Speed (2008) examines how using language (e.g., Tzeltal) as the "primary identifier of an indigenous person" is problematic for indigenous land claim disputes in the region. During colonization, indigenous "parents purposely did not teach their children the language because they felt it would 'keep them from getting ahead'" (pp. 216–217). By examining texts, dialoguing with locals, and pursuing justice, she was able to identify how basing land claims on language fluency might be effective in some parts of the world, but not in this particular context. Researchers like Shannon Speed engage in research that is personal, political, and promising; they use critical transnational feminist praxis to deconstruct phenomenon, expose systemic (in) justices, and offer recommendations to overcome such injustices.

Linda Peake and Karen de Souza are involved with the Red Thread program in Guyana. Peake and de Souza (2010) state:

> Dogged by low prices for its exports of bauxite, timber, and sugar, as well as internal corruption, it is currently embroiled in a downward spiral of narco violence, criminal activity, and political/ethnic conflict, all of which are on the verge of collapse, and there is general agreement that it is the informal sector – the smuggling of people, gold, and cocaine – that dominates the economy … Red Thread emerged in October 1986; it came into existence through the decision of a small, highly educated and politically grounded group of women who had the information, the resources and the experience necessary for its establishment. (p. 107)

In the early years of Red Thread, the focus of the group was on "income generation projects," but over the years, the work has shifted towards research, advocacy, policy-writing, and community projects that are based on ongoing issues such as poverty, health care, domestic violence, homophobia, and the environment (Peake & de Souza, 2010, pp. 107–108). Many of the ongoing issues in the country are tied to "neoliberal capitalist development and modernization" that takes place in a transnational sphere and which has a North/South axis (Peake and de Souza, p. 109). I have gleaned from their writings that as transnational feminist researchers from the North (e.g., North America), they've had to use critical introspection to formulate their research approach. Peake and de Souza state:

> But we have ended up questioning a much broader set of interests in terms of the power dynamics of the research process itself … and which we think overlaps with a major, and recurring tension between northern academic feminists' reflexive discussions of power in the research process and their (ironic, often unintentional) estrangements from the political struggles of survival in scenarios where people/communities are, indeed, "drowning." (p. 106)

They find transnational praxis brings helps break down racialized and geographic divides and that transnational feminist workers "need to think more deeply about how the research process itself is reproducing hierarchies – academic feminists versus activists and elite grassroots women versus other grassroots women" (p. 113). I posit that CFTP research praxis can lead to change-making whereas strictly isolated academic research (e.g., gazing on the problem without being exposed to the circumstances surrounding the problem) may result in mere representations of the struggle and perpetuate hierarchies that divide the researcher from the subjects of research she/he wishes to engage with.

While an international graduate student, from Cambodia, at the University of Boston, Shirley Suet-ling Tang conducted research with "two Khmer (Cambodian)

American communities in Massachusetts" and completed an inquiry into "how bilingual and bicultural community practitioners have become knowledge producers" (Tang, 2008, p. 239). Her work brought her into close contact with immigrants suffering from mental health issues such as post-traumatic stress disorder. Tang states:

> For example, in the Khmer (Cambodian) American communities of Lowell and Lynn, Massachusetts – the second- and fifth-largest Khmer American communities in the United States respectively – violence and trauma through war and genocide, combined with disintegration of the traditional agrarian, social-cultural-spiritual system of Cambodia and their forced migration and displacement through refugee settlement, have had long-term effects on individuals and intergenerational dynamics. Populations in both cities include those who were resettled here as refugees escaping from Cambodia's killing fields in the early 1980's, together with more recently arrived immigrants, younger generations who were born and raised locally, and a segment that has moved from other cities. (p. 244)

The impact of war, especially on refugees and subsequent generations, is immense. It penetrates transnational spheres, crosses multiple frames of time, and can have strong socioeconomic repercussions (e.g., racism, classism, and poverty). Tang discovered that praxis-based research permitted her "unique research opportunities to support community processes not only to uncover and articulate the knowledge that they possess but also to make their knowledge accessible to others locally and nationally" (Tang, 2008, p. 245).

Tang's graduate studies, Cambodian heritage, identification with struggling members, and position as an international student brought her on an unexpected collision course. A young Khmer American man named, Gift Chea, whom she had be encouraging to finish college at the University of Massachusetts in Boston, was tragically killed at nearby Revere Beach (Tang, 2008, p. 240). The media dismissed the killing as gang related, thus racially tainting Gift Chea and other Cambodian immigrants as a problematic source of regionalized violence. Students at the university mobilized a political protest against the racialized representation and portrayal of the incident (Tang). Tang knew that as an international student her participation in the rally could jeopardize her student visa, but she participated anyways. She received a letter from the university indicating that funds for her tutorial assistant position were no longer available and essentially this meant she would not be able to continue her studies. Tang was functioning in a transnational sphere entangled with political boundaries (e.g., activist/scholar, international student/resident student, university researcher/community outreach worker, Cambodian/American, student/tutorial assistant). She was living, studying, and living in transnational praxis wetlands where political, geographical, and historical wounds (e.g., Cambodian immigrants whose lives had been indirectly or directly affected by war) collided.

Tang offers a number of insights about the role that community-centered research plays in the critical praxis lands and the transnational sphere; her work engaged her in multiple struggles, and her research methods were inclusive, mindful, and intended for building capacity (e.g., feminist in nature). Tang (2008) states:

> Despite the value and potential of their involvement, community practitioners are often relegated to instrumental positions in which their voices and visions are marginalized,

> misused, or completely neglected … This is particularly true for immigrant and refugee communities and communities of color that do not have direct access to networks and resources enabling the practitioners to design, implement, and monitor their own research projects and to integrate their personal, professional, and community commitments more holistically in relation to capacity building and long-term community development … At the core of this theory/practice is the enabling of people from communities of struggle to have direct control and full power over how to explore and use their knowledge, skills, and capacities to imagine and build community. (pp. 242–243)

Like the wetlands that have arbitrary borders (e.g., water/land, swamp/sea, trees/marine life) and perpetual change (waves, currents, tides), Tang's research involved dialectical struggles (activist/research, local/national, immigrant/citizen) that were best understand and researched in an integrated fashion where researchers, practitioners, and those living the experiences sought multiple, creative solutions to overcome struggles (e.g., the praxis wetlands). She has found that her most stimulating place to carry out her work and research "is not at the center of dominant academic and public discourses but rather in those in-between spaces of nepantla and constant transformation" (Tang, 2008, p. 261). I believe researchers need to take one step past the "in-between spaces" narrative to recognize that effective activist research can take place in borderless praxis wetlands where the overlapping of research, activism, community practice, policy-writing, and social change projects takes place. "There are different forms of praxis that are occurring in the world today" (Johnson & Maiguashca, 1997, p. 33); research, activism, and practice exist in a "praxis world."

Jennifer Mendez is a research activist who has worked alongside women's organizations in Nicaragua and the United States to confront sweatshop working conditions, poverty wages, and oppressive labor practices. Mendez (2008) states that "globalization disrupts underlying assumptions of what constitutes society, traditionally defined as the nation state, and destabilizes embedded notions of 'place' and 'community'" (p. 136). A significant amount of her research work focuses on "political and economic globalization and implications for social science methodological and analytical strategies" (Mendez, p. 136). She believes that feminist methods are significant to activist research and that "Feminism(s) have called attention not only to whose voices are missing or marginalized from knowledge production but also to how categories like 'community,' 'the oppressed,' or 'the poor' might obfuscate differences of power and perspective" (p. 140). She notes that the number of "transnational social movements" and "international nongovernmental organizations (NGOS)" has exploded and that they are challenging "the tenets of neoliberal and corporate globalization" (Mendez, p. 141). Her research situates her in the realm of critical transnational feminist praxis – the wetlands.

Mendez's research often brings her into the throngs of political resistance, lobbying, campaigning, and strategic planning. She states, "I seek to write in the space between the practical and the theoretical – the space of strategy" (p. 137). This statement is significant as policy research, analysis, and formulation does not exist in a void, but rather within a milieu of political tensions, power dynamics, and ideologies – the space is seldom neutral, apolitical, or ideologically exempt. Policy-makers are researchers who craft research-based strategies, and Mendez optimizes the use of critical feminist transnational praxis (CFTP) to confront injustices that have a transnational power base.

Mendez's concept of strategy-based praxis is powerful, but I believe it reinforces notions of a practical/theoretical schism. I propose that it is time to reframe the dialogue and the narratives used in reference to research and to claim that essentially all research takes place in a wetlands space that is full of political tensions, contradictions, and motivations and that it is especially important to note this when wanting to confront social injustices by any means (e.g., research, advocacy, community-based projects). Mendez (2008) states:

> Through information politics, movements and NGOs gain influence by serving as alternative sources of information, but for transnational advocacy campaigns to be effective the information must be conveyed as 'rigorously argued cases' based on 'objective' data in order to convince powerful national and international decision makers that change is warranted (Harper, 2001, p. 248; Keck & Sikink, 1998, p. 16). In policy arenas the forms of knowledge that communities and small organizations possess (testimonials, vivencias, popular knowledge) may not be considered 'hard' enough evidence. (p. 143)

Mendez identifies key factor in policy research and policy-making; the process often takes place in a change-making space where patriarchal and transnational narratives prevail – entrenched power dynamics are imbedded in research, activism, and praxis. When confronting social injustices, whether by means of research, activism, or policy-making, one is amidst entrenched structures, processes, and change-making (e.g., Weaver-Hightower, 2008). It is more astute to recognize that it is the wetlands where ebbs, tides, and currents are constant than to construct regimented constructs of binaries (e.g., research, practice). It is in the wetlands that substantial change-making can be strategized and catalyzed and social injustices overturned.

This reminds me of when I did a lot of research on coalbed methane fracturing processes because I was concerned about a new project coming to my small town. I gathered research materials, worked with a local organization called Wildsight, and campaigned for the project to halt (Wildsight, 2010). An ally group called the Citizens Concerned About Coalbed Methane (2010) promoted and screened the video Gasland to support our cause. The filmmaker visited coalbed methane sites and reveals that methane gas got into home drinking water; he demonstrates this by lighting the water on fire. Our coalition was most concerned about the impact of chemicals used during the fracking process to drill down to the gas, and the potential leakage into underground and surface water, but we were also concerned about the impact on our many wildlife corridors (e.g., elk, deer, and grizzly bears). The company sold off their asset and left town; fracking was outlawed in the province of Quebec about a year later (Wu, 2011, n.p.). I guess we weren't the crackpot misinformed granolas (e.g., environmental alarmists) we were construed to be – many of us are just concerned parents and citizens. Our victory was Herculean – we were a small community that had ousted a transnational corporation. Like Mendez, I enjoy strategizing research and using critical feminist transnational praxis – it establishes a way for hard facts to be distilled and community concerns to be heard. Strategizing research enables one to confront social injustices.

Over the last 6 years, I've had the opportunity to visit Vancouver quite frequently, and as I come from a small town, I often attend their many film festivals. I've been amazed with three things: the number of incredibly powerful social justice films that I have watched, the number of powerful social justice documentaries made by female producers, and that I've often had the opportunity to meet the filmmaker. *Sweet Crude* is an award-winning documentary, by filmmaker Sandra Cioffi, that explores the plight of the people residing in the oil-rich Niger River Delta. According to Goodman (2008):

> The Nigerian government, along with foreign oil companies, have reaped enormous profits over the years from the sale of Nigeria's oil and gas reserves, while the residents of the Niger Delta live in abject poverty. The region is plagued by high unemployment, environmental degradation due to oil and gas extraction, and a lack of basic resources such as fresh water and electricity. Nigeria is Africa's number one oil producer, accounting for more than a million barrels a day. (n.p.)

According to the documentary *Sweet Crude*, the Niger Delta now has one of the highest infant mortality rates in Africa, and life expectancy has declined to 43 years of age (Sampson, 2010, n.p.). The equivalent of 50 Exxon Valdez spills has entered the Niger Delta, one spill per year for the 50 years oil companies have been in the region (Vidal, 2010, n.p.). This pollution is causing havoc on the aquatic environment and fish stock and tainting the residents' primary food source.

As a filmmaker, researcher, and activist, Sandy Cioffi captures the struggles of people of the Niger Delta, unlike the mainstream media that shows clips of rebel militants. Her research approach replicates critical feminist transnational praxis – she engages with members of the Delta community to support their efforts to resist transnational exploitation of their lands and resources – the resource curse. According to the Mangrove Action Project:

> Nigeria contains the 4th largest area of mangroves forests in the world, but these important wetland forests are endangered by oil development in the Niger Delta, billions of dollars worth of natural gas, which is extracted along with the oil, is wasted by burning in mammoth gas flares that burn 24 hours a day for years at a time. Some of these gas flares have been burning for almost 40 years, polluting the air, causing acid rain and massive oil spills, ruining the waterways, killing the mangroves and coastal life, harming the health and livelihoods of millions of Niger Delta. (Palmer, 2009, n.p.)

Cioffi researched and captured the social injustices being committed in the Niger Delta – she was operating in a zone of local, state, and transnational conflict.

The praxis wetlands are a place where researchers, activists, and the researched converge to improve lives and emancipate souls. Cioffi used her astute journalistic skills to expose what was happening in the Niger Delta and to confront an injustice. She lobbied to make oil and gas corporations more financially transparent and accountable for their actions overseas.

> With final approval of Dodd-Frank Wall Street Reform and Consumer Protection Act in July of 2010, the United States Congress took historic steps to ensure energy industry transparency and give investors and citizens new tools to hold companies and governments accountable for their actions. Section 1504 of the new law requires all U.S. and foreign companies registered with the United States Securities and Exchange Commission (SEC)

> to publicly report how much they pay governments for access to their oil, gas and minerals. (Lugar & Cardin, 2010, n.p.)

It is unknown how much this bill will impact the lives of the people in the Niger Delta, but it should at least make greed more transparent and further efforts to combat the exploitation of the people in the area. It provides residents of the Delta, and future scholar activists, with data and policy to work with. In a digitized world where growing social inequities abound, the codified perimeters and boundaries of academic research may have to become less rigid to accommodate new ways of knowing, doing, and sharing. It may also become more imbued in political struggles and projects of emancipation like the one in the Niger Delta. Critical transnational feminist praxis is suited well for such tasks.

For my last example of persons exercising critical feminist transnational praxis in their research, I want to turn to someone who recognizes the role that introspection plays in praxis and social justice work. I turn to a dissertation by Lapetra Bowman. She posits that "Trans-Colonial Historiographic Embodied Re/membrance is predicated on revolution, movement, and transformation" and situates herself within a Chicano theoretical framework based on the writings of Chicano theorists such as Gloria Anzaldua (Bowman, 2010, p. v). Anzaldua once wrote, "I am the dialogue between my Self and el espiritu del mundo. I change myself, I change the world" (Anzaldua, 1999, p. 92). This phrase takes me back to Dr. Seuss's story about the Lorax:

> But *now*," says the Once-ler,
> Now that *you're* here,
> The world of the Lorax seems perfectly clear.
> UNLESS someone like you
> Cares a whole awful lot,
> nothing is going to get better.
> It's not. (Seuss, 1971, p. 58)

Anzadula and Seuss's comments remind me of the significance of self-reflection to the research process and activist struggles. Bowman (2010) asserts:

> Through their embodied textuality and re/membrance, Chicana, Latina, and Caribbean women of color assert that transformative revolutionary change begins with the embodied Self, a change which marks a shift from individual consciousness to collective consciousness … This shift begins with the female body, the very site of and testament to colonial, political, socio-economic, geographic, and temporal oppression, repression, and unfathomable patriarchal violence. I argue that through Trans-Colonial Historiography Embodied Re/membrance women can transform their bodies as sites of oppression and repression into active sites of revolution through re/membrance. (p. vi)

By reinscribing, rewriting, reimagining, and reclaiming their life stories, and their culture's historical journeys, women can heal, know, and step towards a new consciousness (Bowman, 2010). Bowman states, "women of color have actively engaged in a methodology of corpeal re-visioning, using their bodies as bridges to healing and knowing, and as stepping-stones towards *Othered* cultural shifts in consciousness" (p.vi). She lists some of the oppressions woman of color have endured as a result of the phenomenon of colonialism: "slavery, displacement, emigration, and racial and cultural discrimination" and post colonialism (p. 2). She claims that postcolonialism is over but the "the imperial residue, ideologies, and dominant paradigms left behind which Third-space subaltern women (and Others) continue to struggle against, to represent the metaphorical wounds left on the bodies, minds and psyches of subaltern Others, and ultimately, to represent the production of Otherness" (p. 3). Critical feminist transnational praxis is not just about researching surface tension and the waters one is immersed in, but it requires critical reflection of one's own embodiment and the embodiment of others – their bodies, minds, and psyches.

Working in the Controversial Praxis Wetlands When Confronting Social Injustices

Critical transnational feminist researchers assertively work in a zone that is plagued by politically motivated and hierarchically constructed border tensions. Hale (2008) states, "Commitments to activist scholarship can leave one feeling torn (if not mildly schizophrenic), stretched too thin, and resentful toward the larger academic community, whose reaction generally ranges from indifference to outright hostility" (p. 14). He claims that the tension "is rooted in the systematic, concerted banishment of collaborative knowledge production" and that the project of "activist scholarship, in light of these experiences, is to effect institutional change, creating more supportive space for the particular kind of research that we do" (Hale, 2008, p. 14). Critical feminist transnational researchers are aware of these tensions, but their collaborative work can motivate them to move beyond canonical limitations – their holistic approach spares them some of the discombobulating isolation and anguish that other researchers in the praxis land might endure.

In reference to praxis, Bullock and Trombley (1998) states, "Marx considered that the split between ideal and reality, between a irrational world and a rationalist critique of it, could only be overcome by the development of a theoretical consciousness among social groups engaged in the practice of changing the real world" (p. 676). This is an important intersection in the wetlands. Praxis is a place where researchers can merge lived struggles, interventions, and change-making; social injustices can be addressed. George Lipitz (2008) states, "In both activism and the academy, we suffer when we do not know enough, when critical reflection becomes too removed from practical activity, and when the imperatives of our daily work leave too little opportunity for analysis, reflection, and critique" (p. 92). He believes that the "execrable social, spiritual, and moral conditions of everyday life in this society" should compel us to examine the potential for change in "institutions, practices, and processes" and that educational institutions should especially heed this moral and ethical imperative (Lipitz, 2008, p. 93).

When we consider arguments for a strict activist/researcher divide, we must be cognizant that such dialectical divisions can reduce the complexities of social justice issues. If one is to argue against any political, social, or environmental engagement while doing research, then shouldn't all forms of collaborative practices such as corporate and/or private funding for academic research fall under the same scrutiny. I believe a wetlands narrative could lead research into a far more inclusive research world and that ethical guardianship is a better solution to ensuring objectivity than drawing lines of demarcation that marginalize those working in the field and/or activists. There are of course many laboratory studies that require a closed system to conduct their research – it is not these studies that I am referring to.

Another complication that contributes to the ongoing struggle to legitimize activist research is the entrenched notions of what constitutes knowledge and knowledge production. Nabudere (2008) states:

> The struggle for self-determination and participation in knowledge production and practice has at a cultural level produced a new understanding of the need to develop new forms of knowledge through self-empowerment of actors. The replacement of vertical power relations between the researcher and the researched with horizontal relations that promote communities' involvement in learning and research ensures that all knowledge producers can, through dialogue and collaborative effort, contribute to building fields of knowledge accessible to all. A hermeneutic approach ensures that all knowledge sources are recognized, and welcomed, and integrated and that all human experiences are taken into account. (p. 85)

As in the scholarship/activism demarcation there are legitimacy warriors that attempt to distinguish knowledge (e.g., tradition, indigenous, modern scientific) not for the purpose of indicating diversity but to marginalize some forms of knowledge over others. As well, there are some forms of knowledge that are acknowledged, but which have less chance of entering the halls of academia. Lipitz (2008) states, "Throughout our lives most of us have encountered serious people in all walks of life who lack the dignity of being taken seriously. Their acts of reflection, contemplation, and creation generally take place without any recognition or reward, in spaces quite unlike Butler Library [Columbia University]" (p. 89). The praxis wetlands, in reality, include underpinning narratives and overarching hierarchies that impact the academic world and marginalize the outside world, and vice versa; more research is needed to understand this as erecting an arbitrary divide to contend with this does a disservice to both.

Those exercising critical feminist praxis in their research are not exempt from the dialectical divisions (activism/scholarship, research/practitioner, knowledge/practice), but I hope the examples I have shared will demonstrate they are navigating the wetlands quite effectively despite these difficulties. I want to close this discussion by sharing one more personal experience. I have selected this example because it ties the issues of praxis, the elements of critical transnational praxis, and the significance of all three of these to educational policy and leadership:

> In 1999, Peter and Murray Corren filed a human rights complaint against the education ministry [British Columbia], alleging the curriculum's failure to reflect queer realities amounted to discrimination by omission and suppression. The Corren settlement in 2006 led to the introduction of a new elective course, Social Justice 12, and the promise that regular curriculum reviews will now be conducted to flag areas where queer content can be introduced. (Barsotti, 2009, n.p.)

The Supreme Court of British Columbia decision led to a call, by the BC Ministry of Education, for a Social Justice 12 curriculum writing team. I was honored to be one of the teachers chosen. This opportunity afforded me the chance to introduce high school students to the praxis wetlands. I worked with educators who specialized in various areas such as law, indigenous cultures, homophobia, feminisms, globalization, administration, and youth activism. Quite often, educational leaders examine pedagogy, performance, and equity issues, but in this case, I was engaged in a process where we would be establishing a course that would teach students how to identify, analyze, and confront social oppressions. Students would be expected to demonstrate respectful and mindful inquiry to catalyze change that would confront social injustices. They would learn about systemic oppressions and have the opportunity to engage in research activism. The course would not only raise their awareness of issues, but it would introduce theory and action as fused elements. As a team, we were permitted to etch all aspects of the course from the start. Decisions were based on discourse, dialogue, research, and consensus. Interest groups had an opportunity to offer their concerns prior to our meetings, after our first draft, and throughout the pilot year. The course is designed to engage students in social justice education on multiple levels.

Social justice education, whether at the school (e.g., Social Justice 12), postsecondary, or community level, is multidimensional and requires self-reflection, critical analysis, and opportunities to intersect and interact with like-minded allies. For example, Deborah Brandt is involved in a solidarity "VIVA project" where nongovernment organizations (NGOs) and progressive universities with "more than four decades of engagement in local, regional, and transnational social movements," commit to Freirean-based social justice projects in such places as Mexico, Guatemala, and Canada. According to Brandt (2010), the VIVA project, like other social justice educational programs, engages "peoples' hearts and minds through transformative process," in social justice praxis experiences (p. 168). Brandt states:

> Both our content and process connect to central issues of transnational feminist praxis such as an intersectional analysis of power in cross-border collaborations, an honouring of multiple ways of knowing and embodied practices, and a dynamic relationship between collective reflection and political action. (p. 166)

Confronting social injustices is multidimensional; curriculum and pedagogy should reflect this. Social justice programs should include opportunities to research, lobby, and confront oppressive anti-democratic policies and structures.

The Social Justice 12 course I helped design is very popular today; it is taught in as many as a hundred schools across the province now. Some students even campaigned and protested to have the program in their schools (Steffenhagen, 2011). When teachers asked me how to teach the section on sexual orientation, I didn't have much difficulty addressing the question. I mentioned the higher rates of suicides by lesbian, gay, bisexual, queer and questioning students (Gilbert, 2011), the bullying and harassment they experience (*CBC News*, 2010), the penalties in some countries for being gay or lesbian (e.g., death sentences, lashings, lifetime imprisonment), and I referred to various human rights legislation. I remember the day a young man shared with me how his father beat him and left him in a field to die because he informed his father he was gay. He managed to crawl to the highway and was rescued. Critical transnational feminist praxis isn't just about research legitimacy. It's about conducting engaging compassionate research to seek social justice (e.g., Alexander & Mohanty, 2011; Merry, 2011; Park, 2007). Educators need to prepare students to identify, analyze, and confront social injustices.

Conclusion

Critical praxis (e.g., research and activism) seeks to illuminate how certain structures disadvantage, disenfranchise, or dismiss the addressees who are being oppressed. Mama (2007) states, "Such scholarship regards itself as integral to the struggle for freedom and holds itself accountable, not to a particular institution, regime, class or gender, but to the imagination, aspirations, and interests of ordinary people" (p. 3). I have described my lived experiences of confronting social injustices in the praxis zone, conceptualized "the wetlands" as a new way of looking at activist research, and introduced you to critical feminist transnational praxis. Calhoun (2008) states:

> Activist scholarship is obvious but worth restating: the world is in considerable need of improvement, and improvement comes in large part by means of social movements, struggles, and campaigns to change public agendas, not merely by the provision of technical expertise to those already in power … it is easy for social science to become too complacent, too affirmative of the existing order … Activist scholarship is one way to make social science useful. But activist scholarship can also make social science better, providing occasions for new knowledge creation, challenges to received wisdom, and new ways of thinking. (p. xxv)

The wetlands are a powerful and effective place to conduct legitimate integrated activist research and critical feminist transnational praxis – they are a place where social injustices can be confronted and new social realities constructed. They are significant to the educational purpose. In the praxis wetlands, we can research; write policy; create curriculum; interact with community members; educate students; ally with organizations; stay informed about emergent and historical injustices; critically reflect about peace, sustainability, and social justice; carefully and mindfully analyze information; integrate social justice into pedagogical and institutional practices; create and lobby for just policies; lobby, protest, or campaign; and use any or all of these avenues to generate new knowledge, defeat injustices, and become change-makers.

Chapter 33
Schools for Capitalism, Corporativism, and Corruption: Examples from Turkey and the USA

Duncan Waite, Selahattin Turan, and Juan Manuel Niño

To be blunt, education is under assault across the globe. Perhaps it has always been so, but the forces at play today, the environment and social conditions that prevail make this time unique and the threat to education greater than ever. Globalization, especially, allows movements, ideas, technologies, commodities, and even such unintended or nonrational phenomena as disease and social injustice(s) to spread widely and relatively quickly. So, ideas such as those constitutive of the philosophical-social movement known as neoliberalism can spread and take root and have done just that worldwide, that is, globalization has permitted neoliberalism to spread virally. This movement is one, though as we suggest, not the only or the most pernicious, threat to education. We will show how the thinking that lead to neoliberalism (and more) has continued to evolve and take on other attributes. Socio-philosophical thinking has been severely and, in our view, negatively affected by what we term here *corporativism* (as distinguished from corporatism) and corporativist thinking. This, we believe, is a much more serious threat to education and educational intentions—and, by implication, social justice—worldwide.

Why corruption? Why corporativism? And what have these to do with social justice and injustice? And, finally, how are education and schooling implicated in corruption and corporativism and what's the role of leadership?

In brief, and by way of an introduction, corruption and corporativism matter for a number of reasons. Though distinct phenomena, corruption and corporativism share certain characteristics and have similar effects upon the polity, the lifeworld,

upon society, and the education that is a constitutive part of society. Though not normally thought of in conjunction with social justice and injustice, both corruption and corporativism take from the people and benefit a chosen few—the power elites or the oligarchy.[1] They differ in that, generally, corruption is illegal but corporativism operates, again generally, within existing laws and social structures. The difficulty for us in thinking of corruption and corporativism as being caught up with social justice and injustice may simply be that, besides the fact that, generally, corporativism operates within the law, or on the fringes of the law (if not entirely within so-called ethical bounds), both corruption and corporatism operate in the shadows, and both are what we might term equal opportunity practices, that is, anyone, regardless of race, creed, or what have you, may engage in and benefit through corruption and/or be its victim, the same with corporativism. Also, both are elusive concepts and difficult to prosecute (Noonan, 1984): The victims of the one are coerced not to denounce the perpetrator, and the "victim" of the other is not clear that he/she has been victimized. This last is the point of this chapter: to show how it is that, especially, corporativism acts to subjugate, to victimize and to colonize the subject, and often with the willing consent of the "victim," though the same can sometimes be said for corruption as well. In the worst case, both of these oppressive practices are perceived, when perceived at all, to be commonplace—the taken-for-granted social structure, and, as such, they become hegemonic, or as Bourdieu and Wacquant (2001) phrased it, they become part of "the new planetary vulgate."

The two suspect practices may collide or overlap, as they do in cases involving corrupt practices in schools and education generally, especially when financial inducements spur corruption. Sadly, we need only look to the recent earthquakes in China that disproportionately killed large numbers of poor school children in their schools and the similar devastating results from the earthquake in Haiti to see the pattern: Where large numbers of poor people suffer disproportionately from disasters, corruption rules (*Science Daily*, 2011). *Science Daily* quoted Roger Bilham, one of the authors of a scientific paper correlating corruption to, in this instance, earthquake deaths, to the effect that "'Less wealthy nations are the most corrupt'.… 'We found that fully 83 % of all deaths from earthquakes in the last 30 years have occurred in nations where corruption is both widespread and worse than expected'" (para 7). Generally, standard of living (or GDP) is directly related to corruption, that is, the more corrupt a society, the poorer the people are and, again generally, the more unequal the wealth distribution.[2] Less corrupt societies tend to be more equal. Usually the most vulnerable members of society are the first targets of corruption and corrupt practices and are their victims. And who are more vulnerable than school children and the teachers, the public servants who are tasked with their care?

Though perhaps less tragic are cases where the relations among capitalism, corporativism and corruption are less overt. (Many of these types of cases will be taken up and discussed in more detail below.) One quick and recent example was revealed by a report in the *New York Times* (Winerip, 2011b). It seems that the Pearson Foundation, the nonprofit arm of one of the largest educational publishers in the USA, is in the habit of inviting sitting state school superintendents with whom the publisher has business on expensive all-expenses-paid junkets to exotic locales—Rio, London, Singapore, and Helsinki—ostensibly for educational purposes. The report cites the $138 million contract the State of Illinois has with Pearson, the $110 million contract it has with the State of Virginia, and the $57 million contract it has with the State of Kentucky, as examples: "All three of their commissioners have attended the conferences" (p. A15) at the Pearson Foundation's expense. The report quotes Marcus S. Owens, a former director of the Exempt Organizations Division of the Internal Revenue Service, as saying: "The Pearson conferences fit the same pattern as the influence-buying junkets that the convicted lobbyist Jack Abramoff arranged for members of Congress" (p. A12). Schemes such as this, and the others we will detail below, cheat the citizen, the taxpayer and, in the end, our nations' school children (Meier & Griffin, 2005). This to us rises to the level of the most grievous injustice.

In issuing this warning about the threats to education and the social injustices that follow, we are taking up Gert Biesta's (2011) distinction between education and learning. For Biesta, as for us, education is more of a teleological practice, concerned with aims and purposes (cf. Dewey), whereas learning is not necessarily so. According to Biesta, learning and the language of learning (in his terms, *the learnification of education*, p. 5 [emphasis ours]) "lacks an explicit engagement with the question of ends" (p. 4). He held that:

> this does not mean that educational practices framed in terms of the language of learning are without ends; it just means that they lack reflection and judgment about ends, and thus tend to be directed by so-called common sense or even populist ends. The language of learning thus makes it difficult if not impossible to take responsibility for the direction of education.

Learning and, in Biesta's terms, the language of learning are thus susceptible to being highjacked by, in this case, a neoliberalist agenda. This is done so unreflectively, almost incidentally, that learning and the language of learning gain incredible force for being positioned as commonsensical (and therefore nearly indisputable). They are thus easily co-opted and made an instrument in political educational agendas, forcing the public's and the policy makers' attention onto such educational reforms as increasing efficiency, school and teacher effectiveness, and the like. As examples, in the state of Texas, there are state-level initiatives that employ relatively simple and fundamentally flawed formulas assessing school district efficiency in using state monies, according to high-stakes test score gains divided by levels of expenditure per pupil. Increasingly, districts are being held accountable for the results according to this formula. Teacher merit pay systems, and threatened use of such systems in colleges and universities, are other examples of simplistic thinking as an outcome of accepting the language of learning as commonsensical. Our point being that such acceptance occurs at an ontological level.

In what follows, we shall detail characteristics of what we term corporativism. We will sketch the genesis of corporativism in a bare bones genealogy of the concept. Having accomplished that task, we will demonstrate how corporativist thinking and the policies and procedures it unleashes affect school, schooling, and education. We will especially draw upon examples from the USA and from Turkey to illustrate our points, though we will examine global or international (transnational) examples as well. These examples were chosen for their explanatory power—as telling examples of the issues we wish to highlight—and as they are examples, social conditions, with which we are most familiar. Turkey and the state of Texas in the USA serve as exemplars—the former as a bellwether and the later a cautionary tale: Turkey has a vibrant economic and political engine, making it a major player in the region and across the globe; Texas is perhaps well known as the home of the former US president, George W. Bush, who took the Texas model of school accountability, the so-called Texas Miracle, and was able to impose it nationally in the form of the No Child Left Behind (NCLB) federal education policy—an accountability system which has had profound effects on national and international education policy. As examples, both Turkey and Texas are indicative of and, at the same time, influential in the broader policy and practice contexts. Many of the examples we draw upon come from the domains of commerce and business (i.e., capitalism), as corporatism, neoliberalism, and corporativism appeared in those domains initially and only later affected education, educators, and educational leaders.

A Brief History of the Evolution of Social Thought as It Pertains to Education and Educational Management/Administration/Leadership

From time immemorial, humans have traded with one another. Often, surplus was traded for other necessities. When basic wants were met, surplus was frequently converted into capital (Ferguson, 2008; Simmel, 1978). The world's population grew. People became more specialized in their skills—coincident with the rise of hamlets, towns and cities, workshops, and then shops arose. Trade was one of the earliest and easiest ways to amass large sums of capital (incidentally, trade fueled exploration and exploitation). Marco Polo was driven to find a trading route to China (The Opium Wars in China are a case in point of commercialism coupled with imperialism, which itself relied upon militarism). The East India Company pursued trade on the Indian subcontinent and benefited from wanton English imperialism. Likewise, the Hudson Bay Company and others led and in turn followed British, Spanish, Portuguese, Dutch, and French imperialism into the Americas. Other colonizing countries and their leading merchants operated similarly. Sometimes missionaries and other proselytizers or religious zealots were the first non-indigenous people to venture into certain areas of the world; often they followed upon the heels of the soldiers and their imperial armies.

The burgeoning population in Europe, China, Anatolia, and elsewhere contributed to the rise of, first, great cities, and later, to city-states. Of course, it is thought that cities arose as islands of relative safety, where people who worked the land by day could withdraw within the city's walls at night for safety from marauding bands. Over time and at different rates specific to the particular region, country, or locale (Fukuyama, 2011), city-states coalesced though conquest or alliance into something that resembles the countries we know today. This process was aided by relatively new war technologies such as gunpowder and steel and by improved modes of transport (e.g., roads, horses, sailing ships, wagons, and other vehicles) (Diamond, 1999; Sale, 1990).

Concurrent with the rise of the city-state and state, in some cases preceding it, religions grew to become more and more organized and in many cases increasingly bureaucratic (hence, the cleric becomes the clerical). Throughout most of recorded human history, we see these three forces in dynamic interaction—the church/organized religion, commerce/business, and the state/civil society (Waite, Moos, Sugrue, & Liu, 2007; Wallerstein, 2005). Historical epochs and particular locales may be characterized as being especially influenced by one or another of these forces, or a combination of forces (Fukuyama, 2011). Often, one or another social institutional force predominates, though they all are always in dynamic interaction. There are other forces that contribute to change in the world, and to the tenor or lived conditions of a particular milieu. Lately, another human invention/construction has gained such force as to unsettle the established triumvirate of social forces and compete for recognition as a human/historical change agent; that force is that which is occasioned by technology, its development or invention, adoption, and the effect that technological adoption has upon the lived world of human association.[3]

Changes in Organizations and Roles Within Them

As the world population grew, forms of human association became more complex. In government and civic society, as we have seen, families and clans gave way to tribes, which gave way to nations and city-states (e.g., the Iroquois Nation, the Inca, or the Aztec in the Americas before colonization), which, in turn, gave way to the modern state and associations among states (e.g., the UN, the G8). The trajectories which the development of these governmental entities have taken, as Fukuyama (2011) noted, have been dependent, in part, on the particular historical antecedents of each (i.e., the roots of British jurisprudence are distinct from those in China, e.g., and the resultant sociopolitical order is similarly distinct).

Likewise, church and business associations grew in complexity (and here we are especially interested in the organizational structure and the roles within these organizations). As organizations grow, several interesting phenomena occur: increasing bureaucratization; increasing role specialization, at least for the worker; increasing generalization of role for managers, CEOs, and "leaders"; a potential/tendency for organizational goal displacement (i.e., mission creep) because of, principally, transaction costs (Shriky, 2008; Waite, 2010); and, coupled with this last, increase in the self-preservation impulse of the bureaucracy, the organization, or the business as a whole (Weber, 1958).

The Rise of the Manager

As businesses grew in size—reflecting the rise in national and global populations and increased access to far-flung resources and markets, business and other organizations underwent profound and fundamental changes. Increased bureaucratization has already been mentioned above. Increased organizational size and bureaucratization, generally speaking, resulted in more and more refined hierarchies and hierarchical levels within all types of organizations, not just businesses.

Some 50 years ago, in *The Organization Man*, Whyte (1956/2002) described the social ethic which he thought had come to dominate at that time. He termed it a social ethic in order to emphasize the unitary nature of the social phenomenon, one he described as an American ideology. He claimed that "the 'professionalization' of the manager, for example, and the drive for a more practical education are parts of the same phenomenon" (pp. 6–7). He asserted that "the trainee believes managing an end in itself, an expertise relatively independent of the content of what is being managed" (p. 7). Elsewhere (Waite et al., 2007; Waite & Nelson, 2005), we have done a more thorough job of deconstructing exemplary cases of the rise of the manager, including, especially, the case of Jack Welch, the former Chief Executive Officer (CEO) of General Electric, who, though a manager, came to own a substantial portion of that company's stocks and received such "bonuses" (or perquisites), that the revelation of the excesses of his compensation added fodder to the anti-elitist backlash of the time.[4]

That the manager has risen in importance, not just for the company, organization, or institution she/he manages, but for society at large, can be seen in the fact that, in US sports federations (i.e., leagues, such as Major League Baseball [MLB], the National Football League [NFL], and the National Basketball Association [NBA]), the commissioner of the league often is among the highest-paid personnel in that league, despite the fact that players' huge salaries and bonuses are more often in the headlines.[5] Evidence of a runaway power usurpation—the rise of the manager and his/her power as opposed to that power being attached to other positions or distributed in a more egalitarian manner—have been brought into the open by the recent FIFA (Fédération Internationale de Football Association) bribery and vote-solicitation scandals (Hughes, 2011), and the International Olympic Committee (IOC) scandals involving the state of Utah's bid to host the games before that (Longman, 1999). Also, it is telling, that the past president of the IOC insisted that people address him as "Your Excellency."

The effects of managerialism can be felt on at least two different levels—within the organization itself and throughout the wider society or societies that adopt this form of thinking, this form of organizing. Truly, different organizations may adopt or may reflect different organizational models, some more hierarchical, some more bureaucratic, and some less (Waite, 2010).[6] Wherever managerialism takes root and where it comes to dominate, it affects how one frames issues, how one approaches problems. In effect, application of a managerialist form of thinking causes leaders and others to frame issues, problems, and so on in management terms and to think how best to manage them. This narrow conception of the lived world is what we have referred to elsewhere as *managementality* (Waite & Nelson, 2005)—a play on the Foucaultian notion of governmentality.

Managerialism, Neoliberalism, Corporatization, and the Rise of the Corporate Model

The world's population grew. Fueled by technologies, capitalism, and globalization, organizations grew, too, and became more complex. Indeed, the organization of and the organizations within each and every field—the Church, the state, and commerce—became more complex, leading eventually to the corporation.[7] Fukuyama (2011, p. 449) noted how "the idea of the corporation—a permanently lived institution with an identity separate from the individuals who made it up—arose initially as a religious organization and not for commercial purposes."

As the historical record bears out, the corporation and its adaptive organizational structure were well-suited, not only to business, but to governing as well, or policing in Rancière's terms (2010). According to Rockhill (2004), for Rancière, "the *police* … is defined as an organizational system of coordinates that establishes a distribution of the sensible or a law that divides the community into groups, social positions, and functions" (p. 3, emphasis in original). The idea of the corporation is fluid and flexible, and this serves it well. Its mission is relatively narrow, unlike governments' or governmental institutions', that is, a corporation is concerned with generating wealth for its owners (founding members and shareholders). The state, on the other hand, not only collects rents through fees and taxes and the like (Fukuyama, 2011) but is also responsible for providing services to its citizens. Currently, the state-commerce balance, dynamic, or equilibrium (disregarding the role of the Church for the moment) privileges business, that is, in the Western world at any rate, the state is in a weakened position, while business is strong (we write "in the Western world" as many states, especially in Asia—e.g., China, Philippines—practice state capitalism, whereby the state is often the largest, sometimes the only, business enterprise permitted to operate internally and externally).

The more tightly the corporation adheres to its mission and concomitant image, the better, more successful it is perceived to be. Image and brand are vigorously cultivated and protected. Often, the brand or image may be more valuable than the capital assets held (e.g., IBM). The brand and branding are integral to corporate identity, and this affects internal affiliation and loyalty, external commitment and brand loyalty, and sales, the so-called bottom line. Image matters.[8]

The development of further complexity, in this case at the organizational level, has resulted in the corporation becoming the preeminent organizational form today. This is evidence of what we term corporatism—the most basic level of corporate colonization of the lived world. In a nutshell, the corporation, the corporate form, is ubiquitous: corporations dominate most all fields: In medicine, they are represented by the HMO; in the fifth estate, by media conglomerates such as News Corp and the Washington Post. These commercial behemoths often grow far beyond their original core area or market; this is called diversification. For example, the Washington Post Company, a newspaper, acquired Kaplan Inc.—ostensibly a for-profit education provider—and this education unit of the mother company has accounted for most of the phenomenal profits realized since its acquisition in 1984 (Lewin, 2010). That corporations have become perhaps the most ubiquitous organizational form, worldwide, may be behind the gaff uttered by the front-running Republican in the most recent US Republican presidential primary contest, Mitt Romney, when he said, in response to a heckler's taunt, that "corporations are people, my friend" (Rucker, 2011, para 5).

The idea or conception of a corporation is evolving, in flux. Through incorporation, individuals are able to limit their own individual liability—one of the main advantages of the corporation. As Fukuyama (2011, p. 449) asserted, the corporation is "a permanently lived institution with an identity separate from the individuals who make it up." (Leveraging individual wealth is another distinct advantage.) Accountability is one of the watchwords of neoliberal politics and rhetoric. However, through incorporation, individuals, whether shareholder or CEO, can manage to escape being held accountable, at least in the democratic sense, accountable to the *demos*, the people (see Biesta, 2010), though they may still be somewhat accountable to shareholders.

Accountability is polysemic—variously defined and differentially realized in different contexts or domains (Biesta, 2010; Waite, Boone, & McGhee, 2001). In line with the twisted logic of neoliberalism, accountability is conceived of and practiced differently in, say, the business realm than it is in education. It's not so much that accountability in these different domains is practiced differently as much as it is the case that what may have been, in principle, the same practice (in this case, accountability), when superimposed onto phenomena in totally different realms, effects totally different outcomes. For instance, Biesta has shown how accountability has become transmutated within a neoliberal, consumerist discourse. In the business, consumer capital realm, this is business as usual. However, transposed into the educational realm, this concept and/or practice makes the school-parent relationship into that of a provider-consumer. As Biesta has demonstrated, the relationship between the school or educator and the policy maker is radically transformed, as is the relationship between the parent or public and the legislator. In place of a democratic relationship, it morphs into a consumer relationship, and the only accountability practice-able is that expressed through "choice"—a one-sided, aggregative, nebulous form of accountability. In this way, lawmakers, legislators, representatives, and state education and other policy-setting agencies duck responsibility or skirt being held accountable. The state and its functionaries become simply other providers in a world of such providers. This is one reason that it has been so easy to open public education to for-profit enterprises: Education is no longer seen as a public good, only a service, which can be provided equally well by any and all, and, in the neoliberal logic, the cheaper the better.

Each and every type of organizational form is more than simply a contingent product of situational exigencies, a product of the times, so to speak. They develop alongside, parallel, or concurrently with major philosophical and theoretical movements (evidence Keynes, Smith, and Friedman) or, once established, develop undergirding principles, tenets, and ways of operating, which being ideational, tend to become ideological and even dogmatic (Morgan, 1997).

Table 33.1 Commonalities, complementarities, and characteristics of neoliberalism and corporativism

Neoliberalism and corporativism	
Neoliberalism	Corporativism
Privileges markets, free choice, entrepreneurial competition, and individual initiative in addressing social needs	Issues of identity (e.g., branding): individual, personal identity attached to the corporate
Positions education as a resource for global competition and private wealth accumulation, as an arena for business	Business hierarchical
More stringent "accountability" and increased consumerism	Corporatist culture (i.e., behavior and ways of thinking)(at an ontological level); business/ corporate language
	Imperial hubris ("*El Rey*")

Sources: Gronn (2003), Sleeter (2007), Waite (2011)

The rise of the business corporation (Whyte, 1956/2002) and globalism together precipitated the spread of the financial-ideological tenets of what we know today as neoliberalism (Table 33.1). Others have done a much more thorough examination of neoliberalism (Gronn, 2003; Harvey, 2005; Sleeter, 2007) than we are able to in the space permitted here; however, we would like to briefly mention some of the tenets of the neoliberal financial philosophy in order to advance our thesis.

Neoliberalism

Briefly, neoliberalism and its adherents prize the so-called free market, which they believe to be an apt organizing (and self-correcting) global system. An extension of these free market ideals and mythologies is the neoliberal concept of choice, a concept appropriated and applied, especially, to school attendance. A logical extension of these two beginning, fundamental principles finds, in both the USA and in Turkey, adherents of neoliberalism criticizing the state and its system of free public schooling as monopolistic, suggesting that market capitalism and the introduction of more for-profit schools is somehow more democratic (at the primary and secondary level these for-profit schools are called charter schools, often subsidized with public education funds).

Competition, especially in the marketplace, but extended to other fields as well, is a hallmark of neoliberalism. An unreflective belief in individualism (individual initiative, responsibility, and stringent forms of accountability) complements the neoliberal belief in competition. Taken to the extreme, such beliefs make the individual responsible for his/her condition, predicament, and/or situation, absolving the state or other social structures (e.g., socioeconomic structures of wealth distribution) from any social responsibility whatsoever. Again, in the extreme, a radical neoliberal position may posit that the student and/or his parent(s) is (/are) solely responsible for the provision of his/her education, not the state. In the workplace—including schools—under conditions of neoliberalism, the individual is responsible for his/her further professional development (Billett, 2006), not the company or school organization. Neoliberalism credits the successful individual with his/her success, ignoring and neglecting any and all social conditions (e.g., infrastructure, banking, monetary, and taxation policies that privilege the wealthy) that may have contributed to that success and absolving the successful individual from of any responsibility to the collective.

At the hands of neoliberals, education and its provision are commodified. Education, rather than being seen as a provision of a public good, becomes a market (Biesta, 2010), prone to plunder and pillage by corporations and manipulation by interest groups (often with ulterior motives, some financial, some ideological) and political alliances. Education is marketized. As we have shown elsewhere (Waite, Rodríguez, & Wadende, in press), education and educational reform are businesses and are dealt with as such by policy makers, at national and international levels.

The continued erosion of public, governmental support for education at all levels—preschool, primary, secondary, tertiary, vocational, and continuing adult education—makes of private, for-profit education a more viable option. At elementary and secondary levels, this gap is being filled by, in the USA, charter schools and for-profit schools. At the university level, the market is being flooded with for-profit institutes, vocational programs, colleges, and universities, of both the online or virtual and brick-and-mortar varieties. While the provisions of alternatives might appear attractive, the diminishment of governmental support coupled with the dramatic rise in tuition cost has placed college and even further technical training out of the reach of many (Kristof, 2011). Education is becoming less of an avenue for social advancement, if ever this was the case.

A draconian accountability regime is a result of the application of neoliberal ideologies in education, as market-driven, technicist ideologues, neoliberals push for more “efficiency” in education (Biesta, 2010). Gone is talk of “good” teachers, replaced by efforts to find and reward effective or efficient teachers (often rewarded through market-driven compensation schemes, such as merit pay, pay-for-performance, so-called value-added performative measures and the like). Such heavy-handed, mindless accountability makes workers—teachers and others—subservient to data, data collection, data analysis, and the results of such analysis, often in name-blame-and-shame highly visual public displays. The publishing of league tables, assessment results, high-profile school closures, and the threat of such closure, often on a massive scale, ensures that a climate of fear and intimidation prevails throughout our schools and that such fear, coercion, and defensiveness guide decision making at the school, district, and state levels. Such a climate fear and an obsession with numbers—setting unrealistic goals in an environment of diminishing public resources—guarantees that many will game the system, as happened throughout the Atlanta public school system (Winerip, 2011a), and fosters corruption and impression management (i.e., performativity), rather than authentic education (Waite & Allen, 2003; Waite et al., 2001).

Corporatism and Corporativism

The rise of the corporation as the dominant organizational form throughout the developed world, coupled with globalism and neoliberalism, ensured that corporations would move into the domain of education. The examples are ready to hand: Kaplan, Inc.; University of Phoenix; KIPP academies; and Harmony Schools charter schools are among the most visible, having been in the US national news of late due to some controversy surrounding them, whether it be questionable legal practices; lending, usury, and misrepresentation; charges of cronyism; or US xenophobic (protectionist) to reactions 'foreign firms' entry into the market.

To us this is unremarkable—the fact that corporations, both US and multinational, are eating up more of the US educational pie. This simple fact is what we refer to as *corporatism*. Rather, what we are interested in is how this has affected, how it is affecting, our lived world, our relations, our culture, and our minds, at both the individual and collective levels.

The growth of the corporation and the deep cultural, linguistic, psychological, ontological changes associated with this is what we call *corporativism*. Where the term corporatism may result from a more sociological analysis of the global lived world, corporativism (borrowing from and building upon corporatism, neoliberalism, and other related concepts and being a hybrid form) is a more radicalized version of that which preceded it—including, but not limited to, capitalism, bureaucratization, managerialism, corporatism, and neoliberalism, among others.

Table 33.1 exhibits some of the characteristics we have found that distinguish corporativism.[9] At present, the distinguishing characteristics of corporativism, as denoted in Table 33.1, we have found to be:

- *A complicated, complex construction of identity*—both for the overall organization, its parts, and the individuals who contribute their labor (physical, mental, emotional, psychic, etc.). Identity is dynamic and its construction and maintenance are iterative and reciprocal.
- *Corporate, bureaucratic structures*—including business hierarchical, status and dominance hierarchies, silos, departmentalization, and other structural means for dividing the turf, the rewards, resources, and loyalties and for collectivizing these and other processes and outcomes.
- *A corporatist culture*—collective and individual orientation to the corporation, with variations within and throughout.
- *An imperial hubris*—collective and individual arrogance, superiority, privilege, a sense of entitlement and exceptionality, and impunity.

We acknowledge that this list is not exhaustive, as there is still and yet much to mine as regards corporativism. We submit this as a first, early installment of work yet to come. As these characteristics (and our analytical concepts) are intertwined and mutually supportive, we opt not to discuss each of them one by one, ad nauseam. We will, instead, examine the corporativist characteristic of imperial hubris in more detail and, in this way, draw the other characteristics into the discussion and give them shape.

Imperial Hubris

El Rey is a popular Mexican folk song, one whose lyrics express precisely what we mean by imperial hubris. The song, though ostensibly one of hardship and privation, is also one of hope, drive, and even defiance. The lyrics to the song contain this refrain: *Con dinero o sin dinero, yo hago siempre como quiero, y mi palabra es la ley.* ("With money or without money, I always do as I please, and my word is the law"). Briefly, we see this attitude and disposition when, for example, the CEO of BP stood in front of television cameras during the BP Gulf of Mexico oil disaster and whined about wanting to get his life back and condescendingly referring to the "little people" affected by the spill. Examples abound. It would be one thing if this is all it was: the chief executive of a company or multinational corporation possessed of a swelled head. However, and as we shall show, under conditions of corporativism, this attitude can potentially invade the collective and collectivities, at all levels of society and in all social domains, not just business. For example, again briefly, this attitude, that of imperial hubris, was on display (and with tragic consequences) when Blackwater mercenaries rolled into Nisour Square in Baghdad in 2007, opened fire and killed 17 unarmed civilians. Whether or not they and their "superiors" are ever brought to justice, such actions likely indicate that the perpetrators rationalized their actions, during and afterward, from a superior, privileged position, one which they expected would provide them with impunity.[10]

Imperial hubris is more than a disposition of an organization or a personality trait of an individual or a manifestation of such: it is an orientation (i.e., it is ontological), one which permeates organizations, institutions, and society at large. That such an orientation is societal is evidence for our assertion that corporativism (as opposed to corporatism and/or neoliberalism) has become ontological, has permeated and, you might say, colonized the lifeworld and our ways of thinking. Imperial hubris is socially constructed, again a ramification of its being ontological.

It is not the case that everyone in an organization, everyone throughout the world exhibits imperial hubris. Indeed, owing to the definition of the term/concept and the wide variation in people's positions/positionality, this is impossible. However, it is possible and, we suggest, extremely likely, that nearly everyone throughout the world orients to the legitimacy of imperial hubris. And therein lies one of the dangers. (True, some independent thinkers, democrats, radicals, anarchists, and others strive for and put into practice more egalitarian social relations and structures.) Nor is it the case that corporativism is monolithic, as there are always counterdiscourses in circulation (witness the Occupy movements in the USA and elsewhere), however strong or weak these may be (de Certeau, 1986). We acknowledge this. However, our point here is that corporativism is both the primary contemporary form of social organization and the predominant social organizing principle (i.e., it overshadows competing forms and discourses in the structural and the ontological domains). Absent an awareness of these forms and their rise, we may, in our blindness and apathy, be run over by them, swallowed up. We may even be inadvertently hastening their dominion over us, their hegemony. According to our thesis, corporativism is, in most cases, organized so as to orient toward and rely upon a leader (as an individual or an in-group) as the titular, hierarchical ruler or sovereign of an organization. One of the dangers in this is that in doing so, we invest so much in that leader and grant him/her so much power over us, that it is subject to abuse, manifested in imperial hubris, a corporately generated exceptionality. This exultation of the leader diminishes all others, as status and rank are the stuff of hierarchies (Waite, 2010), and through a hubristic lens, we all look puny and exploitable. Now, ant-like, we become serfs (see Waite, in press).

Corporativism: An Example

Perhaps a simple example will suffice in illustrating our point—that is, how corporativist thinking (i.e., a corporativist ontology) has colonized all other domains, especially those represented by the major social forces discussed earlier. We are aware of at least two ways that such a profound, radical, and fundamental change might occur between and across domains: (a) a frontal assault, wherein one domain simply encroaches upon another domain, and (b) a viral infestation, wherein individual members of a domain are convinced, seduced, swayed, and turned (brainwashed is perhaps too strong a word) and accept the legitimacy or superiority of another domain or its fundamental tenets and at a subconscious level.

Our example: In tertiary or higher education contexts in the USA, analysis of recent trends (Center for College Affordability and Productivity, 2010) reveals that the number of university and college administrators continues to grow at such a pace that it is projected that the number of administrators and their support staff will soon surpass the number of faculty. Simply put, by 2014, administrators and managers will outnumber faculty. What will this mean for university governance and goal setting? How might this shift in balance affect, for example, the assessment of faculty and of programs? How might this shift in numbers (a shift in the balance of power, from the intellectual orientation of faculty to the pragmatic, managerialist ways of operating of administrators and managers) affect rights and responsibilities, such as academic freedom? (See our discussion of managerialism above.) In other words, might a shift in the balance of personnel at universities to a proportion weighted more in favor of administrators cause universities to become more managerial, even more bureaucratic and less pedagogical and educative?

So, colleges and universities have more administrators. At the same time, colleges and universities are hiring more lecturers and adjunct faculty (and fewer faculty on tenure lines, where job security would be relatively secure upon completion of an initial "probationary" period). Lecturers and adjunct faculty are paid less (this is attractive to college and university governing boards and state legislatures) and are less secure in their position (i.e., they are generally hired on a semester-to-semester and course-by-course basis, or sometimes these contracts are from year to year). The pay and the benefits are less for adjuncts and lecturers than for full-time, tenure-track faculty. Adjuncts and lecturers have fewer contracted hours, and the expectations are such that they devote little, if any, time to governance and the other maintenance functions performed by full-time faculty.

That said, the more insidious, seldom mentioned, perhaps unnoticed, trend in higher education—one that replicates processes already well-established in the US and Turkish public schools and at all levels (from aide to teacher to vice-principal, principal, and central office administrator)—is the increasing proportion of the faculties' time that is taken up by paperwork, meetings, and other tasks that are more administrative in nature. This is the tip of the iceberg in representing what is a fundamental role change for university faculty. Such a ballooning in the numbers of administrators at all levels of university systems brings with it an exponential explosion in the paperwork and administrative tasks that these administrators generate, all of which consume more and more of the faculty's time—time that could be devoted to academic pursuits, lesson preparation, and conferring with students one on one. In fact, under the current conditions imposed by a neoliberal agenda, students themselves are being forced to shoulder more and more of the financial burden of a college education (i.e., the states and the federal government are providing less) (Lewin, 2011), while getting less and less instruction and instructional time for their money (Zernike, 2009).

The hegemonic, insidious aspect of this colonization is that relatively few faculty are aware of the changing nature of their job to one that is more administrative, they have few tactics for resistance, they have been co-opted or seduced, or they see opposition as futile. Thus, and since the threat is nebulous, tactics for resistance and the possibilities for organizing in opposition are slim, if not nonexistent, owing, in the USA, to a conservative "right-to-work" policy environment in the southern states especially, anti-unionism, and a pervasive and deep anti-intellectualism that is part of the US collective psyche.[11] More and more, faculty come to accept these administrative tasks as being part of their job responsibilities, unquestioningly. As universities and colleges add administrators, the tendency is to become more bureaucratic, more hierarchical, not less. Increasing the number of administrators increases the work produced (where, however, the nature of the work produced by administrators tends to be administrative in nature—requirements for this and that, requisition forms and reports) the work load is devolved, but the power and authority remain concentrated at the top of the organizational pyramid.

Turkish Contexts of Corporativism

In Turkey, corruption is thought to have emerged during the Ottoman Empire in the sixteenth century. Society was experiencing decay and was collapsing under the weight of the administrative and financial systems of the time. Low-income civil servants fell upon economic hardship, which caused moral decadence, and as a result, bribery became a tradition from then on. According to a survey conducted by the Turkish Economic and Social Survey Foundation (TESEV), white-collar workers perceive bribery as the most important problem in Turkey (Adaman, Carkoglu, & Senatalar, 2001). Satisfaction with services and confidence in public institutions are low; what is worse, only 10 % of the people polled trust the political parties and national assembly in Ankara. The survey reflects the popular perception that corruption, bribery, and embezzlement in the social, political, and economic realms in Turkey are of major concern.

Another survey (Bayar, 2010) pointed out the perception that corruption increased when the introduction of neoliberal policies lowered barriers to investing in Turkey by big cartels. There was found to be a direct relation between corruption and the unemployment rate. Bribery, embezzlement, and organized crime appear to be on the rise, followed by what many believe to be a kleptocratic statist system.

The conditions that promote corruption in Turkey can be classified as managerial, economic, and social. Managerial reasons or conditions include bureaucratic structures and processes, rules and policies put in place for the running of the statist order, employment procedures and a lack of transparency and accountability for the state, and the lack of oversight of state practices and of the judicial system. These all contribute to widespread corruption in Turkey. In fact, rules and regulations in the business sector, including the application of tax law, share the characteristics that they appear to be arbitrary applications of the rules and restrictions governing trade, and this invites corruption (Hasdemir, 2006).

Bureaucracy, as an organizational form, was originally intended to thwart political corruption, cronyism, rent seeking, and bribery in developed countries (Weber, 1958); however, in Turkey, bureaucracy and politics are intertwined and politics has an undeniable impact on bureaucracy. The centralized, status quo structures of bureaucracy protect the state against citizens and does not give birth to decentralization, devolution of powers and civilianization concepts. Actually, social justice is a far way off in Turkey, in part because many bureaucrats obtain and retain their positions through political favoritism and cronyism and are protected by higher-level politicians. In these cases, government bureaucrats practice a particularly Turkish form of imperial hubris and, in the exercise of their authority, violate the “equal treatment of all” principle which is the essential component of public service. Moreover, the multiplicities and complexities of the rules in bureaucratic transactions invite corruption.

As regards the employment procedures of the state, high unemployment and/or underemployment in the public sector drives corruption in Turkey. A lack of a clear legal framework for the public financial management system hampers public transparency and accountability efforts, for example, through the use of the audit. Deficiencies in some of the basic principles and understandings of democratic governance—principles such as transparency in finance, accountability, performance management—lead to serious problems in Turkey. Often, efforts at management and control of public sector departments, institutions, and employees in Turkey leads to a kind of ritualism, and, paradoxically, this increases bureaucratic procedures and creates more red tape, rather than facilitating the management and supervision of the public administration (Türkiye Ekonomi Politikaları Araştırma Vakfı [TEPAV], 2005).

In addition to the political, policy, and structural conditions, economic factors also contribute to corruption in Turkey (and elsewhere). Some of these economic forces include the low-income levels of civil servants, the media and their relationships, the financing of politics and politicians, and the economic impacts of a high level of population growth. These socioeconomic conditions increase the pressure on the social and public services providers, which suffer from reduced resources and increased expectations. Under these conditions, significant opportunities for corruption arise in the distribution of public services. For instance, corruption is the product of the unequal and almost capricious distribution of employee wages and salaries in the public service sector, as there are no set criteria for determining the salaries and wages of workers. Furthermore, political parties and their candidates use the distribution of free goods and services to court votes, in violation of the law—a practice that is widespread. This leads to favoritism and corruption in relationships (TEPAV, 2005).

In terms of social reasons for corruption, the failures of the educational system, a diminishment of a sense of common responsibility, ineffective NGOs, and misplaced societal values are all factors (Hasdemir, 2006). Structures and processes for both non-formal and formal education in Turkey are hardly adequate. In addition, formal education, generally based on memorization, itself gives rise to corruption since it inhibits people's—students' and teachers'—initiative, creativity, autonomy, and free expression. Likewise, the citizens' and bureaucrats' perception of public service as watching over citizens in Turkey increases the likelihood of corruption and bribery. However, in developed countries, with their adoption of democracy and a large number of NGOs, the level of corruption is less than in other countries. In addition, in societies where sense of common responsibility is not developed, individualism is built naturally. In essence, the individual's struggle in Turkey is actually based on favoritism and friend relations (TEPAV, 2005).

Since the 1980s, Turkey has witnessed the emergence of a new economic system which parallels basic transformations in the global economy. Globalization creates an avalanche effect, giving the Turkish people the idea that it is a golden key that will open every door. Popular acceptance of this mythology changes Turkish economic, social, and political life. More importantly, it changes educational life. It implants the idea in the minds of the Turkish people that globalization creates knowledge-oriented people who can invent technologically hegemonic commodities to rule major markets and that the knowledge learned under conditions of globalization can be used in every aspect of life. However, there is another way in which globalization is viewed in Turkey. In this view, there is an antagonistic relationship between labor and capital, and neoliberalism is perceived as a phenomenon which serves capitalist countries' needs, that kills freedom, and that threatens the ethics and moral values at the roots of the nation.

Neoliberal policies after 1980 directly altered the Turkish economy and society by removing all the barriers to international capital and prospective investors. Changes based on neoliberalism have been painful and full of trouble because neoliberalism has been instituted at the cost of national unity, social equality in the sharing of the country's resources and revenues, and a widespread sense of social well-being. Privatization has taken hold and the government, which has been slowly removing itself from the provision of social services. The inscription of neoliberalism in Turkish politics, economics, and policy has ushered in more of a free-wheeling, anything goes environment. Planning is very important for a country's upcoming generations, but neoliberal approaches have narrowed or destroyed a national basis for social planning by the state. On the other hand, and to be fair, this move into a neoliberal policy environment has resulted in processes and procedures that have served to decrease banking fraud and corruption, and the anti-democratic demeanor of the previously existing statist institutions.

The Turkish educational system and the framing of the future training needs of the country have been severely affected by global capitalism and neoliberalist ideologies (Dikkaya & Özyakişir, 2006; Sayilan, 2011). There has been a sharp decline in state investment in the educational system of Turkey. Poor economic conditions and the unstable financial situation of many families have contributed to a worsening of the educational life of the country. Privatization processes and neoliberalist applications have opened the door for private schools, whose owners invest great amounts of financial resources in them, thereby creating cosmetically appealing schools and bringing with them vast inequalities of educational opportunity. As a result, children and young adults' levels of school enrollment rates have fallen considerably, and the quality of education has decreased overall. Insufficient resource distribution (monetary, material, and personnel) brings about unjust outcomes in schools and differences of socioeconomic status (SES) add to the existing injustices in schools. Those schools which capture an advantage in financial and material resources contribute to a decrease in educational quality for students studying at those schools serving a lower SES population. It is evident that there are numerous injustices against students in lower socioeconomic levels.

Another aspect of these selfsame neoliberalist and corporativist policies is that there are an insufficient number of teachers willing to serve in the lower SES schools (a socioeconomic professional trend with parallels in the USA). This shortfall is compensated for by employing teachers on a strictly contractual basis or by hiring teachers by the hour. This decreases the educational opportunities offered these students too (Polat, 2007). There is no basic right to educational equal opportunity in Turkey. This lack results in various injustices being perpetrated by the Turkish educational system and at all levels—from preschool through doctoral study in nearly every school and university. Educational provision in Turkey varies along gender lines, geographical region (east v. west), and according to socioeconomic status (Tanman, 2008).

US Contexts of Corporativism

In the USA, practices similar to those in Turkey are seen in the educational system, and on a daily basis. Some occur at the local level, where parents, teachers, business, and community leaders may perpetuate injustice, though many injustices are fostered at the policy level. We home in on this level in our discussion of how capitalism, corruption, and corporativism plague our educational system and educational provision.

The enactment of the US federal legislation known as No Child Left Behind (NCLB) (2001) was meant to ensure that all students received a quality instructional program. This act required states to develop assessments in basic skills for students at certain grade levels. It called for highly qualified teachers in every classroom for states, districts, and schools to be able to qualify for federal funds. (In Texas, to be deemed a highly qualified teacher, individuals were required to pass a content-level test and a pedagogical exam.) This federal initiative did not assert national achievement standards; on the contrary, it allowed the policy makers in each state to determine the levels of growth each child was expected to achieve. It gave states the freedom to determine how they were going to measure this. Texas developed the Texas Assessment of Knowledge and Skills (TAKS) to assess students and set the Texas Essential Knowledge and Skills (TEKS) as the official curriculum. We are still suffering from the unintended consequences of this initiative.

After the initial administration of the TAKS test, school leaders, specifically principals, began questioning the accountability movement: They claimed that the curriculum was too broad to teach. Multinational publishing companies began producing textbooks to address the Texas curricula. These same publishing conglomerates published the tests and, in a vicious circle, published the textbooks and other instructional material to remediate the "failings" unearthed by the tests. At that time, and in order for textbooks to be adopted for use throughout the state, publishers needed to specify what specific TEKS objectives were being addressed in their textbooks and their lessons. A fractious state school board made the textbook adoption decisions for the entire state, approving several textbooks by various publishers for the state-approved list. The highly politicized textbook selection process (a de facto curriculum) was/is all the more so because, being such a huge market, Texas drives textbook development decisions that have an impact on other parts of the nation. The science textbook selection process was highjacked by conservative Christian blocs and resulted in the introduction of so-called intelligent design (a modified Christian cosmology) into the resultant textbooks developed for Texas public schools. Additionally, state-wide science curricula were altered, and Texas teachers are required by the force of law to teach the state curricula, so that the theory of evolution, when taught, was to be taught as "just a theory," and it had to be taught alongside "intelligent design." The social studies textbook selection was no less contentious.

This last legislative session saw a loosening of the process, one right out of the neoliberal playbook, whereby a fundamental change was implemented, from adoption to allotment. Now, and concurrent with a severe slashing of the state education budget, there is no state-approved list; school districts are allotted a certain amount of money on a per student basis that they may spend for textbooks and/or other instructional resources. Many districts are choosing to spend their "textbook" allotment on computers and other technology (such as tablets) or on teacher professional development. Educational supply companies, vendors, and computer salesmen

(/women) are having a field day, with a lot of profit to be had and precious few guidelines, safeguards or oversight to be found. The excesses and abuses of a neoliberal economic policy infused into school finance are everywhere evident, and the controversy has been devolved from the state to the district level.

As a result of the draconian nature of the Texas accountability regime, more teachers teach to the test and the curriculum has become severely narrowed (Cambron-McCabe, 2010; McNeil & Alenzuela, 1998). Because funding is tied to accountability, this contributes to, if not drives, an obsession with testing and gaming the system to appear successful (Waite et al., 2001). These top-down reforms have contributed to his problematic situation. Challenging the policy-setting structures and processes at the top may be necessary to promote more socially just learning environments (Dantley & Tillman, 2010; Theoharis, 2009).

Conclusion

Social justice and social injustice look remarkably similar in Turkey and the USA, though differences surely exist. We have attempted to show how globalization and neoliberalism are behind many of the injustices perpetrated upon our nations' school children. When corporativism and corruption enter national, regional, state, or district policies and processes, it is not just the children who suffer, we all do. Profit-taking, opening public coffers to private for-profit capitalist concerns—even when they are nominally conceived of as schools, and making decisions based on a short-sighted neoliberal conception of "efficiency" rob us all. Privatization is but one of the contributing factors, but it alone is of insufficient weight to do much damage. In order for injustice to drag down untold individual school children or the teachers who would teach them, privatization must ally itself with other socioeconomic forces.

As such, neoliberalism spearheaded a global ontological shift to what we have described here as corporativism. Superintendents of schools eschew that title in favor of that of CEO. Budgetary decisions are based on a narrow conception of efficiency. Teachers are evaluated or assessed on their effectiveness or efficiency. Federal education initiatives (in the USA, its Race to the Top) strong-arm states into allowing more for-profit charter schools to operate in their states in order to qualify for the maximum amount of federal funding. School districts in the USA make a devil's bargain with on-line educational providers to split the monies allocated to the districts on a per pupil basis.[12]

Our fear is that we have gone too far down this corporativist path to turn aside or staunch this bastardization of our public education system. We need more conscientious citizens to speak out against the gutting of public education, whether done in the name of efficiency, or raising standards, or adopting and incorporating new and emerging technologies.

We have tried to do our part here: to raise the alarm and to try and provide the language and concepts with which to problematize what is happening. We can do more. We all can do more. It is perhaps not too alarmist to say that the future hangs in the balance. Conscientious educators around the world must act if we are to win the future. No less is at stake.

Notes

1. We assert that both of these social phenomena—corruption and corporativism—contribute to grossly unequal, unjust societies. Both operate through and reproduce a type of pyramid scheme (see Waite & Allen, 2003, on the pyramidal nature of corrupt systems). Both processes operate within, take advantage of, and reinforce extremely hierarchical systems, and such rigid hierarchical systems perpetrate undue stress and other maladies upon those, the vast majority, who populate the lower rungs of society, the bottom portions of these pyramids (Waite, 2010; Wilkinson, 2005; Wilkinson & Pickett, 2009).
2. The comparison holds in most cases; there are, however, a few anomalies. The wealth to corruption comparison can be had by comparing Transparency International's corruption perception index (http://www.transparency.org/policy_research/surveys_indices/cpi/2010/results) with global GDP data by country. We used the CIA data from the CIA World Factbook (http://www.econguru.com/heat-map-of-worldwide-gdp-ppp-per-capita-2008/).

   The most glaring anomalies or outliers are the USA and certain Arab countries, notably Saudi Arabia, Kuwait, Qatar, United Arab Emirates, and Oman. The Arab countries, while awash in petrodollars (and hence with a better than average standard of living), fall midrange on the corruption perception index. The USA, on the other hand, is rated relatively favorably on the corruption perception index but manifests extremely high-income gaps between the wealthiest 20 % and the poorest 20 % (Wilkinson & Pickett, 2009, p. 17).

   It seems to us that the tremendous amount of wealth in the Arabian countries ameliorates the effects of corruption, while, in the USA, the tremendous wealth disparity is a result not of corruption, but of corporatism (or corporativism, if you prefer), which, in line with our argument, is not perceived as corruption per se.
3. Alongside the more formal organizations—those at the core of what we here term social institutional forces—there are those forms of human association that are more informal, and perhaps all the more important due to their informality. Here we are thinking of NGOs, loosely connected social and political groups (like "flash mobs" and, recently in Germany, "enraged citizen" groups [Dempsey, 2011]).
4. Welch's (Rushe, 2002) retirement package alone, according to papers filed in his divorce, included:

   > unfettered use of corporate jets (a perk valued by an expert as being worth $291,677 a month). He also had a company-owned apartment overlooking Central Park, a limousine, a cook, free flowers, country-club memberships and a charge account at Jean Georges restaurant. He was also entitled [sic] to top tickets at the Metropolitan Opera,

> tennis tournaments such as Wimbledon, and for games played by the Knicks, Yankees and Boston Red Sox. The affidavit revealed that he didn't even pay for his laundry. (Rushe, para 16)

5. The relative compensation of the league commissioner varies by league (http://sportsbiz.biz/2010/09/13/sports-commissioner-salaries-the-top-five/), but all have extremely attractive pay packages. For example, the Major League Baseball commissioner, Bud Selig, was paid $18.35 million in 2007. Only ten players earned more that year.

   A recent story in *Golf Digest* stated: "With a pay package of $5.1 million in 2009, PGA [Professional Golf Association] Tour Commissioner Tim Finchem leads our list of the highest-paid golf-association executives. The PGA Tour, a tax-exempt organization [!], reported revenue of $954.5 million in 2009 …. Finchem's compensation would've ranked fourth on the PGA Tour's 2009 money list but is below that of MLB Commissioner Bud Selig ($18.3 million), the NFL's Roger Goodell ($10.9 million), the NBA's David Stern ($10 million) and the NHL's Gary Bettman ($7.2 million)" (*Golf Digest*, 2011, p. 44).

   For further statistical comparisons, see also: http://www.pensionplanpuppets.com/2010/7/12/1565848/commissioner-bettman-overpaid-an

6. We are working with the commonalities among organizations and institutions while acknowledging differences or variations. We strive to practice reflection and self-criticism and, in doing so, take note of some different ways of classifying phenomena of interest. Different analytical frames are simply that—heuristic devices that approximate but do not substitute for the phenomena of study. One such heuristic device, one we employ here, is the taxonomy—classifying, grouping phenomena, and organizing them along hierarchical lines. The tendency to employ this heuristic device may have led Fukuyama (1999) to assert that hierarchical organization is human nature, though we believe there is more to it than that.

   There are different forms of organization, other than the hierarchical bureaucracy, as Giddens (1991), Shirky (2008), and Wilkinson (2001) remind us, some having evolved, especially recently, out of the new media—Facebook, Twitter, Flickr, and others.

7. We wish to make clear our conviction that the corporation as an organizational and organizing form was not inevitable or preordained in some sort of twisted social Darwinian sense; anyway Stephen Jay Gould's (1992, 1996) body of work was nothing if not a corrective to the misapplication of evolution and Darwinism—the mistake being teleological, that is, that the resultant or current state was derived, if not purposefully, then by something akin to divine intervention.

8. Note the current difficulties Rupert Murdoch's media empire is undergoing, due, in part to a tarnished reputation resulting from unethical and, likely, illegal aggressive investigative practices, resulting in, so far, the closure of a 168-year-old newspaper, *The News of the World* (Lyall, 2011). In essence, the decision to shutter the paper at the center of the controversy was strategic: it was done in hopes of yet salvaging a larger deal by News Corp to acquire British television rights.

9. However, as we are in the early stages of this research project, we fully expect that the list of characteristics will be filled out and more comprehensive in the future.
10. Which it certainly did in the immediate aftermath of this massacre. The Blackwater employees were extracted from Iraq, and only recently has there been even any hint that a few of these mercenaries may face possible future charges, but for making false statements during the initial investigation.
11. Another dynamic impeding an organized resistance by university faculty to the threat posed by the spread and inculcation of, first, neoliberalism, and then parasitical upon that, corporativism, is the nature of the profession itself and the nature of the professional attracted, to (and developed through) this type of work. It is an inside joke among university faculty and administrators that managing faculty is like herding cats, it can't be done. This presents still another impediment to organizing US faculty, at least, to resist corporativist hegemonic practices and ways of thinking.
12. The costs to the district are nil, and they keep half of the state monies allocated, with the other half going to the Web-based content provider.

Chapter 34

The Courageous Conversations Project: Interrogating Perspectives and Perceptions of Race, Poverty, and Schooling in South Africa and the United States

Arnold Dodge and Berte van Wyk

> Creating freedom, community and viable relationships has its price. It costs time and courage to learn how to sit in the fire of diversity. It means staying centered in the heat of trouble. It demands that we learn about small and large organizations, open city forums and tense street scenes. If you step into leadership or facilitatorship without this learning, you may spend your time recapitulating the blunders of history. ~ Arnold Mindell

Background/Rationale

We (the authors) met in 2009 during a People to People exchange event at Stellenbosch University near Cape Town, South Africa. Since that meeting, we have been collaborating on the Courageous Conversations Project. Visiting each other's countries annually, touring schools and communities, and participating in university colloquies have raised our awareness of our own and other perspectives and perceptions of the relationships among race, poverty, and schooling. We have met collectively and individually with university faculty, school administrators, and regional directors to review the project and ask for guidance for both the purpose and details of the initiative.

Illustrative of the very personal nature of the work, the US author describes his experience upon visiting the Hector Pieterson museum in Soweto, a museum dedicated to the Soweto uprising in 1976 in which soldiers from the apartheid government fired upon students who were protesting the mandate that Afrikaans and English be the only acceptable mediums of expression in their schools:

> I was touring the museum hallways with a delegation of black and white educators from the US, looking at the heartbreaking photographs of soldiers confronting school-age students; especially upsetting was the iconic photo of Hector Pieterson, in the arms of a fellow student, after having been shot and killed by the police. While I was disturbed by what I saw, I was composed and cerebral. I noticed that many of the black people who were touring with me were crying. It was then that I realized that the lived experience of being black was something that I could appreciate but never fully understand. My consciousness is a white consciousness, freighted with historical privileges and protections, and as much as I regard myself as a politically progressive and sensitive individual, I will always be on the outside of the black experience looking in.

The project is driven by what we perceive as social injustice on a systemic and massive scale throughout the educational systems in both countries, an injustice propelled by structural, not overt, racism (Wells, 2010). Rather than building on cultural differences to strengthen our educational offerings, we agree with Moll's assessment regarding how far we have come since the landmark cases in the USA involving school segregation: "… current educational remedies, featuring regimes of standardization and testing to control schools, seem stagnant if not anachronistic, failing, as they do, to mobilize the social, cultural, and linguistic processes of diverse communities as the most important resources for positive educational change. And, in this failure, they also delay for all of us the fulfillment of the promise of *Mendez* and *Brown*" (Moll, 2010, p. 451). Add "… and the promise of the end of apartheid" and Moll's opinion has a two-country relevance.

Within this chapter, we describe a template for action that we believe is replicable in any investigation of the influences of race and poverty on educational opportunity. Our belief is that the first step in any such investigation is the ability to confront social injustice head on, eschewing bromides and polite fiction that so often characterize discussions of race and poverty. We are ever-mindful of these "economies of niceness … ways in which … being nice [is used as a] currency … traded openly as a place-holding discourse to take the place of more critical work" (Galman, Pica-Smith, & Rosenberger, 2010, p. 233).

The project is situated within the framework of critical race theory and is propelled by a vision to challenge the dominant discourse in each country – a discourse that attempts to normalize "whiteness." This phenomenon is animated in fictionalized parables created by critical race legal scholar, Derrick Bell. One parable's lesson is that in schools created for white children, African American culture and language are misunderstood and pathologized as deficient and African American student behavior is framed as oppositional (Taylor, 2007). Despite the daunting task of confronting this dominant discourse, the authors are committed to moving in a positive direction, fueled by the courage of the participants to be actors in uncharted territory. A not surprising (but nevertheless unsatisfying) finding thus far is that we have uncovered more questions than answers.

A tour of a New York suburb by the South African author provides a window into the growing awareness that both authors are experiencing as they work together. He finds a sobering similarity apparent in the social landscapes of both countries:

> As the car drove through an impoverished neighborhood, a community with apartments over storefronts, run-down buildings and black people walking up and down the streets, I was not surprised, knowing that there were many such communities in the US. What was surprising was that within less than a hundred meters the boulevard changed into a leafy and inviting street of wealthy homes with manicured lawns which I was told was an exclusively white enclave. I had to stop and take a photo up and down both ends of the street. The proximity of the disparity was breathtaking, reminiscent of my homeland where poor black townships are within walking distance of magnificent homes, gated, secure and filled with white people. I recalled one of the South African principals in our project discussing proximity and school resource disparity: 'It creates problems when we have a school that offers a wide range of activities, opportunities and outstanding results, while on the doorstep of the same community we have a school that has limited resources, poor results and offers learners no hope.' My American friends seem to be living with the same challenge.

The nature and purpose of the work of the Courageous Conversations Project is manifold:

- To promote honest dialogue and reflection about issues of race and poverty in South African and US schools
- To examine forces of resistance to providing equitable resources and instruction for all students regardless of race or social circumstances
- To examine the historical roots of race and poverty in both countries and the (often subtle but powerful) impact the historical narratives have on the children of both countries
- To examine the current sociocultural influences on race and poverty in schools
- To learn cross-culturally about workable strategies for achieving social justice

While our work is informed by the scholarship of those who have examined issues of race, poverty, and schooling, our approach to the project is spare, direct, and unadorned. A few simple elements comprise the model:

- Situating the project in a historical context
- Becoming aware of some of the "drivers" of social injustice related to schooling in both countries
- Enlisting the support of school leaders who come from a variety of settings
- Creating opportunities for conversation, using protocols that stimulate open and honest deliberation and/or dialogue

With these elements in place, we hope to create uncomfortable, unprecedented, cross-national, nondefensive, vulnerability-inducing conversations (i.e., courageous conversations) about how race and poverty affect educational outcomes for children. By creating dissonance, we hope to stimulate a passion for solving problems that to date have remained intractable. Davidoff's warning about the current paradigm of school leadership in South Africa seems most fitting:

> … the most important dimensions of leadership … have to do with vision, passion, love, imagination, and a burning sense of commitment to the social and human dimension of education – and the importance of leadership in this context… current approaches tend to focus more on skills development and conceptual understandings of specific paradigms, rather than providing opportunities for people in leadership positions to be inspired to

> inspire – for they themselves to undergo profound paradigm shifts through experiencing what it really means to lead into the future. Without such passion, very little is likely to change, and the old divisions which characterised education – and life more generally – in South Africa, are likely to remain. What we are looking for are ways of breaking the chains of the past, which find their way into the present, and are often – unwittingly – created and maintained internally. (Davidoff, 2010, p. 10)

A few caveats about the project are in order. First, while there has been much written regarding the differences in the scourges known as racism and poverty, for purposes of the Courageous Conversations Project, we have chosen to link the two concepts. Indeed, in both South Africa and the United States, those traditionally thought of as the underserved (blacks and coloreds in South Africa and blacks and Latinos in the USA) are also those who often suffer from the burden of poverty. Second, our investigation refers to authors on both sides of the Atlantic. While individual researchers and scholars who have investigated issues of race and poverty have mainly worked within their own countries' contexts, the truths they unearth are applicable for the most part to both South African and US circumstances. Finally, the project is in its initial stages. We make no warrant regarding conclusive findings. We do, however, offer the ideas in this chapter as a draft plan of action, one that can be modified, recontextualized, or borrowed from at will for those seeking to enter the breach.

Historical Narratives

Issues of race, poverty, and injustice are woven into the historical narratives of South Africa and the United States. Hundreds of years of social oppression and tumultuous upheavals in both countries – enslaving and colonizing minorities, civil wars, and power struggles between the powerful and the more powerful – bring us to the modern era where we glimpse as first hand witnesses the continuation of racial and social strife.

In 1946, Alan Paton wrote *Cry*, *the Beloved Country* (Paton, 1948/2003) as both a cry against injustice and a yearning for justice in his beloved South Africa (Callan, 1991). Two years later, the imprimatur of apartheid became law of the land, a law which relegated 90 % of the population to second class citizenship, gave rise to a social revolution, and left the country today, as some see it, "… divided as before … racism … rife at an individual level and heavily entrenched in democratic South Africa on an institutional level" (Naidu, 2003).

A few years earlier, across an ocean, Richard Wright, in *Native Son* (Wright, 1940), wrote of the harrowing experiences of a young black man caught in the grip of racial forces he could not understand. It was 1940, 14 years before Brown v. Board of Education would mark the end of de jure school segregation in the United States, and a generation before the progress of the civil rights movement. Today, widespread de facto segregation stands as the greatest engine of disparity in American public life. Attitudes regarding race have shown little change even after the election of the first black US president, a national survey reporting that "stark racial divides" remain (Winslow, 2010).

Table 34.1 Movements and legal milestones related to race issues in the United States and South Africa

Era	United States	South Africa
Separate but equal	Plessy v. Ferguson	The Bantu Act
Desegregation	Brown v. Board of Education	End of apartheid rule
Redressing inequality	Affirmative action	The Redress Acts
Challenging redress	Bakke decision	Support of "nonracialism"

Note: While both countries have been visited by various movements, the makeup of the populations should be taken into account in any discussion of race and the body politic. In South Africa, 90 % of the country is African or colored and in the USA, while there is a growing black and Hispanic community, the majority (63.7 %) in 2010 was non-Hispanic white

The US and South African societies have undergone parallel scenarios in their respective responses to racism (see Table 34.1). "We can make separate more equal," the call of those who do not want social change (Wells, 2010), began with Plessy v. Ferguson, which officially sanctioned separate but equal in the USA. A US principal involved in the project discusses why separate but equal remains an intractable paradigm in the public consciousness, even for those who would ostensibly gain from integrating schools:

> One option [to address school inequities] would be that wealthier communities could consolidate with poorer communities for purposes of schooling. However, there would be a firestorm of reaction from both communities. A lot of the black communities would be upset because of what they would see as patronage. They say: 'Just give us the resources and we will do fine.' It is unfortunate that consolidation would be so difficult to achieve because both the white students and black students would benefit. It debunks mythology about each community if kids go to school with one another.

In South Africa, the notorious Bantu Act sought the same remedy for social inequity, notwithstanding Alexander's reminder that " … no social system based on the separation of people into 'groups' could result in an equal or just sharing of that society's opportunities and resources" (Alexander, 2004, p. 6). Affirmative action was the US attempt at a course correction after nondiscrimination laws were passed; the Redress Acts in South Africa were similarly situated to make right the injustices of the apartheid era. But just as the Bakke case challenged affirmative action in the USA, there are those in South Africa who have challenged the continuation of categorizing social action by race, seeing it as a betrayal of the ideals of nonracialism (Dugger, 2010).

The Narrative Today

One easily senses the historical DNA of racism and division from both countries in today's narrative as the US author discovered about South Africa during his first visit:

> When I first arrived in South Africa I naively expected black and white folks to be in harmony with the wealth distribution being relatively evenly divided. How surprised I was to find the extremes. And how naïve I was to believe that after 16 years of democratic rule, things would be so very different. Coming from a land in which slavery was abolished

> 150 years ago and school segregation abolished 60 years ago I shouldn't have been surprised. I was reminded of what Titus had to say in his caution to South Africans regarding relying too heavily on a de jure solution to social problems: 'To start with the illusion that the U.S. Supreme Court could fundamentally alter the U.S. school system because of an ikon [sic] called the Bill of Rights, is to end up with a delusion that it can eliminate the vested economic, political and social inequalities in American society generally.' (Titus, 1974, p. 7)

In South Africa, many believe the single most important issue facing the nation since the 1994 abolition of apartheid is breaking the grip of poverty on a substantial portion of the citizenry. Most economic and policy analysts agree that approximately 40 % of South Africans live in poverty, with the poorest 15 % in a desperate struggle to survive (van Wyk, 2010a). The story line of poverty easily bleeds into the schooling narrative. Graeme Bloch, an education researcher at the Development Bank of Southern Africa, remarks: "If you are in a township school, you don't have much chance. That's the hidden curriculum – that inequality continues, that white kids do reasonably and black kids don't really stand a chance unless they can get into a formerly white school or the small number of black schools that work" (Bloch, as cited in Dugger, 2009). This inequality is staggering when one looks at the statistics associated with black and white student achievement in South Africa. As an example, "… in the Western Cape, only 2 out of 1,000 sixth graders in predominantly black schools passed a mathematics test at grade level in 2005, compared with almost 2 out of 3 children in schools once reserved for whites that are now integrated, but generally in more affluent neighborhoods" (Dugger, 2009).

It is clear that after 17 years of democracy in South Africa, "matric results" (similar to graduation rates in the USA) remain a stark reflection of the racial history of the country. The 2009 results clearly indicate that pupils attending former Model C, former House of Representatives (HoR), and former House of Delegates (HoD) schools stood a much better chance of passing matric exams than those in other schools (Roodt, 2010). Roodt suggests that this can be attributed to the fact that former Model C, HoR, and HoD were better resourced under apartheid, and still generally benefit from superior facilities, and other factors, including the greater independence arising from their semiprivate status, and greater parental involvement. Of the 466, 474 African pupils who wrote the 2009 matric examination, more than 90 % did so in schools other than Model C, HoR, and HoD schools. This indicates that a pupil's odds of passing matric are significantly affected by what type of school he or she attends.

The USA has a similar story to tell regarding wealth and schooling today. The wealthiest 1 % of Americans possesses a greater collective net worth than the bottom 90 % (Kristoff, 2011). The percentage of Americans living in poverty in the USA recently hit one in seven, or 44 million, a 15-year high. Long Island, the location of the US site for the current project, is home to the 32 richest zip codes in the United States according to the Forbes List of America's Most Expensive ZIP codes (Endo, 2010). And as witnessed by the South African author, Long Island is also home to poverty-stricken communities, some neighboring extraordinarily wealthy communities. The contrasts on every social indicator between these worlds apart have been labeled by some, the "shame of the suburbs" (The Shame of the Suburbs, 2004). A look at the school profiles indicates the relationship between wealth and school success.

On Long Island, only 9 % of the black students and 14 % of the Hispanic students were enrolled in the top 25 % of Long Island's best schools in 2008–2009, according to the US Dept. of Education. In 2009, one struggling district with a large minority population had a 4-year graduation rate of 50 % while the white majority community next door had a rate of 96 %. (In the adjacent county, a similar statistic is found between neighboring districts – 52 % graduation rate in the minority community and 95 % in the white community.) In the school districts in which 90 % or more of the students are black or Hispanic, on average, only 2 % of their students score at the highest level of the state's eighth grade English language arts exam and 8 % on the math exam. By contrast, on average, 17 % of the students in districts that are 90 % or more white or Asian score at the highest ELA level and 36 % at the highest math exam level (Gross, 2011).

The Drivers

What fuels the continuation of social injustice currently existing in the school systems of South Africa and the United States? Notably, Moll (2010) reminds us that all educational decisions involve relations of power and treatment of differences and have consequences for equity and social justice. Therefore, we ask, "What are the drivers that give force and energy to the structural racism and socioeconomic divide that continue to make schooling experiences so uneven for the children of both countries?" We offer three such drivers which may shed light on this phenomenon.

Zero Sum/No Room at the Top

First, race and poverty appear to be particularly problematic when there is a perception of scarcity of resources. Conversely, in a "non-zero-sum mobility" environment, i.e., one in which there is a perception that there is enough for all (Alba, 2009), there may be less likelihood of racial and social tensions to emerge. To what extent do policy makers, educators, parents, and students believe that a "zero sum" exists in providing school resources? And if there is the belief that there is just so much to go around, how does this affect attitudes when decisions have to be made about schooling? Some strikingly familiar themes emerge in Paton's tale of the South African racial and wealth divide. Here, he weighs in on the zero sum phenomenon:

> Some say that the earth has bounty for all, and that more for one does not mean less for another, that the advance of one does not mean the decline of another. They say that

> poor-paid labour means a poor nation, and that better-paid labour means greater markets and greater scope for industry and manufacture. And others say that this is a danger, for better-paid labour will not only buy more but will also read more, think more, ask more, and will not be content to be forever voiceless and inferior. (Paton, 1948/2003, p. 110)

Is it possible that there is a basic mistrust of the powerless because they may become powerful, thereby threatening the elites who run each country? This appears to be a disturbing but plausible notion. "Societies inescapably generate elites. Those elites can be public-spirited and responsible or they can be selfish and shortsighted. An elite can have concern and care for the less advantaged or it can callously disregard them" (Frum, 2011). Or, the elites can (either consciously or unconsciously) develop a plan which purports to help the disadvantaged, but by its very structure keeps the disadvantaged in their place. The strategy is borne of a fear of zero sum room at the top. Okun (2010) uses a simple trope to demonstrate this phenomenon: "An analogy would be the ladder – its highest point represents our deepest aspiration while by its very nature accommodating only a limited number. Western culture posits this ladder as a big 'T' truth, human nature, an immutable reality, when it is, in fact, simply a single and very specific construct …" (p. 7). In another words, if the elites allow everyone an entrée to the upper echelons of society, then there will simply be less room for the current occupants. We submit that one such strategy in the USA is seen in the energy and drive that powerful and rich people have to close the "achievement gap."

For years, the American public has been bombarded with the news that there exists an achievement gap between white children of privilege and children of color who are poor. Federal and state initiatives abound to address this inequity. Is it possible that some believe that there is room at the top for only a limited number and that by continuing to rank schools and students, we keep the air at the top rarefied for the privileged few? The lurching towards greater accountability may actually be driving the disparity (Wells, 2010). What some see as a well-meaning attempt to offer additional resources – and certainly additional attention – to needy children, others see as a subterfuge with a devious end in mind:

> While the invocation of the achievement gap into the national and intellectual mainstreams began as way to name the nation's failure to educate all youth equally, it soon devolved into a mechanism for normalizing Whiteness and further obscuring past and current histories of racial oppression. Instruments (or, perhaps more accurately, social weaponry) such as aptitude and achievement tests provided (and continue to provide) the blunt force for this invasive effort, both visibly and rationally upholding white-superiority ideology over all student populations regardless of race … the constant and continuous comparison of students of color (African and otherwise) to white students as buffered by test scores reinforces those differences in the extreme … A kind of white superiority- having been firmly established in the discourse of achievement- angles performance squarely in the direction of Whiteness, which occupies a central space in the performance paradigm, a space against which all other things, people, and places are measured … our continuing search for strategies to inspire the performances of youth of color in this country requires renewed commitment, particularly in relation to our much longer quest to redress historical inequities in education. But evoking the achievement gap discourse as matter of fact doesn't get us closer to our goals. In fact, it moves us farther away because the construct of the achievement gap digs deep into those psychoexistential wounds-the same wounds that first severed the nation. (Kirkland, 2010)

The Convenient Lie

> It's … hard to ignore the reality that poverty is an immutable obstacle in the path of improving public education, one that simply can't be swept aside by the rhetoric of raised expectations. (Mahler, 2011)

The second driver to consider is the "convenient lie" factor (Dodge, 2009). Much as there are inconvenient truths that many of us wish would go away, so there are convenient lies that we are willing to accept as facts. One such lie: If only the schools were doing a better job, then the ills of society would be cured. In a now famous statement, US President George Bush, during his campaign for the presidency, claimed that those who thought that schools in poverty-stricken areas could not succeed were practicing "the soft bigotry of low expectations" (Bush, 2000). That clarion call unleashed an army of crusaders who promote the canard that poverty is not the problem.

The truth is that good teachers and administrators are no match for "harsh social policies and the pernicious effects of poverty" (Berliner, 2009). Lack of fundamental community health and infrastructure needs, e.g., permanent roads, piped water and sewage, and electricity (Mbunyuza de HeerMenlah, 2010), are not rendered harmless to a child's welfare by a good school. Such is the stuff of magical thinking, which provides convenient cover for those who wish the social order to remain the same.

Advocates of the good-schools-are-possible-in-spite-of-poverty mantra often point to "high-flying schools" that achieve high test scores despite serving disadvantaged populations. The fact is that the likelihood of becoming a "high-flying school" in spite of poverty should give any thoughtful and honest individual pause: Of 60,000 schools considered, low-poverty schools are 22 times more likely to reach consistently high academic achievement compared with high-poverty schools. Schools serving student populations that are both low poverty and low minority are 89 times more likely to be consistently high performing compared with high-poverty high-minority schools (Harris, 2007).

Not only is poverty self-evidently destructive to a child's well-being, but it produces a host of metastasizing branches that impede educational progress:

- The Century Foundation in "Turnaround Schools That Work: Moving Beyond Separate but Equal" (Kahlenberg, 2009) suggests that the current trend in the USA for turning around schools ignores important factors, including the students and parents in high-poverty and low-poverty schools. Dramatic differences exist in behavior, mobility, peer vocabulary, and parental involvement (in PTA membership and volunteering) between high-poverty and low-poverty schools.
- It is estimated that by the time a child is age 4, children of professional parents have heard on average 48 million words addressed to them while children in poor welfare families have heard only 13 million (Hart & Risley, 1995).
- Students are subject to conditions in poor communities which can have dramatic effects on their ability to perform in school: low birth weight; alcohol and cigarette use, diabetes, and influenza during pregnancy; inadequate dental and vision

care; difficulty providing enough food and therefore inadequate nutrition; the effects of pollution (e.g., high levels of mercury and lead, and PCBs, air pollution inducing asthma); family violence and stress, and neighborhood violence; and transient attendance because of frequent moves (Berliner, 2009).

As Richard Rothstein (2008) opines: “There’s a lack of moral, political, and intellectual integrity in this suppression of awareness of how social and economic disadvantage lowers achievement. Our first obligation should be to analyze social problems accurately; only then can we design effective solutions” (p. 10).

The Gini Index

The third driver, which actually sets the stage for the first two, has to do with the Gini index results. The Gini index, a gauge of the disparity in wealth distribution between the top 10 % and the bottom 10 % of a country, finds that South Africa is #10 and the USA is #56 (in a recent iteration of the index involving 130 countries) in terms of greatest disparity, with the number one position reflecting the country with the greatest disparity. This, in effect, means that both countries, from a global perspective, have huge gulfs between those who have economic resources and those who do not. At the deepest level, this disparity forces those who believe in justice to confront their histories, their policies, and the lack of progress towards equity. Table 34.2 shows the positions of South Africa and the USA – and the company they keep. And, for another point of reference, the countries with the least disparity are also shown.

The impact of the uneven distribution of wealth on life chances should not be underestimated:

- Children who experience even a bout of poverty are less likely to graduate from high school, are more likely to become very young parents, have more difficulties learning, and earn less money than their nonpoor peers as adults. “Child poverty is in some ways a leading indicator of how the country is going to be doing down the road … Nearly all of the social problems that we worry about in this country are heavily correlated with child poverty” (McCarthy, 2011).
- Inequality within rich countries breeds a host of health and social problems, including lower life expectancy, higher rates of infant mortality, shorter height, poor self-reported health, low birth weight, AIDS and depression, mental illness, decreased level of trust, obesity, teenage births, homicides, imprisonment rates, and social mobility problems (Wilkinson & Pickett, 2011).
- “… the disparity between the haves and have nots was often as simple as black and white. Despite the end of apartheid in 1994 the bulk of the diamond mines, farmland and other natural resources remain under the control of the white minority Afrikaners …. Whites make up about 12 % of South Africa’s 50 million people, yet they still hold down about 80 % of all professional jobs. White unemployment is around 5 %; black unemployment, 27 %” (Khan, 2010).

- How many children and parents in impoverished communities can describe their school as this US principal from a wealthy community describes his? "Stable tax bases, continuity of leadership, better retention rate of faculty and staff, better pay, access to technology, appropriate and well-maintained facilities, lower class size, a full array of guidance and special education services, home life which is immersed in culture and literature, two parent families, (you can always reach a parent), home violence and neighborhood violence virtually non-existent. These are the resources of a wealthy district."
- The Pew Research Center study shows that in the USA, the wealth gaps rise to record highs among whites, blacks, and Hispanics (see Table 34.3). These findings are based on the Pew Research Center's analysis of data from the Survey of Income and Program Participation (SIPP), an economic questionnaire distributed periodically to tens of thousands of households by the US Census Bureau. It is considered the most comprehensive source of data about household wealth in the United States by race and ethnicity. This metric of disparity is truly breathtaking.

Part of the work of this project is to interrogate all facets of race and poverty consciousness that shape decision making in the past and now. There have been painful realizations in the journey thus far for those who have chosen to participate. It is no coincidence that the following story is told under the subheading "The Drivers."

Table 34.3 Median net worth of households in US 2005 and 2009

	2009	2005
Whites	$113,149	$134,992
Hispanics	$6,325	$18,359
Blacks	$5,677	$12,124

The authors describe the first time they met, a meeting that ended with a realization that they are struggling to reconcile with the goals of their project …

> We were dining in a South African restaurant with delegations of educators from both the United States and South Africa. Throughout the evening the authors' talked briskly and resolutely about the issues of wealth disparity and the accompanying uneven resources available in schools. We confidently shared stories of our work within our respective countries to even the playing field, for after all, the well-to-do had no more rights than the poor. At the end of the dinner, the US author noticed that the car key his new South African friend was holding sported a BMW logo. Surprised, he asked his friend if he owned a BMW. When the answer came back in the affirmative – and the US author explained that he owned the same model BMW -both had to laugh self-consciously. As it turns out the two arbiters of moral righteousness both owned expensive sports cars. Does this matter? How can it not matter we told ourselves. How can we ignore our own histories and privileges and possessions and how they shape our attitudes about inequalities?

Social (In)Justice and Educational Leadership

> Social Injustice – "Undeserved inequalities heaped on children." – John Rawls

The Courageous Conversations Project attempts to elicit frank discourse on the subject of race, poverty, and schooling, understanding that educational matters reside within the larger context of societal matters, i.e., the historical narratives and the challenges of equitable distribution of resources that still exist today. Believing as we do that school leaders can have a profound impact on not only the children they serve, but entire communities, we have chosen school principals in both countries to work with us on this project. The principals involved in this multiyear initiative have recently begun to engage in both domestic and international conversations about their experiences in schools. They have begun to share their perceptions and perspectives with one another, which has ignited a robust exchange. One example comes from a South African principal's epiphany about his perceptions of the disadvantaged:

> I was an economics educator for nearly 15 years … and never knew anything about the living conditions of people around me in townships. After this experience, I got involved with other learners who came from a previously disadvantaged background. This in turn introduced me to more people in circumstances and conditions that I never have experienced before. The more I got involved with young people from a different background, the more I realised that they had the same hopes and aspirations as the privileged learners in my

> school. The difference was that they lacked information, opportunities and support from their schools and communities. There was no way for them of realising their dreams without help from somewhere.

This same principal has his work cut out for him as he describes his current student body:

> … learners from our school are seldom exposed enough to the imbalances that surround them. They are unaware of the living conditions of others; they are unaware of the realities others are facing. They live in a world of their own where they never encounter poverty. The school uniform they wear is an equaliser as they all look the same in the school. They go home to their affluent neighbourhoods and live a 1st world life. They are never exposed to poverty, and they never get involved in anybody's life who is less privileged. They are totally ignorant of the needs of the people around them.

A school principal, as leader of the educational enterprise in a community, has the unique opportunity to use his or her position as a "bully pulpit" to tackle systemic and structural inequalities and to "disrupt" injustices. According to Theoharris (2010), the injustices that need disrupting include school structures that marginalize, segregate, and impede achievement; a deprofessionalized teaching staff; a disconnect with the community, low-income families, and families of color; disparate and low student achievement. Rather than become a victim of flawed policies, a strong school principal can set an agenda to change policy and practice as it affects the children in his/her charge and rouse others to action as well. It is for schools to take the lead in this matter, as Bogotch reminds us: "… there is no denying the educational fact that the primary role of educators is to extend privileges and develop voice in *others*" (Bogotch, Beachum, Blount, Brooks, & English, 2008, p. 14). We should see ourselves in the forefront of leading social change, not waiting passively for the impact of societal forces to shape our destiny.

An example of taking the lead in change comes from a principal of a well-resourced school in the USA. He describes the white enclave phenomenon which, while apparently providing a high-performance and successful school climate, ironically, does not serve his students well for living in the wider world:

> Equity is a priority in my school because of the students' lack of experience, i.e., no contact with students or teachers of color. They have no idea of what the rest of the world is like. One student after graduation came back and said to me: 'We could have used some background in how other people live; a little exposure wouldn't have hurt.' This is an extraordinarily isolated community geographically, and with the home prices, poorer folks could never afford to live here. Even though many kids in my current school are growing up in a privileged lifestyle, there is little if any racist language heard – it is a matter of 'we just don't want to live next door to them.' Parents have to be taught to teach their children not to be afraid of those who are different from them. If we don't tell our kids about this it won't happen. When I talk to PTAs and parent groups, I like to suggest that the (100 % college bound) kids in my school should be getting ready for the wider world. For example, I say to parents, 'What if your child has a black roommate in college?' When I put the issue in these terms it is not a condemnation of the community, just a bit of reality for the future to help their kids.

School leaders need to set direction for change to take place. George Counts, in "Dare the School Build a New Social Order," asks us to consider this possibility: We seem to be more interested in *action* than we are in *direction*, so we go around in circles (Counts, 1978). As a planned movement to reduce and eliminate social injustice in schools, this project is *committed to moving in a direction* and is fueled by the courage of the participants to move beyond the comfort of the circle they have been used to. This moral compass directs us to an "aspirational space" (Alexander, 2004) to motivate others to join us in these conversations. This space bestrides the twin phenomena of poverty and race and attempts to unpack the economic forces at work as well as the family and social capital underpinnings of youngsters in South African and US schools. For the school leaders who are involved in this project, we expect no less than steadfastness of purpose and a resolve to "make things happen." They have pledged to contribute to the project in the spirit of social change.

The Courageous Conversations Project challenges the authors and their colleagues to become culturally responsive. In the initial stages of the project, we are gathering the resources and background knowledge to make the steep climb towards cultural responsiveness. We intend on scaffolding this work through dissemination of literature and research coupled with numerous opportunities for dialogue about becoming such a leader. We intend on approaching the task from several angles, including supervision of teachers, sensitivity to written and oral communications, interacting with students, and disrupting extant injustices.

As the principals in this project take on the role of culturally responsive leaders, they sign on to becoming role models for their teachers, no simple task, as Buehler, Gere, Dallavis, and Haviland (2009) point out: "Beyond knowledge and skills, culturally responsive teachers must command affective qualities such as courage, will-power and tenacity" (p. 409). This is particularly true for white beginning teachers who "work with students of color for the first time, the process of examining their assumptions about race can bring on emotions of uncertainty, insecurity, and fear. Such introspection, which is essential for culturally responsive educators, requires a degree of emotional risk for which many beginning teachers and teachers educators are unprepared" (p. 410).

A gauntlet awaits those school leaders who wish to engage in disrupting injustice. Many of the challenges center on incorporating language and cultural differences into the school and monitoring how staff and faculty respond to behaviors of students from different backgrounds:

- "… to find their way into writing, children depend on the familiar and typified voices of their everyday lives – the voices of families, friends, media figures, and teachers. These voices literally reverberate in their own as the children orally articulate what they are going to say and monitor its encoding on the page…. a curricular and pedagogical knowledge of young children's languages is important in identifying and helping young children meet the challenges they experience in figuring out how to make a voice visible on paper" (Dyson & Smitherman, 2009, p. 978).
- Language is still a contentious and highly emotive issue in South Africa. Despite the fact that Xhosa is spoken by Nelson Mandela and ten million other South Africans, a 16-year-old was recently disciplined in her school for speaking in Xhosa,

her native tongue. The "… languages of South Africa's colonizers still rule in the classroom and elsewhere, a recipe for resentment …"(Bryson, 2010, p. 1).
- Jansen (cited in van Wyk, 2010a, 2010b) points out that in South Africa, there are hundreds of little incidents, unseen and unrecorded, that happen to younger and older students because of race every day in the South African educational system. He points to a formidable research literature which shows that in South African schools, the grouping of children, the dominant assessment practices, the learner preferences of the teacher, the display of cultural symbols, the scope of awards and rewards, and the decision of "who teaches what" are all organized in ways that show preference based on race (as well as social class, religion, and gender).
- At a recent conference, hosted by the US departments of Education and Justice, the assistant attorney general for civil rights unabashedly addressed the "disparate impact" of discipline in US schools: "Regrettably, students of color are receiving different and harsher disciplinary punishments than whites for the same or similar infractions, and they are disproportionately impacted by zero-tolerance policies- a fact that only serves to exacerbate already deeply entrenched disparities in many communities" (Zehr, 2010, p. 1).
- "For… minority children, especially in the contemporary social context, educational resources and opportunities must include integrating their language and cultural experiences into the social and intellectual fabric of schools, much as these have always been seamlessly integrated into the education of privileged White children. In education, power is transmitted through these social relations, representations, and practices, which determine whose language and cultural experiences count and whose do not, which students are at the center and, therefore, which must remain in the periphery" (Moll, 2010, p. 454).

This work is not for the faint of heart. Understanding the educational implications of the challenges inherent in an initiative involving multiculturalism "requires open, honest, and public discourse rather than the more typical safe, constrained, and politically correct thinking often expressed in schools" (Shields, Larocque, & Oberg, 2002, p. 118). Furthermore, school leaders interested in social justice must practice dispositions that can lead to growth or change, particularly emphasizing courage and initiative for this project. Courage and initiative as a disposition in schools require "Discussing uncomfortable topics or issues … accepting the discomfort that stems from the need to change and seeking or accepting new or unfamiliar roles, responsibilities or challenges" (Martin-Kniep, 2008, p. 4). This courageous disposition takes on added significance given the history of researcher attempts to investigate issues of race and poverty in schools:

> "… conversations in schools rarely addressed the complex issues raised by multicultural school populations. Frequently educators seemed uncomfortable when topics were raised, either changing the subject quickly or engaging the issues in highly emotional ways. Indeed, we became increasingly aware of a general lack of willingness to engage in dialogue about race and ethnicity, perhaps because educators consciously hoped to avoid the arguments and conflicts that often accompany such conversations, but more likely, because they simply did not know how to address the issues." (Shields et al., 2002, pp. 118–119)

Table 34.4 Guiding questions for the conversations, developed bilaterally by faculty, principals, and educational directors

1. How would you define educational equity and redress?
2. Is equity and redress important to you as a school leader? Explain.
3. Describe some of the equity and redress challenges that exist within your school.
4. Describe some of the equity and redress challenges that exist between your school and other schools within your district.
5. What attempts, if any, have been made recently to address equity and redress issues in your district? Have these attempts been successful, in your estimation?
6. What is the role of government in ensuring equity and redress?
7. What is the role of parents in assuring equity and redress?
8. What are the major equity and redress areas that you feel need to be addressed in today's schools?
9. How does funding affect equity and redress?
10. Give one example of the effects of an equity and redress imbalance on a student you know.

Creating an Environment for Authentic Voices

The overarching philosophy for the project, drawn from the tenets of critical race theory, is primarily interested in provoking change, not just recording information. It attempts to go beyond the dominant discourse to a place of honest communication about sensitive matters. Much as Albert Einstein came to believe that simple language had the power to convey ideas that were both deep and disturbing to push the boundaries of the physical world (Isaacson, 2010), we believe in the power of simple, unalterable truths to push the boundaries of the social world.

Questions, developed with the assistance of principals, public school directors, and university faculty – see Table 34.4 below – are being used to gather data to inform the work and to stimulate discussion within and across project locations. (Note that the sample above is used for the South African version of the survey; the term "equity and redress" is most popularly associated with the definition of equity in South Africa. For the US version, the word "equity" is used alone). In addition, notes and commentary from other forums presented under the aegis of the Courageous Conversations Project are being compiled.

In addition, we borrow from those who have considered how to stimulate direct and frank conversations. "What is my role in creating change?" and "Can I be fearless?" (Wheatley, 2009) are two foundational questions that we ask. In addition, we refer often to the concept of equity audits wherein thoughtful and thorough protocols are used to burrow into a school's culture; we arrive equipped with skills to avoid "equity traps" (Skrla, McKenzie, & Scheurich, 2009, p. 101) on the way to becoming "equity –oriented change agents" (p. 70).

Opportunities for Conversation/The Medium as Message

Principals who are participating in the study are drawn from the ACE program (a professional development program for school leaders) in South Africa and from two New York State professional organizations in the USA. These transatlantic school leaders will share many experiences during the course of the Courageous Conversations initiative. The uniqueness of the project may very well be its greatest strength. Attempting to discuss race, poverty, and schools within one's country, a conversation which will undoubtedly be laced with emotions associated with injustice, nevertheless, can be somewhat predictable. Too often, the usual suspects – politics, financial hardships, and historical inertia – are trotted out by partisans on both sides of the argument. As one South African principal noted:

> It is easy to go into the blaming mode: parents from wealthier backgrounds blame people for just demanding more and more and for lowering standards. Parents from less-prosperous backgrounds can blame the past for the inequities. Both these groups of parents have a responsibility to instill a new set of values in their children.

In these "blame storming" (McDonald, 2009) conversations, talking points abound, suspended in a calcified discourse. However, by discussing and experiencing these matters across an ocean, there may be a phenomenon at work which operates like the opposite of the distortions found in a fun house mirror. In our case, we may be holding up a mirror which lends clarity and deeper dimensions to what is observed. At a church in South Africa, the US author had experiences which may be illustrative of this clarity and depth:

> During my visits to South Africa, I attended evening church services set aside for university students. The first time I attended the service I was impressed by the upbeat and youthful presentation by the pastor (a rock band served as the musical accompaniment) and his message of peace and hope. As I looked around the 500-plus seat auditorium, I noticed that there were two or three black faces. I was overcome with emotion as I realized that I was in a house of worship, located next door to a preeminent institution of higher learning, populated by the next generation of South African leaders and intellectuals … and all the faces but a handful were white. I walked back to my hotel room through the university campus, stopped along the way, and cried on the steps of the education building. During my next visit to the church about a year later, I attended the same service, but this time when I looked at the few black faces in the sea of white, I tried to be more intellectual and less emotional – after all, I was a scholar involved in research. This worked until the rock band sang a song as the lyrics were projected on large screen TVs throughout the cavernous church. The lyrics read, in part: '… may oceans of justice flood through your heart. May rivers of fairness touch every part …' My emotions gripped me again and I found myself screaming inside: 'OCEANS OF JUSTICE? RIVERS OF FAIRNESS? THEN WHERE ARE THE BLACK PEOPLE?'

Moll (2010) suggests that creating opportunities for honest conversation may be needed now more than ever: As he observed and participated in groups that discussed social justice issues, he noticed that they became "… a setting to reflect upon and discuss how we thought and talked about differences, to challenge stagnant notions of culture, and to analyze within-group variability. In so doing, we came to realize the crucial importance of creating 'additive' conditions for learning, not only for students, but also for teachers. This is imperative in the rapidly changing demographic context of schools. It is also a tall order … especially in the current context, with all the imposed constraints of 'accountability' or 'market' models" (p. 455).

The project leaders have visited each other's countries on several occasions. Each time there has been a forthright discussion run by the visiting professor on the troubled state of affairs in his home country. This willingness to openly criticize one's homeland in another nation sets the tone for others to follow. We have found that these presentations have yielded enormous frankness on the part of the principals and faculty associated with the project in each country.

While we are learning about our differences, we learn much more about our similarities. Children have physical, social, and psychological needs that transcend national boundaries. This seems best expressed by a US principal who offers this simple but profound notion:

> Every kid wants to be loved. If they can't be loved they want to be respected. If not, then they want to be noticed. Watch how this plays out in every school and community and you get a sense of why children exhibit different behaviors.

Live webcasts with principals and faculty from both countries are being broadcast periodically. During these sessions, there is a palpable momentum in both locations to get to the bottom of things – to tell the truth. Questions asked provoke each side to unpack what their homeland is like. A website devoted to the groups' mutual concerns has been developed, a place to share ideas and exchange documents. Excursions to both countries by visiting principals are in the planning stages. These media experiences and plans for direct contact have produced an atmosphere of trust, energy, and enthusiasm for the work. We believe that this climate has begun to engender the type of courageous expression that will be at the heart of the project. Below are comments from school leaders in both countries, reflective of the initial stages of unpacking the truth about race, poverty, and schooling.

A South African principal in a traditionally underserved community exposes some of the fundamentals of continuing resource inequality, including long-term underinvestment in facilities and teacher training for South Africa's poor ….

> Racial groups in 1994 start out on an uneven playing field and equal treatment does not in and of itself go far enough. Hampered by decades of underinvestment in school facilities and in the quality of teachers serving black and coloured students, uniform funding formulas for current operating spending will not provide the same educational opportunity to these students as to white students – there should be fair equality of opportunity for social and economic advancement. Some of the pressing problems at my school are the lack of classrooms, hostels and sport grounds as well as appropriate learning support material. To set a realistic budget the staff raises funds by means of fundraising projects with little support of the parents. The focus of our primary task – to teach- now has moved to raising funds. The legacy of the past is also evident in the qualification of teachers. Many teachers received their education in the impoverished coloured schools that have since been closed. This resulted in a lot of mathematics and science teachers being underprepared in those fields. Within our circuit we have very rich schools which build extra classrooms, media centres and multi purpose halls out of own funds and money from rich donors. The affluent parents are able to enhance the quality of their child's education by the high school fees they pay and it being used to supplement the resources… public schools in South Africa will continue to consist of two tiers, one privileged and well-resourced and the other poor and disadvantaged. The public schools with high levels of private income continue to have lower teacher learner ratios, attract better qualified personnel and have substantially better instructional resources.

A principal of a well-resourced South African school waxes eloquently and forcefully for the moral imperative of the privileged seeking ways to help the poor and to develop empathy for their plight, while at the same time not lowering their own aspirations. This thorny dilemma begs the question: Can the wealthy and privileged maintain what they have while assisting the less fortunate?

> Due to our past, schools and school communities experience a huge difference in providing opportunities. It is therefore the role of government to redress this imbalance. While the government is responsible for the redress of this imbalance between government schools, communities in more affluent areas are investing in their schools in various ways, making this divide between schools appear even bigger. Redress cannot take place by taking away from or equalising the more prosperous schools in the system. To punish a well-resourced school and to get them on the same level of under resourced schools is not redressing. More prosperous schools have a duty, as part of redress, to prepare their learners to enter into a world where there is poverty, imbalances and other challenges. These schools need to educate their learners, and expose them to the realities of their communities.
>
> The challenge for me in this regard is how to redress the imbalance I know that exists without lowering standards in my school or taking away the strive for excellence that exists in my school, while at the same time assisting other schools and learners. The school would like to appoint people from different races to serve as role models for learners, but at the same time the school is not prepared to lower requirements just to appoint a less qualified person – this applies to all people of all races who apply at the school. The perception therefore exists that the school is excluding people of different races.
>
> In many cases … applications [for my school] come from learners from less-resourced schools, and being the stronger learners in their schools, their departure weakens the society and schools they come from, thus creating more inequality. Until government and under-resourced schools acknowledge the role and importance of an educator who is disciplined, well-trained and has a healthy work ethic, redress efforts will remain fruitless. As this is very difficult for government to do, it seems easier to focus on well-resourced schools and trying to blame them for inequalities and imbalances, and trying to make them feel guilty or pay for achieving while others are not. They create an atmosphere where well-resourced schools are supposed to feel guilty about imbalances and should therefore accept anyone and everything for their schools – let us all rather be mediocre than having only a few performing schools.
>
> It is strange that well-resourced schools are seen as unacceptable and not being part of the new South Africa, and that they are not operating within the spirit of an all-inclusive society, but the government (and school leaders from disadvantaged schools) send their children to these schools. By doing so, they acknowledge the quality of education provided by these schools and at the same time they show a vote of no confidence in other schools or their own abilities to address the perceived problems in the school system. What must be expected from parents in the South African context is to expose their children to the realities around them. They should make their children aware of the society we live in. They should encourage their children to become involved in the lives of the people around them. They should encourage their children to assist people around them with emotional, functional or financial support. Parents from less-prosperous circumstances should try to cultivate a culture of hard work and discipline amongst their children.

A US principal of a traditionally underserved community with a diverse population weighs in on issues of entitlement, shares a chilling reminder that society pays a heavy price through its prisons if we ignore the needs of youngsters – borne out by a recent NAACP report linking high incarceration rates with low performing schools (Wrobel, 2011) – and makes a suggestion for communicating between groups ….

> If minorities can afford to send their kids to a private education, then they increase their chances of their kids succeeding in college and beyond. Private schools are looking for minority kids. In many minority schools you find a lack of leadership and a lack of resources. In many of these places, the administrators are chomping at the bit to improve

> their schools, but they just can't raise the money. In more privileged places they even have foundations to give their kids even more. One of the stumbling blocks to equity is a sense of entitlement. I am entitled because I am white, because I am a doctor, etc. The black kids say the same thing: I am entitled to what the white people have. The resources we expend on the penal system as compared to the school system should enter into the conversation. Put the money we spend on prisons into our schools and the entire equation would change. Turn the schools around and you would not have the need for prisons that we do today. What if we did this: once a week kids from a privileged environment mix with kids from an underserved environment? They meet to discuss their aspirations. The kids might buy into this. If you start this electronically – maybe through social media – the communities might buy into it.

Conclusion/Just the Beginning

As we develop our conversations, the authors reflect regularly on a caveat regarding the work. We need to remind ourselves that what we regard as noble work, nevertheless, does not allow us to presume to speak for those less fortunate. We keep our arrogance in check by remembering the advice of Sbu Zikode, the leader of a poor people's movement in South Africa: "Supportive people should talk with the poor, not for the poor" (Zikode, 2010).

We close with some sobering thoughts for all communities to consider.

> Racism is not a biological fact. Racism is not an idea, nor is it merely expression of dislike or hatred. Racism is an ideology, an ideology with a history. It has no basis in biology, no genetic reality – there is more genetic variation among people of similar ethnic ancestries than between those with distinct ancestries. Moreover, the ideology of racism in America does not coincide with the history of slavery. Racism did not cause slavery nor did it die when slavery ended. Indeed, it became more virulent in the decades after emancipation (Attie, 2010).
>
> Racism refers to the use of mainstream rank against people who don't have enough social power to defend themselves. Racism is always social abuse (Mindell, 1995, p. 151).
>
> Those who are racially marginalized are like the miner's canary: their distress is the first sign of a danger that threatens us all. It is easy enough to think that when we sacrifice this canary, the only harm is to communities of color. Yet others ignore problems that converge around racial minorities at their own peril, for these problems are symptoms warning us that we are all at risk (Guinier & Torres, 2002, p. 11).

This chapter contains a set of guideposts for action. Believing as the authors do, that social justice in the schools of their countries will not happen without painful reflection and dialogue, they have drawn inspiration from those who have examined the landscape. Trailheads appear that we know we must follow if we seek the truth. Bogotch et al. (2008) implores educators to take the lead in shaping society. We have signed on for that duty. Our task, therefore, is to unpack the truth and set it out, unvarnished, for all to see. Only after the interrogation will come the healing and the solutions. This work has become a cri de coeur for the authors. The work is our passion and we have offered ourselves as examples of fallible individuals who harbor biases and resentments that need to be examined. We seek to make a difference. We are driven by our own undying belief that if our societies could shake the yoke of their respective narratives, come to terms with the drivers of inequity and engage in forthright conversations with school leaders, social justice will be served.

Chapter 35

Schools for Justice in the United States

Ivan Greenberg

In the history of American education, adult schools for social justice are little noticed, but importantly, their development can help to bring into focus ways education can serve the cause of social change. Overall, adult education in America has taken a variety of forms. Since the early twentieth century, these schools emerged as an alternative educational experience to develop political consciousness and participation in social movements. They often operated outside the regular public school system organized along class, race, gender, and ideological lines to teach adults to question authority and to rebel rather than submit. For example, working-class labor leaders believed wage earners should study the labor process to understand the role of capitalism and the market economy in structuring inequality and exploitation. Trade union education programs increased consciousness of the political economy and prompted organizing to transform workplace relations. In a similar way, African American leaders believed their people could not be educated about their history and culture within the dominant school system. During the modern civil rights movement of the 1960s, they established independent "freedom schools" to educate activists about where they came from and the historical obstacles they faced. Meanwhile, ideological socialist schools taught radical political philosophies and urged allegiance to third parties. Adult schools associated with Socialist and Communist groups flourished between approximately 1900 and 1960 and became the largest segment of the adult education movement.

The justice schools differ, for example, from Colonial era (1600–1776) schooling to advance the study of the Bible, as well as twentieth-century work-related or industrial vocational training. They also differ from modern efforts to "Americanize" immigrants by teaching civic culture, nationalism, and literacy. In contrast to regular public schooling, teachers eagerly engaged "power" questions touching on existing injustice. Rather than serving counterrevolutionary purposes by instilling

I. Bogotch and C.M. Shields (eds.), *International Handbook of Educational Leadership and Social (In)Justice*, Springer International Handbooks of Education 29,
DOI 10.1007/978-94-007-6555-9_35, © Springer Science+Business Media Dordrecht 2014

an unquestioning allegiance to existing American institutions, justice schools advanced an alternative pedagogy that aimed to help "ordinary" people understand their subordinate place in society, the sources of their oppression, and to think about ways to become empowered in liberation struggles. These schools provided a safe space for the discussion of controversial ideas in a participatory classroom that included an emphasis on public speaking rooted in collaborative, rather than competitive, relationships. Long before the publication of Paulo Freire's *Pedagogy of the Oppressed* (1970), progressives provided alternative practices to the established school system. In this instance, educational leaders often doubled as social movement leaders. They hoped to inspire and mobilize students to make a better world by looking anew at themselves and at society.

The schools usually appealed to an undereducated constituency. Working-class Americans often viewed regular schooling as less of a priority than participation in the labor force at young ages. Low-income families relied on the income of their children to meet basic family needs. This "family economy" only began to change during the 1920s and the 1930s when the combination of child labor laws and compulsory school attendance laws prompted rising high school attendance rates.[1] Yet, even as American high school education became widespread after World War II, unequal conditions – such as tracking and racial segregation – disproportionately affected poor and excluded groups.[2] The adult justice schools could provide an opportunity for education not previously available, and their unique subject matter attracted people interested in learning to advance social action.

Progressive educational leaders long have hoped that schooling could advance an egalitarian, just society. Schooling best can serve as a model for democratic community when it addresses how social class differences, as well as difference along race and gender lines, separate teachers from students. The learning systems of professional, middle-class educators may not be relevant always to the realities of working-class life, and the beliefs and values held by those below them in the class structure. Working-class adults often embraced collectivist traditions, stressing mutual aid. Visions of social transformation based on universalistic values and personal expression are most effective when combined with an approach that privileges solidarity in groups and identifies and confronts power structures.

Immigrants and Workers

Justice schools arose during the Progressive era (1890–1920) as part of the Settlement House movement. As approximately 24 million low-income immigrants from eastern and southern Europe (Italy, Poland, Hungary, Greece, and Russia) established urban ethnic enclaves in America, the new Settlement Houses aided them by providing social services, including education. The prototype was Toynbee Hall in East London established in 1884, and the idea soon spread to America. By the time of World War I, several hundred Settlement Houses were operating in poor urban areas. One of the earliest and most successful was in Chicago, where iconic reformer Jane Addams established a night school for adults at Hull House to teach English and help working-class immigrants adapt to their new surroundings. The school differed from government-funded "Americanization" education: Instead of promoting conformity to American civic culture and the political status quo, the Settlement school advocated reform to improve neighborhood life and humanize conditions in industry. At Hull House, visited by as many as 2,000 people each month, the adult school offered reading groups as well as college extension classes in a free-speech atmosphere that promoted democratic cooperation, defended worker and immigrant rights, and organized for female suffrage. Addams was influenced by John Dewey's idea of the "full-service community school." In a 1902 speech, "The School as Social Centre," Dewey argued that urbanization and immigration placed enormous demands on social systems and the community school must respond to organize support services by fostering strong partnerships and building on community strengths, including diversity.[3]

Settlement schools established a legacy referenced by recent advocates of community schools. Former Chicago school chancellor Arne Duncan – later Secretary of Education in the Obama Administration – headed efforts to integrate academic and social supports to students and families.[4] However, while school-linked health and social services filled a gap in a fragmented social service system, they almost never promoted political education or a protest agenda.

Progressive trade union leaders long embraced a labor-centered adult education movement, which achieved its greatest popularity during the first half of the twentieth century. In 1921, educator Fannia Cohn of the International Ladies Garment Workers Union (ILGWU) proclaimed: "The Labor Movement strives toward a new life. It dreams of a world where economic and social justice will prevail….where society will be organized as a cooperative commonwealth….To attain this end it is necessary to develop a social conscience and a sense of responsibility in the labor movement. With this end in view, we set out to organize our educational work."[5] The ILGWU, whose membership reached about 200,000, operated several education centers in New York City offering classes in economics, history, philosophy, art, literature, music, drama, as well as the English language.[6] At about the same time, labor intellectual Arthur Gleason, who worked with the United Mine Workers, argued: "Workers' Education does not say 'Come and be comfortable.' It demands the impossible."[7] Ralph Tefferteller, who helped direct educational programs at the Amalgamated Clothing Workers Union (ACWU), recalled helping "union members form drama groups to develop plays that had some social content….or hold seminars on the meaning of industrial democracy in America, or the history of the labor movement, or of various types of industries to help newcomers to the industry understand what the old-timers who fought to bring organization went through, and understand what they had inherited without having to fight for it."[8]

During the 1920s and 1930s, independent residential labor colleges enrolled hundreds of workers.[9] A student of the Brookwood Labor College recalled: "Many of the students were miners and textile workers and factory workers who would go back to their own local unions better informed and with a deeper background. The point was to make their own unions better."[10] The Women's Trade

Union League (WTUL) promoted separate education for women workers offering classes in economics, public speaking, writing, and organizing. By the early 1920s, summer schools for working women also enjoyed a high level of popularity. The school at Bryn Mawr College, which operated until 1938, annually enrolled at least 60 union women.[11]

At its height in the early 1950s, trade unions represented about 35 % of the nonfarm workforce. Union education programs taught not only work skills and training but also the study of social problems and workplace inequities. They tried to empower their membership to take part in union affairs and to develop class consciousness by teaching the history of working people. Moreover, leadership courses to current and emerging union leaders helped equip them with the skills and knowledge to be effective labor advocates. The extensiveness of these efforts often reflected a union's commitment to either "solidarity unionism" versus "business unionism." In the former instance, education was central to creating rank-and-file dynamism. In the latter, union bureaucrats feared bottom-up activism reluctant to mobilize through education programs.

Since the late 1960s, the national AFL-CIO labor federation, which currently represents about 13 million workers, operated the National Labor College (NLC). NLC is the only accredited college in the nation dedicated exclusively to union leaders, members, activists, and staff. Approximately 70 week-long continuing education classes address organizing, negotiations, arbitration, and workplace safety and health. Moreover, leadership development is a major initiative at many national unions. The Service Employee International Union (SEIU), which enrolled about two million members in 2011, provides on-site work leaders (known as stewards) education and training to "get an overview of the history of the Labor movement and the history of the Service Employees International Union. Stewards are able to explore the different aspects of the work-site leader…Stewards leave empowered and are equipped with the necessary tools to activate their worksite."[12] At the United Auto Workers (UAW), which represents about 390,000 members, a summer family education center accommodates about 450 students of all ages.[13] Education efforts at the United Electrical, Radio and Machine Workers of America (UE), which represents about 35,000 workers, incorporates "political education that counteracts corporate media influence and promotes a working class consciousness and alternatives to the corporate agenda." The union tries to reach the broader community, including nonunion workplaces, and provides "materials and classes to area schools to educate students on the union's values, principles and contributions to society."[14]

The AFL-CIO formed several educational bridges to nontraditional constituencies. Its Union Summer college student internship program, which graduated about 3,000 activists during the last 15 years, played an important role in mobilizing anti-corporate United Students Against Sweatshops chapters on more than 200 campuses with the help of the United Steelworkers Union. The anti-sweatshop movement, addressing the needs of wage earners in poor nations, represents a new model for student/worker transnational solidarity.[15]

Old Left Schools

Before World War II, socialists, communists, and anarchists established their own adult schools to build a radical movement directed to class struggle, not social mobility. The Rand School of Social Science in New York City; the Work People's College in Duluth, Minnesota; the Jefferson School of Social Science in New York City; and the Highlander Folk School in Monteagle, Tennessee, each demonstrate how schooling could serve as an agent for social change.

The Rand School (1906–1956) had close ties to the Socialist Party of America as well as the AFL's needle trades unions. Rand offered full-time instruction to several thousand students and ran a summer camp for adult socialist and trade union activists. While situated in New York City, it pioneered long-distance learning. By 1916, about 5,000 people from around the nation enrolled in courses by mail. The school's Department of Labor Research also published the *American Labor Year Book*, an important comprehensive volume of articles to chronicle the struggles and achievements of labor unions throughout out the world. Rand's curriculum included socialist theory, economics, American history, and literature. A course titled "Economic and Sociology of the Negro Problem" was offered as being of equal value to black and white students. It presented "in a scientific manner the fundamental facts covering the relations between the white and colored peoples in the United States, with especial reference to the economic and political struggles of the working class, so as to substitute knowledge and mutual understanding for prejudice and vague sentiment." Outside speakers were solicited for the class on "Current Labor Problems." "At each session some live issue in the labor movement will be discussed by a man or woman active therein." The "Elements of Economics 1" course provided knowledge to aid an understanding of socialist theory. "A study of basic ideas in economic science, aiming to develop a clear understanding of the significance of such terms as Commodity-Production, Price, Value, Wages, Surplus-Value, etc."[16]

In the era of World War I, the faculty boasted luminaries Scott Nearing, Charles Beard, James Harvey Robinson, Algernon Lee, Charlotte Perkins Gilman, and Bertha Howell Mailly. But its model of education proved controversial. During the first Red Scare (1919–1920), police raided the school at the urging of the New York State Lusk Committee and seized attendance records. The government prosecuted Rand, which was forced to pay a $3,000 fine, for violating the Espionage Act when it published an anti-war pamphlet, "The Great Madness," by Nearing. The Lusk Committee tried to close the school by court-ordered injunction, but Rand prevailed in a series of court cases in 1920 and 1922.[17] It then expanded its course offerings and increased student enrollment. The curriculum began to shift from socialist instruction to the new areas of child development, home economics, juvenile delinquency, race relations, peace education, social work, as well as trade union policies. Progressive intellectuals such as Franz Boas, Marc Connolly, Stephen Vincent Benet, Bertrand Russell, and August Claessens joined the faculty. John Dewey remained a friend writing in 1933 that "friends of enlightenment and sound adult education must see to it that its great work is not brought to a close for lack of funds." However, after World War II, emerging McCarthyism and the second Red Scare contributed to declining attendance and financial troubles.[18]

The Industrial Workers of the World (IWW) or Wobblies led the Work People's College (1907–1941), which initially grew out of the Finnish immigrant radical experience. The Wobblies wanted to cultivate class consciousness and revolutionary direct action. In their view, classroom instruction supplemented the practical education workers received at the point of production and would create a new cadre of union organizers. Their revolutionary principles were articulated in the official course book: "The school recognizes the existence of class struggle in society, and its courses of study have been prepared so that industrially organized workers, both men and women, dissatisfied with conditions under our capitalist system, can more efficiently carry on an organized class struggle for the attainment of industrial demands, and realistically of a new social order."[19] The curriculum included classes in labor history, sociology, public speaking, writing, bookkeeping, geography, economics, biology, and arithmetic. The labor history class assigned Friedrich Engels, *Origins of the Family, Private Property and the State*, and Karl Marx*, The Eighteenth Brumaire*. The Public Speaking course urged "students to prepare lectures of propaganda value. Lecture to be given to class as if an audience of workers." Articles prepared in the writing class were published in IWW publications. Despite efforts to reach a broad segment of the working class, the College only enrolled about 70 students annually during the 1920s.[20]

IWW pedagogy rejected route learning and the top-down transmission of knowledge. There were few timed exams and competitive grades. As Richard J. Altenbaugh notes, "The school exposed students to classroom situations that encouraged them to articulate their experiences, to raise their level of social consciousness, and to give them practice in speaking before groups."[21] Student Eli Hill wrote a humorous poem about how the school day began:

> At nine o'clock sharp the class bell would crash,
> To classroom B they'd go in a dash;
> The room would be full of hoots and cat-calls,
> But the noise was abated by Fellow Worker Hall.
>
> Next is the period of Charlie Marx,
> This is a class where they all have bad marks;
> [Fred] Thompson calls Marx a volume of jokes,
> But I think he's screwy, it's nothing but a hoax.
>
> Some would go back to wrestle with Marx,
> While others would be torturing their saxophones and harps;
> Industrial Unionism is neither tabooed,
> For it's ambitiously studied in room twenty-two.[22]

IWW leaders also founded their own school for children to counter the teachings of the regular public schools. Elizabeth Gurley Flynn, an organizer of the IWW-led Lawrence, Massachusetts, textile strike in 1912, believed established schools tried to turn the children of the strikers against their parents. "Some of the teachers called the strikers lazy, said they should go back to work or 'back where they came from.'"[23] William "Big Bill" Haywood, an original IWW founder, also believed established schools assumed an antiunion role during the Paterson Silk strike of 1913 in New Jersey. The Wobblies organized their own children's meetings to counter this propaganda leading to "a school strike because the teachers had called the striking silk workers and their organizers 'anarchists and good-for-nothing foreigners.'"[24]

A different set of politics infused the Jefferson School of Social Science (1943–1956). The school offered Marxist adult education with ties to the Communist Party through the merger of two other Communist schools – the School for Democracy and the New York Workers School. Enrollment reached about 5,000 students each semester with the majority consisting of Party members and other recruits. Several teachers, including historians Philip S. Foner and Herbert Aptheker, had been dismissed from New York colleges because of their radical politics. Along with schools in several other cities, Communists ran the largest system of adult education in the nation. Their slogan, "Education for Jobs and Peace," was directed at "the whole mass of the people" with the exception of "known enemies of the working class." There was nothing secretive about the Jefferson school's operation, although during the late 1940s, teachers did not take formal attendance to protect the identity of students from government reprisals.[25]

The school's large library held about 30,000 volumes and as many as 15,000 pamphlets. Their curriculum combined the teaching of Party ideology and programs with broader subject matter, such as art, music, and drama. Within 2 years of its founding, the school offered about 400 courses in a dozen different fields with classes taught not only at its main campus but also at union halls. Although the course list ranged over many areas of study, the underlying socialist principles were expressed in the school catalogue: "The School teaches the principles of scientific socialism, Marxism, analyzing both world socialist developments and the distinctive problems of advancing the cause of socialism in our land." Most teachers shared Marx's maxim not only to interpret the world but change it. Faculty led lunch-hour talks at factories and other workplaces and with staff formed their own union to negotiate with the administration.[26]

Myra Page taught short story writing for over a decade at the Jefferson School and recalled the Left's limited interest in feminist issues. "I taught a class on women for one term, but they didn't ask me for the second term. Perhaps they thought I was too outspoken. I said things that were probably undiplomatic at the time. Mainly, the Left wasn't ready for what women were saying or doing, and they didn't think a course on women was important enough to offer again."[27] In 1944, the school offered a course, "Beauty and Fashion Clinic: Making the Most of Your Appearance," directed at working women. Typical of the limited gender politics of the time, the women were told that their appearance mattered to gain respect from both male bosses and union comrades, and even from men in the Party.

Similar to the experience of the Rand School, the Jefferson School faced government repression. In 1953, the U.S. Justice Department compelled the school to register as a Communist-front organization. FBI informers posed as students and infiltrated classes taking notes on both teachers and students. In 1956, the government forced the school to close but some staff and students later affiliated with the small New York Marxist School.

In the South, the Highlander Folk School (1932–1961) served as a major educational training center for political activists. Whites and blacks worked and studied together, which may be the first example of integrated Southern education in America. Founded by Myles Horton and Don West, the school's original mission sought to teach "rural and industrial workers for a new social order." The school's basic philosophy held that the downtrodden as a group should address their own problems and "the teacher's job is to get them talking about those problems, to raise and sharpen questions, and to trust people to come up with the answers." [28] They hoped to train potential leaders from local communities believing that the solutions to oppression could be found in the experiences and communities of the oppressed. Labor education programs dominated the curriculum until a shift to civil rights for African Americans during the late 1940s and early 1950s. Highlander served as an important gathering place drawing Martin Luther King Jr., Rosa Parks, Fannie Lou Hammer, Andrew Young, and Stokely Carmichael to its classes and workshops. For example, civil rights pioneer Rosa Parks attended a workshop on desegregation several months before her decision to contest the bus system in Montgomery, Alabama, by refusing to give up her seat to a white man. Parks recalled: "I wasn't even aware of what it was like [at Highlander] until I came. I had heard there was such a place…. [you] could just enjoy the relaxing atmosphere without having to have color lines drawn anywhere."[29]

Highlander's workshops stressed the sharing of knowledge by all participants, and once solutions to problems were articulated, the staff emphasized questions of action to implement change. According to Horton, "Unlike people in school, there's no exams to put down and then you're through with it. You are here to act on it. It was education for action…Let's just plan what you are going to do when you go back [into your community]. Let's start talking about how you're going to use this new insight and understanding you've got."[30]

As part of a voter education strategy, Highlander established Citizenship Schools during the late 1950s to advance African American reading skills in order to overcome disenfranchisement literacy laws. The schools followed Highlander's philosophy that education should be based on the individual's experiences. Nontraditional teachers taught adults to read and write with the faith that voting could change their place in society. They taught the black masses to demand their democratic rights. The importance of the Citizenship Schools to the emerging civil rights movement was immense, and eventually the Southern Christian Leadership Conference (SCLC) led by Reverend King took over these efforts and expanded them. When the civil rights movement moved into a community to organize, the presence of Citizenship Schools proved a vital base to mobilize the local black population.[31]

The FBI viewed Highlander as "subversive" and collected several thousand pages of political intelligence. The investigation began in the late 1930s after complaints to the local FBI field office alleged Communist activities. In 1941, an FBI memo summarized the investigation. "Organization, location and directing personnel set out.

Lists of teachers and sponsors obtained. [Text redacted] sources of income indicate Communist Party support. Informants Chattanooga show heads of school attended Communist meetings. Affidavits and correspondence….show Communist teachings at school." Yet these conclusions were exaggerated as the FBI later concluded: "Due to its interracial character it [Highlander] has been the subject of numerous past allegations that it represents the headquarters for communism in east Tennessee. These allegations have never been substantiated."[32] Still, the Southern press engaged in Red-baiting. When Reverend King visited Highlander, an Alabama newspaper reported that he associated with a "communist training school." A visit by former First Lady Eleanor Roosevelt led a Chattanooga newspaper to blame the school for "forcing racial integration and the accompanying deterioration of harmony and disruption of goodwill upon the South…Mrs. Roosevelt's participation in the Highlander Folk School program will not raise either its reputation or hers....since both already have sunk so low."[33]

Highlander suffered a similar fate as the Jefferson School. The Georgia Commission on Education engaged in sensational Red-baiting beginning in 1957. In 1961, the state of Tennessee revoked the school's charter and confiscated its property. With Highlander closed, Old Left schools largely had disappeared.

Civil Rights and Community Organizing

The African American educational experience differed significantly from white Americans due to racial exclusion and oppression. Before the Civil War (1860–1865), literacy itself had been contested: Under slavery, blacks usually were forbidden to acquire reading and writing skills because slave owners feared learning would aid slave resistance and rebellion. After the Civil War, school segregation created inferior schools. Until at least the 1960s, racial inequities in education helped to deter African American advancement.[34]

In the South, civil rights activists developed their own schools as they fought white rule. In 1963 and 1964, the Student Nonviolent Coordinating Committee (SNCC) focused its attention on Mississippi and established more than 40 new "freedom schools." Spellman College history professor Staughton Lynd served as director of SNCC's education program, which reached an estimated 3,000 students of all ages. A SNCC report argued: "People who spend their working hours in the cotton fields and who are uneducated cannot ask such questions as 'WHY'? They cannot question the system of oppression which keeps them…and their children in the fields…or the plantations…Negroes and whites aren't allowed to know each other… How can a people who are separated from their fellow men live the truth?"[35]

The freedom schools reflected liberal concepts and an integrationist vision. SNCC told the volunteer teachers – including many Northern white college students – to implement a curriculum that "begins on the level of everyday lives and those things in their environment that they have already experienced or can readily perceive, and builds up to a more realistic perception of American society, themselves, the conditions the conditions of their oppression, and alternatives offered by the Freedom Movement." The teachers were not to impose a "particular set of conclusions" but rather to "encourage the asking of questions." These questions compared black schools with white ones and probed the social differences between the races. Students were encouraged to consider why poor whites often identified with the power structure.[36]

At the time, such an explicit discourse on power and race relations rarely would take place in the regular public schools. Most schools in the South remained segregated despite the U.S. Supreme Court decision in *Brown v. Board of Education* (1954), which ruled that "separate but equal" was unconstitutional. The process of implementing the decision at the local level proved slow and contested with protest and violence. As late as 1968, more than 90 % of both whites and blacks nationwide remained enrolled in one race schools. In order to resist integration, white Southerners established hundreds of private, white-only "segregationist academies."[37]

Most of the Mississippi freedom schools closed after 1964, but SNCC established other ones in Chicago, Atlanta, and Washington, DC. Black nationalist views began to have an influence in their design and operation. White teachers were excluded and the study of African history often replaced American history. English language use became a topic of controversy. Carmichael, who recently left SNCC to join the leadership of the Black Panther Party (BPP), argued that Black vernacular expressed resistance to American life. "There are cats who come here from Italy, from Germany, from Poland, from France – in two generations they speak English perfectly. We have never spoken English perfectly. And that is because our people consciously resisted a language that did not belong to us. Never did, never will, anyhow they try to run it down our throat, we ain't gonna have it."[38]

Radical "black power" philosophy motivated the BPP educational program, which developed several dozen small schools for children and adults. The Panthers, founded in Oakland, California, in 1966, embraced both a class and race analysis of American society. Schooling became a community control initiative to encourage participation in movements for revolutionary social change. The fifth point in the Party's Ten Point Platform and Program favored "education of our people that exposes the true nature of this decadent American society. We want education that teaches us our true history and our role in present-day society. We believe in an educational system that will give our people a knowledge of self. If a man does not have knowledge of himself and his position in society and the world, then he has little chance to relate to anything else." They supported a process of "educating ourselves and our children on the nature of the struggle and in transferring to them the means for waging the struggle…against the ruling class."[39] In a critical way their views echoed that of white radicals: The public school system disempowered students and taught adherence to a stratified, unequal status quo.

By offering a black-centered curriculum, the Panthers connected education to real-life contexts incorporating student backgrounds. They stressed their interconnectedness with oppressed peoples in other nations. The schools for children consisted of the Free Breakfast Program during the school year and the Liberation Schools in the summer. In Berkeley, California, Mondays was known as "Revolutionary History Day" and Tuesdays as "Revolutionary Culture Day." The political teaching sometimes became overly didactic when it featured recitation drills, where children repeated "Power to the People" with references to capitalists as "pigs who control the country" and "steal from the poor." In Oakland, the children of Party members attended a liberation school whose fieldwork included distributing the Party's newspaper to other youth, attending court sessions for "political prisoners," and visiting prisons.[40] In this turbulent era of protest, the government (again via the FBI) engaged in massive political surveillance against the BPP. Schools were placed under watch. In San Francisco, FBI agents noted the "potentially successful effort…to teach children to hate police and to spread 'anti-white propaganda.'"[41]

The Panther's adult education promoted Marxist, black nationalist loyalties. Teachers assigned such books as *Quotations from Chairman Mao Tse-tung*, essays by Panther leader Huey Newton, Frantz Fanon's *Wretched of the Earth*, *The Communist Manifesto* by Karl Marx and Friedrich Engels, studies of Malcolm X, as well as works by Kwame Nkrumah, Vladimir Lenin, and Che Guevara. The Panther newspaper, which reached a weekly circulation of about 140,000, was incorporated into the curriculum.[42] When the group's membership declined in the mid-1970s, many of its schools closed.

During the turbulent era of the 1960s and early 1970s, other excluded groups also organized their own adult education initiatives to advance the struggle for equality. As the women's liberation movement grew in popularity, led by such groups as the National Organization for Women (NOW), women across both race and class lines sought to rediscover their own history and culture.[43] Female education rooted in identity politics based its curriculum on female voices and experiences. Educational practices included reading circles, literary societies, as well as political consciousness-raising groups, which promoted empowerment. For example, beginning in the late 1960s, hundreds of consciousness-raising groups brought women together to analyze their lives without male interference. Group discussion built on personal experience and democratic participation. In 1971, the Chicago Women's Liberation Union advised: "A different topic could be chosen each week, and everyone discusses it in terms of her own life. Go around in a circle, each woman talking in turn so that everyone speaks; this keeps anyone from dominating a discussion and helps keep on the topic."[44] Ellen Willis notes these groups became "the primary method of understanding women's condition" while forming the early women's movement "most successful organizing tool."[45] Susan Brownmiller, who was active in a group organized by New York Radical Feminists, also believes the informal gatherings served as "the movement's most successful form of female bonding, and the source of most of its creative thinking. Some of the small groups stayed together for more than a decade."[46]

The feminist movement in Chicago supported a Women's Liberation School (1970–1976) offering 8-week courses to about 250 adults. The curriculum included "self-help" and general skills classes to provide women "technical expertise that they are unlikely to acquire elsewhere" such as "how to fix an automobile or repair an electrical appliance." The school offered workshops in childbirth and "Women and their Bodies." While other classes included yoga, photography, creative writing, and nutrition, the most important portion of the curriculum addressed political education: "Struggle for the liberation of women against sexism in all sections of society. Included in this struggle is the struggle for the right of sexual self-determination for all people and for liberation of all homosexuals, especially lesbians." Political instruction covered women's history and feminist theory, Marxism, family issues, and the politics of health.[47]

In the twenty-first century, female advocacy persists among teachers in organizations such as WE LEARN (Women Expanding Literary Education Action Resource Network) and the American Association of University Women (AAUW). Like earlier efforts, it is noted that literacy can become a tool "to see, connect with and act upon a bigger picture….working together and learning each others needs and perspectives in order to reach a shared vision of social justice for all people."[48] Teachers can become organizers for social change depending on the level of academic freedom tolerated in their educational environment. While adult literacy workshops and post-secondary education are very different settings, both hold the possibility to reach a disadvantaged population to challenge obstacles to equality.

In *Reveille for Radicals* (1946) and *Rules for Radicals* (1970), veteran community organizer Saul Alinsky urged activists to empower the disadvantaged to confront local power structures. Since 1940, his Industrial Areas Foundation (IAF) conducted workshops for thousands of community organizers to develop skills for mobilization. Alinsky hoped to develop "native leaders": The work of many organic "Little Joes" would help change the attitudes of people in their communities. The organizer became an educator who facilitated knowledge development based on participation in community activities and programs. For working-class and low-income people, participation would transform ways of viewing the world. As Alinsky said, it is only when "people are organized so that they have the power to make changes….[that] they begin to think and ask questions about how to make the changes."[49] He focused on working-class groups to foster "democratic solidarity" – a consciousness rarely taught in regular schools or promoted by mainstream educators. As Aaron Shutz notes, "the organizer educated through action, by encouraging people to confront inequality and using these confrontations to nurture understanding and reflection."[50] During the last 30 years, other organizations followed Alinsky's lead, such as the PICO National Network, Gamaliel Foundation, Direct Action and Research Training (DART), and the Midwest Academy. At the Midwest Academy, more than 25,000 grassroots activists from hundreds of coalitions and organizations were trained since the early 1970s. The curriculum includes how to build coalitions, recruit volunteers, work with community boards, plan and facilitate meetings, media relations, working with religious and labor organizations, and fundraising.[51]

Conclusion

The historical literature on U.S. education generally neglects the history of adult education.[52] Scholarship concentrates on regular public schools, although some studies venture into urban communities to look at parental attitudes[53]; the relation of education to the economy and patterns of social mobility[54]; and the varieties of school reform.[55] Early revisionists focused on the ways public schools served the needs of corporate elites to train and integrate students into the capitalist economy.[56] Even within this frame of reference, too little emphasis is placed on the history of students, specifically how students interact with one another and also how they receive the lessons of their teachers. Moreover, few historians of American education address the relationship of schooling to social movements and organizing for change in society.

The history of what I have called "justice schools" shows that excluded groups embraced cooperative forms of education. Early Settlement House schools helped the immigrant working class adapt to America and engage in social reform. The movement for worker education and socialist schools demonstrated that learning could be directed to transform the labor process and remake the society. Later, black freedom and black power schools taught democratic rights and community control rooted in identity politics. The empowerment of the individual in female education and in community organizing also placed learning in a justice context. The curriculum in these schools tied learning to activism. While different schools expressed different visions, all held a commitment to use learning to advance a protest agenda. They faced common obstacles, including public attacks and government repression. Nonetheless, they established a legacy of engagement and commitment that can speak to contemporary school leaders interested in social justice.

