluded teachers from any decision-making at a whole school level, and this legacy continues to haunt schools today. Given this contextual backdrop, my studies revealed some examples of teachers participating in decision-making at the level of whole school policy development. These included teacher involvement in 'school tasks teams, such as those related to developing school policy, staff development, and the school development team' (Chronicle 1, p. 520). They involved 'decision-making' in the development of 'school policy on aspects related to homework, assembly, discipline, pupil admissions and sporting codes' (Chronicle 6, p. 295). They also included management functions such as 'responsibility for stock, textbooks and uniforms' (Chronicle 1, p. 520). Whilst these examples illustrate what 'leadership' practices the educators were involved in at a whole school level, they do not provide sufficient insight into the nature and level of participation. In this regard, the quantitative study revealed that teachers 'were not often involved in school-wide decision-making processes and when teachers were involved, this was usually restricted' (Chronicle 7, p. 412). Data from this study indicated that only 30.5 % of the teachers were 'involved in in-school decision-making' (ibid, p. 12), and whilst teachers enjoyed a high level of involvement in 'setting of standards for pupil behaviour in the school' (67.3 %), they were less involved in activities such as organising and leading 'reviews of the school year plan' (27.2 %), setting 'the duty roster for their colleagues' (14.1 %) and participating in 'designing staff development programmes' for their school (11.8 %).

These findings from the quantitative study were strengthened by the qualitative studies and endorsed the argument that teacher involvement in decision-making at a whole school level was severely restricted. For example, in one of the qualitative studies, 'teacher participation in school decision-making processes highlighted the mere rhetoric of collegiality' (Chronicle 6, p. 298). Accounts of how SMT members interacted with DoE artefacts (such as policy requirements and directives) and school artefacts (such as agendas of staff meetings) revealed 'hierarchical relations' (Chronicle 6) and 'monologic spaces' (Chronicle 3) 'within a culture of contrived collegiality' (Chronicle 6, p. 299). 'Monologic spaces', I contend, are characterised by an absence of collegiality, a lack of authentic dialogue together with a lack of trust and transparency. They are spaces of 'inequality, insecurity and fear' (Chronicle 3, p. 11) where 'the powerful dominate and deny others the right to speak' (ibid, p. 7). Furthermore, they are most likely to emerge in 'a regime of autocratic leadership and hierarchical school organisation' (ibid, p. 7) where lip service is paid to teacher participation and dialogue in decision-making which is a strong indicator of 'a lack of valuing of teacher voice and authentic dialogic space in the school' (Chronicle 6, p. 298). In these instances, leadership was primarily understood in terms of 'policy implementation and the development of school structures in a bid to carry out policy directives within a hierarchical chain of command' (Chronicle 4, p. 55). This resonates with the work of Hargreaves who contends that although teachers are often co-opted as 'leaders', their role merely involves 'fulfilling administrative purposes and the implementation of external mandates' (1992, p. 83).

However, the legacy of apartheid with its entrenched bureaucratic-managerial model of leadership and its devaluing of teacher voice is only one of the factors which have contributed to the exclusion of teachers from authentic decision-making at a whole school level. A further significant factor is a societal factor stemming from poverty issues in the country, exacerbated by the HIV/AIDS pandemic. The AIDS pandemic is pervasive, and its impact on schools and schooling in SA has been well documented (see, e.g. Muthukrishna, 2008; Pather, 2008; Porteus, 2008; Ramphele, 2008). Across my studies there were references to poverty and HIV/AIDS. For example, one qualitative study alluded to 'organising feeding schemes for learners' (Chronicle 6, p. 295) and recognised 'teachers' involvement and leadership within the HIV and AIDS "Love Life Campaign", an annual event held by external organizers to raise awareness of the presentation of suicide and drug abuse amongst school children and the community' (Chronicle 6, p. 293).

In another qualitative study which focused on leadership in the context of the HIV/AIDS pandemic, a 'culture of silence' (Chronicle 3; Chronicle 4) was found to exist in the research schools. This 'haunted space' (Ramphele, 2008) of silence prevented authentic leadership from emerging because 'instead of dialogic spaces of trust, caring, and inclusion which encouraged critical reflection and action, a form of monologic space prevailed' (Chronicle 3, p. 13). This resulted in 'a lack of voice on the part of the educators and the learners and by disengagement from authentic dialogue about the realities of living and coping with HIV/AIDS' (Chronicle 4, p. 49). It became clear that the SMT members, the formal leaders in the place of the school, were not actually leading in relation to issues of HIV/AIDS. They seemed unwilling (or unable) to create a sufficiently safe space in which to talk about HIV/AIDS and demonstrated 'a paralysis in respect of authentic dialogue and leadership' (Chronicle 3, p. 13). In relation to the pandemic, they were 'not creating safe and secure places for people to connect with each other and learn together' and neither were they 'setting new directions and gathering information through dialogue' (Chronicle 4, p. 51). They seemed 'unwilling to break the silence around HIV/AIDS for fear of the stigma attached to it' (Chronicle 3, p. 13) and instead attended to the more 'superficial and technical interventions (in relation to HIV/AIDS) in response to bureaucratic directives from the DoE' (Chronicle 4, p. 51).

Thus, the evidence from across the studies suggests that, where teachers were involved in school-level decision-making, it was at a superficial level. When important decisions had to be made, the SMT generally controlled the decision-making process, they often made decisions in a contextual vacuum and they excluded teachers from the process. Dialogic space, conceptualised by Rule (2004) as encompassing movement, spaciousness and freedom, was largely absent at a whole school level. Little space was created for teachers to find their voice, critically reflect on the particular situation and become agents in the leadership practice at a school level. Where teachers were involved in whole school development practices, these were largely management functions which sought to maintain rather than challenge the status quo. In making this the point, I am not suggesting that management activities are unimportant. On the contrary, they are critically important to the basic functioning of a school, and an unfortunate legacy of our racially polarised past is the breakdown of the management function in many of our mainstream schools. And so, like Christie, I acknowledge that there is a need, particularly in our mainstream schools, to establish 'proper and effective management systems and structures with clear procedures and clear lines of authority, powers, responsibility and accountability' (Christie, 1998, p. 291). If this need is not met, learners will remain discriminated against through the neglect of managerial matters of schooling, such as ‘teachers, textbooks and time’ (Soudien, 2007, p. 189).

Nevertheless, whilst management processes are indeed important, equally important are leadership processes of SMT members and teachers alike which seek to challenge the status quo in order to enable change and social inclusion. However, as a legacy of apartheid, the concept of ‘teacher leadership’ was understood in a ‘common sense’ way by educators in my studies who, in many instances, regarded it as an individual rather than a collective activity. Theirs was a ‘restricted’ understanding of teacher leadership (Harris & Muijs, 2005), primarily because the cultural changes required to support the leadership of teachers were not in place in their schools. Thus, the findings of my studies resonated with those of Wasley in the United States who established that the teachers in her study ‘had not given much thought to teacher leadership, how it might be defined, or what it might look like in practice’ (1991, p. 145). As a consequence of this limited understanding of teacher leadership, the educators in my studies exhibited no real insights into the transformative power of teacher leadership and were largely ignorant of their potential to transform schools into socially just and inclusive places of teaching and learning.

Concluding Comments

South Africa’s past has influenced the present. A consequence of the apartheid era is a legacy of ‘unfreedoms’ (Sen, 1999 in Porteus, 2008) including rampant poverty, high levels of illiteracy and unemployment, the prevalence of HIV/AIDS as well as gender violence and discrimination. These ‘unfreedoms’ pervade our country and impact directly on the schooling system resulting in learners with HIV/AIDS-related illnesses, malnourished and hungry learners, illiterate and uninvolved parents, under-resourced schools with weak and unaccountable authority structures as well as demotivated teachers. The aim of post-apartheid schooling has been to reduce the cycle of exclusion and marginalisation of learners, parents and educators in our country, and, to this end, schools have been structurally democratised through the introduction of committees such as the School Management Team (SMT), the School Governing Body (SGB) and the Representative Council of Learners (RCL). Yet, despite this structural democratisation, the extensive range of ‘unfreedoms’ have proved overwhelming and have undermined the capacity for leadership and positive social action.

Thus, structural change alone is insufficient, and I argue along with Harris and Muijs that the answer to improving schools ‘resides in cultural rather than structural change and in the expansion rather than the reduction of teacher ingenuity and innovation’ (2005, p. 2). Whilst the process of instituting structural changes in schools is relatively simple, changing the substance of schools, their cultures, is far more complex. Cultural change in schools, I argue, requires leadership, lots of it, but not a conceptualisation of leadership informed by the bureaucratic-managerial tradition.

In direct contrast, it requires leadership conceptualised through a critical lens which enables social inclusion and which makes 'conscious, deliberate use of differences in social class, gender, age, ability, race, and interests as resources for learning' (Barth, 1990, p. 168).

From a critical perspective then, we can reimagine the field of education in SA as a site of struggle – a struggle for the right to lead in a quest for a less discriminatory and more equally just South African society. And it is the educators who are called to lead, whether they are SMT members or teachers. This requires of educators a basic activist instinct, an instinct which, for many, has lain dormant since the waves of resistance in schools during the 1970s and 1980s. Taking up an activist role is seldom easy, and it necessitates a level of human agency to challenge the status quo in order to facilitate change and social inclusion. This activist role is incorporated in the notion of transformative leadership which is about influential, creative leadership that increases the opportunities for all people, making it possible for them to 'contribute their talents, experience and skills to create a successful, prosperous democracy' (Ramphele, 2008, p. 295). As transformative leaders, educators are challenged not only to transform their personal understandings of themselves and their colleagues but also to 'lay the groundwork for challenging social inequities and inequalities' (Shields, 2006, p. 77).

Whilst this is a daunting challenge indeed given the levels of educator compliance and conservatism within our country, my studies have indicated that teacher leadership is beginning to emerge in some mainstream schools. Where an enabling school environment is created, some teachers are able to identify and understand the problems they face, and they are then able to work collaboratively with colleagues to 'change the situations that caused these problems' (Smyth, 1989, p. 191). These teachers, in moving from a position of subordination and reliance to one of becoming reflexive agents into their own and each other's practices, become teacher leaders. And it is these teacher leaders who are the hope for the future. It is these teacher leaders who will lead the change process in their schools, and it is these teacher leaders who will nurture the next generation of teacher leaders.

Whilst there is little doubt that the process will be slow, the challenge is to awaken the leadership potential of all educators in our country, SMT members and teachers alike. If we are able to draw on the untapped leadership potential in our schools and nurture this potential, the opportunity to transform our schools into socially just and inclusive places of teaching and learning will become a reality. This requires that educators begin to recognise their own agency and the agency of others and to draw on this 'human consciousness of powerfulness' (Porteus, 2008, p. 13). However, if educators elect to remain in their present state of disempowerment and collude to maintain the status quo in schools, the social injustices of the South African schooling system will be perpetuated for years to come.

In conclusion, I wonder whether there are international lessons to be learnt from my research journey. Perhaps there are three? First, as researchers in the field of Education Leadership, we should not lose sight of the political-historical tradition of leadership research as we seek best practices. Second, particularly for other African nations, we should acknowledge and confront discriminatory practices, particularly those related to authoritarianism, gender and HIV/AIDS in the quest for a socially just and inclusive society. The final lesson is to hold on to hope for whilst people are involved in the education project, there is always the possibility of agency and therefore the possibility of change.

Part IV
Advocacy/Advocates for Social Justice

Chapter 30
Community Leadership: Seeking Social Justice While Re-creating Public Schools in Post-Katrina New Orleans

Brian R. Beabout

Purpose

Discussions of social justice in educational leadership generally rely on a shared assumption of a human world characterized by inequality of wealth, health, education, housing, economic opportunity, and agency or self-determination (Beachum, 2008). Those who witnessed the human costs of the 2005 flooding of New Orleans need little reminder of this (Brinkley, 2007; Ladson-Billings, 2006). Seeing shocking inequity and being dissatisfied, the advocate for social justice naturally expresses a desire for change. The advocate can critique the current (or historical) state of affairs (Katz, 1975; McLaren, 1999; Willis, 1977; Zinn, 2003) or articulate an expression of a preferred future (Freire, 2000; Shor, 1987; Wink, 2000). In either case, conceptions of social justice in an unjust world are of limited use unless they are explicitly connected to theories of organizational and social change. Following Bogotch (2008), concerns for social justice cannot be truly developed in practice until the reverse is also true: our conceptions of change must become tied to social justice. And while the process of change is never simple (Fullan, 2001a, 2001b), change that challenges asymmetrical social relations between groups is certain to face organized and powerful opposition (Oakes & Lipton, 2002). Leadership in the service of social justice then must be well organized and creative in seeking and wielding power.

In the context of education, leadership for social justice faces a central paradox in which leaders (often employees of the state) seek to improve social conditions that have usually been created or sustained by the state itself (Beabout, 2008). Such change smells of revolution. And revolutionary change (rather than *evolutionary* change) is important for thinking about the intersections of leadership, social justice,

and educational change. Economist Milton Friedman has stated that “only a crisis- actual or perceived- produces real change” (1962, p. ix). More recently, US Secretary of Education Arne Duncan has offered his policy of crisis creation via reconstitution, school closure, and school takeovers as an approach to reform in persistently failing schools (Harris, 2010). Both Friedman and Duncan exemplify the use of crisis to create change that would have been unfeasible in more stable social contexts (see Klein, 2007). What remains unclear is if this a set of policies that can dislodge entrenched modes of apartheid schooling for marginalized youth, or if it is the educational equivalent of slash-and-burn agriculture in which tremendous amounts of resources are wasted and sustainability threatened in order to get one or two good harvests before moving on. This chapter will offer support for the position that educational leadership for social justice *must* prioritize community engagement, indeed community *leadership*, if it is to be both sustainable and just. To use Freire’s (2000, p. 180) terms, we should seek educational leaders capable of *cultural synthesis* rather than *cultural invasion*. Cultural synthesis emphasizes the agency and wisdom of both leaders and followers, rather than transplanting the ideologies and values of the leaders on to followers. With current educational policies in the USA that serve to sort poor and nonwhite students into their own racially segregated schools (Frankenberg, Siegel-Hawley, & Wang, 2011), this ability to engage in cultural synthesis becomes an increasingly important leadership skill. Educated, middle-class school leaders must find ways to authentically engage with low-income communities of color. This leadership must be characterized by democratic engagement rather than autocracy. This slow, messy work of relationship building with diverse constituencies is where our best hopes for true revolution lie.

I have intentionally foregrounded the concepts of *crisis*, *change*, and *power* here in order to draw attention to specific aspects of the market-oriented charter school reform strategies that have unfolded in the tumultuous 7 years since Hurricane Katrina and the attendant levee failures forever changed my city and its public school system. I will refer to this approach as *expertism*, and it is characterized by the movement towards appointed, rather than elected district leadership, strict adherence to test scores as the correct measure of school quality, and the vision of districts as *portfolio managers* rather than *operators* of public schools (Beabout, 2011; Bulkley, Henig, & Levin, 2010). The discussion of *community leadership* relates to the story of the reopening of the Morris Jeff Community School in New Orleans in this context of portfolio management and *expertism*. Quite uniquely, the Morris Jeff school was created from a community-organizing paradigm (Shirley, 1997; Warren, 2005) and involved a group of parents, educators, and neighbors coming together to create a school where there was once only a storm-damaged building.

The discussion utilizes the *ethic of community* (Furman, 2004; Furman & Shields, 2003) as it attempts to answer the questions: *who shall lead our schools to become more just institutions*, and *what forms of leadership might they use*? What follows is an extensive history of the creation of the Morris Jeff school as a case of *community leadership* in urban schools. Implications for the connection of social justice to educational change are discussed as well as lessons that this case has to teach about the definitions of social justice in an educational arena dominated by a politically constrained conception of what constitutes a "good school" (Eisner, 1991; Rothstein, Jacobsen, & Wilder, 2008).

The Ethic of Community as an Interpretive Frame

Scholars have developed the *ethic of community* (Furman, 2004) as an addition to other ethical paradigms in the field of educational administration, including the ethic of *care*, the ethic of *critique*, and the ethic of the *profession*. As a set of moral commitments or obligations, the ethic of community consists of commitments to practicing shared leadership, dialogue, and collaborative work. This set of practices is informed by the postmodern conceptions of community as impermanent, changing, diverse, and unequal.

Shields and Seltzer (1997) contribute the ideas of a *moral community*, *a community of difference*, and *a community of dialogue* that emphasize the nonnormative and fractured nature of schools when viewed as communities. Their conception pushes us beyond our often false assumption of shared values, to what we find in our modern lives: communities characterized by enduring differences, by conflicting values, and by imperfect communication (Tierney, 1993). Rather than viewing modern life as the end of community, they advocate a reconceptualization that views community as a set of processes through which diverse groups of people can move towards dialogue, trust, and collective decision-making, even in the face of persistent difference. This collective existence invokes the long history of democratic philosophy in education (Dewey, 1916; Green, 1999; Maxcy, 1995; Strike, 1999). Particularly significant for the discussion here are Strike's notions of *thin democracy* characterized by procedural, majority-rules mindsets and *thick democracy* characterized by dialogue and a commitment to inclusion despite persistent differences between people. The ethic of community also urges us to look for these commitments and practices within schools, as they are connected to some of the more established markers of successful schools: teacher collegiality, student engagement, and student achievement (Furman, 2004).

This description of the ethic of community should generate significant dissonance for the reader well versed in the current school reform policies in many Western nations, as exemplified by the testing and accountability policies embedded in the *No Child Left Behind Act* and the *Race to the Top* initiative of the last two presidential administrations in the USA. Furman (2003a, p. 6) offers the following indictment of much of the person-centered leadership implicit in much current reform policy:

> Essentially, these arguments for a democratic communal approach to social justice are saying that social justice cannot be realized given the status quo of hierarchical relationships and communication patterns in schools, the assumption that moral leadership is the purview of "heroic" leaders in administrative positions, and the dearth of opportunities for "full participation and open inquiry."

