At that moment, the experience was uncomfortable and a disappointment. We had, whatever our intentions of being understanding, the feeling of being labeled and assigned to the status of white, Western researchers, strangers to the local situation who were taking a moralizing position. We appeared without realizing it as supporters of a self-righteous discourse, blaming bad practices in the name of a universal value, the “rights of the child.” Afterwards, the situation turned out to be rich in terms of understanding things beyond the theme of corporal punishment. Symbolic re-creation of a dominating/dominated, White/Black relationship in the situation of reporting back led us to expand on interpretation through the lens of the lasting effects of apartheid on individuals, especially on members of those groups that had suffered the most. The perverse overlap between violence and education was brought to light; it affected even progressive actors, who had suffered psychologically from a divided (and violent) educational system under apartheid (Payet and Franchi 2008, 2009). Faced with the challenge of adapting to democratic change, the cognitive frameworks inherited from apartheid constituted both obstacles and defensive resources (Franchi 2003).

This new interpretation was provoked in particular by a surprising, unexpected event: the “confession” of a school principal during the workshop described above. This embodiment of the antiapartheid struggle, this actor who was daily engaged in improving his school in the heart of Soweto, had opened his doors wide to us, hoping that our research would

contribute to the transformation of his teachers towards embrace of the democratic education advocated in the new postapartheid South Africa—especially of abandoning corporal punishment. Yet, this actor took the floor to describe his childhood, which had been at the same time academically brilliant and also rebellious against white authority, to say, “When the teacher hit me, that helped me to behave better. Without that, who knows what I would have become? Perhaps I would not be who I am today?”

The visible divisions among teachers during our reporting back (between groups of men who favored corporal punishment and groups of women or mainly women who were more open to changing practices) led us to take into account relationships of power and inequality other than racial inequality, such as inequality between the sexes. But, even more, these were internal divisions within each individual, linked to identity dynamics in a context of political and social transformation, which we were able to grasp thanks to ethnographic observation (and participation) and the process of interpretation.

Conclusion

Looking back at the studies I have conducted, I realize that the decisive moments that moved the research forward, in terms of understanding the actions and social relations being observed, have been the moments when the act of interpreting ran into difficulty. What I mean is that what makes for an original insight in a piece of research is to be thrown off balance, to experience a lack of fit between conventional interpretive models and some incident. Something happens that you have trouble understanding.

Ethnography places us within such moments, when conventional thinking is toppled. It has the power, because it gets us involved and up close, to provide the researcher with a “question mark” that spans the entire human experience—moral experience, emotional experience, sense of identity, and practical experience. These particular moments are rich in potential meaning; they call forth multiple interpretations. A single reading cannot exhaust their significance. It is possible to discover new layers of meaning, whether by continuing the study or by subjecting the material to other interpretive grids. To be honest, I must say that there are certain situations that I have far from finished interpreting. When rereading them, when presenting them to colleagues or to students, I realize that other interpretations are possible. The basic question to ask is why this action? Why did actors behave as they did? What were their own particular reasons? What were the constraints that weighed on them? What were the available resources? How did one actor’s definition of the situation interact with others’ definitions of the situation?

This concern with getting close to actors’ lived experiences, to offer an account of the complexity of action through direct observation, does not fit with a moral posture of blaming. An attitude of blaming dominated sociology of education for a long time in France, thanks to its double heritage from

(continued)

Durkheim and Bourdieu. Schooling was understood as the privileged counterpoint to individualist tendencies and the risk of social anomie (Durkheim 1968) and/or as the ideal framework for producing equality that is ruined through its implementation by the dominant classes (Bourdieu and Passeron 1970). This normative vision led several generations of French researchers to obscure the organizational and individual dimensions of the academic world. The ethnographic approach permits us to once again see the “institution in the flesh,” to reinstate the lived world of schools, to recognize the multiplicity of interpretations produced by actors in interaction. In this sense, ethnography is particularly well placed to account for and analyze the dynamics that connect the global and the local, the macro and the micro, by linking actors’ moral and emotional struggles with the contexts in which they take place.

Its refusal to blame does not mean the ethnographic perspective is not critical. By observing the concrete conditions of schooling up close, by immersing us in the ordinary life of underprivileged schools, and by assessing the reality lived by different actors involved in these schools, ethnography demonstrates the gap, which is usually large, between educational reforms and their practical application, between the perspectives of political and institutional elites and those of administrators, teachers, pupils, and parents on the ground. But it does not stop at pointing out this disconnect between intentions and actual achievements, between policies and real life. Building on an understanding of the logics and perspectives of *ordinary actors* and of what they have at stake, ethnography captures the reasons why meaning as lived by “frontline” professionals cannot be understood by managers who are closer to political power. It reveals in the end the perverse mechanisms which, at different levels and in a variety of ways, weaken actors—especially the most vulnerable academic staff members, pupils, and parents—by making them bear the contradictions of the system and by making them responsible for their own failures.

3.8 Doubly Reflexive Ethnography for Collaborative Research in Mexico

Gunther Dietz and Aurora Álvarez Veinguer

Despite their success and importance in educational research, interpretive approaches still reflect the heritage of a western-biased hermeneutics, which often overemphasizes the role of the “hermeneutist” and of the interpreter, thus neglecting the self-reflexive role of the “object” of interpretation and her/his active participation in the act of interpretation itself. In this contribution, we aim at highlighting the necessary complementarity of hermeneutically inspired ethnographic research traditions, on the one hand, and collaborative, dialogic, and/or participatory approaches, on the other hand.

Accordingly, after a short conceptual introduction on the role played by diversity as a research topic, in the following we first develop the methodological reasons which lead us to combine and integrate interpretive ethnography and collaborative research. Then, we detail our own hybrid methodology through ethnographic example from an ongoing project we are carrying out in Mexico, before we finally sum up the role played by interpretation in a reflexive and dialogical ethnography.

Diversity and Interculturality in the Anthropology of Education

As the key concepts in the contemporary anthropology of education (Levinson and Pollack 2011; Anderson-Levitt 2012) are, the recognition of cultural diversity, the development of culturally pertinent educational programs, and interculturality as a new form of initiating relations between diverse cultural, linguistic, and ethnic groups, these are the anthropological principles which shaped a new kind of university, the Universidad Veracruzana Intercultural (UVI). The team of mainly anthropologists and educators that designed this program had the explicit general purpose of

favouring democratic coexistence in Veracruz society, as well as the processes of generating knowledge in the localities of the Intercultural Regions, through the training of professionals and intellectuals committed to the economic and cultural development of community, regional and national territories, whose activities contribute to promoting a process of revaluing and revitalising the native cultures and languages. These will be attained by privileging cultural diversity and the participation of communities under the principles of sustainability of the regions of interest, a sense of belonging in the communities to avoid out-migration and protection of the environment. (UVI 2007: n.p.)

These objectives and their underlying proposals have developed since the program was created in 2005. Originally, the UVI was principally promoted from an anthropological–academic field, when lecturers and researchers from a predominantly European school of “Intercultural Studies” (Gundara 2001; Aguado Odina 2003) generated new spaces for research and teaching within the Universidad Veracruzana (UV), the conventional university (Ávila Pardo and Mateos Cortés 2008). Strongly influenced by the contemporary anthropologies of ethnicity and of education, the team that promoted this pilot project opted for a mainstreaming, not minority-centered focus on interculturality (Dietz and Mateos Cortés 2011). A special emphasis was placed on the development of new “intercultural competences”, understood as the students’ future key competences for mediating and translating between different linguistic and cultural traditions—such as interpreters in the Mexican justice system, mediators between traditional healers and the public health system, translators between peasant maize cultivators and agronomical engineers, etc., thus equipping them for future interaction in an ever more diverse and complex society.

However, this western-trained team of promoters quickly established close and fruitful relationships with indigenous activists and intellectuals for whom interculturality must be understood as a strategy of ethnic empowerment in contexts of cultural and ethnic differences and as a key tool for reacting against racist discrimination, which evidently persists in the indigenous regions of Mexico and Veracruz. This encounter between urban academics and indigenous activists has deepened and transformed their exchange of knowledge and their intercultural discourses, as has their close collaboration with NGOs stemming from social and/or environmental movements which are rather strong inside these regions (Mateos Cortés 2009). The

protagonists of these NGOs emphasize the need to initiate more sustainable relationships with the environment. They promote a recovery of local, rural, and/or indigenous knowledge which is traditionally related to the management of natural as well as cultural resources which may support indigenous ecosystems facing the inequalities of global power structures. Under the political impact of the Zapatista movement and the claimed redefinition of the relationship between the neoliberal nation-state and the country's indigenous peoples (Dietz 2004), these three types of actors—the academics involved in the teaching program, the indigenous activists participating in the consultative bodies and the NGOs in which the students carry out their projects—start to mutually fertilize their intercultural discourses and their respective educational proposals, such as those specified in the UVI programs: teachers and students share community development experiences through their NGO participation, indigenous organizations learn from continuous education courses, and NGOs enter the university through “expert” teaching and student supervision activities.

Accordingly, more emphasis is placed on processes of negotiation, intermediation, and translation of heterogeneous kinds of knowledge between these diverse groups participating in the UVI—the mentioned academics, professionals, development agents, and “local experts”. Thus, three dimensions through which interculturality is conceived emerge from this encounter of different perspectives:

- An “intercultural” dimension, centered on complex expressions and links of cultural and educational practices such as intangible cultural heritage, community-rooted socialization and learning practices, as well as locally developed organizational cultures of community self-management and intercommunity relations, which respond to different cultural logics, such as the community culture of common Mesoamerican roots, threatened by many waves of colonization and globalization, but still in use in the indigenous regions; the organizational culture of the social movements that struggle to defend the regions’ cultural and/or biological diversity; and the western academic culture—presently in transition from a rigid, mono-logical, “industrial,” and “Fordist” paradigm of higher education to a more flexible, dialogic, “postindustrial,” or “post-Fordist” one, as will be illustrated in the flexible and modularized UV educational model.
- An “inter-actor” dimension that values and profits from the negotiations and mutual transference between diverse forms of knowledge between UV academics participating in the different orientations, providing anthropological, educational, sociological, linguistic, historical, and agrobiological knowledge, generated in the western epistemic canons; indigenous organization activists and NGOs present in the regions that contribute with professional, contextual, and strategic knowledge; and local experts and knowledgeable sabios who provide collective memoirs and local and contextual knowledge on cultural and biological diversity of the immediate environment.
- An “interlingual” dimension that—reflecting the great ethnolinguistic diversity that characterizes the indigenous regions of Veracruz—overcomes the conventional bilingual focus of classic indigenismo, the traditional integration program for indigenous peoples, and profits from nonessentialized but relational

and contextual interlingual competences that make the translation between such diverse linguistic and cultural horizons possible; this interlingual focus does not aim to provide the complete set of UVI educational programs in various languages but centers on the development of key communicative and translation skills provided by the student and teacher bodies in each of the regions.

Relating these different dimensions of interculturality and their different academic-anthropological as well as ethno-regional and activist sources, the UVI presently pursues both “empowerment” objectives of the (future) indigenous professionals, on the one hand, and crosscutting key competences required for professional and organizational performance, on the other hand.

Reasons for Choosing a Collaborative Approach: The Implications of Reflexivity

Interpretive anthropology has since the 1970s tried to describe and interpret what the discipline considered made sense for the “natives” of a certain context or bearers of a “culture.” To put it in a very schematic way, the interpretivists thought a “dialogue” took place between the natives, the anthropologists, and the readers, and from this dialogue emerged the “transcultural” understanding. But who is the main character of this dialogue? From which point of view and who directs, organizes, and arranges this dialogue? What kind of role have researchers and the traditionally called “informants” played in this research process?

A turning point took place in all social sciences during the 1980s, which can be summarized in two “times.” This clearly marks a transformation in the anthropological “rhythms” (or tendencies) incorporating: (i) the processes of subjectification of the researchers involved (self-referential reflexivity) and (ii) the subjectification processes of the subjects taking part in the research. In this chapter, we would like to focus on this double reflexivity and collaborative ethnography inserted in this last context. Generally, when we talk about reflexivity, it is in association with the process through which the researcher thinks herself or himself in the research process. Her/his thoughts are incorporated in the ethnography. There is a risk of entering a vicious circle (Callejo 1999) since the self-referential reflexivity’s main focus of attention is based on the “researchers” and the view of the “participants” remain silenced and frequently ignored in the dynamic of self-referentiality (Álvarez Veinguer 2011).

In the second “time,” we conceive reflexivity as a process that has to cross transversally the whole research, from the relations established with the people being researched, the own presences/absences of the researcher, the techniques and tools to be used, and the context. This is the context where the doubly reflexive ethnography and collaborative ethnography would be inscribed.

First we will try to explain what we mean and understand when we talk about ethnography. Our first premise is that ethnographic research tries, above everything

else, to tell us something about situations (Velasco and Díaz de Rada 2006, p. 222) which have to be placed and embodied. What does that mean? People who take part in a research process have a life, experiences, and a certain way and a certain “anchorage” to be where they live; they are tied to their experiences, conditioned by gender, class, and ethnic group, among many other elements which establish how we experience, understand, and live the places in a specific way. We have to be able to make these anchorages visible and recognize them from the standpoint from which the people speak, see, interpret, and make sense of the world. This exercise, which traditionally is so opposed to the positivistic point of view (since it is considered to be subjective and not very neutral), is the necessary starting point to place the subjects incorporating their joys, fears, certainties, and worries.¹ Ethnography builds an account interpretation based on accounts or stories of situations lived by the people who carry out research, as much as by situations lived by all the people involved in the research, and by common and shared experiences which necessarily emerge when different universes intertwine and mingle. Ethnography is “a description and interpretation of situated practices” (Díaz de Rada 2010, p. 44). Thus, we understand that ethnography should be thought as a co-interpretation which allows making and building sense on what happens in diverse situations and relational contexts. These should not be understood solely in spatial terms, but related with the multiple actors which are implied and embodied. From this point of view, every ethnographic research process has always, to a greater or lesser degree, a certain collaboration display (Lassiter 2005, p. 16). It is true that every ethnographic practice includes a certain level of collaboration. More so, as Reddy stresses, we are “interminably caught in collaboration” (Reddy 2008, p. 76). However, it is necessary not only to assume the presence and the collaborative nature from a generic point of view. For example, Lassiter (2005), Rappaport (2008), and Campbell and Lassiter (2010) claim to systematize the whole process of collaboration during the fieldwork and writing up. Co-research, co-theorizing, and cowriting are central dimensions vindicated by the authors who argue for the use of collaborative ethnography (Lassiter 2005; Rappaport 2008).

There is no and should be no single model to be copied from different research contexts. Each process will have to be readapted and look for its own strategies depending on the time and place, understanding that the central dimension of collaborative ethnography lies in its collective and relational trait. We do not in any case pretend to introduce collaborative ethnography as a meta-narrative of how to do good ethnography, but to think it as an experiment and as an attempt to avoid certain tendencies historically accepted.

How can we collectively think? Or to put it in other words, how do we collectively build or make sense? How can we derive the full potential/benefit that can result from coming together in collaborative ethnography? How can we

¹ To overcome the epistemological Cartesian heritage implies not to stop asking ourselves at all stages of our research: who is speaking, from which body is she/he speaking, and from which epistemic space is she/he speaking (Mignolo 2000).

produce collective voices if we do not reflect on the dynamics and power relations that are intertwined in traditional research?

In collaborative ethnography, we understand the gathering as a setting where the traditional roles (researcher/research subject) can blur; and a clear demarcation, e.g., between the researcher and the research subject, steps on a different level since co-interpretation processes get activated and everyone involved actively interprets and builds and makes sense of what is happening in the group. There is no doubt and we are not denying the power relations that emerge and cross every relation and interaction. But we would like to notice and underline that it would of course be an irresponsible exercise to say that collaborative ethnography has an egalitarian character, with no power relations where all parts are equal. Although the analysis of power relations exceed the goals of this chapter, we would like to emphasize that we do not deny the existence of power relations, conflict dynamics, and tensions that arise and are generated in any relation. What is relevant is to name them to make them visible and not keep them invisible as it traditionally has happened and put them in the center of our views. To be able to reinterpret its meaning, it is crucial to place them in the center in order to learn how to manage it without falling in a demagogical exercise of apparent and declared equality relations which activate through perverse logics of consensus.

InterSaberes, a Research Report

Inspired by these principles of collaborative–interpretative research, we are currently carrying out a dialogical–ethnographic case study inside a recently created, so-called intercultural institution, the *Universidad Veracruzana Intercultural* (UVI) in Mexico. Our project aims at analyzing how participation in such a program by autochthonous, indigenous people and nonindigenous, so-called *mestizo* people and the teaching by anthropologists and other social scientists shape the still recent move towards the social, political, and even legal recognition of diversity within public universities. Through academic programs that principally target indigenous and nonindigenous students living in marginalized, rural communities, the UVI is trying to diversify supposedly universalist academic “knowledge.” The aim is to relate academic knowledge to local, subaltern, “ethnoscience,” and alternative knowledge—on production systems, the environment, health care, etc., all of which mutually hybridize each other and thus create new, diversified, “entangled,” and “globalized” canons of knowledge (Mignolo 2000; Escobar 2004).

As will be illustrated below, this emerging *diálogo de saberes* or “dialogue among different kinds of knowledge” (Mato 2000; Santos 2006), which involves “intercultural,” “interlingual” and “inter-actor” dimensions, also forces academic anthropology to redefine its basic theoretical concepts as much as its methodological practices that are still all too monologically and monolingually oriented. We will now briefly describe the actors with whom we are collaborating, before describing the methodology of a “doubly reflexive ethnography” which we are developing and applying in our project.

The UVI, Counterpart of Collaboration

In order to generate education systems that are more pertinent to the cultural realities and needs of the target population in rural, marginalized indigenous communities, the present decentralization efforts of higher education institutions have been accompanied by programs to diversify curricular content and teaching/learning methods. In this way, in 2005 the *Universidad Veracruzana* (UV), an autonomous, public higher education institution based in Xalapa, the state capital of Veracruz located at the Mexican Gulf coast, decided to open its own “intercultural programme.” This program focuses preferentially on the claims to higher education in and for indigenous regions of the state. As one of the most culturally and linguistically diverse states of Mexico, Veracruz is shaped by diverse ethnic and linguistic groups (cf. below) that are mostly of indigenous origin and are nowadays inhabiting the most economically marginalized and infrastructurally isolated regions of the country (UVI 2005).

In order to attend to these populations and in sharp contrast to other “intercultural universities” promoted by the Mexican federal government (Schmelkes 2009), UVI program was not created as a completely “new university.” Instead, the UVI emerged from within an established public university. An academic interest in developing culturally pertinent educational programs was combined with the demands of indigenous organizations and movements for broader and better adapted higher education options in indigenous regions and communities. In the most important indigenous regions of Veracruz, local leaders, teacher associations, and NGOs had been claiming the need for a regionally rooted higher education which would allow the local youth to continue their educational cycle but which would not force them to leave the region after obtaining their degrees towards the urban labor markets.

An agreement was established in November 2004 between the UV and the General Coordination for Intercultural and Bilingual Education (CGEIB) of the federal government’s Ministry of Education (SEP) to start such a regionally focused intercultural program from within the university. Since then, the resources for this venture have been provided principally by the general budgets of the Veracruz state government, through federal government funding from CGEIB and from the UV’s own budget. In August 2005, this “intercultural program” started by offering two B.A. degrees in four regional centers: one in “Sustainable Regional Development” and the other in “Intercultural Management and Education.”

The first two generations of UVI students entered the university through one of these two-degree programs. However, local and regional demands exceeded the topics of these two programs, as they did not include any special emphasis on legal, health, or linguistic and translation issues. Accordingly, both the community’s demands for a greater range of academic courses and the impossibility of generating “conventional” degree courses in indigenous regions led the UVI staff, composed mainly of anthropologists, educators, agronomists, and linguists, to redesign the

studies on offer. They opted for just one degree course with a multimodal structure and diverse orientations (cf. below). Hence, since August 2007, the students who had already started their degree courses were integrated into the new B.A. degree in “Intercultural Management for Development,” which is able to offer a wider range of educational options without reducing the number of regional campus locations where this B.A. is taught.

The Participation of Regional Actors

Even though Veracruz University already had a decentralized system of five campuses distributed throughout the state, these academic centers were concentrated in urban areas, where conventional degree courses based on western university models were taught. From the very beginning, the new program decided to establish centers in less privileged and in the most marginalized areas of the state. As a colonial and postcolonial legacy, indigenous peoples in Mexico inhabit so-called regions of refuge (Aguirre Beltrán 1991), often isolated or marginal mountain areas, whereas other more accessible regions have been forced since independence in the nineteenth century by the new nation state to become monolingual in Spanish and ethnically *mestizo*, nonindigenous. As a result, both in Veracruz and in the rest of Mexico, the most marginalized areas are the regions where a mostly indigenous population lives (Lomnitz Adler 1995).

After carrying out a regional analysis that applied a combination of ethnolinguistic and socioeconomic criteria, along with marginalization and social and human development factors (UVI 2005), four regions were chosen. Within these indigenous communities, the new centers of the UVI were established: the Huasteca intercultural region based in Ixhuatlán de Madero, the Totonacapan intercultural region based in Espinal, the Grandes Montañas intercultural region based in Tequila, and the Selvas intercultural region based in Huazutlán. In each of the four regional centers, the UVI hired a regional coordinator, an academic support facilitator, five full-time lecturers, and several part-time lecturers.

The central office in Xalapa administers the programs of study and offers continuous training courses for both UVI staff and the wider university community (cf. below). Apart from rather conventional academic decision-making structures, at least at the beginning of its activities, the UVI has maintained a close relationship to the communities’ local mayors, civil, agrarian, and/or religious authorities as well as to representatives of NGOs and civil associations which are active in the respective region. In order to ensure and to control the local relevance of the academic activities, these actors jointly consulted the UVI with regard to its teaching activities and research projects carried out by students and academic staff together with local communities in the regions. Nevertheless, in the course of our project, we learned that the consultation process decreased in the course of time; after an intense collaboration at the beginning, academic and not community-oriented criteria prevailed in UVI decision making. As a member of a regional

consultative body criticized, “they only asked us in the first two years, but once they got the land from us to build the university, they never invited us again!”

Academic decision making still is strictly centralized in Xalapa, which implies that a real devolution has not taken place until now, mostly due to the university’s insistence in holding control of curricular as well as staff hiring processes. Our interest in collaboratively changing these monological structures is the core impetus of our current research (cf. below).

The UVI Curriculum and Its Development

As previously mentioned, the B.A. degree in “Intercultural Management for Development” is presently offered in the four regional centers. It comprises an official and formally recognized degree program in eight semesters that responds to an inter- or transdisciplinary, multimodal, flexible curriculum. The program requires student autonomy and that has been adopted inside the UV as a whole. Students choose “educational experiences” instead of classical subject courses; these “experiences” are more flexibly conceived of as parts of a network of either methodological or content-driven topic domains, which are grouped by area (basic instruction, disciplinary, terminal, and free choice courses) and per module (conventional face-to-face classes, virtual or e-learning classes, and/or a combination of both types of teaching styles). Face-to-face classes with the local teaching staff make up the vast majority of teaching lessons at the beginning of the B.A. program, but these “traditional” classes are then gradually complemented by more specific courses, which are either taught by “itinerant” teaching staff from other UVI regions or are offered through virtual teaching and other e-learning modes. Similarly, face-to-face tutoring by the local staff is accompanied by distance learning tutors, who “circulate” among the four regions for specific thesis supervision processes.

By combining them thematically according to key professional development areas for the regions, the “educational experiences” generate a range of educational itineraries called “orientations.” These are not disciplinarily specialized curricula, but are interdisciplinary fields of knowledge which are needed for a professional future as “intercultural managers,” knowledge brokers, and intercultural translators. Starting from a shared study program, the individual student chooses her or his own itinerary leading her/him to a particular field of knowledge in which these mediating and translating skills are then applied.

Since 2007, after carrying out regional diagnostic surveys together with teaching staff and students, the following *orientations* have been identified as core curriculum areas offered in the four UVI regional centers:

- Communication: according to its program of studies, this orientation “prepares professionals in the field of cultural promotion, based on the diversified use of media and communication and a critical view of their role in the construction of

identities within a framework of globalization. (...) The training focuses on participative methodologies that enable a contextualized appropriation of tangible and intangible heritage” (UVI 2007: n.p.).

- Rights: this orientation “strives to prepare human resources to improve the areas of justice and legal issues in order to promote effective access of vulnerable sectors of society to the legal system, as well as to secure human rights as a guarantee for broader legal security” (UVI 2007: n.p.).
- Languages: this orientation “fosters an academic re-valuing, management and mediation of inter-lingual communication processes within an intercultural focus” (UVI 2007: n.p.).
- Health: this orientation “seeks to improve the health situation in the indigenous regions of Veracruz, through the training of professionals who can act as intermediaries between traditional medicine and state-run health services for communities” (UVI 2007: n.p.).
- Sustainability: finally, this orientation “establishes spaces for the intercultural construction of knowledge for training professionals capable of contributing to the improvement of the quality of life in the regions and the construction of options for sustainable development, thanks to the generation of knowledge, skills and attitudes targeting the re-appraisal, development and promotion of ancestral knowledge associated with dialogical society-nature relations” (UVI 2007: n.p.).

Independently of the orientation the students choose, this B.A. program is shaped by an early and continuous immersion of students and lecturers in activities carried out inside the host community. The program is based on a crosscutting methodological axis, so that courses and modules include methodologies of community and regional diagnosis, ethnographic tools, participatory project management, and evaluation. From the first semester onwards, students begin to carry out their own research and knowledge transfer activities inside their home communities.

Towards a Reflexive Ethnography of the UVI Dialogue of Knowledges

Our ethnographic accompaniment of these novel teaching and training processes has allowed the identification of spaces and areas of knowledge that are actively participating in an often claimed “dialogues of knowledges” (Leff 2003). In detail, the following domains of knowledge exchanges are being studied:

1. On the Huasteca campus, and in close collaboration with the UVI Rights Department, we are analyzing dialogues between the UVI and local and regional actors in the field of legal pluralism, analyzing how students and teachers of the UVI relate the customary law of *usos y costumbres* of the communities of

Puyecaco (Nahua), San Pedro Tziltzacuapan (Tepehua), and El Zapote (Otomí) with local authorities and official judges. Students and alumni have been particularly successful as brokers in two directions. On the one hand, they have offered several courses and seminars on human rights issues for local authorities and *jueces de paz*, customarily elected community judges, who through these courses realize the complementary nature of external human rights legislation and their own legal practice. As a local judge and bilingual teacher explained at the end of one of these workshops:

We have noticed that we have rights, our own rights and the rights of the city dwellers. For them, we are third class citizens, first there are the citizens of Xalapa [state capital], the second class citizens are those from Ixhuatlán [the municipality], and finally we are third class citizens, the Tepehua peasants in our community. But now we also know our rights as Mexican citizens and as indigenous communities.

On the other hand, the same students and alumni have been revitalizing and regaining traditional community authorities such as the *huehuetlacatl*, the local Nahua healer–counselor, whose range of conflict management capacities had been limited by external, nonindigenous health or political authorities. Recently, several communities have recreated these functions as an attempt to reconquer local autonomy from external, regional institutions.

2. In the Totonacapan campus, together with the UVI Health Department, we are focusing on medical and curative knowledges, as practiced in Totonakú as well as mestizo communities of Filomeno Mata, Macedonio Alonso y Morgadal; how it is articulated in the activities of UVI intercultural health teaching; and what mediating role it plays in front of the state public health system. The local Totonacapan hospital has been hesitantly opening up its institutional practice to include not only Totonakú language interpreters when counseling indigenous patients but has also asked UVI teachers, students, and alumni to offer courses on traditional medicine for physicians and nurses. Despite these first attempts of “opening up” the health institution, the western-trained hospital staff still does not fully recognize community health and midwifery specialists as counterparts in their daily health-care activities. A former UVI student who is now collaborating at the hospital as an interpreter and community midwife jokes about the staff’s ambiguous strategy towards her:

After a lot of paperwork from our *InterSaberes* project, the hospital director finally allowed me to work inside the hospital and to assist in the revision of pregnant women as well as in births. But every once in a while, when the supervisor visits our hospital, I have to hide. They ask me either to stay away from the hospital for that day or to dress in white, as if I were a doctor – that is really funny, isn’t it?

Therefore, the participating UVI researcher and his students focus their broker activities on both spheres: internally, contributing by awareness raising measures to preserve and recover traditional health knowledge inside the community, and externally, insisting on the need to recognize the importance of traditional local specialists for the health provision of the Totonakú and mestizo localities.

3. On the Grandes Montañas campus, working in collaboration with the UVI Communications Department, our ethnography centers on the dialogue that the UVI students, teachers, and graduates maintain with community actors, such as a migrant returnee organization in the Tehuipango Nahua community, in relation to cultural heritage projects and community empowerment activities. Cultural promotion activities carried out together with UVI students and alumni emphasize the often conflictive relations between school institutions, community authorities, parents' associations, and migrant and returnee networks. While migrant remittances are mostly used for single household economic diversification strategies, supra-household, community-based inversion and capitalization strategies are nearly absent. Therefore, local villagers and community authorities asked the UVI research team to look into possibilities of linking and creating synergies between family- and community-driven economic and cultural promotion strategies, such as the construction of a community center or the reform and adaption of the local school facilities.
4. Finally, in the Selvas campus, the analysis is based on our collaborative work with the UVI Sustainability Department and is therefore focused on the environmental and agroecological knowledge exchange which this department is carrying out together with producer organizations, regional sustainable development advisory councils (COMUDERS), and environmental management units in the Nahua communities of Huazuntlán, Pajapan, and Tatahuicapan as well as in the Popoluca community of Soteapan. Inside these externally promoted environmental management units, which have been created by a biodiversity protection scheme, students, alumni, and a UVI researcher are identifying *emic* fauna and flora taxonomies and their related local usages, in order to translate them into the official language of environmental service delivery. Thus, local producers can prove their contribution to preservation and sustainable exploitation of endangered species of birds, reptiles, fruits, and corn variants. As a local UVI teacher and project participant explains,

There is a huge knowledge on the environment, on deer, on birds, on crocodiles, on fish. . . inside the communities. Parents show their kids, grandparents teach their grandchildren daily about how to exploit without destroying these resources. So these peasants, fishermen, hunters, artisans are contributing to the conservation of our environment, but nobody recognizes them, bureaucrats from the city come to tell them what is forbidden and what is allowed. Now, with the newly created councils, the COMUDERS, it is a first step for participating, but external agents still dominate decision-making on local resources. So we support the local networks of producers, we try to make visible their contribution to what the development agencies call 'environmental services'.

These four spaces have been chosen because they are intersecting, in the sense that they do not subsume ethnocultural and ethnoscientific knowledge beneath the traditional monologicality of the western university. Instead, local identity processes as indigenous villagers, as traditional maize peasants, and as ritual "protectors" of the local environment are integrated into preservation, development, and cultural revival strategies, as reflected in the B.A. curriculum. We are studying these knowledge dialogues and exchanges with a hybrid, exploratory,

qualitative methodology that combines institutional ethnography, designed for empirical research within institutions, especially educational (Gobbo 2002, 2003; Velasco and Díaz de Rada 2006), with reflexive ethnography developed for the participative and dialogical study of social movements (Dietz 2009; Álvarez Veinguer 2011), and collaborative and coauthored research between academic actors and local communities (Leyva et al. 2008).

The dialogical strategy applied here is developed together with UVI researchers, students, and alumni who work inside these projects and exchange continuously academic and community-based knowledge. Cyclically shifting between phases of “listening” to our local actors through ethnographic, narrative interviewing; phases of accompanying them through participant observation and collaboration in their specific legal, health, environmental, and/or community development projects; and phases of counseling and jointly analyzing these verbal and visual, interview, and observation data through common workshops where we co-interpret the different experiences, the lessons learnt from each of the projects and the contradictions arising from the clash between expectations and outcomes, between local claims and structural constraints, between first fruitful regional dialogues of knowledge and persisting hierarchies of institutional monologues. As a workshop participant summarized her lessons learnt,

Through this meeting, through this session, I have recognized not only my community’s legal problems with the municipality and with the state government. I have also learnt from my neighbour communities, from their problems, they are very similar to ours. We used to fight among each other, for land, for access to the market, for different conflicts, different reasons. But here I see how important it is to keep on meeting, talking, exchanging. And also learning, for example about the rights we have and how do defend our *costumbre* [customary law], our *deacuerdos* [binding agreements], because they are not contrary to national law, as these lawyers from the city always make us believe. . . .

This cyclical strategy conceives ethnography and its systematic oscillation between an emic and an etic—internal, actor-centered vs. external, structure-centered—vision of diversity, as a reflexive task which, when functioning from the inside, recovers participant actors’ discourses while at the same time, functioning on the outside, contrasting the corresponding habitualized intragroup praxis with intergroup interactions. Taking into account the hierarchical and asymmetrical institutional context, which is implicit in any academic program related to the indigenous context, these two analytical horizons, which interrelate discourse and practice, actor and inter-actor perspectives, are extended towards a third analytical axis: the underlying institutional structurations which characterize the university itself as well as the participating government institutions and the nongovernmental organizations. In this way, a tri-dimensional ethnography emerges that combines the following axes of analysis:

- (a) A semantic dimension, focused on intra- and nonacademic actors who belong to different cultures, ethnicities, genders, and generations, whose discourses and knowledges are collected by ethnographic interviews, from an *emic*, intracultural, and intra-discursive perspective, and are interpreted using critical discourse analysis (Van Dijk 1995).

- (b) A pragmatic dimension, focused on modes of interaction (Soenen et al. 1999) of different academic, organizational, and community actors, whose exchanges of knowledge are studied principally through participant observations, focal groups, and network analysis (Trezzini 1998; Mateos Cortés 2009, 2010), by using an *etic* perspective, which is analyzed in terms of their intercultural and interlingual competencies (Gogolin and Krüger-Potratz 2006; Dietz 2009).
- (c) A syntactic dimension, focused on institutions such as the UVI, the participating NGOs, and the community actors, within which are articulated knowledges as well as practices, as part of their inter-exchange and comanagement. They are analyzed in an inter-discursive manner, as mutually intersecting *histoires croisées* (Werner and Zimmermann 2003). Starting with these “epistemological windows” (Werner and Schoepfle 1987) made available through fieldwork, i.e., the contradictions and divergences that arise from contrasting emic and etic perspectives, these contradictions are made explicit, exchanged and debated in so-called intercultural workshops (Dietz 2009), which are being realized for each of the four knowledge areas mentioned above.

Throughout these workshops, the narrated discourses of the participating actors are analyzed and contrasted with the observed actors’ praxis. The contradictions and/or divergences which arise from these discourse–praxis comparisons are not interpreted superficially as “failed” coherence between what is said and what is done, but are interpreted together with the actors themselves as more complex results of a clash between what is claimed, what is actually done, and what is institutionally allowed to be done.

For example, in one workshop session in the Selvas region, we discussed the need to revise and redefine the students’ B.A. thesis and degree procedure. Students, teachers, and some participating local villagers criticized particularly two constraints in the degree process: the majority of B.A. theses were not delivered in an indigenous language but in Spanish, and local *sabios* and specialists who had collaborated in the thesis were not invited as members of the degree examination board. Both claims were collectively recognized as legitimate but were analyzed as well with regard to the structural constraints they made visible: on the one hand, the university still resists recognizing local expert knowledge unless it is officially expressed through an academic degree. Accordingly, in the curricular revisions our project channels to the UVI directives, we propose to expand the B.A. degree process by including both an “academic validation” (through members of the UV and UVI academic community) and a “community validation” (through expert members of the studied communities); however, the university authorities until now have rejected this proposal. On the other hand, our joint interpretation on the use of the indigenous languages for thesis writing purposes conducted us to a profound analysis of the need not only for regaining and revitalizing these languages in daily life but also for expanding their use and usability towards academic purposes, for decolonizing them from their colonially imposed *macehual* or peasant nature. Several students explained that there are conceptual notions they learnt in

Table 1 Dimensions of a comparative ethnographic methodology (Dietz 2009; Álvarez Veinguer 2011)

Semantic dimension	Pragmatic dimension	Syntactic dimension
Actor-centered	Interaction-centered	Institution-centered
Religious identity and/or ethnicity	Religious praxis, culture (intraculture/interculture)	Institutional entities (territorialized)
= Discourse	= Practice	= Societal structure
Ethnographic interviews	Participant observations	Intercultural workshops
= <i>Emic</i>	= <i>Etic</i>	= <i>Emic/etic</i> (“epistemological windows”)

Spanish which they right now cannot express in Nahuatl or Popoluca, as they lack the respective words. The workshop ended with a very innovative and creative exchange of ideas on language “actualization” and “normalization” as well as of notions of what is expressible and what is translatable and what is not.

The resulting methodological model is graphically summed up in Table 1. Connecting the different intercultural, interlingual, and inter-actor dimensions within this tridimensional methodology, the *emic* and *etic* visions of the principal educational actors are contrasted through the use of the mentioned intercultural workshops. In this way, we pursue classical objectives of empowerment of (future) indigenous professionals as well as objectives linked to the mainstreaming of the key competences required for their professional and organizational performances. Accordingly, our main participants and coresearchers are students and teachers–researchers working inside UVI and recently also alumni already working as intercultural managers outside UVI. In the following, we briefly characterize the brokerage activities of the UVI students and teaching staff.

Emerging UVI Actors as Hybrid Subjects

Taken together, the five generations of UVI students which have been involved in the B.A. program in the five different orientations and in the four regional study centers total approximately 600, of whom more than half are women. Of this student body, two thirds are native speakers of an indigenous language and one third only speak Spanish. The main indigenous languages spoken by students are Náhuatl, Tutunaku (Totonaco), Nún̄tah+’yi (Popoluca), Diidzaj (Zapoteco), Ñahñü (Otomí), Teenek (Huasteco), Hamasipijni (Tepehua), and Tsa jujmí (Chinanteco). Classes are normally taught in Spanish, but certain kinds of teaching and project activities are also carried out in the main indigenous language in the region: in Náhuatl (in the Huasteca, Grandes Montañas, and Selvas centers), in Totonakú (in the Totonacapan center), in Popoluca (in the Selvas center), and in Otomí (in the Huasteca center).

The indigenous regions of Veracruz are still marked by a striking lack of educational options at high school level so that students have often been obliged to pursue precarious modes of distant education such as *telesecundarias* and *telebachilleratos*, which are postprimary schools which lack the complete range of teachers and which are therefore run through satellite TV educational programs. For this reason, the standard process of choosing students through multiple-choice entrance exams is not applied in the UVI regional centers. Instead, students must run through a qualitative selection interview and present a personal letter of their motives for pursuing studies at the UVI as well as a letter of recommendation by a traditional, civil, or religious authority of their local community. Given the recent nature of this new kind of university, the first two generations of UVI Intercultural Managers for Development just graduated and are starting to work, mostly as project managers, mediators, translators, liaison officers, and/or technical assistants in governmental or nongovernmental projects. Others work through self-employment in local and regional development initiatives or consultancies.

To achieve a smooth transit from UVI studies to employment, the majority of students have started rather early to carry out intermediary and advisory activities and to design projects while still studying. Almost all of the UVI students are from indigenous regions and would not otherwise have been able to access higher education in urban centers. However, recently an increase in student mobility between regions is perceivable due to the fact that more students who are from other regions, including urban centers, have decided to apply to study at the UVI.

As mentioned above, the B.A. in Intercultural Management for Development is taught through a mixed format that combines conventional face-to-face classes in small groups with newer kinds of workshop-based classes and intensive community outreach work, which students carry out under the supervision of a lecturer-tutor and in close collaboration with communal authorities, NGOs, and civil associations present in the regions. For this reason, the UVI has signed a series of agreements with local actors and regional networks, who get involved as counterparts in the extracurricular teaching and learning process. Through such early work experiences, the students have to compare, contrast, and translate diverse types of knowledge: formal and informal, academic and community-based, professional and experiential, generated in both rural and urban contexts by both indigenous and nonindigenous actors.

This continuous exchange of knowledge and methodologies, of academic versus community-rooted kinds of knowledge, is generating new rather hybrid subjects which are able to oscillate not only between different kinds of knowledge but also between rather diverse ways of putting knowledge into daily practice inside and outside their communities of origin. Our project has shown that these emerging hybrid capacities not only of translating between knowledges but of creating new cultural and identity strategies go far beyond the expected focus of official interculturalism: students and alumni do not only shift between academic and community knowledge and between nonindigenous, mestizo, and indigenous cultural domains but creatively incorporate cultural innovations which transcends ethnic divisions and which stem from gender diversity; from generational, subcultural developments as well as from locally unconventional sexual identity.

For example, in several UVI sites gay and lesbian students dare to express their sexual identity openly at least inside the university, whereas outside of it they still cannot live accordingly. On the other hand, both students and former students are actively creating self-help and support networks of local peasant women who are trying to get economic independence from their often absent husbands and to obtain legal counseling with regard to their rights as women and as citizens. Gender relations are rapidly changing with the establishment of higher education inside the local communities: particularly young women but increasingly also young men are starting to experiment with new, more diversified, but also more ambiguous gender roles than the traditional ones.

Accordingly, the diversity profiles the intercultural university is dealing with are no longer reduced to ethnic identities which are often officially conceived as binary and juxtaposed ones: students often organize their project work along lines of religious adscription (Catholic, Adventist, Pentecostal, etc.) or their belonging to subcultural youth styles (*darketos*, *emos*, etc.), but particularly new gender roles (female students taking over traditionally male professional tasks and vice versa) and sexual identity (the coming out of gay and lesbian students on campus) are prominently emerging inside academic activities and teaching and learning topics.

This diversification also affects the teaching staff. The UVI lecturers and researchers cover a wide range of humanities, social sciences, and engineering disciplines and include many young, recently graduated teachers who are just starting postgraduate or PhD studies. These lecturers and tutors are not employed with regard to their ethnic origin, but following criteria of professional experience and considering above all their intimate knowledge of and their rootedness inside the region in which their UVI center is located. Accordingly, most UVI lecturers and tutors come from the region in which they work and thus provide their students not only with academic but also with local and regional knowledge. Other nonacademic professionals and/or local experts also participate in the teaching of certain modules or of specific courses which are directly related to their own professional practices. In total, the UVI has a teaching body of approximately 60, including full-time and part-time staff, as well as those in charge of designing and coordinating the B.A. orientations from the central office in Xalapa.

A substantial change that is currently under way within the UVI is associated with the relationship between teaching, research, and community outreach services. Until recently, research and project implementation activities were mainly carried out by students, while lecturers concentrated on teaching and on tutoring projects carried out by their respective students. A university-wide process of “departmentalization” started inside the UV in recent years in an effort to bridge the traditional gap between university teaching, organized in “faculties,” and research, channeled through “research institutes.” By creating the new figure of “departments,” the UVI is in the process of transforming its “orientations,” offered as part of the B.A. program in Intercultural Management for Development, into the future departments of “communication,” “sustainability,” “languages,” “law,” and “health.” Each department is made up of the lecturers in charge of their respective orientation in each of the four regional centers and in the central office in Xalapa,

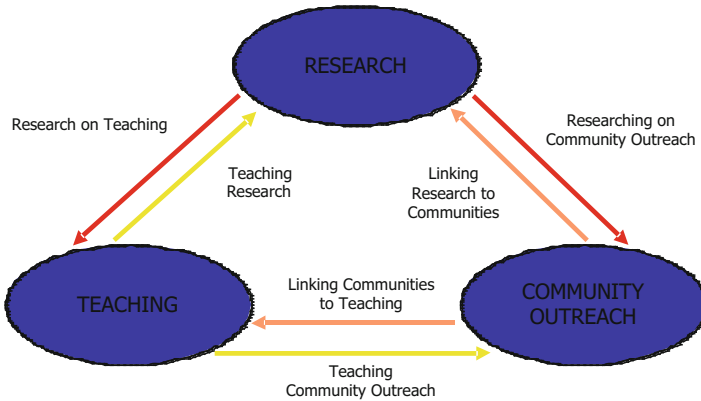

Fig. 1 The UVI loop of research, teaching, and outreach (Dietz and Mateos Cortés 2007)

thus forming small units that combine tasks of teaching, research, and community outreach. Hence, the lecturers' outreach research activities are closely linked to community demands and to ongoing student projects. The result is a mutually enforcing and complementary "loop" of circular teaching, research, and community outreach activities, as illustrated in Fig. 1.

Collaboration, Interpretation, and Double Reflexivity

We will finally describe how our above developed methodology is contributing, firstly, to collaborative research in general and, secondly, to the methodological complementarity of hermeneutically inspired interpretive approaches and action research originated collaborative approaches.

Collectiveness should not be understood as a dynamics to reach an instrumental consensus where the product is the result of a forced agreement due to the own need to synthesize and arrange opposing positions. We have to continue searching and thinking about how, from the different existing experiences and the collective processes, the multiple decisions are made and agreed as well as about the kind of strategies with which the group manages conflicts and settings of disagreements that arise. There are no recipe books for this kind of practice without the specificity of each context and place, as there are none for any ethnographic practice. Each group, each type of relations, conditioned by their own vital experiences of the people who are part of the group will mark and define the possible strategies. What is important is to be able to narrate and share the process in order to understand what has happened, how the situation has been reached, which ways are available to exit these settings, and which options and paths have been built in each process. We need to name and make vulnerabilities, fears, and tensions visible as well as recognize the group dynamics which are placed in specific places and

times, inscribed in privileges and intertwined in power relations. We have to insist, we shall present not only the product but also the process (the path) which has allowed us to reach the place from which we are stating the experience. This will allow us to understand, follow, and share the multiple coordinates with other experiences which are being articulated and brewed.

This is the reason for not declaring collaborative ethnography as a new identity seal that has to be incorporated or as a new paradigm or an avant-garde methodological proposal which promotes the assembly of a solely conceptual innovation. Nothing is further away from our intention. Since the 1980s and especially from the feminist and postcolonial approaches, the vindications about the need to overcome multiple dichotomies and hierarchies which are part of the ways in which we built knowledge is argued for. The positivist legacy, based on a Cartesian epistemology, has consolidated settings of multiple dualisms which have played a central role in the way research is carried out, the methodologies employed, and the knowledge production of the past centuries. Subject–object, objectivity–subjectivity, science–ideology, truth–spirituality, theory–practice, rational–emotional, tradition–modernity, civilization–wildness, etc—all of these are hierarchical couples which have marked and conditioned the ways of understanding, interpreting, and thus building and making sense of the world. As far as interpretation is concerned, research action has been for decades proposing and building active methodologies which try to surf these unidirectional settings. To mention only a few proposals, Lawless, for example, wrote already a long time ago about “reciprocal ethnography” (Lassiter 2005, p. 9), and Dietz works with the “doubly reflexive ethnography,” both possible conceptual scaffoldings.

The notion of “collaboration” does not easily escape the polyphonic character, and depending where we look, we can find different uses for the term. Some authors understand collaboration as a collective writing between different researchers (Kennedy 1995). For some we are talking about a process through which data is “collected” jointly (Moreno-Black and Homchampa 2008, p. 92); for others it refers to a collective writing (Wyatt et al. 2010). In anthropology there are two ways of traditionally thinking about collaboration: first collaboration between researchers and second collaboration between researchers and research subject (Kelty 2009). We would like to focus on the second kind. This is not the place to analyze if the term is operative or not; instead we would like to stress that when we talk about collaboration, our spotlight is to look for an ethnography which allows us to co-interpret and, as far as it is possible, allows us to co-conceptualize, coproduce data, co-analyze, cowrite, become coauthors, etc. (no matter in which order).

The same way the dialogic metaphor substituted the textual metaphor in interpretive anthropology, the collaborative metaphor substituted the dialogue one in critical anthropology. Nevertheless, as Marcus points, the collaboration trope which emerged during the 1980s did not entirely substitute the rest of the tropes (Marcus 2001, p. 159), and in a certain way, for Lassiter, the problem lies in the fact that more critical anthropologists only committed themselves with collaboration metaphorically (Lassiter 2005, p. 160).

We insist, we do not want to vindicate the term *per se* nor to fight its exclusiveness or areas of appliance; we think it is useful and valid to analyze and tackle relations among people who take part in ethnographic research processes. It is useful to short-circuit historically produced unidirectional monologues which are interpreted and narrated only from the position of the so-called researcher. With no other aim, we want to insist on the use of the term *collaboration*, understanding it as a collective process.

However, the collaborative process often faces structurally imposed limits and obstacles. As an innovative pilot project, the UVI has encountered a range of bureaucratic, financial, academic, and political problems since it started only 3 years ago. The heterogeneity of the participating academic, political, and organizational actors has proved quite a challenge when institutional stances must be taken that are both efficient and legitimate for all the parties involved. After a long process of diagnosis and political negotiation on the choice of regions and communities in which to establish the UVI regional centers, the main political representatives have continued to support the UVI project strongly.

Nevertheless, the great cultural, ethnic, and linguistic diversity in the indigenous regions of Veracruz still poses an important challenge for curricular development and diversification as well as for the implementation of programs relevant to the regional population. Our project shows that it is not enough to “interculturalize” a conventional institution by opening up spaces of diversity at the margins, as in the UVI campuses, without challenging the prevailing notions of university, universality, and homogeneity of knowledges.

While the UVI is widely supported by the regional societies it serves, within the public university which gave birth to the project, resistance and misunderstanding persist. Due to the heterodox notion of “university,” of “degrees,” and of “curriculum” employed by the UVI staff, some more traditional and “disciplinary” sectors of academia aim to confine and limit this initiative to old-fashioned paternalist, top-down “outreach” activities rather than open their own teaching and research activities to such experiences: in their view, indigenous regions should be “helped” by particular outreach activities, but these should not impact conventional higher education contents or teaching methods. Therefore, the inclusion of a diversity of actors and a broad range of regional knowledge in the very nucleus of academic degree programs challenges the universalist rather “monological” and “mono-epistemic” character of the classical western university. In this field, for a public anthropologist and his or her corresponding engaged, “activist” methodology (Hale 2008), one of the main challenges consists in linking the characteristics of an “intercultural university,” orientated towards and rooted in the indigenous regions, with the dynamics and criteria of a “normal” public university.

Far from establishing new empirical fields and/or new academic subdisciplines in a context that is already excessively specialized and compartmentalized, the distinctively dialogical contribution to the uses of interpretive approaches in educational research lies in its particular, theoretical–empirical binomial. This dual emphasis on a collaborative, dialogical co-interpretation—on diversity and interculturality, in our example—and an interpretive ethnography of the

interactions between the diverse participating actors at school generates an integral and circular vision, both *emic* and *etic*, of the object–subject and the subject–object of study. This allows us, on the one hand, to deconstruct and decipher the discursive and practical fluctuations of a broad range of usual actor-centered essentialisms—such as ethnicisms or nationalisms. On the other hand, its semantic and pragmatic analyses complement each other and complete an ethnographic vision of the institutions that, like an omnipresent but underlying syntax, structure the identity discourses of each of the actors studied as well as their respective lifeworld practices. By doing this, turning our eyes from the problem to the problem maker; from the individual—the actor and the community member—to the sedentary institutions; and from the subordinate minority or the “beneficiary” client to the hegemonic “benefactor” nation state, the anthropological endeavor turns all too homogeneous and static interpretations at least more conflictive, more challenging, more disturbing for the established orders.

**Genre 4 Ethnography *in* Educational
Research: Applying Ethnographic Methods
in Educational Inquiry**

Introduction

Dennis Beach and Elina Lahelma

Ethnography has been recognized as an important research method in educational research for over 40 years but has a longer history, as is shown in a four-volume set on ethnographic methods in education (Delamont 2011). It has roots in cultural anthropology, particularly in the USA while the British and European tradition is more within the sociology of education (Delamont and Atkinson 1995): see also Kehily's chapter in this section. In both cases, it involves research that takes place in or on educational institutions through observation and participant observation. Researchers are important tools in the research process, as they acquaint themselves with educational settings through immersion in the daily lives of the participants. The ethnographers' selves are implicated in the research process, as they observe, learn, and understand local cultures through their own experiences in the field (Beach et al. 2003). Standards for ethnography have been put as follows by Geoff Troman (2006) in his inaugural editorial for the journal of *Ethnography and Education*. Ethnography:

- Uses multiple methods for the generation of rich and diverse forms of data and is characterized by the direct involvement and long-term engagement of the researcher(s) as the main research instrument
- Gives high status when driving research ideas forward to the accounts of participants' and to their perspectives and understandings
- Involves a spiral of data collection, hypothesis building, and theory testing and focuses on a particular case in depth as a basis for theoretical generalization

- Interrogates and develops theories of educational structures, practices, policy, and experience and seeks to explicate and challenge the effects of educational policies and implementation in/on practice
- Provides accounts of how the everyday and sometimes mundane practices of those engaged in educational processes are implicated in broader social relations, cultural production, and social reproduction and highlights the agency of educational subjects
- Takes place over time in order to allow a fuller range of empirical situations to be observed and analyzed and to allow for the emergence of contradictory behavior and perspectives
- Considers relations between the appropriate cultural, political, and social levels of the research site and individual, group, and community agency there
- Includes various theoretical perspectives in order to sensitize the analysis of data and provide an opportunity to use empirical ethnographic research for the interrogation of macro and middle-range theories.

Education ethnography is thus about developing close-up descriptions of education lives, identities, and activities through situated investigations that produce knowledge about basic educational conditions and practices and the perspectives of the participants involved in them, without over-steering from personal ideas or pet theories. It is said to in this way be able to open up the black box of institutional educational activities and practices.

The chapters in this section of the handbook provide illustrational and exemplary examples. They each examine a specific subject or aspect of the interpretation of data in education ethnography and, at the same time, present research that has been done in a particular subdomain of the educational research field. They use multiple theoretical perspectives to aid interpretations: sometimes conjointly. For example, the chapter of Kehily draws both from cultural and feminist perspectives, Mészáros uses poststructuralist queer theory and critical theory, and the sociocultural method in the chapter by Kozleski and Artiles draws from critical theory and historical materialism.

The history of ethnography is thus both long and varied. However, this methodology has faced new challenges in recent years from technological innovations and epistemology. The former have increased the needs and possibilities for the use of visual and internet methods and social media (see, e.g., the chapter by Holm, Londen, and Mansikka), while the latter, through the textual turn and the crisis of representation (Clifford and Marcus 1986), has impacted on ethnographers for decades, questioning the ideal of objective ethnographic accounts and calling for more dialogic accounts that write the researcher into the text. This is discussed in more detail in the chapters of Dillabough and Gardner and Mészáros.

Still another tendency that we illustrate in this section is in integrating several ethnographic studies. Instead of the lone researcher observing in specific settings for long periods, there are examples of collaboration and joint reflection of several researchers working in different settings. George Marcus (1995) has called multi-sited ethnography work in which ethnography moves from its conventional single-site location, contextualized by macro-constructions of a larger social order, to multiple

sites of observation and participation that crosscut dichotomies such as the “local” and the “global.” Examples about collective or meta-ethnographic perspectives are given in the chapters by Lappalainen, Lahelma and Mietola, Beach, Eriksson and Player-Koro, Dillabough and Gardner, and Geoff Troman and Bob Jeffrey.

Chapter Summaries

There are eight chapters in this section. The chapter of Mary Jane Kehily gives a comprehensive review of the history of ethnographic endeavor, considering it as a project capable of writing culture. The main body of the chapter draws on an ethnographic study of two schools to illustrate the explanatory power of ethnography as a method for understanding school processes. Examples are used to demonstrate how student–teacher perspectives on gender relations, sexuality, and sexuality education are made visible through the ethnographic method. Finally, the chapter considers how ethnographic interpretation remains a product of the research context and the personal/biographical investments which set the scene for encounters in the field.

The chapter by György Mészáros discusses key aspects of the *textual and research context* of autoethnography. Autoethnography is inherently biographical and focuses on the socioculturally situated subject of the researcher. It often deals with sensitive issues. The chapter by Mészáros is no exception. Focusing on his experience as a gay male researcher in the very heteronormative Hungarian socio-cultural context, he discusses issues of going public and interpretation. A *critical autoethnographic* interpretation of the “I” in which the subject is decentered, but not in a poststructuralist way, is contrasted to a narcissistic or solipsistic understanding of the dissolved self without hope and agency. A Marxist interpretation of the subject is contrasted with a poststructural one.

Jo-Anne Dillabough and Philip Gardner illustrate the power of narrative and narrative imagination as a temporally located strategy for making sense of the world. They suggest that the exploration of narrative expressions constitutes a central element of the ethnographer’s trade. They focus on three elements of everyday life—temporality, symbolism, and space—as central to a storied account of research with young people living in the present. They describe the theoretical and methodological problems and approaches that they encountered and sought to address in the design and implementation of a large-scale, comparative ethnography centered upon some of the many disadvantaged and excluded young people who existed at the fringes of the Canadian cities of Toronto and Vancouver.

Photography as a research method and the interpretations of photographs in ethnographic research are the focus in the chapter of Gunilla Holm, Monica Londen, and Jan-Erik Mansikka. They have chosen to work with photos taken by the participants since it is their construction of their own identifications that is in focus of the research. The purpose of their study is to explore how Finland-Swedish students position themselves with regard to belonging to the Finland-Swedish group.

Geoff Troman and Bob Jeffrey's chapter is based on a series of projects researching English Primary Schoolteachers' interpretations of and adaptations to state education initiatives in an era of intensive "reform." They use an interpretivist stance underpinned by a loose body of Symbolic Interactionist theory with a focus on actors' meanings, motivations, and interpretations to discuss how their task was to attempt to penetrate the various "layers of reality" of the social setting of teaching from the actor perspective. The importance of descriptive field notes for familiarity and analysis and in accounting for interpretations of events is highlighted in the chapter in relation to the experiences and impressions of the field and the effects they have had on unfolding understandings and emergent ideas about the situations, cases, and practices researched.

In the chapter by Elizabeth Kozleski and Alfredo J. Artilés, the authors explore the notion of technical assistance within an ethnographic research tradition. They propose a set of approaches to making and acting on interpretations drawn from technical assistance activities to illustrate the complexity of using evidence in a variety of ways to help systems make important shifts in their cultures and decision-making processes with an eye to produce outcomes that are more equitable for the students. Thus, their work could be considered as that of ethnographer activists who participate in and influence the work of schools with particular emphasis on social justice and equity. Through this approach, they try to help organizational leaders understand and remediate the ways that they structure and support equity in their schools. The implications for this for interpretive ethnographic practices are illustrated and discussed in the chapter.

Based on long-term policy ethnographic research of teacher education policy-driven reform in Sweden, the chapter by Dennis Beach, Anita Eriksson, and Catarina Player-Koro explores and illustrates an exemplory response to the challenges and possibilities of ethnographic synthesis based on translocal and transtemporal research connected to teacher education policy making. It explores and tries to illustrate how a synthesis of ethnographic studies and what they term as a meta-ethnographic analysis may produce more general insights than primary studies are able to do. The chapter demonstrates how meta-ethnography involves comparisons across projects in an attempt to identify, interpret, and synthesize key elements from each respective investigation. This process "worked" on the basis of each of the collaborating project (and the publications from them) having unique qualities that were also related through a common focus.

The chapter of Sirpa Lappalainen, Elina Lahelma, and Reetta Mietola demonstrates collaborative and cross-cultural analysis that combines several ethnographic studies conducted in multiple educational settings, multiple localities, and multiple decades. The authors give two examples of their collaborative work, illustrating how the analysis is partly conducted through discussion and interpretations are jointly built. In the first example, the analysis is focused on the construction of a "special student" in a lower secondary school in postcommunist Estonia. In the second case, the analysis concentrates on representations of "normal" childhood and youth in various cultural texts and ethnographic data sets.

The Chapters in Relation to the Aims of the Handbook

The general aim of each genre in this handbook is to present in eight studies representing, in turn, examples of one of eight fields: learning; teaching; curriculum; evaluation and assessment; educational organization and leadership; equity, justice, and diversity; policy; and nonformal education. This kind of strict categorization is difficult in ethnography, which is generally more comprehensive in its approach. Most of the chapters fit into the fields of equity, justice, and diversity (especially Dillabough and Gardner; Kehily, Mezsaros, Lappalainen et al.; and Holm et al.) or policy (Beach et al., Kozleski and Artiles, and Troman and Jeffrey). Therefore, even though the chapters can be placed in the book matrix in one field each, they do this in relation to issues of education equity, policy, or both.

4.1 On the Subject of Sex: An Ethnographic Approach to Gender, Sexuality, and Sexual Learning in England

Mary Jane Kehily

Introduction

This chapter discusses the relationship between educational research and ethnographic methods. Using ethnography as a way of generating insights into the processes of schooling has a long and distinguished history in educational scholarship. The chapter will explore the ways ethnographic methods can be used as an *interpretive tool* for making visible the ordinary. In documenting everyday practice over time, ethnographic accounts accumulate details of events as they unfold through the firsthand experience of being there. This chapter will consider the interpretive power of ethnography to place the taken-for-granted under critical scrutiny, discussing how ethnographic methods have contributed to our understanding of schools and schooling before focusing on an ethnographic account of sexual learning in a secondary school (Kehily 2002). The chapter demonstrates the value of participant observation and other features of ethnographic work to document the familiar but largely unacknowledged culture of school. By getting under the skin of school culture, ethnographic methods have been central to developing an understanding of how schools work and how schooled subjects—both teachers and students—feel about the day to day experience of being in school. The first two sections of the chapter take a historical approach, discussing the development of ethnography as a way of writing culture. Subsequent sections focus on its application in school settings as a method with a strong academic heritage that educationalists continue to draw upon in productive ways. The main body of the paper explores examples of ethnography in action, outlining the context for the research and the approach to analysis anchored in the meaning-making potential of ethnographic method.

The Ethnographic Lens

As a research method for the writing of culture, ethnography has its roots in nineteenth-century colonialism and particularly the emergence of anthropology as a discipline dedicated to the study of other cultures (Clifford and Marcus 1986). Early anthropologists appeared as intrepid explorers, keen to make sense of encounters with “strange people in faraway places.” Key features of an ethnographic approach involve sustained contact with a cultural group or community over time, participating in their everyday life and achieving group membership without “going native.” Conventional ethnographic studies describe the researcher’s initiation into the group through select members of the community, the proverbial “gatekeepers” that mediate access and play a crucial role in interpreting practices for the benefit of the researcher. Crucially, ethnography gives epistemological status to respondents. The ethnographer’s aim to understand the group as an “insider” gives status to *all* group members as expert commentators and interpreters of their own way of life.

At their most persuasive, anthropological accounts speak back to the normative assumptions of West societies by offering other ways of being in the world. To take an obvious though controversial example, Margaret Mead’s (1972[1928]) study of growing up in Western Samoa challenged Western notions of the teenage years. American psychologist G. Stanley Hall charted adolescence as a stage of development within the life course in a two volume study, *Adolescence: Its Psychology, and Its Relations to Anthropology, Sex, Crime, Religion and Education*. Hall is best known for his characterization of adolescence as a period of *storm and stress*:

It is the age of natural inebriation without the need of intoxicants, which made Plato define youth as spiritual drunkenness. It is a natural impulse to experience hot and perfervid psychic states, and it characterised by emotionalism. We see here the instability and fluctuations now so characteristic. (Hall 1904, vol. 2, pp. 74–5)

For Hall adolescence is marked by physiological change and bodily development that in popular discourse conjures up an image of the stereotypical teenager, subject to “raging hormones,” mood swings, and an inability to communicate with adults. Hall’s account of adolescence and the contemporary image of the teenager in popular culture imply that young people are at the mercy of biological changes that produce an erratic range of feelings and behavior. Mead’s study of girls in Western Samoa, conducted in the 1920s, documents how becoming a woman can be differently marked; female desire is conceptualized as positive and sexual coming-of-age as trouble-free. Mead describes the transition to womanhood in Western Samoa as an orderly period of slow maturing and an embracing of sexual pleasure as girls are expected to have many lovers before marriage. Mead concludes that problems associated with young people in the West can be attributed to a regulatory approach to sexuality and particularly the repression of adolescent sexuality.

The Chicago School of Sociology reformulated ethnographic ideas in the mid-twentieth by using ethnographic methods to study local culture and everyday social practices within Western societies. This reorientation of people and place

gave rise to a new body of work that turned the ethnographic gaze inward by documenting diversity “at home” in the urban street life in contemporary America. William Whyte’s Boston-based study (1943) *Street Corner Society: The Social Structure of an Italian Slum* remains an enduring ethnographic study of the period. Asking how we know what we know, ethnographers act upon an invitation to “make the familiar strange” (Mills 1959) by noticing and interpreting what passes as normal in social contexts.

Culture and Subcultural Interpretations

Culture and the craft of writing culture lies at the heart of the ethnographic project, yet the term has a wide range of meanings in both academic and everyday discourse. It can refer to the traditions of a particular society or community, but it can also be used more narrowly to refer to artistic forms and practices, in the sense of “high culture.” From a cultural studies perspective, culture can be defined as *everyday social practice*. No distinction is made between “high” and “low” culture and their associated practices. Rather the idea of culture is extended to include the commonplace routines and practices that characterize and bind together a particular group or community. Culture, in this sense, can be observed and studied in day-to-day engagements with the social world. This way of conceptualizing culture draws upon the work of Raymond Williams (1965) who insisted that *culture is ordinary*. Williams referred to the everydayness of culture as a *way of life* that makes sense to individuals involved in a particular community. This perspective sees culture as a form of action, a dynamic process rather than a fixed entity. It is not something that people *have*; it is also what people *do* in their day-to-day activities. Applying these ideas to young people has important consequences for understanding youth. A cultural perspective suggests that young people make sense of the world and take their place within it through participation and engagement with everyday social practices. Viewing young people culturally also positions them as active meaning makers in their own lives. Through negotiations with the social world and the exercise of agency, young people give shape to their lives and actively ascribe meanings to events. In this way young people can be seen to develop their own cultures. Indeed, the term *youth culture* is commonly used as shorthand to describe these processes. A rich vein of youth scholarship has focused on the concept of *subculture* as a way of making sense of the collective activity of particular groups of young people who differentiate themselves from other young people through modes of dress, musical taste, and attitude.

A.K. Cohen (1955) further explored the concept of subculture and the ways it can aid our understanding of the social world. Cohen suggests that subcultures can help us to understand and explain *what people do*. In Cohen’s analysis, subcultures arise when people with similar problems get together to look for solutions. Through interaction with one another, Cohen argues that members of a subculture come to share a similar outlook on life and evolve collective solutions to the problems they

experience. This process, however, often creates a distance between the subculture and the dominant culture. Indeed, achieving status within a subculture may entail a loss of status in the wider culture (Whyte 1982). Subcultures exist in relationship to the society in which they emerge and their existence may provide an insight into the experiences of young people especially in the areas of education, work, and leisure.

Youth Subcultures and the Birmingham School

The cultural studies approach to youth subcultures has had a generative impact on educational research and is largely associated with the Centre for Contemporary Cultural Studies (CCCS) at the University of Birmingham, UK (1964–2002). CCCS researchers focused upon subcultural formations among young people in 1970s and 1980s Britain. In an influential collection of studies, *Resistance Through Rituals, Youth Subcultures in Postwar Britain* (Hall and Jefferson 1976), CCCS researchers trace their interest in youth subcultures as expressive forms of resistance that make connections between everyday experience, social class, culture, and the wider society. Engaging in subcultural activity involves young people in acts of “articulation”—the bringing together of different elements in particular contexts, in ways that make sense to the individuals concerned. Taking inspiration from Gramscian ideas of cultural and social change, Hall et al. suggest that working-class youth subcultures involve young people in a “double articulation” firstly with their parents’ culture and secondly the broader culture of postwar social change. To view youth subcultures as adolescent rebellion is to underestimate the extent to which young people seek to speak to and comment upon generational change and social structures. Rather, from a cultural studies perspective, youth subcultures appear purposeful interventions, imbued with meaning.

Recent approaches to youth culture have critiqued earlier definitions and challenged the concept of subculture itself. We are all mainstream now, the argument goes; the increased commodification and commercialization of all areas of social life close down the possibility of subcultural space for young people. Besides, the notion of a “dominant culture” is also changing and fragmenting, creating multiple *cultures* rather than the mainstream and the subcultural. Recent studies of youth formations indicate that definitions of subculture cannot be fixed in terms of earlier studies or sociocultural moments. Like other sociological concepts, it is subject to change and redefinition (Hesmondhalgh 2005).

A strand of cultural studies research drew upon subcultural insights to consider young people in relation to the labor market rather than leisure. Using the local context of school and youth club as research sites highlighted the gendered nature of youthful experience. Willis’s (1977) classic study of working-class male counterculture in the West Midlands area of the UK demonstrated the direct and functional relationship between school and work, elaborating on the subtitle of the book, how working-class kids get working-class jobs. As an anti-school group, the “lads” were both popular and spectacular nonconformists. Central to their

school experience was the ability to wring humor out of every situation. Willis concluded that for the lads, ridiculing teachers and having a “laff” could be regarded as preparation for the future world of work in the manufacturing industries of the area. The styles of trickery and subversion the lads engaged in became the means whereby young men literally “learned to labor.” McRobbie’s (1978) study of working-class girls argues that popular cultural forms and the practice of female friendship help to prepare young women for their future roles as wives and mothers in the domestic sphere (McRobbie and Garber 1982). In the post-Fordist era, it appeared that the young people in my study were hardly “learning to labor”; their futures in the workplace and the home were less certain and not so clearly defined.

Contextualizing the Research and the Researcher

Having completed postgraduate study in cultural studies at Birmingham University with 12 years’ teaching experience and a long-term resident of Birmingham, my biographical details appear relevant to the formulation of a research agenda. My approach to ethnography drew upon CCCS insights into culture and subculture and the rich body of research that prioritized taking young people seriously. The schools where I carried out research were located in an area that had undergone far-reaching economic change. The Midlands region of the UK has a history of factory employment as well as a former industrial heritage related to the manufacture of cars and skilled craftwork such as jewelry making. More recently the region has witnessed widespread deindustrialization, the dismantling of former industries, and the emergence of a competitive global economy. Furthermore, in the postwar period, the region has become synonymous with the settlement of diasporic communities from the New Commonwealth countries as well as large numbers of people who have arrived from Pakistan and Ireland. In these “new times” of global change and development, it is the convergence of time and space that has radically transformed English working-class culture. The study recognizes the cultural specificity of the school as a local space that exists in complex interaction with wider global processes relating to migration, the economy, and culture. At the local level, the very fabric of the Midlands region seems to speak of an industrial heritage that can no longer be realized, functioning as a symbol of postindustrial alienation.

The materiality of young people’s lives poses many big questions for schools concerning the nature and purpose of education in the present period and the relationship between school and society in the face of global change. The role of the school and its relationship to the local economy is seemingly less obvious as local industries and long-term manual work decline. At the same time multinational chains in the retail and service sector, together with new forms of “flexible” employment, have expanded. Observing the scope of economic change prompts more questions than answers. How has economic change impacted upon the lives of young women and men in school? What are the implications for versions of masculinity and femininity? Is there a new, emergent sex–gender order? In many

respects, the sex–gender identities of young men and women in the area appear strongly traditional and deeply embedded in older forms of social and cultural practice. It is against the backdrop of these changes and points of continuity that this study has been carried out.

My study aimed to explore issues of sexuality, gender, and schooling ethnographically. I was interested in the way school students interpret, negotiate, and relate to issues of sexuality within the context of the secondary school. In order to explore these themes, I used the concept of *student sexual cultures*, the existence of informal groups among the student body who actively ascribe meanings to events within specific social contexts. *Student sexual cultures* refer specifically to the meanings ascribed to issues of sexuality within peer groups and in social interaction more generally. My argument, developed through the thesis, highlights the constant activity of the student body, their making-meaning processes, and shifting investments in individual and collective identities. Peer group practices produce and maintain self-determining hierarchies embedded in rituals of inclusion and exclusion, involving the constant negotiation of sense of self in relation to others. The study observed and documented the way sexuality features in the context of student cultures and the implications of this for sexual learning and the construction of sexual identities. I was particularly interested in the interrelationship between gender and sexuality and the way school students negotiate complex social relations that can be both creative and constraining.

The study focused upon two key areas in the field of sexuality and schooling: firstly, the shaping of pupil cultures and the construction of sexual identities and, secondly, teaching and learning in the field of Personal and Social Education (PSE), particularly sex education. I was interested in exploring the frameworks informing the teaching of PSE and the ways in which policy is *translated* into practice in schools. Work in this area in the past (e.g., Lees 1993) tended to focus on the *delivery* of sex education programs rather than on the ways they are *received* by students. I was concerned to explore the “reading effect”—the ways in which the meanings and messages of the official curriculum are mediated by student sexual cultures.

The emphasis on student cultures can be seen as a way of “giving voice” to school students who *receive* the curriculum but play no part in the structuring of the school as an organization or the planning of the curriculum and the teaching of lessons. This approach, however, can have a tendency to see teachers a monolithic force, defined in opposition to students. I was, therefore, also concerned to draw upon the experiences of individual teachers, including my own, and their personal accounts of teaching and learning in the field of sex education. I viewed this as an important element in developing an understanding of current practice in contexts where both teachers and students may have investments in the construction and maintenance of symbolic boundaries in this area. Fieldwork was carried out over a total of 2 years, beginning in 1991 and continuing in 1995 and 1996 in two secondary schools in the Midlands area of the UK. Both schools were open-access secondary schools for boys and girls aged 11–16, and both schools served a largely working-class local community. Oakwood School was nondenominational and

ethnically mixed with many students from south Asian and African-Caribbean backgrounds. Clarke School, however, was a Church of England school and the school population was mainly white British.

Doing Ethnography: Making Meaning

Researching sexuality in schools is a complicated business. Linking “sex” and “school” together as a focus for study brings the researcher into direct contact with many of the symbolic boundaries that shape contemporary schooling. Constructions such as public/private, adult/child, teacher/pupil, male/female, and proper/improper organize social relations within the school in ways that seek to demarcate and prescribe the domain of the sexual. Researchers in this field have commented on the ways in which informal school-based cultures are saturated with sex, through humor, innuendo, double entendre, and explicit commentary, yet the official culture of the school frequently seeks to deny the sexual and desexualize schooling relations (Epstein and Johnson 1998; Jackson 1982). Sex education remains a small and discrete part of the curriculum, while abundant and pervasive ways of talking about sex flourish in social spaces occupied by teachers and students. The symbolic boundaries containing issues of sexuality in school juxtaposed with the simultaneous desire to speak the sexual point to some ways of understanding the sexual politics of schooling. Foucault (1988, p. 10) expresses the view that “[t]he association of prohibition and strong incitations to speak is a constant feature of our culture.” This observation leads Foucault to suggest, in his later work, that people are “freer than they feel” (1988, p. 10). This way of looking emphasizes the productive potential of constraint; policing produces rebellion, and boundaries create and define the unbounded in contexts where constraint and freedom exist in a dialectical relationship of support and mutual definition. Researching sexuality in schools calls for an approach which renders visible the social relations of schooling, which recognizes the context in which sexuality is, at once, present and absent, the forms it takes, and the responses it generates. This approach involves the researcher in observations and actions. Observing the symbolic boundaries, shaping sexuality in school necessarily incurs an interpretive understanding of the context of school relations and the development of an analysis of the dynamics that are shaping and informing these boundaries.

My approach is indebted to methodological traditions of ethnography, cultural studies, and feminist practice. While the ethnographer may appear as a solitary explorer, ethnographic work, in fact, involves encounters with the footprints of fellow travelers (see McLeod and Thomson 2009 for a discussion of ethnography and social change). Taking inspiration from prior concerns with issues of reflexivity and research subjects as producers of knowledge, my approach to ethnographic work in school was to see students meaning-makers as the force informing and shaping the research agenda in direct ways. In peer group interactions, I observed

the collective negotiation of an acceptable “line,” defining, for that moment, legitimate realms of thought, words, and actions. Recognizing that there are *moments* of truth and writing (Stanley 1990) influenced my approach to data collection and analysis. I did not attempt to recreate the reality effect of field relations produced in a just-like-being-there linear narrative. Neither did I develop an overview of sexuality, gender, and schooling based on empirical observations. Rather, I looked for *moments* in the transcripts that provide a commentary on the relationship between the domain of the sexual and the domain of the school. Having identified these moments, I began to think of them in Richard Johnson’s terms as *discursive clusters*—instances where ideas and relations are condensed in particular ways. These discursive clusters became, for me, the “text,” the object of analysis which was instructive in pointing me to ways of understanding and interpreting the social encounter. Specifically, my approach to such moments drawn from the transcripts is to treat them as literary text, paying close attention to linguistic features and devices, particular words and phrases, and, occasionally, the absences too. I regard speech as a form of action that requires analysis of the act of speaking as well as analysis of what is said. Moreover, I would suggest that text produced by ethnographic fieldwork can be viewed and interpreted as a form of social practice. Drawing particularly on CCCS studies of youth (e.g., Hall and Jefferson 1976; Willis 1974, 1977), I recognized and enjoyed the “craft” of literary-inspired analysis at work. Since 1996 Willis has discussed his ethnographic method as an elaboration of the close-reading technique employed by his teacher and mentor, Richard Hoggart. Willis describes using this technique to study a Shakespeare sonnet and, later, applying the same technique to culture in his study of a gang of motorbike boys. For Willis this method becomes a way of documenting the stylized display of working-class youth as a “common culture” expressed through the artistry of dress and leisure (Willis 2000).

Sexuality, Gender, and School-Based Knowledge

Within the school context, the artistry of young people has been documented in prior studies. The concept of the “hidden curriculum” has been used by educationists to acknowledge that learning extends the boundaries of the official curriculum and may have inadvertent effects. What is learned by pupils may not fit with the intended aims of teachers and educational policy makers (see Hammersley and Woods 1976 for a discussion of these themes). Research from this period suggests that through participation in school routines, pupils learn to conform or resist the official culture of the school (Willis 1977). Like other feminist educationists, I suggest that the “hidden curriculum” can also be seen in terms of the regulation of sex–gender categories. Within the context of the school, much informal learning takes place concerning issues of gender and sexuality; the homophobia of young men, the sexual reputations of young women, and the pervasive presence of heterosexuality as an “ideal” and a practice mark out the terrain for the production

of gendered and sexualized identities. Furthermore, such social learning is overt and explicit rather than hidden.

A rich vein of research on gender and schooling has exposed the gender inequalities that exist between young men and women and the implications for school-based policy and practice (e.g., Connell 1987; Lees 1993; Griffin 1985; Kenway and Willis 1998; Gordon et al. 2000). This body of work has the effect of “making visible” the experience of girls within the schooling process and points to the need to account for gender inequalities in school. Gordon et al. (2000) explore issues of inequality as a spatial dynamic as well as an effect of power relations. Their innovative approach to themes of marginalization and participation demonstrates the complexity of gender arrangements and the need for a reformulated notion of “citizenship” to be taken up in schools. Further research has drawn attention to sexuality and particularly the heterosexist structure of school relations by acknowledging gay and lesbian identities in school (e.g., Epstein and Johnson 1998; Mac an Ghaill 1994; Trenchard and Warren 1984; Sears 1992). This literature provides us with valuable insights and ways of understanding gendered and sexual hierarchies in schools. Within sex–gender structures in school, homosexuality may be marginalized and stigmatized through the curriculum, pedagogic practices, and pupil cultures. This literature indicates that sexual identities are not biologically given but are created through institutional and lived practices. Moreover, schools can be seen as sites for the *production* of gendered/sexualized identities rather than agencies that passively reflect dominant power relations. More recent work on masculinities has contributed to the literature on sexuality and gender by exploring the recognition that boys too are gendered subjects, engaged in the struggle for masculine identities both within schools and in social relations more generally (e.g., Connell 1995; Frosh et al. 2002; Mac an Ghaill 1994; Skelton 2001). Mac an Ghaill’s study in particular illustrates the ways in which diverse sexualities can be spoken through the various masculinities young men come to inhabit. Being a lad may involve the cultivation of a hyper-heterosexual identity, while being a “wimp” implies occupying a feminized or asexual identity that may easily translate into being called “gay.” In this sense sexuality underpins the location of young men’s masculinities within the schooling system and can be seen to structure gender arrangements more generally.

The conceptualization of schools as sites for the *production* of gendered/sexualized identities represents a break with earlier approaches that viewed schools as *reproducers* of dominant modes of class, gender, and racial formations (Foucault 1976). The theoretical shift from reproduction to production takes into account Foucaultian insights into relations of power in which social categories are produced in the interplay of culture and power. Power, moreover, is discursively produced, not only as a “top-down” dynamic but is also created locally in sites such as school. Within this framework, school cultures can be seen as active in producing social relations that are contextually specific and productive of social identities. Another concern of contemporary analyses in this field is the uncoupling of sex–gender. In this respect there is a recognition that school policies and practices traditionally treat gender and sexuality as if they are inextricably linked where one bespeaks the other.

The prizing apart of the sex–gender couplet in recent research allows for a more nuanced analysis of masculinities, femininities, and their relationship to sexuality. The growth of work on masculinities has been important in this respect and suggests new ways of looking at schools as productive of sex–gender hierarchies.

Student Sexual Cultures

Drawing upon my ethnographic study (Kehily 2002), this section demonstrates the layers of meaning accessed through ethnographic methods, uncovering both the informal learning that takes place within pupil cultures and the ways in which the PSE curriculum is *received* by pupils. The approach points to the social meanings that pupils ascribe to events and the way these meanings contrast and overlap with sexual learning in formal spaces such as PSE lessons. Barrie Thorne’s (1993) US-based study of gender and schooling relations has commented on the ways in which adolescence can be understood as a period of entry into the institution of heterosexuality. Viewed from the perspective of pupils, adolescent relationships form part of a *sexual economy* where features such as physical attractiveness, desirability, and status are commodified and played out in rituals of dating and dumping (Griffin 1992). Within the arena of these cultural practices, same-sex peer groups play an important part in the mediation of ideas and exchanges which involve the acting out of versions of masculinity and femininity in enactments that rehearse and reiterate a repertoire of teenage dramas.

The following extracts are from a Year 10 PSE lesson requiring pupils to complete a quiz sheet on different forms of contraceptives. I am sitting at a table with five girls—Vicky, Sophie, Naomi, Sara, and Sarah—and Nathan, a boy in the class. Nathan usually sat at a table near the door with a group of boys. However, for this lesson he has moved to sit by Louise who is sitting directly behind Naomi. The reason for Nathan’s change of location becomes clear as the lesson progresses. During the course of the lesson, Nathan asks Naomi a series of questions, verbally and in the form of notes, passed via Louise who appears to be acting as an intermediary:

Vicky: (to me) Naomi is having boy trouble.

Vicky: (to Naomi) You told me earlier that you can’t stand him, what are you sending messages to him for? (in loud authoritative voice) You’re playing with his emotions my dear.

[Girls on table work through the questions in the quiz in fairly haphazard fashion.]

Vicky: (reading) “It is easy to teach yourself to use the natural method.” I don’t know. Can you? True? (reading) “Baby oil is good for lubricating condoms” is it? (reading) “Hormone injections interfere with a woman’s menstrual cycle” Yes they do, don’t they?

- Sophie: (reading) “All male condoms prevent against sexually transmitted diseases”? I don’t know. Is this a test? Do female condoms prevent against sexually transmitted diseases? I don’t know.
- Vicky: I don’t know. I don’t know any of this; we haven’t been taught all this. (reading) “IUDs are ideal for”—IUDs, what’s IUDs? (reading) “Condom splits on you, you can take emergency contraception.” Yeah you can.
- Sophie: Yeah, 72 hours after, up to three days.
- Naomi: Yeah. Louise [unclear message to Nathan].
- Vicky: (to Naomi) So are you going to go out with him? You like him then? Just tell him you don’t wanna go out with him if you don’t wanna go out with him. Oh, (in exasperated tone) I don’t wanna get involved.

This extract makes explicit the two different agendas operating in the classroom: the contraceptive quiz and the dialogue between Naomi and Nathan. Students are engaged and occupied by both activities, though there is seemingly no point of connection between the two. The exchange illustrates how two contrasting approaches to the power–knowledge couplet can be deployed and negotiated within the same educative space. The official classroom task sees sex education in terms of technical knowledge, details of biology, and sexual health to be learned and accumulated, while pupil interactions stress the importance of the experiential and the instrumental role of the peer group in key aspects of social learning. The “dialogue” between Naomi and Nathan indicates that, for them, negotiating the sexual is strongly gendered, entailing engagement with normative sex–gender categories that in turn involve identity work and imperatives to act. In this exchange Nathan appears to be enacting boy-who-wants-girl while Naomi’s responses involve her in a performance of the opposite, girl-being-chased-by-boy. Their “relationship” is mediated by a go-between, Louise, and under the scrutiny of the female peer group. There is a strong sense of Naomi and Nathan’s “business” being public property, requiring discussion and intervention by the girls. This sense of collective ownership and negotiation in relation to male/female relationships contrasts with the construction of sex in PSE classes as “private,” involving two people in matters of personal choice, intimate relations, and medical knowledge. The activities of the peer group demonstrate their agency in the negotiation and regulation of gender-appropriate behavior in school. The role of Vicky, in particular, illustrates the accomplished multitasking of high-status girls as she exposes and monitors Naomi, orchestrates peer group responses, adopts different voices, liaises with me, and remains actively involved while claiming to desire noninvolvement. The activities of the peer group highlight the way sex–gender identities may be shaped by and through social exchanges that offer possibilities for expansion and regulation.

As the lesson proceeds, the two activities continue with the details of the quiz being attended to intermittently, interspersed with dialogue and commentary concerning developments between Naomi and Nathan:

- Vicky: She’s (Naomi) just getting another note. What does it say Sara?
 Sara: It says, “So you want to go out with me in two weeks?” *De De Derrr!*

- Vicky: She's told Nathan she'll go out with him in two weeks. Why d'you say you'll go out with him in two weeks?
- Naomi: 'Cuase Jonathan will be back then.
- Vicky: You're not even going out with him though.
- Naomi: I am!
- Naomi (to me): I like Jonathan you see, but Nathan likes me.
- MJK: So what are you going to do about it? Do you feel that Jonathan isn't so interested in you as you are in him?
- Naomi: Um yeah, that's right.
- Vicky: What's a matter? Why d'you tell him (Nathan) you'd go out with him in two weeks?
- Naomi: I don't want to tell you. It's private.
- Vicky: You tell me everything else [laughs].

Here, the interest in Naomi's affairs comes to a tentative and temporary closure. Naomi's concern to make herself available to Jonathan while holding Nathan in abeyance is a strategy which involves distancing herself from her female peer group while responding in favorable, though noncommittal tones to Nathan's advances. Naomi's actions incur direct disapproval and censorship from Vicky who believes that Naomi has misplaced investments in Jonathan and is deliberating misleading Nathan. For Naomi, in this instance, maintaining girlfriends and having a boyfriend is a difficult balancing act and her discomfort can be seen in terse replies and the retreat into "privacy." In courting femininity and heterosexuality, Naomi finds herself contradictorily positioned as loyal female friend and compliant would-be girlfriend. In such moments, heterosexual relations involve a disruption of same-sex alliances. The management of intimacy within the peer group becomes a highly charged affair in which notes, declarations, explanations, and calls for privacy become symbolic signifiers in the paraphernalia of heterosexual practice.

At the end of the lesson, Naomi told me in more detail that she feared her relationship with Jonathan may be over when he returns from his holiday and she may then consider a relationship with Ryan as he "likes her." She, however, likes Jonathan. Naomi's attempts to exercise control point to the gap between sex education and the "lived" version of sexual relationships within pupil cultures. The "just say no" message of the sex education video and the clinical knowledge of the contraceptive quiz do not address the feelings of desire and vulnerability experienced by young women in the negotiation of femininity and heterosexual relationships. Naomi wants to be recognized as sexually attractive, wants to be "liked" and wants a relationship, preferably with Jonathan. Her desire to be desired places her in the uncomfortable position of being pressured by Nathan and policed by her female peers. As Skeggs (1997) points out, the concern of young women to validate themselves through dynamics of desirability requires the confirmation of men. Over the following weeks, the dalliance between Naomi and Nathan escalated to the point where Naomi's mother came into school to speak to Mrs Evans. Mrs Evans reported to me that Naomi's mother expressed concern about Naomi as she was being "pestered" by Nathan. Apparently, Nathan had been telephoning their house persistently and had also followed Naomi around over the weekend when she went into town with her girlfriends. When Naomi told Nathan she wanted

to spend time with her friends, he threatened to get some other girls to beat her up. Naomi's mother had told Naomi to have nothing to do with Nathan and was worried that the boy had an obsession with her daughter and that Naomi was secretly enjoying the attention. Mrs Evans also added that Nathan was sitting near to Naomi in lessons and had asked to change groups for some subjects in order to be in the same class as Naomi on all occasions. Mrs Evans decided to speak to Nathan and his mother about his behavior and hoped that this intervention would resolve the situation. However, Mrs Evans' comments to me focused upon Naomi's burgeoning sexuality:

Mrs Evans: Last year, you know, she (Naomi) wore her hair scraped back into a ponytail and this year she's got it in tresses all over her face; she's always flicking it back and playing with it and then there's all the makeup and the [*flutters her eyes*].

Mrs Evans also commented that Naomi's mother appears to be very strict, does not allow her to have boyfriends, and is clearly not someone Naomi could talk to about relationships or sexual matters. This example illustrates the ways in which embodied femininity is read in terms of sexuality and thus becomes the object of attention, rather than the behavior of the young male. Naomi's sexualized femininity, expressed through her physical appearance and bodily styles and gestures, is interpreted by adults as worrying and potentially dangerous. Naomi's mother appears to wish to repress and deny the sexual in the strict prohibition of boyfriends and her disapproval of domestic disruption. Mrs Evans' preoccupation with Naomi's appearance rather than Nathan's actions echoes elements of the "she-asked-for-it" argument, popularly employed in commonsense discourses to account for incidents of sexual harassment. Both adults indicate an awareness of the dangers ascribed to female sexuality, particularly the power of sexuality to disrupt the rational educative process (Walkerdine and Lucey 1989; Walkerdine et al. 2001). From the perspective of the adults, Naomi is "playing with fire," promoting her sexuality at the risk of damaging her reputation and her chances of academic success. It is interesting to note that Naomi's behavior incurs recrimination from all of the social spheres she has contact with: Nathan's advances, her peer group's regulatory exclamations, her mother's concern, and her teacher's disapproval. The collective rapprochement of Naomi positions female sexuality as culpable. My field notes, written up after the discussion with Mrs Evans, underline the gendered interpretation of the incident and the encoding of a potentially dangerous female sexuality:

I'm sure that Catrina (Mrs Evans) does feel that Nathan's behavior is a form of harassment but find it strange, in retrospect, that she made hardly any comment on his behavior and focused almost entirely on Naomi. (field notes 25.3.96)

Teacher Cultures and Sexual Learning

To enhance understanding of sexual cultures in the school, I sought to include teacher's accounts. I was interested in the ways they narrated themselves as individuals and professional practitioners. This led me to consider teacher's

biographies and how personal experiences play a significant part in shaping and giving meaning to the pedagogic styles they adopt. I found that approaches to sexualities in school and, particularly, the teaching of sex education can be seen to be informed by this dynamic in significant ways.

School structures and processes indicate that teachers cannot approach issues of sexuality in a decontextualized manner (Kehily and Nayak 1996; Lupton and Tulloch 1996). In matters of sexuality, teachers carry with them a set of associations that are not easily divorced from their other teaching initiatives. The positionality of teachers as instructors/professional educators encourages the deployment of formal teaching methods based on a view of the teacher as holder-of-knowledge. In sex education, however, formal methods may not be so appropriate to teaching and learning. Many researchers have commented on the need for less formal approaches to sexuality education which recognize pupil sexual cultures as a starting point for teaching and learning (Thomson and Scott 1990, 1991; Epstein and Johnson 1998; Holland et al. 1998). As part of such informal techniques, teachers often expect pupils to confide in them, open up areas for discussion, and talk frankly. Such strategies can be viewed by working-class pupils as a particular middle-class mode to be resisted. Attempts to teach sex education using informal methods were not necessarily regarded as successful or welcome from a pupil perspective. Many pupils I spoke with found informal approaches “uncool” and unacceptable and were quick to point out the disjuncture with other areas of the curriculum where they were explicitly told what to do.

Mr Carlton, a Craft, Design and Technology (CDT) teacher with many years of experience at Oakwood, illustrates how the success of sex education programs is contingent upon local factors, particularly the connection between individual teachers and the student body. Mr Carlton expressed his relationship to students as based on a strong working-class regional identity:

Mr Carlton: I’m from here, right, from this part of the world. I grew up in this part of the world, went away and came back and taught here ever since and I’ve never been to another school—which could be a mistake, but the kids here I’ve always managed to relate to and I treat them probably the way their parents treat them and I think that’s what it comes down to. They know that if I tell them something then I tell them from the heart, not from what other people are telling them. I try to always tell them the truth, even if it hurts, you know, tell them the truth.

Mr Carlton’s identification with the pupils is based on his commitment to common bonds of community, class, and location. He suggests that this shared experience forges an emotional connection which enables him to speak to pupils as a parent would, from “the heart.” Mr Carlton’s pedagogic style was passionately pupil centered; he talked about teaching and getting the best out of pupils as part of the same process:

Mr Carlton: If you can't be bothered, you're not going to get anywhere; they're [the kids] the most important thing, they're the raw material that we've got to work with and you've got to work with that raw material, and it's something that I've always done, taken a material and made something out of it whether it be a piece of wood or a piece of metal or a piece of a person; you've got to get the kids to work and enjoy the work that they do.

Here, the terms used by Mr Carlton indicated that he locates his teaching activity within the context of industrial processes and manual labor. The analogy of the workplace resists contemporary notions of professionalism and the language of classroom management. Rather, Mr Carlton's conceptualization of teaching forms a point of continuity with his working-class identity and regional affiliations to an area renowned for its industrial heritage and large manufacturing base. Mr Carlton further suggests that because CDT is about "making things" it is possible to break down symbolic spatial barriers. In his classroom, he explains, there is no desk providing a divide between the two groups; teachers and pupils are involved in the same process of productivity, developing and "making things" out of "raw material". Mr Carlton offers an account which makes direct links between his background and pedagogic practice. Talking about his youth,

Mr Carlton: Not to put too fine a point on it, I was, er, completely and utterly a bastard when I was younger and no female meant anything to me. Now please don't take offense at that (laughs) but I was one of the boys, rugby player, drinking quite a lot, playing the field. And then I met the person I wanted to spend the rest of my life with and her attitudes have rubbed off a lot on me. She made me see that things I was talking about then were not quite right.

MJK: What sort of things?

Mr Carlton: How deep d'you want to go? (laughs) ... My attitude to women was appalling ... she [my partner] always thinks about how what she does effects other people and that's rubbed off on me because before I couldn't give a damn.

Mr Carlton's construction of himself as the rugby-playing, hard-drinking, philandering lad casts the transition to adulthood as a specifically gendered project. Mr Carlton's masculine identity is publicly played out and privately appraised in the intimacy of sexual partnership. "Falling in love" becomes a critical moment biographically, producing a dramatic shift in perspective which encourages reflexivity, especially in gender relations. Mr Carlton suggests that his past provides a point of recognition with boys in the school:

MJK: What would you do if you came across lads who were like you when you were young?

Mr Carlton: I dread it (laughs). No I don't dread it, no, no, um; I think most lads are like what I was when I was young, or I was like them. It's just a

stage of growing up and all I try telling them is there's nothing new; I've done all this. You're not going to shock me by the things that you do because I've done it all and worse 'cos I've got fifteen, twenty years more experience of doing it than you've got. Don't try and pull a fast one . . . and once they see that—I bet most of the people you've spoken to who say they can relate to me are boys.

Indeed, many boys I spoke with at Oakwood did speak warmly of Mr Carlton as “someone you can have a laff with” and “the best teacher in the school.” The dynamics of this relationship can be seen as a style of camaraderie, marked by the privileging of hegemonic forms of masculinity. Many girls in the school also held Mr Carlton in high esteem and sought him out as someone to confide in during moments of crisis. Mr Carlton did have considerable experience of talking with girls who became pregnant, providing support and talking through the implications with young women who sought him out as the first adult to break the news to. It is a measure of his success as a teacher that he was still in touch with many former pupils he has counseled over the years. His pedagogic style and personal biography insist that teacher and pupils occupy the same world through shared identifications of class and locality. This mutual recognition between Mr Carlton and the pupils he taught created the conditions for an affirmative approach to PSE where he has developed his own pedagogic style:

Mr Carlton: Six years ago it started and it (PSE) was awful. It was all bits of paper and it was work sheet, work sheet, work sheet, and I was getting brassed off with handing these work sheets out so I thought, “What's PSE? Who can say what PSE is?” PSE is you and me sitting down talking to each other, getting their ideas out of them and that's what I did.

Mr Carlton described his approach as a highly individualized pedagogy, based on his experiences, which incorporated strategies such as: responding to local events, being provocative, winding people up, and using humor. His ability to communicate with pupils was enhanced by his use of colloquial terms and regional dialect:

Mr Carlton: Accent is an automatic turn off. You get someone who's talking in a southern accent and they [the pupils] don't wanna know. Where, if you call a spade a spade . . . The way I talk to kids sometimes is the way they talk to each other and if that involves using four letter words I use them. If it makes it understood and used in context then, to me, that's not wrong . . . Some teachers here might disapprove of the language but if you've got to explain something and you're talking “a penis,” well to the kids, “a dick” you know. You make people understand through the language.

The glimpse into the biography of a practitioner illustrates how approaches to teaching and learning may be shaped by past experiences as a student and gendered

sexual subjects. Policy interventions stress the importance of getting the policy “right,” supported by curriculum documents which encourage a direct and untroubled translation into practice. My argument, however, is that the success of sex education depends on a contingency of factors which cannot necessarily be accounted for at the level of policy. Mr Carlton, for example, is unlikely to match the selection criteria drawn up in a person specification for the post of sex educator. Rather, his profile as rugby-playing, heavy-drinking lad would place him beyond the bounds of desirability for the teaching of a subject which requires sensitivity and understanding, especially in relation to issues of gender politics. However, the success of Mr Carlton’s approach to sex education and PSE generally indicates that other factors may be in play in the development of “good practice.” Mr Carlton’s identifications as local, working-class, speaker of the regional dialect and part of the community give him a grounding which facilitates the development of positive and mutually affirming pupil–teacher relations. In other words, the qualities, characteristics, and identities valued by the student population become important to the success of pedagogic practice. At Oakwood School, there is an engagement between the local culture of the school and Mr Carlton’s organic approach to teaching and learning. This highlights the importance of context in the development and implementation of policy initiatives and pedagogic strategies while pointing to some of the difficulties involved in specifying a formula for “success.”

Reflections

The examples discussed in this chapter have focused on the school as a site for the production of sexual discourses. In this domain, heterosexuality remains the dominant sexual category invoked and produced by school-based practices. Analysis of the data as a whole suggests versions of heterosexuality can be produced within the school through discursive practices in three areas of school life: the official curriculum, pedagogic practice, and pupil cultures. At the level of the official curriculum, heterosexuality is inscribed in school policy documents as a religious and moral ideal, the preferred form of sexual activity anchored in “family values” and heterosexual coupledness. This view of legitimate sexuality is mediated by pedagogic practice. In sex education lessons at Clarke School, young women become the focus for sexual learning in ways that emphasize the dangers of sexual activity and their ability to exercise “choice.” Considering how sexuality features in pupil cultures adds another layer of meaning to the official school story. As the extract reveals, negotiating the meanings of sex and gender takes place within peer groups and student interactions more generally. In this context, we see that young people make sense of sexuality within their immediate social world and that this form of meaning making may appear far removed from the teaching of sex education. My study supports the findings of other researchers who identify a gap between the teaching of sex education and the “lived” experience of sexuality among pupils in school (Holland et al. 1998; Alldred and Davies 2007; Trudell

1992). Finally, the chapter points to the explanatory power of ethnography as a show-and-tell tool in the observation of school processes. The power of the ethnographic gaze can be pointed in any direction. However, what is “seen” cannot be anticipated or fixed. As this chapter has documented, personal biographies, peer relations, and institutional arrangements provide a lens making sense of gender and sexuality in school. In this respect, sexual learning remains a haphazard affair, produced through informal networks in which the school provides a meeting place for contextually specific encounters and acts of interpretation.

4.2 The “Gay Eye” of a Researcher and a Student in a Hungarian School: Autoethnography as Critical Interpretation of the Subject

György Mészáros

Introduction

Autoethnography as a relatively new methodological approach or genre has spread widely in qualitative research in the last decades. Among other qualitative methodologies, it questions scientific “truths” and “facts” by claiming the inherently biographical nature of research and focusing on the socioculturally situated subject of the researcher (Ellis 2004; Ellis et al. 2011). However, in spite of its spreading use especially in poststructuralist research, autoethnography has received serious critiques because of its subjectivism, methodological uncertainty, and ethically problematic character (Anderson 2006; Atkinson 2006; Tolich 2010; Pace 2012) and for being a self-centered poststructuralist approach that prevents research from contributing to social transformation. This chapter aims at reinforcing the scientific legitimacy and importance of this genre but not by hiding the justifiable problems related to it.

The *textual and research context* of this research study is my PhD dissertation. This school ethnography was completed in 2009, based on an empirical fieldwork in 2007 and was one of the first long-term educational ethnographies in Hungary. The aim of the study was to discover cultural tensions in school, focusing on youth subcultures, following the tradition of critical ethnography (McLaren 1986/1999). During the daily interactions with the students, one of them came out to me. His experience as a gay male student in a high school became part of my research, but I could not publish the results of this part of the study in my dissertation because the student did not allow me to do so at that time. Now, after some years, he permitted me to write about his experience, maintaining his anonymity. In this study, I will

use my dissertation, my field notes, a fieldwork interview with the student along with an interview made during the reinterpretation of the original data (*follow-up interview*).

Though I am a gay researcher, I did not come out to the majority of the participants during my fieldwork and did not include this important part of my identity in the dissertation, either. At that time, I believed that it could be a risky step as a university teacher. Now I am openly gay even in the academia, and I do research on LGBTQ issues, but I understand my fears of some years ago because of the very heteronormative Hungarian sociocultural context. Findings of a recent study (Takács and Szalma 2010) indicate that Hungary is one of countries where the lowest level of social acceptance of gays and lesbians was found in Europe. Several studies (summarized by Takács et al. 2012) underscore that the individual and systemic homophobia permeates Hungarian society, and most of the educational institutions do not seem to fulfill their awareness raising and anti-discrimination education tasks, but rather reinforce the systemic oppression of LGBTQ people (Takács et al. 2008).

This new research study intends to offer an autoethnographic reinterpretation of my original one from a (Eastern European) “*gay eye*.” Its aim is to re-present and reinterpret schooling, the studied school environment from the perspective of a gay researcher, and a gay student situated in the above described context. Through this reinterpretation, the “*gay eye*” itself and so autoethnography as a methodological genre are studied.

Theoretical Framework

Three main theoretical approaches constitute the interpretive framework of my study: critical pedagogy, masculinity studies, and queer theories and the theory about liminality.

Critical pedagogy is a diverse field of educational theories that interprets education, youth, knowledge, and school in their social situatedness and in relation to the dimension of power. Its aims are to critique social injustice and want to contribute to the transformation of society (Freire 1970/2000; McLaren 1986/1999, 1995; Giroux 1993). In the last decade, mainstream critical pedagogy has been criticized by radical, Marxist critical scholars (McLaren and Farahmandpur 2005; Hill 2003) who are concerned about what they judge as prevailing reactionary, postmodernist tendencies. These authors claim that we should return to the concepts of capital, class, and revolution in order to change society not within capitalism, but by overthrowing its exploitative mode of production.

There is a clear shift in this reinterpretation of my original study from a less radical to an explicitly Marxist understanding. There are autobiographical reasons behind this change. The main one is my encounter with Marxist circles that moved me to recognize Marxist theorizing and activism as more coherent ways and more effective tools in terms of social transformation.

Interpreting gender and more specifically masculinities, I use Connell’s theory in this paper (Connell 1995). According to the Australian sociologist, masculinities

represent the position of men in the social order of gender. There are hierarchical relations among them, and a hegemonic masculinity can be described: it is a normative ideal of male behavior.

Studies around schools, gender, and sexualities (Meyer 2010, 2012; Meiners and Quinn 2012) underscore that youth culture is pervaded by sexuality and different forms of sexualization (Attwood and Smith 2011) and that gender and sexuality deeply permeate school life on its different levels. However this presence is not reflected in education. The lack of explicit awareness and teaching engenders silence around sexual behaviors and sexual diversity and creates a non-inclusive and often discriminatory school environment, especially for LGBTQ persons. Schools are fundamentally heteronormative institutions with a very strong normalizing ethos and with a hidden sexuality curriculum (Meyer 2012).

Poststructuralist *queer theory* (Butler 1993) radically questions essentialistic categories of gender and sexuality by underscoring their inherent performativity and unveiling the power dimension behind connected identity categories. Regarding school and education, queer theory or queer pedagogy (Britzman 2000) highlights that heteronormativity is rooted on the one hand in the fixed gender structure and in more general social categories and norms transmitted normatively in education. On the other hand, heteronormativity is also built from an interpretation that considers sexuality private and not political: in educational discourses, sexuality has nothing to do with public education and schools. In this chapter, I will use a Marxist reinterpretation of queer theory (Zavarzadeh et al. 2001; Floyd 2009) that situates it in a historical materialist perspective.