Most adult justice schools were not created by existing school leaders but, instead, by social movement activists whose conception of education was directly tied to their transformative political work. These activists worked from the outside to structure environments that asked questions ignored by other educational leaders. It would be useful for contemporary educational leaders to consult with people in social movements to ascertain what issues and concerns disadvantaged groups are privileging to improve their lives. Educators may align directly with social movements to infuse their curriculums with what people at the grassroots want to learn. Outreach and bridge building to activist groups can bring new perspectives to existing educational institutions.

Part V

Socio-cultural Representations of Social Injustices

Chapter 36
Moving Beyond the Injustices of the Schooled Healthy Body

Erin Cameron, Jan Oakley, Gerald Walton, Constance Russell, Lori Chambers, and Teresa Socha

Introduction

> We have bodies not just because we are born *into* bodies but because we *learn* our bodies, that is, we are taught how to think about our bodies and how to experience our bodies. (McLaren, 1991, p. 156)

In this chapter, we present and define the term the *schooled healthy body*, a concept that evokes the historical, social, political, and cultural contexts of Western education and reflects a growing number of policies, strategies, and responses to increased concerns and discourses of obesity and health crises within youth populations. We argue that the schooled healthy body is a site where regimes of discourse and power inscribe themselves in educational curricula and practices, especially in light of global obesity and health crises discourses. As schools, particularly through the subjects of health education and physical education, are increasingly seen as places to "fight the war against obesity," there is a need for critical theory and practice around how students learn about healthy bodies. In particular, there is a need for the concept of the schooled healthy body to be considered within a social justice lens in order to understand how bodies are privileged and oppressed and how this might be affecting the health of youth populations. One unique aspect of physical education is that no other subject requires students to undress, and even when dressed, students' bodies are on display. Thus, according to Kirk (2010), physical

education contributes to the gender order of hierarchicalized bodies: muscular ones for boys (Kendall & Martino, 2006; Ryan, Morrison, & Ó Beaglaoich, 2010) and thin ones for girls (Kilbourne, 2000; Tiggemann, Gardiner, & Slater, 2000).

The schooled healthy body is worth exploring for two reasons. First, as schools are increasingly tasked with solving the health and obesity crises, educators and education bureaucrats have spent valuable resources developing programs and curricula to address growing health concerns. Unfortunately, this approach is not working (Leahy, 2009; McDermott, 2008; Rail, 2009; van Ingen & Halas, 2006). Worse, these programs and curricula are enacted on the bodies of youth in schools (Wright, 2009), projecting and privileging certain bodies while oppressing others (National Education Association [NEA], 1994; Weinstock & Krehbiel, 2009). The American sports world, in particular, perpetuates and benefits from this gender stereotyping and inequality (Messner, 2007).

Second, the right to an adequate "standard of living for health and well-being" (United Nations, 1948) is acknowledged in the Universal Declaration of Human Rights that was ratified in 1948. In other words, while all people have the right to adequate and nutritious food, shelter, access to education, and health care, they also have the right to live healthy and fulfilled lives.

Although the Supreme Court of Canada has been hesitant to endorse economic rights within the framework of the *Canadian Charter of Rights and Freedoms* (hereafter, the "Charter"), a growing body of legal literature critiques this failure (Iding, 2003; Kim & Piper, 2003; Murdoch, 2002; Petrykowski, 2003; Young, 2005). For instance, a law in the province of Quebec excluded citizens under 30 years of age from receiving the benefits of full social security, except when participating in employment programs. The rationale was to urge youth to seek work or go to school. Unemployed and under 30, Louise Gosselin unsuccessfully sued the government of Quebec for violation of equality and autonomy rights provided in the Charter. As Supreme Court Justice Arbour asserted in dissent in *Gosselin v. Quebec* (2002), "few would dispute that an advanced modern welfare state like Canada has a positive moral obligation to protect the life, liberty and security of its citizens" (Donovan, 2008). A purposeful interpretation of the Charter and the decision in *Gosselin v. Quebec* imposes upon Canadians an obligation to explore opportunities to benefit their own health and well-being. We draw from this case to argue that such obligation should be matched by the right to health education that is not discriminatory so that people can live with and in their bodies in better health. Moreover, it is acknowledged that "discrimination based on weight is so widespread in our society that many people take it for granted" and that "derogatory comments about heavier people are commonplace" and "members of this group also experience significant disadvantage in many areas of life, including health, housing, education, and the workplace" (Luther, 2010, p. 168). Although schools are mandated to treat all children equally and with dignity, discrimination based on weight is reinforced, not challenged, by "schooled healthy body" discourses and regimes of discipline.

Also consider the following story. During the 2010 school year, two Canadian post-secondary students failed mandatory school fitness tests, a prerequisite for graduation and university admittance. The fitness test, which was a cardiorespiratory test that measured students' heart rates after vigorous activity, was worth 50 % of their physical education mark. Failing the test, the students took legal action, claiming that it violated the Charter by undermining their active lifestyles and academic pursuits. They argued that the test did not account for individual variability or holistic health indicators. In a media interview, a school spokeswoman responded by saying that the goal of the test is to give students a "healthy mind in a healthy body" (Jerema, 2010, para. 2). The markers of a "healthy body" tend to be narrowly defined in Western societies; however, and in this instance, these narrow markers resulted in the students not only being framed as unhealthy but also having to endure serious academic consequences given their graduation and admittance to university were tied to their heart rates.

While some might argue that fitness testing is in keeping with educational trends toward standardized testing, we argue that the schooled healthy body is deeply problematic and undermines the reality that bodies in schools, as in society, are of diverse shapes and sizes. We also argue that within this discourse, the healthy body has become synonymous with a "fit," thin (especially for girls), strong (especially for boys), trainable, and able body, thereby marginalizing all other body types. To marginalize is to construe something as unimportant. In his book *Stigma: Notes on the Management of Spoiled Identity* (1963), Goffman identifies three realms of stigma, two of which are "abominations of the body," and "blemishes of individual character perceived as weak will [and] domineering or unnatural passions" (p. 4). We suggest that bodies "read" as nonnormative reflect both of these forms of stigma.

Given the increasing health concerns of youth populations, critically exploring the schooled healthy body is timely and of utmost importance. While some critical discussions are taking place in the fields of women's studies, health promotion, and physical education, a critical lens toward the schooled healthy body needs to be cast more broadly within social justice and educational research. It is our hope that our focus on embodied social injustices in schools, in particular within health and physical education, will not only generate awareness for and about constructed notions of the healthy body but will also contribute to the growing body of research that suggests "bodies matter in schooling" (Corrigan, 1988, p. 153) and that every child (of every size) matters (Burgard, 2009; Cale & Harris, 2011).

In this chapter, we draw on critical and social theorists, informed by "post" approaches to the body. By their very nature, "post" perspectives, such as poststructuralism and postmodernism, challenge taken-for-granted ways of thinking and open up spaces for new ways of knowing and being in the world. They help to provide a platform through which to critique existing knowledge and power dynamics and to identify injustices within a field (McLaren, 2003). Until recently, body-related educational research has been characterized by a Western reductionist view that has continued to separate mind from body and has treated the body as machine (Laker, 2003). With such reliance on Western dualistic ideology, there has been a notable absence of "post" perspectives (Andrews, 2008; Fernandez-Balboa, 1997; Laker, 2003; Lawson, 2009). While some research has employed "post" perspectives in the field of health and physical education (e.g., Cliff, 2011; Fitzpatrick, 2011a, 2011b, 2013; Petherick, 2011; Pringle & Pringle, 2012; Shea & Beausoleil, 2012; Webb, Quennerstedt, & Öhman, 2008), there is a need for more.

For this work, we draw from Monchinski's (2007, 2008) work on structures of dehumanization and Foucault's (1984) concept of "biopower"—the idea that individuals and populations are controlled through practices associated with the body. Biopower is a form of invasive and omnipresent health governance and regulation of peoples' lives through body practices that are predominantly classed, racialized, and gendered. We use Bourdieu's (1986) ideas of embodied capital to illustrate how schools reinforce ideas of "good" and/or "bad" bodies, which hearkens back to Goffman's (1963) conceptualization of stigma; capital and power are given to students who demonstrate their "goodness" through being "trim, tight, lineless, bulgeless, and sagless" (Bordo, 2003, p. 32). In a context of widespread panic about rates of childhood "obesity," schools have been identified as sites for active intervention, "as most children and youth spend a substantial amount of time in schools—controlled environments that are subject to extensive government regulation" (Ries & von Tigerstrom, 2011, p. 363). Educators, in particular those in health and physical education, need to question how the bodies of youth are turned into political sites of privilege and oppression through bodily evaluation, monitoring, and surveillance practices. With an increased agenda of high standards and measurement, bodies will continue to be sites of punishment and privilege through such scrutiny, and many youth will continue to suffer from these injustices. Hence, there is a need to explore how schools and physical education courses are (and are not) engaging students in meaning-making practices about their bodies, from the perspective of both physical and social construction.

To do so, we first provide a historical context of physical education in Western societies and its role in establishing the schooled healthy body and how the body is increasingly used as a structure of dehumanization (Monchinski, 2007). We illustrate how health education is increasingly collapsed into physical education and how this contributes to social injustices enacted on the body. We then explore the current context of Western schools and the dominant biopedagogies being learned by students. Biopedagogies refer to both biopower, which frames the body as a site of regulatory power, and pedagogy (Wright, 2009).[1] We offer a discussion of why bodies have variably become privileged and oppressed in schools and physical education and how we need to disrupt this embodied social injustice. We end with a discussion of places and spaces that create opportunities for reimagining embodied education. Although the context of this particular story is Western, the themes are relevant for discourses of social justice in non-Western societies, as well. Moreover, globalization of Western-based products, media, and advertising is increasingly ensuring that Western bodily ideals that are critiqued here, and enforced via the schooled healthy body, are being exported to non-Western societies.

---

[1] Biopower was coined by Foucault (1979), as having power over bodies whereby the body becomes the object of political power. Hence, biopedagogies are pedagogies that regulate the body.

Evans and colleagues use the term body pedagogies, which defines whose and what bodies have status and value. Hence in obesity discourse, an individual's character and value is judged by their weight and size (Evans et al., 2008).

History of Physical Education in Western Society

During the seventeenth and eighteenth centuries, rationalism and the Scientific Revolution gave shape to ideologies of mind/body separation and the body as machine. This idea of the body as a trainable tool inspired educators, in particular German Johann Friedrich GutsMuths (1749–1839), who is regarded by some as the "grandfather" of modern physical education (Phillips & Roper, 2006). GutsMuths is recognized for advocating physical education's potential positive influence on military power and thus its ability to lead Germany to unity and freedom from French control. This inspired many societies around the world, in particular those in the West, to follow suit and use physical education to develop military masculinity, drive paternalistic control, and build disciplined, orderly, and fit bodies (Wamsley, 1999). The perceived need to intensify the physical training and strength of men was also deeply linked to imperialism and the "need" to control women and non-Anglo-Saxon, nonwhite peoples around the world.

In the nineteenth century, physical education took on a new role; it was not only a site for the training of fit bodies, it also became a site for medicine and psychology to enact their political will and ideas of health. Before the late 1800s, health had been considered the opposite of sickness (Donatelle, Davis, Munroe, Munroe, & Casselman, 2004). As deadly epidemics spread throughout society, scientists discovered that all people were susceptible to contracting epidemic diseases unless they took sanitary precautions, which gave rise to a focus on sanitation (Valverde, 1991). Thus, physical education became seen as a site to promote health by promoting sanitary practices and healthy lifestyle activities (Van Dalen & Bennett, 1953).

At the same time, while physical education became a political vehicle for the military and medicine, physical activity was argued as a necessary response to increasing urbanization. Lawson (1998) identifies the period between 1880 and 1930 as the period during which physical activity became institutionalized through physical education for health reasons. He argues that while politicians, educators, and health promoters advocated for physical activity with the intent to improve health and well-being, physical education also promoted physical ability as a form of physical supremacy. The disciplined body demanded by physical education supported the emerging Western ideals of "perfect men" and "perfect women" that went hand in hand with the fit, muscular, military body and the faultless, clean, sanitary body. Even to this day, physical inactivity continues to be positioned as a primary determinant of obesity, and activity is positioned as a key strategy of health governance, despite lacking sound scientific foundation (Botterill, 2006; Brownell, 2005; Brownell & Warner, 2009; Burgard, 2009; Gard, 2010; Gard & Wright, 2005; McDermott, 2008; Rail, 2009; Rawlins, 2008; Rimm & Rimm, 2004; Wann, 2009). The combined physical (in)activity and obesity discourses have created a favorable environment in which to construct a health crisis that is conveyed through experts and represented as "truth."

Thus far, we have discussed the historical significance of physical education as military training, physical education as sanitation, and physical education as physical activity. One remaining influence to explore, one which remains dominant, is physical education as public health, which has become the site of the new public health discourse.

Health discourses have evolved in problematic ways over the last 30 years. In 1986, at the first global conference on health, a "new public health" was established (Catford, 2007). The Ottawa Charter for Health Promotion, an international charter organized by the World Health Organization in 1986, recognized that "health is created in the context of everyday life: where people live, love, work, and play" (Kickbusch, 2007, p. 9). Guiding this new public health approach were five key strategies to increase global health: build public policy around health, create supportive environments, strengthen community action, develop personal skills, and reorient health services.

While some have argued that the Ottawa Charter has yet to be utilized to its fullest potential (Kickbusch, 2007), we argue that it nonetheless has had two profound impacts on education. First, the Ottawa Charter gave rise to what is now known as health-promoting schools. According to the World Health Organization (1996), a health-promoting school is a school that "is constantly strengthening its capacity to be a health setting for living, learning, and working" and that aims "to build healthy public policies, create supportive environments, strengthen action, foster the development of personal skills, and reorient health services to embrace health promotion" (p. 19). Second, the focus on personal skills gave way to public discourses in schools around health and bodies that were more prescribed about how to live than ever before (Tinning & Glasby, 2002). Health curricula like "avoid fat," "stop smoking," "get fit," and "practice safe sex," focused on how risk factors could be navigated by individuals and how an awareness of the risk factors would help individuals adopt more "healthy" lifestyles. Arguably, this turned health into a regime of power and knowledge, oriented to the regulation and control of bodies by the state and by self-regulation (Foucault, 1984). In other words, power and capital were gained and/or lost by demonstrating obedience to prescribed Western notions of health. What this "new public health" approach ostensibly ignored were the different worldviews and the different social, political, and cultural contexts of youth. Just like in the early 1900s, when physical education was based on militaristic consumerism, in the 1990s it became based on health consumerism.

Through a historical lens, it is not difficult to see that physical education has been, and continues to be, dictated by political agendas, policies, and strategies. Furthermore, a lack of critical and theoretical grounding in physical education (Fernandez-Balboa, 1995; Kirk, 2006; Lawson, 2009) continues to nurture master narratives derived from privileged, white, elite, Christian, Western worldviews that exult the continual progress of science and technology, industrialization, and human domination (Fernandez-Balboa, 1997). These master narratives are imposed as hegemonic and totalizing discourses that dictate the conceptualizations and markers of physical health. For example, "fit," able-bodied, and slim bodies of girls and muscular bodies of boys are positioned as healthy, desirable, and the result of individual effort, while "undesirable" bodies are equated with lack of moral fiber, laziness, and lack of effort. This is legitimized through a biomedical model where weight, height, body mass index, cardiovascular health, cholesterol levels, and other scientifically and medically measured health indicators are seen as the total factors in determining a person's overall health. It is also legitimized through educational systems when these master narratives are promoted as taken-for-granted "truths" about the body.

Despite these troublesome narratives, McCuaig and Tinning (2010) argue that a unique aspect of physical education is that, "unlike its fellow disciplines, health and physical education is charged explicitly with the task of producing productive and healthy bodies through the training of apprentice citizens in the arts of healthy living" (p. 57). While this could be interpreted negatively, they position it as a positive and dominant function of health and physical education—to provide solutions to problems surrounding the body in a time of heightened concern regarding the sexualization and domination of and over the body. Perhaps McCuaig and Tinning have a point: if physical education ceased to exist, there would no longer be a school subject that balanced out the dominant "mind" preoccupation in education. Nonetheless, we also argue that physical education as curriculum and practice is part of the problem.

Since health is often collapsed into physical education, it inevitably falls victim to the historical contexts of physical education. For example, while students tend to have a sophisticated ability to be critical of dominant health discourses in the media, they typically do not apply the same critical lens in health and physical education environments (Millington & Wilson, 2010). In other words, within a physical education culture, dominant discourses are often normalized and accepted. This is concerning, especially in the context of what Petherick (2011) calls the biocitizen:

> HPE [health and physical education] becomes a site for the dissemination of ideologies pertaining to lifelong health goals…(bio)pedagogies of HPE involve more than learning practices of health but, I argue, also incite particular modes of subjectification where students perform various practices of the self in becoming (or failing to become) good, self-governing biocitizens. (p. 14)

Biopower and Pedagogy

A "biocitizen" is defined as someone who consciously or unconsciously looks after their health, not just for their own benefit but also for the benefit of the community and state (Halse, 2009). The term highlights the fact that "health" has become less about living well and more about control and external markers of a "good civic subject" (Petherick, 2011, p. 4). In this case, schools and gymnasiums are sites where biocitizenship is taught. For example, in physical education classes, fitness testing and sports drills are often used to evaluate students' health, fitness, and ableness. However, they do much more than that. These types of tests introduce binaries such as "fit" and "unfit," "healthy" and "unhealthy," and reinforce ideas of a "good" and "bad" biocitizen (Petherick). In other words, students who perform well and demonstrate control of the body, and mastery of fitness and sport skills, are considered good biocitizens without actually being labeled as such. Within these boundaries, students quickly learn that while certain classed, raced, gendered, and sexed body types are privileged and celebrated, others are punished and demonized (Andrews, 2008) as well as stigmatized in relation to physical difference (Goffman, 1963).

Indeed, children and youth are plagued with anxieties about their bodies, and "fat" children are routinely ostracized and bullied, within physical education classes and in schools generally (Geier et al., 2007; NEA, 1994; Rimm & Rimm, 2004; Sjoberg, Nilsson, & Leppert, 2005; Wann, 2009; Weinstock & Krehbiel, 2009). Further, for boys and men, privileged bodies—that is, the muscular ones—are seen as hegemonically dominant over girls' and women's bodies as well as other men (Connell, 2007, 2009). Within physical education cultures in schools, masculine and muscular boys are typically rewarded with attention and elite places on sports teams, but boys who are not competitive and aggressive, as signified and interpreted through their bodies, usually face hostility and derision. Thus, the focus on muscularity for boys in physical education reinforces sexism and homophobia in society (Frank, 1996; Walton & Potvin, 2009).

For girls and women, the focus is not on muscularity but on thinness, not only as representative of Western commodified ideals of beauty but also as a physical marker of submission (Kilbourne, 2000; Tiggemann, Gardiner, & Slater, 2000) and a discursive strategy to "normalize" thin bodies by contrast against other bodies (Taylor, 2011). Bodies that are not thin are stigmatized in Western societies, which is why bullying girls through epithets such as "fat" or "cow," regardless of their actual body size, is such a powerful tool in the arsenal of verbal violence. For boys and girls, then, media-driven gender norms are literally embodied and performed as though "natural" and "normal."

The making and marketing of bodies has become a highly profitable practice that some schools promote. Physical education (which could more aptly be called physical education as sport skills) within schools is highly susceptible to political and corporate pressures and is already on the path toward a future of privatization, commercialization, and corporatization (Kirk, 2010). For example, a current trend is for physical education programs to be owned by private fitness companies whose bottom line is driven by profit, not student-centeredness, or even physical fitness (Kirk).

Over the last decade, a flurry of scientific literature and media around obesity and inactivity has emerged (Gard & Wright, 2005). The latter has generated a thriving health and fitness sector (Maguire, 2008). Combined, science and advertising media have fueled an "obesity crisis" that positions inactivity and poor nutritional habits as solely the problem of individuals' poor lifestyle choices. As a result, it has led to a proliferation of policies, educational curricula, and health initiatives around the world to combat and prevent obesity through social regulation and neoliberal individualism (Burrows & Wright, 2007). While health research illustrates that all major health determinants are social (Raphael, 2009), the messages of individualism have prevailed and fueled the development of the schooled healthy body, an icon of biopower and pedagogy in schools and physical education. Arguably, until we can start addressing the major determinants of health, we will not solve any "health crises" (Evans, Davies, & Rich, 2008).

A growing number of researchers challenge the obesity epidemic and the "obesity crisis" discourse (Brownell, 2005; Brownell & Warner, 2009; Campos, Saguy, Ernsberger, Oliver, & Gaesser, 2006; Evans, 2003; Evans et al., 2008; Gard & Wright, 2005; Rail, 2009; Rawlins, 2008; Rothblum & Solovay, 2009; Wann, 2009). As McDermott (2008) argues, the obesity crisis discourse is a "central technology of health governance" (p. 5). Fernandez-Balboa and Muros (2006) further assert that the crisis "is artificially created through the media, schooling, and other forms of institutional socialization that condition and conform our everyday living" (p. 197) and that we learn to "naively accept it as normal and natural" (p. 197). It is this created reality, otherwise known as hegemony or ideological domination, that Gramsci (1971) argued controls the masses and enables injustice and oppression.

These dominant discourses ("it's up to you," "save the child," and "obesity crisis") have huge effects on how bodies are produced and controlled in society and schools. Foucault (1979) theorized the regulation of the body and the role of the body in formations of power and knowledge and called it governmentality. Halas and Hanson (2001) have drawn upon Foucault's ideas, arguing that "it is through governmentality that the state reproduces itself via disciplines (education) whose discursive practices reach the capillary level in individuals in their workplace, schools, and home, ensuring that, as stated, a populace of docile, practical bodies is maintained" (p. 122). They argue that schools have long managed and regulated students' movements by keeping them indoors in classrooms and out of the hallways, having them sit quietly, pay attention, speak in turn, and line up to move from one location to the next. In other words, "the oppression of young people is often masked in the disabling categories constructed to keep kids who have experienced emotional and behavioral problems under control" (Halas & Hanson, p. 125). Social problems, then, are often reframed as individual problems. Through such individualization, individuals are blamed for the very problems that are created through social and economic discourses. Such a focus derives from Western ideology of the individual and contributes to the construction of the schooled healthy body.

Humans, individually and collectively, are shaped by social, political, and cultural ideologies and are influenced to think and act in certain ways. In Western school systems, students learn to privilege the mind for its intellect and to reduce the body to a machine that is controllable, manageable, and trainable. Most children are not taught to question the daily schedule or question why we sit to learn, why "real" learning only happens indoors, or why they learn certain subjects and not others. In other words, students, as young citizens, are not taught to question ideologies or to think critically, despite rhetoric to the contrary (DiAngelo & Sensoy, 2009). Ideology is "a set of generalized and common beliefs that make people act as if the circumstances and contexts of their lives were natural" (Fernandez-Balboa & Muros, 2006, p. 198). In Western societies, there are certain vehicles through which dominant ideologies are perpetuated and disseminated, such as advertising, public relations media, and schools, which often model how people should feel, act, dress, walk, talk, and socialize.

In schools, students are socialized to hierarchies and schedules. They are embedded in school structures where "the stratified and hierarchical relations of power are so prevalent, so much a part of their daily functioning that [they] are seldom questioned" (Fernandez-Balboa & Muros, 2006, p. 199). However, Dewey (1916) argued that perhaps the greatest of all pedagogical fallacies is the notion that a person learns only the particular thing she or he is studying at the time. In other words, as the mind learns to read, write, and do math, the body learns to sit and obey. Even in physical education, where the focus is on the body, the common threads throughout its history as a subject in schools have been power, control, and obedience. Policies in many jurisdictions outline daily amounts of time that schools should dedicate toward physical activity, but one must acknowledge that the majority of the day is used for instructional time where students sit to learn. As Halas and Kentel (2008) point out, rarely do we "consider how painful it can be when we hold young people back from the movement their bodies crave, particularly in schools" (p. 214). Such practices are counterintuitive for children as they learn to not move, and they reinforce a Western ideology that privileges the mind over the body.

Another dominant ideology that pervades Western school systems is what Althusser (1971) called "technocratic rationality," which is the combined influence of institutionalization and corporatization that looks at means, facts, calculations, and measurements, rather than values and sentiments. Put another way, it "turns [humans] into objects to be counted, labeled, classified, and disposed of, according to externally-imposed standards and principles" (Fernandez-Balboa & Muros, 2006, p. 199). Technocratic rationality works under the guise of standardization, specialization, synchronization, centralization, maximization, and concentration. It controls not only school content but also student bodies. It tells them when to move and when to sit still. Within Western cultures that privilege the fit, thin, strong, trainable, able body, there is an increasing need to critically examine the hegemonic truths of, about, and over the body.

While critical theories such as critical pedagogy address the injustices of race, gender, class, and sexuality, there is less emphasis on embodied injustices. By embodiment, we mean the ways that acknowledge and understand that bodies are not just physical entities but also psycho-emotional entities. This goes beyond Descartes' famous saying, "I think, therefore I am," and acknowledges the fact that the very act of thinking is an action that is embodied. The famous sculpture *The Thinker*, by Auguste Rodin, is a case in point. The figure is positioned in the act of thinking, although as viewers, we could not possibly know his thoughts. His body clearly demonstrates that he is thinking, even to those who do not know the title of the work.

Toward a Vision of Embodied Justice

Many scholars have argued that schools and physical education are dominated by Western ideology (Andrews, 2008; Fernandez-Balboa, 1997; Laker, 2003; Lawson, 2009) that separates mind from body and fails to address social inequality or foster social justice (Tinning, 1991). This is not to suggest there have not been scholars working from a sociocultural perspective and applying these ideas to physical education. Critical pedagogy, which derives from the idea of education for social justice, endeavors to transform oppressive conditions and make the invisible visible. It emerged in educational literature in the 1970s and has been gaining strength ever since, to the point of some tenets being taken for granted (Kincheloe, 2008). Its impact on physical education occurred a little later, but then it eventually became a revolt against growing developments in physical culture, namely, the commercialization, commodification, and technologization of sport, exercise, and the body (Kirk, 1999).

Critical pedagogy has been criticized for being idealistic, for foisting its moral values on others (Gore, 1993; O'Sullivan, Siedentop, & Locke, 1992), and for its lack of attention to practical applications (Breunig, 2006). While Fernandez-Balboa (1998, 2009) agrees that much of this criticism is warranted, he also argues that critical pedagogy provides a way to be less a master of truth and justice and more a creator of a space where people can think about their own thinking and care for, and be attentive to, others. He advocates for a pedagogical perspective in physical education that works toward the development of ethics and the care of self (Sicilia-Camacho & Fernandez-Balboa, 2009).

As educators who teach from critical pedagogical perspectives, we have all been struck at one time or another by the overt resistance by students in our courses and by other educational researchers to engage with the notion of the "healthy body" as a social justice issue. Yet in our teaching, we have found that many students remember their physical education experiences as negative and derived from frameworks predicated upon competition and the shaming of "unfit" bodies. Many of our students, like so many others (Guthman, 2009; Hetrick & Attig, 2009; Wann, 2009; Weinstock & Krehbiel, 2009), have internalized this experience as their own individual problem and appear to be unaware of the larger systemic issues at play, that is, how their beliefs, values, and attitudes are driven by cultural lenses and a Western ideology about the body (Giroux, 1992). As such, the need for inclusive and culturally affirming physical education is increasingly imperative (Flory & McCaughtry, 2011; Halas, 2011).

Our hope is to encourage educators and scholars to think about the discriminatory spaces within physical education and schools as a way to start working toward creating democratic and liberatory spaces in schools for *all* bodies and *all* human beings. We are extremely concerned by both the lack of critical awareness of the schooled healthy body and the growing role of physical education in the moral and ethical education of young people and their bodies (Rail, 2009). This reform will not be easy, as evidenced through Kirk's work involving physical education "futures" (Kirk, 2010), in which he struggled to identify solutions to disrupt the current injustices perpetrated on the body. We do not profess to have all the answers, nor do we believe there is one way to go about such work. However, we would like to highlight two examples of critical and noteworthy progress as they demonstrate a shift from traditional technocratic and unjust physical education to socially just physical education.

Our first example is from the work of Jane Addams. Addams, an activist and educator, used the playground in a different way than most in that she used playground physical activity as a tool for recognizing differences and empowering people through festivities, games, and democratic play. According to Azzarito, Munro, and Solmon (2004) in their discussion of the implications of her ideas, to Addams, playgrounds are "spaces that embodied education and social democratic discourses that not only recognized but also emphasized the formation of the community, and the intersubjectivity of the individual and society through democratic play" (p. 391).

A second example draws from the success of the New Zealand Ministry of Education in putting critical pedagogy into policy. In 2000, the Ministry completely revised their physical education curriculum to address the dominant reductionist view by mandating a critical pedagogy perspective (Culpan & Bruce, 2007). Their new curriculum focuses on the movement culture (learning in, through, and about movement and taking into account the physical, social, spiritual, and mental and emotional aspects of well-being), the holistic nature of health, the functions and influence of movement (from both an individual and a societal perspective), the contexts of movement (scientific, physical, social, economic, ethical, and political), and the promotion of an inquiry-based, reflective teaching style. While there have been challenges and setbacks with implementing this new curriculum, Culpan and Bruce argue that "not to engage in such attempts may well bring an end to physical education" (p. 9).

While these and other examples demonstrate the potential of more critical perspectives in physical education (Fitzpatrick, 2010), this approach remains on the fringes of the physical education literature and is often dismissed as "radical" by positivistic and technocratic researchers in the field (Tinning, 2011). Nonetheless, what Addams, the New Zealand curriculum, and a growing number of scholars illustrate is that it *is* possible to disrupt dominant discourses around the schooled healthy body and engage in innovative, embodied learning. Not only do these ideas and practices challenge theoretical and pedagogical paradigms, they also challenge dominant practices enacted on young bodies every day.

Education can also look to The Boston Women's Health Book Collective that produced the landmark *Our Bodies, Ourselves* (OBOS), as a model to counteract the current (in)justices perpetrated on the schooled body. A self-help manual on women's bodies and health that also addresses the socio-political and economic factors that affect women's health, OBOS was first published in 1971, and in 1996, was listed by *Contemporary Sociology* as one of the ten most influential books for the past 25 years. Now in its 5th edition (The Boston Women's Health Book Collective, 2005), OBOS has been translated and/or adapted for women in more than 25 countries (Davis, 2007). Davis appropriately coins OBOS a feminist epistemological project and argues that it "validated women's embodied experiences as a resource for challenging medical dogmas about women's bodies and, consequently, as a strategy for personal and collective empowerment" (p. 2). A catalyst for the women's health movement, its impact has been far reaching. In the medical field, there has been a proliferation of women's clinics in major hospitals, birthing rooms, midwives, family participation in labor, and an increase in research funds for women's diseases. In academia, OBOS has led the way for the integration of the body into poststructuralist and socioconstructionist research perspectives (Gordon & Thorne, 1996).

As awareness of global social justice issues increase, our hope is that the body will not be forgotten. Darder, Baltodano, and Torres (2003) have argued that the goal of critical pedagogy is “to invigorate the capacity of radical educators to engage critically with the impact of capitalism and gendered, racialized, and homophobic relations on students from historically disenfranchised populations” (p. 2). We suggest this definition is still missing a key element: our bodies, and by extension, our “embodied” experiences.

Western ideology on schooled healthy bodies continues to inform current social institutions, including educational systems. Furthermore, the global breadth of media and advertising technologies impose Western, profit-driven ideals about bodies upon non-Western societies. It is thus imperative to continue asking questions about the culture of schools and physical education, how physical education marginalizes and privileges certain body types, and how schools and physical education pedagogy can provide safe and democratic spaces to unsettle the notion of the “schooled healthy body.” We must also continue to ask questions about how to disrupt the idea of a “health” binary through new pedagogical practices or approaches. In schools and in physical education, bodies are made and unmade, learned and unlearned, constructed and deconstructed. Physical education trains the body and schools manage it. Both play foundational roles in the construction of bodies through idealized lenses which privilege some at the expense of others, and both require ongoing interrogation if we are to achieve a holistic, embodied vision of social justice.

Chapter 37
Social [In]Justices of Women as School Principals in Lebanon

Bassel Akar and Maha Mouchantaf

Introduction

The increasing number of women in senior management and government positions across the Arab world during the past two decades is testimony to the degree of progress of equal opportunities in the region. Still, anecdotes and the gradual increase of studies of women managers in the Arab region show the ongoing struggles of women's pursuits to develop as leaders in the workplace. Moreover, researchers suggest that the rising number of women entrepreneurs in the region is indicative of the marginalization of women or limited opportunities for access in the public and private organizations (International Labour Organisation, 2012). A paucity of women's educational leadership studies in the Arab region remains, showing the pressing need to examine the barriers that women experience when reaching and sustaining leadership roles in schools and universities. In this chapter, we explore social justice issues of 12 women school principals in Lebanon through reflections of their struggles and successes. We also examine the cultural variables of social justice of women leaders in related studies carried out in the region.

Perceptions and interpretations of inequalities and injustices of women's experiences in educational leadership have fundamentally been examined and framed by feminist theories. Indeed, feminist discourse on "deconstructive/reconstructive work in educational administration" has focused mainly on leadership and social justice examining the constructs underpinning issues of access, power relations among stakeholders, and the processes of promoting equity in society (Blackmore, 2006, p. 187). One of Blackmore's (ibid) illustrations is the socially gendered responsibility and capability of women as teachers (caretakers of children) and men as principals (leaders and decision-makers) during the emergence of Western

liberalism. Feminist discourse has also pursued “equal but different” approaches in educational leadership. From a wider framework of citizenship, Lister (2003) illustrates the complexities and fragilities of consolidating the typical binary of promoting equality regardless of gender while ensuring provisions for women’s individual needs. For instance, the scholarship of “equal but different” has often resulted in highlighting differences in leadership styles, which have overshadowed the discourse on women’s abilities and skills as key factors that significantly contribute to managerial change (Blackmore, 1996). We are, therefore, conscious of women’s individual constructs of social justice; whether fairness is primarily derived from addressing individual needs, ensuring equal male-female treatment, or some consolidation of the two.

The range of subtle and blatant injustices of women becoming and working as leaders in education administration is exhaustive. Equally, examining these injustices have involved an array of approaches including deconstructing/reconstructing concepts and investigating sociocultural beliefs and practices. In this study, we draw on a framework of social justice that focuses on access and development when exploring the barriers and opportunities of being a woman school principal in Lebanon.

Women leaders accessing senior positions, carrying out leadership roles, and developing professional skills raise issues of equality and social justice. Social justice in the labor market, according to Dana and Bourisaw (2006), transpires when women and men have the same opportunities for work and access to promotion, quality training, and higher executive positions. Furthermore, they maintain that these opportunities, however, are impeded by gender (specifically, being a woman), ethnicity, and sex-role stereotypes. For instance, socially constructed stereotypes typically construct women as homemakers and family caretakers, which manifest into cultural norms where male partners do not share domestic responsibilities and women make career commitments once the children become self-sufficient.

Review of the Literature

The following literature review will uncover various dimensions that construct barriers commonly shared by women leaders in the Arab world including the single study in the region found, to date, on Arab women principals. The issues emerging out of women’s experiences construct a conceptual framework of access, work-home balance, and professional development for exploring similar experiences among women principals in Lebanon.

Two Studies on Women Principals

In the field of education, we found only two research articles on women principals in the Arab region through an extensive search in various online databases including EBSCO, PsychInfo, ERIC, ScienceDirect, ProQuest, and Shamaa, an online database for studies in the Arab region. One of the studies (Khleifat & Al Matārina, 2010) comprised a sample of 331 public school principals ($n = 170$ females) in the southern region of Jordan investigating job stress levels. They found among the principals that not finding the time to participate in professional development activities was the most stressful factor. Gender differences, however, showed that women principals experience significantly higher levels of stress due to efforts of fulfilling responsibilities at home and at work, which "affects the performance of their work" (p. 633).

In nearby Palestine, Arar and Abu-Rabia-Queder (2011) investigated the journeys of two Palestinian Arab women principals, each married with four children, by exploring their childhood ambitions, access to the job, and significant moments during the position. Through unstructured interviews, the two participants spoke of their professional and personal life stories followed by a set of semi-structured interviews inquiring into challenges of being principals and approaches taken to address those challenges. Both faced social and political barriers as women in a patriarchal society and Palestinian Arab minorities in Israel. They confronted resistances from society to taking leadership positions by being assertive and reassuring themselves of their abilities to fulfill their professional desires. They also reflected on their authoritative and highly structured approaches during their initial years as principals and the gradual balance with an empathetic approach to leadership with time. Arar and Abu-Rabia-Queder's study is unique to the following literature through its unstructured interviews, which allowed for the findings of transformational approaches to leadership and evidence to suggest personality as a key factor in overcoming social and political barriers. Their identified barriers and experiences are shared among the levels of injustices found in the following literature reviews on women in management positions in the region.

An Overview of Studies on Women Managers in the Arab Region

Albeit the paucity of research on women managers in the Arab region, two literature reviews conducted show various research trends and outline the extent to which cultural dimensions and their manifestations hinder women's opportunities in the managerial arena. In a meta-analysis of literature on women managers in the Arab world dated to 2006, Omair (2008) examined 20 articles, from which 18 were empirical studies (12 quantitative and 6 qualitative). The studies were conducted in Egypt, Kuwait, Qatar, Bahrain, Lebanon, the UAE, Saudi Arabia, and Oman. From the publication dates – 1980s (1 article), 1990s (6 articles), and 2000–2006 (13 articles) – Omair noted a rising trend in the interest of researching women managers and leaders in the Arab region. Omair also draws on the studies to outline six emerging themes related to women becoming or developing as workers and managers in the Arab world (see Table 37.1).

The second literature review was conducted by Karam and Afiouni (2011) whose comprehensive search for studies focused on women leaders in the Arab world.

Table 37.1 Omair's (2008) review of literature (1980–2006) on women and work in Arab context

Emerging themes	Examples from case studies
Career barriers	Women in the Kuwait civil service feel their access to top-level positions in the government sector is blocked (Metle, 2002). Women in Lebanon face sociocultural barriers such as expectations to raise a family (Jamali, Sidani, & Safiedine, 2005)
Attitudes towards women who work	University students in Egypt hold conservative views towards women who work (Mostafa, 2003). Findings from a study in the UAE indicated a slight shift in attitudes from traditional to more liberal (Mostafa, 2005)
Driving forces for success	In Oman, women's successes were attributed to family support, opportunities to access work and professional development, and more personality-related factors such as self-confidence, determination, and perseverance (Al-Lamki, 1999)
Work-life balance	In Lebanon, women at work expressed little or no support through job sharing and childcare (Jamali et al., 2005), while women in Oman showed contentment about access to child-care centers and affordable live-in domestic workers (Al-Lamki, 1999). In Kuwait, women claimed to having at least two live-in helpers (Shah & Al-Qudsi, 1990)
Reasons for working and role models	Women in Oman (McElwee & Al-Riyami, 2003) and Saudi Arabia (Alajmi, 2001) have been found to work for more personal reasons than economic gain. Alajmi suspects that these women may be protecting their husbands' dignity as main providers of the household
Cultural factors affecting women's working lives	Arab traditions steer girls more towards expected domestic roles (Alajmi, 2001) and value boys more as greater financial investments (El-Ghannam, 2002). Although Islamic traditions have shaped the patriarchal social order in the Arab world, the gender inequalities are primarily due to men's interpretations of Islam rather than Islam itself (Metle, 2002)

Their search resulted in categorizing empirical studies into three areas of focus: (1) women managers in the banking and management sectors, (2) access into the labor market, and (3) the balance between work and family (see Table 37.2).

In the subsequent analysis, we examine the findings of these studies and expand on the framework of accessing leadership roles, working at the workplace, and managing home and work responsibilities.

Accessing Work

The obstacles that women in the Arab world experience when attaining work largely stem from sociocultural norms, which construct women's roles of raising a family, promote the dominant male status of husbands and foster a sense of fear of breaking social norms. In interviews with ten female entrepreneurs in Lebanon, some recalled objections from sisters, cousins, and husbands arguing that work would mean time away from the family (Jamali, 2009). Objections also came from the family's fear

Table 37.2 Studies Karam and Aflouni (2011) found on women leaders in the Arab region

Focus on women in the banking and management sectors
Al-Lamky (2007), Jamali (2009), Jamali, Safieddine, and Daouk (2006), Jamali, Sidani, and Kobeissi (2008), Jamali et al. (2005), Marmenout (2009), Metcalfe (2006, 2007), Omair (2008), Tlaiss and Kauser (2010)
Focus on women's entry into labor force
Assaad and Arntz (2005), Khreisat (2009), Miles (2002), Nasser and Abouchedid (2003)
Focus on women's day-to-day balances between home and work
Farahat (2009), Omair (2010), Vidyasagar and Rea (2004)

of compromising the alpha status of the husband. Women in Lebanon (Jamali, 2009) and Jordan (Miles, 2002) seeking work faced objections from their fathers, husbands, and families who feared that society would consider the husband incapable of supporting the family. Al-Lamky (2007) supposes that women earning a substantial income may bring about a fear that men could be assuming feminine roles. As a result, to consciously preserve a modest position and salary in relation to the husband, one woman in the UAE rejected a promotion (Marmenout, 2009). Besides the attention taken from the family and the caution of undermining the alpha male, a study in Saudi Arabia (Vidyasagar & Rea, 2004) unveiled objections that came from husbands who did not want their wives to mix with other men in the workplace.

Some women leaders, too, appear to reinforce the constructions of gender roles. In a workshop in the UAE, one voiced that she wanted her sons to marry women who would not work to ensure the raising of a healthy family (Marmenout, 2009). Showing similar conservative views, attitudes of 172 females working in corporate business in Turkey agreed more than the male participants ($n = 146$) that "The place of a woman is near her husband and being a good mother" (Aycan, 2004, p. 460). Thus, socially constructed traditional gender roles that women value is a primary and delicate variable when interpreting social [in]justices of women becoming managers in education.

State legislation has also determined the fate of women's work opportunities. By conserving traditional patriarchic values of control, a law in Saudi Arabia forbids women work or travel overseas without a *mahram*, or male chaperone (usually relative). Interviews with 28 female doctors in Saudi Arabia described the complexities and limitations of specialization overseas due to finding and financing a *mahram*, which some resolved through marriage or moving the entire family (Vidyasagar & Rea, 2004). In Jordan, women reported that since the law prohibits them from working night shifts, "factories prefer male workers" (Miles, 2002, p. 421). These women also believed that they do not get hired because of employers' fears of women leaving work once they get married or for maternity leaves stipulated in labor laws (Miles). While legislature has tried to support women managing between work and home, maternity leaves granted to women indeed reinforce gender discrimination so long as men are excluded.

Deep-rooted social norms and expectations have had some significant influence on women's areas of study and job attainment. Nasser and Abouchedid (2003) found “no direct relation” between “high educational levels of female university graduates” in Lebanon “with their occupational attainment” (p. 335). Hence, the authors maintained that the jobs that women get in Lebanon are influenced by the parents’ need to increase social status. They also found the field of study to be a good predictor. Females concentrate in the humanities, which are “traditionally demarcated as feminine” and “naturally lower paying occupations in Lebanon” (ibid, p. 336). Moreover, Nasser and Abouchedid (ibid) connected the scholastic areas of study to findings they conducted several years prior (Abouchedid & Nasser, 1999) that showed discrimination in the enrollment of males and females in majors, reinforcing gendered areas of specialization.

The limitations of accessing jobs have also been more direct through discriminatory selection processes, which have negatively impacted the economics of wages for women. A 10-year study (1988–1998) in Egypt found, in the private sector, “a pattern of defeminization” of jobs and a significant increase in the gender differential of wages with women earning less than men (Assaad & Arntz, 2005, p. 441). Assaad and Arntz (ibid) argue that the increase in wage gap is most likely due to gender discrimination or other barriers at the entry level where the defeminization of certain jobs have resulted in “overcrowding” of the female job market and, therefore, has “depressed wages” (p. 444). Another case of direct discrimination during selection was reported in Jordan by women being discriminated against because of wearing the *hijab*, or head scarf, when applying for teller or administrative positions in the banking sector (Miles, 2002).

The facilitation of employment through connections, or *wasta*, is quite typical in the Arab region. However, the paths to work opportunities that facilitate women’s work opportunities are often built by males, which reinforces the male dominance of work opportunities and, consequently, women’s reliance on men established in the workplace. Suad Joseph (1999) refers to this as “patriarchal lineality” and illustrates this phenomenon by citing several prominent female politicians in Lebanon who all had husbands or fathers as previously celebrated political figures. In the UAE, in-depth interviews with 15 female Emiratis resulted in a classification of a “facilitated career” group, which included women achieving high ranks at work through family or family connections (Omair, 2010).

At the Workplace

Studies on women managers’ experiences and reflections at the workplace in Lebanon and the Arab region illustrate barriers to equal opportunities including pay differences between men and women, exclusive participation, and limited access to professional development. Among 411 female managers in Lebanon, 61.1 % felt that men had more professional development opportunities than women, and 60.8 % wished they had access to more professional development opportunities (Tlaiss & Kauser, 2010). Regarding pay, 53.4 % of this sample claimed that women earn less than men, and 82.3 % claimed they were discriminated against in promotions based on their gender (ibid, 2010). Pay differences across the sectors in Lebanon, however, seem to vary. For instance, women leaders in higher education have expressed gender discrepancies in salaries, while nursing and banking sectors appear to show much lesser degrees of pay differences (Jamali et al., 2008).

Specifically, the banking sector in Lebanon has received a degree of praise in its perceived accomplishments of promoting equal opportunities. The vast majority of 61 women bank managers in Lebanon feel that they are themselves at work and are listened to equally (Jamali et al., 2006). Moreover, Jamali et al. found the banking sector to be "successful in creating a gender-inclusive culture" (p. 635). Looking closer at the results, however, the authors may have too prematurely rejected the hypothesis that these women receive professional development opportunities. The results are presented as "yes," "sometimes," and "no" responses. The "yes" and "sometimes" responses indicate that their perceptions and/or experiences exist to some degree. Therefore, the respective responses – yes, sometimes, and no – to the statements below indicate that approximately two-thirds of these women tend to agree that they:

- *Have fewer opportunities than men for professional development at work* (25, 44, 31 %)
- *Receive fewer opportunities for professional development than you wish for* (22, 45, 33 %)

In addition, their rejection of the hypothesis that the organizational climate as a barrier to women's equalities at work may have also been unqualified since, again, two-thirds of the women leaned more towards the beliefs that:

- [They] *have been unfairly judged* (3, 57, 39 %).
- *Perceptions and stereotypes about women's professional capabilities constitute barriers to women's advancement* (21, 46, 33 %).
- [They] *must be more accomplished in their work than men…to be promoted* (44, 21, 34 %).

We see a clear "two-thirds trend" of perceptions of being discriminated against or limited in their opportunities to develop at work and remunerated fairly.

Gender-based inequalities in the workplace have resulted from various types of barriers, which appear to have primarily taken shape from the organizational culture and sociocultural norms and attitudes. In Bahrain, among 94 Bahraini, Omani, and Jordanian women managers,[1] the majority of participants claimed that their organizations did not have policies promoting equal opportunities such as maternity leave and protection against sexual harassment (Metcalfe, 2006). Moreover, they felt that professional training opportunities were not typically promoted to women due to the expectation of leaving work when getting married to raise children and, thus, 76.5 % saw the business culture as a source of unfairness and discrimination (ibid, 2006).[2]

---

[1] The sample also included five women from Pakistan and three from England.

[2] For an additional discussion on the findings of Metcalfe (2006), see (Metcalfe, 2007).

The structural violence enacted through corporate policy has a direct relation to the extent males seem to protect their gender identity-based dignities and positions at work. Interviews with 52 women in middle management in Lebanon revealed barriers to advancing in their careers and found that women leaders (1) struggle in a patriarchal environment that reinforces traditional expectations of women being homemakers, (2) are questioned by men on their competence and commitment at work, and (3) are excluded from informal networks and high-profile projects that result in preparing males for higher positions (Jamali et al., 2005). These barriers have manifested from the uncritical acceptance of socially constructed women's roles and competencies. Indeed, males at work may find these roles and competencies convenient in securing their dominance at work. This may explain why a study in Qatar and Kuwait found that while women "are willing to accept more responsibilities in the political, occupational, educational and social spheres, Arab men are not willing to share these responsibilities with them" (Abdalla, 1996, p. 36). In addition to the work place, women see male dominance at more deep-rooted levels. In one study, women managers in Bahrain voiced that gender discriminations rooted from the religious culture come mainly from men's interpretations of Islam rather than the religion itself (Metcalfe, 2006).

Women managers in the Arab region, so far, have been reported as victims to gender-based violence systematized by males at the workplace. Still, "a significant number of women highlighted the importance of segregated business associations" since they find women colleagues more reliable and less corrupt (Metcalfe, 2006, p. 101). While preferences for segregated work associates are choices that women managers strive for their own benefit, other choices such as lowering their profile at work are for the benefit of preserving male dignities. In Oman, for example, women in senior positions in government, corporations, and educational institutions attributed much of their success to high levels of motivation to excel, albeit "the need to curb" their motivation levels in the male-dominated workplace so not appear threatening (Al-Lamky, 2007, p. 58).

Support Issues When Balancing Home and Work

Managing between homemaking and work responsibilities consistently emerges as a trial for women across the organizational hierarchies. Balancing between the two tends to become more difficult when children are young, have exams, and are more than two (Marmenout, 2009). Seemingly, the key issue lies in who, from the partners, sacrifices or perceives that they are sacrificing time from either work or home. If the well-being of the child was at stake, the women tend to sacrifice work instead of their husbands (Al-Lamky, 2007; Marmenout, 2009). And when some women have given up time from home, they described how they dealt with complaints from their male partners for "spending more and more time at work" (Jamali, 2009, p. 243).

Another form of sacrifice includes adjustments made to fit better work schedules and family planning. In Egypt's northern region, female physicians who work shifts (afternoon or night) expressed difficulties balancing between home and work significantly more than nonshift-work female physicians (Farahat, 2009). Still, shift-work and nonshift-work physicians cope similarly with the challenges of work-home balance by deciding to have a small family (82.3 %), hiring babysitters or housekeepers (76.3 %), selecting non-emergency specialties (i.e., laboratory work) (34.3 %), choosing to live near the health-care units (21 %), and taking unpaid leave (15.7 %) (ibid). Since these studies' sample sets comprised females, as did nearly all the studies reviewed, the inclusion of males in such research studies could better define injustices of women when examining perceptions of sacrifice in relation to actual adjustments made.

Not all women at work and women managers gave testimony to the strains of work-home roles and responsibilities. In Lebanon's banking sector, approximately two-thirds of the participating women bank managers felt that they have received sufficient support at work and when balancing with home responsibilities (Jamali et al., 2006). Although women have testified that a great deal of support, such as encouragement and confidence, comes from their husbands (Al Kharouf & Weir, 2008; Al-Lamky, 2007; Jamali, 2009), they were unable to illustrate actual activities. The support that many women define as sufficient appears to take the shape of verbal inspiration and psychological backing.

Many of the women who struggle with their male partners when balancing work-home responsibilities revolve around the sharing of domestic work. A sample of ten successful women entrepreneurs in Lebanon described how they have tried to involve their spouses in homemaking tasks by "trying to convince the husband in family and child responsibilities" (Jamali, 2009, p. 243). Still, more reliable avenues for support in maintaining the household come from domestic workers.

Assistance in homemaking and child-caring is accessible and affordable in Lebanon and the rest of the Arab region. Live-in domestic workers are commonly found in Lebanese households probably due to the controversial low range of wages (i.e., 120–250 USD per month). Women managers in the Emirates (Marmenout, 2009), Oman (Al-Lamky, 2007), and Lebanon (Jamali, 2009) have voiced appreciation to the affordability of domestic help. Family networks are also a source of support. The sociocultural values for family have provided women at work with a reliable and secure support network. Despite the availability of and accessibility to live-in domestic workers and extended family, many women at work disclosed the emotional burden of guilt. Feelings of guilt have mainly been related to neither spending enough time with their children nor attending to all their children's needs (Al-Lamky, 2007; Jamali, 2009; Marmenout, 2009).

Many women do not have access to such support arrangements including the sharing of domestic work with husbands and, thus, find no other choice but to leave work. Consequently, some women in Jordan felt that this has built a bad reputation for women that prevents employers from hiring them (Miles, 2002). Here, we can see a relation between access to work and work-home support since more support at home may lead to fewer instances of leaving work.

Conceptualizing Injustices of Women Managers in Lebanon and the Region

The literature above investigated the experiences, dilemmas, and concerns of women preparing for and accessing senior administrative positions, developing at the workplace, and managing between homemaking and work responsibilities. These studies illustrated different *locations* and *forms* of [in]justice along with factors associated with inequalities, struggles, and successes. The locations that women leaders in the Arab region had referred to described spaces where activities, structures, and perceptions determined their journeys of [not] becoming managers at the workplace. Most notably, forms of social [in]justice perceived by women's attributions to injustice and success took shape in three locations/moments: seeking and obtaining work, interactions and opportunities at the workplace, and managing between work and home.

When considering, accessing or accepting senior positions, they reported resistance from family who argued that work meant less time from raising children and could prompt society to question the husband's capabilities of providing for the family. Few women reported that their husbands did not want them to mix with other men. Other barriers to access included travel and night-shift restrictions from state legislature and discrimination against wearing the *hijab* at job interviews. Still, few women noted the support received from their families, which suggests that the family is a significant variable in determining the levels of difficulty and ease when accessing senior positions. At the workplace, the majority of women's perceived discriminations illustrated practices favoring men such as women having fewer professional development opportunities, discrimination during times of promotion, and wages lower than their male colleagues. In addition, some felt excluded from high-profile projects and networks and a few described how they play down their motivation levels at male-dominated workplaces. Positively perceived experiences included feeling they can be themselves, listened to equally to men, and able to promote a gender-inclusive work culture. A few women presented a more active dimension of a just and beneficial workplace when maintaining gender-segregated association for reliability and transparency.

Thirdly, when balancing between home and work, frequently women reflected on the struggles of caring for young children and managing feelings of guilt when not spending enough time with them. To better accommodate the children's needs, which many feel do more than their husbands, they take unpaid leaves, select careers near work, and, sometimes, leave work, which reinforces the stereotype that some women mentioned of being more committed to home than work. Still, on the other hand, contributions to successful work-home management were attributed to "affordable" domestic help, encouragement from husbands, and family networks.

The Study

The literature review prompts a range of questions for further investigation into conceptualizations of fairness and equity and root causes such as social and individual constructions of gender roles. We explore the issues identified with social justice that women experience when accessing and working as school principals in Lebanon. Thus, for the semi-structured interviews with women school principals, we inquired into the following:

1. Background information: *Family, written qualifications, and work experience*
2. Becoming a school principal: *What led you to decide to become a school principal? What made it easy/difficult?*
3. Being a school principal and homemaker: *What makes it easy/difficult? What kind of support would you like to have?*
4. Promotion and professional development: *Who do you report to? What opportunities do you have for promotion/pay/professional development? What would you say is the greatest barrier to your own professional development?*

Research Context

In many ways, Lebanon stands out as a distinctive nation in the Arab world. As a secular state, the Republic comprises 18 official religious sects and dozens of political parties with freestanding elections. It is often considered the most liberal country in the West Asian-North African region, especially when it comes to women's liberties. However, gender inequalities resulting from legislature exist. For instance, Lebanese women married to non-Lebanese men are unable to pass on the Lebanese national citizenship to their children. Also, women who are victims of domestic violence require a witness when filing for divorce. So, while the findings from this study may single out Lebanon from its neighboring Arab countries, particular opportunities and barriers will emerge as familiar to the region as a whole.

Methodology

In this study, we examine conversations with 13 women who reflected on their experiences of becoming and working as school principals in Lebanon. Semi-structured interviews explored how they became principals and fulfill their responsibilities at work. The majority of 11 principals interviewed came from private schools and 2 from the public sector. This opportunistic sample resulted from facilitated access into private schools. Also, with no intention to represent all female principals in

Table 37.3 Sample set of women principals in Lebanon

	Pseudonym	Marital status	Child[ren]	Years as principal	Work experience prior to principalship
Private	Rana	Married	2 boys, 1 girl	11	None
	Anis	Married	3 boys	17	Teacher (12), supervisor (5)
	Ruba	Widowed	3 girls	5	Teacher (5)
	Lyne	Partner	None	1	Teacher (10)
	Huda	Married	2 boys	4	Teacher (10), leader in another school
	Sarah	Divorced	2 boys	10	Started as coordinator
	Nadine	Married	2 boys, 1 girl	2	Teacher (25)
	Salma	Divorced	1 boy	17	Teacher, Assist. Director
	Hiba	None	None	6	Director in another school
	Leila	Married	1 boy, 1 girl	4	Teacher (13)
	Reem	Divorced	2 boys, 1 girl	4	Teacher (4)
Public	Amal	Married	2 boys, 1 girl	37	Teacher (5)
	Lana	Married	2 girls	20	Teacher (9)

Lebanon, it is worth noting that over two-thirds (71 %) of the students in Lebanon are enrolled in private education. The participating schools were across three of the six governorates in Lebanon – Beirut, Mount Lebanon, and North Lebanon. Each interview lasted approximately 20–25 min. One of the private school interviews was conducted via an exchange of e-mails due to geographical distance. The interviews were conducted in Arabic, French, and English. All were transcribed into English for analysis.

Results

The group of 13 female school principals presented a wide variety of marital statuses and years in school leadership posts (see Table 37.3). This sample shows the majority of interviewed principals have two to three children. Also, just over half the women that have children live with male partners. The significance of marital status, the gender of children, and private/public sectors emerged throughout the anecdotes these principals shared.

Access to Leadership Roles

All principals but Rana have had previous teaching experience. Salma, Huda, Sarah, Hiba, Lana, and Anis progressed across various administrative roles including supervising, coordinating, and directing. Only Reem and Lana hold a written qualification in the field of educational leadership, though Reem left the school in 2009 and teaches full time at university. The more personal experiences of how these women reached their leadership roles begin to illustrate possible roots to social [in] justice issues of women leaders in Lebanon.

First, some of the leadership appointments based on sociocultural and political factors indicate that access to leadership positions do not fully recognize women's qualifications. Many private schools in Lebanon are family-run businesses. So, while Leila had taught in the family-run school for 13 years prior, Rana was "assigned" to the post by her husband who was working in another country, despite her lack of teaching and leadership experience in schools. Rana emphasized that becoming a principal was her passion and choice and attends workshops to learn and cultivate her professional knowledge. Still, at face value, a male appointing his wife short of practical knowledge or certification could depreciate the experiences and qualifications of women becoming school leaders.

In the case of Amal, a public school principal, political factors had overlooked her abilities as an educational leader. Indeed, politics posed as a barrier for Amal, which "for years" had "delayed me from reaching where I am." She explained further that politics in the public sector are "the basis for everything" and that "degrees, experience and references will not take you" but connections will. Lana refrained from admitting that politics contributed to her appointment but declared that politicians interfere in her school.

Just over half the principals described how their roles and relationships directly related to the family also emerged as issues that either delayed or facilitated opportunities to be school principals. While Leila and Rana were already part of a family-run school business, Ruba (whose husband had passed away when starting the post), Amal, and Lana had explicitly noted encouragement from their husbands when deciding to take the post. Only Nadine and Anis had mentioned objections from husbands, which apparently did not influence their decisions. Though quite rare, other family members also showed disapproval. Lyne reported that her mother was concerned about the family losing priority from being principal, and Anis' brother protested against the promotion to principal since "he had not been principal yet." Being available to raise children, however, seemed to be the most significant factor in deciding whether or not to accept principalship. For instance, Nadine, Lana, and Salma accepted the leadership roles once their children had either grown up or at least started attending the school they would work in.

Balancing Between Home and Work

The principals reflected on the extent to which their partners and families were means of support and the approaches taken to facilitate the balance between home and work. From the 12 interviewed, 6 were married and living with their husbands with only Rana having her husband working overseas. Lyne had a partner but lives with her mother. Reem and Sarah, currently divorced, reported on their experiences of working and living with their former partners. Although they did not explicitly state the reasons behind the separation, their anecdotes and experiences indicated that the struggles of establishing shared responsibilities may have played a significant role in deciding to end the marriage. Of the nine women who worked while having male partners, only three reported distinct limitations from their husbands who did not contribute with the cooking, cleaning, driving the kids to and from activities, and taking care of the children when they got sick.

The women who described their partners as supportive illustrated three types of supportive partners. The first was the instrumental partner who, portrayed by only Huda and Leila, would take the kids "to the promenade while I stayed at home correcting and preparing" and regularly "gives the kids their baths, takes the kids out to give me time for myself" and shops for groceries. Huda had already begun working when she married. The second illustration was the convenient partner, who is "not demanding," "has no problem [eating] lunch alone," and "whatever there is at home, he'll eat, same thing with the boys." And, finally, the rhetorical partner whose views that women should work for greater independence and impact on the community were sufficient to deem the husband as supportive. Although Leila expressed her appreciation for gender-based roles and differences, perceiving the supportive male as agreeable and sympathetic reveals the extent to which gender-based roles are deeply engrained in women. Moreover, their experiences have shown that being convenient and rhetorically supportive does not necessarily result in shared domestic responsibilities.

When sharing their own experiences, the principals described conveniences that assisted in managing responsibilities between work and home. Grandparents, an aunt, and close friends had helped in many ways including picking the children up after school, providing meals, and looking after the children when the children were sick. Additionally, Rana has two live-in housekeepers and a driver, while Anis, Amal, Leila, Nadine, Lana, and Reem have one each who takes care of the "dust and laundry and doing the dishes" leaving the mother to help with the kids' studies and driving them to and from activities. Only Sarah had neither hired nor familial help. Besides the support for daily tasks, Huda, Leila, and Salma reported on convenience of having their children attend the same school since "you start and finish school with the kids" and have the same vacation times too. For Salma, she eventually accepted the directorship once her child started attending the same school.

One interesting observation was that Ruba was the only participant who mentioned help from the children "by accepting the fact that I won't be there all the time" and preparing "for creative things such as parties, theater, slogans [and] posters." This may have been attributable to either all three children being girls and the normative expectations of girls as "helpers." Direct functional support from the children may have also proceeded from the passing away of her husband when she started work, or the combination of the two variables, each unique to the sample of the principals interviewed.

Despite the apparently available support from family and live-in housekeepers, Salma and Nadine delayed work for child-rearing. From those that maintained their leadership roles, however, nine described how they deal[t] with the emotional burden of sacrificing time from the family. Some of these sacrifices include not being available for the children when they were sick (Reem & Lana), when mom got ill (Hiba) and not having "hubby time" or time with her husband (Leila). When caring for the infants, Sarah and Reem expressed feelings of guilt "when I used to put my child at the age of 40 days in the day care center to be able to go to work." Furthermore, some described how their children's claims of feeling neglected created sentiments of guilt like when "my kids used to blame me for taking care of the school more than I do for them" (Rana & Lana). Anis recalled times of armed conflict when you are responsible for the safety of the children. One day, during an air raid, she spent the time at school making sure the students had arrived home safely. When she called home to check up on her son, he said, "It's great that you remembered me." Anis continued, even with a sick child home alone, "You just can't leave the students, we had 1300." Overall, emotional burdens are shared among the women when wearing several hats alone:

> Women leaders in Lebanon suffer tremendously in general, especially in the educational field. We are expected to lead schools, homes and be a wife and a mother. This is too much. We need more support and more understanding in this patriarchic society of ours. Don't misunderstand me, I have nothing against men, but we are suffering. (Sara)

All 13 principals illustrated some form of emotional strain like guilt and fatigue that followed time away from expected family responsibilities to leadership roles. Only Nadine and Leila wished for more time for themselves.

Equal and Professional Development Opportunities at the Workplace

At the final stage of the interviews, the principals were asked who they report to, if pay was equal, and about their opportunities for promotion and professional development (PD). In the private sector, they report to school boards and males (some are school owners), two report to females who are subordinate to males, and the public school principals are accountable to the Ministry of Education and Higher Education (MEHE). As for pay, eight claimed that pay was equal between male and female principals, Lyne was unsure, and the principal Sarah, the only principal who reported unfairness in salary, claimed that "the guy who I replaced earned three times more my salary." Ruba claimed that one's pay "is up to how you negotiate" and "has nothing to do with gender." "What differs between a man and a woman," said Huda, "is that a woman will not go and ask for a raise while a man would do it claiming that he has a family to support."

Nearly all described the opportunities that they had taken for PD in the forms of workshops, seminars, and conferences. Lyne preferred to read books on school leadership and Nadine is still waiting for opportunities organized by the school. The majority, though, attributed PD with pursuing academic training and qualifications, from which five expressed intentions for (Hiba, Anis, Nadine, Lyne). Hiba had started doctoral studies in the United States but returned to Lebanon to be with her mother after her father passed away. Anis and Nadine shared similar attitudes of turning down higher studies since it would need more time away from home and children. Missing out on opportunities for further studies may have played a part in Anis once turning down a promotion because she "felt that [she] needed more of an academic background in education." A few of the principals identified family as part of the barrier to PD activities including a “lack of money, time and being a single mom” (Sarah) and the load between work and family duties (Amal). Lana said she waited for her children to grow up before pursing doctoral studies. In another direction, Nadine feels that “Now, I don’t need to anymore” despite her initial motivations to develop professionally merely postponed to raise the children. Similarly, Lyne had once considered graduate studies in educational leadership but, at the moment, “I want to enjoy what I’m doing.” Seemingly, the various understandings of professional development are starting to emerge as *written qualifications for competency and promotion.* This construction of PD based on extrinsic motivators could indicate a degree of resistance to further develop practice through collaborative and reflexive approaches. Alternatively, PD that requires a great amount of time and financial resources can significantly and inconveniently add to work and family responsibilities and, thus, become assimilated as unnecessary and burdensome.

Discussion

The experiences of women in Lebanon reaching managerial positions and working as organizational leaders are similar to those found in the region. In the discussions below, we present trends emerging from their conceptualizations of justice and injustice. The themes prompt discussions on how these school principals have interpreted their experiences and indicated the variables that apparently determine the form and degree of social [in]justice, namely, constructions of gender roles, practices in the private, and public sectors and State legislation.

Conveniences and Challenges

Women school principals seem to have an occupational advantage when perceiving their school-based profession as convenient for balancing between work and home since they share the same school holidays as their children. Though an additional advantage is attending the same school and spending most of the day in the same proximity, one was still concerned of what to do when their children finished their school day early.

An opportunity more commonly shared among this sample and women professionals in the region is the availability of affordable domestic help and culture of familial support. Women across the Arab region (Omair, 2008) including Oman (Al-Lamky, 2007; McElwee & Al-Riyami, 2003), the Emirates (Marmenout, 2009), Lebanon (Tlaiss & Kauser, 2010), and Saudi Arabia (Vidyasagar & Rea, 2004) described how live-in domestic helpers have allowed them to commit more fully to work responsibilities. An ethical controversy, however, does loom behind this seemingly fortunate opportunity since women migrant domestic workers in Lebanon

(Jureidini & Moukarbel, 2004) and the region (Chammartin, 2004; Esim & Kerbage, 2011) have limited civil rights, experience abuse, earn below minimum wage, and excluded from labor laws. In accord with Shah and Al-Qudsi's (1990) speculation, we find the economics of social justice foreseeing how the increase in women workers in the region could reinforce the injustices of domestic workers since the demand of domestic workers will inadvertently increase. Therefore, the status quo of domestic workers in the region causes us to hesitate endorsing such provision as a sustainable means of facilitating opportunities for women to work.

The culture of familial support, on the other hand, is a long-lived tradition of family and friends sharing the demands of daily chores. Testimonies from all participants but Sarah (divorced with two boys) showed how parents, grandparents, and close friends helped with preparing meals and watching over the children after school. This culture of communitarianism consistently manifests itself as a factor in the successful management of work and home in the cases of Lebanon (Tlaiss & Kauser, 2010), Turkey (Aycan, 2004), and Saudi Arabia (Vidyasagar & Rea, 2004). However, the culturally established networks, proximities, and connections among relatives and friends seem to equally harm women's processes of taking on senior positions. For instance, in the private sector, a small number of the women principals worked in a school established by either their husbands or other male relatives. Access through patriarchal lineality (Joseph, 1999) not only reinforces male dominance but also potentially depreciates the skills and qualifications of women as school principals. Also, some of the principals reported different degrees of resistance or caution to taking on the senior administrative position, which a mother, brother, and several husbands had voiced.

The dynamics between most of these women principals and their husbands showed a range of reactions towards husbands' apathy in relation to day-to-day tasks at home, despite the support from domestic workers and surrounding friends and family. Though unquantified through large-scale surveys, we notice a relationship between divorces, perceptions of husband's lack of contributions to domestic responsibilities, and pursuits to achieve senior positions. The 3 divorced women in this sample of 13 show a near similar ratio to the 4:14 divorced women in Oman, who prioritized financial need more frequently than the other ten participants (McElwee & Al-Riyami, 2003). Female managers in the United Arab Emirates (Marmenout, 2009) and Turkey (Aycan, 2004) consistently related anecdotes about ending relationships in order to continue working. Still, finding ways to balance between work and home was expressed as more desirable than leaving one for the other among the samples in Turkey (Aycan, 2004).

The principals in this study who reflected on the supportive practices of their husbands described different forms of support that appeared either instrumental, convenient, and/or rhetorical. Likewise in a sample in Jordan, Al Kharouf and Weir (2008) identified support levels suggesting degrees of superficiality in the consistent testimonies of women describing their husbands as supportive by agreeing with their wives to start work. The conceptualizations of partner support levels, dynamics of communitarian and familial assistance, and the women's responses to barriers and advantages surface a number of deep-rooted issues. Below, we critically engage with those associated with gender roles and gendered structures.

Conceptualizations of Gender Roles and Justice

Conceptualizations of gender roles and social justice, appearing at social and individual levels, seem to significantly determine how these women school principals perceive and experience barriers and opportunities. We begin to draw on their expectations associated with being a woman at work and mother. Moreover, their testimonies and manifestations of who sacrifices and inherently assumes nearly all domestic responsibilities piece together constructions of gender roles, which directly and subtly influence their lives as school principals.

The principals' constructs of gender roles emerged from descriptions of:

1. Husband's roles as "helpers" juxtaposed to sharing domestic responsibilities
2. Husband's behaviors perceived as helpful by "has no problem" having "lunch alone" or not being picky with the meals prepared
3. How the Lebanese culture sees women having a "full-time job at home"
4. How they see men's self-concepts as being the "money-makers"

Defined roles for men and women emerge as prominent features that affect women's access to and working experiences in senior positions, which Omair (2008) found as established sociocultural norms across the region. Still, camouflaged among the social expectations of men and women's roles, we find similar suppositions from a majority of the women principals. Alongside the clear frustrations of fatigue from managing between home and work responsibilities, they subtly advocate for opportunity and difference more than for equality through some of the references to husbands as "helpers" than domestic partners and illustrations of convenient partners who are content with the meals prepared.

More explicit descriptions of women's roles, however, have appeared in studies in the region such as Turkey where Aycan (2004) found that women agreed more than men on the item, *The place of a woman is near her husband and being a good mother* and, thus, seeming "to hold more 'traditional' gender roles compared to men" (p. 463). In the creative arts, Dutch photographer Hassink (2008) collaborated with the Arab International Women's Forum to document the lives of 36 successful business women in 18 Arab countries through photographs of their office meeting tables and home dining tables. In addition to raising profiles of Arab women amidst Western-projected stereotypes and creating a medium for representation in certain societies that prohibit portraits of women, Hassink also noted that some of the women were "extremely keen on participating in this project because they thought it was very, very important" (Aperature Foundation, 2009). This photography project reinforced the significance of gender roles to women who identify themselves as homemakers and self-empowered individuals.

Regionally and nationally, a gender-differentiated approach (see Lister, 2003) consistently emerges as a dominant paradigm for social justice of women. Regardless Lebanon position themselves from, gender roles are still related to barriers and challenges. Choosing to raise children, some accepted posts or started principal careers once their children were either grown up or started attending school. Also, the ideals of being a mother and wife – whether determined by self, family, or society – set expectations that, when not fully met, resulted in guilt (i.e., not spending enough time with children or with partner) or emotional fatigue (i.e., worrying about what to do with the child once their school day finished and not having time for self). Furthermore, their self-described roles as homemakers could restrain them from positioning themselves as "family provider" to negotiate salary, an identity that Huda claimed men turn to for pay raises. The roles that women chose to assume and fulfill in this study are challenged by structures, which we found at private and State levels.

Structures of Gender[ed] Constructions

The private sector emerges as a space in education that reinforces, what Suad Joseph (1999) coined as, patriarchal lineality as integral to the processes of accountability and access. All but the two public school principals reported to a male authority, a male-dominated board of directors, or a female subordinate to a male director. Male figures are typically found at the top of the management chain as sole proprietors or religious leaders, especially since schools in the private sector are most commonly founded as private businesses or, according to Abouchedid (1997) religious-based missions. Also, only 2 of the 13 principals are directly related to the sole proprietors of the school; one reporting her husband assigning her the post, which she expressed a passion prior to the post. Practices of women accessing senior positions facilitated by close family/social connections or *wasta* is indeed a global phenomenon with a higher degree of significance in the Arab region (Tlaiss & Kauser, 2010, pp. 470–471). Albeit the conventionalism of *wasta*, women's attainment of senior positions through men reinforces a gender hierarchy of males as providers of opportunity and could possibly depreciate women's skills and abilities to manage and lead.

From the two public school principals' testimonies, politics appeared to have been a more significant barrier to women becoming school leaders. Though public schools in Lebanon must be secular, they still develop a confessional-based staff and student body, largely due to the sectarian identity of communities the school is located in. Amal's declaration that "politics" and "connections" supersede "degrees, experience, and references" defines a culture of *wasta* in a confessional-based organizational structure. With regard to accountability, public school principals report directly to the MEHE. While more evidence is needed to suggest the presence or absence of gender-based discrimination, we find that the public sector is less likely to be a space where male authorities pave the paths for successful women leaders.

State legislature and administrative practices in the private education sector constrain the roles and positions of women in society as homemakers, child-rearers and male-dependent. Articles 28 and 29 of the Labor Code in Lebanon entitle women with maternity leave of 7 weeks and full wage replacement. However, parental leave by law in Lebanon is solely available to mothers. For fathers, parental leave is

> …one of the key policies for improving gender equity at home, reducing marital stress, and contributing to the healthy development of newborns by increasing paternal involvement with their children and families. Paternity leave policies can also increase equity in the workplace. (McGill Institute for Health and Social Policy, 2012)[3]

At a global scale, half the countries in South America and over 80 % in Europe give fathers paid parental leave (McGill Institute for Health and Social Policy, 2009). By providing only women at work and not working men paid leave to care for the newborn child, the State becomes largely responsible for the social and individual expectations of women rearing children, sacrificed work opportunities to raise young children, emotional burdens of guilt from spending time away from family, fatigue resulting from the managing domestic and work responsibilities, and the gender-based disparities of pay.

Conclusion

In this chapter, we examined women's experiences of becoming and being school principals in Lebanon. By conducting a comprehensive literature review of studies on women managers in the Arab region, we drew up a conceptual framework showing a range of injustices and locations where they manifest, namely, when accessing principalship, developing as professionals at the workplace, and managing between home and work responsibilities. Based on these themes, we interviewed 13 women school principals in Lebanon and uncovered structures that sustain the injustices of women pursuing and maintaining school leadership roles in Lebanon and, by and large, the Arab region.

The justice is that they hold gender differences to be important; they have their own roles. Many women showed content with their roles as homemakers and the kind of (rhetorical, compliant and emotional) support from their male partners. However, the shortcomings of a predominant gender-differentiated approach are evident. At the emotionality level, desirable traits of assertiveness, self-confidence, and resilience emerged. However, they were coupled with emotional burdens of guilt for not spending time with family or prioritizing work responsibilities over children, frustrations of lacking 'me' time, and general fatigue from sacrifices made to fulfill individually/socially gendered roles and expectations. In addition, the assignment of positions by male seniors or *wasta* could depreciate the skills and abilities of women as leaders and managers.

We uphold the freedoms of choice and dignities of individuals. Thus, we are deeply concerned with the extent to which choices are intersubjectively and critically examined. Of the numerous core issues that have emerged in this chapter, we highlight two key discourses for public debate, civil action, transformation, and self-reflection. First, structures found at organizational and State levels define the positions and functions of genders. In organizations, women leaders consistently accountable to male authorities situate women as subordinate regardless of their positional power in administration. Furthermore, parental leave for mothers only functionalizes women as the child-rearers resulting in numerous consequences including sacrifices to professional work, emotional fatigue, and socially constructed, minimalist notions of support from male partners. Second, most roles of what men and women are expected to do are defined and, most likely, preferred. These women (like many others around the world) could experience discomfort seeing their husbands actively engaging in child-rearing and preparing meals, which could be perceived as intrusive or threatening to their gendered identities.

---

[3] *Raising the Global Floor* is a research initiative carried out by researchers at the McGill University Institute of Health and Social Policy and the Harvard School of Public Health for the *World Legal Rights Data Centre (WoRLD)* global database.

Further research could focus more on school principals' experiences and perceptions in the public sector. Also, similar examinations with male principals will allow for better understandings of gender-related or gender-specific injustices including the pressures males may feel as a consequence to the construction of "providers." Alongside the sample of principals, future studies can investigate the journeys of teachers or other individuals who have tried but did not become senior administrators. To more accurately interpret the conceptualizations of gender differences, studies can also introduce variables that identify sexism. We urge researchers, however, to exercise caution and care when revising existing instruments for the cultural context. Finally, the extrinsically based motivations for professional development that the school principals described prompt action research studies examining school-based, reflexive approaches that would overcome the reported financial and time limitations.

The prominent gender-differentiated approach to social justice among women principals in Lebanon is often found to be in conceptual tension with gender-neutral approaches that advocate for equality (Lister, 2003) and, thus, prompt examinations into normative approaches for "equal but different" (see Blackmore, 1996; Lister, 2003). In an attempt to reconcile these two approaches, Gewirtz (1998) maintains a postmodern approach for equality and difference through a relational dimension to address individuals or distinct communities by responding to their needs and ensuring freedoms to mobilize. Without the recognition of these needs and reorganization of structures that prevent means to address issues of social injustice, women principals in Lebanon will continue to normalize emotional fatigue, burdens of guilt, disparities at work, and sacrificed opportunities as part and parcel of being school principals. We, therefore, advocate for the following four principles for guiding policy and social transformations:

1. Provide equal time of parental leave for mothers and fathers alike.
2. Promote transparent and inclusive methods of hiring senior administrators.
3. Examine secondary subjects of social injustice in addition to domestic workers.
4. Encourage critical engagement with inter-subjective constructions of gender roles.

Chapter 38
Searching for Social Justice: An Examination of the Views of Alternative School Educators in the San Joaquin Valley of California

Monty J. Thornburg

This chapter explores the meaning of *social justice* for educators who work with "at-risk" youth. Issues related to social justice have been at the center of my reflective practice for years as a teacher and administrator and as a graduate student and researcher since joining the National Teacher Corps in Alabama (Terrar, 2009). Not only is social justice an issue for those like me who work with students who find little social justice in their education, but it seems to be an issue for all educators: "Educational leaders today must operate in a post-modern world where debates and conflicting attitudes about the meaning of social justice exist" (Beck, 2011).

In this chapter an exploration is structured to contrast the *social justice* thinking of John Rawls (1971) in *A Theory of Justice* with that of Friedrich Hayek (1976) in *The Mirage of Social Justice*. Rawls discusses *distributive justice*, *equity,* and *equality of opportunity* in his theory and, by implication, proposes that education leaders should work toward the common public good using democratic processes. *"Any approach to social justice that does not examine the school's role in perpetuating the larger social inequities which exist on the political economic terrain serves to reinforce and perpetuate them"* (English, 1994, p. 91). Rawls' social justice theory, in my view, involves ethical and moral judgments such as provided in Starratt's (1994) Ethical School Model. The model includes the following: caring, justice, and critique. *Caring* is defined by asking the following question: What do our relationships ask of us? *Justice* is defined by asking the question: How shall we govern ourselves? And *critique* is defined by asking the questions as follows: Who controls? Who legitimates? and Who defines? These questions are in Thornburg (2001, p. 72) as originally found in Starratt.

Hayek, in his libertarian view, rejects the Rawls' theory of justice. He argues that *social justice* is centered only in *equal access*, *due process*, *policy formation,* and *implementation* for the individual, not for groups or classes of people. This libertarian view has moved K-12 education toward privatization and competition in recent years. This agenda began in earnest, perhaps, with the publication of *Free to Choose* (1980) by Milton Friedman. William Bennett, President Reagan's former Secretary of Education, advocated for vouchers and other libertarian policies in the middle 1980s (Thornburg, 1986). Hayek was a university colleague of Milton Friedman, and both were Nobel Prize winners in economics. These three giants of philosophical and economic thought – Freidman, Hayek, and Rawls – provided me and the interviewees with a conceptual dichotomy to frame our social justice discussions. That said, Nell Noddings (1992) in *Justice and Equality in Education* identified three themes in education also at work during the last 30 years: (1) inequalities in physical resources, (2) inequalities in basic relationships, and (3) curricular inequalities (pp. 165–177). The first theme is represented in many ways by Title I and became dominant starting with President Lyndon Johnson's War on Poverty. During that time, *social justice* was viewed by many as equivalent to civil rights for historically oppressed groups: African Americans, Latinos, women, Native Americans, and others.

The second theme, inequalities in basic relationships, was inspired by the War on Drugs initiated during the Reagan years in the 1980s. This theme became dominant in the 1990s through the implementation of the Safe and Drug-Free Schools and Communities Act (SDFSCA). It was during that time frame when zero tolerance (see also White & Cooper, Chap. 53 in this volume) became the solution to education problems across America, particularly after Columbine (Thornburg, 2001, pp. 5–8, 39–49).

The third theme, curricular inequalities, is now hegemonic and appears to dwarf other concerns. Michael Apple (2001) in "Educational and curricular restructuring and the neo-liberal and neo-conservative agenda," recognizes two points of view and states as follows:

> There is a new alliance…exerting leadership in educational policy and educational reform. First, there are neo-liberals. These are economic modernizers who want educational policy to be centered around the economy, around performance objectives based on a closer connection between schooling and paid work…The economic modernizers are in leadership, by and large, in this new bloc. They see schools as connected to a marketplace, especially the global capitalist market, and the labor needs and processes of such a market. They also often see schools themselves as in need of being transformed and made more competitive by placing them into marketplaces through voucher plans, tax credits, and other similar marketizing strategies. A second group is neo-conservatives. In most cases it is important to make a distinction between the neo-liberal economic modernizers and neo-conservatives.…Neo-conservatives often agree with the neo-liberal emphasis on the economy, but their main agenda is cultural "restoration." Examples in the United States are people such as E.D. Hirsch, former Secretary of Education William Bennett, and the late Alan Bloom. These are people who want a return to a totally romanticized version of schooling in which we have a standard curriculum. (p. ii)

California and National Context of the Study

This study was conducted with educators who work or have worked in California's San Joaquin Valley. The San Joaquin Valley is the place, arguably, where the most important civil rights movement outside the southern United States occurred. The San Joaquin Valley is similar to the south with respect to rural populations, poverty, and hate groups. Cesar Chavez led the farm worker movement in the San Joaquin Valley when *social justice* seemed to equal civil rights in the 1960s and 1970s.

The story of the San Joaquin and most of California is of a great Diaspora. In May of 1996, the California Research Bureau released a report comparing the San Joaquin Valley to other states. If the San Joaquin Valley were a state, its per capita income would be between South Carolina and Alabama and fourth in the number of persons involved in farming, forestry, and fishing, surpassed only by California, Florida, and Texas. It would be larger in area than ten states and 31st in population exceeding 20 states. It would rank eighth in population of Asian ancestry, sixth in Hispanic population following California, Florida, Illinois, New York, and Texas, and third in persons of Mexican origin or decent, after only California and Texas.

The San Joaquin region, in addition to being poorer on average than most of California, is also the place where prison populations and incarceration of its residents, mostly minority, are larger than average. The average incarceration rate for adults in the San Joaquin Valley is 130 % compared with the rest of the state and ranges in one county as high as 155 %. The largest state woman's prison in the world is in the valley's center. A billboard sign posted by the ACLU reads that "Welcome to America, Home to 5 % of the World's Population and 25 % of the World's Prisoners" is telling. It tells that the "school-to-prison pipeline" in San Joaquin as explained by the Advancement Project's research is a severe problem for educators. The Advancement Project's research articles (2002–2011) explain how schools systematically test, punish, and push-out students, and these studies parallel the experiences of participants in this study.

The high adult incarceration rates contribute to the foster and homeless youth populations and gang problems. In some regions in San Joaquin, mostly in the foothills, the most virulent White hate groups in America took root (Anti-Defamation League [ADL], 1996; Southern Poverty Law Center [SPLC], 2003). Some of these groups have been responsible for the rise in hate crimes in prisons nationwide as their ideologies have spread beyond prison walls over the past few decades. At the same time, drug problems and gang activities are as virulent as any place in the United States according to a Social Justice Journal article (Rodriquez, 2005). The San Joaquin Valley matches the worst incarceration rates in the United States.

At-risk students for the purposes of this study include students sent to California Alternative Education sites through disciplinary action (suspensions/expulsions), through referrals from the criminal justice system through juvenile probation, or through the California Student Attendance Review Boards (SARBs) process. SARBs handle cases, including behavioral intervention cases for at-risk youth through community multidisciplinary boards. SARBs are established by California legislative mandate in each county. The alternative education sites to which students are sent include Continuation Schools and Opportunity Programs (least restrictive), Community Day Schools, County Community Schools (more restrictive), and Court Schools within juvenile detention facilities (most restrictive).

California Education Code explicitly gives direction on the process used. According to a discipline matrix, there are 41 possible violations and some are redundant. Typically, when violations occur, independent panels of administrators participate in hearings and make recommendations to boards of trustees. Five offenses require zero tolerance, and according to law, administrators must recommend expelling the student. Administrators may recommend expelling students on most of the other violations; however, zero tolerance "thinking" and "group think" (Janis, 1972) may sway some. A (CDE) California Department of Education consultant pointed out that by "suspending" expulsions, other outcomes are possible too. Parents sent packets of information each year that includes discipline information, often with the title, Zero Tolerance Discipline Policy. Others include the title Assertive Discipline Policy. Data file systems used to track student disciplinary history use these same titles indicating a clear bias toward assertive discipline and zero tolerance methods.

The competition for average daily attendance dollars over the past 30 years (Timar, 2006) has changed California's educational processes away from "local control" and cooperative, democratic, communitarian processes toward individualistic, competitive, and legalistic processes controlled at the state level. I have often observed administrators talking about students in terms of their average daily attendance (ADA) value, and it has appeared to me that too often students are thought of as commodities to be competed for. Due to an overreliance on state-level funding, districts and schools now find themselves placed into competitive situations with each other and with charter schools. This coupled with (NCLB) No Child Left Behind high-stakes testing standards; districts have incentives to retain high-achieving students and discard low-achieving or disruptive students into alternative programs funded differently.

Incarceration Comparison with Other Countries

According to the Sentencing Project:

> The United States is the world's leader in incarceration with 2.2 million people currently in the nation's prisons or jails – a 500 % increase over the past thirty years. These trends have resulted in prison overcrowding and state governments being overwhelmed by the burden of funding a rapidly expanding penal system, despite increasing evidence that large-scale incarceration is not the most effective means of achieving public safety.

The dramatic rise in incarceration in the United States correlates with the change in zero tolerance and assertive discipline mechanisms that grew out of the "War on Drugs" and with the Safe and Drug-Free Schools Act. In my initial study, zero

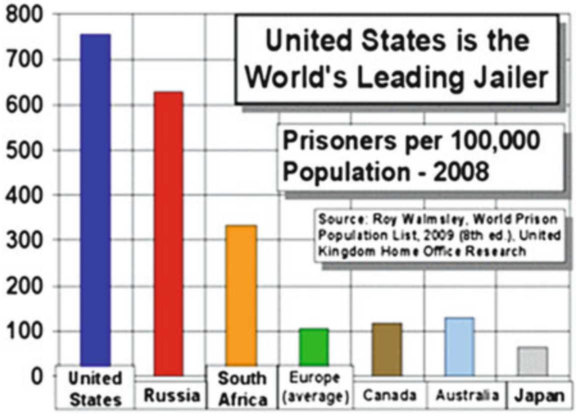

Fig. 38.1 ICPS International Center for Prison Studies. World Prison Population List (8th edition) rate per 100,000 of 218 countries and territories. (Jan 2009)

tolerance and other disciplinary strategies were examined in Louisiana (Thornburg, 2001). According to the Bureau of Justice Statistics, Louisiana has the highest rate of incarceration at 867 per 100,000 with an African American to White ratio of 4.7–1. Now over a decade later, I find that the statewide incarceration rate in California by comparison is 439 per 100,000 with a 6.5–1 African American to White ratio and a 1.7–1 Hispanic to White ratio. The incarceration rate in the San Joaquin Valley region, however, is 130 % higher on average and with a large rural Hispanic population. The U.S. Census Bureau in 2011 lists Black residents in California as 6.2 % of the population, Whites as 57.6 % of the population, and Hispanics as 37.6 % of the population. Louisiana, the state with highest incarceration rate in the United States, has a ratio of Black to White population of 32–62.6 %. Therefore, while both states are clearly discriminatory toward African Americans in terms of incarceration, California appears to be more so based on census data and percentages of White to Black population (Sentencing Project (the)) (Fig. 38.1).

During the preparation of this chapter, I attended California's Third Annual Equity Summit (Watson, 2012b), "Equity, Education and Incarceration: What is California's Future?" I was thus able to reflect on the study's findings and compare them with expert opinions from the summit. James Bell, a prominent civil rights attorney, was the keynote speaker, and he highlighted the difference between incarceration percentages in the United States with other industrialized countries as well as the rise of incarceration rates in the USA over the past three decades. Mr. Bell, in *Zero Tolerance* (2001), wrote "as an advocate for youth in detention" (p. 138) and concluded that there is "too little leadership at the top" interested in the educational well being of incarcerated youth and "too many regulations at the bottom" to help (p. 141). Aligned with Mr. Bell's comments are data compiled by Western, Schiraldi, and Ziedenberg (2003) indicating the growth in spending for incarceration was already 2.5 times higher than for education and this disparity has widened dramatically, since. The growth of incarceration was already at 1,518 % compared with 370 % for education in 1999, and Mr. Bell talked about an increased rate of disparity over the past decade.

Vajra Watson, Director of the Equity Summit and Research for Equity in her new book, *Learning to Liberate* (2012a), dramatically demonstrates through her research that there are ways, outside mainstream education, to break the cycle of social reproduction of poor urban youth. She explains that exemplary leaders, working with youth, can "replace it with *social resistance"* (p. 6) and "*agency"* (Miron & Mickey, 1998). Despite the *ethic of care* or love, competencies, and heroic efforts of the exemplary leaders in her study, Watson (2012a) acknowledges that there is a "current push-pull dynamic between capitalism and democracy" and that "many leaders of school improvement continue to err on the side of the market; that is, they educate to create an economically divided and complacent citizenry" (p. 4). It is the push-pull dynamic she speaks about that is examined in this study.

The Case of the San Joaquin Valley

In the San Joaquin Valley region, the proposed opening of a new charter school became a contentious issue. The public school was closed at the end of the 2011–2012 school year due to poor economic conditions and declining Average Daily Attendance (ADA). According to the superintendent, the reopening of the new charter school would "bankrupt the district." The board of education, however, approved the reopening of its closed school as a charter school (Bowers, 2011, p.1). State charter school law reportedly gave the board no choice even though it was contended that it would be "unfair to poor students" in the rest of the district and there were no provisions for Title I students in the proposal. Research has demonstrated class and racial bias by charter schools (Thornburg, 2012).

Nationally, charter schools in America are significant, since over a million students now attend them (out of 49 million students in K-12 schools). The research literature seems mixed on whether charter schools do or do not improve academic outcomes (Jacob & Ludwig, 2009). Some are lauded as the best hope for poor Black and Hispanic children (Thernstrum & Thernstrum, 2003), but others worry that charter schools openly (Bulkley & Fisler, 2003; Dee & Fu, 2004) or implicitly (Lacireno-Paquet, Holyoke, Moser, & Henig, 2002; Weiher & Tedin, 2002) reinforce racial stratification. One recent Harvard study by the Project for Civil Rights of U.S. Charter Schools (2012) reported that both class bias and race bias exist with charter schools. The Harvard study claimed that with "*subjective student selection, charter schools are clearly achieving a separate and unequal education based on race and class*" in America.

Research Methods and Participants

This "grounded theory" (Glasser & Strauss, 1967) research project has been iterative and heuristic. Both administrators and teachers from the San Joaquin Valley region were interviewed. These educational leaders interviewed were selected using a scaffolding approach. I began with two administrators at the (CDE) California Department of Education. Each interviewee brought a unique perspective about the issues affecting at-risk youth and *social justice* in general using the concepts of Rawls and Hayek.

Additional interviewees were found through research. For example, I found that an upper level administrator in Fresno, California, had presented a dissertation on homeless and foster youth. She sent me a copy of her research, and after I reviewed it, she agreed to an interview. Others were recommended to me or known through professional practice in alternative education, for example, through Juvenile Court Community and Alternative School Administrators of California (JCCASAC). Other participants were university educational leaders at California universities, and some interviewees were chosen on an ad hoc basis when opportunities were presented to learn the views of teachers and other educators from the San Joaquin Valley region.

I interviewed the director of the California On My Honor: Civics Institute for Teachers when I attended the conference in San Francisco during the month of June 2011. The issue of *silencing* of public servants came up in the context of the institute, and when I discussed it with her, she agreed to contribute to the study. Moreover, many of the 40 participants from the institute live in the San Joaquin Valley and/or are involved in alternative education. All of the institute participants worked an entire week on *social justice* and law-related civics curriculum design. This institute experience provided me a rich environment to explore my topic with dedicated and focused educators. The Dean of the College of Education, at the University of the Pacific (UOP) (located in San Joaquin County), met with me and provided invaluable insight, criticism, and suggestions. We met because it was her previous work in educational leadership and the *ethic of caring* (Beck, 1992) that influenced some of my earlier thinking on school-wide discipline in the context of educational administration as I moved toward conceptualizing a dissertation about school-wide discipline in urban high schools.

The interviews of the primary participants were recorded, transcribed, and then coded. I listened for evidence of caring, evidence of traditional justice constructs, due process, and evidence of critique. The evidence that the framework either made sense to the participants or didn't was considered throughout. Each of the participant interviewees was asked if pressures resulting from current political discourse made speaking out either in professional forums or in public difficult. In other words, does silencing of critique occur? Finally, all of the key participants read initial drafts of this document and commented on various parts; thus, the process became both heuristic and iterative. Personal experience, interviews, ad hoc conversations, and other research articles have all been integrated into this research effort.

McNeal and Dunbar (2010) utilized (Lipsky, 1980) street-level bureaucracy theory to analyze their qualitative data. After reviewing their article and methods, I then decided to adopt the concept of street-level bureaucracy because I too could see its usefulness toward understanding how actions can lead to either equality or inequality. This framework is used in the conclusion and analysis to interpret interviews and other related observations.

Structural Contexts

Public Democratic Solutions vs. Privatized Individual Choice Solutions

Each interviewee was made aware of the basic differences between Rawls' (1971) fundamental thoughts about *social justice* and Hayek's (1976) book that rejected his thinking. Information was also shared about the Internet blogs of conservative and even right-wing extremist groups, easily found, that used Hayek's thinking to reject the concept or term *social justice*. Some blogs claim the term *social justice* is code for socialism even communism. There are now postmodern cyber disputes between traditional liberals and conservatives, between progressives and libertarians. Those disputes, perhaps, are understandable and in the postmodern cyber space world as cable news channels employ large teams that daily surf the Internet and social media blogs for stories that are sensational and controversial.

McNeal and Dunbar (2010, p. 296) and discussed in (Thornburg, 2001, p. 39) as follows, provided context for the discussions. In an effort to explain public discourse around issues of school violence, which was the impetus for zero tolerance, John Devine (1996) in his book, *Maximum Security*, couches the public perception into two diametrically opposed tiers. The first he refers to as a "right-wing discourse," which he describes as "chaotic," meaning schools are viewed as being out of control. The second view is described as "mainstream liberal discourse," which he suggests means to "minimize it and psychologicalize it (school violence) as a result of student alienation" (Devine, p. 21). The first view posits "closing the system (schools) down"; the second suggests that schools need to "reform its learning process." In other words, the view of schools from right-wingers is that schools are in a situation of hopelessness as a result of moral and behavioral decay. Consequently, not much can be done to correct the situation therefore warranting school closures. This view places the blame on the victims (i.e., students). Again, Watson (2012a) effectively demonstrates through her research that while education "places the blame on the victims" that through "activism" (pp. 86, 96, 112, 146, 164, 171) to find "social justice" (p. 156) using the pedagogies of communication, community, compassion, and commitment, agency for resistance and change can create conditions where "education is a gateway to survival" (p. 3).

A blog statement was chosen to illustrate to the interviewees how the term *social justice* is being treated in social media. The blog was written by Ms. Flanagan (2009) who had been heartened because she heard the new Secretary of Education Arne Duncan speaks about *social justice.* Secretary Duncan had said, "We have not served all communities equally and this is nothing less than a fight for social justice." Ms. Flanagan wrote the following on her blog:

> So, I put the phrase *social justice* in the title of this blog for all the prickly folks who have their Google alerts set to snag any blogger with the temerity to write about equity and fairness in American education. I could come up with a dozen more interesting titles for this dispatch from D.C. –but the money quote in this blog is about *social justice*, a once-righteous phrase that has lately taken a licking and, one hopes, will come out ticking.

Here are some of the comments made by participants: A former superintendent commented after reading the blog statement said, "There isn't much equity and fairness in many parts of America. It's very disconcerting." He went on to explain that NCLB requirements that now have districts competing with each other and now with charter schools too; it is a real dilemma. He continued:

> Public Education has been its own worst enemy, we complain about the outcomes, yet, we tend not to reflect on what it is we have created… I have a philosophy about this, he said, the whole piece, No Child Left Behind was designed to destroy public education and charter schools are an intermediate step.

Another participant, an educational consultant, responded:

> Statistically, NCLB was designed, albeit certainly not intentionally by all of its authors, for public schools to fail. Those of us here in the CDE tried to ask the question, how do these statistics add up? Eventually, every school will fail!

Another CDE consultant commented:

> We hear from our charter school clients,…We are a charter; we don't have to do that… Many charters are not doing as well as public schools for the at risk…We know this from the kinds of questions they ask, and many are now trying to obtain Title I funds and will have to be monitored.

Soon after these interviews was the California Civics Institute, for teachers, judges, district attorneys, and others spoke to educators about topics related to the function of the courts. Ironically, a few hours before one presentation, we learned that the California Legislature had voted to cut California's Superior Courts budgets. Their calculation in San Francisco was that these cuts would force their Superior Court there to close 40 % of all courtrooms and lay off 41 % of staff. A judge explained that she is very concerned about the direction of society to undervalue collective responsibility as highlighted by the legislature's recent budget cuts to reduce services of the Superior Courts. Juvenile cases, probate, and family cases involving homeless and foster youth, youth on probation, and other at-risk groups are all handled by the Superior Courts. Similarly, "drug courts" for youth and other programs sponsored by the courts are examples of a teaching and learning strategy to assist *at-risk* youth.

The relationship between the courts, *at-risk* youth, and the schools is central to understanding the case of the San Joaquin Valley. The following quote was sent days after I had asked questions about social justice. She reflected:

> What I have found interesting about my work with the Administrative Office of the Courts (AOC) in partnership with California State University San Marcos, is the importance that the court has placed on education. They have funded the California On My Honor: Civics Institute for Teachers (among other amazing public programs for underserved populations) in response to the startling lack of understanding of the judicial branch by the general public. The AOC views this lack of understanding not only as a threat to the judicial branch, but to the democratic principles that were established by our Constitution. They have been doing their part to support teachers, as they believe that education is the answer…they believe teachers are a powerful resource and that they can play a pivotal role in the change that must happen in order to have an informed and responsible citizenry. It is disconcerting to say the least, to be "hit" by these budget cuts from all sides! (Chadwick, 2011)

When I commented that I had observed that administrators are silenced or discouraged from taking a stand on controversial, social issues, or on behalf of at-risk youth because they are seen as outcasts, one CDE consultant responded as follows:

> We were set to put a Community Day School (CDS) into a district. One of the school board members went house to house and invited community residents to come to the board meeting to discuss placing the school in their neighborhood. The board member claimed to be OK or at least interested in the CDS, however, his actions effectively discouraged placement of a school in that neighborhood. Of course that was the neighborhood where those CDS students lived. The CDS was not approved, and expelled students continued to be referred to a county school far from the district, even though it was recognized that the great distance meant few would attend regularly.

Other administrators, too, said that the alternative measures are used by school districts to banish *at-risk* students. They also said that there is a financial tension too. On the one hand, districts want to keep their average daily attendance (ADA) state funding and direct control of students, but, on the other hand, they don't want the disruption in their schools. These tensions were alluded to in other contexts outside the study.

Teaching and Learning Disciplinary Processes vs. Enforcement and Control Disciplinary Processes

Discipline strategies that rely on control and enforcement such as assertive discipline and zero tolerance (Thornburg, 2001, pp. 5–8) were discussed with each interviewee. In an *Urban Education* article, "In the eyes of the beholder, Urban student perceptions of Zero Tolerance Policy," McNeal and Dunbar (2010) explain:

> Yet there is paucity of literature on zero tolerance policy from the voices for which the policy was designed to keep safe—that is, children who behave appropriately. A doctoral dissertation study titled "School-Wide Discipline in Urban High Schools" was conducted in an effort to provide insight on school staff and students' perceptions of violence prevention strategies, including zero tolerance policies. In this study, the data revealed significant differences between fairness, impact on school safety, and overall utility (Thornburg, 2001), in (Urban Education, 2010, p. 296).

The interviewees were asked about the assertive discipline data file systems. The intent was to find out how this particular form of discipline became so dominant. During the interviews, control/enforcement discipline strategies in the form of the Zero Tolerance Policy and assertive discipline were discussed. Data systems track student behavior using these methods. Administrator's wide use indicates acceptance of these strategies. A decade ago I wrote (Thornburg, 2001):

> Despite the dissent and criticism about these measures aimed toward control, suppression, and avoidance of violence, advocates for the use of security and zero tolerance measures have convinced school boards, policy makers, and school administrators to adopt policies nationwide. Many have also been convinced that student fights and other problems need to be dealt with in a criminal-justice-like manner rather than by other traditional humanistic

> systems of discipline. Criminal justice sanctions for offenses such as vandalism, theft, assault, and extortion that are associated with the presence of gangs have been one reason for the change (p. 7) … and … (T)he political rhetoric and random incidents cited seem to demonstrate that the country has moved in a direction that now accepts the premise that student transgressions previously handled by school officials should now be considered as criminal activity. Law enforcement tactics are becoming accepted as a necessary part of public school life. (p. 49)

One California Department of Education consultant spoke passionately about the need for alternative school leaders to demonstrate care by paying attention to student learning outcomes and by teaching in ways that help students to develop emotionally and socially in addition to academically. When discussing with him whether to name him personally in this article, he responded succinctly: “I'm not worried that people discover that I think that education should support successful youth development.”

Alternative school educators throughout the last decade in California have been encouraged to view their students through the lens of resiliency research. Research tells us that resilience is a universal capacity, and all children have a natural, developmental capacity to thrive, even in the face of severe deprivation and adversity. The research also tells us that schools can make a tremendous difference using social justice initiatives as outlined by Bernard (2004):

> As clear as it has become that all young people have the capacity for positive development, resilience research should never be used to justify social and political inaction on the grounds that, somehow, “Most kids make it.” In the face of growing global poverty, abuse, violence, and other threats to children's development, the somehow can no longer depend on the luck of the draw. Increasingly, healthy youth development must depend on deliberate policies, practices, and interventions designed to provide young people with developmental supports and opportunities. As we are learning, young people are resilient, but they are not invincible. (Bernard, 2004, p. 10)

This same CDE consultant pointed out that educators must view students as having assets and not as problems. He went on to say that building resiliency includes recognizing that all students have, and need to build, both internal and external assets.

> We must be forward looking and focus on what students can achieve…as opposed to emphasizing what they've done in the past…We are all at different stages of development and when educators focus on student's assets – in doing so, their actions support both learning and unlearning that needs to occur.

On the other hand, he also recognizes that school districts do not always pay attention to the teaching and learning and the caring when engaged in disciplinary hearings. He acknowledged that a myriad of (sometimes contradictory) California Educational Codes (2010) can prescribe action not suitable for building resilience.

Another CDE consultant concurred independently that zero tolerance, the data-driven assertive disciplinary file used to track students' behavior, is a potential pipeline to the justice system.

> The system is followed as an exclusionary process. The Ed Code has it written in that there is supposed to be a plan to move kids back, however, what is typically written into the Expulsion Order (for example) or the SARB Referral, (for example) is very minimal.

It was acknowledged in different interviews with both CDE consultants that intervention is preferable. One was adamant and reiterated:

> Zero Tolerance literally means that we must intervene. By definition, to tolerate something is to allow it to continue even though we don't particularly like it. Therefore, zero tolerance means that we must intervene, not just let it continue; but, these words do not imply punishment as the form of intervention.

Another administrator who is responsible for several alternative education sites, including a juvenile hall program, said, in contrast: "I hate zero tolerance; I just don't see where it does any good!" She went on to explain:

> When I started as a dean of students I liked Zero Tolerance because it made my job easier. If a student was caught with marijuana, well … you're expelled! Then I began to look at it differently, and I realized after some workshops and so forth that zero tolerance means no due process! Just because a student is below the age of 18 doesn't mean he or she shouldn't have rights!

While remaining optimistic and pointing out that while the rehabilitative Ed Code on discipline is often seen as a legal bureaucratic solution, one CDE consultant insisted on that essential not minimized, deemphasized, or even ignored. He said:

> I usurp the language of zero tolerance to hook them, (teachers and administrators). My background is applied psychology and education, and part of my work here at the CDE is to read a lot of mission statements from school districts. The statements all have blah, blah, blah, to help the student learn, etc. and never bla, bla, bla, to punish or bla, bla, bla to castigate the student. The punishment, etc. is never in the mission statement! I use their mission statements and turn the conversation(s) around.

Another administrator, a principal at an alternative school in a different county, complained to me about the high number of special education students sent to her programs. Her analysis is that many of those students may have technically put themselves in a position to be sent to a county program by violating the Ed Code on "School Disruption and Defiance" more than 20 times. She explained:

> I'm sorry…these (special education) students just don't belong here! Don't get me wrong, I get along well with the Special Education Director, and she knows how I feel. It's just that these students don't need to be exposed to an alternative school where other students who have committed serious offenses also come. I don't know the solution, but, administrators are starting to look at changes because Sacramento, the CDE, is looking at the statistics of the school district(s) that send these students.

A CDE consultant addressed the issues with respect to special education, foster and homeless youth, and the Ed Code on "School Disruption and Defiance" (the most common violation seen) in districts. According to him, the perception of many school districts is that 20 violations constitute a reason for expulsion. His comment was:

> It's just the opposite…the law about not being able to suspend beyond twenty means, you can't suspend anymore. What I tell districts is what you are doing isn't working and you need to find new solutions.

Another CDE consultant believes that solutions can be found, even where things seem desperate.

> I made a visit to some schools in the valley. The poverty levels are super high in those Valley schools. I expected to see a school in 5th year P.I. (NCLB Program Improvement) in shambles, but it was just the opposite. The school provided a good part of their nutrition, safe haven, essentially a second home. So, on P.I. they had to provide those supports and they had very few discipline problems. The reason for their success in my view was that they saw all the kids as their kids. They didn't have a "school on the hill" type of mentality, but rather, strived to take care of all of the needs of their students and not just preparation for testing. The problem is schools could do the same thing without putting a negative and punitive tag on them through Annual Yearly Progress. If you create an environment where kids tend to succeed, they succeed!

The reporting on at-risk youth, with the on-line Assertive Discipline and Zero Tolerance Policy tracking system, may contribute to an overuse of control and enforcement strategies. One administrator with decades of experience explained:

> Yes, assertive discipline came into existence around the same time as zero tolerance. It may have helped lead to it. Since the zero tolerance laws passed, we, (administrators) have not had a lot of flexibility to help kids in trouble individually, to find ways to help them educationally.

Another administrator with years of experience as a hearing officer commented about some of the dilemmas that administrators face where criminality and discipline overlap.

> Every major community in the central valley has a gang intervention unit, it drives school policy, and police departments work closely with the school because schools are a magnet for gang recruiting. Schools are recruiting grounds for gangs. Zero tolerance for gang signs, colors, apparel are created in policy and it goes on from there. In the foothills there's a large amount of poverty, but, mostly white. Racist, skin-heads don't see themselves as gang related but rather as a reaction to immigration. The Skin Heads would put up posters and signs against immigrants. In the foothills I would see some of that when I worked there.

While the prison commitment rates for adults in the San Joaquin Valley remain high compared with the rest of the state, the juvenile commitment rates for juveniles have dropped over the past decade. However, many alternative school youth move back and forth in and out of juvenile detention. I spoke with several interviewees about the high incarceration rates for adults. A Juvenile Court Community and Alternative School Administrators of California (JCCASAC) leader responded:

> There's a disconnect! I know with NCLB about needing good teaching, but, many--most of these kids need more. Many are living with a single parent, grandparent, in foster care (group homes), and many have a parent who is in prison. It's been in the news a lot from Stockton that, the Catholic Charities has a program for Mother's Day. They make gift baskets and bus the kids down to Madera, the Woman's Prison to visit their moms. It's sad!

As acknowledged by several interviewees, youth previously housed in juvenile detention facilities in years past are now placed into the foster care system. Many *frequent flyers,* as they are called, go in and out of juvenile hall. One of the teachers from a juvenile hall school commented in frustration:

> In the Hall, I can't even wear clothing that is red, my favorite color, because of the gang reference. It's not officially against the rules, but is frowned upon. One also has to watch their language. One day I told a student, 'You better get your work done, Buster' and the students in the class all stopped and looked up with their mouths open. Buster is a negative term by Soreneos against Norteneos. On another occasion, a white student came in and made some vile racist remarks and identified himself as a 'Peckerwood' and we had to remove him to his room for everyone's safety. It's sad; one of my students says the gangs are his life. His mom is deported and his dad is dead.

One interviewee with extensive experience in the valley told me the following:

> Once, while serving as a new Principal in one District on Highway 99, while driving home, I had a very frightening experience. I was pulled over, sandwiched between two pickup trucks in the almond orchards. Someone got out and said, 'I'm a representative of the local Nazi Party. We just want to have a conversation with you as the new Jewish principal.' They didn't say much, they just wanted me to know they were there. It was very frightening because they do a lot more in those orchards than grow fruit and nuts!

He then went on to tell about his experience as superintendent after I shared some information about racist and anti-government groups such as Christian Identity, Aryan Nation, Posse Comitatus, and sovereign citizen groups, all of which are or have been affiliated with each other. I shared information about the *Jubilee* magazine (ADL, 1996; SPLC, 2003) and he was not surprised. He went on about another community where he had served as district and county superintendent, and we discussed some instances where each of us had experience with anti-Semitism while attempting to perform our responsibilities as administrators.

Another interviewee, an agency director who works with a school district and manages an anti-bullying program, was equally discouraged in a different way. She is struggling with trying to satisfy the wishes of a high-level administrator who wants to turn her program into an enforcement and control system. The administrator wants the anti-bullying staff to report incidents of bullying to building level administrators and for the information to be placed into the assertive discipline data system. This is very problematic for the director because the essence of the teaching and learning anti-bully program is to teach peer support, empathy, and perspective taking to students. For the program to work, students must trust that they won't be punished for trying and can learn from their mistakes. The program is designed to be nonpunitive. In this case, the street-level bureaucracy is potentially undermining the program. Out of frustration she talked about the difficulty for students to develop the courage needed to act. She went on to tell about a personal experience to illustrate:

> You know, it's difficult enough to gain respect and trust with the students. What we are asking them to do is very hard! We ask them to interject verbally and interrupt bullying. I had a recent experience the other day that shows how hard it can be. It was at the time of the Chavez state holiday, I had forgotten and the DMV was closed due to the state holiday. The next day I returned and along with some other men in the place, we were talking about the closure of state buildings the previous day. They were being very disrespectful of Cesar Chavez and were using foul language. I thought about the lessons we try and teach our

> students. So, I tried to interject, using positive assertive language telling the men that I felt offended because Cesar Chavez stood up for justice. After a couple of verbal exchanges, and being called names, (under their breath), I realized it was hopeless. I realized how difficult this all really is for our students!

During the California On My Honor Teacher Institute and after a simulation lesson, I spoke with a teacher from the valley. The lesson involved the National Socialist Party of America vs. Skokie, 432 U.S. 43 (1977) case, an Appeals Court case involving freedom of speech decided by and upheld by the Illinois Supreme Court. The simulation raised many questions and created a lively discussion. One teacher I spoke with was born and raised in the San Joaquin Valley. During a previous informal conversation, she had mentioned specific communities where KKK marches used to occur, and she went on to tell me where the Grand Wizard of the KKK resides. She also mentioned the peckerwoods and other gangs that she knows about.

While walking back to the hotel after the session mentioned above, I struck up a conversation with her and other teachers. Another teacher from the valley, a teacher that had overheard the conversation, said, "I can't believe how many of my children's parents are in prison!" When I asked her about her comments to the group, she went on:

> We collect Christmas baskets and hold other events. I have gone to their homes many times and some of these children are living in the back of camper trucks without heat and in outside makeshift sheds. NCLB is OK as far as it goes, but, there needs to be more!

As we discussed the ethic of *caring,* one administrator reminded me that I had once said something to him about his having left another district as principal earlier in his career. He seemed irritated! I think he thought that I was being critical of him! We were also discussing how sometimes communities and others in power effectively silence administrators. He went on:

> I left, because I did speak up! In that case, I found that the Superintendent, (name withheld here) was refusing to initiate language learner programs when nearly 70 % of the student population was Latino, and many students clearly needed the interventions. I could see that he and I were not in the same place when it came to educating children! They, (higher level administrators and board members) don't really care what you think. They just want the job done according to their own precepts and ideas.

Analysis and Conclusion

I found evidence throughout the study that public servants, be they teachers, school or district administrators, or state-level administrators, feel they must operate with a *code of silence* about *social justice* issues in many professional settings. That is, they feel a need to keep to themselves when *critique* might be appropriate. I found that for the most part, except in trusting environments, *critique* is discouraged and sometimes even explicitly disallowed inside the circles of administrative discourse. On the other hand, *caring* and action with respect to individual *justice* are expected and rewarded. Over the past 30 years, there has been a shift away from the issues of "Inequalities in physical resources" (Noddings, 1992) and toward zero tolerance and assertive discipline measures (Thornburg, 2001). It can be legitimately argued, I think, that in San Joaquin as elsewhere in the United States, a "school-to-jail pipeline" (Advancement Project, 2011) has become operational as libertarian processes, competition, and privatization in many areas of education have come to dominate.

I found evidence that leaders do see the "school-to-jail pipeline." One of the administrators interviewed in this study remarked extemporaneously:

> "Assertive discipline did certainly invade California schools and became an integral part of not only how discipline was applied but how records were maintained statewide. … There weren't any districts that were allowed not to have Zero Tolerance Policies because of legislation that gave no choice." I asked if he saw any connection between assertive discipline and zero tolerance policies.
>
> "My assumption is that assertive discipline was in place for years, and I've been in education for thirty-two years, but, Zero Tolerance took assertive discipline to a much higher level. It legitimized it and institutionalized it with expensive in-service. You know, three strikes and you're out, green light, yellow light, red light, marbles in a jar, etc. and … if you look at what the results have been over the last fifteen years, I believe it's been disproportionally unfair to minorities. I've always believed in the more relationship orientated methods of discipline from Madeline Hunter and Fred Jones out of UCLA.
>
> He then went on to conclude: I believe that if you look at the past thirty years or so, you'll see that these (assertive discipline and zero tolerance) methods haven't worked! If a kid is checked out of the system, then putting a marble in a jar isn't going to change him!"

His comments echo the findings of a Harvard Civil Rights Study and other studies mentioned to interviewees (Ithaca College, 2012) – see on-line Charter Schools, Education Vouchers, and School Choice.

During the California On My Honor: Civics Institute for Teachers at the CA Office of the Courts, in San Francisco, many teachers openly discussed *social justice* issues. It was during that week of engagement that I personally began to believe that public servants, teachers, administrators, and even judges are constrained in the context of the postmodern world's use of social media and cable news. Early on, and during the process of collecting data at the institute, I contacted a powerful court official after a keynote address that focused on legitimate concerns with California budget constraints. The address to us an audience of civics teachers was heartfelt.

The speaker complained about the libertarian political forces in America and how "individualism" is constraining legitimate social services for the poor and for "at-risk" youth in our society. The speaker said that society seems to be losing a common civic purpose. The comments of this high court official parallel comments made by Watson (2012a) in her new book: *"current push-pull dynamic between capitalism and democracy"* … *"where "this country's democratic principles fuel rhetoric about equal opportunity … and,* as a "*contentious arena, --in K-12 schools-- where these ideologies (capitalism and democracy) collide*" (p. 3).

After the address, I spoke with the high court official and I asked if I might have permission to quote the statements made and explained that I would send a draft of my proposed quotes as I had written them down. Initially, there was an agreement.

However, when I sent the draft, I was asked not to quote the contents directly as ascribed to the court official. My interpretation of this exchange, early in the study, was that if a powerful state court official felt so constrained, then *silencing* was a concern that I needed to examine in this study.

I asked one educational leader directly what he thought about the questions of *critique* found in Starratt (1994) and if they'd have resonance with legislators, school boards, and other governmental officials, and he said, "*They don't care what we think! They just want us to manage, to follow the guidelines, the Education Code.*" This same leader then went on when I pressed him a little further about being *silenced* in a previous job he'd left before becoming a superintendent, where justice issues were at stake, "*I left, because I did speak up!*" As seen above, the interviewee clearly had a goal to achieve the learning objectives of the English language learner students he was concerned about; yet, apparently his boss, a former superintendent in the valley at the time, saw his students differently. His boss saw these farm worker students strictly from a "disciplinary" and control/enforcement perspective. Shortly thereafter, his former boss left education for the private sector. He joined a company that specializes in school safety through interdiction with drug sniffing dogs. When discussing *social justice* in the context of Rawls (1971) and Hayek (1976), he exclaimed, "*There isn't much equity and fairness in many parts of America. It's very disconcerting.*"

Another interviewee who works at the state level and occasionally sees legislators likewise demurred from *critique* questions; he'd made comments to legislators for which he'd been reprimanded by higher up state officials. He stressed the importance of *caring* through teaching for *resiliency* (Bernard, 2004) and the importance of *justice* by turning zero tolerance language on its head and carefully holding school districts to *all* aspects of educational code. *"Zero Tolerance means we must intervene with a viable alternative plan, not just suspend the student. Zero Tolerance means we don't accept the status quo, how we are educating the student"* he said. We shared several e-mail exchanges about my use of quotes and my interpretations from taped interviews. This procedure was a practice followed with all participants.

Another educational leader spoke about the difficulty in building trust with students in using *resiliency* strategies. She spoke about a negative experience with the Cesar Chavez state holiday where she'd personally experienced the difficulties students might have in challenging bullies. Then she expressed concern about the district's assertive discipline data system and its negative effects on her anti-bullying program. She explicitly asked to remain anonymous about her concern. She was fearful that her school program might be jeopardized by more powerful administrators known to use the data system as a device to move kids into alternative education.

At California's Third Annual Equity Summit, UC Davis (Watson, 2012b), the conference provided a climate that encouraged discourse and a *critical* perspective on "*larger social inequities"* (English, 1994, p. 15). I approached one of the keynote speakers at the conference, after she emphasized in her talk that minorities are underrepresented at higher levels of administration in the state of California. I briefly explained this research effort and she said to me, "Tell me a little about your study and what did you find?" I explained that I had asked questions of interviewees based on Starratt's (1994) thesis on *caring*, *justice,* and *critique,* and I said that I contend that all three constructs must work together to find *social justice*. I told her that alternative education students including incarcerated students had been the focus of the study. I explained that everyone interviewed seemed comfortable talking about *caring* for students in any context – libertarian, conservative, liberal, or progressive – and that everyone seemed to agree that *justice* or fairness, in terms of due process, was also important. When I mentioned that in my view, *critique* was absent or seemed to be discouraged and therefore *social justice* was discouraged, she quickly said, *"Nobody in educational administration wants to use* critique*, -Talk about critical issues!"* We both smiled and seemed to agree.

I sent an e-mail with a proposed quote. I was thanked for checking on accuracy, and it was clear from the response that the speaker needed to remain anonymous. As was the case with this Equity Summit speaker, all of the interviewees in this study are public servants they are all exceedingly cautious. I asked a former colleague who works for this person in alternative education, and he said, "One on one, a great person, a superintendent must play politics and image 95 % of the time." With our current political climate where powerful corporate interests and ALEC now undermine public education, and public servants in general, the advocates for *libertarianism* and the privatization of schools (Apple, 2001; Swalwell & Apple, 2011) in my view discourage any public pronouncements that might fit with Starratt's ethical *critique* questions. In the American postmodern world, I've noted that some political media outlets define *critique* – critical analysis – as "class warfare" and are dismissive of it.

According to studies, the typical school option for "at-risk" youth is a public alternative school, sometimes a prison school. Has the underlying political power shift in America toward *libertarianism* and the privatization of schools locked out opportunities for "at-risk" youth? Many *street-level bureaucrats* and some alternative schools work wonders against the odds (see JCCASAC), and other educators outside K-12 education for "at-risk" youth are leading the way (Watson, 2012a, b). In this study, a State of California Alternative Education consultant helps individual youth through counseling on his own time (Sackheim, 2009), and a new associate superintendent in Fresno (Tanner-McBrien & Tracz, 2011) has reduced the numbers of foster youth from being expelled. All have probably saved lives. I think ethical *street-level bureaucracy* is analogous to the work of Oskar Schindler in Poland during World War II. The question is as follows: Is this enough with America's extreme incarceration rates and the school-to-prison pipeline? Can the leadership imperatives as shown in the framework for this study (English, 1994; Rawls, 1971) be met? My conclusion is that when public school leaders are *silenced* and must resort to *street-level bureaucracy* to help overcome injustice, rather than feeling empowered to use dialogic discovery (Shields, 2004), then *social justice* becomes severely curtailed and is difficult to find.

Recognitions

This qualitative research project truly represents the spirit of "grounded theory" as the interviewees and others participated throughout. Each read drafts throughout and approved them before the final draft was submitted. My perceptions and choice of quotes were commented on, discussed, criticized, and eventually agreed on collectively by interviewees and other participants.

I want to thank Dr. Ira Bogotch, former dissertation cochair, for contacting me about this project, and Dr. Caroline Cody, dissertation cochair, for her help to pull the final draft together. I also want to thank Dr. Lynn Beck, University of the Pacific, and Dr. Fran Chadwick, CA State University, San Marcos, for their encouragement, criticisms, and insight as I moved through a process of conceptualization and writing. I also want to thank the CRESS Center for California's Third Annual Equity Summit – *Equity, Education & Incarceration: What is California's Future*? March 24, 2012, UC Davis, School of Education. This summit provided me with thoughtful information and numerous opportunities for reflection and reanalysis of this research.

Finally, I want to thank the interviewees for their encouragement and willingness to reread drafts and make comments about the use of their quotes as I moved forward with revised iterations. I want to mention three interviewees by name: (1st) Mr. Dan Sackheim, Consultant, California Department of Education; (2nd) Mr. Paul Jacobs, Consultant, California Department of Education; and (3rd) Dr. Tanner-McBrien for her interview and for sharing insights about her dissertation with me. Other interviewees read earlier drafts and participated throughout but chose not to be mentioned.

Chapter 39
Living with the Legacy of Conquest and Culture: Social Justice Leadership in Education and the Indigenous Peoples of Australia and America

Bronwyn Fredericks, Priscilla Maynor, Nereda White, Fenwick W. English, and Lisa Catherine Ehrich

Introduction

Through the process of colonization, Indigenous peoples throughout the world witnessed the imposition of British and European worldviews, languages, legal and social structures, and lifestyle: in fact, over all areas of life. By means of domination and oppression, it also imposed derogatory labels on Indigenous peoples such as "uncivilized," "inferior," and "immoral" (Henderson, 2000; Memmi, 1967). Through language usage and colonial processes, the British and the Europeans were imbued with a spurious sense of superiority over the rest of the world (Henderson, 2000; Sawchuck, 1992) resulting in a discourse in which Aboriginal Australians and Native American Indians became the "Other." Everything and everyone else in this process became subordinate to Britain and Europe: culturally, economically, and politically. This was repeated through exclusionary language and privileging difference.

In the making of modern Australia and the USA, Indigenous peoples have survived the most inhumane acts and violations against them, and despite acts of genocide, Aboriginal Australians and Native Americans have survived. It is the historical process of colonization that binds and connects Australian Aboriginal peoples in the same way as it does for Native Americans in the USA. Colonization and ongoing struggles are entrenched within Indigenous people's lives in both countries. The experiences and stories that are shared through the generations demonstrate that the legacy of colonization is still part of the everyday reality for thousands of Indigenous people. The impact of the past 500 years cannot be separated from understandings of education for Native Americans in the same way that the impact of the past 220 years cannot be separated from the understandings of Australian Aboriginal people's experiences of education. Indigenous people in other geographic areas of the world also have their own experiences of education and are linked through a larger project of conquest, imperialism, and colonialism (e.g., people in Mexico, parts of South America and Africa along with Canada, New Zealand, and other areas). This chapter, though, is specifically about comparisons in Aboriginal and Native American communities and their collision with the dominant, white European settlers who came to Australia and America. Moreover, it will highlight important leadership considerations in education in these contemporary times.

Noam Chomsky (1987) once remarked that if one took two historical events and compared them for similarities and differences, you would find both. The real test was whether on the similarities they were significant. The position of the coauthors of this chapter is in the affirmative and we take this occasion to lay them out for analysis and review. The chapter begins with a discussion of the historical legacy of oppression and colonization impacting upon Indigenous peoples in Australia and in the USA, followed by a discussion of the plight of Indigenous children in a specific state in America. Through the lens of *social justice*, we then examine those issues and attitudes that continue to subjugate Indigenous peoples in the economic and educational systems of both nations. The final part of the chapter identifies some implications for school leadership. It is important to note that with reference to the Australian story, the term "Indigenous" will be used to refer to two Indigenous groups, Australian Aboriginal people who have never ceded sovereignty over the Australian mainland and the Torres Strait Islander people who maintain their sovereignty in the islands between the northern tip of Australia and Papua New Guinea. These groups have separate and distinct histories and cultures and many Torres Strait Islanders now live in mainland Australia. The following section will relate mostly to Australian Aboriginal people.

Historical Legacy of Oppression and Colonization in Australia

Prior to 1788, Aboriginal people had a generally good lifestyle and health status (Saggers & Gray, 1991). Indeed, Thomson claims that when Australia was invaded by the British in 1788, Aboriginal people were "physically, socially and emotionally healthier than most Europeans of that time" (Thomson, 1984, p. 939). Aboriginal people lived in family and clan groups within clearly defined borders. The Aboriginal map of Australia (Horton, 1999) provides some indication of the boundaries of the various Aboriginal nations that had occupied the continent before the coming of the "white men." There were over 250–300 different languages spoken with approximately 600–700 dialects (Australian Institute of Aboriginal and Torres Strait Islander Studies [AIATSIS], 1994). Life was framed around complex spiritual, kinship, and social systems that ensured that each individual knew his or her place in the group, the rules for living, and their relationship with each other, the birds and animals, and the environment. For Aboriginal people who occupied mainland Australia and the nearby islands, this framework would have been known by numerous names dependent on the language of the speaker. The Pitjantjatjara desert peoples call it Tjukurrpa, the people in the Kimberley region refer to it as Ngarrankrni, and the Anmatyerre from the Northern Territory know it as the Altyerre. In contemporary Australia, it has more commonly been referred to as "The Dreaming."

Although numerous groups of "explorers" had ventured to Australian shores and the Aboriginal people of North Australia had had many years of contact and trade with the Macassans, English seaman James Cook claimed "discovery" in 1770 and annexed the land for Britain under the claim of terra nullius (meaning empty land) (Blainey, 1994). This critical act set the scene for the denial of Aboriginal land, the first act of injustice, and the struggle for human rights. The first "settlers" arrived in 1788 and began their systematic occupation of the country that had previously been the home of Aboriginal people for at least 70,000 or more years (Naik, 2011).

When the British invaded their land, life for Aboriginal people changed forever. At first some groups of Aboriginal people welcomed the newcomers as returned ancestors (due to the paleness of their skin) (Miller, 1985). However, it soon became clear that the invaders were only interested in possessing the land as a commodity for farming and the resettlement of convicts. Inevitably, clashes broke out between the colonizers and Aboriginal people due to struggles over land, Aboriginal women, and reprisals from both sides. To make way for farming, Aboriginal groups were pushed back from their traditional hunting and ceremonial grounds and camping and watering places. The introduction of hoofed animals such as sheep created squabbles when they were taken by Aboriginal people intent on feeding their families. These actions often followed violent reprisals by local farmers who massacred whole groups of men, women, and children. Aboriginal groups also sought revenge for these acts by killing shepherds and homesteaders. The frontier conflict was bloody and loss of life was extensive on both sides, but more so for Aboriginal people who lacked the weaponry of colonials. Many tribal groups were decimated by the massacres and deliberate poisoning of flour and waterholes and also because of their lack of immunity to introduced diseases such as smallpox, influenza venereal disease, typhoid, tuberculosis, pneumonia, measles, and whooping cough. As a result of the impacts of colonization, the health of Aboriginal peoples dropped from generally good to very poor (Fredericks, Adams, & Edwards, 2011; Miller, 1985).

In a move to quell the "Native uprisings" and to gain better control over the European settlements, in the late nineteenth century, government introduced

Protection laws to save what was portrayed as “a dying race” (Evans, Cronin, & Saunders, 1975). Under Protection, Aboriginal people were rounded up and herded on to areas of land termed “missions” or “reserves.” These were located far from their traditional lands and often in desolate spots far from the sight of “civilized” society. Generally the missions were run by government officials and agencies or by missionaries from different church groups, and life was extremely hard (Huggins & Huggins, 1996; National Library of Australia [NLA], 2006; Rintoul, 1993). Instead of the previously healthy diet of bush tucker, the people were given rations of salted meat, tea, sugar, flour, salt, and porridge (Mellor & Haebich, 2002; NLA, 2006; Rintoul, 1993). Housing on the missions was little more than shacks, and there was limited access to medical supplies and treatment resulting in extremely poor health and early deaths. The children were generally separated from their parents and housed in separate dormitories for boys and girls. While others were sent away to be raised in institutions such as the Cootamundra Domestic Training Home for Aboriginal Girls which was operated by the Aborigines Welfare Board from 1911 to 1968 (Bird, 1998; Haebich, 2000; Human Rights and Equal Opportunity Commission [HREOC], 1997; Mellor & Haebich, 2002).

The speaking of Aboriginal languages and cultural practices was forbidden making it difficult to pass on history, language, stories, art, dance, customs, marriage, healing, and spiritual practices (Huggins & Huggins, 1996; NLA, 2006). In some cases Aboriginal people were put in solitary confinement for speaking their language (Rintoul, 1993). All aspects of life including who married whom and when, travel on and off the mission, the type of education each person received, or the job they did were controlled and supervised by the Mission Manager and the Office of the “Protector” (Kidd, 2003; Rintoul, 1993). Aboriginal people could apply for exemptions if they were willing to embrace a European lifestyle and reject their heritage and language and not associate with any other Aboriginal people (this included family members). These exemption certificates were referred to by Aboriginal people as “dog tags” or “dog licenses.” The above-described restrictions remained in place until 1969 when Protection Boards were disbanded and the Commonwealth assumed responsibility for Indigenous affairs.

Education on the missions in most cases was provided by poorly trained teachers. Generally, Aboriginal children were not educated beyond Year 4 since it was believed that Aborigines were “inferior in intelligence.” This conclusion had previously been drawn from scientific testing including the measurement of skull size. Additionally, further education was considered a waste since most were being groomed for lives of servitude. At the age of around 13 or 14, they were also sent out to work – the girls were given placements on cattle/sheep stations or as maids in the domestic households of white families; the boys were indentured as farm laborers or as stockmen on cattle stations (Bird, 1998; HREOC, 1997; Huggins & Huggins, 1996; Mellor & Haebich, 2002). The purpose of these placements was to segregate “part-Aboriginal” children from their families and to assimilate them into the mainstream community. They were not allowed to remain in any contact with their families with all forms of communication controlled by their supervisors and “bosses.” Both white men and women were party to this form of control and subjugation of Aboriginal people. The stories recounted by Aboriginal people of their experiences tell a tale of harsh treatment and physical, emotional, and sometimes sexual abuse (Blake, 2001; Kidd, 2003).

In the majority of these situations, Aboriginal people received little or no pay. They mostly received the equivalent of pocket money and it was claimed that their major earnings were being sent back to support their families remaining on the missions under a "settlement maintenance levy" (Blake, 2001; Kidd, 2003). These wages were later determined to be "stolen" as they never reached their families and were used by the authorities to undertake development and build hospitals and other infrastructure for the general population (Blake; Kidd). These stolen wages have been the subject of class actions against governments and ongoing tensions between the descendents of past Aboriginal workers and the current governments in Australia.

This impact of "living under the Act" has had far-reaching consequences for Aboriginal people. Substantive scholarship has linked this period to the current poor positioning of Indigenous people in Australian society and the disadvantage that they face in all areas of life as well as the poor regard they experienced from the majority of Australians (Aboriginal and Torres Strait Women's Taskforce into Domestic Violence, 2000; Blake, 2001; Herbert, 2003; White, 2007). Today, Aboriginal people still recount stories of living under the Act and the discrimination and hardships they experienced (Huggins & Huggins, 1996; Mellor & Haebich 2002; NLA, 2006; Rintoul, 1993).

In 1967, the Australian people voted in a referendum to allow Aboriginal and Torres Strait Islander people citizenship entitling them to the same rights and responsibilities as other Australians (Evans et al., 1975). This historic landmark was intended to give Australia's Indigenous people the opportunities to participate more fully in Australian society. However, legally, Aboriginal people were still excluded from the Constitution and their welfare remained grossly neglected. Many Aboriginal people were living in missions that were now called reserves or communities or other names. Education remained inadequate and provided little preparation for working and living in Australian society.

However, from the 1970s in line with the international focus on multiculturalism, there were initiatives introduced to encourage greater participation by Indigenous people at all levels of education. These included the establishment of university-based student support centers or enclaves, the introduction of Indigenous financial support payments called "Abstudy" which was designed to assist with the financial costs of studying at secondary and tertiary levels (similar to other forms of financial assistance available to other Australian students), and various parent and community engagement programs. In 1991, the *National Aboriginal and Torres Strait Islander Education Policy* (NATSIEP) (MCEETYA) (1995) was endorsed by federal, state, and territorial governments. The NATSIEP provided some measure of success in addressing the educational disadvantage through its 21 goals and strategies directly focused on improving access, participation, and educational outcomes for Indigenous students. It not only focused on curriculum but also addressed issues of teacher training, the employment and training of Indigenous teachers and workers, and participation of Indigenous people including parents in educational decision making. However, despite all of these introduced measures, there is little evidence to demonstrate that over the past 20 years, there has been significant change in the educational achievements of Indigenous students when compared with non-Indigenous students (see also Greer and Dempster in Chap. 23, this volume). This has also been witnessed in other parts of the world. It is to America to which this chapter will now turn to understand the experiences of Indigenous people in the USA.

Historical Legacy of Oppression and Colonization in the USA

In the Americas (North, Central, and South), there had been a 500-year period of violent confrontation with Indigenous peoples beginning with the voyage of Christopher Columbus who "discovered" the "New World" in 1492. As Thornton (1987) observed, this "fact" is wrong since "the Vikings had preceded him by 500 years" and "the first human beings to arrive—the ancestors of the American Indians, Eskimos, and Aleuts living on the continent when Columbus arrived—had preceded him by thousands and thousands of years" (Thornton, p. xv).

The devastation which occurred was nothing less than a holocaust for Indigenous people. The first that consumed North American Indians were the fevers brought on by newly encountered disease, the flashes of settlers' and soldiers' guns, the ravages of "firewater," and the flames of villages and fields burned by the scorched-earth policy of vengeful Euro-Americans. The effect of this holocaust of North American Indians like that of the Jews was millions of deaths. In fact, the holocaust of the North American tribes was, in a way, even more destructive than that of the Jews, since many American Indian peoples became extinct (Thornton, 1987, pp. xv–xvi).

Perhaps the most often recorded clashes between Euro-Americans and the Indigenous people of the USA were with the plains Indians, many of whom had domesticated horses left by the Spanish Conquistadors. These tribes (Nez Perce, Cheyenne, Sioux, Assiniboine, Plains Cree, Arapaho, Kiowa, and Comanche (McNab, 2010, p. 89)) had developed into a full-blown horse warrior cultures replete with modern guns obtained through trade or battle (Donovan, 2008). The ferocity of these pitched battles between the ever-encroaching white settlers on Indian lands and the resistance of those warrior cultures to that infiltration was as savage and pitiless as any modern battle in the twentieth century. The Indians were fighting for their land, their culture, and their very survival. Mercy was in short supply. Both sides took part in ambushes and peace treaty talk, in fact hundreds of them, most of which were soon broken by the US government. Women and children were routinely slaughtered on both sides with the unfortunate remark by US Army General Philip Sheridan that "The only good Indians I ever saw were dead" and which later became the infamous slogan, "The only good Indian is a dead Indian" (Donovan, p. 18).

Of the many wars between the Indians and whites, only one was ever won by the Indians, and the peace that followed proved to be short (Donovan, 2008, p. 28). These violent clashes, the stuff of Hollywood film lore for decades, rarely showed how one-sided it really was:

> As the Iroquois, the Shawnee, and the Arapaho would eventually all discover, the white man's superior technology, hunger for land, and ethnocentrism seemingly knew no bounds. The white threat to Indians came in many forms: smallpox, missionaries, Conestoga wagons, barbed wire, and smoking locomotives. And in the end, it came in the form of schools. (Adams, 1995, p. 5)

As with Indigenous children in Australia, the education of Native American children by white authorities was first performed by Christian missionaries near Indian reservations. Reservations were places of land earmarked for the resettlement of Native Americans so their hunting lands could be confiscated by white settlers for farming or mining. In 1870, the US Congress officially budgeted funds for education of Indians through the Office of Indian Affairs (Perdue & Green, 2010). However, these were only partially successful until a former Army officer, Richard Henry Pratt, opened the first off-reservation Indian boarding school in Carlisle, Pennsylvania. Pratt's motto for Indian education, which became the official "philosophy" for all 88 boarding schools by 1901, was a chilling "Kill the Indian, save the man" (Perdue & Green, p. 82). The horrors of the boarding school experience have recently surfaced in many books with titles such as *Education for Extinction* (Adams, 1995), *Genocide of the Mind* (Moore, 2003), and *Kill the Indian, Save the Man* (Churchill, 2004).

Five generations of Native Americans (1880–1980) endured the boarding school experience where tribal customs, language, and culture were ruthlessly attacked and conscious attempts made to erase their cultural heritage and language. Coleman (1993) quotes Indian Commissioner Thomas Morgan on the approach:

> It is of prime importance that a fervent patriotism be awakened in [the children's] minds… They should be taught to look upon America as their home and the United States government as their friend and benefactor…They should hear little or nothing of the 'wrongs [done] to the Indians,' and of the injustice of the white race. If their unhappy history is alluded to it should be to contrast it with the better future that is within their grasp. (p. x)

Young people in the boarding schools were subjected to their captors' "discipline" which included outright torture as well as sexual predation. As George Tinker, a descendent of the Osage Nation (2004), observes, "At some [boarding schools] it appears that every student, without exception, was raped, many of them regularly, over periods of years" (p. xviii). A report completed in for the time period 1933–1945 and which involved visitations of 64 of the then 78 boarding schools found that "the federal government neglected to provide Native children with even the most basic necessities in schools where they resided. The survey staff discovered that the average per capita food allowance in government schools amounted to 11 cents a day, and children suffered from malnutrition and actual shortages of food" (Child, 1998, p. 32).

What emerged as a consequence of the off-reservation boarding school was that about half of the children forced to attend them did not physically survive their experience (Tinker, 2004, p. xviii). The remainder developed a syndrome of problems which were "a complex and intractable blend of devastated self-concept and self-esteem, psychic numbness, chronic anxiety, insecurity and depression" which "goes far towards accounting for the endemic alcoholism, catastrophic suicide rates, pervasive domestic violence and a host of related maladies with which Native

North America has been afflicted, in some ways increasingly so, for the past century or more" (Tinker, p. xix). These indeed are the equivalent of America's "lost generations" though there never has been an apology by any US President to them for an official genocide-specific policy defined and funded by the US government over the decades.

This lies in contrast to a recent event in Australian history when Kevin Rudd (2008), the then Prime Minister of Australia in 2008, apologized to the nation's Indigenous peoples for the Commonwealth's discriminatory policy of forcibly removing Aboriginal children from their families and placing them in state care (HREOC, 1997). The Apology to the "Stolen Generations" was acknowledged by many Indigenous and non-Indigenous Australians (but not all) as an important step in healing and reconciliation (see Behrendt, 2008; Fredericks, 2010a; Gunstone, 2007; Hollinsworth, 2007; Manne, 2001).

Historically, then, there have been parallels in the treatment of Indigenous peoples by respective US and Australian governments. In 1819, the US government assumed the formal responsibility of educating Native Americans as US subjects. In 1873 the duties of Indian education were shifted from the War Department to the Department of the Interior. The actual objective of Indian education was to erase the effect of their culture and to assimilate them into the mainstream.

According to Lomawaima (1999), the pillars of education for Native Americans were predicated on four tenets: (1) Indians were savages who had to be tamed, that is, "civilized"; (2) "civilization" required conversion to Christianity; (3) Indian cities or settlements had to be broken up and resettled to further break the strength of the hold of a "savage culture"; and (4) Indians had mental, moral, physical, and cultural "deficiencies" that made certain pedagogical methods mandatory for their education (p. 3).

The school curriculum for Native Americans was based on the tenets that they were "savages" of limited ability and intelligence and therefore required academic subjects to be taught via manual training. Indians learned to speak English by doing chores. "History became…a lesson about racial progress…Teachers unfavorably compared the Indian past to contemporary Euro-American culture" (Perdue & Green, 2010, p. 84). Girls were trained to become cooks and nurses and "to return to their communities, marry educated men, and become role models for other Native women" (Perdue & Green, p. 85).

Education policies consisted of replacing the use of Native languages with English, destroying Native American customs, and teaching allegiance to the US government (Spring, 2001, p. 28). Boarding schools became the tool for accomplishing this, and through boarding schools experiences, generations of American Indian children separated from their parents, extended families, and tribal communities lost exposure to traditional Native cultures, languages, and values (Butterfield & Pepper, 1991; Demmert, 2001; Deyhle & Swisher, 1997; Lomawaima, 1999).

The American government's strategy of erasing Indian culture was disastrous to Native Americans. In the report titled *The Problem of Indian Administration* (Institute of Government Research) also known as the *Meriam Report* (1928) (Institute of Government Research), the specific failures of educating Native

Americans were identified. One of the causes was not only that Indians were specifically excluded from managing their own affairs but that they were receiving a very poor quality of both education and health services. Still, not much changed after this report for nearly 70 years later, the United States Senate (1969) released a report called *Indian Education: A National Tragedy—A National Challenge.* This report was a blistering condemnation of government policies:

> At the heart of the matter, educationally at least, is the relationship between the Indian community and the public school and the general powerlessness that the Indian feels in regard to the education of his children. This relationship frequently demeans Indians, destroys their self-respect and self-confidence, develops or encourages apathy and a sense of alienation from the educational process, and deprives them of an opportunity to develop the ability and experience to control their own affairs through participation in effective local government. (p. 24)

To this day, some 40 years later, the condemnations and shortcomings of education for Native Americans in the USA remain a continuing legend of cultural marginalization (see Maynor, 2011). In the words of Agoyo (cited in Sando & Agoyo, 2005), a Tewa Native American in New Mexico:

> As I stand and look back years away from that time, I have come to the conclusion that it was not the lack of substantial educational opportunities that was most detrimental; rather, it was the fact that all that schooling taught me many things of the world but nothing of myself or my people and our history. I learned about the causes of the American Revolutionary War and all the wars between then and now. I learned about Plato, ancient Greece, and the rise and fall of the Roman Empire, but not one word was ever spoken of the great leader of the Pueblo Revolt of 1680, Po'pay. In fact, even the Pueblo Revolt itself has been merely a footnote in most history. (p. xii)

The next section considers the specifics of the educational disadvantages faced by Indigenous students in both countries, starting with Australia.

Educational Disadvantage and Indigenous Students in Australia

In 2007, the Close the Gap Coalition presented the Australian government and the major political party in Opposition with a set of National Indigenous Health Equality Targets to address the 17-year life expectancy gap between Indigenous and non-Indigenous Australians (National Aboriginal Community Controlled Health Organisation and Oxfam, 2007). The Close the Gap campaign called on Australian governments to take action to achieve health equality for Aboriginal and Torres Strait Islander peoples. The Coalition of Australian Governments (COAG) launched a Close the Gap campaign in March 2008. It was the first time a coordinated, multi-sector strategic approach was put forward to addressing the poor health and disadvantages experienced by Indigenous Australians. The COAG documents coupled with the NACCO and Oxfam document require a commitment across all levels of government to address the inequities and work toward "Closing the Gap." The expression "Close the Gap" has now come to be used in the Indigenous policy discourse to refer to the need to redress the disparity in health, employment, housing, community safety and security, justice, community development, training and education outcomes, and many other areas that influence the health and well-being of Indigenous peoples (Fredericks, Lee, Adams, & Mahoney, 2011). However, despite the efforts and billions of dollars focusing on improving the status of Indigenous Australians, the Overcoming Indigenous Disadvantage Key Indicators 2011 (Steering Committee for the Review of Government Service Provision (SCRGSP)) continues to reflect the disadvantages that limit Indigenous opportunities and choices. Across virtually all indicators in this report, there are wide gaps in outcomes between Indigenous and other Australians. The report shows that the challenge is not impossible – in a few areas, the gaps are narrowing. However, many indicators show that outcomes are not improving, and that some are even deteriorating. There is still a considerable way to go to achieve the Council of Australian Governments' (COAG) commitment to Closing the Gap in Indigenous disadvantage (HREOC 2008).

The report (Steering Committee for the Review of Government Service Provision [SCRGSP], 2011) found that outcomes have improved in several areas. In those jurisdictions with long-term data, the mortality rate for Indigenous people declined by 27 % between 1991 and 2009, leading to a narrowing (but not closing) of the gap with non-Indigenous people in those jurisdictions. Indigenous young child (0–4 years) and infant (0–12 months) mortality rates declined by over 45 % between 1991 and 2009 (for Western Australia, South Australia, and the Northern Territory). More Indigenous people are home owners, and Indigenous people are achieving better outcomes in post-secondary education with approximately 10,000 Indigenous students enrolled in universities across the country (SCRGSP). Both employment and income have also improved. However, it was noted that outcomes in these areas have also improved for non-Indigenous people, leading to little or no closing of the gaps. In other areas, there has been little change in literacy and numeracy and most health indicators and overcrowding in housing has not improved. Of serious concern is that the rates of child abuse and neglect substantiations and adult imprisonments have increased for Indigenous people. There has been some improvement in juvenile detention rates (SCRGSP).

Some of the specific illustrations of the disparity between Indigenous and non-Indigenous Australians in regard to educational outcomes are included below:

- Indigenous students are less likely to have achieved the Year 7 and Year 9 reading, writing, and numeracy minimum standards (in 2009, 20–30 % points lower than for non-Indigenous students).
- Indigenous students are far less likely to remain in school to Year 12 with a retention rate of 45 % compared to 77 % for non-Indigenous Australians.
- Indigenous students are less likely to be studying for a qualification than all young people (41 % compared with 58 % for 15–24-year-olds in 2008).
- Indigenous students are almost half as likely as all young people aged 18–24 years to be participating fully in education or employment (40 % compared to 77 %).
- Indigenous students are twice as likely to be unemployed as all young people aged 15–24 (26.5 and 11.5 %).

(Australian Institute of Health and Welfare, 2011, pp. 128–134)

In 2008, the Council of Australian Governments agreed to a set of six targets to close the gap and reduce disadvantage among Indigenous Australians. These are:

- Closing the life expectancy gap within a generation
- Halving the gap in mortality rates for Indigenous children within a decade
- Ensuring all Indigenous 4-year-olds in remote communities have access to early childhood education within 5 years
- Halving the gap for Indigenous students in reading, writing, and numeracy within a decade
- Halving the gap for Indigenous children in Year 12 attainment
- Halving the gap in employment levels within a decade

(COAG, 2009)

What the above demonstrates is that there has been a long history of failed government policies and practices that have led to little improvements in the life chances of Indigenous children (see also Greer and Dempster in Chap. 23, in this volume). The next section considers educational disadvantage faced by Native American students in the USA.

Educational Disadvantage and Native American Students

In the USA, there are 562 tribes federally recognized as sovereign nations, both legally and politically. Many other Indigenous communities are identified tribes or tribal entities by their respective states. According to the US Census, 2000,[1] a total of 4.3 million US citizens identified themselves as having American Indian and Alaska Native ancestry. The National Center for Education Statistics (2005) reported that 624,000 American Indian and Alaska Native students are educated in the nation's K-12 system. The majority of these students attend public schools while approximately 7 % attend schools administered by the US Bureau of Indian Education (BIE). In both educational settings, educational outcomes for American Indian students are inadequate, which negatively impacts Native communities culturally, socially, and economically. American Indian students drop out of high school in unprecedented numbers in comparison to their peers. The high school completion rate for Native Americans was 54 % compared to a national rate of 72 and 78.4 % for white students in 2008 (Diplomas Count, 2011). Other disparities in educational outcome include:

---

[1] "American Indian," as defined by the US Census, is a person having origins in any of the original peoples of North and South America and who maintain tribal affiliation or community attachment. The terms *American Indian* and *Native American* are used interchangeably to avoid repetition.

The inclusion of and reference to *American Indian and Alaska Native* are based upon the unique legal relationship with Indian tribes and a special relationship with Alaska Native entities as provided in the Constitution of the USA, treaties, and federal statute.

Beginning in 2006, Bureau of Indian Affairs schools are called Bureau of Indian Education (BIE) schools.

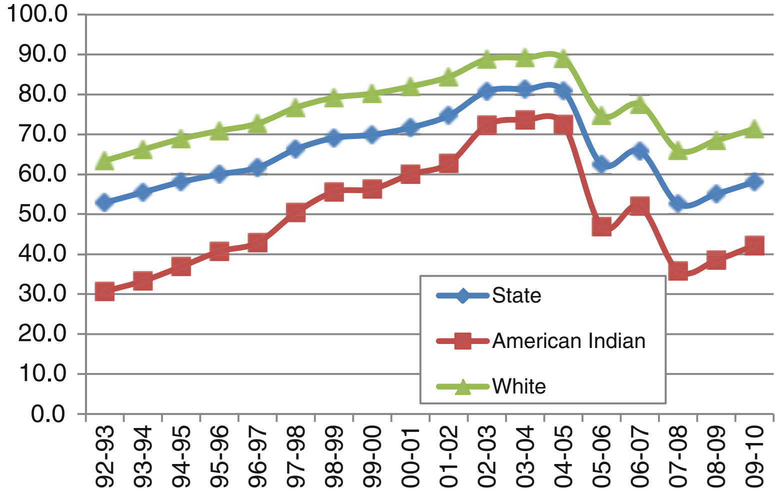

Fig. 39.1 1992–1993 to 2009–2010 End-of-Grade Test results statewide percent of students at or above Level III proficiency in both mathematics and reading, grades 3–8, for American Indian and white subgroups (Source: North Carolina Department of Public Instruction, Division of Accountability Services)

- Significantly lower reading and math scores in grades 4 and 8 for American Indian and Alaska Native students in comparison to non-Native students (National Center for Education Statistics, 2009).
- Higher percentages of American Indians and Alaska Natives receive special education services in comparison to their non-Native peers.
- Fewer American Indians and Alaska Native students participate in the Advanced Placement exams.

The greatest threat to Native communities' culture, language, and identity, however, is the social indicators such as poverty, suicide, teen birth, and substance abuse rates for Native Americans which exceed the national average.

An Illustration of Educational Disadvantage: The Case of North Carolina

The educational outcomes for American Indian students in North Carolina mirror the national trends and statistics. For the past 18 years, American Indians in North Carolina have consistently scored below the state and white student populations. Figure 39.1 illustrates this pattern as reflected in the statewide percent of students at or above Level III proficiency in both reading and mathematics, 1992–1993 to 2009–2010.

Maynor (2011) further explored the academic proficiency for a cohort of American Indian students, specifically those from economically disadvantaged backgrounds, entering third grade in 1998 and examined their progression through the state's public schools through 2007. The examination included a look at the college retention for those in the cohort entering a higher education institution in the state's public university system following graduation from high school. Findings clearly indicate that public schools in North Carolina have not made a positive, significant difference in the educational achievement patterns in reading, math, and high school. American Indian students from economically disadvantaged backgrounds faired the worst. American Indian students who were from lower socioeconomic backgrounds tended to be non-proficient at a higher rate than those who were from higher socioeconomic backgrounds. The density of a school district in terms of the percentage of American Indian students it enrolled made little difference in the proficiency of the lower socioeconomic students in attendance. Without question, the examination of North Carolina's proficiency patterns for the state's American Indian students clearly illustrates the reproduction of educational inequalities.

