- What are the economic impacts of irregular migration?
- How long do irregular migrants stay?
- What rights do irregular migrants have?
- What are the policy options?

The report deals with a whole range of different themes and gives a descriptive overview of “evidence-based facts” that are for the most part of a quantitative nature. After mapping different definitions related to this group of people, push and pull factors for migration are defined. This study goes beyond a mere estimate of the amount of irregular migrants in the country. Nevertheless, all the other questions refer to an evidence-based paradigm. Answers are given in terms of numbers and quantities that are taken as a starting point to get policy making going.

Similar tendencies are apparent at the European level. *Clandestino* is “an interdisciplinary project” and is “a response to the need for supporting policy makers in designing and implementing appropriate policies regarding undocumented migration” (Picum 2009, p. 2). Twelve EU countries participate in this project that aims at:

- Providing an inventory of data and estimates on undocumented migration (stocks and flows) in the selected EU countries
- Analyzing these data comparatively
- Discussing the ethical and methodological issues involved in the collection of data, the elaboration of estimates, and their use
- Proposing a new method for evaluating and classifying data/estimates on undocumented migration in the EU

Again, the number of undocumented migrants in the different countries is at the heart of the research. Similarly, in her book that “aims to be a general reader on irregular migration in Europe,” Triandafyllidou (2010a) “casts light to the hitherto under-researched albeit much discussed phenomenon of irregular migration in Europe” by focusing primarily on the size of irregular migrant populations in each of the studied countries. The fact that there are large methodological problems related to estimating irregular migrants has not prevented policy makers from focusing on this area. Paying lip service to unreliable figures is having far-reaching consequences. Before approaching this issue, I will consider what is said in these reports and the conclusions that have been drawn from the findings.

Techniques for Estimating Irregular Migration Numbers

A lot of creativity is put into action to estimate numbers of irregular migrants. The list of different techniques that can be used is long and varied. Without going too deeply into the particularities of different techniques and the problems each presents us with, an overview of methods will now be outlined. Then attention will be given to some examples of the most widespread methods and how they are applied.

In general, there is a consensus on the classification of various techniques. Recent reports of the Clandestino project (Kraler and Vogel 2008; Vogel and Kovacheva 2008; Picum 2009) and the Home Office (Woodbridge 2005; Pinkerton et al. 2004) all start from the distinction between “*stocks*” and “*flows*,” in the line of earlier research (among others Delauney and Tapinos 1998; Pinkerton et al. 2004; Jandl 2004). This fundamental distinction is made in analogy with data on legal migration and refers to different statistical concepts: *stocks* (e.g., of irregular residents or migrant workers) refer to a number of people that are present in a country *at a particular point in time*, while *flows* (e.g., of illegal entrants or migrants “overstaying”) refer to *movements during a certain period*. Flow estimates thus refer to the number of migrants crossing the border during a period in time. Estimations are mainly based on border apprehension data or entry–exit statistics. Given the volatile nature of migration flows, the scarcity of reliable indicators, and the dearth of appropriate methods for estimating flows, most efforts have so far concentrated on estimating stocks rather than flows. Methods for estimating stocks of irregular migrants can be divided into direct and indirect approaches. *Direct measurement* is based on data that “captures” the subject of research directly. Numbers of irregular migrants taken from administrative statistics based on refusals, infractions, or regularizations are multiplied to estimate the total number in the population. *Indirect estimates* do not rely on such data. They mainly start from general data on the population to estimate irregular migrant numbers (e.g., by expecting similar proportions of irregular migrants or calculating residues in official registers). Direct estimation approaches can be further classified into multiplier methods (among which simple multiplier models, capture–recapture models, and models using a comparison of administrative registers and random effect mixed modeling),

methods of self-identification, and snowball sampling methods. Among the indirect approaches, residual methods, demographic methods, subjective estimations, or indicator methods, econometric methods on the size and structure of shadow economies, comparisons of immigration and emigration statistics, flow–stock methods, and methods based on indirect inferences can be distinguished. It is not the aim here to provide an extensive discussion of all the methods mentioned above (for a very informative schematic overview, see Appendixes 1 and 2). Three examples will be given though, as they are paradigmatic for the problems related to estimating irregular migrants.

Multiplier methods calculate the size of the unknown total from the size of a known subtotal by use of an appropriately estimated multiplier. The use of multipliers to derive the size of a hidden population from the size of a known subtotal of that population is probably the most common way of estimating an unknown population. The problem of giving adequate estimations is then translated in finding the right multiplier (Vogel 2002). An example of using the multiplier method for estimating irregular migrant numbers is provided by a study in Belgium by Van Meeteren et al. (2007). In this study, police data on arrested criminal foreigners is combined with data from in-depth interviews with 120 irregular migrants. The police data on criminal offences committed by foreigners without legal residence is compared with the “crime rate” among the migrants that were interviewed. Three assumptions are internal to this method, assumptions that modify the quality of the outcomes. Firstly, there is the expectation that the crime rate derived from the interview sample is a good indicator for the actual crime rate among the target population. Secondly, the estimate is based on the assumption that the reported crime figures are a good indicator for total crime figures. Thirdly, the sampling group is expected to be representative of the total population of irregular migrants. Concerning the first assumption, it can be argued that long in-depth interviews lead to sufficient trust between the interviewer and the respondent so as to retrieve realistic answers. As regards the second assumption, things get slightly more complicated. It is not clear to what extent police data on arrests cover the total amount of criminal offences that are actually committed. It is very likely that the police do not detect all cases of crime and the resulting estimate is therefore unreliable (Kraler and Vogel 2008). The third assumption implies problems concerning generalization, as the sampling group is rather small and it is impossible to retrieve a randomized sample if the composition of the total group is largely unknown.

Similar problems arise with the capture–recapture method. This method is used in biology to estimate animal populations in the wild. The basic idea is to develop a multiplier through repeated sampling of the same population. Estimating a fish population goes as follows: first, capture 1,000 fish and mark them before releasing them again. Capture another 1,000 fish and look how many are marked. If, for example, 100 are marked, the 1,000 fish will statistically make up approximately 10 % of the total, i.e., 10,000 fish. In the Netherlands Van der Leun et al. (1998) have used this principle to estimate numbers of irregular migrants. Their “repeated capture method” is based on a data set that tries to apprehend numbers of illegal immigrants in Amsterdam, Rotterdam, The Hague, and Utrecht (the four biggest

Dutch cities) during 1995. Using the number of persons captured and arrested again, it is argued that the number of people who will show up again follows a probabilistic distribution called the Poisson distribution (λ). On the basis of the available data, the crucial parameter determining the Poisson distribution can be estimated. This is then used to identify the probability of an individual being caught by the police. Again, a number of problematic assumptions are at work. First, the population has to be homogeneous (with respect to the risk of being caught). This can be met through the use of an appropriate regression method, which accounts for determined features for apprehension, such as age, sex, and origin. Second, there has to be a more or less stable chance of getting caught. The supposition that no major policy changes take place during the time span of the research is thus required. But, most problematic is the third and final assumption: the population under consideration has to remain constant during the period of research. Such stability is highly unlikely as there are peaks in flows of irregular migration (e.g., seasonal workers). This leads researchers to make the decision to exclude certain groups from the study (Pinkerton et al. 2004).

As a final example of estimation methods, demographic methods start from the idea that rates concerning, e.g., birth, mortality, and hospitalization are normally distributed over the total population. Legal and illegal people are thus supposed to experience these events to the same extent. Proportions of irregular migrants' hospitalizations, deaths, and births are then extrapolated to estimate total numbers. The practical advantage of these methods lies in the wide availability of the required data, which means that there is no need to acquire new data sets. However, the assumption that these demographic rates are similar for illegal and legal residents can be questioned. In some populations, the birth rate is very high (e.g., Roma population, Ringold et al. 2005), while life expectancy too may vary a lot (e.g., Fundación Secretariado Gitano 2009). Irregular migrants often live in worse conditions than natives and are more susceptible to health problems. A larger risk of disease due to poverty and bad living conditions may thus lead to an overrepresentation of data. Furthermore, there are registration problems. Irregular migrants are often very mobile and may choose to return due to impending demographic risks (e.g., chronic illness, death). Sometimes, things may be the other way around: people come here to enjoy medical care that is lacking in the country of origin. Finally, differing benefits in the health-care system may lead to serious underestimations. Irregular migrants are not always hospitalized when this is required because they cannot rely on the same benefits or they are afraid to profit from them due to their illegal residence status.

Counting the Uncountable: Some Conceptual Problems

Social scientists generally acknowledge the problems resulting from various estimation methods. They are therefore reluctant to identify estimates and differ over the degree of reliability that they are willing to attribute to these numbers. Problems

of measurement evidently follow from the fact that irregular migration is resistant to registration and statistical description (Tapinos 1999; Gordon et al. 2009). Estimating the numbers of illegal residents in a country is almost impossible given the fact that the phenomenon is a gray zone. Nevertheless, a great deal of pressure is put on researchers to make such estimates. Both journalists and policy makers need numbers to develop a particular argument and make policy. As Clarke (2000) argues, a number that is quoted somewhere in the press has a good chance to develop a life of its own and survive for many years in the media where it is rehearsed as a fact, even if the original estimate was accompanied by disclaimers. As such, they may obtain the character of a scientific finding without, however, having any methodological or conceptual backing (Triandafyllidou 2010b). Surprisingly, problems pertaining to unreliability do not deter researchers from producing estimates. Scientists seem to be equally attracted to numbers (Kraler and Vogel 2008) and search for solutions to deal with the observed problems. These problems are redefined in terms of a lack of quality assessment of the methods of estimation. What is thus required is “a classification scheme that serves as an indicator of the scientific quality of the estimates” (ibid, 2008, p. 6). “Quality classes” (high-/medium-/low-quality estimate and low estimate with a plausibility warning) are distinguished, estimates are formulated in terms of a minimum and a maximum, and different methods are intertwined (“combined methods”) to increase reliability. But still some maintain that “even low-quality minimum or maximum estimates without ranges can be useful in a national context if they challenge generally shared assumptions about the size or composition of a group” (Vogel and Kovacheva 2008, p. 9).

The quality of estimation outcomes remains problematic. Moreover, in what follows it will be argued that there are fundamental problems underlying the search for qualitative estimates of a conceptual nature. In most cases these problems are hardly touched upon. They concern differing definitions, data sources, and collection methods that are used when comparing data. Moreover, different legislations in the respective countries generate problems of comparability. The problematic character of conceptualizations when estimating irregular migrant numbers will be treated in two different ways. Firstly, the focus is on the relation between the definition of the target group of research and the way the problem is conceptualized. Secondly, the unavoidable tendency towards homogenization that is intrinsic to reducing the complexity of a large amount of data to a limited number of differences will be problematized.

Different Definitions, Different People

In the literature a number of descriptive strategies are used to denote people without legal residence. Adjectives such as illegal, irregular, unauthorized, undocumented, or clandestine are often interchangeably combined with the nouns (im)migrants, aliens, or refugees. There is debate over the appropriateness and applicability of

these various concepts. Mostly, discussion is on the (often emotive) connotations associated with different terms. Some authors talk about refugees (Hamilton and Moore 2004), referring to the definition of the 1951 United Nations Geneva Refugee Convention: “A refugee is a person who owing to a well-founded fear of being persecuted for reasons of race, religion, nationality, membership of a particular social group or political opinion, is outside the country of his nationality and is unable or, owing to such fear, is unwilling to avail himself of the protection of that country; or who, not having a nationality and being outside the country of his former habitual residence as a result of such events, is unable or, owing to such fear, is unwilling to return to it.” (UNHCR 1993, p. 6). This term refers to the group of migrants who have been found to “qualify” for official refugee status (Watts and Bridges 2005). In many countries, people who do not meet the criteria that are set by the government to be a “legal” refugee are often called “undocumented migrants” (or *sans-papiers*), a term preferred by, among others, Paspanalova (2006), although it is unofficial and has no legal force. In scientific literature, the term “illegal aliens” (Van Dijk 1996; Ommundsen and Larsen 1999; Martiniello 2005) has, to a large extent, been replaced by the term “irregular migrants” (Jandl 2007; Broeders and Engbersen 2007; Laubenthal 2007). This is due to the fact that “illegality” is too often connected with criminal behavior and human rights advocates argue that “no human being is illegal.”

Without going deeper into the discussion over which concept is most appropriate, it should be noted that the definitions of preference are decisive for the way a problem is conceptualized. Using different terminologies as well as different ways of defining the used concepts can influence the statistical outcomes to a large extent and will finally lead to different conclusions and recommendations. The target group “irregular migrants” exemplifies the importance of conceptual demarcation: definitions frequently have emotive connotations, they are often unclear, and they are used in very different ways. It is thus of crucial importance that research reports clearly indicate the definitions to which they subscribe, who is or is not included in the target group and why this is so. The motives behind conceptual choices should therefore be made explicit due to the potentially unpleasant consequences of not doing so. That is not as evident as it may seem. Definitions of irregular migration always include elements of a negative definition (people *without* papers, who have *no* legal residence status, who *cannot* rely on particular kinds of support). Therefore, policy changes towards regular migration can lead to substantial changes in the irregular migrant population. This is most obviously the case when regularization programs take place, but besides this, attribution of, for example, working permits and medical cards to particular groups may temporarily or permanently change their legal status. Definitions are constructed in relation to their practices of reference that may historically and locally differ to a large extent. The impossibility of deriving concepts from empirical data lies at the basis of the incomparability of much of the research data and outcomes. Unfortunately, this does not stop policy makers and journalists making comparisons. The love for numbers comes with a desire to compare. A good example is the Clandestino project that is funded by the European Union. This project tries among other things

to estimate the stock of irregular migrants in different countries. The total number of irregular migrants in Europe (Picum 2009) is estimated as being between 2.8 and 6 million. To complicate matters, there is no implication that the mean estimate is the most likely number. The width of these estimates is huge and their reliability is questionable. Estimates from different countries are made with different (more and less reliable) methods. Different definitions are used and again it should be stressed that policy differences cannot be overcome. Some figures are even calculated on the basis of extrapolation of the number of irregular migrants that reached their destination countries by looking at the number of migrants arrested at the borders. Based on discussions with border control authorities, a multiplier is defined (e.g., multiplying 60,000 borders' apprehensions in 1993 multiplied by 4–6, cf. Widgren 1994). Estimations then hardly seem to be more than mere “guesstimates” or “politicized number games” as they are to a large extent based on ungrounded assumptions (Vollmer 2010). Moreover, with international comparisons, there are always added difficulties when comparing the different data sets as they measure different things, using different systems, at different times, and by different authorities (Clarke 2000).

This does not keep researchers from drawing remarkable conclusions. It is recognized that “the review of efforts to estimate the size of irregular migration on a European level has shown that the numbers indicated are based on very rough estimates” because “often we do not know which groups of irregular migrants are included in a stock estimate, nor do we know whether a flow estimate is meant to measure net inflows or gross inflows” and “older studies are often quoted in newer studies, so that estimates appear to apply to the present, although they were made some years ago” (Igllicka, in Kraler and Vogel 2008, p. 17). Still, researchers say that “approximate comparability is better than no data at all in a situation where a high degree of comparability may never be achieved” (Vogel and Kovacheva 2008, p. 17) or that “these estimates will greatly aid policy making” (IPPR 2006, p. 9). Reference is made to policy: “In the public sphere, there is a general need to gather reliable information on important social phenomena, to determine whether or not the situation warrants any political action. [. . .] For governments, the perceived size of the phenomenon will have an important bearing on the justification for the expenditure of public resources on alternative uses” (Jandl 2004, p. 152). The idea that “approximate comparability is better than no data at all” seems to count here as well.

Given the far-reaching consequences at policy level, glossing over the large and to a great extent insurmountable problems that are related to estimating irregular migrant numbers is highly problematic. Or as Clarke (2000, p. 21) states:

. . . whichever method of assessment is used, estimated numbers of irregular migrants are based on assumptions, many of which are either untested or maybe even untestable. The fact remains that unrecorded and irregular migration is, by its very definition, unquantified and, indeed, unquantifiable. Any figure generated is at best an educated guess. [. . .] And yet there are many pressures from policy makers, the media and other interest groups to come up with a quotable figure. When an estimated figure is “calculated” no matter what warnings and disclaimers are attached to it, as has been seen a number of times in the last few years of growing interest in trafficking and “illegal” migration, there is a danger that this figure is picked up and rapidly circulated and, before long, quoted as a fact.

The nature of Clarke’s critique is clear and goes beyond concrete problems related to particular methods. From a scientific perspective, there is a lack of reliability in the estimations obtained. To a certain extent, the phenomenon of irregular migration indeed *is* unquantifiable, and the best that can be expected from these estimations *is* an educated guess. But the weight of these scientific arguments, which strive for objectivity, is limited in the politicized context of policy making. For some this is regrettable. It is true that one may find examples of research that is conducted to provide the rationalization for a predetermined policy. In these cases, the outcomes of the research are known long before it even has begun. Research is used as an instrument to legitimize political choices. Both the media, governments, and parties may have something to gain by presenting high numbers of irregular migrant inflows and a dramatization of the situation at hand (Triandafyllidou and Vogel 2010). This is unacceptable but is not what is really at stake here. At the very least, the arguments in defense of using estimates should be taken seriously. A requirement for political action is a well-founded insight in the current state of affairs. To be able to deal with problems related to irregular migration, the nature of these problems requires clarification. Part of that job is to get an idea of the scope of the phenomenon, i.e., to “measure” the “size” of it. The “love for numbers” demonstrated by policy makers may then be an expression of sincere engagement with these problems, rather than a fast solution to legitimize decisions.

The fact that “something has to be done” by policy makers does not take away the fundamental critique on irregular migrants’ estimations. But it does mean that critics have to offer a possible alternative. If not, the argument that from a policy view “approximate comparability is better than no data at all” is legitimate, although, from a scientific perspective, this is not always so. What is left from the critique now is twofold. First, the critique can serve as a “reminder” for policy makers. It does so by stressing the importance of conceptual demarcation and underlining that the information provided by estimations is very limited. It is not the estimations that are the problem, but rather the fact that these numbers start to lead a life of their own. Policy makers should be aware of this danger and the limitations of estimations. Secondly, the critique may be a step-up to develop other research strategies. This refers to the idea that estimates are an *insufficient* condition to gain insight into the problems related to irregular migration. Again, this does not mean that they cannot be helpful; it only means that their contribution has to be put into perspective. Other questions and different kinds of (e.g., qualitative) method (ology)s may form a valuable supplement to the acquired numbers. This may therefore lead to *alternative* ways of approaching irregular migration.

The Homogenization of Complexity

The question of what can be expected from estimating irregular migrant numbers is currently being explicitly brought to the fore. The group of people involved is predominantly approached from a legal point of view that focuses on residence

status. Within that perspective, the heterogeneous character of irregular migrant populations is to some extent acknowledged. There seems to be general agreement of a division of this population into four different groups or categories:

- People who have illegally entered the country, whether independently or with traffickers, by either:
 - Physically evading formal immigration control, or
 - Presenting false papers to immigration control
- People who legally entered the country for a fixed period which has expired; they did not renew their permission to stay and are thus unlawful overstayers.
- Asylum seekers who legally entered the country to pursue a case for refugee status, but who remain despite a final decision refusing them a continuing right to remain; and
- Children born in the country to such “irregular migrants”, who also lack a right to remain although they are not themselves migrants (Gordon et al. 2009).

Still, in each of these cases, the legal status of “irregularity” serves as the benchmark of categorization. The ethnicity, nationality, religion, native language, cultural background, etc., of the people involved are barely considered, as from a policy perspective what is at stake is their legal status. For asylum seekers, things are slightly different. On arrival, attention is directed at political or personal reasons for taking refuge, and nationality is a very relevant factor for recognition of refugee status. But once people are categorized into the group of “irregular migrants,” they are treated as a monolithic group of people. Contextual elements slide to the background and become rather irrelevant. The residence status is the qualifying benchmark to be included or excluded from all kinds of (citizen) rights, provisions, and initiatives. Everything depends on the documents one has or does not have.

As a consequence, the quest for these documents serves as the binding agent for the people lumped together under the denominator “irregular migrants.” This experience *is* shared by all of these people. They come across with each other, e.g., in charity organizations or in shared waiting queues for public services. But at least as important as this guiding similarity are the observed differences between irregular migrants. Various cultural backgrounds, motivations to take refuge, and personal histories that lead to irregularity are often incomparable. An Eastern European girl kidnapped and smuggled into Western Europe by human traffickers for prostitution deals with problems that have little to do with those faced by her immigrant worker compatriots who come here to work for a few months on the black market so as to gather as much money as possible to send or take back to their homeland. Similarly, the unaccompanied child soldier has little in common with the African soldier of fortune looking for a better life in the rich West or the South East Asian refugee seeking safety after suffering persecution in her homeland. Roma gypsies often feel comfortable with their irregular status and are often not even interested in regularization. “Being irregular” in many cases seems to have become a part of their cultural identity, towards which they have adapted to. Of course, within these different groups of people, there are large differences;

homogenizing them through stereotypes is not what the preceding examples are intended to do. What I am trying to emphasize here are the divergent perspectives and (previous and current) living conditions of all these people (at a cultural or ethnic but at least as much at a personal level). The government also recognizes that incomparable situations refer to different problems that are not necessarily related to residence status. Human trafficking, war traumas of unaccompanied minors, moonlighting, clandestine (drugs) trade, etc., are important problems that cannot be captured under the name of “irregular migration.” Unfortunately, this is exactly what is being done when numbers of irregular migrants are estimated. None of the studies mentioned above draw attention to these differences. This leads to injustice for the people involved. They are (independently of the particular term used to define irregular migrants) linked to problems that may have nothing to do with their personal conditions. From a policy perspective, it shows that treating these people as a monolithic group takes away the possibility of making desirable distinctions. In statistical terms, this reflects the danger intrinsic to reducing the complexity of a large amount of data to a limited number of differences. Restricting the degrees of freedom to obtain more accurate data inevitably has homogenizing consequences. What is left are vague numbers that hardly contain any relevant information. That brings us to the last section of this paper, in which I explore alternative ways of dealing with the aforementioned problems.

Does It Make Sense to Say...

The discussion presented above shows how difficult it is to “make sense” of the divergent problems related to the group of irregular migrants. I now want to move beyond the methodological matters concerning the adequacy of various estimation methods and consider the appropriateness of the questions put forward by policy makers and researchers. Why are these questions seen as being so attractive, so apparently integral to the situation presented above? Willingness to “count the uncountable” is surprisingly strong. The fact that the goal of many irregular migrants is to go into hiding does not diminish the conviction that estimations will be helpful when trying to understand the problems at stake. Neither does the finding that it is impossible to even roughly estimate irregular migrants’ numbers keep researchers from doing exactly that. Something more profound seems to underlie the apparent “love for numbers” that to a large extent characterizes Western societies.

Blommaert and Verschueren (1998) largely elaborate on their thesis that “the ‘migrant debate’ rests on the idea that the ideal society should be as uniform or homogeneous as possible. Homogeneity is not only seen as desirable, but also as the norm, as the most normal manifestation of a human society” (ibid., p. 117). In their linguistic discourse analysis, they put forward an impressive number of examples that support this thesis. “‘Homogeneity’ is seen as the dominant ideology that directs our thinking about foreigners. Through the abnormalisation of the foreigner,

it contains an a priori rejection or problematisation of diversity. [...] Foreigners disturb the existing order, they threaten the *status quo*, their presence alone already turns them into a problem” (ibid., p. 146). The attempts to homogenize the group of migrants—which seems to hold for irregular migrants too—thus come from a defensive reflex. This attitude expresses a fear towards the unexpected, the new, and the unknown, i.e., towards whatever can change or damage what has been established.

This critique of homogenization brings a different perspective to the question of “how many irregular migrants there are.” If policy makers ask this question so as to bring about “reliable information” (cf. supra) for dealing with problems related to the presence of irregular migrants, then its contribution seems limited. The repeated search for numbers hardly reveals anything with respect to the content of concrete practices, as by definition it is an expression of the homogenization tendency mentioned earlier. What is at stake concerns attempts to “grab” the situation and the changes to that situation. Numbers help to “get an overview” and in that sense to “control” what is happening. The apparent “love for numbers” in Western societies seems to refer to the dominant presence of a thinking that divides the world into “us” and “them” and continuously looks for “ownership.” Numbers become the tools to realize that ownership: quantifying reality becomes synonymous with objectifying reality, i.e., gaining control over the world surrounding us. One could even argue that the attraction of numbers refers to what Nietzsche called *Wille zur Macht*: the will to power as the driving force behind human actions.

Recognizing the “will to power” in the current love for numbers gives us sufficient reason to judge the estimation practices in the context of irregular migration. But, as mentioned earlier, that does not solve the problem at hand: what course of action is left for the policy maker? The question that remains concerns whether or not there are other ways to “understand” the situation that can be distinguished apart from attempts to “grab” it. A possible alternative may be to develop a problem-oriented policy that works towards finding solutions to current problems. Some irregular migrants would then be liable to prosecution as a result of policy that fights smuggling, human trafficking, poverty, etc. Stretching this line of thought, some decisions might even be directed towards particular cultures, religious groups, or ethnicities. One can, for example, think about discussions on the foundation of Muslim schools in Western European countries or initiatives to promote school participation for Roma people. Irregular migrants are then not approached from the perspective of their (illegal) residence status, but from events they have participated in or been victimized by or from the ethnic, cultural, or religious group they belong to. It is unclear whether or not this would deal with the problem. Even if this approach is adopted, numbers will be sought after to estimate the size of the problem. Whether we are talking about irregular migrants, smuggling, criminality, poverty, Muslims, Roma people, or anything else, obtaining an idea of the scope of a social problem seems an indispensable element of “understanding” that problem and gaining insight into it even if this is only so that policy makers can decide on how the limited means that are available should be distributed.

The earlier critique of attempts to estimate irregular migrants provided evidence of the limited value of these numbers when trying to gain insight into the phenomenon. However, the pragmatics of policy making shows that this limited contribution to understanding irregular migration is better than no contribution at all and that the critique itself has limits too. Estimations make sense, even if their reliability is very low. Although they cannot deliver the profound insight into social problems that is required for a well-founded policy, they can serve as a stepping-stone for further research. The “will to power” may indeed be present in the attempts to frame social phenomena in numbers, but this does not explain the “love of numbers” and the attractiveness of quantitative data. Every search for understanding, whether it be quantitative, qualitative, or even philosophical, is expressing a will to power, i.e., to gain control over a situation.

What makes numbers so attractive then might be their transparency and unambiguous character. That takes us back to the second element of the conceptual critique, namely, the homogenization of irregular migrants. Here, the proposed policy alternative may deliver added value. This alternative does not start from the dichotomy between regular and irregular people and between people with a legal and an illegal residence. It is important to recognize the diversity of problems facing irregular migrants are dealing with. Indeed the very concept of an “irregular migrant” (or any alternative concept referring to this group of people) as an umbrella to homogenize the present diversity should be seen as problematic. This could be a starting point for a more just approach to the complexity of their everyday social practices.

The Educational Solution Beyond Demarcations: Inclusive Education for the Sake of Whom? The Roma Case

In the foregoing, the homogenization tendency that is present in social policy regarding irregular migrants was outlined. In what follows, the focus will be more specifically on education. In this particular area, a growing tendency towards inclusion provides a way of thought that seemingly counters the earlier mentioned homogenization critique. The division between *us* and *them* that is still present in initiatives focusing on integration gives way to an inclusive approach that—as the word expresses it—includes all (Booth and Ainscow 1998). Divisions are avoided, as they may give cause to different treatments and subsequently to discrimination and/or ethnocentrism. In the current discourse, inclusion heralds a new era in which all are fundamentally equal. Or, as it is defined on the UNESCO website:

Inclusive education is based on the right of all learners to a quality education that meets basic learning needs and enriches lives. Focusing particularly on *vulnerable and marginalized groups*, it seeks to develop the full potential of every individual. The ultimate goal of inclusive quality education is *to end all forms of discrimination and foster social cohesion*. (own italics) (United Nations Educational, Scientific and Cultural Organization 2009)

The conceptualization of “discrimination” is very interesting here. In the past it referred to “giving a distinguishing judgement” in an esthetical, moral, or intellectual respect. An “undiscriminating” person lacked the power of discernment. Nowadays, the power of discernment is still valued. Yet, in a positive sense it is rather related to the concept “critical (power)” (cf. the Greek κρινω: to separate, decide). “Discrimination,” on the other hand, still requires an ability to make distinctions, but is foremost presented as something undesirable, as it is associated with racism, unequal treatment, and injustice (Dalrymple 2007). The meaning of this concept has not only shifted, moreover, it is put in an ethical context: “discrimination” implies a position of desirability towards the distinctions that are made and as such it *has* acquired a negative connotation. Inclusion explicitly breaks with all forms of discrimination, encompassing the distinction between *us* and *them*. All are to be included, and thus social cohesion is fostered. This view expresses a universal right to education. All children have the right to participate in the educational system, whatever their ethnicity, nationality, or residence status. Without going deeper into the discussion to what extent this goal is realized in different European countries so far, the inclusive approach clearly aims at removing distinctions and aims to provide opportunities for all.

The question that remains now is whether and in what sense homogenization is still at work in the inclusive view once the distinction between *us* and *them* has disappeared. Above, attempts to homogenize people were explained as expressions of fear towards the unexpected and the unknown, i.e., towards what may change the current state of affairs. That makes this question extremely interesting for education, as (possible) “change” plays an important role in educational practices, whatever the perspective one takes. In what follows, the leading question will be whether and how “homogenization” is or should be still at work in inclusive education initiatives.

Going back to the UNESCO definition of inclusive education, the focus on vulnerable and marginalized groups is very remarkable. It seems to express the opinion that starting from “all are equal” does not take away the need to define groups when adopting an inclusive policy. UNESCO defines seven “target groups” considering inclusive education: street children, child workers, child soldiers, children with disabilities, indigenous people, Roma children, and rural people (United Nations Educational, Scientific and Cultural Organization 2009). I will now focus on the Roma children, considering the focus of this chapter on irregular migrants. This case seems to be particularly interesting, as many Roma live in an irregular status—which has, some even argue, become part of their cultural identity; and as their willingness to become part (“to be included”) of other local communities is often far from evident, which brings along additional educational challenges. Starting from the finding that as many as 50 % of Roma children in Europe fail to complete primary education, UNESCO urges for interventions directed at this particular group. The intentions are laudable: Roma children should be able to exercise the right to participate in the school system just like other children. Potential barriers should be taken away. This implies initiatives such as changing the legislation, developing a positive attitude towards Roma people in the

schools, creating participation possibilities in decision-making processes, and moreover the empowerment of Roma people to advocate themselves (e.g., through training programs). Summarizing, one could say that everything has to be done to “include” Roma children in the educational systems that are present in different European countries. An enabling policy that offers opportunities to empower and emancipate oneself is developed. Focusing on particular target groups is only necessary up to the extent that the ideal of inclusion is not yet realized.

Although the proposed initiatives may sound like humble pie, it might be interesting to have a look at the presuppositions of this view. Divisions are no longer made on the basis of their legal status. Moreover, the distinction between *us* and *them* in any (other) sense seems to be abolished. Homogenization seems to be absent. “All children are considered to be fundamentally equal” and that is the starting point of inclusive education. But is this so? And moreover, is it desirable?

A starting point to answer the latter question (that might go against the grain with many, as “equality” is often considered univocally positive) is brought forward by Roma people themselves in concrete situations. Maybe, the profound disinterest that many social workers encounter when trying to convince Roma to send their children to school should be taken more seriously. The observation that school often “does not make sense” to Roma is easily explained in terms of a lacking information and insight in how the school system works or in terms of discrimination. But the latter may be more than an expression of possible barriers in a current state of affairs. To some people, the idea of schooling itself may not make any sense at all. That possibility forces the inclusive idea to show its true face. The sense and importance of schooling for all children is not questioned fundamentally in the current discourse about inclusive education. The distinction between *us* and *them* is overcome under the guise that it is up to “us” to search our own heart and take the responsibility to “include” the other. Still, the basic idea is one of including, i.e., to make the “other” become part of “us.” Moreover, the conception of quality that is implicit in talking about a “quality education for all” seems to be self-evident.

What is at stake in the discussion is not whether schooling makes sense or not. Rather, it is about the self-evidence of the desirability of “schooling as it is” for all. This becomes very clear in the areas of intervention formulated by UNESCO: all is done to offer (participation) opportunities for Roma people, on the assumption and the expectation that these people are *willing* to participate. Opening up the possibility that this might not be the case shows how homogenization is still at work within the inclusive view, albeit in a different way than it was before. The “us vs. them” has made place for a “we are all one.” The “them” seems to have disappeared at the cost of an “us” that exceeds all boundaries. We are willing to include all, but not to accept another perspective. Inclusive education *should* not only include all, it *must* include all—in the child’s best interest. The next step might then be to blame the parents who do not take up their responsibility (i.e., their duty) to make use of what is offered. To some extent, this is quite understandable: parents cannot keep their children from enjoying the rights that are attributed to them. Yet, there is more at stake here. Who is not willing to participate in inclusive education is regarded as obstructive to the realization of the right to education for all. Thus, the right to education is equated with subscribing to the paradigm of inclusive education.

Coming back to the question whether homogenization is still at work in inclusive education, the answer seems to be a clear “yes.” The definition of Blommaert en Verschueren of “homogeneity as the abnormalisation of the foreigner as the problematisation of diversity” (Blommaert and Verschueren 1998, p. 147) is no longer tenable though. The current homogenization in inclusive education works through the *normalization* of the foreigner. Diversity (e.g., on the cultural or ethnic level) is no longer seen as a problem, but rather denied to avoid possible forms of discrimination. The discourse on diversity no longer focuses on differences between groups. Differences only matter at the individual level, when the aim is to realize a qualitative education for all, i.e., an education that fits individual needs. This tailor-made education is shaped through an extensive amount of initiatives: from personalizable digital learning environments to “care coordinators,” everything is put in force nowadays to address personal needs in the learning process.

The inclusive paradigm reminds us that individuals are not reducible to a group (e.g., culture, ethnicity, residence status, etc.) they belong to. These “groups” are value loaded categorizations that are socially constructed, which indeed implies risks of undesirable forms of discrimination. What is left after deconstructing these (social) groups is the particularity of the individual. In the end we are all unique and irreducible to any social category that is “benchmarking” us. Without wanting to question the truth value of this view, it may be a concern whether one finds fertile soil for education in such an image solely. The factual reality that we indeed *are* all different from one another is crucial for thinking about education. But of equal importance is the insight that educational practice is by definition normative and value loaded, as a conception of what is more or less desirable is implied in every human interaction. That does not justify former practices, nor does it refute the discrimination critique that is formulated by inclusion advocates. But it does imply that the (factual) uniqueness of every individual may be necessary but is clearly insufficient for educational practice.

Individuals live in communities and they share common beliefs and practices. And apart from the ethical concern with the individual, education is about the initiation in these social beliefs and practices too. Then, the homogenization in “we are all the same in that we are all different” becomes problematic again. Individuals cannot be reduced to a group they belong to, but neither can they be reduced to their unicity as an individual. From an educational perspective, shared practices with other people within a community *do* matter. Roma people are a preeminent example here. These children cannot just be “included” in an educational system that is unfamiliar to their social practices and which does not make any sense to them. “Empowering” the Roma may be a step beyond integration; it does not express a readiness to doubt the (universal) rightness of *us* and our social practices.

The limits of the inclusive paradigm come to light in this contradictory situation. To include everyone paradoxically implies that one imposes her opinion to the other. This is to a certain extent unavoidable: escaping from this paradox is impossible as one cannot apply other criteria than her own. The possibility to do justice to the other appears to be limited. If one is willing to question herself and to come as much as possible towards the other, the consciousness of these criteria is a

first step. An openness towards (new) concepts, criteria, and categorizations is moreover required. Qualitative data on the social practices of other people may be helpful to achieve this consciousness and to broaden one’s own perspective, which may finally lead to a certain level of “understanding” the other (Smeyers 2007).

Broadening the Idea of Understanding: On the Social Practices of Irregular Migrants

This chapter focused on the question how “irregular migrants” are being framed both from a policy and a research perspective, mainly drawing attention to the predominant focus on the intent to count and quantify the people that are concerned. The focus on numbers and estimations in research expresses the need of policy makers to get a hold over the state of affairs. Although it concerns people who differ in many senses and who are dealing with very divergent problems and living circumstances, they are all homogenized under the same denominator. Irregular migrants are thereby mostly defined in negative terms: people who do *not* have legal documents, who are *not* granted a refugee status, and who *cannot* rely on different kinds of social support. They seem to be the remnants of all kinds of minorities that fall between the gazes of the social welfare state. It was argued that the situation is somewhat different at first sight within the area of education, where inclusion initiatives are growing. In the inclusive discourse homogenization is still at work, yet in a less obvious and more subtle way than it was before. The case of Roma proved to be helpful in understanding that homogenization; as people with a very particular cultural identity, they frequently oppose to “being included” and give expression to the impossibility of an outside position with respect to the inclusive paradigm. But what is left now? Does this imply that inclusion is by definition undesirable or that we should put educational systems as they are conceived of between brackets?

At least some suggestions can be put forward to help policy makers in their attempts to “do justice” to irregular migrants. First of all, homogenization is not by definition bad or wrong. Sometimes people want to belong to a group as a means to confirm their own identity. Again, reference can be made to Roma people who often seem to confirm the distinction between “us” (the *Roma* people) and “them” (the *gadje* or non-Roma people) rather than blurring it. From the perspective of policy makers, “grouping” people cannot be avoided; it is often desirable or even required to deal with particular problems. Earlier, reference was made to the danger that this kind of relevant differences may vanish to the background when focusing on the irregular legal status. The remaining question is what is “relevant” in the latter and what is not. That brings us to a second suggestion. To answer the question which distinctions are relevant for what purpose, different kinds of research are required. Estimating numbers is certainly not a meaningless activity. Yet, to be able

to make proper judgements on what problems, characteristics, or resemblances are “relevant.” at least a certain level of “understanding” of social situations has to be achieved. Qualitative research—i.e., research that is looking for “meaning”—may then be of great help. The size of a problem or phenomenon can be measured and that is relevant to gain an insight in the scope of the required initiatives. But besides this, “understanding” problems or phenomena implies looking for how those are socially constructed, what meaning people give to them, and how they relate to different social practices. This “understanding” forms a necessary condition to make well-considered choices on which “groups” are desirable to be distinguished for a purposive and conscious policy.

The issue of what legitimizes the dividing lines to mark out particular target groups—in this case irregular migrants and Roma—has now been approached from different angles. In the cases of both irregular migrants and Roma, it turned out to be difficult not only to demarcate clear boundaries between who does and does not belong to the group at stake but also to identify specific characteristics. For irregular migrants, some residence statuses are not only fuzzy (in that it is unclear whether they should be classified as of irregular or regular status), but legal conditions may vary over various countries and over time too, which implies that no fixed criteria can be identified. Similarly, one could argue that linguistic, cultural, socioeconomic, and religious commonalities cannot be deemed characteristic for all Roma. At first sight, the aim to give “recognition” to people, including their particularities, seems to disappear from the picture with this homogenization critique. But such a view is incorrect. Quite the reverse, it opens opportunities to develop a different approach focusing on social practices, the starting point of which is an ethical sensitivity and responsiveness towards the people and situations at stake.

According to Winch (1958) social science has to engage itself in understanding human practices. In suggesting this he draws from the later Wittgenstein such ideas as “following a rule,” “human shared practices,” and “what it makes sense to say.” Invoking Wittgenstein, Winch draws attention to the fact that one cannot make a sharp distinction between “the world” and “the language in which we try to describe the world,” and argues that it is therefore wrong to say that the problems of philosophy arise out of language rather than out of the world: “Because in discussing language philosophically we are in fact discussing what counts as belonging to the world. Our idea of what belongs to the realm of reality is given for us in the language that we use. The concepts we have settle for us the form of the experience we have of the world” (Winch 1958, p. 15). As has been argued throughout this chapter, the relevance of conceptual enquiries into what it makes sense to say should therefore not be underestimated. Words are to be understood in terms of their use in the lives of those who deploy them. Having a language and the notions that go along with that, such as meaning and intelligibility, are logically dependent for their sense on social interaction between people. Turning back to our case, it is shown that recognizing the individuality of, e.g., Roma may imply something else than “calling them by their name” or “revealing and affirming their positive characteristics.” More likely, it requires us to be responsive to who

they are. That does not require that differences are stressed, nor that these are denied or to be overcome. The answer to the questions “what needs to be done?” and “how to go on?” with Roma issues may be one in terms of paying more or less attention to particular group differences; but that is not necessarily so and especially not in an unequivocal or universal way. While in some contexts and policy areas it seems desirable to create a space for people to identify with being Roma, this may not be the case elsewhere. Consequently, “recognition” does not require any sort of particularization. That is only one out of many possible answers to the situations at stake. Rather, the pedagogy proposed here is inspired by ethical sensitivity, responsiveness, and centralization of the questions “how to go on?” and “what needs to be done?”.

From “Knowledge on the Case” To “Knowing How to Go On”

In educational research what is at stake is the understanding of a particular reality brought to the fore by language: this presupposes that this reality can be understood and moreover that its intelligibility can at least partially be made explicit. The core of the conception of language, which marks Wittgenstein’s later work, is that in the context of social practices, any attempt to say something is always partial and is always one-sided. No way of speaking, no doctrine whatsoever can control cultural practices and thus liberate us from the restlessness and uncertainty of human existence, of the search for meaning in our lives. He points to the fact that what we do can never be completely transparent and that it is always characterized to some extent by arbitrariness. Thus, it becomes clear that in what we say we bear witness to what we long for, but also to what we are not certain of, such as how we try to express ourselves or be coherent (Wittgenstein 1953, 1969).

The conceptualization of social (and political) problems therefore demands an ever-renewed rethinking of reality using similar instruments. To think again can only mean to think from a different point of view about what one is trying to understand (and perhaps change). The more general question of what is at stake when dealing with social problems shifts to what is at stake for someone. In order to grasp what matters to a person, it is necessary to obtain an insight into how she makes sense of things. That does not only imply recognition of someone as an emotional being but also a sufficient understanding of her social practices. This is the horizon of meaning from which she gives sense to the things she is doing and to how she stands in the world: it defines “the rules obeyed” which are constitutive for these practices. But these rules are not fixed. In educational terms, initiation into practices is not a predetermined process. Initiation is not intended to result in a reproduction of social practices, though there are some “conservative” elements. Neither is the process of initiation relativistic; rather, what one is initiated into shapes and defines a practice which in its turn continues to be adapted and transformed. The learning processes concerned in initiation thus unavoidably

imply a form of transformation (see Smeyers and Burbules 2006)—which should not be seen however as an end state.

This process of transformation is of the utmost importance for education. Practices are not fixed entities, and therefore knowledge about these will by definition be partial and temporary. But from the focus on “what needs to be done” and “how to go on,” it follows that an investigation of what exists is only a starting point. The questions here at stake relate to what characterizes initiation processes: what are the limits and the possibilities to go on? The conceptual framework of (education as initiation into) practices offers particular opportunities to do so. It provides a language and framework to take a step beyond how these are usually approached and inspires an alternative approach. In that position, knowledge about the present differences cannot suffice; what is required is the kind of understanding that is helpful to go on. Of course, alternative interpretations or positions could have been chosen. Emancipatory approaches or critical theory, for example, would bring up other elements and draw attention to aspects that here remain unnoticed and vice versa. That is unavoidably so, as various stances stress other facets, approach these from different angles, and may lead to different conclusions. Recalling Wittgenstein, none of these positions can claim comprehensive superiority, as the extent to which they are right depends on presuppositions that ultimately are to be accepted or not and for which no conclusive arguments can be given. Still, it is argued that the stance taken offers an alternative to more classic approaches to the issues under investigation. Centering on the question “how to go on?” may be a fruitful way to deal with the differences at hand, which put common ways to deal with differences to the test.

Thus, going back to quantitative estimations of irregular migrants, these may indeed provide valuable contributions to mapping a current state of affairs. Notwithstanding large methodological and conceptual problems, as well as the unavoidable vagueness of such numbers, they may at least offer some support in estimating the scope of the phenomenon at stake. As do many other forms of (quantitative, but to a large extent this also counts for qualitative) scientific research, these numbers add to “knowledge on the case.” The homogenization critique points at some more fundamental objections, however, and clarifies how this way of approaching social reality—particularly in the area of education—unavoidably transforms this reality. It does so both at the level of the estimations informing policy and at the level of the proposed strategies and outcomes of these policies. More importantly, it does so in a particular way. In that sense, the contribution of (quantitative) approaches producing “knowledge on the case” is not only limited to the provision of a first step in the quest for answers to the more fundamental question “how to go on?”, it also alludes to the desirability of a particular direction to “go on.” An interpretive account is thus not merely an additional feature of some forms of qualitative research or a mind game of philosophers. Rather, it should be at the heart of every social scientific endeavor. That will also imply further crystallization of the position of the researcher and more specifically the delimitation of degrees and ways of involvement and

engagement. In the end, this is at the heart not only of science but also of the question “how to go on?”: to question the world around us as well as ourselves and to investigate how we relate to it and keep doing so. Though knowledge may necessarily be the beginning, it cannot leave us to indulge ourselves in the feeling of complacency that this is all we, as researchers and educators, need to acquire or achieve. Indeed, it pushes us in the direction of making it our business to know how to go on. And I modestly hope that this initiation may in its turn induce forms of transformation in a particular direction and as such point to new perspectives on “what is possible” beyond “what is.”

Appendixes

Appendix 1: Methods for Stock Estimates

Approach	Data sources	Method	Estimation technique	Main idea of calculation
Direct approaches	Based on immigration enforcement data	Multiplier methods	Simple multiplier	Estimation of total with a simple multiplier based on derived or estimated ratio of “dark field” vs. “clear field”
			Capture-recapture/ repeated capture	Estimation based on probabilistic function derived from multiple recaptures of individuals in sample
			Matching of registers	Estimation based on implied non-registration in two or more individually matched registers
			Random effect mixed modelling approach	Estimation using statistical regression model assuming comparable apprehension rates of legal/illegal residents with statistical adjustment for random effects

(continued)

Approach	Data sources	Method	Estimation technique	Main idea of calculation
	Based on administrative statistics	Methods of self-identification	Evidence based on regularisation data	Inferences on the size and composition of irregular migrant stock prior to regularization from data on applications for and grants of regularizations
			Using data on status adjustments over time	Inferences derived from data on changes in residence status after a period of irregular residence
	Based on surveys	Survey methods	Direct survey methods	Reconstruction of a “random sample” of regular and irregular migrants through a re-weighting of the probability of contacts
			Snowball sampling methods	Estimation using chain referral methods to obtain a sample of persons not registered vs. persons registered
			Respondent driven sampling	Recruitment of interviewees through peers and incentive system leads to equilibrium sample of respondents after several recruitment waves which is independent from original sample and can be analyzed statistically
	Indirect approaches	Based on census/registers	Residual methods	Differences census results—legal immigration data
Simple comparison of various registers				Indirect estimation based on a comparison of two or more registers with data on the same target population
Demographic methods			Use of birth/death rates	Inferences on demographic subgroups based on the comparison of real and expected birth or death rates

(continued)

Approach	Data sources	Method	Estimation technique	Main idea of calculation
	Based on census/registers/demographic data	Expected population methods	Comparison of census/emigration data and immigration statistics	Indirect estimation of illegal resident population from comparison of emigration estimates with data on legal immigrants at destination
	Based on administrative statistics	Flow-stock methods	Calculating the stock through flow figures	Using estimated inflow and duration of stay indicators to estimate steady-state stock of illegal residents
	Based on complementary data sources and estimates	Indirect inferences	Using information on correlated phenomena as basis of calculation	Making inferences on subgroups of irregular foreign residents on the basis of indirectly related phenomena and estimates such as irregular work, sector-specific demand for irregular services, school attendance or health services (e.g., inference of share and size of irregular foreign workers from econometric estimates on the shadow economy)
	Based on surveys of “key informants”	Subjective estimation/indicators methods	Expert surveys	Survey of key informants on their assessments of sizes, ratios and characteristics of target population
			Delphi surveys	Anonymous multiple round survey of key informants mediated by researcher to attain convergence of opinion
Combined approaches	Based on small scale surveys	Window/postal code method	Small scale study + use of regression analysis	Extrapolation of estimates derived from intense local study with regression analysis
	Based on expert opinions	Localized Delphi	Delphi method + use of regression analysis	Extrapolation of estimates derived from localized Delphi study with regression analysis

(continued)

Approach	Data sources	Method	Estimation technique	Main idea of calculation
	Adjustment to surveys/census data	Non-threatening survey design	Direct survey method + randomized response/3-cards method + residual method	Statistical inferences from employer survey using randomized response method and inferences about share of irregular migrants in sample survey using non-threatening survey questions combined with residual estimation results

Source: Kraler and Vogel (2008)

Appendix 2: Methods for Flow Estimates

Approach	Data sources	Method	Model	
Direct approaches	Based on border apprehension data	Multiplier methods	Simple multiplier	Estimation total illegal border crossings by applying estimated or derived multipliers on border apprehension data
Indirect approaches	Based on stock estimates	Differential methods	Net differences in stocks	Deriving estimated annual net increase of irregular migrants through changes in estimated stocks
	Based on entry-exit statistics	Residual method	Double entry card system	Deriving estimated number of overstayers through individual matching of entry-exit records

7.7 Interpreting Statistics in an English Team-Based Evaluation

Peter Bowbrick

*Teachers – except, of course, statistics teachers – sometimes commit the regression fallacy in comparing grades on a final examination with those on a midterm examination. They find that their competent teaching has succeeded, on the average, in improving the performance of those who had seemed at midterm to be in precarious condition. This accomplishment naturally brings the teacher keen satisfaction, which is only partially dampened by the fact that the best students at midterm have done somewhat less well on the final – an ‘obvious’ indication of slackening off by these students due to overconfidence. (Wallis, W.A. and H.V. Roberts, **Statistics – a new approach**, Methuen, London 1957.)*

The Study

A team consisting of two educationalists, Professor Morwenna Griffiths and Dr. Tony Cotton, with me to do the statistics, evaluated a Department of Education and Science (central government) project for improving the results of selected schools. The time line and funding had been specified by the clients, who also stated the data availability and some of the analysis that must be done. This chapter, therefore, is concerned with drawing inferences in the common situation where time and money are major constraints, where the statistical analysis is only part of the team effort, and where the message communicated to the clients is important. Certainly it would have been carried out very differently as part of a well-funded PhD, and different statistical inferences might have been drawn, but the results would have come too late to affect what the clients did.

The Intensifying Support Pilot (ISP) was designed to offer a package of support and professional development to schools that had low achievement in literacy and mathematics and had made little progress in raising standards since the introduction of the National Literacy and Numeracy Strategies, a central government “initiative.” From the start, the ISP had been fully integrated with the rest of the government

Primary National Strategy. It aimed to draw together existing good teaching and learning practice. It was designed to raise standards and improve teaching and learning in the context of the school as a professional learning community. The program worked in partnership with the LEA (the local government education authority which runs the schools within its area) and the school. It was based on the cycle of audit, setting targets, action, and review. It was designed to support schools to establish self-sustaining systems.

The different players in the system were the main government department (the Department for Education and Science in London), the section in this department responsible for the National Literacy and Numeracy Strategy, the ISP management team working from London for this section, the LEAs, the “consultants” (who were experienced teachers working full time on delivering the support program to the schools within their LEA), the schools, the headteachers, the teachers and, of course, the pupils. All had an influence on our work, and all but the pupils drew inferences from our reports.

In the pilot round of the ISP, starting in May 2002. LEAs with a relatively high proportion of schools in the lowest attaining category on a national scale were identified. They were invited to join a programme under which more intensive support would be delivered by consultants to some of the schools within the LEA. We were appointed to evaluate the pilot in July 2003. In October 2003, an extension of the program to 76 further LEAs was started. We were then asked to expand the 2004 evaluation, first to see what happened to the schools that had been in the ISP pilot program when the support was no longer provided, and, second, to compare the current views of the schools in the second phase with the views that had been expressed by the pilot schools.

Aims of Our Evaluation

Our evaluation examined the delivery of the ISP in the first phase, identifying what seemed to have worked and what problems were encountered. We were also to identify any measurable results and, specifically for the second (2005) evaluation, the impact on attainment in national curriculum tests at the end of Key Stages 1 and 2. (There were state-run tests at Key Stage 1, the first year after the Foundation (infants) stage and again 4 years later at Key Stage 2. Schools were judged on the percentage of pupils reaching a certain level in the Key Stage tests.)

In both stages we were required to carry out statistical surveys and do statistical analysis of test results. That was largely my responsibility.

The evaluation did make substantial use of the statistical analysis to determine whether it could be shown that the ISP had in fact improved the educational attainment of schools in the program. However, it did have much broader

objectives, which required an evaluation of changes in the teaching and administrative approaches. It required, therefore, a team approach.

The Clients' Own Survey

The clients carried out their own survey before our contract started. It was intended that LEA consultants would hand out the questionnaires during a meeting with the staff of a school and that the questionnaires would be filled in during that meeting. This was done by some consultants. In other cases the consultants sent questionnaires to the schools. In some schools nothing appears to have been done with the questionnaires. Indeed one school sent the questionnaires in, untouched. In other schools there was a small response.

This means that there are several forms of response bias. One is that schools dealing with certain consultants and certain LEAs either did not respond at all or had a low response rate. It is conceivable that these consultants and advisers were better or worse than the average, and so the results were biased. Another source of bias is where some teachers chose not to respond. These may have been teachers who were particularly critical of the pilot program. We do not know. The postal questionnaires were submitted later than the others and may reflect how people felt a month or two after the end of term and having rest, rather than at the end of a busy term like the others.

It is also apparent from an inspection of the returns that responses within a given school were surprisingly similar. It seems likely that when the questionnaire was presented to a group after that group had spent an hour identifying and discussing problems and achievements, they all would write down the problems and achievements discussed during that hour.

A disproportionate number of the responses came from a few LEAs where the survey was carried out as intended. In these LEAs there were responses from more schools, and there were more responses per school.

We did not think that anything could be done to remedy this by the time we saw the data. It seemed unlikely that the normal process of sampling the nonrespondents to see whether they were atypical would work. There had been a considerable delay since the survey took place, and perceptions had undoubtedly changed after the holidays. There was a high staff turnover, many of the staff would have moved on—possibly those most disaffected, possibly not. Response rates were likely to be very poor. It was felt, too, that the follow-up would be perceived as more paperwork and would be resented. We had no doubt too that any follow-up to the ISP survey would damage the mail survey we were to carry out.

One problem was that the questionnaire had not been piloted. For example, a large proportion of respondents misunderstood the question “What is your current teaching responsibility?” This meant that it was not possible to analyze the data by whether the teacher was a full-time class teacher, a headteacher, a subject coordinator, etc. It turned out that in most cases they had two or more areas

of responsibility. In fact, when all the combinations were allowed for, there were 119 different categories. Any analysis by responsibility would, therefore, have been seriously misleading.

The only value of this survey to our evaluation was that some of the written comments gave an indication of what issues we might ask about.

It is relevant that our clients were perfectly happy with their survey, and suggested that the biases could be ignored because there was a misunderstanding about how the questionnaires were to be distributed.

Our Mail Surveys

We were asked to do three mail surveys. In the review of Phase I there was a mail survey of the headteachers involved in the ISP and a mail survey of the consultants delivering the ISP in the LEAs (that is to say not the ISP staff operating from head office in London). In the review of the second phase, there was a mail survey of the headteachers of the schools which joined the ISP in this phase.

I had carried out a lot of surveys when I first started in research many years ago, trying to be formally correct in carrying them out so the results would be valid. I came to realize though, that, for my type of research, surveys were an expensive way of putting numbers on what I knew already. The open-ended depth interviews which start the process of identifying what the survey is to be about and what questions should be asked usually made the survey redundant—either they had told me what I needed to know, or they had told me that the real question was something I had not thought of.

Mail surveys take a lot of time to administer. A survey would normally take place over more than 4 months, doing it according to the standard research protocols, so instant results are not possible. This makes them extremely unattractive when I am doing my own administration, or where I am working to a time limit. In my consultancy abroad, my statistically literate employers would not let consultants do surveys. In Britain I note that some consultancy firms routinely carry out mail surveys. The advantages to them are, first, that the surveys can be carried out by cheap clerical staff; second, that the analysis can be done very quickly using SPSS; third, that few clients will know or care if costs are cut by omitting some steps of the standard survey protocols; fourth, that this analysis can produce an enormous number of tables and graphs to give the clients the assurance that a lot of work has been done; and fifth, that publishing programs can present the tables and graphs very prettily, if not comprehensibly. This is very impressive to clients not trained in statistics, who may think that these tables and graphs alone justify the consultancy fee.

In our evaluation none of these considerations applied. The terms of reference required that we do a mail survey.

Our Survey

Surveys provide a lot of the data used for drawing inferences, and there is a tendency to accept that they are grossly inaccurate and then treat the figures as though they are 100 % correct. Sampling error is usually quoted in reports, because it can be calculated quite easily, but the other errors are usually forgotten—questionnaire bias, bad questionnaire design, interviewer bias, respondent bias, recording error, calculation error, and aggregation error. We tried to bear these in mind in drawing inferences.

Response Rate

Our major worry was that we might not get a big enough response to draw any conclusions. We did not know, or care, what might be acceptable to the clients. I have seen a British government department express itself delighted with a mail survey that had 10 % response, though these 10 % were obviously completely atypical in this way at least, and a quick glance at the results showed that they held extreme and incoherent views (Bowbrick 2012). We do not share the government's view of what is an acceptable response.

It was clear from the clients' own survey that nonresponse could be a serious problem, invalidating the whole study. It was clear from our team's initial interviews that the headteachers were swamped with paperwork—they were dealing with up to 30 central government "initiatives," like the IPS, and had to handle the enormous amount of administration imposed on them from above, as well as running the school. It was also clear that the consultants running the process were swamped with paperwork from headquarters.

This meant that the questionnaire had to be very short and obviously easy to fill in. The questions had to be clear, so there could not be the slightest confusion about what they meant. The questions had to be obviously relevant—we could not expect the questionnaire to be returned if questions were perceived to be silly. We had to leave space for the respondents to put in their own comments, both to encourage them to reply and because it was an important part of the study. We had to guarantee anonymity—our guarantee would carry more weight because we were operating from a university. These considerations were important in preparing the questionnaires and in piloting them.

The survey covered all LEAs and schools in the ISP. The questionnaire was mailed to headteachers, project consultants, and LEA personnel. The questions were designed to elicit views about each of the themes and elements in ISP. Respondents were asked to answer each question on a five-point scale and were then invited to comment on the reasons behind their response.

The clients provided us with lists of all three populations together with addresses and contact details. Surprisingly, these were faulty: 6 % of the schools on the list had been closed, and 12 % of the consultants were uncontactable, because, for instance, they had changed jobs.

The questionnaires were sent out in reply-paid envelopes. Two reminders were sent to nonrespondents. In the two cases where there had been a low response rate from an LEA, follow-up telephone calls were also used, and the opportunity was used to ask deeper questions, addressing issues that had arisen.

In the evaluation of the first phase, we got the following results.

		No.	%
Number of questionnaires sent out to heads		132	100
Number of replies		117	89
Of which	Schools closed, etc.	8	6
	Unusable	4	3
	Usable	105	80
Number of questionnaires sent out to consultants, etc.		49	100
Number of replies		33	67
Of which	Not contactable	6	12
	Not usable	3	6
	Usable	24	49

The responses from the initial posting, the reminder, and the second reminder were compared and no significant differences could be observed. It was concluded that the response from the headteachers was satisfactory and that it could be taken to be representative of the population as a whole.

We were not happy with the response from the consultants. The response was a lot lower than I would expect and much lower than we got from the headteachers when using the same methods. We had expected a higher response if anything, because the consultants were employed specifically to deliver the ISP, while the ISP was just one part of a busy headteacher's job. In our evaluation, therefore, we had to bear in mind the possibilities that, for instance, the consultants might be so overloaded with paperwork that it was too much to spend a few minutes on a survey, or that they were extremely unhappy about their work and were frightened of making any comment that might be traced back to them: it might affect future employment with ISP or the LEA.

Generation of Questions

It is standard practice to do depth interviews to find out what questions should be asked, and how they should be asked. Our questions were drawn up after the team members had had in-depth discussions with people in the clients' headquarters, with field consultants, and with headteachers and teachers. They were then piloted with people in the target populations.

For a later survey, depth interviews in selected LEAs, we were able to pilot in LEAs which would not be covered.

Drawing Inferences

The questions had a range of objectives.

The fundamental one was to provide crude answers for the evaluation. Did the consultants and headteachers think that the ISP was working well or not? Which elements did they think were working well or not? This provided the headline information for the Department's public relations: yes, most of them thought it was working well.

The crude figures could then be broken down in the analysis. Analyzing by LEA (local government area), for example, showed big differences between perceptions, suggesting that the stated success of the ISP depended very much on the competence and charisma of the individual consultant responsible for that area.

The first inference was that there was some reason why we had a very low response from the consultants, compared to headteachers, but we could not know what it was. Our response was for the team members to do what they could to identify reasons, using depth interviews and telephone interviews at the later, interview, stage of our study. Statistical methods were inappropriate when we did not know what questions to ask or what the perceived problems were. That is to say, the temptation to draw conclusions directly from the survey results had to be resisted.

In drawing inferences it was important to remember the importance of the charisma of individual consultants. This was stressed to us repeatedly by the ISP management and came up again and again in the team's interviews. We observed a meeting held by London-based ISP staff for the consultants which reminded us of a revival meeting, whipping up a crowd's enthusiasm. This does raise the possibility that the people who reported themselves to be strongly in favor of ISP were in fact reflecting the fact that the LEA consultant had inspired them with enthusiasm. Some consultants clearly aroused this enthusiasm with a lot of headteachers, some only with a few. We did not have the time or money to see whether those LEAs or schools which had been most enthusiastic about ISP did actually produce the best results, or whether there was any relationship between the replies of individual consultants and the results in the LEAs in which they worked. The data on results was not available in time. Some questions still remain, therefore. Would having any sympathetic listener who was willing to listen to problems have had the same effect as the ISP (as some people suggested in interviews)? Would having any person with charisma have the same effect, regardless of technical competence? The design of the ISP did not let us draw any inferences on this.

An important purpose for us, as evaluators, was to find out what aspects of the ISP were disliked by consultants and by headteachers and what aspects they did not think were working well. This was addressed both by specific questions and by the comments that the respondents were invited to give. The results could then be addressed later in our depth interviews.

There turned out to be a fundamental disagreement with the clients on this, a major difference in interpretation. They were of the view that if most people

thought part of the system was performing well (as they did), we could ignore the fact that perhaps a quarter thought it was performing very badly, and we should omit any mention of this quarter from the discussion in the report. We, however, thought it important to find out more about what was potentially a major problem running through the system as a whole: it was not satisfactory that a quarter to half of the headteachers were unhappy with an element of the program.

Partly as a result of this difference in interpretation, they were reluctant to have the critical comments published in the report, though they were happy to give great prominence to any favorable ones. (I discuss below the suppression of unwelcome results in general.) The fact that a problem had not yet impacted on most people does not mean that it never will. The fact that a problem had not yet been noticed by most people does not mean that it is not already impacting on everyone. Indeed, it has been my experience when doing evaluations and investigations that the key fact that explains all the inconsistencies is often given by just one respondent.¹ In drawing inferences from such information, sampling method, response rates, and statistical reliability are irrelevant: someone has pointed out that there is a potential problem, and we should investigate. The evidence to draw conclusions will be found elsewhere.

Most of the analysis of the surveys did not impact on the evaluation. The tables were presented in a format that would facilitate the management of ISP in the future, by the ISP management and by the LEA consultants trying to find out what was happening in their own areas. It was clear that the tables would have to be presented as simply as possible for an audience not trained in statistics, and that we could have no control on how they chose to interpret them.

¹ I struck oil this way when I was evaluating a large irrigation project designed to plant a million apple trees in Pakistan. I got stuck in Peshawar for 3 days, waiting for a plane to take me out. I saw the people I had to on the first day. To pass the time I spent the next 2 days interviewing other people, people who might have had a different perspective. I hired a rickshaw for a day and went from office to office. I enjoy people and this was a lot more fun than sitting in a hotel bedroom. I learned a lot about things that interested me, though not very relevant to my project. Eventually someone let slip the fact that in the Tribal Territory of the North West Frontier, it was not the Department of Agriculture who distributed apple trees, as in the rest of the country; it was the Department of Forestry. I rushed to see them and found that they had handed out a million apple trees in the past 5 years. How could this be? All the project documents I had been given had masses of statistics and there was no mention of these million trees. Nobody I had met in the provincial or national Departments of Agriculture had mentioned them. It turned out that the Tribal Territories are not fully incorporated into Pakistan. They will be when they pay taxes, but this will not happen until a woman can walk from one end of the village to the other in perfect safety—which is not likely to happen for years. In the meantime, the Tribal Territories are treated as semi-independent. Their statistics are not included in the Pakistan statistics, but in a separate volume.

This little bit of information blew the project out of the water. It had only appeared to be profitable because there was a shortage of apples in the country, so apples got four times the price of oranges. This extra one million apple trees plus the million trees of the project I was evaluating would create an oversupply and push the price of apples as low as that of oranges or lower, so the whole project was uneconomic. This one interview saved \$50 million directly and hundreds of millions in wasted investment by farmers. But the result was entirely unexpected. Nobody I had met before had any inkling of this, and nor did I.

Did the ISP Have Any Effect?

The most important questions our team had to ask in the evaluation were, “Did the ISP have any effect?” and “If it did improve outcomes, by how much?” If it had little or no effect, it was not worth continuing with.

For the quantitative aspect, obtaining the data was the first priority. As is always the case when examining a real-world situation, the team started without knowing what was relevant. The first step of our study was, therefore, to build up nonstatistical models on what was happening. The team produced a literature review and interviewed civil servants, the ISP management, consultants in the field, headteachers, and teachers. Once we had this information, we looked for the data to build a statistical model. We soon found that no statistics existed on many of the aspects that were obviously important and that many of the statistics that did exist were wrong or were wrong for our study. This is perfectly normal, but it means that a lot of thought is needed before constructing any statistical model. We had to tackle these problems before we could start drawing inferences.

Working Without Data

No statistics existed for most of the key factors, on inputs or outputs. This had to be taken seriously: it meant that it was not possible to create a statistical model that reflected our model of what was really happening.

We could of course build a model using the data that did exist. There is always a danger that you may leave out a factor because there are no statistics, because the statistics are unreliable, because no observations are recorded for it (which, as will be shown later, is far from saying that the factor does not exist or has not been observed), because the analysis of the statistics that are available is too difficult, or because it would make the model too difficult. There is also the opposite temptation, to include irrelevant data because they exist. It takes a certain firmness to refuse to use some of the vast amount of information produced as a by-product of administration. There may also be a temptation to put all the data that do exist into the computer without prior constraints, to run random regressions, and to include everything that produces a good “fit” into the model. These temptations are particularly strong when one is under pressure to start the analysis as soon as possible, or when the output is an academic paper rather than a recommendation for action.

In this evaluation, lack of data was largely because it is an area of rapid change or great confusion, which is exactly why there was a particularly strong need to investigate it very carefully indeed.

In a sense, leaving out key factors because the data are not available is like removing a leg or two from a chair. Putting in factors purely because the data are available is rather like adding a leg or two, pointing up or sideways rather than touching the floor. That is to say one removes any security from the chair, the other adds expense and complications without increasing security.

Our team worked closely together to limit these dangers. The other team members told me what their work showed them were the key factors, and I told them which areas could not be covered by the statistical analysis and must be addressed in their interviews.

Non-reporting of Selected Observations

The dangers of an incomplete model are particularly likely to arise out of non-reporting of selected observations or of a class of observations. This usually happens because the people responsible for primary data collection fail to report certain observations, but it may happen where selected observations are removed during the data processing or analysis. An example of this bias is where scientists report the yields of a new strain of wheat on those test plots where it gives an increase in yield, but not elsewhere. They may justify this to themselves on the grounds that low-yielding plots must have been affected by extraneous factors that were not observed, that, for instance, "They look as though they were damaged by windborne herbicide" or "Obviously this patch was damaged by white mold." Similar suppressions are common enough in the administrative procedures in the collection of much of the raw data of educational statistics. This is an example of deliberate suppression, though by people who believe that they are being perfectly honest.

Clearly, this suppression invalidates all the perfectly accurate observations in the experiment. The final result is wrong. It means that it will throw doubt on the correct result produced by normal methods. It also throws suspicion on all other statistics collected by the same organization. It changes the standard error as well as the mean.

In this study there was non-reporting of observations. Deliberate non-reporting to bias results is discussed below. The analysis was also handicapped by nonavailability of data when they were needed. It is difficult to understand, for instance, why full information on the percentage of pupils in a class reaching Level 4 at Key Stage 2 should be available, while the average score of the pupils in the class should not be available until months later: the same data are used with a very small difference in the calculation. Nevertheless, this lack of data seriously restricted our analysis, and the inferences we could draw.

In a later section I discuss some more general problems with the use of official data available.

Non-reporting of a Class of Observations

The best-known example of the non-reporting of a class of observations was the thalidomide affair. In the trials of this drug, there was full and accurate reporting of a wide range of phenomena. This showed thalidomide to be an extremely effective and useful drug with no harmful side effects on the patient. It was only after the

drug was released that it was found that it had very serious effects on the fetus of a pregnant patient. The failure to test for this, and the delay in recognizing it when it happened, was due to a weakness in the theory: it had not been realized that the fetus could be damaged by a drug administered to the mother.

There is a difference between (a) failing to notice that a category, such as “deformed babies” might be relevant, (b) failing to notice that a category such as “deformed babies” exists, (c) failing to report observations in that category, and (d) reporting that there were no occurrences in that category, rather than that no observations have been made. In educational statistics it is not usually clear which of these causes the lack of data or the blank in a statistical series. It is not always clear whether “. . .” or “n.a.” means that there was only a negligible quantity in the category or that no data were recorded. If the statistical table does not include a heading for a category such as “deformed babies,” it is hard to find out whether it is because of (a), (b), or (c) above. It may be because someone thought the category was unimportant or because the results looked suspect.

Working with Bad Data

Most non-statisticians ignore data errors when working with statistics. The more conscientious may quote the sampling errors, but not the other errors, and then proceed to use the data as though they were 100 % correct. When they receive statistics they ignore the caveats that the statisticians produced to accompany them. People with some statistical knowledge may run regressions or other models and, when they get a “reasonable,” fit take it as an indication that they were right to take these caveats and sampling errors as only an extremely unlikely theoretical possibility. It is common for them to report their results to three significant figures, accurate to one tenth of 1 %, and it is not rare to see them quote results to one part in a billion.

This does not mean that one should ignore all bad data and statistics. All data are in some way bad for any particular study, and ignoring them would mean relying on wild guesses instead, so the data and statistics must be analyzed rigorously, bearing in mind their weaknesses. This means that there are necessarily a lot of theoretical models and theoretical techniques that are useless in a particular study because they need more accurate data than does exist, or indeed than could ever exist, or because they need quite different data. If the models are used, they produce results that are wrong but have a quite spurious appearance of reliability because of the sophisticated models used.

In my first job I had to publish a monthly bulletin of statistics. I had to go into government and semi-state organizations, get hold of any information I could, and prepare it for publication. There were enormous errors due to the collection procedures and the way the raw data was processed in these organizations. The government policy was to publish them because they were the best we had. In spite of this, the figures looked completely authoritative once they were put into

print. However long the cautionary footnotes I put in, the statistics were used as though they were accurate. It is surprising how few statistics textbooks give more than a passing mention of this, perhaps a couple of pages suggesting that the raw data or the published statistics may be imperfect.

All statistical organizations, public or private, have to justify their existence to nonprofessionals. Nonprofessionals expect statistics to be accurate and they are likely to cut budgets if they find that the organization is producing figures that are wrong. As a result, organizations may be reluctant to admit that their figures are anything but perfect. There is a tacit agreement that statistical organizations do not criticize each other publicly—it is common for different organizations to produce completely different figures for the same phenomenon without mentioning each other's figures or mentioning that there are discrepancies, and I have seen one small organization publishing two series showing very different levels and opposite directions of movement over time for the same phenomenon, without anybody in the organization realizing the contradiction.

Researchers often use techniques that give a wholly spurious appearance of accuracy, because the nonprofessional does not understand that complete accuracy is impossible. For example, they quote four or five significant figures for statistics derived from data that are only accurate within 30 %. This is a falsehood. In fact, Morgenstern (1963) recommended that all statistics should be presented with only the number of significant figures justified by their accuracy. He suggested, tongue in cheek, that the enormous savings in printing costs would finance a major improvement in collection procedures.

We must start, therefore, with the assumptions that:

1. There is probably a large random or biased error. It can never be assumed that the error is constant, whether a constant sum, a constant percentage, or in a constant direction. Nor can the opposite be assumed, that there are random errors which will cancel each other out over time.
2. For most decisions we are not concerned with averages: we are concerned with changes at the margin, at what would happen if we put a few more resources into certain schools (as in this case), for instance. The margin is the difference between two figures, the results before and after the ISP, but each of these figures is subject to random and nonrandom errors. Even if the averages for the sector as a whole were very accurate, the figures for the margin, for the year-on-year changes in these selected schools, would be highly variable.

As the study progressed, we discovered more and more reasons to believe that there were random and biased errors which would make statistics for changes at the margin extremely unreliable. These are discussed below.

Noise

Computers have resulted in an information explosion. There is now a vast amount of information collected, often as a by-product of an administrative procedure. The

data may be made available, and statistics published, but they are of unknown provenance, reliability, and error. We do not know how the data were collected or processed, nor do we know the definitions used. This is just “noise.” It means nothing in itself, but it stops us from identifying, isolating, and using the meaningful information and from identifying gaps. Reliable and accurate statistics which are not relevant to our task must also be classified as “noise” for our purpose. The first, and most important, part of the task of interpretation is rejecting information which is noise.

Are Errors Constant?

A common reaction to the knowledge that the statistics are unreliable is to say “I know that the figures are wrong and are probably not within 20 % of the true figure. However, I am not interested in the average, but the change from year to year. The average may be wrong but the changes from year are right. I can still use them for trends, regressions, and correlations.” In effect, this is assuming that the error is constant. Depending on the specifications of the model, the implicit assumption may be that the error is a constant sum, a constant percentage, or even a constant power. Often one sees that in one part of a single model, a constant sum is implicitly used, in others, a constant percentage. The assumption is that the error is all a constant bias, or, sometimes, that the random errors cancel out. It assumes that there was no change in the bias over time. These assumptions have to be identified, and challenged, before interpretations are made.

For some reason, too, it is very easy to convince oneself that the results of an obviously unreliable survey become completely reliable if the survey is repeated year after year. Because the survey is carried out every year, researchers, including the statistically literate, have no hesitation in using the figures as being both perfectly accurate and strictly comparable from year to year. Perhaps the feeling is that the means (arithmetic? harmonic? geometric?) may be wrong but the changes will be meaningful, an assumption which is false, for reasons that will be discussed later.

In our evaluation this was particularly important. Since we were carrying out the evaluation before the intervention was complete, since we were measuring changes in test scores within 1 or 2 years of the intervention, and since data were not available immediately after the tests were run, we were, in effect, looking at year-to-year changes in test score. We were also concerned with changes at the margin. For reasons set out below, there were strong reasons to expect random and nonrandom fluctuations.

Some Models Are Sensitive to Bad Data

Morgenstern (1963) quotes an example from Milne (1949) to show that slight errors in specification and in input can cause enormous errors in output. He takes two equations:

$$\begin{aligned}x - y &= 1 \\x - 1.00001y &= 0\end{aligned}$$

which have the solution $x = 100,001$ and $y = 100,000$

The almost identical equations

$$\begin{aligned}x - y &= 1 \\x - 0.999999y &= 0\end{aligned}$$

have the solution $x = -99,999$ and $y = -100,000$

While this is an extreme example, you cannot know whether your model will produce similar results unless you test it with variations of the data within the limits of its error. It is possible that the errors might cancel out, but it is equally likely that they would multiply. The implication is that if you feed data with a small error into a complex mathematical model, you can expect to produce results with a large error. The more complex the model, the more likely it is that it will produce large errors in an unexpected direction.

This problem is often tackled by saying in the report, “This model is robust,” and scattering the word, “robust,” through the report, a technique that reduces awkward questions but does not solve the problem.

A lot of simplifying assumptions must be made to make a theoretical model workable. However, each explicit simplifying assumption necessarily introduces implicit assumptions which usually go unrecognized. The more simplifications are made, the greater the effect and the greater the danger.

It is often forgotten that the raw data have been aggregated and then further processed to produce a statistic. This mathematical aggregation and processing is part of the mathematical model when the statistic is used as an input into the model. In our study this hidden analysis proved crucial.

Available Statistics

Data Availability

The interpretation is strongly affected by the data available, and it is a truism that the result can be altered by deliberate or accidental suppression of certain data.

We were astonished to find the sheer quantity of data that could be amassed by a large government department in a rich country and even more astonished to find

how little of it was of any use to this study. Most of the professional statisticians, not least those I consulted when preparing for the present study, have a strong professional integrity which compels them to make available all they know of errors and mistakes in their output. They usually present a very full analysis in the technical appendices, and they are willing to discuss the basis of the figures I want to use and whether my use is valid. At the start of the evaluation I discussed the availability of statistics with statisticians from three LEAs and from the central government Department for Education and Science. They urged caution.

If data are collected and statistics produced by people who have not thought out clearly who is going to use the resulting statistics and what decisions they are going to use it for, it is probable that the wrong information will be collected, that it will be processed in a way that makes it inaccessible to the user, and that it is delivered long after the decision has been made (Bowbrick 1988). This is particularly common when the data are the by-product of administration. Often the definitions and methods used for collecting them and then processing them to produce published statistics may make the statistics unusable for many purposes.

In our evaluation, the only possible measure of whether there had been any impact (as defined in the terms of reference) was the tests carried out first at Key Stage 1 and then, 4 years later, at Key Stage 2. If the schools that adopted IPS had better results in these tests after a year using ISP, it was an indication that ISP might have had some effect.

The Pilot Sample

There are rules for carrying out an experiment to see if a pilot program is working. It would be normal, for example, to select schools by certain predetermined criteria and then to randomly select which of these schools were to be exposed to the program and which would be the untreated control group. It would be normal to do a before-and-after study. And it would be normal to try not to let other factors influence some schools and not the others. The United Nations and the World Bank have strict rules on Impact Studies (Clemens and Demombynes 2010; Angelucci and Di Maro 2010; Winters et al. 2011, 2010). The LEA statisticians volunteered the information that this had not been done in their LEA and that they had not been consulted in the design of the pilot.

When carrying out an experiment, it is normal to be very careful in selecting the subjects for the experiment. In an experiment such as the Pilot, it would be normal to specify the parent population, “All schools with less than 40 % of pupils reaching Level 4 at Key Stage 2” perhaps, and then randomly select schools from this population, so that the results would be representative of the population.

This was not done. First, the LEAs volunteered: they were not selected from a group of LEAs meeting the criterion of less than 40 % of pupils reaching Level 4 (or any other defined group). Nor were they randomly selected. The only group they had in common was, “All LEAs” and they were self-selected using different criteria—they may perhaps have been LEAs which were persuaded that the ISP

would help them be even better, or ones which were desperate to try any new system that might possibly be an improvement on the existing system.

For both the Pilot and the Follow On, individual LEAs used their own criteria for selection of the schools in their own area. These criteria reflected their own priorities, which in turn reflected the social, demographic, and economic situation in the individual LEA—and these vary enormously from LEA to LEA.

The Department for Education and Science meant the ISP to be used in schools which had particularly low performance, and the pilot study was meant to cover schools where fewer than half of the pupils achieved Level 4 at Key Stage 2. The LEAs chose completely different schools, schools which were not part of the intended parent population. Nearly half the schools selected for the pilot had already a better performance than this. The range was from 25 to 94 % achieving Level 4 in 2002 with a mean of 59 %. In one LEA, for example, three of the four schools had scores of more than 60 %. In another, 10 of 18 schools exceeded the 50 % mark, and four had scores of 78–93 %. In a third, 11 out of 16 schools exceeded the 50 % mark. What, then, was the pilot program examining? It was certainly not measuring the effect of the program on the target population.

Similarly, the LEAs selected schools according to their perception of individual headteachers and individual schools. Some chose schools where new headteachers who were perceived to be energetic reformers had just been appointed. Some avoided schools with new headteachers on the grounds that they would be fully occupied settling in. Some avoided schools which were obviously performing very badly but were perceived to be stressed enough without yet another “intervention.”

Headteachers informed us that they had to deal with 25–35 “interventions,” usually central government programs, some of which would require as much staff time and effort as the ISP did. The Pilot did not attempt to control for this or even to record which “interventions” were being implemented in each school. The particular mix of “interventions” varied from school to school, and a different mix applied to teachers at different levels. This raises the question of which “intervention” was responsible for any change recorded or, indeed, prevented any change.

Since the Pilot sample was not representative of any parent population, it was not possible to draw any inferences about what it meant for any group of schools except those actually in the Pilot. Certainly it could not be used to draw inferences about the impact on the specific group of schools that we were told it was designed to study. And it was not possible to do anything resembling an impact study meeting the internationally accepted standards.

Control Group

Obviously there must be some control group, or else it could be argued that all similar schools throughout the country had the same change in test scores whether or not ISP was applied, so we could ignore a fall in performance, for instance. It would be normal for a pilot study to identify the schools in the parent population, to pair similar schools, and then select which were to receive the treatment and which

were to be controls (though this is not a simple procedure). This was not done. There had been no selection of a control group before the ISP so we had to find one ex-post. We decided, for lack of credible alternatives, to use the schools that were selected for the second round as controls. That is to say, we were left with no alternative but to assume that a body of schools had been selected on one set of criteria as needing an intervention to improve performance, and that half of this selection had been selected at random to go into the first phase of ISP, and the rest of them to go into the second phase 2 years later. Unfortunately this was not how it was done. We know that the selection for the second phase was based on different criteria—the two sets of schools were different even in the years before the Pilot—and we have no idea what bias was introduced.

When we were asked to carry out an evaluation of the second phase, no such control existed as all of the initial selection had been incorporated into the program.

Accordingly, it is questionable whether any inferences could be drawn from schools and LEAs selected in this way.

Random Variation

The Key Stage test scores for any school varied a lot from year to year, for reasons quite unrelated to ISP. There are purely random elements in any test score. If the same test could be given to identical pupils on different days, we could expect different results. The wording of one year's tests may help some pupils understand, and reduce the score of pupils from some areas and pupils with a different language background. A school may get higher scores in one year than in another because there is a brighter, or otherwise different, group of pupils sitting the tests that year.

The results will be influenced by the competence of the teachers. The results could be changed dramatically because a better or worse teacher was in charge during the year of the test. The team were told that the underperforming schools had a higher level of turnover of teaching staff than other schools, and indeed, there were examples of three or more teachers being in charge of the KS2 class during the test year. There was also a high turnover of headteachers, which would have affected test results. No evidence was produced to support these assertions.