In the chapter, I use Turner’s theory of initiation and his insights on *liminality* (Turner 1969/1995) when trying to find the in-between situations and the in-between, liminal subjects, which question education structures. The concept of liminal subject is very well connected to the notion of Giroux’s border pedagogy. In the context of fluid, culturally “mestizaje” (McLaren 1997a, 2005) identities, according to Giroux (1993), there is a need of identities that are able to cross the borders of ethnicity, culture, social difference, etc. or stand on the border and in the margins, deconstructing the power relations represented by the borders.

Ontology, Epistemology, and Methodology

The educational context of the school, especially its everyday life and its socio-cultural (economic, political, material) dimensions lived by the researcher in communication with the student involved, is in focus in this chapter. It is taken as representing the social situation of gay men in school and has been analyzed from a historical materialist perspective, which thus constitutes an ontological master narrative. However, the research also has an anthropological starting point that takes reality as accessible for us only by interpretations, mainly narratives. The ultimate goal of the research is to contribute to the transformation of homophobic school environments.

The chapter in one way comprises a *narrative* ethnography that pays particular attention to narratives related to the interpretation of personal stories and to sexual minority and education issues. It is also narrative in its style: constructing an interpretive-narrative, challenging, “revolutionary” text. It intends to be an expressionistic writing (Beach 2005) that wants to convince the reader of a subliminal truth.

As for the methodology of the study, I refer to ethnography. By ethnography I do not mean only the empirical research, but rather the whole writing process and the final written text. This genre is characterized by the cultural perspective of the study, the relatively long-term and direct (participative) involvement of the researcher in the life of the research site, the researcher as the main research instrument, and the spiral theoretical–empirical construction of the study (Editorial 2006). My original paper was ethnography according to these criteria, and this paper is also ethnography but as a reinterpretation of the former investigation. In addition, this study has a strong autoethnographic character, too (cf. Ellis 2004). The socioculturally situated “I” of the researcher is in the center of the constructed narrative.

The methods used in the original study (2006–2007) were participant observation (with field notes, FN) and a nonstructured interview (fieldwork interview, INT1) with the gay student. The data collected and analyzed in 2007–2009 are reinterpreted in the present chapter through self-reflection and a nonstructured interview (follow-up interview, INT2) with the gay man. I used NVivo 8 software in the analysis of the data. The “new findings” are constructed in a dialogical way: by a spiral of theory, self-reflection, conversation, theory, self-reflection, and so on.

The Story of an “Alliance”

I started as a stranger and I finished as a kind of friend. This was the opinion of a lot of students at the end of my fieldwork. I was very well accepted by the students from the beginning. They understood that I was a young adult, but certainly not a teacher, so they invited me to go with them to parties or to the nearest pub after school; they even explained their new cheating techniques to me. I gained their trust. And I built up a certain personal connection to everybody in the class (29 students).

My position was particular on different levels. I was a border crosser in the class, because I cultivated a good relationship with the contrasting groups of the class. I was simultaneously a “member” of the circle of the “macho,” homophobic boys and the “gay-friendly girl and boy” group. They were quite hostile towards each other, but they totally accepted my presence and position in both groups. I was a border crosser in the school, because I broke the traditional hierarchical structure of the institution with my presence. I was a liminal subject who did not fit into the usual teacher–student division. That was particularly difficult for the teachers; the students enjoyed this situation. I was not a mediator. I was clearly at the side

of the students, because the aim of the study was discovering their subcultural and school life and raising consciousness about the forms of oppression in the school in order to facilitate possible forms of student agency. I was a border crosser only in the way that I stayed at the border, always at the side of those who were under the power of teachers, without being under that power myself. So I made the border much more visible. However, I was a clearly adult figure for the students. For a lot of them, I became an adult friend: they approached me to ask for help and to share problems that they did not speak to other adults about. I somehow broke even the more general social hierarchy of adults and children.

This special position in the classroom was probably possible because I hid different parts of my identity in the beginning. In order to be able to approach very different people in the class, I did not initially speak about my musical tastes, my past as a Catholic monk, or my current religious views. But I gradually revealed all these dimensions of my life, because I thought that after a certain point they did not really constitute an obstacle in the conversations, and I wanted to share something about my life since they had shared a lot about themselves with me. Regarding my gay identity, which was in its early phase of evolution at that time, the situation was different. I did not dare to come out to the homophobic boys, because I thought it would have had a bad impact on my relationship with them and in this way on my research. I came out only to a few members of the class.

The gay-friendly girls expressed their openness, and they invited me to go with them to a party. István¹ (the gay boy) was in their circle, and he came to the party with us. He began to test me about gay issues to see how tolerant I was. István often looked for my company and wanted to talk to me. We talked a lot about films we liked, and one day while talking about a gay thematic film, he came out to me. I decided to come out to him and then to the girls, too. I constructed a certain alliance with him and partly with the girls, as well. We could speak about gay and lesbian students in school, about our private lives, we met outside school in gay locals. I was a gay young adult figure for him. We felt that in a hostile environment, we could build up another “secret minority environment” with our conversations, allusions, and mutual support. But we had to be careful:

István tells me before the class that he has brought me something. I guess it is the film, and he says yes: *Transamerica* that he has promised. (. . .) He doesn't dare to give it to me; he is waiting for me to enter the classroom: “It is too crowded!” In the meantime, the teacher arrives, so I tell him: in the interval.

(. . .)

I am leaving. . . , István wants to give me the DVD; he is waiting till the crowd disperses. It is interesting that we have to do it in secret, in hiding.

Put it in your bag quickly, because if they see this, they will think we are together.
(FN 14.3.2007)

This episode shows very well the hidden character of our relationship, and István's irrational fear implies an internalized majoritarian interpretation of being gay.

¹ This is a pseudonym for the student in order to preserve his anonymity.

“If you are gay, your relation with any other man is more likely to be interpreted as of sexual nature.” And “if you are gay, you have to be very careful about your gestures with other gays, because they might discover you.” I think this is an internalized heteronormative image that connects gay identity to unilateral interpretation of sexuality: the connection made is that being gay is mainly a sexual (i.e., private) characteristic (Takács et al. 2012).

Our alliance was important for both of us: for István because he found a gay adult in school to whom he could talk and share even the fact that he arrived late because of a passionate morning sex act with his partner and for me because our conversations alleviated the burden of hiding my gay identity. It was not a totally equal relationship: he shared much more of his life than I did. It is very important to note that this alliance was not political, but totally personal and private. In this way, we conformed to the discourses of education on sexuality as only private matter (Britzman 2000). However, at a certain point during the ethnography, I felt that István was attracted to me (he acknowledged that in the follow-up interview). This feeling was not too strong (he had started a relationship with someone), was not at all mutual, and did not seem to affect our basically friendly relationship too much, but this kind of sexual desire was part of the story. It is important to let even these aspects emerge in order to avoid the asexualization of research and education.

School as an Oppressive Environment and Institution

Negative Experiences

From a gay perspective, one of the main characteristics of school is its oppressiveness. It is not István’s explicit interpretation, but it is rooted in his experience told in the two interviews. In the fieldwork interview, he described his actual school environment as a hostile place. After 2 years he changed school, and he had a shocking experience at the very beginning of his life in the new school: a boy was physically attacked in the courtyard of the school because he was gay. In his previous schools, he had not experienced similar violence, so he realized that here he had to be very careful. Although, he had had different and even positive experiences in his previous schools as a gay student, they had not been secure places for István, either. A deeper analysis made by NVivo 8 of the interview text shows that school and gay issues together appear with negative connotations in István’s personal story. *Feeling of difference, strangeness, being targeted, bullying, name-calling, and pretending (playing a role, having a mask)*—these were the terms related to his school experience as a gay man in relation to his classmates. The positive experiences regarding his gay identity were (i) the circle of friends where he could be himself openly and (ii) sexual and love experiences, which were also related very much to the school environment. These positive experiences are not related to István as a student in school, but they are in connection to his *private life* in the school environment, which was mainly lived very *hidden* in the small circle of friends.

Heteronormative and Gender Inculcation

My field notes reinforce this picture of his school. I noted several homophobic occurrences during my fieldwork. They were not direct (name-calling or bullying), but the homophobic classmates spoke a lot in their circles about “faggots”; they told jokes and expressed their negative feelings related to the issue of homosexuality. They sometimes blamed each other for being too gay (like using gay-related expressions). I noted in my field notes the scene that one of them provoked a physical contact with someone else then said: “Oh, please don’t caress me.” This dynamic can be interpreted as a “playing” with difference, dealing with weirdness and/or as part of the continuous conforming to an ideal, hegemonic masculinity (Connell 1995).

These episodes are just part of the bigger picture. From my field notes, it is clear that the interactions among students and the pedagogical processes of the school are characterized by heteronormative and gender inculcation. The possible relationship forms other than the traditional heterosexual ones were not even mentioned, and the traditional gender roles were explicitly and implicitly reinforced by the gestures, ideas, expressions of peers, teachers, and texts and by the structures, images and symbols in the school environment (pictures, only heterosexual love expressed, teachers’ comments on appropriate gender behavior, the separation of male and female sports in PE, etc.). Pedagogy strengthened hegemonic masculinity and indirectly encouraged homophobic attitudes.

As I described in my original study, a certain subcultural, carnivalesque, liminal youth culture and pedagogy challenged the inculcation of the “official” school pedagogy. Regarding queerness and gender, this subcultural resistance only partly questioned normativity. A lot of images, gestures, and texts present in everyday school life reinforced hetero normativity and gender normativity, and only a few manifestations, utterances, and conversations (especially of the emos and of the gay-friendly girls) challenged it. For instance, topics of sexual practices, experiences, attractions, pornography, etc. were very often raised by the students in different ways but always referring to heterosexual practices. István could speak about his sexual experiences only to his closest friends, while his classmates did that “loudly.”

My Experience

As a researcher, I also experienced the hostile and oppressive nature of school environment. It was a different experience from István’s, because I could keep some distance from the school context. It was “just a research site” for me. But the homophobic utterances touched my personal identity and had an impact even on my research:

Then I am approaching the boys. I ask them what they had said to the English teacher before the class. They show me the poetry (Wordsworth’s) in their Hungarian textbook (there are

some poetries in the original language in the book). There is the word “gay.” We clarify that it means “meleg” [the Hungarian PC expression for gay] in the actual English language.

- B: So faggot [“buzi” in Hungarian]
 I: No, this is the nice word in English for that. For “buzi” there is another English word.
 B: What is it?
 I: Faggot.
 B: Ah, faggot, so later on... (he doesn't finish the sentence)
 (FN 31.1.2007)

I remember that this represented a new and complex situation for me: how to react to homophobia as a researcher (in the closet) in the field? I choose the strategy not to intervene directly, not to “educate” the boys, but to have a very neutral, kind of scientific way in explaining the linguistic differences between the terms, also because the teacher had not done that. In another case, I did not stop the boys either, and I wrote in my field notes that I did not want to be normative, as I did not stop them, when they swore with the name of God, despite it having disturbed me a lot, too. Later on, I realized that in this way, I conformed to the heteronormativity of the school context, my “nonnormative” (in reality nonethical) behavior reinforced homophobia, and I was complicit in the school oppression. I intervened later when I heard any rude expression about gays. I think that intervening in this case is necessary, not only from an ethical point of view (Dennis 2009) but from the epistemological perspective of a revolutionary, transformative research, too.

The phenomena of school homophobia affected my research in some fundamental ways—they made me feel as if I dare not come out, and they played a role in my choice to adjust myself to the heteronormative context without questioning it explicitly.

The Role of Teachers and the Institutional Oppression

The boys sometimes raised the issue of homosexuality even in the classroom, and most shockingly for me the teachers never told them that their approach was not acceptable or that they should not have used the word “faggot,” for instance.² In relation to this experience of mine, it is interesting to see how teachers appear in István's narrative. There are only episodes in which the teachers' acceptance appears; otherwise the concepts connected to teachers that emerged from the coding process were *silence, neutrality, inactivity, nonintervention, complicity with homophobic bullying, and complacency*. István expected that teachers would intervene at least when his gay schoolmate was attacked, but they did not. He did not expect that teachers might speak about gay issues, because they are “more old and prude”

² I have to admit that I also had a similar nonintervention reaction in the beginning. Nevertheless I still think that their educational role should have been much clearer. When I had been in the role of teacher in previous locations, I had always intervened.

(INT1). However, with the silence experienced by István and by me too, the teachers contributed to the institutional heteronormative oppression of the school (Takács et al. 2012):

Well, it is possible not to love gays, or hate them, I don't give a shit, but everybody should do it privately. (...) So I wouldn't let such a situation happen. (...) I took it really seriously, if I would be the principal. This is the same kind of racism when someone starts calling names of Gypsies, Chinese, Negros. (INT1)

Oppression is embedded in the social heteronormative, as is gender oppression. In the same sense as in capitalist exploitation, silence reduces and alienates our being (Floyd 2009). It is in the interest of the bourgeois class to keep sexuality and sexual minorities in a normative framework, but giving them some “free space” on the level of consuming and of the satisfaction of private desires. This oppressive, normative discourse is often internalized even by the members of minorities (Freire 1970/2000). It is part of this internalized heteronormativity when violence either simply isn't recognized or when the victim is blamed for the violent attack. As István said:

... to tell the truth, it was his stupidity, too. He spoke out so much about it [that his boyfriend left him]. He shouldn't have. Especially, in such a context. . . Maybe elsewhere he could have spoken out, and he might have cried on the shoulder of a girl, but this is not that school. (INT1)

Considering the hostile context of the school, this opinion can be interpreted not as the representation of internalized heteronormativity, but as the presentation of a logical strategic option in that particular context. Likewise, my choice not to come out during my fieldwork was a strategy in a heteronormative context (cf. later in this paper).

In the follow-up interview, István reinterpreted his school experience. He told me that the situation did not really change after my fieldwork. The same boys continued their homophobic discourses, but he was never attacked directly, verbally by them, and a newcomer straight boy was even very gay friendly. All in all, he evaluated his life in that school as a good experience in terms of his gay identity. He mentioned the indirect verbal jokes of the classmates around gayness, but he said:

I didn't mind them. I take a lot of things seriously. But I never took those jokes seriously. (INT2)

On a personal level, this strategy might seem adaptive because it alleviates the burden of being offended, discriminated, and eventually oppressed. But in the last instance, it does not help point out oppression, nor does it strategically fight against it. Hence, on a personal level, it is just a form of alienation. In the follow-up interview, István acknowledged that the school years were good only because he had created a circle of friends. He used the metaphor of an “*island*.” It was an island in the hostile school environment where he could live without the disturbing outside world. So in reality, it wasn't the school as an institution or István's school experience that were good, but the “life on the island” created in and separated from the heteronormative environment and everyday school life. And again this island was a

private space far from any political struggle. Enclosing political issues in private spaces is a typical hidden strategy of capitalism.

Commodification of Gayness

The power of capital can be traced in several dimensions of István's experience. In both interviews, he mentioned that he had had very different experiences in his previous school than in the one I studied. The other school was an "elite school" where the community of the class was better, and he experienced acceptance of his probably known gay identity by his peers. In the new school, the teachers were much closer to the students; there was a more cheerful atmosphere, but the students were from a different sociocultural environment (they were "bunkó" [a Hungarian slang word for rude, not educated people] according to his expression), and therefore they were not "mature enough" to accept gayness. In addition, according to my field notes, the gay-friendly circle of students implicitly connected their tolerance to their middle-class position and cultural tastes (tolerance and diversity as values, diverse musical tastes, emo and goth style, etc.), while the homophobic boys' behavior and expressions seemed to be related to a more working-class culture (rock and underground hip-hop music, fear of diversity, xenophobia, anti-Semitism). I am aware of the fact that these labels and my labeling here are dangerous, but this division not only rests on my interpretation; it was also expressed in various ways by others as well.

It seems that tolerance and diversity were regarded as a reserved privilege of the middle-class students. Working-class youth were conceived of as immature, unintelligent, and not liberal enough to accept diversity and homosexuality, such that behind this logic lie once again the exploitation of the working class and the commodification of gayness. In the struggle between capital and labor, capital uses all the means to create obstacles to working-class agency. In this case, the conservative working-class ideology, the image of immaturity, and the separation from oppressed minorities that obstructs united activities are all easily identified factors of the oppressive strategy of an exploitative capital.

The commodification of gayness (Zavarzadeh et al. 2001) connects LGBTQ identities to consumerism. As a good consumer, part of the "liberal" free-market-dominated middle-class sociocultural context, an LGBTQ subject can enjoy tolerance, freedom, acceptance, and self-expression. But being gay in this way is just another commodity. From this point of view, and considering teachers' neutrality, and the heteronormativity of textbooks and school environment,³ István's previous high school was as oppressive as his second one, though it subjectively felt more tolerant.

³ With an awareness raising LGBTQ school program, we (with my LGBTQ association) tried to enter this school in 2011, but we did not get the permission.

Border Identities and Liminal Subjects?

Some of the most important questions of this paper are related to our border identity and liminal position in the school context. Two questions emerge. They concern whether we were border identities and liminal subjects as gay men in that environment or not and, if we were, how we exercised that role and position. They relate more generally to how it is possible to be liminal subjects as gays (student and researcher) in a heteronormative context situated in the wider social context of a post-socialist country. To speak about this issue, it is necessary to examine our identities as constructed in the texts of the study.

Our Gay Identities

It is possible to delineate a narrative of the development of our identities by reflecting on our experiences. For István, the time when we met was clearly a period of discovering sexuality and developing relationships. It was a time of self-discovery and self-definition. In the first interview, he spontaneously spoke a lot about his sexual and relationship experiences and about what he had learnt from them. He described and interpreted his position as a “different” student in the different class communities. It was an initiation process of becoming gay. His gay identity was shaped by his experiences and the discourses and conditions around “gayness” in the society and in school. His self-representation as a gay student in school was mainly based on the concept of difference, especially in terms of gender atypicality (wearing rings and colorful outfits, being less “macho,” etc.). He connected his feeling different also to a voluntary attitude of nonconformity, of “don’t give a shit” to others’ opinion. In his self-definition as a gay boy, he adopted a common homonormative discourse that he is not a “faggot” who exhibits himself during gay prides and “fucking around” but a “gay” who wants to live a normal life, like a heterosexual man, but with another man.

It was a period of initiation also for me as a researcher, as a man living on his own, and as a gay man. Some months before my fieldwork, I totally changed my life: I had been a Catholic monk and priest before, but I left the priesthood and the Catholic religious community I had been part of and had started my “civil” life. My radical turn originated partly from the fact that I had accepted my homosexuality, and I had wanted to have a gay life. So that period was an initiation, a learning process of self-definition and discovering. In a certain way, I was on the same level as István, but I reflected much more on my position and social situatedness.

After the school years, István has felt freer and more open according to his narrative in the second interview. He interprets his actual attitude as a continuation of his previous nonconformity approach which could be really accomplished without the normative environment of the high school. While in school “everybody has to conform to a certain degree” (INT2), now, he can be really himself and “not

give a shit about anyone's opinion." However, his rhetoric is contradicted by some elements of his narrative in the follow-up interview, in which conforming is clearly present (for instance, not holding hands of his partner in the streets). His gay identity is interpreted mainly in private terms, and political issues are raised only in relation to his strong fear of right-wing extremism in Hungary.

My gay identity has changed a lot in these 5 years. I have engaged in LGBTQ activism, I am totally open now in every field of my professional and personal life, and I have reflected a lot on my identity. I interpret my gayness much less in terms of a fixed essentialized identity and much more in political terms. In my self-representation, like István, I also use the rhetoric of nonconformity, but I am a bit more reflective on it, and I see how much involuntary conformity is still present in my life. There is another important common element in our narratives: the "after-school" freedom. I know another lesbian ethnographer doing her fieldwork in a school, and her strategic choice was also not to come out. I think I could not be so free about the expression of my identity if I were still doing my fieldwork. And it is a strong question if I could initiate school ethnography now, with my openly gay identity; it was extremely difficult to find a school open to such a research experience even without this issue.

Our gay identity was and is in complex relations with our other identities and with our social position. István wants to be a journalist, but he stopped his college studies. He seemed to struggle with his more lower middle-class roots, being eager to be part of the higher middle class. I finished my PhD; I have a good social position but a very bad economic situation after the crises. We both make a living by selling our labor, and in this sense we can both be considered as part of the working class in a wide sense in Marxist terms.

Revolutionary Resistance?

As a radical intellectual, my actual question should be how much our alliance and our border identities and liminal subjectivities could have represented revolutionary presence or have been the driving power for the transformation of school regarding heteronormativity. Or at least, I should ask how could I have been a more transformative researcher. But at that time my identity, my self-definition, was not like now, and I did not have this radical view of transformation. In this study, I have reconsidered my position and also the two related pivotal concepts: liminality and border identity.

Liminality (Turner 1969/1995) is opposed to normative structures and challenges them, for example, the "unquestionable" structure of private property or the normative order of gender and sexuality related to capitalism. It can be considered effective from a revolutionary perspective if it does not constitute simple discursive or ironic challenging, but brings about real transformation. Liminal phenomena often just reinforce the previous social structure after a period of brief resistance and liminal subjects can be seen as weird and possibly ironic, if also sometimes somewhat

interesting, figures who are part of a given social context without offering any real change to that context.

Border crossing or border pedagogy (Giroux 1993) is more of a cultural practice that engenders the remapping of the order of power. The notion of border identities emphasizes both the historical and cultural formation of the self and its multiplicity. If this concept is connected to political activity and reconnected to class struggle without dissolving the self, it may be still a useful theoretical framework for revolutionary practice.

Of course, border identities and liminal subjects cannot be the driving force of systemically transformational, revolutionary politics on their own without coalitions and alliances. From a radical Marxist point of view, the real transformation of schooling is not possible without deep systemic changes and eventually the abolition of capitalism, but on the road towards the final socialist goal, there are smaller struggles and resistances without the potential to change the whole system but with the promise to challenge it and to unmask everyday oppression. If these actions are strengthening the broader anti-capitalist struggle and not undermining it, they are certainly important also from a socialist perspective. In this way, we could have been forces of resistance as liminal subjects and border identities in the school context, especially if we could construct some alliances with others. But without an openly gay identity, the “voice” is missing, as is the *clear* challenge to heteronormativity. Without representation, in a hidden way, it is not possible to resist, to struggle.

However, in some way, we might have had an impact on that school environment. On the one hand, István in his follow-up interview stated that his gayness was visible and not told but known by everyone in the class, and in this way it was a continuous challenge for the homophobic classmates. On the other hand, I challenged the hegemonic masculinity in the classroom. At the end of my fieldwork, some of the boys told me that I was differently male, but in a positive sense (not aggressive, not macho type, etc.), and also the class teacher underlined the fact that I was among them as a positive *male* adult figure, and in her opinion I had a very positive effect on them. Certainly, my being in a good relationship with István’s circle and with their group was also challenging for them.

Nevertheless, the question still remains if these challenges were really transformative or not. István’s “known” gayness may be reinterpreted as the reinforcement of heteronormative structures in which what is “not normal” can be tolerated, if it is not expressed. Moreover, can an identity closed in a separated “island” be a real challenge to oppressive discourses and to an oppressive system? My masculinity could have had an effect on the boys and on their discourses, but it was more a personal challenge without questioning the system of gender inculcation in school; and most importantly, the boys interpreted my difference not in connection with my different sexual orientation, which was unknown to them, but with my former priesthood, which I revealed towards the end of the fieldwork.

One of the most pressing, specific epistemological questions related to this issue is the hiddenness of the researcher’s gay identity. How can research challenge heteronormativity if it conforms to its order? And is hiding our identity a strategic

choice or complicity with oppression, how much conformation is understandable, and how much is just a contribution to conserving the oppressive structures? Without giving final answers to these important questions, I attempt to outline some elements of a possible response. On the one hand, according to queer Marxist theorists (Morton 2001), the centrality of coming out as the solution to the oppression is a social construction which focuses on a personal choice without considering the subject's social and material conditions and the wider capitalist political and economic context. Deconstructing the centrality of coming out and reflecting on the particular context, not to come out seems to be a rational and strategic choice, at least during the actual fieldwork.

Fighting against heteronormative oppression is possible in a lot of other different ways. On the other hand, the importance of being transparent and authentic in research cannot be denied, and the non-expression of identity might be viewed as the reinforcement of the heteronorm. Similar points and criticisms can be made of researchers who try to critique the capitalist political economy and culture from within a liberal identity. So the researcher might consider revealing their identity at a certain point of the fieldwork or in the end, and it seems desirable that in their writing, they present their identity since it has a certainly strong impact on how they interpret the data. If they cannot contribute directly to the transformation of the research site, they should write a transformative text. As for the more general question around conformity, my paper suggests that the illusion of a voluntaristic nonconformity attitude is to be deconstructed. Conforming is not totally avoidable, and we cannot get rid of our socioeconomic conditions and situatedness. What we can do is to make this conforming visible. With our reflective writing, we can unmask and denounce the exploitative and oppressive processes we conform to, and at least in this way we may contribute to the struggle against them. This has also been the purpose of the present chapter.

Reflections on Autoethnography

Autoethnography is a term used to indicate a “method” or a genre applied in a lot of mainly interpretive and constructionist research studies, but it is very difficult to define it exactly (Ellis 2004). As Ellingson and Ellis (2008) remark, what is called autoethnography depends fundamentally on the author's claim. And there might be a lot of factors that influence the researcher's choice to call their study autoethnography: the popularity of the term (as Ellis 2004 notes it has become the term of choice), the scientific or academic context, publishing practices, and so on.

In the case of the above presented study, originally I used the term ethnographic case study or simply narrative ethnography, and I acknowledged its autoethnographic character. But some of my colleagues interpreted it as an example of autoethnography and it moved my interpretation, too. After studying more deeply the variegated field of autoethnographies, I have applied the term to my

ethnography, and in this text I have re-elaborated it and I am reinterpreting it in this way. This subsequent change is in coherent line with the interpretive nature of the study qualified by the process of continuous reinterpretation.

This choice is rooted in the text and in the process of my writing. My paper is clearly autobiographical, it even alludes to the autobiographical reasons of my theoretical choices, it reflects on my gay self and identity and connects my subject to the sociocultural context, and it also tells the story of the student from my perspective, filtered through my narrative. The text can be interpreted as the story of the student connected to my story and reflected by me as a researcher or rather as my own reinterpreted story in communication and strong connection with the student's.

I think now that the second interpretation is the more appropriate one, as my colleagues also noted, so the term autoethnography is properly used for my research. It is constituted certainly not only by a simple self-reflection but by a communicative, conversational process: my experience as unfolded in the written text is in dialogue with the student's narrative. As Coffey (1999) explains, the dimensions of self and autobiography are deeply involved in every piece of ethnographic research. However, in autoethnography the self is positioned in the center; the “subject” itself is researched always in relation to its contexts and other persons (Ellis 2004; Starr 2010). In this research, I consider autoethnography a genre of writing characterized by personal storytelling and self-reflection as a methodological approach that analyses the socioculturally situated subject with an ethnographic eye.

Nonetheless, employing the term autoethnography has not only professionally justifiable reasons; it is my strategic and political choice, too. Reinterpreting my study as an autoethnography challenges the Hungarian sociological and educational academic context as an arena where the study of the self and reflections over representation, authority, and interpretation are missing. Then, concerning the international audience, with this reinterpretation, I would like to emphasize and strengthen the legitimacy, importance, and usefulness of critically researching the socioculturally situated subject, particularly in relation to LGBTQ issues. I propose that the “I” as the object–subject of research with a focus on its sociocultural (material, economic, historical, political) dimensions can fertilize an effective critical epistemology. The story of the political self might bring new ideas and perspectives even for a common revolutionary practice (cf. ad. es.: McLaren 1997b).

Autoethnography is considered to have its origins in the postmodernist turn or challenge that questions representation, authority, and (scientific) truth in research; and it is mostly linked to poststructuralist approaches that deconstruct “traditional,” “humanist” subjectivities (Ellis et al. 2011). This seems to be the “natural nest” of this approach. In addition, LGBTQ-related autoethnographic texts and some methodological papers (Berry 2007; Adams 2011; Adams and Holman Jones 2007, 2011) suggest that there is a certain inherent connection between autoethnography and poststructuralist queer theory.

My study represents a *critical*, LGBTQ-related autoethnography, taking a certain distance from this “original” tradition, displacing the genre from its nest. This

is not without precedent. Denzin (2003b) in his manifesto-like article and in his book (Denzin 2003a) connects autoethnography to performance ethnography and, in reaction to the proliferation of oppression, outlines a new critical, politically committed qualitative research trend. Starr (2010) underscores the transformative and catalytic force of autoethnography in education because it results in the increased awareness of the researcher, so in their emancipation and through dissemination, it induces also the transformation of the readers and the studied context.

There are several examples of critical autoethnography in education. McLaren (1997b) creates a narrative text reflecting on his ethnographic self as a critically reflexive flâneur. Taylor (2007) engages critical autoethnography as a teacher education method and defines its specificity referring to its emancipatory and transformative character. Similarly, Kahl (2011) and Warren (2011) propose it can help teachers recognize their oppressive practices and discourses. Quicke (2010) reflects on his own story as an educational psychologist, a critical practitioner who resists dominant discourses and constructs a hope-without-illusion story. Spry (2001) interprets autoethnography as dialogical performance reinforcing emancipation and constructs a poetical and theoretical, performative text on her embodied journey as a woman. All these studies can be labeled as critical but in different ways. However, except of McLaren's text (1997b), none of them can be considered as a critical Marxist writing. Moreover, they fundamentally remain in the original epistemological realm of autoethnography. My study, reinterpreted as autoethnography, is an endeavor to demonstrate that autoethnography can be epistemologically positioned in Marxist critical theorizing and Marxist research is rewarded by studying subjectivity in this kind of way.

Contemporary critical Marxist scholars tend to develop more analytical papers on capitalist oppressive social structures and processes and/or activism-related, manifesto-like writings. The shift in style, from ethnographic texts in dialog with postmodern approaches towards more structural analysis and practice-oriented statements, is clearly visible, for example, in Peter McLaren's works. He did not continue his autoethnographic project so well grounded in his cited writing (McLaren 1997b). Among Marxist scholars, there is a certain fear of solipsism, self-centeredness, and narcissism that self-reflective research could convey. Autoethnography, because of its postmodern roots, might be seen as an approach that undermines revolutionary practice by relativizing truth and making the subject fragmented. In addition, while different subjectivities (mestizaje, hybrid, working class) were and are studied by the proponents of critical pedagogy (McLaren and Farahmandpur 2005; McLaren 2005), autoethnography seems to be disregarded by radical Marxist critical educators.

There are deeper philosophical questions behind these problematics. Several valuable works appeared that examine the subject from a Marxist point of view (Althusser 1969; Boudain 1982/2009; Žižek 2009), but it is still a philosophical field to deepen and explore further, considering even the new challenges of post-structuralism and postmodern society. The latter are often considered as threats for the revolutionary committed subject (Heartfield 2006), but I think the sharp-edged antagonism between postmodern and Marxist thought might become more moderate in the future and new ways of conversation might open.

While I am in favor of an explicitly Marxist and radical commitment in research, I hesitate to embrace the strong contraposition of the two approaches, due to autobiographical reasons among others. I cannot see the possible lines of this future dialogue yet, because in this historical moment, gestures of conversation with postmodernism certainly appear to be complicit with reactionary thoughts and praxis. Nor can I situate my ethnography well among Marxist theories of the subject. Nevertheless, with this writing I underscore the importance of the study of the self. In this process, the subject becomes other (object of research), and through this otherness, it can be more reflexive by being more vigilant against its own oppressive practice and self-deceit. Furthermore the “I” is never isolated, it is constituted in relation to others, and it is being itself only through others (Berry 2011; McLaren 1997b). This reflexivity encompassed in autoethnography, and this openness of the self to others is interconnected and crucial for critically engaged educational research. My autoethnography is in a moment of potential and tension. I cannot give answers to the problems mentioned above. My text just aims at showing some possible ways of reflection and reflexivity.

This is an LGBTQ-related critical autoethnography, and it bears another mutual enhancement. Critical theory can be enriched by the LGBTQ perspective, the special queer or gay eye often marginalized and oppressed; and a critical Marxist approach might offer new ways of interpretation of LGBTQ issues. Moreover, autoethnography can give voice to this perspective and can make an oppressed voice louder.

The critical autoethnographic nature of the study allows for an epistemological reflection on this gay eye. According to the idea of epistemological pluralism, the perspective (the “eye”) of a certain group by which reality is inquired can constitute a particular epistemology. This paper seems to strengthen this idea and presents how schooling might be seen from a LGBTQ perspective which is different from other approaches and how a certain “queer or gay knowledge” can be constructed around education. The LGBTQ eye shows heteronormativity and gender inculcation of schooling on the basis of personal experiences; it may privilege the reflection on self-definition and self-development in research, and it repudiates the impersonalization and asexualization of education and of research. However, in this study, the “gay eye” was not the only perspective, and a critical transformative or Marxist approach might be interpreted as an even stronger or inclusively bigger epistemological dimension. Perhaps this paper may best be thought of as an example of a functioning queer Marxist approach.

In this study, I claim that there is a specific Eastern European perspective, too, and together with the LGBTQ eye, they constitute a particular Eastern European gay epistemology. This Eastern European perspective leads me to purposely use the term *gay*, even if it might seem homonormative or not fluid enough for the proponents of queer theory. In our context, queer issues are not familiar, still not rooted enough in LGBTQ activism, so realistically we should utilize a more understandable terminology in order to construct a politically more effective discourse (Connell 2010).

My original goal in this research was to focus on this “gay eye.” This epistemological purpose could be pursued very well using a genre that explores and writes the subject. This was one of the reasons why I stepped on the slippery path of autoethnographic research. Another factor was that since I am gay, part of the studied minority, the reflections evolved naturally in this direction of self-reflection. Moreover, excluding autobiographical, personal dimensions from research or even diminishing these elements for the sake of “objectivity” would have created an obstacle to present the whole picture, so the very “objectivity” and the authenticity of research would be questionable. It would have undermined the resistant, revolutionary character of the study, as well. Eventually, this study is a reinterpretation, and this reflexive reinterpreting is one of the most typical methods used in autoethnography.

The methodological specificity of my paper resides in this self-reflection. I did not use originally autoethnographic field notes (Chang 2008), and although I did use interview and a certain content analysis of the texts, I consider my “main method” the critical reinterpretation of the self, defining my text as a combination of reflexive and native ethnographies with some characteristics of layered accounts that focus on the procedure of research (Ellis et al. 2011). This is certainly problematic on different levels. First, it is difficult to exactly describe this “method,” and the accountability of research might be queried. Then, questions can be raised about methodology from a Marxist perspective. How can this method of self-reflection be considered a critical, Marxist method? Moreover, is there a specific Marxist methodology, and are there Marxist methods or methods used differently by Marxists? To what extent are they different? I do not have an answer to this challenging question. The Marxist specificity might be found more in my way of interpretation and in the concepts I use. But it is certainly a question to be studied in the future even in relation to autoethnography. Regarding accountability, I am not concerned by the objections of other postpositivistic research paradigms (Holt 2003), and I think that *authenticity, rhetorical force, and new ideas generated* (Ellis 2004) strengthen the narrative truth of my writing.

Nevertheless, I see some other problems and pitfalls in my research. First of all, because of the centrality of my subjectivity, I could disregard István’s perspective. Due to organizational reasons, the conversation, part of my study is less strong than I have planned: I have managed to arrange just one follow-up interview with the student. Autoethnography conveys the danger of colonizing other participants involved in the process. The conscious strengthening of the dimension of conversation should help decrease this pitfall. Another problem is related to ethnography as conversation with the audience. According to Berry (2006): “At the heart of autoethnography is the communicative goal to perform as storytellers in creative, evocative, and engaging ways.” I think this evocative nature of my writing is not strong, so might not match one of the criteria of good autoethnography: the aesthetic quality (Ellis 2004; Spry 2001). It was difficult to find a balance between storytelling and analysis. This is partly due to the Marxist approach. How to construct a more understandable and evocative style within the Marxist tradition is always challenging, because it has a quite specific vocabulary and dialectical-analytical style that cannot be totally avoided.

Interpretation

Interpretation is a crucial concept in my research and in this whole chapter. All my efforts at self-reflection and theorizing and my epistemological struggling can be summarized in this term: interpretation. Interpreting is inherently embedded in our human condition and our life; it is a continuous process of searching for meaning. Also science and research might be considered as procedures of interpretation. Certain traditions of social and educational studies claim that theorizing and empirical study; eliciting data and interpreting it; and seeing, collecting, and analyzing (constructing new knowledge) are not different moments in research, but it is a whole complex hermeneutical process always qualified by different ways of interpretation (Denzin 1997). In autoethnography, the two dimensions (i.e., interpretation as human condition and as research) are deeply intertwined blurring the borders of mundane and scientific, literature and science, and theory and praxis. Some opponents of this approach might consider this as a weakness, but I think this is one of the strengths of autoethnography. In this way, it can perform revolutionary research creating convincing transformative narratives of critique, hope, and change. This critical interpretation of the “I” can be really fruitful because it speaks the human language of personal storytelling but at the same time the language of political engagement.

The previous part of this chapter has already treated a lot of hermeneutical considerations. In this conclusive section, I am just summarizing what I mean for critical interpretation of the “I.” I situated (my) autoethnography in the border field of interpretive research. I disapprove of the post-positivistic, analytical concept of science that pretends to be neutral but often unreflectedly serves the interests of oppressive systems. I claim that critical Marxist ethnography should consider itself within or strongly connected to the concept of interpretive research, though its interpretation is necessarily more analytical to a certain extent; and it should maintain its alliance with the trends of this tradition resisting and criticizing post-positivist science. My hermeneutical choice is clear in this study. I intend for interpretation of the “I” a narrative, self-reflecting, relational process that is permeated by values, interests, emotions, and views, not excluding some analytical moments. Therefore, I have resisted taking into consideration the queries around validity from the (mainstream) post-positivist research paradigm. I cannot totally dispense with the poststructuralist approach either. I recognize the textuality of my research, and even if I do not follow a deconstructionist style in my writing, I am aware of the slippery nature of textual meaning giving, and I acknowledge that (re) interpretation and (re)writing are always happening; it is not under my power after the written text is read by others (Culler 1983). While I affirm that in written narratives the “I” itself is given in the text, irrefragable from its textuality, I do not follow the poststructuralist interpretation of the fragmented, dissolved, textually deconstructed subject, because I want to create a transformative, critical narrative. I indubitably feel it to be an ethical and political duty for a critical researcher.

I am convinced that texts can be transformative in this historical moment only if they express an explicitly Marxist critique of the social order and if they transmit

hope or at least make visible the potential of action for radical change. This is the *critical* dimension of (my) interpretation. It means the use of a certain conceptual apparatus of Marxist analysis. Furthermore, it encompasses the interpretation of the self as socioculturally, historically, politically, economically embedded subjectivity in a dialectical tension of situatedness and agency.

This *critical autoethnographic* interpretation of the “I” is very different from the most popular postmodernist one. The subject is decentered, but not in a post-structuralist way. It is the contrary of a narcissistic or solipsistic understanding of the dissolved self without hope and agency how Marxists envision poststructural interpretation of the subject. Critically, the “I” cannot be interpreted per se but rather in relation to others, as part of society, anchored in its context, moreover as a subject *for others*. This is possible if the interpretation is reflexive and dialectical.

My study and this whole chapter hold the tensions of continuous, multiple, and multilayered *reinterpretation* and the burden of the interpretation of interpretation. I have made it quite transparent how I have reinterpreted, and I am reinterpreting my text till the last moment when I hand it in to the readers, and it will be their turn to reinterpret it. This *reflexivity* might sometimes be disturbing, but it supports the openness of the “I” for further auto-evaluation and revision necessary for a decentered, revolutionary, researcher subject; and it guarantees the democratic nature of the narrative always being questionable, reinterpretable. This issue of re-reinterpretation seems to be more connected to a postmodernist tradition, but again I think that it is in total accordance with the critical approach reinforcing democracy, freedom, and justice in science. It has particular importance in a post-socialist context, where Marxist ideas were used as unquestionable “truth” and tool of oppression.

Eventually, I understand my critical interpretation as *dialectical*. It means that the “I” is interpreted in terms of its material conditions, within the capitalist society, related to the modes of production of this society, and in the context of class struggle and that the interpretation has a certain fluid character: inconsistencies, discrepancies, and tensions are embraced opening up to new possibilities (Harvey 2010).

Dialectical self-reflexivity is one of the main characteristics of my interpretation; it makes my writing a carrier of transformation. I hope that I managed to convince the readers about this critical potential; hence, my study may contribute to the emancipation of LGBTQ people especially in education, and this chapter may fecundate further discussion around philosophical, epistemological, and methodological implications of the critical exploration and interpretation of the “I.”

4.3 “Of Time and the City”: Young People’s Ethnographic Accounts of Identity and Urban Experience in Canada

Jo-Anne Dillabough and Philip Gardner

Reporting on the Complexity of Ethnographic Research with Young People: Multiple Sources and Multiple Narratives

Andy: There is a lot of Asian here because this school is by [...] They call us chinks and stuff like that.

JD: Who’s the they? [...] When you say they call us chinks?

Andy: Native people. Yeah, they are like get off our land and stuff. And it’s like, for them, there are too many of you. Then we call them a racist word for Native, jugs, when people get pissed off and when people get mad or when a group beat on one guy. For being racist.

JD: Who beat up who?

Andy: Well then it gets complicated and it’s mixed. . .because some Natives hate racism too! [Andy, Chinese Canadian, aged 14, Vancouver BC]

A key power of narrative, claims Ricoeur, is to ‘provide ourselves with a figure of something’ [...] So doing, we can make present what is absent. [What we are doing is liberating] ourselves from the blind amnesia of the ‘now’ by projecting futures and retrieving pasts. (Kearney 2004, p. 99)

‘Of time and the City’ is taken from the title of Terrance Davies’ photomontage of childhood in Liverpool, UK during and after the Second World War.

Department of Public Welfare: In the event that displaced persons or other immigrants coming to the attention of this department as public charges, such cases are to be immediately reported to the Welfare Services in order that immigration authorities may be given immediate opportunity to arrange for deportation []. Under no circumstance are they eligible for regular assistance, and temporary or emergency assistance can only be issued on the author of the deputy commissioner [City of Toronto Archives, LLP-46: 55.1 copy, 46.21, 39., March 3, 1950].

The above words, some scholarly, some derived from a research interview, and some from archive sources, convey in different ways the power of narrative and the narrative imagination¹ (see Kearney 2004) as a temporally located strategy for making sense of the world. In this respect, the exploration of narrative expressions constitutes a central element of the ethnographer's trade. It also, however, presents a number of methodological and interpretive dilemmas which are not easily resolved. For example, such dilemmas may emerge when a young person is interviewed about, or asked to visualize, their past experience in a neighborhood, the wider city, or family life. For experienced ethnographers, in such cases we learn that young people may often imagine they have little history of their own to tell and know still less about the history of the city in which they live. And this can be true for all of us at some point or another in a particular time and place. It may also be the case that there are young people who have been born into local conditions of loss that have substantially erased patterns of familial or community memory (Skantes 2012).

In this chapter, we argue that narratives expressed by research participants—in this case, young people—always carry residual meanings which operate in the present in re appropriated forms which help to shape their projected futures. It is the ethnographic interpretation of these narratives that will allow us better to understand how particular identity categories may be seen as part of a *larger narrative imagination*. A young person imagining he or she is *Eminem* or seeing themselves as “a Thug” or “a Gina”² constitutes a form of social and cultural meaning which carries residual effects into the present. In exploring such meanings and their effects, we focus on three elements of everyday life—temporality, symbolism, and space—as central to a storied account of research with young people

¹ Here we are able to witness the power of Ricoeur's notion of narratives and their surplus effects in the form of the imagination. Ricoeur suggests that individuals must narrate themselves into a possible world based upon their own historically informed imagination of the future: “what is proposed in the text is the proposing of a world that I might inhabit and into which I might project my own powers” (Kearney 2004, p. 53).

² These subcultural groups will be discussed later in this chapter in the description of the ethnographic study.

living in the present. Our objective is to explore the role of everyday practices—localized memories, youth conflicts, feelings of security, young people’s reactions to new knowledge of an urban landscape, and its past—to uncover what they might tell us about both the contemporary moment and about a time that has long since past (Willis 2000). Alongside the significance accorded to the symbolic and the spatial in ethnographic work, we argue also for the importance of engaging time through the analysis of youth narratives. The importance of the temporal dimension is illustrated by findings emerging from a major cross-national ethnographic research project in which we have participated in different ways across the last decade (see Dillabough 2008; Dillabough and Kennelly 2010; Dillabough et al. 2005; McLeod 2012). As principal project investigator, supported by a team of three project researchers, Dillabough spent over 2 years in research sites in Toronto and Vancouver, as reported in *Lost Youth in the Global City: Class, Culture, and the Urban Imaginary* (see Dillabough and Kennelly 2010). She “hung out” on a regular basis at the local school, shadowing a small sample of students in classrooms and hallways and, in a different guise, undertook two 6 to 12 month periods of action research and team teaching alongside the English and social studies classroom teachers in the schools where the study took place. Away from school, she sought, where possible, to share the activities and experiences of the young people, joining them in the informal learning contexts of their neighborhoods, away from the formal world of the school.

Those with whom we worked in this study comprised two diverse groups of economically disadvantaged and excluded young people living at the fringes of the contemporary global city.³ In working with these young men and women—utilizing a combination of visual and more traditional research methods such as oral histories, open-ended interviews, photo-narratives, media analysis, visual time lines, and documentary and archive analysis—we found that young people’s cultural expressions led us, over and over again, to a striking and poignant recognition: the ways in which they characteristically narrated their experiences in the present were marked by a powerful and pervasive temporal quality. Here, for example, is Cynthia, a 15-year-old “white” working-class “east ender” from Vancouver, Canada, reflecting on the financial challenges she faces. She is speaking of the present, yet her words are captured by symbolic references about single mothers and working-class labor that are grounded in collective memories of the urban past:

I feel like kids should not have to worry about the money [. . .], yet, they’re almost forced to because it impacts them a lot. I always have to worry about my mom’s finances cause she is a *single mother*. I have to support her as much as I can to make sure she is happy because she is the one who has to *bring in all the bacon* [. . .]. At the same time it’s hard. When she comes home she doesn’t want to do any *housework*. I have to do all the *housework*. Extra pressure for me on top of my school work which I should really be concentrating on.

³ We also begin to showcase work on a third case study which was not completed at the time of the Canadian study but is currently underway, in the UK and South Africa, and is supported by the second author. We wish to thank Jaqueline Kennelly for acting as the senior researcher and co-author on “Lost Youth in the Global City” and her valuable methodological insights which have inspired elements of this chapter.

The accounts that we heard from young people such as Cynthia showed us how the effects of time and its passing acted subtly and ceaselessly to transform and to constrain the course of their everyday lives. This recognition prompted an approach asserting neither a critique of liberal humanistic youth narratives which present young people as free and unconstrained actors nor one that proclaimed objectifying, essentialized narratives of young people who are frozen in time (see McNay 2000; Britzman 1995; Skourtes 2012). Rather, the narrative expressions that we heard from our young participants invoked highly complex storied accounts of selfhood in which everyday lived experience and the rhythms of a longer and deeper collective memory were closely entwined.

In consequence, we tried to think differently about the relationship between temporality and ethnographic practice. In so doing, a conceptualization which we found useful, both methodologically and theoretically, was the notion of *narrative identity*, as elaborated in Paul Ricoeur's philosophy (Ricoeur 1991, pp. 73–81; Kearney 1998, p. 17; Clifford 1988). For Ricoeur (1991), the idea of narrative identity comprises “the kind of identity that human beings acquire through the mediation of the narrative function.” Ricoeur (1991) writes:

After a long journey through historical narrative and fictional narrative, I asked [...] whether there was any fundamental experience that could integrate these two major types of narrative. I then formed the hypothesis that the constitution of narrative identity, whether it be that of an individual person or of a historical community, was the sought-after site of this fusion between narrative and fiction. We have an intuitive pre-comprehension of this state of affairs: do not human lives become more readily intelligible when they are interpreted in the light of the stories that people tell about them? And do not these ‘life stories’ themselves become more intelligible when what one applies to them are the narrative models—plots—borrowed from history or fiction (a play or a novel)? (cited in Wood 2004, p. 188).

Ricoeur's emphasis upon narrative and storytelling offered a productive interpretive channel for trying to reach towards an imaginary in which circulating currents of struggle and accommodation, of fantasy and recollection, were gathered together. What this meant was we could begin to confront some of the interpretive issues that linked the world of the past and the world of the present in young people's narratives of identity and exclusion in the “global city”.

Reporting Ethnographic Research Reflexively: Critique, Concepts, and Interpreting Young People's Imagined “Identities”

To contextualize this exploration, this section—guided particularly by the earlier work of Deborah Britzman (1995) and James Clifford (1983)—will briefly consider the handling of ethnographic practice and the problematic of the concept of *identity* in existing educational and social sciences research. This discussion will lead onto a

description of appropriate tools for assessing the use value of the terms “narrative” and “narrative identity” as expressed by young people in storied accounts of selfhood and urban experience. These tools should be seen as linked to what Kearney, following Ricoeur, has referred to as a “social imaginary”: a “body of collective stories, histories and ideologies which informs our modes of socio-political action (and which) is constitutive of our lived reality [...] serv(ing) both an ideological role of identification and a utopian role of disruption” (Kearney 2004, p. 86; also see Sargent 2008). In narrative performance, the ideological dimension pulls one way towards the past, striving to preserve and maintain, while the utopian is animated by alternatives, straining towards a radically different future. Understood in this way, the stories told by young people always constitute something more than their surface presentation. They cannot be approached directly through the application of objective criteria linked to straightforward notions of historical truth or narrative authority. As Somers (1994, p. 606) argues: “one way to avoid the hazards of rigidifying aspects of identity into a misleading categorical entity is to incorporate into the core conception of identity the categorically destabilizing dimensions of time, space and relationality.”

Categorical destabilization of this kind is evident in this story, told by Tony, a 14-year-old Portuguese gangsta boy [also self-identifying as a Thug] from Toronto, who visually portrays his sense of selfhood (as Eminem) and goes on to speak about his hopes for a “real” identity in the future (Fig. 1):

Tony: Most people classify me as a Thug because they call me Slim Shady, you know, Eminem. They mostly classify me as that cause I listen to Rap and all that [and I shaved my head]

[...] But they say I am slowly starting to turn [...] I eventually hope to get out of that, like to be my own self, by next year. [...] Like this year I was trying to impress people by trying to look, like, get all the new fashions but I’ve learned that I have had my fun so next year I will be dressing the way I feel like. Yeah, then [those others], they’ll be on their own [...] If they can’t accept me for who I am [...], then it’s their own fault.

Fig. 1 Tony’s self-portrait (Toronto Case Study), Portuguese Canadian male (aged 14)

In Tony's words we see the imaginative combination of factual and fictive elements in the construction of a workable narrative identity. This narrative expresses a struggle to envisage a selfhood that is rooted in the here and now but which bears within it the prospect of breaking through the constraints of the present to attain a transformed future with new horizons of possibility.

Twenty-First Century Problematics in Ethnographic Research: "Identity" and the Ethnographic Imagination

More than 15 years ago, Deborah Britzman (1995), in an elegant piece of writing on the politics of ethnographic narratives, identified a set of key problematics associated with the practice of writing ethnography. Her key concerns were as follows. In the wake of the cultural turn in anthropology and the social science and humanities, she argued that critical ethnographers were often content to criticize the authority of a social system (as perceived and defined by them). But they were much less disposed to criticize the authority of their own writing or the authority of its meanings as inscribed in the form of academic text. As Clifford (1983; Clifford and Marcus 1986, p. 118) argued, "while ethnographic writing cannot entirely escape the reductionist use of dichotomies and essences, it can at least struggle self-consciously to avoid portraying an abstract, a-historical other."

Following the work of Simon and Dipbo (1986), Clifford (1983), and others, Britzman (1995) went on to argue that there are three key forms of ethnographic authority about which we should be concerned: "the authority of empiricism," the "authority of language," and the authority of "reading." In each case, she sought to delineate the role of authority as manifested in the power of the ethnographer to shape or regulate representations of research participants' imagined identities. Her dominating argument was that ethnographers do not do enough to challenge the humanistic ideal of the universal "identity." Here we must be aware, according to Britzman, that it is not enough to question the language used by participants to define themselves. It is also necessary to assess how the ethnographer seeks to represent participants' conceptions of themselves in order to make the ethnographic story intelligible to their perceived audience (Britzman 1995; Connerton 2008).

Latterly, there have been many attempts to challenge notions of sacred, pitied, or objectified identities in ethnographic research and the kinds of affective reactions which emerge in the reading of such accounts. Clifford Geertz (2000), for example, warned of that sentimentality or pity which may act upon the readers of ethnography when the narrative is represented in terms of an individual's plight or as a "true" account of "culture." According to Geertz, this sentimentality can often lead simply to pity for the research participants, rather than to positive political action. Here, the narratives represent a form of ethnographic commemoration, in the form of highly psychologized "trauma narratives" (see Felman 2001; Simon 2005) to the

degree that “the death of the subject”—the research participant—may be seen really to take place, with lives or identities represented as frozen in time, as that to which Kearney and Taylor (2004) referred as the *sacrificial stranger*. The paradoxical consequence of this is that we must also witness the death of the actor who has played an active part in the making of the narrative itself, a part that has been rendered invisible to the reader of the ethnographic text. Here, then, ethnography may serve to undermine the complex and contested accounts of participants and the hope of eliciting critical and agonistic engagement with the meanings attributed to youth cultures themselves. An example of this misapprehended form of objectification comes from Freddy, a 15-year-old Latino “east end” boy, struggling to be recognized in his own neighborhood. In the passage below, Freddy remarks on the new arrival (a consequence of the project of “urban regeneration” at the fringes of Vancouver’s urban core) of homeless people in his neighborhood. The forms of historical classification that are rendered visible in this example reflect the significance Freddy must place on deploring the newcomers. In declassifying them or misrecognizing them as the symbolically charged foreign and failed other, he simultaneously elevates his own status at the price of demeaning other historically marginalized groups, such as the “bums and mums.” Here, the power of gender and social class in carrying the explanatory weight of the category of the mothers of the homeless is prominent: according to Freddy, the mothers must have done something stupid:

The bums I see, or the *homeless people* I see are like, you look at them and they’re like, “What are you looking at?” *I feel like what the hell is wrong with them.*

Interviewer: Yeah. Yeah. Um. What do you think has happened to them? [. . .] If you were going to speculate on what happened to them, like, what would you say? [. . .]

I don’t know. They didn’t do education or anything. They like dropped out, or their *mum*, they did something stupid. So their *mum* kicked them out or I don’t know. [. . .] *It’s their fault that they’re out there.*

Such expressions of ethnographic authority are also tied up with the empirical element of ethnography (i.e., with the speaking power of the ethnographic text and of the ethnographer), as a form of evidence (Britzman 1995), and with the many challenges to the idea of ethnographic representation as a form of allegory (Clifford and Marcus 1986). Here the “authority of language” and the objective dimensions of the ethnographic text play a dominating role for the reader, leaving us with a realist claim about the essence of participants’ “true identity,” and inviting the charge of exoticising the “other” as an abstraction that does not carry its own history, memory, or story. In this respect, we may simultaneously fail to witness competing or contested interpretations of identity and culture. In reflecting upon this limitation, it may be that despite the advances made in these earlier and innovative debates, we are still struggling to achieve a landscape of narrative imagination within ethnographic practice sufficient to illuminate that “ambiguous, multi-vocal world”—Bakhtin’s “heteroglossia”—that Clifford (1983) urged us towards.

It is important to note that it is not just the narratives that come to matter but also the role of powerful scholarly discourses enforcing academic authority within the

ethnographic narrative itself (Lather 1991, 2007). In recent years only minor attention has been paid to the conceptual elements of narrative and particularly the practice of narrativization as part of a social imaginary—as in the creation of a story—and their role in expressing the wider historical conflicts that touch young people by way of collective memory as well as by their direct human experience.⁴ In consequence, as Kearney and Taylor (2004) observe, “such crucial functions in our social and personal lives as myths, dreams, symbols, metaphors, or social imaginaries like ‘ideology’ and ‘utopia’ are sometimes taken less seriously when assessed against a renewed emphasis on evidence-based research. Concerns about the role of the ethnographer in the framing of meaning systems about youth identity have particularly weighed upon the field of youth studies. In consequence, traditionally configured ethnographies have frequently been under-equipped to trace historical struggle, contestation, or change in the public meanings generated about youth cultural groups across diverse contexts.”

Canguilhem (1989) has referred to the “crisis in representation”—the recognition that interpretation must always fall short of the full comprehension of lived experience and is therefore always incomplete. As such, it has served to radically disrupt the ways in which ethnographers practice their trade and the manner in which they seek to narrate the politics of representation in ethnography. We can now turn to examine other methodological dilemmas which may challenge us to think beyond current and often polarized debates about the representation of young people’s “identity” in educational research.

Ethnographic Imaginaries, “Historical Time,” and Young People: Theoretical Dilemmas and Research “Choices”

Despite the existence of now well-rehearsed arguments about “identity” and representation in ethnographic research, there are other traditions of social theorizing to which we can turn. These traditions help us to look beyond the representation of young people as being ever in need of rescue from the clutches of the ethnographer and instead towards a temporal and spatial narrative of youth experience (see Ricoeur 1981). It is this focus on time—not as the moment of the present but as a broader temporal arc which unites past, present, and future in the moment of the here and now—to which we should turn. Such an appeal is likely to promise the possibility of a deeper understanding of how the reproduction of historical narratives reconfigures the symbolic practices constituting narrativity and

⁴ There are some notable exceptions (too see the work of Roger Simon (2005)). Noteworthy to is that narrative and narrativization are largely defined in educational research as one’s personal narrative. For Ricoeur, narrative has a much wider meaning in that narrativization refers to the idea of expressing a story though an imagined ideal of what we wish the story to be, as a horizon of the possible.

Fig. 2 Time line exercise: future, Portuguese Canadian girl (aged 13)

ethnographic work alike. Here we may invoke the metaphor of interlocutors joining and participating in a conversation that began long before they came to join them (Fig. 2).

A key theoretical concept we have sought to embrace is the notion of distanciation, as developed by Ricoeur (1991, p. 157). Distanciation recognizes that we will always feel estranged from any social text from another time or place, primarily because of our cultural and temporal separation from the original contexts in which it was initially formed and received. Such separation must not however be viewed in a negative light: distanciation is rather “the negative condition for the possibility of new and deeper meanings to emerge” (Smith 1987, p. 211). It is the very recognition of this productive estrangement, and the ceaseless hermeneutic endeavor to overcome it, that allows us to keep the sense of the text from perishing and permits new understandings to emerge. Distanciation thus constitutes the conceptual ground upon which interpretation is always able to operate (Bell 2011). This means that for us, the *story* of being young forms the object of representation rather than the *identity* of the young person. Cavarero (2000, p. 37) writes: “the identity that materializes in a “life story” has no future that is properly of its own if it has no past in the present of its memory” (p. 37).⁵

⁵These storied youth narratives—encoded and recoded in human time—point us towards a sociology of young people which does not use the category of “change” as a fetish and which endeavors to position young people solely as the vehicles of transition, future citizenship, and progress.

The narratives (visual, linguistic, aesthetic, written) which we encountered in our ethnographic research clearly exposed some of the current struggles that the young people we met were navigating in the global city. For example, through the strategy of asking young people to examine, critique, and re-represent historical archival images of young people living in an earlier time, we were able to witness their own affiliations to historical discourses of young people and how they imagined such young people in the present. The image below is one such example we presented to young people in wider discussions about the history of disadvantaged young people living in the “slums” of urban Toronto at the beginning of the twentieth century (Fig. 3).

But such narratives, in visual form, also spoke directly to larger theoretical concerns which identify the shifting moral registers of time and place as they are performed by young actors and which we strived to capture in our ethnographic writing. How have the dilemmas and impasses in youth studies and ethnographic approaches to which we have alluded changed the way we might think of young people’s narratives within the wider theoretical context of ethnographic practice? From our perspective, the ethnographic encounter should help us to reach out for phenomena which may at first glance appear very distant from our own experience. We need to attend to the ways in which young people interpret, narrate, and perform symbolic practices from past time—inherited from others that they themselves are unlikely to have known—as they live out their lives out in the present.

Fig. 3 Department of Health, 326, Rear Williams Street, August 1914, Toronto City Archives (@Permission granted from the Toronto City Archives)

In recognizing that any cultural performance of being young inherits elements of the past, we may hope to confront important theoretical dimensions of narrativity rather than comprehending narrative too narrowly as only ever a methodological approach or an authentic voice. If we see cultural meaning as a representation of the past and the present in discontinuous tensive relation, then our ethnographic approach ought to highlight both the paradoxical modes of representation and the ambivalences and desires which give the symbolic narratives of youth culture their particular currency. As Mabaloc (2005, p. 1) suggests: “Human existence finds at the very core of its being that it is perpetually a way to language. [. . .] it is through language that the responsible human subject is revealed, a subject who speaks and acts in a world that is immersed in constant conflict, a subject who continuously suffers in life but still desires to live.” The human persons in our ethnographic research were young people accounting, in part, for their desire to be, as they understood it in the city. But the young person remains a mystery and must always be reached for and interpreted through the indirect mediations of language, symbols, and history. It is the representation of the “overflowing creativity of language” (see Mabaloc 2005, p. 1) and its consequent surplus of meaning that can be deemed a form of narrativity. The imagined self as an actor in the ethnography is the unraveling of the text into a meaningful story (see also Arendt 1968). Understood in this way, there may be some capacity for the ethnographer to move away from an overemphasis upon questions of whether or not we should “trust” young people’s testimony or even the testimony of the ethnographer. Rather, it is this turn away from scientific “trust” and towards the multiple layers of the ethnographic narrative within a wider interdisciplinary arena where meaningful narratives can most productively be interpreted. The narrative encounters we have described thus far are best understood through the critical tradition of phenomenological hermeneutics, as developed by Ricoeur (1981) and also by Arendt (1968). Both of these thinkers have perceived phenomenology not in foundational terms but as an inherently hermeneutic endeavor (i.e., as operating through an art of interpretation in which explanation and understanding may be brought together), showing us how the appropriations and reinventions of past time—today marked by novel and immensely complex global flows within transnational social formations—serve to animate the performance of cultural identification in the present. As Arendt writes:

to identify an action is to tell the story of its initiation, of its unfolding, of its immersion in a web of relations constituted through the actions and narratives of others. Likewise, the wholeness of the self is constituted through the story of a life (Arendt 1968, p. 150).

In the case of understanding the lives of young people, the hermeneutic task for us then was to tease out the unfolding of stories as constituted through a web of historical and contemporary relations.

To be more specific about the methodological work, we drew strongly upon critical, cultural, and spatial ethnographic practices and upon field observations and semi-structured interviews, as the means through which to seek insights into the daily lives of our research participants. We also sought to understand the role of cultural symbols and narrative representation through visual approaches in producing that surplus of meaning, borne forward from the past, which it is the task of hermeneutics

Fig. 4 Mira Thrives But Mothers Rarely Do. Photo source @Peter Power/Get Stock.com, Image Number 2083215602

to interpret. For example, after investigating the archives at the start of the ethnography, we went on to examine media representations of young women and presented these to our young participants to consider. We also conducted our own analysis of these images. An image which was used in the media critique as part of the ethnography is presented above. Particular excerpts from the media account were analyzed as a way of showcasing the symbolic power of the story and its own representation of female identity. The article was taken from the Toronto Star and was entitled “Mira Thrives but Mothers Rarely Do” (Fig. 4).⁶

The emphasis upon the application and integration of multiple methods helped us to generate an approach that was consistent with our epistemology. In exploring these three dimensions, we sought to move beyond the politics of representing identity and associated paradigmatic debates in ethnographic practice and towards the recognition of a dimension of narrativity that addressed more fundamentally the making of the self through the idea of “social life as storied” (Somers 1994, p. 614), whether these were stories emerging from the official public record or from young people themselves.

The Ethnographic Imagination: Phenomenological Hermeneutics in Practice

How has the theoretical and conceptual approach we have discussed thus far informed, and in turn been informed by, our work and findings in the field? Here, Paul Willis’ thoughtful reflection on the exercise of ethnography comes to mind:

⁶ Mira is not the woman in the image. Mira was a baby found wrapped in a blanket and left on the streets of Toronto in the middle of winter in the late 1990s. The woman in the image is Jazzie and the article which sat alongside this photo was part of a series about homeless women and abandoned babies which arose after the incident involving baby Mira (for a full account of how we assessed these images before taking them into school classrooms for discussion).

[...] There is something rare and special about the symbolic stresses of the common and everyday that ethnography so routinely picks up and records. The fact that these experiences are both repeated and common does not make less of them, or make them any less human defining. They are an essential part of the creative finding of symbolic place and identity, of recognizable time and place in out-of-scale and baffling historical structures. (Willis 2000, p. 6)

Uncovering the complex commerce between “the common and everyday” and the “creative finding of symbolic place and identity of recognizable time and place in out-of-scale and baffling historical structures” neatly summarizes the goal towards which the range of our research methods was directed. These methods were designed to illuminate the three key analytical dimensions we have considered, namely, the symbolic, the temporal, and the spatial (see also Kennelly and Dillabough 2008). Before examining each in turn, the key parameters of the research project itself should be sketched.

At both sites, copious field notes were generated, and these, alongside full and authentic interview transcripts and associated media, journalistic and visual photographic sources, together with oral histories of place (with police officers, social workers, youth workers and long standing community members), comprised a cumulative stock of rich ethnographic data. Young people engaged in photo-narratives of, and interviews about, the city and urban space, self-portraits, and visual representations of temporally inflected educational and professional aspirations: they produced critical accounts based on archival material relating to young people living in the city a century before them; and they undertook mapping exercises, urban walks, and film analyses of young people living on the economic and cultural margins of urban cities in other sites (see Fig. 5).

AS you can see this is what I see every day
to school. Most people on the drive try to sell
weed to me and I always say no. After
a while it gets annoying.

Fig. 5 Photo-narrative taken by Eastside Vancouver participant, Latino-Canadian male (aged 15)

Open-ended individual interviews with the young people in both sites concentrated upon their accounts of schooling and social experiences set within the contexts of local urban space and school life at a time of profound local and global change. At the same time, interview schedules were also oriented towards uncovering that larger social imaginary of which we spoke earlier, illuminating the ways in which everyday experience unfolded against the broader rhythms of urban collective and transnational memory across time. This pattern, as Raphael Samuel has indicated, is a familiar one, “to all those, like field anthropologists and ethnologists, who have studied the storyteller’s arts (finding) that myth and history are not mutually incompatible, but coexist as complementary and sometimes intersecting modes of representing the past” (Samuel 1998, p. 14). As seen in some of the extracts and images already discussed, interview data revealed narrative imaginations composed from a complex amalgam of everyday experience, desires and fears, and currents of collective memory. They revealed, for example, students’ perspectives upon themselves in relation to peers and peer rivalry, to popular culture and cultural identity across the generations, and to the impact of popular culture upon their school experience and their wider sense of security, citizenship, and belonging in the radically changed city. The interviews also illuminated young people’s relationship to local, historically sedimented accounts of social class, citizenship, race, and emergent forms of masculinity and femininity (Fig. 6).

Fig. 6 Youth participant’s perspective on citizenship, Vancouver sample, Chinese Canadian male (aged 14)

All the young people who participated were aged between 13 and 17 and came from a broad range of ethnic backgrounds and cultural and religious identifications. This range varied depending upon the histories of migration and urban biographies of change in each of the cities where the research was conducted. Each participant attended a comparable secondary school at one or other of the two research sites. Many had recent histories of family migration, with large numbers having parents or grandparents who had arrived in Canada in the postwar period with refugee or asylum status. Some were second- and third-generation immigrants, with families and entire villages in some cases having migrated into a single neighborhood (chain migration) as specialized laborers at the turn of the twentieth century. A minority of participants came from white or Aboriginal backgrounds, and a further group originated from communities of Eastern European migration.

One factor unifying almost all participants was their social location and historical positioning as either “working class,” “economically disadvantaged” or “working poor,” living at the edge of the urban core of an affluent “world-class” city. Like their own parents before them, parents of participants held occupations such as taxi drivers, babysitters, cleaners, factory workers, fish farmers, construction workers, or agricultural laborers. Many parents held multiple part-time or seasonal jobs, and often youth participants were expected to care for younger children at home while parents worked. In both sites, students habitually referred to their schools and neighborhoods as a “ghetto,” as a “warehouse,” or as a “slum” for “poor kids.” We now turn to offer some further examples of how we sought to capture dimensions of time and space in our ethnographic and historical work with young people and other social actors.

Capturing the Symbolic in Ethnographic Practice

I am convinced that we must think, not behind the symbols, but starting from symbols [. . .]
In short, the symbol gives rise to thought. (Ricoeur 1981, p. 6)

Our understanding of the realities faced by the young people at our two sites turned upon the power of the symbol as a key point of mediation for understanding the narratives they related about their young lives. Symbols also constituted a powerful focus for recognizing the ways in which narratives of the present can give way to knowledge of the past. We found that symbols were expressed in highly diverse ways—through the social narratives of semi-structured interviews, through oral histories, through visual images generated by both local media and the young people themselves,⁷ and through the operation of a wider symbolic order associated with common perceptions of marginalized young people and youth cultures in the contemporary neoliberal era. Below we provide a brief extract from an oral history

⁷Rose (2007) tells us that making images as a way of answering a research question is relatively rare but is crucial in understanding social differences and of visualizing these differences as a form of cultural expression.

interview taken from a local youth community worker who had lived in the abridging neighborhood in Vancouver BC, where we undertook our study:

This neighbourhood has always been vilified. Young people, and particularly young women, are seen here as going nowhere and that started after the 60's when canning industries shut down and single night dwellings and cheap pubs were introduced. The municipality did nothing to stop it because the drug business took over and many of the police used young people to further facilitate their trade. (Oral History Interview, Youth Community Worker, Vancouver, BC)

The sources upon which we drew allowed us to access not only young people's wider symbolic worlds but oral history accounts of how such views had developed over time in relation to an already existing system of moral classification about young people.

Until the relatively recent surge in visual methods in the sociology of education (at least in the postwar period and until the early 1990s), sociologists of education remained largely preoccupied with charting narratives of exclusion almost exclusively through the means of language,⁸ whether written or spoken, or through policy studies, often underexploiting the power of the image to illuminate the social life world. The text or the spoken word of course constitutes a central resource for ethnographic research with youth people, as long as we recognize that it may be rendered, in Arendt's terms, banal and paralyzing if it cannot move us beyond the idea that youth exclusion is merely or solely a case of trauma. Rather, it must also be linked to our understandings of historicity and to ethnographic research as addressed, conducted, and expressed within the terms of a symbolic temporality. As Fyfe and Law (1988, p. 1) suggest:

to understand a visualization is . . . to enquire into its provenance and into the social work that it does. It is to note its principles of inclusion and exclusion, to detect the roles that it makes available, to understand the ways in which they are distributed, and to decode the hierarchies and differences that it naturalizes.

To access the residual symbolic traces associated with young people's experiences of urban and social exclusion, of being "warehoused" in failing schools and neighborhoods, and of the enduring epithets associated with contemporary moral panics about terrorism and migration, we made use of a variety of focused exercises. An emphasis on the making of visual culture, as well as young people's reflections upon it, helped us to access the symbolically mediated meanings they attributed to social class and security, together with reflections on their own aspirations and expectations for the future. These visual projects generated novel symbolic images that often represented more temporally complex, ambivalent, and contradictory elements of young people's experiences of the social world than they expressed through the more immediately constraining context of conventional spoken interviews, which are exemplified in Fig. 7. Indeed, in a similar manner to that described by Hall (1997), we were able to witness those modes of

⁸ Noteworthy exceptions to this were the visual sociologists from the early subcultural studies tradition developed primarily at the Centre for Contemporary Cultural Studies at the University of Birmingham, founded by Richard Hoggart in 1964.

Fig. 7 Visual self-portraits of past, present, and future, Toronto sample, Canadian Philipino female (aged 14)

ambivalent knowing that young people expressed about the changing nature of the city, their place, and future within it. We also gained insights into the ways in which they understood space as a border zone of alterities of the familiar and the strange, the citizen and the other, and as a space of classification and scapegoating. This also included ways in which youth identities were “orientalized” in particular times and spaces (see Fig. 7, for example).

Participants were also invited to devise captions for media and archival images of child and youth economic disadvantage. Each of these strategies generated valuable data sources in their own right, as well as serving to deepen the spiral of active reflection within the interview context. These approaches highlighted the tensions between the interpretation of young people from what Ricoeur identifies as an archaic time—a distant and unfamiliar time—and the time of the now as expressed by young people’s place in the urban landscape of the present, allowing us to assess the power of visual symbols to render the significance of the past for the everyday lives of these young people.

Capturing the Temporal in Ethnographic Practice

Every image of the past that is not recognized by the present as one of its own threatens to disappear irretrievably. (Benjamin 1968, p. 255)

A particularly important and productive visual technique for this research proved to be the use of local historical archival images, specifically images of low-income young urban dwellers in different temporal periods. These were

powerful and evocative resources in the hands of our participants, for whom the images were characteristically a mixture of the alien and distant but also the familiar and near. In working with these photographs, it became apparent that any ethnography which posed questions only about the present threatened to compromise the “art of seeing” within and across time, pointing up the absence of a historical dimension from existing ethnographies about young people. What seemed absent or lost in this respect was a methodological engagement with the role of a *historical sensibility* (see Tinker and Jackson 2011) in the making of contemporary representations of young people, particularly as inspired by vivid photographic and media images and their accompanying textual accounts. Previous work by youth ethnographers has considered the importance of history in partially framing the nature of young people in the present (Cohen 1997), as has the work of some feminist historians and historical sociologists before the second half of the twentieth century. But, with few exceptions (see, e.g., McLeod and Yates 2006), sociological research, particularly after World War II, has seemed largely oblivious to history (see Dillabough et al. 2010), concentrating instead on the present as a discrete and defining temporal frame.

In response, we undertook preliminary archival research in each urban site where contemporary ethnographic data pertaining to young people were collected. Through this process, we came across many striking visual and documentary sources from the public record representing young people across the course of the twentieth century. How could we draw upon these images most productively in the field? How might we find ways to use such images as both a historical and a contemporary resource that would illuminate the lives and contemporary social circumstances of today’s deprived and excluded young people? How might these images provide us with some understanding of the narrative imaginations of young people as they operated in the space between myth and history?

We viewed the symbols young people drew upon and referenced in their narrative accounts and visual work—just as we viewed the photographic images from the archive—in terms of the double meaning of symbolic understanding, not only speaking to their lives in the present but also to a past which would otherwise have been elusive to both us and them. We sought to capture, as far as was possible, an understanding of the operation of moral regulation through a series of hermeneutic encounters with the material traces—visual and temporal—from now absent pasts which were at once familiar in the immediacy of their symbolic power and strange in their manifest temporal distance.

To take these encounters further, we asked participants to create their own images and symbols to stand for the present moment, specifically in the light of their engagement with the historical representations we had gathered. We particularly asked our young participants to reflect upon these urban images from a past long-lost but still recognizable, to consider the once-young people they portrayed, and to comment upon the manner of their visual representations. We solicited their thoughts on why young people from a different and very unfamiliar temporal moment appeared, as were they, to be living in organized sites of urban economic disadvantage and how this fact spoke to their own circumstances in the present. Participants were invited to write captions and fuller storied accounts relating to the archival

photographs upon which they were able to gaze and to use these to stimulate discussion about aspects of change and permanence in their cities and neighborhoods in the absent past and the familiar present. The results of these activities required us to think more seriously as methodologists about “the problematic of the representation of the past [and the present]” (Ricoeur 2004, p. xvi). Here we came to see the formal historical record as not only as the “archiving of a social practice,” but also as involving a methodological approach which could assist us in taking an analytical detour away from late twentieth-century emphases upon the question of whether “identity” constitutes a discursive or a realist phenomenon. Instead, we were able to move towards a deeper understanding of how the sedimentation and reproduction of, for example, historically grounded classed and gendered narratives of youth identity could be seen to play a part in sustaining such forms of ontological sedimentation (Ricoeur 2004, p. 220) (Fig. 8).

In contrast to the persistence of seductive myths of benevolence within critical ethnography about the nature and import of the relationship with research participants, it is important to strive for some analytical and methodological distance. Historical sensibility (see Tinker and Jackson 2011) can come only with temporal distance from our own analytical authority and, in our particular case, from images of young people in the city, as they were offered to us as part of the research process. Moving beyond the impasses associated with the polarized

Fig. 8 Slum interior, October 1913 (Source: Series 372, Subseries 32, Item 26. @Permission Granted by the City of Toronto Archives)

debates about the critique of the essentialized youth identity, and towards a reminder of a once-present past as a form of social narration within methodological practice, obliged us to work towards such distancing. This also took us towards Kearney's poetics of imagination—either biographical or dramatic—showing us that young people are both actors and sufferers who are always held within moral interpretations and temporal locations, but who are never finally cut off from the meaningful presence of those others without whom they could not themselves have existed.

What this demands of us is to draw on historical sources in more expansive ways, to engage them not only analytically but also dynamically in the service of deepening the temporal dimension of our work. As suggested in Dillabough and Kennelly (2010, p. 64), “we need to find ways – to take the case of the sources we found within the archives – of inscribing images and meanings from the past more explicitly within ethnographies of the present. This necessitated the development of strategies which [. . .] allowed both participants and researchers to respond directly to evocations of young lives speaking from a different time and place, but also from a spatial setting which was immediately familiar.” Here, the goal was to utilize images systematically to open a space within the narrative for a sustained temporal and generational dimension of public understanding of young lives in urban contexts, in which the research dialogue could be stretched across time as well as within place. In this case, engaging our connection to others living in the same city in past time through research practices was a necessary hermeneutic strategy for rethinking the present. A representative example of an archival source we discussed with young people is presented below:

Memorandum To:

Municipal Clerks, Municipal Relief Administrator, Provincial Relief Inspectors, Letter Dated: Toronto, June 10th, 1940. Re: Enemy Aliens in Receipt of Relief

Non-Naturalized Italians or their dependents in receipt of relief no longer herewith receive provincial contribution

Re: “Agitators” or Sympathizers in Receipt of Relief: Some foreign born relief recipients now naturalized still retain considerable sympathy for the cause of the enemy at war with His Majesty the King. It is imperative that all municipalities scan their remaining relief rolls carefully and track down any subversive statements of sympathies which are detrimental to the Allied Cause. . . . Until further notice any relief assistance continued to proven agitators or sympathizers is a matter entirely at the discretion of the local authorities. [retrieved from Toronto City Archives, Ontario, Unemployment Relief Branch: Department of Public Welfare, June, 1940].

The Spatial

Space is never empty: it always embodies meaning.

Where there is space there is being (Lefebvre 1991, p. 22)

Within each research site (Toronto and Vancouver), several months were spent prior to embarking on fieldwork, gathering contextual data from archives,

Fig. 9 Interior January 20, 1911 (Source: City of Toronto Archives, Series 372, Subseries 32, Item 10)

government and policy documents, and local written sources about the neighborhoods in question (Fig. 9). Such contextualization was essential for an ethnographic approach that understands both history and the local conditions that have shaped contemporary neighborhoods as essential elements of the imagined realities of lived experience in the present (Bourdieu and Waquant 1992; see also Miller and Rose 2008). This is a strategy that is also important for understanding the role of space in shaping young people’s understandings of identity not only symbolically or temporally but as a set of social relations (Massey 1994). A spatial account was germane to the questions and concerns that drove the research because, as feminist geographer Doreen Massey succinctly suggests, “the social relations of space are experienced differently, and variously interpreted, by those holding different positions as part of it” (1994, p. 3). Massey’s emphasis on the interpretations of space afforded a valuable complement to the hermeneutic emphasis on the interpretation of historical traces that marked the temporal dimension of the research.

Both of the sites in which we worked had been home to working-class communities since at least the nineteenth century; both had been disproportionately affected by the forces of deindustrialization and reorganization of labor that have taken place since the rapid onset of neoliberal policy regimes and practices which were then particular to the Canadian context. Each neighborhood had likewise been the site for housing waves of migrants seeking respite from poor economic and social prospects in their countries of birth, as well as being a target for accompanying moral panics and public attention directed to perceptions of class abjection and supposedly increased criminality and/or deviancy. Each site also rested at the

edge of the urban core and had been increasingly subjected to re-zoning policies and development resulting in substantial gentrification and the associated rise in housing costs that typically accompanies this trend.

We accessed young people's experiences of the spatial through the means of project-based approaches that brought to the forefront participants' encounters with, and imaginaries of, the spaces and places through which they passed each and every day. For example, participants were supplied with disposable cameras and asked to take photographs of the "places" where they spend the most time. We developed the photos and returned them to participants so that they could organize them into booklets that would include a narrative description of the photos and an account of life both for them and for imagined others in the city. This method generated a vast range of images, including local parks, housing projects, streets, public transport, apartment complexes, and stores, with associated narratives that described the significance of particular sites to participants. Figure 10 is an example of a photo-narrative produced by a young female asylum seeker from the Congo and aged 15.

This method allowed us important insights into participants' experiences of inclusion and exclusion within local spaces that were both demonized and valorized and also gave us a clear sense of where young people perceived the lines between each to be drawn. Our spatial approach to youth research methodologies was thus highly dependent on the phenomenological and hermeneutic appropriation of the centrality of symbolic meanings for young people in local spaces and what these images could reveal about young people's experiences of urban transformations, moral regulation, and their own everyday encounters with spatial structures of inequality.

Fig. 10 Photo-narrative of familiar city environments, African-Canadian female (aged 15)

Conclusion: Towards a Symbolic–Temporal–Spatial Ethnography of Contemporary Youth Cultures

This chapter has sought to describe the principal theoretical and methodological problems and approaches which we encountered and sought to address in the design and implementation of a large-scale, comparative ethnography centered upon some of the many disadvantaged and excluded young people who existed at the fringes of the Canadian cities of Toronto and Vancouver, Canada—a population that we see replicated in many other cities throughout the west, albeit in different configurations. We had hoped that any potential strength in our ethnographic approach lay in its sustained attempt to address the importance of the temporal dimension for the everyday lives of these young urban dwellers, alongside a more familiar concern to trace the symbolic and spatial elements shaping their daily existence. Though these three dimensions are analytically separable, we found that in practice they constituted a tightly entwined set of conceptual fields which could be drawn upon conjointly to better understand how compelling youth narratives were fashioned, modified, and maintained by our participants.

In terms of the strengths which the incorporation of a temporal approach brought to the study, the intimate—if often unregarded—relation between past and present was powerfully in evidence. It was founded upon the ways in which an absent past is always available for representation to the current moment in the form of its material traces, visual and textual, and in its residual persistence in the present as memory, both individual and collective. A central conceptual device for the research, uniting both history and memory as well as the social and the personal, was the notion of narrative identity, whereby an individual self or a social institution generates a sustaining awareness of time and its passing, in which elements of truth and fiction, of past and present, and of ideology and utopia are held together. In this way narrative or storied identity unites elements of permanence and persistence with the recognition of constant change and adjustment. Narrative identity is a concept that is particularly amenable to the hermeneutic approach that we have followed in this work, with traces from the past constantly open to interpretation in the present but, by virtue of the fact that historical traces always rest upon a once real present, not open to any and all interpretation. The past is never helpless in the face of the present and not all interpretations are equally valid; some repay the debt of the present to the past more and more authentically and ethically than others. No interpretation is, however, final, because the meaning of a text can never be fully apparent to this or that generation of a readership that is, in historical terms, limitless. But as we observed our young participants and other social actors (e.g., longstanding community member’s oral history accounts), working with the traces of their own local pasts, our study brought home to us how the past not only endures in shaping both our experience and our understanding of the present, but also

(continued)

the closer its embrace becomes, the more our grasp on the future strengthens in the same degree. In recognizing that actions, like texts, are open to hermeneutic reading, we see that the spatial and symbolic dimensions of our study share with the temporal the capacity for illuminating the often masked relationship between social class, urban space, and reconfigured youth cultures as they have been experienced, examined, and lived out in the inner-city settings of the ever-changing global city.

4.4 Interpreting Visual (and Verbal) Data: Teenagers' Views on Belonging to a Language Minority Group in Finland

Gunilla Holm, Monica Londen, and Jan-Erik Mansikka

Introduction

This chapter is focused on photography as a research method and on the interpretations of photographs in ethnographic research. There are two types of image-based research, namely, moving images and still images. There are also several different kinds of still images besides photographs such as drawings and cartoons. The case we have chosen in order to examine the use of photography in ethnographic research is an example of participatory photography where the participants have taken the photos. We have chosen to work with photos taken by the participants since it is their construction of their own identifications that is in focus in our study (see also Davies 2007). Pink (2007) lists several other ways of using photography in research such as photography as a recording device, collaborative photography, participants photographing the ethnographer, interviewing with photographs, and interviewing with participants' photograph collections. Many of the issues explored here with regard to participatory photography pertain as well to other ways of using photography in ethnographic research.

Society is becoming more visual with, for example, increasing advertisement and photographs on social media like Facebook and Instagram. Mirzoeff (2009) estimates that over 478 billion photos were taken with mobile phones in 2008. Photography has been used in research for a long time in anthropology and sociology. Mead and Bateson used photographs extensively already in the 1940s,

but film has been a more common way of visually communicating anthropological research (Hockings 2003; Banks 2000). In sociology photography was popular in the 1960s but has been seen as too subjective for most sociologists (Grady 2001; Harper 2000). Overall photography and visual research methods are slowly moving from the margins towards the center in educational research. In the last few years, numerous books on visual research methods have been published (e.g., Banks 2007; Mitchell 2011; Pink 2007, 2012; Rose 2012; Stanczak 2007), and it is more common for published articles and book chapters to contain photographs (e.g., Clark-Ibanez 2004; Cremin et al. 2011). Most of the literature is focused on how to use photography in research, but not much literature focus on the interpretation of photographs, which is the focus of this chapter. Therefore this chapter is built around our example of visual research since visual research requires being seen or experienced more so than described in order to be understood. We have chosen a very recent study of ours as the case to exemplify interpretation of photographs in ethnographic research.

The case is focused on Swedish-speaking lower secondary students in Finland. Finland is officially a bilingual country with Finnish and Swedish as national languages. This is due to that Finland was part of Sweden for hundreds of years up till 1809. The Swedish-speaking minority is numerically a small group but fairly well protected in the constitution. There is a parallel Swedish-speaking school system. The climate towards language and ethnic minorities in Finland has become quite hostile during the last few years, partially due to a new conservative party. The party has, among other things, called for the abolishment of Swedish as a compulsory language in Finnish schools even though the country is officially bilingual (see, e.g., Salo 2012). Against this background the purpose of this study is to explore how Finland-Swedish students position themselves with regard to belonging to the Finland-Swedish group by using photography as well as interviews as data collection methods. In particular we were interested in exploring what kinds of data we would receive by using only photography as the data gathering method in comparison to using photo-elicitation interviews or only interviews. We are exploring the role of the researchers' own identifications and sense of belonging as well as habitus in the interpretation of data about participants belonging to the same language minority group and presumably having a similar language minority identification.

Framework for a Visual Method Study

Traditionally photographs were seen as presenting the truth or the true reality, but as Rose (2005) points out photographs are only interpretations. They are the photographer's interpretations of the world. The interpretation of the photograph is always dependent on the photographer (and maybe the persons posing if the photograph is of people), the researcher, and the viewer. The researcher decides on the theme or subject and through his or her interpretation of them decides whether to include them in the reporting. The researcher might also be the photographer, but otherwise

the photographer interprets the researcher's directives and photographs his or her interpretation of what he or she sees. The viewer might be steered in a particular direction through the context as well as the titles of the research and the photograph itself, but ultimately the interpretation is up to the viewer. The approach with the participants taking the photo equalizes the power in the study to some extent in the sense that the participant decides on the specific subject/topic of the photograph within the context given by the researcher. The photo then becomes a production of how the participants/photographers see or want to see themselves and their more factual position in a societal relationship (Gibson 2005; Bourdieu 1998; Holm 1997). It is important though to be aware of the researcher's influence on the photographs even when they are taken by the participants. The photographs are taken for the purpose of the research, and the researcher's instructions and guidance influence the photos.

There are many different ways of analyzing photographs (see Holm [forthcoming](#); Rose 2012; Margolis and Pauwels 2011), but in the case described in this chapter, we have taken an ethnographic approach to the analysis of visual images. The visual data complement and interact with other kinds of data. The different kinds of data do not represent the same thing from different perspectives but are different kinds of data. In her book *Doing Visual Ethnography* (2007, p. 119), Pink states that "the purpose of analysis is not to translate visual evidence into verbal knowledge, but to explore the relationship between visual and other (including verbal) knowledge." She sees a more open ethnographic approach as being more fruitful where the photographs' ambiguity and expressiveness can be fully used instead of trying to force the photographs into more "objective" forms. Pink (2001) suggests that "(t)his subsequently opens a space for visual images in ethnographic representation. . .In practice, this implies an analytical process of making meaningful links between different research experiences and materials such as photography, video, field diaries, more formal ethnographic writing, local written and visual texts, visual and other objects. These different media represent different types of knowledge that may be understood in relation to one another" (p. 96).

Rose (2005) is also arguing for acknowledging "that visual images can be powerful and seductive in their own right" (p. 10). However, Holm's (2008a, b) research shows the difficulties in interpreting photographs without any text or complementary data since certain things like absence are difficult to express in photographs. In addition, photos with symbolic meanings can easily be misinterpreted without complementary data. Therefore we have, in the study described here, asked the participants to write a short text describing each photograph or to give a title to each photograph. In addition, we have conducted interviews with the participants.

Since we are interested in the students' deep-seated and taken-for-granted notions of their linguistic identifications, we are exploring their habitus by also using photographs. Bourdieu argues that it is not possible to make the habitus explicit, to verbalize it, since it is "beyond the grasp of consciousness" (Bourdieu 1977, p. 94). However, both Bourdieu (1990a, b) and Sweetman (2009) see the use of photography as a means to research abstract aspects like habitus. Bourdieu further states that when there is a lack of fit between the habitus and the field, the habitus is brought to the forefront. This is relevant for our case where students have difficulties in the interviews articulating their belonging to the language minority

group in the school context (or the field) that supports the minority habitus, while the habitus is more clearly brought to the surface in cases of, for example, harassment outside of school in a context/field that is majority Finnish. In this study we are interested in their individual identifications as Finland-Swedes and also in their descriptions of the collective Finland-Swedish group habitus (see Bourdieu 1990a; Broady 1990). An interesting question is whether the habitus of bilingual and monolingual students differ. What is the influence of developing a different linguistic capital and of a different social capital on the students' identifications with the group and sense of belonging (Bourdieu 1993, 1986)? One of the tasks of the school as a language minority school is, according to the national curriculum, to maintain and support the Swedish heritage and language (Finnish National Board of Education 2004). The school's task is to further the cultural identifications and Finland-Swedish habitus of the school. The dispositions constituting the Finland-Swedish habitus seem to have changed over time as the student population has become more multilingual.

Against this background we have used Yuval-Davis' concept of belonging to interpret the students' photos as well as the interviews (2010). Being a member of a language minority often creates a sense of belonging. Minority language speakers tend to have a sense of connection, of a community, or a collective identity. Especially if the members/speakers feel threatened from the outside, an "us" versus "them, the others" identification tend to emerge and thus tie the members, i.e., the "us" more closely together (Liebkind and Jasinskaja 2006).

The Study: Methods and Data Sources

Our case discussed here is part of a multi-sited ethnography of four Swedish-speaking lower secondary schools (ninth grade) in the metropolitan Helsinki region. These schools were chosen because in the metropolitan area 50–80 % (depending on the school) of the students in the Swedish-speaking schools come from bilingual homes. Many bilingual and Finnish families enroll their children in Swedish schools since they want their children to become bilingual. Bilingual in this study means that the students can speak Swedish and Finnish at home, or mostly Finnish at home and Swedish at school. Since these are Swedish-speaking schools, Swedish is the language of instruction and students are expected to speak Swedish in class while they can speak whatever language they like during recess. Depending on the school, but in general many of the students speak Finnish during recess. This is not only due to the fact that many of the students come from bilingual homes but also that the region is heavily Finnish speaking and Finnish is the dominant language among youth as well. Consequently, all the schools in this study are minority language schools. The student population is quite diverse with regard to the students' home languages. The majority of the students are bilingual Swedish–Finnish, but there are also students from monolingual Finnish or monolingual Swedish families.

The data were collected between August 2010 and May 2011. Three fieldworkers did observations in the fall and interviews in the spring. In the larger study there were

62 interviews with students and 28 with teachers. In addition students in one school took photographs of what they thought Finland-Swedishness to be. The students were asked to take photos of what it means to them to be a Finland-Swede and what Finland-Swedishness means. Finland-Swedes refer to the language minority group in Finland that speaks Swedish. Traditionally a Finland-Swede was a person who came from a Swedish-speaking home and spoke Swedish. As will be seen, the bilingual students in this study have a somewhat different definition.

In this chapter we focus on the 62 interviews conducted with students as well as on the photographs taken by students in one of the participating schools. Altogether 43 students participated in the photography project (19 Swedish-speaking and 24 bilingual students). The students are 15 years old and in ninth grade, which is the last grade in the comprehensive school. The 43 students took 337 photographs for this study. They also wrote a sentence or two describing how they saw each photo. In addition photo-elicitation interviews (Clark-Ibanez 2004; Harper 2002) were conducted with 22 of the students. In this chapter, the title of the photo or the students' descriptions of their photographs are included under each photo.

The fieldwork began in August when school started, and we had obtained the school district's, the principal's, the teachers', and the parents' informed consent and the students' informed assent for this study. The goal was to get a sense of the school culture, interactional patterns, and student groupings. Most importantly though the fieldworker worked to create a trusting relationship with the students so they would be interested in taking photographs as well as participating in interviews. She also worked with the teachers in the five ninth-grade classes in order for them to take an interest in the photography project. She needed class time to introduce the project in the five classes. She also needed the teachers' help in encouraging the students to return their parents' consent forms and to collect the forms when the fieldworker was not in school.

In school, the photo project started with a brainstorming session about what it means to be a Swedish-speaking person in Finland and what Finland-Swedishness means overall. The question is always whether it is only the language that separates the Swedish speakers from the majority Finnish speakers or whether the Swedish speakers form a distinct cultural group. The students first discussed this in small groups and then as a whole class. Suggestions were developed by students for what kind of things one could photograph. The students then had 1 week to take photographs. They were encouraged to bring in their ten best photos. Once they had brought in the photos, they gave the photos a title or wrote a one- or two-sentence description for making the photo more understandable for the viewers. The fieldworker also conducted a concluding class discussion. The photos were then used in some of the interviews with the purpose of stimulating thoughts about the meaning of Finland-Swedishness.

All photos have been analyzed as data independently of the interviews. The interviews have also been analyzed separately and then in connection with the photos. We did a thematic analysis of verbal texts (interviews) and the visual texts (photographs), meaning that we look for patterns and types of articulations and photographs forming themes. In the interviews and the photos, a series of themes emerged including, for example, loneliness, feeling different, feeling threatened,

language differences, traditions, and the connection to Sweden. Even though all themes were found in both interviews and photos, some were more prominent in the photos and others in the interviews.

Most of the photos were pictures of objects. One reason for the lack of people portrayed in the photos could be that students did not want to bother with having people sign a photo release form. Many of the photos were constructed by the students, but many were also taken of naturally occurring things, and many were symbols of their reality rather than the reality in itself.

Interpretations of the Photos in Combination with the Interviews

In interpretations of the photographs, it is important to remember that the photographs are already an interpretation. The students/photographers have taken photographs that communicate what they have interpreted the task to be. Hence, our interpretations are interpretations of the students' interpretations expressed in the form of photographs.

The photos express several themes related to what the students perceive Finland-Swedishness to be. In the analysis the photographs were first grouped according to themes and then grouped according to *literal* and *metaphorical* representations (Sensoy 2011) since they clearly fell into two different kinds of expressions. Foremost, the themes in this study include issues related to language such as bilingual signs, customs and traditions, newspapers, and theaters as well as photos portraying nature and hobbies like sailing. Most of these are all fairly tangible aspects or literal representations of the collective Finland-Swedish culture. The other less tangible aspects of the culture cluster around themes related to the language and culture as a resource, being a minority group, prejudice, and perceived threats against the language and the culture. The photos within these themes are metaphorical expressions of what it means or feels like to be a Finland-Swede. However, many photos overlap the two distinctions in the sense that on the surface they portray a concrete manifestation of the culture or group but at the same time carry a deeper symbolic meaning. Similar themes emerge in the interviews but to varying degrees. Hence, our interpretations are a combination of the photo and the interview data. Both sets of data are read in the contexts of the students living conditions, namely, an urban, mostly Finnish-speaking environment.

Literal Representations

The photos in this section portray literal representations of the Finland-Swedish life that can easily be observed daily in the Helsinki region. These photos can be grouped as language related, culture related, and traditions.

Language had a prominent role in our empirical material. The crucial role of language for identity formation is also acknowledged by previous research (Liebkind and Jasinskaja-Lahti 2006; Østern 2004). In the interviews all students emphasize the importance of knowing the Swedish language in order to be called a Finland-Swede, and for many it means knowing both Swedish and Finnish. In the photographs the importance of the language comes mostly through various signs or texts that are in both Swedish and Finnish, as can be seen in the signs below.

Typical Finland-Swedish area because street signs are in Swedish first

Both languages are used in many places in Finland

Signs in two languages signify that the area is bilingual. It is an easy way to visually express the presence of two languages. The language that comes first indicates which language is in majority in that particular area. In the street sign it is Swedish, but the traffic sign shows that majority language is Finnish. Interestingly it is mostly bilingual students who have taken photographs of signs in two languages and other explicit signifiers of the Finland-Swedishness. Even though students emphasized the language in the interviews, no one mentioned bilingual signs, directions, and product descriptions. In the photos they stand for literal ways of expressing presence of bilingualism. This is a good example of the kind of data photographs added to this study. By just focusing on the interviews, we would have missed the importance of explicit signifiers.

Another theme is *cultural institutions* related to the Swedish-speaking population. Schools, daycare centers, newspapers, theater, and radio and TV channels are frequently photographed as representations for what is Finland-Swedish. Cultural institutions are much more common in the photographs than in the interviews. They are examples of concrete or virtual places where Swedish-speaking people come together. This does not, however, mean that the students who took these photos spend much time in these places and spaces and more that these tangible aspects are part of the students' reference framework for what Finland-Swedish is. They are representations of the collective Finland-Swedishness. It is also more common that bilingual students have taken photos of these cultural institutions, even if bilingual students visit these places or "consume" this culture much less than monolingual Swedish students. From this we can conclude that literal representations of language and culture seem to slightly differ between bilingual and monolingual Swedish students. They are indicative signs for the bilingual students, but for the monolingual Swedish speakers, these representations are so much part of their daily lives that they do not see or notice them as a sufficiently meaningful indication of being a Finland-Swede. Overall both monolingual and bilingual students describe themselves in the interviews as Finland-Swedes, but the definition differs since the bilingual students see a Finland-Swede as a person who speaks both languages, not just Swedish.

Photos of the main daily Swedish newspaper were also recurrent. Interestingly the photo below of this newspaper also hints at the more symbolic meaning of this newspaper. It is through this paper that news important to the minority group is communicated. It is the biggest national newspaper in Swedish and therefore also contributes to creating a bond between Swedish speakers in Finland. Not many of the bilingual students read this newspaper at home. It has, nevertheless, an important place in the schoolwork where it is often utilized in different subjects. The question mark in the title indicates that it is an assumption that everybody reads this newspaper.

Most (?) Finland-Swedes read HBL

Many photos portrayed a Swedish school or daycare (but in order to protect the confidentiality of the school, these photos cannot be shown here), and in fact a Swedish-speaking school is a very literal and perhaps the most tangible example of something Finland-Swedish. The interviews show that, beyond proficiency in Swedish, many students say that what makes a person Finland-Swedish is that the person has attended a Swedish school. Many students reflected on the school as an institution contributing to who you become as a person. The school was mentioned as perhaps the most important place that creates and maintains Swedish language and culture for them. Here the community aspect is more often referred to, rather than the language of instruction. School is a place where “*everybody knows everybody*”. Our interviews indicate that there are surprisingly little groupings based on language and also that teachers are perceived as fair to students independently of their home language.

Close to the theme of cultural institutions are photos that portray *persons* who are or have been influential for the Finland-Swedish culture, Finnish history, or internationally. Here students are also reclaiming individuals who have become cultural representatives for Finland as Finland-Swedes. Students list, for example, a historical politician, a famous department store owner, and a well-known candy maker. Most frequently they mention the Moomin storybooks written by Tove Jansson.

Both Moomin books and Moomin films are immensely popular among children in Finland. Swedish speakers are also aware of that Moomin originally is created in Swedish in Finland. From this point of view, Moomin can be seen as part of the cultural heritage of Finland-Swedishness, a “world” Swedish-speaking children are socialized into. According to the photo above, it is something that *everybody* has in common.

Moomin is written by a Finland-Swedish author; all Finland-Swedes have read the Moomin books and watched the Moomin films

Close to this are examples of contemporary brands connected to the Finland-Swedish culture. An example of this is Linux, whose creator Linus Torvalds is a Finland-Swede. The photo below shows a sense of pride (in the text), claiming a famous person as belonging to the same language group. The computer world is part a teenager's daily life; hence sympathy and pride are easily awoken.

Linux is Finland-Swedish

Traditions in different forms is another common theme that is frequently photographed in a literal way. We speak of traditions in a broad sense including holidays, traditional places, and events. Particularly holidays that are specifically Finland-Swedish like “the Swedish day” and “Lucia day” are pictured. Among traditions annual crayfish parties with family and friends are mentioned and photographed.

The crayfish party is one among many Finland–Swedish traditions

Traditions can also be described as belonging to certain places or areas. The archipelago signifies for many the Swedish speakers' origin and heritage. Many of the Swedish-speaking students have relatives and summer cottages in the Swedish or bilingual parts of the archipelago due to the fact that many Swedish speakers have been fishers and farmers for generations. Many pictures of the archipelago and its nature are pointing at meeting places for Finland-Swedes, as well as activities that are connected to these places. Therefore the two pictures below are closely related; one is about a place and the other is about what you do in this place.

Nature is an important part of Finland-Swedishness

Sailing shoes, it's very Finland-Swedish to sail

Metaphorical Expressions

Another more complex type of photos were those that contained clear metaphorical references to what it means and feels like to be a Finland-Swede. These photos were more explicitly connected to the *minority* language position. There were two different forms of metaphorical expression. One was looking at the Finland-Swedish identity as a resource. Another strand was focusing on threats and existential questions. These representations, taken together, express certain characteristics for students identified with this particular culture. More specifically the

themes emerging were being in a minority position, stereotypes and harassment, sense of belonging, and views on the future. All subdivisions express certain “qualities” about living as a Finland-Swede in this particular urban milieu.

As discussed above the minority language *position* is a prominent feature in the data. However, the photos and the interviews do not only deal with the fact that there are two languages but also with the experience of belonging to a minority group.

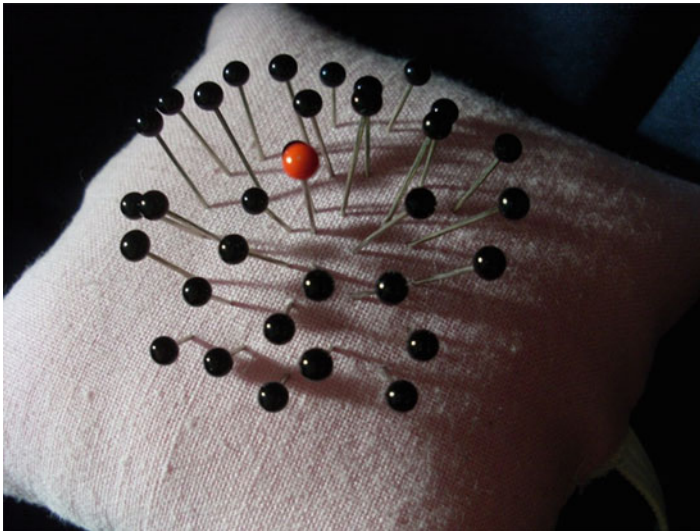

We have two languages! Two choices

In this picture the student describes how Finland-Swedes in urban milieus are perceived as having an advantage. Speaking two languages opens up more choices for the future. A Finnish-speaking student, who speaks Swedish only in school, nevertheless talks about how “we Finland-Swedes” have more opportunities because of the extra language. Here language, and bilingualism, is clearly expressed as a resource (see also Østern 2004). In the photographs the language is only one aspect, while in the interviews it is the aspect talked about most.