Notable here is that much of the hierarchical, hero-based reforms of the current era are framed in social justice language, and the mantra that "education is the civil rights issue of our time" has been used to remove schools from local control, dismiss veteran teachers, and allow state takeover of schools in communities of color. The ethic of community forces me to ask of these policies, *can socially just ends be served by autocratic means*? The answer, of course, depends on our definition of socially just. If closing the racial achievement gap on state examinations is social justice, then perhaps. If our definition hinges on marginalized communities gaining some agency in the public institutions that serve them, probably not.

In addition to the focus on community as practices emphasized by Furman (2003a), I also wish to emphasize the role of inclusion. While one might be satisfied to build exemplary communitarian practices among a school's staff, leadership, and students, those fully embracing the ethic of community emphasize inclusion of parents, community members, and other persons over whom the school administration exerts less formal control. Drawing boundaries around the communitarian *us* to keep out the unpleasant *them* certainly makes a farce of any meaningful sense of community in the diverse school communities of today. This natural human tendency to fudge on inclusion for the sake of consensus is the *dark side* of community (Noddings, 1995) and plays significantly into the following discussion on the rebuilding of schools in post-Katrina New Orleans. Significant consideration should be given to conceptions of the administrator as a *representative* or *leader of* the broader geographic community served by the school (Khalifa, 2012). This definition greatly expands the definition of who is considered a stakeholder in public schools to include community members with (or without) formal affiliations to the school.

The ideas presented above (community as a set of practices, the moral community, community of difference, community of dialogue, community as vehicle for social justice, and the dark side of community) serve as the interpretive lenses for the case of community leadership. These ideas will be identified where present and extended where necessary to aid our understanding of the highly complex interactions that are embedded in approaches to change in urban schools.

The Creation of the Morris Jeff Community School[1]

The Morris F.X. Jeff Elementary school building is located at 800 N. Rendon St. in the Faubourg St. John neighborhood of New Orleans.[2] In typical New Orleans fashion, the school was tucked away in the middle of a residential neighborhood, a few blocks from both the palatial, high-ground homes on Ursulines and Esplanade

---

[1] The narrative constructed here is based on a combination of personal experiences, personal correspondence, and media reports about the creation of the Morris Jeff Community School. I have been involved with the school as a board member, parent, and classroom volunteer since December 2008.

[2] As this chapter goes to press, the vacant and storm-damaged building was recently sold at auction by the Orleans Parish School Board to CCNO Development for $980,000. It is likely to be converted to multifamily housing.

Avenues, as well as a few blocks from some of the city's most violence-plagued streets. Built in 1904, the school originally opened under the name McDonough #31. John McDonough (1779–1850) was a businessman and entrepreneur who left considerable fortunes to support public school construction in both his native Baltimore and his adopted home of New Orleans. School district directories show that the school regularly served between 400 and 600 students with 10–22 teachers. The school was a *coeducational whites-only* elementary school until the New Orleans schools were desegregated after 1960 (Inger, 1969; McKenzie, 2009). The school, like most other non-magnet schools, experienced a rapid shift in student demographics, and McDonough #31 rapidly became a predominantly low-income and African-American elementary school after 1960 (DeVore & Logsdon, 1991).

In 1995, the principal of the school coordinated a successful campaign to change the name from McDonough #31 to Morris F.X. Jeff Elementary School to honor the revered educator and city recreation department leader who had passed away in 1993 (Frazier, 1995). A number of schools opted to change their names during this period in an effort to eliminate the names of former slave owners from the names of schools in the predominantly African-American school district.

The more recent history of the school is documented in part by the state's online data reporting on public schools (see http://www.doe.state.la.us/data/school_report_cards.aspx). The state has accountability data on the school dating from 1998 to 2005 which shows a relatively stable school, with just over 300 students, nearly 100 % African-American, with 98 % receiving free or reduced-price lunches. Class sizes were nearly all below 25 students, and the school was never labeled as *persistently* dangerous, one of the indicators used by the state's report card system. Student attendance was generally near 95 %. Student academic performance lagged. The majority of students scored at the *unsatisfactory* or *approaching basic* levels on state testing and around the 20th percentile nationally on the norm-referenced Iowa Tests of Basic Skills. The school was slightly below average when compared with other public schools in New Orleans, but far from the bottom.

As a public school in the accountability era, it was an African-American institution serving low-income families that enjoyed high regard as a safe and caring place for children. Deep ties between the African-American community and the school are evidenced by its relationship with the nearby Zulu Social Aid & Pleasure Club and by the photos of parents and children posing with sequin-adorned Mardi Gras Indians visible on a plexiglass-covered bulletin board outside the school (*Morris FX Jeff Elementary School*, 2008).

Evacuation and Neighbors Return

Like most other public schools in New Orleans, Morris F.X. Jeff Elementary was closed in 2005 after Hurricane Katrina struck and the state legislature seized the opportunity to give control of the much-maligned New Orleans Public Schools to the state-run Recovery School District, run by a state-appointed superintendent (Beabout, 2010; Perry & Schwam-Baird, 2010). And as the neighborhood around the school began to rebuild, the handsome school building, spared by the worst of the storm because of its relatively high elevation and a serendipitous roof replacement shortly before Katrina, just sat there, windows and doors left open by storm survivors awaiting rescue or by looters (*Morris FX Jeff Elementary School*, 2008). As the neighborhood was repopulated in the months after the storm and the building continued to sit there, an unsecured eyesore, people began talking. Neighbor Jenny Bagert said, "We looked at the school over our back fence every day. I began to ask myself where the students from our neighborhood were supposed to go to school" (Himelstein, 2009, p. 19).

In March 2007, cleanup contractors began working on the Morris F.X. Jeff site. The district's policy was to declare all items inside of schools as *storm debris* and throw them away, even items on unflooded upper floors. While concerns about mold spores and potential lawsuits were a common official refrain, some have challenged this approach as wasteful and overly cautious, as tens of millions of dollars in equipment was discarded from schools across the city (Ritea, 2006). Neighbors who saw this at Morris Jeff were disappointed that the first significant official attention given to their abandoned public school was this wholesale filling of dumpsters with what appeared to be useful books and supplies. A neighborhood blogger reported that one onlooker watching books and computers being tossed out of second-story windows said, "You know somebody could have used it" (*N.O. school* "*cleanup*" = "*throwout*", 2007). Another neighbor responded by entering the abandoned building and retrieving books for the neighborhood kids to take home. Regardless of the soundness of this cleanup decision, something about the sight of work crews coming unannounced into the neighborhood and removing scarce supplies inspired a reaction.

Much of the critique of post-Katrina educational change has been that a self-serving group of well-funded and out-of-town charter school advocates has moved in to replace local educators, thus removing any sense of community that may have existed under the struggling pre-storm system (see Buras, 2010; Klein, 2007; Perry, 2007). The micro-narrative of Morris Jeff's neighbors parallels the broader macro-narrative in which the post-storm reforms were perceived as being done *to* a community rather than *with* a community. The Morris Jeff neighbors understandably defined the school as theirs. It was across the street from their houses, and there was a tremendous distrust of governmental authorities that emerged from Katrina and the catastrophic failures of the Army Corps of Engineers. There was a feeling that something as important as the neighborhood school could not be trusted to distant authorities. And this feeling was about to grow stronger.

A Community Engages

State superintendent Paul Pastorek hired Paul Vallas in the summer of 2007 to lead the state-run RSD, which directly operated or turned over to charter operators all schools in the state deemed failing according to the state's accountability policies.

Nearly all of the public schools in New Orleans, including Morris F.X. Jeff, were moved into this district following a change in state policy in November 2005, explicitly intended to wrest control of New Orleans schools from the locally elected school board.

A polarizing figure, Vallas was a former superintendent in Chicago and Philadelphia after serving as the budget director for the city of Chicago. He had supported charter school expansion and strict test-based accountability in both previous school posts. The RSD, faced with having to decide which schools to open, which to tear down, and which to prepare for renovations, began holding public meetings in the winter of 2007–2008 in order to gather public input for the school facilities master plan. During a January 15, 2008 meeting at the Crossman School, about a mile from the Morris Jeff site, several audience members posed questions about the Morris Jeff building. After noticing their common interest in the building, they gathered after the meeting to talk about their thoughts for the school.

A second RSD facilities meeting was planned Thursday, February 28, and the group decided to take action to impress on the committee that they wanted their school opened. A neighborhood meeting was called by Broderick Bagert, Jr., and his wife Celeste for the Saturday prior to the meeting (*This is the way we save our school*, 2008). The purpose of the meeting was to gather input and prepare their message for the master plan committee. In full-group and in breakout teams, they discussed some unified concerns that included renovating and reopening the Morris Jeff school. The group organized a neighborhood petition drive, had t-shirts printed, and coordinated rides to the meeting that next Thursday. The group, calling itself *Neighbors for Morris F.X. Jeff School*, included a broad cross section of residents in the diverse neighborhood including a former principal and teacher at the pre-storm school, alumni from the school, citizens committed to seeing the historic building preserved, and young families interested in having the neighborhood school reopened. They planned to have survey data about community wishes, a petition of signatures, and a mobilized group of neighbors to help make their case.

Taking Direct Action

In the meeting at the Medard Nelson school on February 28, the RSD's planning board put forth their recommendation that Morris Jeff be "repurposed" and that elementary school children be sent to school elsewhere. Leaders from the Morris Jeff group rose to speak at the meeting and argued for their school's reopening. The board informed the large Morris Jeff contingent, which took up ½ the seats in the school cafeteria, that no final decisions had yet been made, and since community input was a key factor in the board's decision-making, their request would be considered. The group posed for an all-smiles photo in the back of the room following the meeting. The group got another 25 people to attend a meeting of the state's education board on June 18 and presented the results of their community survey of over 500 families and their demographic analysis demonstrating the need for more elementary school seats in the Bayou St. John and Mid-City neighborhoods. Neighborhood resident Shana Sassoon concluded that "Our need for a quality school is undeniable" (Simon, 2008a, n/p). The group had made their case and waited for the release of the RSD's facilities master plan.

The RSD's August 2008 facilities master plan included a "New Jeff site at Easton Park" in phase 2 (of 6) of the rebuilding process. This suggested the district wanted to keep the "repurpose" designation on the original Rendon St. site and build a new school building at a nearby park in the next 5–7 years. On one hand, the group had achieved a small victory: convincing the board that an additional school was needed in their neighborhood. On the other hand, the historic 1903 building that had been the source of their concerns was still being left out of the rebuilding. Even worse, the price of their new school might mean the loss of one of the few green spaces in the densely populated neighborhood. The city-owned Easton Park is home to a playground and a youth football team and hosts high school softball games each spring. Another surprise was the call for the nearby *John Dibert* school to be closed, which was currently serving over 300 students, many from the areas surrounding the shuttered Morris Jeff.

Neighbors for Morris F.X. Jeff called a press conference at the Rendon St. site on the morning of Friday, August 22, 2008, to voice its critique of the RSD's master plan. This included the lack of responsiveness to community input in the master plan and the fears that closing so many schools in one neighborhood would force children into unnecessarily long bus rides. Broderick Bagert, Jr., criticized the current treatment of the neighborhood in the plan harshly, "this is an unfunded plan to take a neighborhood park and to close three neighborhood schools" (Carr, 2008, n/p).

On Thursday, September 18, the group joined approximately 150 citizens at a public hearing on the master plan held at McDonough #35 high school. The group repeated its call for a new Morris Jeff school to be moved into the first rebuilding phase and called out the board for its lackluster performance in demographic analysis. Bagert again had sharp words warning that the facilities master plan could "go down in history as a colossal embarrassment and one of the most unsuccessful failures of planning in our community" if not revised (Simon, 2008b, n/p). Their arguments at the McDonough #35 meeting earned them an invitation to meet with RSD director of operations, Karen Burke.

As the group emerged from the fall of 2008 with the attention of the RSD officials as an active community force, two things became clear to the members: (1) they were not going to be successful in their bid to reopen the old Rendon St. site, as the state's refusal was based on state minimum size requirements, and (2) they wanted to continue organizing the neighborhood and there was a possibility that a *new* Morris Jeff school could be opened on a different site, with significant community leadership. The group held an open community meeting at the Bibleway Missionary Baptist Church, 2 blocks from the school, on Thursday December 11, 2008, in hopes of expanding community understanding and participation in the group's efforts. Led by a self-titled *steering committee* and community organizers Bagert and Aesha Rasheed, the meeting provided information on the history of the group, and attendees participated in several small group discussions on topics such as curriculum, teachers, and leadership for the new proposed school. In groups of 5–7, participants talked about their experiences in schools as both students and parents, as well as their ideas for an excellent neighborhood school. Based on this meeting and subsequent information gathering events drawing on hundreds of community members, some emerging core values became evident including *student diversity*, *open-access*, *community-centered*, and *high-quality learning*.

Becoming Formalized

From here, the group began transforming itself from a group of concerned neighbors to a governing body preparing to open a public school. The e-mail address that the group used on its materials changed from savemorrisjeff@gmail.com to morrisjeffschool@gmail.com. This is indicative of a shift of attention away from *saving* from the old building towards the possibility of *designing* something new. The group formed several standing committees that would do the majority of the near-term work: principal selection, curriculum research, finance, fundraising, and parent/community outreach.

The principal selection committee placed online advertisements beginning in December 2008 and began meeting to review candidates in January 2009. All told, the group received almost 50 applications for its founding principal position. The committee included a handful of neighbors of the old school building, a high school teacher, a college professor, an insurance claims manager, a day-care administrator, and a community organizer.

The curriculum research committee began meeting in January and visited a number of schools to get a sense of the curriculum offerings at successful schools that had diverse student bodies. Their work was important in articulating the group's emerging commitments to inquiry-based learning and foreign language instruction. They visited the highly regarded (though selective) Laboratory School at Louisiana State University, the International School of Louisiana located in New Orleans, and several other local schools.

The finance team opened a bank account and set up accounting procedures that would get the group operating smoothly for its first tax return and first year of board meetings. Initially, the group collected donations through the Faubourg St. John Neighborhood Association, which had a preexisting 501c3 status. With a relatively small amount of money going in and out over the school's planning year, getting comfortable with accounting procedures was important as the amount of money, and public scrutiny, would increase significantly once it was operating with students and staff.

The fundraising team collected several thousand dollars in initial contributions from active steering committee members. The group also won a grant for a governance retreat from *New Schools for New Orleans*, a charter school support organization founded post-Katrina. Plans were undertaken for an initial Community Gala that took place in August 2009 at the Zulu Social Aid & Pleasure Club, located a few blocks from the still-shuttered Morris Jeff building. The event, featuring live music and food donations from local restaurants, raised over $20,000 to cover training for the school principal and costs for the initial marketing of the school (brochures, website, banners, and yard signs).

The community engagement team recruited parents and volunteers at community events and block parties. An Easter Egg Hunt on April 11, 2009, helped to ensure that the parents of school-aged children were aware that the school, which still had not been assigned to a building, would be opening in the fall of 2010. Members staffed booths at community events such as the Urban League's School Expo, the International Day of the Child in Audubon Park, and the Fortier Park Festival. They also organized community walks in the spring of 2010 and organized house meetings to hear from interested families.

The full steering committee was still in place and held regular meetings to coordinate committee activity. The steering committee drafted bylaws to become a nonprofit corporation and submitted them to the state, receiving approval on February 13, 2009 (Louisiana Secretary of State, 2011). That same week, on February 12, Paul Vallas and Karen Burke from the RSD failed to show up to an agreed upon meeting with the steering committee to plan for the hiring of a principal and the governance plan for the proposed new school. At the time, the group was considering entering into a memorandum of understanding (MOU) with the RSD whereby the RSD would retain legal authority for the school but would cede responsibility for curriculum and personnel decisions to the community board and the principal they hired and supervised. The group had strong reservations about joining the *charter movement* that was sweeping New Orleans at the time, not sharing in its acceptance of highly segregated public schools or in its broad condemnation of all things related to the pre-Katrina system. Vallas pushed the charter option to the group, and it was perhaps a bit of intentional rebellion that prompted the group to continue pushing back against Vallas, a man who usually got what he wanted.

While the option of entering into an MOU was eventually taken off the table by the RSD, the distrust sewn by that missed meeting and several other uneasy interactions with the RSD helped to solidify the group's decision to keep the RSD at a distance and apply to the state for a charter. This process included a document review and an in-person interview with the National Association of Charter School Authorizers (NACSA), but if successful, the group could elect its own board, receive state funds directly, and not be under the thumb of the RSD. As long as their fiscal and academic performance was strong, the school would be relatively free to pursue its mission.

On May 29, 2009, several members attended a workshop held by the state department of education for prospective charter applicants, and the steering committee submitted a letter of intent prior to the state's deadline of July 10. The charter was written during the summer of 2009 and primarily was done electronically as many team members were in and out of the city during the summer holidays. The 248-page charter application document was submitted to the state on August 21.

A Formal Leader

The other significant event of the summer of 2009 was the hiring of the school principal, Patricia Perkins, to begin the school's planning year. The steering committee and the smaller, newly created board, whose role was formalized in the articles of incorporation, had settled on three finalist candidates (out of almost 50 applicants) by the end of March and conducted interviews in late April and early May in donated board room space at the New Orleans Museum of Art. Approximately 30 community members participated in some part of the interview process, which lasted a grueling 8 hours per candidate and was comprised of a prepared professional development session, small group meals with steering committee members, and separate meetings with parents, educators, and the full steering committee. All this was done, however, without any source of steady funding, as negotiations were still underway with the RSD for the source of the founding principal's planning-year salary. The group expected this to come from a combination of RSD funding and independent fundraising.

On Thursday, May 28, 2009, the principal selection committee met to make a decision on the two finalist candidates for their founding principal. The group entered into a long discussion that involved tears and long pauses. There was a weight to this meeting that had not existed previously. Previous meetings entailed strategizing, discovering shared values, and were pervaded by a sense of consensus. This meeting was spiked with sense of division. In the end, the votes were split between two candidates, and the steering committee votes split along racial lines.