Other Variation

A lot of the schools in the ISP had a high level of pupils having English as an additional language (EAL), some with as many as 95 %. Some of these pupils had arrived as immigrants within a year of two of the test, some were born to recent immigrants, some were second- or third-generation British, with Polish or Punjabi, say, as the home language of a bilingual family, which is to say very different performances could be expected from schools with the same proportion of EAL pupils. There were no data on which was the case. The team was informed that

typically these pupils would perform badly in reading and writing at Key Stage 1. In some LEAs the previous experience was that these pupils made their big improvement in these subjects at secondary level, just after the Key Stage 2 tests. However, if they made the improvement slightly earlier, in primary schools, the schools which had these pupils at both levels of test would appear to be high-performing. If ISP could speed up this improvement, it would mean a sharp improvement in Key Stage 2 results compared with Key Stage 1, but we would have no way of knowing whether it altered Key Stage 3 results. It might have no effect at all.

It cannot be assumed that the pupils doing the Key Stage 1 tests are the same as the ones doing the Key Stage 2 tests 4 years later, so it cannot be assumed that any change in marks achieved are due to the school. Many of the schools covered had a high level of “turbulence,” with pupils moving from one school to another. This was particularly obvious in inner-London schools. The KS2 pupils might have been in different schools in the same LEA, from different LEAs, or from different countries in the KS1 year. It was not possible to compare the performance of children who were in different countries or different LEAs in the Key Stage 1 year. Comparisons could have been made of performance of children who were in the same LEA for both tests, but this would have required that the ISP project had asked the LEAs to collect the information, which they had not done. In some schools, nearly all the pupils who did Key Stage 2 in one school had also done Key Stage 1 in that school. In one school, just a single pupil in the Key Stage 2 class had been at the same school for Key Stage 1. One headteacher said that the school had a high turnover, as the upwardly mobile families moved pupils to other areas—producing a bias, as the pupils from these families could have been expected to perform better.

Each pupil does have a unique individual identification number in the Department for Education and Science database, and it would, in theory, be possible to link the performance of those pupils who had done both tests in England (but not Scotland or Wales). In practice it would have required far more time and money than we had to make use of this. Individual performances are sensitive information, and in our view it would have been both unethical and unlawful for us to have access to this information for this particular study. Even if we had had this information, we would not have been able to determine which of the schools that a pupil had been to should be credited with any improvement. Similarly, we did not have the resources needed to determine which students in a class, if any, benefited.

Some of the schools had particularly severe turbulence, with changes of headteacher, teachers, and pupils. In these cases it may be questioned whether the “school” of 1 year is in any sense the “school” of 4 years later. One bias would be introduced if we ignored these schools, another if we included them. However nearly all of the schools selected had some of these problems. It may well be that schools in richer areas with stable, nonimmigrant populations are more likely to retain their staff and get better results, regardless of the quality of teaching.

At best, therefore, the figures for Key Stage 1 would give some idea about the performance in the year before the test with the obvious limitation that the pupils in

the poor areas covered and those with more EAL pupils might be expected to have low scores anyway. The figures for Key Stage 2 might indicate that the ISP intervention in the final year before the test influenced, or did not influence, results. They also indicate, to an unknown extent, the influence of teaching in the previous years, mainly in the same school for some schools, mainly in other schools for others.

Number of Years

We would have liked to analyze year-to-year variations in results over a long time period before the Pilot, so we could make a judgment on the degree to which any change observed might be due to these exogenous factors rather than to the Pilot. Unfortunately the only data series was recent. For Phase 1 we had to do the analysis on only 80 % of the schools, those for which 5 years' results were available. Some schools had closed, some had started more recently, and there were problems with the data for others. Accordingly the main analysis was done on those schools for which data from 1998 to 2004 existed. 115 schools met this criterion out of 143.

Value Added

One figure starting to be produced by the Department for Education and Science when we did our evaluation was the "Value Added" statistic, designed to measure how much of any improvement or lack of improvement in pupils' performance could be ascribed to the school. This was comparing Key Stage 1 and Key Stage 2 test results and was produced by a complex formula using several data series. Certain observations in the data were excluded from the calculation—the Department for Education and Science ignored results:

'if at either Key Stage 1 or Key Stage 2 results for that pupil were missing, or the pupil was not eligible for the tests, would take the test in the future, was working at the level of the tests but 'unable to access them', was 'not awarded a test level', was working towards level 1, or if there were lost scripts, or the results were 'annulled', 'disapplied', or 'disregarded'.

It may be that some of these reasons applied for just one of the tests taken in any year. It appears likely that many of the pupils at some of the pilot schools would have been omitted on these grounds, introducing a bias.

The Value Added statistic had all the data problems discussed above, and one discussed below. It required complex calculations and used explicit and implicit assumptions which necessarily introduced biases. It is normally considered good statistical practice that statistics should be presented with the minimum amount of processing of raw data, and that routine publication of statistics derived by amalgamation of data from different data sets and complex calculations are to be avoided, to avoid such problems.

The way in which the statistic was calculated might have had some value if we had been comparing middle class schools with static staff and pupils, but was of no value at all for our evaluation.

Experimental Results

The ISP management had not intended to do an evaluation, even though this was a pilot of a new program of intervention which they intended to roll out to cover a large proportion of the educational system. They did agree to an evaluation because pressure had been brought to bear on them by LEAs which thought that the ISP was badly managed and ineffective. Had the management thought about an evaluation at the beginning, and particularly if they had examined the data needed, a much fuller evaluation would have been possible.

We had discussed data availability with the clients before entering the contract. They assured us that the data were readily available from the Department for Education and Science statisticians within the building, and that we would not need the time we had set aside for data collection, a time we had based on our experience elsewhere. In fact the statisticians within the building flatly refused to give us the data for unstated reasons, and we had to spend a lot of time and money finding out where else we could get the data, which turned out to be in another section of the same Department—where we were told that that the man we first approached was the person who should have supplied it.

We were hampered by the fact that no preparations had been made for an evaluation when the ISP was started. Indeed we were told by consultants that it was only at their insistence half way through Phase 1 that an evaluation was carried out at all. This meant that there was not a properly selected control group. It also meant that a lot of information that was available within some LEAs, like a comparison of Key Stage 1 and Key Stage 2 results, and which could have easily been collected by other LEAs on request—the LEA statisticians we met were keen, helpful, and enthusiastic—was not available within our time and budget constraints. Similarly, raw data and processed data that would have been provided by the Department for Education and Science for routine evaluation by one of its own sections was not made available to an outside organization, a university, requiring the information at short notice. The statisticians said that we, as an outside organization, would have been charged if they had produced anything but the raw data at our request. Had we been given correct information on the availability of data by the clients, we might have done something about this.

Some data, notably matched figures, matching Key Stage 1 and 2 can be bought. We were not sure how well this would allow for the extreme turbulence of the selected schools. It was not possible to buy data, given the financial limits to the study which had been imposed by the clients.

Percentage Reaching Level 4

The Department for Education and Science targets were based on the percentage of pupils reaching Level 4 at Key Stage 2. This is very different from a figure for the average score in a class.

The English government had adopted a policy of monitoring the efficiency of government and local government organizations by setting “targets,” usually a calculated statistical measure. Sanctions were imposed on management if these “targets” were not met. There was a widespread view, among the general public at least, that the organizations were skewing their performance to do whatever would produce the statistical measures to show that they had met their target and were forgetting what their real objective was. The health service could achieve their targets by manipulating waiting lists and neglecting some patients, for instance. We considered therefore whether the Department for Education and Science targets could be skewing the delivery of education in this case.

The Department for Education and Science set achievement targets for all schools on a variety of targets. The targets for primary schools were set in terms of the number of pupils reaching Level 4 at Key Stage 2, for example. This target ignores the number of pupils who reach Level 5, as well as those who were working below the level of the test, those who were not awarded a test level at all, and those reaching Levels 2 or 3.

This contrasts with an average score for the school, which takes all pupils into account.

In our interviews, the team were told by consultants and headteachers that the teachers and schools were under strong pressure from the Department for Education and Science and the LEA to reach the target by increasing the proportion getting of pupils reaching Level 4. The teachers were under personal pressure, both out of loyalty to the school and for career reasons. They explained that they could achieve this in several unacceptable ways that did not improve average score and might well reduce it. They said that lots of teachers and schools did in fact adopt these practices, though the teachers, consultants, and headteachers we spoke to said that they themselves resisted this pressure and did not use such improper practices.²

The first way was to concentrate on two or three pupils who would otherwise get marks just below Level 4. If there were 15 rather than 12 pupils in a class of 25 reaching Level 4, the target figure, “Percentage achieving Level 4” would rise

² We did not challenge this claim, of course. Similarly, when I am interviewing the village moneylender and he says, “I only charge 1 % interest, and the farmers never pay me back anyway. I am losing money out of it, and only doing it out of charity,” I nod sympathetically, and say, “That must be difficult for you.”

He then goes on, “But what some moneylenders do is. . . .” And then tells me a tale of violent extortion. I get the information I need on how the system really works, and he saves his face.

from 48 to 60 %. This looks very impressive, though it may just mean that three pupils get 5 % more marks. How do teachers get the extra time to push these pupils? The obvious way is to ignore the pupils who would normally get a Level 5, and will certainly get a Level 4 anyway, and to ignore those who could never be pushed as high as Level 4. However low their score falls, they did not affect the target statistic.

The tables and graphs below show how this works using a simplified example. By concentrating efforts on the pupils achieving just below Level 4, the percentage achieving Level 4 or above can be raised 27 % from 44 to 56 %, but this means reducing the average marks 11 % from 5.4 to 4.8.

Comparing average marks and % Level 4 or above											Example 1	
Level	Level			Level		Level			Level		Total	
	0-2			3	3+	4	4+	4++	5	5+		
Marks	1	2	3	4	5	6	7	8	9	10		
Number of pupils	1	1	2	4	6	4	3	2	1	1	25	
Total marks	1	2	6	16	30	24	21	16	9	10	135	Marks
Average marks											5.4	Marks
% Level 4 or above											44	%

Comparing average marks and % Level 4 or above											Example 2	
Level	Level			Level		Level			Level		Total	
	0-2			3	3+	4	4+	4++	5	5+		
Marks	1	2	3	4	5	6	7	8	9	10		
Number of pupils	2	1	1	4	4	6	4	1	2	0	25	
Total marks	2	2	3	16	20	36	28	8	18	0	133	Marks
Average marks											5.3	Marks
% Level 4 or above											52	%

Comparing average marks and % Level 4 or above											Example 3	
Level	Level			Level		Level			Level		Total	
	0-2			3	3+	4	4+	4++	5	5+		
Marks	1	2	3	4	5	6	7	8	9	10		
Number of pupils	4	0	0	7	0	12	0	1	1	0	25	
Total marks	4	0	0	28	0	72	0	8	9	0	121	Marks
Average marks											4.8	Marks
% Level 4 or above											56	%

Example 1

Example 2

Example 3

The ISP gave the teachers computer programs which made this a lot easier: these could identify the pupils who were just below Level 4, so they could be given an extra push. They also helped identify those pupils who were never likely to receive Level 4, and those who might drop from Level 5 to Level 4, but were most unlikely to drop below Level 4.

An alternative way of increasing the percentage achieving Level 4 was to see that some of the lower performers were excluded from the calculation, and the ISP system gave teachers the tools to identify the pupils who should be excluded. If two weak performers in a class of 25 are excluded, the percentage achieving Level 4 might increase from 48 to 52 %, meaning that the school reaches the government target figure. One way reported in the interviews was to suggest to parents that a weak pupil might take a day off when the test was taking place, another was to encourage, or permit, parents to take weak pupils on holiday or go on a long visit to Poland or Pakistan to “re-engage with their culture.” Disruptive pupils might be excluded. The Department for Education and Science also reported omitting results when results for that pupil were missing, or when the pupil was not eligible for the tests, would take the test in the future, was working at the level of the tests but “unable to access them,” was “not awarded a test level,” and was working towards Level 1, if there were lost scripts, or the results were “annulled,” “disapplied,” or “disregarded,” which provide lots of possibilities.

Another, common, intervention was to put the best teachers in the class that was sitting the test and give them additional resources, using the worst teachers in other years. If a lot of the pupils moved from school to school, the school’s apparent performance would be maximized by this. Using resources on pupils who would be moving to other schools for their KS2 would be helping the other schools.

Percentage of a Percentage

There is a presentation bias that arises from expressing change as a percentage of a percentage. At first sight it may seem that if the percentage achieving Level 4 rises from 50 to 60 %, there is a 20 % improvement in “performance.” When one tries to work out what it means, one becomes increasingly confused. If a school increases the number of pupils reaching Level 4 by two, the result can be presented as a percentage of a percentage. In one school this may mean that 12 pupils reach the target instead of 10, 48 % instead of 40 % presented as a 20 % increase in achievement. In another it may mean that 25 instead of 23 do, 100 % instead of 92 %, an increase of 9 %. Surprisingly, some of the schools selected did have as many as 96 % of the pupils reaching Level 4, which meant that it would be impossible to have two pupils increase to this level.

Statements of an increase in average mark are more comprehensible.

Our Conclusions

In Phase 1 it was difficult to identify any impact from the ISP for Key Stage 1. The average point score results were broadly the same before and after the ISP started and broadly the same as for the control group. Average point score was not available for Key Stage 2, so we had to use the suspect measure of percent reaching Level 4. There was a sharp rise in the levels reported after the ISP, which was not observed in the control. We pointed out in the report that it was possible to make these increases look much larger or smaller by selecting different base years for the comparison.

Did They Concentrate Efforts on Half a Dozen Borderline Pupils?

In Phase 1 we reported that for KS1, where it was possible to use average point score rather than a break point, there was no change in performance. These statistics were not made available for KS2, so the possibility remained that borderline pupils were pushed, at the expense of the very good and very poor students. This possibility was taken very seriously by the team and emphasized in our report and in other communications with the clients.

In Phase 2 we had a longer data series and were able to compare the average mark obtained in the Key Stage 2 tests with the percentage of pupils obtaining Level 4. For English there was a clear indication that, overall, average marks fell by perhaps three percentage points over a time that the percentage attaining Level 4 rose nine points. This discrepancy occurred for all LEAs except one and was much more marked for some of the LEAs. There were only half a dozen schools for which average mark increased more than percentage Level 4. For Mathematics

there was an increase in overall Average Marks of about 3 %, compared with an increase of ten percentage points in the Percentage of Pupils achieving Level 4. This does not show beyond doubt that teachers were concentrating on the pupils who might achieve Level 4, but is consistent with it. The possibility was considered that the vast majority of pupils are concentrated very close to the minimum Level 4 mark, so that if all pupils got three more marks, this would push three or four pupils per class into Level 4, but disaggregation of the statistics showed that this was not the case. Disaggregation showed that for a third to a half of the schools, there was clear indication that average marks fell while the percentage of pupils achieving Level 4 rose. Again, the concentration could be on the pupils who are borderline Level 4, to the detriment of the others.

Caveats

To summarize, the only statistics available which could give any indication of whether the ISP had any effect on pupils were the results of the tests. These probably were correlated with what the pupils were able to do, but we had no information on this: the results may well have reflected other factors. There were certainly random and nonrandom fluctuations on what test result would be produced from a group of pupils of a given ability, and these could be expected to influence different LEAs differently, but again we had no information on this. There were large year-to-year fluctuations in the average results and percentage reaching Level 4 in total, more obviously in each LEA and most obviously in each school. Many reasons could be suggested. The very short time series meant that it was not possible to analyse the fluctuations in an attempt to quantify the random and nonrandom fluctuations. That is to say any variation in test scores might be just normal variation, which happened to affect the chosen schools in one way. Since these schools were not systematically selected, nonrandom fluctuations affecting this particular group may well have been due to their special characteristics (e.g., non-English speaking pupils, pupils from poor families, schools with a high proportion of children having special needs, regional culture, and dialect). We must be extremely cautious about drawing inferences from them.

The schools were not randomly selected or selected according to common criteria. There was no attempt at a controlled experiment to evaluate the ISP. The figures were consistent with a large number of schools, sometimes most of them getting worse results after the ISP.

The figures were consistent with schools adjusting their teaching and other factors to maximize the percentage of pupils achieving Level 4 at Key Stage 2 by reducing the attention given to non-marginal pupils. The percentage achieving Level 4 rose while average score fell, sometimes overall, but always for a large number of LEAs and schools. It is noted that it is possible to get some increase in

the percentage Level 4 in a school without reducing the average by these methods, so they do not always show up.

For all these reasons we could give only the most tentative statistical conclusions, except to state that the figures were consistent with concentrating on the marginal pupils at Level 4.

Inferences Drawn

Inevitably the inferences drawn purely from analysis of the data will be quite different from those drawn by people who are reading the full report and integrating it with their knowledge, experience, and emotion. And people may be unable or unwilling to understand what the data show and do not show, and the limitations in the reliability of any results of a statistical study. However, it is the inferences that are drawn that influence future study, so we must take into account inferences drawn.

By team as a whole

By clients

Department for Education and Science
National Literacy and Numeracy Strategies
ISP management team

By consultants delivering ISP

By LEA officials

By headteachers

By teachers

We can only speculate about how these groups interpreted the evidence and conclusions we provided. Obviously there was a very complicated micro political environment within the Department and within each LEA. In carrying out the study and presenting the results and conclusions, we had to bear in mind how they could possibly interpret what we said and how they might react to it.

We did know from interviews that, among the people from National Literacy and Numeracy Strategies and the ISP to whom we were reporting, there were people who thought that ISP was so self-evidently going to work that it was unnecessary to do an experiment or do an evaluation. Nearly everyone in this group appeared to believe that the pilot stage had been such a clear success that there could be no doubt that it would be rolled out to the whole country. (Or at least anyone who dissented felt it wise to keep their opinions to themselves.) And the message we got was that nearly everyone believed that any evidence that challenged this belief must be invalid.

Controlling the Discourse

Could we, the team, or I, the number man, control the discourse by the clients, Department for Education and Science, the National Literacy and Numeracy Strategies section, or the ISP management team? Could we control what they told themselves or what they told other sections, other Departments, or their political masters?

Communicating Statistics

In most of my consultancy the technical staff in my client organization are statistically literate, and people from other organizations who read my report are also statistically literate. I expect them to understand any caveats and limitations stated and not to use my figures where they do not apply. I expect them to understand the figures I give and to correct politicians if they misunderstand. In this particular evaluation I worked with team members who were numerate academics accustomed to rigorous analysis, though they were not statistically trained—one had a first degree in physics, the other in mathematics. They understood what I was saying. I had assumed that the people in the clients' unit, who were graduates—many of them with experience in teaching mathematics—would be able to understand what I wrote. I did not realize that the staff of the clients' unit were statistically illiterate, and many of them numerate only in the sense that they could teach primary school mathematics. Had I realized this, I would have presented the quantitative analysis very differently.

Suppression of Unpalatable Results

Choice of Sample LEAs

A key question was whether the ISP was successful in the experimental schools, and whether ISP should be rolled out on a large scale, first to similar schools in more than 360 LEAs in England and then to other schools.

Our team included two education specialists, part of whose job was to interview ISP staff, consultants, headteachers, and teachers. Obviously, they wanted to see successful and unsuccessful parts of the ISP, to see what could go wrong, and to find out whether the fact that some were perceived successful was purely down to chance, or was due to unstated factors, for which no hard evidence might exist, for instance. The clients were strongly opposed to this and instructed us to do our interviews on only three LEAs. Two of these were ones where the ISP was perceived to be highly successful. One was an LEA where there had been a lot of problems, so many problems that the LEA had demanded an evaluation. The ISP

refused us access to other LEAs. In particular, the ISP officials were most reluctant to let us visit LEAs where problems had arisen, or to visit the schools we wanted to visit.

In our view this selection of LEAs to visit was worse than useless when the evaluation was to see whether there was any point in rolling out the ISP to a large number of schools in all LEAs using normal consultants and consultants whose particular charisma might not have appealed to LEA staff.

The LEAs in the ISP had been self-selected as keen to take part, and we could not assume that the results would be in any way similar to all LEAs and particularly to those where schools were in most need of improvement. A wide range of biasing selection criteria for schools has been identified above.

Concentrating on the schools and LEAs in which the ISP appeared to be outstandingly successful was clearly a waste of time. The ISP management were of the view that the success was because these had a very competent, charismatic, consultant working closely with an enthusiastic LEA which had chosen the schools very carefully to have headteachers who would make the program work. If the system were rolled out to all underperforming LEAs in that met the target criteria, there would clearly be some equally successful examples, but the proportion that could be expected was much lower than in the experiment. What we wanted to know was what problems had occurred in other schools, whether these problems had been solved, or could be avoided in future, and whether similar schools could be expected to do better in the rollout. We were not allowed to address this problem. We had also carried out our mail survey to find out what parts of the program headteachers and consultants were not happy with or were extremely unhappy with. These results could only be of interest if we followed them up with depth interviews to find out why they were unhappy—and the fact that half were not happy with a part of the program is serious. We were not allowed to do this.

We protested very strongly, to no avail. Eventually the team interviewed some people involved in other areas by telephone. This gave useful results, but the bias was obvious.

All three members of the team were involved in this phase. The other two members of the evaluating team were fully involved in formulating statistical hypotheses, and they took the results into account when interviewing ISP staff, consultants, headteachers, and teachers.

On the information the other two team members got, they concluded that the ISP was widely popular and seemed to be effective at improving working practices. They confirmed the worry about teachers concentrating their efforts on marginal pupils. They made a lot of recommendations for tackling problems that had been identified. Overall, their report was favorable. They could not comment, of course, on whether ISP had any impact on pupils.

If the statistical analysis of the results and the discussion of problems that had been identified could be suppressed, and removed from our report, therefore, the survey results and the comments could be presented by ISP staff and civil servants as providing overwhelming support for the ISP.

Recommendations

The purpose of a pilot study is, of course, primarily to find out what the problems are. It is not a criticism of staff or, necessarily, of planning that problems are found, and we do not want to put pressure on staff to conceal problems. The pilot is done precisely to find out if the new system is fundamentally flawed, or if there are problems that need fixing—and there are always problems. The normal approach in evaluation is to exercise tact, by making recommendations for future action to avoid these problems, which appears more positive than a long list of the problems identified.

The ISP management insisted that we did not include the recommendation section in the evaluation reports. “This should be treated as internal advice to the ISP team who can use them to inform their discussions, if appropriate. The research team were not asked to make recommendations in their contract and so any recommendations are their private advice to the PNS.” “Move or amend the recommendations of the research team (as this is not a research finding. Separate the finding from the recommendation).” “Move final bullet point to recommendations. Not a finding.” I found this argument extraordinary. It is quite normal for the major part of a report to address points not specified in the terms of reference, to the extent that the points in the terms of reference are dealt with very skimpily. The points specified in the terms of reference are the clients’ first guess at what issues will be of key importance to address the main objective. They often turn out to be relatively unimportant. The key issues are often not mentioned because nobody knows that they are the key issues: if they had been identified the clients would probably have dealt with them instead of calling in the consultant. That is why people employ outside consultants.

We agreed to suppress the recommendations, though with serious misgivings. I believe it to have been a mistake.

Literature Review

Again, the ISP asked us to remove the literature review. “It is not necessary to make the literature review (currently Appendix 1) public. This was commissioned and paid for separately from the main evaluation and it is therefore justifiable that it should be treated as a separate document for internal use only.” The logic of this statement escapes me.

Average Marks

The question of using percentage achieving Level 4 instead of the average marks really upset the ISP project management. In the first phase, we agreed, with misgivings, to let this finding be tucked away in the back of the report as long as they

undertook to implement our recommendation on it fully and immediately. This was a mistake. In the second phase they claimed, “The focus on average marks is not one that was explored in the original evaluation and it wasn’t part of the brief for the follow up.” Analysing the statistics on changed test performance was, of course, part of the brief. Even if it had not, it would be considered deeply dishonest for an evaluator to suppress important results because they were not specified in detail in the brief.

In the second phase we set out the facts and figures. We met with strong resistance:

‘There could be other reasons for the fall in average marks. . . . Our concern is that one link is being made and repeated for which there is no evidence.’ ‘However the data does not provide evidence to show that the fall in average marks is consistent with teachers concentrating all efforts on pupils who could, with a push, achieve Level 4 (p. 29, 30), or that the concentration could be on pupils who are borderline Level 4, to the detriment of others (p. 31).’

They did not respond to our request that they present the other reasons that they believed could explain the facts, nor their reasons for the extraordinary belief that the reasons we suggested were not consistent with the facts. This would, of course, have required some serious analysis by someone who could at least calculate an average.

Changing the Statistical Conclusions

The ISP proposed to publish only the main body of the report on the Department for Education and Science, leaving off the appendices, though it costs nothing to put the appendices on a website.

They proposed to change the executive summary of the findings to

‘indicate that the statement relating to KS1 Is based on only one years data and a footnote is added indicating that the two year data is now available and shows increases at KS1 also.’
 ‘Any public requests for the report are accompanied by a page of statistics prepared by the [ISP] showing the relevant statistical data for the [ISP] schools (or LEA).’

Clearly it would be totally unacceptable to adjust my conclusions on the basis of calculations by the ISP. I had not seen the new figures, nor the calculations, and I had and have no confidence in the statistical competence of anyone I met working for the ISP.

Providing Different Statistics

The ISP management told us, “We intend to publish the main body of the report on the public DfES website; the full report would be available on request from PNS or from NTU. In order to publish it on the website, the following recommendations are made:

Any public requests for the report are accompanied by a page of statistics prepared by the ISP showing the relevant statistical data for the ISP schools (or LEA).

That is to say, our statistical analysis was suppressed and replaced with statistics produced by someone else, statistics which we were not allowed to see, based on data not given to us, with calculations that were not disclosed.

I do not know who did what to the statistics, but some time later I was informed that recommendations to roll out the ISP on a very large scale had been submitted to the Prime Minister based on the claim that we had shown that the ISP had increased pupils' performance by 14 %. The claim of increased pupils' performance was false at many different levels, as shown in this paper.

Ethical Implications of Different Inferences

We believed that our primary duty was to the children being educated. If an ineffective approach to teaching was introduced, or one which actually reduced attainment, the children would be harmed. Possibly more important, the time, effort, and money switched to this approach would be removed from other approaches which might be more effective. If there were weaknesses in this approach, it was our duty to say so in order that they might be remedied. We did not believe that we had any obligation whatsoever to protect the interests of the Department for Education and Science, of the politicians in charge of it, of the National Literacy Strategy, or of the ISP, nor did we have any obligation to protect the interests or careers or any of their staff. We recognize from our experience of working in institutions and in government that this perception of duty is not always that of people affected.

The managers who set up and operated the ISP were the people who recruited us to do the evaluation, and they kept tight control on what we did and what we published. Their careers would be affected by our conclusions—some were employed specifically for the ISP and their jobs would go if it were terminated. This is a serious moral hazard. The UK Treasury guidelines are that the recruitment of evaluators for a project must be done at arms length when the results may adversely affect the recruiters, so the people being evaluated and the people affected by the evaluation can have no control who is appointed to do the evaluation, of how the evaluation is carried out, or what results are published. These guidelines appear to be ignored in practice (Bowbrick 2012). The United Nations agencies have strict rules for evaluation which would not permit this to happen: they have their own pressures on evaluators but the pressures work differently and come from a different direction, usually from the desk officers in headquarters who approved the funding for a project rather than the people who implemented it (Griffiths 2003).

The evaluation team felt itself under pressure. There was also the feeling that we had two different evaluation objectives, summative, whether the project was working, and informative, where we would be helping identify problems and opportunities for future implementation. We have written on this pressure in this case and in others (Bowbrick 2012; Griffiths et al. 2006).

One has, of course, to adapt to the culture of the country in which one is working. International consultants describe with astonishment the British system in which government departments usually send a report back five times for “corrections” and when the government tender documents say that this should be allowed for in the costings. The UN, World Bank, and European Commission have strict rules, saying that the evaluator is employed as an independent, to give an independent opinion. I have evaluated for these organizations, I have been evaluated by them, and I have seen many other evaluations done for them. There has never been any suggestion that the people or organization evaluated could demand changes in the evaluation. If they disagreed with the evaluation, the most they could do was write a response.

The power structure is important here as it introduces a serious moral hazard. Academics in UK education faculties are most likely to get consultancies and research grants from government. There is a widespread belief that if they annoy a government department in any of these consultancies or research projects, they will not get any more. I have been blacklisted for a government consultancy on the basis of a journal article and report written 20 years previously when I was working in another country, though I had an international reputation in the subject (Bowbrick 2012). While one person may be willing to resist the pressure and lose government funding, there is also a widespread belief that it is not a single person that is blacklisted, but a whole department. There is pressure to submit, to protect the jobs of one’s colleagues. One British university had a formal committee to vet all research, not just government research, and to suppress any that produced results that might be unpalatable to any firm or organization that might possibly give the university a consultancy or a grant in future.

Working in an Imperfect World

In this chapter, I have described some of the problems that arose in a fairly normal use of statistics in consultancy research. In this evaluation, as in all research, we had to operate in an imperfect world. Inferences were going to be drawn by someone whether or not we wrote our report, and whether or not it was accepted by the clients, so we had to do the best we could, making unpalatable compromises, which may or may not have been justified. We had to work, as always, with constraints of money and time available. As always the data and statistics were not right for the task. As always the information and support promised by the clients were not made available. As always, the results were not what the clients had expected.

7.8 Making Sense of Layers of Interpretation in Quantitative Educational Research

Paul Smeyers

Introduction

Statistics are everywhere. In their descriptive mode they often indicate the level of satisfaction of clients/customers of post offices and hospitals, of one's use of an e-mail system (e.g., Eudora), and of the number of downloads (provided by publishers of journals) and are gathered for various purposes (including to evaluate scholarly conferences such as AERA). This may be innocent as far as it goes, but it carries with it a number of presuppositions that should not necessarily be taken for granted. One of these is that it is possible to represent reality (and have a grip on it), shifting often to the simple equation that this *is* the reality we belong to. This either implies that (1) there is nothing else to know about a subject or (2) if there is anything else to know, this is still the best way to deal with reality, the one that is the least harmful and most objective. Another presupposition (or should one say promise) that statistics carry with them is the possibility of control, particularly when an explanation is offered (by this I mean the control of the evolution of dependent variables in terms of the independent variables which have led to the distributions that are offered or the correlations that may be observed). Thus a paradigm of (quasi-)causality enters that goes together with estimation and management of risk (this applies in the case of experiments as it does for randomized field trials). At the same time, the attraction of statistics lies in its simplicity (the reduction of the variability of the data to as few "factors" as possible, as few homogeneous classes as the data permit) as well as in the accompanying belief that it is possible to characterize reality and the way it shapes our lives. Though what has been outlined so far may well be recognized (or deplored) by many, there is a more complex story to

be told. Moreover, though we may be familiar with the possible objections and take these “warnings” into account, this does not really change the fact that we often unthinkingly rely on what is presented to us. Why is that the case, or in other words, what do statistics do for us that makes them so irresistible?

This chapter deals with a number of meta-issues concerning the use of statistics in educational research. Though familiar with what quantitative educational researchers do, as an “outsider,” I approach the assumptions that are often taken for granted by quantitative researchers from a philosophical stance. I distinguish several layers of interpretation that may guide the quantitative researcher: looking for simplicity (reducing the number of variables), offering an explanation, and outlining implications for practice (advice). Though these layers go together, they can nevertheless be distinguished at a meta-level. For example, whereas an explanation often offers a starting point to make suggestions for practitioners, in a number of cases authors signal that other issues may also be involved and that there is no direct (or deductive) relationship between the results of what has been investigated (“what is the case”) and what should follow for the handling of these issues by practitioners in the educational field. What I have called looking for simplicity should also be qualified: what one is interested in is an explanation that offers as few variables as possible, but to do justice to the problem that is addressed may require attention to a large number of variables and a rather complex scheme that shows their interconnectedness.

I start with some detailed examples of quantitative research. After a description of interesting research from the area of child-rearing as well as schooling, I foreground questions which address the underlying assumptions and identify some possible criticism. Each example is used to highlight one possible layer of interpretation; obviously, this is to some extent arbitrary, as these layers are interwoven. In a more systematic way, I then distinguish kinds of understanding and explanation and deal more in detail with causality and probability and their underlying assumptions which guide the quantitative educational researcher. I point to the strengths of a quantitative approach, but I also highlight the limitations. I argue that though attention to the particular (the opposite of generalization) has much to be said for it, it is not the only alternative when trying to decide what needs to be done. Backed up by an amended correspondence theory of truth and an awareness of the limitations, I develop the idea that there is nothing necessarily problematic about the quantitative approach. On the contrary, it can contribute to the process of doing justice to the multilayered complex educational reality one finds oneself in. But in order to do this properly, attention, so I emphasize, must be given to interpretation all through the process of this kind of research.

Layer 1: On the Promise of Simplicity

Consider, for instance, the following abstract which was sent around recently to the staff of the Faculty of Psychology and Educational Sciences, KU Leuven. The abstract was for a talk to be given by Peter Wilhelm (University of Fribourg, Switzerland) titled “How to Assess Synchronization in Family Members’ Daily Life?”:

How family members affect each other’s feelings and behaviours is a crucial question in family and social psychology. To answer this question, ambulatory assessment techniques that capture family members’ experiences and behaviours in their usual daily life over days or weeks are especially useful. To date various diary studies have been conducted to investigate transmission of affects in couples and in parent-child dyads. However, diary studies to investigate the synchronization of current affects in entire families are rare. The aim of our research was to investigate the extent to which family members’ current moods synchronize in their usual daily life and how this synchronization can be explained. Using a computer-assisted diary approach, six times a day over the course of a week we asked 192 parents and 122 adolescent children from 96 Swiss families how they were feeling, where they were, with whom they were, and whether they had experienced conflicts with each other. To answer our research questions we propose a multilevel approach in which the similarity between family members’ average mood (trait component) and the similarity between their current mood (state component) is reflected in the covariances of the random part of the model. Using this approach we were able to show that average mood was moderately correlated among family members. As expected, family members’ current mood (state component) was more similar when they were together, than when they were apart. This indicates that family members’ mood synchronizes when they come together. By extending the analyses we could explain the amount of synchronization by shared setting factors that have an impact on mood, such as location, activity, and time of the day. However, conflicts between the family members produced the largest decreases in the covariances and therefore seem to contribute most to the synchronization of current mood in family members’ daily life.

It may be fun to speculate about the practical consequences of the insights this study comes up with, i.e., the family members’ mood synchronizes when they come together especially when they have conflicts. Has it thus been established that one should test a relation to its destruction or has a more general argument been developed in favor of quality time? A positive reading may indicate that the latter is obviously the case—we need to spend time together if we desire synchronization of current affects in families. Though this seems rather obvious, this research can substantiate it. Granted, this does not go very far, but at least it provides insight into how an issue in family and social psychology is dealt with. It provides answers and takes us beyond mere speculation in regard to something we may be (really) interested in (how things are).

The following abstract of a talk by Jeff Rouder (University of Missouri-Columbia) for another seminar at the same Faculty, titled “Using Bayesian hierarchical models to search for structure in recognition memory,” is much more straightforward when indicating what, according to its author, is at stake:

Science has conventionally progressed by identifying regularities or invariances; for instance, planets orbit the sun as ellipses. These invariances then serve as the phenomenon

to be explained by theory; for instance, elliptical orbits may be explained by the Newtonian theory of mechanics. In this mode, the search for invariances is a necessary precursor to theoretical development. Though this approach has been fruitful, psychologists, who tend to focus on verbal explanations of differences idiosyncrasies across conditions and populations, have not adopted it. The search for invariances is complicated in many domains by the presence of unintended or nuisance variability. For instance, in memory research, there is variability from the selection of participants and items in addition to that from the mnemonic processes at hand. The conventional approach is to aggregate across these nuisance sources, but this aggregation may distort the structure and mask important invariances in the data. To address this problem, my colleagues and I have developed a collection of Bayesian hierarchical models for modelling nuisance variability so that structure in psychological processes may be explored. I apply these models to recognition memory, where there is a vigorous debate whether memory is supported by a single mnemonic process or by multiple distinct processes. Model analysis reveals that ROC [receiver operating characteristic] curves across people and conditions form an orderly field, much like the order in gravitational of magnetic fields. As a consequence, the structure of recognition memory seems to be one-dimensional and may be accounted for with a single parameter of mnemonic strength.

A single parameter of mnemonic strength is the result of a search for invariances in this area. It is a “structural quality” (a reduction of the complexity of the data here as invariance, in other cases, for instance, a pattern), which should now be taken up by theory and explained (or “given a place”). We might ask what exactly the relationship is between this result and the particular method that has been used (in this case, a collection of Bayesian hierarchical models). Furthermore, we might consider whether it is in some sense useful. Clearly this is all about reduction, about “seeing” something in a simpler form. For this reason (maybe for this reason alone), it is something to be strived for.

Layer 2: On the Promise of Advice

My attention was recently drawn to a study by Van Petegem et al. (2012) published in the Web of Science journal *Developmental Psychology* which focuses on the concept of adolescent autonomy and its relation with psychosocial functioning. In this study the aim is to differentiate between two prevailing conceptualizations of autonomy, that is, (a) autonomy defined as independence versus dependence and (b) autonomy defined as self-endorsed versus controlled functioning. As their second goal the authors identify to examine the relative contribution of each autonomy operationalization in the prediction of adolescents’ adjustment (i.e., well-being, problem behavior, and intimacy). The article (of more than 10,000 words) follows a standard format: it gives an abstract; describes where the study starts from; gives details of the method that is followed, the data collection, analyses, and results; links the latter with previous research (and theories); deals with limitations of the present study; and offers suggestions for future research, before turning to conclusions and adding on the list of references.

The authors gathered data in a sample of 707 Belgian adolescents. Using a newly developed questionnaire, they assessed both the degree of independent decision making per se and the self-endorsed versus controlled motives underlying both independent and dependent decision making.¹ They report that the present study empirically underscores the conceptual difference between two prevailing definitions of autonomy. As specific results concerning their second goals, they report that deciding independently because one personally values doing so relates to a better quality of relational functioning, whereas being externally pressured into independent decision making is associated with less adjustment. Further, for the motives for dependent decision making, it is reported that identified motives were related to higher subjective well-being and to lower problem behavior, introjected motives were related negatively to subjective well-being, and external motives were associated with more problem behavior. They thus argue that identified motives for dependent decisions generally relate to a better pattern of adjusted functioning though not to intimacy, whereas controlled motives are associated with less adjustment.²

It goes without saying that the mentioned conclusions/results are substantiated by detailing the techniques of analyzing the data. I don't think, however, a lot of

¹The following is a summary of the different steps in the analysis of the data. An integrated measure was developed to assess both aspects of adolescent autonomy. Participants first completed a variation of the Family Decision Making Scale (FDMS; Dombusch et al. 1985), where they answered the question "Who decides [horizontal ellipsis]" on the following 5-point scale: 1 (My parents alone), 2 (My parents, after talking to me), 3 (My parents and I together), 4 (I, after talking to my parents), and 5 (I alone). The scale consisted of 20 issues that typically came from five social domains (Smetana et al. 2004; Smetana and Daddis 2002), that is, the personal domain (e.g., what clothes to wear), the friendship domain (e.g., whether you can hang out with friends your parents don't like), the prudential domain (e.g., whether you smoke cigarettes or not), the conventional domain (e.g., how you talk to your parents), and the moral domain (e.g., whether you can hit others). In a next step, they measured the motives for independent decision making. The questionnaire comprised 18 items, derived from the Self-Regulation Questionnaire (SRQ; Ryan and Connell 1989). Formulation of the items was based upon versions from related domains and reflected identified motives (e.g., "because this is personally important to me"), introjected motives (e.g., "because I would feel bad if I didn't"), and external motives (e.g., "because I am forced by others"). Respondents indicated their agreement on a 5-point Likert scale ranging from 1 (Completely untrue) to 5 (Completely true). A similar procedure was used to assess the motives for dependent decision. Participants completed two scales tapping into their subjective well-being: the global self-worth subscale of the Self-Perception Profile for Adolescents (SPPA; Harter 1988); next, they measured depressive symptoms, using a six-item version of the Center for Epidemiologic Studies-Depression Scale (CES-D; Radloff 1977). Concerning problem behavior participants completed a shortened version of the Alcohol Use Disorders Identification Test (AUDIT; Saunders et al. 1993) to indicate the level of alcohol abuse; the Deviant Behavior Scale (DBS; Weinmann 1992) was used to assess rule-breaking behavior. Finally, they measured the quality of intimate functioning in the relationship with one's best friend or romantic partner, using a shortened version of the Intimate Friendship Scale (IFS; Sharabany 1994). For further details, see Van Petegem et al. 2012; see also endnote 3.

²They report that in the final model, the predictor variables explained 24 % of the variance in well-being, 43 % of the variance in problem behavior, and 23 % of the variance in intimacy (Van Petegem et al. 2012, p. 83).

people will be surprised by the results that are offered—granted, now it has empirically been established (of course, one should not forget that this presupposes accepting the many “operationalizations” such as the integrated measure and all the other scales that are used, further the presuppositions of the various statistical methods, and last but not least what is involved in what is mentioned by the authors themselves “the conceptualization of autonomy,” i.e., the way they handle, operationalize, the two conceptualizations of autonomy). They suggest further that their findings may have some implications theoretical as well as practical; let me draw attention to what they call important implications for clinical practice:

...for instance with respect to parenting advice. Based on the correlates of independent decision making, one may consider the maintenance of dependence to serve a protective role against problem behavior. However, the undergirding motivational dynamics for such dependent behavior seem as crucial. If parents use pressure to foster dependent behavior, they may instead elicit rebellious reactions and oppositional behavior, such that their children distance themselves from them rather than stay dependent on them. Likewise, even though an increase in independent functioning is normative through adolescence, youths should not be pressured to decide or behave more independently, as controlled motives for independence also relate to maladjustment. By contrast, fostering adolescents’ self-endorsed functioning (e.g., through empathy, giving choice whenever possible, and encouraging them to act upon their personal values and interests; see Grolnick 2003; Soenens et al. 2007) seems to be especially crucial for parents, in order to deal successfully with the challenges of raising an adolescent. (Van Petegem et al. 2012, p. 85)³

How remarkable to use the concept of “clinical practice” when referring to advice for parents. But even if that is seen as fine (or just a matter of no importance), what about the presupposition in this kind of argument which clearly bears the label of a “means-end” reasoning (the use of pressure to foster dependent behavior which serves as a protective role against problem behavior is negatively appreciated because *children may distance themselves from them rather than stay dependent on them*; moreover, youths should not be pressured to decide or behave more independently as *controlled motives for independence also relate to maladjustment*). The final addition, again based upon empirical research, to foster adolescents’ self-endorsed functioning to deal successfully with the challenges of raising an adolescent, will surely baffle the reader, will it not?

I will continue with detailing quantitative educational research with another example from a similar field. It concerns a study by Bosmans et al. (2011) titled “Parents’ power assertive discipline and internalizing problems in adolescents: The role of attachment” published in the Web of Science journal *Parenting: Science and Practice*. The authors start from the observation that current evidence-based therapeutic and preventive parent management training programs teach parents to discipline their children in response to misbehavior. As research, according to these authors, has demonstrated that parental disciplining leads children to develop

³The references to publications which are part of quotations of the two educational research examples that are discussed either in the main text or in endnotes are not included in the list of references given at the end of this paper. They are nevertheless included to do justice to the study that is discussed.

less antisocial behavior, it is important to know whether discipline has side effects for the child (i.e., leading to internalizing problems). They distinguish power assertive discipline and inductive discipline. Examples of the former are corporal punishment, deprivation of privileges, psychological aggression, and penalty tasks; examples of the latter are diversion, explanation, ignoring misbehavior, reward, and monitoring.

Because it has been demonstrated, so they argue, that it is the power assertive character of disciplining that predicts internalizing problems, it is this what they will study further. More particularly, they are interested in the relation with attachment insecurity, as the link between power assertive discipline and attachment (which provides internal working models) has not been studied explicitly. Following Wu's assumed close association between power assertive discipline and attachment insecurity, and in line with the association that obtains between attachment and internalized behaviors, they hypothesize that attachment insecurity mediates the association between power assertive discipline and internalizing problems (Bosmans et al. 2011, p. 37). This is, they say, at the same time a test of a basic tenet of attachment theory which predicts that children and adolescents store their experiences with parents in internal working models (less secure working models are expected to be characterized by insecure attachment, cognitions, and behaviors, and this should be linked with an increase in internalizing problems). It is their prediction that power assertive discipline will be positively linked with adolescent internalizing problems and that this effect will be mediated by attachment security (ibid., p. 39).

Thus far it is clear that the interest of this study is motivated by a theoretical issue, a particular theory, and that it is a specific hypothesis based on this theory that is tested; there is, however, also a further interest which is explored and which is inspired by a particular practice (parenting advice) where disciplining in response to misbehavior is taught; here it is all about the possible side effects such as a clinically relevant emotional cost for the child leading to internalizing problems. Participants included 514 elementary and high school students ranging in age from 10 to 18.⁴ The article describes in detail the characteristics of the scales and instruments that are used (including their reliability, validity, etc.). It then details all the analyses that were carried out and offers justifications for the choice they made and the ways they proceeded. The study confirms that "...when parents apply more

⁴ Power assertive discipline was assessed using the Ghent Parental Behavior Scale. Two punishment scales of the GPBS are combined: harsh punishment (e.g., slapping one's child) and disciplining (e.g., taking away something fun or not letting her watch TV). For "internalizing problems" the Youth Self-Report questionnaire is administered (internalizing problems, syndrome scales, withdrawn/depressed, somatic complaints, and anxious/depressed subscales); for "attachment" a short version of the Inventory of Parent and Peer Attachment (IPPA) was used attachment was conceptualized as the quality of the relationship with mother and father; it has three subscales: "trust"; "communication"; for example, "I tell my mother about my problems and troubles"; and "alienation," for example, "My mother doesn't understand what I am going through these days"). For further details, see Bosmans et al. 2011.

power assertive discipline, adolescents report higher levels of internalizing problems and report being less securely attached. It is important to note that our analyses show that attachment completely explains the relation between power assertive discipline and internalizing problems” (ibid., p. 48). They continue by warning the reader:

These findings should be interpreted with caution. Demonstrating mediation suggests causal pathways, our data are cross-sectional and we investigated correlations. This allows us only to conclude that what we observe is consistent with what we would expect to see whether indeed a causal path leads from power assertive discipline to internalizing problems over attachment representations . . . Future research should investigate these associations using longitudinal research designs (ibid., p. 48).

Their findings are important they say for at least three reasons: they have implications for our understanding of the influences of power assertive discipline, they confirm a basic tenet of attachment theory, and they suggest that attachment is still malleable in adolescence. As customary they also discuss the limitations of the study, the relation of their findings with what has been suggested by other studies, options for future research, etc.

It comes as no surprise that these authors too (given their own starting point) return towards the end of the paper to implications for clinical practice:

The present study has implications for clinical practice. Clinicians should exercise care when they propose to use disciplining tactics such as deprivation of privileges or imposing penalty tasks, even in a consequent manner, to counter externalizing problems, because these results suggest that, at least in adolescence, this might have negative side effects as well. Our findings should be further investigated before advising too strongly against using nonphysical power assertive discipline. Research is needed to investigate whether applying nonphysical power assertive discipline in combination with parental warmth and involvement has more positive outcomes. Research on the authoritative parenting style advocates in favour of such a balanced perspective (Baumrind 1996), but all power assertive discipline behaviors have in common that they do not allow the adolescent the autonomy he or she requires in this developmental phase. Consequently, less controlling and more autonomy-supportive parenting behaviour might have a positive effect on internalizing and externalizing behaviour problems in adolescence given that they have a positive effect on attachment security (Soenens et al. 2008). (Bosmans et al. 2011, p. 50)

And they continue:

The mediation effects add to the growing suggestion that merely trying to change parenting behaviours without taking into account the quality of the relationship between parents and adolescents might not have an immediate or sufficient effect on psychopathology, nor on less secure attachment-related cognitions that are associated with power assertive discipline . . . This study shows that one of the reasons for the limited therapeutic effect of parent management training might be because cognitions about the quality of the relationship become more important than the actual behaviors of the parents. Therefore, in adolescence it might become increasingly important that therapy focuses on these maladaptive cognitions and on the quality of attachment relationships. After all, research shows that less securely attached children communicate less with their parents about their feelings. Consequently, they become more vulnerable to develop depression (Bosmans et al. 2010) . . . In sum . . . [r]esults demonstrate that power assertive discipline is associated with internalizing problems and less secure attachment . . . The large sample families, the use of a multi-informant measurement of parenting behaviors, the use of well-established measures, and the replication of findings across parental gender, gender of the adolescent, and age groups all underscore the results. (Bosmans et al. 2011, pp. 50–51)

This research, as the previous one I discussed, has a lot to go for: theoretically embedded (documented by several pages of references), moreover related to clinical practice, meticulously detailed, sophisticated, addressing issues that so far have not been studied, sound argumentation, etc. Interestingly, Bosmans and Van Leeuwen—two of the co-authors—are affiliated with the “Parenting and Special Education Research Centre” of the KU Leuven; and taking further in consideration the journal where the study is published, I presume therefore that this can be seen as an example of educational research.

Yet, focusing on at least one of the results (that power assertive discipline is associated with internalizing problems and less secure attachment, in the particular way this has been given shape; see footnote iv); one is inclined to comment that it would indeed be very strange if this were not the case. And it goes without saying that there are many reasons why people should refrain from power assertive discipline (never mind its association with internalizing problems and less secure attachment). It is furthermore remarkable that though at the beginning of the paper reference is made to inductive discipline, this was just left out in this study (granted, it has a specific focus, but it is telling that it is left out). And further, the advice to focus on attachment relationships instead of focusing on particular parental behaviour again will presumably not surprise many (and please do recall that such is suggested on the basis of the results of this and other empirical studies).

Layer 3: On the Promise of Explanation

Class size, and, more particularly, the reduction of the teacher–student ratio, has been discussed widely. There is indeed a widespread belief among parents, teachers, and others that pupils learn most effectively in small classes. This is, according to Mortimore and Blachford (1993), reflected by the fact that one of the main reasons cited for choosing independent schools is class size. That many people expect a lot from smaller classes is understandable as the size of a class is one of the most important means by which the school environment affects children’s learning and behavior. Yet some people are hesitant and argue that the cost of such an operation cannot be justified in terms of the benefits it generates for student learning (Slavin 1990; Tomlinson 1990). Though there is a lot of debate concerning this issue, some critics argue that there is not a wealth of evidence gained by well-designed studies to support size reduction. Most of the research is piecemeal and would not survive serious methodological scrutiny, at least not as far as it would be held to corroborate a general conclusion concerning class size. As regards the UK Mortimore and Blachford (1993) claim that typically only correlations or associations have been reported between class size and average pupil attainment, with little or no firm evidence on the impact of a particular class size on the achievements of its pupils. It is widely recognized, they say, that results from these studies are difficult to interpret because they do not account for intake (for instance, lower-attaining pupils can be concentrated in smaller classes).

Furthermore, it should not go unnoticed that there have been instances of meta-analysis regarding this issue. But even if one takes these into account, it is not clear what conclusions should be drawn. The situation is somewhat different for North America where more research has been conducted on this topic, though again interpretations differ. Some argue that there is a clear and strong relationship between class size and achievement (Glass et al. 1982). Others criticize the idea that an optimum class size can be specified in isolation from factors such as the age of pupils or the subject matter being taught (Robinson and Wittebols 1986). In conclusion, though a bibliographical search (ERIC) generates 456 references (to reports, journal articles, etc.) for the period 1966–2005, it is not, as many scholars have argued, transparently obvious that there is hard empirical evidence regarding the impact of class size on student learning.

Concerning class size, there seems to be one case many authors refer to due to its all-encompassing approach: the Tennessee Studies of Class Size, project STAR (Student–Teacher Achievement Ratio). In this study moreover very clear conclusions are offered. It is described by Mosteller et al. (1996) in an article published in the *Harvard Educational Review*, in which they use it to show that large, long-term, randomized controlled field trials can be carried out successfully in education.⁵ Project STAR is seen as an experiment that starts from the idea that in smaller classes, teachers have more time to give to individual children. This is to cope with a number of problems, as children face a great deal of confusion when they first come to school. For instance, they need to learn to cooperate with others, to get organized to become students, and of course they come from a variety of homes and backgrounds. In the experimental classes, the class size was reduced from around 23–15, by approximately one third, in kindergarten, first, second, and third grades (ages 5–8); the children moved into regular-size classes in the fourth grade. There were three kinds of groups: classes one third smaller than regular-size classes, regular-size classes without a teacher aide, and regular-size classes with a teacher aide. The experiment was carried out in 79 schools in the first year; both children and teachers were randomly assigned to the classes. In the second year it included 76 schools with 331 classes including 6,572 children in inner-city urban, suburban, and rural schools. It was continued for 4 years (1985–1989). After this period there was a second phase, the Lasting Benefits Study, which followed participating children into later grades and recorded their academic progress.

What are the major findings on class size? Firstly, smaller classes did bring substantial improvement to early learning in cognitive subjects such as reading and arithmetic. Secondly, the effects persisted into grades 4, 5, 6, and 7, after pupils moved to regular-size classes. Students who had been originally enrolled in smaller classes continued to perform better than their peers who had started in larger classes. Incidentally, minority students gained twice as much as the rest during the first 2 years before settling to about the same gain as the rest. Thirdly, the presence of teacher aides did not produce improvements nor did their presence seem to have as many lasting benefits.

⁵ In what follows I will draw mainly upon their characterization of the project.

Some more detailed results will further corroborate this conclusion. Performance was assessed through the use of two kinds of tests: the standardized Stanford Achievement Test and the curriculum-based Tennessee's Basic Skills First Test:

The effect sizes are around .25 for small versus regular-size class without an aide and around .10 for regular-size class with an aide compared to regular-size class without an aide. Thus the small class size advances the typical student an additional 10 percentile points, to the 60th percentile, while the aide advances the same student 4 percent, to the 54th percentile. (Mosteller et al. 1996, p. 819)

The authors hurry to add that although "... not huge, these improvements are substantial; when applied to a large population, they represent a solid advance in student learning" (p. 819). Furthermore, it is encouraging to find that students' early experience of smaller size classes has lasting effects that can be observed when they move to regular-size classes—the measurable effect after the first year was .12 and in the fifth grade the effect was nearly .20.

Mosteller, Light, and Sachs finally indicate that there are many issues involved when a well-designed and implemented study comes out with a definite finding. Serious consideration has to be given to all the available alternatives and to the costs and social consequences of implementing the new policy suggested by the findings. In this case, policy makers thought about the most effective place to introduce this intervention and decided to implement it in the 17 districts with the lowest per capita income. Thus the method was used in about 12 % of the state's districts and reduced class size in only about 4 % of all K-12 classes in the state. They further point out that, at the time of the study (1996), no further information became available from the 17 low-income districts after their students moved to regular-size classes. Therefore, they stress that these findings do not automatically mean that reducing class size is the best way to improve schooling—this has to be compared to other measures (for instance, one-to-one tutoring by qualified teachers, peer tutoring, or cooperative group learning).

As argued above, the matter of class size has been the focus of interest in various places. In the 1995 report "Class size and the quality of education," Ofsted used data from inspections to examine the possible relationship between class size and the quality of pupil's learning in UK primary and secondary schools. I will not go into details concerning this study, but it is interesting to have a brief look at the conclusions. Some of the main findings are that:

- no simple link exists between the size of the class and the quality of teaching and learning within it;
- small class sizes are of benefit in the early years of primary education. Once pupils have achieved competency in basic learning, particularly in literacy, they are more able to learn effectively in larger classes;
- within the range of classes inspected, the selection and application of the teaching methods and forms of class organisation have a greater impact on learning than the size of the class. (see Ofsted 1995)

There really is an abundant amount of research to select from. In some reports, attention is drawn to the fact that numerous aspects of the classroom are changed when the class size is reduced. Furthermore, teachers that have been assigned to

smaller classes report that the classroom environment is better. There are fewer reports of distractions. The changes lead to the noise level being lower and the room arrangements are more flexible because there are fewer desks. Sometimes researchers observed that, in small classes, the majority of a pupil's time was spent in individual communication with the instructor, while most of a pupil's time in a large class was evenly split between individual and group instruction. Moreover, many forms of behavior that are not tolerated in large classes because of the disruption they create, such as walking around the room, may be acceptable in small classes.

Though the results of the STAR project have not generally been disputed, some critics have pointed out that the effects seem to decrease after a number of years. One may want to remark that this was probably to be expected in the sense that the experience of the initial class reduction was a one-off event that could not possibly produce the same effects the following years. Others have claimed that the reason for the limited benefits that derive from small classes may be found in the fact that teachers maintain their old methods of teaching and do not take advantage of the new opportunities small classes offer. Thus Mortimore and Blatchford (1993) argue:

It is difficult to know whether it is the opportunity for more individual attention for pupils, more opportunities for pupils to become involved in practical learning tasks, or enhanced teacher motivation and satisfaction in small classes, which indirectly benefit pupils. It makes little sense, therefore, to consider class size in isolation from teaching practices, because the potential benefits of reducing class size will only occur if teachers alter their behaviour and classroom organisation. (p. 4)

There may be other elements as well that have to be considered, such as the preparation time for teachers which is supposed to be higher for larger classes, whether larger classes are given to more experienced (or possibly better) teachers, and the views of pupils themselves (whether they feel happier, believe they are less likely to be bullied, and are more confident about speaking up for themselves and participating in practical activities). Other more general issues have also to be taken into account: the relationship between class size, teaching methods, and the age of the pupils. Therefore, it is suggested that the effects of class size may be different at various ages, a matter which will interact again with the kinds of teaching and instruction that are offered. For instance, it could be the case that class size reductions will be more effective in the first years of school when children are more dependent on adult help, whereas peer tutoring and computer-assisted learning are likely to be more effective once pupils have been in school for a few years. Therefore, it may also be the case that reduced class sizes can prevent problems but are not sufficient to remedy problems later on, and so forth. It goes on and on. Other issues that are suggested concern the relationships between pupil and teacher, attitudes, and morale, and the relationships pupils have with each other.

Given the success of project STAR, some authors have drawn conclusions concerning the kind of research we need to conduct. Mortimore and Blatchford argue that a carefully controlled British research study is long overdue (1993) and furthermore that what is needed is "... experimental research which compares the

progress of pupils who have been randomly allocated to classes of different sizes” (Blatchford and Mortimore 1994, p. 418) because it is the only research which can give us conclusive answers to the question of whether children in smaller classes do better. In the same vein, Mosteller et al. (1996) argue that having access to strong research and policy studies will enable educators to make wise choices. One should not forget that educators have to work with scarce resources and constrained budgets and must decide on how to organize students into classrooms. And they continue:

Hunches, anecdotes, and impressions may have been the only available options in the year 1900, but as we approach the year 2000, society has a broad set of analytic design techniques, widely accepted and effectively used in many fields, that can offer more reliable evidence than hunches and impressions. . . . Not all questions can be tackled using controlled experiments, but many can be. We need larger scale investigations because studies carried out in single schools always have the limitation of doubtful generalization. (Mosteller et al. 1996, pp. 822–823)

They suggest a list of issues which may be tackled in a similar way (i.e., well-designed, randomized controlled field trials preparing for educational innovations) such as the appropriate amount of homework in different classes for children of different ages, the distribution of time to tasks among different school subjects, and even, the question of whether or not students are losing too much of what has been learned in the school year during summer months and vacations. I find these examples quite strange and it is not clear to me how they could be studied by randomized controlled field trials. Even more remarkable is the fact that Blatchford and Mortimore (1994) express some doubts about the results of (quasi-) experimental findings or randomized controlled trials, while on the other hand, they do not give ample space for other alternatives. Though (in my opinion) they quite correctly point out that class size reductions and methods of teaching need to be considered together and that benefits are only likely to take place if we consider what kinds of teaching, classroom organization, and tasks are relevant to a particular size of teaching group, they insist that these issues should be approached in an experimental way—or how else, given their earlier statements, does one interpret their plea for *sound information* that appears in the same article (p. 426)?

I said earlier that it is strange to find, on the one hand, pleas for well-designed (experimental) research, while, on the other hand, these empirical researchers are aware of the multiple elements that have to be taken into account and the problems to overcome. It is clear that they fully realize the limitations of the methods they want to follow. For instance, in a study of 1998, Goldstein and Blatchford discuss observational studies and randomized controlled trials, in which they argue for the assumption that the point of doing class size research is to make statements about causation:

By causation we mean the inference that, from an observed ‘effect’ of class size on achievement estimated by research, we can assume that moving children from one class size to another will have a similar effect on achievement. (Goldstein and Blatchford 1998, p. 256)

Yet in the same study they argue:

Even with the most carefully controlled study causal interpretations will be difficult, not least because we need to take account of the context in which the research has been carried out; and whether the 'effect' may vary across schools, educational systems and other contexts such as social background.⁶ (Ibid., p. 256)

Goldstein and Blatchford draw attention to several problems, which may arise because researchers have ignored the problematic aspects of measuring or defining certain concepts. The following list is long, though not exhaustive:

- The actual size of a class is not the same as the student–teacher ratio.
- The number of students formally on the register may differ from those being taught.
- The experienced size is to be differentiated from the actual size.
- The sample population may differ from the target population.
- Reduction of class sizes within a large school may not be the same as an equivalent change in a small school.
- Because of the inherently historical nature of all social research, by the time the results are available that context normally will have changed.
- The institutions or populations which are most accessible for study are often atypical.
- In the case of randomized controlled trials, the expectations about the effects of class size may be partly responsible for observed effects.
- Teachers and children within a school in different class sizes may interact over time and possibly “contaminate” the effects of the size differences.
- A design where randomization occurs only at the school level may not be representative of the real world where typically differential sizes do exist within schools.
- Teachers may alter their style of teaching (they might tend to use more whole-class teaching methods and concentrate more on a narrower range of basic topics) and consequently compensate in a number of ways with larger classes.
- The role of “mediating variables and processes” (such as quality of teaching, pupil attention, teacher control, etc.).

Reanalyzing the data of the STAR project, Goldstein and Blatchford (1998) identify other “shortcomings.” For instance, they point out that 24 % of the children were removed from the project after kindergarten and these had a markedly lower score than those who remained in the study. They also noted that problems regarding dropping out continued at grades 1, 2, and 3. In conclusion, one finds that, on the one hand, pleas are made for well-designed (mainly experimental) research, while on the other hand these empirical researchers are aware of the multiple elements that have to be taken into account and the problems to “overcome.” Clearly they fully realize the limitations of the method they want to adhere to, but, nevertheless, decide that it is still the best path to follow.

⁶ Causality here and elsewhere is conceptually identified as law-like generalizations paradigmatically used, for instance, in physics.

Of course, it is interesting to know that reductions in class size have no negative (and indeed have some positive) effects on student learning, but the question remains whether the level of those effects substantiates the claim for greater investment—resources are always scarce. This necessarily requires a different line of research and of argumentation. Many other issues are involved, which the STAR study does not go into, such as the workload of the teachers, the feelings of happiness of the students, and other issues which can hardly be measured in the same “objective” experimental manner. This is also a problem because the various elements that are involved relate to each other. It comes therefore as no surprise to find in many studies that it is not so much class size that is important, but the way the teacher deals with it, i.e., varies his teaching to accommodate optimal student learning.

So what may be concluded on a meta-level as regards this kind of research? First of all, it seems that, in these studies, the benefits of reducing class size are determined in terms of factors (independent and dependent) that can be measured and manipulated in their constituent parts. What does not fit into this experimental pattern is simply left out. Although the well-being of pupils and teacher workloads are mentioned, there is no attempt to incorporate these factors into the design. Obviously it would be very difficult to analyze some of these relevant variables in random settings. Nevertheless, case studies are ruled out because the conclusions they offer cannot be generalized. It is true that most of the researchers working in this area accept that the higher cost of smaller classes is a relevant consideration. However, they are much more concerned with establishing whether or not there is an effect, rather than considering the strength of the effect that would justify higher spending on education. The latter, much more political issue, is *irrelevant* for such researchers and is not dealt with. This generates a picture, which suggests that once the facts have been determined, the conclusion (i.e., to decrease class size or not) follows on of its own accord. Second, it is difficult to see how long-term studies can accommodate for situational/historical change. It is not only impossible to foresee which new elements have to be taken into account, but what is ignored are the different elements which, in their interaction with each other, create something new (which is not just the result of addition or subtraction of variables seen as factors). Problems of discipline, for instance, may disrupt the interactions to such an extent that regularly observed relations between variables no longer hold. Conversely, we are told that one of the advantages of smaller classes is that many forms of behavior, which are not tolerated in larger classes because of the disruption they create, may be acceptable in smaller classes. Third, and less technically but perhaps even more importantly, the favored design seems to ignore the fact that teachers deal with class situations (or learning situations) in a creative manner. It comes as no surprise to find in many studies that it is not so much class size that is important, but the way the teacher deals with it, i.e., varies his teaching to accommodate optimal student learning. Teachers will look for opportunities for students to learn and thus act more in the spirit of “making the most of it,” rather than carefully “following” regularities or causal inferences. They realize that there are many roads to Rome, and also that it may not be the only place worth going to. All three of these conclusions could be seen as strengthening the case for a more holistic approach, where the relation of the elements that are involved is given a more prominent

place. It seems that in educational contexts, it is not so much factors or elements that have to be studied as such, but the complex relationships between them. Here the presence or absence of something may change the whole picture and, consequently, the conclusions that can be drawn from a particular setting. Yet from the position that is generally embraced, such studies are seen as irrelevant due to their lack of potential for generalization. Does this rule out experimental or even empirical research? For some that is the conclusion, but this seems wrong to me.

Kinds of Understanding and Explanation: Layers of Interpretation

In educational research as everywhere else in science, academia, or even ordinary life, we are for various reasons interested in trying to understand (some would say, “make sense of”) the phenomena we are surrounded by or subjected to. This understanding is supposed to give us a grip on what is happening, bring some order to the chaos. It is not in the least bit concerned with how we see ourselves, or what we aspire to achieve. Some explanations are more attractive to us than others, some are more popular in particular periods, and some focus on groups. Others center on the individual. Crucial in this endeavor are issues about truth (A) but at the same time at lot will depend on what one is particularly interested in (B). The latter may or may not be intertwined with one or other sort of good that is envisaged either by a person or a particular group, and this opens up the sphere of manipulation (C) but also of responsibility and responsiveness (D). Thus matters of the particular concept that is used when studying a problem come to the forefront (E) as crucial factors concerning the characterization of that phenomenon. This will have implications for where one can arrive at in terms of solutions for dealing with it.

Let me begin by arguing that whether something is *really* explained, or whether “reality” here is merely the opposite of fiction, should not necessarily invoke a naïve form of correspondence theory of truth where sense data are the exclusive building blocks. Instead, as Peter Winch rightly argued, it is always about “what is real for us.” It goes without saying that answering a research question in terms of causes and effects will not generate an answer in terms of the understanding of those involved. But this kind of circularity is not to be regretted. It is characteristic of all explanation. Scientific, and for that matter any other kind of explanation, will always take the data which are to be interpreted to a higher step of abstraction. This will engender a particular theoretical construction that makes sense. This is a circular process in which each level is taken to account for, to derive from, or to elaborate on the other. Thus instances are explained by patterns and patterns by instances. For Winch too, there is more at stake than just the practitioner’s understanding or the concepts of those involved (i.e., raw data as interpreted phenomena), but those of the “student of society” as well. Clearly, here it is not prediction that may exclusively provide us with a point of reference, nor is the method of the natural sciences the only way to come to valid conclusions. But if the possibility of

prediction is what one is interested in, even then a meaningful background must be present. That sense data and observations will play an important role does not jeopardize the claim that concepts are always involved. Possible exceptions occur at a very basic level. For example, light of a particular intensity is painful. In such cases one may argue that particular phenomena have “meaning in themselves” and do not presuppose a shared meaningful background. With the example of the light, what is “shared” here is the human body and its particular physiology. But these cases/examples are rare, and moreover, once we start speaking about them, a language in which we can determine “what makes sense for us” is implied. Again this has to be distinguished from a context in which reasons can be given. It is therefore not correct to argue that phenomena which have a “meaning in themselves” play no role whatsoever in our understanding of human behavior. But it would also not be correct to ignore that more is involved if they have a place in our lives. In that case they also presuppose some kind of shared meaning that will include elements over and above the physical, chemical, physiological, or biochemical level.

Explanation and Causality

When trying to understand natural phenomena, one may want to distinguish a unified style of explanation from explanations of a mechanical kind. The former explains in terms of basic comprehensive principles (for instance, in biology: selection, mutation, heritability of traits). In other words, a unified style of explanation situates phenomena into an overall scheme. The latter style of explanation answers questions of how things work (sometimes understood as what they are made of). It therefore comes as no surprise that Wesley Salmon, a philosopher of science, argues that the constant efforts of the sciences to explain involve “revealing the mechanisms at work in the world” (1989, p. 156). In terms of understanding a society one may be interested in how it functions at large, what and why people do what they do, and “who” they are. However, in many cases in this area, the concept of “causality” seems to pervade our thinking about ourselves and others, about our environment, even concerning the entire universe we live in. It is involved in the use of technology (where we attempt to achieve particular effects while avoiding undesirable ones) and in our everyday practical planning and dealings. For a lot of authors, to explain an event is to identify its antecedents, i.e., its causes.

Though clearly in many cases the use of statistics is aimed at unraveling causal mechanisms, this is not always the case. For example, one may be interested to know how many cases there are with this or that characteristic and this can be useful for a particular purpose. These descriptions (a distribution of the actual cases concerning a particular variable) may be vital for policy issues. Let us take bullying as an example. How many cases of bullying are registered in primary schools? This can be specified further for particular subgroups such as boys and girls, according to age, ethnicity, various living conditions, and so on and so forth. A model of causality looms up behind these descriptions. Now it goes without saying that to have an informed estimate of the frequency of the occurrence of a particular problem (as detailed as this can be) is quite essential in educational contexts. Policy

needs to take this into account, as it can be an element in the process of determining how relevant the problem is and what should be done about it. It should, however, be noted that when studies use *descriptive statistics*, which evidently have a place in their own right, they take a step further. Then statistics become part of a much broader (sometimes “causal”) concern, whether they are used to explain what is going on or to be made use of (i.e., used to tackle the envisaged problem). I will refer to this as *the explanatory use of statistics*. I will not deal with the area of problems the “use of” statistics confronts us with (these are typically identified as “contextualization,” “generalizability,” or even “eco-validity”). Instead, I will focus on what lies at the basis of the explanatory approach. The open door descriptive statistics offers lures us into an area that is beset with serious problems. Such problems are often put aside (“forgotten”) in the interest of explanation.

In quantitative research, one typically looks for a distribution of variables (how many cases are there with this or that characteristic) and uses this for explanations. Such explanations can be of a deductive–nomological kind (incorporating universal laws) or be of an inductive nature. Explanations of an inductive nature are supposed to contribute to what Peter Lipman calls “. . . Inference to the Best Explanation” as they provide “a partial solution to the problem of description by giving an illuminating account of the black box mechanism that governs our inductive practices” (Lipman 2004, p. 164). Clearly, bringing something under a set of laws can also offer an explanation not in terms of an argument (a logical structure with premises and conclusions governed by some rule of acceptance), but as a presentation of the conditions relevant to the occurrence of the event and a statement of the degree of probability of the event given these conditions.⁷ Thus the problem of determinism

⁷Incidentally, it is interesting to notice that examples from the atomic and subatomic world show us that there is a limit to the joint precision with which two so-called complementary parameters can be known: there is an inescapable uncertainty if one attempts to ascertain the values of both the position and momentum of a particle. The same thing goes for energy and time. Ascertaining the position of an electron with great precision makes us unable to ascertain its momentum exactly and vice versa. More precisely: when a photon strikes an electron, the direction in which the electron will go is not determined. There is a probability distribution over all possible directions. Furthermore, in this collision the amount by which the frequency of the photon will change is not determined. A probability distribution over all possible amounts exists. Because of the conservation of energy and of momentum, there is a perfect correlation between the direction of the electron and the change in frequency of the photon. The pair of values is however not determined. Incidentally, it is important in this context to refer to problems with our instruments of measurement. The click that results from a genuine photon detection is utterly indistinguishable from the click that results from a spurious count. And finally, there is of course the presumption that conditions surrounding this particular occurrence can be specified in enough detail to establish the existence of a unique necessary and sufficient cause (this example is discussed in Salmon 1998.) To offer an explanation here is something different: it comes down to the assembling of a total set of relevant conditions against which the event can be explained, and to the citing of the probability of that event in the presence of these conditions. It is in this case not an argument (a logical structure with premises and conclusions governed by some rule of acceptance), but rather a presentation of the conditions relevant to the occurrence of the event, and a statement of the degree of probability of the event given these conditions. Evidently, a persistent statistical correlation—a genuine statistical-relevance relation—is strongly indicative of a causal relation of some sort, but one should not confuse statistical correlation with genuine causation. This would be to conflate symptoms with causes.

versus indeterminism is invoked. For the determinist, the fact that we are unable to make perfect predictions in all cases is the result of human ignorance and other limitations. This is not because nature is lacking in precise determination; clearly, accuracy of prediction is irrelevant to whether determinism is true in principle. This framework is challenged by frameworks of indeterminism, for instance, by quantum theory. It is not simply that quantum mechanics is *prima facie* nondeterministic, but that under plausible constraints no deterministic completion of the quantum theory is possible. In view of this it seems inadvisable to accept determinism as an *a priori* principle—and of course the truth or falsity of quantum mechanics is a matter of physical fact. Doubts about the possibility of finding causes for everything, either on the basis of logical or empirical considerations or on the basis of relativity theory, press the case for a move to indeterminism as the more rational choice for the overarching framework. However, as far as I can see, this sort of metaphysical discussion is not terribly pertinent to the argument presented in this paper. Indeed, as argued above, laws can be seen as offering an explanation by presenting the conditions relevant to the occurrence of the event and a statement of the degree of probability of the event given these conditions. I therefore conclude that the discussion of determinism or indeterminism does not damage the use of causes and laws. Moreover, because of this it will not diminish the interest in causes and causal explanation. We explain facts (general or particular) by exhibiting the physical processes and interactions that bring them about, but such mechanisms need not be deterministic to have explanatory force. In the following I will talk about laws and causes with this in mind.

The form philosophical discussions of causality take is usually as follows: there are two facts (or types of) or two events (or types of) between which there is a relation *R*. Sometimes the logical structure of the relation is discussed in terms of necessary or sufficient conditions or a combination of both, which given the interaction of several conditions leads to complex schemes for understanding particular occurrences. To put the issue again more generally, when two types of events, *A* and *B*, are positively related to each other, we hunt for a common cause *C* that is statistically relevant. The statistical-relevance relations must be explained in terms of two causal processes in which *C* is causally relevant to *A* and *C* is causally relevant to *B*. This is the heart of matters where it is claimed that a statistical explanation is based on causality. Now the question is, why should we prefer, for explanatory purposes, the relevance of *C* to *A* and *C* to *B* over the relevance of *A* to *B*, which we had in the first place? The answer is that we can trace a spatio-temporally continuous causal connection from *C* to *A* and from *C* to *B* (while the relation between *A* and *B* cannot be accounted for by any such direct continuous causal relation). Recall that, according to Hume, causal explanations present us with a problem. As deductive logic cannot provide the answer (that explains why ball number 2 is set in motion after being hit by ball number 1), Hume turns to empirical investigations. On the basis of his observations he concludes that in situations where we believe that there is a causal relation, there is a temporal priority of the cause to the effect. There is furthermore a spatiotemporal contiguity of the cause to the effect, and finally, on every occasion on which the cause occurs,

the effect follows—there is constant conjunction. As there is, in his opinion, no physical connection between the cause and the effect (the connection does not exist outside of our own minds), the relation between cause and effect is to be found in custom and habit. We may want to qualify the latter and argue for a more robust interpretation of causality (see, for instance, Salmon 1998), but for our purposes little depends on this. It does not affect either the use of cause nor our interest in causes. As indicated, it is important to realize that when statistics are used to explain the occurrence of events, a model that uses causes is operative. Hempel's position, often referred to in this context, makes this clear.

In an explanation one may cite specific conditions obtaining prior to the event (initial conditions) and invoke general laws. It is held that the occurrence of the event to be explained follows logically from those premises, i.e., those initial conditions and laws. One can distinguish between deductive explanations that incorporate universal laws (which hold without exceptions) and inductive explanations, which employ statistical laws (which hold for most or many cases). According to Hempel (1965) scientific explanation consists in deductive or inductive subsumption of that which is to be explained under one or more laws of nature. This is referred to as the deductive–nomological model (D-N). For Hempel, however, inductive–statistical explanations are essentially relativized to knowledge situations—he suggested the requirement of total evidence that took the form of the requirement of maximal specificity, where all possibly relevant knowledge is available. If there were an inductive–statistical explanation whose law-like statistical premise involved a genuinely homogenous reference class, then we would have an instance of an inductive–statistical explanation *simpliciter*, not merely an inductive–statistical explanation relative to a specific knowledge situation. However, as there are, according to Hempel, no inductive–statistical explanations *simpliciter*, ideally inductive–statistical explanation would have no place in his account. There is a striking similarity between this kind of explanation and Laplace's formulation of determinism. In view of this close relationship, it is tempting to conclude that events that are causally determined can be explained, and those that can be explained are causally determined. Above we have set aside the problems of determinism versus indeterminism, as well as those concerning the formulation of laws (among others underdetermination; see also footnote 1). Let me reiterate the point that what is important is to focus on the fact that in many cases we do not have enough facts to be able to construct a full explanation and we can never be sure that a new condition might not turn up: one can never exclude the possibility that a further relevant subdivision of a reference class might be necessary on the basis of additional knowledge. Moreover, an explanation requires a sufficient condition that is based on empirical evidence that something actually happened, and inference on the other hand refers to something in the future. To infer something that lies in the future not only presupposes that everything relevant has been taken into account but requires that the future replicate the past. Notwithstanding these difficulties, it seems that for a statistical-relevance model, it is the amount of relevant information that counts; it consists of a probability distribution over a (maximum) homogeneous partition of an initial reference class (and thus is all about the gain in information it provides).

So one answer to the question “why are we attracted to statistics?” comes down to the fact that it helps us to find what is hidden (either a law, or a law-like generalization). We think that this hidden law may assist us in dealing with future problems. Therefore, though we are aware of the problems explanations in terms of “(quasi-)causality” are beset with, and we are knowledgeable about the limits of the use of statistics (and take these into account), there is no more trustworthy method to rely on if we want to know how things work (either in the natural or the social world), so the story goes, but there is, as I will argue, more complexity at stake.

Interpretation and Complexity

In the *Philosophical Investigations* Ludwig Wittgenstein argues against essences and metaphysics, or more precisely against our metaphysical disposition. For Wittgenstein, this is exemplified in the general propositional form of a sentence. Against the Augustinian picture of language (all propositions are or contain a description), he argues that: “language plays us entirely new tricks” (Wittgenstein 1966, *Aesthetics*, I, # 3). And in section 115 of the *Philosophical Investigations* he writes: “A picture held us captive. And we could not get outside it, for it lay in our language and language seemed to repeat it to us inexorably” (Wittgenstein 1974b, I). The reason for this is that in a proposition, something of the subject of that sentence is always said. His move is in the opposite direction, towards particularity, and thus philosophy offers reminders for a particular purpose. In this sense (and only in this sense, because Wittgenstein is wary of theory generally and of looking for hypotheses or “what is hidden from us”), statistics may not be that different at all from our “normal” way of speaking. However, clearly retreating into “a new way of looking at things” as one or other kind of aesthetic existence may not be enough to convince the skeptic. Though much can be said for particularity at some point, we may want to transgress such a stance because resources are limited and we are urged to make decisions on a larger scale. There is much more to be said about this, but I should return now to the central focus of this paper, namely, interpretation in quantitative research.

Interestingly, the aesthetic dimension we touched upon has also been addressed more generally in regard to research methodologies in the social sciences. David Fenner (2006), for instance, argues that quantitative and qualitative methodologies could be seen as exemplifying respectively a disinterested and an engaged approach. He maintains that there exists a strong parallel between current research methodologies in the social sciences and the two most central and popular approaches to aesthetics over the last four centuries. Fenner approvingly quotes Eddy Zemach who argues that within the stance of scientific realism, “Scientists apply criteria to theories, such that those theories that best meet those criteria are those theories judged to most closely approximate the truth” and that “[a]t least in part, these criteria are aesthetic: simplicity, elegance, unity, etc.” (Fenner 2006, p. 321). Somewhat further he endorses the position that scientists do not celebrate

aesthetic properties like ambiguity or “sublime disorder.” In the conclusion he claims that “[m]otivations to employ one educational research methodology are quite similar to motivations to favor one sort of approach to aesthetic experience (or judgment) over the other” (Fenner 2006, p. 327). This far-reaching conclusion reiterates the point that was made earlier concerning a taste for the simple or the complex. That the simple can be dangerous is evident. Though simplicity may often be a good thing, it avoids the hazards of the oversophisticated, the baroque, or even the decadent (as John Dupré argues in “The lure of the simplistic,” 2002, p. 284, concerning the theory of evolution, this attractiveness can make us blind to what is naïve, unsubtle, or just misguided—he speaks of the “unifying and simplifying urge, reductionism,” *ibid.*, p. 291). So is statistics only about the simple in its pejorative sense?

There have been attempts to rescue analytical statistics in a way that is acceptable to skeptical critical realists. In an interesting paper “A critical epistemology of analytical statistics,” Wendy Olsen and Jamie Morgan (2005) argue that the significance of a method can be transformed by a reconstruction of the methodology. In their words: “It is not implausible to suggest that methods predicated on closure and regularity can contribute to an open methodology that in turn has something valuable to say about an open social reality” (p. 262). Furthermore, they argue that “. . . a post-positivist social science would want to reject empiricism but not necessarily all the techniques associated with empiricism” (*ibid.*, p. 265). There could be a case for optimism regarding the possibilities for operationalizing aspects of social reality. Furthermore, realists need not be empiricist in their interpretations. They argue that eight claims or criteria can be set up to provide for a multifaceted defense of analytical statistics.⁸ This allows us to avoid throwing out the baby with the bathwater. Here are Olsen and Morgan:

1. Methodological closure need not presume a closure in reality for explanatory significance. Non-identity between the two means that a closed method may still contribute to a realist account of an open system where the degree of openness is known in advance.
2. A manipulation that constructs regularity need not imply that the basis of that relative regularity is arbitrary or unrepresentative of the aspects of the world under scrutiny. Synthetic epiphenomena highly determined by method itself can occur, but do not necessarily occur.
3. Regularity-seeking analytical statistics are capable of highlighting non-regularity and the breakdown in relative regularity. Analytical statistics can accommodate complexity and contingency.
4. The interpretation of analytical statistics allows non-atomistic inferences about relations.

⁸ They use what they call a widely accepted notion of analytical statistics as the mathematical process of manipulating survey data in an attempt to reach “well-founded” conclusions which generalize across the region and time period from whence the data came. The analytical methods can be seen as including regression as well as some exploratory methods such as factor analysis (cf. Olson and Morgan 2005, p. 280, footnote 1).

5. As a consequence of 1–4, the results obtained through analytical statistics can be counter-phenomenal or unexpected. As such they are able to contribute to a qualitative understanding.
6. The role of the analyst in the initial choice of method(s) and in the subsequent development of the particular research application is highly significant in realizing the possibility of 1–5.
7. As a consequence of 1–6, manipulations can contribute to retrodiction [which explains what conditions in reality may have or could have led to these observations] to causal mechanisms rather than hypostatizing [acting as if, or assuming that, the relations between things are fixed] variables as chains of events through interpolation.
8. 1–7 imply that an analytical statistical method may be appropriate as part of a methodologically pluralist research project. (Olsen and Morgan 2005, pp. 269–270)

Olsen and Morgan claim that one need not believe that data *represent* the world for them to be useful in constructing arguments (ibid., p. 277). Moreover, it may be extremely difficult to disagree with their conclusions (ibid., p. 278):

Counterfactual work in analytical statistics requires comparative statistics, and can usefully bring out findings about minority groups vs. the majority, or different populations which have common causal mechanisms. The class structure of different countries, and different policy regimes which together generate different employment outcomes, illustrates the possibilities for comparative statistics. To throw out statistics as a method would involve discarding all possibilities for such comparative work, yet such work has been very illuminating in many disciplines.