To describe this occurrence, Maynor (2011) used Bourdieu's (1984) concept of *habitus* to explain how individuals internalize their objective chances of succeeding based on their economic and cultural background, as well as what is common for their social class. School "reinforces rather than redistributes the unequal distribution of cultural capital" (Swartz, 1997, p. 191) and "deflects attention from and contributes to the misrecognition of its social reproduction function" (p. 191). Schools "privilege certain cultural heritages" (Swartz, p. 199) and exclude others, such as in this case the cultural values of American Indians. Instead, the cultural values of middle-class families are accepted and rewarded by schools. Because most American Indian students often come from lower income backgrounds, they are placed at a disadvantage. Middle-class families tend to employ resources and capital to improve their students' academic trajectories. However, lower-status American Indian families lack the cultural capital or resources to pursue such options.

Success in school, as Bourdieu (1994) argues, is determined by the amount and type of cultural capital inherited from families rather than by measures of individual talent or achievement. This strongly implies American Indian students from more privileged home environments have acquired throughout their childhood patterns of thought and behaviors consistent with the dominant values schools expect. To the contrary, American Indian students from disadvantaged backgrounds, as Maynor concluded, start with a disadvantage that contributed to higher rates of non-proficiency.

The results in Figs. 39.2 and 39.3 illustrate that from 1998 to 2007 American Indian students from higher socioeconomic backgrounds consistently reflected greater mean proficiencies than students of lower socioeconomic backgrounds. Lower enrollments in the last year of high school led to the only exception in the pattern, which show greater proficiency for lower socioeconomic status (SES) students. Overall, the proficiency of lower-SES students is significantly lower than those of higher SES and suggests that Bourdieu's theoretical framework of *habitus* is

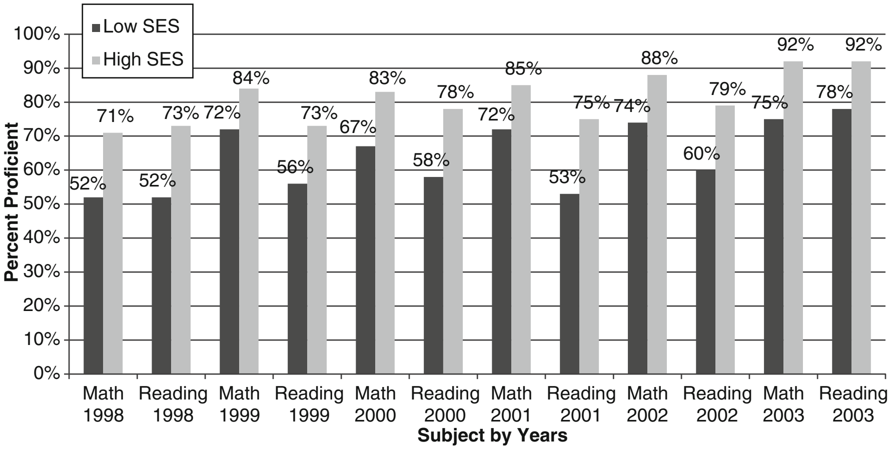

Fig. 39.2 Percent proficiency on math and reading for American Indian students 1998–2003 for low vs. high SES

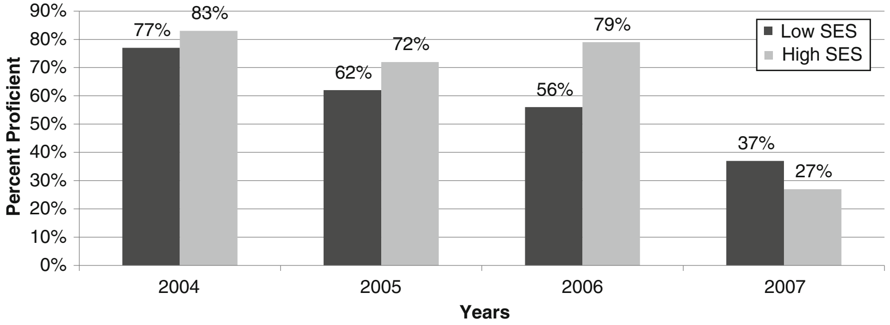

Fig. 39.3 Percent proficiency of high-school American Indian students 2004–2007 for low vs. high SES

supported, that is, "the habitus is the source of 'objective' practices, but is itself a set of 'subjective' generative principles produced by the 'objective' patterns of social life" (Jenkins, 2002, p. 82). As hypothesized, higher-SES American Indian students showed higher rates of academic proficiency on standardized math, reading, and high-school assessments than students from lower-SES backgrounds.

Socioeconomic status is defined by a student's eligibility for free or for a reduced lunch (FRL) in the National School Lunch Program and is used as the indicator for economic disadvantaged. The eligibility status is often used as a proxy for a student's socioeconomic status. Students from families with incomes at or below 130 % of the poverty level are eligible for free meals, and those with incomes between 130 and 185 % of the poverty level are eligible for reduced-price meals (Siren, 2005). Eligibility for school-lunch programs is one of the most

Table 39.1 Chi-square test on freshman retention in institutions of the UNC System

Variable	Retained in Year 2	Not retained in Year 2	Total	χ^2	p
				4.53	0.030
American Indian students	195 (73.3)	71 (26.6)	266 (100)		
Non-American Indian students	18,458 (81.9)	4,051 (18.1)	22,509 (100)		

Note: df = 1, values in parenthesis are percentages

commonly used SES measures in the current literature on academic achievement (Siren) which is why we have also used it within this chapter.

Additional supporting evidence, according to Maynor (2011), reflects a significant difference in the freshman retention rates of American Indians compared to their peers. American Indian students enrolled in North Carolina's public university system as freshman following graduation from high school experienced a lower reenrollment rate than non-American Indian students. According to University of North Carolina records, a total of 22,775 students entered the university system. The total number of students who identified as American Indian were 266. Eighty-two percent of the non-American Indian student population returned for a second year in fall 2008. As Table 39.1 shows, the percentage of American Indian students returning was 73.3 (195 out of the 266 American Indian students). This reveals a dropout rate of 27 % compared to 18 % for non-American Indian students. The percentage of non-American Indian students returning was 82 %.

When modeled alone, SES and percent proficient were both significant predictors of freshman retention, meaning that as the students tended toward high SES or proficiency, they were more likely to be retained. Density was not a significant predictor of freshman retention. When the significant, independent variables were entered as simultaneous predictors, the only variable found to be significant was SES. As the students tended toward high SES, they were more likely to be retained. Therefore, SES and proficiency were both significant predictors of freshman retention. However, SES was the strongest predictor of freshman retention for American Indian students.

The aforementioned discussion has highlighted the disparities in educational achievement between Native American Indian students and non-Native American Indian students. It also raises a question about the effectiveness of education reforms in improving Native American and Alaska Native education. With the passage of the Indian Education Act, by the late twentieth century, American Indians were granted authority to engage more in the education process.

Since this time, some progress was made but is credited to the persistence of American Indian educators and parents continually fighting for equal access to education and proper federal support for programs to meet the unique cultural needs of American Indian students. In the midst of governmental reform initiatives and discourse, the Native American voice is marginalized, if not unnoticed. Brayboy and Castagno (2009) explain by stating that education, like in the past, is "framed and lived within a framework where larger assimilative forces and local, Indigenous forces are engaging in a "battle for power"" (p. 32). The present "battle for power" confronting Native Americans, albeit less overt than practices of the past, are assimilative processes masked as accountability, standardized testing, and a recent movement toward common core standards.

For example, the most notable federal education reform initiative in the USA, *No Child Left Behind Act of 2001-Public Law 107–110* (NCLB), is lauded for its noble intent of ensuring all American students regardless of race, ethnicity, or income achieve at high standards. Yet, NCLB has not succeeded. The policy has received significant criticism from Native communities and opponents who argue it has negatively impacted Native American children and educators and presents little evidence of significant differences in the instructional practices and education achievement for Native students (Beaulieu, 2008; McCarty, 2008; Watanabe, 2008; Winstead, Lawrence, Brantmeier, & Frey, 2008). According to Beaulieu, the reform has served to "diminish almost entirely the role of Native languages and cultures in schools with Native students and to revert federal Indian education policy to a time prior to the Meriam Report 1928" (p. 32). Similar sentiment emerged from Native American communities in eleven hearings convened across the USA:

> Upon the enactment of the Federal No Child Left Behind Act, parents and tribal leaders breathed a sigh of relief that finally someone will notice what is happening to our children. We applauded the attempt at system accountability. All of a sudden, school administrators; teachers and state education agencies were recognizing the serious state of neglect in the education of our Indian children. On the surface, the goal of the No Child Left Behind seemed a worthy one. Unfortunately, the approach dictated by the law has created serious negative consequences. Instead, it has become our children who are being held accountable for something that is out of their control. Schools are sending the message that, if our children would just work harder, they would succeed without recognizing their own system failures. Indian children are internalizing the system failures as their personal failure. Their rights exuberating the shame and guilt.

In 2011, the current US Secretary of Education, Arne Duncan, described NCLB as "far too punitive, far too prescriptive, and filled with perverse incentives" (Meckler and Banchero. A2).

Implications of Unequal Cultural Capital for Indigenous Australians and American Indian Students

The historical context of Indigenous Australians and American Indians and their educational experience is an unquestionable tragic story of how dominant cultures and dominant government policies have led to the destruction of traditional ways of life. Under the cloak of imperialism, colonization, and progress by either colonial rule, governments, or secular or religious agencies, in both overt and covert ways, Indigenous peoples from both nations were forced to marginalize or erase their cultural ways of being for those of the dominant culture. The motive underlying the powerful resistance experienced by Native Americans, from the past and present, comes from the demands of the respective education systems to maintain the preexisting social order, that is, the unequal distribution of cultural capital between students. Those with more cultural capital in terms of economic, social, and political resources have the advantage of shaping the values, ways of thinking, and practices of the social world. They define and control the official histories that support their dominant practices that, in turn, are circulated and repeated with authority and are practiced and embodied in the social consciousness of all. Institutions such as government, education, and other bureaucracies are at the dominant group's disposal to "mold mental structures and [impose] common principles of vision and division" (Bourdieu, 1994, as cited in Webb, Schirato, & Danaher, 2002, p. 92). It is the culture of the dominant group that is embodied in education institutions.

This is not dissimilar to what happens in Australia (and indeed other parts of the world). In other words, by imposing meanings and ways of thinking and acting, schools "operate to perpetuate specific power relations as they unfold and are expressed in the dynamic of social evolution" (Grenfell, 2008, p. 159). In Australia, the "colonizer/settler-colonized" relationships are also reproduced over and over again through symbolism, metaphors and practices in society, behaviors of regard and disregard, word choices, and through the media and also within schools. By maintaining the status quo, the dominant group benefits from the profitability of capital accumulation and sustained positions of social privilege while subordinated groups endure continual symbolic violence and suffering. In questioning Indigenous people risk being perceived as aggressive, undeserving, and ungrateful.

The notion of *habitus* further explains the complicity. For Bourdieu, "habitus is a cultural agent before it is a social form of identity" (Webb et al., 2002, p. 117). Emerging from early socialization experiences and restructured through interactions with the social world, habitus "sets structural limits for action" while also "generating perceptions, aspirations and practices that are consistent with the conditions under which it was produced" (Swartz, 1997, p. 103). Thus, *habitus* is a product of early socialization experiences, particularly those that occur within a family, and continues to restructure itself by what an individual encounters in the outside world. As Mills (2008) states, it forms individuals' dispositions and "recurring patterns of social outlook—the beliefs, values, conduct, speech, dress and manners that are inculcated by everyday experiences within the family, the peer group and the school" (p. 100).

Dispositions that make up *habitus* reflect the social context in which they were acquired and, therefore, shape what the person perceives as reasonable or unreasonable, likely or unlikely, natural or unthinkable for them. Individuals become predisposed to adjust their aspirations and expectations accordingly. As Bourdieu explained, "agents shape their aspirations according to concrete indices of the accessible and the inaccessible, of what is and is not for us" (Swartz, 1997, p. 107). Consequently, individuals tend to naturally move toward those positions that best match their dispositions and, in turn, avoid those that conflict. In projecting the future that fits them and acting accordingly, individuals accept their social reality as the way things are. They "accept their fate and misrecognize the arbitrary for the essential" (Grenfell, 2008, p. 59).

Cultural differences, according to Deyhle and Swisher (1997), “intertwine with socio-structural factors to create an educational context that ensures failure for many American Indian students” (p. 163). The same could be said of Indigenous Australian students and possibly other Indigenous peoples, for example, Maori in New Zealand, Native Hawaiians, and First Nations people in Canada. The work undertaken by Bishop (2008) in New Zealand on structures within schools provides a strong evidence base. We know there are some Indigenous students who do succeed by choosing to alter their behavior while interacting with and within the education system and the rules that have been applied by the dominant culture. This does not mean they alter their behavior in the home environment. However, others may have difficulty with this or are unwilling to and may appear to “drift through schools” or to be “disengaged from schooling,” while others do not see the value in graduating and choose to drop out and others will draw the difference between being educated about culture, people, and the world and being schooled in a classroom. By making choices of this nature and by accepting the superiority of others in the social world as natural (Henderson, 2000; Memmi, 1967) or as the way things are, American Indians and Australian Indigenous people also participate in their own subjugation and the reproduction of the social stratifications due to the nature of contemporary society.

Another way of viewing this situation is to argue that Indigenous peoples are generally asked to fit within someone else’s framework of seeing the world, including the education system that sits within that world (Henderson, 2000). Indigenous people are asked to fit into a dominant viewpoint of education and the curriculum that is contained within that education (Henderson). In this way, the dominant views and understandings are given privilege, status, and prominence in Australian and American contemporary society and override all other views and systems. Indigenous people and others are then asked to fit in with or accept these views (Fredericks, 2009, 2011; Henderson, 2000). If they do not, they risk being “uneducated” and then risk a life of poverty and limited choices. In Australia, the USA, and other places in the world, Indigenous people know what it is like to exist within learning environments which were established by denying their existence. Indigenous experiences of this denial are often topics of papers and discussion at international Indigenous conferences along with strategies to combat the denial. Schools can be places where curriculum and structures seek to continue this denial and where they attempt to assimilate Indigenous peoples.

Toward a Lens of Social Justice

In 1993, the then Aboriginal and Torres Strait Islander Social Justice Commissioner Mick Dodson lamented the long history of social injustice for Indigenous Australians and the stark reality of what for many is a daily struggle.

> Social justice is what faces you in the morning. It is awakening in a house with adequate water supply, cooking facilities and sanitation. It is the ability to nourish your children and send them to school where their education not only equips them for employment but reinforces

> their knowledge and understanding of their cultural inheritance. It is the prospect of genuine employment and good health: a life of choices and opportunity, free from discrimination. (Dodson p. 1)

There are various definitions of social justice. John Rawls (1971) observed that a consideration of justice involved "the basic structure of society, or more exactly, the way in which the major social institutions distribute fundamental rights and duties and determine the division of advantages from social cooperation" (p. 7). Rawls observed that "men [sic] born into different positions have different expectations" and that "some institutions of society favor certain starting places over others" and that "These are especially deep inequalities" (p. 7).

But with Indigenous peoples of Australia and America, there is a past history that must be confronted as well. Rawls quotes Aristotle's notion of *justice* which involves refraining from *pleonexia*, meaning "from gaining some advantage for oneself by seizing what belongs to another, his property, his reward, his office, and the like, or by denying a person that which is due to him, the fulfillment of a promise, the repayment of a debt, the showing of proper respect, etc." (p. 10). Clearly Indigenous peoples are deeply disadvantaged in ways the majoritarian poor are not. The exploration of this dilemma is one of the major concerns of this chapter.

The Role of Decolonization in Social Justice

In formulating a present and future classroom or education system, which does not reinstate the injustices and inequities of the past, certain steps are required. Sherwood (2009) says that "To take these steps requires a balance of histories, informing our current political and social context, critical reflexive practice and open communication" (p. 24) with Indigenous people. The work of Sherwood and her colleagues (Sherwood, Keach, Keenan, & Kelly, 2011) along with Battiste (1995), Rigney (1997, 2001), Smith (1999), and others assists us all in the process of learning and developing a deeper understanding of the relations between Indigenous and non-Indigenous peoples within education contexts, knowledge, and power gained through colonization. Lowman (2007) explains that the idea and process of decolonization and self-decolonization are essential for achieving peaceful and equitable relationships between settler and Indigenous peoples.

The coauthors assert that decolonization processes are ways that we can come to know ourselves and each other more. We need to know and understand how we all contribute to ongoing oppression, systemic marginalization, and institutional privilege of some over others in ways which continue to subjugate Indigenous peoples and maintain the dominating groups control through positions of power as in scripts of the past. Decolonization is not just a process for non-Indigenous peoples; both Indigenous and non-Indigenous people have been colonized through the global colonial project (Battiste, 1995; Henderson, 2000; Smith, 1999). The writings of authors from New Zealand, Canada, Africa, Central and South America, Australia and elsewhere, some of whom have already been cited provide evidence that colonization is an issue for many Indigenous people. We assert at this point that in the context of our work, it is the responsibility of non-Indigenous Americans and Australians to investigate their own subjectivities and their own societal, political, and cultural positioning in order to fully engage with Indigenous people (MacIntosh, 1998; Nicoll, 2004a, 2004b). It is about non-Indigenous people taking up the responsibility for themselves in this regard.

Moreton-Robinson (2004, 2005, 2007) contends that it is white hegemony which impacts their positioning of Indigenous peoples and this issue needs to be explored and challenged. Non-Indigenous people need to ask if they are ready for it even when they desire for this to happen. We acknowledge it can be confronting. Similarly, it is the responsibility of Indigenous people in America and Australia to do their work by examining how they are a product of the colonial project (Rigney, 1999; Sherwood, 2009; Sherwood et al., 2011; Smith, 1999). Failure to do so will maintain the countervailing voices of power and privilege between Indigenous and non-Indigenous peoples.

This brings to question the effectiveness of education reforms in making significant changes in the outcomes students experience in schools. Like many other federal education reforms preceding it, the reality is that the implementation of the American *No Child Left Behind Act of 2001* (NCLB) has not advanced educational progress for the nation's Native Americans. With this, it is safe to conclude that the entire system of changes, interventions, and other reforms schools employed in the past decades have not been effective in improving the educational outcomes for Native youth (Maynor, 2011). European American "thought, knowledge and power structures dominate present-day society" (Brayboy, 2005, p. 430).

From the perspective of Native Americans, education reforms have not worked because the dominant ideals continue to marginalize or exclude their rich cultural heritage and presence. This is additionally the case for many Indigenous Australians. So far we have described how the legacy of colonization and oppression shaped and continues to influence policy and practice which impact the life chances of Indigenous students in Australia and America. In the final part of this chapter, we consider some of the ways that educational leaders in schools might take up the challenge of working for justice and equity.

Educational Leadership for Social Justice

The field of educational leadership for social justice is concerned with exploring solutions to issues of inequality in schools (Dantley & Tillman, 2006). A variety of frameworks and theories has been put forward by scholars as they have endeavored to understand how theories of social justice can be used to better inform the practice of educational leadership. We would argue that leadership not only needs to question existing practices and policies in the school that perpetuate disadvantage but should call "into question the larger societal assumptions and practices which relegate schools to the role of reproducing them inside" (English, 2006, p. 9). This type of leadership calls for leaders who not only are culturally aware but have a deep respect and understanding of what Bourdieu (1984) has called “cultural capital” and the privileged forms it takes in the public educational systems of both nations.

We also put forward that in the case of social justice and Indigenous peoples, educational leadership must also address some fundamental issues in regard to the impacts of colonization and formulate a present and a future that does not reinstate the past. In the section that follows, we advance some ideas that may help to contribute to the debate about how educational leadership can be transformed to focus on issues of social justice. The achievement of American Indian students has not been substantially improved in that students are engaged in a perpetual cycle of low achievement, as evidenced by findings in this study. As noted, past and current education reforms have not changed the pattern of low achievement for Native students because deeply ingrained ideals and inequalities continue to define educational policies. As a result, American Indian students are considered less likely to be successful when compared to their white peers, and that expectation, too often, is the reality.

The analyses of American Indian patterns of proficiency conducted in this study provided evidence of this. Many of the current education reform models promote provisions outlining equal access and support to ensure minority and disadvantaged students succeed educationally. Standards and improved test performance have increasingly become integral parts of these reform movements. Yet, both standards and tests represent the social and cultural knowledge and language for the dominant class and, therefore, work against most minority populations. Well-meaning intentions and reforms have continued to fail because Euro-American ideals persist, while American Indian worldviews are disregarded. Instead of embracing differences and validating the academic and cultural needs of American Indian students, reforms such as the current NCLB Act and others have caused states to submit to new standards that do not acknowledge what is most crucial for Native students to succeed.

Bourdieu’s mission was to explain the social, political, and cultural practices that surrounded him in a manner that would help others restore the meaning of their actions (Swartz, 1997). Here lies the first implication for school leaders, policy makers, and educators at every level. Schools need leaders who possess the fortitude to radically rock the boat, embrace differences, and challenge the status quo that is currently perpetuated in schools. However, before doing so, an individual must first tackle their personal internalized dispositions.

Consistent with Bourdieu’s argument, through habitus, individuals have unconsciously been led to value the dominant culture to the rich culture and heritage of others who have been marginalized in the process. Senge (2006), in *The Fifth Discipline*, discusses *mental models* as “deeply ingrained assumptions, generalizations, or even pictures or images that influence how we understand the world and how we take action” (p. 9). Fredericks (2010b) demonstrates how signs, symbols, representations, and images within an array of settings are not neutral or innocent and how they produce and reproduce power and social practices and structures and the interrelationships between Indigenous and non-Indigenous peoples. Devaluing stereotypes and remnants of colonial education along with misinformed histories about Indigenous people can be found everywhere including schools in both America and Australia, no doubt in other countries too, for example, Mexico, Canada, and further afield. This is how schools can be sites of "social struggle and contested realms of identity" (Foucault in Gordon, 1980, p. 149) even while proclaiming that they have a "good understanding of cultures" and are "inclusive."

A common perception in North Carolina's public schools is that American Indians are a part of history that no longer exists. Therefore, a radical disruption is necessary and must first begin with reflection on oneself, one's personal assumptions, and actions. Lomawaima (1999) supports this position in the context of the broader education community in stating,

> As long as stereotypical ideas are accepted as natural facts, they will never be scrutinized, analyzed or revised. They will become dominating influences in the training of young minds, Native and non-native alike. Native and non-native educators have an opportunity and responsibility to scrutinize, analyze and revise the natural truths and pedagogical theory and practice they implement every day. (p. 21)

School leaders working in Native communities and schools serving American Indian students and Indigenous Australian students must also realize relationships reflecting a genuine, mutual understanding and respect for one another are critical to improving Indigenous education. The key to the success of Indigenous students is the establishment of meaningful relationships, not only within the school between teachers and administrators, but also with community and tribal leaders. Tribal communities value their relationships with schools, and they want active engagement. In interviews the State Advisory Council on Indian Education (2009) conducted, a Cherokee Native commented:

> We don't only want a place at the table. We'd like to have a voice as how things should go for us and not have things administered on us. We need to be involved and part of the decisions and in shaping what we know works for us. (p. 20)

Through meaningful relationships, intercultural understanding and a climate for collaborative learning and leadership are created. White, Ober, Frawley, and Bat (2009) argued for what some Indigenous people in Australia's Northern Territory label *both ways* education. Instead of just being one way (called *kartiya*, i.e., a European way of schooling), they argue for a kartiya and *ngumpit* (Aboriginal) way together. "This concept of two-way schooling, which involved reciprocity and obligation, involve[s] curriculum, knowledge, policies and power" (Whiteet al., p. 91).

School leaders working in Native communities and schools serving Indigenous students must also understand the profound effect historical attempts to eliminate Indigenous cultures and languages have on Native communities. As a Cherokee Native (cited in State Advisory Council on Indian Education Report, 2009) articulated, "For our Indian people, education is needed for success but also to reestablish the importance of our identity and our own culture" (p. 21). This is the crux of the power struggle. As Brayboy and Castagno (2009) asserted in their research:

> No evidence is found in Indian Country that parents and communities do not want their children to be able to read and write and do mathematics and science—these communities are keenly aware of this need and are engaged in this process but they insist that children's learning to "do" school and should not be an assimilative process; rather it should happen by engaging culture. (p. 31)

American Indian parents and communities support an educational approach that values both Native and Western knowledge because both are necessary to benefit Native communities. It is important for school leaders to provide leadership to ensure connection to the Indigenous culture, traditional values, knowledge, and resources of the state's American Indian community so they are perceived of value in the same way that those of the dominant culture are of value. Moreover, leaders should show how devaluing and disregarding creates situations which disadvantage and marginalize other people in society.

Given the increasingly culturally, linguistically, and racially diverse society in which we live, there is an urgent need for school leaders to be culturally aware and to have a practice-based understanding of race, gender, class, and other types of difference and how this difference impacts upon learning for students. As Coulby (2006) states, it has never been more urgent for educators to "recognize, tolerate and, at best, understand cultures other than that of the state into which people are born" (p. 246).

Lopez, Gonzalez, and Fierro (2006) argue that culturally aware school leaders are those who "cross borders" and "embrace hybridity." Although they are referring to educational leaders who work in districts along the US–Mexican border, their work has relevance to this chapter. According to the authors, leaders who cross borders (i.e., different worlds, different territories, different cultures) "reside in two worlds at once" (p. 65). It could be said that non-Indigenous educational leaders who work in locations where there are Indigenous students or students of different race, religion, culture, or other types of difference are involved in crossing borders. Similarly, Indigenous leaders who work within existing western bureaucratic structures are "walking between two worlds" (Fitzgerald in Kamara, 2007, p. 12).

The implication raised by Lopez et al. is that effective educational leaders who find themselves in these contexts employ a "hybrid leadership style" (p. 65) that allows them opportunities to inhabit a variety of positional spaces. Here, borders are not seen as barriers but sites of opportunity and possibility. Working across borders requires leaders to work navigate a politically complex environment and "work confidently and with influence in two worlds" (Cranney & Edwards, 1998, in White, Ober, Frawley, & Bat, 2009, p. 88). As Lopez et al. (2006) explain, working across borders requires leaders to "have a keen awareness of school-community relations, group dynamics, intercultural tolerance, politics and power, team building, and community engagement and how to effectively bridge these 'Borders'" (p. 66).

The results from a 4-year research project that explored Indigenous leadership in remote settings in Australia have highlighted the need for leaders to engage in an "intercultural space" (D'Arbon, Fasoli, Frawley, & Ober, 2009, p. 3) so that they can best support Indigenous students to achieve in the mainstream education system without compromising their cultural identity. Yet, D'Arbon et al. indicate that working across two spaces can be challenging for both Indigenous and non-Indigenous leaders due to language and cultural differences. In referring to the unique challenges faced by Indigenous female principals working in remote schools within the Northern Territory (Australia), Kamara (2007) states:

> while they [Indigenous female principals] are advocates for Indigenous children, parents and the entire community with a strong voice on Aboriginal issues, they also represent the central system as ambassadors for promoting western bureaucratic structures that are process driven and are in many ways the antithesis of Indigenous worldviews. (p. 17)

Similarly, non-Indigenous leaders who find themselves in Indigenous communities face significant tensions in their daily work as they seek to achieve common understandings and work in genuine partnerships with parents and members of their local community (Jorgensen & Niesche, 2011). D'Arbon et al. (2009) maintain that when working in two worlds, what becomes important is a strong "intercultural identity" (p. 40) which acknowledges and values knowledge, language, and differences from both Indigenous and Western perspectives. Moreover, ongoing learning that calls for an "even understanding" among leaders and their communities is vital for a balanced approach to leadership (D'Arbon et al.).

A number of lessons can be distilled from the research of Lopez et al. (2006) and D'Arbon et al. (2009), and these are as follows:

- Leaders need to understand, respect, and work across both worlds.
- Leaders need to challenge assumptions and expectations of themselves and others.
- Leaders need to learn about the community, develop authentic dialogue, and be responsive to their community's needs.
- Leaders need to be advocates for the students and the community (D'Arbon et al., 2009; Lopez et al., 2006, p. 78).

Another important issue is the role Indigenous leaders themselves can play in inspiring and supporting the education success of Indigenous students. There are many examples of outstanding Indigenous leaders within schools, universities, and communities in Australia, the USA, and other geographic localities who are doing this. It is not surprising, then, that Indigenous teachers and leaders have been identified as a central approach designed to support educational achievement for Indigenous students. Their contribution to schools cannot be underestimated as they send a vital message to students that it is possible to succeed without compromising one's cultural identity. Thus, the recruitment and retention of Indigenous educators is a key issue for education systems (Australian Human Rights Commission [AHRC], 2009).

However, it is a concern in Australia and the USA that there is an underrepresentation of Indigenous leaders and teachers working in schools. For example, only 1 % of teaching staff in all government schools in Australia are Indigenous people (AHRC, 2009). In Australia and the USA, Indigenous people are generally positioned as being in "high need" and "lacking" and as such the point that Indigenous people value add when they are undertaking their roles as teachers and leaders is largely missed. That is, not only is the education system getting someone who has been highly trained and educated as a teacher or an educational leader but also someone who is Indigenous and who may also have (depending on their background) another set of highly developed skills, experience, and knowledge to draw upon. The value-adding benefits that Indigenous people can offer within an educational system are often not recognized or realized because non-Indigenous people and the broader system get caught up (sometimes unwittingly) in the stereotypical "needing" and "lacking" attributes vested to Indigenous people rather than seeing "they can do this, and this and that." When Indigenous people are regarded for all that they bring to a school or education environment, the relationship changes between Indigenous and non-Indigenous people: They all become colleagues, peers, and supervisors working together for change in education within that school or education environment.

Conclusion

The nexus of the quest for social justice for Indigenous peoples in both Australia and America is the recognition of what Taiaiake Alfred (2009), from Kahnawake in the Mohawk nation, has called "a certain way of thinking with an imperialist's mind" (p. 102). This mindset "marks a person as guilty [in] taking part in territorial dispossession, the political denial of Onkwehonwe (original people) existences, racialized violence and coercion, cultural disruption, and economic exploitation" (p. 103).

Alfred (2009) disputes the labeling of "Aboriginal" to the Onkwehonwe peoples. He indicates that this identity is "a legal and social construction of the state, and it is disciplined by racialized violence and economic oppression to serve an agenda of silent surrender" (p. 23). Alfred issues a challenge to all Onkwehonwe people when he observes that:

> change cannot be made from within the colonial structure. Institutions and ideas that are the creation of the colonial relationship are not capable of ensuring our survival; this has been amply proven as well by the absolute failure of institutional and legalist strategies to protect our lands and our rights, as well as in their failure to motivate younger generations of Onkwehonwe to action. (p. 24)

What Alfred (2009) advocates is a profound shift in mental positioning within those who work in government and education. This means stepping out of the colonial mindset and seeing differently. Alfred believes that *justice* is important, but that it is not the end of the struggle. The reason is that "However noble and necessary justice is to our struggles, its gaze will always be backward. By itself, the concept of justice is not capable of encompassing the broader transformations needed to ensure coexistence" (p. 27). Alfred cites the old maxim, "No justice, no peace" where "we must move from injustice, through struggle, to a mutual respect founded on the achievement of justice and then onwards towards peace" (p. 27).

Max Dulumunmun Harrison, a Yuin man of Australia, makes a similar point when he wrote that "There can be no reconciliation between Indigenous and non-Indigenous people of this land because there has never been a partnership in the first place to reconcile about" (cited in McConchie, 2003, p. 1). Dulumunmun goes on to capture the spirit of true respect which would be the nexus of a social transformation founded on social justice:

> The only way I can see the non-Indigenous person making amends is by walking the land with Aboriginal people and understanding their spirituality to the land; understanding why a tree is important, why a tree is sacred; understanding why the rivers and the waters become sacred; understanding why the wind is sacred; understanding all the animals that they share this planet with (cited in McConchie, 2003, p. 3).

Chapter 40
Corrupting Children: The Regulation of Children's Gender Presentations and Identities and Implications for Educators and School Administrators

Gerald Walton

In September 2011, the *National Post*, one of Canada's national newspapers, ran a full-page advertisement for a right-wing Christian fundamentalist organization presumptuously called the *Institute for Canadian Values*. Their ad was a response against lesbian, gay, bisexual, and transgender (LGBT) lobby groups and activists who seek to infuse school curriculum and policy with representations of LGBT issues, histories, and people in society. Specifically, the ad asked that children not be made to feel "confused" about their gender identities as boys or girls and attributed such confusion to "exposure" to discussions in school about LGBT issues. The ad also claimed that such discussions "corrupt" children. In response to widespread outrage about the advertisement, the *National Post* printed an apology a few days later, claiming that the advertisement was not vetted in accordance to their policy on advertising. Discussing the debate about such curriculum was appropriate in a democratic society, the editors of the *National Post* claimed, but labelling it as "corruption" of youth crossed the line.

In this chapter, I argue that transphobic and homophobic attitudes and practices, themselves, rather than discussions about LGBT issues and people in school curriculum, "corrupt" children. By "transphobic" and "homophobic", I am referring to social systems across cultures that privilege certain gender and sexuality identities and expressions (those that accord with social norms and expectations) and stigmatize other identities and expressions (those that do not accord with social norms and expectations). Such regulation enacted through official state and school policy and social attitudes and beliefs are guided by and perpetuate a system of ideology about gender that boys and men should look and act in certain ways that are associated in the culture with masculinity, and girls and women should look and act in certain

ways that are associated with femininity. Gender itself, then, is a system of regulation that operates in societies and schools. It forms the basis of stigmatization and marginalization of gender atypical children and youth while also regulating masculinity and femininity of all children.

In short, gender ideology shapes the human world and provides gender typical people with measures of unearned social privilege and gender atypical people with measures of undeserved social oppression. This is the starting point from which the rest of this chapter will unfold. Following Davison and Frank (2006) who sought to "demystify what we have come to believe are the 'truths' of gender" (p. 162), the purposes of this chapter will also be to:

- Illuminate the ways in which gender as a social practice shapes, influences, and regulates identities, practices, relationships, and social politics
- Describe how gender is entangled with sexual identity (or what I would prefer to call sexuality identity)
- Indicate how gender has been and continues to be a site of contestation, resistance, and refusal among those who are disaffected by, as Connell (2009) puts it, "regimes of gender" (p. 72)
- Discuss how regulation of gender plays out in schools
- Propose how teachers and administrators can foster social justice by considering conceptions of gender anew and how educational policy can play a role in supporting them

What Is Gender?

Cross-culturally and historically, gender is a powerful social force. It shapes everyone's lives in deep and complex ways, sometimes in the explicit foreground, other times in the background, but at all times in operation. Despite its ubiquity, gender as a concept defies precise definition. It is, as Glover and Kaplan (2000) put it, a "busy term" (p. ix). A universal definition of gender does not exist and it is an arguable point whether or not one could or should exist. As Rudacille (2005) found when she asked scholars and activists gender and sexuality to articulate the meaning of gender, she heard widely diverse ideas about the concept. Simply put, she learned that gender and how it manifests in people's lives and societies are not simple matters. Gender is highly complex, manifests in widely different ways depending on cultural context, and defies convenient conceptualizations. However, it can be said that it provides people with a key aspect of their personal and group identities by which they engage in their social world. Gender is thus a social accomplishment, not as uniform, stable, or fixed, but in perpetuity through processes of normalization, indoctrination, and regulation, as well as resistance and refusal.

Complex and convoluted, the ways that gender plays out can foster social injustice in fairly predictable and patterned ways. Gender is not simply about two discrete categories of "boys" and "girls" – and the adult equivalents of "men" and "women" – and their supposed differences. It is about learning and relearning the codes, norms, and expectations of gender throughout a lifespan, in accordance with cultural, ethnic, and historically specific contexts and how such codes are reinforced and regulated.

Even the idea that gender is socially constructed remains a matter of debate (Bradley, 2007; Rudacille, 2005). Further, that which constitutes "normal" and "natural" in terms of gender varies significantly by historical, cultural, political, and interpersonal contexts. In general, however, what we can learn from gender outsiders – the atypical – regardless of the context, is how gender is socially constructed and regulated rather than essentially "normal" and "natural". By "socially constructed and regulated", I do not mean that categories are rigid and static (Davison & Frank, 2006) or that people are hapless and powerless victims of social norms. According to McGuffey and Rich (2011), it is not simply the case that girls and boys, women and men enact "handed-down scripts" (p. 166) by which to perform gender. Gender roles of masculinity and femininity are "not simply imposed on us", claims Bradley, but "something which we are constantly engaged in creating and recreating" (p. 21).

Fair enough. Yet, regardless of our cultural or ethnic context, we are not free to create gender anyway we like, completely free of the potential for negative consequence (Connell, 2009). Acknowledging the complexity of the tension between structural imposition and individual and group agency, it remains the case that gender as a practice constitutes a form of social regulation (Haskell & Burtch, 2010; Pascoe, 2007), as evidenced by gender outsiders who reveal how these gendered attributes and expectations are, themselves, socially constructed through the daily *practices* of gender. Bornstein (1994, 2006), a gender theorist and activist, refers to such gender outsiders as "gender outlaws" meaning that there are indeed rules of gender presentation (clothing, physical and vocal mannerisms, interests, occupations, and so on) that adversely affect those who are not gender normative. Similarly, Wilchins (2002) describes gender as a series of meanings and symbols "and the rules, privileges, and punishments pertaining to their use – for power and sexuality: masculinity and femininity, strength and vulnerability, action and passivity, dominance and weakness" (p. 25). She also explains that to be "gendered" means investing something as masculine or feminine, such as "ships, clothing, sexual positions, pens, bowls, hand positions, head tilts, vocal inflections, body hair, and … sports" (p. 25). For instance, meat is routinely gendered as essential food for boys and men (see, for instance, the September 2009 cover of *Men's Health* which announces "the best guys foods in America", all of which are meat based), whereas salad and yogurt are typically feminized in advertising media (see, for instance, any typical salad dressing or yogurt television commercial).

A key idea here is gender is not limited to a state of being or an identity; it is also a "practice". As Butler (1990) famously points out, norms become norms only through repeated practices that collectively and over time create social convention, foster continual scrutiny, and, when warranted, incite correction. Gender "performativity" is that which has become normative and thus not readily noticed by the "performers". As she puts it, "Gender is the repeated stylization of the body, a set of repeated acts within a highly regulatory frame that congeal over time to produce the appearance of substance, of a natural sort of being" (p. 33). Such repetition belies common sense notions of gender being an unproblematic social enactment of sex that males are therefore boys or men and that females are therefore girls and women (Devor, 1989). Norms, then, are practices that are always in process and, as such, are continually subject to change.

Identifying what gender is *not* may be a useful step towards understanding what gender is. Simply put and contrary to common understanding, gender is not sex. "Gender" and "sex" are often used synonymously and assumed to be inextricably linked. "Sex" is a biological category determined at birth through observation of genitalia. In the first few seconds of life, people are categorized as either "male" or "female" and attributed corresponding genders of "boy" and "girl", notwithstanding intersex people for whom such dualistic categorization is problematic. Many people mistakenly conflate gender with sex (male and female) and rarely acknowledge those who are not distinctly male or female, such as intersex people (Callahan, 2009). Physical diversion from the two-sex model is typically a source of social and cultural shame, as depicted in the 2007 Argentinian film *XXY*.

The biological is routinely conflated with the social. The point to be made clear, here, is that gender is read on the body without the "reader" knowing about physical attributes such as genitalia size and shape and chromosomal formulation. In other words, most of us presume a particular gender of people around us based on surface cues that are visible, such as clothing, hairstyle, and vocal tone. When we see someone who does not fit into our socially constructed and affirmed ideas about how gender is supposed to *look*, we are often confused and intrigued. Some are fearful and angered. Gender, then, provides a framework by which "normal" and "natural" are perceived and (mis)taken as givens. As a direct result, gender insiders and outsiders are constructed in accordance with those who fall within the scope of "normal" and "natural" and those who do not. It is the former group, whom I will refer to as gender typical, who acquire social capital and privilege on the basis of being gender normative. Being gender normative in accordance with one's sex as male or female regardless of sexuality is increasingly becoming known as *cisgender* (Yost & Gilmore, 2011). The latter group, on the other hand, whom I refer to as gender atypical, are routinely dismissed as inferior, stigmatized through fear, and targeted with violence of exclusion if not verbal and physical assault. Admittedly, it is not the case that humans can be so easily dichotomized between insiders and outsiders; many of us are simultaneously insiders and outsiders in different ways and at different times. Further, such dichotomization may be typical of Western ways of thinking (Bockting, 1997; Brumbach, & Jarvenpa, 2002; Derrida, 1976; Nanda, 1999). True enough. However, referring to a dichotomy provides a convenient heuristic from which we can later consider complexities, contradictions, and nuances.

In Western practice especially, gender is a social system that organizes people into one of two categories or what gender theorists such as Garfinkel (1967) and Devor (1989, 1997) call the two-gender model. The model describes how, hegemonically, there are two and only two genders, everyone must fit into one or the other but not both and not neither, and gender is immutable for life. For many people, the assignment of their gender identity and role based on genitalia is unproblematic. Being cisgender, they may feel comfortable with the sex they are assigned at birth and the gender that corresponds. However, some people do not feel comfortable with their expected gender role based on their assigned sex. For example, someone may be born with female genitalia and thus socialized as a girl and expected to present themselves to others as feminine as visual cues of being a "girl", but this socialization might feel false to the person and she may not feel comfortable being referred to as a girl. In other words, although people see her as a girl, *he* may not see *himself* that way. One of the problematic aspects of gender is that, in Western society, language itself limits the options and makes it nearly impossible to escape being pressed into these rigid gender binaries. In other contexts such as South Africa (Currier, 2011; Epprecht, 2004) and Namibia (Hoad, 2007), gender outsiders may be considered cultural and racial traitors.

Thus, many people do not fit into the two-gender, two-sex model, either because they identify as the "opposite" gender regardless of their sex or because neither gender identity feels inclusive enough. Most are born either male or female and expected to be socially recognizable as boys or girls and later as men or women. To be socially recognized, one has to learn what these gender categories mean or, more accurately, one has to learn how to think, behave, and sound like one gender or the other so that others can "read" one's gender. In other words, one identifies as one gender or the other and learns the norms of conduct and character associated with gender category that corresponds to the sex category. Thus, gendering and being gendered is a process of learning in association with sex (Shaw, 2005; Wilchins, 2002, 2004).

According to Bradley (2007), gendering operates at a micro level (through patterns of individual behaviour and social interactions), a meso level (through norms that are regulated institutionally and socially) and a macro level (e.g. through society in the form of gendered divisions of labour). She describes gender as a "social dynamic" (p. 181) that operates at these three levels simultaneously. Similarly, Connell (2009) claims that gender is a "dynamic system" (p. 89), involving instability, contradiction, and crisis. Despite the evolutionary characteristic of gender as a practice, gender remains a key ideological mechanism for social injustice because, as norms shift and evolve, so do conceptions of what constitutes normalcy, resulting in the privilege of some through no effort of their own and the oppression of others through no fault of their own.

Gender and Sexual Orientation

Sexual orientation is connected to, but not synonymous with, gender because heterosexuality is the presumed and prescribed sexuality that are expected of all boys and men, and girls and women (Rich, 1980), and those who present their gender normatively are widely presumed to be heterosexual in practice and identity. The so-called gaydar is a popular and unscientific concept whereby people somehow sense other people’s homosexual orientation. Gaydar typically registers for the observer not from actual sexuality, of course, but from gender cues that are non-normative.

I make a key distinction between sexual orientation and sexual orientation identity. Sexual orientation describes the attractions, desires, fantasies, and behaviours that constitute sexuality, meaning what people actually do (or want to do) sexually. Sexual orientation identities, on the other hand, are self-identities that may or may not reflect actual sexuality. Many people who identify as “straight”, for example, have had (and may continue to have) homosexual sex, despite being publicly known to be in heterosexual relationships. Gendered sexuality (Devor, 1994) describes how masculine men are usually assumed to be heterosexual, while feminine men are usually assumed to be gay. Similarly, masculine women are widely assumed to be lesbian, while feminine women are usually assumed to be heterosexual.

However, such attributions are often incorrect. Attributed identities and self-identities are often not aligned with actual behaviour. Like gender attribution, sexual orientation is also attributed to individuals but not because others have witnessed actual sexual activity but rather because of the investment we collectively have made ascribing gender to mannerisms, clothing, and ways of moving and talking. As Namaste (2006) correctly points out, sexuality and gender get confused in Western societies. Among children, for instance, she notes how some boys and girls will call a masculine girl “dyke” regardless of whether or not she is a lesbian, and feminine boys will get called “queer” regardless of whether or not they are gay. Such boys and girls do not fulfil the norms of their assigned gender role, namely, masculinity for boys and femininity for girls. Namaste points out that “[W]omen, (especially those who are perceived to be lesbians or ‘masculine’) are most at risk in everyday locations that assume the ‘naturalness’ of heterosexuality” (p. 589). Thus, she argues that, “the demarcation of public space is intimately related to the articulation of culturally sanctioned gender identities” (p. 590) and offers the term “genderbashing” (p. 591) to describe what actually happens during the so-called gaybashings that target gender transgressors who are thought to be gay or lesbian (and sometimes are) rather than actual gay men and lesbians. The crucial point here is that it is usually non-normative gender cues that raise the attention of gaybashers rather than actual sexuality or sexuality identities.

Schools as Sites of Gendered Regulation and Resistance

Around the world, one of the key sites where gender is normalized, practiced, and regulated is schools (Haskell & Burtch, 2010; Meyer, 2009, 2011). Students are not just individuals who attend school; they come into schools as gendered human beings in progress. By that time, children have had 4 or 5 years of learning the practices of gender; being gendered is another way of saying that gender is a social process rather than a product. Prior to stepping into a classroom for the first time, children have been learning the practices of gender since the day they were born. As described by Chanter (2006),

> As soon as we are born (perhaps even before) we are color coded as boy or girl, and systematically trained according to our genders. Our rooms are painted sky blue and decorated with mobiles of toy planes, or rose pink and decorated with flowers. We are either given Barbie dolls to play with and dressed in frilly clothes, or footballs to kick around and pants to wear. (p. 3)

Children later come into schools to learn the formal curriculum and also more informal lessons about gender, especially from peers in the form of what Kessler and McKenna (1978) refer to as the "gender attribution process" which they define as "the process through which we all assign a gender to every person with whom we interact, based on rules and assumptions that are usually unacknowledged or unperceived" (2006, p. 165).

Some students will excel in these informal lessons on gender (which is to say they will learn to present themselves in gender normative ways in accordance with cultural expectations); others will not. Either way, the lessons pertain to all students. What I am indicating here is how school culture mirrors norms, attitudes, and prejudices of the societal context and informally teaches all students about the rules of gender. Such rules are not necessarily written down in school manuals or posted on bulletin boards or school websites. They are, however, made highly evident through the reactions of others when students break them or otherwise contravene them.

Like light against dark, normalcy is most evident in the glaring contrast against non-normalcy. Socially, gender variant boys and girls straddle an uneasy line between boy (and the requisite interests and characteristics usually considered to be masculine) and girl (and those considered to be feminine). The term "sissy" is widely used as a pejorative label against boys as a way of enacting fear through bullying as well as asserting normalcy of non-sissies. According to Letts (2005), sissies are "[s]ituated at the intersection of misogyny (hatred of women) and homophobia (irrational fear of homosexuality)" (p. 796). Sissies are perceived as threatening to other boys that somehow they will infect them with (what are perceived as) their feminine afflictions. To maintain masculinity of other boys, sissies must be rejected or expunged through bullying, ostracization, and violence. In Martino and Frank's (2006) view, regulating masculinity as a gender performance is an indication of a "'moral panic' and concern about failing masculinities at school" (p. 29).

In 2008, such panic took a deadly turn when 15-year-old Lawrence King was shot to death in Oxnard, California, by a male peer because Lawrence liked feminine jewellery, clothing, and make-up. The King murder, though extreme, is a tragic indicator that sissies are thus not included in boy cultures but are rejected from them and can, at any moment, become victims of physical violence and even homicide. Rejection and violence not only expunges sissies from the ranks of normative boys but also signifies to all other boys what could happen to them if they do not live up to the social expectations of what it means to act like a boy. The paradox here is that non-normative boys serve an important function for other boys; by comparison, the latter need the former to measure their masculinity. In short, violence towards sissies maintains gender boundaries and highlights how normalcy is constructed and regulated.

Boys who are labelled as sissies are usually instilled with shame. By comparison, tomboys, who are girls whose gender presentation and interests are associated with masculinity, are generally seen as socially acceptable but only until puberty (Bradley, 2007). After that, most tomboys are expected to act and look like gender normative girls. For most parents, gender non-conforming behaviour and interests of their children raise the fear that they will grow up to be gay or lesbian. Even among gay men, sissies – also known as queens, nellies, nancy-boys, and femmes – generally rank low on the gender hierarchy of men (Bergling, 2001; Martino, 2006). As is the case for other "gender deviants", such as cross dressers, tomboys, and intersex people, sissies are usually treated as abnormal (Wilchins, 2004). Medically, gender non-normative people are sometimes diagnosed with gender identity disorder (GID), which is a diagnostic category of the *Diagnostic and Statistical Manual of Mental Disorders* (DSM) of the American Psychological Association. The current version of the DSM includes GID but the term "gender dysphoria" has already become a term of preference to describe people who experience a high and consistent degree of anxiety and unhappiness about their gender identity in relation to their sex.

For instance, according to the website www.athealth.com (2000), boys diagnosed with gender dysphoria

> … tend to prefer to dress in girls' clothes. They often avoid competitive sports and have little interest in rough and tumble games. They frequently prefer to play games with girls, and they enjoy girls as playmates. They usually enjoy acting as a female figure, such as a mother or a princess, in the games they play.

"Treatment" for gender dysphoria ranges from psychotherapy to enhance self-esteem to behavioural modification that rewards gender typical behaviour and punishes gender atypical behaviour. Websites such as www.healthatoz.com (2006) proclaim that, "the cause of [gender dysphoria] is not known", while www.athealth.com warns that, "if the disorder *persists* into adolescence, it tends to be chronic in nature. There may, however, be periods of remission" (italics added). In his 1984 book based on longitudinal research, Green describes sissies as boys whose gender atypical characteristics represent a "syndrome", meaning a symptomology that is presumed to be indicative of emotional or mental disease or problematic condition in need of therapy.

Contrary to psychiatric diagnoses that represent individuals as having personal problems with their gender identities, the problem of sissies and tomboys is not themselves but rather the presumption held by most people, including some paediatricians and psychiatrists, that sissies and tomboys require treatment and, thus, are viewed as "damaged goods". Such conceptualizations mirror usual attitudes and presumptions evident in wider society. For instance, being a sissy is equated with being weak, which is anathema to normalized ideas about masculinity, boyhood, and manhood (Martino & Frank, 2006). Being a masculine girl raises fears that she is or will be a mannish lesbian. For gender typical individuals, that is, for cisgender individuals whose gender presentations and identities match the social conventions of their sex as male or female, gender conformity is strongly rewarded through inclusion among peers, parental support of boys being tough and aggressive and girls being feminine and nice, and media that replicate and validate such conformity. It is not that all parents encourage and sometimes enforce toughness in boys and niceness in girls, but many do. Such rewards act as an investment against children and youth becoming gender outsiders, including being gay or lesbian.

Despite strong social sanction for gender non-conformity, being a sissy or tomboy does not have to be viewed as a condition that "persists". Rather than stigmatizing feminine boys and men and masculine girls and women, a more supportive view is to consider that the dominant model of gender, limited to only two types and signifying dominant practices in society, does not account for a wide variety of gender expressions and identifications that have existed throughout human history (Connell, 1993, 1995; Devor, 1989; Lacqueur, 1990) and that exist cross-culturally today (Haywood & Mac an Ghaill, 2003; Letts, 2005). Devor (2007) describes the gender duality as "simplistic notions of gender, sex, and sexuality which dominate the thinking in society at large". Conversely, it is widely assumed, even among medical practitioners, that gender is a simple matter: either one is a boy (who should present himself as masculine) or one is a girl (who should present herself as feminine). Such notions do not allow room to consider that gender represents a myriad of expressions and identities. Referring to the constellation of genders, sexes, and sexualities, Devor (1997) aptly puts it this way: "it is time that we learn to count higher than two, that we learn to multiply and divide, and that we endeavour to expand our options exponentially" (p. 609).

Rather than being determined by biology, gender is a social practice that organizes society in particular, rigid ways (Connell, 1993). Pretending to be informed by "objective" science, the Diagnostic and Statistical Manual of Mental Disorders (DSM) does not account for the possibility that gender is a dualistic *social* system, imposed upon almost everyone and maintained through dominant social practices that are replicated and repeated daily. Societies vary in the ways that gender norms, expectations, and divisions between girls and boys are constructed and regulated (Sandfort, Melendez, & Dias, 2007). Generally, however, and in Western societies at least, such social conditioning to the expectations of gender begins at birth. Boys receive blue blankets, and girls receive pink ones. A pink blanket being given to a boy would be treated as a mistake, as misguided, perhaps even as abuse. A blue blanket given to a girl would likely be considered similarly, but perhaps not quite as urgently.

The fact that some boys and girls are stigmatized for being sissies and tomboys (especially after puberty) indicates that children are taught to "perform" (Butler, 1990) gender in particular, socially acceptable ways and shamed when such performances do not conform to social expectations. To characterize gender as a "performance" suggests that "doing" gender is intentional and chosen. On the contrary, Butler's term "performativity" refers to gender expressions that have been reinforced through repetition, broadly validated, and normalized into invisibility. Through habit and social conditioning, many people unconsciously demonstrate in public that they are typical boys and men or girls and women with relative ease, but doing so does not mean that gender is somehow biological or genetic. Such linkages are common yet spurious. Examining the ways in which gender is enforced and regulated in society becomes highly evident in cases of people's reactions to gender atypicality, such as that of sissies and teenage tomboys. Daily conditioning results in the appearance of gender as natural and normal when in fact it is constructed and highly regulated across societies and cultures.

Other Narratives and Their Implications for Teachers and Administrators

Rather than being looked at as a condition or syndrome in need of medical or psychiatric intervention, or as mistakes that must be corrected, or even as character weakness, gender atypical children and youth can (and should) be looked at through an alternative set of lenses, ones that recognize gender variance and diversity (Davison & Frank, 2006; Devor, 1997; Meyer, 2011; Walton, 2010). In schools, gender atypical boys should be given options for activities apart from those that are attributed to gender typical boys and should be recognized for achievements beyond masculine domains such as team sports (Martino & Pallotta-Chiarolli, 2003; Rofes, 1995). In schools and out, gender atypical youth can and should be supported rather than ostracized. They need not feel shameful or inferior because of their gender atypical presentations and interests. Drawing from an example in popular media, Jack McFarlane (played by Sean Hayes) exemplifies *sissy pride* on the TV show *Will and Grace* (1998–2006) by holding his head up high as he prances throughout New York, as does Emmett Honeycutt (played by Peter Paige) throughout Pittsburgh in the US version of *Queer as Folk* (2000–2005). Although men rather than boys, the characters of Jack and Emmett potentially serve as positive role models for boys who do not fit within mainstream notions of what it means to be a boy. Apart from fictitious characters, the Radical Faeries (radfae.org) also celebrate and express their femininities.

Letts (2005) observes, however, that "cultural representations of sissies as children and young adults are far less prevalent, particularly sympathetic or positive [ones]" (p. 796). Films such as *Ma Vie en Rose* (1997) and *Running with Scissors* (2006) depict sissy boys with dignity and sensitivity. The ABC news program 20/20 in their documentary called *My Secret Life* (Gutman, 2007) did likewise in interviews conducted by Barbara Walters of transgendered children, some of whom had been vilified as sissies and negatively labelled as tomboys.

Media depictions of trauma inflicted from the abuse of others towards those who are gender atypical or LGBT sparked the "It Gets Better" campaign in the United States, launched in 2010 by Dan Savage and his husband Terry Miller as a response to what was widely represented as a wave of suicides of young gay men and those perceived as gay (see itgetsbetter.org). From what began as one video that offered to message to gender and sexuality minority youth that life does get better after high school, the *It Gets Better* channel on YouTube.com has amassed over 22,000 videos with a similar message, many posted by media celebrities as well as one from Barack Obama, President of the United States.

The campaign has been controversial not only because it has garnered criticism from right-wing religious leaders but also because, as youth themselves have pointed out, children and youth who are bullied routinely because of their gender presentations (conflated with being gay or lesbian) should not have to wait for their situations to "get better". Rick Mercer, Canadian comedian and host of *The Rick Mercer Report* (rickmercer.com), challenged all LGBT adults in one of his weekly "Rick's Rants" to come out and be visible so that LGBT youth have role models and can see through such modelling that, not only will their situations improve over time but they can be better now. In response to the 300 suicides that took place among youth in Canada in 2011, he put it quite emphatically in his rant of October 25, 2011 that,

> It's no longer good enough for us to tell kids who are different that it's going to get better. We have to make it better now. That's every single one of us, every teacher, every student, every adult has to step up to the plate. And that's gay adults, too … the problem is, adults, we don't need role models. Kids do. So if you're gay and you're in public life, I'm sorry, you don't have to run around with a pride flag and bore the hell out of everyone, but you can't be invisible. Not anymore. [see the full rant http://www.youtube.com/watch?v=Wh1jNAZHKIw]

Building on Rick Mercer's challenge, lesbian and gay adults and straight adults, particularly those in schools, also need to, using his words, "step up to the plate" and speak out against bullying on the basis of difference including gender and sexuality. It is morally and legally incumbent upon teachers and administrators to ensure safe schools for all students (Meyer, 2009, 2011). Media can provide pathways for thinking of other narratives of gender aside from the dominant one that regulates the gender performances of everyone (Schrader & Wells, 2007). As adults in school settings, it behooves teachers and administrators to consider gender not as a simplistic duality but as a complex set of social arrangements that create divisions between insider and outsider, often expressed through forms of violence such as bullying and genderbashing, to use Namaste's (2006) term. Lugg (2003) points out that unfortunately, "ignorance of these contentious areas has been the cultural norm" (p. 96), among researchers, to which I would add teachers and administrators particularly in geographical locations where conservative ideas about gender norms are deeply entrenched in the local culture, often validated through traditionalist religious beliefs and practices.

As a topic of continual debate and discussion, bullying is now widely considered to be unacceptable behaviour in schools. Programs and policies are designed to change such *behaviours* (rather than ways of thinking, contrary to those who decry that "political correctness" tells them what they should think and believe). Its status as a significant and continual problem in schools is implied in the proliferation of discourse on bullying in research and policy. As an indicator of how bullying has become highlighted as an urgent problem in schools, for instance, consider the *Bullying Prevention Summit* held by US President and First Lady Obama that was web streamed live from the White House on March 10, 2011. Amidst most of the concerns expressed about bullying in the Summit and elsewhere, very little of it addresses norms and expectations about gender as a platform for bullying. Here, then, I advocate a rethinking of essentialist assumptions about gender and propose how doing so is a crucial component of creating safer schools that do not perpetuate the lessons that have been, and continue to be, learned in schools and society.

To state the obvious, schools are places where students learn; learning is most recognized as an outcome of prescribed curriculum. Facilitating school safety requires not just discussions about "homosexuality" sequestered within health curriculum but a broader approach that shapes curriculum in ways that are inclusive of gender atypical people as well as gay, lesbian, and bisexual people and families that are not reflected in the hegemonic conceptualization of "mom, dad, and 2.5 children". Simply put, curriculum must be inclusive of gender and sexuality variant children and youth (Koschoreck & Tooms, 2009), and educators concerned about social justice issues in education must grapple with LGBT topics, and all forms of social difference and marginalization, to foster safer spaces in schools (Capper et al., 2006). Anything less is tantamount to fraudulence (Capper et al.) and "an act of abandoning students that [sic] are marginalized by the everyday inequity of gender discourses" (Davison & Frank, 2006, p. 162).

Recognizing and working against such inequity is useful and important, but not sufficient. Typically, "diversity" discourse focuses on race, ethnicity, and culture, giving gender and sexuality identities only quick mention if mentioned at all. Through administrators' education and professional development opportunities for teachers, educators must be more adequately prepared to support gender atypical children and youth (Capper et al., 2006; Greytak & Kosciw, 2008) in combination with racialized and cultural identities (Kumashiro, 2004; McCready, 2005). National surveys from the USA (Kosciw, 2004) and Canada (Taylor et al., 2008) indicate that gender atypical youth are more likely to be the target of harassment and bullying than their gender typical counterparts. One of the compounding problems raised by Currier (2011) is that Westernized terms such as "gay" and "lesbian" are considered offensive in cultures such as those in Namibia and South Africa where public discussion about gender and sexuality diversity contravenes social convention.

Some targeted youth demonstrate resilience in the face of unsafe learning environments. Far from being passive victims, some assert their right to be out and visible in school (D'Augelli & Grossman, 2006; Holmes & Cahill, 2005; Ream & Savin-Williams, 2005). Further, a national survey on homophobic and transphobic violence in Canadian schools showed that some, "[c]ourageous LGBTQ students across the country have decided not to let their fear or anyone else's stop them" (Taylor et al., 2008).

Such resiliency and resistance are laudable. However, it should not be left up to students alone to protect themselves or enact social change in schools. Trustees and school authorities need to take more responsibility in creating and adopting proactive and preventative efforts to curb bullying in schools (Lugg, 2003; Meyer, 2009, 2011; Walton, 2010, 2011) and educational leadership preparation programs need to prepare educational leaders for social diversity in all of its dimensions, including gender and sexuality identities (Tooms & Alston, 2006). In short, violence against gender and sexuality difference, among other forms of violence against difference, should be named in policy because, as Macgillivray (2004) points out, homophobia proliferates among children and youth – and sometimes among administrators and teachers. Doing so may risk inciting judgment from some, such as parent groups, but school authorities need to muster up the courage and take the risk if "safe schools" is to be legitimately claimed (Walton, 2010).

Supporting a Gay-Straight Alliance (GSA) is one strategy for enhancing safety in schools. GSAs are student-led and student-run groups in middle or high schools that provide support for LGBT students, straight allies, and students with LGBT family members and friends (Gay, Lesbian, and Straight Education Network (GLSEN), 2005; Griffin, Lee, Waugh, & Beyer, 2005; Macgillivray, 2007). Predominantly a North American phenomenon, GSAs also exist, albeit in smaller numbers, in countries such as Mexico, the Netherlands, the United Kingdom, and New Zealand. To navigate and steer away from opposition from school administration and conservative parent groups, student groups exist in some schools to serve the same purposes as GSAs, but they may be called Pride Alliance, Diversity Club, or Spectrum, among other titles.

It is not only morally and ethically necessary but also legally astute to foster cultures in schools that support the diversity of the student population. The ruling of the Supreme Court of Canada in the *Jubran vs. North Vancouver* case, for instance, indicates that school districts are obliged to curb behaviours such as homophobic violence and to create learning environments that are free of discrimination (Meyer, 2006). In abbreviated form, the facts in the Jubran case are that between 1993 and 1998, Azmi Jubran was routinely bullied in his North Vancouver school, located in southern British Columbia (BC) on the west coast of Canada. Much of the violence, both verbal and physical, was homophobic in nature despite Jubran identifying as straight. His struggle to hold the school accountable for the ongoing violence he endured was a process of filing complaints and appealing rulings. First, he filed a human rights complaint. Then, the BC Human Rights Tribunal ruled in his favour, but their ruling was overturned by the Supreme Court of BC. Next, Jubran appealed to the BC Court of Appeal, which upheld the original ruling of the BC Human Rights Tribunal. Finally, the school district appealed to have the case heard in the Supreme Court of Canada, which refused to hear the case. In the end, the North Vancouver School District was held accountable and responsible to deal with problems such as homophobia in a systemic and proactive manner. According to Findlay (2011), victims of bullying and their parents are increasingly taking teachers and administrators to court for lack of effective policies and practices that are informed by such policies.

To repeat the point, policies that identify violence, including but not limited to homophobia, against gender atypical youth are rare in schools. Even more rare are schools and classrooms that are created specifically for LGBT students. In North America, schools such as the Harvey Milk School in New York, Oasis and Eagles in Las Angeles, and the Walt Whitman Community School in Dallas "were created for youth whose neighbourhood schools are unable [or unwilling] to safeguard them or lacked resources to support their sexual orientation" (pp. 160–161), according to Campos (2003). He adds that, "without these schools, the future of some youth would be bleak, dismal, and unsuccessful" (p. 160). In Canada, the only equivalent school is the Triangle Program of the Toronto District School Board. According to their website, the Triangle Program is committed to "providing a classroom where LGBT youth can learn and earn credits in a safe, harassment-free, equity-based environment, and developing and teaching curriculum which includes and celebrates LGBT literature, history, persons and issues" (Triangle Program, n.d.).

Students who are able to attend these schools are fortunate in the sense that they can study and learn in environments that are safer than regular schools when it comes to hostilities against gender and sexuality variation from the norm. However, such schools and programs do not compel school districts to curb or educate about homophobia nor are students anywhere else in Canada besides Toronto able to access such programs. Clearly, then, administrators and teachers need to do a more concerted job of educating themselves about violence on the basis of gender atypicality. Pre-service teachers in Bachelor of Education programs need to be educated by informed faculty of their moral and legal obligations to all students, even those whom they find objectionable because of gender and sexuality difference.

Addressing oppression against gender minorities is not an easy task, particularly in some non-Western societies and in other locations that are characterized by conservative values about gender. Such values maintain a sharp and clear categorical division between boys and girls and men and women, foster gender presentations that represent such divisions, and validate public sexualities that are demonstrably heterosexual. As Rottman (2006) indicates, "homophobia and heterosexism continue to haunt public schools today through educational policy, the climate for sexually-minoritized individuals, and leadership and governance structures" (p. 2). It may be useful to consider community consultation and forging community alliances to create a "social collective" (Boske & Benavente-McEnery, 2010, p. 373). However, the risk of such a collective is that it may reflect dominant voices while marginalizing, or even failing to recognize, other voices. Boske and Benavente-McEnery acknowledge that schools in North America and other Western regions of the globe have become more "racially, linguistically, religiously, and culturally diverse" (p. 369) to which I would add: in addition to diversity of sexuality and gender identity that confounds dominant paradigms of gender and the regulation that tends to accompany such paradigms. Further, Tooms and Alston (2006) point out that while acknowledgment of student diversity has expanded in some regions to recognize gender and sexuality diversity, educational leadership has, on the whole, not kept pace in leadership preparation programs.

Depicting curriculum and policies in schools that address violence against gender atypicality as "corrupting children", as the so-called *Institute for Canadian Values* did through the *National Post*, is social bigotry disguised as "values" that operates among religious fundamentalists and is disseminated by them. It also operates less obviously in daily experiences of children and youth who are continually placed in emotional and physical danger through no fault of their own in the very places where they are expected to learn.

Chapter 41
Zimbabwean Women Primary School Heads

Irene Muzvidziwa

Purpose

This chapter focuses on the role of educational leaders in creating enabling socially just educational environments. One of the objectives is to provide an awareness of the gendered nature of division of labour in educational settings which historically defined women's position in a negative manner. The chapter seeks to provide new data that would make meaningful contribution to the field of educational leadership. Views of leadership that used to justify patriarchal dominance and cultural barriers in education by considering authority, power and the division of labour as both neutral and essential are examined. By ignoring the inequalities of organisational power, leadership theory neglects the significance of gender. In this write-up, the theory that moves away from traditional organisational setting and its 'simplistic recipes' for effective leadership is arguably the notion of leadership for social justice. Rawls (2003) challenged society to develop a sense of justice in its members.

Background

The notion that patriarchal norms emphasises gender differences and men endeavour to preserve their status by restricting women's opportunities to senior positions is a global trend (Addi-Raccah & Ayalon, 2002; Cheung & Halpern, 2010; Madsen, 2007; Peter & Horn, 2005). While internationally, discriminatory practices against women have been experienced in different ways, this chapter draws its examples

mostly from Zimbabwe, one of the Southern African Development Community (SADC) countries of sub-Saharan Africa, to demonstrate issues of power prevalent in previously male-dominated school organisations. The absence of theory that would offer new ways of understanding and perceiving power in educational institutions will be part of the debate. Like other developing countries, Zimbabwe has a rich diversity of cultures rooted in tradition and patriarchal values. Extending further, literature shows that men have dominated the field of education (Enomoto, 2000). Patriarchy in this chapter is used to describe the power structure which underlines social, political and economic systems as well as cultural and religious beliefs in most societies.

Before Zimbabwe's independence, schools were dominated by racial discrimination and later the discourse diverted to black male-female inequalities. Little attention was given to gender issues. The norm was that girls were mostly prepared for marriage. From the late 1970s, issues emerged concerning women's careers which reflected women undertaking training in the lowest level of teaching profession such as infant and domestic science areas (O'Callaghan & Austin, 1977). Men dominated higher level teacher training. The notion of normalisation, and the parents' perceptions of what is termed normal, is the key factor that contributes to the girls' educational success or lack of it and in a way was and/or is still being reinforced by the way in which we are positioned by our own parents and the society at large. When the Zimbabwe government introduced free education to eradicate educational inequalities that existed during the colonial period, the rate of expansion of schooling in the first decade of independence 1980–1990 was phenomenal, but gender was still not an issue in educational policy (Gordon, 1994; Chikomba, 1988). Gender imbalances continue to exist in educational leadership even today. To pursue my argument on leadership for social justice and the issue of gender, I begin by exploring issues surrounding gender and educational leadership. I further focus on the concept of gender stereotyping in education that has led to the under-representation of women in positions of authority and how education has served largely to maintain the 'status quo' in gender relations, reflecting on continuing inequalities in male and female access to power and resources in the wider society. The purpose is to illuminate the injustices central to the highlighted concepts. It would seem difficult to define social justice in terms of both theory and practice in educational leadership. To demonstrate this, I reflect on how patriarchal norms and values strengthen and emphasise gender differences and how men's dominance in leadership positions is perpetuated through societal values.

Rationale

My early experiences have had a strong bearing on my interest in understanding the forces that deny, for instance, Zimbabwean African women's educational opportunities, let alone, being in positions of authority. My status as a teacher, and later a senior lecturer, was achieved after a struggle. I grew up in a rural farming community.

Being the second born child in a family of six children, four boys and two girls, my education was cut short at an early age after 2 years of secondary education. This was simply because my elder brother who was the first born in our firmly had decided to end his education at form two level. According to my thinking, this was not fair. The kind of issues and questions that preoccupied my mind after this incident could be best understood in the light of my own history and educational background. What has been the trend in developing countries is to value sons more than daughters. My parents, like most African parents, did not consider educating girls as an investment and hence could not let their daughters be more educated than the son. For me there was no social justice practised between us as children. This however was also pointed out by Hill and King (1993) who observed that parents' socio-economic background and attitudes about educating girls contribute to educational success or lack of advancement of their daughters. What the parents value in relation to their children's future, to a certain extent, determines the level of education the children will get, especially girls. Social justice issues, especially relating gender and educational leadership, have historical roots, not only in Zimbabwe. Mathur-Helm (2005:60) discussing issues of equal opportunity and affirmative action for South African women, 'women continue to face barriers to their career advancement'.

Social Justice

Justice is fairness in the treatment of people or persons irrespective of their status in life. Although the issue of equality is part of an exercise towards ensuring justice, Hoy and Tarter (2004:252) argued that 'treating everyone equally is not equal. Individuals have different needs and talents; thus rigidly treating everyone the same is not equal'. A good example is reflected in my own experience highlighted above. It is the quality of being just or fair that counts. Social justice has something to do with an ethic of caring and empathy and being sensitive to human rights and gender. Gewirtz cited in Theoharis (2007) sees social justice as a process of recognition and acknowledging the institutional injustices and trying to empathetically re-dress them. Women's under-representation in educational leadership, for instance, though not the focus of this chapter, has something to do with the marginalisation of women that requires certain adjustments to be made if women are to receive equal employment opportunities and appreciation from within the communities and society. This is why, for instance, Bogotch (2002) contested that social justice definition is inseparable with educational leadership. If men are socialised not only to be public holders of power but to own and control major resources of a society in which women are taken to be part of those resources, then consciousness raising is critical to create an awareness of the importance of women's leadership in schools. Goldfarb and Grinberg (2002) had similar thoughts about social justice as they perceived it an active exercise, an involvement into transformational processes of promoting fairness in the way resources are shared socially, economically and educationally. For the purpose of this chapter, I confine myself to social justice definition that addresses and eliminates marginalisation of women in educational leadership and takes into account the issues of gender and education and the practice of patriarchy that strengthens institutional injustices. Although issues of gender and justice in leadership affect many nations as would be highlighted, examples in this chapter will be drawn mostly from the Zimbabwean context.

Gender and Education: Foundation for the Formation of Moral Justice

In Zimbabwe the teaching of morals starts at home where boys and girls perform different duties and are always reminded to behave within the expected norms. The school then serve as agents of society by transmitting the values of society to the pupils. In textbooks, women and men are portrayed according to culturally accepted gender role definition, that is, women as mothers and housewives and men performing outdoor activities (Sharma, 2000). If the problem starts from home, the question is 'How can educational leaders create enabling socially just educational environments?' Similar trends have been observed in other African countries (McFadden 1997) as demonstrated below.

In South Africa black women have faced and are currently facing a dual challenge in attaining top management positions (Booysen, 1999). This is simply because gender in South Africa is racially and culturally segmented as it takes on a particular apartheid-related characteristic, thus marginalizing all other forms of discrimination creating inequality among black and white women (Mathur-Helm, 2005:66). This was the situation with Zimbabwean women before independence. In Tanzania, "women are poorly represented in the decision-making structures" in senior management positions and other areas within the employment sector (McFadden, 1997:31). A similar situation was observed in Kenya where women, as elsewhere, are under-represented in leadership positions.

When I went to New Zealand to pursue my studies, I undertook a course in Women and Educational Leadership. This course greatly assisted me in developing an awareness of the problematic nature of gender and educational leadership issues not only in developing countries but also in Western societies. Literature shows that for both developed (Acker, 1994; Blackmore, 1998; Court, 1993; Cubillo & Brown, 2003; Shakeshaft, 1999) and developing countries (Chitiga, 2003; Dorsey, 1996; Gordon, Swainson, Bondera, & Kadzamira, 1998; Kark, 2004; Mathur-Helm, 2005; McFadden, 1997; Oplatka, 2002), women are marginalised and under-represented in positions of authority in educational settings. Male dominance has been observed in 'top' leadership positions where women populate the lower levels of teaching (Acker, 1994; Blackmore, 1998; Court, 1993; Shakeshaft, 1999; Shakeshaft, Brown, Irby, Crogan, & Ballenger, 2007; Smulyan, 2000). In another study, a publication by Wilson (2004) examined the situation of women in educational management in Europe from the 1990s. Her book exposes prospects of women's promotion in the education professional field, the obstacles to progress in that area and women's overall situation.

She argued that gender was treated as a marginal issue in the literature on school leadership, yet 'teaching represented one of the most highly feminised of all professions', and in many countries it has been one of the few traditional avenues for female advancement. A similar situation existed in New Zealand as evidenced by O'Neill's (1992:62) assertion that 'gendered-type' subject areas led to a limited range of 'gendered career opportunities'. The issue of opportunities relating to girls and women has been well articulated by Okin (1989:18) who argued that, 'the family is a crucial determinant of our opportunities in life of what we become', just as attested by the author of this chapter through her background history. Through this reflection issues concerning school organisations and the problematic nature of gender are portrayed. The major question is how best can social justice be enacted to create socially just educational environments? It is the responsibility of both the school and the family to work together towards building a community of practice that has respect for one another and value all human beings irrespective of gender, race or colour.

Family and the Formation of Morals

In pursuit of the social justice issue, Okin (1989:22) sees the family as the first 'series of associations' in which individuals participate and from which people acquire the crucial capacity of a sense of justice, to see things from the perspectives of others. She believes that the family is important for the moral development of individuals, especially the development of a sense of justice that grows from sharing the experiences of others and becoming aware of the points of view of others who are different. Approaching the issue from this observation, it can be argued that, if the family is the foundational institution in the formative of moral development, and if the school serve as the agent of society, then structures and practices of the family should be well connected such that the larger society respects the human rights in relation to gender – if a sense of justice is to be fostered and maintained. Okin's belief seems to suggest that almost every person in society starts life in a family of some sort, and while the nature of the family varies, it is the potential place where people through socialisation learn to be – or not to be – just, hence the importance of schools needing to collaborate with its community and parents in a transformative way, in order to develop in children certain moral values. It is also essential that children who are to develop into adults with a strong sense of justice and commitment to just institutions spend their earliest and most formative years in an environment in which they are loved and nurtured and in which the principles of justice are practised.

Theoretical Framework

A theoretical and conceptual framework for this chapter is underpinned by literature on women and educational leadership, focusing on society as one of the contexts in which the experiences of women can be explored. Maddock (1999) and Wacjman

(1998) emphasise the need to tie in the cultural obstacles women leaders face in organisations with what they experience in their daily lives. Given that historically, schools have been organised in bureaucratic ways and in which authority has been considered as legitimately accorded to the principal, who generally used to be male (Blackmore, 1998). The traditional leadership and organisational theory – being the dominant paradigm – provides the context from which mainstream leadership will be analysed in this chapter, against leadership for social justice. In addition, now that women increasingly enter leadership roles that traditionally have been occupied by men, and the relationship between gender and transformational leadership theory with its emphasis on empowerment of followers has gained momentum in literature on leadership (Kark, 2004), although it is a neo-charismatic leadership theory, transformational leadership is considered in this framework since it recognises 'employees' creativity skills' (Birasnav, Rangnekar, & Dalpati, 2011).

Transformational leadership conception originated most visibly in Burns' (1978) work concerning transformational political leader who used transactional approach to leadership. For Burns (1978:3) transactional political leader 'approached followers with an eye for votes or subsidies for campaign contributions… such transactions comprised the bulk of the relationships among leaders and followers'. Drawing on Burns' theoretical ideas, Bass (1985) developed a model of transformational leadership which conceptualised transactional and transformational forms as separate but interdependent dimensions. Within the transformational approach, four distinct components identified include idealised influence, inspirational motivation, intellectual stimulation and individualised consideration. As mentioned before that in this chapter, leadership for social justice is that which departs away from the mainstream leadership thinking which views a leader as extraordinary, marginalising followers – but takes into consideration leaders who value those around them, motivate and inspire them. Thus, Bass's transformational leadership is quite accommodative and, as part of the framework, provides a platform for employees to communicate and in the process improve their capacity to think creatively. Unlike the traditional theories of leadership, the traits approach has been challenged for failure to address a number of issues in leadership including social injustices in organisations. The field of leadership is seen as gendered in favour of men as Enomoto (2000:376) contended 'to argue that management is a gendered construction is to posit that there is one gender (male) that defines and dominates the discourse in the field of study', and thus, there is no social justice. As Taylor's scientific management treatise established him as the 'father' of industrial management, his managerial theory emphasised standardisation and expertise in large organisation. Linked to this argument is the notion that trait theory privileged traits associated with male leadership (Smulyan, 2000). Leadership and management have been conceptualised by focusing on traits associated with males such as 'strength, toughness and decisiveness' (Eisler, 1994:38). Women's apparent lack of such traits as perceived in their behaviour is seen to make them unsuitable for leadership (Blackmore, 1998). Literature on traditional approaches to leadership shows how leadership and management theory has shaped the assumptions, beliefs and values that have become the underpinnings of leadership and organisational theory. From

Blackmore's observation women are in a double bind. Chapman and Luthans reinforce this point of view in their observation that:

> If a woman displays the culturally defined traits of femininity (being emotional, nurturing, intuitive or submissive) she is perceived to be a poor leader. If she acts according to the male role definitions of a leader (being aggressive, achievement oriented, self-confident, forceful or competitive) she is condemned as being 'unfeminine'. (cited in Blackmore, 1998:100)

In view of the above, transformational leadership theory was considered as one of the alternative views (Hau-Siu-Chow, 2005; Rosener, 1990). Its particular focus on empowering and developing followers' potentials is in line with this chapter's concern for the creation of leadership for social justice. Leadership theory has implications for what goes on in schools and how leaders evolve and enact leadership practices. Hence, transformational leadership with its emphasis on promoting employees' innovative and creative skills stands to bridge the gender gap of male-female role definition of leadership approaches. It thus celebrates the uniqueness of each human as a resource, and in this way, social justice is enacted.

If any concept of leadership deals with exercising influence on others through social interaction, it follows therefore that to examine leadership that would create socially just environments, there is need to understand the nature and quality of social interactions involved. Mothers, for an example, as leaders, intentionally seek to influence the behaviours of their children. Likewise, women leadership approaches should not be despised but celebrated if the outcomes of their interactions are progressive. McGregor (2010) on her reflection, on the role of gender research, argued that the status of women in senior management is linked to the kind of treatment they receive nationally and internationally, suggesting that if they are marginalised in both private and public sectors, they might as well be disadvantaged anywhere else. For instance, history is replete with the story told from a male perspective only and the area of leadership is not an exception. Thus, in this study, women's leadership experiences were explored from a phenomenological approach using the perspectives of women to understand the meaning in the context of their lived worlds as school leaders.

Methodology

The study from which findings of this chapter were drawn was restricted to one province outside Harare, the capital city of Zimbabwe. Eight women school heads were interviewed. A purposive followed by snowball sampling was used as the chief sampling technique for selecting research participants. The criteria for selection was that research participants for inclusion in the study should have the experience relating to the phenomenon, that is, be educational leaders, verbally fluent and able to communicate their feelings, thoughts and perceptions about the phenomenon to be researched. While an eclectic phenomenological approach was adopted, the main data-gathering tool in phenomenology is the in-depth, semi-structured interviews (Van der Mescht, 2004). The inquiry was initiated through open discussion and conversation, with questions flowing from the dialogue as it unfolded. However, the use of phenomenological method was a deliberate commitment to an understanding of the social meaning of women primary school heads' lived experiences. Although phenomenological analysis has something to do with meanings in contexts and emerging of themes from research participants, its analysis does not go beyond interpretation; hence, my presentation in this chapter takes a different approach.

With the approach that was adopted in analysing data, issues that emerged from the study included lack of acceptance of women leaders by both male and female teaching staff and the assumption that leadership is for men was linked to women's lack of aspiration. However, my argument, in line with Blackmore's (1998) contestation that the dominant research approaches to leadership, presents 'seemingly neutral and unproblematic accounts that ignore issues associated with gender inequalities, organisational power differential and organisational politics' (Ford, 2005:241). To examine further the issue of justice and gender relating to educational leadership, a critical approach was adopted, to analyse the impact of organisation theory in the field of leadership. Women leaders and feminist researchers (Blackmore, 1998; Chiu & Walker, 2007; Enomoto, 2000; Ford, 2005; Shakeshaft, Brown, Irby, Crogan, & Ballenger, 2007) perceive the dominant discourse as denying individual differences, ignoring context and giving little or no consideration to the influence of diverse settings within which educational leaders and subordinates operate. Feminist researchers have modified and created important ways of viewing the world through consciousness raising or specific policy recommendations and in a way contributed to social change.

Findings

The main themes that emerged from the participants were linked to women's roles as educational leaders and how they perceived power. While a number of themes emerged in bigger project of the study, this chapter focuses on the constraining factors the injustices experienced by participants and how the women responded to the challenges and, in the process, enacted the ethics of caring and nurturance in their approach to leadership. The first challenge which emerged as one of the important themes was resistance to women leadership. The participants linked this to both the organisational structures and culture of society, since they were the first group of women to be appointed as school heads after Zimbabwe's independence in 1980.

From the participants' discussion of how they responded to the challenges emerged another broad theme, reshaping the school's 'culture' in order to bring about social change within the school community. Although the women did not mention directly the type of leadership they enacted, grounded in the findings were themes such as nurturance, creativity, caring and empowerment. Drawing from Theoharis' (2007) article, we are informed that social justice leadership goes beyond just being good leaders but sees it as a process of exercising and practising good morals, being sensitive to issues of fairness and having an ethic of caring and empathy. These concepts link well with the themes that emerged in the study of women school leaders, as major approaches that facilitated their breakthrough in the creation of favourable atmosphere within school environments such as those in Zimbabwe. The women's descriptions of their experiences of handling challenges as they felt were like shaping the culture in a different way. It is from these broad themes that the issues of social justice are clearly reflected. This study brings to the fore complexities of educational leadership, social justice and equity issues within the field of education particularly contexts such as that experienced by the women school heads in my study.

The study from which the findings were drawn was an interesting one in that the women interviewed were the pioneer group to be in educational leadership positions after Zimbabwe's independence in 1980. The major questions the women focused on in their responses were: 'How did you get your promotion to the level where you are?' 'What was your first experience in this position?' 'How did you handle the different situations that you came across?'

All of them acknowledged that their promotion was a response to an advert. According to their understanding, not many had applied or responded to the advert in most regions. When they were appointed, they all were deployed as deputy school heads. For the sake of this chapter, I will focus on just one (Enita – pseudonym) of the participants. My reason for choosing this particular one is that she did not see herself in isolation as reflected in her introduction. Enita said:

> At first I was excited and felt I had done a great achievement. Unfortunately we were the first group of women to be in headship positions and as a result, we received a great deal of resistance and that was a big challenge (direct quotes from Enita)

When Enita assumed the leadership position, she thought she would just fit into the system like the male leaders did. When she was not accepted as a leader within the community that is when she realised, leadership was perceived as a domain for men and not women. She went further to elaborate on her experience still in plural terms:

> On our arrival as a substantive deputy heads both the acting heads and the heads did not like it… In my case, 'I was more of a rubber stamp.' The head and the 'so called deputy head' would discuss school issues without telling me or consulting me. The head could lock the office when-ever he wanted to go somewhere and give the keys to an ordinary teacher without even telling 'you' that he will be away. He did not want to accept my presence as his deputy. (direct quotes from Enita)

If leadership for social justice was being practised in those schools, it would have meant women's deployment in schools could have been accepted with recognition and respect and not resistance. In Zembylas' (2010) article on 'The emotional aspects of leadership for social justice', although its focus was on implications for leadership preparation, it articulated on tensions involved in leaders' struggles for equity and justice in schools. It highlighted the importance of emotional tools during times of turbulence like the ones faced by both females and male leaders discussed in this study. The women's entry into leadership positions was a radical move by the Zimbabwean government, an unplanned change process that was happening in these schools. It became a challenge to both parties as it needed change of structures and cultures, women venturing into male domain and the community in their life time for the first time seeing a woman trying to lead. It came as a culture shock that needed both the community, the acting heads and deputies to embrace and enact leadership for social justice. Theoharis' (2007) definition of social justice leadership as leadership which promotes social inclusion and respect for others, care and equity clearly shows that if justice is to be enacted in schools, historically marginalised issues should be considered seriously.

Working as deputy heads was more challenging than when they were promoted to headship positions. However, even then, when they had been promoted, their arrival to the new schools for their principalship post was not that easy. Resistance still existed, as Enita articulated:

> At this school there was no hand over take over. Before I came to this school, there was an acting head who, pretended to be good when he heard that I was coming to head the school. Yet he was busy writing letters to all responsible authorities and offices influencing them not to accept me. I was shown the copy at the Ministry of Education which had signatures of the School Development Committee (S.D.C)members saying that they do not want a woman head they wanted the man who was acting. (direct quotes from Enita)

These findings led me to reflect on the structural and cultural inequalities that seem to perpetuate the injustices in school organisations. Chiu and Walker (2007:733) argue that: 'school communities are unlikely to become more sensitive to issues of social justice unless the formal processes and structures which restrict equity are changed'. If the community as a society perceived women as leaders and valued them as such, they would not have been manipulated to the extent of endorsing their signatures supporting issues reflecting injustice in an organisation.

Enita added acknowledging that:

> When they showed me the letter they said they just wanted me to know the environment that I was going into. So I was told to 'pretend' not to know anything about that and I did that.

Although it is true that discrimination towards women in organisations exists, what is worrying is that it persists in different forms. This observation is also echoed by Fletcher (2010) who highlighted on the importance of identifying the kind of gender stereotype a culture holds. Looking at Enita's scenario, one gets the impression and convinced that social justice should be a concern with addressing issues on marginalisation and exclusionary processes – educational leadership not an exception, within educational environments (Bogotch, 2002; Gewirtz, 1998; Goldfarb & Grinberg, 2002; Theoharis, 2007). In the case of Enita, the information that the previously acting head and the community was not in favour of her coming to that school, while insulting, helped her to think of a strategy to find her way forwards as she indicated:

> I started by calling the School Development Committee members. I introduced myself to them knowing that they don't want me. Because they thought I did not know anything about their story behind their letter, they welcomed me as if there was nothing. (direct quotes from Enita)

Drawing on Zembylas' (2010) concept of emotional tools in the fight for social justice, I see women in this study handling their emotions in a unique way and creatively applied to bring the community and the school together. As mentioned before that the move to address inequalities that existed before was in fact a radical change, Enita presents a lived experience journey of the change process and its complexities, as she notes:

> I approached the chairman of the school development committee and he took me around showing me the school, but there was no hand over take over. No financial records for the school, no water … the taps were locked … no electricity and yet the school used to have electricity. Some of the buildings were falling. (direct quotes from Enita)

Automatically, a number of issues can be seen unravelling themselves from this type of community. Induction into the system and mentoring was not an option, it was not featuring. Chiu and Walker (2007) focusing on Hong Kong and looking at social justice and leadership in schools contented that the meaning of social justice is not static but contextually specific and societal based. In the case such as that of Enita, access to information and resources was barred. The previous leadership did no justice to the woman head. In women's vocabulary the terms creativity, nurturance and empowerment emerged as themes from the data. One of the ways the women in this study used to overcome challenges they faced in schools was creativity. They developed mechanisms of interacting with everyone within the school community starting with the senior teachers, the responsible authorities and the community. Enita concluded:

> With the support of the responsible authority and the senior teacher, I worked my way out. The water was unlocked and the electricity re-connected. I asked for permission from the responsible authority to start my own new records and he gave me a go ahead. I made progress. (direct quotes from Enita)

While the women did not even mention the term justice, their emphasis on bringing together the school and the community, pulling together and involving the senior teachers, reflects leadership with moral values. It reflects leadership that respects and in the process people feel included, and they result in taking ownership of the different activities within the school. In my introductory section, I made it clear that the definition for social justice in this write-up is taken to mean views that are not discriminatory. Leadership for social justice is therefore perceived as those forms of leadership that reflect a shift away from the traditional notions of power as control or as the domination of decision-making. In women's approaches to leadership, though they are perceived as passive, their impact is slow but effective. Capper, Theoharis, and Sebastian (2006) in their framework for preparing leaders for social justice raised an important issue about principals needing skills to empower staff through setting up structures that facilitate collaboration and shared decision-making. In a similar manner, women in this study were concerned with communitarian and collective activities which is an approach that steered up their followers towards self-development. The emphasis on reciprocity, shared responsibilities reflecting values of love, nurturance and involving others through creative mechanisms, is what characterises empowerment. Enita brought the community closer to the school through good communication skills. One of the challenges she struggled with as she mentioned was that:

> The school was a farm school and had children from surrounding farms but those children were not contributing anything to the school. I tried to find out what exactly was happening…

> I talked to one of the farmer first… The parents could not afford to pay fees for their children. …So I approached the farmers surrounding the school on behalf of the parents, so that the farmers pay the fees and uniforms for the children and hold back part of the parent's money every month until the bill is over. I called the parents and discussed the issue with them highlighting the advantages of this approach to handling their financial challenges. Parents indicated that transparency was a missing factor which they believed would be addressed through the discussed approach to solving their fees and uniform problem. (real story from Enita)

Leadership for social justice is leadership that respects the integrity of others and is sensitive to moral values issues. Although this approach involved a lot of movement, it necessitated the participation of every stakeholder, and as a result, the school gained support from the whole community. Enita's story continued thus:

> The parents were taking the children to work in the farm fields leading to frequent absenteeism from school. So I had to approach the farmers again to discuss the issue of child labour and abuse since they were employing these small kids leaving them with no time to go to school. Some were baby-sitting while parents were going to work. It was an issue of educating the whole community. It took us about 3 years for the community to conform, but at least progress academically was finally raised. We introduced garden and poultry projects. These projects boosted our school budget that we managed to renovate some of the school buildings. (direct quotes from Enita)

Implications for Research and Practice

Not much research on social justice and human rights has been carried out in Zimbabwe just like many other countries. Education is a human right, however, curriculum consciousness needs to include an accurate history of schooling and articulate the nature of inequality reproduced daily. The forms of inequality that exist can only be detected through more research attempts. Although basic learning begins within the family followed by formal schooling which is a process of developing an individual's potentials, consistent with social values, it is important, however, to recognise that the concept of leadership does not enjoy any ontological status free from the mechanism of society. Hence, despite education being a human right, the issue of moral development of individuals, a sense of justice and an appreciation of others is of importance to be nurtured in both children and adults through the work of educational leaders and their colleagues in schools and the community.

This study does provides not only for Zimbabwe but many other countries a framework on which to build further work in the country that has done so much to educate its population but with little concern for human rights and social justice issues. All gender stereotyping should be somehow eliminated, if a sense of justice and a commitment to just institutions is to be fostered. The importance of theory in educational leadership should therefore not be taken for granted. Since theory seeks to explain practice, it provides leaders with a guide to action and has implications for what goes on in organisations, for instance, in education, particularly in schools. Feminist theorists challenge the emphasis on 'hierarchy and efficiency', such as the approach advocated by scientific management, which has led to the 'myth of a neutral professional educator' (Enomoto, 2000:376). The study demonstrates that nurturance is the theme connecting women's ways of leadership and their ability to empower others for social justice. Success of women educational leaders in this study depended mostly on their ability to develop a network of influence and interaction patterns which are different from those exercised from within the mainstream leadership approaches.

Transformational Leadership and the Practice of Social Justice

Bass' (1985) model of transformational leadership resonates well with Hurty (1995) power with model of leadership using an interactive approach. From the findings of the study in this chapter, it shows that interactive leadership (reciprocity) encourages participation and arouses enthusiasm for work. In the same way, nurturance of children's growth, treating them with dignity, respect and trust and giving them support and encouragement, require 'reciprocal obligation' (Hurty:389), that is, communicating with others and listening to and learning from their points of view. It was only through talking to both the children and the teachers that the school head got to know the truth about the school situation since no records were archived for information storage. Enita, the school head, did not turn away the children because they could not afford to pay fees. She was innovative and sought to involve the parents to be responsible for their own children in a creative way. The surrounding farmers who were the employers of these parents were indirectly involved in the development of the school since they agreed to open accounts for these parents. The type of leadership reflected in this study was that of the 'servant leader' whose motivation for leadership is the desire to serve (Russell, 2001). Enita as a school head worked together with the senior teachers and retained the dignity of the children. This was demonstrated by showing an attitude of concern for parents' inability to sponsor for the education of their children and an appreciation of pupils, by developing the capacity for listening, eliciting trust. Hurty's notion of interaction resonates with Bass and Alvio's (1994) concept, the transformational theory in that leadership is seen as shifted from simply leading followers to 'empowering them to become leaders through the development of a relationship of mutual stimulation and trust' (Boehnke, Bontis, Distefano, & Distefano, 2003:6). While the women in this study were treated with injustice when they initially joined leadership in schools, they did not assume their leadership roles using the preconceived notions of styles. Given the opportunity to focus attention on the roles and experiences of women who are in educational leadership positions, the educational research community would gain new insights that can be offered for the transformation of schools. Offering new ways of understanding and using power would enhance the opportunity to enact leadership for social justice in schools. Literature shows that:

> Many women in school administration view power as being multi-dimensional and multidirectional and encourage empowerment of all organisational members through the development of communities based on collective values and actions. (Fennell, 2002:100)

This augurs well with the notion of leadership for social justice defined in this write-up. Andrews and Crowther (2002) noted that the past decade has seen major developments in the reconceptualisation of educational leadership for successful school reform. In the similar vein, Hayes, Christie, Mills, and Lingard (2004:520) also place emphasis on those 'forms of leadership that support the development of whole school communities as learning organisations', just as reflected in the study of women school heads. These views about leadership relate well with Lambert's (2000:3) thinking that leadership should be 'embedded in the school community' as a whole because leadership is about 'learning together' and 'constructing meaning and knowledge collectively and collaboratively'.

One of the leading feminists in the field of leadership, Shakeshaft noted that:

> There are scores of great women whose stories lie buried in school historical societies, and in the archives of national organisations. Learning more of their lives may help to shape and understand the knowledge base; at the very least, such research will provide a fuller explanation of the legacy of their early courage and sacrifice. (Shakeshaft, 1999:114)

What Shakeshaft is arguing for in effect is an alternative discourse on leadership. This is in line with Hurty's work, who used the writings of one of the early feminists, Charlotte Perkins Gilman, to posit an alternative discourse about female leadership. Gilman (in Hurty, 1995) argued that the ideal is a humane society, not a patriarchal masculine-dominated one. On this point Gilman raised the issue that Okin (1989) also challenged. Gilman's writings highlighted a methodology which requires a full exploration of women's experience. Her discussion of education places women in participatory and responsible positions. For Gilman:

> The mother is the first co-ordinator, legislator, administrator and executive. From the guardian and guidance of her cubs and kittens up to the longer, larger management of human youth, she is the first to consider group interests and correlate them …. (Gilman, 1911:183 cited in Hurty, 1995:399)

Drawing on the work of Mary Parker Follett (1924) to demonstrate a conceptualisation of power that was intended for practical, participatory strategies in the business community, Follett devoted her life to the study of how people treated each other. This write-up is trying to make sense of the role of educational leaders in offering socially just educational environments. Follett's theoretical work included studies of human interaction, conflict resolution and decision-making in organisations. In her theorising, Follett believed that people grew and changed by talking through conflicts and differences, searching for what each party really needed (Hurty, 1995; Brown, 2004). Such processes of negotiation do not rely on traditional notions of power as control or as the domination of decision-making. The authenticity and integrity of female experiences, often hidden or missing from the public historical record, can be appreciated as contributions to more fully accountable stories of human, social and moral development. Women in Hurty's study got tired, angry, frustrated and shared those feelings honestly with their subordinates. Unlike in this study, for instance, Enita, when she was informed about her community resisting actions on her arrival, might have gotten frustrated or angry; however, how she was supposed to respond and how she managed that were just but fighting with her emotions. Enita still had to work together with that same community which had mixed feelings about her coming. Consistent with Follett's thinking about conflict resolutions or approaches to challenges is Irby, Brown, Duffy, and Trautman's (2002) concept of synergistic leadership theory, synergistic meaning working together. Synergistic thinking in terms of understanding school leadership is important because when people work together in administrative meetings, school meetings, parent-teacher associations and with the community, they have contradictions and different opinions over certain issues, but they still have to come to a common goal. In the same way, Enita did not remain focused on the negative aspect but looked for 'the way forward'.

Leadership for Social Justice

The theory that moves leadership away from its traditional organisational setting and its focus on effectiveness is the notion of leadership for social justice discussed in this chapter. Capper et al. (2006) linked leadership to social justice issues by proposing a framework for conceptualising how leaders can be skilled to sensitise communities for social justice. The importance of community involvement in fighting the issues of social justice is echoed by many authors. In consistent with this thinking is Rawls (2003) observation as explored earlier in this write-up who challenged society to develop a sense of justice in its members. In a similar vein Riester, Pursch, and Skrla (2002) talking about the principles of social justice highlight ideas which augur well with Capper et al. (2006:213) who argue that 'school leaders need to embody a social justice consciousness within their beliefs systems or values'. When the women school head in this study initially entered into leadership positions, there was no gender sensitivity nor social justice consciousness on the part of the leaders and the community they were deployed, as reflected in the type of resistance they encountered. This suggests that leaders within schools should be gender sensitive and morally conscious and treat every human with fairness. However, when these women got the opportunity to exercise their leadership, they facilitated a culture of openness, respect and caring through their interactional patterns and in the process created a socially just educational environment, by letting everyone take responsibility and be involved in the development of the school. By approaching different stakeholders including the farmers and parents, Enita valued them as people who can make a difference even despite parents having poor or children coming from poor backgrounds. Russell (2001) perceives values as core beliefs that stimulate human behaviour. In the same way, Capper et al.'s (2006:212) framework depicts on what 'school leaders must believe, know and do to lead *socially just schools*'.

Bringing the community together is a skill that needs commitment and moral ethics. It requires not just theoretical approach but practical engagement in the process of making a new shift. For Mckenzie and Scheurich (2004:609) enacting social justice takes on practical dimensions that need principals with skills to encourage their staff 'to get to know their students' and to facilitate dialogue with 'their students' families and community on a personal level' and to 'dignify the culture of their students'. All this is about respect for one another and being sensitive to issues of moral values. Justice and fairness is about being considerate of human dignity despite colour or race and gender. Mckenzie and Scheurich (2004) remind us that students and staff members appreciate diversity of cultures and beliefs through both study and direct experience and suggested that school principals can help children develop social skills and moral values through modelling, direct instruction and continual practice. In building upon Mckenzie and Scheurich's idea of facilitation, Shields, Larocque, and Oberg (2002) supported the notion that leaders need the skills to lead dialogue that engages staff about issues of race and ethnicity and for people to re-examine their own practices, perceptions and beliefs. Why social justice issues have become important in literature today is the genuine concern to improve educational environments which are not just culturally but racially diverse. Women as a resource have the potential talents for promoting leadership for social justice in schools. However, not much has been done globally to progress these talents as indicated by Blackmore (2009) in her observation of the Australian context.

The women school heads in this study (Enita and others not cited here) used creativity in their communication as they applied new ways of dealing with different challenges in their leadership. They enacted leadership that was more inclusive and accommodative of everyone without discriminating. The provision of sensitive and respectful treatment of both parents and the pupils showed the women's interpersonal principles of justice. While the study for this write-up cannot be generalised to every school, leader or society, there are lessons that can be learned which can help school leaders to improve their perceptions of their own school communities irrespective of the pupils class, cultural and ethnic backgrounds. The writer sought to highlight the uniqueness of the approaches enacted by women in an effort to combat the practices of injustices that reflected in their schools. The chapter demonstrated how leadership facilitated the creation of socially just educational environments within the discussed communities. Using literature, the author tried to demonstrate how and why, from a global context, a concern for social justice has risen. There is a need however to ensure that the school curriculum is gender sensitive and highlights women's achievements. Referring to issues of social justice at work and gender sensitivity, a need for adjusting the traditional hierarchies and drawing on flexible approaches inclusive of the school community is advocated.

Chapter 42
Leadership, Educational Development, and Social Development

Joaquín Gairín and David Rodríguez-Gómez

Introduction

Education is a social construct permeated with values and one of the main instruments of socialization available to societies and power groups. Therefore, education has always been highly politicized. However, the development of clear and stable educational policies that contribute to substantial social improvements is still a major hurdle in the majority of democratic societies today. Unfortunately, education still reproduces inequalities (such as schools for the rich and poor, unequal access to the right to education, and insufficiently inclusive programs) and is not always a factor of social cohesion.

We should recall that the European Union set improvements in educational results and social cohesion as one of its priority objectives for 2010, two outcomes in which little headway has been made if we take into account some of the results from the latest international evaluations. Therefore, the goal is still to make inroads in strengthening the relationships between social and educational commitments, which would entail arduous efforts that combine constant progress in educational participation, equity, and quality (Santos Rego & Barca Lozano, 2009), factors which are directly related to social justice.

Considering the multiple meanings of and approaches to the concept of social justice (i.e., Bogotch, 2000; Dantley & Tillman, 2006; Furman & Gruenewald, 2004; Soho, Merchant, & Lugg, 2005; Theoharis, 2007), and the fact that it is a construct that is highly dependent on the context in which it is used, in this chapter social justice will be considered directly linked to the processes of educational and social development inherent to each different context and in relation to the users of education.

Educational institutions, as organizations which play an active role in educational policies, are thus facing new social demands and requirements which involve transforming themselves as institutions for preparing students to participate more actively in increasingly diverse, complex, and dynamic communities. This change is necessary, yet it is only possible if the different educational contexts themselves change their traditional ways of acting in order to promote the development of educational leaders who are prepared to handle and respond satisfactorily to these challenges, thus generating "schools that advocate for education that advance the rights and education for all children" (Jean-Marie, Normore & Brooks, 2009, p. 2). As Tolosana and Muñoz (2010) suggest, educational centers "should be contexts of participation, management, and personal and collective realization" (p. 24).

Among other issues, as Bogotch (2000) notes, "the ongoing leadership challenge is to create social and political spaces for advocates, as well as outlaws, to function inside and out schools and deliberately to encourage activists and radical intellectuals to make explicit the connections to their subjective meaning of social justice" (p. 9).

School leaders, as the cornerstone for the improvement of disadvantaged schools, should have the expertise and specialized knowledge to face the challenges of education in the twenty-first century, combining a fair balance of quality and equity (OECD, 2012). The role of educational leaders should be reconsidered, taking as a reference the complex realities of school and the community which should collectively be developed to contribute to social development. In this regard, educational leadership beliefs should be revised to include perspectives of critical pedagogy (Freire, 1970), thereby strengthening their commitment to social justice by connecting their contributions to social development and promoting more democratic and inclusive social relations and institutions (Allen, 2006; Jean-Marie et al., 2009; McKenzie et al., 2008).

From this new vantage point, it makes sense to regard educational managers and leaders as agents of change, community leaders, and as promoters of social development through educational development. In contrast to a management model of maintenance, we propose management for transformation in which the values of equity, justice, commitment, and cooperation take priority over the traditional values of equality, efficiency, control, and competitiveness and all of this from the perspective that combines personal ethics with the social ethics and responsibility of the organization.

This chapter addresses issues linked to educational and social development, viewing educational organizations as an instrument to promote this development, community leadership, and ethics in organizations. The chapter will close with a description of an experience in educational and social development in the commune of Coyhaique (Chile), financed by the Spanish International Development Cooperation Agency (AECID), which involves 12 educational centers, a variety of programs (both school and social), and diverse collectives (i.e., vulnerable schoolchildren, maladapted youths, broken families). Its management is an example of cooperation and involvement in the region by several universities (both Spanish and Chilean) along with private and public institutions.

Educational Development and Social Development

Educational and training inequalities due to geographic or social origin or based on job, salary, or income opportunities are critical dimensions in social disaffiliation or exclusion, meant as the individual's inability to participate in the basic political, social, and economic functioning of the society in which he or she lives (Castel, 1995; Tsakloglou & Papadopoulos, 2002). According to OECD data (OECD, 2012), almost 20 % of students do not develop enough basic skills to function in today's society, and students of low socioeconomic status are more likely to be at risk of school failure. National education systems are not the only or the primary causes of social inequalities; however, they occupy a central place in developing compensatory actions that may contribute to lowering inequalities among youngsters of all classes and conditions.

The development of policies, including educational policies, which expand the access to opportunities, is fundamental in combating the permanent nature of exclusion and promoting democratic and healthy societies. As Ainscow (2008) reminds us, "to create a fairer society we must develop more equitable systems in the field of education that enable us to effectively handle the link between disadvantage, education, and opportunities" (p. 263). However, the development of fairer societies entails finding a balance between skepticism of the current role of educational institutions and the educational optimism which claims education – in and around educational institutions – as the cause of social equity (Tedesco, 2010).

There are studies that note the clear relationship between educational level, social development, and economic development (Bernard, Encinas-Martín, Rogers, Sato, & Valentini, 2009; Lind, 2008; Machin, 2006; OECD, 2006; Richmond, Robinson, & Sachs-Israel, 2008). Strengthening educational institutions, therefore, is an important factor in boosting the competitiveness of the social, economic, and productive structures and in fostering the development of a competent, committed citizenry. Today, one of the indicators of a community's commitment to social and economic development is a measure of how a society's tertiary educational systems are committed to research and development (R&D) indexes, the transfer and development with the productive sectors of society, and the processes of creating new scientific and technical knowledge.

Educational development can contribute to social development and can lower social inequalities and injustices if we first accept the belief that educational institutions today are partly responsible for the inequality of educational opportunities for whatever reasons (e.g., race, gender, culture, and socioeconomic level, among others) which perpetuate and accentuate social exclusion. Therefore, promoting educational development should enable people to establish a responsible, open, and critical relationship with their environment, which should enable them to make headway towards fairer societies.

Tedesco (2010) proposes five key strands which pose serious theoretical and political questions on their future of educational development. Based on these strands, strategic educational actions might enable us to move towards fairer societies:

(a) Early education: Early intervention, before inequalities are reproduced, is fundamental in breaking the vicious circle of social exclusion. Only through educational policies that place importance on early childhood education and developing strategies (i.e., educational, affective, health, and nutritional) that lower inequalities during the early years of life will greater levels of equity be achieved in adult life.

(b) Educators and pedagogical knowledge: Today, no one doubts that the quality of education rests largely on the quality of the educators (i.e., the existence of a suitable plan, a clear orientation towards teaching, commitment and responsibility with the results, teamwork, and the institutional climate). However, we are living in a time when the teaching profession is losing prestige, and there is a surge in low motivation and mistrust in the learning potential of the teachers themselves. This situation reveals the need to revise the effectiveness and relevancy of pedagogical knowledge, to develop collective teaching professionalism, to improve working conditions, and to provide professional development plans according to the individuals and contexts in which educators work.

(c) Scientific literacy and citizen training: Two of the cornerstones of fair, high-quality education are "learning how to learn" and "learning how to live together" (Delors, 1996). Scientific literacy is a necessary, though not sufficient, condition for the development of a critical, reflexive citizenry and a concomitant drop in the social fragmentation derived from this "cognitive divide." This scientific and citizen training can be achieved through both formal and informal education.

(d) Digital literacy: The rising presence of the information and communication technologies (ICTs) in recent years offers a new source of exclusion and inequality, digital ones (DiMaggio, Hargittai, Celeste, & Shafer, 2004; Warschauer, 2003). Digital inequalities stem initially first from access to these technologies and secondly from the motivation, capacity, and effective use made of them. Even though educational centers can contribute significantly to lowering these digital inequalities, recent studies show that schools play a secondary role in the development of digital competences (Meneses & Momino, 2010). If so, we must think about effective processes of including ICTs in the day-to-day business of schooling so that they can have the desired effects on better school performance.

(e) Subjectivity policies: The four elements or strands of intervention listed above are crucial in efforts to lower social inequalities, but they are not enough in

> themselves. We must also more strongly affect the subjective determinant that reproduces social inequalities and explains individuals' limitations in generating and achieving their aspirations. "The contexts and frameworks of references in which households operate influence both individuals' aspirations to achieve different functions and their perceptions regarding the possibilities of achieving the goals they set" (UNDP, 2010, p. 81). Therefore, it is not enough to solely work on the material results of learning as a way of promoting fairer societies; rather we must also influence the subjective dimension of the main stakeholders in the teaching-learning process.

How do we achieve the factors above which are linked directly to educational processes which influence educational and social development of any country? To do so requires that we talk about both educational exclusion and social exclusion. Fortunately, educational and social exclusions are neither natural nor episodic; rather they are processes that are developed and constructed in socio-educational contexts in which school, personal, and social factors converge, and we can act on these factors to attenuate and/or combat these exclusions.

We can now say that the development of high-quality education for everyone is the sine qua non condition for lowering school failure rates and achieving a just society. However, in recent years, because of decontextualized educational policies, practices have been developed based on the erroneous equation of educational quality and equity with earning the best results on a variety of exams and tests (such as PISA tests). These practices have had a variety of results which often penalize the schools and students who are situated in and start from more disadvantaged positions. This results in boosting the dissatisfaction with the processes and results of education and neutralizing the democratizing effect of the expansion of school coverage (Ainscow, 2008; Tedesco, 2010).

We also recognize the efforts being made in Latin American countries [and Spain] to spread basic and middle-level instruction (OEI, 2010); however, these initiatives aimed at developing "quantitative" policies (e.g., education for as many citizens as possible) must be complemented with "qualitative" policies of positive anti-discrimination and support for the social collectives whose economic, geographic, ethnic, or cultural vulnerability leads them to experience more problems.

However, affecting social and community development, and promoting equity and social justice based on educational processes, is extremely complicated if it does not come hand in hand with the involvement and commitment of the local, political, civic, and economic authorities of the sphere of action. Overarching policies are needed which include social commitments, but at the same time, they must be aligned with ethical practices among the authorities, territories, and educational centers.

In Spain, one clear example of the common effort among the different educational agents, authorities, and regions to lower social injustice is the "movement for quality education in Madrid" since the mid-1990s. This movement is aimed at combating the process of social deterioration and marginalization in the southwest sections of this city which has experienced deindustrialization in the 1980s, the proliferation of drug addiction since the early 1990s, and the settlements of marginal shanty town dwellers

(Casas, 2008). This movement, which is essentially made up of teachers, families, unions, and neighborhood and cultural associations and which has close ties to the social and educational worlds, "managed to exert a significant influence among public opinion, the authorities, and the school and social community in the zone" (Casas, p. 211). Its objectives were:

1. To demand the legal, budgetary, and organizational measures that would enable them to offset the sociocultural deficits of the affected population
2. To promote the involvement and coordination of all administrations in the task of education
3. To spearhead coordination among schools, especially primary and secondary schools
4. To draw up and disseminate new theoretical and practical perspectives on the subject of the movement
5. To encourage other entities and associations to develop educational practices (education open to the environment)

Another example of educational actions that aims to contribute to social justice has been the "local educational plans" promoted by the Department of Education of the Generalitat de Catalunya. This is an open educational cooperation initiative which aims to offer comprehensive, community responses to the educational needs of children and adolescents by coordinating and promoting educational action in the region outside the schools (Generalitat de Catalunya, 2011). As a strategy for social transformation, the local educational plans strive to:

- Contribute to the goal of finding a balance between competitiveness, individual effort, and the struggle against inequalities which emerged from the conference[1] that the European Council held in Lisbon on the 23rd and 24th of March 2000 to reach a new strategic objective for the European Union aimed at strengthening employment, economic reform, and social cohesion as part of a knowledge-based economy.
- Handle the steady rise in immigrants and the new demands being placed on educational centers, which are recommended joint, complementary educational actions among families, schools, and all the local educational stakeholders.

The two major objectives of the local educational plans are thus related to the following: (1) achieving educational success for all students in their personal, social, academic, and job-related dimensions, so that they develop a rich and balanced personal identity, acquire the competences they need to rise to the challenges of daily life, and develop the social skills and right attitudes to live peacefully in today's society and (2) promoting social cohesion through intercultural education, equality, and fostering the use of Catalan to contribute to creating a common space of values shared by the entire citizenry which fosters peaceful coexistence through the respect for diversity.

---

Other examples of synergies between educational programs and social community development can be found in the *favelas* of Sao Paolo, Brazil, and the educational and social services in marginalized neighborhoods like Barcelona's El Raval, the professional initiation activities being disseminated in several Latin American countries (Peru, Bolivia, Nicaragua, etc.) by civic associations. All of them aim to promote social inclusion through education.

Educational Leadership, Commitment, and Social Justice

Even though it is true that studies reveal that teachers (their beliefs, attitudes, and actions) are crucial to the effective development of inclusive practices that contribute to social justice, they are not the only factor to take into account. Inclusive practices also rely on the influence of educational policies, either state or municipal, as well as the forms and styles in which schools are managed and operated (Ainscow, 2008).

Just like other authors (Pont, Nusche, & Moorman, 2009), we are referring to school leadership in the broadest sense, which includes school managers and other external and internal agents who affect school administration and operations, in short all the agents (principal, head of curriculum, heads of educational departments, etc.) devoted to coordinating the work of other professionals. Recognition of the importance of school leaders in the progress of educational centers is unquestionable. The rising complexity of educational organizations and particularly the gradual increase in the levels of autonomy and responsibility are leading to greater difficulties in the managerial functions (i.e., planning, delegating jobs, coordinating, executing, and monitoring). They also require a revamping of the concept of school management to adapt to the contextual needs and demands by promoting the development of leaders who are grounded and contribute to creating solid social and organizational knowledge through their day-to-day experiences.

There is a clear tendency, which is even further accentuated in some English-speaking countries (but not the USA) to provide greater autonomy to schools, turning them into key agents of change in improving the quality of the educational system and in boosting students' performance and social cohesion and lowering dropout rates.

This greater autonomy (pedagogically, organizational, managerial, and in relation to the surroundings) and the reconsideration of schools as network nodes where social, political, and cultural change can be promoted entail a reconsideration of the role of the leaders at public educational centers. Their competences and responsibilities expand, and they take on necessary functions for the proper exercise of institutional autonomy: participating in determining the staff, in selecting part of this teaching staff, and in determining the internal organizational structure, among others. Within this framework, both educational leaders and educational researchers should remind society of the essential role played by schools in promoting democracy and insist on their role as intellectual activists which contribute to strengthening this democracy (Kochan & Reed, 2005a). These new assumptions are aligned with some of the characteristics that school leadership should have if it aims to effectively contribute to social justice as transformative, technically and morally balanced (Dantley & Tillman, 2006), distributed (Pont et al., 2009), collaborative, and communitarian (Kochan & Reed, 2005b).

> Inclusive administrative practice is rooted in values of equity and social justice; it requires administrators to bring their full subjectivities to bear on their practice, and it implicates language as a key mechanism for both oppression and transformation. (Riehl, 2000, p. 55)

Moving towards more inclusive and committed systems and schools which face a higher degree of uncertainty also requires the development of competences to manage and promote change based on constructive, interactive educational leadership which is shared with the educational community, which jointly constructs meanings, and which shares a common educational purpose.

Thus, the concept of school leadership must be extended to encourage and foster distributed leadership through the creation of new structures and ad hoc teams without neglecting the need to strengthen the existing structures and bodies (such as the school board or head of curriculum), which give greater guarantees of successfully rising to the challenges facing schools (Lambert et al., 1995; Pont et al., 2009). Additionally, some studies (Mulford, Silins & Leithwood, 2006) have found relationships between distributed and transformative leadership, which enable the other members of the school community to participate and foster the organizational learning processes within schools. This is, we believe, a new profile for educational leaders with competencies and capacities to promote the development of an inclusive educational culture and effective instructional/curricular practices through greater ties between the school and its environment and through the professional development of its teaching staff (Hasazi & Shepherd, 2009; Huber, 2004; Pont et al., 2009; Riehl, 2000).

The distributed leadership to which we are referring is directly linked to what we could call a communitarian leadership profile which is charged with connecting and adapting the educational centers to their surroundings and to reinforcing their relations and ties with other educational and social agents and entities in their immediate environs. Their job is to open the school up to its environs and bring it into a local network that generates processes of knowledge management and collective learning and which shares resources and consequently facilitates the development and adaptation to this changing context to which we have referred to above (Gairín et al., 2011; Hargreaves, Halász, & Pont, 2008; Kochan & Reed, 2005b). However, promoting this profile of educational leadership and collaborative institutional culture open to its environs will not be an easy job when the vertical structures and individualism in school, reinforced by a poorly understood autonomy, are so accentuated and complexly resistant to change.

Several studies (i.e., Jean-Marie et al., 2009; Marshall & Oliva, 2006) note that oftentimes the subject-matter content linked to equity, democracy, and social justice is neglected or marginalized in the preparation programs of educational leadership, making it difficult for aspiring leaders to get an in-depth understanding of the issues and consequently for them to act effectively on behalf of social justice. Jean-Marie et al. suggest that the uses of the dialogic framework derived from critical pedagogy can help educational leaders to develop a profile more attuned to fostering social justice and handling the changing social conditions. Preparation programs for school managers and leaders must therefore offer spaces of "critical reflection, leadership praxis, critical discourse, and develop critical pedagogy related to issues of ethics, inclusion, democratic schooling, and social justice" (Jean-Marie et al., p. 20). The pedagogical activities of leaders under this perspective should combine the aforementioned contents with the development of positive sensibilities and attitudes towards communitarian work and action to combat inequalities and processes of marginalization.

Ethics and Social Justice in Organizations

Educational centers, as social institutions, must necessarily contribute to the social and community development of their immediate context by getting actively involved in lowering social differences (Jean-Marie et al., 2009; Tedesco, 2010) and accepting the social commitment that behooves them. Even though the instrumental conception of educational organizations is still valuable, "their role in promoting internal change and driving social transformation is increasingly emphasized" (Gairín & San Fabián, 2005, p. 181).

Educational institutions can contribute to making headway in democracy in society, or, to the contrary, they can perpetuate and foster the existing inequalities (Apple & Bean, 1997); their actions are not neutral and are framed around specific values that are either explicitly or implicitly ever-present. Hence, there is the need to stress the ethical nature of educational institutions, especially when viewed from Levinás' perspective based on the idea of otherness. Educational centers as organizations must side with the "other" and understand that it is through this "other" that they are what they are. "From the moment that the other looks at me, I am responsible for him without even having to take responsibilities in relation to him; his responsibility is incumbent upon me. It is a responsibility that goes beyond what I do" (Lévinas, 2000, p. 80).

This perspective pushes us to shift from personal ethics to organizational ethics. In other words, the view of managers as agents of change who act on persons cannot be separated from ethical considerations, nor should we separate organizational actions from the effects that they have on the people who interact with them. Ethics should not only encompass individuals' actions but also organizational action and even the organization's commitment to universal problems (Gairín, 2004). It should also refer to both real and virtual situations to avoid falling into relativism according to the means of communication. We thus fall within Edgar Morin's perspective, who speaks about the ethics of the human being as one of the kinds of knowledge needed for the education of the future. For this reason, he posits an approach that takes into account both the individual and the society and even the species. This entails envisioning humanity as a planetary community composed of individuals who live in democracies.

> I talk about self-ethics, socio-ethics, anthro-ethicsm and planetary ethics. And I do so because I see the individual, society, and the human species as interdependent categories. Above all, contemporary complexity makes it impossible to discard any of these perspectives. Today's problem with ethics is not duty, prescription, rules. We do not need categorical imperatives. We need to know whether the result of our actions corresponds to what we want for ourselves, for our society, and for the planet. We know that having good intentions is not enough, given that innumerable disastrous actions have been taken with good intentions. My ethics is an ethics of the goodness of thinking, and my entire idea of complex thinking is implicit in it. (Morin, 2004, p. 56)

Based on *individual consideration*, García and Dolan (1997) posited a different perspective in relation to management, linking it to values and introducing references to ethics and morality. In their view, true leadership includes a dialogue with values, which entails such things as a greater person orientation, help to achieve the strategic vision, and the inclusion of ethical and ecological principles. The consideration of ethical dimensions in leadership, even though they are implicit in many training and intervention processes, has not always been dealt with explicitly and treated as such. One example is the work by Pelletier (2003) focusing on the development of educational leaders. While his work presents many ideas for action and innovation in leaders (e.g., forging alliances, showing confidence, openness), it does not explicitly mention ethical behavior. Managers' actions are not neutral and usually have a range of consequences. What managers do affects the community, and they are therefore ethical acts because they generate favorable or unfavorable consequences for everyone and affect the institutional harmony.

There are diverse models of ethics, although the ones recognized by Nava (2003) are significant for their clarity as they identify typical managerial behaviors. A summary of his proposals is contained in Gairín (2004).

(a) The management model based on the ethics of exclusion, which can be identified by factors such as the following:

  - The ethical nature of decision-making. This is focused on the manager's sole criterion and as a demonstration of his power, authority, and self-complacency regarding his greater knowledge or ability. This entails the impossibility of accepting other approaches and denies others' freedom as it relegates them to oblivion.
  - The formation of groups in favor of the school's responsibility. The managers' work with unconditional lowers the chance of opportunities, fosters the existence of a narcissistic ethics, and boosts the difference between management and the moral and professional growth of the members of the organization. Here we can identify an instrumental ethics, since it seeks the simplest ways of achieving the organization's purposes; however, its application denies others' participation and the quest for the best working proposals.
  - The kind of communicative rationality. Here we are referring to the language of imposition which does away with other forms of manifestation, becoming a totalitarian language because it only has the formula of power and all its proposals are translated into domination. By denying educators as people with opinions and a language of their own, it is impossible to learn about the

diversity of opinions existing in schools, and words are often not found to address others.

(b) A management model based on a shared ethics, which is characterized by three factors:

- The nature of decision-making. Viewing management as a constant dialogue with the agents involved entails recognizing them as people, fostering shared purposes, and helping to eliminate entrenched perspectives that are not always coherent with collective commitments. It means recognizing a space for justice where the members' actions are not arbitrary but subjected to rules of cooperation and a climate of mutual respect.
- The manager's experience as a moral underpinning of management. The managers' experiences as teachers are fundamental in sharing the teaching and management approaches, thus effectively linking the teachers' needs with the institution's needs.
- The managers' actions as virtues when decisions are taken according to what one is morally obligated to do. This is only possible if the ways of operating reflect certain values.

The considerations above highlight the fact that managers are obligated to provide certain conditions of treatment and respect for the members of the educational community. This entails accepting the teachers and other organizational members as capable of proposing projects and creating conditions for change.

> Thinking about management as an ethical accompaniment means taking into account others' intentions, expectations, desires, and opinions; that is, the teacher's subjectivity should be borne in mind. The intentionality towards the other is the opposite of an individualistic management model. (Nava, 2003, p. 71)

Therefore, ethics should be a constant referent in managers' actions which can integrate ethical values into the entire set of values making up the culture of a center, or alternatively, ethics is the crosscutting referent of the other values and beliefs that make up the ethical universe of the institution.

Based on the *organizational consideration*, organizations are viewed as social spaces which are not only carriers of values but can also act in shaping new values and ways of acting that confer meaning on what had been done before. We are talking about the organization as a true ethical space where values like justice, reciprocity, cooperation, and creativity are manifested. Ethical commitment entails, among other things, a political commitment, effective codes of conduct, transparency in actions, and commitment to the stated values. We should also view that ethics in organizations is a dimension of the broader concept of civic ethics.

However, we tend to forget that educational intervention has a moral and ethical grounding and that a good education itself contains many ethical principles of action. When we say that the school should be autonomous and autochthonous, open and committed, updated and critical, participative and democratic, a school for opportunities that places the strengthening of leadership, the professional development of its teaching staff, the implementation of the information and communication technologies, and constant improvement as crosscutting policies (Gairín, 2003), this is precisely and literally what we mean.

Underlying the entire proposal is the idea of promoting an ethical, high-quality school for all citizens. This includes ongoing efforts to create a school that is (1) democratic in its objectives, processes, and purposes, (2) self-critical, (3) understanding, (4) not elitist, (5) inclusive, (6) integrative and equitable, (7) attentive to diversity and pluralities, (8) nondoctrinaire, (9) competent but not competitive, (10) open to dialogue and participative, and (11) committed to its surroundings and to social improvement, as befits a progressive view of education.

Thus, intervention includes and entails *ethical behavior* by organizations. The future depends not only on the evolution of the productive systems or the vitality of the values and citizen actions that direct and feed them but also the development reached by organizations as the context and text where people interact. Here is where education takes on meaning as a collective conscious, intentional project, as an expression of the utopia we want to achieve, and as the methodology for achieving it.

Organizational realities and processes express values and priorities. Free access to spaces is not the same as controlled entry or the existence of spaces that are restricted to certain actors; promoting diversity is not the same as uniformity; making action possible is not the same as constraining it. The organization is projected into what it is and what it does; we know this and confirm it through these examples. However, perhaps we should give it yet "another turn of the screw": organizations should analyze the reasons behind their actions and whether their actions and their results reflect or respond to the values they wish to project, that is, whether their actions are ethical or not, whether they generate positivity or not. The point is not that organizations do not educate or that they do not act with logical, legal purposes. The goal is to act from a positive human standpoint, reviewing what organizations do and what their forms of action entails.

In this regard, we have to consider the sense of using punishment or humiliation to achieve certain lessons; the use of selection, marginalization, or expulsion systems on certain users; the lack of proper security and hygiene in some facilities; the outsourcing of staff for conducting certain activities; the (usually economic) reasons why some real social problems are concealed; the use of economic reasons as the only reason to justify actions; the dogmatic and non-debatable beliefs on operation; the impunity of power; and the meanings of the official history.

Even organizations which are supposed to provide services to the community, but from an ethical perspective, their performance and conditions are destructive to their members. For example, how do we account for run-down senior citizen centers, companies that encourage NGOs while they destroy the environment, and institutions that combine exclusive services and services for the socially marginalized? We cannot ignore effects and conditions of social realities (Gairín, 2004). As such, we must reject any organizations that neither measure nor consider the effects of their decisions on people and society .We must criticize organizations that damage their members and the community even when they are providing required services. In such instances, the effects are often attributed to pragmatism, amoral leadership, and the transgression of ethical principles. The ethics of these approaches includes a commitment to improvement, and in this it is related to social justice. Thus, the goal is to uncover perversities not just to condemn but in order to act. Acting against these perversities is a process of reordering, of rethinking as a whole, of rebuilding the pathway as realities take shape, and of striving to generate more positive results. It is the idea of rethinking the culture and the perspective of viewing change as a cultural feature. The referents in all these cases are the values linked to human dignity, freedom, autonomy, equity, and equality.

We believe that getting back the ethical sense of organizations or ensuring that rules on content prevail is therefore fundamental when outlining and developing institutional guidelines. This insistence on the "why's" of what we do also entails a return to the human dimension of organizations and with it a consideration of people (with their feelings, attitudes, interests, and perversions) as an active, direct part of their success, including both external concerns (working conditions, effects on the social reality) and internal processes (people as a whole).

Therefore, we are calling for a new way of acting and managing educational institutions which not only emphasizes technical improvements in processes but also entails a concern with the underlying values and applied ethics.

Educational and Social Development in the Town of Coyhaique in Chile: An Experience to Share

The purposes of this project are first to validate a socio-educational development model for medium-sized Chilean municipalities and secondly the desire of the University of Talca (through its Institute of Education) to become an agent that promotes change and social transformation through social, technological, and human transfer strategies in the region.

The "Project on Support and Educational Strengthening in Management and Professional Teaching Competences" carried out in the commune of Coyhaique in southern Chile is a proposal promoted by several institutions (the University of Talca, the Training Foundation [FIDECAP], which depends on the Federation of Private Educational Institutions [FIDE], and CEIS Maristas) was coordinated by the Organizational Development Team (EDO, http://edo.uab.cat) at the Autonomous University of Barcelona and is funded by the Spanish International Development Cooperation Agency (AECID).

The reasons for choosing Coyhaique as the town to perform the activities that serve as a practice field for developing the model are linked to the region's situation of geographic, economic, and political marginalization and even more importantly to the fact that its academic results are among the lowest in the country. Likewise, Coyhaique is a region suffering from serious problems linked to social collapse and marginalization among a broad range of its population.

Regarding education, the commune or town of Coyhaique offers several levels of pre-basic, general basic, and middle education in the fields of science, the humanities, and professional technology at 16 educational centers, half of which are located in rural areas. Likewise, it has a special education school and a comprehensive adult training center, all of which depend on the town's education service. All told, the educational institutions in the region serve 5,000 students. These institutions, in turn, according to the figures from outside testing conducted nationally through SIMCE (educational quality measurement system) are the ones with the poorest academic results.

The town's educational leaders themselves identify three factors that somehow define the precarious status of the schools in the commune. The first is the shortage of resources due to the fact that the school's funding is insufficient and unstable. Likewise, they also spotlight families' lack of concern with their children's education, which burdens the educational institutions with greater responsibility. Finally, they note the low level of generational renewal in the schools, which is due to the low pensions paid to the teachers, rendering it impossible to hire new professionals with up-to-date ideas and knowledge.

Given this context, the project aims to improve the capacity in the educational centers of Coyhaique by promoting changes that make it possible to improve their educational capacity and indirectly improve social development through better qualified human resources and greater societal involvement of its promoters in an effort to avoid excluding the more disadvantaged classes. The goal is to leave the personal and institutional capacity that already exists and to strengthen the educational centers in the areas that we believe exert the most influence on school performance (leadership and curricular development in instrumental subjects). In concert, another goal is to boost the school's importance in the family and sociocultural setting by supporting parallel projects like the ones linked to youth, promoting parents' schools, spearheading community educational projects, and combating absenteeism.

The ultimate goal of the project is to construct and reinforce a network of cooperation and support among the educational centers dependent upon the commune of Coyhaique (Chile) in order to promote educational improvement and with it the social and cultural development of the region. The basic premises upon which the project is grounded are associated with the relationship that we believe exists between educational development and social and economic development, especially if we relate the spaces of poverty with educational variables (attrition, literacy levels, quality of learning, etc.).[2] Also, from our abovementioned ethical and leadership for social justice approach, the project enhanced distributed leadership profiles that support, evaluate, and develop teacher quality, as well as encouraging social commitment (i.e., better education investment) and a strong relationship between all stakeholders in schools (i.e., school-family-community partnerships).

---

[2] Reflections, actions, and proposals related to the project can be seen in the texts by Gairín and Castro (2010) and Gairín and Sánchez (2011), which also outline the subprojects performed and the personnel involved.

The overall objectives of the proposal refer to support for the municipal educational centers in the commune of Coyhaique in their management processes and the development of the language/communication and mathematics educational programs. They are outlined in specific objectives every year (see Table 42.1).

Activities Performed at School

The project is working on four major strands which take shape through six activity packages that were designed in the first year and have been implemented in the ensuing years in order to achieve the annual operative objectives (see Fig. 42.1). In essence, we can note that there is complementariness between the activities implemented in-person and the activities performed virtually, so the project remains active all year long despite the fact that its members are not always in the site where it is being implemented.

Training Activities

Training activities were held targeted at two specific groups: first, the managers of the educational centers in the town and, second, the language and mathematics teachers. These activities were based on a training plan which was drawn up in the first year of the program after an assessment of the needs in the region. The purpose of this initial diagnostic was to determine the current situation in the region, to compare it with the desired situation as expressed by the recipients and the educational authorities and regulations, and based on that to plan the training programs.

The training targeted at the language and mathematics teachers was managed by the University of Talca under the supervision of the Autonomous University of Barcelona, while the training for the management teams was coordinated and delivered by the UAB professors associated with the project. The 4-year training plan for managers was fleshed out into key subjects in effective managerial action, as shown in Table 42.2.

These in-person training activities include explanations by the staff of the universities involved, which are then complemented with debates, related activities, exercises, and proposals for projects at the institutions. What is more, the training activities are complemented with online knowledge creation and management activities which enable the managers to stay in touch with the trainers, in addition to facilitating the exchange of experiences and points of view among the different educational institutions in the commune. Likewise, it should be borne in mind that the knowledge creation and management networks generated have enabled subjects of interest to the institutions to be examined (such as the institutional image), which have helped to demonstrate the tacit knowledge of the experiences being conducted

Table 42.1 Outline of operative objectives for the period 2008–2011

Objectives 2008	
To delimit the needs for change in the schools To design and launch the management training program To delimit the training needs in language and mathematics teachers and to draw up a training program To develop virtual spaces for knowledge creation and management (KCM)	To support the educational centers in their management processes To create a consulting program for the staff of the educational centers To outline the proposal for follow-up and evaluation of the progress, results, and impact
Objectives 2009	
To develop the annual management training program To start the first phase in the training for language and mathematics teachers To strengthen the network of KCM managers with two new subjects To create and develop KCM networks of language and mathematics teachers To advise the schools involved in the innovation programs	To work with the teaching and research teams at the University of Talca to enhance their ability to transfer knowledge to their environs To maintain and develop the project's website and virtual campus with new contents and activities To evaluate the impact of the training and other kinds of programs developed To disseminate the project to other towns and in the socio-educational context
Objectives 2010	
To design and develop the annual training program for teachers and managers To institutionalize strategies to develop and constantly improve the institutions To strengthen the network of KCM teachers and managers with new subjects To encourage specific consulting with the managers and teachers involved in the innovation projects	To evaluate the impact of the training and other kinds of programs developed To maintain and develop the project's website and virtual campus with new contents and activities To disseminate the project among public organizations and agents To encourage the exchange of students and teachers from the institutions involved
Objectives 2011	
To design and develop the annual training program for teachers and managers according to the 4-year plan approved To institutionalize the improvement plans developed to date To set up a network to support the managers' professional activities To manage spaces for knowledge creation and management To maintain and develop the project's website and virtual campus with new contents and activities	To celebrate the second regional gathering and the first national gathering on educating towns To get the agents participation in national training actions involved to complement the perspectives offered in this project To evaluate the impact of the training and other kinds of programs developed in the schools To disseminate the project among public organizations and agents To encourage the exchange of students and teachers from the institutions involved

Fig. 42.2 Basic scheme followed in the educational development of the schools in Coyhaique

Consulting at Schools

One of the activities performed as part of the project was to outline the innovation and development projects at the schools and in relation to their environments. The members of the project team travelled to the town of Coyhaique (usually in three periods per year) and have visited the centers to provide advice and support in implementing the different proposals for improvement. Figure 42.2 describes the process/development model designed based on a prior analysis of the schools' needs taking into consideration the progress that they have made and their end situation.

As can be seen, the initial phase of the project entailed gathering information on the level of organizational development at the schools using the Quafe 80 questionnaire, and the academic results of the students were analyzed based on the results of SIMCE tests and the tests performed by FIDE. Likewise, the training needs of the teaching staff and managers were also taken into account.

The results of the analysis helped to define the specific training topics and design the innovations to be spearheaded and performed at the different sites:

- Curricular development and optimization of times at Río Blanco school.
- Encouraging reading and the use of the school library at Valle de la Luna rural school.
- Educational innovation project: sharing education with my children at República Argentina school.

- Development of psycholinguistic skills in reading comprehension and speed at Nieves del Sur school.
- Coordination of teachers tending to special education needs at Víctor Domingo Silva municipal school.
- Outline and use of curricular materials at Josefina Aguirre lyceum.
- Reading plan and its implementation at Pedro Quintana school.
- Mentoring teachers in the classroom at Baquedano school.
- Lowering school absenteeism: a network experience at the Integrated Adult Education Center.
- Implementing the project to improve the social climate at España special education school.
- Reading at our school, a challenge for better teaching at Pablo Neruda school.
- Reading plan and improving reading comprehension: together we will build the future at Valle Simpson school.

The implementation of these projects led to noticeable improvements in the educational institutions; however, we also detected several problems in this implementation which are related to the lack of resources available to the centers, the low degree of involvement by the teaching staff, and in some cases the difficulties of securing the support of external advisors during the periods in which the university advisors were not there.

Exercises and Simulations

Part of the implementation of the training and consulting activities also consisted of designing exercises and simulations which helped both the managers and the teachers to provide coherent, professional responses to the activities and problems that arise in day-to-day management and the new demands in and approaches to language and math teaching.

A variety of teaching guides were also developed to help the participants in the training to prepare for the sessions and to be used as reference. Several Moodle classrooms were also set up linked to the Autonomous University of Barcelona's Virtual Campus, through which the doubts and questions sent in by the participants in the training actions could be tracked.

Overall Assessment of the Educational Project

Now that the project has been completed, we can assess its results at different levels: objectives, activities conducted, execution, and follow-up mechanisms and results. Only the assessments of the school activities are included since other programs and local authorities handle the extracurricular programs.

Regarding the Objectives

Support for the managerial processes at the municipal educational centers in the commune of Coyhaique is a reality today, and we can state that the objectives were successfully transmitted.

The processes of strengthening the teaching staff in the processes of teaching language and communication and mathematics took place according to the prearranged sequences and reached the quality benchmarks set. However, the influence of the calendar of work stoppages and strikes by public school teachers shifted some of the activities within their planned time frames; they also affected the in-person sessions with the trainers that were heavily focused on theoretical aspects, and few applied activities linked to problems in professional practice were held.

Promoting processes of change in educational centers that depend on the town by installing and developing networks for knowledge creation and management in the chosen areas has been effectively institutionalized. We can say that the culture of innovation has been adopted at the level of managers, and this cultural shift is underway at the level of teachers.

Regarding the Activities Performed

All the planned activities were performed with high rates of satisfaction (diagnosis, analysis, training, consulting, dissemination, platforms, networks, etc.), and they were effective in achieving the stated objectives of the activities. Likewise, we can say that they were also effective in their execution and design, except in the case of the specific teaching areas where we initially detected certain deficits in the teaching and the thematic content, which were later offset.

Regarding the Execution and Monitoring Mechanism

The coordination and monitoring mechanisms set up proved to be highly effective. The internal coordination of each team was managed by the heads of each university center. Their goal was to carry out the actions called for in the initial design, to execute the diagnoses, training, and consulting, and finally to supervise the headway made as the work progressed.

Intergroup coordination mechanisms were also set up via in-person meetings in the target country, the operative coordination of the two team coordinators (in Spain and Chile), and the exchange of management documents regarding day-to-day operations among the institutions involved.

Regarding the Results

The establishment of this project has effectively fostered the relationship between the consolidated EDO working and research team at the UAB and the researchers from the University of Talca and the other participating organizations. This network of cooperation has generated a model of exchange, reflection, and mutual support whose synergies foster training, consulting, and constant improvement. In parallel, there are signs that it is possible to devise overall local educational plans and that this formulation not only facilitates educational development but also supports dynamics of social change.

Evaluation processes of the actions have been institutionalized through quality systems with the application of PISA or similar tests, and their monitoring demonstrates improvement in school performance. Therefore, the improvements have come not only in the potential academic performance but also in the related diagnostic and implementation processes.

Conclusions

We do not and should not conceive of any educational intervention except in relation to the social context. This two-way relationship between educational development and social development is nothing other than a cooperative relationship, and just like all cooperative relationships, it must be based on mutual respect for the different situations that may arise. In this regard, we should recall the five cornerstones upholding "genuine" socially conscious cooperation, in the words of the Dutch aid worker Hernán Vandevelde (Gairín & Castro, 2010), which may be adapted to institutional work with the community.

1. The *art* of listening: OPENNESS. Knowing how to listen and doing so while showing a profound respect for the other person. The goal is to listen and be heard, respecting diversity and considering the relationship as an opportunity to jointly construct new pathways and perspectives.
2. The ability to interpret: READING. The goal is to know how to critically interpret the shared context in both the town and the community, on the micro- and macro-levels. This entails eliminating the imposition of one's own predetermined criteria thanks to the aforementioned openness.
3. The *desire* to share: TENDERNESS. This refers to tenderness or what can be simplified by being united actively and affectively in the pathway to be taken or when jointly grappling with problems.
4. The *decision* to commit: POSTURE. The goal is to take a stance or choose "a side" where we want to be. True cooperation must translate into a radical option for the exploited classes, the impoverished classes, and the excluded classes. Genuine cooperation does not mean acting freely; rather it implies a well-defined and contextualized preferential mindful choice.

5. The *vision* of integration: STRUCTURE. All genuine cooperation implies a great deal of effort in terms of organization and coordination, of working in and with networks. It includes a human structure that will make the cooperation sustained. The goal is thus to shift from processes of aid or providing aid, no matter how important they may be, to processes of cooperation in which the one-way movement of aid is replaced with a two-way relationship that enables both parties to define and operate together. This perspective allows contextualized improvement mechanisms to be installed and the ties in all directions to be strengthened.

Our experiences of linking educational development with social development have always been positive and have enabled us to make headway in complex social and educational issues, making the identification of educational centers as organizations of and for society a reality. The case of Coyhaique confirms this.

The relation between educational development and social development is obvious and neither can school leaders avoid it nor should they. School leaders' commitment includes sensitivity towards the reality of the environment (i.e., understanding diverse social, cultural, and economic situations), moral obligations towards the most disadvantaged sections of society (i.e., supporting an inclusive school, which achieves quality education that overcomes personal and social circumstances), and being proactive in the development of a more just society (i.e., social leadership, agent of change, encouraging social participation in education, alignment with socio-educational problems).

In any event, the most important finding in Coyhaique (and other similar experiences) is not only the direct effects on the school performance of some students but also the direct and indirect effects that several coordinated action programs in a given area under similar working schemes may generate. Thus, for this experience we can cite:

- The greater involvement of the parents in supporting, monitoring, and ultimately controlling the children's school activities
- The institutionalization of the parents' schools at the different schools
- The involvement of external organizations (such as companies, NGOs, and social institutions) and various collectives (such as managers' associations and freelancers) in the educational subjects
- The promotion of effective continuity between school and extracurricular activities and between actions at the school and actions in the region; complementariness in the support for schools, youngsters, and adults; coordination of actions among different agents, etc.
- The heightened awareness among the town political leaders about the possibility, feasibility, and efficiency of overall local plans or plans by age group
- The intensification of the relations between educational organizations and companies and cultural and social institutions
- The schools' acceptance of their commitment to nonschool space and time
- The development of a new global as opposed to fragmented approach to education

In short, as Tedesco (2010) suggests, contributing to social justice through education entails "expanding our sights on educational problems and incorporating the vision that comes from studies on the profound social, political, economic, and cultural changes that take place in society" (p. 8). It also entails accepting the action of transformation as part of the educational and social process. And managers, teachers, families, students, and social and political agents are all involved in this endeavor.

Chapter 43
Dominance Without Hegemony: Unmasking Social Injustice Leadership in University Education in Zimbabwe

Munyaradzi Hwami

Introduction

Post-independent Zimbabwe, most significantly the last two decades, has been marked by a crisis of governance (Bond, 2010; Cross, 2011; Ndlovu-Gatsheni, 2009a, 2009b; Raftopoulos & Mlambo, 2009; Tsvangirai, 2011; Zamponi, 2005) that has witnessed an unpopular and dictatorial government, using state apparatus including higher education institutions, to maintain its hold on political power. The rise of dictatorship and authoritarianism, by a state characterised by an alliance of the ruling Zimbabwe African National Union Patriotic Front (ZANU PF) party and the military (Chikwanha, 2009; Gumbo, 2011; Laing & Thornycroft, 2010; Zaba, 2011), has been accompanied by a ruthless and consistent attack on independent critical thinking and opposing voices, and this has had a direct impact on the business of higher education institutions, especially universities. That the government of Zimbabwe is a violent and repressive dictatorship has been widely recognised and documented (Blair, 2002; Bond & Manyanya, 2003; Cross, 2011; Ndlovu-Gatsheni, 2009a; Sithole, 2001). What is further observed are the efforts of the ZANU PF government to rule without the mandate of the people (Dansereau, 2005; Editorial Standard, 2011; Phimister, 2006) and explain the draconian laws and regulations that have been enacted to control and quell opposition and all this accompanied by state-sanctioned violence. In this chapter I utilise Ranajit Guha's analytics and critics that culminated in his thesis of "dominance without hegemony" (Guha, 1997, p. xvii), a situation where a plutocratic oligarchy governs by use of coercion and without the mandate of the people. What is observed in Zimbabwe is the establishment of a ZANU PF empire, "internal colonization" (Mignolo, 2000, p. 27; Quijano, 2000, p. 224) of the people of Zimbabwe by President Robert Mugabe's party that is in alliance

with a partisan military (see Chikwanha, 2009; Zaba, 2011). Universities by definition critique society for the good of the majority and attempt to fulfil such societal expectations by students and faculty at the University of Zimbabwe and the Great Zimbabwe University have been received with a heavy iron hand by the government, culminating in university administration that operates as an extension of the security arm of the state and giving rise to human rights violations and hence the need to document, explain and authorise these social injustices being perpetrated at the two state universities.

This chapter argues that university education leaders have been turned into Zimbabwe's ruling party activists and state security agents and in the process turning their backs on the fundamental basics that guide education leadership. They have become architects and constructors of social injustice practices; an accusation evidence from their institutions convincingly sustains. It also critically discusses how university vice chancellors have been transformed from superintendents of education to agents of the ruling party there to silence criticism against an increasingly unpopular regime and in the process ignoring all forms of compassionate and ethical leadership expected from such high institutions of learning.

First, though I am grounding my analysis of social injustices in Zimbabwe's universities in dominant strands of social justice theory or policy that dominate the discussion of this topic, this chapter is also strongly informed by my engagement in what I call academic activism, education and research in struggles against the deteriorating conditions of higher education in Zimbabwe, which evolved from my work in Zimbabwe with student movements and faculty associations. I utilise various theoretical frameworks that tend to isolate hegemonic tendencies inherent in neoliberalism and nationalism (Amin, 1989, 2011; Dei, 2010; Fanon, 1952/2008, 1963/2004; Grosfoguel, 2005; Guha, 2001; Shivji, 2011), the two dominant discourses that are shaping the contemporary Zimbabwean narrative. Consequently, the following section of this chapter deals with the critical colonial theoretical frameworks that guided the chapter. This will be followed by the conceptualisation of social injustice within the Zimbabwean context. Views and narratives of students and faculty from the University of Zimbabwe and the Great Zimbabwe University are further captured to landscape the level of social injustices and the accompanying complicity of education leaders. The following and final section considers how the deployment of critical/anti-(neo)colonial analyses and critics excavates university education leaders as accomplices and willing agents in the commission of social injustices to further the international and internal colonialist ambitions of the dominant groups.

Theoretical Framework: Critical Colonial Perspectives

Guha's analysis that culminated in his observation of dominance without hegemony was with reference to British colonial rule in India. Further analysis led him to conclude that "the colonial experience has outlived decolonization and continues to be related significantly to the concerns of our time" (Guha, 2001, pp. 41–42). In Zimbabwe, like in most former European colonies around the globe, the promise of independence from colonial rule never looked like it was going to be fulfilled, and the disappointment of the "post-colonial condition" (Gupta, 1998, p. 7; Kapoor, 2003, p. 73) or the failed promise of colonial and imperial projects of development and globalisation dominates the narration of more than 30 years of the end of British administration. This study is situated from a standpoint that observes the continued existence of colonial, neocolonial, internal colonial and imperial influences on the people of Zimbabwe and consequently notes the myth of independence, "the mythology of the decolonization of the world" (Grosfoguel, 2005, p. 287). Ramon Grosfoguel further noted that "one of the most powerful myths of the twentieth century was the notion that the elimination of colonial administrations amounted to decolonization of the world. This led to the myth of the postcolonial world" (Grosfoguel, p. 287). These critical observations and analyses led me to conclude that the people of Zimbabwe are not independent contrary to the proclamations that were made in 1980, and the rampant cases of social injustices being committed at the University of Zimbabwe and the Great Zimbabwe University are manifestations of the continued existence of colonial influences and relations.

Critical colonial perspectives observe two variants of colonialism in modern day Zimbabwe, global (mostly Western) and local (ZANU PF internal colonialism), and both have had negative consequences on the observation of social justice in higher education. As Shohat (1992) and Shohat and Stam (1994) argued, both colonialism and neocolonialism imply oppression and the possibility of resistance and in the process the inappropriateness of the term "postcolonial as it obscures the traces of colonialism that exist in the present" (Daniel, 2005, p. 262). With neoliberal globalisation and its accompanying radical capitalist trajectories as observed when Zimbabwe adopted IMF and World Bank reforms through structural adjustment programmes in the 1990s, "we continue to live under the same colonial power matrix. … we moved from a period of global colonialism to the current period of global coloniality" (Grosfoguel, 2005, p. 287). A critical colonial standpoint on Zimbabwe, following Grosfoguel's analysis, recognises that even though there has been the eradication of British colonial administration and the organisation of Zimbabwe into a politically organised nation-state with a black African government, Zimbabweans continue to live under Euro-American exploitation and domination through the intrusion and adoption of neoliberal policy frameworks. It is characterised by a "coloniality of power" (Quijano, 2000, p. 216, 2007, p. 170), "imperial globality or global coloniality" (Escobar, 2004, p. 207), which has proved to be longer lasting than Euro-centred colonialism that ended with the attainment of independence from Britain in 1980. "Coloniality refers to the continuity of colonial forms of domination after the end of colonial administrations, produced by colonial cultures and structures in the modern-colonial capitalist world-system" (Grosfoguel, p. 287). Zimbabweans continue to live under the regime of global coloniality imposed by the United States and its allies through the IMF and the World Bank among other Western international institutions. Privatisation and marketisation at the University of Zimbabwe and Great Zimbabwe University and the resultant immiserating situation can be traced directly to the two Bretton Woods institutions. Thus, in Zimbabwe, what is observed is the sustenance of colonial relations from the days of formal European colonial rule to the current post-independence era.

Consequently, this chapter adopted the standpoint that colonialism did not end with the demise of European rule but that other even stronger benign forms of colonialism exist in the south and in Zimbabwe in particular. Neoliberal globalisation represents a new form of imperialism, "benign colonialism that is still underdeveloping Africa and its people" (Abdi, 2006, p. 17), "a process of re/colonization" (Choudry, 2007, p. 97), a form of imperialism where accumulation by dispossession is the main feature (Harvey, 2003) and also seen as a form of Western global hegemony (Tikly, 2004). Most people from the weaker economies, because of the immiseration they endure, at the expense of the extravagant consumption culture found in the Western capitalist world, do not hesitate to see neoliberal globalisation as yet another episode in Western hegemonic tendencies. For instance, Grosfoguel (2005) perceives globalisation as capitalist and Euro-centred colonisation. Along the same lines, McMichael argues that it is a "Western imperial project" (2005, p. 119). It is yet another stage of Western pillaging of weaker societies' resources. It is further seen as "transnational capitalism or collective imperialism" (Amin, 2011, para. 1). This is corroborated by Escobar's observation of the existence of what he calls:

> US based form of imperial globality, an economic-military-ideological order that subordinates regions, peoples and economies world-wide. Imperial globality has its underside in what could be called … global coloniality, meaning by this the heightened marginalization and suppression of the knowledge and culture of subaltern groups. (Escobar, 2004, p. 207)

Following Quijano (2000, 2007) and Grosfoguel (2005), I used coloniality to examine and address "colonial situations" in contemporary Zimbabwe in which colonial administration has been eradicated. By colonial situations, I employ Grosfoguel's understanding that this refers "to the cultural, political, sexual and economic oppression and exploitation of subordinate groups by dominant groups with or without the existence of colonial administration" (2005, p. 288). The condition of Zimbabwe's peasants and workers and of their children at the University of Zimbabwe and the Great Zimbabwe University illustrates political and economic oppression and exploitation. This colonial situation was well captured by A. Cesaire:

> I am talking about millions of men whom they have knowingly instilled with fear and complex of inferiority, whom they have infused with despair and trained to tremble, to kneel and behave like flunkeys. (Fanon, 1963, p. xi)

What Fanon described represents British colonial administration, and it is largely accurate to say that it is being reproduced and repeated in Zimbabwe today by ZANU PF and its aligned military.