As the votes were called by hand, the group realized that a division existed in the group that hadn't been visible before. Within a few seconds of the vote, several group members, from both the "winning" side and the "losing" side, commented that they were uncomfortable moving forward with the group split this way. It was decided that they would take a few days to think about the choice and to collect additional information on each candidate through personal contacts. The group met again in 4 days and, on the advice from a steering committee member with a background in Quaker education, decided to have the members talk about what they had learned and what they were feeling about the candidates rather than proceeding to a quick vote that could potentially be divisive. The group, numbering over 20, sat in a big circle in a member's house on Dumaine St. and shared new information and personal reflections on the candidates. After about an hour, it became clear that there was much more support for Ms. Patricia Perkins, and those in opposition decided not to stand in the way. Members were drawn to her experience in a high-performing school in the city, her strong sense of curricular knowledge, and an overwhelming number of positive references from colleagues.

This decision-making process is a good example of the "commitment to communal processes" emphasized by Furman (2004). Not only did voting and dialogue get used, but group reflections led to an alternative to majority-rules voting that maintained some level of group consensus in the face of persistent differences. In alignment with Shields and Seltzer's (1997) assumptions about postmodern community, this *community of difference* negotiated internal conflict and came out altered, but intact, on the other side. Final negotiations with Patricia Perkins took place, and she began as the school's first employee on July 1, 2009. The group had survived its first crisis, and time would tell how successfully it had managed it. Shortly after being hired, Perkins was interviewed by a community paper and stated:

> My goal is to see a community of students, parents and neighbors. The students will be challenged, held to high expectations. They will see learning as a joy as well as a challenge in their student life. (Himelstein, 2009, p. 19)

Capacity Building

The fundraising team held its first major fundraiser at the Zulu Social Aid & Pleasure Club on August 19, 2009 (Himelstein, 2009). Up to that point, the group had used small donations (totaling several thousand dollars) from individual members to pay for things. As the group prepared to officially enter its planning year, expected additional costs included teacher and student recruitment, principal school visits, and marketing. The Community Gala at the Zulu club was an opportunity to get the word out about the school, expand its network of supporters, as well as to raise money. As part of the preparation for the event, steering committee members hosted house meetings where strategies for fundraising were discussed and sample solicitation letters were shared. Each member was asked to submit a list of 25 names to the Gala coordinator, from which the master invitation list would be compiled. Those with fundraising experience led the training, and first time fundraisers talked about being uncomfortable asking their friends and family for money. Trainers acknowledged their feelings and role-played scenarios in which they asked neighbors to support the school or asked local businesses to support our event.

In addition to a monetary goal of raising at least $20,000 at the event (which it met), they set a goal of 300 donors. This served to encourage members without a lot of wealthy contacts to make significant contribution towards the goals of the event. On one level, the group was raising money to prepare the school's opening. But on the level of social capital, as used by Bourdieu (1986), the group was building its capacity to exercise influence within the broader social and political systems it was a part of. While the community already included some individuals with fundraising experience, it was not shared in several important ways. First, those lacking fundraising experience didn't necessarily know that their neighbors had those skills. In a city deeply divided by lines of race and social class, this comes as little surprise. Second, those lacking fundraising experience of Morris Jeff community members was not shared prior this effort because there was not imminent reason to do so. Those with fundraising skills used them for their jobs with nonprofit organizations or other community entities but, for the most part, had never had reason to share their skills with their neighbors. The creation of the Morris Jeff Community School gave them this reason. In this sense, the school was the beneficiary of the fundraising, but so was the community itself, for it possessed expanded skills that it didn't have before the event. This fundraising example highlights a key element of community leadership: a commitment to not only educating children but building the skills of their families and neighbors so that self-determination and advocacy are more possible. The broad distribution of skills supports the community by creating a dense support network around the public school. It also benefits the school and it's students by having an increasingly skilled and increasingly organized group of advocates fighting the inevitable battles that a new organization has to fight: from raising funds, to securing facilities, to engaging in public relations activities. As of this writing, the school and its newly minted fundraisers have raised more than $155,000 in grassroots fundraising, from more than 500 individual donors, over $300,000 in private foundation grants, as well as a 3-year, $600,000 Public Charter School Program grant from the US Department of Education. While this is a far cry from the totals amassed by some of the other charter schools in New Orleans, this money has been raised by public school parents and public school supporters, and every dollar raised signifies an uptick in public faith in the historically unsupported public school system.

The School Today and Challenges Ahead

As of the 2012–2013 school year, the Morris Jeff Community School serves 330 pre-K through 4th graders and has maintained the notable racial balance it achieved in its first year of operation (Pope, 2010). It has kept a stable staff while adding teachers as the school grows and new administrative positions are created. As a relatively small school, having enough support staff to meet both the academic and social/emotional needs of students is a challenge.

A second challenge is continuing to negotiate as the school facilities master plan is implemented and the city begins spending the nearly $1.8 billion on school construction money that was allocated by the Federal Emergency Management Agency in order to rebuild Katrina-damaged school buildings. While successful organizing among parents and the broader mid-city community earned the school a good location at the recently demolished Fisk-Howard school, less than a mile from the old Morris Jeff building, the new building is only in the design phases and supervising the construction (through Fall 2014), as well as maintaining their temporary school site will remain time-consuming for the short term.

A final challenge the school faces is leveraging leadership from the low-income families the school serves. The school has a racially and socioeconomically diverse student body and a racially diverse staff and governing board. But, as was remarked to the group during a 2010 leadership retreat, this was a racially diverse group of adult leaders with "more college degrees in the room than people." Developing shared leadership across these lines of social class is a goal that the school holds for itself, but has not yet managed to achieve. This is in line with the experiences other community-oriented charter schools with social justice missions, like the Camino Nuevo schools in Los Angeles (Warren, 2005). What makes the problem at Morris Jeff particularly unique is the presence of a wide range of socioeconomic levels among the parent population. While Warren cites Camino Nuevo for having relatively excellent parental *participation*, but lackluster parental *leadership*, they were dealing with an almost uniformly low-income, Latino parent pool. At Morris Jeff, there is excellent parent participation *and* leadership, but while the participation includes parents of many income levels, parent leadership has tended to come from the more educated and middle-class families of all races.

Developing leadership among low-income families is an important and challenging goal, so it comes as little surprise that schools have underperformed in this area. Even these rare schools that make parent leadership a stated goal, barriers to this participation are well documented (Davis-Kean & Eccles, 2005; Hoover-Dempsey & Sandler, 1997) and include factors on the parents' side as well as the school's side of the relationship. Moving from lower-level participation (lunch duty, chaperoning field trips) to higher-level leadership (parent-led advocacy, fundraising, participating in curriculum and personnel decisions) presents another level of challenges. It is clear that continued persistent engagement and capacity development with low-income parents are crucial avenues for developing this leadership. Perhaps most important to the school's future success in leveraging leadership from lower-income parents will be to continue asking, inviting, and expecting leadership from these families. Having a full stable of middle-class parents will raise the temptation to invite low-SES parents less vigorously, but to do so would be a violation of some of the school's founding premises.

Morris Jeff Community School as an Example of Community Leadership

This story of the creation of the Morris Jeff Community School gives a picture of a school created by a community. Warren (2005) articulately outlines a typology of relationships between community-based organizations (CBOs) and public schools: full-service schools, CBO sponsorship of new charter schools, and school-community organizing. All of these approaches involve creating new school-community relationships via preexisting organizations. The Morris Jeff approach created an organization where there was none. This organization-less emergence took tremendous efforts on the part of a few key organizers, but in the end, a group of neighbors achieved some impressive results and forged a *community of difference* that persists to meet future challenges. The school is one of the most diverse open-access schools in the city, and the links between school and community are pervasive. It has presented a new model of urban educational reform that offers possibilities other than the charter school incubation model which has been popular in New Orleans. But the opportunities for new school creation in the post-Katrina period as well as the tremendous volunteer efforts of community organizers in establishing a new organization are barriers to replication. A discussion of *community leadership* as a model for socially just educational change seems appropriate.

If leadership for social justice is predicated on altering the ways in which social and material goods are distributed, then this approach of community leadership seems an appropriate model. A community that manages its own institutions is less likely to passively have unjust things done *to* it. They possess agency and autonomy. Of course, the broader social ills of racism, classism, and all the rest exist within this community, as in all others. Particularly when a community is explicitly diverse, acts of injustice will occur through active and passive means. Maintaining community in the face of such diversity is an arduous process full of reflection, critique, and dialogue. But a community with traditions of dialogue, acceptance of difference, and the patience to work through conflict is well positioned to do this. Members of a community can build trust through repeated interactions. This trust makes reflection, critique, and dialogue more possible. Bureaucracy cannot perform these functions. Policy cannot perform these functions. Reform models dependent purely on technical fixes or those that divorce the struggles of urban schools from the struggles of urban communities (David & Cuban, 2010; Noguera, 1996; Oakes & Lipton, 2002) do not address the issue of relational trust, even though it is a root cause of many of the challenges of our urban schools: unequal funding, racial segregation, intensely concentrated poverty, and uneven community engagement.

In urban schools, trust is a requisite for school improvement as well as school sustainability (Bryk & Schneider, 2002; Forsyth, Adams, & Hoy, 2011). By default, particularly in modern times (Fukayama, 1999), trust is almost impossible unless there are some shared concerns, time, and geographic space. It is this building of trust across racial and economic lines that might create schools that entwine, rather than separate, individual lives in a community. The existence of the Morris Jeff Community School makes the claim that socially just leadership is leadership that is shared, local, emergent, and built on relational trust in a specific geographic community. Community leadership requires individual leaders to inspire, coordinate, and build capacity. But following Freire (2000), this leadership is not charity to improve the lot of others, but self-serving and self-liberating, as a stronger community improves life for all members. As of this writing, two more charter schools have been approved that show significant influence by this community-based approach,[3] and the RSD, under the leadership of New Orleans native Patrick Dobard, has convened a working group to explore ways to support community groups in successfully opening charter schools in New Orleans.

In Furman's definition of the ethic of community, she describes schools governed by a "moral responsibility to engage in communal processes as educators pursue the moral purposes of their work and address the ongoing challenges of daily life and work in schools" (Furman 2003b, p. 2). Scholars have also pushed this definition further by suggesting that our schools also engage in such processes with their external communities (see Croninger & Finkelstein, 2003; Mawhinney, 2003).

---

[3] See the Plessy School (http://www.plessyschool.org) and Bricolage Academy (http://bricolageacademy.wordpress.com).

Furman advocates that leadership perspectives that support community include distributed leadership, interpersonal skills, striving to know others, communication, teamwork, dialogue, and the creation of forums where the isolationism that pervades most work in schools (Datnow, 2011; Hargreaves, 1994; Little, 1990) can give way to sharing and support.

Community Leadership as Social Justice

Many scholars have outlined the common sense approach that urban school reform needs to take both educational and social actions if educational equity is truly a goal we hold dear (Anyon, 1997; Arriaza, 2004; Noguera, 1996). One promising source for conceptualizations of community leadership in practice is the area of community-organizing approaches to urban school reform (Cortés, 2010; Evans, 2011; Fabricant, 2010; Shirley, 1997). These approaches to reform share common commitments to broad stakeholder participation, the development of political capital via strengthened adult relationships, and the building of trust across racial and socioeconomic lines. Oakes and Lipton (2002) outline three basic elements of community organizing as they might be applicable to social justice-oriented reforms. First, relationships are created so that groups of increasingly connected individuals gain power and exercise leadership through their network. Second, the already forming community engages in dialogue about common problems and preferred solutions in order to generate momentum and focus. Third, the group takes action to move from the present state of affairs towards their preferred future state. Their analysis notes that while more technical school reforms (altered curriculum, new assessments, new schedules) are well served by the existing reform implementation literature (McLaughlin, 1990), reform efforts that directly address issues of social justice (de-tracking in their case study, or racial integration in the Morris Jeff case) require broad-based coalitions to be successful. This is logical in that when schools take on broader social forces that exist outside of schools, limiting reform strategies to teachers and students will never be sufficient. Note here that definitions of social justice limited to within-school outcomes are rejected by those exercising community leadership. Improved educational outcomes for students are likely to be a significant stated goal under community leadership, but they must be colocated with broader struggles for equality in the world outside the walls of school (Beabout, 2008).

And while nonschool goals must be on the agenda of social justice leaders, the improvement of in-school conditions and educational outcomes must also involve the work of nonschool people. Warren (2005) points out the necessity for equity-focused reforms to recognize that "addressing the structural inequality in American education requires building a political constituency for urban public schools. Collaborations with broad-based community organizations whose constituents have their children in urban schools can provide an essential piece of the political effort necessary to address these issues…" (p. 135). In a city like New Orleans, where over 30 % of children attend nonpublic schools, this goal of constituency building takes on particular significance. With a recent $1.8 billion settlement from the Federal Emergency Management Agency (FEMA) to rebuild Katrina-damaged schools, New Orleans will, in a few years, have an entire system of newly constructed or fully renovated public school buildings. But if the majority of the middle class continues to use the private schools (or Governor Bobby Jindal's statewide voucher plan) and the public school community remains divided by charter-induced competitive frenzy, will there be enough political support to even maintain these new buildings? Will the current pressures of high-stakes testing close schools that seek to balance academic and community concerns in favor of schools more willing to solely pursue academic goals? These questions do not have easy answers, and answering them is beyond the scope of this chapter. It does become clear, however, that community leadership in urban education, while broad and inclusive, is indeed radical. Current policy arrangements emphasize the role of technocrats as the arbiters of school goals in a process that requires little inclusion and little dialogue. Ernesto Cortés (2010), leader of the national community-organizing group the Industrial Areas Foundation, provides an image of what community leadership might look like:

> Robert Cordova, principal of Harmony Elementary in the Los Angeles Unified School district, initially saw his work with the congregations and unions of One-LA IAF as a way to deflect the concerns of parents onto different institutions. However, once Cordova began to have conversations with and be mentored by other institutional leaders in his community, he began to see himself not just as a manager of crises, but as an educational leader in a network of institutions with a broader vision for the transformation of his school and community. (p. 100)

This idea is echoed by Khalifa (2012) who reports on principals who, through high community visibility and advocacy for community issues, earned the trust of parents and raised achievement for at-risk youth. At its heart, social justice as community leadership in public schools rests on the simple premise that those who are most impacted by our public institutions should have a say in how they are constructed and how they function (Sarason, 1995). A key to successfully implementing community-organizing strategies is balancing the specialized knowledge of professional educators with a commitment to community-based decision-making.

Expertise and Expertism

The Morris Jeff case emphasizes a definition of leadership for social justice that includes both academic excellence for students and strengthening the political and social capital of parents and community members. Morris Jeff was created utilizing a community-organizing approach (Shirley, 1997; Warren, 2005) and continues its social justice work by retaining a volunteer governing board and principal leadership dedicated to building capacity for community leadership. Community leadership relies on partnerships so that educational offerings are a product of dialogue between professional educators and parents and neighbors. To understand community leadership is really to understand the differences between *expert leadership* and *expertism*.

Expert Leadership

Expert school leadership (Leithwood, Begley, & Cousins, 1992) has been defined as leadership that (a) manages the school so that basic functions are carried out despite individuals joining and leaving and (b) leads organizational change that leads to school improvement. Expert leaders both influence individuals and manage institutions—they both *lead* and *manage* (Bolman & Deal, 2008). Expert leadership leads to schools in which, in Fullan's almost poetic simplicity, "more good things happen; fewer bad things happen" (2001a, p. 4). While critics might argue that Fullan's avoidance of the specification of the goals of education leaves the puzzle undone, this generality is viewed here as recognition that the outcomes of expert leadership appear on multiple hierarchical levels (students-teachers-parents-community) and appropriately vary by community (Beabout, 2008). Just as the appropriate educational goals for students remain contested terrain (Kozol, 1967; McLaren, 1999; Willis, 1977), the specific goals of successful leadership vary by context as well. Nonetheless, expert leaders share some broad sets of knowledge, skills, and dispositions that enable their schools to reach shared goals. The Educational Leadership Constituent Council (ELCC) has published its list of educational leadership standards that include: (1) building and sustaining a vision, (2) establishing a positive school culture, (3) efficient management, (4) communicating with the public, (5) ethical behavior, and (6) awareness of the larger social context. While mastery of all of these standards may not be universal, they at least represent some consensus of the minimum capabilities of educational leaders as they enter the field.

As someone who works to develop leadership skills in aspiring educational leaders, I am acutely aware of the challenges of developing quality leadership. Leithwood et al. (1992), in their writing on problem-solving practices of expert principals, note that the existence of many *swampy* problems makes the teaching of explicit skills or procedures only partially effective. To Leithwood and his colleagues, "problems were considered swampy [challenging] when they involved many people, especially including people outside the school whose responses could not be controlled in any systematic way" (p. 53). They also denote the importance of a principal's prior experience in determining the difficulty of problems faced in schools. These findings underscore two aspects of leadership: (1) the importance of experience in making difficult problems easier to solve and (2) interactions with the school's external environment are a major source of difficult problems for principals. When school leaders are new to the profession and new to their community, swampy problems can consume them. Leithwood et al. also note that expert school leaders have a detailed vision of an educated student that "was consistent with the values of the larger public served by the school" (p. 59). Expert school leaders that they studied had goals that centered on what students would be or become, were flexible in their thinking if presented with compelling evidence, and sought goals consistent with the larger school community. Certainly, the final two of these qualities require experience and interaction and deep knowledge of with the school community.