Sylvia Walby (who is interested in a more theoretical stance) develops a parallel argument (2007) where the implications of complexity theory for the analysis of multiple intersecting social inequalities are investigated and applied. Similarly Helga Nowotny (2005) draws attention to the fact that we seem

to be engaged in describing and interpreting complexities with the desire to understand and to engage in both – in building higher-level complexities because they are a more efficient way of doing things and to reduce complexity in order to minimize undesirable effects and to be able to cope with the increasing levels of complexity around us (Nowotny 2005, p. 19).

Both, she claims, are indicative of a dynamic which points to the ongoing coevolutionary processes between science and society.

Evidently, there is a real danger here of committing a logical fallacy, in which one ignores the original topic of an argument and subtly changes the subject, but still claims that the conclusion concerning the original subject is reached even though the argument has little to do with the conclusion. This so-called red herring fallacy looms around the corner for statistics. It is committed when the arguer diverts the attention of the reader or listener by addressing a number of extraneous issues and ends by presuming that some conclusion has been established. This confuses scientific with faith-based belief. What can we conclude from this? It seems to me that when one does not hypostatize (by this I mean formally treat or represent something abstract as a concrete reality) the results of statistical analyses, they have the potential to engender better understanding. Of course, statistics may reveal what we are interested in or point us to something that we were unaware of (e.g., that in the Flemish-speaking part of Belgium compared to the French-speaking part more drugs are used to treat ADHD and less for depression). Yet at the same time

they may conceal what we should (also) be concerned with. But to simply regard statistics as dangerous (or redundant) does not do justice to the complexity of what is involved in understanding.

The philosophical problem about the structure of language, namely, the particular metaphysical enframing (and longing) that unavoidably seems to take place (this is overwhelmingly clear in Plato's work and those positions that were developed in this vein) and which was foreshadowed in pre-Socratic stances (such as the fascination for numbers) and present in later developments, for instance, by Bacon and Descartes, haunts us to use a Wittgensteinian expression. As a result, the ideals of objectivity (bracketing the performative embeddedness) and rationality that, since the Enlightenment, have characterized our understanding of reality may be seen as indicative of unwillingness to live with complexity. Humans not only long for knowledge (to know how things are, for instance, "Is this a tenor characterizing a particular voice?" or "How long will I be in the traffic jam—incidentally, knowledge of that does not shorten the time?"), they also seem to have an insatiable need to gain control over the world. That we always use concepts that invoke something general, that there is no alternative to this even when we take it fully into account, is a profound Wittgensteinian insight. The attraction of statistics lies in the fact that they make things more simple and answer a "human all too human need" to get some kind of grip on reality. This is bound up with the force of rhetoric, a force that may be easier to exploit now than ever before given the availability of super computers and Web-based dissemination of what has been found to be the case.

On the Limits and Unavoidability of an Amended Correspondence Theory of Truth

As I implied above, all of this is puzzling, very puzzling indeed. What is it that these authors of the examples I discussed above hope to achieve? And why, one is inclined to ask, is the demonstrated reliance on empirical methods the only avenue they dare to walk confidently? The knowledge that is offered in educational research is of various kinds:

- (a) Local, situated, descriptive (of whatever nature: either based on sensory experience or observation or involving the subject to express one or other judgment about the situation or herself, or a combination thereof)
- (b) Addressing some elements to make the process run more smoothly (let us call this "technological" knowledge)
- (c) Generalization (theoretical, in many cases based on statistical methods), complemented with results based on other empirical research directed towards theoretical insights (most frequently combined with an interest to achieve certain ends)
- (d) Finally, interpretation including discussions "where to go"

The examples I have discussed (which I hold paradigmatic for educational research nowadays) do pretty well on (a), (b), and (c), but do poorly and are even neglectful concerning (d). What does this point to? Although very few colleagues in educational research will admit it, I surmise that most of them are in fact embracing the presuppositions of positivism, logical positivism, or logical empiricism. They pay lip service to the traditional criticisms, they know how to speak politically correct about the *limited* nature of their own research, and they will grant everyone that value questions are always involved and that they have to pay attention to these, yet when they are pushed to make explicit what they think their own knowledge as experts is, then what one hears is nothing less than what may be labeled objective knowledge, which invokes one or other variation of the correspondence theory of truth in a rather naïve form. Though such a kind of educational research has been criticized, successfully one may say, and moreover logical empiricism (logical positivism/empiricism and positivism) has been criticized, again successfully let me insist, it is as lively as ever.⁹ Why, one may ask is it so attractive, so much alive? The quite simple answer to this is surely that as it focuses exclusively (or at least predominantly) on referential meaning, it is more satisfactory than other positions (which include other kinds of meaning) because it leaves (almost) no room for doubt (at least not once a particular theory has been identified including the concepts it works with). In epistemological terms this may be characterized as a kind of logical positivism (maybe even the kind that is present in Wittgenstein's *Tractatus*; see Wittgenstein 1974a).

As I argued above, most educational researchers seem to be aware that there are necessarily limitations concerning how to proceed. They put a lot of effort in determining the kind of data they need and how to analyze these, and are showing their willingness to justify all the steps they take before offering (usually in a tentative way) some conclusions. That their approach is heavily criticized turns out not so difficult to explain. Indeed it is tempting to ignore momentarily the pictorial form (a particular kind of (re-)presenting reality exclusively focusing on referential meaning) and then forgetting that one has ignored other (re-)presentations (see Smeyers 2014). In trying to achieve value-free, i.e., objective knowledge, to represent reality as it really is, many educational researchers confuse rational discussion with a rather crude kind of naïve registration (which they

⁹ There is a further development, i.e., post-positivism which too embraces ontological realism, the possibility and desirability of objective truth, and the use of experimental methodology. In this amended version of positivism, it is held that reality can only be known imperfectly and probabilistically (taking into account among other things that theories, background, knowledge, and values of the researcher can influence what is observed). For post-positivists human knowledge is based not on unchallengeable, rock-solid foundations, but rather upon human conjectures which are justified by a set of warrants which can be modified or withdrawn in the light of further investigations. Though this stance deals successfully with a number of criticisms of various versions of positivism, it remains however a meta-theoretical position that cannot do justice to what according to many is at the heart of social sciences, i.e., the interpretation of human experience and the particularly human reality that is addressed here (including what is offered, for example, in disciplines such as history, philosophy, etc.).

present) in their representation of research. Though it is accepted that theories and concepts are needed, no serious engagement is shown with the kinds of theoretical insights the complex human reality requires, with the kind of questions Socrates famously asked—one may want to recall his “the unquestioned life is not worth living.” What they offer can be identified as positivism, or in any case as a less outspoken or milder version of it. A metaphor may be helpful here: in a similar manner as facts and concepts are often portrayed as two sides of the same coin, ethics, aesthetics, and all dimensions which come together in our social practices can be taken to identify what will be seen looking through a prism (of which each point of entry may be a particular dimension). For a moment one may indulge oneself getting engrossed in how reality looks like (really is) from a *particular* point of entry. But when choosing to take a particular stance, one is not at liberty to forget or do away with its particular picturing (neither with other possible entries). It (i.e., the stance) is therefore not a matter of taste at all, or of what works or what is popular, but must be part of a rational deliberation involving various perspectives and the voices of all who want to be part of it. Each of these possible stances (particular entries in the prism if I may be allowed to continue the metaphor) may focus on what is absolute in a particular “perspective.”¹⁰ What I labeled “referential meaning” is thus a particular case (a discourse which relies on *sense* data); it is by no means the only way reality makes sense for us and that is shown in the variety of ways we speak of what is “real” for us.¹¹ Let me recall: it is easy to forget this.

Decisions need to be made and for that reference to “what is real” is crucial. Following Winch (1958), it is my claim too that a more fruitful way to talk about this is phrased by “what it makes sense to say.” The answer the majority of educational research nowadays offers is something that aspires to be “beyond reasonable doubt” within the chosen framework (or language game) of empirical educational science. One is interested in what is the case, what is real, unbiased, and therefore one typically also suggests that the insights should be taken up by practitioners. However, one operates as if educational research is a kind of natural science and is inclined to forget that there is more at stake. It is telling that one wants to be as far as possible removed from discussions about ends; moreover, these are presented as if they are to be situated beyond critical scrutiny. Possibly

¹⁰ Incidentally, the concept “perspective” may suggest that one can take a distance from what one observes and/or that one can decide to take only a particular perspective. Both of these tendencies should be resisted: the first is clearly impossible; the second can only momentarily be the case in view of a particular purpose. It is rather that one always finds oneself in one or other perspective which foregrounds itself.

¹¹ Of course, it may never be completely or totally possible to diverge oneself from one or other kind of correspondence theory of truth. Once one accepts, however, that there is theoretical knowledge one needs to realize that more is at stake which can no longer be captured by a correspondence theory of truth, and from this it follows that more and different kinds of “what makes sense to say” have to be “admitted.” Such broadening can build on a thin conception of meaning (may even always necessarily build at least partly on this, for example, on referential meaning, a language game which one can hardly avoid to play), but offers richer perspectives which are I believe no less rational.

this is because one is afraid of doctrines professed under the guise of wisdom and because one abhors preachers. But this is not the right kind of identifying alternatives. What is argued for in ethics, philosophy, and so forth is not excluded from rational debate and should not be confused with telling people how to think and/or act. It is not the case that what is offered in the dominant stream of educational research is not interesting (and it definitely is in the particular context in which these researchers operate); and it is certainly doing well in the present climate of performativity at the university, but it is so limited, especially when it is offered for clinical practice. The wariness of these researchers to engage with other areas, sometimes motivated by “perhaps it is not a lot research has to offer but it is the only thing it can offer,” is troublesome.

The nowadays dominant tradition of educational research presupposes that what is the case administers a normative background and generates aims which have to be observed and aspired at any cost. The illusion of certainty that they uphold is very attractive, almost irresistible to all those who struggle to decide what to do but is yet another manifestation of skepticism. Their help, well intended, cannot do away with their responsibility, it cannot do away with the normative stance they themselves are necessarily embracing as researchers. In their search for what is real in a particular sense (what explains how things are, which insights correspond with what is observed), their forgetfulness of the pictorial form is at odds with the position they seem to embrace.

I have argued that there is nothing necessarily problematic about the quantitative approach as long as one realizes what one is doing: observes complexity and acknowledges limitations. It is I think not unlikely that many statisticians and quantitative educational researchers would go along with the general stance I have been arguing for. Only in cherishing layers of interpretation one can do justice to the complexity we find ourselves in.¹²

Genre 8 Cultural-Transgressive Approaches

Introduction

Robert A. Davis

Late in their distinguished collaboration, Gilles Deleuze and Felix Guattari wrote that “*Philosophy needs a nonphilosophy that comprehends it; it needs a nonphilosophical comprehension just as art needs nonart and science needs nonscience*” (1994, p. 218). We might add to this that every interpretation needs a non-interpretation; every “hermeneutic” needs to be reminded that the god of interpretation is thrice-blessed Hermes: psychopomp of entrances and exits; thresholds and perimeters—genius, charmer, cheat, liar, thief, trickster, dreamweaver, propagandist on behalf of his morally compromised fellow divinities; patron of merchants, teachers, magicians, and the dying. The essays in this section of the present volume welcome Hermes in all his ambiguity to the limits of the known and the knowable, to the edges where transgression of the established measures of meaning and measurement is not at all nihilistic (as Nietzsche knew, Apollo the God of Reason is the true metaphysical nihilist, not Hermes), but redounds to the enriching transformation of interpretation as an art of the human imagination applied to the joys and the sorrows, the successes and the failures, of experience and learning.

Critical-theoretical approaches to educational research and interpretation are not new and neither is the eschewal of positivism or the embrace of “critique” as a reproach to the limitations of conventional analytical methods. The culture wars have penetrated education as visibly as any other social science or humanity, and this section of the volume *might* have been populated with the poststructuralist or postmodern deconstructions of the favored hermeneutics of educational research at the beginning of the twenty-first century. That is not to say that poststructuralist, postmodern, and postcolonial approaches to educational research are invisible in

the collection of essays presented here. It is to say, however, that the often highly varied and divergent themes and topics pursued throughout the section have taken advantage of a kind of “transgressive permission” of the kind Hermes is pledged to protect—an editorial license to pass over the boundaries of even radical critique and personal investment, but on the understanding that the night journey into self, culture, language, knowledge, mystery, alchemy, music, dispossession, and anger will bring back to the larger ambitions of the book a gift or boon by which its important hermeneutical objectives can be secured.

For this reason, the section begins with Robert Davis’ examination of an area of contemporary educational research work with a strong family resemblance to other concerns and topics discussed elsewhere in the present book. As Davis argues, linguistic ethnography has since its rise within anthropology acquired a niche respectability in educational field research because educational spaces are for ideological reasons commonly regarded as highly fertile zones for its application. Foregrounding material from a major Glasgow University ESRC research project on the effectiveness of the teaching of Religious Education in UK schools, Davis highlights the merits of linguistic ethnography as a strategy for mapping the subtle and shifting perceptions of teachers and students while pointing to issues of voice and voicing, materiality and immateriality that it does not as yet comprehensively address and which, especially in the context of religion, require more nuanced and reserved examination.

Liz Mackinlay can also be seen to extrapolate several crucial lines of development from the juxtaposition of ethnography and education, attending to regions of educational experience often seen as remote from, or immune to, interpretation. Through a self-critical close-reading reprise of her prior idealistic doctoral ethnographies of Australian Aboriginal women’s musical and sung performance from the late 1990s, Mackinlay boldly disavows much of the ethical and methodological apparatus of what she subsequently came to see as her inescapably colonialist anthropological training, venturing through a necessarily difficult process of self-reproach and professional abandonment towards a new kind of “hope.” The basis of this hard-won hope is her (re)-discovery of the *storyline* impulse in her original data and her embrace of strategies that both painfully unmask the previous collusions and complicities of ethnographic practice while offering the prospect of its reinvention through the acceptance of a “storied” or narrated vulnerability and solidarity brought forth and shared between researcher and researched.

Mackinlay wishes, among other things, for interpretation to honor the viscerality of voice and somatic being, and in Chapter XX, defamiliarization of the classroom space and the oversimplified dualism of virtual and material, remote and proximate, leads Greenhalgh-Spencer to a similar restitution of embodiment and embodied selves at the heart of learning. This commitment draws forth from her detailed work on school environments a vigorous, wide-ranging technofeminist critique of *all* interpretation in educational research that is still obviously housed within the artificial contrasts of mental and physical, digital and material, virtual and face-to-face—even when these dualisms are applied recuperatively to the preservation of an idealized (and wholly misconstrued) experience of “interactive” learning and teaching.

Lundie takes the reassertion of embodiment to frontier issues in the pressing ethics of privacy, where contemporary systems of technico-rationalist information management now dominate education in the form of big data, MOOCs, Internet breadcrumb trailing, and frequently invasive digital monitoring of teacher and learners. The same resources underpinning an emergent step change in research capacity and granularity now threaten, Lundie argues, the humanizing processes they were originally designed to enhance. Vast gaps in the awareness and vigilance of educational professionals have been actively colonized by the technocrats of behavioral prediction and surveillance, making the private an increasingly menaced and contracting domain. By refocusing the “intersubjectivity” of privacy, Lundie refurbishes what are in some respects neo-traditional concepts of propriety and property rights and through these incentivizes citizen-researchers and citizen-subjects to be energetic in the production and expansion of their own educational privacy.

David Bridges, Kairat Kurakbayev, and Assel Kambatyrova are also strongly rooted in the pragmatics of educational interpretation, discerning in the difficult reciprocity of theory and practice a means to enrich the notion of “translation” as it serves to navigate complex interactions of local cultural expectation, educational reform, and often impersonal global forces prescribing the terms in which such reform is to take place in developing or emergent countries. The authors’ informal *bricolage* approach to their practical responsibilities as researchers nonetheless emerges as a potent perspective for improvising and adapting meaningful policy making across challenging cultural, historic, and linguistic divides. This in turn works to challenge widespread prevailing assumptions around both essentialized indigenous epistemologies and seemingly anonymous and irresistible national and global economic mandates, both of which can induce a defeatism in progressive reformers. The effect is profoundly empowering in restoring creative autonomy and collaboration to various “translators” as they recapture the initiative actively to shape and direct educational change within testing but potentially highly rewarding contexts.

Operating from out of the same cultural and political matrix as Bridges and his colleagues—the educational development agenda in post-Soviet Kazakhstan—Olena Fimyar also seeks to redeem, like Mackinlay, an enlarged (auto)ethnography, capable of extending the parameters of policy sociology by an act of epistemic inclusion that valorizes the detailed analysis of teachers’ beliefs and memories. At the same time, Fimyar seeks uninhibitedly to refresh the potential for educational renewal latent in the multilayered heuristic narratives through which diverse policy actors and practitioners rediscover and exercise their expertise in conditions of frequent subordination and disempowerment. The subtle and critical interpretation of teachers’ professional beliefs documented in the essay is then seen to be vital in motivating staff to address assertively a moral campaign against social inequality while applying their accrued wisdom and professional knowledge to the critical assessment and redirection of often suspect plans for national educational modernization. The massive and multiple transitions captured by the term “post-Soviet” in the positivist project underpinning the essay lead Fimyar to an entirely revisionist

position on the role of educational researchers as partisan actors in the processes of understanding—and supporting—teachers, their evolving values and aspirations and their emergent pedagogical priorities.

Conroy and Leitch also offer a robust yet watchful rehabilitation of teacher subjectivity through the remarkable application of the neglected arts of mask-making and mask-wearing to what they term the “imaginary of teaching”: a post- or pre-instrumental encounter with archetypes that are both collectively curated and individually inflected to enable teachers to refashion proactively the terms of their own identity against the grain of performative restraint. The authors’ “poetics” of teaching and learning goes to the heart of the hermeneutic task, where subjectivity is formed through a psychic combination of withdrawal and engagement protected by the autopoiesis of mask and theater.

Lapping brings to all of these andragogical and profession tasks the resources of Lacanian psychoanalysis to question the prior methodological and epistemological assumptions around which the researcher-participant axis revolves in much standard educational research. The clinical moment of psychoanalytic interpretation is in some important senses the template of all interpretation, and Lapping interrogates this to reassess the terms in which researcher and participant intersubjectivities are constituted through countertransference and affect—helping us better understand and harness unconscious communication in the spaces, and across the boundaries, of almost all forms of educational inquiry.

In a final exercise in protean self-narration, drawing promiscuously on the storehouse of motifs, symbols, and concepts informing many of the surrounding essays, Alan McManus returns the section to the custody of Hermes Trismegistus, in his guise as oneirocritical alchemist and showman. In a bravura narrative of his own highly personalized odyssey through graduate studies, McManus places receptivity to learning at the center of qualitative research. But it is a receptivity open to traditions of thought, study and self-examination often marginal to Western rationalism in even its most postmodern and ludic forms. Accessing dreams, esoteric knowledge, literature, myth, and a metaphysics, McManus seeks to raise transgression to the level an art tempered only by the moral seriousness of the researcher-adventurer invested in the fortunes of the marginalized and the forgotten. In these respects, his monumental undertaking converges with the intentions of his co-contributors in wishing for the practice of interpretation an ever-receding horizon of opportunity and trust.

8.1 Hermeneutics of Linguistic Ethnography: Teachers and Students Losing and Finding Their Voices

Robert A. Davis

After Ethnography

In Jorge Luis Borges' 1969 short story, "The Ethnographer," the protagonist Fred Murdock, a doctoral student in a US university—a young man at "that age when a man doesn't yet know who he is"—is steered by his supervisor for his PhD topic towards the study of Native North American indigenous cultures: "one of his professors, an older man, suggested that he go live on a reservation, observe the rites, and discover the secret revealed by the medicine men to the initiates" (Borges 1998, pp. 334–335). Murdock hence embarks upon what was once considered a respected and defining academic mission for graduate students of the social sciences in Europe and North America: to secure through ethnographic fieldwork a reproducible "anthropological legibility" (Avelar 2004, p. 62), or effective encounter with "otherness," and to retranslate that encounter back into the language of "sameness" in the form of the doctoral thesis that the ethnographer is expected to write at the conclusion of his prolonged period of participant observation (Cook 2010).

Murdock's research project is at first successful, assuming the form of a classic immersion in radical otherness, in which he embraces unconditionally everything from the tribal norms of work, dress, and diet to the shamanistic experience of lucid dreaming, "in a language that was not that of his fathers." In the initial phase, indeed, the story seems to confirm through Murdock's fieldwork the possibility of a transparent legibility of the Other, underpinned by scrupulous adherence to all of the protocols of an ethical and efficacious ethnographic practice. In a utopian fusion with his object of study, Murdock "becomes" one with the tribe. His dreaming in

another language offers the seemingly incontrovertible proof that the great fissure of researcher and researched can in good faith be bridged. As the surprising ending of the story makes clear, however, Murdock's absorption in his object—the horizon of perfection for all ethnographies of the modernist type—also comes to emblemize the complete failure of his entire undertaking and the collapse of the ambitious paradigm within which he had been trained. Initiated as intended into “the tribe's secret doctrine,” upon his return to his university Murdock is utterly unable and unwilling to communicate his newly acquired knowledge to anyone. Yet by the same secret's ineffable light—and, more importantly, the memory of “the paths that led me to it”—his professional surroundings now appear to him jejune. He leaves the university to become—with Borges' signature irony—“one of the librarians at Yale.”

Much of the interest of “The Ethnographer” lies in its ambivalent perspective on ethnography itself, leaving unanswered the question that could make the text reducible to an anthropological warning: did Murdock return from the tribe because, as he declares, he can now live anew anywhere in accordance with principles learned among the Plains Indians? Or did he choose the (for Borges) semimonastic occupation of librarian at an elite university to signify his repudiation of his previous vocation and its exaggerated assumptions? Might it be that abandoning the project of studying the tribe was the indispensable lesson of the journey—that in fact turning away from the Other, in a style reminiscent of the Heideggerian observational ethic of *Gelassenheit* or “letting be” (Heidegger 1998, p. 154), signifies at the end of his sojourn the only legitimate response to the Other? If we take this inference to be the organizing impulse behind Murdock's final self-effacing decision to “turn away” also from university research, we would then be compelled to recognize that his paradoxical withdrawal from his doctoral studies is a disclosure of what he has discerned to be the only truly coherent ethnographic ethic. The discipline of ethnography is then expressed in the story purely apophatically, through an act of quiet renunciation prompted by the *aporia* between Murdock's seemingly “successful” experience as an ethnographer and the aphasiac impossibility of writing or speaking about it. For Murdock there is no simple choice between the *endotopic* knowledge of his revelation on the plains and the *exotopic* knowledge of a doctoral dissertation (Cameron 2012), because if the former is initially thought of as a necessary condition for the latter, its successful acquisition abolishes the very possibility of translating it into citable academic rationality.

This “haunting” of ethnography by the “secret” of its own epistemological incoherence has been central to the critique of field anthropology almost since its inception, expressed vigorously in both positivist and poststructuralist–postcolonial objections and inflected across multiple domains and eras of ethnographic inquiry (Clifford 1998). It has of course excited vociferous rejoinders, most of them located in adaptations of ethnographic social science that seek to take the measure of the “secret” and compensate for the genuine problems it raises, while insisting strongly on the maintenance of a core and coherent rationale for the authentic engagement with the Other in any environment of creative understanding and mutual agency (MacClancy 2013). Whether in Malinowski's monumental collections and

recodings, in ambitious theories of communicative action, in interactional sociolinguistics, in the embedded close readings of micro-ethnography, or in Abrahams' poetics of vernacular practices (2005)—the spirited defensive argument has been waged that, in Wortham's words,

Instead of imposing outsider categories, linguistic anthropology induces analytic categories that participants either articulate or presuppose in their action, and it insists on evidence that participants themselves are presupposing categories central to the analysis. (Wortham 2003, p. 18)

Perhaps the most advanced and far-reaching hermeneutic through which the probity and validity of reproductive anthropological interactionism of this sort has been elucidated and asserted lies in the labors of linguistic ethnography and the diverse range of supplementary paralinguistic methodologies that have accrued to it across the social sciences. In both principle and action, these have combined to blur the boundaries between investigator-anthropologist and subject participants, reportedly opening the locus of field research to much more indeterminate and dynamic constructions of collaborative meaning making in which all have secrets, dreams, wisdom, and incomprehension mapped through the iterative patterns of speech and silence, plenitude, and absence:

Linguistic ethnography generally holds that language and social life are mutually shaping, and that close analysis of situated language use can provide both fundamental and distinctive insights into the mechanisms and dynamics of social and cultural production in everyday activity. (Rampton et al. 2004, p. 2)

Linguistic ethnography has hence evolved a sophisticated qualitative philosophy, which holds that every context for communication can be excavated rather than assumed. In almost all fieldwork settings, meaning emerges within the architecture of specific social relations, transactional histories, and labile institutional regimes, parsed and reproduced by agents who themselves harbor expectations and manifest behavioral repertoires that demand to be grasped ethnographically (Maybin and Tusting 2011). The analysis of the internal management of verbal and other kinds of semiotic data within these localized settings is essential to the appreciation of their significance and location in the environment under investigation. Meaning in these spaces is then understood to be far more than just the transparent expression of world views and values by compliant exoticized subjects and restlessly "positioned" participant-observers. Instead, the conventional measures of biographical recount, identification, disposition, and dialogue are extensively problematized in the high-resolution assessments and interrogations of linguistic and textual performance accompanying each mode (Duranti 2004). Linguistic ethnography as a result also addresses the empirical gradient of much social science research by offering descriptive and analytic procedures for investigating communication within the temporal unfolding of social process, especially as this affects persons, situated encounters, institutions, actor networks, and communities of practice. Attending to these profoundly interwoven empirical concerns, linguistic ethnography also uses case-study methodology to engage with issues, formulations, and claims made more pervasively across the social science canon and

in public discourse more generally perceived (Jacobs and Slembrouck 2010). The aim is to generate research that shows proper regard for the uniqueness, deficiency, and exuberance of the communicative moment, alongside acceptance that there can be no complete or definitive interpretation of the meaning of an utterance or exchange (either for the analyst or the participants). A secondary objective is to formulate accounts of how participants handle specific forms, strategies, materials, or genres, venturing confident interpretation of how this use supports and limits the communication overall, connecting more broadly with indigenous social life. These accounts require to be sufficiently persuasive to stand up to critical scrutiny from other analysts as well as satisfying the participants' need for plausible explanatory judgment traceable to reliable and accurate evidentiary material of which they themselves are a part (y Blasco and Wardle 2007; Latour 2013).

Central to this ratification of the ontology of linguistic ethnography has been its valorization of the *voice* of participants in the communicative event. In the classical formulations to which Murdock would have been heir, voice is an “analytical heuristic” (Hornberger 2006) for an empirically based sociolinguistics of ethnographical investigation. Through studying voice, the ethnographer can search in the fieldwork data for instances of conflict, inequality, and asymmetric distributions of social power—as well as resistance, creativity, and counter-hegemonic subversion. Voice provides a tool for isolating and interpreting alternative understandings of the languages, institutions, and cultural mores that speakers inhabit. Taking ordinary, vernacular voices seriously then has the potential, it is asserted, to challenge conventional academic constructions of the research object and its subjects, and to renew and customize the theoretical and conceptual apparatus brought to bear on the fieldwork phenomena (Kuipers 2013).

Rooted in the European linguistic structuralism of Jakobson (1960) and Vološinov (1973), the ethnographic modalities of speaking were transformed by the rediscovery in the late twentieth century of the narratological methods of Mikhail Bakhtin. Bakhtin's definition of voice is inextricably bound up with the recognition of the internal stratification or “heteroglossia” of language—the varieties of linguistic forms that exist within a single language and that are functionally mobilized depending on the context of use or the social group with which the speaker is affiliated (Bakhtin 1981 [1935], p. 263). Building on this insight, Bakhtin's narratological methods (e.g., 1984 [1930s]) placed formal analysis central and offered linguistic ethnography new tools for understanding the tension between emergent performance and stylistic characteristics: *Situation, Participants, Ends, Act Sequence, Key, Instrumentalities, Norms, and Genres*. These functioned to map the hidden valences of talk within the fieldwork scenario, exposing to the ethnographer's gaze—and to the participants' first-person attention—the concealed forces and influences conditioning and mediating utterance within semantically policed parameters. The principal long-term effect of this innovation was to politicize and relativize linguistic ethnography from the 1980s onwards, integrating it into a Marxist–Foucauldian critique of the discursive regulation of speech at the service of covert and pernicious economies of disciplinary and ideological control (Rinehart et al. 2014). Strengthened by a resurgence of a

new style of campaigning anthropology responsive to the often painful emergence of globalization in conditions of grave injustice and exclusion, and conscientized by the postcolonial protesting voices of plundered and disenfranchised subaltern groups from across the world, linguistic ethnography came to be aligned decisively with cultural and ethnological comparativism and political advocacy:

Ethnography, as we know, is in fact an interface between specific inquiry and comparative generalisation. It will serve us well, I think, to make prominent the term ‘ethnology’, that explicitly invokes comparative generalisation. . . . An emphasis on the ethnological dimension takes one away from immediate problems and from attempts to offer immediate remedies, but it serves constructive change better in the long run. Emphasis on the ethnological dimension links anthropology of education with social history, through the ways in which larger forces for socialisation, institutionalisation, reproduction of an existing order, are expressed and interpreted in specific settings. (Hymes 1996, p. 19)

Linguistic ethnography as an intellectual program galvanized by these fundamentally ethical concerns, and targeted upon the corrective redress of what Miranda Fricker has called “testimonial and epistemic injustice” (2007), of course, swiftly committed its academic capital to the support and illumination of the endeavors of popular education, which it regarded as exemplary avenues for ethnographic interpellation and political change. A succession of fieldwork champions proceeded to customize the instruments of linguistic ethnographic inquiry for the exploration of schools, classrooms, staffrooms, playgrounds, lessons, teacher education courses, leadership and management training schemes, professional associations, as well as the abstract discursive systems of curriculum, governance, and accountability through which public education was accredited and monitored in democratic society (Woods 1986; Rampton 2007). A sophisticated methodological inventory also rapidly evolved, introducing into empirical educational fieldwork technologies of ethnographic *souveillance* and strategies of critical accompaniment and mediation, all of which were designed to make sense of the cacophonous cultural production of diverse educational environments—including their noisy give and take, their ritualistic redundancies and repetitions, and their endemic problems of corporate memory and transparency. The emphasis once again lay unreservedly on the facilitation of change and the righting of perceived wrongs that were seen as endemic to the mass educational system and the industrial culture from which it had emerged:

Linguistic anthropology of education is, perhaps fundamentally, a field that seeks to understand macro-level societal phenomena, and in particular societal inequities, in terms of micro-level person-to-person interaction, in the hopes of enabling work for change from both the bottom up and the top down. (Hornberger 2003, p. 266)

The cherished concept of voice, on which classical linguistic ethnography first established its fieldwork credibility, also found renewed traction in applications to education that foregrounded both the multivocality of almost all educational settings and the inequalities of utterance linked specifically to the alleged abjection and “muting” of children and young people within the pedagogical processes, recreational spaces, and disciplinary influences most directly affecting their lives (Hardman 1973; Hohti and Karlsson 2013). Since its founding scholarly rejection

of the orientalist silencing of the Other, linguistic ethnography had recognized the baleful force of the deracinated or “ventriloquized” voiced, possessed by the hierarchies of bureaucratic authority and trapped within the approved registers of professional or (in the case of the young, especially) subordinate and delinquent speech. The principle of ethical advocacy applied to this primary analysis too, commissioning linguistic ethnography not only for the task of *interpreting* the many voices of educational experience but for *liberating* them from the constraints of permissible, desiccated utterance. Such an openly emancipatory rationale clearly implied a determination to give back a voice to the voiceless or to free autonomous talk—through the tested and celebrated strategies of linguistic ethnography itself—from illicit possession by heteronomous, sovereign third parties requiring of research subjects that they speak only that which the third parties wished to be heard:

Research in linguistic ethnography and linguistic anthropology is fundamentally about the reconstruction, recontextualization, and representation of the voices of others. As such it involves speaking about, through, alongside, and in those voices. Furthermore, and often hidden from view, it is about making meaning from those voices. (Creese and Blackledge 2012, p. 317)

This stance has of course also required of linguistic ethnography that it safeguard its own political integrity and itself avoid becoming a “ventriloquized voice” disguised by the convenient registers and managed consensus of progressivism. It is not entirely clear that this trap has been circumvented, and concerns remain that ethnographers have been more directive in working with, e.g., young people than the model suggests is possible. Extraordinary steps have been taken, however, to try to ensure that the ethnographic exchanges of researcher and researched in educational settings are processual and incremental, open to ongoing renegotiation, accepting even of what Bourdieu terms “conflictual cooperation” (1990, p. 122), and triangulated by the extensive corroborative and verificatory measures available from the application of wider ethnographic and sense-checking resources (Aunger 2004).

Does Religious Education Work?

Does Religious Education Work? An Analysis of the Aims, Practices and Models of Effectiveness in Religious Education in the UK was a major educational research project (2007–2010) led by the University of Glasgow and stemming from the *Religion and Society* collaborative research program (2007–2013) of two of the major British Research Councils: the Arts and Humanities Research Council (AHRC) and the Economic and Social Research Council (ESRC) (Conroy et al. 2013). The project set out “to track the trajectory of RE in secondary schools in the UK from the aims and intentions represented in policy through its enactment in classroom practice to the estimations of its impact by students nearing the completion of their compulsory study of the subject.” It pursued these goals through

“a combination of philosophical, theological and ethnographic approaches” for the purposes of “investigating the local, social, cultural, pedagogical and professional practices which determine and shape the delivery of RE in secondary schools” (Lundie 2010, pp. 163–164).

From its outset, the project foregrounded linguistic ethnography and employed a team of field anthropologists and investigators to work collaboratively with teachers and pupils in the detailed critical analysis of pedagogy and practice in RE in the sample schools. The reasons for this were in one sense obvious. Ethnographic research methods lent themselves to the vernacular, learner-centered aims of the project. This included explaining the ways in which the actors involved understood and generated a meaningful disciplinary and pedagogical reality. The deployment of a range of related, complementary research methods—including focus groups, high-stakes interviews, and the collection of documents, visual records, and artifacts intended to provide enriched contextual information—further reinforced the ethnographic rationale (Webster and Lipka 2004). Rather than deploying the fieldwork in a secondary (or confirmatory) fashion, the project leaders chose also to use the ethnographic data sets as a source for the fashioning of subsequent quantitative instruments, such as a student knowledge-and-attitude questionnaire, on the assumption that the ethnographic detail would support a better-informed tool for the alignment of statistical data to the trends initially observed and identified in the field.

Another important justification for the ethnographic emphases resided in the core questions of the project itself and especially in its critical attention to the vexatious topic of religion and the place of religion in modern, liberal-democratic educational systems. The *Religion and Society* program represented a concerted campaign on behalf of the UK Research Councils to restore religion to the center of social science attention in the wake of a decade and more of turbulence around religious and civic belonging in the UK and beyond. In part a response to the unexpected post-secular “return of religion” to the post-ideological global stage (in forms ranging from the decorative to the lethal) and in other respects a more localized attempt to understand the character of religious affiliation and commitment in twenty-first century multicultural Britain, the successful launch of *Religion and Society* was attended by some express anxiety that the standard procedures of social science empirical inquiry had grown over the preceding 30 years constitutively desensitized to the experience of religious faith and its possible implications for shared social life in late modernity (Conroy and Davis 2008; Cadge et al. 2011). *Does RE Work?* sought to take the measure of this difficulty by setting aside normative secular recordings of religious belief and doctrine within the sample schools and examining the schools’ treatment of faith on their own highly individual and distinctive terms, ranging from the pluralist to the catechetical. Linguistic ethnography lent itself naturally to this inclusive methodological accommodation, possibly because of its long history of respectful encounter with the realms of the sacred and the magical in indigenous societies and minority groups (Scharen and Vigen 2011, pp. 28–47).

Anterior and preliminary phenomenological research within the project approached the dimensions of religious commitment by focusing chiefly on

experiential meanings, or what Findlay has termed the “life world” (2009). The life world comprises the “world of objects around us as we perceive them and our experience of our self, body and relationships” (p. 7) and is the locus of interaction between subjects and their overall perceptual environments. Ashworth (2003) notes that the various interlinked components of the life world such as a sense of self, embodiment, sociality, spatiality, temporality, project, discourse, and mood as atmosphere act as a lens through which to view ethnographic data gathered in relation to it. Findlay further observes that phenomenological research seeks to explore the “structural whole that is socially shared while also experienced in individual and particular ways” (p. 2). Dahlberg et al. add that such life world research aims “to describe and elucidate the lived world in a way that expands our understanding of human being and human experience” (2008, p. 37). Phenomenological research is also, Findlay underlines, concerned with the “subjective interconnection between the researcher and the researched” (p. 8), in a manner which recognizes the indeterminacy and ambiguity involved in such an inherently unpredictable process.

As had been demonstrated above, the classical ethnographic method is also deeply preoccupied with experience and with the intersubjective relationship between researcher and researched. However, it often strives to go beyond the limits of the phenomenological framing by also excavating the wider social context of the various social actors *from their own points of view*. That is, it seeks to understand the individual in terms of the social constructions and identities of which he or she makes use, including where relevant the refractory demands and rewards of faith. This juxtaposition allowed the research team more fully to comprehend “Religious Education” by going to the very source of its practice and construction in the classroom and the school. It permitted the inclusion of actors’ accounts and interactions (including those of non human actors, such as books and artifacts), along with other contextual material and objects positioned to illuminate the ways in which the various representative modes in Religious Education were choreographed and, importantly, the extent to which events taking place in the classroom reflected broader Religious Education policy and professional thinking in relation to these modes. Placing an ethnographic approach at the core of the research thus allowed the gathered data and information, in essence, “to speak for itself,” in accordance with the sequences and formats elucidated by distinguished commentators on ethnography and the “spiritual” such as Carspecken (1996, 2001), Nader (2011), and Hymes himself (1996).

Attempting to see and understand social and religious phenomena from the point of view of the subject is not without its challenges. Some of these practical challenges were etched upon the project from its outset, exercising a regular pressure on the relationship of participant-observers to the observed. The project was therefore certainly not exempt from the “observer effects” that stalk ethnographic integrity. However, spending protracted periods of time with those involved in the research schools, building rapport and trust with them, meant that the behaviors, interactions, and accounts of the actors were more “natural” than might have been the case had the engagement been more perfunctory or episodic, as

is often the approach in research into religion. The research team forged relationships over a 3-year period that were intended to underscore the pervasive presence, rather than the absence, of highly charged value attachments—and in respect of which, it was accepted, researcher prejudice, aversion, and values might potentially influence, or interact with, the analysis. Nonetheless, and with a deferential glance at Bourdieu and Wacquant (1992), the project strove to be aware reflexively of potential biases in the process of gathering and analyzing the information and to deal with these using the intersubjective resources and insights concentrated through the research itself (Lefstein and Snell 2013). Such sensitivity extended to the potentially controversial and conflicting issues of belief, skepticism, and toleration that were highlighted through every phase of the ethnographic process.

The ethnographic paradoxes of “voice” documented throughout this essay were also pervasive in the unfolding and implementation of *Does RE Work?* over the course of 3 years. There were also, however, specific instantiations of voice that served to showcase both the dilemmas and the breakthroughs of contemporary ethnography precisely in relation to the challenges attendant upon the legitimation of, and attentiveness to, the religious utterances and investments of the ethnographic subjects. These were always of course—even in the context of the confessional or faith-based schooling that figured in the project—authentically *educational* inquiries, deliberately silent upon the question of faith-based teaching and firmly neutral towards the wider doctrinal claims of religious faith. In this regard, they echoed the positionality of many teachers in the sample schools. Nevertheless, there is some evidence of what might be termed “liturgical” or “ritual” interpellation of the interpretative ethnographic encounter, as the exchanges of fieldworker and subjects (whether teachers or pupils) pressed the discourse more deeply into the intractable terrain of existential, moral, and theological absolutes—perhaps closer to the muffling secrets of Murdock’s oneiocritical medicine men than modern ethnography would normally find agreeable or normative (Conroy et al. 2012). In the face of these sometimes intransigent yet compelling realities, the ethnographic layering of the experiences within the selected schools sought self-consciously to draw out the translocality of the participant-observed phenomena as it materialized cumulatively in events, interactions, and interpretations that were embedded *diachronically* in the distinctive histories and identities of the specific schools, while resonating *synchronously* with the unsettled hermeneutics of contemporary Religious Education as these were manifest across all of the schools and, indeed a fortiori, in the wider culture beyond (Maclure 2003). The schools then afforded the ethnographic turn within the research its “analytic vignettes” (Erickson 1990) from out of which were crystallized highly indicative feelings, attitudes, stances, and narratives that incrementally consolidated the project’s critical understanding of Religious Education as a social and pedagogical practice—and even in places as a fideistically formational system.

At the shared threshold of religion, education, and learning, discussions with teachers, particularly, enlisted the verticality of the central linguistic ethnographic methods through which the project fieldwork was undertaken in order to highlight particular nodes of response, behavior, interaction, reflection, cognition, and

justification which resonated consistently with the conceptual preoccupations and questions from out of which the projected rationale originated and from which it subsequently developed. The mapping of these iterative patterns of nondeterministic utterance and exchange echoed Rampton's perception of the anthropological inquiry as "a site of encounter where a number of established lines of research interact, pushed together by circumstance, open to the recognition of new affinities, and sufficiently familiar with one another to treat differences with equanimity" (2007, p. 585). The resultant interpretative synthesis was intended not to disparage the established modes of quantitative investigation and qualitative interpretation by which questions of educational purpose and meaning are commonly (and cogently) pursued, but to enrich them by forms of representative "situated interactionism" (Goodwin and Goodwin 2000) which foreground the selected nodes as discursively illuminating of the frequently obscure or concealed dynamics of power, choice, and agency operative in almost all educational settings. The eventual complementarity echoed the findings of more mainstream methods of educational research: that the teacher-participants were dignified social actors functioning within environments where their contextual awareness and commitment was high, their disciplinary understanding strong, and even their professional autonomy relatively flexible. It nevertheless disclosed in the unfolding ideological patternings of speech, judgment, and disciplinary ownership the adjacency of other influences and assumptions, conditioning what Holmes and Stubbe (2003) refer to as the structure/boundary interactions between the controlled and the uncontrolled in any classroom or educational episode. Recognition of these patterns in the evidentiary record argues in favor of depth rather than breadth in ethnographic plotting, close textual reading rather than statistical comparison, allowing researchers, as Scollon and Scollon suggest "...to transport selected and carefully focused slices of life out of the original nexus of activity for collegial, peer-reviewable examination in richer more multimodal formats" (2007, p. 620). The principal data vectors with which the classroom ethnography was concerned were then seen to reinforce—while also further complexifying—sensitive critical interrogation of the principles of effectiveness and coherence in Religious Education as these were shared and negotiated within and beyond the subject's authorized institutional parameters (Erickson 1984), including in the elusive and sometimes inaccessible sphere of committed religious belief itself.

This issue of the imperfect "mesh" of RE with other aspects of learning, teaching, and believing is also obtained, both positively and negatively, in many of the schools in the project. In the vibrant, cosmopolitan atmosphere of a busy multi-faith (nonreligious) London Grammar School, for example, the Head of Department (HOD) of Religious Education viewed these continuities and discontinuities between the subject as currently configured and messiness of "the rest of life" with some ambivalence:

It's not religious education any more. It's not like when I was at school even. I was doing it 15 years ago and it wasn't anything like that now. It's ethics and philosophy and the GCSE and the A level: their exam is ethics and philosophy because I think religious education has got such connotations with it that it's just not about that. (Conroy et al. 2013, p. 88)

In one respect, the rebranding of RE as an inflection of the fashionably literate and intellectually respectable “ethics and philosophy” culture of the twenty-first century UK senior school classroom rescues it from the eccentricities and obscurantism of “religion” as widely perceived in the surrounding liberal educational environment. The HOD is experienced and astute enough, however, to state provocatively that the outcome is “not religious education any more,” removed as it is from his personal and professional recollections of a period when the expectation in the traditional Religious Education classroom was that “At the end of this lesson you will all know what the Ten Commandments are and why you should know them” (p. 89). This incisive insight into the now problematic place of “religion” in a Religious Education curriculum that (for good or ill) is in important zones colluding in its own secularization of course ramifies throughout the project. It subtly underlines the impression that the subject may at last be submitting to the internal logic of the classical Enlightenment drivers through which modern mass education was brought into being in the first place and for which religion per se was a superannated form of thinking for a pre-rational, indeed pre-educational, age. It is also instructive in micro-ethnographic terms that an experienced teacher is prompted by the ethnographic query to raid his own memories in search of an originating pedigree for the subject alternative to current secular professional norms.

At what might superficially be regarded as other end of the confessional spectrum, in terms of disposition towards religious commitment—a Scottish Catholic secondary school—the charting of ethnographic self-examination moves in a quite different direction, towards a pervasive sense of a performative (even theatrical) religious discourse where the language of education is constantly invoking the registers of faith from obscure sources beyond the school. In sustained dialogue with the fieldworker, the head teacher of the school quietly insisted that

In a Catholic school in particular—maybe somebody from a non-denominational may disagree—it’s not just about the two periods of RE. In essence, it’s a way of life. What we’re about in RE isn’t just refined to two periods a week or to the RE classrooms, but that it’s out and about; it’s everywhere; the standards we’re setting; the behaviours; the expectations of attainment—they all come from our vision of what RE is: a response to the call of God and faith which is what the whole school is about. (Conroy et al. 2013, p. 92)

One of the school’s Religious Education teachers strove in his comments to the same ethnographer to bind this leadership perspective on religion and institutional purpose to the school’s grassroots aspirations for the individual learner, as well as for the outworking of the key disciplinary aims and objectives of RE:

RE is about giving the child a sense of identity: recognition of himself and their role to play within the community. . . in a microcosm of the wider community; starting off in the school, school community; that they are valued, that they are special/unique; really to give them a self-regard for themselves, to give them that recognition and to get them to recognise their importance and with that their responsibilities as well. (p. 93)

In context, the sincerity of these convictions and their attendant hopes for faith-based Religious Education is indisputable: staff faithfully pursue a vision of the good life in which Catholic values stamp the corporate, community, and individual

experiences of the school at as many levels as they can sustain. The values foundation upon which these intentions for the school are raised runs deep into indigenous traditions of minority Scottish Catholic religious practice and educational history in modern Scotland, as well as into the key educational pronouncements of the post-Vatican II Catholic Church. It is nonetheless at least arguable that in some of the semantic slippages and displacements in the contributions of the staff that are documented in the field ethnography, we can see a sometimes uneasy oscillation between Catholic identity, Catholic ethos, ecumenical citizenship, and the subject of Religious Education which risks presenting the discipline as placeholder for *everything* about its distinctive mission that the school in fact values and wishes to project (Boeve 2012). This may be in part a genuine effort to de-enclave “Religious Education” from the narrow confines of the school timetable and to embed it in a wider construction of contemporary experiential, pupil-centered learning and teaching. But a Religious Education that is *everything* might also be a Religious Education struggling to define and establish its academic (indeed, in confessional terms, its *theological*) credentials within the curriculum.

Webb Keane (2004) has related this discursive juxtaposition to a particular version of the core ethnographic concept of “mediation” that is uniquely operative when the distinctive claims and calls of religious fealty are in play in the ethnographic encounter. Keane argues that ethnographic exchanges that admit the presence of religious entities or loyalties into the research relation—even in exclusively second-order, interstitial, or symbolic terms—always inescapably call forth an alternative or superordinate order of signification which impinges on what can be learned or interpreted within the confines of even the most comprehensive anthropological hermeneutics. A condition of endemic, repetitive “allusion” then obtains—close, perhaps, to Murdock’s esoteric “secret”—where ethnography must find ways of managing the spectral presence of specific and often recondite organizations of language associated with, e.g., liturgy, catechesis, prayer, initiation, ritual, or “spirituality,” none of which may actually be expressly realized in the field interactions:

Religious practices therefore require an appreciation of mediation in at least two respects. First, beliefs are mediated by the linguistic forms and practices through which they are remembered, transmitted, and made available for acts and reflections. . . . Second, those linguistic forms are not fully deterministic but are subject to reinterpretation within particular social and historical circumstances. (p. 444)

Established ethnological models of “voicing” and “ventriloquism”—for all their essentially emancipatory origins—soon prove too schematic in their understanding and application to capture and uncover the dynamics of this kind of ethnographic performance. The proximity of the religious in the interview or dialogue is not concerned chiefly with the possession of the subject-speaker by a supervening ontological power or doctrinally driven credal lexicon (however much actual religious structures and their habitual logic of submission may suggest this). Instead, it is manifest in sporadic allusive gestures made towards something much more improvised, fragmented, incremental, and heteroglossic. Prevailing styles of educational rationality find this difficult to contain, perhaps because the volatile registers of religious utterance have been progressively delegitimized in the

advance of Western mass education and its implicitly secular assumptions (Wexler 2014). The “channeling” of the religious in these settings may then actually be closer to a species of “mediumship,” in which the character and socialized positionality of the research subject disturb and pluralize the concept of voice, disclosing each seemingly unitary speaker as a voluble antiphonal chorus of speech that may be sometimes educationally cogent and autonomous and sometimes heteroglossically multiple and ambiguous:

From the first point it follows that close attention to language is required for any ethnographer who wants to gain insight into what people “believe”, or even identify “who” the actors are in any particular situation—neither the invisible spirits presupposed by some acts nor the collective entities entailed by others may be immediately apparent to the external observer. It follows from the second point that linguists must bear in mind the importance of the social field for the interpretation of linguistic form in its ethnographic realization. (Keane 2004, p. 444)

In the distinctive context of Scottish Catholic schooling, it may seem self-evidently obvious, for example, that the formulation of truth claims within Religious Education has assumed a relatively seamless dogmatic shape by virtue of the interlocking guarantees afforded by credal assent, personal faith commitment, and the elective nature of parental choice. The comportment of the head teacher in the Catholic school referenced above offers a beguilingly simple and honest account of this backdrop to the work of Religious Education, couched in the familiar discourse of the Catholic catechism. However, the word “honest” is, again, a recurrent and unstable lexical marker in the school’s ethnographic record, sometimes functioning as declaration of intent (“so they honestly believe”), sometimes as conspiratorial admission (“I have to be honest and say. . .”):

The formation is the first part: you’ve got to give the youngsters the sense of the last two thousand years and the development of Christianity and in particular the Catholic faith. . . [and] the experience of their faith, so they honestly believe that is where the real growth can come through. There’s no point telling them if they can’t experience it. So in the day-to-day life of a school how do you experience your faith? Through the love of your neighbour, and through that, the love of God. (Conroy et al. 2013, p. 109)

The concentric circles of Church, community, Religious Education curriculum, and (inevitably) “*experience of faith*,” reinforced through the fine-grained textures of daily school life, induce the production of a self-contained (and, in its own terms, completely coherent) yet expansive proclamation of revealed truth. This truth is in turn partially “ventriloquized” from research subject to ethnographer. There is sustained throughout the public mission of the school a consistent view that Religious Education can be inherently educational *and* constitutively evangelical without prejudice to either motivation. Closer ethnographic inspection does test some of the apparent homologation of faith and education here by pointing to certain discontinuities in the relations between the various, mutually validating centers of authority with which the school supposedly articulates. As well as admitting to first hand acquaintance with “other” Catholic schools where Religious Education is paid only “lip service” and treated as a site where “you can just do your homework,” senior managerial and departmental staff are also conscious of unequal

distribution of responsibility for catechesis across that community of which they are considered to be a part:

I have to be honest and say that for a lot of the pupils—and I’m talking here of children who are defined as being Catholics—the school was probably the only place where they were getting any formal regular Catholic education. A lot of them didn’t go to Mass. A lot of it was just down to the school. There can be a mindset that says, ‘Well I’m sending him to Catholic School, what else do you want me to do?’ (Conroy et al. 2013, p. 110)

This is of course a constant challenge for the Catholic school in modern secular society and perhaps explains better than any other cause the recent intensification of catechetical endeavor in much Catholic Religious Education throughout the developed world, as the subject absorbs responsibilities previously discharged across a variety of community and parish agencies now figuring much less conspicuously in the lives of increasingly sophisticated and socially mobile populations. The enhanced influence—indeed in classically ethnographic terms, the *sacred power*—accumulated by Religious Education as these historic secularizing processes work their way through the ecclesial and educational structures may appear attractive to the officers of the faith community. The ethnographic record also nevertheless conveys some professional misgivings among the research subjects that it is a status that has been purchased at considerable cost, leaving the spaces for genuinely “religious” stimulus, surprise, and imagination within the Religious Education curriculum to contract before the weighty yet conflicted requirement to form the baseline commitment of the next generation.

Moreover, if Keane’s admonitions are correct, then the tensions and uncertainties he identifies with the limitations of certain orthodox styles of ethnographic engagement with religion will not be confined to Religious Education in the confessional sector. These confusions—and possible ways forward from them—certainly were also exhibited throughout *Does RE Work?* at numerous and diverse locations. In what is conventionally known in the UK as “non denominational” education (non-faith-based state schooling), a tacit yet semiofficial vocational understanding of the teacher of Religious Education clearly prevailed, one which described a professional who will implement programs of work fundamentally aligned to the interests and “lifeworlds” of pupils just as assuredly as the faith-committed teacher within the confessional school. The task of mediating the apparently less “relevant”—or unfamiliar or exotic—features of (especially) the “religious” in Religious Education remains highly prized within this set of expectations (Withey 1975; Egan 2003). It was a quality widely evident in the non-denominational schools examined throughout the project and across the UK, often expressed in the near-talismanic invocation and embrace of certain multicultural and interfaith priorities to which Religious Education is expected by school management and local authority overseers automatically to respond, from out of the near-universal perception of the subject’s supposed historic moral values and intrinsic pedagogical principles. In one Scottish non-denominational school, the HOD recalled that

...our...material for racism has been moved forward because Guidance suddenly decided to do *Show Racism the Red Card* which we’ve always done, but suddenly...it’s all the flavour of the month for them to do that, so we’ve given them a copy of the unit that we do...and we’re having on 1st September a *Show Racism the Red Card* day whole school activity...and every

class that you teach has to have something to do with the racism theme in it. So you're thinking OK great, might do this and might do that. (Conroy et al. 2013, p. 101)

There is of course nothing essentially untoward in the conscientious dedication of the school to the tasks of antiracist education; nor is it at all unreasonable to assume that the Religious Education department might have something edifying and enlightening to contribute to it—even when it stems from *Show Racism the Red Card*, a celebrity-led media initiative originally conceived to banish racism from soccer. The non-denominational London Grammar, given its geographical location and ethnically diverse intake profile, possessed an even more pervasive commitment to antiracism and multicultural education and saw the work of Religious Education as central to the successful discharge of these obligations. The London HOD reflected that

We've got kids who come from London and in a London where you've got huge diversity. This whole area is just huge diversity and I think it's more now. It's not so much 'let's sit down, this is what they need to know.' It's like relating it and how it's relevant. . . .it's about making the kids well-rounded and understanding one another. Again, like, all my kids were aware who were fasting during Ramadan; all my kids were aware who were celebrating Eid; they're all aware who's going to be celebrating Diwali. It's about creating that. . . let's be honest, I wouldn't be able to do that with those classes if I don't teach them the way I teach them because you couldn't have that discussion. (pp. 101–102)

The lexical moves and shifts within this cache of revealingly autoethnographic professional discourse—from both school contexts—are pregnant with the modulation of treasured, if fluctuating, professional identities and the pragmatics of politically and culturally shaped disciplinary priorities. The speech records map multiple sources of ambiguity, with the indexicals and passive deictics of place, time, and event spatializing the speaker's locus in a discourse of which she is both the channel and the agent (“suddenly decided. . .”; “has to have. . .”; “do this. . .do that”; “relating it and how it's relevant”; “aware. . .aware. . .aware”) (Ewing 2006). This might be a permanent tension for those occupying appointments of curricular leadership in Religious Education: the pressures of manifold external imperatives and heterogeneous decision makers laying periodic claim not only to the content and focus of the curriculum but also to the modes of inquiry and communication by which that content and focus is to be mediated and sustained. Multicultural and antiracist education are by no means repudiated in this assessment of their influence, but the assumption that their relationship to Religious Education—and more broadly to *religion per se*—is an educationally straightforward one can be challenged by a close reading of the linguistic ethnography, both in terms of their secular superordinate claims on the shape and pattern of the curriculum *and* their contiguity with a highly defined—even inflexible—discursive and pedagogical regime within the classroom itself (Barry 2000; Sikka 2010):

There's a lot of enquiry with the students and I find that particularly in this school because of it being so multi-ethnic. They're just so terribly interested in certain things—and even topics that would be deemed as unacceptable in other subjects. They will enter and engage with it. I'm using the subject like, for instance, circumcision. It's a really weird thing to say, but they have heard of the word; they want to know. But it's also a good way to explain why these things happen and then you can branch out from there and talking about human rights as well because of the gender issues and it's an opportunity. (Conroy et al. 2013, p. 102)

Once more, although the teacher's planning here is perfectly creative and enterprising, the multicultural driver draws together paradigm, pedagogy, and ethical principle—propelling the learning sequence from the regulative social context of the classroom to the validating normative order of universal human rights, where Religious Education becomes tacitly absorbed into the language of citizenship. Closely read, the ethnography suggests that it is not at all self-evident that potent cultural and religious practice of circumcision can actually be comprehended at all in properly religious terms by this act of translation from the sacred to the secular. The teleology of classroom learning, here and elsewhere, may require some searching scrutiny if the academic integrity of Religious Education in an increasingly interdisciplinary curriculum, and an increasingly learner-centered school culture, is to be explained and maintained.

For the Scottish non-denominational school, the explicit cultivation in the upper school of the “individual's understanding of religious beliefs, transcendent issues, and critical and evaluative thinking” (HOD in Conroy et al. 2013, p. 111) was idealistically motivated by a similar radical pluralism, which in certain important respects *did* question the limitations of mainstream phenomenological, multicultural, and critical-realist accounts of religious experience. Intriguingly, senior pupils in dialogue with the fieldworker recuperated much of this energy by explaining that the central purpose of their learning in Religious Education was, first, to “gain awareness of other faiths in order to promote tolerance” and, secondly, “promoting positive values contributing to citizenship” (p. 111). This is in no sense a reproach to the HOD or her effectiveness in the school, nor does it minimize the young people's enthusiasm, but it may again underline the internal inertia and vulnerability in the subject that often impedes the committed engagement with *religion* to which the HOD aspired. Revealingly, some pupils defended their reductive account of the effectiveness of Religious Education by adverting to the skepticism with which significant numbers of their peers—and several of their teachers—viewed the role of the subject in the school timetable. The HOD remained refreshingly unapologetic about her own personal and professional investments and uncertainties, resorting again to the protean indexical of “honesty” to explain and project them:

You've also got to be honest enough to say 'No, I don't know the answer to that. I'll find out.' They don't. . .there's no way you *could* know everything about all religions. . . I will say to a class, 'You've taught *me* that. I didn't know that; that's great.' And you can see they go 'Oh, I taught teacher!' It's about. . .knowing yourself and having enough basic knowledge and being supportive. (p. 111)

The discursive patterning of evolving teacher subjectivity—and teacher–pupil intersubjectivity—shifts ironically and revealingly through these sentences and fragments, the texture of speech disclosing intermittently a powerful rapport of professional personality and the idealized representation of the subject matter at its very best. Remarkably, the apodosis of the final statement draws both person and concept back to an abiding insight taken straight from the annals of both faith and philosophy: *know thyself*—not, we might observe, in the Apollonian version of rational self-mastery, but clearly and daringly in the older, archaic, oracular awareness of the liminal, the threshold, the edges of shared meaning making

(Conroy 2004). This is Religious Education become mantic: the teacher glimpsed for a moment by a “charged” ethnography as mystagogue, rather than philosopher. It comes as little surprise, then, that in some of the department’s most enthusiastically received lessons—on, for example, the origins of the universe—this same voluble cocktail of intertextual learning across science, myth, and faith pushed at precisely the same heteroglossic boundaries of certainty and agnosticism, movingly fluently and imaginatively through a multimedia palimpsest of cosmological theory, creation stories and quiet personal meditation, and finding no secure point of conclusion about truth or the claims to it.

A range of realist perspectives on the teaching of Religious Education, claiming vindication from the disclosures of traditional classroom anthropology, has been trenchantly interrogated in recent years by commentators such as Anna Strhan (2010) and David Aldridge (2011). Strhan in particular proposes that

Current models of RE, emphasising the importance of conceptual transparency and the ability to logically evaluate and critique the rival truth claims of religions are already misconstruing the nature of religion. (37)

In place of this predetermination of religious meaning, Strhan and Aldridge, from by no means identical points of departure, each exhort teachers to a recovery in their classrooms of a species of “textualized hermeneutics,” where the vaunted “openness” of modern progressive, pluralized Religious Education, wherever it is practiced or ethnographically tested, ceases to govern in advance its objects of pedagogical interest (be they “experiential” or “transcendent”) and opts instead for an authentically deregulated, interruptible learning, “the subject matter” of which “must be constituted in the hermeneutic exchange” itself if religion is to be penetrated seriously as a human reality on its own terms (Aldridge 2011, p. 43). It can also be reasonably inferred from this speculative mapping of a fresh terrain for the conduct of Religious Education that the forms of post-critical engagement with religion essayed in any such new paradigms for the subject must equally incentivize an ongoing institutional *microethnography* of the kind championed throughout *Does RE Work?*: a drill-down into the illocutionary force of text, voice, command, and happening across school actors and circumstances, alert to all of the intertextual and heteroglossic strata where the production of localized personal and professional speech inadvertently discloses the unspoken costs involved in creating and sustaining a meaningful, confident commerce between Religious Education and the principal, defining objects of its interest.

Voices Lost and Found

In his searching critique of the neglect of materiality in the dominant Western metaphysics of voice, the cultural theorist Mladen Dolar links problems in psychology and anthropology to everyday misrepresentations of free indirect self-narration:

If we speak in order to “make sense”, to signify, to convey something, then the voice is the material support of bringing about meaning, yet it does not contribute to it itself. It is, rather, something like a vanishing mediator. . . it makes the utterance possible, but it

disappears in it, it goes up in smoke in the meaning being produced. Even on the most banal level of daily experience, when we listen to someone speak, we may at first be very much aware of his or her voice and its particular qualities, its color and accent, but soon we accommodate to it and concentrate only on the meaning that is conveyed. The voice itself is like the Wittgensteinian ladder to be discarded when we have successfully climbed to the top—that is, when we have made our ascent to the peak of meaning. The voice is the instrument, the vehicle, the medium, and the meaning is the goal. This gives rise to a spontaneous opposition where the voice appears as materiality opposed to the ideality of meaning. The ideality can emerge only through the materiality of the means, but the means does not seem to contribute to meaning. (Dolar 2006, p. 5)

While he articulates an account of language and subjectivity based on a psychoanalytic reading of the materiality of the abstracted voice, Dolar's suspicions also extend to ethnographically prized qualities such as “the prosody, the intonation and the accent, the melody, the redundant, the variations and so forth” (p. 9) that characterize individual speech acts and interactive exchanges—and which, of course, figure ubiquitously throughout a social scientific undertaking such as *Does RE Work?* These are the features, after all, that carry speaking subjects along specific social and cultural (and religious) axes, both enabling and impeding horizontal and vertical mobility over the difficult terrain of identity, attachment, status, and individuation. In this demanding process, Dolar discerns a pervasive linguistic bias, one that treats the voice as “*what does not contribute to making sense*” (p. 5, emphasis in the original). The consequence is that important dimensions of the function of language in the agitated formation of subjectivity and cultural and political consciousness become marginalized, attenuating the concept of ventriloquism, especially, to the narrowest constructions of heteronomous annexation and third-party propaganda or possession (Kroskity 2000).

Dolar seeks to recover an older, more archaic appreciation of the power and potential of the voice by highlighting the extensive catalogue of physical and transformative actions that may actually be *performed* by it—from the whisper to the shout, the curse to the prayer, the promise to the threat, the thrown voice to the singing voice. The last of these, especially, dramatizes for Dolar the active production of the corporality and artifice of vocal and polyphonic subjectivities in terms consistent with the Lacanian “object voice”—the rendering of the voice as *objet a*, an object that emerges from the body but is neither fully defined by matter nor completely detached from it. Dolar aptly describes the “object voice” as “a bodily missile which has detached itself from the source, emancipated itself, yet remains corporeal. . . . So the voice stands. . . . at the intersection of language and the body, but this intersection belongs to neither” (2006, p. 73). Occupation of this liminal threshold makes vocal production much more transgressive than most mainstream accounts of the ethnographic encounter suggest, freighted with a surplus of meaning that does not necessarily collude with the declared message in an act of communication but may actually subvert it. Indeed, such “voice fetishism” indicates that there is something to the voice that is “different from” the meaning of the utterance. Rethinking the voice as an excess or an internal difference of communicative action, Dolar describes it finally as the “vanishing mediator” of meaning: “the voice is precisely that which cannot be said” (2006, p. 15) (Dohoney 2011).

The transgressive character of the singing and speaking voice illuminates its particular and polymorphous materiality but also runs the risk of essentializing vocal acts as ontologically excessive and overflowing. Such a “romantic” portrayal of vocalization is problematic because it might too easily overlook the vital sociocultural conditions for such vocalizations that are in fact so finely documented by the best expressions of achieved ethnographic exchange and analysis. As Jonathan Sterne has observed of the cultural history of sound and its technologies in Western modernity: “that elusive inside world of sound—the sonorous, the auditory, the heard, the very density of sonic experience—becomes perceptible only through its exteriors. Sound is an artifact of the messy and political human sphere” (2003, p. 13). While the speaking, singing, praying, lamenting, celebratory, teaching voice might periodically transcend specific socio-material boundaries, joining and simultaneously separating bodily interiorities and exteriorities, no act of human utterance cannot be fully detached from the ambiguities of the social and cultural matrix of which it is a determinant part. It may be possible, nonetheless, to cooperate with this very ambivalence actively to take creative command of the voice as a material artifact of spontaneous expression.

At the conclusion of *Does RE Work?* a remarkable attempt was made to exploit the potential of this much freer, rhizomic understanding of the research subject’s voice and speech than conventional linguistic ethnography had hitherto appeared to afford. It took the form of supporting undergraduate student teachers in creating a Boal-style Forum Theatre interpretation of the project fieldwork data and the case studies and classroom episodes surrounding it (Lundie and Conroy 2012). Few innovations could have more successfully extended the hermeneutical parameters of the linguistic ethnographic model on which the project framework had so depended—inviting students to find and express not only their own stakeholder voices as aspiring teachers, but the voices of the often anonymous characters and actors submerged within the vast data sets. Liberated by the political and performative impulses of the Forum Theatre rationale and practice, the participants transformed the perception of voice and vocal subjectivity, repurposing ventriloquism as a multidirectional and reversible process opened out to new interpretative possibilities by play, impersonation, mockery, interrogation, repetition, and the sustained scrutiny of many and varied audiences, live and virtual. Such overt “democratization” of the primary materials of the linguistic ethnographic encounter, perhaps more than any other single intervention, beckoned at the end of whole project towards new and untested opportunities for evolving ethnographic inquiry to still more reflexive levels of collaborative recognition and educational understanding.

8.2 Making an Appearance on the Shelves of the Room We Call Research: Autoethnography-as-Storyline-as-Interpretation in Education

Elizabeth Mackinlay

Introducing a Story

But, you may say, we wanted you to write about autoethnography and education—what has that got to do with interpretation, teaching and learning, theory and story, social justice, and Indigenous people? The title autoethnography and education might mean, and you may have meant it to mean, autoethnography and what it is like, or it might mean educators and the autoethnographies they write, or autoethnographers and the educative process of doing ethnographic work; or it might mean education and the autoethnographies written about it; or it might mean all are inextricably linked together and you want me to consider them in that light (after Woolf 1929/2001, pp. 1–2). And yet even before I begin, I realize I will fail—like Virginia Woolf whose words I have already, perhaps cheekily, but hopefully carefully, paraphrased—“I should never be able to fulfil what I understand is the first duty of a writer – to hand you . . . a nugget of pure truth wrapped up between the pages of your notebooks to keep on the mantelpiece forever” (Woolf 1929/2001, p. 2). The only thing I can promise is a moment to think with and about autoethnography as interpretation in educational research. It is for you to “decide whether any part [of this story] is worth keeping” (Woolf 1929/2001, p. 2).

Let us then begin there then—with and about story, for story and autoethnography are long-standing friends in this academic playground. If I use the word “story,” what does it mean to you? Perhaps like me, the word story takes you back to a place in your childhood where everything was lived through your

1437

imagination. For some of you, the word story might easily be replaced with others such as fairy tale, fable, or fiction, or it might even take on a more cynical twist to mean a fanciful retelling of facts. Riessman (2008, p. 4) reminds us that stories, in an Aristotelian sense, are indeed always interpretive because “they mirror the world” rather than copy it exactly. Story is a kind of remembering, and Frantz Fanon might mischievously suggest that stories are revolutionary which should “properly be called a literature of combat” (1967, p. 193) for they evoke dangerous truths about a nation’s history and identity that “won’t stand still” (Denzin 2006, p. 334). If Hannah Arendt were here, she might say “storytelling reveals meaning without committing the error of defining it” (1968, p. 105); and Virginia Woolf would insist stories are essential for us to begin moving from the “cotton wool of daily life” to “moments of being” (1976, p. 72). Which is truth and which is illusion, is it fact or is it fiction (Woolf 1929/2001, p. 12), and are we locked inside or outside as ethnographers? “Fiction,” writes Woolf, “is like a spider’s web, attached ever so lightly perhaps, but still attached to life at all four corners” (1929/2001, p. 34) and likely to contain more “truth” than fact (Woolf 1929/2001, p. 2). Autoethnography, I would argue, is the same—woven by the intercorporeal threads of life that we emotion, embody, and experience, to make an appearance on the shelves of the room we call research as story.

The threads which interlace and form the narrative web in this chapter bring together my work in Indigenous Australian communities as a music ethnographer; my feminist work related to gender, performance, and music; and my role in teaching, learning, and researching in and around educational issues with Indigenous Australians. The personal *becomes* the political *becomes* the performative *becomes* the pedagogical *becomes* the passion in this chapter and does not promise to be neat—I have delighted in doing away with the “angel in the house” (after Woolf 1974) that might predicate the writing to be otherwise, a risky but ever so tantalizing strategy which enacts the very essence of what autoethnography as storyline might and perhaps will do. “What it will do” is an interesting phrase in and of itself, don’t you think? Framed in this way, autoethnography as storyline no longer sits stagnantly in the corner of a room which is not her own, but shifts in agitation from one foot to the other ready to claim her space and dance her way with words about, in, and through life. She holds heartlines in her hand—looking outwards, inwards (Ellis 2004, pp. 37–38), and back and forth in time (Denzin 2014, p. x) at the self and the social so that the power of embodied, “emotioned,” and ethical ways of thinking, being, and doing autoethnography as storyline can take center stage. She urges us to consider the ways in which an ethical, wise, relational, and loving politic is key to social justice in our practice as qualitative researchers, and she finds her expression through autoethnography as storyline, a kind of writing which seeks to uncover the heart of the world, even for a moment, by drawing us into a space of “heart thinking” where emotion becomes entangled with experience and epistemology so that all and everything we have left is our response-ability. Is this not what you thought autoethnographic writing as storyline will do?

Together then, as always already readers, writers, and researchers, let's take an adventure into the educational performative story telling playground I alluded to earlier, to "work together to unconceal what is hidden, to contextualise what happens to us, to mediate the dialectic that keeps us on edge, that may be keeping us alive" (Greene 1995, p. 115). Let's promise ourselves in educational research that will not rest in our search for "wide awakeness" to social justice and be brave enough to hold the storylines in our hands and hearts as we play. Take a seat beside me on the wooden swing of educational research and listen to the creaking chains of interpretation beginning to move in ways familiar and strange. Backwards and forwards our legs will fly, higher and faster we will swing, inwards and outwards we will look, until the lines between the personal and the cultural (Ellis 2004, pp. 37–38), experience and theory (Holman Jones 2005, p. 765), the creative and the analytic (Richardson, in Richardson and St. Pierre 2005, p. 962) become loose and irrelevant and ruthlessly let go. We will wait with baited breath, hoping not to and yet desperately wanting the thrill of the fall as we become dizzy with the uncertainty of it all—for who can say who can say what will come flying out (Behar 1996, p. 19)?

But, do not be misled, our play is *serious* (Weber 2010, p. 136) and comes with a warning. The way in which some or all of this story is told may come across as dismissive, mocking, and disparaging of people whose identities are firmly embedded in by no means simple ways within discourses of "imperial white supremacist capitalist patriarchy" (hooks 2013, p. 23), and indeed the very academic institution education and research would be deemed to serve. If you are offended, I understand for I am stuck in and out of those discourses too; but I cannot say that I am sorry. This chapter as story is intended to be both troubling and troubled by the relationships it invokes (Gandhi 1998, p. 4) about the tangled up nature of race, responsiveness, and representation in our practice as educators. It travels, as does Conrad's (1899/1999) novella, into the "heart of darkness" where words like ethics, social justice, relationship, compassion, vulnerability, and love make space for the difficult and unsettling issues of race, politics, power, and representation to take center stage in our theoretical, methodological, and interpretative narratives in education. In this playground, you will find me on the swing, watching myself watching the world to share moments of my experiences in educational research which came to life and continue to live through autoethnography as storyline, performative and interpretative work. Fragmentations of words written long ago, writing which mimics and plays with the poetics of others as though we were friends, and ideas and ideologies embodied as characters are the whoosh and whisper carried on the breeze as I swing backwards and forwards. I look to my left and notice the spare swing beside me. I wonder whether you as the reader will sit next to me, whether you might rather stand behind me and push, or whether in fact you might prefer to place yourself on the see saw which stands before us. After all, the positioning and performance of us all in the playground of research and education is a matter of interpretation.

Entering the Playground of Educational Research: A Tra-re-jectory

I swing backwards to look at my PhD in ethnomusicology, the moment that saw a group of Aboriginal women from the Yanyuwa, Mara, Garrwa, and Gudanji nation located in the remote community in Burrulula in the southwest gulf region of the Northern Territory of Australia begin the process of “growing me up.” I went there as a young white woman, wanting to right/write the research record about unknown Aboriginal women’s performance practices in this region, believing that research was my right/rite and that the right/rite thing to do was research. I went without invitation but as family, married to a Yanyuwa man and always already in relationship but not fully understanding what “being in relation” would come to mean. I began to make meaning, to interpret, and to write the words that fitted the research right/rite. I smile, nostalgic with memory and emotion of people and places, as I read my present in the past: *The end of the wet season had not yet brought the much desired ‘knock em down rains’ and the fan was switched to full strength in the small flat as we tried to keep ourselves cool. The three of us sat cross-legged in Eileen Manankurrmara McDinny’s flat in Darwin, talking and singing together. I was showing Eileen and her half-sister Jemima Wuwarlu Miller some of the musical transcriptions of Yanyuwa song that I had recently completed. Upon seeing the music, Eileen commented: “Yeah . . . you gotta give me this one, that [song] and I can show and I can tell [everybody] my sister bin working for that song now! . . . This girl is doing this work for us, not for herself for us, write down this song for us! . . . This girl bin write [song] and he [she] sing!”* (pers. com. E. McDinny 1995) Eileen’s comment illustrates the nature of my relationship with Yanyuwa people. Eileen recognised the dual role that I have to play in writing down Yanyuwa songs and also in my relationship with her as sister. Thus I am at once partial insider and partial outsider, a family member on the one hand and a researcher on the other (Mackinlay 1998, p. 60). My smile becomes a grimace as I read on and remember the way I analyzed this duality and its effect upon the type of representation, which could have been possible and the type of representation it actually became. As I wrote, I knew that the worlds these words represented were not really mine, and yet I was in the business of representation so I needed to find the words. I continued to write them, trying to find a way to appease the discomfort which had begun to emerge through what I imagined to be a dialogic process. *This performance ethnography hopes to present both Yanyuwa and my own perspective of the meaning of performance. I have concentrated and emphasised what performers of the a-nguyulnguyul [Yanyuwa women’s public singing genre] tradition have told me during singing sessions and in discussions elsewhere about performance of this genre in an attempt to involve indigenous [sic] perspectives in the ethnographic process* (Mackinlay 1998, pp. 40–41). I was no longer sure whose words were whose and what right I had to write them. I tried to write myself into the ethnographic and representational space. *I am a woman, an ethnomusicologist and a member of the extended Yanyuwa family. These three aspects of my life closely*

intersect and one can never be free of the others. My work is at once personal and professional. The literary style I have adopted in this work is as close as I can come to portraying the people with whom I have worked and the music they make while remaining true to my sense of family obligation (Mackinlay 1998, p. 82). These words starkly illustrate the inner turmoil I faced in trying to border cross between the professional and the familial, the personal and the political, the necessary and the self-indulgent in my retelling of a shared musical experience. Implicit here too is an acknowledgement that this ethnographic text will still not get it “right”—it is as close as I can come but not necessarily close enough to arrive at some kind of ethnographic *truth*. The words were still not right. I tried again. *Although I have attempted to have Yanyuwa voices heard throughout this study, statements from Yanyuwa people are inextricably bound up with my own theoretical and academic interests which are often quite separate from Yanyuwa interests* (Mackinlay 1998, p. 41).

I watch myself in this time past breathing out—for now at ease with the words I had written. My legs kicked lazily back and forth on the swing as I continue to stare back in time. More words flowed into publications, for after all, was this not my right/rite? “Music for dreaming: Aboriginal lullabies in the Yanyuwa community at Borroloola, Northern Territory” (Mackinlay 1999), “Maintaining grandmothers’ law: Female song partners in Yanyuwa culture” (Mackinlay 2000a), “Blurring boundaries between restricted and unrestricted performance: A case study of the mermaid song of Yanyuwa women in Borroloola” (Mackinlay 2000b), “Women play too: Didjeridu performance at Borroloola, NT” (Mackinlay 2003b), and more still. I was giddy and soaring with the *good* work I was doing as a music ethnographer, butterflies of excitement fluttering in body and mind as I planned what I might write next. The good work was embedded in the notions I held about the capacity of research to work towards social justice—I thought that writing about Aboriginal women’s musical worlds would somehow bring understanding, respect, and tolerance to Indigenous Australian peoples. I thought my academic work would somehow translate into “something better” for the women, men, and children whom I call family: better homes, a fair education, an end to racism, and the reinstatement of Indigenous Australians as a sovereign people. My PhD and the journal papers I subsequently wrote about the social and musical lives of Aboriginal women and men did not change anything, despite how well I wrote them and the prestige of the publications in which they appeared.

Ashamed and embarrassed, my legs propel the swing roughly forwards 10 years later to another PhD, this time in education. Write, my right/rite, everything changed. I began to write my right/rite differently. *“You now baba (sister)!” says Jemima a-Wuwarlu Miller as she turns to me to begin painting my body with white ochre in the appropriate body design for performance of the Yanyuwa women’s dance called Ngardirdji. Forty pairs of student eyes are upon us as Yanyuwa performers Dinah a-Marrangawi Norman, Jemima, Rosie a-Makurndurnamara Noble, Linda a-Wambadurnamara McDinny and I prepare ourselves for performance. We sit together and “paint up”, we make small talk and sing quietly. We take our time, we are well practised and yet nervousness, uncertainty and fear also*

pervade this moment. It is not the first occasion that we have performed this ritual for performance in the Indigenous women's music and dance . . . classroom at the University of Queensland. It is not the first time that I have sat and questioned what do they see in the actions of these four moving and animated bodies, three black and one white? (Mackinlay 2003a, p. 1) I had begun to ask different questions about performance, ethnography, and research and my own positioning within these discourses. *Being half on the inside and being half on the outside have lead to an overwhelmingly sense of personal and political commitment to an ethical and moral rel/presentation of knowledge in mainstream circles about Indigenous Australian women's performance practice. This study has provided a vehicle for me to understand my role as pedagogue in this setting, the impact that I have upon students, my relationships with performers and the efficacy of my praxis at building a teaching and learning environment with the potential to transform lives* (2003a, p. 2). I see myself writing these words, pen flying fervently across the page, fighting against the futility of knowing that these words were not right yet. There was something important missing. I realized that despite the new personal-is-political sentiment these words alluded to, I was still writing the research right/rite as it had always been done. I see myself wondering whether the words in fact had changed at all. For all my talk about resistance, social justice, and transformation within/against the boundaries of race in educational praxis, they were only words: empty words, hollow words, white words some of my Yanyuwa family might say. The words seemed to fall seamlessly into step with a research right/rite that no longer fitted a wide awakesness to the power and privilege of writing white. I see myself realizing that while people might be hearing the words I spoke at conferences and reading those that appeared in my writing, they were not listening—not with their hearts. Neither were the words I wrote those which my Aboriginal family wanted to listen to—they didn't tell a good story. My words were heartless and the butterflies were not excitement at all—they were harbingers of shame and guilt as I became painfully aware of my positioning as a non-Indigenous woman in relation to and in relation with Indigenous peoples, knowledges, and cultures and the enormous white power and privilege I held. Other kinds of words needed to be found—words at once curious and furious, cheekily refusing easy endings, brave enough to ban boring beginnings, and meddlesome enough to mix it up and mess around in the middle ground. Words replete with relationship and being in relation, words that went straight to the heart of the matter with no thought or care for return, racey enough to at once e/mb-race to the finish line knowing that you will be forever on the way (after Greene), all the while holding enough of the flesh, breath, and blood of life to speak to the heart. I tried to find different words. *I see the futility of so much of my earlier music research, dotted quavers on white pages trying to capture the sung magic of black singers – too many dots I painstakingly plotted so that I could take an understanding and text it into shape for a Western academic audience so that they too may have this understanding which was never given in that way. I think to myself how ironic it is that I began my work as an ethnomusicologist with the credo of preservation firmly in my front pocket. I am reminded of*

summer time at home with my Mum and my sister. We would stand in the cool kitchen and help Mum carefully cut and peel boxes and kilos of stoned fruit – peaches, apricots, plums – and delicately arrange them in glass vacola jars to preserve them for winter. We wanted to savour the flavour of these summer fruits for as long as we could, even though we knew they wouldn't taste quite the same. When children are hungry, when my kundiyarra cannot keep themselves safe, warm or healthy; when grog and so much other violence kills too much of life; when the words and ceremonies of ancestors can no longer be heard or sung because whitefella business steals, colonises, interrupts and destroys – any dots on a white page I may write, fancy presentations at conferences I may give, and written papers in academic journals I publish, are just not enough for me anymore. The intellectual thirst, greed and desire for more of the Others squeezes the life, the song, the voice, the essence out of what I do. The music becomes lifeless because the singers cannot take breath. Their mouths are smothered by the heavy blankets of analysis, transcription and theory. The less they breathe, the more we as researchers take – selfishly and without care for life, committing a further act of dispossession (Mackinlay 2009, p. 243). I refuse to write this research right/rite any longer. I look into the mirror of research and see music. She glares back at me and accusingly screams, “You didn't hear me!” And then so forlornly, “Such beautiful songs I sang for you, why did you leave me?” I turn my head away. Even then she keeps on with a tight voice, pursed lips and teeth clenched. “Why did you stop singing with me?” I put down my head ashamed. She shouts at me. “What is this performance you call research?” She pauses. And then comes a soft and sad whisper, “And why did he replace me?” I cannot bear her sadness. I know what I must do. I lift my head up and look bravely into the mirror. I stop seeing research and now I see music. I wonder how I could have ever let her fade away. I hear nothing but her . . . as I open my mouth . . . to sing (Mackinlay 2009, p. 226).