Since 1980, the new nation-state of Zimbabwe, following the dominant Eurocentric liberal discourses (Bloom, 2004; Petras & Veltmeyer, 2001; Wallerstein, 1995), "constructed ideologies of national identity, national development and national sovereignty that produced an illusion of independence, development and progress" (Grosfoguel, 2005, p. 288), yet the economic and political system (parliamentary democracy and neoliberal capitalism) was largely shaped by its subordinate status in a capitalist world system organised around a hierarchical international division of labour (Wallerstein, 1995). This is illustrated by Zimbabwe's current growth strategies, namely, the Short Term Emergency Recovery Programme (STERP) and Medium Term Plan (MTP), which seek to "establish a framework for Zimbabwe to emerge as a vibrant, private sector-driven economy" (Herald Reporter, 2010, para. 7). Despite President Robert Mugabe's anti-Western rhetoric and strained relations with the Euro-America bloc, his government's nationalist posturing is nothing but a Eurocentric response or solution to a Eurocentric global challenge. His authoritarian nationalist paradigm is authoritarian and anti-democratic as was British colonial administration before 1980 and hence produces an internal coloniality of power within Zimbabwe.

It would be misleading to portray "the postcolonial situation" (Ake, 1996, p. 3) or the failed promise of development and modernisation as only about the devastation caused by Western modernist experiments. I note that it is also about forms of "internal colonization" (Mignolo, 2000, p. 197) and, with specific reference to Zimbabwe, the impact of ZANU PF authoritarian nationalism (Bond, 2010; Bond & Manyanya, 2003; Dansereau, 2005; Ndlovu-Gatsheni, 2009a, 2009b; Raftopoulos, 2003). Although political independence brought some changes to the composition of state administrators, the character of the state remained much as it was in the colonial period (Ake). Kapoor noted and concluded that:

> Anti-colonial nationalist movements (as a significant expression of decolonization), have rarely represented all interests and peoples of a colonized country…Neither did the dismantling of colonial rule automatically result in positive changes for all groups, as the fruits of independence were made available unevenly and selectively; a version of colonialism was reproduced and duplicated from within. (2009, p. 4)

Similarly Dei noted that "colonial in this context is understood as not simply foreign or alien but as anything imposed and dominating" (2010, p. 13). These views aptly capture the character and nature of ZANU PF hegemony. Grosfoguel (2005) concluded that "nationalism is complicit with Eurocentric thinking and political structures" (p. 289) further excavating the capitalist and exploitative nature of nationalism. In the process, Zimbabwe is witnessing kleptocratic capitalism (Barber, 2004; Nonini, 2005; Tandon, 2011):

> the creation of fictitious wealth without going through production of real wealth and political governance controlled by looters and daytime robbers. It is rent seeking by the rich nations, and within each nation by the rich economic and power elite. This creates at the opposite polar end the dispossession and disempowerment of the masses of the people. (Tandon, 2011, para. 6)

University students and faculty have rightly observed and criticised these developments, and in response the government has used all resources at its disposal and in the process trumping students and faculty rights and hence committing social injustices.

It is against such observations that "anti-colonialists" (Dei, 2010, p. 1) or "critical colonialists" (Kapoor, 2011, p. ix) tend not to subscribe to the view that we are in a post-colonial era. The end of European rule ended physical British administration in Zimbabwe (as was in other colonised countries), but the world economic order dominated by the Washington consensus has maintained Western dominance over the former colonies, thus the idea of American globalism/colonialism illustrated by development and globalisation projects that have dominated the world. Furthermore, the African liberators who took over power from colonial European administrators have mostly turned out to be crocodile liberators, far much worse than the foreign colonisers. President Robert Mugabe of Zimbabwe (32 years in power) belongs to the same league with the late Gaddafi of Libya. They represent internal colonisation, and the exuberant joy expressed by Libyans showed the people were being freed from some form of colonial rule. Similarly contemporary Zimbabwe is characterised by international/foreign colonialism (Euro-American and Chinese, mostly) and internal colonialism (a dictatorship by the ruling elite as demonstrated by the narratives from those at the University of Zimbabwe).

Conceptualising Social (In)justice Leadership in the Context of Zimbabwe

Developing a universal definition of social (in)justice has been a struggle for many scholars, human rights practitioners and activists in different fields. The concept of social (in)justice has been employed as a rationale for various causes including maintaining the status quo, promoting social reforms and justifying revolutionary action (Reisch, 2002). Ira Bogotch utilised Dewey's insights to argue and conclude that it is significant to have multiple perspectives on social justice (Bogotch, 2000). Thus, social (in)justice has multiple meanings, mainly varying with perspectives "on the nature of the self, the basics of moral law, the role of the state, and the relation between individual rights and the common good" (Caputo, 2002, p. 356). However, the universalism of certain basic human rights should be acknowledged. In Zimbabwe oppressive and undemocratic laws have been enacted mostly since 2000, and the government justifies such authoritarianism on the idea that the country is undergoing an economic revolution that involves transferring economic means of production to black indigenous Zimbabweans (Caplan, 2008; Government of Zimbabwe, 2007; Moyo, 2011; Raftopoulos, 2011), and this has created unfair opposition mainly from Western countries and locals supported and sponsored by these countries. Resultantly, almost all national institutions, and of importance here universities, have become sites where infringement of social (in)justices has become rampant on the conservative pretext of defending national independence and sovereignty.

Commentators and scholars of social (in)justice issues trace the different interpretations of the concept to classical thinkers such as Plato who stressed harmony as the main condition for the attainment of social justice and Aristotle who emphasised the regulation of the allocation and distribution of benefits or resources (Bell & de-Shalit, 2003; Capeheart & Milovanovic, 2007; Caputo, 2002; Miller, 1999; Reisch, 2002). The continent of Africa and Zimbabwe in particular has been an arena of human rights injustices stretching from colonial times to contemporary post-independent era

(Ayittey, 1992; Caplan, 2008). African governments tend to label advocates of social justice as Western emissaries and agents of neocolonialism attempt to introduce Euro-American values that will ultimately see the triumph of global capitalism. This is largely accurate of the government of Zimbabwe since 2000. Zimbabwe has been undergoing a process of massive transfer of national resources from whites of European descent to indigenous Zimbabweans (see the Government of Zimbabwe, 2007). From a post-colonial and anti-colonial standpoint, the Zimbabwe state's policy is aimed at establishing a just society. However, post-independent Zimbabwe has been observed to be a replica of European colonial administrative systems (Hwami, 2011), and consequently, as was the case during British colonial rule and as has been widely observed elsewhere, the roots of social injustice lie in political-economic structures that are based on subjugation, discrimination, violence, exploitation and privilege (Berlin, 1996; Reisch, 2002).

This chapter borrows from Bates' (2006) and Foster's (1986) contention that social justice is central to the pursuit of education and therefore should also be central to the practice of educational administration or leadership. I am swayed by the conception of educational leadership as a "deliberate intervention that requires the moral use of power" (Bogotch, 2000, p. 2). It is observed that the missing space in educational leadership, "that is, the roles of persons occupying hierarchical positions in formalized, educational institutions" (English, 2011, p. vii), as in national governance is the ethical. The neoliberalisation of the economy has not been accompanied by the granting of any individual liberties, and hence, this chapter notes the incompatibility of neoliberal universities in an authoritarian nationalist conservative environment. Such inconsistencies have led to social injustices being perpetrated in higher education in Zimbabwe.

The idea of social justice employed in this chapter borrows from a variety of definitions that have been put forward by some notable scholars. To Plato "justice consists in the set of enforceable rules that have the effect of promoting the greatest possible amount of happiness", while Rawls conceived justice as "consisting in the equal distribution of social primary goods such as liberty, opportunity and wealth" (Bell & de-Shalit, 2003, p. 1). Others similarly note that "social justice has to do with the way in which benefits and burdens are assigned to individuals" (Miller, 1999, p. 2), "the various philosophies attending to the fair allocation of resources as well as of burdens" (Capeheart & Milovanovic, 2007, p. 3), and that "social justice supports a process built on respect, care, recognition and empathy" (Theoharis, 2007, p. 223). Nancy Frazer argues that social justice today requires both redistribution and recognition because both socio-economic injustice and cultural injustice are rooted in the processes and practices that systematically disadvantage some groups of people (Frazer, 1995). This is seen as a challenge to be tackled head on if marginalisation of certain segments of the populations is to be averted (Marshall, 2004).

Despite the above conceptualisations and understandings being rooted in Western sociocultural and political contexts, their applicability to African and Zimbabwean setting cannot be contested. The idea that the concept of social justice is "Western" tends to be used by those who want to mask themselves from international criticism because of their policies and practices. Killings, beatings, ethnicism/tribalism and so forth are social injustices, even from traditional African perspectives. For instance, the Zimbabwean traditional philosophy of *unhu* emphasises sharing, peace and harmony in society (Battle, 2009; Shizha, 2009; Swanson, 2007; Venter, 2004), and these are the same tenets informing the idea of social justice as presented in Western societies. Thus, though this chapter employed Western definitions, what they entail is progressive humanism, and it applies to whites, blacks and all other colours. The Zimbabwean culture has never tolerated the suffering as seen at the University of Zimbabwe.

Consequently, for the purposes of this chapter, the concern is with the ways in which a range of social institutions and practices together influence the sharing of resources available to different people. There is no question that the government of Zimbabwe is the primary institution whose policies and practices contribute to social (in)justice. Along such observations I concur with the views that social justice requires the elimination of institutionalised domination and oppression (Frazer, 1995; Miller, 1999; Young, 1990) and that "it is the exercise of altering institutional and organizational arrangements by actively engaging in reclaiming, appropriating, sustaining and advancing inherent human rights of equity, equality and fairness in social, economic, educational and personal dimensions" (Goldfarb & Grinberg, 2002, p. 153). All these observations and understandings of social justice informed the definition of social (in)justice employed in this presentation.

However, the work of Young (1990) and Goldfarb and Grinberg (2002) who collectively address the issues of social (in)justice on institutional arrangements that oppress and marginalise some groups largely shapes my understanding. This chapter defines social injustice educational leadership to mean that university administrators consider issues of democracy, individual liberties, ethnicity, class and gender among other national historical factors. Social justice university administration must not sacrifice the universally acknowledged mandate of a university for political expediency and patronage. This conceptualisation of social (in)justice is concerned with the redressing and advancement of university education of the poor rural peasant student, the disadvantaged girl child and the politically active youths who cry to have their voices heard on the future of their country. The view also places the realisation of social justice and the democratic development of the post-independent nation of Zimbabwe on the significant role of the university and hence its leadership. William Rainey Harper (1905, pp. 19–20) cited by Ira Harkavy identified the university as the most strategic agency or national institution best positioned to bring about social justice. He said:

> The university, I contend, is this prophet of democracy-the agency established by heaven itself to proclaim the principles of democracy. It is in the university that the best opportunity is afforded to investigate the movements of the past and to present the facts and principles involved before the public. It is the university that, as the center of thought, is to maintain for democracy the unity so essential for its success. The university is the prophetic school out of which come the teachers who are to lead democracy in the true path. It is the university that must guide democracy into the new fields of arts and literature and science. It is the university that fights the battles of democracy, its war-cry being: 'Come, let us reason together.' It is the university that, in these latter days, goes forth with buoyant spirit to comfort and give help to those who are downcast, taking up its dwelling in the very midst of

> squalor and distress. It is the university that, with impartial judgment, condemns in democracy the spirit of corruption, which now and again lifts up its head, and brings scandal upon democracy's fair name …. The university, I maintain, is the prophetic interpreter of democracy; the prophet of her past, in all its vicissitudes; the prophet of her present, in all its complexity; the prophet of her future, in all its possibilities. (Harkavy, 2006, p. 7)

The definition being used here associates the observation of social justice with ethical university leadership, thus placing a huge responsibility on the shoulders of university leaders in Zimbabwe. University administrators should offer "transformative leadership" (Astin & Astin, 2000, p. 11; Shields, 2004, p. 113) that is deeply rooted in moral and ethical values in a social context (Shields, p. 113). Astin and Astin summarise in these words their hope that transformative leadership may help to change society:

> We believe that the value ends of leadership should be to enhance equity, social justice, and the quality of life; to expand access and opportunity; to encourage respect for difference and diversity; to strengthen democracy, civic life, and civic responsibility; and to promote cultural enrichment, creative expression, intellectual honesty, the advancement of knowledge, and personal freedom coupled with responsibility. (2000, p. 11)

Thus, university education leaders should be found protecting students and staff against police brutality, promote responsible academic freedom and ensure students from vulnerable sections of the Zimbabwean society gain access to and remain within university education. Vice chancellors and other top university administrators should realise that they are potentially architects and builders of a new social order wherein traditionally disadvantaged peoples have the same educational opportunities and experiences as traditionally advantaged groups.

Research Methodology

This was a "critical interpretive research" (Anderson, 1989, p. 249; Bartlett, 1991, p. 21; Fossey, Harvey, Mcdermott, & Davidson, 2002, p. 720), and this approach was employed in order to arrive at in-depth insights and understanding into the issues and cases of social (in)justice in higher education. It was a case study (Merriam, 2009; Stake, 2005; Yin, 2009) of the University of Zimbabwe and the Great Zimbabwe University. It has been established that critical interpretivists seek research accounts that are sensitive to the "dialectical relationship between the social structural constraints on human actors and the relative autonomy of human agency" (Anderson, p. 249). "It is critical in that it shows how people's own understanding of their situation are implicated in their unhappiness and how the structures that produce and are reproduced by those understandings trap people in situations that they find frustrating and oppressive" (Robinson, 1992, p. 345). With that in mind the influence of ZANU PF authoritarian nationalism and neoliberalism on social justice issues had to be understood as well as the participants' views based on their experiences. In such a critical interpretive case study, "the researcher builds a complex, holistic picture, analyzes words, reports detail views of informants and conducts the study in a natural setting" (Creswell, 1998, p. 15).

It is generally acknowledged that research that aspires to be critical seeks, as its purpose of inquiry, to confront injustices in society. Its purpose is "to reassert the basic aim of the Enlightenment ideal of inquiry: to improve human existence" (Giarelli, 1992, p. 4). Critical inquiry is "disruptive, explicitly pedagogical and radically democratic; its topics: fascism, the violent politics of global capitalist culture, the loss of freedom in daily life" (Denzin, Lincoln, & Giadina, 2006, p. 777). The overriding goal of critical interpretivism "is to free individuals from sources of domination and repression" (Anderson, 1989, p. 249). The victimisation of students and faculty by state agents, police and the military (Makoni, 2007; Students Solidarity Trust, 2009; Zeilig, 2007, 2008; Zimbabwe National Students Union, 2010) and the immiseration caused by neoliberal policies (Hwami, 2010, 2011) are injustices by any definition. Therefore, the critical interpretive approach was employed bearing in mind the ultimate desire to end oppression and suffering. This was activist research, research with a human face aiming at authorising social injustices and in the process hoping to build consciousness among participants of the context of their challenges.

Practical Perspectives on Social Injustice Leadership in Higher Education

The centrality and significance of schooling in general and higher education, particularly universities, in the promotion of national social justice has been widely established (Bollinger, 2003; Harkavy, 2006; Theoharis, 2007) and by further implication the importance of the role of education leaders in the successful attainment of this mandate (Astin & Astin, 2000; Marshall, 2004; Shields, 2004, 2010). As was recognised by Bogotch (2000) and repeated by Larson and Murtadha (2002), Goldring and Greenfield (2002), Reisch (2002), Bates (2006) and Theoharis (2007), educational leadership should utilise moral interventions in the protection of the weak and marginalised and in the process uphold and inform national social justice discourse. Also Miller (1999) noted that the state is the primary institution whose policies and practices contribute to social justice or injustice, and this is more so in societies with weaker economies where the state is involved in almost all facets of the nation. This is also an accurate portrayal of Zimbabwe, and utilising stories and experiences of students, faculty and administrators from the University of Zimbabwe and the Great Zimbabwe University, this section of the chapter explores and analyses the social injustice situation in Zimbabwe, further arguing that the picture can also be transferred to other similar state institutions. The close to total decline of the rule of law and the poor human rights record of the country can arguably be traced to the failure of higher education, especially universities to perform their core business satisfactorily. Lee Bollinger emphasised the eminent role of the American university, and this is universally true of any university:

> Universities remain meaningful because they respond to the deepest of human needs, to the desire to understand and to explain that understanding to others. A spirited curiosity,

> coupled with a caring about others (the essence of what we call humanism) is a simple and unquenchable human drive, certainly as profound an element of human nature as the more often cited interests in property and power, around which we organize the economic and political systems. (Bollinger, 2003, p. A20)

While acknowledging the significance of the university, one cannot but observe the way university leadership in Zimbabwe has been turned into political party functionaries by the ruling Zimbabwe African National Union Patriotic Front (ZANU PF) party. According to Section 7.1 of the University of Zimbabwe Act (UZ Act) and the Great Zimbabwe University Act (Chapter 25: 24), "The president of Zimbabwe shall be the Chancellor". Furthermore, Section 8.1 states that the chancellor appoints the vice chancellor, and Section 8.3 a-f empowers the vice chancellor to:

1. Prohibit the admission of a student or any person to the university.
2. Prohibit, indefinitely or for such a period as he may specify, any student or group of students from attending any class or classes.
3. Prohibit any student or group of student or person or group of students from entering or remaining on such part or parts of the university campus as he may specify.
4. Expel or suspend, indefinitely or for such period as he may specify, any student or group of student.
5. Dissolve or suspend, indefinitely or for such a period as he may specify, the students' union or any of its committees or organs, or prohibit or suspend, indefinitely or for such a period as he may specify, any activity or function of the students' union or any of its committees or organs.

The University Act appears to be giving the vice chancellor arbitrary and excessive powers, and evidence profoundly shows that vice chancellors have been willing state agents, utilising these monstrous powers with devastating impact on students and faculty. This has been interpreted differently by the university community, but stories and real experiences from faculty and students lead one to conclude that educational leadership in Zimbabwe is compliant and complicit in the commission of social injustices. The Zimbabwe National Students Union (ZINASU) argues that the vice chancellor is endowed with unchecked powers and this has contributed to the collapse of the university (Students Solidarity Trust, 2009). Such perceptions are widely shared within the university community where some consider that the powers of the vice chancellor are intended to control and discipline academics and have nothing to do with the promotion of learning. Some students and faculty members had this to say about the vice chancellor's powers:

> The Vice-Chancellor is beholden to the state president; he throws away academic freedom for the convenience of keeping his post. He enjoys the benefits and those who appointed him expect patronage. (Interview notes, Faculty member, July 2010)

The view expressed by students is widely shared by the university community and portrays the way the vice chancellor's office is perceived. It is not seen as a professional administrative organ of the university but an extension of the dictatorial ruling party structure. To affirm this observation, other students shared their experiences and one of them said:

> On the 14th of January 2010 we had a demonstration against high fees and 28 students were arrested, spent three nights in cells and later released on free bail. When I returned to campus I was suspended and they were citing section 30 of the University Act or Ordinance 30 which gives the Vice Chancellor powers to suspend anyone. I was accused of bringing the name of the institution into disrepute. On the 30th of July we were acquitted because the witnesses could not prove a prima facie case against us. I then went to the university to negotiate my reinstatement as a student but unfortunately they are refusing to take me back. I am on two years suspension and currently engaging lawyers from the Zimbabwe Human Rights Association. We were accused of contravening section 37 of Public Order and Security Act, which said that it was an illegal gathering with the intention of promoting public disorder. The Vice-Chancellor and the university are saying their decision is final regardless of the fact that I was acquitted by the magistrate. The bottom line is I was involved in a demonstration. Precedence has it that one Levy Nyagura (University of Zimbabwe Vice-Chancellor) is well known for contempt of court, defying court orders. There is Lovemore Chinoputsa former secretary general of ZINASU and Promise Mukwananzi, former president of ZINASU they challenged their suspension and were ordered to go back to college but Nyagura told them that they must go and learn at the high court. (Interview notes, Student leader, August 2010)

Along the same line another student activist's narrative equally showed social injustices committed by university administrators:

> I have been arrested 13 times now and with university administrators, you attend a well-managed disciplinary committee and you get suspended for a year, minimum. The moment you are arrested you get a year's suspension. In 2006 I managed to escape arrest but my friends were captured by the police and they got suspended for periods ranging from 1 to 3 yrs. In 2008 we had a demonstration over presidential elections; we were with other students from the whole country. My results for that semester were held and I was later told they were to be nullified. This year (2010) in January we demonstrated in support of expelled students and I was arrested. I then got a year's suspension up to September 14. I am not hopeful because it is well known that the Vice-Chancellor does not respect court rulings. (Interview notes, Student activist, August 2010)

Students and faculty, like many other Zimbabweans, view the government as a violent dictatorship that does not respect the rights of its citizens (Bratton & Masunungure, 2008; Caplan, 2008; Cross, 2011; Makumbe, 2002; Mamdani, 2008; Meredith, 2007; Ndlovu-Gatsheni, 2009a; Raftopoulos, 2011; Raftopoulos & Mlambo, 2009), and hence, there is high expectation for national institutions such as universities to do better by intervening. The silence of the grave coming from the professoriate over critical and pertinent issues such as social injustice even within their workplace has been so outstandingly disturbing that one national daily newspaper ran a headline entitled "Where are Zimbabwe's academics?" and further claimed that:

> Newspapers fail to get brave academics who are prepared to comment or be interviewed on burning economic, political, social or business issues affecting the country, but prefer to shamelessly hide behind those brave enough to stand up and be counted regardless of the consequences. (Karoro, 2011, para. 3)

The noble function of modern universities as argued by Harkavy (2006) and Bollinger (2003) appears to be missing in Zimbabwean universities. Universities are expected to speak out for the good of their society and not just for selfish ends.

Along the same argument, Larson and Murtadha posited that, "university professors have an obligation to provide independent criticism of their society and its institutions and to generate theories and policies that enhance the public good" (2002, p. 135). The above sentiments from those in university, national observers and social justice scholars persuade some to conclude that the post-independent university leadership in Zimbabwe is to a certain extent responsible for the prevalence of social injustice.

Another perspective considers the intimidating environment academics have been operating under especially since 2000 when the widely accepted value of freedom of the academy was openly trampled upon and students started to be expelled for expressing views against the government and faculty are refused tenure for criticising the establishment. While scholars of social justice leadership would like to see educators taking the lead in promoting and shaping social justice and social justice theories (Bogotch, 2008; English, 2011; Brooks & Kensler, 2011; Shoho, Merchant, & Lugg, 2011), in Zimbabwe university leaders are used as an arm of the state security apparatus to control a largely restless university community and nation. However, university professors and students face persecution for criticising their society, and vice chancellors, registrars and other top administrators are appointed on the basis of party loyalty and not professionalism. The following is a story of one faculty member's experience with the university administration that provides credence to the above view:

> I was the secretary general of the lecturers' union and I was seen as a threat to the Vice-Chancellor. At one time I was suspended for three weeks and other lecturers fraternized with me and went on strike. Many at times I would not take two weeks without being called to the Vice-Chancellor's office. I was told that if one differs with the Vice-Chancellor it was only that person that would leave as the Vice-Chancellor was appointed by the state President and would not go. When I applied for my tenure, whereas the department and external examiners recommended that I should be granted tenure, the Vice-Chancellor decided that I was an academic terrorist who should leave the university, who could not be given tenure and should be taught about the ethics of research. This was because I had written an article over the death of Hebert Chitepo that highlighted the different elements involved in the death of Chitepo and these included some presently in the ruling party, ZANU PF. This was seen as unacceptable. The Vice- Chancellor said a university where the chancellor was the state President could not be seen to harbour lecturers with such minds. I also wrote another article that considered the crisis situation in Zimbabwe, looking at whether President Mugabe had become an asset or a liability to the nation. Again to my surprise this was deemed to be dangerous and was seen as an academic terrorist who was criticising the President. The university later communicated that my services were no longer needed. (Interview notes, Faculty member, August 2010)

What is observed is the politicisation of the university and education leaders in these institutions have become integral elements of the ruling regime and unfortunately constructors of social injustice as they work to please their political parties and not furthering educational aims of the university.

Zimbabwe's state universities have students predominantly from poor rural peasant backgrounds and/or lowly paid working class civil servants (Hwami, 2010; Zeilig, 2008; Zeilig & Ansell, 2008), and one would have expected university vice chancellors to have compassion and positively intervene to alleviate the negative influence of "market fundamentalism" (Anderson & Pini, 2011) that currently guides universities (Levidow, 2005; Nafukho, 2004; Shizha, 2006). The immiseration brought about by failed economic policies accompanied by corruption and undemocratic leadership of the government demands university education leaders to play a "stewardship role" (Goldring & Greenfield, 2002, p. 4), "act as moral stewards" (Murphy, 2002, p. 67), "lead by empowering" (Sergiovanni, 1992, p. 34) and provide "bridge leadership that connects education and social justice" (Tooms & Boske, 2010). These descriptors confirm the importance of moral education leadership, and when students gather at the University of Zimbabwe to discuss high tuition fees, they are met by campus and state security agents and student leaders face immediate suspension pending expulsion regardless of ruling from the courts of law.

Miller (1999) addressed the issue of access to education as a social justice aspect, especially when institutional arrangements make it difficult for students from certain societal backgrounds. Miller wrote:

> If we are genuinely concerned about social justice, therefore, we must apply its principles to substate institutions that individually or together produce distributive effects that range across a society. Take as one college admissions. …the overall result is important from the point of view of social justice, not only because higher education is a good in its own right, but because who receives it also determines in the long run the allocation of many other benefits. (1999, p. 12)

The adoption of neoliberal policies in Zimbabwean universities accompanied by the dollarisation policy that stipulates that all tuition fees are to be paid in United States dollars has restricted the opportunities for university education of many students (see Student Solidarity Trust, 2009 and/or Zimbabwe National Students Union, 2010). These studies show that students from poor rural backgrounds, ethnic minorities and girls are facing difficulties to enter university, and those admitted encounter many challenges that are not conducive for any meaningful university career. This is what Nancy Frazer called "socioeconomic injustice that systematically disadvantages some groups of people vis-à-vis others" (Frazer, 1995, p. 72). At the University of Zimbabwe, the condition of these weaker sections of the student body has been exacerbated by the university leaders' decision to close campus halls of residence and consequently forcing all students to seek accommodation as renters in the surrounding suburbs. One study found out that:

> The halls of residence have been shut, students eat from informal roadside caterers and students' vocational loans are not available. It emerged early this year that 28 % of students had dropped out of the University of Zimbabwe. Students have been struggling to raise fees of between US$300 and US$1 500 in a country where civil servants earn less than US$300 per month and unemployment is pegged at 90 %. (Muzulu, 2010)

In corroboration another study noted that:

> On July 9 2007, the Vice-Chancellor of the University of Zimbabwe, Professor Levi Nyagura ordered the closure of halls of residence in 30 minutes-rendering the estimated 4,500 student population homeless. This was two weeks before crucial end of year examinations and during a pretty cold winter spell. Students continue to long for the day when professionalism returns to colleges. Indeed, the current crop of college administrators continues to do ZANU PF (PF)'s bidding at the expense of students nationwide. They are condemning the country to a future where all educated minds will have to be imported. The culture of getting instructions

> from a political office must cease in order to enable full recovery of the education system. (Student Solidarity Trust, 2011, p. 13)

As a result of such administrative policies, some have observed that:

> About 20 students share a guestroom in the main house and there are 11 illegal wooden cabins, which house more than 45 students. Most house owners collect between US$20 and US$40 in rentals a month from each student. These landlords are making a killing from the students' predicament. Our landlord collects over US$3 200 every month, as there are more than 80 students each paying US$30 per month. (Share, 2009)

And one of the student activists I interviewed told me that; "I am staying in a garage and we are 13 in that room. We pay US$ 25 a head per month" (interview notes, student activist, August 2010). Along the same lines the following views were captured and they corroborate Frazer's (1995) notion of socio-economic injustice:

> Enrolment figures have been affected. In 2009 students failed to raise US$105 dollars as registration and many couldn't take up places. We ended up taking people with as low as 3 points and in the past we could come down to 7/8 points in critical areas. This has lowered down our standards. Some are still to finish their studies. Those who can manage to pay have political contacts or relatives outside the country. For us education is not only about understanding the world but a tool for better life and for most of these people this is the end of any dream of social mobility. (interview notes, faculty members, July 2010)

Furthermore, government funding policy for students has been shrouded in controversy and characterised by nepotism and party cronyism. Government has been accused of using the student loan systems as a bait to control student activism. A report that was tabled in Zimbabwe's parliament exposed the politicisation of government's funding policy, the cadetship system. Part of the report said:

> The Committee on Higher Education, Science and Technology said a probe it conducted recently found that the country's so-called cadetship programme was highly politicised, benefiting mainly President Mugabe sympathisers. Parliament said the cadetship programme's criteria for selection were discriminatory, ranging from political affiliation to faculty preference. It said that proof of the partisanship of the cadet scheme was the recent withdrawal of the funding of 12 students, on the grounds that they supported the Movement for Democratic Change, a rival party to Mugabe's ZANU PF. (Mashininga, 2011)

What is being observed is the commodification of university education in Zimbabwe, and in a country where academic qualifications are inflated and education for the majority is mainly for economic purposes, some of these young women and man are destined to struggle in their adult life. All this is seen against the luxurious working and living conditions of the top administrators some of whom enjoy conditions similar to cabinet ministers.

Critical Colonial Perspectives: Talking Social Injustice Truth to Hegemonic Powers

The critical and/or anti-(neo)colonial lenses used in this presentation consider the post-independent nationalist government of Zimbabwe as a continuation of British settler administration, neocolonial system of governance characterised by authoritarian elite nationalism, a dominating class, black skins in white masks, following Fanon's (1952) observations. The structural mode inherited from colonialism has dominated state and higher education administration in post-independent Zimbabwe. During the same period, the Zimbabwean state has slowly transformed itself into a force behind internal colonisation of the people of Zimbabwe, black neocolonialists (Ayittey, 1992), characterised by the use of state security agents to silence the people and force them to vote for President Robert Mugabe and his party. Dictatorships retain power through all means necessary, and in Zimbabwe the government of Zimbabwe has not hesitated to use force and violence to quell any attempts at undermining or criticising it (Moyo, 2011, para. 3). It is also a well-established fact that the fight and struggle for human rights and democracy in Zimbabwe has been spearheaded by civic groups of which the student union has played a pivotal role (Chikwanha, 2009; Chimanikire, 2009; Hwami, 2010; Makumbe, 2002; Muzulu, 2010; Tengende, 1994; Zeilig, 2006, 2007, 2008; Zeilig & Ansell, 2008). As a result government policy has been to ensure that strategic institutions are administered by loyal party cadres who are prepared to work for the ruling party in its grand scheme of governing Zimbabwe regardless of the wishes of the people.

In terms of university leadership, this has seen the appointment of vice chancellors, who are loyal to the ruling ZANU PF party, party functionaries whose allegiance and interests are defined by party manifestos and not educational considerations. This has not gone unnoticed by the university community, particularly students and faculty. While scholars of educational leadership have called for moral leadership that aims at fulfilling societal and institutional educational objectives (Bates, 2006; Bogotch, 2000, 2008; Murphy, 2002), the Zimbabwean university is being led by a cabal of political appointees, party activists in PhD gowns masquerading as education leaders. Their brief seems to be dominated by the agenda that they should silence student, and faculty political activities geared against the ruling party and government, and evidence shows that they have not been failing their political masters. Student arrests, assaults, suspensions and expulsions have become common as statistics on the Table 43.1 indicate.

Social injustices have been committed on students by those that society would expect to be the protectors of students, and they justify their actions on the pretext of safeguarding the gains of national independence and sovereignty. University administrators, in trying to please their pay masters, have ceased to be educational stewards or superintendents of education, but agents of a dictatorial state. In return they have been rewarded with ridiculous hefty packages and their portfolios equal a cabinet minister; hence, they have joined the gravy train, the new indigenous kleptocrats (Cross, 2011; Tandon, 2011).

The intermediary dictatorship or authoritarian space dominating university leadership and giving rise to social injustices could be viewed as the major signifier of the Zimbabwean education crisis that has been witnessed since the turn of the new millennium. It reveals a strong tension between Western democracy and human rights tradition that often are illusions of modernity and a tradition that sometimes reflects the monarchical, patrimonial and harmonious mythical traditional past. The unethical and crisis-ridden space has been a great problem since independence;

Table 43.1 2009 reported cases of violations to students by category, adopted from the Students Solidarity Trust

rather than being a step in the imagined development process, it has been the locus of paradoxes that call into questions the modalities and implications of modernisation and democratisation of Zimbabwe. The human rights discourse, and resultantly the social justice debate, is dominated by scholars from the Euro-America bloc of countries and can reasonably be defined as Western culture. But the Zimbabwean state and university, as well as university educational leadership, are seen as oscillating between tradition and modernity (Westernisation) depending on the circumstances and when they suite their hegemonic tendencies. Furthermore, the Western neoliberal university model has been adopted with no government intervention measures to alleviate the immiserating conditions of students from vulnerable groups and giving rise to distributive social injustice concerns (Frazer, 1995), and on the other hand, personal and individual liberties much valued in Western ideologies are shunned and ridiculed as un-African and foreign to Zimbabwe. It is from observing such contradictions and inconsistencies that I observe what can be described as education leadership constructed social injustices in the Zimbabwean university. As agents of the state, university education leaders, led by vice chancellors, are complicity in the commission of social injustices on students and faculty.

Conclusion

In this chapter I used critical colonial or anti-hegemonic analysis and critics to isolate institutional social injustices as a creation of those who seek power and domination without the concern of the people. The ideologies of authoritarian neoliberalism and nationalism are considered as hegemonic and hence behind the prevalence of social injustices in Zimbabwe. British colonial governance was obviously foreign and exploitative with resource exploitation as the main occupation, and it was expected that post-independent Black Nationalist government would be different. Thirty years into independence, echoes of frustration have been resounding throughout the country, and the ruling Zimbabwe African National Union Patriotic Front party has roped in universities in its quest for eternal power. During times when the attention is on the moral focus of educational leadership, university education leaders in Zimbabwe are being found wanting; they have a social and moral obligation to foster social justice practices. Unfortunately, evidence shows that they are political party activists and agents, whose policies are geared at pleasing those who appointed them. Consequently the challenge is that educational leaders in Zimbabwe should increase their courage, intelligence and vision (Jean-Marie, Normore, & Brooks, 2009) and help end the commission of social injustices in their institutions and by extension throughout the Zimbabwean society.

The fundamental role of universities and university leaders in any society cannot be underestimated, and this chapter encourages all efforts to achieve social justice in the Zimbabwean university. Hegemonic forces, notably neoliberalism and nationalism, are corroborating in transforming the university superintendent into an agent of authoritarian political and economic dominance. Against such a disturbing background, I end my effort to expose and hopefully end social injustice at the University of Zimbabwe and the Great Zimbabwe University by speaking for dissident students and faculty and to hegemonic powers, with a defining quotation from a renowned African writer, the brilliant Ngugi wa Thiong'o:

> Our lives are a battlefield on which is fought a continuous war between the forces that are pledged to confirm our humanity and those determined to dismantle it; those who strive to build a protective wall around it, and those who wish to pull it down; those who seek to mould it and those committed to breaking it up; those who aim to open our eyes, to make us see the light and look to tomorrow … and those who wish to lull us into closing our eyes. (1987, p. 53)

Part VI
Glocal Policy Interventions

Chapter 44
Inclusive Education for Children with Special Needs: The Case of Lebanon

Ahmad Oweini and Heyam Lutfi El Zein

Introduction

Many remembrances in the last 50 years have emphasized how movements for social justice helped to define the history of the countries that developed it (1964 Civil Rights Act, 1954 decision for desegregation of schools…). These remembrances and others have played an important role in how school leaders turned out to be social justice advocates and activists. Dantley and Tillman (2006) have framed the concept of social justice in the field of education around several issues including race, diversity, poverty, marginalization, gender, spirituality, age, ability, and sexual orientation. Most Middle Eastern governments have tried to provide appropriate remembrances to promote social justice but were not able to implement and empower school leaders by these abilities. The case of Lebanon is not an exception. The purpose of this chapter is to establish functional administrative management reforms in favor of social justice leadership and moral responsibilities of school leaders and their communities as they advocate for the inclusion of students with special needs. This reform should be based on international standards and cultural considerations. This chapter argues that fostering social justice starts with reestablishing ethics of care, education, and integration of what is social justice and how to seek it and to question what is and what is not, what practices have to be developed, and what skills have to be acquired. The main intent of this particular intervention program is to create a positive school environment encouraging collaborative partnership with constructive ramification towards management of social justice for children in appropriate and innovative way in the community.

International initiatives have been taken to support inclusive education. The UNESCO Salamanca Statement (1994) calls on the international community to endorse the approach of inclusive schools by implementing practical and strategic changes. The UN Convention on the rights of the child contains several articles which taken together provides the right to inclusive education.

These initiatives have lead to a considerable growth in the literature on integration and inclusive education (Jenkinson, 1997). In general, it has headed in three main directions: understanding the practice of inclusion as it related to different disabilities, understanding the factors which help build inclusive schools capable of responding to diverse needs, and comparing the effectiveness of separate special education and inclusive education (Jenkinson).

The lack of documented information about the field of special education in Lebanon has compelled the authors to rely on informal observations and anecdotal reports. In describing the existing reality of special education practices in Lebanon, we can reveal that the educational private sector is the main provider of educational services for students with special needs (Ismail, 2004). Some private schools started building their own special units, typically referred to as the Learning Support Department, to teach students with special needs. Other schools use resource rooms as a main setting for providing specialized academic help for students with learning difficulties. A handful of private schools host children with special needs, placed by one of numerous nongovernmental organizations.

Although the Lebanese educational system has been updated to keep up with recent trends of technology, the component that involves exceptional students remains grossly overlooked. Policy makers have kept the educational titles “regular” and “special” independent of each other (New Hierarchy for Education in Lebanon, 1995). Arab countries like Jordan, Morocco, Tunisia, Saudi Arabia, Syria, Palestine, Egypt, Libya, and the United Arab Emirates have already taken the appropriate measures to restructure their educational system to combine the two educational systems into one by adopting the UNESCO project, Education for All (Yacoub, 2000). Therefore, Lebanon, in comparison to other Arab states, is not as competitive in adopting the principles of special education. With the social awakening concerning children with special needs, the academic integration of these children into regular schools became essential both for the person with a need and as a solution to a problematic situation.

Having acknowledged the seriousness of the problem at hand, what can we do to help solve this dilemma that is complex and multidimensional? In the authors’ view, we need to create a holistic approach *where educational leaders, parents, students, and stakeholders operate together to solve the problem*. We would like to propose an integrated framework of performance and well-being that unlocks parents, children, and staff potentials leading to a fundamental transformation of the school environment, its society, and its culture as a whole. This integrated framework is underpinned by psychological learning theory in a process that is progressive, brings adjustment, and is culturally attentive. It facilitates flexibility and variability in its application, to expand outside the walls of the school.

In setting the foundations of this framework, some basic steps have to be preformed:

(a) Developing a vision that tries to answer certain questions in order to help create an ideal school/community life; the first is “What do we believe inside ourselves that special needs children deserve in order to be healthy (physically, mentally, and socially) in our environment?” The second, “What would be the attitudes and behaviors of those who interact with these children when they have to apply the core convictions derived from the first question?” Thirdly, “What would be the behavior and attitude of the children and their peers when all the school community lives by these core convictions? Lastly, “Did we enumerate all the achieved standards and mastery level of performance and add or delete goals based on data collection?”

(b) Improving quality: Quality improvement occurs at three levels: competence, awareness, and management. At the level of competence, skills are planned at the personal, social, cultural, as well as professional. As for awareness, emphasis is at the level of self-awareness, compassion with the other, and awareness of cultural differences and performance. While at the level of management, stress is on teaching self-regulation, social skills, leadership, and continuous professional development. With the continued emphasis on school/community environment development, the integration of Maslow pyramid, Cognitive Behavior Therapy, and Social Ecology model can demonstrate success in helping these people change.

(c) Accentuating collaboration: As for collaboration, the focus is on students’ family, peers, staff, professionals, and stakeholders. In establishing the program of collaboration, we need to be cognizant of what really bothers each group if we are going to develop ways of genuine empathy and caring. We have to be aware about the issues and problems that make individuals anxious, such as lack of justice, equality, security, rights, equal opportunities, and survival. The framework emphasizes on the social ecological model as a form for collaboration where interaction in relationships has to be between the special needs child and the surrounding community. The model uses horizontal multilateral rather than vertical approaches to service delivery through creative use of volunteers, paraprofessionals, peer support, and social networks, in addition to professional services. Training at the level of collaboration provides services in the domains typically classified under the heading of “social support.”

The link that has to be established between the aforementioned three parts will create a difference in the lives of the students and the whole community. Such integration will embrace the physical, intellectual, emotional, and social growth of children without forgetting the traditional values of the society and thus having good productive citizens. The practical guidelines that will introduce social justice to educational programs and community can be grouped into four categories: vision that works towards restructuring curricula and teaching techniques to include culture, life experience, learning styles of the community, and history dialogue; quality improvement in terms of teachers' empowerment and administrators' leadership; associated with parental and peers' collaboration; and sustainability in terms of implementation of governance, accountability, and abiding by legislations around the world. If applied well and designed to suit specific school's culture and accommodated to the age and background of students, then these programs can be effective.

Vision

It would be to start with a definition of disability: it is a complex phenomenon that reflects an interaction between features of a person's body and features of the society in which he or she lives. The International Classification of Functioning (ICF) defines disability as an umbrella term for impairments, activity limitations, and participation restrictions. Disability is the interaction between individuals with a health condition (e.g., cerebral palsy, Down syndrome, and depression) and personal and environmental factors (e.g., negative attitudes, inaccessible transportation and public buildings, and limited social supports).

A child with disability may suffer from mental retardation, hearing impairments (including deafness), speech or language impairments, visual impairments (including blindness), serious emotional disturbance (referred to in this title as "emotional disturbance"), orthopedic impairments, autism, traumatic brain injury, other health impairments, or specific learning disabilities (*IDEA, 2004, Sec. 602(3)).* So, people with disabilities have abilities that go unnoticed because society focuses excessively on their limitations and not enough on what they can do. In many ways, disability can merely be a point of view.

In addition, a disability is a "social construction," whereas impairment is not. As such, a person can be blind (a disability), but in the dark, a sighted person becomes handicapped and hence on equal footing with the blind person. Not every inability is a disability because a "disability is an inability to do something that most people, with typical maturation, opportunity, or instruction, can do "(Kauffman & Hallahan, 2005, p. 30). As such, a person's inability to read is not disabled if he or she was not exposed to reading instruction.

Most persons have not directly encountered people with disabilities and the challenges they face. Accordingly, they may not appreciate the extent to which people with disabilities and their families are excluded, impoverished, and marginalized within a vicious poverty disability cycle. Persons with disability remain invisible and isolated because of stigma, discrimination, myths, misconceptions, and ignorance. Only by a thorough analysis of this experience and input from people with disabilities can society build a sound understanding and development of a strategy to address the needs and aspirations of disabled groups.

Based on what was mentioned, the development of a vision will be mandatory. This vision has to replace the archaic relationship existing between school administration, parents, and children by an active performance-driven development. Bainbridge (2007) describes the importance of a vision by stating that "… creating a vision… encourages thinking 'outside the box'. In order to do this you will need to undertake the process of 'visioning' in a safe and secure environment where new ideas are encouraged and possibly innovative ways of working are explored… (P3)" Following this particular definition, few questions need to be formulated in the quest to create a vision tailored towards an ideal school/community life. The first is "What do we believe inside ourselves the special needs children deserve in order to be healthy (physically, mentally, and socially) in our environment?" The second, "What would be the attitudes and behaviors of those who interact with these children when they have to apply the core convictions derived from the first question?" Thirdly, "What would be the behavior and attitude of the children and their peers when all the school community lives by these core convictions? Lastly, "Did we enumerate all the achieved standards and mastery level of performance or add or delete goals based on data collection?" This vision seems utopic and unrealistic unless the last question is answered where vision is put into action.

The answer to the first question, "What do we believe inside ourselves the special needs children deserve in order to be healthy (physically, mentally, and socially) in our environment?", could be reflected through a system of shared values that if applied it will facilitate the whole life of the children, their peers, and caregivers not in the school community only but outside it. These values are intended to guide everyone who interacts with special needs children and assist them to become independent, healthy, and safe. It is the view of the authors that these values can be represented through powerful key terms derived from literature that provide direction and reflect social justice. The core values are acknowledgement, diversity, intra-/interpersonal relationships, needs, equity, and sustainability. Thus we coined the acronym *ADINES* that has to be integrated into all levels and functions of the school organization:

A = Acknowledgement Recognition of another's existence, validity, authority, or right.

D = Diversity To recognize and appreciate diverse characteristics that make every person unique in an atmosphere that promotes individual and collective achievement.

I = Intra-/interpersonal relationship *Intra:* To have the kind of life that a person wants as related to private effects, personal growth, and spiritual/moral. *Inter:* The important relationships that exist between individuals.

N = Needs The needs are a motivating force that compels action for its satisfaction. They range from basic survival needs satisfied by necessities to cultural, intellectual, and social needs satisfied by necessaries.

E = Equity Equal treatment of people with disabilities through development of legislation to provide protection from discrimination and implementation of a policy to combat discrimination and promote equality.

S = *Sustainability* It is intended to be a means of configuring civilization and human activity so that society and its members are able to meet their needs and express their greatest potential in the present, while preserving biodiversity and natural ecosystems and planning and acting for the ability to maintain these ideals indefinitely.

Thus, it is necessary to remove attitudinal barriers and strive for further integration of people with disabilities, and by this it will help to remove the biggest danger in society which is people's ignorance in dealing with learning disabilities. Intellectually disabled people are not mentally ill or contagious. While they may not be totally independent, they can learn to do simple household chores or attend to their self-care needs. The intellectually disabled can take part in all activities if people allow them to. Some learn vocational skills and can even become part of the work force. It is merely a question of proper job matching and job training. Intellectually disabled people have emotional needs just like other people.

Another point that has to be looked at in establishing the vision is inclusive education. The Salamanca Statement passed by UNESCO (Ainscow, 1994) fully advocates the practice of inclusive education for students with disabilities with the caution that "while inclusive schools provide a favorable setting for achieving equal opportunity and full participation, their success requires a concerted effort, not only by teachers and school staff, but also by peers, parents, families and volunteers" (p. 11). Thus, the pendulum for special educators worldwide has swung towards a position of inclusion, rather than segregation or exclusion, where inclusion refers to the full-time integration with appropriate accommodations and supports of students with disabilities in general education classrooms located in their neighborhood schools (Bartolo, 2003).

Educational values such as "freedom," "equality," "justice," "personal autonomy," "self-realization," and "the growth of understanding" that are often discussed in the context of inclusive education are notoriously vague and cannot translate into concrete quantifiable indicators of educational outcomes. They are rather qualities that can be achieved through proper interaction with students in learning situations and "not extrinsic products of these interactions" (O'Hanlon, 2003). Inclusive education has had tremendous impact on philosophy, values, and practice of entire educational systems worldwide and is often based on ideals of social justice (Artiles, Harris-Murri, & Rostenberg, in Inclusion & Diversity in Education, 2009).

For inclusive education to attain freedom, equality, and justice and foster autonomous learning depends largely on the nature of the conditions for learning set forth by the teacher, rather than its products. "Therefore, teaching is seen as an ethical activity, and an appropriate focus for practical investigation and reflection. All areas of education and schooling are open to scrutiny in the advancement of such values and concepts within inclusive practice through research processes like action research. However, it is argued that, within a discourse of ethics, 'maintaining segregated special education is incompatible with the establishment of an equitable education system and hence, ultimately with an equitable society. It follows therefore that only inclusive education can deliver social justice' (Dyson, 1999)."

Quality Improvement

Teachers Empowerment

The answer to the second question of our vision, “What would be the attitudes and behaviors of those who interact with the special needs children when they have to apply the core convictions derived from the first question?”, will be through training the whole constituents of the school, to build a good quality of life for these children in and out of school; there is a pressing need to build capacities and develop the skills of its constituents who have to practice and teach these skills, in other words, teachers, staff, caregivers, mental health staff, and stakeholders. The biggest challenge lies in the transition from an archaic system of interaction with special needs children to a system of various roles and wide variety of tasks that offers a cooperative and comprehensive program in managing the situation in inclusive schools. With continuous emphasis on school environment development, integration of Maslow pyramid and development of Cognitive Behavior Coping skills and Social Ecology model can demonstrate success and induce positive change.

In Lebanese schools, teachers have to follow a limited agenda in teaching and giving information, and they value students’ success by this set agenda. They are disregarding a human value, a personal ability to contribute to society. They devalue the students’ capacity to do and to be. But psychological evidence shows that if educators infuse teaching activities with value, dignity, and respect of the learner, the learners will be ready to do and contribute to the utmost of their ability (Rogers, 1983).

When teachers follow the limited, short-term goals of the educational programs set by the government ministers, they are narrowing the concept of education and disabling student to be value-laden human being. This situation has lead the researchers to ask what contribution might the skills of special needs helper make to increase the levels of dignity with which people in the Lebanese schools are treated.

Although they may lack the professional training of special needs helper, school teachers have a long tradition of helping students with disability problems. They also interact daily with the students and thus are in an excellent position to provide personal direction. In fact, effective teachers share many of the same traits as effective helpers: ability to empathize with students, patience and flexibility, excellent interpersonal skills, openness to new ideas, and awareness of individual differences. Good teachers also habitually promote and sustain positive group interaction in their classes and develop a helping relationship with both students and parents. In all these ways, the elementary school teachers, who work closely with young children in a single classroom, generally might have the idea that developmental guidance is an integral part of their responsibility to students (Ismail, 2004).

As National Disability Authority (NDA) summed it up, understanding social constructions of disability and impairment can help to explain why people with disabilities have been marginalized. Contact with people with disabilities under particular conditions can reduce prejudice. Also, affective ties including forming close friendships appear to be very effective in reducing prejudice. Further, disability awareness training is required for all but how it is carried out is important. The impact of disability awareness training should be evaluated. Media may play a larger role in determining attitudes and knowledge than otherwise, and in these circumstances, the need for an enlightened, responsible, and nondiscriminatory media culture becomes more important. Finally, understanding and promoting the values underpinning basic human rights or the basic human conditions required for development—equality, autonomy, dignity and solidarity/social justice—is essential if governments and individuals are to commit themselves to ensuring that each and every person can access the conditions required to live as self-determining individuals (Hannon, 2010).

The 58th World Health Assembly has adopted a resolution aimed at improving the daily lives of people with disabilities. It calls on WHO and its Member States to work towards ensuring equal opportunities and promoting the rights and dignity of people with disabilities, especially those who are poor.

In Jordan, His Majesty's initiative and instructions have resulted in a new Jordanian strategy paying particular attention to issues central to the lives of citizens, including the rights of persons with disabilities, by developing a National Disability Strategy. In the area of accessible communication and environment, the National Strategy calls for accessibility in all forms including social and behavioral attitudes and stereotypes, through a series of interventions and programs, to simplify and facilitate the movement of persons with disabilities on an equal basis with others, by altering transportation, information, and communication technologies and all other public service facilities which will result in self-reliance and social integration for persons with disabilities.

In the target area of media and awareness raising, the document calls for effecting a change in Jordanian society, leading to a reduction in the incidence of disability and to the restructuring of the physical and social environment, enabling persons with disabilities to achieve their rights and improve their image in society.

The National Strategy aims at ensuring equalization of opportunities for persons with disabilities with the aim of leading lives with dignity, including accommodation and sustainable care services aimed at all types of disabilities, especially for those with medium and severe intellectual disabilities, and to ensure equalization of opportunities for persons with disabilities on an equal basis with others.

In the field of sport, recreation, and culture, the strategy seeks to enhance the physical, psychological, social, and cultural well-being of persons with disabilities and to build their confidence in themselves and in their abilities, as well as helping them regain motor and other skills through sports and cultural activities. These factors play a significant role in the development of physical capabilities as well as their impact on the development of adaptive behavior and social maturity of individuals with disabilities.

Regardless of what was issued or what was planned, quality improvement in schools occurs when people use their abilities to the maximum.

A first step that has to be done is to improve the well-being of teachers by improving their attitudes towards themselves and towards others. They need psychological support for their own self-esteem and well-being; they need help in understanding and coping with the stressful situations they are experiencing as well as the demands of the position.

Second, the role of the teacher has to be changed from a dispenser of information to a facilitator, a skilled helper, communicator, and a certain extent therapist. Here the role of training becomes important due to the difficulty in changing adult attitudes and behavior. Without training to tackle teachers' own behavior, there is the danger that the adults' words will not match their actions.

A third thing that should happen is empowering teachers, because teachers can influence students' affective, behavioral, and intellectual abilities if they are empowered. By empowerment we mean how to make the transition from a traditional system of teaching to a system of various roles and wide variety of tasks to offer a cooperative and comprehensive program in psychosocial support and justice as an equal partner with educational programs. There is evidence (Norcross & Grencavage, 1989; Sizer, 1992) that human beings perform better; will learn more effectively, when they perceive themselves as possessed of inviolable dignity and worthy of unconditional respect and when they share in decision making; and have a certain level of control. What we have to do is to help teachers develop inner justice, peace with their own self, with no inner conflict. If this is achieved, then social justice will prevail, and thus we will experience harmony in human relationships, social justice, friendship, unity, cooperation and collaboration, and community development.

Authors contend that teachers should be trained in the basic skills of psychosocial support, teaching diversity, communication skills, critical thinking, and others. When teachers are trained on these basic skills, they will be able to help learning disabled students cope with particular challenge in some cases. But, they need to have the opportunity to internalize these concepts and skills themselves before they can develop these skills and attitudes in these students. By applying this, the teacher will be using the first key to social justice education: a helping and healing relationship. In addition, when we stress the importance of acquiring these skills, we are not devaluing teaching and academic skills nor disregarding the value of knowledge that the teacher has, but we are trying to show that deficiency in interpersonal and intrapersonal skills has a negative effect on teaching and learning (Blase & Blase, 2001; Keiser & Shen, 2000).

Teachers also receive important benefits from teaching in an ILFE (Toolkit for Creating Inclusive, Learning-Friendly Environments, 2006). They have more opportunities to learn new ways to teach different kinds of students. They gain new knowledge, such as the different ways children learn and can be taught. While looking for ways to overcome challenges, they can develop more positive attitudes and approaches towards people, children, and situations. Teaching becomes a joy, not a chore. Teachers also have greater opportunities to explore new ideas by communicating more often with others from within and outside their school, such as in school clusters or teacher networks, or with parents and community members. By applying these new ideas, teachers can encourage their students to be more interested, more creative, and more attentive. As a result, the children and even their parents can give teachers more positive feedback. They also can receive increased support from the community and be rewarded for the good work they are doing.

Teachers can experience greater job satisfaction and a higher sense of accomplishment when ALL children are succeeding in school to the best of their abilities. Remember, however, that "ALL children succeeding" does not necessarily mean that all children successfully pass a written examination. It means accepting diversity in the different ways children learn as well as how they show their success in learning, for instance, when they can successfully explain and apply a concept to the teacher or to the class, instead of answering questions about it on an examination.

In schools that are inclusive and learning friendly, teachers may have more volunteers working in their classrooms, which reduce the teaching workload. Under the teacher's guidance, these volunteers will more likely want to help when they understand how what is learned in the classroom is important for the lives of children and their families

Increased professional development opportunities are also needed to create a more dynamic and peaceful workplace. In this situation administrators and principals should encourage teachers in creating their own professional development opportunities. They have to be aware of their needs in relation to the vision and mission of the school. Another way to improve professional development is to recognize that teachers have different needs. Teachers vary in their learning styles and their desires and needs also differ. Teachers have to be given options to decide what kind and type of professional growth, training, and career goals (Robinson, 1994).

The working conditions of teachers will improve dramatically. Instead of working in isolated settings with few resources, teachers will have time to collaborate with one another. The ideas of teachers will be highly valued, and they will be viewed as leaders who work collegially with school administrators to design the best learning environments for students. There will be a place that creates winners, not winners and losers (Kottler, 1998).

Rejecting teachers cause disabled students to perform more poorly, both socially and academically. The self-concept of a rejected student can be affected. Simply including students with disabilities in the regular classroom does not guarantee their social acceptance or their acquit ions of improved social skills. Teachers must participate in developing and implementing a systematic program designed to improve the students' social skills and to increase their social integration (Marshall & Oliva, 2006).

Teachers should start by changing their attitude as their attitude has a significant effect on the attitudes of the students within the class; negative feelings towards students with disabilities can be communicated by the teacher. Teachers should attempt to convey a positive attitude that encourages acceptance of the student with special needs (Turnbull & Shulz, 1979).

Teachers should focus on students' similarities. Turnbull and Shulz (1979) state, "A difference is only a difference when it makes a difference…[C]hildren [with disabilities] has far more similarities than differences with the children without disabilities" (p. 48).

Because of the strong relationship between attitude and information, teachers should be sure they have adequate knowledge about students with disabilities and the appropriateness of different educational interventions. They should assume primary ownership and accept responsibility for the education of students with disabilities, just as they do for all students on the class list; provide families with documented evidence of their children's progress and successes; help families become more actively involved in their children's education; help families determined where a student's interests lie so that appropriate long-term goals can be established; teach and reinforce social skills that are needed for students to be successful, contributing members of the communities in which families live; tell families when their children exhibit inappropriate behavior or academic needs in the classroom; provide important educational and community data to help families stay current and knowledgeable about opportunities available for children; and lend a helping hand, a supportive ear, and a friendly face to all families served (Hattie, 2002).

Another important figures that play a role in creating and developing social justice for special needs children is the principal and stakeholders. If they are supportive, involved, and engaged in what is happening, all the positive powers of students, teachers' assistants, and counselors will be unleashed to their fullest. In this situation, they will be facilitators and managers at the same time. Trust and rapport must be established through open communication with students, parents, and teachers. By maintaining a positive attitude and viewing all members of the school and community as assets, then culture of social justice will prevail (Bentley, 2000; Harris & Enfield, 2003).

Children's mental health, social, and emotional development should not be the responsibility and goal of teachers only, but every active member within the school community. All staff should be trained in the basic skills of observing and discovering the beginning of health and mental symptoms, dealing with diversity and communication skills (McGuiness, 1993). When staff is trained on these basic skills of rights, equality, and diversity, they will be empowered to help special needs children cope with their particular situation.

To alleviate problems and enhance and develop awareness, a map of how to improve performance will be based on training that tackles the health, personal, professional, and social factors of the people in the school. The most feasible way seen by the authors could be through practical and applied workshops and activities like but not limited to (Hallahan, Kauffman, & Pullen, 2009; ILFE, 2006):

- Development of students profile.
- Offer trainees simulation of situations that occur on job, and make them practice ways of how to cope with these situations.
- Offer sessions in human rights, justice, peace education. and conflict transformation.
- Organize events designed to improve teachers and staff motivation and analyze successful actions in dealing with health and disability problems.
- Offer activities related to relaxation training, stress booster training, and cognitive structuring.

In addition to training and workshops, certain activities and incentives have to be promoted such as:

- Updated information for teachers and parents as related to the nature of the job and their children's development.
- Offer social activities for teachers and children's family in the school vicinity to understand the nature of work handled.
- Opening a unit of stress management and physical training. The focus of the unit's activities will be on both individual and organizational levels, not forgetting the promotion of the awareness for children's right and justice workshops.
- Promotion criteria and salary improvement plays a role in creating a positive atmosphere.

Administrators' Leadership

Within a task, there are many activities, which only the leader can perform. However, there are often opportunities for leaders to delegate parts of the task to colleagues. Delegation should not be undertaken in order to off-load boring, tedious, unrewarding tasks, but to empower and enhance job satisfaction and reward (Bennett, 1994; Praisner, 2003).

Kottler and McEwan (1998) suggest that when a principal chooses to accept the leader role, he/she has to develop as a skilled helper. This skill will involve mastering a number of counseling and consulting skills. The acquisition of these skills will allow the principal to gain access to the mind of the people whom he/she is interacting with, earn their trust, and understand what they are experiencing. In return, the people will listen to him/her because he/she has credible helping skills and an authentic interest in their benefit.

As a leader in his or her school, the principal has to be aware of the needs of students and ensure that teachers create an encouraging atmosphere for education. Hazler (1998) emphasizes the importance of the climate of respect and caring that engenders effective teaching and learning. Hazler contends that if the principal is supportive, involved, and engaged in what is happening, all the positive powers of students, teachers' assistants, and counselors will be unleashed to their fullest. In this situation, the principal will be a facilitator and a manager at the same time.

The climate of the school and the leadership of the principal in the school play significant roles in creating a positive environment that can affect the students' behavior and subsequent learning. The principal is one of the most important people in the school; the leadership provided by the principal determines whether a maximum opportunity for developmental task mastery by the students in the school is promoted.

Administration support is *vital t*o the intervention and its sustainability. They can give a hand in identifying specific dilemmas that represent the current culture of the school. Administrators and supervisors should undergo training that has to do with awareness, accepting diversity, human rights, etc. If teachers and staffs see their administrators and supervisors attending the training, they will acknowledge that this is important and their own participation is necessary.

How can we create a just, accepting society, and fair treatment for special needs children? This is where the third level of improving quality comes: management. An implementation of a comprehensive prevention program, which is characterized by a number of cognitive, behavioral, and social activities that form the basis for understanding the best practices, will be needed.

At the level of cognitive activities the teacher should be able to (Hunter et al., 2005; Mastropieri & Scruggs, 2007:

- Assess the nature and type of skill deficits in every child.
- Increase the child's ability to cope with high-risk situations including both interpersonal difficulties and intrapersonal discomfort.
- Be able to use active behavioral or cognitive coping methods to deal with problems.
- Through simulation, teachers will develop the skill of self-efficacy and be persuaded by the possibility of change.
- Teach coping behavior through instruction, modeling, directed practice, and feedback.
- Involvement and engagement of the significant other of the child (parents, peers, etc.) in attending training sessions.
- Elicit from the significant other and the child some important positive aspects and explore how they can work together to overcome the problem.

Behavioral and Social Activities

Physical activity constitutes an important factor in promoting resilience and mental health in the children. In fact, physically active people tend to have better mental health than their inactive counterparts. The physically active usually score better in regards to positive self-concept and self-esteem. Physical activity has also been used to treat mental health problems such as depression (American Heart Association, 2009).

Practical ways of enhancing resilience include but are not limited to:

- Access to sports and other activities that suit the situation of every child.
- Opportunities to participate in arts.
- Practice in social skills.
- Opportunities to practice enjoyable and fulfilling use of time, for example, involvement in the theatre, arts, music, drama, or exercise.
- Opportunities for socially useful activity, for example, through peer support or community involvement.
- Opportunities to benefit from education and obtain qualifications.

Collaboration

Thirdly, “What would be the behavior and attitude of the children and their peers when all the school community lives by these core convictions?” This question can be attained by collaboration between teachers, mental health professionals, students’ family, and stakeholders. Collaboration can be grouped into shared core values and respect, proper training, and continued cooperation. Each level depends on and potentiates the other.

Maslow’s theory of self-actualization maintains that there is a hierarchy of needs, ascending from the basic biological needs to the more complex psychological motivations that become important only after the basic needs have been satisfied, namely, physiological needs, safety needs, belongingness and love needs, esteem needs, cognitive needs, aesthetic needs, and self-actualization needs.

The needs at one level must be at least partially satisfied before those at the next level become important determiners of action. When food and safety are difficult to obtain, the satisfaction of those needs will dominate a person’s actions and higher motives are of little.

Most individuals with special needs continue to struggle to fulfill the first four needs as many are poverty stricken in developing countries. Those who are luckier and live in more prosperous and supportive societies cannot claim to have achieved esteem needs, in other words, to achieve, be competent, and gain approval and recognition (Atkinson & Hilgard, 2003; Walker, 2003). Chief among the traits that set self-actualizers part from other individuals are (1) the ability to accept themselves and others for what they are and (2) to show concern for the welfare of humanity. We believe that that social justice embodies these two distinguishing characteristics. Using Maslow’s nomenclature, when a particular nation has peak experiences in the form of “temporary, nonstriving, nonself-centered state of perfection and goal attainment” (p. 467), albeit at different intensities and in various contexts such as appreciation of and intimate relationship with others, it follows that the journey towards social justice has begun, ending with wholeness, perfection, aliveness, uniqueness, effortlessness, self-sufficiency, and the values of beauty, goodness, and truth.

Parental Collaboration

To have social justice implemented in a holistic way, parents have to share in creating this atmosphere. Most parents in Lebanese families show caring about what happens to their children. Many parents want a third party, usually the school, to guide them through this arduous process. It is the view of the authors that teachers should spend a significant amount of their time working with the caregivers by encouraging them to appreciate the value of their own social action efforts.

An ILFE can offer many benefits to the community in the view of the authors. The community develops a sense of pride as more children go to school and learn.

They discover that more “community leaders of the future” are being prepared to participate actively in society. The community sees that potential social problems such as petty crimes or adolescents’ problems may be reduced. Community members become more involved in the school, creating better relations between the school and the community.

Lebanese schools have to do certain steps to establish partnership with parents and the community to share their convictions with young people, to nurture and inspire hope, compassion, and commitment in the family and larger community. Thus, the authors have some suggestions; if implemented it will lead to involvement that is more parental in social justice. We suggest the following ideas:

- Assessing parents’ commitment to social justice issues.
- Learning and teaching ways how families can participate together in projects that contribute to the greater societal good.
- Appreciating the important role that parents play in the development of children’s social conscience.
- Help parents build a community of learners who respect and value personal uniqueness, choices, and differences and who promote mutual understanding and inclusion through workshops, activities, and parental meetings.
- To further demonstrate this commitment to diversity and social justice, the authors believe that schools have to offer dialogues on societal issues, sustainability, and classes on subjects such as peace and conflict, gender, feminist, and much more.
- Finding out about the social justice needs of parents and communities to help children overcome their problems, this can be reached by asking parents during conferences or by making interviews and surveys to learn about the activities that parents are interested in and the nature of assistance that the parents want or that they can offer to the school as social backup.

Implementing these, strategies will take time and might be frustrating when response from parents in the beginning of the implementation of the suggested ideas might not be up to the intended goals. In this situation, creative ways and insistence on cooperation in a positive and gradual way will lead to a change. The more parents become interested in the school’s activities, the more effectively they will be helping the school, the more they will ask from schools, and the more positive effect will be reflected on the behavior of their children (ElZein, 2009). This might be troublesome in the beginning, but this is what is needed for social justice.

Peers’ Collaboration

Students with special needs may encounter difficulty in social interactions with general education because of their behavior, fail to conform to the expectations of school and society, may not look or act the same as other students, can be easily identified, have their appearance or their actions visibly different, are delayed in social development, often encounter failure, and lack the necessary language skills for effective communication.

Successful inclusion depends on three factors: attitude, resources, and curricula (Favazza, Phillipsen, & Kumar, 2000). Hence placement alone does not guarantee acceptance, social integration, and social justice. What is needed are multiple opportunities for children without disabilities to interact with special needs children, especially when they are supported and encouraged to do so. In their research, when participants (kindergartners) played directly with peers with disabilities, they reported increased levels of acceptance, began to incorporate children with disabilities in their drawings, stop by the classes of children with disabilities, and greet one another in the hallways, cafeteria, and playground.

Peers should provide support and assistance (assisting students with physical or visual impairments in their travels around school or providing a student with severe disabilities the opportunity to learn and practice age-appropriate skills while participating in games or verbal interactions with others) (Reay, 2006).

Peers can become peer tutor to help them with instruction and the model provided by the general education tutor. Tutoring is effective with students who are withdrawn and have acting-out behaviors and those with academic needs.

Through an ILFE, children become more self-confident and develop greater self-esteem. They take pride in themselves and their achievements. They learn how to learn independently both inside and outside of school. For example, they can learn how to ask good questions. They learn to understand and apply what they learn in school to their everyday lives, such as in their play and in their home. They also learn to interact actively and happily with their classmates and teachers. They learn to enjoy being with others who are different from themselves, including how to be sensitive to and adapt to these differences. All children learn together and value their relationships, no matter what their backgrounds or abilities. Children also become more creative, and this improves how well they learn. They learn to value their native language, to appreciate their cultural traditions, and to consider themselves as also being different from others, which is normal and something to respect and to celebrate. Through an ILFE, children improve their communication skills and are better prepared for life. Children gain—or can regain—self-respect for themselves as they learn to respect others.

In addition to parent, peer, and family involvement, collaboration must occur internally (within the school) and externally (outside the vicinity of the school). Within the school, it is the responsibility of the leaders to build collaboration. If collaboration and collegiality are missing within schools, we cannot build collaboration with business, political bodies, universities, or organizations (Vincent, 2003).

In establishing collaboration, we need to be cognizant of what really bothers each group if we are going to develop ways of genuine empathy and caring. We have to be aware about the issues and problems that make individuals anxious, such as lack of justice, equality, security, rights, equal opportunities, and survival. The framework emphasizes on the social ecological model as a form for collaboration where interaction in relationships has to be between the children and the surrounding community. The model uses horizontal multilateral rather than vertical approaches to service delivery through creative use of volunteers, paraprofessionals, peer support, and social networks, in addition to professional services. Training at the level of collaboration provides services in the domains typically classified under the heading of "social support," including (Hiatt-Michael, 2001; Jazzar & Algozzine, 2007):

(a) Creating awareness as related to special needs problems
(b) Developing skills that have to do with support such as:

  - Readiness to offer help upon observing personal risk or health problems.
  - Recognize some of the signs of injustice and discrimination, health, and mental health illness.
  - Emphasize on personal responsibility for working towards change.
  - Use appropriate flexibility in managing children's disabilities.
  - Facilitate self-efficacy and encourage optimism.
  - Show compassion without overruling the acquired skills.
  - Offer clear advice to change.

(c) Instrumental support (referrals, help centers, etc.)
(d) Networking between school and community to facilitate good resettlement and rehabilitation

For families to be healthier, they should be cohesive, that is, family members are free to act independently of other family members. Such families can offer a child with a disability the necessary support. It should not be overly cohesive as it becomes overprotective.

It should also be adaptable, that is, the degree to which families are able to change their modes of interaction when they encounter unusual or stressful situations. A family should be neither unstable nor rigid as it would become less effective in dealing with disability.

Another substantial collaborative work is the development of a board or committee that handles complaints and problems between the school community as a whole, the children, and their parents. This committee is responsible for handling problems and improving the school system, since an outside observer can handle any problem objectively.

In general the suggested horizontal cross-training can plant the seeds for the development of awareness, knowledge, and appreciation especially if all contributing members are receptive to the conveyed messages. The triangular relationship established between parents, teachers, staff, and stakeholders could be ultimate strategies to ensure social justice in school. A good knowledge of the network and a comprehensive health and social needs assessment plan allow for a correct orientation of children in school and in their community.

Through all forms of cooperation between parents, teachers, and peers, children become more self-confident and develop greater self-esteem. They take pride in themselves and their achievements. They learn how to learn independently both inside and outside of school. For example, they can learn how to ask good questions. They learn to understand and apply what they learn in school to their everyday lives, such as in their play and in their home. They also learn to interact actively and happily with their classmates and teachers. They learn to enjoy being with others who are different from themselves, including how to be sensitive to and adapt to these differences. All children learn together and value their relationships, no matter what their backgrounds or abilities. Children also become more creative, and this improves how well they learn. They learn to value their native language, to appreciate their cultural traditions, and to consider themselves as also being different from others, which is normal and something to respect and to celebrate. Through an ILFE, children improve their communication skills and are better prepared for life. Children gain—or can regain—self-respect for themselves as they learn to respect others.

Through collaboration, the community develops a sense of pride as more children go to school and learn. They discover that more "community leaders of the future" are being prepared to participate actively in society. The community sees that potential social problems, such as petty crimes or adolescent problems may be reduced. Community members become more involved in the school, creating better relations between the school and the community (Casanova, 1990; Hudson & Fradd, 1990).

When inclusion is implemented properly, which means involve and give training to the teachers, give the kids support in the integrated environment, involve general education and special education parents from the beginning, and make adjustments as the program is implemented, the whole school becomes a better place.

Sustainability

Fourth question asked in developing the framework for social justice was the evaluation of the achieved standards and mastery level of performance: "Did we enumerate all the achieved standards and mastery level of performance and add or delete goals based on data collection?" The authors consider four steps to be followed in order to answer this question: implementation of governance, accountability, and order, abiding by legislations around the world that stipulate information about dealing with disabled children and their rights, enhancing partnership with educational organizations and the children's community, and exchanging practices. The success in delivering all the services needed demands dedicated and well-trained teachers, but they in their turn need support and recognition from the administrators. The more this positive environment is maintained, the clearer the emotional resilience among children is observed.

Research shows that many mistakes were major with the rush to implement massive inclusion programs in the United States. Some of these mistakes include inadequate preparation of mainstreaming participants (regular education teachers, special education teachers, parents, etc.), misunderstanding of the principle of Least Restrictive Environment which presupposed a continuum of services as full inclusion, inappropriate selection of students for full-time mainstreaming, insufficient support to inclusion students and general education teachers, and inadequate communication among team members (Lewis & Doorlag, 2009).

Moreover, research on inclusion showed mixed results that have to do to the effectiveness of inclusion programs. There were several examples of successful programs that showed more gains in self-contained classrooms than the resource room for mildly handicapped students, whereas placement in the regular classroom with a combination of carefully designed individualized instruction and resource support was more effective for students with mild learning disabilities (Lewis and Doorlag 2009; Smith & Tyler, 2010).

Generally, inclusion yielded positive outcomes for students with severe disabilities in terms of social relationships and friendships, acquisition of communication skills as part of their participation in cooperative learning activities, and generally tended to receive more academic instruction, one-to-one instruction, and more teacher attention than their peers in self-contained classroom.

Research concluded that the instructional factors that promote achievement of students with disabilities include:

- Small class size
- Consistency between curricular goals and instructional activities
- Mastery learning and a formal management system
- Increased time for cognitive activities
- Increased instructional time
  (Lewis & Doorlag, p. 435)

A quantitative study in Kuwait (Al-shammari & Yawkey, 2007) concluded that teachers were supportive of autistic students and their education because of their learning potentials compared to students with other disabilities, and attributed this finding to parental involvement in programs related to their children's needs. Recommendations of this study included additional training for special education teachers which may influence attitudes towards teaching and accepting students with special needs. Another recommendation was the awareness of and need for parent involvement of families with their special needs children.

Furthermore, there is research evidence that the family attitude contributes to the prognosis. Family stresses associated with limited financial resources, lack of appropriate services, and insufficient support systems are examples of family system risk factors that can contribute to poor prognosis. Environmental risk factors such as lack of services and negative attitudes can also have an adverse influence on the prognosis of the child with disability (Gupta, Kar, & Thapa, 2006).

In India, disability is still largely viewed in terms of a "tragedy" with a "better dead than disabled" approach, the idea being that it is not possible for disabled people to be happy or enjoy a good quality of life. Dalal and Pandey (1999) and Gupta and Singhal (2004) investigated cultural beliefs and attitudes of a rural Indian community towards physical disability. The results revealed fatalistic attitudes and external dependence in families with disabled children.

Though it cannot be disputed that parents of disabled children face a great deal of stress, it is now important to move away from describing these stressors and their adverse effects. Instead, research should now focus on exploring the ways that such families cope with varying degrees of success.

Not forgetting the reported results that families with a child with disabilities can and in fact do have positive perceptions which lead to better quality of life for the family and scope for maximizing the child's potential. Though precipitated by a specific event, formation of positive perceptions is usually a process, which can occur simultaneously on a long time after the event. This leads to three main implications. Firstly, given this framework, the situation calls out for more extensive exploration. Second, it is imperative to look at the tools being used and whether they provide space and opportunity to give positive responses. If we do not ask positive questions, we would rarely get a positive answer. Finally, helping families develop a positive outlook might be the serving points of intervention by the clinicians themselves. Although, the research in this area is limited as yet, there is a possibility of developing practical interventions to help families to adapt. Most often their intervention is done at the level of the child and addressing the disability per se. Therapists might want to concentrate on this aspect and facilitate families' coping processes by encouraging and supporting positive outlook on self and life. This can be executed through the course of family therapy, marital therapy, or individual counseling. A very effective way would be moderating self-help or support groups for parents with children with disabilities. Parents with positive perceptions can help the other parents in the early stages of adjustment develop positive but realistic expectations.

To support the sustainability of the social justice intervention, the Lebanese government needs to abide by the national and regional civil rights of the people with disabilities, legislation, and litigation and court decisions. Cooperation with community agencies is vital to secure continuity of treatment and to facilitate the mainstreaming of children into the school community. One important thing has to be added related to making changes in the children's way of life and situation. Changing the way of dealing with the learning disabled children requires some basic assumptions like taking a gradual approach, avoiding too ambitious a time span, recognizing reason for the changes that are made, and reconsidering workload.

Another factor that leads to sustainability of intervention program is to do continuous evaluation of the program in terms of:

- Respect of children's rights
- Application of the process of confidentiality
- Quality of care and consultation
- Reports of meetings between parents, professionals, and teachers
- Quality of the physical and social climate of the disabled child

Certainly, education and skills are key to opportunity, employability, and security. Yet, it takes more than personal attributes and resources to drive educational and life opportunities. Other factors such as where, how, and who the person with disability lives with can be of equal importance to one's personal resources. This is referred to by Putnam as "social capital" (1993) and is identified as the key to success in communities. This consists of the means to access "networks, norms and trust that facilitate co-ordination and co-operation for mutual benefit" (Putnam 1993), thereby making a healthy society where dignified life is possible (O'Hanlon, 2003).

Similarly, Dyson (1999) who distinguished between justification (rights and ethics, and efficacy) and implementation (political and pragmatic) of inclusive of special education has coined the term efficacy discourse and argues that students may socially benefit all students through well-implemented models. To do so, political actions are called for through addressing inequity among communities and abolishing ideas and assumptions that continue to feed segregated special systems (Artiles et al, 2006). He argued that social justice can be viewed as individualistic or communitarian. In the former, it focuses on access and distribution of resources; hence it is libertarian and merit based; in the latter, it emphasizes social cohesion, care, and responsibility.

Therefore, authors contend that public policies should give priority to the following concerns:

- Universal preschool education
- Basic skills for all children through literacy and numeracy targets in the National Curriculum
- High achievement for all young people through a unified qualifications system for 14- to 19-year-olds
- Training investment by employers
- The expansion of university education
- The development of lifelong learning opportunities

We believe that universal/inclusive design provides an environment that enables people with disabilities to move about freely and safely and to use its facilities and services without undue convenience and danger. The creation of universal access is a matter of design and standards rather than cost (Disability Brief, 2005).

In addition to what was mentioned, what can improve the Lebanese intervention program is the exchange of best practices from other countries under the condition of adopting experiences to suit cultural differences. This can be actualized through organized meetings, exchange of successful practices, development of management instruments and training materials, and supply of books, guides, and brochures.

Skills, knowledge, strategies, and cooperative community are the key elements for sustaining integrity, multiplicity, and social justice in educational organizations. Whether the individual is a teacher, administrator, parent, or student, there is a need for empowerment, guidance and counseling, support, and practice. This chapter was intended to offer a framework to help facilitate the important work of promoting equity and social justice for the benefit of the Lebanese community in general and the learning disabled children in special.

The Fifty-eighth World Health Assembly has adopted a resolution aimed at improving the daily lives of people with disabilities. It calls on WHO and its Member States to work towards ensuring equal opportunities and promoting the rights and dignity of people with disabilities, especially those who are poor. Countries are requested to strengthen national policies and programs on disability, including community-based rehabilitation services. WHO is requested to support these efforts and to collect more reliable data on all relevant aspects of disability, including the cost-effectiveness of interventions.

Conclusion

Lebanese children are the most valuable asset. They need us to provide support for their educational and emotional needs, taking into consideration the stresses and demands of school. As suggested, the first step to the development of a program is to build awareness of the situation, understand the degree of the problem, and identify the needs. To address these problems, a multifaceted framework has to be developed that deals with reestablishing safety and basic health needs and offers education and integration. These elements would provide the basis for all partners to move forward and put future plans by providing technical assistance for legal review, assessment, advocacy, fund raising, capacity building, investment projects, and monitoring and evaluation.

As teachers whose expertise is to understand the dynamics, challenges, and resources within the school environment and the cognitive, behavioral, and emotional functioning of children, the teacher plays a central role in supporting the educational and mental health needs of students. Legislators know this, educators know this, and the community recognizes and appreciates this. As key players, to them go to make the difference in whether or not revitalization efforts will be sustained or will fade away. Schools cannot act in a new way unless leadership prevails. In addition, restructuring will not happen unless there is external support from politicians and community. The most influential key players are teachers, who serve as primary motivators in helping students to grow to achieve. Parents must become active players in changing student attitudes. Students must assume responsibility for their own growth, learning, and achievement. Legislators interested in presenting social justice in schools should encourage the formation of a legislative study committee to determine the best ways to support social justice in Lebanon. In addition, professionals and educators who support such programs must become organized and active on the country level. The researchers suggest a 3- to 5-year start-up period as a sensible time frame to use when considering implementing social justice. This provides time for the universities to prepare qualified teachers and for administrators, educators, and parents to develop strong effective programs.

Chapter 45
Education Policy in Cyprus: From Decision-Making to Implementation

Christina Hajisoteriou and Panayiotis Angelides

Introduction

Marshall and Gerstl-Pepin (2005) argue a point familiar to educational researchers within the field of policy sociology. Traditionally, policy analysis for social justice has taken place at the macro-level of the educational system while taking an interest in the objective measurement of justice-related phenomena. To this extent, the positivist, functionalist and pluralist assumptions have largely remained uncontested. Marshall and Gerstl-Pepin go on to explain that traditional policy analysis for social justice falls short in challenging the reliability of economics-based methods including cost-benefit or decision analysis. By relying on the assumption that policy for social justice can be studied in an analytical framework, the traditional view overlooks the sociocultural and value-laden character of education. However, education policies for social justice are the outcome of policy debates and conflicts over culture and values and 'result when certain cultural values win' (Marshall & Gerstl-Pepin: 65).

In sociopolitical arenas, the political actors' normative judgments, such as their values and interests, influence the problem definition, meaning the ways in which the social justice issue is labeled, defined and ranked on the policy agenda in order to be satisfied. The definition of the social justice issue turns into policy goals reinforcing either developmental or redistributive policies, meaning 'whether a policy is a small add-on or it takes from some to give to others' (Marshall & Gerstl-Pepin, 2005: 40). Nonetheless, Marshall and Gerstl-Pepin conclude that in order to disrupt inequity in education, not only political actors but also education leaders and educators across all the levels of the system should move from reproduction to reconstruction. They should challenge and disrupt the taken-for-granted assumptions, norms,

I. Bogotch and C.M. Shields (eds.), *International Handbook of Educational Leadership and Social (In)Justice*, Springer International Handbooks of Education 29,
DOI 10.1007/978-94-007-6555-9_45, © Springer Science+Business Media Dordrecht 2014

policies, structures and practices that perpetuate inequity by challenging the legitimacy of the system in order to systematically deinstitutionalise inequity.

Thereafter, we contend that beyond the structures of policy and policy planning for social justice in education, it is necessary to look into the cultural processes of policy implementation. For many analysts, education policy for social justice is delimited to the macrostructures of the state-derived rules and directives and hence disconnected from the educational cultures and implementation realities while neglecting the role of human agency (i.e. Hoskins, 2008). However, a broader lens of policy investigation implies not only the examination of social justice policy enactments but also the examination of the intentions, actions and inactions of the educators that are involved in the policy process, both decision-making and implementation.

Our argument is lent weight by Ozga's (2000) conception of policy as a process of negotiation, cooperation and conflict between different groups and individuals inside and outside the official mechanisms of policy-making. Accordingly, it opposes the instrumental notions of policy that conceptualise education as a social institution and define policy as the product of the institution's operation. Such conceptualisation decouples policy from the context within which it has emerged and fails to consider policy as both product and process. We thus disregard a conception of policy as a linear process which signifies that once developed, policy is implemented as intended. Consequently, policy for social justice does not include fixed and unambiguous mandates that derive from a single level of the educational system. On the basis of Ozga's definition, we indicate that education policy for social justice is rather ambiguous and unstable and encompasses all parts of the education system.

On this point, Bogotch (2008) argues that in order for social justice to become a reality, we should take into consideration the critical reflections of educators, across all the levels of the education system, upon professional issues of teaching, learning and leadership. We would agree that:

> if we are to succeed in clarifying social justice issues and problems of contemporary educational leadership, it will happen only when educators, at all levels, fully embrace the intellectual, political, social, and ethical challenges they face in everyday life. (Bogotch, 2008: 11)

Nowadays, many educators develop their school agendas and organise their school practices according to what the centralised state institutions say that matters in their schools. Bogotch remarks that the process should rather occur vice versa; supranational, national and local agencies should acknowledge educators' concerns on leadership and pedagogy in their decision-making.

The evidence we will present here seems to indicate that policy processes for social justice do not consist only of official policy formation by the state. Arguably, policy can exist, but without the implementation and the monitoring of its implementation, policy may also be non-existent. The implementation stage of the policy process entails the reinforcement of a policy formally adopted by a governmental body into practice. Implementation may differ from the planned policy or its adoption, meaning the decision to employ this policy. That is, because ‘institutional leaders do not mechanically implement policy from the state, nor do those studying and working in educational institutions mechanically implement the policies of their institutional leaders’ (Bell & Stevenson, 2006: 9). Therefore in researching education policy for social justice, we should never take policy implementation for granted. Although the analysis of education policy for social justice stems from conceptualising the social justice issue within a particular sociopolitical context, it should also encompass the implementation of social justice policies in practice.

Conceptualising Social Justice Within the Political Theory

Notably, conceptions of social justice underpinning educational policy are not fixed, stable or uncontested across time, place and political context. Nonetheless, Lingard and Garrick (1997) in their trajectory study of social justice policy in Australian education identify three dominant traditions of social justice within the political theory: the liberal democratic, the liberal individualist, and the social democratic. The liberal-democratic tradition promulgates an activist role of the state which endorses a continuum of affirmative action and redistributive policies. Thereafter, ‘each person should have the most extensive personal liberty for all that primary social goods’, including education, and ‘should be distributed equally, unless unequal distribution benefits the least advantaged’ (Lingard & Garrick: 162). The liberal-individualist tradition (otherwise the market-individualist conception) instead of the distribution process focuses on the competition for the accumulation of social goods. The state plays a minimal role, just about to ensure fair competition. Lingard and Garrick criticise the first and second traditions as arbitrarily assuming that all individuals act in their own personal interest. On the other hand, the social-democratic tradition reinforces a more collectivist conception of society, pointing to a different relation between social justice and the market; the achievement of social justice necessitates state intervention within the market.

The different traditions of social justice policy attempt to conceptualise its goals and classifications. Nonetheless, in real-life situations these categories overlap and are always tentative. Although education policy provides for individual benefits, it should also emphasise the collective good by establishing relationships of equality and reciprocity within the context of a ‘truly civil society’ (Lingard & Garrick, 1997: 175). We argue for a collective equality perspective, which adheres to conceptions of active citizenship. The concept of active citizenship draws upon the idea of active participation by promoting the feeling of belongingness to a community. Participation in political processes alongside civic and cultural participation is an important aspect of active citizenship (Niessen, Yongmi, & Migration Policy Group, 2004). Education policies which are oriented towards active citizenship aim at enabling all children to play a full role in society. Education for all not only allows individuals to develop their personal potential but also promotes the development of democratic and participative societies.

The reconceptualisation of a 'truly civil society and collective well-being' brings together a politics of recognition and a politics of redistribution (Lingard & Garrick, 1997: 176). Thereafter, we would suggest that the prevailing political culture should shift from 'a process-based social justice orientation to a distributive outcome conception' (Opfer, 2006: 283). Therefore normative definitions of social justice should be rooted in the distribution of outcomes rather than the distribution of access. Social justice goes beyond access, rather than it questions a *politics of equal dignity* which is grounded in all students' equal treatment (Clay & George, 2000: 208).

Fraser (1997) explains that injustice has two facets, namely, socioeconomic and cultural or symbolic. Socioeconomic injustice is rooted in the political-economic structure of the society and refers to exploitation, economic marginalisation and deprivation. Cultural or symbolic injustice stems from social patterns of representation, interpretation and communication and points to cultural domination, non-recognition and disrespect. Fraser argues that redistribution is the remedy for socioeconomic injustice, which includes policies such as the redistribution of income, the reorganisation of the division of labour, democratic decision-making and/or the transformation of other political-economic structures. On the other hand, recognition is the remedy for cultural or symbolic injustice that involves policies such as 'upwardly revaluing disrespected identities and the cultural products of maligned groups' and 'recognising and positively valorising cultural diversity' (ibid: 17). Nonetheless, redistributive remedies presuppose recognition and vice versa. As economic disadvantage and cultural recognition are intertwined, Fraser concludes that 'justice today requires both redistribution and recognition' (ibid: 12).

Clay and George point out that a *politics of recognition* should inform education policies for social justice policies. If education policy is to recognise diversity, it should challenge power relations and promote social change. A *politics of redistribution* is reminiscent of Stone's (1997: 44) concept of *vertical equity* which indicates the 'unequal treatment of people in different ranks' in order to achieve the 'same' outcomes. Stone argues in favour of rank-based rather than group-based (re) distributions. She suggests that group divisions across society in terms of demographic characteristics, such as ethnicity, race, gender or religion, which are often perceived as identity characteristics, fail to visualise the actual experience of marginalisation, disadvantage or discrimination. Thereafter, (re)distribution according to group membership may disregard important individual characteristics. On the other hand, rank-based (re)distribution assigns people to groups on the basis of 'fairly fine-tuned individual measurements', including individual history, performance and achievement (Stone: 47). Stone suggests that rank-based (re)distribution should take the place of group-based (re)distribution in affirmative action policies. She goes on to explain that whether the same (re)distribution is perceived as equal or unequal, fair or unfair, depends upon a policy actor's (or a network's) point of view and by extension their social justice values.

Social Justice Values in Education Policy

Stone (1997) argues that social justice values play a key role in the development and implementation of public policies, in general, and educational policies, in particular. According to Stone, policy actors who operate across all the levels of the education system have a range of social, ethical and political values. Moving a step forward, Bell and Stevenson (2006: 63) propose that policy actors' values regarding social justice and their normative expectations from education are 'not wholly the product of deliberate rational calculation…but could vary culturally'. Drawing upon Bell and Stevenson, we suggest that through cultural and ideological struggles, actors construct their own assertions, interpretations and axioms of social justice in education. They are educated, persuaded and socialised through ideas to support or oppose certain values regarding social justice. Subsequently, their social justice values become 'the prism through which new policy proposals are filtered' (Bleich, 1998: 93).

We define values as assumptions describing both the current state of affairs and the desirable state of affairs that we want to achieve. Valuing all students equally in a context of cultural diversity is often compounded by diverse meanings and values of social justice. Stone (1997) maintains that values underpinning education policies offer a continuum between equity and efficiency. Finding the best 'mix' between equity and efficiency is often at the core of policy debates regarding social justice. Stone disapproves of a zero-sum relationship between equity and efficiency, arguing that education policies should sustain more equity without sacrificing efficiency. Similarly, Ainscow et al. (2006: 23) depict social justice values as bounded to 'equity, participation, community, compassion, respect for diversity, sustainability and entitlement'. On the other hand, they are critical of a standards agenda approach to education, which is primarily concerned with achievement and attainment scores. Still, they point to a social justice agenda that is 'no less concerned with achievements but with *all* the achievements of *all* children' (Ainscow et al.: 29). Policies for social justice should take into consideration teaching, learning and leadership and provide the necessary resources to support the active and sustained involvement of all.

It is noteworthy that values denote certain interests regarding how things should be. Different policy actors pursue different interests according to their sociocultural, economic and political expectations and their own definitions of social justice in education. Interests are formed on the basis of four key values that underpin education policy for social justice: educational, economic, social and institutions. Thus conflicts over interests become conflicts over values, which affect both the process and product of policy for social justice. On the basis of shared or competing interests, policy actors form social groupings that indicate coalitions or conflicts driven respectively by a sense of common or conflicting purpose. The subjective sense of shared interests drives policy actors' participation in collective action (or inaction) for social justice. Consequently, policy actors form different groups (coalitions) that vary according to the levels of power with which they are accredited. Within coalitions, power operates as a mechanism for subordination of the individual interests to the group interests. Group interest is more than the sum of the interests of the individual policy actors who belong to the group, rather than including things that are beneficial for the group as a group beyond the self-interest of its members.

Ball (2006) maintains that the perpetual interplay of relationships within and between interest groups is influenced by power, which operates through cooperation and loyalty. Policy actors' choice to enter a conflict over policy issues derives from the existence of a group or a network that shares the same interests and is willing to support the same 'version' of ideas regarding equality and social justice. Long-term cooperation creates strong linkages between the network members and, by extension, loyalty. Loyalty may have a counteractive effect; the interests of the network members are influenced by their groups or networks, while the members' loyalty to their group or network derives from the ability of that group or network to represent their interests. Yet members of enduring alliances may feel coerced into continuing their cooperation with their group or network by pursuing their group's or network's policy expectations regarding social justice. Coercion may also derive from the unequal power of those entering the cooperative endeavour. This may result in the subordination of the weaker side by the more powerful one. More powerful individuals, groups or networks may impose their own expectations on the less powerful for the development and implementation of education policies for social justice.

Nevertheless, we propose a concept of power that is not bounded to the notion of *coercion*, which emphasises the capacity of those with power to control the policy agenda and impose it on others. Bell and Stevenson (2006: 21) define *coercion* as 'bounded by rule-making processes with clear expectation that subordinates will implement the decisions of superiors – willingly or unwillingly'. On the other hand, we suggest that power derives and operates through *influence*, as opposed to *coercion*. *Influence* has a powerful impact on policy processes, as it allows for institutions and actors without authority over one another to affect policy processes regarding social justice. Furthermore, influence may be exercised through collectivities of actors (i.e. groups or networks) while also adhering to top-down and bottom-up patterns, as subordinates can potentially influence the decisions of their superiors in the hierarchy. For example, school actors, who are lower in the hierarchy, may not only further but also mutate, 'midgetise' (restrict the policy change) or abandon a policy developed by policy-makers, who are at the upper levels in the hierarchy. Bell and Stevenson conclude that school policies develop through the actions of the individual school actors, which in turn are constrained by their values of social justice. Accordingly, educational researchers should bring together both the development and implementation processes of policies for social justice.

Education Policy for Social Justice: From Policy Formulation to Implementation

Rizvi and Lingard (2010) contend that the development of the policy agenda and the production of the policy texts often seek to 'symbolically' reconcile competing interests and/or conflicts over values. Policies for social justice are thus represented as advocates of the public interest while they conceal whose values and/or interests they actually serve. We may argue that social justice policies are pictured as profound solutions to perceived problems of inequality in education. Nonetheless, policies through normative judgements about social justice in education impact not only the definition of the problem of inequality but also the solutions they provide to the discursively constructed problems. The normative action to provide resources in support of the dominant values and/or interests draws upon the perpetual interplay of power relations. More influential institutions, groups and individuals may impose their own expectations of policy formulation and implementation on the less powerful.

Additionally, the articulation of system-wide strategy is a necessary but not sufficient condition for the practice of social justice in schools. In real-life situations, many policies for social justice are never implemented or they are implemented poorly. On the other hand, Bell and Stevenson (2006: 13) argue that education policy for social justice 'derived from the wider socio-political discourse, is mediated through the formulation of a strategic direction in the national and regional context which, in turn, generate organizational processes within which schools are located'. Moving from policy development towards implementation, the social justice issue formation is shaped not only by the individual beliefs of the school actors but also by the broader political culture and the wider social context. On this basis, action or inaction by school actors on social justice issues depends on the interaction of the political culture and their individual beliefs and values. Thus, there is a reciprocal relationship between individual beliefs and social culture, which indicates that the political culture is bounded by the accumulation of individual beliefs. Simultaneously, shifts in individual beliefs about social justice may reflect changes in the political culture.

To this end, Ball (1997) argues that the implementation of policy cannot be examined in isolation from the policy trajectory. He suggests that research should not be located at a single level of analysis (i.e. the school or the classroom), but it should 'attempt to capture the dynamics of policy across and between levels' (ibid: 264). Therefore, Ball (1994) contends that policy trajectory studies map out the interpretations and compromises of policy for social justice across all the levels of the educational system. He goes on to explain that relational constraints and influences play an important role in policy-making and implementation (Ball, 2006). Such influences may derive from both the national and the supranational institutions (i.e. European Union). On this account, policy should be examined through a 'framework that extends beyond the national level' (Ball, 2006: 18).

According to Brooks (2008), policy researchers hold a genuine concern of just development and application of policies that seek to address systemic inequities. Brooks criticises such concern as it triggers an exclusive interest in measurement and objectivity in analysing justice. He therefore argues that the examination of 'indirect' and 'imprecise' measures may prove illuminating for justice-related phenomena, for example, willingness to pay and sacrifice. Brooks (2008: 8) contention is that 'the field might consider in taking a step backward in order to take several forward'. He admits that we should re-examine social justice in terms of multiple and overlapping spheres, such as the interrelationship between social and individual dynamics.

On a similar route, we propose that as policies for social justice are authoritative allocations of values, educational researchers should link the micro-politics of actors' agency and personal relations to a systemic analysis of power structures. To this end, policy analysis for social justice provides also an insight at 'the lowest level of implementation and backs up through the policy structure, examining the decisions that each level makes, the incentive structures that operate on the targets of the policy, and bargaining relationships among actors at various levels of the implementation process' (Goertz, 2006: 705). Our argument is substantiated by previous research carried out in the field of social justice in education. By using Cyprus as our 'case', we aim to indicate the importance of researching the process of implementation of education policies for social justice at the micro-level of the school.

Education Policy for Social Justice: Findings from Previous Research

The prevailing discourses, which underscore educational policy, are formed within the broader sociopolitical context. Corollary to this observation is the examination of the sociopolitical evolution of the issue of social justice in Cypriot education. In a highly centralised system, the state via its agency, the Ministry of Education and Culture (MEC), has gradually adopted the rhetoric of 'human' and 'democratic' schooling as the preferable goals of education in Cyprus (Ministry of Education and Culture [MEC], 2010). With the discourse of a 'democratic' school which does not exclude, the MEC promulgated the provision of equal educational opportunities for access, participation and success for all students. The MEC's definition of the term 'democratic' school is 'the school in which all children sustain the qualities characterizing the educated human today. It is the school which provides educational goods adapted to each child's zone of proximal development. While it refuses to assign students to categories, it draws upon the fundamental principle that every child is different and needing appropriate confrontation' (MEC: 6).

Arguably, the MEC has envisioned the creation of a school system that respects diversity and cultural, linguistic and religious pluralism while arguing that education becomes a process accessible by all students. Thus the school system should become conducive to the success of all students despite their diversity. In addition, the MEC (2010: 6) defines the discourse of a 'human' school as 'the school, in which no child is excluded, marginalized, stigmatized, despised or becomes unhappy because of any individuality. It is the school of the absolute respect of human dignity and the school, in which all children can become happy'. In sum, the MEC declares its willingness to promote a social justice agenda while eradicating stereotypes and prejudices. The development of a 'human' and 'democratic' school focuses on the reconceptualisation of educational norms in order to meet all students' individual needs such as different starting points, interests and learning styles.

Hajisoteriou (2010) has conducted a multilevel study examining the ways in which intercultural education policies are mediated and reframed by education institutions in Cyprus. Her findings illustrate that incongruence of values concerning diversity and social justice was evident between and within the groups of policy-makers, school inspectors, head teachers and teachers. Within the overarching thrust towards intercultural education, the MEC's policy has undermined the development of coherent school policies. In the developed policy, both the MEC and its policy-makers argued for the development of all children's potential, regardless of ethnic origin, religion or gender. At the same time, they depicted social justice as the provision of equal opportunities for access to education for all children. In these terms, social justice was understood primarily as the taking of steps to facilitate access of immigrant students into their schools without any differentiated treatment once in school. Such conceptualisations were bounded on values underlying the celebration of diversity, on the one hand, and diversity-blind approaches, on the other.

At the school level, personnel echoed the contradictory value premises articulated by the policy-makers who participated in Hajisoteriou's (2010) study. Consequently, the absence of congruent intercultural discourses and policy goals at the macro-level of the state was mirrored at the micro-level of the schools. This range of values offered a continuum from monoculturalism to interculturalism from within which intercultural school policies would emerged. As school leaders and actors held contradictory values and belief systems regarding diversity and social justice, there was no evidence of a clear process of development of intercultural policies in these schools. In some instances, school inspectors' and head teachers' promulgation of intercultural school policies was merely rhetoric reflecting socially desirable roles that were remote from actual school practice.

On a different route, Zembylas (2010) has attempted to examine the interrelationship between social justice issues and school leaders' emotions. He carried out a case study of a head teacher regarding the emotional aspects for leadership related to social justice in Cyprus. Zembylas's research suggests that efforts to enact leadership in the field of social justice entailed intense emotional development. Although, the head teacher felt a moral duty to promote school success for all of his students, his emotions of helplessness, disappointment, frustration and exhaustion often led to his resistance towards social justice work. To this extent, Zembylas maintains that leadership for social justice should become conducive to collaborative and distributed leadership, meaning the development of teamwork not only within the leadership group of the school but within the broader educational community. The enactment of social justice leadership prerequisites the acquisition of emotional balance on the part of school leaders through strategies including keeping things in perspective and talking with friends and colleagues.

Angelides and Karras (2009) have completed a comparative study on the provision of equal opportunities in Greek and Cypriot classrooms. Their study provides mounting evidence that the implementation of educational strategies promoting equity is not an easy affair. On the contrary, it is a difficult, complex and beset-with-obstacles procedure. In the Cypriot context, specific factors acted as barriers in the teachers' efforts to provide equity, including the school culture and the policies of the Ministry of Education and Culture. Furthermore, most of the teachers and head teachers participating in the study did not have the necessary social learning required to promote equity. Angelides and Karras conceptualise social learning as the learning that comes through the interaction of the different stakeholders within the framework of a community of learning where all collaborate with the purpose of providing equity. The two researchers conclude that in order to overcome the obstacle of educational policy for the purpose of promoting greater equity, we should adopt Ainscow et al.'s (2007) proposal. Ainscow et al. (2007: 3) propose 'the development of national policy frameworks which allow the freedom for local level decision making, guided by principles of shared accountability, local networking, and equity informed target setting'.

The literature discussed above deals with the scarce research that has specifically focused on social justice in Cypriot education, while it mostly consists of small-scale research. However, we may still conclude that despite the presence of a social justice discourse within the Cypriot sociopolitical environment, social justice is often accompanied by witting or unwitting inaction at the school or classroom levels. We then state that in the study of policy for social justice, the micro-politics of policy implementation at the school and classroom levels are of equal importance to the macro-politics of policy formulation at the system level. Nonetheless, the implementation of education policy for social justice cannot be examined in isolation from the policy trajectory. Educational research for social justice should not be located as a single level of analysis (i.e. the state or the school or the classroom), but it should gain an insight into policy dynamics across all levels.

Education Policy for Social Justice: The Politics of Macro- and Micro-implementation

In order to capture the passages from policy decision to policy outcome, we encompass Goertz's (2006: 702) macro- and micro-implementation process; 'that is, how does one level of government (e.g. federal or state) execute its policy in ways that will influence institutions and actors in other levels of the system (e.g. states, districts, or schools) to act in desired ways'. Such an approach involves not only a structural but also a cultural analysis of education policy for social justice examining the ways in which implementing institutions and actors interpret policy and draw their own implementation decisions. Goertz's model of the macro- and micro-implementation process includes four non-linear stages, which we present below. Namely, the four stages are administration, adoption, micro-implementation and technical validity.

To begin with, administration refers to the passage from policy decision to an operational government programme. The policy goals are substantiated in a regulatory framework that consists of selected policy instruments and administrative approach. Such regulatory framework communicates adequate information on the type of support provided (political, financial and/or technical); programme rules, requirements, procedures and service mandates; and programme management. It is noteworthy that strong political support within and outside the school system may promote policy implementation. Nonetheless, the formulation of social justice policies has historically derived in the light of conflicting political demands, addressing equity, on the one hand, and efficiency, on the other. Such political controversy undermines the implementation of social justice policies at the local level. Moreover, programme management implies responsibilities for policy planning, monitoring and evaluation of policy implementation. Policy planning involves the gathering and allocation of fiscal, human and organisational resources to support implementation. However, resource shortage and unwise allocation of resources impedes the implementation of social justice policies.

The second stage of Goertz's (2006) model entails the passage from the government programme to the local adoption of policy. While the regulatory framework presents the official roles and responsibilities of each level of the system and the education institutions to take these roles (e.g. local educational authorities and schools), the stage of adoption examines the actions of these education institutions as the local adopters of policy. Goertz (2006: 703) poses the following questions to be examined at the second stage: 'What does the local program or policy look like? What assistance and resources did local adopters receive from the implementing agency? Is there discrepancy between the intended and enacted policy? If so, what is the nature of discrepancy and why did it occur?' Lastly, the stages of micro-implementation and technical validity comprise the passages from local adoption to implemented local practice and from local practice to outcomes, respectively. The third and fourth stages are composed of the changes in the practices and technologies of institutions which deliver education services.

The local adoption and implementation of policies for social justice is affected by the agreement between local interests and policy goals, communication between the different levels of the system and the availability of resources for implementation. In the examination of the local adoption and implementation, we should take loose coupling into consideration, meaning that the coordination, monitoring and communication of the system may be weakly connected. Loose coupling bears a neutral connotation for implementation as it may have both positive and negative implications for policy implementation. For Berman (1978), 'looseness' pictures that different education institutions, and the actors operating within these institutions, have their own problems, perspectives and goals according to their specific cultures and structures and that institutions as such have more or less autonomy within the macrostructure of the education system.

We have already argued that for social justice to become a reality, emphasis should be placed upon teaching and learning. Notably, loose coupling within schooling has particular salience for teaching and learning. According to Ainscow (1998: 21), in order to reach out to *all* learners, we should develop 'a more tightly coupled system without losing loose coupling benefits'. That is, we should sustain coordination and cooperation within schools without restricting teachers' autonomy to ground their own decisions in their classrooms according to the individuality of their pupils. The successful implementation of any education policy for social justice at the grass roots relies upon teachers' willingness and ability to tailor their practices to their pupils' needs, interests and learning styles.

Conclusions

Education policies should legitimate social justice as an issue to be acted on in the phases of macro- and micro-implementation. Action at the stages of administration, adoption and micro-implementation of policies for social justice may contribute to the development of democratic societies. As policies for social justice should enable *all* children to play a fully participatory role in society, they substantiate active citizenship as a fundamental element of the learning process. As such, active citizenship does not only aim to empower individuals to reach their full personal capacity but also seeks to develop a participative and democratic society reached by active and responsible participation in the sociopolitical and economic domains of the community. Although social justice policies are often targeted to specific groups (i.e. immigrants), they should purport to promote education for all.

Education policies for social justice as active citizenship need to shift to successful policy implementation, which presupposes communication between the different levels of the school system. Policy goals should be in congruence with implementers' cognitive or value systems. Accordingly, agreement on policy and its underlying values between policy-makers, school leaders and teachers implies strong organisational structures that facilitate policy implementation. On the other hand, the inconsistency between the national policy, school policies and implementers' personal and professional value systems may lead to policy slippage. Bevan-Brown (2006) defines policy slippage as the implementers' resistance to policy implementation. The reasons behind their resistance may be rooted within their personal or group interest, which is affected by the policy, the inconsistency between the policy and their personal and professional value systems and/or poor decision-making processes.

It is noteworthy that policy slippage could 'sabotage' the implementation of promising policies for social justice. Detrimental social and individual beliefs and practices often disrupt the implementation of such policies for social justice. Implementers' responses to policies being inconsistent with their values or lacking cohesion may include the abandonment of the organisation (i.e. school), the expression of their concerns about the policy, or their failure to conform the policy either by mutating the policy initiatives or by deliberately delaying policy implementation. Policy administrators should critically listen to and analyse the implementers' objections, as legitimate objections can potentially suggest policy modifications through mutual adaptation between the policy for social justice and the setting. Otherwise, policy administrators should persuade implementers for the benefits of the developed policy for social justice. Changes in the policy-making and in the practice of social justice should be accompanied by a shift of beliefs, preferences and values related to social justice (*thick learning*) across both the macro- and micro-levels, rather than the adoption of adaptation and coping strategies in response to external stimulations, such as political pressure (*thin learning*).

Changes in the beliefs of policy-makers, school leaders and school actors may be the outcome of learning processes occurring in-between collaborative networks, which gradually become communities of learning on social justice issues. The implementation of collaborative networks may generate new ‘knowledge’ on justice-related issues, while it may influence the decision-making processes both at the macro- and micro-levels. Such networks are assembled as ‘learning consortiums’, within which policy actors across all levels of the system operate both as learners and partners in the construction of knowledge for social justice (Lieberman & Wood, 2003).

At the heart of a collaborative network, there are people working together. Ideas are generated and activities are implemented. Learning is documented and shared to spark new ideas and to begin the cycle over again. However, these processes, Creech and Willard (2001) argue, do not occur automatically. Collaborative networks, they contend, can cause frustration and undercut the feelings of mutual admiration and appreciation that may have attracted members in the first place. Joining a collaborative network entails a long commitment to collaborative effort. In order for a network to exist at all, Creech and Willard conclude, careful attention must be given to how members will be managed.

Collaborative networks are directly connected with communities of practice and professional learning communities (see Stoll & Seashore Louis, 2007). Wenger (1998) mentions that in most institutions when referring to learning issues, these are largely based on the assumption that learning is an individual process, that it has a beginning and an end, that it is best separated from the rest of our activities and that it is the result of teaching. Wenger makes this comment in order to subsequently argue that learning is a social phenomenon and that it is achieved better when there is social participation and in particular when there is participation in ‘communities of practice’. Knowledge, for Wenger, is inseparable from practice, and it is integrated into the life of the ‘community of practice’ where members share values, beliefs, language and the way they do things.

Wenger (1998) talks about ‘communities of practice’ and describes the transfer and the creation of knowledge within a workplace. The members of a community of practice transfer their knowledge and ideas from the one member to the other through the processes of ‘negotiation’ during which common meanings are created. In this way, new knowledge is generated. This knowledge is put into practice and is inevitably modified because it is influenced by new experiences and new contexts. Moreover, this knowledge is transferred from the one member to the other, and it is continually refined and modified. Thus, the knowledge is recycled within the community, and gradually with this cycle, the community increases its knowledge as well as its understanding of a situation. During the collaboration, those who collaborate have the opportunity to work, having common purposes and beliefs and sharing and using each other’s knowledge, and through the process of sharing, reflection and recycle, they create new knowledge.

Communities of practice are groups of people who share what they know, learn from each other regarding issues of their work and provide a social context for this work. For Wenger (1998), communities of practice develop around things that are important to the people involved. The fact that these communities are organised around a certain area of knowledge and activity, Wenger continues, gives their members a feeling of a common enterprise and identity. In order to function, a community of practice needs to produce and assimilate a common repertoire of ideas, obligations and memories. Moreover, as Wenger points out, the 'community of practice' needs to develop certain resources like tools, routines, vocabulary and symbols, which carry, in a way, the accumulated knowledge of the community. In other words, the 'community of practice' includes practice. That is, in the community of practice, the ways in which members do or approach something are common to a significant degree among the members. The members of a community of practice are virtually connected in a collaborative network where they interact, reflect and have common experiences, aimed towards a common purpose.

Successful collaborative networks – or communities of practice – therefore, have the potential to re-culture the environments within which policy-makers are operating to create more collaborative and multi-agency endeavours (Chapman & Aspin, 2003). In addition, the realisation of across-level collaborative networks can significantly contribute not only to implementers' professional development but also to the improvement of schools in the field of social justice. In these ways, collaborative networks may provide for more effective policy development and implementation with regards to social justice.

Chapter 46
The Role of Academicians' Networks in Latin America: The Fight Against Social Injustices. An Institutional Challenge

José Antonio Ramírez-Diaz, Jesús Ruiz-Flores, and Antonio Teodoro

Education and Social Policy in Latin America and Europe

Social Policy

By the first quarter of the twenty-first century in most countries in Latin America, the foundations of welfare regimes had been laid and lead to important actions in the field of public health, such as health campaigns, vaccination, and health education. In education, through the Ministries of Public Education, the State assumed responsibility for providing primary education to all people. During the first half of the twentieth century, achieving national integration was one of the principles that promoted and justified social and economic policies as priority actions due to the large dispersion and isolation from population centers. The actions of governments in this direction were the construction and expansion of highways and roads to reach to small towns, cities, and states, to facilitate the transit of goods, services, and people.

In Mexico and other Latin American countries, Welfare State took the form of arrangements between government, employers, workers, and other sectors of the population to generate and distribute welfare. As these arrangements were subjected

to the 6-year temporary government, they became what experts identified as a *welfare scheme*. This expresses a difference in the characterization which we will be looking to perform here on the evolution of social policy between the two regional blocks, because, as pointed out by Fleury and Molina (2000), “It was the recognition of poverty as a social problem that created the conditions for the development of powerful institutional mechanisms of social protection in the European context, known as the State Social Welfare (Welfare State).”

The *grosso modo* review we show here from the post-Second World War assumes that it is from this period in which different Latin American countries share relatively similar stories in economic and social terms. While in the post-war period the attention of governments in developed countries focused on the reconstruction of the standards of economic and social well-being that were seriously damaged or destroyed by war, the deployment of social development policies in Latin America were initiated and they embarked on a process of industrialization by import substitution, which emphasized economic growth. Since the 1980s, Latin America has experienced a decrease in the relative share of social spending in state budgets. Social security systems, public health, and education, which are fundamental to the achievement of social development, were seriously affected.

In order to contribute to the understanding of current social policy and developments and transformations of the welfare regime in Latin America and its relationship with the European Union, we focus initially on the periodization made by Carlos Barba (2004) with appropriate settings for the purposes of this chapter, as well as the reflections of Marco Antonio Rodriguez Camacho (2003) and several authors in *Social Development* of the Center of Social Studies and Public Opinion (CESOP, in Spanish) (2006).

Linkages Between Social Policy and the Imports Substitution Development Economic Model (1940–1970)

From the 1930s, health campaigns spread and began the systematic provision of health services, and measures were undertaken to extend public education beyond the primary level. By the 1940s, as discussed by Wilkie (1974), governments put greater emphasis on achieving economic growth through industrialization. Although state promotion of social development continued, economic growth was considered the mechanism *per se* to raise the standard of living of the population. To expand and diversify the production structure, the actions of well-bounded urban organized groups resulted in the improvement of various social indicators, especially in terms of expanding health coverage and education.

State intervention in the economy was financed with income from raw materials in various countries, such as oil in the case of Mexico; incomes were insufficient, and that opened the appeal of using the fiscal deficit. The strategy of economic growth without inflation and low deficit, known as stabilizer development, was encouraged by the proposals for economic growth through import substitution industrialization promoted by the Economic Commission for Latin America and the Caribbean (ECLAC). These recommendations coincided with the nationalist discourse and objectives that characterized this period, which were applied in much of the Latin American region.

In this period, social security had already been established in several Latin American countries (Argentina, Chile, Uruguay, among others), with lag in some countries, including Mexico. In the mid-1960s, the social protection system recorded a remarkable achievement to make mandatory contributions for the social housing business.

For Viviane Brachet (1996), the most significant feature of Mexico in the 1940s was the emergence and consolidation of corporatism, which became crucial for social development, as much of the welfare benefits and social security since then was assigned to groups of organized workers. Thus, Brachet finds that social security and progress in labor was a way to control the labor movement before the advance of socialism and the beginning of the Cold War, a situation which was common in different latitudes of the region.

International agencies began to increase its influence in designing social policies through the dissemination of European welfare measures as a model to raise the standard of living of the population or through the active involvement of agencies such as the Inter-American Development Bank (IDB). Before the triumph of the Cuban Revolution, the U.S. government, in 1963, created the Alliance for Progress (ALPRO) as the social development agenda in this decade, a strategy that had broad support from multilateral institutions such as the World Bank and the IDB.

High population growth was a big problem for employment policies, education, housing, health care, and human settlements, and the coverage of demand for food and clothing were inadequate in relation to the amount of funding provided by the ALPRO, the IDB, and the International Bank for Reconstruction and Development (IBRD) declined drastically. Cordera and Lomeli (2005) report that, in Mexico, the substitutive industrialization strategy favored economic growth, but shaped and unbalanced social development; although there was a relative reduction of poverty, social inequality emerged as an inherent feature of the country's social development.

The economic and financial instability in the early 1970s was seen as an expression of attrition of the *stabilizing development model*.

Precursor Social Policies to Combat Poverty (1970–1980)

Cordera and Lomeli considered as precursors three programs. The first is the Public Investment Program for Integrated Rural Development (PIDER, in Spanish), created in 1973 to integrate existing programs at the three levels of government for the rural environment. Part of the resources came from multilateral agencies, such as the World Bank and the IDB.

Two flagship programs created in 1976 were the National Plan for Depressed Areas and Marginal Groups (COPLAMAR, in Spanish) and the Mexican Food

System (SAM). The first – remarkable in the history of policies to combat poverty – conducted an extensive assessment of the situation of marginalized groups and areas of the country. The results showed a radiograph of the marginalization that made it possible to program specific actions in the fields of health, food supply, rural housing improvements, expansion of potable water networks, electrification, road construction, and support for peasant activities organization. Although the program was in effect only from 1976 to 1982, the focus of attention to marginalized groups, especially in rural areas, was an implicit recognition that universal policies and widespread consumer subsidies applied so far did not reach those segments of the population, as revealed by studies conducted by the same COPLAMAR (1983).

The SAM purposed to fight the loss of food self-sufficiency and agricultural commodities contributing to reducing poverty. The COPLAMAR and SAM were canceled at the beginning of the financial and economic crisis of the early 1980s (Cordera and Lomeli, *op. cit.*), a crisis that resulted in the structural adjustment process, which lead to a profound change in social policies.

Recurrence of Crisis and Change in the Paradigm of Welfare (1980–2005)

In all countries, there are private systems of provision besides public social services. México, Argentina, Costa Rica, Cuba, Uruguay, Brazil, Jamaica, the Bahamas, and Barbados all have more extensively developed social security systems. At least formally, 70 to 100 % of the population of that group of countries is covered by that system. At the opposite extreme, we have countries like Honduras, Guatemala, El Salvador, Dominican Republic, and Bolivia, where only a maximum of 20 % of the population is covered by public social security systems. Since 1988, there began a new stage of social policy through an alternative package of social welfare that sought to compensate for the socially disadvantaged with scarce fiscal resources.

Several experts (Brachet, 1996; Gordon, 2000) agree that social policies in the early 1990s meant an *easing of open market policies*, with a new approach to welfare policies, in which *assistencialism* together with selective social policies and targeted programs are found.

As pointed out by Rodriguez (2003), international agencies agreed on the requirement of a structural adjustment that is more *humanitarian*. Thus, in the 1990s the World Bank supported the development of strategies to fight poverty, but because they were subordinated to the economic structural adjustment, they worked only as a "buffer" – and only in the short term – for the social costs of adjustment.

In addition, the IDB and the United Nations Program for Development (UNDP) produced a Latin American social reform that relied more strongly not only on compensation and assistance programs in the short term and in various public and private services, but also in the integration of economic and social policies to create jobs. The State is, again, assigned a major regulatory role. The ECLAC also sought structural reforms aimed at producing social opportunities for education and productive employment for the disadvantaged, and, above all, seeking to eliminate the long-term structural poverty.

The oil boom of the early 1980s in Mexico – which turned out to be very short – permitted new social reforms, but was interrupted almost immediately by the emergence of the crises in 1980–1982, which were triggered by the inability to repay foreign debt. A reform of the State was initiated; it involved, amongst other things, public sector downsizing and rethinking the role of government in social policy (Brachet, *op. cit.*). The economic model to guide the economic and trade liberalization and financial deregulation was much in line with the explicit inclusion of the country's economy into the global economy during the presidency of Miguel de la Madrid. This process brought about profound changes in the design and implementation of social policies, such as the replacement of universalism – which privileged the middle and upper strata of urban groups – selective policies, and programs targeting the segments of the population in greatest need and longest lags.

The adjustment process initiated in 1982–1983 on public spending in general and particularly social cuts was substantial. Social policy was subject to criteria of efficiency in resource allocation. The lack of funds to meet the demand for public goods and services widened social inequality and poverty increased. It is estimated that over 40 % of Latin Americans lived in poverty, many in extreme poverty. The relative share of social spending in state budgets decreased. Social security systems, health, and education – fundamental to the achievement of social development – were seriously affected. During this period, spending on new investments and maintenance of equipment were drastically reduced; in some countries, these costs fell to 70 %. This period is characterized by the absence of compensatory social policies to cushion the effects of the crisis and structural adjustment; with the exception of regional employment programs, the effects were very limited.

The above two paragraphs express the view taken by the cabinet predecessor Carlos Salinas de Gortari (1988–1994) in México, and from whose criticism formed the National Solidarity Program (PRONASOL), and with more explicit support of the guidance and support given by international agencies. Rolando Cordera (*op. cit.*) reports that to the cumulative lags were joined the demand for new services, such as building more schools, the expansion and rehabilitation of basic infrastructure (water, sewer), and the housing backlog and demand for health services, both from recipients of institutional systems and those who were external to them.

The linchpin for actions of PRONASOL was the building of social relationships in the communities in extreme poverty. Resources were provided directly to communities, a situation that Mariñez (2003) noted did invoke patronage of the program, and was certainly criticized at the time. The program was aimed at indigenous peasants in extreme poverty and marginalized urban groups most affected by adjustment policies. The actions took place in the areas of nutrition, health, land, housing, education, and agricultural infrastructure. According to Mario Coria (2005), the impulse to social networks in each community was one of the peculiarities of PRONASOL, unlike previous welfare programs that left no space for the participation of people.

Cordera (*op. cit.*) identifies that, while social spending in 1988 accounted for 31.9 % of programmable expenditure, in 1993, it accounted for 51.1 %, with health, education, and the lines of social spending having higher increases. In 1997, endorsing the sectional changing nature of public policies in Mexico, the Education, Health, and Nutrition Program (PROGRESA) replaced PRONASOL. The PROGRESA had a comprehensive social policy approach, included health services, food, and education to develop the capacities of individuals and families in extreme poverty, incorporating a gender approach intended to promote the attendance and retention of girls in schools and the role of women at home; women were appointed to manage the monetary transfers that the program provided.

Starting from 2001 – and the promise of political change in the country – PROGRESA was converted to the Human Development Program (OPORTUNIDADES). This program began its activities in response to families in extreme poverty in rural areas, while OPORTUNIDADES has extended its coverage to urban areas. OPORTUNIDADES, which is a conditional cash transfer program aimed at training human capital, is considered by the International Food Policy Research[1] as a social program that is successful and distinguished by its design, operation, and good results in reducing extreme poverty, and which has been encouraged to be taken as a model for other countries in Latin America.

The OPORTUNIDADES program is part of CONTIGO, which is a comprehensive strategy aimed at the social development of poverty reduction. CONTIGO is conceived as a new approach to social development, overcoming the shortfalls of previous programs, which tended to duplicate efforts and, on the other hand, to leave priority areas unattended. According to Miguel Székely (2002), "The central idea in the new strategy is that poverty in Mexico and, in general, social disadvantage, are mainly caused by high inequality in the possession of resources and not by the inability of the economy to generate goods and services for the entire population." In a kind of self-criticism and self-justification, David Ibarra[2] (2004) considers that economic reforms have given mixed results for its success in achieving fiscal balance and control inflation; however, the pace of economic growth and development of the labor market have not been favorable for the reduction of poverty in Mexico.

The CEPAL (2004) notes that two general characteristics in the countries of Latin America in the 1990s have been the tertiarization and informalization of the economy, and poor economic performance combined with a profound transformation of the occupational structure; employment fell in primary and secondary sectors, and increased in trade and services. This resulted in the growing informalization of the labor force; it was estimated that, in Mexico, there were 8.6 million persons employed in the informal sector in 1995, equivalent to 25.7 % of total employed persons. The CESOP (2005) estimated that, by 2003, employment in the informal sector had increased to 10.8 million people, representing 26.7 % of the total

[2] David Ibarra Muñoz was Ministry of the Secretaría de Hacienda y Crédito Público in the José López Portillo period (1976–1982).

occupation of the country, while by 2005, the informal sector production accounted for 10 % of the GDP. It is worth remembering that this large segment of the population in the informal economic activity has no access to social security or institutional health services; only from 2003 was the *Seguro Popular* available.

As a partial closure, we can say with Cordera and Lomeli (2005) and Boltvinik (2000) that economic policy has not been beneficial for the improvement of welfare conditions in the last 25 years, since there is no congruence between the objectives of social policy and economic policy. In fact, social policy has worked as a palliative for the negative results of low economic growth and structural adjustment processes.

Social policies and programs to overcome poverty were refined taking the PRONASOL experience and, above all, the World Bank recommendations. The approach of selective and targeted programs implies the view that poverty reduction can only be achieved with the participation of beneficiaries (the co-responsibility).

In the intention to remove the bias of welfare, both programs have emphasized the development of the capacities of people to stop the intervention of public policy to deal with the elements in the labor market and social life. However, given that governments continue to consider the *assistencialism* as a resource to maintain social control, and, consequently, its paternalistic view, despite the criticism of the populist PRI government promises, in the short term, we do not see it as a solution to equity issues.

Different governments have not neglected in their speeches education as a "tool" for the "leverage" of development, and we really consider that a broad sense is, indeed, a social resource for social and individual emancipation. However, few countries have placed meaning on education as a key factor for social change. We will review this topic in the next section.

The Educational Policy. From Developmentalism *to* Neoliberalism*: The Fading of Social Perspective*

In a similar temporal scheme to the previous section but in "packages" that are more compact, we will review the "discourses" on the role of education in Latin America, taking as reference the *Summit of the Americas* meetings (Feldfeber & Saforcada, 2005) and approaches of the ECLAC (Solano, 2000).

Regardless of how grounded conceptualization of the welfare state came to Latin America, which, for us, is more appropriate to refer to as *welfare regimes* (as defined at the beginning of this chapter), there is some consensus that, in the documents of the first summits (1956 and 1967), education, science, and technology are conceived as the basis of comprehensive development and social welfare of *developmentalism*.

On the other hand, in the first two summits of the "new process" – Miami, 1994 and Santiago de Chile, 1998 – we can find a change in paradigm, in diluting the link between education and overall development and welfare, strengthening its relationship with economic development and competitiveness. Public education, therefore, is considered more as a palliative than a State's duty towards the whole society. In line with the goal of limiting social policies and developing targeted policies, typical of the neoliberal model, public education is raised in response to problem situations and attention focused on vulnerable social groups. It redefines the State's responsibility in education, moving to develop policies for dealing with diversity and poverty. Thus, education policy loses the reference of a social right to be guaranteed on an equal basis to all.

Based mainly on the document "Changing production patterns with equity, the priority task for Latin America and the Caribbean in the Nineties" (UN/ECLAC, 1990), Solano (2000) identifies the *shift* that occurs from the "education for development" to "education for productive transformation with equity," with ideological, political, and economic implications.

Even more, the paradigm of education for productive transformation with equity is not yet well assimilated, when education and *knowledge*, along with technology, are conceived as central to the achievement of competitiveness and penetration of international markets, but still with the remaining pending tasks of democratization and the achievement of equity (Solano, 2000: 84).

Therefore, it will not stop ringing strange that, meanwhile, our societies are being demanded to advance to the *knowledge society* – as technologies are available to do so – when there are major delays not to say in the modernization and democratization of institutions, but of social backwardness: lags such as low schooling compared with developed countries, high rates of poverty, unequal distribution of welfare, and so on.

Even so, but rather because of that set of situations that make reality more complex, is that opportunities for integrated approaches in areas of knowledge is seen as desirable, feasible, and urgent. Therefore, in the following section, we discuss in more detail the possibilities of a more equitative development and try to identify the role that higher education institutions could play, as well as academic institutions and their explicitly intended research-oriented networks.

Process Integration of Knowledge in Latin America and Europe

We are going to consider two initiatives whose objective considers integrating knowledge between Latin America and Europe: (1) The Ibero-American Space for Knowledge (EIC) that emphasizes its connection to productivity and competitiveness, giving priority to higher education and research, development, and innovation (Summit, 2005, Salamanca) and (2) The Latin America, the Caribbean, and the European Union Common Area of Higher Education (ALCUE Common Area of Higher Education), which considers education as "a public good, essential for human development, social and technological … essential for overcoming inequalities between individuals, educational institutions and national societies, and the balanced exercise of their interdependence" (ALCUE Portal).

The EIC conceives the regional integration of knowledge as an interactive and collaborative space between universities, research centers, and companies for the generation, dissemination, and transfer of knowledge on the basis of complementarity and mutual benefit. As for the ALCUE Common Area of Higher Education, the regional integration of knowledge is a Latin America–Latin America and between Latin America and the European Union higher education systems infrastructure for cooperation at the institutional, national, and regional levels for academic cooperation and integration.

The Ibero-American Space for Knowledge (EIC)

The EIC is promoted by the Organization of Ibero-American States for Education, Science, and Culture (OEI, in Spanish), among other organizations, an initiative that arises in the context of the Summit of Heads of State and Government, held annually since 1991. The agency noted the reiteration of the need for regional cooperation mechanisms, and current circumstances in the world make it even more necessary. The EIC is formally defined in the XV Summit of Salamanca (2005), where the text of the Declaration states that the "Iberoamerican Space for Knowledge, will be oriented to the necessary transformation of higher education, organized around the research, development and innovation, which are necessary to increase productivity by providing better quality and accessibility goods and services for our people and the international competitiveness of our region…" (Article 13).

In the OEI Summit at Santiago de Chile (2007), the "Latin American Initiative mobility for master and doctoral students" was approved, and seeks to promote the training of young scientists and technologists required by the region. The most advanced action of the *Initiative* is expressed in the *Pablo Neruda Program*, which is aimed at graduate academic mobility, of the subregional, regional, and multilateral levels. It is structured in thematic networks formed by higher education institutions of at least three countries participating in the program. It specifies that governments define priority areas which science and graduate programs may participate, provided they have accreditation of the quality of their respective national agencies and have the guarantee of academic recognition by the university of origin.

On the basis of common language, education is considered a natural place for the Latin American, and, in this context, is where it presents its full potential of building the Ibero-American Education Higher Education Area, which, in turn, will be fully linked to the Euro-Ibero American Higher Education Area.

The OEI considers promotion and support to research networks as fundamental to boost the Ibero-American Area of Knowledge, and includes support for the mobility of researchers and students. Human resources training in the field of science, research, and innovation should be targeted not only nationally but throughout the region. Among the objectives are:

(a) Promote cooperation aimed at continuously improving the quality of higher education;
(b) Strengthen efforts to create networks of cooperation and academic exchange and research, as means to build the Ibero-American Area of Knowledge;

(c) Support national science and technology for the development of national science, technology, and innovation;
(d) Promote scientific literacy and stimulate young people's dedication to the study of science and technology, while embracing the independence of mind and a sense of critical responsibility;
(e) Develop and strengthen scientific and technological capabilities of Ibero-American countries and highly qualified human resources;
(f) Promote a science and technology agenda that is responsive to the Ibero-American social demands for knowledge and to promote equity and social cohesion.

As strategies:

(a) Consolidate the University Center for Advanced Studies (CAEU) of the OEI as a means of energizing the Ibero-American Area of Knowledge;
(b) Enhance the operation of the Ibero-American Observatory of Science, Technology and Society as a tool for the monitoring and evaluation of policies for science and higher education in the context of the Ibero-American Area of Knowledge;
(c) Implement and consolidate a system of mobility of students, with recognition of studies, as well as researchers and university professors from Latin American countries;
(d) Create opportunities for interaction and collaboration between universities, research centers, enterprises, and social organizations for the generation, transmission, and transfer of knowledge and to generate social demands;
(e) Strengthen the technical teams of national science and technology in design, management, and evaluation;
(f) Advise on the design and implementation of actions aimed at promoting scientific careers among students, in coordination with the educational policies;
(g) Establish disciplinary and interdisciplinary networks of academic and research cooperation in education, science, and culture;
(h) Establish, under the coordination of the General Ibero-American Secretariat (SEGIB), lines of joint work with other Ibero-American programs in science, technology, and innovation.

The last strategy is expressed in Fig. 46.1.

The Latin America, the Caribbean, and the European Union Common Area of Higher Education (ALCUE Common Area of Higher Education)

This is an initiative of the European Union countries, Latin America, and the Caribbean, favored by the Inter-American University Organization (OUI) for the creation of an environment of bilateral and multilateral interaction among higher education systems. Its origin is in the Rio de Janeiro Summit, on June 29, 1999, in which the Heads of State and Government expressed their political will to strengthen

relations between these countries and identified higher education as a priority. The main goals and objectives of the ALCUE Common Area of Higher Education were established at the Conference of Education Ministers of European Union countries, Latin America, and the Caribbean, held on 2 and 3 November 2000 in Paris, whose Declaration envisages higher education as a public good, essential for human development, social and technological, and stated as being essential to overcoming inequalities between individuals, educational institutions, and national societies, and the balanced exercise of its interdependence. Actions take into account the fundamentals of common cultural heritage of the countries of the European Union, Latin America, and the Caribbean to contributing to promoting mutual understanding of those countries and stimulating the interaction of its colleges, universities, and non-universities, and their respective education systems.

This initiative has, in VertebrALCUE, the strategy factor in the process, in accordance to the different levels of articulation in academic cooperation in Latin America – Latin America and between Latin America and the European Union, through the design and implementation of an infrastructure of cooperation at institutional, national, and regional levels. This infrastructure is made up of 25 Units in VertebrALCUE among the member institutions. See Figs. 46.2 and 46.3.

Fig. 46.3 Support and interaction for ALCUE Common Area of Higher Education

For the explicit purpose of this text, it is important to highlight the relevance of several projects. The fundamental purpose of DEMOPOL is to contribute to the definition and implementation of public policies […] to build democratic societies that are more just and inclusive. This network is coordinated in Argentina (Buenos Aires Representation at the University of Bologna) and Bolivia (Bolivian Centre for Multidisciplinary Studies). Along with DEMOPOL and in a sense of complementarity, UNIGO aims to facilitate innovation and improvement in university management and governance. This network is coordinated from Colombia through the Colombian Association of Universities and ANUIES in México. EMPLOYALCUE (employability of graduates) exists to strengthen the link between university and professional sectors requiring graduates and reduce the gaps between labor demand and supply of graduates from higher education. This network is coordinated from Chile (Universidad Central de Chile) and Italy (University of Bologna).

So, as Fig. 46.3 shows, VertebrALCUE together with INFOACES give support to this initiative. INFOACES is an ambitious project whose aim is to improve the quality and relevance of Higher Education Institutions (HEIs) in Latin America and to increase its contribution to the social and economic environment. To do this, INFOACES will generate comprehensive information on all Latin American IES and will allow institutional development and academic cooperation between the participating institutions and serve to support the development of the Common Area of Higher Education (ACES) in synergy with the European Union.

It is defined by Jose Carot as “An information system [that] will facilitate comparison of quality and case studies of good practice, [will] allow the definition of university policies based on the actual analysis of results and facilitate the transparency of the system of higher education in Latin America, an essential condition to build the Common Area of Higher Education (ACES), a common goal of Latin American countries and the European Union.”

The Role of Institutions and Academic Networks on Social Injustice

In Latin America, México along with Chile were among the first countries that made changes to the economic subsystem, conforming to the neoliberal trend that was implemented in Latin America in the late 1980s and early 1990s. With this, all social and educational policy became, for the purpose of responding to the significant changes that evolved during the growth of world trade, the emphasis on democracy and reducing state intervention in the economy.

Over time, the consequences of policies are meant to become an obstacle to the aspirations of vulnerable groups to pursue higher education. Mexico's history records the passage of a period characterized by the absence of policies on higher education (1950–1968) to its formation as a subsystem that has closer links with business and consumer markets and the production of goods, a concept that was part of the modernization of Mexico, designed by the government of Carlos Salinas de Garter (1988–1994). During this period, the government created the Fund for Educational Modernization (FOMES), and, in 1992, it joined the National Agreement for the Modernization of Education, amending in 1993 the Mexican Constitution and also promulgates the General Law of Education with the purpose of promoting a high-quality education system (Mendoza et al., 1986).

During the Salinas government, four strategic lines for higher education were raised: "… evaluation, competition for funding, opening and linking educational institutions and the productive sector, and organizational reforms" (Mendoza et al., 1986: 239). By the 1990s, evaluation became the central strategy to increase quality in higher education emerging what is known as the *Evaluator State*, reflected in a remote control of universities and conditioning funding to specific criteria, focusing on the use of measures and actions that appealed to assess excellence and relevance (Mendoza et al., 1986). To it was added a set of measures that radically transformed academic life, measures such as: the dehomologation wage, the creation of competitive funds for the purpose of modifying the scheme of resource allocation to universities, processes of evaluation by external bodies to the institutions, assigning a high importance to the quality of programs, and the social relevance of the institutions.

On this idea of modernizing the educational institutions appeared the first national assessment, reflecting the reality of education in the social sectors. It was found in the *National Assessment of Education*, developed in 2000, that young people from marginalized groups face serious barriers to entry, retention, and graduation in higher education institutions. Similarly, it was discovered that this educational level was attended by only 11 % of those living in poor urban areas, 3 % of those living in poor rural areas, and only 1 % of those belonging to indigenous groups. This situation created interest in responding to the issues of equity. To do so, aims were directed to expanding and diversifying opportunities of access to higher education and offer educational opportunities to disadvantaged social groups. This included the diversification of institutional profiles and educational opportunities in states of different types of open and distance learning.

However, over time, the measures taken were scarcely investigated and analysis of the issue does not transcend the public domain, which is why the phenomenon of educational exclusion are unknown nationally, and, specifically, higher education discussion is practically abandoned. This situation, resulting in a reduced level of information available, has led us to write this section, based on the national census of 2010, which, while it provides updated statistical data, lacks disaggregated information of regions or particular cases.

In writing this section of the report, we developed a strategy for comparing the poorest states and states that reflect less poverty and can be considered among the states with the greatest drive to national development. By this procedure, we form a comparison of the conditions experienced by the inhabitants of the poorest states in order to enter and remain in colleges of education. The three states that have traditionally made up the specter of poverty in Mexico are Chiapas, Guerrero, and Oaxaca, according to data provided in the last measurement of poverty. The evaluation carried out from 2008 to 2010 by the National Council for Evaluation of Social Development Policy (CONEVAL)[3] was updated with data from the 2010 Census conducted by the National Institute of Statistics and Geography (INEGI).

According to figures from CONEVAL, for 2010, there were 52 million people in Mexico considered to be in poverty, representing 46.2 % of the total population. States with the largest population living in poverty are Guerrero, which ranks first in terms of poverty, Oaxaca the second, and Chiapas occupying the third place.[4] In all three cases, the degree of social backwardness is considered to be very high.

The population living in poverty in Mexico has common characteristics: living in rural areas with homes devoid of basic services such as water, sewerage, and electricity; deprived of well-paid jobs, and social security as well as cultural and cognitive deficits suffered because educational services are poor. While it is true that the states of Guerrero, Oaxaca, and Chiapas are states which historically manifest poverty, it is not concentrated in this region; rather, poverty should be understood as a social scourge that is distributed across the different municipalities of Mexico and that it accurately expresses the enormous social inequality prevailing in the country.

Measurements by municipality in Mexico are not common, but data from the latest figures from the 2005 Human Development Index (HDI) by local authorities, on the basis of information from the 2000 General Census of Population and Housing, generated a huge dataset on wealth inequality in the country. At that time, there were 2,443 municipalities, of which only 20 were classified as entirely urban, as the population of all their locations exceeded 2,500 people. Similarly, 911 of these municipalities were considered as totally rural, given that among the total of their localities, the people who inhabit them numbered less than 2,500. Of all Mexican municipalities, 120 had fewer than 1,000 inhabitants and the 11 most populous municipalities made up 14 % of the population (PNUD, 2004).

---

[3] The measurement of poverty made by the CONEVAL considers the following variables: current income per capita, average educational gap in the household, access to health services, access to social security, quality of living space, access to basic housing services, access to food, and degree of social cohesion.

[4] In 2005, these same states ranked in descending order in the measurement of poverty. The classification was as follows: Chiapas (1st place.), Guerrero (2nd place), and Oaxaca (3rd place) (CONEVAL, 2010).

Within the same state, there may be significant differences as to when the analysis was performed by the municipality. This is the case in 2004, when municipalities with the highest quality of national life, that is, those who occupied the top ten in terms of HDI, is concentrated in five states. Five of the ten municipalities were in the Federal District, two in Nuevo Leon, one in the State of Mexico, one in Morelos, and one in Oaxaca. A similar phenomenon appeared in the ten municipalities with the lowest HDI, that is, the poorest municipalities or those with a lower quality of life were distributed in just four states of the Republic. Four belonged to the state of Oaxaca, three to Chiapas, two to Veracruz, and one to Guerrero.

Thus, the inequality can be reflected within the same state, in this case of Oaxaca, which had rich and poor municipalities in the same measurement. This situation is common in all states of Mexico (PNUD, 2004).

The last measurement shows that the poverty situation in Chiapas is serious; it affects 78.4 % of the population. For Guerrero, the index is 67.4 and, for Oaxaca, it is 67.2 %. In these states lives a large proportion of indigenous population[5]: in the case of Chiapas, 1,209,057, 1,203,150 in Oaxaca, and in Guerrero 481,098. Among the three states, there is a total of 2,893,305 indigenous people, equivalent to 41.8 % of indigenous people throughout the country. To this sum, there are a large number of people with a disability.[6] In Chiapas, there are 168,968 people with disabilities, in Guerrero 166,430, and in Oaxaca 227,262. Much of that population is in the preparatory school age range (National Council for Evaluation of Social Development Policy [CONEVAL], 2010; National Institute of Statistics and Geography [INEGI], 2010).

For the purposes of our work, it is important to reveal the conditions under which vulnerable groups need and receive support to join the national education system, specifically, higher education. We, therefore, consider as an axis of reflection the three poorest states in Mexico to compare with the support and conditions that are provided to the richest states and the Federal District,[7] a federal entity which is lobbying for higher education for all and it stands as the most favored entity nationally.

---

[5] Mexico has an indigenous population of 6,913,362 distributed throughout the territory (INEGI, 2010).

[6] Mexico accounts a total of 5,739,270 people with disabilities. The highest percentage of national disability focuses on the inability to walk (58.3 %) and disability to see (27.2 %) (INEGI, 2010).

[7] The Federal District (DF) is a federal entity with special political status. As the headquarters of the Mexican federal government, it concentrates economic and political power. Nominally under the control of the federal executive, but since 1997 an elected official in the capital rules of the corresponding local government.

Table 46.1 Historical evolution of the national population at high school and university age

Oaxaca	282,549	317,728
Guerrero	259,266	290,239

Source: Population census, INEGI

Demand for education has increased with the massive expansion of the population in Mexico. The population groups have been distributed in the following manner. In 1950, Mexico had 13,354,848 school-age population, of which 2,299,334 were in the age range 20–24 years when reaching graduation. Sixty years later, in 2010, Mexico had 47,276,312 schoolchildren, with 9,892,271 in the 20–24 years range (see Table 46.1).

In this reporting framework, the states identified as being poorer reveal their educational reality, given the characteristics, conditions, and restrictions they faced historically. Here are some data. The percentage distribution of the school-age population, which ranges from 3 to 24 years, is as follows: Chiapas has increased demand for schooling from 2,014,435 (in 2000) to 2,295,041 in 2010; Guerrero had in 2000, a demand for education of 1,573,912 inhabitants and in 2010, this increased to 1,580,512; Oaxaca demanded spaces for 1,730,853 inhabitants in 2000 and 10 years later, there was a decrease to 1,691,868 (INEGI, 2000, 2010).

In the case of groups of interest for the present report, we note that claimant groups of high school education (those aged from 16 to 19) were as follows: in Chiapas, there was an increase from 341,511 in the year 2000 to 418,535 in 2010; in Guerrero, during the same decade, there was an increase from 259,266 to 290,239; in Oaxaca, in 2000, 282,549 demanded spaces, while in 2010, 317,728 spaces were demanded. At the opposite pole, the states that had a similar suit (Nuevo León) or less (Coahuila), except in the case of the Federal District which, although in 2010 reduced its population, there were more than half a million inhabitants of an age to attend to high school (see Table 46.2).

However, the levels of attention to the demand for the three poorest states that we analyzed are quite low, since none of them achieved the national average in the years reviewed, while in the richest states, they all reached the national average in

Nuevo León	391,235	401,723
Coahuila	223,857	230,132
Chiapas	361,994	438,019
Oaxaca	288,035	313,523
Guerrero	265,129	290,684

Source: Population census, INEGI

that year. That is, the percentage of the population attending school is higher in these states (see Table 46.3).

In higher education, the percentage distribution of the school-age population aged 20–24 years by state for 2000 and 2010 is as follows: in Chiapas, it increased from 361,994 in 2000 to 438,019 in 2010; Guerrero had a population of 265,129 in 2000 and 290,684 in 2010; Oaxaca, having a population of 288,035 in 2000, increased to 313,523 in 2010. According to the review, these states have a demand equivalent to that of the stronger states, with the exception of Federal District, which almost doubles the pregraduate age population (see Table 46.4).

The rates of attendance in higher education in poor states are very low. In all cases, these states are below the national average of 17.7 % in 2000 and 22 % in 2010. The three states are far from the percentage of the leader, Federal District, which was 36.3 % in 2010 (see Table 46.5).

The situation is confirmed when one identifies the total undergraduate population, that is, the data of the highest level of studies in the population over 24 years of age obtained at the country level. In 2000, 12 of 100 people had at least 1 year of graduation; in 2010, this increased to 17 in every 100. In this case, leadership is maintained by the Federal District, as, currently, 30 out of 100 have at least 1 year of graduation. In contrast, the poorest states show rates below the national average. In the case of Chiapas, in a span of 10 years, the proportion increased from 6.7 to 12.3 %; Guerrero, in 2000, 9 out of 100 had 1 year of graduation compared to in 2010, where this proportion reached 13 %; Oaxaca is last in this indicator, as, in 2000, only 6.5 % of its inhabitants had 1 year of graduation, but in 2010, this population increased to 10.8 % (See Table 46.6).

Source: Gobierno Federal de México (2011). Fifth report of the government of Felipe Calderón, 2011

Next, we analyze the historical evolution in coverage on higher education and school age. Data by state show a significant rise over the past 15 years. States with higher rates of poverty substantially increased the coverage at this level. Chiapas went from a coverage of 5.9 % in the cycle 1995–1996 to 19 % for the 2011–2012 cycle, that is, it nearly tripled its coverage. Minor advances are shown by Guerrero and Oaxaca, as they doubled their coverages in the same period (see Table 46.7).

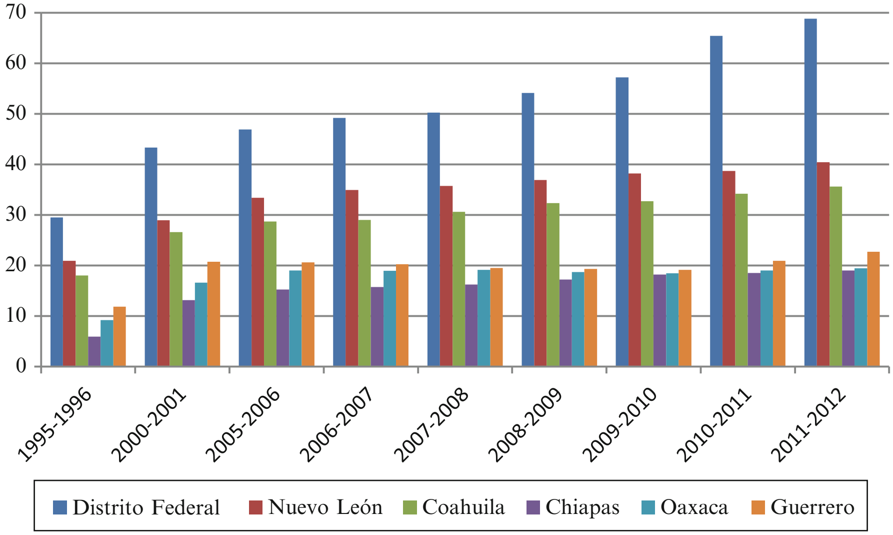

Fig. 46.4 Change in the percentage of population coverage of people aged 19–23 years (Source: Gobierno Federal de México (2011). Fifth report of the government of Felipe Calderón, 2011)

The same information shows the enormous gap between rich and poor states. Coahuila and Nuevo Leon have, in the last school year, coverage above 30 %. Coahuila has a rate of 35 %, while that of Nuevo León reaches over 40 %. The leader in the coverage of higher education is the Federal District with 69 %, which means that only 31 out of 100 people in that state had no access to education (see Fig. 46.4).

Attempts to strengthen the entry of Mexican youths into higher education have led to the creation and maintenance of different types of scholarships. The National Scholarship Programme for Higher Education (PRONABES)[8] encourages the retention of students by means of economic support; grants from the National Council of Science and Technology (CONACYT) are awards to support research training in postgraduate programs of high impact; there are other types of scholarships which are awarded by various Mexican agencies to train undergraduate and graduate students.

PRONABES scholarships can be seen as support for those students who seek to pursue economic conditions of graduate studies. While its approach is not mentioned,[9] it is clear that it serves to cover the cost of the opportunity of education for

---

[8] Scholarships from PRONABES started in the 2001–2002 school year with the participation of all states and the four higher education institutions of the Federal Government (IPN, UAM, UNAM, and UPN). The fund's resources are provided by the Federal Government, state governments, and public institutions of higher education in equal parts.

[9] Grants from this program are intended to ensure that students in adverse economic situations and with the desire to excel (such as during further studies) can continue their education project at the top level in public institutions in degree programs or higher technical colleges.

Table 46.8 PRONABES scholarships by school year

e	2005–2006	2006–2007	2007–2008	2008–2009	2009–2010	2010–2011
Distrito Federal	20,235	23,702	36,194	40,076	61,584	78,358
Nuevo León	4,418	4,495	4,744	3,954	3,880	3,294

those students who pursue their studies that are prevented from earning an income to support their families, that is, to offset the income they could have had if they were working instead of studying.

PRONABES scholarships are aimed at more depressed social and economic sectors nationwide. Its application and competition takes place in all states. The analysis we performed allows us to establish a set of differences between rich and poor states that we have outlined. First, it highlights a slight change in the support accorded to the rich states. In 2005–2006, these states received a high number of scholarships (only Chiapas received more than Coahuila and Nuevo Leon). By the 2010–2011 cycle, the three poorest states are able to overtake Coahuila and Nuevo Leon. However, over time, the dramatic growth is noticeable in terms of scholarships provided to the Federal District. In only five school years, more than 58,000 scholarships were earned by their students (see Table 46.8).

In comparative terms, the three poorest states show an increase in support. Oaxaca has been the state which benefited the most, as grants increased from 2,396 in 2005–2006 to 5,812 in the cycle 2010–2011 (an increase of 142 %); the other two states have not yielded generous benefits. Chiapas has achieved a 46 % improvement in the number of scholarships for the last five cycles, but Guerrero has only obtained a 20 % increase over the same period of time. In the case of the three richest states, Coahuila remains at virtually the same level of support over the past 5 years. Nuevo Leon has seen a decrease in the number of scholarships, going from 4,418 to 3,294 (25 % less). A special case is the Federal District, increasing from 20,235 to 78,358 grants (a 287 % increase) in just 5 years (see Fig. 46.5).

The last dataset we present are the fellowships awarded by the government for the training of researchers through postgraduate study. CONACYT grants have been awarded for 40 years. This program is designed to support people in undertaking high-level studies in academic institutions of excellence, both in the country and abroad. The objective is to contribute to the training of scientists and technologists of the highest level and increase scientific and technological capacity in Mexico. The training of human resources for research and development in Mexico are practically taken by rich states. It highlights the fact that, in 2001, the state of Guerrero received only a single a scholarship, while the Federal District had 4,603 scholarships for students (see Table 46.9).