However, there is something more to being a language minority speaker than just the language. According to many language minority students, they feel different than the majority Finnish speakers even if they are bilingual. A bilingual girl says: “If we are among totally Finnish people from my mother’s side, for example at a relative’s party, then it can feel a bit strange... One feels different... if there are only Finnish speakers then it feels like one doesn’t belong there... you are just outside... the rest of the community.” We found many symbolic expressions about this theme in the photos. Feeling different is however often something the students see as positive, connected to a certain confidence of belonging to the language minority group. The confidence might be related to the status of the language as a national language.

One photo shows a bigger leaf and a smaller leaf; in addition the smaller leaf is upside down with a bump on it—it (and Finland-Swedes) is not only smaller but also different in more than one way. One simply feels different and the smallness of the group (altogether about 300,000 Swedish speakers in Finland) is tangible in many ways. It is present every day in the students' lives since they go to separate schools and in most cases switch language several times a day.

The photo symbolizes how few Finland-Swedes there are in comparison to Finns

For this student the Swedish speakers are at the center surrounded by Finnish speakers. However, interestingly the red needle head is standing straight up and is bigger than the other needle heads. In our interviews we found that many pupils feel confident, and value their own origin and culture, and independent of social class. This particular picture symbolizes this as well: Swedish speakers stand up for themselves even if there are not many of them. Almost all students identify as Finland-Swedes, and they describe the comfort and joy of having another Swedish speaker in a group of only Finnish speakers.

Stereotypes and Harassment

While students typically identify with the Finland-Swedes, they at the same time resist common stereotypes about the group. Even though the photos often present symbols signifying the collective identity, the students simultaneously distance themselves from these symbols. They emphasize their own individual uniqueness and identifications. They perceive each Swedish speaker as unique as each sunset.

Finland-Swedes are individuals

Being a minority language speaker does not only mean that you encounter stereotypes and feel alone at times. For Finland-Swedes it also means that you are *harassed* for speaking Swedish (see also McRae 1997, p. 113). Although fluent in the majority language, Swedish-speaking people in the Helsinki region are on a daily basis reminded that they do in fact belong to a language minority. The harassments captured in the photos are more on a group level than on a personal level, but symbolizes their own experiences as well. This is, for example, shown by a beautiful autumn photo—but with the text “*Finland-Swedes are like autumn, a time nobody really waits for.*” In addition, emotionally it may be easier to acknowledge how the minority group as a whole is harassed, as opposed to the more personal harassments many students in fact talk about in the interviews. However, as Pink (2007, p. 123) points out, photographs representing, for example, emotions or power relations need to be contextualized. “To analyze images, then, it is more useful to examine how people’s uses and definitions of the visible content and form of photographs. . . attach them to particular ideologies, worldviews histories and identities.” It is clearly necessary to attach the photos these students have taken to their and the group’s histories and identifications as well as the current societal context.

This example of different things being emphasized in different kinds of data also strengthens the argument for using different methods of data collection in order to receive a multifaceted and deep understanding of a complex phenomenon such as harassment. This need can clearly be seen in our study since in the interviews the students openly talked about the harassments and name calling they have encountered:

Ida: *People say “move back to Sweden from where you come”. . . a long time ago it felt really bad, but now I understand that they are just stupid that I don’t need to listen to them. But I don’t really know; do they really believe I’m from Sweden when they so often say it or are they just very envious because they don’t understand what we say?*
 Stella: *Some (Finnish friends) are like yes, I want to learn Swedish, but then half are like “we don’t want you Swedes here in Finland, go back to Sweden” and things*

like that. Sometimes it's really bad to be with them. . . They cuss, but they don't hit or something worse.

Interestingly the students often make excuses for those who harass them by explaining that they were just teasing or were drunk as if being drunk gives a license for harassment. Even though they try to brush off the harassment and try not to care about it, it does have a long-term impact. They often recall events from many years ago when they were young children. A bilingual boy describes how he was beaten by older Finnish boys in sixth grade because he spoke Swedish. He says that he becomes very annoyed at people who tell him and his friends not to speak Swedish, for example, on the bus. He would like to tell them to go somewhere else and that he has the same rights as others. However, in reality he, like many others, do not speak Swedish on public transportation, especially in the evenings in order to avoid being harassed (see also McRae 1997).

The effect of the harassment seems to be that it strengthens their identification with the minority group (c.f. Liebkind et al. 2006). When telling stories about harassment, Lukas says: *I'm proud to be a Finland-Swede* or Filipa. *I'm glad I'm a Finland-Swede*. Even the students who speak only Finnish at home or who speak another language than Finnish or Swedish at home are treated by society at large as Swedish speakers, which makes them feel more like Finland-Swedes. The harassment has also forced many students to learn to pass as a Finn by recognizing potentially troublesome situations and immediately switching languages to Finnish. This is only possible for the bilingual students. Importantly also this harassment does take place exclusively outside school. All students—Swedish speakers, bilingual students, and Finnish speakers—feel they are supported in school. Due to the anti-Swedish political climate at the time of the study, many students (including bilingual students) feel that Swedish speakers as a group are pressed into a corner from where it is difficult to escape.

In my opinion Finland-Swedes are pushed into a corner and cannot get out of the corner

One student even states symbolically by photographing a bilingual sign for a life threatening danger that “*it can be life threatening to be a Finland-Swede*” if you are in the wrong place at the wrong time.

It can be life threatening to be Finland-Swedish

Belonging and Views on the Future

Belonging and views on the future are also themes emerging strongly both in the photographs and in the interviews. Of interest is the school's explicit and implicit role in supporting the students' identifications with and sense of belonging to the Finland-Swedish group. The students say (in interviews and via the photos) that certain Finland-Swedish holidays are celebrated in school. Likewise a few mention and have photographed a relay festival for all Swedish-speaking schools. It is the biggest school sports event in Europe. Of a total population of 32,400 Swedish-speaking students in Finland (Westerholm 2011), over 10,000 runners and 1,500 cheerleaders from all levels of schooling participate in this annual 2-day event, and it is therefore a real network builder.

However, the implicit role of the school is much more important. For some students, especially those from bilingual or Finnish-speaking homes, the school is the only, or the main, place where they speak Swedish. Students perceive the interactional patterns to be different in Swedish-speaking school as compared to Finnish schools. For example, in Swedish schools teacher–student relations are perceived as informal with the students calling teachers with their first name. They perceive the school as a Finland-Swedish space with a Finland-Swedish atmosphere even though things like cultural traditions are not strongly emphasized in the curricula. As Prosser (2007, p. 14) points out, the hidden curriculum of a culture is “all the more powerful because it is visible but unseen”. Lane (1993, p. 161) also

argues that we develop an “unconscious mental model of our culture,” that is, even though we are not always aware of the cultural premises that influence us, they exist and facilitate us in our everyday life. The Finland-Swedishness is built into the structure of the school in subtle ways, and this *visible but unseen* culture and habitus can also be identified in the interviews; the students find it hard to explain what exactly it is that makes up the Finland-Swedishness or how a Finland-Swedish school is different from a Finnish school. As Albin says “*Well I know I’m Finland-Swedish, but I don’t think about it much. It’s a basic thing. I’m a Finland-Swede. It doesn’t mean so much for me.*” The Finland-Swedishness is the daily life and is taken for granted. It’s the students’ and the school’s habitus. However, this kind of Finland-Swedish habitus is one that accepts the students’ bilingualism. The habitus of these urban schools has changed over the years due to a sharp increase in the number of bilingual students (see also Slotte-Lüttge 2004).

Students see the common language as the major bond in their identification as Finland-Swedes. In addition, many students claim that everybody knows everybody. These teenagers are already in the process of building their own social capital as adults have done. They build their own social networks by getting to know other Finland-Swedish students from other schools directly, via friends, hobbies, or parties. As one bilingual student states: “*Almost everybody who speaks Swedish are friends.*”

Networks, “everybody knows everybody”

Even students without this kind of network see themselves as Finland-Swedes due to the common language. Some argue that there is a strong community. They have a strong sense of belonging to the group. This is evident in that they, at times, feel as outsiders in groups of Finns. A bilingual student says “*for example, if you find a new group of friends and they all speak Finnish, then you are kind of alone.*”

And one can feel as an outsider.” She continues by saying that if another Swedish speaker joins the group, it’s a really good feeling even if she doesn’t know the person.

In other words, the school contributes to a Finland-Swedish habitus which also shows itself in that the students will continue to Swedish high schools, vocational schools, or universities. Many also state that they in the future will speak Swedish with their children. Even those who argue that there is no community, say Finland-Swedes protect each other: *“Of course we take care of each other against the Finns who think we should go back to Sweden. It’s kind of a group feeling, kind of, that we protect each other.”* This student clearly speaks of us the Finland-Swedes as opposed to the others, the Finns. It is self-evident to him to protect other Swedish speakers in potentially troublesome situations. It is part of his habitus and positioning himself against the other strengthens and clarifies his habitus.

Finland-Swedes stick together

Sticking together means you are part of the group; you belong. An indication of this sense of belonging is the many thoughts on the future. As was mentioned above, most students say they will go on to a Swedish high school or vocational school after the lower secondary school. Students mention that they will speak Swedish with their children, and bilingual students often say they will speak Swedish with their children if they marry a Finnish speaker in order for the children to become fluent in both languages. The future was symbolically expressed through growth like photos of growing plants, flowers, and trees, light like how the sunlight appears through an otherwise dark sky, a candle in the dark, babies (growing up to be Finland-Swedish), and photos of people sticking together through hard times. However, many worry about the future of the group which shows in photos like the one below.

It's fine, but for how long?

The sun is going down like the Finland-Swedishness

Only people who feel a kind of belonging to a group and identify with people sharing, for example, a common language or similar values are concerned with the future of the group. Keeping in mind that the photos are taken by 15-year-olds, the photos show an awareness of their language minority in a broader societal perspective. However, students are happy with being a Swedish speaker and express no desire not to be who they are.

Finland-Swedishness is beautiful

It's nice to be Finland-Swedish

Participatory Photography and Interviews as Our Preferred Methods

Using photography in relation to interviews was an innovative way of exploring students' personal identifications with being a Finland-Swede and their perceptions of the collective Finland-Swedish habitus. Both Bourdieu (1990a, b) and Sweetman (2009) indicate that it is possible to explore habitus using photography which supported our decision. Holm also has an extensive experience in using photography as a data collection method in ethnographic studies and especially with regard to identity and self-perceptions (Holm 2008a, b; Janhonen-Abuquah and Holm 2008; Veintie and Holm 2010). From her research it is also clear that even if photography has worked very well as a data collection method, it is not possible to use photography alone without complementary verbal data (Holm 2008a, b, 1997). This led us to ask the students to give titles or descriptions for their photos. With regard to many of the metaphorical photographs, it would have been difficult to understand the meaning without the students' comments accompanying the photographs. In all Holm's earlier studies, the photographs were taken by the participants themselves which produced very insightful data. Therefore we also decided to use the same method in the study described here. Participatory research allows the students to produce their own representations of or views (Sensoy 2011) on their identifications and the collective habitus. Through interviews and observations, we developed a partial understanding of the students' identifications and feelings of belonging to a Finland-Swedish community. However, we wanted something more directly based on the students' own perceptions of their own identifications and belonging. Also, for young people who grow up in the digital age and have phones that allow for good photo and video quality, taking photos and videos comes naturally and has become a way of interacting and, for example, showing friends what they have been doing. Children and adolescents show a great deal of creativity when it comes to using their phones and other forms of digital media. The students use photos on a daily basis for their Facebook profiles and blogs, to name only a few ways adolescents use visual material. Keeping this in mind using photos as a way of collecting data can be a strong way to approach young people who, as was mentioned above, might find it intimidating to discuss rather personal and not so straightforward topics face to face with a researcher. Participatory photography is a way to connect to and engage the students in the research questions. Photography usually evokes their interest (Cremin et al. 2011).

We expected that the photographs would give us much richer data and a different kind of data, especially since this was a difficult topic for the students. Analyzing oneself and one's linguistic and group identifications is difficult since many different identifications influence who they are, especially since they were only 15 years old at the time of the study. The photos give a strikingly different and much more varied picture of how students see themselves as Finland-Swedes and Finland-Swedishness in general than what emerged in the interviews. In general taking photos requires much more engagement from the participants than participating in

interviews. The photographs require initiative since they were told only the themes and not what to photograph. The thoughtfulness and insightfulness with which they constructed the photographs are striking, especially since we thought we had a thorough understanding of their situation as minority language speakers. Some students were of course engaged in the interviews as well, but in interviews students are more influenced by the interviewer's presence, which is not the case when students took photos on their own. Mannay (2010) similarly found that photographs taken by participants opened up new ways of seeing a familiar situation. It is also easier for young people to express the complexities and difficulties of their lives through photos and especially easier for the less verbal and more visually oriented students (Cremin et al. 2011; Sensoy 2011; Lodge 2009; Wilson et al. 2007). Burnard (2002) also points out that young people are not always aware of what they know and much of their knowledge is implicit and therefore more difficult to express in words. Interestingly, it is much more common to use participatory photography with young children than teenagers (Serriere 2010; Stephenson 2009; Einarsdottir 2005).

Others (e.g., Croghan et al. 2008) have also found that photos allowed young people to bring up issues and themes that would most likely not otherwise have emerged. Like in our study, they found that certain aspects of the young people's self and identity emerged often in the photos but rarely in interviews and vice versa. In Croghan et al.'s study, the participants through the photos also brought up serious and sensitive issues to race, ethnicity, and religion, which seemed difficult to do without the photographs. Croghan et al. see that "(p)hoto-elicitation might therefore be a useful method of researching identity positions that are usually silent," (p. 355) and by extension photos bring out what might otherwise remain silent.

Using photography as a data collection method is not without difficulties. As can be seen also in our study, participants are reluctant to take photographs of people since they need a photo release from those photographed. It is of course possible to blur or "box" faces in the photographs but that takes away substantial information from the photo itself. It also objectifies the person in the image (Wiles et al. 2008). It is overall more difficult to promise confidentiality when using photographs. It requires more sensitivity from the researchers when publishing results. For example, in our study we have not published photos of the school or other recognizable institutions or places nearby that could identify the school. Due to this difficulty in promising confidentiality, it is also more difficult to obtain permission from some institutional review boards (Wiles et al. 2012). If participants themselves take photos, there is no way to completely control or regulate what they photograph. However, the researcher is still in charge of how the photographs are used. In our study too there are tens of photos that we cannot use since we did not receive either the responsible adult's consent or the student's assent form and images of people for whom we have no photo release form. Image-based research does even less than regular ethnographies fit the preset rules of institutional review boards. Many argue for an ongoing informed consent process where the participants give informed consent as new situations so require (Wiles et al. 2012; Pauwels 2008). Interestingly not all participants want confidentiality. They prefer it to be known that they have taken the

photograph or that they are the person in the photograph (Renold et al. 2008; Grinyer 2002). However, if the group or the school is promised confidentiality, then individuals' photos cannot be identified due to the risk that the individual's known identity leads to the recognition of the others.

With digital cameras often huge visual data sets are to be combined with the verbal data. Even though we did an ethnographic study of four lower secondary schools, photography was used for data collection in only one. Collecting photographs from four schools would have meant close to 2,000 photos. It is difficult and time consuming to analyze first the photographs and then the photographs in relation to interviews and observations. Data management programs where the different kinds of data can be combined are helpful, but the amount of data can still be overwhelming.

Issues in the Interpretation of Photos and Interviews

This study provides support for the increasing interest among educational researchers for visual research methods (e.g., Lodge 2009; Allen 2009; Newman et al. 2006; Fischman 2001). Photography has played an important role in social science research, and especially in anthropology and sociology, for a long time but less so in education except for in the history of education (e.g., Grosvenor 2007; Grosvenor et al. 1999). Photographs are still to a large extent used as illustrations and not as a data source in educational research. Consequently it is very common to see quotes from interviews in ethnographic writing in education, but photographs have not been included very often even though we are seeing a change here too with at least token photos being included (Cremin et al. 2011). Sometimes photos are used in the study but then translated into words in the reporting of the results. If photographs are interpreted only via verbal explanation, everything hinges on the researcher's ability to interpret and describe the photos. The reader cannot interpret the photographs but has to rely on the researcher's interpretation.

In the study described here, photographs are used as data in themselves and are not translated nor used as illustrations. The study though shows that it would have been difficult to interpret some photographs without any text. For example, looking at the photo of a sunset (p19), it would be impossible to know what the student intended to communicate. One student saw the sunset as the downhill path of the Finland-Swedes, and another interpreted her photo of a sunset as the Finland-Swedishness being beautiful. With the text it becomes very clear at least for someone with a similar language group habitus or identification. On the other hand, it is important to note that in this case it would have been entirely possible to use the photographs with their titles but without the photo-elicitation interviews and other interviews as the primary data source due to the researchers' familiarity with the culture. Interestingly the photo-elicitation interviews did not give more data than just the plain interviews. In questions about a photograph, students repeated what they had written in the accompanying text about the same photograph

and had difficulties elaborating on their thinking about the photograph. Banks (2001) stresses that a photo needs to be interpreted in relation to its social context. We argue that our familiarity with the social context makes the interpretation easier for us. We know what Banks calls the external narratives of the photos. We have a deep understanding of the everyday culture in which these photos are produced (see also Pink 2006; Lister and Wells 2001).

In the interviews students tended to focus a lot more on the language, while the photographs to a much larger extent take up a diversified array of aspects related to the students' minority status. Since the Finland-Swedishness is their identification and habitus, it is difficult for them to talk about it. It is self-evident and taken for granted. It is the lens through which they view and act upon the world. However, it is also a rapidly changing habitus due to students' increasing multilingualism. What it means to be a Finland-Swede varies to a large extent based on whether the student is bilingual or monolingual and social class background also colors the definitions. As Sweetman (2009) points out, it is in some ways easier to express habitus through photographs instead of verbally. This has been shown to be the case in our study as well. A significant result is also that the school, by accepting the students' bilingualism but by providing instruction in Swedish and creating an atmosphere supportive of the minority language culture and language, contributes to a minority language identification and habitus for bilingual students. The majority language Finnish is not looked down upon even though students are strongly encouraged to speak Swedish in school. Finnish is nevertheless acknowledged as part of the students' lives and is constantly present in school as well even if it is not actively supported other than taught as a home language or second national language.

The students constructed their identifications and perceptions through the photographs and the accompanying text in either literal or metaphorical ways that were very revealing and understandable for the researchers. However, since the focus in this case was on belonging and identification, the photos would have been more difficult to understand and interpret for a researcher not belonging to the same language minority group or knowing the context and the significance of institutions portrayed like the Swedish newspaper. Hence, we discovered that sharing certain experiences with the participants made our interpretation much easier, but we still look at the students' identifications and interpretations as outsiders since they are different from our own. For example, regarding the harassment and feeling unsure about the Finland-Swedes' future is of course understandable at a surface level for someone not very familiar with the situation. A person from another minority group might have a somewhat deeper understanding of what the students are expressing. However, for the three of us, we knew instantly the current and historical reasons for, for example, the feeling of the group being pushed into a corner and not being able to get out from it. Likewise the harassment and the necessity of switching languages is something every Finland-Swede in this region has experienced.

Similarly the photos of the crayfish platters do not signify just a platter of crayfish or a party where crayfish is eaten as it would be understood maybe by an outsider. Crayfish parties give a stereotypical picture of the Finland-Swedes and is seen as typical for the group even though most Finland-Swedes do not have crayfish

parties every year in August. Crayfish parties have a strong social class connotation since traditionally only the upper class could afford the expensive crayfish. Crayfish is associated with dinner parties, drinking, and singing. The stereotype is of elaborate, expensive parties, but these days imported cheap crayfish makes eating crayfish possible for the middle and working classes as well. Hence, here too we are seeing a change. Many of the students have given us photos of crayfish, a partially stereotypical picture of the Finland-Swedish group, even though they have never eaten crayfish or been to a crayfish party. Interestingly though, Rose (2012) points out that sometimes participants avoid taking photos of things disadvantageous to the group like stereotypes, but that was not the case with this group of students. They took photos of several different kinds of stereotypes.

Consequently questions arise: What is required of the researcher with regard to knowledge of the researched group in interpreting especially photographs? Can we understand photographs without having knowledge about the societal context for the photos? How much of the context or culture do we need to understand and know in order to interpret the photographs? Do we need to have a similar framework in order to have a deep understanding of the photos or does a similar habitus or identification prevent us from seeing certain things in the data? In qualitative research, as Coffey (2007, p. 1) states “the experiences of the researcher are integral to data collection and analytical insight.” What background knowledge about the participants do we need in order to understand their photos and accompanying texts? How do texts produced by the participants help us interpret the photographs taken by the participants? As Bloustien (2003, p. 1) argues “the representations of what we see are influenced by our historical and cultural perspectives.” Hence, if the participants’ historical and cultural perspectives are shared by the researchers, it influences the researchers’ interpretations.

Furthermore, how is our own understanding of our own culture and of the participants’ views on our common culture influenced by the data produced by the participants? Are the researchers influenced by the general societal attitudes and debates about the participants’ culture and situation? Photos produced by young people can also help us see familiar things from a new perspective (Lodge 2009) such as the notion that a Finland-Swede is a person who is bilingual. As Bourdieu (1990b, pp. 6–7) points out “the most trivial photo expresses... the system of schemes of perception, thought and appreciation common to a whole group... Adequately understanding a photograph... means not only recovering the meanings which it *proclaims*, that is, to a certain extent, the explicit intentions of the photographer; it also means deciphering the surplus of meaning which it *betrays* by being a part of the symbolism of an age, a class or an artistic group.” In other words Bourdieu sees photography as a tool that can uncover habitus at a superficial level. However, Sweetman (2009) argues that it is possible to move beyond this superficial level and study habitus at a deeper level through photography.

As with other methods there are numerous issues to be considered in using photography in ethnographic research. It is a method that is best used in combination with other data collection methods. Receiving permission for and from participants participating in a study using photography is important but also somewhat

difficult due to confidentiality issues, especially with regard to publishing. Even though most of the attention in the literature about visual methods, and in this case photography, has been focused on the actual data collection, the more difficult and equally important aspect is the interpretation of the photographs. The study we have discussed here is an attempt to further the understanding of the interpretation process as well as of how the interpretation of photos is combined with the interpretation of other kinds of data.

4.5 Interpreting Education Policy and Primary Teachers' Work in England

Geoff Troman and Bob Jeffrey

Introduction

Our research over the past two decades has involved a series of projects researching English primary school teachers' interpretations of and adaptations to a range of state education initiatives in an era of intensive "reform." In this work we have used an approach to empirical research that has adopted an interpretivist stance underpinned by a loose body of symbolic interactionist theory. Three basic and interrelated ideas are critical to this theory:

1. The focus is on the interaction between the actor and the world.
2. A view of both the actor and the world as dynamic processes and not static structures.
3. The actor's ability to interpret the social world.

Social researchers guided by this theoretical framework necessarily need to focus on actors' meanings, motivations, and interpretations. Social reality has "many layers of meaning." Our task, therefore, was to attempt to penetrate the various "layers of reality" of the social setting of teaching (schools and classrooms).

Parts of this chapter have been published as 'Primary teacher commitment and the attractions of teaching', (2008) *Special Issue: Teacher Identities in Pedagogy, Culture and Society* Vol. 16, No. 1, pp. 85–100, Taylor and Francis Group.

This required understanding the social lives of schools and teachers and that we took the role of the other by putting ourselves in the participants' position, looking at the world with them. We also recognized the importance of the culture and attempted to capture the meanings that permeated that culture as understood by the participants. Part of this task required the researcher to learn the symbols of the culture studied. This primarily involved learning the language of the participants with all its nuances and perhaps special vocabulary. Interpretations and interactions were also "situated" because situations affect perspectives and behaviors and perspectives can affect situations.

What our interpretations of the empirical studies showed was that the effects of restructuring the education system in the UK and the responses of the teachers to the process were both complex and contradictory. Teachers' interpretations and reactions could not simply be read off from official policy prescriptions. Policy analysis revealed the nature of education policy at the macro (system/societal) level. Ethnography helped us to understand the implications reforms have for teachers, how they are experienced and interpreted at the meso (organizational) and micro (personal) levels and how these interpretations and experiences work and affect their teaching.

In order to illustrate the ethnographic approach developed by us in various studies, this chapter focuses on one project Primary Teacher Identity, Commitment and Career in Performative Cultures (PTICC) 2005–2007 (RES-000-23-0748) which was funded by the Economic and Social Research Council of the UK. This project built on our previous research (Woods et al. 1997) into primary teachers' responses to educational reforms. We charted the adaptations of "creative teachers" to the national curriculum and other policy changes during the 1990s (Jeffrey and Woods 1996), showing teachers both responding to policy prescriptions and playing a creative role in its implementation. Since 1995 three allied projects focused on teachers developing creative learning (Jeffrey 2003); school restructuring (Troman 1997) and the impact of Office for Standards in Education inspections (Jeffrey and Woods 1998) with a reported growth of constraint, intensification of work, and increasing managerialism; and the social aspects of stress and teachers' identity reconstructions (Troman and Woods 2001).

The research on which this chapter focuses extends this work of mapping changes in primary teachers' identity, commitment, and career in the context of performative cultures and identifying policy implications concerning the recruitment, retention, and morale of teachers.

Our focus on the meanings the restructuring policies held for the teachers and their interpretations of them led us to develop theory in the areas of "identity," "commitment," "career," and "culture."

Interpreting Research Problems

The Research Project

Numerous authors argued that teacher commitment was central to the work of teaching and the functioning of education systems. Elliott and Crosswell (2002, p. 1), for example, argue that:

Teacher commitment and engagement has been identified as one of the most critical factors in the success and future of education (Huberman 1993; Nias 1981). It contributes to teachers' work performance, absenteeism, burnout and turnover, as well as having an important influence on students' achievement in, and attitude toward school. (Firestone 1996; Graham 1996; Lewis 1990; Tsui and Cheng 1999)

But there were indications that with the introduction and intensification of the recent performative reforms that teachers were experiencing a crisis of commitment. For instance, of the five reasons most often cited by teachers for leaving teaching identified by Smithers and Robinson (2003), salary ranked last and workload, school cultures, and commitment were ranked higher. Their study suggested a causal relationship between teacher supply and the experience of working/training in the performative cultures of schooling. Further, indications of disillusionment and disengagement were evidenced by the large numbers of unfilled vacancies for deputy and headteacher posts (Howson 1999). The forced overreliance on supply of teachers and teachers unqualified in specialist subjects threatened the quality of educational provision (Menter et al. 2002). The Organisation for Economic Co-operation and Development (OECD) (2001) data indicated that this crisis was not limited to the UK but was global. Hargreaves (2003, p. 2.) argues teaching, though vital to the knowledge economy, is now a profession which "more and more people want to leave, fewer and fewer want to join, and very few are interested in leading ... (and that) it is a crisis of disturbing proportions."

Research by Jeffrey and Woods (1996, 1998) and Woods and Jeffrey (2002) indicated identity transformations and changes in commitment suggesting government policies were changing not only what teachers do but also their social identity (Ball 1994). The teachers "self" and "ontological security" (Giddens 1991, p. 36) had come under challenge. Our previous research on primary teacher stress (Troman and Woods 2001), for example, showed how the reforms rode roughshod over the values of English child-centered teachers and how overcommitment and over-conscientiousness of primary teachers to preserve their values and identities while implementing the reforms resulted in stress, burnout, and the exit of many from the profession. For those that remained, the experience of primary teaching was one largely of "change without commitment" (Webb and Vulliamy 2006) which was a teacher survival strategy "employed to reduce stress and to try to conserve time and personal resources for those aspects of teaching (to which they were strongly committed) such as building relationships with children, which were priorities for most teachers but were increasingly being eroded by time pressures" (p. 130). Primary teachers, it seemed, had become more strategic and political in

defending their self-identities. Some evidence suggested that their priorities had been to hold on to their humanistic values and their self-esteem, while adjusting their commitment (Woods and Jeffrey 2002; Nias 1989; Broadfoot and Osborn 1988). They had, perhaps, become more instrumental and now seemed to be seeking “satisfiers” more outside teaching (Goodson and Sikes 2001). An urgent task identified by these authors was to realign teachers’ personal projects with education.

These trends in teaching raised important questions for the effective running of the education system and the nature of contemporary society. Goodson (2006) argued that “attempts to commercialise the public services through the introduction of tests and targets” affected commitment and “people’s sense of meaning and mission” and this would “turn teaching into a profession attractive only to the compliant and docile, and conversely unattractive to the creative and resourceful. By pushing too far, they threaten to turn our schools into places of uniformity and barrenness – hardly a site on which standards will rise and educational inspiration flourish” (p. 17). In terms of social theory, this type of evidence supported arguments around a general demise of commitment to and in organizations and careers in Western societies. This raised some very interesting empirical and theoretical questions. Had the experience of work in new capitalism, which may be destructive of commitment, loyalty, and solidarity, brought about a “corrosion of character” (Sennett 1999) so that the way people now expressed their commitment and pursued “meanings,” “missions,” “dreams,” and “purposes” in their lives was no longer through work and occupations? Were there processes of “individualization” (Beck and Beck-Gernsheim 2002) or “reflexive projects of the self” (Giddens 1991) taking place? Goodson (2006) argues that this seems to be exactly what was happening:

What we may be seeing, then, is the beginning of a substantial “turning away” from one of the major sites of collective purpose and social engagement – the public service workplace. The other side of this movement is a “turning towards” the individual; the personal; the consumable; the special interest; the private purpose. It is not quite as stark as “there is no such thing as society” or that “greed is good” but it is a growing focus on the private world of the individual self. (p. 6)

In this context our research, PTICC, was eliciting data on primary teachers’ experience of work, the nature of their commitment to this work, and how commitment changed during the teacher “career.” We were also interested in those factors in schools and social life which sustained or diminished commitment to teaching. In taking the “policy case” (Ozga 2000) of teachers, we were, potentially, therefore, in a position to reflect on the changing nature of public service work more generally, given the pervasive nature of performativity in this sector, thus, contributing to the debates outlined above. One aim of the project, therefore, was to identify changes in commitment over time and the implications of this for personal and professional identities and conceptions of teaching as a career. Later in this chapter we will focus on the various forms of commitment the teachers revealed as important in their decisions to teach and why primary teaching was an attractive occupation for the realization of their “purposes.” To do this we revisit some of the “classic” texts on teacher commitment by way of comparing our data derived from teachers working in contemporary cultures of performativity. We argue that the

teachers in our study exhibit the main forms of commitment to teaching as found in these previous studies. However, the commitment they exhibited is a complex of parallel commitments which show them investing in both the personal and professional—the private and the public.

We begin with details of the sample and methods used in the project.

Sample and Methods

We conducted fieldwork in six contrasting primary schools in five local authorities. The distribution and characteristics of the schools and teachers participating in the research were as follows:

London

Borough A – medium-sized primary school, high SES, *Green Common Primary*

Borough B – large inner-city school, low SES, *West Side Primary*

Borough C – large inner-city primary school, low SES, *Metropolitan Primary*

Southwest

Large urban primary school, high SES, *Albert Road Primary*

South Midlands

Small rural primary school, high SES, *County Primary*

Large inner-city primary school, low SES, *City Primary*

SES = socioeconomic status

Fieldwork commenced in May 2005. We conducted initial interviews and recorded life history details with 42 teachers. These represented the gender proportions in primary schools nationally at the time and a range (early–mid–late) of career stages. Analysis of the interviews, life history details, and school documentation was an ongoing process forming the basis of continuing visits to schools for progressive focusing. School visits at “high” and “low” points in the teachers’ school year and observation have taken place in classrooms, and other school contexts (e.g., staffrooms) took place. We are also tracked (for their first year in teaching) with two career change Postgraduate Certificate of Education-trained teachers who took up their posts in autumn 2005.

Methodological Approach

To understand and interpret the complexities of what was happening, we employed an ethnographic approach, which “captures and records the voices of lived experience...contextualises experience...goes beyond mere fact and surface

appearances. . . presents details, context, emotion, and the webs of social relationships that join persons to one another” (Denzin 1989, p. 83). Data collection took place over one school year, enabling us to follow some identity trajectories and expose some of the contradictions and developments as well as gaining deeper analysis.

Data was collected within the school context, since identities are strongly shaped by that context (Rosenholtz 1989). We saw identity not as an entity but as processes, subject to change and modification in the light of changing circumstances. We mapped changes in identity, commitment, and the teachers’ subjective experience of career against changes in national, local, and school policy and changing schoolwork cultures. An “intermittent” approach (Jeffrey and Troman 2004) to data collection enabled us to visit the sample schools at significant times during the school year to observe and record events where performativity was overt (threshold payment assessments, pupil testing) and other occasions (outings, celebrations).

The research was based in six primary schools across two local authorities with a sample of 24 teachers. We judged this to be the maximum possible, given the depth of fine detail we sought, but large enough to afford a comparative basis for the research. We aimed for some significant contrast between the research schools (large inner city, small rural) in terms of size and socioeconomic status (our theoretical interpretation judged these likely to be important influencing factors on teacher identity and school culture). Among the teachers, we aimed for a balance of sexes, career stages and positions, and roles (see Table 1 for a breakdown of the sample). This sample provided an opportunity for comparison between such factors as gender and status and different forms of adaptation. We consulted LEA officials, teacher unions, and headteachers in identifying suitable schools. We had good contacts here from our previous and current researches. An example of a School Description Summary made at the time of the research can be seen in Appendix A.

Data were collected using several different methods and techniques. These included an interview facesheet to record teacher career, and demographic details were completed at the commencement of each “formal” interview (see Appendix B); semi-structured, in-depth life history interviewing, informal (conversational) interviews and observation, document analysis of national and school policy documents. Interviews were tape recorded, subject to participants’ approval. Recorded interviews were partially transcribed and those which were of theoretical significance were professionally transcribed in their entirety.

On average 1 day a week was spent in one of the six schools over the school year. This allowed interviewing to take place in different temporal phases of the school calendar and also facilitated the development of rapport between researcher and staff, the penetration of the various layers of reality in the schools, and the mapping of changes in teacher morale and commitment over time. We aimed for at least five interviews of at least 1 h duration with each of the teachers to be conducted over the school year. In addition, a number of unplanned, unstructured conversations

Table 1 Sample of teachers participating in the study

and discussions with teachers singly and in groups took place. The extent of interviewing was dependent on the willingness of the teachers to continue their commitment to the research. The interviews probed such areas as:

- The teachers' sense of self and identity and how these were changing
- The importance of teaching in their lives
- Teachers' views of the "satisfiers" and "dissatisfiers" in teaching and how they secured a balance between them
- Teachers' views of how their classroom teaching and relationships with pupils have been affected by the introduction of performativity cultures
- Teachers' views of working in performative cultures, in terms of staff relationships and of what changes would enhance their commitment

Our ethnographic approach was the same as that employed in previous projects (Woods 1995; Troman 1997; Troman and Woods 2001). The researcher's role was one of the "involved observer" (Woods 1979), taking part in school activities without becoming a fully participant observer. This aided insights into teachers' work situation and facilitated interviews and conversations with the teachers. It also provided triangulation for the teacher interviews. We expected to witness instances of "satisfiers" and "dissatisfiers," and various forms of social relationships. The observations we recorded were unstructured in the sense that they were not collected or recorded in the form of a structured observation schedule. Recording was in the form of field notes later entered into a research diary. Observation took place in a number of contexts in the school (classroom, staffroom, headteacher's office, and meetings) where the performativity culture was influential. This provided in-depth knowledge of school organization, climate, and teacher culture and teachers' subjective experiences of these. This highlighted the complexities affecting the performative culture of teaching. We were then in a position to identify those factors that enhanced commitment or, alternatively, reduce it and induced disengagement from teaching.

Teachers who are willing to do so were encouraged to keep diaries over a school year (audio or oral). The aim here was to encourage reflection, free writing (or speaking), and personal and private testimony. We envisaged some of the diary compilation to be done at home, enabling them to consider their work and their attachment to it "at a distance." The diaries were a resource during the interviews, promoting a number of "diary interviews." Zimmerman and Wieder

(1977) employed this technique, allowing interviewees to expand on what was written and to fill out “the less directly observable features of the events recorded, on their meanings, their propriety, typicality, connection with other events and so on” (p. 484). Diaries, we felt, could benefit teachers in terms of professional reflection and continuous professional development. Payment for teacher supply cover was included in the research budget in order to facilitate these activities, enabling teachers to do some of this at work, thereby maximizing the chances of completion. Documentary analysis of official national and school policies was undertaken in the manner described and demonstrated in Troman (1996).

Theoretical Interpretations

Research proceeded in the sequence, data collection–analysis–data collection–analysis, to provide a “spiral of insights” (Lacey 1976). We sought to generate theory from the data using the method of “constant comparisons” (Glaser and Strauss 1967). Comparisons took place both within the research and outside, especially with other, related, studies. Analysis of the data, alongside ongoing reference to the literature, informed data collection.

Primary analysis aimed to identify broad themes and categories from the data. These were then saturated, refined, and sometimes modified by more data collection, sometimes using different methods to triangulate the results. The category was then specified in terms of the conditions which gave rise to it, the context in which it was embedded, the strategies by which it was handled, and the consequences of those strategies (Strauss and Corbin 1990). These concepts were then reconsidered with others from related literature with a view to developing a more comprehensive theory (see Troman and Woods 2001). Data storage, retrieval, and analysis were supported by the use of the qualitative data analysis computer package ATLAS.ti.

We planned to provide feedback on findings to teachers and schools and any other interested parties and further develop policy recommendations through these discussions.

Theoretical Interpretations of Teacher Commitment

Woods (1983) argues that teacher identity, commitment, and career are closely interrelated concepts. In terms of commitment, there is a:

range or degree, from near total through partial, to almost complete lack. Career bound teachers tend toward the first, misplaced teachers the last, but most show partial commitment. (Woods 1983, p. 155)

Three forms of commitment in teachers have been identified—“vocational,” “professional,” and “career” commitment (Woods 1983, p. 155). Vocational commitment leads teachers to seek out schools in which their values (especially

pedagogic) can be realized (Lacey 1977). They are committed to education in a wider sense and “if blocked from achieving their ideals through teaching will explore other means of bringing them about” (Woods 1983, pp. 155–156). Professionally committed teachers “rated their teaching abilities very highly and were committed to their advancement” (Woods 1983, p. 156). Career-committed teachers “find what is profitable to [them] is bound up with [their] position in the system” (ibid). Here there is a strong career investment in the organization in terms of advancement or merely career continuance for “other involvements and responsibilities, like family, house, community, pensions, keeping them going” (ibid).

Nias’ (1984) 100 English primary teachers had “strong dedication to religious, political or humanitarian ideals” (p. 270). These beginning teachers saw themselves as “missionaries” or “crusaders” and were committed to “create through their teaching, a more humane, socially just and constructively self-critical social world” (ibid.). Two thirds of Nias’ sample expressed the “pursuit of principle” as a “crucial part of the job” (ibid.) and were “guided by the inner conviction about what’s right” (ibid.). Others were “concerned with broader professional standards and the single-minded pursuit of ‘occupational competence’” (ibid). Of course, not all of the teachers were initially committed in these ways; one felt “I’m very unsure about my identity as a teacher, what I believe in, what I want to do’ (ibid.). And some of those who entered teaching without a strong sense of commitment had found the work of teaching had induced it and had ‘been motivated by the job into wanting to work hard for something’ (ibid).

There are clearly, then, different forms of commitment to teaching. There is also a range of commitments. Changes in the nature and intensity of commitment to teaching are, of course, contingent on factors derived from personal and professional lives. In terms of the professional, Day et al. (2005) argue that:

researchers have found that teacher commitment may be enhanced or diminished by factors such as student behaviour, collegial and administrative support, parental demands and national education policies. (p. 566)

And teacher commitment “is thought to decrease progressively over the course of their teaching career” (Elliott and Crosswell 2002 see also, Fraser et al 1998; Huberman 1993).

While the dynamic nature of teacher commitment is acknowledged here, we concentrate in the following section on the forms of commitment the teachers expressed when they chose teaching as an occupation.

Interpretations of Empirical Data

Lortie (1975, p. 25) argued that:

Occupations compete, consciously or not, for members, and there is a largely silent struggle between occupations as individuals choose among alternative lines of work. Occupations proffer different advantages and disadvantages to those making choices, and people vary in

their dispositions and personal circumstances – an occupation will attract some persons and repel others. Out of the combinations which ensue, an occupation will come to be staffed by people of particular dispositions and life circumstances.

In trying to discern what attracts individuals to teaching, we can, potentially, identify important data on personal dispositions in terms of identity, commitment, the meaning of work, and conceptions of career. Lortie “questioned those within the occupation, asking them to describe the attractions they saw in it and to identify those which made it more attractive than the alternatives they seriously considered” (p. 26).

We adopted a similar approach in parts of our interviews, though unlike Lortie (who conducted a questionnaire survey and interview approach) we held life history interviews with further follow-up informal conversation style interviews during the school year. Like Lortie we were interested to identify what kinds of people were finding teaching in performative school cultures attractive. We particularly concentrated on the choice of teaching as a “career,” when and how this was made, and what forms of commitment were revealed in this way. The identifications of attractions in teaching, of course, indicate potential “satisfiers” (Evans 1998) in the work of teaching.

Lortie (1975, pp. 27–37) categorized, in the form of themes, the five attractors of teaching, arising from his interview and survey data, as follows:

The Interpersonal Theme; The Service Theme; The Continuation Theme; The Theme of Time Compatibility; and the The Material Benefits Theme.

We explored these themes in our data, by way of comparison. This constant comparative method (Glaser and Strauss 1967) also meant that the interview data were interpreted in the context of the knowledge and understanding we had derived from informal interviews/conversations, national and school policy analysis, school descriptions and observations, and teacher demographic and career details.

Our interpretations using this method generated the following categories.

The Interpersonal Theme

Since teaching “calls for a protracted contact with young people” (Lortie 1975, p. 27), it is, perhaps, unsurprising that the interpersonal theme provided the largest category in our data. Some teachers talked of a long-term attraction or “loving” to work with children. Some talked of the “love of teaching” and “love of being with children” (Lara, Green Common, Y1). Stephanie (deputy, West Side) said that:

I always loved children right from an early age. My Mum was a Keep Fit Teacher and my sister also loved children and she went into teaching too. So I suppose it's a family career.

For some of the teachers, opportunities to work with children became attractive when they experienced motherhood and becoming parents themselves (Sikes 1997); Sharon (City School, Y6) found:

When I had my own children and they came to this school I decided to help them out in nursery and then help them out in their classroom. From then on a teacher asked me, would I like to do some paid work as a Teaching Assistant. So I started doing the odd days which then went to me getting a job in another school. And I did that for four years and then started thinking, well actually I'd quite like to take this on. My children were getting older and I wanted a career and then it took me two years to make the decision to actually go into teacher training.

For others it was strong identifications with people who were teachers which provided the attraction.

The Service Theme

Lortie (1975, p. 28) noted that “although their (teachers’) status had been shadowed, teachers have been perceived as performing a special mission in our society, and we see the continuation of that conception among those engaged in the work today.”

In our research, both older experienced and younger inexperienced teachers saw some kind of service to society as an important attractor. But only the older generation of teachers expressed this in the form of a strong sense of mission.

Edith (headteacher, City), for instance, encapsulates this perspective:

I just always knew that I wanted to be a teacher from primary school and I think it's the old story of an inspirational teacher called Mr. Johnson, who changed my life. He made magic for us as children and I wanted to do that for children, combined with a very appalling teacher who made life miserable for a whole class. In fact a generation of children brought up in that town. We all hated her. Horrendous woman, horrendous! It was in the 2nd year Juniors, equivalent to Year 4 now, but I can remember being terrified, absolutely terrified of her and such a negative feeling. I went from her to Mr. Johnson and I think even at that age I realised that it's how you are with other people that can change their lives completely, and I wanted to do that for children, so that's why I went into it. So I trained straight from school. I wanted to learn about the craft of teaching. I'd like to say the whole thing was magical when I started teaching.

This testimony is strongly reminiscent of the vocational commitment Nias (1984) identified in some of her teachers.

The mission and identification with teaching as an occupation (often mentioned alongside other possible “service” choices) were formulated (in the case of the older teachers) sometimes at a very early stage in life.

A number of the younger teachers developed a sense of mission and purpose through global issues while working abroad.

Both Lortie and Nias note a long tradition (in both American and UK cultures) of not only a secular service ethic but also one derived from religion. Nick (County, Y4) attended Bible school for a year and in that time did placements in primary

schools. He did weekly assemblies and on the strength of that experience felt these schools “looked like a good place to be.” George (Metropolitan, headteacher) had a strong religious mission which was influential in his later entry to teaching:

The Continuation Theme

Lortie (1975, p. 29) noted that “some who attend school become so attracted to it that they are loathe to leave”—the teachers in his study “referred to such attachments as attractive to the occupation.” Teaching also can “serve as the means of satisfying interests which might have been fostered and reinforced in school.” For some of the teachers in our study, school had been a positive experience, thus making an occupation in teaching attractive. Chloe (County, Y3) found:

I just thought it (junior school) was very interesting. I had a great time when I was at junior school. Absolutely adored it. So I think it brought all the memories flooding back, I would enjoy teaching the children the kind of things I learnt when I was at school and I would enjoy doing all the preparation for it. I found it interesting.

Christine (Green Common, headteacher) had taught at school and home as a pupil:

I was very lucky when I was at school and I was allowed to be very supportive. I was able to help with the younger ones quite a bit and things like that. And also I've got younger sisters – I've got one sister who is 14 years younger than me. Right from when I was 14 years old there was a little one around. I think that makes a difference.

Penny (Albert Road, Y2), a career changer, had developed a strong interest in sport throughout her primary and secondary schooling and wanted to continue to develop this interest in teaching primary children.

The Theme of Time Compatibility

Lortie (1975 pp. 31–32) argued that:

The working schedules of teachers have always been special; although the length of the school year has increased steadily over the last century, most (other workers) are required to work considerably more days per year than the average teacher. Teachers are sensitive to criticism about this, and one senses that reaction in the statistics their national association gathers to show that teachers actually work longer hours than formal school schedules require. The fact remains, however, that the teacher's schedule features convenient gaps which play a part in attracting people to the occupation. Work days which are finished in mid-afternoon, numerous holidays, and long summer holidays do not go unnoticed by young people comparing teaching with alternative possibilities.

In our research one male teacher mentioned the attractions of time flexibility because of the issue of balancing work with family life. Most of the female teachers, particularly those with children, did find (initially) this potential flexibility of

working hours to be an attractor. Given the traditional (and persisting) sexual division of labor in the home (Oakley 2002; Crompton 2006), this is not surprising. Ellie (West Side, Y4) was attracted to teaching for this reason:

Teaching is a good career if you want a family, it's quite flexible in that respect, so that was also a consideration I suppose. I couldn't go back to an office.

Mary (Green Common, Foundation), a career changer, found teaching compared much more favorably to her former work in architecture with a long-hour culture:

Having my own family and realizing that I actually enjoyed children, had a rapport with them, I wanted to be a full-time mother, which I did until Jessica was nearly 4 years old and then realized that I did want some sort of employment, and the sort of things that I can do with architecture didn't appeal with the hours I was having to meet.

Hannah (County, Y2) a former journalist (also an occupation with a family-unfriendly work culture she argued) developed a career within education, which facilitated her with working within the same institution as her young son, thereby, removing the need to organize (and pay for) child care.

The Material Benefits Theme

Material benefits refer to money, prestige, and employment security. Obviously, in most occupations remuneration for the work done could be expected to be a prime attractor and, therefore, source of commitment. Traditionally, in primary teaching, salaries and status have been low, which some have argued (see Crompton 2006; Evetts 1987, for examples) accounts for the preponderance of female teachers while making it an unattractive occupation for males. However, few of our respondents raised this aspect in interviews. Lortie (1975, p. 30) explained this phenomenon in terms of traditional views of teaching as an occupation:

Historically the status has been defined as under-rewarded; teachers addressing others may hesitate to cite material benefits when in the public eye, such rewards are said to be inadequate. But I suspect that the emphasis on service, on teachers as 'dedicated', is a more potent source of inhibition, since many people both inside and outside teaching believe that teachers are not supposed to consider money, prestige and security as major inducements. Such normative pressures make it probable that material benefits influence teachers' decisions more than their answers indicate.

While this might have been the case in our research, some respondents were willing to talk about material benefits of teaching as an attractor. These respondents tended to be women and women with children. Hannah (County, Y2) had a salary increase when entering teaching; in provincial journalism her salary was "rubbish and if you want to earn money you have to go to London, but journalism's worse than teaching when you start, certainly, when you start." Moving to London to increase salary was, however, not a viable option given the location of her husband's work and child's school. Career changers sometimes took a large cut in salary to become teachers. Samantha (Albert Road, Y3), the former army captain, said, "I was earning a lot of money in the Army, 3 or 4 times what I'm earning now."

Pat (West Side, Y2) made an interesting comment which suggested that “good” salaries, presumably aimed at increasing teacher commitment once in teaching, were in fact, for some teachers, sustaining commitment merely in the form of career continuance—and both the teachers and their pupils were experiencing negative effects as a result.

The Interpretation of Interpretations

It is probably evident from the transcript materials above that some of the attractions of teaching and the commitment(s) they reveal cannot easily and neatly be allocated to discrete categories, though the exercise is fruitful for analytical purposes. This is because the individual teachers' life history accounts contained within them show evidence of a range of commitments. It is clear from looking through these categories that particular teachers appear in more than one category. Some of this complexity can be seen in the accounts of Hannah and Jeremy above, but all the teachers' transcripts showed range and complexity of commitment. This is methodologically interesting, and a critique of Lortie's research might be appropriate at this point, but we want to focus here instead on what we see as the theoretical interest—what are these data and our interpretations of them telling us about the nature of teacher commitment?

The narrative accounts provided by these teachers display multiple commitments which reveal multifaceted identities. When assessing the commitments of these teachers, it is hard to separate out the professional and personal—the public and the private. For example, taking the theoretical case of a teacher deciding to leave teaching to have a child (Pomson 2004, p. 657):

As Acker (1992) has shown, a choice such as this might once have been regarded as indicating a lack of career commitment in the face of pressures from home. More recent research which attends to the subjective content of career decisions, suggests that the juggling/balancing of personal and professional commitments may more likely evidence what is often referred to as a parallel rather than vertical career strategy (Evetts 1990). To quote Nias, it shows that someone ‘may hold personal and professional goals to be of equal importance and seek to achieve both simultaneously’ (Nias and Aspinwall 1995, p. 200). It need not imply a lack of career commitment.

Acker (1999, p. 162) also points out that an implied lack of career commitment which may be involved in the “stop-start career” and the choice to have a family can also be the cause of “career blockage” and occupational resentment and frustration:

Women who had children were thought to experience further disadvantages. Either they carried on, with only a short break for maternity leave, or they were faced with returning to a lower-status, often marginal position. Grant's (1989) review of studies of women teachers' careers identified the ‘career break’ as particularly deleterious to women's chances of career advancement in a system where ‘promotion is tied to age-related norms’ (p. 44). Nias (1989) discusses sources of satisfaction and dissatisfaction for primary teachers she interviewed. Those who were temporary, supply or part-time were particularly likely to express ‘disappointment, resentment or frustration’ (p. 127). Chessum's (1989) interviewees voiced similar sentiments, one terming herself as a ‘part-time nobody’. (Acker 1999, p. 161)

There was much evidence in our research of the “seriousness” with which teachers “treat both their professional and domestic commitments” (Pomson 2004, p. 657). It was clear too in the testimony of some of our teachers. Dorothy, for instance, said that “her sense of herself as a mother was coloured by her identity as a teacher, just as her work in the classroom was shaped by her experiences as a mother” (ibid.). There was, then, “a weaving of personal and professional commitments” (ibid.) and very often this was the source of tension and contradiction.

Conclusion

Our interpretation of the teacher narratives (in the context of our other empirical data) does not show much evidence of the grand narratives of modernity such as “crusading” moral purposes or social class-based commitments with regard to addressing educational inequality. But these were, according to the “commitment literature,” only ever held by a minority, with the majority being “conservative” and uncommitted to progressive change in school or society. Perhaps, the grand narratives have become elided into the softer, late-modern, and ambiguous narrative of “making a difference” or those around global issues such as the body, health, international development, and the environment. These kinds of projects are, of course, forms of identity politics: arising from lifestyle issues. In this sense there does seem to be increasing investment in the self revealed through these forms of commitments. And it must be remembered that many of the teachers in our current research had recently turned to teaching from other professions. Initial and career-change decisions were characterized by a great deal of uncertainty around choices (Duncan 2003) and preferences (Hakim 2000) of career in postindustrial society (Hage and Powers 1992). In terms of portfolio careers, then, we must ask, what kinds of commitment(s) were the teachers investing in their previous occupations and what happened to it?

There was much evidence in the teacher narratives, though, of “love” and commitment to “care” which must be the most fundamental commitments in life in both domestic and work spheres. The teachers of our previous researches had, in many cases, owing to their strong professional and vocational commitment, failed to “juggle” the personal and professional and with this failure came an identity crisis and the vulnerability to which Edith referred. Teachers in the contemporary context seemed much more adept and realistic in both recognizing and managing their range of parallel commitments. An increasing emphasis on strategies to protect the personal and invest in the personal, while also investing in the public, need not necessarily be read as “instrumentality” or as a form of “individualization” or “projects of the self.” They do seem to be kinds of parallel and “care-full” commitments. However, whether they can be sustained in contemporary society under rapid change and in performative school/work cultures is another matter.

Appendices

Appendix A: Example School Description Summary

City Primary School

The City Primary School became primary school in 2003 when it amalgamated of a first and an infant school. It is situated at the margins of a southwestern English city, surrounded by big council estates. Ofsted cited in its 2006 inspection report that the school serves a significantly disadvantaged area and the proportion of pupils eligible for free school meals is well above average. The school is part of an excellent and city program. The City Primary School has been in special measures, but was able to raise standards during the last years. The school has established "excellent links with outside agencies" with their "total commitment to the Family Links Nurturing Program." In its 2002 report Ofsted cited that there has been a very high turnover of teaching staff over the last 2 years.

Pupil Data: City Primary School

Total number of pupils on roll	473
Pupils with SEN, with statements: number and percentage	19 (4.0 %)
Pupils with SEN, without statements: number and percentage	157 (33.2 %)
Number of pupils eligible for free school meals is well above the national average	
Absence record for pupils of compulsory school age	
% unauthorized absence	2.0 %
<i>Key Stage 2 Test Results 2005</i>	
English	
% of pupils achieving level 4 or above in English	61 %
% of pupils achieving level 5 in English	9 %
Mathematics	
% of pupils achieving level 4 or above in mathematics	63 %
% of pupils achieving level 5 in mathematics	13 %
Science	
% of pupils achieving level 4 or above in science	75 %
% of pupils achieving level 5 in science	21 %
Average point score	25.6
Value added	
School VA measure	99.2
School VA coverage indicator	97 %

Details of interviewed
staff: City Primary School

Name	Age	Post
Edith	62	Head teacher
Susanna	31	Deputy
Kate	28	Year 2 teacher
Rachel	30	Year 3 teacher
Nancy	23	Year 3 teacher
Sharon	51	Year 6 teacher

Teachers and Classes: City Primary School

Qualified teachers

Total number of pupils per qualified teacher

Average class size

Details About the Schools from Its Prospectus

The school describes itself as an “excellent school” in its school prospectus. It sees itself as “a center for learning and development,” “where standards are high in all subjects,” “where all can develop and achieve their potential,” and “where there is a stimulating, safe environment and teaching is exciting and relevant so that children are eager to learn, where all learn how to learn.” Furthermore, it describes itself as a “happy school,” “a bright, attractive place where all are valued and welcomed,” and “a place where there is mutual respect.”

The school strives for:

- Clear expectations, high and consistent, and understood by everyone
- Clear boundaries
- Commitment from everyone and an understanding of where we fit into the school community
- A conscientious headteacher and good clear management
- Sensitive caring staff who are happy, motivated, and able to inspire
- Effective liaison with parents/carers: good communication leading to support, loyalty, and respect from parents
- Effective links with other schools
- Awareness of different kinds of disability and a determination to make sure it will make no difference to life opportunities and self-worth
- A broad, rich curriculum to inspire and enrich
- An effective governing body
- Self-evaluation

Appendix B: Example Teacher Interview Facesheet: Demographic/Career Details

Name of School	Green Common
Local Education Authority	London
Date of Interview	22.11.05
Time of Interview	9.00 – 10.00
Place of Interview	Head's office
Head Teachers' Name	Christine
Female/ Male	F <input checked="" type="checkbox"/> M <input type="checkbox"/>
Age	<input type="checkbox"/> 52 <input type="checkbox"/> Early <input type="checkbox"/> Mid <input type="checkbox"/> Late <input checked="" type="checkbox"/>
Union Member	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>
Role in School	Head Teacher "external communication"
Class this year	
Years in Teaching	"I've been teaching for 25/28 years. A deputy for five years. .. I was a head for three years in Richmond"
Years in this School	5 years
Experience in other Schools	"I was in a very difficult school in Hackney ... I've taught in all sorts of schools. ... I taught in Battersea for six years as well and I loved teaching in those multicultural schools and the challenges that those schools offered."
Experience in other Employment	Went straight into teaching but was thinking about going to the Police as well

4.6 Mediating Systemic Change Through Sociocultural Methods in Educational Systems in the USA

Elizabeth B. Kozleski and Alfredo J. Artiles

Mediating Systemic Change in Educational Systems Through Sociocultural Methods

In this chapter, we explore the notion of technical assistance within an ethnographic research tradition and then propose a set of approaches to interpreting and acting on interpretations drawn from technical assistance activity. In the end, we hope to reveal to the readers the complexity of using evidence in a variety of ways to help systems make important shifts in their work, their cultures, and their decision-making processes so that changes in systems produce outcomes that are equitable for the students who go to school there. The processes that we use to collect, compile, analyze, and inform our work are steeped in ethnographic research methods. Thus, our work could be considered as that of ethnographer activists who participate in and influence the work of schools with particular emphasis on social justice and equity. Through this approach we help organizational leaders understand and re-mediate the ways that they structure and support equity in their schools.

Both the first and second author acknowledge the support of the Equity Alliance at ASU under OESE's Grant # S004D080027. Funding agency endorsement of the ideas presented in this article should not be inferred. They do not necessarily support the views expressed in this paper. All errors are attributable to the authors.

Some of this work offers units of analysis that link macro with micro level factors (Artiles and Dyson 2005; Gallego et al. 2001). For instance, we examine how federal policy makes its way through state and district interpretations to locally enacted practice at the school-wide and classroom level and even into specific interactions between teacher and student. This emergent work transcends fragmented views of individuals in which single markers of difference (e.g., race, social class, gender, etc.) constitute the focus of analysis (Ladson-Billings and Tate 1995). It moves beyond psychological notions of learning and development that locate knowledge development and change within individuals to focus on learning within communities as individuals build shared experience, explore opportunities, and hone their practice through interaction (Engeström 1999).

Change in participation defines learning. Systems change work embodied in sociocultural research methods offers an approach to engaging in change within community. In this approach change work becomes both the *method of inquiry* (i.e., the process for understanding) and the *mediating context* (i.e., the activity that shifts understanding) in which change occurs. In addition to locating change in community and identifying change processes as research, there is a third pillar of this work: on equity focus. By focusing on equity, systems divest themselves of institutionalized racist policies and practice that, we argue, are a result of action without inquiry, which, in turn, stems from anemic or weak methods for examining, interpreting, and critiquing local practice (Engeström and Sannino 2010).

Using the tools of ethnography to examine a system's work in action offers opportunities and challenges for researchers and participants alike. Participants within activity arenas like schools and school systems wrestle with time on a minute-by-minute basis. Institutional mandates, the 182 days that students attend school; the densely packed, test-atomized curriculum; and the unexpected daily even hourly surprises that come from large numbers of people trying to navigate the same pathways; at the same time, following the same routines, challenge even the most skilled time managers. Therefore, reflexivity, the luxury of considering an action before making it and assessing its value afterwards, is rarely experienced.

Our project work with school personnel asks practitioners to take time to remediate their experiences, attending to multiple influences and interpretations of the events that surround them. We meet with small groups of school personnel with a set of questions that help lead them through a process of questioning their daily practices, both what and how practice occurs. Critical ethnographic methods require the accumulation of evidence in some consistent process, the development of hunches or working hypotheses about what is happening, followed by more and more focused evidence collection to help make meaning and refocus effort (Holstein and Gubrium 2008). Vignettes from shared descriptions of everyday life and the commentary that accompanies these vignettes become part of the evidence change that is used to chronicle conceptual and activity shifts in school communities. In this way, together, researchers and participants document how schools construct, manage, and sustain social realities. Importantly, in our work, we ask ourselves and our participants to be *critical* ethnographers (Anderson 1989). We collectively examine how, through our discourse and instructional tools,

meaning emerges and the cultural work of schools is woven. As we discuss here, entering into a critical stance complicates research efforts to warrant our processes with participants and external audiences as we construct understanding of our data. Thus, using ethnographic tools to mediate our activities as technical consultants creates a number of methodological and ethical dilemmas that we explore in this chapter.

In this chapter, we reveal a kind of double move in which the data in the system (e.g., vignettes and their commentaries) and our own field notes about the influence of our presence are consulted as we move forward. How we take care to collect, compile, and use our own field notes, status reports, and decision trees to track and examine our own work is a critical piece of this chapter. We explore the ways in which our mission constrains our support and our support constrains our mission. Further, while we provide support in specific ways, we are also funded by governmental agencies in which vested interests define what counts as success. Chronicling, interpreting, and theorizing about the meaning of these moves offer a telling view of the politics of educational reform. Along the way, readers will encounter sections of this chapter that explain the context of our work, describe systemic change with educational systems using one case as an example, highlight the methods, and explore the impact and analytical opportunities by enacting our role as a method of inquiry.

Methods

Setting: Working on Equity Issues as an Arm of the Federal Government

This chapter draws from work completed through a grant from the US government that funded our work as an equity assistance center. The center was responsible for providing rights training and advisory services for all schools and communities in three states to address equity and access issues in public education. There were almost eight million students from preschool through 12th grade in these three states. We focused on prevention, intervention, and remediation strategies with schools, local school systems, and state education agencies to reduce racial, gender, and socioeconomic disproportionalities among groups of students.

Variability in public education in the USA is important because local and state contexts produce very different kinds of tensions and opportunities. States, not the federal government, have the constitutional responsibility to ensure access to education in the USA. This means that all 50 states and 10 US territories (e.g., Puerto Rico) have their own sets of educational laws and regulations that map, where required, onto national legislation that finances some programs, notably those for students who meet certain thresholds for poverty, English language skills, and educational disabilities. Local school systems raise much of the operating costs

for educating children from kindergarten through high school graduation through local property taxes. Locally elected (in some cases appointed) school boards oversee local school districts that have distinct and specific sets of regulations. For instance, in one metropolitan area of more than eight million residents, there are 18 different school districts and school boards each with their own curriculum, teacher hiring and evaluation procedures, transportation systems, and so on. Thus, working with any school district requires careful excavation and attention to its cultural history, rules, lore, collective identity, modes of communication, and procedural fluencies. This context is critical to understanding that centralized and national strategies to change educational practice have had little impact on local experience in spite of more than 60 years of sustained efforts to improve educational outcomes through national initiatives.

What became apparent in working with individual systems was that often, districts and schools lacked information on two counts. First, their knowledge of current research and emerging knowledge was fuzzy at best. Second, they were unaware how their own practices improved outcomes for students viewed as culturally and linguistically diverse (see field note 1, 2009). Further, school and school district organizational structures served as barriers to change and improvement. Institutional structures lacked flexibility for developing internal capacity in terms of the distribution of knowledge and inquiry strategies, the redistribution of services and supports, and communication strategies with their employees as well as the larger communities they served (Kozleski and Artiles 2012). Complicated by institutionalized practices, these structural barriers appeared to explain some of the graduation and assessment data gaps between White and Asian-American students and other ethnic, racial groups as well as special education and EL groups.

Keep in mind the importance of our approach as a continual interpretive act based on analyses of the institutional and structural constraints of the system that we were entering. That is, interpretation of our work began as we made decisions about where to enter a school system in order to increase the probability of changing practices. Understanding the local context meant that deciding whom to call for an initial contact had implications for who would call us back and what kind of reception we might have. What occurred in these initial conversations had ripple effects in terms of who else in the senior administration might call us and begin conversations. We wanted to connect with enough people in the system to help us better understand the constraints and affordances that existed in this particular context so that our work with them could expand and connect both quickly and deeply. Each move was based on interpretations that were being made as we talked and began to map the relationships, the leadership dynamics, and the local funds of knowledge (Chase 2005). We taped these initial conversations (with permission from our participants), wrote field notes, and involved our own team members in interpreting the emerging story lines.

In the district that we refer to in the paper, district leaders were in flux. The superintendent was retiring. Several senior executives each with different kinds of responsibilities such as curriculum, personnel, and finance each saw themselves as potential superintendents. The interviews with each of them and

the people who supported particular promotions equivocated between offering sharply focused (a) analyses of equity issues and (b) analyses of poor leadership decisions. In the next sections, we describe our work with schools and districts from the first contact with a district, through data gathering, planning, implementing, learning, and honing the remedies or processes.

Process: The Conceptual Frame

We conceptualized transformative equity assistance work as coordinated effort to build capacity and nurture ongoing professional development through reflexivity. Ethnographic methods provided the vehicle. Using data, we worked with organizational leaders to inform their frameworks, develop their knowledge base, and remediate what they emphasized through discourse and action. We supported this work with tools designed to help mediate how people understand the landscape in which they work and define their problem spaces in ways that recognize and organize complexity (Engeström 1999). In addition, we proposed that transformative equity work is institutionalized and scaled up through a distributive model of organizational change in which effective practices are systematically disseminated through school networks (Kozleski and Huber 2010). We have described this work elsewhere as organized around five key transformative mediating structures: (a) remediating understandings of the problem; (b) disrupting the view from above; (c) forging new spaces; (d) cycles of inquiry, reflection, and action; and (e) implementing and assessing change (Kozleski and Artiles 2012). Critical ethnography demands that researchers examine how power and privilege are exercised within settings (Cannella and Lincoln 2009). Unexamined everyday practices reify historical patterns of interaction in which some groups benefit because of the existing informal or unspoken rules of conduct that marginalize other perspectives and frames of reference.

One district in particular had serious gaps in achievement among racial/ethnic groups. After a series of conference calls in which the district superintendent, the chief academic officer, and other district leaders identified a set of issues that they felt were contributing to their data outcomes, we proposed a process for working with them. We designed this approach to foreground organizational change for social justice and equity outcomes since addressing issues of inequity for some families and students emerged from an initial needs assessment. Our task was to create access to tools that captured the current landscape as well as anticipated progress on critical equity issues that centered on differential educational achievement based on gender, national origin, and race. We wanted to help the district team understand how a focus on improving results for *all* students improves results for particular groups as well. As ethnographers, we went back to our data to examine the relationships.

Throughout this period of time, with the consent of the individuals and the school system involved, we audiotaped our meetings, made field notes, and shared

brief summaries of those notes with the district participants. We were beginning the work of laying an ethnographic trail of our entry into the system. While we talked with groups, we also interviewed key players individually to understand motivation, commitment, and the degree of reflexivity that key individuals brought to their work and the problem spaces they inhabited. As Charmaz and Mitchell (2001) remind us, we had to collect and sift through our data carefully. The data connected in specific ways to the context in which we were operating. While disclosures from individuals mounted as we built closer relationships, we had to be cautious about introducing mediating tools based on what was emerging. As ethnographers we needed to preserve our relationships with all the participants. We could create new tools, like processes for conversations that we knew needed to occur but were mindful that we might create uncomfortable dilemmas for participants about whether to disclose information or stay silent. In these moments, we returned to data to tell the story for us. Sometimes, crucial concerns remained buried for some time before they emerged, if at all. While we coded our data line-by-line, we also had to stand back from our transcripts and look at whole anecdotes and scenarios to understand the emerging relational and political map. We shared our data with our participants, always in groups so that data that came to us looped back to groups to interpret together.

We both established a bounded space in which individuals developed relationships *and* explored assumptions and ambitions about the nature of the space and the complex issues that surfaced. Our technical assistance emerged as a process for troubling the spaces in which equity issues were emerging. At the same time while we were creating the contexts for awareness to develop and build momentum for change, what we did was also critical ethnography. It made participants aware of how they conceptualized and acted within this bounded space.

Widening the Work: Remediating Whose Views Matter and How Problem Spaces Are Conceptualized

We asked the district leadership team to identify a set of key leaders among their teachers, related service personnel (e.g., school psychologists, speech/language therapists, counselors), principals (i.e., school heads), and district managers. Members needed to be able to commit to working as members of a district change team in the mode of what Engeström (1999) calls an “expansive lab” to reimagine the landscape of the district looking at historical timescales, patterns of migration, the emergence of the professional hierarchies, and the structures and socialization patterns that shaped contemporary practices. This team needed to consist of more than inside members of the organization; it also needed to include the students and families who experienced the school culture and establishment. This mix of insiders and outsiders was a critical move intended to disrupt practice and dialogue in its usual way. As critical ethnographers, we needed to broaden the participation

in our research since we wanted to uncover the multiple intersections of power and privilege. The experience of family members in schools is often a telling detail.

We asked to meet with family groups that were informally organized and serving as critics of the system. A series of focus groups helped us to learn more about family experiences and responses to the school experiences of their students. We also met with students in focus groups. Data from these focus groups merged into our mapping phase described in detail in the next section. Our ethnographic strategy was to widen the circle of reference for the work and widen our own understanding of the cultures negotiated and transformed within the district. Through the voices of families, we began to understand the distribution of power within the school system. With the families, we analyzed transcripts from the focus groups from two perspectives: the ways in which families read the official district discourses and how families were attempting to mediate and shift those discourses to benefit their children (Anderson 1989).

Through the focus groups, we nominated a set of family representatives and students who joined the *district change team* (DCT). Their participation elevated concerns with district staff and family members. At the heart of these concerns were issues around (a) expertise, (b) the capacity of the district to meet the “demands” of families and students, and (c) how negotiated spaces might be constituted and engaged to find ways of moving forward together. Families and students were concerned about being drowned out and dismissed. These concerns came from our frequent individual interviews with key participants. As ethnographers, not only were we interested in the work of the group around making changes to improve the opportunities for historically marginalized students, we were also interested in the individual narratives that were traveling alongside the constructions of the larger group. We wove back and forth between these lenses to help us understand the change project as it evolved but also to understand its impact on individuals within the system. We sifted and analyzed the individual and collective evidence. The ongoing data analysis accomplished two agendas. It provided direction for our technical assistance while it also informed our ethnographic discovery method, helping to direct us to new sources of information.

We surfaced issues that emerged in our focus groups and interviews through small vignettes that we wrote for dyads of school and family members to read and discuss. These anchored conversations became a way to open up conversations about the nature of knowing and the kinds of knowledge prized in schools. Transcripts from our focus groups were analyzed as they became available. They helped us develop hunches about the dynamics of the district, the decision-making processes, who and what was valued in decision making, and the historical threads that seamed together some working assumptions of the group.

For our work, making hunches marked a new period of inquiry. What was being interpreted and problematized began to seep into our work. We wrote brief memos and vignettes that captured emerging tensions to share with the participants. In this way, without naming sources and through describing what we called “cases,” we were able to member check our analyses, sharpening our understanding of what we were learning *and* improving the quality of our interventions.

We wanted to generate insights, develop explanations for how the district operated and used power to maintain its stasis, as well as to seek understanding for why the system operated as it did. We did this always mindful that, while the participants had particular experiential knowledge that we lacked, they also were reconstructing their own individual and collective social realities (Anderson 1989).

Through the member checks, individuals began to know one another and develop appreciation for the points of view and experiences that they brought into the DCT. Developing a team selected for its transdisciplinary nature meant selecting school insiders who represented a variety of teaching, learning, and operational perspectives. It also meant that inviting school outsiders who had stakes in school outcomes but weren't employed by the system to change the nature of the dialogue. Selecting who would be on the DCT was the first of several disruptive moves that we made. These moves were designed to help reveal to participants the unexamined assumptions that formed the foundations of some of their everyday practices. For instance, while teachers said that they engaged parents, they didn't want parents at their DCT meetings because "they wouldn't understand." At each juncture and new step in the process, we made sure to remind participants of the double moves being made by supplying participant meanings and perspectives ethnographically: (1) the conversations and meetings formed the basis of inquiry and (2) the inquiry formed the basis of action. Because of this interactive process, we were able to get feedback frequently about our hunches about what was being observed and interpreted.

Gathering Data: Disrupting the View from Above

We asked the district leaders to compile data from district databases to display geographically the contours of the issues that they faced. We wanted to use maps since they emphasize the spatial relationships that provide texture and describe patterns without words to translate these relationships. As Paulston et al. (1996) noted, words sometimes filter the interpretative act, putting unnecessary barriers between the observer and the data. We mapped a variety of data. For instance, data from the focus groups that identified schools where referrals to the office for students of color were frequent were mapped onto geospatial Google Maps of the community. We included achievement data by clusters of students grouped by (a) gender, (b) ethnicity, (c) race, (d) ability, and (e) English language status. Imagine a Google Map that you might encounter in the local newspaper showing neighborhoods by density of the population. Highly dense neighborhoods might be red, while moderately dense ones would be yellow, and low-density spaces would be colored blue.

We used maps to accomplish a similar goal. This kind of data representation is so important to visualizing the narrative in critical ethnography. Explanation gives way to geospatial representation. The picture provides the opportunity to pinpoint social injustices quickly without much mental effort. Mapping entailed coloring

school buildings by one factor, such as the racial makeup of the student population. For example, all buildings with a student body comprised of more than 70 % Latino students were colored yellow. A district might have 120 schools, marked on the map, by location. Of those 120, 84 would be colored yellow. And then, because the purpose of the map would be to show the spatial dimension of a problem, all the buildings that overidentified their Latino students for special education might be shaded with diagonal lines. In many cases, the schools that were overidentifying might be the 36 schools that were predominantly White.

This kind of data representation tells a powerful story to its users and moves the conversation beyond what numbers represent to questions about what happens in the two sets of schools, surrounding neighborhoods, and communities. Critical ethnographers can build a narrative case using data in a number of visual ways. Geospatial representation reminds us at once that we inhabit lives that have geography and this geography as Soja reminds us shapes our lives (Soja 1996). Curricular resources, teacher experience by years of service, building facilities, longevity and experience of principals, student population numbers, class size, and many other features of opportunities to learn (Oakes 1990) were overlaid onto the maps. Images of neighborhoods and context anchored the data, pushing the conversations forward.

By creating these maps and the space for analysis and interpretation within the DCT, we were setting the stage for the team members to understand the educational space created within the district in new ways. Members of the school district had been exposed to *receiving* numerical data in the form of tables and charts, but they had never connected the data to place so that patterns were readily discernible across the geographic scape of the district. Further, by overlaying different kinds of data, patterns between placement and achievement or opportunities to learn and active, well-used community space (like parks, community farmer's markets, and local grocery stores) emerged. The DCT began to connect data in new ways that accounted for the contexts in which school and student performance occurred. Together, the DCT was able to examine context and current outcomes.

Ruitenber (2007) notes that "representations never merely represent, they also constitute and produce (p. 9)." Geographic data displays shaped the discourse. We constructed geographic information systems (GIS) maps and other evidentiary sources (e.g., classroom photographs, videos, and building walk-throughs) to disrupt simplistic explanations of the problem. We also mapped enabling influences that might inform future intervention efforts (e.g., collective efficacy, social networks, civic engagement) (Artiles et al. 2011; Kozleski and Artiles 2012). The artifacts we designed also made visible the ways in which disability constitutes a boundary object (Star and Griesemer 1989) that is highly adaptable to local conditions "but [its] structure is common enough to more than one [social] world to make [it] recognizable, a means to translation" (p. 393). *Equity* can be indexed and more readily seen in spatial analyses that demonstrate the distribution of *inequities* (Artiles 2011). Participants noted that there was "disparity in our own knowledge of the district (field note 2, district meeting)." They began to discuss who had access to certain kinds of information, what kinds of information were

privileged, and which were dismissed. By shifting the team's conversation to understanding as opposed to recognition, the group coalesced around inquiry as a mode for dialogue.

The next step in our ethnographic process was to design inquiry tools (sets of questions that required analyzing evidence before answering) that mediated the participants' understanding in new ways. We used available evidence and represented it in unfamiliar ways that demonstrated the complexity of educators' work at the intersections of policy, research, and practice (Engeström 1999). By changing the discourse around data, we tried to disrupt binary explanations of outcome inequity that blame either students and their families or systems. Critical ethnographers must be concerned with how the distribution of power and privilege operates to marginalize some while privileging others. Mapping data offered what Engeström (1999) refers to as a mirror that both reflects a picture of the district and requires the construction of a shared narrative that offers a way of different factions to co-construct a new reality. Thus, our mapping venture provided a situated, improvisational, and contested space so that narratives and counter narratives emerged from the participants. Our mapping process required three meetings for the group to (a) move through their reactions, (b) develop shared understandings, and (c) forge new narratives for the school district. Embedded within this narrative were spaces to concentrate effort and innovation to shape improved outcomes around equity.

Forging New Spaces

We continued to meet as a district change team to develop a plan based on the new narrative around equity and inequities. Through the process of mapping, we created an analysis and conceptual framework explaining how the system produced inequities. The next part of our process was to use this conceptual framework to design collaboratively a plan for remediating the institutional structures and cultures that maintained the status quo. Developing this conceptual framework with our participants helped to name problem spaces while still maintaining the drive towards understanding.

The planning process began with identifying features of good solutions to equity issues. Small groups of three and four team members worked together to develop a set of criteria that they would use to evaluate whether or not solutions that might be suggested would meet their criteria for "good." This allowed the participants to delve more deeply into considering the notion of "good." In particular, they explored notions of good *for whom* and *for what outcomes*. This approach was initially confusing and difficult. Participants in project of this nature want to identify solutions. They rarely consider the features or criteria for good solutions before trying solve the problem. At first, their conversations easily strayed into identifying what would work. After several false starts, they began to understand the importance of considering what they typically saw as ways of solving problems

and how bringing a critical lens to finding solutions changed the nature of problem solving itself.

This work was frustrating and slow for many of the participants. However, two aspects of the social nature of the groups seemed to maintain their willingness to stay connected to the process. The variety among the group members kept individual participants working. School personnel wanted to demonstrate their professional commitment to leadership work so they maintained their effort. Families and students maintained their participation because they wanted to sustain their involvement over time and avoid returning to old patterns of exclusion. Charmaz and Mitchell (2001) remind us that grounded theory development requires attention to several dimensions: (a) the simultaneous need for data collection and analysis, (b) the search for emergent themes in the early stages of data analysis, and (c) the opportunities that arise for understanding basic social processes within the data.

Spirited and intense conversations generated a variety of criteria for good solutions. Small groups presented their criteria to the entire team. Participants clustered criteria when they seemed to have similar intent and concern. One criterion that emerged from multiple groups was to build in a sense of urgency into each goal by setting expectations for rapid and sustained change. Each solution included specific evidence to track progress and goal attainment. In this phase of the process, the group began to talk aloud about what researchers might call internal validity. They began looping back to previous work to ensure that their sorting processes were consistent over time. Where they found anomalies, they discussed changes in their protocols and decision trees. Where they made changes, they went back and resorted criteria. The role of the group facilitators was to ask questions to help clarify processes. The group determined the point at which all criteria for good solutions had been determined. The next step in the change process was to examine the maps again to identify key issues, identify possible solutions, apply their criteria for good solutions, and then craft explicit goals for change processes. As ethnographers, our work was to focus some attention on the process itself, ensuring that all perspectives were aired and discussed fully. We tracked these conversations to make explicit the kinds of decision-making processes that were being used.

Cycles of Inquiry, Reflection, and Action

The district change team was ready to move to a new phase of their work: the familiar space of action. First, they needed a plan that not only had instrumental equity goals but was designed in such a way that it expanded learning and development for practitioners, families, and students throughout the district. Thus, the processes of mediating how people came together to understand, reflect, and act in congruence with equity outcomes were critical to the success of the end goals. Gutiérrez (2006) speaks to this notion of reflexivity in which critical issues like voice and participation become key touchstones for ongoing research that is equity minded in nature. However, the process of inquiry, reflection, and action was

unfamiliar. It clashed with deeply held notions of the role of leadership in creating a path forward and conflicted with needs to make rapid advances in long-standing inequities. In this district, leadership had meant commanding attention, issuing policy, and asking managers to carry out the policies. Where resistance arose, staff attended professional learning workshops to learn to perform the new policy. Political power was maintained by creating small, loyal groups that worked behind closed doors to decide on collective public performances. This strategy sustained over several generations of superintendents. Spending time in shared inquiry, evidence interpretation, and critical analysis was unfamiliar territory for most of the school personnel.

The tension between technical solutions, that is, what should be done and in what detail, and a critical analysis of the power and privilege dynamics that maintain certain structures, notions of accomplishment, forms, and functions within organizations and among people, was continuously present in our discussions. Our constant threading of critical ethnography methodologies in our work helped the group to be both in the process and stand back from it so that a constant critical examination of the power dynamics happened simultaneously. The role of our mediating tools was to surface the assumptions that undergirded solutions that were proposed. We still needed to create social spaces to use tools productively and where particular practices mediated people's engagements with the tools.

The design of two kinds of social spaces was instrumental in our work. First, we designed social spaces for labor-intensive meetings led by our staff with state Department of Education personnel. Second, we designed learning networks among states. These two strategies allowed us to infuse explicitly an introspective dimension through activities that promoted a "double move" (Hedegaard 1998) in which participation structures compelled personnel to shift from personal/professional experiences to theoretical sense making, based on a new vocabulary offered in these meetings. Simultaneously, the everyday experiences of the personnel offered a way into sense making that was grounded in local state department problem spaces. These two processes constituted the double move in which both the TA staff and the government personnel engage in understanding the target problem. The TA staff created a platform for understanding, while the government personnel brought their everyday conundrums into the space. For instance, a phone call from a mother requesting assistance because someone wants to label her son begins to be mediated by helping to identify the problem space (i.e., the object), as ways of engaging families and the schools that serve them. Shifting problematizing to engagement helps the participants begin to learn more about how they systematically categorize and organize their students in order to accomplish their own schooling tasks rather than how they organize their work to support their students. Central in this work is exposing the nature of assumptions about the roles that schools take on and their public purposes, as well as the identities that are conferred to those that hold the roles. Part of our technical assistance work is to reveal through dialogue how these perceived identities as well as prescribed roles interact to afford certain kinds of responses while constraining others.

Once a problem space was identified from the mapping work and the features of good solutions were described, then small groups worked together to identify at least three strategies for addressing priorities. The group selected a final slate of action items after considering the work of each small group. Reviews of what to do and why, how others would be involved in learning and developing their understanding of the agendas, and how they might be shaped and modified at a local classroom or building level were established. Then, participants designed plans for communicating the work, the steps forward, and the outcomes. The design team specified progress checkpoints and outcome measures. A small group produced a project tracking and coordination plan that was reviewed and agreed to by the entire design team.

We used two ethnography tools consistently in our work. The first was the design and development of a field note tool that each of us used whenever we had a face-to-face or virtual meeting with members of the DCT. This field note extended the field note description of Emerson et al. (2011). The field note had places to itemize what was discussed, what was planned, and who had responsibilities for following through on tasks. The field note also had spaces for chronicling observation in which many power-laden actions were noted: (a) the changing uses of language, (b) developments in discourse patterns that altered standing practices around who spoke and who primarily listened, and (c) notations on the social networks within the team.

Once a month, these field notes were compiled, looking for emergent themes. Quarterly, the field note compilations were fed back to the DCT as a form of reconstituting and remediating the communication patterns and impacts within the team. At almost every meeting, we were able to identify one or two participants who seemed to either be strongly involved or moved to the margins in the conversations. We interviewed these individuals to check our field note observations, get expanded points of view on the meeting, and help us understand how we might change up the mediation patterns at the next meeting. These interviews also became part of the data feedback loop. We sought to avoid providing information in such detail that identities were revealed while wanting to show that we constantly assessed our own understandings to better understand and detail the process. Sharing the data became another form of intervention with the DCT.

Implementing and Assessing Change

Another key assumption that informed our practices was that educators' professional learning is promoted through data-driven and research-grounded content *within the context* of educators' practice-embedded activities (King et al. 2009). Thus, these social spaces were grounded in personnel's professional practices and evidences collected by the system in which they worked. Moreover, in response to a critique by Davies, Nutley and Walter (2008) of the use of research in policy and practice, we suggest that research methodologies need to transcend linear views of

knowledge work. Critical ethnography is a kind of knowledge work as this chapter has demonstrated. It is, at best, a spiral process in which information is gathered, interpreted, processed with participants, and examined again as perspectives within the group shift through interrogation and interaction. No longer do ethnographers labor in specific contexts to produce evidence that is transported into other settings. Instead, our critical ethnography approach provides action processes for the design, modeling, and development of research *as* practice. For this purpose, we followed cycles of inquiry, reflection, and action with the DCT so a period of active data collection was punctuated by sets of meetings that required examining evidence of how our work was changing perspectives and the power differentials within the group. We asked the DCT to consider who benefited and who was marginalized by our actions and their results. The data we used to examine power and privilege as an outcome of the organization were also part of our ongoing inquiry into the process of inquiry itself.

Sharing the Data as a Form of Intervention

Our task was to help support questioning, data gathering, and the ways in which systems change efforts were assessed against equity benchmarks such as demographic data on discipline referrals, community involvement on the part of school staff, and the redistribution of creative capital through, for instance, creating teacher networks to support and develop robust teaching (Kozleski et al. 2012). Further, the DCT team members learned to collect multiple kinds of data that helped them to understand what, why, when, how much, and how inequities seem to develop and sustain locally. These approaches to inquiry, implementation, and assessing change outcomes led to changes in how principals worked with their staffs. They began to use heuristic tools to help teachers question their practices and reposition their approaches to learning. Together, they began to develop feedback loops that traced their initial assumptions about what was needed locally, their efforts to implement, and the results of those efforts on changing patterns of performance locally. In this section, we explore some of the methodological issues that emerged as we engaged with the DCT.

Our approach was grounded in an emphasis on civil rights and cultural responsiveness, as well as evidence from the literature that students can excel in academic endeavors if they are provided with access to high-quality teachers, curricula, instruction, programs, and resources and their cultures, languages, and experiences are valued and used to facilitate their learning (Rumberger and Ah Lim 2008). Guided by a thematic focus on enhancing both *understanding* of equity in classrooms, schools, and school systems and the *use* of evidence-based practices, our approach addressed the gaps and priorities identified in recent, major policy and research equity reports (Artiles and Dyson 2005; Donovan and Cross 2002; Harry and Klingner 2006; Klingner et al. 2005; Skiba et al. 2008).

Conclusions and Next Steps

Our work focused on partnering with school systems to address equity and social justice in schooling. We used a set of ethnographically crafted tools that both help districts examine and understand their data in deep ways. This same data helped us as technical assistance providers to interpret what we chose to look at and then to make decisions together in terms of the change process. The entire process is ideographically complex and fraught with unknowns that, at each step, must be fairly and productively addressed. What our data compilations examine and omit in displays of evidence skewed participant attention and, therefore, their activities. To maintain our stance as researcher-activists, we pushed ourselves to warrant our data trails, insisting on integrity in member checking and ensuring that the resulting evidence both help us understand the process of change while powering change at the same time.

A substantial proportion of our equity work focused on the racialization of disability as a means to address deep educational inequities for learners that live *multiple marginalities*, i.e., gay, disabled, and African-American (Kozleski and Artiles 2007). Our critical ethnographic work assumed a systems change stance in which macro, meso, and micro levels of systems interacted to seek stasis while, simultaneously, individuals and groups within systems remediated goals, reinterpreted events, and renegotiated activity (Kozleski and Huber 2010; Cole 1996; Cole and Griffin 1983). This required an ethnographic examination of evidence about practices that make visible the deficit visions about some learners that permeate educational policies and practices and the subjective nature of disability diagnostic decisions (Kozleski and Artiles 2012).

Our perspective on technical assistance transcended previous notions of “assistance” that sought to transfer research knowledge to the everyday worlds of practitioners. Instead, we designed theoretically grounded artifacts with evidence from participants’ everyday practices as a way to remediate their views and actions (Kozleski et al. 2012). Next, we engineered social spaces with practitioners in which we used these artifacts in the analysis of the racialization of disability. What emerged from these analytical events were new forms of understanding the problem and alternative educational futures for the affected marginalized learners (Engeström 2011).

We examined how researchers and scholars can engage in opening up the possibilities of what McKenzie and Scheurich (2004) call “the gaze.” That is, we helped participants use unfamiliar lenses to examine and understand evidence from different vantage points. Further, once evidence is curated, how it is displayed, to what audiences, and for what kinds of discussion, analysis, and interpretation provide a setup for uncovering within group differences as well as offering opportunities to uncover and debunk assumptions and positions that may have been masked to participants. Evidence referred to both quantitative and qualitative information that we asked participants to explore in novel ways that require their own participation in constructing cases, vignettes, and other forms of intermediary analysis.

Importantly, because our work was systems change in action through critical ethnography, the quality of the kinds of interpretations that were made and how interpretation migrates into action causes another form of data transformation. Standing somewhat apart from the action within the organization is our work as technical assistance providers who track the ways in which the school, district, or state teams understand, influence, and support decisions at each part of the process and make these data transparent to the members of the change system.

We described, analyzed, and discussed the study, interpretation, and implementation of ongoing educational change that explored the limits of conventional approaches to inquiry-driven projects and offers some alternative approaches to engaging change. Using data from a case study of a recent technical assistance project concerned with educational equity for marginalized groups, we detailed the challenges of careful inquiry and interpretation in a rapidly changing complex environment that characterizes school systems in the USA. In this chapter we suggested that technical assistance offers a critical opportunity to engage individuals and activity systems in changing the outcomes of their practice and, in doing so, shift their praxis in ways that can mediate future work. Because we locate this work within an ethnographic methodology that is steeped in activity theory, we described and critiqued ethnographic methods that offered a new, critical approach to technical assistance that offers a rich context for ongoing research and inquiry as a critical feature of systems transformation.

4.7 Changing Teacher Education in Sweden? A Meta-ethnographic Analysis Based on Three Long-Term Policy Ethnographic Investigations

Dennis Beach, Anita Eriksson, and Catarina Player-Koro

Introduction

Jeffrey and Troman (2004) described ethnographic research in education as research that was usually conducted by a lone researcher through direct and participant observation in specific settings over a significant time period. This time period was ideally one of several years rather than only a few months or weeks (Walford 2008). It involved, they added, continuous reflections concerning the complexity of the researched contexts and made use of explicit theories and theoretical perspectives in its analyses. These dimensions of ethnography have also been pointed out by others, such as Willis (2000). The aim is to identify significant processes of social interaction in order to develop well-founded assessments of the ways social reality is constructed and produce detailed and precise accounts of them (Beach 2010). Their success requires “catching” the significant details of lived processes in field notes and freezing them for later, repeated inspection and analysis. Repeated interactions between ideas and data in the use of comparisons and the search for generic concepts that link and transcend local circumstances thus form the basis of an essentially creative act of ethnographic interpretation and representation (Willis 2000; Trondman 2008).

Three research projects of this kind have informed the present chapter. Each was based on long-term policy ethnographic research of teacher education policy-driven

reform in Sweden (Beach 1995; Eriksson 2009; Player-Koro 2011, 2012a, b). They were conducted at different times (in 1988–1991, 2003–2005, and 2008–2010) as separate studies, but they also formed links in a chain of investigations. We could thus describe them in this sense as comprising a series of investigations that covered a continuing plot of policy change and teacher education development that has been presented in a sequential episode-by-episode fashion. Each project had its own unique qualities, but they (and the publications from them) were also related through their common focus on teacher education policy and the organization and content of the internal activities of teacher education over time.

Each project can be analyzed and read as an independent ethnographic study, and studies from either of them could have been used to illustrate elements of “conventional” ethnographic interpretation in keeping with the aims of the present handbook. However, due to the shared interests across the projects, there is also a possibility for making a collective analysis. This is what we try to show in the present chapter, illustrating an interpretive innovation in ethnography that goes under the name of meta-ethnography. Using meta-ethnography means that while in the independent studies we were analyzing and trying to make sense of what was going on in specific educational settings at a particular time and place, in our combined reanalysis we are interested in general trends and possible patterns in policy development over time and providing generalizations from earlier data and analyses by exploring and extending the conceptual schemes from these different studies.

Parallel to other forms of meta-analysis, meta-ethnography thus involves comparisons across projects in an attempt to identify and synthesize key elements from the contents of each respective investigation (Weed 2006; Savin Baden et al. 2008; Beach et al. 2013). These are then used as “data” and extracts from them are employed both to illustrate arguments and question any emerging claims that are made. In the present case it is extracts of and summaries from official policy, educational arrangements, and educational effects that figure in this data. Student teacher comments and reflections on their education and professional knowledge needs in the independent projects have also been drawn upon heavily. This has produced a bias in the chapter in the form of what we could term “text and talk data” (basically formal written text materials, interview extracts, and transcription fieldnote extracts). Descriptions of material relations in educational practices, social regionalization in educational spaces, and the content of social and physical interaction, all of which are common and important in the representations from the original projects, are not significantly represented here.¹

¹ Most material is from field conversations in or close to actual class-/lecture-room contexts. These conversations have been “naturally occurring” in group work and breakout sessions in conjunction with seminars or the so-called mentor group meetings. They have mainly taken place within the formal institution within one or other of the multitude of small group rooms and classrooms of the research institutions. All talk data used in the chapter has been respondent validated previously, in conjunction with our earlier investigations and reports.

History of Context: Teacher Education Policy

Ethnographic studies may (and perhaps ideally should) begin with a background analysis and presentation of the research context (Walford 2008). In the present case this context is formed by the three investigations themselves, the arenas they were carried out in, and the policy background to teacher education reform and content that they were each interested in. It is not possible to present this entire background context here. However, the common policy background is important and will be dealt with in the coming pages.

As in many other countries, teacher education policy in Sweden has been historically structured in accordance with the characteristics and content of the school system. This has created a history of different teacher educational traditions and different ways of perceiving what characterizes the teachers' mission and professional expertise (Beach 1995; Erixon Arreman 2005; Erixon Arreman and Weiner 2007). However, two distinct traditions predominate in regard to teacher education for prospective teachers of school-aged children. One derives from the teacher education seminaries from the early part of the previous century. It focuses on practical aspects of teaching younger children. The other derives from an academic education focusing mainly on academic subject teaching in the grammar schools and academies (*realskola, läroverk*).

These two traditions of teacher education have historically been very different from each other. Their recruitment was from different social classes initially and later also genders. They had very different curricula, and their "graduates" formed different professional agendas and relations to state bureaucracy. The seminary tradition has been based on a practice-oriented curriculum model together with a subject knowledge curriculum that generally consisted of the same literature that the prospective teachers could use in their future teaching. It was aimed at the teaching of younger children and children from low socioeconomic backgrounds in the so-called *folkskolan* (Jedemark 2006; Åstrand 2006). Being a seminary-trained school teacher in the lower grades of the elementary school was the lowest and least prestigious position in the education field (Lindström-Nilsson and Beach 2013), which we can still see evidence of today (Erixon Arreman and Weiner 2007).

The second tradition that of grammar school teacher education, in contrast, emphasized the learning of formal subject (disciplinary) knowledge for teaching older children, mostly from the middle and upper-middle classes. In it knowledge of teaching as a professional praxis was regarded as scientifically unproblematic, practical, and personal (Jedemark 2006; Åstrand 2006). Grammar school teachers had an academic matriculation and university studies based on extensive academic training. Subject matter expertise formed the specific cognitive base for professional action, together with one semester of studies in education and psychology that prepared candidates for teaching in both the upper levels of the academic grammar school (the academies or *Läroverk* in Swedish) and the university. Subject teachers took a dominant position in the education field because of this. They could often have a double affiliation to both the education field and the academic field, and this provided possibilities for professional closure and

distinctions based on social and cultural capital, social background, and gender (Lindström Nilsson and Beach 2013).

For some four decades from the end of the nineteenth century onwards, the public elementary and grammar school traditions of teacher education existed alongside each other, as separate forms of teacher education. However, since then the policy history of teacher education has shown a number of distinct efforts to try to weaken these boundaries. These efforts actually began as early as the late 1800s, when liberal education policy makers introduced the idea of using the elementary school to provide a common education foundation, where children from different social classes were to be taught jointly during the first years of their education. They were opposed by the Grammar School Teacher Association and right-wing political parties and temporarily put to rest, but the struggle for unification was later intensified again after the introduction of the common comprehensive school idea from the 1940s onwards by the then Social Democratic Labour Party-led government.

The 1946 National School Commission Inquiry was the starting point of a 60-year-long process, and it began a policy trajectory connected to a new school and a new teacher education for a new society (Beach 2011). It proposed a 9-year compulsory comprehensive school in 1948 and outlined a reorientation of teacher education which, it was suggested, currently set organizational and personal barriers between primary, standard secondary, and grammar school teachers (Lindström-Nilsson and Beach 2013). The Commission therefore proposed a shared teacher training for all categories of teachers to create a shared (cognitive) knowledge base for the development of the comprehensive school (SOU 1948, p. 27, s 36).

The Social Democratic Party was the strong political proponent of these proposals, with support from the organized labor movement in the trade unions and the elementary school teachers' association. However, there was also some significant resistance to the proposals. This resistance came again from the right-wing parties in the parliament, the Grammar School Teacher Association, and the universities. Regarding teacher education, grammar school teachers already had matriculation and university studies and had thus already achieved important profession-specific attributes, such as several years of academic training. Their assertion was, as previously, that subject expertise formed the cognitive base for their professional action, that a professional component based on studies in disciplinary pedagogy could only be a secondary factor, and that increasing this component at the expense of subject knowledge risked watering down academic content and was hazardous for the quality of learning, recruitment into universities, and the knowledge standards prevailing in society.

The 1946 Commission recommendations weren't the only components in the school and teacher education unification projects. Other key components in teacher education were the reports and recommendations from the 1960 Teacher Education Expert Committee in 1965 (SOU 1965, p. 29) and the 1974 Teacher Education Investigation in 1978 (SOU 1978, p. 86), the Higher Education Act of 1978, the Teacher Education Reform Bill in 1984, the report of the 1997 Teacher Education Committee in 1999 (SOU 1999, p. 63), and the recommendations for

a unitary teacher education by the Social Democratic Government in 2001 (Government Bill 2000/01, p. 3). They formed a policy trajectory that was broken first in 2007.

In 2007 the newly elected right-wing coalition government appointed a new teacher education commission, the Sustainable Teacher Education Commission (HUT 07) (SOU 2008, p. 109), to see over the unitary organization of teacher education and suggest more sustainable alternatives, which it did. These recommendations reasserted the original dualist distinctions in formal policy and the replacement of the common core professional knowledge component that had previously existed (Ahlström 2008; Beach 2011; Kallós 2009). The recommendations were followed by a Government Bill (Government Bill 2009/10, p. 89) and an Act of Parliament in 2010 that acted directly to instate the main ideas (Beach and Bagley 2012; Payer-Koro 2012b; Sjöberg 2011).

Policy Analytical Theories, Concepts, and Method

As well as an adequate social, cultural, political, and historical background analysis, the interpretation of ethnographic data also requires sensitizing theories and theoretical concepts or is at least widely felt to be facilitated by these (see, e.g., Trondman 2008; Beach 2010). In our work theories and concepts developed by Basil Bernstein have been significant. The concepts of horizontal and vertical discourse, pedagogic discourse, recontextualization, classification and framing, code, and modality have all been important (see Bernstein 1999, 2000). However, two concepts have been particularly significant. These are those of the *official recontextualizing field* (ORF) and the *pedagogic recontextualizing field* (PRF). They correspond to two distinctive but also related fields of policy practice that are sometimes termed the fields of policy formulation and of policy interpretation, respectively, where the pedagogic discourse is produced and converted to the field of reproduction (the pedagogic practice) (e.g., Ball 1990). The former is dominated by the state and selected agents in, for example, the Ministry of Education, while the latter consists of education institutions and their actors. In the present analysis much of the data that is illustrated consists therefore of formalized statements of the former, from texts produced in the field of policy formulation in the ORF, interpreted and converted in the PRF to talk data generated in interactions with and between agents in the pedagogic practice.

A number of specific policies in the teacher education ORF have been considered in the research. They have been introduced above and include proposals related to: (a) the creation of the Teacher Colleges as post-gymnasial research and education institutions for the development and communication of professional content to all prospective teachers in the 1950s and 1960s (see, e.g., SOU 1948, p. 27; 1965, p. 29), (b) the introduction of full research professorships in applied educational theory and curriculum methods in these colleges, (c) the incorporation of the colleges in the integrated higher education system in 1978 (SOU 1978, p. 86),

and finally (d) the introduction of new research subjects in university teaching and research after this from the mid-1980s. These subjects were didactics (didaktik, i.e., roughly studies of curriculum development, teaching methods, and innovation) in 1984 (Government Bill 1984/85, p. 122) and educational sciences (utbildningsvetenskap) in 2001 (SOU 1999, p. 63; Government Bill 1999/2000, p. 135) including the subject of education work (pedagogiskt arbete).

The concept of policy ethnography strongly informed each of the individual research projects and provided the empirical basis for the joint interpretative work (see, e.g., Beach 1995; Eriksson 2009; Player-Koro 2011, 2012a, b). The joint work was made plausible in that our respective points of departure in the individual studies all lay close to Ball and Bowe's description cited in Beach (1995, p. 7). They were concerned with exploring policy making in terms of the processes of value dispute and material influence which underlie and invest the formation of policy discourses (in both the official recontextualizing field, ORF, and the pedagogic recontextualizing field, PRF) and portraying and analyzing the processes of active meaning making which relate policy texts to practice. They included the plotting of matches and mismatches in and between contending discourses in these arenas and examining distinctions between expressed formal policy and policy in use. Our joint focus in respect to this was on written policy, policy outcomes, policy mediation, and policy recontextualization (Bernstein 1990, 2000; Ball et al. 1994) as well as exploring the way teacher education was being organized, reorganized, and communicated over time and what young adult student teachers made from their experiences and expressed about what teacher education offered to them generally and in relation to their future profession.

Common Themes

From the individual and collective analyses, in the coming pages we will attempt to illustrate and support several empirically grounded interpretations. The first of them concerns the policy background. In line with suggestions by other researchers, such as Erixon Arreman (2005), Erixon Arreman and Weiner (2007), Ahlström (2008), and Kallós (2009), it states two things. The first has already been introduced. It is that for several decades from the mid-1900s, official teacher education policy had clearly expressed aims related to a social democratic vision of a common school for all and a more equal and democratic society. The second is that teacher education was given a leading role in realizing this vision but was recognized as also needing to significantly change in order to fulfil this role (Beach 2011).

A series of parliamentary-appointed national inquiry commissions were set up and given the task of assessing how well teacher education was living up to its charge and with recommending further needy changes in this process (Beach and Bagley 2012). These commissions stretched, as suggested earlier, from the 1946 *Teacher College Delegation Report* (SOU 1948, p. 27) to the *report of the Teacher Education Committee* in 1997 (SOU 1999, p. 63). They expressed a kind of policy

optimism, i.e., principally a kind of faith in the abilities of reform to actually change things (Beach 1995). Intermediate policies were, as stated earlier, recommendations in the *Teacher Education Expert Committee Report* (SOU 1965, p. 29) and the 1974 *Teacher Education Investigation Report* (SOU 1978, p. 86).

The identification of this common policy trajectory takes us to our next two assertions. These are firstly that despite some 40 years of expressed policy ambitions from the ORF, these developments have proved difficult to fulfil (Ahlström 2008; Kallós 2009). Instead, the content and practices of teacher education seem to have retained an emphasis on the initial dualism established by the seminar tradition on the one hand and the academic tradition on the other. They are secondly that attempts to break this dualism have actually been internally consciously and unconsciously resisted by most student teachers and subject teacher educators (Beach 1995, 2000; Eriksson 2009; Player-Koro and Beach 2012). This point concerns disparities between the formulation arena (the ORF) and the outcome from the PRF enacted in practice. The discovery of the disparity provides an important critique of policy optimism, which is a further common theme in our three studies.

The next significant common finding from the meta-analysis is that the most recent cycle of reform initiated in 2007 breaks with the historically established efforts in the ORF towards the development of a single teacher education with a common professional knowledge (cognitive) base and makes reverse recommendations (Beach 2011). Indeed this new policy cycle actually critiques the efforts that have been made previously in these directions (Player-Koro 2012b; Sjöberg 2011). We also add that it does so despite having no scientific support for its critique and that it therefore makes its recommendations in a way that demonstrates the important role that ideology clearly plays in (teacher) education policy making today (Beach 2011; Beach and Bagley 2012). This became the next common outcome from the meta-investigation.