Expertism

Contrasting with this idea of expert leadership is the idea of *expertism*, which can be defined as:

> the sense that *we possess* [as experts] a wealth of knowledge that *we need* to bring to our communities. It is this method in which power is bestowed upon experts and reserved from those who posses unrecognized wealths of indigenous knowledge (Carr-Chellman, 2006, p. 7) [italics added]

Expertism has been described powerfully as the white-man's burden and as the colonizing gaze. At its heart is a belief that certain individuals or groups ought to, by right, have more power in the design and maintenance of societal functions than others because of certain characteristics they possess: education, wealth, political connections, etc. The concept emerges from the historical power differences that have left human history scared by (and perhaps uniquely identified by) slavery, colonization, and social inequity of multiple forms. *Expertism* pathologizes the historical tendency of the powerful to design social arrangements, institutions, and programs that will benefit themselves but harm others. Even when projects have an explicit intent to foster social justice and equity, expertism can be identified when these activities are done with an attempt to make things better "for" the impacted people rather than "with" the impacted people.

To be clear, pathologizing the dominant form in which even most social justice-oriented work is conducted is nothing short of revolutionary. Freire (2000) explains the role of leadership for social justice work in clear terms:

> Domination, by its very nature, requires only a dominant pole and a dominated pole in antithetical contradiction; revolutionary liberation, which attempts to resolve this contradiction, implies the existence not only of these poles but also of a leadership group which emerges during this attempt. The leadership group either identifies itself with the oppressed state of the people, or it is not revolutionary. To simply think about the people, as the dominators do, without any self-giving in that thought, to fail to think with the people, is a sure way to cease being revolutionary leaders. (p. 132)

Freire was not an advocate of incremental reductions in social inequity by the provision of slightly better jobs, housing, education, and medical care to the poor. The goal was not an expanded welfare state but a society in which all people are able to become "more fully human" and are not objectified as units of labor or units of consumption by the system of governance. Freire would agree with Willis (1977) that social inequity is remedied not by providing the poor with the external trappings of wealth (diplomas, fancy houses, or cars) but by groups of individuals altering the way in which they see each other. In this sense, social justice is first and foremost a result of changed perceptions and less a description of the conditions in which some people enjoy more resources (distributive justice) and better protections than others (procedural justice) (Fine, Bloom, & Chajet, 2010). Without retooling how we perceive each other, inequality persists unabated. The Morris Jeff case, if nothing else, presents an opportunity for hundreds of diverse families to retool their perceptions of their neighbors via their shared engagement with a public school. These opportunities are in short supply in increasingly segregated communities in which many Americans live (Orfield, 2002).

Expertise Without Expertism

And so how is one to mold these conceptual understandings of social justice into practical advice for educational leaders concerned with social justice? Viewing educational leadership as an avenue for social justice work requires high levels of expertise. Such leaders must possess excellent skills in teacher hiring and development, curriculum development, student assessment, public relations, political advocacy, listening to diverse perspectives, facilities management, fiscal management, group facilitation, and building commitment to a shared vision. One might certainly call a leader with all of these skills and expert—and they might be right. But, as a moral enterprises (Starratt, 1994), education and educational leadership for social justice require *expertise without expertism*. That is, it requires the skills and dispositions to lead a community of learners and the humility that social justice work is done with the communities we serve, not for the communities we serve. As Freire (2000) notes in his discussion of revolutionary leaders,

> Revolutionary leaders… cannot believe in the myth of the ignorance of the people. They do not have the right to doubt for a single moment that it is only a myth. They cannot believe that they, and only they, know anything- for this means to doubt the people. Although they may legitimately recognize themselves as having, due to their revolutionary consciousness, a level of revolutionary knowledge different from the level of empirical knowledge held by the people, they cannot impose themselves and their knowledge on the people. They cannot sloganize the people, they must enter into dialogue with them… (p. 134)

The formidable skills of the expert leader must be mobilized in a way that connects the school to the community in dialogue, but never in monologue. Social justice leaders invest in others, share leadership both inside and outside of the school building, and stand with the community even when this puts them at odds with powerful foes (Beabout, 2008). Expertism would advocate the design of idealized educational plans (lessons, schools, systems) by those with the most training and the greatest professional accomplishments. Here, I still advocate for the best-trained and most accomplished educational leaders but let them take a seat at the table (not the podium) alongside parents, students, the business community, elected officials, clergy, and other constituent groups to collectively author plans for the schools they will direct. Leaders exercising influence in this way are developing *community leadership* in which community engagement, shared leadership, and building community social capital are seen as fundamental, rather than tangential, to the work of schools. It is this final task of exercising community leadership in a current political context that does almost everything to prevent it that I will turn to next.

Four Cantankerous Contradictions

School reform policy in the USA, currently supported by both major political parties, is that student academic achievement is the sole metric of school success, that schools in and of themselves are the vehicle for producing such achievement, and that academic success must be achieved for all students with no excuses or a school should be closed down and reconstituted with new faculty and leadership. These ideas have been operationalized in much of the market-based approach to educational change and the burgeoning charter school movement (Lubienski & Weitzel, 2010; Wells & Scott, 2001). These beliefs are in direct opposition to the communal process advocated for by Furman and Shields (2003) and the emphasis on engaging with the broader community and building external constituencies that are key elements of the community leadership as demonstrated by the Morris Jeff case. Below, I explore this dissonance in a series of cantankerous contradictions. I use the word *cantankerous* because these contradictions are not simply irreconcilable ideas, like an erroneous mathematical calculation, soon to be erased from a blackboard. They are noisy and disruptive contradictions that should alter the ways in which we view leadership in schools and animate our actions towards social justice. They should mold our understandings of leadership for social justice to include some agency on the part of a school's community, regardless of income, skin color, or educational attainment.

Cantankerous Contradiction #1: Heroic vs. Democratic Leadership

Community leadership is shared and democratic as opposed to heroic and charismatic. Yet, this is exactly the mode many charter school leaders in New Orleans have been forced into. Under today's market-based policies, principals are responsible for delivering improved test scores to the public in exchange for having authority for *nearly all* of the functions pertaining to opening and running a school. In New Orleans, they often select their own board, write their charter application to the state, take the lead in defending that document to the state, sell the school to potential funders, and recruit staff, families, and students. Regardless of the leadership philosophies of the individuals placed in these roles, any notion of shared or democratic leadership is enacted only after hundreds of decisions and thousands of hours had been spent by the principal working essentially alone. The Morris Jeff case depicts a charter school started by a community. This community selected its own curriculum, fought for its own building, hired a principal who was comfortable with significant community leadership, and raised its own funds.

Cantankerous Contradiction #2: Market Competition vs. System-Wide Improvement

While the ethic of community encourages leaders to be relational in a world characterized by antagonistic us-them relationships, much of the leadership embedded in today's market-based reform policies focuses on competition leading to a higher place on the test-score/league tables that are published following state testing each year. Leaders in such an environment are incentivized to push out troubled students, to keep organizational knowledge private, to poach teachers from neighboring schools, and to design programs that improve their school's scores at any cost (see Rothstein et al., 2008). Under the hypercompetitive conditions fostered by modern reform policies, educational leaders are rewarded for having higher scores than the school down the street. This creates a disincentive for relationships between schools rather than cooperative ones. This flies in the face of much recent thought on educational change emphasizing the use of networks of schools (or educators) to improve system-wide performance (Daly, 2010; Hopkins, 2007).

Cantankerous Contradiction #3: State Control vs. Local Control of Educational Goals

Leadership informed by the ethic of community supports the co-construction of purposes and actions of schools. This inevitably requires dialogue among the diverse groups of parents, community members, and educators that make up the environment of a school. Paradoxically, while the charter movement in the USA has been billed as an increase in autonomy for educational leaders (which it is), other groups (parents/community) often have less, not more, input into setting the agenda for educational means and ends. Charter schools are run by appointed boards, not elected ones. They are authorized by states or universities or school districts, with the express goal of improving test scores. School principals are hired by these boards for their commitment to raising academic achievement levels. In Louisiana, charter schools are renewed after 3 and 5 years of operation. These decisions are based primarily on student testing and fiscal performance, with attendance and graduation rates also being factored in. While charter applications include a section on school-specific goals, they are significantly less important, as the state doesn't track or enforce performance on these goals. In essence, the "local control" lauded by school choice reformers today applies only to educational *means* but not *ends*—as these have been increasingly fixed by the state testing policies.

Cantankerous Contradiction #4: Developing Leaders vs. Novice Teacher Churn

Leadership in the practice of community leadership is distributed—and its goal is developing leadership in others (Fullan, 2001a). But the development of distributed and shared leadership requires intentional action, resources, and existing leaders with the confidence and skill to identify leadership talent and develop it. While thin staffing arrangements often require classroom teachers to take on administrative tasks during the start-up phase of a charter school, I differentiate between having teachers help out with administrative tasks and leadership development which is planned and intentional and includes supervision and coaching from more-able leaders. Multiple factors make the development of teacher leadership challenging in their "no excuses" reform environment. Thin budgets at start-up negatively impact staff development time and expenses. The pressures of state accountability and the hyper-racial segregation of many charter schools (Frankenberg et al. 2011) mean that meeting testing targets requires an all-out assault—leaving little in the way of resources for faculty development. Media reports from post-Katrina New Orleans indicate the high level of charter school teacher burnout (Carr, 2010) and the constant churn of inexperienced teachers working with our neediest students (Carr, 2009). These pressures, of course, are certainly not unique to either charter schools or Louisiana (Olsen & Sexton, 2009). Community leadership suggests that while immediate academic improvements are certainly an important leadership goal, leaders must also set up sustainable investments in professional educators to establish true learning gains as well as to insulate schools from the shifting priorities of politically driven education reform.

Implications for Theory and Practice

Public schools are undoubtedly in an age of increased accountability. The interesting piece of this accountability, however, is that it is the state that is the main actor here. Instead of the American tradition of locally elected school boards and open meetings laws as the primary mode of accountability, states are now telling local communities, "Don't worry, I'll take care of this. I'll let you know which of your schools are good and which are not." Increasingly, states are also prescribing specific actions (closure, charterization, turnaround) for the schools they deem unworthy. This sets up educational accountability as an action done by politically powerful on the politically marginalized. In communities like New Orleans, the level of community-based accountability is almost zero. But when community leadership exists in the school, local accountability is invigorated. Educational goals that are important locally can be safely pursued. By capitalizing on geographic proximity, communities (rather than bureaucrats) can provide more responsive, intelligent, and sustainable accountability than the state can. By advocating for particular curricular or pedagogical changes, they can preempt the rather heavy-handed rank-and-reconstitute policies of most states which causes disruption with no guarantee of improvement (Beabout, 2012). Of course, if this community leadership is to be wise leadership, particularly in our poorest communities, we need to develop adult leadership in places where it is not often fostered. This is what makes the community-organizing approach to school reform a powerful one. It provides for the development of shared leadership at the local level so that communities get inside and participate in the management, operation, and, indeed, the defense of their children's schools.

Appendix A: Job Advertisement for Morris Jeff Community School's Founding Principal

Founding Principal, Morris Jeff Community School (Elementary)

Position: Founding Principal
School: Morris Jeff Community School (Elementary)
Salary: Competitive salary and benefits package

Background

The Morris Jeff School Steering Committee seeks a founding principal to help build and lead what will become one of the most innovative and successful public elementary schools in the country.

The new Morris Jeff Community School will open as an "autonomous public school," officially under the Recovery School District, but with full authority over budgeting, hiring of staff and curriculum devolved to the Morris Jeff Community Board and the school leadership team. Morris Jeff Community School will open first as an incubator school with 60–80 early elementary students (pre-K through 1st grade), growing over the next few years into a full-scale elementary school.

The school will be in a temporary location in the Mid-City area of New Orleans for 3 years, before moving to a new $19 million, custom-built facility.

The principal will work with a community board with extensive contacts throughout New Orleans to build a top-flight elementary school from the ground up. This will involve engaging with parents' and community's vision for the school, recruiting and mentoring top-quality teachers and other staff, budgeting, and working in an ongoing way with board, staff, and community to develop the school's pedagogic philosophy and curriculum.

The school has the approval to open in the fall of 2009, if a top-rate school leadership team and founding staff are identified in time. Otherwise, the school will open in the fall of 2010.

Experience, Background, and Qualifications

The successful candidate will have expertise and leadership experience in an elementary setting; familiarity with the developmental, behavioral, social, and academic needs of students in the early childhood years; and a concrete record of success. The candidate should have strong organizational skills and be able to create an organizational culture that engages and inspires teachers, parents, students, and community members in a rigorous dedication to teaching and learning. The candidate should be a creative and flexible thinker, with a strong focus on identifying and cultivating teachers of the highest quality. Experience teaching at-risk students in an urban school district is important.

We are looking for a school leader with the vision to push beyond the traditional structure and narrow expectations that too often limit the potential of public education.

Chapter 31
Making a Difference: The Balance of Stance and Strategy for Social Justice Advocacy

Phil Hunsberger and Phyllis Balcerzak

> *I believe that the school is primarily a social institution. Education, therefore, is a process of living and not a preparation for future living.*
>
> John Dewey

Dewey's (1923) thought regarding school offers a posture exceedingly supportive of social justice advocacy. The idea that education ought to be regarded as a "process of living" strengthens the idea that social justice advocacy cannot merely be an effort of description and debate but instead the formulation of policies and actions to respond to social injustices. School leaders often see social justice advocacy as a means to remediate unfairness within the school setting. Unfairness may range from issues of bullying to course selection, grade distribution, and/or advanced course opportunities. No one would doubt that these are not important issues, but they tend to narrow social justice efforts to a plan of remediation or restitution. The Leadership and Racism Program as developed by Educational Equity Consultants is focused upon a more comprehensive scope to social justice advocacy. Consider the following image as a way of describing that scope:

> Picture a parking lot in front of a grocery store with lots of spaces for cars to park and some close to the store labeled specifically for people living with a disability. Many drivers will respect this label and park somewhere else on the lot. However, others may ignore the label justifying their parking with the idea that they will only be a short time in the store. This image offers us three levels of thinking about social justice advocacy.

> The first of these levels is the fact that the construction of the parking lot includes an acknowledgement of the need for some customers for closer access to the store. Much like public education we acknowledge different needs in formal ways i.e. special education, gifted programs, AP courses.
>
> A second level of thinking is exemplified by those who arrive at our imaginary parking lot respecting the needs of different customers choosing to park in other spaces. Much like many educators who respect the various learning needs of the students and adjust instruction to accommodate their needs.
>
> A final level of thinking is one of either denial or oblivion. This would be those who arrive at the parking lot and ignore the label, park their car in the space, and go about their shopping. Postman and Weingartner (1969) suggested that public education is guilty of a "carry on regardless" nuance. This level reflects that "carry on" dynamic and as well, the dysfunction of a "colorblind" stance that ignores significant data that indicates inequity. This level may emerge from a blatant denial of difference, but more likely, it results from a lack of a critical consciousness regarding social justice issues.

Since 2001, Educational Equity Consultants (EEC) has worked with approximately 2000 school leaders and school faculties through the Leadership and Racism Program (LRP). The LRP program explores how personal attitudes about race and racism might be limiting students' capabilities to achieve. EEC began with several school districts in the St. Louis, Missouri, area and over the years has included school districts in Illinois, Virginia, Pennsylvania, Wisconsin, and, in partnership with other agencies, California. Educational Equity Consultants (EEC) has worked to develop in these educational leaders a critical consciousness that will confront policy, practice, and cultural nuance that prohibit certain students from successful learning opportunity and performance. A critical consciousness is exemplified by educators who arrive at our "parking lot" metaphor with a sensitivity and diligence to avoid the "carry on" disposition or the dysfunction of "color blindness." The capacity to develop such a consciousness is the willingness to explore personal dispositions, attitudes, beliefs, and insights that inform behaviors and actions. This focus upon stance, the manner in which we see, hear, and interact with others, is fundamental for any effort toward meaningful reform in school systems, and though we begin this focus primarily upon the issues of race, this personal exploration does not ignore other identities that a diverse student population includes and may similarly reflect injustices. However, the achievement gap as reflected in public education of the United States is framed predominantly around race, and this initial focus is consistent with the present-day demands placed upon school leadership.

In an editorial for *Education Week* (2001), Julian Weissglass wrote:

> Any reform effort designed to reduce the achievement gap that does not help whites and people of color heal from the hurts of racism will not likely succeed over time. Although educators cannot, by themselves, solve all the problems caused by racism in society, it is possible for us to construct healing communities in which people can learn how to listen and give attention while others heal. http://www.edweek.org/ew/articles/2001/08/08/43weissglass.h20.html?tkn=TYMFqDBpaD%2Fb5SKjt3d%2B2Qn7KXEKM7o39AB0

Though race is a social construct with no biological evidence of fact, its impact upon constructing a society in which dominance and privilege are afforded only to Whites, while people of color are targeted and suffer from the internalization of their oppression, is rooted in the social, economic, and political fabric of America. The history of America is filled with evidence of institutionalized racism. Thus, racism is far more than merely individual acts of injustice but results as well from an architecture of governance, the building of economic strength, and a hierarchical view of humanity that sustains power and privilege for the dominant culture – the White race. Thus, Weissglass' call to reduce the achievement gap with a focus upon healing from racism offers terminology seldom associated with theory and practice within educational leadership. The notion of healing brings attention to a personal agenda of stance rather than the commonly held focus of strategies for reform efforts. It echoes as well Ronald Edmond's (1979) position that we know what to do for learners, we have strategies for ALL learners, but instead the question is why we have not had the "will" to do it. Simply put, we have a plethora of strategies of both practice and policy, and we still have an achievement gap. Thus, this exploration of personal stance aligns our work with both a healing focus and challenges the development of a "will" toward action. It also contextualizes our efforts in an affective domain, often regarded in school reform as important but rarely viewed as the "main course."

Leadership and Racism Program: Grounding Assumptions

Clearly to impact the affective domain of learning requires a strategy of reflection upon practice. Reflection for educators is to explore a landscape of both hard ground and swamp as suggested by Donald Schon (1987). The hard ground presents some manageable problems lending themselves well to research-based theory and technique. The swamp however is, as one would expect, full of messy confusing problems. Schon suggests that it is in the swamp we find the problems of greatest human concern as in confronting injustice. The swamp is filled with indeterminate zones of practice, ones that include uncertainty and uniqueness, and that are dominated by values. Therefore, it is important to make transparent a set of assumptions upon which we have built this program to navigate the swamp.