Finding Hope Within/Against Ethnographic Research: A Story

I jump from the swing and find myself in another kind of playground—an academic conference. I am reminded immediately of Ruth Behar's (1996, p. 161) desire to be somewhere else once she arrives at the place where she thought she needed to be. Behar describes the apprehension she felt when discussing the “difficult” aspects of her work to colleagues at an academic conference, and I am about to do the same. I have not presented in this forum since the arrival of my two children almost 10 years ago. I am nervous, unsure of whether I still belong. A young girl in a black t-shirt with the organization's logo scrawled in white across the front asks if I have received a program and hands me a conference bag. A brief peruse tells me that my name is not written anywhere on the conference schedule and my anxiety about whether or not I should be here increases in intensity. Even though my

doctoral research qualifies me to call myself an ethnographer—indeed, a music ethnographer, I am doubtful that the kind of ethnographic work I do these days is of the accepted disciplinary kind in Australia. And yet, that is partly why I am here. I want to give voice to the kind of applied and activist music ethnography—of autoethnography as storyline that I believe in—a personal and politicized research practice which aligns itself as close as is possible with Indigenous Australian peoples in a “struggle for rights, redress . . . empowerment and a commitment to produce knowledge in collaboration and dialogue” (Hale 2007, p. 105). Some might decry it as “black-arm” band or “heart on your sleeve” ethnography, but my relationships and responsibilities to Aboriginal and Torres Strait Islander peoples as a white Australian who has used her power and privilege to cross over into their worlds under the guise of research mean that I can no longer “do” ethnography any other way.

The paper I am giving is a direct hit on the colonial and patriarchal underpinnings of music ethnography in Australia. The irony of trying to negotiate a space to speak with the white male conference organizer *after* my erasure buzzes around in my head like a swarm of angry wasps poised to strike and sting. He apologizes profusely and makes space for me to give my paper at 5:00 pm. The air is close and still as my sense of foreboding thickens. My instincts are screaming at me to walk away and never come back, but my commitment to imagining and creating a different kind of ethnography compels me to stay. I am the final presenter of the day. I see many weary and ready to go home faces in the audience, and I promise them that I will try to make it lively and interesting. Imagining myself as the kind of iron butterfly that Regine speaks of—a woman who is about to make herself “radically vulnerable” (2010, p. 17)—I take a deep breath and words become the life of a new story.

*In the Beginning*¹

When the world of ethnography was first created, it was a happy place of discovery and adventure. Joining the crusade of Colonialism and scientific exploration, ethnographers armed themselves first with notebooks and then the gramophone and all manner of visual and audio recording equipment to collect, capture, and catalogue the world’s musical cultures (c.f., Cooley 1997, pp. 5–11). They worked alongside and oftentimes in collaboration with Colonialism’s soldiers, administrators, and missionaries, driven by a desire for the exotic sounds of the Other. The sun shone every day, but the ethnographers paid no heed to the shadows they cast in the

¹ An earlier version of this story was published under the title “Decolonising Australian ethnomusicology through autoethnography: A retelling of Pandora’s story” and appears in *Creative Approaches to Research*, 5(1), 3–14. Full copyright permission to reprint this paper here has been granted by the Editor of *Creative Approaches to Research*.

lives and worlds of the Others. Their eyes were fixed firmly on the prize of detailed documentation, description, and explanation of the peoples, languages, musics, and cultures they found rather than on the white power and privilege which enabled them to be there in the field with the Others in the first place. At the end of each day, the ethnographers would return home to their world, suitcases heavily laden with words, artifacts, melodies, rhythms, and musical and cultural symbols not their own to be rewarded by the god Colonialism with praise and promises of potential expeditions, promotions, and professorships.

One afternoon, a woman called Ethnography was inside her office at the university carefully cataloguing the recent recordings she had made of Yanyuwa Aboriginal music from Burrulula in the Northern Territory, when Colonialism knocked on the door. Ethnography sighed heavily. Her colleague Aboriginalism, excited by the “traditional” and “authentic” Aboriginal melodies he said he had heard coming from her room, had already interrupted her many times today. She pasted the brightest smile she could muster on her face and opened the door. Colonialism stood there, bowed down to the ground holding a dark wooden chest that he was carrying on his shoulders. He looked as though he might collapse under its sheer imperialistic weight. Ethnography rushed to get the worn-out Colonialism a seat and called out to her colleagues to assist. Aboriginalism, Colonialism’s right-hand man, arrived quickly and dutifully to help the old man lower the chest onto the floor. It was tied shut with golden cords and carved with unusual musical markings variously resembling long-necked lutes, reversed treble clefs, and dancing women.

“Oh thank you my dear girl!” Colonialism sighed as he sat down heavily on Ethnography’s only chair. She bit her tongue in frustration at once again being patted on the head as the young female scholar—the dutiful daughter—doing her time. Looking directly at Aboriginalism and ignoring Ethnography, Colonialism asked, “My friend, I have come to ask of you a great favor.” Aboriginalism nodded eagerly, already agreeing to the something that Colonialism required of him. “This academic environment is so heated right now and I am finding this box, burdened as it is with artifacts of history and so on, too heavy for me to carry on the next leg of my neocolonial journey. Would you mind terribly if I left it here in your office while I take this backwards step forwards into a-colonial amnesia and a convenient forgetting of the trauma and aftermath of my actions?” Ethnography cleared her throat noisily, and when she spoke her voice was saccharine sweet: “With all due respect Colonialism, this is actually my office and I’m not sure I have that much space for your . . . what did you call them? . . . trophies of the past? Are you sure that’s what they are anyway?” Colonialism looked at Ethnography with a sneer that was filled with both incredulity and contempt. “My dear girl, how could you think they might be anything else? There is nothing else except for my legacy!” Worried that the two were headed for a showdown, Aboriginalism hastily interjected, “Ethnography was only joking, weren’t you E? Of course you can leave your box here!” After hauling the large box into Ethnography’s office, Colonialism furtively poked his head out to look up and down the hallway. “Are you sure no one will steal it?” he asked anxiously. “This is my box and NO ONE under ANY circumstances must challenge it, damage it, open it, or take it without my authority!”

Aboriginalism laughed a little too confidently, “Don’t worry Colonialism, I will always protect what is yours—in fact, I’ll fight to the death to make sure that what you own becomes dogmatically and directly enshrined in the theory and practice of ethnomusicology, that race is placed firmly in the back of the cupboard along with all of our other skeletons, and that our view of what constitutes Indigenous Australian peoples identities, performance practices, histories, and contemporary realities stays firmly in place.” Colonialism looked Aboriginalism squarely in the face and stared at him sternly. “Alright, I’m leaving my legacy in your hands. This box contains powerful and dangerous things that must not be released. It’s up to you to continue the grand narrative of whiteness and rightness—don’t let me down Aboriginalism—the very premise on which this grand nation of ours was peacefully settled depends upon it!” The two men shook hands as Colonialism left.

The Whispering Begins

Aboriginalism exhaled noisily. “Well, what are you going to do for the rest of the day E? Fancy a little bit of transcription and analysis?” Ethnography looked at him in disgust. Guys like him just didn’t get it. The postmodern move to self-reflection had brought Ethnography a crisis of representation—“jargon to some, provocative insight to others” (Barz 1997, p. 206)—whereby ethnographic texts in all of their guises were now deservedly subject to interrogation. She constantly questioned her right to be white, the power and privilege she carried because she was white, and the heavy mark that her whiteness brought to bear on her work and relationships with Indigenous Australian people. Ethnography knew in her heart that it was up to her to do something different, but she was torn. She was struggling. She felt uncomfortable. But she knew it was a discomfort that she had to own and live with—the comfortable alternative would only breed complacency and complicity with Colonialism, and Ethnography would rather die than jump into bed with him and his band of merry men.

Turning back to the here and now of Aboriginalism standing in front of her, Ethnography replied, “Oh why don’t you just f . . .” but stopped and frowned. “Can you hear that?” Aboriginalism listened hard, but heard nothing. “What are you talking about E? I can’t hear anything except Patriarchy clinking cups around in the tea room.” “No, listen Aboriginalism! I’m sure I can hear voices whispering!” Aboriginalism stood very still this time, tilting his head slightly to one side as if that would help his auditory perception. Ethnography sat down cross-legged next to the strange box and waited. “What the hell are you doing E? Colonialism forbade us to do anything to the box! Move away from it!” Aboriginalism was angry with Ethnography and roughly tried to pull her to one side. But she would not be moved. She was sure the whispering had come from inside the box. After only a few seconds, she heard the voices again. “Ethnography, listen to us! Decolonize

...” the voices were so low and whispery, she wasn’t sure whether she was really hearing them or imagining them. She bent down even closer and put her ear to the lid. No, this time she was sure—the box was calling to her. “De-col-on-i-ssss ... this whispering ... can you hear us? de-col-on- i-s-a-tion ... de-col - on - i - sshhh ...” Ethnography looked up at Aboriginalism who just stood there staring at her in disbelief. Why can’t he hear it? She thought to herself. Ethnography sat in the silence between them and realized that the murmuring she heard was stirring inside her alone. The voices were getting louder and louder. “Ethnography! Please let us out ... we are stuck in this dark box of colonialism! Please help us to escape!” Again Ethnography glanced at Aboriginalism. Surely, he could hear them now? Her breath caught in her throat. Why? Why can’t he hear it, this whispering so persistent? How can he stand there so indifferent to “[the] dispossession, death and despair” (Rose 2004, p. 5) she could hear in the voices?

There were so many voices. Ethnography imagined she could hear those of her Mara, Kudanji, Garwa, and Yanyuwa teachers, friends, sisters, family, and *kundiyarra*—her most necessary companions (see Mackinlay 2000)—as they sat around the campfire and lifted the songs of the Dreaming mermaids right up into the night sky. She heard the voices of many senior song men and song women who were no longer alive as they walked her through the country of their ancestors on foot and their feet kicking up sand on the ceremony ground. Ethnography heard her granddaughters as they put their own Yanyuwa words to silly made up whitefella songs and laughed until they cried. She heard the wailing of women as they cried for the stolen country, stolen innocence, stolen children, stolen identities, stolen knowledges, and stolen freedom.

“Ethnography! Don’t turn away from us! Listen to this whispering in your heart. Henry Reynolds (1998) did it, Ruth Behar (1996) has opened up to her vulnerability, Deborah Bird Rose (2004) has even taken us on a journey into the wild country and back again! You are not alone. Listen Ethnography! We beg you!” The voices inside the box were now reaching a fevered pitch. “Let us out so that we can work together to expose Aboriginalism and Colonialism’s research for what they are—vehicles of sustained oppression, a tool of colonization (Mutua and Swadener 2004, p. 14), machines which continue to dominate our worlds as Indigenous and non-Indigenous people today.” Ethnography felt as if she were going mad and hastily covered her ears with her hands to block out the voices. “Ethnography, don’t you realize? Everything is in danger of colonizing—everything is suspicious (Cary 2004, p. 77)—just think about the Colonialism has protected this box which has now invaded your office! Listen to us, let us lead you to let go of your power and privilege so that you can really ‘look at us’—your-self at us, the Other!” Ethnography could no longer stand it. Suddenly all fingers and thumbs, she fumbled to untie the knots in the golden cords that held the box tightly shut and all the while pleading voices filled her ears. At last Ethnography undid the thick threads and the gleaming cords fell away. She took a deep breath and opened the lid.

Unconcealing Colonialism, Unleashing Ethical Ways of Being in Relation

Now we all know what happens next in the most well-known version of this Greek story—Ethnography opens the box and unleashes all kinds of unspeakable evils onto her disciplinary male-dominated world. She would be forever demonized as the woman who brought about the downfall of ethnomusicology just as another woman in a garden in another world was blamed for war, death, disease, and all of mankind's other ills. But if it is true, as bell hooks (2010) tells us, that what we cannot imagine cannot come into being, then, it is my wish to take this ending of the Pandora's box story on a very different turn.

As soon as Ethnography opened the lid, she realized what she had done. The box had been crammed with all of the secrets of Colonialism's past. The hush-hush hide it under the carpet actions and attitudes about Indigenous Australian people that he had never wanted anyone to know about because of the threat they posed to his position of as the civilizing presence and power in this country. All of these secrets came flying out. They flew out of the chest in a great swarm and fluttered all over Ethnography's skin. For the very first time, Ethnography felt pain, regret, and guilt, a guilt so heavy she began to struggle to breathe: Her baba Jemima telling the story of being a slave for the mijijis at the big house, the white boss smelling around the young gins to make or take yellafella kids, and the white trash selling grog to 7-year-old girls today; the Binbingga people who were led to a cliff and forced to jump or they would be shot, white men shooting Aboriginal people like wild animals, and white men using and abusing my mother-in-law and her children in exactly the same way; the missionary's car shining in the sun as it came to take ceremony, culture, and children away and the doctor's plane taking on the same sinister gleam as it similarly came and went with too much frequency; and young men and women dying from alcohol, gunja, violence and jail, suicide. She saw her white ancestors standing around, laughing, and pointing at her Aboriginal family, screaming at the top of their lungs, "See, we told you! They'll never be any bloody good—they were never *meant* to survive." Ethnography staggered and stared at them in disbelief. "These are *my* people," she thought, "these whites who knew and think they still know best." She began to wail with anger, confusion, shame, and despair, and all too late, she slammed the lid down onto the box.

Ethnography cradled her head in her hands and curled up into a tight ball on the floor of her office, oblivious to the coffee stains and ingrained dirt. She tried to calm herself, slowly breathing in and out, and again, and again until she almost choked. "Shit! There it is again!" Ethnography once more heard voices coming from inside the box. She had foolishly thought that all of Colonialism's secrets had flown away but she was sadly mistaken. "Let us out Ethnography!" Ethnography waited. Not daring to move. "Don't be afraid of us! We can help you!" came the voices yet again. Ethnography whispered, "What am I going to do?" Ultimately, she knew that there was only one thing she could do. Uncurling herself from the floor, she opened her eyes and turned to open Colonialism's chest for a second time.

Ethnography gasped. She saw with her own two eyes that Colonialism's box was not actually a box, but a beautiful large vase half buried in the ground. Before her demotion by Hesiod and later Erasmus in Greek mythology, Pandora was known as "she who sends up gifts," and the vase was representative of her status as the earth goddess who bestowed all things necessary for life (Marquardt 1982, p. 286). Ethnography gently lifted the lid, and one by one the whispers she had heard began to appear out of the vase. First to appear was Decolonization, holding hands with Postcolonialism, Critical Race Theory stood side by side with Whiteness studies, and lastly came Feminism in an embrace with the Ethical Necessity of Being in Relation with the Other. Decolonization spoke first.

"Ethnography, we promised that we would offer you something and so I bring to you openness. Somewhat risky I know because you 'do not know the outcome . . . one's own ground can become destabilised . . . one's self [is] available to be surprised, to be challenged, and to be changed' (Rose 2004, p. 22). However, openness comes hand in hand with situatedness and dialogue. What matters is that you take me on board as a way of thinking which requires us to be critically vigilant (hooks 2010, p. 26) about the colonial past in the present—to not be afraid to look into the dark corners of our fieldwork notes, recordings, and research papers to uncover what may be lurking there." Ethnography looked at Decolonization, "So what you're saying is that you want me to uncover and remember the history of ethnomusicology in Australia with Aboriginal and Torres Strait Islander peoples as a racialized landscape, because after all, race is everywhere (c.f., Radano and Bohlman 2000)?" Decolonization smiled and made space for the Ethical Necessity of Being in Relation with the Other to speak.

Clearing her throat, Ethical Necessity spoke quietly. "Ethnography my message to you comes from Levinas and his good friend Rosalyn Diprose (2002). The face of the other—all of the Indigenous people we work with—calls the subject (that's you Ethnography) to responsibility . . . it does so in a way which that demands our attention to [her] call. [She] shows [her]self to us, and we cannot help but respond, because we cannot turn away" (Levinas, in Fryer 2004, p. 42). Ethnography immediately understood the truth of what Ethical Necessity said and a single tear fell down her cheek. "Through such literal, discursive, and intercorporeal looking," Ethical Necessity continued, "You and them enter into a relationship with and a responsibility to one another—lives, histories, memories, stories, conversations, emotions, and desires become entangled. You have to be brave enough to listen to the whispering in your heart and once you have heard, wear it proudly on your sleeve." Ethnography is unsure, "Is that all I have to do?" "Well no—there is one more thing," Decolonization interjected. "Don't waste the words we have given you—there are too many wasted words in academia. We ask that now you have released us from Colonialism's box, embrace the gifts from this vase, and begin the dialogue we have started with you with others—your colleagues, the ones that matter, those who have the power and privilege to start telling the stories behind Colonialism so that together we can deconstruct his discipline and reconstruct a future in the present." Ethnography was still not convinced. "But really, what good is that going to do? Colonialism is everywhere—he is too powerful. He is inside our

heads, our institutions, our disciplinary practice, our classrooms—I bet he’s even here in this office if we look closely enough!” Ethical Necessity moved herself closer so that she could look directly into Ethnography’s face. “All we ask is that ‘on the day that we [you] can conceive of a different state of affairs [and] a new light falls on [your] troubles and [you] decide that these are unbearable’ (Sartre 1956, pp. 434–435)” (in Greene 1995, p. 5), then you at least begin to imagine what a decolonized ethnography—and, indeed, education—might look like. “There are always vacancies: there are always roads not taken, vistas not acknowledged. The search must be ongoing; the end can never be quite known” (Greene 1995, p. 15). I can’t promise you that you will find what you are looking for, but is it not our responsibility to at least try?”

Seeing that Ethnography understood, Decolonization and Ethical Necessity kissed her gently on the forehead and waved good-bye. Ethnography felt terribly alone and did not know what to do. She turned towards the vase, remembering that Colonialism would soon be back and would want an explanation for why the box was now a vase and why the once box was now open and empty. As she turned to replace the lid, out of the vase came another whisper—it was Hope. Ethnography heard clearly in that moment the message Hope held—it was a belief in the capacity of humanity to recognize wrong doings, to be transformed, to engage with one another’s differences with honesty and openness, and thereby to enter into a relationship with a wise and loving politic necessary to achieve any measure of justice. Ethnography sobbed with relief as Hope fluttered gently against her skin, soothing her sadness and singing a song for a new tomorrow. And luckily, Hope has stayed with her ever since.

A Decision Is Made

The three colleagues from the Faculty of Social Science sat around a small round table in a square office far removed from the swing in the playground, each of them silent and deep in thought. They had all heard her paper at the conference and felt strongly that it was time to make a decision. One of them, head in her hands, sighed noisily.

“What are we to do then?” Amanda asked. “She’s gone and done it, she’s finally done it!”

“I know, I still can’t quite believe it,” Paul’s face was white. “I never thought she would actually do it. I mean; I know she’s been talking about it for awhile, but I thought it was all just talk.”

It was Sarah’s turn to speak. This is how their departmental committee meetings always went—Amanda first, then Paul, and last of all Sarah, always in that order and always with the same intent. Usually Elizabeth was there to add something to the conversation but today was different. Today, Elizabeth was absent and she

was the main item on the agenda. Sarah continued to sit quietly, waiting for the right words and moment to speak.

“Well, come on Sarah, what are we going to do about Elizabeth? We cannot simply stand by and do nothing—no, that won’t do at all,” Amanda shook her head vehemently.

Paul began to resemble a bobblehead on the dashboard of a car as he joined her.

“Yes, I agree, we have to do something. What Elizabeth has done goes completely against everything that we believe in as traditional realist ethnographers!”

They both looked at Sarah expectantly, waiting for her wise and considered response.

“Well,” Sarah began. “Her paper was very performative—I do remember somewhere reading or someone telling me that she was a dancer in a former life, but I am afraid I have to agree with you both. Can we seriously think that autoethnographic writing and research—or *whatever it is she calling it these days, storyline*—is proper social science? That is the question for us to consider today.”

“Are you kidding me?” Amanda was incredulous. “The goal of social science—of which she claims autoethnography to be an example of—is to study the social world; let me say that again, the social world. If the topic of autoethnographic research is the self, how on earth can it be considered valid and legitimate social science?”

“I mean what would our head of school say if he was there to hear her sanctimonious crap about heart, hope, and *storyline* in ethnography?” Paul asked. “Does he know this is what she does, gets paid a generous salary to sit in her office obsessing about herself writing narcissistic narratives? Sociology is an empirical discipline and we are supposed to study the social (from Delamont 2009, p. 60).”

“Mmm,” Sarah agreed. “I can see your point. I guess whether we like it or not—and I happen to not like it—the self has always been present in ethnography, and the postmodern turn has shifted our attention to issues of voice, power, authority, and representation in the work that we do in, out, and between the field. These theoretical, philosophical, and methodological debates have certainly laid fertile ground for the growth of autoethnography over the past 15–20 years.”

“But does this necessarily mean that this is a good thing?” Amanda wanted to know.

“A good thing for ethnography? These autoethnographers can’t even agree on a label for what they do—sociological introspection; critical autobiography; personal, self, reflexive, and/or phenomenological ethnography; psychobiography; self-ethnography; auto-anthropology; personal and/or self-writing; native and/or narrative ethnography; emotionalism; evocative and/or experimental ethnography; analytic; interpretive . . .”

Paul groaned loudly and dramatically, “Oh please don’t get me started on Norman Denzin (2014), I mean really, ‘A call to arms?’ What does he think . . .?”

“OK, we get the message Paul,” Sarah interrupted. “And yes, I am as frustrated by it as you are.”

“I wonder what happened,” Amanda began, “To Elizabeth, I mean. Why did she start writing like this? She used to be such a nice dutiful daughter of traditional ethnographic method. We’ve all read her early papers and PhD on the social and musical lives of Aboriginal women—such solid pieces of analytic research grounded in data from the field.”

“She erased the line between ‘the researcher’s self and the investigation’ (Delamont 2009, p. 60),” Paul offered. “She let relationship—god knows we’ve heard her harp on about that for years—cloud her judgement and blurred the boundaries between the familiar and the strange. Studying ourselves can never make anything ethnographically strange and our task has always been to fight familiarity.”

Amanda agreed. “It’s just a little too familiar and subjective for my liking. And quite honestly, we are not interesting enough to write about in journals, to teach about, to expect attention from others” (Delamont 2009, p. 59).

“Yes,” Sarah nodded. “And one of my main concerns relates to exactly that. Because of the reliance on the self and the telling of a good story, autoethnographic research is . . . well, it’s basically unethical.”

Amanda shook her head once more. “You know in this recent paper she gave about decolonizing ethnography, she talked about people at Burrulula—people she claims to have relationships with? Did she ask her family if she could use them in this paper? That’s a huge problem with autoethnographic research and writing—other social actors cannot be disguised or protected. Did she get their permission to describe their world and their experiences in such a revealing way?”

“I doubt it,” Sarah declared somewhat smugly. “And she dares to rant and rave about white power and privilege, social justice, and ethical necessity. From where I stand, when you write autoethnographically, you are standing categorically on the wrong side of the fence. Because you cannot see beyond yourself, you can only focus on the powerful—you. ‘Autoethnography is, whatever else it may or not be, about things that matter a great deal to the autoethnographer’ (Delamont 2009, p. 57), but I would argue that it’s the powerless to whom we should be directing our sociological gaze.”

A snide smile appeared on Paul’s face. “I can just imagine what she would say in her defence. It would begin with ‘from my experience . . .’”

“A-ha! Exactly!” Sarah was beginning to warm up now. “Autoethnography is all experience—there is no data. Research is supposed to be analytic, not experiential, and autoethnography is noticeably lacking in analytic outcome—there is no analytic mileage (Delamont 2009, p. 58). It abrogates our duty to go out and collect data.”

“And we can’t forget that sociologists are a privileged group,” Paul added. “Qualitative sociologists are particularly lucky as our work lasts. Think about what sociology is remembered for—the great ethnographies: *City of women* (1994) by Ruth Landes or *Boys in white* (1961) by Howard Becker et al. Autoethnography is an abuse of that privilege—our duty is to go out and research and write the ethnographies which will become the classic texts of the year 2090—not sit in our homes focusing on ourselves.”

Sarah slapped her hand on the table. “Damn it! There is nothing more to be said about it. The assumption that there is something more inherently authentic and authoritative about autoethnographic writing is total bullshit. It’s mischievous—some would say malicious even. Autoethnographers are nothing but bricoleurs—tricksters! They assert, exaggerate, speculate, improvise, and don’t test out ideas! Autoethnographers are essentially lazy—literally lazy and intellectually lazy. And what’s more, they all think that by being ‘artistic’ and ‘creative’ they are performing science! Most of them can’t even write well, they’re just second-rate, two bit, wannabe novelists and poets!”

Paul and Amanda looked wide-eyed at Sarah and would later solemnly swear they had actually seen smoke and fire snorting from her nose. Gathering as much courage as he could, Paul asked, “Well, we are still left with the same question Sarah—what are we to do?”

Amanda’s eyes glittered with revenge. “We can reject all and any of the work she submits for publication, ensure that she is never given an opportunity to speak at conferences, and when she does get a look in, we can heckle her from the back . . . I don’t suppose a good old-fashioned public burning at the stake is an option?”

Sarah’s mouth set in a hard line. “We can but do the only honest thing . . .”

Elizabeth leant back against the stone bricks lining the hallway, her breathing shallow and fast. She knew she was not supposed to have heard the words she had stumbled upon – they were about her and they were designed to hurt after the fact. She hadn’t meant to eavesdrop, but the conversation was too public and too loud to ignore once she had encountered it. The cold hard reality of the wall steadied her and as she looked down at the heartlines on her hand, she felt her blood pumping with a new sense of resolve to w/rite/right. She would leave this School of the Lifeless, replete as it was with inert concepts and colleagues, and return to the playground to begin writing life. Knowing that others were waiting for her there on the seats of the wooden swings, Elizabeth became filled with the ‘courage, the desire, to approach’ (Cixous 1993, p. 7) writing as a way of learning to die, to break with the darkness of dominator culture and write herself (Cixous 1976, p. 880). She would write herself and her being into new ways of becoming an educational researcher as storylines in her hand and heart, indeed, “From now on, who, if we say so, can say no to us [me]? We’ve [I’ve] come back from always” (Cixous 1976, p. 878).

The Only Honest Thing

The truth is, now that I have reached the end, I realize that a chapter about autoethnography as storyline in educational research always had “one fatal drawback. I should never be able to come to a conclusion” (Woolf 1929/2001, p. 2). My mind has become increasingly tangled as I have thrown around words,

turned over pages, written and rewritten carefully constructed sentences only to erase them and start all over again. I write autoethnography as storyline because it is the only honest thing I know to do in this particular personal–pedagogical–political somewhere I find myself. It is the only interpretative move, which holds the possibility for living the discomfort of writing, researching, and being in relation as a white settler colonial woman. If I imagine autoethnography as a person, she is woman, sitting in a room of her own (Woolf 1929/2001) writing in “white ink” and “draw[ing] her story into history” (Cixous 1976, p. 881). She is an “undutiful daughter” who loves the part she plays in conceptual disobedience and disturbance (Braidotti 2012, p. xii), and in the here and now, she impulsively tosses away her name to become in the moment of being storyline. She wears her heart on her sleeve as philosophy, theory, and methodology (Denzin 2006, p. 334) and is not afraid to break it once, twice, and then do it all over again. Relationship is the breath which gives flesh and life to the very bones of her existence as a researcher and an educator. Emotion, empathy, and experience are embodied in the storylines she writes because she knows from her heart to hand that “censor the body and you censor breath and speech at the same time . . . your body must be heard” (Cixous 1976, p. 880). She wants you to know intimately with every fiber of your being the good alongside the bad through the self and the social world. She loudly and shamelessly proclaims the personal-as-performative-as-pedagogical-as-political in a quest for education as the practice of freedom (Denzin 2003, pp. 258–559). Storyline demands a response and will continue to speak where some would prefer silence. She threw away her white naiveté long ago and dares to ask questions about moral discourse and ethical responsibility—and she refuses to stay quiet. She knows that not everyone likes her, respects her, understands her, or thinks she has a place, but she stays the course. There is too much at stake to give up now, and besides, that would be the easy way out. Hope is the steady and rhythmic swing to her storyline reason, punctuated with tumbles and turns towards giving and vulnerability, community and solidarity, conversation and compassion. The game she plays privileges relationship, relationship as pedagogy, and the power of such a pedagogy of heart—indeed, of love—holds for *not forgetting*, shifting, changing, and transforming the ways in which we think about, make representations of, and engage with Indigenous Australian peoples in education and ethnography. She wants the play to stay long after the sun goes down, the cold sets in, and the day ends, to carry you across the threshold from mere disinterested critique into a space where empathy, compassion, and mindful caring emerge as necessary recognition and a vital response to the “somewhere” we find ourselves. “[She] is the words; [she] is the music; [she] is the thing itself” (Woolf 1976, p. 46) and she must “write herself” (Cixous 1976, p. 875). I would like to think that if storyline were a person, she and I would be friends, swinging side by side in this educational playground we call research.

8.3 Critical Interdisciplinarity and Noticing Absences

Heather Greenhalgh-Spencer

This chapter explores the *hows* of doing research by bringing a critical lens from an outside field of research to bear on one's own field of research: Critical Interdisciplinary Studies in Education. In this research methodology, one draws on various studies, metaphors, and terms from one field in order to ask questions of, illuminate, or challenge some assumptions in another field. While most critical interdisciplinary research tends to bring together knowledge fields from the humanities—languages, race studies, gender studies, and so on—I use the methods of traditional critical interdisciplinary work in a somewhat unorthodox way by marshaling fields of knowledge from anatomy, kinesiology, sociology, soma-cognition, and other areas more associated with both social sciences and natural sciences, to illuminate what goes on in the traditional classroom space. Using critical interdisciplinarity as a research methodology—as with any research methodology—involves acts of interpretation. In order to excavate how interpretive moments shape the research process, I will draw on my research study “Re-thinking Bodies in the Traditional Classroom Space.”

This “rethinking bodies” study was intended to push the field into rethinking assumptions about embodiment in both online and bricks-and-mortar classrooms and to interpret embodiment and the meanings of embodiment in a new way. Specifically, the study was intended to create a moment where new questions could be raised. It is, if you will, an interpretation of absences—of what is NOT generally talked about. As I saw it (and sometimes still “see it”), there is a pervasive assumption that online education is less “embodied” because people do not sit in a room together. A binary exists where online education is set in opposition to bricks-and-mortar classrooms, and then this binary is further fleshed out through

speech acts (the writing within the field) that normalize the idea that online spaces are disembodied and bricks-and-mortar spaces are embodied, but not just embodied—bricks-and-mortar spaces are *produced* within the literature as places where, supposedly, this embodiment creates feelings of connection, liberation, and deep learning that cannot exist in online spaces. The point of my research study was to look more closely at these assumptions around embodiment; and this meant starting with a question: Are bricks-and-mortar classrooms creating spaces that are more laudable (than online spaces) because of how bodies are embodied within the space? In order to do this work, I juxtaposed knowledge sets from other fields—fields of sociology, technofeminism, kinesiology, soma-cognition, and haptics technology, among others—in order to question and challenge these assumptions about embodiment in classrooms that were playing out in my own field. I made my own classroom observations, in order to critically analyze what bodies were actually doing in the traditional classrooms space, but then I also drew on research studies from other fields to not only help me *see* what was going on in the traditional classroom but to help me make sense of, understand, and create an argument around the actual physicalities of bodies *as embodied* within the traditional classroom.

In this chapter, I will briefly talk about this research project on bodies, trying to key in on moments where acts of interpretation came to the fore during the research process. I will then highlight the *hows* of doing my research study by foregrounding the role of theory, the role of interdisciplinarity, and the role of background knowledges and experiences.

The Research Project

This research project, “Re-thinking Bodies in the Traditional Classroom,” was meant to challenge one of the more pervasive critiques of online education: that online education is a pale substitute for the traditional classroom experience *because* traditional education is embodied and online education is—somehow—disembodied. While this critique has lost some of its force in the last few years, it is one that I still hear at various conferences and see in the literature on education and teaching. It is an odd critique because it suggests that there are some places or times when people can literally be *without* their bodies.¹ As this is impossible, we can assume the critique is driving at the idea that having bodies together in the traditional classroom space creates a more humanizing learning environment. In the research project, I not only wanted to bring to the fore that this dichotomy between online and bricks-and-mortar classrooms was being *assumed*, but I also wanted to actively show the ways that students—and even teachers—are *actually* embodied in rather inhumane ways in the traditional classroom space. Critics of

¹ Even while using avatars in online world, or simply engaging in text conversations on a blog, we are still embodied. We are in our bodies, somewhere, even while we are interacting online.

online education tend to derogate the “absence” of bodies in a classroom while not attending to the ways that bodies are shaped by disciplinary regimes in real time and space in the traditional classroom. This research project was designed to make an embodied accounting—a phenomenological and soma-conscious accounting—of what happens to our bodies in the traditional bricks-and-mortar classroom spaces.

The paper examined the production of bodies in the material classroom by targeting four practices/objects of the traditional classroom: the gaze, the chair, the desk, and the ability to move and touch. While the project had its beginnings in a debate over online *versus* traditional schooling spaces, the bulk of the research project was directed to the bricks-and-mortar spaces. However, all of this research was in the context of attempting a critical examination of assumptions—interpretations of embodiment or disembodiment—that exist(ed) in the field of education, teaching, and learning.

The Debate

My first role as researcher was to critically analyze and dig into the debate about online spaces and bricks-and-mortar spaces. For this, I read deeply through the literature in the field of education, as well as other fields like computer science, technofeminism, and posthumanism, to get a sense of what was being said, expected, and left unsaid. In general, the literature reflected my own sense of the field: that both critics and advocates of online education were taking up online spaces in ways that assumed disembodiment. In the late 1980s, 1990s, and early 2000s, there were many claims that technology and the World Wide Web would revolutionize education and completely change the way we learned and taught. Barker² suggested that the Web would revolutionize the lack of resources experienced by most rural schools. Batey and Cowell³ proclaimed that the Web would provide greater access to information for all schools, thus closing the achievement gap. Chute, Brunning, and Hulick⁴ suggested that online learners did better on tests. Many critics came forward to push against these overblown claims, suggesting that online teaching was an exercise in dehumanization because bodies were never really *present*.

Notice the ways that the traditional classroom space is automatically assumed to be humanizing—because of the presence of bodies together—and the online space is positioned as bereft of bodies in the following quotes from critics of

online education. This *noticing* of some of the key assumptions within the field contextualizes my larger research project; it is within the context of a larger field who seemed to reject online education based on the assumption that it was disembodied that I came to both see and challenge assumptions about embodied learning within the traditional classroom space.

Anderson⁵ advocates the “importance of the body in establishing and maintaining human relations.” Because of the centrality of the body to learning, Anderson⁶ concludes that cyberspace and its so-called communities of learners are actually “detrimental to establishing intimate lasting human communities.” Says Anderson⁷: “virtual communities by comparison to real ones [are] abstract, diminished, fragile and tenuous relationships, easily broken precisely because they lack the concrete situatedness of embodied subjectivity and intersubjectivity.”

Dreyfus⁸ furthers this critique by claiming that online education is but an anemic simulation of the real, embodied, experience of the traditional classroom. Dreyfus suggests that the traditional classroom creates an atmosphere of learning precisely because it is an atmosphere where people take social risks, and make social commitments, by choosing to engage with each other in a conversation. Says Dreyfus⁹:

Only those willing to take risks go on to become experts. It follows that, since expertise can only be acquired through involved engagement with actual situations, the possibility of acquiring expertise is lost in the disengaged discussions and deracinated knowledge acquisition characteristic of the Net.

Dreyfus is sure that learning can only take place when bodies work in nearness to each other. There must be the potential for physical, engagement, for the touching of the world and each other. Dreyfus believes that this potential for nearness is impossible online. In fact, Dreyfus has a section in his book where he suggests that “real” learning can only take place where there is risk—a kind of physical risk where it is possible for one student to physically strike another. Again, reading these arguments about embodiment and education challenged me to think about what constitutes risk and question why there was an assumption that there is no risk in online education and that there is no physicality in online education and, in the case of Dreyfus’s argument, why there would be a need for potential physical violence in order to create an educative moment.

⁹ Dreyfus, H. “Anonymity versus commitment,” p. 374.

While I believe that bodies are important for learning, I was not sure that the traditional classroom space allowed for the use/performance/practice of our bodies in particularly laudatory ways. My research project attempted to make a phenomenological accounting of what bodies were actually doing in the classroom space in order to find out exactly *how* we are embodied in most classrooms. My research project targeted the ways our bodies interact with/are shaped by the gaze, the chair, the desk, and the ability to move and touch. I chose these artifacts or technologies of the classroom because they seemed—to me—to be a ubiquitous part of almost every classroom space. Also, as will be mentioned later, my background experience allowed me to notice the ways that bodies hunch over in their desks and chairs in ways that are not very healthy. I decided to do more work and delve deeper into what was physically going on as bodies come to learn in the traditional classrooms space.

The Gaze

In order to think through the ways that bodies exist in the traditional classroom space, I first delved into the literature in sociology on the ways that bodies are literally shaped through the expectations and practices that exist in society. I found Foucault's notions of technologies of the body and technologies of discipline to be extremely helpful in exploring the actual practices of the classroom space. I asked myself what goes on—perhaps unseen—to create the commonsense understanding of how one is supposed to behave in a classroom space. I tried to think through the ways that the technologies of the classroom work on bodies.

In *Discipline and Punish*, Foucault¹⁰ considers that technologies of discipline presuppose “a mechanism that coerces by means of observation; an apparatus in which the techniques that make it possible to see, induce effects of power.” This is to say that the power to train or discipline a body becomes most effective through the “exact observation” of that body.¹¹ Says Foucault:

The perfect disciplinary apparatus would make it possible for a single gaze to see everything constantly. A central point would be both the source of light illuminating everything, and a locus of convergence for everything that must be known; a perfect eye that nothing would escape and a centre towards which all gazes would be turned.¹²

This description of the perfect apparatus of power to discipline bodies sounds remarkably like the traditional classroom space.¹³ For, while it is true that online

¹⁰ Foucault, M. *Discipline and punish*. (New York: Vintage Books. 1977/1995, pp. 170–171).

¹¹ Foucault, *Discipline and Punish*.

¹² Foucault, *Discipline and Punish* p. 173.

¹³ In *Discipline and Punish*, there is a picture—one of several between pp. 169–170—in the book depicting a lecture given at a prison. Notice how remarkably similar this picture is to one of the traditional classroom.

classrooms also involve surveillance, there is also the embedded disruption of that surveillance because, embedded in the online modality, is the choice to be seen and heard or not. Not so in material spaces; where the body is always under the gaze.

In the material classroom, students desks are usually situated to always face the teacher. The students are positioned to view the teacher as the locus of knowledge. Even when the teacher moves around the room, the students will tend to follow the teacher with their eyes. The landscape of the classroom dictates a traditional power structure. For example, think about how often you can enter a classroom and tell where the “front” of the room is meant to be. While rooms may have several walls of chalkboards or learning stations, there is often a larger desk, a more central chair, the location of a movie projector, or some other object that locates *how* the classroom should be situated in order that the students may be fully observed and the teacher may be fully followed.

In the traditional classroom space, students’ bodies are meant to be fully visible. It is that very visibility that is supposed to act as a dissuasion from texting, tweeting, Facebooking, Snapchat, Instagram, talking out of turn, daydreaming, or doing any number of things other than focusing on the teacher. While it would be nice to say that this visibility makes it possible for people to read body language in order to better understand the students, often this “reading of body language” is done as a means of finding out who is paying attention and who is not. In other words, often, visibility functions as a disciplinary technique more than a technique of loving attunement to or dialogue with one’s fellows. This argument is made more obvious when we reflect on the high level of errors that occur in the act of reading body language. I know students who are very good at nodding their heads and appearing to pay attention and be engaged in class discussions, when in fact they are texting a friend or simply daydreaming. Often these bodily signs of “engagement” are more of a performance than an actual bodily outgrowth of an inner state of mind. We all think we can read body language well, and, as teachers, we count on it to guide the pacing of the class. But, as Judith Butler¹⁴ reminds us, bodies are a tenuous collocation of performance by a body and the reading of the body by an “audience” within specific socio-ideological and institutional contexts. While I have no doubt that teachers understand that bodies give cues, I also have no doubt that the presence of the teacher walking around and observing the bodies of the students creates a sort of force, a gravitational pull, towards creating a certain kind of performance in the classroom. In the traditional classroom, the body is made visible in order to have *power over*, rather than to empower, students.

My background experience guided me towards the belief that the gaze is not the only thing that shapes bodies in a classroom and that objects—material artifacts—within the traditional classroom also shape our bodies in specific ways. Thus, the research project then turned to exploring the ways that material artifacts shape and condition our bodies. My hunch, based on previous experience and my background knowledge in anatomy, was that the physical artifacts of the classroom were doing

¹⁴ Judith Butler *Gender Trouble* (New York: Routledge), 1999.

some damage to bodies. But I needed to do more research to consider what bodies were actually doing—how they were sitting and writing and how they were physically positioned—in order to find out how physical objects actually shape bodies and whether or not bodies were actually suffering physical drawbacks from the ways that the physical objects acted on the bodies.

Chairs

I first took up the material artifact of “chairs.” This involved doing both research of my own into how students use and sit in chairs, as well as aggregating and analyzing research from the fields of disability studies, fat studies, gender studies, and kinesiology in order to better understand how bodies are shaped by chairs—and how the classroom both presumes and creates particular kinds of embodiment. Research from these various fields show that chairs—specifically office or classroom chairs with a particular type of tilt or connected to desks—tend to damage bodies. Chairs function to discipline, normalize, and captivate the body—especially within a traditional classroom space.

Jonathan Crary¹⁵ posits that, since the nineteenth century, Western Modernity has insisted that “individuals define and shape themselves in terms of a capacity for ‘paying attention,’ that is, for a disengagement from a broader field of attraction, whether visual or auditory, for the sake of isolating or focusing on a reduced number of stimuli.” The ways in which we “accomplish certain productive, creative, or pedagogical tasks” links in to power, ideologies, and histories.¹⁶ Crary deliberately points to the schoolroom bench/chair as a technology that functions to create “a subject [who] is productive, manageable, and predictable.”¹⁷ The chair literally positions the body to look forward, remain still, and be accessible. The chair also teaches the body through habituation to stop noticing other signals or stimuli around the body.

Galen Cranz¹⁸ talks more about the ways the chair actively erases the perceptions of the body—erases the ability of the body to *feel* and know itself. Cranz argues “that years of sitting in chairs have contributed significantly to this problem [of kinesthetic awareness] because chair sitting distorts and reduces . . . perception of comfort”¹⁹ Cranz suggests that, in order to successfully sit in chairs, especially for long periods of time and on a regular basis, we must teach our bodies to ignore

¹⁵ Crary, J. *Suspensions of perception: Attention, spectacle, and modern culture*. (Boston, MA: MIT Press, 2000). p. 1.

¹⁶ Crary, *Suspensions of Perception*.

¹⁷ Crary, *Suspensions of Perception*. p. 4.

¹⁸ Cranz, G. “The Alexander Technique in the world of design: Posture and the common chair.” *Journal of Bodywork and Movement Therapies*. 4(2), (2000). pp. 90–98.

¹⁹ Cranz, “Alexander Technique” p. 93.

signals of pain and discomfort. We must teach ourselves to, literally, ignore the feelings and perceptions of the body. This bodily captivity—made possible through the chair—is justified by the societal expectation that chairs help us to “pay attention”: pay attention to our work, pay attention to those who are giving us knowledge, and pay attention to authority. The act of paying attention is discursively aligned with the act of sitting still, being quiet, tuning other things out, and focusing forward. This is problematic, says Cranz, because chairs *hurt*.

Cranz traces out exactly why and how chairs are harmful. She²⁰ critiques the types of chairs that are canted back, have no support, and are enclosing structures: chairs typically found in schooling spaces are specifically mentioned. These chairs tend to compact the head–neck jointure. “Any chair that puts people in a posture that distorts this joint upsets the equilibrium of the entire body.”²¹ If the head–neck joint is compacted, then the back slumps out, the shoulders round, and the body is thrown out of alignment. “The cervical vertebrae including the first cervical vertebrae extend forward, while the weight of the head comes back and down, rather than forward and up, in relation to the neck.”²² The problems of this off-kilter posture “include back ache, neck ache, problems with vocal production, eye strain, sciatica, shallow breathing.”²³ Often, chairs condition the body to slump back in the chair rather than sit with a tall spine. Chairs—specifically classroom and office chairs—cause “thoracic humping” where the neck and upper back must slump forward in order to counteract the backward canting of the chair. This move to bring the head forward causes such strain on the neck that, often, people will then move the upper chest forward in order to relieve strain on the neck. “This then collapses the ribcage over the abdominal region and exaggerates the curve in the mid-back.”²⁴ This will often lead to back injuries such as: glenohumeral tension, migration of the scapulae, cervical lordosis, brachial plexus compression, prolapsed discs, disc protrusion, spinal stenosis, and collapsed vertebrae. Repeated and prolonged tension on the vertebrae—produced from a slumped over or tucked under sitting position—often results in disc and vertebrae injury and neck and back pain.

My research found that, most often, bodies are not used to do some sort of kinesthetic performance that leads to a deeper understanding of truths—a deeper and more relevant learning. They are not used to find deeper levels of intimacy and relationality between students and teachers. Often, bodies *are used*—made to fit within a chair, forced to stay in that chair, and conditioned to ignore the perceptions of the body in order to more fully focus on the information delivered by the teacher. Desks can similarly be critiqued.

²² Cranz, “Alexander Technique.”

²³ Cranz, “Alexander Technique.”

²⁴ Cranz, “Alexander Technique” p. 95.

Desks

In order to explore the ways that desks shape bodies in the classroom, I once again conducted my own classroom observations and then also drew on the literature from disability studies and fat studies. These fields of research show that desks assume a certain type of embodiment to be normal. They also shape bodies into a particular pose—uncomfortable and injury causing for all bodies, but particularly painful for bodies that do not fit within societal norms of average height, small-ish weight, not pregnant, and “able-bodied.” Hetrick and Attig²⁵ write extensively about the myriad ways that “desks hurt us.” And while Hetrick and Attig focus their research on the ways that desks confine and shame the “fat body,” I have found that much of their work and observations extend to the ways desks work on *all* bodies. Regardless of body weight, desks are not “neutral and benign spaces; they are, rather, highly active material and discursive constructions that seek to both indoctrinate students’ bodies and minds into the middle-class values of restraint and discipline, and inscribe these messages onto the bodies that sit in them.”²⁶ The research from the fields of kinesiology and fat studies show that desks function to both physically shape the body and socially normalize particular types of bodies.

Bodies are made visible as abnormal the moment they overflow or move out of the space of the desk. Bodies are noticeably *out* the moment we feel too big, too tall, and too fidgety, to comfortably contain the body under or within the space that the desk prescribes. This is to say nothing of the ways that bodies with impairments, or even left-handed bodies, are pinpointed as “not normal” in the classroom space where desks assume mobile, small, and right-handed bodies. The desk makes bodies visible only through the matrix of ab/normalcy. In addition to directly fashioning the body as a docile, quiescent, mind/subject, desks *hurt* our bodies.

The desk/chair combination creates a space of “hard materials” and “punishing shapes.”²⁷ The wood, plastic, and metal of the desk precisely surrounds most of the student’s body. This makes moving from side to side, or even bending over to fetch something from a backpack, almost impossible. The desk is actually placed quite low vis-à-vis the chair, which causes people with long legs to have to round their back more fully in order to comfortably fit the legs under the desk. This rounding of the back can lead to the backaches and other problems listed in the section above. The placement of these desks also means that many people have to lean forward, slouch to the side, and, once again, round their backs, in order to rest their elbows on the desk. And the act of resting the elbows is

conditioned by the fact that the desk surrounds the body in such a way as to make it awkward to place the hands at the sides, in the lap, or anywhere other than on the desk. This further shapes the body into a hunched over position—leading to strain and compacting of the vertebra. Drawing on my own observations, my background in anatomy, and drawing on the research from kinesiology and fat studies, I was able to argue that school desks *produce* a painful posture in the body. But because we have become so habituated by these desks, we barely notice that our bodies are uncomfortable in them.

The desks and chairs of the classroom coerce, make visible, normalize, and physically shape the body of the student. Not only that, but the desks and chairs tend to forbid a very human aspect of flesh. Perhaps one of the more enjoyable and humanizing aspects of being together—in the same physical space—is the potentiality of moving together and of touching. These desks and chairs (incarnations of societal norms) inhibit moving and touching.

For me, this was one of the main arguments of the research project: that traditional classroom spaces that were envisioned as being these place where people learn together through the act of moving and touching in ways that create a more embodied learning experience are not at all the practice of the traditional classroom space. This was also an argument that I did not expect to make. Given my background, I expected that schoolroom desks and chairs were likely not the best things for our bodies and that the teachers gaze created more coercion and stricture than liberation. However, I was surprised by the research showing how much learning, especially learning on a deep level that challenges assumptions and that stays with us, is connected to movement and touch. I was also surprised by my own observations and aggregations of other studies showing that students rarely touched and moved in the traditional classroom space.

The Ability to Move and Touch

For this avenue of the research project, in addition to the literature from the fields of kinesiology and disability studies, I also drew from the fields of dance studies, anatomy, haptics technology, and soma-cognition. Drawing on these branches of research informed my own research but also offered a challenge as I became enmeshed in reading studies that drew on terms and metaphors—some of which were familiar to me as part of other background knowledge that I possess—but some of which were completely new. I had to judge whether or not I felt that I had understood the research from another field in order to use it to illuminate questions and assumptions—interpretations—in the field of education. I'll say more about this later in this chapter.

Dance theorists, soma-cognition theorists, and kinesiologists have all done multiple studies showing the connections between movement and learning.

Nunez and Freeman,²⁸ Clark,²⁹ Iverson and Thelen,³⁰ and especially Sheets-Johnstone³¹ have all written extensively on the importance of movement and touch to the acts of learning and cognition. In order to fully understand objects, and the self-object relationship, we must be able to move around said objects and touch them. Not only that, but as Sheets-Johnstone³² points out, the very act of moving strengthens our brain's ability to make connections between what we see, what we think, and how we reason. This is because, as we move, not only does our body take on a greater sense of awareness of the world (in order that we won't run into something or be harmed by something), but we are more likely to come into contact with (touch) other objects or subjects in the world. A body in motion *is* a body in learning.

Think of how often movement is limited within a traditional classroom space—not only by the actual objects of the classroom but by the teacher's eye—by societal norms. I have been in classrooms where the fidgeting of students is called out as being “disruptive”—all by a teacher's glance. How and why does the traditional material classroom space *signify* embodiment, if this classroom structure so rarely allows for the movement of the body? In fact, Nunez and Freeman³³ and Sheets-Johnstone³⁴ argue that students rarely move and touch in a traditional classroom to the disadvantage of the students. Bodies in the traditional classroom space are not only limited as to when and how they can move; they are also limited in their ability to touch.

Think about the proscriptions against touch in the classroom. Teachers tend to stay away from students' bodies—particularly in the context of secondary education—so as to avoid the appearance of sexual impropriety. There is an awareness of and the simultaneous disavowal of students as both sexual and physical beings. Students are also discouraged from touching other students. There are societal norms that prohibit and make shameful both sexual and violent touch in the classroom to the extent that *all* touch between students becomes suspect, ill-advised, and unexpected.

So often, the critics of online education argue that distance learning is inferior to the traditional classroom *because* it happens at a distance. There is no presence of bodies together. But then, what does this presence matter if those bodies—while together in this traditional space—are coerced, normalized, made visible, shaped,

injured, enclosed, and precluded from touching and moving? The traditional classroom can hardly be said to serve the body in any humanizing way. Hence, it seems curious that *the body*, and being embodied, is so often deployed as the reason we should venerate the traditional classroom space above the online classroom space. When advocates of the traditional classroom invoke *the body* as the reason why traditional classroom spaces are superior to virtual spaces, what kind of body is being invoked?

To conclude the research study, I then focused on some of the emerging affordances of online education and the ways that online spaces specifically value and intersect with embodiment. My point was not to position online education as the solution to or the superior version of traditional education. Online education has many problems of its own. However, I was trying to point out that online education offers some creative ways of getting around some of the strictures of the traditional classroom space. This “conclusion” of the study was meant to offer some results or suggestions, based on my research on embodiment, to guide practice—both online and in bricks-and-mortar classrooms—towards more consciously embodied learning.

Productive Possibilities

My research shows that it is important to reflect on, create an awareness around, and guide practice towards a more embodied sense of learning. In some ways, this is easier online. Online, I am free to get up, walk around, sit on the floor, sit on an exercise ball, sit on a chair made for my body, use a desk designed for my size and height, use a book, use my computer, shift position, fidget, and make faces—all of this without the strictures of the material classroom space. I have the choice, through the use of my webcam, to make myself visible to students and teachers or to choose to avoid being “seen.”

My research has guided my own practice and pedagogy in online classrooms as I now try to create activities where students go out into their communities and interact with the world. Students then take pictures or videos and then talk about their experiences touching and moving in their communities—and how that links into their learning and critical reflections on whatever topic we are discussing as a class.

Additionally, the absence of touching each other can more easily be pointed out—or observed as an absence—in online classroom spaces. This “absence” can become fodder for productive conversations about how bodies learn through movement and touch. This noting of the absence of touch with each other contextualizes our classroom practice of going out into our neighborhoods and communities. Students to go out into their neighborhoods, to move, to touch and interact with the environment—the ecosphere—around them. We then critically engage with the ways that space and materiality shape what we expect, what we learn, and how we learn it. Online spaces create the possibility for interaction across time and

distance—a different kind of moving and touching. But noticing the importance of movement and sensing—perception is vital and sometimes made easier to point out and take up when we meet together in online spaces.

This research project has also shaped my pedagogical practice in bricks-and-mortar classroom spaces. I now try and find ways for us—as a class—to engage in learning activities that require movement and an awareness of physicality. The bricks-and-mortar classroom space has been productive for me as I am then forced to think about how to create opportunities for movement but also accommodate students with motor impairment in the classroom. Those chances to think about movement *as* learning, and the ways that learning intersects with bodies, expectations, and disability or impairment, have been particularly productive for me as a teacher striving to deepen my own sense of embodiment in the classroom.

All of these changes I have made in my own pedagogical practice, and argued for in my work, are based on my own interpretation of my research findings. The research showing that chairs and desks tend to do harm has influenced me into trying to figure out how to subvert the expectation that chairs and desks are a necessary part of learning. The research showing that the teacher gaze exerts a certain amount of coercion and shaping of student bodies has guided me into drawing attention to the practice and asking students to help me figure out how to use digital technology in ways that subvert the gaze. This particular research project has channeled my desire to incorporate movement and touch—even across time and distance—into my classroom pedagogy.

This research project has educated me towards a questioning stance vis-à-vis bodies and technologies. I am guided to ask: What is inherent in the traditional classroom space, and what kinds of educational spaces are yet to be fully used? What is made possible, and what is made awkward or unlikely in these various spaces and through the use of various technologies? There needs to be a deeper understanding of what every modality brings to the table—and not on a rush to condemn or laud one modality above another.

My research study on bodies in the classroom specifically aimed at questioning and parsing out the nature of embodiment in the traditional classroom; it aimed to begin, continue, and enrich conversations about technology and embodiment. The study itself, as well as work that has branched out from this study, was shaped by interpretive moves at every stage of the process. I will now take some time to flesh out some of the ways that interpretation—specifically as it connects to interdisciplinarity—shaped (and shapes) my own research.

In *Beyond Good and Evil*, Nietzsche³⁵ argues that new types of researchers must emerge who are reflective of the shaping power and value of interpretation. Nietzsche argues that we must engage more deliberately and self-consciously in interpretation and notice the ways that interpretation is a practice that shapes our

³⁵ Friedrich Nietzsche, *Beyond Good and Evil (Jenseits von Gut und Böse)*, 1886), trans. Walter Kaufman (New York: Vintage, 1966).

understanding of truth and intelligibility and also that interpretation is in turn shaped by power, knowledge, and expectation. In alignment with that call for self-conscious interpretation, I will spend the rest of this chapter practicing a meta-reflection on what went into the research project described above. I want to show how I came to see and understand this research project, and I hope to show how my own interpretations influenced my understanding of the research. In order to do this, I will highlight three main themes that have emerged for me as I have reflected on the role of interpretation in my own research. The interpretations that researchers make and bring to their work—certainly the interpretations that I make and bring to my work—are influenced by: the theoretical lenses we use to view and question the world around us; the interdisciplinary sources we draw on to see things differently and ask new questions; and the role of our own background knowledges and experiences as a shaping power for interpretations and intelligibility. I begin by focusing on the role of theory.

The Role of Theory in Research

I see theory as a type of lens: different theories highlight or erase different things from our view. Like lenses for your camera or the different colors and finishes on sunglasses, different lenses allow us to see different colors, different levels of contrast, a wider angle of view, and a more focused or micro-oriented view; they show us the world in overlapping and yet also divergent ways. The field of education—especially in relation to the use of technology in education—tends to draw on a theoretical tradition rooted in a masculinist point of view. This theoretical lens creates a certain picture of what we do and who we are in relation to technology; it highlights certain relationships and erases others. Feminist theory, specifically technofeminist theory, tends to argue for a different view of technology, bodies, and the relationships between the two.

Many of both the critics and the advocates of online education have tended to draw on more masculinist theoretical lenses. Rene Descartes³⁶ proposed, in an extension of earlier Platonic³⁷ philosophy, that the mind is different from the body; that physical matter is different from thought or mental matter; and that it is the mental processes that get us closer to some sort of truth. Descartes rather lauds the idea of somehow being able to transcend the physicality of our bodies in order to get at some deeper level of truth or living and to get at the pure mind. Martin Heidegger³⁸

³⁶ Descartes, Rene. *The Philosophical Writings of Descartes*, 3 vols., trans. John Cottingham, Robert Stoothoff, Dugald Murdoch and Anthony Kenny, Cambridge: Cambridge University Press, 1984–1991.

³⁷ From *The Phaedo*.

³⁸ Martin Heidegger exhibits this distrust of technology—or at least a distrust in humanity’s ability to really see and understand technologies—in both *Being and Time* (New York: Harper Perennial Modern Classics), 2008, and *The Question Concerning Technology* (New York: Harper Perennial Modern Classics), 2013.

and Walter Benjamin³⁹ both argued for a view of the world where technology was set in contrast to a greater reality or a more humane understanding and living of life. Drawing on these notions—enabled by a theoretical lens that validates the idea that bodies are separate from minds and that technology separates us from living a fuller humane life—Hubert Dreyfus,⁴⁰ Sherry Turkle,⁴¹ and others argue for a sort of digital dualism, where not only should we contrast the virtual sphere with the material sphere, but we are guided, as readers of both Dreyfus and Turkle, to value the material world as always/already different from and better than the digital world. Perhaps Turkle and Dreyfus are aiming at offering a contrasting view to the also existing theory that the digital world is separate from and better than the material world. Megan Boler⁴² takes aim at this romantic view of the internet when she challenges the techno-optimists as represented in the old MCI telecommunications commercial: “There is no race. There is no gender. There are no infirmities. There are only minds.”⁴³ Into this space—where both pop culture and the dominant historical trajectory of research in the academy have divided and set as a binary the online space from the material or embodied space—it is easy to see how theory guides us into an argument about whether it is better to have the embodied experiences of the material classroom space *or* the disembodied experiences of the online space. This argument comes to the fore, rather than questions about the assumptions built into that argument: Are we disembodied when we go online? Do our embodied experiences cease to matter when we go online? Are the embodied experiences of the RL world so different from our experiences online? Are our embodied practices and interactions with each other really somehow more humane—more truly human—in the material space when compared and contrasted with the online space?

I believe that, for me, the questioning of the assumptions built into arguments that assume the disembodiment of online spaces began because of my background in technofeminist theory. This different theoretical lens assumes that not only are we always embodied but that our bodies are always shaping and shaped by our interactions with technology. Technology can be harmful or helpful, or somewhere in between, but it always has a relationship with bodies. Perhaps because of my background in science and technology and perhaps more because of my experiences of *awareness* of my gender within STEM fields—being a woman in a place that tends to be dominated by men—I have felt at home with technofeminism as a theoretical lens. Technofeminism is a theoretical space that combines the rigorousness of science with an attunement to the ways that gender, bodies, and

⁴³ The MCI ad can also be seen at <http://www.brillomag.net/NO3/erasism.htm>.

technologies tend to intersect. Technofeminism is productive in its ability to illuminate the ways that bodies shape and are shaped by technology. And it is through the lens of technofeminism that we are able to interpret online classroom spaces as always/already embodied; and it is this lens that allows us to more deeply question how bodies interact with technologies (of discipline, of desks, of chairs, etc.) of the classroom.

Technofeminist theorists like Elizabeth Grosz, Terri Kapsalis, Susan Squier, Iris Marion Young, Toril Moi, and many others, have argued that bodies shape—literally suggest the shape of—technologies (the way that a phone is designed to fit into a hand or an IUD is literally designed to fit into a body) and also that technologies can literally shape our bodies (the way that prostheses or corsets shape bodies). Donna Haraway—perhaps the “mother” of technofeminist theory—argues not only that there is a reciprocal interaction between bodies and technology but that these relationships are not always/already good or bad, more humane or less humane.

In *A Cyborg Manifesto*, Haraway⁴⁴ shows both the potential for harm and the potential for new more freeing possibilities as we imagine the further hybridity of bodies and technologies. Haraway foregrounds the coupling of bodies and technology in the service or war, violence, bioterrorism, and environmental devastation. Writes Haraway⁴⁵:

Modern production seems like a dream of cyborg colonization work, a dream that makes the nightmare of Taylorism seem idyllic. And modern war is a cyborg orgy, coded by C3I, command-control-communication-intelligence, an \$84 billion item in 1984s US defence budget. . . The silicon chip is a surface for writing; it is etched in molecular scales disturbed only by atomic noise, the ultimate interference for nuclear scores. Writing, power, and technology are old partners in Western stories of the origin of civilization, but miniaturization has changed our experience of mechanism. Miniaturization has turned out to be about power; small is not so much beautiful as pre-eminently dangerous, as in cruise missiles. . . Our best machines are made of sunshine; they are all light and clean because they are nothing but signals, electromagnetic waves, a section of a spectrum, and these machines are eminently portable, mobile—a matter of immense human pain in Detroit and Singapore.... The diseases evoked by these clean machines are ‘no more’ than the minuscule coding changes of an antigen in the immune system, ‘no more’ than the experience of stress.

But Haraway also signals the potential transgressive power toward liberation of the hybridity between bodies and technology. Haraway⁴⁶ writes:

So my cyborg myth is about transgressed boundaries, potent fusions, and dangerous possibilities which progressive people might explore as one part of needed political work. One of my premises is that most American socialists and feminists see deepened dualisms of mind and body, animal and machine, idealism and materialism in the social practices, symbolic formula-tions, and physical artefacts associated with ‘high technology’

⁴⁴ Donna Haraway “A Cyborg Manifesto” Retrieved on May 14, 2014, from: <http://www.egs.edu/faculty/donna-haraway/articles/donna-haraway-a-cyborg-manifesto/>.

⁴⁵ Ibid.

⁴⁶ Ibid.

and scientific culture. . . . Another of my premises is that the need for unity of people trying to resist world-wide intensification of domination has never been more acute. But a slightly perverse shift of perspective might better enable us to contest for meanings, as well as for other forms of power and pleasure in technologically mediated societies.

For Haraway, there is great liberatory possibility in the ability to see both the potential for calamity, oppression, and damage and the potential for unity and a politics of change. Haraway⁴⁷ argues:

From one perspective, a cyborg world is about the final imposition of a grid of control on the planet. . . . about the final appropriation of women's bodies in a masculinist orgy of war. . . . From another perspective, a cyborg world might be about lived social and bodily realities in which people are not afraid of their joint kinship with animals and machines, not afraid of permanently partial identities and contradictory standpoints. The political struggle is to see from both perspectives at once because each reveals both dominations and possibilities unimaginable from the other vantage point.

This double vision, the ability to see the ways that bodies interact with and become hybrid with technologies in both positive and negative ways, informs my own interrogation of the supposed divide of embodiment between online and bricks-and-mortar classrooms. It is the theoretical lens, offered by technofeminism, that helps me to notice the absences in much of the discourse in educational technology; this helps me to interrogate the assumption that the interaction of bodies and technologies is always/already, automatically and inherently, dehumanizing or liberating. It helps me to interpret our embodied relationships to technologies in ways that are new to the field of education.

To further this point, that we see things differently as we bring knowledges and practices from other spaces to bear on assumptions in our own field, I want to now explore the role of interdisciplinary knowledge in my own research project.

The Role of Interdisciplinarity

As mentioned in the description of the research project, the noticing and analysis of absences in my own field of research, the field of education, was made possible by bringing to bear outside lenses, outside knowledges and fields of research, in order to turn what is largely an assumption—that online education is disembodied and less humane education—into a critical question. For me, this interdisciplinary work involved gathering and analyzing research from fields that are close to my own, as well as fields that are not related—fields where there are whole different sets of terms, expectations, and metaphors for understanding. Critically engaging with the research from other fields not only necessitates some background knowledge that allows the researcher to delve into another field; it also requires a state of meta-reflection on the part of the researcher: you need to know when you

⁴⁷ Ibid.

know enough to really grasp the research from another field and also know when you lack enough knowledge to honestly engage the research from another field. You need to be able to see your own lacunae.

In order to trouble the assumption that we are embodied in liberatory and productive ways in the traditional classroom, I drew on research and literature from technofeminism, fat studies, sociology, disability studies, dance studies, kinesiology, soma-cognition, and haptics technology (the engineering field devoted to understanding how to create sensory experiences in virtual reality). The first few fields of research just mentioned have connections to the field of education, and this made reading the literature both familiar and disconcerting in a productive way—in the same way that seeing one's self in a slightly different light can be both startling but also familiar.

The fields of technofeminism, fat studies, sociology, disability studies, and to some degree dance studies, all have overlapping discourses, metaphors, terms, expectations, and goals as theories in education. Each of these fields, to one degree or another, acknowledges the theory of the social construction of embodiment. Whether the research one reads from these fields is for or against a social constructionist understanding, there is an acknowledgement of the work of Michel Foucault, Judith Butler, Eve Kosofsky Sedgwick, Robert McRuer, and other theorists who argue for an understanding of embodiment as a productive process—as a coinstantiation of social institutions, ideology, performance, and flesh. There is a Marxist backbone where we acknowledge that bodies are interpolated into the political economy and that ideology shapes what we see and how we see it, what we expect, and what we count as normal. Whether you agree with the terms or not—and whether or not you use the terms in precisely the same way—in all of these fields, there are echos of the idea of technologies of discipline, technologies of the self, performance and performativity, and the circulation of power throughout norms and social institutions. Throughout these fields, there is also a joint history of being influenced by phenomenology or the shaping power of material objects. Whether you draw on LeFebvre, Husserl, Merleau-Ponty, de Certeau, or one of the many sociologists and anthropologists who analyze examples of material culture, there is a common assumption that ideology, culture, and social systems intersect with physical objects and materiality.

Reflecting on the shaping power of material objects, and the intersections of culture, ideology, technologies of discipline, and tangible things, was important for me in my own research project as I was able to aggregate data on the ways that chairs and desks hurt our bodies and create an environment less conducive to deep and liberatory learning. Both Hetrick and Attig⁴⁸ from the field of fat studies and Robert McRuer⁴⁹ from the field of disability studies—or Crip Theory which is the comingling of disability studies and Queer Theory—foreground the ways that chairs, desks, and schooling spaces can work to produce some bodies as invisible and other bodies as hyper-visible; some bodies are produced, through the material

⁴⁸ Hetrick and Attig, "Sitting Pretty."

⁴⁹ Robert McRuer, *Crip Theory* (New York: New York University Press) 2006.

objects within the schooling spaces, as normal and others are produced as abnormal. This was key for me as I was questioning the power that schooling objects have to shape bodies, often in painful ways. My own reflections on the power of tangible objects to change what we see and how we move was furthered and complicated by the work of Christopher Tilley who is a landscape phenomenologist. His work gives examples of how physical objects like hills, fountains, benches, rivers, and handrails can change how people move, what they see and what they do not see, and how their bodies are exerted and shaped. It was Tilley's work—from a research discipline apart from my own—that really inspired me to think more deeply about the shaping power of things. But this work, like many of the works in disability studies, sociology, etc., draws on ideas, terms, and even authors that are common among multiple fields of discipline. Tilley's work is inspired by the writings of Merleau-Ponty and de Certeau. In my own studies, I became familiar with these authors and ideas, so picking up the vocabulary and ideas in Tilley's work was not a difficult project.

By contrast, my experience aggregating and exploring research studies from the fields of kinesiology, soma-cognition, and haptics technology required learning new sets of terms, new norms, and new metaphors and required assuming a stance where I had to be much more aware of whether or not I knew enough to be fair or just in the way I was analyzing and using for my own purposes research from other fields. Drawing on the literature from other fields in order to subvert a commonsense understanding in one's own field can be a tricky act of interpretation. Reading and understanding the writings of people from one's own field is an act of interpretation that draws on one's own area of study in order to make sense of what is being presented or argued. Reading and understanding the research from *another* field—especially one that does not have many overlapping points of commonality—not only involves a different set of background knowledges but also involves knowing when you do not have enough of a background to truly understand and use the arguments and evidence from another researcher's work. This proved true in my critical interdisciplinarity research project on bodies in the traditional classroom.

While I was researching what happens to bodies—literally how are bodies shaped and molded by desks and chairs—I read many research studies from the field of kinesiology. While there are increasing intersections between the fields of kinesiology, sociology, feminist studies, and other social fields where there is an understanding of social constructivism, the larger body of the field tends to focus on the science of bodies at rest or in motion. It is a field informed by medical science, and, in the case of many of the studies that I read to inform my own research project, there is a prevailing sense that a body can be seen as a sort of machine that can be tweaked, trained, and shaped into optimal performance. There were no references to Foucault or Butler, but there were many rigorous accounts of what happens to vertebrae, spinal fluid, knee joints, hip joints, trapezius, and scalene muscles, when bodies are kept in chairs—arching over desks—for long periods of time. In order to understand these research studies, you need to know where to find the ischial tuberosity and how the positioning of these bones affects the sacrum and the posterior superior iliac spine. You need to know how to read anatomical diagrams.

You also need a good-ish understanding of geometry in order to grasp how the angle at which one is seated vis-à-vis another object—like a desk or table—changes the arch of the back, neck, and pelvic areas. Borrowing research from the field of kinesiology was necessary for me to really understand and make an accounting of *how* we are embodied in the traditional classroom space and exactly what happens to our bones, muscles, and tendons as we sit in chairs and use our desks. It was also difficult work that required both some background knowledge of anatomy and also the humility or self-understanding to know when I was out of my depth.

This same need for background knowledge and a meta-reflective stance also proved necessary when engaging with research from the fields of soma-cognition and haptics technology. Soma-cognition is a field of research devoted to understanding how our body—and movement of our body—shapes cognitive processes. Haptics technology involves the study of how our sense of touch and other sensory input can be manipulated or stimulated in virtual environments or with digital technology. Both of these fields focus on how bodies use and make sense of external stimuli. Contra the field of education, where the focus is on outcomes and outcomes are assessed based on external performance (how many people passed a test, how many people graduated from secondary school, how many people moved on to university), in the fields of both soma-cognition and haptics technology, the focus is on what the brain is doing; the assessment is on internal processes. Much of the data presented was a showcase for what was happening in the brain. It was very normal to show brain scans as part of the “evidence” for a particular argument. For me, as a researcher immersed in social theory that troubles Cartesian dualism, reading papers where the brain—and what was happening in the brain—was standing in for and linking into what was happening in the body was an odd moment of synecdoche. My background as a social theorist created a moment where I was startled by the elisions between brain, mind, and body. As I was aggregating and analyzing these studies, my background knowledge in anatomy was helpful, but there were also moments where I could tell that I was understanding the basics of what was being said but that I lacked the background to make full sense of it. There were also moments where I was completely out of my depth. There were some studies from the field of soma-cognition that made it into my own research paper, but oftentimes these papers from soma-cognition or haptics technology acted as a guide for future search terms, or a link to yet another paper—one that I could make more sense of and use more intelligently.

Let me provide an example. While aggregating and exploring research on what happens to bodies during learning and movement, I read several papers—from the field of soma-cognition and neuroscience of movement—that used fMRI machines to show what happens to our brains while we are trying to learn in/through/using movement. I read papers like “Contributions of the Basal Ganglia and Functionally Related Brain Structures to Motor Learning”⁵⁰; “Patterns of Regional Brain

⁵⁰ Julien Doyona, Pierre Bellecc, Rhonda Amseld, Virginia Penhune, Oury Monchia, Julie Carriera, Stéphane Lehericyh, and Habib Benalia. “Contributions of the basal ganglia and functionally related brain structures to motor learning” in *Behavioral Brain Research*. 199 (1), 2009.

Activation Associated with Different Forms of Motor Learning⁵¹; and “Cognition in Action: Imaging Brain/Body Dynamics in Mobile Humans”⁵²—which was by far the most attuned to my own research project. These papers, and many like them, attempted to model how learning was happening, and what counts as learning, by creating brain scans using fMRI—or related—technologies in order to see where and how much of the brain is activated during specific tasks. While doing this research, it became clear to me that the term “movement” had a very different meaning than the one to which I was accustomed. As a researcher who thinks about movement and learning in many of the same ways as my colleagues in Kinesiology, imagine my surprise to find that the act of moving two fingers to press buttons was considered “movement” by many of these researchers. This made me not only rethink what counts as movement and learning, but it helped me to interrogate my ableist world view that assumes a body should be jumping up and down or doing something that could possibly result in breaking a sweat to be considered a body in motion, or a body that is moving. In some ways this definition of “movement” reframed the research of kinesiologists and some soma-cognitivists who specifically argue for getting students out of chairs and desks—get students standing up and walking around—in order to create the optimum environment for learning. Because there were more research papers arguing that the benefits of movement for learning required more than just moving one’s fingers, I chose not to interrogate what counted as “enough” movement within my research study. This was an interpretive move on my part, and it frames in a specific way what the research tells us about movement and learning.

Another example of this kind of disconnect that resulted in some difficult choices for the research project comes from the paper “Cognition in Action: Imaging Brain/Body Dynamics in Mobile Humans.”⁵³ This paper argues that fMRI scans, as they have traditionally been done, leave out many of the possibilities of seeing how brains react to active movement as opposed to small movements using only fine motor skills. This paper argues for a new type of imaging—mobile brain imaging method (MoBI)—that is specifically designed to develop brain images while humans are active, using gross motor skills. This paper challenged me to think about the validity of other research that relies on fMRI-produced brain scans or neural models in order to make the argument that learning is enhanced through movement. However, rather than bringing this into the more formalized research study, I decided that the efficacy of fMRI scans and modeling was a paper for another day—and probably not one that *I* should be writing.

There are moments of interpretation where what you are interpreting is your own knowledge base or lack thereof. You must decide when you—as the researcher—have grasped the research of another enough to do it justice and deal with it honestly in your own work; and you must also make the choice to put it aside if you do not know enough, yet, to take the research up in productive and faithful ways.

The ability to read and engage with research from other fields requires a wide array of background knowledges and experiences, as well as a sense for when you have enough background knowledge and when you do not. This leads me to the final theme of this chapter: the role of background knowledge and experience.

The Role of Background Knowledges and Experiences

Our background knowledges and experiences shape—not overdeterminedly, but still forcefully, shape—how we see the world, what strikes us as questionable, and what “feels right” for how one should exist and operate in the world. This sense of the world, produced through our accumulation of experiences and knowledge and information fields in which we operate and take part, shapes our research as well. Many researchers I’ve talked with express having a moment at the genesis of their own research where they looked at a known problem, a known solution, or just a commonplace practice in their own field and thought: that doesn’t make sense; that can’t be all of the story or there has to be more to it than that; or I think I could come up with a better solution than that. As I have furthered these discussions, most researchers that I know can trace this moment of discomfort with the way things are in the field—the productive discomfort that can lead to new research and new ideas—to a dissonance between their own background knowledge or experience and the commonsense understanding within the field. Emerging research shows that even our mother tongue can influence how we see the world and how we interpret the world around us. Guy Deutscher, a cultural linguistics researcher, argues that our mother tongue and the gender systems, or lack thereof, inherent in our mother tongue, shape how we see the world, what we expect from the world, and how we act and react to each other and material objects. Deutscher⁵⁴ argues:

The habits of mind that our culture has instilled in us from infancy shape our orientation to the world and our emotional responses to the objects we encounter, and their consequences probably go far beyond what has been experimentally demonstrated so far; they may also have a marked impact on our beliefs, values and ideologies. We may not know as yet how to measure these consequences directly or how to assess their contribution to cultural or political misunderstandings. But as a first step toward understanding one another, we can do better than pretending we all think the same.

⁵⁴ Guy Deutscher, from his book *Through the Language Glass: Why the World Looks Different in Other Languages*, Deutscher’s account of his book and this quote can be found at: http://www.nytimes.com/2010/08/29/magazine/29language-t.html?pagewanted=all&_r=0.

In my research project on bodies in the traditional classroom, my research question as well as my ability to use critical interdisciplinarity as a research method were influenced by my background knowledges and experiences. I will briefly talk about two that tended to come up over and over again.

At the heart of my discomfort with the assumption that online spaces are disembodied spaces is my own experience working, playing, and interacting online. As a student in primary school, I designed my first computer game. I have played online games and been part of online communities since Netscape. I remember when RPGs were MUDs and ran on CompuServe. I grew up with a father who worked at a company that designed computer chips and touch navigation. I have also taught university courses online for over 5 years. I mention this as a way to point to my background experiences as formative for how I see and experience technology in the classroom. I know that bodies viscerally feel and physically react to what they are experiencing in virtual environments. I have personal knowledge of that melded moment when what is happening to your avatar online creates a physical reaction in your body. Your hands sweat when you are involved in a battle online. Your head and shoulders move out of the way—as if you can move your physical body to avoid the blow to your online avatar. I know the feeling of depression and mourning you experience when your character—the one you have nurtured and leveled up through multiple challenges and fights—dies. I also know what it is like to teach online courses—synchronous courses—where I can hear my students’ babies crying or the neighborhood noises coming in from a student’s open window as they sit in their kitchen taking an online course. For me, it is hard to take seriously the notion that we are disembodied in online spaces because my background experience of online spaces is so linked in with the visceral physicality of bodies. It was my own background knowledge and experience that guided me to challenge the assumption of disembodiment and to do research into what our bodies are actually *doing* in both bricks-and-mortar classrooms (for this research project) and online classrooms (a different research project).

In addition to background knowledges and experiences with online spaces and digital interaction, I also have background knowledge and experience working with bodies. I started university as a premed student. And, while that major didn’t last, it allowed me to take anatomy classes that helped me later as I pursued certification to become a yoga teacher. I have now taught yoga for over a decade, and this practice has not only made me more attuned to how my own body moves and works but has forced me to notice how others’ bodies move and work. As a yoga teacher, it is my job to notice alignment and to see what the muscles and bones are doing as students move through or stay in various yoga poses (*asana*). For example, when students move into Warrior II (*Virabhadrasana II*), as the teacher, it is my job to make sure that the front knee is tracking over the foot, but not beyond the toes. If the knee goes over to one side or the other, or tracks too far forward, it is easy to do damage to the knees. So, in order to keep my students safe, I watch what bodies do. This background knowledge and experience not only helped me to read and understand the anatomical terms and images in the research studies from other fields; it also helped me notice, in the first instance, that bodies were not embodied

in humane and liberatory ways—certainly not in properly aligned ways—in the traditional classroom. The ability to see a problem where others saw nothing at all—to see bodies in pain or doing damage to themselves rather than “common-place” classroom sitting postures—was aided by my background knowledge and experience. What we have done and who we are (or were) in the past shapes what we see, what we question, and the types of research we do; we interpret the world through the lens of personal experience.

Concluding Thoughts

Interpretations and the incitement to interpret exist all throughout the research process. Whether we are conscious of our acts of interpretation or not, interpretation is woven into every question, every view of the world that causes questions to arise; it is woven into data sets and the determination of how to go about acquiring data sets; it is woven into how we interpret data or how we make sense of or make intelligible what we are seeing in the data; it is woven into how we write about our research projects. Interpretation is everywhere. For this research project, it was my own background knowledge and my personal experience that lead to questions about assumptions in the field; but it was the interpretation of what was considered normal in the field and my interpretation of the “reality” of online education—interpretation through the lens of personal experience—that allowed me to come up with questions about how we are embodied in classroom spaces and online spaces in the first instance. It was my interpretation—an interpretation, again, guided by background knowledge and previous experience with various interdisciplinary theories and studies—that channeled my interest in studying embodiment through a critical interdisciplinary method. Interpretation existed at every stage, during my observations of classrooms, and throughout my readings of various studies aggregated from multiple fields. My decisions, throughout the process, to focus on one question around embodiment rather than another question around embodiment was driven by my interpretation of what was meaningful. My interpretation of the research as well as my interpretation of how to create a written account of the research project guided what went into the final research paper. Interpretation, shaped by personal experience, background knowledges—including knowledges from other fields of research—and the expectations of one’s own field as well as one’s sense of what is “normal” for an academic paper, guides both the process of research and what, in the end, is produced.

8.4 Theorizing Relational Privacy: Embodied Perspectives to Support Ethical Professional Pedagogies

David C. Lundie

In almost all situations in which people must choose between privacy and just about any other good, they choose the other good. The list is long. . . People choose the options that offer convenience, speedy passage, financial savings, connectivity, and safety rather than those that offer privacy. (Nissenbaum 2010)

Mobile phone location-based services, ubiquitous surveillance, “dataveillance,” SOCMINT (SOCial Media INTelligence), and a range of innovations in communication technologies are rapidly changing the legal and folk definitions of what counts as private. Growing concerns over the gathering and sharing of data by government and corporate repositories of “Big Data” have led to calls for a digital charter to protect openness and individual freedom online (WebWeWant 2014). Revelations about government appropriation of private data (Gustin 2014) and private acquisition of government data (Ramesh 2013) have ramifications at the global diplomatic scale, with the “safe harbor” agreements which protect the free movement of data around the world being called into question (Article 29 Data Protection Working Party 2014). As accepted definitions of public and private are renegotiated, individual self-determination, democratic governance, and the legitimacy of government action are called into question.

Education is not exempt from this critique. The range of metrics used by learning analytics software to measure the private learning of the student include text highlighting (SparTagUs), comprehension questions (Zementis-ADAPA), and visual models (Cognos). Often, such software measures effectiveness in terms of the transfer of information, offering an attenuated view of the learner as subject and eliding under-determined spaces where personal exploration and interpretation can add meaning to learning. The extent of investment in educational technology research by Pearson, Google, AMD, News Corp, and others underscores the

imperative for a humanizing function to be found for educational technology. The theoretical interpretations offered in this chapter are aimed at developing effective ethical reflection on privacy and technology among a range of professionals engaged in work with private information. This includes reflection on the ethical discourse among software engineers responsible for designing privacy-aware systems (Schrader et al., [under review](#)), the use of Big Data for intelligence-led decision making by police and security services (Mulqueen 2014), and the need to develop critical awareness among schoolteachers around the pedagogical changes wrought by the technologies at their disposal. The paper begins with a critique of empirical studies of privacy, which report value without meaning, before developing an interpretive direction aimed at understanding the meaning of privacy to human subjects, and finally a pluralistic approach through which interpretive and empirical directions can mutually illuminate one another in future studies of privacy in practice.