We make the claims about recommendations for change being unsubstantiated by science and based purely on ideology for two reasons. First of all, a common shift towards shared progressive professional values and practices is described as having taken place through the enactment of previous teacher education policy in the curriculum practices of teacher education by the HUT commission (SOU 2008, p. 109) and in the subsequent Government White Paper (Bill 2009/10, p. 89), but this development has not ensued in practice and nor has it ever been shown to have ensued by any scientific investigation (Kallós 2009). On the contrary, according to our ethnographic projects and other research, in relation to the pedagogic recontextualizing field (PRF), the opposite is the case and there is no really compelling evidence of any kind of unification (Beach 1995, 2000), let alone one based on progressive values. Secondly, some very negative consequences are claimed in the HUT Commission Report and the subsequent Government Bill to have arisen from this asserted but absent common shift, in that the “progressivism” that is said to have developed is also said to have led to a watering down of subject knowledge in teacher education, a lack of attention to how pupils learn subject knowledge most effectively in school, and ultimately to poor school performances

in international comparison studies like PISA (SOU 2008, p. 109; Government Bill 2009/10, p. 89). As we assert and ethnographically illustrate, the historical dualism in teacher education and the teaching profession has never been broken in the PRF or in the reproduction field in terms of the development of teacher education student professional knowledge values and commitments and in effect should really be seen as productively associated with the problems it is asserted to be a cure for in the recent reform, not a treatment of these asserted problems.

Coding and Interpretation Processes

Coding of ethnographic data is one of the common practices in ethnographic research and much has been written on this topic. It is discussed also by Troman and Jeffrey in the present collection. In their description, as elsewhere, it is described in terms of two main strategies: precoding and in vivo coding. The first is self-obvious. The second involves combing the data for *themes, ideas, and categories* and then labeling these with specific “tags” so they can easily be retrieved for further comparison and analysis later on. Coding makes searching the data to make comparisons much easier and facilitates, as Troman and Jeffrey (this volume) suggest, the researcher’s ability to identify interesting patterns for further investigation. These can be based on *themes and topics* or *ideas* and expressed by *concepts, keywords, or phrases*. In line with Charmaz (2003, pp. 94–95) they should relate to *what is going on* and *what people are doing or saying, what denoted actions and statements may take for granted, and/or how structure and context may support, impede, or change these actions and statements*. They can be based on concepts that participants use to understand their world and describe the *norms, values, and rules* that guide their actions (so-called emic concepts), or they can be based on scientifically derived concepts relating to the meaning or significance actions and statements have for scientific analysis (so-called etic concepts). These ideas were important to each of us. We employed them to various data, not the least that relating to student understandings of the main forms of knowledge and significant skills and insights (“key content”) that they felt were central to learning the professional work of teaching.

The materials that were coded for “key content” were expected to identify and mark whether common or different understandings of professional knowledge needs were apparent between student teacher groups and what patterns there might be in terms of the distribution of these understandings. One other common code was for the *use of classroom space* in the taught components on the teacher education programs (“Space use”). Here our interest was for possible patterns in the social regionalization of education arenas. What we found was that the same spatial dispositions and forms of appropriation of physical and social space in teaching arenas as those described by Beach in 1995 seemed to apply even in the two later project periods. What we saw was that for different kinds of lesson content (e.g., subject theory, curriculum theory, and educational theory), the same

regionalization patterns applied in all the studies. This was evidenced in one of Player-Koro's journal entries:

This lesson follows roughly the pattern that has been in recent weeks. . . Henry goes through examples on the board. The group is largely silent and listening. . . This (is) the normal pattern (also described in Beach's research earlier). . . Students sit facing forward while the teacher speaks and writes on the whiteboard. . . It has even characterized work in the computer labs. . . Spatial dispositions are different in curriculum theory (which) is often open-plan. . . Students are also more pro-actively involved in classification and framing . . .

When analyzing the data coded in the individual studies, the most stable findings were firstly that "Space-use" showed similar patterns and secondly that the outcomes of instruction (expressed through "key content") were similar too. This, in that although different students in the three investigations expressed some different understandings concerning the demands of teaching and the professional skills and competencies needed by teachers, these differences were rarely related to which decade the research had been conducted in and thus which part of the policy trajectory of teacher education that their education was part of. Instead they were identified as clearly related to the former traditions that teacher education rests on historically (i.e., seminar/class teacher education vs. grammar/subject teacher education), as described in the earlier parts of the paper. Our meta-analysis showed in other words that:

The comments by prospective upper-comprehensive school (school grades 4 to 9) teachers from my studies clearly emphasise that their centrally valued knowledge is subject based (and) these comments are not significantly different from comments in Catarina's group, but they do differ in several respects from those made by prospective lower-grade (1–7) teachers, both in my investigation and Anita's (1–6), both of which seem to hold strong similarities that reflect values expressed in policies for a seminary kind of teacher education. . . It seems that whilst policy may influence practice in the pedagogical re-contextualisation field (PRF) to some degree, other features have greater (and also conservative) influence. (Analytic email memo: Beach to Player-Koro and Eriksson)

Although it should be read together with a word or two of caution due to sample limitations, this extract has certain implications for policy making and policy research. First of all, it supports ideas about the risks of policy optimism, but it also makes the claims made by the HUT Commission in 2008 and the government in 2010, about needs to re-traditionalize teacher education, seem rather suspect. There is in other words ground for policy critique, which becomes the final common outcome of the meta-analysis. This critique addresses the recent claims of policy makers that a rampant progressivism was ruining the education offered in the country and jeopardizing its economic future. It points out that these claims may be false. In teacher education progressivism has never progressed beyond an idea of the ORF. Indeed in strong contrast to progressivism, the outcomes from the PRF that is made visible through interactions in the teacher education reproduction field have led to the development of highly traditionalist understandings of the professional knowledge needs of teachers among the different students (Beach 2000; Eriksson 2009; Player-Koro 2012b) that may also be extended into and influence their schoolteaching (Jonsson et al. 2012). What was claimed to be a cure for

“diseased school performances” was more likely to be part of the problem of performance than a solution to performance shortcomings. Some key data and analytical support for these assertions are presented in the coming pages.

Data Support and Analysis

Data that were coded in relation to students’ expressions about what they felt was the most important knowledge for teachers, and teaching (“key content”) was the data that we analyzed in most detail in the meta-analysis. When this was done we felt that these data suggested a number of common things. These are basically all in line with the assertions we have made above. They are firstly that there are several important differences in what different students regard as key professional knowledge, i.e., there is some individual variation (Eriksson 2009). They are secondly that these differences can be reliably grouped in terms of which enrichment (i.e., lower or upper grade) the students were following and that they thirdly seem to have cultural and historical antecedents. They were expressed in the Grammar School Teacher Education Act from the beginning of the twentieth century and the seminary statutes between 1890 and 1932, but were also “caught” by the secondary codes developed by Beach in his 1995 research. These codes and the data in them equated well with those used by Player-Koro and Eriksson together in their later studies. They therefore seem able to represent historically structured homologies of specifically lived cultures, to paraphrase Trondman et al. (2011), as expressions relating to and reflecting particular structural, cultural, material, and historical symbolic legacies of a bygone age (Beach 1995, 2000). Our suspicion is that they may have haunted successive rounds of teacher education reform that were intended to disturb them. Taken from Beach’s investigation, concerning subject teachers, they are that:

- Teaching well means knowing the subject you will teach (“subject primacy”: SP).
- Professional skills are related to subject knowledge, personal development, and some knowledge about child psychology (“subject-based professionalism”: SBP).
- Strong identification with subject compared to other professional knowledge (“personal identification with subject”: PIS).

Upper-grade focused students regularly put things as follows:

As teachers we need a certain psychological maturity and awareness... This isn’t really something you can be taught... It is more something you simply have or acquire... You need to understand your own attitudes and values... The greatest thing a teacher can possess is insight and an ability to use these insights efficiently when teaching... This and subject knowledge (are) the things that will be of most value to us... I identify with my subject, specially maths, more than I do with the other things connected to the job of teaching... (Göran, upper, 88 intake)

Two things in particular are emphasized here. These are the value of: (a) knowledge in and enthusiasm for the subject and (b) personal insight and

practical (know-how) knowledge related to teaching (Beach 1995, 2000; Player-Koro 2011, 2012b). These were considered as “the most essential aspects for teaching in school” (Joanna, upper, 2005 intake) by prospective subject teachers and for the “quality of (pupil) learning” (Michael, upper, 05 intake). They were equally emphasized regardless of the decade in which the student studied. They suggest that prospective upper-grade student teachers tend not to see the professional knowledge of teaching as scientifically problematic in the sense that it can be objectified and scientifically studied in research and objectively exemplified and discussed in teacher education courses:

You can only learn the subject this way. . . Knowledge of a subject is important (as) is the ability to communicate this knowledge. . . Teaching is quite simply an appropriate innate ability and skill of a good teacher who knows her or his subject. . . Something she simply has. (Bella, upper, 05 intake)

You learn the knowledge of teaching more as a craft in schools (in) a kind of teacher apprenticeship situation. (Jon, upper, 88 intake)

For some students the position and outlooks expressed here may render formal education in professional studies both “unnecessary and perhaps even impossible. . . aside from a few tricks of the trade and communication and motivational skills” (Asta, upper, 05 intake). As one student from the upper intake put it, “if there is one thing that I as a math teacher have to be good at it is math. . . Another thing is that I can convey this knowledge and motivate pupils to learn” (Joseph, 88). Other upper-grade specializing students have said:

There are two parts, personality, and some education. . . But if you are not fit to play the role of a teacher it does not matter how much teacher education you have. . . It won't help. . . I can exemplify. . . You (i.e. the subject tutor) teach pretty well. . . despite not having formal teacher education and this curriculum and education theory stuff. . . so that shows we can skip it (and) don't need it. You (need) good mathematics skills as a teacher and a social competence. . . (Asta, upper, 05 intake)

It is in the school in teaching where you really learn to become teachers. . . Schools and teacher education institutions should cooperate more. . . The strategy should be to teach us the subjects we need to know and maybe something about psychology of learning and how to motivate the pupils. . . Examples of how to teach things' are important (but) mostly you learn this in school from other teachers and in practice. (Dean, upper, 88 intake)

These kinds of expression about subject value and the place of a subordinate component in some kind of educational (psychological) studies, which are again in keeping with the Grammar School Teacher Education Act, were consistent across the research period for prospective subject teachers according to our meta-analysis and seemed to reflect a general position. Moreover, the centrality of the teacher's knowledge of subject matter and the importance of subject matter content in teacher education were also reflected in comments by subject tutors and in how instruction was organized in subject areas for prospective upper-grade teacher students. As is clear in both Beach (1995) and the collection of articles and commentary texts in Player-Koro's PhD thesis (Player-Koro 2012b), subject theory is highly classified and framed front dominated instruction that gives primacy to a teacher-centered approach to the curriculum and the (assumed) superior knowledge and power of the educator.

Prospective teachers of younger children put things quite differently to their colleagues from the upper-grade specializations. They emphasized the need of “understanding the child and her way of learning” (Liz, lower, 88 intake), which they saw as “far more important than understanding the subject at a highly advanced level” (Astrid, lower 03 intake).

The position expressed here can be found in teacher education curriculum history as far back as the early teacher education seminaries in the late 1800s. It was present in the ORF until the 1940s but seems to have hung on much longer in the PRF. For instance, among the comments from prospective early grade teachers in our data, we can still find expressions about the necessity and value of having “general practical knowledge and understanding of pupils’ needs. . . and what they will study in school” (Mary, lower, 88 intake) ‘but not needing advanced subject knowledge” (Astrid, lower 03 intake).

Statements like these are child-centered in one sense. Knowing what “kind of things pupils will study” (Astrid, lower, 03 intake) together with knowledge of the “psychology of the child and group psychology” (Trine, lower, 88 intake) is “what is most important” (Astrid, lower, 03 intake). As far as actual subject knowledge was concerned, students said things like:

We probably know enough maths or science already. . . so we don’t need to spend more time on that. . . What we need is examples of the content the pupils will study and examples of how to present this to them so they can learn it effectively. (Tina, lower, 88 intake)

Again this statement could have been lifted from the seminary statutes from the late nineteenth to the early mid-twentieth centuries.

The Juxtaposition of Codes and Categories

The data coded for “knowledge content” and use of space respectively in our three investigations through the meta-analysis seem able to assert several key points. The first is the continued existence of divisions of practice and feeling in teacher education that date back to its binary structure in the academic tradition on the one hand and the seminary on the other. Prospective upper-grade student teachers affirm the need and value of “academic subject knowledge, personality. . . a little psychology maybe, for conflicts and so forth. . . and some concrete subject related communication skills and knowledge” (Dave, upper, 88 intake). Prospective lower-grade student teachers affirm “general practical knowledge. . . knowledge of what pupils study in school (and) an understanding of the psychology and learning needs of different pupils” (Joanne, lower, 03 intake). However, at the same time as the assertions firstly thus seem to reflect and derive from potentially ancient homologies (Beach 1995, 2000), they also secondly nevertheless and at the same

time both reflect and forego the recommendations and aims from the most recent round of reform. Students put things roughly as follows:

Prospective upper-grade teachers	Prospective lower-grade teachers
<p>“Being able to teach is something you are in a way born to. . . You can either do it or you can’t. You either have the skills and so on or you don’t. . . It’s not really something you can teach. . . What we do need is knowledge of the subjects we will teach and methods to help get this knowledge across to pupils” (Dave, 88 intake). “I want to be a teacher but I am also very interested in the subjects themselves and want to know as much as I can about them. This content is. . . the most important knowledge I think. You have to know the subject to be able to teach it. We all think that” (Ben, 88 intake)</p>	<p>“Teaching is about (connecting) the inside of the teacher (her thinking) with that of the pupils. . . This means psychology. . . Pupils are different (and) they learn differently” (Jemma, 03 intake). “Understanding pupil psychology is. . . central, as is a repertoire of skills and knowledge that will enable us to understand pupils’ learning styles and needs. . . and tailor our teaching accordingly” (Mary, 88 intake) “to cope with the differences in the pupils we will meet in the future” (Jemma, 03 intake). “What pupils study is important. . . but we don’t need to go to a really high level” (Joana, 03 intake)</p>

Our interpretations here are that what is expressed above is the importance for student teachers of developing the kinds of knowledge and skills that will help them “manage the practical demands of teaching. . . at the levels (they) are specialising in” (Mary, 88, lower). We also see this as fairly logical. However, at the same time, it is also very ideological, prescientific, primitive, and pragmatic. What they are interested in is coping and (or by) “knowing what you teach” (Dave, upper, 88 intake) and “gaining *different strategies and different ways of teaching something*” (Mary, lower, 88). For prospective lower-grade teachers, this know-how knowledge means knowing that pupils learn differently and “having a repertoire of practices to match these different learning needs, styles, experience and so on” (Joana, 03 intake). As one of them put it:

You cannot actually teach pupils anything outside their own capacity. . . You can only help them to learn (and) you can only do this if you understand them as individual persons and learners and reflect over how to deal in the best way with the objects of their learning. (Jemma, lower, 03 intake)

For prospective upper-grade teachers, the understanding of key demands is both different to and consistent with the above. It is consistent in terms of the issue of coping with performance demands, but different in terms of the demands that are experienced as most challenging and in most need of being responded to. Being able to cope with subject knowledge and conflicts between and with adolescent pupils is what is most important.

Prospective upper-grade teachers	Prospective lower-grade teachers
<p>“We need some general skills, but also methodology” (Bella, 05 intake). “We need to get 3–4 different ways to teach each thing” (Michacprel, 05 intake). “We need to know subjects and ways of motivating and controlling pupils. . . There is a parallel with understanding a patient and treating a disease. . . We will be</p>	<p>“Development psychology and curriculum methods are. . . important. The education should include different methods for working with mathematics” (Jonna, 88 intake). “Our responsibilities are with pupils and their futures not subjects specifically. . . Pupils are different and have different learning needs (and) we have to</p>

(continued)

Prospective upper-grade teachers	Prospective lower-grade teachers
<p>teachers, but. . . of subjects to older pupils. . . some are almost adults. . . in the upper-secondary school they can already vote even some of them. . . We don't need child psychology for this. . . We need subjects and knowledge about how to motivate and control pupils when needed and how to communicate subjects to them" (Colin, 88 intake). "We will be teaching subject knowledge to pupils and (therefore) want more knowledge of the subject plus professional studies content from curriculum studies. . . that illustrates how to make the subject appropriate in ways that are relevant to what different age-groups study in school and how they study them. . ." (Colin, upper, 88 intake). "We have to have something to teach in and we have to pass exams in it. . . We need the subject (but) also methods to communicate and motivate pupils. . . The subjects need to be possible to teach at the age level we are teaching in and curriculum studies (didaktik) should give examples among other things. . . We don't really need the rest (i.e. educational theory) just now" (Michael, upper, 05 intake)</p>	<p>adapt our teaching to their needs and the ways they are able to learn" (Joana, 88 intake). "We must recognize and respond to their different learning needs and the possibilities different learners have (due to) maturity (and) psychological make-up (not the least special needs)" (Jemma, 03 intake). "It is important to explain a variety of methods for us" (Jane, 03). "The subject knowledge needs in mathematics are really fulfilled very much through entry demands. . . Of course I don't mean we don't need any kind of mathematics at all. What I mean is that you do, up to a point, and that it is good to have this knowledge to teach the subject. . . Curriculum theory and pedagogy should then teach us both about pupil differences, how they affect pupil learning skills and capabilities (and) how to deal with this. . ." (Henry, lower, 03 intake). "We are not going to be mathematicians. . . We will be working with young children. . . We need to know how they perceive numbers and sets and so on and how we can help them understand and do division and subtraction and so on. . ." (Joana, lower, 03 intake)</p>

All the data presented in this section are quite striking in relation to the recent HUT Commission Report (SOU 2008, p. 109) and the Government White Paper (Government Bill 2009/10, p. 89) following it. Indeed they actually suggest that this round of reform seems to stand on clay feet and is based on purely ideological conceptualizations of current conditions and needs. What is suggested in the most recent round of reform is that a common core of progressivism was both ubiquitous and highly problematic in schools and that this emanated mainly from teacher education and was responsible for current lapses of performance in and of Swedish schools. What is in fact the case however in teacher education is that this "progressivism" is actually only an artifact of a curriculum discourse from the ORF and that the failure of progressivism is in other words politically constructed, and pushed forward within the most recent policy cycle, to drive a highly political and singularly ideological notion of much-needed changes that actually lack scientific support (Sjöberg 2011).²

² In this sense policies seem to be reacting to earlier policy formulations rather than to empirical analyses of actual policy outcomes. The policy texts of the ORF have exhibited tendencies towards educational progressivism in the period from 1952 to 2001, but this hasn't been matched by a concomitant shift in student values and the education practices and content in the PRF or student values. Practices and understandings are still highly "traditionalistic." Students with a focus on teaching younger students express more interest in school subject content knowledge and an education that is dominated by psychology, while those who intend to teach older pupils place more emphasis on formal subject knowledge and how to transform it to and communicate it at different grade levels of the upper-grade comprehensive school.

On Differences and Similarities

Students in the two enrichments (early versus late grades) seem to be quite different from each other. However, in another sense the differences expressed by the two groups (i.e., lower and upper) may actually also reflect deep similarities. For instance, they are both technically normative towards the origins of the teacher education that the respective students are a part of, i.e., the seminar and academic teacher education traditions as described by Jedemark (2006), which are never commented on by them or, according to our field notes, mentioned in their subject education or their curriculum theory and therefore the majority of content of their university-based studies. Also common is a criticism (at times) and (at other times) marginalization of the professional content knowledge of educational theory, except in relation to psychological knowledge, in favor of a professional knowledge that primarily only consists of objective teaching techniques. Quite simply:

I have absolutely no interest... in the sociology, history or philosophy of education... They are more or less irrelevant to us... We need to know what we are teaching, who we are teaching it to (and how) to do this effectively... (Dave, upper, 88 intake)

This lack of commitment to a more theorized professional knowledge of practice is also reflected in observational data. This data suggests that students tend more often to be absent from such lectures where they exist, than others, and are more often connected to the Internet if they are there (Beach and Player-Koro 2012). Coded interview data from the investigations we have made is also in agreement on this point. Both student categories (i.e., early/general and late/subject, respectively) describe curriculum and education theory “as really a bit of a waste of time” (Jane, lower, 03 intake) or at least a “using up time that could be spent doing things we need more of” (Colin, upper, 88 intake). There are some differences of course.

Prospective upper-grade teachers	Prospective lower-grade teachers
<p>“What on earth do we need to know things like the history or sociology of education for... It isn’t even interesting... Psychology yes... but not this... We will be teaching a subject... Teaching is a <i>craftsmanship</i> or an <i>art</i> and method... not a science... We need to know what to teach and we need the skills of teaching it” (Dave, upper, 88 intake)</p>	<p>“Although some didactics is interesting... it is (not) centrally relevant... in order to develop our work in school and our understanding of how pupils learn and what they need from us to become more motivated and successful as learners... We need to know about how pupils learn... There should be more time spent on this...” (Jenny, lower, 03 intake)</p>

These kinds of comment and their similarities and differences were consistent across the 25 years of our investigations. They point out that student teachers don’t seem to have ever been very committed towards a vertical professional discourse (of scientifically grounded know-why professional knowledge in the sense of Brante 2010, communicated in university studies) and that they have instead always tended to place premium on the vocational aspect of their education in school (i.e., teaching practices) as the “main source of learning the profession” (Jemma, lower, 03 intake), with this corresponding mainly with “learning how to do the job”

(Annie, upper, 88 intake). In this sense, once again, the most recent round of reforms is attempting to move teacher education policy in directions that re-traditionalize practices and values that are already highly traditional, this time by reinstating a horizontal knowledge of practice as the only professional knowledge component.

Using Bernstein to Interpret the Meaning of Patterns

Bernstein (2000) argues that teacher education can be described in relation to two different forms of knowledge. One is concerned with a body of knowledge similar to general pedagogical knowledge (e.g., SOU 1965, p. 29, 1978, p. 86). This component (called the teacher education *Trivium* by Bernstein) is related to internal control and the development of thinking skills and attitudes towards teaching and learning processes and their outcomes. It derives from a problematization of internal learning and reflection with respect to also external sociopolitical conditions and aims and concerns the development of the consciousness of the learner (Bernstein 2003, p. 161). The second body of knowledge (the *Quadrivium*) is related to the “external” independent subjects that teachers teach in schools (Beach and Bagley 2012).

In relation to the two divisions, Bernstein (2003) also identified six steps that described how the organization and communication of content and the relative distributions and relations between these two kinds of contents have varied over time. They bear strong similarities with the policy cycles we have described:

1. Teacher education professional knowledge is essentially vocational.
2. Lectures and positions became successively specialized to one or the other side of the Trivium (professional educational studies)/Quadrivium (subjects) distinction.
3. Education studies (Trivium) became specialized in, e.g., the philosophy, sociology, psychology, and history of education.
4. A new body of recontextualized knowledge successively emerged between the discourses of education studies (Trivium) and school subjects (Quadrivium) that was, Bernstein suggested, in part technical in focus and probably in aspiration. This subject was initially formulated in relation to bridging a theory–practice dislocation, but it became increasingly technical in terms of its relationship to school subject content knowledge.
5. The specialized disciplines of educational studies (Trivium) become weakened as “political, cultural and academic sites” (Bernstein 2003, p. 161) in a manner that leaves psychology as the only realistically remaining specialization. This specialization is taught in combination with subject knowledge, curriculum studies or didactics, and a professional training dimension through apprenticeship-like learning in schools.
6. Teacher education professional components (Trivium) become fully school-based and apprenticeship-like consecutive studies to the academic subject component.

The first five steps are represented in the policy cycles we have discussed. But step five is that which best characterizes the most recent one, which entails a greater emphasis on the Quadrivium and the introduction of a more horizontal set of content relations in the Trivium (Player-Koro 2012b). This kind of development has been described by Bernstein (2003) as a general shift to the (re)generification of professional knowledge (p. 163). It is a movement that he expects will eventually lead to the dissolution of the Trivium component of the teaching profession and professional knowledge. The development of the teacher education Trivium has been described as important for bridging the gap between theory and practice (Eriksson 2009; Kallós 2009) and between the divisions of seminary and academic teacher education. According to Zeichner (2010) and Apple (2001, p. 195), this kind of knowledge is important in determining whether teachers in schools after teacher training will be able to understand their profession in relation to its broader economic, sociopolitical, and ideological circumstances (Beach and Bagley 2012).

Our analysis differs somewhat from that of Bernstein, however, in that through policy ethnography we have researched not only official policy texts from the ORF of teacher education but also “the dark underside of policy development” that emanates from the PRF (Beach 1995, p. 7). In this analysis the emphasis on the teacher education Trivium was evident primarily only in the ORF of teacher education. It never actually gained a foothold in the mull of everyday life inside teacher education and left little if any marks or impressions on students there (Beach 2000; Eriksson 2009; Player-Koro 2012b). Moreover, it has also lately been replaced even in the ORF by a “generic” discourse that is less embedded in disciplinary pedagogical knowledge (education theory) and more connected to the everyday language of praxis, common sense knowledge, and practical goals of teaching as an occupation (Beach and Bagley 2012). This risks undermining all possible autonomy for teachers from organizations, institutions, and individuals “outside” (or structurally “above”) their profession (Apple 2001; Zeichner 2010).

The new policy cycle thus changes the classification of the professional knowledge need statements of the ORF to a more horizontal form and shifts the balance of the formal/official voice on teacher education from the Trivium to the Quadrivium elements. Moreover, it also legitimizes an archaic knowledge relationship in the ORF of the teacher education curriculum and brings it back into the line with existing structures in the PRF. It is quite reactionary in this sense. But by being homologous with and appealing to the common sense knowledge of lived cultures, in the sense expressed by Trondman et al. (2011), it is also very able to obtain support from key agents, even when this is actually not at all in their own best interests (Beach and Bagley 2012).

Concluding Remarks

The policy ethnographic research we have conducted over the years has addressed historical changes in the content and makeup of the teacher education policy field in terms of changes in both written formal policy formulations from the ORF, from the

1940s to the present day, and the recontextualization and enactment of policy in the PRF and the reproduction field of teacher education, in relation to three rounds of reform and two “kinds” of teacher education. A reanalysis of the products of this policy ethnographic research, a meta-ethnography, has then been carried out and is reported on in the present chapter. The meta-analysis of the policy ethnographies allows us to make a few important statements.

The first statement we can make is that the content of the written national policy (ORF) has shifted over the years and that the shifts that can be noted follow something like the six-stage model described by Bernstein (2000). Three significant turns can be noted in this process in relation to professional teaching knowledge. The first was from a view of teaching as based on vocational–practical knowledge and knowledge of subjects to a model divided and then specialized in terms of a teacher education Trivium. This was then followed by a re-vocationalization tendency and a reaffirmation of the value of subject content as the lone academic component. However, also noted is that student teachers seem hardly to have changed their values over time and have remained tightly tied to ideas that seem to emanate from teacher education in the early part of the previous century. Finally, we have noted that these values have now once again also become the values of the official position in the ORF.

One further issue we have noted but have not dwelled upon in the chapter is that the development of teacher education and the reflections of what constitutes valid professional knowledge for teachers in Sweden today reflect similar positions taken and policies produced by New Right governments in Europe and more widely in recent decades (Apple 2001; Beach and Bagley 2012). However, what we have also noted is that these developments in the ORF seem to be made on ideological grounds only and without (or possibly even against) research-based knowledge (Erixon Arreman 2005; Erixon Arreman and Weiner 2007). Right-wing governments today may seem therefore to tend to (a) drive reactionary policies in education and teacher education, (b) without research support and (c) regardless of any contradictory scientific evidence. This may be seen as somewhat ironic given their expressions about the need and value of evidence-based policy making.

These suggestions become graphically evident when we contrast the data discussed in the chapter about the effects of teacher education on students with the claims made in the most recent round of reform through Government Bill 2009/10, p. 89. This Bill and the Parliamentary Act following it are both written as if the previous reforms from the unification trajectory in teacher education and the development of a teacher education Trivium in the ORF have had an effect in the PRF, through a common, unison, and radical pedagogical progressivism that had become rife in teacher education and had spread to today’s schools, with devastating consequences for individual learning and aggregated performances (in investigations like PISA and TIMS) at the national level that must be remedied. In our interpretation nothing could be less true than this. The latest round of reform expresses that the problem with teacher education is the absence of conservative values and that, in order to save schools and society, they must be reintroduced (Sjöberg 2011; Beach 2011). Our research suggests clearly that conservative

values have been continually formed and reformed among all categories of student teachers and that the development of progressive tendencies is in no way evident. Conservative attitudes, structures of communication, forms of authority, and knowledge in teacher education are more correctly still to be analyzed as a potential cause of the current problems of performance in Swedish schools than they are a solution to these problems because of this (Beach and Player-Koro 2012).

4.8 Problematizing Evaluative Categorizations: Collaborative and Multisited Interpretations of Constructions of Normality in Estonia and Finland

Sirpa Lappalainen, Elina Lahelma, and Reetta Mietola

Introduction¹

In this chapter we demonstrate ways to build up interpretations through collaborative and cross-cultural analysis that draws from several ethnographic studies, conducted in multiple educational settings, multiple localities, and multiple decades. Such research is often called multisited ethnography (e.g., Marcus 1995). We also discuss ethnographers' experiences about discussions that suddenly start to trouble earlier interpretations or "tickle our brains," paraphrasing Davies (2003), and invite new questions and new studies. These kinds of discussions might take place within the field with the informants, as well as with other researchers or people in other contexts. They have methodological value when conceptualizing one's understanding about research questions and focusing the gaze of the ethnographer (Gordon et al. 2005), as well as in analysis and interpretation.

The paper draws from various ethnographic studies that are conducted in our research group with colleagues in Finland and abroad. We have worked jointly since the 1990s, with joint research interests in social justice and constructions of

¹ The chapter is partly based on article Lahelma et al. 2014.

differences in educational contexts. In research seminars and workshops, we have shared ideas and developed methodological understanding in rigorous ways during these years. According to our experience, some of the most fruitful ideas might come up by coincidence when someone happens to reflect on her/his experiences with somebody else. At their best, the informal discussions have led to joint analysis in which separate data sets have been combined, resulting in interpretations that could not have been arrived at otherwise. Among ethnographers serendipity is recognized as a valuable concept when making sense of ethnographic fieldwork (e.g., Arora 2008; Jeffrey and Troman 2003). We argue that the concept of serendipity has its methodological value, too, when conceptualizing one's understanding about research questions, as well as in analysis and interpretation. Giving two examples from our work, we will suggest in this paper that it is possible to find new kinds of interpretations by joint reflections that draw from different ethnographic studies and other data.

We start the paper by discussing some of the methodological ideas that we have adopted, reflecting on them in relation to the ideas of multisited and collaborative ethnography. Then we provide two concrete examples to illustrate how we have built our interpretations collaboratively. In the first example, the analysis is focused on the construction of a "special student" in a lower secondary school in post-communist Estonia (Leino and Lahelma 2002). Interpretations based mainly on data produced in Estonia were generated with reflections drawn on data produced in lower secondary school in Finland (Gordon et al. 1999, 2000).

In the second case, the analysis concentrates on representations of "normal" childhood and youth in various cultural texts, such as research reports and policy texts on education, and on the impact of these representations on the evaluation of normality of children, adolescents, and families by educational professionals (Mietola and Lappalainen 2006). Interpretations were built by combining two ethnographic data sets, one generated in the context of the preprimary education and the other in the lower secondary school, with the analysis of policy texts and research reports.

Collective, Comparative, Cross-Cultural, and Contextualized Ethnography

The methodological innovations that are presented in this chapter are elaborated by drawing from the ideas originating in an ethnographic project in two lower secondary schools in Helsinki and two in London² (e.g., Gordon et al. 2000, 2006). In this collaborative project, theoretical and methodological principles were shared,

² The project *Citizenship, Difference and Marginality in Schools* was supported by the Academy of Finland 1994–1998. Elina worked in this ethnographic project together with Tuula Gordon (director of the project), Pirkko Hynninen, Tuija Metso, Tarja Palmu, and Tarja Tolonen in Helsinki and Janet Holland in London.

while the planning and the actual conducting of the fieldwork in all locations were more or less joint efforts. The researcher group was interested in both the pedagogical practices and informal interaction of the school and the way in which time and space affect pedagogy and interaction. Inspired by Nancy Lesko (1988), they also wanted to trace a “curriculum of the body.”

Therefore, the group developed an analytical differentiation between the *official*, the *informal*, and the *physical* layers of the school (Gordon et al. 2000). The official layer refers to teaching and learning, the curriculum, pedagogy, and formal hierarchies. The informal layer refers to interaction among teachers, among students, and between teachers, students, and other staff, including informal hierarchies, and the physical layer to spatiality and embodiment, including space, time, movement, and sound/voice (Gordon et al. 2006). These layers helped to focus the gaze in the field but also helped to formulate the research and interview questions in certain frames and further the analysis and interpretations as well as in writing (Gordon et al. 2000). This analytical differentiation, developed in the project, has proved to be a fruitful way to deal with the inevitable “messiness” of the ethnographic approach (e.g., Lappalainen 2009; Rajander 2010). In the first example presented in this chapter (Leino and Lahelma 2002), the differentiation was utilized by focusing on the physical layer of the school.

The researchers in this project used to refer to this kind of ethnographic research as the “four Cs”: collective, comparative, cross-cultural, and contextualized (e.g., Gordon et al. 2000, 2006). Collectivity was a rather intuitive concept that reflected the setting: several researchers conducting ethnographic research in the same schools. It also reflected the commitment to feminist methodologies and a sense of rapport between the group of researchers and across the two countries. While working in a collective way, the research group also provided the opportunity to jointly discuss the initial interpretations. The discussion started already in the field, with brief comments during the breaks when meeting each other in school corridors. It continued later, for example, by reading each others’ notes and interviews and reflecting on possible interpretations in long meetings. Gordon et al. (2000) began to refer to this way of working in methodological terms as “analysis through discussion.”

What here was called collective ethnography has similarities with some of the typical ways of conducting collaborative ethnography (e.g., May and Pattilo-McCoy 2000; Choy et al. 2009). There were several ethnographers coordinating fieldwork efforts to gather data in the same setting. But data concerning the same social phenomena was also gathered from different social settings: the schools in London were studied by different ethnographers than those in Helsinki.

The term cross-cultural study is often used in literature as a synonym for comparative study.³ Sometimes, when people refer to the term cross-cultural, they might regard the “culture” as some kind of broad concept, even a synonym for the society or a nation state. Cross-cultural comparisons were then self-evidently comparisons between nation states. In our understanding, a cross-cultural perspective means that analogical incidents are explored in various cultural

³This argument is based on a literature check, conducted 2003 (Lahelma and Gordon 2010).

contexts (e.g., in different educational institutions in the same country or in the same type of institutions in two or more countries), and the main focus is not in trying to find differences but, rather, to find similar or homological patterns or processes (cf. Bourdieu 1979/2002). Strathern (2004, p. 35) uses the concept “compatibility without comparability” regarding the constant work of making connections within the recognition of difference. The aim for us, also, has been to increase theoretical understanding through analyzing cultural variation (Lahelma and Gordon 2010). For example, in the first example presented here, the educational situation of post-communist Estonia was discussed by contrasting findings that focus on special education in Estonia with those which are considered to be ordinary and normal in Finnish lower secondary schooling (Leino and Lahelma 2002, p. 81). The second example (Mietola and Lappalainen 2006) is cross-cultural in the sense that similar patterns in two different educational contexts in the same country have been recognized and placed under scrutiny.

A contextualized and cross-cultural perspective combined with comparative aims is related to what Troman et al. (2006) have called policy ethnography, in which influences of policy on educational institutions are examined. Contextualization in all studies presented here means that ethnographic interpretations from fieldwork in educational institutions were reflected against the current educational policies in each country. In both cases presented here, it means that the data from Finland and from Estonia were reflected against the ideas of neoliberal educational restructuring that has originated from the USA and reached the European countries (Beach et al. 2003; Dean 1999). This change meant a shift towards increased concerns for individualization, choice, and markets (e.g., Lundahl et al. 2010; Ball 2006). These notions stand in contrast to the ideals that were previously influential in educational policy formation of Nordic social democratic welfare states with an emphasis on equal opportunities, for example (Arnesen and Lundahl 2006; Antikainen 2006). The change was even more remarkable in post-communist countries where neoliberalism met socialist tradition (Lahelma and Leino 2002, p. 79).

Collaborative Understandings in Multisited Ethnographies

The methodological ideas elaborated in the project described above have then been adapted and elaborated further in later work in several interlinked research projects within the Research Community Cultural and Feminist Studies in Education at the University of Helsinki.⁴ Generally speaking, the objective in the majority of the projects has been in making sense of processes related to citizenship and

⁴The collaboration has taken place within the context of several successive research projects directed by Lahelma and supported by the Academy of Finland, the latest of which is *Citizenship, Agency and Difference in Upper Secondary Education* 2010–2013. The project of the Academy of Finland by Lappalainen (2010–2012) is interlinked with the above-mentioned project. The Research Community is part of the Nordic Centre of Excellence *Justice through Education* (2013–2017).

differences—especially gender, ethnicity, sexuality, and disabledness in intersectional analysis. But the situation is different from that in the project of Gordon et al. (e.g., 2000) presented above. Collaborative analysis is now conducted, drawing upon individual PhD or post doc studies that do not have a collective layout or joint planning, even if they belong to the same research program and the researchers mainly share methodological and theoretical perspectives (e.g., Lappalainen et al. 2013; Rajander and Lappalainen 2011; Mietola and Lappalainen 2006).

We reflect on our experiences about this kind of work with the ideas of multisited ethnography in which, as George Marcus (1995) has suggested, ethnography moves from its conventional single-site location, contextualized by macro-constructions of a larger social order, to multiple sites of observation and participation that crosscut dichotomies such as the “local” and the “global.” We agree with Matei Candea (2009, p. 26), who notes that, when presenting the concept of multisited ethnography, Marcus (1995) actually reviewed already existing research strategies and nevertheless framed and concretized a methodological trend by providing it with historical contextualization and legitimacy as a proper way of doing research. The classical statements of multisited ethnography have been criticized by the absence of thick descriptions, with the practical problems of working in diverse localities, the challenges of projects based on collaboration, and the problem of implicit holism (Falzon 2009). Our ways to conduct multisited ethnography differ from that of Marcus, as we are going to demonstrate (see also Honkasalo 2011).

The first project described above, in which Elina was involved, was actually going on when Marcus provided his conceptualization. Accordingly, it did not affect this work. Later on, we have read texts by Marcus and others who elaborated ideas of multisited ethnography and collaborative work (e.g., the chapters in Falzon 2009). These theoretizations have helped us to build a more compact way of describing our collaborative work—even if we did adopt earlier the ideas of working collaboratively. We have constructed our shared research field (see Amit 2000; Cook et al. 2009) by combining data generated in individual projects in order to analyze particular processes that were difficult to capture in depth through single studies (see Hannertz 2009). In our shared work, collaboration is positioned similarly to Choy et al. (2009) as a distinctive feature of our work, opening new research topics and forming new ways of analyzing data as well as new ways of writing about our research. It has turned out to be an essential element in several interpretations that are new and unexpected.

Collaborative analyses might start with unexpected findings or serendipities that we reflect on jointly. It proceeds with questions to the one who had been in a specific field, with reflections about others’ experiences or findings that might draw from different fields. We then continue by selecting data concerning relevant themes from each study. It is important to notice that after the preliminary reading is done and pieces of data are brought into discussion, they are handled as “shared” data in the sense that we do not hesitate to analyze data pieces originating from each other’s fieldwork. It means that, for example, when Sirpa reads data generated by Reetta, her interpretation is based on the text, whereas Reetta has an embodied experience, emotional ties, and visual memories based on her fieldwork.

One of the challenges in educational ethnography is how to fight against familiarity, caused by our own experiences from the school—earlier as pupils, as parents, or as teachers; we are all well acquainted with schools and the constructions of normality within them. Therefore, many everyday practices are often considered to be self-evident (e.g., Delamont and Atkinson 1995). Some of the ways to fight against familiarity and to find different ways of seeing (Skeggs 1999) are brought about by another person, who is not familiar with the field, but views the data or makes short visits to the field and asks new kinds of questions. We present experiences from this in this chapter.

Reflecting on data jointly works as one strategy to take and maintain analytical distance. For example, when Sirpa, whose knowledge about this field is extremely partial, reads Reetta's data, she might ask questions that Reetta may not have regarded as relevant, being so familiar with her own data. Making interpretation together, "living with" the data generated by one or several of us, deepens our analysis and, at the best, leads to new questions and theoretical reflections. A prerequisite for this kind of work is confidential relationships, sensitivity to ethical questions, and shared methodological understanding.

Working together in several projects, contrasting and reflecting data from various fields, collected with different methods, has helped us to see the limitations of straightforward analysis that would be expected to provide concrete answers to research questions that were defined beforehand. A multisited approach has reminded us about the impermanence of the interpretations. As Joanna Cook, James Laidlaw, and Jonathan Mair (2009, p. 58) argue, abandoning the idea of a field as a geographically (or in one of our cases institutionally) bounded location helps to concede that a complete description is impossible; therefore, the sensible way to determine the boundaries of the field is in relation to our research questions. Good research tantalizes one into thinking and imagining, it pulls apart and seduces, it unveils the invisible (Ojala 2011). Through the following examples we suggest that our own research process—the process that we have called analysis through discussion—has seduced us into new interpretations.

Analyzing “Normality” and “Special Needs,” Produced Through Discursive Practices

The guiding theoretical principle in our analyses is to deconstruct “regimes of normal” in the educational context we are analyzing (Burman 2008; Cannella and Viuru 2004). The theoretical analysis of “normality” and “special needs” that is suggested in the examples draws from perspectives inspired by Foucault (see, e.g., Rose 1998; Popkewitz and Lindblad 2000; Davies 2004): what is implied, taken for granted and unnamed will embody the normative “center/core” against which deviance—what discursively is articulated, for example, as “children with special needs,” “children with low self-esteem,” and “families in crisis”—is analyzed. Universalized concepts, such as citizenship and competence, represent certain norms for conduct. For

example, Thomas Popkewitz (2001, 2003, 2008) has introduced the concept of the “cosmopolitan child” to analyze how principles of universal progress construct particular kinds of children as being agents and empowered, at the same time constructing “others” as abject, as not embodying the characteristics required to belong. In our analyses the focus has been on how this construction of “others” takes place in the everyday life of educational institutions. We share a cultural viewpoint, in which cultural and structural conditions framing an action are taken into account (Alasuutari 2006). The knowledge production is regarded as a political practice carried out in order to change those conditions (Barker 2008; Hall 2001).

Our data sets have been a combination of existing cultural texts concerning the explored educational field, such as curriculum texts, research reports and media texts, ethnographic data, and teachers’ writings generated in educational institutions, such as kindergartens and schools.

Interpreting Constructions of a Normal and a Special Pupil: Cross-Country Reflections from Estonia and Finland

The first example for “normality” is given from the cross-country perspective, and the focus is in lower secondary schools in Estonia. These reflections draw from Mare Leino’s ethnographic study in a special class in Estonia. Her data set analyzed in this research included the writings of 23 teachers, concerning a “problem child” and field notes from a special class, especially from a period of 2 weeks when a trainee teacher conducted her practical studies in the class. Leino conducted her study during the first years of independence after four decades of communist regime. At that time special classes or schools were only for students with a medical diagnosis, and, within the socialist ideology of equality, other differences were not thought to exist. The concept of a special class for the so-called problem children, students with behavioral and/or learning problems, was considered an innovation in the post-communist Estonia (Leino and Lahelma 2002). This innovation took place at the same time when, in several other countries (including Finland), the aim was, rather, to increase integration and inclusion of students with special needs (e.g., Arnesen et al. 2007; Kivirauma et al. 2006; Winzer 2007).

This “core data” was analyzed with reflections regarding the data from Finland and analysis conducted in the ethnographic study in lower secondary schools in Helsinki and London that is referred to earlier in this chapter (Gordon et al. 2000). When choosing data for analysis from the Finnish data sets, special interest was paid to the period of the first 2 weeks in the lower secondary school (Gordon et al. 1999). This period of 2 weeks was regarded as analogical with the 2 weeks in the Estonian schools with the trainee teacher. In both cases the class teacher was especially explicit in sharing pedagogical principles and school rules: in the first one she taught the principles to the trainee teacher, and in the second one she taught the rules to pupils newly enrolled at the lower secondary school (Lahelma and Gordon 2010). In everyday routines in the school, rules and principles are taken for granted and not so easy to see for an ethnographer.

For analyzing how the categories of normal and special are constructed in the classroom, the useful concepts of “professional pupil” and “physical school” developed in the project *Citizenship, Difference and Marginality in Schools* (e.g., Gordon et al. 2000) were used. “Professional pupil” referred to students who managed to conduct themselves competently without making mistakes or unintentionally breaking the rules (Gordon et al. 1999, 2000; Lahelma and Gordon 1997). The concept of physical school was developed to conceptualize patterns that are related to time, space, voice, movement, and embodiment in the everyday life of schools. The ethnographic analyses suggested that pupil professionalism was closely related to competence in dealing with the physical school: students are supposed to be in the right place at the right time, with appropriate embodiment and equipment; they should know when and how they are supposed to speak, move, raise their hands, etc. (ibid).

These kinds of reflections and interpretations from her own data were in Elina’s thoughts when she, as supervisor of Mare Leino, visited Mare’s research school and read translated extracts from her field notes and other data. Her visits to Estonian schools turned out to be specific because she does not know the Estonian language, and therefore, the focus of her attention was intensively on movement and embodiment (see also Epstein et al. 2013). She found within this classroom behavioral patterns that she had regularly observed in the Finnish classrooms as well. These kinds of patterns were, however, interpreted as “problematic” by teachers in Estonia and a reason for students to be moved into a special class. In Finnish lower secondary school, the same kind of behavior was generally considered as normal adolescence behavior that did not provoke further measures.

Elina’s observation that she made more or less by coincidence led Mare and Elina to analyze the constructions of normality as context-specific phenomena. Another data set was formed by writings of the Estonian teachers whom Mare asked to define a “problem child.” In the analysis the definitions were put into categories: behavior that disturbs the class or the teacher; unsuitable use of time, space, voice, or movement and embodiment; lack of engagement; lack of respect for school equipment; and unmannerly behavior. Most of them could be analyzed in terms of the physical school. Below are some examples:

Unsuitable use of time can be found behind the following ways of performing:

is late; is absent without a cause; has no time perception; answers before the question is finished; does not wait for his or her turn; gets tired quickly; looks for a reason to leave the classroom.

Unsuitable use of voice is behind the following responses:

uses foul language; makes strange sounds; speaks in an unrestrained way; is reserved; does not answer orally; is unable to act silently; speaks alone.

The following attributes that the teachers used can be interpreted as unsuitable movements and embodiment:

rocks with a chair back and forth; does not stay in his or her place; fidgets; lies on the desk; sometimes crawls under the desk; careless appearance.

The same categories were also present in Mare’s ethnographic accounts. Especially rich data was provided during a period of 2 weeks when a trainee teacher Liisa was practicing in the classroom and the class teacher Maija sat at the back. It turned out that situations when Maija interrupted the interaction in the class were closely related to situations when regulations concerning time–space paths, voice, and embodiment were broken. The following extract illustrates time as a problem (Leino and Lahelma 2002)⁵:

Liisa tells the children to read the book. Maija whispers from the back to Alvin: “You, Alvin, have to start reading as well – otherwise you will get into trouble with time.”

The following example demonstrates situations when voice turned out to be a problem which provoked Maija to intervene.

It was very noisy again. Maija came from the back of the class to the front once again and said: “We agreed that we should all help the young trainee with her teaching here in our class.”

Regulations of embodiment are involved in the following extract:

Anton lies on his face, Maija asks: “Do you have problems with your eyes, are you short-sighted?” Anton: “No.” Maija: “You musn’t sit like that, with your face down!”

While ethnographic research has for decades suggested that challenging, testing, and “sussing out” the teacher (Benyon 1985) regularly take place in schools, the Estonian teachers in Mare’ study have in mind a child who has gone too far by frequently breaking the school norms and has shown unprofessional behavior. The ethnographic findings in Finnish secondary schools (Gordon et al. 2000, 1999) suggest countless numbers of examples when students behave during lessons in a similar manner to that as described above. The next extract from field notes of a lesson in the 7th grade in a Finnish school is an example of some students’—often boys’—constant negotiations with teachers about possibilities to leave the necessities of certain spaces at certain times, trying to move their bodies from the compulsory desks:

Pete: Someone knocked [at the door].
 Teacher: Still another picture.
 Pete: I’ll go and open the door.
 Teacher: I didn’t ask you to do it.
 Pete: How can he get in?
 Teacher: There is knocking all around here.
 Pete: Hi, I forgot the folder [in the locker in the corridor], I’ll get it.
Starts to walk towards the door
 Teacher: No, you don’t go!
 Pete: It’s just very close.
He gets the permission to leave. Heikki starts to walk towards the door

⁵ All names of the students and teachers in this chapter are pseudonyms.

Teacher [to Heikki]: You mustn't go!

[Somewhat later] *Pete starts to walk.*

Pete:

I took a wrong folder by accident!

The teacher does not allow him to go out. Pete still tries, but then returns to his desk.

These kinds of incidents were regular in the schools in Finland that Elina had studied. They can sometimes be interpreted as resistance and sometimes as expressions of tiredness during what is considered to be boring lessons by school students, but often as boys' performances through which they compete with their male classmates within the informal hierarchies (see also Tolonen 2001). Often all these interpretations are interlinked (Lahelma and Gordon 2010). Teachers tend to reprimand or negotiate or sometimes to ignore this kind of behavior. However, students who behave in these ways are not necessarily regarded as "problem children"; a popular discourse of "normal" development of puberty is evoked instead (cf. Aapola 1999)—especially when the disturbing child happens to be a boy. Even in teacher education there are examples when disturbing behavior of some boys has been regarded as normal, something that both teachers and other students have to get used to (Lahelma 2011).

Already during the initial encounters in secondary schools, much energy and time are used in teaching "pupil professionalism"—skills and manners that are expected from school children (Lahelma and Gordon 1997; Gordon et al. 1999). Lack of such skills is more or less expected and tolerated in the Finnish schools, nevertheless. Leino (1999) argues that a dramatic shift towards neoliberalism in post-communist Estonia has rapidly changed the society. Young people's values and ways of behaving have changed, while changes in teaching traditions take place at a slower rate and are contradictory.

Through these reflections it is possible to problematize what is "normal" and what is "special" in the ways that young people behave in schools (cf. Popkewitz 1998). The cross-cultural analysis shows that "normality" is locally constructed, even if educational ideas travel from one country to another (Lindblad and Popkewitz 2003). The taken-for-grantedness is challenged in situations in which rules and routines become explicit; in the Finnish research this happened during the first weeks of secondary school, when we observed the initial encounters of teachers and students (Lahelma and Gordon 1997; Gordon et al. 1999; see also, e.g., Ball 1984). In the study of Mare Leino in Estonian, the way that the class teacher gave instructions and intervened in the incidents during the lesson of the trainee teacher rendered the pedagogical principles explicit. Here the cross-cultural analysis also was a method to challenge the familiarity of the school (cf. Epstein et al. 2013).

A comparative study between Finland and Estonia would have suggested a huge growth in special education in post-communist societies, with possible interpretations concerning the growing problems of youth. We do not challenge this

interpretation—it is easy to believe that there are marked differences in Estonian young people’s behavior when compared to the Soviet era. However, cross-country ethnographic reflections suggested that there are differences in conceptualizations of normality and speciality in the countries’ pedagogical discourses, rather than differences in young people’s behavior.

Interpreting Constructions of a Normal Child and Family: Reflections from Professional Texts and Teachers’ Talks

Another example draws on Reetta’s and Sirpa’s (Mietola and Lappalainen 2006) joint analysis of the representations of “normal” childhood and youth and the evaluation of the “normality” of a particular child, a young person, or a family. At the time of starting this collaborative analysis, Sirpa was conducting an ethnographic research aimed at studying intersections of nationality, gender, and ethnicity in the context of preprimary education (Lappalainen 2006, 2009), and Reetta for her part was analyzing education policy documents and research texts on the well-being of children and youth, for the contextualization of her ethnographic fieldwork with students in special education (Mietola 2010). Joint reflections on Sirpa’s ethnographic fieldwork and Reetta’s interpretations from the documents in a shared office led to an insight about similarities in patterns, repeated in different educational arenas when children and their well-being were discussed. Reetta and Sirpa decided to explore this phenomenon more thoroughly.

An important starting point was the bafflement and irritation that both felt when encountering professional descriptions of different kinds of children and families. In accounts of documents and research reports, as well as in preschool teachers’ talk, there was a strong moral tone in the ways that children and families were talked about and categorized. Sirpa and Reetta noticed that particular concepts were “picked out” from popular research-related texts and were further used by the professionals of education in their everyday work in diagnostic and often rather exclusive ways. For example, Eeva Hujala-Huttunen and Veijo Nivala (1996) have drawn a Gaussian curve to describe families. The extreme points of the curve were presented with conceptualizations “families with a weak control of life’ and ‘families with a strong control of life.” When conducting her fieldwork Sirpa realized that it was the former of these concepts that had established a firm position in early childhood educational context and was continuously repeated when families were discussed (Lappalainen 2006; Mietola and Lappalainen 2005). The following extract is a piece of Sirpa’s field notes on her first encounter with the teacher of the preschool class she was going to follow. In the extract, the teacher describes the neighborhood where the preschool was located:

There [in the locality of the research pre-school] are lots of children that have not been set bounds by their parents, [there is] weak parenthood, incompetence with house holding, families with weak control of life. . . . (Teacher in Sirpa’s field notes).

Although being frustrated with the stigmatized effects that the concepts had in educational institutions, Reetta and Sirpa strongly felt that all professionals they had met during their fieldwork were committed to doing their job as well as possible, and as researchers they did not aim to question the professionals' proficiency.

Sirpa and Reetta also felt that there was a certain kind of urgency in this talk—a general worry expressed about the living circumstances of Finnish children and youth in the change of the century. The need to study these representations was largely built on this urgency—this public worry seemed to have far-reaching effects, on everyday practices in the educational settings, as well as on educational policy, and as such it needed to be studied. They started to build up their analysis on the idea that, as researchers, they try to make visible the ways professionals in particular educational contexts make sense of their work (cf. Davies 2004). They decided to do this by asking the data how this worry discourse is built (where do the concepts and representations come from), what is done with it (how does it appear in the everyday practices in educational institutions and what kind of effects does it have on the lives of children and their families), and what kind of interests does this discourse serve (e.g., Davies 2004). In their analysis they were interested in the widespread worry discourse circulating in (and from) the research reports, public and media discussion, policy texts, and the everyday discussions of the professionals of education. Major interest was the localized sense-making processes that were constructed within the wider discursive context. Their thinking was influenced by the poststructuralist feminist theory. The especially strong source of their inspiration was the approach that brings into question how language, rationality, power, knowledge, and truth are considered in humanistic thinking (Adams St. Pierre 2000; Davies 2004). When analyzing professionals' reasoning, they used as an analytical tool the concept "story line" which, according to Dorte Marie Søndergaard (2002, p. 191), is "a condensed version of a naturalized and conventional cultural narrative, one that is often used as the explanatory framework of one's own and others' practices and sequences of action."

Analysis was done by reading different kinds of data, such as government reports, curriculum texts, research texts, and data generated in both Sirpa's and Reetta's ethnographic projects, side by side. The focus was on how different concepts and manners of speaking become embedded in the educational contexts. Sirpa and Reetta explored what kinds of story lines and images of subjectivities these data sets carried within them. One important body of data was research reports discussing well-being and social exclusion of children and youth in Finland in the turn of the century and observations made of the public discussion following the release of these reports. The most influential seemed to be the final report of the 3-year research project "Social Exclusion and Social Integration in Childhood" (Järventie 2001). The release of this report received wide media interest. The report stated that only 26 % of Finnish children aged 7–14 were receiving good basic care and had a positive sense of identity. In the report a strong dichotomy between good

and poor childhood was established, while providing detailed descriptions of these categories:

Children, living a good childhood, go to bed on time, they wash themselves often enough and they have a warm daily meal at home (. . .) Only sometimes do these children feel tired. They consider themselves nice looking, they are not bothered by bodily aches or pains and thus are not worried about those issues.(. . .) Children living a poor childhood sleep far too little, because they often go to bed only after 11 p.m. and regardless of this they still have to wake up early for school. The sleep they get is not calm and refreshing, because they suffer from sleeping disorders (. . .) Some of these children do not get daily food at home and they also have deficiencies in their personal hygiene. (Järventie 2001, p. 101, translation Mietola)

In the analysis, attention was paid to the ways these descriptions were built and who were positioned as actors. Reetta and Sirpa recognized that the descriptions were constructed through further dichotomizing between characteristics such as clean/dirty and regularity/irregularity. What was also apparent in this research report, as well as other research texts on children, youth, and well-being/social exclusion at the time, was that the education professionals were positioned as key actors. The research texts emphasized the need of early identification and intervention and positioned educational institutions and professionals to work towards this goal. At the same time children, young people, and their families were positioned mainly as objects of professional action. Sirpa and Reetta also recognized power invested in these detailed descriptions: they definitely provided means to identify children and families accordingly. Although the main focus of the reported project was a critical scrutiny of the prevailing social and family politics, these descriptions of good and poor childhood also dominated the media and public discussion and geared the attention away from societal conditions where families lived their everyday life (Mietola and Lappalainen 2006).

When analyzing Sirpa's field data, it was possible to find clear connections between descriptions provided by the research document, as in the example above, and those of the teachers in the context of preprimary education, as in the example below:

Sirpa: How about. . . you mentioned this kind of normal family, how would you characterise it, you mentioned 'love and quarrelling' is it that or. . .?

Eevi: Well, children have a regular rhythm in their everyday life and hmm. . . bounds, not necessarily so that both parents are in working life, but my own family has been that kind of family. Sometimes there is quarrel and sometimes love and bounds hm. . . That's normal life. Parents give their limited time for their children and not in that way that children would have too much leisure activities, not in the way. . . or that parents would hang around somewhere in the bars or something like that. In my opinion that's normal life: children are taken care of, basic care and regular rhythm in the everyday life. Sometimes children when coming here have used to eat when

they are hungry, go to bed when they want to and to sleep late. It's not necessary to have both parents, that's not the point. Maybe a single parent is able to do that as well (basic care and regular rhythm in everyday life).
(Teacher interview)

Also the teachers talked in a detailed manner about how the everyday life of a child should be organized. The regularity of life constructed a central feature in the descriptions of normal family life. Reetta and Sirpa paid attention to the ways research results and concepts were translated into everyday use. An established discourse in those times (at least in Finland) was the discourse of a "faded parenthood," which included claims that the border between childhood and adulthood had become vague in the postmodern world and parents hesitated to control their children (Hoikkala 1993; Kalliala 1999). Teachers' talk about boundaries can be connected to this discourse, against which the normal family with healthy boundaries is constructed. The teacher also refers in her talk to the problematization of single parenting. When looking at these two extracts above, we can recognize the *story line of normal family*, which is constructed through the story lines of other kinds of families: the career family pushing children towards leisure activities, the family of a single parent, and a family with weak control over life in which "parents hang around in bars." The data suggested that good parenting is naturalized through examples of bad parenting, and boundaries of good parenting are rather narrowly defined indeed.

Reetta and Sirpa conducted their ethnographies in different educational contexts: Reetta in lower secondary education (with a special focus on special education) and Sirpa in preprimary education. However, a striking observation was that very similar discourses circulated in both educational contexts. They paid attention to the tendency that risks and problems seemed to be individualized and all critiques towards the unequalizing policy vanished when educational professionals described their work. Reetta and Sirpa were curious about knowing how risks and problems become individualized by finding out the story lines inherent in the "at-risk talk" (Mietola and Lappalainen 2006, p. 237). They suggested the *story line of exclusion* as one of such pathways. In the language and work of education professionals, the concept of "exclusion," already during the 1990s, had attained an established position (Järvinen and Jahnukainen 2001). In the case of children and youth, exclusion is usually situated in the future as a possible destiny. The story line of exclusion is heavily based on theories of developmental psychology, with an emphasis on the primary relationship between the child and the adult caring for him/her.

In this story line the child's future is determined already by her primary relationship to the adult carer, where the insufficiency of this relationship is internalized by the child as a feeling of insecurity (see Burman 2008). Because of this, the child will not be able to go through the developmental tasks she is going to face at different ages. The life path of this child is described as a circle in which the

individual is drifting with accelerating speed until finally falling outside the social structures, into exclusion. In the following example Reetta tried to provide a perspective in which exclusion would be discussed from a distance:

I ask Mari [youth worker] if their organisation wants to profile itself as an organisation working on the prevention of exclusion. Mari starts to speak about self confidence and lists some of their activities which have this function.

Reetta: Well, actually, where I'm trying to get to here is that exclusion is still kind of a heavy concept.

Mari: Yes it is.

Reetta: And when it is used in the context of youth. – I still think that it carries in it this certain kind of image of an excluded, of a type of person, of a way of living.

Mari: That's true, but there still are clearly these kinds of –
Mari starts to tell me about a client of hers.

Mari: He doesn't have the means, the home doesn't provide the means to deal with difficult things . . . periods of drinking. . . mental health problems at home.

Mari tells me how they had been working with this client to sort things out. She tells me that the client had kept telling her that he doesn't want to end up living in a ditch. And when the things had been ok again, he 'just lost it [control] again'. Mari continues that when we are talking about an 18 year old, what can you do in a situation like this: 'It's her/his choice', 'you can't save them all.'

Mari: Here again you can see that there hasn't been any safety nets there earlier to fall into. (Interview with a youth worker, private sector)

When analyzing this example, we paid attention to the concepts used and the construction of the story line. We noticed that as the discussion moved to talking about exclusion, the concepts, such as self-confidence provided by psychology, were mobilized immediately. The story line is drawn from the childhood home to early adulthood, where finally possibilities of turning one's life path, avoiding "living in a ditch," are constructed as following from individuals actions and choices, from his/her inner ability to control his/her life. We also considered things which are not said as relevant in our analysis (e.g., Mazzei 2011). Reetta's suggestion to discuss the blaming effects of the concept of exclusion was quickly turned down and the individualizing perspective was set on the agenda in its most extreme form by referring to the life story of the individual client.

The concept of exclusion has previously been problematized by critical social policy researchers (e.g., Helne 2002). However, through this analysis we made visible its power in educational contexts. We interpreted that its power is realized in the way that access to particular subject positions is controlled. "At risk"

constructs a sphere of worry within which certain subjectivities are placed (see Popkewitz 1998). Once a subject is positioned outside the position of neutral normality, within the sphere of concern, her life course will be read according to the story line of exclusion. And accordingly, the life histories of those positioned as “excluded” are rewritten as stories of lack of agency and drifting. In the field of education, the image of the excluded and the concept of exclusion have attained a very powerful position: it has become an effective concept for getting funding for different kinds of exclusion prevention programs, as well as for research programs and to legitimate intervention practices (see Järvinen and Jahnukainen 2001; Niemi and Kurki *forthc*).

In their analysis, Sirpa and Reetta connected this story line to the wider “childhood in crisis discourse” (Wynes 2000) in which diversification of childhood and families is strongly problematized, while childhood in general is essentialized. According to this way of reasoning, childhood is in crises because of the disappearance of the parents’ moral and social resources to raise their children into “proper” citizenship (cf. Wynes 2000, pp. 9, 16). They argued that the worry discourse works as an individualizing, normative discourse of childhood and youth which, by putting certain categories of families and individuals under worried scrutiny, turns the focus away from unequal practices in the social, economic, and political system (Mietola and Lappalainen 2006; cf. Stainton Rogers 2004). They interpreted the situation to the effect that the worried discourse actually worked to govern childhood and youth—to redefine and demand a certain type, a suitable Finnish childhood for the twenty-first century. As such, it can be recognized as being a neoconservative discourse, with strong moral tones arguing for the traditional family structure (Mietola and Lappalainen 2006).

Conclusions: The Impact of Interpretation in This Work

The main conclusions of the paper discuss the usefulness, as well as prerequisites, of the methods that we have been elaborating. We suggest that working together in several projects, contrasting and reflecting data from various fields, collected with different methods, has helped us to see the limitations of straightforward analysis that would be expected to provide concrete answers to research questions that were defined beforehand. We suggest, following the ideas of Cook, Laidlaw, and Mair (2009, 58), the importance of liberating ourselves not only from the bounded site but also from the idea that the field of ethnographic research could ever be coterminous with or the same thing as a geographically bounded location or area.

In our research group we have regularly used the same methodologies by contrasting and reflecting data from different studies (see other examples in Lahelma et al. 2014). Here we have focused on constructions of normality in several educational contexts. Through the first example we problematize what is regarded as normal and what is ‘special’ in young people’s behavior

(continued)

in schools (Popkewitz 1998). We suggest how “normality” is locally constructed, even if educational ideas travel from one country to another (Lindblad and Popkewitz 2003; Arnesen et al. 2007). In the analysis of the second case, we suggest the “worry discourse” as a part of the wider childhood in crisis discourse (Wynes 2000) with pathologizing effects for poor families. In this discourse, diversification of childhood and families is strongly problematized, while childhood in general is essentialized. This worried discourse actually worked to govern childhood. As such, it can also be recognized as a feature of New Right ideology in which neoconservative and neoliberal discourses are intertwined (Mietola and Lappalainen 2006; see also Beach et al. 2003).

In the introduction to this handbook, the general editors suggest that interpretative frameworks are (i) brought to a piece of research, (ii) embodied in the data we collect through research, and (iii) generated out of interaction between the theoretical frameworks that the researcher brings to the research and all that he or she encounters through the research process. Finally, the kinds of conclusions that are drawn from the analysis and argument are themselves the product of interpretations and not only of the research.

The cases that we presented demonstrate a variation of these ways to use interpretation. Firstly, our earlier life histories as well as joint discussions and theoretical reflections in our research group have sensitized us to regard some incidents as tantalizing and inspiring. As feminists and persons committed to the idea of social justice, we were easily alert in situations in which we anticipated inequalities and repression; in this way interpretive frameworks were already fully engaged when we decided to explore some patterns from our data more deeply.

The cases that we have presented here are the tangential products of more coherent and planned research projects. They have resulted in one or two jointly authored articles, after which the original research plan has continued—often as a more lonely endeavor, when the researcher has struggled towards her PhD or other study. The first example started by way of Elina’s astonishment, when she followed the lessons in an Estonian classroom with students that were defined as being in need of special education. In the second case it was Sirpa’s and Reetta’s discussions about their shared annoyance about the public discourses on young people and families. But often a whole research project starts with astonishment or annoyance when confronting a tantalizing incident. For example, Sirpa’s doctoral study (Lappalainen 2006) on citizenship, nationality, and gender in preschool was inspired by her irritating experience as a preschool teacher and the feeling of not knowing how to handle a racist situation.

(continued)

Thirdly, the editors (Smeyers et al., Introduction) suggest that interpretation is generated out of interaction between the theoretical frameworks that the researcher brings to the research and all that he or she encounters through the research process. This means that the whole product of the research is interpretation. Here we emphasize the collaborative methods that we have used in working with these cases. Analysis through discussion also means for us that interpretations, made by the person who has generated the data through field notes or interviews, are reflected with others who read the accounts but do not have the long-term embodied experience from the same field. In some cases this might open the possibility of new ways to interpret data. For instance, in the examples presented here, it was Elina who noticed that behavior, which drove students towards the route of special education in the Estonian school, was considered as “normal” in Finnish schools. Moreover, there are more theoretical frameworks to use for the interpretation because—even if we share some general theoretical understanding—we have read different texts and also interpreted the same texts differently.

Finally, the editors suggest that “the kinds of conclusions that are drawn from the analysis and argument are themselves the product of interpretations not only of the research.” Interpretations are always informed by the context in which they have been made. For example, Reetta and Sirpa interpreted educators’ ways of making sense of children and families in the light of public debate that was going on at the time.

Through the examples presented in this paper, we suggest the usefulness of collaboration and cross-cultural ethnography for theoretical interpretations. With our cases we also problematize what the “field” is and what “data” is in ethnographic studies. Moreover, we suggest how discussions that “tickle our brains” or serendipity (e.g., Arora 2008; Jeffrey and Troman 2003) have methodological value when conceptualizing understanding about research questions, as well as in analysis and interpretation. Finally, we reflect our work with the ideas provided earlier in methodologies of multisited ethnography (e.g., Marcus 1995, Falzon 2009).

While we suggest the usefulness of the methodological ideas that we have discussed and illuminated through our own experiences, we are also aware of the difficulties and the problems involved. When we have presented versions of this paper, colleagues have sometimes argued that this kind of collaborative work is possible only in very specific circumstances, and this certainly is true. It is necessary to have a research group with a long joint history and rapport between the participants. This is not easy in current university environments with a strengthened individualistic ethos. Moreover, it is not easy because the researchers that conduct joint analysis have different positions in the academic hierarchies: when there are different interpretations of some accounts, it is important—and not necessarily easy—to realize that the

(continued)

interpretation of the youngest and least experienced member of the group might be more acute than that of the senior professor, a supervisor of the former. There may, moreover, be special arrangements in relation to confidential research data. We do not claim that we have succeeded in overcoming all these difficulties, but being aware of them has been very helpful.

Acknowledgment We express our special gratitude to two colleagues, Dr. Mare Leino, University of Tallinn, Estonia, whose data and reflections are used in this chapter, and Dr. Tarja Palmu, University of Helsinki, Finland, who has been elaborating these ideas in the context of another article (Lahelma et al. 2014).

Genre 5 Historical Approaches

Introduction

Lynn Fendler and Marc Depaepe

Interpretation has always played a role in every imaginable dimension of historical research. First, interpretation is involved at the most fundamental level in which it is first determined what counts as an artifact of history. For example, archaeologists interpret which rocks, shards, and soil samples “count” as artifacts and which do not. Second, all archives are curated, which is an interpretive process in which the curator decides which objects to include and how to organize objects into searchable categories. Third, very little of the past is available in any archive; therefore, we must interpret not only the salience of artifacts, but we must also interpret the silences, gaps, and absences. We must imagine what and how much is not extant. Fourth, historians use interpretation to decide which artifacts from the past ought to be included in any particular research project. For example, when we conduct historical research on philosophy of education, should we include Dewey’s shopping lists among our historical data? His daily planner? Why or why not? Finally, of course, composing and organizing a historical narrative is always an interpretive project, as is all reading of historical narratives. When we recognize that interpretation plays a role in every dimension of historical research, it becomes obvious that interpretation is a pivotal concept in historically oriented educational research. Interpretation converts the chaos of objects and ideas into an intelligible order.

We can have no direct perception of the past; the past is not present to us. To one degree or another, then, historians tend to agree that it is not possible to project four-dimensional life onto a two-dimensional narrative without some

interpretation. However, historians disagree about how we ought to deal with the issues of interpretation and perspectivism (Nietzsche 1967/1887) in historical research. Given the range of contentious debates among historians in general (Loewen 2008) and among historians of education in particular (see, e.g., Tamura et al. 2011; Goodman and Grosvenor 2011; Smeyers and Depaepe 2008; Cohen 1999) and the degree to which historiographical research has changed over time (Burrows 2009), historians are surprisingly unanimous in their agreement that historiography is an interpretive endeavor. The question then is not *whether* interpretation plays a role in history, but what various kinds of interpretation have shaped research in educational history.

For educational purposes, we have organized the chapters of this volume according to three broad approaches to interpretation: objectivist, critical, and aesthetic. These three categories should not be read as discrete or definitive—most histories include objectivist, critical, and aesthetic elements, and of course, there are many other possible ways one could classify historical writings. For the moment, however, the categories of objectivist, critical, and aesthetic are useful for illustrating the broad range of approaches to interpretation that constitute the spectrum of historical research in education these days.

Objectivist Interpretations

Objectivism is one approach to historical interpretation in which the historian strives to write history as a mirror of the past (Depaepe 2012a). Related to historicism, objectivist interpretation holds that historical ideas and forms should be described as they occurred. The language of the historian is supposed to be a mirror or photographic plate, as impartial and as objective as possible in rendering an undistorted picture of the events of the past. We can recognize objectivist interpretation in the work of Leopold von Ranke who advocated an approach to historiography that was supposed to be free of subjective or authorial influence. Few historians today would claim that pure objectivity is possible in history. Nevertheless, in this tradition, historians regard it as important to adhere to epistemological and methodological principles that are designed to minimize subjective influences such as presentism or ideology (Fendler 2008).

Of the chapters in this volume, those of McCulloch, Gardner, and Richardson share objectivist values in their approaches to interpretation for educational history. The objectivist tradition is evaluated on its fidelity to archival materials and on its methodological avoidance of bias. The ideal rendering of historical research in objectivist traditions should avoid subjectivity and strive to remove the author's voice in order to let the past speak for itself. To the extent that subjectivity is unavoidable, then it is the historian's task to account for the possibility of bias in the interpretation as part of the analysis. Described by Paul Ricoeur (1976) as "distanciation," the purpose of interpretation in objectivist-oriented historical

research is to guard against subjectivity and to discern that which can be most reliably be claimed as objective and aligned with archival sources.

Critical Interpretations

A second approach to interpretation in historical research understands history as a critical project. By critical we mean concerned with power relations in the production of knowledge. History is a source of knowledge about who we are and what is possible in the world. Therefore, some historians take seriously how the different narratives about the past have inequitable impacts across different ways of being in the world. In critical approaches to historical research, there has been an array of ideological commitments, from left to right and center to margin; political approaches to interpretation are not limited to any particular slant. For example, movements that wish to establish legitimacy may write history in a heroic mode that emphasizes triumphs of a particular race, culture, or ethnic identity. Other movements may write histories that highlight voices of silenced or marginalized groups of people. Critical approaches to historical research may also interpret historical events in unconventional ways, or from a nontraditional point of view for purposes of calling assumptions into question.

In critically oriented historical projects, language is not an autonomous mirror or a photographic plate. It is, in fact, not a mirror at all; rather, it represents the expression of ourselves and of what structures our thoughts. Only in historical discussion, in conversation with other researchers, can historical knowledge be articulated. Historical knowledge forming is, therefore, not to be sought in the past itself, but in the interpretive traditions of the “historiographical operation,” which according to Certeau (1988) is related to the way in which the historical “evidence” is produced by historians. As Ricoeur has told us, the past is not something that is, but something that has been.

In this volume, the chapters of Chartier, Franklin, and Mayer illustrate critical interpretations of historical research. In the case of Chartier’s chapter, historical evidence is interpreted to emphasize discontinuities in the history of writing. Franklin’s chapter provides historical documentation of unlikely alliances across races and cultures in the case of urban curriculum reform. Mayer’s chapter raises the voices of women as active participants in the history of vocational education. These three chapters provide some insight into the ways interpretation can function not only as a mirror but also as a lever for lifting our awareness of dynamics in history (Depaepe 2012a).

Aesthetic Interpretations

In addition to objective and critical approaches to historical interpretation, a third orientation towards interpretation can be described as aesthetic. Again, the aesthetic approach to historical research still relies on careful examination of artifacts and rigorous analysis; however, the mode of interpretation seeks neither to mirror the past nor to leverage a critical point of view (Fendler 2013). Rather, aesthetic interpretations are related to the historiographical theory of Hayden White who called our attention to the ways in which history can be analyzed in terms of literary tropes. For an aesthetic interpretation, historians use aesthetic sensibilities to analyze and classify historical artifacts on the basis of their material qualities. In addition, many aesthetically oriented histories are written in literary styles, attending to poetry, imagination, and figurative language in the narratives.

In aesthetic interpretation, there is some relation with the ideas of Sol Cohen in the history of education (see, e.g., *Paedagogica Historica* 1996 special issue on the history of education in the postmodern era). One of the central ideas in this collection is that the historian of education had to join in the “heterogeneity of language games” in order to understand and explain them. For example, the article by Sol Cohen (1996) on *Dead Poets Society* offered a good example of postmodern heterogeneity of language games. His article explored the possibilities of film as an element of the expanded textuality of postmodern culture and as a source for the history of education. Analyzing *Dead Poets Society*, Cohen’s history provided an aesthetic interpretation to the dichotomy of traditional and progressive education. In that way, the aesthetic approach to interpretation provides fresh insight and perspective on the perennial conflict between self and society.

In this volume, the chapters of Dussel and Priem illustrate aesthetic modes of interpretation in historical research. It is not only that these two chapters focus on visual images in an aesthetic domain; it is also the case that the approaches to historical interpretation are shaped by aesthetic sensibilities. Dussel’s chapter calls explicit attention to Derrida’s two kinds of interpretation—decipher and play—terms that align with objectivist and aesthetic modes of interpretation. Priem’s chapter contributes an appreciation for the history of education relative to informal education through images in *The Family of Man*.

Conclusion

Recognition of the roles of interpretation, and appreciation for a variety of approaches to interpretation, allows us to cultivate diversity in the history of education, the relativity of our own discourses, and the impossibility to find general and absolute truths in history.

In order to expand the interpretation possibilities of the researchers, it would be intellectually and educationally responsible for historians to take up as many diverse interpretive approaches as possible in the study of the past.

(continued)

Different ways of seeing can lead to multilayered frameworks of interpretation, which contribute to insight and inspiration as educational projects (see, e.g., Depaepe 2012b). If we are willing to embrace multiple different approaches to interpretation, our research will yield not only epistemological modesty but also intellectual maturity, which are both qualities of excellence in any research field. Such epistemological pluralism in research does not imply that anything goes; as for all good research projects, each of the various approaches to interpretation has its own appropriate criteria for excellence according to which it is possible and necessary to evaluate the quality of the research. Good practices of historical research are, perhaps even more than those of other approaches, preeminently those of sharing interpretive sensibilities that have been shaped by ordinary daily-life experiences.

5.1 A Footnote to Plato: Interpreting the History of Secondary Education in Mid-Twentieth-Century England

Gary McCulloch

Introduction

Secondary education has attracted a great deal of attention from historians over the years, and this historical interest shows few signs of diminishing (McCulloch 2012). Interpretations of the historical nature and role of secondary education have changed at the same time, so that what were once widely regarded in fairly unproblematic terms as great engines of social mobility have been problematized in many different ways. This has certainly been true in the context of the history of secondary education in twentieth-century England. My own research has attempted to reinterpret the history of secondary education, especially in relation to the Education Act of 1944 and the character of “secondary education for all” from the 1940s to 1960s. Secondary education for all was initially implemented mainly on the basis of providing different types of schools for differing aptitudes and abilities, in three types of schools—grammar, technical, and modern. By the 1960s, however, this so-called tripartite system was generally acknowledged to have many shortcomings and flaws and was superseded by comprehensive schools that were intended to cater for all pupils.

What, then, was the fundamental character of secondary education in England in the years following the Education Act of 1944? Initially, optimistic assessments suggested a general growth in equality of opportunity stemming from the reforms of the 1940s. Subsequent verdicts were more critical and tended to emphasize structural inequalities on lines of social class and gender. My own research supported the view that secondary education was unequal and unbalanced, but proposed a cultural more than a social interpretation for this that linked modern secondary education

with the writings of the ancient Greek philosopher Plato, especially *The Republic* (Plato c. 380 BC/1976), his ideals of education for leadership, and his vision of society. This led me to map out the three types of secondary school in turn. It also provided scope for a reinterpretation of the Norwood Report of 1943, *Curriculum and Examinations in Secondary Schools* (Board of Education 1943), which was the avowed inspiration for the tripartite system. Furthermore, it offered a means to interpret the basis of curriculum differences in secondary education. This was generally a policy-oriented approach, although it sought always to interpret educational changes in relation to social history. As my research developed further, it took me in a direction that was increasingly biographical and social, focusing, for example, on the life and educational career of the principal author of the Norwood Report, Sir Cyril Norwood, and the social dynamics of the English middle classes in the nineteenth and twentieth centuries. Rather than being contained within a single book or paper, this research stretched over at least five books (McCulloch 1989, 1991, 1994, 1998, 2007) and a large number of articles and essays in a 20-year period, resembling overall something like a research program. The present chapter seeks to reflect on the historical interpretations offered in this body of work and on how these changed in subtle ways during the course of this project.

Changing Interpretations of the 1944 Education Act

Reinterpretations of secondary education as it developed in England following the Education Act of 1944 took place in a broad intellectual and policy context that highlighted the importance of this particular sector. In terms of the historiography of education, such reinterpretations were an aspect of revisionist and critical scholarship. Earlier liberal-progressive perspectives had viewed changes in the education system as progressing steadily towards improvement for the benefit of all, providing greater individual opportunities and enhancing national prosperity. New research challenged such interpretations and emphasized the tensions and inequalities that underlay educational provision (McCulloch 2011a).

Internationally, secondary education has attracted considerable attention from historians especially since the 1980s. In the USA, for example, a number of important studies were produced by Labaree, Reese, Herbst, and others (Labaree 1989; Reese 1995; Herbst 1996; Rudolph 2002; Kridel and Bullough 2007). In many other countries, such as Canada, China, and Germany, new work was also forthcoming to constitute overall an impressive body of literature (Albisetti 1988; Gidney 1990; Thogerson 1990). In 2004, a special issue of the international journal *Paedagogica Historica* was devoted to “Secondary education: institutional, cultural and social history” following a meeting in Paris of the International Standing Conference for the History of Education, including a wide range of new research in many different countries (Paedagogica Historica 2004). A series of books on *Secondary Education in a Changing World*, edited by Franklin and McCulloch for Palgrave Macmillan in New York, similarly found extensive scope for a wide range

of national historical studies, for example, in the USA, the UK, Australia, and New Zealand (Sherington and Campbell 2006; VanOverbeke 2008; Openshaw 2009). It also highlighted international comparisons in relation to the history of comprehensive schooling and of secondary education for girls (Wiborg 2009; Albisetti et al. 2010).

This growth of interest in the history of secondary education occurred partly because secondary schools related well to many different social, economic, and political issues. As Savoie et al. pointed out, “It is precisely because it raises the issues of the connection between school and society – on such matters as culture; national identities; elitism, meritocracy and social democracy; the gender gap; moral and civic values and behaviours; vocational skills – that the history of secondary education is so fascinating” (Savoie et al. 2004, p. 14). It also grew at this time because secondary education was itself an increasingly controversial issue. This was certainly true in England, particularly in relation to comprehensive schools. After the 1960s, comprehensive schooling was consolidated as the dominant pattern of secondary education, but then a succession of reforms gave renewed emphasis to specialization and differentiation. Under Conservative governments from 1979 to 1997, and then Labor governments from 1997 to 2010, secondary education became a principal focus for initiatives designed to improve standards, which led to much stronger control being exerted to allow further change (McCulloch 2011b). Interpretations of the history of secondary education were conducted against a background of heated political debates and were in part at least a response to these.

These contemporary debates were clearly reflected in the historiography of secondary education, as more or less settled accounts of secondary education as gradual change and improvement over the long term became invaded by doubts and contentions over rival nostrums. At the same time, the history of education responded to broader developments in social history which became a specialized academic field in Britain from the 1950s to 1960s (Obelkevich 2000). R. L. Archer’s history of secondary education in the nineteenth century (Archer 1921) and John Graves’ account of “policy and progress” in the decades following the Education Act of 1902 (Graves 1943) were chronological and factual depictions of gradual social progress, such as were familiar in the history of education literature of that time. In the 1950s, the sociologist Olive Banks documented the controversies around the social functions of the different kinds of secondary education and in particular the social implications of grammar schools (Banks 1955; McCulloch 2008). Growing awareness of the social inequalities involved in secondary education helped to generate a more critical historical literature addressing issues of social class, such as in the work of Brian Simon (Simon 1974) and later those of gender, for example, by Felicity Hunt (1991). A number of critical overviews and interpretations served to emphasize the unresolved problems of secondary education in the twentieth century (e.g., Lowe 1989; McCulloch 2001; McCulloch 2004a; Richardson 2011). The history of secondary education in Scotland (Paterson 1983; Anderson 1983, 1985) and Wales (Evans 1990, 2008) also stimulated much more critical scholarship than in earlier decades.

These changes in interpretation were also evident in relation to the 1944 Education Act and the secondary education of the 1940s and 1950s. Early commentators such as Harold Dent pointed out the high ideals of the wartime educational reformers. Dent argued that public education had made considerable progress since the eighteenth century and put the provisions of the 1944 Act in this long-term historical context to demonstrate the “almost unbelievable change” that had come about since that time (Dent 1952, p. 19). These achievements began to appear less impressive by the 1960s as the failures and disappointments of the Act became more widely apparent. The continuities represented in the Act also appeared no less evident than the changes that it helped to bring about (McCulloch 1994, p. 49).

Growing dissatisfaction with the outcomes of the 1944 Act was further encouraged by the development of more radical interpretations that portrayed it in terms of a conspiracy on the part of politicians and officials. According to this general viewpoint, the Board of Education and its advisors constituted a self-serving elite group in ultimate control of educational policy, imbued with common values arising from their public school education and with common class interests in restricting and manipulating educational reform. The survival of the independent or “public” schools despite their widespread unpopularity during the war was an important indicator of such a conspiracy, and the Fleming committee on the public schools is an example of the kind of mechanism that was used to ensure the maintenance of social stability.

The Norwood Report of 1943 also played a key role in this interpretation. It was portrayed as a device that was intended to channel the heightened expectations for reform that existed during the war years into socially conservative directions. In particular, its preference for three different types of secondary school, rather than for one single type, was criticized for being socially divisive and elitist. Its elaborate rationale in favor of tripartism in secondary education became the focus of critical attention, especially when the grammar schools maintained their dominance after the war. Because of the strategic position of the Norwood Report, published as it was the year before the 1944 Act, it could be portrayed as the darker side of the 1944 settlement, the handbrake on a generally progressive reform. While the 1944 Act itself made no reference to different types of secondary school, the quasi-official support given to the idea in the Norwood Report appeared to provide justification for a tripartite system.

The chairman of the Norwood committee, Sir Cyril Norwood, was himself a convenient target for criticism which tended to strengthen the view that the report was reactionary and socially divisive. Norwood was much more attuned to the traditions, problems, and possibilities of public schools and grammar schools. His idealization of an “English tradition of education” was strongly reflected in the Norwood Report. His position in the charmed circle of advisors to the Board of Education, no less than his social background and his advancing years, made it straightforward to label him as a bastion of conservative forces determined to prevent wholesale or radical reforms in education. It was concluded that Norwood controlled the agenda of his committee and that the final report had a widespread

influence in persuading the Ministry of Education and local education authorities to favor a tripartite system after the war, rather than to adopt the pattern of a common secondary school for all.

The left-wing historian Brian Simon was foremost in developing this radical reinterpretation of the 1944 Act. According to Simon, the politics of the Norwood committee itself were “devious and multifarious” and “shrouded in a certain amount of mystery” (Simon 1986, p. 38). Yet its establishment was a “masterstroke” because it provided “an ideological underpinning for the tripartite system” (Simon 1986, pp. 38–39). It thus “appeared to lay down a clear pattern (and rationale) for a divided system of secondary education following whatever reforms were to be brought about by legislation” (Simon 1986, p. 39). The “devious practice” that it involved led directly to the strengthening of “selection and an elitist structure” (Simon 1986, p. 40; see also Simon 1974, pp. 323–33; Simon 1991, chapter 1). Simon concluded that as a result of this kind of “manipulation and control” during the formulation of the 1944 Act, “after all the discussion and legislation, the country emerged with an hierarchical educational structure almost precisely as planned and developed in the mid-late nineteenth century” (Simon 1991, p. 74). In short, the 1944 Act itself could be regarded as a “Conservative measure,” through which “The “New Order” in English education, celebrated by Dent and many others, turned out to be the old order in a new disguise” (Simon 1986, p. 43).

At the same time, a right-wing critique of the 1944 Act also emerged. During the 1980s, as the Conservative government struggled with the consequences of economic decline and industrial conflict, the view gained ground that such problems were rooted in the character of the education system. Martin Wiener’s highly influential work *English Culture and the Decline of the Industrial Spirit* (1850–1980) (Wiener 1981) emphasized the importance of the Victorian public schools in the “shaping of a gentleman.” Wiener proposed that the nine ancient public schools examined in the Clarendon Commission of the 1860s became established, “more or less as they were, as the model of secondary education for all who aspired to rise in English society” (Wiener 1981, p. 17). In turn, this encouraged a detachment from business, commerce, and industry that continued to shape British attitudes and values in the twentieth century.

This argument was highly attractive as an explanation for Britain’s relative economic decline and served to reinforce criticisms of the education system. It also carried with it significant implications for an interpretation of the 1944 Act. The reforms of the 1940s could be represented as being based on a social idealism and extravagance that were misplaced in a nation facing economic ruin, as well as favoring an old-fashioned ideal of liberal education rather than the needs of modern industry and commerce. Such a view was argued in forthright terms by the military historian Correlli Barnett in his book *The Audit of War* (Barnett 1986). According to Barnett, “Britain’s post-war decline began in wartime British dreams, illusions and realities” (Barnett 1986, p. 8). Barnett argues that the cultural and political elite was directly responsible for encouraging what he describes as a mood of “New Jerusalemism” and that underlying this was the pervasive influence of the public school ethos, leading to a tradition of “education for industrial decline.”

Barnett links the 1944 Act to this tradition and again makes the Norwood Report the most prominent target for criticism. Educational reform in World War II, Barnett complains, was “in little sense related to manpower policy or to the future industrial and export prospects so depressingly debated in other corners of Whitehall” (Barnett 1986, p. 276). The Norwood Report itself is dismissed scathingly as an “amazing document” and “an exercise in hypocrisy, if not actual deception” that “publicly affirmed in uncompromising language the prevailing outlook and beliefs of the British educational establishment, and in particular of those who controlled, and would control, the levers of the educational system” (Barnett 1986, p. 299). The failure to develop secondary technical schools and county colleges in the 1940s and 1950s is attributed to this cultural and social malaise, a theme pursued further by historians of technical education such as Michael Sanderson and Derek Aldcroft (Aldcroft 1992; Sanderson 1994).

These, then, were the main frameworks of interpretation around the 1944 Education Act and secondary education in the 1980s and 1990s as I began to reassess this period in my own research. They had already generated a lively debate which was of significance for historians and also for current education policies and established some orthodoxies around the role of the Norwood Report and the characteristics of the tripartite system. These emerged as principal subjects for reinterpretation.

Three Types of Mind

The philosopher Alfred North Whitehead famously declared that “The safest general characterization of the European philosophical tradition is that it consists of a series of footnotes to Plato” (Whitehead 1928/1978, p. 39). The general interpretation that I developed was that Whitehead’s comment was almost literally true of English secondary education in the nineteenth and twentieth centuries. It was a view that helped to explain the so-called tripartite system that emerged after the 1944 Act in terms of Plato’s typology of three types of mind, described in his work *The Republic* (Plato c. 380 BC/1976). Reference to the ancient Greek philosopher Plato provided a broad framework for understanding the intellectual and cultural basis for the divisions in English secondary education, which then translated into social divisions. The fact that Cyril Norwood and many other educators of this period were avowed Platonists also made this at least a plausible point of departure for my work.

Plato’s *The Republic* proposed that there were three distinct classes in society, each of which required a different kind of preparation or education. The first class, associated with gold, was that of the philosophers. The second, made of silver, comprised the “auxiliaries” or skilled merchants and tradesmen. Last came the artisans and farmers, made of iron and copper. Plato insisted that future “guardians” or rulers should be taken only from those made of gold. Their education would involve training in music and gymnastics and then, for the most promising, tests of courage and particularly of self-control. Those emerging from such training would be not only philosophers but also rulers, indeed philosopher kings, who alone would

be fit to lead and serve the community as a whole. Meanwhile, the auxiliaries would be educated in a more practical rather than in an intellectual way to prepare them for their future vocations, while the mass of the population would be educated, if at all, to play their part in society in a more modest way.

The tripartite divisions accepted in the 1940s can be understood as a version of Plato's typology, applied to English society. It served to legitimize a social hierarchy that correlated in a straightforward manner with an educational hierarchy. As in Plato's scheme of education, the academic or "liberal" approach to education came first, the technical or vocational was assigned a poor second place, and the plebeian or banausic came in last. In this way English education seemed to constitute a life-size working model of Plato's educational ideals. As John Dancy pointed out in the 1960s, "Plato was a social and intellectual snob rolled into one, a combination irresistible to the English. His intellectual theory matched and reinforced our traditional social practice" (Dancy 1965, p. 385).

In the nineteenth century, the reinvigorated public schools provided the philosopher kings; a range of technical institutions struggled to survive as an intermediate tier; the elementary schools that were grudgingly and belatedly created were clearly intended to provide the workers of tomorrow. In the early decades of the twentieth century, the elite group was broadened to include the "meritocracy" of the new state-aided grammar schools, almost if not quite alongside the "aristocracy" of the public schools. The junior technical schools and the elementary schools continued in these circumstances to perform preordained and familiar roles. Fred Clarke, professor of education in South Africa in the 1920s, could observe from a distance the maintenance of social distinctions in this period, reflected, for instance, in upper-class opinion that could see "something incongruous and almost indecent in the phenomenon of the coachman's or butler's son learning Latin." On this view, Latin was "like polo or pheasant-shooting – the prerogative of a gentleman, and should not be prostituted to base plebeian churls" (Clarke 1923, p. 51).

A wide range of influential social and political theorists in the 1920s and 1930s also exhibited a strong regard for the values articulated by Plato. Jose Harris has argued that a form of idealism imbued with the social philosophy of Plato formed "the overarching philosophy of the early days of the welfare state" (Harris 1992, p. 142). According to Harris, "early twentieth-century social scientists found in Plato not simply a system of logic and epistemology, but a series of clues, principles and practical nostrums with which to approach the problems of mass, urban, class-based, industrial and imperial civilisation" (Harris 1992, p. 127). Moreover, the "vast majority" of these British Platonists were "reformers, democrats and egalitarians, largely oblivious of Plato's apparent endorsement of absolute political obedience, a functional caste system, and the selective breeding of a master race" (Harris 1992, pp. 127–28). These tendencies were especially noticeable in the field of education in the 1920s and 1930s.

A similar hierarchical pattern could be observed in the tripartite system after World War II. Indeed, this was noted with increasing discomfort by the classics-trained administrators of the period. Sir Robert Wood, as deputy secretary at the ministry, noted that the education system was "attaining Plato's rule that "children

must be placed not according to their father's conditions, but the faculties of their minds". On the other hand, he conceded the possibility that it might replace "social class distinction by equally objectionable intellectual distinctions – creating an aristocracy of intellect in the grammar schools and putting the "runners-up" in the Secondary (Technical) Schools, and "the field" in the Modern Schools" (Wood 1946). By the 1950s, another thoughtful senior official at the ministry, Toby Weaver, feared entrenching "for as long as we can foresee the three-tier system of Plato's Republic that is already hardening – the "fliers", whether humanists or technologists, in academic grammar schools, the technicians and managers in second creaming technical schools, and the "pedestrians" in banal modern schools with little hope of challenge or standard in their courses" (Weaver 1955).

The Norwood Report of 1943 mapped out these three types of mind in precise and graphic detail. Part I of the report identified three "rough groupings" of pupils which, "whatever may be their ground, have in fact established themselves in general educational experience" (Board of Education 1943, p. 2). It argued that these distinctions should be acknowledged and catered for in the future provision of secondary education.

The first type of mind, it proposed, was "the pupil who is interested in learning for its own sake, who can grasp an argument or follow a piece of connected reasoning; who is interested in causes, whether on the level of human volition or in the material world; who cares to know how things came to be as well as how they are, who is sensitive to language as expression of thought, to a proof as a precise demonstration, to a series of experiments justifying a principle; he is interested in the relatedness of related things, in development, in structure, in a coherent body of knowledge." Formerly, such pupils had been associated with the grammar schools, and they had generally gone into the learned professions or higher administrative or business posts. The curriculum best suited for these pupils was one that "treats the various fields of knowledge as suitable for coherent and systematic study for their own sake apart from immediate considerations of occupation" (Board of Education 1943, p. 4). According to the report, grammar schools should continue to provide such a curriculum, in order to uphold an ideal of "disciplined thought provided by an introduction to the main fields of systematic knowledge, which is valued first for its own sake and later invoked to meet the needs of life" (Board of Education 1943, p. 7).

The second type of pupil was identified in the Norwood Report as showing "interests and abilities" that lay "markedly in the field of applied science or applied art" (Board of Education 1943, p. 3). These pupils were held to be especially well suited to a curriculum that was "closely, though not wholly, directed to the special data and skills associated with a particular kind of occupation," and this could be developed in secondary technical schools that would be designed for this purpose (Board of Education 1943, p. 4).

Lastly, the Norwood Report perceived a grouping of pupils who dealt "more easily with concrete things than with ideas" and who demanded "immediate returns" from any endeavors. As it explained, "His horizon is near and within a limited area his movement is generally slow, though it may be surprisingly rapid in seizing a particular point or in taking up a special line" (Board of Education 1943,

p. 3). For these pupils it suggested a curriculum with “a balanced training of mind and body and a correlated approach to humanities, Natural Science and the arts,” not to prepare for a specific job or occupation but to “make a direct appeal to interests, which it would awaken by practical touch with affairs” (Board of Education 1943, p. 4). The new secondary modern schools would be well placed to cater for these pupils, according to the report.

Thus, the Norwood Report articulated a tripartite ideology with unsurpassed acuity and enthusiasm, although it was far from alone in its support for such a structure. Such an ideal was widely advocated and was deeply rooted in the politics and society of the 1930s and 1940s (see also McCulloch 2002). In order to understand this more fully and in greater complexity, I determined to analyze each of the three Platonic types of mind separately as historical traditions or trends to find out how they had culminated in the types of secondary school and curriculum of the postwar system. This project led to the production of three books that were devoted to these traditions.

The first book to be published (although I worked on it simultaneously with the second while on sabbatical leave from my university in 1987–1988) focused on the secondary technical schools. This was a book that was strongly oriented towards understanding educational policies, past and present, for there was at this time renewed interest in technical and vocational education initiatives in Britain in the form of the Technical and Vocational Education Initiative and the city technology colleges. It attempted to explain why the secondary technical schools had been developed after World War II and also, no less important, why they had failed to prosper and spread and why they were abandoned as a policy in the 1960s. It found, consistently with the general interpretation of the period that I was already developing, that the secondary technical schools were viewed as being an important complement to the grammar schools but that they failed first and foremost because of a widespread antipathy towards technical education. Indeed, their failure was due in large part to the resistance of parents and industry, and it was Sir David Eccles, Conservative minister of education for much of the 1950s, who helped to prevent the further development of the schools. Thus, I argued, the secondary technical schools were not a successful and popular policy stifled at birth by the spread of comprehensive schools, but a policy that suffered due to social and cultural preferences and was already widely regarded as a misguided failure well before the 1960s (McCulloch 1989, p. 7).

The second work explored the tradition of education for leadership in England in the nineteenth and twentieth centuries. Here the task was less straightforward than with the technical schools, as the Platonic leadership tradition was only partly associated with the grammar schools and was more fundamentally rooted in the Victorian public schools. For this reason, I began my analysis of this tradition with an appraisal of the Victorian public schools and then sought to trace how this had been adapted and developed in the changing social and political context of the twentieth century. The Board of Education, strongly influenced by the public school tradition, strongly encouraged the grammar schools to imitate the ideals and practices of the public schools, and after World War II, it was Eric James, high

master of Manchester Grammar School, who expressed Platonic ideas about education for leadership most explicitly (James 1951). Nevertheless, this was fundamentally a story about the decline and dispersal of the classic ideology of the public schools as it mutated into different forms in a changing society (McCulloch 1991).

The third theme in this series of publications was that of working-class secondary education, leading eventually to the failed experiment of the secondary modern schools. The early origins of this movement were identified in the higher grade schools of the late nineteenth century, and the educational debates of the 1920s and 1930s reflected a search for a distinctive type of secondary education that would be most appropriate for working-class pupils. The Hadow Report of 1926 broadly supported such ideas and recognized in them “the half-conscious striving of a highly industrialised society to evolve a type of school analogous to and yet distinct from the secondary school, and providing an education designed to fit boys and girls to enter the various branches of industry, commerce and agriculture at the age of 15” (Board of Education 1926, p. 35). Many leading politicians and administrators, including ministers in the Labor government from 1945, hoped that the secondary modern schools would realize a new and more fulfilling approach to the education of the majority of pupils than was to be found in the academic grammar schools (McCulloch 1998, pp. 60–65). However, by the early 1960s it was unmistakably evident that secondary modern schools tended to be seen as inferior and that an alternative approach was urgently required.

One key conclusion that emerged from this set of studies was that Harold Dent was broadly correct when he argued in the 1950s that tripartism was “a manifestation of the “tradition of the society”, with long and deep historical roots, and should be treated as such” (Dent 1952, p. 93). It was indeed an integral aspect of the social history of secondary education in the nineteenth and twentieth centuries. The inequalities of secondary education were cultural as much as social and political, and the ideas and assumptions that supported them in areas such as technical education and the importance of public schools and grammar schools were widely shared. At the same time, it is also true that at different times administrative concerns and class interests and ideologies have served powerfully to reinforce this underlying and embedded approach. The “tradition” was manipulated in ways that Dent did not concede to favor the continued dominance of grammar and public schools and of the academic and liberal curriculum.

A further theme that became evident was the nature of the secondary school curriculum over the longer term. In particular, the elite traditions associated with the great public schools of the nineteenth century seemed to have a continuing purchase over curriculum changes in the new phase of universal secondary education after World War II. For example, as I proposed, it was the desire to update and revise the idea of education for leadership in a changing society that helped to guide the school science initiatives of the 1950s. A key priority of the time was to equip the future elite with scientific and technological knowledge and skills, rather than the classical training that had been deemed appropriate in the Victorian period. Yet this technocratic vision retained many of the educational and social

assumptions of the public schools, especially in its concern for social leadership, its preference for humanistic and liberal values, and its focus on boys rather than girls. Whereas their Victorian predecessors had looked to classics and “greats” to produce empire builders, in the 1950s the sponsors of science curriculum reform hoped to produce a cadre of leaders suited for late twentieth-century society (McCulloch 1988).

The ideal of education for leadership was indeed to the fore in school science reform initiatives. The science periodical *Nature* described Eric James’s book *Education and Leadership* (James 1951) as a “tract for the times” and emphasized “the implications for to-day of the Platonic conception of education” (Nature 1951). James himself was active in promoting science education with this underlying vision. Addressing the Science Masters’ Association in 1955, for example, James argued that scientists should be able to use their gifts in administration and government: “Plato envisaged his philosopher kings as having been trained in the mathematics and science of his day. We must see that his vision is realised” (James 1955, p. 324). Similar arguments were widely prominent. Lord Hailsham, appointed as Britain’s first minister for science in 1959 and himself a classical scholar, suggested that science education had differing aims for three different kinds of people—the “mass of the people,” the “bureaucracy,” and the “aristocracy.” It was the members of this last group, who “by their talents and training have the power of making new scientific discoveries and so of keeping the whole fabric alive,” who should have “the training and equipment to enable them to discharge their task” (Hailsham 1963, pp. 40–41). C. P. Snow’s influential work on the “two cultures” and on science and government entertained basically the same elite vision of education for leadership (Snow 1964).

That the secondary technical schools suffered by comparison with the public and grammar schools is not altogether surprising in this broader social and historical context. In the northern industrial city of Wigan, for instance, Thomas Linacre School was established as a secondary technical school in 1953 with new, purpose-built premises and a selective pupil recruitment policy. However, it was not able to compete with Wigan Grammar School, and indeed parents showed an overwhelming preference for the latter. The traditions and reassuring shape of Wigan Grammar made it a most unequal contest with Thomas Linacre’s unfamiliar curriculum and modernist buildings (McCulloch 1989, pp. 146–51). The parity of esteem that was anticipated by the educational policy makers of the 1930s and 1940s failed to eventuate because of deeply ingrained cultural and social prejudices that favored the academic and liberal curriculum over the technical and vocational alternative.

The Second Phase: Biography and Society

By 1998, then, this historical project had fashioned a coherent interpretation of English secondary education after World War II and had mapped this in detail in relation to the different kinds of school and curriculum involved. The Norwood Report and its Platonic ideals about tripartism were the focal point of this general

interpretation, enabling it to offer a distinctive understanding of the history of secondary education which, if it was broadly consistent with Simon's class-based interpretation, helped to explain the nature of the schools and curriculum in a particular way. From this point, my historical interpretation developed further in what I would characterize in retrospect as a second phase of this general project. This amounted to a biographical and social turn. It explored the development of Cyril Norwood's contributions to education in order to help to understand the origins of the ideal of secondary education that he represented. It also investigated in greater depth the middle-class characteristics of the dominant form of secondary education as it had formed in England since the nineteenth century. Both of these approaches helped to bring into greater relief the social practices associated with education for leadership over this time. They also led towards an engagement with new scholarship in related fields, not only in history but also in education and the social sciences, especially in sociology.

As has been seen, Norwood's own role in influencing his committee's report of 1943 has often been criticized, and yet there had never been a full biography of Norwood himself and he remained a somewhat shadowy figure. Nevertheless, he had been actively involved in English secondary education since before the Education Act of 1902, first as a teacher and headteacher at urban grammar schools, then as the headmaster of two elite public boarding schools, and also as a leading policy maker at a national level through his position as chairman of the Secondary Schools Examinations Council from 1918 onwards, a role that he continued throughout the interwar period and in World War II. He had been a controversial public figure in education for over 20 years by the time the Norwood Report was produced in 1943. In personal terms, also, Norwood's life was of interest. His father, Samuel, had been the headmaster of a small grammar school in the later nineteenth century. Cyril Norwood himself had been educated at Merchant Taylors School, in London, one of the leading public schools but unusually a day school rather than a public school. He gained an outstanding first class honors degree at the University of Oxford and was appointed to the Admiralty before resigning from this and embarking instead on an educational career. It was the connection between Norwood's distinguished contributions to secondary education and his own personal development that seemed to hold a clue to the rise of a particular ideal of secondary education based on academic and liberal values (McCulloch 2006a).