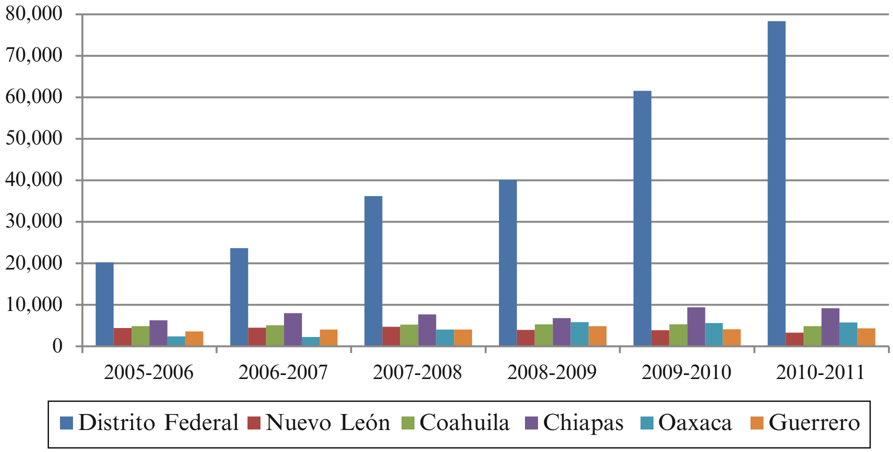

Fig. 46.5 PRONABES grants evolution (Source: Gobierno Federal de México (2011). Fifth report of the government of Felipe Calderón, 2011)

Differences between states are evident. Students of Coahuila and Nuevo Leon have greatly benefited over the past 10 years, since they have achieved an increase of those who access them. Coahuila has grown from 116 students with scholarship in 2001 to 887 in 2011, an increase of 664 %. Nuevo Leon also has had a good increase, as numbers went from 253 to 1,897 in the same 10 years; its increase is 649 %. But the most notable increase is the Federal District, since, in 2001, it had a high number of scholarships (4,603), and this tripled in 10 years, reaching 12,731 students with scholarships. The differences are best appreciated in Fig. 46.6.

The data presented allow us to understand the high degree of inequality existing in Mexico. This is expressed by the enormous weight of the Federal District in obtaining and consuming resources for higher education. Similarly, via documentation, we have shown how the state of Mexico receives more support than poor states, although demand for educational services is equal to or greater than rich states.

These characteristics should allow the placing of higher education in an educational context that is witnessing a rapid growth of scientific discovery, with an impressive advance of information technology and communications (ICT) to be applied in the educational context worldwide. However, it must also be understood that the context of inequality in Mexico means a barrier to reach a higher level of collective life in which to enjoy the benefits of scientific and technical progress, because, in a context of growing inequality, the consequences of this situation can lead to a social demarcation (and not just territorial) of boundaries, the growth and acceptance of interpersonal differences.

This level of inequality and lack of opportunity should be part of national priorities and international agendas, as this type of phenomena is important because their impact is unknown (directly or indirectly) on the issues that have been privileged in

Table 46.9 Graduate scholarships awarded by CONACYT

the educational agenda: economic competitiveness and market share, sustainability, identity within globalization (including information, trade, and people and their cultures), equity, and, increasingly, the role of public institutions, including educational institutions.

The existing social structure we have, including the identity and cohesion in society and their understanding and acceptance of other societies, is largely created in schools. Educational institutions are one of the few trusted entities that may provide opportunities for socialization subjects and escaping poverty through learning. School education helps give meaning to and promote the sustainability of these changes, in particular, through life-long learning. In this regard, we believe that it is necessary to nourish the high expectations of a change in every country in the shared work of officials and scholars from institutions of higher education, who can lead the processes of learning and managing social change.

Adding to the expectations placed on education to promote equity and social justice, we find pressures of the approaches promoted by international agencies to ensure educational reform worldwide. The approaches of international agencies (OECD, OEI, World Bank) make clear the presence of a particular political leadership to drive change in higher education institutions, which has a huge impact on the kind of research that is legitimate and the notion of social transformation that is induced, as we have noted in the two preceding paragraphs.

Epistemology of Research and Social Transformation

One of the most pressing educational issues is the configuration of educational research in the way that it has become an international agenda since the last century. The OECD (1995) explored the trends, issues, and challenges of educational research and development. The agency acknowledged, among others, four generic problems that limited the value of educational research. The first was the fragmentation, not only among political actors, policy makers, and practitioners, but also among researchers themselves. Second, the irrelevance of the issues set. The third was low quality and efficiency because of the resources invested and the products were meager. The fourth was the low applicability in educational institutions, which was attributed to the poor dissemination of results.

The reconfiguration of the research agenda for Latin America must pay special attention to the issue of educational leadership, as has already been confirmed to be an important factor in the success of educational institutions.

This leadership is especially important because of the impact of principals on student achievement, which demonstrates the influence of this work in academic outcomes through the proper organization of teachers and the setting of relations with society and families (Bell et al., 2002).

It is clear that, given the enormous gap that has been generated in Latin America, the educational leadership demands needs to incorporate issues such as providing education to promote social tolerance at a time of increased pluralism and multiculturalism. Similarly, it is important to meet the needs of growth and development within the context of economic and social gaps that have been generated with neoliberalism and, finally, it must include the educational agenda in the field of government, especially in reference to the responsibilities of governance that have been acquired with the multiple reforms driven by different sectors. In the same way, it is important to link education and research development with the type of preparation required by the government commitment to democracy, equitable development, and increased social capital and its citizens.

We have considered that the issue of educational research, leadership, and transformation is a subject that passes through the newly minted education policies in the countries of Latin America. In previous writings (Ramirez & Ruiz, 2011), we considered necessary a set of dimensions, linked to epistemology, linking higher education and social transformation. At one level, it is intended to analyze the instances that act on the higher education systems. This is a reflection on the structure, processes, and relationships that determine the general orientation of national systems of higher education. Relevant questions about it are: Who defines the problems for higher education to attend and which tools should be used? What theories support the defined problems?

To answer the previous question would imply taking into account the ideology and setting of the educational agenda. It may also be useful for discovering and criticizing the models and theories that explain the problems and activities that create a collective perception of the problems. Why do they choose these problems and not others? How do you define the problems and policies for resolution? With the search for answers at this level, we generate an explanation of how and why the decision-making happens, and how the analysis of problems structures the decision-making process in the academic leaders.

Another aspect to consider is the presence, relationship, and influence of businessmen in international organizations for educational policies that are really needed to form a framework to promote greater equity (Slaughter, in Torres & Schugurensky, 2001). At a second level, one can seek to understand the structure, processes, and relationships that determine the orientation of the institution. This is intended to identify and characterize the processes by which institutional change takes place, that is, identify how knowledge is produced in order to structure the practice of politics. How are educational policies in the institutions operated? How is their transition to the institutions facilitated? Are the issues raised by researchers and specialists considered on the agenda? When asked of their responses, we explore the implementation and maintenance of educational policies.

Outstanding issues at this level also include: Ways to influence the entrepreneurs and capitalists of education in the decision makers in institutions; Alternatives of resistance or acceptance of the educational agendas of institutions and, if this situation has not diminished, the social commitment of educational institutions. What is analyzed is the acceptance or rejection of the demand function for public universities to the detriment of the historical conception of the university; Conception and exercise of university autonomy; New forms of government acquired; The nature and impact of the new bureaucracy cordoned off the axis of planning – evaluation – accreditation, decisions to fulfill a social responsibility as an institution.

For a third level of analysis, one can explore the structure, processes, and relationships that define the new practices in the institutions: The belief systems and interests of individuals to accept, resist, or give consent to the projects and emerging education policies; Identities arising under the guise of competition. The scope of an academic culture based on individualism and competition among students recreated.

Conclusions. The Role of Transnational Education and Research Networks for the Construction of Citizenship and Fighting Social Injustice

To understand changes within universities, a deep reflection on the mission of the university and, therefore, relations between the university and society are necessary. Motivation in many countries to participate in processes of regionalization have been linked to trade negotiations to determine certain "social" objectives or to obtain arguments to use within their nations in an attempt to show a more human face of regional economic integration against the growing criticism of citizens (Gudynas, 2004a, in Feldfeber & Saforcada, 2005: 19). It is here where researchers are called to address a social responsibility as members of an institution of higher education to conduct research on controversial topics or the shared goals and resources of business organizations or international organizations, because of possible distortions and misapplications of the results. Thus, the responsibility does not end with the presentation of technical reports, but, instead, with the review of the impact of their research results. In this line, the Ibero-American Area of Knowledge received in 2010 in Guadalajara from *Universia*[10] the commitment to allocate 60 million Euros over the next 5 years for student mobility and the training of young researchers. Considering the source of this support, and the widespread presence of *Universia*, one realizes the magnitude of the goals and limited opportunities that are financed with government resources or institutions of higher education themselves. It also realizes the complexity of the required actions, whereupon it is highly recommended to create social observatories on different thematic issues, actions of governments, and knowledge transfer from universities to society.

The problem of inequality and social injustice that has been accentuated by the incursion of neoliberal policies is not a problem that is exclusive to Mexico. There is evidence that it is presented throughout the regions of Latin America. In this final section, we will refer to the relationship between translational research and the fight against social injustice.

We consider that we are in a transcendent point in time for research. The importance that the U.S. has granted to the research agenda has been leaked to the point that the American Educational Research Association (AERA) unanimously approved a resolution (AERA, 2003), which recommends to keep under special surveillance the questions that guide the research methods and, thus, improve the approach to problems. In essence, it should be to formulate what is worth knowing, how to know, and make the new knowledge produced to address the inequalities and foster a culture of citizen participation, having the expected effect.

This approach to the knowledge of social problems can only be followed if one is able to interpret social research as an academic commitment to exercise leadership for social transformation. For this, it is essential to recognize that social leadership requires the action of the officials who run educational institutions, and that their actions are of high impact inside and outside the institutions, as has been documented that leaders play an important role and make significant contributions through the good organization of teachers. Transmitting and exercising leadership by teachers is also essential, for it may be necessary to make changes to the organization or the substantive functions. These actions are, in fact, a construction of powerful teaching and learning, strengthening communities, and the development of educational cultures (Leithwood & Riehl, 2003).

So far, we face the challenge of understanding that justice is part of a social construction that is composed of educational practice, which is why we cannot assume that equity and social justice have fixed meanings, as these are manifested only when educational practices propose social transformation through the practice of educational leadership that responds to the everyday realities and, under the principles of no discrimination based on social, economic, and political background, race, or gender, are created in each school (Bogotch, 2002).

---

[10] *Universia* is a network of universities integrated by 1,232 institutions of 23 Latin American countries, representing 14.3 million teachers and students. It was founded in 2000 with the support of 35 Spanish universities, the Conference of Rectors of Spanish Universities, and the Higher Council for Scientific Research. Between 2000 and 2005, it was established in 11 Latin American countries, completing its presence in all countries by 2010. The network promotes activities, products, and services to encourage joint projects between universities and explore the potential relationship between academia and industry. http://www.universia.net/nosotros/quienes-somos/

Chapter 47
Dilemmas and Challenges in Forging Social Cohesion Through Education: Emerging Struggles in Social Justice in Post-conflict Education in Sri Lanka

Damaris Wikramanayake

Sri Lanka is a small island in the Indian Ocean with a multiethnic and multireligious population. From 1945, Sri Lanka has provided free education for all children from primary to tertiary level. Since the 1990s, free education has been supplemented by free textbooks, free school uniforms, and a midday meal for children in poorer districts. These efforts have sought to equalize the opportunities afforded to children of Sri Lanka and ensure equity in access to education. The population of Sri Lanka is made up of Sinhalese (74 %), Tamils (14 %), Muslims (7.6 %), Indian Tamils (4.6 %), and Burghers and Malays. Sixty-nine percent of the population are Buddhists, 7 % are Hindus, and approximately 6.2 % are Christians. As a result of the free education policy in 1945, Sri Lanka, though a developing country, has achieved a high level of human development and also maintained a high literacy rate. Yet Sri Lanka has been embroiled in a civil conflict from 1983 to 2010, and education has failed to inculcate values of peace and tolerance in the future generation. With the end of the war, the country needs to focus on bringing about social cohesion and justice and moving towards achieving national solidarity and a culture of peace. The long period of war has caused mistrust and intolerance among ethnic communities. Thus, Sri Lanka presents a unique case for a study on social justice and social cohesion.

In 2008, education policy leaders in Sri Lanka took the crucial step in preparing a national policy on social cohesion and peace education. The many issues of conflict and the lack of social harmony in the country deemed a national policy on social cohesion and peace education necessary. Although there were many initiatives already being carried out in the country to promote peace and social cohesion, there was a general lack of coherence and coordination among the programs. Recognizing the role education could play in the promotion of social cohesion and

in the growth and development of future citizens, policy leaders made the decision to strengthen this role. The policy identified seven strategic areas through which social cohesion could be developed: (1) curriculum, (2) teacher education, (3) second national language (2NL), (4) whole school culture, (5) integrated schools, (6) cocurricular activities, (7) and research (Ministry of Education [MOE], 2008, p.iv). A special unit, the Social Cohesion and Peace Education Unit (SCPEU), was formed in the Ministry of Education to oversee and coordinate all the policy initiatives.

The policy was prepared to address the problems of intercultural disharmony, ethnic conflict, the lack of tolerance, the lack of trust among different communities, problems in communication, the inability to communicate in another's language, lack of protection of the rights of others, an increase in violent behavior, and the improper distribution of power and resources (MOE, 2008). Through these initiatives, the policy aimed to produce the "desired citizen," who is one who can live in a multicultural society, respects diversity, values and tolerates other cultures, communicates well in several languages, is politically enlightened, and has a global vision (MOE).

This chapter will focus on education leadership as demonstrated by the vision of policy leaders in Sri Lanka in their attempt to promote social cohesion in education through various policy initiatives. It begins with a background to Sri Lanka and a description of the National Policy for Education for Social Cohesion. This will be followed by a discussion of the concept of social justice and social cohesion as a vital component for its implementation. The chapter will go on to discuss the dilemmas and challenges that education policy leaders face in the promotion of social cohesion in Sri Lanka.

Social justice is a concept that is hard to define. Social justice has been defined in different ways based on factors ranging from political interests to social philosophy. According to Michael Novak, "Social justice rightly understood is a specific habit of justice that is "social" in two senses. First, the skills it requires are those of inspiring, working with, and organizing others to accomplish together a work of justice. ….. The second characteristic of 'social justice rightly understood' is that it aims at the good of the city, not at the good of one agent only" (Novak, 2000). Social justice is embedded in the morals and values of societies and draws from the codes of morality rooted in each culture. Theoharis (2007) states that "social justice supports a process built on respect, care, recognition and empathy." These particular aspects of social justice are very relevant to Sri Lanka in the aftermath of the civil war. Mistrust between communities and a lack of respect for other ethnic groups has been fueled by years of conflict. Social cohesion is the ongoing process of creating a community of shared values and challenges and equal opportunities for all ethnic groups. Social cohesion is the key that holds diverse groups together in a common bond of trust and respect. Jenson identified five dimensions of social cohesion: belonging, inclusion, participation, recognition, and legitimacy (Jenson, 1998). Only when these five dimensions are present in a society can social justice be truly achieved. Social cohesion then is an important component for the functioning of social justice in Sri Lanka.

From an equity point of view, Sri Lanka seems to have struck out on the path for social justice in seeking to give her children a free education, and ensuring economic difficulty would not hamper that learning by providing uniforms and textbooks and a midday meal in poorer schools. In the aftermath of war, education leaders (policy makers) have realized the importance of promoting national unity and solidarity among the different social groups in the country and recognized the role education could play in this. In response to this realization, education leaders in Sri Lanka have initiated strategies to promote social cohesion through the school curriculum, textbooks, teacher development, cocurricular and extracurricular activities, the organization of schools, and language policy. How successful these measures have been will be seen in the discussion that follows. Yet, although policy makers had the vision to initiate policies that would enhance social cohesion in education and in that sense ensure social justice was practiced, a lack of understanding of the realities and the shortcomings in the system resulted in problems with implementation.

The promotion of social cohesion in education, however, causes education policy leaders to face several dilemmas and challenges. Some of these dilemmas and challenges are outlined below.

Dilemmas of Education Policy Leaders

The initiation of measures to promote social cohesion and social justice necessarily involves ensuring the equity of access and resources in education to all groups of children. In making decisions on policy for the promotion of social cohesion in education in multiethnic and multicultural societies, policy makers must take into account certain factors. Often the first and immediate focus of policy makers is on identity, and groups, marginalized because of difference, be it due to ethnicity, religion, economic, or political factors or disadvantage in some way. This strong focus can sometimes serve to preserve those very same disadvantages and inequalities and presents education policy leaders with several dilemmas.

Ethnic Diversity and National Identity

Many developing countries are faced with tensions and dilemmas arising from the complex nature of their ethnic and linguistic composition that, until relatively recently, few of the industrialized countries have had to face. The increasing ethnic diversity in countries around the world and the continuing demand for cultural recognition and rights have forced governments to try to construct new definitions of citizenship and national identity (Banks, 2004, p.296). Citizens in an ethnically diverse community should be able to maintain their cultural traditions while participating in the achievement of national goals. Governments then ought to be able to "provide opportunities for different groups to maintain aspects of their community cultures while building a nation in which these groups are structurally included and to which they feel allegiance" (Banks, p.298). One of the dilemmas facing governments in many multiethnic and multilingual societies, therefore, is how to achieve a sense of national identity, without at the same time destroying the existing ethnic and cultural identities of different groups that make up the whole of society. According to Banks, there should be a delicate balance of diversity and unity in any democratic state. Recognizing disadvantaged groups and compensating for their disadvantage through various reforms can also serve to preserve those same group identities. In Sri Lanka, this can apply particularly to students in estate schools that lack the basic facilities and resources that are common in other schools. Policies that grant these schools extra resources can also serve to ensure they are continually classified as "estate schools" as separate from other schools.

When all citizens in a nation share the same common goals and values and are committed to the progress and prosperity of their nation, then that country is more likely to develop economically and politically as national solidarity is important for economic development. In multicultural societies, a national identity that all groups can feel a part of is an important aspect for the promotion of social cohesion and the progress of the nation. Sri Lanka needs to focus on building such an identity that includes all ethnic and religious groups. Until all groups, whether they be defined by ethnicity, religion, language, economic, or political status, can feel they belong and are respected and valued citizens of the country, there will not be true social cohesion. At the national level, policy makers in the recent past have made several references to building this national identity, particularly in the aftermath of the civil war.

The national policy on social cohesion in education in 2008 proposed that every citizen ought to learn a national language other than his/her own and also gain competency in English an international language, vital for science and IT (MOE, 2008). In 2007, the policy decision requiring all government officials to gain proficiency in the second national language within a period of 5 years was made. As we have seen, the policy also identified attributes of the "desired citizen" who will be a product of the initiative Education for Social Cohesion. Education can thus help to forge a national identity that will bring all diverse groups together, if used in a positive way.

Challenges of Education Policy Leaders

There are also several challenges that education policy leaders must face in the promotion of social cohesion in education. The challenges arise from having to move from an idealistic concept of "perfect inclusion" to an inspirational yet more realistic set of policy measures geared towards a society for all. How to show an appreciation of all ethnic cultures and yet cultivate a spirit of national solidarity and cohesiveness is the necessary focus for policy makers.

Textbooks and Diversity

Education policy leaders face a major challenge in trying to combine a recognition of and respect for the diverse identities of students with a concern for greater equality. The promotion of social cohesion in education requires a lot more than a mere recognition of identity. Identities are constructed in a process set within a network of power with differentiated access to economic, social, and cultural resources. Sometimes people identify themselves with a group, through religious, ethnic, or political affiliation, and there are various dimensions to an individual's identity. Policy makers must also be aware that if we are interested in affirming people's identities, then we must be prepared to accept them for who they think they are and not thrust our own classification on them. Recognizing someone's identity means we see them as they want to be seen. True bonding requires us to treat these people as individuals, not categories or groups, and to listen to their stories and learn from them. Assimilation alone is no longer enough; there must be accommodation as well. In this sense, curriculum too must reflect the stories of all groups in society.

Rather than design a whole new curriculum to promote social cohesion and peace concepts in schools, policy makers in Sri Lanka decided that social cohesion and peace concepts should permeate the whole school curriculum. In some subjects, this was easier to achieve than others. History, on the other hand, is a very important subject for the promotion of social cohesion, and the subject can be used to show the intermingling of the two main ethnic groups during the long course of the country's history. Yet History textbooks and curricula for grades 6–11 show a lack of sensitivity towards ethnic minorities. History is told from the stance of the majority race and topics are selected accordingly. Previous studies have pointed out these same biases (Rasanayagam & Palaniappan, 1999; Wickramasinghe & Perera, 1999). Minority races are often presented in a negative fashion. Characters from the majority race are depicted as heroes. Field investigations undertaken by the writer revealed that of a sample of History teachers in schools in the Eastern Province,[1] all but one indicated that the curriculum was unfair and biased with about 80 % of respondents stating that the history of minority cultures was not addressed.

According to Greaney (2006), there are eight ways in which textbooks can undermine regard for diversity and tolerance: narrow nationalism, religious bias, omission, imbalance, historical inaccuracy, treatment of physical force and militarism, use of persuasive techniques, and artworks (pp.50–51). With the exception of the artworks, the Sri Lankan history textbooks appear to have examples for each of these categories. The way in which minority ethnic groups are presented in textbooks is an important factor in the promotion of social cohesion in education (Heyneman & Todoric-Bebic, 2000). Students all over the country read these textbooks every day, and if textbooks are biased in any way, students can be easily influenced. It is therefore essential that textbooks are scrutinized for evidence of bias or prejudice towards any particular culture or religion. Educational policy leaders thus have an important task in ensuring these biases are removed. In the past few months, however, some improvements have been seen in this area which is an indication that authorities are moving in the right direction. Review panels in the Education Publications Department have made changes in some of the textbooks to eliminate these biases.

---

[1] Largely minority Tamil and Muslim population.

As History is a compulsory subject for the OL examination, there is an urgent need for a re-scrutiny or revamping of the curriculum, making certain that the stories of all ethnic groups are presented and that all groups are represented in a positive manner. Only then can all ethnic groups truly feel that they belong. It is also hard to discriminate against a particular group of people if their histories are an essential part of the school curriculum. Recognition also causes students to feel more engaged and focused on lessons. It is evident that curriculum and writing panels for the subject of History lack sufficient representation from minority communities. This is a leadership issue. National Institute of Education (NIE)[2] sources state that there is a difficulty in obtaining the assistance of qualified subject specialists from the minority groups. The continued conflict has caused mistrust between ethnic groups, and this prevents people coming together and working on common goals. Specialists from minority groups in turn state that their ideas are not considered. Policy makers must try to rectify this. There is a need to work out how trust can be rebuilt between communities. Policy leaders must also ensure that all voices are heard and accepted in curriculum and writing panels.

Extracurricular Activities

In post-conflict situations, education is often required to address additional issues like peace education, which has become a kind of generic term for formal and informal educational activities that promote peace and tolerance and respect for diversity in schools and communities. Following civil war and conflict, there is usually a plethora of activities, planned by governmental and nongovernmental organizations and multilateral agencies, that are implemented in an ad hoc fashion. This presents another challenge to education policy leaders to find a balance and provide some leadership and coordination between these activities. Peace education activities that are linked to wider peace building in the community are more likely to make an impact on student behavior than forced attempts to link schools that are in alienated communities.

Education policy leaders in Sri Lanka nominated that extracurricular and cocurricular activities could be one of the strategic areas for the promotion of social cohesion, and educational leaders at the Social Cohesion and Peace Unit have spearheaded programs in this area. The enthusiasm displayed by the officers in this unit is the reason for the resounding success of these programs. This is the component that has had the most success in building trust and bonds between students (and teachers) of diverse ethnic groups. The programs planned by the unit also involved educational authorities at the provincial, zonal, and school levels.

---

[2] The institute responsible for curriculum development and teacher training.

One of the programs, *Denuwara Mithuro* (Pals of two cities), begun in 2007, brings together 200 students and some of their teachers from both Tamil-speaking zones and Sinhala-speaking zones in a 7-day program of fun-filled activities. A quick brushup course on basic language ensures that students make friends and have fun. The students are hosted to lunch by the community and are entertained with traditional songs and dances. There have been 7 of these student friendship programs to date, involving 15 zones and 150 schools.[3] The programs, while fostering social cohesion, were not expected to be an end in itself but were counted upon to be the beginning of a long relationship between the schools and students. In this, again the organizers have been overwhelmed by the enthusiasm and appreciation shown by the participants in the programs. Most students had not mixed with students of other ethnicities before and were amazed at the degree of acceptance and friendship they were shown. The program has also seen the creation of student leaders, who have enjoyed participating in these programs and who now want to share their experiences with others in their schools and host a similar program for their new friends. The precise impact of this program is revealed by the fact that students continue to be in touch through letters and greeting cards and even through Facebook.

However, although these programs have brought together a large number of children from diverse ethnic groups in friendship and been a huge success, the unit is uncertain about future funding and this could hinder the development of more programs. According to the Policy for Social Cohesion, the unit, which was established in 2008, would have control over all the strategic areas for the development of social cohesion. But this has not happened and the unit does not even have control over the funding of its own programs. The unit today has lost its original status and now comes under the direction of the Director of Cocurricular Activities. All stakeholders are not convinced of the necessity of this unit. Some state that the war is over, and therefore there is no need for programs on social cohesion. Changes in leadership often cause these problems. Leaders must ensure there is continuity of ongoing programs even though there may be changes of personnel in key places.

These successful programs are in danger of petering out due to a lack of resources and support and give rise to the type of leadership issues and challenges that is often found when what appear to be excellent policies are implemented without the required resources in place and without all stakeholders being on board. At a field level in this case are a group of highly motivated education officers with a successful model which they are unable to replicate or expand due to a lack of support. Policy makers need to deal with this issue and ensure the continuing success of the activities of this unit.

---

[3] There are 97 educational zones and 10,400 schools in the country.

Language in Education

In ethnically and linguistically diverse nations, often issues arise over the subject of language. Language is at the center of ethnic identity and recognition of language in the administration, the judiciary, and in education is crucial in indicating the acceptance of ethnic and religious groups. Coombs (1985) has observed that "the choice of language of instruction is one of the least appreciated of all the main educational problems that come before international forums" (cited in Watson, 1994). In many postcolonial states, governments vigorously promoted local languages in place of colonial ones (Bray & Koo, 2004). Often the choice of a single national language was made despite the existence of many languages, as in Sri Lanka. Everywhere the change to a national language had implications not only for administration and governance but for education as well, and often this last factor is not given enough consideration in the political decisions on language (Wikramanayake, 2009).

Language has always been a sensitive issue in Sri Lanka because of the diverse ethnic and religious groups in the population. Since independence in 1948, language has been the cause of ethnic tensions. Feelings of nationalism rising after independence caused English to be removed as the official language of administration and to be replaced by Sinhala. Although both Sinhala and Tamil were to be made national languages, in practice, only Sinhala was. This caused many grievances to the Tamils.

Education policy leaders in Sri Lanka made two very important policy decisions to further promote social cohesion through education: the teaching of the second national language (1999) and the teaching of English as a second or link language (1997). Learning of a second national language is a popular policy reform in countries that wish to build national solidarity. In Sri Lanka too, it was decided to introduce learning of the second national language in schools, requiring Sinhala-medium students to learn Tamil, and Tamil-medium students to learn Sinhala. The subject was first introduced in 1999 to students in grades 6–9 and made compulsory. In 2001, it became an additional subject for the GCE OL (grades 10–11). In 2007, it was introduced as an oral subject from grade 1 and was made an optional subject for the OL examination. While this seems an excellent reform to foster social cohesion, tolerance, and acceptance of diversity and is crucial to a multiethnic, multireligious society such as Sri Lanka, the system lacks the necessary teachers and resources to carry it out. The second national language ought to be taught to all children in all schools as part of the curriculum. But this is not the case because of the shortage of teachers trained to teach the subjects.

At present, only approximately 45 % of all schools teach the second national language. Approximately 16,000 students offer Sinhala as a second national language at the OL examination, but only 3,000 offer Tamil. Although the number of students selecting the subject at the OL is rising, there is a severe shortage of teachers to teach both Sinhala and Tamil as second languages. Often teachers, with other subject specialties, are made to teach the subject, and they resent this. The National Policy on Social Cohesion sought to remedy this situation by introducing a policy for the teaching and learning of the second national language in schools and teacher education institutes, thereby increasing the number of teachers competent to teach the subject. But no policy has been made yet on the teaching of the second national language, and the numbers of teachers have increased only marginally.

According to the Department of Statistics, only 94 schools in Colombo offer teaching in the second national language, and there are only 64 teachers in total to teach approximately 30,500 students. In the whole island, there are only 846 second national language teachers and 2,046 schools that teach the subject (Ministry of Education, 2009). Of course, teachers who have been recruited to teach another subject and were also teaching the second national language would not be counted here. Anyway it is apparent that there are great shortages in the numbers of teachers available. This reveals that education policy leaders, while making the right decisions in terms of fostering social cohesion, do not take into account the lack of resources, human resources, or the time needed to plan for decisions like this. Policies thus fail because the leaders down the line have not got the resources to sustain it. Often policy leaders legislate from above without taking into account the reality of education practice.

A similar situation is observed with the learning of English as a second language. English is the language of Science and of IT. It is also important both as a communication link between the two major communities and as an international language. English is taught as a second language from grade six onwards and is regarded as a core subject for the GCE Ordinary Level (OL) Examination. But there is a severe shortage of English teachers in the schools. Most rural schools in disadvantaged areas have no English teachers. Yet students from these schools must sit the examination in English at the OL and fail, because they have not had a single lesson in English.

The policy of bilingual education was introduced in 2001. Bilingual education refers to education in the mother tongue and English. This gives students the option of studying a few subjects in English while studying in the Sinhala or Tamil medium. Schools that had teachers proficient to teach in English were permitted to join the bilingual education program. This program was introduced as another way in which to get students to be more conversant in English. There is again a shortage of teachers capable of teaching in the English medium, and only a limited number of schools offer the option of bilingual education. However, the demand from students is strong and bilingual education is expanding in the country. Often the children demanding English-medium education come from English-speaking backgrounds. Schools feel compelled to cater to this demand as they might otherwise lose their students. Schools are also not allowed to teach the subjects they want in the English medium, as the Department specifies which subjects must be learnt in the mother tongue – the mother tongue is understood as being only Sinhala or Tamil, which are the languages of the majority races. English is not considered as the mother tongue because only a very small percentage use it as a first language. While the policy could be very useful in the promotion of social cohesion, leadership exercised at the next level directs the way the policy should work.

Teacher Training

Teachers are the most valuable component in the promotion of concepts of social cohesion and the acceptance of diversity. They can be viewed as potential agents of social change. Teachers, as educational leaders, also have a cardinal role in imparting the subject matter of a curriculum. How teachers do this and the attitudes conveyed by the teacher have a great impact on the child. Therefore, it is important to ensure, particularly in a post-conflict situation, that teachers have been trained both in the concepts of social cohesion and peace and in the imparting of these to students. For finally, it is the manner in which these values are taught and the behavior modeled by the teacher that has a profound effect on students' learning. "As a group, teachers wield significant influence over successive generations of young adults through a combination of the way they teach values, the selection (and omission) of values and the manner in which the selected values are translated for students and subsequently evaluated" (Print, 2000, p.12).

Since classrooms around the world now contain a more heterogeneous mix of students from diverse ethnic cultures, teachers are required to acquire new knowledge and skills that help them to work in multicultural settings and to develop an understanding of the value of diversity and a respect for difference. This brings new challenges to policy makers who have to improve the quality of teacher education to incorporate these new requirements and plan policy initiatives that will continue to enhance teacher skills and performance. No initial teacher training course can provide a teacher with all the skills required during his/her career. The demands on the teaching profession are evolving rapidly, and policy makers must decide on actions that would give the profession a much needed boost. Recognizing this, policy leaders in Sri Lanka have included teacher training as part of the policy for the promotion of social cohesion. However, this has remained mere rhetoric in the Sri Lankan context.

Although social cohesion and peace education is a component in the curriculum of teacher education programs in the country, according to the MOE, unfortunately, the teacher educator is not always sufficiently competent to impart these concepts to the teacher trainee, which means that these values do not reach the classroom (MOE, 2007). In-service training of teachers stresses more on the content areas of the subjects. Therefore, the concepts of peace and social cohesion are not passed down to the students as the teacher is not always aware of them (MOE). A dedicated focus on the content of the training teachers receive in terms of aspects of social cohesion is necessary if the results are to be achieved. Policy leaders must ensure that initiatives are carried out down the line.

The Education for Social Cohesion (ESC) program of the Ministry of Education was implemented in 2005 with the cooperation of the German Technical Corporation (GIZ). The program supported the Ministry's efforts in improving the services in the areas of peace and value education, language education (both second national languages and English), disaster safety education, psychosocial care, and programs for disadvantaged youth. The first phase of the project focused on training specialist staff and educationists at the Ministry, the NIE, the National Colleges of Education, and the teacher training centers and on building capacity in teacher pre- and in-service training for the components of ESC.

However, the baseline survey directed by the Ministry of Education and the NIE in August 2010 demonstrated that peace and value education was taught in only 50 % of the schools in the survey and that a significant number of teachers had not had any training in the past 5 years, which indicates they had not been exposed to concepts of ESC (Ministry of Education [MOE] & National institute of Education [NIE], 2010). Although 80 % of the teachers interviewed stated that they understood the concepts of peace and value education, only 24 % were able to give a valid response to questions asked (p.24; Wikramanayake, 2011, p.19). In addition, the survey revealed that over 40 % of second national language teachers rated their ability to speak the language as low, and many of the schools lacked sufficient teaching staff for the components of ESC. The survey also reported that a large number of teachers who had received training were unable to apply what they had learnt in the classroom (p.31; Wikramanayake, 2011, p.19).

According to the NIE, 150 in-service teachers have been trained in civics education since 2009, and 7,040 teachers have been trained in general education, which incorporates the topics of civics, peace and value education, and social cohesion, through the new nongraduate course for teachers in the system.

Yet it is not possible to obtain an exact figure of the number of teachers who received training in these subjects. These issues raise many questions for policy makers as the teachers are of paramount importance in delivering the curriculum in any education system. Policy leaders if they are serious about the promotion of social cohesion and social justice ought to investigate the training system for teachers and ensure that trainers are capable of imparting this knowledge to teachers. Again this raises the issue that this is mere rhetoric and leaders have failed to follow through with implementation.

Integrated Schools

The increase in the number of integrated schools, that is, schools that offer teaching in more than one medium (2 or 3 languages), has been an initiative proposed by policy makers for the promotion of social cohesion. Children learn to accept diversity and difference more easily than adults and if encouraged to mix with children of other cultures from an early age would naturally learn to respect and tolerate people of different ethnic backgrounds. Children in integrated schools have a better chance of developing friendships with peers of other ethnicities and religions, whereas children in segregated schools often get used to seeing only one point of view and tend to develop stereotype notions of other cultures.

In Sri Lanka, most schools are segregated by medium of instruction. There are at present only 484 schools in the island that offer mixed-medium education. This is barely 5 % of a total of approximately 10,000 schools. There are some schools that have two or three language mediums side by side, and this helps to create social harmony. Often these schools cater to three or four religions with shrines or places of worship for each. Some schools cater to two different ethnic groups but offer instruction only in one language.

Physical size and the location of schools do not make the task of increasing integrated schools easy. The site of a particular school may not also offer much chance for expansion or addition of classrooms, but there might be a possibility of bringing together two nearby schools that offer teaching to different ethnic groups. However, each ethnic group tends to be located in geographically different areas, and finding a location that has students from all ethnicities is difficult. This provides a big challenge to policy leaders to try to get children of different ethnic and religious groups to study together in the same classroom. Yet the urban areas of each district might provide a start for the building of an integrated school.

Next Steps

The biggest challenge for policy leaders in the immediate future is achieving a sense of national identity without destroying the ethnic and cultural identities of different groups in society. A start might be found in a celebration of the best in each cultural group focusing on values that can contribute to a national identity and culture. Strengthening and supporting the activities of the Social Cohesion Unit in the Ministry of Education is vital for the promotion of social cohesion in the country. The most success has been seen in the programs organized by this unit, and this is probably because the programs have touched the wider community and had their support. These programs if allowed to continue can reach every educational zone in the country and have a positive impact on the promotion of social cohesion in Sri Lanka.

Important next steps would include the urgent need to re-scrutinize all textbooks to ensure the removal of bias and stereotype statements of any ethnic or religious group especially in the subject of History. Education policy leaders might also ensure the inclusion of the histories of all ethnic and religious groups in the country and their contribution towards the national character and culture. Policy makers will also have to focus on teachers and their training in the context of the promotion of social cohesion. Measures will have to be taken to deal directly with the shortage of teachers in the second national languages and in English, both as a second language and for the purpose of bilingual education. Immersion courses and the recruitment of retired teachers might help solve the problem of English teachers in the short term. Training all teachers at National Colleges of Education (NCOEs) in the methodology of teaching a second national language might produce more teachers who could teach the subject part-time. A re-scrutiny of the bilingual education program is needed to ensure the program is maintaining the purpose of its initiation.

This is an interesting period in Sri Lanka's history. The country has made a good start in the initiatives for the promotion of social cohesion, but this alone is not enough. Policy leaders must ensure the momentum is maintained and particularly in the aftermath of the civil war, make certain that the country builds on these initiatives and moves towards achieving national solidarity and a culture of peace.

Leadership and Social Cohesion and Social Justice

From the above discussion, it is clear that at least in the Sri Lankan context although policy leaders had the vision to use education to build social cohesion in the country, not all initiatives were entirely successful. This has been due to several reasons. Firstly, it is apparent that all stakeholders and implementers down the line have to be convinced of the importance of the initiative or else the policy is not carried through. An understanding of the education system and its shortcomings is also an issue that policy leaders need to deal with. While policy leaders have the vision for future initiatives, the realities of achieving this vision in the circumstances must be understood. An understanding of the education system will give policy leaders a clearer view of what could be achieved in a given time frame. Shortcomings in the system can then be dealt with in order to achieve these aims.

The importance of achieving social cohesion in a multicultural, multireligious country like Sri Lanka that has been through years of civil war is brought home in this study. To rebuild a society to have respect, care, recognition, and empathy for all members of the society regardless of ethnicity, religion, or social status after years of mistrust and suspicion is not an easy task. It takes more than the vision of leaders to try to right wrongs that have taken place over the years. Commitment to the implementation of goals and conviction in the truth of these goals is important to ensure the carrying out of social justice. In the matter of social cohesion and social justice, the Sri Lankan study indicates that leaders must first make the effort to convince all stakeholders of their beliefs and of what is right in the context before making policy, as even the best policies can fail if those down the line are not convinced of its importance.

Chapter 48
A Glimpse into Homelessness in the United States

Amy L. Warke

> *A brain tumor. When I was diagnosed, I had no idea my family and I would become homeless.*
> *– Mrs. Browning*
>
> *I'll admit it. I mismanaged our money. I never dreamed we would live in a hotel for two years.*
> *– Mr. Compact*
>
> *Divorce. I never thought a divorce would cause me and my children to become homeless.*
> *– Mrs. Trekker*

Homelessness. Have you ever thought about the people who are experiencing homelessness? Where they live? The circumstances that rendered them homeless? United Commissions on Human Rights (2005) reported an estimated 100 million people live without shelter or in unhealthy and unacceptable conditions. United Nations Centre for Human Settlements indicates that the majority of the 100 million people experiencing homelessness are women and children. Hulchanski (2009) confirmed those statistics indicating that women and children are the fastest growing subgroup of the homeless population.

The Brownings, the Compacts, and the Trekkers are three families experiencing homelessness that you will meet in this chapter. They represent more than the one million children and families experiencing homelessness in the United States who share "precarious living arrangements and the daily struggles to find food and shelter" (Love, 2009, p. 1). The National Center on Family Homelessness [NCFH] (2009) estimates that over the course of a year, "between 2.3 and 3.5 million people will experience homelessness, of which between 900,000 and 1.4 million will be children and 42 % of these children are under the age of six" (p. 1). Additionally, the statistics state "that children without homes are twice as likely to experience hunger as other children, twice as likely

to experience health problems, as well as repeat grades in school, or drop out of school" (National Center on Family Homelessness, 2009 p. 1).

These staggering statistics require school leaders to consider a new form of leadership, transformative leadership (Kose and Shields, 2010; Shields, 2011) to help the growing numbers of families in need. Using the lens of transformative leadership, this narrative study (Clandinin & Connely, 2000) explores the realities of families experiencing homelessness and the challenges they faced in schools and with day-to-day living. This chapter will show the need for school leaders to employ transformative leadership to ensure that students are receiving an equitable quality education. Specifically this chapter recommends that leaders know and understand homelessness and the laws and rights that families experiencing homelessness have, and that leaders have the moral courage to change inequitable school practices to address the unique needs of the students experiencing homelessness.

Homelessness Defined in the United States

Currently, there is a transition in the definition that is used to define families as homeless in the public school system. The Homeless Emergency Assistance and Rapid Transition to Housing Act (HEARTH Act) was signed into law by President Obama in 2009. This Act is the most recent update in law to help those experiencing homelessness. However, as of May of 2012, public schools are still functioning under the Title VII of the McKinney-Vento Homeless Assistance Act. In the rest of this section, you will learn about the two laws that are available to help those who are homeless in the United States.

History of the HEARTH Act

A global crisis began in 2007 triggered by a financial crisis in the United States (Congressional Research Service, 2010). The repercussions of that financial crisis began to hit the housing market in the United States in 2008. It was because of this recession that many families began to lose their homes. In the United States, the Department of Housing and Urban Development specifically has programs to help families who have lost their homes. There has been an effort to merge the definitions of homelessness from the McKinney-Vento Homeless Assistance Act and the Department of Housing and Urban Development.

The HEARTH Act, also known as Public Law 111–22, details two findings: (a) the lack of affordable housing and the limited housing assistance programs and (b) homelessness occurs in rural, urban, and suburban areas across the United States

(National Alliance to End Homelessness, 2009). Additionally, the HEARTH Act expands the definition of homelessness. This definition now includes:

- People who reside in a shelter or place not meant for human habitation and who are exiting an institution where he or she temporarily resided
- People who are losing their housing and in 14 days and lack support networks or resources to obtain housing
- People who have moved from place to place and are likely to continue to do so because of disability or other barriers
- People who are victims of domestic violence and sexual assault (National Law Center on Homelessness and Poverty [NLCHP], 2009)

Specifically the HEARTH Act:

- Consolidates the separate homeless assistance programs carried out under Title IV of the McKinney-Vento (consisting of the supporting housing program and related programs, the safe haven programs, the section 8 assistance program for single-room occupancy dwellings, and the shelter plus care program) into a single program with specific eligible activities
- Codifies the continuum of care planning process as required and integral local function necessary to generate the local strategies for ending homelessness
- Establishes a federal goal of ensuring that individuals and families who become homeless return to permanent housing within 30 days (NLCHP, 2009)

The HEARTH Act is funded by federal grants and intended to be used by a community to help sponsor projects within a community to end homelessness.

The McKinney-Vento Homeless Assistance Act

The public schools continue to use the definition from the Federal Legislation Title VII of the No Child Left Behind Act named the McKinney-Vento Act. Under the Act, someone who is homeless is an individual who lacks a fixed, regular, and adequate nighttime residence. Additionally, the guidelines include:

- Sharing the housing of other persons due to loss of housing, economic hardship, or a similar reason (sometimes referred to as doubled up)
- Living in motels, hotels, trailer parks, or camping grounds due to lack of alternative adequate accommodations
- Living in emergency or transitional shelters
- Abandoned in hospitals
- Awaiting foster care placement
- Children and youth who have a primary nighttime residence that is a public or private place not designed for, or ordinarily used as, a regular sleeping accommodation for human beings
- Children and youth who are living in cars, parks, public spaces, abandoned buildings, substandard housing, bus or train stations, or similar settings

- Migratory children who qualify as homeless because they are living in circumstances described above (p. 2–3)

The three families you will meet in this study all qualify as homeless under the definition from the McKinney-Vento Act. Additionally, the act decrees:

> Each State educational agency shall ensure that each child of a homeless individual and each homeless youth has equal access to the same free, appropriate public education, including a public preschool education, as provided to other children and youths. (McKinney-Vento Homeless Assistance Act, 2002)

The act also mandates eliminating residency requirements for student enrollment based on qualifying as homeless and guaranteeing educational services. Children who are experiencing homelessness cannot be sent to a separate school because of their circumstances. The NCFH (2009) states that despite the provisions in the law, school districts' compliance with the act is less than complete. This further justifies the need for transformative leadership.

Literature on Homelessness in the United States

Currently, the scholarly literature related to homelessness focuses on school-related challenges that children and families experiencing homelessness face and makes suggestions for teachers, school counselors, and, at times, school principals. Most of these studies begin with an examination of the McKinney-Vento Homeless Assistance Act and in particular the need to address the gap between income and housing costs. Stronge (1993a, b) reiterated the need for continued research in access to education and academic success as well as the need for additional revision of public policy to enhance the educational opportunities of children experiencing homelessness.

Another topic in the literature comes from authors such as Nabors and colleagues (2004) and Yamaguchi and Strawser (1997). These authors identify the importance of school social workers developing collaborative relationships with families. Additionally, they recommend that counseling for children by social workers, helping with applications for free breakfast and lunch programs, assisting with acquiring clothing and food, and providing school supplies are needed services for the families. Additionally, Nabors et al. promote the need for schools to have medical and dental services provided in the school setting.

In 2006, Mawhinney-Rhoads and Stahler used a case study approach to recommend school reforms include "homeless children need to be tailored to the specific context of the community" (p. 288). This study reiterates that each family's experience with homelessness is unique and must be looked at on a case-to-case basis.

A provision of the McKinney-Vento Act mandates that schools have a local liaison to assist families experiencing homelessness. Miller (2009) discusses his role in assisting the homeless as a "boundary spanner" because it is more comprehensive and expands the role of the "typical" liaison. The role of a "bounty spanner" involves facilitating work "with and between teachers, families, and district-level administration" (Miller, p. 619). This type of leader will forge relations with not only school personnel but also outside organizations to ensure children and families experiencing homelessness will have someone to help them advocate for the rights given to them under the law.

Additionally, several authors add to the generally descriptive literature on the homeless, offering several hopeful descriptions of programs developed to offer support to children experiencing homelessness. One program created was The Yellow School Bus Project (Vissing, 2003) which helped families experiencing homelessness acquire the necessary school supplies and clothing needed to begin the school year. Another program in Orlando, Florida, is described by Pawlas, West, Brookes, and Russell (1994). This program works with families in shelters providing tutoring and scholarships for after- and before-school programs. In Phoenix, AZ, Woods (1996) assigns a mentor to children who are homeless. Lastly, a program described by Finley (2003) called "Dignity Village" helps residents who are homeless learn about technology and reading as well as teach others about what it is like to be homeless.

More theoretical studies were found and offer useful perspectives for educators. The concept of resilience, which is a "framework that looks to understand individual's responses to stress in difficult circumstances" (Reed-Victor & Stronge, 2002, p. 159), is discussed by several authors.

Reed-Victor and Stronge's (2002) study of resilience identified both individual and environmental factors that contributed to resiliency which helps children experiencing homelessness successfully navigate the challenges they face each and every day. Some individual factors they indicated "include a range of positive behaviors including social interaction, reactions to an interest in the environment, self-regulation, task orientation and positive self-appraisals" (p. 161).

Environmental factors that Reed-Victor and Stronge (2002) indicate are support, structure, and opportunity. They clarify these factors explaining that:

> Support entails warm caring relationships with significant adults; positive peer interactions; encouragement and recognition. Structure is clear, consistent and high expectations (in line with developmental level); shared values; instruction/mentoring in goal setting, problem solving, decision making and task completion. Opportunity is multiple avenues for talent and interest development; advocacy for expanded learning experiences; access to services. (p. 162)

Reed-Victor and Stronge advocate that schools combine the individual and environmental factors of resilience when designing programs to assist children and families experiencing homelessness.

In another study, Obradovic et al. (2009) found that when schools pay attention "to *early* preventative interventions" (p. 514), these children will have a better chance of decreasing the educational disparities that arise because of being homeless. Furthermore, they found that that resilience could help to overcome subsequent "troubles in secondary school and beyond" (p. 494).

Yet another study explored ways in which educators can address, or fail to address, the needs of minoritized students. Shields, Bishop, and Mazawi (2005) found that educators can have beliefs related to race, ethnicity, or, in this case, homelessness that reveal deficit thinking or pathologizing differences about certain groups of children. The authors also found that even negative attitudes among other students can be detrimental to a student who is marginalized. This leads to my choice of using transformative leadership as a useful theoretical lens for this study.

Transformative Leadership: A Lens for Leaders to Employ

Transformative leadership is an approach to leadership based on Burns' (1978) notion of leadership as being transforming rather than transactional. Unlike the transformational leadership theory of Leithwood and Jantzi (1990), transformative leadership focuses on the relationships among the inequities and material differences in the lived experiences of students and how they play out in educational settings (Shields, 2003, 2008).

Transformative leadership is based on Foster's conviction that leadership "must be critically educative; it can not only look at the conditions in which we live, but it must also decide how to change them" (1986, p. 185). When a leader addresses the needs of homeless children using transformative leadership, educators begin to have an understanding of the lived realities of these children and their family's experiences.

This perspective must be followed by critical consideration of how leaders provide support as they work to improve the realities of these children experiencing homelessness. The academic achievement of homeless children cannot be considered only from an educational or institutional perspective, but must be seen through a broader theoretical lens. Quantz, Rogers, and Dantley (1991) emphasize that transformative leadership "requires a language of critique and possibility" (p. 105) and that a "transformative leader must introduce the mechanisms necessary for various groups to begin conversations around issues of emancipation and domination" (p. 112).

Transformative leadership focuses not only on organizational effectiveness or improvement, but also on equity reform (Oakes & Rogers, 2006). That reform begins with questions of justice, democracy, and the dialectic between individual accountability and social responsibility (Weiner, 2003, p. 89). When looking at homelessness or any situation when someone is marginalized, through the lens of transformative leadership, a leader has the ability to focus on equitable education for all students.

A detailed framework presented by Kose and Shields (2010) examined transformative leadership. The framework identified five distinct elements that informed the analysis for this study and that distinguished transformative leadership from other theories. First, "the need to deconstruct and reconstruct knowledge frameworks that perpetuate inequity and injustice including the inequitable distribution of power" (p. 6) requires educators to reexamine ways in which we think about homelessness. When using this element, leaders conduct conversations with staff that address belief systems that contribute to the perpetuation of inequities.

Second, "the mandate to effect deep and equitable change that focuses on emancipation, democracy, equity, and justice" (p. 6) signifies our current practices still perpetuate injustice with respect to the education of homeless children. This entails leaders doing more than just talking about change. Leaders need to introduce socially just educational programs that develop citizens who are action oriented and will ensure change happens.

Third, "an emphasis on both private and public (individual and collective) good and the need to acknowledge interdependence of all people as well as inter-connectedness with one another" (p. 6) emphasizes the need for the school-community to include those who are traditionally marginalized. Leaders must recognize the dominant culture and ensure that all voices not just the dominant culture are "seen" in the curriculum.

Fourth, "the necessity of balancing critique with promise" urges positive action with respect to policies and practices that continue to marginalize the homeless. Shields (2003) would encourage leaders to engage in conversations [dialogue] that examine current practices and pedagogy to ensure that the curriculum is structured from students' lived experiences.

Finally, "the need for educators to exhibit moral courage" (p. 6) emphasizes the unpopular and therefore risky nature of acting on behalf of those who may be marginalized. This means holding difficult conversations and confronting behaviors that marginalize students who are not part of the dominant culture.

Each focus detailed in Kose and Shields (2010) emphasizes leadership that goes beyond "typical" organizational improvement and managerial tasks leaders engage in on a daily basis. It is a school leader's charge to emphasize ways to ensure a more equal playing field both in terms of access and outcomes (Farrell, 1999) for the most disadvantaged and challenged members of our society.

An updated framework presented by Shields (2011) expanded the system of belief of transformative leadership to include:

- The mandate to effect deep and equitable change
- The need to deconstruct and reconstruct knowledge frameworks that perpetuate inequity and injustice
- A focus on emancipation, democracy, equity, and justice
- The need to address the inequitable distribution of power
- An emphasis on both private and public (individual and collective) good
- An emphasis on interdependence, inter-connectedness, and global awareness
- The necessity of balancing critique with promise
- The call to exhibit moral courage (p. 8)

In a recent book, Shields (2011) explained how the final two beliefs, the necessity of balancing critique and promise and the call to exhibit moral courage, are embedded throughout all the beliefs. A transformative leader is one who is connected to the greater global community and recognizes that there are inequities in society and is willing to address those inequities that are present.

Transformative leadership is leadership that goes beyond "typical" organizational improvement and managerial tasks. "Transformative leadership is an exercise of power and authority that begins with questions of justice, democracy, and the dialect between individual accountability and social responsibility" (Weiner, 2003, p. 89). When employing transformative leadership, leaders, on a daily basis, engage in ways to emphasize and to ensure a more equal playing field for families experiencing homelessness. Transformative leadership suggests that leaders attend to issues of equity in order to provide a climate that will enhance student learning. Using this lens, I examine the ways in which school leaders can better offer a holistic approach to support the growing population of homeless students.

Studies have shown that children in poverty do not have equal access to educational experiences (Giroux, 1995; Ladson-Billings, 2009; Rothstein, 2004; Shields 2003, 2007, 2009a, 2009b). Houston (2003) states, "Public education isn't important because it serves the public, it is important because it creates the public" (p. 10). Shields (2009a, 2009b) states:

> to create the conditions under which all children can learn, it is important that every educator and every child believe that he or she actually belongs in school-that as citizens of a democratic society, the American ideal is attainable, in large part, through equitable educational opportunities. (p. 32)

It is through this lens of transformative leadership that I examine the ways that school leaders could offer a more comprehensive approach to assisting families experiencing homelessness.

The Families' Stories

The three families from the United States you are about to meet are all considered homeless based on the definition in the McKinney-Vento Act. Each family has a unique story that rendered them homeless. The families in this chapter had the opportunity to choose the pseudonyms that are used to protect their true identities.

The Brownings

No one ever thinks they are going to get sick. No one would ever think they would be homeless because they are sick. I was diagnosed with a brain tumor. That fact alone changed my life. It was what happened after that made me and my family homeless.

The bills began to pile up which was causing stress on me and my husband. He made a poor choice: he chose to attempt to rob a bank to get money to pay our bills. He ended up in jail. My kids and I ended up living in his taxi. It was the summer, so the weather was warm. Me and my six kids were in the taxi. I was petrified. I was afraid we would get pulled over because I did not have a license to drive the taxi. I was afraid I would get arrested and lose my kids.

We tried a shelter. They would not let my oldest son stay with us because he was 12. He had to stay with the men. He was afraid, and I was afraid for him. They gave us mats to sleep on the floor but we hated sleeping all together in one big room. The kids really hated it; they preferred to stay in the taxi.

Finally, Catholic Charities helped us. They pay for our rent and utilities and we live in a town house. If you look at us and where we live, no one would know that we are homeless.

School has been hard for the kids. They do not want anyone to know we are homeless. They really have not told their friends what has happened to us. They are afraid of the judgments people will make if we tell them our story. We stick together; this has actually made us closer.

My one daughter is suffering from depression and has attempted suicide because of all we have been through. She never felt comfortable telling anyone at school what has been happening. The school my kids go to now is like no other school I have ever experienced. The principal called me one day and asked, "Is there anything I can do for you? Do you need anything?" I ask that because I notice your son has worn the same clothes for 3 days. His shirt had a mustard stain on it. I began crying. I couldn't help it. No one had ever called and asked what we needed. They always assumed I was a bad mom and couldn't provide for my children. I told her everything – about my illness, about our experience. She helps us out.

Sometimes the school gives us projects that cost money. I do my best to make sure that the kids have what they need to do the project. We had to make something out of paper mache. It cost $20. I had to decide if we would eat or if we would buy the stuff for the project. Sometimes I don't think they think about things like that. We value education. My kids know that school means everything. That is how they are going to be successful.

The Compacts

We had an apartment, the kids had bedrooms, they shared, but they had their own rooms. I do admit, I mismanaged our money. We were evicted. We could not pay our bills, and we got into trouble with a lot of debt. I have a job and my wife has a job, but we have to live in a hotel room. We've been here for the last 2 years. I NEVER thought we would be here for 2 years, all six of us in one room.

We have been here 2 years for two reasons. One, where we live, they have an ordinance that states with the number of people in my family, I must rent a three-bedroom apartment. We can't afford three bedrooms, we can afford two bedrooms, and because of that, we are still in this hotel. We are paying off our debt living here. I know when we do get out of here, I will try to manage our money better.

We have had a really hard time with schools. In this one school, they thought my youngest was not old enough for school. We could not get to the birth certificate because it was in storage. They accused us of sending him to school too early. They never asked us anything. Then they thought I abused my children. Two different times, my daughter had a reaction to hair pins and my son has a birthmark. I had to sit and talk to the department of children and family services and answer questions about whether I abuse my children because of an allergic reaction and a birthmark. The school never talked to me.

The school the kids go to now is really different. The principal, she actually stayed one night to meet me and my wife to talk about concerns. It was after 6:00 when we met. I knew then that I would work with her. To stay late based on our schedule to help my son, that was great. We told her about my son's premature birth and services that he received. She had a plan ready to go to help him get on track. That was great. She also helped us get the birth certificate the school needed for my son. The other school never did that.

My children do not tell anyone about where we live or our circumstances. We think my wife got fired from her last job because we are homeless and live in a hotel. We want our kids to have their own rooms again. All six of us living in one room is really hard, but we are closer together because of it. We don't have places to go to spread out. It all happens in this one room.

The Trekkers

I was married, we had a lovely home, the kids had their own rooms, and we had belongings, things to call our own. My husband had not been working, and I lost my job. As if that stress was not enough, my husband was diagnosed bipolar and did not take medicine. We separated and I filed for divorce. I did not think that we would be homeless. We lost the house and had nowhere to go. I moved to the state my father lived in and me and the kids moved in with him. Five of us were sleeping in one bedroom of his two-bedroom condo. We knew it was not going to be forever. He was also in the process of selling his place.

I enrolled the kids in school and found a job. I also began searching for organizations that could help me. Luckily, I applied and was accepted to a community program that provides transitional housing and support so that we can make it on our own. My kids and I are now in a two-bedroom apartment. We have a home again.

The school my kids go to is great. They have helped us a lot since we moved here. They understood when I was registering my children and made sure we had everything they needed to start school. My kids do not tell anyone about our circumstances. They are afraid they will be teased. When we were moving into our apartment, my daughter told a friend she was getting a bed and the friend replied, "What's the big deal?" My daughter replied, "I've been sleeping on the floor for the past five months, I'm just a little excited."

The school has parent meetings to help homeless families like me. They let us know about all these resources that can really help us. They give us food at the meeting and provide child care so that the kids can come too. That helps the kids because they know other kids are going through the same thing they are.

Using the Lens of Transformative Leadership to Learn from Their Stories

Because these families were willing to share their stories, school leaders can learn from those stories through the lens of transformative leadership. Transformative leadership requires reflection and acknowledgement of the realities and inequities that exist. As you read, each family shares a unique story of their experiences with homelessness, but as you reflect on the stories, a common theme emerges from their stories. This final section will briefly examine how by utilizing the eight elements of transformative leadership (Shields, 2011) will assist leaders with new ways of understanding how to work with families experiencing homelessness, community organizations that can assist these families, and policy makers to ensure a more equitable quality education.

The Mandate to Effect Deep and Equitable Change

Deficit thinking (Shields et al., 2005) has a huge impact on the way children and families experiencing homelessness are treated. The families indicated that people make assumptions when they hear the word homelessness. Many of the families spoke of the "stigma" that exists when you mention the word homeless. Additionally, the families spoke of the stereotypes that exist when school personnel find out about their circumstances. In order to begin to have deep and equitable change, leaders need to be aware of these assumptions and stereotypes that exist in society.

The mandate to effect deep and equitable change begins with leaders having the courage to hold difficult conversations challenging assumptions, biases, and stereotypes that are held by those in the dominant culture. Once leaders begin to acknowledge that many school personnel unknowingly hold biases and assumptions and begin to address that these biases and assumptions are present, equitable education can begin to occur.

The Need to Deconstruct and Reconstruct Knowledge

To tackle assumptions and stereotypes that exist around homelessness, leaders need to deconstruct existing negative knowledge frameworks and reconstruct new ones. To do so, they will need to have conversations to address the deficit thinking which impacts the ability of children experiencing homelessness to receive an equitable education. These conversations and dialogue need to occur not only with staff but also with families, thus establishing and building a relationship of trust and partnership between the school and the family. Starratt's (1991) ethics of caring focused on developing relationships that are authentic and genuine. School leaders must challenge assumptions of staff by engaging in conversation dialogue that allows staff to confront deficit thinking so that all children have the opportunity to receive an equitable education. All of the families indicated that they value education. Ms. Browning would even ground her children if they did not bring home the grades they were capable of earning; the Compacts stated education is an equalizer. Many staff have the belief that these families do not value education; these two examples prove leaders need to challenge assumptions in order to move towards equitable education for children experiencing homelessness.

When deconstructing and reconstructing this knowledge, it is important for a leader to focus on equal equitable access to all children. Leaders should build strong relationships with staff so that the difficult conversations and dialogue can begin to help all deconstruct the knowledge held that contributes to deficit thinking.

A Focus on Emancipation, Democracy, Equity, and Justice

This form of transformative leadership employs the belief that to improve achievement for all students, "deep democracy" (Green, 1999) must be present. Specifically, Green urged, "*a deeper conception of democracy* that expresses the experience-based possibility of more equal, respectful, and mutually beneficial ways of community life" (italics original, p. vi). Transformative leadership "would seek to identify those who are included or excluded, privileged or marginalized, listened to or silenced; we would ask who benefits and who is disadvantaged by any given decision, practice, resource allocation, or curricular representation" (Furman & Shields, 2005, p. 134).

The basis for the beliefs of transformative leadership stemmed from Paulo Freire (1998). His belief was, "that education is not the ultimate lever for social transformation, but without it transformation cannot occur" (p. 37). This statement encourages leaders to be transformative and to infuse democratic education and social justice into the school system. Freire (1993) said, "the solution is not to 'integrate' them into the structure of oppression, but to transform that structure so that they can become 'beings for themselves'" (p. 74). Leaders need to include families in the decision-making process. When leaders included the families into the planning process and provided the training based on their needs, the families have a chance to change their circumstances. More importantly, the families had a say in what would be most helpful to them. By asking the families what they need to help change their situations and then bringing in speakers to support the families in those areas, attempts are made to break the barriers that exist by educating the families on what resources are available to help change their circumstances. It is because of those meetings that Mrs. Compact gained the confidence to reenter the workforce.

Additionally, leaders need to be aware of the curriculum that is being delivered to all students if they are to help teachers offer equitable and liberating learning experiences to all students. It is important to ensure that the curriculum encompasses all children's lived experiences. When school leaders are willing to have the conversation about curriculum, one can refer to Grumet (1995) who defines curriculum as the conversation "that makes sense of things" (p. 19). It is important for leaders to hold conversations with teachers to gain an understanding of curriculum, ensuring that all teachers know and understand cultural practices, backgrounds, and circumstances of all children and families in their schools. The hidden curriculum that is being delivered needs to be exposed to ensure that all students have an opportunity to learn and understand the "expectations" of the hidden curriculum. When the hidden curriculum is exposed, and all students are taught, an equitable education can begin.

The Need to Address Inequitable Distribution of Power

Transformative leadership must be what a leader lives on a daily basis. When the leader's belief system is one that challenges the status quo in order to ensure that other voices besides the dominant culture are heard and that democracy is teaching children to be citizens who take an active role in society, reform can begin to occur that will change society. Weiner (2003) recognized that transformative educational leaders work within a hierarchical system and must learn to "exercise effective oppositional power, to resist courageously, to be activists and voices for change and transformation" (p. 102). He continued to say transformative leaders must "take risks, form strategic alliances, to learn and unlearn their power, and reach beyond a 'fear of authority' toward a concrete vision of the work in which oppression, violence, and brutality are transformed by a commitment to equality, liberty, and democratic struggle" (p. 102).

The families in this chapter indicated barriers that were perpetuating their circumstances of homelessness. One family, the Compacts, has money, however, must continue to live in a hotel because of the local ordinances that exist forcing the family to rent a three-bedroom apartment because of the number of people in their family instead of a two-bedroom apartment that they could afford on their salaries. The Brownings indicated practices that shelters enforce, having all family members present for entry and that boys at the age of 12 must sleep with the men instead of with their families. Transformative leaders need to begin to challenge policies and practices that continue to marginalize these families.

Emphasis on Both Private and Public (Individual and Collective) Good

The purpose of education is to build an educated citizenry. Barber (2001) wrote, "For true democracy to flourish there must be citizens. Citizens are women and men educated for excellence by which term I mean the knowledge and competence to govern in common their own lives" (p. 12). Having an educated citizenry will be a first step in attempting to alleviate the inequalities that currently exist in society. Leaders need to encourage and support an equitable environment that supports a child's academic, social, and emotional growth as well as one that creates "learning communities in which each person feels a strong sense of belonging and safety and in which each knows that he or she has something important and meaningful to contribute to the learning situation" (Shields, 2008, p. xiv).

Additionally, to create a climate for the collective good, the ethic of justice (Starratt, 1991) promoted participating in society by teaching the individuals to think and act in terms of the common good for the community as a whole. Starratt also promoted ethics of caring which "requires fidelity to persons, a willingness to acknowledge their right to be who they are, an openness to encountering them in their authentic individuality, a loyalty to the relationship" (p. 195). The families indicated the need to develop a relationship with those experiencing need in order to ensure that the specific needs of the family were being met. I even found that when a strong relationship existed between the family and the school leader, (or the interviewer in my case) the findings were more detailed and specific. Leaders need to ensure that strong relationships are built with all families to ensure the schools are producing citizens that are caring and contributing to all of society.

Emphasis on Interdependence, Inter-connectedness, and Global Awareness

It is important for school leaders to understand that by providing the necessary support for those families experiencing homelessness is not simply an expression of generosity, but a way of promoting a mutually benefitting, interdependent society (Starratt, 1991). It is not simply ensuring that the basic needs of food, clothing, and shelter are provided, but ensuring an educational environment that is equitable and just.

All of the families commented on the supports that are provided to help the families meet the basic needs of survival, but more importantly, it was the families' sense of belonging that helped them feel welcomed and part of the educational environment. From my personal experience, even though children's homeless status was recorded on their permanent records, as they progress from elementary to middle school, their status was sometimes ignored or overlooked, which singled out the student, perpetuating the feelings of embarrassment and fear.

The Necessity of Balancing Critique with Promise

It is important for leaders to engage in conversations about policies and practices that continue to create barriers for those families experiencing homelessness. The families indicated several policies that created barriers to the families.

The Brownings indicated how the shelters would not allow the son, 12, to stay with the family. Because of his age, he (at 12) had to go stay with the men at the shelter. This policy forced the family to stay in the car instead of in a shelter. The Compacts were not allowed to rent a two-bedroom apartment that they could afford because of policies that dictated the number of people who were allowed to live in a two-bedroom apartment.

Policy makers should examine the practice of paying for transportation, using taxpayers' money, transporting children long distances to attend the school of origin. Would it be better for policy makers to consider using the money to assist the families by using the money to gain greater stability for the family? Additionally, local policy makers should examine the current practice of not allowing larger families to rent a home or apartment that is within their means, forcing some families to remain homeless.

The Call to Exhibit Moral Courage

In order to fulfill the beliefs of transformative leadership, it is evident that moral courage is needed. This belief is embedded throughout each tenant of transformative leadership. Shields (2011) summarizes this belief below:

> It must be apparent that if one is driven by a sense of moral purpose and clarity about the multiple goals and purposes of education, one cannot identify the need for deep and equitable change without subsequently beginning to deconstruct the knowledge frameworks that perpetuate the structures and cultures that need to be changed, and trying to replace them with alternative ways of thinking and knowing. … Further, to do any of this successfully, and particularly to go beyond simple critique to introduce educational experiences that hold promise of a better future, requires a healthy dose of moral courage. (p. 2)

The final summary of transformative leadership that I want to leave with everyone is found in an article from Shields (2010). Shields wrote:

> Transformative leadership, therefore, recognizes the need to begin with critical reflection and analysis and to move through enlightened understanding to action – action to redress wrongs and to ensure that all members of the organization are provided with a level playing field as possible – not only with respect to access, but also with regard to academic, social, and civic outcomes. In other words, it is not simply the task of the educational leader to ensure that all students succeed in tasks associated with learning the formal curriculum and demonstrating that learning on norm-referenced standardized tests; it is the essential work of the educational leader to create learning contexts or communities in which social, political, and cultural capital is enhanced in such a way as to provide equity of opportunity for students as they take their place as contributing members of society. (p. 17)

Society is in need of transformative leaders who are willing to confront deficit thinking perpetuated by the dominant culture. These leaders need to ensure that all children, regardless of their circumstances have the ability to receive an education that teaches everyone to become a productive citizen to further advance our society.

Conclusion

Every country across the globe has families who are experiencing homelessness. Each country has different policies and practices that are intended to help these families change their circumstances. This chapter has shown that it takes more than policies and practices to change these families' circumstances. It takes a leader, specifically, a transformative leader, who is willing to hold difficult conversations, challenge the status quo, and has the moral courage to bring attention to the inequities that exist for families in need.

Chapter 49
Reducing Socioeconomic Inequity by Improving the Equity of Education

Ned Van Steenwyk

Introduction

Socioeconomic inequities can be difficult to deal with when the adult labor force has low levels of productivity and education and a lack of employment opportunities. These challenges become further complicated when a country is not focused on correcting deficiencies in regulations, judicial systems, security, and other factors that make a developing country less attractive for investors. While equity in education is a worthy goal in itself, the real payoff for many developing countries can be subsequent improvements in socioeconomic equity and reductions in poverty. To achieve improvements in socioeconomic equity, inequities in education must be addressed, with ambitious goals to improve the coverage and quality of education and a clear focus on the equity of education.

The purpose of this chapter is to examine the challenges and opportunities for reducing socioeconomic inequity through education planning and improving equity in education. Prioritizing investments in education, however, can become very confusing for decision makers, and opportunities may be lost when inappropriate information is used for allocating limited resources. Honduras is used as an example.

The chapter begins with background information on Honduras and the region, the challenges and opportunities facing the country; a brief discussion of education and development; followed by sections on socioeconomic inequity, equity in education, challenges and opportunities for reducing inequities; difficulties with the use of enrollment data from local and international sources for tracking improvements

in coverage rates; and a summary of efficiency issues. The conclusions summarize the probabilities for reducing socioeconomic inequity by improving the equity of education, with policy recommendations for establishing ambitious but realistic goals for achieving improvements in the equity, quality, and efficiency of education in Honduras.

Background

While each country in Central America has its own particularities and challenges, the entire region was affected by the cold war and the civil wars of the previous decades. Today, Central American countries are grappling with the increased influence of organized crime, drug trafficking, gangs, unemployment, poverty, socioeconomic inequities, and the ideologies of the cold war – which are still shaping political positions in the region.

Honduras is the second largest country in Central America with a population of 8.2 million, an average of 6.9 years of education for the working-age population and a monthly per capita income of $146.[1] The country's largest trading partner is the United States and with the economic downturn in 2008, the demand for exports from Honduras was significantly reduced, resulting in increased unemployment and underemployment. Problems were exacerbated by political turmoil during 2009 with the controversial removal of the president, the polarization of civil society, social unrest, and the suspension of economic and security assistance by international donors. This resulted in further increases in unemployment and underemployment, increased violence and drug trafficking. From May 2008 to May 2011, unemployment increased by 61 % and underemployment by 59 %, with increases in extreme poverty and limited employment opportunities for young people.[2] The education system also suffered with continuing teachers' strikes and limited days of class from 2009 through 2011.

Although the population was warned by the supporters of the deposed president to stay away from the polls because of violence, elections were held in November 2009 as voters turned out in record numbers and a newly elected president took office in January of 2010.[3] International donors ended the suspension of economic and security assistance in July 2010, but many of the suspended activities did not begin significant disbursements until 2011 and 2012 as donors reviewed and reprogrammed their assistance programs.

[1] Instituto Nacional de Estadística (INE), *Encuesta Permanente de Hogares de Propósitos Múltiples* (May 2011, Household Survey).

[2] INE, *Encuesta Permanente de Hogares de Propósitos Múltiples* (May 2008 and May 2011); and Ned Van Steenwyk y Rolando Sierra Fonseca, *La Oferta y Demanda de la Educación Técnica y Formación Profesional en Honduras* (Tegucigalpa: Programa de Apoyo a la Calidad de la Educación Básica del Plan EFA-FTI (GIZ) y el Ministerio Federal de Alemania de Cooperación Económica y Desarrollo, 2011).

With three administrations in less than a year, the poorest sectors of the economy were the most affected, and per capita income declined by 4.4 % from May 2008 through September 2010. Although some of the jobs that had been lost in industry and other sectors during 2008–2010 began returning during 2011, many of the positions had salaries below the poverty level for heads of families and contributed to an increasing underemployment rate of more than 45 %, and the percentage of the population living in poverty increased from 64 to 67.6 %. The problem is a lack of employment opportunities for nearly 200,000 people entering the labor force annually, while the combined unemployment and underemployment rates are at 51 %.[4]

In addition to the challenges summarized above, there are demographic changes. Birth rates have been declining, following decades of high birth rates, while the working-age population is growing and the ratio of dependents (0–14 and 65+ years of age) in relation to the working-age population is declining. The changes in the distribution of the population by age groups could reduce economic burdens on parents and provide more resources for improvements in the quality of life of families. The following graph summarizes the window of opportunity for Honduras from the year 2015 until 2040 when the ratio of the dependent population, as compared to the workforce, will be below the working-age population. The top line on the left side of the graph is the ratio of dependents in relation to the working-age population. The next line at the left of the graph, which rises above the ratio of dependents in the year 2015, represents the working-age population. The third line is the dependent population of children 0–14 years of age, and the bottom line depicts dependents of 65 years of age and older.

The graph, fig. 49.1, summarizes the window of opportunity that Honduras is about to enter, which could reduce poverty – if productivity increases with better paying jobs. Based on the experiences of other countries that have gone through similar changes in the distribution of their populations by age groups, the keys to success for Honduras will depend on the levels of education and productivity of the

---

[3] Voters were initially hesitant and nervous, but as the day went on, more and more people turned out to vote, ending the day with a record turnout. The author was an international observer for the elections in the province of La Paz.

[4] Unemployment in Honduras is 4.3 % and underemployment 46.7 % for a total of 51.0 %. Extreme poverty is having a monthly income of less than $64 per family member for food. Relative poverty is an income of less than $110 per family member for food, public transportation, minimum housing, health, and public education costs for children. Data on employment, poverty, and incomes from INE, *Encuesta Permanente de Hogares de Propósitos Múltiples* (May 2011).

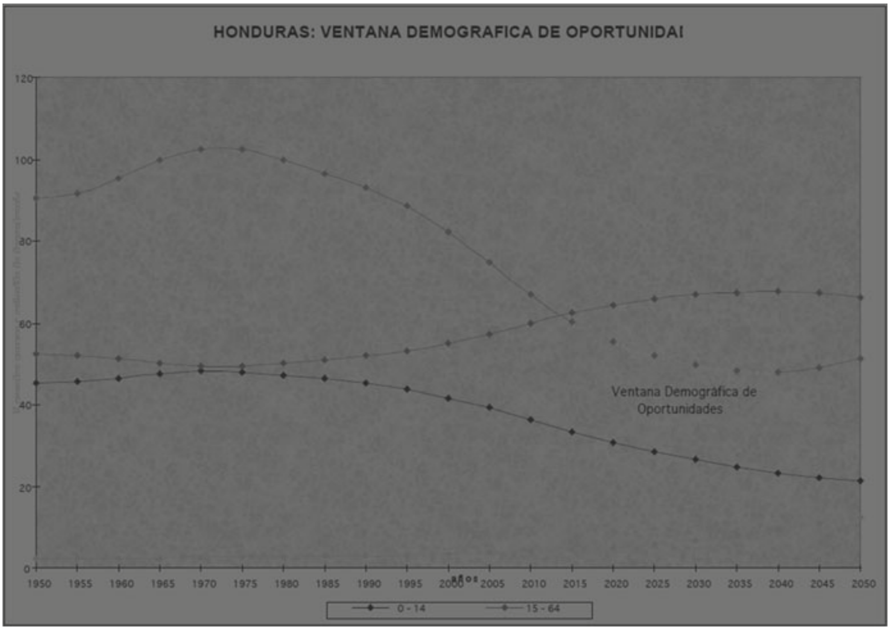

Fig. 49.1 Population changes from 1950 to 2050 (Source: United Nations Population Fund (UNPF) y el Comisionado Presidencial para la Reducción de la Pobreza, *El Cambio Demográfico: Motor de Desarrollo* (Tegucigalpa 2009))

young workforce from 2015 to 2040 and attracting investments for providing employment opportunities and higher incomes.

Countries that did not have a better educated and more productive young workforce as this segment of the population was growing and could not provide appropriate employment opportunities for a growing young workforce experienced increased poverty, unemployment, civil unrest, and violence (Afghanistan, Angola, Botswana, Ethiopia, Ghana, Haiti, Iran, Iraq, Pakistan, and Uganda).[5] One of the biggest challenges during the twenty-first century for Honduras and other developing countries with a growing young workforce will be attracting investments to improve employment opportunities.[6]

See also USAID, *Central America and Mexico Gang Assessment* (2006) and Clare Ribando Seelke, *Congressional Research Report for Congress: Gangs in Central America* (2008) for the consequences of low levels of education and a lack of opportunities for a growing young work force.

Education and Development

The importance of education for developing countries is widely accepted, and this has contributed to wider public access to data and research on education in developing countries.[7] Assuring that all children complete primary school is the first challenge, but the value of post-primary education is also well documented, with increases in secondary education enrollments and graduates associated with export-led growth, the attraction of international capital, technology transfers, a more competitive young workforce, and the reduction of poverty. Improvements in the quality of secondary education are also associated with better jobs, higher incomes, and increased economic growth.[8] These are the changes Honduras needs to employ its young workforce and provide higher-paying jobs.

Historical data from 1970 to 2000 provides further insights on achieving accelerated rates of economic growth for a country like Honduras, with the most promising combinations of education attainment for a young workforce. Based on evidence from 120 countries, universal primary education and 50 % of the population with secondary education would provide the highest probable rate of economic growth for Honduras.[9] The World Bank also shows attractive private rates of return on education, with a high school education having the highest rate of return for young people in Honduras, and household survey data shows an average income increase of 13 % for young people 14–17 years of age with each additional grade of secondary education completed.[10]

---

[7] For comparative data on the education systems of countries, see UNESCO's Institute for Statistics and the Work Bank's Education Statistics at www.worldbank.org. For Latin America and the Caribbean, see USAID, *Latin America and the Caribbean Selected Economic and Social Data*. Research summaries are also available from USAID, the World Bank and the German Development Agency (GIZ); see, for example, Abby Riddell, *Factors Influencing Educational Quality and Effectiveness in Developing Countries*: *A Review of Research* (GIZ, 2008) and for Latin America, Javier Murillo, "School Effectiveness Research in Latin America," in the Springer *International Handbook of Education* at springerlink.com. For educational outcomes in developing countries, in terms of international testing results, see data from the *Programme for International Student Assessment* (PISA), the *Third International Mathematics and Science Study* (TIMSS), and for Latin America, see the *Segundo Estudio Regional Comparativo y Explicativo* (SERCE).

[8] See, for example, DFID Practice Paper, "The Importance of Secondary, Vocational and Higher Education to Development" (July 2005); World Bank, "Expanding Opportunities and Building Competencies – A New Agenda for Secondary Education" (2005); and Eric Hanushek and Lugar Wobmann, *Education Quality and Economic Growth* (2007).

[9] International Institute for Applied Systems Analysis (IIASA) and the Vienna Institute of Demography (VID) at the Austrian Academy of Sciences, *IIASA Policy Brief*: "Economic Growth in Developing Countries: Education Proves Key" (August 2008); a growth rate of about 13% annually is projected for Honduras, Guatemala, Kenya, Rwanda, and Uganda with more emphasis placed on secondary education.

[10] Rates of return from the World Bank, *Central America Education Strategy – An Agenda for Action* (2005), p. 73: Private rates of return for people 18–30 years of age in Honduras are 6.4 % for completing primary education, 6.0 % for lower secondary education (middle school), 13.3 % for high school, and 10.9 % for tertiary education. Income increases from household survey data cited by Philip Marx, *La Inseguridad y su Efecto en el Sistema Educativo de Honduras* (Tulane University, June 2010); presentations on the effects of urban violence on enrollments for youth 14–17 years of age.

Today, with nearly 90 % of the children in Honduras completing primary school, the demand for post-primary education is increasing, parents are much more aware of the importance of education, and more than 90 % of the young people would like to continue their studies through secondary education, which are positive trends for a growing young workforce.[11]

Socioeconomic Inequity

Most Latin American countries have high levels of income inequity, and lower incomes are associated with lower levels of education.[12] The Gini coefficient for Honduras is 53.8–55.3, which is high but about average for the region.[13] Honduras, however, is one of the poorest countries in Latin America, resulting in economic inequities, inadequate incomes, and poverty being more evident, as compared to higher-income countries with similar Gini coefficients.[14] The following table summarizes the income and education characteristics of heads of households and shows an inverse relationship of incomes and family size, with higher incomes associated with higher levels of education.

---

[11] Results of a survey with over 1,400 young people 16–22 years of age in urban and rural areas in 16 of the 18 provinces of Honduras: 94 % expressed a desire to continue their studies through secondary education, including 90–91 % of the dropouts and out-of-school population; see Ulana Umansky, Russbel Hernandez, Mario Alas, and German Moncada, *Alternative Upper Secondary Education in Honduras*: *Assessment and Recommendations* (USAID, Academy for Educational Development and CIDEH, 2010).

[12] For one of the early studies on the association of inequities in education with subsequent socio-economic inequities in Latin America, see Juan Luis Londoño, *Poverty*, *Inequality*, *Social Policy*, *and Democracy*, World Bank Conference on Development in Latin America and the Caribbean (1995). For more recent data on the association of higher levels of education with higher incomes and reduced poverty, see the household surveys and census data from countries.

[13] Gini coefficients are used for estimating income equity and range from 0, with everyone in a country receiving the same income, up to 100, with 1 person in a country receiving all of the income. No countries are at the extremes of 0 or 100, and most countries range from about 30 to 60. Gini coefficients vary from the two sources cited below: South Korea 31.3–31.6; USA 40.8–45.0; Mexico 46.1–48.1; Peoples Republic of China 41.5–46.9; Nicaragua 43.1–52.3; Costa Rica 47.2–49.8; Peru 49.6–52.0; El Salvador 49.7–52.4; Chile 52.0–54.9; Paraguay 53.2–58.4; Guatemala 53.7–55.1; Honduras 53.8–55.3; Colombia 53.8–58.5; Panama 54.9–56.1; Brazil 55.0–56.7; Bolivia 58.2–59.2; Haiti 59.2; etc. See http://hdrstats.undp.org/en/indicators/161.html (UNDP, 2009 Human Development Report) and other sources citing Gini coefficients from the US Central Intelligence Agency.

[14] Comparing Honduras with other countries with similar Gini coefficients can be misleading. While Honduras, Guatemala, Panama, Paraguay, Colombia, and Chile have similar coefficients, the per capita income for Honduras is 15–20 % less than the per capita incomes of Paraguay and Guatemala, half of the per capita income of Colombia, 1/3 of the per capita income of Panama, and 1/4 of Chile's per capita income. With less money to distribute among the population of a country, inequities and inadequate incomes are more evident than in higher-income countries with similar Gini coefficients.

Table 49.1 Income and education characteristics of heads of households

Income quintiles	Monthly income per capita[a]	Years of education of heads of families	Family size	Monthly family income[a]
1st quintile (poorest 20 %)	$18	4.6 years	5.4 people	$98
2nd quintile	45	5.0	5.2	236
3rd quintile (average income)	80	5.7	4.9	392
4th quintile	138	6.9	4.4	609
5th quintile (wealthiest 20 %)	448	9.9	3.6	1,612

Source: Instituto Nacional de Estadística (INE), *Encuesta Permanente de Hogares de Propósitos Múltiples* (May 2011), Ingresos de Hogares

[a] Monthly incomes in US dollars (L19 = $1)

Table 49.1 shows the association of higher incomes and higher levels of education, with smaller families for upper-income groups. Socioeconomic inequities are evident and achieving improvements in equity will require improvements in the education levels of the workforce, with better paying jobs for reducing the high poverty rate that affects 68 % of the population and the 51 % unemployment and underemployment rate. With demographic changes, however, Honduras will have a larger and better educated young workforce, and fewer dependents. This could reduce poverty and inequities – if investments can be attracted for increasing employment, providing higher-paying jobs for the young workforce, and students receive the best education possible for increasing their productivity before entering the labor force.

Equity in Primary Education

Primary school enrollments show high levels of equity based on the net and gross enrollment rates for children from the richest and poorest families. The net enrollment is 82.6 % of the children from the poorest families and 83.4 % for the children from families with the highest incomes, with gross enrollments of more than 100 % for children from all income levels.

Table 49.2 shows high levels of equity for net and gross enrollment rates in primary education, but the net rates do not include the enrollment of many children who are under- or overage. The high gross enrollment rate for children from lower-income families of 107 % as compared to 102 % for the richest families appears to be positive – but the higher gross enrollment rate for lower-income students also reflects inequities, with lower levels of achievement, higher failure and repetition rates for children from lower-income families.[15]

---

[15] For data on the economic status of children, failure and repetition rates, and standardized test scores, see Germán Moncada y Mario Alas, *El Currículo Nacional Básico en el Aula* (SE, USAID, American Institutes for Research and CIDEH, 2009).

Table 49.2 Enrollment rates for children from the poorest and wealthiest families in primary education

Socioeconomic level of families	Net enrollment[a] (%)	Gross enrollment[a] (%)
1st quintile (poorest 20 %)	82.6	106.7
2nd quintile	86.8	113.3
3rd quintile (average incomes)	88.9	114.9
4th quintile	87.8	111.8
5th quintile (wealthiest 20 %)	83.4	101.6

Source: INE, *EncuestaNacional de Demografía y Salud*, (ENDESA) (2006); pp. 32–36

[a] The net enrollment in primary school is based on the enrollment of children 7–12 years of age/ population of children 7–12 years of age for the National Statistics Institute (INE). The gross enrollment rate is the total enrollment in primary education/population of children 7–12 years of age. The gross enrollment rate can exceed 100 % with under- and overage students

There have been significant improvements in the efficiency of primary education, however, with the implementation of strategies from a multi-donor program with the Secretariat of Education (SE) under the Education for All – Fast Track Initiative (EFA-FTI). The annual dropout rate in primary schools of 3.4 % was reduced to 0.9 %, repetition rates for grades 1–6 were reduced by an average of 24 % during the same period, and student achievement on standardized tests increased. Reductions in dropout and repetition rates should continue with curriculum reforms in primary education and access to 1 year of preschool education increasing to 82 % in the year 2009.[16] Further reductions in dropouts and repetition are needed, however, to achieve the EFA-FTI goal of all children completing primary school.

Equity in Secondary Education

During the past decade, primary school graduates increased from 69 % in the year 2000 to 88 % by 2009, resulting in increased enrollments in middle school, with a 79 % gross enrollment rate for the 7th grade in the year 2010 and a 70 % rate for the 7th–9th grade.[17]

With increases in enrollments in lower secondary education (7th–9th grades), enrollments in upper secondary education (10th–12th grades) also increased to

---

[16] SE, *Avances y Logros Educativos en la Educación Básica* (2009) for improvements in primary education. Enrollments of children 5 and 6 years of age in preschool (preparatoria)/population 5 years of age = 82 % coverage of 1 year of preparatoria in 2009; the enrollment of children from 5 to 6 years of age is used in the calculation for enrollments in preparatoria because Honduras is in a transition to lower the age for enrolling in the 1st grade of primary school to 6 years of age and age 5 for preparatoria (preschool) before enrolling in primary education.

[17] Total enrollments of 402,524 students in the 7th–9th grade/a population of 573,241 people 12–14 years of age = a gross enrollment rate of 70.2 % for the 7th–9th grade. Enrollments from the SE for the year 2010 and population data from INE for 2010 (INE, *Proyecciones de Población 2001–2015*).

Table 49.3 Enrollment rates for youth from the poorest and wealthiest families in lower and upper secondary education

Socioeconomic level of families	Net enrollment (%)	Gross enrollment (%)	Enrollment probability
1st quintile (poorest 20 %)	9.0	11.4	1.0
2nd quintile	17.8	23.6	2.0
3rd quintile (average incomes)	35.6	47.1	4.1
4th quintile	54.6	74.1	6.5
5th quintile (wealthiest 20 %)	72.0	97.4	8.5

Source: Enrollment data from INE, *Encuesta Nacional de Demografía y Salud* (ENDESA), (2006). Calculations of enrollment probabilities by the author based on gross enrollment rates by quintiles of income

49.9 % in 2010.[18] With higher incomes associated with higher levels of education, probabilities for improving future socioeconomic equity are increasing with higher enrollment rates in secondary education, but secondary education is characterized by more inequities than the primary level. Table 49.3 summarizes inequities in access for young people by family incomes.

Table 49.3 shows that the economic status of students is associated with probabilities for enrolling in lower and upper secondary education with much higher probabilities for enrollment for the children from higher-income families. In addition to inequities based on the socioeconomic status of youth, nearly 3 out of 4 students enrolled in grades 10–12 and most of the high schools for upper secondary education are located in urban areas (76 %), with some rural provinces having very few high schools for young people to continue their education.

Gender inequities are also evident with 1.4 times more females enrolled in high schools in rural areas.[19] The following table summarizes problems with gender and geographic parity. Enrollments for females are higher, and youth from urban areas have 2.7 times more probability of being enrolled in high school, as compared to youth from rural areas.

Table 49.4 shows that urban youth are 2.7 times more likely to be enrolled in high school than rural youth, but the problem is not limited to a lack of access to the 10th grade. More students from low-income and rural sectors are not completing previous grades. Five rural provinces reported gross enrollment rates in high school of 30 % or less for the 2010 school year, while urban provinces reported the highest enrollment rates, with the total national gross enrollment rate at 50 % (Table 49.7)

---

[18] Total enrollments of 266,910 in grades 10–12/a population of 534,852 people 15–17 years of age = a gross enrollment rate of 49.9 % for grades 10–12. (Note: total enrollments include an adjustment for young people enrolled in academic programs which are 2 years in length in grades 10–11, with these students graduating at the end of the 11th grade, while most students are in programs of study 3 years in length and graduate at the end of the 12th grade). Calculations by the author with data on 2010 enrollments from the SE and cited in Van Steenwyk and Sierra Fonseca, *Op. Cit.*

[19] Data on urban, rural, male, and female enrollments is for the 2010 school year from INE, *Encuesta Permanente de Hogares de Propósitos Múltiples* (May 2010).

Table 49.4 Geographic and gender inequities in high school enrollment rates

	Data from INE (%)	Probability of being enrolled
Rural and urban		
Urban	42.4	2.7
Rural	15.6	1
Male and female		
Urban	42.4	
Male	41.5	1
Female	43.2	1.04
Rural	15.6	
Male	13.2	1
Female	18.6	1.4

Sources: INE, *Encuesta Permanente de Hogares de Propósitos Múltiples* (September 2010), Educación, Cuadro 2. Probabilities calculated by the author based on enrollment rates

and enrollment rates by provinces varying from 17 to 74 %.[20] More females complete middle school and are more likely to be enrolled in high school than males on the national level, but Table 49.4 shows that the most serious problem in gender parity is in rural areas (1:1.4) because of the need to work and higher opportunity costs for attending school for lower-income rural males. Low-income urban youth, however, have the added strain of violence and insecurity in some neighborhoods reducing probabilities for enrollment by 20 % or more.[21]

In summary, enrollments and graduates from primary, middle schools, and high schools are increasing, and equity in primary education is high – which could help reduce income inequities in the future. Continuing inequities in access to post-primary education for lower-income and rural students, however, will make it more difficult for these young people to escape the poverty of their parents.

Challenges and Opportunities for Reducing Inequities

In a country with 68 % of the population living in poverty, there are major challenges for receiving a demographic bonus with a growing young workforce and the competition of countries for investments to improve employment opportunities. There are also the dangers of a demographic time bomb for Honduras, if investments are not attracted to provide more employment opportunities, as a consequence of high levels of unemployment and related problems.[22] With the evidence pointing towards the importance of secondary education, Honduras established goals under

El Salvador	55 % (2008)
Costa Rica	52 % (2006)
Nicaragua	45 % (2008)
Guatemala	40 % (2008)
Honduras	34 % (2011)

Sources: USAID; http://lac.eads.usaidallnet.gov; Development Statistics for Latin America and the Caribbean (2006–2009), with no data on secondary enrollments reported for Honduras; and INE, *Encuesta Permanente de Hogares de Propósitos Múltiples* (May 2011), for school attendance data on the population 13–18 years of age in Honduras

its Poverty Reduction Strategy (*Estrategia para la Reducción de la Pobreza*: *ERP*) for a 70 % net enrollment rate in lower secondary education and 50 % of the youth completing high school by the year 2015. Goals for the country's new National Development Plan are a net enrollment rate of 100 % for grades 1–9, a net enrollment of 75 % for high school, and increasing student achievement based on standardized tests to 70 % on all levels of the education system by the year 2038.[23]

The strategy Honduras is using for reducing poverty by increasing the education levels of youth is backed by evidence from many countries with increases in economic growth, technology transfers, and higher incomes associated with higher levels of education. Improvements in primary, middle, and high school completion rates should help more young people break out of the poverty cycles that have been passed on to children from low-income families. Table 49.5, however, shows that Honduras is at a disadvantage for attracting investments to improve employment opportunities for a growing young workforce based on the goals established for *net* enrollment rates, with Honduras having the lowest net enrollment rate in Latin America for secondary education.

---

[23] República de Honduras, *Visión de País 2010-2038* (2009) and Government of Honduras, *National Vision and Plan Summary* (2010).

The preceding table shows that Honduras has a very low net enrollment rate for lower and upper secondary education (grades 7–12). This is a serious concern for planning investments in education, with half of the potential and emerging workforce of Honduras being 15–29 years of age and two-thirds of the population under the age of 30. Both the SE and INE are reporting very low net enrollment rates for secondary education, which could affect the country's productivity and reduce chances for improving income equity for another generation, leading many people to conclude that the highest priority must be for increased investments to expand access to post-primary education.[24]

While many international organizations use net enrollment rates for comparing the coverage of education systems of countries and some international donors encourage developing countries to report net enrollment rates, there are problems with using net coverage rates in a country like Honduras. The use of net enrollment rates may help a country attract donor funding for expanding access, but using net enrollment rates for education planning can result in serious misunderstandings of the challenges facing education systems and mistaken priorities for the use of limited resources in many countries. Net and gross enrollments can be similar in more developed countries, when education systems have efficient pass rates and children begin school at an appropriate age, but in many developing countries, constraints analyses for improving equity in post-primary education will result in very different conclusions when using net or gross enrollment rates.

The net enrollment rate is an indicator for both coverage and efficiency, because the focus is on students of an appropriate age being enrolled in a grade level. In many developing countries, students may be in other grades as a consequence of not beginning school at an appropriate age, failing a grade or two, or dropping out of school and then returning. For example, in 2009, the SE reported 215,570 students 12–14 years of age enrolled in middle school (grades 7–9)/population of 562,743 ages 12–14 = 38.3 % net enrollment rate for lower secondary education. The National Statistics Institute (INE) reported a similar rate for net enrollment with the May 2009 household survey: 245,340 students 13–15 years of age attending school/population of 639,735 youth 13–15 years of age = a net enrollment rate of 38.4 %, and by May 2011, the net coverage rate reported by INE had increased by only 0.8 percentage points to 39.2 %.[25]

---

[24] Net enrollment rates are the students of a specific age who should be enrolled in grade levels. Gross enrollment rates are the total enrollments in grade levels/the school-age population that should be enrolled in grade levels.

[25] INE, *Encuesta Permanente de Hogares de Propósitos Múltiples* (May 2009 and May 2011). INE and the SE have been using different ages for net enrollment rates in primary school, grades 7–9 and 10–12. INE was using the traditional and legal age for enrolling students in the first grade of primary school, which is 6.5 years but usually means children enrolling in the 1st grade at 7 years of age with INE using ages 7–12 for primary schools, 13–15 for middle school, and 16–18 for grades 10–12.

Gross enrollment rates for the same level are very different. The SE reported 367,600 students of various ages enrolled in grades 7–9 (367,600 students enrolled for the 2009 school year/population of 562,743 people 12–14 years of age = a gross enrollment rate of 65.3 % in grades 7–9 for the 2009 school year), which increased by 4.9 percentage points to 70.2 % by the year 2010. The gross enrollment rate is not an indicator of efficiency and is used less frequently by international organizations for comparing the enrollment or coverage rates among countries, but gross enrollment rates are very useful for understanding the total coverage of education systems and improvements in access for many developing countries.

With the examples above, the gross enrollment for grades 7–9 in Honduras is 70 % higher than the net enrollment rate. It is not probable that enrollment rates will increase significantly for youth from higher-income families, who tend to begin school at more appropriate ages and have higher levels of academic achievement, with lower failure and dropout rates. The most significant opportunities for increasing enrollments and reducing poverty are with lower-income and rural youth, but many of these young people will not be counted when using net enrollment rates because these students tend to be overage by the time they reach lower and upper secondary education.

In summary, while net and gross enrollment rates can be similar in more developed countries, many children in less developed countries are not enrolling in the 1st grade at an appropriate age. Students leave and return to education systems for economic, health, and other reasons, and with high repetition rates in many developing countries, there are more overage students, resulting in net enrollment rates being a poor indicator for measuring the coverage or improvements in the equity of education systems for many developing countries or for attracting investments to employ a growing young workforce.[26]

Nevertheless, the Poverty Reduction Strategy (*Estrategia para la Reducción de la Pobreza*: *ERP*) for Honduras established the goal of a net enrollment rate in middle school (grades 7–9) of 70 % by the year 2015. However, 1st grade students enrolling in primary schools at the age of 6 in the year 2012, under the new law for education to reduce the minimum enrollment age in the 1st grade to 6 years of age, will not reach the 7th grade of middle school until 2018, 3 years after the Poverty Reduction Strategy is scheduled to end. The ages used for calculating net enrollments by the SE and INE omit significant numbers of students, because of different ages for enrolling children in the 1st grade, high repetition rates in the

---

With the proposal for EFA-FTI, the SE lowered the minimum age for enrolling in the 1st grade to 6 years, and with the new education law for Honduras in the year 2012, the legal age for enrolling in primary school was reduced to 6 years of age. This should result in both the SE and INE using the same ages for calculating net enrollment rates with ages 6–11 for the net enrollment rate in primary schools, 12–14 for grades 7–9, and 15–17 for grades 10–12. Both options for age-appropriate enrollment, however, have had large omissions of students who are either under- or overage.

[26] For comparisons of net and gross enrollment rates of countries, see education statistics with country profiles at www.worldbank.org. For comparisons of net and gross enrollment rates in Honduras, see Tables 49.6 and 49.7.

Table 49.6 7th to 9th grade net and gross enrollment rates

	Data from the SE
Net enrollment rate	38.3 %
Gross enrollment rate	65.3 %
Students enrolled	
Net enrollment	215,570
Gross enrollment	367,600
Increase in students enrolled with the gross enrollment rate in grades 7–9	+152,030 (+70 %)

Sources: SE, *Censo de Centros Educativos*, *Año 2009*, and population data from INE, *Proyecciones de Población 2001–2015*

early grades of primary education, and some students leaving and returning to school – resulting in many students being overage by the time they reach middle school and high school.

The new development plan for Honduras from 2010 to 2038 also established national goals for net enrollment rates with a 100 % net enrollment rate for grades 1–9 and 75 % for high school. The goals are inappropriate because of the large omission of students with net enrollment rates, the time it will take for students to receive the benefits of reforms and improvements in primary education and middle school, and reach the 7th to the 12th grades, and with curriculum reforms in upper secondary education only beginning.

In addition, the poverty rate is high (68 %) and many lower-income children have experienced nutrition problems, which can result in children being smaller. Under these circumstances, parents often wait until a child is 7 or 8 years of age before sending them off to school. These students are not enrolling in the 1st grade at the age of 6, especially in rural areas where students must walk longer distances to reach school and in some urban neighborhoods with security problems, resulting in further problems for tracking improvements in the enrollments of lower-income and rural students with net enrollment rates. Table 49.6 provides a summary of the comparison of net and gross enrollment rates for middle schools (grades 7–9).

Table 49.6 compares gross and net enrollment rates for middle school. Based on the net enrollment rate, achieving the ERP goal of an enrollment rate of 70 % would not be possible, but the net enrollment rate omits 152,000 students enrolled in middle schools and had increased by less than one percentage point to 39.2 % from 2009 to 2011. With the gross enrollment rate from Table 49.6, enrollments increase significantly and a gross enrollment rate of 70 % for grades 7–9 was achieved during the 2010 school year.[27]

In summary, achieving a 70 % enrollment rate for a goal related to the ERP with a gross enrollment rate is not a problem, but equity issues remain. Equity rates for primary schools in Honduras are high (Table 49.2), but things change rapidly after

---

[27] Net and gross enrollment data from the SE and cited by Van Steenwyk and Sierra Fonseca, *Op. Cit*.

Table 49.7 High school net and gross enrollment rates

	Data from INE	Data from the SE
Net enrollment for ages 16–18	27.7 %	
Students	174,240	
Adjusted gross enrollment (grades 10–12)		49.9 %[a]
Students		266,910[a]
Increase in students over net enrollment		+ 92,670
		+ 53 %

Sources: INE, *Encuesta Permanente de Hogares de Propósitos Múltiples* (September 2010) for the net enrollment rate; gross enrollment for the 2010 school year from the SE and the adjusted gross enrollment rate of 49.9 % calculated by the author based on data from the SE and cited in Van Steenwyk and Sierra Fonseca, *Op. Cit*.

[a] The adjusted gross enrollment rate compensates for the students in 2-year academic programs of study, with students graduating in the 11th grade, and the majority of the students in 3-year programs from the 10th to 12th grades. The adjusted gross enrollment rate is used for comparisons with the net school attendance rate reported by INE for young people 16–18 years of age (3 years)

the 6th grade, with more probability for urban youth and young people from wealthier families being enrolled in middle school as compared to youth from rural areas and lower-income families (Tables 49.3 and 49.4).

Upper Secondary Education (High School): Grades 10–12

Honduras established a goal for 50 % of the young people completing high school by the year 2015, which is a gross graduation rate. This can be achieved with the gross enrollment rate for grades 10–12 of 49.9 % during the 2010 school year (Table 49.7). The gross enrollment rate for high school also shows that the country is beginning to meet the thresholds established by the United States Agency for International Development (USAID) for competing in the twenty-first century and the International Institute for Applied Systems Analysis (IIASA) for higher rates of economic growth.[28]

Table 49.7 compares the net and gross enrollment rates for upper secondary education (grades 10–12) and shows a difference of 92,000 students.

Table 49.7 shows significant differences in net and gross enrollment rates for high school, with the gross enrollment rate being 53 % higher than net enrollments. Data from the SE on net rates shows even greater disparities because the students currently in high school were not affected by the reform to reduce the initial age for enrolling in the 1st grade of primary school or improvements in primary school retention and reductions in repetition rates in recent years. It will take time for these students to reach grades 10–12 in significant numbers.

---

[28] USAID, Bureau for Global Programs, *Strategic Plan for the Center for Human Capacity Development* (1995): 90 % completing primary education and 50 % of the youth completing high school to compete in the world economy in the twenty-first century; IIASA and the Vienna Institute of Demography, *Op. Cit*. recommend universal primary education and 50 % of the youth with secondary education for achieving higher levels of economic growth in Honduras, Guatemala, Kenya, Rwanda, and Uganda.

Equity and Efficiency

Expanding access in the provinces and communities with the lowest coverage for secondary education is not the only challenge. Many of the regions with the lowest middle and high school enrollments are also making less progress with improvements in the quality and efficiency of primary education, and expanding access to the 7th or 10th grade will not help if students are not completing primary school.

Other inequities are associated with the socioeconomic status of families. Table 49.2 shows high enrollment probabilities for children from both rich and poor families in primary education, with similar enrollment rates and a high degree of educational equity for primary schools. In secondary education, young people from the 40 % of the wealthiest families have 7.5 times more probability of being enrolled as compared to youth from the poorest 20 % of the families. Students from the second quintile have twice as much probability of being enrolled, and youth from the 20 % of the families with the highest incomes have 8.5 times more probability (Table 49.3). The World Bank reports similar inequities for other Central American countries.[29]

Higher personal costs for studies after the 6th grade of primary school (textbooks, uniforms, notebooks, contributions for the security and maintenance of schools, etc.) contribute to lower enrollment rates for youth from families with lower incomes. Higher opportunity costs after primary education, with the need to work, also reduce probabilities for enrollment by young people from lower-income families. While scholarships can help, there are limits to the amounts of financial assistance that a developing country can provide, and scholarships will not resolve all of the problems with higher opportunity costs for low-income youth and the need to work.

The efficiency of secondary education is also an equity problem, affecting students from lower-income families to a greater extent than youth from higher-income families.[30] Table 49.8 summarizes dropout rates from the 7th to the 11th grade from the year 2009 to 2011.

Table 49.8 shows high dropout rates from the beginning of the 7th grade to the beginning of the 11th grade, the loss of 43 % of the students, and the highest

[30] *Ibid*. For more recent data on dropout rates, failure, and lower student achievement for lower-income students in Honduras, see Mario Alas y Germán Moncada, *El Tercer Ciclo de Educación Básica – Línea Base Respecto a Implementación del DCNB y Factores Asociados con el Rendimiento Académico* (SE, USAID, American Institutes for Research and CIDEH, 2009).

Table 49.8 Projected dropout rates from the 7th to the 11th grade

Grade	Gross of students enrollment/	Population	=	Gross enrollment (%)	Loss of students[a] (%)	Number dropping out
7	146,778	191,951	=	76.5		
7–8	118,367	188,098	=	62.9	−16.7	−24,448 (7°–8°)
8–9	102,455	183,958	=	55.7	−10.7	−12,716 (8°–9°)
7–9	367,600	564,007	=	65.2	−25.3	−37,164 (7°–9°)
9–10	95,170	174,941	=	54.4	−4.6	−4,715 (9–10)
10–11	72,512	169,769	=	42.7	−21.7	−20,700 (10–11)
9–11	167,682	344,710	=	48.6	−26.7	−25,415 (9–11)
12	Not applicable with some students graduating in the 11th grade					
7–11	535,282	908,717	=	58.9 %	−42.6 %	−62,579[b]

Sources: SE, *Censo de Centros Educativos*, *Año 2009*. Population data by ages from INE, *Proyecciones de Población 2001–2015*

[a] Projections of dropouts are based on gross enrollments for each grade from the 2009 census of schools −2.7 % annual population increase of school-age youth in the 7th to 11th grades. Projections of dropout rates are used because cohorts are distorted with significant variations in the reporting of data by public and private secondary schools from year to year

[b] 37,164 dropouts from the beginning of the 7th grade to the beginning of the 9th grade + 25,415 dropping out in high school = 62,579 dropouts

dropout rates from the 7th to the 8th grade (17 %) and grades 10–11 (22 %), indicating curriculum articulation problems from the 6th to the 7th grade and from middle school to high school.[31]

In summary, while Honduras has access problems after the 6th grade, the inefficiencies and inequities of education from the 7th to the 11th grade are also evident, with an accumulated dropout rate of 43 % and more than 60,000 students dropping out of school from the 7th to the 11th grade as compared to an average dropout rate of less than 1 % per grade in primary schools. Quality and efficiency problems deserve much more attention, and with improvements in these areas, more young people could be expected to continue their studies through middle school and high school. Economic and geographic parity are also concerns. Enrollments favor urban youth and young people from wealthier families, while dropping out of school, insecurity, and cost issues affect lower-income students to a greater extent than students from higher-income families.[32]

Nevertheless, there are opportunities for improving student achievement and reducing failure and dropout rates for students from both poor and wealthier families. A recent study used standardized test results from grades 7 to 9 to identify the factors associated with higher student achievement and reduced failure and dropout rates.

---

[31] Curriculum articulation is improving with a new curriculum and standards aligned with international standards from the 1st to the 11th grade, but the full implementation of the reforms will take time.

[32] World Bank, *Central America Education Strategy*; INE, *ENDESA*; Alas y Moncada, *El Tercer Ciclo de Educación Básica*; and Marx, *Op. Cit.*

By implementing these strategies in more schools, dropout and failure rates can be reduced.[33]

Lower-income and rural students, however, will need more alternatives to continue their education while working or attending families for further reductions in socioeconomic inequities. Alternative delivery systems follow the same curricula as traditional middle schools and high schools, but with distance learning, recorded lessons, and support from educators and community volunteers, allowing young people from lower-income and rural families to work and attend families while continuing their secondary education. National standardized test results also show that student achievement in alternative systems is similar to student achievement in traditional schools, which helps justify further investments in these delivery systems and other alternatives for providing greater access to secondary education for low-income and rural students.

Conclusions

The purpose of this chapter was to examine the challenges and opportunities for improving socioeconomic equity and reducing poverty with planning for investments in education to achieve higher levels of equity in education. Honduras used as an example is facing a special window of opportunity offered by demographic changes with a growing and better educated young workforce and reductions in dependents. The country, however, is also in danger of not being able to attract sufficient investments for improving employment opportunities and salaries. Two out of three people are living in poverty (68 %), 51 % of the workforce is unemployed or underemployed, and exports depend on the economic situations in the regional and world economies. Other challenges are related to reforms for improving educational equity, quality, and efficiency, which could prevent the country from taking advantage of a demographic bonus.

Information for Education Planning

The net enrollment rate for middle school and high school in Honduras shows that the country has the lowest coverage rate for secondary education in Latin America (34 %, Table 49.5). The net enrollment rate suggests serious problems with *access* to secondary education and little hope for improving socioeconomic equity with increased numbers of graduates or a better educated young workforce – unless additional resources are provided to expand coverage. This projects a negative future for a country, with social, economic, and political repercussions within the country, and for attracting investments to improve incomes by providing better employment opportunities for young people. The net enrollment rate for lower and upper secondary education in Honduras, however, omits nearly 245,000 students enrolled in middle school and high school (Tables 49.6 and 49.7).

---

[33] The factors identified for increasing student achievement and reducing failure rates include the following: the use of the SE's new curriculum (Currículo Nacional Básico: CNB); support materials for the CNB (curriculum calendars, academic standards, and formative assessments of student progress); the use of textbooks based on the CNB; active and participatory pedagogical strategies; assigning teachers specialized in the subject areas in which they are to teach; middle school principals providing pedagogical leadership for teachers; and the participation of parents in the education of their children. The study also measured the effects of the strategies with students from different socioeconomic levels, and the strategies were shown to have positive effects for students from all levels of society. See Alas y Moncada, *Op. Cit*.

Net enrollments in many developing countries are not appropriate indicators for recording improvements in the equity of education with low-income and rural youth, because many of these students tend to be overage when they reach secondary education. When gross enrollment rates are considered, access to post-primary education is much less of a problem. The gross enrollment rate of 70 % from the 7th to the 9th grade in Honduras should result in 70 % of the young people completing the 9th grade and more than 50 % of the young people could be completing high school to achieve goals related to the country's Poverty Reduction Strategy by the year 2015. Moreover, with 50 % of the youth completing high school, Honduras would be meeting the thresholds established by IIASA and USAID for competing in the twenty-first century and achieving higher rates of economic growth. These outcomes present a much more optimistic future for the country, just as the window of opportunity for a demographic bonus is beginning, with the need for additional employment opportunities and higher incomes for a growing and better educated young workforce.

In summary, the data from Honduras shows how net enrollment rates can distract attention from efficiency, equity, and quality issues and overestimate access problems. This might help attract international assistance for capital investments to improve access, but it also results in a serious misunderstanding of the challenges facing an education system. With gross enrollment rates and indicators for efficiency and quality, equity becomes a key issue because higher repetition and dropout rates, lower student achievement and enrollments are evident for young people from families with limited economic resources.

These are more sensitive issues for teachers and administrators than expanding coverage, because they will require a focus on improving coverage, quality, and efficiency with equity. The challenges may be more difficult to resolve, but should not require large injections of additional funding from national or international sources. Reforms in these areas could help Honduras achieve further improvements in the education level of its young population to attract investments and technology transfers, improve employment opportunities and incomes for a growing young workforce, and improve probabilities for receiving the benefits of a demographic bonus with reductions in socioeconomic inequities.

Policy Recommendations

Honduras should be able to achieve 95 % coverage for 1 year of preschool education before the end of the current decade with children receiving the preparation they will need to be more successful in the early grades of primary education. New curricula for middle school and high school are only beginning to be introduced, but Honduras could also have the new curricula for secondary education fully implemented by the year 2025. Under these assumptions, children enrolling in the 1st grade in the year 2019, after having completed 1 year of preschool education in the year 2018, should be reaching the 7th grade of middle school by 2025 and graduating from the 12th grade of high school in the year 2030. Based on these projections, net enrollment rates for secondary education should be showing significant improvements from about 2028 to 2038, and a net enrollment of 6–75 % in high school may be achieved by the year 2038.

However, half of the 25-year window of opportunity for a demographic bonus from 2015 to 2040 will have passed by the year 2028 (Fig. 49.1), and Honduras would be reporting discouraging data on net enrollment rates in high school from 2012 to 2028. Potential investments for improving employment opportunities, reducing poverty, and taking advantage of a demographic bonus could be lost with discouraging data on the country's goals in education – and net enrollment rates from 2012 to about 2028 would suggest low levels of education for a growing young workforce. To address these problems, the following recommendations should be considered:

- Replace net enrollment goals with gross graduation rates on each level of education from preschool through high school.
- Use net and gross enrollment rates with other benchmarks to track progress on improving the quality, efficiency, and equity of education.
- Establish more ambitious goals for academic achievement based on standardized test results, while assuring that preservice and in-service teacher training programs share accountability for achieving goals, with incentives for achievements.
- Disaggregate data on benchmarks and goals by provinces and municipalities, rural and urban areas, and the socioeconomic status of families to help local education leaders and civil society indentify and address the constraints that are preventing some provinces and municipalities from achieving national goals in education.

The justifications for the reconsideration of the goals for education in the National Development Plan for Honduras are the following:

Ambitious and Realistic Goals: One of the greatest challenges during the twenty-first century for developing countries is attracting investments for improving employment opportunities and incomes. Countries reporting discouraging data on the education levels of a growing young workforce will find it more difficult to attract investments for improving employment options and reducing poverty – although other data from the country might show more encouraging improvements in education, as in the case of Honduras.

Preschool and Primary Education: Net enrollment rates can be useful as benchmarks towards achieving the final goals of graduating from primary school and subsequent levels of education at an appropriate age, but reducing the high repetition rates in the early grades of primary schools in Honduras will take time.

Middle School: Net enrollment rates in middle school are affected by the high repetition rates in primary education, with overage students and some young people dropping out of school for a year or two, before continuing their studies in middle school and graduating from the 9th grade.

High School: The discouragingly low net enrollment rates in high school are associated with youth not being able to enroll in middle school or the 10th grade at an appropriate age (Tables 49.5, 49.6, and 49.7). It is not realistic to expect that the problem of overage enrollments in high school will be resolved rapidly. More encouraging net enrollment rates could be observed in Honduras by the year 2028 after the full implementation of the new curriculum in primary schools during the current decade and the new curricula in middle school and high school by the year 2025, with about 95 % of the children enrolling in the 1st grade of primary school after 1 year of preschool by the year 2019 and graduating from high school in the year 2030. In the meantime, however, with national goals based on net enrollment rates for high school, Honduras would be reporting very low enrollments rates in secondary education, discouraging investments for improving employment opportunities for a growing young workforce with limited options for employment.

Academic Achievement: The National Development Plan for Honduras established the goal for increasing student achievement based on standardized test results to 70 % by the year 2038 over a 25-year period. This will make it difficult to attract investments for improving incomes and employment opportunities.

Honduras has developed standardized tests, aligned with new curricula from primary education to high school. Standards are aligned with regional and international standards, but student performance on the new standardized tests is still very low. With the opportunity for a demographic bonus from 2015 to 2040 and the need for more employment opportunities for a growing young workforce, consideration should be given to increasing student achievement to at least 80 % on national standardized tests for attracting investments and improving employment opportunities.

Until the new curricula are fully implemented on each level of the education system and teachers develop the pedagogical skills for all of the content of the new curricula, however, progress towards improving student achievement will not be the same on each level of the education system (primary education, middle schools, and high schools). Indicators for student achievement should be established for each level and grade of the education system, based on the anticipated implementation of the new curricula to help concentrate attention on each level of the education system as curricula are implemented.

Final Considerations

Establishing ambitious goals in education for a school, community, or a country is an important step towards transforming inequitable education systems, but goals must also be aligned with other development benchmarks for attracting investments, when a young workforce is increasing more rapidly than employers can absorb. Goals must also be realistic and understandable for parents, students, civil society, and educators. Achieving goals for improving net enrollment rates in countries like Honduras will take time. Many parents and communities might not understand the importance of net enrollment rates or how they are calculated, but virtually everyone understands the importance of completing primary and secondary education, and the calculations are relatively simple.

Ambitious but realistic and understandable goals are also needed so that teachers, leaders in education, students, parents, and communities will be able to monitor local progress towards meeting national goals and see more immediate results for their efforts. By establishing goals for gross completion rates on each level of the education system and more ambitious goals for academic achievement, Honduras should be able to demonstrate more positive trends towards preparing a large young workforce with higher levels of education for improving employment opportunities and incomes.

Accomplishments towards achieving national development goals and improving the equity and quality of education in countries like Honduras should be the primary focus for establishing goals and benchmarks and prioritizing investments in education to set a National Development Plan in motion – with local participation in monitoring the progress of each school and community towards meeting national goals.

Chapter 50
The Overpowering Role of Policies in Constructing Social Identities of Children with Disabilities

Maha Damaj

Introduction

The chapter investigates the current Lebanese social policy and practices concerning children with disabilities in general and children with visual impairment in particular on the social construction of disabling identities. The chapter contains the findings of a study that was conducted through an organisational ethnography of a residential institution for children with severe visual impairments, supplemented by interviews with the children, some members of their families, teachers, staff and alumni from the institution, as well as participant observation sessions at integrative settings, and interviews with parents and activists pursuing inclusion. The analysis explored the influence of the existing legislation and policy on practices and service provision, and the impact of these practices on the self-identities of children with disabilities. Theoretically, the analysis drew on Foucauldian ideas of power, control and surveillance and applying Goffman's concepts of stigma and the concept of a total institution. The findings show that rights-based legislation cannot on its own result in inclusive changes of policy and practice. In the absence of implementation mechanisms, practices remain predominantly exclusionary, with no effective mechanisms for the meaningful participation of parents or children, eventually socialising the children into disabled identities. Children 8–12 years of age were not exhibiting any noticeable resistance to the systems of control and had adopted the discriminatory values relating to disability exhibited around them.

As such, this chapter looks into a specific aspect of social injustice: discrimination. Dominant social constructions of children with disabilities, frequently discriminatory in their disempowerment, emerge as the main fuel hindering inclusive legislation

and progressive empowering education and training. What's more, this practice of discrimination further propagates social injustice by socialising children with disabilities into 'spoiled' identities.

This chapter, which is drawn from original research, will present a brief outline of the legal backdrop and the institutional setting to provide context for the discussion of identity formation among institutionalised children with severe visual impairment.

Research Methods

This is a qualitative research study in which an organisational ethnography was undertaken within one institutional setting with additional limited participant observation and interviews in two other educational settings and some homes of children. The participant observation involved taking the role of a visiting volunteer teaching assistant/helper within the institution for some months. A number of individual and group interviews were completed with teachers, children, alumni and family members. The material was analysed through content analysis with lower-order and higher-order categories. These methods were chosen as the most effective way to elicit the voices of these children, their teachers and family members. Additionally, policy materials were drawn upon to place these experiences and practices within the current policy setting in Lebanon.

Actively involving the main study subjects children or persons with disabilities as primary informants enhanced the *validity* of the research. For example, in their research with children, Mahon et al. (1996) found that it is 'neither theoretically nor methodologically appropriate to rely on proxies to represent the views and experiences of children' (Mahon et al. 1996: 146). The individuality of children and the diversity of family situations implies that 'valid accounts of children's attitudes and experiences (can) … only be obtained by engaging directly with the children (and by) treating them as independent actors who (are) engaged in negotiating a complex set of relationships and loyalties' (Mahon: 148). Participatory research with children has provided insights into the lives of children and communities that were inaccessible through traditional research methods, and has gained a rapidly developing body of resources outlining tools and methods to ensure the meaningful participation of children in research (Boyden & Ennew, 1997; Johnson et al., 1994; Laws & Mann, 2004; Lewis, 2000; Save the Children, 2003; van Beers, 2002).

The main subjects of this study are children, and child-focused research raises several *ethical issues*. The aims of the research need to be made as clear as possible to the children to address concerns about obtaining proper consent from the children for taking part in the research. There is a need to avoid raising expectations among the children that the research, or their involvement in it, would be succeeded by any type of change in their situation (Mahon et al. 1996).

Research Setting

The main case study site for this research was an institution, where ethnographic fieldwork was undertaken in addition to group and individual interviews. It is also the only setting where services are subsidised by the government. More limited participant observation and interviews were conducted in two other settings: a centre with an integrative programme and an inclusive school.

As the main study site, only the institution is described here in some detail:

The BAL School for the Blind[1]

This school was established in 1957 through the work of the Lebanese Society for the Blind, which was co-founded by the country's First Lady at the time. The school came into being with donations from the government and individual donors and still greatly depends on government subsidies and donations as a main form of income.

Its enrolment has increased from around 20 students in the 1960s to a student body size that exceeds 100 at the time this research was conducted. The curriculum spans pre-school to baccalaureate level and goes on to offer assistance in college entrance exams or vocational training. It also provides an avenue to integrate some students into mainstream public or private schools at the secondary level, whereby the students are given additional coaching, teaching aids and tutoring by the school's staff. The school operates mainly as a boarding school and is attached to its sister school, a school for the deaf, on the same campus.

To this day, BAL remains the only national educational service offered to children with visual impairment that is subsidised by the government.

The Legal Backdrop: Law, Legislation and Policies in Lebanon

The current disability law in Lebanon is Law 220/2000 'Rights & Access for the Disabled', which was finally passed by the parliament in May 2000. The law reflects the great influence of the *World Programme for Action Concerning Persons with Disabilities* (UN General Assembly, 1982) and the *Standard Rules on the Equalization of Opportunities for Persons with Disabilities* (WHO, 1993). This Law 220 addresses issues such as physical access, education, provision of social services and equal opportunity employment. It also extends to producing a national register of all individuals with disabilities and creating a 'National Committee for Disability Affairs' which would include persons with disabilities. It is worth noting here that although the law highlights the responsibilities of the varied relevant sectors and cuts across them, it did not manage to break the traditional practice of assigning disability issues primarily to the Ministry of Social Affairs (MoSA), a trend that is mostly unchanged to this day.

---

[1] *The name of the school and the interviewees cited in this chapter have been changed.*

Additionally, the law also took several measures to address prior discriminatory legislation that prevented persons with disabilities from registering in vocational training centres or applying for employment. Other new issues that were raised by Law 220 dealt with housing and the accessibility of the physical environment, which were not previously included in any other legislative framework in Lebanon. The law proposes that a building code of minimum standards be developed by the National Committee and is then included in the legal conditions for contractors. Furthermore, the law not only specifies that all public buildings and new construction must be accessible but also asserts that all new housing projects must set out sections that are available for purchase by persons with disabilities.

The law is lauded for being the first of its kind to strongly and clearly address issues of discrimination towards persons with disabilities. In each of its sections, it is asserting that all aspects of daily life and governmental decision-making must take into consideration the segment of the population that is disabled. As such, measures such as employment quotas and housing allocations and loans are considered stepping stones towards equal opportunities for persons with disabilities.

Where children are concerned, the main section that directly addresses them is that of education and sports. The section details the right of all children and adults to be admitted into all schools and educational centres and proposes measures for adapting formal examination formats and schedules to be suitable for each student. It also asserts steps towards raising awareness among the student population as well as training for the teaching staff. In terms of exemption from fees, article 61 in this section specifies that fees for tuition, sports, social activities and medical needs will be covered by the government for all students choosing to attend a specialised centre or institution, a request that is processed through applications submitted and approved by the MoSA.

Despite these major advances, however, Lebanese legislation and policy concerning persons with disabilities remains broadly exclusionary, despite the rights-based rhetoric that has been adopted. Upon close inspection, a number of contradictory measures emerge. The broad by-line of its sections calls for the rights of persons with disabilities to medical services, employment, education, recreation and housing with considerations of access to the physical environment and transportation, but these rights are then interpreted by concepts of services and allowances that carry traditional, discriminatory constructs of welfare and needs. The expressed intention is to avoid segregation, while the actual practical measures subscribe to modified versions of labelling and surveillance, such as marked housing, employment quotas, special education classes and disability card holders. Therefore it is unclear if Law 220 can promote inclusion.

Despite all adopted precautions to ensure non-discrimination, some of the proposed measures in Law 220 were only a slightly evolved form of the traditional discriminatory attitude towards persons with disabilities. A case in point is the section on housing which, though it suggests methods for facilitating housing loans, proposes creating separate housing for persons with disabilities within housing projects (article 55). These buildings are also to be tagged with the universal disability sign (article 55.d), which for all intents and purposes will serve only to create ghettos of persons with disabilities. Whereas including this section in Law 220 is an improvement on the total absence of this issue in previous disability laws, the final format may not be empowering to persons with disabilities in practice.

All in all, Law 220 contains a new rights-based perspective on disability issues and promotes a new social construction of disability that falls closer to the social model than the traditional medical model. However, the subtext of the larger part of the articles still subscribes to a needs-based perspective of disability or easily allows for that interpretation within the bounds of the law. Article 61 of the section on education asserts that all fees will be sponsored by the government for children registered in specialised institutions; promotes segregation and exclusion, which are the current dominant practices; and works against the concept of inclusive education that is raised in articles 59 and 60. Article 62 concerned with the adaptation of formal examinations as per the needs of students with disabilities has been interpreted as setting up separate examination centres within specialised institutions. Formal examinations follow a standardised, centralised process which deliberately assigns students to different examination centres to safeguard against cheating or discrimination. Setting up separate centres especially for students with disabilities not only questions the honour code employed by the examiners and the students during examination but is also exclusionary and confirms the perception that these are special students. Consequently, as with other social services and systems in the country, this initiative is 'grappling with modern concepts of development and at the same time remaining faithful to… traditional value-systems' (Jawad, 2002: 338).

Additionally, the lack of implementation of Law 220 in the years since its approval by parliament in 2000 demonstrates the governmental system's refusal to adopt even the most minimal changes required to address disability issues, that is, any changes to the public and private structures. As a relatively young state since its independence from occupation and foreign mandates, Lebanon has taken great strides in developing comparatively progressive social policies. However, despite the consistent and steady process of evaluation and review undertaken by civil society, these legal advancements have occurred in specific times of reform and relative political tranquility. New legislation for persons with disabilities is no exception. Such laws do not only require legal and financial commitments and changes on the part of the government and its services, but these also have to address existing welfare-minded systems and attitudes. At the present time, Law 220 has done neither.

The current disability law in Lebanon promotes the rights of persons with disabilities rather than their need for rehabilitation and care. This approach is in almost direct opposition to a powerful ongoing tradition of institutionalisation and care, and dominant discriminatory attitudes in society. In the text of the law itself, economic allowances have been maintained for institutionalisation; other essential steps that would contribute to altering the status quo, such as supporting schools financially to include children with disabilities, are not specified. Despite arrangements being made to allow visually impaired students to sit for official examinations, their teachers at BAL do not trust the resulting grades and remained sceptical of affirmative action measures that had started to appear as a result of Law 220/2000. In other sections, such as housing, deep-rooted ideas regarding segregation are blatant. The text itself appears to be the outcome of a struggle to find compromises between the existing systems and the international conventions that the government has signed and agreed to ratify. Passing the law is considered a victory by disability activists who had lobbied long and hard for the beginnings of a qualitative change in the perception of disability in government agencies. It is clear that this transformation remains in its early stages, and though lobbying for the implementation of the law has not been facilitated by current political events, it continues to provide a foothold from which additional advocacy for change may be launched. This is needed as the lack of any engagement with the law by several ministries, specifically the Ministry of Finance, indicates that the rights of persons with disabilities remain marginalised within the government's agenda.

It is clear that the practices in the aftermath of this current legislation remain grossly exclusionary for persons with disabilities and more so for children with disabilities. The law subscribes to a rights-based philosophy but has translated this into articles that effectively create parallel systems for persons with disabilities and remove physical barriers. Both of these thrusts have not actually challenged the existing structures of control and surveillance nor the pervasive power relations entrenched at every level. Persons with disabilities have been moved from being marginalised in society to being marginalised in policy. This is evident from the resistance to change within governmental agencies, and the fact that the law has actually reduced the influence of grass roots lobbies through creating a National Committee on Disabled Affairs, and diminished the representation of persons with disabilities through the mechanism of registration for a Disability Card, with grossly low numbers of children and persons with disabilities registered.

A rights-based approach would, in practice, impose a change in the balance of power and the nature of power relations. This approach of rights as universal, indivisible and inalienable can compel policymakers and providers to alter their perceptions of persons with disabilities from 'users' to 'rights holders', from 'addressing the needs of many' to 'ensuring the rights of all'. In effect, such an approach would intrinsically need to allow for channels that would challenge the hegemony of the state and legitimate authorities in promoting individual rights. It is clear that legislation on its own cannot foster inclusion. Legislation and policy need to be backed up with social measures at the field level that actively work towards redefining disability in the society and with capacity building of all service providers in order to recognise the necessary shift in their roles with persons with disabilities. Additionally, persons with disabilities must be empowered, as individuals and as groups, to act as 'watchdogs' monitoring and lobbying for the promotion of their rights.

Within a Foucauldian approach, it would be argued that change can only come about through a process of resistance that transforms power relations (Foucault, 1991). In studying Law 220, and the geopolitical forces and circumstances that continue to prevent it from changing, there will not be any real rights-based changes towards inclusive practice, regardless of the legislation and policy that is drawn up, until persons with disabilities are empowered to take a leading role in the system, and participatory systems of accountability to ensure implementation of legislation are introduced and respected. Additionally, this should not be limited to government-level processes, such as the National Committee for Disabled Affairs, but rather specifically at regional and local levels involving users, parents, service providers and professionals.

The Institutional Setting: Exclusion vs. Inclusion

Studying BAL indicated that it was operating as a 'total institution', with integrative measures appearing tokenistic, at best. Within such a system, opportunities for participation, where they exist, were limited and were delineated within the school's perception of worth, which was mainly by academic achievement or musicianship. Furthermore, the administration had achieved an 'expert' position among parents by corroborating notions of technical expertise in educating, treating, rearing and financially supporting the children's development. This completely stifled resistance from the parents, and by proxy, the children, and nurtured a disempowering dependence on the school in all these matters. Additionally, the director's authority was recognised by all, especially the parents and students, who sought out her assistance as the individual who possessed the most legitimate authority to issue final decisions.

In relation to the immediate surrounding environment, the school population was generally cocooned within the school grounds. Though some teachers expressed their opinions that much awareness raising needed to take place in society in order to change current attitudes towards persons with visual impairment, they did not recognise the inhibitory role to this process that the school was playing. The issue was not only that the school is a 'special school for the blind', which on its own merit falls into predominant attitudes that children with disabilities should be taught in a separate setting, but the school's physical environment was also closed off, thus preventing the community circles around it to learn anything about them. Similarly, during the long periods that the boarding students spent at the school, they received very little exposure to the social world outside their school walls. From a physical space point of view, this setting translated 'segregation' into 'isolation'. Within this environment, surveillance was constant, in the classroom, cafeteria, playground and dormitories. The children were monitored within a regimented time-space schedule, and this surveillance extended to their homes through visits of the psychosocial coordinator and the folders that she maintained for each child, as well as to the regular schools that some of the older students were integrated into.

The principles that have been adopted by the school administration and staff are reflected in all its official protocols, relating to educational and residential guidelines, and in the informal organisation of authority and power propagated by the children and with the parents. The administration presented the school as a special, expert institution in a manner similar to medical rehabilitation centres. Its efforts were focused on rehabilitating the children academically and musically as a means towards compensating for their disability. The curriculum and modules of teaching did not include any adaptations that would make the child comfortable with their impairment, not even in adequately training the teaching staff, but rather urged the child to perform within a non-adapted educational environment. As a result the school was promoting the normalisation of the disability by encouraging the children to overcome it as a means of being able to fit back into society. As reintegration into society was cited as the school's main goal, analysing its exclusive versus inclusive ethos gave some indication as to how effective these measures were for reintegration.

With its educational approach and the control of social space, the administration treated the student population as a homogeneous group, with the inference being that they were similar because they shared the same disability. The only distinction that the administration made among the students was for those who had excelled academically or musically. These attitudes were not challenged by the students.

The school administration had recreated a regular school and sought to train the children to manage themselves within it. This not only applied to the formal curriculum and system but to the attitudes adopted regarding age, gender and disability as well. The children among themselves employed these parameters in their perceptions of who was more powerful or dominant, and these were aligned with the discriminatory attitudes prevailing in society. The most striking was the distinction that was made between children with low vision and those who were severely visually impaired, and the role that the adults played in supporting it by giving tasks to the children with low vision that were not related to their age or academic achievement – factors that teachers usually use when choosing a helper – but solely on the fact that they had low vision. This reinforced the perception of the children with severe visually impairment that their impairment was disabling them.

The teachers maintained low expectations of what the students could achieve after BAL, and alumni claimed that BAL did not prepare them for anything that benefited them later. As the alumni interviews illustrated, whether they succeeded academically at BAL or not, the education that was provided to them proved useless in later years, with a number of them re-educating themselves in profitable occupations.

The school administration therefore primarily subscribed to the medical model of disability and a non-inclusive curriculum. The children did not have legitimate, representative arenas in which to participate, and their informal participation was hinged on their placement within a discriminatory set of parameters. Furthermore, it lays the burden of achievement on the children alone and offered no alternatives to build on the children's strengths if they were not academically or musically gifted.

The parents came to the school with a medical definition of their children's impairments in line with the formal diagnosis. This understanding did not seem to change as they moved their children to another expert institution, one that they considered qualified to make decisions for them regarding the children. This discouraged their involvement in any school issues, which they felt they were ill-equipped to advise on, and fed into their dependence on the school that was not only educating a child that nobody else knew how to teach but was also assisting them in obtaining sponsorship and funding.

From a Foucauldian perspective, it can be deduced that an institution such as BAL was established to 'reform' children with disabilities into acceptable, productive members of society (Driver, 1994; Foucault, 1973). Aside from the elements of segregation and normalisation illustrated by these findings, the strength with which control is exercised throughout the school's practice with children and parents led to imbalanced power relations, so that decisions by the school were rarely challenged. There was no room left for resistance, and whatever the children managed within the school grounds remained quite restricted to small transient initiatives within informal circles. Those who managed more did so by virtue of status bestowed upon them by values propagated by those in authority, and thus do not really challenge the system.

Additionally, this diminished margin for resistance also hindered the children's ability to disengage from the roles that were being proliferated through their interaction with the teachers and staff. These 'situated roles', as described by Goffman, are symbolically defined by social interaction and ritual order. Analysing the social interaction among students and teachers in this chapter has indicated that the formal and informal organisation of this institution inhibits participation and acts upon the premise that being disabled is a weakness stemming from a deficiency. There is a finality to their perception of this deficiency, as expressed in their interviews and conversations, and this is illustrated in their charitable care for the children and their low expectations for their achievements. Forrester (2002), Mayall (2002), and James and James (2004) research point to the influence of such daily interactions and social dynamics with adults on shaping children's understanding of being a child.

Despite their dedication and hard work, the staff at the school was propagating medical, traditional and discriminatory constructions of disability. The children were being prepared to face the outside world by being taught how to conform to societal constructions and expectations of persons with visual impairment. This socialised the students into a 'disabled identity' rather than the identity of 'a person with a disability'. This is outlined in more detail in the following section.

Self and Other: Disabling Identities

This section presents an analysis of some primary factors that impact on the children's social identities, such as valuing normalisation, devaluing the disability and preset present and future expectations, in addition to exploring how children manifest aspects of their identity formation as a person with disabilities. Based on the data, the argument here is that exclusionary practices of the institution and their influence on the home setting are socialising children into stereotypically inferior, disabled identities. This section thus focuses on the social construction of the children's' identities, while drawing on symbolic interactionism which is influenced by the work of Goffman, who argued that 'the self' is produced by presentations in the social life, which are designed in response to perceptions of one's place in society.

From the point of view of the sociology of childhood, the children's management of their identities would also reflect how they are adapting to their role as an oppressed social group and what modalities they are creating for their participation and agency within that role. Additionally, the field of disability studies is relevant when analysing the social construction of the identities of people with disabilities. Within disability studies there is the individualised medical model of disability and the more recent social model of disability. The analysis of field notes and interviews in this chapter focuses on how the children are identifying themselves and their impairment within their social environment of the home and school through themes such as participation, normalisation, play, role modelling, belonging and self-perceptions.

Normality and Normalisation

When discussing normalisation in this chapter, reference is being made to the dictionary definition of the word – that is, the imposition of a standard – and not to the theory of normalisation and social role valorisation as theorised by Wolfensberger and Tullman (1982). Wolfensberger's assertion was that if culturally normative standards were used to value the role of a traditionally devalued member of society, then that would facilitate their integration and acceptance into society. The theories expand beyond this, with several sociological evaluation tools being developed, but they do not serve the purposes of our research to identify how children are being socialised into a particular role or identity. It is the researcher's standpoint that employing culturally normative standards and working with devalued individuals to excel and fit into them leans closer towards concepts of exclusion, normal versus abnormal, and once again lays the onus of change on the devalued individual rather than on the social environment.

It is argued here that the children are being socialised into stereotypically inferior identities, in other words, disabling identities. The distinction between this and 'identity as a person with a disability' is that the former subscribes to a group identity constructed of discriminatory social perceptions that are disabling to the person, whereas the latter is a process of self-reflection illustrated in stories of individual identity of persons who happen to have an impairment. From the varied data, themes of normalisation, denial and traditional disability stereotypes of weakness and inferiority emerged.

Devaluing Disability

A commonly held view is that people with impairments are incapable of performing up to 'normal' expectations. At BAL, this was evident in terms of the expectations concerning the children's academic achievements.

In interviews with teachers and staff at the BAL, many opinions were expressed that reflected their low expectations of the students. Teachers, who were not trained to teach students with visual impairment, did not have high expectations for their students' academic performance. They were even sceptical of the scores that their students achieved on the official government examinations.

> Teacher 6: And all of this is assuming that they will graduate from here.
>
> I mean, we work our hearts out with some of these students to get ahead in any subject (but nothing…)
>
> 'Who knows how well qualified they will be – they are all passed in their government exams (baccalaureate) without the examiners even looking at their papers.' (Yola)
>
> 'They are not doing any favours for the blind students with the formal exams, where we all know that all blind students definitely pass (no matter how they perform on the exam).' (Mr. Taha)

As discussed earlier, BAL and the teachers consider fostering the children's academic progress as their main role and as such place much emphasis on academic achievement. They consider the optimal course of action to normalise the disability and allow the children to reintegrate into society with peers who are not visually impaired. Similarly, the achievement criteria focus on areas that are considered of high achievement to students who are not visually impaired, ignoring other measures of success and usefulness for persons with visual impairment.

> Teacher 6: Whatever they think of doing, they must go to university. There is no other way they can compete for the same jobs as sighted graduates.
>
> '(BAL) prepared me to go to university and study Mathematics – which I then dropped because I realised that I couldn't do anything with it, not teach or anything.' (Jamil's interview)

It appears that the driving force was to assist the students at BAL to academically overcompensate for their disability in order to be accepted by society. The overcompensation refers to directing the students to fields where success is highly regarded by society, but not necessarily of use to the person with visual impairment. It also refers to fields where the educational staff would not usually expect a student with visual impairment to succeed; thus, any measure of accomplishment feeds into the 'supercrip' image, a triumphant superhuman achieving feats worthy of respect.

These same teachers, however, continue to highlight how disadvantaged the children are in the process of learning because of their visual impairment. They consistently expressed how children with visual impairment cannot learn in the same way as other students, which is true in terms of their need for alternative approaches and educational material, none of which were made available at BAL. As the teachers did not adopt any different teaching methods that could facilitate the process of teaching children with visual impairment, it appeared that their argument was based on the fact that without perfect sight, the children simply could not learn or take in as much as children without visual impairment.

> Teacher 2: (Teaching a child with visual impairment is) absolutely different, a sighted child would understand quicker because he/she is using their sight.

> Mr. Taha: Also, don't forget that the image (the picture) plays a big role (in learning); blind children can't keep up with the sighted children.

> Teacher 6: It is totally different than teaching sighted students. I mean, 90% of what a student gets is from his vision, so the teaching had to be very different. I mean, I would be moving around and gesticulating, but that isn't doing any good. I teach English, and I talk Arabic in class, though I shouldn't, but there was just no other way.
>
> Teacher 4: But you can't keep insisting that the child needs to be treated the same way, they require different type of work.

The doubts of the staff and the administration regarding the children's ability to achieve academically also emerged from the back-up systems that had been set up. Academic performance was paralleled only by musical distinction, which was considered the other path that would be worthy of respect in society for visually impaired persons. Indeed the emphasis that was placed on music by the school administration was evident in the investment in musical equipment and training that exceeded what was made available for academic instruction or any other nonacademic activity. Additionally, whereas academic success was seen as a stepping stone to higher education outside of BAL, and musical talent was similarly a path towards economic opportunities, the only option that BAL offered for failing in both is to direct the students to the handicrafts workshop.

> Omar (alumnus): At BAL, if you're not talented in music, you end up in the handicrafts workshop.
>
> Jamil (alumnus): (The school) told others not to go to university – there's an inclination in all institutions for the blind that the students don't need to go beyond the Brevet (10th Grade). Instead, they would refer them to the handicrafts workshops or train them to work as phone operators.

These limited options for students with visual impairment reflected a conception on the administration's part that these were the only skills that were attainable for people with visual impairments. This slightly restricted vision was also reflected in the lack of any recreational alternatives for students in residence at BAL. Aside from the television set in the main TV room, there were absolutely no other facilities for students to pass their time during their break sessions in the afternoon. All that was available was the space of the courtyard.

> Field Notes:
>
> I was sitting outside with Aida (one of the teachers) during one of the students' afternoon breaks. I had just arrived and it was not yet time for my session with the children. Aida had to attend to something else when I was once again mesmerised by the dull routine movement of the older children, boys and girls, arm-in-arm, walking round and around in circles on the asphalt. When Aida returned, I just blurted out: 'I just want to figure out why they do that – why do they just walk around?' Aida responded: 'What else are they going to do?'

This staff member's response represented the general opinion amongst the staff, that there was really no need to expand on or provide alternatives to what was already available, because there was only so much that visually impaired persons could do in any case. Whether this was born of the staff members' own opinions or was influenced by the system at the school was not clear, but either way the end result was this concept of limited abilities and possibilities for persons with visual impairment. This was probably the root of the supervisors' overprotective nature towards allowing the younger children to play in the courtyard or the outdoor playground equipment, that they would not be able to avoid hurting themselves.

The school staff's attitude towards visual impairment was perhaps best represented in the distinction that they made between children with low vision and children who were completely visually impaired. Within the informal organisation of power among the students, the advantage was assigned to children with low vision. This was not challenged by the staff, and was additionally confirmed by them with errands and tasks being assigned to children with low vision, frequently involving taking care of children who were blind. Through these actions, the staff were distinguishing between those who had some sight to those who had none and were perceiving the former as being more capable and responsible for their actions.

> Field Notes:
>
> Children with low vision can be seen guiding their classmates and younger children to their classes when the bell rings…
>
> In the nursery class, when Yasmina, who is blind, wanted to go to the bathroom, Hussein, her classmate with low vision, was asked to lead her there.
>
> Young Omar is a new addition to the nursery class. He is taller than the others, and extremely thin and weak. As he would normally just stay seated wherever he is lead, one of the dormitory supervisors had asked two older boys with low vision to just walk him around. They did, and when they wanted to move on to something else, they would pass him onto Ayman or Riyad, who also had low vision…
>
> Tony, who has low vision, is always called upon to fetch Leila, his classmate who is blind, and bring her to dinner and take her back to the older girls to take care of her.

The students with low vision, whether they were younger or older or even whether they were considered good performers academically or musically or not, were asked to run more errands than the students who were blind. In seeing the students with low vision as worthy of such responsibilities and as these responsibilities usually involved a student who is blind, the staff were creating a pattern of care for those who were totally impaired by those who were less so. In other words, they were expressing their sense that the capacities of the children were diminished with the acuteness of their impairment.

In all of these actions and traits, the staff at BAL were devaluing the disability by attaching a host of inabilities to it – academically, recreationally and socially. This emerged from their adoption of normalised criteria for behaviour and achievement as is indicated in their classroom methods and in their expectations. Their standpoints were predominantly rooted in the medical model of disability in that their priority was to assist the children in overcoming their impairment in order to be accepted within the 'normal' standards. The absence of any recreational options or facilities suggested that the school administration did not consider these priorities or needs for persons with visual impairment who may not be able to appreciate them and whose primary focus should be on being accepted by society. The administration provided for this by focusing on the students' academic and musical training.

Passing for 'Normal' and Covering

In Goffman's study of stigma (Goffman, 1963), he referred to three strategies that are adopted by the person with disabilities in managing their stigmatised disability: 'passing' for normal and non-stigmatised, 'covering' the stigma so that it does not overwhelm social encounters, and 'withdrawal' from social activities with 'normals' altogether (Barnes et al., 1999). In their daily interactions with their teachers or with the researcher and in their interviews, the children at BAL seemed to adopt all three in different measures and in different contexts. This section will address the first two management strategies: 'passing' and 'covering'.

Analysis of the data showed that the children in their actions and interviews and from the parental reflections on their children, that these children are often attempting to pass for 'normal'. This was especially true of children with low vision who sensed a distinction between themselves and their blind peers and tried to use their limited vision to attempt tasks that could not be achieved by their blind peers. In fact, these acts were sometimes meant to affirm the difference between them and these peers, thus presenting themselves as more 'normal'.

> 'One of the boys with low vision is hunched over so close to his book that it appears as if he is reading Braille with his nose, but it turns out that he is reading it with his eyes.' (Field Notes)
>
> Riyad is being taught Braille so that he has something to fall back on should he totally lose his sight, but I constantly saw him reading it with his eyes instead of his fingers.
>
> Riyad's father: 'I know! I see him reading it – and not with his fingers – and I just go "what are you doing?"'
>
> Riyad: 'I hope to God I never need to use Braille alone because I read too slowly.'

Riyad is respectful and loyal to his friends, many of whom are blind, and would thus make light of comments regarding Braille or other implements that were specific to blind persons, such as the one above. This would be similar to a person with no physical impairment saying that they would probably be bad in a wheelchair because they would keep running into walls. Braille is Riyad's first language of instruction in the only school he has ever attended, and this comment represents a soft attempt to distance himself from it and, correspondingly, from the impairment. During his interview, he would try to explain different situations to me at the school by using phrases such as *'These people (his peers) don't see'* (Riyad's interview), implying that he feels he does. Quite often, these were also the students who were still seeking out medical procedures to restore the rest of their sight.

> Riyad: I had an operation in the summer (possibly for strabismus), and I feel I can see a little better.
>
> His father did not think that these operations were making any difference to his son's sight.
>
> Ayman's Mother: Once, Ayman and I were sitting on the balcony and he seemed deep in thought. When I asked him what it was, he asked me if he could have an operation if someone would donate an eye, and he started crying. I told him that I had asked about it, and if donating an eye would work, I would have donated one of my own. But it doesn't work, it won't solve the problem.

Other students with low vision also used passing as a strategy. They could be seen to be playing games that required sight – and here, reference is not being made to playing soccer or other ball games which most of the students seemed to manage quite well, but to card games and the like, using flat, unmarked cards. These games did not make allowances to include friends who were blind, who were often observed sitting just outside the 'game circle' while the others played.

> Field Notes:
> Outside the room, the boys were playing with their Pokemon discs and Jaafar and Kamal (both totally blind) were there, sitting just around the circle, totally left out. I came up to talk to the children, asked them how they were playing the game, then said that next time, we'll come up with a game that Jaafar and Kamal can play while the others are playing Pokemon. Jaafar and Kamal and the rest of the boys then started coming up with ways that they could adapt the Pokemon discs so that everyone could play.

The children were clearly willing to involve their friends in these games; they had just not thought of the necessity of adapting games to include everyone when those with low vision could play without any trouble. The children with low vision probably found this a reaffirmation of their 'sighted' status, but they were also part of this larger group which included their blind friends. Perhaps they had not thought of ways to adapt their games because there were so few examples of such adaptations at the school for them to be inspired to do so. To some extent, it also implies that these children are striving to play these regular games and be like all other children.

This was again apparent in the preparations for the student council elections. In the weeks leading up to the elections, posters were hung up around the school campaigning for the different candidates, emulating the publicity campaigns of the local MP's. These were neither in Braille or any other tactile material – they were meant to be read, and those who could not read them would need to ask someone to do so for them. The posters were not particularly flashy or catchy and did not include much useful information, so it was not very clear how they served the election process. It appeared as if the students had gone to great lengths to execute the process as normally as possible and had, in the meantime, excluded their peers with severe visual impairment as most processes in the community do.

Aside from the children themselves, other staff or relatives in their lives were also encouraging them to appear as 'normal', whether directly or indirectly. These were mostly their siblings and family, who would take pride in how you could often not notice that their sibling or child had an impairment at all.

> Ayman's sister: If people were to spend time with him, they would realise that he is very normal but we need someone to appreciate that.

Yola is one of the dormitory supervisors who also has a brother at home who is blind. The following is an excerpt from notes taken after spending an afternoon with her.

She takes great pride in pointing out that you simply cannot tell that (her brother) is blind and recounts anecdotes of people waving at him or holding out their hands to shake his, not realising or forgetting that he cannot see them.

And then there are those who bring their friends or fiancées to the store to show them the blind guy.

The siblings were equally aware of when people around them pointed, stared at or mocked their sibling with visual impairment, and they were also managing the stigma by trying to have their sibling pass as 'normal'.

Attempts and motions for 'covering' the disability to stabilise social encounters were more noticeable among the students, and humour was a common tool. The students were constantly making jokes about their impairment, usually for the benefit of an audience who was not visually impaired. In fact, very few of the students referred to themselves as ‘blind’ except in jest.

> Teacher 6: When I first started teaching here, I was so tensed up and so worried, but the students are the ones who helped me. They would keep cracking jokes (about their visual impairment) like ‘I had such a bad headache, I could no longer see’, or bumping into me and saying ‘Oh, sorry Miss, I didn’t see you there’.
> Field Notes
> In gym class, Josette – who is blind – puts on the blindfold (meant for the students with low vision) as well and yells out ‘I’ve become blind!!’

A class role-play between two students in 4th grade was considered hilarious by their classmates because it depicted an incident when a taxi driver yelled out at a pedestrian ‘Can’t you see?’ and she replied, ‘No, I’m blind’, which was met with roars of laughter from the children. What was more striking about the role-play was that it stalled after that line – neither of the students knew how the rest of the conversation might actually go. The outburst of laughter may have also been a release in that the children turned the joke on the sighted driver, that they finally managed to call themselves ‘blind’ as a matter of fact, and not as a cause for sympathy.

The jokes about their impairment were a continuous means to try to make others feel more comfortable around them, and perhaps a defence mechanism to make the joke before somebody else did.

> Field Notes
> In Grade 6 – There are more jokes being made about being blind. They are asked to pick a grammatical element out of a sentence that has Sharon Stone in it. The boys ask about the sentence again and (the teacher) responds: ‘An amazing actress… if you saw her you’d fall over.’
>
> (One of the girls) retorts ‘Miss, he can’t even see her and he’s falling over, if he saw her he’d melt’.

These jokes, however, were not as common amongst the younger students who were struggling to think of themselves as visually impaired. Some, especially those with low vision, had not come to terms with their sight loss at all and would probably have found jokes about their sight hurtful. Not unlike the older students, these children were overcompensating to overcome the disability of their impairment, and this habit extended to their social skills, where all their mannerisms were slightly exaggerated. They spoke louder, reacted impulsively and went to great pains to entertain or attract attention by making jokes or coming up with witty put-downs. These were all typical of pre-teenagers, but they were exaggerated with this group. Furthermore, they never admitted that there was something that they could not know how to do and would often try to prove to you that they could do something. ‘Honestly Miss. Shall I show you Miss? Shall I show you?’ Once again typical of children, but the persistence echoed a need to prove that they were ‘normal’.

If they did admit to any type of incapacity, it was usually attached to elements or services that are lacking or beyond their control. In one of the older students’ performances in their Christmas show, they broached the issue of the rights of persons with disabilities but the persons with disabilities that they depicted was physically disabled and used a wheelchair. The point that they wanted to drive home, that when they spoke of disability they were not just referring to visual impairment was well received. But their arguments for the provisions and services that they felt persons with disabilities deserved in order to overcome their disability were entrenched in the medical model outlook on disability. They were not rights-based, and not empowering. One explanation would be that they drew their world view from the vernacular used in the school, which demanded provisions that would allow the students to surmount their disabling impairment and fit into society.