Gilles Deleuze's brief but prescient *Postscript on the Societies of Control* highlights and elucidates a fundamental shift in, or rather away from, the relations of social control in recent decades. Deleuze argues that the information society operates by a new locus of control, decentering the enclosures of earlier disciplinary societies: factories, schools, and, archetypally, prisons (Deleuze 1992). While the societies of control functioned by enclosing bodies in a space, in the information age, the individual is divided among a constant plurality of controls which operate regardless of where the embodied person may be. While many of the critics of changes to perceptions of privacy have pointed to the dangers of a digital panopticon, evoking Bentham's disciplinary prison *par excellence* (Solove 1997; Wicker and Schrader 2011), Deleuze argues that a different force, *dividuation*—the dividing of the individual among the ceaseless entailments which make a claim upon their identity—has thrown into crisis the entire logic of enclosure by which social control operated in modernity:

The family, the school, the army, the factory are no longer the distinct analogical spaces that converge towards an owner – state or private power – but coded figures – deformable and transformable – of a single corporation that now has only stockholders. (Deleuze 1992, p. 6)

The work e-mail at 6 am, the educational podcast to listen to at the gym, the social network feed at the office desk, and the surveillance of map searches triangulated against speed camera data, all point to the dividuation of the subject. According to Deleuze, the human subject in the information age is constantly divided within his or her subjective identity. This concept of dividuation is taken still further by Baudrillard (2001) who sees the dividuated subject as laying bare the mere informational character of the self, infinitely reproducible and therefore without value. Baudrillard's somewhat fatalistic account of dividuation differs in important respects, however, from the theory expounded here, which addresses itself largely to applied approaches to the recognition and flourishing of the human person in informational exchange.

Privacy is not only a concern for users to negotiate, nor is regulation sufficient to secure the right to privacy. In a study of 45,091 internet interactions, Bakos et al. (2009) found that fewer than 2 in every 1,000 users even accessed the privacy

policies of websites before indicating their consent. Only around 3 % of users even read the privacy policies of their online banking provider (Harris Initiative 2001). Such findings are hardly surprising, with PayPal’s end user agreement more verbose than Hamlet (Jennings 2012), the opportunity cost in lost time if users actually read every end user license agreement before clicking “agree” has been estimated at around \$365 bn for the USA alone (McDonald and Cranor 2008). Notice-and-consent approaches to privacy, which place the onus on the user to negotiate the ethics of disclosure decisions in cyberspace, are doomed to failure due to lack of awareness and transparency (Carson 2014). The design of a system can intentionally compromise or bolster individual self-determination (Dodig-Crnkovic and Horniak 2006). Preexisting biases in systems design can replicate and even intensify inequalities in the material world (Friedman and Nissenbaum 1996).

If the threats to privacy of the first generations of the Internet are a concern, the much more radical challenges brought by Big Data and the Internet of Things require a response which cuts to the very theoretical core of the meaning of personal information. The growing interest in, and capacity for, the systematic acquisition and mining of fine-grained demographic data has applications in improving business performance and state and corporate intelligence and for other actors in online space. Big Data, a term coined to represent the exponential growth of information storage (by some measures, more data is generated every 2 days in the 2010s than in the whole of human history up until 2003 (Siegler 2010)), brings in its train a tangle of technological, socio-legal, economic, and moral questions. The Internet of Things, the networking of the ambient environment—sensors in energy meters communicating directly with the supplier, digital toys responding to crowdsourced data on the mood of the child, and dog collars “tweeting” data on your pet’s activities—is increasingly becoming normalized. As technology advances and is adopted at a rate that outpaces technological literacy, a sense of “enchantment” is fostered; the tendency to look upon such objects as magical (McEwen and Cassimally 2014) masks their status as manufactured and socially embedded. The technologies employed in these new developments are not value neutral and rely on assumptions regarding what counts as meaningful information, the origins of which are rarely exposed to scrutiny.

As the mixed results of the first generation of massive open online courses (MOOCs) illustrate, far from democratizing access to elite higher education, digitization appears to have further reinforced the advantages of those possessed of digital cultural capital. For information systems to be instruments of equality and democracy, every user must have equal control over his or her private information. Systems which replicate inequalities may further exacerbate and accumulate disparity, leading to “informational injustice,” disproportionate control over privacy decisions by one party over another (Van den Hoven 1997). Recent concerns about the civil rights implications of the potential use of mined metrics to create discriminatory hiring policies have prompted action at government level (Sullivan 2014).

Unforeseen biases may also emerge as the consequence of design algorithms as they interact with an evolving user culture. A search engine which displays the ten

most highly rated results on page one, for example, may exacerbate the discrepancy between result 10 and 11, granting one a level of exposure disproportionate to its utility. These unforeseen consequences of interface design can create threats to moral autonomy, cueing users to imitate unhealthy social practices, including the disclosure of private information. Significant changes have already occurred in the way subjects conceptualize privacy (Boyd and Marwick 2011), and it is widely acknowledged that legislative and regulatory frameworks are constitutively incapable of keeping pace with innovation in the technology/use nexus (Schrader and Lundie, [in progress](#)).

The concept of privacy encompasses such diverse concerns as “freedom of speech, freedom of religion, search and seizure, and marital rights” (Wicker and Schrader 2011), making a purely normative definition understandably elusive. Competing interdisciplinary definitions draw on disparate normative and disciplinary perspectives. These contestations are constitutive, representing the different foundational assumptions of diverse disciplines; privacy is variously conceptualized as individual right, legal guarantee, exchange value, or secure system. Faced with such contested definitions, theoretical explorations tend to fixate on legal and regulatory frameworks, despite the acknowledged limitations of such an approach. In order to render intelligible the concept of private information, it is necessary to explore the phenomenon of privacy as experienced by the subject. A small number of empirical studies (John et al. 2011; Loch and Conger 1996; Schrader et al. 2011) have sought to define privacy empirically, by drawing upon definitions given by participants under a range of conditions. The outcomes of such studies are often determined by the norms within cultures of practice and the design of interactions (Friedman and Nissenbaum 1996). The interdisciplinary approach undertaken by the Privacy-Aware Design Strategies project, to which I played a small part prior to the interpretive work here theorized, sought to bridge normative, empirical, and design aspects of the question of privacy (Schrader et al., [under review](#); Wicker and Schrader 2011).

The anthropology of privacy which I have derived from reflections upon this approach recognizes that the experience of information as private is intersubjectively constructed between human actors and information interfaces. This interpretive approach furnishes future empirical work with an important sense of the “inscape”: the way subjects understand and experience meaning in the complex decisions they make about their private information, with varying degrees of awareness, every day.

This chapter reports the process of interpretive reframing as I transitioned from empirical work with quantitative and ordinal data on privacy decision making (Schrader and Lundie 2012) to a normative consideration of private information in the context of the philosophy of computing and information (Lundie 2014). Crosscutting a reflection on my involvement in the experimental study, I introduce interpretive and normative reflections drawing on the work of Deleuze and Marion, positing a normative model for the relational understanding of privacy. Exploring important absences and dichotomies which run through the experimental paradigm, I highlight a transition from value to meaning as experienced by the subject.

By conceptualizing the human experience of privacy relationally, the empirical paradigm is problematized. In taking cognizance of this important interpretive dimension, empirical researchers can develop more anthropologically truthful instruments for future work.

Educating Privacy Professionals

The aggregation, mining, and strategic use of the vast reserves of data openly available on the internet, dubbed “Big Data,” has become a source of great knowledge and power as well as a cause of significant controversy and concern among government and industry bodies alike. Educating software engineers to create a more ethically aware discourse was a key aim of the work carried out by the Cornell team (Schrader et al., [under review](#)). Working with the security analytics sector, the UK Intelligence Futures Group at Liverpool Hope University has been developing CPD events and courses which draw upon interdisciplinary studies in media, ethics, information science, and security studies to explore the complex implications of the big data revolution for a range of security professions. Recognizing that this change signifies the end of neatly separated disciplines and forms a new scientific field, this course explores new methodologies, tools, and normative resources which are required to navigate the practical, policy, and ethical complexities of big data, not ignoring the normative, interpretive, and critical perspectives. The courses are aimed at a range of professionals whose roles increasingly require the management of complex data sets, designed to grow as the field grows, to provide plural perspectives on privacy and information as these issues are encountered by police in their day-to-day experience.

By making use of methodological resources appropriate to their professional context, our students have been encouraged to develop solutions which recognize the limitations of traditional disciplinary responses, as well as the embodied expertise of professionals in the field. To give just one example, out of the many data sets handled by analysts, headline data reports may be generated to disseminate to neighborhood patrol teams. Matters as simple as the choice of graphical visualizations can foreground and conceal key aspects of data, subtly biasing pedagogy and practice. Two approaches may be compared and contrasted—a statistical analysis driven by performance targets could enable officers, through multivariate analyses such as principal component analysis, to identify areas likely to be subject to burglaries and vandalism. Such approaches, however, rely on correlation without consideration of agency—externalities from this data-driven approach could include neighborhood police focusing on “knowable” crimes to the detriment of other events or innocent parties being targeted due to incidental correlations. The interpretive approach, on the other hand, drawing upon the practical wisdom and ways of knowing among neighborhood policing teams, makes use of reflections from officers, in the light of critical incidents, to identify headline data which they believe would be of benefit. While this approach is less

likely to skew policing practice, it risks leaving out information the officer is unaware exists. The aim of UKIFG is to develop a pluralistic community of inquiry to discuss, compare, and contrast practical, professional working practices with regard to data privacy and intelligence, drawing on practical ways of knowing, Big Data, and interpretive perspectives from the humanities and social sciences, bridging the divide between data-driven and values-driven approaches.

Economics and the Limits of Experimentation

The optimality of privacy-aware design for economists depends on the tradeable value of privacy—if its value is ambiguous, individuals may take decisions based on “herding” effects, disclosing private information because others are doing so, rather than based on rational behaviors (Acquisti et al. 2009). Where decision processes are based on familiar stimuli, judgment processes may be implicit, not subject to rational consideration; users click “agree” without even thinking. Given the importance of understanding the effects of prerational decision making, the Cornell Privacy experiment drew upon the behavioral economics paradigm. Unlike the standard economic model, which presumes that humans are rational agents acting to maximize their own utility, behavioral economics recognizes that risk, endowment, and affect can have a profound effect on subjects’ valuations of exchange (Kahneman and Tversky 1979). Behavioral economists refer to this as System 1/System 2 thinking: System 1 is associated with affect, intuition, and diffuse attention, while System 2 with logic, focused attention, and explicit cognition (Kahneman 2011). Put simply, people are naturally risk averse, more willing to accept payment than to pay, and more willing to go with their instincts unless their attention is focused on rational decision making. Particular emotional factors, such as fear and stigma, can exacerbate this irrationality (Schulze and Wansink 2012). Given the difficulties in defining privacy enumerated above, behavioral economics experiments are designed to uncover the degree to which participants have a stable, rational sense of the value of their privacy.

A dominant model of moral development theory in contemporary social psychology is derived from the work of Lawrence Kohlberg. Grounded in Piagetian cognitive psychology, Kohlberg addresses the relationship between moral judgment and moral action, proposing a staged model of moral reasoning. In the highest, “post-conventional” stage of moral reasoning, Kohlberg assumes a universality and in his original formulation a universal conception of shared values, but in later revisions a universality in the forms of moral reasoning (Blum 1990). While Blum categorizes Kohlberg’s work as giving primacy to dialogic approaches in arriving at post-conventional reasoning, Sullivan (1977) points to a liberal bias in Kohlberg’s methodology. Sullivan’s critique in particular highlights the contextual limitations of Kohlberg’s work to late industrial modernity. The theoretical reflections in this chapter, and in particular the notion of divided identity, call into question whether the norms of late industrial modernity continue to hold in cyberspace.

A number of experiment studies have been carried out, making use of this or similar paradigms to understand the phenomenon of privacy. John et al. (2011) carried out a web-based survey on New York Times website users. Participants who were able to disclose information covertly were 1.48 times more likely to disclose sensitive information than when asked intrusively to disclose. A distraction study among female shoppers found that there is a significant endowment effect—people accept the privacy conditions of the first product they are given, rather than swap it for something which preserves their privacy (Acquisti et al. 2011). A “herding” effect has also been identified, in which participants who receive information indicating that others have disclosed sensitive information are more likely to disclose information themselves (John et al. 2009). Many of these economics studies seem to point to the importance of the givenness of context over the value of the private information as a commodity.

Some peculiar features of experiment conditions must be addressed, which problematize this methodology. The disembodied nature of the interaction design, which appears to mimic the paradigm of sharing private information over social networks, may be compromised by the reality of situating subjects in close proximity to one another. Subjects may be swayed by the appearance, the “gaze” or embodied reality of the other in the lab environment, representing a departure from the lived experience of online privacy disclosure as disembodied. The lab experiment paradigm is one of enclosure, with participants isolated and focused upon the task in hand, whereas the reality of online privacy decisions is that of dividuation, barely conscious acceptance of the externalities associated with giving away private information in exchange for some other task at hand—access to information, making social connections, and convenient purchases.

In contrast to this model, which assumes subjects to be isolated individuals concerned with maximizing utility, the interpretive framework I propose draws upon the intersubjective dimension of privacy. Privacy disclosure decisions are experienced fundamentally as social and interpersonal choices, and critical phenomenology seeks an interpretive clarity by understanding the individual in terms of the social constructions and identities he or she makes use of. Phenomenology seeks to effect a projection of oneself into the other (Trondman 2008). Moving beyond attempts to map the conversation on privacy (Schraeder et al., *under review*), the language of privacy is examined with regard to meaning, rather than motivation. “[W]ithout entering the issue of individual motivations for such behaviours. . . the notion of preference is not individually but collectively defined” (Duranti 1997, p. 263). Collective representations are essential to the experience of privacy, as is acknowledged even in the economic literature around the effects of herding, cueing, and status quo bias. To understand privacy decisions as occurring in a dividuated rather than an embodied environment requires a recognition that the *place*, the context in which privacy decisions matter, is both essential and ambiguous. As already noted, people make very different decisions about their privacy based on the biases designed into human–computer interactions. *Place*, in this sense, denotes

more than physical location; it is bound up with *voice*, agency, and autonomy. It is the position “from which one may speak to important issues... without being challenged about identity or the right to engage in dialogue” (Gerhart 2003).

The Act of Abduction

A single note, buried in some of my exploratory and descriptive numbers marks the interpretive turn in this investigation:

Perhaps there is something about foregrounding what others ‘know’, rather than whether they/you ‘care’, which has an impact [on valuation decisions], but this cannot be measured with any accuracy with this instrument.

The “know”/“care” dichotomy, which was suggested in one of the questions in Schrader et al.’s debriefing survey, and its enigmatic bifurcation of the decision categories we had anticipated set off a journey into further layers of interpretation which would lead me to diverge from the broad empirical direction of the ongoing Cornell project, as I left to pursue a career in the philosophy of education.

The relationship between the earlier empirical methods, which draw upon behavioral economics (Kahneman and Tversky 1979), moral development theory (Colby and Kohlberg 1987) (Haidt 2001), and phenomenology (Marion 1998), is one of niche complementarity, a model drawn from ecology, wherein the robustness of the conceptual ecosystem

increases with diversity because no monoculture is as productive as some combination of two species, and no combination of N species is as productive as some combinations of $N+1$ species. (Tilman et al. 2001, p. 843 cited (Kassam 2010))

The concept of niche complementarity when applied to pluralistic interpretations in the social sciences suggests that the addition of overlapping interpretive perspectives entails a more robust conceptual model. In the case of the privacy study, the interpretive approaches discussed in this chapter are intended to inform more sensitive empirical instruments and illuminate spaces of absence in findings drawing on the economics experiment paradigm, e.g. (Acquisti et al. 2009), rather than to essentially undermine or problematize. This positive pluralism cannot proceed without active commitment to the meaningfulness of plural perspectives on all sides. Two interpretive reframings took place: The first involved the gathering of intersecting empirical perspectives and is the intellectual property of the investigators at the Privacy Ethics project in progress at Cornell University. Only the second is described here. This second reframing involves a normative leap, interrogating spaces which intersect and bifurcate the foundational assumptions of the research instruments. Reading beyond the data, this second reframing enables the development of a model which can be retroactively applied as an explanatory framework upon the data. This normative leap proceeds by means of what CS Peirce (1903) terms “abduction”:

That process in which the mind goes over all the facts of the case, absorbs them, digests them, sleeps over them, assimilates them, dreams of them, and finally is

prompted to deliver them in a form, which, if it adds something to them, does so only because the addition serves to render intelligible what without it, is unintelligible. In the act of abduction as described here, data, art, theory, and metaphor all played an important role.

Data

One enigmatic but unfinished hypothesis, interpretively derived from the earlier experiment data, functions as the jumping-off point for this act of interpretive induction:

Subjects overwhelmingly describe this valuation in interpersonal terms (foregrounding the other), they are divided on whether this is about what someone else ‘knows’ or whether they ‘care’

This finding seems to open up a space of absence in the underlying method, if not the methodological paradigm. These are draft conclusions and likely to remain in draft. Analyses of the data are currently being carried out by the Cornell team, with continuing economics experiments and various manipulations. The act of “abduction” by which interpretive approaches were incorporated to these findings underwent a number of iterations. Designed into the experiment methods, an initial approach to the apparent intersubjectivity of privacy focused on the problem of contextual integrity: when making decisions about private information, the anticipated scope and audience of disclosure is an important factor. As information becomes infinitely reproducible, the open-ended scope of disclosure makes this form of reasoning problematic. If subjects make decisions to reveal private information based on the audience, this will prove problematic in the case of social media, where audiences are invisible, and information can be infinitely replicated and searched (Boyd 2007). Based on this conception of networked intersubjectivity, a subsequent approach I attempted in theorizing privacy focused upon an honor ethic (Appiah 2011), understanding ethical change in terms of densely networked cultures of social norms, changing not through argument but through shared mimesis of praise and blame. The honor ethic did not appear to account for this distinction in the data and required a departure from empirical findings into interpretive explorations in order to be tested.

Art

Pick a work on which to base your own. This original you will henceforth know as ‘the cadaver’ . . .

Of course we by no means insist on derivation from photorealist work. We do, however, demand that you pick for your provocation a painting in which representation outweighs abstraction.

Stand before your cadaver. Tap your temnic intuition. . .

Temno-: to slice.

Extend a conceptual slice through your chosen scene. It may continue into the picture at any angle on any axis, so long as it intersects both the left and right vertical edges of the hanged cadaver. . .

Your task is to depict a cross-section of your cadaver. (Miéville 2014)

Besides presenting an intersecting critique and reframing of the experiment findings, the normative reflections below draw upon insight from the creative arts, recognizing the limitations of existing form and method in representing the complexity of privacy in the new relational interactions which exist in an information age. Given that conventional legislative and regulatory approaches seem constitutively incapable of responding to the pace and nature of socio-technical innovation and given the seeming incompatibility of such approaches with the intersubjective reframing attempted above, opportunities to influence policy and practice through theoretical research may be attenuated by too abstract an analysis. Collaborative work with the Foundation for Art and Creative Technology (FACT) and the Creativity Research Adaptive Roadmap (CRE-AM) observatory project enabled alternative presentations of the personalistic and intersubjective core of this work. Moving from denotation to inspiration, Liverpool-based artist Laurence Payot's project <http://1inamillionyou.com> creates a virtual tribal identity, at once masking the subject and expressing shared identity through a tattoo-like mask, spread through social networks; the project elicits video, images, and text exploring subjects' self-concept and experience of the masked identity. China Miéville's commissioned writing *Science Fiction: New Death* explores the concept of relationality in virtual space by imagining a subjective turn in death and dying. The temnic nature of this interpretive research, crosscutting empirical studies of the same, is designed to highlight a "conceptual slice," not to present a conclusive account in itself, but to illuminate dimensions of the privacy debate conceptually inaccessible to positivist research:

It is not the end of the physical body that should worry us. Rather, our concern must be to live while we're alive – to release our inner selves from the spiritual death that comes with living behind a façade designed to conform to external definitions of who and what we are – Elisabeth Kubler Ross. (Freehand Connects 2014)

Theory

The singular note above regarding the question of knowing or caring about private information opened a doorway into the study of Heidegger's phenomenology of being, as interpreted by two different traditions of scholarship. Is privacy enframed as object or as property? Two contrasting definitions presented themselves. In an analysis of Heidegger's metaphysics of objects, Harman theorizes referentiality—the phenomenon is a tool with reference to an object (Harman 2002)—while the personalist philosopher Zahavi theorizes indexicality: the phenomenon is a

property with reference to a subject (Zahavi 1999). In both cases, the directionality of considerations of private information seems to be important. If private information is referential, subjects ought to report their considerations with reference towards some other person, or some other end. If it is indexical, subjects ought to foreground the information being “mine” in contrast to some other person or end. It was not the design intent of the experiment method to gather such data, and so this theoretical insight remains only a staging post on route to an interpretive framework.

Metaphor

The concept of enchantment is advanced by a number of theorists as a metaphor for technological design. Heralded by some as an opportunity to push imaginative boundaries and free humanity from passion and necessity (Bailey 2005), for others the concept of enchantment alludes to the return of premodern superstitious ways of being (Taylor 2007). As metaphor, enchantment speaks both to the ways technology can lead us down a rabbit hole into a world that both explores what we are and distances us from embodied reality; its explanatory force is in dividuating, not elucidating, the entailments of the information age. So far, the magic of most information solutions is of a more mundane kind than that found in myth and fairy tale, but enchantment can denote the sense that personalities are permeated by forces beyond their scope, whether granting invisibility and invincibility or simply navigating a less congested commute.

In previous work, I used the notion of the seer to critique false ideas of transcendence in the curriculum (Lundie 2011). Unlike prophets or oracles, seers are not possessed of unmediated access to a metaphysical realm, but involved in a process of meaning making that includes exposing culturally excised and concealed realms. In the postmodern satire *The Seer* (Smith 2006), the playwright Ali Smith uses the device of her antagonist’s awareness of the stage and the audience to destabilize an otherwise closed culture—the encroachment of the audience on the scene establishes the seer as at once distinct from, and part of, the insider group, a fellow character yet also a doorkeeper. Smith draws here on the tradition of Scottish seers, such as the Brahan Seer, who claimed a power to

foretel of happy marriages, good children, what kind of life men shall live, and in what condition they shall die. . . [yet this] seems a thing troublesome and uneasy to them to have it, and such as they would fain be rid of. (Anonymous 1775)

The idea of foresight guides much of the analysis of privacy, at once something dismal in that it disenchants the wonder of the technological world but also necessary if we are not to throw away important aspects of reality, such as the long developed distinction between public and private in liberal democracies, in the name of illusory enchantments.

Theorizing Privacy

A more fruitful direction for my own work presented itself in the idea of “propriety.” Reflecting upon Sullivan’s critique of dominant theories in moral psychology as limited to late modernity, a key feature of late modernity appeared to be that of “propriety.” While preindustrial publics had limitations on surveillance by necessity—through relations of deference, personal authority, benefit of clergy, and the technical limitations of the age—in the societies of control (Deleuze 1992) of industrial modernity, polities limit their own surveillance by choice. The exemplary instantiation of state propriety, limitation of the public knowledge/power by choice, is found in the Fourth Amendment of the United States Constitution, around which much subsequent Anglophone privacy law has been built. Spousal privilege, by which spouses cannot be compelled to testify, is another such formal instance, and a range of informal arrangements of propriety characterize much nineteenth- and twentieth-century legal practice. Drawing upon the work of Giorgio Agamben (1998), the concept of propriety was theorized as belonging to the “bios” the political life of the citizen—propriety is given as gift, a legal fiction, to be recognized even to the detriment of justice, and may be distinguished from an earlier, embodied concept of privacy, derived from a sphere of “zoē,” bare life, anterior to social interpellation.

This distinction further draws attention to the nature of privacy as belonging to an aspect of the person not theorized by modernity. Agamben’s distinction between *auctoritas* and *potestas*, with *potestas* denoting a totalitarian power of life and death, distinct from governance (Agamben 2011) prompted reflection on the origins of the discourse on privacy. Reflecting on the embodied origins of privacy in the *zoē*, the bare life of the person, prior to governance, it is possible to bring in a deeper level of normative reflection than is common in much of the information ethics literature. The relation between the private and the “privy,” and their origins in embodied *potestas*, personal power, are illustrated by the most intimate of medieval monarchs’ courtiers—the “Groom of the King’s Close Stool” who alone had access to the royal body at its most “private” of moments. Far from a menial service, such intimacy connoted power and prestige, deriving from the physical body of the king.

An inversion of such embodied modes of the private occurs with the shift in emphasis from embodied *potestas* to *auctoritas*, public governance by written statute, with the embodied sovereign elided. This shift to “authorship,” with its concomitant relation “auctor,” “autenim”—authenticity (Donovan et al. 2008)—brings us closer to the disembodied concept of “privacy” with which the experiment was initially concerned. The privacy of the “privy,” attaching to the embodiment of the person, gives way to the privacy of the thought; privacy becomes the privacy of the ear, not of the body; trust is to be negotiated through written statute. As the private person becomes increasingly disembodied and dividualized, the conception of privacy advanced by digital scholarship distances itself from this embodied origin.

Building on previous scholarship on embodiment and agency (Lundie 2009), this line of investigation tends towards a definition of the “privus,” that construct of

identity which is “set apart” to participate in public life. The negotiation of such an identity proceeds by way of two processes—as a “gift” of the public sphere, choosing to limit itself by its own authority (propriety), what the other is deemed to **know**, and as an act of concealing/revealing on the part of the subject, what the subject **cares** to reveal. Further exploration of the notion of privacy as gift led to the final interpretive framework, that of “indexicality”: that human subjects (unlike computer systems) value their *own* information incommensurably with information *simpliciter*.

An information-theoretic account of knowledge dominates the philosophy of computing, including the field of information ethics. This account can be defined as “K knows that s is F = K’s belief that s is F is caused (or causally sustained) by the information that s is F” (Dretske 1982). While this account is highly satisfactory in the design of information communication systems, the argument that an informational causal chain is sufficient to account for human subjective knowledge fails in an important regard. Beyond that attenuated privus, the self-authored person, open to collective representations, there is an embodied individual subject, a particular *isness* of the self. This *isness* or indexicality, though situated in a network of cultural and technological representations, transactions, and interactions, retains an irreducible interior complexity.

The work of Jean-Luc Marion on givenness and the subject is of particular significance in refuting the information-theoretic account as it relates to subjective, “private” information. For Marion, I may know that I am, but not what it is that I am; the inference from existence to essence is not valid. Because the subject remains always insufficient to its own informational truth value, the subject is always incapable of fully appropriating itself. The human call–response includes an intersubjectivity not found in TCP/IP protocols; the *I* cannot authenticate itself without remainder (Marion 2003).

In contradistinction to the causal authentication proposed by the information-theoretic account, which underpinned the notion of private information as a “packet” of information, bearing stable value in itself, Marion draws attention to “responsibility” as characteristic of the human call–response. Responsibility is not caused but given, a function of

‘Mineness’ – the characteristic according to which I am at issue, in person and without any possible substitution – . . . a claim imposes a choice on me; or better; that a claim poses *me* as the *there* where one might recognize oneself. . . In short, the claim does not destroy the irreducible identity-with-self by diminishing any *I* in me, but inversely, underscores and provokes it. (Marion 1998, p. 201)

A causal chain of information is insufficient to such an approach but is also, importantly, unnecessary because responsibility according to this account consists of a response not reducible to authentication and therefore to information.

While Husserl did indeed use the analogy of photographic plates to describe the phenomenon, Marion describes responsibility in terms of gaze or witness; this is not a causal claim, akin to downloading a .jpeg image, but rather the responsible agent’s gaze necessarily involves affect. Data is not necessary for the phenomenon because

there is nothing *behind* the phenomenon from which to form a causal chain, nor is data sufficient for the phenomenon, because data cannot cause the affect, the gaze of the responsible subject. Marion proposes three criteria for the givenness of the phenomenon which by definition render it incompatible with an informational account of knowledge:

1. Intrinsic – givenness involves a bracketing out of the giver, there is no recourse to a cause
2. Irrevocable – the given is not reproducible or repeatable [one may say it is in-dividual]
3. Radical – no gap exists between the givenness of a phenomenon and the phenomenon itself (Marion 2002a)

Consequently, as I have argued elsewhere (Lundie, [under review](#)) human responsible subjectivity is not reducible to repeatable, communicable, or causally sustained data. Therefore the data of human subjectivity cannot be regarded as meaningful or well formed according to the information-theoretic account of knowledge. Put simply, human persons value *their* information incommensurably with information *simpliciter*. Human information is always encountered as given, or as gift, and the giver and receiver engage on a level other than transmission or transaction.

From Theory to Practice

In the information society, as theorized above, the dividuated subject is at risk of being alienated from the private realm in a way that cuts much more deeply than the revelation of sensitive secrets. In the information age, transmission of information and production are coterminous, and this points to a paradigm shift for education. For the programmable information agent, nothing is gained by work which was not already inherent in programming:

Because the [information] technology operates at the traditionally human level of control in enabling the achievement of any and all objectives, we cannot expect to discover or design new requirements for control that only people can fulfil. (Spencer 1996, p. 73)

The formerly human element of control alienated, human education as education for control of means no longer furnishes a sufficient account of the purposes of education for the information age. An indexical understanding of the human subject requires an education which is open to the irreducible, an education which recognizes an element incompatible with even the most fine-grained of metrics. Indexical pedagogies, particularly in online learning, require an understanding of private information as relational, an understanding that human agents do not only learn in order to know, but in order to become:

Autonomous individuals do not spring full-blown from the womb. We must learn to process information and to draw our own conclusions about the world around us. . . ‘Autonomy’ constitutes an essential independence of critical faculty and an imperviousness to influence.

But to the extent that information shapes behavior, autonomy is radically contingent upon environment and circumstance. The only tenable solution – if ‘autonomy’ is not to degenerate into the simple stimulus-response behavior sought by direct marketers – is to underdetermine environment. (Cohen 2000, p. 1400)

By grounding the autonomous subject in the givenness of their phenomenal experience, and not in information transfer, it is possible to imagine a learning technology which respects the private subject as a learner. Examples of the use of such values in the design of educational technologies are still thin on the ground; one example of note is the Conservation Bridge project, a dialogical learning project which enables children learning about conservation in American schools to connect with scientists working in China’s Yangtse gorges, as well as with children living in the region, fostering a pedagogy of authentic encounter (Conservation Bridge 2013).

Returning to the development of ethically informed, digitally literate professionals, the intersubjective approach to privacy informs the work of the British Intelligence Futures Group, which was established as a national support unit to enable UK intelligence to sense, seize, and exploit the opportunities of Big Data. Bringing together police, academics, industry, and creative and artistic interests, the overriding objective is to reduce risk and harm to communities, recognizing that the over-collection and inappropriate use of information damage trust and legitimacy. In practice, this means the creation of spaces for dialogue where police analysts are able to consider the subjective dimension of how mined data will be used in practice by officers in a range of roles, drawing positively on the skillful means and practical wisdom of officers in their communities.

Further development of experimental methods which respect this interpretive perspective is possible. Reflective accounts which take into account the complex intrapersonal dimensions of private information, whether this is constructed as a commodity of the divided self, or as a gift, part of the givenness of the self. Far from a rejection of empirical methods, it is my contention that these reflective and critical perspectives can illuminate interdisciplinary spaces in the discourse, leading to further refinements. These refinements include both a methodological pluralism within academic studies of privacy and a pedagogical pluralism which recognizes that the irreducibly human element of practical wisdom has a contribution to make, no matter how data driven our professional practices may become. Such phenomenal reflections may contribute to the design basis of future privacy-preserving regulations, systems, and learning environments.

Acknowledgments The experiment data described in this chapter is based on experiments designed and conducted by Dawn Schrader, William Schulze, and Jubo Yan at Cornell University, funded by NSF Grant #1016203 to Stephen Wicker and Dawn Schrader (co-PIs), making use of the LEEDR Lab at Cornell University’s Dyson School. The author wishes to acknowledge the work of Dawn Schrader, William Schulze, and Jubo Yan in the design and analysis of the experiment and of Dawn Schrader, Jon Tse, Dipayan Ghosh, and Tony Liao in carrying out bibliometric analysis reported in this chapter.

The British Intelligence Futures Group is funded by the National College of Policing, in collaboration with the Association of Chief Police Officers. The professional education

opportunities described in this chapter have been undertaken at the Centre for Applied Research in Security Innovation, Liverpool Hope University. The author wishes to acknowledge the work of Michael Mulqueen, Anno Bunnik, Bryce Evans, and Anthony Cawley at Liverpool Hope University, Julian Richards at Buckingham University, and Andrej Zwitter and Joost Herman at the University of Groningen in developing the agenda of the International Network Observatory described in this chapter. The author also wishes to acknowledge the work of Roger McKinley and the artists involved in the *Science Fiction: New Death* exhibition and the CRe-AM project, funded by EU-FP7 grant #612451, to Lampros Stergioulas (PI).

8.5 Interpreting the International and Intranational “Translation” of Educational Policy and Practice: A Case of Opportunism, Serendipity, and *Bricolage*

David Bridges, Kairat Kurakbayev, and Assel Kambatyrova

The Research Project in Context

This chapter reflects on a piece of research carried out during 2012 and 2013 on “school reform and internationalization” in Kazakhstan. The research grew out of a partnership between the University of Cambridge Faculty of Education and the newly established Graduate School of Education of Nazarbayev University in Kazakhstan’s capital, Astana.¹ The university was and is being grown through international partnerships between the schools within the university and selected international institutions. The Cambridge Faculty of Education advised on appointments, course development and administrative process, admissions, and even the organization and equipping of teaching spaces. It was also tasked to help build research capacity, which we did through a few workshops, but we decided at an early stage that the best way to do this was through a thorough collaboration involving NU staff in every stage of the development and conduct of research from initial planning to conference presentations and publication.

This paper was written by and in the authorial voice of the first named author, David Bridges, but since it draws heavily on material from the collaborative venture which was the original paper on which it is based and other discussions, all three original authors are acknowledged here.

¹The partnership also included the University of Pennsylvania Graduate School of Education whose research focus is on higher education.

Some papers arising from this collaboration have been or will be published in national or international journals, but we were also successful with a proposal for a book under the title *Educational Reform and Internationalisation: The Case of Kazakhstan* which will be published by Cambridge University Press (Bridges 2014a). One of the chapters in this book was the result of a collaboration between myself and Kairat Kurakbayev and Assel Kambatyrova, two early career researchers from Nazarbayev University Graduate School of Education.

The membership of the research team fluctuated a little over the 2 years, but the core group consisted of six staff of the Faculty of Education, three to six staff of Nazarbayev University, and, for fieldwork in 2013, three staff from a sister organization of the university, Nazarbayev Intellectual Schools. Eight of the team could speak Russian, six Kazakh, and one Ukrainian. The research was funded through the University by the Ministry of Education and Science of Kazakhstan.

In 2012 most of the Cambridge team were new to Kazakhstan, and we conducted a scoping study informed primarily by document research and interviews with key players around the central organs of educational administration. We wanted to understand something of the policy context, to identify the sources of policy (in national and international terms) and what our colleague Olena Fimyar called “policy rationalities” (Fimyar 2010). In 2013 we decided to look at the system from, as it were, the other end of the reform process and through the eyes and experience of teachers and school directors who had to implement the reform and (to some extent) those in the local administrative system and in-service training institutions who were part of the process of “transmitting” or “translating” messages from the center to the periphery.

To this end, we divided into three teams and went to locations in three very different parts of Kazakhstan: to Shymkent in the south, deep in the heartland of Kazakh people, to Pavlodar in the north (mainly Russian, but with, in one locality we visited, a significant Ukrainian population), and to Aktau in the west on the Caspian Sea. We focused in each location on two schools, one urban and one small rural school, as well as the administrative and training organizations that were the vehicles for translating national policy to them. Our aim was to produce rough hewn case studies (case data with only a light thread of linking commentary) of the schools in the context of educational reform in their localities. These would then be available to all members of the research team for cross-site analysis leading to the production of thematic analytic papers grounded in the case material.

In advance of two periods of fieldwork in Kazakhstan, we agreed among ourselves on the central research questions which we would seek to address through the research. The overarching question was:

How do mainstream schools in Kazakhstan perceive and understand the aspirations, expectations, and requirements of the contemporary educational reform in Kazakhstan—and how are they responding to these?

But we also asked, among other things:

What issues were identified in translating educational policy and practice from international to national contexts and from the center to the periphery in Kazakhstan?

What was the role of school directors in the reform process?

How do the requirements for reform impact on teachers' professional identity?

Each team agreed to collect data which would help members of all teams to address the research questions which most interested them. The data were in the form of documents, photographic evidence, transcripts of semi-structured individual and group interviews with people at all levels in the school and local system, and questionnaires administered to both teachers and students. With this substantial data set to hand (coded using NVivo software), we could then interrogate the material and write about the issues that interested us. For Kairat, Assel, and myself, our particular interest was in a nest of issues around the notion of the translation of educational policy and practice, and this was the focus of the paper that I shall discuss here.

These, then, are the bare bones of an account of what we did. In the context of this handbook, however, I should reflect a little on what lay behind this approach.

Reflecting on the Project Plan

I should acknowledge, perhaps, that I am a researcher with a rather long history in education and, worse perhaps, one that I have an increasing tendency to revisit. In this case, when wondering how we might best begin to understand what “educational reform” might mean if you were situated somewhere on the edge of Kazakhstan’s vast geographical spread (the country is the size of western Europe with a populations just over 16 million), I drew, in particular, on the model of the first empirically based project in which I participated between 1979 and 1981, the Cambridge Accountability Project, directed by John Elliott. This project looked at six “self-accounting” schools in the East of England and their relationships with parents and other local stakeholders. Eighteen months of fieldwork (for all but one of the team in one school) was issued in six case studies, which we were then all able to use as a basis for cross-site analytic papers (published in Elliott et al. 1981). This always seemed to me a very effective way to combine depth of study with a sufficient range of examples to stimulate comparison and on some issues to develop cross-site analyses and generalizations—grounded theory perhaps—that were at least not contradicted by these cases.

My own interest in case study as a vehicle for educational inquiry was sustained through a range of other research initiatives, for some of which the “case” became individual people, i.e., it morphed into life histories and biography I had quite recently written a defense of case study approaches (Bridges 2011) and had found myself railing against attempts to restrict the research that might inform policy to large-scale populations studies and randomized controlled trials (Bridges 2008; Bridges et al. 2009). I was drawn back via the edited collection of essays by Isaiah Berlin published under the title *The Proper Study of Mankind* (Berlin 1997) to Giacometto Vico, the eighteenth-century Italian philosopher, and *La Scienza Nuova*, the post-Enlightenment reaffirmation of the role of *fantasia* and the humanities in informing our understanding of human action (Bridges 2012; Vico 1725/2002).

All this juggled with more pragmatic considerations about how we outsiders might even begin to understand Kazakhstan education if we did not engage over time with schools and their communities, how to satisfy the genuine research interests of a large and diverse team, and, in the light of our mission to “build capacity,” how to give colleagues from Kazakhstan a variety of research experience. Personal history and pragmatism thus combined to produce a fairly loosely defined methodology that gave scope for different members of the research team to give emphasis to their own interests and approaches in what I hope was a spirit of mutual support and collaboration.

The Research Paper

The focus of the paper that Kairat Kurakbayev, Assel Kambatyrova, and I wrote out of this work was on the international and intranational “translation” of educational policy and practice. More especially we were intrigued by what happens as these policies and practices moved across national boundaries—invoking the discourses of “policy borrowing” (Phillips and Ochs 2004), “policy transfer,” and “policy traveling” (Silova 2005) and the “internationalization” and “globalization” of educational policy (see, e.g., Sayed 2006, p. 12; Giddens 1990, p. 64) and of “international socialization” (Sayed 2006)—and then what happens within the country when policies and practices are “translated,” “transmitted,” “rolled out,” “cascaded,” and “mainstreamed” from the center to the periphery. It is generally recognized that, as Robert Cowen put it with admirable succinctness, “when it moves it morphs” (Cowen 2009)—but how are we to interpret, understand, or respond to this morphology?

The language and literature tend to divide at this point. At one extreme, the response draws on a rhetoric of criminality with references to “subversion,” “hijacking” (Silova 2005), and “brand-name piracy” (Steiner-Khamsi and Stolpe 2006, p. 2 ff). Many are tempted, as we were, to write of what is “lost in translation,” but something more positive is indicated perhaps by those who write of the “indigenization”—as, for example, in the country which is the focus of their major study, “Mongolization” (Steiner-Khamsi and Stolpe 2006, p. 2 ff). For my part, as I worked on the paper and read the evidence from the case studies, I became increasingly convinced, first, that reframing and reinterpretation of policy and practice messages were inevitable in the process of translation and, secondly (and more interestingly perhaps), that, conceived of in terms that might be borrowed from work on linguistic and literary translation, the co-construction of meaning from the original source, the creative interpretation of meaning, and the realization or discovery of new meaning in the literary, policy, or practice “text” could be viewed as something very positive, something to be engendered rather than feared. To return to our cliché, meaning could be found as well as lost in translation. This then pointed to the engagement of stakeholders at all levels in the system in critically examining and creatively interpreting and developing policy and practice—something of which we found a number of examples in our school-based studies.

In the context of this handbook, I should perhaps pause to note one or two features of the writing process I have described. I wrote in the previous paragraph that “as I worked on the paper and read the evidence from the case studies, I became increasingly convinced. . .” Some models of academic writing seem to suppose that the author has a clear idea of the “results” of their research or the conclusions to which they point before they start writing their “research report.” In such cases, the inquiry, the research, is seen as something independent of the writing or the report. For me, by contrast, the writing is emphatically part of the inquiry, the research. In general I do not know when I start writing what I shall conclude or where I shall end, and on more than one occasion, I have been rather surprised to find where my argument has taken me. (I do not as I write this know where this paper will end up either, though of course there will come a point of rereading and revision when I shall know the destination and perhaps lay clearer markers as to how I get there.) My own practice is to take in as much of the “evidence” and the “literature” as I can, then set it aside for some time, and then construct a narrative or, in my more philosophical mode, an argument, and an interpretive pathway through the sources and data. Only when I have completed a first draft do I go back to the sources for confirmation, for contradiction, and for illustration and example. But the interpretation comes through the writing process itself: the writing is an attempt to make sense of and to convey to others what I have read, seen, or heard.

Except that the writing starts before I put pen to paper (so to speak). The writing begins in conversation (Bridges 2014b): accidental conversations over lunch in the university cafeteria, in the pub, on the staircase, trying out ideas, making connections, rehearsing what I might be beginning to want to say. In the case of this paper, a conversation with Lynne Parmenter, Associate Dean, Nazarbayev University Graduate School of Education, in the cafeteria at Nazarbayev University in Astana helped to open up for me the literature on literary translation, which turned out to be one of the most fruitful sources for our conceptualization of policy and practice translation. But before coming to this, let me provide a more sequential account of our search (more accurately, feeling around) for ways of making sense of interpreting “translation.”

Interpreting “Translation” in the Context of Educational Policy Transfer

None of the authors brought to this writing project any grandiose or very systematic theoretical framework. Our paper was, rather, something of a theoretical *bricolage*, with images, metaphors, and theories snatched from some rather different sources in the hope that they might help to illuminate, describe, and explain. I will here refer to just five of these.

From Flow Diagram to the Silk Road

At an early stage, we tried to produce a flow diagram showing pathways through the educational system that policies and practices traveled in the process of international and intranational translation. This was helpful insofar as it became immediately obvious how many stages there were in the process of translation and how many points at which someone was involved in selecting and interpreting the message to be passed on. We noted that “In the UK there is a children’s game, known as ‘Chinese whispers’ in which a message is whispered from one person to another round a room. The fun is in comparing the message that is announced at the end of this process with the original – to which it rarely bears any resemblance.”

But the flow diagram was all too tidy, and we then realized that Kazakhstan’s own historical position on what has been since the nineteenth century known as the “Seidenstrasse,”² the Silk Road, provided a more accurate picture of its complexity and diverse pathways:

The term is a misnomer: the Silk Road was not really a road at all – it was vast network of land-based and maritime trade routes, and the merchants who used it carried far, far more than silk... Along with trade goods came new ideas – religions, medical knowledge, scientific and technological innovations passed in both directions and the Silk Road became a complex network of veins and arteries, carrying the lifeblood of nations across the then known world. (Tucker 2011, p. 1)

In the paper, we wrote:

The Silk Road had not one starting point nor one destination but several. Nor did goods necessarily travel all the way from one end to another: rather they were traded at different points, carried on through a kind of relay, sometimes worked on and processed to add value and thus transformed as they were transported. This, rather than the flowchart, is a richer, more complex and more accurate picture of the process of the translation of educational policies and practices.

Piaget Revisited: Towards a Cognitive Model of Translation

It is 50 years ago since I was introduced to Piagetian cognitive psychology on my teacher training course, but the notions of accommodation and assimilation were clearly well embedded in my consciousness (even if I had to go back to the source to check which was which), and they resurfaced when I was thinking about some of the difficulties encountered for individual learners and for social groups in coming to terms with, especially, radical new ideas. Both processes, or so it seemed to me, are usefully understood as learning processes and might usefully be illuminated by learning theory. In the paper we explained:

²So named in 1877 by the German geographer Baron Ferdinand von Richthofen, great uncle of the Red Baron (Tucker 2011).

Piaget (1978) points, then, to two sides of the coin of the absorption of new ideas or practices. On one side the ideas themselves get re-shaped in order for the receiver to be able to accommodate them to their existing conceptual apparatus. In the extreme case, where they are too far removed from what the subject can make sense of, they may simply be totally rejected. On the other side, the understanding, the thinking, the conceptual apparatus of the learner gets changed to a greater or lesser degree in order to accommodate the new ideas. Either way a new balance or ‘equilibrium’ is struck between previously held beliefs and the new ways of thinking.

This perspective also forewarns us of the need to prepare people for the reception of the new ideas. A Kazakh colleague herself, while studying in Cambridge, had become enthused by the notion of classroom action research. On one of her visits back to Kazakhstan, she had held a workshop in which she had tried to explain this practice to colleagues from schools in Kazakhstan. She came back despondent: “They just don’t get it” she said, so we started to talk about why they might not “get it” and began to identify a whole series ideas and practices that needed to be in place before anyone could really make much sense of action research:

It presupposes perhaps a different concept of small scale applied research from those that teachers are mainly familiar with; it pre-supposes a higher level of self actualisation and professional autonomy than teachers in a country like Kazakhstan may be accustomed to; it pre-supposes (in most of its forms) a professional collaborative culture which may be non-existent in schools in which teachers are encouraged to compete with each other for credit for innovative practice.

As with individual learners, so also with social communities. The “indigenization” of educational policies and practices is from this perspective essentially part of this process of assimilation. Understanding these processes through the lens of even this very basic learning theory helps us to normalize the changes that take place in translation rather than seeing these as an aberration but also to see how one can structure individual and social learning so as to achieve, perhaps, a learning outcome which has a reasonable proximity to what is sought.

Deconstructing the Indigenous

The notion of “indigenization” itself was, however, not straightforward in a country for which its position on some of the main arteries of the Silk Road, nomadic past, and its multilingual, multiethnic, and multicultural population are powerful components of contemporary political rhetoric and cultural identity. We quote in our paper one senior government officer, who explained:

We are Kazakhs, nomads, and many cultures crossed our steppes. Even during the USSR, Kazakhstan became a refuge for many repressed nations. Many nations found a second motherland – Germans, Koreans, Chechens, Turks and various Caucasus nations. We have more than 137 nationalities and we have rich experience in tolerance and multiculturalism. [Respondent A MOES]

To a significant extent, the contemporary educational reform agenda is (rightly or wrongly) about moving away from Kazakhstan's Soviet/Russian past, though the respect for Russian culture is deeply embedded even in its iconic Kazakh scholars like the nineteenth-century poet and philosopher Abai:

One should learn to read and write Russian. The Russian language is a key to spiritual riches and knowledge, the arts and many other treasures. If we wish to avoid the vices of the Russians while adopting their achievements, we should learn their language and study their scholarship and science, for it was by learning foreign tongues and assimilating world culture that the Russians have become what they are. Russian opens our eyes to the world. By studying the language and culture of other nations, a person becomes their equal and will not need to make humble requests. (Abai 2005: Word 25, pp. 124–5)

So is “indigenization” about embedding internationally sourced policies and practices in the Russian/Soviet tradition... or in contemporary conceptions of Kazakh culture ... or...? In a country that is trying to hold these and many other traditions together in the interests of national harmony and cohesion, the answer is not a simple one. In a sense what is perceived as and can be presented as *international* “best practice” provides a safe haven from these issues of internal identity.

Positionality and Perspective

As I have already indicated, over the first 2 years of this research, we consciously changed position in relation to the reform process. In the first year, we tried to understand what was going on through the accounts provided in official policy documents and through interviews with people who saw themselves as driving change from the center. Theirs was in a sense a rhetoric of aspiration and intention. In 2013, we deliberately set out to find out how things looked from the periphery. We asked, if you are working on a day-to-day basis in a school, what does the education reform agenda mean to you? And through what channels is it communicated? I suppose that we should not have been surprised that many of the answers were very uncertain.

When we asked teachers and headteachers what were the main features of the government's educational reform program, they were often at a loss to answer, and when they did answer, they tended to come up with two fairly tangible responses: the introduction of computers and the twelfth year of schooling. We very rarely encountered any reference to, for example, shifts in pedagogy. It is not so much that schools are resistant to its demands or to change in general: they were greedy for knowledge of how things were done elsewhere. But, in a sense, for those whose daily lives are wrapped up in a school and the demands of its children, the school *is* the center.

We had at first understood that we were dealing with a very strong “center to periphery” model of change, but it became rapidly obvious, first, that the center itself (in the form of the ministry and its agencies) was seriously uncoordinated and following disparate paths but also that the “center” itself was not, like the rainbow, always somewhere else, but rather:

The ‘centre’ seems sometimes to be wherever you are situated. Officials locate it in the Ministry, the Oblast or the Rayon, but the Vice Director of a local ORLEU was also able to claim ‘We are the centre of all educational reforms’. It does not stop there: one deputy head explained: ‘time has shown that we have already anticipated all the reforms that later have come from education authorities’ (Deputy Head 2, School F). And finally, and perhaps most compellingly: ‘Everything depends on the teacher. . . Speaking frankly . . . everything depends on the teacher’. (Biography teacher School F)

There were other issues of positionality and interpretative perspective that we did not fully explore but can nevertheless offer some observations—and these were to do with the positionality not of research participants but of the research team. The Cambridge team included two post doc researchers, Olena Fimyar, who was originally from the Ukraine, and Natallia Yakavets from Belarus. Both commented in their own writing on the way they were perceived both as insiders (“You as a former Soviet person, you should remember this . . .” (Interviewee A, NIS)) and outsiders, since they did not come from Kazakhstan.

We relied heavily on our Kazakhstan colleagues for translation, especially where we needed Kazakh, and being mainly young and female, they struggled to get acknowledgement as *bona fide* researchers rather than as interpreters. Being mainly city dwellers themselves, they came to some of the country schools with some of the unfamiliarity of outsiders. One of the men in this team, Kairat Kurakbayev writes about his own position on an insider–outsider “pendulum”:

I have perceived my role as an insider because I have been generally familiar with school settings in Kazakhstan and have even worked in some of the schools in our case-based research. I have considered myself to be an outsider because I have been away for so long from complex realities of the schools in Kazakhstan and now come to visit those rural schools from Astana. This distance prompted me to question my experience of having been a school teacher and “to make the familiar strange”. (Stenhouse 1975)

Doing collaborative educational research with international researchers has also been a great stimulus for not taking everything for granted. For example, if you, as a child, have grown up in a school where every classroom has one and the same layout, you would have learned to expect them to be that way. But for international co-researchers the universal conformity to this organization was, in the words of one colleague “mind-blowing”. “Making the familiar strange” often requires the assistance of someone unfamiliar with our own world who can look at our taken-for-granted experiences through, precisely, the eye of a stranger.

My own struggle, perhaps, was judging when to accept gratefully and when to try to discard in the interests of inquiry and authenticity the status that the combination of age, gray hair, and Cambridge University bestowed on me among these deeply respectful and hospitable communities.

My point here is that participants in the research selected in different ways for this rather diverse research team what they wanted us to hear according to their perception of us; and we inevitably selected too from the experience that the research provided what we were interested in seeing and hearing, explicitly according to the research questions that guided our individual and collective inquiry but also less self-consciously according to who we were and our relationship with the research field.

Understanding Policy Translation Through the Lens of Literary Translation Theory

Where do the ideas come from that enter our analysis and interpretation of educational research? On doctoral programs, students are taught to immerse themselves in “the literature” (but which literature—perhaps they should be reading the Norse sagas?) and then from this to select a theoretical framing for their research. Perhaps our paper would have been more scholarly if I or we had adopted this approach, though in fact all of us brought to the research a familiarity with at least some relevant “literature(s).” But for me at least the story is rather one of serendipity, opportunism, and *bricolage*.

One of the ways of thinking about our narratives about the translation of educational policy and practice that seemed to me most illuminating was looking at it through the lens of literary translation theory. Perhaps this is a fairly obvious move, but in practice I arrived at this place via a long and winding path. It starts in the early 1960s with me sitting outside Basel cathedral with a Swiss friend watching a performance in German of Schlegel’s translation³ of Shakespeare’s *Hamlet*. Even with my limited German, the poetry of the translation was eloquent, powerful, and moving. My friend explained that in German literary circles, Schlegel’s translation was regarded as an outstanding work of literature in its own right. This idea of a translation that brings something rich and new to an existing work intrigued me then and lay at the back of my mind (as you may see) to the present. The idea was reinforced some 30 years later when I was teaching at the University of East Anglia in Norwich. UEA was the first university in the UK to establish a degree-level course in creative writing, and for a number of years, it ran a conference on literary translation. I never entered beyond the edges of this event, but it reminded me that translation was a literary art in its own right—and that it had an accompanying literature. These serendipitous events from my personal biography resurfaced when I sat looking at what we were writing and found the notion of translation and the evidence of the reconstruction of meaning in front of me. Surely there might be something in literary theory that would illuminate this phenomenon.

At this point, my conversations with Kairat and Assel about this approach led to their having a conversation with a recently appointed colleague at Nazarbayev University, Lynne Parmenter, who, as it turned out, was familiar with some of this literature. She provided us with a selection of material, including, most interestingly Walter Benjamin’s (as I now know) celebrated *L’essai sur la traduction*.

Much of what we read about literary translation resonated with and enlarged our thinking about policy translation. We noted, in particular:

³To be accurate, the translation of Shakespeare’s works to which I refer here was initiated by the Romantic poet, August Wilhelm Schlegel, but ultimately completed under the supervision of Ludwig Tieck by his daughters Dorothea and Wilf Heinrich Graf von Baidissin in the early nineteenth century.

The active role of the translator in interpreting the source material: “Translation ultimately depends on dynamic, contextual reading, understanding and sometimes creative reception of a source text. In the process of translation, the mediator’s own understanding or “misunderstanding” of the source text will be realised in the translated text” (Wang 2002, p. 284).

The importance of understanding the possibilities and limitations of the destination language and culture if the meaning of the original text is to be successfully conveyed: According to Brisset (2010), “the cultural turn” in translation studies that revolutionized translation studies came in the wake of post-colonialism, though the need to problematize the cultural context of translation came from as far back as the anthropological work of Malinowski. “The problem for anthropologists,” writes Brisset, “is that the translation of other cultures is always beset by the dangers of distortion posed by interpreting indigenous concepts in a conceptual system that is foreign to them” (Brisset 2010, p. 71). Such also, we argued, is the problem of translating educational policies and practices.

The charge of neocolonialism when there is a one-way traffic in translation: Wang (2002), for example, discusses this in the context of the rather unbalanced traffic of translation between China and the English-speaking world. The UNESCO *Index Translationum* suggests that only a trickle of books get translated from English compared with the flood that get translated from other languages into English. In education policy terms, Kazakhstan is clearly a major receiver rather than a transmitter of texts, though, as we illustrated in the paper, the sources are very diverse, and it has explicit ambitions to offer models of educational reform at least across Central Asia—and institutions established for this purpose.

The role of the reader and not just the author or translator in constructing meaning from text: Dobson writes of the translator as pedagogue and of the pedagogue as translator, and he highlights “the teacher’s need to teach the pupil to be active and collaborative with the pedagogue in order to co-author meaning through acts of translation in the classroom” (Dobson 2012, p. 283). We saw the translator of educational policy and practice as emphatically in this pedagogic role and those at the destination of translation as actively engaged in redefining and co-constructing the locally applicable meaning of what is received.

The scope for creativity and the bringing of new meaning through translation: This is a rather crude way of expressing something that, for example, Walter Benjamin conveys rather more subtly in *L’essai sur la traduction* (1997). Benjamin points out that translation proceeds not so much from the life of an original, which are rarely translated in the age in which they are produced, but from its “afterlife” or “survival” [*Überleben*] and perhaps because of their continuing life [*Fortleben*]. “Translations that are more than transmissions of a message are produced when a work, in its continuing life, has reached the age of its fame. . . In them the original’s life receives its constantly renewed, latest and most comprehensive unfolding” (Benjamin 1997, p. 154). Further, “in its continuing life, which could not be so called if it were not the transformation and renewal of a living thing, the original is changed. Established words also have their after-ripening” (ibid, p. 155).

There are, however, dissimilarities between the literary and policy translation which are also revealing.

One of the ethical obligations of the translator of the literary text is as far as is possible to *faithful* to the text, to be *true* to the original work. The translator of policy or practice—at least in the context of the international translation—really has no such obligation. Indeed it is almost the opposite: the policy translator has a responsibility to adapt international practice to local requirements and to the functions they are expected to perform in that context. Derrida allows room for a slightly pragmatic function of translation even in his discussion of literary translation:

A relevant translation would therefore be, quite simply . . . a translation that does what one expects of it, in short, a version that performs its mission, honours its debt and does its job or its duty while inscribing in the receiving language the more relevant equivalent for an original. (Derrida 2001, p. 177)

But, we asked, does this freedom/responsibility of translators to adapt (e.g., at regional level or at school level) apply equally to the intranational translation of policy and practice, or does the center here have an entitlement to require conformity rather than adaptability?

Secondly, the translator/interpreter of a given text does not assume responsibility for the truth or value of what that text has to say. His/her task is to translate, not to make any judgments enter into any debates about the truth or falsity of what is being said or written. It is not obvious, however, in the context of policy or practice translation that the translator can avoid some such responsibility. The position is analogous to the contrast that the philosopher G.E.M. Anscombe draws between the interpreter and the teacher:

Consider the belief reposed in what an interpreter says – I mean the belief reposed in the sentences he comes out with. If you believe those communications, probably – i.e. in the normal case – you are believing his principal: your reliance on the interpreter is only the belief that he has reproduced what his principal said. A teacher, on the other hand, even in no way an original authority, is wrong if what he says is untrue, and that hangs together with the fact that his pupils believe (or disbelieve) him. (Anscombe 1979, p. 147)

We argued that neither government officials nor external consultants are simply in the business of describing how things are done elsewhere; by deciding to translate practice or policy from one place rather than another, they are giving it their own approval and authority, and they have to take some responsibility for the validity of what they are putting forward.

In short we felt that both an examination of both the similarities between literary translation and policy translation and the differences helped to illuminate and give shape to our observation and understanding, and they served to provide a helpful summing up of what had become a rather long (12,000 word) paper.

Interpretation, Interpretation, Interpretation

One of the first points we made in our original paper was that the “translation” of educational policy and practice always requires interpretation, evaluation, and selection, so in a sense the research paper that I have discussed here was already an attempt to interpret what was going on in a process of interpretation.

Now I have added another layer of interpretation by reflecting on our own attempts to interpret the interpretation/translation. This reveals, in short, no grand design, but rather a seeking after a metaphor, a descriptive or explanatory framework, a theory that might illuminate what we have read, observed, experienced, and reported. I have also indicated the part played in this process by really rather serendipitous episodes from personal biography, ideas that have been reawakened by the focus of our research, and chance encounters that have proved timely and fruitful—all seized gratefully and assembled in a *bricolage* of interpretation which, if it lacks consistency, is hopefully put together in a form that itself prompts reflection, interpretation, and ongoing conversation.

8.6 Five Conversations and Three Notes on the “Soviet,” or Finding a Place for Personal History in the Study of Teacher Education Policy in Kazakhstan

Olena Fimyar

Scoping the Scoping Study: An Introduction

The purpose of this part of the chapter is to introduce the study and the original paper that this chapter uses as a basis for reflection and analysis. This section discusses the multiple contexts of the study which influenced the authors’ decision to approach the analysis and interpretation of teachers’ professional beliefs somewhat unconventionally—i.e., by bringing the elements of autoethnography and memory research into the study of policy. These multiple contexts include the research and education policy contexts, the state of existing scholarship, and the intellectual biographies of the authors. Each of these elements represents a building block which enabled and at the same time set limits to the range of analytical and interpretative possibilities available to the authors.

The original paper “The “Soviet” in the memories and teachers’ professional beliefs in Kazakhstan” (Fimyar and Kurakbayev, [under review](#)) analyzed in this chapter is part of a 1-year scoping study, *Internationalisation and School Reform in Kazakhstan* (Bridges 2014). The data collection for the study was jointly conducted by an international and multilingual (English, Kazakh and Russian) team of researchers from August to September 2012 in Kazakhstani capital Astana. The primary objective of the study was to document the most recent educational initiatives in the country and to identify research areas in need of further investigation. The study was conducted in parallel with three other educational support initiatives jointly delivered by the Faculty of Education of the University of

O. Fimyar (✉)

Faculty of Education, University of Cambridge, 184 Hills Road, Cambridge CB2 8PQ, UK
e-mail: ohf21@cam.ac.uk

Cambridge (FoE) and Cambridge International Examinations (CIE) in Kazakhstan. These initiatives are:

1. Support for innovation in curriculum and assessment at Nazarbayev Intellectual School (NIS)
2. A research and capacity building program at Nazarbayev University Graduate School of Education (NUGSE)
3. A “training of trainers” program at the NIS center of excellence (CoE)

One of the key objectives of the study was to map these multiple initiatives and understand their impact on the wider education system in Kazakhstan. The study was also interested in understanding a model of educational reform whereby national governments directly, or through the centers of national expertise, recruit international research and consultancy networks to address national policy problems. The study involved two field trips to the Kazakhstani capital Astana in August and September 2012. In the course of the study, six team members conducted 25 interviews with policy makers in the government as well as newly established NIS and NU.

Prior to interrogating the theoretical, methodological, and interpretative approaches used in the original paper, we briefly outline the educational policy context, without which it will be difficult to understand the significance and persistence of the “Soviet” in contemporary policy debate in Kazakhstan. The question about the role of interpretation in the study will be addressed directly in part three entitled *Three Notes on Methodology*, which explains how the context, theoretical perspectives, and intellectual biographies of the authors, the development of disciplines, and opportunities of working at the intersection of different disciplines together created an interpretative framework for the study.

Understanding Education Policy Context: Rapid Change Amidst Persisting Inequalities

The size of Western Europe, Kazakhstan as a country remains a large “terra incognita” in most of the academic literature. Apart from a handful of illuminating studies on the history and politics of Central Asia (e.g., Hiro 1995, 2009), the attempts to offer a sociological analysis of the complex and diverse region have been unsystematic. In education research the surge of interest in the question of how “traveling policies” are manifested in local settings (Seddon 2005; Silova 2005) was followed by a relatively small number of studies attending to the questions of education reform (Heyneman and DeYoung 2004; Silova and Steiner-Khamsi 2008), the impact of economic crisis on the teaching profession (see, e.g., DeYoung 2006, 2008; Niyozov and Shamatov 2010; Niyozov 2011; Silova 2009, 2011), and the analysis of teachers’ professional beliefs (e.g., Niyozov 2011, pp. 287–313; Burkhalter and Shegebayev 2010, 2012). A renewed interest in educational problems in the region is reflected in a number of reports by international organizations predicting and documenting acute educational

and social crises in Central Asian countries (e.g., International Crisis Group 2011; WHO/UNICEF 2013).

The factors contributing to the virtual absence of the region in social science literature are many. Some of the most prominent ones include the policies shaping the focus of the government-sponsored *Bolashak* (*Future*) study abroad program. The emphasis on technical, economic, and applied disciplines as priority areas for the country’s future development and the preference (up until recently) towards undergraduate and master’s degree courses set limits to the research and publication input of program alumni. Due to the language barriers and other structural divides, local scholars rarely publish in English-language journals. To reverse this tendency and firmly establish Kazakhstan’s presence in research literature are some of the key tasks delegated to the newly established Nazarbayev University (NU, established in 2010 in Astana) and the Kazakhstan Institute of Management, Economics and Strategic Research (KIMEP, established in 1992 in Almaty).

This lack of attention to Kazakhstan in academic literature, and consequent lack of reliable data on recent social and political developments in Kazakhstan, makes it difficult to discuss the country’s context without falling into the trap of the following dominant political discourses and ideology praising the country’s accelerated strides towards world-class standards. By recognizing the powers of dominant political rationalities in producing a particular view of social progress in the country, we, as the authors of the paper, made the first interpretative move towards problematizing the existing policy narratives in Kazakhstan. By distancing ourselves from existing political and policy narratives, we have created a space for early interpretations to enter the analysis. These early problematizations have allowed us to look critically and with caution on dominant political rationalities shaping education policy debate in Kazakhstan.

Faced with the problem of the lack of research data on Kazakhstan, we had to rely extensively on the reports, policy documents, and media coverage by national and international organizations. The understanding we gained from reading these reports differed from the official narratives in one important detail. While recognizing the progress made in educational and social spheres in the last two decades, an acknowledgment of the problem of poverty and other structural inequalities is what is sometimes missing in the official policy reports. Drawing on the reports of international organizations, we came to the conclusion that the most recent developments in education and society in Kazakhstan are best described as rapid changes amidst persisting inequalities. The economic collapse of the early 1990s set in motion processes which were beneficial for some, but which left the majority, especially in the rural areas, economically disaffected and marginalized (International Crisis Group 2011; WHO/UNICEF 2013). Recent accounts presented in the national media reported a 30-fold difference between the income of the rich and the poor in the country (Tengri News 2012).

In education we found only two policy documents that critically approach the question of rural/urban inequalities. These are the “State Program of Educational Development 2011–2020” (MOES 2010) and the most recent presentation by the new Minister of Education and Science of the Republic of Kazakhstan, Aslan

Sarinzhipov (MOES 2013). In particular, the “State Program of Educational Development 2011–2020” admits that “37.4 % [of schools] don’t have access to drinking water,” “201 schools [out of 7576] are in poor condition,” “25.1 % of schools need an overhaul,” and that there are “70 three-shift schools and one four-shift school” (MOES 2010, p. 9). Further, it is stated that:

Every fifth school lacks either a dining room or canteen. Depreciation of equipment and inventory in school canteens is 80 %. 26.4 % of schools do not have gyms. (ibid.)

What is particularly disturbing is that the above disparities in educational provision and school infrastructure are disproportionately evident in rural areas, which are 4.5 times more likely to have schools without gyms, 4.5 times more likely to have schools working in three shifts, and 13.2 times more likely to have schools in shabby buildings as compared to the number of schools in the same conditions in urban areas (MOES 2013).

Against the background of schools lacking drinking water and basic hygiene facilities, a multimillion dollar investment in Nazarbayev Intellectual Schools (NIS), which serve directly less than 1 % of 1-year student cohort in the country, is criticized by some as a move that may further deepen inequalities (Bartlett 2012). NIS responded to these criticisms by launching a number of “translation” initiatives, including curriculum transfer and a teacher professional development program in the mainstream sector.

We conclude this contextualization, which follows our initial thoughts in making sense of a diverse and highly unequal landscape of Kazakhstani education, by proposing a metaphor of two Kazakhstans, which we encountered in the course of our research. One Kazakhstan, for which Astana’s glamorous architecture provides a powerful visual metaphor, is urban, modern, mobile, and rapidly changing. However, there is also another Kazakhstan—rural, remote, traditional, and crying out for investment in basic hygiene facilities and infrastructure. Significantly, the level of educational achievements and educational opportunities open to children in these two Kazakhstans differs sharply across these divides. Bridging these divides will remain a key national policy priority for the years to come.

Introducing the Original Paper or Why Focus on the “Soviet”: Now?

In this part of the chapter, we will closely follow some of the key arguments advanced in the original paper. The discussion is organized around *five conversations*, each focusing on a particular meaning of the “Soviet”: (1) starting the debate about the “Soviet,” (2) “Soviet” in the recollection of the last generation of Soviet children, (3) “Soviet” in the view of knowledge, (4) “Soviet” in the punitive function of assessment, and (5) “Soviet” in teaching methodology. By organizing the discussion around these five conversations, we aimed to achieve two tasks. First, we wanted to reflect the frequency of references to the “Soviet” in research

interviews in relation to each of the themes: losses and achievements, our recollections of school architecture, knowledge, assessment, and teaching methodology. Second, we wanted to keep enough space between those conversations to allow interpretations and recollections of the readers to come into place. Thus these conversations worked not only to communicate data but also to stimulate new conversations about the “Soviet” in our and our participants’ present.

Due to the country’s recent history, the references to the “Soviet” in research interviews were not entirely unexpected, but the number of those references was highly significant. The exploratory nature of the scoping study has allowed us to analyze the meaning behind those references in greater detail. At the outset of the study we were particularly interested in two questions: *What memories and practices of Soviet education are still dominant in the field of education in Kazakhstan? How do these beliefs continue to shape educational debate in the country?*

Yet, throughout the study for ourselves, for our critics, and reviewers, we had to rationalize again and again: *Why focus on the “Soviet” amidst fast-paced educational initiatives and why now?* As we argued in the paper, a proper engagement with the history of educational thought in the country is what is missing in the current education debate.¹ At a time when the official policy discourses are primarily concerned with raising the economic competitiveness of the country, many practitioners are still coming to terms with the breakup of the Soviet Union and hold true to the practices of teacher-centered education, which the current reform agenda frames as “outdated” and “resistant to change.” Understanding the centrality of practitioner beliefs in the process of educational change, the paper was written with the intention of bringing the concerns of the practitioners to the attention of policy makers and those involved in the reform agenda.

The paper was also written with the hope that it can challenge an established approach in international and comparative education and move the debate forward. This is because at a time when mainstream research is preoccupied with comparisons between the global “east” and “west,” and “north” and “south,” very few attempts are being made to learn from the countries’ histories or, to put it differently, to examine how the “east as it is now” is different from the “east as it was 20 years ago” and, crucially, to learn from this comparison. Although calls to learn from the countries’ own histories rather than uncritically adopting best international practices are becoming more pronounced in the field (Steiner-Khamsi 2013), in our paper we have actually attempted to deliver such analysis.

¹There are a number of studies by local scholars on the history of pedagogy and education in Kazakhstan. However, the majority of those studies tend to focus on the issues of ethno-pedagogy and national identity, rather than approaching the question of Soviet education, its legacies, and ways of socialization from a sociological perspective.

Five Conversations About the “Soviet”

Conversation One: Starting the Debate About the “Soviet”

‘We had Sputnik, . . . but we lost our [Kazakh] language.’
(Interviewee A, early-career professional, NIS)²

Our research participants expressed rather ambivalent attitudes towards the Soviet past. They would start their recollections with a statement acknowledging the achievements of Soviet education. Among these, just to name a few, were universal literacy, free access to all levels of education, provision of preschool and extracurricular education, and the rate of participation in higher education. This statement would be followed by a more revealing account about the inadequacies and failings of the Soviet system. This ambivalence towards the past was very well captured in the account of one interviewee who acknowledged that, on the one hand, “we had Sputnik, Soviet education was successful” yet, on the other hand, “we lost our [Kazakh] language” (Interviewee A, early-career professional, NIS). Indeed, during the Soviet times titular languages of the nations other than Russia suffered great losses and neglect (Shturman 1988, pp. 211–12; Fierman 1998).

The interviewees reported that the use of languages of instruction in secondary schools was also severely imbalanced:

In especially difficult situation are now schools with the Kazakh as the medium of instruction, because they were severely affected during the Soviet time. There was a very small number of Kazakh-language schools left in the Soviet time. As an example, in Almaty [with approx. 250 000 inhabitants of ethnic Kazakh origin] there was only one school with the Kazakh language of instruction. All others switched to Russian, because if you didn’t know Russian then you will not have your career at that time. (Interviewee B, mid-career professional, International organisation)

The lasting legacies of the neglect of the Kazakh language in Soviet times continue to affect the quality of teaching and the provision of textbooks in the Kazakh-medium schools. Some interviewees were self-critical enough to admit that they themselves, and their lack of knowledge of Kazakh, are the lasting legacies of Soviet education:

Unfortunately, I am not reading or writing in Kazakh . . . so you can see me as the ‘outcome’ of the Soviet education system. (Interviewee C, mid-career professional, International organisation A representative)

²All interviewees are assigned letters A–K according to the order they appear in the article. These letters do not correspond to their initials and are used here to indicate the number of respondents quoted in the paper. The respondents’ career stage (early, mid, late) is also indicated because the involvement of early-career professionals is a significant feature of the new initiatives. The gender of the respondents is not indicated as it could compromise the anonymity of the interviewees. However, it is important to mention that our sample was overwhelmingly female. Out of the 11 respondents cited in the paper, 8 are female and only 3 are male.

And this interviewee is not alone: Fierman (1998, p. 174) uses the 1989 census to illustrate how severely imbalanced the use of languages in Kazakhstan was at the time. According to census data, over 80 % of Kazakhstan’s population reported either native or close to native fluency in Russian. Yet, this did not mean they were bilingual, because while over 60 % of ethnic Kazakhs claimed fluency in Russian, only less than 1 % of Russians claimed fluency in Kazakh. Other numbers from the census were even more disturbing, with only 40 % of ethnic Kazakhs claiming fluency in their native language.

In the second conversation on the “Soviet” we have combined our authorial voice and our children’s voice to explore our memories of Soviet schooling. We saw this exercise as highly beneficial for understanding the prevalence of the “Soviet” in the accounts of our interviewees.

Conversation Two: “Soviet” in the Recollections of the Last Generation of Soviet Children

We could closely relate to the description of Soviet schooling provided by one research interviewee:

I was born in 1981 and our generation was the last to study under the Soviet education system. In the Soviet system, we had the ‘upbringing’ [Rus. *Vospitaniye*] component and I even was an *Oktyabrienok* [a first level of socialisation into communist ideology followed by Pioneer, Komsomol and Communist Party membership]. I was also a Pioneer but did not achieve the Komsomol level [Soviet Union collapsed]. (Interviewee D, early-career professional, NIS)

Yet the formal structures of Soviet schooling and membership of *Oktyabrist* and Pioneer organizations are not the only things that came to mind when we thought about Soviet education. The presence of the Soviet ideology everywhere in school was another strong memory. Everyone who went through Soviet schooling can recall how powerful and omnipresent Soviet ideology was in school. It manifested itself on paper and in stone. Everything from the school curriculum to the school architecture and classroom organization was subordinated to Soviet ideology. We could all remember how methodologically and purposefully we were socialized into the values of the Soviet regime. Every school subject from literature to mathematics and science was imbued with the communist ethos and an unshakable belief in the supremacy of the communist world view and societal organization over the capitalist ones. It was not only through the subject knowledge that we were continuously molded in the image of and in line with the communist ideals; indeed, the arrangement of the classroom, the iconography on the walls, and the whole architecture of the Soviet school served the same purpose. Outside the classroom, we were continuously reminded of the values, principles, and founders of the regime through countless slogans, statuettes, portraits, and posters in every Soviet school. Grant (1964) refers to some of the famous slogans of the time (which we can also remember) including “Forward to the building of communism,” “We must study and work as Lenin taught,” “Glory to the Soviet people – the people of heroes” (Grant 1964, p. 24).

Another vivid memory of Soviet schooling is the classroom set-up with its strict rows of desks which were hard to move and which were often nailed to the floor. The classroom set-up was a material embodiment of the Soviet ideology, and, apart from its most obvious function, worked to promote and reinforce the values of structure, order and control. A similar role of reinforcing uniformity, standardization and control was played by the school uniform, which was hugely disliked by the students for its lack of functionality, unattractive design and gloomy color palette among which the most memorable were various shades of gray, brown and dark blue.

Perhaps these recollections will not strike the reader as anything intrinsically “Soviet,” rather they are features of any traditional system of education which relies on teacher-centered pedagogy, strict subordination, order and control. We will not argue against this interpretation, but we insist on the use of the “Soviet,” because for us it represents the time that we lived in, the country we all inhabited: this is our history, this is our lived experience, this is our “Soviet” childhood.

Conversation Three: “Soviet” in the View of Knowledge and the Preoccupation with the Systemic Approach

In further exploring the references to the “Soviet,” we came close to the question of knowledge and the preoccupation with the system approach in Soviet education. Partly drawing on our own memories of Soviet schooling, partly on our teaching experiences in newly independent Kazakhstan and Ukraine, and partly on the studies of Soviet education, what can be said with a great degree of certainty is that Soviet education prided itself on its use of theoretical knowledge in all areas, from curriculum, assessment, and pedagogy to the organization of extracurricular activities and school timetables. Everything was considered to be a part of a greater system, an endpoint of which was the holistic, all-round development of Soviet citizens. All school lessons and planning objectives were prefixed with the “systemic approach,” “system of procedures aimed at,” and similar phrases postulating the primacy of systemic, i.e., the scientific foundations of education.

In the organization of school subjects and selection of subject knowledge, preference was given to material which was systematic and organized in blocks susceptible to explanation through rules or exceptions to these rules. Knowledge itself was viewed as solid and fixed in time. Teaching preference was given to classical texts, formulae, and algorithms. The overall purpose of education was viewed as an orderly, systematic, well-organized process of acquiring and consolidating knowledge through formal instruction in fairly large classrooms (Muckle 1988, p. 188).

This is how one of our research interviewees described the prevalence of the knowledge-based approach in teaching at the outset of Kazakhstan’s independence:

Twenty years ago we were deeply convinced that the priority should be given to the content of each subject, and we believed that if we provided students with systematic, fundamental knowledge in every subject, then our educational objectives would be achieved. (Interviewee E, late career professional, NIS)

In the literature on education reform in CIS countries and the wider region, several attempts have been made to grasp conceptually the shift from the traditional, Soviet, teacher-centered view of education to the more innovative, liberal/Western, and student-centered approaches. Fimyar (2010), for example, put forward the term “changing rationalities” of postcommunist education reform. Drawing on a different country context, Cheng (2008, pp. 14–15) proposed the term “paradigm shift toward the third wave,” by which he means the movement towards world-class standards in education.

Our preferred term is “paradigm”³ because it encompasses the changes not only at the level of conceptualization but also at the level of practice, teaching methodology, curriculum, and assessment. Useful in this respect is Borytko’s (2005, pp. 38–39) conceptualization of educational change as the move from a *sciento-technocratic* to a *humanistic*⁴ paradigm. Drawing on Kolesnikova’s (1991) earlier work, Borytko (2005) identified the following differences between the two paradigms (Table 1).

Table 1 Changing Educational Paradigms: from a sciento-technocratic to a humanistic model

Paradigm name	Sciento-technocratic	Humanistic
Motto	“Knowledge is power”	“Learning is power”
Core value	Cognitive experience	Mode of knowledge acquisition
View of knowledge	Fixed, fundamental, theoretical	Fluid, multiple, constructed
Teaching and pedagogy	Rote learning, memorization, teacher centered	Activity-based experience, student-centered
Assessment	Identifies “gaps” in knowledge, lack of knowledge equals to inadequacy, incompetence, weakness	Assessment for learning, focus on what students already know, not the “gaps” in their knowledge
Outcomes	Well-informed students with encyclopedic knowledge	Students able to argue, interpret, synthesize

Adapted from Borytko (2005, p. 38)

³The calls to change educational paradigms are heard all around the world. This is not something specific to the CIS countries. For an informative and thought-provoking example, see Ken Robinson’s TED videos on “Changing Educational Paradigms” (2010a) and “Bring on the Learning Revolution” (2010b).

⁴In the original paper, Borytko (2005) uses the term “humanitarian,” but we think that “humanistic” is a more appropriate term.

Conversation Four: “Soviet” in the Punitive Function of Assessment

In our review of literature on Soviet schooling, we found that the role of assessment in Soviet education received very little attention. This is rather surprising, because in any education system assessment, apart from measuring academic progress, performs a very important social function. It works to discipline an individual and submit him/her to the standards, behaviors, and ethos of schooling. In an attempt to provide a sociological, Foucault-inspired, reading of the functions of assessment in Soviet schooling, we turned to an inspiring and thought-provoking study *The Collective and the Individual in Russia: The Study of Practices* by Kharkhordin (1999). Through a rich and compelling analysis, Kharkhordin demonstrates how deeply “the rituals of revealing one’s weaknesses in the presence of the relevant community” penetrated the logic and organizational structure of Soviet society.

Assessment as a particular form of “hierarchical surveillance,” to use Kharkhordin’s words, was often conducted in the public gaze, when an individual exposed his or her guilt to the judgment of the collective, be it classroom, university, teacher, or factory meetings. Public criticism was considered an effective tool for ensuring the improvement of individual behavior and, by extension, academic progress. This conviction was in line with the belief that the child could be molded in the image of the heroic “Soviet man” through intense reflection, admittance of one’s guilt, and self-criticism—rituals which, according to Kharkhordin, had their antecedents in the Orthodox Christian practices of doing penance in the public gaze (Kharkhordin 1999).

From the conversations with our parents, we can recall that the organization of parents’ meetings followed a similar logic. The teacher would publicly read out the grades each student had received, starting by praising the best-performing students and criticizing the worst performing. For similar disciplining and revelational purposes, each classroom had a register of students’ achievements on public display.

Our interviewees criticized the assessment practices of Soviet schooling not so much for their repressive nature but for the exclusive focus on recall of knowledge as the primary goal of assessment:

The system of assessment and learning in the USSR limited the competencies of students by getting them just to reproduce knowledge. That is why many knowledgeable pupils were not successful, they could not adjust to the realities of life. (Interviewee F, early-career professional, NIS)

The link between the assessment of high-performing students and their success in life is an interesting one. Another interviewee followed a similar line of argument, stating that Soviet schooling failed to provide students with the tools for using knowledge in their everyday life:

[In Soviet times] throughout many years, we have been noticing that the best high performing students, the so called ‘*otlichniki*’, who finished the school with the gold medal, were not becoming ‘*otlichniki*’ in their lives after finishing the school. . . . Due to some circumstances, they were getting lost in life, and they were failing their lives. . . . Why? Because, at school, they were not taught how to make use of the knowledge they learn, how to be successful in life – that is why. (Interviewee G, early-career professional, NIS)

However, as well as criticizing the knowledge-based assessment practices in Soviet schools, these interviewees equally pointed towards another underlying critique, which is a lack of entrepreneurial spirit in those who were successful in Soviet schooling. This is because soon after the collapse of the Soviet Union, for many “success in life” was redefined primarily in material terms and income had become the single measure of “success.”