Assumption #1. We believe that racism is an intentionally developed system to insure a dominant group both power and privilege over a targeted group. As building a house begins with architectural drawings of how elements fit together, we believe that institutionalized racism is built upon carefully designed structures to maintain this system of a dominant and targeted group. For this reason, we refer to the "architecture" of racism as a means to begin to understand the system. Race is a social construct having no biological basis. But racism is alive and well. There is a tendency to treat racism as merely an interpersonal issue, a form of individual human behavior. But doing so avoids the deeper issues of institutionalized and structural racism, the architecture of this system. For this reason, we use various theoretical models for individuals to understand and recognize the institutionalized racism we wish to unravel.

Assumption #2. We believe that conscious learning emerges from places of dissonance. Our social environment is one in which we receive countless messages that shape our thinking about self and others. We cannot escape these messages that all too often distort truth. These messages eventually become embedded in our dispositions regarding our own sense of identity as well others different from ourselves.

The only means in which we have to escape these messages is to confront them, and confrontation for many takes us to a place of dissonance. Therefore, we accept that this work may often lead folks to an uncomfortable place in which their own beliefs may be challenged. We believe that the “journey” we often describe in our work is filled with this kind of circumstance, and we often suggest that people “lean into the discomfort.”

Assumption #3. We believe that the feelings of blame, shame, and guilt are yet other elements that have sustained racism in America. Spending time focusing blame on individuals for this system is often wasteful and does little to dismantle the system. We believe that shame and guilt, though real feelings, provide little energy for transforming individual lives. Thus, our work is to create a safe environment for individuals to explore a new way of thinking about self. We accept that feelings of blame, shame, and guilt may emerge from the work; however, we remind individuals that none of these emotions will help to reconnect us to our inherent goodness.

Assumption #4. We believe that our unconscious minds drive many of our decisions regarding human interaction. We believe that all of us carry a set of assumptions about others, assumptions that we have come to regard as truth. We believe that our efforts to create an intentional and courageous examination of those “hidden” assumptions allow us to impact students’ lives in a more meaningful, authentic fashion. Our work is built upon the endless research regarding teacher expectations and students’ performance. We believe this work helps to unravel the unconscious assumptions that each of us holds regarding the intellectual capacity of our students and as well how we view what constitutes “acceptable” behavior.

Connecting Stance and Students

Alignment of educators’ stance regarding students and their performance has a substantial body of research to support this exploration. As early as 1968, the work of Rosenthal and Jacobson benchmarked the impact an educator’s stance regarding students impacted their academic performance. The observer-expectancy effect (Pygmalion effect) demonstrated that unconscious biased expectations influence instructional outcomes. This influence can be either a benefit or equally a detriment depending upon the identity of the student and the unconscious stance of the teacher regarding that identity. In the same year, 1968, a third grade classroom brought a racial lens to this Pygmalion effect. Their third grade teacher, Jane Elliott, wished to demonstrate the distress of prejudice upon individuals. She constructed a relationship between behaviors and intellect associated with blue eyes and brown eyes. Over a 2-day period, she assigned positive behaviors and intellectual prowess to only blue-eyed students on 1 day and then to brown-eyed students the next day. The students felt the impact of prejudice and targeting as well as the distorted notions of superiority and inferiority. Just as Rosenthal and Jacobson purported, third graders labeled with a “superior” identity scored high and those with an “inferior” identity scored low even when these identities’ groups were switched on the second day of her experiment. Once again, even with young children, even in the context of a brief 2-day contrived experience, a conscious and explicit stance that is held regarding differences impacted behaviors and actions. Years later, Claude Steele explored this phenomenon regarding academic performance as he and his associates researched stereotype threat – the threat of being viewed through the lens of negative stereotype or the fear of doing something that would inadvertently confirm that stereotype. Steele's research implicated the power of stance as it relates to performance even with students who have not been routinely viewed with a negative stereotype. Within the context of instruction, teachers who expect and believe their students to do well and show intellectual growth will do so. Conversely, teachers who do not have such expectations for student performance may unconsciously behave in ways to discourage and diminish achievement.

Most recently, the work of Ronald Ferguson demonstrates yet another impact of stance upon instruction and student engagement. His research includes numerous surveys of seventh and eleventh grade students from school districts with strong financial support but still demonstrate an achievement gap. These surveys indicated a significant number of non-White students feel that encouragement rather than demand is a stronger leverage for classroom engagement (Ferguson, 2007). Encouragement unlike demand emerges from an affective rather than cognitive domain. Teachers tend to encourage students for whom they see to have potential. It is true that potential is often benchmarked by test scores or past schoolwork performance, but these measures can be a misrepresentation of intellectual capacity. Students who do not feel a sense of commitment to or a belief in their ability in the school settings often do not engage their full potential within the classroom setting.

Engagement in the classroom with little doubt has a strong link to a feeling of belonging. Students who know they are safe, have a sense of value, and are able to exhibit some degree of power and self-actualization will no doubt exhibit stronger engagement in school. Those students because of issues of social justice who feel lost, separated, and have no sense of belonging will seek their "own sense of belongingness" in a context that is more antisocial (Kaplan & Johnson, 1992).

All these findings reflect a special importance of teacher-student relationships as a source of achievement motivation for Black, Hispanic, and disenfranchised students. Here again, the unconscious stance regarding a student's identity has a major impact upon the authenticity or "specialness" of that relationship. Herbert Kohl (p. 124) suggested the following regarding the absence of that relationship:

> To agree to learn from a stranger who does not respect your integrity – or I would say, your identity – causes a major loss of self. The only alternative is to not learn and reject the world.

The Journey: Leadership and Racism Program Description

The Leadership and Racism Program (LRP) is a professional development program which assists teachers and administrators to develop the knowledge, skills, and dispositions necessary to integrate social justice issues into the learning environment and to implement culturally relevant teaching in their classrooms and schools.

LRP is based on the premise that there is an important correlation between student achievement and the capacity of teachers and administrators to develop and sustain a critical consciousness about race, class, and gender. The program facilitates the growth of race consciousness through a series of activities and discussions that focus on the intersection between the participants' individual racial identity and the enactment of their role as teacher and/or leader of the district's curriculum and instruction goals.

The program opens with a 2-day overnight retreat (20 h of instruction). The retreat is experiential, asking participants to understand and address their own issues with race, in the context of other oppressions, for example, class and gender. As has been established, the program attempts to balance "stance" and "strategies" giving each of these domains an equal standing with regard to the development of critical consciousness. The retreat is followed by sessions conducted over a school year in school and district settings. These sessions assist districts and schools in building leadership teams by helping individuals continue practicing "courageous conversations" with their team while expanding their capacity to "talk race" to others they encounter in their role as educators. The success of transferring the insights gained from the retreat to the school setting is dependent on establishing trust among the individuals on the leadership teams as well as the continued development of skills to incorporate effective strategies into the enactment of a culturally relevant curriculum. This connection between "talking race" and increased trust among administrators, teachers, and learners leads to an increase in student achievement.

Unlike other professional development programs, the LRP does not provide a "lesson plan" that can be adapted and implemented into a classroom. Instead, the program is built upon the same ideology as expressed by Dewey (1923) that education is "a process of living." For this reason, we often refer to the program as *a journey*, and though all of us have not arrived yet, we agreed to go.

The Retreat

A 2-day retreat begins the program, and during this time, participants focus upon personal stance, i.e., the dispositions, attitudes, and beliefs that are held regarding differences. Beginning with stance, in particular a stance that evolves out of our socialization regarding race, can only be transformative in an environment that is free of blame, shame, or guilt. An environment of safety emerges from one in which language is clarified. For this reason early on, we make explicit the definitions used for this leadership development work, which include:

- *Prejudice*: an attitude, opinion, or feeling formed without adequate prior knowledge, thought, or reason.
- *Discrimination*: the effective, injurious treatment of other groups so as to give an advantage to one's own group.
- *Oppression*: the one-way systemic mistreatment of a defined group of people, with that mistreatment reinforced and supported by society.

- *Racism*: a complex system of beliefs and behaviors, which are both conscious and unconscious and personal and institutional. They result in the oppression of people of color and benefit of the dominant group. It is a system grounded in the presumed superiority of the White race.

These definitions are introduced to participants with certain visual representations to enhance understanding and applications. A prejudice can be viewed as a "narrative" often established outside of our own identity development. This narrative becomes an unconscious tape that plays out in our heads when we encounter differences. This tape includes distorted narratives about people different from ourselves. In her book, *Young Gifted and Black*, Theresa Perry (2003) suggests that what we need in schools is a "counternarrative," one that confronts the messages surrounding our young people about their lack of intellect and capacity for learning. Discrimination, unlike a prejudice, is visible and an action, one that supports a dominant group while targeting a subgroup. Oppression has an "architecture" and does not emerge out of accident but instead by intention. Finally, although race is a social construct, racism is an intentional oppression which also has a structure. These definitions are presented to the participants as a demonstration of transparency without a need to seek group agreement.

The exploration of each of these definitions and their impact upon our personal lives is then supported with three fundamental anti-oppression constructs: the cycle of oppression, the table of oppression, and the fabric of oppression. These constructs assist participants in a deeper level of learning regarding racism and other oppressions.

Cycle of Oppression

This model outlines the manner in which the outside world has influenced the way we think about others and ourselves. The cycle begins in our early years when we encounter misinformation, missing history, biased history, and stereotypes. We refer to these as messages that define ourselves and others. Often these messages come from loved ones and significant persons in our lives. They come to us as well from the media, our faith-based affiliations, and of course school. Peter Taubman's (1993) work regarding identity development calls this early stage a "fictional register" filled with distortion serving to imprison us as subjects leading to alienation and objectification. A second stage in the cycle is that of formal institutions that reinforce these earlier messages. This would include the media, government, houses of worship, economics, and, again, education. These two stages cause an internalization of belief systems that ultimately lead to a final stage of collusion in which each of us passes the same messages we received on to our children. The cycle of oppression as an overview of our socialization process begins the personal journey as each participant revisits the messages they heard and learned at younger ages. The cycle is a first episode of reflection in this journey in which participants uncover what may have been installed and reinforced in our own life experience. Ultimately, our effort is to interrupt the conscious and unconscious ways in which we each collude with these messages, in particular the negative messages about differences that we have encountered about other identities.

Table of Oppression

The table of oppression is a graphic way of presenting the “architecture” of oppression. It also provides individuals a way of thinking about themselves and their own individual collusion, both conscious and unconscious, regarding oppression. The table stands because of two sets of legs that hold it in place. One set of legs belongs to the dominant group, and for the oppression of racism, that would be the White race. Built upon the distortion of the Calvinistic doctrine, the Pilgrims arrived with the idea that God had constructed mankind upon a hierarchical system in which “whiteness” was closest to God and their cause was sanctified as “Manifest Destiny.” The notion of supremacy was consequential to a belief of a status of privilege, entitlement, and advantage. This belief gave as well a right of ownership over those that have been deemed “less than” in the eyes of God. The set of legs – supremacy and privilege – essentially led to the construction of the other set of legs that of internalized oppression and targeting.

In racism, the targeting of people of color is ubiquitous as it exists in all “walks” of life. Opportunity and access for goods, resources, and benefits are clearly diminished by the power held by the dominant group. This constant barrage of assault leads as well to an internalization of the oppression, one in which, as Paulo Freire suggests, over time the thinking that was used to oppress individuals will be internalized and ultimately they will oppress themselves and will not need the dominant group to keep them in subjection. He further states that the tool of the oppressor is the mind of the oppressed.

This table assists individuals in examining the institutionalization of racism. It is important for participants to recognize that racism, and for that matter any system of oppression, is not merely personal behavior but exists within a systemic structure the holds both privilege and power in place. The symbiotic relationship of privilege and targeting and superiority and inferiority helps participants understand how each racial group has personal challenges to address as well as the work that must be done together.

Fabric of Oppression

As has been stated, though the focus of the LRP is racism, the work does not ignore the social injustices of other identities. Both the cycle of oppression and the table of oppression apply to the multitudes of identities that we each possess. Realistically, no student is asked to leave at home their identities regarding gender, age, religion, sexual orientation, looks, abilities, etc., before they arrive at school. Nor should we ask this of our educators. The oppression of any of these identities is constructed in the same way, with a dominant group having power and privilege, while others remain targeted and experience limited or no access to goods, services, and resources. Additionally, we cannot at any time divorce ourselves from our own specific identities. Thus, we present this model as a fabric of oppression with each of the strands representing the multitude of "isms" we encounter in our society. This model also allows the opportunity to see the ways in which all of these "isms" intersect so that as a male in the dominant gender role may indeed have privilege, a Black male might experience that privileged role differently than a White male. This construct reflects the complexity of living in a very pluralistic society in which social injustice can easily be obscured, ignored, or minimized.

These three constructs are examined with multiple forms of mini-lectures, interactive activities, dialogues, triad conversations, and both White and people of color caucuses. The variety of configurations in which this courageous conversation is structured allows for various viewpoints, beliefs, and experiences to surface among participants. Frequently, the call for "no blame/no shame/no guilt" helps to maintain the conversations so that the dialogue is not silenced. Early in the retreat, a set of norms are establish that include respect, engagement, speaking from one's experience, and listening with the intent of being influenced and are offered to maintain an environment of safety and honesty. Examining each of the table legs of oppression can easily provoke feelings of distress, anger, and/or confusion. The retreat is designed in a way that acknowledges these feeling and provides a path which enables understanding, empathy, and a willingness to address racism.

The Follow-Up Sessions

The success of transferring the insights gained from the retreat to the school setting is dependent on establishing trust among the individuals on the leadership teams as well as the continued development of skills to incorporate effective strategies for enacting culturally relevant curriculum.

As stated, the retreat begins the journey. At the conclusion of the retreat, participants are divided into groups referred to as ally groups. These groups are expected to meet regularly to continue the conversations regarding their personal growth in developing their own individual critical consciousness of the issues of racism and how it impacts their classroom and school or district. The ally groups can serve as a pivotal leadership function to focus a social justice lens upon the school systems' policies, practices, and decision-making processes.

After the retreat, participants meet for an additional 24 h of professional development. It is during these follow-up sessions that we begin to shift the focus from personal stance to professional strategies. These sessions examine more thoroughly the work of Theresa Perry, Claude Steele, and Asa Hilliard III's outstanding essays in their book: *Young Gifted Black*. In this examination, participants begin to construct counternarratives as examined by Theresa Perry. They explore the issue of stereotype threat as researched by Claude Steele and its impact upon instructional practice. Finally, this same book offers Asa Hilliard III examination of the true essence of the "gap" and its spurious relationship with achievement as opposed to preparation. Follow-ups also begin the process of talking race in the classroom. Using Jane Bolgatz book (2005), *Talking Race in the Classroom*, participants explore strategies for having conversations regarding social justice issues within the classroom setting. Finally, the Center for Research on Education, Diversity & Excellence (CREDE) offers a set of instructional standards that make cultural relevance within the classroom setting explicit behavior rather than implied practice. Some districts have incorporated the CREDE standards into their curriculum development and review process and into teacher and administrator evaluation.

LRP: Theory of Change

This connection between "talking race" and increased trust among administrators, teachers, and leaders leads to an increase in student achievement. This triad of learning – self-awareness, leadership team building, and culturally relevant instruction – characterizes the three phases of the LRP program. As participants deepen their awareness of the impact of race on their professional behavior (Phase I), they are enabled to create more authentic relationships across difference with colleagues, administrators, students, and parents. This strengthens individual voices for social justice and enables leadership teams to become proactive in acquiring resources to improve teaching and learning of their students (Phase II). Support and interaction of leadership teams at both the school and district levels enable courageous conversations to inform curriculum and instruction and school and district policy (Phase III).

Two Lenses for Making a Difference

Educational research regarding professional development is often the examination of correlations between the developmental experience and its impact performance. One lens to assess the impact of LRP includes a study of the development of a critical consciousness regarding social justice issues (the experience), and a second lens is an examination of the patterns of changing behaviors within the classroom and district settings (performance).

Research Findings: A Lens upon Stance

A study was conducted to determine if the program's use of affective strategies at the retreat shifted the disposition and stance of participants toward their own participation in institutional racism and if shifts in consciousness transferred to changes in the school setting. The research hypothesis was:

> If the program impacted participants' stance towards race and institutional racism, then evidence of discourse would indicate a shift from color-blindness to color-consciousness. Secondly, would color-awareness transfer to anti-racist leadership activities in daily activity?

This is a qualitative, longitudinal study of the impact of the program over a 6-year implementation period. Conclusions and insights were based on a conceptual analysis (Bogden & Biklen, 2007) of the evaluation summary data provided by participants at the close of their retreat and at the end of the last follow-up session. The summary data are comprised of an average rating on a 5-point Likert scale and comments written by participants on eight open-ended questions on the retreat and follow-up evaluations. Evaluation summaries included in this analysis represent 19 schools who participated in the program from 2003 to 2008. The participants in the retreats and follow-up sessions were from multiple school district roles: teachers, administrators, staff, and parents. The responses used as the primary data source in this evaluation are not identified by school district role, race, or other demographic markers.

The evaluation summaries from both the retreats and follow-up sessions were read and coded in the following manner:

1. Codes were applied from themes identified from the stated purpose of each of the two parts of the professional development program, i.e., retreat and follow-up. These were "color consciousness," "knowledge of racism," and "strategies for action." As stated in the program design, color consciousness and knowledge of racism were emphasized in the retreat, while curriculum and strategies for action were emphasized in the follow-up sessions.
2. Themes that emerged during the analysis were added to the code list and reapplied to all reports in an iterative process. There were two dominant emergent themes. The first was derived from comments about vulnerability, honesty, openness, and deeper understanding of colleagues. These were summarized into the thematic category, "affective relational." A second dominant theme was derived from comments about the workshop activities or logistics. These were summarized into the thematic category, "process comments."