This interpretation of the significance of Norwood's own life and career owed much to biographical and sociological insights into the relationship between individual lives and the wider society. In particular, it took its cue from the classic work of the sociologist C. Wright Mills, *The Sociological Imagination* (Wright Mills 1959). Wright Mills emphasized the need to try to understand the relationship between the individual and structures of society as a key component of his ideal of the sociological imagination, which makes it possible to understand "the larger historical scene" in terms of "its meaning for the inner life and the external career of a variety of individuals" (Wright Mills 1959, p. 5). Indeed, he argued, "The sociological imagination enables us to grasp history and biography and the relations

between the two within society.” He contended that this was a prime concern of the classic social analysis: “No social study that does not come back to the problems of biography, of history, and of their intersections within a society has completed its intellectual journey” (Wright Mills 1959, p. 6). Wright Mills also traced out a key relationship, often neglected, between “personal troubles,” in which an individual finds his or her values being threatened, and “public issues,” involving crises in institutional arrangements (Wright Mills 1959, p. 7). This was a set of insights that promised to deepen and extend the interpretation of the history of secondary education that I had developed in my earlier work. It provided significant connections to more recent biographical work informed by feminist and sociological theory that had become more widespread in the history of education in the 1990s and the early twenty-first century (Martin 2012).

This new direction in interpreting the history of secondary education was also informed by fresh historical and sociological research on the middle classes. Whereas in the 1960s and 1970s, the working class had attracted more attention from historians and sociologists, by the end of the century, it was the middle classes that were receiving a great deal of interest. Much of this had served to highlight the insecurities of the middle classes in terms of an underlying fear of failure and anxiety regarding social decline. Ambition and social climbing coexisted with nervousness at the possibility of failure or defeat. This was the keynote of new work in the USA (Bledstein and Johnston 2001; Aronowitz 2003), as well as in England (Kidd and Nicholls 1999; Bourke 2005). Sociological research has similarly rethought the characteristics of social class, with a special emphasis on the middle classes, often drawing on the insights of the French sociologist Pierre Bourdieu. This work has set out to examine the nuances of middle-class identities and social practices and how middle-class families ensure the retention of social advantages from generation to generation (Devine 2004). Sociologists of education were also active in exploring the nature of class strategies (Power et al. 2003; Ball 2003).

My next full-length study therefore sought to relate Norwood’s life and educational career to these current developments in historiography, the social sciences, and educational scholarship, no less than to pursue the longer-term origins of the ideals around secondary education. It found that Norwood himself represented a particular kind of middle-class figure, with clerical and provincial roots in the nineteenth century, linked more closely to the local grammar schools than with the elite public schools that he came to idealize and to associate with leadership. The “English tradition of education” which he tried to define and extol was rooted in the ideal of education for leadership represented by the Victorian public schools (Norwood 1929). He could be regarded as something of an outsider to this elite tradition, “not quite-quite” in the telling phrase of teachers, parents, and pupils at the public schools that he admired so greatly (McCulloch 2006b). Norwood’s own life and career therefore highlight the contradictions and tensions around this tradition, as well as tracing the intellectual and policy development of the ideal itself (McCulloch 2007).

Concluding Reflections

It is of course easy to exaggerate in retrospect the coherence and rationality involved in a long-term research project which has certainly roamed around many different topics, but overall the account provided here seems to me broadly accurate. The first phase at least was an ambitious plan of research, and although the second phase was not anticipated to the same extent, it did follow on from the first in a broadly consistent manner. I have tried to describe how a particular interpretation was developed and applied to the history of secondary education in England. This interpretation began from the Platonic tripartite ideals of the Norwood Report, especially the elite tradition of education for leadership, and sought to provide explanatory purchase on the schools and curricula of the postwar period in a way that other interpretations did not take fully into account. My final reflections on this process address the nature of the project as a contribution to social history, the implications for the interpretation of historical evidence, the relevance of contemporary issues for historical interpretations, and the connections between education, history, and the social sciences in the history of education.

Although there was a philosophical basis for the interpretation developed in relation to the ideas of the Greek philosopher Plato, the project was always intended to be a contribution to social history rather than to philosophy. Plato's typology and the ideals of education for leadership informed the historical interpretation. It was the currency of these ideas within a changing educational, social, and political context and the way that they comprised one of what Whitehead called "a set of footnotes to Plato" that was of prime interest. The research was concerned not solely with ideas and their philosophical implications but with the historical development of ideas and practices and how these related to changes in education, society, and politics. As such, the interpretation as it developed conformed to the recognized conventions of historical research in terms of method and sensitivity to the concerns of the period being examined (McCulloch and Richardson 2000). It was concerned with a particular national context also, rather than seeking a general theory that would apply more broadly. It aimed to provide a critical interpretation of issues and problems in the spirit of other recent revisionist historiography in this field of study. It tried to avoid "raiding the past" or to adopt a selective use of the past in the search for telling examples to support a particular contemporary theme (Silver 1980, p. 279). At the same time, it also conformed to Harold Silver's advice that in identifying a legitimate role for themselves, "historians will be inevitably and usefully compelled to review their own organising concepts and assumptions, to learn from evaluators, ethnographers and others grappling from different directions with the same complex sequences and processes" (Silver 1990, p. 30). In its discussion of the relationship between education and a changing society, moreover, it tended to problematize and render complex what other interpretations had

(continued)

found to be relatively straightforward. In particular, the role of the Norwood Report and of Norwood himself came across as complicated and diverse and arguably more interesting than the one-dimensional interpretations that had previously been offered. In general, it was a historical interpretation that afforded scope for complexity, ambiguity, and detail rather than seeking to maintain a rigid, convenient, or simple storyline.

As with any historical interpretation, this account depended on the historical evidence that was available for the research. A large number of published policy reports were readily accessible for the period, and in particular the overall analysis gave purchase to a more detailed study and interpretation of the Norwood Report than had been available hitherto. In the first phase, the research drew mainly on the policy archives of the Ministry of Education at the National Archives in Kew, southwest London, supplemented by local and school records as appropriate. These sources of data sustained a strong policy orientation for the project as a whole and made it possible to map the different kinds of school and curriculum. They also facilitated insights into the thinking of politicians and officials which was certainly not always public or transparent. The further development of the project was greatly assisted by my discovery of the personal papers of Cyril Norwood. These included background papers on the Norwood Report, a large number of press cuttings on the many issues of educational controversy during Norwood's career, drafts of sermons and speeches given by Norwood, diaries on overseas journeys, photographs, and hundreds of personal letters. Together, these papers were vital in illuminating not only Norwood's own life and career but also the nature of his contribution to public policy. They made it possible, that is to say, to connect together "personal troubles" and "public issues" in the manner recommended by C. Wright Mills (McCulloch 2004b, pp. 70–72).

While the historical interpretation that developed in this project was concerned to make sense of secondary education in the historical period that it addressed, it also responded at different levels to contemporary issues and problems. It began in the aftermath of the Education Reform Act of 1988, which had overturned the consensus that had once existed around the principles underpinning the 1944 Act. At one level, therefore, it may be read as an attempt to provide a critical appreciation of secondary education in the 1940s and 1950s which would help to understand current policies. Several of my published contributions tried explicitly to draw out the connections between past and present (McCulloch 1989, 1994, 1995). At a time when official documents such as White Papers rarely articulated historical issues, they also attempted to instill some historical memory. By the early twenty-first century, as governments continued to grapple with seemingly intractable problems around secondary schools and their curricula, it remained an underlying aim to bring some historical understanding to the policy debates, although it must

(continued)

be said with increasing pessimism about how effectively this could be achieved in current circumstances (McCulloch 2011a, Chapter 4; McCulloch 2011b). At the same time, the questions and ideas that underlay the research also developed in response to new scholarship in related fields.

Finally, one may reflect on the ways in which this historical interpretation has related to the broad field of education, to the discipline of history, and to the social sciences and humanities more broadly. The history of education has often been contested and effectively fragmented in terms of its rationale, whether for its contribution to education, for its historical value, or for its contribution to the social sciences. Viewed retrospectively, the interpretation of the history of secondary education that has emerged from this project has engaged and interacted with all of these different kinds of approach. It has found common ground with the politics and sociology of education; it has been grounded in the methods and precepts of historical scholarship; it has drawn on social scientific theories and methodological insights. In cultivating our interpretations of the past, then, it seems apparent that we can look towards a broad spectrum of strategies and ideas, rather than a narrow set of predefined issues, to help us on our way (McCulloch 2011a, b).

5.2 Silences and Interpretations: Historical Approaches in Understanding Classroom Teachers from the Past

Philip Gardner

The voices of school teachers weigh upon the lives of children and linger in the memories of adults. Teachers are memorable and influential figures. But when it comes to compiling the larger historical record, the voice of the teacher—once so locally powerful and authoritative—falters or falls away entirely. It is as if those who taught us so assiduously in our childhoods have nothing left to teach us in later life when it comes to understanding the course of the educational past. In this respect, teachers belong more easily to memory than they do to history. Perhaps as a consequence of this, in their efforts to make sense of educational history, historians have not always been very concerned to seek out the voice of the teacher from past time. Instead they have turned more readily to the historical traces inscribed within the formal written record—to legislation, to policy documents, to administrative records, to inspectors' reports, to school textbooks, and the like. In such records, the active figures of teachers, together with that to which Dan Lortie once referred to as their "special combination of orientations and sentiments," have left but a feint impression.¹ Moreover, for such a highly educated group, teachers who spent their working lives in publicly funded schools—by contrast with those in elite private schools—have tended to leave few written memoirs of their professional work and experiences.²

¹ Dan C. Lortie (1975) *Schoolteacher: A Sociological Study* (Chicago: University of Chicago Press), viii.

² Kate Rousmaniere (1997) *City Teachers: Teaching and School Reform in Historical Perspective* (New York: Teachers College Press), 7–8: "(T)he primacy of each teacher's individual classroom left this highly literate group little time to reflect on or document their work." The voice of the classroom teacher appears only rarely in sustained prose testimonies such as that of Martha Mizell Puckett (2002) *Memoires of a Georgia Teacher: Fifty Years in the Classroom* (Athens: University of Georgia Press).

The relative rarity of the teacher's voice as a historical resource has resulted in a double disadvantage for the history of education. In the first place it has meant that the classrooms of the past—those intense, enclosed sites over which teachers presided across the course of their working lives—have substantially evaded the attention of historians.³ As a result, the study of education policy has predominated over that of practice in the classroom, despite the fact that the latter has always represented the putative focus for all the efforts of national educational endeavor. In the second place, the absence of the teacher's voice has meant that the history of the teaching profession itself, and of the individuals who served within it, has remained a sketchy and indistinct one.⁴ In failing more effectively to seek out the voices of teachers from the past, the scope and reach of that which we are able to say in broader terms about the history of education, and more specifically about the history of teachers themselves, have been substantially reduced.

It is the recognition of this failure—and the paradox which it dramatizes—that stands at the heart of Kate Rousmaniere's original and continually instructive historical study from 1997, *City Teachers: Teaching and School Reform in Historical Perspective*. Rousmaniere's book is noteworthy because histories of teachers that seek to place the figure of the classroom teacher at their heart, as does this one, are few and far between. It is also particularly valuable because, in the way of all thought-provoking works, *City Teachers*, as John Rury has noted, "raises as many questions as it provides answers."⁵ Some of the most interesting of these questions impinge upon the exercise of historical interpretation in relation to both documentary and oral sources, and it is these that the second part of this chapter will seek to explore.

Before turning to these, however, it is necessary to look more closely at *City Teachers* as a product of the historian's craft, particularly in relation to its research objectives, its methods, and the assumptions that underpin the historical interpretation it presents.

The book is about the work of a group of public school teachers in a particular place and at a particular moment in time: the place is New York City; the time is the 1920s, a period dominated by a curriculum reform movement "encapsulated in the term *social efficiency*."⁶ The study is therefore concerned with teachers and their professional activities within a very particular context of heightened administrative and organizational change. As Rousmaniere observes, "No decade in American history was more noted for its school reform initiatives than the 1920s."⁷ In this

⁷ Rousmaniere, *City Teachers*, 1.

respect, in engaging the teacher's voice to serve its research goals, *City Teachers* involves an exercise closer to oral history rather than to life history; it does not take the life course of its protagonists as its object of enquiry, but rather their experience of a defined and particularly memorable episode in the span of their professional lives. "After 30 or 40 years of employment in the school, it was remarkable that these interviewees could isolate only a few years of their career, perhaps because the 1920s were their most formative years at work, when they learned not only how to teach but how to become a teacher."⁸ Conceived in this way, the data generated by the voices of former teachers can be set alongside the data emerging from the contemporary documentary record, the voice, and the document speaking to conjoined historical contexts. But though they reveal a shared past, the two sets of traces take the relational form of a spiral rather than a composite, in much the same way that, in their own time, the daily working lives of New York teachers from the 1920s stood in relation to the terms of the governing local curriculum reform agenda. The two—and the evidential categories which flow from them—knew each other well enough in practical terms but were also existentially deeply removed from each other. If they could not fail to be close to one another in their shared object—the educational life of the classroom—they were also often mutually incomprehending. In Rousmaniere's words, there was a "persistent discrepancy between administrators' and teachers' versions of order. . . (A)s teachers continually pointed out, school reform initiatives of the 1920s were often ignorant of the daily human dramas that made up the schoolday. There was a great divide between administrative ideas of a functioning school and teachers' actual needs and practices."⁹

The methodological entailment of this complex relation between classroom teachers and the framers of local curriculum policy is that, for the history of the classroom, the evidential primacy of neither the teacher's voice nor the educational policy document can ultimately be asserted. What can be claimed, however, is that the latter has dominated most historical interpretations of the educational past to date, and that on this ground, work to recover the former carries its own intrinsic justification. Further, the unearthing of teachers' memories of the classroom in past time may be seen to promise a doubly productive return. In addition to the richer and more comprehensive answers teacher memory supplies to substantive questions about the educational past, it also opens the way for broader methodological consideration of the processes by which such answers are generated. In particular, it promises to illuminate the relation of memory and history as distinctive routes to the past and to test the relative value of the spoken word and the written word in achieving the best understanding that can be made of that past.

From the outset, *City Teachers* stresses the importance of the recovery of the teacher's voice. The study is not only "based upon. . . the testimony of 21 retired teachers, contacted through the New York City Retired Teachers Association";

⁸ Rousmaniere, *City Teachers*, 8.

⁹ Rousmaniere, *City Teachers*, 4.

it is also “driven” by it.¹⁰ “(N)obody had asked them what it was really like to be a teacher. This poignant comment, in and of itself, drove my writing of this book.”¹¹ Rousmaniere employs this energetic verb again in a subsequent methodological discussion, observing that in historical research, “(t)he nature of the historical data that is used drives the interpretation.”¹² This does not however imply that the character of a historical interpretation is an immanent property of the data or, in the words of an emblematic methodological conservative such as Geoffrey Elton, that “historical study depends on discovering meaning without inventing it.”¹³ For mainstream professional historians such as Elton, the historian reveals and reports the past rather than constructing and composing it. While recognizing the driving force of the data of history, Rousmaniere accords a very large space to the agency of the historical researcher: “(I)t is the historian who does the interpretation. In a very real sense, there is no history until historians tell it, and it is the way in which they tell it that becomes what we know as history.”¹⁴ The relation between conceptions of history as driven by the surviving traces of a once-present past or as driven by the interpretive predilections of the historical researcher in the present will always be a complex and tensive one, as Rousmaniere’s comments suggest. Just as the title “history” may apply both to the commission of actions and events in the past, and to the business of rendering coherent accounts of those actions and events in the present, both may be also seen as the processes by which history is “made.”

For many researchers in the field of educational history, as Rousmaniere makes clear, the second of these two processes—the history making of the historian— involves an explicit commitment to build a better future as well as faithfully to represent the past. In this perception, the past is not just made; it is also made for a purpose.¹⁵ History shows the past in order to direct the making of a better educational future. History in this respect is neither innocent nor neutral. Rousmaniere therefore seeks to “keep this historical work close to the present,”¹⁶ to conceptualize the “link between educational history and labor history”¹⁷ and to maintain a

¹⁶ Rousmaniere, *City Teachers*, viii.

¹⁷ Rousmaniere, *City Teachers*, vii.

“faith that progressive workers can create a better world.”¹⁸ Producing history of the best possible quality and integrity is an ever-present, implicit objective; but the history of education here fulfills a further practical purpose in its commitment to inform educational advance in the present and into the future. In this respect, “Historians of education are rooted in the education profession, even as they also identify as historians.”¹⁹ The shape of the discipline of the history of education is in this way seen as jointly determined by both of the nouns inscribed in its title—unlike the singular emphasis in the alternative formulation, “educational history”—and the difficult but necessary consequence of this is that “(h)istorians of education are in many ways strangers in two worlds.”²⁰

Both in *City Teachers* and in subsequent methodological writing, Rousmaniere addresses the importance of this duality of intellectual location and affiliation by elaborating the relation of the historian of education to each of these disciplinary “worlds,” together with some implications, both explicit and implicit, for the process of historical interpretation. As with many historians of education—myself included—Rousmaniere’s academic interest in education in general, and in teachers in particular, has its roots in personal experience of professional classroom teaching. “My interest in the history of teachers’ work,” she writes, “originated in my own tenure as a high school teacher.”²¹ This experience was marked by an awareness of that pervasive and seemingly ubiquitous phenomenon that Larry Cuban has described as schooling’s “policy-to-practice paradox” which results in “teachers

¹⁸ Rousmaniere, *City Teachers*, viii.

Aldrich (eds) *History of Education for the Twenty-First Century* (2000: Bedford Way Papers, Institute of Education), 17–35; William Richardson, “Historians and educationists: the history of education as a field of study in post-war England. Part II: 1972–1996,” *History of Education* 28:2, 109–41, 138; Richardson notes “the continuing working out of a range of institutional and professional tensions. At their heart is a long-standing and defining difference between the practice in England (and overseas) of academic historians who reconstruct the past in ways influenced by present concerns and of educationists who invoke the past in order to apply its lessons to present concerns.” In his commentary on the influential early writings of Larry Cuban, Edward Ducharme expressed such tensions as stark oppositions: “An activist, Cuban apparently cannot resist the reformer’s impulse when he should be fulfilling the historian’s task.” Edward R. Ducharme, “Past and Present: Teachers and Pedagogy 1890–1980,” *Journal of Teacher Education* 1989, 40:2, 61–3. Cuban would doubtless challenge the implication of this opposition for the task of historical interpretation, acknowledging the first element of Ducharme’s statement and rejecting the charge contained in the second, identifying himself as both “a reform-minded practitioner” and “a scholar dispassionately investigating and documenting classrooms, schools and districts. . .” Larry Cuban (2009) *Hugging the Middle: How Teachers Teach in an Era of Testing and Accountability* (New York: Teachers College Press), 68.

²⁰ Rousmaniere, “Historical Research,” 36: “the field of the history of education has always stood part-way between past and present, and for many educational historians the driving question of their research is simultaneously historical and contemporary.” Cuban associates this disciplinary dualism with the tensions of an insider–outsider binary; see Cuban (2009), 68. Also see Schuetz’s classic essay: Alfred Schuetz, “The Stranger: An Essay in Social Psychology,” *American Journal of Psychology*, 49:6, 1944, 499–507.

²¹ Rousmaniere, *City Teachers*, vii.

being both the problem and the solution to the enduring educational crisis.”²² What the policy maker and the teacher share is a common recognition of the classroom as a uniquely important space²³; but the purchase which they are able to bring to it is very different—while the former seeks to invest it, the latter actually inhabits it. As Richard Altenbaugh has observed, “Students, and often administrators, are transient, but teachers are likely to remain in their classrooms and school buildings year after year, sometimes decade after decade.”²⁴ One of the consequences of this has been that the customary rhythms and rituals of classroom life—particularly when, as throughout most of the twentieth century, teaching has been a lifelong occupation²⁵—have proved very resilient or, for Rousmaniere, “invulnerable”²⁶ to fundamental change.²⁷ It is this enduring awareness that Rousmaniere captures when, as a schoolteacher, she “observed the dismantling of a richly collective teachers’ work culture by school administrators who interpreted teachers’ occupational pride as dangerous worker insubordination.”²⁸ This sentence, with its intimation of an interpretive double hermeneutic—the historian interpreting actions and events that were the products of interpretation in their own time—is an epitome both of the theoretical assumptions of *City Teachers* and its sustaining narrative theme of mutual incomprehension between teachers and school administrators.

Policy development and administration—to the general dismay of classroom teachers but to the consolation of historians—produce an abundance of documentary materials that, in the fullness of time, come to stand as the most detailed, authoritative, and readily available assemblage of historical traces. But for the daily

²² Cuban (2009), 68.

²³ See Doreen Massey (2005) *For Space* (London: Sage), 9. Space is “always under construction. . . space. . . is a product of relations-between, relations which have to be carried out. . . it is always in the process of being made. It is never finished; never closed. Perhaps we could imagine space as a simultaneity of stories-so-far.”

²⁴ Richard J. Altenbaugh “Introduction” in R.J. Altenbaugh (ed.) (1992), *The Teacher’s Voice: A Social History of Teaching in Twentieth-century America* (: The Falmer Press), 1.

²⁵ See the emblematic verse, “Fifty years a toiling teacher,” in the 1926 annual report of the Brooklyn Teachers’ Association. Rousmaniere, *City Teachers*, 40-1.

²⁶ Rousmaniere, *City Teachers*, 112. Also 133: “city teachers’ experiences at work have changed little over the decades. . . The recurrence of these problems should lead us to do more than shake our heads in amazement at the constancy of the ages.”

²⁷ “There is clearly a constant gulf between the context (the history of ideas) in which pedagogical innovations are rooted and the frequently conservative socio-historical context in which they have to be implemented.” Marc Depaepe, “Introduction” in M. Depaepe et al. (2000: Leuven University Press) *Order in Progress: Everyday Educational Practice in Primary Schools – Belgium, 1880–1970*, 12. Also see Rousmaniere, *City Teachers*, 112: “Historical studies of teaching have noted that no matter how many reformers propose pedagogical innovation, teachers’ classroom work seems invulnerable to change.”

²⁸ Rousmaniere, *City Teachers*, vii. Rousmaniere’s own subsequent summary of *City Teachers* is “A study of teachers in early-twentieth century New York City show(ing) how teachers developed their own work culture that served to buffer them from oppressive administrative rule and support them in their own definition of good work, even as it also mired teachers in conservatism, fear of change, and isolation from progressive reforms.” Rousmaniere, “Historical Research,” 40.

practice of classroom teaching, the record is much slier; “evidence of classroom activities of the past is fragmentary, consisting of only piecemeal snapshots of teachers’ work.”²⁹ In the round of everyday contest, dispute, and misunderstanding that often marked the collision of the worlds of educational policy and educational practice in the past—that which Rousmaniere describes as the “bitter irony of (a) historical continuum”—both parties possessed a range of techniques and approaches in their struggles for tactical advantage or strategic advance. But when that past comes under the scrutiny of the historian, though evidence for the policy side remains in place, in the archive, and the public record office, that which emanated from the practice side has much more easily faded away, much like the passing of a school day, lingering only in the memory of those who were present there and then. The teacher’s voice, in other words, ceases to speak, leaving to history only a “haunting silence”³⁰ with few “accounts from the inside of schools that would document the meaning that teachers’ work held for them on their own terms.” If the voice is to speak again, in a form and volume consonant with its original character, then it has to be sought out; and one way of achieving this is through oral history, through the words of former teachers recollecting life in the classroom. For Rousmaniere, in the absence of the teacher’s direct voice, historians have, and will continue to be likely to, “misread the actual conditions of their work.” Moreover, accounts of teachers’ work founded upon the formal documentary record of their own professional associations may well form part of this misreading: “(h)istorical interpretations of teachers through the lens of workers’ unions or professional organizations. . . render a somewhat narrow vision of the occupation of teaching.”³¹

In common with Cuban and with Depaape, Rousmaniere emphasizes the significance of deep and powerful currents of continuity within the culture and practices of schoolteaching across the twentieth century, features combining professional pride with a stoical practical conservatism and a resigned social insularity: “If becoming a teacher meant anything, it meant literally becoming a certain kind of person.”³² In making sense of the professional voice of such a person, Rousmaniere identified “four recurring themes that characterized teachers’ stories of their work in the 1920s.”³³ In the first place there was “a steady increase of demands on teachers’ time and energy without concomitant support.” Teachers

³³ Rousmaniere, *City Teachers*, 3.

were required to engage in a widening range of social service functions alongside their existing pedagogical duties. Secondly, teachers suffered from a sense of personal and professional isolation compounded by an institutional ethos—“teachers were taught to stand apart from one another”—that placed a premium on the teacher as a “self-monitoring individual,” an orientation which contributed to the shaping of “a strangely lonely environment.” Thirdly came the “great divide” between the teachers and local educational officials, founded upon the “persistent discrepancy between administrators’ and teachers’ version of order.” Finally, there was the distinctive character of the pragmatic response of the teaching profession to the cumulative consequences of the first three trends, amounting to an alternating combination of accommodation with, and resistance to, administrative change directed or imposed from above. This stance turned the profession towards a highly defensive cultural strategy which “provided consistency and continuity to an otherwise confusing work situation”³⁴ and which spoke to “the persistent struggle of teachers to make sense out of their day.”³⁵

The educational justifications for the interpretive strategies that the historian of education brings to the past are deeply and passionately inscribed in the pages of *City Teachers*. In methodological terms, these strategies are founded upon the desire to recover lived experience from the past, to probe the meanings attached to that experience, and to explore the patterns of individual and collective memory by which they have been sustained and to which they have contributed. The emphasis is less upon the development and operation of educational institutions as the key focus for the history of education and more upon the beliefs, meanings, and associated actions of those who spent their lives within such institutions.³⁶ These strategies involve a serious and sympathetic conversation—a teacherly conversation—across time about the nature of teaching over time. But the historical assumptions and approaches deployed in *City Teachers* also have to grapple with the same difficulties that all historical endeavor confronts: temporal distance, the partiality of historical traces, the immense difficulties involved in restoring contexts to past actions and utterances, and the problem of recognizing the role—in Gadamerian terms—of prejudice, or prejudgment in the process of interpretation. All of these elements impinge upon the fundamental tension between the realist epistemology to which non-postmodernist history subscribes³⁷—that actions and events in the past unfolded in one way and not another—and the interpretive methodologies by which the historian is obliged to render an absent time that once possessed the same fullness, complexities, and confusions of our own present, but which is now in the past, as much forgotten as remembered.

³⁴ Rousmaniere, *City Teachers*, 2–4.

³⁵ Rousmaniere, *City Teachers*, 133.

³⁶ Rousmaniere, “Historical Research,” 41. Also see Harold Silver “Knowing and not knowing in the history of education,” *History of Education*, 21:1, 1992, 97–108.

³⁷ See Keith Jenkins (1995) *On “What is History?”* (London: Routledge); Roy Lowe, “Postmodernity and Historians of Education: A View from Britain” *Paedagogica Historica*, 32:2, 307–23.

The methodological reflections that the book offers are very insightful, though they are also consciously lacking in development. There is a disciplinary reason for this. As Rousmaniere herself points out, “(h)istorians do not address questions of methodology in the same way that other qualitative or quantitative researchers do,” instead placing “more emphasis on historiography than they do on specific historical methods.”³⁸ In other words, in engaging with their raw materials—which is to say their sources or, better, their traces³⁹—historians test new knowledge by debating with other competing historical interpretations in their chosen field rather than by reflecting upon the methods and procedures by which that knowledge has been generated. Undue methodological reflection on such understanding presents itself as too great a diversion from the more pressing work of arriving at viable and persuasive narrative accounts of events from the past. Nonetheless, Rousmaniere clearly articulates both the centrality of the process of interpretation in doing historical research and its implications for the epistemological status of such work: “historians need to be conscious that their argument and interpretation about what happened in the past is driven by an explanatory theory.”⁴⁰ In the construction of a historical narrative, “the data and the theory evolve simultaneously and the role of the historian as interpreter is ever present.”⁴¹ One shorthand expression of this recognition is that references to historical truth are characteristically qualified by the addition of speech marks: “the historical “truth” of many student-teacher relations has been difficult to identify. . .”⁴² Another is the hermeneutic observation that despite the rigor and conviction with which a historical account may be given, the process of interpreting the past remains a never-ending one: “there is not one true historical story out there waiting to be told if only the correct facts are pulled together.”⁴³ And another is a reminder that history is always an exercise in the interpretation of experience which has already been interpreted by its original actors: “By presenting the world in which teachers worked by drawing on their own descriptions, (*City Teachers*) presents broad impressionistic sweeps of recurring themes.”⁴⁴ And the process runs further still, as Rousmaniere stresses. If interpretation may result in findings which might be

³⁸ Rousmaniere, “Historical Research,” 33.

³⁹ Peter Burke (2001) *Eyewitnessing; The Use of Images as Historical Evidence* (London: Reaktion), 13; Paul Ricoeur (2004) *Memory, History, Forgetting* (Chicago: University of Chicago Press), 13.

⁴⁰ Rousmaniere, “Historical Research,” 44; “the types of sources used, and the way in which they are interpreted, have a lot to do with the types of questions asked, the theory relied upon, and the argument.” Rousmaniere, “Historical Research,” 45.

⁴¹ Rousmaniere, “Historical Research,” 47.

⁴² Rousmaniere, *City Teachers*, 112. See also Rousmaniere, “Historical Research,” 34, 40-1: “the very nature of historiography teaches us to question the notion of ultimate truths or objective facts.”

⁴³ Rousmaniere, “Historical Research,” 33.

⁴⁴ Rousmaniere, *City Teachers*, 8.

seen as impressionistic, it also governs the convention by which the discipline of history is able to warrant the validity of knowledge claims: “what is a “valid” interpretation or source is still subject to judgment by other historians.”⁴⁵ If, as Paul Ricoeur suggests, the work of historical research will always generate a conflict of interpretations, the reception of each claim by the historical research community acts to assure that “interpretation must be not only probable but more probable than another.”⁴⁶

But the great absence of teachers from the historical record—the “haunting silence” to which Rousmaniere’s study addresses itself—is not conceived only as a problem of interpretation. It is also a problem inhering in the range of sources upon which interpretation is able to work. Like the great social and cultural historian Raphael Samuel, Rousmaniere sets a catholic standard in this respect. Historical silences are in part the consequence of history’s failure to seek out new sources or to interrogate old ones in innovative ways; the filling of the silent spaces of the past calls for imagination in the selection of sources as well as in their interpretation: “Writing about these silences involves a creative use of new resources, including oral history, the study of architecture, school photographs, and critical readings of school texts from curriculum to student notes. Such readings are inherently interdisciplinary, creative, and imaginary, and necessarily involve the self-conscious presence of the historian in the text.”⁴⁷

There is a productive irony in *City Teachers*. It is this. In setting itself the task of filling the silence left by the lost or forgotten voices of teachers from the past, the book draws our attention to another and, more pervasive, silence in historiography itself—the silence around the ways in which the defining research activity of the historian, namely, interpretation, is actually carried out. It is not only the experience of the work of the teacher in the past that needs to be pursued but also the experience of the work of the historian in the present who undertakes the pursuit. On this second silence *City Teachers* offers important but allusive insights which call for further elaboration. For such a task, perhaps the most helpful, perceptive, and stimulating guide is the hermeneutic philosopher Paul Ricoeur, for whom questions concerning both the nature of history and the methodologies of the social and human sciences were abiding concerns over many years.⁴⁸

Hermeneutics is that strain of continental philosophy which derives from the Greek verb *hermeneuein*, “to interpret,” and which gives a name to the figure of Hermes and to his task of rendering to humankind the messages of the gods,

⁴⁵ Rousmaniere, “Historical Research,” 49.

“transmuting what is beyond human understanding into a form that human intelligence can grasp.”⁴⁹ From the sixteenth century onwards, hermeneutics developed as the disciplined task of deriving the most accurate or appropriate meaning from written texts that were otherwise obscure, uncertain, or contradictory. In this respect, its mode of operation, like that of history, proceeds through the exercise of the interpretive skills of its exponents. Historians seek to render clearly to the understanding of the present that which, because of its temporal distance and terminological or semantic unfamiliarity, may be otherwise hidden, doubtful, or alien in written texts from the past. History, like hermeneutics, is concerned with the distillation of legitimate and authentic meaning from the texts—the documents—which it habitually consults. This task is required because the reflexive condition of human being is inescapably a temporal one. The awareness of time, its irresistible passing, its contingent effects, and its ultimate consequences are experienced by all, as is the sensibility of an endless succession of once-present moments of time that have now slipped into the past to be variously forgotten, remembered, or commemorated within the faculty of memory or, more formally, within the discipline of history. Human beings are temporally aware, “timeful beings.”⁵⁰ As such, the form of knowledge to which they are most readily inclined is narrative—the arrangement of actions and events in time within a coherent, emplotted story which moves from beginning to middle and to end, in the manner of an individual human life. Time and narrative are inextricably linked. For Ricoeur, narrative is in effect “the only form of knowledge human beings can have about the phenomenon of living in time.”⁵¹ Contrasting the ungraspable extent of cosmological time with the span of human existence, Ricoeur asserts that “time become human time to the extent that it is organized after the manner of a narrative.”⁵² In composing a historical narrative, the documents upon which the historian draws cannot authorize the shape of the narrative which emerges, but neither are they helpless in the face of a form of emplotment that might be unwarranted; the meaning of a text may be interpreted very differently by this or that interpreter, but the range of possible meanings it allows is not unlimited and must always be amenable to a defense founded upon the sources themselves: “The historian. . . by virtue of the links. . . between history and narrative, shapes the plots that the documents may authorize or forbid but that they never contain in themselves.”⁵³

As has been seen, the force of Rousmaniere's narrative has a double intensity; it stands both as the singular story of school teachers' responses to the specific curriculum reforms of the 1920s and as a wider account of "recurring echoes of meaning and thinly connected patterns"⁵⁴ centered upon "the significant issues that the occupation of teaching raised to its workers on a daily basis."⁵⁵ In relating these narratives, two types of historical data are drawn upon—the first, on which the study is "based," are "teachers' own accounts," comprising their "descriptions of the daily rhythms of their workday," focusing "on the "commonplaces of schooling": daily occurrences in schools that. . .make up the experience of the schoolday." The second group of sources is made up of "other observations of those close to them," with which the teachers' accounts may be supplemented.⁵⁶ In practice, documentary sources turn out to be rather more prominently drawn upon in the study, and oral data rather less so, than Rousmaniere's introductory "A Note on Method" initially indicates. However, the salient point here is that by drawing upon two data sources—oral interviews and documentary traces—relating to the same sets of events, *City Teachers* endeavors to present "a composite picture of teachers' work."⁵⁷ The utilization of all the available relevant sources is clearly the best practice for producing the most comprehensive historical narrative, but in the harnessing of oral and documentary data to make a composite, important epistemological and methodological issues come to the fore, illuminating both the distinctive characteristics of different types of historical data and the implications that these hold for the process of historical interpretation. Here, the categorical distinctions between data derived from the written word and data derived from the spoken word are particularly significant.

For Ricoeur, speech and writing constitute speech acts of a quite different order, signaling that data produced through oral history interview, speaking, and through documentary research, reading, need to be approached and analyzed in terms appropriate to their differing evidential status. This does not at all mean that the data each generates cannot be used in tandem, but it does mean that each needs to be analyzed separately. Speech is a mode of communication that is designed to be heard, while writing is designed to be read. In this respect, any analogy of a conversational relationship—such as that indicated by Gadamer—between the historical researcher and the archival documents under their gaze is misplaced.⁵⁸ As Martyn Thompson has argued, "neither a text nor the past has a voice independent of a present reader. And when a historian decides to "interrogate" a text, whatever "dialogue" might ensue can only ever be internal, it can only

be a dialogue in the historian's own mind."⁵⁹ Written texts, in other words, do not approximate to the formalization or fixing of anterior speech, and reading cannot be construed as a special version of listening across time; written texts belong to their own paradigm of appropriation, the paradigm of reading.⁶⁰ To treat the relation of reader to written text as a species of dialogue is to confuse or conflate the two modes of communication. Writing is the mode to which hermeneutics is designed to answer, with the process of hermeneutics beginning its work "where dialogue ends."⁶¹

According to Ricoeur, and against Plato, the "fixing" of discourse in the form of writing releases an expansive capacity and a communicative potential that is lacking in speech. Plato had inveighed against writing not only because it represented the loss of the specificity and directness of meaning inhering in face-to-face speech but also because it seemed likely to result in the atrophy of the faculty of memory upon which the accurate transmission of spoken tradition across time depended.⁶² Writing had the critical characteristic of separating meaning from authorial intention in discourse; once committed to writing, a text is able to embark on its own temporal career, freed from the grasp and clarifying constraint of its original author.⁶³ In consequence, the content of written texts "rolls about everywhere"; "it doesn't know to whom it should speak and to whom it should not"; "it always needs its father's support; alone, it can neither defend itself nor come to its own support." The meaning of the text may now no longer be that which its author intended, with all the complex polysemic features of language liberated from ostensive contexts and consequently able to refer in new ways to the novel situations in which it might be read, outside the limits of its original point of production. Ricoeur refers to this detaching of the text from its author as comprising a four-stage process of "distanciation," by which the text achieves its capacity to carry surplus meaning, or meaning which reaches beyond the intention of its original author.⁶⁴ In this understanding, distanciation is a fundamental condition for the process of interpretation, rendering it possible in the first place, amounting to "the negative condition for the possibility of new and deeper meanings to

emerge.”⁶⁵ Distanciation involves, firstly, the “fixing of discourse” such that the temporal moment of a speech act—the event of saying—is surpassed by the meaning of what is said; secondly, the separation of the intention of the author of a text from its meaning; thirdly, the freeing of a speech act from its original ostensive reference and its consequent capacity to refer more widely, opening the “world of the text” in which a document from the past takes on the capacity, familiar to all readers of history, to evoke “a world “as if” we could be there”⁶⁶; and fourthly, the ability of the text to surpass the confines of the original audience to which it was addressed and to direct itself also to the “unknown, invisible reader” of the future.⁶⁷

Taken as a whole, it is the process of distanciation which makes possible the interpretation and resultant understanding and explanation of the absent worlds of the past by way of the documentary traces which have survived from them into the present.⁶⁸ What is particularly instructive about Ricoeur’s approach is that, although it is often densely articulated, it is very helpful in clarifying the stages in the hermeneutic process—what Ricoeur calls the hermeneutic arc—by which texts or documents are characteristically read and interpreted. As Rousmaniere has indicated, historians are generally too fully occupied with the practical task of working through and interpreting archive materials to clarify or systematize, beyond allusions to principles such as “immersion,” “context,” or “judgment,” the procedures by which a historical document may be read, assessed, and analyzed. Such procedures are always complex, involved, and rarely sequentially precise; they are therefore infrequently elaborated, though routinely engaged and successfully accomplished in practice by the trained historian. However, a recent systematization by Allan Bell of the operation of Ricoeur’s hermeneutic arc within the field of discourse analysis presents a useful model which might be drawn upon for illuminating the case of historical research.⁶⁹ Bell’s model begins with the process of distanciation, by which the content of a past text may appear to an interpreter as mysterious, estranged, or alien; thence follows an initial reading which is oriented by the reader’s preexisting knowledge, opinions, and judgments; this exercise produces a proto-understanding or naïve initial guess as to the meaning of the text; from here, the text is analyzed more fully within its ideological and intertextual contexts, allowing proto-understandings to be tested and prejudgments to be reexamined; next comes the phase of reading and seeking to understand in front of

⁶⁷ Ricoeur, “Model,” 150.

⁶⁸ Packer, *Science*, 113. It is instructive to set Ricoeur’s hermeneutic approach alongside that of the intellectual historian Quentin Skinner, whose influential intentionalist histories dramatize Ricoeur’s distinction of reading “behind” or “in front of” the text; the significance of authorial intention is the major issue of contention here. See Philip Gardner, “Hermeneutics and History,” *Discourse Studies*, 13:5, 2011, 575–81, 579.

⁶⁹ Allan Bell, “Reconstructing Babel: Discourse analysis, hermeneutics and the Interpretive Arc” *Discourse Studies*, 13:5, 2011, 519–68.

the text, a process in which the world of the text is allowed to unfold itself as fully as possible in the mode of the “as if”; and finally, completing the arc of interpretation comes the point at which the original estrangement from the text is replaced by the fullest possible appropriation by the reader of its meaning, an appropriation which adds to understanding and to the critical refinement of initial prejudices.

The greatest value of such a model for the historian is not programmatic but heuristic—in clarifying or separating out the interpretive processes involved in doing historical research, it permits critical reflection upon the ways in which historical understanding and explanation are achieved through interpretation. The purpose of such reflection is to contribute to the better practical execution of interpretive work in the future. Further, such reflection helps in understanding where the limits of documentary interpretation lie. The capacity of written traces from the past to carry surplus meaning is evidenced by their ability to attract successive, competing exercises in interpretation across time. The document—so long as it can be shown to be genuine—has the pristine quality that attaches to any artifact which remains as an unalloyed trace of the time to which its original reference speaks. In this sense it is, and always will be, “of its time.” Successive historians may interpret the document differently and may extract new layers of meaning from it, but, having done so, they return it, unchanged and unaffected, to its original place in the archive to await the attentions of the next researcher, with different features to be accented, different meanings to be uncovered. For example, Rousmaniere introduces a chapter on the life of the classroom—“Through the Classroom Door: Teachers’ Work Culture and Students”—with a striking contemporary report of a classroom observation, entitled “Any School Morning,” published in *The New Republic* in November 1924.⁷⁰ In a mixture of summaries and direct quotation, Rousmaniere addresses the observations of the author, the progressive educationist and journalist, Agnes de Lima, adducing them as part of her developing narrative argument: “the classroom was a “cramped and arid space” . . . the activities inside the room were also deadening and dreary. The teacher’s work was nothing more than “police duty” . . . The students sat frozen to their seats, bored into obedience. . . The teacher herself was “as aware as anyone else of the futility of the performance. Still, was she not as trapped as the children?” . . . The students droned their recitations in “utter indifference.” . . . But when the noon bell rang, “a shiver of expectancy went over the room.” . . . Only . . . as the children entered the street was vigilance relaxed and “the children burst out into the free air of the streets like so many exploding shells.”⁷¹

Here, the teacher, her students, and the sympathetic visiting observer share the same frustrated confinement within the educational regime willed by curriculum reformers and administrators. This is the interpretation that best fits with the

⁷⁰ A. de Lima, “Any School Morning” *The New Republic: Educational Section*, vol. XL, no. 519 Part II (12 November 1924), 19–20.

⁷¹ Rousmaniere, *City Teachers*, 127.

theoretical position announced at the opening of *City Teachers*. But on another interpretation, the report might also be seen to show that the relation between teacher and observer possesses a further layer of complexity, of difference, which is worthy of note. De Lima validates her observational report as “an exact transmission of what took place” and claims a degree of representativeness for it based both upon her preconceived expectations and the assumed validity of her sample, resting upon her apparent warrant to visit any public school classroom: “Both school and class were selected at random, the visitor merely choosing the first school she happened to come across after going into an unfamiliar part of town. . . her notes would probably have been little different, no matter what school or class she had visited.” De Lima reports the teacher’s classroom demeanor in an explicit, mannered tone of distaste and with a degree of license and disregard that would challenge the ethical assumptions of a later research generation: “Miss Perkins examined them critically. . . “the boys who have pens in their hands put them down instantly! . . . let us try a spelling match.” This was obviously for the visitor’s benefit.’; ‘one boy involuntarily thrust his foot into the aisle. . . in the direction of freedom. “John!” snapped Miss Perkins, “you may stay after class for fifteen minutes.”’ “The teacher’s voice was hard and metallic and her face lined with a multitude of little seams of nervous irritation.” And as for the content and cadences of the voice itself, reported directly from its original time and place—that very voice which oral history strives otherwise to recover indirectly across many years of intervening time—some of this is recorded here in immediate and revealing detail: “I always say that the dull child has as much right to be educated as the smart one. That means giving him a hand once in a while. Now then boys clear the board. Put down six million, three hundred and twenty-seven thousand, five hundred, and fifty-two. Divide by nine hundred and fifteen. Nathan, where are your eyes? . . . We shall stand here until every head is still. . . The boy who has his elbows up put them down.” In a related fashion, de Lima’s observations also commend themselves as highly productive stimulus material for eliciting focused responses in oral history interviews with former teachers—for example, her unveiled assessment of pedagogical standards and styles in 1920s New York: “the teacher doled out irrelevant and uninviting bits of knowledge in the name of “education.””

Oral history interview data of course make up the second major source informing *City Teachers*. And, in the same way that Ricoeur’s methodological commentaries shed light upon the properties of the historical document as a product of the written word, they also help in assessing the potential of the spoken word as it is expressed in the form of the oral history interview. Here, once again, the important distinction between meaning and intention in discourse is the key starting point. In writing, the separation of meaning and intention through the operation of distanciation is the motor for the widening reference and surplus meaning which a text is able to sustain and which, for Ricoeur, bestows upon the written word its power for interpreting and understanding the past. In speech, by contrast, particularly in the context of an oral history interview, meaning and intention in the speech acts of interlocutors are held together, in part because of the ostensive, prosodic, and gestural features that govern the sharing of the same conversational

time and space—precisely the conditions which cannot apply in documentary or archival research work. More significantly, however, in speech, meaning and intention are held together—indeed, may come to be demonstrably the same—because the mode of face-to-face conversation allows for successive requests for clarification or elaboration until an interlocutor can be sure, unless the other is lying, that the meaning conveyed by their statements accurately represents their intention in speaking. This means that, for all its richness, rhetorical force, or revelatory detail, speech can never carry, across time, the same expansive interpretive potential of writing. Its meaning, however dramatic or illuminating, remains tied to the context of its production. In the words of Jane Bachnik, spoken discourse “fails to transcend the specific situation. Only when discourse becomes text does it achieve autonomy from the spatiotemporal context of the speakers and their subjective intentions, becoming public and open to multiple interpretation.”⁷²

The capacity of the spoken word to keep meaning and intention together in this way is linked to the operation of a yet greater temporal unity, namely, that which holds past and present together. The idea of history as a disciplined academic enterprise is conceptualized against such an intimate connection, acknowledging instead the extent of the temporal rupture which separates that which is past and absent from that which is present and extant. History recognizes the past as different, distanced, and estranged from the present, calling for disciplined historical research and the knowledge which it produces to act as the bridge by which the two may be meaningfully reconnected. But in the case of memory, continuously active in human consciousness, the categorical separation of “then” and “now” does not apply in the way that it does for history; in memory, past and present do not require a connecting bridge, for they are always already dynamically joined in the lives and remembrances of individual human beings and the collective communities of which they are a part.⁷³

It is precisely this living connection between past and present in memory that oral history values and seeks to uncover and explore. Here, the greatest strength of oral history data lies in its capacity to release or rescue the historical voices of those—in this case, school teachers—who do not have the inclination, the opportunity, or the power to add their voices, with all the authentic detail of the insider, to a historical record from which they have been excluded or marginalized and to which they can be restored by no other technique.

As *City Teachers* demonstrates, once added to the record, the assembled voices of those who have been effectively silenced are able to support the significant rewriting of received historical interpretations. But it would be a mistake to set oral interview data alongside documentary data promiscuously in the expectation only

⁷² Jane M. Bachnik, “Native Perspectives of Distance and Anthropological Perspectives of Distance” *Anthropological Quarterly*, 60:1, 1987, 25–34, 26.

⁷³ See Geoffrey Cubitt (2007) *History and Memory* (Manchester: MUP), 30: “Where the discourse of history poses the question of how the present can achieve knowledge of a past from which it is separated, the discourse of memory posits a more intimate or continuous connection between past experience and present consciousness.”

of further augmenting or corroborating the stock of information available to historical research. The spoken word surely possesses great evidential strengths, but it also presents a number of technical issues—quite different from those attaching to the written word—which bear upon the process of historical interpretation. In the first place, the historian can no longer claim the putative role of disinterested interpreter, as in the case of surviving documentary evidence; in oral history interview, he or she becomes the partial producer of a new source of evidence generated through conversational exchange which he or she has herself initiated. As a result, while it may be possible to evade injunctions for methodological reflexivity by adopting the role of detached or omnipotent narrator in the presentation of documentary data, such a strategy is far more difficult where oral data are involved, as in *City Teachers*. Moreover, in the conduct of oral history research, the “texts” that we encounter actively talk back to us in conversational contexts, placing the importance of originary intentions and understandings alongside the primacy of the interpretive meanings that we might otherwise seek to ascribe to them. “In the homes of over a dozen retired teachers,” in Rousmaniere’s case, “I listened to stories about what it was like to be a teacher in city schools more than 70 years before. . .ask(ing) not for precise events, but for the recurring themes and for the meaning that teaching held for them. . .Notable. . .was their generosity and eagerness to talk with a stranger about their work. Many of these teachers thanked me for coming, often remarking that in all their years at work in city schools, nobody had asked them what it was really like to be a teacher.”⁷⁴ The evidential status of the oral history interview transcript both symbolizes and realizes the extent of the historian’s implicatedness in the production, as well as the selection and interpretation, of the historical data that he or she uses in understanding and explaining the past. The transcript is a data source over which the interviewer will always retain a special degree of interpretive insight, for only the interviewer can read the transcript as a personal memory of an intersubjective event as it was experienced, with each line evoking a fullness of contextualized meaning which cannot be directly achieved by other readers.⁷⁵

Secondly, the validity of the data generated in the course of an oral history interview must always depend to a greater or lesser degree upon the accurate rehearsal of memory. Memory, exercised in the present, about the past may be unreliable, undisciplined, or confused; it may even be misled or manipulated.⁷⁶ With this recognition, it is possible to perceive memory as the enemy of history, if history is conceived as a measured and systematic discipline, objectively interpreted, and constructed from sources flowing directly and authentically from

⁷⁴ Rousmaniere, *City Teachers*, 8.

⁷⁵ See Raphael Samuel “Perils of the Transcript,” in R. Perks and A. Thompson (eds) (1998) *The Oral History Reader* (London: Routledge), 389–92, 391: “The collector of the spoken word – of oral memory and tradition – is in a privileged position. He is the creator, in some sort, of his own archives, and he ought to interpret his duties accordingly.”

⁷⁶ Ricoeur, *Memory*, 53.

the past times of which they speak.⁷⁷ And indeed, in Ricoeur's concept of narrative identity, or in the idea of narrative composure, as deployed by oral historians such as Alistair Thomson and Penny Summerfield, personal experience, public discourse, imagination, and chronology may be seen as intricately interwoven and creatively shaped in the service of a meaningful, unifying, or consoling memory through which the pattern of a life may be understood.⁷⁸ In other words, the need for equanimity by way of a settled and coherent temporal identity—"telling and retelling, to ourselves and to others, the story of what we are about and what we are"⁷⁹—constitutes the distinguishing marks of a memory that may be governed by accreted and generalized rhythms of repetitive remembrance, as opposed to the goals of scientific rigor and chronological accuracy which govern history. Many of the memories of lives given to professional teaching that are recorded in *City Teachers* are of this sort; for example:

Very regularly I would go to visit students in their homes. But I learned that this was not such a good thing to do because the picture got so big and you could only handle so much. After seeing the home, you could only see the child in the midst of his problems. Unless you are able to see the whole picture and treat it as the whole picture, then you can only take a little bit at a time.⁸⁰

The limits of memory in the service of identity—in this case professional identity—need to be properly understood; this does not mean, however, that such memory should not constitute a legitimate object for historical interpretation.⁸¹ But by no means all the products of oral history interview yield this kind of data. There are occasions when, whether by consequence of the type of questions asked or as a result of a respondent's purposeful reflection, answers take the form of those of a formal witness, conscious of the need to render evidence of an event as it happened in its own time and context:

⁷⁷ Raphael Samuel (1994) *Theatres of Memory, Volume I: Past and Present in Contemporary Culture* (London: Verso), ix. Also J. Wertsch (2002) *Voices of Collective Remembering* (Cambridge: Cambridge University Press), 18–19.

⁸⁰ D. Mayer, quoted in Rousmaniere, *City Teachers*, 118.

⁸¹ See A. Portelli (1991) *The Death of Luigi Trastulli and Other Stories: Form and Meaning in Oral History* (Albany: SUNY), 15, 15. Also Cubitt, *History*, 87: For Portelli, "'The discrepancy between fact and memory ultimately enhances the value of the oral sources as historical documents', for it is this discrepancy that gives us clues to the mental strategies by which those who are caught up in history make sense of their own experience and of the political and social conflicts that have moulded it."

So I walked into [the principal's] office, and she was very polite, she listened to me until I was finished and then she looked at me with her cold blue eyes and she said: "Miss Smith, I am the principal of this school and I will decide." And she tore up this thing I had worked so carefully on. Well! She might just as well have slapped my face. . .⁸²

Memory work in oral history possesses the demonstrable capacity to answer to a different standard of evidence to that deployed in the repeated stories upon which the processes of narrative identity or composure rest. This alternative source, often hard for interviewers to seek out and harder for interviewees to relate, is based upon those half-forgotten, unarticulated, or suppressed recollected memories which emerge from the disruption or challenging of settled identity accounts. Here we hear, instead, the form of bearing witness or giving testimony, generating attested accounts of the past as it was, that are able to stand alongside, to corroborate, or to be corroborated by, accounts founded upon the documentary record.⁸³ In other words, in this mode oral history has the capacity to uncover the "how it was" of specific events from the past, as well as the "how was it" of lived experience understood across the broader sweep of time.⁸⁴

In revealing the daily lives and work of New York's public schoolteachers from the 1920s, *City Teachers* spoke with effect to a great silence in the historical record of education, filling it with historical data made from the discursive resources of both the written and the spoken word. In so doing, the book performed a further service in opening the door to a yet greater silence on the nature, operation, and limits of interpretation in the history of education. In the case of the first of these silences, Rousmaniere's work has been a particularly important and productive exemplar for continued historical investigation of the lives, educational ideas, and pedagogical practices of generations of schoolteachers from the past. In the case of the second silence, despite a growing body of powerful and exciting methodological writing in the field of history of education,⁸⁵ much remains to be done to invest the insights of such work more securely within the conventional interpretive practices of historical research.

5.3 Liminality: Interpreting Research on Learning in the Context of the History of Childhood

Theresa Richardson

Introduction

This chapter examines ways the historiography of modern concepts of learning as constructed in relationship to how childhood has been investigated and interpreted in the first half of the twentieth century. Large-scale philanthropies associated with the fortune of John D. Rockefeller Sr. funded research in the social and behavioral sciences with the objective of identifying universal standards for normal stages of mental, physical, and emotional growth. It was believed that perfecting child rearing by understanding how children grow and learn would lead to the advancement of humanity.¹ Influenced by the mental hygiene movement, research on childhood was grounded in positivistic assumptions about the capacity of modern science to establish universal and objective truths. In contrast postmodern perspectives on the nature of knowledge and science take into account the historical and contextual framework that supports research on particular topics as well as paradigm shifts in scientific explanations.² The concept of liminality, as a period of transition subject to interpretation, is used as a way to understand from a postmodern perspective how learning and childhood have been researched and

classified in the twentieth century in ways that reflected not only assumptions about the structure of knowledge but the politics of knowledge and the implications this has for historical research.³

The focus is on the underlying paradigms of US American models of learning as rooted in scientific and medical views of reality. Learning theory and research is commonly associated with the discipline of psychology in the USA.⁴ Psychologists have variously studied learning as a phenomena that can be isolated in a laboratory setting and examined through animal as well as human behavior. Early philosophers and proto-psychologists in the USA were also influenced by the emerging field of scientific medicine and its counterpart in psychiatry as well as psychoanalysis stemming from Sigmund Freud's work in Europe. These approaches focused on the physical, cognitive, and emotional development of human subjects using a therapeutic model of preventive medicine. Harvard philosopher William James, psychiatrist Adolf Meyer, and child study pioneer G. Stanley Hall are examples of early professionals who shaped the knowledge base of the mental hygiene movement.⁵

Medical and psychoanalytic models of learning and human development infiltrated popular ideology as well as child-specific institutions such as schools through the mental hygiene movement, child study movement, and progressive education movement. Psychology became the major carrier of these models into teacher training, curriculum and instruction, as well as learning theory. Therapeutic approaches to stimulating changes in behavior or remediating emotional, academic, or perceptual problems are central to professions in education, social work, and public health, as well as counseling and guidance. Concepts of health and pathology and normal and abnormal growth are pervasive in American cultural perspectives on how children should be socialized and educated as well as how the problems of childhood can be remediated.

The Historiography of Liminality in Learning and Childhood

Learning can be seen as a liminal state between knowing and not knowing. It is a process of gaining knowledge or a skill informally and formally. Learning takes place over a lifetime causally by observation and experience. It also takes place

⁴ Educational psychologist Edward L. Thorndike is credited with making learning the central issue of psychology.

⁵ Patrick Suppes and Hermine Warren, "Psychoanalysis and American Elementary Education," in Suppes and Warren, eds., *Research on Education: Some Case Studies* (Washington, DC: National Academy of Education, 1978), pp. 319–396; note that Freudian theory and psychoanalysis ultimately had more influence in the USA than in Europe.

intentionally through instruction and socialization. Formal systems of education emerged parallel to the rise of civil societies, but research on learning is relatively new, emerging after the establishment of systems of compulsory mass education in modern industrial societies and only after special disciplines focusing on human development in the social and behavioral sciences emerged in the late nineteenth and early twentieth centuries in the same period as the rise of modern medicine. Research on learning escalated with the movement for compulsory education and the empiricist impulse to determine the intellectual capacity of a child to learn and thus the ability of educators to determine which children would profit from being educated. This began in Europe but was quickly adopted and expanded in the USA by figures such as Henry H. Goddard, director of Vineland Training School for the Feeble-minded, and Lewis Terman at Stanford University.

Learning has been examined as the outcome of making connections between outcomes and actions and as a reaction to stimulus. It has been interpreted as a product and as a process. The underlying mental hygiene approach to learning is a dynamic process. While learning has been studied as an objective subject where animal learning is considered to be the same as human learning,⁶ the mental hygiene movement and the research it promoted was solely concerned with human processes of development. The objective was to understand growth in individuals and to invoke positive social changes in society. The mental hygiene movement was not exclusively about children, but children were central to the applied research on learning conducted under the auspices of the movement as funded by Rockefeller philanthropies. The mental hygiene movement and Rockefeller philanthropies in the USA significantly contributed to the formalization of the idea of childhood as identified by psychobiological growth patterns with increases in learning capacity as independent of cultural contexts. The modern scientific approach to learning was fundamentally ahistorical. The effort was to define childhood as stages of growth that could be measured and normed rather than as a fluid and liminal process. From a postmodern perspective, childhood is a historical cultural category that is not uniform between different societies or even in the same society over time.⁷

Brown, ed. *Picturing Children: Constructions Between Rousseau and Freud* (Aldershot: Ashgate, 2002).

In fact, the definition, duration, and historical trajectory of childhood are controversial and differ between cultural contexts as well as in the lived experiences of individuals.⁸ Children in the same society even of the same age do not have the same experiences and even the adults who devote their lives to work with or study children do not conceptualize them in the same ways even in the same discipline.⁹ Studying the history of childhood is not only recent in origin; it is controversial in its interpretations.¹⁰ This work seeks to analyze the normalization of modern concepts of childhood and also to critically examine how research paradigms shift in their interpretations in response to funding agencies in the transition to modern approaches to research and more recently postmodern approaches. Within the framework of this essay, the idea of learning similarly is constructed as controversial in relationship to how it is investigated and interpreted.¹¹

Ideas on how human beings learn and how children are treated are interdependent. For example, “readiness” is a critical concept in learning theory as well as medical designations of physical human growth patterns identified with “normal” stages of growth from infancy to adulthood.¹² The idea of normal processes of maturation and readiness as a precondition for learning is grounded in psychoanalytic theory as well as medicine. It has become a crucial feature of learning theory in psychology and education. The idea of readiness is based on interpretations of normal human development including: (1) the idea that physical maturation involves progressive stages that are associated with age and (2) that cognitive growth progresses similarly from simple to more complex perceptions of reality. Increases in physical and mental functional complexity lead to changes in behavior as well as understanding and competency. As young people learn and their world view expands, they can make more sophisticated choices. Subjective mental and emotional states therefore operate in conjunction with and in response to external events and experiences. Finally, (3) positive and negative aspects of personality and character are an outcome of these accumulated threshold experiences over time. Stimulus–response, cause, and

effect interpretations of learning focus on the inborn human capacity to reason and the progressive ability to postpone gratification in lieu of future rewards. Similar concepts are prominently played out in psychiatric theories and psychoanalysis as well as theories of learning and behavioral change in child and educational psychology.¹³

Evidence and Perspective: The Century of the Child

Hygiene at the turn of the nineteenth to twentieth centuries described the branch of knowledge associated with medicine that sought to promote health and prevent disease.¹⁴ This section examines how historians can approach and interpret research originating out of the mental hygiene movement.¹⁵ The movement early turned to children as a subject with the idea that adult problems had roots in parental practices and childhood socialization patterns that could be objectively identified. It was assumed that by following rigorous scientific methods, researchers could establish absolute standards that were immune to the subjective perspectives of the researcher's personal, cultural, or class-based beliefs and experiences. They did not entertain the idea that research conclusions could be influenced by interpretations subject to biases. This was made more complex and problematic in that the pursuit of objective criteria for normal development implied deviations as evidence of pathology. Additionally, the impact of the research was intensified in that findings were early directed towards popular outlets and implementation in educational institutions as well as social policy.

The mental hygiene movement quickly became entangled with the child study movement, development of psychiatry and psychology, and Rockefeller philanthropy,¹⁶ Rockefeller funding guided the movement and its academic

counterparts towards childhood and prevention using the emerging scientific medical approach to establishing objective knowledge about human subjects. The early mental hygiene movement was not about children. It originated in an obscure text by Clifford Whittingham Beers, a self-appointed advocate for the insane. In 1908, Beers published an autobiography, *A Mind that Found Itself*, about his personal journey from sanity to insanity and back to sanity. He subsequently began a social movement he identified as mental hygiene, which promoted the idea that mental illness is a medical problem that can be cured and that the insane should not be dehumanized and placed in asylums. It was about adults and self-healing, not children and professional intervention, but this changed.¹⁷ The National Committee for Mental Hygiene in the USA (now the National Association for Mental Health) and Canadian National Committee for Mental Hygiene (now the Canadian Mental Health Foundation) founded in 1909 and 1918, respectively, took up the cause of educating the public and identifying and curing mental illness and other forms of social and behavioral problems within a medical framework that eventually “medicalized” far-reaching fields from education, social welfare, and public health to public policies concerning research into normal and pathological development as well as child guidance as concerned with delinquent youth.¹⁸ This movement took off in both the USA and Canada in the same time period as John D. Rockefeller Sr., the world’s first billionaire and tycoon, vilified and admired as founder of Standard Oil, retired, and his son, John D. Rockefeller Jr., began to establish and guide the growing fleet of philanthropies associated with the family fortune in the twentieth century. The mental hygiene cause included support for child-focused research, the establishment of appropriate disciplines in the medical and social sciences concerned with formalizing standards about normal childhood and youth, as well as exploring interventions designed to influence leaders and the public so that they would support a medicalized approach to how adults should think of and treat children and youth as precursors to adulthood and the future.

Mental hygiene became an international movement of great consequence with special significance for the USA. The individualistic ideology of popular thought in the USA quickly adopted the psychobiological framework of psychiatry and clinical psychology. Mental hygiene as an interdisciplinary and international phenomenon is an example of historical inquiry that has to be interpreted from a perspective that integrates the interdependency of its disciplinary perspectives through primary and secondary data sets.

It should be noted that this involves another aspect of liminality, that is, of disciplines and ideas that move through thresholds from obscurity in private spheres to official public spheres taken to be objectively true, endorsed by scientists, professionals, and those in positions of power, who are able to gain and sustain their

legitimacy. The liminality of childhood, as timed and staged, was formalized in the establishment of modern disciplines. Rockefeller family money was a significant factor from the earliest gifts from John D. Rockefeller Sr. to the formation of the formal philanthropies that supported the mental hygiene movement. Most notably this included the transition of medicine from prescientific practices and customs to medical science, a process encouraged by the Rockefeller family in the establishment of the Rockefeller Institute for the Advancement of Medicine (now Rockefeller University) in 1901, which became a model for using applied science to solve what the officers of the family business and philanthropic offices considered to be the most pressing problem of all, health.¹⁹ Physicians, psychiatrists, psychologists, and others related to clinical practices involved with mental hygiene also went through various stages of liminality as they evolved from projecting practices that were grounded in family-based tradition or customs and personal subjective beliefs to trained professional personnel grounded in science that was believed to be impersonal and universal in application. The General Education Board, a Rockefeller philanthropy founded in 1903, promoted education in the southern states of the USA and was a model for applied science with a focus on changing society through providing opportunities for healthy development/learning in children.

The idea of a normal science, which examined human life and sought to cure and prevent ignorance and disease, influenced the establishment of the social sciences. The University of Chicago, established with funds from John D. Rockefeller Sr. in 1890, was influential in developing the child study disciplines related to psychology, education, sociology, and social work.²⁰ Support for disciplines involved with clinical mental hygiene practices included schoolteachers, counselors, nurses, juvenile court personnel, social workers, and others in fields related to testing and measurement dealing with children and parents from preschool to high school and beyond.

The formalization of a body of expert knowledge in a particular field also demonstrates the progression of stages of liminality. As fields of study were professionalized, the knowledge upon which they were grounded moved from operating on informal sources of information to creating formal research-based bodies of literature with distinct content and subject-specific agendas. The transition from informal to formal disciplines in the social and behavioral sciences was often supported by grants from philanthropies and eventually by government funding to universities that trained professions related to mental hygiene.

Liminality is also part of the trajectory of the growth of institutions that create, promote, and legitimate knowledge, most notably in modern research universities.

The Archeology of Clinical Practice, Learning Theory, Research, and Knowledge

In addition to framing research questions around intersecting topics and organizations, there has to be reliable, verifiable, and extensive sources of data. Public and private archives hold extensive collections related to the mental hygiene movement in the USA and Canada. In the following section, the ideas associated with the childhood gaze and their evolution are traced in order to show the sometimes divergent aspects of the underlying medical model as it was incorporated as a rationale for identifying knowledge about children and their learning capacity as psychobiological linked to behavioral outcomes. Three aspects of the mental hygiene movement are relevant in data collection and interpretation. First, it is critical to identify the various branches and connections within the mental hygiene paradigm that served as a vehicle for the momentum of research. Second, it is important to uncover how mental hygiene was integrated into policy and effectively applied within the practice of multiple professions and especially psychology. Finally, the question remains “how did this paradigm change domain public thinking about how children learn and grow with implications for how they should be raised and educated?”

The papers of Thomas W. Salmon, the first medical director of the National Committee for Mental Hygiene, show how Salmon moved mental hygiene towards a working hypothesis that mental illness arises out of harmful experiences in childhood, therefore constituting a form of negative learned behavior. He also secured Rockefeller support with his argument that it was important to develop a scientific approach to applied extramural psychiatry.²¹ The problem with the application of a medical model for research, which was not completely formed

²¹ See letters and interviews in the Thomas W. Salmon Papers and Clifford W. Beers Papers in the American Foundation for Mental Health Archives (AFMH) and Payne Whitney Clinic Library at Cornell Medical Center. Also see the National Committee for Mental Hygiene Records in Record Group 1.1 in the Rockefeller Foundation Archives (RFA) at the Rockefeller Archive Center (RAC). Secondary literature includes biographies of Beers and Salmon: Norman Dain, *Clifford W. Beers*; and Earl D. Bond with Paul O. Komora *Thomas W. Salmon: Psychiatrist* (New York: W. W. Norton, 1950). Raymond D. Fosdick’s *The Story of The Rockefeller Foundation* (New York: Harper’s Brothers, 1952), and General Education Board, *The General Education Board: An Account of Its Activities 1902–1914* (New York: G. E. B., 1915), which give an overview of the philanthropies in contemporary perspectives. Fosdick was the president of the Rockefeller Foundation and a long-term officer with Rockefeller philanthropies and in the family office. His own papers are also housed at RAC. The General Education Board Archives are also at RAC. Canadian archives on mental hygiene and child development include the Greenland Griffin Archives in Toronto and the Public Archives of Canada in Ottawa.

but was taken as objective science, is amply demonstrated in Salmon's papers. On one hand, the application of experimental ideas on human subjects actually touched relatively small numbers of children and their families even if the harm done to individual children deemed "maladjusted" may have been significant to that individual. However, the propagandistic aspects of the program included a broad-based dissemination of ideas that over the long term can be seen to be very successful in shaping social thought and public policy. Mental hygiene was well situated to become part of the cosmology of modern approaches to problem solving based on individualized models of intervention. This approach took off in the USA following the rapid changes and dilemmas of the Progressive Era of reforms and the disruption of World War I.

When Salmon joined the NCMH in 1912, he undertook mental hygiene surveys of institutions that housed large numbers of delinquent and dependent children. The effects of negative socialization on learning became the first focus of attention in the mental hygiene field. Salmon also organized a Mental Hygiene Conference in conjunction with the New York State Charities Aid Association that was held at the City College of New York. Clarence Hincks and Helen McMurchy, who became prominent in the Canadian National Committee, were among the delegates. Records of the meetings, letters, and commentary, as well as publicity are among the records held in the Rockefeller Foundation Archives in New York and Greenland-Griffin Archives in Toronto. Related records on the National Congress on Social Hygiene and International Conference on School Hygiene in Buffalo in 1913 as well as newspaper reports on these events in the *Toronto Star* show the momentum and international character of the early movement.

The process of "medicalizing maladjustment" was the first thrust of "preventive" mental hygiene work with children. It followed from the preoccupation with dependent and delinquent children originating in the late nineteenth century that promoted juvenile courts among other approaches to controlling youthful populations in times of industrialization and urbanization. Under the guidance of the NCMH and Commonwealth Fund, this program took the form of "child guidance" demonstrations between 1921 and 1927. Child guidance programs were curtailed in 1932 when funding was cut off due to the Great Depression in the USA. This is ironic in that the Great Depression in the USA in the 1930s escalated social problems. Mental hygienists, however, dismissed social class, status, or culture as contributing to conformity or nonconformity to what science established as normal stages of developmental learning or what was interpreted as normal or delinquent behavior. Letters, reports, and memorandums in the Commonwealth Fund Archives and Laura Spelman Rockefeller Memorial Archives in the RAC collection that trace the rationale for child guidance and outline its progress are also supported by vehicles for disseminating mental hygiene ideas through the US Department of Interior, Office of Education, bulletins and

biennial surveys of education as well as the publications of the US Department of Labor, Children's Bureau.²²

The documents reveal an ambitious program that included the establishment of a Bureau of Child Guidance, directed by Bernard Glueck under the auspices of the New York School of Social Work. Glueck argued that the Bureau "actually put into practice on a fairly large scale, the means for the eradication of the evil influence upon the life of children." The records show that over 1,000 children received consultation services and 800 were accepted for treatment. The most common "symptoms" were lying, disrespectful behavior, and disobedience, "disorderly conduct in school," and "stealing." The Bureau actively promoted the rationale for therapeutic psychiatric and psychoanalytic approaches to adjusting "problem" children so that they unlearned bad behavior. The approach was case based, imitating a clinical model, with a focus on parents, especially mothers. In this view, children were not born maladjusted but were trained/learned to deviate from the norm by their family of origin. Teachers were also targeted. Eighteen public schools, along with hospitals and social work agencies, cooperated with the Bureau in 13 demonstration locations in major cities across the country. "Visiting teachers" trained in mental hygiene set about changing school practices and engaging in therapy in schools across the country. Classrooms were considered to be "natural" mental hygiene clinics. Learning problems in school were considered to be "symptoms" of maladjustment that could be corrected by training teachers to perfect the techniques used to handle problem students more successfully. A "well-rounded" personality, it was thought, would best prepare the child for adulthood. Academic learning was not considered to be the primary objective. Learning in the sense used in mental hygiene was more closely akin to socialization. Delinquency defined as not learning to behave properly was taken as an indication of mental illness. Out of the 800 children accepted for therapy over 5 years, only about half the subjects were "cured." A follow-up study in the case of the St. Louis demonstration was not critical of the ways in which maladjustment was identified nor was it critical of the paradigm used for therapy. Rather it was concluded that antisocial behavior in childhood powerfully predicted adult maladjustment. Social class was again dismissed as not relevant to the way maladjustment was being defined or treated. Further, it was concluded that children with "mild disorders" who had fathers who were also identified as antisocial were less likely to profit from therapy and were much more likely to have "poor outcomes." This was a surprising conclusion given that researchers had previously identified mothers, as primary caregivers and early

²² Samples of supportive documents include "Annual Report to the Commonwealth Fund on the Operation of the Bureau of Child Guidance by the New York School of Social Work as Section I of the Program for the Study of Methods for the Prevention of Delinquency Covering the Year 1924-1925"; Bernard Glueck's "Annual Report of the Bureau of Child Guidance"; Barry C. Smith, "Report of the General Director, Child Welfare Program for the Prevention of Delinquency"; and many others including letters and interviews in the CF Archives at RAC and AFMH Archives. Secondary literature includes books by principal investigators at the time such as Smiley D. Blanton and M. G. Blanton, *Child Guidance* (New York: Century, 1927).

educators, as the primary source of maladjustment in children. Children, who were in a loosely constructed control group, were said to live normal lives free of “divorce, hospitalization, and criminal activity.”²³ This definition of normal in itself provides a window into the middle-class child guidance researcher’s definition of the normal family as monogamous, middle-class, prosperous, and responsibly engaged as upstanding responsible citizens.

In contrast with normal scientific approaches to the study of children, proto-sociologist W. I. Thomas, of the University of Chicago, pointed out that a prior “definition of the situation” determines what constitutes good health and proper conduct. This prior definition, Thomas argued, effectively shapes not only the perspectives but also the practices of childrearing.²⁴ Thomas’ observation that “if men define situations as real they are real in their consequences” is essential to understanding the mental hygiene movement and its impact from a historical perspective.²⁵ It also helps clarify a historiographic problem where historians predefine scientific research as a path to objective reality and similarly create real consequences even if the practices and policies derived from supposedly scientific facts are not true and may even be harmful.

The Historiography of Research on Infancy to Adolescence

Between the first and second World Wars, Rockefeller philanthropy supported research that established a medical basis for the cultural perception of a sequentially elaborated mental world of childhood and adolescence, which was correlated with biological maturation unique to preadults. Without this original perception, the “terrible twos” and the “teenage monsters” of post–World War II notoriety could not have become part of the conceptualization of children and youth in the 1950s and 1960s, concepts with their own versions today as institutionalized in public thought and accounted for in social practice.²⁶

Whereas G. Stanley Hall’s child study movement at the turn of the nineteenth to twentieth centuries initiated a momentum for the scientific study of children, his psychology of youth was largely grounded in biography and philosophy

influenced by Freud.²⁷ The mental testing movement during and after World War I, although it correlated mental functioning with age, did not interweave the progress of bone growth and maturation of the nervous and reproductive systems with mood and behavior changes.²⁸ The mental hygiene movement integrated these ideas, tying together concepts elaborated by research and related social movements into an identifiable, if amorphous, pattern ready for public consumption. Much of the current information on growth that is taken to be self-evident is based on mental hygiene concepts.

The twentieth century witnessed the institutionalization of the idea of stages in the normal human life cycle each with specific “normal” learning characteristics. Similar to intelligence tests, if a child was exactly on target for his or her age, they were considered to be progressing at the average or normal rate. Children who exhibited learning characteristics of an older age or younger were considered either precocious or slow. There was an obsession with normalizing the sequence of stages of development and consequently with pathologies and deviancies. Being ahead of one's age/stage could be considered as positive or negative. It was good to be intelligent and to learn quickly in school, for example. Such children were recognized as “gifted.”²⁹ However, to demonstrate precocious behaviors related to sexuality or to adopt adult postures and interests was considered to be unhealthy and possibly criminal. Slow children or those typed as various levels of incompetence for their age were singled out also as vulnerable to corruption. Patterns of lagging or retardation could be treated harshly and interpreted as a menace to society.³⁰

The establishment of professional disciplines whose official role was to intervene into previously private spheres of life accompanied these trends. Medicine served as a model for intervention. It also served as a successful prototype for advanced graduate training in universities. Technical experts and professionals filled the ranks of bureaucracies whose mandate was to oversee public interests.

Uncovering the mechanisms through which mental hygienists learned their trade and more importantly how they developed a distinctive world view can be traced through the archival data.

The Laura Spelman Rockefeller Memorial (LSRM), established in 1918 for the welfare of women and children, was a major funding agency for research on child development in the 1920s. The LSRM produced Annual Reports that were published by the Rockefeller Foundation describing their projects, which are available in many library collections as well as at the Rockefeller Archive Center. When the LSRM was merged with the Rockefeller Foundation in 1929, the work of finishing LSRM projects was taken over by the General Education Board and also the Spelman Fund, a Rockefeller philanthropy established in 1929.

An important aspect of child development research as conducted by university personnel and supported by the LSRM was that the mandate was not to create knowledge about children for its own sake but rather to uncover practical solutions to problems associated with learning. The motive was not sheer curiosity as to how various human and social phenomena came to be. The interest in science was an interest as one means to an end, and the end was explicitly recognized to be human welfare.³¹ This guiding policy shaped the character and direction of scientific child research and also explains the rapidity with which it was disseminated into training programs in child-related disciplines as well as to parents and the general public. The archival records show that much of the scientific basis for child development was a product of longitudinal child growth research involving anthropomorphic and physiological measurement, psychological testing, and systematic observation. The studies began with school-age children but encompassed a range from infancy to adolescence by the end of the 1930s. Two major sets of data were compiled, one from the early childhood studies of the 1920s and the second from the adolescent studies of the 1930s. Literally thousands of children across the country became case histories. The studies were unique. They established what was considered to be scientific standards for evaluating physical and mental maturation in human populations without regard for cultural or social class differences. Based on compiled sets of individual data, the assumption was that the outcome would automatically account for individual variation, and finding the mean in a population would lead to accurate conclusions about standards for average, above average, and below average progress. This ideology left very little room for critical self-evaluation even though the letters, memorandum, minutes of meetings, and reports show that there was considerable dialogue among the researchers and with their philanthropic mentors.³²

Detailed archival records of 15 projects involved with five major research institutions trace the progress of the research and evolving paradigm in the creation of what was hoped to be universal standards of mental–physical health. From the beginning, the objective of demonstrating the creation of a technology of human

³¹ Laura Spelman Rockefeller Memorial, *Annual Report* (New York: Rockefeller Foundation, 1930), p. 10.

³² Richardson, *Century of the Child* see pp. 129–147 and notes 235–241.

relations and clinical practice was to have other institutions create similar centers and for them to become self-sufficient and permanent. The underlying ideology becomes apparent in the belief that there is one truth and that science can uncover that truth; further, the truths or facts that are established are accumulative and build upon one another in ways that can be used to improve collective reality of human beings on earth. There was also a belief in the permanence of the institutions that supported the research in spite of the fact that not only do ideas and paradigms shift over time, so do institutions.³³

Archival Revelations in the Historic Records: Child Study Institutes

There were seven major institutions conducting child study research initiated with LSRM funds in the 1920s. These include the most distinguished and successful programs such as the Iowa Child Welfare Research Station; the Clinic for Child Development of the Institute for Human Relations at Yale University; the Institute of Child Welfare at the University of California, Berkeley; the University of Toronto Institute for Child Study; the Institute for Child Welfare at the University of Minnesota; the Child Development Institute at Teachers College Columbia University; and, the LSRM's funding for home economics and child study under the auspices of the American Association of University Women (AAUW) at Cornell University.³⁴ In the section that follows, the trajectory of research is examined through the records of three institutes for child study in the USA, the first institute in Iowa, Arnold Gesell's influential work at Yale, and the last institute at the University of California Berkeley, which illustrates the institutionalization of the mental hygiene paradigm in multiple venues.

Iowa Child Welfare Station: Rockefeller philanthropy, when possible, preferred to support projects that were proven to have merit and to have potential for success. They also preferred to work with other agencies either public or private. They felt that their support could boost a modest operation into a major force for change. The Iowa Child Welfare Station is a case in point. The impetus for the movement goes back to a Progressive Era statewide campaign for child health by Cora Bussey Hillis and her associates. After 16 years of advocacy for "fitter families," Hillis attracted the support of the president of the University of Iowa, Thomas H. MacBride, and the first chair of psychology and dean of the Graduate College, Carl E. Seashore.

³⁴ The extensive records on these files are in the LSRM, GEB Archives, as well as in the Spelman Fund Papers, a philanthropy created in the 1930s to continue child study research on adolescence. All are housed at RAC. In addition, Canadian materials are also in the Public Archives of Canada and Griffin-Greenland Archives in Toronto.

Working together, they were able to convince the state to pass legislation, creating the Iowa Child Welfare Research Station on April 21, 1917. The objective was to investigate the “best scientific methods of conserving and developing the normal child.”³⁵ Bird T. Baldwin, the first director of the Station, sought to expand the research with the financial assistance of the LSRM. Topics such in psychology, nutrition, eugenics, and “social betterment” were conducted with the cooperation of the medical and dental colleges, college of education, extension division, school of public health nursing, department of speech, and home economics. Publications looked at questions of heredity versus environment, learning and mental growth in relationship to intelligence, and the impact of rural living as retarding growth and learning capacity.³⁶ The Iowa Child Welfare Research Station became prominent in the nature–nurture debates on the side of nurture. Their publications emphasized the position that environmental interventions could transform a child’s mental, emotional, and physical capacity to learn.

Arnold Gesell’s Laboratory at Yale University: Child study at Yale University concentrated on infant growth and the determination of norms for mental, motor, and emotional development, building on Arnold Gesell’s work beginning in 1911, which was supported by the LSRM from 1920 to 1944. Having studied at Clark University under G. Stanley Hall, Gesell was also a medical doctor and stressed physical maturation. He was a major figure in determining age, and stage-related sequences in the maturation process, which branched out into personal hygiene, emotional health, fears and dreams, sexuality, play, school performance, and ethics as well as learning. He also gave advice as to how to handle “defective” children. Some of his books were made into film versions, presumably for public educational purposes. His work covered 37 years of research. In his research, he used videos and photographs of children as well as observation through one-way mirrors. He contrasted his studies of humans with animal studies including monkey learning behavior. His work was translated into numerous European languages.³⁷ Gesell

Lippincott Co., 1937); Arnold Gesell, et al., *The First Five Years of Life* (New York: Harper & Brothers, 1940, 1971); Arnold Gesell, Francis Ilg, Louise Bates Ames, and Glenna E. Bullis, *Youth: The Years from Ten to Sixteen* (New York: Harper, 1956). The US Library of Congress lists 77 publications of Gesell including translations.

was not necessarily easy to get along with and defended his own approach to understanding child growth, sometimes getting into disagreements with researchers at other institutes as documented in his correspondence and memorandums.

The records show that LSRM support for research at Yale included support for settings to observe and experiment with interventions such as the Shirley G. Moore Laboratory School. Counterparts of the child study institute and laboratory school continue today under the College of Education and Human Development. Research concentrates on child psychology with a psychobiological orientation. Early childhood research is currently conducted under the auspices of the Center for Early Education and Development and the Center for Neurobehavioral Development. There is also an Irving B. Harris Training Center for Infants and Toddler Development and a Child, Family, and Youth Consortium.

Institute for Child Welfare, University of California Berkeley: LSRM records demonstrate that in 1921, California volunteers attempted without success to enact a law similar to Iowa in order to establish an institute for child study. Similar to Iowa, in 1923, the idea of establishing an institute attracted the support of the president of Stanford University, David Starr Jordan, and Stanford psychologist Lewis M. Terman, champion of nature interpretations of the nature–nurture debates as author of intelligence tests and measurements. Olga Bridgman, a psychologist at the University of California, Berkeley, also became an advocate. A bill was successfully passed, but disagreements arose over the site of the proposed station between Stanford and Berkeley as well as control over its work leading to the rescission of the legislation. The LSRM was willing to take advantage of the early interest in a child study and parent education institute but declined to intervene until a request was made for support. Lawrence K. Frank, officer of the LSRM, had been willing to partner with the General Education Board and Rockefeller Foundation, to support a California project in 1923, but it took until 1927 before the final plan for an Institute for Child Welfare at the University of California, Berkeley, was finalized.

The Berkeley Institute was the last major research center initiated with LSRM funds, since the Memorial, which was established with a 10-year time line, was on the verge of being integrated into the Rockefeller Foundation, GEB, and new Spelman Fund. The financial records show that the Memorial appropriated 300,000 dollars to be distributed for the Institute at the rate of \$50,000 a year for 6 years ending in 1933. Lawrence K. Frank, now an officer of the LSRM and GEB, took an active role in the design and progress of research and choice of personnel. The Institute was to include a nursery school, child study center, and research facilities used cooperatively among several departments. The first director, Herbert Stoltz, was a medical doctor who had widespread legitimacy as a researcher, administrator of Oakland Public Schools, and as a state-level bureaucrat. He was married to Lois Meek (Stoltz), a child study professor at Stanford. Harold Jones, a psychologist, with a dual appointment in psychology and in the Institute followed Stoltz as director. Jane Walker MacFarlane, also with dual appointments, followed Jones as director. She had been a director of child guidance and was increasingly influential in the 1930s and 1940s in promoting longitudinal child guidance and adolescent studies using Oakland Public Schools as sites for case studies. The

LSRM and GEB Archives at RAC contain a rich set of letters and memorandums concerned with the progress of research between the officers of the philanthropies, researchers, and administration of the university, Oakland Public School officials, and state officials. It also documents efforts to disseminate the results through conferences and publications.

Adolescent research was a logical continuation of the earlier emphasis on infancy and early childhood. The research began with pilot studies that grew in size and cost into longitudinal studies. Data gathering included anthropometric, photographic, and medical records. A physiological battery of tests were performed yearly as well as intelligence tests using Lewis Terman's Stanford Binet Intelligence Scales in addition to measures of specific learning skills in reading and math. Clinical observations used rating sheets to determine the range of personality traits indicative of attitudes, ambition, and aptitudes in the school, home, and community. Home visits were made by psychiatric social workers.

The slow pace of the longitudinal studies and the fact that their results were often arcane were taken as evidence of their validity. The research was taken as painstaking and exact in the accumulation of evidence that would uncover the true nature of adolescence. The conclusion was that adolescence was not a chronological category but a physiological category offset by cultural expectations and pressures that presented a severe challenge for parents, teachers, and school administrators. The research continued until 1950. It became increasingly apparent that the results did not lend themselves to publication in conventional discipline-based journals and books since the interdisciplinary nature of studying children to youth crossed multiple disciplines and sought audiences in multiple fields. By the end of the 1930s, it was concluded that the publication of the data would have to be subsidized by Rockefeller philanthropy. In 1938, four theses and two monograph series including six publications, 11 articles, and seven other abstracts or papers on institute research were published using Rockefeller Foundation appropriations approved by Raymond Fosdick, president of the foundation. Additional funds produced a *Yearbook on Adolescence* and Herbert Stoltz' and Lois Meek's work, *Somatic Development in Adolescent Boys*.

It became increasingly apparent that even though the participants in the project including their philanthropic mentors were convinced that the research reflected the truth about human growth and learning characteristics, there was a problem of screening information given to the public and to make sure it went to legitimate professionals. They feared that scientifically validated knowledge would be twisted by unwarranted assumptions, oversimplifications, and blatant prejudices of lay audiences. An effort was made to secure professional oversight by the creation of the National Research Council (NRC). The NRC Committee on Child Development and the Monograph Series on Child Development and Abstracts did not, however, prove sufficient. Lawrence Frank left the Rockefeller philanthropies and took a position at the University of Chicago as secretary of the Committee on Human Development, which had been created with GEB funds in 1943, as one way to professionalize the distribution of research. Robert Havighurst took Frank's place coordinating Rockefeller support for the distribution of research on children and

youth, until he too joined the University of Chicago faculty. A committee was formed with 15 members representing the major research centers in child study that evolved out of the work of the LSRM. Their mandate as recognized “experts” was to identify “scientifically validated generalizations of principles...from research findings in biological, psychological, sociological, and medical sciences.” This information was to be distributed to other practicing professionals working with children and youth. A sequence of courses was also developed. A subcommittee on Standards of the American Association of Teachers Colleges relayed information to 175 institutions associated with professional education as well as college administrators, curriculum committees, and professors of psychology and child study.

Paradox and Paradigm Shifts in the Historiography of Illusive Subjects

From a historiographical perspective, mental hygiene received relatively little scholarly attention in spite of the concentration of social historians on twentieth-century social movements from the 1960s to the 1990s. While mental hygiene in the broad sense of the term from its origins in the national committee of the USA became popularized as common sense, propaganda and misinformation also proliferated in negative ways as feared. Ironically, the archival records show that mental hygiene approaches to the study of children and youth tended to expand without the input of medical science. Alan Gregg, medical director of the Rockefeller Foundation, and Lawrence Frank brought psychoanalyst Erik Erikson into the Berkeley and Oakland research project to analyze the data. Erikson, however, to the disappointment of Gregg and Frank, was more interested in the impact of socialization and mental development in different cultures and collaborated with Alfred L. Kroeber in anthropology. He published *Childhood and Society* in 1950 and had little impact on the Oakland data set.

As the mental hygiene paradigm successfully infiltrated multiple interdisciplinary venues in the twentieth century, it became less vulnerable to critical examination. What was left out of the research paradigm limited the data and narrowed the possible interpretations. The protected core was invulnerable to a paradigm shift. The underlying medicalized hypothesis about the nature of learning was accepted as a true reflection of reality and the answer to producing usable knowledge through research. The method in following the childhood gaze reflexively reveals the biases of the fundamental belief systems of the individuals and organizations involved in the pursuit of a normal science of learning.

Following a medical model, the major omission in the research related to learning as influenced by the mental hygiene paradigm was the impact of cultural, political, or socioeconomic factors on family and child life. The orientation of the research as based on a medical paradigm downplayed or ignored historically specific conditions as irrelevant to the creation of a universal science of the

psychobiology of human beings and their readiness to learn in a healthy way. In today's postmodern world, perhaps it would not be possible to have such unshakable faith in the powers of the scientific method without taking culture, economics, and the politics of knowledge into consideration. It is less likely that there would not be a countervailing dialogue addressing the liminality of subjects as well as the liminality of disciplines that seek to define and shape social reality. Basic concepts of human development, nonetheless, were established in the twentieth century that were legitimated as immutable and universal, which is why it is vital that historians visit these ideas and their origins in a critical way. We need to be persistent in following the labyrinth of the archives, tracing the trajectory of past interpretations of historical events and ideas, as well as checking on and creating a dialogue about each other's contemporary interpretations, for therein lies the source of paradigm changes that open up new perspectives and form new thresholds through which to pass when historians pursue liminal subjects such as childhood.

5.4 Interpretation in a Historical Approach to Reading

Anne-Marie Chartier

Introduction

Nothing is more easily ordered than numbers. The general public is used to images of numeric assessment: descending and ascending line graphs “show” the progression and regression of everything that can be measured (populations, earnings, calories, barrels of oil, tons of garbage), as well as the growth or reduction of differences between nations. These quantified representations are so common and so banal that readers no longer question how these figures were constructed: everything seems assessable and thus entirely comparable. And yet, certain realities seem difficult to measure, like the quality of education or the written culture of a particular social group. To measure these less measurable realities, statisticians track “indicators” that must be universal and easy to monitor. In this way, UNESCO’s annual report, *Education for All* (www.efareport.unesco.org), estimates *reading levels* based on percentages, whether steady or declining of illiterate adults, according to three state primary school indicators: percentages of children between the ages of six and ten beginning primary school and rates of attrition at the end of the primary school cycle. The political authorities of the nineteenth century, to evaluate the progression of education in France, region by region, made a similar choice. They quantified the number of illiterate adults, the number of uneducated children, and the proportion of the population that has partially or fully completed schooling. Yet, in minister Guizot’s investigation of 1833, quantitative information was collected along with many qualitative details (on the condition of local schools, the reputation of the teachers, pedagogical styles, books used in coursework, etc.).

Everyone knows that it takes more than simply attending school to learn how to read, and regular attendance does not imply anything about the quality of the teachers nor about the knowledge different students acquire in schools in various countries. What sense does it make to want to rigorously “measure” qualitative information about teacher training, the public or private school system, the organization of curricula, programs of study, or the local or national examination system? The only thing that matters to education economists is the relationship between what is spent on education (input) and the results (output). Since 2000, standardized tests taken by a sampling of 10-year-old students (TIMSS, PIRLS <http://timss.bc.edu/>) or 15-year-old students (PISA <http://www.pisa.oecd.org>) are sufficient to classify the countries of the OECD by their reading, math, and science test results. Math and science are undoubtedly universal fields of study, but is it possible to assess reading skills while ignoring the language, the literature, and national curricula?

Before the 1980s, these types of comparisons were difficult to imagine, because methods of teaching reading seemed inseparable from school language and the subjects examined in the reading material of each individual country’s school system. From the beginning of one’s studies, debates surrounded the details about which texts to assign (religious or secular, scientific or literary), invoking cultural values and raising the stakes about how they are taught (language, literature, and national history). Everyone understood that writing was socially useful for daily life, but schools wouldn’t deal with social learning meant to be taught out of schools. What challenged this cultural goal of scholarly learning and cleared the way for current international comparisons regarding functional reading skills?

This article will examine these recent trends and inscribe them in the long history of written culture and its place in schooling. First, I will present two French studies that, during the 1980s, examined the “reading crisis.” One study is about the decline in reading due to increased competition with other leisure activities, and the other study is on the scope of illiteracy in poorly educated adults. Second, I will present theoretical debates about the challenged certitudes upon which education policy had been based since the nineteenth century. The first certainty: thanks to compulsory schooling, reading rates increased continuously and the general population reads more and more material of higher and higher quality. The second certainty: reading was considered as a basic and general skill, regardless the texts to read. Knowing how to read meant a person was able of reading “everything.” Third certainty: widespread education would lead to the simultaneous progress of individuals, nations, civilization, and more.

Because of those deceptions, progress in the written knowledge of the Enlightenment also seemed a myth (Graff 1979, 2011). What new look on reading was coming on? I will present, third, impacts on teacher training (new learning frames, new primers) and in history of education. If what was called “reading skill” had changed over time, then the history of reading in schoolteaching was in question. I tried to make this “new history” of literacy, looking for “historical changes” in young reader’s training and assessments, from old primers and textbooks. What had been my assumptions and methodological precautions?

In the 1980s, the crisis of reading was perceived in discourses. What value ought one attribute to the pessimistic discourse about the potential loss of reading skills in

society? Has it been a question of diagnostic research or of irrational fear? Was it a knowledge or a belief? In studies on these questions, the gap between discourse and practice was crucial to consider when interpreting the data. The question was about the method: based on oral and written sources about the discourse on reading (on the decline in reading and on illiteracy), could one describe reading practices, themselves? The question was also about the artifacts studied: which type of reading, which ability to read, was the goal in one situation or another? It is the reason why the enquiry since 2000s was not based on discourse but had focused on teaching material. Primers and textbooks obey rules of use. That restricts freedom and determines practice. Which implicit definition of reading did textbooks use?

One basic postulate underlines all reading studies and legitimates comparisons: literacy is the ability to read in any context (*savoir lire, c'est toujours savoir lire*). Of course, the number of people that know how to read, the percentage of avid readers, and practices of reading varied by time, place, gender, and age, but the expression “to know how to read” (*savoir lire*), “to be literate,” seemed invariable. If this is not the case, we need new categories of analysis. In this chapter, I will present the story of this change.

Discourses on Reading: Collection and Interpretation of Data

A Study of Discourses: Questions, Methodology, and Results

In 1981, the new minister of culture¹ wanted to promote in France an ambitious policy initiative to support reading in the general public (Butlen 2008). He found himself in a paradoxical situation. The minister’s statistical investigations showed that, as the number of readers grew, so too did book sales. Little by little, reading books became more of a habit among the French, and while books remained minimally present in daily life, there was progress (Donnat and Cogneau 1990). And yet, the media reported the opposite: “Reading is in peril; France reads less and less; the French enjoy reading less and less.” Corroborating stories came from schools (where a number of adolescents struggled to read an entire novel), libraries (where new readers were drawn to use audiovisual equipment and borrowed few books), and bookstores (which were crushed by megastores). To understand this astonishing gap between the scientifically measured data and popular knowledge, the minister of culture called for a study on why and when this discourse of failure began. Who was perpetuating the discourse? What was the “grain of truth” in it?

¹ Jack Lang was the minister of culture (1981–1986, 1988–1993) after the left came to power in 1981, then he became the minister of National Education and Culture (1992–1993), and finally, he was the minister of National Education (2000–2002).

A team of historians (and not of sociologists) replied to the minister's request. The study had to focus on one of several hypotheses: either it was a discourse due to a particular situation or the discourse of professional groups (editors, booksellers) to get state funding to support their institutions or an old permanent speech similar to the one about "declining school level" (Baudelot and Establet 1989). The researchers chose the time period of 1880–1980 for their study: a century is time enough to detect trends in optimism and pessimism, if there were any.

The study found, to the great surprise of the researchers, that, longitudinally, the dominant discourse did not bemoan a lack of reading. On the contrary, all of the advisers and educators complained that the French read "too much, and anything and everything." Second surprise: despite huge political confrontations between 1880 and 1914 about secularism, for all of those responsible for religious or secular instruction, for educators on all sides, and for militants of popular culture and Catholic libraries, reading was never considered to have had value in and of itself. Bad readings were a risky business and only good readings, with high moral and cultural standards, were encouraged. Contrary to the consumerist discourse (to read a lot), maintained only by a minority of librarians, the consensus was that it was only necessary to read a small amount, to read to learn and not to entertain yourself, and to read good books (like literary "classics" that could be reread indefinitely).

The Reading Crisis in the 1960s–1980s

Persuaded that the change in public opinion happened around the time of World War II, the researchers did not continue the study beyond the 1950s. To find when and why this old discourse that "the French read too much" had been replaced by the idea that "the French no longer read," it was necessary to examine more recent data. I was given the task, along with Jean Hébrard, to complete the research and write a final report (Chartier and Hébrard 1989a). The change in public opinion was dated by corroborating information from multiple sources: official texts about academic reading, Catholic youth magazines, and professional journals. The turning point appeared in the middle of the 1960s: teachers, booksellers, and journalists, previously in competition with each other, had, at that time, created a united front to "save reading," which was threatened by the popularity of television. This pessimistic discourse took hold during the 1970s: there is a reading crisis; the French no longer read (Chartier 1990).

What was the context of this change in public opinion? Three phenomena combined at that time: the omnipresence of the television in family life; the challenge of comprehensive school where the teachers still taught as they did before, when it was more selective; and, finally, the trend of privileged families towards pursuing study more frequently in the sciences than in literature. These three changes undermined the old hierarchy of values founded on the cultural supremacy of literature. These three changes were immediately thought to be a bad omen, while the quantitative data still showed the aftermath of academic politics of the past. When the new edition of *Discours sur la lecture* (Chartier and Hébrard 2000) was published, a new study

(1980–2000) revealed an evolution over the prior 20 years: reading rates had stopped increasing and younger generations had many fewer avid readers than their forebears (Donnat 1998, 2003). On the other hand, the amount of reading practiced in social media had decreased: people were reading fewer books and newspapers, but many more magazines. People read for work, to purchase products, and relied incessantly on the media, either on paper or a screen; computers exponentially increased the time that people spent doing something that is called “reading.”

Initial Conclusions About Research Methods

What can we learn from this research? First lesson: the rapid amnesia of experience. Most of the protagonists of the study were in school during the time of this change in public opinion, but the data, which was collected after that time period, brought back forgotten or considered as “unimportant” memories.

Second lesson: the persistent gap between public opinion and statistics. The progress detected by quantitative research (the reduction of rates of “nonreaders” of books, the growth in the trend of “poor” readers) remained an invisible and insignificant phenomenon for all that consider reading books essential to life. “To read is to live,” proclaimed one of the slogans of the campaign for reading. And yet, it is always the “reading minority” that writes about reading and that speaks about reading on the radio, on television, and in newspapers, setting up their own standards for their vision of the world (Barbier-Bouvet 1988; Chartier et al. 1993). Researchers and scientists, who are professional readers, naturally see reading as the royal road to learning and comprehension and as the most efficient and democratic way in which to do so (published works are supposed to be available and everyone “can” read). Furthermore, teenagers’ disaffection from reading (Baudelot et al. 1999) undermined confidence in the value of schooling for all. The democratization of schooling was accused of creating these challenges, whereas it merely revealed the difficulty of reading literature. Inversely, statistics that continued to postulate the construction of stable variables are poor sources of information about emerging phenomena that quickly alarmed and even confused certain researchers in the field.

Third lesson: the elliptical uncertainty of ordinary speech. In texts written in the 1880s, just as in texts of the 1960s, those that spoke of “knowing how to read,” “loving reading,” and “having a taste for reading” always assumed, without explicitly stating it, that they were speaking about reading books. Those who read magazines, newspapers, comic strips, and adventure novels were not considered “real” readers. A “real reader” is someone who improves and cultivates his mind through reading and never reads for practical reasons or for pleasure. This is the origin of the pessimistic discourses of the period (“the French read too much” (improper reading material) and they “would read anything and everything”). Nevertheless, reading gained an intrinsic value as soon as TV screens seemed to endanger it. It was necessary, in the urgent effort to save reading, that all reading, of any kind, was supported and continued. In this way, the meaning of the verb “to read” changed (Chartier 1992),

at the same time as education practices changed: simply to tear teenagers away from television screens and to seduce them, the promise of the pleasures of reading appeared to be the salvation. Since the 1970s, all reading materials developed to please children (magazines, comic books, comic strips) were welcomed without hesitation into middle-class families, libraries, and at school. At the same time, statistical studies replaced qualitative judgments (good vs. bad books, pseudo-readers vs. real readers) through quantitative criteria (very good or good readers, moderate readers, and nonreaders, based on the number of books read).

Fourth lesson: this concerns, in a much more transverse way, the complex relationships that maintain discourses and practice² and not the declining relationship between “theory and practice.” The discourses were a reservoir of writing much broader than theory. These writings include prescriptions, opinions, beliefs, critiques, and projects. They unceasingly evoke their present-day realities shared with their contemporary audience but unknown to future generations. In this way, between 1880 and 1960, literature teachers were all familiar with the expression, “literary reading.” It concerned rarely a complete work, but only short pieces, never written by a living or foreign author (Chartier and Hébrard 1989b). One generation later, paperback books brought full-written works into the classroom, and new syllabi authorized contemporary authors and translated works. Young teachers found old syllabi limited or “incomprehensible,” because the outdated practices to which they referred to had been forgotten.

These four findings are methodological (they construct a corpus of information and analyze the data) as well as epistemological (they turn current issues into historical research). The study of *Discours sur la lecture* simultaneously showed the contributions and limits of a history based on the analysis of texts that were used for a long period of time to support academic orthodoxy.³ Teaching reading to beginners, which was at the center of violent debate, thus had all of the characteristics of a theoretical conflict between supporters of traditional pedagogy and militant supporters of new ways of teaching. Was it possible to understand these confrontations any differently by connecting the history of reading methods with classroom practices? This is the work we began doing (Chartier and Hébrard 1990), but we found these confrontations wrapped up in tumultuous debates about illiteracy, where one can easily see repetitions of the same dialogue between functional

² This will be the central point of reflection of my thesis, which revisits the empirical data taken for the study: *La lecture scolaire entre prescriptions et opinions: comment les discours disent les pratiques*, doctoral thesis, University of Paris V, Paris, May 1992, 3 volumes, typed.

Anne-Marie Chartier, “Usages de l’oral et rapports à l’écrit.” *Illettrismes: quels chemins vers l’écrit?* F. Andrieux, J.M. Besse, B. Falaize, dir., Paris, Magnard, 1997, pp. 95–112.

³ The history of education had long been confused with the evolution of “pedagogical ideas” over the centuries: Rousseau is neither Montaigne nor is he Dewey. Nevertheless, the endurance of certain keywords (school, teaching, training, culture) or the same pairings of keywords (adult/child, master/student, authority/liberty, knowledge/ignorance, study time/free time, work/play) could make one believe that the fundamental questions and “academic attitudes” were perennial concerns: in this way, the unconditional trust in children that Montaigne, Rousseau, and Dewey makes them appear to be guardians of “new pedagogies.”

and cultural reading. Who were these illiterates, incapable of reading quotidian writing? Why, before the 1980s, were they not present in representations of the public and thus from statistical data?