Conversation Five: “Soviet” in Teaching Methodology

The teacher tries to fill students with all this knowledge, practically, by chewing it for them. (Interviewee H, early-career professional, Teachers’ focus group, CoE training)

Soviet education was notorious for producing conceptual binaries which many of its prominent thinkers and theorists were aiming to overcome. Two such binaries which continue to structure educational debate in Kazakhstan and other CIS countries are *theory and practice* and *education and upbringing* (Rus. *vospitanie*). In the interview process, there were frequent references made to the disjuncture between theory and practice. On the one hand, the Soviet curriculum was often criticized for being overloaded with factual knowledge. On the other hand, this theoretical density was something that many of the respondents took pride in as one of the greatest achievements of Soviet education. One of the respondents explained how successfully theory and practice were integrated in the Soviet schools and universities:

The material and technical base of schools at the Soviet times were very well supported. Our curriculum always had practical assignments side by side with learning the theory. The same was true about the funding and support for universities. For example, I studied mineral and raw materials, the stage between the mining and smelting metallurgy. Our department had all the necessary devices, mechanisms and units, which would be found at any factory. We had the same machineries, maybe of a smaller size. We used the same chemical reagents and obtained the same process but in its smaller size. Approximately until the year of 1996 we had this base. But then everything collapsed, everything was lost. Buildings were sold and bought, and the base which supported the theory was lost. (Interviewee I, mid-career professional, Teachers’ focus group, CoE training)

However, another respondent views this legacy of the theoretical overload of the curriculum as counterproductive:

In our system of education we learn a lot of theory, and then what happens is that a teacher tries to fill students with all this knowledge, practically by chewing it for them. And then students go to university and they cannot apply any of that knowledge there. They do not know how to work independently; they do not know how to find useful information in textbooks and other sources. After this they graduate and go into profession. And there they do not know how to deal with any arising question or task. (Interviewee H, early-career professional, Teachers’ focus group, CoE training)

The discussion of teaching methods and the scope for innovation in Kazakhstani schools brought attention to another deep-seated tension, which is a tension between the statuses of senior and newly qualified teachers. This is how one of the research interviewees described this tension:

Experienced teachers often do not even allow young teachers to do something. They say, they are more experienced, and young teachers have to do exactly what they are told to do. (Interviewee J, early-career professional, Teachers’ focus group, CoE training)

Another interviewee anticipated resistance to the new initiatives on the part of senior colleagues and articulated the need to shift the status quo for the successful unfolding of the reform:

The young teacher comes to the mentor and says that he/she has got this and that idea, and the mentor says: ‘What is that? This is absurd! It will not work!’ as he/she knows better because of his/her experience. Our task will be to change this mentality. And many teachers will not want to do it. (Interviewee K, early-career professional, Teachers’ focus group, CoE training)

Therefore, in the Kazakhstani context, careful consideration should be given to the tensions and relationship between senior and newly qualified teachers. Without an intergenerational dialogue, mutual respect, and collaboration, sustaining the momentum of reform will be problematic if not impossible.

Five Conversations Revisited: A Call for a New Debate

We concluded our paper by appealing to key actors in the educational policy field with the hope of starting a new debate. In formulating our initial propositions for this new debate, we were inspired by conversations with our colleagues, particularly David Bridges. We gained important insights into seeing the value and centrality of individual experiences in understanding complex societal transformations from watching Robin Hessman’s “My Perestroika” documentary (2011). The tone and style of our appeal was shaped by the key messages from Ken Robinson’s TED videos on “Changing Educational Paradigms” (2010a) and “Bring on the Learning Revolution!” (2010b). These are some of the important conversations and reference points which shaped our approaches to interpretation, writing, and analysis.

We suggested that the key message policy makers could take from our discussion is the need for an informed and engaging discussion with practitioners and society at large about why reforms are necessary and what new set of values and practices they entail. For the reform to gather its full momentum, reform objectives need to be communicated to the practitioners in the same dialogic ways as we would like practitioners to communicate and engage with students. Policy makers should be able to unite practitioners around the idea that the new policies are implemented not because they are “best international practices” from somewhere else but because they can enhance learning here and now in each individual classroom in Kazakhstan.

In appealing to international consultants, we stressed the importance of understanding the country’s history, including the histories which shaped professional practices and meanings operating in the field. This task requires the ability to find the points of divergence between the old and new practices and the skill to start an engaging intercultural dialogue exploring these differences. Our second proposition for international consultants was to reconnect with their own experiences of the “Soviet,” by which we meant traditional ways of teaching which surely all of us

(perhaps to varying degrees) experienced in our lives and bring these experiences into their training and conversations.

Practitioners—particularly those who had experience of Soviet schooling—could find beneficial the idea that, for new experiences and understanding to emerge, it is important first to embrace the previous, i.e., the Soviet, traditional, and conservative experience. This reflection would allow space for observation and analysis of how far the new practices depart from the traditional ones. Our key proposition to the practitioners was that professional judgments about the appropriateness of particular methods should always be guided by the question: *Would I enjoy this as a student?*

For those researching the field of international and comparative education, our intention was to show the value of autoethnography for the study of policy. We did not aim to provide an exhaustive analysis of the foundational ideas of Soviet education—these were presented in broad strokes and in relation to the issues addressed by current reform initiatives or to illuminate the point of rupture or continuity between previous and current understandings of education.

For us as the authors of this paper, the pleasure of writing the paper was mixed with the opportunity to continuously reassess, question, and critique our own experiences of Soviet schooling, those of our respondents, and those presented in the literature. Secondly, we gained an appreciation of the vital importance of the past, which for us, and the majority of our interviewees, is still “Soviet,” and of how it can be mobilized to construct new meanings and practices. What came as something of a surprise for us is that for many of our respondents, regardless of their gender and career stage, “Soviet” was not a distant past; it was here and now, despite its historical closure twenty years ago. And most importantly, that whatever there is that is “Soviet” in the field or in us and in our teaching practices and beliefs, it is keen to engage in conversation with the “Western” and “global” and, to quote one of our respondents, to “have a critical look” at it and at ourselves.

Three Notes on Methodology

In this part of the chapter, we will reflect on methodological choices and considerations that guided our analysis. The discussion is organized in three sections each attending to a particular methodological question. The overarching goal of the discussion is to retrace methodological choices and explain the role of interpretation in the study.

Note one: writing between criticism and nostalgia:

‘– Do you have any questions?’

[we asked the participants of an ‘Action Research’ workshop
in one of the Kazakhstani secondary schools]

‘– Yes, why do you think the Soviet Union collapsed? . . .?’

By writing our paper we contributed to the studies which explore the “Soviet,” its legacies, paradoxes, and inherent tensions in educational and social settings in the countries of the former USSR and its satellite states (see Aydarova 2013; Griffiths and Millei 2013; Koshmanova and Ravchyna 2008; Silova 2010; Yurchak 2005). Unlike those studies, however, researching the “Soviet” was not a part of our initial task, and only the exploratory nature of the scoping study has allowed us to pursue this area of research.

In writing the paper, we engaged with the “Soviet” concept twice. First it entered the analysis from the accounts of research interviews. The second time it entered the analysis was from our own memories of Soviet schooling. Instead of dismissing our narratives as unimportant, we approached them as useful resources for illuminating some of the most contentious issues in contemporary education debate. As a result of this double engagement, our authorial voice emerged as a dialogue which we initiated at different levels with actors in the educational debate. We were in the conversation with our interviewees, with each other, and with our own memories of Soviet schooling. The *double-voiced discourse* which permeates the analysis (cf. Bakhtin 1981; White and Peters 2011) is also a result of our complex “situatedness” (Haraway 1991 cited in Yurchak 2005, p. 6) as both insiders and outsiders in relation to our interviewees and the object of analysis.

Note two: who are the authors?

Our intellectual biographies as the authors of the original paper and scholars who made forays in academic publishing (Fimyar 2008a, b, 2010, 2011, 2014a, b; Kurakbayev together with Bridges and Kambatyrova 2014a, b) worked as sources of inspiration and interpretation in the paper. Our theoretical perspectives and research interests in the issues of education reform, academic migration, governmentality studies, and discourse analysis (Olena Fimyar) and the question of how teachers make meaning and respond to educational reforms taking place in Kazakhstan (Kairat Kurakbayev) map out the horizons of our analytical endeavor and place at our disposal interpretative frameworks offered by these disciplines. By engaging with the disciplines and the arguments advanced in our previous publications, we were developing our “expert voice.”

By embracing the possibility of revisiting memories of our Soviet childhoods, we were encouraging our “children’s voice” to fully participate in writing, interpretation, and analysis. Born and raised in the two republics of the former Soviet Union, Kazakhstan and Ukraine, and later educated to degree level in UK universities, we as the authors of the paper have acquired what Pavlenko calls “the joys” and we also add *the burdens* “of double vision” (2003, p. 182). Being able to see close and far, we encouraged both our “expert” voice and “children’s” voice to equally participate in the study. In encouraging our “children’s voice” we were inspired by autoethnographic writing by Charon-Cardona (2013), Pavlenko (2003), and also Miller (2008) and Richardson (2000, 2001).

We were convinced that the “children’s” voice has a lot to say to the participants of the education debate about the future directions of policy. This is because student’s voice is still silent in the definition of education policy objectives. In

eliciting our children’s voices, the process of writing played a critical role. Writing in such a mode was at once restricting and liberating. It was restricting because it made us feel very strongly that our understanding depends on discourses available to us at a particular point of time, space, and positioning within the field; but it was also liberating because it freed us from the need to produce “a single text in which everything is said at once for everyone, a text where the “complete” life [and story] is told” (Richardson 2001, p. 36). The challenge of the task was, following Yurchak’s observation, “to avoid a priori negative accounts of socialism without falling in[to] the opposite extreme of romanticising it” (Yurchak 2005, p. 9). Taking this observation on board, writing worked for us as a balancing act between criticism and nostalgia.

Note three: the functions of the “Soviet” in research interviews:

You as a Soviet person, you should remember this . . .
(Interviewee E, late career professional, NIS)

Continuing the discussion of the methodology used in the original paper, it is important to stress that out of all 25 research interviews and two focus group discussions conducted in the course of the study, the research participants who made the most references to the Soviet past were the six teachers from the center of excellence (CoE) training. This is not surprising because these teachers anticipated that in delivering their own training, they would be at the front line between the new approaches and conceptualizations of education and those which are deeply rooted and still dominant in their schools. The way these teachers described themselves also deserves attention. They view themselves as professionals “with the classical Soviet secondary and higher education who [through participating in the CoE training] have a unique opportunity to look with a critical eye at the Western system of education, which is being introduced in our country” (Interviewee I, mid-career professional, Teachers’ focus group, CoE training).

Yet it was not only these six research participants who felt the need to explain and reflect on the points in the reform agenda that might be most difficult to implement or might encounter the most resistance. The majority of research interviewees felt the need to refer back to Soviet practices at least once during the interview and explain these practices to the UK-based researchers who were leading the interviews. The UK-based research team included two Russian-speaking researchers of Ukrainian and Belarusian origins whom research participants would address during such recollections: “You as a Soviet person, you should remember this . . .” And, of course, we did, and by writing this paper, we paid a symbolic tribute to all who went through the Soviet system of education and who are now, with professionalism and passion, attempting to understand this critical period in their lives and in the lives of millions affected by it.

As was mentioned earlier in the chapter, the concluding part of the original paper, in its appeal to various actors in the field of policy, was reminiscent of the style of a manifesto (cf. Fimyar 2011). We would like to conclude the overall discussion in a similar manner, this time appealing for policy analysts to view auto-ethnography as a useful interpretative lens in the analysis of policy.

Instead of Conclusions: Finding a Place for Autoethnography in the Study of Policy

Autoethnography and policy analysis represent distinct analytical traditions, which rarely cross each other's intellectual trajectories. Despite offering a more direct and productive way of *getting to the culture through the self* (Pelias 2003, p. 372), autoethnography as a method of inquiry is not used by policy makers and educational practitioners as a tool for zooming into educational practices and understanding the forces that inform professional beliefs and guide professional behaviors. A widespread belief that sets these two traditions even further apart maintains that "objective" data required by policy makers is incompatible with the personal and evocative writing which characterizes most of the works on autoethnography.

The irony of the situation is that by maintaining the established separations between disciplines, both intellectual camps deny the possibility of producing more nuanced and engaging analyses. The article which this chapter uses as a basis for reflection and analysis has attempted to break with this tradition and use the authors' memories of Soviet schooling as resources for understanding present-day teacher professional beliefs in Kazakhstan. However, to bridge two analytical traditions in a meaningful and engaging manner is not an easy task. For the authors of the original paper, two related tasks turned out to be particularly challenging. These were (1) redefining the role of writing in a research study and (2) addressing the questions of the authority of the author.

Writing as it is practiced in the works on autoethnography (e.g., Alvesson 2003, pp. 174–91; Anderson 2006; Coffey 2002, pp. 313–31; Doloriert and Sambrook 2009, pp. 28–30; Ellis 1997, 2004; Holt 2003; Humphreys 2005, pp. 841–43; Learmonth and Humphreys 2012, pp. 103–5; Miller 2008, pp. 348–50) is an all-encompassing activity. It is never diminished to a "mopping-up" task one does in the aftermath of a research project (Richardson 2000, p. 923). Writing is always "a way of "knowing" – a method of discovery and analysis" (ibid.). Through practicing autoethnographic writing, one masters the art of "heightened self-reflexivity" (Anderson 2006, p. 373). Through interrogating a particular aspect of our being, consistently and reflectively we learned "new aspects of our topic and our relationship to it" (Richardson 2000, 923) and by doing so reached a deeper stratum of "knowing" (Miller 2008, p. 349). It takes courage and time to produce writing whereby "form and content are [truly] inseparable" (Richardson 2000, p. 923).

The second issue we needed to attend to was the question of the authority of the author. Continuously reflecting on the question "Do I have enough authority through *my* story to reveal a particular aspect of the *social*?" (cf. Ellis 2004, p. xviii – authors' emphasis) allowed us to write from a more authentic place, the place of truth from within. In searching for answers to the above question, we found Richardson's and Foucault's observations about the fault lines of reasoning about subjective/objective and personal/theoretical divides particularly illuminating. We tend to agree with Richardson that in social sciences, humanity suppressed under the guise of "objective science" "thankfully keeps erupting in [the] choice of

metaphors, topics and discourses” (Richardson 2001, p. 34). This is precisely because “the old idea of a strict bifurcation between “objective” and “subjective” – between the “head” and the “heart” – does not map onto the actual practices [of] production of knowledge” (ibid.).

Foucault’s observation about how his lived experiences provided a fertile ground for theoretical reflection echoes our own stories of entering the world of research:

Every time I have tried to do a piece of theoretical work it has been on the basis of elements of my own experience: always in connection with processes I saw unfolding around me. It was always because I thought I identified cracks, silent tremors, and dysfunctions in things I saw, institutions I was dealing with, or my relations with others, that I set out to do a piece of work, and each time was partly a fragment of autobiography. (Foucault 2000, p. 458)

The above observation has also strengthened our belief that we, as children of the last Soviet generation, have not only authority but also a moral duty through our memories to bring to the attention of the participants of the current educational debates in Kazakhstan the lines of argument which are neither visible nor audible otherwise.

To conclude, our lived experiences and intellectual trajectories and, most importantly, the desire to start a new debate on post-Soviet education served as most productive sources of interpretation in our paper. Such tasks imposed on us, to use Denzin’s observation, “an obligation to develop a personal style that brings meaning and morality into discourse” (1997, p. 40). It made us search for a style of writing which would balance our need to attend to criticism and nostalgia, to bring “children’s voices” and “expert voices” into the conversations about the values and purpose of education. It made us recall and embrace our childhood memories with the hope that such reflection will contribute towards making the educational experiences of today’s children meaningful and memorable.

Introduction

Educational research has been increasingly subjected to normalizing accounts of “what counts.” On occasion this takes the form of “what works” (which is not actually so much a research question as concerned with political choice). Alternatives have included, among others, various claims to the efficacy of randomized control trials (RCTs) and large-scale secondary data analyses among other forms of empirical determination. Barone (2007) in the USA, for instance, refers to the passage of the No Child Left Behind Act of 2001 where the law calls explicitly and exclusively for the use of *scientifically based research* (a phrase used 111 times within it) as the foundation for any educational development or pedagogical application (p. 455). The underpinning assumptions of such advocacy include the claim that the arithmetic offers an adequate cipher for the experiential. In his “Fragments of the World,” Castoriadis (1997) argues that the arithmetic has been endowed with an ontologically originary status in late modern cultures. While this deep attachment to the arithmetic offers a kind of security to a political class

concerned to demonstrate how their policies are endowed with a self-evident quality (Conroy and Davis 2002), we would argue that the being and nature of the world cannot easily or comprehensively be captured numerically. If, for example, one is to decide that social security directed towards helping the most vulnerable in society is an intolerable burden on the commonweal, then it has to be demonstrated axiomatically and be accompanied by the attendant discursive practices of inevitability. In such political speak, a government spokesperson is apt to opine, “It is obvious that we need to do something about the overspend on social security – just look at the numbers!” The embedded claim is that the numbers demonstrate the folly of particular social actions and entailments and (re)assure others by overcoming the poverty of our subjective judgments. So it is increasingly in educational research, witnessed most obviously in the rise of RCTs and “Big Data.”

The claim that the success of particular forms of educational intervention can be measured without reference to the dynamics of human relations, including the relation individuals have to their own interiority and biography, rests on the assumption that social and educational patterns and performances are to be considered technical achievements:

What we’re learning in our schools is not the wisdom of life. We’re learning technologies, we’re getting information. (Campbell (with Moyes) 1988, p. 9)

As with the practices of education so too, such “technologies” are to be considered the apogee of educational understanding. In what follows we wish to argue for and illustrate an alternative (or at the very least a complement) to such a technicist account of educational research that is rooted in older forms of human understanding and disclosure. Given that educational research is not the same kind of thing as technological or indeed biological research and that causal connections are rarely to be considered in terms of straight-line trajectories, we suggest that these other more deeply fissured accounts and expressions of human exchange and encounter can rescue much educational intervention from its own sterility. Educational research requires from time to time the introduction of modifications that entail a studied attention to the ways in which psychological and social forces intertwine and indeed the ways in which these intertwinings manifest themselves in, and shape, forms of practice. It is in this intersection that the public and private face each other in a series of veilings and unveilings where the individual begins to recognize and acknowledge the multiple and complexly refracted encounters with personal and social history as well as individual and collective consciousness. Such encounters are not singular; that is, they are not easily encapsulated by the arithmetic or the algorithmic.

Inquiring into Subjectivity

It is a truism that we live embodied, emotive lives, nowhere more so than in educational spheres with the powerful emotionality that runs through the veins and arteries of those who encounter each other daily, in colleges, schools,

classrooms, curricula, pedagogy, and assessment practices constitutive of education systems worldwide. It is these ongoing individual subjective and collective transactions that are the often unrecognized undercurrents of educational life that have the capacity either to enhance or resist educational endeavor, innovation, and improvement, even those endorsed “scientifically” through the outcomes of the “what works?” tradition. In research terms we wish to retrieve the notion of self-understanding as of having inherent value in the conduct of educational research. For a fuller, indeed richer, account of educational life, we must seek other creative research possibilities that help us understand and represent the nuanced nature of human experience and where the personal and the political are seen as deeply intertwined. As Haug (2000) observes:

Experiences are both the quicksand on which we cannot build and the material with which we do build. . . . A method has to be found that makes it possible to work on experiences and to learn from them. (quoted in Walsh 2006, p. 978).

While we consider this work to be of the utmost importance in educational research, we are not insensible to its challenges and complexities. Questions as to how we inquire into and understand the dynamics of human experience, into the subjective states of first-person consciousness, have perennially perplexed philosophers, psychologists, and neuroscientists. The study of consciousness as central to the very understanding of our everyday existence as human beings has been caught in numerous volatile debates across time. William James (1890) considered consciousness as “the stream of thought, . . . of subjective life” (James 1890, i, 239). More recently, in one of the many philosophical and psychological turns of modernity and its aftermath, Blackmore (2001) has decried consciousness as nonexistent: “There is no stream of vision. And if we think there is, we are victims of the grand illusion” (p. 3). With developments in computer science and neurotechnology, disputes about consciousness have duly shifted, evident in contemporary scientific turf wars. Searle (1997) and Dennett (1991) notoriously have been at loggerheads on whether conscious states are little more than the epiphenomenal echoes of neurochemically induced brain activity.

This chapter however does not concern itself directly with the veracity of these deeper ontological and philosophical questions. Rather its intention is to focus more pragmatically on the question of how to inquire meaningfully into multilayered subjective states of human consciousness (given our belief that such states are at least as significant as resource and material conditions in the determination of educational outcomes). In particular, how can we come to understand, interpret, and potentially transform the psychosocial meanings attached to our sense of self-identity in the shifting worlds we inhabit and, in particular, the shifting worlds of education? Traditional notions of self-identity as something fixed and unchanging, something inside of us “like the kernel of a nut” (Currie 1998, p. 2), give way to alternative notions that self-identity can never be something that is solely interior because identity as lived and experienced is necessarily relational with the world, with the Other, and with our own and others’ histories (O’Grady 2014). Given the largely unsayable and unknowable dimensions of our so-called “fluid, protean, and problematical” lived

experience (Lasch 1984, p. 32), aspects of which are difficult to grasp and articulate, we draw on the use of the mask in research as a specific, culturally rich, mediating object that holds complex notions of identity and self as its essence.

We also draw on those notions of “self” articulated by Kristjansson’s “alternative self-paradigm” (2010, p. 237), which is rooted in something like a commonsense view of the self. Here the self is not fixed, immutable, and intransigent but a composite, fluid, dynamic entity—a locus of one’s core and peripheral/transitory senses of personal history, memories, emotions, positionality, commitments, traits, aspirations, and ideals, some or all of which may be more or less salient depending on external conditions or specific context. Here we emphasize three essential elements that facilitate our understanding and use of the mask as both object of enquiry and heuristic tool in the practices of educational research: (i) The mask, with its inside/outside materiality, opens up and metaphorizes the paradoxes or contradictions inherent in self-material. (ii) Following James, we see the self as not “cognized only in an intellectual way,” but rather than when “it is found, it is felt” (1890, p. 299) with emotions essential to the sense of selfhood. The mask as object incarnates or enfleshes, makes manifest, the immateriality of the “felt.” (iii) The arithmetic, for sure, offers an account of behavior and achievement but such an account must perforce avoid the spiritual, the unsaid, or, to put it another way, the nooks and crevices wherein both student and teacher occupy spaces that have no business being performatively recast. “Elected silence sing to me and beat upon my whorled ear. . . .” In these lines from “The Habit of Perfection”, the nineteenth-century poet, Hopkins opens up this spiritual or transcendent self to the possibility of embracing what Rudolf Otto considered “das ganz andere” (the (w)holy other). This sense of the spiritual and the mystical (even if it is merely epiphenomenal of material life) remains real and is often to be found in the students withdrawing from the practices of the classroom or the teacher’s desire not to be cast performatively. The mask facilitates, what Hopkins terms, “the inscape” of personal and social life (Conroy et al. 2013). In other words, landscapes paint a kind of exterior and inscape of the whorled interior—so too with research—the numbers may offer a set of contours by which we can map certain pathways across a given terrain, but what is of interest and what determines what happens on the way across such a path may lie underneath—in the inscape.

Faces, Masks, and Embodiments of Self

Masks and mask making have rarely, until recently, been associated with social and educational research. Yet, from the rock paintings of the San and other preliterate cultures to the theaters of antiquity, masks have been ever-present artifacts in psycho-spiritual being and social exchange. They are most often associated with the stylized artistic expression in classical Greek and Roman theater out of which eventually emerged the culture of facial acting. More recently, academic research has been undertaken in mask iconography and in anthropology, but, as Johnstone (1981) has

argued, we do not know much about masks in Western culture, partly because, historically, the church considered masks as pagan, confiscating them because of their perceived association with native rituals and trance states. In the fields of anthropology and theater studies, there has however been a resurgence of academic interest in masks. In modern performance, for example, in the *commedia dell'Arte* tradition, masks are enjoying a comeback, where, theatrically, they are viewed as “a sort of vehicle, drawing the whole body into an expressive use of space, determining the particular movements which make the character appear” (Lecoq 2005, p. 56).

For most individuals, a consciousness of self includes a sense of embodiment and, as Cole (1999) suggests, perhaps “the body-part we feel most embodied in is our face” (p. 301). The face is a unique identifier¹—“masks can be the face itself, something worn before the face or the entire body” (Sorrell 1973, p. 3). Moreover, facial embodiment is also central for our emotional existence and for our social relations—“I exist in the facial expression of the other as they do in me” (Merleau-Ponty 1964, p. 113). And it is in this potential—the power of the mask to instantiate, embody, and project lived experience—that drives us towards its unique possibilities as a mediating tool in research concerned to inquire into the multiple and contradictory dynamics of the subjective experiences of those who engage in social and educational spaces.

Masks as Elemental to the Imaginary of Teaching

Parini (2005) considers teaching as a creative form of theater in which teachers craft their teaching personae as deliberate choices and use different appearances on different occasions. In this sense this donning of the persona in the service of the moment; the occasion is redolent of the changing of theatrical masks. It is indeed a modest step to recognize the role of the mask as both metaphor for and the embodiment of the professional persona. Hence, in one interpretation, the promulgation of the teacher’s mask in educational discourse is suggestive of some sort of necessary bifurcation in the professional personality/identity whereby teachers *should* construct some prosthetic and some false self at the expense of their “true (r) self,” which they *should* keep hidden from the external world of the classroom, including personal beliefs, and passion only some of which *should* be permitted to progressively filter through the teaching persona. In this reading the mask is deemed to be yet another singular and limited stratagem in the pursuit of a technician and performative agenda. In other words, it is a professional cover to be deployed in the pursuit of particular ends and as such is vulnerable to being stripped away to reveal the “real.” It is this somewhat clichéd reading that, in the everyday transactions of schooling, exposes it to a loss of force, mostly prosaically seen in the desire of students to strip it away.

¹ Identical twins excepted and even then there are unique elements.

There is however an alternative more “promethean” way to construe the mask. Drawing on the conceit of the persona in Greco-Roman theater, Jung regarded the “social mask [as something] that one wears to adapt to the perceived expectations of others” (Russell-Chapin and Rybak 1996, p. 173). More than a “thing” to be donned it evinces “a complicated system of relations between individual consciousness and society, . . . designed on the one hand to make a definite impression upon others, and on the other, to conceal the true nature of the individual” (p. 93). For Jung the mask as persona is an archetype, suggesting that there is an inevitability and ubiquity to its “being.” While differing cultures or societies may establish the value and hierarchy of differing personae, nonetheless whatever the context, they function as a means of facilitating relationship and exchange between the social world and the interiors that individuals inhabit. Early on Jung frequently deployed the concept of archetype as akin to a Kantian category or a Platonic idea—a type of “organising form to our mental life” (Mayes 2010, p. 1). Later, however, he revised his thinking, defining archetype more as a universal inclination or image that attaches to highly charged universal emotional states. Segal (1999) describes an archetypal experience as not any emotional event but one, which is overwhelming or extraordinary. Thus, masks are to be considered as archetypal, constructive, and purposeful means of self-representation that both present and disguise and portray and conceal the passions themselves. Post-Jungian therapist, Hopcke (1995) observes that Jung “saw the persona as a vital sector of the personality which provides the individual with a container, a protective covering for his or her inner self.” Despite the postmodern critique of Jungian essentialism and its apparent lack of political and cultural engagement (see Hauke 2000; Rowland 2001 for well-presented defenses), we argue that there is a contemporary, heuristic value in adopting a Jungian framework of the persona as a constitutive feature of subjectivity for exploring the complex interface of the personal and professional in teacher identity and of understanding the role of myths and archetypes in teacher identity. In doing so we recognize that in the course of a lifetime, many personae will be worn and several may be combined at any one moment. Masks viewed as archetypal personae represent and disguise the passions that inhabit classrooms and mediate sensibly (consciously and unconsciously) between internal and external worlds. So it is that the masks embody a plurality of selves; a polyphony of masks pertains rather any singular notion of the teachers’ mask, thus more fully reflecting the diverse range of activities, obligations, and entailments of teaching in contemporary culture. Despite political imperatives over the last 10–20 years that aim to reduce their spheres of professional influence, teachers, individually and collectively, continue to assert/reassert their desire for autonomy and capacity for judgment.

Research, Mask Work and Archetypal Reflexivity

Of course within the research domain, if we are to understand the important effect of facial experience on our whole experience of and sense of self, we have to do something more than simply introspect. Reflection and reflexivity have become

ubiquitous, almost virtuous, in educational research (Lynch 2000), most frequently presented through forms of introspective writing that insinuate themselves into research texts and, while occasionally insightful, rarely offer more than mundane exposition of under-interrogated thought and behavior (by the researcher and/or the researched). As things stand it can be challenging to determine whether reflexivity offers a methodological basis for enhancing objectivity or functions as a critical weapon for undermining forms of deracinated objectivism (Lynch *op cit.* p. 26).

Nevertheless, the world of social and educational research has been extending its boundaries, increasingly embracing more artful, nonverbal, and creative methodologies that enrich possibilities for capturing the ineffable. The task of using such “transgressive” modes of research encounter is to ensure that they are not, in their turn, domesticated as yet one more banal datum in an agglomeration of surface accounts of efficacy and experience. A willingness to experiment with alternative approaches carries the potential to challenge traditional/empirical methods that reduce human experience to knowledge claims of certainty, rather seeing truth and knowledge as individual, contextual, contingent, and always in process. Embodied knowledge is a way of knowing that goes beyond the intellectual, logical, and rational mode of thinking to include emotions, culture, physical sensation, and life experiences. Writing and traditional forms of inquiry and representation, we argue, do not completely convey embodied knowledge in the same way that an image, a poem, a sculpture, a performance, or indeed a personal artifact like a mask can do (Leitch 2006).

Arts and artifacts in research are becoming more commonly used in social and educational research (Barone and Eisner 1997). At its most prosaic, an artifact is defined as an object produced or shaped by human craft out of raw or found materials for a particular set of purposes. Possible artifacts range from simple doodles, drawings, sculptures, graphics, photographs, and clothing items though to computer-generated images and film. Although controversial, in arts-based research, poems, plays, musical pieces, and dances are viewed as both artistry and artifact. For research, artifacts can be considered as means to generating data, most commonly verbal. Soroke (2003), for instance, argues that an artifact can serve as a thinking–reflexive tool for researchers, as means to data generation with participants and as opening up opportunities for reciprocity between the researcher, the researched, and the public sphere. Masks we would argue can indeed be considered as research artifact, as a rich-mediating tool that leads to the unfolding of the storied worlds of educators and students, and others but also to be viewed as something more, as a symbol, and as an extension of the physical and spiritual being of the person who created it.

Creatively deployed in research masks are created self-images that can serve as “mediators” between “inner felt experience” and the outer world and, indeed, within and between our “inner” selves, including the deeper resonances with the collective. They act as the selective membrane between the “blooming, buzzing confusion” of inner, cognitive, biographic, emotional, kinesthetic, and sensate experience and the external world while also mediating between differently un-cognized or not yet cognized internal states of individuals, including the mythic.

So What Kind of “Mask Work” Are We Considering?

Data for this chapter are taken from Leitch’s (2003, 2006, 2008, 2010) systematic inquiries on teacher identity and teacher personal and professional development using creative self-study methods in various studies across UK and Canada. It is supplemented by Conroy’s readings of the liminal metaphors of teachers and teaching (Conroy and Davis 2002; Conroy 2004). Elsewhere, Leitch (2010) has reported the findings from her inquiries with teachers at differing stages of their careers, which have utilized mask making as performative self-study. In these exercises participants agreed to undertake a series of mask workshops for research purposes creating three-dimensional representational images/artifacts as embodiments of what (and who) they present professionally and what remains beyond the surface. The process initially required participants to work individually on the composition of one or more masks that represented the face(s) or personae they experienced in being a teacher. They were asked not to think too deeply about the task nor to be overly concerned about aesthetics, given that they were not artists, but rather to work intuitively, allowing whatever appeared from their “felt sense” or their imagination to find form as their mask(s). To do this, the teachers either selected from a range of preformed mask shapes or made their own papier-mâché mask using a range of available basic craft and art materials. In either case they could then decorate their artifacts in whatever way they chose using the range of available materials.

This was a contemplative yet practically engaging activity that required an unhurried sense of time and space where ethical boundaries had already been carefully negotiated. The decoration of the mask was considered as the vehicle for forms of self-disclosure not normally available to standard forms of educational research. Hence this exercise was not primarily pedagogically determined but was the ground upon which research was founded. In this way the mask functions as both a thing in itself and a heuristic.

What is distinctive about such creatively engaging forms of research is not to be found only in the “object” under consideration but in the way in which the role of researcher is considerably at variance from that of privileged “scientific observer.” Here she or he occupies a space that is self-evidently more that of a facilitator (or shaman) who keeps faith with the ineffable that cannot be expressed in words alone but can be better represented in the face, the eyes, the mouth, the gestures, and the symbols that come to adorn the constructions of self that are formed. This move evokes Campbell’s (1968) conceit of the “mythogenetic zone” which he describes as any space in which the language of symbols and related rites can be shown to have sprung into being:

The mythogenetic zone today is the individual in contact with his own interior life, communicating through his art with those “out there,” (Campbell 1984, p. 93)

We recognize that these inscapes (interior landscapes) can only be represented indirectly, symbolically, and partially. To allow for the possibilities that these

inscapes find meaning and expression “out there,” the researcher builds an “enclave of shared experience” where the images, words, patterns, signs and symbols, colors, textures, and sensations can subsequently be decoded, where the mask makers/mask wearers can bear associations to their present and their past and, vitally, to the occluded worlds of myth and symbol. For each participant moves in two worlds—the inward world of their own awareness and the outward world of understanding how social and cultural forces have become inscribed within their being and in their turn how they impinge on professional identity.

The resultant masks in all their color and variety then are the visual research texts, but they also proved to be avenues to self-mediation and self-definition, ones that rendered the invisible world visible not just to researcher but perhaps more significantly to the participants themselves. What we have found is that participants’ imaginations are roused by “the waking power of symbols” (Campbell, *op cit* p. 94) through encounter with their own and others masks and where they return to the world having learned from their own depths the grammar of symbolic speech.

Illustrations: Interpretation

In this final section we (a) consider how we are to interpret mask work as a form of research into the complex, porous, and striated persona of the teacher and (b) offer an illustration of how this material can be understood. What is at stake here is a consideration of the mask in research as a mode of reflection and understanding that not only challenges the easy dichotomy between inside and outside but also between researcher and researched. Of course dichotomizing tendencies pervade human exchange. Indeed, as teachers made and enacted their personal masks, the separation of “inner” from “outer” was common among participants. However, whatever its broader merits in the search to understand professional identity, we are not, here, primarily concerned with interpretation as a process of individual psychologizing. Rather the turn to the mask is an attempt to disclose some of the ways by which the relationship between individual representation and archetypal myths, such as the promethean teacher archetype (Conroy 2004), is to be considered. Interpretation is not linear and contained. Indeed, as they reflected on their masks as personal (and cultural) symbols and motifs that embody different meanings from inside or outside, participants found themselves encouraged to note the tensions and the meanings marked by these distinctions. Looking from multiple vantage points, masks offer embodiments of being simultaneously inside and outside self-experience and culture. This multiperspectival positioning was important to both researcher and researched alike. It offered a complexity that somehow approximates to the complex ways in which the inner and outer, the personal and the social, and the political and the professional are porous and interwoven in the lived experience of the teacher. It also keeps open the possibility of revision and refinement in interpretation for, as Peshkin (2000, p. 9) suggests, it is to be considered not as an endpoint. Interpretation is rather a journey, an act of

imagination and logic, on behalf of the researcher, which entails perceiving importance, order, and form in what emerges in the observations and reflections that relate to the stories and narratives that are, in a state of flux, constantly being created and recreated. Simultaneously attending to that which is presented on the surface and that which hides behind or is occluded pulls mask makers out of the narrowness of idiosyncratic and dyadic meanings, and demands confrontation with wider universal patterns and meanings.

If we accept mask research as opening up spaces where interpretations and meanings are continuously layering and delayering, accreting as we go we must, perforce, accept that these outworkings constitute a dynamic interplay between participants and their masks as symbolic artifacts and the researcher. Hence masks are texts replete with meaning in and of themselves while also being the objects of ongoing individual and collective interpretation. The research processes act as intermezzo that progressively permits unconscious contents *safely* to surface in consciousness. Notions of a singular evidentiary narrative provided by the authoritative researcher rapidly give way to more blurred boundaries between researcher and participant. But more than this, the kind of mask work we are proposing here offers a communion between researcher and researched that normally evades the standard compacts of educational research

Of course, as we have suggested earlier, this sense of the polyvocal is underpinned by the claim that the unconscious is irreducible to its personal manifestation; hence, in the interpretative phase, we propose a loose coupling of a form of archetypal reflexivity (Mayes 2002; Villate 2012) with a synthetic form of Jungian analytical psychology. Here “archetypal reflexivity” might be described as a type of deep reflection where people consciously consider the archetypes that are active in their lives as a form of teacher (and/or researcher) insight and renewal. The distinction made here is that participants extend their understandings by exploring through literature, religion, anthropologic readings, and the arts some of the key archetypal symbols and motifs that are actively invoked through their masks, amplifying these through further artistic endeavor and/or creative writing particularly in the forms of story, poetry, fairy tale, and myth:

Not only is a symbol autonomous, but it remains unknown and inactive till at some particular moment it is activated by an access of energy and so rises above the threshold and assumes a form capable of being perceived by consciousness. (Harding 1961, p. 2)

The synthetic framework/method of Jungian analytical psychology (Jung 1916) works to support this reflexivity by being both indirect and interpretive which, although this sounds somewhat paradoxical, is grounded in the *transcendent* function that forces the energies of the conscious and the unconscious together. It is the transcendent function that puts an end to division and that creates a symbolic bridge between the realm of the unconscious and the phenomenal world of human experiences (Semetsky and Delpech-Ramey 2012). It is through the encounter with the mediating object, the mask as artifact, that otherwise unconscious content is given form and made conscious and where meanings can be understood. The trickster figure as shamanic teacher is a notable representation of this symbolic bridge

between the imposed order of the contemporary classroom and the potential disorder that lurks within and beneath. As Jung eloquently has it, the trickster emerges from and refers humanity back to its earliest encounters with a world prey to disorder and danger, a world where rational, scientific morphologies, typologies, and analyses do not obtain. But more than this (and of particular salience here), “the trickster motif does not crop up only in its mythical form but appears just as naïvely and authentically in the unsuspecting modern man – whenever, in fact, he feels himself at the mercy of annoying “accidents” which thwart his will and his actions with apparent malicious intent” (Jung 1972, p. 142). It is this “cropping up”/emergence and disappearance that interest us in the use of the mask as mediating research object. It is through the encounter with the mediating object, the mask as artifact, that otherwise unconscious content is given form and made conscious and where meanings can be understood. For Jung the unconscious is irreducible to its personal dimension solely but draws its color from the individual consciousness and its interplay with the social and cultural. This perspective is reinforced through a reading of Vygotsky’s conceit of the imagination as constituting a functional unity drawing together the interplay between realistic and fantastical (Wertsch and Stone 1985). For him maturation, the high point of conscious development, holds the key to greater integrity of consciousness and the possibility of transcending the limits of one’s socialization. It is this dynamic interdependence of social and individual (John-Steiner and Mann 1996); the archetypal and mythic process that so strongly recommends itself to the educational researcher who wishes to develop a more intense understanding of what is at stake in the “life” of the teacher. If we wish to understand more fully why “what works” doesn’t always work, we would do well to understand the ways in which the life of the imagination intersects with the rational and performative.

While we are not here arguing for generalizability in the “traditional” empirical sense, we nonetheless consider the discussion of the following example as offering a case illustration of how mask making provides an intersection between subject and researcher. In doing so we unearth the teacher’s interpretation of the symbolic realm as integral to both their experience of mask making and the nature of the interpretation. This, in turn, facilitates the emotionality inscribed in visual symbols to reveal itself to the extent that the individual teacher is prepared to address and interpret the meaning. What also emerges from Leitch’s work over many years at this interface is that teachers are open to develop interpretations in radically shamanistic ways—ways that rarely takes place within the orthodoxy of educational life. What follows is an exemplification of how one young teacher engaged with the process of mask making meaning over a period of 6 weeks.

Case: Mask and Archetypal Reflexivity

In the case under scrutiny here, the teacher, E-M, who was 4 years into her teaching career, agreed to participate in a mask research workshop along with a group of eight other teachers at varying stages of their careers. The process was carefully

ethically negotiated. (Clearly dealing with such sensitive material requires a level of informed consent that goes beyond plain language statements and their like.) E-M worked in the behavior support unit of a special school for children with moderate learning difficulties, teaching general subjects and acting in a peripatetic role with children aged 6–9 years. Fuller details of the participant's professional narrative are discussed elsewhere (see Leitch 2010); however what we wish to draw attention to here is how embodying the mask and turning her gaze on significant visual symbols not only led her to engage with her current lived experience but also drew her into the realm of the archetype.

E-M took the task of composing her mask eagerly, using a blank papier-mâché mask as her base. She reflected later, "*I didn't falter in that I didn't think, "Oh, what'll I do? Oh, I'm not sure!", you know, I didn't have to stop and think about what I could put on it; it just did it itself really.*" Interestingly, the joy of making the mask was in sharp contrast to her experience of wearing it "*I don't like putting my mask on, It takes on a persona of its own. It's eerie and sad and somehow emptier than when it is off me.*" The final artifact was elaborate but decorated on the external surface only, and it was characterized by two sides:

I couldn't make two masks, one of my inner self (personal) and outer self (professional), because I could not portray the tension that lies between the two, so I represented this by the tornado on my forehead.

At one level of disclosure, performing her mask crystallized her professional crisis of identity; although previously obliquely aware of it, she found she was living and suffering from a seemingly irreconcilable contradiction between the values of the organization and those of her own deeply held, child-centered values. Composing and embodying the mask through enactment brought this dilemma sharply into her awareness. Subsequent processes of dialogue and reflection on the mask gave her permission to place these emotional issues and tensions within her wider biography where she began to formulate something of a rational resolution.

Turning her gaze on those images and symbols embellishing the mask that for E-M held the most intense emotional energies led her to engage with the archetypal realm, opening up deeper ways of making meaning and understanding herself and her relationship to the world. Her engagement with three of her most significant symbols serves to demonstrate the power of this form of archetypal reflexivity to unveil deeper refractions of subjective experience that are too readily dismissed from common scientific accounts of human existence and public (professional) experience.

The three symbols that most attracted her gaze for deeper inquiry were: the "All-seeing eye/vortex," "Chain," and "Spirit." Some of E-M's understanding and interpretations arising from her mask are presented directly from transcriptions of dialogue (between herself and other participants in the mask research workshops and between herself and the researcher), creative writing reflections, and a journal she kept. These narrative excerpts are interwoven with some interpretive commentary to aid understanding of the partial narrative.

The All-Seeing Eye

I could not convey the tension between my personal and professional context; I could not illustrate the tension that lies between the two. This is symbolised by the tornado on my forehead.

On the material plane, I read that a tornado occurs when two different linear forces meet and interact. And in the cosmos, this tornado is like the cosmic Vortex which encompasses the boundless universe. In my own inner spiritual word the forces are gaining their momentum – like a maelstrom of emotions.

Here she moves her attention to the pivotal feature of her mask, the eye of the storm, placed in the position of the “third eye” at the center of her forehead, on the sixth chakra point, that seemed to act as referent to her most intense experience:

The eye of the storm is the still point, it sees all; it sees the calm, happy, logical and bright side, a side that is true to me. It sees the confused, frustrated, angry and scared, dark side, a side that is also true to me. The tension lies in how the two can live parallel and in tandem with each other, as I cannot control one and I cannot define the other. There is a tension . . . like being caught in the maelstrom. . . . that is almost mirrored in the tension I feel in my job.

From this “still point” on her mask, she temporarily steps out of the maelstrom to gain some sense of perspective, while simultaneously reaching to realms beyond her own immediate professional dilemma, opening up not just to her own deeper emotional substrates but also to the eternal/numinous.

The “Eye of Providence” or the open eye is the invisible eye which provides perception beyond ordinary sight. It is seen as the symbol of watchfulness and the eye of God as the symbol of Divine watchfulness and care of the universe.

The Chain and Primordial Matter/Chaos

I'm not one thing outwardly and something else totally different inwardly, I'm, well, I think I'm kind of, I just am a mixture of the two (sides) all the time constantly transforming one thing into the other . . . the other, I don't even want to say "dark," but it's just messier . . . and yet sort of stronger in many ways than this side, but more layered, I think . . . and grounded by the "Chain" . . . which is felt like a big weight sometimes that's unbreakable and . . . I still don't know where this comes from. I think everybody has this messy, darkish side . . . but I don't think people have it as heavy as me. And yet, it is what grounds me

As we indicated earlier, standard accounts of the distinction between the internal (private) and external (public) life are challenged by this more nuanced account of the self. Inner perception is so often concerned with dealing with opposites, not thought but sense and "It is the archetypal symbolism that presents us with those inner unconscious meanings that, while being outside of the conscious thought, are nonetheless 'located' within our embodied experiences, in which the archetypal patterns are embedded" (Semetsky and Delpech-Ramey 2012, p. 71). Here E-M touches and finds reassurance in the universal through engaging with the concept of *prima materia* as part of her inner experience. *Prima materia* is the chaos and raw material of the universe out of which the "lapis philosophorum" is to be formed, an alchemical process which for Jung was symbolic of the individual's journey to wholeness.

Myth and Teacher as an Archetype of Spirit

E-M's mask subsequently became a source for storying. Creating myths or fairy stories opens up avenues to embed these symbols in narrative form such that their complexity can be marked even if not completely understood or grasped. It is in these forms that we find access to refractions and personifications of various archetypal forms rooted in teacher thinking. Singer (1988, p. xi), for example, observed that the texts and subtexts of the narratives that a person constructs regarding his or her life and work often have archetypal images and motifs. Towards the end of the process, E-M wrote a spontaneous child's spirit tale inspired by ruminations on her mask:

Once upon a time there was a being, she wasn't girl or a woman or man or human or animal but merely a being. She doesn't walk but flits from place to place, not flying or jumping or hopping or even swimming but seamlessly moving in a fluid alive kind of way. She lives in buttercups and other such pretty flowers, in hems of lovely ladies' dresses and in the clean fresh upturned cuffs of gentlemen's shirts.

She is the bright light, the inkling of something good stirring in your stomach. . . She is the little thing that makes your tears stop flowing when you have cried too much. . .

She can be found on the white foam atop thunderous waves, in the smile of a passer-by, the velvet of a horse's muzzle and in the pinky hue that promises a shepherd's delight. . .

It's sad that the world can't have her. It's sadder still the soul that cannot see her. On days she is not seen, those times are bleak. . . . If we are in doubt she will shrivel and decay, the birds will pick her bones and the mice will nibble. So let her not be 'Once upon a time,' but rater in abundance in our lifetime.

Here all E-M's magical allusions can be viewed as symbolic expressions of her inner unconscious drama and desires, which had become accessible to her through projections of herself as "free spirit." Early alchemists thought there was a spirit hidden in the darkness of *prima materia*, and Jung considered that the archetype of spirit was usually occluded by the chaos of everyday life. While she doesn't have access to the theoretical frames of Jungian psychology nor indeed feel its necessity, E-M has nonetheless access to the archetypal tropes of fairy tale and myth. She, herself, loved the surprise of this story, curious at how it emanated from apparently nowhere, and, even though not crafted, gave her a great sense of release and lightness. In "The phenomenology of the spirit in fairytales," Jung (1970) argues that "the hallmarks of spirit are, firstly, the principle of spontaneous movement and activity; secondly, the spontaneous capacity to produce images independently of sense perception; and thirdly, the autonomous and sovereign manipulation of these images" (Jung 1970, p. 90).

E-M's archetype of the spirit was her way of embodying her human quest to discover freedom, become spritelike, and rest in the psycho-spiritually foundational ground of being human. It is evident that her "sense of calling" in terms of one of the most significant archetypal motifs—teaching—is being severely challenged even at this early point in her career and, through the mask research, she declares that the work has instilled in her new ways of viewing her personal and professional life, arriving at a place where she begins forging some kind of resolution:

If I can manage my own feelings then I may instill some self awareness and emotional capabilities in my students which will give me some peace at least in my professional context where too much is mandated and prescribed for these children (in the special unit for Special Educational Needs) and at odds with my conscience.

Conclusion

Jung (1954) proposed that self-knowledge is an indispensable basis of self-education and that the route to such inner self-knowledge was by means of symbolic mediation between the conscious mind and the unconscious (Semetsky 2011). In the world of research, researchers are not psychotherapists. Consequently, it is not the role of the researcher(s) to search out the meanings or psychological significance of symbols but to act as mentor to a "sacred way of working," which acknowledges that there are no road maps in processes such as this. The researcher's role then is to act as guide, supporting the participants' searches for meaning, holding the research group as a safe space for deeper penetration, and emphasizing to the individuals that expression leading to self-understanding rather than analysis is the goal. In this way the subject herself is a partner in the research as a form of self-disclosure. Yet for the researcher, these adventures in mask-based research open up new ways of understanding the forces at play in the life of the teacher and how these might impact on professional practice.

(continued)

It is no part of the argument here that this form of psychosocial research offers a comprehensive account of qualitative research. Rather, we wish to suggest that many of the accepted accounts of educational research intended to establish forms of efficacy require supplementing with more nuanced accounts of how the self is placed in relation to the spaces of professional life. After all, the kinds of things that are likely to impede educational success are social, personal, and interpersonal rather than simplistically cognitive. Understanding how the myriad, yet archetypally grounded, ways in which individual teachers stand in the world and consequently assisting them in the exploration of the self and unconsciousness, is apt to open up new (relational) personal and professional possibilities. Moreover there is ample evidence (Day 1999) that the relational is a key component in the securing of educational research. Perhaps uncomfortably for a deeply grounded materialist culture, it is also likely to signpost the spiritual as a motive force in education. As E-M observes understanding herself carries the potential for improved understanding of her students. In this, it stands as a transgressive practice, interrogating and calling into question the normalizing homogeneous stratagems of standardized ethnographic research.

8.8 Writing and the Articulation of Disciplinary Identifications: A Psychoanalytic Exploration of Methodological Practice

Claudia Lapping

Introductory/Concluding Narrative: The Process of Production of the Paper

I want to begin with a reflection on the process of production of the paper that forms the basis of this chapter, which was originally written for the *Journal of Psychoanalysis, Culture and Society*. There are aspects of the process of production that I am not going to explore here: for example, psychical resonances or punctuations into my personal history and upbringing that, perhaps, constitute significant associative strands in my ambivalent yet persistent attraction to methodologies of non-meaning, lack, and the failures of interpretation. The process can also be traced in my interest in the way we are captured by knowledge, which was first formulated, for me, in the concept of ideology, and in Althusser's (1971) "Ideology and the State," which I encountered as an undergraduate, and which later constituted my introduction to Lacan and to psychoanalysis. These histories, associations, and practices that constitute the process of writing a research paper are enigmatic and impossible to fully capture. My introductory reflection here, then, focuses on some of the more concrete stages or aspects of the process of writing the paper, as I remember them. My intention is to notice some tensions between different aspects or experiences in the writing.

One anxiety or motivation I was aware of might be described as a concern to better understand some aspects of psychoanalytic and, in particular, Lacanian theory and to explore how these might be used in empirical research. I always feel that my understanding is lacking and that I need to read more to avoid

oversimplifying or revealing my ignorance in my writing. In tension with this is my concern not to be overly obedient to this theory and a sense that my ongoing engagement with Lacanian concepts can lapse into something that feels too dutiful, too captured by his ideas, in the place of an articulation of my own. Both these aspects—the desire for a better understanding and a desire not to submit—were present from the start, but reemerged in different stages or moments of the writing.

One starting point for the paper was a (mis)interpretation of a small extract of data: a moment in an interview where my participant, an academic, had stated quite emphatically that she “hated” it when colleagues tried to avoid teaching. My initial interpretation explored the possibility that she might be projecting her own ambivalence about teaching onto her colleagues. Initially, I was pleased with the way this seemed to trace an instance of unconscious projection and in doing so also constituted a (re)iteration of my own still tentative identification with psychoanalytic ideas. However, in discussing the interpretation first with the participant, and then with colleagues in a research seminar, I felt less convinced, and I couldn’t find additional data in the participant’s interviews to support my interpretation. Following from this, my initial idea was to write a paper that would explore how my interpretive process had been driven by a desire to identify with psychoanalytic theory. It is also worth noting that as I became less convinced by my initial interpretation, this reading of the data became more shameful and difficult for me to write about, and the initial instance of “hate” doesn’t appear in the paper. However, the notion of shame, specifically Zizek’s (2005) Lacanian account of shame as a response to a confrontation with lack, emerged as one strand or conceptual focus in the paper.

At the same time as I was thinking about my initial, shameful, moment of (mis)interpretation, and I was also reading chapters by Zizek (2005) and Butler (2005) about the (im)possibility of recognition of the other. These resonated with my attempts to trace my interpretation of my participant as not recognition but an imposition of my own insecure disciplinary identifications. In my first draft of the paper, then, I drew heavily on both these authors and the different ways they account for the subject’s experience of the enigma of the other. Their accounts of the impossibility of recognition between subject and other fitted neatly alongside my exploration of Lacan’s rejection of the notion of interpretation and his repositioning of truth in the discourse of the subject. This reading of Butler, Zizek, and Lacan enabled me to develop a more precise conceptualization of (mis)recognition, while remaining securely within a field of theory and theorists that was already familiar to me.

I submitted the first draft of the paper to the journal and received comments recommending, as I remember, major amendments. The two more critical reviewers both suggested that I needed to engage with wider methodological debates within the field and that the issues I was exploring had been discussed by other psychosocial or psychoanalytically informed researchers, whom I needed to acknowledge. I was in fact already familiar with, but inclined to dismiss, the debates the reviewers were referring to, but their comments forced me to rethink. Their feedback led me to reorient the conceptual focus of the paper from subject/other, to contrasting conceptualizations of “countertransference,” the focus of recent debates within empirical psychosocial research. These debates set up

opposing positions on the extent to which the analyst/researcher might legitimately use their own affective responses in the development of an interpretation of patient/participant. Reexploring these debates in relation to my analysis of data in the paper constituted an expansion of my previous, more abstract, writing on this topic (Lapping 2011). The additional interpretive work this involved enabled me to shift the status of interpretations within the text: to unfix and to speculate in a way that was both more independent of and also, therefore, I think, truer to “Lacan’s” ideas than the initial draft had been.

The process of engaging more seriously with other approaches helped me to loosen a fixed attachment to a Lacanian epistemological position that foregrounds ambiguous, associative features of language and is skeptical of individualized affective experience as a direct source of understanding. On reflection, I think, this identification had infiltrated my work beyond the epistemological, infecting my methodological and interpretive practice. Previously, as I suggested earlier, I had been both aware of this attachment (methodological attachments have been a central focus of my research; see Lapping 2011) and unable to find a way to escape it. At an epistemological and political level, I still react quite strongly against methodological approaches that foreground affect and recognition without paying what I consider to be due attention to the risks this poses in terms of the power to impose the interests and frameworks of the analyst/expert onto the other. However, the process of writing the paper, juxtaposing conceptions of countertransference to open up contrasting interpretive trajectories in relation to moments of data, enabled me to better tease apart epistemological and interpretive concerns.

I began the paper wanting to use psychoanalytic theory to explore some problematic aspects of interpretation in empirical research. The process of writing the paper has opened up, for me, the complicated interrelationships between epistemological and interpretive aspects of methodological practice in ways that perhaps aren’t yet fully articulated in the paper itself. They are hinted at in the contrast or disjuncture that emerges, I think, between the epistemological insistence on the dangers of interpretive authority and the similar but different interpretive itch to continually scratch at the surface of discourse.

One resource I might use to develop these ideas is Arkady Plotnitsky’s (1994) account of complementarity: an anti-epistemological practice that at the same time allows contradictory epistemologies to coexist. Complementarity, as formulated here, involves not a rejection of classical theories or epistemologies but rather their “*rigorous suspension*” (p. 11, italics in original; see also Escandon 2014). This suspension of epistemology allows and requires the constitution of radical disjunctions and associations between concepts, in a way that, rather than producing a new synthesis, acknowledges the inevitable loss, fragmentation, and metaphoricity inherent to the production of theory. Coming across Plotnitsky’s work after finishing the paper helps me begin to clarify the shift in the status of epistemology that was tentatively, perhaps, articulated in my writing. So, I am finishing this introductory reflection by looking forward to work yet to be done: to recognize epistemology at the level of methodological practice and, in doing so, perhaps to maintain the practice of interpretation in a state of rigorous suspension.

Which Subject, Whose Desire? The Constitution of Subjectivity and the Articulation of Desire in the Practice of Research¹

There is always a question about the extent to which an interpretation, in research or in analysis, articulates the desire of the researcher/analyst, as opposed to that of the participant/analysand. Is an interpretation always, to some extent, an imposition of our own discursive or psychological attachments? Is it possible to construct a relation to an other in such a way that an “interpretation” might emerge that does not simply rearticulate our narcissistic attachments to recognized identities? This paper is an exploration of the relation between subject and other. It is an attempt to keep contrasting conceptualizations of this relation in play, in an analysis of an encounter between two subjects within my recent, interview-based research project investigating academic practice. This aspect of the paper is an attempt to think through some ongoing questions that have emerged in my attempts to explore what happens to psychoanalytic concepts when they are deployed in empirical social research (Lapping 2011). My general stance has been to argue against the reification of concepts, or of psychoanalysis, or of the clinic, as a unitary origin for psychoanalytic practices or ideas. I would argue, instead, that concepts are necessarily reiterated and transformed in the process of research and analysis. So, in this paper I am raising a series of ongoing methodological questions and exploring these in relation to instances from my interviews.

My first methodological question is: how might contrasting conceptualizations of “countertransference” suggest different approaches to the process or action of interpretation within research? The epistemological status of affect and language is of central importance here. Within psychoanalytic theory significant positions are marked out in relation to the conceptualization of affect, understood either as directly accessible knowledge or as an experience that is always already culturally or linguistically mediated. These contrasting epistemological stances have implications for the direction of interpretive work and have been the subject of considerable debate within the field of “British Psychosocial Studies” (Layton 2008; Parker 2010). Broadly speaking, there is an opposition between those who articulate a naturalized, universal conception of psychological processes, who seem comfortable with the notion of an “expert” using their affective experience to produce an interpretation of an other (Hoggett 2008; Rustin 2008) and more constructionist perspectives that foreground the dangers of claims to authoritative knowledge, focusing instead on the discursive construction of the interpreting subject (Frosh and Baraitser 2008; Lapping 2011).

My second methodological question emerges from this constructionist perspective and the problems it raises for an understanding of the objectives of interpretive

¹The remainder of this chapter is a slightly revised version of a paper that originally appeared in the *Journal of Psychoanalysis, Culture and Society* (2013) 18, 368–385.

processes: how might Lacan's (1991) distinction between "interpretation" and "the action of interpretation" help us to understand the articulation of desire in the process of research? For Lacan, the analyst's interpretation constitutes an imposition of preexisting psychoanalytic theories of desire. This is in contrast to the "action of interpretation" that occurs when the analyst provokes the analysand's articulation of their own desire: "...what's important is to teach the subject to name, to articulate, to bring this desire into existence . . . If desire doesn't dare to speak its name, it's because the subject hasn't yet caused this name to come forth" (p. 228). It is only when the analyst is able to bring the subject to the point of naming (their) desire, bringing forth "a new presence in the world", that what Lacan calls "the action of interpretation" can be conceived (ibid, pp. 228–9). However, since within Lacan's framework desire is precisely that which is excluded from language, any articulation of desire is only a fragile disruption of the more rigid discursive contexts that constitute the encounter between subject and other. This leads to my next question: how might we recognize an action of interpretation in the research encounter?

Jason Glynos (2002) provides a useful elaboration of how the Lacanian action of interpretation relates to a conception of "truth," and of what this might look like within psychoanalysis. He asks: "What kinds of evidence qualify as legitimate indices of the effectiveness of the analyst's interventions?" (p. 32). He suggests that an intervention will be judged "by whether or not it facilitates the production of more material" (p. 33), which itself can only be judged in relation to the singular discourse of the analysand: the "truth" of an intervention depends on whether or not it brings about a change in the structure of a specified discourse. An additional important feature of an effective intervention is "the experience of surprise," evoked when the subject is confronted with their own unconscious formations (p. 35). So, my final methodological questions are the following: How might we bring this insight about the specificity of the discourse of an individual subject, surprise, and confrontation with unconscious formations into a practice of empirical research? And whose discourse might be the site of "truth" within research?

The paper explores these methodological questions through my provisional analysis of moments from my interviews with one academic, a participant in my project. This analysis develops an argument about the encounter between contrasting disciplinary identities, suggesting some of the complex ways in which academic subjectivities are constituted in relation to methodological discourses. We may intend to be open to new ways of thinking, but we also defend key attachments to disciplinary and professional identities. This is both my fear and my interest in this paper. I am interested in disciplinary attachments, in the ways in which they support our narcissistic desire to establish an identity and in how they might be disrupted. This aspect of the paper explores the responses or disruptions that emerge in our encounters with the radical difference of other disciplinary and methodological identities.

I'm going to develop this argument by looking at articulations of subjectivity in an encounter between myself and one participant in my study of knowledge practices in higher education. The next section introduces this project. In the

following sections I explore three instances from multiple interviews with one participant, F, a lecturer in literary studies. The first instance is extracts from my field notes. I begin by speculating on the interpretive directions that might be suggested by three contrasting conceptualizations of “countertransference”. I then look in more detail at the way the relation between subject and other is theorized in the work of Judith Butler and Slavoj Žižek and use their ideas to develop a fuller interpretation of my field notes. The second instance from the interviews comprises a series of moments in which F appeared to be exploring or attempting to name my desire or the desire of my research. The analysis traces the way her interpretation of this desire shifted in the course of the research. The final instance from the interviews is a moment where F and I were discussing a case study I had written relating to one of the other participants in the project. I use this to explore what it might mean to talk about a participant as subject of an action of interpretation that provokes a new articulation of desire within the research process.

The Project

The aim of the study was to enhance understandings of unconscious relations within institutionalized disciplinary practices. In order to do this, the methodology drew explicitly on psychoanalytic approaches. Participants in the project—eight academics in the humanities and social sciences—were interviewed eight times each. For the first five interviews, participants were asked to select a text that in some way represented their field of research, and this text acted as the initial prompt for the interview. The interviews began with participants reflecting on their choice of text, their experience of reading/writing the text, and their thoughts and feelings about it. My interventions within the interviews were intended to elicit additional meanings or associations. I also shared initial “interpretations” with participants during the interviews. These interventions were intended to draw participants’ attention to ways in which they might be idealizing, denigrating, objectifying, or identifying with aspects of their practice and to provide opportunities for them to elaborate, correct, or refine these interpretations. In practice, in the early stages of the project, it didn’t feel as if there was as much time as I had hoped to discuss and refine interpretations within the interviews, so I introduced an additional stage to the study. After the fifth interview, I wrote a detailed (10–12,000 words) case study of the first five interviews. After checking that they would be happy to read a written analysis of their words, I sent the case study to the participant, and in interview six, we discussed their responses to my interpretations. The focus/prompt for the final two interviews (7 and 8) was left open. In several instances we agreed that I would send the participant a chapter I had written that included case studies of other participants. A part of the following meeting was then spent discussing responses to these case studies.

Interpretive Directions in Contrasting Conceptions of “Countertransference”

The participant, F, whose interviews form the basis of this paper, was a lecturer in literary studies. Most of her work involved tracing connections between texts and cultural artifacts in order to “reconstruct where forms of thought come from” (Int. 2, 41:28): for example, exploring the use of metaphors of magic by literary and nonliterary authors. Much of her work was on the borders between literary and cultural studies, and she was familiar with the kinds of psychoanalytic and post-structural approaches that I use in my research. However, while I am relatively new to academia, F had been working in her field for over 20 years, and at times this difference in experience and seniority seemed to become relevant in our meetings.

The first instance of data comes from field notes I wrote following our first interview. Before this meeting F had sent an image as her chosen text. In the interview she talked about the way she felt the image in some way constituted a connection between different projects she had undertaken throughout her career. As she talked, I found it difficult to follow shifts between different projects and themes. She also talked about policy and practice in higher education, which I felt was of less relevance to my project. My notes suggest a sense of dislocation or a lack of a sense of recognition. The first thing I recorded was my sense of not having listened properly, and I speculated on possible reasons for this:

- *I felt slightly absent—not as engaged as I should be—not always following during the interview. I felt moments of being out of my depth when I couldn’t follow exactly what she was saying about her work. At one point I explicitly reminded myself to try to concentrate on her. . . but I don’t know if I did, and I’m not entirely sure at this minute why/whether that would be the right thing to do.*
- *. . . at the very beginning of the interview, F said about having just been interviewed for a longitudinal medical study. . . and how she’d wondered how anyone could possibly be interested in what they were asking her about.. she seemed to be equating my project with that. . . so perhaps I felt quite distanced/objectified. . . as a researcher in a strange other discipline. . . a social science. . .*
- *Her account [of higher education] felt rehearsed, unspontaneous, possibly defensive.*

As I have suggested, contrasting conceptualizations of affect and language suggest different understandings of the status of affective responses recorded in field notes of this kind. I want to use these extracts to explore the way contrasting epistemologies of affect and language, and conceptualizations of “countertransference,” might initiate different interpretive processes.

Some psychoanalytic approaches suggest that we might interpret our affective responses as direct signals or communications of our participants’ emotions. Racker, for example, suggests that if the analyst listens carefully, they will be able to identify with the patient’s “thoughts, desires and feelings.” He explains: “If the analyst is well identified with the patient, then the thoughts and feelings which

emerge in him [sic] will be, precisely, those which did not emerge in the patient” (1982, p. 17). This account of the possibility of communication of unconscious or repressed desire both universalizes and essentializes affective experience: it presumes that processes of identification can replicate the affect of the other and that we can distinguish an affect from its contextual relations. A slightly more cautious formulation of this conception of countertransference suggests that our experiences of affect might be interpreted as responses to the unconscious communications of the other. This foregrounds the way we respond to bodily and linguistic signals that communicate something other or beyond that which is within the subject’s conscious control. However, this still downplays problems associated with distinguishing a communicative origin of affective experience. This conception of countertransference has been adopted in various ways within psychosocial studies. Some researchers have been excessively ready either to claim identification with participants, suggesting, for example, that after working on a participant’s transcript, they might “feel inhabited by that person” (Hollway and Jefferson 2000, p. 69), or to interpret participants as controlling the affective responses of the researcher (Clarke 2002). There are also instances of more careful practice. Sue Jervis (2009) traces the physical and affective sensations that she experienced in an interview, linking these to specific elements of her participant’s account, and warns that researchers “should be careful not to make any interpretations based on the feelings evoked in them unless they are supported by other evidence within the research material” (p. 155). This echoes Racker’s warning about the dangers of becoming carried away by affective responses without carefully tracing their origin in the analytic material (1982, p. 19).

These approaches suggest that our experiences of affect might alert us to look for related signals of unconscious communication. So, my sense of dislocation in my interview with F might be a response to something in F’s own feelings about taking part in my project that she is unconsciously communicating when she tells me about her previous participation in a medical study. Or her unspontaneous, or “well rehearsed,” account of shifting practices in higher education might in some way communicate her own sense of detachment from her institution, so that my sense of rejection might correspond to her rejection of aspects of her working environment. However, the individualizing opposition this sets up between my affective responses and my participant/the other elides the multiple intersecting discursive contexts that constitute specificity of our subjectivities (Parker 2010, p. 20). As Frosh and Baraister (2008) have pointed out, the dangers of this approach, foregrounded in constructionist and poststructuralist critiques, relate to the colonizing effects of expert systems that claim to produce knowledge of other subjects.

Jessica Benjamin’s (2004) account of an intersubjective third space is one response to the difficulty of avoiding this colonizing relation of “doer and done to.” She suggests the possibility of creating a position of “thirdness” through a recognition of the inevitability of mutual influence that can help us to move beyond interpretations that depict one subject of the relation as imposing on the other (F imposing her affect onto me; or me imposing my interpretation onto her).

Benjamin argues that the ability to accept our own inevitable contribution to communication with the other “opens the space of thirdness, enabling us to negotiate differences and to connect” (p. 11). This shifts the meaning of interpretation:

Rather than viewing understanding – that is, the third – as a thing to be acquired, a relational view sees it as an interactive process that creates a dialogic structure: a shared third, an opportunity to experience mutual recognition. (p. 23)

In order to create this dialogic structure, Benjamin suggests that at times analysts might need to be able to communicate their own failure and vulnerability in relation to the interpretive process to their patients (p. 32). Returning to the question of my interpretation of my field notes, the relational approach that Benjamin proposes would foreground the way that F’s communications in the interview were inevitably structured in response to communications from me. It would suggest that one way to explore the meaning of my initial responses to F, to shift them from the “complementary” doer/done to dynamic, might be to share the interpretations represented in the field notes in order to develop a dialogic shared third.

The Lacanian perspective is similar to the relational approach in recognizing the dangers of imposing interpretations onto other subjects. However, in contrast to Benjamin, Lacan does not see this insight as the basis for reconceptualizing recognition, but rather as necessitating an alertness to *mis*recognition. As Bruce Fink suggests: “Lacan’s perspective is not that countertransference feelings do not exist, but that they are always and inescapably situated at the imaginary level and thus must be set aside by the analyst” (Fink 1995, p. 86). The claim that these feelings are “situated at the imaginary level” implies that they are always a misrecognition, at least in so far as they may be taken to indicate the feelings or unconscious of the other. For Lacan, the unconscious is revealed not through affect, but through symbolic relations. He shifts the emphasis of the training from the analyst’s receptiveness to affect to the analyst’s duty to disrupt imaginary recognitions, in order to situate experiences of affect as signifiers within the symbolic register. The symbolic register is a register of ambiguity rather than fixity, of incompleteness rather than closure, and a register that allows for the flow of desire across signifiers, rather than insistent, repetitive demand for “interpretation, recognition, approval” (Fink 1999, p. 26). From a Lacanian perspective, Benjamin’s suggestion that the analyst might share vulnerabilities with the patient in order to “experience mutual recognition” constitutes an imposition of the analyst’s demand onto the patient.

A more Lacanian approach to interpreting my field notes, then, requires me to shift my understanding of my sense of dislocation into a more symbolic register. In order to achieve this, it is necessary to sketch out some aspects of the signifying context of my interviews with F. This includes the discourses that constitute the “psychosocial” methodology of my project, the current institutional context of higher education, and, most significantly, the discourse of literary studies.

While it might be presumed that some mode of attachment to signifiers of literary studies is constitutive of F’s identity, I also have a relation to this discursive

field. My doctorate was an investigation of undergraduate literary studies modules, and my experience of the lecturers' facility in tracing complex chains of meanings within and across cultural texts left me with a sense of something tantalizingly beyond me in the interpretive processes of contemporary literary studies. My ambiguous feelings about my first meeting with F, then, might relate to my position in-/outside the contrasting disciplinary discourses of social science and the humanities.

So when, at the beginning of our first meeting, F's account of her previous experience of being interviewed constructed an association between my project and her interview for a medical study, I felt in some sense emptied out, not recognized, or too well recognized as someone on the outside of literary studies. At the same time, I found it difficult to follow F's account of her work, reiterating my sense of exclusion. The context of the interview might thus be said to have constituted a web of signifiers that fixed existing discursive identities, blocking the movement of affect across signifiers that might allow for a shifting of subjective positions within the interview. This blocked desire found articulation in my slightly negative responses to F, recorded in the field notes. This approach constitutes my sense of "dislocation" as a signifier, rather than taking it as a direct experience of affect, and thus understands it not as representative of itself but in symbolic relation to other elements in the discursive terrain. That is, my consciously felt affective response to F during the interview encounter is understood as a representation of a displacement of an excess of affect that escapes discursive articulation. It is a misrecognition articulated as a demand. This interpretation can be extended if we explore the theorization of the impossibility of the relation to the other a little further.

The Failure of Castration: Lack and Other(ness) in Disciplinary Identities

In order to develop my interpretation, I am going to draw on Judith Butler (2005) and Slavoj Žižek's (2005) conceptualizations of the relation between subject and other(ness) and of the disruptions that might emerge in our encounters with the radical difference of the other. For both these authors, rather than recognition, the relation to otherness implies a confrontation with lack, with the discursive limit to my subjectivity, and with the impossibility of knowledge of the self as a unified entity. For Butler, however, while direct recognition necessarily eludes us, it is possible to recognize a universally unknowable aspect of human subjectivity in our relation to an other. For Žižek, in contrast, the encounter with the other is an encounter with a specificity that is radically nonhuman. I will elaborate these two conceptualizations of otherness a little further and then come back to the extracts from my field notes.

For Butler, the social/the other is constitutive of the subject but also leaves an unknowable excess, an opacity within the subject. It is this unknowable, excessive

quality of the material out of which we are constituted that, she suggests, might also constitute an ethics of recognition based on the unknowability of the other: “It would be, perhaps, an ethics based on our shared, invariable, and partial blindness about ourselves” (Butler 2005, p. 41). This “blindness” relates precisely to that part of myself that is constituted from the overwhelming imposition of otherness that brings me within the realm of the social. Butler’s argument here draws on Laplanche’s account of the initial formation of an individual subject: “Jean Laplanche contends that the limit to full articulation arrives [. . .] because of the overwhelming and enigmatic impressions made by the adult world in its specificity on the child” (p. 70). This account is suggestive of the materiality of the unformed subject’s uncomprehending experience of the social world of the adults/others with whom they interact, and, crucially, it foregrounds the impossibility of these impressions being fully articulated in the emergence of the subject. Butler suggests that this impossibility constitutes the basis for our relation to the other in the transference. She says: “What emerges as enigmatic within the transference, then, is a residue of a primary situation of being overwhelmed that precedes the formation of the unconscious and of the drives” (p. 71). The relation to the other is here formulated as key not just to the formation of subjectivity but also to its persistent, enigmatic, unknowability.

It is easy enough to assert an understanding of this opacity within the subject, but, Butler seems to suggest, it can perhaps be evoked in its specificity when we attempt to narrate ourselves before another subject. She suggests that psychoanalysis offers a model for this encounter and describes the effect when this relation to an other who might receive ones words breaks down:

Subjects who narrate ourselves in the first person encounter a common predicament. There are clearly times when I cannot tell the story in a straight line, and I lose my thread, and I start again, and I forgot something crucial, and it is too hard to think about how to weave it in. I start thinking, thinking, there must be some conceptual thread that will provide a narrative here, some lost link, possibly some chronology, and the “I” becomes increasingly conceptual, increasingly awake, focused, determined. At this point, when I near the prospect of intellectual self-sufficiency in the presence of the other, nearly excluding him or her from my horizon, the thread of my story unravels. If I achieve that self-sufficiency, my relation to the other is lost. I then relive an abandonment and dependency that is overwhelming. (Butler 2005, pp. 68–9)

As I understand it, in this passage, Butler is trying to articulate the way the experience of the trace of the other is evoked at the point at which she, perhaps in therapy, in the presence of an other, attempts to provide a self-sufficient account of herself and at that moment is invaded by overwhelming affect. She constructs an association between this emergence of affect and her dependency on the other to receive her words, in order to constitute or affirm her subjectivity. This, then, is the transference: the reiteration of the original overwhelming constitutive relation with the other that is both formative and incomprehensible. It is through this encounter, Butler suggests, that it might be possible to constitute an ethical relation that does not exploit the other, by coming to recognize the other as an unknowable constituent of the self.

For Žižek, in contrast, the other evokes that *specific* excess that is excluded from the discourse of the subject. He suggests that what is evoked in the encounter with otherness is the inhuman excess associated with *jouissance*; and he describes the nightmare quality of an encounter with an object that might best be understood as that which is both beyond subjectivity and its eternal/external mark. Otherness is thus “*jouissance* embodied” as both “that which we can never attain *and* that which we cannot ever get rid of” (p. 164). In other words, the other reminds us of that which was both excluded and not fully excluded in the constitution of our subjectivity, on entry into the symbolic order: it is the failure of castration, the hidden shame of the human subject. He explains:

...shame displays a desperate attempt to keep the appearance: although I know the truth (about castration), let us pretend that it is not the case. This is why, when I see my crippled neighbour “shamelessly” pushing toward me his disfigured limb, it is I, not he, who is overwhelmed by shame. When a man exposes his distorted limb to his neighbour, his true target is not to expose himself, but the neighbour: to put the neighbour to shame by confronting him with his own ambiguous repulsion/fascination with the spectacle he is forced to witness. (Žižek 2005, p. 171)

This shame is ambiguous, focused not only on the fact of being castrated but on the failure of castration, in what is left behind, the continuing fascination with the possibility of *jouissance*, and thus the failure of castration to fully impose the law.

For Žižek the ethical stance is thus not to recognize or construct some commonality between subjects but violently to disrupt individualized, humanized relations by introducing the specificity of the faceless “thing” that had to be excluded in the constitution of my subjectivity. In contrast to Butler’s somewhat humanistic elevation of the subject as a primary point of recognition, even in its very unknowability, we might see a more theological humility in Žižek’s account of our subordination to an excess that we cannot capture in terms of individualized human identities. Alternatively, we might see Butler’s position as one from which it is possible to let otherness be, while Žižek reiterates the Lacanian itch to continuously scratch away at the surface of discourse.

So, in so far as literary studies constitute a specific other from which my subjectivity is constituted, and in so far as there are opaque aspects of literary studies that cannot be articulated within this subjectivity, it might be said that my interview with F evoked a disturbing otherness. This experience of otherness confronted me with my incompleteness, the gap in my ability to perform as researcher, and a certain, inevitable limit to my ability to concentrate on or attend to my participant. Because I don’t understand F, because I am in a sense overwhelmed by her otherness, I attribute my lack to her: *she* reduced me to a dull social science interviewer; *she* was being defensive (when in fact it is the unconscious relations between signifiers that constitute these interpretations). It is thus possible to see the research encounter as an analogy for my attempt to constitute an identity as a researcher. As Butler suggests, it is when I attempt to narrate myself as self-sufficient, omnipotent researcher while in the presence of an other that I am suddenly overwhelmed by a forceful affective experience of lack. This experience of lack is articulated, I think, in a sense of confusion as I am writing the field notes: “At one point I explicitly reminded myself

to try to concentrate on her. . . but I don't know if I did, and I'm not entirely sure at this minute why/whether that would be the right thing to do."

In some ways this encounter with the specificity of our ignorance, our unknowingness in the process of research, seems to me to be absolutely what we should be aiming for, as we investigate something that, from a Lacanian perspective at least, cannot be known and has not yet been articulated. If we don't at some points experience this kind of dislocation, methodological attachments may become fixed, in a rigid fantasy of control. However, there is a question about what we do with this dislocation. For Butler, it indicates, perhaps, a possibility of recognition of a similar overwhelming lack in the other (my participant, F, or the field of literary studies). For Žižek, it comes with an ethical demand that this very specific otherness—which is in no way similar to me—be allowed to disrupt the established discursive order (Žižek *ibid.*, pp. 137–8). In this instance this demand to scratch at the surface of discourse might require me to allow the terrifying or incomprehensible aspects of literary studies to enter into my practice in the field of social science research.

The final two sections of this paper look at two instances from my interviews with F where this struggle over discursive boundaries to disciplinary identities emerged in slightly different ways.

Relations to Signifiers of the Disciplinary Other: Identifying, Naming, Rearticulating?

Complex reiterations and disruptions of disciplinary boundaries were articulated throughout F's interviews. Sometimes these related to F's engagement with other disciplines. She seemed both fascinated and surprised by the questions that occupied them, and her account shifted between denigration and idealization of their practices. In other instances F's exploration of disciplinary boundaries seemed to relate to my own work and an attempt to name my desire, or the desire of the research. In these instances, it appeared possible that just as the interpretations of the analyst articulate desire as reiterated demand, so F's interpretations of the project reveal something of her own reiterated demand for recognition. This appeared to relate to her overwhelming sense of institutional pressures.

In our first interview, when she was describing the pressures to publish and the impact that had on her field, F made a reference to what my other participants might have told me:

I've been around before this kind of real pressure descended on us, and there was a time when, in my field – I'm sure your other interviewees have said this or will say this to you – that you could know your field. (Int. 1, 25:20)

There are several interesting things about the parenthetical interjection in this extract. The fact that it emerges at all is suggestive of the way a concern about the nature of my project hovers nearby, punctuating the interviews. More specifically,

this concern is articulated as a comment relating to institutional pressures. While there is an explicit identification with other participants in the aside, there is also an identification with me/my project. In a sense F is naming my project here, suggesting what it might be about the kinds of things participants might say and therefore, implicitly, the kinds of things that I might be interested in. What is foregrounded and generalized in this identification is the institution, or institutional pressures, while other possible aspects of both the participants and the project are momentarily obliterated.

F's interpretation of my project seemed to shift significantly as the interviews progressed, and she drew on her ongoing experience of my responses in our meetings. For example, when she was talking about her participation in a multidisciplinary seminar where there had been a discussion of the ethics of ethnography, she speculated about a "voyeuristic desire, something that is about your own pleasure and being able to look upon the practices of these others" and suggested "they're your fundamental questions aren't they? Why do we do it? And how do we feel about it?" (Int. 5)—naming my desire/the desire of the project. In interview six, when she had read the case study based on her own interviews, she began by commenting: "It's interesting. None of it's a surprise, really, I think." This apparent refusal of difference suggests, perhaps, an attempt to occupy the desire of the other, my project in this instance. It replicates, perhaps, the interest F also showed in other disciplinary fields, rearticulating their questions, subsuming their interests within a language that she could control. One way of dealing with the disciplinary other seemed to be for her to take the position of subject within the interpretive process.

This is, of course, my interpretation, an imposition onto a brief moment in F's discourse. One aim of my approach throughout the project was to find ways to disrupt my own interpretations. In line with this, in interview 8, when I was in the early stages of writing this paper, I told F my provisional thoughts about her attempts to interpret the project. She reflected:

Perhaps the process starts off with me wondering what's required of me. And then once you'd shown me the work that you'd done, and then I get some sense of what you're doing with it, and that's sort of revealed, isn't it? And then I suppose it's that reflection on whether that's what I thought I was doing, and whether it's a surprise that it comes out in that way, or it's a surprise that those things come out of it. Yeah, it does make sense. (Interview 8, 03:35)

I wonder if this moment of joint reflection on my interpretation in some way corresponds to Benjamin's account of the construction of a dialogic space: Does this represent an open negotiation of our differences, in which we, momentarily, experience recognition? Or does it reaffirm the ongoing unraveling of the attempt to interpret? Where Benjamin's approach suggests we might allow this exchange to rest, as a momentary construction of a dialogic, shared third, Lacan directs us to scratch at each signifier for eruptions of affect and exclusions of meaning. We might, for example, note F's repetition of the signifier "surprise," which I hadn't used in summarizing my interpretations to her, but which had appeared in the previous interview. F's use of the word again here might suggest that this signifier

captures something and that it perhaps covers over a more complex affect in her relation to knowing and not knowing.