Since the data presented were already summarized from individual reports, the unit of analysis is the individual response not the participant. A meta-analysis was conducted of the responses of participants on existing evaluation forms that were administered at the end of each retreat and at the conclusion of each of the follow-up programs. Each response for each question was coded according to the main conceptual themes present in the goals of the program (Fig. 31.1). Responses that did not fit the conceptual themes were labeled and categorized as emergent. These codes were reapplied to each evaluation in an iterative process resulting in a total list made up of both prescribed and emergent themes. Respondent comments that did not apply exclusively to one thematic code were assigned to multiple codes. Primary and secondary themes were assessed for the overall retreat and follow-up data sets. Analytical themes were then compared to programmatic expectations for both the retreat and follow-up phases. Primary and secondary themes were compared to programmatic activities to evaluate the impact of various activities on the participants.

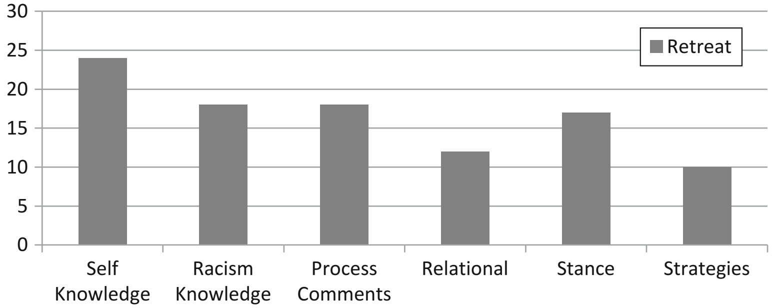

Fig. 31.1 Percentage of response by themes ($N = 3{,}937$), LRP retreats, 2003–2008

Results of Conceptual Analysis

The analysis was based on the pooled data from the implementation of 46 retreats and the subsequent follow-up sessions, attended by participants from 19 schools over a 6-year period of time (2003–2008). The coded responses have been recorded and tabulated by the question number with which it was identified. However, the participants' comments did not correlate to the question prompt; rather, all themes showed up in all question categories. So, question type was not a useful organizer for this analysis. Therefore, results are discussed relative to the frequency of response within each theme, regardless of question prompt.

Analysis of Retreat Evaluations

Generally, comments on the retreat evaluation summaries were heavily weighted toward personal awareness/awareness of racism and a disposition to change one's relationships with colleagues around issues of race (Fig. 31.1). These comments were indicative of a highly affective discourse. For example, one participant stated that the experience was "powerful, shocking, challenging." Another said, "I am still digesting everything but know my eyes are open in a way they weren't before." And another transferring awareness to a desire for personal change declared to "Stop justifying myself." Others extended personal awareness to a desire for change in the broader social sphere, "I want to become aware outside of the retreat-use in real life, be the solution not the problem." And "I want to connect with more people of the opposite race, develop my allies."

These results align with the stated expectations of the activities conducted during the retreat format and with the primary objectives of the program. In response to prompts to specify post-retreat action steps, some responses indicated a specific school- or district-based act. However, a surprising number of responses to this question demonstrated a more affective disposition or stance to address racism, not specific actions typically associated with job role in the educational setting. For example, although not directly asked, many respondents stated action steps to include working with others, affective relationship building within and across races within district teams. Therefore, the disposition/stance of participants to address racism, whether through more personal consciousness raising or "courageous conversations" with ally groups, emerged as an analytical theme and solid outcome of the program.

Analysis of Follow-Up Evaluations

The follow-up evaluations had the highest percentage of all responses in the category of a desire to enact strategic change in the educational setting. This is in alignment with the program's curriculum plan, highlighting the retreat as a space to focus on personal awareness, color blindness, and knowledge of racism and the follow-up sessions to focus on strategies that transfer to the school and/or district setting (Fig. 31.2).

These actions that resulted from individual shifts in consciousness appeared in a variety of ways. For example, in one district, a superintendent immediately changed hiring practices to recruit candidates of color into leadership positions. In another, the administrator in charge of assessment began to analyze data in ways that would reveal inequities and remedies to the racial achievement gap. In a classroom, a teacher designed instruction about racial inequities that resulted in her class of predominantly White students writing letters to their city and state legislators about policy change. Another teacher, well practiced in color-blind behaviors, pointed out to a student the similarity between a brown crayon and the color of her skin resulting in the child's willing engagement in activities previously shunned. Nearly, all of the respondents articulated a need for more time to talk with their ally groups.

Comments indicating personal awareness were also present in the follow-up but with less frequency than the retreat comments. Thus, the retreat impacts participants' awareness of racism, and more importantly, the participants retain this attitude from the retreat at least to the end of the post-retreat follow-up sessions.

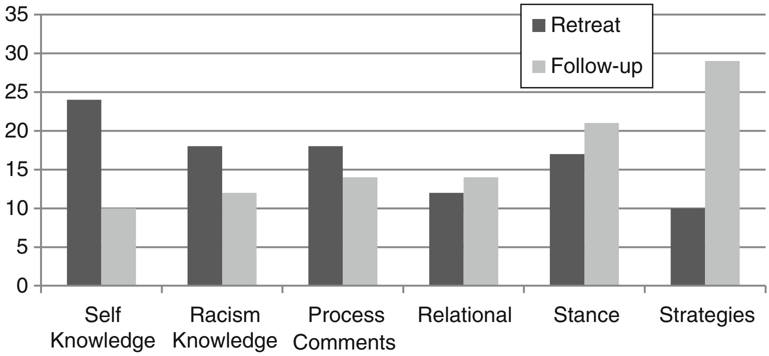

Fig. 31.2 Percentage of responses by theme, $N=3{,}937$ (retreat) and $N=1{,}760$ (follow-up), retreat + follow-up, 2003–2008

Further Considerations

Many participants wanted the follow-up sessions to attend to relational intimacy similar to that created in the retreat environment. This expressed need points to a tension between continued development of personal emotional awareness and the desire to enact strategies to address racism in the schools. The participants' comments are divided between strategies that would re-create the emotional environment of the retreat and those that directly address the racial inequities that result from decision-making in districts, schools, and classrooms.

This leads to questions of how educators might best continue the deep unpacking of unconscious racist beliefs in an institutional environment that is structured for activity, often in ways that contradict reflection. The evidence from this study would indicate that the personal and public awareness and knowledge of racism created through the retreat program transfer to the educational setting as a desire among participants to act as change agents. Additionally, the strategies for change that are enacted vary from changing hiring practices, attending ally groups to share knowledge and practices, engaging colleagues in interpersonal conversations about racism in the setting, and discovering ways to create learning opportunities for children of color in classrooms. Additional research might clarify how the deepening of emotional awareness of educators interacts with the emotional needs of students of color and the intellectual demands of the curriculum. A deeper understanding of the multiple processes that educators use to move between self-reflection and change in practice will allow more effective support structures to be provided for change agents.

Back to the Parking Lot: Level One

This chapter began with the metaphor of a parking lot to establish the social justice context upon which the Leadership and Racism Program has been developed. Three levels described in the imaginary parking lot served to provide a lens upon which the LRP program could be reviewed. The "lot" as described included designated spaces based upon customer needs. Much like a school district certain decisions are made resulting from clear and diligent examination of the various needs of students. Thus, evidence of the LRP can be viewed through participant voices at a district level that engage a critical consciousness regarding both stance and strategies.

Stance and Strategy: At the District Level

School reform cannot rest solely on the change of individual behavior without an equally aggressive change of the present public education system, which tends to support and maintain the status quo (Schlechty, 1997). A second order change leading to substantial reform is emergent, complex, and a disturbance to every element of the system (Marzano, McNulty, & Waters, 2007). Given these challenges for reform, districts that have committed to LRP recognize that moving from working with cohorts of teacher and administrative leaders to influencing entire school faculties requires a strategic effort. The strong societal norm of "not talking about race" can make members of these cohorts feel apprehensive about sharing the courageous work they are doing. This challenge is being met in several inventive ways in which social justice advocacy becomes woven into the fabric of a district culture and reflected in both policy and practices.

A small suburban school district of the St. Louis area provides an example of this strategic effort to embrace social justice within the culture and practices of the district. The district includes approximately 4,000 students of which approximately 73 % are White, while 27 % are students of color. The district also serves 19 % of students through the Free and Reduced Lunchroom program which is considered a measure of social/economic status. Beginning in 2005–2006, the district committed to social justice advocacy with the target of including their entire staff in LRP.

The superintendent whose role is much like that of a minister, CEO, or chief compliance officer, a Missouri school district, and three school board members presented at the Missouri School Boards Association Annual Meeting. Their presentation entitled *Taking an Active Role in Social Justice*: *Experiences That Lead to Action* included these characteristics for change toward social justice:

- Change requires both pressure and support from leaders. An organization that changes must change beliefs as well as practices. An organization that changes practices without changing beliefs will quickly revert to the old practices.
- Change necessarily causes ambiguity, tension, and self-examination. An absence of mistakes likely indicates an absence of growth.

The district's social justice initiatives have had significant impact upon Black student graduation rates as they have increased from 70 % in 2005 to 92 % in 2008 and again in 2009 to 84 %. Culturally relevant teaching and leading are further reflected through student voice, in which the voices of all oppressed groups are honored and activated. A strong sense of belonging and community for all has been promoted that includes a view of difference as strength and contribution rather than deficit and a need for assimilation. School board members have also participated in LRP and established an Achievement Gap Committee which reports five to six times per year upon progress toward excellence. The superintendent states:

> The social justice training provided by EEC has been life changing for myself and our district. We know each other better and we trust each other enough to talk about the hard things and to work together to find solutions that make our schools and our community a better place for children and adults.

In 2007, another school district of the St. Louis metropolitan area began their journey with nine cohorts of administrators and teacher leaders. From 2007 to 2011, a total of 19 cohorts have completed the program which represents over 400 of the professional staff of the district. This is a large school district of 17,467 students of which 66.7 % are White, 14.4 % Black, 11.1 % Asian, 3.8 % Hispanic, and .1 % American Indian. Approximately 20 % of the students are also eligible for Free and

Reduced Lunches. The district also participates in the Voluntary Transfer program, a state program, which transports inner-city students predominantly students of color into this suburban school district.

These cohorts include all levels of the professional staff, i.e., administrators, teacher leaders, professional support staff, and noncertified employees. The Director of Pupil Personnel/Educational Equity, a central office administrator, leads this district initiative. In an effort to insure continual growth of participant, she strengthened the ally groups with scheduled dates for meeting and provided additional resources beyond the LRP curriculum. To further insure the integration of social justice advocacy, the district designated a lead teacher and administrator in each building to promote social justice initiatives and courageous conversations. The teacher designee of this program is identified as a "Diversity in Action" leader and receives a stipend comparable to other coaches and activity leaders. The director also found that the leadership of the Diversity in Action leaders has:

> … paid great dividends regarding the 'spread' of social justice advocacy work. The common language developed by administrators in LRP became a significant contribution to the goal of eliminating the academic achievement gap.

Another way in which social justice advocacy for educational equity becomes institutionalized is by helping educators see it as a "natural" fit. In one central Illinois large urban school district of over 6,000 students, the principal of the middle school shared the following regarding his leadership role to support social justice advocacy:

> The foundation for social justice advocacy must be embedded in the vision of the leader. Moving along a continuum toward cultural competence needs to be a part of the climate of the school. This is accomplished through education and training (head), deepened relationships (heart), and action (hands).

This school includes a student population that is 60 % Caucasian and 38 % African American and includes 57 % of students eligible for Free and Reduced Lunchroom. The principal benchmarked the essential connection between personal journey and professional practice through their Positive Behavioral Intervention and Support Program (PBIS) data that has been collected for numerous years.

PBIS is a national program which identifies disciplinary action in ways that are uniform, consistent, and effective. Collection of this data over time helps staff members to recognize effective intervention strategies, inconsistencies of practice, and development of a stronger focus upon students in greatest need of intervention. This was the "natural" data used by the principal to help staff recognize disproportionality of race in office referrals.

Research indicates that policy statements regarding disciplinary procedure are generally race-free. However, the implementation of such policy is not free of whatever "stance" the administrator or teacher holds. In one study by the Indiana Education Policy Center, the following was reported:

- White boys are referred to the office for smoking, leaving without permission, obscene language, and vandalism.
- Black boys are referred to the office for disrespect, excessive noise, threat, and loitering (Skiba et al., 2000).

This study suggests that referrals for Black boys are dependent upon teacher perceptions, as none of the reasons for a referral described explicit violation of rules. The research goes on to state:

> Absent support for any plausible alternative explanation, these data lend support to the conclusion that racial disproportionality in school discipline, originating at the classroom level, is an indicator of systematic racial discrimination. (Skiba et al., 2000)

One item used in the assessment of teachers from The National Center for Culturally Responsive Educational Systems asks, "*Is the teacher aware of how his/her own racial identify affects his/her assessment of the student*?" (NCCRESt, 2005). Thus, stance can disproportionately impact disciplinary referrals to the office.

The principal, using PBIS data, was able to support the effort toward racial consciousness within his staff. Through sharing and examining discipline data by categories of behaviors (i.e., "subjective" categories such as defiance, disrespect, and disruption), school staff were able to affect a 37 % decrease in subjective referrals for all students from 2006–2007 to 2008–2009. Additionally, over a 4-year period, the data also included a significant reduction of referrals for special education testing from 2.6 to .1 %. This reduction, at a middle school level, is of significant importance as Black males remain disproportionately identified for special education. Further fewer referrals to the office meant increased instructional engagement, a major element of reducing the achievement gap.

Back to the Parking Lot: Level Two

A second level of the parking lot included customers who arrive respecting the designated spaces by parking in other locations. We would suggest that a majority of teachers, in a similar fashion, arrive at the school house door respecting the decisions of differentiation that have been determined by the system. We also believe that these teachers do not consciously make decisions that harm or exclude students from a positive learning experience but may unconsciously behave in ways that can minimize student growth and achievement. Thus, another lens of evaluating results of the LRP is the voices of those directly involved with instruction and the manner in which this work has influenced their practice.

A Lens of Stance and Strategy: In the Classroom

Christine is a young woman of color, who first participated in LRP in 2003 while in her senior year as an education major at Southern Illinois University. She continued to participate in numerous Educational Equity Consultants programs as she moved in her career from classroom teacher to teacher leader to central office administrator. She is presently working as a doctoral student at the University of Illinois with a focus upon critical literacy instruction for Black boys. The following is her reflections regarding the impact upon her stance as a classroom teacher:

> As educators, we constantly bring our own theoretical stances and frameworks into schools and classrooms. Prior to my participation in LRP, I was not consciously aware of my stance. I was not quite able to clearly articulate the influences or the structures that framed my life. While my stance was the driving force of my classroom instruction, my practices as an administrator and even the actions that governed my personal experiences, I never took the time to either acknowledge or reflect upon these actions or my social behavior with students and colleagues. The fact remains that this is the case for many educators. This then makes it extremely difficult or one may argue impossible to understand the identities and perceptions of children in our classrooms. The LRP program therefore brought light to my stance(s) in education and the theoretical framings that guided every aspect of my personal and professional world. This allowed me to then critically reflect upon my own thinking and actions and in many ways gave me the "critical literacy tools" to "read" myself and positions among local and broader contexts.
>
> With other participants, I experienced both joy and pain, which were both essential as we worked to uncover painful experiences or realities that governed our lives. And it is necessary to do so in this society in our current culturally diverse landscape. Many teachers teach and work with others who have cultural identities different than their own so it is not just encouraged, but necessary that we have spaces to collaborate, share, develop and understand the identities of ourselves and others. The LRP workshop was this space. This space allowed us to "step outside the comfort" or those practices that make life comfortable or easy (often creating few learning opportunities). Learning and engaging one another in uncomfortable spaces gave us the opportune time to learn about ourselves. In traditional education courses and professional development, teachers rarely get the chance to just learn about who they are.

In 2003, Ronald Ferguson's research revealed that teachers' expectations for success were higher for White students than for African American students. In other research, teachers who lack confidence regarding their ability to teach children successfully will tend to implement strategies of speed and precision rather than meaning and understanding (Good, 1987). The elements of expectation and confidence create a unique variable when working with students of color, as noted in one study: negative perceptions and low efficacy held by White teachers were found to be three times greater with African American students than White students (Jussim, Eccles, & Madon, 1996). Expectations, confidence, and efficacy all emerge from stance. The weekend retreat is a first step toward developing a critical consciousness that will challenge these elements of stance as they impact instructional behaviors. However, the continuation of this work is the challenge to bring this consciousness into the classroom and school settings. Another participant voice exemplifies this critical consciousness that balances stance and strategies within the classroom setting.

Sarah is a first year communication arts middle school teacher for a large suburban outside of St. Louis, Missouri. Her classrooms included 61 % White students and 39 % student of color. Included in her class assignments were students identified for special education support as well as those students identified gifted. Students assigned to Sarah's classroom may well reflect the diversity of numerous middle school classrooms throughout the country. In the summer of 2010 prior to her first teaching assignment, she became a participant of the LRP along with 25 other district educators. Her undergraduate coursework included some classes in diversity, but none in her opinion were of great depth. She did do volunteer work with a program through the Columbia Missouri Housing Authority entitled Moving Forward.

She felt that this experience was significant and served as a catalyst for her search for deeper meaning regarding teaching for a diverse student population. She is a White female whose life is that of middle-class suburban experience.

Reflecting upon the LRP program, and in particular the development of a critical consciousness, Sarah regards the experience as a major catalyst impacting her planning and implementing instruction, developing relationships with her students, and striving to insure each students' success within her classroom. In viewing the struggles that adults, including herself, encountered during the retreat while unraveling the complexity of personal identities and racial stance, she felt a strong sense of empathy which she then carried into her classroom. Her feeling was that her classroom could offer the opportunity for these young individuals' to seek a sense of self in constructive ways and her content of communication arts would be their vehicle. Thus, a major attribute of her emerging critical consciousness was not merely empathy – the capacity for caring, but, more importantly, agency – the capacity to act. Her sense of cultural sensitivity within her classroom went far beyond a "study and celebrate" agenda but instead toward activity toward assisting her students in knowing self and relationships with others. Literature, as has been stated, became an excellent tool for this exploration.