A Theoretical Debate: Literacy vs. Illiteracy: An Old Reality and a New Concept

Adult Illiteracy, from Indifference to Discovery

In 1984, the report to the prime minister *Des illettrés en France* (Espérandieu and Lion 1984) ignited an explosion of public opinion. The report found that a significant portion of the population does not know how to read, a revelation that created scandal during an era when the word “illiteracy” had hardly entered the lexicon.⁴ In 1999, the sociologist Bernard Lahire published a study that examined discourse surrounding illiteracy (Lahire 1999), as we had analyzed the discourse surrounding reading 10 years earlier. In this case, there was no need to examine illiteracy from a historical point of view: in France, before 1980, there was no data. During the 1980s, 69 government reports officially acknowledged this problem and created a permanent Committee to Fight Illiteracy (CFI) (*Groupe Permanent de Lutte contre l’Illettrisme/ GPLI*) in the Ministry of Social Affairs. Between 1990 and 1999, 113 subpoenas for colloquia organized by the CFI were issued, where politicians, grassroots activists, researchers, and experts expressed their views on the origin of the problem and how it correlated with other social realities. In 10 years, the term “analphabeticism” disappeared from the vocabulary, whereas “illiteracy” became a major social problem. However, during the decade of 2000–2010, illiteracy disappeared from urgency, except in school where it became the new name for failure.

From 1984 to 2000, vague definitions of illiteracy proliferate and the number of illiterate people did not stop increasing: in 1982, there were between 500,000 and 2 million; in 1990, there were between three and six million; and in 1998,⁵ there were between three and nine million illiterate people in France. This media-driven rhetoric has social repercussions and possibly political aims: it turns

⁴ During the 1980s, the reports used the term illiteracy or alphabeticism, which are still competing terms: Viehoff (1982) *Rapport sur la lutte contre l’analphabétisme*; Anglade et al. (1984), *L’Alphabétisation en Europe*; Dossiers IFOREP (1985) *Illettrisme et alphabétisation*.

⁵ Debates about the total number of illiterates stem from the absence of a clear definition of illiteracy and from assessments that vary in rigor, according to the studies. But everyone agrees that literacy can be considered on a hierarchical scale of competency, going from basic elementary to the most complex skills, resulting from internalized models of scholarship, but for some (the philanthropic association ATD Quart-Monde) a person is illiterate if they cannot read fluently (the reading level of an 8-year-old); for others (the AFL or Association Française pour la Lecture), a person is illiterate if they cannot effectively discuss written information (the reading level of a 16-year-old).

illiteracy into a national cause and perpetuates budgets that support systems to meet the demand for adult training.

The public needed an explanation for the looming illiteracy problem. From 1945 to 1975, during the years of economic growth, nobody cared whether the Spanish, Portuguese, or North African workers in factories or construction sites were literate or not. During this time of full employment, failing students had no trouble finding work. As the psychologist, Rene Zazzo, wrote: a child whose schooling has been compromised is not equally socially compromised, because “Society is less challenging than school,” which requires up-to-date writing skills, contrary to the world of manual labor (Zazzo 1969). However, manual labor changed, after the oil crisis caused closures of factories and a rise in unemployment. The ability to read and write became a requirement for employment. New technologies (ICT) entered the working world, and new jobs required workers to read protocols and fill out forms. The written transmission of information, formerly reserved for middle managers and supervisors, became a responsibility of the least skilled workers, both in stock warehouses and at construction sites (Clot 1995). Illiterates had been working in those positions for a long time: in 1988, 75 % of “illiterates” attended school before 1955, when schooling stopped at age 14, according to a study done by the minister,⁶ but their illiteracy was unnoticed, since it did not affect their ability to have a job. That was no longer the case in the 1980s: the discovery of illiteracy had an impact on the economy, as international comparisons later verified (EFA 2006). In England, Lord Moser, made responsible to report to parliament on the issue, linked the high illiteracy rate directly with the ineffectiveness of school and the weakness of the economy. “Something like one adult in every five in this country is not functionally literate. This is a shocking situation and a sad reflection on past decades of schooling. It is one of the reasons for relatively low productivity in our economy, and it cramps the lives of millions of people.”⁷ Thus, in the same way that the reading crisis, as a vehicle of personal culture, had been revealed by the increase in mandatory schooling, the crisis of illiteracy had been revealed by the demand of new jobs designed for manual laborers who could read.

Two Definitions of Literacy: Social Practice or a Level of Scholarly Aptitude?

In the vocabulary used in France, the contrast between analphabets (that never learned how to read, because of faulty schooling) and illiterates (former students

⁶ According to the October 1988 study conducted by the Institute of Infometrics, 50 % of illiterates were over 65 years old and thus retired. The National Committee to Combat Illiteracy (NCCI) confirmed this data in 2010: 50 % of illiterates are elderly and/or live in the country. <http://www.anlci.gouv.fr> “Rates of Illiteracy,” 2010.

⁷ Moser Report (1999), p. 9, quoted by Vincent (2003), p. 345.

that failed school) was quickly accepted, while the pairing of “illiteracy/literacy” took much more time to get established. What remained unclear was the hazy designation of the English term *literacy*. After 10 years, a practical consensus was reached about the reality of illiteracy in its multiple social manifestations, without a definitively resolved theoretical definition on what literacy was (Fraenkel and Mbodj 2010). During the 1960s, UNESCO defined *illiteracy* as the inability to independently read quotidian writing. *Literacy*, therefore, *a contrario*, was the capacity to read quotidian writing. But, is it necessary to understand what transpires for those who have the lowest reading levels—just enough to get by, but nothing more? And how far does “quotidian writing” extend? Road signs, but not maps? Television schedules, but not information about television shows? Pay records, but not employment contracts? The binary opposition between *literacy* and *illiteracy* was unfit to encompass the diversity of ways in which they are used. During the 1990s, the Organization for Economic Cooperation and Development (OECD) defined literacy as, “the aptitude for understanding and using written information for everyday life: at work, at home, in the community, in preparation for attaining personal goals and extending one’s knowledge and capacities.” This definition was so broad that the OECD immediately defined “five levels of literacy” (OCDE 1992; OECD and Statistics Canada 1995, 1998). The illiterate person is one who reads below the minimum level. Could one, with this model, speak of *media literacy*, *physical literacy*, and *emotional literacy*, by using the word *literate* as a generic term? “Literate: competent and experienced in something specified, e.g. computer-literate” (Chambers, *21st Century Dictionary*, quoted by Vincent,⁸ 2003). What is clear is that the increasing number of illiterate people does not signify that literacy standards are falling, but that they are rising (the minimum social demand for literacy is rising).

During the 1990s two opposing approaches of reading abilities prevailed. The first idea defined reading by all of its empirical uses⁹ (Street 2010; Barton and Hamilton 2010, Rockwell 2010). Social practices of writing are many, localized, and heterogeneous: browsing the newspaper, looking over a list of classes, filling out a form, checking the train schedule, reading a novel, flipping through a dictionary, and studying a history lesson are reading activities that have “nothing to do with each other.” Thus, it is necessary to avoid confusing learning how to write and the schooling process, even if, in Western countries, these two phenomena had a tendency to overlap (Scribner and Cole 1981, Hébrard 1988). One could learn outside of school, and while someone could manage to bypass challenges that writing creates in their home environment (they could get assistance from family, at a work site, or at the workshop), the occasional difficulty is not any different from

⁸ Vincent wrote he was allowed according to the model of computer literacy to talk about “Literacy literacy,” ironic title he gave to his article in 2003.

⁹ This idea privileges the ethnographic description that takes account of the variety of situations in which reading occurs. Brian Street critiques both the statistical reductionism and approaches in opposition to ideas about oral and written culture that are too abstract, in the tradition of Jack Goody (Goody and Watt 1968; Goody 1977).

the inability to drive a car, to type on a keyboard, or to speak a foreign language. Nobody was to be a social outcast because of this lack of competency. Furthermore, if someone must be labeled “illiterate” to have the right to attend a training course to “bring their French language skills up to par,” then public aid to fight illiteracy stigmatizes as much as it assists. And yet, the profiles of those asking for training are shockingly heterogeneous (Besse 1997), and the people in charge of the courses doubt that the same classroom exercises that could help a warehouse worker use software to follow the ebb and flow of products, an immigrant mother to understand her children’s report card, and an unemployed person to choose from job opportunities.

The second idea, on the contrary, defines “knowing how to read” on a progressive continuum, going from lowest level of reading ability to the highest. This is the OECD’s idea: as soon as writing becomes mandatory in social and economic circles, illiteracy is judged according to academic norms. The five levels of literacy reflect the five levels of professional qualifications (Nickell and Bell 1996), defined by levels of academic achievement.¹⁰ This definition has the clear advantage of being compatible with formal academic frameworks for the quantitative evaluation of skills for adults as well as children (Limage 2005, Fernandez 2005).

Thus, the discourse about illiteracy contributed to legitimizing a new ambition for teaching: school must prepare students for functional reading. In school, functional writing is what students need to do their student “job”: read instructions, read working papers, follow evaluation protocols, and understand performance evaluations written by their teachers. All of these various forms of information are used to come from oral exchanges in class, but now they have to be read alone. Second change, the discourse on illiteracy had validated for all school criteria. Effectively, this graduated idea of literacy¹¹ appeared around the beginning of the twentieth century, as soon as the ability to read and write became an indication of scholarly performance and individual intelligence. The question of evaluation significantly overwhelms the question of the effectiveness or ineffectiveness of the learning process, since it constructs new criteria for judging people.

The Ability to Read as a Criterion of Cognitive Normalcy

In France, as in other nineteenth-century European countries, mandatory schooling laws aim to eradicate illiteracy: “The illiterate population, that is to say those who can neither read nor write, will get smaller year by year in France and... the nineteenth century will end with a population that can cross that word out of the

¹⁰The levels go from primary school (level 1) to vocational certifications (level 2), then the mandatory high school diploma (level 3) to the level of the general or technical *baccalauréat* (level 4), and the fifth level corresponds with higher-level technical or university degrees.

¹¹Or of “analphabetism,” as they say in francophone Canada, or of “written culture” or “basic competencies,” as is more often said in France. Cf. Cavet (2002).

dictionary.” This can be read in the article titled, “Illiterates,” in the *Buisson Dictionary* (Ballet-Baz 1887). And yet, the tables of the same article reveal an insurmountable rate of illiteracy, so high that the idea of 100 % literacy seemed a statistical fiction (Chartier 1993a, b). How to distinguish children unfit for any sort of schooling from those who could attain at least an average level of learning? Certainly, those who are “extremely behind,” who cannot even figure out how to speak, cannot benefit from schooling, but how can one classify the others? In 1904, Alfred Binet was asked to develop a simple instrument to make this distinction: this is the metric development scale that classifies all students based on the rapidity with which they learn (Binet 1909).

Binet’s test seeks to test superior functions of intelligence (imagination, memory, attention, and moral sentiments). It gives students an oral test, without asking them to read or write, since it assumes a correlation between linguistic ability and average intellectual and scholarly ability. In this case, a normal child is one that learns how to read within a set amount of time, like the average student in his or her age group. Binet refers to those who are “far behind the average,” who can speak, but will never learn how to read, “abnormal students.” Those who can manage to decipher text, but will always need help to understand it, will never be able to follow a standard curriculum, because they need “special education.” In this way, between the spontaneous, natural acquisition of language and the formal learning process that goes with entry into the language of scholarly writing, the metric scale of intelligence makes a hypothesis of a certain continuity: the differences are by degree and no longer by nature. The metric scale thus constructs a modern definition of intelligence, which is linked to the requirements of mandatory schooling. Converted into the intelligence quotient by Stern, an American psychologist, the Binet test has been used around the world. Through the intermediary of schooling, teachers, students, and parents learn to link intelligence, mental processing speed, and literacy. They grow accustomed to think that failure to learn to read reveals a sort of deficiency that will obviously be a barrier to academic study, but does not get in the way of social and professional integration.

This evidence is questioned, a half-century later, when one can observe that a growing number of children fail to learn to read and that a number of those children have, according to tests, “normal” intelligence. In 1962, according to the statistics of the Minister of National Education, 28 % of boys had to retake their first year of mandatory schooling and more than three out of four children finishing elementary school had been held back for 1 or more years. Psychologists argue about the causes of failure; some still attribute it to intellectual deficiencies (Zazzo 1969), others to emotional challenges (Chiland 1971), and still others to a specific neurological problem, dyslexia (Debray-Ritzen and Milikian 1970). All of the institutions built around tests (scholarly psychology, counseling, and special courses for challenged children) find themselves undermined by them. At the same time, statistics show the social composition of those who are behind in school (INED 1970). For sociologists and psycholinguists, working-class students, resistant to abstract codes of conduct, are not held back by any mental handicap (Bernstein 1971). Is it necessary to attribute a sociocultural handicap to them? In order to do

this, we must define “cultural norms,” which no one is able to do, unless a middle-class education is set up as a model. There again, there are a multitude of challenges in reading (which effectively reduce the chances of academic success), stemming from the academic situation: to be able to manage alone with middle-school-level texts (texts for adolescents ages 11–15), students must read “autonomously” much earlier, by the age of 8 and no later than the age of 10 or 11. Few achieve that level of reading. Mass failure in reading therefore happened simultaneously with the redefinition of manual labor, obliging (almost) everyone to use the written word.

In the polemics about adult illiteracy, teacher trainers (working, as was my case, in teacher training institute) could see, without any difficulty, a revival of the polemics which were common 15 years earlier, but they were used at that time exclusively about school reading (Chartier and Hébrard 1992; Chartier 1993a, b). The question of reading as “mandatory” returned, for reasons that were soon considered social and academic, and from then on, reading was inserted into the new framework of analysis. The evaluation of success or failure had long seemed to describe reality as it was. Studies from the 1980s showed that the “objective” indicators were tools used to interpret reality, because they constructed the object that they were measuring. Those who denounced the enslavement of schools to economic aims, foreigners to the initial project of education for all, could just as well wonder about working in a more and more “scholarly” or “pedagogized” way in which the economic and social worlds work (Depaepe et al. 2008). At the heart of these changes that provoked as much conceptual interference as social and pedagogical stalemates, there was the acquisition of reading and thus the question of how it should be taught.

From Study on Discourse to Study on Practice: Questions, Methodology, and Results

New Representations of the Act of Reading

The traditional conception of the learning process sets two different steps: first, deciphering without error and then reading out loud to enhance understanding. In this conception, the only special feature of writing was the alphabetic code. Understanding of a text seemed to naturally follow reading it aloud. The process of reading one’s native language, hearing oneself reading aloud, word after word, enables the reader to understand. From the 1970s, the educational discourse rejected this dichotomy: to know how to read aloud is not to know how to read. One could read a text out loud without ever understanding its meaning. The official guideline of 1985 adhered to and affirmed “to read is to understand.” As long as beginners worked hard to assemble the text, word by word, they could immediately grasp the overall meaning of it. Furthermore, as soon as students could identify words without effort, they had truly begun to read. Since 1989, national assessments

were designed to precisely identify which reading skills have been mastered and which remain challenging for 8- to 11-year-olds, that is, after 2 and 5 years of mandatory schooling.

The failure of former methods can be attributed to theoretical or practical “errors,” perfectly rectifiable thanks to scientific knowledge. When phonemes and graphemes stood for letters and sounds in textbooks, linguists demanded that all teachers had some knowledge of the graphophonic system of the French language (Marchand 1975). Didactitians denounced the dangers of exercises that had got children into the habit of reading aloud without understanding the content “like parakeets” (Charmeux 1975). Psycholinguists found that many children didn’t speak good enough to start learning how to write (Dannequin et al. 1975). Sociologists had described in detail the selective results of reading codes and content for working-class students (Bourdieu and Passeron 1964, 1970). According to some psychologists, orderly steps should be followed to learn how to write and read. Otherwise, teachers would assign exercises prematurely and with no outcome (Ferreiro and Gomez-Palacio 1982). According to cognitive psychologists, teachers taught too little or not at all the formal signs that contribute to the understanding of texts (punctuation, syntax, discursive organization, and layout) (Zagar and Fayol 1992).

In short, reading practices and teaching methods were now subjected to multiple analyses by researchers, thus destroying the beautiful simplicity of an old idea: to learn to read combines processes so complex that the teacher has to combine an inordinate amount of high-level knowledge and didactical skills. To guide the class and best assist the academic progress of each student, the teacher must have as much rigor as flexibility. One can understand how a single idea began to unite people during the 1980s: one must not trust the first year of schooling to a new teacher. This recommendation seemed to make sense for teacher trainers, but it revealed a radical change in reading teaching compared to previous teaching practices. In the nineteenth century, teaching a child to read and write was considered a tiresome but easy task that one entrusted to the wife of the primary school teacher, to beginning teachers, to instructors recruited from the group of the most advanced students. Any housewife was presumed capable of teaching her children to read. In the twenty-first century, despite many years of university studies, young teachers were not deemed ready for the same task. At this point, what had changed that teaching reading had become such a difficult task? This report created a real enigma: all of the history of literacy and of teaching of reading seemed ripe for reconsideration. My research has been based on this historic mess since the 2000s.

The Representations of the Savoir Lire (Literacy) and the Question of Markers

I will sum up the steps and the results of the existing scholarship in order to question how the data gathered during the documentary research was constructed and what, in these data, pertains to interpretative choices: what made these choices possible? What makes them legitimate?

Firstly, let us remember that this type of research is set within the scope of a history which considers itself part of the social sciences: the realities at stake do not belong to political history and are not the result of legislative or institutional decisions. The history of reading (Cavallo and Chartier 1999) and of the representations of the act of reading (its functions, value, and requirements) belongs, in every period, to the realm of personal experience. Nevertheless, some of the coexisting social practices are raised to the status of an ideal model: this is the case for the “professionals of reading,” who can be depending on the centuries, religious personnel, legal practitioners, scientists, writers, or journalists. The representation of this model, adopted and transmitted by those who educate children, imposes itself on everybody, orienting the aims of the school learning process and the evaluation of its effects.

Investigating the practices in order to date these changes and to find their causes is a different task: we need to find documentary corpora that allow us to detect those practices, to situate their actors, and to set forth interpretative hypothesis that would “explain” their appearance. The search for clues implies a hypothesis that one needs to put to test against the sources. Contrary to what the proponents of the “linguistic turn” may have believed, the “plausibility” of an explanation cannot be sufficient for historians. Historical research does not obey the same paradigms as works of fiction: it requires a “documentary proof” (Chartier 1998).

For what reasons can a difference be or not be described as “historical change”? It depends on the topic of the research, which can be macroscopic (the fall of the Roman Empire) or microscopical (the apparition of the semicolon in nineteenth-century manuscripts). All primers being different from one another, what is it that allows the researcher to establish that some differences are “significant” and others are not? For instance, alphabet books can easily be classified in three corpuses, depending on their contents: religious texts (Catholic prayers, Christian instructions), instructive and moral texts (about the Earth, plants, animals, and the duties of children), or playful and childish texts (collection of anecdotes, short tales of children’s lives). In the beginning, I had assumed that those were in fact three steps going from the old textbook to the modern one, but that was a misleading path: all these different models coexisted between 1820 and 1880, and similar learning exercises could be found in all three corpora. These “differences” of content were useful for studying the ideological orientations which contributed to the construction of a cultural identity, but they were useless to reflect on the learning process.

Research on the history of alphabetization opened up another lead. The history of school, initially focused on political struggles between the Church and the state, was part of a broader social and cultural history—the story of the democratization of writing made possible by Gutenberg. But the research on popular alphabetization was at odds with the Republican vulgate: it was not the III Republic (with Jules Ferry’s laws) that had allowed the people into the written culture but the Reform in France as much as in other European countries (Furet and Ozouf 1977). The Protestant North preceded the Catholic South, but it was always in order to instruct the people about the necessary truths to their salvation that religious and civil authorities had wanted to alphabetize and school the people, not in order to form free citizens or efficient workers.

The Furet and Ozouf survey had settled the ground for a great theoretical debate on markers (Sachs and Furet 19974). Was the ability to sign a wedding or baptism register enough to prove that one could read? Statistic figures could only be drawn if the markers remained “stable” during the period. International comparisons had confirmed that signature was a “good marker” until 1870 (Graff 1981), but not any more so in the time of compulsory schooling.

Teaching How to Read and Situation Constrains

What place did learning tools hold in the alphabetization growth? As in the nineteenth century, the history of pedagogy remained the history of doctrines (Avanzini 1981). Through the evolution of reading pedagogy, it was possible to see a history of progress—progress of ideas towards science and progress of techniques towards a greater efficiency, under the impulsion of “precursor” pedagogues (Maria Montessori, Ovide Decroly, Edouard Claparède, Célestin Freinet). If pedagogy advanced, it was thanks to these exceptional innovators, whom the teachers, it appears, almost always resisted, out of hostility or of habit inertia.

This bottom-down history of pedagogy left aside all the innovations that emerged in the classroom as well as the teachers’ contribution to the crafting of their working tools: most of the textbooks had been designed by practitioners. This history made it impossible to understand why ideas or processes, which were for a long time without effect, had suddenly been massively adopted. It left in the shadows all the material obstacles to the use of new methods and ignored the debates about professional and cultural questions that divided teachers.

The beginners’ textbooks constituted a series.¹² They allowed us to date the evolutions of production and to understand how it was received on the ground. If a publication is republished endlessly (136 editions for Peigné’s one, published in 1835), it means that it meets the expectations. As opposed to the didacticians and the linguists that are looking for signs of didactic archaism or modernity in relation to current “scientific” criteria, my concern was to analyze nineteenth-century textbooks according to their classroom use value. What kind of resources did a textbook provide teachers for their day-to-day work (boards to pin in the classroom, quizzing methods, progression, oral–written relations)? To shed light on teaching situations, I had prefaces, guidebooks for teachers, student accounts, and personal narratives at my disposal. The absence and then the presence of notebooks soon appeared to me as essential data.

Firstly, I tried to understand why the syllabic method, held responsible for the massive failure in 1960s France, had allowed, on the contrary, to shorten the reading learning process of 1 or 2 years in the 1860. This first enigma

¹²I have studied 135 *primers*, edited from 1830 to 1890 (Library of INRP, now in the “Bibliothèque Diderot”, ENS-Lyon).

could be solved through dating the appearance of printed words in books in both roman and cursive characters. Cursive syllables and cursive words were models for students to read and copy in their notebooks. Yet, the methods used at the beginning of the nineteenth century separated the reading learning process from the writing one, which was to be undertaken much later. The “modern” method of reading and writing simultaneously had been made possible thanks to a technological innovation (low-cost paper and metallic pens). As soon as students learned syllables while writing them, letter by letter, they did not need to spell them out loud anymore. They could read syllables altogether (BA), hence the name “syllabic method.”

Secondly, I tried to understand how the spelling method (the B-A BA) abolished by the syllabic method worked. In order to do this, we ought to accept the idea that it is possible to know how to read without knowing how to write. The current opposition (illiterate/literate) ignored the existence of the “knowing only how to read” and to manage to understand to what this “semi-competence” corresponded; it was not didactics, but rather the anthropologies of the written word and of the division between clerks/clerics and illiterate people in ancient societies, which one needed to consider (Goody and Watt 1968; Goody 1977; Hall 1981; Grafton 1991; Hébrard 1996). Historical research about the memory of texts (Ong 1982; Carruthers 1990) has allowed us to shed light on the modalities of reading before the Reform. Back then, texts were read to be learned and recited in unison, along the lines of liturgic texts. Texts for the beginners were always heard before they were read. Thus, before reading catechism, the younger had already heard the older students reciting it (La Salle 1706). Spelling prayers known by heart, like the Pater Noster, aimed at making students perceive how a sequence of words was “encoded” in writing (P-A Pa, T-E-R Ter). Spelling a text was similar to sight-reading a musical score already memorized by hearing. Spelling was therefore a good way of learning how to read and reread out loud a limited corpus of religious texts (Strauss 1981; Hébrard 1988; Monaghan 1998). By the same token, this shed light on the “evaluation criteria” of the learning process.

Learning Aims and Evaluation Modalities

Once these texts were well memorized, students would try their hand’s at unknown texts of the same sort (psalms, hymns). Those of them that did not reach this “autonomous” reading knew enough nonetheless to answer the catechism exam and be admitted in communion: religious education did not ask for more. These examinations—to access communion in Catholic countries, or confirmation in Reform countries—existed throughout Europe. They were more or less severe depending on the expectations of the clergy: lots of children “failed” (Johansson 1981; Julia 1995). We could consider them the “PISA tests of the seventeenth century,” because they evaluated literacy of the time, though declarative (the contents of the dogma, religious history) and procedural knowledge (be able to recite/reread a know text). They were at the basis of a lot of ulterior examinations

(Caspard 2002). Communion was done at age 11 or 12 and confirmation at age 14 or 15: this 3-year gap was sufficient to explain the higher level of Protestant Northern Europe compared to the Catholic South. However, this proficiency did not allow to quickly and silently read the vast quantity of profane products mass-printed with the steam-powered printing press.

These documentary data converged towards a general interpretation. First of all, the very definition of what “knowing how to read” means had changed during the eighteenth century. This “reading revolution” (Wittmann 1999) felt around 1750–1760, when the deplorative speech appeared (“people read too much and read anything and everything”) which was to last two centuries, as we have noted. On the contrary, the learning techniques in agreement with the new aims (reading to be informed, to learn, and to enjoy oneself) and with the new modalities of reading (to read alone, fast, and silently) did not arrive in the school until the next century, around 1860, with the “reading–writing method.” Between 1760 and 1860, “reading was the curse of childhood,” to quote Rousseau. All accounts from the times converge: the old method could not meet the new objectives and too many children finished school without knowing how to read, in France and everywhere else (Matthews 1966; Vincent 1999). Moreover, school banned from the classroom entertaining and useful readings to keep only the “instructive” ones. These are “lessons” (of moral, history, sciences) that are to be read out loud again and again in order to be learned and to be recited, along the lines of catechism. Beyond the first class, school pedagogy conserved collective, slow, and aloud readings until the “reading crisis” of the 1970s.

This interpretation allows us to understand the transformations of the school curriculum, by showing the link between didactic progression and writing technologies. The method of reading and writing simultaneously was rapidly adopted by teachers, thanks to the simplicity of the new tools, but also because it solved the principal difficulty of the multilevel classroom: to occupy students who did not yet know how to read and “could not do anything without the teacher’s help.” Like the older students, they alternated between lessons and exercises, reading and writing. Thus, since the 1860s, what will later become the “preparatory course”—the first year of the new elementary curriculum, which became compulsory in 1886—has gradually been shaped.

Second relationship is between intelligence and learning pace. In 1830s textbooks, there was no length prescribed for the different steps. This is no longer the case with the textbooks from the 1860s, split into daily lessons, and distributed during the school year. Thus, teachers must have the students that “follow” study together and those that “do not follow” in another group, because everything goes too fast; the teacher moves to the next lesson before they have assimilated the previous one. Teachers notice “in practice” the relation between intelligence, rapidity, and mastery of school writing, which Binet theorized in 1904 when he establishes his metrical scale for intelligence. New modalities of reading evaluation have become “thinkable,” linking the steps of compulsory schooling and the “levels” of intelligence: to be ahead or behind (in regard to one’s age group) becomes an indicator of success or failure.

This interpretation finally solves the contradiction between speech and practice when it comes to memory. Elementary instruction is composed from this point forward of two times: the time of alphabetization (decipher between six and seven) and the time of instruction allowed by readings (moral, history, sciences). Successes in school and memory are therefore inseparable “in practice.” And yet, speeches from the time keep stigmatizing memory, always characterized as mechanic, repetitive, catechistic, and meaningless, while, in fact, having a good memory is enough to be a good student. Through this rejection, it is the old way of religious instruction through reading which is aimed at. In 1880, the great flaw of memory is that it allows to “recite without understanding.” To this date, the spelling method that came with the popular alphabetization in the time of Reform has become “incomprehensible.” Republicans, proud of the progress realized since school was no longer the Church’s business, but the state’s mission, attribute this pedagogical archaism to the clergy’s reluctance to instruct common people, or even to its will to keep it ignorant.

Conclusion

The recent fields of inquiry on the history of teaching how to read arose from present questions, because of the current mutations of writing technologies. These concerns have brought new perspectives on old sources, with new interpretative hypothesis.

The history of textbooks has “proved” the historicity of the concept of literacy, conceived as the capacity to read written texts whose usage was (historically) a social imperative. The aimed literacy in the sixteenth- and seventeenth-century Europe is religious instruction, be it reformed or Catholic. The literacy of the 1780s is the reading of gazettes, encyclopedias, and novels. The French school literacy of the 1880s is about morality, sciences, and the national humanities of republican instruction. The new literacy of the 1980s is the reading of useful writings in the working places and social space.

Between the research on teaching how to read conducted in the 1970s and those that we have carried out since the 2000s, it is not only the interpretation of data that has changed but also the interpretative framework. Until the reading crises of the 1970s, the international interpretative framework was, like the UNESCO one, built on the belief of the ineluctable progress of “the” written culture. Just as mastery of the alphabetical code potentially opened to reading anything, school had to avoid this knowing how to read being deviated into reading the “wrong” things, focusing on the corpus of instructive and formative readings, tuned to the project of the authorities of the time. Thanks to the school obligation, the democratic division of the written culture seemed secured between people and peoples.

This belief was undone at the moment when the secondary teaching became compulsory for all the teenagers in developed countries. Therefore,

(continued)

reading found itself to be competing with other cultural activities. At school, it was possible to be a good student and not liking to read as long as one was strong in mathematics. At the same time, useful readings that school did not care about until there invaded the working spaces and the social exchanges. School mass failure shows that knowing how to read was not as “cross-cutting” of a skill as it was thought to be. The problem increased with the digital technologies of the 1970–2000s, easier to deplore than to be thought, unsettled all the reading pedagogies, and confronted to failures that they still struggle to diminish.

On the other hand, they allowed to realize retrospectively of reading revolutions that produced great ruptures in past pedagogies. Beginners initiation, in agreement with the aims of the Reform, leaned on the inherited tradition (clerks formation) and a technical innovation (the printing press). Thus, a reading pedagogy built on the memory of texts passed from the clerics to the people thanks to Gutenberg. But at the cost of a concession: the ability to read and hand-write. This pedagogy of the “only reading” affected the way texts were understood or known by heart without being understood. It found itself unsettled by the rise of edition and printing press in the eighteenth century, but it perpetuated until around 1860, for lack of a collective pedagogy in agreement with the aims of extensive pedagogy, until a new technology (pens and paper at low cost) made easy the learning of reading thanks to the one of writing.

Nevertheless, this entrance into reading–writing perpetuated the separation of the learning process into two stages, one centered around accurate deciphering (oralization of syllables, words, and sentences) and the other focused on the memorization of contents (read to understand and learn). Curiously enough, “theoretical” debates between the syllabic method (dominant in France and in the countries of regular orthography) and the global method (dominant in the USA and England) constantly underestimate the role of writing in the learning process (Huey 1908; Chall 1967; Monaghan 1998). That is still where we are, at the end of the twentieth century, when new communication technologies allow online interactions between keyboard and screen, between writing and reading. Just as it happened at the beginning of the sixteenth century and in the mid-nineteenth century, these technological innovations should produce pedagogical inventions, in agreement with the new interactive modes of reading and writing.

We find ourselves in a paradoxical situation: all the reading practices that have superimposed over the centuries continue to coexist in practice in the social and school space. Nonetheless, speeches about reading, focalized on readings assessment, only legitimate those readings that are tested in the “paper–pen” tests, while we still wait for the “multimedia” tests that would associate the written word, images, diagrams, and the symbolical or formal writings.

(continued)

Evaluations pertain therefore to different levels: practices of reading (leisure activities or working tasks) pertain to the sociological and ethnological enquires, where observations and personal interviews are more important than final accounts. Numerical evaluation of proficiency has a simplistic aspect because of its structure, even if comparisons are useful in the short term. Thus, France results in PISA are stable “on average” between 2000 and 2010, but the rate of students in great difficulty has almost doubled in 10 years. How should we interpret this data? How can this drifting be stopped or reduced? Statistical markers decide how much of the iceberg is visible, but in order to address the observed “failures,” we ought not to forget the submerged part: oral exchanges, out loud reading, collective activities, memorization of poetry and songs, and free writing are also what gives meaning and value to learning processes, what makes “a culture” out of school literacy.

School reading policies are thus put to test with concrete pedagogical choices. If regulatory texts explain aims, the implementation is the day-to-day work of teachers, who never settle for barely executing the ministerial prescriptions nor for applying protocols deduced from scientific research. It is visible in classrooms; it is visible in photos and videos that show what is masked by numerical markers: the reorganization of the working spaces imposed by new tools, in a school environment which undergoes complete evolution (Rockwell 2011). In a period when social reading practices go through such important changes, patient observations in situ are always indispensable in order to avoid confusing declarations of intent and realization, wishes, and acts, in sum, discourses and practices.

5.5 Curriculum History and Interpretation

Barry M. Franklin and Richard K. Nye

Act of Interpretation

At the heart of the discipline of history is the act of interpretation. Although in our common sense world, history is often thought of as representing a factual account of past events, it is actually something different. Clearly history is part of a real past, but it is a constructed past rooted in the imagination of the historian. It is this process of interpretation that defines history much as the task of explanation typifies the work of the natural scientist and even the social scientist (Gardner 2010). In their introduction to historical methodology, Martha Howell and Walter Prevenier note that every culture tells stories about itself. And it is these stories that create the meaning that constitutes the culture. History as these scholars see it is the collection of stories that we tell ourselves and others about those things that are important to us. Such stories, however, are not discovered. Rather they are constructed by historians who select the people and events that they believe are critical in revealing what a culture is all about and in so doing they “interpret the past” (Howell and Prevenier 2001, p. 1).

Sections of this essay represent a revision and extension of ideas originally developed by Barry Franklin in his book *Curriculum, Community, and Urban School Reform* (New York: Palgrave Macmillan, 2010). The revision emerged from the joint efforts of Franklin and those of Richard Nye in his 2011 doctoral dissertation at Utah State University entitled, *Comprehensive High School Reform: The Lived Experience of Teachers and the Small Learning Community Initiative*.

Curriculum is as it turns out an especially appropriate site for this kind of work. As the historian Frederick Rudolph has noted, the curriculum “is one of the places where we have told ourselves who we are” (Rudolph 1977, p. 1). Since the curriculum embodies in written and material form those things that we so prize that we wish to pass on to future generations, as well as those things that we so fear that we wish to rid ourselves of, it represents an artifact that gives meaning to our culture (Kliebard and Franklin 1983). The purpose of this essay is to explore the use of interpretation in the work of curriculum history.

Timberton and Smaller Learning Communities

Our starting point for this essay will be a consideration of a study that we undertook between 2006 and 2009 in which we studied the transformation of an urban high school that we called Timberton Central into a number of smaller learning communities. The result was to divide the school’s approximately 1,500 students, housed in traditional secondary academic departments, into a number of themed learning communities that over the course of the study varied in size from about 200 to 400 students. During the time that we were studying Timberton’s reorganization, there were changes in the shape of these communities. Originally there was a Ninth Grade Center and four career oriented communities—Applied Science and Technology, Arts and Humanities, Business and Computers, and Health Science and Human Service. Midway through our time at Timberton, the school’s administration introduced an organizational change that would occur the following year and involved the merging of the Business and Computers Community with the Arts and Humanities Community to create three career-oriented units for the tenth through twelfth grades enrolling an approximately equal number of students. The change was designed to correct an imbalance in the enrollment of the career-oriented communities and a school system decision to move the ninth grade in the city’s two high schools into the new junior high schools that were designed to replace the district’s existing middle schools.

Located in the economically distressed, high poverty, and racially diverse Intermountain West City of approximately 79,000 inhabitants, which we named Timberton, the impetus for this high school reorganization was a demographic shift in enrollment that was bringing into the city’s two comprehensive high schools—Timberton Central and Timberton North—increasing numbers of at-risk, limited English proficiency students. At the time that we began our study, Timberton had the highest concentration of Latinas/Latinos of any community in the state. Between 1990 and 2000, their share of the city’s population had increased by approximately 138 %. The result was high levels of unemployment among the city’s inhabitants, a growing population of unskilled individuals working in low paying jobs, and a high rate of childhood poverty.

This demographic shift has not left the city’s schools unaffected. At the time of our study, 43 % of Timberton Central’s student population was of Latina/Latino origin and 23 % possessed limited English proficiency or spoke no English. The 2000–2001

demographics of Timberton North show that there were 1,594 students. Of those students, 46 % qualified for the free or reduced lunch program. There was a 34 % mobility rate, as defined by students enrolling in or moving away from the school. Exasperating student attendance challenges, administrators estimated that one third of the student body missed at least one class daily. Administrators at Timberton have pointed out that many Latina/Latino students miss 8–10 weeks of school during the year as they travel back and forth to their home countries. Also, half of the Latina/Latino students reported “a low commitment to school.”

Over half of the school’s enrollment qualified for free and reduced lunch. This was a student population that was experiencing declines in academic achievement and graduation rates and increases in the dropout rate, student drug use, and school-related violence. The domestic abuse issues and violence that are present in the Timberton area have also infiltrated the district. Inner city Timberton has 71 gangs leading to the highest juvenile violent crime rate in the state, and nearly one in six of Timberton’s youth belongs to a gang. Delinquent behavior by area youth is also manifested in the form of substance abuse. It has been reported that minors in the Timberton area regularly engage in substance abuse activities where 58 % report using alcohol, 47 % cigarettes, 35 % marijuana, 22 % inhalants, and 18 % sedatives.

As a result of the delinquent behavior that existed in the city’s two comprehensive high schools—Timberton Central and Timberton North—both campuses exhibited high rates of disciplinary action. During the 2001–2002 school year, there were 1,003 suspensions, nearly a third of all high school students. Teenage pregnancies in the Timberton area are the second highest in the state, and the district referred 269 students to the city’s alternative high school as a result of pregnancies. The district’s challenges are not necessarily unique as many urban high schools have faced similar issues across the country.

In 2000–2001 and in 2001–2002, Timberton Central failed to make Annual Yearly Progress (AYP) as measured by the state criterion referenced tests. The 2001–2002 tests indicated that 65 % of the school’s students scored below the state standard in science, 38 % below the state standard in language arts, and 80 % below the state standard in mathematics. And in this same year, Timberton Central reported graduation rates of 68 % for its White students and 32 % for its minority students. Many urban high schools have turned to comprehensive school reform to serve as a catalyst to promote change in their students’ lives (Levine 2010, p. 277). Given the nature of these challenges and the alarming necessity to do something to help the area youth, the Timberton City School District felt that it was critical to adopt a comprehensive school reform that was centered on building positive relationships among teachers and students.

The purposes behind the introduction of smaller learning communities were to “improve overall student achievement, thereby decreasing the achievement gap” and to “provide a more personal, productive, and safe learning environment where all students can realize their potential.” The goals that the project spelled out in achieving its purposes were to:

- Improve every student’s academic performance to meet high standards of excellence

- Prepare each student to successfully transition to the next stage in his or her development, including ninth grade for those entering high school and higher education or the workforce for those in the 10th–12th grades
- Improve student school-related attitudes and behaviors
- Build the school's capacity to create, support, and sustain more personal learning communities for students

Overall, the reorganization was promoted on the grounds that it would offer a curriculum that would engage students, reduce the likelihood that they would drop out, and respond positively to the school's changing demographics.

We inaugurated our study of smaller learning communities at the beginning of the fourth year of the school's reorganization. At the time that we arrived at the school, the Ninth Grade Center and the original four learning communities had been established, teachers had been assigned to these units, and each of the communities was at different stages in implementing their theme-based curricula. In our visits to the school, which occurred roughly every 2 weeks during the first year of the study and less frequently as the research progressed, we interviewed teachers, students, and administrators, talked informally to teachers in their lounge, sat in the hallway outside the main office and observed passing events, and attended learning communities and school wide meetings. Towards the end of the first year that we visited the school, we observed several classes that seemed to be making progress in implementing specific curricular innovations.

In the course of our visits to the school, we collected a large body of observational and written data. The most important information that we obtained came from the various interviews that we conducted, which we supplemented with teacher class schedules, meeting agendas, memoranda of various sorts, and teacher-produced curricular materials. Our data gathering identified a number of issues that were important in shaping our study. They included the reaction of Timberton teachers to other small schools and smaller learning communities that they visited, the leadership of school personnel during the planning and initial implementation of the project, the support of teachers and other stakeholders for the project, the effect of smaller learning communities on interpersonal relationships among teachers and students, and the obstacles that affected the implementation of the project.

Timberton's teachers were generally supportive of this reorganization. They thought highly of the new principal who was hired to implement it, and they for the most part indicated a willingness to support his leadership. They particularly liked the fact that he both set a clear agenda for the direction that the faculty would take but at the same time provided them with a large degree of autonomy in implementing the reform.

Yet, there were divisions among the faculty regarding smaller learning communities. The majority of Timberton's teachers supported the reorganization. There were others, however, who either explicitly opposed the reform or were hesitant and seemed to question its wisdom. In the latter group were teachers, typically those who had been at the school the longest, who saw smaller learning communities as

just one more reform effort that they had undertaken over the years. The problems with educational change are further exacerbated when seasoned faculty are called upon to implement and endure change after change (Evans 2001, p. 5; Hall and Hord 2001, p. 25; Oxley 2004, p. 3). Such initiatives, according to some of these reluctant teachers, come and go and over time have engendered an attitude, according to a history teacher that “this too shall pass.” What bothered these teachers was their belief that the introduction of smaller learning communities would change what had become long-standing and comfortable practices at the school.

One of the features of the Timberton reorganization, which was in fact a hallmark of small school reform generally, was the belief that the establishment of smaller instructional units would create stronger and more intimate relationships among students and between students and teachers. The initiative was to be a vehicle for building a sense of community and common purpose throughout the school. In that vein some of the teachers who we interviewed reported that the line that is often drawn between educator and student in typical comprehensive high schools became blurred in Timberton’s smaller learning communities. Students also noted that the smaller learning communities improved relationships between teachers and students and among students themselves.

Establishing smaller learning communities at Timberton did, as it turned out, pose serious challenges for the school and its staff. One obstacle to reforming the school was the idea of change itself. Faculty were not comfortable with having to alter practices that they had followed for years. Another difficulty that got in the way of the reform was the belief among some teachers that the initiative was just not working in the way that it should. It was, for example, a central belief of those supporting this kind of change that an important factor in the ultimate success of students was their selection of the community that matched their immediate interests and career aspirations. Yet, it was never all that clear as to whether students were very thoughtful in making this seemingly important choice. From our interviews with students, it seemed that many of them selected their communities on the basis of their friends’ selections rather than on their interests or long-term career goals. It has been noted that smaller learning community similar to Timberton Central have experienced the unintended consequence of “within-school social segregation, as minority and low-income students are less likely to be placed in (or choose) advanced academic classes” (Lee and Ready 2007, p. 10). Students from lower socioeconomic backgrounds may be less inclined to engage in curricular activities with greater amounts of academic rigor for a wide variety of social and cultural reasons. As a result, many students choose to associate with those who share their same academic and social aspirations or lack thereof (Ready et al. 2004, p. 2007). Additionally it turned out in some cases at Timberton Central that students were assigned to communities for scheduling purposes, rather than because of individual student preference.

One of the greatest stumbling blocks to Timberton Central’s reorganization was the fact that the principal who orchestrated the reform was planning to retire at the end of the fourth year of the program. Faculty thought that this would mean the end

of the grant money that had made the effort possible as well as the distinct possibility that the school would return to its former departmental structure. Another obstacle to the program's success was the attitudes of students. While many students saw the establishment of smaller learning communities as a means of helping them plan for their future, there was a sense that the program was not well organized. In that vein, students reported that they encountered difficulties in actually getting into the learning community that they wanted. Other students reported that the practice of enrolling both college-bound and noncollege-bound students in the same communities undermined the focus of these supposed career-oriented instructional units.

Notwithstanding the difficulties that accompanied the smaller learning communities' initiative, Timberton's faculty identified a number of positive changes that the initiative had brought. The establishment of smaller instructional units created an environment where teachers were able to know their students, which in turn created a safer environment for everyone. It was far easier in this setting for teachers to recognize who were the potential troublemakers and who might have entered their classrooms but did not belong. Teachers also noted that student attendance and achievement were improving and that the graduation rate was increasing with the introduction of smaller learning communities. Likewise teachers pointed out that the reorganization had brought with it additional funding to enable them to attend conferences, to introduce instructional innovations, and to learn new skills.

It is difficult to know what to make of these favorable faculty impressions when we consider them side by side with the reports on Adequate Yearly Progress (AYP) that the Federal government employed to assess the success of the program. Timberton did not achieve AYP in 2005–2006, the first year that the smaller learning communities were in operation. While the percentage of the school's White students performing at the proficient level in language arts and mathematics was adequate to achieve AYP, the percentage of the school's Latinas/Latinos, economically disadvantaged, and limited English proficient students was not. The following year, the school did attain AYP with Whites, Latinas/Latinos, economically disadvantaged, and limited English speaking students all achieving proficient performance in language arts and mathematics. During the next year, however, only White students at Timberton attained AYP.

Historical and Contemporary Interpretation of Smaller Learning Communities

Interpretation plays a key role in our effort to understand the small class transition that we detailed in our consideration of Timberton Central High School. The reorganization of Timberton is an example of the debates surrounding the appropriate size of the high school that characterized alternative views of this institution during its early history. It is a discourse that contains conflicting elements, some

supporting small schools as a route to constructing a child-centered community, and others opposing this organizational scheme because of its supposed threat to academic achievement. Depending on which elements of small schools one chooses to focus, it is a framework comprised of different circulating discourses in the form of beliefs, knowledge, and social practices that point in conflicting directions about the purposes of this organizational pattern. We can, for example, concentrate on the deep and intimate relationships that are possible in the small school with the kind of close interaction between people who know and value each other and share a common understanding. But we can also focus on the opposing kind of relationships that occur when our interactions are distant and our understandings of those with whom we interact are transitory and superficial. Small schools are then subject to different understandings that lead us towards distinct conclusions about this form of social organization (Olssen et al. 2004).

Our focus on this topic stems from our interest in two important issues in curriculum research. First, we were interested in advancing our understanding of curriculum history further than we had heretofore. In a number of publications during the past almost 40 years, one of the authors—Barry Franklin—had been engaged in a continuing effort to explore the development of the curriculum. He embarked on this work in the mid-1970s and over the next three decades published a number of essays on the history of curriculum theory and practice. His initial work looked at the historical development of twentieth-century American curriculum thought but soon evolved into wider studies that considered the history of curriculum policy and practice (Franklin 1991, 1999, 2008; Kliebard and Franklin 1983).

Second, our research was part of a funded study to explore the implementation of smaller learning communities in urban, comprehensive high schools. The school that we selected, Timberton Central, was in the process of reorganizing the school into smaller learning communities as part of its effort to enhance student achievement in this urban, largely minority high school. This effort held out a great appeal to us because it would allow us to consider what a conceptual framework that had guided our work in curriculum history for many years, which we labeled *community*, told us about this innovation.

Our study focused on two sources of data. One source was ethnographic and included interviews of key stakeholders at Timberton who played a role in the smaller learning communities initiative, notes we took from our observations of classrooms that we visited, and a variety of memoranda, curriculum material, and other written documents related to the initiative. A second source of data was historical in nature and included a host of primary documents that examined the introduction during the twentieth century of the small schools and smaller learning communities movements as well as secondary documents in the form of scholarly articles and book chapters that explore the history of these two movements. Our approach to this research was to consider the interplay between these two data sources in providing us a picture of the introduction, development, and implementation of small schools generally and smaller learning communities in particular. Our overall framework was that of *community*, and our research consisted of considering what these different sources of data told us about this notion and how

our understanding of this concept affected our interpretation of smaller learning communities.

The notion of community is a popular concept that is often used in ambiguous and imprecise ways that allows individuals and groups with conflicting viewpoints to employ the term differently. The sociologist Nikolas Rose (1999) describes a number of different ways that the term has been used since the late nineteenth century. In the late nineteenth and early twentieth centuries, the concept of community referred to a sense of solidarity that would repair the dislocations caused by industrial capitalism and an accompanying division of labor. In the years after World War II, the invocation of community involved efforts to repair the kind of undermining of neighborhoods that had occurred as a result of the rise of the impersonal, bureaucratic state. In the 1960s, community was a collective term to refer to the various welfare institutions that were to be found in close proximity to where people lived and work. And presently when those of a communitarian persuasion talk about community, they are referring to the affective elements that enter into the establishment of one's identity. These diverse uses of the notion of community can work to undermine the usefulness and value of the concept.

Another problem with the notion of community involves the fact that there is something nebulous about the concept that leads those who use the term to define it in numerous, vague, and oftentimes contradictory ways. The sociologist Suzanne Keller (2003) notes in this vein that the term has been used to describe a physical or geographical place, as a set of shared values, the bonds and network that join people and groups together, and a host of other collective entities.

A third problem associated with the concept of community has to do with its actual existence. The anthropologist Benedict Anderson notes in this vein the "imagined" quality of one kind of community, that of the nation. He argues that once the features of the notion of nationality were defined in the late eighteenth century, they took on something of a life of their own as present in any entity given the designation notwithstanding its actual characteristics. A feature commonly associated with community is that of deep, face-to-face relationships among members of a group. For Anderson, however, such relationships are often not possible in anything beyond the smallest of such groups. Yet, they are often posited to exist as one of the defining attributes of any group. They are, in other words, imagined (Anderson 1991).

Because of these problems with the notion of community, it is not surprising to find commentators and critics voicing doubts about its efficacy and urging elimination from our lexicon of possible societal visions. In an opinion piece in the British journal *Prospect*, William Davies noted that invoking notions of community have less to do with "revealing truths or referring to facts" than it has to do with "projecting a persona and shaping a situation." This is what he refers to as serving a "performative" function that rarely addresses or resolves important questions but rather reduces them to the level of distracting "moralisms" (Davies 2006, pp. 15–16).

We are often left, then, with the dilemma of what to do with a concept that appears to be important and yet whose meaning seems so nebulous and indefinite as

to lead many to doubt its usefulness. The ethnohistorical approach that we adopted in this essay offers us one possible resolution. Building on the ideas that we developed in the essay, we can consider the notion of community as what is called a floating or empty signifier, that is, a word without a single or specific referent (Laclau 1994). According to Rosa Burgos, a notion of this sort “flows and circulates throughout a variety of meanings and sites of enunciation, and it has become what it is today through a series of discursive articulations throughout history” (Burgos 2003, p. 55). The research approach that we took in this essay, then, offers us a way of making sense of a concept that is used simultaneously in multiple ways.

We obtained our data using traditional techniques that typify the kind of research routinely used by qualitatively oriented educational scholars who work in the fields of educational history, curriculum, and educational sociology (McCulloch 2004). It was from these data sources that we constructed our narrative and based on that account developed a historical and contemporary interpretation of the Timberton smaller learning communities initiative. We selected what we are calling a policy narrative for conveying this research because our account of Timberton’s smaller learning communities tells the story of an educational dilemma—low achievement among Latina/Latino students in an urban high school—and how that problem is addressed through public policy, in this case educational policy. As in any story, there is a beginning in which the problem is identified, a middle that suggests possible policy solutions, and an ending that explains the consequences of the selected policy in action (Fischer 2003). Framing this dilemma as a narrative gives something of a human face to the often dry world of policy deliberations. It enables us to encase the deliberation within a plot involving actual people and events, conflicts, and contingent results. It makes clear that there are numerous policy outcomes to any dilemma that hinge on the context in which the problem arose as well as on the cast of characters involved and their beliefs and predilections. Not only do such dilemmas depict what happens in the real world when people set about to resolve the issues that they face. They serve real policy makers as clear reminders that their work has real consequences for real people.

As one reviews our research, readers no doubt will raise the question of why we selected this approach as opposed to other possible approaches. The answer to this question lies in part, we think, on how scholars have heretofore explored issues of curriculum history and the strengths and limitations of those approaches. Curriculum history as a field of study first emerged in the early 1970s as the study of curriculum theory or ideas. It was in effect a history of recommendations offered by prominent and not so prominent individuals regarding what the schools should teach. Over time curriculum scholars did recognize that important limitation in this data, namely, that it addressed proposals or suggestions for what the schools should teach but not a treatment of what actually occurred in the schools. It may in fact be the case that these recommendations represented a good picture of what schools in fact did, but there was no guarantee that this was the case.

By the 1990s, we had in effect two curriculum histories. We had a history of curriculum theory focusing on what key stakeholders thought schools should teach. And we had a history of what actually occurred in schools in the form of curriculum

practice. These domains, however, were not connected. What was needed was an interpretation of the relationship between what was proposed by way of curriculum practice and what actually occurred in that practice. During the last several years, we have begun to develop this connection in what we are calling an ethnohistory of the curriculum. We are currently attempting to develop the contours of this approach. Our present work, which is described in this essay, involves part of this process, namely, an effort to situate contemporary curriculum practice as expressed in ethnographic documents in their historical context (Franklin 2010; Franklin and Ortiz *in press*).

We also selected this approach because we believe that the conventional interpretation of the small schools movement has not provided a full picture of its origins. According to this widely held view, the small schools movement was a 1960s effort to interpret the practical applications of early twentieth-century progressive era educational reform, particularly the work of John Dewey, to contemporary school organization (Semel and Sadovnik 2008; Schubert 2000). While one can correctly make this connection, it does not, we think, tell the entire story. There was a debate about the proper size of the American high school occurring during the first half of the twentieth century that went beyond the issues considered by progressive era reformers and offers us a context for exploring this issue. Contemporary discussions of the small high school seem to point to its value for attaining a number of desirable student outcomes, not the least of which is improved academic achievement. This has, however, not always been the view of school size. Early in the twentieth century, however, the small high school was seen as something of a problematic institution that did not provide students with an adequate education. Among the problems with small high schools, according to John Ruff of Michigan State College in 1926, was the fact that in such schools there was the lack of a sufficient number of well-trained and experienced teachers, inefficiencies in administration, high operating costs, an inadequate physical plant, a lack of extra curriculum activities, and a limited curriculum (1926). Twenty years later in 1946, a University of Southern California professor, E. H. LaFranchi, noted a similar set of problems (1946). Among these difficulties was the small school's curriculum, which he noted did not have the personnel and other resources to offer more than a single, college preparatory course of study. He went on to say that because of this limited program, the small high school could not provide the array of nonacademic courses to meet the needs of all who might wish to attend this institution.

It was this criticism about the limitations of the high school curriculum that was the basis for the support that educational reformer James B. Conant offered in the late 1950s for the establishment of large, comprehensive high schools with diverse curriculum offerings. It was Conant's position that high schools with graduating classes of less than 100 students, the defining feature of the small school to his way of thinking, could not provide an adequate education to groups of diverse students with different attributes, including those who were academically able, intellectually slow, and vocationally oriented. Requiring all students who attended the high schools to take an academic course of study, he noted, had the effect of frustrating less able students while reducing standards for student who were more able. Replacing these small schools with larger comprehensive high schools would, he argued, allow for a

system of secondary education that would meet the needs of all students (1959). The debate over small schools was not simply an effort to support progressive-oriented school reform. It was a more complex dispute continuing to the present day that included discourses favoring small schools as well as discourses criticizing them in favor of larger, comprehensive high schools (Franklin 2010).

The approach that we are advocating under the rubric ethnohistory is not, then, a new approach to undertaking curriculum history. Rather, it brings together two long-standing strategies, the study of curriculum theory and the study of curriculum practice, to establish a different and more useful approach to exploring the history of the curriculum.

Ethnohistorical Lens

Taking an ethnohistorical approach to writing curriculum history takes what we already know about the history of the curriculum and looks at a problem that has not been given the attention that it deserves. The problem that we are talking about is the link between what various curriculum stakeholders, teachers, administrators, academics, parents, and a host of ordinary citizens wish the schools to do and what schools actually do. This is clearly an important issue in that it identifies the critical question of what schools do as well as providing us insights about what the schools should do. In this essay, we focused on one such issue, the small schools movement. This is, however, a broader and more useful strategy that can explore a range of issues affecting the interplay between what various stakeholders believe that schools should do and what they in fact do.

So much of what occurs in the domain of educational scholarship, particularly curricular and pedagogical research, involves efforts to change or reform existing school practices to secure more effective learning. Consequently, making the connection that we are advocating becomes important. It enables us to gain insights about what can occur when we implement recommendations about curriculum and pedagogy into school practice. It provides us in this sense a better understanding of what one needs to do to change schools in the directions that we desire.

5.6 Vocational Education, Gender, and Inequality in Hamburg, Germany, 1849–1914

Christine Mayer

Interpretation is central to any historiographically oriented form of education research. This is true not only *sensu stricto* for hermeneutical reconstructions in the tradition of the humanities, but equally applies to a multidimensional social science approach. Such an approach to history of education involves interpretation at many levels and stages, though this is often comparatively little reflected or addressed. I would like to use a study of the gendered history of vocational education to exemplify the role of interpretation in the research process and the interpretative contexts that the source material opens up. The central questions of the study were which paths pupils—especially those from the lower classes—took after finishing school and which vocational and educational possibilities were generally open to them. These questions were studied on the basis of the vocational and educational choices of male and female school leavers from the lower respectively elementary school system of the city of Hamburg between 1849 and 1914.

In the following, I will first outline some specific characteristics of the field of research in question. These not only provide the backdrop against which we ask our questions but also the frame of reference for the data to be interpreted. As a second step, I will present the source material and analyze its value both in terms of immediate data and potential interpretative scope. The next step will be focusing on the analysis and interpretation of the source material and its context. In the process, I aim to show how references to context have entered into the interpretation and affected the perspective. The following two steps will then be to analyze the suitability of the case study's approach to its subject, and to see how the results fit into the greater interpretative framework of a gendered history of vocational education.

Research Field and Problem Statement

Vocational education tends to be a field of marginal interest in both the history of education and in gender history. This can not only be observed at the national level but tends to apply internationally. It may be due to the fact that, compared with general scholastic education, vocational education is not only more complex but, as an international comparison shows, takes on a great variety of forms over time and space. The marginal position of vocational education as an area of research is very likely also informed by the relatively lower prestige it enjoys in almost all institutionalized education systems. Given the multiplicity of forms in which it was realized over time in different countries, a transnational or generally comparative approach is also beset with greater difficulties than it is for other forms of education.

Therefore, research into vocational education must take into account that its subject—like no other field in education—is greatly influenced by its sociohistorical context which determines not only the position of vocational education within the education system as a whole but also its societal status. In Germany, vocational education has a long guild tradition that sets it apart from other Western countries (e.g., France, Great Britain, and the USA). Whereas guilds in France were dissolved during the French revolution, and even earlier in England, the guilds in some German states retained their privileges until the 1860s. Therefore, more than in other countries, vocational education in Germany has been influenced by the traditional forms of apprenticeship practiced in the crafts and trades. Even after the eventual dissolution of the old system, the new vocational organizations continued to wield great influence. Their structures provided the basis on which the German vocational education system was structured into the so-called dual system providing for training both in the workshop and the school from the turn of the twentieth century onwards. Until well into that century, women were largely excluded from this guilded apprenticeship tradition, which continues to shape vocational education. Though historical research has shown that both in the Middle Ages and the Early Modern Period, some guilded crafts at some times and places permitted apprenticeships for women and girls, and we also find evidence for informal artisanal training provided to wives and daughters, the importance of these incidences should not be overstated (cf., e.g., Wiesner-Hanks 1996; Wensky 2005; Simon-Muscheid 1998). Even taking them into account, we find that no continuous tradition of formal artisanal training for women existed and that, moreover, female education and training was informed by entirely different goals and ideals (Mayer 2007a, 2009). The traditional occupational paradigm for youth in the lower classes was manual trades for boys and domestic service for girls. Yet while vocational training for boys began with a formal apprenticeship, there were few if any formalized vocational educational opportunities for girls.

This traditional framework of vocational education corresponds to a continuing trend of gender-based segregation in the field of labor and employment. Gender segregation continues to be a central structuring feature of the German vocational education system. More than in other parts of society, the function of gender as a

“central code” (Goffman 1977/1994, p. 105) becomes visible here. Despite efforts and campaigns to address the unequal access to vocational education between the sexes, gender coding continues to be effective here. While young women tend to achieve better results in general education than men, represent the majority of pupils in higher secondary schools (*Gymnasium*),¹ and firmly expect to have a profession and a career, their full integration into the dual vocational education system has not yet been achieved. Only slightly under 40 % of all apprentices are female, and they are concentrated in a relatively limited number of vocations.² This is especially significant since these apprenticeships are the dominant medium for the reproduction of a skilled labor force and the institutionalized acknowledgment of expertise in Germany. In 2004 the apprenticeship system took in 69 % of the 18–21-year-old male population and 48 % of the corresponding female age cohort (Harney and vom Hau 2008, p. 260). This makes clear not only that in Germany, “a substantial amount of employees are socialized into the labour force and acquire their professional skills through this institution” (ibid., p. 261), but also that it continues to be structured by gender both horizontally and vertically.

This is only a bare outline of the extent of gendered segregation and consequent inequality of educational opportunity that affects youths in Germany’s vocational education system. It was these phenomena that motivated my research into their historical roots. Up to now, the transition from school to employment has rarely been a focus of interest in history of education. There are some historical studies for Germany, though these generally concentrate on vocational education as it applies to male pupils.³ Interest in the history of female vocational education was and has remained marginal (cf. also Rahn 1997). The study which will be presented here addresses the fact that to date, little data has been available in the history of education on the paths pupils from the lower classes took after finishing school and which vocational and educational options were open to them. The fact how these options changed in the context of the economic and social changes during the nineteenth century especially in urban environments, and the patterns of gender segregation that emerged, is another aspect that has been underresearched. Here, a regional case study is undertaken to remedy this lack by looking into these developments and relationships in the context of the city of Hamburg. This kind of study must be oriented not only along the lines of gender, but also take account of class divides, especially in the context of an urban educational landscape that was increasingly differentiating and producing additional options of further scholastic and vocational education in the course of the nineteenth century. Vocational education can thus become a field in which historical educational research can study the connections and intersections of “gender” and “class” as categories of inequality.

¹ In 2012, they accounted for about 52.6 % (Statistisches Bundesamt 2013, p. 82).

² In 2012, over half (about 52 %) of all women in vocational education, but only 36 % of men were distributed among only 10 occupations (Statistisches Bundesamt 2012, p. 30).

³ For example, the seminal works by K. Stratmann (1967, 1993) on the history of vocational education and the historical studies of the emergence of apprenticeships in artisanal trades and industrial manufacturing (Harney 1987; Harney and Tenorth 1986). An overview over the state of current research is provided in Kipp and Büchter (2003).

The Sources

The sources this study is based on were found while researching the history of Hamburg's public education system. They consist of archival materials, mainly the reports and protocols of education authorities responsible at various times for the schooling of the poor respectively the lower classes (Mayer 1998, 2011). Mainly, they record the vocational and educational options chosen by both male and female pupils after finishing the schools of the lower respectively elementary school system in Hamburg. The sources provide serial quantitative data regarding the vocational and educational choices of school leavers from the second half of the nineteenth into the early twentieth centuries.

Specifically, there are materials on the schools of the *Allgemeine Armenanstalt* (the poor relief authority), especially the (handwritten) protocols of the *Schulkonvent* (its schools boards) between 1849 and 1870. These contain information on the "chosen vocations" (*erwählte Berufe*) or the further careers of school leavers. Except for 2 years, the records are complete, each year containing data on roughly 300 male and female pupils leaving school, separated by gender. However, detailed data on the vocational choices in trades or crafts were not recorded until 1860. The data from these protocols were recorded and analyzed by separate years. A source of further data is the (printed) annual reports of the school authority (*Oberschulbehörde*), which took over responsibility for the public elementary school system from 1871 onwards. This newly constituted authority continued the management of schooling for the poor, also continuing to record the school leavers' chosen vocations by gender every year. For this study, the data on the years between 1890 and 1914 were collated and analyzed. The expansion of the elementary school system under this authority meant not only an ever-increasing number of school leavers—rising from 7,400 in 1890 to 13,900 in 1913—but also more detailed information on the chosen vocations or further education. In addition, earlier data on the chosen vocations of young people leaving the Hamburg *Industrieschule* were recorded in the protocols of the *Schuldeputation* between 1788 and 1811. These data were entered into a first analysis,⁴ but for further study were only used as a standard of comparison and interpretative aid.

As interpretation is also prefigured by the choice of sources from a given time period, the decisions to include or exclude certain periods also require justifying. The protocols of the *Schulkonvent* begin recording the chosen vocations of pupils from 1829, but the data are initially limited to a few individuals, usually those whose parents were unable to secure them a position and who were then placed in employment or apprenticeships by the "*Nachweisungs-Comptoirs*."⁵ Comprehensive lists of vocational choices for all school leavers are not found until 1849, which

⁴ A first analysis of the data is provided in Mayer (2008); some aspects are also covered in Mayer (2009), pp. 21–29.

⁵ Since the early nineteenth century, institutions that specialized in matching job seekers with openings for a fee had emerged on the Hamburg labor market.

justifies the choice of this date as the starting point. The decision to further base the study on employment and educational options for school leavers in the period between 1890 and 1914 was made because of the considerable changes in economic circumstances at the time, leading to altered placement patterns and an expected change in preferences. The beginning of World War I was a further criterion for limiting the scope of the analysis.

As any historical or empirical study must, we also have to ask the question whether the source material on hand can actually be profitably used to answer our questions, what information we can draw from them, and what scope for interpretation they allow. On the one hand, we can say that a serial, gender-specific data set over such a length of time is an exceptional find. This offered the hope of coming to a better understanding of the development that produced such a pronounced gender segregation in vocational education today. On the other hand, the value of the sources must also be viewed critically. Since they record chosen vocations of school leavers, it is not possible to be sure that choice actually was realized. However, the data is likely to be relatively trustworthy judging from the fact that it also records how many were left “without employment” (*ohne Anstellung*) in a given year. The relatively low number thus recorded suggests that the data on vocational choices were collected late. Nonetheless, the question what interpretative scope these sources offer and what aspects must be considered in the process does demand attention. Their character certainly does not allow for more than an identification of broad trends, and their specificities must be taken into account at the linguistic and interpretative level throughout. It was also necessary to view the material in the context of its time, augmenting it by additional sources where necessary. These included official statistics produced by the government of Hamburg on its working-class population and its labor market.

To judge the relevance of our data set, a certain understanding of the historical context, i.e., an understanding of how they fit into the specific conditions of the time they were produced in, is required. Thus, it cannot be left out of the analysis and interpretation that the data for the first phase recorded here were taken from materials on Hamburg’s school system for the poor (*Armenschulwesen*). In an educational landscape dominated largely by private schools, these public institutions initially formed a substitute and later the basis for the development of a general public education system. This was only undertaken in Hamburg with the introduction of mandatory school education in 1871. Thus, the schools of the *Armenanstalt*, being free, catered only to a specific group of poor pupils. To better understand the material they produced, further sources were drawn on. These included a survey on the *Armenschulwesen* from 1861 detailing how many boys and girls were using free schooling for the poor at the time (altogether 3,794) and what social backgrounds they came from. According to this data, more than half of all pupils came from families of craftsmen (34 %), laborers (26 %), cigar makers and factory workers (4 %), or waggoners (4 %). Most of the widowed mothers recorded were cleaners and laundrywomen (9 %) or tailors and seamstresses (3 %) (StAH, pp. 34–35).

We must further take into account that this is a local case study whose data and conclusions are shaped by the specific social and economic context of Hamburg as a major city and trading hub. Any analysis and interpretation must be aware that Hamburg's economy was dominated by trade, navigation, the transport industry, and small artisanal businesses rather than industrial manufacturing. Further, though some guild privileges were abolished in the 1830s, a guild structure remained in place until 1865. The trade and transport sector (including navigation) even grew at the expense of the manufacturing industry during the time period studied.

Analysis and Interpretation of the Source Material

An important aspect of the preliminary work was tabulating the vocations given for male and female school leavers by single vocations and fields. To improve comparability, the classification followed the records as they were available for the elementary education system (*Volksschule*) leavers starting from 1909 to 1910. Two school years were entered into each table to keep the data manageable. The data of all school leavers recorded between 1849 and 1870 were entered into separate tables by gender. The same was done for the vocational choices of female school leavers for the 1890–1914 period. The breadth of vocational choices recorded for males in that time frame was too large to be accommodated, though, so that only the most popular choices were entered separately. This selection was clearly informed by an interpretative perspective that viewed the data primarily as a resource for quantitative analysis while the breadth of the vocational spectrum was sidelined. The data themselves were analyzed both in a gender-neutral and gendered manner. Since the subject matter was not a new one for the researcher herself, we must bear in mind that a certain level of knowledge on the context entered the analysis from the start. This knowledge is not free of its own interpretative aspects. That is why comparisons with other sources and statistics on the Hamburg labor force—as we will see in the following—played an important role in the analysis and interpretation of the data.

A first glance at the tables demonstrates that the choice of possible vocations was much larger for male school leavers than for female ones. Male choices between 1849 and 1870 cover a spectrum of 131 vocations, of which 79 were skilled trades (*Handwerk*), many of which still guilded until 1865. The data also show that apprenticeship in the trades remained the most important destination for male youths. On average, a little under half (45 %) of each year's male school leavers intended to apprentice. Though the specific vocations are spread over a broad spectrum, joiner, cooper, locksmith, mechanic,⁶ and shoemaker were among the most popular choices. To better understand these findings and make them useful beyond their limited local scope, the study looked at Jacob Eberhard Gailer's *Neuer Orbis pictus für die Jugend* (New orbis pictus for the youth, 1835) for comparison.

⁶Specializing in the production of physical instruments and machinery.

This widespread encyclopedia for young people includes descriptions of the most important professions. The comparison shows that the majority of male youngsters aimed for an apprenticeship in traditional crafts that were widespread not only regionally. Though Hamburg's economy was dominated by trade, the number of school leavers seeking employment in either retail or wholesale was small, averaging 4 % of a school year. This does not reflect the importance of this field for the city's job market as a whole.⁷ The data suggest that trade and especially mercantile apprenticeships were not open to male youth of the lower classes. Once we take into account that mercantile apprenticeships (just as those in the skilled trades) required payment of a fee, we understand why especially boys from poor families had to begin their careers as office boys. On average, 15 % of male school leavers did so in any given year. Employment in manufacturing also was of some importance, taking in 19 % on average. However, the most important employers were cigar factories where an apprenticeship as cigar maker was offered. This is owed to the trade-oriented nature of Hamburg's economy. Another important field of employment was transport, especially training as sailors and bargemen. It is notable that the majority of school leavers are recorded as heading into apprenticeship or training. Few of them aim for a subordinate position as manservant or laborer. A comparison with the employment landscape in Hamburg at the time shows that, aside from mercantile pursuits, the choices of male school leavers mirror the structure of the actual workforce in many respects (Neddermeyer 1847, pp. 291–294; Statistik 1871, pp. 34–46).

Compared to those of male school leavers, the choices of females show a much more limited spectrum of options. They are recorded as entering only 35 vocations, with the majority of them concentrated in a handful of those. The main form of employment for the lower-class female youths in Hamburg was domestic service, taking in almost half (47 %) of the average cohort. An alternative to domestic service, once the 1835 reform of guilded crafts allowed this, was the production of women's clothing and accessories. The vocations of tailoress and milliner took in an average of 12 % and 2.9 %, respectively. However, an apprenticeship in these fields was not comparable to those in the skilled trades that male school leavers aimed for. The traditional work of a seamstress was unattractive to female school leavers, with only 4 % opting for it (this number decreased with the introduction of the sewing machine). The emergence of ironing shops in Hamburg opened a further field of paid employment for women. Between 5 % and 6 % chose work as an ironer. Even though small retail and mongering offered employment to women in Hamburg, too, this choice appears only in vanishingly small numbers. Neither did factory work compete meaningfully with domestic service, which again may well be owed to the trade-oriented nature of Hamburg's economy (Statistik 1871, p. 46).

⁷ One comparison is offered by the first statistical survey of occupations in the population of Hamburg in F. H. Neddermeyer (1847, pp. 289–294) or *Statistik des Hamburgischen Staats* (1871, pp. 34–48), where a breakdown of the population by different forms of occupation is given for 1868.

In the 1860s, no more than 3 % of female school leavers on average are reported as working in factories. What is notable is that about a fifth (19.8 %) of female school leavers are recorded as staying at home. The vocational choices of female school leavers, just as those of their male counterparts, mirror the employment structure of Hamburg's labor market. Women were mainly employed as tailoresses and, in smaller numbers, milliners, also working as machine seamstresses and in the laundry business (Statistik 1871, pp. 36, 38, 1875, p. 111), fields that the school leavers are rarely recorded going into. The largest number of women aged 16–30 in the labor force was employed in domestic service, primarily as maidservants. In Hamburg, they accounted for about 13 % of the total population in 1867 (Statistik 1875, p. 116f.). We also know from other cities (e.g., Berlin and Frankfurt) that domestic service was the most important form of paid employment for young women (ibid., Kocka 1990, pp. 120–124).

As this overview and analysis of the findings shows, certain facets of interpretation are already built into the selection, emphasis, and formulation of results. The question remains which larger interpretative contexts can be gained from these findings. We find above all that the traditional vocational options—apprenticeship for boys, domestic service for girls—continued to structure the orientation of the majority of youths between 1849 and 1870. We further find that, though options for young women increased, their choice of careers remained limited. The abovementioned encyclopedia *Neuer Orbis pictus* für die Jugend illustrates this situation. While vocations for boys are shown at length in many different illustrations, the only feminine profession that is shown is milliners. In contrast “Female employments” refer to domestic work, in keeping with the bourgeois conception of the female sphere (Gailer 1835, p. 247f). The vocational choices of school leavers, too, show that, as bourgeois society sought to integrate the lower classes, its model of the family based on a sole male breadwinner was spreading into the poorer parts of the population. Compared to the previous generation, far more male school leavers sought an apprenticeship or other forms of training, while few were content with working as a laborer. Their female counterparts show the spread of bourgeois values even more markedly. Almost every fifth female school leaver is recorded as staying at home after finishing school, which indicates that even among the lower classes, domestic service in another household was beginning to be replaced by using the help of their daughters in their own homes. The options recorded for male school leavers did not include anything similar.

This interpretative perspective becomes plausible as we relate the findings to their context. The rise of real wages around the middle of the nineteenth century allowed for a reconfiguration of families around a male breadwinner (cf. Kocka 1990, pp. 493–496). Only on the basis of an overall improved standard of living can the bourgeois family model and its ordering of gender roles spread into the working population. Whereas previously the family had been conceived of as a community earners, the new orientation—as the writings of social reformers around 1848 show (Stammler 1994)—was towards the bourgeois norm of a gendered division of labor in which the woman is no longer co-earner, but housewife. Her merit was to be maintaining what the husband earned by being attentive and economical with her

resources.⁸ We find very different pedagogical aims emerging for boys and girls, a fact that is also evident from the way the *Armenanstalt* structured its schools (detailed in Mayer 2011). The primary goal for female youths even from the working classes was no longer gainful employment of any kind, but domesticity.

The focus of the second half of the study is on the vocational choices of youths and their career opportunities at the end of the nineteenth and the beginning of the twentieth century. At this stage of analysis, we need to take into account the fact that the expansion of the mandatory elementary education system (*Volksschule*) led to a great expansion in the school intake, including a broader part of the population, and consequently in the number of school leavers (from 7,874 in 1893 to 13,899 in 1913). At the same time, the labor market underwent considerable differentiation, providing us with much more complex data. Therefore, the following will be limited to outlining some tendencies relevant to interpretation. Here, too, we must consider that interpretative aspects entered into the analysis from the start, and that the contextualization of the source material itself included interpretation. Unlike for the first period studied, we have sociological studies regarding the situation of people employed in trade and domestic service for the late nineteenth century. These were used in the analysis and interpretation.

We find a shift in the chosen vocations of male school leavers, in this case away from the traditional skilled crafts and towards a variety of metalworking vocations. Among the still very numerous artisanal occupations, locksmith, plumber, mechanic, and electrician now dominate. Alongside this, we see an increase in the numbers of school leavers going into trade. While artisanal occupations had accounted for 44 % of all choices as late as 1893, their number declined to under a third by 1913. In keeping with the expansion of all aspects of trade in the late nineteenth century, its share of vocational choices rose to over a third (1913, 34 %). Of 6,968 male school leavers in that year, almost a quarter (22.5 %) aimed for an apprenticeship in wholesale trade (*Handlungsbeflissener*); 5.5 % opted for an apprenticeship in retail, while the number of those who began their working life as office or messenger boys continued to decline, averaging slightly over 4 %. Manufacturing—which in Hamburg mostly meant shipbuilding—added the choice of machine fitter to the spectrum of popular choices with 4.2 % in 1913. Unskilled factory labor was an unpopular choice, though, with only 2.3 % of school leavers recorded in 1913. Transport, especially shipping, remained important, with youths opting to train as sailors, bargemen, or stewards. Public service occupations such as railway or postal worker too are now recorded, and youths opting for free professions, especially teacher, are also found more often.

For female school leavers, domestic service continued to be the most important vocational option, though preferences gradually shifted away. While over half of all female school leavers aimed to become maidservants in the 1890s, by 1911 it was only about a third (34 %). This development mirrors the changes on the local labor market. While the percentage of domestic servants among the entire female

⁸ For Hamburg, cf. the detailed calculations in Lappenberg 1848 (StAH).

workforce had still been 37.5 % in 1900, it dropped to 24 % in the following decade (Statistik 1902, p. 90, 1919, p. 12f). This roughly matches the general trend (Kocka 1990, p.123). As for male youths, the importance of trade also grew for female school leavers. Though apprenticing as tailoresses (1913, 3.7 %) and milliners (1913, 1.1 %) remained an important perspective and new professions in printing, photography and the graphic industries as well as bookbinding were added to the options for skilled apprenticeships, only an average of 6.7 % of them chose these paths after 1911. Factory work, too, continued to play a minor role, though female employment in the German manufacturing industries overall rose strongly between 1895 and 1907 (Hauff 1911, p. 27). The question poses itself whether this pattern is owed to the specific structure of Hamburg's economy, or whether the higher social status made employment as a sales girl more attractive to female school leavers than factory work. That social prestige must be factored into any analysis and interpretation of occupation choices is exemplified by the distribution of the choice of sales versus office work. The occupation as a clerk, more highly regarded and more easily reconciled with bourgeois ideas of suitable work for women, was especially common for girls who, graduating from the *Selekta* class of their school, boasted higher educational achievements (Schulz 2000, p. 21; Timoschenko 2005, p. 140). The number of women in trade, an area so far dominated by men, began rising with the boom starting in 1890. Between 1895 and 1907, the number of female sales staff grew from 81,483 to 173,420, i.e., by roughly 36 %, while the equivalent figure for office staff was 76 %, from 13,763 to 110,220 (Schulz 2000, p. 80). These trends are also reflected in the vocational choices of school leavers: alongside sales (1913, 3.7 %), they sought apprenticeships as accountants or office clerks (1913, 10.8 %). By 1913, 15.2 % of girls leaving school saw their future in commercial careers, which is twice the number going into skilled trades. However, the rise in numbers did nothing to improve the conditions of their apprenticeships and employment. While male apprentices typically were trained for 3 or 4 years, almost half of the girls were given only 1 year of training (Timoschenko 2005, p. 48; Reinisch 1993, pp. 337–366). We also find that, as with male youths, the choice of occupations open to female school leavers generally had widened. Here, too, we find public service careers such as telephone and telegraph operator or postal worker, but also educational work as kindergarten or schoolteacher making an appearance. A further notable development is that far more female than male pupils considered continued school education. From the school year 1867/1868 onwards, we have had records of a few girls switching to the *Gewerbeschule für Mädchen* (trade school for girls). The number had hovered around 0.5 % in the 1890s. By the early 1900s, institutions like the *Fortbildungsschule* (further education school, 1913—1 %), *Handelsschule* (commercial school, 1913—0.9 %), and *Haushaltsschule* (home economics school, 1913—0.5 %) were added. The number of girls opting to stay home with their families also increased from roughly a fifth to about a third (33.8 %). From 1900 onwards, the number of those seeking to learn home economics (*Hausstand erlernen*) in preparation for their housewifely existence also rose to 4.1 % on average.

The question which further interpretative connections can be drawn from the data analyzed also must be asked for the second time period studied. We note that traditional patterns of vocational education continued to obtain well into the twentieth century, even though their dominance was reduced. This had difference consequences for the genders. Female youths gradually were offered a wider choice of occupations in the second half of the nineteenth century, though it would be erroneous to assume that their options came close to those open to boys in either quality or quantity. Instead, the opportunity gap yawned ever wider. The 1913 data for male school leavers records 185 occupations (89 of them in skilled trades and crafts), while for females, only 55 are mentioned. This imbalance was exacerbated by the fact that half of all female school leavers' choices (51.4 %) went for only four occupations: maidservant, office clerk, tailoress, and sales girl.

The gendered patterns that these trends show indicate that the bourgeois model of "a woman's vocation" had spread to large parts of the population. This meant that for a large part of the girls in question, formal education ended with leaving the *Volksschule*. If you include the shrinking, but still considerable number of female school leavers who worked as maidservants between leaving school and entering into marriage, almost three quarters of the girls recorded after 1911 opted for a path that prepared them for a housewifely existence, be it for family reasons or social expectations. By contrast, the number of girls who chose an apprenticeship or other forms of training was vanishingly small. This means that by the early twentieth century, vocational education for girls leaving the elementary school (*Volksschule*) was far from a matter of course. Looking at the transition of girls from the *Volksschule* to the Hamburg *Gewerbeschule für Mädchen* (trade school for girls) and its context opens up a different interpretative connection. On average, the school founded in 1867 by the *Verein zur Förderung weiblicher Erwerbshätigkeit* (Association for Promoting the Employment of Women) took in about 22 female school leavers per year. However, the overall composition of the student body and the fees payable there indicate that, even though *Volksschule* graduates were not categorically excluded, they remained a minority. We will return to this aspect later.

Thus we can end this section by asking what conclusions can be drawn from the data analyzed and its interpretations. We can certainly state that a strongly gendered system of life patterns and expectations is reflected in the vocational choices of Hamburg school leavers. While the majority of boys, following the normal pattern of a male biography, viewed an apprenticeship as a vital next step, a large part of the girls pursued a concept of their future that was oriented towards a "female vocation" of domesticity. For them, apprenticeships or other forms of vocational education were therefore considered dispensable, even undesirable or socially dysfunctional. Consequently, their options were limited and usually channeled them into occupations that were compatible with their perceived domestic vocation, or at least did not threaten it. Based on this local case study, we thus gain insights that, while limited to Hamburg, show a larger pattern of gendered segregation. This offers an explanation for the continued gender gap in vocational education.

Case Studies: An Appropriate Approach?

In many academic disciplines, case studies are an established part of the methodical toolkit. The concepts pursued, however, differ as widely as the positions on their functions and the value of their findings. History, too, has embraced case study as a valid historiographical hermeneutic tool with the emergence of microhistory and the cultural turn (Süßmann 2007, p. 9). However, as yet there are few mentions of the approach in historiographic literature, and no entry is found in the relevant reference works (*ibid.*, p. 14). Case studies can look back on a long tradition in education research, especially in connection with a research perspective informed by individual theory. They were especially widely received in the 1980s, when they were deployed in field research and evaluation under actual classroom conditions (*cf.*, e.g., Stenhouse 1978; Simons 1980; Fischer 1981). In the history of education, case studies have mostly figured in the form of surveys of individual schools, though the significance of the approach has, as yet, been little studied.

The conception that underlies this study views case studies not as a method, but as a research approach. They are read as representations of the represented as a case, with the layout of the case depending on the research interest. The unit studied here is a locality, *i.e.*, a specific sociographic space—the city of Hamburg—and the actions of people within that space. In their common understanding as a method, case studies in educational research are usually grouped with qualitative approaches. This overlooks that in case studies, the positions described as quantitative or qualitative research overlap significantly. From an interpretative research perspective, we may even ask whether this divide is at all useful and productive in educational research (Smeyers 2008). As regards case studies in research overall, there is general agreement that they have a number of advantages in grappling with complexity, accessing new fields of study and exploratory research, developing hypotheses, or coming to a more concrete understanding of a general fact. Their primary problem is the relationship between the general and the specific case, *i.e.*, the tension between individual, case-specific finding and generally applicable insight. The question to what degree the findings of a case study are applicable beyond its scope and how far the results can be generalized must thus also be asked in this case.

An obvious advantage of case studies is that contextualization—placing facts and data into their broader, more specific contexts and connecting them to other factors—is more easily feasible. This strong focus on context as a methodological principle can not only lead to new insight (Tröhler 2001, pp. 26–34) but also contribute to a greater transparency and accessibility of the research process and lend greater plausibility to the interpretations necessarily inherent in it. This is important insofar as the decision whether to accept the interpretations gained from a research context “will rely heavily on whether others can agree with this particular interpretation” (Smeyers 2008, p. 700). In the case of the study presented here, contextualization also serves to check the validity of the sources used. Studies spanning greater geographic or temporal ranges also force us to acknowledge the limits of contextualization, though. It can be difficult to establish complex

interrelations and connections over long periods of time and to integrate the data into broader historical contexts. In this kind of case study, the focus is rather on development trends and the interpretative perspectives that determine the narrative. The approach as it is deployed here must thus be understood as explorative. That especially means addressing a previously underresearched field such as the history of a gendered vocational education, rendering interconnections visible, and formulating the important questions which may then be followed up using other methodological tools as well. A stronger emphasis on discursive or power relationships would be well feasible in order to take account of discursive elements and their greater context while exploring the educational opportunities and limits especially female *Volksschule* leavers faced in shaping their careers. A study of this type might look at the introduction of home economics as a subject at the *Volksschule* or at the discursive binds within attempts to regulate and standardize apprenticeships in typically female occupations or open other skilled trades to women. Other methodological approaches could involve individual testimony or other first-person documents (including autobiographies, diaries, letters, etc.) which place greater emphasis on the perspective of the historical subjects. It would also be useful to draw on records of private girls' schools and general secondary schools, which often contain data on school leavers, to create a broader basis of data and gain further insight into both the gender and class aspects of vocational education.

The difficulties of regional or local case studies are mainly in producing conclusions that reach beyond the specific case. What must be addressed is how to increase the possibility of generalization, i.e., how to ensure that the interpretations derived from within-case analyses and the narrative that structures them can be placed in an interpretative context that reaches beyond the confines of the case itself. This requires a high degree of sensitivity towards and reflective capability regarding methodological questions as well as openness, transparency, and clarity in research and interpretation. A further methodical approach would be through comparative case studies in the sense of cross-case comparisons. The question researched here would be open to a comparison with similar data from cities like Berlin, Frankfurt, or Bremen to produce a more robust foundation on which to base conclusions. Berlin offers itself since the greater importance of manufacturing industry in this region can be expected to have provided a different spectrum of opportunities for school leavers, while Frankfurt and Bremen, primarily centers of trade, make for a good comparison of cities with similar labor market structures. A transnational comparative approach, too, could produce interesting results. Using local, properly contextualized case studies from, e.g., France or Britain could not only shed light on vocational education opportunities for school leavers under different cultural circumstances but also offer more accurate insights into the historicity of gendered structures and patterns in the vocational education of those countries. Even though a case study approach carries some difficulties and the subject studied here is open to different ones, it still offers a good basis to research this complex, multifaceted, and nationally divergent field.

Locating/Placing the Findings in a Gendered History of Vocational Education

If you follow Stephen Mulhall, the process of interpreting “things into practical life . . . [has] . . . no distinctive structure or principles because it is fundamentally not based on the following of some pre-given set of rules; it depends upon imagination, the ability to see connections, the creative shaping of one’s sense of how aspects of human experience hang together or fail to do so” (Mulhall 2000, p. 264; quot. after Smeyers 2008, p. 703). However, the imaginations and connections that form the basis of interpretative processes and therefore are also the foil against which narratives can unfold must always be understood in their close connection with the person of the individual researcher. As Paul Smeyers points out: “whenever we conceptualise a particular part of reality, this necessarily occurs within the boundaries of what already makes sense for us” (2008, p. 701). This act of sense making, conceptualization, and knowledge construction in turn depends on our particular contextual knowledge and our views on certain issues. In this sense, the effort to place the interpretative options presented earlier into the greater interpretative framework of a gendered history of vocational education also represents a narrative that is linked and closely connected with the insight and understanding the researcher herself has gained in this field.

When looking at the development of a gendered history of vocational education in a broader context, especially with regard to the situation of women, we open interpretative perspective whose discursive interrelations remain effective well into the twentieth century. The focus of these perspectives are two countervailing transformative processes with decisive impacts on the shape of the emerging German system of vocational education.

At the heart of the first transformation lies the process—well documented in the source material—of transferring the bourgeois domestic ideal of female education and vocation to the working classes. The backdrop to this transformation was provided by a broad discourse whose societal impact is seen at many levels. It is made explicit, e.g., in the famous 1856 work by Luise Büchner *Die Frauen und ihr Beruf* (Women and their vocation). In it, the sister of famous writer Georg Büchner and co-organizer of the German bourgeois women’s movement calls for future working-class wives to be educated not towards gainful employment, but towards their domestic vocation. She regarded the founding of educational institutions as a “true blessing for the lower classes,” though only if they didn’t train them “to be chambermaids or seamstresses, but for their true domestic vocation” (Büchner 1856, p. 102). The process is also documented at the level of schooling and education. Thus, the ninth *Allgemeine Deutschen Lehrer-Versammlung* (General Meeting of German Teachers) held in 1857 in Frankfurt (Main) discussed the “female vocation” (*der weibliche Beruf*). The first and most important of the principles passed there is: “The vocation for which a girl is to be educated is the same for all walks of life: to be a wife, mother and housewife” (Die Frage über weibliche Bildung 1857, p. 40). The statement further reads that since every woman

had to fulfill this vocation, every girl had to be prepared for it regardless of her social background. In the context of this discursive development, domestic service was defined not as a form of gainful employment, but as a “transitional period necessary in preparation for her vocation” (ibid., pp. 40, 11). The discursive dispute sharpened under the influence of accelerating industrialization in the late 1880s. Initiated by the *Verein für Armenpflege und Wohltätigkeit* (Association for Poor Relief and Charity), a broad-based discussion on the merits of instructing poor girls in home economics to counteract the deterioration of the family, the decline of morals, and the consequent heightening of class antagonism began (Schrader-Breyman 1888/1962; Kalle and Kamp 1889). A different face of this transformation in the discursive shape of its era is the idea of home economics education proposed by Georg Kerschensteiner at the beginning of the twentieth century (Kerschensteiner 1902). He used the idea of a “natural vocation” as a basis on which to argue for a comprehensive school reform that sought to introduce home economics not only in the *Volksschule* (Mayer 1992). One impact of this discourse was that vocational education for girls was regarded as less important than for boys despite the fact that wage labor continued to be a fact of life for many women even after marriage. Further, it established a concept of female education centered on home economics as the curricular core of vocational education well into the twentieth century, especially for young women entering unskilled or semiskilled fields or staying at home with their parents while still under obligation to attend school.

The second transformational process is the spread of wage labor in the form that had characterized the lives of working-class women into the bourgeois world. That this process did not pass without resistance is demonstrated by the broad public debate on vocational education for middle-class women that arose against the backdrop of increasing industrialization, social change, and the altered economic circumstances of families. In this case, too, a powerful societal discourse provided the background. It was contributed to not only representatives of the bourgeois women’s movement such as Louise Otto-Peters, who called for allowing women increased educational opportunities and thus the right to economic independence and individual self-determination in her 1866 work *Das Recht der Frauen auf Erwerb* (Women’s right to employment). Liberal middle-class men, too, were willing to fully or at least partly support these demands, while representatives of bourgeois conservatism regarded the debate on educational and employment opportunities for middle-class women as an assault on the proper relationship between the genders and the natural order of society (detailed in Mayer 2007b, pp. 85–99, 2009, pp. 10–21). These discursive patterns show how difficult it proved to break open established ideas of women’s “natural vocation” in the domestic sphere.

With a view to the interpretation of the source material presented here, it is important to keep in mind that the second process was driven largely by pragmatic considerations. Decisive impulses were provided by the *Vereine zur Förderung der weiblichen Erwerbstätigkeit* (Associations to Promote Female Employment) founded in Germany after the model of the *London Society for Promoting the Employment of Women*. Their primary aim was to provide educational and employment opportunities for young women. In the 1860s, the first vocational schools for

the female youth were founded. By the 1890s, a network of various forms of vocational training schools had developed which cannot easily be systematized because of its heterogeneous structures (for an overview, see Morgenstern 1893). The example of the Hamburg *Gewerbeschule für Mädchen* (trade school for girls) we already mentioned taking in some female *Volksschule* leavers shows, though, that these institutions primarily met the needs of a middle-class clientele. Looking at the composition of its student body, we find that young women from the lower classes are hardly present. Of the 590 pupils attending the *Hamburger Gewerbeschule* in 1897/1898, only 3.7 % came from families where the fathers were sailors, farmers, bargemen, or laborers (in 1881/1882, the number had still been 7.8 %) (Mayer 2007b, p. 94f.). The middle-class nature is also evident from the curricula and vocational options on offer, including the fact that higher fees were charged for some vocational training courses as well as other classes. Above all, though, it is telling that the requirement for admittance was often defined as the knowledge acquired in the first year of the *höhere Mädchenschule*, a female higher secondary school catering to middle-class families. The new scholastic opportunities for female vocational education thus in effect catered to girls from a bourgeois background who could meet the educational requirements and whose families could afford the not inconsiderable school fees. A large part of female *Volksschule* leavers was thus excluded from scholastic vocational education and the emerging, higher-prestige school-trained vocations.

Thus, these privately funded institutions could, by combining elements of general and vocational education, theoretical and practical aspects, and professional and family-oriented aims, create a system of female vocational education aimed at middle-class girls. It established itself as a serious alternative to the traditional, male-dominated “dual system” of apprenticeships without ever challenging its primacy. We can thus see not only a boundary of gender segregation around the traditional “dual system” of vocational education but also between emerging elements of the system itself. The interplay of class and gender we find repeated in the various strands of a gendered history of vocational education pointed to the fact that the problem of segregation there was not solely determined between genders, but was also informed by social and societal interests that shaped expectations of vocational education. As a result, it was made available to women in a context defined by a separation of classes and social milieus from the very beginning.

Conclusion

In my contribution, I have tried to use the connections between vocational education, gender, and inequality to show in a case based on concrete quantitative data how interpretation is a key aspect of any form of historical educational research. That is true not only in the analysis and evaluation of source material but at every stage of the research process. Interpretations affect the course of research, e.g., in the selection of sources and the question what

(continued)

interpretative scope they offer; in the connection of research question, sources, and historiographic approach; or in contextualizing sources and their interpretative contexts that social history, cultural history, gender, and other theoretical perspectives can open up. Such processes of interpretation are usually woven into the process, remain intransparent, and often go largely or entirely unreflected in historical narratives if their presence and role is recognized at all.

This effort to admit to the full importance of context in making interpretation explicit should also demonstrate that the choice of that context and our particular contextual knowledge as well as our views on certain issues influence the interpretative perspective in their turn. Interpretations themselves lack any distinctive structure. They consist of imaginations and the creative shaping of connections that cannot be viewed as independent of the processes by which the individual researcher creates and ascribes meanings. However, the fact that we can regard interpretation as an individual act of sense making, conceptualization, and knowledge construction that exists in close connection with the person of the individual researcher, we not only gain context for interpretation but the opportunity to be guided towards a wide variety of new perspectives by our research interests, questions, and standpoint-theoretical aspects. Regarding the example presented here, it must thus be kept in mind that its integration into a greater historical context—a gendered history of vocational education—is based on a specific interpretative scope that demonstrates the particular perspective adopted by an individual researcher. The conclusion we must draw for historical research in general is the importance of integrating the question of interpretation more fully in historical narratives. We need a more reflected, open, and transparent approach to interpretative context and the emergence of interpretative perspectives. Such greater transparency and accessibility of the research process and the interpretations gained from a specific research context ultimately decide whether the interpretation itself can be agreed to by others. Changing the interpretative process from an internal, unaddressed one towards greater transparency and accessibility would also make particular interpretations capturing segments of a historicizing world more accessible to discursive engagement by others.

5.7 Educational Policy in Historical Perspective: Interpreting the Macro and the Micro Politics of Schooling

Inés Dussel

Interpretive sources are chosen partly because they are in the air. . . . Theory *dates* research. (Elkins 2007, p. 482)

[There are two traditions of interpretation.] The one seeks to decipher, dreams of deciphering a truth or an origin that transcends play and the order of the sign, and for it the necessity of interpretation is lived as a kind of exile. The other, no longer oriented towards origin, affirms play and strives to pass beyond man and humanism. . . . [Derrida, “Structure, Sign, and Play,” quoted by Weber 1987, p. 3]

Introduction

Interpretation is dated, says James Elkins, and this means much more than simple chronology. *Dating research* means understanding not only the debates and strands of interpretation that are available at particular moments, but also the ways in which an interpretation mobilizes or replicates these debates. “What is ‘incorporating’? What are citations? What mixture of discourse have I made?” asks Elkins (2007, p. 485). These questions have no straight answers, because

[t]he result is a mixture of discourses, blended according to rules, taste, and customs that the writer might not even be aware of. (Elkins 2007, p. 482)

Moreover, *dating research* is not exhausted by the allocation of a statement to a given time frame. It is an action that acknowledges that a particular theory or research project might be engaged in a dialogue across multiple temporalities, in readings of readings of readings that go back and forth in time. Paraphrasing art

historian Georges Didi-Huberman's talk about images, it can be said that theories are always "temporally impure, complex, overdetermined" (2006, p. 6).

If I start this chapter with this appeal to temporalities, it is because I would like to argue in favor of locating the interpretation of the history of educational policies within a distinct moment that frames ways of asking questions and of searching for answers, a moment that, it is important to say again, is not contained by dates, but has more of the "air" quality mentioned by Elkins.

The moment is related to what Derrida, in the epigraph that opens this text, refers to as the second tradition of interpretation: that of play and of posthumanism.¹ It is defined by the critique against historicism brought by the linguistic turn. For historicist historians, interpretation is the act of unveiling the hidden logic of history, of rendering the context transparent through causal connections, and of finding the underlying meaning to human acts.² But the linguistic critique has stated that these reconstructions are first and foremost narratives, and that history and fiction are not far apart. Interpretation is thus anything but a smooth walk through clear-cut and transparent options and depends heavily on rhetorical decisions made by the historian (cf. Hamilton 2003; Popkewitz *in press*).³

The critique of historicism has led to new questions and problems in the writing and the interpretation of history. The acknowledgement of the narrative quality of historical arguments has implied for some that all interpretations are given equal footing, as there are no firm grounds to decide which argument is better than any other beyond its persuasive force. Historical texts have to be considered as narrative fictions that reconstruct a past that does not exist outside them (White 1973).

Yet, others claim that this acknowledgement should not derive ineludibly in an "anything-goes" relativism. From this hindsight, some historiographical readings are better than others because they can account more thoroughly for the choice of analytic techniques and of an archival corpus (cf. Ginzburg 1988), and because they take it seriously to discuss previous accounts and inscribe themselves in an informed conversation about a particular issue. While it recognizes that there is no guarantee about the truth value of an argument, this second approach struggles

¹ Derrida's argument goes on: "man being the name of that being which, throughout the history of metaphysics and of onto-theology. . . has dreamed of the plenitude of presence, of reassuring foundations, of origin and the end of play" (in: Weber 1987, p. 3). Foucault's text on "What is an Author?" makes a similar point in relation to the search of a unity of the text, which is to be found in the biography or personality of the author (Foucault 1984).

² Historicist historians believe that "they can explain any phenomenon purely in terms of its genesis . . . that they can grasp historical reality by reconstructing the course of events in their temporal succession without any gaps" (Kracauer, S., *History. The Last Things Before the Last*, quoted by Ginzburg 2007, p. 176).

³ While it exceeds the possibilities of this text, it would be interesting to trace the links between the critique of historicism and what Boltanski and Chiapello call the artist's critique, the new regimes of truth and of validation of arguments that put authenticity and verisimilitude as the main rule, a movement that starts eccentrically and as a radical critique but that has been swallowed by capitalism in the new creative industries (cf. Boltanski and Chiapello 1999).

with the question of what was possible at particular moments in history in ways that relativistic approaches do not.

But the “air” of this moment of research is also made of other strands of critique, particularly the critiques of power and the state, which have had considerable effects in the field of educational policy studies. This is a second *dating of research*, for theories make some concepts and processes visible, and obscure others. Until the 1980s, the study of educational policy tended to be dominated by a centralized vision of the state and of policy.⁴ Foucault said in 1977: “We need to cut off the King’s head: in political theory it still needs to be done” (Foucault 1980, p. 121). Due to the “Foucault effect” (Burchell et al. 1991) and many other theoretical movements (historical sociology, subaltern studies, feminism, actor–network theory (ANT) and others), it is now current to read that the state is not a united, single, coherent, or necessarily capable actor (cf. Yashar 2005), and that this fragmentation and instability makes “the local state a key conjunctural terrain, shot through with slippages, openings and possibilities” (Hart 2002, p. 312).

Also, political anthropologists have recently paid attention not to the state as an agent but to stateness as a relational attribute. The state quality is not an a priori given but something that is produced historically and at particular places. “The attribution of stateness to various forms of authority . . . emerges from intense and often localized political struggles over resources, recognition, inclusion and influence” (Hansen and Stepputat 2001, p. 9; see also Scott 1998).⁵ Finally, ANT has produced a small but increasingly important conceptualization about educational policies, which de-centers policies from the state and claims that there are multiple agents acting politically in education, at different levels (cf. Nespor 2011, for an analysis of the politics of educational technology). These agents are not defined before their interaction.⁶

This dating of research defines what it is possible to think about the history of educational policies, in ways that leads researchers to define problems in particular ways, look at particular sources, choose analytic methods, and produce interpretations with the available concepts. Again, the dating does not imply a self-contained era that reduces everything to its context; but doing the exercise to revise how problems are thought at a particular time and how this leads to specific research

⁴ A classic textbook in Argentina was Americo Ghioldi’s *Política Educacional en el Cuadro de las Ciencias de la Educación* (1972), which defined educational policy as “the theory and practices of the activities of the State in the matters of public education” (quoted in Paviglianitti 1996, p. 4).

⁵ One example of scholarship informed by these renewed considerations about policy is Elsie Rockwell’s work on the schools of the Mexican state of Tlaxcala, which does not take the centrality of the nation state for granted and that looks for the nuances and negotiations that made the federal state a local construction, produced in the interaction between federal initiatives and local formations (Rockwell 2007).

⁶ A fine example of this approach is a recent study on educational reforms in India. For the authors, globalization and the construction of international networks—key players in these reforms—are better understood in terms of the translations between spaces that configure agents than in terms of “educational borrowing” that considers two already-defined actors (Mukhopadhyay and Sriprakash 2011).

questions might help the researchers to live interpretation as a kind of exile in a positive sense, as a “stranger to the world evoked by the sources” that gains knowledge because of this exiled condition, as Siegfried Kracauer said (quoted by Ginzburg 2007, p. 180).

In this chapter, I would like to perform this exercise of dating research and discussing the play of interpretation through two examples of my own work on the history of Argentinean educational policies. These two examples are 10 years apart, but despite their difference they speak about a moment of the historical interpretation of educational policy, at least within the research traditions I was inscribed at that time.

The first example is related to the history of the Workers’ University, a creation of the first Peronist government in 1948–1952. The Workers’ University was supposed to be the “crown” of a new system of technical education that ran parallel to the traditional school system and that was to include workers and farmers. The Workers’ University was also set as a model of a new type of university, less academic than the existing ones, and more linked to developmental and industrialist policies. It was an educational policy quite common in Latin America in the 1940s and 1950s, when national popular movements took office and decided to create new educational institutions as a way to negotiate with the old (see Pronko 2003).

In the historiographical readings available at the time when the research was conducted (late 1980s), it appeared that the University had been a decision of the government and also of the unions, resisted by traditional universities and thus destined to fail. But my research wanted to explore why the Workers’ University had survived the destitution of the Peronist government by a military dictatorship that closed down most of its creations. What was it in there that had made it possible to continue and redefine itself in the midst of a repressive context? Oral histories and written sources brought back the students’ movement that produced a social mobilization that gained the streets and kept the university open and alive. But they also brought another set of actors: disenchanted engineers and technical workers who had fled from the traditional technical schools and universities and had written the curriculum and pedagogy and served as the staff in the new institution, bringing international experiences and building a network that could last more than the government. I found that there were professional bodies and expert knowledge that preceded the Peronist era and whose struggles found a course in the Workers’ University, and eventually amplified and got reshaped. The awareness of the role of many agents and of a multiplicity of discourses and strategies helped my research to consider different layers and actors in the interpretation of policy making in education.

If the creation of a new university is clearly a state decision (although, as it has been said, the state itself cannot be taken as a fixed entity), my second example points to the micro level of everyday schooling as another layer in which policy making takes place. In the late 1990s and as part of my doctoral dissertation, I studied the adoption of school uniforms in public schools. In Argentina, schools started donning white smocks in the first decade of the twentieth century, in what was commonly interpreted as a democratic measure that supposedly contributed to an equal and homogeneous public school system. Interestingly, these dress

regulations were not ordered by an official decree but emerged out of a practice “invented” simultaneously by several school principals and teachers (I found as many as seven reports of “inventors” of such practice in the same years, 1905–1910). The practice of donning uniforms seems to have been created from below, borrowing what was common in other school systems (France, Italy, Spain) but with particular traits such as the white color of uniforms, their imitation of medical smocks, and their incorporation into daily hygienic and disciplinary supervisions of children’s bodies. In this creation, intermediate knowledge, such as the one carried by school inspectors and teachers, popular journals, and family strategies, was relevant, perhaps more than the one that came from the top of the system. It was in 1915 that the first decree was passed that turned it compulsory for teachers, and not for students, to use the white smocks. The measure was supported on a scaffolding of moral, scientific, political, and economic discourses that made it “commonsensical” to don uniforms in public schools.