In light of the attitudes among the staff and adults at BAL that devalued the disability of the students, their attempts to pass for normal or cover their disability may be a direct response to this. However, as family members were also involved in this process, it would appear that this defence mechanism or strategy to manage their stigma was for the benefit of people they had come into contact with outside of the school as well. Several examples illustrated the measures of denial, rejection or even mourning for their impairment, all of which fall into what the medical model of disability would assert as the process of dealing with loss (Shakespeare, 1996). In all cases, the children were attempting to rectify what they now felt was a 'spoiled' identity, one that was deviant and a source of social stigma. Though one factor contributing to this stigma was the wider society and general social interactions, ascribing any part of the formation of this identity to the institution was only apparent when comparing these coping mechanisms with how children with visual impairment who had been included in regular schools, and continued to live at home, dealt with their impairments.

By a rather young age, the children observed or interviewed who had been included in regular schooling illustrated very little shame or stigma associated with their disability. Quite to the contrary, they expressed their affirmation of being called 'blind' and, after a while, tired of and rejected being observed or studied.

> From Naji's home visit:
> When I had first called to ask for this interview, the mother had asked that we meet somewhere outside the house as she did not want Naji to know about this. Naji had, in the last period, become annoyed with the slew of interviewers and students who were coming to write something about him. 'What am I? A showcase?'
>
> This is also the reason why his school no longer allowed such visitors to observe him in class.
>
> (At the end of the interview, his mother) voiced her relief that it was not one of those interviews where the interviewer wanted to watch how Naji ate, or dressed, or did mundane things or the like.
>
> When Naji performed (guitar) at the Presidential Palace, he met the First Lady (he won one of 2 prizes). When she asked him if there was anything he wanted, he said that he would like to see the Presidential Palace, and she took him for a tour and called in the President to see him. In the car afterwards, he told me that he really enjoyed meeting the First Lady, but mostly because when she called the President to come meet Naji, he heard her say to the President that Naji was blind. And Naji was pleased that she just said it as it was and didn't try to soften it up or make a big deal of it.

In preparation for an awareness raising photo exhibition where children were encouraged to take photographs of their days included in a regular school, Rida and Sara who were now at an UNRWA school apparently refused to take part in the exercise at first. Their reasons were: 'We know why you're doing this, because we're blind. Well, there's nothing special about us being blind and we want you to stop pointing us out in that way' (Personal Communication, UNRWA personnel).

These three children fell in the younger half of the 7–12 years age bracket under study and yet had already rejected being labelled as ‘disabled’ without rejecting their impairment. They made no excuses for their impairment and continued to demand that they be treated with respect. Without doubt, factors that facilitated this process for them were not only present at the school but also at home where they continued to live and in the community that they were not withdrawn from.

Whereas the children at BAL were working to achieve ‘normality’ in a detached setting, the included children were, for all purposes, living inclusively at home and at school with their impairment. These children’s experiences and expressions of their disability could lead us to deduce that the institutionalised experience for the children at BAL, with all its components of staff, educational system and family perceptions, was contributing to a sense of spoiled identity and feeding into defence strategies and coping mechanisms focusing on ‘passing’ and ‘covering’. Within such a small school population, there was little evidence of the students employing ‘withdrawing’ as one mechanism for handling their stigma during their school days. It could, however, be deduced that this was more widely adopted outside of the school, with the students who are integrated into regular high schools but do not mingle, and the alumni who return to BAL to live or work.

Self-Perceptions, Aspirations and Role Models

There are a number of elements that impinge on the child’s sense of identity. James (1993), James and Hockey (2007), Kelle (2001), Lansdown (2005, 2006) and others illustrated the effects of language, culture, social perceptions, intergenerational relations and social interaction on the processes that children undertake to make meaning of their world and recognise their role within it. All of these elements appear in the analysis of the interview data to examine the process the children are undergoing in forming their self-identities and self-perceptions. This was certainly the case for children with visual impairment under study. As students in a school where their capacities were underrated due to the staff’s devaluation of their disability, the children would naturally seek to be acknowledged by attempting to do well within the skills that were highly rated at the school. They were simultaneously learning what skills gained them praise.

When setting up the interviews with the children, I had explained to them that I wanted to learn more about them and about how they dealt with things at home and at school. The first interview was with Maroun, who, upon hearing this explanation, immediately asked if I wanted to see how he writes. A Braille printer was brought to our small round table and he delicately explained how to feed in the paper and printed my name for me to feel. (Maroun’s interview)

Kinan, in his interview, did the same. This is what the children felt differentiated them and what they felt they could teach me about how they dealt with things.

No doubt this was a special skill in comparison to their siblings and family members at home who did not know Braille.

The children had started imagining themselves in the future. In their interviews and in their descriptions of what they would like to do when they grew up, the larger part of the children's dialogue reflected a paradox of their rejection or denial of their disability, as well as categorising themselves in traditional disabled roles. Historically in Lebanon and other Arab countries, children with visual impairments were trained to become priests and sheikhs. It was considered important to teach them the Bible and the Quran, and parents guided their children with visual impairment to become priests or sheikhs as it was considered accessible employment that would socially compensate for their disability. In the last 60 years or so, they were also trained to become musicians, language teachers, telephone operators or workers in handicrafts workshops. These became the socially expected lines of work for persons with visual impairment and were propagated by institutions through vocational training that directed them to these professions. BAL is slightly different in its emphasis on academic study especially for the students in the elementary grades, but its focus on music has been previously illustrated, as well as the presence of its handicrafts workshop on hand for those who do not succeed academically or musically.

> Jaafar: 'God knows (what I will be). Maybe teach English, they say that that would be a good thing for me.'
>
> Maroun: 'A music teacher, or a priest'.
>
> Ahmad: 'I want to become a sheikh.'

Perhaps the children had started sensing a level of inadequacy in comparison to non-disabled peers and their responses were seemingly in passive agreement with what others have suggested to them. This was slightly different for children with low vision, who, as mentioned earlier, felt less disabled in the company of their blind peers, which assisted them in denying their disability. Their responses were typical of young children's dreams or were plausible professions outside the group of sanctioned jobs for persons with visual impairment.

> Joseph: 'I want to be an airplane pilot!'
>
> Munira: 'I want to go to university … (and) become a lawyer.'
>
> Ayman: 'I want to become a mechanic because I love cars.'
>
> Riyad (who loves computers): 'I want to open up a computer company.'

The children's explorations of their potential future careers were also affected by the influential persons in their surrounding environment, either directly by their parents' and administration's advice or indirectly by the staff's attitudes to their potential abilities, and the role models available to them through the staff with visual impairment at the school.

The parents who were interviewed had high hopes for their children's futures. They expected that the children's time at BAL would enable them to overcome their disability and be able to pursue further studies or a career that would overcome society's attitude to their impairment. Education and high achievement was seen as key to reintegration and respect.

> Ahmad's father:
> Most importantly, I don't want anybody to pity them. I keep telling them: prove to everyone that you're educated.
>
> I want Ghina to go to university. She wants to study Psychology, but I would like her to study English Literature. I feel she can work with that, she can teach. I want her to have her status in society.
>
> I would like Ahmad to become a musician; I feel it is a good profession.
>
> Upon mentioning that Ahmad said he wanted to be a sheikh, the grandmother responded: That is probably because of me, I would like him to be a sheikh.
>
> Ayman's mother: I wanted him to be an eye doctor or a mechanic because he really likes cars.

The parents, and grandparents, are naturally looking out for what they felt might be in the best interests of their children, but aside from an overambitious desire for a child with low vision to become an ophthalmologist, they all subscribed to the traditional professions assigned to persons with visual impairment. Ayman's mother, in her response, presents hints of denial of her son's impairment, which probably assists her son in doing the same, as indicated in his ongoing hope and quest for medical procedures to eliminate his impairment.

The BAL staff views concerning the children's futures were derived from their experiences with older students at the school. The importance attached to academic studies and music was tangible in that they were the only areas for which they received the highest recognition and were afforded informal power, by the director and by the staff. The proximity of the handicrafts workshop and the workers and telephone operators who shared residence with the students also alerted them to what their other possibilities were should they not succeed academically or musically.

> Omar (alumnus): The handicrafts workshop has generally been for… school dropouts (from BAL or elsewhere) or those who don't like education… At BAL, if you're not talented in music, you end up in the handicrafts workshop.

The educational staff was never observed giving career counselling advice, but their opinions and thoughts as to the students' future prospects probably filtered into their attitudes and instruction in class. In all fairness, these views were not necessarily their personal opinions as much as they represented a synthesis of where they thought society would accept visually impaired employees.

> There was a long pause among the teachers in their group interview when they were asked what career choices they thought their students would have. Finally, there were only a few suggestions…
>
> Teacher 6: I only see them working as phone operators (which others – mainly the blind teachers – argued with).
>
> Teacher 7: They are going to have a lot of better job opportunities because everything is computerised now. I know someone who is working as a translator, someone is working at ESCWA. There are opportunities. Which would hopefully improve in the future.
>
> Teacher 6: They could go into computers.

The teachers did not seem to have given the students' future much thought beyond what has been set out by the administration and society in general, and remained sceptical of affirmative action measures that had started to appear as a result of Law 220/2000.

> Teacher 3: Yes, but look at how it's (Law 220) being implemented in some places – blind people are getting paid (employed) without being given a job to do. It's just as bad as begging.

These are the same teachers who barely expected that their students would graduate. For those who would, the teachers did not seem particularly hopeful of the opportunities that would be made available to them.

> Mr. Taha (blind teacher): You don't think of what you want, you just think that you need to work. I know two people who had Master's degrees, and now they're just working as phone operators.

The teachers with visual impairment at the school mainly taught music or languages, Braille, English or Arabic, with the exception of one who runs the computer classes. They constituted the students' immediate professional role models and were respected in accordance with the higher importance ascribed to the educational staff at BAL. It was these very same role models, some of whom were BAL alumni, who had returned to teach at their alma mater. Not only did they follow in a traditional profession, but they also preferred to pursue it in a special school. This contributed to the children's sense of belonging at BAL, which will be discussed further in the following section, but also reaffirmed some of the opinions that had been expressed to them regarding the limitations of their future opportunities.

Marriage seemed to preoccupy the girls more than the boys. Specifically in this area, the students looked to the staff with visual impairment for clues as to what they might expect. Of all the staff with visual impairment at BAL, only two of the teachers were married, one of whom, a female, was married the year that the data collection was conducted. All the other staff, visitors and alumni with visual impairment that the students came into contact with remained unmarried.

> Yola (dormitory supervisor):
> She mentions that the girls at (BAL) are always thinking of when they get married. Thoughts similar to those that would occupy the minds of any average teenager. She feels that all the possible obstacles or challenges in doing something like that doesn't occur to them, and they raise the issue whenever they have an outside speaker 'Why are our chances to get married so low when they are not for boys?'
>
> People also urge Yola to find a bride for her brother. She feels that she cannot pass such a burden on to somebody else.

Nobody seems to have provided a clear response to the girls' persistent questions, almost as if, as indicated by Yola above, they should recognise the clear hindrances. In the children's interviews, the two girls in the sample group were the only ones to bring up the issue of marriage, but with an interesting condition – 'I would like to get married, to someone who is not blind*' (Samia).* When I enquired why they specified this quality in their potential spouse, their non-verbal retort indicated that it should be intensely obvious; the girls wanted to marry out of the discriminatory perception of their disability, this was one way to break the endless cycle and provide them with a less limited life in the mainstream.

All the guidance and information that the children received regarding their future role in the society's economy fell within the existing system that had made allowances for persons with visual impairment in a few professions. When opinions emerged to challenge this system, they were usually unrealistic or overambitious and rooted in a denial of the disability. When being presented with what to expect in the job market, either directly or through their own observations, the children were presented with a group-specific category of jobs. These were the fields that you may be able to pursue as a person with visual impairment. The focus was on the impairment and what that would allow them to do, rather than on any individual basis of potential, talent or inclination.

These restrictions overflowed into future social prospects of marriage, where they were also taught to curb their expectations because of their disability. This was especially pertinent to the girls, not necessarily in terms of finding someone who would love them and marry them, but that there would be great social resistance to such an occurrence. While the system that had placed them at BAL is coaxing them to defy their disability and prove themselves to society, it was concurrently guiding them into pigeon-holed options due to what was socially perceived as appropriate for their inabilities and inadequacies.

Belonging to a Group/Identifying with the Disability

Many of the issues and themes that have been analysed and discussed thus far influence the children's sense of belonging to a group and identifying with their disability. This did not only emanate from their need to associate or identify with a group, but was also affected by external factors such as the perceptions imposed upon them by the school administration and staff, their segregation within an enclosed environment away from their homes, their parents' views and involvement and the discriminatory attitudes that they faced in the outside community. With time, the children found strength and understanding in their person with visual impairment and thus commenced to feel they belonged to this social group.

Their sense of belonging to this group was also linked to the school itself, as was observed in their growing attachment to remaining in the school on weekends and returning there after graduating. Belonging to this group was thus, to some extent, one facet of the third strategy proposed by Goffman for managing stigma: withdrawal. All of the children perceived themselves as different enough to warrant them living at BAL. They felt that they belonged at BAL as disabled and different children who were 'all the same here' *(Kamal)* and because of their fear of being in a regular school. Children who had attended a regular school before coming to BAL described their school only as having not been 'for blind children' *(Munira, Kinan, Adel – children with low vision)* or as one where 'there were all types of people … but I was the only one who was blind' *(Maroun)*. Being in a special school such as BAL actually provided the students with a space where their impairment almost became invisible.

> Abed (alumnus): At (BAL), you don't feel like your lacking/missing something.

They also feared being outside of BAL because they simply would not fit in, and they would lose whatever status they had gained within the BAL community.

> Riyad: ‘But it would be difficult to go to a regular school, because of the atmosphere there and my friends being here. It has nothing to do with the actual classes or studies, I just wouldn’t want to leave (BAL).’
>
> Abed (alumnus): ‘What can a blind child play (in the neighbourhood)? He will always be segregated/excluded, will always be clinging to his family and parents, he won’t play with the kids in the neighbourhood. I remember when I was young I used to hold onto my mother’s dress and follow her everywhere.’
>
> ‘I can’t explain why it would be harder at an inclusive school … you know, you’ll always trip on a step, or someone might trip you…’

Thus, their reservations were not only that they would not fit in the outside world but that they would also be subjects of abuse and that the community would not understand them or know how to deal with them. Their fear of being segregated or excluded from their neighbourhood led them to a segregated setting at BAL.

This sense of being ‘out of place’ extended to their homes as well. The children became acutely aware of their sense of difference in comparison to their siblings who continued to live at home. The parents continuously stated how pleased they were with BAL and how the staff had helped them with different issues regarding their children’s upbringing. These were all statements that were made in front of the children, who slowly internalised the important role that the school was playing.

> Ayman’s mother:
> It wasn’t easy for me to send him. But Ayman was having a tough time at home, he wasn’t accepting his predicament. He was always angry or nervous. It all changed when he went to (BAL), he calmed down considerably.
>
> Riyad’s father: We are really happy about the school in general, we haven’t had any trouble ever since we sent Riyad there.
>
> Ahmad’s father: It’s different at (BAL) than if they were going to school here. You can see the difference, they’re disciplined to be polite, their social interactions are different (better).

The mutual affection between children and parents was clearly expressed, but the estrangement related more to a faint understanding of what the children did and how they were dealing with their impairment. Moreover, the parents’ non-challenging and dependent relationship on the BAL administration bestowed more power to the latter regarding decisions concerning the children, and the children were aware of this. Though the children struggled to create links between their school and homes, these efforts eventually petered out as the gap between their two lives became wider and as their sense of belonging at BAL grew.

> Ruba: At the beginning, I wanted to go home all the time. Towards the end, I didn’t want to leave (BAL) any more.
>
> Abed: When I was younger, I didn’t used to want to go home.

The school administration and educational staff also contributed to drawing out the contours of this group. As discussed earlier, the school administration had adopted an exclusive ethos in which it viewed the students as a homogeneous group due to their shared impairment. This applied to the educational approaches and the control of the social space. It had created this enclosed space that was detached from the surrounding environment, and had acted in a specialised, expert role that distanced the parents from their children's daily lives for reasons of expertise and economics. These children were living different experiences from their siblings and family, which was only partly due to their impairment and partly due to their residence and attendance at BAL.

All things considered, the students understood that their best option was to be at BAL. As students in this enclosed setting, they also coveted the opportunity to obtain the high grades that would allow them to be integrated into a regular school at high school level. However, it emerged from the interviews with present and past students of BAL that this was not a comfortable move for them, but was probably desired because it was a sign of achievement that earned high praise from the school administration and naturally the parents.

> Ruba (alumnus): In the last few years, I was integrated in the high school in Kfarchima … Us blind students would also always stay together. The others couldn't really mingle with us.
>
> Omar (alumnus): Making friends at the regular school didn't come naturally to everyone … Some of the (blind students) stayed alone at the regular school.
>
> Ghina (currently integrated in a regular high school): It was just hard at the beginning, for a week or so, but then I got used to. They're all very helpful at the school. But some of my friends are still finding it hard to be there.
>
> Not just being in a new school, it's very different than here (at BAL). Here you're among people like you who are also blind, and it's much different being around students who can also see…

This first foray into the outside world confirmed to the students that they were extremely different from the others and that they belonged at BAL. The special treatment that they received, whether negative in terms of minimal socialising or positive in terms of examinations being sent to BAL in order to be printed in Braille for the student to execute in the afternoon with little supervision and no time limit, was an additional line distinguishing and separating the students from their peers who were not visually impaired. This was one additional factor contributing to the students identifying with their own social group, one in which they shared similar experiences due to their visual impairment.

As mentioned earlier, one alumnus likened his time at BAL to that of being in prison for a period of time, in the sense of being cut off from the outside world and belonging totally to the institution. The lasting effects of this sense of not belonging anywhere else other than BAL was observed in alumni who returned to the school, either to work or to continue studying.

> Field Notes:
> Another one (girl in the over 20-year-old classroom) has been through the whole educational process somewhere else, but found it hard to step out into the 'world' and has come here to take classes in English, computer and handicrafts.
>
> Omar (alumnus): The handicrafts workshop has generally been for … people who graduate and live far away (and don't want to go back to their villages).

A number of the staff with visual impairment at BAL were alumni of the school. Aside from a few who were teachers, others returned to live there and took on miscellaneous tasks as support staff. Notwithstanding their own experiences, their presence at the school with the full knowledge that they were alumni presented another indication to the children that they all belonged to this same group that was not connected through an educational experience, but through their impairment.

Conclusions

This chapter has looked into the impact of inclusive and exclusive practices on the children's social identities by exploring themes such as participation, normalisation, play, role modelling, belonging and self-perceptions. The argument is that children with disabilities learning in segregated residential institutions are being socialised into disabled identities.

The findings show that the students at BAL have identified themselves with a group of their peers who share their impairment. This has been amplified by their presence in a segregated setting in two distinct ways. On the one hand, this setting has protected them from the social stereotyping and discriminatory behaviour of their home neighbourhoods and from what appears to them as the lack of understanding and qualification of their families; they do not, after all, come from families who share their experience in terms of their impairment. On the other hand, within this enclosed setting, the children were subjected to an administrative system and perceptions and attitudes of the staff that treated the students as a homogeneous group. Moreover, these experts were assisting them in dealing with their disability and yet were predominantly negative in their evaluation of the students' capabilities due to their impairment. The older students, the returning alumni and the staff and teachers with visual impairment were their only available role models, and their experiences were not empowering. There was no challenging case for change due to their own conformity to the existing social attitudes, and the reaffirmation that this segregated institution is where they belong.

The children had been socialised into a spoiled identity, one that had become so because of its deviance from what would be considered 'normal'. The stigma that they carried was illustrated in the strategies that they adopted to manage it, in their quest for normalisation, for passing as normal and for covering their disability, which they felt was considered the most pertinent part of their identity to other people they interacted with. The aim of these management strategies was to be socially accepted.

The loss or diminishment of their sight was also associated with a sense of inferiority and inadequacy to perform, be industrious or to obtain a productive place in society's economy. This was, after all, considered the optimal path towards social acceptance and reintegration. Yet throughout this process, they were being guided into professions that have been traditionally socially accepted for persons with visual impairment, continuing their categorisation and assignment to this disabled group, as their only future means for economic gain. They were taught that they would always be inferior to others who pursued other fields of work, or had a wider choice of doing so, and that their abilities would always be insufficient to engage in other professions. The basis for this was not their own capacities or potential, but the social obstacles that they would face.

Throughout these experiences, the children encountered social discrimination in their home communities, expressed a sense of progressive estrangement from their home environment and were subject to a specialised institutional system that perceived them as a homogeneous group. In the process, a solidarity grew out of these shared concerns and developed into a sense of belonging to this social group. This group passively took on the traditional roles of persons with visual impairment, such as expecting charity, taking on occupations traditionally assigned to visually impaired persons, relating to those in their surrounding environment through musical performance and merely retreating from games or settings that required sight. The group is defined by its disability, by its deviation from standard mould, not by any other traits of its individual members. The students internalised this and were being socialised into this disabled identity, and not into an identity of an individual person with a disability.

To quote Weeks, 'identity is about belonging, about what you have in common with some other people and what differentiates you from others. At its most basic, it gives you a sense of personal location, the stable core to your individuality' (Weeks cited in Shakespeare, 1996). Social constructionism plays a prominent role where inputs from all social actors in the children's social life portray them as spoiled or deficient. These attitudes are reflected in decisions that are made about their lives, such as sending them to a segregated special school, in social interactions of avoidance or derision in their home community and in the control and sympathy that they are subjected to at their special school. Wherein all of these social interactions treat them as commonly disabled, as different from those in their family and social circles, the children find their personal individuality within a group of their disabled peers.

The analysis here has shown that children with disabilities attending institutions were managing stigmas and were being socialised into disabled identities. In addition to the findings drawn from the data at the institution, the links between institutionalisation and spoiled identities were further emphasised as such stigmatised identities were not evident or manifested in any of the children with visual impairment who were included in regular education, indicating that different social values were being attached to their impairment, and it is these values that have been the primary influences on the children's identity formation.

This situation has not been aided by the recent disability legislation and policy. Though these are based on rights-based perspectives, the content of the law continues to interpret this within segregated notions of equality. That is, the rights violations towards persons with disabilities that existed in Lebanese policy are being rectified by creating separate parallels for persons with disabilities. These parallels consist of measures that have adopted a social model approach by adapting disabling barriers and creating allowances in health, education, employment, housing, recreation and transport, but as parallels, they do not make it a requirement that any of the mainstream service provision become inclusive for all. Whereas the law subscribed to the thrust of the social model to bring persons with disabilities into society, it only managed to create a concentric circle for them on its fringe. This reflects the perception of disability as a general misfortune which policy-makers have responded to by broadening the outreach of governmental services (Donoghue, 2003).

In other words, the content of the law reverts to prevailing understandings of persons with disabilities and their support. Those who capitalise on the potential opportunities within the law's delineation of rights in specific realms, and challenge the segregation of its implementation, do so individually, mirroring a medical model outlook that places the burden of 'fitting in' on the persons with disabilities. Therefore, the content of the law did not challenge socially constructed views of disability or stereotypes of incapacity. Additionally, the content of the law did not include mechanisms to support its implementation, within ministries and governmental decision-making processes, and has thus had little influence on adapting or changing the system of service provision or practice.

Overall, the children could best relate to their families and communities by attempting to 'normalise' their actions and achievements. This only served to confirm their disability and their difference from 'the norm'. This dichotomy of their experiences inside and outside BAL reinforced their belonging to a similarly disabled peer group and perceiving that group as existing mainly at BAL. The school had created an isolated subculture of 'the blind' that the students clung to more and more as they grew older. It was the place or group where they felt that they belonged because it was where they felt they were accepted, in a group that shared their experience of difference and discrimination. Their experience of physical segregation has led to self-initiated social segregation. The findings demonstrate how these many factors were internalised in the children's self-perception and identity formation.

In conclusion, these empirical findings have contributed to understanding and knowledge of disability legislation, policy and practice in a number of ways. They have shown that rights-based legislation cannot impose inclusive changes in policy and practice without mechanisms and incentives in place for implementation. In the absence of such change, practices remain predominantly exclusionary, with no effective mechanisms for the meaningful participation of parents or children, eventually socialising the children into disabled identities. In order to change provision and practice, a full implementation programme has to be in place with participation of stakeholders, activists and professionals in partnership. Without this, the gap between the rhetoric of the legislation and policy and the provision and practice will only be bridged with difficulty and very slowly as is the case in Lebanon.

The findings have shown that children 8–12 years of age were not exhibiting any noticeable resistance to the systems of control and had adopted the discriminatory values relating to disability exhibited around them. This may change later on in their lives although the data does not extend to any possible changes in their later years. Some of the interviewed alumni expressed some resistance to these values later in life, while others did not and continued to return to the institution as visitors or friends. This would indicate that it is of particular importance for young children that there are formal mechanisms in place for them to express their views.

The analysis of power and control and social oppression has drawn on Foucauldian ideas of power, control and surveillance and Goffman's concepts of stigma and total institution in an analysis of a Lebanese institution for visually impaired children. Goffman's concepts of stigma and total institution were explored through the organisational ethnography and provided insights into the social construction of identity and exclusionary and inclusionary practices in relation to the use of space, the mechanisms for the children's representation and participation within the institution and the ways in which stigma and social acceptance operated both amongst the staff and the children. The lack of participation and agency of these children was clarified at both the institutional level and within the wider society.

Within a total institution, the individual's identity is restructured and redefined. For children, this started with their removal from their family and home setting. They were then oriented to actions that were considered appropriate by administration and staff at the institution. Within these interactions with the staff, the children began to form a specific outlook on their disability and their self-identity. This was reflected in the levels of ascribed status, where children recognised an assigned lower status for higher levels of visual impairment. It was seen in the 'phantom normalcy' that the educational system promoted and was later exhibited by the children themselves. The task facing the children was not only of compliance, but conformity, which emphasised their physical deviance from a norm and which led to their self-perception of stigma that they attempted to manage to mask their difference.

The cumulative effect of these actions and systems led the children to be socialised into disabled identities. Work needs to be done to mainstream disability so that it is not viewed as deviance or a source of stigma. This can be initiated by deinstitutionalising children with disabilities and modifying social services and systems to make measures of control and surveillance reciprocal and share responsibility and decision-making with parents and children. Such actions would create a different web of power relations that does not oppress parents and children and allows for greater room to manoeuvre to express agency and resistance, which would ensure a constant dynamic of adjustment and change.

The concepts of power and stigma have been extended through their application to this setting, particularly in illustrating their combined influence on self-identities and marginalisation. This study at macro and micro levels has extended understanding of the processes of change between policy and practice in the field of disability. This can be used in further research on other disabilities, as well as in comparative studies between countries in the region. Such a study can also be used to inform future social action.

In terms of the study of the social construction of children's identities, this study has illustrated the multivariate elements in social interactions, organisations and legal systems that contribute to the social construction of identities. Young children are making meaning of their lives by observing and experimenting within these realms, and the resultant responses impinge on their self-perceptions and their understanding of the social world and their place in it. This study has shown that, from a child's perspective, discriminatory attitudes manifest themselves in various ways through their daily life, reaffirming what is considered socially acceptable behaviour and roles, eventually socialising them into disabled identities.

In other words, rather than standing in the face of this social injustice, the children are being taught how to play their role within this dominant status quo.

Chapter 51
Leadership for Social Justice Throughout Fifteen Years of Intervention in a Disadvantaged and Multicultural Canadian Urban Area: *The Supporting Montréal Schools Program*

Jean Archambault and Chantale Richer

For years, school boards in Montréal, Québec, Canada, have fought for additional resources from Québec's ministry of education, given that Québec's poverty is concentrated in the city of Montréal. The province of Québec has a long tradition of equalling resources to every student be they living in urban centers, in rural areas or in difficult-to-reach parts of the province. Nevertheless, for Montréal's school boards, equalling resources was not enough. Montréal's poorer students showed greater school difficulties, had less school attendance, more dropouts and as a whole succeeded less in school than their more advantaged counterparts. For Montréal's school boards, this was considered as injustice even in the face of equal resources.

In 1997, Québec's ministry of education responded positively to Montréal school boards' demands. Taking advantage of the educational reform to be put in place, the ministry introduced Supporting Montréal's schools as a line of action of this reform. With its innovative governance structure based on collaboration and with a professional team exerting educational leadership for the schools, the Supporting Montréal Schools Program, implemented for elementary schools, began fighting against injustice to every student in order to improve every student's learning. Since the beginning, fighting for injustice to improve learning was the goal. With the years this goal became more and more explicit, and teaching and learning along with fighting against prejudices and false beliefs as well as opposing deficit thinking and readiness took their place. This was attained mainly by producing and using data from a series of research studies on leadership for social justice.

The Supporting Montréal Schools Program has been in place for nearly 15 years. In this chapter we describe this programme in the context of Canada's and Québec's education systems and Montréal's urban area and show how it evolved in fighting injustice in disadvantaged areas with leadership for social justice by school principals.

Education in Canada, Québec and Montréal

Canada is a British-style constitutional monarchy, a confederation of ten provinces and three territories. One province has French as its official language (Québec); eight provinces and the three territories have English as its official language, and one province has both English and French. Québec, the focus of this chapter, is the second largest province with 24 % of Canada's population. Throughout Canada, education is a provincial responsibility and each province has the exclusive right to make its own laws to organize its education system (Gouvernement du Québec, 2006).

As for the quality of education, Canada enjoys a favourable reputation around the world and many countries envy its education system (Dubet, 2010). Analyzing data from the Program for International Student Achievement, the Organization for Economic Cooperation and Development shows that Canadian students are amongst the highest performing students of its member countries not only in science but also in mathematics and written comprehension (Organisation pour la Coopération et le Développement Économique [OCDE], 2011[1]). Duru-Bellat (2009) presents data where Canada is considered one of the richest countries, where schooling has a 17-year expectation compared to only a 2-year schooling expectation in least developed countries. Moreover, amongst the richest nations, Canada's education system is considered as "low" in creating social inequities of performance (Duru-Bellat, Mons, & Suchaut, 2004). However, poverty still exists and persists in Canada's urban areas (Levin, 2004, 2009).

Québec's Particular Situation

Québec is the French province of Canada. About 83 % of the 7.5 million people speak French, whereas 18 % speak English or other languages. This particular linguistic situation has political and social impacts given that Québec is surrounded by about 330 million people who speak English. Because the official language is French, all political and governmental institutions function in French. For more than 40 years, some political parties have worked to give Québec its political independence as a way of protecting its French heritage and language. For now, Québec is recognized by federal and provincial governments as a distinct nation and the French people as one of the two founding peoples of Canada.

---

[1] As French is the official language in Québec, the part of Canada where this study took place, we often used the French versions of publications. But publications like this one are also available in English.

Under the Charter of the French Language, instruction in Québec "…is to be given in French at the preschool, elementary and secondary levels. However, some students who meet specific requirements of the Charter may receive their schooling in English. These students account for approximately 11.2 per cent of the total enrolment in Québec's elementary and secondary schools" (Gouvernement du Québec, 2006, p. 3). For instance, students whose parents are Canadian citizens who have been educated in English in Canada may be given instruction in English in school.

Québec's Education System

In Québec, instruction at the elementary and secondary levels is free, public or private whether in French or English. Québec's education system is under the governance of a ministry of education, le ministère de l'Éducation, du Loisir et du Sport (MELS), that decides orientations and gives directions to the whole system (Gouvernement du Québec, 2006). The system is then divided into a public sector (more than 90 % of the students at the elementary level and around 70 % of the students at the secondary level) and a private sector with French or English schools' funded at 60 % by the ministère de l'Éducation, du Loisir et du Sport.

This particular situation, i.e. a large public sector mandated to serve every student in Québec and a private sector abundantly funded by the government, is a source of tensions and of social injustices in Québec's education system. Private schools are highly selective. Students in these schools are selected on the basis of good behaviour and high academic performance. If a problem arises, students may be sent back to the public sector which is compelled to serve students with whatever "difficulties". Students with difficulties or whose parents cannot afford private schools' fees are clearly not eligible to the private sector. Furthermore, the business sector helps maintain this selectivity of the private sector by publishing each year a "palmares", an honours' list of the best performing schools in Québec. Private schools are always amongst the first on the list. And even if some public schools do well in this comparison, it is clear that the worst schools are in the public sector. This reinforces rich and educated parents' choice for the best schools in the private sector and drains the "best" students from the public sector to the private sector. Clearly the poor and the "difficult" students have no place in the private sector schools. In fact, no private school, by any measure, is considered a poor or a disadvantaged school.

The public sector has two linguistic school board networks, one for children from the Francophone majority and another for children from the Anglophone minority who meet the linguistic requirements of the Charter of the French Language. These networks overlap so that each one covers the entire territory of the province of Québec so as to ensure that instruction in French or in English be given wherever it is needed.

There are 60 Francophone school boards and 9 Anglophone school boards across Québec's territory that are mandated for organizing educational services in their regions. The vast majority of the population of Québec (more than 80 %)

is concentrated along the Saint-Laurence river in the southern sections of Québec. Therefore, school boards vary greatly from small ones with very few students (less than a thousand) covering a very large geographic territory to large ones with many students (as many as 100,000 students in the largest school board in Montréal) covering a very small geographic territory.

The ministry of education does not work directly with the schools. Instead, in addition to financing the school boards and giving orientations and directions, it supports the school boards in labeling the educational services. School boards are financed on an equality basis. That is, every student is afforded equal financing. Additional financing is allocated for special services (for handicapped students or students with adaptation or learning difficulties) and to take into account extra transportation of students due to distance. Special allocation is also provided to schools located in disadvantaged areas.

School boards are responsible for ensuring access to elementary (6 years) and secondary (5 years) schools to every student in Québec. Here, students are expected to complete at least secondary education, and in 2007, 91 % of the students were awarded a secondary education diploma (Gouvernement du Québec, 2008).

Poverty and Immigration in Montréal

With a population of nearly two million, the Island of Montréal is Canada's second largest city and the largest city of Québec, the French province of Canada. In Quebec, poverty is highly concentrated in the Montréal urban area. Nearly 30 % of its families use 20 % more income than the general mean of the population for food, lodging and clothes and are thereby considered with low income (Low income cut-offs for 2008 is 21,359CDN$). Two-thirds of Montrealers have an income that is under the mean of 34,300CDN$ (Statistique Canada, 2010). And this is not to imply that those residents earning the mean income are considered well off.

This economic situation has to be put into another context, that is, the high immigration rate in Québec. Montréal, as a large urban area, is the main entry for immigrants into Québec, and it has welcomed the vast majority of the more than 40,000 immigrants each year. Most of these immigrants settle in Montréal. This immigration is diverse and varied: people come from around the world. This diversity of immigration is evident in our school system: the biggest of the five school boards in Montréal is serving 70,000 children and has children from 188 different countries with about 150 different mother tongues. One out of four of these children was born outside Québec (Commission scolaire de Montréal, 2010).

Poverty is also evident in our educational system. Montréal's five school boards' schools serve about 21 % of all Québec's children, but they account for 82 % of the 10th decile on poverty in Quebec and for 62 % of the 9th decile. The majority of Montréal's elementary schools (56 %) are from low socio-economic status neighbourhoods. These 184 public schools serve about 57,000 students and benefit resources from the government (Gouvernement du Québec, 2009).

Socio-economic inequities abound in Montréal, as middle-class and rich neighbourhoods border with much poorer areas. While poverty is often highly concentrated in schools and poor and rich children are not mixed, sometimes children from these different neighbourhoods go to the same school. For many years, the French and English school boards have fought to obtain additional resources from the governments. Education being a provincial jurisdiction, Quebec's government acknowledged particular needs for Montréal urban area and provided for additional resources. In fact, it is this particular situation of Montréal that led to the creation of the Supporting Montréal Schools Program in 1997 as part of Quebec's educational reform (Gouvernement du Québec, 1997). This programme (SMSP) is responsible for providing support to 184 low SES elementary schools from three French and two English school boards of Montréal. This chapter takes a close look at this educational programme to promote equity.

The Supporting Montréal Schools Program

Before describing the key components of the programme, we will present its origins. Afterwards, we will take a look at its evolution and at its evaluation.

The Origins of the Supporting Montréal Schools Program

In 1996, the Conseil Supérieur de l'Éducation du Québec (CSE), the advisory council for the ministry of education, analyzed Montréal's particular situation and described two major characteristics of Montréal schools: the concentration of poor children and of multiethnic groups. For the CSE, the principal difference between Montréal schools and other schools in the rest of Québec resides in the concentration of these characteristics and their effects of accumulation and mutual reinforcement.

Thus, the CSE realized how it was important to do something special for Montréal schools, in particular for disadvantaged neighbourhoods. In fact, in CSE's (1996) notice, we can read that Montréal public schools have problems with student achievement and that these problems represent an educational, economical, social and cultural stake, not just for the island of Montréal but for all the schools of the province of Québec.

These observations had been long made by Montréal's school boards themselves who had had no rest in asking for additional resources from the ministry of education. They were well aware that these problems meant social injustice for Montréal's students.

In 1997, in the context of the educational reform in Québec, the Ministère de l'Éducation du Québec put forward seven action lines for the elementary and the secondary schools of Québec (Gouvernement du Québec, 1997). One of these action lines took into account Montréal's particular characteristics and was aimed at supporting Montréal schools in order to reduce the inequality of achievement described by the CSE (1996). By this time, some funds were already allocated to schools in disadvantaged areas and some interventions were already present in those schools, but the Ministère de l'Éducation du Québec considered them insufficient. This is why it created the Supporting Montréal Schools Program (SMSP) that was different from previous interventions particularly in its mode of governance based on educational leadership and in its emphasis on empowering the schools and school principals. SMSP's objective was thus " to promote the personal and educational success of students from disadvantaged neighborhoods while taking into account their needs and resources, and contributing to the creation of an engaged education community" (Gouvernement du Québec, 2009, p. 8), and its orientations were to facilitate students' schooling experience that take into account their characteristics and their needs, to facilitate schools' openness to its community and, lastly, to facilitate schools' autonomy and responsibility (Gouvernement du Québec).

This acknowledgement by the Government of Québec and the additional resources granted to these schools were based on the intention of increasing Montréal students' performances. In this sense it was a first official step in considering social injustices in the schools and the decision to help in the fight against social injustices.

So the first implicit definition given to social justice in the SMSP was one where fighting injustices and having equal learning opportunities available to the poor were salient. In fact, the raison d'être of the Supporting Montréal Schools Program was to render more probable the equal opportunities of children living in poverty. This definition stems from Quebec's government's intention to allow Montréal schools in disadvantaged areas additional resources. Over the years, these steps would become more explicit, larger and more usable within an intervention framework.

Key Components of the SMS Program

Structurally, the Supporting Montréal Schools Program comprises a coordination committee, 184 targeted elementary schools (the most disadvantaged schools of the Island of Montréal), service to about 57,000 of the 101,000 students, seven measures or strategies to be implemented by the schools, a professional team in service to the schools and additional funding of 12,2 million CDN$. Let us describe these components, beginning with a vision component: educational leadership and empowerment.

Educational Leadership and Empowerment

Educational Leadership and empowerment were core aspects of the vision underlying interventions of the SMS Program. Leadership would be exerted mainly by school principals, but teachers engaged in professional development would be encouraged to take leadership in their areas of expertise while principals were also encouraged to empower them to do so. Empowerment meant giving power to people so that they could take charge and responsibility of their professional behaviour. Leadership was defined as the influence exerted so as to guide improvement in a school (Leithwood, 2005; Yukl, Gordon, & Taber, 2002). The word educational was used first to mark a sharp contrast with a managerial perspective and to think of school as a community instead as an organization or an institution (Sergiovani, 2005; Shields, 2009) and second to keep opened to the whole area of education and, as it, to be less restrictive than other forms of leadership like instructional leadership (Hallinger & Murphy, 1985) or learning centered leadership (Knapp, Copland, Honig, Plecki, & Portin, 2010; Murphy, Elliot, Goldring', & Porter, 2006).

Even though social injustice for the poor was acknowledged since the beginning of the programme and interventions to open access and opportunities to the students were already in place, the concept of leadership for social justice became apparent with the establishment, in 2005, of a collaborative research programme between our research team at the Université de Montréal and members of SMS Program's professional team and school principals. At first, we were interested in school principals' job in disadvantaged areas, and soon it became clear that leadership for social justice would become a main research issue in studying principals' job. In fact, the very reason why the SMS Program was put in place (inequities for the poor) became a main issue in our collaborative research, issue on which we could now put new words: leadership for social justice.

In order to better understand the concept, we reviewed the literature on leadership for social justice (Archambault & Harnois, 2009a) and isolated definitions and concepts that could be helpful in research about principals' jobs and in professional development (Archambault & Harnois, 2010b). Our working definition was inspired by Ayers, Quinn and Stovall (2009) for whom social justice education rests on three principles:

> 1) *Equity*, the principle of fairness, equal access to the most challenging and nourishing educational experiences, the demand that what the most privileged and enlightened are able to provide their children must be the standard for what is made available to all children… 2) *Activism*, the principle of agency, full participation, preparing youngsters to see and understand and, when necessary, to change all that is before them… 3) *Social literacy*, the principle of relevance, resisting the flattening effects of materialism and consumerism and … nourishing awareness of our own identities and our connection with others,.. (p. xiv)

We have found these principles very useful in helping principals and teachers grasp the full reality of social justice. But the interventions and our research data bore mainly on prejudices and false beliefs (e.g. deficit thinking) against poverty and poor people because it was part of the SMS Program to fight those prejudices and false beliefs and because this was the easiest thing to see in the schools. Nevertheless, these principles guided action in that equity was promoted instead of merely equality, activism instead of awareness alone and self-awareness to help understand one's privileges and change one's behaviour.

As we will see later, our attention was also drawn to transformative leadership (Shields, 2010), a theory that helped us understand the work of typical school principals. We will later take a closer look at the research programme on leadership for social justice. For now, let's turn to another of SMS Program's component.

The Coordination Committee

The intention at the beginning was that schools should be mobilized and empowered to take charge of their own destiny and that the responsibility of the Ministère de l'Éducation du Québec was to provide the frameworks, the means and the scope for decisions. This is why the Supporting Montréal Schools Program was managed by a coordination committee composed of the vice deputy minister, the director of the Direction générale de Montréal (MEQ) and the director general of the five school boards involved (Gouvernement du Québec, 2009). It was the first time that officers from the school boards and from the Ministère de l'Éducation, du Loisir et du Sport,[2] were collaborating to manage a programme like this. This joint management was and is an important leadership orientation aimed at empowering the schools themselves.

The coordination committee's tasks were to define the SMSP's objective, orientations and the collective services offered to the schools, to distribute financial resources and to ensure SMSP's evaluation (Gouvernement du Québec, 2009).

The Seven Measures (Strategies)

In the plan presented to the schools, seven measures to be implemented by the schools were put forward. These measures are "…recognized as having a potentially significant impact on the progress, learning and motivation of disadvantaged students" (Gouvernement du Québec, 2009, p. 39). School teams are responsible for the implementation of these measures, which is coordinated by the school principal and supported by the SMSP's professional team.

It is interesting to note that these measures are in fact cues for the schools but that schools remain responsible for choosing the means they will use to implement the measures while taking into account their particular contexts. This orientation shows again the importance attributed to the local school and, as we will see later, to the school principal as leader of the changes brought by the implementation of the measures.

The seven measures are defined as follows:

1. Instructional interventions that promote learning and success for all
2. Development of reading competency
3. The guidance-oriented approach
4. Professional development of school administrators and the school team
5. Access to cultural resources
6. Cooperative links with students' families
7. Cooperative links with the community

---

[2] In 2004, following a change in government, the ministère de l'Éducation du Québec became the ministère de l'Éducation, du Loisir et du Sport.

Measure 1: Instructional Interventions that Promote Learning and Success for All

For a school team, this involves acknowledging that every child from disadvantaged areas is able to learn and then establishing conditions that will ensure that the child is actually learning. For the team, these conditions include having an open attitude towards all students and their families, maintaining high expectations for these students, gaining knowledge and understanding of the neighbourhood in which they work, keeping knowledge up to date on best practices for learning and, for school principals, creating administrative practices that center on learning for all.

During the 15 years of the programme, this measure was the one that has changed the most in relationship to social justice. At the beginning, this measure was centered on interventions to adapt teaching and referred exclusively to students with handicaps or with learning or behaviour problems. Then it was broadened to encompass support to students at risk and was centered on adaptive interventions. This conception of "students at risk" was later abandoned because it referred only to students' difficulties and did not question the school's responsibility. It rather implied that students are primarily responsible for their being at risk. For example, it was heard in schools that students lack maturity and knowledge, are under-stimulated at home and have difficulties in learning. In spite of educators' good will, the description of the measure reinforced deficit thinking against students from poverty (Archambault, 2010; Garcia & Guerra, 2004).

The following description was "Actions that promote learning for all", *all* meaning every student without exception. This description was not aimed at labeling students as was the case with "students at risk". This change in description was seen as an important social justice change to begin fighting prejudices and deficit thinking against students from poverty and to help schools gain a new representation of students and act according to this representation.

Measure 2: Development of Reading Competency

At the beginning, this measure emphasized that each school team has to ensure that emergent reading and writing are introduced at the preschool level and that the necessary conditions for optimal progression of reading competency at the elementary level are put in place. Later, the view of the reading competency expanded and it became important that every student is immersed in a culture of reading and writing and have access to diverse, rich and complex reading experiences. This difference is important because the idea of a culture of reading and writing exceeds learning letters, syllables and sentences. Rather, it refers to the world of reading and writing so as students experience the meaning of writing, its function and this to what it gives access to human beings. The SMSP offers many training sessions to teachers to ensure that they demonstrate a broad interest in various contexts and experiences to bring to the children.

Measure 3: The Guidance-Oriented Approach

The meaning of this strategy is to have school teams introduce steps that help students assume responsibility for their own educational paths by learning to know themselves and by developing self-efficacy beliefs, by knowing about the labour world, by recognizing their aptitudes and interests with regard to vocational choices and by developing a vision of their own future. The ultimate goal of this strategy is to promote students' active social participation in order to counter social exclusion so often linked with poverty.

Measure 4: Professional Development of School Administrators and the School Team

School principals and school teams must recognize their need for ongoing professional development particularly in disadvantaged areas and its impact on student learning and must also have opportunities for ongoing professional development. SMSP's training sessions aim at a deeper knowledge of the conditions and effects of poverty and its influences on learning in order to develop a better understanding of interventions in disadvantaged areas. Through the years, as SMSP's professional team gained knowledge and understanding of social justice, the concept of social justice (equity, activism and social awareness) was gradually introduced in the professional development activities for principals and their school team, mainly in the sense of acknowledging their own prejudices and false beliefs particularly their own deficit thinking, and taking steps to eradicate these prejudices and false beliefs.

Measure 5: Access to Cultural Resources

For someone living in poverty, it is difficult to use family money to go to a theatre or to visit a museum. Moreover, cultural resources are virtually absent from disadvantaged neighbourhoods. In fact, with very few exceptions, cultural resources like public libraries, book stores, performing arts or theatre companies, science clubs, music, dance or painting schools, movie theatres and so on usually settle in more advantaged neighbourhoods. As a result, children in disadvantaged areas have practically no access to cultural resources, another kind of social injustice that merits fighting against. Thus, the goal of this strategy is to have school teams and students be brought to and visit cultural venues and events in Montréal (wherever they are located) during school hours to instill students with a taste for the arts and sciences and to promote visits to cultural organizations. The goal of this strategy is also to enrich education by creating links between classroom teaching, cultural objects and people involved in the arts and sciences. This enrichment is easily available to students from middle and upper class in their families and neighbourhoods, whereas it has to be initiated and promoted in part by the schools with students in disadvantaged areas (Rothstein, 2004).

The whole community of more than 60 Montréal cultural partners like cultural centers, theatres, museums and scientific centers work collaboratively with schools to elaborate educational cultural projects for the students. In those projects, students were not only consumers of artistic culture but also were taught how to produce cultural works.

Measure 6: Cooperative Links with Students' Families

This is intended to bring families and schools closer together. This strategy involves school teams facilitating closer ties between school agents and family members and promoting parental involvement in children's educational success. Communication strategies, facilitation of parents' role and knowledge of community's resources were to be developed by schools. In particular, school personnel had to work at knowing their students' and their families' ways of life, their relationship with the school and how they apprehend the language of instruction, authority, knowledge, etc. This is what González, Moll, and Amanti (2005) refer to as funds of knowledge. There are people working in schools with children of poverty who do not know how these children live and how they function socially and therefore cannot appreciate the difference that can occur between school's expectations and these children's lives. This is not to say that these children all live in the same way. Rather, this measure was intended to initiate reflection on these differences, whatever they are, and to develop knowledge of children's realities, whatever they be, in order to bring families and schools closer.

As a complement to this measure, an interpreter service has been created for the schools in order to allow better communication with immigrant families who do not speak French (remember that French is the language of instruction in Québec and immigrant children are greeted in French schools) and better integration of the families to school life, avoiding by the same way exclusion of the families from an important part of their children's life.

Measure 7: Cooperative Links with the Community

School teams must ensure that participants from the school along with the family and other community partners (community, social, cultural, institutional or economic organizations) work together to implement the necessary conditions for students' overall development.

This measure, intended to create links between the school and its community in order to better respond to students' needs, has greatly developed during the last decade. School teams along with community partners have worked together to ensure that the necessary conditions to students' global development are in place. This common goal for all partners was the orientation given to the collaboration between partners, putting together every expertise in order to support students and their families.

SMSP's Professional Team

The professional team is composed of either French or English education professionals from the five Montréal school boards and is chosen according to their expertise in intervention in disadvantaged areas. This French and English formal collaboration was a premiere for the Ministère de l'Éducation du Québec. These professionals were responsible for supporting the schools in the implementation of the seven measures while taking into account a needs assessment performed by each school for its milieu. Bringing together different beliefs and different school board cultures from different with linguistic disparities was made possible because each professional adhered to SMSP's philosophy. SMSP was thus seen as the point of intersection for these differences.

School teams, principals, teachers, pedagogical trainers or counselors, pre-K personnel and special education, psychology or speech professionals could all receive support from the professional team. For example, they could receive support:

To understand a single measure or the programme in its entirety
To know about poverty and about its impact on learning
To implement professional development networks

The professional team was also contributing and engaging in development projects with the schools and their community partners and in collaborative research with universities. Many of these projects resulted in the development of tools for the schools (brochures, frameworks for intervention or for innovative projects, short films, guides, films, questionnaires, lists and descriptions of innovative projects, etc.) and of intervention models in order to support measures implementation by the schools.

Finally, the professional team has conceived and developed several training opportunities for the schools. These training sessions were continually infused by research results on effective and relevant interventions. During the years, about 50 of these training sessions were given to the schools mostly extending from 1 to 10 days during the school year in order to ensure depth of reflection and follow-up of action. All of the 184 school principals and more than 900 teachers and 100 other professionals participated in those sessions every year.

SMSP's expert professional team worked with schools and their partners for 15 years in order to empower schools and help them change their way of seeing poverty and learning in poverty, help them change their practices and help them take charge of their interventions and create their own way of making school so that every child from poverty feels he or she has a place in the school.

Allotment of Financial Resources

SMSP also provided additional funding of 12, 2 million CDN$ from the Ministère de l'Éducation du Québec to help Montréal's schools in disadvantaged areas. Eighty-five percent of this money was transferred directly to the schools and 12 %

went indirectly to the schools by the implementation of collective services to answer their needs.

Moneys were allocated to schools according to their area's poverty level and to the number of students in each school so as the most disadvantaged schools would have even more funding than less disadvantaged schools. This funding plan aimed for the equity of resources for schools with greater needs and greater challenges with their families living in greater poverty. Nevertheless, every target school had opportunities for additional funding to help implement SMSP's seven measures.

Evolution and Evaluation of the Supporting Montréal Schools Program

As soon as the second year of life of the SMSP, an evaluation plan was put in place in order to assess its functioning and to evaluate its results. Twenty one university studies were conducted on different aspects of the SMSP: implementation of the programme or of a particular measure, relevance, efficiency, effects, functioning or regulation. Generally speaking, SMSP's evaluation judgment took into account its contribution to students' success by accessing to quality instructional services and adequate learning environments.

One example of the contribution of these studies to the advancement of the SMSP is the one on leading a school in disadvantaged areas with a particular emphasis on social justice (Archambault & Harnois, 2008). The first part of this study was a literature review commissioned by the SMSP in order to evaluate if the measures were still relevant, 10 years later. It strongly supported the finding that making learning a priority, instructional innovation and co-responsibility and principals being leaders for learning and leaders for social justice were amongst the most important leadership characteristics of high-performing schools in disadvantaged areas. But the study led to other interesting findings on school principals' job in disadvantaged areas, particularly concerning social justice, such that it became a research programme in collaboration with the SMSP. We will now turn to this specific research programme.

Research on Leadership for Social Justice

One of the Supporting Montréal Schools Program's mandates is that research be produced on its different aspects. For our purpose here, the research that is relevant is the one linked to measure 4 of the SMSP, *continuous professional development of the school principal and the school team*.

Over the years, our research team at the Université de Montréal has established a collaborative research programme with members of SMSP's professional team and school principals. SMSP's professional team was responsible for offering professional development activities to the elementary school principals working in the targeted schools. We were interested in school principals' job in disadvantaged areas. SMSP's professional team wanted to make sure that what they would offer principals would be related to their professional needs. So upon collaborative reflection, we asked questions about these principals' job: what is the job of a school principal in a disadvantaged area? Is it different from leading a school in a more advantaged area? If so, what is different and what do these principals need for professional development?

We began by searching the literature on principalship in disadvantaged areas, and at first we found only normative papers or opinion papers, but no research papers (Haberman, 1999). So we turned to research on school effectiveness and school improvement in disadvantaged areas. We found in this literature converging results that were useful for our own research (Archambault, Ouellet, & Harnois, 2006). Then we became aware of a set of research initiated by Leithwood, Jacobson, Chapman and their colleagues where they studied successful school principals (Leithwood, 2005), improvement of schools facing difficult or challenging circumstances (Chapman & Harris, 2004) and successful school leadership in challenging or high-poverty schools (Jacobson, Brooks, Giles, Johnson, & Ylimaki, 2007). While these studies repeatedly supported Leithwood and Riehl's (2005) initial findings that four core practices were present in effective leaders even in the most challenging contexts (1 – setting directions, 2 – developing people, 3 – redesigning the organization and 4 – managing the instructional programme), they did not inform us on typical principals' leadership practices nor how principals develop those practices to become effective. And in our research with the SMSP, we work with typical principals, not many of them being effective as transformational leaders if we look at Leithwood's criteria.

Furthermore, given that the main reason the SMS Program exists is to fill the gap between Montréal's disadvantaged students and their more advantaged counterparts, our thinking came to include social justice issues. But we found that this literature did not really take into account social justice. With a little help, this way of studying leadership could have taken into account the issues of social justice in the organization, but it still did not question issues of power and inequities nor did it intend to modify the organization in order to ensure equity. In fact, the latter is better taken into account by transformative leadership theory. For Shields (2010), transformative leadership first implies critical reflection on the part of the leader in order to analyze and understand his reality, then "… action to redress wrongs and to ensure that all members of the organization are provided with as level a playing field as possible—not only with respect to access, but also with regard to academic, social, and civic outcomes" (Shields, p. 572). The emphasis here is on a particular way of looking at things and on the action that will change things to resolve a problem of inequity but that will also organize a learning context so as to provide equity of opportunity and to prevent inequities to happen. In our work with SMSP, we advocate this way of seeing things and embrace transformative leadership theory given the orientations and actions of the SMSP. In fact, transformative leadership theory seems more relevant to SMSP's interventions with school principals.

For research, it became our framework to operationalize leadership for social justice, one of the more important ways to fight inequities for poor Montréal's students.

Nevertheless, although Shields (2003, 2010) has presented us with conceptual thinking about transformative leadership, not much empirical work has been done on the subject, the less being on typical school principals. Shields (2010) and Theoaris (2010) have worked with what we may call outstanding school principals who had already made large changes in their schools, but again research with typical school principals (the majority of school principals) in the process of professional development is badly missing.

Our Evolving Research Program

One of the major goals of our research programme is to know better what is the job of a typical school principal with regard to transformative leadership for social justice (research team) in order to offer principals relevant professional development activities (SMSP's professional team). We have now conducted three studies on the subject and three others are on their way (Archambault & Garon, 2011a, b; Archambault, Garon, & Harnois, 2010; Archambault & Harnois, 2010a). But before describing these studies, let us consider a statement we made about social justice, statement that came out of a literature review on the subject (Archambault & Harnois, 2010b) and that will help us to explore the reality of the schools:

> Social justice in education rests upon these principles 1) equity,…; 2) activism, …, and 3) social literacy, … (Ayers et al., 2009). Equity in systems and in political, economic and social structures with particular respect to the exercise of power, wealth and resources sharing and to the acknowledgement of diversity on all forms leads to social justice. Moral values like equality, justice, democracy, equity and respect and the full and complete participation of every one contribute to this ideal of justice. Instances of absence of social justice leads to questioning supposedly neutral and objective political, economic and social systems and structures reproducing the dominant culture which has been imparted power and resources to the detriment of other peoples. (p. 3)

This statement became our working definition of social justice, and we use it as a basis for our interviewing and observing school principals and in data analysis.

In our first study, we interviewed 45 typical elementary school principals in eight focus groups that met twice. At the first meeting, we asked them to talk largely about their jobs. At the second meeting, we presented principals with the main findings of a review of the literature on performing schools in disadvantaged areas (Archambault & Harnois, 2006) in order to further stimulate responses from them.

We found that school principals saw leading a school in disadvantaged area as having to exert a transformative leadership that advocates social justice. This finding is consistent with the abundant literature on leadership for social justice (Archambault & Harnois, 2009a) and on transformative leadership (Shields, 2003, 2006). Nevertheless, this subject was not discussed by school principals at the first meeting. At the second meeting, we presented leadership for social justice as being one of the main features of performing schools in disadvantaged areas (Archambault & Harnois, 2006) and questioned principals about false beliefs and prejudice that are present in disadvantaged areas (Archambault & Harnois, 2009b; Gorski, 2008; Normore & Blanco, 2006). At first they told us that there were no prejudices or false beliefs in their schools: their personnel had been working in the school for many years and knew the neighbourhood and its characteristics. Upon further questioning, they acknowledged that there were prejudices, false beliefs, deficit thinking and lowering of expectations in their schools. This first and subsequent follow-up questioning process is very important.

Then, principals described their role as being one of fighting against these prejudices and false beliefs in order to protect social justice. Yet, during the two meetings, principals also exhibited their own prejudices and false beliefs very similar, on the whole, to those of their school teams. One could hypothesize that it is our questioning that sensitized them to their school team's prejudices and that, since nobody can be against virtue, it became morally just for them to speak up against those prejudices and to claim they were fighting against prejudices. Furthermore, given that they themselves showed these kinds of false beliefs and prejudices, one could ask if their level of awareness towards prejudices and false beliefs was really that high and if they would have thought of fighting against false beliefs and prejudices without our questioning during the interviews. If so, then it would confirm the role of leadership research for social justice. In any case, the principals described strategies they used to protect social justice in their schools. Some principals reported being extremely active in promoting social justice.

Nevertheless, these findings were astonishing given that the reason for the very existence of the SMS Program was to fight inequities and injustices directed to the poor. So we then wanted to know more about what principals were doing to address these issues. We wanted to further examine how school principals not only fought prejudices or false beliefs but also, more broadly, how they exerted transformative leadership in order to pursue social justice in their schools (Shields, 2010; Theoaris, 2010).

To answer this question, we collected actual behaviour data by observing 12 typical elementary school principals for 3 days during which they were followed by a research assistant who recorded everything they did.

We found that very few observation data were related to social justice; that was and is an interesting finding—though not surprising. Indeed, given the fact that in the first study, principals had to be questioned directly on the subject to even talk about it was anticipating the evidentiary findings. Maybe this was because principals understand only superficially the issues of the dominant culture, of poverty and, more broadly, of social justice. Furthermore, many behaviours could not be categorized as social justice behaviours [or not], because principals' intentions were rarely explicit. And lastly, maybe observing principals for 3 days is not long enough to see all the instances of advocating for social justice. Occasions like principals' speeches at the beginning of the year or a particular principal's interventions happening only once during school year (versus prejudices apparent in the school's personnel room, prejudices against some parents or some ethnic minorities, etc.)

may be not amenable to observation during our short time frame. Thus, it became evident that we had to design a more elaborate framework for studying transformative behaviours and to choose a methodology that would allow us to have access to the motivations and intentions underlying what principals do and when to supplement the many situations that are missed by on-site observations.

With respect to transformative leadership, we agree with and take into account the advice of scholars who claim that transformative leadership for social justice is not only a matter of believing or talking about social justice but more importantly a matter of *doing* something to promote social justice (Beachum & McCray, 2010; Bogotch, 2002; Shields, 2003, 2010; Theoaris, 2010). Compared to outstanding principals who turn their schools around using transformative leadership, our typical school principals' work does not seem to be influenced by social justice. Yet, when they are shown social injustices, they acknowledge them verbally. But clearly, talking about it is not enough.

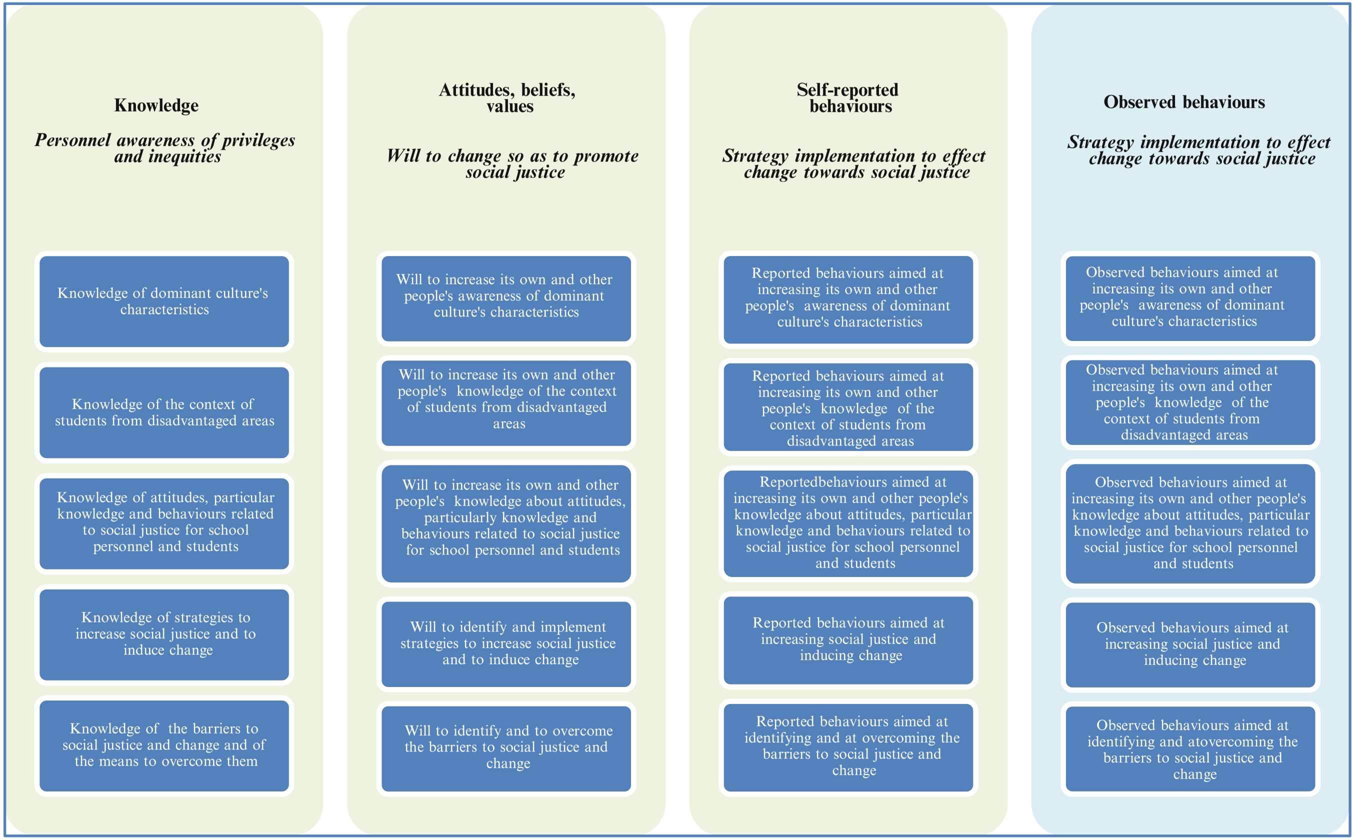
So we then looked at the literature on behavioural change (Eccles, Grimshaw, Walker, Johnston, & Pitts, 2005; Fishbein, 2000; Hagger, Chatzisarantis, & Biddle, 2002) and we integrated it with aspects that have to be taken into account by transformative leaders in order to effect changes in their schools (Shields, 2010; Theoaris, 2009).

We arrived at a new framework containing four core elements of behavioural change: 1 – knowledge, 2 – attitudes-values-beliefs, 3 – reported behaviour and 4 – actual behaviour and skills which focused on five aspects for transformative leadership:

1. Elements of the dominant culture
2. Context of students from disadvantaged environment
3. Personnel's and students' knowledge, attitudes and behaviours linked to social justice
4. Strategies to promote change and social justice
5. Barriers to the promotion of change and social justice and means to overcome them

Each column of Fig. 51.1 represents one of the four elements of behaviour change, whereas each line represents an element to be taken into account by transformative leaders. These elements combine with aspects of behaviour change to show every part of the framework that should constitute the discourse or the behaviour of transformative leaders—or both.

In future research, our work as researchers is clearly to better understand school principals' work. We plan to develop and refine our conceptual framework and to pinpoint the strengths and weaknesses of both data collection methods—interview and observation. As for professional practice, our work is also to help principals be aware of the importance of power imbalance in their schools and to act to improve it. The framework we presented here, to be used to study transformative leadership practices for social justice, can be useful in school principals' preparation. Our initial preparation programmes and professional development programmes for school principals should take social justice into account. We will gain a better idea



Knowledge ***Personnel awareness of privileges and inequities***	**Attitudes, beliefs, values** ***Will to change so as to promote social justice***	**Self-reported behaviours** ***Strategy implementation to effect change towards social justice***	**Observed behaviours** ***Strategy implementation to effect change towards social justice***
Knowledge of dominant culture's characteristics	Will to increase its own and other people's awareness of dominant culture's characteristics	Reported behaviours aimed at increasing its own and other people's awareness of dominant culture's characteristics	Observed behaviours aimed at increasing its own and other people's awareness of dominant culture's characteristics
Knowledge of the context of students from disadvantaged areas	Will to increase its own and other people's knowledge of the context of students from disadvantaged areas	Reported behaviours aimed at increasing its own and other people's knowledge of the context of students from disadvantaged areas	Observed behaviours aimed at increasing its own and other people's knowledge of the context of students from disadvantaged areas
Knowledge of attitudes, particular knowledge and behaviours related to social justice for school personnel and students	Will to increase its own and other people's knowledge about attitudes, particularly knowledge and behaviours related to social justice for school personnel and students	Reportedbehaviours aimed at increasing its own and other people's knowledge about attitudes, particular knowledge and behaviours related to social justice for school personnel and students	Observed behaviours aimed at increasing its own and other people's knowledge about attitudes, particular knowledge and behaviours related to social justice for school personnel and students
Knowledge of strategies to increase social justice and to induce change	Will to identify and implement strategies to increase social justice and to induce change	Reported behaviours aimed at increasing social justice and inducing change	Observed behaviours aimed at increasing social justice and inducing change
Knowledge of the barriers to social justice and change and of the means to overcome them	Will to identify and to overcome the barriers to social justice and change	Reported behaviours aimed at identifying and at overcoming the barriers to social justice and change	Observed behaviours aimed at identifying and atovercoming the barriers to social justice and change

Fig. 51.1 Operational framework for the study of transformative leadership (Archambault & Garon, 2011a, 2011b)

of Québec school principals' needs for training (SMSP's goal). Should training be concerned with their knowledge, their attitudes or their behaviour? Which of the five elements that distinguish transformative leaders from typical principals should be addressed first? Answering these questions empirically should help faculties to renew their curricula and staff to improve their services so as to better suit school principals' needs for professional development and practice in disadvantaged schools. Indeed, we can educate principals better if we take elements of the framework into account. First, professional development should consider the many aspects of behaviour change: principals' knowledge, attitudes, beliefs and values, as well as their reported behaviour and, primarily, their actual behaviour. Knowing better where they stand on each of these aspects will allow us to focus on the most salient points during professional development. Secondly, these aspects of behaviour change should be worked upon in order for principals to increase their awareness of the aspects of social justice they will have to look after in their schools: the elements of the dominant culture and the exercise of power; the context of students from disadvantaged environment; personnel's and students' knowledge, attitudes and behaviours linked to social justice; strategies to promote change and social justice; and barriers and resistances to the promotion of change and social justice, and the means to overcome them. By taking into account each element of this framework when preparing school principals, one could contribute to better development of principals to embrace a transformative leadership role for social justice.

Conclusion

Supporting Montréal Schools Program was created 15 years ago by Québec's ministry of education because of the acknowledgement that schools in poverty were highly concentrated in Montréal. This poverty concentration was aligned with less students' success at school, more learning and behaviour difficulties and greater dropout rates.

For years before, Montréal's school board's demands were that they be allowed more resources to fight what was considered as a major inequity despite the equal share of resources in Québec schools. Additional resources would be used to close the gap between poor children and more advantaged ones in the schools. SMS Program was these additional resources and its mandate was to help schools put in place seven measures that would help reduce this gap.

Since its inception in 1997, SMSP's interventions were oriented towards social justice. At the very beginning the concept of social justice was not used, but with our review of the literature and our research findings shared with the SMS Program's community, it became clear that what was the programme working on was indeed social justice. In fact, research with school principals was and still is intended at knowing better their job, but it became quickly evident that their job had to do with them exerting leadership for social justice. Bringing precision to one of the measures of the SMS Program (measure 4 – professional development of school administrators and the school team), it also served at operationalizing this part of intervention to promote social justice: principals' leadership. Accordingly, interventions to support schools and reflections on these interventions were reshaped with a social justice orientation, and in turn these new interventions helped shape a more complete view of social justice.

Changes in labeling of the measures and in their implementation in the schools are but one example of SMSP's improvement instilled by our findings: widening the concept of learning and applying it to more students in order to avoid exclusion, doing the same with reading and writing in order to open access to a larger number of productive learning situations, helping students take charge of their own educational path, giving students more and more access to cultural resources, creating and maintaining links with parents and the community and, last but not least, using research to better understand school principals job in fighting for social justice in their school in order to offer them professional development situations that help them improve. Needless to say that these changes in labeling were accompanied by a change in SMSP's professional team intervention emphasis. In fact, it is these changes in understanding and emphasis in interventions from the professionals that brought the labeling changes.

Our research on leading a school for social justice has also brought about other changes in the programme. The literature reviews we produced have been rewritten in professional language and distributed to school principals working with SMSP or outside. Our findings, in particular the necessity of an ongoing professional development bearing on poverty (and its impact on learning), social justice and social inequalities (Duru-Bellat, 2009), have been integrated in the professional development sessions offered to teachers, principals and other school personnel (in the last years, 27 % of the 184 schools had poverty as a professional development content, while very few had it 12 years ago). New professional development networks for school principals have been given birth with emphasis on increasing awareness of prejudices and false beliefs, of social injustice and exclusion situations and on interventions to fight them. Furthermore, it became evident that school principals should also benefit from this new emphasis on social justice. This is why a course on leading a school in disadvantaged areas has been created and given to future and in-service principals in Montréal and throughout Québec.

Many conditions have rendered possible this evolution throughout 15 years of intervention. The particularly collaborative way of governance of the SMSP, its confidence in the capacity of the schools to implement the measures and to improve and its orientation towards schools taking charge, the capital role given to school principals as a leader who supports implementation and improvement, the engagement and collaboration of the professional team and its research-oriented decision making and, above all, its clear orientations towards learning and social justice for all.

School principals are pivotal to the implementation of SMS Program's measures in their school. As so they are responsible for changing their school in order to close the poverty gap, for fighting injustice and for promoting equity and justice. Our research programme is instrumental in delineating principals' behaviours related to social justice. As so it helps gaining knowledge of and informing professional development for what should be considered as one of the main intervention of the Supporting Montréal School Program: principals' leadership for social justice.

Chapter 52

Research for Social Justice in Contexts of Student and Family Homelessness

Peter M. Miller

Dorothy Day once claimed that “Our problems stem from our acceptance of this filthy, rotten system” (Gioseffi, 1988, p. 103). Her succinct assessment is noteworthy in that she attributes society’s wide-ranging challenges to a flawed *system*—one that actively undermines countless people’s chances to thrive—and she implies that we are culpable for its existence. She attaches our collective agency to her problem identification; we can either acknowledge and work to change the system—a system of social injustice—or we can continue to tolerate it. My views of social justice are largely informed by Day’s. I believe that conditions of justice are furthered by cultures and structures that afford all people fair opportunities to enjoy society’s benefits. I think these cultures and structures are animated by ethical action and that this action must be particularly responsive to those whose opportunities to thrive are most fragile. Given the historical pervasiveness of injustice in our society and the ongoing dominance of established power structures, such action must unfold consistently and across a multitude of spaces and methods. Educational researchers clearly have a role in this work.

Finding Niches in Social Justice Research

Efforts to learn about and promote social justice in education research unfold at different levels of abstraction and with diverse conceptual, theoretical, and methodological foci. In this chapter, I describe how my work is situated within these larger areas.

Levels of Abstraction

Social justice research is conducted at several different levels of abstraction in the field of education. Perhaps most common among the empirical work are micro- and macrolevel studies. Microlevel work focuses on issues of justice "at the ground level"—that is, as they are situated in particular schools, neighborhoods, and organizations. I have conducted a number of microlevel case studies of schools, neighborhoods, and community-based organizations. For example, one of my papers (Miller, 2008) examined the ways that leaders attempted to recognize and respond to community residents' voices in the context of an emergent university-school-community partnership. What such work often lacks in external validity, or the extent to which its findings can be generalized to other settings, it often makes up for its rich, descriptive nature. It can reveal the everyday subtleties and complexities that shape social and educational opportunities within bounded spaces.

Other social justice works take on more macrolevel foci. More so than microlevel work, they examine "big picture" trends, issues, and ideas. A noteworthy example of macrolevel scholarship is Berliner's (2006) widely disseminated article entitled "Our Impoverished View of Educational Reform," which delineates an array of national and international trends in economics, health, and education in order to highlight conditions of social injustice. Some macrolevel work takes on a more policy-specific focus, including my (Miller, 2011a, 2011b) examination of the federal McKinney-Vento Homeless Assistance Act. Such efforts provide key insights to leaders and policy makers who engage issues of social justice at multiple levels and keep them abreast of the larger contexts in which local and regional action develops.

Along with micro- and macrolevel matters (which clearly intersect), I am especially interested in learning about *meso*-level issues of justice. That is, I examine the ways that key social and educational organizations work together and attempt to understand how their boundary-crossing capacities facilitate and/or inhibit social justice. Such meso-level analyses are consistent with the conceptual, theoretical, and methodological orientations of my work.

Conceptual Foci

Many scholars' social justice work is tethered to particular conceptual areas. That is, rather than talking about social justice in the abstract, it is examined in light of a particular issue, policy, event, or occurrence. Amid a panopoly of overarching social justice "issues"—such as race, class, and gender—I focus most closely upon issues of student and family homelessness in the USA.[1] I want to learn about homeless students' and families' education experiences—and how they are associated with the ways that communities develop collaborative and/or integrated structures to serve them. I view the context of student and family homelessness as being an increasingly relevant social justice issue in the USA for three reasons: (1) students who experience homelessness occupy the far end of the continuum of social and educational risk, (2) more schools and communities are facing significant challenges relating to homelessness than in recent years, and (3) there is a lack of "differentiated" knowledge about how to best address homelessness in school settings.

---

[1] While I am interested in examining issues relating to schooling and homelessness other countries as well, my time and resources have not been sufficient to begin this work yet.

Homeless Students on the Continuum of Risk

Homelessness has been shown to have wide-ranging deleterious effects upon parents and children alike, but amidst these diverse situations—whether related to financial duress, domestic violence, substance abuse, etc.—children are almost always among the most innocent and vulnerable of victims. Wong et al. (2009) explained:

> The reality that vulnerable children and youth are among the homeless debunks the public generalization that homeless people do not take personal responsibility for their actions—that they choose to be homeless. The homeless population in fact includes children and youth whom a complex set of circumstances beyond their control—and often understanding—has rendered without a home. Homelessness for this group is traumatic, hurtful, and often terrifying. (p. 56)

This trauma, hurt, and terror—which I witness just about every time I visit a shelter—accompany students to school. It is not surprising, then, that homelessness is associated with an array of negative school outcomes such as low attendance rates (Maza & Hall, 1990; Rafferty, Shinn, & Weitzman 2004; Rubin & Erikson, 1996), poor grades and achievement scores (Cauce, 2000; Masten et al., 1997; Rafferty, Shinn, & Weitzman, 2004), and social stigmatization (DeForge et al., 2001). Findings from the National Center on Homeless Education's ([NCHE] 2010) annual report, for example, indicate that homeless students in school districts that receive federal McKinney-Vento Homeless Assistance Act funding throughout the USA score quite low on academic achievement tests. While these numbers are not significantly lower than those of students who are poor but housed, they represent only a sliver of homeless students' school-related challenges. My comprehensive review of the research on schooling in contexts of homelessness (Miller, 2011a), for instance, found that homeless students appear more prone to social isolation and school mobility than just about any other segment of the wider student population—relegating them to positions of extreme risk for academic failure.

Increasing Prevalence of Homelessness

A second reason that student homelessness is an important social justice issue to address is that it has increased at a startling rate in recent years. NCHE noted that nearly a million students were identified as homeless in US schools in 2010—an 18 % increase since 2007. In fact, during that same period of time, 42 of 50 states

Table 52.1 States with increases of at least 20 % in students identified as homeless between 2007–2008 and 2010–2011 school years (NCHE, 2011)

Alabama	Alaska	Arizona	Arkansas
Hawaii	Idaho	Illinois	Kansas
Maryland	Minnesota	Nebraska	New Hampshire
Oklahoma	Pennsylvania	South Carolina	Wyoming

noted increases in the number of students identified as homeless, and 16 have witnessed increases of over 20 % (refer to Table 52.1). Within these states, increases have been seen in urban, suburban, and rural school districts, indicating that homelessness is not just an "urban" issue, but one that touches most communities. As we seek more socially just school and community systems of practice, then, matters related to homelessness are to be increasingly centered in education research agendas.

Understanding Diverse Conditions and Practices

Finally, in addition to the fact that homelessness is associated with widespread school problems and that more and more students are experiencing homelessness throughout the country, its pertinence to social justice education research agendas is heightened given the relative paucity of empirical understandings we have about the diversity of homeless students' residential contexts and the types of practice that can best engage them. The major aims of my research agenda include the parsing out of such matters.

A first step in this parsing out is to move the field beyond categorizations of the homeless as a monolithic group of chronically mobile and/or dysfunctional individuals. Widely disseminated works by Bahr (1973), Bahr and Caplow (1973), and Rossi (1989), for example, were noteworthy in conceptualizing homelessness as a "condition" witnessed among swaths of highly troubled and often self-destructive individuals. Presented as a population consisting largely of socially detached single men residing in distressed urban corridors, such conceptualizations of homelessness concurrently fueled and jived with common public perceptions of the homeless. Such perspectives were perhaps crystallized in Ronald Reagan's 1983 framing of homelessness as a "lifestyle choice" (Foscarinis & McCarthy, 2000). In recent years, however, more nuanced attempts have been made to move beyond such portrayals of the homeless as monolithic assemblies of dysfunctional individuals. Significantly, a number of studies in the 1990s examined and/or produced different typologies of homeless people. Kuhn and Culhane (1998) suggested that the most noteworthy of these typologies include (1) Grigsby and colleagues' (1990) model that clustered the homeless into the "recently dislocated," the "vulnerable," the "outsiders," and the "prolonged"; (2) Mowbray et al.'s (1993) model that identified the "hostile/psychotic," the "depressed," the "best functioning," and the "substance abusing";

and (3) Humphreys and Rosenheck's (1995) model that clustered the homeless as "alcoholic," "psychiatrically impaired," "best functioning," and "multi-problem." These typologies recognize key differences among the homeless but move only a bit beyond earlier homogenizing conceptualizations, in that, like the previous work, they focus almost exclusively on individual characteristics.

Kuhn and Culhane (1998), building upon the work of several others (Fischer & Breakey, 1986; Hopper, 1989; Jahiel, 1992; Koegel, 1987; Lovell, Barrow, & Struening, 1984; Morse, 1986; Rossi, 1989; Snow & Anderson, 1987; Sosin et al., 1990), attempted to account for more diverse factors related to homelessness by testing a model breaking homeless case profiles into three patterns: the transitionally homeless, the episodically homeless, and the *chronically* homeless. The authors refer to the *transitionally* homeless as those who are forced to enter shelter systems for short periods of time—and usually just once—due to some traumatic life event. Those who fit this category are least likely among the wider homeless population to have significantly destructive and/or debilitating personal characteristics. The *episodically* homeless are described as those who "shuttle in and out of homelessness" (Kuhn & Culhane, p. 211) and are more likely to experience mental/physical health and abuse problems. Finally, the *chronically* homeless are characterized as people who are "entrenched in the shelter system, and for whom shelters are more like long-term housing than an emergency arrangement" (p. 211).

Testing this typology of homelessness in New York and Philadelphia, Kuhn and Culhane found that 80 % of the homeless population was composed of young, transitionally homeless individuals who were less likely to have physical/mental health or abuse problems than those from episodic and chronic homeless groups.

While such research that tests and/or puts forth various typologies of homelessness appears to have utility in debunking deficit-oriented depictions of the homeless as a unitary group—instead focusing on incidences and durations of homelessness, it has limitations in that, to date, it has focused mostly upon *adult* individuals who are staying in *shelters or on the street*. There is, in fact, a dearth of work that has taken differentiated approaches to learning about *family* homelessness in different types of shelters as well as in conditions of shared housing. Findings from such work could be vital to the development of responsive school practice.

In concert with this continued examination of diverse family and youth contexts of homelessness, I consider how schools—and the key actors within them—can best respond. While there is an abundance of articles that describe or examine the roles of school counselors, social workers, and teachers (refer to Table 52.2), we know far too little about how these roles intersect within school contexts and, just as importantly, how they intersect with outside-of-school organizations as they attempt to serve homeless students' needs. Further, there is a striking shortage of scholarly work that addresses school administrators' work around issues of homelessness. As such, I have studied the collective work of school and community leaders serving homeless students and families—an agenda that I continue to pursue in my current line of inquiry.

Accordingly, given well-documented school struggles of students who experience homelessness, the elevated nature of the crisis in recent years, and the lack of

nuanced understanding of homeless students' conditions and/or needs, work that examines homeless students' experiences—and the systems that serve and/or inhibit them—has a clear place in the wider body of social justice research in education.

Theoretical Foci

Theory shapes the ways we examine, analyze, and discuss particular issues of social justice. Critical theory is particularly relevant and visible in the wider body of social justice-oriented education research. Critical Race Theory, feminist theory, and critical pedagogy, for example, reveal and critique structures that undermine justice. While some of my work has drawn from elements of Paulo Freire's critical pedagogy and, in turn, is related to other specific critical perspectives in highlighting some "dirty, rotten" aspects of the education system, my studies of homelessness in contexts of education have most frequently been guided and informed by distributed leadership theory and social capital theory.

Jim Spillane's work on leadership as a distributed practice has structured the ways I consider leadership in contexts of student and family homelessness. Spillane (2006) depicts leadership as a practice that unfolds in the interactions among leaders, followers, and their situations over time—a perspective that provides appropriate insights for my meso-level inquiry because it focuses on more than simply the attributes and/or actions of those in formal organizational leadership positions. Rather, it emphasizes the central relevance of other actors and *the situations* in which practice occurs. Leadership is depicted here as a multilayered relational practice that is notably shaped by specific school—and, in the case of my research on homelessness, community—contexts. Spillane explains the fundamental relevance of the situation from the distributed perspective:

> The situation is not simply a context within which school leaders practice; it is a defining element of practice. The situation – tools and routines of various sorts – shapes leadership from the inside out rather from the outside in…In this view, *the situation does not simply affect what school leaders do*; *in interaction with leaders and followers*, *the situation defines leadership practice* (p. 22).

Importantly, the distributed perspective calls for understandings about how aspects of the situation enable and constrain leadership practice "and thereby contribute to defining it" (p. 19).

Learning about leadership in homeless education contexts from a distributed perspective necessitates deep understandings of key school actors and the organizational structures in which they operate but also understandings of the homeless families themselves. The distributed perspective centers the relevance of both micro- and macrolevel data in describing the situation. For example, Nunez and Fox's (1999) "snapshot of family homelessness" was useful in providing broad insights into the scope and scale of homelessness around the United States. The authors substantiated previous indications that there is great variance in homeless populations both within and between cities. (For instance, they found that although only 68 % of homeless adults across the country had high school degrees, homeless adults in Atlanta, GA, and Salem, OR, graduated at rates of 77 and 75 %, respectively.) Because the backgrounds, experiences, and perceptions of parents and other key stakeholders are important elements of the homeless education situations in these cities, such findings could have significant implications for the ways educational leaders engage homelessness in their schools. In fact, from a distributed perspective, these backgrounds, experiences, and perceptions—which are quite similar to "the situations" in which I have examined leadership in contexts of homelessness—actually shape leadership practice.

In addition to distributed leadership theory, much of my inquiry has been informed by social capital theory. Specifically, I have drawn from the work of James Coleman, Pierre Bourdieu, Mario Small, and, especially, Nan Lin to examine families' and organizations' ties that shape homeless students' school-related experiences. Given the fundamental role of Lin's work in shaping my inquiry, I describe how several of his constructs are particularly useful for the study of student and family homelessness.

Lin (1999) defines social capital as "resources embedded in a social structure which are accessed and/or mobilized in purposive actions," (p. 35) specifically identifying the three ingredients to social capital as (1) resources embedded in a social structure, (2) accessibility to such social resources by individuals, and (3) mobilization of the social resources by individuals. Lin's network theory is especially useful as an analytic lens for my work because it can help uncover the complexities of families' and students' relationships with and deployment of education-related resources in a way that can yield new insights for educational theory and practice.

Embedded resources, in this instance, are conceptualized as being situated in families, schools, shelters, and other community-based educational resources (after-school programs, early childhood intervention programs, etc.). I attempt not only to surmise *if* such resources exist but to learn about factors such as the *heterogeneity* of these resources and their *institutional attachment*. Lin (1999, 2000) claims that these matters are often noteworthy when considering individuals from non-dominant backgrounds because they tend to have social capital networks that are homogeneous (they know mostly people who are like themselves), limited in range (they do not know many "highly ranked" people), and institutionally unattached (they do not have meaningful roles or affiliations with resourceful groups/organizations). Lin (2000) describes these as issues of "social capital inequality" that restrict individuals' life opportunities. According to Lin, women, African Americans, and the poor tend to be particularly limited by such resource-poor networks. They often rely upon family and kin networks—networks that are helpful in many ways, but can also limit upward mobility because they often lack "bridges" or "structural holes" to new personal, professional, and/or educational opportunities.

Accessibility, the second of Lin's (1999) social capital ingredients, is useful as an opportunity construct. That is, embedded educational resources (that are situated in schools, shelters, etc.) must be known by and available to students and their families in order to be made relevant. If families are unaware that resources exist and/or they perceive resources and relationships to be unavailable, such resources cannot be made meaningful to them. A range of factors such as public/school policy, community context, and family conditions can affect accessibility.

The third ingredient of Lin's social capital, mobilization, refers to the actual use of these resources/relationships. That is, a family might know about a program and understand that the program is one for which they are eligible, but unless they actually use that program, they would not be mobilizing it. Figure 52.1 portrays the interrelated nature of the three central elements of Lin's (1999, 2000) theory.

Accordingly, I draw from Lin's work to analyze the broader structures and relationships that affect diversely situated children and their families as they engage schooling processes. This theory leads me to ask broad research questions such as: What is the nature and extent of education-related relationships and resources available to students and families during periods of homelessness? What factors shape these resources' accessibility to students and families? and how and to what extents and effects are accessible resources mobilized?

These social capital-informed questions have been particularly useful in my research that compares families social and educational situations if different

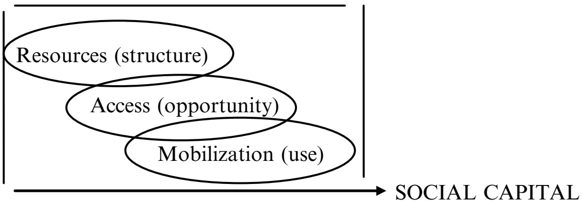

Fig. 52.1 Lin's elements of social capital

contexts of homelessness. They have allowed me, for instance, to consider how and to what extents students and families who are in "doubled-up" conditions (sharing housing with others) experience homelessness and schooling differently from those who are in shelters or other formal residential programming. I have found that, from a network perspective, doubled-up conditions—which, like sheltered ones, are often marked by stress, turmoil, and mobility—are especially concerning for several reasons. First, families' relationships in these contexts are typically geared toward serving only what Lin (1999, 2000) refers to as "expressive" ends. As opposed to "instrumental" action, which is directed toward bettering one's life conditions (i.e., better job, education, etc.), expressive action serves maintenance purposes. It seeks to keep things as they are or, at the very least, to keep them from getting any worse. Accordingly, families are unlikely to be actively seeking or, in turn, gaining educationally expanding resources or relational supports from their surroundings when they are doubled up with others for extended periods.

On a related note, a second concern is that *even if* families are seeking life improvement (and, specifically in this context, educational improvement), doubled-up settings do not appear to naturally facilitate access to "rich" relationships and resources that are heterogeneous and/or institutionally attached. Doubled-up settings provide families with few cues about how to access or mobilize educational resources (such as those afforded by the McKinney-Vento Homeless Assistance Act) and, by nature of their out-of-the-system statuses, can complicate schools' efforts to identify and serve them. This is especially relevant considering Lin's (2000) finding that women, African Americans, and those who are poor—all of whom are significantly overrepresented among the homeless—are most likely to have networks that are "resource-poor" and devoid of institutional support. They need connections to school resources and relationships and often do not receive them in doubled-up settings. Accordingly, while shelter/agency resources such as in-house tutoring programs, daycare services, and tools of practice (books, computers, supplies, etc.) are likely of utility to students and families experiencing homelessness, a social capital perspective would suggest that shelters'/agencies' greatest utilities rest in their capacities to connect the homeless to sustainable school and community resources. These utilities are not found in doubled-up settings.

While both distributed leadership theory and social capital theory have been central in framing my research on homelessness and education, there is much space in the wider field of student homelessness for more work that is rooted in—and advances—theory. Indeed, the lack of theoretically grounded work is a major gap in this area of research, for only a handful of the countless articles and reports on student homelessness are substantively guided by a particular theoretical framework or philosophical schema. Whether used in tightly deductive or more loosely guiding manners, theory has great potential for organizing and focusing inquiry and for providing a rigorous foundation upon which new learning can occur. Importantly, theory can also facilitate greater transferability of research methods and findings across places and disciplines, making prominent differences between urban, suburban, and rural settings—and education, social science, and medical/health science fields—more navigable. Theory can help us move toward collective, yet nuanced, understandings of common issues. Calabrese-Barton's (1998) work, for example, draws from feminist and liberation pedagogy theories to examine the teaching of science to students who are homeless. Although it is focused on one narrow area of practice, her research offers meaningful insights to practitioners and scholars in diverse fields because matters of oppression, voice, and empowerment—which are central to her theories of choice—are relevant to almost all who are homeless or serve the homeless.

Methodological Considerations

Finally, social justice research in education is executed with a range of methods. Qualitative research has found a central place here in that it allows researchers to vividly present participant voices and experiences. Jonathan Kozol's *Rachel and Her Children*, for example, provides a rich, moving description of homeless families' experiences in a crowded, dirty New York City high-rise and contributes a deep, historically rooted understanding of complex policy, poverty, and opportunity intersections. For such reasons, I use mostly qualitative methods when I attempt to learn about inter-organizational relationship networks in contexts of student and family homelessness. I value—and attempt to center—the multi-positioned voices that shape homeless students' chances to thrive. In this way, qualitative methods ensure that my interrogation of *structures and systems does not* obfuscate *my ultimate commitment to the particular, to individuals*, for, as eloquently stated by Dorothy Day, "It is *people* who are important, not the masses" (Day, 1952/1980).

In my examination of homeless families' education experiences in one urban region, for example, a number of mothers cited shelter-based after-school programs as major asset in their children's learning and development. They provided rich insights about how and why these programs helped their children—insights that would have been difficult to gain without narrative data. The following two excerpts provide examples:

> The after-school program here is very, very helpful. It's tremendous. Because they're *here*. When we're getting off work or coming back late from school, they're *here*. It's wonderful. I hope it never changes – even for families who come here years from now. … They have a reading program that is special. My daughter kind of liked reading in school, but she *loves* reading here – and it brought her grades up in school. It's great!

> They’ve been really, really great with my daughter. There was a time when the children were struggling with spelling words and the staff here designed a curriculum to help them with that – to incorporate their spelling words into the after-school program. I thought that was great and my daughter’s grades improved because of the extra support she received here. And the reading program where the kids can check out books is great. My daughter comes home with all kinds of books and she loves it. We read them together, she comes back and gets new ones and we do it again… It encourages children to read and go to the library…And the computer center is really great.

As noted, I have also found qualitative inquiry to be useful in shedding light on the procedural complexities of inter-organizational work that aims to benefit those who are experiencing homelessness. Interview data can address questions such as: How do productive, resource-rich relationships unfold across organization boundaries? and how do entrenched systems of policy and practice facilitate and/or inhibit collaborative action? These questions were central to my (Miller, 2009) study of inter-organizational leadership in contexts of homelessness, in which, for example, shelter workers voiced frustration with schools that they perceived to be nonresponsive to homeless students’ needs. The following quotes were representative of many others gathered from that study:

> We have children who are transferring often, who haven’t made friends in the schools, haven’t done well. Our kids have a lot of problems with other children when they go into the schools. Our mothers are fired up wanting to call people, wanting to take names, wanting to find help … but who do we call? Who do we talk to deal with it? There’s not a lot of communication when a child is failing, especially if it’s one of our children. There are all kinds of excuses …’I don’t know the mailing address. I didn’t have the phone number. This wasn’t right. That wasn’t right.’ (p. 239)

> Our schools are all used to working in compartments. And when something throws them for a loop, they fly off the lid and don’t take responsibility. But in the world of the homeless, the unusual is the norm. The school district needs to respond immediately. (p. 239)

I have found that narrative data can be further interrogated, built upon, and complemented in a range of ways. Many researchers, for example, gather observation and documental data to complement interview data and increase the trustworthiness of their work. In addition to these, I have also found geospatial and participatory methods to be useful. For instance, I used geospatial analysis to probe claims of inequitable student “opportunity zones” in one city (Miller, 2011a) and, in another study (Miller, 2011b), attempted to learn more about mothers’ claims that their transportation options were inadequate by actually riding all their local bus routes myself. Such data can move beyond confirmatory purposes, lending researchers multilayered, experiential understandings of their work.

Amid the promise of qualitative inquiry in this context, however, I should note that qualitative research in settings of family and student homelessness faces at least two significant “access” issues. First, although researchers must develop deeper understandings of how students who are doubled up can better access and mobilize educational resources, it is highly difficult to identify critical masses of these students and to study them over extended periods of time. Second, even when students who are homeless are identified and their families agree to take part in studies, it can be difficult to gain “authentic access” to their actual lives and the issues affecting them. Douglass (1996) provided an eloquent description:

> Much of the interviewing of children who are homeless has been conducted by interviewers who are unfamiliar with the children, in settings that are often overcrowded, noisy, and busy…It is critical to understand the impact that an unfamiliar interviewer or a hectic environment may have on a testing situation and on young children’s behaviors and ability to demonstrate competencies. Parents know how different most children act in an unfamiliar setting with unfamiliar adults. A usually focused or thoughtful child may become silly, non-attentive, or impulsive. (p. 745)

Douglass’ (1996) insights here are noteworthy, in that only a handful of the hundreds of articles and reports I have read in this area acknowledge this subtle, yet fundamental challenge—that the very presence of researchers in homeless families’ lives might alter their behaviors. There is a general dearth of researcher reflexivity. This, in fact, emerges as a clear weakness in the broader field. Researchers need to reflect upon their own roles and presences in the lives of the homeless and to consciously cultivate valid, authentically representative designs and methods for learning about these individuals’ and families’ everyday experiences with education.

Implications of My Work

Regardless of the methods or theories I employ or the levels of abstraction at which I write, the ultimate purposes of my work are to improve students’ and families’ education-related opportunities during and after their experiences of homelessness. I hope to help further inform the fields of research and practice about how conditions of social injustice—such as inadequacies of affordable housing, jobs, quality schooling, and transportation—lead to and perpetuate homelessness. I hope to facilitate systematic collaboration and coordinated action that ensures that fewer families’ fall through cracks in service. In particular, my work is directed toward the differentiation of service to students and families. That is, I seek the development of more nuanced systems of engagement that recognize and respond to the diversity of homeless conditions in appropriate fashions.

While my work—like other social justice-oriented research that critiques entrenched systems of power and privilege—is unlikely to go uncontested, I am encouraged that it appears to have had some effect on the field of practice. Most notably, the recommendations from my extensive research and evaluation work in Pittsburgh, Pennsylvania contributed to the development of the Homeless Education Network (HEN), a consortium of resourceful agencies and organizations in the Pittsburgh region that works to increase students’ and families’ education experiences amid conditions of homelessness. Specifically,

> HEN connects and advocates with interested parties, facilitates discussions among partners, serves as a catalyst for action, creates effective models, brokers resources, and provides a forum for community discussions to create action — all to ensure children and youth who are experiencing homelessness are enrolled, attending, and succeeding in school as mandated by the McKinney-Vento Homeless Assistance Act. (HEN Mission statement)

After 2 years of implementation, hundreds of Pittsburgh area families have benefited from HEN's burgeoning influence in the region. Further, findings from the study that informed HEN's development were disseminated by the Homeless Children's Education Fund, leading to pending changes in state-level legislation on how students' education rights are protected and furthered in Pennsylvania.

Therefore, although social justice research is advanced in contested spaces, it can indeed lead to meaningful change. I firmly believe that such action—that which expands opportunity for those who suffer the brunt of inequity and whose life conditions are most fragile—ultimately benefits us all, for the "full humanization" (Freire, 1970) of all people is dependent upon our fixing of our "dirty, rotten systems."

Chapter 53
Towards an Understanding of Social Justice in Our Schools: Globalization, Inclusive Leadership and the Transformation of Schooling

Robert E. White and Karyn Cooper

Introduction

This article attempts to view schooling through the lens of social justice and offers some small considerations regarding how the educational system can be made more equitable for all students. The term "schooling" refers to the process of education provided by an educational institution, whereas "education" does not necessarily take place only within schools. As has been suggested by more than one pundit, education has become reduced to schooling and schooling has become reduced to a measurement of outcomes. Now, this is only problematic if one believes that a fundamental purpose of schooling is to get an education that not only prepares a student for work but for life as well. It is the purpose of this article to describe and discuss possible models and strategies that may be adopted in order to assist schools to become places where issues relating to schooling and social justice can be engaged with, explored and enacted.

Globalization and Schooling

Because it has long been known that schools assist in the replication of dominant culture values (Barlow & Robertson, 1994; Cummins, 1995; Wortham, 1995; Young, 1995), it is vitally important that educators become cognizant of shifting patterns in world societies. Now, more than ever before, societies around the world

are becoming connected through technology. But why has this become such an issue in the world of education today? As a result of the proliferation and advancement of technologies that some say has heralded in the postmodern era, time and distance have fallen softly dead as globalization has overseen a process of amalgamation of disparate world economies in the form of global trading blocs. Due to the ramping up of competition between competing economies, there has been a perceived need on the part of governments worldwide for economies to become ever more vibrant. In fact, corporations exist within the world that have the ability to not only topple governments but also to make the notion of "country" an obsolete term (Castells, 2000). Globalization isn't just about turning services into commodities for trade or about "harmonizing" in a race for the bottom in jobs and social services, it is also about turning the purpose of schools to the values of the market, as shown in the Asia Pacific Economic Consortium's (APEC) education agenda for schools to become more open to business initiatives (Keuhn, 1997). It is also about fostering the idea of a competitive marketplace and training a labor force geared to reaching the economic goals imposed by industry and business groups. As a result, there is growing pressure to make the perceived needs of business and industry the primary goals of schooling in order to increase profit margins and the accumulation of capital rather than to address imbalances in the lives of minority groups (Fernandez-Balboa, 1993) and individuals through positive social justice initiatives.

While there may be many positive outcomes to globalized societies, the problem is that, as a result of educational policies emanating from issues relating to increasingly globalized societies, schooling is becoming increasingly standardized not only in terms of assessment and evaluation but also in terms of processes, policies and procedures. As world cultures, pushed by superimposed technological imperatives, succumb to homogeneity; as transnational companies, dependent on constantly expanding markets, gain greater control over government decision-making processes worldwide; and as the division between the rich and the poor of the planet widens, it is crucial to reconsider what we expect our students to inherit and become part of (Bates, 2001). Therefore, it is of vital importance that administrators, teachers, students and other stakeholders in the school system become even more involved as designers of our social futures (Barrell, 1997), especially as schools experience ever-increasing diversity and difference (Bates) around the globe.

Although education is seen as having transformative potential for society through its relation to the "knowledge economy," administrative thinking and action can still be informed by considerations of curriculum, pedagogy and evaluation, within the context of concerns over difference, social justice and democratic development for students not just locally, but nationally and internationally as well.

If corporations are able to superimpose their own values or the values of the marketplace on the educational system, then, in effect, it is the corporations themselves which are assisting not only in the reproduction of dominant culture values but in the creation and replication of new marketplace values. Differences in associations of ideas and ideologies between educators and their counterparts in the corporate world may indicate that opportunities exist for corporate interests to manipulate school culture, to exert influence over teaching and testing, and to encourage their own brand of dominant culture values (Barlow & Robertson, 1994; Boyles, 1998; Winner, 1997; Wortham, 1995). At issue is the question of the role of social justice within competing notions of greater order and control over the process of schooling.

Lack of information on the part of teachers regarding corporate involvement in education may represent a sort of hegemony (Apple & Christian-Smith, 1991; Giroux, 1983) which may serve to marginalize students who do not have cultural capital similar to their classmates (Livingstone, 1999; Wortham, 1995), who therefore cannot gain access to the dominant culture, and who will continue to be a powerless, voiceless and oppressed underclass within the society in which they live (Corson, 1995). As an issue of social justice, which has implications for us all, it is vital that educators, specifically administrators and teachers, understand whose interests educational policies are really serving, as well as who the major beneficiaries of these policies are.

Social Justice and Schooling

As education becomes commodified around the world, students are being forced to become more competitive. As a result, some students may experience greater levels of anxiety, social and physical disorders that can result in student (and teacher) burnout, disengagement and hopelessness while others, who have the necessary capitals to succeed under such circumstances, thrive. Such circumstances breed an inequitable society, a society that is meritocratic rather than socially just.

Social justice is generally considered to relate to the creation of a society based on principles of equity and equality, of understanding and valuing human rights, and recognizes the dignity of every individual. For purposes of discussion, social justice is considered to be an ideal condition in which society members have the same rights, security, opportunities, obligations, social benefits and fair treatment (Garner, 2004). The emergence of concepts relating to social justice occurred mainly in the latter part of the twentieth century and serves to distinguish between those who are more privileged in society and those who are not. It has long been maintained that if the society were truly equitable, all people would be equal. By the same token, if everyone within a given society were truly equal, then there would be no need for such a term as social justice. Unfortunately, such terms and such conditions do exist within societies around the globe, and, consequently, “social justice” can devolve to nothing more than a politically correct term that really only identifies those who are excluded, as if those who are marginalized require further marginalization in order for false prophets to introduce personal agendas that have been referred to as “social justice for me.”

Because schools represent, to some extent, microcosms of society and because schools are one of the last bastions where large numbers of impressionable children congregate, these institutions are positioned to be able to promote dominant culture values, values that are being drawn increasingly in line with market place and consumer values. On the obverse side of the coin, schools are also in a position to become more proactive in terms of attempting to create a more inclusive society that has, at its core, a valuing of social justice. Although schooling tends to promote dominant culture values, the challenge is for schooling to become proactive rather than reactive. Our schools need to become ever more inclusive and socially just in order to engage minorities, if we are to survive as a society. As Bauman (2002) notes, we need to sacrifice in order to subscribe. In this case, we need to sacrifice our prejudices in order to belong to a society our children would want to inherit. Consequently, individuals, groups of individuals and minorities must be able to "fit in" without fear of assimilation and destruction to the cultures that they have brought with them and which continue to be a valuable and valued part of their heritage.

Deinstitutionalizing Schooling

What follows are suggestions that may help to situate schools as places of education. Hopefully these ideas will help to forge a middle ground or provide a point of balance in the face of encroaching globalization on the one hand and the time warp that schools find themselves in terms of attempting to apply outdated ideas and processes in an era of increasing demands and conflicting notions about what "good" schooling looks like.

The first concept that appeals to us is the idea of schools as places of safety for students and educators (Cooper & White, 2004). Building a community is a term that can frequently be heard around schools, but what does this look like in action? First of all, the school must commit itself to creating a safe haven for all. This can be agreed upon at a general staff meeting, but it is up to each individual teacher and the administration to keep the profile sharp. Modeling respectful behavior goes a long way in assisting students to feel that they can bring forth issues, engage with learning in a meaningful way, and live and work in a kind and supportive atmosphere. It won't happen overnight but, if teachers and administrators take the time to get to know their students and their students' needs and wants and model respectful behavior, educators will be better equipped to deal with interpersonal issues and will be able to plan lessons that take student needs into consideration. This is the first step towards differentiated learning and a more socially just school system.

Fullan (2001), however, suggests that achieving lasting change is elusive because of the isolation faced by teachers and the competing pressures of the reality of schooling in these global times. Ainscow and Sandill's (2010) article on inclusive leadership in education looks at creating an inclusive and, therefore, a socially just culture within a school that helps to eliminate social exclusion stemming from negative responses to diversity in race, social class, ethnicity, religion, gender and ability. These authors believe that education represents a basic human right and is the foundation for a more just society. However, within any school:

> The development of inclusive practice is not…about adopting new technologies of the sort as described in a fair amount of existing literature.… [I]t involves social learning within a given workplace that influences people's actions and the thinking that informs those actions…. The implication is that a methodology for developing inclusive practices must

> take into account social processes of learning that go on within particular contexts. It requires a group of stakeholders within a particular context to look for a common agenda to guide their decisions of practice and, at much the same time, a series of struggles to establish ways of working that enable them to collect and find meaning in different kinds of information. (Ainscow & Sandill, 2010, 403)

Ainscow and Sandill conceptualize the school as "a community of practice" defined as "a social group engaged in the sustained pursuit of a shared enterprise" (2010, 403) and is seen by these authors as a way to negotiate meaning through social action. Angelides, Antoniou, and Charalambous (2010) provide conditions for success in inclusive and socially just education through a case study of a school in Cyprus. In such a school, difference is welcomed as a learning opportunity, rather than as a predicament, a problem to be fearful of, or an issue to be dealt with. A socially just school is an ideal to be striven towards and it depends upon attitude, energy and time. When we believe that everyone has been included and that we have met everyone's needs, it is time to begin again, for we have surely ignored someone, or needs have changed, or we have only been partially successful in meeting existing needs. Angelides et al. address this in terms of inclusive school cultures:

> The development of inclusive cultures in schools creates a community which is characterized by safety, acceptance, and collaboration. In this type of community, all are valued, and this forms the basis for higher achievement by all students. The principles that emerge out of inclusive cultures guide decisions about policies and the everyday practices of school so that the learning of all is supported through a continuous process of school development. (Angelides et al., 2010, 322)

Three basic conditions contributed to the success of this school in developing a socially just environment; children felt loved and cared for in the school environment; the school provided opportunities for acceptance, appreciation and success of all children, and also helped to provide the parents with support and guidance. This was accomplished through the involvement of teachers and co-teaching within a collaborative culture premised upon love, care, acceptance and involvement of children and the involvement of parents and the community (Angelides et al., 2010). While it is a well-known fact that collaboration between schools and families lead to more inclusive and socially just environments on both sides, it is still a "project in the making" for many schools to become used to the idea that parents are important and necessary members of the school community. In addition to encouraging familial support, school leaders may benefit from becoming more aware of patterns of globalization so that they may be able to lead their schools in a more socially just manner.

A Perspective for School Leaders

Many leadership styles allow for some form of democratic interaction. The entry of critical approaches into the leadership arena has provided valuable alternatives for those interested in pursuing issues of social justice (Ryan, 1998) through shared power concepts (Capper, 1993) such as emancipatory leadership (Corson, 1998) and critical leadership strategies (Ryan) which reunite facts with values (Foster, 1986). Key to the understanding of education as an extension of social justice is the view that race, culture and ethnicity (Reyes, Velez, & Pena, 1993), not to mention issues of gender (Sears, 1993) and disabled students (Bishop, Foster, & Jubala, 1993), must be relocated to the heart of democracy. School as a moral institution holds the public school administrator legally, professionally and morally obligated to be responsible for the processes and outcomes of schooling (Greenfield, 1993). Artful leadership must be built on an aesthetic interest above that of the business mode by pledging itself to the conscious and critical reconstruction of an ever-changing culture (Maxcy, 1998).

Although research in educational leadership does not always develop practical aspects relating to the valuable issues addressed, Specht and Young (2010) outline a collaborative process in schools that may help children reach their highest personal achievement in all spheres of education: (1) The first days of schools are instrumental in building class climate; (2) staff should develop positive support structures and behaviors; (3) student success is as unique as the individual child; (4) expectations for students should remain consistent depending on the school context, consistency is key; (5) administration should encourage staff to be respectful, caring and compassionate as teachers by providing an environment that emulates those qualities; (6) engage the entire community, ask students and parents for their input; (7) recognize the need for socialization as a key part of education, growth and development for all students; (8) differentiate instruction and engage all students to be challenged in curricular material to feel successful; and (9) engage families in the schooling process, be it directly or uniquely, to ensure familial support (Specht & Young, 2010). The authors encourage educational leaders and engage the reader in understanding the need for all educational stakeholders to work collaboratively to optimize the classroom environment.

Angelides et al. (2010) highlight the importance of distributive leadership as key to inclusive practice and a more socially just education. The authors state that inclusive leadership should include the collective mentality of the entire community, encourage the diffusion of barriers and demonstrate more inclusive social practices through modeling appropriate behavior. These authors emphasize the value of school culture in creating a school climate supportive of democratic and socially just practices. Five themes – the involvement of teachers, co-teaching, a collaborative school culture, an ethic of caring, acceptance and involvement of children, and the involvement of parents and the community – represent a collaborative effort on the part of the educational leaders, staff and community to foster a supportive educative environment for all.

Raffo and Gunter (2008) describe a variety of leadership frameworks that encourage a socially just school environment to flourish. The researchers examine plausible policy and procedures of social inclusion and discuss the importance of engaging staff in developing a socially inclusive and just environment. The authors examine functional and socially critical perspectives in implementing school policy that addresses economic and cultural diversity. Delivery, localization and democratizing are three policy initiatives highlighted. Raffo and Gunter further note that implementation of policy is equally as much a process of carrying out government policy, as it is an effort to reduce social exclusion in our schools. Through creating examples or engaging in theory, this article encourages school leaders and educators to examine their practices and to become more cognizant of their own educational practices regarding social justice. The next two sections deal with examples of policy issues that can benefit from further examination by educational leaders in the pursuit of a more equitable system of schooling.

At Issue: "Zero Tolerance" Policies

Unfortunately, as a result of educational policies emanating from issues relating to increasingly globalized societies, disciplinary policies in many schools have begun to shift toward treating children in ways that closely resemble a version of the adult criminal justice system (Daniel & Bondy, 2008). Consequently, many North American schools appear to have adopted a "legalistic" view of school management that puts children in untenable positions. This is exemplified in a very controversial and not very well-debated topic known as the "Zero Tolerance Policy."

Zero tolerance policies are school district policies that specify predetermined consequences for particular violations (Sughrue, 2003). Such policies were originally designed to punish those engaging in acts that potentially put themselves and/or others at risk of harm or danger. Over time, zero tolerance policies have come to include many types of punishable behavior, ranging from possession of drugs, licit or otherwise, to real or symbolic weaponry such as toy guns. Insubordination and classroom disruptions (Schwartz & Rieser, 2001) have also come to be included in this "catch-all" policy, even though many of these items pose little threat to school safety (Dunbar & Villarruel, 2002, 2004; Henault, 2001; Sughrue, 2003; Villarruel & Dunbar, 2006).

This policy, implemented in schools over the past number of years to address a perceived increase in violence and to provide a safe environment for our children, has received mixed reviews from many different school boards throughout Canada and the United States. Ambiguity concerning what constitutes expulsionable or even suspendable offenses has led to growing confusion and disgruntlement from various factions of the school communities about what exactly zero tolerance is and who it is intended to serve.

In order to explain public discourse around issues of school violence, the original impetus for zero tolerance, Devine (1996) claims that public perception frames two diametrically opposed views – a "right-wing discourse" which views schools as being out of control and a "mainstream liberal discourse," which views school violence as "a result of student alienation" (21). The view of schools from right-wingers is that schools are in moral and behavioral decay. This view blames the victims, the students. The opposing view suggests that if children are absorbed in learning, behavior problems will disappear. Zero tolerance policies have met with criticism from stakeholders and from the media. Some critics suggest that the policy and the way it has been implemented leave too much discretion in the hands of those who exercise it, while others view the policy and its trappings as inflexible and intolerant. While some claim the policy is not enforced uniformly, others claim it is enforced inappropriately. Some advocates request less discretion on the part of the implementers, while others request more flexibility to deal with issues on a case-by-case basis.

It is evident that there exist varied views on zero tolerance policy that include its intent and its viability to address the perceived problem of school violence. Further to this, according to McNeal and Dunbar (2010), urban school principals tended to align themselves with the perception that schools are in a chaotic state. Rural school principals, however, saw the policy as an irrelevant intrusion that bore little relationship to the communities they served. By these examples of urban and rural school administrators views, a zero tolerance policy constrains administrators simply because it does not allow for recognition of differences or individual situations (Ableser, 2002). Accordingly, Merrow (2004) suggests that physical, emotional and intellectual safeties are necessary to maintain a socially responsible school. While a zero tolerance policy is intended to maintain a strict policy of safety for its students, such "inclusive" policies mandate standard operating procedures for all offenders, even for the first offense. As a result, written policies tend to become iron clad and this may not serve the best interests of students. Consequently, if the policy is not for the benefit of all students, then it is not good policy (Cooper & White, 2004). As MacNeal and Dunbar (2010) imply, are we merely symbolically and practically replicating an unloving society as we teach our children to design a single set of guidelines to be used for all types of unacceptable behavior ranging from verbal threats and physical violence to dress code violations? This relates to the equity versus equality issue because zero tolerance policies offer up a standardization argument in that all students are treated equally, whether they are all the same or not – and we know that they are not.

A further finding from the study by McNeal and Dunbar (2010) notes that a disproportionate number of minority groups are negatively affected by zero tolerance policies, rendering such policies socially unjust. In theory, zero tolerance policies were intended to preserve safe school environments. However, suspensions and expulsions began to increase to alarming proportions particularly for minority students (Skiba & Leone, 2001). In discussing suspensions from school as remedial practices, Ableser (2002) feels that zero tolerance policies create a false sense of security because suspension merely displaces the problem from our schools to the society in general, negating valuable opportunities for the development of appropriate behaviors and validating a cycle of failure culminating in higher dropout rates.

Circumstances leading to suspension of students need to be investigated on an individual basis. The intent of the student accused of violation is an area of concern that is often ignored. Alternatives to suspension may be considered to suit the violation. If and when students are suspended for serious incidents, they may be automatically referred to outside counseling and law enforcement agencies. Suspension should be used sparingly and with extreme caution. Less serious violations may be dealt with in conjunction with peer mentoring programs in order to develop and maintain lines of communication within and outside of the school environment. Curwin and Mendler (1999) suggest that "zero tolerance is another example of the road to hell paved with good intentions" (119). While zero tolerance policies send a powerful message to students, staff and parents that violent, aggressive behavior is not acceptable in our schools, it also succeeds in clouding important distinctions between victim and aggressor, thus making equity and, therefore, socially just schools increasingly elusive.

As such, zero tolerance policies represent an effort to apply a morality of authority that demands respect and fear. In this sense, it is fascist in that it fails to provide students with the ability to think critically about authority relating to democratic moralism (Ableser, 2002) and, as such, it is anti-democratic. The positive correlation between suspensions and future dropout rates implies that these students are marginalized by the very system that has promised to protect them. Issues of fairness come into question when we talk about extreme consequences of discipline that have little to do with school safety or the improvement of student behavior. In any case, what appears to be conspicuously absent is the voices of those who are most often directly affected by such policies, the students themselves.

McNeal and Dunbar (2010) address this issue of the suspension of minority students in practical terms by interviewing a group of urban high school students who are directly affected by the zero policy. They found that students and other stakeholders could benefit by being brought into the discussion, rather than having a "sudden death" policy that harms rather than guides students. Skiba (2000) concurs and goes on to suggest that we need more graduated policies that match offenses with consequences, as each new outbreak in school violence appears to yield increasingly severe punishment in terms of school discipline. In short, we appear to be creating new problems in dealing with existing issues. As it stands currently, zero tolerance policies serve to recreate the very symbolic violence (Bourdieu & Passeron, 1979) that they are employed to eradicate. According to Daniel and Bondy (2008), such disciplinary policies must not criminalize our youth but should rather engage them in a problem-solving process. Given our current efforts to manage change and control our school environment, we seem to have defaulted to using a model that is strikingly similar to that being used in penitentiaries. Even such penal terms such as "lock down" and "color codes" have been implemented in schools. However, there is no penitentiary in the world that is truly rehabilitary, as they all use various forms of symbolic or concrete incarceration. With the importation of such a paradigm firmly in place, how socially just can our schools really be, not only for students but for teachers as well? In fact, Jull (2000) suggests that teachers are directed to implement, support and enforce school codes of conduct whether they agree with them or not, representing a symbolic violence against teachers. If left unexamined, teachers may, themselves, become perpetrators even while considering themselves to be upholders of the tenets of social justice.

Zero tolerance policies represent a type of binary thinking and, as such, they do not recognize subtleties, but rely on equality of consequence without considering equity of intent. Equity must come first in order to achieve true equality. More consideration needs to be directed toward the individual social contexts of conflict and uneven distribution of social power relations that are part of each school's social climate (Jull, 2000, 5). Zero tolerance policies typically represent a kind of "triage" model that merely has a nice ring to it. Such policies have not been proven to effectively reduce youth violence and serve only to temporarily displace the issue by returning it to the larger society (Jull). This procrusteanization of policy serves the "factory" model of education very well but it does little to advance transformative practices within schools. Such transformative practices represent a form of social justice that is much needed within the school edifice.

At Issue: "Inclusive" Education

The term "inclusion" is an interesting word in its own right. It is often construed, in educational jargon, to refer exclusively to special education. Thus, its connotation, how the term is used, differs from its denotation, what the word actually means. Theoharis and Causton-Theoharis (2008) expand the meaning of inclusion to embrace all marginalized students – not just special education. For the authors of this piece, inclusion is taken to refer to inclusivity in a general sense and thus, this notion of "true" inclusion may be twinned with notions of social justice and equity. Armed with a broader understanding of what it means to be inclusive, school leaders advocate for *all* marginalized groups within their school community. This broader definition for inclusion helps to eliminate social exclusion in response to diversity (Rice, 2006).

Increasing diversity of school-aged population in tandem with demands for educational reform and accountability poses enormous challenges for school leaders on a worldwide basis. Inclusive education was originally considered as an approach to educating children with disabilities within regular school settings. Internationally, however, it is being increasingly seen more broadly as a reform that supports and welcomes diversity among *all* learners. In fact, inclusive education has emerged in many school districts as the norm rather than the exception, the expectation rather than the ideal, and has been mandated in a growing number of locations. Consequently, it no longer is debated whether or not inclusion *should* occur, but rather *how* to implement it.

In an effort to create "systemic, sustained and differentiated professional development for social justice" (4), Kose (2007) recommends three categories of professional development: professional development for the whole staff, professional development for specific groups within a staff, and professional development based on specific needs of individual teachers. In order to bring "suburban and urban students together, cultivating individual talents and needs, and developing students as global citizens and environmental stewards in an interdisciplinary school" (4), Kose maintains that all professional development, such as differentiating instruction, diversity discussions and critiquing curricula through a multicultural lens, be focused on achieving these goals. Teachers require opportunities to meet as core teams, subject area teams and mentor groups to focus on curricular requirements and on acquiring knowledge and creating PD activities for individuals and groups (Kose). This works in conjunction with a school-wide focus on disrupting current marginalizing conditions in the school. Such a framework allows for teacher learning on three different levels: school-wide learning, group planning and individual professional development needs. This organizational framework constituted of diverse groupings allows teachers to implement programs at their discretion and promotes "sustained and systemic professional learning" (Kose, 3). Theoharis (2010) exemplifies this approach in an article describing the strategies employed by six social justice leaders to counteract school structures that marginalize, segregate and impede achievement, a deprofessionalized teaching staff, a school climate that needed to be more welcome for marginalized families, and low student achievement.

While "full" inclusion has the benefit of allowing all students to receive the same *level* of education by eliminating pullout programs and "special" classrooms, it may not serve the purposes of students who cannot benefit from being mainstreamed into regular classes. These students may be physically incorporated into regular classes, but the *quality* of their education may suffer as a result of not having access to specialized equipment and/or instruction. While it is agreed that mainstreaming students allows the marginalized students who would ordinarily be segregated in smaller instructional groupings to learn more about the mainstream culture of the regular classrooms and that "regular" students can benefit enormously from learning about students with specific and general disabilities, the key word becomes "balance." Any policy that requires all students to fit into a particular mold without consideration given to unique characteristics is not a policy that tends to operate in all students' favor. As such, it is a policy that tends to exclude and marginalize even as it draws students together.

Inclusion as a Form of Social Justice

Salisbury (2006) posits that although administrators and schools may differ in their definition and stages of progression toward fully inclusive and socially just programming, similarities can be found in administrative qualities that are conducive for promoting these practices. These include committing to social justice, nurturing the staff's attitude and core beliefs to embrace diversity, using language that supports the inclusion philosophy, and soliciting support from parents and community. Salisbury notes that the principal is key in developing inclusive and socially just schooling. Given this point of view, Edmunds, Macmillan, Specht, Nowicki, and Edmunds (2009) note the importance of the principal's role in developing and maintaining an inclusive school environment. To this end, the assessment of professional development needs is of major importance for principals. Through the use of action research methodology, principals can become more aware of conditions necessary for the support and sustenance of inclusive practices within their schools. Such an endeavor begins with careful scrutiny of current relevant literature. Principals must have access to the most current information about inclusive practices, as it is they who are ultimately responsible for implementing truly inclusive practices, policies and procedures within their schools. Once the administrators are knowledgeable concerning inclusive practices, professional development opportunities can be implemented in order to address all aspects of inclusion.

However, principal knowledge of inclusion is not a satisfactory prerequisite on its own, as teachers and support staff must also "buy in" to a more inclusive model. Because teachers and support staff often feel inadequately prepared, it is critical that principals address the needs of teachers and support staff within their schools. Otherwise, by avoiding proper professional development, there are risks that teachers' "perceptions of inclusion will swing from positive to negative as their frustration with its implementation grows" (Edmunds et al., 2009, 18), because avoiding such necessary professional development fosters a climate of resistance to change (Rice, 2006).

As noted by Angelides et al. (2010), special education teachers can become a resource to classroom teachers and educational assistants by providing knowledge on inclusive practices. Such specific, timely and appropriate professional development establishes "harmonious and synchronized interactions of all school staff" (Edmunds et al., 2009, 19). Thus, the special education teacher, in collaboration with classroom teachers, can instigate positive social change within their sphere of influence by involving teachers in co-teaching and by providing examples of what an inclusive culture looks, feels and sounds like. Rice (2006) refers to the special education teacher as the "cornerstone" to developing a collegial climate throughout the school, and, as such, special education teachers may be key allies in supporting inclusive leadership strategies. Subsequently, three administrative tasks as identified by Riehl (2000) include being supportive of creating inclusive schools, encouraging new understandings of diversity, nurturing inclusive school cultures and building relationships between school and community can help to promote a more inclusive atmosphere for students, staff and the surrounding community.

Another suggestion for supporting inclusive socially just schooling is for the leader to maintain a vision of what a truly socially just school looks like. This is an ideal for which to strive. When we believe that all perspectives, voices and ways of being have been included, it is time to begin again to ensure that no one has been left out and that all concerns are not only being heard and listened to but also attended to. In the words of Gwendolyn MacEwan (2007), "…the moment when it seems most plain is the moment when you must begin again" (92).

Community support is also an important attribute of inclusive schooling. Salisbury (2006) states, "The most frequently mentioned barrier identified by respondents was the negative attitude of teachers and parents" (71). Of course, the task here is to change negative attitudes into more accepting attitudes. This is a daunting task for anyone, seasoned and novice school leaders alike. However, the prize is well worth winning. Riehl (2000) advises principals to coordinate services among stakeholders and for the school to become the focal point of the inclusion movement:

> Schools are viewed as the most logical choice to be the anchor or hub of services, since children interact with schools on a continuous basis and problems can be detected and addressed as they arise. (Riehl, 2000, 67)

Riehl (2000) also raises some unsettling issues, including how principals "reproduce, sometimes unwittingly, conditions of hierarchy and oppression, in particular by fostering compliant thinking rather than critical reflection" (59). Managerial types of leadership tend to foster this, whereas many other types of leadership – for example, emancipatory, distributive and critical, to identify just a few styles of leadership – hold inclusion central to their system of values. Further to this, Riehl introduces another troubling notion that, if school leaders truly become aware of how much marginalization exists within any given school system which the system is actually causing, they would choose not to work there:

> A genuine commitment to diversity would require administrators to attend to the fundamental inequities of schooling, to disavow the institutions which they purportedly lead, and to work toward larger projects of social and institutional transformation. (Riehl, 2000, 58)

However, for those who are committed to truly inclusive practices, this is viewed as an opportunity. Issues with the educational system marginalizing students are often the result of policies delivered by non-practitioners who, incidentally, rarely avail themselves of current research on matters educational. Thus, by influencing and shaping our fully inclusive schools rather than by advocating for "full inclusion," are we not already working toward developing lasting change of a more socially just nature?

Teachers who have little background in inclusive practices require not only opportunities to learn effective instruction methods to meet the needs of all students but also the time to discuss the results of their efforts. Unfortunately, according to Edmunds et al. (2009), not all principals have a complete understanding of inclusive practices, themselves, and their active participation is essential in assisting them with discovering strengths and weaknesses related to inclusive practices that exist within their own schools. In short, we need to concentrate on leadership as well as teaching. Oluwole (2009) chronicles one principal's struggle between continuing with full inclusion at his school and doing what is best for a particular student. Ultimately, as a result of a legal and ethical dilemma, the principal tendered his resignation because the inclusive education program was benefiting the special needs population in his school less that the thoughtful accommodations that were already in place. Ironically, the so-called inclusive education program was less inclusive than the program it replaced! Experiences such as these beg the question of how effective "full" inclusion is, as it may not work in every instance. In short, full inclusion as it is frequently practiced has its own set of limitations because, like zero tolerance policies, full inclusion does little to advance true inclusionary practices within schools. One may begin to forge a way forward by questioning one's own beliefs about such policies and the system that reinforces them.

Furthermore, as educators, we strive to practice what we preach. While this is increasingly important as an administrator, ofttimes our leaders experience conflicts that result in contradictions and conflicts in the treatment not only of students but of staff members as well. This brings to light the idea that we must question ourselves throughout our careers and change and adapt our beliefs as different policies such as zero tolerance and full inclusion are implemented.

Inclusive leadership is quickly gaining traction in schools and school systems in any area where significant diversity exists. Since every student is unique in his or her own way, it can be argued that diversity exists in every educational landscape, and, therefore, inclusive leadership is and will become one of the most important issues facing administrators. Such inclusive leaders adopt and live a set of values – including self-esteem, respect for others, values beyond self-interest and restraint in the exercise of power – that place relationships at the focal point of educational policies, practices and procedures. Those values define schooling in ways that standardized test scores can never do. Such responsibility for inclusive leadership in creating supportive, inclusive schools will need to be found not only within the school's administration team but also among teachers, parents and support staff members (Mayrowetz & Weinstein, 1999). All staff members and, indeed, all stakeholders, including the students themselves, must strive in concert to meet the needs of every student. In this way, truly inclusive educational practices will be possible within the school edifice.

Conclusion

As a result of educational policies emanating from issues relating to increasingly globalized societies, schooling is becoming increasingly standardized, not only in terms of assessment and evaluation but also in terms of processes, policies and procedures. Thus, due to the exigencies of globalization, schools and their leaders are being held more and more accountable for implementing blanket policies for their school populations and this is, unfortunately, often detrimental to marginalized students. For example, as standardized testing gains increasing value, disadvantaged, minority and disenfranchised groups suffer. In some schools, minority and disabled students are exonerated from taking standardized tests, but even this serves to marginalize them in the face of other students. There are fewer and fewer avenues available for such students to be involved, included and accepted.

"Full inclusion" and zero tolerance policies represent but two postmodern puzzles that serve to exclude students by "one size fits all" policies. By supporting flawed policies such as zero tolerance and notions of full inclusion regardless of the student's ability to subscribe to the mainstream, educators are not serving the student but are responding to convenient policy measures that support order and control – policies which do little to further citizenship and socialization skills among our future leaders and populace. This is an unattractive alternative that may only serve to reproduce the "inmate ethic" and can serve to increase dropout rates and increased crime among disenchanted youth who have not been successful within a system in which they feel that they neither belong to nor are supported by.

This article advocates the deinstitutionalizing of schools in order to gain greater clarity about what some of the advantages are for creating more socially just schools. At issue is the question of where social justice should fit within competing notions of greater order and control over the process of schooling. In short, part of the answer to this question might be inclusive leadership.

As many studies regarding inclusive leadership suggest, it is important to distribute leadership not only among administrators but among teachers as well if in fact socially just schools are to be made possible. In this regard, school leaders can benefit immensely from listening to the voices of students, by motivating staff members, and by becoming more aware of the communities within which our students are living. Once these conditions are met, truly inclusive and socially just education can help all students achieve success in terms of each student's personal best. This represents the "trickle-down effect," where all educational stakeholders can feel supported by their educational community and conversely, they can begin to support others. A truly inclusive school provides an excellent example of democracy in action. Sharing leadership is, by its very nature, inclusive. Therefore, truly inclusive schools, by their very nature, are democratic and it takes inclusive educational leaders to forge the way.

Chapter 54

The State's Responsibility to Fund Basic Education in Public Schools

Raj Mestry

Introduction

Prior to 1994, South Africa was a highly segregated society and apartheid laws placed every citizen in an elaborate and vicious racial hierarchy which dehumanized both the oppressor and the oppressed (Brown, 2006: 512). Blacks were denied the most basic citizenship rights and overt racial discrimination was legal. Racial divisions were also enshrined by law in the education sector. Thus, in terms of per capita grants from the state, white learners received the highest, while black African learners received the lowest. To illustrate this anomaly, in 1994, the state's annual per capita expenditure for learners from the most advantaged schools was R5 403, compared to R1 053 for learners from the most disadvantaged schools in Transkei (Patel, 2002: 175). Thus, the politics and economic imperatives of the state were closely linked to the development of inequality in the larger society through education funding.

The struggles in the education sector, the adoption of the Freedom Charter, the call by a range of social movements for free and compulsory education in the anti-apartheid struggle, and the inclusion of education as a human right in the Constitution (South Africa, 1996a) suggested significant state commitment and investment in education (Ahmed & Sayed, 2009: 203). The post-independent state has been trying to reverse this situation without much success because the basic structures of our education system have not been fundamentally changed as evidenced by the fact that rural, township, private, and former Model C schools[1] still exist with disproportionate

---

[1] Model C schools catered for mainly white learners during the apartheid regime.

resources which impact on teacher quality and learner performance. After 18 years into democracy, there is still everyday occurrences where children are being locked out of schools for not paying school fees or walking many kilometers from home unsupervised, grade 12 learners being made to start classes in March because they did not have the correct color shoes, withholding school reports and textbooks, and parents' labor being bartered for school fees (Tucker, 2008: 6).

Chisholm (2004: 206) asserts that inequalities between urban and rural schools are visible in the provision of financial and physical resources. These infrastructural backlogs and inequalities are very unevenly spread across the provinces and are most notable in rural areas. Infrastructural inequalities are also documented in the School Register of Needs Survey, first conducted in 1996 (Department of Education, 1996) and again in 2000 (Department of Education, 2000). Severe overcrowding is still prevalent in classrooms especially in rural areas of the country (City Press, 2008). For example, in the Eastern Cape,[2] there was a backlog of 10,000 classrooms (Soweton Live, 2008), and thousands of learners were still being taught under trees and in unsafe mud buildings (City Press). According to Vally et al. (2010: 60), of the 27,000 public schools in South Africa, a conducted study estimated that 27 % had no running water, 43 % were without electricity, 80 % were without libraries, and 78 % had no computers. A total of 12,300 schools used pit latrines and 2,500 had no toilets at all. In schools that had toilets, 15.5 % were not in working order. Schools requiring additional classrooms numbered over 10,700. The conditions of many black schools are critical and not conducive to effective teaching and learning. Beinart (1995: 3) emphasized that the effects created by the legacy of the past are still felt by millions of the marginalized groups (Indians, coloreds, and especially the majority Africans).

The government's educational reforms since 1994 have focused on access, equity, redress, quality, efficiency, and democracy. All policy documents that have emerged stressed the principles of social justice, quality education for all, the right to basic education, equality of opportunity, and redress of past educational inequalities among the blacks who have suffered particular disadvantages (Muthukrishna, 2000). Redressing historical imbalances and achieving equity are central policy components in attempts to restructure South African education. Equity and redress have been identified as the operational building blocks for the realization of social justice in education (Motala & Pampallis, 2002: 178). This aspiration is demonstrated in many education policies, such as the post-provisioning norms, rationalization and redeployment of teachers and non-teaching staff, management of school fees, the functioning of governing bodies and the National Norms and Standards for School Funding (NNSSF), and other pragmatic interventions. While inequalities in resource allocation from the state have been removed, inequalities persist for a number of reasons, including the inability of parents to pay fees, the unavailability of qualified teachers in rural schools, and unfavorable teacher-learner ratios, especially in black schools and public schools in general (Motala, 2006: 80). This chapter makes the argument that, despite substantial government interventions to the education system, social justice and equity have not been served adequately by the NNSSF because inequalities based on race, class, and gender persist in the education system. Jansen (in Bogotch et al., 2008: 147) is of the view that sustaining privilege for the few at the expense of the marginalized is justified even in societies emerging from long periods of colonialism and racism.

---

[2] South Africa comprises of nine provinces. Eastern Cape being one of the poorest provinces, is one of the nine provinces.

Thus, it is ironic, given the emphasis on redress and equity by the government, that the funding provisions of the South African Schools Act (South Africa, 1996b) appeared to have worked thus far to the advantage of public schools patronized by middle-class and wealthy parents of all racial groups (Chisholm, 2004). Vigorous fund-raising by parental bodies, including commercial sponsorship and fee income, have enabled many such schools to add to their facilities, equipment, and learning resources and expand their range of extramural activities. Poor parents, on the other hand, especially in the former homeland areas, have contributed a disproportionate share of their incomes over many decades to the building, upkeep, and improvement of schools, through school fees and other contributions, including physical labor. A number of schools in poor rural and urban working-class communities suffer the legacy of large classes, deplorable physical conditions, and absence of learning resources, despite a major Reconstruction and Development Program (RDP), National School Building Program, and many other projects paid directly from provincial budgets. Yet, the teachers and learners in poor schools, mainly African, are expected to achieve the same levels of teaching and learning as their compatriots. Such contradictions within the same public school system reflect past discriminatory funding policies in schooling and vast disparities in the personal incomes of parents from all racial groups (Ndimande, 2006: 147). Consequently, unequal racial residual categories from the past now give rise to class inequalities which cut across race. Disparities in funding of the education system are common, and thus per capita grants are useful as a key indicator for equity and social justice which will be used in this paper (Motala, 2006: 79).

In this chapter, inequitable funding practices are highlighted, and the relationship between funding (resources) and educational outcomes, and its implications for equity and social justice in education elucidated. To adequately address this matter, key policy changes over the last 5 years will be documented. It is important to proffer an explanation of how issues of social justice and equity are implicated in the contestations and reproduction of inequalities in society which are now based on class, race, and gender. Cultural and class reproduction in education is not a straightforward process, but rather it is contested on the basis of geographic location (urban/rural), class, race, gender, and sexual orientation. To be able to unpack these processes, given the government's Herculean efforts at social justice through funding, a critical perspective which enables one to understand how issues of class, race, power, and the political are implicated in the funding of schools and how there has been a reproduction of inequalities based on race and class in a system that is ostensibly equitable and ameliorative in its orientation, mission, and funding policies will be utilized (Popkewitz & Brennan, 1998: 4). A critical perspective helps us to understand and explore funding in education as a process that is fraught with contestation in ways that are both political and historical.

Social Justice and Equity

It may be helpful to clarify the terminology social justice and equity. Equity can be described as "equal treatment by race, equal educational opportunity and educational adequacy" (Fiske & Ladd, 2004: 96). Motala (2006) suggests that in addition to equality which is about sameness, equity should also encompass differential distribution to achieve social justice.

Within recent studies of education policy, social justice has been an under-theorized concept. Some studies simply marginalizes or rejects social justice concerns, either because of skeptical postmodernist denial of the tenability and desirability of universalistic principles, or because of an uncritical, problem-solving orientation, or because of a commitment to "value-free" research. However, there is also a significant group of researchers who are unambiguously committed to social justice in education, as evidenced in the growing number of empirical studies which draw attention to the ways in which inequalities are produced and reproduced by post-welfarist education policies (Gewitz, 1998: 469). A wealth of educational resources and school finances were channeled to white public schools during the apartheid era. As a result, school finances were characterized by staggering funding disparities in the schools that served different racial communities. The deliberate lack of state funding for schools, as well as abject poverty within the black communities, led to massive dropouts in black schools (Muthukrishna, 2008: xvii). Essentially, most research in the area of social justice in education examines how inequalities are reproduced through multiple sites of difference and unequal power relations and the struggles against them – that are based on and built out of an entire network of social, political, and cultural relations and practices (Muthukrishna: ix).

Conceptually social justice is viewed as a key component of a government policy that is oriented towards equity, redress, restoration, renewal, and redistribution of resources. This definition is heavily influenced by the position taken by a Symposium on Social Justice (2008) held in Berkeley which defined social justice as "a process, not an outcome, which (1) seeks fair (re)distribution of resources, opportunities, and responsibilities; (2) challenges the roots of oppression and injustice; (3) empowers all people to exercise self-determination and realize their full potential; (4) and builds social solidarity and community capacity for collaborative action." Without conflating equity and equality, a much broader view of social justice is adopted which embraces political, ideological, social, and cultural perspectives (Soudien, Jacklin, & Hoadley, 2001). Scrase (1997: xi) asserts that social justice in education is not simply met by providing a large number of schools, institutions, and training programs. It has to be linked to broader social justice imperatives, such as the full and unhindered opportunity to participate in society's major institutions regardless of class, race, or gender. Connell (2003: 15–19) explains that governments have long been operating from a perspective of distributive justice. For them, as long as schools are provided for the populace, universal literacy programs put in place, or an affirmative action program established, governments are satisfied that they have met their social justice requirements. For Rawls (1971), social and economic benefits are to be distributed fairly in that they guaranteed and proportional for everyone in society. That is, everyone benefits, but the least advantaged benefit the most. In our view this is not enough. The relationship of social justice to education is one that is concerned with fairness, rights, and equal opportunity to participate in one of society's most fundamental institutions.

Social justice is the distribution to the population of scarce resources, such as education. According to Scott and Marshall (2005: 329), such a view of social justice is premised on due process, impartiality, and distribution according to appropriate criteria. Most importantly, social justice in the provision of education needs to translate into a broader educational transformation and empowering process that can be seen to meaningfully translate into positive gains in the classroom, the school, and, in terms of outcomes and upward mobility, especially for historically disadvantaged learners. Social justice in this schema becomes a political act (Elster & Hylland, 1986: 103) because its mission is that of making society and its institutions more democratic, empowering, and transformative (Giroux, 1992: 10). However, in the South African case, as noted by the OECD (Organization for Economic Cooperation and Development), "real expenditure on education from 1995 to 2002 declined as a share of both total government expenditure (from 19.2 % in 1996 to 18.8 % in 2002) and Gross Domestic Product (from 5.7 % in 1996 to 4.9 % in 2002)" (Organization for Economic Cooperation and Development [OECD], 2008: 97). On the whole, household expenditure on education has increased to an extent that those families that pay around R100 for fees are actually struggling to do so. The Schools Register of Needs Survey also shows that black schools still lack the basic resources critical to effective teaching and learning. The situation has been exacerbated by the fact that at the provincial levels, funds meant for education have actually declined, largely due to competition from other social sectors such as health and housing. The net effect is the reproduction of inequalities in education based on class.

To support the argument that social justice and equity have not been supported by the NNSSF policy, I draw on secondary empirical data and then discuss this within the framework of a critical perspective that goes beyond education and the classroom to show how inequalities are being reproduced in a system that is ostensibly equitable and just. The issue of social justice is aptly encapsulated in the preamble to the Schools Act (South Africa, 1996b):

> … the country requires a new national system for schools which will redress past injustices in educational provision, provide an education of progressively high quality for all learners and in so doing provide an education for the development of our people's talents and capabilities, advance the democratic transformation of society, combat racism and sexism and all other forms of unfair discrimination and intolerance, contribute to the eradication of poverty and the economic well-being of society, protect and advance our diverse cultures and languages, uphold the rights of all learners, parents and educators, and promote their acceptances of responsibility for the organization, governance and funding of schools in partnership of the state.

South Africa has focused primarily on the complex issue of racial equity in the distribution of governmental resources (Jansen & Amsterdam, 2006: 1x). Equity, as the term is used in education finance literature, is a relative concept that is based on comparisons of spending across schools and provinces. An equitable finance system is one that reduces to a "reasonable level" the disparity in spending (Downes & Stiefel, 2008: 222).

The government's efforts since 1994 to attain equity and redress in education have faced considerable obstacles and contradictions, largely rendering the quest for social justice rhetorically desirable but practically elusive. The emerging pattern is one where changes have been mainly symbolic and linked to the political climate (Jansen, 2000), and the inequality in funding can best be ascribed to state bureaucracy and limited capacity at provincial level to implement policies. We also attribute this problem to the nature of the post-apartheid state, whose fundamental economic model is driven by an imperative that emphasizes economic growth rather than a radical redistribution of resources.

Inequalities were apparent in differential spending, which had an impact on access to, and the quantity and quality of education on offer to black and white. Typical indicators were literacy levels; school completion rates; learner-teacher ratios; number, quality, and qualifications of teachers; and availability of different types of resources. On all indicators, the poorest off were Africans living in the previous homelands and on farms and in townships (Chisholm, 2004: 204). This means that at the microlevel, which is the school and classroom levels, schools and the education system as a whole become agencies of social and cultural reproduction of inequalities within the state, civil society, economy, and political spheres of South African society. As Giroux (1997: 71) notes, even "where resistances, agency and mediation appear in the accounts of the excluded majorities in the schools" the current constructs of school funding engender inequalities that enhance a "paralyzing pessimism among the poor that consigns them to the logic of defeat and domination rather than to the imperatives of struggle and emancipation."

In this schema, social justice can be seen as a deliberate intervention that challenges fundamental inequities that arise, in large part, due to the inappropriate use of power by one group over another. Inequities may be material, such as differential funding, instructional materials, facilities, and resources. This is how inequalities are being reproduced, especially on the basis of class. As noted by Reschovsky (2006: 43), inequalities continue within the education system, irrespective of improvements in funding, because "many students, especially in rural South Africa, continue to face dilapidated schools, few, if any, textbooks and school supplies, and poorly trained teachers." Thus, structural constraints continue to erode any gains that may accrue from improvements in funding.

Post-apartheid Policies on Funding

All South Africans have the right to a basic education, including adult basic education and further education. According to the *Bill of Rights* entrenched in the country's *Constitution* (South Africa, 1996a, Section 29), the state has an obligation, through reasonable measures, to progressively make this education available and accessible to all. The South African Schools Act (South Africa, 1996b, Section 3) prescribes that school attendance is compulsory from the ages 7 to 15 years (or Grade 1 to Grade 9). However, what is not clearly stated is the fact that the state is obligated to provide free education to its citizens. The view that every child has a right to quality education and schools should ensure their access is essential to the discourse on rights-based democracy and social justice (Gardner & Crockewell, 2006: 7). Based on the policies of the apartheid regime, the unevenly distributed resources were based on race/ethnicity and socioeconomic class such that inequities have been continually reproduced. Thus, for a large number of learners participating in today's mainstream, schooling is not only problematic but virtually impossible.

The state funding policy environment for the education sector in South Africa is framed by the South African Schools Act, which stipulates that "the state must fund public schools from public revenue on an equitable basis in order to ensure the proper exercise of the rights of learners to education and the redress of past inequalities in educational provision" (South Africa, 1996b, Section 34.1). Thus we see a state that is concerned with redistributive policies rather than the complete overhaul of the funding system in favor of blacks. This explains the ameliorative nature of funding reforms – hence, the perpetuation of inequalities in a state that is concerned with a macroeconomic policy focused on growth. A number of policies at both the national and provincial levels have been promulgated to ensure the implementation of equitable funding mechanisms in South African schools. Notable among these have been the Equitable Share Formula (ESF) and the NNSSF. The former policy focuses on interprovincial equity, while the latter focuses on more equitable inter-provincial expenditure (OECD, 2008: 98). Calculated by the National Treasury, the ESF reflects provincial variables, such as the size of the school-age population, the number of learners enrolled in public ordinary schools, the distribution of capital needs, the size of the rural population in each province, and the size of the target population for social security grants weighted by a poverty index (OECD: 100).

In terms of increasing access and equity in the school system, the main policy mechanism has been the Education Laws Amendment Act of 2005 (South Africa, 2005), which ushered in an era of "no-fee schools." This policy targeted the poorest two quintiles (i.e., 40 % of learners nationally), and such a bold move by government was aimed at addressing the need for access and equity for the marginalized in rural and peri-urban township schools who were struggling to pay fees. It will be argued that such policies have not adequately addressed the issue of equity and social justice because of broader macro educational and social issues that enhance the perpetuation of inequalities in the education system. In this context, the nature of the post-apartheid state makes it difficult to bring about radical reforms in the financing of education, because it is relatively autonomous from local and international capital.

Amended National Norms and Standards for School Funding

The preamble to the South African Schools Act (South Africa, 1996b) states that:

> …this country requires a new national system for schools which will redress past injustices in educational provision, provide an education of progressively high quality for all learners and in so doing lay a strong foundation for the development of our people's talents and capabilities…

Table 54.1 Resource targeting table based on condition of schools and poverty of communities

School quintiles from the poorest to least poor	Expenditure allocation	Cumulative percentage of schools	Cumulative percentage of non-personnel and non-capital recurrent expenditure	Per learner expenditure indexed to average of 100
NQ 1: poorest 20 %	35 % of the resources	20 %	35 %	175
NQ 2: next 20 %	25 % of the resources	40 %	60 %	125
NQ 3: next 20 %	20 % of the resources	60 %	80 %	100
NQ 4: next 20 %	15 % of the resources	80 %	95 %	75
NQ 5: next 20 %	5 % of the resources	100 %	100 %	25

Source: Resource targeting table (South Africa, 1998)

The Schools Act imposes important responsibilities on the state in respect of funding the public schools derived from the constitutional guarantee of equality and recognition of the right of redress. The Act provides that the state should develop norms and standards for school funding and that they should fund public schools from public revenue on an equitable basis in order to ensure the proper exercise of the rights of learners to education and the redress of past inequalities in education provision.

The purpose of the NNSSF regulations which came into effect in 1998 (South Africa, 1998) and subsequently amended in 2007 (South Africa, 2006b) is to effect redress and equity in school funding, with a view of progressively improving the quality of school education, particularly in previously disadvantaged schools. The NNSSF focuses on more equitable interprovincial expenditure (OECD, 2008: 98). This policy requires that each provincial education department (PED) rank all its schools from poorest to least poor, at first equally weighted between the physical condition, facilities, and crowding of the school and the relative poverty of the community around the school (South Africa, 1998) but changed in 2003 to take only household income into account (Department of Education, 2003a). Since 2008, this ranking has been further specified and differentiated according to the income dependency ratio (unemployment rate) and level of education (literacy rate) of the school's surrounding community (its geographical catchment area). Current policy determines that a ratio of at least 7:1 be applied to the amounts paid to schools in the two outer quintiles, where quintile 1 represents poor schools and quintile 5, affluent schools (Mestry & Bisschoff, 2009: 47). Table 54.1 reflects how schools will be funded based on their quintile ranking. For example, the very poor schools classified as national quintile (NQ) 1 will receive 35 % of the PED's budget on resource allocation, whereas NQ 5 schools will only receive 5 %.

While both the NNSSF for non-personnel expenditure and the post-provisioning models contain aspects of socioeconomic targeting, actual non-personnel expenditure constitutes only 8–10 % of school budgets. This means that only a small portion of basic education allocation by the state is targeted towards redress. Except for the

2 % pro-poor weighting, the balance of state spending on schools directed towards the payment of personnel continues to favor historically advantaged schools (Porteus in Veriava, 2005: 4). Such a critique is essential in our understanding of the subjective and objective forces of social and cultural reproduction in our education system. As argued above, the issues of equity and equality, and how class has replaced race, can be easily linked to redress mechanisms to educational outcomes.

Up to 2006, the national school funding policy did not set out minimum per learner funding levels. With varying provincial financial capacity, it was certain that the funding of poor learners across provinces would not be the same (Wildeman, 2008: 3). The contradiction became obvious when it was found that learners who were classified as non-poor in one province were receiving a per learner allocation greater than the poorest learners in another province. This constraint restricted the ability of most PEDs to effect a meaningful distribution of redress funds to the majority of poor learners. The average per learner expenditure distributed by the NNSSF mechanism was R184 in Gauteng and R275 in the Northern Cape, while in KwaZulu-Natal the amount was only R35 (Maile, 2004: 57; Wildeman, 2000: 3). Poverty targeting takes as its point of departure the assumption that certain groups of learners need more resources than others as a result of economic advantage. Based on these statistics, poor schools and learners are persistently disadvantaged and will take much longer to overcome the barriers of the past, thus prolonging the cycle of poor quality education (Wildeman, 2001: 10, 2008: 4). Funding policies that are intended to redress past inequalities actually end up being sources of a serious process of reproducing inequalities based on class, race, and physical location of learners. Because of the inherent contestations in the process of developing these inequalities, the process of social reproduction engendered by funding policies becomes "a unity of social contradictions, unity of change and stability, unity of continuity and discontinuity" (Morrow & Torres, 1995: 8). As such, social justice and equity in education becomes a pipe dream as inequalities engendered by funding policies continue.

The NNSSF added another dimension to the problem of redress. By targeting only the poorest schools, those schools that are located in the middle of the resource-targeting table, the so-called middle schools, became neglected and impoverished. Wildeman (2001: 8) states that the implementation of the funding policy meant that, "these schools qualified for less state funding and in the absence of strong socio-economic parent communities, they faced the danger of real financial deterioration." These "middle schools," as schools that do not exist in abject poverty but which nevertheless lack stable income from user fees, became financially vulnerable because of insufficient funds and were therefore unable to maintain themselves and provide adequate services to learners. In spite of the real increases in the NNSSF allocations, and the fact that more poor learners benefited from redistribution, the problem of middle schools persists. Thus, we see the subtle process in which, as Bourdieu notes, an educational system has specific structures which correspond to both their "essential function" of inclusion and their "external function" with respect to the reproduction of inequalities based on the socioeconomic status of schools, districts, and eventually learners (Bourdieu & Passeron, 1977).

School Fees

Research undertaken by Fiske and Ladd (2004) revealed that enrolment rates are generally high in primary schools and then drop significantly at secondary school level. They suggest that one of the reasons could be the higher cost of school fees at secondary level. Also, the inability of parents to pay for school fees, uniforms, and transport was the primary cause for nonattendance (Roitmayr, 2003). Many children are temporarily or permanently barred from school because of nonpayment of fees.