Sarah also strengthened her own confidence in speaking with her students about race supported by the follow-up session in which we explore Jane Bolgatz's book (2005), *Talking Race in the Classroom*. Participants examine ways to construct discussions in which issues of race and racism are considered instructive rather than taboo. Bolgatz states that:

> We learn to talk about race and racism by talking about race and racism. Talk gives shape to our ideas and helps us complete our thoughts. When we talk with others – particularly those considered different from us – we can explore creative ways to interact.

All these support Bolgatz's definition of racial literacy: "being able to interact with others to challenge undemocratic practices."

For Sarah, this session along with her ally group (smaller groups of participants' cross-race that meet regularly between follow-up sessions) helped to create a confidence in her willingness to talk race with her middle school students. She states:

> I was not a teacher that was squirming when the subject of race came up in the classroom. Thus, my students didn't have to "squirm" either and we had authentic conversation.

One specific lesson that Sarah developed for her classes represents well her critical consciousness regarding the development and facilitation of instruction focused upon authentic exploration of identity development. With her students, she discussed the difference between the notions of "deserving" and "worthiness." She helped her students distinguish the sources of these human attributes. The students shared that deserving is a benchmark achieved by others' assessment. Worthiness, by contrast, emerges from an internal source, a personal measurement of self.

This became a focus for a lesson involving poetry. Using a number of different sources for prewriting, students began to explore their inner characteristic. Shel Silverstein's poem – *The Invisible Boy* – began the student's exploration of what might be invisible about each of them. Sarah also used *Skin Again*, by B. Hooks, to deepen the exploration beyond the racial identity of skin color. This prewriting activity, a substantial part of the writing process, gave each student some idiosyncratic ways to recognize their personal identity.

Nikki Giovanni's poem entitled *Ann's Poem* gave an excellent poetic structure through which she writes about three themes about her friend Ann. The themes include physical attributes, emotional characteristics, handling difficulties, seeing the world, and expressing joy. Each student then composed their own "I" poem by replicating Giovanni's poetic structure with their own personal themes. A special morning was set aside with invited guest to hear each student share their poem.

The lesson reflected well Sarah's sense of efficacy, high expectations, and a stance that acknowledges the intellectual capacity for success of ALL her students. She exemplifies the balance of stance and strategies as hoped for in the LRP. She continues to explore in numerous ways an instructional approach that mirrors the ideology of Paulo Freire (1970) that literacy is not merely reading the word but reading the world.

Back to the Parking Lot: The Final Level

Our final parking lot reflection were of those who ignore the special needs of designated spaces or deny their need and park wherever they wish. It is unfortunate that this too may describe educators who ignore needs and significant data that would cause them to behave and work differently. As stated previously, these may be individuals who "carry on regardless" or offer a "color-blind justification" for their lack of a social justice conscientiousness. Impacting these individuals in ways that will move their patterns and practices of instruction in a manner that supports social justice advocacy may only be obtained through a careful evaluative process, i.e., one that benchmarks specific behaviors and skills.

A large urban school district in Illinois engaged in a strategic effort to include a social justice emphasis within their existing teacher evaluation process. Their clinical model, much like countless other school districts, includes a preconference/observation/post-conference protocol. Questions were developed by school leaders for use during these conferences to promote the instructional behaviors of equity they wished to observe. When examining how a teacher could use a student's life experience in preparing a lesson, the principal might ask: *How will you connect the lesson plan to the experiences and prior knowledge of all of your students*? During the lesson, the principal might gather data that provides a picture of how the teacher circulates, who the teacher calls upon, for which students does the teacher elaborate upon answers, and who is engaged in the lesson. Many of these questions are not new to a clinical evaluation methodology. But this district was insistent upon making racial consciousness a significant attribute for lesson development and facilitation.

In one end-of-year reflection, a principal noted that a teacher's grade distribution had an unusual racial pattern. Rather than excusing the data, she placed it in front of the teacher and asked that they spend time talking about the impact of this information.

The principal indicated that her LRP experience provided her the “lens” to notice this information and to have the courage to address it.

In Summary

The critical consciousness achieved by participants of LRP regarding a social justice agenda enables school leaders to address all three of these “parking lot” levels. It has caused administrators to act vigorously to formulate policies, strategies, and actions to respond to social injustices that are created by the system. It has engaged educators in a courageous exploration of their own “stance” regarding difference and how that “stance” impacts their instructional practices as well as the relationships they share with their students. Finally, this critical consciousness is further benchmarked by educators who will actively engage other colleagues in an effort to “level the playing field,” so that all students can achieve success.

The Leadership and Racism Program is clearly an effort to go beyond the political agenda of narrowing the achievement gap and, instead, reforming school environments through a social justice advocacy so that the elements that create the “gap” do not exist.

Chapter 32
Confronting Social Injustices in the Praxis Wetlands Where Research, Policy, and Activism Integrate

Louise Gonsalvez

Introduction

> Another source of critique of social science methods is activist research – an area that has garnered increased recognition in recent years. Debates about the blending of political commitments with scholarly research agendas raise epistemological questions about the nature and value of research as well as political questions about how scholarship might act in conjunction with struggles for social justice. The convergence of both critiques at this juncture calls out for critical analysis. (Mendez, 2008, p. 136)

Researcher, feminist, and activist Gloria Anzadula wrote about highly transformative, cultural spaces she calls "nepantla," and the transformative "nepantlers" who inhabit these in-between spaces that privilege some while marginalizing others (Anzaldua, 2002, p. 1). Her writings about researchers situating themselves in "nepantla" to seek knowledge and assist emancipation led me to the metaphor I wanted to use to write about an important transformative space where theory and social justice action converge. It is a praxis zone where researchers, activists, community groups, educators, and others gather to identify, analyze, and confront injustices (e.g., sex trafficking, water privatization, homophobic bullying) that affect students, communities, and society. I call this place los humedales – the wetlands – metaphorically comparable in their structure and functioning to the coastal wetlands where land and sea, like research and activism, fuse to become a singular space. As with the coastal wetlands (e.g., the shoreline and the ocean), power (e.g., the oppressed and the oppressor) and praxis (e.g., theory and practice) both "mutually intersect and constitute each other" (Johnson & Maiguashca, 1997, p. 37). I will capture how the "praxis wetlands" are an effective place to confront social injustices, and I will reveal how educators can play an important role in addressing social injustices.

By first sharing my lived experiences (e.g., Gonsalvez, 2005b) of researching and confronting social injustices in the praxis zone (e.g., Freire, 2004) and then discussing the lived experiences of other researchers, I can best present and analyze my claims: that praxis (e.g., research and activism combined) is a fitting place to confront social injustices and that contemporary critical transnational feminist praxis research is a prime example. Maturna and Varela (1992) state, "What we do intend is to be aware of what is implied in this unbroken coincidence of our being, our doing, and our knowing. All doing is knowing, and all knowing is doing" (p. 26). I bring this to your attention because I intend that you "know my doings" and I share "my knowings" (e.g., my social justice knowledge and experiences), as well as discuss the work and inquiries of others working in the praxis zone. Varela, Thompson, & Rosch, (1991) note that "The new sciences of mind need to enlarge their horizon to encompass both lived experience and the possibilities for transformation inherent in human experience" (p. xv), while Stanley (2008) notes that "there is a need for a 'necessary circulation' through first-person accounts and third-person descriptions" (p. 2). Thus, I begin by sharing those experiences that have transformed and shaped my "knowing and doing" of confronting social injustices.

As a rationale idealist (Davis & Davis, 1982), scholar activist (Fine, 1994), and social justice policy writer, curriculum designer, and educator, I actively confront historical, systemic, and emergent social injustices. My research, policy-writing, and advocacy work are seldom compartmentalized, and it is while working in the overlapping praxis zone of research and activism that I do my best work. I've seen how activist research leads to policy changes and subsequently enhances the lives of others. I've researched, lobbied, wrote policy, and developed curriculum on such issues as sex trafficking, water privatization, homophobia, prostitution, dating violence, teen suicide, rape, genocides, and polygamy. My social justice work has introduced me to local issues and taken me to some fascinating places such as Ghana, Ecuador, the Galapagos Islands, South Africa, and China. In my experience, I have found that whether I'm working at home or abroad, the most effective research and activism I do takes place where researchers, practitioners, activists, and those being oppressed work together – in the place I refer to as "the praxis wetlands."

In 2005, I volunteered at Congal Biomarine Station which is a research center situated on the northwest coast of Ecuador. The memory of this experience came to mind when I began writing this chapter and I revisited an article I wrote and began reading:

> I didn't think I'd ever become the machete-swinging maiden of the Esmeraldas. Neither did I think I would be an Eco-rebel invading an abandoned shrimp farm to plant mangroves. Despite ticks, misquotes and fatigue, this Wellington boot wearing volunteer mud-bogged through Ecuadorian swamps and trekked through South American jungle habitat …We all know that the forests are the lungs of the earth but I never knew that the coastal wetlands, as for example the gnarly high rooted mangroves, are essentially the gills to the seas. After an international symposium on wetlands, governments and environmental agencies acknowledged the high importance of these once considered worthless wastelands. Their roots secure coastal shores, the tides exchange salt for photo-plankton rich ingredients, the estuaries are a haven for small marine life and the trees are not only a habitat for wildlife but also a carbon engine for the air we breathe… (Gonsalvez, 2005a, n.p.)

At Congal Biomarine Station, we conducted research on various bio-marine and farming practices while at the same time identifying, analyzing, and confronting issues such as poverty, malaria, and food shortages. We also assisted the locals with microcredit projects, education, and technology skills – the center was situated in oceanic wetlands and we operated as a research/community action site – a place of praxis. Congal Biomarine Station is a place where oceanic tides literally roll in and out of a network of mangrove swamps, and it is also a praxis wetlands, where research, activism, and policy-writing/projects coexist.

A vast majority of Ecuadorian people living in the wetlands love to dance, so in my initial, more whimsical and unedited title, *Manglares*, *Marimbas and Vida Marina*: *Confronting Social Injustices in The Praxis Wetlands*, I more specifically alluded to the manglares (mangroves), the marina vida (marine life), and the women and families, who despite their struggles love to marimba (e.g., a form of Latin dance). Songs, dance, and celebration are often an integral part of work in the praxis zone as evidenced in the following experience I participated in:

> One of the goals of the Congal Biomarine Center is to promote the resurrection of abandoned shrimp farms. In the eighties huge dikes and reservoirs were built to create shrimp ponds that captured the harvests of the seas on a high tide… Conversely, if shrimp farms were completely abandoned then the dikes and ponds were often destroyed to make way for mangrove replanting. To celebrate international mangrove day we joined forces with several other environmental agencies and youth groups to break down the walls of a shrimp farm and replant mangroves in the gooey mud. We couldn't even wear our rubber boots because the mud demons would suction them away. To commend our work at the end of the day, all the restaurants on Muisne Island opened their doors for free meals and the following night the community had a rip-roaring festival which culminated with hundreds of people dancing the night away to salsa, marimba and meringue music. (Gonsalvez, 2005a, n.p.)

Activist research in the praxis wetlands is hard work, exciting, and rewarding. It not only produces new knowledge but it also creates social change.

Using Praxis to Confront Social Injustices

Praxis is the place where theory, practice, and change-making coexist – it includes the particularities of each (e.g., theory, practice, and social justice), and it is a site where reflection, imagination, and social justice are conjoined by a moral imperative to assist the liberation of the oppressed and transform lives. Nagar and Swarr (2010) state:

> Praxis is understood as the processes of mediation through which theory and practice become deeply interwoven with one another. It is often traced back to Paulo Freire's (1993 [1970]) concept of liberation as praxis – that is, the cycle of action, reflection, and action through which human being work to transform their worlds. (p. 6)

The idea of a conjoined praxis (e.g., activism and research) is a highly contested concept in academia, as many feel research and practice should be isolated spaces. But praxis is unique as it can suspend time, place, and material limitations – it is a place where the "sociological imagination" (Mills, 1959, p. 5) can look back in history, forward into the future, and beyond constraints of existing sociopolitical, cultural, and environmental conditions. I will illustrate what I mean in the following recollection, but I must warn you that it takes me a minute to draw upon my experience before I explain how the parts of the story demonstrate praxis in action – theory, practice, and change-making conjoined to confront a social injustice.

In 2007, I was sponsored by the British Columbia Association for the Learning and Preservation of the History of World War II in Asia to participate in a tour of China which included visitations to Nanking where the 1937 genocide took place, to Shanghai where we met and interviewed some of the "comfort women" who had been forced into sexual slavery by the Japanese imperial army during WW II, and to Harbin where live subjects were experimented upon to gather data for biological/chemical warfare. The trip included a series of academic lectures, interviews with victims of human rights atrocities, and visitations to tourist sites. Prior to our departure, we were responsible to attend a series of sessions that introduced us to some of the issues this organization was confronting, and this is when I was introduced to the work of Iris Chang who wrote The Rape of Nanking.

Iris's extensive research revealed that in 1937, Nanking had been the sight of a massive genocide (Chang, 1998, p. 221). A Canadian by the name of Norman Bethune established a safety zone to protect upwards of 300,000 Chinese (Chang, p. 139), and Minnie Vautrin, a teacher, helped protect those in the safety zone and documented events in her diary (Chang, p. 261). What drastically affected me the most was to learn that the Japanese had established upwards of 200 "comfort women" houses where, according to expert Dr. Su, as many as 200,000 women were forced into sexual slavery (Zhen & Linin, 2007). As a point of clarification, I want to note that I previously was sponsored for an Asian Pacific exchange to Japan, so I mindfully remember that I am examining an issue not condemning a particular race. Chang (1998) describes the institutionalized rape that was established by the Japanese Imperial Army:

> Japanese high command made plans to create a giant underground system of military prostitution – one that would draw into its web hundreds of thousands of women across Asia … The first official comfort house opened near Nanking in 1938 … the conditions of these brothels were sordid beyond the imagination of most civilized people. Untold numbers of these women (whom the Japanese called 'public toilets) took their own lives when they learned their destiny; others died from disease or murder. Those who survived suffered a lifetime of shame and isolation, sterility, or ruined health. Because most of the victims are from cultures that idealized chastity in women, even those who survived rarely spoke after the war – most not until very recently – about their experiences for fear of facing more shame and derision (p. 53)

As we had a film crew with us on the tour, we interviewed elderly women who recollected the horrors they experienced as comfort women, and we were fortunate enough to be at Dr. Su's opening of the first comfort women museum in Shanghai (Zhen & Linin, 2007). As a gesture of appreciation, I had offered to raise awareness of this chapter of history and Iris Chang's work by creating resource materials to accompany the new Social Justice 12 course (British Columbia Ministry of Education, 2008) that I had the honor of cocreating. What I didn't realize at the time was that Iris had committed suicide, and later, this weighed heavily on my heart. Iris spent thousands of hours researching what had happened to the comfort women, lobbied governments to seek an apology from the Japanese for what had happened, and raised the public consciousness of a chapter of history that had been omitted from the history books. She delved into thousands of documents, interviewed multiple victims, and worked with various advocacy groups (Jacobs, 2007) – she worked in the praxis zone.

In 2007, 70 years after the event, the documentary "Nanking" was shortlisted for a Best Documentary Feature at the Academy Awards and won the Peabody and Emmy Awards (Stanford Graduate School of Business, 2011) and the movie Iris Chang: The Girl Who Couldn't Forget which was popular in theatres around the world (Miller, 2008). In July, 2007, the United States passed Resolution 121 which essentially asked Japan to apologize for what happened to the comfort women, and in November 2007, the Canadian government passed a similar motion (*CBC News*, 2007, n.p.). I met Iris's parents, attended premieres for the documentaries, and I recently published a book review of Ling-Ling's story about her daughter's life and the bond they shared; the book is entitled *The Woman Who Could Not Forget*: *Iris Chang Before and Beyond* "*The Rape of Nanking*." Praxis work can take us back in history and forward in time – it is an inclusive space where research, advocacy, and lived experiences are conjoined to advance social justice.

In the praxis zones, transformative thinking, transformative processes, and transformative change fuse with the socio-imagination to create change. As an educator, I believe it is important that educational pedagogy has a transformative paradigm and praxis. In 2007, I also traveled to South Africa and researched the prevailing water crisis in the area. I was firmly committed that efforts for educational policy reform must take into consideration a more important priority – many children weren't attending school because they were too ill or dying as a result of waterborne illnesses. As I started to conduct my research, I realized that perhaps the water scarcity narrative that was being reproduced wasn't quite accurate – the more pressing issues were that water had been privatized for profit, and people couldn't afford to pay their water bills so their lines were turned off.

After apartheid policies ended and Nelson Mandela won the national election, the International Monetary Fund and the World Bank lent funds to the country to build dams and distribute water (Gonsalvez, 2007). When the large transnational water companies became dissatisfied with the returns on their investment, they began charging fees for household water, and many citizens couldn't afford to pay their bills (Gonsalvez, 2007). Women began collecting water from cholera-infected watering holes where they risked death to disease or crocodile attacks. Essentially, the new water policies replaced the previous race-based polices, thus re-creating Apartheid conditions all over again. Many researchers, activists, constitutional lawyers, community groups, and global allies sought to make water a human right in South Africa's constitution. On October 8, 2009, the dream was realized (Danchin, 2010, n.p.), and water was declared a human right in South Africa. Later, on July 28, 2010, after substantial resistance from Canada and the United States, the United Nations also declared water a human right (Lui & Naidoo, 2011, n.p.). Research, activism, and change-making (e.g., policies and their implementation) take place in an overlapping space – in the praxis zone. Those working for social justice, whether they be researcher, activist, or policy-maker, can often optimize their efforts if they work together. I have often found that emergent issues have a time frame of their own, necessitating emergent research and quick mobilization to effect change (e.g., policy); the two groups often need to work synchronously to address time-sensitive limitations and opportunities (e.g., legislative decisions).