The two cases are different, and yet in their interpretation I looked for similar themes: de-centeredness of educational policies, local struggles, lack of direct and transparent relations between political agents and educational strategies, and density of institutional histories and of objects. At the same time, the approaches I took differed significantly: if in the case of the Workers’ University I looked at political debates and texts, in the case of the uniforms I focused on objects, material culture, fashion, and the regulation of morals. Interpretation, then, while sharing the same “air,” opened in different paths, as it will be seen in the next sections.

Educational Policy as Seen from Above: The Case of the National Workers’ University (1948–1959)

How to study the short life and transformation of the National Workers’ University (Universidad Obrera Nacional, UON)? The traditional account stated that it was a creation of the first Peronist government (1946–1955) and was the third and last step of a technical branch of schools that ran parallel to the traditional educational system. This technical branch, under the umbrella of the National Commission for Vocational Orientation and Learning (CNAOP) created in 1944, under Perón’s impulse (not yet president), offered vocational training for workers. That was a time marked by an imports’ substitution process opened by World War II but that was expanded in the postwar years. The CNAOP schools offered new specializations (mining, industrial mechanics, car motors, electrical installations, etc.) and had an academic organization that allowed adults to study while working; some of the schools were located in factories or were associated to them (Pineau 1991). It encouraged the inclusion of working-class students: an employment certificate was required, preferably from an industrial factory.

The UON was presented in 1948 as the culmination of this system. But the rhetoric of its foundation emphasized not only the needs to industrialize Argentina

but also the social justice that it implied. A Workers' University was the recognition that there was a debt in the education of the working class and that it was finally going to be redeemed. As Pronko (2003) states, the idea of a Workers' University had been there for some time, advocated by Catholic workers (inspired in the Belgian case from Charleroi) and by the socialist and anarchist unions. Pineau (1991) documents an Argentinean Workers' University that opened in 1939 organized by the National Confederation of Trade Unions and gave courses on labor legislation and technical contents (i.e., car motors). However, as in many other aspects (most notably, feminine vote), Peronism picked the idea and turned it into its own program (Torre 2002). The political antagonism was so wide that it was difficult for the opposition to cross the board and welcome the initiative.

The parliamentary debates that preceded its creation were heated, and in the end it was only the Peronists and some independents who voted for it. The Law 13229 was passed in a climate of hostile partisanship, and this signaled its development for a while. When it finally opened its doors to students, in March 1953, the perception, later picked and amplified by the historiography, was that it was a "peronist university."

But things changed when the Peronist government was overthrown from office by a military coup d'état in 1955. Most of the institutional creations of Peronism were either dissolved or integrated into preexisting structures (cf. Bernetti and Puiggrós 1993). However, the UON survived, and its students' movement struggled for its continuity under a new name, the Technological University. Ministry commissions were created that studied its case, and finally in 1959 a law was passed that fully recognized it as a national university and officially changed its name to UTN (Universidad Tecnológica Nacional).

As it can be implied by this short account, given this partisan character of its creation, the interpretation of the UON depended on the characterization of the Peronist experience and derived in antagonistic positions (Garay Reyna 2007). Peronism has been considered "a reaction to modernization" (Germani 1971), "a new class alliance" (Murmis and Portantiero 1973), and a "populist regime" (Laclau 1978). The educational histories about the UON emphasized its contribution to the democratization of higher education or its demagogic and lower quality education.

The research I started in 1988 was interested in the role of the students' movement, comparing the students from the UON and from the traditional University of Buenos Aires, which had been radically aligned with the opposition to Peronism. These antagonistic interpretations were part of the actors' rhetoric and of the way in which they presented their positions and their struggles. At that time, the dominant historiographical interpretation was a critical one. Studies done by Wiñar (1970) and Tedesco (1971) had concluded that the main drive behind the creation of the university was a political one. Through an analysis of economic data of the period, both authors pointed to the lack of need of qualified technical cadres and the low technical complexity of the industry at that time. Also, through following the low level of payment of industries of a tax created to support technical education, they stated that there was no interest or need by economic forces to have a technical university for workers. Particularly Tedesco emphasized the

hypothesis that education was serving a political function and not an economic one, in an open debate both with human capital theories and Marxist reproductive ones. Education was independent from economic variables and was serving political needs, be it the ones from the government or the ones from the popular classes—to be included in a body of legitimate knowledge and credentials.

The group in which I was doing research at that time had a different agenda.⁷ Educational history had to be read as a social and cultural history, de-centered from the State, and had to study continuities and ruptures. If Peronism in particular had been subjected to readings of either/or, radical break/total continuity (De Ípola 1989), then the group was set to produce nuanced interpretations that looked at the specificity of education. For example, the UON had rarely been considered a university, and its statutes or professorships had not been looked. It had been too easily dismissed as a demagogic creation, but there was almost no data about who taught there, who the students were, the curriculum, the internal organization, or its results.

The sources had to be, then, more diverse than the ones considered by previous histories. I looked at parliamentary debates and legal decrees, but also reviewed university sources (official journals both from the University of Buenos Aires, the “legitimate” and traditional one, and the UON), accounts and pamphlets of students’ associations, and texts by engineering professional associations. At some point, and related to the fact that most of the archives of the Peronist era had been destroyed by the military dictatorship, I decided to interview former students.

What I found was that there was a large professional movement that preexisted Peronism that was very important in the organization of the Workers’ University. If its first President had been a union leader, Cecilio Conditti, its vice president was an engineer, Pascual Pezzano, who was a relevant figure in the field of engineering. Having directed the most prestigious industrial school in the country, he defended the specialization of engineering against the general orientation of traditional universities, which the University of Buenos Aires defended until 1958 (cf. Dussel and Pineau 1995). Pezzano had been very active in the 1930s and early 1940s in disciplinary congresses and in educational journals, advancing the renovation of orientations and the regionalization of teaching to meet local needs, against the generalist engineers who were dominant in traditional university and professional associations. At the UON, he brought with himself a group of industrial engineers that were also recognized in their fields. While Conditti gave Perón

⁷ Some notes for a prospective intellectual history. The group was organized at the University of Buenos Aires by the late Cecilia Braslavsky, who had studied at the Democratic Republic of Germany (DDR) and had done her PhD work on the expansion of primary schooling in Latin America using Robert Alt’s category of “monopoly of education.” We read and discussed at large Brian Simon’s social history of education in Britain. I worked closely with Marcela Mollis, whose interest was the history of universities and was central in locating the UON within higher education, and with my friend and colleague Pablo Pineau, who studied trade unions. Mollis had just returned from Japan, and that added multiple perspectives to the group. I was a senior student at the BA in Educational Sciences at the University of Buenos Aires and benefited from a research fellowship for students recently created.

the first chair of the university, naming him its first professor, other faculty had sufficient academic qualifications. In an interview, a former student told that

There were some peronist professors, but we resisted them. We wanted to be taught seriously. We fought so that two professors we had, which were peronists and very bad teachers, were changed, and we won.

In my research, I took up a long tradition of studies around university politics and students' movements that date back to the 1920s in Latin America (Portantiero 1978). But I was also interested in the new sociology of curriculum, and my readings of Basil Bernstein, Pierre Bourdieu, and Tom Popkewitz made me think about the hierarchy of knowledge that this new university was trying to establish. Also, Ivor Goodson's use of the sociology of professions and of Bourdieu's notion of field for the history of curriculum was also helpful for problematizing the established interpretation (Goodson 1988). Herbert Kliebard's discussion on the impact of vocational education in the USA helped me think about the oblique effects of vocationalism in the traditional school system (Kliebard 1990).

With this framework, I studied the UON's study plan and organization. One of its remarkable features was its regionalized structure. It had a central branch and regional campus that were to be established according to "the needs of the national industry." For example, in an Andean province, Mendoza, there was a specialization on "anti-seismic constructions"; in Córdoba, "aeronautic industry"; in Tucumán, "chemical industries" and "rail constructions." There were also offers on textile industries, sanitary works, mechanical constructions, car motoring, electromechanical constructions, electric installations, and many others.

All classes were to be in the night shift, from 7 to 11 pm, considering that the students were workers. The curriculum included labor legislation, industrial hygiene and security, and two courses on unions and workers' legislation.⁸ But these courses were less than 20 % of the weekly schedule; most of the curriculum focused on specialized subjects. The classes were supposed to be active, hands-on, and there were traces of progressivist pedagogies in the didactic guidelines that I was not expecting.

Regarding the student population, the data left was scarce and did not supply much information. I could gather that, by 1955, there were 1,887 students, 30 % of which came from the CNAOP schools and the rest from the traditional and preexisting industrial schools. One of the interviewees said that most of the students were workers, but another one said that they were middle- and mid-low class students, employed in tertiary services. While I could not find conclusive data, the proportion of students coming from the traditional industrial schools supports the second view of middle and lower classes as the primary component of the student body.

⁸ The name of the course was "Sindicalismo justicialista y legislación obrera," "justicialista" being the official name of the Peronist party. So the course was overtly a partisan syllabus on the role of party unions.

The interviews gave some hints about what happened between 1955 and 1959. When Perón was overthrown by a military coup d'état in 1955, the UON was intervened by the military. For a while, according to the testimonies, there was uncertainty about the continuity of the university. Due to the pressures of the students' movement and also of some of the faculty, the Ministry of Education created a Commission to consider its case and decide on its continuity. In 1956, the provisional president of the UON addressed the students to talk about the change of denomination, from Workers' University to that of Technological University. In his speech, he said that, if their students were technical cadres from the industry, it was "natural" that the University received that name. With this movement, the dictatorship intended to separate the university to its link to Peronist rhetoric and liturgy, and this separation was central to its institutional survival (Mollis 1991). The students' movement supported this change in their periodicals; according to the testimonies, they decided not to graduate until the change of denomination was settled, worried that their degrees would not be legitimate (Dussel 1990). In October 1959, more than 4 years after the Peronism was overthrown by a military coup, a law was passed that granted recognition to the National Technological University as part of the system of national universities.

My own interpretation sought to illuminate the multiple agents that were at play at that time. While the established version had neglected the works of professional groups and the relevance of disciplinary conflicts, these appeared to be central both to the creation and to the survival of the University after the military coup. Also, the students' movement, generally romanticized for its leftist politics, appeared aligned with traditional forces that defended a particular status quo for the institutions of knowledge. Marcela Pronko's work, published more than a decade later than my research, showed another important group that had remained invisible, even for me: that of Catholic groups. The Catholic Workers' Circles, active in those years and influential in the Peronist movements, brought the experience of Belgium's Workers' University and advocated for a higher education option for unions. This group, which combined political, religious, and pedagogical dynamics, seems to have been central to the advancement of this type of institutions (Pronko 2003, p. 24 ff.).

State educational policies then appear less as the product of univocal forces and more as the result of changing terrains of struggles and of possibilities, and of agents that configure themselves in these struggles. Moving beyond the opposition between continuity and radical break, I could interpret the creation of the Workers' University as an event in which several strategies converged, and which found a course momentarily in the Peronist government, soon to reorganize themselves under different lines. Certainly, Peronism was an adequate catalyst, and it added the presence of unions, a political discourse that placed the working classes as principal actors of the nations, and a cultural politics that challenged the existing hierarchy of knowledge (cf. James 1990; De Ípola 1989; among many others). But my point is that the research illuminated that this event could not be reduced to Peronism/anti-Peronism. The interpretative narratives had to look at other layers and dynamics such as the curriculum debates in the field of engineering and the students' movement that had played an important role in educational policies.

Educational Policy as Seen from Below: Educational Micro Policies and the Materialities of Schooling. School Uniforms

My second example has to do with school uniforms in Argentina, and it implies a change of scope and scale from the analysis done in the previous section. School uniforms are educational policies that are part of the school “marginalia,” apparently not central to policy as the curriculum, school fees, or entrance exams, and yet they have been important in configuring school identities and power relations (cf. Meadmore and Symes 1997). The regulation of clothing is part of a legal order that is made of minor decrees, some of which have not the full force of law but which nonetheless shape daily practice, and which get their enforcement power through many informal ways (teacher training, pedagogical advice, fashion, and taste, among others) (cf. Hunt 1996, 1999).

School uniforms in Argentina, which are white smocks that resemble physicians’ attire or lab coats and are used over street clothes, have been traditionally interpreted as the result of egalitarian policies.⁹ The assumption was that, with the same clothes, everybody would look alike in schools, and uniforms would erase, at least temporarily, the traces of social inequalities. Oral and press accounts presumed that they had been created in the 1870s, by the person who is considered to be the “founding father” of common schooling in Argentina, Domingo F. Sarmiento—a version that was taken up by some scholars as well.¹⁰

White smocks were used in Argentinean schools all throughout the twentieth century, and they persisted through dictatorships and radical democracies. When I was starting my doctoral research, the teachers’ unions, involved in a dramatic struggle for higher salaries, gave away white smocks as symbols of public schooling to those who supported them. These uniforms continue to be, to this day, a significant marker for public education, and parents and children refer to the pride they have when kids wear their white smock in their first day of class (cf. Fernández 1999). However, the white smocks had not been subject to specific research, except from some clip notes in newspapers and isolated paragraphs in histories of education (cf. Puiggrós 1990).

Why did I choose this topic? Some professors in Argentina told me it was a waste of my time, smocks being inconsequential and unimportant. Serious scholars had to study laws, documents, statistics, and curriculum. But white smocks were part of my own educational biography. Having experienced the donning of uniforms, and lived through a repressive dictatorship that obsessively controlled my external appearance, I knew that there were other components in uniforms besides social inclusion, and that stains, bad smell, or untidiness in the smocks had consequences on how children were considered and classified by teachers and principals. This was an important drive in my investigation and was reaffirmed

⁹ Egalitarianism is a political discourse centered on equal political rights. In the case of nineteenth-century republicanism, it was based on the notion of inclusion in a homogeneous polity (cf. Nique and Lelièvre 1993).

¹⁰ Georgette Magassy Dorn, Chief of the Hispanic Division of the Library of Congress, wrote that “Sarmiento introduced the white uniform worn by students today” (Magassy Dorn 1993, p. 83).

by a Foucaultian theory that emphasized bodies as the site of power and that looked at disciplinary regimes to understand the production of homogeneous bodies (Foucault 1984). This framework, as well as my own experience of a strong public consensus, led me to challenge the idea that uniforms had been produced exclusively from above, and to problematize their emergence.

But personal biography did not stop at my school years in Argentina. As the historian as exiled described by Siegfried Kracauer, I was doing my research in a country where egalitarianism and school uniforms had not crossed paths. In the USA, uniforms had been donned for minorities, generally those who were deemed incapable of self-government by fashion and taste¹¹ and whose regulation was supposed to come from the outside (Lomawaima 1995). They were associated with distinction (as the preppy schools) or with inequality (Indian boarding schools), and most of the times they were resisted as an intrusion on personal freedom; at any rate, they were hardly seen as a symbol of an egalitarian polity.

The strategy I chose to undertake my study was a comparative history of school uniforms. I wanted to read and conceptualize these cases together; I believed the comparison would tell me something that I could not grasp only by looking deeper at one case. I am not sure I was conscious of that at that time, but I find that this option helped me keep my research questions open. The Foucaultian framework was inspiring but it could also become a straight jacket; uniforms could be (too) easily read as technologies totally aligned with disciplinary regimes of power, in their anonymity and impersonality, in their working from the outside to the inside, in their production of fixed categories, in their interchangeability. Interpretation could become, paradoxically, as transparent as that of historicists’.

Comparison, international and also throughout time, proved a good choice for finding differences. In a quote that would have helped at that time but that I found only recently, Haun Saussy says that comparativists “are likely to want to accentuate the particular inflections taken on by [global modern] culture in its various local destinations, for without particularity, what is left to compare?” (Saussy 2001, p. 163). True, there are comparativists who only look for the same. But I was only briefly interested in world institution theories as a method of comparison (cf. Ramírez 2003); it might have been that the large amount of data they collected was way out of my reach, but I also think that the historical and anthropological sensitivity for particularities was more appealing to my experience of exile and estrangement. I could “see” that uniforms expanded as a universal technology with schools, and at the same time, that they worked differently in each country.¹²

¹¹ “As a form of self-government rather than rule by coercion, liberal governmentality elicited voluntary compliance through the mechanisms of fashion and taste” (Poovey 1998, p. xx).

¹² This paragraph needs to be qualified, because it is a central part of research. What is it that the researcher “sees”? How is it connected to her or his own biography, emotions, and affects? I refer to the first pages of Stanley Cohen’s *States of Denial*, a wonderful example of the opaqueness of what made some people “see” the injustice of some situations such as apartheid, while other people “saw” the same things and did not interpret them in that way (cf. Cohen 2001). Research includes affects, inclinations, and sensitivities, in many more ways than one can account for; but it is advisable to be aware of how they play in one’s own focus and questions.

The historical comparison brought up other questions. One issue that puzzled me was why the policy of donning uniforms had not been adopted everywhere (notably, the USA did not adopt them as universal policies until the 1990s, and then, only some school districts followed them). But there was also the question of why uniforms had taken such different forms: *le tablier* in France, which was homemade and had dark colors; the *gray babi* in Spain; the *guardapolvos* (dusters) in Argentina, which were white, industrialized, and had different models for boys and girls; and in Uruguay, the smocks with *moña azul*, blue ribbons used by boys and girls. These differences led me to consider translation as an important category for analyzing how a particular object or technology traveled across countries and times, and how it became domesticated into local cultural forms (Appadurai 1996; Latour 1988, 2005).

But the comparison could also be done with other pieces of clothing and other types of regulation. I decided to study the disciplining of bodies through clothing regimes, analyzing the role of fashion in the production of technologies of the self, and locate uniforms as particular objects or technologies within the regulation of clothing (Joseph 1986; Steele 1989; Symes and Meadmore 1996). One important reading at the beginning of my work was the history of sumptuary laws by Alan Hunt, who traced the regulation of the use of velvet or of colors in early modern times; it helped me understand how social boundaries were produced through clothing (Hunt 1996). Also, Philippe Perrot's genealogy of the austerity of appearances of the bourgeois that linked the black suit with Calvinism brought the religious discourses together with the political and social transformations in ways I had not considered before (Perrot 1987). I looked at histories of fashion (Perrot 1994; Roche 1994; Binaghi Olivari 1991), but also at histories of the regulation of clothing tied to moral discourses (Valverde 1989) and histories of the transgression of these vestimentary codes (Garber 1998, *Vested Interests*). I tried to find the models in which the white smocks were inspired and surveyed the history of medical clothes (Blumhagen 1979; Pellegrin 1991), of academic vestimentary codes (Davidson 1990; Hargreaves-Mawdsley 1963; McVeigh 1997), and of children's attire (Cunnington and Lucas 1978, among many other).

The history of the body and of sexuality was another important source for my inquiry. As said before, the Foucaultian framework was determinant in this respect, but both the history of the body and of sexuality were and are vibrant fields of scholarship that went far beyond any simplistic reading of that theory. Particularly Georges Vigarello's history of the *dressage* of the body, of the right posture as a pedagogical power, which traced the moral, health, and political discourses, as well as the objects and technologies (school desks, gym apparatuses, prosthesis, and the like) that have tried to shape the body from the sixteenth to the twentieth century, was useful as a model for a long time-span study (Vigarello 1978). His later histories of cleanliness and of the discourses on the healthy and the unhealthy (Vigarello 1988, 1993) were also important references for my own research. Social hygiene was an important discourse by the end of the nineteenth century; in my look for understanding more about it, I bumped into Bruno Latour's *The Pasteurization of France* (1988), which opened a different conceptual framework to work with, and helped me interrogate the medical discourses and the "war on microbes"

declared by Pasteur and his acolytes in their relation to the white smocks donned in Argentinean schools.

In Latin America, I found oblique yet important references to uniforms or fashion in literary histories and in the history of sexuality. For example, Francine Masiello's work on the production of citizenship as a matter of style was quite important: "How to act as a modern person in the nation was set out through prescribed behaviors and through standards of dress and speech. They all conferred a limited range of identities upon which individuals as a part of a fledgling democracy. . . . In this way, they regulated the style of being a citizen" (Masiello 1997, p. 220). Good taste became, following Masiello, "a social regulator, a way to control abuse and excess" (Masiello, p. 224). Jorge Salessi's study of the medicalisation of society, particularly of the immigration issue and of homosexuality, was also relevant for understanding how expert knowledge was turned into political and populational categories (Salessi 1995).

These readings were not done before the archival work but most of them ran parallel. Eventually, they were central to my ability to read through the sources with many more concepts and questions that I had at the beginning of my research. For example, Valverde's work on Victorian morality and the anxiety about the "love of finery" of women (1989) guided me to read teachers' accounts about clothing and state regulations under a new vein. I also read their narratives about children looking for signs of this anxiety about decorum and cleanliness, and how these turned into moral and political categories that classified children—as I have seen through my teachers' doing.

This scholarship also broadened my archival work. If I began my research looking for legal decrees and official periodicals, I soon found that I had (and wanted) to look at other texts: educational journals, pedagogy and school hygiene textbooks, books of manners that prescribed clothing, autobiographies of teachers, school pictures, and children's and popular magazines. They all gave me hints about their extension and their inscription in moral, political, and economic discourses. I looked at commercial ads to understand their availability and circulation in different social strata. I had to learn to look at pictures, date them more precisely, and understand what they showed and what they obscured, something that later became a research problem in itself for me (cf. Dussel *in press*). The archival work was done at many libraries, as many as I could visit those years.

I also wrote e-mails to authors I was reading and was fortunate enough to engage in an interchange with them, particularly with Alan Hunt and Daphne Meadmore. And I counted with the help of friends and of colleagues that sent me news clips, articles, and books that spoke to my research. School uniforms are, as someone once told me, a good cocktail topic; each one of us has some memories or opinions about it, and if one asks around, one will probably find many ideas or clues that have not appeared before. That is what I did, and it helped. But, besides the enormous generosity of friends and colleagues, what organized this somewhat chaotic corpus were the theoretical categories I was using: disciplining of bodies, regulation of clothing, translation, and difference.

What did I make of all this work? I will focus on the Argentinean case for the sake of this text (cf. Dussel 2001, for the US and early modern Europe). Contrary to the popular belief that school uniforms had been established by Sarmiento in the 1870s, I found no trace of uniforms in public schools until the first decade of the twentieth century. The first dress codes that were established were informal regulations that appraised cleanliness and decorum (Szuchman 1988). By the mid-nineteenth century, schools and educational authorities began to oblige students to comply with rules of hygiene and to wear “appropriate” attire, but what exactly “appropriate” meant was unclear.

One story was particularly interesting. Among the 65–70 teachers who went from the USA to Argentina to work in normal schools between 1869 and 1890, in a sort of “importation” of human resources, there was William Stearns, a University of Chicago alumni, who was hired to head the new normal school at Tucuman, in northwestern Argentina. The letters he wrote to his brother portrayed several aspects of daily life, among which clothing issues were common.

“The poorest children here, wrote William sometime between 1875 and 1877, go entirely naked or at most with only a ragged shirt, and even those of the middle classes wholly unwashed and uncombed and dressed in clothes which we should think fit only for beggars. . . . By refusing to allow anyone not decently clothed to enter the school, we have produced a wonderful change. The school has the reputation of being very far ahead of any other in the city and the parents rather buy new clothes than lose the opportunity to send their children here. We have some 200 children in the graded school and pride ourselves upon the change we have effected in their manners and appearance”

(quoted in Houston Luiggi 1965, p. 89).¹³ Clothes were charged with social and moral overtones and acted as a regulator and a marker of citizenship and inclusion in the social body.

These dress codes, informal as they were, collided with some other policies. Given the slow progress of literacy and school attendance rates, many districts ruled out the possibility of excluding students from schools. In September 1865, the General Director for Schools passed some instructions that asked teachers to “avoid . . . that any children is left out from school with a frivolous pretext; always giving preference to those who are in the most need” (*Anales de la Educación*, Sept. 31, 1865, p. 51). A few decades later, a rule from the National Council of Education stated that: “It is prohibited to principals and teachers . . . to oblige students to come to school with uniform garments, . . . or even do the slightest mention of this issue” (undated decree, ca. 1890s, *Digesto Escolar* 1920, p. 191).

However, the trend towards uniforms prevailed, and by the beginning of the twentieth century several schools were using them, with a remarkable coincidence in its design: the *guardapolvo* or duster. Interestingly, many people claimed to

¹³ Changes were not limited to the clothing of students. One alumni said that she “remembered with a smile the way in which some of the North American teachers dressed themselves, foreign to that era and costumes, in short skirts.” The fashion of ankle-length walking skirts was quite a scandal in the provincial cities (Houston Luiggi 1965, p. 90).

have invented the *guardapolvos*. Among them were Pablo Pizzurno, general inspector of Schools for the capital city; Julia Caballero Ortega, a professor of manual skills in a suburban school; Antonio Banchemo, teacher of 6th grade in 1906 in a central school in Buenos Aires; the professor Pedro Avelino Torres, from an experimental school in Buenos Aires; and Matilde Figueira de Díaz, who has been included in the “Dictionary of Argentine Women” because of the invention of the white apron in 1914 (cf. Dussel 2001, for a detailed account). I found these claims in disparate sources: biographical dictionaries, educational journal, and newspapers.

Medical doctors and school inspectors also started to recommend using the *guardapolvos* at that time. For example, the chief inspector for School Hygiene said that “smocks would help prevent . . . contamination by germs . . . if they are left in schools, and do not come back and forth from home to school. In that way, it would be a great means for preventing the irradiation of infectious diseases in schools” (Sisto 1915, p. 565). It was established that a daily inspection of children were to be performed, looking at hands, nails, teeth, ears, neck, and head. Clothes, shoes, and tools brought by the student should also be surveilled, to ensure their cleanliness and tidiness. There would be a morbidity record for each student, indicating name, infectious diseases, other diseases, and vaccines (Sisto 1915, p. 563/564). This recording and individualizing can be seen, as Foucault described it, disciplinary power at work.

But this creativity at the level of teachers and inspectors was soon to become a centralized strategy, sanctioned by legal decrees. The first official rule to talk about the white smocks is from 1915 and it did not actually mandate uniforms but encouraged them. I found an important nuance: smocks were mandatory for teachers but not for students. It was then considered as a “good practice,” because “besides teaching the students to dress simply, it will also suppress the competency about who is better dressed among school personnel” (December 23, 1915, *Circ. 101, Expediente 19*). Echoes of the sumptuary laws and the regulation of the “love of finery” can be found in this phrasing.

In 1919, only 4 years later, another measure was passed that established that parents’ associations would provide uniforms to the families that lacked the resources to buy them, so that they didn’t suffer “any violence of an economic order.” After recommending the use of smocks during school hours and in school activities, it said that: “Smocks should be considered as uniforms characteristic of school attire, and in analogous conditions to textbook and school materials, in relation to their provision to children who do not pay school fees” (November 1 1919, in: *Digesto Escolar* 1920, p. 724). After that, more than two decades of informal policies (through PTAs, donations, provision of uniforms along with school material, teacher training, and expert advice in educational journals, among others) followed that paved the way to universalizing school uniforms in public schools. School pictures, which I traced through the journal of the National Council of Education, *El Monitor de la Educación Común*, show uneven levels of school uniformation until the 1940s. I did not find any decree instituting *guardapolvos* as mandatory, and while this absence might be due to the lacunae of the archives (which, in the case of Argentina, have been ransacked by the many

dictatorships), I suspect that it was never issued, as it might have been contradictory with national laws of compulsory and tuition-free schooling. But this speculation might need more archival work in local archives, which sometimes have been better preserved of political turmoil.

The interpretation I produced played with the notion of the scaffolding of discourses (Popkewitz 1998). While egalitarianism was indeed important in supporting this policy, it was nonetheless inscribed in a series that tied together austerity of appearances and consumption along with republicanism as a homogenizing polity, moral discourses as decency and decorum, social hygiene, and the moral superiority of the schooled, national body. This moral–political–economic complex was multilayered, and not univocal as the traditional interpretation had stated. The studies done by Alan Hunt (1999) and Mariana Valverde (1998) on moral regulation as combining different “repertoires” and kinds of knowledge helped me interpret this scaffolding of discourses as “the outcome of a complex of elements of governmental discourses, rationalities and practices” (Hunt 2000, p. 1). In this approach, cultural artifacts and technologies such as uniforms did not have a single meaning, but encompassed multiple series that could be combined in a strategic device.

I also tried to interpret why so many people wanted to be credited with the creation of uniforms. Were some of them lying? I’d rather think it was an idea that was “up in the air.” As Bruno Latour says, “[a] cause is always the consequence of a long work of composition and a long struggle to attribute responsibility to some actors” (Latour 1988, p. 258). I came up with the notion of a choral creation made from below: the simultaneity of their accounts might be related the availability of this idea and of this particular object (the white smock, typical of medical doctors) at that time. At any rate, this multiplicity helped debate with the interpretation that uniforms were produced by a single and centralized decision, but it seemed much more plausible to look at them as the result of “long work of composition” made within a network of discourses and technologies available at that time.

Concluding Remarks: Interpretation in the History of Educational Policy

Carlo Ginzburg, in his review of Natalie Zemon Davis’ *The Return of Martin Guerre*, discusses the role of narrative and fiction in historical research. He appraises the historian’s participation in the making of the film, an experience that she described as “an historiographic lab, a lab where the experiment did not generate irrefutable proofs but historical possibilities” (quoted in Ginzburg 1988, p. 114). Having the chance to look at actors playing with different tones of voice for a particular character, Zemon Davis, and Ginzburg through her, transformed the indicative mode of historical narrative in a conditional, acknowledging that historiographic accounts make infinite choices when they translate traces of the past into a coherent story.

The choices made by research are related, as I said in the beginning of this text, to a particular date or air in which one moves. How one looks at the text is related to the theories or categories that are current at certain moments. In her wonderful *A History of the Modern Fact*, Mary Poovey said that “issues that were not problems for past writers *became* problems for writers who returned to earlier texts” (Poovey 1998, p. 23, her emphasis). It is not that the past writers were dumb or ignorant; there is a field of visibility, a language, a horizon of problems, which are historically defined. Theoretical interpretations supposes an awareness of all the operations “implied in the simple fact of seeing” (Jacob 2006, p. 8).

In the discussion of both cases, I intended to show that it was important for my research to restudy the multiplicity of agents and dynamics involved both in the design and the implementation of educational policies, and to reassess their connections. I questioned preexisting interpretations that took for granted that the State was the key player in the definition of educational policies, be it the Workers’ University or the donning of uniforms. The “air” in which I breathed as a researcher pointed to the multiplicity and de-centeredness of the political, and I was set to look for that plurality in policy making. This plurality marked the way to look at the archives and build my corpus of documents: it was important not to stay with the official, written sources at the level of the central state; the combination of oral histories, visual sources, and many intermediate texts contributed to look for a complex grid of intelligibility.

The resulting interpretation placed educational policies in the midst of a scaffolding of available technologies and ideas, of changing strategies of agents whose behavior was not easily predictable, and of a continual rewriting of these strategies as the play of politics continued to take place. This movement was clearer in my doctoral research than in the case of my analysis of the Workers’ University, but the concern about plurality and shifts was there too.

Interpretation, then, paid attention to the movement of signs, and not to their fixation; in that respect, it is dated within theories that look for the fluid, the liquid, and the circulation and translation of concepts and belongs to this era. Is it the final, definite word on these topics, as historicists thought they had achieved? Certainly not. The work and play of interpretation never ends. But it is good enough to produce plausible arguments that account for what was possible at a given time and that prove to the extent of their possibilities that this argument is grounded on rigorous interpretations. They also expand the way for new plays and works of interpretation that will point to movements or connections one has not seen.

5.8 Nonformal Education on Display

Karin Priem

Research Report: “The Family of Man” as a Means of Public Education?

This chapter deals with the topic in the larger context of exhibitions and public education. In the discipline of the history of education, the focus has been mainly on world exhibitions that have been analyzed as sites of traveling ideas, of the competitive display of education systems and policies, and of meaning making in general (e.g., Lawn 2009; Dittrich and Kaiser 2009). Little research has so far been carried out on visual and multimodal aspects of exhibition spaces in general, even though exhibition techniques rely on complex strategies regarding the arrangements of objects and images, the use of time and space, and how audiences are guided through these “theaters of display” (Priem and Thyssen 2013). Together with Geert Thyssen (ibid.), I have examined these issues in greater detail elsewhere. For the purpose of this essay, I will concentrate on the visual level only and analyze how images have been used as a means of cultural policy and nonformal, or public, education. The goal of this chapter is to explore how images in a three-dimensional space are arranged according to certain strategies of presentation and representation and how these arrangements emphasize what should be perceived and which meaning should be ascribed to it. The questions I will address are thus mainly related to the epistemological effects of photographic images. From a didactic point of view, images are, in fact, expected to stimulate meaning making and inspire learning; they thus become pedagogical objects. On the one hand, learning through images takes as its reference the symbolic order of society. On the other hand, the

Route de Diekirch, B.P. 2, 7220 Walferdange, Luxembourg
e-mail: karin.priem@uni.lu

arrangement and the presence of images can be used to symbolize the social world and to structure and interpret reality.

My research on Edward Steichen's exhibition *The Family of Man* touches on many of these issues. So far, the exhibition has been referenced only in a few monographs and anthologies (e.g., Sandeen 1995; Back and Schmidt-Linsenhoff 2004). Most publications devote only short essays (e.g., Szarkowski 1994) or book chapters (Staniszewski 1998; Corbus Bezner 1999; Museu d'Art Contemporani de Barcelona 2008) to the project, concentrating on individual aspects of or contemporary texts on Steichen's work. This may be due to the fact that the Edward Steichen Archive (ESA) at the Museum of Modern Art in New York was unprocessed and not open to researchers until September 2011. In addition to material on Steichen's personal life, the Archive contains, among other things, correspondence, press releases, photographs, notes, and clippings concerning the planning, installation, and worldwide circulation of *The Family of Man*. Other materials—including photographs of international installations of the show, statistics, fact sheets, installation instructions, checklists, and international press clippings—had been accessible before, in the Department of Circulating Exhibitions Records (CE) and in the International Program Records (ICE) of the Archives of the Museum of Modern Art. Additional information about the photographic material is available in the catalogue of the show (Museum of Modern Art 1955).

The Family of Man was first shown from January 24 to May 8, 1955, at the Museum of Modern Art in New York. The exhibition was composed of ca. 503 photographs grouped thematically around subjects such as love, marriage, childbirth, childhood, play, family life, work, religious feelings, old age, human relationships, basic human needs, death, studying and learning, hunger, aggression, and war. Dramatization surely was the essence of the photographic assemblage exhibited as *The Family of Man*, and the prologue to the show, written by Steichen's brother-in-law Carl Sandburg "in a vaguely Old Testament style" (Szarkowski 1994, p. 27), was quite pathetic as well. Quoted in the introductory panel of the exhibition, it underlined the exhibition's claim for universality, "of photography as a universal language in recording the world we live in": "There is only one man in the world/and his name is All Men./There is only one women in the world/and her name is All Women./There is only one child in the world/and the child's name is All Children" (CE, MoMA Archives, NY, II.1.57.1). After its initial showing at the Museum of Modern Art in 1955, the exhibition toured the world for 8 years, making stops in 37 countries on 6 continents. The photographs included in the exhibition focused on issues, emotions, and concerns that were supposedly shared by all people and cultures around the world. Conceived in the first decade of the Cold War, the show was meant to express a universal humanism and general (Western) values such as democracy and freedom. A checklist (CE, MoMA Archives, NY, II.1.57.1) reveals that most of the ca. 503 photographs exhibited in the show were taken by American photographers and had been published before in popular US media such as *Life* magazine. This American photographic gaze on the world has been the main frame of reference for the show while at the same time indicative of how the US—and eventually the global—audience was expected to see the world.

The exhibition therefore has to be analyzed in the context of the Cold War rivalry of the 1950s and of how Western concepts of universal humanity were fabricated by means of photography and public display. According to Frances Stonor Saunders (1999), the US government, during the 1950s and 1960s, spent “vast resources” on “cultural propaganda” (ibid., p. 1), which also involved covert operations such as the Congress for Cultural Freedom, run by the US Central Intelligence Agency: “At its peak, the Congress for Cultural Freedom had offices in thirty-five countries, employed dozens of personnel, published over twenty prestige magazines, held art exhibitions, owned a news and features service, organized high-profile international conferences, and rewarded musicians and artists with prizes and public performances” (ibid.). *The Family of Man* most likely was not funded by the CIA, but there is evidence that the show was part of the huge propaganda machinery to promote an image of “America” or, more specifically, the USA not only among intellectuals but among all people worldwide. Not only were copies of the show commissioned by the United States Information Service (USIS) for circulation around the world; the International Council of the Museum of Modern Art in New York (founded in 1953) also strongly supported a policy of international exchange in the arts as a mission for “America.” In 1955, George F. Kennan, a US American diplomat who had a strong influence on the Marshall Plan, gave a speech to the Council members, putting particular emphasis on how to promote the national interest through international cultural exchange and on the importance “to correct a number of impressions that the outside world entertains of us, impressions that are beginning to affect our international position in very important ways” (Kennan 1956). Similar to Steichen’s principal idea of *The Family of Man*, Kennan, in his speech, referred to “cultural values, universal in their meaning” and to “artistic creation and higher forms of scholarly thought,” which in his view “remained the only areas in which it was conceded, even by totalitarians, that men of different political faith and allegiances might conceivably find a bond” (ibid.). What he implied, of course, is that US culture would be the most appealing when seriously introduced to the rest of world and when being “enriched by acquaintance with similar activity elsewhere” (ibid.). Referring to Henry Luce’s famous *Life* magazine editorial of 1941, Guilbaut (1983) thus argues that, at the end of World War II, “America was ready to lead the newly liberated world into the ‘American century’” (ibid., p. 101) and to follow an “imperialist internationalism” (ibid., p. 103) by promoting America as a model of the future. Coincidentally, the Hiroshima explosion in 1945 and the impact of atomic weapons (see ibid., pp. 101–194) gave rise to a similar new concept, created by American intellectuals and artists who saw only one way out of this state of dehumanization: to propagate a new myth, a new “religion” of essence, purity, transcendence, and the universality of man. This new concept of universal humanity fitted very well with the political claim of America’s supremacy and of American art and culture as an explicitly superior and therefore universal model for the world. As it were, universal humanity and cultural supremacy were key principles of *The Family of Man* as well.

Another characteristic of *The Family of Man* is the use of superlative figures when it comes to visitors, venues, catalogues distributed, and images involved. For

example, Steichen and his team are said to have chosen their material from out of six million photographs (Sandeen 1995, p. 41). As it is difficult to corroborate all these figures during an archival search, a wide variety of exorbitantly high figures are circulating in both contemporary texts and subsequent scholarship, thereby underlining the size and magnitude of an exhibition characterized as being beyond words. The numerical superlatives additionally (sometimes unintentionally) have helped construct the myth of *The Family of Man* as a democratic and universal show that was created not for experts, but for everybody everywhere, for the purpose of morally and politically “educating” a mass audience. In fact, Steichen looked at photography as a mirror of the universal experiences of mankind. One of the critics of the show, Roland Barthes (1964), pointed out its purely historical importance, noting that photography was an inappropriate means for generalization and objectivity. Human aspects and political values in particular, he argued, vary historically and are not as universal as Steichen’s show would suggest. Taking my cues from Barthes, I will look at *The Family of Man* as a visual strategy to construct and establish (Western-oriented) values as universal human values.

The purpose of this chapter is to reflect on visual politics with regard to a (sometimes global) public, which is supposed to respond in a certain way: for example, to absorb certain ethical and political values, repeat cultural formula, or support ideological beliefs. Traveling exhibitions such as *The Family of Man*—just like shows in historical or art museums or, to give another example, didactic strategies in classrooms—are means of governing the public by imagination and by using seeing as a cultural practice. This approach is based on the power of visual media, which in turn refers to a set of underlying didactic strategies enhancing nonformal education. This chapter will, therefore, on the one hand, contribute to the current research on the political impact of visual media. In addition, it will examine the cultural promotion of political values by means of nonformal learning.

The design and installation of *The Family of Man* was not neutral in terms of meaning and power, but thoroughly composed in accordance with the show’s mission. Steichen and his designer Herbert Bauer, a former Bauhaus scholar with substantial experience in the aesthetic practice of European avant-gardes of the 1920s and 1930s and related exhibition and propaganda design, were very much concerned about how the installations and modes of display would affect viewers’ experience and creation of meaning (e.g., Staniszewski 1998, pp. 1–57). The show was not only inspired by an avant-garde aesthetic, however; advertising and popular magazines, war photography, fashion photography, and documentary photography also strongly influenced the design of *The Family of Man* (e.g., *ibid.*, pp. 207–259). In addition, the images were not presented as individual pieces of art in their original format, but were chosen in accordance with the overall mission of the show. Within this particular setting, the artistic quality of an individual photographic image did not play a key role; the pictures rather had to fit into the visual assemblage of *The Family of Man* in general and were selected “to contribute pace and drama to the story” (Szarkowski 1994, p. 13). “The criterion was to portray a message through the assembled whole” (Sandeen 1995, p. 53). The exhibition techniques used by Steichen and his team were meant to create a multilayered, dynamic space that was not dependent on

fixed and limiting walls—a “theater of display” (Priem and Thyssen 2013) offering a changing flow of different views. This effect was realized by freestanding circular, multidimensional, and even transparent installations; by pictures hanging on wires far away from stationary and immobile walls; by enlarging, downsizing, and cropping images to set up either a dramatic or intimate framework of seeing; and by mounting images on Lucite or Masonite panels without using mats or frames to avoid distance and to directly involve the viewer by “eliminating the aura of high art that enforced respectful distance” (Sandeem 1995, p. 61) and “by not attempting to match the high-gloss sacralisation of the artistic photographic print” (ibid.). The design of the show can be described as a dynamic play of different forms, surfaces, theatrical light effects, panoramas, movements, and captions (Priem and Thyssen 2013). The latter—“brief quotations from the Bible and the Bhagavad Gita and legends of the Sioux nation and from Shakespeare and James Joyce and others” (Szarkowski 1994, p. 14)—did not provide any information about the photographs themselves, but were inscribing the images into the universalizing story and “grand tapestry” of the show (ibid.). One of the most spectacular installations of the show was “the pregnancy temple,” a womb-like white rotunda, half encircled by fine white curtains and giving access to a set of relatively small photographs showing birth and intimate mother-and-newborn-baby scenes hanging on transparent wires in front of a shimmering curtain. Another important aspect of the show was its independence from a traditional museum context and fixed space. The show was composed as a mobile set of elements and could easily be installed at other locations in a similar way. The venues of the show often were temporary and popular spaces created for mass audiences. Commenting on a photograph of the exhibition space in Moscow, Eric Sandeem (1995, p. 190) writes: “Many of the exhibits were encased in structures entirely made of plastic. The experimental units of fiberglass were hurriedly tested for stability in the wind by blasting a test module with the prop wash from several airplanes on a Long Island airstrip.” The novel and flexible materials of construction added new meaning to the show, promoting it as a promising symbol of the future of mankind.

Many researchers stress the major influence of documentary photography, especially of the photographs taken under the aegis of the Farm Security Administration (FSA), among them many shots that have later become cultural icons. One example is Dorothea Lange’s famous “Migrant Mother” (1936), which was also shown in *The Family of Man*. While it is worth mentioning that Dorothea Lange, in fact, played a key role in the planning of *The Family of Man* (Szarkowski 1994), it is also important to know that Steichen gained the idea for his future show when he saw one of the first exhibitions of FSA photography in 1938. In an article on *The Family of Man*, John Szarkowski, Steichen’s successor as director of the department of photography at the Museum of Modern Art, points out that the FSA style of documentary photography inspired Steichen to think of the “possibility of using photographs as building blocks from which one might construct cumulative and coherent meanings” (ibid., p. 18). He also mentions that it gave Steichen the idea that photography could be used as a means of propaganda (ibid., pp. 18–19).

I will now first outline methodological approaches to analyze Steichen’s show, before applying them in a second step to a selected section of *The Family of Man*.

Images and the Creation of Meaning

Photography has traditionally been associated with the notion of producing a precisely accurate rendering of historical reality. However, at least since photography's recent "discovery" as a historical source and artistic product (e.g., Tagg 1988; Mitchell 1994), there have emerged a wide range of points of departure for a more intensive exploration of this genre. In his introduction to the German translation of Svetlana Alpers' *The Art of Describing* (1983), art historian Wolfgang Kemp (1985, pp. 7–20) has presented an idea of interpretation that explicitly does not highlight the mimetic or documentary character of the visual product, putting major emphasis instead on aspects of image production. What this interpretation foregrounds are visual technologies as epistemological practices to shape what should be seen by viewers and which meaning should be ascribed to it. The approaches developed subsequently by Jonathan Crary (1990) and Hans Belting (2001) relate to viewer orientation and the history of perception and to media history and the anthropology of the image, respectively.

Unlike texts, images have a primarily visual status, which in turn is due to instruments or techniques of image production. As far as photography is concerned, this means that the emphasis lies on the importance of the camera as an instrument of perception, a means of visually describing social facts, and a specific technique of image production. This then casts a different light on the question of the objectivity and authenticity of photo-technical perception and of seeing through the "eye of the camera," which in turn has consequences for the analysis of visual sources (Priem 2006, 2009).

"The history of vision," writes Ralf Konersmann (1999, p. 18) was "from the very beginning" closely tied to a "critique of vision." Sensory vision has been regarded, on the one hand, as a means of disclosure, exposure, and production of evident proof; it stood for empirical precision, evidence, loyalty to the facts, and the establishment of certainty and authenticity. On the other hand, vision has also been associated with illusion, delusion, limitation, and deception. Konersmann thus accurately refers to the "dual structure of vision" (*ibid.*, p. 14); from an epistemological point of view, he considers this duality to derive from persistent differences between intellectualism and empiricism. He points out, however, that "modern pictorial art" (*Bildkunst der Moderne*), as well as the ongoing modification of optical instruments, meant that vision itself was interrogated time and again, with "the critique and rehabilitation of vision" engaging in a dialectical relationship (*ibid.*, pp. 30, 45; see also Crary 1990). It seems reasonable to assume, therefore, that photography likewise combines both aspects: that is, it not only records the interaction and discrepancy between the image and social reality, between accurate perception and ideal, between individually and culturally preformed models; it also subjects them to critical evaluation. The claim that photography, because it does not resolve this duality but instead makes use of it, must be regarded purely as a means of deception can be refuted by arguments put forward by the scientific theorist Ludwik Fleck (1983, pp. 147–174). In his 1947 essay "Schauen, sehen, wissen"

(Looking, seeing, knowing), Fleck pointed out that scientific knowledge was subject to particular social conditions and conventions of perception, whose individual expressions he describes as “*Denkstile*” (styles of thought). For example, he provides an impressive description of how, following the invention of the microscope, the scientific definition of bacterial groups at first oscillated between different possible classifications before one particular, scientifically accepted visual image asserted itself and became firmly established, which in turn determined subsequent research. This in no way meant, however, that the development process was complete. According to Fleck, such positively sanctioned forms and attributions also lead to the discovery of new shapes and structures, which diverge from these norms and initially also appear to be in a state of oscillation. In this sense, the results of scientific research are always fundamentally determined—in both a positive and negative sense—by preexisting conventions as well as by the invention of particular measuring instruments and devices. As such, every piece of scientific knowledge is, in Fleck’s words, “a process between the individual, his style of thought, which ensues from the fact of belonging to a social group, and the object” (ibid., p. 168). Applied to photography, we can thus draw the following conclusion: similar to the situation found in an experimental laboratory, the photographic gaze isolates and fixes its object of study, and it is this process which exposes the object to attentive perception. In both cases, the result is influenced by prevailing social conditions, but this by no means makes it a deceptive illusion. Viewed from this perspective, “visual discovery through art,” as Ernst Gombrich (1982) once described it, is produced under similar conditions as scientific knowledge. In both situations, it has to do with styles of thought or conventions of perception as well as their continuation, differentiation, and possible correction using methods of isolation and detachment that are in turn subject to social, cultural, and technical conditions. For this reason, the accusation that is leveled against photography, namely, that it isolates details from their wider context in order to “strip the make-up from reality” (Benjamin 1931/1980, p. 208), can also be viewed in a positive light. A special characteristic of photography is, in fact, its potential to question the epistemic value of realistic depiction that is deemed to be objective. For “visual discoveries” are made, according to Gombrich (1982, p. 37), when “the normal relationship of recognition and recall is reversed between the picture and reality, so that we genuinely recognize pictorial effects in the world around us, rather than the familiar sights of the world in pictures.”

Bettina Heintz and Jörg Huber (2001), in their introduction to an anthology on scientific strategies of visualization, similarly discuss how scientific research is put on display. The authors underline that scientific images are not meant to represent reality in a vertical way, but rather refer horizontally to other images of the same subject, which they describe as a space of corresponding references and representations (ibid., p. 12). Scientific images are expected to compress a lot of information into a special configuration of display (ibid., p. 13) while being dependent on certain instruments and techniques of seeing and image-making. Historically, optical devices at first were considered to be more rational than the subjective human gaze (ibid., p. 17), whereas later, when the concept of modern objectivity was successfully established during the nineteenth and twentieth centuries, human expertise was seen as a necessary

intervention to interpret and detect patterns of “reality” within “established traditions and horizons of display.” Similarly, Lorraine Daston and Peter Galison (2007) have argued that an important change in epistemological ideals took place in the middle of the nineteenth century when objectivity was established as a new ethos of research. Objectivity differed fundamentally from the preceding truth-to-nature principle of the seventeenth and eighteenth centuries. While the truth-to-nature principle constituted an ideal figure or type by combining several particular items of one species, objectivity was based on reproducing exact forms of detailed items of a species by mechanical means such as photography or microscopic analysis. According to Daston and Galison, these epistemic ideals are, however, not mutually exclusive but coexist and lead to different forms of knowledge.

With respect to photography, the significance of the camera thus becomes a key issue. A camera is not just an instrument of visual perception and observation; it is also a means of questioning vision and reality, as well as of establishing conventions as frameworks of reference and correspondence.

Depictions of Children in The Family of Man

Throughout the exhibition, the “magic of childhood” is promoted as a central human ideal, a promising link to the future of mankind, and an “eternal hope” (CE, MoMA Archives, NY, II.1.57.1). In a press release and fact sheet published by the Museum of Modern Art and dated September 12, 1955, Edward Steichen describes the first section of the show as follows:

“Photographs of women heavy with child walking rapidly in a street in Japan, a Dutch mother nursing her child, first steps of children in Germany, in India and South Africa. A small boy playing marbles in Java, a little girl splashing in a New England pond are akin, and so is the lonely and unwanted unloved child in one part of the world like another such child thousands miles away. Photographs of a father with his son in primitive Africa and another in Levittown, U.S.A., show the same kind of closeness. The essential oneness and goodness of man is mirrored in the simple direct terms of photography”

(CE, MoMA Archives, NY, II.1.57.1).

One of the last sections of *The Family of Man* was also dedicated to childhood. Most critics of the show have characterized this part as being the most sentimental and have accused the curator and his team of having created an overall illusive impression that was far from a realistic image of childhood (e.g., Corbus Bezner 1999, pp. 121–174)—an impression exacerbated by the fact that the show included only minor references to industrialization and urban life. Many photographs show scenes of peasant life and mankind’s struggle or relationship with nature, stressing purity and simplicity, which on a symbolic level have traditionally referred to childhood and Western ideas of paradise.

As the different sections of the show have been published in a catalogue (*The Family of Man* 1955), I will now single out one page (p. 189) and use the group of photographs shown on that particular page (Fig. 1) to discuss how they represent childhood.

Fig. 1 Exhibition catalogue of *The Family of Man*, p. 189

The page consists of eight small photographs arranged in three rows. Seven of them show children from the USA and one photograph is of children in Germany. The page contains different photographic genres such as artistic, documentary, and journalistic photography. In the catalogue, all photographs bear captions that give the name of the country where the photograph was taken as well as the name of the photographer. The arrangement of the photographs in the catalogue is a good example to demonstrate the techniques of display used in *The Family of Man*.

Fig. 2 Exhibition catalogue of *The Family of Man*, p. 189, top row

Fig. 3 Exhibition catalogue of *The Family of Man*, p. 189, middle row

The first three images in the top row (Fig. 2) show photographs by Gjon Mili (1904–1984), Annelise Rosenberg, and Barbara Morgan (1900–1992). While Annelise Rosenberg is a rather unknown artist, Gjon Mili, a *Life* photographer, and Barbara Morgan, who is famous for her portraits of dancer Martha Graham, are well known for their work. Even if their approaches to photography differ markedly, they all refer to the previously established convention and ideal of the innocent child: a child playing with bubbles, a quintessential symbol of the fleetingness and volatility of childhood (see Schama 1987, pp. 543–546); a Christmas scene showing three angelic children; and, finally, two young children dancing happily. It is very possible that all three pictures show the children of the artists and thus have a semi-private character.

The three images in the second row (Fig. 3) show photographs by Toni Frissell (1907–1988), Helen Levitt (1913–2009), and Sanford Roth (1906–1962). Toni Frissell is an American photojournalist who worked for *Vogue*, *Harper's Bazaar*, and *Life* and volunteered to photograph the Women's US Army Corps during World War II. Helen Levitt, another American photographer, is famous for her

Fig. 4 Exhibition catalogue of *The Family of Man*, p. 189, bottom row

documentary street photography of New York City. Sanford Roth has built his career on portrait photography of painters, writers, and actors, some of them published in *Vogue*, *Life*, and *Harper's Bazaar*. The photographs taken by Frissell and Roth take a more artistic and abstract approach: by showing children's bodies in relation to repetitive ornaments and patterns, they refer to individual variations within a series and to differences between big and small. Frissell's photo, positioned right underneath Mili's girl with the bubble, also reminds us that childhood is a short, vanishing, and transitional stage of life—which, again, is a conventional and idealistic image of childhood. Contrast this with Helen Levitt's street photograph, shot in New York in 1942. It is a very good example of documentary photography and, as such, interrogating social reality. The image shows a group of children in an urban environment: two children are holding a broken mirror, framing a small boy on a bicycle, while two others are picking up glass splinters lying on the ground, and a more cautious African-American child is looking on.

In the bottom row (Fig. 4), another of Levitt's photographs reminds us that childhood is not only white but also black, with the picture of three boys being reminiscent of young street gangs in urban areas. The second photo in the row was shot by Guy Gillette and shows the photographer's sons playing "trains." Emphasizing the imagined movement of a train by using straight lines and a close-up shot from below, this example of Gillette's early work creates a dynamic perspective. Both images put the focus on the fleeting nature of childhood rather than on sentimental images.

According to epistemic ideals, images always are both guided by and shape certain strategies of evidence, presentation, and representation. Truth-to-nature views of childhood have not vanished entirely, however. They are still part of the repertory of twentieth-century photographic images, which are expected to be objective representations of reality. On the one hand, the depiction of children can be interpreted as a means of establishing and changing cultural concepts of childhood. On the other hand, visual media, with their different strategies of image-making, can be assumed to represent, shape, and question cultural concepts. Thus it can be expected that twentieth-century images of childhood such as can be found in *The Family of Man*

continue to adhere to an ideal image of the child. At the same time, children are depicted by emphasizing individual differences and variations of visual formulae. Within this framework, my analysis focuses on twentieth-century photographs of children in order to compare and distinguish changing and ongoing practices of imaging childhood.

Some of the photographic examples I have analyzed follow conventional cultural formulae and support the concept of childhood as modern versions of a cultural ideal by linking childhood with innocence and positive concepts of the future. Other images, however, which are related to the epistemic principle of objectivity, depict ruptures and changes in this ideal of childhood by stressing individual and social differences. In contemporary art as well as in photography, we often find both principles and formulae of childhood—the idea, and ideal, of childhood and the variety of children—questioning and challenging each other.

Steichen decided to ignore cultural and social differences and, in the words of Eric Sandeen (1995, p. 53), “burrowed to a more literally radical level where . . . people could be affected at their roots.” His frame of reference was mainly an American photographic gaze on the children of the world. In the installation of his show, he and his team used cropped, downsized, and oversized images as “building blocks” of “coherent meanings” (Szarkowski 1994, p. 18), thereby following preexisting conventions and a specific style of thought. By combining images to produce a thoroughly constructed set of elements and a coherent flow of different views, Steichen created dramatic frames of reference that did not interrupt viewers’ gazes: the visual regime of his show thus established epistemological concepts of mankind that, in his view, should be seen and anticipated as evident by the viewer. Steichen’s strategy of universalizing and thus naturalizing the specific order of meaning of his show did not work fully all the time, since individual photographs in the show, by referring to the concept of objectivity and by subjecting the mission of the show to critical evaluation, undermined these conceptual aims. Nevertheless, it has to be underlined that Steichen chose his images very carefully in order to propagate an ideal that he achieved by combining corresponding though not identical or contradictory elements.

As stated in the methodological framework, acts of seeing and epistemic practices as they are realized in photography give rise to intellectual concepts and lead to different forms of knowledge. Applied to childhood, this means that knowledge created by the true-to-nature principle is based on the potential of childhood as an ideal of pure mankind. Other concepts of childhood are more committed to objectivity; they foreground contradictory images of childhood and analytically distinguish between real children in different though sometimes similar social and spatial contexts. In *The Family of Man*, deviations from the ideal (with some unintended exceptions) were usually integrated inconspicuously, with the goal of adding, together with the flexible and nonconventional exhibition design, a touch of modernity and dynamic flow of time to the overall nostalgic character and frame of reference of the show.

Photography as a Visual Method of Observation

In her book on photographic portraits of prisoners, Susanne Regener (1999) points out that these photographs, taken within a total institution, establish extremely rigid patterns and conventions of imaging criminals. In *The Family of Man*, Steichen also set up visual patterns, but utilized them in a more flexible way through different arrangements of images, materials, and spatial arrangements. By using attractive modern designs and surfaces, his concept of meaning creation was much more refined and aesthetically conscious. Still, he was extremely keen on persuading the audience of his mission and, in fact, managed to be highly successful in terms of the show's resonance. It is therefore very important to further examine the didactical aspects of the show, to analyze how images and their arrangement in time and space followed certain strategies of evidence, and how these assemblages were expected to shape the perception of “reality” and influence what viewers saw as “real,” “essential,” and “true.” To underline the enormous epistemological impact that the arrangement of images has on the order of knowledge and meaning, I will give an example of how different messages can be created by means of comparison and combination.

One of the two pictures (Fig. 5) I would like to analyze was shot by Swiss photographer Robert Frank (born 1924). In the mid-1950s, Frank travelled through the USA on a Guggenheim Fellowship to work on a photographic portrait of the USA. The result, a book entitled *The Americans*, was first published in Paris in

Fig. 5 Robert Frank,
Fourth of July—Jay,
New York, 1955/1956
(Frank 2008)

Fig. 6 Exhibition catalogue of *The Family of Man*, p. 192

1958, and many of the images, while initially drawing major criticism in the USA, have since become photographic icons (e.g., Frank 2008). None of these photographs had been exhibited in *The Family of Man*; preferring more private and intimate photographs, Steichen excluded those photographs from his show that subjected the USA to a critical gaze or portrayed the country as a particular cultural constellation rather than a universal model of mankind. I would like to compare Frank's photograph with the concluding, oversized image of *The Family of Man* exhibition (Fig. 6). Taken in 1946 by American photographer Eugene Smith (1918–1978), it is entitled “Walk to Paradise Garden.” The image is said to have been the photographer's first shot after recovering from an injury that he had incurred as a war photographer in 1945. According to Eric Sandeen (1995, p. 69), the image was also featured in a 1954 General Electric advertisement campaign. In Steichen's show, it was used to stress childhood as an “eternal hope.” It shows the two children of the artist on a forest trail, walking happily into the bright sunlight, thereby symbolizing a much better future for mankind, religious hope, and the eternal cycle of life. This message was further stressed by the caption “A world to be born under your footsteps . . . St.-John Perse.”

Robert Frank's photograph “Fourth of July,” shot on the US national holiday in 1955, displays the same pattern of childhood in an even more exaggerated manner by highlighting the white dresses of two little girls and positioning them in the center of the image. While these two figures also symbolize innocence and hope, this message is being undermined by the fact that they are walking rather forlornly towards an oversized and dominating American flag that reaches all the way to the top edge of the photograph. The extremely big flag made of poor fabric with multiple patches puts critical emphasis on the USA and its overreaching claim to represent political supremacy and a universal ideal of mankind. This claim is further challenged by the cropped male figures in the right foreground and the young adolescent on the left side, who simply ignore the flag by concentrating on

each other or turning their back on the flag. When we compare the two photographs, the message is markedly different: while Robert Frank's shot conveys a rather critical and contradictory message by depicting a specific social and historical situation, Eugene Smith's photograph is a rather trivial image that stresses purely sentimental aspects and conventional patterns of childhood that are not contextualized in a social setting. Even if Frank's photograph most probably was shot after the opening of *The Family of Man* show in 1955 and therefore could not be included in the exhibition, the overlaps as well as the differences in content are quite evident. Steichen surely would not have included both images within the same thematic block. Frank's photograph would have affected the meaning of Smith's photograph in a way that would have been contrary to, or at least inconsistent with, the overall mission of *The Family of Man*. The show has a strong tendency to naturalize and universalize specific views without giving the viewer too much contradictory information about the particularity of the images and their social settings. This is why the show was able to project a largely unbroken American view of the world. In terms of education, it is important to analyze the manifold possibilities of images to manipulate the creation of meaning by making use of epistemological mechanisms like the ones shown here.

On Display: Epistemological Rationales of Photography and Their Didactic Impacts

This chapter has dealt not so much with the question of how exhibitions concretely affect potential viewers and are received by different audiences (e.g., Priem and Thyssen 2013), but how they are deliberately created as visual displays and sites of public education in order to convey coherent meaning. The focus has not been on the learner, but on the didactic rationale behind the selection and design of images in the context of exhibitions. I have analyzed *The Family of Man* as a thoroughly composed visual learning context by referring to methodologies and theories of the visual that focus on epistemological rationales, the dual structure of images, and material issues of image production. This approach emphasizes the selection of photographs and their arrangement in thematic blocks as a visual policy that in turn focused on photography as a universal language by subtly creating a coherent framework of reference. Within this framework, Steichen and his team managed the dual structure of photography—an accurate rendering of reality on the one hand and a depiction of an ideal on the other hand—by consciously selecting and combining the images. Many of the photographs displayed in *The Family of Man* did not convey specific contextual information and therefore abstained from communicating irritating messages, which in turn would have fostered critical inquiry into notions of particularity or cultural diversity. Modern exhibition techniques such as minimizing, cropping and enlarging images, mounting them on panels, and arranging them in thematic blocks, helped not only to exclude contextual

information and suppress difference and diversity but also to present visual statements of a more private or intimate nature. It was this visual mix that created the seemingly timeless atmosphere of the show.

From a didactic point of view, images in general play a key role in education and instruction. According to the German philosopher of education Klaus Prange (2005), all modes of education can be reduced to gestures of display that demonstrate what should be seen and learned. Within an educational context, activities such as persuading, motivating, punishing, threatening, supporting, or explaining are always based on something that either was or is demonstrated or displayed in the classroom in a literal or symbolic way. By means of literal or symbolic display, the recipients pick up meanings they had not considered before. The recipient or learner thus always has to learn *something*, and this subject of learning is filtered and prepared for the classroom and other learning spaces by using techniques that are similar to exhibition techniques, thoroughly planned operations of display, and the epistemological principles involved. In classrooms as well as in other spaces of learning, the learning outcome is carefully anticipated by didactic strategies that are expected to guide the learner towards what he or she should hear, see, feel, and experience. It is therefore difficult to draw a straight line between the didactics of the classroom and the didactics of exhibitions like *The Family of Man*, between classroom didactics and ways of creating scientific models, between didactics and commercialism, persuasion, and other modes that highly determine what should be seen and learned. Putting things on display is never a neutral activity and always happens in a mediated way within a specific social context and power structure. It is obvious that teaching and learning are based on a certain order of meaning and often take place in hierarchical spaces (e.g., Bennett 1995). In fact, schools and curricula can be characterized as sites of symbolic domination (Bourdieu 2001), where students are often expected to follow the didactic strategies of evidence without questioning how they learn and what they are expected to see. Schools are, after all, spaces of cultural tradition and conventions of thought.

Genre 6 Philosophical Approaches

Introduction

Yusef Waghid

If we consider that interpretation is an attempt to make clear, to make sense of text which might in some way be confused, incomplete, cloudy, unclear, and seemingly contradictory in one way or another (Taylor 1985, p. 1), then interpretation is constitutive of what makes a philosophical approach to educational research what it is. A philosophical approach to educational research is “seeing something as something” or a matter of interpretation—that is, making clear meanings of texts (Cavell 1979, p. 354). It is interpretation that accounts for that which is strange, mystifying, puzzling, unclear, and contradictory and which cannot be distanced from a philosophical approach to educational research (Taylor 1985, p. 17). In several ways, the authors of the eight chapters in this genre attempt to explain learning, teaching, curriculum, evaluation and assessment, educational organizations and leadership, equity, justice, and diversity, policy, and nonformal education—all interrelated educational fields that draw on philosophical approaches to educational research. We try to make sense of, and provide some understanding of our thoughts, speeches and writings in relation to readings and expressions of texts we have authored and perhaps lived in our lives. Our work has been presented as living agents in this text in relation to how we have experienced our situations in terms of certain meanings. In turn, our narratives recounted here are in turn interpreted by the explanations we proffer for our actions. As aptly put by Taylor (1985, p. 27), we meet an important condition of an interpretive science: “making sense of” our lived experiences. Of interest in the practice of interpretation is the agency of the narrators in this philosophical genre. In our own interpretations as captured and reflected in our narratives, we share our capacity for thought, speech, and our desire to search for meaning. Through our interpretations, we share our understandings, attitudes,

e-mail: yw@sun.ac.za

and justifications in relation to the social practices in which we happen to work. Hence, our interpretations are intersubjective meanings, “ways of experiencing action in society which are expressed in the language and descriptions constitutive of institutions and practices” (Taylor 1985, p. 38). I now offer an exposition of the interpretive stances adopted by ourselves as we endeavor to give meaning to our educational research approaches vis-à-vis our specific educational fields.

Lesley Le Grange’s poststructuralist stance on interpretation through his explication of learning is nuancedly informed by his recent analysis of the work of Deleuze and Guattari. He adopts the view of Deleuze and Guattari that concepts are created and always in becoming—that is, there is seemingly no end to how concepts are constructed in relation to the social context in which they become. In short, for him, interpretation as philosophical inquiry means making sense of concepts as they become in sociohistorical, real-world contexts. Commensurate with the approach of inquiry used by Deleuze and Guattari, he endeavors to reappropriate Thomas Kuhn’s concept of paradigm as exemplar, Turnbull’s concept of science as performance, and Jegede’s concept of secured collateral learning in his attempt to transform the notion of secured collateral learning. In a way, his interpretation is aimed at making possible new ways of doing and becoming that can alter classroom practices, in particular learning. His interpretive approach to educational research is evident in his annulment of particular hegemonic Western understandings of learning that do not take into consideration what is indigenous, other, and different.

Yusef Waghid’s pragmatic stance on interpretation is couched through his philosophical engagement with university teaching, in particular his critical analyses of the seminal works of democratic education theorists such as Habermas, Benhabib, Callan, Nussbaum, Marion Young, and Cavell. His interpretation of teaching as a deliberative activity is examined in relation to practices such as compassionate imagining and responsible action. Central to Waghid’s philosophical analysis of democratic education in relation to university teaching is that the practice of democratic education cannot be realized through belligerent engagement alone but also manifests more profoundly in teaching if situated within other related actions such as showing compassion and being responsible. Waghid’s stance proffers a view of interpretation aimed at cultivating pedagogical activities along the lines of communitarian and responsible action—that is, action aimed at actuating pragmatic change in university teaching.

Christine Winter’s deconstructive reading of (geography) curriculum policy foregrounds interpretation as a response to the notion of enframing educational research as technology. In a deconstructive way she argues that enframing of technology leads to the valorization of specific standardized educational research methodologies in the form of “methodolotry.” And, because enframing closes down the possibilities of other thoughts and actions about the concept of education and of social and economic life, for example, the ethical and political, she considers it (enframing) to be a problem. In other words enframing educational research is to render it as totalized, structured in pre-calculated ways, and limited to certain orthodox operations and therefore closed to new possibilities. She troubles her initial philosophical approach to educational research which was preoccupied

by an enframing of the educational research process, that is, as necessarily “comprehensive, rigorous and systematic.” For her, enframing obscures other substantive ways of thinking and doing as it is too focused on empirical data collection, analysis, and interpretation; compartmentalization of “the ethical” at the operational level; linear, step-by-step technical process; and a preoccupation with outcome/impact. Instead, drawing on Heidegger, Derrida, and Levinas, she makes a cogent argument for an encounter with the Other which opens the possibility of becoming an ethical being, open to alternatives and unfettered by the pre-suppositions of orthodox, enframed research. It is the opening of thought beyond domestication, she avers, that moves educational research towards the unexpected, the uncalculated, where multiple voices are heard, and a different language is summoned, a language that is open to the future, to something unthinkable.

Guided by a philosophical analysis of Mouffe’s treatment of liberal democracy as a site of conflict and struggle in relation to citizenship competency tests in Colombia, Andrés Mejía’s chapter focuses on the presence of exclusions and inclusions in such evaluations and assessments. That is, his philosophical analysis of evaluation and assessment aims to accentuate the tensions in a universalist approach to democratic citizenship education that couches the practice as something that recognizes all individuals as equal and that assumes that they all share the same conditions that enable them to be citizens. He illustrates through identifying tensions that appear in his object of analysis vis-à-vis tests for national citizenship competencies in Colombia that different interpretations resulting from accommodation of political conflict should be introduced in the various decisions that give substance to politics in a liberal democracy. More specifically, in his analysis he summons up various suggestions for policy and action in educational evaluation and assessment in which the possibility of political conflict and struggle is protected, particularly as regards citizenship education and its evaluation in Colombia. As such, he firstly argues for the need to promote other forms of assessment on different levels (especially in municipalities, schools, and universities) that can exert a real influence on the kind of citizenship that is actually taught in educational institutions; and secondly, through minimalism, he argues for the need to make explicit the inclusions and exclusions present in the current tests.

Janet Orchard’s focus on educational organization and (school) leadership is informed by a notion of desirable democratic leadership which she avers is possible within the existing structures that commonly regulate schools. Premised on the idea that notions of organizational leadership “do not float freely in the discourse of textbooks of educational administration or in the prescriptions of technical primers of school management,” she develops interpretations of the concept in relation to the particular context(s) in which they are situated. Her philosophical approach is both interpretive and interdisciplinary, founded on sociological methods in tandem with philosophy of educational research. She draws on Taylor’s “justification of belief” as a form of interpretive inquiry to develop a defense of critical and democratic school leadership. Her philosophical leaning towards philosophy of educational research in relation to democratic school leadership is applied in different ways such as through clarifying concepts, highlighting logical

contradictions, considering values and leadership, asserting what should be the case, setting out a practical alternative, and anticipating likely concerns and addressing them. Her investigation makes three new contributions to knowledge. Firstly, by extending arguments for democratic school leadership on direct or deliberative lines to representative forms of democratic school leadership; secondly, by resolving a paradox between school leadership and learning, both at the level of theory and in relation to pedagogy; and thirdly, she proffers an interdisciplinary argument when seeking to interpret education policies and practices within the sociopolitical context in which they are situated, as well as the power of a theoretical argument informed by empirical data. The alternative account of leadership that she proposes is that while individual school leaders should be competent and efficient at the tasks they undertake to do on behalf of others, their actions should be consistent with the values and beliefs of the particular society in which their leadership practice is situated.

Penny Enslin and Mary Tjiattas focus on a case study where they show how methods of philosophical interpretation can illuminate fundamental questions concerning education, justice, and democracy, more specifically of a deliberative kind. Through analytical interpretive research called “reflective equilibrium”—a method made famous by Rawls—they engage coherently with evolving positions on social justice in relation to equity, justice, and diversity. Their often speculative work develops a defense of qualified universalism, because they remain convinced that, aside from its conceptual strengths (including its ability to respect many of the considerations advanced in favor of opposing, anti-universalist positions), such an approach is indispensable to addressing contemporary problems of justice in education, both domestically and globally. In the main, their interpretive endeavor attempts to resolve the tensions between current theoretical positions and the demands and constraints imposed by contemporary global political, ethical, and educational issues.

Through drawing on the terminology of Foucault, Maarten Simons’s study of governmentality uses a specific analytical frame that focuses on processes of governmentalization. His philosophical approach to the interpretation of policy documents and instruments aims at understanding the role of information for education policy of the Flemish government in the current global/European context and for schools in the Flemish policy context. His philosophical approach to interpretation is not hermeneutical. The aim is not to come to an understanding or to grasp the true meaning of particular policy decisions, policy measures, and polity texts by taking into the account the historical or social context, the intentions of actors, or a particular systematic logic. Instead, he applies an interpretative analytics that offers a “cartography” that “maps” the present focusing on what is said and done and what allows it to be said and done. This Foucauldian approach of interpretative analytics assumes that questions about legitimacy—for instance, debates about adequate information or relevant quality indicators for education—only come to the foreground if a (self-)understanding in terms of comparison, quality, and information circulation has emerged.

Stefan Ramaekers's philosophical report attempts to address particular developments in the area of parenting support (specifically in Flanders) from the end of 2009 until now. For him, interpretation is at work at "every stage" in reporting on developments regarding parenting support in Flanders. That is, interpretation is not so much what has emerged from his research but rather "the coming about of the argument" itself. This leads him to posit that doing philosophy is, in an important sense, always personal. And, the philosophical writing of parenting support that he presents in his chapter is a kind of writing that always already locates and involves him as a person, thus accentuating the dimension of being human as one becomes immersed in philosophical research in education.

In light of the remark that all educational research of a philosophical kind is constituted by our humanity is to acknowledge doing interpretive work is a matter of bringing into play our individual "singularities" that situate our endeavors in what Agamben (1999, p. 81) refers to as a "potentiality." To say our philosophical work has potential is to say that our philosophical endeavors have the potential to do something—that is, produce more nuanced meanings, better understandings, or provide more substantive justifications. And, by doing the latter would imply that our interpretations have brought about an alteration in thought, speech, text, or form of living. Simply put, our interpretations have given rise to a "becoming other" (Agamben 1999, p. 179), albeit other ideas, practices of new possibilities for being. The kind of potentiality mentioned here should not be conflated with having realized an actuality that points to mastery and conclusiveness. Rather, to say that our work has potentiality is to say that our interpretive ways "give itself to itself" (Agamben 1999, p. 184)—that is, there is always more to learn, more to understand, and more to know in reference to the improbable, the unexpected, the unpredictable. In a way, our philosophical work presented in this volume is situated within our own potentialities.

6.1 Indigenous Students' Learning of School Science: A Philosophical Interpretation

Lesley Le Grange

Introduction

There has been some interest into inquiring about learning in Philosophy of Education over the past decade or so. These inquiries reflect an array of philosophical strategies and diverse emphases on learning. For example, in 2003 a special issue of the *Journal of Philosophy of Education* (JOPE) focused on upholding the integrity of teaching and learning. This special issue emerged as a response to Alasdair MacIntyre's argument that teaching is not a practice but an important ingredient of all practices. In one of the articles published in this special issue, Hogan (2003) argues that learning (along with teaching) is a distinctive way of life. Such a view of learning sees it, "as an unfinished and unfinishable undertaking" (p. 221). In presenting his argument, the author draws inspiration from "Socrates of Athens" and also draws on insights from more contemporary works, in particular Lyotard's notion of performativity. As is the case with much contemporary work in Philosophy of Education, a single philosophical strategy cannot necessarily be identified in Hogan's work. Traces of conceptual analysis might be evident (clarity of expression and economy of words), deconstruction of learning associated with performativity, and a normative–ethical strategy evident in the central argument about what learning ought to be—"a distinctive way of life."

Another inquiry into learning is that of Biesta (2004, 2006) who focuses on the discourse of life-long learning—a concern with what he terms "a rise of a new language of learning." Biesta (2004) argues that the emergence of a language of learning is not an expression of a single underlying agenda, but should rather be understood as the unintended outcome of a range of different developments:

theories of learning, the silent explosion of learning, and the erosion of the welfare state. Theories of learning refer to developments in the field of the psychology of learning and specifically the emergence of constructivism and socio-constructivism. Constructivist theories of learning shift the emphasis from teacher to learner, since they are premised on the view that students actively construct knowledge and understanding, and that knowledge cannot be transferred intact from teacher to learner. By the “silent explosion” Biesta (2004, p. 73) refers to the mushrooming of nonformal kinds of learning such as “fitness centres, sport clubs, self-help therapy manuals, internet learning, self-instructional videos, DVD’s and CD’s etcetera.” The rise of a language of learning is also associated with the decline of the welfare state and the rise of neoliberalism. The welfare state provides all citizens (rich and poor) with health care, security, education (it claims to provide education, but what it mainly provides is schooling), and so on. Biesta (2004) argues that within the neoliberal state, “value for money” (p. 33) has become the key principle in many of the transactions between the state and taxpayers. The state’s role has shifted from provider of the mentioned goods to taking on a monitoring role with tighter systems of inspection and control and prescriptive protocols over education—what Ball (2003) refers to as a rising culture of performativity/accountability. In this context, Biesta (2004) argues, parents are viewed as purchasers of the services that education/schooling provides for their children, and the suitable name for the consumer is therefore the learner. Biesta (2004) argues that one of the main problems with the new language of learning is that it makes possible the redescription of the process of education in terms of an economic transaction, that is, the learner (who has the needs) is the consumer, the teacher or education institution the provider, and education becomes a commodity. Viewing education as an economic transaction dilutes education processes to technical concerns of efficiency and the effectiveness of such processes, neglecting questions concerned with the content and purpose of education, which Biesta (2004) argues should form part of the education process—that asking questions about the content and purpose of education are important educational questions. As in the case of Hogan, no single philosophical strategy is employed by Biesta. Biesta (2004, 2006) analyzes concepts, he deconstructs (lays bare the multiple layers of a new language of learning), and employs ethics in his argument that a language of learning limits the possibilities of being and becoming.

A further example of an interest in learning in Philosophy of Education over the past decade was a special issue on *New Philosophies of Learning* (Cigman and Davis 2008) published in *JOPE*. The special issue comprised several sections which focused on the following topics: brain-based learning, learner categories, ICT and learning, the enhancement agenda, noncognitive intelligences, and students, teachers, and reflection. Given the focus on “new philosophies of learning,” much of the focus of the special issue is on the analysis of concepts (clarifying the meaning of concepts). For example, in his article Howard-Jones (2008) clarifies what learning is from the view of neuroscience and from the view of education. Similarly, Goswami (2008) clarifies the principles of learning from a cognitive neuroscience perspective and explores its implications for teaching.

The brief review into learning by philosophers of education and the strategies they employ serve as a useful background to what will be reported on in this chapter. In this chapter I shall report on a different aspect of learning, that is, how indigenous students learn school science. The way(s) in which indigenous students learn about natural phenomena through their own sociocultural interpretive frameworks conflicts with school science which is Western based, potentially causing cognitive dissonance. Moreover, I shall provide a particular interpretation of this research that uses Deleuzo–Guattarian concept creation as a philosophical strategy rather concept analysis. This strategy does not focus on what a concept is, what it ought to be, but what it might become. The rest of the chapter is divided into the following parts: part 1, the project (non-Western students' learning of school science), and part 2, interpretation (concept creation). I “end” the article with some parting thoughts.

Part 1: The Project

Non-Western Students' Learning of Science

The inquiry reported here is a response to a complex problem concerning the learning of school science in an African context. I conducted the inquiry firstly in critical response to the school effectiveness movement. The focus of school effectiveness research (SER) is on how school factors influence scholastic achievement of students. I argued that SER has shortcomings because factors outside the school such as students' sociocultural frameworks impact on what happens inside schools (see Le Grange 2007). Secondly, I conducted the inquiry to extend research conducted on this issue over several decades. Thirdly, I conducted the inquiry response to a challenge presented by postapartheid curriculum frameworks in South Africa, which mandate that indigenous knowledge forms part of all school subjects.

The issue of conflicting world views is of course not unique to Africa. It is a challenge faced by all indigenous peoples in countries that have become Westernized. Even in Western societies, different world views interact and play out in educational contexts. For example, what a student learns about the world through religion may be different from what he/she learns in school science. In the United States of America (USA), there is, for example, an ongoing debate on evolution versus creation and to what extent opposing views should be included in the school curriculum. For non-Western students interaction between two world views characterizes much of their school experience, complicating the learning process and potentially resulting in cognitive conflict or, as the literature describes it, cognitive dissonance/perturbation. Importantly, in Africa south of the Sahara, schools are the sites where most students first experience the interaction between African indigenous and Western world views. Therefore it might be necessary for teachers working in these contexts to be aware of this interaction and understand the

way it could complicate the learning process. By extension inquiry into this interaction could provide significant insights. According to Jegede (1999, p. 119), the culture of a learner's immediate environment plays a significant role in learning and determines how concepts are learned and stored in the long-term memory as schemata.

The past three decades have witnessed much research conducted on complications indigenous students experience when learning science (see, e.g., Ogawa 1986; Ogunniyi 1987, 1988; Jegede 1996, 1999; Jegede and Okebukola 1989; Jegede and Fraser 1990; Okebukola and Jegede 1990;). A summary of key findings of reported research on how indigenous students learn science shows that:

- Sociocultural background has a greater effect on learning than subject content.
- The indigenous world view inhibits the initial adoption of Western science by students.
- Indigenous (non-Western) students are involuntarily selective when making observations in science classrooms.
- The indigenous learner might explain natural phenomena in ways that appear as non-rational in the perception of Western science, but the learner experiences no contradictions in his/her conceptual system.
- Knowledge learned about school science and through traditional ways is compartmentalized by the learner giving rise to what Wiredu (1980, p. 23) has termed "a kind of ethnic schizophrenia" (Adapted from Jegede 1999, p. 128).

Jegede (1999, pp. 128–129) identifies two important implications of these findings. Firstly, any science curriculum that does not take particular account of the indigenous world view of the learner risks destroying the framework through which the learner is likely to interpret concepts. Secondly, an indigenous learner can perform excellently in a Western science classroom without assimilating the associated values. As Jegede (1999, p. 129) writes: "[A] 'good' scientist at school can at home be a 'traditionalist' without any feeling of cognitive perturbation or dissonance." The latter claim will become clearer when Jegede's theory of collateral learning is discussed later.

There is a renewed interest in indigenous knowledge and school/university science (see, e.g., Ogunniyi 2004; Le Grange 2004a, b) in postapartheid South Africa. This interest is the consequence of greater prominence given to indigenous knowledge systems (IKS) internationally and the inclusion of indigenous knowledge as a principle underpinning all versions of postapartheid curriculum frameworks. In the most recent version of the national curriculum, Curriculum Assessment and Policy Statement (CAPS), the following is said about indigenous knowledge: "Valuing indigenous knowledge systems: acknowledging the rich history and heritage of this country as important contributors to nurturing the values contained in the Constitution" (DBE 2011, p. 5). The relationship between indigenous knowledge and science in this curriculum is evident in one of the three specific aims of CAPS for Life Sciences which states: "Specific Aim 3 . . . relates to understanding the applications of the Life Sciences in everyday life as well as understanding the history of scientific discoveries and the relationship between indigenous knowledge and science" (DBE 2011, p. 13).

The body of literature that has been produced over the past three decades, the reality that indigenous knowledge systems reside among the majority of South Africans, and the fact that the topic has been given attention in postapartheid curriculum frameworks provide reasons for exploring the topic in greater detail. To specifically explore how indigenous students learn school science, we turn to Jegede's theory of collateral learning.

A Theory of Collateral Learning

Jegede (1995, 1999) posits that a duality of thought is created in the memory and schemata of indigenous students when they learn Western science, because of the resilience of the indigenous knowledge framework. It is also a way they use to cope in a learning environment that is hostile to what indigenous students bring to the science classroom. He argues that this situation results in collateral learning. Jegede (1999, p. 133) identifies four types of collateral learning: parallel, simultaneous, dependent, and secured. Importantly, these types of collateral learning should not be viewed as disparate but rather as occupying a continuum, and that "a student could be helped to progress through them for meaningful learning to occur" (Jegede 1999, p. 133).

Parallel collateral learning occurs when students acquire and maintain opposing schemata about a concept and idea in their long-term memory when learning new science concepts. The learner does not experience conceptual conflict, but readjusts the memory to accommodate changing contexts of learning. Jegede (1999, p. 134) writes that parallel learning is particularly evident when indigenous students first come into contact with school science and that these students allow the new information to coexist in their schemata while they are still attempting to make sense of them. With respect to simultaneous collateral learning, Jegede (1999, p. 134) points out that for a concept to be embedded in the long-term memory of a learner, the information needs to be processed over a period of time. Therefore, at the point when students are exposed to a new concept in the science classroom, they might still be processing information in relation to this concept that they learned at home or in their cultural/environmental setting. A situation arises when students simultaneously learn about a concept from two different world views. Simultaneous collateral learning thus places students in a position to assess similarities to and differences between ideas from different world views in relation to the concept being learned. Dependent collateral learning occurs when schemata from one world view are presented which challenge those of another world view enabling the learner to modify existing schemata. No radical restructuring of the existing knowledge base occurs, but learning of a new idea is triggered by what is already known. Jegede (1999, p. 134) writes: "This means that a currently held belief (indigenous or otherwise) is held tentatively to be altered by the construction of new knowledge from the new schema or the rejection of a current one." Secured collateral learning involves recognizing that acquiring knowledge or an intellectual

skill is a gradual and incremental process rather than a single event. To ensure that this prolonged process of learning is effective, the learner has to resolve what he/she might experience as cognitive conflict or mental dissonance in the knowledge base embedded in his/her long-term memory. In other words, the indigenous learner has to resolve the mental conflict created by the Western science learned and the indigenous knowledge base brought to the classroom. The process of resolving the cognitive dissonance culminates in the learner evaluating seemingly disparate explanatory frameworks and “draws from them a convergence towards commonality” (Jegede 1999, p. 135). He writes: “This strengthens the learning process and secures the ‘new conception’ in the long-term memory” (Jegede 1999, p. 135).

The discussion on collateral learning demonstrates the point made earlier that, rather than being seen as disparate, the four types of collateral learning should be viewed as a continuum against which science learning can be understood in a sociocultural framework. I aver that Jegede’s (1995, 1999) thesis of collateral learning contributes greatly to theoretical debates on science learning in non-Western and multicultural contexts. Moreover, his work has practical significance for policy makers and science teachers who perform their work in such contexts. However, much of his discussion frames the African indigenous world view and Western world view as being disparate. These world views are disparate only if science or knowledge is understood as representation. However, they are not disparate if science is also viewed as performance. I shall argue that science is both representation and performance, and that if science as performance is emphasized, greater credence might be given to Jegede’s notion of secured collateral learning. Science as performance is discussed next.

Science as Performance

I argue that Western science and indigenous knowledges could be viewed either as disparate epistemologies or as complementary frameworks depending on whether one views science/knowledge as representation or science/knowledge as performance. In his seminal work *The Structure of Scientific Revolutions*, Kuhn (1970) identifies two distinct notions of the term paradigm, namely, paradigm as disciplinary matrix and paradigm as exemplar. The former denotes the “entire constellation of beliefs, values, techniques, and so on shared by the members of a given community” (Kuhn 1970, p. 175). The latter refers to some sort of element in that constellation, “the concrete puzzle-solutions which, employed as models or examples, can replace explicit rules as the basis for the solution of the remaining puzzles of normal science” (Kuhn 1970, p. 175). Turnbull (2000, p. 8) points out that Kuhn’s (1970) first use of the term paradigm (the main focus of his book) is somewhat analogous to a global theory such as Newtonian physics and is subject to revolutionary change. The second use (exemplar), on the other hand, is closer to the standard meaning of the term—“a sample problem solution which can be extrapolated to other problems” (Turnbull 2000, p. 8). Exemplars are based on

agreements about which kinds of problems are sufficiently similar so that they can be treated in the same way. The implication of this is that disparate problems can be perceived as being similar and known techniques and solutions can be applied to them. Turnbull (2000, p. 8) notes that exemplars are the product of tacit knowledge that is learned by doing science rather than by acquiring rules for doing science. Table 1 below illustrates a representationalist perspective of knowledge, where African indigenous knowledge is viewed as distinct from Western science. The table does not include all items that Ogunniyi (2004, pp. 292–293) incorporated. A few items are included for illustrative purposes.

To borrow Kuhn's words, "the entire constellation of beliefs values, techniques," and so on shared by members of traditional African and Western communities is perceived as distinctly different. Separating knowledge systems/world views conceptually helps us to think and learn (i.e., for heuristic purposes). However, there is a danger of our constructions/representations being perceived as mirroring reality to the extent that we try to make reality fit representations of it. For example, I remember that as a university science student, when asked to sketch objects that I had observed with the aid of a light microscope, I (and my fellow students) often turned to the textbook diagram of the object to measure the accuracy of my work. As a student of science, my confidence was not in the work I had performed (what I drew from what I had observed), but in how accurately it resembled the representation(s) of the object(s) as it/they appeared in a textbook. School and university students learn early on to view science as representation to the neglect of science as performance. What students do not learn is the situated messiness of science and, for that matter, the situated messiness of all knowledge production processes. Furthermore, in representations of Western and African indigenous knowledges,

Table 1 Assumptions underlying science and indigenous knowledge systems

Assumptions underlying indigenous knowledge systems	Assumptions underlying Western science
Indigenous generalizations have causal, personal, rational/non-rational, and logical/nonlogical dimensions	Scientific laws/generalizations are causal, logical, rational, impersonal, and universal
Language is important as a creative force in the workings of both the natural and the unnatural worlds	Language is not important to the workings of natural world
Indigenous knowledge is a critical part of culture	Science is culture-free
Facts within an indigenous knowledge corpus are both tested and experiential	Scientific facts are tested observations
Indigenous knowledge is based on a monistic world view	Science is based on a dualistic world view
Generalizations within the indigenous knowledge systems are relative statements which do not purport to have universal application	Scientific generalizations (laws and theories) are declarative statements with universal application
Humans are capable of understanding only part of nature	Humans are capable of understanding nature

Adapted from Ogunniyi (2004, pp. 292–293)

Western science often is portrayed as superior, universal, and as not having the “cultural fingerprints” that appear to be much more conspicuous in other knowledge systems (Gough 1998, p. 508). Also, representations of Western science are used as criteria for declaring “other” knowledges as nonscience. A representationalist perspective on knowledge therefore produces an incommensurability perspective, that is, that Western science and indigenous knowledges are incompatible or that indigenous ways of knowing may be recognized as a particular way of understanding the world, but that it is not science. A representationalist view of knowledge is reflected in the CAPS for Life Sciences:

“All knowledge stems from views on how the world works. One of the differences between modern science (and technology) and traditional indigenous knowledge systems is that they have their origins in different world views. Students should understand the different cultural contexts in which indigenous knowledge systems were developed (DBE 2011, p. 17).” However, understanding knowledge production as performance enables seemingly disparate knowledges to work together so as to produce new knowledge spaces, what Turnbull (1997, p. 560) terms “third spaces” or “interstitial spaces.” It is widely recognized by sociologists of scientific knowledge and philosophers of science that, even though knowledge systems may differ in their epistemologies, methodologies, logics, and cognitive structures or in their socioeconomic contexts, a characteristic that they all share is their localness (see Latour 1988; Rouse 1987; Shapin 1994; Turnbull 1997, 2000). Moreover, knowledge is not simply local but located/situated, that is, it has place and creates space. When knowledge is produced, it is assembled from heterogeneous components and given coherence through the deployment of social strategies and technical devices. As Star (1989, p. 388) writes:

[Knowledge production] is deeply heterogeneous: different viewpoints are constantly being adduced and reconciled . . . Each actor, site, or node of a scientific community has a viewpoint, a partial truth consisting of local beliefs, local practices, local constants, and resources, none of which are fully verifiable across all sites. The aggregation of all viewpoints is the source of the robustness of science.

As mentioned, the common element of all knowledge systems is their localness. However, their differences lie in the way they are assembled “through social strategies and technical devices for establishing equivalences and connections between otherwise heterogeneous and incompatible components” (Turnbull 2000, p. 13). As Turnbull (1997, p. 553) writes:

Some traditions move it and assemble it through art, ceremony and ritual; [Western] science does it through forming disciplinary societies, building instruments, standardisation techniques and writing articles. In both cases, it is a process of knowledge assembly through making connections and negotiating equivalences between the heterogeneous components while simultaneously establishing a social order of trust and authority resulting in a knowledge space.

Viewing knowledge in this way enables seemingly disparate knowledge traditions to be integrated so as to disrupt the dichotomy between Western science and African indigenous knowledge. In short, science as representation refers to: abstractions such as theories and laws; the idea of a scientific method; descriptions of the

world in textbooks; and so on. Science as performance, however, refers to the doing of science, that is, that science is a human and social activity that is messy, heterogeneous, and situated.

I aver that effective science education in South Africa (and similar contexts) depends on understanding how non-Western children learn. Jegede's thesis of collateral learning provides useful insights into how indigenous students learn Western science. His thesis has important implications for teachers' work and teacher education programs. Firstly, teachers need to understand the importance of not denigrating or discrediting the indigenous knowledge that students bring to the classroom because it serves as the framework against which they learn science and also provides the trigger for learning science. Secondly, the four types of collateral learning provide teachers with a framework to mediate and scaffold indigenous students through different phases of science learning. Importantly, national curriculum frameworks provide legal enablements for facilitating processes towards secured collateral learning, since indigenous knowledge systems form part of the discursive terrains of all learning areas/subjects. However, secured collateral learning might only be possible when science is viewed not only as representation but also as performance.

But how might students be scaffolded through the different phases of science learning? Jegede and Aikenhead (1999, p. 55) suggest that the teacher needs to take on the role of cultural broker, that is, he/she should help students mediate or negotiate cultural borders. They suggest that in some instances the teacher needs to be a tour-guide cultural broker and in other instances a travel-agent cultural broker. When cultural border crossing (from life-world culture to school science culture) is difficult for the learner, the teacher needs to take on the role of a tour-guide, whereby the teacher takes students to the principal sites in the culture of science and coaches them on what to look for and how to use it in their everyday lives. In doing so, the teacher uses an extended repertoire of methods. In other instances where students require less guidance when border crossing, the teacher may take on the role of travel agent, whereby the teacher provides students with incentives such as topics, issues, activities, or events that create the need to know the culture of science. In other words, border crossing occurs through academic bridges and less through guidance. Scaffolding students through parallel and simultaneous collateral learning would require the teacher to play the role of tour-guide, whereas scaffolding students through/from dependent learning to secured collateral learning might require the teacher to chiefly take on the role of travel agent. Needless to say, both approaches assume that learning/teaching occurs within an ecocultural paradigm, that is, that science content used in classrooms strongly relates to and uses the life world of the learner as the focus and starting point of learning. Furthermore, both approaches are dependent on interactive teaching strategies. By way of illustration, two interactive strategies will now be discussed.

In South African classrooms, students could experience cognitive dissonance when learning about certain phenomena in science classrooms. For example, the

scientific perspective that lightning is caused by the discharge of electricity between clouds or from a cloud to the earth may be in conflict with students' cultural understanding that lightning is caused by, for example, witchcraft. Two strategies may be useful in helping students to deal with cognitive perturbation in this instance. The first strategy is what Bajracharya and Brouwer (1997, p. 436) termed "a narrative approach." This approach involves arranging students in small group discussions on questions such as, "Is lightning caused by witchcraft?" What this approach does is to provide to a small degree, a conceptual ecocultural paradigm that can serve as the basis for the teacher to take on the role of cultural broker. The second approach is one that was introduced by Aikenhead (1996), where border crossing is made concrete by asking students to divide the page in their notebook in half to form two columns: "my ideas" and the "culture of science ideas." To return to the lightning example, students would record their own ideas and beliefs about lightning in the one column and in the other column what they learned about lightening in the science classroom. This strategy/activity enables the learner to consciously move back and forth between the everyday world and the world of science: "switching terminology explicitly, switching language frameworks and conventions explicitly, switching conceptualizations explicitly" (Jegade and Aikenhead 1999, p. 57). The teacher is able to assess students' recordings and navigate his/her own changing roles of tour-guide and travel agent so as to facilitate students' border crossings. These strategies will help students through the first phases of collateral learning, but secured collateral learning is evident when students are able to write about their ideas about lightening on one page, with only one column.

In summary, I have argued that much of Jegede's work and his thesis of collateral learning remains focused on the representational aspects of knowledge, in the sense that Western science and indigenous knowledge are seen as disparate. I suggest that, although science is representation and that it is useful to distinguish between Western science and indigenous (at a conceptual level) knowledge, it is also important for science to be viewed as performance. When the performative side of science is emphasized, then it is understood as a situated activity which connects people, sites, and skills: science is locally produced through processes of negotiation based on the social organization of trust and not empirical verification/falsification. Viewed in this way, it is possible to compare seemingly disparate knowledge traditions more equitably—in other words, such a view decenters modern Western science—that modern Western science is one way of knowing and not the way of knowing. Science as performance provides the basis for secured collateral learning and as such the basis for effective science education in (South) Africa. In this instance, the focus should be on doing science—on science as an activity (how it is performed). Viewing science as performance shifts the angle of vision on the problem of cognitive dissonance in science classrooms. But, how might we interpret this work philosophically? I turn to a discussion on this next by offering an interpretation using a Deleuzo–Guattarian philosophical strategy, concept creation.

Part 2: Interpretation (Concept Creation)

Deleuze and Guattari (1994, p. 5) point out that the philosopher is the concept's friend. By this they mean that philosophy is not only an activity that consists in "forming, inventing, and fabricating concepts," but more rigorously, it is the discipline of creating concepts. For them, philosophy is also about putting concepts to work in new ways (Stagoll 2005, p. 50). Deleuze argues that Western philosophy has tended to merely use concepts as abstractions for categorizing phenomena—to express the essence of phenomena (Stagoll 2005, p. 50). Individuals would therefore be labeled, ranked, and measured according to a norm (concept). But what do Deleuze and Guattari mean by a concept? For Deleuze and Guattari, a concept is not a label for naming things (objects or phenomena in the world). Rather, they are creations that bear testimony to the positive power of thinking as an event of life (Colebrook 2002). In other words, philosophers create concepts to transform life—concepts do not represent life. Importantly, they distinguish between concepts used in everyday life and philosophical concepts. Deleuze's theory of concept creation only has application to philosophical concepts and not to everyday concepts of recognition, such as flowers, bicycles, tables, and trees. For Deleuze philosophical concepts are "vital concepts"—concepts that have to be created. In the creation of "vital concepts," the concept posits itself and object simultaneously. This is different to everyday concepts of recognition, such as the concepts of sun and moon—a philosophical concept is self-referential (Smith 2012, p. 128).

Moreover, Smith (2012, pp. 122–123) points out that from a Deleuzian perspective, concepts do not have an identity but only a becoming. He shows that even in Deleuze's own corpus, concepts such as intensity undergo their own internal mutations. Concepts for Deleuze are singularities/multiplicities. For Deleuze, philosophers are just as creative as artists. The difference lies in what they create. For Deleuze, philosophers create concepts, artists create sensible aggregates of percepts and affects, and scientists create functions. One might raise questions about Deleuze's crude distinction about what philosophy, art, and science create. Smith (2012, p. 127), however, points out that the point of the distinctions is to provide a point of reference from which to assess and explore the resonances and exchanges (or the mutual becomings) that take place between the three domains. As Smith (2012, p. 127) elaborates:

Concepts . . . are necessarily inseparable from affects and percepts; they make us perceive things differently (percept) and they inspire new modes of feeling in us (affect) . . . thereby, modifying our power of existing.

Holland (2005, p. 52) points out that for Deleuze the activity of concept creation is forced upon the philosopher rather than initiated by him/her. For Deleuze there are three ways in which thought is provoked. Holland (2005, p. 52) contends that in his early works, it was paradox/logical contradictions that provoked Deleuze's thoughts—in other words, it was thought itself that provoked thought. The second provocation is associated with Deleuze's collaboration with Guattari, which saw the locus of stimulus to thought shifting outside of thought and also outside of

philosophy. The provocation of thought arises from fields ranging from biology, geology, physics, music, and so on. Holland (2005, p. 52) argues that the third kind of provocation arises from the connection between philosophy and its sociohistorical context. In this instance the nature of the problems is not philosophical but the solutions or articulations that are furnished are philosophical. Put differently, thought is not provoked by philosophical problems but by problems forced upon the philosopher by its real-world context. As Deleuze and Guattari (1994, pp. 99–100) write:

Actually, utopia is what links philosophy with its own epoch, with European capitalism, but also already with the Greek city. In each case it is with utopia that philosophy becomes political and takes the criticism of its own time to its highest point. Utopia does not split off from infinite movement: etymologically it stands for absolute deterritorialization but always at the critical point at which it is connected with the present relative milieu, and especially with the forces stifled by this milieu.

So, for Deleuze and Guattari philosophy (through concept creation) is about proposing solutions to problems faced by humanity at a given time. They contrast philosophy with science, which they argue aims to capture states of affairs as they are—science aims to mirror reality—to produce accurate descriptions of the world. In contrast, philosophy aims at transforming the world—or our understanding of the world. It is in this context that Deleuze and Guattari (1994, p. 84) write: “Philosophy does not consist of knowing and is not inspired by truth. Rather it is categories like Interesting, Remarkable, or Important that determine success or failure.”

But, how does all of this relate to learning by indigenous students? Deleuze (1991, p. 33) argues that in order to respond to any event, one needs to understand its underlying problem. The evolution of organisms should be understood as a response to a problem. For example, the evolution of the eye should be understood as an organism’s problem in responding to light (Colebrook 2002, p. xxxiv). Similarly, the creation of concepts should be understood as responses to problems. The concept collateral learning and its four types should be understood as a response to a problem. At a micro level the problem concerns how indigenous students learn school science, which is embedded in a cultural framework that is different to the sociocultural framework in which they have been socialized. This could potentially lead to cognitive dissonance, impeding their learning of (school) science. However, the problem is broader than this. The problem should be understood as challenges faced by postcolonial societies and, in this particular case, also a postapartheid society. Colonialism and European imperialism has denigrated the knowledges of indigenous peoples across the globe, and the homogenizing and domesticating effects of globalization might further limit the becomings of indigenous peoples generally, but more specifically the young. At the same time the work postcolonialists, feminists, sociologists of science, philosophers, and others have opened up ways of viewing science differently so that it can be decentered—be viewed as one way and not the way of knowing. Globalization also affords possibilities for the formation of new solidarities—and in this regard we have witnessed the internationalization of indigenous peoples and

their knowledges, for example. In postapartheid South Africa, the promotion of indigenous knowledge, including its incorporation in the school curriculum, potentially opens up new pathways for the becoming of the young. The problem is how to open up multiple becomings of the young and avoid indigenous ways of knowledge from being absorbed in what Foucault (1972) referred to as a “Western cultural archive.”

The philosophical activity of creating concepts such as collateral learning and science as performance needs to be understood as a response to the problem outlined above. As such, the approach is akin to the third provocation that Holland (2005) identifies, where philosophy connects to its sociohistorical context—“what links philosophy with its own epoch” (Deleuze and Guattari 1994, p. 99). The concepts collateral learning and science as performance might be understood as philosophical articulations in response to problems of a real-world context.

From a traditional Western approach to philosophy, the concept collateral learning would be viewed as representing students' real experiences—that is, that the concept captures the essence of the phenomenon—what is actually occurring in the minds of students. With reference to the inquiry reported on in this chapter, the four types of collateral learning serve to categorize phenomena and could be used as a norm against which learning would be assessed. Such a view would hold that when concepts change and/or their meanings change, it occurs only so as to grasp reality more accurately. However, for Deleuze and Guattari, concepts are not extractions or abstractions of reality. Rather, concepts are created so as to transform life—concepts do not lie outside of life but their creation should be understood as events of life. From a Deleuzo–Guattarian perspective, the concept collateral learning does not represent the experiences of students but makes a new way of understanding school science learning in postcolonial Africa possible—a new way of learning that overcomes the problem of cognitive dissonance. It makes possible holding in parallel seemingly disparate world views, and secured collateral learning makes possible the integration of disparate world views. Moreover, it makes new school science practices possible that will change teachers' actions and open up new possibilities for the becoming of students.

For Deleuze, a concept has no beginning or end, only a becoming. His interest is not what a concept is but how it works and what it does. The four types of collateral learning, parallel, simultaneous, dependent, and secured are not merely representations of different indigenous students experience when learning school science or accurate descriptions of the phases that indigenous students experience (as Jegede might be suggesting) as they learn school science over time. Rather, the four “types” of collateral learning are part of the becoming of the concept of collateral learning. A becoming, needless to say, is influenced by learning theories such as constructivism but more importantly created in response to a real-world problem of cognitive dissonance experienced by indigenous students. The becoming of the concept has material effects on what happens inside school science classrooms.