It is thus worth noting the way alternative psychoanalytic frameworks might suggest contrasting interpretations of F's relation to other disciplines. A Kleinian interpretation might foreground the reparative aspect of her interest in my project and in other disciplines, as in some way making up for her more negative fantasies about their oddity or lack of worth. A more Lacanian interpretation foregrounds the way F's very identity is bound up in the discursive constitution of literary studies, suggesting the dangerous territory of nonidentity that she enters when she trespasses into other fields. However, in order to explore the specificity of F's unconscious relation to these other discursive identities, we would need to explore her own articulation of what this might mean to her. When, later in interview eight, I suggested that her interest in other fields might be understood as "your own kind of colonial expansion" or "a kind of acquisition," she reflected:

I don't know which way round these two things come, but I hate ignorance, and any kind of unfounded statement, kind of proclamation, and unquestioned assertions of things. And I really, really dislike it, in a disproportionate way, when people say things like, "well, this is the case," "global warming is this." And I think I have a responsibility not to say things like that or to let things like that go unchallenged. (Int. 8, 17:15)

This initial, provisional account of her relation to ignorance opens up a possible direction that might produce an action of interpretation and a new articulation of F's unconscious associations to knowledge, to ignorance, and to other disciplines.

The Action of Interpretation: Disrupting Disciplinary Boundaries

The final instance I want to explore suggests how our encounter within the research process might have constituted an action of interpretation—in Lacanian terms—that, momentarily, allows desire to speak its name.

As I have suggested, the study was designed to enable participants to engage in the interpretive process: the multiple interviews, the case study, and the possibility of reading and responding to the chapter with case studies of other participants. Although this had been in my mind in designing the process, I had not fully thought through how I might respond if a participant fully took up this offer that I felt I was making, to explore what the project means for me. In the event there were moments that felt quite dangerous, when I was drawn into/enjoying the opportunity to engage in speculative conversations about one participant with another. These moments foregrounded questions about the ethics of interpretation of human subjects; they seemed to break some established boundaries, offering a moment of disruption to disciplinary discourses/identities. In a sense they constituted a liminal space in which the desire of the project was not in the possession of either myself or my participant.

One instance in which I was confronted with the instability of my position came in interview 7, when F had read summarized case studies of three other participants. She had been talking about her response to “Andy,” a lecturer in cultural studies, who was also an animal activist and a vegan. She began by speculating on his feelings about bringing his politics into his academic research and teaching. She then raised a question about the way I had interpreted his account of his writing. Andy had talked about the pleasures of writing but also about what he described in relation to one piece of work as “the fantastically anal way I structured the project.” This involved deciding a structure in advance—possibly generated from a literary source or a conceptual framework—and then rigorously sticking to this preconceived structure. F suggested that there might be further possible interpretations:

F: Yes. And I thought his stuff about writing was interesting, production, that very – producing, it doesn’t matter what it was, just the writing pleasure that – Is that something that you’ve thought through in analytic terms, about what that is? Because you’ve sort of thought about it as a relationship between form and content [. . .] but it seems so Freudian. It seemed much more like a kind of, *jouissance*, didn’t it, that he was describing. (Interview 7)

In my memory of this moment, I felt discomfited by the sense of the inadequacy of my initial interpretation and also immediately felt that F’s interpretation was far richer than my own. When she suggested that there was a Freudian interpretation that I had not explored, I attributed to her a far greater understanding than my own—the signifier “Freudian,” for me, both obscuring and challenging. There was a sense, at several moments in this interview, in which I was being positioned as student and I was consciously trying not to either resist or conform to this positioning. However, F’s reference to other possible interpretations of Andy’s writing evoked an overwhelming flood of ideas and questions and excitement at the possibility of talking about these, as well as insecurities about my grasp on these not yet formulated thoughts, some of which I had deliberately left aside because of various “ethical” difficulties I associated with this line of analysis. Where F had referred particularly to Andy’s account of the pleasures of writing, my garbled response raised the possibility of a relation between his use of preconceived structures in his writing and veganism as a mechanism for control:

CL: Yeah, an abstract – it’s also about – I haven’t thought it through, but the whole notion of veganism and the reason for veganism, the reason for animal activism, there’s something quite similar in that. There’s something similar in this kind of control and having a system to direct you, once you’re a vegan you know what you’re doing, that’s kind of – I don’t know if this is what you? – And when he talked about the ‘why’ – I can’t remember if this came up in one of the late interviews, some kind of an account of how he became – what is it? Is it, in fact, an affection for animals? And he presented it as a pure rational argument, he said, ‘the animal activism is because I thought about it and it was the right thing.’ I wasn’t expecting that kind of refusal of affect there, and that, to me, felt – it resonated with this abstractive structure, which isn’t really an abstractive structure, because there is something underneath it, why would you – I can think through the rationality of veganism and I’m still not a vegan. So, there’s obviously something else, there’s that sort of other thing that’s kind of driving this slightly –

This intervention feels like a garbled tumbling of ideas. First I refer to reasons for veganism—meaning, I think, psychoanalytic interpretations, which I had briefly discussed with Andy and which I was aware that he found reductive and not particularly helpful. Then I make a direct appeal to F—“I don’t know if this is what you?”—seemingly wanting some sort of affirmation of this idea. In the next sentence I leap to another moment in my interviews with Andy, where I had been surprised by an apparent resistance in his account of why he became a vegan. I’m also coining this odd word “abstractive.” At the end of the extract I seem to make a link back to something like the unconscious or, perhaps, F’s reference to “jouissance.” This inarticulacy is suggestive of something not yet named, a desire waiting to be spoken.

In the following interventions F seemed to articulate a coherent version of ideas I had failed to formulate, talking about eating and the codes of what goes into/out of the body. I interrupted to make a link to Andy’s use of the term “anal,” and we appeared to come to a moment of shared interpretation, when F responded:

Yes, absolutely. It’s just what I was thinking about him. (Int. 7. 26:41)

Whether or not our interpretations of “Andy” might constitute a productive line for further analysis, there were several troubling aspects to this exchange. As we both interpreted this human subject in my research project—and there is something truly repulsive in this appropriation—we lose aspects of our own identities as neatly castrated disciplinary subjects. I am displaced from researcher to student; F is displaced from participant to tutor; but, further than either of those, we are both detached from the regulative security of our usual disciplinary boundaries. My garbled intervention might be interpreted in terms of Žižek’s account of shame as respect for castration, “an attitude of discreetly covering up the fact of having been castrated” (Žižek 2005, p. 171)—the “scientific” origins of social science forbidding the imaginative associative excesses of literary interpretation. This moment in the interview confronts me with both my inadequate, castrated knowledge and my inability to conform to the codes (self-) imposed by the castrating regulative context of my research. F’s fluency in articulating her speculative interpretations evokes and reveals my own ongoing fascination with the shameful excluded other that I have not been able to completely cast out from my practice: the failure of castration, as Žižek describes it. The castrating boundary between empirical social science and literary studies is ruptured in our exchange.

While it is easier, in a sense, for me to document my own shame in confrontation with otherness, it seemed that F was also troubled by the rupture constituted in our exchange. As we continued to speculate, she made an interjection that reaffirmed or attempted to reaffirm disciplinary boundaries:

F: Yeah, it’s very – if it were a literary text, if he was a literary text, that would be what I was thinking about. (Int. 7, 33:24)

The formulation of this intervention constitutes a striking repair to disruption of this boundary: the conditional “if” obliterating the already articulated speculations. It foregrounds something of the liminal and potentially violent nature of the

interview space: a space that, in this instance, actualizes an otherwise conditional disruption of our specific subjective discourses, allowing for the fragile emergence of new material. What happens when we are confronted with this evidence of the unconscious limits to our subjectivity? Can we accept these new eruptions of desire? Or do we need to obliterate them immediately to reassert the established orderly boundaries between subjective/disciplinary identities? The shame we experience in the encounter seems to work against the action of interpretation that evoked this disruptive articulation of the new.

Conclusions

I have been trying to draw attention to the shifting locations and modes of articulation of desire within the research process. In the context of research, I have suggested articulations of desire might be understood as tussles over its location in the possession of the researcher or of the research participant: Who can name? Who can bring forth a new articulation? Whose desire is the object of investigation and what does it mean to posit the desire of a subject as such an object? By positing the participant/project as the subject of a Lacanian action of interpretation that can bring the researcher to the point of a new articulation, we can begin to shift our understanding of the position of desire within research. However, it is also important to recognize—as Žizek suggests—the shame that is associated with a new articulation that confronts us with the unconscious limits to our subjecthood. This explains the rapidity and relief with which we retreat to more comfortable, discursively established identities.

This is important because, if we accept this Lacanian insight, it can help us to clarify the political objectives of research. In the Kleinian tradition there is a politics of reparation between distinct identities, and Benjamin's relational approach suggests a possibility of working towards an "authentic," co-constructed thirdness. In contrast, the Lacanian/Žizekian politics of disruption foregrounds the intense difficulty of moving beyond established discursive identities. This foregrounding of powerful unconscious attachments also points to the impossibility of controlling the effects of our interpretations. No framework can predict, and it is partially towards the seductive illusion of control inherent within reparative or relational approaches that Lacan's disruptive politics is addressed.

Finally, it is worth noting that a mode of this disruptive or shameful troubling of boundaries is also in play in the attempt to work with contrasting theories of psychoanalysis. I wonder if this is why we find it so difficult to engage productively across epistemological frameworks: our commitments to the epistemic status of different materialities act as guarantor to our academic and professional identities (Lapping 2011). However, while consideration of epistemological issues can help us to clarify and refine our engagement with

(continued)

research data, it can also distract us from an interest in the material itself. Any framework will produce unconvincing interpretations. Lacan may say we should attend to the specific discourse of the subject, but, as others have noted (Parker 2010), a Lacanian conceptual vocabulary is no guarantor that we will do this. My experience of the fixing and unfixing of interpretations in the process of writing this paper simply confirms how obvious this should be: that what is at stake in research is the attempt to keep my own desire in flow, to avoid the sedimentation of desire into a claim to know. To do this it may sometimes be necessary to stop the continual undoing, to pause, and let the words of the other be.

Acknowledgments Many thanks to Morwenna Griffiths for inviting me to rethink this paper; to the editors and reviewers at *Psychoanalysis, Culture and Society*; and to Zoe Charalambous, Arturo Escandon, Jason Glynos, Angela Kühner, Sara Matthews, Ian McGimpsey, Diego Santori, Laura Teague, and Angie Voela and Natasha Whiteman for their incredibly useful contributions. The ESRC funded the research project that produced the data analyzed in the paper.

8.9 Strange Attractors: Myth, Dream, and Memory in Educational Methodology

Alan McManus

Academia and the Art of Memory

It was my intention when writing my doctoral thesis on education (*Alchemy at the Chalkface: Pirsig, Pedagogy and the Metaphysics of Quality*) that it would be useful. While the academic adage, “there is nothing so useful as a good theory,” may be true, academic language is often dry as dust and meaning can be lost in rarefied concepts. This may seem a strange comment from one who spent 6 years (re)writing 92,000 words on metaphysics, and I do not claim that my writing is especially entertaining, but I have tried to make it memorable. Having taught English language for years at home and abroad, I appreciate the smoothness of a well-turned phrase and the jarring effect of a mixed metaphor. But good academic writers also know when to break the rules for rhetorical effect and will not slavishly follow the word order of grammar rules designed for Latin and not English. Indeed the revival of rhetoric among critical theorists such as Terry Eagleton¹ is leading to a reappraisal of the rigidity of academic writing style.

Even so, dialecticians’ distrust of rhetoricians is ancient. Philosophers tend to see Socrates as a martyr for the truth discovered by dialectic, executed for his opposition to rhetoricians. This distrust is not limited to philosophers but to the many academics and professionals who situate themselves in the tradition of Socrates’ condemnation of rhetoric, a condemnation continued by Plato, founder of the Academy. Critics of this continuing tradition see the “spin” of politicians today as utilizing the same sleight-of-word techniques used by glamorous *rhetors* in the Athenian *Agora*.²

¹ See Richards 2008, pp. 156–161.

² Richards (2008, p. 10) critiques “political journalists whose dismissive view of rhetoric as ‘spin’ makes them inattentive to the persuasive strategies that they also use casually every day.”

Given the huge loss of military and civilian life which the emotional and non-factual use of language in the UK and USA has recently caused abroad, and given the fact that most of the political “spin doctors” responsible are still very publicly operating at high levels of political power, condemnation of rhetoric may seem justified. Rhetoric is a major theme in the work of Robert M. Pirsig (1999, pp. 359–381), and, to do it justice, I discussed it throughout my thesis. Without anticipating that discussion, I felt that my use of a rhetorical technique (a mnemonic system to structure the argument) needed, in the Introduction to my doctoral thesis, an *apologia*—especially as this system has, today, a low academic repute—and it is from that section of my thesis that this first part of the present chapter is derived.

Academic repute, of academics or of their ideas, while supposedly deserved by intellectual prowess, is a *social* value. It is one of the main functions of rhetoric to propose an intellectual argument in such a way as to overcome any contrary social prejudice. The history of scientific revolution provides famous examples in Galileo Galilei and Charles Darwin of both the support and the obstruction, by changing social values, of evolving intellectual values. The mob, the Church, the market, the state each and all may fight for ideas which are convenient to them (at one time) and against the same ideas (when they are not). Rhetoric becomes a necessary defense of an idea when the idea is perceived as “incredible” because it is against the mood of the mob, the *sensus fidei*, the force of an the market, and the concerns of the state. When these values are in support of an idea, rhetoric is unnecessary: the idea is “commonsense” and need only be stated as “obvious.”

Mnemonics are useful because they make argument and knowledge memorable. Familiar examples of mnemonic phrases are as follows: “Every Good Boy Deserves Fun” (for the lines of the treble clef) and the various versions (some more vulgar than others) for kingdom, phylum, class, order, family, genera, and species. *The Art of Memory* by Frances Yates (2001, pp. 17–41) describes the classical application of the art: the imagination of a theater or palace of memory where *topoi* (“places” in Greek), perhaps under an arch, are repositories for themes or items to be remembered. Images (imaginary or material) in those places would locate, group, and sequence the “topics” to be declared. A method would spread with its success, and when different orators used the same topics, they became known as “common-places.” Commonplaces are “vulgar” because they are known to the “*vulgo*”—the population as a whole. The mnemonic system employed must be memorable; therefore it must be reasonably well known. The rosary and the Stations of the Cross (the latter involving a physical peregrination of the topics) are Catholic examples of the use of mnemonic images, while the trumps of the tarot and the Decans of the zodiac, once famous sequences of images, are now “esoteric.”

For a thesis on education as alchemy, my first choice (as the stages of alchemy are variously described and ordered and in any case known to few) was the periodic table. Primo Levi’s book of tales by this title is a lovely, funny, and moving example of a selection of tales each one based on an element—but in no particular order. Order is as crucial to mnemonics as liveliness (see Yates 2001, p. 97), and as I wanted to start with lead and end with gold (preferably encompassing mercury, sulfur, silver, and salt), this would have involved over 70 elements. And who,

nowadays, apart from industrial chemists and science teachers, knows their periodic table? Therefore, as elemental alchemy can involve the transformation of lead to gold, I chose instead the traditional rulers of a set of seven elements (or compounds). This set includes those two elements (lead, tin, sulfur, copper, mercury, silver, gold): the five planets and the two luminaries known to the ancients. These planets are: Saturn, Jupiter, Mars, Venus, and Mercury; the luminaries (light bearers) are the Moon and Sun,³ respectively. These seven rulers named my seven chapters (subsequent to my Introduction), and I allocated topics to a chapter according to the correspondence between the topic and the ruler.

In English and in many other European languages, the traditional rulers of the planets are Græco-Roman deities, whose mythology is multitudinous with images. I chose and then sequenced certain of these images, not in accordance with any inherent logic but rather with their ability to personify and link stages of my argument. Images for the chapters of the two luminaries are of alchemy (the Moon) and of gold (the Sun). Each ruler (chapter) has five images. Under each image are grouped the topics of my thesis. The fifth image of each ruler is what is commonly known as a “sun sign”: a place through which the sun “passes” on the ecliptic—its apparent yearly orbit around Earth. “Sun signs” are more formally known as “constellations.” The name denotes a group of stars (star is *stella* in Latin). There are 12 constellations and I employed them not in their usual order (Aries–Pisces) but in a sequence according to their rulers. The five planets each rules two constellations; the two luminaries each rules one. The 12 constellations are, following the above-explained order⁴, Capricorn and Aquarius, Sagittarius and Pisces, Scorpio and Aries, Libra and Taurus, Virgo and Gemini, Cancer, and Leo.

These 12 constellations are each traditionally associated with fairly well-known personality types or characters, which I used to illustrate my argument. These characters may be imagined as *extreme* examples of the variety of teachers found in school staffrooms (or department/faculty “bases”). They are intentionally stereotypical, as their mnemonic value depends on them being vividly drawn (*cf.* the traditionally very disturbing images of the zodiacal “Decans”). It is important to remember, even when contrasted or opposed, that each character is portraying values which—together and in harmonious relation with all the other characters—can compose Quality. Quality arises under certain conditions and the various topics discussed concern these conditions, especially as they occur in schools.

My use of the passive voice above “the variety of teachers *found* in school staffrooms,” masks the subject of the sentence. *I* found this variety of teachers in

³ Another traditional order, the “Chaldæan,” has the Sun between Venus and Mars. Both of these astrological orders are geocentric. See Couliano 1987, p. 131. The order I employed has the advantage, for a thesis on alchemy, of starting with the ruler of lead (Saturn) and progressing to the ruler of gold (Sun).

⁴ For each planet I started with the constellation traditionally known as its “day house” and then that known as its “night house.” The scheme works for either the “natural” or “tropical” zodiac—i.e., for constellations of differing or even lengths of ecliptical circumference (respectively). See Campion 1989, p. 35.

schools in Scotland, Mexico, Brazil, Spain, England, Italy, Turkey, and Greece, since starting teaching in 1990 (the order of countries is chronological of first employment). I started by teaching English as a foreign language in small private schools abroad and on summer courses in the UK and then in 1996 did the autumn term of a PGCE (Postgraduate Certificate in Education) and returned to EFL and care work and then did a full PGDE in 2005 (“diploma” and “certificate” are basically identical). One course was denominational (Roman Catholic) and the other non-denominational; both studied in Scotland. A result of this variety of employment was a rich pedagogical experience which, spanning two decades and the western hemisphere, would have been difficult to present as formal (auto) ethnographic data. This experience informed instead the passages which illustrate this variety of teachers.

Epistemology and Narrative Flow

An example of the mnemonic structure of the thesis may clarify its purpose and value: Chapter 1 is named “Saturn/Κρόνος,” first in this sequence of traditional rulers of elements and compounds. Saturn rules lead the base metal for much elemental alchemy. A traditional image of Saturn is “Old Father Time,” with his scythe of adamant associated with age and death—cutting off life from a body as a farmer cuts off stalks of wheat from their roots. Saturn is also associated with breakdown, caution, coldness, colorlessness, contraction, control, cutting, division, gloom, isolation, justice, knives, locks, melancholy, narrowness, negativity, obsession, pedantry, pessimism, rectitude, restriction, rigidity, sharpness, skeletons, structure, tension, thrift, weakness, and wounds.

The first image I employed in Chapter 1 was the “knife,” also an image Pirsig uses to illustrate the epistemological partition of knowledge into a hierarchy of concepts. Under this image I gathered together related topics of political and philosophical divisions analyzed (literally “cut”) by an epistemological knife, dualism, obsession, and nervous breakdown. All of these topics have Saturnine associations. Even the term schizophrenia (the diagnosis for Pirsig’s former mental state) literally means “ripped personality.” These topics were not only grouped by mythological association for mnemonic value: this association is highlighted by Pirsig as the origin of culture and therefore of philosophy. As “Quality is the *generator* of the mythos” (Pirsig 1999, p. 351, emphasis original), so too the *logos* (the rational order) is also generated by Quality—but born from the mythos. That we cannot recognize this is because we believe so devoutly in a modern “scientific” mythos. Therefore, only an ancient “prescientific” mythos will seem mythological (*ibid*, p. 373).

The topics in each chapter are associated with its main argument and also prepared for the further development of the argument in subsequent chapters. Grouping topics under images of Græco-Roman deities organized them and brought out the mythological associations which philosophers, ancient and modern,

debate. As the argument developed, it became apparent that the topics positioned at the beginning of the thesis allowed the stage to be set for Pirsig's philosophical and fictional performance. Other topics provided a backdrop to today's philosophical conflicts, with metaphysics highlighted and the *dramatis personæ* of Pirsig's first novel presented. As the argument progressed, image by image, the backdrop changed or different parts of the backdrop were highlighted as either Pirsig's fictional characters or my fictional teachers came onstage to embody the developing argument.

As the 35 images (5 in each of the 7 chapters) were chosen and sequenced to carry forward the argument, they provided at once the branches of an epistemological hierarchy and the tributaries of a narrative flow. The two constellations/characters for each of the five ruling planets (10) and one for each of the two luminaries (2) gave a total of 12. The number 12, in many European and Semitic languages and cultures, has connotations of plenitude and completeness.⁵ In personifying the argument, the constellation characters functioned both as exemplars and explanation. In each case, the constellations employed were not totally coterminous with the juxtaposed argument they illustrated; however the richness of the symbolism allowed me to choose those characteristics of the constellation which best highlight these juxtapositions.

Author and Authority

For a thesis which discussed, and consciously employed, rhetoric, obviously the issue of authorial voice was important. The first two chapters discussed the polyphony of Plato and the contending voices of Pirsig. While it would be possible—and perhaps illuminating—to conduct an *ad hominem* critique of Pirsig, my line of enquiry was in keeping with his authorial request that his narrative “must be regarded in its essence as fact” (Pirsig 1999, Author's Note). Therefore I focused on the narrative and not on his “private life.” When, however, Pirsig shares events from his life in the *addenda* to his books, I judged that he does so in order to inform interpretation of his argument and I employed these personal revelations accordingly.

For my own voice, I was inspired by a choir of educators who are not always in harmony (or even singing from the same page); however their contrapuntal tones are full throated in their expression of personal, professional, political, and intellectual values. Pirsig, of course, but also Plato, Martha Nussbaum, Mary Midgley, and, at the end, Grace Feuerverger. Plato as he is the ultimate court of appeal, as founder of the Academy, when dramatic narrative or lyrical exposition (as in Plato's *Phaedrus*) is considered not to be “academic” by people who have forgotten their intellectual heritage.⁶ Nussbaum (2001) and Midgley (1992), as the

⁵ For example, 12 tribes of Israel/apostles; 144,000 (12,000 from each tribe) “sealed” in Revelations 7: 4–8.

⁶ See Plato 1952.

unassailable erudition of their writing is combined with myth, metaphor, and passionate argument. Feuerverger, because when I was tempted to lose hope that the current orthodoxy, a perversion of pythagorism, “teaching-by-numbers,” could ever be overcome, or that policy makers, run by numbers, would stop treating pupils as products and schools as factories or permanent staff stop treating student teachers, probationers and supply teachers as scapegoats and punchbags; her *Teaching, Learning and Other Miracles* (2007) inspired me.

Voice became a central concern in the production of this thesis due to my over-enthusiastic months of typing resulting in repetitive strain injury and in dictation, employing both scribes and voice recognition technology. A supportive matrix (in my case both human and technological) embraces the lone researcher and problematizes any claim to absolute autonomy. The combative language of academia (“stance,” “defend,” “position,” “strategy,” “interrogate,” etc.) does not lend itself to the expression of the polyphony in which “we live and move and have our being.” This polyphony is often heard as a feminist (or simply female) chorus: “the language of women” of Ursula K. Le Guin; the blurred ego boundaries of Nancy Chodorow, and Dianne Tiefensee’s critique of “the male artist.”⁷ Mine is not a feminist reading of Pirsig—and the claim that someone biologically and socially male could have the experience necessary for such a reading is problematic. Nonetheless, I mention this topic here as it provides a context for the issue of authority, with its attendant academic supporters: quotation and reference. Although Pirsig does not focus on feminist critique, the intersubjective nature of his patterns of value may mean that his metaphysics of Quality is a conceptualization of reality more hospitable to feminism than the various versions of Plato’s abstractions which reduce our existence to numbers.

English-language academic style tends to favor sparse quotation and prefers paraphrase and translation. This is not the only academic style in the world. Its vaunted virtue is clarity and lack of clutter. Its result is a monolingual hegemony of discourse which privileges the authoritative academic voice over its interlocutors. My own academic style reflects my years of living and studying in Latin cultures whose language politics are not (now) as imperialistic as those of English. It has been wisely said that “there is nothing new under the sun” (Ecclesiastes 1:9), and the use of alchemy as a paradigm for education is no exception. Bill Marsh’s *Plagiarism: Alchemy and Remedy in Higher Education* quotes Michel de Montaigne plagiarizing Seneca on little boys among books as bees among flowers: they gather nectar not their own, but, by dint of their labor of appropriation and transformation, theirs is the honey of that harvest (Marsh 2007, p. 82).

⁷ Ursula K. Le Guin, *A Left-Handed Commencement Address* (1983, Mills College, CA. www.pacifict.com/ron/Mills.html); Nancy Chodorow, *The Reproduction of Mothering* (1978, University of California Press, Berkeley) p. 169; Dianne Tiefensee, *The Old Dualities: A Deconstructive Reading of the Prose of Robert Kroetsch* (<http://ir.lib.sfu.ca/bitstream/1892/6037/1/b14424897.pdf>) p. 243; respectively. All accessed 18/11/09.

The practice of “show and tell” (beloved of US American schoolkids), the process of contemporary documentary making, Italian Renaissance *poesia commentata*, the spirituality of Hugh of St. Victor, the pedagogy of Jean-Jacques Rousseau, and the *Sentences* of Peter the Lombard are all in this great tradition of appropriation and transformation. Marsh situates education as alchemy—explicit in Montaigne, the Moravian bishop John Amos Comenius and Ivan Illich—in this tradition. In Pirsig’s terms, the pattern of values shown, documented or commented on, is not only contextualized but is appropriated by being valued differently. In this thesis, the melodies were diverse in origin, but the composition was my own.

Patterns of Value

The novel approach which I took to educational methodology is really not so strange when viewed from its point of origin: my dissertation (McManus 2002) written some years previously, for a master’s degree in religion, culture, and critical theory, which took the form of preliminary considerations for ethnographic study. The link with the work of Pirsig is at once theoretical and biographical, as one of the main inspirations for his conceptualization of “patterns of value” was a discussion of a “contrarian” in Ruth Benedict’s famous work: *Patterns of Culture* (see Pirsig 1992, p. 132 & *ff.*). Whereas, for my doctoral thesis, the patterns of value which operated as strange attractors were Graeco-Roman mythical rulers of the planets, for my master’s dissertation, they were those mnemonic sticky webs of meaning which the ancient Greeks and Romans believed to be the stuff of oracle (and we, mostly, the effect of overeating): dreams.

Text, Lust, and Researcher Bias

In the Temple of Reason (*cf.* Pirsig 1999, pp. 151–153), if the sophist is priest and the scribe acolyte, then the proofreader exercises the oldest profession. Whether our work has been in the production, the supervision or the correction of social science research text, the varieties of that ubiquitous illustration of “the research onion” in the Methodology chapter will be familiar to us all. Having been officially two of the above professionals over the years, and unofficially the other, the philosophical (at base metaphysical)⁸ categorical confusion and coercion of that illustration is as familiar to me as the scanty nature of the paragraph which typically follows the identification of possible researcher bias—and then blithely asserts how this possibility has been rendered improbable. At this point the thesis or dissertation

⁸ See McManus 2010 p. 115.

usually skips on to tricky problems envisaged in the data analysis and how they are to be solved. Researcher bias is, typically, never mentioned again.

It ain't necessarily so. Viewing educational research in the broader lens of social science allows us to take into consideration the debate on participant observation and observer effect which has, since (at least) the late 1960s, preoccupied anthropology in general and ethnography in particular. Published posthumously in 1967, 25 years after the death of the author (Llobrera 1990, p. 53), the real scandal of Malinowski's 1914–1918 field diaries of Mailu and the Trobriands (Malinowski 1989) was not their racism, homesickness, and lust but the fact that his official ethnography bore no trace of this and so pretended to be an objective account of the essential data. In terms of racism in particular and cultural imperialism in general, anthropology has come a long way since Malinowsky, Mead, and Radcliffe-Brown and is (at least) *aware* of its researcher bias in this regard. Edward Said has shown that "Orientalism is [. . .] a sign of European-Atlantic power over the Orient" (Said 1995, p. 6) and cites the use of a description of a village in Egypt to describe one in Syria (*ibid*, p. 23).

Josep Llobrera has a similar critique of the sign "Mediterranean" and speaks of "the Myth of Carmen" whose "Mediterranean" characteristics are clearly not to be found in either Catalonia or the Piedmont:

La etnografía del Mediterráneo constituyó su propio objeto al crear comunidades sin historia ni milieu. The ethnography of the Mediterranean constituted its own object by creating communities with neither history nor *milieu*.

(Llobrera 1990, p. 80, translation mine)

This debate betwixt and between anthropologists and ethnographers challenged my own cultural imperialism, when in the autumn of 2001 I spent 4 months in the Iberian Peninsula doing preliminary ethnographic fieldwork in an *okupa* community of *libertari@s*⁹ near Irunea/Pamplona and writing up and reading anarchist theory and Iberian anthropology in Granada, Andalusia. My near-native grasp of Castilian Spanish and my familiarity with the philosophy and indeed some of the members of the community from previous visits encouraged my rather naïve optimism for the success of the project. Concerns voiced by the community about confidentiality and academia called for a sensitive methodology. This was in tune with my own desire to write ethnopoetry (I have two anarchist poems on the community published in the Peninsula) inspired by the work of Hubert Fichte (1987) *Etnopoesia: Antropologia Poética das Religiões Afro-Americanas*, on *Macumba* in Brazil. I combined this with an (Italian) renaissance pedagogy of

⁹The "@" is one of the strategies of Spanish anarcho-punk feminist orthography. All Spanish nouns and adjectives show a binary division of gender: this "@" neutralizes gender and visually privileges the feminine "a" as well as referring to the anarchist capital "A" in a circle. Hooper speaks of the "use of a 'k' . . . [as] one of the orthographic innovations employed by the founder of Basque nationalism, Sabino Arana, to differentiate Basque from Spanish, and for recent generations it has come to symbolize Basque rejectionism" (Hooper 1995, p. 284). My ethnopoem, the original of "A Perfect Anarchist" uses this orthography.

poesia commentata, which I had studied in the Spanish mystical poetry of San Juan de la Cruz.

I had lived in several, diverse, communities, and several facts endeared me immediately to this particular one, which I called “Erkametzza”¹⁰: I had known one of its members over a period of 2 years, when we studied together at university and when I visited him in two other *okupa* communities, also in the Pyrenees; I was used to community life, “roughing it” and working on organic farms; I was in the process of bitter conflict with the Dept. of Religious Studies of my university over fair funding, grading, and staff professionalism—and I made great scones! My previous sojourn in the Peninsula had culminated in 18 months of utilizing Freudian methodology to read poetry as dream. I felt that *The Interpretation of Dreams* might be useful in dissolving the emic/etic (insider–outsider) division and foregrounding the process of identification/rejection undergone by the ethnographer in the community as well as highlighting the fractured and/or relational self. The process of using this alternative methodology in the field (quite literally!) brought up a number of questions, considering the appropriateness of my methodology, which I decided to explore as *prolegomena*:

- (i) From a postcolonial perspective, what “Mediterranean” stereotypes may influence a northern European ethnographer studying anywhere in Spanish territory?
- (ii) What do theories on the “self” contribute to a self-aware methodology?
- (iii) Is anything of value in Sigmund Freud’s *Interpretation of Dreams*?
- (iv) How adequate is a bipolar division of gender and of work/nonwork?
- (v) How should dreams with difficult and offensive matter be interpreted and reported?

My purpose was neither to attempt a complete ethnography (whatever that may be, apart from cultural arrogance) nor to exhaustively answer all these questions. Instead I aimed to illustrate the perspective of an oneirocritical methodology on the ethnographer, the community studied, and the relationship between them and to discuss the effect of this on an ethnography. In terms of ethnographic theory, I was attracted to Geertz’ (2000) “thick description” and ethnography as “deep hanging out” and Clifford’s (1997) work on transient populations. I was also influenced by the experiences of a growing number of—mainly female—ethnographers such as Donner (1982) and Cesara (1982) who, in foregrounding the integration process, do not see this process simply as a step towards the real goal (objective data) nor as a hindrance. Instead, as the ethnographer develops more emotional bonds with the community, the research becomes at once more subjective, more nuanced, and complex. Geertz defines the “study of other peoples’ cultures” as “discovering who they think they are, what they think they are doing, and to what end they think they are doing it” (Geertz 2000, p. 16). No doubt there is substance to Llobrera’s complaint that Geertz’ conflation of (social) anthropology and ethnography is

¹⁰I also spent 10 days in a sister community, “Chinebro.”

unjustified (1990, p. 39) and that, in “thick description,” “*el bosque de la descripción no deja ver los árboles de la precisión fatiga*,” [the forest of description doesn’t allow the trees of factual precision to be seen] (Llobrera 1990, p. 40), but his excommunication of Geertz is overdone.

Further to this argument, if Geertz and Llobrea are championing a right brain/left brain methodology, respectively, then science nowadays (as in pre-Enlightenment days) can sit happily in either hemisphere and especially in their connection. Can what Kitcher (1992) warned of in interdisciplinary sciences be a helpful corrective here? Should such sciences, basing their epistemology on other (“hard”) sciences, must constantly check and keep up to date with developments in those supporting bases otherwise the whole edifice falls?¹¹ Lloberea’s simplistic nomenclature of “*la antropología subjetiva, interpretiva o dialógica, o como se quiera llamarla*” [subjective, interpretive or dialogic ethnography, or however one would wish to name it] (*ibid*) ignores everything since Einstein about the effect of the observer on the system observed. If Geertz (2000, pp. 12, 13) can, tongue in cheek, state “Everyone knew that . . . the Tepotzlanos [were] either unshakeably unified or hopelessly divided (there were two anthropologists who studied them, one the student of the other),” then my questions would be: Did they hate each other? Did one cut off the other’s funding and the latter take ethnographic revenge? What moods were they in most of the time? Did they like the Tepotzlanos? How were they dressing, eating, speaking, and working and who were they attracted to and what differences did all that make to the community?

Ethnography Step by Step (Fetterman 1998) recommends choosing between a mentalist and a physicalist theory of anthropology—as a first step. Also called cognitive/idealist or materialist, the author considers this division as a given in social science. From Plato to Pirsig these contending options and their related aesthetics, Classical and Romantic (or Apollonian and Dionysian, as named by Nietzsche), have waged war: the former concerned with underlying form and the latter with outward appearance. However in my general reading of recent anthropological accounts, I felt that both approaches are important for the apprehension of the *Gestalt* experienced in the field. Kurt Lewin, commenting on the “variety of facts which social psychology has to treat” and listing examples (“values,” “ideologies,” “cultural,” “psychological,” “physiological,” “physical”), states that “it is utterly fruitless and merely a negative scientific treatment to put these facts into classificatory pigeonholes [. . .] we need positive means of bringing these various types of facts together in such a way that one can treat them on one level without sacrificing the recognition of their specific characteristics” (Lewin 1939, p. 871). He recommends a “field-theoretical approach [as] a practical vehicle of research” (Lewin 1939, p. 872).

Using this approach to discuss “the problem of adolescence” (*ibid*), Lewin feels that “a way must be found to treat bodily changes, shift of ideology, and group-belongingness within one realm of scientific language, in a single realm of

¹¹ Paraphrase of Kitcher’s entire thesis. See her critique of Freud, which I discuss below.

discourse” (*ibid*). His method utilizes “constructs which characterise objects and events in terms of interdependence rather than phenotypical similarity or dissimilarity” (*ibid*). He goes on to an example of a concrete research methodological problem in the field of adolescence “whether or not one is permitted to combine concepts of values with those of bodily weight” (*ibid*)—which “vanishes when confronted with the simple truth that both facts influence the same situation” (*ibid*). Iain Ross Edgar’s work on dream groups (1994) was interesting as at first I wondered if we were doing something similar. However, as the following quote shows, he is very definitely using a mentalist approach:

The base of my study is a “psychoethnography” as Obeyeskere (1990, p. xx) defines the study of the transformation of symbolic forms from and into culture. The base of the ethnography is a textual construction of the dream reports and the process of developing meaning in emic terms by the group members. Such a ‘thick description’ shows the creation of the ‘webs of significance’ that Geertz (1973, p. 5) defines as ‘culture’. ‘Psychoethnography’ cannot see the description of a material universe or a set of economic and political realities as its main task. Rather I describe the processual construction of meaning in a group setting. (Edgar 1994, p. 12)

From my (hopefully) more holistic approach, both “economic and political realities” and “symbolic forms” come clearly into focus. I have mentioned other ethnographers, but perhaps I was most inspired in my presentation of ethnographic material by Margery Wolf, who, in *A Thrice-Told Tale: Feminism, Postmodernism, and Ethnographic Responsibility* (1992), used field diary, short story, and standard anthropology speaks to tell her tale, bringing out different aspects of a dramatic incident in a village in Taiwan.

Freud in Crisis: Theory, Methodology, and Values

The self-conscious methodology that I adopted was to record and analyze my own dreams while in the community, using *The Interpretation of Dreams* as a toolbox. I hoped to observe not only the transition from English (and Scots) to Spanish (and Basque) but also the *Gestalt* of resistance and attraction to my self-definition as a member of the community. Using Freud’s theory of everyday events stimulating appearances in dreams, my dream analysis necessarily included substantial ethnographic material of a more traditional kind. Thus my ethnography was an example of the double discourse of symbolic/semiotic coined by Julia Kristeva and, while not pretending to objectivity, highlighted the selection of data and hypotheses which “objective” studies do not. My data was my dreams, a fitting form with which to study a utopia. Patricia Kitcher’s subtitle of *Freud’s Dream: A Complete Interdisciplinary Science of Mind* indicates her belief that Freud too was interested in “a single realm of discourse” (Lewin, cited above) in fact in “the synthesis of the mental sciences at the end of the last century” (Kitcher 1992, p. 219). However she believes that “the unsavoury reputation of psychoanalysis is due largely to Freud’s

misunderstanding of the interdisciplinary structure of his theory.” Even so, she feels that “perhaps psychoanalysis still has substantive insights to offer in the fields of personality and motivation, and even in anthropology and sociology” (*ibid*).

One of the principles of scientific research is verifiability: in this study I limited my choice of lens to that of Freud in *The Interpretation of Dreams* (1977) and published my dreams and selected analyses and forswore other readings so as to foreground the Freudian reading which could thus be verified or challenged. I am neither a psychologist nor an unquestioning adherent of Freud. Cognizant of the many flaws and ethical problems with his theory (not least his hetero/sexism), I nonetheless feel that his work on *latent* and *manifest content* of dreams has yet to be surpassed. Freud summarizes his theory of dreamwork (mental processes of the person while dreaming: not while undergoing analysis, *pace* Edgar) as:

investigating the relations between the manifest content of dreams and the latent dream-thoughts, and of tracing out the processes by which the latter have been changed into the former. The dream thoughts and the dream content are presented to us like two versions of the same subject-matter in two different languages [...] The dream-thoughts are immediately comprehensible, as soon as we have learned them. The dream-content, on the other hand, is expressed as it were in a pictographic script, the characters of which have to be transposed individually into the language of the dream-thoughts. (Freud 1988, p. 381)

This pictorial script gives rise to Freud’s use of symbols and also the dramatization which is the “grammar” of the manifest content. By “condensation” Freud means “the amount of compression that has taken place” (*ibid*, p. 282) in the dream narrative (e.g., compression of time, space, and people/objects), while “overdetermination” signifies that “each of the elements of the dream’s content turns out to have been ‘over-determined’ – to have been represented in the dream-thoughts many times over” (*ibid*, p. 389).

“What” asks the proverb, “do geese dream of?” And it replies: “Of maize.” The whole theory that dreams are wish-fulfillments is contained in these two phrases. (Freud 1988, p. 212)

My Freudian reading consisted of accepting his basic premise that dreams are wish fulfillments although I grant with Osborne (1993, pp. 111–2) that the introduction of the concept of Thanatos (as opposed to Eros) complicates this, unless desire is seen as often also sadistic or masochistic. I then used Freud’s forensic interrogation of the dream in reference to the events of the previous day and the concerns of the dreamer (Freud 1988, p. 247) in order to reverse the dreamwork processes of condensation, displacement, overdetermination, and secondary revision so as to observe the latent content of dream-thoughts. Freud’s dream analyses can be challenged, but not all of these challenges run counter to his theories. In his famous dream (Freud 1988, p. 182) about a patient he names “Irma,” for example, he interprets this “overdetermined” figure as a condensation of different women (by such associations as her position in the room and reluctance to open her mouth). Another analyst may not see these associations as primary but may well accept that the *mise en scène* can be read as extremely “Freudian”—with the symbolism of

a “dirty injection” and a gang of men around a woman coercing her to open her mouth! In the same way my published self-analyses left levels of analysis unread (or unwritten) either from personal reserve, resistance, omission as inappropriate to the study, concerns of confidentiality, or simple oversight and thus are open to other readings, verifying (or not) my conclusions. Edgar’s *caveat* on the popularization of Freudianism, as distinct from Freud’s work, warns against the (fashionable) dismissal of the latter because of the former:

Freud’s pioneering work on the psyche and the role and function of the unconscious is extremely well known and many of his insights have passed, *not always exactly*, into the popular culture of understanding dreams. (Edgar 1994, p. 45, emphasis mine.)

Although I place more faith in Freud’s work than Edgar, I do however agree with Edgar’s comments on *bricolage*, and this is in fact the main use I made of the dreams—to observe the ethnographic data they accrued:

as myth for Levi-Strauss is a form of bricolage (1966, p. 17) so the dream for Kracke is a form of bricolage which gathers, [“]from among the day residues ready to hand, and uses them to express metaphorically an emotional conflict, and to work out (or work toward) some resolution of it[”] (1987, p. 38) (Edgar 1994, p. 7)

I recorded 32 dreams over a period of a (lunar) month. I chose this initial period to record as I was continuously in Erkametza or Chinebro, and these dreams most highlighted my integration. Freud interprets “propinquity in time as representing connection in subject-matter” and so saw that as “one of a series of dreams” was “surrounded by the others it must have dealt with the same subject.”¹² Therefore I numbered all dreams in the same night as the same but used letters to differentiate their successive parts. The total word count for the dreams themselves was about 8,000 plus a further 13,000 for analysis. This is unsurprising as in Freud’s famous dream about “Irma,” the dream sequence consists only of almost a page, whereas the analysis extends to over 15 (Freud 1988, pp. 182–199). Freud uses such lengthy analyses not only to analyze them but also to fully illustrate his method of the reversal of the above-noted dreamwork processes. In a compromise between space and verifiability, I included all the dreams recorded leaving intact the inserted numbers relating to the analysis, of which I used some that illustrate my perspective on the community and myself. The dreams seem to show a progressive identification (notwithstanding a countercurrent of repugnance) with the community. In the first dream, where my position vis-à-vis the group was one of the aspirations to enter, this was symbolized by a semicircle, which I compared in the analysis of one of 3 weeks later, when the dream featured a complete circle (which I felt may symbolize acceptance of my membership).

¹² All three quotes from Freud 1988, p. 346. Each numbered dream, therefore, is a different night, while letters refer to chronological priority and bracketed roman numerals to the notes of the analysis.

Monsters from the Id: Revenge, Racism, and Erotica

The cross-referencing and overdetermination of dream narrative meant that certain themes featured frequently. One about conflict with the department, usually involving Harry Potter, was so pervasive that I seriously considered reversing my ethnographic focus from the community to the department—in the spirit of that “parochializing” which Gayatri Spivak calls for. I complained of this in a letter to my supervisor where I told him to try and resolve money matters (the promised financial support for fieldwork upkeep never arrived) so that I could stop dreaming about how angry I was with them! This conflict was often symbolized by the figure of Harry Potter who had become an important persona for me of winning against the odds, given the departmental powers which I felt (rather histrionically) were stacked against me, as the discussion under Oneirocritical Methodology shows.

The negative portrayal of known persons (even departmental powers that be) in dreams, for purposes of revenge or self-aggrandizement, must be read as subjective caricature. Racism and other prejudiced materials are more difficult to deal with. If my dreams present a friend in a negative light, the astute reader or listener will give the friend the benefit of the doubt. If I, as White, represent a Black person negatively, then a White reader sharing unconscious/conscious racist assumptions may let my racism by uncensored. Edgar comments on racist assumptions in identifying “shadow” imagery:

With regard to the example of racial stereotyping, Jung’s analysis of the “black man” as representing the “shadow”, or inferior, personality is now rightfully seen as racist by contemporary commentators on Jung’s work. (Edgar 1994, p. 52)

Two dreams out of the 32 (#17 and #30) portray Black men as drug takers and muggers. The former activity, as my analysis of that dream points out, was quite normal in the (White) community, so why did I need an image of a Black man? I am aware of this racism only in the analysis of dream #17, rather than in the dream itself, but in dream #30 itself I attempt not to be prejudiced—only to then create confirmation of my fears. This racism is mitigated only slightly by my own, ambiguous, Black identity in another dream (#1) in the analysis of which I consciously employ a technique of multiple allusion so as to have positive alternatives to the “shadow” imagery. I have the same political motivation as Edgar, but I see that White people are still generally racist. So if an image of a Black person is obviously functioning as a “shadow” in a dream, that dream will be misinterpreted if this function is ignored. However, is there hope in this technique of conscious positive allusion and can it change the way White people dream? Could I better struggle with my own racism in dream #30 because I had tried to “de-program” my racist responses in dreams #1 and #17? Is the Black man in Dream #30, as well as mugger and Harry Potter/George Weasley, also an angel (in Hebrew a “messenger”—the consciousness of my own racism?) with whom, as Jacob, I struggle with/embrace all night and who leaves me wounded and wiser?

#30(iv) A short story I wrote (after the very successful “Sun on Pale Skin” presentation to the Dept. and before the bitter parody – both based on Harry Potter) involved the “transmogrification” of Harry Potter from White to Black and George Weasley (who’s White) putting his arm around Harry after dealing with the evil Draco Malfoy. This image is a reversal, the Black guy embraces me (presuming that in the dream I’m White!)

A very prominent theme was sexuality, and some of my dream analysis may well be an instance of what Llobrera entitles “*pornografía*.” I can see what he means in the sex scene at the end of the ethnographic work, *Shabono*, by Florinda Donner (1982), a work which she interestingly describes as “a subjective account of the surplus data.” Is that because she stood up from her folding table, left behind the hamper from Fortnum and Mason’s, and walked off into the forest with the Iticoteri clad in nothing but *onoto* paste and underpants and thus discovered what she never could have otherwise? James Clifford comments on this level of involvement:

Only recently, and still rarely, has the taboo been broken (Rabinow 1977; Cesara 1982). Why should sharing beds be a less appropriate source of fieldwork knowledge than sharing food? (Clifford 1997, p. 72)

Johnathan Culler (1997) notes that:

“schools” of literary criticism [tend]. . . to give particular kinds of answers to the question of what a work is ultimately “about”: “the class struggle” (Marxism); the possibility of unifying experience (the New Criticism); “Oedipal Conflict” (psychoanalysis). . . (Culler 1997/64)

Employing a Freudian analysis, one should not be surprised at so much sex! I could have used Jung, but in my experience of Jungian dream interpretation, everything ends up very beautiful and vaguely spiritual (but mostly just vague, which is why I didn’t use him). The decision to include dream #2 (the best example of classic Freudian forensic analysis) was a difficult one, and I’m sure there was a reason why I did not remember my dreams of the night between dreams #7 and #8. The sexual content of the dreams was more of a problem for me than for the members of the community who were very open to such discussion and were often complimented by having starred! This open attitude helped me to limit my censorship of the dreams to two instances: dream #21b and dream #2 (iv/v). Not doing groupwork, I did not face the problems with interpretation which Edgar notes:

My gender in the research process was probably most manifest in the interviews with some female members when I felt less than confident in pursuing very emotive and intimate issues for them when they emerged. For instance when one female member referred to having “blue pencil”¹³ dreams about other group members I didn’t follow it up. (Edgar 1994, p. 19)

I feel that the amount of self-revelation (even of unconscious impulses) should be up to each individual ethnographer but to cheerfully record Inuit avuncular initiatory *fellatio* or adolescent free-for-all in western Samoa and then to pretend to the sexual stoicism of a medieval monk¹⁴ is to risk the Malinowski syndrome.

¹³ “a [phallic] ‘mini-archetype’, to borrow Jung’s term (1959, p. 3), for the group” Edgar 1994, p. 13. “Especially if one thinks of the rubber on the tip!” as a fellow student, David Fairbairn, noted in conversation, Stirling, Aug. ’02.

¹⁴ For which see Umberto Eco’s *The Name of the Rose*!

Oneirocritical Methodology: A Shut Eye View

Freud informs us that “in the later years of antiquity, Artemidorus of Daldis was regarded as the greatest authority on the interpretation of dreams, and the survival of his exhaustive work [Oneirocritical] must compensate us for the loss of the other writings on the same subject.”¹⁵ The “oneirocritical” methodology I used for this ethnography came to me upon waking one morning in the Youth Hostel where I worked after a restful sleep in which the problems with the department had receded to reveal bright hopes for my forthcoming fieldwork. *Contra* Edgar I use “oneirocritical” with the full and open value of its long use and resist his attempt to replace it with the misnomer “dreamwork”:

Hierognosis (Corbin 1966, p. 384) refers to the hierarchical classification of the different orders of visionary knowledge displayed both in dreams and waking realities. Therefore dreams would be interpreted by oneirocritical means by reference to the status of religious imagery appearing in any dream. (Edgar 1994, p. 43)

Dreams themselves are not simply outpourings of excess *libido* (as some psychologists view them) but also have a critical role. Dream #10b mentions “. . .(a book) and the Dedication to Harry Potter.” The accompanying note in the analysis (iv) has:

. . .it would be interesting to note what is written in the dedications of the Harry Potter books I have read (1–4). The folder which encloses these notes is of Harry Potter, which I bought in Tesco in Stirling in a fit of impishness as a member of the R.S. Dept. condemns it as “Capitalism” cf. note (vii) dream 26.

In the latter dream’s analysis I now:

. . .wonder if the “dedication” is actually the motto of Hogwarts “*draco dormiens nunquam titillandos*” which is a version of “let sleeping dogs lie” but literally “never tickle sleeping dragons”. [Dream 26(vii)]

Having decided this to be so, I then apply this motto in the analysis of dream #28(v):

#28(v) A short story I wrote about Harry Potter and “transmogrification” was based on an incident in the book (Book 3 I think) where he and Ron shapeshift into the form of the enemy (Draco Malfoy and his sidekick) to learn their secrets. . . (“Draco” means “dragon” and thus the motto of Hogwarts would apply). . .My conflict is whether to “let sleeping dogs lie” or to set them at each other’s throats. . .

However what dream #26 actually says is: “Reading a book from Denise to Harry the dedication is confused.” Its explanation [note (vii) of the analysis, quoted above] is misleading. The dedication of the book of the series I’d most recently read, Book 4: *Harry Potter and the Goblet of Fire*, is:

To Peter Rowling, in memory of Mr Ridley and to Susan Sladden, who helped Harry out of his cupboard. (Rowling 2000)

¹⁵ Ch1 *The Scientific Literature on Dreams* p. 60. Book title added as gloss by Freud’s Editor.

Given the amount of homoerotic reference in the dreams, I obviously had a few candidates in mind to help out of the closet! Also, given the position of Harry in the Dursley household (forced to live in a cupboard under the stairs), dream #28 also makes more sense with this reference, as the following analysis shows:

#28(ii) On the eve of my departure to the Basque Country I pinned a satirical episode on the Religious Studies Students Board – it was immediately censored – describing my feelings at the shoddy treatment by the department and manifesting the support of Hermione (F and K. from Stirling and also my sister A.) and the power of magic.

Thus dream #26 can be read as an attempt to jog my memory because there was an association I was not seeing. In fact I was only able to confirm this when back in Scotland. Freud sees the super-ego (as well as the Id) as unconscious (and Anna Freud even the ego in its self-defenses), so this critical, corrective faculty of dreams would I hope serve to challenge the ethnographer when an interpretation of the culture of a community was misconstrued. Although ambiguous, the unconscious is extremely perceptive. With all this evidence of my subconscious using dreams intelligently to try and communicate with my conscious mind, I cannot agree with Edgar in his chillingly rationalist and positivist conclusion:

Symbols then, can be said to mean nothing except what is produced by the audience and the group interaction. If this thesis is correct then dreams do not represent the fundamental truths of the personality as psychoanalysis asserts. Rather they are formed through the bricolage process and their essential nonsense is made culturally meaningful solely through the group process. Such a perspective positions social anthropology, and perhaps sociology, in a powerful position to claim an increased role concerning the elucidation of the processes and outcomes of dream interpretation in modern society. (Edgar 1994, p. 80)

This seems to be at odds with his own, previous, work in which he observes:

the impact of dream imagery on the dreamer, in this case the ethnographer, and the congruence of at least parts of the imagery with central preoccupations of the community in question (Edgar 1994, p. 81)

What did I gain from employing oneirocritical methodology and what if I were to expand this prolegomena into a fuller ethnography and recommend it for educational methodology, would I do differently? The first bonus was acceptance. My willingness to be object of study reflected my academic gaze onto myself and, though Llobrera (1990, p. 47) complains that the “*problema del etnografía moderno, con su énfasis en el problema dialógico del encuentro entre sujeto y objeto, es su carácter narcisista*” [the problem of the modern ethnographer, with their excessive emphasis on the dialogic problem of the encounter between subject and object, is their narcissistic character], this vision is “warts and all.”

To continue the metaphor, if I am gazing into the pool of my dreams to see my own face, I also see those of the community. In a “back to nature”-type community such as this one, preindustrial skills are greatly valued, and as noted above, being able to interpret dreams and share this skill gave me a valued place—especially (as in most communities) when rubbing along together needed more lubrication than the leaky Landover! This acceptance was crucial in a community where vigilance was the order of the day, when day or night uniformed thugs could roar

up to harass, beat up, and arrest members of the community and destroy all their painstaking agricultural and artisanal labor and their very dwellings. This methodology enabled me to mitigate people's fears that the information might be misused, my dreambook was always lying about, and several people read English and the native and near-native speakers could translate. People would ask me what I'd dreamed and be interested in my interpretations—often as a prelude to bringing up a dream of their own.

The second bonus was that, in the process of information gathering, the dreams functioned as Tony Buzan's "mind maps," or, perhaps better, as the "link system," a mnemonic technique in which "you throw things together, place things on top of each other, or substitute one for the other." This description, of a very similar process to Freudian dreamwork, is combined with "outstandingness... the combined image must be larger than life, garishly coloured, humorous or absurd; and you must where possible, be able to imagine yourself tasting, touching, hearing, seeing and smelling it" (all Buzan 1988, pp. 43, 44). A good example of this is the Documentary Comic Book Series. I can easily recall information from Osborne's *Freud for Beginners*, but as for Webster's (1995) *Why Freud Was Wrong*, what sticks in my mind are precisely Freud's dream analyses because, unlike Webster's prose, they are so lively.

The dreams, written down upon first awakening, would stay in my mind during the day as well as being discussed with other people while we were working. In dream #9, for example, the image of a member of the community as Coppelia making robotic movements yields the information about the *Billera* (meeting), its function and frequency and her worries about court action and decision to prioritize the latter. Further notes to this would have included the informal postal system [a lawyer's letter arriving at the local village—as alluded to in dream #24(xv) — was driven and walked up to Erkametza by a friend of the community, whereupon it was relayed by shouting up the mountain to this member of the community, walking beside me to Chinebro] and the relationship of the community to a network of individuals (helpful lawyers and social workers) who worked free of charge to help in the effort against the dam. This mnemonic excellence¹⁶ of overdetermined dream images and their subsequent agglutination of material meant that the use of this methodology freed most of the day for normal community life instead of time-consuming questionnaires,¹⁷ interviews, "counting things," and general anthropological head measuring.

Finally, oneirocritical methodology is aesthetically pleasing. The right/left brain blend that it necessitates gives rise to poetry naturally and jokes and puns of language, mythological allusion, and stories upon stories. Luisa Teish, my *Voudou* teacher in the Institute of Culture and Creation Spirituality (CA), said that Yoruba spirituality is like a circle: you have to go all the way round to know where you're

¹⁶ See discussion above, on Harry Potter and dream memory.

¹⁷ My supervisor wondered what the result would have been had I sent questionnaires. I laughed out loud as I imagined the examples of Dadaist artwork I may have received in response!

starting from.¹⁸ The representation of another's culture is not only made richer by story, poem, and dream: it is made possible. While my methodology, as I have noted above, did proceed with the helpful suggestions and information of the community and an explicit censorship which I was trusted to internalize, I could not say that it was undertaken with strictly anarchic principles. I confess to having been swayed by reading of the experiences of ethnographers who attempted to write ethnography by consensus and whose "native informants" collaborating on the editing process "turned it into mush."¹⁹

One justification for this could be the ethos of the community that, recognizing the inequality of skills among the members, those with less know-how would simultaneously defer to those with more, while learning the skill and thus equalizing the levels of ability. This is of course an ideal situation (anarchist groups seem to have the ability to be at once extremely idealistic and to rub along with very botched circumstances and far from perfect people); individual people's abilities and inclinations to learn do not usually extend to all the skills necessary for the life of a community. However I wonder what would happen with more time, when the community was more *au fait* with Freudian dream analysis (which needs only a fairly forensic mind and an ability to spot bad puns). I had participated in "dream groups," in ICCS (mostly Jungian based) but did not attempt to start one in the community. The reasons why it did not occur to me were my desires both not to disrupt the normal life of the community (a fallacy since the addition of one to a group of ten is a big change) and also, aware of their suspicion of academia, to work discretely. This "discretion" diminished as I shared more of my work, but I at first wanted the people to get to know me rather than consider an abstract academic proposal sent by letter (which I feared they would refuse). As is apparent in the first dream, although a member of the community (who was a good friend of mine) had vouched for me, I was still wary of my perception by the community. More honesty and more trust (and possibly more patience as to starting time) may have dissolved that apprehension. Edgar's more participatory role²⁰ as "dreamwork facilitator and resource person for a, more or less, autonomous group" (Edgar 1994/1) was neither autocratic nor anarchic but democratic, and it encountered the problems of representing the majority and quashing the minority that democracy always will:

Four main areas of conflict emerged in the dreamwork groups studied. These were the nature of dream interpretation; the nature of the group; the role of myself as facilitator; dealing with the evidently 'different' orientation of one of the group members. (Edgar 1994, p. 35)

¹⁸ ICCS is now The Sophia Centre, California. Louisa Teish is the author of *Jambalaya* (1986) London. HarperCollins. I paraphrase her words from class, Autumn, 1990.

¹⁹ I confess to amnesia over this striking reference, but Agar (1980, p. 186) makes the same point.

²⁰ Although he and his colleague "usually did not work on our own dreams in the group" (Edgar 1994, p. 38).

The “nature of dream interpretation” seems fairly predetermined (Edgar 1994, p. 1):

The analysis proper proceeds in four stages.

The first is concerned with “dreamwork”, the way that the narration to and within the group can be shown to be collectively converted into a verbally expressed narrative of an experience seen as having hitherto been concealed and confined to the imagination. Second, I turn to the analysis of structure and process in the group itself and the communicative context in which this dreamwork took place.

Third, I use an hermeneutic analysis to unpick the emic and etic interpretive, and to some degree feminist-inspired, perspectives used by the group to make sense of the narratives they have collectively created.

Finally, I move outwards to the processual, meaning-creating and outcome, analysis of such groupwork methods as gestalt, psychodrama and imagework which are used to elicit meaning from narrated dream imagery.

I conclude that dreams are transformations of cultural symbols and that their interpretation is an example of what Obeyesekere, significantly calling on both psychoanalysis and cultural analysis, has called ‘the work of culture’.

Even so, there is considerable variation in “the range of interpretive schemata within which group members explored, explained and understood their reported dreams” (Edgar 1994, p. 43):

the approaches used included quasi-religious, Freudian, Jungian, revised psychoanalytic, gestalt, transpersonal and what I define as a socio-political contextualisation approach emanating from a structuralist perspective. (Edgar 1994, p. 1)

Edgar (1994, p. 5) gives an informative survey of “historical development of dream theory” and does not find any other instances of oneirocritical methodology apart from his own, previous, work (which he appends).²¹ His comments on the geographical limitation of anthropological interest in dreams invite postcolonial analysis:

Whilst anthropology has in the past only considered the dreams of bounded groups in the third world as of cultural significance, my thesis asserts the significance of dream and its elucidation in modern society as a vital source of understanding and information about the culturally constituted and becoming self. (Edgar 1994, p. 80)

it is perhaps somewhat novel for the study of dreaming, dream narration and dream interpretation in the western industrialised world to be the ethnographic focus, although the work of Hillman is similarly focused on the US context. (1989, pp. 117–141) (Edgar 1994, p. 20)

Maggie has been marked from early childhood as the one to inherit her mother’s altar and, along with it, the responsibility of serving the family spirits. Prescient dreams, starting when she was quite young, indicated that the spirits favoured her. Alourdes also had such dreams, beginning when she was little more than a toddler. For both of them, dreams continue to be significant life events, sometimes diagnosing current situations and sometimes foretelling important future events. (McCarthy Brown 1991, pp. 295, 296)

²¹ *Dreaming as Ethnography*; paper given at the 1989 ASA annual conference: “Anthropology and Autobiography.”

I juxtapose these quotations and wonder now at the initial urge I had to use the setting of McCarthy Brown's work (with a mostly poor, Haitian diasporian community in Brooklyn) as an instance of Edgar's "third-world" (would it not be "fourth"?) category and the setting of my own work (with a mostly *nouveau*-poor Western European neo-pastoral community up the Pyrenees) as an instance of his contrasting situation, "in the western industrialized world"!

Strange Attractors

My previous study on the master's course in critical theory had established that anthropology and especially ethnography (not to confuse them) was changing, turning towards postcolonialism. For the dissertation, I tried to follow that turn by steering clear of "Mediterranean" stereotypes while working in Spanish territory. I also celebrated the debunking of much anthropological imperialism masquerading as positivism—a celebration which would continue with my doctoral thesis on Pirsig. I was inspired by the vulnerability of many recent ethnographers and the complexity of their reporting of fieldwork and used a delicately nuanced theory of "self" to understand their work and mine. In an *excursus* I found, for the community under study, the bipolar division of gender both inexact and oppressive and that of work/nonwork inadequate. In my methodology, I displayed sensitivity to political and social concerns of the community studied and found in Freud a dream detective who (despite much needed critiques)²² remains useful today. I foregrounded my unconscious portrayals of members of the community and our relations in order to challenge a false objectivity and to be aware of my effect on the system observed. Finally, I used a holistic mode of presentation, combining dream, poem, and theory to prove the validity of oneirocritical methodology for self-aware ethnographers.

The mnemonic function of myth and dream in educational methodology is valuable precisely because it breaks down the social and intellectual patterns of value which otherwise constrain the research discourse. Schools, as one of my doctoral supervisors warned me (during my first attempt at teacher training), are "conserving places,"²³ and my own experience is that teachers are very controlling people (see discussion on ITE as rite of passage, McManus 2010, Ch. 1, Section 3: "Maiming the Father; Swallowing the Child") and that, in common with the practice of other "caring professions," this control is masked by kindness. Isabel E. P. Menzies' study of nurses, *The Functioning of Social Systems as a Defence Against Anxiety* (discussed in the same section of my thesis), highlights these defensive social patterns just as the argument between Llobrera and Geertz (discussed above) highlights the defensiveness of intellectual patterns of value. The attractors

²² See Crews (1995) for the social devastation wrought by the Recovered Memory Movement's (mis)use of his work.

²³ Prof. James Conroy, in conversation at St Andrews College, Glasgow, autumn term, 1996.

I suggest for educational research are indeed strange (although “dreamwork” is becoming more widespread in social science research), and their use may provoke indignation from both schools under study and study supervisors. However, the disdain towards research widespread among teachers necessitates that our academic work be (and be seen to be) useful.

That usefulness may not come from supervisors continuing to send out droves of enthusiastic young researchers into the field with forms to fill out, things to count, and boxes to tick (the way tired primary teachers send out their more lively pupils to measure the playground, again, with the trundle wheel). We may need, as academics, to rethink our intellectual categories and, as researchers, to reform our social practice. To inspire that revolution in praxis, it may help us open our eyes to the possibilities inherent in our mythologies, those old tales which always have something new to teach, and to shut our eyes and dream, in the darkness, a new educational enlightenment.

Afterword: A Conversation

In this Handbook the editors invited contributors to reflect on research in which they have been involved, considering why they adopted the research approach they did and in particular what was the role of interpretation in the process of research. The 65 cases produced diverse responses to this task, and it would probably not be very sensible to attempt either a summary or a 'conclusion'. Nevertheless, having reviewed all these studies, we thought it appropriate that we ourselves should reflect on the material that we had been reading and on our own editorial process and purposes. This Afterword is an edited version of a conversation that took place at our last face-to-face working session on the Handbook. We are grateful to Kseniya Tyshkevych for her transcription of the conversation.

Bridges: So this is an opportunity for the four of us to have a conversation reflecting on the totality of the Handbook: about, perhaps, what you feel we have learned from it; the extent to which the resources in the handbook confirm or otherwise some of the expectations we had from the beginning; about the similarities and dissimilarities across the genres in the way which interpretation features and the role it plays in educational research. Are there aspects of the reflections on interpretation across these diverse cases which nevertheless suggest something in common?

On Interpretation and Theory

Burbules: I think one thing that has come into my mind after looking at some of the individual chapters is the relationship between theory, or theory choice, and interpretation. I have thought a lot about theory in terms of how your theory choice frames questions or how theory frames what kind of data you look at. But I have not thought as much about how your theoretical framework and assumptions guide the ways in which you interpret what

you actually find. I don't know if this is true in every case, but a number of these papers talk specifically about the role of theory as a framework or heuristic for the process of interpretation itself. Theory comes in toward the end of the research process as well as at the beginning of the process.

Bridges: Can you say a bit more about theory, because like interpretation I suspect we are looking at different kinds of theory, some of which might be high level meta-philosophical theory, some might be much more grounded.

Burbules: I think theories provide a couple of things. They provide concepts or definitions, ways of defining or framing the things you are trying to study, and they can provide structures of explanation. That will be especially relevant to the issue of interpretation. So when you find out certain things in the course of the research, the ways in which you try to make sense of them are often in terms of the theoretical categories or relationships that you study. So, if you are viewing things through a certain kind of lens – for example, through theories about gender – then as you start thinking about what you have seen, or observed, or experienced you bring in this theory. You start bringing in a lot of the framing assumptions about ‘what this means’ or ‘this is important because my theory tells me that gender operates in certain contexts, in such and such ways’.

On Interpretation and Particularity

Bridges: Paul [Smeyers], would you make the same connection between interpretation and theory? Does linking interpretation with theory actually add anything? Or is theory just another version of interpretation?

Smeyers: I don't know about that. What comes to my mind, if I go through all these chapters, is the enormous importance of *details*, of *particularity*, wherever you start. And so, in relation to theory, I would say, yes, this is where it starts from, but it gets amended and modified in a particular situation. So if you look right across the genres, what first comes to my mind is that in all these approaches, we are looking for detail, the authors are, as it were describing what has happened backwards, why they made sense of that in that particular way and so on, And those things can never be foreseen. (David, you yourself describe the role of serendipity in developing your interpretative framework). You never know in advance what will be important, what will determine a particular meaning, what you will be able to construct or re-construct or find out along the way, what it will deliver for you in terms of interpretation. So, yes, I go along with your overall stance, Nick, but at the same time I think the approaches are a little bit amended and modified by what you find out.

This comes across even in the genres which I initially would not have expected. I mean, let's say, in a quantitative approach: the zero hypothesis you formulate and the testing of the prediction of the theory, etc., etc. It is all very straightforward. But even there you will see this particularity, all the small decisions you have to make along the way, how important they are and how important is the role they play in the eventual conclusion that you offer.

Burbules: It is interesting because it is in the particularities that we often get surprised or we encounter things that don't fit our theories or that challenge our theories. So the more that we think about the specific situation, sometimes we see things that don't fit our theoretical categories and processes, and I don't really know how the situation is supposed to work. Because the actual details in the situation often don't fit, it becomes a challenge to try to interpret what it means. It is as if you say, 'this is not the way my theory would have made me predisposed to anticipate or expect'.

Bridges: I think in the framework chapter, we actually express some suspicion of getting too immersed in the meta domains. The rationale of the handbook is to look at concrete cases, individual instances and to see how interpretation, at least in the eyes of the authors, operates within these situations. So that attention to the particular and the detail is precisely what the handbook sets out to provide.

Griffiths: While Paul was talking, I was thinking about the particularities, and about how it is with hindsight that we have been concerned to make sure that we make *explicit* the context for a particular piece of research – that this piece of research was done in the Czech Republic, and that one was in the USA. That might prompt the people in that area, field or genre to re-think a bit, to say, 'Oh! That was surprising. I'll need to start re-interpreting my own findings. What I found – what happened – in my research was actually context dependent, perhaps not as universal as I'd thought.' So, the very act of reading the particularities should help change later interpretations.

Smeyers: Yes, and that is even the case for philosophical and historical approaches. How much deep contextualisation is going on there, in that particular context and what it brings with it, etc. Which is a little bit of a surprise, of course.

On the Role of Biography in Shaping Interpretation

Bridges: You can talk about the social context, or the political context, or cultural context of a piece of research, but to what extent do the cases point towards the power of individual biographies in shaping the interpretive

frameworks that people bring? Are these interpretive acts primarily explicable by reference to social context or to individual biography?

Burbules: I don't think that individual biography on its own is enough. There are a lot of things that enter into the process of interpretation. I think the important thing, if you look at the examples in the Handbook, is that there is a lot of context in the accounts of the research. Interpretation is not something that just happens, determined by the person or the situation, the framework assumptions or theoretical orientations or whatever. The work of interpretation is to try to make sense of the surprises, the things that don't fit our categories . . . Maybe this contradicts what I said earlier, but the challenge in research is to interpret something new, something that doesn't fit our theory where we thought we already knew how to make sense of them. The surprises that we encounter, cause us to ask, 'What does this mean, how do we make sense of this?'

Griffiths: Your question David, about individual biography is a really difficult one to answer for another reason. In some of these approaches, positioning yourself as a researcher is part of what the genre requires you to do. It is integral to the genre, rather than just something you might observe as an incidental feature. So, researchers in these genres are more likely to be saying, 'The fact that I have done such and such in my life. . .

Bridges: For example, in Olena Fimyar's account of the Soviet childhood that she shared with participants in the research and the difference that that made. . .

Griffiths: Exactly. Whereas if you are in some genres – like quants, obviously, but also I suggest in some of the philosophical chapters, for instance – to start by saying, 'I first position myself as. . .,' is not part of the normal way of doing that approach. Though it may in fact be just as relevant. So we only get that information in some genres which makes it very difficult to answer your question.

On Interpretation and Audience

Bridges: You emphasised the individual cases, the groundedness of the way in which interpretation is used. We chose to cluster the accounts in terms of genre. We emphasise that the genre is a collection rather than a clearly defined, clearly bounded set of approaches, but nevertheless, do you observe significant differences in the way in which interpretation is used across some of these different genres?

Griffiths: I do, I think. But that would not be saying that all of this genre does one thing and all of that genre does another. But, still, I think it is more probable that some genres pay more attention to one matter, in a way that I had not

expected. I think I had not realised before looking at all these chapters how for some people interpretation is partly about, ‘Who I am I talking to and why’. That changes how I interpret, what I should say and how I should say it. That is not an aspect I thought of before. For instance, perhaps if you have a very causal view – whether you are dealing with case studies and illumination, or whether you are dealing with large scale datasets – you may take the line, ‘Look, I am now showing you how it is; now you go and do something about it.’ But there are other researchers who pay a lot of attention to the rhetoric of the research report. So that would be a difference I think across the genres, as it may be more likely in some genres than others.

Burbules: That is an interesting point, So there are at least two functions for interpretation in what you say. One is our attempt to make sense of what we have seen in our own terms as a researcher and a scholar. But the other is the task of interpreting for a particular audience. And this raises questions about how we represent our material and portray it for the sake of an audience that we are trying to help understand the things that we are showing them. And these are not necessarily the same.

Griffiths: But they may be.

Burbules: Well, they certainly might be. But the thing is that the way these things make sense to me, may or may not be the way in which I then try to help make sense for other people. So it sounds like these are two functions of interpretation – maybe more. But is the way I make sense of something also the way I represent it?

Griffiths: But my interest is then, once you are conscious of your rhetoric, you find it is not the case that: first I have an idea and then I use the rhetoric. The very fact that I have now put it in this rhetoric changes my interpretation. So, maybe you could say you could distinguish the two analytically, but I think maybe you really could not.

Burbules: We find it all the time in our teaching, don’t we? When we are teaching some material that we think we know quite well. Someone asks a question and suddenly – it happens to all of us – we realize, ‘Oh, I have never really put it together that way before’. We see it in a different way because we have had to explain it to a different audience.

Bridges: This also highlights one of the problems that I had to face in my current research when, out of the same body of research, we are trying both to develop papers for publication in international journals, but also, out of the same body of research reporting, to the Deputy Prime-Minister and the Minister of Education in Kazakhstan. Our discussion makes me ask to what extent these two reports offer the same interpretation of the research with different rhetorical presentation or to what extent the interpretation of the research is itself transformed by the different rhetorical requirements of the different audiences.

Griffiths: I was thinking that after all, this is all *educational* research. It is not simply research *on* education but also research which educates – even,

let's say, in the case of history of education. In so far as it is educational then has to respond to the different needs of different audiences. So the rhetoric is not just important, it is essential. Educational researchers need to pay attention to more than just an academic audience.

Burbules: We talked about translation the other day. This is something I have been thinking about and writing about for the past couple of years. How do we translate something that makes sense to us, for others? And here I note that we use terms like translators or interpreters . . . And the idea that an interpretation is a kind of translation, may grow into something interesting . . .

On Reflexivity and Meta Discourse Across Different Genres

Bridges, You said earlier, when we were talking about the significance of biography in shaping interpretation, that some genres require some sort of declaration of positionality, while others might find this very inappropriate. Would it also be the case with the sort of reflexivity we have been asking all our authors to engage with? Are there some genres in which that sort of reflexivity on method and self consciousness about underlying assumptions is more part of the expectation than in other cases?

Smeyers: Outside these, there is a philosophy genre, where people are drawn to the meta-level, but then at the same time in a number of cases what they offer is first and foremost an exposition of the particular theoretical position which they embrace, say Foucault or Wittgenstein or whatever. And they actually look for examples that fit within that particular stance. And sometimes they are still surprised about what they find there. As I said earlier, sometimes a deepening of insight of that stance is offered, they deal with what the particular thing they are discussing would mean from that stance. . . . But in a number of cases they go just back to their theoretical position, how they make sense of it, detail it and explain it. There is a kind of circularity which is characteristic of all explanations. Each level is taken to account for, to derive from, or to elaborate on the other. Thus instances are explained by patterns and patterns by instance.

Bridges: But even philosophers are rarely explicit about, as it were, how they are proceeding, about the methodology, less still the method, of the philosophical approach they are employing. More typically they go straight into whatever it is they are writing about, and they bring their Aristotelian or Kantian or Foucauldian perspective with them. They do not commonly in my experience do that very self-consciously or examine the assumptions behind why they are adopting the perspective they bring. If they are doing more analytic kind of philosophy they don't locate what they are doing as 'I am here going to employ an approach which is located within the analytic tradition' or acknowledge other methodological approaches to the same set of problems.

Smeyers: Oh there is a serious problem there, of course. If you look at a particular philosophical stance and you look at presuppositions of that philosophical stance, how are you going to say that you agree or disagree with those fundamental presuppositions unless you do that from another philosophical stance, which may be completely the opposite of the one that you were studying in the first place? You could ask yourself, of course, questions about, is it correct that the concept of power has to be so central in every thing we analyse. Now the answer to that is another philosophical position. And it is a bit like Gadamer's or Taylor's horizon idea that you get conscious about the presuppositions of your own perspective but only when you confront it with a completely different position. And I would not call doing that doing methodology; that would be doing philosophy, I think.

Griffiths: I agree with that. But I think that there would also be a more biographical story to be told. As for instance Joe Dunne does in his book *Back to the Rough Ground*. How you move into an area, looking at whatever it is you were drawn to. Think of Paul Hirst, and his changing position from a focus on forms of knowledge to social practices, as he describes it in Roger Marples collection, *The Aims of Education*.¹ Or think of the early and later Wittgenstein.

But to go back to your question about reflection being more likely in some genres than others: I am wondering if we are, inevitably, talking to some degree from a philosopher's viewpoint about what reflection should be, a viewpoint which is closer to what an ethnographer might do than a statistician. Because from a stats viewpoint, it might be reflective to say, explicitly, 'When we chose the sample we chose to count people of a certain age, etc. And now I look back on that, I realise that the reasons that I did that were A or B.' Equally, as a stats person I could explain the procedures of analysis, like the choice to use a T-test rather than a Chi square. That would be a reflection on how you came to a particular interpretation. One of my computer science friends tells me, that the first thing he teaches his students is how to count. They need to know exactly what is it that they are counting, which is not simple or obvious. That is a highly reflective thing to do and would be expressed completely differently in a different genre. That is not a different kind of reflection, I think, but it is an important one. It is more likely to be brought to mind if you in the paradigm of quants and counting, than if you are in a paradigm of where you proceed by going and having a look, 'purposeful wandering' as Golden explains it in her chapter.

Bridges: It is interesting if we take history, for example. Certainly in the days when I used to study history, historians would firmly distinguish what they did

¹ Paul Hirst (1999) The nature of educational aims, in Roger Marples (ed.) *The Aims of Education*, London and New York, Routledge.

from philosophy of history or social theory. Whereas I think most of the contributors to this book are very conscious of the location of their historical work within a social theoretical or even philosophical framework. It seems to be a genre in which reflection on method and methodological assumptions has kind of surfaced, and some contributions to contemporary writing in the history of education look more philosophical or at least self consciously embedded in social theory than in a more traditional or popular view of history, which is content to tell a story without overt or self-conscious reflection on its theoretical assumptions or its methodological approach. Some ethnographers, too, put, it seems, as much effort into their reflexivity as into their fieldwork, and this becomes a very visible part of their writing.

On the National and the International

Bridges: There is another interesting feature I would like to put to you which concerns the international character of this set of accounts. We and the contributing editors self-consciously sought to draw contributions from as many parts of the world as possible. That raises the question as to what extent do you feel the chapters reflect their different national and cultural locatedness (as Morwenna suggested earlier in this conversation) or to what extent are they all written within what might be perceived as a shared 'global educational space'? In a sense we have seen a certain homogenisation of academic discourse, so that scholarly papers of this kind written by people in Japan, in India or in the United States are not going to be very different because they share a single kind of international discourse. Does this handbook provide evidence of this kind of internationalised, homogenised scholarly community or is there evidence of significant differences arising out of the diversity of national and cultural locations of the contributors?

Smeyers: I would say that national differences are visible not in the approaches but of course in the content that is prioritised. For some genres that is more the case than for others of course. For quantitative methods and for philosophy I think although the context is still important the methods are widely shared. But the kind of theme they address – that is more context dependant. The selection of the topic of inquiry says something about themes that are discussed at the society level and in the country where this scholar is from. But at the same time, the approach to the theme, the way that is it done of course reflects very much let's say the standard vocabulary, the standard argument, the standard of how we are approaching this all over the world.

Burbules: Is that the same sort of thing? I think we see that with the work in this Handbook from non-English-speaking countries, the scholars are generally

much more explicit about their situatedness. Most of the time they say, I am talking about *this* country or situation. And it is in general, the Americans and Brits who often write as if, “I am studying the relationship between families and schools” and not “The relationship between families and schools *in Missouri*, etc.”

I think one of the factors about this explicit positioning is that as in many other contexts dominant populations feel less need to position themselves because they think they are speaking the language of universality or universal terms, whereas people who are in non-dominant positions are much more aware that they are in Georgia or Ethiopia or wherever.

Griffiths: This raises a really difficult question, because this Handbook is a collection of reports by English speaking people or by people who normally write in some other language but are capable of writing in English. I think that Payet’s paper was the only one translated by someone other than the author. And anyway, the authors’ first languages are largely European languages, like French, Italian, Swedish, German. Not Swahili or Zulu, for instance, or Korean. So just at the very simplest level, there is a homogenisation of discourses through the dependency on the English language. But also we have got people educated in one place, coming from a second place, discussing a third place and examples of chapters written collaboratively by people coming from very different environments – such as the chapter by Ridley (UK) and Asgedom (Ethiopia). So the examples we have should make us cautious of over-generalisation.

However, that said, the context matters. Ethical questions as you understand them in Birmingham in the US, or Birmingham in the UK, are different from the ones that arise in Japan or in Sri Lanka, as the chapters by Okubo and Benadusi show. So that difference is a way of shaking up the dominant discourse of ethics in educational research.

Burbules: But we are talking about interpretation broadly as a process of meaning-making, that does always occur within a particular language. And so I think it is perhaps a limitation or restriction on interpretation that many of our authors are doing their work or thinking about their work or writing about it in a different language than their own. How does it affect that sense-making process in a language that incorporates a particular vocabulary, a set of definitions and terminology, that might be quite different from the language in which they might have been originally doing their work, because we are asking them to write and publish in our language?

Griffiths: As we were saying earlier today, the normal way of writing in French and Spanish or Italian is to use much longer sentences than in English and, as you said, to be more allusive. When that is translated into English it looks like bad English. So sometimes it gets chopped up into much sharper sentences, which inevitably changes what you can say or how you will say it. That may be the same, or much more so, for, say, Chinese, Japanese or Farsi: we don’t know.

- Bridges: So the language is itself a homogenising factor, both in the sense of the selection of who might participate, then in the way in the way in which they might go about it.
- Burbules: Yes, homogenising, but also potentially distorting. If I am speaking from a linguistic and cultural background in which the concept of X is really a central concept in terms of identity and describing personal relationships, and there is not an equivalent for X in English, and you are asking me to say, well how did I interpret the significance of these interactions, how do I describe that to *you*?
- Griffiths: So we require a proper humility. We can say: “Look, we have managed to be international” – and we have done that. Yes. Better than many. But all we are doing is saying we are giving the reader some different contexts and some authors from different places. But we have not done very much. Because look, it is still basically Anglophone, or if not Anglophone, it is filtered through accounts written in English.
- Burbules: There is another problem that we talked about in our very first discussions, which is whether the notion of *interpretation* itself is a particularly Western preoccupation.
- Griffiths: I’d forgotten we talked about that.
- Burbules: Do they think about it that way in China? Do they use a concept like interpretation? I don’t know. We think this is the category that defines the book, but other people may not think about it in terms of that notion of interpretation.
- Bridges: Not only this, but I think in contemporary mainly western educational discourse the tendency is to encourage *diversity* of reading, of interpretation and of perspective. But there are societies where such diversity is not valued in the same way for various reasons, perhaps some of them quite legitimate. The emphasis is rather on building consensus, on commonality of perspective and understanding or perhaps respect for the authoritative voice. So even the attention to diversity of interpretation itself is something that is socially located rather than universal.
- Griffiths: The tiny bit I know about communication in Ethiopia is that it is expected that the audience will read between the lines. That is the expectation for Ethiopians of how we speak and how we explain or describe things. And that is so different from what we are asking here. It would precisely be a distortion if the explanation has to be blunt.