According to Reid (2002), as South Africa forges ahead with rebuilding and transforming its education system following the end of the apartheid in 1994, school fees have emerged as a highly controversial issue. Such fees exacerbate a problem-plagued national system of education funding that falls short of meeting even the most basic needs of the nation's historically disadvantaged learners. Roitmayr (2003) contends that fees violate the Constitution (South Africa, 1996a), which guarantees the basic right to education. School fees contradict international law, including the Convention on the Rights of the Child, the international human rights treaty that requires all governments (South Africa is among them) to make primary education free for all. Overt racism in the form of apartheid laws has been replaced by covert racism and class domination in the form of school fees. Brown (2006) suggests that as a result, new educational injustices are preventing poor and marginalized groups from getting universal access to high-quality education in South Africa. There is a danger that schools can deliberately exclude learners and resist transformation through levying exorbitant school fees that will protect the status quo of some of the affluent schools. According to Mestry and Bisschoff (2009: 52), school fees may act as a barrier towards embracing diversity and ensuring that a school does not reflect the broader South African community through the exclusion of those who cannot afford to pay school fees. Ahmed and Sayed (2009: 204) asserts that despite global declarations to abolish school fees, free provision of education by the state seems to be the exception, with the majority of countries charging fees in different forms.

In order to counteract the potential inequalities that school fees may cause, the South African Schools Act specifically creates provisions for school fees exemption policy. Furthermore, the no-fee school policy is contained in the Education Laws Amendment Act of 2005.

School Fee Exemptions

In order to redress past imbalances in education, the Ministry of Education amended school fee regulations. The Education Laws Amendment Act 24 of 2005 (South Africa, 2005), the new NNSSF, and the new regulations relating to the Exemption of Parents from Payment of School Fees (South Africa, 2006a, 2006b) have been amended to give poor parents relief in the cost of their children's education.

There are three levels of exemptions, which may apply if parents cannot afford to pay school fees: full exemption, partial exemption, and conditional exemption. Parents will be granted an exemption based on their income and the number of children attending school. The proportion of parental income and number of children to school fees is determined by a set formula which schools should apply, upon receiving a written application from a parent.

The regulation also makes provision for automatic exemptions based on the following:

- A person who has the responsibility of a person in respect of a child placed in a foster home, a youth care center, a place of safety, or an orphanage
- A person who is a caregiver of an orphan or a child who has been abandoned by his/her parents or who is without any visible means of support
- A child who heads a household

Roitmayr (2003: 400) explains how the school exemption policy hinders access to education. Many families who are eligible to apply do not do so because the process is time-consuming, while it is also likely that the cost of dignity in terms of how parents and learners may be treated at school is regarded as too high. The policy fails to address other costs, such as transport, uniforms, and textbooks, and this cost burden can force poor parents to keep their children at home. Proponents of a school fee policy, while disagreeing that fees solely act as a barrier to education, do concede that fees coupled with other access costs can have serious implications for learners' access to education.

The inbuilt principle in the state's funding policy has been that the higher the fees set by a school, the greater the number of parents who will be exempted – thus deterring schools from increasing their fees (Department of Education, 2003a). According to Fiske and Ladd's (2004: 72–74) investigation of school fee exemption patterns, only 2.5 % of families with children in primary schools and 4.1 % of families with children in former white schools receive fee exemptions. At secondary school level, only 3.7 % of families and 5.7 % at former white schools receive exemptions. The Plan of Action (Department of Education, 2003b) states that affluent public schools (quintile 5) will be compensated if they enroll and grant exemptions to poor learners. The purpose of the school allocations flowing to quintile 5 (the wealthier public schools) is "to make it possible and fair for these schools to enroll learners to a level where 25 % of them would be granted full exemptions from school fees." This has not been followed through in any fundamental way in the Education Laws Amendment Bill (Veriava, 2005: 10) and appears to be the primary reason for the non-enforcement of the policy on the part of many schools. However, with effect from 2012, the Department of Education has requested all schools granting school fee exemptions to poor learners complete prescribed forms so that they can be compensated the amount calculated on a set formula.

Also, there are no formal requirements that schools determine their budgets for the year by taking into account the number of exemptions likely to be granted. Consequently inequalities exist.

According to the South African Human Rights Commission (Mestry & Bisschoff, 2009: 60), the following issues concerning exemptions should also be considered since the new regulations do not make provisions for these:

- The HIV/AIDS pandemic has led to dramatic changes in the structure of families within South Africa. In all of the provinces, there are many older persons who are caring for their grandchildren, as their children have died of HIV/AIDS. This places enormous financial, social, and emotional strain in the grandparents. The regulation should provide that grandchildren under their care and who are recipients of state old-age pensions should be automatically excluded from paying school fees.
- The regulation defines income as gross salary or wages, money received from investments, and profit gained from any form of business undertaking. However, more parents in South Africa earn a living through the informal sector. A recent study released by Stats SA (2008) showed that 8.8 million people are in informal employment, 2.2 million people are employed in the informal sector, and one million people are employed as domestic workers. People who are employed in the informal sector are usually not registered businesses or are not registered to pay income tax. It is thus difficult for parents to declare their true earnings.

Exemptions in theory permit even the poor to attend affluent or fee-charging schools. There is evidence that many affluent schools fail to implement the exemption fee policy. This has serious implications for poor parents living in the catchment area where schools are situated. They are forced to pay the exorbitant school fees or send their children to schools outside their area.

No-Fee Schools

Following the publication of the Plan of Action (Department of Education, 2003b), an important immediate step was the promulgation of the Education Laws Amendment Act of 2005 (South Africa, 2005). This legislation provides the legal mandate for the Minister of Education to determine quintile norms and minimum standards for the funding of public schools. The no-fee school policy applies in principle to both primary (Grades 1–9) and secondary schooling (Grades 10–12).

According to regulation, all quintile 1 and 2 schools (representing about 40 % of schools in the country) will be declared no-fee schools. In the current policy, a fee-charging school can now apply to the provincial departments of education to be declared a no-fee school should it qualify. The no-fee schools are not allowed to charge school fees. In some provinces, the no-fee school concept has been extended to quintile 3 schools. The National Department of Education should annually publish the list of no-fee schools in a government gazette and a target table, which reflects the target per learner allocation for each of the five quintiles. The lists of no-fee schools are determined provincially by the provincial department of education using a standard national procedure. Each school is assigned a poverty score

Table 54.2 National table of targets for the school allocation (2007–2009)

Quintile	A (%)	2007 B	C (%)	B	2008 C (%)	B	2009 C (%)
NQ1	30.0	R738	100	R775	100	R807	100
NQ2	27.5	R677	100	R711	100	R740	100
NQ3	22.5	R554	100	R581	100	R605	100
NQ4	15.0	R369	67	R388	100	R404	67
NQ5	5.0	R123	22	R129	22	R134	22
Overall	100.0	R492	89	R517	89	R538	89
No-fee threshold		R554		R581		R605	

using data from the community in which the school is located (Ahmed & Sayed, 2009: 206). The school will be assigned to one of the poverty quintiles determined nationally (See Table 54.2). The middle quintile is referred to as the "adequacy benchmark." Schools in this category will receive a minimum of about R554 (equivalent to $70) per learner annum. This subsidy excludes personnel expenditure. Schools in poorer quintiles (1 and 2) are no-fee schools that receive larger allocations than those in quintiles 4 and 5 (affluent schools). Thus, no-fee schools receive more government funding and also receive compensatory funding in areas such as school safety, nutrition, classroom construction, and Grade R expansion (Wildeman, 2008: 6).

Note: Amounts in South African Rand. Amounts refer to per learner allocation for each category of school, and information is provided on the national percentages per quintile (Column A) and per learner amounts for 2007–2009 (Column B), and Column C specifies "the maximum percentage of learners in each national quintile that could be funded to the no-fee threshold level" (South Africa, 2005).

According to Table 54.2, schools falling in NQ1, NQ2, and some in NQ3 (the poorest, no-fee schools) would receive allocations of R738, R677, and R554 per learner, respectively, in 2007, and 100 % of learners would be covered in these categories. Column A represents, for example, 30 % of learners in South Africa attending quintile 1 schools and 5 % attending quintile 5 schools. NQ3 is the adequate benchmark (R554), and therefore schools falling in quintiles 4 (R369) and 5 (R123) would receive less than the benchmark.

According to Ahmed and Sayed (2009: 213), the no-fees policy fails to address many of the current challenges facing South African education. In the first instance, the policy is dependent on whether the provincial departments of education have the capacity to implement and monitor the policy. Concerns about provincial departments functioning relate to the accurate dissemination of information, communication with schools, monitoring, and administrative inefficiency. Based on media reports (Macfarlane, 2007), principals have complained of the delays in payments into the schools' banking accounts. From anecdotal evidence, many schools in the township face serious cash shortages. They are unable to purchase basic necessities for their school such as stationery or to manage their schools on a day-to-day basis. This hampers the provision of quality education in schools.

Public schools are scarce and face severe overcrowding in certain areas, forcing parents to send their children to schools in neighboring ones. By declaring only certain schools free, many poor parents will be in the situation where they cannot access these free schools and will be forced to enroll their children at middle-of-the-range schools where they must pay fees. The financial implication is that provinces in close proximity might have to deal with migration of poor learners from a poor province to a relatively rich province. The latter departments may not necessarily have factored such movement into budgetary allocations, which are based on the number of learners in that province.

School Choice

There is a trend for learners to migrate from schools in the townships to schools in the suburbs and inner city motivated by the poor quality of schools in townships. Learners travel daily from townships to attend schools in other areas and are prepared to pay the exorbitant school fees. In the same light, learners from suburbs are migrating to private or ex-Model C schools where fees are sky high to deliberately prohibit poorer children from gaining access to these schools. Many township schools had to shut down or combine with other schools in order to deal with low learner enrolment and teacher redeployment.

The complexities of the freedom to exercise choice – or the liberty principle in education finance – have serious implications for parents who are subjected to high school fee structures and are discouraged from applying for a fee exemption. Parents who want their children to receive “quality” education have no option but to abide by the school’s fee payments, otherwise their children will not be allowed to continue with their schooling in the more affluent schools. To maintain a good educational standard, these schools have to raise their school fees because the state subsidies to them are minimal. However, parents have in theory the freedom of choice within the constraints of private resources and school-level policies; in fact, government policies create markets for education within which choice behavior is exercised (Woolman & Fleisch, 2006). In the process, inequalities based on class are perpetuated as wealthier parents “buy” a better education for their children. Consequently, though dramatic positive changes have been made, many poor and rural provinces still find themselves at the lowest end of infrastructure provisioning with a continuation of gross inequalities in educational outcomes.

Learner Access and Dropout Rate

Undoubtedly, since 1994, there has been a rapid growth in school enrolment. The introduction of 10 years of compulsory schooling (South Africa, 1996: Section 3.1) has resulted in numbers peaking. The African learner enrolment increased by 16 % between 1991 and 2001. In the same period, the colored learners increased by 2 %, while the Indian and white learner enrolment decreased by 5 and 28 %, respectively. Overall, 83 % of African learners were in the public schooling system (Bot, 2005: 8). Based on the Household Survey conducted in 2006, it was established that close to 250,000 primary school-aged children and a further 280,000 learners with physical and mental challenges were not in the school system (Department of Education (2002) in Bot (2005: 8)). Poverty is the primary cause for keeping children out of school, with HIV/AIDs being a contributory factor for this bleak state of affairs. Based on projected figures, over the next decade, enrolment is most likely to decline due to HIV/AIDS, and the number of AIDS orphans is expected to rise from 200,000 to almost two million between 2010 and 2014.

In an article "Dropout rate mystery," various education labor unions in South Africa questioned the National Department of Education about the high learner dropout rate (Chuenyane, 2010). About one million learners who started their schooling 12 years ago cannot be accounted for. Over 1,444,018 learners enrolled in Grade 1 in 1998, and only 552,073 (38 %) wrote the Senior Certificate Examinations (SCE) in 2010. Of this amount only 334,718 learners (24 %) passed the SCE. However, the Director-General in the Department of National Education, Duncan Hindle, refuted the statistics provided by the unions, claiming that "there are many factors involved, including a high repetition rate in Grade 1." Hindle asserts that some of those learners that dropped out of mainstream schooling might have opted for further education and training (FET) colleges after Grade 9, or enrolled at private schools, and others might have failed a grade but were still in the system.

According to recent research undertaken by Social Surveys SA (Blaine, 2010), poverty and the generally poor quality of basic education are primary reasons behind South Africa's slow school completion and high school dropout rates. The many learners were taking more than 12 years to finish school was costly to the state and the households they lived in. At least 21.8 % of colored children, 12.8 % of Indians, 9 % of blacks, and 4.2 % of whites are not in school. The dropout rate is fairly high in Grades 10–12 (Bot, 2005). Other reasons cited for the high dropout rates include teenage pregnancies and feelings of alienation and disengagement. While the research revealed that black children were more likely to repeat a grade six times than white learners, race was a "thin film through which to view other variables – access to good quality education, living conditions and home language." However, Gardner and Crockwell (2006: 5) assert that there are many factors that impact the learners to stay and succeed in school, factors which include economic hardships, family challenges, different forms of social discrimination, peer challenges, interpersonal conflict, and lack of classroom supports. In a South African context, the socioeconomic status of parents still remains the primary reason for the high dropout. The low promotion requirements for learners to progress from one grade to another have resulted in the promotion of learners who cannot cope with the curriculum, resulting in a bottleneck especially in Grades 10 and 11, and therefore a sharp drop in Grade 12 enrolment. Overage learners have been removed from the schooling system and the option these learners have obtaining the SCE as private candidates or enrolling at FET colleges. What is most disturbing is the sharp drop from 101 to 67 % in the Grades 11–12 ratio for the same period. Bot is of the opinion that there may be evidence that schools and districts engage in gatekeeping or culling of Grade 11 learners.

Resource Allocation and Educational Outcomes

Adequate school funding secures essential resources for the provision of quality education. The relationship between the resources used to provide education and the resulting outcomes for learners is treated as analogous to a general production function in economics, in which inputs (factors of production) are related to outputs. The education production function focuses on the relationship between resource inputs and learner outcomes, largely ignoring the complexity of the family and school processes that intervene and are largely responsible for reproducing inequalities in the system. Levacic and Vignoles, (2002: 1) suggest that if robust evidence on school production function relationships were more widely available, decisions concerning the adequacy, efficiency, and equity of school resource allocations would be much more soundly based:

- Education economists have different views on whether there are causal links between resources and educational outcomes, but Levacic (2004) asserts that there is one between resourcing and learner outcomes: Changes in class size in the primary school from 40 to 50 may have a significant effect on teaching, learning, and outcomes.
- Conditions of classrooms (leaking and unusable classrooms) have a strong effect on reading and mathematics scores for middle school learners.
- Providing textbooks increased primary learners' attainment quite substantially.

In our rural and peri-urban societies, most schools are poorly resourced and thereby engendering a poor quality education.

In South Africa, research conducted by Van der Berg (2006: 60) reveals that despite shifts in real resources, educational outcomes hardly improved in former black schools – although admittedly, some more affluent black learners moved to historically white schools, which maintained their results over the period. Despite additional resources channeled into school education and the more equitable distribution of such resources, the aggregate number of successful candidates increased only moderately in the decade after the transition to democracy. Increase in pass rates was initially driven by a reduction in the number of candidates through restrictions on overage learners in the school system. Analysis of the 2003 matriculation results further illustrates the situation of racial educational differences in educational outcomes. In 2003, white learners who passed matric in public schools constituted 69 %, whereas for black learners this figure was only 28 %. One in ten of the white cohort achieved an A-aggregate, whereas scarcely one in a thousand of the black cohort managed this. Moreover, barely half of the black learners achieving this distinction came from former black schools. Thus, we see inequalities in school performance being replicated.

While it is true that fiscal resource inputs are no guarantee of desired educational outcomes, they do have some effect on the educational outcomes. According to Van der Berg (2007: 851), equity of educational outcomes requires both well-targeted fiscal expenditure and efficient schools. On the one hand, fiscal resources do not necessarily translate into scarce real resources (qualified teachers and school management)

Table 54.3 Gauteng senior certificate examination results, 2004–2006

Quintile	Average funding per school	No. of schools	Below 40 %	41–50 %	51–60 %	61–70 %	Above 70 %

Source: Data supplied by the Gauteng Department of Education

required to improve school performance. Good teachers are scarce and it is difficult to entice them to work in townships or rural schools, where there most needed. Secondly, even where resources are available, their effective utilization is not guaranteed.

Table 54.3 (below) illustrates uneven school performance from 2004 to 2006. The pass rate of Gauteng schools is classified into quintiles. Similar data sets from the Department of National Education and some provincial education departments are not available. It is evident that there is very little improvement in pass rates in black schools, despite large resource shifts. While the pass rates in affluent schools were almost uniformly high, predominantly black schools performed abysmally, with most reaching pass rates in the range of 20–60 % or even lower. Even though many former white and Indian schools accommodate black learners, the matriculation pass rate is still consistently high. Thus, we note that inequalities at the matric level are more accentuated in a system that purports to be just and equitable.

Drawing on international and national research, we concur with the findings that resource increases alone do not improve the matriculation results and therefore impede social justice and equity. The role of socioeconomic status (SES) and other factors, such as dropouts, transitions between grades, and quality of educational performance up to matriculation level, are some factors that determine the matriculation results. We, however, believe that resources (human, physical, and financial resources) contribute significantly to the provision of quality education and social justice.

Conclusion and Recommendation

Although the South African government has taken numerous strides in enhancing equity, redress, and social justice in education, there have been a number of challenges in the implementation of policies which have affected the process of bringing about fundamental changes and transformation in education. Inequalities based on race and socioeconomic status in particular continue to be reproduced in a system that is only superficially egalitarian and democratic. Although progress has been made towards a just distribution of public funds through the NNSSF, "no-fee" schools, and school fee exemptions, significant inequalities persist, attributed largely to the social legacy of apartheid and new emerging discourses. It is unclear to what extent funding has translated into actual resource inputs and gains for the poor, but it would appear that there is a strong correlation between funding and educational outcomes. Most affluent schools achieve excellent matriculation results because, among others, they have more physical resources than poor schools and employ more teachers than are allocated by the education departments.

Although the NNSSF and other related funding policies address social justice and equity issues, the implementation of these policies is a major concern: large and overcrowded classrooms still exist, township learners migrate in large numbers to inner-city and suburban schools, high school fees, poor teacher training, ineffective management of school finances, lack of leadership from SGBs, SMTs and Districts, and the inaccessibility of poor learners to affluent schools.

Based on this discussion, it is evident that while the state is making a concerted effort to address social justice and equity in public schooling, educational outcomes and learner achievement still leaves much to be desired. I propose that the funding model be reviewed to consider important but deeply neglected aspects in education:

- The quintile system of public school funding should be abandoned. Even though it has been reported in the media that the state intends abolishing the quintile system, nothing has been forthcoming. The criteria for ranking schools into quintiles are seriously flawed. For example, even though a school is situated in an affluent area, it may cater for over 90 % of learners from outside its feeder area. This school is ranked as quintile 5 and receives the lowest funding on the scale, yet caters mainly for middle-class and poor learners. The school is placed in a diabolical situation: They raise school fees and then adopt a hard-line approach to grant exemptions to learners who have difficulty in paying these exorbitant fees. Similarly, learners from affluent circumstances may attend no-fee schools without making any monetary contribution to schools.

- The funding policy should seriously consider the adage that "funding should follow the learner" similar to the voucher system applied in the USA.
- The application for state funding should not be prescriptive. The funding set aside for resource allocation to public schools by provincial departments should not be ring fenced. For example, the Gauteng province prescribes that schools should spend 50 % on LTSM and 50 % on services and school maintenance. SGBs should spend the funds on educational matters they deem necessary for their schools or to employ additional teachers and pay from these funds. However, the SGBs would still remain accountable for the application of funds to the Head of Education.

Therefore, it is challenged that school funding policies should be based on comprehensive analyses of the contextual situation in our urban, rural, and poor schools, so that those who should benefit from funding do actually get the benefits of our young democratic dispensation.

Part VII
Leadership Preparation as Intervention

Chapter 55
Clarifying Conceptual Foundations for Social Justice in Education

Susan B. Feldman and Kersti Tyson

In the United States, we hold the truth that public education equalizes individuals' opportunities to participate effectively in our capitalist democracy to be self-evident, and yet we have not demonstrated this to be true. Instead, the social disparities in the social world outside of schools permeate the social world inside of schools. As a system of educators and infrastructures, public education has not succeeded in securing equal access to high-quality learning experiences for all students. The 2001 passage of the federal Elementary and Secondary Education Act (ESEA, commonly referred to as No Child Left Behind) shifted the expectation from school systems to provide equal opportunity for all students to have an education, to school systems producing equal educational outcomes for all their students. Taken in its best light, this policy change was intended to create pressure on the system to comply with the expectation that schools should provide equal access to high-quality instruction for all of their students.

This shift has had noticeable impact on the work of school leaders and, therefore, the preparation of school leaders. For example, New York City has developed a leadership academy to prepare leaders to lead schools through the "turn around" from simply offering the opportunity to learn, to schools that can generate high academic achievements for all of their students. Atlanta, Georgia, St. Louis, Missouri, and the whole state of Massachusetts have created similar leadership preparation programs to teach leaders particular strategies to lead equity-focused

learning agendas. Each of these programs frames the problem of how to "improve" the educational outcomes in schools differently, and each of these programs and school leadership preparation programs, generally, establish their own set of approaches to preparing leaders that tend to serve the interests of the school districts where their graduates find jobs.

Despite the blossoming of a few new leadership development innovations, leadership preparation programs, new and long established, lack clear theoretical foundations that explain school leaders as pivotal social justice workers. In fact, we do not yet know what the leadership strategies are for generating high academic achievement outcomes for all students. We know more now than we knew in 2001, but we have few to no examples to follow given that very few schools have accomplished the goal of equal educational outcomes for all students. The persistent challenges at the core of school leadership continue to be problems of equity, equality, and social justice. We assert that school leaders continue to be woefully underprepared to negotiate these problems.

Despite good intentions, it is rare to find fully developed theories and practices of social justice guiding school leadership preparation programs. We submit that this is less because professors of school administration are unconcerned with this issue and more because of the formidable challenge of developing a program-wide theory of action for enacting social justice in education. Not only are the faculty unlikely to agree on what the role of school leadership is or ought to be in producing social justice, but no less consequential is the fact that there are few local proofs to learn from.

Despite school leaders' intentional dedication to leading a school with a clear, equitable learning agenda and a commonly professed commitment to school as the social institution intended to equalize otherwise unequal social conditions, their aims fall short. In response to these observations, we propose that unless school leaders develop a coherent conceptualization of social justice, they will be unlikely to fashion their leadership accordingly. Designing context responsive leadership preparation is challenging. The solutions to academic injustice in one school or district may or may not apply to another. There is not one set of skills or knowledge that will work across all contexts. It is not easy to know which of the multiple theories of social justice is useful for preparing leaders in education (Griffiths, 2003). It is not a surprise, then, that school leaders might lack a coherent vision of social justice in education when most school leadership preparation programs lack a coherent theory of action for social justice in education.

Educational leaders develop their thinking about these matters across a career, and there are many influences on their thinking. Their first formal exposure to these ideas about their practice—in formal programs that prepare them for administrative positions—is likely to exert an especially powerful influence on their initial images of what it means to lead for socially just purposes and how to realize these images of leadership. Our goal here is to delineate a conceptual framework for school leadership preparation programs to clarify their own comprehensive and coherent programmatic approaches to preparing school leaders who will transform schools and school systems into institutions that promote social justice. To contextualize the necessity for school leaders to be well prepared to address issues of social justice in their schools and districts, we present two scenarios taken from actual school practice.

Scenarios

The scenarios below are developed from everyday real problems of practice in schools in the United States after the federal reauthorization of Elementary and Secondary Education Act (ESEA) of 2001. This federal policy required state-level development and implementation of standardized academic expectations that would be tested each year in grades 3–10 and test scores for each school be reported publicly. This created significant pressure in schools and school districts, making it clear to the public that some students attend schools that do not prepare them equitably. Public reporting of school academic achievement data starkly exposed the fallacy that public schools were equalizing students' opportunities to succeed in our capitalist democracy.

By 2005, many schools were exposed as failing to produce adequate learning outcomes, particularly for economically poor students. The new measures of student achievement produced the "achievement gap," "education debt," or "opportunity gap" (Ladson-Billings, 2006). These terms describe the persistent inequity in educational outcomes throughout the US school system. The new measures were not exposing new problems but transforming long-standing inequity into an urgent topic of concern for school leaders who were being held accountable, for the first time, for the education of all of their students. Once exposed, school leaders were expected to eliminate the academic disparity in their schools. These new accountability pressures created new needs and expectations for school leadership programs.

This is the policy context of the two scenarios below. Each illustrates the dynamic and multifaceted conditions of in/justice in schools expected to produce equal opportunities for all students to learn and equitable academic outcomes that would provide authentic opportunity to successfully participate in the capitalist economy. Like the real-life situations school leaders face each day, these scenarios can be understood from multiple and conflicting perspectives. We take up four of those perspectives following the presentation of the scenarios.

What the Data Display in a District[1] with an Apparent Achievement Gap

> Disaggregated standardized test score data have made it clear that there is an achievement gap that cuts across race and class in every school in the district. A group of teachers from one of the district's two high schools wants to close the achievement gap in their school. They approach their school leader, the principal, for support. He gives them money and time to attend a workshop entitled "Strategies for working with students from poverty." The principal is hoping they find the answers they are looking for. The teachers return from the conference with new ideas and language and a new appreciation for the magnitude of the problem and the complexity of closing the achievement gap. They see clearly that deficit

---

[1] For more information on the structure of US k-12 school system see: http://usinfo.org/enus/education/edu_overview.html

> model thinking, and victim blaming, is common throughout their school and school district. They had heard the principal justify the low achievement of economically poor students in the high school as "a problem with our cliental." They are fully aware of the tracking system controlled by the school councilors that place economically advantaged students in "college bound courses" because "those students were more likely to go to college."
>
> How could this small group of teacher leaders, just learning to see the complexity of injustice in their school make a difference? They first went to their teachers' union for support. They wanted to start by gaining the support of the principal but were not confident that they could explain their emerging perspective to the principal without jeopardizing their standing. There was nothing in the union process that could support teachers confronting a principal's inequitable leadership. In fact, they found that inequitable opportunity was normal practice throughout the district and the union leaders did not see it as a problem.
>
> The teachers next approached the district's leader, the superintendent, with the request to lead a district-wide task force to begin to study the achievement gap in the district more closely and to design a district-wide solution. The superintendent didn't return the teachers' letters or e-mails.
>
> The teachers began to complain in the hallways and staff rooms across the district that the district was expecting teachers to close the achievement gap while providing no direction, vision, or practices to lead the work. In an effort to pressure the central office administrators, a group of teachers contacted parents on the high school's academic excellence committee and asked them to attend school-board meetings in order to raise questions about the district's strategic plan to close the achievement gap. When these concerns showed up in the newspaper after the board meeting, these parents found themselves swamped with calls from other parents interested in getting involved.
>
> Next, the high school teacher's group formed an equity committee on their own, and they invited students, leaders, and central office leaders to join them. One principal in training and two out of 23 leaders showed up for the first meeting, but no central office administrators. The two leaders who did show up were in the process of planning a district-wide meeting for all of the school leaders. They invited this new committee to organize a one-day, anti-oppression training as part of this meeting.
>
> At the close of this one-day meeting, the superintendent was moved to tears. He explained that his tears were caused by his realization that he had been leading school districts for more than 25 years without knowing his own biases and that he could now see how he had blamed others for what was within his control to change yet, he confided, he had no concrete strategy for change.

This scenario highlights a process by which a diverse group of people might collectively lead the work of transforming schools into institutions where education is a tool that promotes social justice. Yet, in the scenario, the positional leaders were the least prepared to inform this work. These leaders have a unique responsibility for leading this work, but they have to be taught to lead it. Clearly, position alone will not create the necessary conditions for transforming schools into institutions that promote social justice. Leaders need to know and be able to do more. Hence, a central problem and opportunity for educational systems reside in the ways that educational leaders come to understand their work, develop images of possibility, and become competent in attaining those visions. This scenario hints at the lack of learning opportunities, both formal and informal, for the superintendent and his colleagues and district and school leaders to develop more specific ideas of a more socially just school system and how to work toward such an ideal.

Let's now turn to a scenario for a developing leader who is a principal in training in a middle school in the same district. He participated in the anti-oppression training then returned to his preparation program with a strong interest in learning how to lead for social justice in his future schools.

> When the principal intern returned to his weekly principal-preparation classes at his university preparation program, he shared with his colleagues what had transpired at the anti-oppression training. His peers had a variety of responses to his story. A small group believed the superintendent should quit and let someone who knew how to do the work take the job. Some students were moved by the superintendent's learning and willingness to continue to learn about this area of school district leadership; others thought the issue was overemphasized and not really the work of a superintendent; and still others thought the superintendent should hire a person of color to come in and do ongoing diversity training for the whole district. Students saw their various perspectives as being in conflict with each other. They turned to their university faculty to resolve the conflict.
>
> This experience created a conflict that students wanted the faculty to respond to and resolve for them over the course of their program. All of the students understood that the program's core values were grounded in social justice. What was now clear was that each group of students had its own ideas about what this meant and what it might look like in the program coursework. Each group now had an interest in the program moving in the direction of its point of view. Interestingly, the faculty were themselves conflicted about how to address the question of how to prepare school leaders to work for social justice in their settings.

Leadership preparation programs with unclear or under-conceptualized definitions of social justice may lack the necessary foundation to guide program design and instruction.

These programs are places where foundational ideas about leadership are formed. While leadership may be learned over the course of a career, a comprehensive understanding of the interaction between social justice and education practices may best be established in preparation programs. School leadership as social justice work may be antithetical to current leadership practice and may, in some contexts, be considered poor leadership. Without a coherent and comprehensive understanding of social justice in education and associated knowledge and skills, aspiring leaders may be left confused and underprepared for their work.

While there are many steps in any educational leader's learning process, a first and important occasion for such learning resides in the formal programs that prepare individuals to assume credentialed administrative positions. We assert that aspiring school leaders who learn, in their leadership preparation program, that social justice is the centerpiece of their job are more likely to see and address the constant injustice in schools. Formal school leadership programs have the advantage of designing and enacting intentional learning experiences with willing participants. Learning experiences of this kind offer the chance for aspiring leaders to begin to grasp the complexity of social justice as a central problem of practice, as hinted at in these scenarios. While the formal preparation of leaders may not offer everything a leader will need to understand, explain, describe, and advocate for, this phase of leadership development can lay essential groundwork for a career-long pursuit of just educational practice.

Keeping in mind these scenarios, the next section presents four distinct theories of action for school leadership as the work of social justice. Each theory of action proposes particular and distinctive ways to understand and address injustice in education. Although there are more theories available, we chose four that have wide currency, each with a well-established literature and history in practice. This is not intended to be an exhaustive description of each of the theories but rather an attempt to highlight four central constructs that model how the deconstruction of theories for education to realize social justice goals can be useful for leadership program planning.

The four theories for promoting social justice through education are:

A. *Antibias education*—a developmental approach to social justice rooted in racial identity development theory and progressive, grassroots practices of education as activism for social change
B. *Critical pedagogy*—an empowerment approach to social justice concerned first with emancipatory education of the oppressed through critically questioning the contradictions in the immediate reality of schooling
C. *Multicultural education*—an intellectual approach to social justice rooted in expanding the production and dissemination of knowledge to include all groups in society
D. *Whiteness studies*—a decentering/deconstructing whiteness approach to social justice rooted in the understanding of race as a social construction that produces the system of advantage based on race and locates racism as a white problem to be solved by whites in education

Preparing School Leaders to Work for Social Justice in Their Schools

For our purposes here, we frame school leadership for social justice as the leaders' prioritization of the high academic achievement and educational success of students who have historically been marginalized and underserved in the school system (Ford, 2011). By prioritizing the educational success of these students, the institutionalized, routine practices of injustice, and particular locally situated injustices, become apparent obstacles to be eliminated and areas to be transformed.

The research on school leadership for social justice elaborates an array of challenges for preparing school leaders to work for the form of social justice defined above. Three prominent challenges are highlighted here. First, deficit model thinking (Skrla & Scheurich, 2001) and victim blaming (Ryan, 1976) hold routine injustices in place. They propose the students and/or their families are the reason the school does not succeed. Conceptualized this way, the non-achieving students arrive at school each day somehow deficient, and therefore their unequal accomplishments are their own fault. Put overly crudely, these conceptions relinquish educators and school leaders from the responsibility of providing conditions for high academic achievement, because the problem is defined out of school (Howard, 1999; Gay & Howard, 2000).

Second, schools suffer from institutional racism that is both historical-structural and perpetuated interpersonally (e.g., Griffiths, 2003; Orfield & Eaton, 1996; Hale, 1982; Hooks, 1994; Ladson-Billings, 1994). Here low academic achievement is recognized as a problem inside the school, but beyond the scope of an individual school leader to effect.

Third, school leaders are poorly positioned to advocate for deconstructing the barriers to social justice because they have benefited from the system of advantages those barriers protect, as have their board members, and their peers in their clubs and committees (e.g., Bell, 1987; Kivel, 2002; Spring, 2000; Tyack & Hansot, 1982).

We submit that school leaders, and particularly leaders, for the first time in the history of school leadership (Tyack & Hansot, 1982) are in the position to advocate for the social justice goals described above (Foster, 1997). Currently, leaders are held accountable for running schools that generate high academic achievement across all student populations, which requires that all students have access to high-quality learning experiences. It is widely accepted that schools, as they have been run in the past, are "failing" to produce the learning outcomes expected and are being "restructured" to meet expectations that, though not generally stated as such, align with the social justice goals stated here. In other words, unlike in the past when the principal's job was to maintain traditions and to keep the school running smoothly, the principal's job now is to find and eliminate obstacles that cause some students to struggle to learn in the school. Leaders are to "turn around" the school and restructure the learning environment, the learning experiences, and the learning outcomes to keep their jobs (Portin et al., 2009). These job changes require changes in school leadership preparation. We submit that a primary obstacle to schools realizing their role as a tool for social justice is the lack of leadership preparation for this social justice work. Without explicit training, school leaders cannot and will not advocate for the complex changes required of them.

For leadership preparation programs to train leaders to restructure their schools to ensure the high academic achievements of students who have historically been underserved by the school, school district, and school system, they require the faculty time and attention to clarify the ways systems of advantage work through schools. These conversations among faculty members can be challenging, often engaging multiple conflicting perspectives, which can make faculty meetings contentious (e.g., Cochran-Smith et al., 1999; Berlak and Moyenda, 2001; Dilg, 1999). As was illustrated in the second scenario, students also bring conflicting perspectives and expectations to the preparation program, which can cause contentious learning environments. Another complicating factor is that leadership preparation programs may not have faculty members whose disciplinary training is in the field of social justice, making expertise a problem. The content of social justice (e.g., Rousseau, 1968; Arendt, 1981; Foucault, 1977; Rawls, 2003; Solomon, 1990; Waltzer, 1994) is often left up to well-intentioned faculty members to sort out for themselves with little help to think carefully about how their coursework relates to preparing school leaders to run schools that prioritize the academic success of the unsuccessful students. Even under the new accountability expectations for school leaders, there is tension between old and new leadership models. For example, in the current model, most candidates complete an internship with a principal mentor who defines the candidate's "fit" for the job. Candidates for school leadership with an interest in shifting or dismantling the system of advantage in the school can easily be seen as "unfit" for the job. Leadership preparation programs must also prepare leaders to think beyond the current conditions of schooling to the desired future of education. Preparing school leaders to run schools that provide for the academic success of *all* students by prioritizing the high academic achievement of unsuccessful students is an enormous task, and there are few local proofs that it can be accomplished, which is why this chapter is proposing theoretical approaches to this work. The four theories below offer four distinctive approaches to preparing school leaders for this work. These theories were largely crafted with teachers in mind, and we have extended them for application to and even further to the preparation of school leaders.

Four Theoretical Frameworks

In the growing literature on teaching social justice in leadership preparation (e.g., Brown, 2004a, 2004b; Capper, 1998; Marshall & Olivia, 2006; McKenzie & Scheurich, 2004; Shields, 2004; Skrla & Scheurich, 2001), most common are activities to include in courses, strategies for activities or for courses, ideas that might be taught in courses, and models for courses (e.g., Adams, Bell, & Griffin, 1997; Derman-Sparks, 1989; Derman-Sparks & Brunson-Phillips, 1997; Katz 1978; Marshall & Olivia, 2006; Tatum, 1994).

While all these activities are important and a part of the work of leadership preparation, what seems to be missing, and what we hope to encourage, are program-wide designs linked to explicit theories of education for social justice that inform instructional decisions in school-leadership preparation programs. Linking program activities, strategies, and practices to theory provides a backbone for conceptualizing and doing the work of preparing leaders to meet the accountability expectations and realizing their potential to enact social justice in schools and districts. There are many scholars who contribute to the work that we are only briefly summarizing here. Our goal is not to present a literature review for these theories or an exhaustive explanation of each theory but instead to illustrate how, by creating four central constructs from each of these four distinctive theories, it is possible to see how each theory suggests a particular approach to leadership preparation and can be a basis for program design.

Each of the theories presented below, while grounded in the same hopes for education to be a tool to realize social justice, posits a different set of ideas about how to accomplish the goal. Each theory suggests a different explanation of the role of education in promoting social justice, a different definition of social justice, and a particular theory of action for school leadership, all of which suggest particular implications for leadership preparation. Taken together, these distinctive constructs pose a different set of considerations for how to prepare leaders to lead schools that embrace and enact one or more of these theories in practice.

Framing the theories this way creates a tool for the faculty to organize and analyze personal and programmatic responses to program policy, practice, and interactions

Table 55.1 Elements of conceptual framework

Elements	Descriptions
Definition of social justice	Describes what social justice looks like through the lens of the theory
Role of education in promoting social justice	Describes the way education is or can be central to realizing social justice
Theory of action for school leadership	Describes the underlying conceptions, within the theory, that can inform strategic and intentional leadership action in schools
Implications for leadership preparation	Describes the pedagogical practices suggested by the theory of action

as well as providing lenses for making programmatic and instructional decisions. When there are competing interests about what to teach, when to teach it, and how to teach it, the framework can guide decision-making with the question, of all of our choices of action, which best enacts our theory of action for preparing these school leaders to prioritize and ensure the academic success of their historically marginalized and underserved students?

Construct Framework for Leadership Preparation

The construct framework begins with the definition of social justice; this describes what social justice means through the lens of this theory. The second construct is the role of education; this explains the way public education is or can be central to realizing social justice. The third construct, "theory of action for school leadership," describes the underlying conceptions within the theory that can inform strategic and intentional leadership action in education, and the fourth construct, "implications for leadership preparation practice," describes the pedagogical practices suggested by the theory of action. While this doesn't tell the reader everything there is to know about each theory, it presents core constructs necessary to see key features of the theories and to consider the various possibilities each theory offers for guiding leadership preparation programs (Table 55.1).

We are not advocating one or another of the theories below, nor are they presented in any particular order; instead, we are modeling how a program planning group might take a set of compelling or popular theories for social justice in education and analyze their core features to consider their programmatic possibilities.

A. Antibias Education

The foundation of antibias education is generally attributed to Louise Derman-Sparks (1989). Antibias education combines racial identity development theory (e.g., Carter, 1997; Cross, 2003; Helms, 1989; Phinney & Rotheram, 1987; Tatum, 1994,

1997) with critical pedagogy (e.g., Freire, 1985, 2000, 2001; McLaren & Kanpol, 1995; Nieto, 2003; Trifonas, 2003) and progressive grassroots activism. From the perspective of antibias education, schools are considered inherently unjust, and a school leader's job requires establishing the ongoing process of challenging, intervening, and actively countering personal and institutional behaviors that perpetuate oppression (Derman-Sparks, 1989).

Antibias education rests on a theoretical foundation of racial identity development theory that proposes the more one's racial identity develops, the more effectively one can work as an anti-oppression activist. Race is centralized in antibias work because race is understood as a social construct at the intersection of multiple systems of advantage (e.g., class, gender, ability). For example, when racial identity is called into crisis, it necessarily stimulates considerations of class, gender, and ability identities, which are also socially constructed through systems of advantage.

From an antibias perspective, social justice is defined as the activity of individuals with sufficient racial identity maturation to stand up for fairness and interrupt the system of advantage based on race. This capacity to stand up for fairness is achieved through education. There are four components to an antibias education. First, learn to interrogate your own location in the system of advantage based on race; second, learn to understand multiple perspectives. This includes learning to recognize the boundaries of one's own cultural encapsulation and decentering whiteness as the "normal" or dominant perspective. Third, teach critical thinking. Among other things, critical thinking enables school leaders to question who is benefiting from current practice and whose perspective is missing from the account of the situation. Fourth, learn to stand up for fairness through identity development where one comes to know one's self as an antiracist activist. Identity development occurs through a crisis-resolution process that progresses through predictable stages. Antibias education generates an identity crisis in order to encourage development.

Aspiring leaders' (students of an antibias education, generally) responses to an antibias education are fairly predictable and help the faculty assess student development and tailor learning experiences to students' particular developmental needs (e.g., Helm's stages of racial identity development: contact, disintegration, reintegration, pseudo-independence, immersion-emersion, and autonomy). According to these staged theories, the most mature stage is to know oneself as an antiracist activist. School leaders need to develop through all the stages of anti-oppression identity to understand the full spectrum of expression that oppression produces. A mature racial identity results in the leaders' ability to build coalitions across groups with significant differences to stand up for fairness.

Antibias theory offers a useful explanation for why it is emotionally charged to teach and learn about race (or class or gender) in education. Racism is not simply a historic condition; it is a personal orientation where every individual is implicated. Antibias education recognizes that teaching and learning about injustice puts people's identities at stake. This theory can help the faculty plan instruction that anticipates stimulating and resolving students' identity crises as an inherent part of the learning process. Identity development is caused by discomfort and the resolution of that discomfort through greater understanding of oneself and the social and political

Table 55.2 Antibias education

Elements	Descriptions
Definition of social justice	When racially mature individuals act individually and collectively to stand up for fairness. Fully developed individuals empowered to disrupt oppression through individual direct action and collaborative grassroots organizing in social settings including schools.
Role of education in social justice	Antibias education includes four essential components: (1) know yourself, (2) know others, (3) critical thinking, and (4) stand up for fairness and identify and interrupt unfair action.
Theory of action for school leadership	Stimulate and encourage racial identity development for the teaching staff and students through constructed interactions that cause identity crisis and re-equilibration toward a mature anti-oppression identity. Enact norms of anti-oppression activism that expect the four components of an antibias education to be central to classroom instructional designs, staff interactions, and the overall goals of the school community.
Implications for leadership preparation instruction	Learning caused by the careful construction of discomfort and its resolution. Identity development follows a developmental continuum of intra-/interpersonal psychological processes that lead to anti-oppression activism. Enactment requires that leaders have fully developed racial identities. The graduate school leaders need to understand the theory and practice of the program and fully support it when students complain about the discomfort of identity crisis. Internships must be reconceived. The faculty must be highly skilled in facilitating socially constructive conflict engagement.

conditions that inform personal identities. Therefore, program faculty need to teach from a mature racial identity in order to construct and navigate the disruptive interactions that emerge in antibias environments. A leadership preparation program could set completion standards based on students' demonstrations of progress through recognizable developmental stages, culminating in a demonstration of effectively standing up for fairness in their school setting (Table 55.2).

In summary, antibias education proposes that while injustice is both historical and structural, individuals maintain systems of advantage based on race. To realize the goal of leadership for social justice, prioritizing the high academic achievement of students who the school has historically failed , the theory of leadership action is to disrupt the school's systems of advantage based on race, which are likely to be normalized and deeply embedded in all practices in the school. Leadership will require racial identity development, informed by the interrogation of the leader's own location in the system of advantage based on race, continuous consideration of perspectives different from the leader's own, critical thinking, and actively and publicly standing up for fairness.

B. Critical Pedagogy

Paulo Freire (1985, 2000, 2001) is generally credited as the original thinker for critical pedagogy, but the roots of this work are traced to Marx and Engel's writings on social reform (Bowles & Gintis, 1976). Critical pedagogy is based on critical social theory and conceptualizes teaching and learning as a form of social activism. To teach is to expose the inherent contradictions in the immediate social circumstances of the learners, and to learn is to be empowered and emancipated from previous unexposed tendencies of social reproduction that strives to consolidate power and resources with those who already have it. Central constructs underlying critical pedagogy include (a) recognition of power as a constant factor in the social and political context that constructs and constricts thought and experience, (b) inquiry into inherent contradictions in immediate experience that generates empowerment and emancipatory practice, and (c) dialectical materialism that ties the sociohistorical past to the present social conditions of education (e.g., Apple & Beane, 1995; Darder, Torres & Baltodano, 2003; Freire, 1985, 2000, 2001; Giroux, 2001; McLaren & Kanpol, 1995; Shor, 1992; Shor & Freire, 1987).

Critical pedagogy is primarily interested in the education of the oppressed. Taken to the extreme, this includes all students under compulsory attendance conditions, which alienate them from their own choices and learning interests (e.g., Aronowitz, 2004; Mayo, 1999). Social justice is realized in schools that disrupt the social reproduction of injustice and enable emancipatory education of students who have historically been marginalized. Critical pedagogy is a practice of teaching and learning, which may be formal or informal, that recognizes the power structures in knowledge, social organizations, personal relationships, and the immediate experiences in the learning environment as a laboratory for learning to redistribute power to benefit the oppressed whose emancipation comes through understanding the sociohistorical conditions that led to the current conditions of oppression.

From this theoretical perspective, school is the location of a consequential struggle between social reproduction and the emancipatory interests of students who have been historically marginalized by schooling. The definition of social justice is the ongoing struggle to redistribute power and resources in the interest of the oppressed. Social justice is not an achievable state; it is instead a continuous dynamic practice of finding, interrupting, and redistributing power. Unlike antibias education, in which social justice is manifested through mass identity maturation that changes the way people feel toward and interact with each other, from a critical pedagogy perspective, social justice is manifested in the continuous struggle to redistribute material resources and tangible power.

Critical pedagogy suggests a social change theory of action for school leaders. Unlike most theories of action for school leadership that locate the leader as the highest positional authority in the school, expected to maintain the traditions of power and resource distribution, the theory of action for critical pedagogy is for school leaders to analyze and problematize the immediate experience of education by exposing the inherent complexities and contradictions within the schooling

Table 55.3 Critical pedagogy

Elements	Descriptions
Definition of social justice	The ongoing struggle to redistribute power in the interest of the oppressed.
Role of education in social justice	Learning to live in the struggle between the interests of social reproduction and emancipatory interests, which are constantly being redefined.
Theory of leadership action	Leaders assume oppression as the tendency of schooling and vigilantly disrupts the social reproduction of injustice that schools tend toward through the active redistribution of power and resources and the continuous interrogation of the inherent contradictions in the immediate learning environment.
Implications for leadership preparation	Critical pedagogy is primarily concerned with the education of the oppressed. Unlike dominant educational practices that marginalize poor and minority students, critical pedagogy places their education for their emancipatory interests at the center of the schools interests.

experience. Once exposed, the social and political context of the immediate reality of the K-12 school system becomes the site for social change. The school leader assumes oppression as the tendency of schooling and vigilantly disrupts the social reproduction of injustice that schools tend toward. Critical pedagogy is likely to call the very nature of compulsory education into question, and students could be expected to question authority and make choices that reflect their own learning interests. Aspiring leaders might be expected to link their own actions to articulate theories of power and to demonstrate how their leadership actions redistribute power to benefit others.

Critical pedagogy has proven largely successful for students and teachers around the world. While it aligns with leadership for social justice as the prioritization of the success of underserved students, it poses potential problems for leadership preparation. With its central concern for the education of the oppressed, it recognizes the oppressive and socially reproducing nature of schooling in its current form and plans for the deconstruction of the very system the developing leaders are trying to enter. This tension immediately calls into question issues of power and privilege of the aspiring leaders in the preparation program. Critical pedagogy locates school leadership preparation in a constant struggle to use the system in order to dismantle the system. Leaders' preparation might focus on what they need to know to live in this struggle and to use their power and privilege to the advantage and emancipatory interests of oppressed groups in their school community (Table 55.3).

In summary, the theory of leadership action, from a critical pedagogy perspective, is to redistribute power in order to prioritize the high academic achievement of students who have not yet been well served by the school, the school district, or the school system. This generates a constant struggle for the school leader between the pressures of social reproduction, which undermine the emancipatory interests of underserved and historically marginalized students, and the school community members who have benefited from this social arrangement.

C. Multicultural Education

Dr. James Banks and Cheery Banks (e.g., 1995), Dr. James Banks (e.g., 1993, 1994, 1997, 1998), Christine Sleeter (e.g., 1996), Carl Grant (e.g., 1992), and Geneva Gay (e.g., 1994) are five foundational authors of multicultural education. Underlying multicultural education is the idea of social transformation through cognition. Multicultural education recognizes that knowledge is never socially or politically neutral. Multicultural education's central premise is people who control the production and dissemination of knowledge influence what is considered valuable to know. People are changed by what they know. Social justice requires the expansion of the production of knowledge to all groups in society for all groups in society (Banks, 2002). Social justice is realized when all people participate in the construction of knowledge and diverse contributions to the body of knowledge are recognized, not for conformity with dominant and popular thought, but for divergence and innovation (Hill-Collins & Anderson, 1998).

The role of education is to produce meaningful knowledge and to understand the social and political implications of knowledge and knowledge production. The theory of action for school leadership is to ensure the inclusion and dissemination of empowering and relevant knowledge and to ensure curriculum and instructional practices do not offer privilege of one group's knowledge (i.e., the cannon of European-American male fiction writers) over other groups.

Implications for leadership preparation from a multicultural education perspective include rethinking what is taught, how it is taught, and who is teaching it (e.g., Darling-Hammond & Sykes, 1999; Darling-Hammond, 2004; Fine, Weis, Powell, Wong, 1997; Sleeter, 1992; Moses, Cobb; 2001, Gay, 2000). Multicultural leadership preparation programs could not rely on past practices because the aim is for a future different than the past. Leadership preparation would require critical analysis of the "common knowledge" of leadership and the inclusion of multicultural leadership models gathered from diverse educational settings, as well as the production of new knowledge about leadership, to fully understand the social and political construction of knowledge (Table 55.4).

In summary, the theory of action for school leadership from the perspective of multicultural education is to lead schools that focus on teaching all students to produce knowledge that is meaningful while exposing the social and political implications of both the knowledge production process and the knowledge itself. Again, different from critical pedagogy, which focuses on school leadership that redistributes power, and antibias education, which focuses on school leaders' racial identity development, multicultural education focuses on school leadership that provides access to the means of knowledge production for all students.

D. Whiteness Studies

The past 15 years have seen the start of more than 30 university courses or programs in whiteness studies in the United States. The courses, conferences, and scholarship under the name whiteness studies generally locate race as the central structure of

Table 55.4 Multicultural education

Elements	Descriptions
Definition of social justice	When all people participate in the construction of knowledge and diverse contributions to the body of knowledge are recognized, not for conformity with dominant and popular thought, but for divergence and innovation.
Role of education in social justice	To learn to produce meaningful knowledge and to understand the social and political implications of knowledge production.
Theory of action for school leadership	Lead schools that teach the social and political nature of the construction of knowledge and engage students in the production of knowledge including the construction of concepts and theories that produce a more just society.
Implications for leadership preparation	Leadership preparation would increase the critical analysis of the “common knowledge” of leadership and the school curriculum and train school leaders to produce new knowledge about leadership to fully understand the social and political construction of knowledge. Leadership preparation could not rely on models from past practice because schools have not yet achieved multicultural integrity.

oppression operating in society and, therefore, in schools (e.g., Darling-Hammond, 2000; Irons, 2002; Johnson, 2001; Lewis, 1978; Lipsitz, 1998; McIntosh, 1988; Ryan, 1976; Weis & Fine, 1993). Working from the definition of racism as a system of advantage based on race (Kivel, 2002), whiteness defines and is defined as racialized privilege (e.g., Fry-Jacobson, 1998; Irons, 2002; Johnson, 2001; Kivel, 2002). This definition locates whites as “racist,” not primarily related to personal intention or action but by the nonpersonal systemic structural and institutionalized ways in which whiteness is privileged in the United States. In other words, regardless of the personal beliefs or actions of an individual white person, which may be antiracist in intention, the individual is still operating within a system of advantage that she/he benefits from. While the race category of “white” has changed over the years, it generally implicates Americans of European decent. Due to the racialized history in the US, including forced and voluntary immigration trends, Americans of European decent maintain a position of privilege based on skin color, white. This particular position, both historically defined and currently enacted, defines whiteness. While this history is complex and affords differentiated privilege across European groups, white and whiteness have emerged as terms to help interrogate the inequity of racism. In other words, racism is seen as primarily a problem constructed by and for whites. Whiteness studies aims to prepare whites to dismantle the system of advantage that serves them (Frankenberger, 1993). Whiteness studies rely on awareness to inspire a moral imperative to act for just purposes, including ending white privilege and racism.

The definition of social justice is whites, the people who benefit from white privilege, exposing and dismantling the system of advantage based on race. The role of education is to expose and dismantle the system of advantage based on race. The theory of action for school leadership is to expose and dismantle white privilege in school by having those who benefit from it learn to deconstruct it. Through examination, whites can understand the injustice of their privilege and deconstruct the myth of meritocracy, the falsehood of the American dream, deficit model thinking, entitlement, and victim blaming (Kivel, 1992, 2002; Lewis, 1978; Ryan, 1976; Skrla & Scheurich, 2001). Each of these rationales works to stabilize the system of advantage for whites. Schools would have an instructional goal to end racism by exposing whites to their own history of unearned privilege and entitlement and unjust politics.

Through the lens of whiteness studies leadership preparation would focus on preparing white leaders to understand and dismantle racism in schools. Utilizing the growing literature about the history of whiteness and the history of racism as a white construction, whiteness studies expose both the personal history and the social construction of white superiority as essential to understanding how and why racism operates in education. This information is tricky for a number of reasons. First, the inherent racism in universities and college classrooms makes focusing on this racism challenging. Decentering white privilege disrupts patterns of learning familiar to white students. It is common for white students to drop out of these conversations and courses to avoid disruption of their sense of privilege. Second, a focus on whiteness, while important for understanding white superiority in schools, centralizes whiteness in the curriculum in ways that can alienate nonwhite students. Leadership preparation must attend to these dynamics in its pedagogy and curriculum. Third, whiteness studies can serve to establish white superiority in the leadership program when the bulk of the readings focus on whiteness. Even if the readings and discussion are critical of white privilege, the conversation is still centered on issues of whiteness. A growing number of schools and school districts are not run by white leaders and are not dominated by white students, but nationally most of the teaching population continues to be white. Developing African American leaders, for example, may have little interest in whiteness other than how it operates in resistance to their leadership. The particular racial makeup of the school and community plays a role in what knowledge and skills might be most useful from whiteness studies (Table 55.5).

In summary, the theory of action for school leadership, from a whiteness studies perspective, is to identify and dismantle white privilege and entitlement in the school and school system and to expose racism as a white problem requiring changes in whites' social interactions for its solutions. Drawing on antibias education's intra-psychological, identity development approach to social justice, or critical pedagogy approach to redistributing power, or multicultural education's approach to intellectual and academic social justice, or whiteness studies approach to dismantling white privilege as an organizing tool for school leadership preparation, has possibilities and problems.

Conclusion

The frameworks above reflect a careful distillation of complex literatures. While none of these frameworks tell "the way" to organize a leadership preparation program, they do provide a model for people to conceptualize and articulate what

Table 55.5 Whiteness studies

Elements	Descriptions
Definition of social justice	Whites dismantle the system of advantage based on race. Through awareness of unmerited privilege and power whites actively resist unfair power and privilege and use any benefit they have received through the system of advantage based on race to further the purposes of dismantling the system.
Role of education in social justice	To expose white privilege and superiority and dismantle racism.
Theory of action of school leadership	Racism is a white problem with a white solution. School leaders' work is to expose and dismantle white privilege in schools and the systems of advantage that are based on race in the school.
Implications for leadership preparation	Address race and the system of advantage based on race and the central rationales that stabilize the system of advantage based on race. Resist becoming another way to draw attention to whiteness and to locate whiteness back in the center of leadership. Foster awareness to end racism by exposing whites to their own history, politics, and identities. Awareness is understood as fundamental to inspiring a moral imperative to act for just purposes.

they mean by social justice in a leadership preparation program. We argue that if a leadership preparation program does not clarify what motivates their purposes and actions, it would be wrong to say it prepares leaders to work for social justice. Each of the four theories presented offer useful ideas to draw from in creating a comprehensive leadership preparation program. Developing an activist identity, producing knowledge, critically examining the immediate conditions of learning and power, building coalitions with community partners, and recognizing racial identity could be the backbone of a leadership program's practice. A purely multicultural or antibias approach could also provide the main support for a leadership preparation program. We urge the faculty to use the work we have done here to help organize your thinking as you sort through the literatures and program practices to determine what precisely you intend to prepare school leaders to do. It is also our hope that the faculty will use these frameworks for further study of leadership preparation programs. In doing so, we are confident that our collective understanding of what it means to prepare a school leader to transform his or her school into an organization that promotes social justice will grow and change. On many college campuses, the faculty have avoided the topic of preparing leaders to lead for social justice in education. Their avoidance is understandable, yet problematic. We hope this chapter will provide the faculty an opportunity to further their work in the area of planning and implementing leadership preparation that prepares school leaders to transform their schools into institutions that promote social justice. We believe that the faculty in leadership preparation programs, and their students, are poised to meet this challenge.

Chapter 56

Issues of Social Justice and Fairness in the Development of Aspiring Head Teachers: I Had Not Really Thought About My Values Before…

Christine Forde

Introduction

Bogotch (2008) sees the project for education as one of 'seeking a pedagogy and leadership that might guide us towards change and social justice' (p. 94). However, what drives education policy currently in Scotland as elsewhere is the search for effective practice and the improvement of pupil attainment. Further, while education is seen as a means for achieving greater equality and fairness, this is not the only driver, nor indeed the dominant driver in education policy. Instead education is placed as a strategy for economic development. The alignment of educational policy with economic performance in many developed economies has been underlined by the recent report from the Organisation for Economic Development and Cooperation [OECD] (2010), *The High Cost of Low Educational Performance*. Written by two economists, this report uses PISA (Programme for International Student Assessment) scores of cognitive skills to identify the impact of lower attainment scores on a country's economy. This report illustrates the issue Bogotch (2008) points to where the measurement of success is decontextualised particularly through the pervasive use of sets of performance indicators or attainment targets to make comparisons between individual institutions or more recently between national educational systems. As Bogotch argues, these crude measures of performance and the high-stake public accountability of individual institutions and practitioners that accompanies these measures have had the effect of creating a strong sense that any new ideas are to be resisted – even those ideas around social justice and fairness which could pose a challenge to these technologies of performance management and accountability. These forms of performance management shape the governance of education in

Scotland and so are highly significant in questions relating to the preparation of aspirant school leaders. Professional development programmes have to recognise the policy frameworks within which school leaders must operate particularly around issues of public accountability, the orthodoxies relating to effectiveness in education and the improvement of pupil learning outcomes. The question then is how do we imbue such programmes with a sense of leadership for social justice which, at its heart, is about not only challenging current practices and assumptions but transforming education. To begin to address this question, we need to consider the articulation of these values in Scottish educational policy.

Values and Questions of Social Justice in Scottish Education

If we want to explore the development of leadership for social justice, equality and fairness, a useful starting point is to examine the 'values' underpinning Scottish public education (public education forms 95 % of school education provision in Scotland, ScotGov (2010). The articulation of such values in education has evolved from a point where concerns were expressed about the legitimacy of any public statement of values in education to a position now where educational policy is guided by a clear legislative framework in relation to equality.

In 1991, the main curriculum development body for Scottish education, the Scottish Consultative Committee on the Curriculum (SCCC), published *Values in Education*. The paper recognised that the explicit articulation of values was, at that point, a new step for many schools and that there could be much debate about what values were to be identified: 'There is a fear that any commitment to an explicit statement of values might be used as an instrument of social control, as a device to stifle dissent, and to entrench currently received ideas' (Scottish Consultative Committee on the Curriculum [SCCC], 1991: 4). Nevertheless, sets of values in education were put forward:

- Appreciation of learning
- Respect and caring for self
- Respect and caring for others
- A sense of belonging
- Social responsibility (SCCC, 1991: 4)

Most of these sets of values seem at first glance to be concerned with personal and interpersonal dimensions, and only 'social responsibility' seems to have more of an orientation to social justice:

> Social Responsibility:
> to develop among all learners personal responsibility in society at local, national and international levels. (SCCC, 1991: 9)

Included in social responsibility are skills relating to participation as a citizen and global awareness, respect for democratic processes, justice and the environment. There is also an explicit reference to economic disadvantage and, perhaps uniquely, the consequences of an unchecked approach to economic growth: ‘appreciating the ways in which wealth is generated and the impact of wealth creation on the world and on the environment’ (SCCC, 1991: 9). However, dimensions of a wider understanding of social justice also ‘pepper’ the other aspects. Part of an appreciation of learning relates to appreciating cultural difference and freedom of expression and developing understanding of the importance of a cultural perspective, respect for evidence and freedom of expression as the foundational elements of a democratic society. Respect and caring for others include valuing racial, ethnic and religious diversity, and a sense of belonging recognises the importance of the diverse cultural and faith communities children and young people belong.

At this point, 1991, the exposing to scrutiny of the implicit values that shaped practice and culture in Scottish schools was highly significant. This thinking did evolve in three ways: firstly, into ‘values education’ which became linked with religious and moral education (one of the core curricular areas in Scottish education) and, secondly, into some of the ‘technologies’ related to school effectiveness and school improvement with schools being required to develop ‘mission statements’ and sets of aims with their stakeholders. The third way in which the issue of values in education was taken forward was in the explicit articulation of values within educational policies.

Educational Policy in Scotland

Policy development is a three-layered process in public education in Scotland: with policy articulated at national level and then translated into practice through local and institutional policy frameworks. Here we see a set of values again being publically articulated but there is a move from broad statements about ‘respect’, ‘care’ and ‘appreciation’ to an increasingly assertive stance on the importance of equality and fairness in education and the contribution of education to ensuring equality and fairness in society. These values are evident in a range of policy developments in three core areas: (1) the curriculum, (2) professional standards and (3) quality assurance.

Scotland has been undertaking a generational programme of curriculum reform: *A Curriculum for Excellence* (Scottish Executive [SE], 2004). This reform programme is situated in a sociopolitical context where there is an emphasis on creating and supporting an engaged, highly skilled and participatory citizenry of an increasingly diverse society. In this curriculum programme for ages 3–18, the focus is on high cognitive skill, holistic development and interdisciplinary learning. Further the curriculum framework is underpinned by a set of key capabilities to be developed which reflect the sociopolitical and educational aspirations of Scotland:

> Like other countries we face new influences which mean that we must look differently at the curriculum. These include global, social, political and economic changes, and the particular challenges facing Scotland: the need to increase the economic performance of the nation: reflect its growing diversity; improve health; and reduce poverty. In addition, we can expect more changes in the patterns and demands of employment, and the likelihood of new and quite different jobs during an individual’s working life. (SE, 2004: 10)

The outcome of *The Curriculum for Excellence* framework is the four capacities. Thus, the purpose of education in Scotland is to enable children and young people to be 'confident individuals, responsible citizens, effective contributors, and successful learners' (SE, 2004: 12). While these capacities might be similar to the outcomes sought in many educational systems, the historical context of Scottish education has been influential in the stated values underpinning this curriculum framework. In 1998 devolved government was instituted in Scotland with the (re)establishment of the Scottish Parliament. This is very much reflected in the foundational document for this programme of curriculum reform:

> Wisdom, justice, compassion and integrity: the words which are inscribed on the mace of the Scottish Parliament have helped to define values for our democracy.
>
> It is one of the prime purposes of education to make our young people aware of the values on which Scottish society is based and so help them to establish their own stances on matters of social justice and personal and collective responsibility. Young people therefore need to learn about and develop these values. The curriculum is an important means through which this personal development should be encouraged. (SE, 2004: 11)

This programme of change in Scottish education has implications for the role of teachers and the role of leaders in school, and so the issue of values has become part of the professional standards teachers and leaders are expected to achieve. In Scotland there is a suite of professional standards relating to different stages and roles in the teaching profession. Extant are four professional standards which cover initial teacher education and registration (GTCS, 2012a), continuing professional learning (GTCS, 2012b), and leadership (GTCS, 2012c). The design of these professional standards has been based on the understanding that 'professional practice' – whether in leadership or teaching – is through the ability to undertake professional actions based on sound knowledge, effective personal and interpersonal attributes and professional values and personal commitment.

In this discussion on leadership development and social justice, *The Standard for Headship (SfH)* is particularly relevant. The shift towards greater specificity is evident in the different versions of the professional standard for school leadership. In the first *SfH* (Scottish Office Education and Industry Department [SOEID], 1998), the importance of values was recognised, but there was a reluctance to specify what these values were, beyond these being described as 'educational values'. In the revised standard (GTCS, 2012), there was a much clearer articulation reflecting the values set out in other frameworks. Under the essential element, 'Strategic Aims, Vision and Values', in the *SfH*, the following are identified:

> In SfH SE (2005a) the focus is on 'Integrity and ethical practice': and on 'Democratic values' (SE 2005a: 6). In the most recent SfH now there is specific reference to Social Justice which includes global sustainability, equality, diversity, education as a human right and a commitment to learner engagement in real world issues (GTCS, 2012c: 6)

Similar themes are also evident with the quality assurance frameworks. Scotland has a national quality assurance framework for schools, *How Good Is Our School* (Her Majesty's Inspectorate [HMI], 2002; Her Majesty's Inspectorate for Education

Table 56.1 Equality and fairness in quality assurance

Date	1996	2002	2006
Title	How Good is Our School?	How Good is Our School? 2002 Edition	How Good is Our School? The Journey to Excellence (Part 3)
Indicator	5.1. Ethos: A sense of identity and pride in the school, equality and fairness	5.3 Equality and Fairness: A sense of equality and fairness Ensuring equality and fairness	5.6 Equality and Fairness: Approaches to inclusion Promoting equality and fairness Ensuring equality and fairness

[HMIe], 2006; SOEID, 1996), which is the basis for external inspections carried out by Her Majesty's Inspectorate in Education (HMIe). Over a series of publications, we can see the way the idea of 'equality and fairness' has not only gained more importance in education, but there is greater clarity about the areas of concern (Table 56.1):

In this quality assurance framework, we see a move from a broad sense where 'the work of the school at all levels is imbued with equality of opportunity and a sense of fairness' (SOEID, 1996) to a much stronger sense in the 2002 version (HMI, 2002) where there are active steps to be taken by school leaders not only in building the ethos of the school but ensuring that equality of opportunity is provided. Thus, there must be evidence of 'fairness' in the activities of the school: 'positive steps are taken to ensure pupils, parents and staff are treated equally with respect and in a fair and just manner: culture and language, disability, gender, race, religion, sexual orientation and special educational need are not barriers to participation' (HMI, 2002: 54). In addition, there is an explicit statement identifying groups of pupils who may be particularly vulnerable:

> refugees, traveler children, looked after children, those for whom English is an additional language, pupils with disabilities, those with irregular attendance caused by illness, family circumstances or respite care and any other potentially vulnerable group within the school experiences of pupils. (HMI, 2002: 54)

A further development is evident in the current framework (HMI, 2006). Whereas in previous documents special educational needs or support for learning was treated as a separate aspect, in the 2006 framework, a clearer link with inclusion in education is made. Further, schools are now obliged to gather information about the achievement and progress of different groups as part of efforts to ensure equality and fairness. Thus, school leaders must make sure that 'diversity in the school community and beyond is valued' (p. 32). In addition, there is specific guidance for schools in relation to the provision of education to additional support needs and race equality (HMIe, 2004a, 2004b).

Thus the ideas of 'fairness and equality' have gone from almost an afterthought in the first quality assurance framework in 1996 to a specific criterion which carries requirements on the part of the school leader. As we have seen, the focus is on 'equality and fairness', and the term 'social justice' is rarely used. It could be argued that this is more about vocabulary than expectations and practice: that implicit in ideas of equality and fairness is a sense of social justice. On the other hand, it could be argued that 'equality and fairness' can be interpreted within the confines of a school's immediate activities: that the school has a duty to ensure there are 'equal opportunities for all' and to ensure all activities are conducted in a fair manner. In contrast, the term 'social justice' signals a wider socio-political impact. Thus, in these policies, the relationship between the educative process and wider sociopolitical transformation can be underplayed unless there is an explicit connection made with ideas related to social justice. While part of the task of the Scottish Qualification for Headship is to enable school leaders to address educational policy, equally important is the setting of educational policies within a wider sociopolitical frame, a dimension often not included in leadership development programmes. A limited form of leadership development will fail to acknowledge the wider legislative framework in which head teachers have to work and the contested nature of policies and their underpinning values and purposes.

Social Justice and Social Policy in Education

With the reestablishment of the Scottish Parliament in 1999 and as part of the 'nation building', there was a recognition of not only the increasingly diverse and pluralist nature of Scottish society but that the experience of exclusion and marginalisation in poor communities was significant. Thus, in a report from the Parliamentary Taskforce on Poverty and Inclusion, *Social Justice…a Scotland where everyone matters* (SE, 1999: 18), a wide ranging definition of social justice was set out.

> Social justice and equal opportunities
>
> We will promote equal opportunities and challenge discriminatory attitudes and practices. Some groups within our society suffer persistent injustice. This is often caused and exacerbated by discrimination and prejudice. Women form a significant proportion of groups vulnerable to poverty, especially lone mothers and elderly women. People from minority ethnic communities and people with disabilities also suffer injustice or discrimination, and continue to encounter barriers to their full participation in employment and in society more generally. Discrimination on the grounds of sexual orientation restricts opportunities and contributes to injustice. Age discrimination, too, means that society is failing to benefit from the skills and experiences of all its members. We are working to make sure equal opportunities for all is part and parcel of all our programmes. Gender, race, sexual orientation, disability, age - these should not be allowed to affect choice and opportunity in the new Scotland.

This position, which includes the ambition to end child poverty in a generation, is evident in subsequent legislation. Since *Standards in Scotland's Schools etc.*

Act 2000 (Scot Parliament, 2000), education has moved from being a compulsion (as per the 1872 Education Act which introduced compulsory education) to being constructed as a right; the opening statement of the 2000 Act declares that 'It shall be the right of every child of school age to be provided with school education by, or by virtue of arrangements made, or entered into, by, an education authority [the local district]' (Section 1).

The specific Scottish legislative framework sits within wider UK legislation – the *Equality Act* 2010 which lays a public duty on the public sector and so covers schools in Scotland. This equality duty includes the following:

> Eliminate unlawful discrimination, harassment and victimization and other conduct prohibited by the Act.
>
> Advance equality of opportunity between people who share a protected characteristic and those who do not. (Equality and Human Rights Commission [EHRC], online)

It would seem from this substantial legislative framework that questions of equality, fairness and social justice have been addressed or at least the means of ensuring such issues are addressed are available in Scottish education. However, there remain significant tensions which relate partly to assumptions about the egalitarian nature of public education and the continued existence of persistent social marginalisation and poverty. Tensions are partly to do with the role of school leaders and the enactment of government policy.

Education and Equality of Opportunity in Scotland

One of the iconic figures of Scottish education is the idea of 'a lad o' pairts', that is, a bright boy from a humble background could progress through school to university and into the professions. However, this myth is now more revealing of a monocultural society where although education was seen as a social good, conformity sat side by side with educational opportunities based on merit for a small minority. Progress was deeply gendered and reflected a historical divide between two religious communities – 'the lad o' pairts' was solidly within the Presbyterian tradition, and the largest minority group, the Catholic community who had emigrated from Ireland and the Highlands of Scotland to the central belt of Scotland, remained outside the public education system. Since that time Scotland has become much more socially diverse through immigration from India and Pakistan in the 1960s and increasingly from Africa, Hong Kong and parts of Eastern Europe. There remain social divides that in many respects are becoming more entrenched, notwithstanding the myth of the 'lad o' pairts'.

Patterns of underachievement are evident in relation to factors such as ethnicity, disability and gender, and these differences in attainment are becoming more apparent as more migrant learners from diverse circumstances are coming into Scottish schools. Changing social trends of not just greater diversity, but the continuance of poverty and indications of the creation of 'an underclass' through generations of worklessness and poverty and a decrease in social mobility over the last 20 years, has brought the issue of values in education into sharp focus. In Scotland, the impact of social class and poverty remains profound in determining educational achievements and the destinations of young people post-school. Thus, Iannelli and Paterson (2005: 14) argue that their analysis:

> has shown evidence that, for people born since the 1960s, the direct influence of class of origin has started to become more important again, after a post-war interlude in which acquiring credentials seemed to be emerging as the main way in which middle-class children acquired middle-class jobs. The role of education is still strong, but it is not getting stronger, and may be weakening.

Thus, while comprehensive education continues to exist, there are significant disparities between the attainment and achievement of pupils largely based on economic disadvantage. At the same time issues of equality and fairness are threaded through policy in Scottish education. However, the language of social justice is not always explicit in educational policy, and so there is a danger of a reductive approach with equality and fairness reduced to matters of attainment rather than social transformation. We need to move beyond just the recognition of ‘equality and fairness’ in education and understand these as political processes relating to redistribution and transformation. This tension is acerbated by specific expectations around improvement and effectiveness which not only dominate the policy imagination but also drive accountability regimes.

The core purposes of education are reiterated time and time again in terms of ‘effective learning and teaching’ (HMIe, 2006), and while clearly this has to be of fundamental importance, the issues of equality and fairness remain abstract ideas or problems to be faced in terms of individual pupils rather than systemic sociopolitical issues. The drive for improvement alongside the demand for ‘effective learning’ has led to an emphasis on attainment particularly in public examination system as the measurement of success. Notwithstanding the wider legislative framework, which underlines the importance of equality and fairness, there is a tendency to look to teaching strategies and learning theories which improve the learner’s ability to attain. Solutions are sought that are psychological in nature – looking to brain theory, developmental psychology and the affective domain. Where social learning processes are used, a ‘therapeutic’ discourse predominates (Ecclestone & Hayes, 2009) rather than any sense of social activism for change. It is this tension that runs through debates about leadership development and particularly headship preparation.

Leadership Development

Hernandez and McKenzie (2010) argue for programmes to explicitly prepare leaders for social justice, and so we need to tease out the place of issues related to social justice in approaches to professional learning. Debates about continued professional development of teachers and leaders in Scotland are dominated by the question of ‘impact’ (Donaldson, 2011), and the search is for forms of provision which have a demonstrable positive impact on pupil attainment and achievement. Side by side with this, there is a discourse which favours experiential learning. This drive to adopt more experiential approaches particularly mentoring and coaching (SE, 2006) reduces the wider sociopolitical dimensions of education. The focus is on sharing 'practice' and exploring solutions to problems of interpersonal conflict or resistance to change. Although some models of coaching look at institutional power relationships and the micro politics of schools as organisations, this largely focuses on transformational leadership (Davidson et al., 2008) where the task is to develop and enhance sets of interpersonal skills to engage, influence and persuade others of specific courses of action. In these models of professional learning, there is a danger of focusing on technical aspects and on policy implementation rather than the development of more critical capacities. This is a limited construction of leadership development and does not relate to the needs articulated by school leaders themselves.

Recent studies on the views of school leaders about their ongoing professional development highlight the importance of opportunities to reflect in order to interrogate practice and values. A survey of the views of serving head teachers in Scotland conducted by Woods et al. (2009: 246) indicates that a substantial proportion of respondents (62 %) wanted time for reflection on their values:

> Time for reflection can be for the individual but can also comprise periods of shared reflection in which a group of headteachers take time out to consider and re-evaluate their principal values, as one headteacher found with his preparation for headship (that is in the SQH).

There is a danger in such processes that reflection becomes simply confirmatory, and the harder questions and dilemmas where there are significant tensions related to social justice are not fully explored. Here Woods et al. highlight the useful of 'disturbances' as interventions (p. 261). Therefore, we need to look to approaches to professional learning that enable aspirant and serving head teachers to analyse problems on the basis of more philosophical questions of social justice, equality and fairness and appreciate some of the tensions inherent in such situations rather than be driven to find immediate and largely superficial solutions. A starting point is to consider the implications for the preparation of school leaders.

Questioning Assumptions: Lessons from the SQH

The *PG Diploma in School Leadership and Management (Scottish Qualification for Headship) (SQH)* is the professional qualification for headship in Scotland and is a mixed mode programme which combines taught elements with practice-based learning. Participants undertake this programme part-time as they continue in their current leadership role in school. The first two units of the programme are designed to enable the participants to examine, firstly, their values, purposes and practices as a leader in school and, then secondly, the school's culture and capability for change. The final two units then relate to the initiation, implementation and evaluation of a strategic change programme which contributes to the improvement of the quality of pupil learning experiences. The participants must identify specific success criteria using baseline data and then demonstrate the outcomes that have been achieved through this change programme conducted over an 18-month period. It is through this strategic improvement initiative aspiring head teachers demonstrate their holistic achievement of the *Standard for Headship* (SE, 2005) where professional actions must be underpinned by sound knowledge and clear educational values. Thus, efforts are made to ensure that there is not a division between the exploration, debate and articulation of values in the first phase of the programme and leadership practice in school in the second phase. The starting point in the *SQH* programme is a consideration of 'values' in education and to set education in a wider sociopolitical context.

Blackmore (2009) argues that we need to develop a critical pedagogy for leadership development. She advocates drawing on theoretical perspectives particularly critical race, queer and feminist post-structural approaches. She argues that 'these theories can disrupt our taken-for-granted assumptions of what leadership is, what it can be, and what purpose it ultimately serves'. These theoretical insights provide a critical framework for the examination of unquestioned beliefs particularly on questions relating to social justice. However, we have to recognise that in much of the provision for the continuing development of educators and educational leaders, the drive is to effect 'best practice' and there is a resistance to what is often characterised as theoretical or academic. The challenge then is to draw on these perspectives to develop critical tools among aspirant head teachers in ways that are accessible and meaningful to the participants. In the *SQH* programme, a series of activities are undertaken to enable participants to interrogate their values and appreciate some of the tensions related to the purposes of education.

Thinking About Values

All schools in Scotland have mission statements and sets of aims. However, these values are cast in such a way that some of the underpinning tensions and differences are not explored. The starting point for the *SQH* programme is an exploration of values in education set within an understanding of the sociopolitical dimensions of education. A theme reiterated by successive cohorts of *SQH* candidates is the impact that pursuing the programme has had on their understanding of the place of values in their leadership role. When asked to comment on what they got from the exploration of the purposes and values in education, the following are typical (Table 56.2):

These comments from participants relate to a series of activities to identify what they see as their core values and collectively interrogate these. Here we see that for many aspirant head teachers, this may be the first time they have thought about their values in any depth and for some this in itself is transformative. Typically candidates gain greater clarity in the place of values and become more skilled in their articulation of their values as a leader. What also comes across strongly is the growing understanding of the contested nature of values. This challenges previously

Table 56.2 Thinking about values

Clearer understanding of the challenges of establishing closely own values and ideas on purposes
Understanding there are competing views of the purpose of education. I have established in my own mind the purpose of education, and this will inform my vision and values for leading a school
This focused my ideas and then made me question and reassess my understanding
Competing views and my stance and how it has changed
Best session so far really led to reflection on own values and helped to focus on the differing needs when relating to other people's values
Interesting to note how the values overlap. How inextricably bound they are – yet to make an attempt to separate then out, clarify thinking. Also – how much these issues do need discussed openly, since their language is ambiguous and so open to interpretation – 'achievement', 'quality', 'equality'

unquestioned assumptions and the sense that values are largely shared and 'common sense'. Further, as these participants progress to lead a strategic change project, there is the appreciation of the need to base decisions and actions on values. However, what is missing from these comments, as we have seen in policy, is the lexicon of social justice. There is a danger that ideas about social justice and fairness become reduced to common sense – 'of course we want all children to achieve'. Thus a vital step has to be about the definition of social justice. Course members then undertake a mapping exercise to explore the concepts of 'social justice', 'fairness' and 'equality' and the relationship between them. In this typical set of responses, we see different broad dimensions being highlighted (Table 56.3).

Building a Model for Leadership Development for Social Justice

The activities above can be characterised as the classic methodology in social activism, that of consciousness-raising. An example of this methodology can be found in Jean-Marie's (2010) approach as an educator of aspiring and serving principals where she reflects critically on her own practice. Drawing from her personal experiences, Jean-Marie explores the way in which she has imbued her own praxis with a social justice stance by adopting critical pedagogies. In the *SQH* programme, we adopt an active socially based pedagogy which privileges collaborative learning and critical reflection on values and practice in order to develop a sense of agency and self-efficacy on the part of the aspirant head teachers as they move into headship. However, there are limitations on approaches based on consciousness-raising particularly when the cohorts of aspirant head teachers are those for whom education has been an arena where they have experienced success both as learners and now educators. In these circumstances, as Blackmore (2009: 5) argues, there can be 'a failure to trouble existing leadership practices in the field' and proposes that there is

Table 56.3 Defining social justice

Doing the right thing
Each according to his needs
Caring for all
No discrimination
One's background does not result in inequality of opportunity
Moral bases
Big picture
Needs strategic leadership
Respecting the views of others
Opportunity to shine for all
Social status does not dictate opportunities for the individual
All have a right to a voice and be listened to no matter background, culture
Does our school care for all in the school community
Understanding everyone deserves a change
Access to what is needed to learn
Knowledge of right and wrong
Right to be heard
Right to be safe
Right to grow educationally and emotionally
Entitlement to advance own personal goals
Democratic values
Opportunities to excel
Core values of respect and diversity

a need for 'leaders to reflect on their own position with the relations of ruling'. The question then is how do we take on Bogotch's challenge (2008: 10) and move beyond consciousness-raising about issues of social justice, fairness and equality to a point where educators and educational leaders are able 'to make a practical difference in the real world' (Bogotch: 103). Here we need to look to the means through which experience and ideas interplay in the development of approaches to social justice within specific institutional contexts.

Lindsey, Lindsey, and Terrell (2011: 27) advocate 'cultural proficiency as a social justice approach that focuses on our practice as educators, not on perceived deficiencies of the students and communities we serve'. They define social justice as 'doing what is right for our students'. However, we need to interrogate this idea for it seems to suggest that social justice is simply a matter of understanding the needs of each child and addressing these. It is at this point that the tensions between policy discourses, around 'getting it right for every child' 'achievement for all' and 'realising full potential', need to be exposed and interrogated particularly in a context where the high accountability regimes still largely focus on attainment data related to public examinations. Scenarios such as the following are useful ways of beginning to unpack some of these tensions:

Scenario
Using statistical data, the school has identified that if a small percentage of secondary year 4 pupils (18 % of the year group) improved their examination results by one grade, there would be an overall significant increase in attainment. A mentoring programme has been proposed. This will entail reallocating teaching and support resource from a low achievers programme.

Particularly important here is the construction of these problems not simply as emotional issues or interpersonal conflict which has to be 'managed', that is, a swift solution found in order that 'things can go back to normal'. Instead as Murphy (2007) argues such situations need to be constructed as ethical dilemmas resolved on the basis of principle. Scenarios help to illuminate some of the tensions and dilemmas in leadership, but there is always the danger that such scenarios remain detached from the experiences of school leaders. The process is strengthened then by participants identifying and analysing situations where they have faced a dilemma. This aspect is not always fully realised given that some participants will not necessarily have had substantial experience in making decisions – this would be the task of their own head teachers. Further, the situations that are proposed as often are ones that are exceptional, and again there is a danger of these being seen as infrequent circumstances. There is a need to go much deeper and examine the skills, attributes and actions of leadership for social justice whereby through their practice, school leaders create the conditions in school for a more socially just education. Therefore, we need to consider the construction of leadership that underpins preparatory programmes for aspirant head teachers.

The Construction of Leadership

One of the issues faced regularly in leadership development in education in Scotland is the 'cosy consensus' around issues related to social justice. As we have seen Scotland now has a well-developed legislative and policy framework around issues of equality, social justice, inclusion and fairness. Educational policy is replete with demands that relate to attainment for all. For example, one of the features of 'excellence' is a school that 'focuses on outcomes and maximizes success for all learners' (HMIe, 2006: 44). The question then is how can ideas of equality, social justice, inclusion and fairness shape leadership development and practice. Theoharris (2010: 333) argues that leadership for social justice is about 'how they [school leaders] 'live out' this definition in their practice'. Thus, in exploring leadership for social justice as a lived process, we need to consider the circumstances in which leadership is exercised. The reality is that most school leaders not only have to deal with competing demands especially in a situation where there are finite resources in terms of time, staff skill and an ever expanding set of expectations on schools by different stakeholders. Therefore, as part of the development of leadership for social justice, we need to construct leadership as a political process, where leadership is the exercise of power to influence others to achieve specific aims.

In the *Standard for Headship* (SE, 2005) 'political insight' is one of the personal qualities and interpersonal skills:

> **4.3.4 Showing political insight:**
> Headteachers have a good understanding of the relationship between schools and society. They understand and take account of the political and social context of educational policy. (SE, 2005: 7)

This construction of 'political' in leadership practice is in terms largely of understanding, adapting to the political decision-making process which shapes education policy by local and national government.

Ryan (2010) takes a slightly different perspective arguing that the use of political skills or acumen is a means of enacting equality policies. His study

> …examines principals' political acumen… it explores their efforts to understand their political contexts, the manner in which they employ their knowledge in the strategies that they use and the ways in which they strategically monitor their actions as they work towards their equity goals. (p. 358)

Ryan identifies three broad areas of skills in this political acumen – an understanding of the political environment, developing political strategies such as 'developing and establishing relationships, persuading others, persisting, planning, experimenting, being up front, keeping others off balance, playing ignorant, working the system and quietly advocating' (p. 366). And these skills are balanced with an understanding of the needs of the context and power relations. This political process has to be imbued with a sense of social justice. Studies by both Theoharris (2010) and Ryan (2010) illustrate the critical importance of not only the stance adopted by individual leaders but their efforts to realise these values in school. Theoharris's study illustrates the significant resistance school leaders meet in pursuing the aims of social justice largely because as Hynds (2010: 378) argues, resistance to change is 'typically connected to individuals' values, beliefs, professional identities, social position and response to change'. We cannot then underestimate the task faced by school leaders in seeking to bring about change in relation to promoting social justice. For Ryan the use of these political skills is central to leadership for social justice. However, while pointing to the critical role political skills play in leadership for social justice, we need to be clearer around the nature of leadership being proposed here and be cautious about regarding this as the definitive model of leadership.

What is being pointed up in Ryan's analysis is a form of transformational leadership in which leadership is characterised as the exercise of power to influence stakeholders to achieve specific goals. Here the concerns relate to inspiration, influence and the development of a shared vision and values, aspects consistently identified as key factors in the policy on educational improvement in Scotland (HMIe, 2006). More recently there has been a growing focus on the impact of school leadership and learning (e.g. Bell, Bolam, & Cubillo, 2003; Leithwood et al., 2006) from which has emerged a greater emphasis on instructional or pedagogical leadership. Robinson et al. (2009) in their synthesis report of studies examining the impact of school leadership on pupil achievement note that alongside transformational leadership where the focus is on influencing others to act in accordance with specific positions or policies, pedagogical leadership looks to the shaping of conditions for and practices around teaching and learning. In their review, the authors found that 'pedagogical leadership' had a substantially greater impact on the quality of teaching and learning and pupil outcomes than transformational leadership. The idea of pedagogical leadership has evolved in Scotland into the idea of 'leadership for learning' (HMIe, 2007). However, the model of change within this construction remains managerialist. For example, in guidance from the HMIe, the following are the steps leaders can take to bring about change:

- Clear remits for working groups and/or committees
- Time for staff to talk about and reflect on learning and to learn from each other
- Involvement in action research projects
- Clear tasks linked to the improvement priorities
- SMART targets with associated milestones
- Regular monitoring and progress reporting (HMIe, 2007:50)

Therefore, constructing leadership in terms of influence and pedagogy are vital aspects but not sufficient in themselves.

Headship as Social Activism

The drive in Scotland is to raise attainment in public examinations, and within this there remains a strong sense of a meritocracy; the success of individual schools is measured by attainment and underpinning; this is a sense that 'bright children' have the opportunity to progress to their 'full potential' regardless of their social background. However, the focus predominantly on attainment and outcomes can reduce the scope of leadership. A more fundamental restructuring through education is not fully engaged. Therefore, we need to reconstruct school leadership. Berman (2011: 129) argues:

> Leadership for social justice and democracy involves more than believing in and articulating a vision, however. It means providing the leadership for integrating into a culture of schools and into classroom instruction those programs that effectively engender social responsibility and develop social consciousness.

The task then is to shape leadership development programmes to enable participants not only to understand and articulate values related to social justice, equality and fairness and to appreciate the dilemmas posed in seeking to work towards these but to use these principles to challenge structures and practices which create barriers to learning. Theoharris (2010) found in his study of the strategies used by those school principals who sought to challenge injustice that attainment was not the specific focus of their activities. Instead these principals look to achieve a fundamental reshaping of the school. The focus for these head teachers is on challenging practices in relation to 'school structures which marginalize, segregate and impede achievement' (p. 341), developing and empowering staff in their role in promoting social justice and creating an ethos which was inclusive particularly for marginalised families. We cannot underestimate the complexity of the task and the risks in this form of critical school leadership which understands and challenges power, tradition and unquestioned assumptions both within the school and in the wider community and political context. Mullen (2008: 275) sees social justice as an educational intervention that connects theory to practice and the moral use of power: 'injustices should not be taken-for-granted, everyone in education has a serious role to play with respect to identifying if not addressing, injustices in our immediate and more remote locations'. It is here that the 'grit' of social justice can help interrogate policy, strategy and practice. This interrogation will help expose some of the tensions particularly where resistance is evident.

Pushing these barriers helps to underline the public role of head teachers in leading change for social justice. As Marshall and Anderson (2009: 9) highlight, there are the considerable risks for educators engaging in activism around issues of social justice and equality:

> Educators thus, sense the informal rules the hierarchies and patriarchies embedded in education professions and the tacit agreements about avoiding uncomfortable issues, the constraints presented by cultural traditions that define behaviors and guard against upsetting influences by 'outsiders'.

School leadership has to be based on a model of leadership for social justice otherwise the reproductive function of public education in Scotland will continue to perpetuate inequalities, social divide and injustice.

From the preceding discussion, we can set out a model for leadership development programmes to ensure that social justice is the pivotal principle underpinning leadership in school (Table 56.4).

Conclusion

Bogotch (2008: 79) in the light of the array of problems not addressed by the theorisation of social justice across different disciplines poses the question 'why then has the alternative empirical options of education not been re-considered as a viable if not the *better social justice response*' (italics in the original). To my mind though there are two levels in which theorisation from the empirical data can occur – one through large-scale educational research and the other more locally constituted theory-in-action. This latter aspect is a vital dimension given that education is a deeply contextualised practice. In this though, we need to move beyond understandings of 'practice' as simply sets of strategies and where the imperative for educational research both at the macros and the institutional levels is to delineate 'what works best'.

Table 56.4 Towards a model of leadership development for social justice

Phase	Aspect	Possible tasks
1	Consciousness-raising	Exploration of concepts and definitions Exploration of own experiences as a learner and educator
2	Understanding dilemmas	Exploring scenarios Exploring experiences
3	Skills for social justice	Building skills for transformational leadership: influencing, engaging, debating; dealing with different standpoints Building skills for pedagogical leadership based on learning for all
4	Headship as social activism	The articulation of values Values used as the lens to shape and reflect on action

Here theorisation must be accompanied by critique which is imbued by ideas of social justice, fairness and equality. If we are to achieve Bogotch's challenge about education contributing to the theorisation of social justice, one important source would be to consider the processes of theorisation found in the process of theory-in-action in the development and practice of school leaders. For aspirant and serving head teachers in public education in Scotland, at the heart of their role, there is a contradiction: their task is to improve educational achievement for all, but as Blackmore (2009: 4) argues, at a policy level there is 'a refusal to address the structural and cultural factors that will make a difference'. Pryor (2008: 280) argues that what we need is a 'vision of leadership that encourages debate, deliberation and disagreement of school policy and concerns'. Building leadership for social justice as the underpinning stance (which incorporates ideas of transformational and pedagogical leadership) in preparatory programmes for head teachers challenges this contradiction in that the expectation to work for social justice becomes the premise on which the leadership practice of aspirant head teachers is based, and by examining the way in head teachers grapple with these challenges and dilemmas, this process of theory-in-action can contribute to the ongoing task of the theorisation of social justice.

Chapter 57
Cultural Dialogue as Social Justice Advocacy Within and Beyond University Classrooms

Carol A. Mullen, J. Kenneth Young, and Sandra Harris

> Dialogue cannot exist … in the absence of a profound love for the world and for men. The naming of the world, which is an act of creation and re-creation, is not possible if it is not infused with love. (Freire, 1972/2000, p. 77)
>
> We learn by getting comfortable with being uncomfortable. (graduate student, Texas)

In this dialogic chapter, we theorize about cultural dialogue in educational and public spaces as social justice advocacy. Our thesis is that difficult cultural dialogue advances social justice in education and leadership and that cultural dialoguers cultivate improved learning and teaching. We support our stance by articulating specific contextual meanings about social justice that foster value for cultural dialogue within and beyond university classrooms and, specifically, as interventions for leadership preparation. These notions—for us, intricate beliefs about the value of dialogue as advocacy—inform our work as educational leadership professors and program directors in doctoral-granting institutions in the United States.

Cultural dialogue as a pedagogy is closely aligned with the views we present on social justice and the illustrations we provide of social justice advocacy in education from various studies for different populations. Our purpose is to describe the need for collectively raising critical consciousness about inequities and disparities ingrained in societal structures for disadvantaged populations. We bring to the fore cultural interventions that help position educators and leaders not only to understand schooling conditions but also to exert agency as social justice advocates.

Leadership actions are described, with anchorage in leading studies from the educational leadership and teacher education research. Readers are encouraged to take next steps for considering leadership actions that transform educational environments into healthy, collegial spaces for learning.

This chapter is thematically organized to address the importance of reorienting the educational leadership field to address social justice theories, with particular relevance for leadership preparation. Also included is discussion of cultural dialogue as social justice praxis, in addition to ideas and practices of social justice advocacy in school communities, countries, and legislatures. Another discussion point encourages thinking about social justice ideas within and beyond local contexts and at all levels of the educational system so that students can benefit from social justice advocacy in their own lives. A final idea expressed is for different constituent groups from around the world to collaborate by developing new platforms for cultivating cultural discourse in teaching and learning contexts.

The student and educator groups that we reference throughout in a range of contextualized studies include our own students who, as practicing school leaders and experienced teachers, live the tensions of school-based inequities. We have immersed them in dialogic interventions, a primary goal of which is raise their consciousness about dynamics of cultural dominance and commitment, and another goal of which is to accelerate their role of positively affecting their school cultures and the lives of young students and adults. By *student*, depending on the context we are writing about, we mean graduate students in educational leadership, undergraduate students in teacher education, or school-aged children and youth.

Stimulated by the mold-breaking, textual dialogues of scholars from different disciplines, we describe a few pivotal concepts and support these with illustrations in the literature of social justice. We explore the value of cultural dialogue for consciousness raising and community building, with untapped transformative effects for individuals and their communities. Conversational snippets from dialogue with doctoral (postmaster's) students imbue these concepts with contextual details. Our students, who reflected on their internal growth struggles, are classroom educators and rising leaders in PK–12 public schools. Those who shared their comments with us had begun advancing into senior leadership positions, primarily as principals and school district leaders, including superintendents, across Texas and North Carolina.

We join the effort of bringing alive cultural dialogue in the social justice contexts of engagement, community, and transformation relative to the complex processes and effects that occur educationally and publicly. Situating our students and ourselves as cultural dialoguers, we adopt Brazilian educationalist Freire's (1972/2000) (1895–1975) concept of "dialoguer" but reorient it by adding "culture." Freire's meaning of "dialoguer" had a different purpose, we think, of underscoring a critical stance toward dominant, power-based interactions in which one party has the control, communication is one way, and social distance is perpetuated.

Cultural dialoguer spotlights generative possibilities for understanding human interaction and social justice advocacy. We think of this way of studying educational leadership as creative heuristics for which no formula exists and for which experience and reflection on one's own experience are essential to identifying problems and seeking solutions. Participants in this ongoing project are school leaders who educate pupils and teachers across the career spectrum. We tap a source of information for this writing that aided our graduate students' reflection because of the temporal distance it afforded them as completers of our courses. We relied on student volunteerism so we could sidestep the issue of teacher–student power dynamics commonly known to influence graded courses. This desire led us to elicit nongraded postcourse reflections from nonidentifying university students. The developing leaders who took our educational leadership courses—currently practicing leaders—studied multicultural relationships in a global society, cultural influences on American education, and proposal writing for the dissertation. Assuming a reflective stance on their coursework with us, they shared overarching statements that were consistent with our pedagogical goals; specifically, some of their professors productively examined positions on democratic issues from different perspectives, and they affirmed the value of contrarian positions and discourse as a way to interrogate beliefs. From their point of view, these same faculty members provided constructive balance for them, emphasizing that leaders have to act and be accountable for their actions. As we discuss here, these emancipatory goals and beliefs inform our teaching and raise the bar for educational leaders to evolve into culturally competent, responsible change agents. The notion of educational leader as a socially just force of accountability itself reflects the contradictions leaders must negotiate every day (see Mullen, Harris, Pryor, & Browne-Ferrigno, 2008).

The cultural dialogic orientation toward interaction between any individuals or groups, such as educational faculty and their students or school leaders and their teams, highlights the importance of relationships (Shields, 2004). US educational researcher Shields believes that relationship building is a vital part of transformative cultural dialogue:

> One of the central interventions of educational leaders must be the facilitation of moral dialogue. I propose that transformative leadership, based on dialogue and strong relationships, can provide opportunities for all children to learn in school communities that are socially just and deeply democratic. (pp. 110, 114)

We agree that "strong relationships" must be intentionally developed, which has implications for the teaching responsibilities of higher education faculty. We try to foster individually and collectively social justice advocacy in the university classroom and beyond. Our strategy of eliciting reflections on experiences of a socially just nature from course completers provided an opportunity for sense making of social justice issues for which we would not otherwise be privy.

We feel more convinced, based on insights gained from the written student comments and social justice literature that university students can productively develop into cultural dialoguers committed to social justice advocacy development. Moreover, by having to struggle with their own development and actions in a deeply personal way, they come to understand that relationships are not only central but also complicated. In fact, we think that their internal struggles with and negotiations of challenging conversation on personal, professional, and communal levels likely reflect their greatest learning curve. The feedback we received suggests that they are positioning themselves and others to make sense of situations in socially just ways for effecting change (Kasumagic, 2008; Kincheloe & Steinberg, 1998; Meath-Lang, 1993; Smyth, 2009). In educational leadership studies, scholars have written about difficult or complicated conversations, but few have staked out this area for its potency as a social justice agenda that has clear relevance for different populations in education (exceptions include Shields & Mohan, 2008; Shoho, Merchant, & Lugg, 2011).

Like activist–pedagogues Kasumagic (2008) and Meath-Lang (1993) and educational researchers Mirón, Bogotch, and Biesta (2001) and Taines (2012)—all of whom risked engagement in cultural discourse with youth from backgrounds of hardship—our writing speaks to passionate pedagogical work. Consistent with an essayist style, we are not presenting the results of classroom research conducted and reported elsewhere, or an assessment of the design, delivery, and effects of our course curriculum, or even a detailed description of our database of student comments. Instead, we refer, with partial and particular brushstrokes, to our multicase curricular interventions and classroom results in service of our larger ideas. As cultural dialoguers, we use a compass metaphor for orienting discourse about social (in)justices as leadership constructs and actions. We think that the educational leadership field could benefit from loosely construed, conceptual writing largely because it is in the early phases of social justice thinking and praxis.

Our compass construct—cultural dialogue as social justice praxis—has two directional needles: consciousness raising in educational spaces and social justice advocacy in schools, communities, and legislatures. We argue that meaningful cultural dialogue is vital for raising the awareness of educational stakeholders (e.g., leaders, educators, policymakers, parents, youth) whose actions influence their everyday social practices and advocacy in and beyond immediate workplaces. Our goal is for difficult conversations, integrated within social justice frameworks, to become part of leadership programs and professional development. We hope to see much more discourse on the subject of difficult cultural conversation within a changing global economy for the benefit of educational stakeholders and communities. Our dialogue, while partial and incomplete, can offer a starting point for exploration.

Cultural dialogue is itself partial and incomplete. The dialogic encounters we allude to seem to have fostered the potential of students for whom growth itself is a deep struggle, a constant negotiation, and an enduring commitment. Importantly, failed discourse involving social justice encounters has also been recorded in the literature, and we refer to several of these occasions. To us, the failed attempts are an inevitable part of social justice work that yields information for renewal. World-renowned Russian philosopher Bakhtin (cited in Morson & Emerson, 1990) (1895–1975) gives perspective on this subject, positioning difficult cultural discourse as inevitably partial and incomplete. He ascribed dialogue social value beyond being a communicative necessity, for it speaks to life, living, and the human condition. An inescapable necessity for catalyzing the potential of global citizens, difficult cultural conversation at the interactional level involves, in Bakhtin's words:

> provoking a specific answer that actualizes the potential, albeit in a particular and incomplete way. … the questioner necessarily undergoes the same process, which helps him comprehend unsuspected potentials in his own culture. The process … educates each side about

> itself and about the other, and it not only discovers but activates potential. Indeed, the process of dialogue may itself create new potentials, realizable only through future activity and dialogue. (as cited and translated in Morson & Emerson, 1990, p. 55)

Cultural dialogue involves risk, breakthrough, development, progress, failure, and momentum.

We next give more background to this multilayered conversation.

Background Context: Reorienting the Field's Compass

Educational Leadership Standards

In the USA, the compass for educational leadership preparation has been characterized as malfunctioning (English, 2003, 2011). A primary reason is that agencies external to universities and schools direct this work and without meaningful and purposeful discourse with stakeholders (e.g., educational leadership professors, teachers, parents). National policy boards and accrediting bodies decide educational missions and priorities for which unfairness and oppressive dynamics are associated and documented elsewhere (e.g., English, 2003, 2011). We wish to reiterate what English (2003) has persuasively argued—that the external compasses lack an appreciation for complexity, sensitivity to contextual realities, and legitimacy with respect to the claims (e.g., of generalizability) made.

Other educational researchers are concerned that high-stakes accountability standards reify expectations for homogeneity, uniformity, and conformity in university curriculum and performance outcomes (e.g., Bogotch, 2011; Shields, 2004). Standardized testing downplays the importance of learning that cannot be measured (English, Papa, Mullen, & Creighton, 2012) and defuses the efficacy of pedagogically centered approaches to learning and leadership that re-center schools to focus on high-quality learning and teaching and ways of organizing, leading, assessing, and integrating this work (Hollins, 2011). Viewed through the lens of critical liberation discourse, then, the validation of educational standards by "dominant organizational and business models that are not pedagogically grounded" (English et al., , p. 108) has a remedial, dehumanizing orientation toward difference and diversity. Negative repercussions have been known to ensue for the inherent worth and value of all children and youth, all who teach them, and disciplines outside math and science. High-stakes standards also seriously compromise the educative role of professors, relegating them not as subject expert, collaborative leaders but instead as tools for delivering behaviorist curriculum that is technical, organizational, and managerial (English et al., 2012; Kincheloe, 2004).

Banded in opposition to producing standard leaders for standard schools, we side with English's (2003) "cookie-cutter" critique. His provocation has made it more glaring to us just how much social justice is still a contested topic in the world of education. New compasses informed by constructive liberation critique would help articulate productive directions for the educational leadership field (Shoho et al., 2011). Orientations aimed at inclusiveness could give scholars and practitioners voice in making programmatic, curricular, and policymaking decisions. Their stakeholder groups, particularly pupils and others outside the majority culture, are in need of close attention, deep listening, and respect (Donmoyer & Kos, 1993; Mirón et al., 2001). We are intent on changing leadership preparation missions from outdated, if not oppressive, behaviorist ideas of schooling to socially just advocacy that empowers educators. At this time in the history of educational studies, we are able to adopt, as our taken-for-granted stance, the pushback social justice discourse (e.g., Bogotch, 2011; English, 2003, 2011; English et al., 2012; Shields, 2004). A growing cadre of school leaders is also resisting the takeover of education in their buildings (e.g., Theoharis, 2007).

Wanting to see the mission of leadership preparation uniformly become social justice oriented, then, we also seek renewal of the field. The idea is to make legitimate "alternative discourses" and new "ways to imagine possibilities for schools and school leadership" in educational leadership and university classrooms (Bogotch, 2011, p. 131; see also Donmoyer & Kos, 1993; English, 2003, 2011). These are generative sides of the complicated critique↔possibilities equation, so to speak. They force open spaces for imaginative pedagogical work that undergirds the liberation critiques. We are committed to helping aspiring leaders understand who they are and what they stand for and to building constructive leadership capacity within school communities that supports culturally responsive, networked learning spaces. Our scholarly activist agenda is oriented in this direction (see, e.g., Harris, 2009; Mullen et al., 2008). Such curricular interventions legitimize the development of prospective leaders as intentionally minded humanitarians who create contexts that enable inclusiveness, power sharing, community building, and democratic learning. Difficult cultural discourse as an ideal and as a practice is a purposeful catalyst for this social justice vision.

Social Justice Theories

Social justice pedagogues' writings on difficult conversation have influenced our discourse as educational leaders and the cultural discourse itself, which is cross-disciplinary and eclectic (e.g., Donmoyer & Kos, 1993; Meath-Lang, 1993; Mirón et al., 2001; Nixon et al., 2010; Shields & Mohan, 2008; Sue et al., 2010; Temple & Ylitalo, 2009). We join them by expressing our emancipatory goals with students and the dialogic reflections we elicited. Counternarratives appearing in leadership studies, as well as teacher education, psychology, and political science, have grown out of multicultural discourses. We think this direction holds promise for renewing and enriching leadership theory, practice, and policy and for re-centering the educational leadership field, in particular within universities and school communities.

A small group of academics in any discipline has construed *social justice* in various ways and leads dialogue about this concept beyond the early work in multiculturalism (e.g., Shields, 2004; Shoho et al., 2011). Across different disciplines, there is support for the notion that, in addition to principles that nourish the moral good (e.g., through such means as a leader's or group's principled decision making), interventions must occur deliberately and with sensitivity for communities to develop morally (Banks et al., 2005; Bogotch, 2002; Taines, 2012).

Widespread demographic changes in student populations have been influencing cultural communication for aspiring leaders in unique ways. In the USA, workplaces are rapidly becoming more diverse. The changing demography of public schooling is apparent, making cultural communication within heterogeneous contexts an existential necessity. Latinos and Asians are growing more than ten times the pace of White students, but Black and Latino students and their professional counterparts say they feel segregated; with 47 % of Americans classified as White, no clear racial or ethnic majority will exist by 2044, yet people in the changing global economy could feel increasingly isolated (King, 2005). Statistics, such as those previously mentioned, serve as a validation for the intentional development of socially just leaders in and for our educational communities. Based on 2007–2008 data from the National Center for Education Statistics (NCES), K–12 public schools are still being led by educators who are predominantly White (83 %), yet a majority–minority population (40.7 %) increasingly constitutes the student population (Feistritzer, 2010). Consequently, it is incumbent upon educators to establish learning environments where all students are valued and respected. Thus, educators themselves must have opportunities to engage in and understand cultural dialogue. Their dedication to social justice advocacy can create a more equitable society. Changing demographics bring to the surface the need for cultural dialogue to relate to a new majority that will be that much more impacted by "who is included in the circuits of communicative power and who is not" (Fraser, 2007, p. 25).

A foremost challenge of public schooling is for citizens of a new democracy to adjust and thrive, especially for those living in disenfranchised circumstances (Okun, 2010). As US leaders Banks et al. (2005), Bogotch (2002), Shoho et al. (2011), and Taines (2012) insist, social justice cannot simply be theorized at a distance—focused activity is needed for promoting a healthy citizenry in which youth and children are involved in creating their own destinies. Within socially just communities, such as graduate classrooms, students' internal compasses influence direction and redirection and reflection and postreflection. Students learn about culturally difficult discourse by exploring its meanings and practicing interchanges in safe contexts. They can be prepared to meaningfully address stakeholders' perspectives, include key parties in decision making, dissolve power-based monopolies, and establish communication across different communities (Allen, 2006; English, 2003; Fraser, 2007; Shields, 2004; Shoho et al., 2011; Taines, 2012). Thus, leaders effect justice through knowledge-informed action or praxis. Praxis occurs as people thoughtfully translate theories and principles by acting, and difficult cultural dialogue sets praxis in motion. Social justice compasses are praxis oriented.

Cultural Dialogue as Social Justice Praxis

Cultural dialogue, viewed as social justice praxis, is not only a necessary means for communication and connection among different people and cultures but also, as Freire, like Bakhtin, conceived, an "existential necessity" for life and living (Freire, 1972/2000). In the Freirian worldview, dialogic encounters have a profound impact on critical teaching theory for the larger purpose of ideally expressing people's respect and love for humanity, ultimately transforming the world into a better place.

Speaking to educators, Freire (1972/2000) used his lived experiences with peasants and urban laborers as a platform for urging teachers to transform social injustices into equitable and egalitarian conditions for all oppressed groups worldwide. Freire's advice was for every educator to intentionally use his or her power, position, and authority to teach for social justice by, notably, fostering critical conscious raising with students, the education profession, and the public. Pedagogical actions to this effect include proactively facilitating students' knowledge and action by modeling critical and rigorous thinking that forwards the creation of a liberated and just society that requires robust critique of the status quo and overpowering of the dulling effect that bureaucracies have on people. With intense conviction, Freire articulated the need for pedagogues (e.g., teachers) to come together with their students ("the oppressed" in the schooling context) to reflectively participate for the purpose of liberation:

> Critical and liberating dialogue, which presupposes action, must be carried on with the oppressed at whatever the stage of their struggle for liberation. The content of that dialogue can and should vary in accordance with historical conditions and the level at which the oppressed perceive reality. (p. 52)

By understanding their own oppression and acting in the world, students can be empowered to change horizontal, power-based relationships and structures through their complicated conversations with oppressed groups and emancipatory actions. Educators are called upon, in his vision for social justice, to use their classrooms for awakening their critical self-reflective consciousness and outwardly directing it by creating situations that enliven the social justice principles of fairness, inclusiveness, diversity, acceptance, and openness. Leaders, including policymakers, make desirable change possible by listening to a wide range of constituents to infuse communities with consciousness-raising agendas. Freire envisioned people who have institutional power immersing themselves in learning encounters with oppressed or disfranchised populations, such as families living in poverty and African American, Latino, and Native American students that are "socially, linguistically, and economically marginalized" (Kincheloe, 2004, p. 15). He also felt that powerful others should publicly represent the voices of such populations and propel social justice agendas.

Some critical theorists who teach graduate and undergraduate students have applied the Freirian principle of critical consciousness in their own leadership actions through dialogue. For example, Kincheloe (2004) describes experiences of teaching novice critical theorists to question the status quo transmitted through the formal curriculum. Illustrations include guiding graduate students to deconstruct the power embedded in a supervisor's expectation that the curriculum being taught reflect the official White male-centric version of great achievements. Breakthroughs in transformative learning can occur for students when educators make space for interrogative dialogue that leads to alternative versions and realities and different interpretations of history.

Menard-Warwick and Palmer's (2012) very different example comes from their teaching of prospective teachers in the state of Texas, USA, for whom cultural dialogue was primarily between the teacher aspirants and impoverished families living in Mexico and the students with their peers and professors. Lessons learned that extend the Freirian framework include the necessity for educators to explicitly prepare students for study abroad opportunities by helping them (1) to connect their experiences to a larger social context in their communications and (2) to become critically aware through guided instruction (described as "repeated, multimodal reflection," p. 136) on the culturally immersive experience. Students' dialogic encounters with families in Mexico fell short of these learning goals and of expectations for improved understanding of their home region of Texas where Mexican immigrants were struggling with hardship.

Consciousness raising is a Freirian necessity for educational activism, as next described. This process of transformation refers to a political–personal change in attitude on the part of not only individuals but also communities and countries. Inner change that is manifested in action is dependent not on the technical delivery of curriculum but rather on participatory dialogue that fosters new attitudes and civic outreach within schools and other communities (Freire, 1972/2000; Kasumagic, 2008).

Consciousness Raising in University Classrooms

Consciousness raising can be detected when a population shows evidence of a changed thought process that is more aligned with social justice. This indicates heightened sensitivity in the interpretation of and interaction in the world. The Freirian compass is attuned to the struggle of reading the world differently, in part by critiquing and affirming micro-interactions within public spaces generated into learning communities. We strongly feel that this work is in keeping with the promise of democracy through an intentional remapping of university curriculum.

As experienced teaching faculty whose graduate students are responsible for the development and inclusion of teachers, pupils, and others, we orient aspiring leaders and early career leaders toward their social justice development as engaged community leaders and citizens. We wonder, where is their consciousness-raising compass pointed with respect to social justice advocacy? For example, how do they make sense of cultural dialogue in the university classroom? And does their reflective learning suggest a commitment to community building in the graduate context and beyond with underserved student populations and disaffected parents?

Such questions reflect open-ended pedagogical goals. Our purpose is to raise, not pursue, them here as creative possibilities for future work and in service to readers' social justice inquiries. With such compasses in hand, we underscore social justice engagement as a work in progress at the level of the student, curriculum, classroom community, school community, and life experience. We think speculative questions like those posed may have deep relevance for student populations across different backgrounds, degree programs, disciplines, and grade levels worldwide. Recent literature from developing countries forges new worlds through intergenerational peace education with struggling youth, for example. Kasumagic's (2008) cultural dialogic essay is inspiring, for it involves a high degree of personal and political risk and deep communal momentum for social justice change.

As teaching faculty, we bring our belief compasses to class. We believe that a transformative liberation process can translate in university classrooms where professors and students together engage in critical self-reflection (Donmoyer & Kos, 1993; Meath-Lang, 1993; Menard-Warwick, & Palmer, 2012). We also share with our students that a culture of silence insulates race relations, gender identity, sexual orientation, religion, and more, which we think intensifies personal discomfort with dialogic encounters with peers. We ask for their patience, involvement, and persistence concerning difficult topics under discussion.

The work is not easy. In fact, our students shared feeling anxious, insecure, uncertain, and, in a few instances, even regret concerning some of what they had disclosed. Although they are experienced educators, many with administrative or leadership experience, they commonly profess to lacking knowledge of and skills in social justice leadership. They see it as new learning to be required to reflect on social justice concepts and situations and to express what they believe about social justice topics and the potential for better informed, and especially different, leadership actions.

In an effort to stimulate intentionally discourse that is both cultural and complicated, we assign Freire's (1972/2000) *Pedagogy of the Oppressed* as reading material before the first class. Students read it in its entirety, reflect on its ideas, and record their thoughts in a cultural communication journal (a graded assignment). They also react, in writing, to each class session, in effect participating in an ongoing dialogue in which they are enhancing one another's development. Because of this lead time in preparation and because we situate the students as cultural dialoguers and place them in small groups where reflective conversations flourish first, the discourse of difficult conversations more readily unfolds with the entire class.

We engage our students in cultural dialogue by inviting them to critically reflect on the assigned readings that include Freire's and others' works from multiple disciplines. (The readings we assign and that students select include the sources discussed and referenced herein.) We stimulate discussion with open-ended, lead questions, such as:

- As a school leader, your communication and interaction with others are the gateway for your stakeholders to figure out what you stand for and who you are as a leader, so what incident or concern are you dealing with that involves others' rights?
- What do your reactions communicate implicitly about your values, beliefs, and commitments?

- Do these values, beliefs, and commitments match your vision statement for the school or educational campus for which you work or lead?
- Why do you think that good people can become complicit in wrongdoing or silent even when they witness or know about wrongdoing?

No matter the lead questions asked, the postcourse comments that students submit as they provide evaluations for the class experience imply that the consciousness-raising dynamics around cultural dialogue are emotional, personal, and political, and while they elicit discomfort, the feelings of unease are a necessary part of meaningful conversations. The cultural discourse was seen as essential for producing the momentum for advocacy work in school communities. (We elaborate in the next sections.)

Self-Censorship–Openness Dynamic

Many of the students explicitly identified the emotions of anxiety and insecurity, as well as the contrasting emotions of calmness and safekeeping. Chubbuck and Zembylas (2008) of the USA and Cyprus, respectively, refer to such expression as "emotional ambivalence" in their work with teachers. Furthermore, our leadership students expressed concerns about being misunderstood, or even rejected, by community members regarding one's personal beliefs and positions about sensitive topics (e.g., race, sexual preference, religion, politics). As our students underscored, they were unaccustomed to cultural conversation in their professional roles and most or all other courses, which brings into question assumptions we hear about educational leaders and the knowledge they possess relative to social justice constructs. Thus, the experience of speaking honestly proved to be an "extremely difficult learning curve" for the majority of students. Some even admitted to censoring and silencing themselves at times.

Paradoxically, the students' sharing at the conclusion of the course seemed more complex than what they discussed during class sessions and wrote about in their journals. We think that the postcourse writing had educational value because it afforded them reflective distance, anonymity, and more advocacy stances or experiences to ponder. The improved quality of their disclosures suggested that consciousness raising continued past the course and that they were experiencing developmental gains in their leadership roles. One of our students disclosed postreflectively:

> My need to speak wholeheartedly was trumped by my own feelings of insecurity at times with my cohort. I came from a large district where we held gay educator support activities with a community that appeared uncomfortable with gay people *period*, much less gay educators. My openness was more apparent with my liberal professors, yet I felt silenced, not just as a lesbian, but as a student, teacher, and leader with the self-proclaimed conservative professors.

Students described a deep reservation about being completely transparent; they identified potential reasons for this emotion, ranging from personal boundaries and judgment calls to status quo expectations for group interaction, as well as socialized behaviors, for example:

> I shared in class to the extent I felt comfortable. I may not have shared every single view I held, but I shared those that seemed appropriate at the time. The constraints of polite conversation and desire not to offend people from other cultures did occasionally cause me to censor my comments.

We see internal growth struggles as giving momentum to social justice learning. Students who have completed social justice interventions on their campuses can better articulate their thoughts and the unresolved issues they may feel while opening up. Paradoxically, the willingness of group members to speak openly was a competing theme expressed in the comments we received. Students thought that intentionally "broaching the subject" of racism, religion, politics in education, and other social justice topics to get conversations under way within the diverse groups was important. Several expressed appreciation for being able to share their personal experiences as an ethnic minority member, self-identifying as African American. A crucial component of honest communication was alluded to: "Almost always, people prefaced their comments with an explanation of where they were coming from (how they formed their viewpoint; what baggage they were carrying), which gave us perspective before they made their comments." They wrote that this conversational strategy, which we modeled during classes, probably helped buffer responses that might have otherwise been volatile.

Such dynamics as conversational strategies enabled a climate for difficult cultural conversations to evolve, but the postcourse comments drew attention to how self-censorship and openness were in tension for many individuals, possibly competing forces with personal development itself. At a deeply personal level, participants in cultural dialogic situations may be in a sporadic or even prolonged state of stress, as the students revealed. We recognize more fully now that many of our students can be having an internal conversation that is at odds with or in conflict with the discourse they publicly generate. The postreflections suggest that students do not always express what they are feeling or thinking, which does not surprise us. Consciousness raising about these subtexts and nuances of discourse has implications for learning how to broker meaning making with groups. Gray areas of cultural discourse support our own consciousness-raising development as leaders of leaders who are learning alongside them and other social justice advocates.

Discomfort–Comfort Dynamic

Participation in complicated conversations forced our students to, as someone suggested, "look at the inequalities in society. Even if it is uncomfortable, we need to have open and frank discussions." The students mutually reinforced the message by engaging in dialogue that was "uncomfortable" and "difficult" and, importantly, recognizing that they and their professional colleagues "should embrace culturally difficult conversations, no matter the discomfort." Their consciousness raising made them critical of what they described as “menial conversations that lack substance,” the source of which some identified as their “lack of experience” in having social justice conversations. Many of them recognized in hindsight that “the implications of not having these conversations are grave.” One student rightly applauded Dr. Martin Luther King’s courage as an iconic civil rights activist in the USA, referencing his correspondence from a jail in Alabama: “‘We will have to repent in this generation not for the actions of bad people but the appalling silence of the good people,’” suggesting the belief some of the students came to embrace is that “good people” can be complicit in wrongdoing and “silent when they lack the skill and experience in difficult conversations.” The importance of engaging educational leadership students in doctoral programs through challenging cultural conversations to gain experience for sophisticated work in their vocational practices resonated as a new value for these adult learners.

Cultural discourse is not just about the content and delivery of social justice ideas, for it necessitates delicate risk taking for which a safe space is essential. A particularly salient insight that we highlighted at the beginning of the course is that people have to, paradoxically, seek a comfort level while feeling uncomfortable in order to internalize and better understand complicated feelings and issues. Other students agreed that “there aren’t many places that difficult cultural conversations can be raised” and, more specifically, that the university classroom can provide just such a space: “These classes were a safe environment where I was surrounded by people that I knew.” The majority of students stated that, because they felt safe, they were able to share their honest beliefs to a greater extent. Even so, someone self-describing as “open” and “brave” disclosed that she had nonetheless feared social repercussions: “There are times when I fear being seen as too liberal or conservative since I fall into both camps.” For her, silence was at times a politically safe harbor to which she retreated. Indeed, we can see much more clearly that the students found the cultural dialogues to be uncomfortable even when they had struck a chord of comfort. We are that much more convinced that these dialogues must be practiced more frequently in safe contexts that encourage risk taking, openness, and courage.

Meath-Lang (1993) articulated this high-risk challenge with penetrating precision. Having been intensively involved in cultural conversations with theater students, she insisted that:

> Dialogue is dangerous. It causes worry. It is approached, very often, with trepidation. One never knows what to expect when other people have the chance to talk. I have put myself at risk; in T. S. Eliot’s term, my universe could well be disrupted, my perceptions shattered. (p. 386)

In this quotation, the “I” belongs to her students who put themselves at risk to engage culturally with one another and whose worlds she was imagining they worry will have to change. In her analysis, comfort is attached to the status quo. Discomfort disturbs what is known and protected. The comments from our education students made us think more about the risks involved in candid disclosure for them. This often involves sparks discomfort, especially around topics of identity, community, and power for which the compass (i.e., orientation) and parameter (i.e., area) can be made known in advance but not the terrain (i.e., interpersonal dynamics).

Exposure–Immersion Dynamic

Regarding exposure, the idea universally expressed in the student commentaries is value for being in a shared space with others who are different from themselves. This is something that many educators and scholars may take for granted, yet we know that the mere configuration of a group wherein members see or learn about difference can be a significant step forward. With cultural dialogue, participants can test their assumptions, biases, and stereotypes by, to quote one student, "help[ing] one another discern between perceptions and realities of people, cultures, and religions." While some may experience breakthroughs in understandings, others, like this individual, benefit from being exposed to how people in the same profession think who may be a different race or have a different religion, sexual orientation, or lens for viewing the world:

> Quite honestly, I did not experience an enormous shift in my beliefs due to these conversations in class, but two things of value occurred for me. One, I was exposed to, and allowed to share in, the life-worlds of others who were unlike me but people I valued. This served to broaden my lens somewhat, so I could begin to empathize with them. That may or may not have changed my mind about a particular issue, but at least I learned that I could hear a different worldview and not be diminished by that hearing. Two, I was allowed to subject my worldview to differing opinions and gauge that which I believed was true against other facts and experiences. Whether I changed my thinking, at least my beliefs were based on broader "research." I believe that viewpoints that are not occasionally subjected to trial and opposition are weakly held.

Students shared that social justice topics that were important, relevant, and "of high interest" enabled them to become immersed in difficult conversations. Thus, they found it necessary "to offer a different viewpoint" if they were to voice their opinions. A student of color stated, "Others need to try and understand how we as African Americans [for example] feel and take off the rose-colored glasses." We believe that stating views and sharing perceptions enabled learning across race and other differences. Regarding their personal growth and learning, students felt it was "important for all of us to share in order to maximize learning from one another." As someone else emphasized, "[I would provide] my view and also learn about the views of other students in the class." Subjecting viewpoints to "trial and opposition" also forced the issue of participation in conversations that necessitated discomfort and emotional arousal.

Based on the individual student commentaries in postcourse reflections, we could discern almost universal consciousness raising reported by the groups (with exceptions where students felt the classroom dialogue did not allow room for their input). In a few cases, there were signs of critical consciousness, which Freire (1972/2000) explained is indicative of a deeper understanding of the world, extending to embrace of contradictions in educational, social, and political situations and for taking action to change oppressive elements. Critical consciousness, in particular, is crucial for disrupting cultures of silence and perpetuating counternarratives of social justice advocacy in schools, communities, and legislatures.

Social Justice Advocacy in School Communities, Countries, and Legislatures

Cultural dialogue within graduate classrooms and beyond has serious implications for school communities, countries, and legislatures. In the context of this bigger picture, we raise starting points for in-depth discussion.

Signs indicate that some developing leaders radiate the promise of a social justice center or axis. As they produce changes within their communities and schools, social justice advocates resist educational inequities, enact resistance, and use policy advocacy to achieve social justice ends. We can see some compatibility between our students and the practicing school principals that US educational researcher Theoharis (2007) described as possessing strong social justice compasses. He believes that principals can show a policy advocacy orientation through, for example, such school community actions as resisting "all tracking or segregation models" as "not only a pedagogical or learning shift but also a moral act" (p. 234). Attuned as social justice leaders, the principals he studied were openly against deficit thinking about pupils from diverse backgrounds. Praxis driven, they intentionally brought about "changes in structure as a result of their beliefs (e.g., creating heterogeneous and inclusive programs)," thereby positioning "traditionally marginalized students' failure … as an inherent result of an unjust system" (Theoharis, p. 235). Resonating with these leadership actions, we want for the developing leaders who study with us to feel uniformly inspired to enact their social justice beliefs with clarity, fervor, and force.

Theoharis (2007) has challenged school leaders to transform their communities with schoolwide structural changes, which requires knowledge of legislation that affects human rights. Similarly, Bogotch's (2011) challenge to educational leaders is to use "pedagogical power collectively" to develop "a learning-to-learn leadership context that extends outwards, inside and out of school settings" (p. 135). A few of our students explicitly addressed their current work in policy advocacy with respect to the right to equal educational opportunity. One took up the disconcerting eruption of segregation and resegregation practices in some US states:

> Analyzing current trends in segregation has made me realize that this is a very serious civil rights issue. I've decided to fight the dissolution of diversity policies in my district and the resegregation of our neighborhoods with constituents who are caving into racial discrimination—in my school and district we've taken a public stance against school board discriminatory practices. We're debating county officials in public meetings. I'm a protester in the news.

We think the idea of a socially just leader can be taken to the next level of a socially just community and, with greater vision, a socially just country and global community. In their post-reflective commentaries, our students spoke about honoring certain tenets that foster difficult conversation with stakeholder groups, knowing that they are being called upon to address "an under-the-surface need."

The awareness shown by one of our students, a White school superintendent, is particularly noteworthy, in part because of the power she holds in her leadership of a large urban district. For 2 years while studying with us, she had been leading the school board in her district before realizing that the African American members, who were parents, were silently feeling alienated and perhaps misunderstood. Due to an increase in cultural sensitivity attributed by her to the dialogic interventions in her university coursework, she could now:

> see the distress in their eyes as they heard the annual accountability report and the achievement gaps highlighted. I am now acutely aware of how these members feel as children of color underachieve while our efforts [as leaders] to recruit minority teachers are only marginally successful.

Consciousness raising about issues of race, inclusion, and policy within dominant cultures of schooling carried over into this real-world context for which democracy in action had been internalized by our former student. Positioning herself as a cultural dialoguer, this superintendent committed to holding "discussions with school leaders and minority members about how to close [the achievement] gap this school year." Such ruminations are suggestive of the kinds of actions that developing leaders can take for creating a socially just community. Consciousness raising involves the interrogation of long-held assumptions and entrenched patterns of apathy, indifference, or inaction while recovering hope and optimism. Like this superintendent, other leaders have risen to the call to include nondominant populations in conversations about schooling on campuses.

Empirical case illustrations from the leadership literature help make this point. Mirón et al. (2001) explored students' perspectives on their personal schooling experiences through cultural conversations. The researchers created an opportunity to have dialogic encounters with African American youth in US inner-city high schools. This countercultural work gave the students openings for authentic personal↔political dialogue with adults who were not their teachers. Initiating a metadialogue about students' constructions of morality (around such uncomfortable topics as feelings and sources of discomfort), the researchers empowered African American adolescents to construct, on their own terms, cultural knowledge as they live it. As one strain of discourse, students revealed deep relational concerns about problematic dynamics involving powerful others, particularly teachers. In the Taines (2012) study, urban and suburban youth engaged in face-to-face discourse about the educational conditions of schooling they personally experienced, to compare the quality of resources, relationships, and systems, and to "interrogate" the privilege of suburban schooling while wrestling with ways to productively improve schooling for urban youth.

The real-world struggles inherent in such stories forward the mission that authenticates challenging conversation for different communities. Communities assert their sense of power or authority in part by creating safe spaces for cultural experiences to become known and acted upon with sensitivity. Poor-quality education and inequities, exclusion and alienation experienced by the youth at the inner-city schools, and poignant realities conveyed in both the Mirón et al. and Taines' studies framed the next steps for leadership action. The researchers addressed school practitioners, policymakers, and the public about startling inequities and disparities structurally ingrained within public education for minority and poor youth. Learning about these dynamics in acute interpersonal, discovery ways, students dialogue with researchers or peers in different circumstances. Transformative encounters enable meaning to be made of schooling conditions beyond one's insulated personal circumstances. For adults and activists, the emerging dialogue confronts the ideological rhetoric that dominates academic and policy discourse. The idea for a transformative education is that it takes personal dialogic encounters, like those described in this chapter, for revelatory momentum that redirects the compass of communities toward equitable and egalitarian conditions of schooling for impoverished and disadvantaged youth in the USA as well as globally. Thus, campus leaders should access students' perspectives to purposefully guide (and interrogate) adult mindsets and the school curriculum and policy.

Unlike the adolescents in the Mirón et al. (2001) and Taines (2012) studies, our students are adult leaders of high schools, middle schools, and elementary schools, as well as central office administrators at the district level. They are responsible for youth within their charge for which dialogic-oriented studies of urban and suburban contexts have deep value. The leaders we teach see it as their life's work to empower all students, especially those who are culturally disadvantaged; through our curricular interventions, they may be more apt to value meaningful cultural discourse for all school populations. We realize that the social justice consciousness we have broached reflects early development, with unevenness evident also through praxis, where the students were either uncertain of next steps in their daily work life or had already created conditions for furthering political discourse and community empowerment. These developing leaders have expressed pressing tensions and fears about open dialogue and potential risks, namely, personal alienation in their roles.

The risks are exacerbated when cultural dialogue is with youth from inner-city, high-minority schools (Mirón et al., 2001; Taines, 2012) and war-torn, developing countries (Kasumagic, 2008). Purposeful curricular interactions with high-need populations are vital for attaining social justice goals. Given that the nature of the engagement necessitates high-risk conversations, we must also consider the participants' psychosocial development and intentionally work to protect adolescent identity development. Researchers are exploring how adult educators can develop into strong social justice advocates of youth through such actions as maintaining confidentiality about students' backgrounds and lives (Mirón et al.).

On the horizon of social justice advocacy in school communities, countries, and legislatures is the power of cultural dialogue on a larger scale. At these levels, cultural dialogue can engage all parties inwardly and outwardly for tackling such problems as societal discrimination and such possibilities as civic engagement.

Such on-the-ground activism, complete with theorized interventions, school-based encounters, and contextually informed results (e.g., Mirón et al., 2001; Shields & Mohan, 2008), sporadically appears in educational leadership discourse as well. We agree with Shields (2004) that preparing school practitioners as social justice leaders helps position them to have a strong philosophical–political orientation in their life's work. This orientation is undergirded by what she recognizes as a "just, democratic, empathetic, and optimistic" sensibility (p. 125). A goal of this work is to influence educators' discourse about schooling, democracy, curriculum, and change so they can affect the lives of children, youth, and adults (Mirón et al., 2001).

Such examples of difficult cultural dialogue bring praxis to life. Freire (1972/2000) wrote that praxis is theory-informed action; not value-free or conceptual only, praxis is, instead, value driven and change oriented. A goal of praxis is to make a difference in a way that is informed by and informs theory. To explain, a primary concern with achieving justice in society requires praxis, which necessitates that participants fuse theory and practice as pragmatic theorists, that is, cultural dialoguers. Shields and Mohan's (2008) evocative portrait conveys how challenging praxis can be. In a public school in the USA, teachers and school leaders present at a workshop found the ideas of creating culturally inclusive learning communities that address cultural and ethnic difference for children to be less pressing than accountability demands from the state.

Cultural dialogue does not always work or it can be left undetermined at the time—these are different realities of and outcomes for social justice. Social justice agendas can be abruptly circumvented, forced to take a backseat to school tests or any other competing agenda, such as the comfort or protection afforded by menial conversation, as several students of ours noted. Democratic community building suffers when the leaders of them acquiesce to constructing mentally resistant fortresses that seal off social justice agendas. We can see from our own courses that this is a steep climb for educators, given the narrow-minded praxis they must demonstrate on school-level test performance, making social justice advocacy seem distracting.

Pushing from the other direction, teachers and young people alike express concern about deficit thinking. They feel stigmatized by characterizations of their schools and neighborhoods as poor, underserved, and less than that of affluent school communities, as Shields (2004) attests. With reference to a compass in education (the *Publication Manual of American Psychological Association* [APA], 6th edition, 2010), this field has guidelines for reducing bias in language and perception. Labeling is pervasive and it distorts and misrepresents. Labels, such as *disenfranchised populations*, function at different levels as socially unacceptable realities and space-saving signifiers (APA, pp. 71–73). There is a fine line between wanting to change socially unjust thinking and unintentionally perpetuating it. We see it as an important challenge for researchers not just to examine their personal biases and constructions of citizens (e.g., practicing leaders), as Theoharis's (2007) self-referential scholarship accomplishes, but to extend outward as a profession and discipline.

Relationally experienced dialogue with school constituents, whether teachers, leaders, youth, or parents, repositions praxis—it becomes two-way learning. Shoho and colleagues (2011) asserted that it is the school's responsibility "to engage school leaders in a meaningful dialogue on social justice issues" (p. 37). We think that higher education as a domain, and university faculties in particular, has the responsibility to make this kind of dialogue happen with and on behalf of school practitioners and other stakeholders. A goal is to enlarge the sphere of responsibility that prepares educators so that school practitioners can feel more efficacious about leading and participating in difficult conversations across contexts. Complicated dialogue is challenging for many reasons, including the fact that it is "central to the task of educational leadership" and is associated with "a way of being," not simply better communication (Shields, 2004, p. 115). Temple and Ylitalo (2009) also see universities as "places of possibility" and thus seek to involve their higher education populations "in social and cultural change" by using critical dialogue to surface "underlying assumptions about cultural and ethnic diversity" (p. 278).

From our advocacy positions as educational leaders whose life's work is in public spaces, we believe that social justice in action has global promise as a catalyst for a democratic ideology where it energizes meaningful, cross-cultural dialogue and fosters change. We think a "common language" of social justice along the lines that Shoho et al. (2011) raised could support a consensual framework and guiding principles in a profession that has a much more advanced justice-oriented advocacy mindset than ours currently does, so we worry that premature efforts in this direction could perpetuate unexpected deficit thinking. Labeling could take over, nuance compressed, and voices censored or left out. We understand that social justice has widely varied meanings (Temple & Ylitalo, 2009), but this also makes it that much more attractive to us in that a common language cannot possibly reflect such different cultural and historic contexts.

Unlike critical studies, sociology, and other fields, educational leadership and administration has only more recently encountered critical and transformative consciousness around its own conservative, segregator, and alienating practices (Shoho et al., 2011). We professors of educational leadership are spurring one another on to uncover cultural hegemonic values that reflect the taken-for-granted values and beliefs of ruling classes (e.g., district superintendents) within culturally diverse societies (e.g., school districts), and we are seeking productive ways to do this within our own pedagogies, theorizing, and research.

Such dialogic encounters reveal just how rough the edges are of social justice advocacy. These also reveal how real and tangible the discomfort can be for educators both in difficult cultural conversations and at the ground level who must contend with different and contradictory expectations about what is best for children. Nonetheless, all leaders must rise to the occasion of problematizing power-laden schooling. We can take emotional sustenance from our graduate students who are practicing educators in high-poverty public schools facing the relentless accountability pressures of high-stakes testing, severe budget cuts, and personnel turnover.

Turning Social Justice Compasses Outward

Through our stories, we come to know how university classrooms and schools play a central role in developing the consciousness of new generations of leaders and citizens. Professors of education, for example, in many cases deliberately foster learning inside and outside universities for the active creation of social democracies that enable all children and youth, especially those who are marginalized or less fortunate, to have enriching, lifelong opportunities (Kincheloe & Steinberg, 1998; Mirón et al., 2001; Shields, 2004; Shields & Mohan, 2008).

Out of our "everyday activities" with school practitioners and their struggles, "new leadership theories [are] discovered" through such processes as building "cultures of inquiry" and motivating, mentoring, and role modeling (Bogotch, 2011, p. 133). Passionately engaged, we feel energized by the clamor and chaos of schools and other educational places. Some of us are living the cautionary tale of just how hard this work can be and how rewarding it is. Social justice work can productively expose dynamics of cultural dominance and separation by educators throughout a system who mirror paternalistic, indifferent, and apathetic behaviors (Reed, 2004; Shields & Mohan, 2008). A critically reflective lens can expose what social injustices look like in practice and what advocacy alternatives can be imagined or produced.

This takes us to critical theorist Reed's (2004) story of social injustice concerning low-income areas where some citizens already distrust institutions based on negative experiences. At several American schools he observed, principals and teachers exhibited a "fortress mentality" in their dialogue over (not with) parents in various assemblies. He witnessed the school-based leaders dominating and silencing parents by using a distant tone, that of the uninterested outsider. Moreover, they had cast blame for youth violence and, by way of implication, came across as apathetic in those public spaces about the loss and trauma of several families, in effect deepening the school–neighborhood divide. Based on his observations, Reed wondered what the educators had been learning in their university programs. To paraphrase, why had they not exhibited social justice dispositions, such as empathy, sensitivity, and connectedness, through the facilitation of meaningful conversation and authentic listening? Why had they failed to come through as morally attuned, cultural pedagogues who know how to cultivate dialogic equality with parents?

Leaders like those in Reed's (2004) account seem like socially distant spectators not engaged in the complex process of schooling and the role of complicated discourse in it. In contrast, activists like those in Theoharis's (2007) account had learned to reorient their compasses by inwardly transforming, having meaningful encounters with citizens of lesser social standing, and releasing human vitality through democratic conditions of learning. The Freirian worldview involves confronting paternalism, power, and inequity in relationships, practices, and policies by using one's moral compass while in relation to others, whether parents or others.

We think it is liberating for dialogue to be embraced in pedagogical contexts not only as a tool for educational learning and discovery but, moreover, an aesthetic for advancing democracy. Critical theorists Kincheloe and Steinberg (1998) would passionately argue that such breakthrough ideas about dialogue deeply influence education. As previously mentioned about Kincheloe's (2004) reflection on teaching, together they positioned their graduate students as "thinking educators" of practice by placing explicit value on dialogic encounters that help them to actualize the growth in their social environments. "Set[ting] the stage for a long-running, meta-dialogue" that extends beyond the university classroom, Kincheloe and Steinberg's students were guided to enact Freirian conditions for an "inner conversation" in their school communities that redefines "their images of both self and world" (p. 16). Conversation occurs, then, with the self, with the other, in the community, and within one's field.

The actual encounter is the dialogic imperative that accesses how practitioners, youth, parents, and others think. Such work provides an opportunity for promoting moral leadership through listening to others and taking action (Mirón et al., 2001). When we listen to others, students become reconstituted in school life as a contributor to education and global citizenry.

Next steps beyond raising critical consciousness in the classroom and education leadership field involve acting on cultural dialogue as social justice praxis. Educators are becoming oriented to this work through the concept and practice of pedagogically centered leadership. Teachers, leaders, and other educators dialogue in ways that are collegial and in spaces intentionally redesigned to make schooling less hierarchical and bureaucratized in an effort to foster pedagogically centered leadership. This social justice framework, US teacher educator Hollins's (2011) explains, shines light on pedagogically enriched teaching and learning, group cohesion, and collegial learning. We contend that meaningful, critical conversation is the nexus for fostering professional identity, growth and development, professional learning community, and collaboration. In order to improve learning for students and their circumstances, educators must themselves commit as cultural dialoguers to pedagogically centered learning and leadership; they work with other leaders to, for example, combat the managerial takeover of schools, eliminate test score obsessiveness, and foster healthy and humane educational environments that benefit all participants in the schooling enterprise (English et al., 2012).

More specifically, pedagogically centered leadership is, at the level of praxis, a compass for reorienting teaching and learning to emphasize knowledge, learning, communication, pedagogy, assessment, and integration with curriculum. With regard to each of these components, pedagogically centered leaders foster "knowledge of how humans grow and develop, which includes group-based development and cultural differences in the home and family"; develop "an intensive understanding about the learning process itself and how that understanding can be employed to enhance learning"; participate in extending the "knowledge of discipline and domain-specific conceptual patterns and how they inform the discourse in those disciplines"; connect "specific pedagogical practices [with] specific theoretical perspectives … to attain immediate and longer-term learning outcomes"; use "a variety of assessment strategies to evaluate pedagogical practices," including "authentic assessment models"; and work toward integrating all of these efforts "to the creation of the common core curriculum standards currently being developed" (English et al., 2012, pp. 105–106).

These cultural learning components for PK–12 schools overlap with the university domain. Increasingly, professors must model what teachers and leaders need to know, model, and be able to do. In order to confront and change managerial mindsets about learning and teaching that infuse higher education institutions, educators in all systems are being challenged to facilitate opportunities for cultural dialogic encounters, as we have described.

Expanding Platforms for Cultivating Cultural Discourse

Educators are gradually developing new platforms for cultivating cultural discourse and articulating ideas that educators can take seriously as part of their curriculum and life's work. As described, there are inspirational examples from the education literature of pedagogues who are acting on the promise of local and global transformation for bettering their communities. Readers can find sustenance in written accounts that narrate the strengths and shortcomings involved in the work of fostering generative cultural discourse that helps students to express themselves in cultural terms and to do the courageous work of social justice pedagogues.

After concluding this inquiry, our pedagogical learning in leadership preparation reinforces the message that students can reflect more deeply in class and through culturally immersive assignments and that the learning continues for them as developing leaders. We are trying to become more comfortable with the reality that our social justice interventions and the effect of them are incomplete and unknown to a large degree. We now better understand that engaging in difficult cultural conversations within a classroom that is simultaneously a public forum constitutes an ongoing struggle on different levels for our students and ourselves as part of a steep learning curve.

Finally, we see this chapter as our ethical responsibility to help extend the pedagogy of a democratic theory in action by communicating with audiences around the world. We want to learn from people in different countries about their ideas of dialogue, consciousness raising, and community for the benefit of stakeholders such as leaders and educators, youth, and pupils. We believe a measure of overall community health is for professors to model engagement with public educators and to join forces that link private and public platforms of social justice for wide benefit. As we talk to one another, the world changes.

Talking across cultural differences of race, gender, class, and more is a form of activism. While societal problems like poverty, racism, sexism, homophobia, and persecution are concrete struggles of human plight around the world, people have the power to change what only appears fixed—identities, structures, and beliefs are malleable. By intervening with intentionality and alongside others, we move past social justice rhetoric, as well as our own sense of hopelessness and fear, to effect significant change in and beyond our lifeworlds. Difficult cultural discourse helps citizens to understand the inner power they have to unmake and remake the world. A positive attitude about the future probably serves as the best catalyst for engaging in this challenging creative work.

Chapter 58

Beyond the Colorblind Perspective: Centering Issues of Race and Culture in Leadership Preparation Programs in Britain and the United States

Lauri Johnson and Rosemary Campbell-Stephens

Calls for leadership preparation programs to develop leadership for social justice abound in the US educational literature. Yet to date there are few guidelines about how to reform leadership preparation programs to develop the capacities needed for social justice leaders or study in depth those programs which have reorganized to implement a socially just approach (Furman, 2012). In a comprehensive review of 72 articles and book chapters on leadership for social justice, Capper, Theoharis, and Sebastian (2006) identified only 11 articles that offered explicit suggestions for changes to leadership preparation programs. Capper et al. proposed a framework for leadership preparation for social justice that incorporates (1) the development of a *critical consciousness* of power relations and systematic inequalities such as White privilege, heterosexism, poverty, misogyny, and ethnocentrism; (2) *knowledge* of evidence-based practices that can create an equitable school; and (3) specific *skills* that leaders require to enact justice in their schools such as establishing a service delivery team to eliminate pullout programs (p. 213). In their model these three elements intersect with revisions in the curriculum, pedagogy, and assessment in ways that enable future school leaders to become "change agents for difference" (p. 215). In turn, McKenzie et al. (2008) proposed a leadership preparation program for social justice that focuses on academic achievement, critical consciousness, and inclusive practices. In their model aspiring social justice leaders must learn how to raise the academic achievement of all students in the school, teach students to live as critical citizens in society, and ensure that students learn in heterogeneous, inclusive classrooms. Their view of critical consciousness envisions citizens who critique society to

"ensure that schools are safe places for all children" (p. 122). McKenzie et al. also advocate proactive systems of support that enable school leaders to establish a professional development system that maximizes learning for all students.

Despite these two comprehensive proposed models, leadership preparation programs lack a clear focus on how aspiring school leaders might develop an awareness of race and culture and the role they play in their own and their students' lives. In the early 1990s Parker and Shapiro (1992) noted the omission of conversations on race and gender in graduate programs of educational administration. With few exceptions, little has changed today – it continues to be difficult for educational leadership faculty to talk about race and incorporate culturally specific curriculum in their courses. Leadership preparation programs in the United States often maintain a colorblind perspective when analyzing school organizations as well as aspiring leaders' racial identities and leadership approaches (see Rusch, 2004; Rusch & Horsford, 2009; Young & Brooks, 2008). This "difference blindness" (Larson & Ovando, 2001) ignores systematic inequities and suggests that individual deficiencies account for the problems of entire social groups (Tarca, 2005).

In Britain the literature about school leaders of color, most of which has been produced in the last 10 years, could be characterized as barrier research which is focused on documenting the shortage of Black and Minority Ethnic (BME)[1] educators and their failure to progress into senior leadership positions. Recent efforts to diversify school leadership in Britain are often tied to succession planning as impending retirements, along with perceptions of the difficulty of the job, and a long apprenticeship (often 20 years as teachers and deputy heads) has led to a shortage of headteachers just as British schools are becoming increasingly racially and culturally diverse.[2] In the National College for School Leadership's[3] campaign on succession planning, Bush (2011) notes that "the diversity aspect has been the least successful" and that discourse about the need for more Black and Minority Ethnic (BME) leaders is nonexistent or marginalized in many local educational authorities (p. 191). In Britain there has been little discussion about social justice-oriented leadership development because transformational and distributed leadership approaches tend to dominate and homogenize the field (Lumby, 2006). Missing from the British literature are studies that examine the leadership philosophies and practices of Black headteachers and other school leaders of color as well as leadership preparation programs that might help nurture and support these perspectives.

This colorblind approach (Mabokela & Madsen, 2003; Schofield, 1997) to leadership preparation, where leadership theories, practices, and curriculum are viewed as neutral and free of cultural perspectives and beliefs, characterizes aspiring school leaders as a "homogeneous group where what they do matters more than who they are" (Lumby, 2010, p. 2). This approach to school leadership extends beyond the USA and Britain to other national contexts as well. In a recent comparative study between a racially diverse English and South African school, Lumby and Heystek (2012) found that White leaders at both schools ignored issues of race and that recent dramatic demographic changes appeared to have little impact on how the leaders viewed themselves and exclusionary practices in their schools. The authors conclude that leadership development programs should encourage aspiring leaders to reflect on their identities.

Drawing on examples from both Britain and the United States, in this chapter we identify critical elements in a race-conscious and diversity responsiveness approach to leadership preparation for both aspiring leaders of color and White leaders that aims to go beyond the colorblind approach, develop a critical consciousness about issues of race and identity, and promote new leadership approaches that consider the importance of culture and context. From Britain, we describe curriculum examples and leadership perspectives evidenced in a study of the *Investing in Diversity* program, a Black-led leadership development program developed in 2004 by Rosemary Campbell-Stephens to address the underrepresentation of Black headteachers and middle-level leaders in the London schools (Johnson & Campbell-Stephens, 2010).

From the United States, we draw from the small but growing literature on how White educators might learn to go beyond the colorblind perspective and come to understand themselves and their students as racial beings (Johnson, 2002; Sleeter, 2008; Teel & Obidah, 2008; Ullucci & Battey, 2011). Ebert (2004) notes that color blindness rests on the belief of equal opportunity for all, regardless of race, and that pervasive *individual* deficiencies account for the problems of entire social groups (p. 175). While this blindness to difference and lack of collective response can serve to reinforce racism (Tarca, 2005), White educators often believe just the opposite – that to “see” race is to be racist. Studies that document how White educators become racially conscious focus on their firsthand knowledge of diversity as a lived experience, their developing understanding of insider’s perspectives on race and racism, and self reflection on their own privilege (Theoharis & Haddix, 2011).

While much of the literature on color blindness arises from studies of teacher education, we apply these findings to educational leadership preparation to suggest how aspiring school leaders, including those White leaders who predominate in leadership preparation programs, might learn to become color conscious and critique and challenge the status quo of unequal practices based on race.

Lessons from *Investing in Diversity*

The London Context

With a population of almost eight million, London is one of the largest cities in Europe and has emerged in the twenty-first century as a global city of unprecedented diversity. Migration to the UK is at record levels (Travis, 2012). More than 300 home languages are spoken in the London schools and 67 % of secondary school students are students of color (“Ethnic Minority Pupils Increase by 57 % in a Decade,” 2011). From the first immigrants who came from the Caribbean in the late 1940s, Britain’s Black population has grown to 3.5 % of the total British population and 11 % of the London population. The Black population in the schools is higher, with 17 % of the students in the Inner London schools of African origin and

11 % of Caribbean background. British Asians of Indian, Pakistani, and Bangladeshi descent represent 13 % of the London population. Some inner London boroughs like Newham and Tower Hamlets are over 30 % Asian (Rogers, 2011).

London is also a city of vast disparities between the rich and the poor and a continuing racial and ethnic achievement gap. The achievement of African Caribbean, racially mixed children (White and Black Caribbean), Pakistani, and traveller/Roma students falls in the bottom quartile of that gap (Department for Education [DfE], 2012b). Young Black males have been particularly affected by these disparities. The London Development Agency has described the situation facing African Caribbean boys in the London educational system as "catastrophic" (London Development Agency [LDA], 2004). In the face of the recent recession, long-term youth employment in Britain is the highest in a generation, with the unemployment rate for young Black men at 55.9 % (Ball, 2012).

Despite the growing diversity in London schools, Black and Minority Ethnic (BME) teachers are greatly underrepresented and the city has the largest gap (37 % in Inner London and 24 % in Outer London) between the proportion of pupils and the proportion of teachers from a minority ethnic group (Department for Education and Skills, 2006). The latest Department of Education's School Workforce Census indicates that while BME teachers have increased from 3.8 % in 2004 to 5.4 % in 2010, only 2.4 % of headteachers are from a Black and Ethnic minority background (DfE, 2011). Government statistics show that BME teachers are much less likely to be promoted to leadership positions than White teachers (Powney et al., 2003). Black male headteachers in England's 21,600 state schools number just 30, a fact which has led both university researchers and community leaders to characterize the lack of Black and other educators of color in leadership positions as institutional racism (Bush, 2011; Shepard, 2011).

The Investing in Diversity Program

Investing in Diversity operated from 2004 to 2011 as a "bespoke" leadership development program for Black and Global Majority educators[4] designed to change the "face and heart of leadership" in London (Campbell-Stephens, 2009, p. 322). The program was sponsored by the London Centre for Leadership in Learning, a faculty within the Institute of Education at the University of London. Funding was provided through the London Challenge (now termed City Challenge) to improve educational outcomes for students with a particular emphasis on the "challenges" present in urban contexts. *Investing in Diversity* encouraged Black and Global Majority educators to embrace the "additionality" they bring to their leadership (Campbell-Stephens, 2009).

Participants

Over 1,000 teachers of color completed the program. Participants were predominately Black (69 %) of African Caribbean (36 %), African (24 %), or Black British (9 %) background. However, South Asians (of Indian, Pakistani, or Bangladeshi background) were also recruited and made up another 20 % of the participants. The remaining 11 % of program participants were racially mixed (Black White or Asian White). In general, participants in the *Investing* program were teachers who were applying for their first leadership position as middle-level leaders. While program participants represented all 33 local authorities in London, many were from neighborhoods that enrolled high percentages of students of color (e.g., Waltham Forest, Tower Hamlets, and Newham; London Centre for Leadership in Learning, 2007).