Change-making never ends, the struggles continue, and they often colonize new shores – praxis work has no real beginning and no real end. After creating two workshops and training nine workshop facilitators, I am pleased that the BCTF now funds "Women and Water: A Feminist Perspective" and "Thirsty for Change: The Global Water Crisis" workshops for teachers around the province. The BCTF also passed policy that prohibits the sale or distribution of bottled water in their offices and at any of their events – they are encouraging all school districts and municipalities to do the same. According to Maude Barlow, the United Nation's first senior adviser on water issues, "More children die every year from dirty water than war, malaria, HIV/AIDS and traffic accidents together" (Barlow, 2009, p. 19). Social justice research, practice, and activism often lead us to discover how systemic oppressions impact certain populations more harshly than others (e.g., water access and women's lives) and spur us to recognize that our behaviors and policies can contribute to oppressions elsewhere (e.g., investing in transnational water companies) and that we often overlook our own backyard. I discovered water issues in South Africa are gendered, race based, and income related. I then discovered the same held true in Canada:

> Drinking water conditions in many First Nations communities are deplorable and unsafe. A 2008 report entitled "Boiling Point!" revealed that 85 First Nations water systems were in a high risk category and that close to 100 communities have 'boil water' advisories on them; the Neskantaga community in Ontario has been on a 'boil water advisory' for 13 years. A CBC documentary in 2006 entitled 'Slow Boil' interviewed residents of various First Nation communities to discover that residents face such conditions as high arsenic levels in their water, water that stains their sinks and toilet bowls orange within forty eight hours of use, and completely contaminated waters where bottled water is the only safe option … A 2005 Commissioner of Environment and Sustainable Development (CESD) report deemed that First Nations communities do not have the same level of protection as the rest of Canada regarding water safety. (Gonsalvez, 2010, p. 8)

The research report "Boiling Point" raised awareness of the deplorable water conditions on Canada's First Nation Reserves (Harden & Levalliant, 2008, p. 6). As a result of research, activism, and education, the Canadian government recently budgeted monies to address the dreadful water conditions on Canadian Aboriginal reserves (Thompson, 2010, n.p.); the amount is a pittance considering the severity of the situation. More research, lobbying, and action need to take place, and I believe researchers, community members, and activists need to work together (e.g., praxis) to help improve water conditions on the reserves.

As well, now that Canada is a signatory to both the United Nations Declaration of Human Rights: Article 31 making water a human right and the United Nations Declaration on the Rights of Indigenous Peoples, Aboriginal groups, research allies, and activist allies should draw upon these international agreements to build new knowledge about the application of these agreements and catalyze corrective action. Speed (2008) states:

> Indigenous people and others are increasingly demanding a voice in what is researched, how the research is conducted, and what is done with the knowledge produced. They frequently require evidence of political solidarities and a clear commitment to producing knowledge that is of some benefit to them. (p. 234)

In the future, praxis-oriented work may be shaped more by those that are being researched and less by "hierarchies that elevate theory, research, and academic knowledge production to a higher plane than method, outreach, community-based conversations, and nonconventional academic writing" and labels them as "methodology," "activism," "atheoretical," or "unscholarly" (Nagar & Swarr, 2010, p. 8). Grassroots research, activism, and praxis may become an expanding field of study, and more research on praxis may become critically important.

Social injustices are often best confronted while groups (e.g., researchers, activists, policy-makers) work together in the praxis lands. Strict binary divides are arbitrary constructs (e.g., activist/researcher, theory/practice, personal/political) that can impede social justice work. A researcher must create paths that maintain the integrity of their inquiry (e.g., validity, reliability, objectivity) but also be aware that they are immersed in a praxis wetlands that shapes the circumstances of the research, researcher, and those being researched. Feminist praxis utilizes feminist theory and critical activist strategies to explore the layers, contradictions, and tensions that arise when confronting social injustices.

Using a Feminist Praxis to Confront Social Injustices

Critical social theory is significant to praxis analysis. "A critical social theory is concerned with issues of power and justice and the way that the economy; matters of race, class, and gender; ideologies; discourses; education, religion and other social institutions and cultural dynamics interact to construct a social system" (McLaren & Kincheloe, 2007, p. 90). As a feminist, I am particularly concerned with feminist struggles and feminist approaches to researching sociocultural, political, economic, and environmental struggles. I respect that feminists have differing views, and I highly regard feminist solidarity which focuses on supporting one another in the struggles to overcome oppressions.

Feminists engage in the contradictions that arise in research and activism, and they endorse processes that facilitate dialogue (e.g., forums, panels, focus groups). Harcourt (2006) states:

> A feminist perspective has two major implications … First, central to the vision must be ending all forms of discrimination against women and, specifically, those forms that impede human rights and foster sexual and gender-based violence. Second, we need to forge a holistic analysis that acknowledges and builds on the multiple struggles of women for sustainable natural resource management, social and economic justice, rights to water and

> land, etc. Our paper is grounded methodologically in what we call feminist praxis – the interplay of feminist ideas and practice – in shaping a vision for the future that can achieve these ambitious goals. (p. 1)

Feminists share a collective purpose to confront "the multiple dimensions of women's oppression" (Harcourt, 2006, p. 2), but they also do more. Harcourt states:

> We are defining feminism as not only the political focus of women's multifarious oppressions, be they in the global South or North, but also to include political analysis, vision, and practice that addresses the power relations between and among women and men in different cultural, economic, and political contexts. Gender analysis is the analysis of the relations among women, among men, and between men and women, relations that imbued also with differences of ethnicity, class, caste, age, sexual orientation, and race. (p. 3)

Feminist praxis is not restricted to oppression against women, but rather, it is inclusive of the interlocking oppressions that affect family and communities. A universal feminist position on all issues does not exist; women from the global South have experienced multiple interlocking oppressions such as colonialism, imperialism, and racism. Often though, feminists share a collective vision (e.g., harm reduction) but they may disagree on how to achieve this for women (e.g., to legalize or not legalize prostitution).

In 2009, prior to the Olympics coming to British Columbia's shores, our Status of Women at the BCTF was asked to respond to concerns that Pivot, a leading non-government organization, was supporting a movement to decriminalize prostitution, and they had secured a high-powered lawyer to do so. These efforts were timely, given that this could open the doors for prostitution rings and brothels in time for the Olympics. Our group gathered reams of articles on prostitution and began to analyze them. Forums, panel discussions, and interviews were set up with prostitutes, ex-prostitutes, various women's organizations, and experts in the field of prostitution. We attended an international symposium on prostitution where we dialogued with experts on the topic from multiple countries. We also sought feedback from teachers in the province. We needed to identify what the social injustice was (e.g., denying women the right to sell themselves, denying businesses the legal right to establish a vibrant sex trade and brothels, legalizing sexual exploitation, and institutionalizing harm against women), and there were competing feminist positions on the issue.

I was fortunate to work with strong feminists who mentored me and taught me about the intricacies of feminist research procedures. They taught me the importance of establishing forums for dialogue, ensuring that all voices had access to the debates, collaborating with other organizations, recognizing and respecting political differences, establishing democratic processes, researching diverse literature (e.g., academic, community based, legal), gathering data (e.g., focus groups, interviews, surveys), involving those being researched (e.g., prostitute support groups), and so many other valuable skills. I believe they gave me strong feminist roots. Ackerly and True (2010) state:

> Feminism is the search to render visible and to explain patterns of injustice in organizations, behaviour, and normative values that systemically manifest themselves in gender-differentiated ways. The variety in feminist research comes from those problems or anomalies

> that provoke the curiosity of a giver researcher; the complexity of those problems; the range of ways researchers choose to explore those, and the theoretical lenses we use to prompt and guide our inquiry. While many theoretical perspectives inform feminist work, feminist scholarship is given theoretical coherence through its roots in feminist struggles. (p. 464)

A common narrative that was being presented by those wanting to decriminalize prostitution was that it would reduce harm (e.g., taking prostitution off the streets and into protective brothels, institutionalizing regular checkups for sexually transmitted diseases, reducing crime and violence), that women had the right to secure such employment, and that women had the right to exercise sexual choice. Our textual research indicated that decriminalizing prostitution had not reduced harm (e.g., sexual assault, sexually transmitted diseases) in countries or states that had legalized prostitution, that it perpetuated violence against women, and that it didn't reduce crime. We tactfully put forth a policy recommendation that our organization oppose the sexual trafficking of women for the purpose of prostitution, presented it to our 700 delegates, and it passed. Our opponent's constitutional challenge in the British Columbia's Supreme Court failed, and we felt our efforts had paid off. I thought it was fortunate that we were able to dialogue with those most impacted by the decision (sex workers) and with groups from other countries (e.g., researchers and writers) who were able to share their expertise on the issue. Working in the wetlands (e.g., with community women's organizations, prostitutes and ex-prostitutes, other researchers, union representatives, educational leaders, academics from other countries) enriched rather than tainted our research. Given the time-sensitive nature of the issue (e.g., the upcoming Olympics and the constitutional challenge going before the courts), we needed to act quickly to collect data, analyze the data, formulate policy, and advocate for our position. The issue brought together national groups, and we were able to gain transnational perspectives on the issue of prostitution and a new topic that emerged from this issue – transnational sex trafficking.

Using Critical Transnational Feminist Praxis to Confront Social Injustices

To orientate my interpretations of the term "transnational," as in critical "transnational" feminist praxis, I first return to a concept that I am more familiar with, and that is globalization. Chang and Ling (2011) state:

> At least two processes of globalization or global restructuring operate in the world political economy today. One reflects a glitzy, internet-surfing, structurally integrated world of global finance, production, trade, and tele-communications. Populated primarily by men at it top rungs of decision making, this global restructuring valorizes all those norms and practices usually associated with West capitalist masculinity, 'deregulation,' 'privatization,' 'strategic alliances,' 'core regions,' 'deadlands'- but masked as global or universal. Like the colonial rhetoric of old, it claims to subsume all local cultures under a global umbrella of aggressive market competition – only now with technology driving the latest stage of capitalism. (p. 30)

The praxis wetlands have become more global, political, and interconnected. Globalization has sped up the rate that financial, social, and media transactions take place and increased global connectivity.

Transnational corporations now often operate outside the jurisdiction of state regulations; some regard it as modern-day imperialism. Some of these changes have created new social injustices and made it more difficult to unmask systemic oppressions. Castles and Davidson (2000) state: “Globalization has destabilized the ‘national industrial society’. The central dynamics of economic life now transcend national borders and have become uncontrollable for national governments” (p. 7). Castles and Davidson also note that “Economic development under conditions of free markets and non-interventionist states seems inevitably linked to greater inequality. Modernization theories claim that higher living standards will ‘trickle down’ to disadvantaged groups, yet it is far from clear that this is happening” (p. 5). As I consider transnational feminist praxis, I consider globalization and how transnational corporations and neoliberal politics are altering many aspects of society, governance, and power. Marchand and Runyan state (2011):

> Under neoliberal governmentality, the state is reduced to a promote of the ‘free market’ leading to the privatization of social welfare and the ‘marketization’ of political and social life whereby populations are to be ‘free, self-managing, and self-enterprising individuals in different spheres of life –health, education, bureaucracy, the professions, and so on. (Marchand and Runyan, 2011, p. 4)

Most neoliberal transnational narratives claim that global/transnational capitalism leads to greater freedom, individual choice, and global connectedness, but they neglect to note the many detrimental effects such as increased poverty, environmental degradation, and cultural erosion that such a masculinized “capitalist penetration” causes (Gibson-Graham, 1996, p. 124). Women and families often are most detrimentally affected by these structural rearrangements, and many feminists are rising in opposition to a “financial industry” which has “been exerting more and more pressure on governments to reduce social welfare and public works spending” (Young & Schuberth, 2010, pp. 3–4).

When one is researching and confronting social injustices today, they must consider that in a transnational world, oppressions may have deep roots, just like the mangroves in the coastal wetlands. Rowley challenges the underpinning messages celebrity-philanthropists use to promote transnational networking. Rather than exposing the systemic inequities that accompany many transnational corporate takeovers (e.g., agribusiness, exporting processing zones, water), some philanthropic groups just encourage people to donate to disadvantaged groups; they neglect to address the transnational structures that are responsible for some of these oppressions. Rowley (2011) states:

> I draw on an anti-capitalist, transnational feminist praxis to analyze the global political economy and the emerging symbolic economy that have become integral to the glamorization of philanthropy within development campaigns such as the (RED) campaign to provide AIDS medication in Africa and the ONE campaign to reduce world poverty championed by pops stars Bono and Bobby Shriver … I show how race, masculinity, femininity, and geopolitics manifest and are variably deployed as categories of seduction in the (RED)

> campaign, aimed at wooing us into believing in capitalism's power to produce global solidarity and to solve rather than exacerbate, human suffering. (p. 78)

Transnational feminist critique is not limited to critiques of women's struggle, by women, and for women, but rather, it is also a theoretical framework, research method, and/or a means of addressing issues that negatively affect culture, society, and the environment. In this case, Rowley challenges the glamorization of philanthropy and misleading narratives equating global capitalism to global solidarity.

Critical transnational feminist praxis often interlocks with the struggles against diverse oppressions (e.g., racism, poverty, homophobia, colonialism, and neoliberalism) and interweaves critical self-reflexivity, collective agency, and transnational networking. Nagar and Swarr (2010) state that:

> Transnational feminisms are an intersectional set of understandings, tools and practices that can (a) attend to racialized, classed, masculinised, and heteronormative logics and practices of globalization and capitalist patriarchies, and the multiple ways in which they (re)structure colonial and neo-colonial relations of domination and subordination; (b) grapple with the complex and contradictory ways in which these processes both inform and are shaped by a range of subjectivities and understanding or individual and collective agency; and (c) interweave critiques, actions, and self-reflexivity so as to resist a priori predictions of what might constitute feminist politics in a given place and time. (p. 5)

Feminist theory, research, and praxis work focus on "women and men in their lives and everyday struggles," and construct "a critical theory that illuminates the dense webs of intersecting power relations that together make up world politics" (pp. 8 Vet).

After, our BCTF Status of Women group dealt with the prostitution issue, another interrelated issue emerged; the issue was sex trafficking and its correlation to major sporting events. It was brought to our attention that major sporting events, such as the upcoming 2010 Olympics in Vancouver, often draw sex traffickers and sex trafficking to the host city. "Human trafficking and sex slavery is not a new problem. During the 2006 World Cup in Germany an estimated 40,000 women were trafficked into that country" (Lopez-Hodoyan, 2010, n.p.). Our research indicated that large-scale international sporting events, like the Olympics, do attract sex traffickers, so we established a workshop on sex trafficking and lobbied the government to monitor potential trafficking. We then worked with the Office to Combat the Trafficking of Persons, and they presented a workshop at our summer conference. The following is an excerpt from an article I wrote in our teachers' social justice journal to raise awareness of the issue:

> The RCMP now estimates that 600 to 800 victims are trafficked into Canada each year, and another 1,500 to 2,200 persons are trafficked through Canada to the United States annually. The US State Department estimates that 600,000 to 800,000 people are trafficked internationally every year, of which 80 % are women and girls, and up to 50 % are minors, while the United Nations estimates that over 700,000 persons are trafficked annually… Trafficked persons are enslaved and exploited both within our borders and internationally. Sex traffickers often target 12- to 17-year-old children as their choice candidates. The children are considered to be vulnerable, sometimes homeless, seen as petty criminals, or at best victims of their environment, desperate for survival. (Gonsalvez, 2009, p. 8)

We wrote policy rationale encouraging the BCTF to support and endorse the Blue Blindfold campaign that is used in other countries to combat human trafficking and created a poster for every school district in the province. The policy recommendation stated:

> The Blue Blindfold Campaign is an internationally recognized campaign that is designed to raise awareness about human trafficking, and educate the public how to recognize and safely report suspected trafficking. The Blue Blindfold campaign slogan is "Open Your Eyes to Human Trafficking," and the blue blindfold that accompanies the message is fast becoming an internationally recognized symbol. There are many anti-trafficking campaigns, but the advantage of this program is that it is part of a larger integrative network that consists of the Canadian Crime Stoppers Association, RCMP and Public Safety Canada. The BCTF should endorse the Blue Blindfold program in principle, promote the program within local social justice networks, and establish a plan to pilot the program in some school districts. (Gonsalvez & Kilbride, 2008, n.p.)

During my PhD program, I attempted to write a paper where I analyzed the potential and suitability of a national Blue Blindfold campaign, but I struggled with the rigors of choosing the most appropriate method, methodology, and theoretical framework, so I just left my informal rationale and recommendation with a member of OCTIP. At this time, I also felt that my hybrid activist-research was on a collision course with positivist ideologies that question whether this praxis approach was legitimate, reliable, or valid. Later in the year, I heard that the Canadian Public Safety Ministry Vic Toews launched the Blue Blindfold program nationally, and I received a letter from him thanking me for my contribution. Our Status of Women team had worked together to research the issue, write policy, campaign, present workshops, and collaborate with other organizations such as OCTIP. We used critical transnational feminist praxis (CTFP) to examine this transnational phenomenon (e.g., sex trafficking) and confront it (e.g., raise awareness, lobby, and develop policy).

Using Critical Transnational Feminist Praxis to Confront Social Injustices

There is a plethora of feminist research and activism taking place in transnational spheres (e.g., human rights, deregulation policies, gender equality), so I have selected diverse examples of these praxis-based projects to illustrate the intricacies of various projects conducted by feminists in the field. Shannon Speed has conducted research on the indigenous community of Nicolas Ruiz, in the Chiapas state of Mexico. Speed (2008) states:

> The tension between political-ethical commitment and critical analysis is always present in activist-research, alongside numerous other tensions: those of power relations between researcher and researched and of short-term pragmatics and longer-term implications. Yet such tensions are present in all research. The benefit of explicitly activist research is precisely that it focuses on those tensions and maintains them as central to the work. (p. 230)