On ‘Theories in the Air’

- Bridges: Can I ask you a slightly different question? We have talked about interpretation and about theory underpinning interpretation. In her chapter Inés Dussel refers to Elkins, who says that interpretive sources are chosen partly because they are ‘in the air’. And then it continues, ‘theory

dates research'. Do we have evidence of what is the theory that is 'in the air' in this document, in this handbook? Do we see theories on their way out, theories on their way in? To what extent are the kinds of theories referred to in these examples going to date in the coming years?

Smeyers: There are different ways of using the concept of theory and different ways of using the concept of interpretation. So if you start from the most basic level, it is about how we make sense of something. And that is in a very large part inherited – we have the theories and concepts that have been passed down to us – and of course someone could make in a slightly different way a sense of something according to their inheritance, and that can be made explicit. Now we might call that the basic level, which refers to our social practice: our gestures and words have a particular meaning in the social practice into which people are initiated when they are born in that particular culture or sub-culture.

Now above that there are various kinds of theory, there are various kinds of interpretation. So one kind of theory, a technical sense of theory, is the zero hypothesis testing theory, which we will find in a number of quantitative approaches (see for example the chapter by Kyriakides or the chapter by Azola and Kelly). In that sense, theory will predict and will either be refuted or not refuted and as a consequence of that it will be changed, and of course the basic concept of that theory will therefore be changed as well, because the concept will be defined in that particular technical theory.

But there is another sense of theory in a non-technical way, more like an encompassing way of bringing things into a certain framework, at an abstract general level. I don't think that there is a lot of that going on.

Most of the work in educational research won't lead to an all-encompassing theory; moreover it is questionable whether we will still find a lot of what is in that sense offered now in 20 or 40 years. I don't think that the level of abstraction is that high in many of the chapters. On the contrary, people try to develop ideas about the particular issue they are addressing, which situations have led to certain problems, which elements have solved certain problems, or give us advice to deal with those, in other words offer a particular way to understand these. But these do not lead to all-embracing theories. There is perhaps a sloppy usage of theory, a sloppy usage of broad or general. As people say, "What's your philosophy in life?" And that is ok, but it means something completely different for a philosopher. And so there is a technical sense, a very technical sense, a broad sense.

And the same goes for interpretation. I mean if I say there is a chair over there, there is not a lot of interpretation that comes in, not in the normal sense of the word. That is just how you make sense of what you perceive and how you talk about these things. Sometimes of course I go to a museum of modern design furniture and then someone says: 'Look at that chair over there'. And then I can ask him: 'Are you sure that's a

chair?’ Then there is a little bit of interpretation. But there are levels and levels and levels of interpretation. I think educational research leads to interesting insights, but it does not lead to all encompassing theories which could be used to predict and to manipulate certain things.

Now on the contrary, there is variety, all kinds of things are going on there. As Nick says you can be surprised about certain things. There are always new things that you come across, and that is exactly I think the message to readers, Master’s students, doctoral researchers, when they go through these chapters. This book is not about everything. But rather, here are a couple of points that may be interesting to think about when you set up your research.

Burbules: It also introduces something that we were discussing earlier, in terms of the last genre, what we called cultural/transgressive approaches. There are some people that may like some essays and may not like others. But part of what we are trying to do is to operate in areas where the familiar theoretical categories and definitions don’t help or they start breaking down.

Bridges: I was going to say, in response to Paul, that some chapters, like the Leitch & Conroy one but not only this, set out explicitly to challenge what is ‘in the air’ in terms of dominant theoretical framing.

Burbules: This is like technology, perhaps, where things are rapidly changing. New things are happening, new kinds of relationship and activities that really don’t fall quite so neatly into some of our theoretical assumptions. And we see people in those chapters struggling to make sense of domains that are pre-theoretical or whatever you want to say. They still try to interpret them and to make sense of them, without handy theories to draw from or in some cases using theories drawn from unconventional sources. And in that sense those chapters and some others in the collection illustrate this process of what do we do when theory breaks down? How do we make sense of things when prevailing theory or our theory breaks down, or where we don’t have a theory?

Griffiths: I think there are some approaches within particular genres that are in the air at this time. I think critical discourse analysis has now become very central to language and signification. Some other language theories are there in the background but they do not get discussed with quite such excitement. But I am sure that given another 10, 15 years, something else will take its place. I think ‘voice’ has appeared quite a lot. And that’s another one that I think has been prominent in the past few decades. After all, we were asking people to look *back*. So it’s not surprising if some things that have been around very recently do not make an appearance. For example, I am quite interested, given my general focus on social justice, that intersectionality seems to be something that is missing as a concept, even in the ethnographic sections where, as the contributing editors observed, most of the chapters could be placed in the field, ‘Equity, justice and diversity’. Similarly, Ranci ere and Agamben are

now beginning to come into favour. Yet they hardly appear at all in these papers.

So, yes, if we did this again in 10 years time, I think we would see a different set of middle-level theories and iconic big names being mentioned.

Bridges: We also got examples, even in the cultural/transgressive section, of Freud making a comeback if he ever went away. And Michael Peters kicks off his chapter with a quote from Marx. There are some enduring names: Plato features in Gary McCulloch's chapter in the history section too. Some figures are sticking around!

Griffiths: And we can't tell who it will be. It is really interesting I think when you read educational philosophy from the nineteen fifties, for instance, on social justice, pre-Rawls. You might even bring those fifties names back in again, though now they are so comprehensively forgotten. Can you talk about distributive justice, without mentioning Rawls? I doubt it. But in another 50 years?

Smeyers: Another which is perhaps of our age is that a lot of chapters talked about what research is *for*. If you look at the last three or four decades, I am not saying that it was not there or that there was no author who addressed this, but it is certainly something that now comes more and more to the foreground. This is something that has evolved, so it is therefore not surprising to find also a shift in the interpretive frameworks that are drawn upon to serve this interest. This is reflected in some of the ethnography chapters, but also in other chapters as well. For example the chapter by Hemelsoet pays attention to how irregular migrants are defined and the repercussions that has for the statistics, but also to *what needs to be done*. Again there is the question of what research is for combined with what we exactly want to know from the reality we live in. This gives us not only a sense of what is going on but points to how we may be able to change certain things or not. Even the chapter by Simons on governmentality is not just describing using a Foucauldian framework, it is not just giving a description, but through the description it is asking the reader whether she goes along with everything that is presupposed, implied etc. It is about being conscious, in as far as that is possible, of what you are doing with a view to *what might be changed*.

In some sense we had lost that emphasis on changing the world for a time. We were very much familiar with it in the late sixties and in the early seventies I think, after the things that happened in the Quartier Latin, in Berkeley, and all over the world. But in the period in between there was less focus on that. And so a lot of research adopted much more of what the historians call an objectivist approach. It is not that looking for particular outcomes and so forth was not there anymore, but there is a growing awareness that it is not enough, and that you do research not only with a particular theme in mind, but with a particular aim and not only when you are addressing policy-makers. This reflects on the

researcher, reflects on the person at the receiving end, the practitioners. Furthermore a number of chapters will explicitly argue that, obviously, practitioners themselves also have to make sense of the results, also have to interpret them, otherwise they cannot impact on practice. They surrender the authoritative interpretation of the researcher.

I find this development interesting, certainly much more than what happened in the ‘traditional’ approach where the focus was on a particular content combined with a strong effort to follow a particular methodology. A number of chapters exemplify this embracing “Don’t worry too much about the method we follow. We do all kinds of things, but generally it is within this approach or that approach”. But of course all elements get together in the particular research project. I mean there is not so much, not even for the philosophy genre, an occupation with: “Is this now correct within that genre. Am I doing what I am supposed to do. Do I follow the rules of the cookery book? Is this correct or not?”. I don’t feel that in the chapters. A lot of them explicitly say they are not doing that. But it even goes for those who don’t talk explicitly of that. I mean, there is a lot of sociology in the governmentality approach of Foucault, and there were days that a lot of authors would have not have liked that. They would have said “This is not philosophy”.

Bridges: So the very concept of genre is really pretty disrupted by the examples we have here?

Smeyers: Yes.

Burbules: Let me pick up on what you have just said. I mean you start with certain genres and categories and this is laid out in the Introduction. That was how we thought we were going to organise the book. But when you look at all this work, in the particular, you start realising that many other forms of organisation would have been at least as good or, maybe, even better. These things don’t fall out in terms of simple natural categories. It isn’t straightforward at all. Things are more interdisciplinary, there are more mixed methods. And certain work actively resists being put into particular categories, as in the transgressive section.

Bridges: Anything you would like to add?

Griffiths: I am so pleased that we asked for detailed examples. There is an awful lot of stuff available for students who are expected to learn about how to do research, but it is often at such an abstract level that it does not represent the reality of research practice. You can see many academic articles on how to do a kind of dance with the words epistemology, methodology, ontology, theoretical framework, qualitative, quantitative, mixed methods, etc., etc. And then they do their research. And these two parts of the enterprise don’t really seem to meet up. And what has happened in this book is that they have met up in a whole range of complex ways. I am very pleased that we insisted on having examples. And I think it worked pretty well. . . . Didn’t it?

Imagine that you enter a parlor. You come late. When you arrive, others have long preceded you, and they are engaged in a heated discussion, a discussion too heated for them to pause and tell you exactly what it is about. In fact, the discussion had already begun long before any of them got there, so that no one present is qualified to retrace for you all the steps that had gone before. You listen for a while, until you decide that you have caught the tenor of the argument; then you put in your oar. Someone answers; you answer him; another comes to your defence; another aligns himself against you, to either the embarrassment or gratification of your opponent, depending upon the quality of your ally's assistance. However, the discussion is interminable. The hour grows late, you must depart. And you do depart, with the discussion still vigorously in progress Burke, K. (1957) pp. 110–111.²

About the Editors

General Editors

Paul Smeyers is Research Professor for Philosophy of Education at Ghent University, Extraordinary Professor at K.U.Leuven, both in Belgium, and Honorary Extraordinary Professor at Stellenbosch University South Africa. He teaches philosophy of education and methodology of the *Geisteswissenschaften* (Qualitative/ Interpretative Research Methods). He holds or has held several positions in the *International Network of Philosophers of Education* (President since 2006) and is link-convenor for Network 13, Philosophy of Education of the *European Educational Research Association*. He is Editor of *Ethics and Education*, Associate Editor of *Educational Theory*, and a member of the Editorial Board of *Studies in Philosophy and Education*, of *Educational Philosophy and Theory*, and of *Journal of Philosophy of Education*. For more than a decade he is the chair of the Research Community *Philosophy and History of the Discipline of Education* established by the Research Foundation Flanders, Belgium (Fonds voor Wetenschappelijk Onderzoek – Vlaanderen). Together with Nigel Blake, Richard Smith and Paul Standish he co-authored *Thinking Again. Education after Postmodernism* (Bergin and Garvey, 1998), *Education in an Age of Nihilism* (Falmer Press, 2000) and *The Therapy of Education* (Palgrave Macmillan, 2007) and co-edited *The Blackwell Guide to the Philosophy of Education* (2003). Together with Marc Depaepe he co-edited eight books (between 2006 and 2014, Springer). With Michael Peters and Nick Burbules he co-authored *Showing and doing. Wittgenstein as a Pedagogical Philosopher* (Paradigm Publishers, 2008). Forthcoming is a co-authored book with Richard Smith (*Understanding education and educational research*, Cambridge University Press, 2014).

David Bridges is Director of Research (Kazakhstan and Mongolia) in the University of Cambridge Faculty of Education, Emeritus Fellow of St Edmunds and

Homerton Colleges and Emeritus Professor in the University of East Anglia, where he was formerly Dean of the School of Education and then Pro Vice Chancellor. He has recently served as Director of the Von Hugel Institute and Director of the Association of Universities in the East of England. Originally a historian, he has a distinguished record of contributions to philosophy of education and is an Honorary Vice President of the Philosophy of Education Society of Great Britain, but he has also directed or co-directed some 30 empirically based research and evaluation projects. He was a Council member of both the British and European Educational Research Associations, is an elected Academician of the (UK) Academy of Social Sciences and of the Lithuanian Academy of Science and holds an Honorary Doctorate of the Open University. He has been Visiting Professor in the universities of Hong Kong, Oslo, Trondheim, Chung Cheng, Addis Ababa and Kaunas Technology University. David Bridges' has published over 150 journal articles, chapters and authored, edited, and co-edited books that include: *'Fiction written under oath'? Essays in philosophy and educational research*; *'Evidence-based educational policy': What evidence? What basis? Whose policy?; Philosophy and methodology of educational research*; *Higher education and national development*; *Education, autonomy and democratic citizenship*; *Education, democracy and discussion*; and *Educational reform and internationalisation: the case of school reform in Kazakhstan*.

Nicholas C. Burbules is the Gutsell Professor in the Department of Educational Policy, Organization and Leadership at the University of Illinois, Urbana-Champaign. His primary research focuses on philosophy of education; teaching through dialogue; and technology and education. His current philosophical work focuses primarily on the idea of "situated" philosophy of education, a way of reframing the question of whether philosophy of education is merely a derivative branch of pure philosophy or an "applied" field. Situated philosophy of education begins with real cases and problems and derives philosophical questions from them, rather than beginning with philosophical problems and then using educational cases as examples or illustrations. He is also continuing to work on the topic of dialogue and communicative virtues. His current work on technology emphasizes the topic of ubiquitous learning, the study of new models of "anywhere, anytime" teaching and learning arising from the proliferation of mobile technologies and pervasive wireless connectivity. He has published several papers and given numerous talks on the topic. He is currently the Education Director for the National Center on Professional and Research Ethics, located at Illinois. His most recent books are *Showing and Doing: Wittgenstein as a Pedagogical Philosopher*, coauthored with Michael Peters and Paul Smeyers (2010, Paradigm Press) and *Feminisms and Educational Research*, coauthored with Wendy Kohli (2012, Rowman and Littlefield).

Morwenna Griffiths is the Chair of Classroom Learning in the Moray House School of Education at Edinburgh University. She has taught in primary schools

in Bristol, and at the University of Isfahan, Iran, at Christ Church College HE in Canterbury, and at Oxford Brookes, Nottingham and Nottingham Trent Universities. Her recent research has included philosophical theorising and empirical investigation, related to social justice, the nature of practice, pedagogy, the feminisation of teaching and creativity. Her books include *Action for Social Justice in Education: Fairly Different*; *Educational Research for Social Justice*, and *Feminisms and the Self; the Web of Identity*. She has contributed chapters on social justice and educational research methods to International Handbooks in a range of research areas: *International Handbook of Educational Leadership and Social (In)Justice*, (eds.) Ira Bogotch and Carolyn M. Shields 2013, *Routledge Companion to Research in the Arts* Routledge, (eds.) Biggs, M. and Karlsson, H. 2010, *Handbook of Educational Action Research*, (eds.) Bridget Somekh and Susan Noffke 2009 and *International Handbook of Self-Study of Teaching and Teacher Education Practices*, (eds.) J. Loughran, M.L. Hamilton, V. LaBoskey and T. Russell. Her other publications include quantitative studies of computers in schools, action research, self-study, research evaluations based on interview data. Her current interests are related to a concern about how to be and to act justly in a world which is constituted of relationships with our natural world that includes but also exceeds human beings.

Section Editors

Kathryn Anderson-Levitt has a PhD in anthropology from Stanford and is professor emerita of anthropology at the University of Michigan–Dearborn. She currently teaches at UCLA. She has conducted ethnographic research on teachers, reading instruction, and the flow of educational reform in France, the Republic of Guinea, and the United States. She is the author of *Teaching Cultures: Knowledge for Teaching First Grade in France and the United States* (2002) and the editor of *Local Meanings, Global Schooling: Anthropology and World Culture Theory* (2003) and *Anthropologies of Education: A Global Guide to Ethnographic Studies of Learning and Schooling*. She has served as a President of the American Anthropological Association's Council on Anthropology and Education and as an editor of *Anthropology and Education Quarterly*. Currently, she is one of the co-editors of *Comparative Education Review*.

Dennis Beach is Professor of Education with a specific interest in the sociology of education and ethnography. He works at the Department of Education and Special Education at the University of Gothenburg, Sweden. He is the author and co-author of multiple research articles in sociology of education and ethnography and has specialized in particular in research on issues of justice and equity in teaching and teacher education. Teacher education reform was the subject of his first academic work in 1989. Ethnography was the chosen methodology and has remained a major methodological interest since then. Dennis Beach is Editor in Chief of the

international research journal *Ethnography and Education*, co-founder of *Ethnography and Education International*. This is an international and informal research group connected to the development of ethnography in educational research. Beach is also lead-convenor in the European Educational Research Association for its ethnography network and a research team leader in the Nordic Centre of Excellence (NCoE) for Justice through education in the Nordic Countries (JustEd). JustEd is a multidisciplinary, cross-national research network coordinated at the University of Helsinki, Institute of Behavioural Sciences, as part of the NordForsk programme *Education for Tomorrow*. The centre's aims are to research the challenges facing Nordic educational systems in the twenty-first century and to contribute to the re-formulation of the project of democratic, inclusive education for justice in the context of the globalizing Nordic welfare states. Beach was scientific leader of the former NordForsk network on Youth and marginalisation in the Nordic countries.

Robert A. Davis is Professor of Religious and Cultural Education and Head of School of Education in the University of Glasgow. He has taught, written and broadcast nationally and internationally on philosophy and theory of education, religion, postsecularism, literature, music, folklore, education, history of education, sectarianism, childhood studies, environmental education, natural history and the development of Catholic education in Scotland and beyond. Teacher education remains central to his interests, encouraging a wider exploration of professional values and professional formation more generally. His recent publications include a monograph on the educational reformer Robert Owen and a series of interrelated articles on concepts of childhood in educational theory and practice. Robert A. Davis is Editor of the *Journal of Philosophy of Education*.

Marc Depaep is since 2013 deputy chancellor at the *Katholieke Universiteit Leuven* with full responsibilities for the campuses at Kortrijk (Kulak), Ostend, and Bruges (Kulab). Co-editor-in-chief of *Paedagogica Historica*, since 2005, and member of several editorial boards of national journals in the history of education. Former president of the *International Standing Conference for the History of Education* as well as of the *Belgian Dutch Society for the History of Education*; former vice-president of the *Internationale Gesellschaft für Historische und Systematische Schulbuchforschung*. Since 2010, "Fellow" and member of the "Board of directors" of the *International Academy of Education*. Published hundreds of articles and several books on the history of education in general and the history of educational sciences, the history of education in Belgium and in the former Belgian Congo, the historiography, theory and methodology of the history of education as a discipline in particular. His selected readings were published in 2012 by Leuven University Press as: *Between Educationalization and Appropriation*.

Lynn Fendler is a professor in the Department of Teacher Education at Michigan State University where she teaches courses in curriculum theory, philosophy of education, and humanities-oriented research. Professor Fendler received her Ph.

D. in Curriculum and Instruction from the University of Wisconsin-Madison in 1999; she was a Visiting Professor at the University of Luxembourg in 2010–2011. She is the 2013 recipient of the University of Wisconsin-Madison School of Education Distinguished Achievement Alumni Award. Since 2000, she has been a member of the Research Community: History and Philosophy of Education Research Community of Leuven, Belgium. A paperback version of her 2010 book, *Michel Foucault*, will soon be available from Bloomsbury Publishing. Professor Fendler's focus of research is the Ethics of Knowledge. Using genealogical and historiographical approaches to critique, she examines ways in which knowledge has unintended and unanticipated harmful and exclusionary effects in education. Her recent research projects include a history of the bell curve, a critical examination of chronology in educational historiography, and curricular theories of gustatory taste.

Francesca Gobbo held a position as Professor of Intercultural Education and Anthropology of Education at the University of Torino (Italy) until February 28th 2014. As of March 1st 2014 she is Associate Editor of the international journal "Intercultural Education", and continues to be part of the Nordic Center for Excellence in Education and of the "Education for Tomorrow" Programme as well as of the networks on "Social Justice and Intercultural Education" and "Ethnography" with the European Education Research Association. After graduating from the University of Padova, she studied at the University of California, Berkeley. She was Fulbright grantee (1969), Visiting Scholar at UC Berkeley (1995) and Harvard University (2001). She is on the editorial boards of international journals, has published extensively in Italian and English and participated into Comenius projects. She studies and teaches contemporary educational issues from a comparative and interdisciplinary perspective combining educational theory with cultural anthropology and anthropology of education so as to problematize and widen the discourse and research on intercultural education. She carried out ethnographic research among Italy's "internal minorities" such as the Albanian speaking minority of Calabria, the Waldensian religious minority in Piedmont, the occupational minority of travelling fairground and circus people in Veneto. She is presently researching the rituals of lunch in nursery and childhood schools of Padua and "clown interventions" in Padua hospital's pediatric ward.

Marilyn Johnston-Parsons is a professor in the Department of Curriculum and Instruction at the University of Illinois at Urbana-Champaign. She has been a classroom teacher and then university professor for more than 40 years. One co-written narrative book, *Success Stories in a Failing School* (2007), narrates teachers' successful attempts to help students learn in an urban school in the midst of a district imposed scripted curriculum and testing that labeled the school "failing". In a collaborative study of an urban-focused teacher education reform initiative at The Ohio State University, she and her teacher and faculty colleagues describe their 16-year longitudinal research on this reform and its impact on graduates in a book entitled, *Dialogue and Difference in a Teacher Education*

Program (2012). The authors write narrative accounts of their experiences in this reform initiative. Marilyn Johnston Parsons' research interests have focused primarily on teacher education. She is interested in how schools and universities can collaborate to enhance the learning of future teachers and the integration of theory and practice. These interests have been influenced by the research in teacher education, particularly work by Linda Darling-Hammond and Marilyn Cochran-Smith, but also by the insights and implicit theories of the teachers with whom she worked for many years in a Professional Development School project at The Ohio State University, USA. She has also been influenced by post-structural feminist theories looking at the power, language, and gender issues in teacher education in particular and in schooling in general.

Elina Lahelma is Professor of Education (emerita) and Research Director, University of Helsinki, Finland. She has worked as the responsible leader of the Research Unit of Cultural and Feminist Studies in Education and of several research projects granted by the Academy of Finland, the most recent 'Citizenship, Agency and Difference in Upper Secondary Education'. She is senior member in a Nordic Centre of Excellence 'Justice through Education in the Nordic context' Lahelma's fields of interest are in sociology of education and gender studies in education. She has conducted ethnographic research in schools and ethnographically grounded life-historical study on young people's transitions. One of her foci of interest is in ethnographic methodology. Her publications in English include books 'Making Spaces' (Macmillan, with Gordon and Holland, 2000) and 'Democratic Education: Ethnographic Challenges' (Tufnell Press, edited with Beach and Gordon, 2003) and 'Fair and competitive? Critical perspectives on contemporary Nordic schooling' (Tufnell Press, edited with Arnesen, Lundahl and Öhrn, 2014) and tens of articles in Journals, the most recent (2014) in 'Gender and Education', 'Ethnography and Education' and 'Educational Research'.

Vally Lytra is Lecturer in the Department of Educational Studies, Goldsmiths, University of London. Her research interests are in the areas of multilingualism, language use, language ideologies and social identities in schools, homes and communities in cross-cultural urban contexts. She is the author of *Play Frames and Social Identities: Contact Encounters in a Greek Primary School* (John Benjamins, 2007). She has co-edited *Multilingualism and Identities across Contexts: Cross-disciplinary Perspectives on Turkish-speaking Youth in Europe* (with Jens Normann Jørgensen, Copenhagen Studies in Bilingualism, 2008) and *Sites of Multilingualism Complementary Schools in Britain Today* (with Peter Martin, Trentham, 2010). She has also co-edited two special issues, *Bringing the Outside In: Negotiating Knowledge and Agency in Urban Multilingual Learning Contexts* (2011, with Janus Møller, *Linguistics and Education* 22:1) and *Language, Discourse and Identities. Snapshots from the Greek Context* (2009, with Alexandra Georgakopoulou, *Pragmatics* 19:3). Her new edited book *When Greeks and Turks Meet: Interdisciplinary Perspectives on the Relationship since 1923* (Ashgate) will appear in May 2014.

Jane Mulderrig is a Lecturer at Sheffield University, UK, where she runs the MA in Applied Linguistics (<http://www.shef.ac.uk/english/people/mulderrig>). After several years teaching in Japan she took up doctoral research in Linguistics, developing a corpus-based critical discourse analytical approach to the political economy of education policy. More generally Jane's research and teaching combines sociological theory with linguistic analytical methods to investigate questions of identity, power and personality in a range of public discourse contexts. Several of her publications (*Discourse and Society*, *Critical Discourse Studies*, *Educational Philosophy and Theory*) use this combined approach to investigate the linguistic dimensions of managerialisation, discourses of the knowledge economy in education, as well as the role of personal pronouns in 'selling' policy to the public. Her work also investigates the rise of 'soft power' in contemporary governance. While working in educational research at Edinburgh University, Jane also published in the area of disability and gender policies, and equality and human rights (<http://www.ed.ac.uk/schools-departments/education/rke/centres-groups/creid>). Jane's current research examines the use of 'nudge' strategies in UK public health policy as well as contemporary public discourses of ageing. For downloadable publications see: <http://sheffield.academia.edu/JaneMulderrig>.

Yusef Waghid is a full Professor of Philosophy of Education in the Department of Education Policy Studies and previously Dean of the Faculty of Education at Stellenbosch University. He is an elected member (fellow) of the Academy of Science of South Africa (ASSAf), executive member of the International Network of Philosophers of Education, and Editor-in-Chief of *South African Journal of Higher Education*. His most recent books are *Conceptions of Islamic education: Pedagogical framings* (New York: Peter Lang, 2011); *Citizenship, education and violence: On disrupted potentialities and becoming* (Rotterdam/Boston/Taipei: Sense Publishers, 2013); *African philosophy of education reconsidered: On being human* (London: Routledge, 2014); and *Pedagogy out of bounds: Untamed variations of democratic education* (Rotterdam/Boston/Taipei: Sense Publishers, 2014). He is a Member of the Task Team of the Council on Higher Education (CHE): Reviewing the State of Higher Education in South Africa over the past 20 years (2013–2014).

Michael F. Watts is an independent education consultant. Before going freelance, he spent 12 years at the Universities of East Anglia and then Cambridge where much of his research was concerned with the widening participation agenda in and beyond the UK. This work typically made use of life history research and included studies of the aspirations of young people who choose not to enter higher education, higher education opportunities for refugees, asylum seekers and migrant workers, the pedagogies of higher education, access to higher education in India and the funding of higher education as well as several projects focusing on the progression of state-educated students to the Universities of Oxford and Cambridge. He is currently involved in several long-term projects in South East Asia and Sub-Saharan Africa. His interests in the philosophy and sociology of education

have been shaped by the work of Jean Baudrillard and Pierre Bourdieu but most of his research has been informed by the capability approach (outlined in his chapter in this volume) and is therefore concerned with human well-being defined as the substantive opportunities individuals have to choose and lead lives they value and have reason to value. His previous editorial work includes the journals *English Time: a journal for Cambodian Teachers of English* (co-editor, 1993–1994) and *Power and Education* (lead editor, 2009–2011) and the forthcoming volume *Higher Education and the Capability Approach*.

About the Contributors

Aurora Álvarez Veinguer is Associate Professor of Social Anthropology at Universidad de Granada (Spain). Her main research interests are processes of identities (re)presentation, ethnicity, ethnography, migration and gender. Her latest publications are: “Mutual understanding” in Tatarstan? Teachers’ and pupils’ attitudes to Tatar and Russian in Tatar and Non-Tatar gymnásias (2013, *Pragmatics and Society*), with Arribas Lozano, Alberto, García-González, Nayra, Álvarez Veinguer Aurora y Ortega Santos, Antonio (2012, *Tentativas, contagios, desbordes. Territorios del pensamiento*. Granada: Universidad de Granada), García Castaño, Javier, Álvarez Veinguer, Aurora y Rubio Gómez, Maria (2011; “Prismas Trasescalares en el estudio de las migraciones”, *Revista de Antropología Social*), Álvarez Veinguer, Aurora, Rosón, Javier and Dietz, Gunther. Under the shadow of Al-Andalus? Spanish teenagers’ attitudes and experiences with religious diversity at school (2011, *British Journal of Religious Education*).

Yuni Sari Amalia is a doctoral student in the Department of Curriculum and Instruction at the University of Illinois at Urbana-Champaign. She is currently collecting her data for her dissertation research on a community-founded school. The purpose of her research is to learn more about the implementation of social justice issues as she works collaboratively the teachers in the school. She graduated with her master program from the same department with a thesis on “Teachers’ Perceptions toward the Indonesian Government’s Instruction for a Decentralized and Competence-Based Curriculum.” Prior to coming to the USA, she was a junior faculty member for 7 years at Airlangga University, Indonesia in the English language department. She has done several presentations related to narrative studies.

See About the Editors for Editors who are also authors or co-authors.

Yvonne Anders is professor of educational science with a focus on early childhood education at Freie Universität Berlin, Germany since 2012. Before she worked as a research scientist at various institutes, such as Otto-Friedrich-Universität Bamberg, the Max Planck Institute for Human Development Berlin, the University of London and the University of Münster, Germany. Her research interests are quality and effects of early childhood education and care, professional competencies of early childhood professionals, as well as international comparative studies. Selected publication: Anders, Y., Grosse, C., Roßbach, H.-G., Ebert, S. and Weinert, S., Preschool and primary school influences on the development of children's early numeracy skills between the ages of 3 and 7 years in Germany (2013, School Effectiveness and School Improvement).

Alfredo J. Artiles is the Ryan Harris Professor of Special Education at Arizona State University. His scholarship focuses on understanding and addressing educational inequities related to the intersections of disability with sociocultural differences. He directs the Equity Alliance, and co-edits the International Multilingual Research Journal (Taylor & Francis) and Teacher College Press' book series Disability, Culture, & Equity. He was Vice-President of AERA (2009–2011), is an AERA Fellow, a Spencer Foundation/National Academy of Education Postdoctoral Fellow (1998–2000), and a 2008–2009 Resident Fellow at the Center for Advanced Study in the Behavioral Sciences (Stanford University). He received the 2012 AERA's Palmer O. Johnson Award. He is a Commissioner in President Obama's Advisory Commission on Educational Excellence for Hispanics. He is the 2009 Distinguished Alumnus from University of Virginia's Curry School of Education Foundation. His latest book is *Inclusive education: Examining equity on five continents*, Harvard Education Press (2011, with Kozleski and Waitoller).

Amare Asgedom is an Associate Professor Curriculum and Instruction at Addis Ababa University (Ethiopia) in the College of Education and Behavioral Studies. He has taught graduate and undergraduate courses in the same institution for the last 35 years, since 1979. Moreover, he has a wider participation in academic administration, including heading a research branch, the *Institute of Educational Research* for 7 years (1996–2003). This author had rich community participation in policy formulation and design of educational programs at the Ministry level. In addition to research consultancies carried out at national and international levels, he has served as the Director of MERA (Monitoring and Evaluation, Research and Assessment) for a year and a half in a USAID Project, IQPEP (Improving Quality of Primary Education). Moreover, he served as a team leader of a World Bank program in Uganda called Secondary Teacher Development and Management Systems (STDMS). In addition to publishing several articles in a peer reviewed national and international journals, the author has recently (2011) published a book, Academic freedom in higher education of Ethiopia.

Marta C. Azaola is a Senior Research Fellow at the School of Education, University of Southampton. She specialises in the sociology of education and education

policy, especially in relation to the participation in education of those from deprived backgrounds and the ways in which home-school-community links are influenced by social organisation in rural areas, and how these links impact on the educational and occupational trajectories of individuals. Dr Azaola is a graduate of the National Autonomous University of Mexico. She holds an MA in Educational Research from Lancaster University and a PhD from the University of Bristol.

Mara Benadusi is an Italian anthropologist working as researcher and lecturer at the Department of Political and Social Sciences at the University of Catania. She is also member of the Ph.D. program in Anthropology at the University of Messina. Her research interests include the anthropology of education and anthropology of disasters. She had long been studying how the “intercultural approach” is applied in Italy, especially when immigrant-origin students are concerned. She has also extensively worked in Sri Lanka during the reconstruction phase that followed the 2004 Indian Ocean tsunami. Her current work focuses on the political and educational aspects of post-catastrophe interventions, including how individuals and social groups learn to protect themselves in disasters. In 2013 she received the Mary Fran Myers Scholarship by the Natural Hazards Center (University of Colorado, Boulder) for her commitment to disaster research. She co-edited *Disasters, Development and Humanitarian Aid. New Challenges for Anthropology* (Guaraldi, 2011).

Peter Bowbrick has worked as a consultant in more than 35 countries, mainly for governments, the UN, the EC and the World Bank, as well as in Cambridge University and a research institute. The work has involved working in teams which interact with teams from the host governments, and sometimes from the international organizations. The aim has been to change action and policy. He has published widely including work on the limitations of data and statistics for action and policy.

Anne-Marie Chartier born in 1944 is holder of a philosophy agrégation and a PhD in teaching didactics. She first conducted her research as an associate professor in the Department of didactics at the INRP from 1974 to 1980, where she studied the teaching of mathematics at elementary level. Still as an associate professor from 1994 to 1996 and as a teacher and researcher since 1996, she worked on reading and writing in primary schools at the SHE (history of education). Her recent publications are connected to the history of written work at school, the teaching methods of reading in France and Western Europe and to a greater extent, the history of teacher training and teaching practices.

James C. Conroy is currently Vice-Principal for Internationalisation at the University of Glasgow where he has previously served as dean of the Faculty of Education and Professor of Religious and Philosophical Education. He is the author of numerous papers and monographs including ‘Betwixt and Between: the Liminal Imagination, Education and Democracy’ and ‘Does Religious Education Work?’ He has been a visiting Professor at the University of Rio Grand do sul, Porto Alegre,

Australian Catholic University, Fordham University and in 2011 was European Modern Universities visiting Professor at the University of Warsaw. He has been President of the Association for Moral Education and is currently chair of the Philosophy of Education Society of Great Britain. In 2012 he was elected to the Academy of Social Sciences. His scholarly interests include interculturalism and plurality, childhood and religion and politics in education.

Sophie Dewayani earned her PhD in University of Illinois at Urbana-Champaign and is currently teaching in Bandung Institute of Technology in Indonesia. This article represents her methodological reflection when conducting her dissertation research, which involved a street community in Bandung, Indonesia. Her research interests include children's literacy and social justice, identity construction in school settings, as well as children's literature. Specifically, she focuses on how disadvantaged children use books, television shows, and other cultural resources around them to write and to learn in schools. While teaching and conducting research, she helps developing the Early Childhood Center in the street community in which her child participants learned.

Gunther Dietz is Research Professor of Intercultural Studies at Universidad Veracruzana (Mexico) Main research interests: minority integration and development policies in indigenous regions, ethnicity, interculturality and intercultural/inter-religious education; ethnic and/or multiculturalist movements and non-governmental organizations as new social actors. His latest publications are *Multiculturalismo, interculturalidad y diversidad en educación: una aproximación antropológica* (2012, Mexico City: Fondo de Cultura Económica), with Laura Selene Mateos Cortés, *The need for comparison in intercultural education* (2012, Intercultural Education), *A Doubly Reflexive Ethnographic Methodology for the Study of Religious Diversity* (2013, British Journal of Religious Education), and with Bertely Busquets and Guadalupe Díaz Tepepa, *Multiculturalismo y educación 2002–2011* (2013, Mexico-City: Comie and Anuies).

Jo-Anne Dillabough is Reader in the Sociology of Youth (Education), University of Cambridge and David Lam Chair in Multicultural Education, Educational Studies, UBC. Recent book publications include (with J. Kennelly, Routledge, 2010) *Lost Youth in the Global City: Class, Culture and the Urban Imaginary* and *Troubling Gender in Education* (with J. McLeod and M. Mills, eds., 2011). She is also co-editor of *Education, Globalization and Social Change* (with H. Lauder, P. Brown, and A. H. Halsey, translated into Japanese, University of Tokyo Press, 2012). Her most recent work focuses upon the linkages between urban housing, economically disadvantaged youth and the politics of 'bordering' and securitization. Her forthcoming book assesses the work of Hannah Arendt and its impact on how we might rethink notions of gender, culture and political action in times of heightened austerity and mobile fears of the 'stranger' or the 'foreigner'. She is co-editor of *Gender and Education*.

Emilia Djonov is a Lecturer at the Institute of Early Childhood, Macquarie University, Australia, and an honorary postdoctoral research fellow at the University of Technology, Sydney. Her research interests and publications are in the areas of (critical) multimodal and hypermedia discourse analysis, social-semiotic software studies, visual communication, social semiotics, systemic functional theory, and multiliteracies. She has published in journals such as *Visual Communication*, *Semiotica*, *Social Semiotics*, and *Text & Talk*, and co-edited the volume *Critical Multimodal Studies of Popular Discourse* (Routledge, 2014, with Sumin Zhao).

David Doubek graduated at the Faculty of Sociology of Charles University (Anthropology) in 1998. In 2003 he gained PhD (Faculty of Education, Charles University). From 1994 to 2003 he participated on the longitudinal project research of Prague Group of School Ethnography “*Pupil in the changing conditions of contemporary school*”. From the year of 2008 he focused on the issue of Roma education. He cooperates with Markéta Levínská and Dana Bittnerova on the research projects *Function Cultural Models in Education* (2008–2010) and 2012–2015 *Decision-making processes of helping professions in the area of intercultural relationship* (2012–2015).

Yo Dunn received her PhD from Lancaster University, UK, on a thesis titled ‘New Labour’s discourses around exclusion from school 1997–2006: disguising change and dodging critique’, supervised by Dr. Yvette Solomon and funded by the Economic and Social Research Council (PTA-030-2003-00012). Although a non-linguist herself, Dr. Dunn’s approach to Critical Discourse Analysis was developed within the Linguistics department at Lancaster University and influenced by Norman Fairclough, Ruth Wodak, Andrew Sayer and members of the Language, Ideology and Power group. Broadly she is interested in Critical Realism, normativity and the application of emancipatory goals in social scientific research. Methodologically her research interests include the development of multi-method approaches to Critical Discourse Analysis incorporating corpus techniques and metaphor analysis. She chooses to focus on applying these methods to issues of inequality and the positioning of marginalised groups in society.

Inés Dussel is a researcher and professor at the *Departamento de Investigaciones Educativas del CINVESTAV*, Mexico. She received her Ph.D. at the Department of Curriculum and Instruction, University of Wisconsin-Madison. Before moving to Mexico, she was a researcher at FLACSO/Argentina. She has done research on the relationships among knowledge, school, and politics, in a historical and sociological approach, and has published 8 books and over 120 articles and chapters in academic journals and books in 6 languages. She is currently working on a research project on the changes brought by digital artifacts in schools, looking particularly at shifts in the visual technologies of schooling and the changing hierarchies of school knowledge. She has received fellowships from the Spencer Foundation (USA), DAAD (Germany), Georg-Eckert-Institut (Germany), CAPES (Brazil), and the University of Buenos Aires (Argentina). She is a member of the National System of Researchers (SNI) in Mexico.

Penny Enslin is Chair of Education at the University of Glasgow, and Professor Emeritus in the School of Education at the University of the Witwatersrand, Johannesburg. Her research interests and publications are in political philosophy and education with particular reference to democratic citizenship, cosmopolitan justice, and gender in education. Recent work across these themes has focussed on tensions between diversity and universalism in liberal theory, ethical implications of globalisation in education, and feminist ethics.

Anita Eriksson is a researcher-lecturer in Education with a specific interest in professional development and early childhood teaching and teacher education. She works at the Department of Education and Behavioural Sciences at the University of Borås, Sweden. She is the author and co-author of several research articles in her field and has ethnographic methods as a methodological speciality. Her current research is in the field of professional mentoring, mentorship relations and the professional development and responsibilities of early childhood teachers.

Peggy A. Ertmer is Professor of Learning Design and Technology at Purdue University. She specializes in instructional design (ID) and educational research. She is particularly interested in the impact of inquiry-based instruction on higher-order thinking skills; the adoption of student-centered, inquiry-based learning approaches by k-12 teachers; and strategies for facilitating higher-order thinking and self-regulated learning in online, inquiry-based learning environments. Most recently, Dr. Ertmer has examined how students' problem-solving skills are shaped through their engagement in case-based learning.

Olena Fimyar is a Senior Research Associate in the Kazakhstan Project at the Faculty of Education of the University of Cambridge, UK. The range of Olena's research interests includes education reform, academic migration, governmentality and discourse analysis. Before embarking on her research career, she worked for 5 years as an EFL teacher in Tsyurupynska Gymnasium, Kherson region, Ukraine. She holds an MPhil and PhD from the University of Cambridge, Faculty of Education. Prior to joining the Kazakhstan Projects team, she led a project on 'Return Academic Migration in Post-Communist Europe' at the Center for Area Studies, Free University Berlin, and prior to that, a study on the 'Sociology of Post-Communist Intellectuals' at the Collegium Budapest, Hungary.

Barry M. Franklin is Professor of Education and Adjunct Professor of History in the School of Teacher Education and Leadership at Utah State University. He is author of *Curriculum, Community, and Urban School Reform* in which he uses the concept of community as a lens for interpreting urban school reform since 1960. Focusing on the curriculum and employing case studies, he applies the concept to reform initiatives in a number of city school systems. His previous books include *Building the American Community: The School Curriculum and the Search for Social Control* (1986) and *From "Backwardness" to "At-Risk": Childhood Learning Difficulties and the Contradictions of School Reform* (1994).

Philip Gardner is Senior Lecturer in Education in the Faculty of Education, University of Cambridge, where he teaches history of education and research methods in education. He is a Fellow of St Edmund's College and a Fellow of the Royal Historical Society. His principal research interests centre upon the history of teachers and the teaching profession, and upon methodological problems in history, in both of which fields he has published extensively. He is the co-author, with Peter Cunningham, of *Becoming Teachers: Texts and Testimonies 1907–1950* (London: Woburn, 2004). His most recent book is *Hermeneutics, History and Memory* (London: Routledge, 2010).

Deborah Golden studied social anthropology at University College London which, in the British way, combined a strong respect for the empiricist tradition together with a romantic view of fieldwork in exotic places as needing little preparation in the nitty-gritty of how to go about gathering data and making sense of them. Hence, I learned about doing ethnography – both process and product – while in the field. I since ordered that somewhat chaotic experience into a graduate course on ethnographic methods which I have been teaching, with much enjoyment, for the last two decades at the Faculty of Education, University of Haifa, where I am Senior Lecturer and currently head the program in Education, Society and Culture.

Heather Greenhalgh-Spencer is a visiting assistant professor in the Department of Educational Policy, Organization, and Leadership at the University of Illinois at Urbana-Champaign. Her teaching interests include global studies in education, philosophy of education, social foundations of education, soma-cognition, and philosophy of technology. Her research interests include embodiment in online education, digital technologies as a hermeneutic for globalization, kinesiology of learning, technology as a global labor of production and reproduction, environmental ethics and technology, and hybrid practices of low tech/high tech educational intervention. Her work is highly informed by feminist theories, kinesiology, and science and technology studies. Heather is a certified teacher and has taught at the secondary level for several years. Heather's work has appeared in many peer-reviewed international journals including: *Journal of Communication*; *Philosophy of Education Society Yearbook*; *Globalisation and Education*; *Journal of Philosophy of Education*; *Borderlands*; and other international journals. She has received multiple scholarships and fellowships in order to continue her research.

Elias Hemelsoet received his PhD in Educational Sciences titled 'A critical appraisal of policies and practices focusing upon the right to education: The case of the Roma in Ghent' from Ghent University, Belgium. His primary areas of scholarship are politics of education, Roma people, irregular migration, human and children's rights, educational justice, philosophy of education, social integration and social policy. He is the author of the book '*Roma in het Gentse onderwijs: een verhaal apart?*' (in Dutch) and has published in various international journals. Apart from his scientific work, he is also engaged in a number of volunteer initiatives related to Roma and irregular migrants.

Gunilla Holm, PhD, is a professor of education in the Institute of Behavioural Sciences at the University of Helsinki and director of the Nordic Centre of Excellence in Education 'Justice through Education'. Her research interests are focused on photography as a data collection method as well as social justice issues in education related to race, ethnicity, class, and gender. She has published widely on cultural diversity issues in education related to youth and teacher education as well as on schooling in popular culture. She has co-edited several books, including *Contemporary Youth Research: Local Expressions and Global Connections* (2005) and *Schooling in the Light of Popular Culture* (1994).

Bob Jeffrey is Honorary Research Fellow at the University of Exeter, UK following retirement from The Open University in 2012. He researched, from 1992, the effects of reforms on the work of primary teachers with Professor Peter Woods and Professor Geoff Troman. He was co-leader, of two ESRC studies in the 2000s into 'Primary Teacher's Careers in Performativity Cultures' and 'The effects of Performative and Creative policies on primary schools'. They have published extensively, including methodology articles on ethnography approach including cross cultural approaches. He also worked with Professor Anna Craft developing research into creative teaching and learning through an ESRC seminar series from 2004 to 2005 and an edited Special Issue on Performativity and Creativity for BERJ in 2008. Bob is co-founder of the *Ethnography and Education* journal and edited it from 2008 to 2012, co-organised an annual ethnography conference in Oxford for 10 years as well co-editing a book series from 2007 to 2012 www.ethnographyandeducation.org.

Daniel F. Johnson-Mardones is a Ph.D. student at the University of Illinois at Urbana-Champaign, Department of Curriculum and Instruction studying on a Fulbright-CONICYT Chile grant. He has worked in teacher education in Chile for 10 years teaching curriculum studies and didactic of history and social sciences. His interests are in the fields of curriculum studies, teacher education, and qualitative inquiry. His work in the last years has been focused on biographic approaches in those fields.

Mary M. Juzwik is a teacher, scholar, and writer working in the department of Teacher Education at Michigan State University (MSU), where she teaches undergraduate and graduate courses in writing, discourse, and English education. Her abiding interest in the interactional dynamics of English language arts classrooms has led to studies of narrative talk-in-interaction in English language arts classrooms, to investigations of curricular designs that build capacity for dialogic teaching in pre-service teacher education, and most recently to research on how religious faith enters into classroom dialogues in public secondary school classrooms in the United States. Her current scholarship also more broadly examines the literacy practices, pedagogies, and learning surrounding the Bible in America's evangelical Christian sub-culture. Her interdisciplinary work engages with diverse scholarly traditions such as narrative studies, interactional sociolinguistics, rhetorical theory, and religious studies. With colleagues, she recently published *Inspiring Dialogue: Talking to Learn in the English Classroom* (Teachers College Press,

2013) and *Reading and Writing Genre with Purpose in K-8 Classrooms* (Heinemann, 2012). She serves as co-editor of *Research in the Teaching of English*. Learn more about her work at <http://juzwik.wiki.educ.msu.edu/home>.

Assel Kambatyrova is a manager at Nazarbayev University Graduate School of Education. She is responsible for administrative operations of the School as well as she is involved in research project on “Internationalisation and reform of secondary schooling in Kazakhstan” in collaboration with the University of Cambridge Faculty of Education. Assel has been working in the education sector for 6 years. At the moment Assel is working on her MA in Education at the University of Sheffield (UK) in the framework of the International Scholarship of the President of the Republic of Kazakhstan “Bolashak”. She earned an English teacher’s diploma and Master’s degree in Philology from Kazakhstani University.

Mary Jane Kehily is Professor of Gender and Education at The Open University, UK. Having completed postgraduate study in Cultural Studies at the University of Birmingham and the Institute of Education, University of London, Mary Jane’s academic interests continue to focus on the intersection between cultural studies and education. Following cultural studies traditions, she is particularly experienced in ethnographic methods and uses them to explore the everyday settings in which gender and sexuality, narrative and identity and popular culture are given meaning by young people themselves.

Anthony Kelly is dean of the School of Education, University of Southampton. He researches in the areas of policy, improvement/effectiveness theory, governance, and developing innovative quantitative approaches to educational research. His most recent books are on the use of game theory in decision-making (Cambridge University Press), conceptualising a theory of intellectual capital for use in schools (Kluwer), adapting Sen’s capability theory to school choice (Palgrave Macmillan) and the use of effectiveness data for school improvement (Routledge). Professor Kelly is an elected Fellow of the Institute of Physics and in 2012 was elected to the Academy of Social Science.

Deborah Kerdeman is Associate Professor of Education at the College of Education, University of Washington in Seattle, Washington. Her research interests include philosophy of education and the implications of hermeneutics and the humanities for educational practices, policies and aims. She has published in venues such as *Educational Theory*, *Journal of Philosophy of Education*, and *Philosophy of Education*. Kerdeman received her Ph.D. from Stanford University and was a National Academy of Education-Spencer Foundation Postdoctoral Fellow.

John S. Knox is a Lecturer in the Department of Linguistics, Macquarie University, Sydney, Australia. His research interests include multimodality, media discourse, language in education, and systemic functional theory. He has published research in journals such as *Visual Communication*, *Social Semiotics*, *Discourse and Communication*, and *Distance Education*.

Elizabeth B. Kozleski is Professor and Chair of the Special Education Department at the University of Kansas. Her research interests include the analysis of models of systems change in urban and large school systems, examining how teachers learn in practice in complex, diverse school settings. She was awarded the 2005 UNESCO Chair in Inclusive International Research, received the 2011 TED-Merrill award for her teacher education leadership in special education, and the 2013 Scholar of the Century award from the University of Northern Colorado. She is a member of a national technical assistance effort focused on creating, sustaining, and scaling inclusive schools nationwide as well as a senior advisor on the national initiative on special education teacher education. She co-edits a book series for Teachers College Press on Disability, Culture, and Equity with Alfredo Artiles. She was the senior author for *Ability, Equity, and Culture* published in 2014 by Teachers College Press and co-authored *Equity on Five Continents*, published in 2011 by Harvard Education Press.

Kairat Kurakbayev is the Research Institute's Director at Nazarbayev University Graduate School of Education, Astana, Kazakhstan. His professional experience includes working as a school teacher, a teacher educator and a higher education administrator at the university level. Prior to joining to Nazarbayev University, Kairat served as an acting director of the Office for Strategic Planning and a deputy director of the International Office in Eurasian National University, Astana. Kairat has been awarded the British Council and American Councils academic scholarships in 2004 and 2008 respectively. He holds an MEd degree from the University of Exeter, UK. His research interests focus on teacher education policies, comparative policy studies and globalisation of education.

Leonidas Kyriakides is Professor in Educational Research and Evaluation at the University of Cyprus. His field of research and scholarship is the evaluation of educational effectiveness, whether of teachers, schools or educational systems. Currently his research agenda is concerned with the development of a *dynamic model of educational effectiveness*, and the *application of effectiveness research to the improvement of educational practice*. He is a member of the editorial board of several international journals with review process and the chair of the EARLI SIG on Educational Effectiveness. He acted as chair of the AERA SIG on School Effectiveness and Improvement and as a board member of the International Congress on School Effectiveness and Improvement. Finally, he is the author of more than 100 research papers in refereed journals, 6 books and 80 chapters in books.

Sirpa Lappalainen is an Adjunct Professor, currently working at University of Helsinki at the Research Unit of Cultural and Feminist Studies in Education. Her academic interests are in sociology of education as well as cultural and feminist studies. She has examined educational processes and pedagogical practices that construct normality and address differences in the various educational arenas, such as vocational education, special education and pre-primary education, covering the life course from early childhood to the late adulthood. One of her primary interests

is qualitative methodology (especially ethnography). She has co-edited the method book on Ethnography 'Ethnography as a methodology' (with Pirkko Hynninen, Tarja Kankkuinen, Elina Lahelma and Tarja Tolonen) (Vastapaino 2007). She is on the Editorial board of three journals: Ethnography and Education, The Finnish Journal of Youth Research, and Nordic Studies in Education.

Claudia Lapping is Senior Lecturer at the Institute of Education, University of London. Her research occupies intersections between the sociology of knowledge and psychosocial studies, and she is interested in expanding understandings of methodology to incorporate unconscious or psychical aspects of research practice. This area of her work explores the use of psychoanalytic approaches within empirical research practice. Current projects are drawing on Lacanian conceptions of fantasy to investigate a range of empirical questions, including the temporality of research practice, and logics of pay and remuneration in education. She is author of *Psychoanalysis in Social Research: Shifting theories and reframing concepts* (Routledge, 2011) and co-editor of *Knowing and Not Knowing: thinking psychosocially about learning and resistance to learning* (Special Issue of *Pedagogy, Culture and Society*, 22/1, 2014).

Lesley Le Grange is professor and Vice-Dean (Research) in the Faculty of Education at Stellenbosch University, South Africa. Lesley teaches and researches in the fields of environmental education, research methodology, science education, and curriculum and assessment. He has more than 150 publications to his credit and serves on editorial boards of seven peer-reviewed journals. Leading international journals that he has published in include: *Educational Philosophy and Theory*, *International Review of Education*, *Journal of Curriculum Studies*, *Journal of Moral Education*. Lesley is a rated social scientist in South Africa. His research interest is to apply philosophical strategies to issues arising within the fields of education that he specializes in.

Margaret D. LeCompte, PhD University of Chicago, is Professor Emerita of education and sociology at the University of Colorado-Boulder. Author and editor of 16 books and many articles and book chapters on qualitative research methods, school reform and school organization, and school success among at-risk, ethnically diverse, gifted, artistically creative and language minority students, she is internationally known as a proponent of qualitative and ethnographic research and evaluation in education. Her publications include *The Ethnographers' Toolkit* (1999, 2013), with J.J. Schensul, a 7-volume set of books on ethnographic research methods and *The Way Schools Work* (1991, 1994, 1999), with A.G. Dworkin. Winner of the 2011 Spindler Prize for advances in educational anthropology, Dr. LeCompte is a Fellow of the American Educational Research Association, was president of the Council on Anthropology and Education of the American Anthropology Association from 1983 to 1985, and editor of the journal, *Review of Educational Research*, from 2003 to 2006.

Adam Lefstein is Senior Lecturer in Education at the Ben-Gurion University of the Negev in Israel, where he conducts research and teaches about pedagogy, classroom interaction, teacher learning and educational change. He's particularly interested in the intersection between research and professional practice, and how to conduct research that is meaningful, rigorous and helpful for educators. His recently published book, *Better than Best Practice: Developing Teaching and Learning through Dialogue* (with Julia Snell, published by Routledge), investigates the possibilities, challenges and dilemmas of dialogic teaching and learning, and offers practical tools for using discussion of video-recordings of classroom practice to hone teacher professional judgment. Previously, Lefstein worked as a teacher and facilitator of teacher learning at the Branco Weiss Institute in Jerusalem. He is currently engaged in studies of pedagogical practices in Israeli primary schools, teacher professional discourse, and strategies for improving teaching on a large scale.

Ruth M. Leitch is professor in the School of Education, Queen's University Belfast, Northern Ireland and former head of the School (2001–2006). She is currently visiting professor at the Universities of Bergen, Norway and Alberta, Canada. She has been co-convenor of the awards committee of the AERA Arts-based SIG and international referee for the outstanding dissertation award for the International Institute of Qualitative Methods (IIQM) in Canada. She is co-convenor of the European Education Research Association Network 15: Youth at Risk. She has been co-editor of the British Educational Research Journal is currently on the editorial board/international advisory committee for six other international Originally trained as a clinical psychologist, her publications have become strongly associated with qualitative research and arts-based methodologies. In 2004, her expertise was recognized by winning the Mary Catherine Ellwein Award for outstanding contribution to qualitative research from the Qualitative Research SIG of AERA for her development of creative and arts-based methodologies. In Ireland she developed the AIRE network (Arts Informed Research in Education) and successfully organized the first UK conference on Arts-based Research in Education.

Markéta Levínská graduated at the Faculty of Education Charles University (1994) and at the Faculty of Sociology Charles University (1998, Anthropology), she gained PhD (Faculty of Education) in 2004. From 1994 to 2003 she participated on the longitudinal project research of Prague Group of School Ethnography "*Pupil in the changing conditions of contemporary school*". From the year of 2005 she focused on the issue of Roma education. Researches projects were grant-aided by Czech Science Foundation; "*Education and Its Value from Roma Perspective (Education as Seen by Roma Mothers)*" (2005–2007). She cooperates with David Doubek and Dana Bittnerova on the research projects *Function Cultural Models in Education* (2008–2010) and 2012–2015 *Decision-making processes of helping professions in the area of intercultural relationship* (2012–2015).

Monica Londen, PhD, is a senior lecturer in university pedagogy at the Swedish School of Social Sciences at the University of Helsinki. Her research interests lie in university teachers' pedagogical development and awareness, students' study strategies and academic achievement. She is currently involved in the research project *Study skills and student integration as keys to learning for all students in higher education* at the University of Helsinki. The project is a part of Justice through Education within the Nordic Centre of Excellence in Education. Her latest publication includes *Ambivalence and responsibility: domain loss as an implicit process at bilingual university* (2012).

David C. Lundie's PhD at the University of Glasgow, part of the AHRC/ESRC Religion and Society programme, explores approaches to otherness and inter-community dialogue through religious education in schools. Dr Lundie undertook postdoctoral research on the cultural and economic value of privacy, as part of the National Science Foundation funding stream on dependable and secure computing. This research, undertaken with Professors Dawn Schrader and Steven Wicker at Cornell University, has uncovered a discursive gap between engineers and ethicists in the conversation about privacy and online security. Drawing on continental philosophy and moral development theory, Dr Lundie's work concentrates on developing normative models which discriminate between human and machine responses to the valuation of information. Dr Lundie is a member of the Beyond Diversity network at Cornell University, which seeks to foster dialogue between communities, professionals and academics by developing a culture of positive pluralism which respects the explanatory frameworks used by indigenous communities, and the International Network Observatory at the University of Groningen, which engages with ethical questions around security and governance in an information age.

Elizabeth Mackinlay is an Associate Professor in the School of Education at the University of Queensland where she teaches Arts Education, Indigenous Education, Qualitative Research Methods and Women's Studies. Liz completed her PhD in Ethnomusicology in 1998 and continues her work with Aboriginal women at Burrulula in the Northern Territory of Australia. She also completed a PhD in Education at the University of Queensland in 2003 and has a primary education degree from Charles Darwin University. Liz has published many chapters and articles in the fields of ethnomusicology, Indigenous education, music and arts education, and feminist studies. Liz is currently involved in a number of different research projects which include drumming circles for primary students, the politics and pedagogies of Indigenous Australian studies in primary and tertiary education contexts, programs for mentoring Indigenous pre-service teachers, autoethnography as heart-line-work, and feminism in higher education.

Jan-Erik Mansikka, PhD, is a senior lecturer in education in the Institute of Behavioural Sciences at the University of Helsinki. For the moment he is working in a program of Early Childhood Education. He also teaches in University of Arts in

Helsinki, and is active as musician in artistic projects. His PhD thesis from 2007 dealt with Steiner education and its relation to German Idealism. His research interests cover different areas, such as philosophy of education, art education as well as questions concerning cultural diversity in education. He has regularly been publishing in international journals in education.

Christine Mayer is professor of theory of education and gender at the University of Hamburg, Germany. She has written numerous articles on education, vocational education and gender and on women's and children's work in the eighteenth and nineteenth centuries. Her current research focuses on the relationship between educational thoughts and gender anthropology as well as on the transnational and transcultural circulation and transfer of educational ideas and practices. Recent publications include: "Poverty, education and gender: pedagogic transformations in the schools for the poor (*Armenschulwesen*) in Hamburg, 1788–1871," in *Paedagogica Historica*, (2011), "Female education and the cultural transfer of pedagogical knowledge in the eighteenth century," in *Paedagogica Historica*, (2012), and *Zirkulation und Transformation. Pädagogische Grenzüberschreitungen in historischer Perspektive* (coedited with M. Caruso, T. Koinzer and K. Priem, Köln, Böhlau 2014).

Gary McCulloch is Brian Simon Professor of the History of Education at the Institute of Education, University of London. He is a past president of the UK History of Education Society and a previous Editor of the journal *History of Education*. His recent publications include *Cyril Norwood and the Ideal of Secondary Education* (2007), *The Struggle for the History of Education* (2011), and (with Tom Woodin and Steven Cowan) *Secondary Education and the Raising of the School Leaving Age: Coming of Age?* (2013). He is currently the Editor of the *British Journal of Educational Studies* and president of the annual conference of the International Standing Conference for the History of Education (ISCHE) in London in July 2014 on 'Education, war and peace'.

Alan McManus studied Divinity at the University of St Andrews, Religion, Culture & Critical Theory at the University of Stirling, Religious, Moral and Philosophical Studies at the University of Strathclyde and the Philosophy of Education at the University of Glasgow where he is now (2013–2014) studying Playwriting and Dramaturgy. His teaching career has included EAL/ EFL (as teacher, manager and university tutor) at home; EFL in the northern Mediterranean, Mexico and Brazil; teaching RMPS, Spanish and Home Economics in comprehensive schools in Scotland and WW1 heritage education in Flanders and Picardy. His research interests focus on the application of the metaphysics of Robert M. Pirsig to ethical polemics; myth and magic in academic and scientific discourse; mnemonics and remembrance. He has published articles on global polity and on remembrance in *Citizenship, Social and Economics Education* and his first book on ethical polemics (same-sex love) with John Hunt Publications.

Andrés Mejía is presently working at the Centre for Research and Training in Education (CIFE) at the University of los Andes (Bogotá, Colombia). He is also the editor of two academic journals: *Voces y Silencios: Revista Latinoamericana de Educación*, and *Ixtli: Revista Latinoamericana de Filosofía de la Educación*. His research mostly adopts the shape of the philosophy of education, although he is occasionally involved in qualitative and quantitative research, which is perhaps the result of an eclectic background in terms of previous studies. His current research interests include ethical and citizenship education, higher education, critical thinking and critical pedagogy, the philosophy of educational research, and the philosophy of language.

György Mészáros is Assistant Professor at Eötvös Loránd University, Faculty of Education and Psychology, Budapest. He received his PhD degree in 2009. His doctoral research was the first long-term Hungarian school ethnography. He has been teaching in teacher training and pedagogy BA and MA since 2004. Beside his university job, he works in the Hungarian Institute for Educational Research and Development; leads in-service trainings on Holocaust and Human Right Education, theatre education, minorities, LGBTQ and gender topics. He has participated in several national and international research projects on LGBTQ issues and on teacher education. His research fields are: youth subcultures, critical pedagogy, educational ethnography, autoethnography, teachers' continuous development, gender and sexual minorities in schools. He is member of the Administrative Council of the Association for Teacher Education in Europe, and he works as a volunteer in the Szimpozion LGBTQ Association.

Reetta Mietola is a postdoctoral researcher currently working at University of Helsinki, the Research Unit of Cultural and Feminist Studies in Education. Her research has focused on practices of special needs education and guidance in compulsory and post-compulsory schooling, and educational paths of students 'with special needs'. Her research interests are in sociology of education as well as cultural, feminist and disability studies.

Diana Milstein is Research Secretary and Associate Professor in the Department of Health Sciences of National University of La Matanza, Buenos Aires, Argentina. She was Associate professor at the Faculty of Education at National University of Comahue, Neuquén, Argentina for 20 years, since 1991. Her fields of interest are education, politics and school ethnography, ethnography with children and art education. She has taught graduate courses in national and Latin American universities. In addition to publishing several articles in peer reviewed national and international journals and book chapters, she is co-author of *La escuela en el cuerpo* [The School in the body] 1999, and *Escola, corpo e cotidiano escolar* [School, body and daily school] 2010; author of *Higiene, autoridad y escuela* [Hygiene, authority and school] 2003, *La nación en la escuela* [Nation in school] 2009, and co-editor of *Encuentros etnográficos con niños y adolescentes* [Ethnographic encounters with children and adolescents] 2011.

Nicolina Montesano Montessori completed her PhD thesis on a critical discourse analysis of the political discourse in Mexico at Lancaster University (2008). She is a member of the Research Group ‘Moral Dimensions of Teachers’ Professional Development’ of the Utrecht University of Applied Sciences. She is one of the founders of the Amsterdam Critical Discourse Community (ACDC) currently connected to VU-University. She is particularly interested in research on social change, as well as research concerned with the concept of power. She has conducted participative action research on social justice in four primary schools and on democratic citizenship in a professional school. Her current research topics are social entrepreneurship in the Netherlands and the discourse of the Occupy movement in Spain, the so-called *‘Indignados’*. She is an adviser of the advisory board of *Pedagogy, Culture and Society*.

Richard K. Nye is the Director of Assessment and Curriculum in the Ogden Utah School District. He received his Ph.D. from Utah State University in 2011. His dissertation, *Comprehensive high school reform: The lived experience of teachers and the small learning community initiative*, was a study of the voices of teachers in relation to planning and implementing school-wide reform.

Yuko Okubo is a social research scientist at Fujitsu Laboratories of America and an academic specialist of the Center for Japanese Studies at the University of California, Berkeley. She received her doctorate from the Department of Anthropology at the University of California, Berkeley. Her research interests include education/learning, migration and transnationalism, and the (nation-)state. She looks at how concerns of race, ethnicity, and nationality are translated into the everyday practices of schooling, and reshaping ideas about national culture and identity in Japan today. At Fujitsu Laboratories of America, she is currently examining how technologies are changing everyday practices and learning in the digital age. Her publications appear in *Intercultural Education*, *Anthropological Quarterly*, *Critical Asian Studies*, and elsewhere.

Janet Orchard is a former schoolteacher and administrator in schools in England. Having lectured previously at the Institute of Education, University of London and the Department of Education University of Oxford, she is currently a Programme Director of the PGCE in the Graduate School of Education, University of Bristol. She is a member of the Executive Committee of the Philosophy of Education Society of Great Britain and on the editorial board of ‘IMPACT’, its topical pamphlet series. She takes a particular interest in the professional education of school teachers and school leaders. She co-authored ‘The Contribution of Educational Research to Teachers’ Professional Learning – Philosophical Understandings’ with Christopher Winch and Alis Oancea for the BERA/RSA Teacher Education Inquiry and in 2014 she co-edited ‘Learning Teaching from Experience: Multiple Perspectives, International Contexts’ (Bloomsbury) with Viv Ellis.

Anne T. Ottenbreit-Leftwich is an Associate Professor of Instructional Systems Technology at Indiana University – Bloomington. Her expertise lies in the areas of the design of digital curriculum resources, the use of technology to support pre-service teacher training, and development/implementation of professional development for teachers and teacher educators. She has experience working on large-scale funded projects, including projects supported by the U.S. Department of Education. Her current research focuses on teachers' value beliefs related technology and how those beliefs influence teachers' technology uses and integration. She is currently working on a projects associated with K-12 teachers' uses of technology and incorporation of open educational resources.

Kate Pahl is a Reader in Literacies in Education at the University of Sheffield. I am the author of a forthcoming book, *Materialising Literacies in Communities* (Continuum 2014). I have recently completed projects funded by the AHRC Connected Communities research programme that have been community led and directed, with a focus on engaged research with communities. My projects include 'Writing in the Home and in the Street', 'Language as Talisman' and, 'Communication Wisdom: Fishing and Youth Work'. Within the university I teach on relational arts practice, literacy, writing in the community and collaborative ethnography.

Jean-Paul Payet is professor of sociology of education at the University of Geneva. He carried out himself of many surveys into schools in underprivileged areas in various national contexts (France, South Africa, Switzerland, Tunisia). His ethnographic investigations show the school institution and its actors put at the challenge of integration the public ones socially stigmatized. He is particularly interested in the ordinary situations of the school life, in which teachers and school administrators are confronted with moral dilemmas. His interactionnist approach makes it possible to highlight both the situational constraints and the resources whose actors lay out to act in an ethical way and in order to promote equality. His group of research (SATIE) develops a program on the transformations of contemporary institutions in the educational, while in particular proposing to examine the processes of recognition of the socially weakened individuals.

Michael A. Peters is Professor of Education at Waikato University and Emeritus Professor at the University of Illinois. He is the executive editor of *Educational Philosophy and Theory*, founding editor of three international e-journals, *Policy Futures in Education*, *E-Learning and Digital Media* and *Knowledge Cultures*, and the free online *Encyclopedia of Educational Philosophy and Theory*. With degrees in Geography, Philosophy and Education he has written 65 books on educational theory and social policy including most recently *Education Philosophy and Politics: Selected Works of Michael A. Peters* for the Routledge World Library of Educationalists. He has been awarded many prizes and honors including an Honorary Doctorate of Letters by the State University of New York (Empire) in 2012 for his work on openness in higher education.

Catarina Player-Koro is a researcher-lecturer in Education with a specific interest in the teaching and learning of mathematics and of IT and digital technologies in education. She works at the Department of Education and Behavioural Sciences at the University of Borås, Sweden, and is the author and co-author of several research articles in her field. She has ethnographic methods as a methodological speciality. Her current research is in the field of one-to-one lap-top initiatives in Swedish education.

Karin Priem is professor of Education with a focus on Cultural Contexts of Education and Media History at the University of Luxembourg. She has been president of the German History of Education Association (2007–2011) and is a member of the international advisory board of the Educational Review and the *Revue Suisse des Sciences de l'Éducation*. She is co-editor of the book series *Beiträge zur Historischen Bildungsforschung* (Böhlau, Cologne) and of the *Jahrbuch für Historische Bildungsforschung* (Klinkhardt, Bad Heilbrunn). Her research focuses on the history of educational theories and concepts, the social, visual and material history of education, and the history of curriculum and cultural practices. Recently she has co-edited a special issue of *Paedagogica Historica* on “Modes and Meaning: Displays of Evidence in Education” (2013).

Annelies Raes is final-year PhD student at Ghent University and is part of the research group that focuses on the implementation and evaluation of innovative ICT applications in education using a design-based research approach. The focus of her dissertation is on the use of Computer Supported Collaborative Learning (CSCL) as a promising approach for secondary science education and how learners can be scaffolded by technology, peers and the teacher to improve the learning outcomes. More information about her work can be found here: <http://www.onderwijskunde.ugent.be/user.php?u=amraes>.

Stefan Ramaekers is affiliated to the Laboratory of Education and Society (KU Leuven, Faculty of Psychology and Educational Sciences) as assistant professor. He studied Educational Sciences and Philosophy at KU Leuven. His research can be situated in the broad field of philosophy of education and educational theory. The last couple of years he has focused on investigating the changing discourses of the parent–child relation and on the pedagogical significance of parenting support, for a large part in cooperation with Judith Suissa from the Institute of education of the University of London. Further research interests are the social/societal role of the educator and forms of ‘scepticism’ in educational practices and research. His main philosophical sources of inspiration are the works by amongst others Friedrich Nietzsche, Ludwig Wittgenstein en Stanley Cavell.

Theresa Richardson is a professor in the Department of Educational Studies, Ball State University. Her doctorate and post-doctorate in the history and sociology of education and knowledge, and educational policy are from The University of British Columbia. Her research interests are in the history of childhood, development of the social sciences, the influence of American philanthropy on social and

educational policy, and educational research. Her books include: *The Century of the Child: The Mental Hygiene Movement and Social Policy in the United States and Canada*; *The Development of the Social Sciences in the United States and Canada: The Role of Philanthropy* with Donald Fisher, *Educational Research, The National Agenda and Educational Reform: A History*, and *Race, Ethnicity, and Education: What is Taught in School* with E. V. Johanningmeier. She is completing monographs on the history of philanthropy and educational reform; childhood in the twentieth century; and youth in the 60s.

Barbara Ridley is a visiting fellow at the University of East Anglia (UEA). She has spent more than 40 years in education, first as a teacher of English and performing arts and followed by 20 years at UEA where she worked predominantly with international students. Her research interests include performing arts both in the UK and in international settings and processes of educational change in South East Asia and Sub-Saharan Africa. Her involvement in the development of higher education in Ethiopia began in 1996. Early projects concerned in-service teacher education. Since then she has co-directed a number of research capacity building projects in Addis Ababa University and in support of new regional institutions.

Jennifer Rowsell is Professor and Canada Research Chair of Multiliteracies at Brock University. She has written several books, articles and chapters in the areas of New Literacy Studies, multimodality, and multiliteracies. Her current research project is a SSHRC Insight Development project, *Community Arts Zone*, which is an international study that links communities and arts-based practice with Literacy Studies.

Pamela Sammons BSocSci PhD HEA FRSA is a Professor of Education at the Department of Education, University of Oxford and a Senior Research Fellow at Jesus College, Oxford. Previously she was a Professor at the University of Nottingham, (2004–2009) and at the Institute of Education, University of London (1993–2004). She was a senior researcher at the Inner London Education Authority for 9 years and then the LSE (1981–1993). Her research focuses on school and teacher effectiveness and school improvement, the early years and equity in education. Sammons, P., Anders, Y. and Hall, J., *Educational effectiveness approaches in early childhood research across Europe* (2013, *School Effectiveness and School Improvement: An International Journal of Research, Policy and Practice*).

Tammy Schellens is a professor Educational Technology at Ghent University in Belgium. Her research focuses on two areas: technology-enhanced instruction (web-based learning, electronic learning environments, the use of technological tools, social network sites, . . .) and innovative instructional strategies (Jigsaw, Peer assessment, . . .). Central in her research and that of her PhD students is the design, implementation and evaluation of learning environments in authentic classroom settings with a focus on the impact on knowledge construction, motivation, . . . and the question under which conditions these learning environments can be

implemented most effectively. For more information about her work: <http://www.onderwijskunde.ugent.be/user.php?u=tschelle>.

Hans Schuman, PhD, worked as a teacher and coordinator in a special secondary school for students with a visual impairment in the Netherlands. Research for his PhD focused on the impact of a visual impairment on family relationships and personal well-being, the struggle for inclusion, the development of an empowering curriculum and supporting students with learning disabilities to speaking out for themselves, having a voice. Diversity, participation, citizenship and inclusion of people with disabilities and action research are the main themes in his research. He is currently working as senior lecturer at the Utrecht University of Applied Sciences in the master's programme Special Educational Needs Provision. At Heliomare Education and Rehabilitation he is responsible for knowledge creation, innovation and curriculum development through practice-oriented research projects with teachers and support staff, supported by professional learning communities composed of staff working in one of the four special schools.

Wendi Shen is a doctoral candidate in the Department of Curriculum and Instruction at the University of Illinois at Urbana-Champaign. She is interested in teacher education, instructional design, teaching and learning for international students, and narrative inquiry. She has participated in various research projects and co-authored one journal article as well as various conference papers. She has been a Teaching Assistant at the College of Education at the University of Illinois at Urbana-Champaign for over 4 years working with online programs. Wendi received her Bachelor's degree in English Education and Master's degree in Applied Linguistics from China. She also holds a Master's degree in Educational Technology from Texas A&M University.

Yun-Sun (Ellie) Shin was born in South Korea and educated there and in the U.S. She earned M.TESL at Arizona State University and worked as an English instructor in numerous educational settings such as universities and online education settings. She is now a PhD candidate in the Department of Curriculum and Instruction at the University of Illinois at Urbana-Champaign. Her research interests lie primarily in language and literacy studies, especially in matters of linguistic diversity and language and identity. She is currently working on a research project about language and social and cultural identities of various groups of Korean heritage language learners.

Amy Shuman is Professor of Folklore, English, Women's Studies, Education, and Anthropology at The Ohio State University. She is the author of: *Storytelling Rights: The Uses of Oral and Written Texts Among Urban Adolescents*; *Other People's Stories: Entitlement Claims and the Critique of Empathy*; and, with Carol Bohmer, *Rejecting Refugees: Political Asylum in the 21st Century*. Her current projects include a study of the life history narratives told by artisan stonemasons in Pietrasanta, Italy, research on narratives told by the parents of children with

disabilities, and community narrative projects at the intersection of collective memory and public policy.

Maarten Simons is professor of educational policy and theory at the Laboratory for Education and Society of the University of Leuven (Belgium). His principal interests are in educational policy, new mechanisms of power, and new global and European regimes of governing Education and lifelong learning. Moreover, in his research he focuses explicitly on the challenges posed to education with a major interest in (re-)thinking the public role of schools and universities. Together with Jan Masschelein he is the author of *Globale Immunität. Ein kleine Kartographie des Europäischen Bildungsraum* (2005, Berlin/Zurich, Diaphanes) and *Jenseits der Exzellenz. Eine kleine Morphologie der Welt-Universität* (2010, Berlin/Zürich, Diaphanes), *In Defence of the school: a public issue* (2013, Education, Culture and Society Publishers) and he is the co-editor of several books, including *Re-reading educational policies* (2009, Rotterdam, Sense Publishers) and *Rancière, Public Education and the Taming of Democracy* (2011, Wiley-Blackwell).

Julia Snell is Associate Professor in English Language at the University of Leeds, UK, where she conducts research and teaches across a range of topics in sociolinguistics, discourse analysis, linguistic ethnography and educational linguistics. Her published research has been concerned mainly with linguistic and communicative processes within educational settings. She is particularly interested in the way children use the resources of their local dialect to construct identities, negotiate social hierarchies and manage their relationships with each other and with their teachers. She has written extensively on the relationship between classroom talk and learning, and has worked on teacher professional development in this area. Her recently published book, *Better than Best Practice: Developing Teaching and Learning through Dialogue* (with Adam Lefstein, published by Routledge), investigates the possibilities, challenges and dilemmas of dialogic teaching and learning, and offers practical tools for using discussion of video-recordings of classroom practice to hone teacher professional judgment.

Jason A. Swanson currently serves as an administrator at the International Preparatory Academy (IPA) in the Champaign (Champaign, IL). The IPA is a dual language elementary that aims to foster bilingualism, biliteracy and biculturalism, as well as a space where students can critique societal norms. Built in to the daily schedule is a 30-min block of time, the Cultural Roundtable. It is a period where students share narratives about their lived experiences, reflect on other's experiences, and work to disrupt stereotypes. Prior to his work at the IPA, Swanson completed his doctoral work at the University of Illinois at Urbana-Champaign. His research interests explore the intersection of leadership for social justice and dialogue. In his dissertation, Swanson used dialogue in narrative inquiry to supplement the data collected for his case study. For his work on this study, Jason was selected for the 2014 AERA LSJ Dissertation Award.

Sharon Tao is an Education Adviser at Cambridge Education and is currently Deputy National Coordinator for the Education Quality Improvement Programme in Tanzania (EQUIP-T), which is a 4-year, £50 million, DFID-funded programme aiming to improve education quality in 3,800 primary schools in Tanzania. She has spent several years as a volunteer teacher in government primary schools in Tanzania and Rwanda, and recently won the Institute of Education (University of London) Director's prize for Best Doctoral Thesis for her PhD entitled: 'Rethinking Teacher Quality: Using the Capability Approach and Critical Realism to provide causal explanations for teacher practice in Tanzania.' Sharon's research interests include teacher well-being, teacher quality, school improvement, and educational issues surrounding gender, gender based violence, community participation and social justice.

Mary Tjiattas has taught philosophy in the Department of Philosophy and the School of Education at the University of the Witwatersrand, Johannesburg. She now teaches applied ethics at North Carolina State University. Her research interests are in social and political philosophy, moral psychology, and philosophy of social science and psychoanalysis. Her most recent research focuses on global justice and its educational implications.

Jo Tondeur is working as a researcher (Research Foundation Flanders) at Ghent University (Belgium). His research interests are in the field of instructional design and educational innovation. Most of his work focuses on ICT integration in teaching and learning processes and how this can be associated with teacher and school characteristics. In more recent work, he is especially interested in exploring the interplay between (ICT) innovations and professional development.

Geoff Troman is Professor Emeritus of Education at Froebel College, School of Education at Roehampton University, London. Formerly he was Director of the Centre for Research on Education Policy and Professionalism – CeREPP. He was also Visiting Professor of Education at the University College of Borås, Sweden. He was Director of the Economic and Social Research Council funded project: Primary Teacher Identity, Commitment and Career in Performative Cultures (PTICC) 2005–2007. He was also Co-Director (with Bob Jeffrey) of the 2005–2007 ESRC Creativity and Performativity in Teaching and Learning (CAPITAL). Before moving to Roehampton he was a Research Fellow and Associate Lecturer in the Faculty of Education and Language Studies at the Open University and researched with Professor Peter Woods and Bob Jeffrey. Geoff was founding Editor (with Bob Jeffrey, The Open University; Geoffrey Walford, University of Oxford; and Tuula Gordon, University of Helsinki) of the Journal 'Ethnography and Education' published by Routledge, Taylor & Francis Group.

Ellen Vanderhoven is a final-year Phd student at the department of Educational Studies at Ghent University in Belgium. Her research focuses on privacy and security in online social networks. Using a design-based research approach, she

develops, implements and evaluates educational materials, to raise the awareness about risks on social network sites, and to decrease unsafe behavior. This research fits in the SPION-project (Security and Privacy in Online Social Networks). More information about her work can be found here: <http://www.onderwijskunde.ugent.be/user.php?u=evderhov>.

Monne Wihlborg, PhD, is an associate professor at the Faculty of Medicine, institution of Health and Social Sciences at Lund University in Sweden. Wihlborg, has been a teacher in higher education contexts since 30 years and has an integrative background. She studied at the faculty of Humanities at the department of philosophy and the department of cognitive science in the 90s, and completed her PhD in 2005, at the faculty of Social Sciences at Lund University in Education, concerning internationalisation in higher education. She has worked as an assistant professor at Blekinge Institute of Technology in Sweden and present as an associate professor in Education at the faculty of Medicine at Lund University. She is also an elected member of the Teaching Academy at the Faculty of Medicine and an elected co-convenor of the European Educational Research Association's in the network Research in Higher Education related to ECER (European Conference on Educational Research). She is also a member of the PESGB (Philosophy of Education Society of Great Britain). Her current research interest involves development of and critical reflection on methodology and learning in higher education, and, Bildung, knowledge development and internationalisation in higher education.

Christine Winter is Senior Lecturer in Education. Christine researches school curriculum texts from a poststructural perspective. She is interested in the language of curriculum, how this self-deconstructs and how it can be revitalised. She enquires into ways in which school curriculum knowledge is produced and transformed, and the ethical and political responsibilities involved. She studied Geography at Oxford University before embarking on a career as a school Geography teacher. She entered the University of Sheffield as a researcher in 1990 and has directed international Masters, EdD and doctoral training programmes. She currently directs the Centre for the Study of Educational Development and Professional Lives and the EdD Educational Studies. Christine is Education Pathway Lead for the White Rose Doctoral Training Programme (Universities of Leeds, Sheffield and York). Her most recent publication is 'Curriculum knowledge, justice, relations: The Schools' White Paper (2010) in England' (*Journal of Philosophy of Education*, 2014).

Sumin Zhao is Chancellor's Postdoctoral Research Fellow at the University of Technology, Sydney. Her current project investigates preschool children's interactions with mobile technologies in home-settings by combing multimodal discourse analysis with other research methodologies. She publishes in the research areas of digital literacies, systemic functional linguistic theory, and multimodal discourse analysis. Her latest book (co-edited with Emilia Djonov) *Critical Multimodal Studies of Popular Discourse* has just been published by Routledge.

Karin Zotzmann works as a lecturer in Applied Linguistics at the University of Southampton. Previously she supervised doctoral students in the field of Education at Walden University (U.S.A.). She also worked as a research officer at the Institute of Education, University of London, and as a lecturer in Applied Linguistics at different universities in Mexico. She holds as a Ph.D. in *Linguistics* from Lancaster University, an M.A. in *German as a Foreign Language, Social Psychology and Intercultural Business Communication* from Friedrich-Schiller-University (Jena, Germany), a 2nd M.A. in *Cultural Studies* (Lancaster University) and a 3rd M.A. in *Spanish as a Foreign Language* (University of Jaén in Spain). Her research interests include intercultural education, foreign language teaching and learning, academic literacy practices and genre and discourse theory and analysis.