The Program Curriculum

The *Investing in Diversity* program was organized over a 12-month period, beginning with a residential weekend and followed by ten after school or "twilight" sessions and a whole-day seminar at the end of the year. Every residential weekend began with an inspirational keynote address about the ongoing struggles of Black teachers, parents, and community members for equity and social justice in Britain presented by Professor Gus John, the first Black Director of Education in the country and a longtime African Caribbean community activist who has been at the forefront of equal rights and racial politics in Britain for more than 30 years (John, 2009). During the weekend residential participants engaged in consciousness-raising activities that challenged participants to explore what Black educators bring to leadership. The twilight sessions included ten modules throughout the school year on topics such as moral purpose, data analysis, finance, leading teams, leading innovation in learning, and school improvement. The focus in these modules was not just about learning the skills and abilities necessary to be an effective school leader but to develop a critical consciousness amongst the participants by questioning how specific policies and practices might affect groups of students who have traditionally been failed by the British education system. For instance, students studied the origins and effects of the racial achievement gap for African Caribbean boys in the London schools and critiqued the government's Contextual Value Added measures (CVA)[5] which are built on the premise that academic progress for racially and ethnically diverse groups will innately be slower than those of their peers.

Perspectives on Leadership

All of the instructors or "master tutors" in the *Investing in Diversity* program were leaders of African Caribbean, African, or South Asian descent, mainly senior school leaders but also professionals from business and other sectors such as the criminal justice system. Instructors were selected for both their expertise in the subject area they teach and their consciousness about diversity issues and the Black experience. They were encouraged to bring their perspectives and lived experiences as Black leaders to the classroom.[6] While *Investing in Diversity* was grounded in a political and historical mandate to prepare "conscious" Black leaders, the program did not essentialize Black leadership approaches. As Campbell-Stephens (2009) notes, "the intention was to create an intellectual/practitioner space for aspiring Black leaders to discover, define and refine their craft" (p. 323). By hiring Black instructors from a variety of school settings and political perspectives, the program modeled that "there's no one way to be Black" (Johnson & Campbell-Stephens, 2010).

Preliminary themes identified in the leadership philosophies promoted in the program include the importance of moral purpose, the need for cultural awareness or cultural literacy, and the development of high expectations and a sense of responsibility for Black students.

Moral Purpose

Introduced by Rosemary Campbell-Stephens in the weekend residential and then taken up in the first twilight session, participants were asked to reflect on their moral purpose because, in Rosemary's words, "your moral purpose (or lack of it) speaks directly to who you are and what you stand for as an educator" (Portelli & Campbell-Stephens, 2009, p. 16). Although moral purpose is not an uncommon topic in traditional leadership preparation programs in Britain, it often gets reduced to the "lowest common denominator in terms of raising the bar and narrowing the (achievement) gap" (Portelli & Campbell-Stephens, p. 17).

In *Investing in Diversity* moral purpose was infused with a focus on equity and justice issues to advocate for those students who have been marginalized in British schools. It is the lens that the participants were asked to use to analyze their day-to-day decisions as a school leader. As the course progressed throughout the year, participants were questioned, "What does your moral purpose look like when you do data analysis? When you decide how to use your finances? Manage staff?"

Cultural Awareness and Cultural Literacy

Investing in Diversity stressed the importance of Black educators understanding that culture informs who they are and provides a lens through which they see the world. Developing cultural awareness or cultural literacy goes beyond integrating multicultural curriculum into classrooms but also includes how school leaders bring their personal culture into the school. As Ivy Braithwaite, one of the lead instructors in the program and a headteacher in North London, puts it, "it's about my ancestors, my grandparents and my parents and what they've been put through. Cultural awareness is walking tall and representing my community" (Johnson & Campbell-Stephens, 2010, p. 861).

The focus on culture in *Investing in Diversity* asked program participants to "bring who they are" to their leadership and clarify how they view their identities as school leaders. During the first residential weekend, participants were questioned, "Are you a Black leader or a leader who happens to be Black?" For the instructors on the *Investing* program, it seems clear that they would characterize themselves as conscious Black leaders, not professionals who happen to be Black. As an example of race- and color conscious leadership preparation in Britain, *Investing in Diversity* contributes an international dimension to the growing body of literature on self-defined Black leadership perspectives (Brown, 2005).

Lessons from White Educators Becoming Race Conscious

Like the headteachers of British schools, school leaders in the United States are disproportionately White. Results from the latest *Schools and Staffing Survey* (2007–2008) conducted by the National Center for Educational Statistics indicate that the racial breakdown of all US principals is 82.4 % White, 9.7 % Black, 5.9 % Hispanic, and 2 % other (including Asian American, Native American, and two or more races) (National Center for Education Statistics [NCES], 2011a). Principals of color are greatly underrepresented compared to the student population in US schools. In 2008 students of color made up over 45 % of the student population in public schools in the United States. This group included 17 % African American students, 22 % Hispanic/Latino students, and 7 % other (students who identify themselves as Asian, Hawaiian, Alaska Native, Pacific Islander, American Indian, or two or more races). In some states, such as California and Texas, and in the 20 largest urban school districts in the United States, students from racially diverse backgrounds constitute an overwhelming majority of the school population. In New York City, Chicago, or Los Angeles, for instance, students of color constitute 80 % or more of the student population (NCES, 2011b).

Aspiring school leaders in leadership preparation programs in the United States are also overwhelmingly White. While little research has been conducted on the views of White aspiring leaders toward diversity, a growing body of research has examined the views of White teacher education candidates. In her comprehensive review of the literature, Sleeter (2008) found that White preservice teachers failed to recognize the pervasiveness of racial inequity, held deficit views and lower expectations for students of color, adopted a colorblind approach to teaching, and lacked a sense of themselves as cultural beings which led to assumptions that their cultural lenses represented the norm for all their students.

How might White educators learn to "see race" and become race and color conscious? Teel and Obidah (2008) define color conscious teachers as those who understand that racism exists and that issues around race and racism affect schooling. Ullucci (2010) builds on this definition to describe race consciousness as occurring along three dimensions: (1) teachers understand that racism impacts schools, (2) they acknowledge and draw on the racial and cultural backgrounds of their students, and (3) they understand the value of culturally relevant pedagogies.

Johnson (1997) identified three possible explanations about coming to racial consciousness through her analysis of the published autobiographical accounts of White teachers and teacher educators (Howard, 1999; Paley, 1995; Sleeter, 1996). One explanation is that White educators become aware of race and racism by drawing on their own experiences of perceived marginalization to empathize and make connections with other marginalized groups (see, e.g., Greene, 1995; Paley, 1995). Another possibility is that White teachers reduce their prejudice toward other racial groups and begin to develop multiethnic competencies by engaging in cooperative endeavors with individuals and communities of color in relationships that approximate equal status (Allport, 1954). A third possible interpretation of this process is that White teachers gain access to an alternative standpoint (Hartsock, 1987) about race through living and working with individuals and communities of color and consequent exposure to insiders' perspectives on race and racism. In her subsequent life history study of six White teachers who were nominated as "aware of race and racism," Johnson (2002) found these teachers learned to see race through their perceived identity as outsiders, living and working with individuals of other races in equal status relationships, and personal religious and philosophical beliefs that emphasized equality and social justice concerns. Similarly, Ullucci (2011) also found that White teachers in racially diverse urban schools empathize strongly with their students when they themselves know what it is to be marginalized or thought of as "other," "different," or "needy." Firsthand knowledge of diversity as a lived experience was important for the three White urban teachers she studied. Ullucci concludes that, "knowing 'others' matters" (p. 575) for White teachers' development of race consciousness.

The narratives of White teachers coming to racial consciousness also indicate that preservice education programs that provide quality field experiences in urban communities can make a difference in the development of racial awareness. To avoid cultural tourism or voyeurism, these field experiences should strive to ensure the dignity of the communities where students are placed and focus less on exposure and more on engagement (Ullucci, 2010).

Although most studies of White educators developing awareness of race and racism have focused on teachers, Theoharis and Haddix (2011) found similar themes in their study of six White principals who self identified as social justice leaders. These principals were committed to creating more equitable schools for students from marginalized communities. They went beyond the colorblind perspective through their lived experiences in racially diverse communities, engaging in emotional and intellectual work around race that confronted their own privilege, conducting "difficult conversations" about race with their faculties, using race to critically inform their use of school data, and engaging with families of color.

Elements of a Race-Conscious Leadership Preparation Program

How might we restructure leadership preparation programs to make them more race conscious and develop aspiring school leaders' knowledge base about diverse communities? What might we learn from the perspectives and experiences of Black leaders in the *Investing in Diversity* program as well as the literature on how White educators develop racial awareness? Hafner (2009) notes that leadership preparation programs in the United States that have been redesigned to focus on leadership for social justice (LSJ) generally include critical reflection, problem-based learning, and the inclusion of leadership literature that emphasizes equity, diversity, and social justice.

Few of these recommendations to reform leadership preparation programs, however, have focused on the specific knowledge, skills, and abilities needed to develop culturally competent (Bustamante, Nelson, & Onwuegbuzie, 2009) or culturally literate (Johnson & Campbell-Stephen, 2010) leaders, and even fewer have examined how aspiring school leaders learn to go beyond a colorblind perspective to "see race" in their schools and their lives and develop an antiracist perspective in their stance as school leaders. Some preliminary strategies to begin this process in leadership preparation programs in both countries are described below.

Rethinking Selection Criteria and Program Composition

Reforming selection criteria in traditional leadership development programs is often framed in terms of establishing higher standards for admittance (e.g., higher GPAs, writing samples) to raise the professional status of the field. Like others who promote leadership for social justice, we advocate a more nuanced approach to selection criteria and program composition that includes the consideration of candidates' dispositions and life experiences that value diversity. McKenzie et al. (2008) suggest selecting individuals for leadership preparation programs who "already have a propensity to question the inequities found in schools" as well as those who have a proven track record as teacher leaders in their schools (p. 118). To prepare effective teachers for diverse urban schools, Haberman (1993, 1995, 2005) has long argued that university educators have to find ways to focus more on "picking the right people" rather than on "trying to change the wrong ones" through preparation programs.

With the increasing racial and cultural diversity of the student population in both Britain and the United States, we believe that selection criteria for future principals and headteachers should be incorporated in entry interviews that solicit potential candidates' lived experiences in diverse communities and their willingness to rethink their conceptions of race and the learning capacities of diverse learners (Garmon, 2005; Johnson, 2002).

Rethinking the composition of leadership preparation programs also requires rethinking our conceptions of who "fits" as an educational leader (Tooms, Lugg, & Bogotch, 2010). Aspiring Black and Global headteachers in the *Investing in Diversity* program often acknowledged to instructors the lack of affirmation and encouragement they had received from supervisors in their schools who didn't "see" them as headteachers. Participation in *Investing in Diversity* served to confirm their leadership potential and bolster their confidence to pursue headship.

One of the first steps in creating leadership preparation programs that are race and color conscious may be to acknowledge that there are multiple ways to lead effectively and that in both Britain and the United States we need to provide a variety of leadership development opportunities, including bespoke programs like *Investing in Diversity* that are focused on the needs and perspectives of aspiring leaders of color, as well as programs where students learn together in racially diverse cohorts. While Bush and Moloi (2008) note that Black-focused programs may prove controversial in some contexts, the responses of *Investing in Diversity* participants indicate this Black-led program provided important elements not readily available in traditional British leadership preparation programs, including Black leadership perspectives and role models. Racially diverse cohort programs are important as well, however, particularly for the education of White aspiring school leaders. The literature on White educators coming to racial awareness indicates that these students are unlikely to go beyond the colorblind perspective without being challenged by racially diverse standpoints in the classroom.

Internships in Diverse Communities

Similar to teacher education field-based experiences that immerse students in diverse settings (e.g., urban communities, Native American reservations, or schools serving recent immigrant students), aspiring school leaders should participate in internships outside their comfort zones where they learn about the perspectives of diverse parents and communities alongside of experienced community school leaders.[7] These internships might include apprenticing with principals or headteachers who are deeply connected to the local community as well as other field-based experiences where aspiring school leaders work under the leadership of parents and neighborhood leaders in community-based projects (Auerbach, 2009). To be most effective, these internships should be coupled with seminars where students can dialogue and critically reflect on how their experiences intersect with issues of race, culture, and power. The effects of these internships might be different for aspiring leaders of color than aspiring White leaders. Cross (2005) notes that simply immersing White students in diverse contexts for field experiences can serve to reinforce biases and stereotypes and reinforce "colorblind racism" if these experiences ignore how power and Whiteness operate and do not require students to address or challenge their own unearned privilege and advantage. Real-world internships can provide aspiring school leaders with crucial lived experiences in diverse settings, but they must be embedded within a spirit of critique to develop a more complex, asset-based approach and knowledge base about the cultural funds of knowledge (Moll, Amanti, Neff, & Gonzalez, 1992) and perspectives that diverse families bring to the school. As Ulucci and Battey (2011) note, aspiring educators must have support in order to manage the disequilibrium between "what color blindness tells them they see and the reality" (p. 1212).

For aspiring leaders of color in Britain, internships alongside of experienced Black school leaders can provide mentorship and critical leadership experience as well as everyday advice about ways to navigate a system where Black leaders are not only in a minority but may face active resistance from teachers and parents. For instance, the new BME Headteacher Internship Programme (DfE, 2012a) initiated by the National College for School Leadership provides deputy heads with a coach and the opportunity for a 10-day internship in another school as a working headteacher with support from an experienced BME headteacher as mentor.

Developing More Complex Views of Race and Cultural Diversity

Castro (2010) notes that preservice teachers continue to demonstrate the lack of a complex understanding of multicultural education and the processes of institutionalized racism and oppression. This is true of leadership preparation students as well. Many aspiring school principals in the United States and headteachers in Britain still subscribe to a belief in individualism and meritocracy that success in school depends on one's merit or hard work, or "pulling oneself up by their bootstraps" (Milner, 2010). This approach stems from a lack of awareness about structural and institutional inequities that affect students of color as well as other students who are marginalized in schools. Aspiring school leaders must learn to recognize and name how institutional racism is manifested in (1) the underrepresentation of Black and other school leaders of color, (2) achievement gaps between racial groups, and (3) whose cultural knowledge is included (or not) in the school curriculum.

To become culturally literate and race conscious, aspiring school leaders need to move beyond a "food and festival approach" to cultural diversity (Banks & Banks, 2010) that focuses on sharing cultural contributions to an analysis of the ways that schools may reinforce inequalities and blame students for realities beyond their control (Milner, 2010). Class projects like equity audits (Skrla, Scheurich, Garcia, & Nolly, 2004) where racial achievement gaps and differences in teacher quality are compared across local school districts can help uncover how "schools reinforce social inequality while pretending to do the opposite" (MacLeod, 1995, p. 11). These audits should also include analyzing the curriculum to investigate whose culture is included (or not) in textbooks, school assemblies, extracurricular activities, and parent involvement programs. Other consciousness-raising class activities might include field trips and community walks guided by community residents and activists who can provide an insider's view and historical perspective about issues and concerns in local communities of color (Lauricella, 2005).

Aspiring school leaders must also learn how to engage in "courageous conversations" (Singleton & Linton, 2006) and moral dialogue about race (Shields, 2004) and explore their own racial identities on their way to becoming antiracist leaders. Gooden (2011) defines "anti-racist leadership as leadership that actively fights against principles, beliefs, and acts (overt and covert) that operate to perpetuate race-based inequities in schools." Some of this work to develop the racial awareness of aspiring school leaders is already happening in social justice-oriented leadership preparation programs. Six US universities are currently developing curriculum modules under a FIPSE grant entitled "Preparing Leaders to Support Diverse

Learners" which are available online to enhance the curriculum used in UCEA (University Council for Educational Administration) school leadership programs.[8] For example, the University of Texas-Austin has developed a unit entitled "Building a Community of Trust Through Racial Awareness of Self" in which course instructors explore their own racial awareness while developing the racial awareness of students and others (Gooden & O'Doherty, 2011). The module includes readings, discussions, and conscious-raising activities that explore students' definitions of race and the effects of race and White privilege on their lives. The module culminates in the composition of a racial autobiography, similar to the cultural autobiography advocated by Brown (2004), but focused specifically on critical life incidents which contributed to the author's understanding of race, racism, and privilege. Engaging in class experiences, readings, and field experiences which foster a critical consciousness can help aspiring school leaders develop a more complex understanding of race and multicultural education and the ways that the school curriculum can be transformed to meet the needs of *all* students.

Conclusion

Race- or color conscious leadership preparation builds on and extends culturally responsive approaches (Johnson, 2006; McCray & Beachum, 2011) by acknowledging that in order for aspiring school leaders to develop competencies associated with culturally relevant leadership (e.g., high expectations for student achievement, incorporating diverse cultural knowledge in the curriculum, and creating inclusive organizational structures), they must first take into account the role of race in their schools, their communities, and their lives. Aspiring school leaders must know who they are as people, understand the contexts in which they lead, and question their knowledge base and assumptions about the status quo (Gay & Kirkland, 2003). We believe these self-reflective qualities are as important as developing more generic leadership skills and abilities.

A range of leadership preparation programs and experiences must be available to develop race-conscious and socially just leadership, including "bespoke" programs for leaders of color such as *Investing in Diversity* as well as immersion experiences and internships that place aspiring White school leaders outside their comfort zones where they learn about the perspectives of diverse parents and communities. The identities and life experiences of aspiring school leaders in both Britain and the United States must be considered in the selection process and further opportunities to reflect and interrogate those identities provided during the course of school leadership preparation programs.

Kimberle Crenshaw, professor at UCLA School of Law and Columbia University Law School and one of the founders of Critical Race Theory, has asserted that, "You cannot solve race problems with colorblind means."[9] In turn, we believe you can't prepare school leaders who are culturally responsive and socially just through colorblind leadership preparation. Leadership preparation programs in both Britain and the United States must help aspiring school leaders develop personal and professional cultural consciousness that challenges the status quo. As Professor Gus John (2009) notes,

> What difference does it make to the situation of the majority of the group that black teachers (and leaders) are supposed to represent, if the training and professional socialization those black teachers receive, the institutional culture of which they become a part, and the systems and processes they operate are identical to that of their white counterparts?

In conclusion, in order to change the way we prepare effective and socially just leaders for increasingly diverse schools in Britain and the United States, we must go beyond the colorblind perspective and acknowledge the "difference that difference makes." We believe that more race-conscious and culturally specific leadership preparation approaches can help create those change agents of difference who are so desperately needed in our schools and communities on both sides of the Atlantic.

Notes

1. While the term *BME* is widely used in the British research literature, it is contentious because it fails to differentiate between groups based on their cultural background and position in the racial hierarchy. We have used this term when citing particular research studies or government reports.
2. Students of color now constitute 67 % of the students in the London schools, 58 % of the students in Leicester, and 52 % of the students in Birmingham. See "Ethnic Minority Pupils Increase by 57 % in a Decade" (2011).
3. The National College for School Leadership is a government-funded center that initiates and coordinates professional development and research on school leadership in the United Kingdom.
4. Black and Global Majority is used in the *Investing in Diversity* program as a reflection of the reality that people of color are a majority in the world and increasingly in the urban contexts of Western countries. In the Investing program *Global Majority* is characterized as an empowering term that "brings us in from the margins and challenges directly those who have the power" (Portelli & Campbell-Stephens, 2009, p. 2).
5. Contextual value added (CVA) was a statistical procedure used by the UK government intended to show the progress children have made while attending a particular school by taking into account nine factors that the government believes will affect the performance of students such as gender, eligibility for free school meals, first language, and ethnicity among others.
6. In a British context, the term *Black* has been used in a political sense to mean those people of African, Caribbean, and South Asian descent and other groups who are discriminated against on the grounds of their race, culture, color, nationality, or religious practice. This use arises from the understanding that while individual ethnic groups have faced racism and discrimination differently, there is much that unites people of color in terms of government policy, particularly

around immigration and the way these groups have experienced education (see Richardson, 2007).

7. This concept is similar to Murrell's (2001) notion of "community teachers," accomplished urban educators from the local community who share their culturally competent practice with novice teachers through an apprenticeship approach.
8. Curriculum modules can be accessed on the UCEA website at http://www.ucea.org/lsdl-preparation-modules-new/

Modeling Social Justice Educational Leadership: Self-Assessment for Equity (SAFE)

The persistence of social inequities (reflected for instance as classism, racism, sexism, heterosexism, and ableism) that negatively affect students, families, and communities and contribute to disparities across groups as they engage with institutions instills a sense of urgency among many educators to respond to the call for equity. Calls for equity have helped to heighten the focus on social justice and make it a centerpiece of leadership preparation programs in the United States (US) (Furman & Shields, 2005; Marshall & Oliva, 2006, 2010). Education is the purview of the states in the USA rather than the federal government. However, passage of federal Education Legislation Act, No Child Left Behind (NCLB) (2001), exacerbated the tension between the states and the federal government over control of public education. With its strong emphasis on student achievement, NCLB consolidated an era of accountability across the country and placed educational leadership preparation programs at a crossroad between scientific management and social justice (Brooks & Miles, 2008). The tension between managerial approaches to leadership preparation and social justice-oriented leadership offers a moment(um) that if seized can improve education for all students (Furman & Shields, 2005). Despite the increased rhetoric on the value of social justice leadership in the USA, research shows that social justice issues still reside in the margins of educational leadership preparation programs as their focus remains on traditional topics such as school law,

organizational theory, supervision, and finance (Brooks & Miles, 2008; Jean-Marie, Normore, & Brooks, 2009; Shoho, 2006).

In the research on leadership preparation and certification of aspiring principals in the USA, few program designs have been evaluated (Firestone & Riehl, 2005). According to Capper, Theoharis, and Sebastian (2006), "[a]ssessing leadership preparation should be the first priority in future research on preparing leaders for social justice" (p. 19). Similar to the efforts of Lalas and Morgan (2006) to establish a doctoral degree preparation program with social justice as a guiding concept, we describe our efforts to provide and internally evaluate a social justice-oriented leadership preparation program through an evolving model of self-assessment for equity (SAFE). SAFE is being developed and piloted by us (the first two authors) as members of a university faculty who prepare future school leaders in a graduate Department of Educational Leadership and Policy Studies (DELPS) in order to assess the alignment between the department's mission statement and the practices, processes, and policies of the program that affect students from application through enrollment until exit. SAFE coincides with departmental efforts to improve current institutional status, maintain program accreditation, excel in teaching beyond the leadership standards, and increase students' pass rate on the leadership certification exam. As such it can support broader attempts at evaluation (i.e., college-wide external evaluations).

SAFE is a student-centered model that is evolving organically and dialectically through our collaborative efforts to simultaneously conceptualize and apply it while conducting research related to the critical examination of the department's purposes and practices. As Shoho (2006) reminds us, individuals and institutions can interact in intended and unintended ways to affect leadership preparation (Shoho). We offer SAFE to assist leaders, leadership programs, and faculty in conducting an internal (self-) assessment of the integration of the social justice ethic throughout programs preparing leaders to facilitate equity and educational excellence across schools, students, families, and communities. Through SAFE we aim to improve the program in educational leadership and provide a model for programs similarly inspired to facilitate equitably excellent and socially just education for aspiring school leaders.

Critical Social Justice Education via Leadership

The conceptualization of SAFE is informed by critical education studies (Apple, 2000), critical social theory (Young, 1990), and critical social justice leadership (Ryan & Rottman, 2007) coupled with advocacy (Anderson, 2010; Bloom & Erlandson, 2003; Cambron-McCabe & McCarthy, 2005; Lather, 1991), anti-oppressive intentions (Kumashiro, 2000), and the following assumptions: (1) social institutions are human creations; (2) societal institutions continuously disadvantage some communities more than others; (3) patterns of (dis)advantage are not always visible; (4) social justice involves more than resource distribution and economics; (5) social justice is not consistent with the idea of just dessert; (6) social justice favors equity over particular versions of equality; (7) social justice involves all aspects of education; and (8) social justice calls for hope (Ryan & Rottman, pp. 12–16). We borrow and modify methods of evaluation (audits) and conceptual frameworks informing the development of social justice leadership preparation programs (see, e.g., Capper et al., 2006; Skrla, Scheurich, Garcia, & Nolly, 2004).

Reflected in this framework are our concerns about providing theoretical, conceptual, and practical knowledge congruent with constructs relevant to social justice leadership (i.e., empathy, care, critique, indignation), providing a program and related experiences that are responsive to the funds of knowledge from which students draw (Lalas & Valle, 2007; Moll, Amanti, Neff, & Gonzalez, 1992) and facilitating productive dialogue through the cognitive dissonance students may experience as they encounter opportunities to develop, apply, or translate their knowledge and experiences into practices, paradigms, and relationships that are conducive to social justice leadership in their respective contexts.

We work from a relational theory of social justice as (re)distributive and that is concerned with equality and/or equity of conditions, opportunities, and outcomes (Lynch, 1995). This relational theory of social justice is concerned with reducing patterns of inequity and harm that derive from hegemonic expressions of values and assumptions and fostering conceptions of social justice that are responsive to various expressions of contextual, cultural, and environmental knowledge. The SAFE framework is consonant with the ecological model of social justice advanced by Furman and Gruenewald (2004) who view environmental crises as inseparable from social crises.

Critiques have been made by female social and educational theorists such as Young (1990), Noddings (1999), and Smith (1987) that distribution has been privileged in social justice theory and relationships marginalized. Also inserting relationships into the discourse of social justice is Nancy Fraser (1997) who argues that recognitive justice is a foundation for social justice. The principle of recognition concerns culture, respect, and redress for oppression and injustice that occurs through cultural domination, nonrecognition (i.e., lack of authority, communication, representation), and disrespect. To provide a more complex understanding of social justice theory, Connie North (2006) identifies three relational spheres of tension: micro-/macro-level distinctions (i.e., institutional power, internal power), sameness/difference, and equality/equity. She concludes that singular approaches to education for social justice and the marginalization of actors (in policy and practice) to whom the intended benefits are expected to accrue will do little to result in equitable education. Unpacking these theories and grappling with their tensions and absences should be part of educational leadership that inspires toward more socially just/anti-oppressive relationships among actors across institutions impacting education. In giving attention to the theories of social justice, faculty preparing educators and administrators can respond to the critiques that social justice in the USA is under-theorized in teacher education preparation (Grant & Agosto, 2008), educational leadership (Jean-Marie et al., 2009), and educational policy (Gewirtz, 1998).

In the following sections, we provide a brief history of the social justice impetus in educational leadership preparation and review the conceptual and empirical research on social justice-oriented leadership preparation and evaluation. The literature review consists of four parts: (1) calls for teaching social justice in educational leadership programs, (2) models for preparing leadership for social justice,

(3) empirical studies on social justice leadership preparation, and (4) evaluations of leadership preparation programs. Additionally, we provide examples of how we have been implementing SAFE.

Literature Review

In our search for relevant literature, we used keywords in combinations such as educational leadership, social justice, equity, evaluation or assessment, and leadership preparation. From the literature in the databases Education Full Text and ERIC, we identified articles published in special or themed issues of US journals on leadership for social justice (e.g., *Administration Quarterly Journal*, 2004, *40*(1); *Journal of Research in Leadership Education,* 2010; *Journal of School Leadership*, 2002, *12(*2), *12(*3); *5*(3)) and articles published in other peer-reviewed journals, major texts (e.g., Marshall & Oliva, 2006, 2010), conference proceedings, and dissertations. In total, we reviewed approximately 100 related articles, book chapters, and dissertations. We left the time period open in order to gauge the historical development of the concepts of social justice and equity within the literature on educational leadership preparation in the USA. While the use of the above journals forwards a social justice framework that is contextually (US) bound, the broader literature review includes authors from the UK, Canada, and Australia.

Calls for Teaching Social Justice in Educational Leadership Program

Appeals for attention to social justice leadership have been accompanied by critiques of its ahistorical and acritical theorization (Grogan, 1999 cited in Jean-Marie, Normore, & Brooks, 2009) and exclusion of interdisciplinary and international perspectives (Jean-Marie et al., 2009). According to Bates (2006), “conflict over curriculum, pedagogy and assessment is endemic in public discussions of education” but has been “largely sidestepped in discussions of educational administration” (p. 146), as have been the voices of critical theorists (some exceptions are Brooks & Miles, 2008; Dantley & Tillman, 2010; Jean-Marie et al., 2009; Schoorman & Bogotch, 2010; Young & Lopez, 2005). For instance, Sharon Gewirtz’s (1998) efforts to conceptualize social justice from the perspective of educational policy are virtually absent in the literature currently framing social justice in educational leadership in the USA. Advocates of social justice in educational leadership have drawn on social reconstructionist (Bogotch, 2002; Capper, 1997), critical theory, and postmodern perspectives (Foster, 1986; Grogan, 2004) and have helped to bring the concepts of equity and justice into the discourse of educational leadership preparation.

Despite the increased focus of scholars on social justice in educational leadership (Bogotch, Beachum, Blount, Brooks, & English, 2008; Jean-Marie, Normore, & Brooks, 2009; Capper, Theoharis, & Sebastian, 2006; Larson & Murthada, 2002;

Marshall & Oliva, 2006, 2010; McKenzie & Scheurich, 2004; Skrla et al., 2004; Shoho, 2006), there has been little or no systematic evaluation of leadership preparation programs (Capper et al., 2006; Chenoweth, Carr, & Ruhl, 2002; Shoho, 2006) and their impact on the preparation of aspiring school leaders. The importance of addressing this gap in the research is made evident by recent studies of principals who have been able to infuse social justice within a school's culture despite resistance from colleagues (Kose, 2009; Theoharis, 2007).

Models for Preparing Leadership for Social Justice

The capacity or suitability of programs to prepare leadership to act courageously about social justice in education is an under-explored area in the research on leadership preparation (Jean-Marie et al., 2009). Many scholars attuned to the importance of preparing leadership for social justice propose that to act upon inequalities and lead toward social justice requires (1) requisite perspectives (that the inequalities are unjust, unwarranted, and a function of various factors within the school and educational community) and (2) a willingness to restructure organizations (McKenzie et al., 2008; Radd, 2007; Skrla et al., 2004; Theoharis, 2007). Scholars have provided models for programs preparing leadership for social justice in professional development and pre- and in-service leadership preparation programs as a separate but equal component to effective leadership training (Cambron-McCabe, 2010; Cambron-McCabe & McCarthy, 2005; Larson & Murthada, 2002; Pounder, Reitzug, & Young, 2002; Young & Laible, 2000). According to McKenzie et al. (2008), programs preparing leaders for social justice should have three goals as a basis of their curriculum and instruction: (1) achievement gaps from high-stakes testing should be controlled by increasing the achievement level for all students; (2) students need to be prepared to live as critical members of society; and (3) schools need to be structured properly to ensure academic success in heterogeneous environments.

More specific recommendations have been provided to address the curriculum, instruction, and assessment of educational leadership programs oriented toward social justice. For instance, Young and Laible (2000) suggest three approaches educators could use to teach toward racial justice: (1) the personal approach, (2) the institutional approach, and (3) the multiple fronts approach. Brown (2005) advocates a radical change of content, delivery, and assessment, and she outlines eight strategies that comprise her transformative framework and pedagogy: cultural autobiography, life histories, prejudice reduction workshops, reflective analysis journals, cross-cultural interviews, educational plunge, diversity panels, and activist action plans. Hafner (2010) describes two specific pedagogical tools to create a socially just environment: (1) social justice education practice and (2) social reconstructionist schooling. Both these approaches are part of a framework that reminds educators that the process of teaching for social justice models the goals of social justice education (p. 203).

A considerable part of the literature emphasizes the importance of awareness and understanding of the potential harmful effects of the inequalities as a fundamental component toward creating socially just environments (Brooks & Miles, 2008; Dantley & Tillman, 2006; Furman & Shields, 2005; Hafner, 2006; Lopez, Magdaleno, & Reis, 2006; Theoharis, 2007). Capper et al. (2006) provide a research-based framework for developing programs toward preparing leaders for social justice in which emotional safety for risk taking is a necessary condition that permeates both horizontal and vertical dimensions of leadership programs. The horizontal dimension consists of three domains: critical consciousness, knowledge, and skills, which need to be reflected in curriculum, pedagogy, and assessment (vertical dimensions).

Some have argued that who enters educational leadership preparation programs is just as, if not more, important a factor in providing social justice leadership as the preparation provided. To ensure that some aspiring school leaders enter preparation programs with an inclination toward social justice and willingness to engage in developmental experiences toward social justice leadership, there needs to be stringent selection criteria established at institutions informing the selection of students into programs preparing schools leaders (McKenzie et al., 2008). Furthermore, some have recognized that social justice preparation is more likely to be effective when departments, institutions, and organizations share a unified front to infuse social justice within the curriculum (McKenzie et al., 2008; Murphy & Vriesenga, 2006).

Empirical Studies on Social Justice Leadership Preparation

There is a considerable number of studies on leadership preparation programs (e.g., Darling-Hammond, LaPointe, Meyerson, & Orr, 2010; Levine, 2005; Murphy & Vriesenga, 2006). However, there is a dearth of empirical studies on leadership preparation for social justice. Boske (2010) found that students of color in an educational leadership preparation program received fewer resources, faced resistance from faculty when drawing on their social and cultural capital, and were silenced in classrooms as dominant perspectives were perpetuated. The experiences of participants in leadership preparation programs speak to the need for increased research on how educational leadership programs perpetuate injustice (Rapp, Silent, & Silent, 2001).

Evaluations of Leadership Preparation Programs

Studies on evaluation of leadership preparation programs, both graduate programs at colleges and district "homegrown" principal preparation programs, have highlighted several components that make these programs successful (e.g., Brown, 2006; Darling-Hammond, LaPointe, Meyerson, & Orr, 2010; Nelson, de la Colina, & Boone, 2008). However, "research on evaluations of leadership preparation programs [for social justice], their content, delivery, and outcomes, is virtually non-existent" (Capper et al., 2006, p. 219). Capper et al. chastise the field of leadership preparation programs for social justice for "languishing in hypocrisy when faculty expect equity-oriented leaders to maintain high standards of accountability, supported by federal legislation, when these programs themselves engage in no systematic, empirical studies or equity audits of their own" (p. 219). Cambron-McCabe and Cunningham (2002) expressed similar concerns about the lack of sustained dialogue confronting race and class and urge us (leadership professoriate) to learn "how to incorporate such a dimension throughout our preparation programs" (p. 295).

In an external cross case study of three programs (early childhood, counseling, and a doctoral program in leadership) rooted in social justice preparation of professionals, Rodriguez, Chambers Venzant, Gonzales, and Scheurich (2010) outlined the four critical values evident in all three programs: first, the value of faculty preparation; second, the value of selecting diverse students who demonstrated social justice in their professional experiences; third, the need for a social justice mission to be at the core of decision making; and fourth tailoring the program to meet student needs. The authors noted a variety of program structures across the three cases that underscore the need for continued conversations about the most effective delivery method for individual programs and the students they serve. Finally, resistance to social justice was present on multiple organizational levels and among groups (faculty, students, and administrators). The emphasis of the study was program structure and processes rather than their immediate impact on students' practice in schools. While this study is of value to the field, it does not address specifically the preparation of aspiring school leaders in principal certification and master's degree programs, nor is it a study of their own programs. External evaluations of leadership preparation programs seldom focus on the suitability of the programs for preparing social justice-oriented leaders.

Although the practice of internal or self-evaluations of leadership programs has been introduced to the field (e.g., Glasman, Cibulka, & Ashby, 2002), it has not yet been utilized to focus on those aspects of leadership preparation associated with social justice pedagogy and curriculum. According to Skrla et al. (2004), school leaders need access to practical tools for use in developing a comprehensive and insightful understanding of inequities, tools which should be "designed to be useful to professors in leadership preparation programs for the purpose of helping them develop leaders who have the knowledge and skills needed to create equitable and excellent schools" (p. 138). The literature lacks a conceptual framework for the evaluation of leadership preparation programs for social justice. In this chapter we fill this void in the literature and offer a model from conducting internal or self-assessments with regard to equity in a critical social justice leadership preparation program.

SAFE Praxis

DELPS offers an advanced degree (master's degrees) to students who have already earned a bachelor's degree from a 4-year university. Applicants must meet admission requirements such as graduate point average (GPA), a minimum of 2 years of teaching experience, and a teaching license. SAFE represents internal praxis: “engaging in a cycle of theory, application, evaluation, reflection, and then back to theory” (Freire, 1998, p. 75) in order to continuously assess whether DELPS actions reflect a social justice orientation. Informing our praxis is the context in which we work, namely, the mission statement and philosophy of DELPS:

> The purpose of DELPS is to prepare ethical, compassionate, public intellectuals to become critical and transformative leaders committed to social justice in America’s schools. The primary means to achieve our purpose are: collaborative inquiry, culturally relevant pedagogy and public deliberation on the historical and perennial issues that confound public education in our nation. We expect our faculty and students to make value-added contributions to national, state, district and school-level policy and purposeful inclusive practices that lead to social justice and learning for all.

The mission statement was constructed by the faculty in 2008 and since then some have left and others have arrived. In our context, we operate under Florida Leadership Standards whose language provides an exemplar of what Brooks and Miles (2008) consider a return to scientific management in schools where issues of equity and social justice are almost nonexistent (Black & Karanxha, 2009). Begin with Students who participate in social justice leadership means will likely confront traditions and superiors in the field that may not be similarly oriented toward equity and social change as “educational leaders in districts and schools today are defined by a conservative discourse that homogenizes education throughout the country” (Grogan, 2004, p. 222).

(Re)Drawing (from) the Audit Culture

SAFE is a model of internal assessment that poses as its problem, the extent to which the social justice ethic is infused throughout the experiences made available to students in educational leadership programs. The equity audit is a tool based on a history of auditing in civil rights, curriculum and state accountability policy systems. Its areas of concern for evaluation include teacher quality equity, programmatic equity, and achievement equity. By combining the curriculum audit (English, 1988; Poston, 1992) with the equity audit and a praxis approach to program evaluation based in the ethics of critique and justice and the practices of reflection and advocacy, we respond to the managerial impulses driving leadership in this era of accountability (Anderson, 2010). This model also moves away from the audit culture’s emphasis on external evaluation. SAFE coincides with the progressive framework of leadership in which curriculum, broadly defined, is central (Ylimacki, 2011).

We appropriate and translate the programmatic component of the equity audit described by Skrla et al. (2004) and curriculum equity audits into the self-study process. We also borrow from the areas of analyses (e.g., individual differences, administrative and supervisory practices) of Mitchell and Poston’s (1992) equity audit and standard three of Fenwick English’s (1988) curriculum management audit (connectivity and equity) which calls for cohesion of the curriculum, examination of the allocation of resources for disparities and inequities (e.g., financial, programmatic, and racial), and an exploration of remedies. Although the above-named audits typically focus on K-12 schools or districts, we are appropriating and translating these tools for use in higher education. In the tradition of equity audits in the K-12 schools, we are using percentages and ratios to determine whether there is a disproportionate and under- or overrepresentation of racial/ethnic groups in the admission process. Our theoretical frame is informed by social constructionist perspectives in that we view educational leadership, policy, and curriculum/instruction as social constructions amid power relations that can be altered through the reappropriation of tools for the benefit of equity and excellence. To conceptualize SAFE we borrow from the framework on social justice leadership preparation advanced by Capper et al. (2006) and modify these components where necessary in response to the local needs of the context in which we work. SAFE is a student-centered model, meaning it looks at the phases in the students' journey through the program of study (from pre-enrollment, enrollment/engagement, and post-enrollment) in relation to the policies, processes, practices, and relationships concerning curriculum (official, hidden, null), pedagogy, and assessment that are primarily structured by the institution and its representatives (Fig. 59.1).

Enrollment

The components we include in this phase of student preparation are teacher quality, curriculum, pedagogy, assessment (Capper et al., 2006), and achievement. The teacher quality indicator for SAFE is whether faculty are modeling the expectations they require of the students in leadership preparation programs for social justice. The areas of interest are research, publishing, teaching (pedagogy) (Capper et al., 2006), hidden curriculum of faculty, and their professional development (i.e., what workshops or seminars do faculty choose to attend).

Curriculum

Our definition of curriculum as all the planned and unplanned experiences that students have and that matter in their access to educational opportunity, outcomes, and processes encompasses the official curriculum, hidden curriculum, and null curriculum. In studying the program for social justice, we have focused on the hidden curriculum which we discuss later as one of the examples of studies provoked through the development and implementation of SAFE.

We view official curriculum as courses taught in the program, syllabi, and additional content used in courses and assignments that lead to knowledge (of), knowledge (how), and knowledge (to) (Apple, 2000). Knowledge of would include oppression, inequities, dominance, assimilation, exclusion/othering, and practices leaders for social justice have successfully used to address the inequities. Knowledge on how to (curriculum on skills) would include ways to disrupt the policies and processes that maintain the status quo and enable the existence of unjust institutions. Knowledge to curriculum on dispositions would engage students to analyze and critique their values and beliefs on diversity and equity for

excellence. The goal is to move students toward beliefs that inequalities in schools are unjust, unwarranted, and a function of various factors within the school and educational community and: toward a willingness to restructure organizations (McKenzie et al., 2008).

The null curriculum (Eisner, 1994) is what we do not teach, thus implying to students that this knowledge is not important in their educational experiences or in our society. According to Eisner, if we are concerned with "consequences" of our "programs" and "their role in shaping those consequences" (in our case students' knowledge, skills, and dispositions), then we should examine what faculty of a program do not teach. "Ignorance is not simply a neutral void; it has important effects on the kinds of options one is able to consider, the alternatives that one can examine, and the perspectives from which one can view a situation or problems" (Eisner, p. 97). We advance Brown's recommendation on infusing issues of equity and difference throughout the range of courses offered in the program (Brown, 2005, as cited by Capper et al., 2006).

Pedagogy

The centrality of pedagogy to social justice education has been noted (Brown, 2006; Furman & Gruenewald, 2004; Grogan, 2004). This particular component is concerned with teaching to develop the knowledge, skills, and dispositions of students. Teaching strategies recommended by Brown (2006), Hafner (2010), Young and Laible (2000), McKenzie and Scheurich (2004), and Skrla et al., (2004) are instructional approaches that we will rely on in addition to those in our repertoire. For instance, it is not uncommon for students to have assignments (some required and optional) that are framed as life histories of curriculum ideologies, asset-based portraits of communities, equity audits, and leadership or curriculum platforms in which they are asked to conduct research, take a position on an issue, plan for action, or communicate their findings with others.

Assessment

Assessment practices of the program related to enrollment concerns the knowledge, skills, and dispositions. At the conclusion of the program of study, students prepare a portfolio that faculty evaluates. The portfolio is organized around the domains featured in the state's leadership standards, and students are required to include a reflection of their leadership development in each domain and academic and practice-based artifacts they have created individually or as part of group projects. Their reflections and topics they explore in the artifacts provide us with anecdotal data on whether the value of equity has become a relevant frame of reference and guide in their development and expression of leadership. Additionally, in the Foundations of Curriculum/Instruction Course, students take a survey of curriculum ideologies, and over the last 4 years, no more than two students in a class have embraced the curriculum ideology related to social reconstructionism/social justice.

Through our studies of students' artifacts (statements of interest) and experiences (see the following section for descriptions of studies), we are better able to assess the impact of their preparation for social justice leadership on their practice in schools and understand the population we serve. We have yet to conduct systematic analyses of our courses; however, students interviewed have been able to recollect where preparation has explicitly referred to the concept of social justice, while others were able to infer how content has indirectly invoked notions of equity and justice.

Piloting SAFE: Our Experience

Students experience our program in three phases: pre-enrollment, enrollment, and post-enrollment.

Pre-enrollment

The processes under examination in this stage are recruitment, admission, and transition from admission to actual enrollment in the program. Our process mirrors the recommendations in the literature on social justice leadership preparation concerning the selection and evaluation of candidates provided by McKenzie et al. (2008) who suggest "[t]hat candidates be asked to respond to written materials on social justice and describe their leadership experiences and their attitudes and assumptions about school leadership so that faculty could evaluate their social justice orientation" (p. 121).

The importance of student selection has been raised in the literature (Capper et al., 2006; Hernandez & McKenzie, 2010; Lopez et al., 2006; McKenzie et al., 2008). There is agreement in the field on the necessity of increasing the diversity of students through "aggressive" (McKinney & Capper, 2010) recruitment and selection of students. Despite the noted importance of selection in the literature and studies conducted on leadership preparation programs with a social justice framework (e.g., Hernandez & McKenzie, 2010; McKinney & Capper, 2010; Rodriguez et al., 2010), there is little research that specifically and deliberately examines the selection of students as an institutional process that affects the movement of students from underrepresented racial/ethnic groups of color into educational leadership.

The Hidden Curriculum: In this study we focused on the department's efforts to produce policy and procedures to guide the application and selection for recommending (to the graduate school) a diverse pool of candidates for acceptance into a master's degree program of educational leadership. We (Karanxha, Agosto, & Bellara, Forthcoming) used an interpretive lens featuring constructs based in critical and sociocultural theory, the *will to policy*, and the *hidden curriculum* to examine the department's selection process in the master's degree program. We found that (1) there was a low number of applicants from underrepresented groups and (2) that the unsystematic process of applicant selection operated as *hidden curriculum* affecting the opportunities for the program to enhance meaningful candidate contact with diversity (we found that qualified women of color would have experienced the highest rate of rejection were it not for tie-breaking vote (an unplanned procedure) from one of the faculty that enabled more women of color to be admitted in the program). We define the *hidden curriculum* as teachings that are unintended, unanticipated, and/or unconscious that socialize students and contribute to the social, political, and cultural climate of educational spaces and ultimately society. It is a theoretical framework based in critical theory and useful for exploring the social functions of education. Uncovering hidden curriculum can illuminate the processes in higher education institutions that produce stratified outcomes (Margolis, Soldatenko, Acker, Gair, Peekaboo, 2001).

We initiated a process for revising the selection process and developed a rubric to score the application materials of the candidates and a prompt that would suggest to the admission committee those candidates who had a social justice inclination. By adding criteria to the selection process, we hoped to reduce arbitrariness in the process and at the same time value the candidates who voice their thinking and orientation toward social justice.

Despite the revised process, during the second selection cycle, we noted a similar trend and decided to look at the selection process longitudinally. In this study we illustrate how institutional structures disenfranchise African American women in their efforts to become educational leaders in K-12 schools through faculty negotiations of power and privilege in the policies and practices affecting candidate selection (Agosto, Karanxha, & Bellara, 2010). We analyzed the candidate selection process and faculty participation through critical race theory (CRT) praxis with a focus on racism (i.e., democratic, color-blind, dysconscious) and the principle of interest convergence/divergence. This exploratory self-case study, based on self-study methods and equity audits, used qualitative data such as field notes, narratives from conversations, experiential knowledge, memos, and descriptive statistics such as percentages and ratios to describe the disproportionate rejection of African American women applying to an educational leadership program as a factor in their underrepresentation in educational leadership. We found that African American women were rejected at a higher rate than their white counterparts when attempting to enter the educational leadership program. Their efforts to become educational leaders coincided with the difficulties faculty faced in a department of educational leadership to engage in race-conscious discourse. We concluded that departments of educational leadership need faculty who will confront race/racism and gender through race-conscious discourse in which they face and embrace risk.

Enrollment

Searching for a Needle in a Haystack: Utilizing a prompt as part of the application process to the program provided the department an opportunity to know their future students' knowledge, skills, and dispositions. As part of SAFE, we examined applicants' statements (a total of 34 statements and approximately 135 pages of text) of interest for indications of a social justice/anti-oppressive orientation (Agosto & Karanxha, 2012). The statements were submitted as part of the admission process into an educational leadership and policy studies master's degree program, while this analysis occurred after all decisions regarding their rejection and acceptance were finalized. To interpret the statements, we used Apple's (2001) description of three types of knowledge and the four approaches to anti-oppressive education that Kumashiro (2000) identified as recurring in the work of educators and educational researchers concerned with issues of oppression.

Four themes in the candidates' treatment of the writing prompt concerning their leadership in relationship to equity included ignoring, marginalizing, mentioning, and embodying a social justice orientation. Next, we centered our analysis on the few candidates who embodied an ethic of (social) justice by conducting a secondary level of analysis in order to extrapolate the knowledge, skills, and dispositions of critical literacy and gain a nuanced understanding of their leadership practice and our shared perception of what constitutes social justice leadership. We also identified five broad themes that resonate with our understandings of what social justice leadership entails: realistic hope, advocacy, culturally diverse bridge building, insistence, and multi-level critique. These themes reflect the diversity in what we understand as practices conducive to our working definition of social justice advocacy as an expression of anti-oppressive advocacy. We also recognize the absences in their statements as marginalized discourses.

We found that few applicants used terminology in their statements of interest that speak to inequities and biases: racism, sexism, classism, gender, etc. As a result, the department determined that a course on culturally relevant leadership across diverse communities would help students to understand foundational concepts that support discourses of social justice related to anti-oppressive education (racial justice, eco-justice) enacted by communities, schools, and fields of study (critical (dis)ability, curriculum studies). We also noticed that after admission in the program, some of the students either deferred enrollment or chose to not enroll due to financial reasons. Since then we have proposed that a fellowship be established to support students who face financial hardship and have indicated through their application package several of the indicators that we as a department are committed to fostering.

The Journey of Elam: In our attempts to connect with similarly-minded individuals and gain a better understanding of leadership for social justice praxis in the surrounding districts, we explored pedagogical moments of Dr. Donna Elam in her journey as a public intellectual (Karanxha, Agosto, & Elam, 2011). Using autobiographical methods, we examined critical moments in her work across contexts: conducting diversity workshops, providing professional development for principals and teachers, and leading district and regional interventions in response to court orders to racially desegregate. We focused her leadership through the lens of critical pedagogy. In the journey of Elam, we found an expression of critical social justice leadership that is inspired and empowered by the values of public service, spirituality, and humanitarianism. This autobiography contributes to our knowledge of educational leadership practiced by a Black female educator.

Traversing Educational Leadership: Our next effort as part of SAFE was to study the experiences of Black women who had graduated from or were in the latter stages of our program (Karanxha & Agosto, 2011). We were particularly interested in the curriculum and pedagogy of our educational leadership program which aims to support systemic equity through the leadership it models and encourages. Furthermore, we wanted to know how leadership preparation, when informed by the concept of social justice, supports and/or inhibits the capacity of Black women to serve as social justice leaders personally and professionally. We turned to the lived experiences of six Black women in order to learn from their stories traversing educational leadership preparation. We relied on their lived experiences and narratives of experiences that countered, contradicted, denied, and/or affirmed the program's intention to embolden students to lead toward social justice. We used CRT and critical legal theorist Derrick Bell's (1992) argument that race and racism are so deeply embedded in US society that racism is a permanent condition.

The themes from interviews suggest that (1) race/racism is present even when avoided, (2) racial and ethnic diversity is lacking (among faculty and students), and (3) racial battle fatigue from racial micro-aggressions. Thus far we have found that students perceive social justice as a value unevenly distributed across the program.

The program's lack of integration of social justice throughout its curriculum raises concerns in the program's capability to fulfill its mission and prepare students to become transformative social justice leaders. Social justice issues when discussed became a source of further divide rather than common understanding. More specifically, issues intersecting race, gender, and class were accompanied by tension and conflict in class. These discussions led to limited success in bridging difference and knowledge and resulted in very little or no change in dispositions in students who entered the program with value-neutral orientations. The stories of the Black women suggest that much unlearning is needed and that the politics of identity (student, cohort, racial) are active and contrary to the development of a learning environment conducive to learning about and practicing social justice.

Post-enrollment

During this phase, students leave the program, and we are concerned with their experiences and views of the program (via exit surveys, interviews, focus groups), postgraduate praxis (their sense of capacity and efficacy to engage in leadership for social justice, their knowledge, skills, and dispositions as reflected in actions they take (not take) when faced with injustice in their schools), career advancement (promotion, i.e., who gets hired, who gets transferred, or who gets fired), and the program's efforts to provide support for its graduates.

Teacher Leadership: In order to evaluate whether the educational leadership preparation program promotes a sense of agency and builds capacity, we interviewed women of African descent (who identify racially as Black) on how the program aided their work as teacher leaders for social justice (Agosto & Karanxha, 2012). From participants' narratives of experience, we extracted their understandings and expressions of social justice that suggest teacher leadership as described in the literature as well as those which are absent. Reflective interviews with teachers who had nearly completed or recently completed the educational leadership preparation program provided insights into our graduates' teacher leadership.

The participants recognized learning gains for self (not as discrete knowledge or sources) in their overall preparedness to lead from the disposition with which they entered. In their work they were able to operationalize and concretize abstract concepts such as advocacy and equity in their contexts. The participants were able to reflect on and recall specific instances in which lessons in the program informed their leadership practice. Furthermore, all of the participants demonstrated egalitarian values. More importantly, some found ways to express these values in their efforts to support students' learning by building relationships, marshalling resources, and breaking down barriers. Their expressions of social justice help us to understand their varied notions of the concept which according to Bogotch (2002) has "no fixed or predictable meanings" (p. 153). As societies redefine what is unacceptable, unreasonable, intolerable, or inhumane, the meanings given to the concept social justice will likely shift.

The Work Continues…

The process we have described so far has been organic and has been shaped by our context and the changes we have experienced as a department. Our next steps include a curriculum audit of the syllabi and interviewing of the faculty in the program. We have found that the process of self-assessment is continuous and that praxis of self-assessment must be done in collaboration. Furthermore, this work requires a combination of risk taking, stamina, persistence, and advocacy for all forms of justice over the long haul (Horton, 1990). Our intentional laboring to center social justice through SAFE has helped us to better articulate the tacit nature of our work, examine our sensibilities regarding equity and justice, increase the transparency of our work for colleagues and students, and model how an equity framework can help to guide leadership, preparation, and assessment toward social justice.

Educational leadership faculty hold some responsibility for developing school leaders who are prepared to aim toward social justice, forge democratic communities, attack inequitable treatment, and champion advocacy-oriented action that supports the sustainability of earth and the flourishing of lives. Ignoring the cumulative effects of past and present injustice allows systems of inequity to remain unchallenged and deprives all students, albeit differently. The challenge is to recognize where preventions have failed and respond by providing redress, remedy, and relief from the causes and cumulative effects of injustice (Agosto et al., 2010). We recommend that the field of educational leadership preparation develops a research base concerning the evaluation of leadership preparation programs that are intentional in their efforts to prepare effective leaders with a social justice ethic.

Chapter 60
Inserting Inclusivity and Social Justice into Conceptualizations of Leadership for Early Childhood: Theoretical Anchors and Postfoundational Pedagogies for Inspiring Provocations in the Field

Julie Nicholson

> *I continue to ask myself…as millions of American children suffer and even die from social neglect in one of the richest and most powerful nations in the world. How and why do we continue to walk past these children—in homeless shelters, in juvenile detention centers, in adult prisons, in multiple foster placements, in segregated and impoverished communities, on dangerous street corners in a crossfire of drugs and violence, in underfunded schools characterized by hopelessness—why aren't we so alarmed at this betrayal of the American dream and fundamental human rights that we rise in a new revolution against the forces that allow such misery and wasted human potential to exist?*
>
> —Beatrice Fennimore, 2011, p. 1—

> *Our task is not just to learn how to be a leader. It is to grapple with the complex conceptual structural and political roots of leadership aspiration and to ask ourselves what leadership is for.*
>
> —Amanda Sinclair, 2007, p. 33—

The Call for Leadership Development in Early Childhood

Public recognition is growing among diverse stakeholders that strong and sustained investments in children's first 5 years provide a public good and are essential for reversing our most intractable equity gaps in student achievement and citizens' health and well-being across the lifespan (Heckman, 2008; Reynolds, Temple, Ou, Arteaga, & White, 2011). Although this increased focus on the importance of early childhood is enormously beneficial for a profession too often undervalued and underappreciated, it is inspiring renewed concerns about the lack of a developed pipeline for leadership development, a necessity for comprehensive coordinated

systems building within the field (Goffin & Washington, 2007; Kagan & Bowman, 1997; Kagan & Neuman, 1997). This chapter aims to articulate the historical barriers that have limited leadership capacity building within the early childhood profession including the marginalizing effects resulting from the use of corporate literature to inform the field's production of the construct of leadership. Variations in more contemporary discussions of leadership are presented and highlight the field's expansion beyond traditional business models towards relational and field-oriented constructs. An argument is made that conceptualizations of leadership must continue to be expanded in order to bring visibility to the leadership activities that have too long remained in the shadows of public discourse and to keep the field's collective gaze on the expressed *purposes* of our leadership work as fighting for social justice and equity in society. Through a tripartite discussion of conceptual anchors, postmodern pedagogies, and contextualized narratives of work in the field, a window is provided into one graduate program's work to author new ideas about leadership for early childhood.

Historical Inequities in the Conceptual Production of Leadership

> *At the last meeting there was a discussion about the leadership conference and who will be attending…This has often been a topic of conversation – who are we talking about when we talk about leaders?…Many people still strongly believe that leaders are people in formal positions of authority and, in the case of some of the people in the group, people who work specifically as directors of a center…I took the opportunity to suggest that people who bring value aren't just those in power… I am not and have never been the director of a center, but believe that through my experiences and education I bring a lot to the table, and I think people would be missing out on valuable perspectives if they exclude people simply based on the position they hold…I fully understand it is hard to break away from those classic definitions and begin to embrace new ideas around leadership… there is possibly a lot of fear to redefine what a leader is.*
>
> –Mia, Child care provider—

> *In working with the senior management team I found that my style of communication and focus on program is viewed as avoiding leadership. At first I believed the expectation was that I needed not only to change my style of communication to be more businesslike, but also to change the focus of my work from program to pure administration…I believed I had to change, but that seemed to be a contradiction to my personal values regarding the field… I do not need to divert my focus from program, I need to repackage my presentations about program…delivering the key ideas and concepts without the assumption that the other executives know the work of my department…Making the work visible, compelling, and understandable is necessary.*
>
> –Olivia, Program Director—

Scholars have outlined many reasons to account for the paucity of leadership development in the profession of early childhood. Obstacles described include the lack of an agreed-upon definition of leadership, early childhood professionals' feelings of ambivalence about authority, their limited opportunities for informing policy or engaging in professional collaboration, and the field's historically low compensation rates. Additionally, low value and disrespect accorded to teacher and care provider skills in society, the absence of a professional career ladder, positioning of leadership training within institutions of higher education, and poor public perceptions of women in leadership positions are named as explicit barriers impeding leadership development within the profession (Cox, 1996; Ebbeck & Waniganayake, 2003; Morgan, 1997; Whitebook, 1997). Recognizing the import of these challenges, it is essential to articulate that traditional conceptualizations of leadership, inspired by organizational structures in corporate America, have also severely limited theorizing and discussion of leadership in early childhood. Traditional models have left a legacy with our field that "leaders" are program directors or other field roles commensurate with the highest levels of formal authority within organizations, and being on a "leadership track" means ascending a hierarchy increasingly distanced from direct service work with children and families (Ebbeck & Waniganayake). These traditional mental models of leadership are still strongly influencing the field today as reflected in national early childhood leadership institutes dedicated to "enhancing the management skills, professional orientation, and leadership capacity of early childhood *administrators*" (http://cecl.nl.edu/) and state-level quality rating and improvement systems, charged with improving the quality of early learning and care programs for children from birth to 5 years old, limiting the scope of discussion about leadership to program *directors* (www.cde.ca.gov/sp/cd/re/documents/fnlrpt2010.pdf). As developing leadership capacities within early childhood has historically been inversely correlated with direct work with children and families, an unfortunate legacy has created a false and inequitable binary between direct service work and leadership.

Traditional definitions of leadership drawn primarily from business literature—privileging individual performance, competition, certainty and decisiveness, material success, and authority "over" others—have also served to marginalize relational approaches to leadership, a preferred style among the majority of women and men who comprise the early childhood workforce, leaving their contributions unrecognized or, worse, discounted altogether (Fletcher, 1999; Hard, 2008). Advocates have long called for more recognition of the leadership skills that early childhood professionals, especially teachers and providers, develop that go unnoticed by the "acknowledged leadership," primarily administrators and policymakers, who too often have little understanding of the leadership skills developed in working directly with children and families (Hard, 2008; Whitebook, 1997). The hegemony of business discourse in defining leadership for early childhood has left an unjust historical legacy within the profession that prevents many individuals from naming and celebrating their authentic contributions as defining the work of leading and leadership.

Resisting Traditional Leadership Discourse: Expanding Boundaries and Inclusivity

A panoply of voices emerging from within the early childhood field have strived to push beyond the limitations of traditional models to define leadership as encompassing a wider range of the professional skills required for effective work with children and families. Although there is no convergence upon shared definitions of leadership in early childhood, a review of national and international publications provides evidence of the progress that has been made in freeing this construct from corporate and management orthodoxy. For example, leadership is discussed as multifaceted including every role in the profession that includes, but is not limited to, administrative positions (Hard, 2008; Kagan & Bowman, 1997; Ren-Etta-Sullivan, 2010). Different “faces” of leadership have been described including pedagogical leadership (related to innovative teaching practices in early childhood), advocacy leadership (policy/legislation, strategic thinking, and communication with stakeholder groups working on behalf of children and families), community leadership (mobilizing communities to invest in the health and welfare of children, developing coalitions, working towards “collective impact”; Kania & Kramer, 2011), conceptual leadership (having knowledge of the complex field of early childhood as a whole, thinking long term and beyond what is to what might be), and administrative leadership (Educational Leadership Project, 2013; Kagan & Bowman, 1997). Similarly, effective leadership in early childhood has been described as requiring different “wisdoms” including people wisdom, emotional wisdom, role wisdom, and resource wisdom (Henderson-Kelly & Pamphilon, 2000).

Waniganayake (2000) proposed a distributed leadership model for early childhood foregrounding leadership as participatory, decentralized, collaborative, and situated within multiple spheres of activity. This model recognizes that within organizations, there can be many leaders with specified domains of expertise and experience who enact their leadership by organizing and implementing activities to share their knowledge with others. Leaders in this model are defined as those who have access to pedagogical and practical knowledge and are skilled in reflecting upon, analyzing and collaboratively sharing this knowledge in order to empower others. Leadership develops by establishing a culture of learning with an explicit value and encouragement for promoting others’ abilities, strengths, and growth (Sarros & Butchatsky, 1996).

Ebbeck and Waniganayake (2003) discuss many “tools of a children’s champion” that early childhood leaders possess. These tools include knowing how to stay well informed on current issues, understanding relevant legislation and governance structures, and the processes of advocacy and policymaking. Leaders, they suggest, need strong communication skills and a toolbox of effective strategies for affecting change within organizations and the larger field including culturally sensitive approaches to working with multiethnic societies in diverse contexts, knowledge of negotiation strategies, and skills in strategic planning and coalition building. Inspired by Oberhuemer (2000), they also suggest that leadership in early childhood requires taking an international perspective as increasing globalization—resulting in international collaborations, partnerships, and alliances—requires a strengthened skill set in cross-cultural communication, use of information technology, and professional networking.

Using Feminist Poststructuralism, Meyerson's Metaphor of the "Tempered Radical," and Social Justice Discourse to Emancipate Discourse on "Leaders" and Focus the Purpose of Leadership Work in Early Childhood

As outlined, the field of early childhood has made substantial progress in disentangling leadership from specified positions and theorizing that all early care and education professionals have leadership capacities that can be developed and enacted within the context of their daily practice. Despite the promise of these expanded definitions, traditional models that privilege administration and formal authority continue to have wide influence in defining leadership in the profession. As a result, supporting early childhood professionals to develop as leaders involves guiding them to see how traditional models have either privileged or marginalized their professional work while simultaneously introducing them to contemporary conceptual models that are more inclusive of the diverse range of roles and leadership activities represented across our complex field. Additionally, leadership development also requires intentionality in determining as Sinclair (2007) states, "*what all this leadership is for*." Learning to lead in early childhood should become commensurate with a professional commitment to direct one's work towards an ongoing fight for equity and social justice in society. In this conceptualization, assuming particular professional roles or having authority does not ipso facto equate with leadership. Instead, whether administrator, teacher, or policy maker, one enacts leadership by working intentionally to interrupt historical inequities and to engage in work that improves justice and equity for marginalized individuals or groups and underserved communities.

Supporting early childhood professionals to reconceptualize understandings of leadership in these ways requires making visible to them who benefits and who is harmed in traditional models of leadership, introducing them to alternative views of leadership and guiding them in learning to think critically about privilege and disenfranchisement in society. Feminist poststructuralism, Meyerson's (2001) metaphor of the "tempered radical," and social justice scholarship are conceptual anchors that each provides important foundations for doing this work.

Feminist Poststructuralism and Postmodern Perspectives: Discourse, Power, and Signification

Feminist poststructuralism explicates the powerful yet often hidden relationship between knowledge production, power, and discourse in society (Blackmore, 1999; Fletcher, 1999). Poststructuralist inquiry outlines that the process of knowledge production is an exercise of power as certain voices and experiences are heard and privileged as "knowledge," while other voices representing different worldviews and experiences are discounted and marginalized (Foucault, 1980). Poststructuralist theory inspires a critical reflection on "self-evident truths," for example, in societal discussions and definitions of "leaders," "leadership," and "competence" in ways that make visible who benefits, and who is silenced, in the reified process of knowledge construction as it exists. This process reveals how the "truths" embedded within traditional conceptualizations of leadership maintain power within a small group of administrators with the highest levels of formal authority, whereas alternative models of leadership proposed by early childhood scholars—e.g., faces of leadership, tools of a child champion, and distributed leadership (Ebbeck & Waniganayake, 2003; Kagan & Bowman, 1997; Waniganayake, 2000)—challenge the inequitable marginalization of early childhood professionals' work, reclaiming it as valuable and central to definitions of leadership enactment.

Poststructuralism is also valuable for bringing attention to the process of "signification" (i.e., how individuals are named through such signifiers as "family child care provider," "policymaker," or "leader") and the highly political process in which ideology shapes the meaning and power we attach to these signifiers. Language, and the act of representing experience or signifying it, is a "powerful means of constructing an ideological worldview that furthers the interests of particular dominant groups" and sustains particular hegemonic power relationships in society (Fletcher, 1999, p. 23). This is taken up by Chappell (2010) who describes how dominant groups engage in "colonizing the minds" of non-authorized identities and voices by transferring values and beliefs through narrative structures and performances intended for their consumption (p. 11). Lukes (1974) describes this as the "unobtrusive exercise of power" where those who have been traditionally silenced begin to "internalize, accept, and give voice to dominant thinking" (Fletcher, p. 17) as seen with early childhood professionals who routinely separate their professional work from definitions of leadership.

Feminist scholars explain that naming and giving voice to one's experience is the first step in learning about domination and how it functions (Wright, 1998) and knowing one's positionality acts to galvanize individuals into action as increased self-awareness of one's positioning (i.e., inside or outside the boundaries of "leadership") inspires "moral action to enhance our subjectivity and that of others" (Monchinski, 2010, p. 131; Oliver, 2002). Thus, the bifurcated process of learning how one has been signified while also learning to give voice to one's personal experience can be a powerful catalyst for early childhood professionals in learning to critique, resist, and reauthor their positionality.

"Tempered Radicals" Instigating Change from Center Stage to the Periphery

Increasing equity in discussions of the enactment of leadership requires recognition that early childhood professionals affect change through a comprehensive continuum of tactics and strategies ranging from public pronouncements to covert actions in resistance. Meyerson's (2001) description of the "tempered radical" is useful as she defines them as “operat[ing] on a fault line…organizational insiders who contribute to and succeed in their job,” yet continuously work to insert “ideals and agendas that are somehow at odds with the dominant culture” (p. 5). Tempered radicals live with a continuous tension between conformity and rebellion, and they engage a spectrum of strategies to inspire positive change varying according to their intended scope of impact, from a few people to the provocation of large-scale learning and change, and their level of visibility, from public and pronounced to stealthy and covert. While some actions are almost invisible and, therefore, do not result in strong opposition, others manifest more publicly and incite strong resistance and disapproval. The promise of Meyerson’s continuum ranging from “resisting quietly and staying true to one’s self” to “broadening impact through negotiation,” “leveraging small wins,” and “organizing collection action” is the inclusivity in defining how individuals contribute to social change. Meyerson’s theoretical understanding of change is emergent and continuous, responsive to “little prods” that catalyze adaptation versus episodic and dramatic transformations. Her view of organizational and social change

> Makes room for lots of normal people to effect change in the course of their everyday actions and interactions. It is an inclusive model that sees people on the margin as well as the center making a different in a wide variety of ways. Change agents are not just those characterized by bold visions and strategic savvy, but also those characterized by patience, persistence, and resourcefulness. In this model, change agents are sensitive improvisers who are able to recognize and act on opportunities as they arise. This view of change and change agents is less dramatic, less inspiring and less breathless than portraits of grand transformation and revolutionary leaders. It is also more inclusive, more realistic and more hopeful for most people who care to make a difference in their worlds. (p. 13)

Meyerson’s theory also describes personal actions as the starting point for affecting change. When individuals’ actions express valued parts of themselves (e.g., their value as early childhood professionals), they materialize these aspects of who they are, reinforcing to themselves and others that they will not be silenced nor allow themselves nor their potential to be defined by the dominant culture. Taking action allows individuals with similar social identities and values to “find one another,” develop relationships, and build broader coalitions in working for change. Actions also lead individuals to feel an increased sense of efficacy, even if the difference they make must be catalogued as a “small win.” This strengthening of personal efficacy often leads to increased motivation to look for opportunities to act. Meyerson’s conceptualization of leadership as embodying a continuum of strategies for change provides an inclusive space where the contributions from a range of early childhood professionals working across diverse sectors and wide-ranging roles can be named and celebrated as leadership.

Social Justice in Early Childhood Education: Amplifying a Discourse

Social justice has been defined variably as beliefs that focus on care, justice, respect, and equity issues (Marshall & Olivia, 2006), having self-knowledge as well as deep appreciation and understanding for others’ viewpoints, perspectives, opportunities

(Darling-Hammond, French, & Garcia-Lopez, 2002), and fairness (Rawls, 1971) and working for “what we believe ought to be” (Greene, 1998, p. xxix). Inserting social justice front and center into our discussions of leadership in early childhood ushers in an urgency a collective focus that points a spotlight on inequalities that demands attention, action, and active imagination from all who work within the early childhood profession. Social justice discourse acts to break the silence of unspoken dialogues by commanding forward “courageous conversations” that require collective engagement, speaking truths, experiencing discomfort, and expecting and accepting non-closure (Singleton & Linton, 2006) in a continuous struggle to focus on and improve the life circumstances for “those who have the least and those whose rights and entitlements are being ignored or violated” (Fennimore, 2011, p. 4). Thus, foregrounding social justice transfixes an unwavering focus on major structural inequalities while maintaining an unrelenting goal of transformation (Van Hoorn & Levin, 2011).

Social justice frameworks influence a bold line of questioning for the field including:

- When defining what we mean by “leaders” and “leadership”; whose skills, knowledge, and capacities are made visible and celebrated; and, inversely, who is left unacknowledged, in the margins, and silenced in these definitions?
- When working on behalf of children and families, whose cultural values and beliefs are shaping the discussions? How are these values and beliefs similar or distinct from those who are being represented and influenced by these discourses and actions?
- Who is missing from decision-making tables? What actions are being taken to increase diversity of perspectives and participants in policy and decision-making?
- How are children and families empowered or disenfranchised by particular programs, policies, legislation, and research projects? What steps must be taken to disrupt and reverse the process of those that are suffering?

By asking such questions and placing social justice as a central value in conceptualizations of leadership, we actuate agendas that otherwise remain unnoticed or hidden and, through work avoidance or lack of courage, neglected. Leadership that works from a social justice agenda inserts a human rights discourse when discussions of the value of early care and education are singularly framed by instrumentalist cost-benefit discourse recognizing that children are “rights bearers” and that public investment in children’s health, education, and well-being is a human right validated in international human rights conventions. Leadership within a social justice framework increases awareness of the mechanisms of oppression—including racism, sexism, classism, ableism, heterosexism, linguistic privilege, and religious discrimination—and how they persevere in programs, organizations, and within society while simultaneously expanding knowledge of the resources and strategies that can be drawn upon to disrupt these realities. Valerie Polakow’s decades of field research exemplifies both of these aspects of social justice-oriented leadership in the field of early childhood. By documenting how poor women (and their children) routinely have their rights violated through inequitable policies that prevent them from accessing child care, post-secondary education, and welfare subsidies, she has used her research to leverage positive changes to better protect and support single impoverished women and their young vulnerable children (Polakow, 2007, 2011; Polakow, Butler, Deprez, & Kahn, 2004). Leadership work in this sprit, emphasizing the advancement of equity and social justice for children, families, and communities, must become the central focus of a reconceptualized definition of leadership for our profession. It is not enough to move definitions beyond particular roles and formal authority; we must be able to answer what all of our collective leadership is for.

Conceptual Anchors for a Reconceptualized Leadership

Early childhood professionals must learn to work within systems as they exist while also strengthening their ability to successfully resist, reimagine, and reassemble these systems in ways that are more equitable and just. This process can be advanced by inserting discourses rooted in frameworks of social justice and postmodern epistemology that value courageous questioning, the process of destabilizing dominant discourses and recognition of a continuum of options for accomplishing social change. To become effective change agents, early childhood professionals must gain knowledge of the complex systems that comprise the profession in which they work and be supported to discover how individuals and groups (e.g., child care providers, preschool teachers, administrators, policymakers, low-income families, and children) are politically positioned within these systems. Most importantly, they must gain tools and strategies they can use in authoring or materializing (Davies, 2000) disenfranchised individuals and groups into more equitable futures. Thus, central to social justice-oriented leadership education is first learning to see how deficit discourse has been historically used to marginalize and oppress individuals, families, and communities and then learning how to interrupt and replace inequitable signification with capacity-framed discourse that emancipates work from the margins.

Scaffolding Leadership Development: Postfoundational Pedagogies to Inspire Transformation

There are multiple layers of complexity involved in working to empower early childhood professionals, so they take risks to insert their voices, bodies, and lived experiences into new arenas while also making visible for them the challenges and resistance they will face in attempting to reframe leadership towards inclusivity, equity, and social justice for the field. The next section introduces a sampling of pedagogical strategies that I have used to accomplish these goals with graduate students enrolled in an early childhood leadership program designed for full-time working professionals in ECE situated within an American institution of higher education. These pedagogies were created to scaffold students in learning to increase their perceptions of themselves as leaders, to expand their enactment of leadership actions in a wide range of professional contexts, and to strengthen their focus on becoming leaders for social justice.

Re-performances of Statewide Policy and Other ECE-Related Organizational Meetings

Practitioners learning to insert their voices into federal-, state-, and local-level policy meetings face a context where the discourses used, the participation formats allowed, and the political alignments among "players" are unfamiliar and often intimidating. Teaching students about the mechanics of these meetings (where they take place, the names and roles of the participants, translation of acronyms) is a necessary but not sufficient curriculum to prepare them for active participation. A critical first step is teaching them to understand and analyze how the production of knowledge unfolds in these meetings, a foundation necessary before they can engage in "sous rature," Derrida's (1976) idea of going "under erasure" where taken-for-granted readings of the world (e.g., the absence of teacher or child care providers' voices in policy discussions) can be crossed out, displaced, and thought differently (Lenz Taguchi, 2008). I have found that re-performing and "textualizing" these meetings in class in a manner that allows for simultaneous "freezing" of particular interactions for deconstructive analysis, the students are provided with valuable texts for analyzing the various ways in which language and other forms of representation (e.g., nonverbal cues, text, graphics, and/or auditory input) mediate the relationship between power and knowledge construction.

Stakeholder Presentations

This activity engages early childhood professionals in advocating for a change they think is "worth fighting for" in front of their colleagues who are role-playing specific stakeholders (e.g., school board, legislators, state-level policy commission members) holding the decision-making power to enact these policy changes. Designed as a "practice run" in learning as they prepare to expand their voices into public arenas, this activity is inspired by performance theory (Butler, 1993; Schechner, 2002) and Chappell's discussions of "embodiment" in cultural performances as a process for socializing specific identities. In these performances, power is enacted through "physicalization" as students consciously "embody" a character (or themselves as character) with that character's "controlling knowledge, beliefs and values" (p. 8). For in "*becoming* the other—in a limited capacity and for an isolated period of time—the performer learns what it is to be the other, and makes choices about his or her identity-in-role" (Aristotle, 1989; Chappell, 2010, p. 5). For example, in speaking behind the microphone as both expert presenters on a variety of current topics central to their field (e.g., state and federal budgets, quality rating and improvement systems, aligning preK-3rd grade curriculum within public school systems) and key stakeholders (e.g., school board members, city supervisors, state legislators, business executives, philanthropic donors), students are offered a safe place to practice inserting their voices in new formats before taking risks to do so in a more public, and authentic, arena. This experience provides students with discursive space to rewrite normalized dominant meanings (who sits at these tables) destabilizing their further omission and allowing them to "embody a future self" who inserts their voice into a variety of stakeholder meetings.

Leadership Interview Project

Students complete two brief interviews with individuals that they perceived to be leaders: one working within the field of early childhood and one employed in a different disciplinary context (e.g., nursing, business, medicine, law, engineering, prison reform). They develop a range of questions (e.g., what has been the biggest obstacle/challenge to your leadership development and how did you overcome this challenge? What successful strategies have you used to mobilize people in your organization or to build coalitions?). A digital wiki page (www.pbworks.com) provides a context for sharing the data with students and interviewees and invites reflection on the aggregated findings. This project was developed in order to help the students see a wider range of "truths" about leaders and leadership that are too often masked by the traditional discourse. By collecting and analyzing a diverse array of personal stories from many individuals about their experiences with leadership, students considered what Sinclair (2007) describes as the "critical alternatives to dominant accounts of leadership."

Audio Perspectives

This assignment highlights the sensory insertion of "voice" into the classroom space by using 2 min audio-recorded self-reflections where the students described what they had learned about leadership over the course of a year. These audio recordings are played back to back for everyone in class to listen to and discuss, and I use them to inspire a deconstructive critique about the personal act of "doing leadership" (Sinclair, 2007) in early childhood. Use of the digital format is an intentionally political choice to challenge the privileging of text-based constructions of knowledge, instead, giving space for "new literacies" in the classroom (Leu, O'Byrne, Zawilinski, McVerry, & Everett-Cacopardo, 2009).

Rhizoanalysis: Exploring the Politics of Discourses of Power

Rhizoanalysis (Deleuze & Guattari, 1987; MacNaughton, 2005) is a method that employs intertextuality, linking a target text with others, to produce new meanings and to challenge the politics of the dominant ideology reflected in the target text.

Authoring Leadership Inclusively and Learning to See Leadership as Enacted for Social Justice: Self-Discoveries and Reverberations in the Field

I now turn to descriptions of the early childhood professionals' engagement with these pedagogies and selected stories of the ripples and reverberations their increasing participation and leadership actions initiated within the field. All of the early childhood professionals represented in these stories were enrolled in the leadership program between May 2009 and June 2011. Students in this program represented the diversity in the childhood workforce; 89 % were female, 50 % identified as students of color, 1/3 were multilingual, approximately 60 % were first-generation college attendees, and 75 % were the first in their families to attend graduate school. Abbreviated portals are offered into the dynamic-evolving artistry of their leadership development (Austen, 2010) as they made self-discoveries, managed tensions, and learned to engage in creative resistance in authoring new understandings of leadership.

Self-Discoveries

When discursive spaces were created for these professionals to unpack, trouble, and reformulate concepts of leadership and their personal relationship to the act of leading, they made important personal discoveries. Eva, a family child care director, explains in her audio perspective how her increased knowledge of the field and the inclusive approach to leadership she learned about in class led to "finding her voice" and inserting it in new contexts within the field including her attendance at policy meetings, engagement with her congressional representative, and discussions with the local health department in "problematizing" the required use of bleach due to its toxic health effects for family child care providers, an action that led the health department to a change in policy for providers across the large urban city in which she practices.

> The leadership class confirmed me, a family child care provider as a leader, and helped me find my voice. I know the importance of taking a stand and being heard and seen in early care. I count! My voice counts! I must lead and guide others to this realization, helping and assisting them to find their voices. I now know what most of those ECE acronyms mean and why political bills are important and how they come about. Since participating in this program, I have attended and understood more policy meetings, for the first time I have written a letter to an Assemblywoman, and agreed to be an active member of the Family Child Care Association. I now understand and have shown the power of quiet resistance and leveraging small wins when challenging the use of bleach in an ECE setting.

Michelle describes her experience of learning to speak back to the dominant discourses in society that were acting to narrowly define the "performance of leadership" reified through consumption, expensive clothing and cars, and particular expressions of "authority" behaviors. In destabilizing this assumed reality about leadership, she was able to "walk the fault line" (Meyerson, 2001), appropriating the rules of the dominant game while also troubling it through her own actions to interrupt the process of her disappearance and to consciously work on being seen.

> In my leadership role, it is expected of me to "show that I am the boss". I must dress the part (hence, my white button down) and to behave with authority….During many evaluations, I was told that I was unprofessional, had no personality or seemed cold….It was appalling to think that I was being judged based on the way I "looked" instead of evaluated on my work practices. There are times when I feel pressured by my organization to be the leader they want me to be. To always smile, say the right thing or even wear the right pair of shoes… Do I have to wear this mask and teach my staff to do the same?…I have taken off the mask. I have taken chances, [taken] control and have created an environment that *sees* me. I am no longer invisible. I have learned to play the game and be the person they want me to be without losing my identity. I stand with many hats and have learned to use them wisely.

Other individuals discovered narratives circulating within their organizations that made visible to them how they were being signified, and their professional skills, knowledge, and contributions represented in ways that sustained inequitable power relationships. As Kristen explains, this recognition inspired her to disrupt the process of being represented by others by repositioning herself as a subject and re-signifying the associations of power attached to her professional work.

> At [my organization], there is a story told over again about how the child care work is not as valid as the [other] work. Both sides fuel this theory due to the fact that, although sustainable, the child care work doesn't raise much unrestricted revenue. The [other] department has the ability to raise revenue to sustain salaries… Many times child care is ahead…in terms of innovative programs….I began talking with my manager about the need to tell our positive stories over and over until [the organization] understands our work. My manager asked me to report…at the next meeting. As I reported, colleagues learned things about my programs they had never heard before. A shift was created as [the organization] began to recognize our strengths and how important the child care work is. Even if it doesn't generate revenue, it generates practical applications and understanding of direct community work. In addition, I now have a direct relationship with other staff [in the organization] and can talk with them about the exciting work we are doing, thereby increasing our positive stories and importance.

As Lenz Taguchi (2008) describes, poststructurally inspired teacher education repositions the learner's personal narratives as central to their educational process as students do not arrive with an "empty toolbox needing to be filled with educational theories and methods, but rather with a toolbox *already filled* (and continuously filling itself), with tools needing to be unpacked, investigated, and reformulated" (p. 55). As with Monica below, many classmates learned to listen to their own stories as essential material for their professional growth and, in this case, their leadership development.

> I had never imagined that I would use my own life, upbringing, development, current work, parenting styles and knowledge of the field to inform my personal leadership development. I always assumed that your style of leadership was based primarily on the "way things have always been done", textbook theories of child development, traditional notions of teacher directed activities and the status quo.

Traditional hierarchical discourses were challenged as early childhood professionals deconstructed the construct of leadership. Laurel, a Head Start Family Advocate, expresses how she came to challenge hierarchical "masculine" models of leadership that privileged "profits" and "quick results" as out of alignment with the early childhood profession. In juxtaposing these competing narratives of enacting leadership, she was able to rethink the process of improving her leadership by recasting leadership actions through a relational lens.

> I have started to realize that a leader in early childhood education is different than a leader in business. A businessman can show a profit with direct and powerful numbers in three to six months. However, a leader in early childhood education cannot provide any profit in a short period of time….The development of a human relationship is a very important issue in the ECE field….my first year at Head Start there was low parent attendance and I thought I could get more participation by making the monthly workshops and meetings mandatory. After I finished many readings, I started to rethink how I could improve my leadership in order to increase the parents' attendance and one way was to spend the year developing relationships with the families…. As a result, my parent workshop attendance has gone up. Based on my position and leadership level, I have realized that providing love and care is the essential way to develop leadership with the Head Start parents. Developing a relationship needs time.

And these professionals learned that inserting their voices into decision-making circles with a goal to inspire change did not require them to be in positions of authority. In the following example, Haley juxtaposes the lack of formal authority she was perceived to have (as a preschool teacher) with her ability to insert her voice and to make visible an unspoken dialogue within the local policy council where she volunteers.

> One practice that I am trying….is leading without authority…I teach preschool and have an untitled part-time position with Head Start. Another new practice for me has been addressing work avoidance. When work is controversial or threatening, people tend to avoid it. Dual language learner work is both controversial and threatening. It was clear to me that our group would need to acknowledge that we are initiating a movement that will be politically contentious. We need to prepare ourselves for what is to come. When I did not hear this message from the group members, even though they have more experience in this area and more formal authority, I chose raise the issue. Though some people were not yet ready

> to acknowledge the barriers we will face in this work, others were. By raising the issue, I developed allies in addressing work avoidance. Not all of my attempts to try out new practices have been successful, but I will continue to try and continue to learn.

Rhizoanalysis supported early childhood professionals to engage in a political critique of the production of power as belonging only to a limited group in positions of authority who reify values of individualism and marketplace competition. Through intertextual analysis, power was held up for critical analysis. To begin, students read an excerpt from Pfeffer's (2010) book, "*Power*: *Why Some People Have It and Others Don't*," reflecting dominant views of power where world is a "tough system" that requires "survival skills" and individuals must know the rules to succeed. Below is an excerpt from the introduction.

> "Jeffrey, it's a tough world out there," Beth said. "People take credit for the work of others. People mostly look out for their own careers, often at the expense of the place where they work. The self-promoters get rewarded…I guess I haven't been willing to be mean enough or calculating enough or to sacrifice things I believed in order to be successful."…Jeffrey responds, "So welcome to the real world—not necessarily the world we want, but the world that exists. It *can* be a tough world out there and building and using power are useful organizational survival skills…rivalry is intense and only getting more so…Some of the individuals competing for advancement bend the rules of fair play or ignore them completely. Don't complain about this or wish the world were different. You can compete…if you understand the principles of power and are willing to use them. Your task is to know how to prevail in the political battles you will face. My job in this book is to tell you how."

After reading this text, the students worked in small groups to link it with ideas gleaned from feminist poststructural discussions of power (e.g., MacNaughton's *Journeys to Activism: Becoming Poststructurally Reflective About Truth* and Sinclair's *Journey Around Leadership*). Using the tools of rhizoanalytic thought, early childhood professionals were able to explore the politics of the various texts by exploring how each one "organizes meanings and power" (MacNaughton, 2005, p. 210). For example, they analyzed the ethical consequences of different definitions of power, whose interests were being served in each conceptualization, the role of doubt and uncertainty in these definitions, and learning to "see" what was concealed and asking, "why is that so?" As the assumptions of power within the dominant [Pfeffer's] text were made increasingly visible to them, they came to see how they, as early childhood professionals, were too often positioned *outside* of the boundaries of power in this social production of it. In working to resist and even reject this inequitable signifying of their potential, discursive spaces were created for them to argue back to the assumptions underlying the dominant discourse. They used their personal experiences and the feminist readings to inspire their spoken and written responses. One individual wrote, "One versus many. Shared vision. Which is stronger? Who will get more done?" Another began with a quotation from Pfeffer, "It's stated that managers primarily concerned with power are the most effective in accomplishing their jobs" and followed this truth with a set of provocative questions, "But what is the bigger picture of the organization, the other people? What are the larger implications of this kind of behavior outside of short-term results?" Still another wrote across the bottom of the poster, "I DON'T WANT TO PLAY YOUR GAME!" Several wrote short statements of discontent, "Moral Leadership does not equal controlling and manipulating others" and "Personal success and gratification is not a reason for leading." Finally, one professional wrote with intensity, [quoting from Pfeffer] "Don't complain about this or wish the world was different." "WHY??? Why can't I complain AND make this world different? Can we be politically savvy and not manipulative to others and invite collaboration?"

This process supported students in learning to disrupt reified and inequitable definitions of power and leadership as accessible to only a privileged few who are willing to sacrifice their personal beliefs and integrity in the process. Blackmore's (1999) discussion of power as the ability to act with others and support them in doing things, Fletcher's research into the power of relational leading, and Sinclair's (2007) continuum with high and low voice strategies for exercising power and leadership provided them with critical alternatives for exploring the politics of the dominant views of power that too often marginalize early childhood professionals. Reframing power through these lenses allowed several students to stop from "disidentifying" (O'Loughlin, 2001) themselves with dominant discussions of power and to imagine themselves as relating to power and authority in ways that aligned with their personal values and beliefs. In their final reflections after this activity, several students described the importance of power being used to "empower others," "create spaces for collaboration," "not needing to know all the answers to have power," and "leadership and power [being] shared and…fostered within *and* between individuals." This rhizomatic analysis inspired freedom for these early childhood professionals to see power as accessible and dynamic and developing through relationships.

The leadership interview project was a very effective format for helping early childhood professionals to see that their capacities and vulnerabilities were similar to individuals they perceived to be leaders in the community. Aggregating the interview data and analyzing it for the emergence of common themes allowed them to discover that journeys to leadership were human endeavors that entailed the full continuum of emotions and vulnerabilities reflected in any learning continuum. Permeating the construct of leadership with human narratives of realism allowed individuals to contest metanarratives in society that project leaders as invulnerable beings with all the answers. As Jonake remarked, "It was noticed that the leaders in their early stages of leadership felt the lack of self esteem, had a fear of speaking in public, but with time and practice, gained confidence." Rebecca learned that "leaders do not necessarily have all the answers nor do they need to be the front runners in all that they do," and Talia explained that her reading of the data suggested the importance of "accept[ing] ourselves and recogniz[ing] our shortcomings, so that we can use our strength to move forward without false pretense or apology for who we are." Naomi explains how looking at the data for this project helped her to challenge the dominant mental models that equate leadership as exclusively the domain of individuals with certain traits.

> [I learned about] some attributes I had never considered as "leadership" qualities…"striving for diversity" and "making sure all voices are heard". I really liked that she [my interviewee] framed them as important qualities of leadership…we are so accustomed to hearing leadership framed in terms of personal attributes—not as part of a collective whole. It made me notice my default mental model—and awareness is the first step to making change.

The leadership interview project supported early childhood professionals in learning to view leadership as a relational, dynamically constituted construct inclusive of their various roles and the diverse ways that leaders inspire positive change in their professional work.

Focusing Leadership on Equity and Social Justice

Examination of the complex relationships between discourse, power, privilege, and oppression in society inspired professionals to focus their leadership efforts on addressing pressing social justice issues within their work. For example, Petra used courageous questioning and the act of naming silenced dialogues (Delpit, 1995) to create ripples of change within her large urban city's discussions of quality in early childhood settings. Multiple stakeholders and agencies were involved in developing a quality improvement system to expressly improve the level of quality in child care centers and preschools across the large urban city where she worked. Ironically, the child care centers rated consistently as the lowest in quality were also the *least* likely to receive targeted quality improvement funding and resources as centers needed to receive a certain score to quality for the improvement program. Petra began to repeatedly raise for public scrutiny that fact that the quality improvement system, as it was being developed and implemented, was serving to reinforce, not ameliorate the marginalization of children living in the city's most underserved communities. By repeatedly pointing out the structural inequality built into this system, Petra was insisting that policymakers consider who was gaining and who was being harmed in the system as it was being implemented. Petra's work to insert an ethic of social justice into policy discussions took tremendous courage and often left her feeling frustrated by the lack of public will to examine how racism and classism was being reinforced in the city's emerging quality improvement system. Petra maintained her persistence in enacting her leadership for justice by drawing on the comprehensive continuum of tactics and strategies available to a tempered radical at work. At times she worked covertly to subtly shift discourse within stakeholder meetings while other strategies were more public and broad based as reflected in her decision to create and facilitate a "quality committee" allowing a space for stakeholders from across the city to engage in long-term discussions about what it meant to "increase quality" in early childhood settings.

Another example of leadership enacted for social justice is seen with Patrick whose goal was to create a welcoming and inclusive environment for lesbian, gay, bisexual, and transgender (LGBT) families in the child development center where he worked. Using a human rights discourse, the right that all children have to feel safe and respected in their school community and that family is a foundational element informing children's identity and sense of security in the world, Patrick worked to insert a value within his organization for respecting the human variation in family structures including all of the LGBT families enrolled at his center. Recognizing the profound impact that professional development devoted to this topic could have for shifting beliefs and practices within the wider field, Patrick decided to use his strengthened knowledge of advocacy to inform a presentation for the board of directors overseeing the large management company responsible for administration of his center. He passionately spoke to the board about the importance of creating high-quality early learning environments for young children and the connection between quality and inclusivity. In response, the board provided Patrick with funding to facilitate workshops for 500 employees within the organization, including board members, administrators, teachers, and teachers' assistants, on using a curriculum titled, "Making Room in the Circle – LGBTQ" designed to create early learning contexts that support, welcome, and respect LGBT families. As a result, Patrick spent a year providing weekend workshops for directors knowing that they would each return to their centers with an expanded repertoire of resources and strategies for interrupting the disenfranchisement of LGBT families. Patrick's leadership sought to shift LGBT families' personal narratives and experiences from the shadows into the center of public discourse being circulated within early learning classrooms as part of a larger project in valuing and normalizing human diversities.

Ethan, having previously worked as preschool teacher and preschool director and now working exclusively within a policy arena, worked to reverse the silencing of practitioner voices in the very policy conversations that could be greatly informed by their knowledge and perspectives. His realizations about the chasm between providers and policymakers led him to resist and realign these inequities within his organization. Significantly, he proposed and enacted important changes in the policy meetings he organized to make them more inclusive of early childhood professionals including physically arranging the room for more collaborative dialogue, translating the acronyms used, and adding index cards for participants to insert their questions and comments and voices directly into the conversation. Ethan also began to question the underlying power distribution in the policymaking process. He began to talk about a "learning gap" that had to be bridged by practitioners *and* policymakers.

> [there is a] 'learning gap' that needs to be bridged before practitioners are able to participate fully. This gap exists amongst both providers and the local planning councils [policymakers]…For practitioners, an understanding of ECE funding and programs, state and city budgets and policy, and ECE acronyms, are necessary tools for them to have in order to become involved in a meaningful way. This information needs to be made readily available and offered to providers regularly and freely, in a straightforward, accessible way…It is important for council members to recognize that it may be the way that discussions are actually being framed at the meetings that makes issues like these inaccessible to providers. For the planning council members, knowledge is gained by directly hearing from the practitioners themselves, and learning and understanding more about the impact that policy, planning, and budget issues and decisions have on direct service providers, and the children and families they work with.

Ethan also challenged the assumption that making policy meetings "accessible" to early childhood professionals, that is, holding them during evening hours, finding ways to advertise these meetings to provider groups, was an equitable distribution of power. He contested the idea that simply having early childhood professionals physically present at the meetings equated to their meaningful inclusion “at the table” where decisions are made that ultimately impact their daily work. In this way, he called for an examination of the system as it existed, a system that has historically left providers’ voices in silence.

> I have shifted my belief that engaging practitioners only involves making it possible for them to physically attend and participate in the local planning council and other citywide ECE meetings. It may be more useful and appropriate to determine new and innovative methods to get important ECE updates and information to practitioners in their own programs, homes and communities, and alternative means to encourage input and feedback, rather than focus mainly on how to increase their attendance at meetings…the local planning council, and me as staff to that body, needs to establish meaningful links and relationships with citywide associations and neighborhood groups for providers, through which a means of providing information in both directions can be established…and this information should be prioritized and filtered to include those issues most relevant to the lives and work of the practitioners themselves.

In a final example, Deborah, who worked at a child development center on a large college campus, used her increased knowledge of the intersection of discourse and power to interrupt the language used by college officials to signify her staff as “nursery aides.” Contesting the manner in which her staff was being marginalized, Deborah persisted in advocating that the employees at her center be signified in all formal documentation and informal communication with discourse that accurately represented their professionalism “teachers” and “educators.” She used this “small win” as a leverage point for negotiating a 30 % increase in their compensation rates. Deborah also worked to raise the visibility of the work unfolding at her center by working with her staff to apply for a very prestigious national diversity award, an honor that her center received. Her unflappable persistence in pointing a spotlight on the conditions requiring critique and transformation was critical. Not only did she instigate changes that reinforced public messages of respect and recognition of early childhood as a profession, she also inspired her classmates and colleagues to believe in the power of personal agency to bring about social change within large, seemingly intractable, institutions.

Emancipating Conceptualizations of Leadership for Early Childhood

> *Tempered radicals inspire change. Yet their leadership resides equally in their capacity to inspire people. They inspire by having courage to tell the truth even when it’s difficult to do so and by having the conviction to stay engaged in tough conversations. They inspire by demonstrating the commitment to stay focused on their larger ideals even when they suffer consequences or get little recognition for doing so. Their leadership does not rely on inspiring through periodic heroism and headlines. Their leadership inspires—and matters—in big and small ways every day.*
>
> —Debra Meyerson, 2001, pp. 175–176—

The need for leadership development in early childhood is growing as future systems building will require individuals who deeply understand the complexities in designing facilities, programs, research, and policies that are responsive to the increasingly diverse needs of children and families in our nation today. Developing a new generation of leaders who emerge from, and represent, the field requires that we author new concepts of leadership reflective of the "human capacities widely distributed" within our profession (Hemley & Carini, 2000), an important step in increasing public awareness, value, and respect for the complexities of early childhood work. It is essential that we continue to disrupt traditional corporate discourse from framing our conversations and recognize the diverse spectrum of leadership actions taken from the center to the periphery of our field. In acts of silent resistance, speaking truths, asking courageous questions, sharing information and resources, building coalitions, administrating programs, and intentionally subverting dominant, and inequitable, discourses, early childhood professionals are expressing their leadership in covert and bold fashion. Expanding conceptualizations of leadership cannot stop at expounding its diversity. As a field we must collectively examine our purposes for leadership and combine the courage to make visible structural inequalities with actions that destabilize, reimagine, and transform possibilities for a more equitable and just future—intentionally, passionately, every day, resolute with hope.

Chapter 61
At the Intersections of Black and White: Defining Social Justice from Different Perspectives

Gretchen Givens Generett, Jill A. Perry, and James E. Henderson

The Context

After a unanimous vote by the University Council of Educational Administration's Executive Committee, Duquesne University's proposal to establish its own UCEA Center for Educational Leadership and Social Justice was accepted in February 2009. The University Council for Educational Administration (UCEA) is an international consortium of over 80 prestigious research universities committed to advancing the preparation and practice of educational leaders for the benefit of children, schools, and society. UCEA, as a consortium, symbolizes an important aspiration—advancing significantly the field of educational leadership through interinstitutional cooperation, communication, and contribution.

When UCEA selected the Duquesne University to house the UCEA Center, it became one of only eight UCEA centers in the world. The center is uniquely positioned at Duquesne in that the founders and owners of the University, the congregation of the Holy Spirit, have an expressed imperative to make themselves "the advocates, the supporters, and the defenders of the weak and the little ones against all who oppress them," and whose University mission is "to serve God by serving students."

The primary focus of the UCEA Center for Educational Leadership and Social Justice at Duquesne University is to investigate the relationship between educational

leadership and social justice. The School of Education faculty, with the support and encouragement of Dean Olga Welch and Dr. Rick McCown, then Chair of the Department of Educational Foundations and Leadership, proposed to investigate the relationship between educational leadership and social justice critically, comprehensively, and collaboratively.

Critical investigation of the relationship means rigorous interrogation of the assumptions that underlie the practice of educational leadership and the formation of educational leaders who take action in their own lives and in cooperation with others to effect positive social change. Comprehensive investigation per their thinking means investigating the relationship within and across the complex contexts in which educational leaders practice and are formed, the theoretical and empirical antecedents that operate in those contexts, and the theoretical and empirical consequences of practical efforts to identify and resolve issues of social justice. Similarly, collaborative investigation means investigations that include and address practitioners, researchers, and policy makers from diverse scholastic, academic, community, and government institutions. These are matters that have relevance for educational leaders, aspiring leaders, and those who prepare them around the world.

The first director of the UCEA Center for Educational Leadership and Social Justice was James E. Henderson, a professor in the Department of Educational Foundations and Leadership, former Dean of the School of Education and Director of the Interdisciplinary Doctorate in Educational Leadership. During the 2010–2011 academic year, he invited Gretchen Givens Generett, a colleague from the same department to join him as codirector of the center. This chapter explores the manner in which individual narratives and lived experiences have shaped how two academics understand social justice and, subsequently, how they collaborate professionally to engage the ways in which social justice frames educational leadership preparation and practice. Jim is a white male raised in the North who came of age during the 60s as a first-generation college student from a steel town working class family. Gretchen is an African American female who was raised in the South and was part of the first generation to benefit from the Civil Rights movement of the 1960s. As they came together to codirect the University Council of Educational Administration Center for Educational Leadership and Social Justice at Duquesne University, each recognized that, while different, their understandings of social justice have been shaped largely by their racial, ethnic, and socioeconomic experiences and by the modeling of those closest to them. As a result, Jim and Gretchen have worked together to bring the richness of their experiences to benefit the goals and missions of the center. Interviewed by and cowritten with Dr. Jill Perry, this chapter demonstrates the importance of perspective and framing, not only in an individual's understandings of social justice but also their role of each in teaching about social justice to future educational leaders. Connecting similar themes in two very different life histories, this chapter argues for educational leaders to seek out dialogical relationships that push their own understandings of social justice in action.

Bill Moyers, an American journalist and public commentator, served as White House Press Secretary in the Johnson administration. Moyers had an extensive involvement with public television, producing documentaries and news journal programs. He won numerous awards and honorary degrees. He became well known as an incisive critic of the US media. Additionally, Moyers was the President of the Schumann Center for Media and Democracy. Moyers once famously opined that, “Talking with people who agree with you is like jogging in a cul-de-sac.”

The constituents of the UCEA Center for Educational Leadership and Social Justice believe that it is vital to communicate and collaborate across *all* cultural, gender, racial, and other chasms of difference that would serve to divide rather than unite. From that perspective and from a common bond of wanting to enhance learning experiences and outcomes for *all* students, Gretchen Generett and Jim Henderson have attempted to model the sharing they want to encourage in their own students and with their own peers. Effective communication leads to understanding, effective communication leads to trust, and effective communication leads to action. All three imperatives—understanding, trust and action—are necessary if the UCEA Center for Educational Leadership and Social Justice is to realize its Mission “to advance equity and excellence on behalf of young people, especially those who have been marginalized, mistreated, and neglected.” We believe it can be accomplished.

The Changing Same: Connections Across Difference

When Gretchen and Jim invited me to participate in this project, I had no idea how we would write the story of two seemingly opposite members of our faculty coming together to build a center that serves as the hub for merging leadership and social justice. I’ll admit, as a new member to the faculty, I didn’t fully understand why Jim was the first director nor how he had selected Gretchen to codirect. What I did understand was that this was an opportunity, so I agreed.

This chapter is a classic example of judging a book by its cover and then upon reading it anyway, finding the story is a keeper for generations to come. As I interviewed Gretchen and Jim, I found myself engrossed not only in their individual narratives but also the immediate overlapping and intertwining of their stories. Several common themes—self as “different,” the role of family, and education as escape—emerged from their individual narratives and brought them together in similar personal missions and work that will frame the mission of the UCEA Center for Educational Leadership and Social Justice.

As young people, both Gretchen and Jim were aware that they were different from their peers. They were each sensitive to racial and socioeconomic injustices and were inclined towards kindness and the helping of others. In each of their stories, they identify their families and upbringing as primary influences on their worldview. Each of their families was close knit and they both identify key family members who modeled equity, as simply as treating all people with human dignity, in their everyday lives. As a result, both Gretchen and Jim developed a self-concept that places them as part of a larger community rather than as lone individuals. Another part of both Gretchen and Jim’s self-concept was an identification with the “have-nots” as each were raised in loving but economically challenged circumstances. As a result, they both identify education as a means of “getting out” or advancing both their own and their families’ situations.

This chapter is set up as a conversation between Gretchen and Jim. Together, they explore each of these key themes and how they shaped their understanding of social justice and, ultimately, crafted their goals for the UCEA Center for Educational Leadership and Social Justice at Duquesne University.

Equity and Excellence

Jim: I had the good fortune to attend in 1987, as part of the Pennsylvania delegation, the National Youth At-Risk Conference in Arlington keynoted by then-Governor Bill Clinton. The speaker who made the most impact on me, though, was a 7th grader from Thomas Jefferson Junior High School who opened the first general session by asserting to that group of educational and policy "experts": "Ladies and Gentlemen, You are in trouble." He went on to explain: "How would you like to spend your retirement years in a country run by dropouts?" I think that question is very much aligned with Dr. Martin Luther King, Jr.'s famous quotation, "We may have all come on different ships, but we're in the same boat now." Without devolving into the political rhetoric of "No Child Left Behind," we do have choices about where we place our priorities, dollars, and focus as a nation and as states and communities. Actions (or inactions), though, have perilous consequences. If we continue exacerbating the differential opportunities available to poor kids versus kids from advantaged backgrounds, we will suffer that fate of which the 7th grader warned us over two decades ago. Even if some individuals and naysayers don't have a "heart for social justice," I hope we can convince them of the efficacy of socially just behavior to enhance their own self interest. As utilitarian as this may seem, self-centeredness may be the only way to motivate some people to egalitarian behavior. So be it! For, as we know from our social psychologist colleagues, if behaviors change, attitudes will follow.

Gretchen: For me, in one way or another, equity has always been about resources and opportunities. In elementary school, I recall being very aware of differences. Today, I am certain that this is because I was different—new to the school, African American, from a single parent home. I looked for and befriended everyone and anyone who I saw as being different like me. They were the kids that people bullied. They were the kids who were just a little shy or a bit awkward and uncomfortable with their smarts. As socialization and assimilation quickly teaches you, I learned that I needed to befriend the "cool kids," as well, those who made school life for us "different" kids miserable. I decided then and there that I had to be a bridge. I would learn to navigate both worlds. Reflecting upon that time in my life, I realize that I was destined to be the bridge. My ancestry and family history would culminate in a time and space that demanded that I step into that role and stretch myself in ways which demanded that in order to be successful, I would experience my schooling in ways that, by definition, gave meaning to the pragmatic political decisions about race and education that were made before my birth.

In his book *Silent Covenants* (2004), Derrick Bell writes,

> The world is moved by diverse powers and pressures creating cross currents that unpredictably, yet with eerie precision, determine the outcome of events. Often invisible in their influence, these forces shape our destinies, furthering or frustrating our ambitions and goals. The perfection for which we strive is elusive precisely because we are caught up in a myriad of manifestations of perfection itself. (p. x)

From my earliest memories, my family and community charged me with the responsibility of crossing cultural boundaries, of mastering the codes of power without severing ties to my Southern African American community. Examples around me, in the small rural African American community where I started school, believed that I (and all those whom they loved) had the ability to change the world. At least, that is how I felt. I grew up seeing people "do things." They organized meetings, ran churches, made a living on farmland they owned. Like most adults from a child's view, they were larger than life. Even though the older people in the community had minimal formal education, the ways in which they engaged the world made them appear to the smartest people I knew. They demonstrated love, kindness, and respect. Taught me right from wrong. My Grandfather affectionately known as "Poppa" and Grandma raised ten children of their own (helped with others). They sent them all to college, half of whom have advanced degrees. Their 18 grandchildren followed suit going to college and obtaining advanced degrees. It was all quite normal; nothing special, really. It was the expectation.

1971, the year of my birth, was the year that all the schools in the state of Virginia were finally integrated. Since poppa made mom the sacrificial lamb, one of four Black children who would integrate Stony Creek High School, it seemed only natural that once mom had completed college and could afford a home in the suburbs, she would move my brother and me to one of the best school districts in the state. We left our small, rural predominantly African American community school, where my second grade teacher had taught at least six of my aunts and uncles and attended our church on second Sunday's of every month, to go to a "better" school. In today's educational jargon, one would say that it, by definition, was a better educational choice because it had higher test scores.

That decision sealed my destiny. Equity and excellence seemingly meant access to resources and opportunities. In the 1970s and still today, this meant becoming fluent in the meaning-making structures of "White Culture" (Bower & Hunt, 1996; Clark & O'Donnell, 1999; Nakayama & Martin, 1999). I would be enrolled in a racially mixed school, take honors classes, become a class officer, and high school prom queen. I would learn (without the benefit of about what any of this meant) how to balance excellence on the terms of a White dominant culture all the while "being tethered to my grandmother's porch" (Hicks & Generett, 2010, p. 685). In many ways, I continue to grapple with the crosscurrents that Bell describes as determining the outcome of events. In reality, I learned little to nothing about equity and excellence in majority schools because they failed to critically engage me in an inquiring way about resources and opportunities. I was to be happy that *I* was in that school, that by their definition *I* was doing well. What I learned about equity and excellence, I learned by watching my mother's generation engage racism head on in their lives. My understanding of the collective ways in which historically oppressed groups persevere to obtain excellence was solidified by watching them remain engaged and hopeful in their quest for equity by taking actions each day to demonstrate their value and human self-worth in places where they were unwanted. As a result of such modeling, I learned that equity and excellence was never just about test scores and academic achievement. If it had been, the people who I held to be some of the smartest in the world by that definition would cease to be. Instead, equity and excellence came from knowledge that was rooted in lived experiences, not textbooks. I learned that equity and excellence would come only when knowledge rooted in experience was used to shape what we value and, as a consequence, "how we know what we know as well as how we use what we know" (hooks, 2010, p. 185).

Love: Operationalizing the Concept of Humanity Through a Servant's Heart

Jim: I will discuss the leader's authenticity later, but one aspect of that construct that I originally clumsily named "nonmanipulation of subordinates" in the original successful effort to develop and test a Leader Authenticity Scale (Henderson & Hoy, 1982) comes very close to describing a leader's obligation with regard to the concept of humanity. The leader authenticity aspect of "nonmanipulation" is based, to a large degree, on Tiryakian's (1968) classic work in which he distinguished between two levels of existence—the ontic and the ontological. Ontic referred to discrete things, to objects perceived by the senses and having recognizable physical properties. When used with regard to human beings, the ontic orientation referred to the objectification of self and others. The ontic mode of behavior, according to Tiryakian, was inauthentic. The ontological level referred not to a finite entity; rather, it was the essence, the source of identity, and the realness of an entity. To Tiryakian, the authentic person was one who behaved in such a way as to respect the ontological nature of others and himself or herself, indeed, the basis of ethical treatment of others.

Authentic behavior was the avoidance of manipulating other people as if they were inanimate or ontic beings. Inauthentic behavior was seen as the objectification of the self and others in interpersonal relations. The difference between the authentic and the inauthentic individual was the extent to which the person in question treated other persons as if they were inanimate beings. Likewise in another classic, Bennis (1989) depicts the fundamental differentiation between leadership and management: "the manager focuses on systems and structures; the leader focuses on people," and "the manager relies on control; the leader relies on trust" (p. 45). In fact, Burns' (1978) differentiation between the "transactional" leader and the "transformational" leader essentially distinguishes between those leaders who would undergird leader-follower relationships with the exchange of benefits or objects (transactional) and those leaders who would support the development of individuals within the organization, thereby supporting the growth—or transformation—of the organization.

Hence, it is imperative for all leaders—and especially those whose essential behaviors are circumscribed by notions of social justice—to treat their colleagues (see, I've grown beyond "subordinates") in a nonmanipulative fashion.

A Servant's Heart

My mom is my hero. She doesn't give voice to the term, "servant leaders." In fact, she probably doesn't even know the term; rather, she lives it. Given the unselfish way she always served others—without recognition and without reward—I always thought of my mom as having a servant's heart, but I never really thought about my mom as a servant-leader…until now.

In his 1970 essay, *The Servant as Leader*, Robert Greenleaf wrote:

> The servant-leader *is* servant first… It begins with the natural feeling that one wants to serve, to serve *first*. Then conscious choice brings one to aspire to lead. That person is sharply different from one who is *leader* first, perhaps because of the need to assuage an unusual power drive or to acquire material possessions…The leader-first and the servant-first are two extreme types. Between them there are shadings and blends that are part of the infinite variety of human nature.
>
> The difference manifests itself in the care taken by the servant-first to make sure that other people's highest priority needs are being served. The best test, and difficult to administer, is: Do those served grow as persons? Do they, *while being served*, become healthier, wiser, freer, more autonomous, more likely themselves to become servants? *And*, what is the effect on the least privileged in society? Will they benefit or at least not be further deprived?

I used to think that, while Greenleaf's essential focus on service was well-minded, he had the terms backwards. I used to think that leaders could also be service oriented, but leaders first. The older and more experienced I become, I am totally convicted that Greenleaf was absolutely correct all along. There has to be a primacy of servant spirit first if one is to be a servant-leader. Service cannot be an afterthought or a useful leadership trait appendage; otherwise it is not genuine. Moreover, Greenleaf's definitional focus of attending to the needs of "the least privileged in society" clearly creates the crosswalk to the notion of socially just leader. To me, social justice and servant leadership, though not a tautological relationship, are at least correlated at the .90 level in the jargon of some of my quantitatively oriented colleagues. For the years I have remaining, my essential mission in life is investing in my students' and my colleagues' future.

So, what about my mom? Well—to paraphrase Bill Clinton's handlers in 1992—it's the behavior, stupid! Whether it is watching an ailing neighbor's pet, making scones for her senior citizen apartment's bake sale, or chauffeuring a friend to the doctor (yes, she still drives at 89!), my mom is a servant and—in the eyes of her peers—a leader. Way to go, mom!

Gretchen: Somewhere in my informal learning at home and in community, I came to the understanding that the very people who cause you the most hurt and pain are the ones you have to learn to love. “Love them the most,” is a phrase somewhere in my consciousness, though honestly, I am not sure who put it there. There are days that I am distressed by how inhumane I observe educators interact with students. In the African American community, being treated inhumanely is a dark reality of our past. What is often not exposed and talked about in today’s mainstream educational discourse is how schooling continues to inflict such inhumanity in its structure and institutions.

I recall how thrilled and angry I was when I was finally assigned African American literature as a required text in a class. Yes, it was in college, but for the first time, I was provided evidence of what my home community had told me about by someone in a formal educational setting. It was at that point that I was able to articulate why the better school district, with the higher test scores had failed to connect equity and excellence. They had not engaged me at the level which I was human, at the level of my cultural self.

In a book chapter entitled, *What’s in a Myth: Qualitative Research as a Means of (Re)creating the World* (2003), I wrote about the popular myths of inadequate segregated school and inferior Black educators as a way of illustrating my own relationship to education and schooling more than 30 years after *Brown v. Board of Education.* As the myth goes, African Americans were segregated in dilapidated school buildings and without texts books. By definition, the inferior accommodations housed inferior educators and students. So goes the myth. Indeed, research provides a different narrative (Cecelski, 1994; Foster, 1996; Jeffries, 1997; Shujaa, 1994; Walker, 1996), one where African Americans created extraordinary learning contexts, where success was measured by college attendance and subsequent careers. Remember my grandparents? Ten kids, all college graduates, some with advanced degrees. They all attended segregated black schools with the exception of my mother. A merit scholar, Research I institutions, and Ivy League schools were the result of their schooling experiences in educational contexts created by people who loved them. I have come to learn that lots of good outcomes are possible when educators love their students and are able to connect to their humanity.

Consider the following quote taken from Historian Elizabeth Higginbotham, who writes about the experiences of the first generation of African American college graduates from majority institutions. She writes,

> Instructing children to survive in a racist society was a complex and cumbersome task with a long tradition in the Black community. As Black children learn at an early age that their group is devalued in the wider society, Black parents have to prepare their children both to recognize and to handle racist situations. Racism has the potential to limit life chances and choices in the lives and Black women and me; thus the expectations nurtured at home might reflect distant possibilities for individuals. Parents must be ready to provide support and encouragement to contradict the negative feedback their children will receive within schools and other mainstream institutions. Ideally, such encouragement and skills will enable Black children to become adults who have the capacity to love and work with others despite the crippling effects of racism. (Higginbotham, 2001, p. 65)

> Lack of an inclusive curriculum, disproportionate office referrals, and referrals for special education, an educational achievement gap that it is seemingly the norm, are commonplace daily assaults to the humanity of African American children. These assaults do not happen in the most distressed school districts. For African American students, they are just as likely to happen in what are considered the best districts as well. As a parent raising two African American children, I can attest to the thought and intentionality through which my husband and I navigate their educations. As a parent and educator, there are far too many days when there is very little love within the walls of schools today.
>
> My propensity to want to see the good in people leads me to believe that it is not that the educators I see do not have the capacity to love other people's children. Perhaps, just perhaps, the vast majority of them have lost hope in the educational process. Indeed in order to be hopeful, one must have faith in their efforts to make a difference. This statement is more pronounced in places where there is little evidence of the impact of one's work. Drawing upon the knowledge of my lived experiences, including what I have learned from my family and community, I have come to the conclusion that "hope" and "action" have a symbiotic relationship (Generett & Hicks, 2004). In order to take or continue taking action, one must have a hope-filled frame of reference. The opposite is also true. In order to be hopeful, one must take action (Generett & Hicks, 2004). Educating in the service of others is a form of action, but working for social justice begs the question. What if our educators have bought into the myth that dilapidated buildings (think communities) equal inferior parents and children? What if educators have bought into the notion that those people are somehow, less human? How can they be hopeful? How can they take action? How limited is their capacity to love, to serve?

Taking the Risk to Forgive

Jim: People have hurt me, people I have trusted. Of course, I know that I have hurt others, in fact perhaps too many to recall. Love and forgiveness—especially as a leader concerned with issues of social justice—is the only way out of the inviting downward spiral of bitterness, revenge, and hatred because such leaders will absolutely suffer rebukes, affronts, and recrimination. As to perspective on being hurt or affronted, I especially resonate to an example from the Torah. You may know the background of the story especially if you've seen the Broadway show "Joseph and the Amazing Technicolor Dreamcoat." The youngest of 12 brothers, Joseph, received the jealousy of the remaining 11 and was ultimately duped, trapped, and sold into slavery in Egypt. Time passed and, because of his ability to discern dreams, Joseph became the Pharaoh's top assistant. When Joseph's brothers came to buy grain in Egypt because of the great famine, Joseph invited his family to remain and he finally revealed himself to them. All went well until Joseph's father passed away and his brothers assumed that Joseph would take his revenge. My favorite part of this story is described in the Book of Genesis (50:20). Speaking to his brothers about his having been sold into slavery and brought to Egypt, Joseph said: "You intended to harm me, but God intended it all for good. He brought me to this position so I could save the lives of many people." So it is with social justice leaders. We must assume that the end will be justified, even if the means are painful and disheartening. We are called to more than simply move ahead with optimism, though. Turning to the Bible's

New Testament, Jesus of Nazareth urges, “But I say, love your enemies! Pray for those who persecute you!” (Matthew 5:44). I have seen it dozens of times in my life as a leader and in others, when you love your enemies they will often (though not always!) become your allies in a just cause. It’s worth the risk.

Risk-taking—“It is from numberless diverse acts of courage and belief that human history is shaped. Each time a man stands up for an ideal, or acts to improve the lot of others, or strikes out against injustice, he sends forth a tiny ripple of hope, and crossing each other from a million different centers of energy and daring those ripples build a current which can sweep down the mightiest walls of oppression and resistance” (inscribed on Robert F. Kennedy’s gravesite at Arlington National Cemetery).

> “A man who won’t die for something is not fit to live” (Martin Luther King, Jr.).
>
> “The greatest love you can show is to give your life for your friends” (Jesus of Nazareth (John 15:13)).
>
> I cannot improve on these words to live by, so I won’t even try.

Gretchen: If I am honest, I will admit that there are days when I am very angry. Writing this in and of itself is risky. People don’t like angry black women. But, it is true. Perhaps, if I am really, truly honest, I will admit that coupled with that anger is a visceral sense of disappointment. Martin Luther King, Jr.’s dream of this country’s potential has not been realized. As a representative of the positive outcomes of the Rosa Parks Generation, I am a representative of the work that remains.

Pragmatism put the African American community in a situation where the compromise to close our schools and leave our communities for a “better” life has proven less fruitful than imagined. In K-12 schools, African American students are falling further and further behind. Integration did not really transpire. For the most part, Black schools were closed, Black educators were fired, and Black students were sent into hostile environments. Today, our schools are just as segregated as they were in 1954. And, while I will never be as tired as by grandmother who cooked, cleaned, and washed clothes on a washboard for a family of 12 so that I could one day have a doctorate. I am mentally tired. Tired because I was raised to believe that the master’s tools were accessible to all. Not so.

Furthermore, I have learned that being the bridge is not enough. People whose knowledge and experiences are rooted in privilege, have to be willing to be bridges as well. The idea of privilege suggests that people benefit from and are thereby socialized into a worldview of power and influence without asking for those benefits. Senge et al. (2000) suggest that we all hold “mental models” (p. 67) that help us to frame and interpret knowledge. Therefore, it is essential for those who have access to the power that privilege affords to work to understand how power coupled with privilege operates. It is not enough for someone whose knowledge experience is not of privilege to state that inequities exist and that barriers continue to prevent equal opportunity. It is not enough for people from historical marginalized groups to sit at the table, share their stories, and be the bridge. It is not enough because, what invariably happens is that my family and my experiences are invisible to members of privileged groups. All they see is a tenured professor in the room. Rarely acknowledged are the barriers that were crossed by my family or myself to get into the room. Rarely do people acknowledge that I, or people like me, were once excluded from the room. The denial of this reality is painful to accept. This is why codirecting a center for social justice is important. It's about the relationships that one is able to create while doing the work to make ones context more socially just.

Reciprocal Relationships and Leadership Authenticity

Jim: The key to reciprocal relationships, I believe, is not to treat them as reciprocal relationships per se. Let me explain. Earlier I wrote of Burns' (1978) memorable distinction between "transactional" leadership and "transformational" leadership, in which transactional behavior essentially involves a quid pro quo exchange; I'll scratch your back, if you scratch mine. In fact, Blau (1964) and others later have referred to this effect as the "norm of reciprocity."

I would assert that genuine reciprocal relationships are established and nurtured because those invested in the relationships are *not* concerned about "what's in it for me" (using others as things in an ontic way); rather, the participants in the relationships are seeking to selflessly benefit their partners (in a transformational or ontological fashion) irrespective—and sometimes contrary—to the good that they will receive. The correlation with servant leadership here is apparent as is the reality that social justice leaders may not always be appreciated, or even tolerated, by those whom they would choose to establish a relationship and serve. But they move forward with the relationship anyway. They are willing to discern, and risk in, the potential of others. After all, that's what leaders do.

The original leader authenticity scale (Henderson & Hoy, 1982) and its subsequent derivatives (Henderson, 1998; Henderson & Brookhart, 1996) have proven to be of substantial heuristic value and have produced certain interesting and illuminating findings. Links have been tested and found between leader authenticity and trust; organizational climate; humanism in pupil-control orientation; teacher job satisfaction; accountability; faculty efficacy, teaching efficacy, and total efficacy; collegial faculty-faculty relations; faculty authenticity; faculty empowerment; organizational effectiveness; leader effectiveness; and more.

The school leader's selflessly working to perform in the best interest of others—internal or external organizational "clients" such as teachers, students, and parents—is a respectful act. This is directly analogous to the leader authenticity aspect of nonmanipulation. The school leader's possessing courage and a strength of character is another ethical imperative. To accept responsibility for actions and mistakes and to move to correct those difficulties is a sine qua non of effective schools. This attribute directly relates to the leader authenticity aspect of accountability. Finally, the ethical and socially just school leader exhibits the actions of servant leadership and is clearly honest—both to herself or himself and also to the school's stakeholders. The ethical and socially just school leader is not a puppet, but is, rather, a real person possessing a moral compass for the leader's expressions and actions. This leader is not just a role incumbent per the leaders authenticity aspect of salience of self over role—this leader is a real person.

If we believe the empirical evidence presented in numerous leader authenticity studies (Henderson, 1998), in what will authentic and socially just behavior of the part of school administrators and teachers result? We will have schools in which interpersonal trust and respect, ethical and socially just behavior, and positive morale and job satisfaction predominate. Moreover—and of great importance to those who would call for increased school productivity and enhanced standards—authentic behavior also results in schools in which accountability, teacher self-efficacy, effective teacher supervision, and leader effectiveness are evident. These ethically based and socially just schools are places where students have a chance to model behavior on the part of teachers and principals that is accepting of responsibility, that exhibits a sincere concern for all of the stakeholders in the school, and that demonstrates that the teachers and principals are real human beings who treat others according to their needs and not according to monolithic rules. These are schools where young people are encouraged to succeed academically and interpersonally. These are schools that work.

Gretchen: Relationships are where I have learned to trust that people have the capacity to change the world. I know this because in relationship with others is where I work to create my own ethic of risk. Doing so is a continuous process, not unlike the process of becoming a leader. In actuality, at this point in my life, I believe that creating an ethic of risk and leadership are toggled together by the one's enactment of social justice. Let me explain. In relationships with people (as opposed to being the bridge), I have refined the exceptional lessons taught to me by my family. First, I have redefined my understanding of responsible action. Growing up, responsible actions entailed being better than the majority because that is what it took in order to have access to resources and opportunities. Striving for excellence served me well, but excellence without responsible action did not nourish my soul. In her text, *A Feminist Ethic of Risk*, Sharon Welch redefines responsible action as "the creation of the conditions of possibility for desired changes" (p. 46). Responsible action as one works on the behalf of others suggests that context *really* matters. Over the years, I learned to pay very close attention to context if I am to carry out responsible actions that include all stakeholders. I cannot be inclusive without cultivating relationships.

I have always been grounded in my community, another important concept in creating an ethic risk (Welch, 2000). The relationships that I have cultivated over the years include a much larger, more extensive community. Working for social justice demands that I integrate my past, present, and (hopefully future) narratives along with my understandings of community in order to lead for social justice and to learn from the interactions I have with others.

Finally, witnessing others as they work to be authentic leaders for social justice has taught to me to be a strategic risk-taker. Welch defines strategic risk-taking as "not the willingness of someone to risk their life, but the contribution that such an action will make in the imagination and courage of the resisting community" (p. 47).

My early lessons of equity and excellence did provide me with access to resources and opportunities. My access to privilege has surely increased. As I work in urban schools and listen to young people describe the lack of hope they have in adults to do the things they feel will make a difference in their schooling experiences, I am reminded of my colleagues near and far who sustain my hope by their acts of resistance and strategic risk-taking. There are days, and I have written about this in other works, where my relationships with these courageous individuals sustain me.

Questioning

Jim: A great example of questioning the status quo is found in Robert F. Kennedy paraphrasing George Bernard Shaw: "There are those that look at things the way they are, and ask *why*? I dream of things that never were, and ask *why not*?" Of course, my favorite example of questioning is Dr. King's juxtaposing the picture of America as a racist and racially divided nation with his picture, his vision, his dream of an integrated and unified America in what came to be known as his 1963 "I Have a Dream" speech. Leon Festinger (1964) was right too—cognitive dissonance is a powerful force. Cognitive dissonance essentially involves a discomfort caused by holding conflicting cognitions simultaneously. Dr. King masterfully painted a picture of what America was and yet could be. The result is a painful, but important history. More recently, Christensen, Johnson, and Horn's (2011) notion of disruptive innovation involves a process that simplifies products or services that were historically expensive, complicated, hard to use, very centralized, and it transforms them into ones that are far more accessible, simple to use, affordable, far more customizable. Both concepts rely on the observer's being able to not only notice but viscerally feel the difference between states of being and—here's the key—to be motivated to change behavior. The process starts with questioning, though. In the region of Pennsylvania in which I live, if one were to first visit an elementary classroom in the Clairton School District, then one in the Upper St. Clair Schools (where my home is), one should be prompted to ask, "Why do the predominantly Black kids in Clairton not have access to the same kinds of spaces, equipment, supplies, materials, and resources that the predominantly White kids in Upper St. Clair?" Simple question. This, though, should then prompt equity-audit-type questions about inequitable school funding, racist public policy, and the corporate will necessary to educate all children, among others. An anonymous pundit once asserted, "The best way to get an answer is ask a question." I believe that contention with all of my heart and it is especially important when children's futures are on the line.

Gretchen: In a recent leadership class, I encouraged them to use their imaginations in order to take more risk. Actually, I encouraged them to dream big, to consider what they would do if the current barriers that impede them were removed. They shared some extraordinary ideas about assisting families and communities, about righting education. They described a world where social justice was commonplace and everyday language. My question for them, "What's stopping us?"

Maxine Greene (1995) reminds us of the importance of the capacity to imagine our world as we think it should be. She writes,

> Imagination, as is well known, is the capacity that enables us to move through the barriers of the taken-for-granted and summon up alternative possibilities for living, for being in the world. It permits us to set aside (at least for a while) the stiflingly familiar and the banal. It opens us to visions of the possible rather than the predictable; it permits us, if we choose to give our imaginations free play, to look at things as if they could be otherwise. (Greene, p. 494)

Asking myself what I would do if I could to create more socially just contexts encourages me to think big. It forces me to reflect upon my own narrative and to imagine the possibilities when people believe that you are the very thing that will be the difference.

Frameworks Summary

Jim: The last graduation over which I presided as Dean of the Duquesne University School of Education in 2003 was bittersweet for me. Our School's students and graduates were doing incredible things, and the School was very healthy with respect to enrollment, faculty, and staff complement, and program growth. What was disquieting for me, though, was that I was going through some professional and personal challenges that would result in my resigning the Dean's position and returning to my role as professor. So it was in that context that I wrote my last graduation speech to attempt to teach our soon-to-be graduates:

> For you graduates and your family and friends I expect that you will celebrate this evening and the rest of the weekend … and you should. This is a great life occasion and the perfect stuff of celebration. But what is better than celebration? What can I wish for you?
>
> I pray that you will celebrate today and have a profound sense of peace tomorrow, and the next day, and the next!
>
> And what is one person's recipe for peace? This is by no means an exhaustive treatise on the subject (we haven't the time and you do want to celebrate this evening, don't you?), but I do want to summarize some of the research lessons and—more importantly—life lessons that I've experienced. So, how do you experience that elusive quality, peace?
>
> - First, Forgiveness. People will hurt you. Your coworkers and friends will hurt you. Your students will hurt you. That's the nature of people and it's also our nature to want to extract revenge. *Don't*. Resentment can eat you alive. Forgive instead. It's as close as we come to Godly behavior.
> - Next, Service. Whether it's part of your job or—better—if it's not, spend your life serving the needs of others. You'll figure it out—there are needs everywhere. Keep your eyes open and keep your heart open.
> - Then, Selflessness. This is very close to service, but I think it's different. Recognize the will of God for your life by giving yourself up to something or some cause greater than yourself. After all, you're graduating from a school that fundamentally is about the activity of teaching, a Godly calling indeed.
> - And, Patience. Don't try to save the world on a global scale, but try to save your little piece of the world through one action of kindness at a time to one student at a time. In that way, you have the opportunity—every day—to change one world.

- Of course, Love. But when I talk about love, it's not just loving those students or clients who respond to your efforts, who are, by definition, loveable—it's especially focused on loving those who are seemingly unlovable … or incapable … or unreachable. You may be their only hope. Be different—love them all.
- Finally, Faith. The author of the book of Hebrews indicates that, "Faith is the assurance of things hoped for, the conviction of things not seen." You can't assure that your students' lives will turn out well any more than you can assure that the lessons you teach will have an impact.

> You know that some of the lessons you intend to teach will be rejected or—even worse—ignored. You *will* make a positive difference, though. Have faith!

When I had the opportunity to work with my friends and colleagues to propose then create the UCEA Center for Educational Leadership and Social Justice, I tried to incorporate the lessons and the imperatives outlined in that last graduation speech into what I thought we should be doing in our center. Of course, I have been richly blessed by my association with Gretchen Generett to guide my thinking. That led, of course, the creation of a vision and an agenda for the Center.

Creating an Agenda for the Center

We have been working over the past 2 years—first with our staff, student, and faculty colleagues at Duquesne and also with our network of critical friends (Jeffrey Brooks, Gary Crow, Michael Dantley, Fenwick English, Mark Gooden, Margaret Grogan, Leslie Hazle Bussey, Gaetane Jean-Marie, Lauri Johnson, Reva Joshee, Gerardo Lopez, Peter Miller, Diana Pounder, and Michelle Young)—to craft the direction and agenda for the center. Certainly, anything can be amended, but we are pleased with the articulation of our vision, mission, beliefs, and our action imperatives.

Vision

The UCEA Center for Educational Leadership and Social Justice aspires to be a community that is dedicated to identifying and eradicating conditions of social injustice in our schools and communities through enlightened and actionable scholarship, preparation and development of socially just educational leaders, and the encouragement of leader-practitioners in service of all students. We envision a future in which all young people will be accorded respect and will achieve success in schools and in their communities.

Mission

The mission of the UCEA Center for Educational Leadership and Social Justice is to advance equity and excellence on behalf of young people, especially those who have been marginalized, mistreated, and neglected. This mission will be accomplished by educators, community members, and academics working together to study, implement, and continually assess educational systems, procedures, and activities through the lens of socially just and educationally sound practices.

Beliefs

We believe that socially just leadership is the fusion of the mind, heart, and spirit in the moment of action.

We believe that leaders impact the conditions of social justice and that the conditions of social justice impact the formation of the leader.

We believe that educational research only has meaning when put into action to positively affect the lives of kids.

We believe that educational leaders, when confronted with conditions of social injustice, must have the courage to risk personal comfort and safety to improve the lives of students.

We believe that socially just leaders systematically and intentionally interrogate themselves to continuously improve and understand personal biases, assumptions, and prejudices.

Action Imperatives

We must identify and develop educational and community leaders who are committed to, and effective in, eradicating conditions of social injustice that are experienced by any of our society's young people.

We must pursue and promulgate research dedicated to testing and identifying best educational practices that will enable all young people to learn as much and as well as possible.

We must establish and maintain a dialogue among educational practitioners, community leaders, and university scholars regarding advancing equity and excellence in our schools and communities for all young people.

We must advocate for policy reform to ameliorate socially unjust systems and processes in our communities, states, and nation.

The UCEA Center for Educational Leadership and Social Justice in the Duquesne University School of Education has the potential to impact the intellectual conversations about social justice and social inequities, but more importantly, it is poised to impact actions taken to alleviate social injustices. The center is a resource to academics, practitioners, students, and community members interested in the intersections of and relationship between educational leadership and social justice. Through a diverse range of platforms, the center will disseminate information on social justice issues as they impact students at all levels. The center strives to be a place where individuals and groups working to address issues of social injustice are able to integrate theories and actions that address the identified problems. We believe that educators from different orientations within the field need to create a common language and have a more uniform understanding of social justice and its role in education. Ultimately, educators in the academy and in the field need to have models/examples of (1) how to integrate social justice frameworks into their practice and (2) how to create supportive networks whose purpose is to critically question the discussions and impacts of the intended work.

One example of how we are working to create a framework for our learning as individuals whose work is housed within a center is through a partnership vehicle called *School-Academy-Community (SAC) Partnerships*. SAC partnerships seek to bring together stakeholders from schools, from local universities, and the broader community including nonprofits, business, organizations, and individuals who hold an interest in improving schools, to work in a process that allows for equitable engagement on critical issues in education. Ultimately, we believe this framework will allow us to identify and better understand obstacles that prevent more equitable schooling in any and all contexts, to design and develop ways of overcoming barriers through collaborative means that bring diverse opinions and input at each stage of our learning.

As we work to engage colleagues across differences, we are mindful of the barriers that confront us. And, while we want to be a resource to educators interested in integrating social justice practices into their work in critical and engaging ways, we are mindful that we, as committed as we may be, have a lot to learn as well. Thus, partnerships that bring together like-minded people from a vast array of backgrounds and communities, including international perspectives, are essential to *our* learning and ability to serve as a resource to all educators. We recognize that the conversation between Jim and Gretchen, while modeling dialogical engagement across differences, is limited in that it highlights differences within an American context. SAC Partnerships provide a frame whereby those truly interested in issues of social justice can engage in dialogical encounters that help to identify and address educational problems in any context. In our minds, the possibilities for learning and creating better, more equitable educational outcomes for all are limitless.

Conclusion

By sharing their experiences, Gretchen and Jim have found that, though their journeys may have been very different, they have arrived at a common ground. We believe that this common ground can be found among all educators in any context. Gretchen, a young Black woman from the South, trained as an academic, and touched and transcending the institutional racism in which she found herself in various venues of her life, has chosen to follow her role models in the quest for equity and justice for all children. Jim is an older White man from the rust belt, trained as an educational administrator, who experienced a growing awareness of both the societal inequities imbedded in education and of the need to ameliorate those curses, has given his life to both leading schools to change and teaching others how to do so. Individually, each is a model of what the center aspires to develop in other leaders. Together, they share, in the words of Duquesne University's mission, the "mind, heart and spirit" to accomplish the vision of the UCEA Center for Educational Leadership and Social Justice.

Part VIII
Afterword

Chapter 62
The Way Forward

Carolyn M. Shields and Ira Bogotch

We conclude this international handbook on educational leadership and social (in) justice with just three words, *the way forward*, knowing full well that the real work doesn't end with this publication. It cannot. It must not. So let us be clear upfront: the use of the phrase "social justice" does not make it a reality. We believe sincerely that we are leaving you in a much stronger political and intellectual position than when you first began selectively looking at individual chapters in this *handbook*. The 100 or so authors have challenged us to think and act and stay committed to social justice as an educational construct in whatever community, state, or nation we live.

We have read how various authors conceptualize social (in)justice in their contexts and seen how social injustice plays out in these different contexts in various ways. We have reflected on how to study social justice and how to prepare leaders for social justice. We have considered some of the challenges presented to educators who lead for social justice. We have seen evidence of educational leaders *making a difference* where they are. And throughout all of the chapters, and particularly in the sections related to advocacy, activism, and intervention, we have heard calls to action.

We have also seen that social justice is relevant to all regardless of the state of a nation. The distinction between developed nations and undeveloped nations need not be a barrier to social justice; indeed, it is in difficult circumstances where social justice is needed most. Many of the chapters originate in nations in conflict, where human rights, social cohesion, and democracy have not taken root.

I. Bogotch and C.M. Shields (eds.), *International Handbook of Educational Leadership and Social (In)Justice*, Springer International Handbooks of Education 29,
DOI 10.1007/978-94-007-6555-9_62, © Springer Science+Business Media Dordrecht 2014

The purpose of the *handbook* was not to promote social justice talk, but rather to demonstrate the critical need for a bold new approach to educational leadership—an approach that has the potential to make a difference to the peace, prosperity, and welfare of our global community. It is not possible, as early scholars of educational leadership in North America argued, to exercise leadership that is objective and devoid of values, subjectivity, or moral purpose. It is not sufficient to operate educational institutions that promote the achievement of those who already hold status, power, and influence in society. It is not sufficient for those who hold power to argue that others have similar opportunities to succeed if only they work hard enough. Educational leaders must strive to create institutions of excellence that level the playing fields, that "float all boats," and that transform the circumstances of the least advantaged in every milieu. We must remove the barriers to participation, inclusion, and achievement to ensure every student in every classroom—child, youth, or adult—has the opportunity to succeed. And we must ensure that educational success is only the beginning, a means to the goal of what Judith Green (1999) describes as "the experience-based possibility of more equal, respectful, and mutually beneficial ways of community life" (p. vi).

Thus, one of the major lessons from these chapters collectively is that leading for social justice differs from place to place in emphasis, action, and practice. Nevertheless, it is embedded in several attitudes, concepts, and principles that we believe hold true across contexts and sociopolitical and cultural milieus. The idea of the inseparability of space-time as a continuum is what Bakhtin (1981) called *biographical time*. Bakhtin identified three different ways of living in space and time. He believed that too many of us live much like comic book heroes, in what he called "adventure time"—believing that events are controlled only by chance and that it is futile to try to change them; or in a combination of "adventure time mixed with everyday life" in which we move from crisis to crisis, never being able to predict or control circumstances or exercise advocacy, action, or agency. Bakhtin argues the importance of living life in *biographical time*, living in the public square, fully aware of the complexity of every situation and, perhaps most importantly, of our personal agency. In biographical time, we cannot understand the present without knowing the history of a particular place or people, not believing that history determines the present, but in understanding the complex and dynamic interplay of often contradictory forces. This interplay is what we have highlighted in this handbook—an array of social conditions, geographic places, and educational beliefs, strategies, and interventions.

We have not tried to be representative of all continents, countries, or regions; nor have we tried to represent every ethnic, religious, or linguistic tradition. Instead, we have tried to give voice to various perspectives, without making them token representatives of any given category. We have tried to show the rich and diverse ways of thinking about, leading for, and doing social justice, without any claim to be globally comprehensive. Thus, although we have given voice to diversity and difference, the perspectives still unheard are boundless.

Multiple authors have emphasized that we carry within us an embodied history and a complex mixture of injustice and justice. Some are most familiar with oppression and marginalization; others are cognizant of privilege, domination, and power (often but not exclusively associated with whiteness). Regardless of where we are located, we are works in progress, striving to move beyond understanding or Fraser's (1997) concept of recognition to advocacy, activism, or action. In other words, we are suggesting that, taken together, the chapters in this *handbook* comprise a call to radical action that we believe is at the very heart of excellent educational leadership. Some might call it a call to critical educational leadership in that we are arguing for overcoming forces that have excluded, marginalized, and oppressed the least advantaged and least powerful members of every society. We are well aware that we have all prepared our chapters within a global context of fiscal and political challenge, in an era of increasing neoliberalism with its emphasis on international comparisons, benchmarks, and performance assessments; on accountability and performativity; and on market competitiveness. Unless we are careful, all of these forces can serve to increase social injustice on a global scale rather than to promote social justice. In fact, many policies distract us from the goal of educational leadership for social justice. A focus on test scores, for example, while serving to present a more successful front to the community and general public may simply mask the numbers of students who have been "pushed out," retained in a lower grade, misplaced or misdiagnosed as needing special education provisions, and so forth. It may also mask the bias of the test, that is, its inappropriate use as a measure of student learning, or a narrowing of the curriculum that equates education with test passing instead of learning.

Hence, we believe the call is to go beyond reforming and improving or "helping," to go beyond "ensuring equity of access," or ensuring that all students are well prepared for higher education (as important as these may be). Excellence in educational leadership cannot be achieved by following a prescriptive set of policies, by ensuring adherence to formal policy, or by guaranteeing that the organization runs smoothly.

Instead, our call is for educational leaders not to be diverted from the fundamental goal of promoting social justice wherever and whenever possible, inside and outside their institutions. Oakes and Rogers (2006) offer considerable insight here in that they argue persuasively that the reason there has been so little real change towards equity or social justice despite all of the cycles of educational reform most educators have experienced is that few reforms have taken the end of social justice as an explicit goal. They argue that "merely documenting inequality will not, in and of itself, lead to more adequate and equitable schooling" (p. 13). In fact, they assert that "the vast change literature says little about strategies for disrupting social inequality through school reform" (p. 30) and that their research has taught them "that technical knowledge is insufficient to bring about equitable education, even when attention is paid to changing the school's professional culture" (p. 31). Ultimately Oakes and Rogers state that "equity reforms must engage issues of power by extending beyond the school" (p. 31). To that end, we have tried, in these chapters, to go beyond documenting inequity within school contexts to focus on a broader range of social injustices and to provide rich discussions of implications for educational leaders and suggestions for moving forward.

The word “spaces” is often repeated in these chapters as we rethink how we make sense of our lives and our work. Various spaces lead us to know the differences between socially just educational activities, such as good teaching and moral leadership practices in schools and universities (Bogotch, Chap. 4 in this volume), and social justice within and beyond the wall of educational institutions (Shields, Chap. 19 in this volume). As a profession, educational leaders will need to commit to more socially just and equitable educational practices and policies in order to promote high levels of intellectual development and academic achievement as well as to develop active and engaged citizens. We must ensure that our policies and practices are educative—developing understandings that help us to take our place among those who strive to transform our communities and societies. And we must do no less for those with whom we work and for those whom we teach. Educational leadership must, as Foster (1986) argued a quarter of a century ago, “be critically educative; it can not only look at the conditions in which we live, but it must also decide how to change them” (p. 185). Burns (1978), whose book *Leadership* has been seminal, called for leadership to have a transforming role and argued that, in order for this to happen, the leader “cannot stand outside society” (p. 142) but must be a “response to society.”

Unless we are able to make social justice fundamental to education and educational leadership, unless we are able to recognize injustice and work to overcome it, then as educators we fail to fulfill our civic role in societies around the world; indeed, we are complicit in perpetuating injustice. Leadership for social justice is more than a set of socially just educational practices which are necessary but not sufficient to effect social transformation. In fact, we believe with Burns (1978) that nothing short of a revolution in education is demanded to address the multiple injustices of the twenty-first century. Burns wrote:

> Revolution is a complete and pervasive transformation of an entire social system. It means the birth of a radical new ideology; the rise of a movement bent on transforming society on the basis of that ideology; … reconstruction of the economy, education, communications, law, medicine, and the confirmation and perhaps deification of a new leadership. (p. 202)

It is to this new ideology of educational leadership that we are called through the chapters in this *handbook*.

Looking Backwards

The titles to the subsections were chosen deliberately; we asked authors to interrogate their theorizing, researching, policymaking, programming, and leadership preparation as if every activity was an intervention, grounded in advocacy and activism and leading to a more socially just education in a more socially just world. Here, our goal is not to reiterate or summarize what you have read, for to attempt to do so reduces the rich variety of multiple perspectives to meaningless platitudes. It is certainly not to suggest that leadership for social justice must follow a particular path or a series of prescriptive actions that may be checked off on a “to do” list.

Instead, it is to encourage you to take time to reflect on what you have read and to carefully consider which ideas have spoken to you most, where you are, and, thus, can inspire you to action.

Thus, the way forward must begin by looking back—back at the situations, ideas, and suggestions of these authors, back beyond the chapters to the historical realities of injustice, suffering, and struggle represented in these pages and by many other stories and situations you do find in these pages. The way forward begins with each of us, where we are, knowing ourselves, and interrogating our history, our assumptions, and our positioning. Those of us who are privileged must acknowledge that privilege and the complicity in injustice that may have fashioned us. It requires us to question ourselves and our motives, but never to assume that we can know others' situations or speak *for* them. Too often those in positions of power or privilege sound defensive, claiming they cannot be held responsible for the "sins of their fathers," but at the same time failing to recognize how they benefit from the past. Too often, those in positions of power or privilege argue that it is time to put the past behind us, to simply get on with the task of living in the present and planning for the future.

What we fail to understand is how we carry within us, within our embodied presence, the nails, the insults, and the injustices of the past. We cannot expect those who have been victimized by policies aimed at destroying their beliefs, language, or culture to simply move forward, unless we acknowledge the harm done in the past. We cannot expect those who have been wrenched from their families through policies aimed at "civilizing" indigenous populations through residential school programs in many countries to move forward without acknowledging the disruption to family and community. We cannot expect those whose families were dispossessed of most of their material goods and interned in countries where they had become citizens not to be resentful at having to start again. We cannot expect those whose family history is inextricably bound up with slavery to easily accept the indignities of being considered and treated as chattel. Individual, personal insults are difficult to let go of, unless a sincere apology is tendered. How much more necessary is it for a society to acknowledge the wrongs that have been perpetrated on some of its own, to apologize, to make reparations where possible, and to stand *with* those who have been wronged as they move forward? To do anything less is to silently assent to past inequities, making ourselves once again complicit, and perpetuating the injustice in a new, and perhaps more egregious fashion.

The way forward must go beyond intellectualizing inside the academy of scholarship as well as beyond the meanings of good intentions, of "best practices," and "hard work." What that means for us is that the way forward cannot ignore material differences that are based on disparities, inequities, and injustices in our everyday practices as researchers, professors, teachers, or school leaders. And it also means we must make the tough decisions to confront past injustices and to raise them, acknowledge them, discuss them, and apologize for them. Requiring uniforms in schools and providing free lunches may be moral and ethical and right, but until we connect why we provide goods and services to the more challenging conversations about how we can reduce inequities in homes, in healthcare, and in family literacy projects, then our priorities and good works will not change the world and the lives of children. And what we all want to do is to *make a difference*.

For this reason, the handbook offers questions about the role of educational leaders in addressing homelessness (e.g., Miller; Warke) and in educating children with special needs (e.g., Damaj; Oweini & El Zein) and about the state's responsibility to fund free education for all (e.g., Mestry). Many authors have offered salient critiques of current dominant conceptions of social justice and of current practices (e.g., Grant; Mansfield; Johnson & Dempster) and challenges to current methodology (e.g., Larson; Lyman, Lazaridou & Strachan) and to leadership practices (e.g., Orzel; Ryan; Gonsalvez). In every case, we have invited you to reflect on the relevance of the question, or critique, or challenge to you in your context and to determine what insights the chapter offers you to help you move forward.

Looking Ahead

We now want to make your drive/ride/walk/commute to the work of social justice leadership hard. The next steps ought not be taken lightly because hard cannot just mean being busy or consumed by activities or "to do" work lists. What we mean by hard is that leadership is difficult; it requires us to recognize the larger moral challenges we face as educators that require us to take courageous stands; to contribute to solutions to eradicate such injustices as illiteracy, poverty, and joblessness; and to challenge both the *status quo* and those who benefit from it (often those in power). It requires us to take risks, to accept angry responses from those who feel threatened, to lose sleep, to agonize over how to align oneself with the oppressed without being hegemonic or patronizing, and to be willing to persist over time and obstacles. It requires recognizing that leadership for social justice is organizational and managerial and financial work, but it is also political and cultural work. It requires standing with those who have little influence or formal power but who need our support.

The way forward will be difficult because there can be no road map and no prescription and because it will be different in each place and for every leader; it will be different because each context, each history, and each lived experience is different. We cannot assume we know people, their challenges, or some possible solutions even if we believe we have shared a similar situation. Data do not and cannot tell the whole story. Hence, leadership for social justice demands more than data analysis, more than strategic planning, and more than efficient expenditures. Addressing social injustice, including societal, health, or educational gaps, must be linked to making political and ethical changes in how we work and live—beginning today.

The way forward is rooted in historic realities—the material, sociocultural, and political advantages and disadvantages that have always existed in our societies. In the USA, at the top of the economic ladder, some parents register their unborn children on waiting lists for the most prestigious private preschools that charge high tuition fees while others can only hope that their local school provides a sound education. But what if all children had access to high-quality preschool education that did not require waiting lists or fees? What if educators really believed that all children had the potential to graduate from college or university and to take up a productive and caring place in society? What if, instead of building expensive prisons, we used the funds to support the higher education of those who cannot afford it on their own? What if, instead of arguing over whether governments or individuals are responsible for child care, welfare services, or healthcare, we simply ensured that every citizen in every society had his or her basic needs met? What if we could put an end to the ceaseless competition for resources and put our efforts into creating systems that were excellent, more equitable, and socially just?

Too often educational benefits are described in individualistic and competitive terms. A higher education permits one to attain a better paying job, to advance one's career aspirations, and so on. But it is also abundantly clear that education promotes the welfare of civil society. However, this does not occur automatically or by a process of osmosis. Benjamin Barber (2001) asserted that

> the literacy required to live in civil society, the competence to participate in democratic communities, the ability to think critically and act deliberately in a pluralistic world, the empathy that permits us to hear and thus accommodate others, all involve skills that must be acquired. Excellence is the product of teaching and is liberty's measure. (p. 12)

These are the tasks of the educational leader focused on social justice education as a basis for civic competence and intellectual achievement. For educational leaders, the way forward, as Barber advocates, involves listening, learning to hear and accommodate others.

Hence the way forward is rooted in dialogue—not as endless talk that entrenches perspectives and positions, but as dialogue that permits suspension of oneself, one's beliefs, and one's positions and that leads to understanding of "the other." This does not require reaching agreement and, indeed, most often cannot. When we seek the middle ground, the points on which we can agree, we are often avoiding the central issue of inequity or social justice. At other times, reaching agreement necessitates agreeing on a large principle, but avoiding the ways in which it plays out unfairly in practice. For Bahktin, dialogue is not just talk but a way of life. It does not imply endless discussion until one party gives in, but endless listening to promote understanding. Dialogue, as Bakhtin develops the concept, is foundational to life itself. He writes:

> everything … gravitates toward the dialog, toward dialogical opposition, as the center point. Everything else is the means, the dialogue is the end. One voice alone concludes nothing and decides nothing. Two voices is the minimum for life, the minimum for existence. (1973, p. 213)

In other words, educational leadership for social justice requires an ontological approach rather than an instrumental approach to dialogue. The dialogue, through which we develop new understandings and new relationships, is an end in itself, not a means to achieving an organizational goal, attaining consensus about a policy or practice, or moving forward to develop a new program. Even trying to find a win-win solution implies that the playing field is level at the outset; otherwise, a win-win solution most frequently serves to benefit the party who held the advantage or privilege to begin with.

The way forward requires educational practice grounded in relationships, relationships of respect and what Starratt (2011) called "absolute regard." Educational leaders must acknowledge, as we have said before, that we cannot understand all history and experience all inequity; we can never have all the answers. In fact, we must stand with others and work alongside those whose experiences, beliefs, and even values may be different from our own, cognizant that anything else may comprise misplaced or even hegemonic and patronizing efforts that fail to enhance equity and social justice.

The way forward is grounded in action. There is little doubt that "merely documenting inequality will not, in and of itself, lead to more adequate and equitable schooling" (Oakes & Rogers, 2006, p. 13). Moreover, it will never lead to a more equitable and socially just society. Action, indeed, collective action, is required. And educational leaders for social justice must play a central role both in constructing the public awareness required and in leading the action that will permit transformation to occur.

It is to these ends that this handbook is dedicated—as we, the editors, join with the 100 other authors in this collective search for global approaches to education that promote the collective good of all.