As noted, for Deleuze and Guattari, philosophy does not only involve the creation of new concepts but also involves putting concepts to work in new ways.

In their works they reappropriate several concepts of great philosophers and put them to work in new ways. As Stagoll (2005, p. 51) writes in relation to Deleuze:

Henri Bergson's concepts of duration and intuition, Gottfried Wilhelm von Leibniz's monad, Hume's associationism, and numerous concepts from literature, film, criticism, science and even mathematics are reworked and put to work in new and creative ways.

In line with the approach used by Deleuze and Guattari, in the inquiry I reported on earlier, I reappropriated Thomas Kuhn's concept of paradigm as exemplar, Turnbull's concept of science as performance, and Jegede's concept of secured collateral learning to transform the notion of secured collateral learning, making possible new ways of doing, being, living, and becoming and having transformative effects on classroom practices. Moreover, such a notion of secured collateral learning dissolves the boundaries between modern Western science and indigenous knowledge, moves beyond the binary oppositions produced by a representationalist view of science, and blurs the boundary between philosophy and science. The methods of science are not merely there to capture the world—do not only grasp the state of affairs as it is—but are creative/productive. As Law (2004, p. 144) writes:

... method is not just what is learned in textbooks and the lecture hall, or practiced in ethnography, survey research, geological field trips, or at laboratory benches. Even in these formal settings it also ramifies out into and resonates with materially and discursively heterogeneous relations which are, for the most invisible to the methodologist.

Moreover science as performance produces new knowledge spaces in which new knowledge is produced in new ways. For example, Aborigines in Australia's Northern Territory have for many years through their own performative modes mapped their country by identifying every tree and every significant feature of their territory. Today some Aborigines are doing the same using the latest in satellites, remote sensing, and geographical information system (GIS). By representing their local knowledge on digital maps, they are able to make their ways of knowing visible in Western terms—"a new knowledge space which will have transformative effects for all Australians" (Turnbull 1997, p. 560). Similarly, in South Africa San trackers are being equipped with digital devices (as part of the CyberTracker program) to record animal sightings, a local example of traditional African ways of knowing working together with sophisticated Western technologies (Le Grange 2009).

Summary

Over the past decade or so, there has been some interest into inquiring about learning on the part of philosophers (of education). By way of introduction, in this chapter I refer to some of these inquiries. For example, I refer to Hogan's (2003) argument that teaching and by association learning is a distinctive way of life; Biesta's (2004, 2006) critique of the rise of "a new language of learning"; and a special issue

of JOPE which focused on “new philosophies” of learning. I argue that the mentioned inquiries into learning focus in the main on the following philosophical strategies: concept analysis, deconstruction, and ethics—or at least there are traces of these strategies evident in the inquiries. However, the central focus of the chapter is on a different issue with respect to learning, that is, how indigenous students learn school science. The issue is pertinent because the sociocultural framework (which is indigenous) into which learners are socialized is different to the cultural framework of school science (which is Western based). The upshot of this is that indigenous students might experience cognitive dissonance when learning (school) science.

Jegede (1995) posits a thesis as to how indigenous students learn school science, which he refers to as collateral learning. He identifies four types of collateral learning: parallel collateral learning, simultaneous collateral learning, dependent collateral learning, and secured collateral learning. Briefly, collateral learning occurs when students are able to evaluate seemingly disparate explanatory frameworks and draws them together towards commonality. I argue that Jegede's thesis remains underpinned by a representationalist view of science and argue for science as performance so as to give greater credence to the idea of secured collateral learning. In a Deleuzian sense I reappropriate Thomas Kuhn's concept of paradigm as exemplar, Turnbull's concept of science as performance, and Jegede's concept of secured collateral learning to transform the notion of secured collateral learning, making possible new ways of doing, being, living, and becoming. The reworked concept, secured collateral learning, is the child of all three concepts.

In the interpretation of the inquiry into indigenous students' learning that I report on in this chapter, I use Deleuze and Guattari's philosophical strategy of concept creation in lieu of more traditional strategies as those listed earlier. In so doing I argue that Jegede's notion of collateral learning (including its four types) is not representations or abstractions of reality that accurately describe what students are experiencing, as traditional approaches to Western philosophy would have us believe. The four types of collateral learning are concepts that represent the essence of what students are experiencing. Rather, they are philosophical articulations that are aimed at solving problems in a real-world context. Moreover, philosophical concepts do not exist as abstractions outside of reality—creating concepts are events of life—they transform life. In this instance the creation of the concept collateral learning enables new ways of learning for indigenous students and produces new classroom practices and new becomings for students.

And if concepts do not have an identity, only a becoming, then the concept collateral learning is always in the making—always becoming. So, I cannot finish the unfinishable. I part with Kappelar's (1986, p. 212) words, “I do not really wish to conclude and sum up, rounding off the argument so as to dump it in a nutshell for the reader. A lot more could be said about any of the topics I have touched upon . . . I have meant to ask the questions, to break out of the frame . . . The point is not a set of answers, but making possible a different [philosophical] practice . . .”

6.2 Teaching and Learning for Citizenship in a Postapartheid South African University Classroom: An Interpretive Interlude

Yusef Waghid

Teaching and learning in postapartheid university classrooms have been intended to produce teachers and students who could contribute towards cultivating democratic practices in society, considering the country's history of segregation and discrimination in the public sphere. Much of the research that I have embarked on over the past decade and a half involved foregrounding the view that deliberative teaching and learning ought to be fostered in university classrooms and that this can open up the possibility for responsible human action. I argue that responsible action involves producing citizens who act deliberatively, compassionately, and justly. Only then it might be possible to produce a society which takes seriously global cosmopolitan norms that integrate what is local, and vice versa. I show my attraction to the philosophical method of interpretation by situating my arguments in interpretive reflections of Jürgen Habermas, Seyla Benhabib, Martha Nussbaum, Amy Gutmann, Iris Marion Young, and Stanley Cavell on what it means to act responsibly in and beyond university pedagogy. Simultaneously, I show how interpretation has become central to my own exposition of what it means to cultivate deliberative, compassionate, and cosmopolitan citizens.

Moreover, the interpretive lenses I bring to my reflections on deliberative teaching and learning in university classrooms are constituted, firstly, in narrativism or telling stories (Fay 1996). According to Fay (1996, p. 13), our stories are in part constituted by the interpretive assumptions people (in this instance, students and I) bring to particular classroom settings—that is, they are

Y. Waghid (✉)

e-mail: yw@sun.ac.za

shaped by the expectations, memories, beliefs, desires, and cultural prejudices that constitute these assumptions. Secondly, I use MacIntyre's (1999) notion of "detachment," that is, to detach oneself from one's own reasons to revise or abandon them in light of what others with whom one engages—in this case, the aforementioned authors of texts—have to say. MacIntyre (1999, p. 96) argues that we come to know when we are able not just to evaluate our reasons as better or worse but also when we detach ourselves from the immediacy of our own desires in order to "imagine alternative realistic futures" that might give rise to unexpected results. This implies that it would be inconceivable to read texts as master works that should not be engaged with and not to stand back from one's rational judgments about what one's understanding of these texts is. Detaching oneself from one's own reasons in relation to one's evaluation of texts suggests that these texts cannot be treated uncritically and uncontroversially. The mere fact that one acts through evaluation and detachment brings into question the underlying assumptions of texts that one reads and analyzes. Thirdly, I use Greene's "dialectic of freedom" (1988, p. 14) whereby one can arouse students "to go in search of their own"—that is, to provoke students to reach beyond themselves, to wonder, to imagine, and to pose their own questions. This "dialectic of freedom" that ought to exist between a student and his teacher presupposes a critical relationship whereby a teacher distinctively orientates the student in such a way that he (the student) takes the initiative, discovers new possibilities, looks at things as they could be otherwise, and moves beyond with the awareness that such overcoming can never be complete (Greene 1988, p. 5). When students are taught to think about what they are doing and to share meanings with teachers or their critical friends, it is unlikely that their writing will be confusing and muddled. Similarly, when students are taught to conceptualize in order to search for undisclosed possibilities and alternative meanings—to look at things as they could be otherwise—the potential is there on the part of students to engage scrupulously and carefully with texts and even to take texts into systematic controversy. In short, freedom implies that students have developed capacities to imagine alternative possibilities and that their teachers have succeeded in establishing spaces in which meanings can be shared, understood, reflected on, and contested. This implies that freedom does not become a preoccupation with self-dependence or self-regulated behavior, but rather an involvement with others—a relationship. The upshot of this "dialectic of freedom" in a relationship between a student and his or her teacher or supervisor is that the students would develop a passionate desire to speak and write their own words; and a teacher or supervisor would carefully and respectfully evaluate the work of his or her students. In other words, students and supervisors are not merely functionaries in an instrumental system geared towards turning out theses (products) that meet the standards of quality control, but rather free participants in a highly esteemed academic enterprise—one in which students and teachers mutually assert their autonomy and "prepare the ground for what is to come" (Greene 1988, p. 3).

Introducing the Research: Democratic Citizenship Education in University Education

Over the past 15 years, I have been extensively involved in teaching deliberative democracy at a local university in terms of the seminal thoughts of four prominent theorists: Jürgen Habermas’s notion of persuasive action, Seyla Benhabib’s idea of reflexive action, Iris Marion Young’s conception of communicative action, and Martha Nussbaum’s idea of compassionate action. In this section, I set out to challenge some of the blind spots in these theorists’ conceptions of deliberative democracy, arguing that their accounts of action with respect to achieving the most persuasive argument, reaching a temporary consensus, telling your story, and recognizing the vulnerabilities of others, can potentially compromise what deliberative democracy ought to be like (my first interpretive move). With reference to university teaching and learning, I make an argument for distress, belligerence, and responsibility in/through pedagogical action. In this way, university teaching and learning could cultivate deliberative democratic citizens.

Postapartheid university education in South Africa has adopted an outcomes-based education approach aimed at actively engaging teachers and students in pedagogical processes. For many university teachers, such an approach to education represents a definitive break with the transmission mode of education. According to the transmission mode, teachers merely transmit knowledge, and students are expected to consume such knowledge uncritically—that is, at most times without questioning or challenging. Consequently, many of the teachers at South African universities (23 in total) who wanted to move away from the transmission modes of teaching and learning became attracted to democratic education—that is, that approach to education that favors teacher and student engagement. In this section, I argue, firstly, that democratic action in university classrooms based on/derived from the theoretical understanding of four prominent scholars (Jürgen Habermas, Seyla Benhabib, Iris Marion Young, and Martha Nussbaum) has the potential to engender much-needed deliberative engagement. However, I show that implementing the theoretical positions of these scholars uncritically could potentially undermine what deliberative engagement ought to be. Secondly, therefore, and with specific reference to university education, I show how Eamonn Callan’s ideas on distress and belligerence could enhance deliberative engagement in classrooms. Thereafter, with reference to a moment in my teaching with education students, I offer an account of how belligerent deliberative engagement can be cultivated, in particular focusing on students’ reflections (my second interpretive move).

Habermas’s Discourse-Oriented Theory of Democratic Action

A discourse-oriented view of democratic action involves intersubjective communicative processes aimed at securing compromises, consensus, or fair bargaining based on a preponderance of “the better arguments” (Habermas 1996, p. 24). Put

differently, persuasive argumentation which can engender shared compromises, mutual consensus, or fair bargaining foregrounds a discourse-specific view of democratic action. In this way, Habermas proposes that deliberation unfolds on the basis of producing “the better arguments”—those arguments that rely on the citizenry attempting to produce reasons that are publicly more defensible than those proffered by others. For instance, students in a university classroom engage in communication with others whereby they offer reasons in defense of particular points of view. Those students whose views hold sway in the classroom—those views that others have found more convincing than their own—are said to be the most persuasive ones. And, on the basis of intersubjective agreement, some students accept that others’ reasons can change their initial opinions and preferences—that is, others’ reasons can persuade them into accepting that their initial opinions and preferences are no longer appropriate. In this way, a shared consensus is attained based on what most of the students consider as the better arguments. However, such a discourse-oriented view of democratic action, more specifically deliberative engagement, presupposes that all students are eloquent and capable enough of producing the better arguments. And this is not necessarily the case. One may find that some students might hold more persuasive views than others, but that they cannot articulate these as eloquently and convincingly as others can their views. What follows from this is that some students might not necessarily be able to articulate what might in fact be more persuasive opinions. Habermas’s account of a discourse-oriented deliberative engagement does not seem to be plausible enough, as it cannot ensure that “the better arguments” will prevail—a situation which could, in turn, potentially undermine deliberation because such action is meant to engender the most substantive points of view. Following a strict form of discourse-oriented democratic action might at times silence more substantive opinions or preferences, because searching for “the better argument” at the level of plausible articulation could subvert more reasonable views. For example, some students might persuasively argue that violence could bring about democratic change in a country, while other students might have better reasons to explain why violence subverts democracy but may be unable to eloquently articulate their substantive arguments against the use of violence to achieve democracy. Hence, Habermas’s view of deliberative engagement does not seem to be adequate to engender defensible forms of democratic action. For this reason, I find Seyla Benhabib’s view of democratic action complementary to Habermas’s conception of democratic action.

Benhabib’s Reflexive Account of Democratic Action

Seyla Benhabib’s account of democratic action builds on Habermas’s discourse or consensus-oriented view of deliberative engagement. Whereas Habermas’s idea of democratic action favors the achievement of consensus based on “the better arguments,” Benhabib extends this view to one that challenges the conclusions

arrived at by consensus or unanimity (Benhabib 1996, pp. 77 and 87). Her idea of democratic action is underscored by a condition of reflexivity whereby the outcome of deliberation is not fixed, but can be revised and subjected to reexamination—that is, debated, questioned, and criticized (Benhabib 1996, p. 72). In this way, even the consensus that is attained should not be considered as the conclusive outcome of deliberation, but rather a temporary consensus until more reasonable judgments have been attained. Such a reflexive account of democratic action would not silence or curtail dissenting minority viewpoints that a strictly consensus-oriented approach to democratic action would dismiss. In other words, reflexive democratic action, referred to by Benhabib as “egalitarian reciprocity,” would allow both minorities and dissenters the right to challenge the outcome of public deliberation (Benhabib 1996, p. 79). By implication, even “the best arguments” should be subjected to revision and reexamination, perhaps at a later stage; therefore, the outcome of deliberation is considered as an interim consensus until more reasonable opinions and preferences confirm or overturn previously held views. With such an idea of deliberative engagement in mind, it could be that students who previously held views that violence could bring about democratic change might have their views revised and reexamined on the grounds of more substantive views that might not support or advance their views on violence and democracy. The point is that these students’ views on violence generating democratic change only remain valid until they are persuaded to alter them by the more reasonable views of other students.

Now, although Benhabib is mainly concerned with not excluding minorities and dissenters from deliberation, she seems to fall short of achieving this aim, because even the revised and reexamined views still depend on how convincingly these arguments are articulated. What follows from this is that the most eloquent students’ views would still be in the ascendancy, which does not necessarily avoid the problem of excluding perhaps more informed yet unstated or inadequately articulated views. Therefore, I support Iris Marion Young’s suspicion of a discourse theory of deliberative engagement, or more specifically of deliberative democracy.

Young’s Communicative Account of Democratic Action

Iris Marion Young’s idea of inclusive democratic (inter)action attends to virtues or a set of dispositions of communication—greeting, rhetoric, and narrative—in addition to the contents of arguments in order to achieve an “enlarged conception” of democratic engagement (Young 2000, p. 79). Greeting, she claims, precedes the giving and evaluating of reasons in dialogue whereby participants publicly acknowledge and recognize one another. Simply put, greeting refers to those moments in everyday communication—that is, “Hello,” “How are you?,” as well as forms of speech—which lubricate discussion with mild forms of flattery, stroking of egos, deference, and politeness such as handshakes and making small talk before

commencing with business (Young 2000, p. 58). In other words, greeting is a communicative moment of taking the risk of trusting in order to establish and widen the bond of trust necessary for a discussion to proceed in good faith (Young 2000, p. 60). This makes sense for the reason that if teachers and students do not acknowledge and recognize one another as worthy of listening to, deliberation might be stunted quite prematurely because the parties refuse to engage one another as dialogical partners. For instance, if university teachers refuse to listen to students' diverse views on an issue, the practice of presenting and evaluating arguments would not begin to unfold.

Young claims that rhetoric should also accompany argument, by situating the argument for a particular audience and giving it embodied style and tone (2000, p. 79). In other words, rhetoric concerns the manner in which arguments are made as distinct from the assertive value of the arguments. The good rhetorician is one who attempts to persuade listeners by acceding to others that they are the "judges" of arguments, rather than claiming herself to "know" (Young 2000, p. 69). For instance, in rhetorical style, a university teacher might request her students to carefully consider a view on justice and await some of their responses to the concept—a matter of producing alertness for the sake of ensuring democratic (inter)action.

Narrative or relating stories is considered to be a means of giving voice to kinds of experience that often go unheard. For instance, at the institution where I work, several non-Afrikaans-speaking students often feel excluded and marginalized when some academics teach and provide class notes only in Afrikaans. In this case, storytelling by the students to each other and to wider publics as to why such practices constitute an injustice with respect to their learning could enlarge thinking about the problem of language use at my institution. In this way, listeners (academics) can hopefully learn about how their own position and actions appear to others from the stories they tell (Young 2000, p. 76).

I share Young's view that practices of greeting, rhetoric, and narrative can complement argument. I am also less skeptical about these virtues of communication devaluing or dismissing central normative concerns about argument, in the sense that such forms of communication can potentially be superficial, insincere, and merely aimed at gaining the assent of others through flattery and not by reason. What concerns me more is the fact that narrative in particular still requires people to articulate their experiences (and at times eloquently) in order that others should listen attentively to such experiences. The point I am making is that it seems rather unlikely that the individual testimony of a student who relates a sense of wrong without some manner of justification can resolve, for instance, the language dilemma at my institution. For this reason, (democratic) action also requires that university teachers in particular recognize the vulnerabilities of others (including the injustices students might experience) and not just the probative strength of students' reasons. It is here that I find Martha Nussbaum's account of compassionate action to be an enabling condition to achieve democratic action.

Nussbaum's Account of Compassionate Action

Martha Nussbaum (2001) raises the question of what positive contribution emotions such as compassion can make in guiding deliberation among university teachers and students. Her main argument in defense of compassion is that the latter ought to be the emotion which should be most frequently cultivated when people embark upon democratic action in public life (Nussbaum 2001, p. 299). For her, deliberative engagement ought to be occasioned by the impulse to treat others justly and humanely—with compassion. Certainly in South African universities—where diverse students of advantaged and disadvantaged backgrounds (black and white) are beginning to deliberate about matters of public concern such as crime, victimization, homelessness, job discrimination, unemployment, domestic violence and abuse of women, poverty and lack of food, political alienation, alcoholism and drug abuse, and the absence of good prospects—certain practical judgments have to be made by students about these variants of their public and personal lives. Invariably, judgments to be made will be based on students' perceptions of other's distress, undeserved misfortune, suffering, injustice, plight, disability, and disease. It is in this regard that compassion becomes a necessary condition to deliberate about such matters. Compassion not only prompts in people an awareness of the misfortune or suffering of others but also pushes the boundaries of the self outward by focusing on others' suffering that might be the result of no fault of their own (Nussbaum 2001, p. 299).

Nussbaum's understanding of compassion as painful emotional judgment embodies at least two cognitive requirements: firstly, a belief or appraisal that the suffering of others is serious and not trivial, and that persons do not deserve the suffering; and secondly, the belief that the possibilities of the person who experiences the emotion are similar to those of the sufferer. I shall now discuss these two requirements of compassion in relation to the way that students and university teachers ought to deliberate rationally (which includes being good listeners), yet at the same time also cultivating in them the concern to be just and humane towards others—to be compassionate.

Firstly, insofar as one can become serious about the suffering of others, one believes them to be without blame for the kind of undeserved injustice they might have suffered, and one recognizes that the person's plight needs to be alleviated. Many students who are perhaps blameless for their inability to pay university fees due to their parents not having enjoyed economic prosperity after decades of apartheid require the compassion of others. In such circumstances, deliberation at universities should rather take the form of ascertaining what could be done to ensure that students who do not have the finances to study remain part of the university community, rather than finding ways to penalize or at times humiliate them. So compassion requires blamelessness on the part of students who are unable to pay university fees, as well as onlookers who can make judgments about the need to expedite the flourishing of the students in question. Similarly, a university teacher has compassion for students with an impoverished schooling background

not necessarily of their own creation (parents could not afford to send children to more affluent and organized schools or to pay for the services of extramural tutors, as is the case in South Africa). Such a university teacher recognizes the need to find creative ways to assist disadvantaged students to come to grips with difficult concepts in their studies and at the same time acknowledges that the unjust education system to which these students might have been exposed is no fault of their own. One could argue that all students should be treated equally and that no student should receive preferential treatment in terms of additional pedagogical support. But then this would be to ignore the undeserved unequal education many students, certainly in South Africa, have been—or might still be—subjected to.

Secondly, compassion is best cultivated if one acknowledges some sort of community between oneself and the other, understanding what it might mean for one to encounter possibilities and vulnerabilities similar to those of the sufferer: “[One] will learn compassion best if he [she] begins by focusing on their sufferings” (Nussbaum 2001, p. 317). Again, “in order for compassion to be present, the person must consider the suffering of another as a significant part of his or her own scheme of goals and ends. She must take that person’s ill as affecting her own flourishing. In effect, she must make herself vulnerable in the person of another” (Nussbaum 2001, p. 319). What this recognition of one’s own related vulnerability means is that students who might have a clear understanding of, say, concepts in a philosophy of education classroom and become impatient with their peers for not grasping such concepts should imagine what it would mean for them to encounter difficulty with concepts. Likewise, university academics teaching philosophy of education should become more aware of what it means for students to encounter epistemological difficulty. In the words of Nussbaum (2001, p. 319), “the recognition of one’s own related vulnerability is, then, an important and frequently an indispensable epistemological requirement for compassion in human beings.”

In essence, compassion brings to the fore the intellectual emotions of people in ethical deliberation. It is simply not sufficient to educate by just focusing on deliberative argumentation and narratives without also cultivating compassion. Deliberation and narratives prompt students and university teachers to question meanings, imagine alternative possibilities, modify practical judgments, and foster respect and critical engagement—a matter of doing interpretation. Yet it seldom brings into play those emotions of people that are necessary to make it worthwhile to continue the dialogical interaction. If one is going to ignore the pedagogical vulnerabilities of the weak, very little will be done in the direction of meaningful education. So we also need compassionate students and university teachers.

But an overwhelming application of compassion in relation to democratic action could potentially reduce the rigorous forms of argumentation required in deliberative engagement. For instance, it is one thing to recognize that some students have physical and epistemological (including articulation) vulnerabilities and that, when they articulate their narratives, university teachers ought to listen to their voices. This, however, does not mean that one should merely accept everything students have to say, if they do not offer reasonable and sufficient justifications for their views. I cannot imagine university teachers in South Africa accepting feeble

arguments by students to use violence against alleged racists. Likewise, I cannot agree with views which advocate the establishment of a Black Native Club movement that aims to advance the interests of only African blacks in academe to the exclusion of whites, coloreds, and Indians. One ought to listen compassionately to the claims of some black academics who allege that they still encounter exclusion and marginalization in the higher education sector. But establishing a movement on the basis of excluding others, who might have similar common aspirations to rekindle the voices of the marginalized (vulnerable), would undermine democratic action—that is, as South African academics, we should collectively oppose exclusion and other forms of discrimination in higher education. And, in order to do so, university teachers and students cannot do so just on the grounds of compassionate action whereby we recognize the vulnerabilities of one another and others without forms of democratic engagement that bring to the fore our most substantive opinions and preferences. Hence, I am attracted to the cultivation of distress, belligerence, and responsibility in democratic action as supplementary virtues to deliberative argumentation, narrative, and compassionate action.

In Defense of Callan’s View of Distressful and Belligerent Democratic Action

Callan (1997, pp. 221–222 and 73) makes a cogent case for democratic action as being constituted by at least the following aspects: cohesive identity, public deliberation, and responsibility for the rights of others. Firstly, democratic action, particularly in pluralistic free societies, makes urgent the task of creating democratic citizens who share a sufficiently cohesive identity (Callan 1997, p. 221). By this Callan means that such a conception of democratic action “honours the sources of diversity that thrive within the boundaries of a strong common citizenship, and yet supports a judicious tolerance to ways of life that conflict with some of its demands.” The pursuit of a collective identity without discounting the differences of others could do much to prevent ethnic hatred and religious intolerance (Callan 1997, p. 221). My focus is on Callan’s view of democratic action as a way to prevent ethnic hatred and religious intolerance. (South) Africa’s past history has been marred by ethnic violence and religious bigotry—Zulus fighting Xhosas and Afrikaners resenting English-speaking peoples in South Africa, Muslims and non-Muslims attacking and hurting one another in Nigeria, and the Zimbabwean government confiscating white farmers’ property and evicting them. It is here that teaching and learning can provide enabling conditions for democratic action, more specifically pursuing a pathway to collective political identity. This implies that university teachers should not merely listen compassionately to the narratives of students, but actually encourage a spirit of living together in diversity—that is, through dialogical action, university teachers and students should together establish dialogical opportunities that take into account people’s linguistic, cultural, ethnic,

and religious commonalities and diversities. The idea of finding a dialogical space for the sharing of different people's commonalities is based on the understanding that people need to learn to live with the otherness of others whose ways of being may be deeply threatening to our own. And by creating a dialogical space—referred to by Benhabib (2002, p. 127) as “intercultural dialogue”—in which people can enact what they have in common and at the same time make public their competing narratives and significations, they might have a real opportunity to coexist. In this way, they would not only establish a community of conversation and interdependence (i.e., they share commonalities) but also one of disagreement (i.e., they do not share commonalities) without disrespecting others' lifeworlds (Benhabib 2002, pp. 35, 41). Put differently, when teachers and students are engaged in a conversation underpinned by interdependence and disagreement, they engage in democratic action with a collective identity—they share commonalities. And educating students to become democratic citizens involves creating civil spaces in which they can learn to share commonalities and to respect the differences of others.

Secondly, Callan (1997, p. 215) favors a conception of public deliberation characterized by the distress and belligerence (i.e., a rough process of struggle) of confrontation that will naturally give way to conciliation as moral truth is pieced together from the fragmentary insights of conflicting viewpoints. For him, the idea of public deliberation is not an attempt “to achieve dialogical victory over our adversaries but rather the attempt to find and enact terms of political coexistence that we and they can reasonably endorse as morally acceptable” (Callan 1997, p. 215). Through public deliberation, participants disturb doubts about the correctness of their moral beliefs or about the importance of the differences between what they and others believe (a matter of arousing distress), accompanied by a rough process of struggle and ethical confrontation—that is, belligerence (Callan 1997, p. 211). If this happens, belligerence and distress give way eventually to moments of ethical conciliation, when the truth and error in rival positions have been made clear and a fitting synthesis of factional viewpoints is achieved (Callan 1997, p. 212)—this is an idea of public deliberation, with which I agree, where no one has the right to silence dissent and where participants can speak their minds. In the words of Callan (1997, pp. 201–202), “real moral dialogue (as constitutive of democratic action), as opposed to carefully policed conversations about the meaning of some moral orthodoxy, cannot occur without the risk of offence, an offence-free school would oblige us to eschew dialogue.” It does seem that some university teachers, when listening compassionately to students' narratives, become culpable of steering the conversation in a way in which preference is no longer given to the substantiveness of articulated views. Rather, these teachers seem to focus on who the students are and not also what they substantively have to say. I am sometimes inclined to listen to students' claims about how difficult it is to write a section of a thesis to the extent where some students attribute their incapacity to produce argumentative writing to not having been taught argumentation in their undergraduate studies. Of course, this might be true. But then to have reached the stage of thesis writing, one should at least know what it means to write a lucid, substantiated, and coherent argument.

For this reason, it would not be inappropriate to confront and even offend students. Simply put, tell students that their writing is not good enough and that they could do something about improving it.

Thirdly, Callan (1997, p. 73) does not merely call for the recognition and respect of other's rights (whether civil, political, and social) through democratic action, but also stresses the importance of taking responsibility for the rights of others. In his words, taking rights seriously means "accepting appropriate responsibility for the rights of others, not just making a fuss about our own" (Callan 1997, p. 73). For instance, people who champion the right to employment in South Africa also consider just as important the cause of others to take responsibility to meet the needs of those who are jobless. Such an understanding of democratic action could potentially extend the mere recognition of, and respect for, other's rights to a position whereby we assume appropriate responsibility for the rights of others. In South Africa, with the new neoliberal market economy influencing universities—in particular coercing universities to offer inter- and transdisciplinary programs—many departments and academics are beginning to work together under the guise of deliberative engagement. However, such working together is mostly geared towards designing and developing programs that have a market orientation in terms of which graduates stand a better chance of being taken up in the competitive job market. What invariably happens is that students become more and more self-centered and narcissistic about their own individual futures and prospects at the expense of national interests, without deliberating what their collective contributions could be in shaping the future of their country. Most of the students whom I have encountered doing a Postgraduate Certificate in Education reason as follows: "I want to be a teacher so that I can secure a job." Very little is said about how prospective teachers ought to deliberate about improving schooling in order to produce better citizens or what ought to be done about turning schools into environments that are more conducive to learning and teaching. On the one hand, it seems as if university teachers produce materials mostly aimed at equipping students with universal skills that match the requirements of the world of work and not with what it means to be educated in a transformative society. On the other hand, some students narcissistically acquire formal qualifications that seemingly prepare them for the labor market, but which do not instill in them qualities that can help build a better country—one free from social oppression (drug and alcohol abuse, gangsterism, human rights abuses), economic marginalization (unemployment is rife among the majority of the previously disadvantaged), and subtle forms of racist exclusion (the most lucrative jobs are still occupied by those who were privileged in the past). The point is that unless universities become havens of deliberative discourse aimed at producing a better future for all South Africans, we would not have seriously engaged with the challenges of the unexpected—that is to say, our deliberative efforts have not been responsible enough. In fact, they have been biased towards perpetuating injustices. Therefore we have acted irresponsibly. In this regard, Arcilla (2003, p. 149) makes the point that university teachers and students need to take more responsibility for the social context of their education.

This brings me to my comment on how we can act more responsibly. In the first instance, education is a human or social science, which is to say that the theories that characterize it cannot be disconnected from the culture within which they are produced. In other words, education cannot be understood in isolation from processes of immense cultural (regional, historical, and temporal) change. It therefore is not possible to establish a theory of education that is culturally transcendent, because it involves a number of practices between which there are parallels, but which do not themselves share unifying characteristics (Uljens 2003, p. 43). So, simply to assume that one has to accept a universal understanding of education exclusively along the lines of Enlightenment thought is to be insensitive to alternative views, in this instance, views from African traditions. Yet my argument is that being culturally sensitive to African traditional thoughts and practices does not mean that one has to abandon a universally enlightened idea of, say, democratic action. It is here where I would argue for efforts to communicate between rival and perhaps competing traditions—a matter of acting responsibly, since we would be nurturing an idea of education with which genuine African universities should become involved.

Thus far, I have attempted to show (through interpretation) how democratic action can be widened by making a case for distress, belligerence, and responsibility as additional virtues to encouraging narratives and listening compassionately. Only then would teaching and learning in South African universities become more deliberative and responsible. With the aforementioned theoretical frameworks of deliberative engagement in mind, I now proceed to a moment in my teaching that will hopefully foreground my deliberative encounters with students of philosophy of education.

Data Construction: Pedagogical Encounters with Students of Philosophy of Education at a Local University

This section of the chapter is an attempt to show how deliberation is used in university classroom pedagogy to engender in students a commitment to become responsible citizens of a postapartheid South Africa. Firstly, I show that, through deliberation, controversy can be attended to with specific reference to three incidents in my country: alleged racist practices at a university; an instruction by the minister of education to introduce a pledge of allegiance in public schools; and xenophobic attacks on foreigners. Secondly, I show that deliberation alone cannot guarantee responsible citizenship. Students also need to be taught to have compassion for the vulnerable other. Finally, I argue that cultivating citizenship through deliberation offers much hope to counteract blindly patriotic sentiments and to engender cosmopolitan justice.

At the beginning of each academic year I teach a module in philosophy of education to postgraduate students in their final year of a professional teaching

qualification. The theme of this academic module is entitled “democratic citizenship education.” The module aims to elucidate meanings of democratic citizenship education such as teaching students—about to become high school teachers—to use aspects of democratic citizenship education in their classroom practices. The demographic composition of the class over the past 15 years is overwhelmingly white (90 %), whereas blacks constitute the minority. One of the reasons for this anomaly in a country where the majority of the population is black is the fact that many black people do not speak Afrikaans—considered to be the dominant lingua franca used at the institution where I work. This brings me to my first strategy in educating students to become deliberative inquirers. The pedagogical moment I focus on in order to illustrate how democratic citizenship has been taught over many years happened during the year 2008.

Education as Deliberation

In 2008, at the time when I commenced with the teaching of deliberation, three issues surfaced dramatically in my country: racism, blind patriotism, and xenophobia. I introduced students to three video clips of incidents related to these phenomena. They were then asked to give an account of why racism, blind patriotism, and xenophobia are societal ills that should be eradicated. Working in groups, the students had to justify to one another why racism, blind patriotism, and xenophobia are detrimental to the process of cultivating responsible citizens after decades of apartheid rule. What ensued was that some students gave an account of their explanations of why these societal ills surfaced, while other students, in turn, would critically evaluate these explanations. After this these groups of students offered their arguments against racism, blind patriotism, and xenophobia to the entire class. Randomly, I asked students to respond to other students’ reasons, thus taking one another’s reasons into systematic controversy. Critically evaluating one another’s reasons has always been done through listening to what the other had to say before agreeing or disagreeing with the other, and this is then followed by giving an account of one’s own reasons. As the university teacher, I eventually considered the reasons offered by the students before giving an account of my own reasons, after which the students could evaluate my reasons. Sometimes, students became annoyed with other students for what they perceive to have been an articulation of ill-conceived reasons. It was my task to emphasize that respect demands that we can disagree (even belligerently) with one another’s reasons and that we have to tell one another when we think the other is wrong. Thus, through listening, evaluating, and reevaluating one another’s reasons, deliberation was fostered in the university classroom.

However, what sparked much heated controversy in the class was the remark by a white student that the racial prejudice and racist actions perpetrated by five white students against elderly, black workers at a university residence (in 2008) can be seen as a response to the killing of some white farmers in the country. One of these

five white students urinated into a prepared meal for black workers to show how gullible and ignorant black people are in the country. Of course, the humiliation of people should not be tolerated because their human dignity is undermined. Similarly, the brutal murder of some white farmers is an abhorrent and barbaric act. However, to argue that racially degrading behavior can be justified as a response to the farm killings is not only an ill-conceived argument but also the expression of an irresponsible view. It is at this point when even white students belligerently disagreed with the views of a fellow white student. The most defensible argument raised against this ill-conceived view was the argument used by Amy Gutmann (2003), which recognizes that freedom of expression should not be left unconstrained when an injustice to others is perpetrated. The white student who attempted to rationalize the racist incident suffered some kind of distress, which is not unusual for the kinds of deliberations we encourage in the class. The debate became very heated, and one might have expected students to leave the classroom. Yet conditions of deliberation had already been engendered in the class for some time, which meant that such an act was not necessary.

The point I am making is that even when deliberations are belligerent and distressful, students should continue to participate in them. As mentioned earlier, Eamon Callan (1997) makes the point that the idea of deliberation does not entail an attempt to achieve “dialogical victory over our adversaries,” but rather to find ways to morally coexist (Callan 1997, p. 215). If belligerent deliberation happens, university teachers and students can speak their minds, and they are then also prepared to take risks that will prepare them well to enhance justice in their society.

Education as Compassion

In February 2008, the Ministry of Education released a revised pledge to be recited in schools that reads as follows: “We the youth of South Africa, recognising the injustices of our past, honour those who suffered and sacrificed for justice and freedom. We will respect and protect the dignity of each person and stand up for justice. We sincerely declare that we shall uphold the rights and values of our Constitution, and promise to act in accordance with the duties and responsibilities that flow from these rights.” When I asked the PGCE students to comment on this pledge, many white students argued that the pledge makes them feel guilty for past apartheid injustices for which they had not been responsible. I agree that the present generation of white PGCE students was not responsible for South Africa’s apartheid past and should not be made to feel as if they had been the perpetrators of such injustices against human beings. Many of these students are in their early twenties and thus were barely 10 years old when the first democratic government came to power. But then the question should be asked whether by recognizing the injustices of the past, it can be assumed that they perpetrated a wrong themselves. Some black students felt that recognizing

injustices of the apartheid past does not seem to be a detrimental practice. Again, some white students put forward the argument that honoring those who suffered for justice and freedom actually means that they should honor those black people who had been liberation fighters and now serve in the African National Congress-led government. Some white students raised the point that honoring those who suffered and sacrificed for justice and freedom in this way would be problematic, because the activities of some black activists actually violated human rights as well, specifically some of the bombings that killed innocent (including white) bystanders.

It seemed as if the students did not want to be reminded of South Africa's past, as they did not want to bear the burden of being responsible for the previous racist government. Therefore all the students agreed that respecting and protecting the dignity of each person (black and white) and upholding the rule of law were vital. Not a single student (black or white) denied the fact that people should be respected on the basis of their humanity. These students were specifically concerned about every person in the country who suffers vulnerabilities such as poverty, unemployment, and prejudice (including sexism, racism, domestic violence, and stigmatization as a result of HIV and AIDS). For these students, reducing and eradicating such vulnerabilities is tantamount to preserving the dignity of people.

During our deliberations about the revised pledge of allegiance to be implemented in public schools, the students were introduced to the seminal thoughts of Martha Nussbaum. As has been mentioned earlier, Nussbaum (2001, p. 299) argues that deliberation ought to be impelled by the emotion that moves one to treat others justly and humanely—with compassion. It is understood that compassion focuses on others' suffering. Our deliberations about the pledge of allegiance in relation to compassion brought to the fore the intellectual emotions of people in ethical deliberation. The students agreed that it is simply not sufficient to educate by just focusing on deliberation without also cultivating compassion. Deliberative argumentation prompts students and teachers to question meanings, imagine alternative possibilities, modify practical judgments, foster respect, and develop critical engagement. Yet it seldom brings into play those emotions of people that are necessary to make it worthwhile to continue the dialogical interaction. If one is going to ignore the pedagogical vulnerabilities of the weak, very little will be achieved in the way of meaningful education, that is to say, action with unpredictable and unintended outcomes. What the classes in philosophy of education clearly emphasized was that, in our universities and schools, we also need compassionate students and teachers.

Education as Cosmopolitan Justice

Our deliberations in the philosophy of education classes were extended to reflections on cosmopolitan justice when the growing xenophobia in South Africa took an ugly turn in May 2008. Not a single student made any approving comment about the

xenophobic attacks on “foreign nationals” (immigrants) that resulted in 62 people dead, 670 injured, about 47,000 displaced (28,682 displaced persons in 99 sites across Gauteng, KwaZulu-Natal, and the Western Cape) (The Times, 10 June 2008), and many returning to their native countries. Areas most affected by the xenophobic attacks were townships in Cape Town (Du Noon, Masiphumelele, Khayelitsha, Lwandle, Macassar, Mitchells Plain, Nyanga, Ocean View, and Soetwater) and Johannesburg (Alexandra, where the violence started, Diepsloot, Zandspruit, Primrose, Tembisa, Reiger Park, Tokoza, Hillbrow, Jeppestown, Thokoza, Themisa, and Cleveland). Although the government claims that attempts to curb xenophobia have been successful, there is still growing concern that immigrants might not be reintegrated into the local communities.

The question that we addressed in the philosophy of education class was: How can cosmopolitanism combat xenophobia? Cosmopolitanism recognizes the rights of others to “universal hospitality.” Simply put, others have the right to be treated hospitably. For Benhabib (2006, p. 22), hospitality, in a neo-Kantian sense, “is not to be understood as a virtue of sociability, as the kindness and generosity one may show to strangers who come to one’s land or who become dependent on one’s act of kindness through circumstances of nature or history; hospitality is a right that belongs to all human beings as far as we view them as potential participants in a world republic.” Such a right to hospitality imposes an obligation on democratic states and their citizens not to deny refuge and asylum to those whose intentions are peaceful, particularly if refusing them would result in harm coming to them (Benhabib 2006, p. 25). So, if the intentions of Somali entrepreneurs are peaceful (and there are many of them in South Africa), it would be considered their right to be treated hospitably and all democratic citizens’ obligation to ensure that these immigrants enjoy such a right.

Our main task in the philosophy of education class was to answer the question about what such a cosmopolitan approach to education entails. Firstly, considering that cosmopolitanism involves the right to temporary residence on the part of the “stranger who comes to our land” (Benhabib 2006, p. 22), it follows that public schools in South Africa cannot deny access to children of immigrant communities. In most cases, they are not refused. However, some children are excluded in subtle ways, considering that the language of instruction, for instance, is not in the mother tongue of these immigrant children. In fact, in the black township of Kayamandi (in Stellenbosch, South Africa), African children find it difficult to cope with non-mother tongue instruction in public schools. Three Belgian teachers once requested a mediator to assist them in teaching children in Kayamandi to participate in art and cultural activities. And taking into account that local school children find it difficult to cope with a different language, it would be extremely challenging for immigrant (say Somali) children to adapt to the public school life in their country of temporary sojourn. What cosmopolitanism thus demands is that immigrant children should be taught initially in their mother tongue before they are assimilated into the broader public school life. Or, alternatively, they should simultaneously learn the language of instruction and be supported in doing so. The point I am making is that one should not take for granted that people with immigrant status would fit

naturally into the public structures of their adopted countries or countries of temporary residence. They have to be initiated gradually into social and public life on the basis of a sense of obligation on the part of democratic states. Failing to do so—for example, denying immigrant children gradual access to public schools and thus depriving them of developing and exercising their capacities—would amount to treating others unjustly. The upshot of this view is that if my Malawian student’s children, who are attending the local Kayamandi school, are not treated hospitably by, for example, being initiated gradually into public school life by South African teachers and other learners, then the teachers and learners are not abiding by their obligation to treat others humanely—that is to say, justly. This unfavorable attitude towards immigrant others would not only retard interaction and cooperation among different people but also impede the education for social justice project that the Department of Education in South Africa so dearly wants to implement in public schools. This is because the consequence would be that these immigrant children and their parents will invariably develop a mistrust (as is seemingly the case with my Malawian student and his children) of the public school sector—a situation which, in turn, increases their suffering (discomfort) and perpetuates what Iris Marion Young (2006, p. 159) refers to as “structural social injustice.”

Secondly, “the right to have rights” prohibits states from denying individuals citizenship rights and state protection against murder, extermination, enslavement, deportation, and other inhumane acts such as persecution (whether political, cultural, or religious) (Benhabib 2006, p. 25). So, if Somali immigrant children wish to wear their head scarves in South African public schools, following “the right to have rights” notion, these children cannot be discriminated against if they wish to do so. Asking these children to remove their scarves, which they might consider as important to their religious and cultural identity, would be a matter of treating them unjustly on the grounds that their right to be different would be undermined.

Thirdly, one of the main arguments that emanated from our classroom deliberations is that “hospitality” can only manifest itself if South African local communities can begin to offer a welcoming hand to the beleaguered immigrants by supporting their integration into our society and by providing them with protection against possible criminal attacks.

In essence, cosmopolitanism and its concomitant agenda of the hospitality that ought to be afforded other human beings (especially from immigrant communities) in many ways complement the duties and responsibilities associated with the activities of democratic citizens. Unless countries (such as South Africa) and their peoples recognize the rights of others to be treated with dignity and respect, and not suppress their rights, the achievement of justice will remain remote from the minds and hearts of people. I have argued that South African public universities and schools can do much to promote these norms, which would inevitably consolidate and extend the just actions linked to the implementation of a democratic citizenship agenda.

The Role of Interpretation in This Research

In this section, I use some of the seminal thoughts of Stanley Cavell (1979), particularly his ideas on “living with skepticism,” to show how interpretation further manifests in my research. I point out that teaching students skeptically might engender moments of acknowledging humanity within the Other, attachment to the Other’s points of view with a readiness for departure, and showing responsibility to the Other—all practices that require some form of interpretation, understanding, and reflection about one’s self in relation to the Other.

Acknowledging Humanity Within the Other

Central to one’s connection with the Other is the view that one has to acknowledge humanity in the Other, of which the basis for such action lies in oneself: “I have to acknowledge humanity in the other, and the basis of it seems to lie in me” (Cavell 1979, p. 433). One’s engagement with postgraduate students ought to be shaped by an acknowledgement that they be considered as fellow human beings. In acknowledging others as human beings worthy of respect, one should simultaneously acknowledge oneself as a person who should exercise respect. This is what I think Cavell (1979, p. 435) has in mind when he claims: “[A]nother may be owed acknowledgement simply on the ground of his humanity, acknowledgement as a human being, for which nothing will do but my revealing myself to him [her] as a human being, unrestrictedly, as his or her sheer other, his or her fellow, his or her semblable. – Surely this is, if anything, nothing more than half the moralists who ever wrote have said, that others count, in our moral calculations, simply as persons; or that we have duties to others of a universal kind, duties to them apart from any particular stations we occupy.” One considers oneself to be students’ “semblable” who invites them to a form of life in which one recognizes their humanity. In this way, one’s engagement with students through recognizing their otherness is an interpretive act because one makes particular assumptions on the grounds of how they supposedly present themselves to one. In fact, acknowledging students’ humanity does require some form of moral judgment (interpretation) about their humaneness.

Attachment with a Readiness for Departure

If one were to perform one’s duty to others as human beings, should one engage in social practices with something, say, morally just in mind? Teaching students to connect with issues of civility, following Cavell, makes us “open to complete surprise at what we have done” (1979, p. 325). In other words, teachers and students

can be initiated into practices about what is morally good for society but with the possibility that what is perceived as good for society is always in the making, continuously subjected to modifications and adaptations. For instance, it may be morally good for society to produce work about advancing belligerent educational encounters at some stage in its history—and we may decide this in advance. But when hostility emanates among people and makes interactions to be such distressful confrontations that may result in excluding the Other, we may want to suggest that peoples' distressful encounters be constrained. That is, our students' deliberations should be about what is desirable for society, with the possibility or readiness of departing from such practices if the situation arises—that is, advocating belligerence in deliberations might not always be desirable for the public good. The point I am making is that to cultivate in ourselves and others the view that we can be attached to a position momentarily and become detached from it again requires some form of reflecting on/about one's stance towards the position. So, in deliberative encounters, the possibility exists for people to think about, think through, and think beyond a particular position; otherwise one would not become attached or detached from a position at all. This means that interpretation about deliberative encounters between teachers and students determines the adjustment of one's particular views in relation to others and of particular points of view.

Responsibility to the Other

Cavell's remark "we are alone, and we are never alone" is a clear indication that one does belong to a particular group (being alone with others, i.e., "we") and that, by virtue of being human, one bears an internal relation to all other human beings—especially those who might not belong to the same group as one. This internal relation with my fellow human beings does not ignore my answerability/responsibility as to what happens to them, although I do not belong to the same group as they do. As a member of a particular cultural group in society, I cannot just impose my views (albeit religious or political) on others, for that in itself would deny that there are others in different positions (with different cultural orientations) than mine. Doing so would be doing an injustice to others. But being answerable/responsible for what happens to them means that their views are acknowledged, although I might not be in agreement with them. Rather, one conceives the other from the other's point of view with which one has to engage afresh (Cavell 1979, p. 441). As a person who belongs to a minority ethnic group in society, I should acknowledge the majority ethnic group's views, although I might be in stark disagreement with them. But in so doing, I do not compromise my relations with others, for that would mean a complete breakdown of society. From my own cultural vantage point, I might find another group's views repugnant (what Cavell would refer to as living my skepticism), but this does not mean that I view this group as outcasts unworthy of any form of engagement. That would be an abdication of my responsibility. The point I am making is that as a human being, I can

firmly distinguish between the values that constitute the practices of the cultural group to which I belong and the values that inform social practices other than mine—that is, in an interpretive way, I learn to understand the social practices of postgraduate students, and in turn they endeavor to understand my practices. Thus, when we (students and I) exercise our responsibility towards one another, we are in fact acting as interpretive beings—the latter depending on how the students and I engage with and respond to one another.

In demonstrating one's responsibility towards others, one immediately acknowledges one's capacity for intimacy with others—thus limiting one's idiosyncratic privacy. It is for this reason that Cavell (1979, p. 463) claims that “human beings do not necessarily desire isolation and incomprehension, but union or reunion, call it community.” Our private actions may lead to a betterment of our communal actions. I might privately contemplate to do something about improving human relations between foreign nationals (say from African countries) and South African citizens in my neighbourhood, but doing so autonomously without also penetrating the thoughts of other community members may not necessarily contribute towards a desired action. If my privacy remains restricted to me with the intention not to exercise my responsibility to others, my practices would remain unshared and separated from the people with whom I happen to live. So, my privacy opens a door through which someone else can tap into my thoughts—which might be of benefit to society. But if my privacy is prompted by narcissism, the possibility that others might gain something valuable for the good of society might be stunted. If I were to think about social practices in an interpretive way, I should acknowledge the private efforts of individuals, yet simultaneously not avoid the possibility that their private actions can be of good public use.

In a Cavellian fashion, university teachers ought to be responsible human beings with regard to their students. Responsibility towards one's students implies that one has to create opportunities for them to think, argue, and reflect about their texts—all practices that point to interpretation.

6.3 Language, Meaning, and the Other in Curriculum Research

Christine Winter

In this chapter, I examine the problem identified above by looking at a curriculum project I carried out in an English secondary school in 2008/2009. I worked over a period of 5 months with two geography teachers to develop and teach a curriculum unit for a class of 12–13-year-olds. The project was located within two technologies—one of performativity (relating to school compliance with national curriculum policy and attainment targets as well as with researcher career development) and the second of orthodox educational research methodology. Both are driven by a neoliberal politics where the culture of measurability, competition, and economism exerts a keen presence. I suggest that the problems I identify in the chapter arise from the misconception of the way language operates to curtail the possibility of both research and education.

I begin the chapter by proposing the arguments underpinning the enquiry, drawing on the work of three philosophers to help me, Martin Heidegger, Jacques Derrida, and Emmanuel Levinas. I contextualize the school-based curriculum project in the second part of the chapter, describing its focus and explaining its rationale, as well as explaining the rationale for my involvement. In the third part, I focus on two issues of particular concern and interest which arose in the conduct of the project, namely, researcher positionality and data analysis before trying to imagine things differently in the chapter's final section.

Enframing by Technology

The dominant “toolbox” idea of educational research crops up in many publications under titles like *How to Do Your Educational Research Project*. In such publications, methodology is discussed through a standardized lens of reflecting on methods, evaluating their strengths and limitations, and clarifying their underpinning assumptions, while methods are portrayed as the procedures or tools for collecting empirical data. Data, analyzed and interpreted according to a prespecified program, lead to findings which show “what works” (not, usually, “what doesn’t work”) in educational practice (Smeyers and Depaepe 2006). The logical, technical language and organization of thinking in this mode show how educational research is “ruled by machinery” (Smith 2006), in other words, how it operates when it is in the grip of technology. The danger is that technology, attractive as it is for its assumed power of prediction and promise of solution to all educational problems, has failed to deliver on both counts to date. Worse than this, it has unobtrusively closed down thinking about alternatives.

According to Heidegger, there is more to technology than meets the eye. The way to open our minds to a better understanding of technology, to reveal its essence, is by questioning it in certain unorthodox ways. He proposes an approach he describes as “questioning concerning technology” (1977, p. 3). Beginning with the definition of technology as instrumentalism (providing a means to an end) in the hands of humans, he soon admits that this definition singularly fails to reveal its essence. His preferred approach is to reveal the essence of technology through a careful critique of the notion of causality that underpins it, by means of a consideration of how things come to be or how they “come forth into presencing” (p. 9). Presencing or bringing forth is about how something comes into existence or appears in the world within nature or as a result of human action. This presencing or bringing forth into existence involves a process of revealing which gives rise to what the Greeks described as *aletheia* or the correctness of an idea, or “truth.” But, as Heidegger so aptly puts it, “What has the essence of technology got to do with revealing?” (p. 12). Heidegger thinks of technology as a kind of metaphysics or rule book governing the presencing, bringing forth, or revealing of what is in the world. He gives the example of modern technology, like the mining of minerals or modern farming techniques that are ordered or controlled by the rules of efficiency—maximum yield at minimum cost. He claims that humans, without realizing their complicity, play a key role in this totalization by technology, in this efficient ordering and revealing, to the extent that they make it the norm and never question it. They become part of the process and the process takes on a life of its own. Heidegger calls this process “enframing.” Enframing of technology is more than thinking about technology and technological processes or the application of technological methods. It “organises being, structures consciousness” (Stone 2006, p. 536). It is “the box that we find hard to think outside of” (ibid, p. 542).

In the context of educational research training for graduates in the USA, Stone argues that enframing of technology leads to the valorization of specific standardized educational research methodologies in the form of “methodolotry.” Enframing is a problem because it closes down the possibilities of other thoughts and actions about the concept of education and of social and economic life, for example, the ethical and political. In the grip of technology, educational research is totalized, structured in pre-calculated ways, and limited to certain orthodox operations. If we wish, like Heidegger, to have a “free relationship with technology,” if we wish to know its essence, we need to think about and question technology’s metaphysical power to order and control. Heidegger believes the essence of technology can be known by the kind of questioning, thinking, and reflection that invoke, through art, new possibilities of thought that lie outside the “box” of orthodox educational research. This is the way to shake off metaphysics, to bring forth into presencing, and to reveal the truth.

Language and *Différance*

Acknowledging his debt to Heidegger for questioning the metaphysical foundations of our thinking by drawing attention to the ontico-ontological difference, Derrida argues that Heidegger does not go quite far enough in his proposal (Derrida 1981, pp. 9–10). In *Being and Time*, Heidegger argued that although we believe we know what we mean when we talk about “being,” actually, we do not. Heidegger’s challenge is “to raise anew the question of the meaning of being” (Heidegger 1962, p. 1). His thesis rests on the difference between what he describes as “being” and “Being.” The idea of being (lower case “b”) concerns what is, in other words, what entities are in the world. For example, at the moment in my room, there is a desk with a clock and a mug. These are entities which exist—they are intelligible as things which are. I comport myself towards them as I work. Science gives us the ability to name and describe the characteristics of differentiable entities through its concepts and language. Any inquiry into what these entities are is understood by Heidegger as “ontical” or “fundamental ontology.” But Heidegger’s notion of Being with a capital “B” is something quite different from knowing what an entity is in terms of its predicates. Being (upper case B) concerns what it is for those entities to be. Heidegger’s project is to inquire into the way that Being manifests itself and, by so doing, to clarify the meaning of Being, to understand what determines entities as entities, and to determine the basis on which entities are always understood. This second project is described by Heidegger as “ontological” or “regional ontology.” Heidegger wishes to go back a step prior to scientific inquiry, language, and concepts to find the “truth” of Being. Derrida challenges Heidegger’s quest for the originary meaning of Being because he recognizes that Heidegger’s quest is set within “a system of languages and an historically determined ‘significance’” (Derrida 1974, p. 23), which does not embrace the main tenet of Derrida’s work—that of *différance*. Instead, Heidegger, while claiming to denote

the difference between being and Being as his critique of metaphysics, at the same time, looks to and privileges the “gathering” or “belonging together” of thinking (language) and being in his search for the originary “truth” of Being. The revealing of difference in Heidegger’s account occurs through the notion of “belonging together” or “gathering” “as the mutual tending towards each other of being and thinking, which belong to each other in order to be manifest, even as thought is always the thought of being” (Caputo 1997, p. 152). Derrida’s opinion is “exactly the opposite.” “Once you grant some privilege to gathering and not to dissociating, then you leave no room for the other, for the radical singularity of the other” (Derrida 1997, p. 14). Derrida denounces Heidegger’s celebration of “belonging together,” of unity between what is and human thought because, by privileging association and gathering (in other words, sameness), Heidegger denies dissociation and disjunction, closing down the movement towards pluralism and a democracy to come.

Questioning concerning technology provides a good example. Heidegger’s questioning of the metaphysics of technology (enframing) as an ordering, controlling force with which humans unwittingly collude, opens a space for thinking differently about technology. Heidegger views the bringing forth of this different way of thinking as occurring through the belonging together (*Versammlung*) of being and thinking that reveals, through art, the “truth” of the matter (Derrida 1981, p. 11). But Derrida sees a problem in this, since Heidegger simply ends up repeating metaphysics on another level, by moving from the ontico-ontological difference to the unity or gathering of being and thought, to arrive at the “truth.”

Derrida’s neologism, *différance* picks up on Heidegger’s thinking at the point before being and thought unite and gather towards truth. By making unity and gathering tremble, Derrida irrupts the metaphysics tied up in that very relationship between being and thought, disturbing the hubris of truth, thinking afresh, and opening a space for the incoming of other thoughts. By the orthodox account, the language of educational research (methodology, methods, empirical data) is assumed to correspond with clear and stable meaning (self-presence) and is not open to questioning. Reading the orthodox account deconstructively, however, challenges this view by revealing *différance* through the metaphoricity or play of traces operating through language (Derrida 1974), opening a space for the unfolding of different meanings which are not pinned down by the metaphysics of presence. Enframing of technology confers on educational research methodology a metaphysics couched in the standardized procedures, technical language, and systematic programs of the educational research handbook or manual, promising an economy of returns but, at the same time, blocking the emergence of something inventive, unexpected, and uncalculated—the “pure gift” that is not part of a system of exchange—as an infinite and unconditional ethical responsibility (Derrida 1992; Caputo 1988). Enframing of technology thus conceals as much as it reveals. Emmanuel Levinas offers two directions of thought which cast further light on concealment, bringing forth beyond the given, “truth” and ethics in the context of orthodox educational research methodology.

Language and Ethics

In the first direction of thought, enframing of technology in educational research methodology involves what Levinas describes as “autonomy” (1987, p. 48). In this mode, the educational researcher draws meaning from within the totality of what educational research is, what it is known to be, what is self-present as consciousness, and what is the same. The problem is that what is limited by enframing of technology and therefore constrains thinking otherwise and encourages closure. In the second direction of thought, called “heteronomy,” the researcher moves beyond the totality of what educational research is, what is known, towards the unfamiliar, the strange, and the other. The movement towards the other is “the fundamental movement, a pure transport, an absolute orientation, sense” (1996, p. 52). Levinas does not understand sense as a meaning or signification which serves as a response to a personal need or desire but as a unique orientation towards or understanding or recognition of the needs of the Other (Autrui). This relationship with the Other is a primordial experience which occurs before Being, before metaphysics, and before consciousness. It involves the subject, empty of any thought, facing the Other. It manifests in the encounter with the human face. The face is abstract, naked, and “without cultural ornament.” It bears no prior disposition because it exists outside the order of the world, outside what already is known to exist. The encounter with the face is the summons to “think beyond what one thinks,” of “thinking more than what is thought” (Levinas 1996, p. 55), an opening towards Infinity, where the ego is overpowered, consciousness of totality ceases, and ethics begins. The encounter with the Other involves an ethical movement which renders the subject as responsible for seeing and being beyond the given. Sense is revealed in the emergence of the other, in the ethical responsibility of the I, the responsibility of the I to answer the summons of the other, in the form of morality:

The calling into question of oneself is in fact the welcome of the absolutely other. The epiphany of the absolutely other is a face in which the Other (Autrui) calls on me and signifies an order to me through his (sic) nudity, his denuding. His presence is a summons to answer. The I does not only become aware of this necessity to answer, as though it were a particular obligation or duty about which it would have to come to a decision; it is in its very position wholly a responsibility or a diachony . . . (Levinas 1996, p. 54)

It is through the encounter with the Other that the researcher questions herself, finds an humility, and gives. This opens the possibility of becoming an ethical being, open to alternatives and unfettered by the presuppositions of orthodox research. The ethical is thus not confined to considerations of respondent confidentiality, sponsorship, or researcher ontology and epistemology. Ethical problems cannot be anticipated and prevented prior to the start of the research through the process of vetting and clearance by an ethical review panel. The ethical is not only recognized as permeating every element of the educational research project; the ethical extends to abandoning reflection and “going beyond the given.” In order to escape the foreclosure permeating educational research methodologies, reflection on the given is to be avoided because it brings consciousness back to the self, to the

same, to preexisting subjectivities (Levinas 1996, pp. 56–57). It is in the idea of “consciousness without return,” without return to the same, that Derrida and Levinas are interested, and this involves a very different language to that used in the description of the curriculum research project which follows.

The Curriculum Project

The project was initially conceived in 2008 as a way of experimenting with some ideas I had developed through my deconstructive reading of geography curriculum policy at the secondary school level in England (Winter 2009). In an article, entitled *Places, spaces, holes for knowing and writing the earth: the Geography curriculum and Derrida’s Khora*, I attempted to read the 2007 Geography National Curriculum policy differently, to open it up to new ways of thinking about the configuration of subject knowledge. Having presented my thoughts on paper, I was curious to find out how they played out in the school classroom. I constructed the project design, was successful in obtaining funding from the university where I worked, and enlisted a secondary school and two geography teachers (Sally and John) who taught in the school, as participants. The school-based project began in December 2008 and was completed in April 2009. It consisted of the development and teaching of a geography curriculum unit focusing on the topic of coasts for one class of Year 8 students (aged 12–13 years) Key Stage 3 (KS3).¹ The framework of the curriculum unit was made up of a scheme of work and individual lesson plans focusing on a nearby stretch of coast with which most students in the school were familiar through family holidays, a study of its physical characteristics, a study of one specific coastal town, and a field visit to parts of the coast. In one part of the curriculum project, the class of students was divided into groups of four to research a particular aspect of the town of Whitby—a seaside town on the northeast coast of England and a popular holiday destination for many students. Each group researched one of the following topics: Captain James Cook (the “explorer” who learned his seafaring skills as an apprentice in Whitby), Whitby Jet (a semiprecious stone found locally and used for mourning jewelry in Victorian England), Whitby Abbey (the history of which goes back to AD 657), and the novel “*Dracula*” by Bram Stoker (partly written and based in the town). The project aimed to refresh the geography curriculum and introduce challenges to student learning by encouraging thinking about a familiar coastal location in ways that were unexpected, inventive, and unknown. The deconstructive approach involved thinking beyond the established boundaries of the subject and its interpretation through school curriculum policy as a means of writing the earth (“geography”) differently. We looked beyond the physical–human geography binary; broke the disciplinary divide between geography, history, literature, geology, and cultural studies; and opened up students’ imagination through activities involving

¹ Key Stage 3 refers to the National Curriculum in England program of study for children aged 11–14 years.

students' family members, unsolved mystery, playfulness with language, and calling on the emotions (Winter 2009, 2013).

I restrict deliberation in this chapter to the enframing of technology with respect to areas relevant both to the purpose of the chapter and to the three-fold perspective on the relationship between being and human thought described above. These areas are pressures of performativity in the school/education research community, researcher positionality, and orthodox education research methodology. Other influences, as well as curiosity, drove my concern to shift the focus of my research interest from an understanding of the ethics and politics of language and meaning in school curriculum policy texts and geography subject knowledge to the school environment. I realized, only gradually, that deconstructive reading of geography policy texts was successful up to a point of providing critique and possibilities of alternative approaches, but these remained paperbound, not yet thought about in the context of a school classroom. The accusation of critique with a only few stabbing suggestions for new policy and/or practice possibilities was well deserved, giving rise to my questioning my ethical responsibility to open up possibilities for teachers and students in classrooms. There were, as well, enframing forces at work. My developing understanding of the field, text-based enquiries, and publications provided a place within the educational research economy, because my publications ticked the relevant boxes of contemporary currency, at the same time as providing a track record of relevant "theoretical" publications to underpin any future external funding application. And yet another three boxes in my research profile remained tick-less: "collaboration with user groups" (i.e., school practitioners and students), "user impact," and a practice-based "pilot study" on which a future external funding proposal might be based. Developing, with teachers in a school, and teaching a curriculum unit would, I surmised, allow the remaining preparatory criteria for accreditation as a fund-seeking researcher to be achieved. I recognize the instrumentalism driving my own ambitions and undertakings up to this point, easing my conscience by the prospect that shaking out the metaphysics of traditional approaches to curriculum policy and practice in a school would do some "good" by opening up thinking to new and exciting possibilities. Although acutely aware of the power of the performativity agenda in respect to my own ethics as researcher working in an HEI, I remained unaware, initially, of the economy of performativity associated with the research school's agreement to participate in the study. This only came to light after the end of the school-based phase of the study.

Although, looking back on the period of school-based research, I recall only a few occasions when the project teachers mentioned reasons why the school was keen to participate in the project, further reflection, an Ofsted² report and GCSE³ examination results published just prior to the project, revealed the goals the school wanted to achieve through participation and, moreover, explained why the project was steered in certain directions. The Ofsted report stated the need to raise students' attainment levels across all subjects at KS3 by developing the curriculum

² Ofsted is the Office for Standards in Education, i.e., the School Inspection Service in England.

³ GCSE stands for the General Certificate in Secondary Education, a 2-year program of study usually taken by students aged 14–16 years.

to meet students' needs, to introduce more challenging lesson activities, and to improve their learning skills. Following a meeting in school at the time of the project, one of the project teachers reported that the headteacher described the school as "coasting," meaning "underperforming," "under-attaining," and not applying adequate effort to improve GCSE results, which were below the regional average. In the specific case of geography, recruitment to the GCSE course was declining each year and deregulation of national curriculum requirements meant that several schools had chosen to move from discrete subjects (of geography, history, and religious education) at KS3 to an integrated curriculum focusing on a competency-based rather than subject-based humanities curriculum. The project teachers identified themselves as geography subject specialists, firmly rejecting the idea of replacing the subject-based KS3 curriculum with one focusing on generic learning skills. Their participation in the project was driven, then, by four key performance goals: to improve the next Ofsted assessment by addressing the points raised by inspectors; to increase GCSE attainment levels by introducing into the KS3 curriculum topics which would be revisited in KS4; to stimulate recruitment to geography GCSE by offering an attractive and innovative new curriculum which included a field trip in Year 8; and, finally, to resist the threat of the introduction of an integrated KS3 curriculum by strengthening the popularity and increasing standards of attainment in the subject. The technology of performativity exerted a strong pressure on the whole school and on the project teachers, leading to, as Stone described earlier, the box that it was difficult to think outside of.

I planned and executed the project according to orthodox educational research textbook rules—developing the research questions, reviewing the literature, establishing the theoretical framework, making methodological decisions based on my positionality as researcher, analyzing and interpreting the data, and discussing the findings. My ethical review application highlighted, among others, the need to protect the respondents' and school's identities, guard them from harm, and carry out member checks and store the data securely. I tape-recorded planning meetings and individual interviews with teachers and focus group interviews with students and collected curriculum material, students' work, and observations from lessons. I also kept a research diary. All the meeting and interview data was transcribed and filed, digitally and in paper copy. When, after an intervening period of 2 years, I returned to the data to analyze it, I described my relationship to it in the following way:

I realised the danger that treating the "data as given" reduces it to an inert raw material awaiting the application of procedure; that the tight framing of the project with certain instrumental goals and time frame in mind shapes the end result; that an assertive, logical analytical procedure applied to "the data" serves as a one-way track to fast and efficient completion that can easily overlook the messiness and the ethical importance of the whole experience. (Winter 2013, p. 92)

I realize now that my approach to the study was preoccupied by an enframing of the educational research process as if it were in the grip of technology, in other words, as necessarily "comprehensive, rigorous and systematic" (Winter 2013, p. 192). This enframing operated to obscure other ways of thinking, not only about the research process but about the substantive context, life, politics, and

ethics of the project, the school, and education itself. I'll develop the analysis further by discussing two key notions which surfaced during the conduct of the project: first, researcher positionality and, second, data analysis and interpretation.

Researcher Positionality

I have already “fessed up” my vested interests in relation to the curriculum project. Such an explicit statement about my stance as researcher is, according to the positionality debate important, because of the claim that “rigorous” research acknowledges the researcher’s stance in order to fend off accusations of bias. All research is constructed by humans who bring their “baggage” or understandings to the act of research, and an acknowledgement of this helps to move the research through an explicit account of how her stance influences herself as a researcher, towards robustness. In line with the positionality movement, I reflected critically on how my personal background, professional loyalties, politics, and values shaped my decision to design and carry out the curriculum study in a particular way. As a former geography teacher and teacher educator who has maintained a keen interest in curriculum policy change over the last 25 years in England, I argue for what I called an “inventive geography curriculum” in all schools, for increasing teacher responsibility for geography curriculum making, and for reducing prescribed content and political control.

I began the research project by unwittingly adopting the latter of two “positions” which emerge under the heading of “researcher positionality” in some accounts of educational research. These two “positions” serve to crystallize into a binary the way in which people understand educational research. At one pole of the binary, there are “facts” based on truth and objectivity. The underpinning argument goes like this: there exists a reality outside the self that is external, objective, and independent of humans, as a “given.” This argument gives rise to the idea of a researcher who can investigate the world accurately and neutrally in pursuit of the truth. It relates to the idea of a God’s-eye view of the world. I rejected this position in my study. At the opposite pole, human values arising from the researcher’s ontology and epistemology influence research. These values find expression through the researcher’s methodological stance. The second argument goes like this: reality is socially constructed, subjective, arising out of human thoughts, values, actions, and power relations. It gives rise to the idea that each researcher constructs his/her own knowledge and this is the source of truth. The assumption here is that everyone has the right to her/his own opinion and that authority is distributed on an individual basis across the population. This latter position is the one I adopted in the design of my research project, but it raised certain questions: Is an Heideggerian technology at work here to naturalize these two positions in polarized terms and, in so doing, to conceal other ways of thinking? Is there a danger that such positions become hardened and that they stand in the way of thinking clearly about other rather complex things going on in the project?

Both positions make very broad claims, and they do this in abstract terms. It’s worth considering whether these claims become inflated because of this—that is, whether they part company with the way that the terms “objective” and “subjective”

are more commonly used. Thus, perhaps it is better not to ask about objectivity in this general way but rather about the way we use “objective” (“truthful,” “factual,” “scientific”) within the contexts of particular areas of our lives. It is true that the curriculum project involved two teachers and a class of 13–14-year-old students. It is true that Whitby is a coastal resort on the northeast coast of England. Nonetheless, some things do seem to be subjective, in the sense that they are matters of personal taste. For example, in the case of preference for tea or coffee, this does seem to be a purely personal matter. But in the case of ethical matters such as the rightness of plans to mine for potash in the North York Moors National Park, the views people hold are something more than preferences, they relate to facts and values, and people can be expected to support these views with reasons. Where we are into reason-giving, we can look for what is right—even if we accept that we shall not be able in many cases to come to definitive answers or ways of proving what is right. The point is that our reason-giving is orientated towards objectivity—not that there is a right or wrong to the matter.

It may be a mistake, therefore, to think of a sharp dichotomy between objective facts and subjective values. When we look at what seem to be purely factual matters carefully, we find that they in turn presuppose certain values—if only in the sense that these statements are selected from the infinite number of things that we might have said about the world. For example, it’s a fact that the research school received a disappointing Ofsted grade, but this doesn’t mean anything without the institution of Ofsted, and Ofsted inspections of schools (like all human practices) have values built into them from the start. You can’t get away from values (or Ofsted).

Regarding the picture of social constructivism and subjectivity, are these two concepts entirely compatible as bedfellows? Do things (personal preferences, self-identity, individual value system) start in the individual, or are they already socially constructed—that is, by something beyond the individual (the public world of the community)? If the individual is the source of truth, this sounds as though it is not possible to criticize the individual or to show that she is wrong. This is counter intuitive, and it is difficult to see how we could live with this in practice as any criticism would be taken as a personal insult. Of course, it is the case that research and other learning are advanced by people and that people are individuals. So perhaps the problem is thinking of this knowledge as something “in people’s heads” rather than being something “out there.” People need brains (in their heads) to think, but it is a mistake to think of thoughts as already in existence in people’s heads, as if they were words written on sheets of paper, filed in folders in the cabinet drawers of our brains. Our thoughts characteristically take the form of words, and words are first and foremost things that are spoken or written (i.e., they are public). It’s through hearing them spoken or seeing them written that we come to have them as thoughts; in other words, their meaning comes into being.

The objectivist/subjectivist binary is an example of Levinasian autonomy referred to earlier, where meaning is drawn from an existing order or totality of consciousness of what is. The epiphany of the face is a visit by the other, and the other makes preexisting consciousness unavailable as ethics steps in. The encounter with the other in the curriculum project serves to arrest the slide of the researcher

into an extreme position of subjectivism, narcissism, and egocentricity, which can be seen as a form of piety leading to a confessional, religious duty or the “methodolatry” to which Stone alludes. In this approach, there is a danger of adopting an overconfident understanding of self that panders to self-indulgence (Hodgson and Standish 2006, 2013), sensationalizing the researcher’s personal story, and losing sight of the move towards truth. Instead it is important to see the ways that “researcher positionality” may have become inflated by enframing of technology and to return it to more realistic contexts of use. While it is crucially important for the researcher to be sensitive about the way she looks at things and makes decisions about the research, recourse to introspection and inflation can be avoided by attention to the variety of practices in the research situation, recognizing their complexity at different levels of significance. The context of the research is very important and has to be engaged with in depth. But it is also crucial to think about the research using ordinary judgments, to try not to dissect and identify the various contributory facets of the researcher and use these to explain why and how she/he relates to the research. This is because to do so is an infinite project and can never be completed because the researcher is so multiply faceted, experience is so immediately present, and language is so unstable. What is required in research is careful attention to the detailed description of educational practices and the clarity of expression (perspicuity) that lead us to step beyond the frameworks (like the objectivity/social constructivism binary and the idea of positionality) that shape our ways of thinking. The second point of interest to surface during the project concerned the analysis and interpretation of the data.

Analyzing the Analysis

I collected, systematically and rigorously, a large amount of data during the course of the project. This data consisted of textual transcriptions of planning meetings and 1–1 interviews with teachers and of focus group interviews with students and of curriculum resources, students’ work, lesson observation notes, and my research diary entries. In the following analysis of the analysis, I examine one small section in each of the four student focus group interviews because these offer a number of interesting opportunities to think about whether the procedures of the research process, in other words, the technology of enframing, took over the interviews in ways that concealed and constrained other ways of thinking and how the interview language arose and how it was interpreted. In the first two lessons at the start of the project, the students were encouraged to explore people’s perceptions of the stretch of coast under study—the northeast coast of England from Whitby to Spurn Head—as a way of increasing familiarity. They constructed a short questionnaire survey to collect data about their family’s and friends’ knowledge about this stretch of coast. The rationale and activities for the two lessons can be found in the [Appendix](#). The four focus group interviews, each with 3–4 students, were conducted towards the end of the project in an otherwise empty classroom in the school at a time when the remaining class members

participated in a geography lesson in a classroom nearby. The “interviewees” sat around a table with the tape recorder in the center, and were asked fairly open-ended (“semi-structured”) questions, intended to give opportunities for unexpected responses to arise. In the section of the interview focusing on the questionnaire survey, the four main questions I posed in turn to each of the student focus groups consisted of: (1) What did you think of the activity of making a questionnaire? (2) What happened in your group? (3) What happened when you took the questionnaire home? And (4) what was the point of the questionnaire? The approach to analysis I adopted was a basic thematic analysis, as described in Vulliamy and Webb (1992) which involves the identification of recurring themes, omissions, and anomalies in the interview transcript via a ten-step procedure (pp. 216–217).

It is at the point of the application of a supposedly robust technique to engage with the transcript in the form of “data as given” (Standish 2001, p. 506) that the problems start, since the system itself takes over from a more nuanced understanding of the words and from consciousness of what words do and how they do what they do in relation to meaning in a text. In applying a robust technique, the words in the transcript assume the form of chemical substances in a laboratory that can be mechanically identified, classified, and reduced to a manageable state for storage and later use. The instability, scope, and metaphoricity of language are lost as the researcher corrals the data under themes which address the research questions and provide “valid” findings to meet the study’s aims and objectives. This approach illustrates Heidegger’s enframing and hints of the self-presence of which Derrida writes and the autonomy of Levinas. I’m not suggesting that this thematic analytical approach should be condemned out of hand. In the transcript under examination here, systematic thematic analysis revealed some interesting commonly held views from students about their engagement with the questionnaire activity, categorized under the recurring theme of “the other.” It appears that, taking the transcript at face value, all the students enjoyed working on the questionnaire for the following main reasons: you get to know other people’s thoughts and likes about the place (10); the activity was different from regular geography homework (6); you learn about other people, not just for yourself (4); and it brought back memories for other people (3). Students reported that it was a good way to learn because it made you think, it was fun, and it got everyone involved—the class and family members.

The Other

Would Derrida and Levinas be pleased to see the attention paid to the other and to difference in these “results”? On the one hand, at the general level, the project did welcome the other (*avenir d’autre*), in respect to thinking beyond the traditional conceptualization of geography by engaging with other disciplines, like history, literature, linguistics, and postcolonialism. The project also broke away from the orthodoxy of the physical/human geography binary, introduced group-based research projects, involved family members and computers, and gave more

responsibility to students than was usually the case in geography lessons. Yet, the project could have pushed further against the enframing by technology in other ways, for example, by attending to the other members of the class who were not included in the focus groups interviews, those whose voices were not heard, and those who were not comfortable with the curriculum but didn't have the opportunity or the inclination to speak. Other considerations might concern the others of the places we studied, for example, Whitby. Who are the poor, the homeless, the disadvantaged in this seaside resort which holds fond memories for the families of students?

On the other hand, Derrida and Levinas require us to move one stage back from thinking about the other in terms of the conceptual frameworks of subjects, the excluded and marginalized. Derrida offers hope of thinking more radically from another space:

...we cannot really say that we are 'locked into' or 'condemned to' metaphysics, for we are, strictly speaking, neither inside nor outside. In brief, the whole rapport between the inside and outside of metaphysics is inseparable from the question of finitude and reserve of metaphysics as language. But the idea of the finitude and exhaustion of metaphysics does not mean that we are incarcerated in it as prisoners or victims of some unhappy fatality. It is simply that our belonging to, and inheritance in, the language of metaphysics is something that can only be rigorously and adequately thought about from another topos or space where our problematic rapport with the boundary of metaphysics can be seen in a more radical light. (Derrida 1984, pp. 111–112)

For Levinas, the other space is a stage back from being, a stage back from that metaphysical finitude by which language has us in its grip. In that primordial space beyond being, before ontology, before culture, and before language, there is nothing other than the gaze of one human being looking at the face of another human being. This is the infinite responsibility to the other; in other words, this is ethics (1996, p. 58).

What does Levinas' thinking about Infinity mean for school performativity, school curriculum, and curriculum research? It is not possible to predict in advance the other of these educational configurations that are so deeply ingrained in our psyches. All we can do is imagine the possibilities. These may be the imaginings of an educational world which is not enframed in a performative culture dominated by targets, goals, and outputs in the race for the top of the school league table or in the race for the career development of educational researchers. Instead, attention is diverted to careful observation of what happens in classrooms, schools, and, more widely, education with an appreciation that what happens is delicate, complex, unstable, political, and ethical. This is not a world in which curriculum researchers are so preoccupied with their ontology and epistemology that they lose sight of injustices taking place through curriculum policy and practices. Instead, everyone becomes a curriculum researcher and is absorbed by curriculum problems, what they are, where they arise, and why. This is not a world in which university curriculum researchers breeze into a school classroom twice a week for 5 months and then breeze out to write up and publish their findings. Instead, students and teachers become curriculum researchers, and curriculum imaginaries arise from the interests and commitments

of the school members and its local, national, and international communities. This is not a world in which the researcher conducts “data collection,” through predetermined questions and student responses recorded and later transcribed and analyzed, as a separate activity from the everyday life of the classroom. Instead, the school community is constantly engaged in curriculum conversations as embedded contingently in the curriculum experience. This opening of thought beyond domestication moves us towards the unexpected, the uncalculated, where multiple voices are heard, problems are sought not addressed, difficult issues arise with no immediate solutions, and a different language is summoned, a language that is open to the future, to something unthinkable. We need to pay patient attention to passing thoughts that can’t be forced or hurried. We need to slow down, to wait for fresh thoughts to emerge. We have no clear ideas of what ideas might arise. In this space, we encounter the face of the other which allows us to see ourselves as we are, preoccupied by career progression, confessionals, self, and finding “what works” as a result of a logical and rigorous research design, neat and manageable research questions—in other words, hubris. Heidegger, Derrida, and Levinas disturb our complacency about what is, who we are, what we do, our curricula, and our educational research methods, reminding us of our responsibility to the other, encouraging our humility.

Appendix

Lessons 1 and 2 Knowing the Coast: making the questionnaire, analyzing, and presenting the results

Rationale

In these first lessons on coasts, the aim is to build upon students’ existing knowledge by exploring perceptions of the stretch of coast that is nearest to the school and is probably the most familiar coast to the Year 8 classes—the NE coast of England (from Whitby to Spurn Point). We want to move from the traditional way of teaching and learning about the coast to encourage the students to develop their own research skills through a small enquiry into interpretations of real coastal places and spaces. The first lesson involves students making their own group questionnaire which they will use to gather information about what their families, neighbors, and friends think about and feel about places along this stretch of coast. The activity will raise students’ (and their respondents’) awareness that people have different knowledge and experience of places and that these are important for geographers to find out about and to understand.

Students will work in groups to develop geographical questions to help them to collect information about people’s interpretations of coastal places. This will involve creative thinking in order to construct the question and predictive thinking in order to anticipate how to collate, analyze, and present the results.

In the second lesson, students will analyze the results of their questionnaires and decide how to best present them in a way that the findings can be disseminated to as wide a range of audience as possible, including their respondents. Students will reflect on the survey and on whether carrying out has changed their views of what geography is about.

Key question: What are people's knowledge and experience of the NE coast of England?

Activities

1. Recap

- What is a coast?
- What sorts of coasts do the students' know?
- Which is the nearest coast to school?
- What do students know and feel about this coast?

Resources: map of NE coast Whitby to Spurn Point with coastal places marked.

Students jot down some facts and feelings about particular places along the coast.

2. Making the questionnaire

The aim of the lesson is for students working in groups to make a questionnaire to use with family, neighbors, and friends to find out what different people know about and how they feel about the stretch of coast from Whitby to Spurn Point.

Resources: guidelines for making the questionnaire.

Groups of students draft a questionnaire and pilot it on other groups.

Students collect data from family and friends and bring completed questionnaires to next lesson for analysis.

3. Analyzing and presenting the questionnaire results

The aim of the lesson is for students to collate the questionnaire results, analyze them, and decide on the best way to present the data, e.g., a wall poster, a paper copy, and/or electronic version.

4. Conclusion

What do the results show?

What is interesting and/or surprising about the results?

Did any issues about places along the coast that emerged in the findings?

What further research would the students carry out if they had the opportunity?

What have the students learned by carrying out the survey?

Has it influenced their ideas about what geography is about?

Students may be interested to post their favorite place (with a photograph) to the Geographical Association My Places webpage:

6.4 The Open Space of Liberal Democracy: Interpreting the National Tests of Citizenship Competencies in Colombia

Andrés Mejía

A Research Project About Evaluation in Education

This paper reports on a project in which I attempted to produce a critical interpretation of the national tests of citizenship competencies that are currently administered in Colombia. Both citizenship education and its assessment are topics of great interest in education today, as can be seen in the UNESCO declaration of the four pillars of education in the twenty-first century, one of them being learning how to live together (UNESCO 1996). Additionally, various governments have instituted some form of citizenship education—under different names and guises—as a mandatory component of the curriculum in schools and even universities. In Colombia, for instance, the Constitution that was proclaimed in 1991 and the General Law of Education that followed in 1994 made it one of the responsibilities of every institution of formal education in the country, private or public, to teach its students the Constitution and educate them as citizens in the Colombian democracy. But of course, this interest in some form of education of the individual *as a citizen* is not new, as its roots can be found in a systematic way in the Enlightenment (Heater 2001), but perhaps even as far back as classical Athens. In Colombia, the constitutional mandate for citizenship education has been implemented in different ways throughout the years, a fact that in itself reflects different interpretations of what the educated Colombian citizen should look like according to the Constitution. Public policy is the result, or perhaps the enactment, of particular interpretations made in particular places and moments in time.

Besides its inclusion in the curricula of schools and universities, citizenship has also made itself present in educational assessment. At an international level, tests

A. Mejía (✉)

Centro de Investigación y Formación en Educación, Universidad de los Andes,
Cra.4 No. 26B-33 Apt. 501, Bogotá 110311, Colombia
e-mail: jmejia@uniandes.edu.co

have been constructed and administered at least since 1971 (Torney-Purta and Amadeo 2013). In Colombia, the Colombian Institute for the Assessment of Education (ICFES) has been testing citizenship competencies in school children in grades 5 and 9 since 2003 and since 2012 in university students who are about to graduate. And of course these tests, as an element of public policy, carry in themselves an interpretation of the idea of citizenship in the Colombian democracy.

These interpretations of the educated citizen are, however, not completely transparent. That is, despite the declarations that can be found in the official documents by the Ministry of Education (2004; 2011) and ICFES (2013), the elements of public policy in themselves—if read attentively enough—can tell a story of citizenship and citizenship education that may refine, add to, or even contradict the official story. It is with this purpose that I wanted, in this research project, to produce a critical interpretation of one of these elements of public policy in Colombia: the national tests of citizenship competencies. My interpretation is an appraisal of the ways in which these tests have interpreted the idea of an educated citizen in Colombia. My ultimate purpose was to help us—concerned citizens, educators, policy makers, and researchers from Colombia and elsewhere who are interested in citizenship and citizenship education—understand the ways in which these tests in particular, but more generally elements of public policy, can produce meaning by embracing certain conceptions and ideologies but also by rejecting or ignoring others.

This research project, then, produced an interpretation of an interpretation. In this sense, it could be seen as operating on a second level, as a kind of meta-interpretation that needs to escape the messiness of everyday educational practice and take critical distance from its object of study in order to see it from above and grasp its sense and meaning by means of establishing its connections and relations with other concepts, institutions, and perspectives. In fact, however, the project was almost quite the opposite. I have been involved in this construction process, together with a number of other academics that come from various disciplines such as education, law, political science, psychology, and sociology. Of course, this involvement may raise suspicions about my possibility to be critical and not simply try to defend my own work at all costs. This is a reasonable concern, but it should not be used to reject my project and its results *a priori*. With this caveat, the reader should be able to tell by herself, at least to some extent. But there are other things worth saying concerning this issue. Firstly, it is not my intention to carry out a case study that truthfully and systematically depicts the process of construction of the tests as well as the theoretical framework that accompanies it. My main purpose is to use this as an example that will allow me to illustrate the more general conclusions that I want to advance in this paper. Secondly, I rather see this analysis as humbly suggesting the limits of the political model that underlies the Colombian Constitution—as well as many others—and of citizenship education and its assessment. Thirdly, this particular and ongoing process of constructing the tests in Colombia is inevitably vulnerable to the fact that, as documented by Levinson (2004) and by Levinson and Berumen (2007) for the particular case of citizenship education, governmental decisions are hardly the product of a single unified ideology. In this case, the team that has been participating in the construction of the tests rarely achieved pure moments of consensus, and in practice many decisions ended up being the result of accommodation.

This last paragraph is by way of acknowledging that my approach to the question under discussion is informed by my own practical experience; it comes out of my educational biography. It also reflects my inclination as a philosopher of *education* to ground my philosophical work, or at least some of it, in contemporary educational practice. But I also want to stress the fact that while one may be uncritical about one's own work, that is not an inevitable fact of life. That is simply a welcome reminder. One's credibility should not be dismissed a priori as if it were a legal trial.

What Is to Be Interpreted? The Educated Citizen of the Colombian Constitution

From the start we are faced with one central decision as to what kind of citizenship education is supposed to promote and evaluate. An answer to this question will shape the way we can address any subsequent ones. The basic political ideological orientation one might refer to in a country, in order to seek orientation as to what kind of citizen to aim at, is usually expressed in its Constitution where there is one. Therefore, policy making concerning citizenship education is, at least in part, about interpreting the Constitution. In Colombia, there is some consensus regarding the fact that its Constitution is an example of the attempt to merge strong liberal ideals of respect for the individual and her freedom, as well as encouragement of pluralism and difference, with democratic values of participation and citizen empowerment (Arango 2004; Cárdenas et al. 2006; Eslava 2009). But then, what does it mean to educate for citizenship in a liberal democracy? A first approach towards an answer would be to straightforwardly refer to the central values of liberalism—for instance, with knowledge of fundamental and other human rights and of the mechanisms for protecting them—and of democracy, for instance, with knowledge of mechanisms of participation and skills necessary to achieve an understanding of issues of public concern in society at various levels ranging from the local to the planetary. According to the taxonomy proposed by Abowitz and Harnish (2006) for conceptions of citizenship in educational programs, this one would be of the liberal kind.

All the activities that constitute education, of course, would have to reflect the same values driving education as a whole. Assessment, as one such activity, would have as its purpose the evaluation of the knowledge, skills, and understandings mentioned in the previous paragraph. This means that all the various instances of assessment that take place in education—ranging from classroom assessment by teachers to standardized testing at a national level—share a fundamental common set of educational objectives that they should aim to evaluate.

Nevertheless, such an interpretation would meet important obstacles. As has been pointed out by many authors, liberalism and democracy do not naturally complement each other in a perfect way, and some contradictions, paradoxes, or tensions—with different authors choosing different words—exist between them

that establish important dilemmas for the political conduct of citizens and the state (Schmitt 1985; Mouffe 1993, 1997; Bellamy and Baehr 1993; Sartori 1994; Greaves 2008; Gaber 2009). Interestingly, while some of them predicted that this constitutive contradiction would ultimately produce the self-destruction of liberal democracy (e.g., Schmitt), others have suggested that this intrinsic tension determines its dynamic nature in which the political is constituted as a site of continuous struggle (e.g., Mouffe, and Bellamy and Baehr). There are various versions of this contradiction; but it can be said, *grosso modo*, that many of its characteristic problems stem from the facts that liberalism stresses individuality and difference, while democracy emphasizes collectivity and equality and that the protection of individual rights can sometimes be hindered by the collective decisions and self-determined modes of life of people in a community, and vice versa.

This conceptual characterization of a central tension between liberalism and democracy poses an interpretive problem for any element of public policy about citizenship education that attempts to take the Constitution as its political ideological guide: how can it reconcile the divergent tendencies between liberalism and democracy? This question is the one that I chose as the starting point for my own critical interpretive project. This choice is a departure from what could have been the perhaps easier path of using some taxonomy of approaches to citizenship education—such as those by Abowitz and Harnish (2006) and Pykett et al. (2010)—and classifying the national tests of citizenship competencies in one of them. In this case, establishing the tests as belonging to the liberal category seemed warranted; nevertheless, in such a path my analysis might have fallen short of producing more detailed and illuminating ideas that could go beyond those used for defining the categories in the taxonomy. Additionally, the depiction of the tension between liberalism and democracy as an open space that created political possibilities—as some of the aforementioned authors envisioned it—seemed to fit well at the same time as allow for a new understanding of my own experience of involvement in the production of the tests. And, as the space that it opens up needs to be filled, decisions have to be taken which unavoidably lead to the adoption of political and existential values that, at one point or another, depart either from the basic tenets of liberalism, or of democracy, or of both.

Chantal Mouffe's work was perhaps the most extensive one concerning the tension between liberalism and democracy and the political space that it opens. Therefore it seemed like a good springboard for critically interpreting the national tests of citizenship competencies. Nevertheless, I decided to also draw on a number of different authors who have written extensively on democracy, so as to have a more balanced as well as richer understanding of what is involved.

Liberal Democracy and the Colombian Constitution

The citizenship competencies tests in Colombia follow the Constitutional command that education should promote the development of the knowledge, skills, and attitudes necessary for being a good citizen in the Colombian democracy and should

reflect the political commitments expressed in the Constitution. As mentioned above, the Colombian Constitution is regarded as embodying basic central principles of liberalism and democracy. In what follows, I will first describe these principles, to then shortly explain the inherent contradiction or tension between liberalism and democracy.

Liberalism

Despite the many versions and nuances of the use of the term *liberal*, some common referents seem to exist that point at notions such as those of the individual, difference, plurality, freedom, dignity, and rights. The fundamental liberal principle is seen to be that liberty is normatively basic and that any restrictions on it must be justified (Zakaria 2004). As Sartori shows (1994), the term started to be used in the nineteenth century, but liberal principles had been around for a very long time even if they were not referred to with that term. A starting point for justifying liberty seems to be the idea that each person is an individual who is different from others not only in terms of her biological characteristics but also and most importantly in her ideas of the good and worth and of how they can and should be realized. Individuals, then, must be free to pursue such different life ideals as a basic condition of their human dignity. A major political theme in liberalism will be, therefore, how this plurality of life ideals can be given the opportunity to coexist; and a central mechanism for this to happen is the granting of rights and freedoms, whose major contemporary expression is the Universal Declaration of Human Rights. Pykett et al., in their discussion of the different discourses of citizenship education, have put it simply: “Liberals see good citizens as individuals, with rights and freedoms, who respect the rights and freedoms of others as they pursue their interests” (2010, p. 524). The fact that there are rights and freedoms effectively imposes restrictions on the conduct of both state and citizens. But it also attributes the state the responsibility to actively protect them.

The Colombian Constitution has enthusiastically embraced human rights and has declared the submission of the State to the Law (Arango 2004; Eslava 2009). The very first sentence of its first article reads: “Colombia es un Estado social de derecho” (a “social rule of law state,” or a state based on the rule of law, with a social duty). Arango remarks that the word *social* puts an emphasis on at least two principles: (1) beyond simply abiding by the law, the state has a duty to actively promote the constitutional values; and (2) the state must guarantee all human rights in a holistic way, without prioritizing or even distinguishing between first-, second-, or third-generation rights. Of course, the fact that the Constitution declares that Colombia is an *Estado social de derecho* does not mean that in practice everyone will have all their rights protected (Rodríguez et al. 2003). But it establishes a basic principle that can and that indeed in some occasions does, exert pressure on the state to attend this obligation, by means of the sentences of the Constitutional Court (Arango 2004).

Democracy

If there are differences in meaning concerning the word *liberalism*, polysemy seems to be a central mark of *democracy*. As some authors have pointed out (Sartori 1994; Cunningham 2002), this expression has been used in many different ways throughout history, in many cases in a contradictory way, and very frequently for reasons or a political nature. From ancient Greek times, democracy has been a political term, used to refer to a particular arrangement for taking decisions of public concern, that is, a sort of state (as in Plato and Aristotle). Democracy is a term coined in the fifth century BC from *demos* (people) and *kratos* (power) and seems to derive from here its most basic characteristic: that it is the people—or actually eligible citizens—who govern and represent the state, rather than single rulers or a reduced elite. This basic idea of rule by the people is connected with other conceptual referents for democracy such as participation, self-determination (of nations), and equality. Democracy implies, then, that citizens will participate—in more direct or indirect ways—in the activities of the state, which then translates that they, as a nation or society, will determine their own fate. According to Ariza (2007, p. 158, my translation),

Democracy as a social and political regime would be characterised by two essential ‘traits’: first, the possibility that societies and individuals question present laws and social institutions, and second, the possibility to transform such laws and institutions, and based on this to create new ones. Any democratic system that denies groups or individuals of any of these two possibilities is no more than a formal democracy: democracy as there mere exercise of electing a leader once in a while.

Furthermore, this citizen participation is necessarily based on a principle of equality: the idea that each citizen counts the same and has the same opportunity to influence the collective decisions taken on matters of public concern. As Watson puts it, Lincoln’s words that “no man is good enough to govern another man, without that other’s consent” embody the idea that “human equality, in fundamental political respects, is at the heart of democracy as understood in the modern world” (Watson 1999, p. 2). And as Carl Schmitt (1985) and Chantal Mouffe (1993, 1997) have pointed out, this idea also entails the definition of boundaries that separate equals from unequals: those that are effectively allowed to participate from those who are not, a distinction that occurs at various levels, the first of which is the national boundary. Democracy, then, inevitably creates sides, an *us* and a *them*, even if these sides are continually reconfigured and are, thus, dynamic, as a mark of the political.

Various authors coincide in pointing out that there is a deep commitment with democratic ideals in the Colombian Constitution (Arango 2004; Peralta 2009), especially as regards the promotion of participation. According to Peralta (2009, p. 169, my translation),

important changes were introduced in the organisation of the state: new mechanisms for the protection of the fundamental human rights and of collective rights; participation as a right that vindicates social and public interests; additionally, a new kind of participation was motivated that would make further intervention in the construction of public policy possible (in health, education, housing, or the environment). A dynamisation of an “active citizenship” is then proposed, by means of the redistribution and the resignification of roles and responsibilities of each group or actor, in defence of the public.

Now, the fact that the Constitution provides the mechanisms for active citizen participation in public affairs has not necessarily been reflected in an actual effective change in the dynamics of the public sphere in Colombia, possibly due to the weakness of its social movements and civil society (Arango 2004). Perhaps this is a matter of time. Nevertheless, still the Constitution provides a normative reference and therefore serves as a regulative ideal that has indeed guided efforts in public policies concerning citizenship education in Colombia (Ministerio de Educación Nacional 2011).

Liberal Democracy and the Relation Between Liberalism and Democracy

As various authors note (e.g., Cunningham 2002), liberalism and democracy are different species, and the links between them are not completely transparent. This is interesting, given the fact that most democracies nowadays are of the liberal kind, and as a consequence, the expression *democracy* is often used as referring to *liberal democracy* (Sartori 1994).

One of the first systematic explanations and defenses of liberal democracy was made by John Stuart Mill in two essays, titled *On Liberty* and *Considerations on Representative Government*. According to Cunningham (2002), some elements of the relation between liberalism and democracy were advanced by Mill, which continue to be seriously considered to this day. One of them constitutes a reason to think that liberalism strengthens democracy: by protecting freedoms such as those of thought and speech, citizens will be better informed and will have developed a more critical understanding to take decisions concerning the realm of the public, which is one basic tenet of democracy. It can also be contended that Dewey's (2008) idea that a mark of democracy is the greatest possible interaction among members of society is based on a similar argument (albeit in a different terminology). Moreover, I also take it that Enslin's (1999) defense of autonomy as a worthwhile educational purpose, not only in liberal societies but also in traditional ones, took this argument even further: it is only in a society that guarantees basic liberal freedoms and rights, such as those of thought and speech, that the idea of collective self-determination—a condition of democracy—can make sense at all.

Regarding the influence in the opposite direction, Mill also argued that democracy could strengthen liberalism because liberal norms would be better supported and respected if they were constructed democratically (Cunningham 2002). Even though this is a matter of an empirical nature, there is now some consensus on the idea that, at the classroom level, in general this is the case.

Another dimension in the relation between liberalism and democracy reflects how one can help solve the problems raised by the other. Agreeing with Tocqueville's concern that democracy bears the risk of becoming a tyranny of the majority, Mill also suggested that liberalism can serve to contain the possible

excesses of democracy when it turns against some of the members of society (Cunningham 2002). This view of liberalism as a form of containment for democracy, which is shared by Sartori (1994) and others, is complemented by the idea of the rule of law as a way to limit the possibly tyrannical action of the state and to protect the individual. Arango's analysis of the so-called Law of Justice and Peace, which was issued to rule the demobilization of armed paramilitary groups in Colombia, attempts to show how human rights can serve to protect the people from the possible excesses of democracy (Arango 2007).

Now, this relation of containment will give rise to paradoxes, contradictions, or tensions within liberal democracy. After the fall of the Berlin wall, Fukuyama wondered about the future of liberal democracies: "Assuming that liberal democracy is, for the moment, safe from external enemies, could we assume that successful democratic societies could remain that way indefinitely? Or is liberal democracy prey to serious internal contradictions, contradictions so serious that they will eventually undermine it as a political system?" (1992, p. xxi). Some authors in the past, such as Schmitt (1985; see also Mouffe 1997), have answered this latter question affirmatively without much doubt. But even among those who are not so fatalist, there seems to be some agreement on the fact that "certain concepts, ideals, and practices exist at the interstice between democracy and liberalism, deriving their roots from one or both yet in conflict with some element of either liberal or democratic foundational principles" (Greaves 2008, p. 59). For some authors, the contradiction can be traced back to the ideas that define liberalism as based on a principle of difference and democracy as based on a principle of equality (Schmitt 1985; Sartori 1994; Mouffe 1997; Habermas 2001). In Watson's words (1999, p. 3),

Democracy implies the consent of the governed, which consent rests, implicitly or explicitly, on the recognition of the effective political equality of the individuals who constitute the *demos*. Liberalism implies a respect for, nay, an exaltation of, the individual qua individual, which respect or exaltation is in tension with the idea of consent of the whole. This brings to light the inadequacy of a relatively common definition of liberal democracy; it is inadequate because it fails to take into account the true meaning of liberalism.

There are various versions, formulations, and instances of the contradictions (or paradoxes, or tensions) between liberalism and democracy. While some authors point at some particular issues in which democracy and liberalism seem to clash, such as humanitarian intervention (Greaves 2008), political communications (Gaber 2009), or the response to environmental problems (Byrne and Yun 1999), others have tried to theorize the basic contradiction in different terms: as an inevitable promotion of egoistic individualism that overrides the ideals of civil and human rights (Watson 1999) or as the tension between an universalistic discourse that is unable to produce politics and the configuration of the *demos* with its unavoidable inclusions and exclusions in terms of collectives (Mouffe 1993, 1997, 2005), among others.

In this paper, I am particularly interested in Mouffe's formulation because, as I will try to show, it explains, makes sense of, and is illustrated by the tensions that appear in my object of analysis here: the tests for citizenship competencies in

Colombia. Mouffe, drawing extensively on Schmitt, explains this in the following way (1997, p. 25):

By stressing that the identity of a democratic political community hinges on the possibility of drawing a frontier between “us” and “them”, Schmitt highlights the fact that democracy always entails relations of inclusion/exclusion. (...) One of the main problems with liberalism—and one that can endanger democracy—is precisely its incapacity to conceptualize such a frontier. As Schmitt indicates, the central concept of liberal discourse is “humanity”, which, as he rightly points out, is not a political concept and does not correspond to any political entity. The central question of the political constitution of “the people” is something that liberal theory is unable to tackle adequately because the necessity of drawing a “frontier” is in contradiction with its universalistic rhetoric. Against the liberal emphasis on “humanity”, it is important to stress that the key concepts in conceptualizing democracy are the “demos” and the “people.”

This way, liberalism on its own cannot be political because it can only appeal to a universalistic notion of human beings equally entitled with rights. It is paradoxical in itself that liberalism’s emphasis on difference and the individual ends up with a universal principle. But the problem for politics is that the issues about which struggles take place and decisions are made in a democracy are inevitably defined around categories that position different individuals in different ways and that create various sorts of relations between them. These relations configure social actors which constitute friends and enemies, adversaries and allies. Politics is more about groups and collectivities than about individuals. Nevertheless, the liberal universalistic discourse on rights and freedoms does have a political role to play in democracy: it can always serve as a correction on the exclusions inevitably generated by democracy. The result, for Mouffe, is that these adversarial relations are fluid, contingent, and ever-changing, as an essential mark of liberal democracy: “Liberal democratic politics consists in fact in the constant process of negotiation and renegotiation—through different hegemonic articulations—of this constitutive paradox” (1997, p. 26).

A conclusion that can be derived from Mouffe’s analysis is that the very conditions that in a liberal democracy define citizenship *in practice*—and not only formally as requirements for voting and for being eligible in government—will be neither stable nor conceptually solid (in the sense of being incontestably derived from the basic principles of liberal democracy). This way, the contradictions between liberalism and democracy open up a space of interpretation of inclusion and exclusion, around categories that define social actors.

At any given moment in time, in fact, the actual institutional and policy arrangements will reflect the momentary accommodation of the various political forces in democracy which, as part of their resources in conflict, make use of liberal principles in the “negotiation and renegotiation of the constitutive paradox.” This implication can be further developed in terms of the life ideals that individuals bring, *qua* citizens, into the conversational processes of democracy. The plurality of values and forms of life that liberalism attempts to safeguard as a result of the autonomy of the individual cannot be seen as purely matters of private concern; they inevitably express ideals about the social interactions between the different individuals that share a public space. In other words, ideals of private life carry with

them ideals of social and public life, and so the private and the public spheres cannot be neatly separated (Cunningham 2002). But then, citizenship in a particular liberal democratic community will not only be defined, in practice, by the theoretical ideals of liberalism and democracy but also by the political ideologies inscribed in the life ideals of the individuals that conform the social actors that participate in the political conflicts and processes of democracy.

This way, decisions about actual institutions and arrangements in a liberal democracy at a particular moment in time will not reflect some pretended pure political values of liberalism and democracy, as if there were no tensions and contradictions between them. Instead, different comprehensive political ideologies—different interpretations resulting from accommodation of political conflict—should be noticeably seen to be introduced in the various decisions that give substance to politics in a liberal democracy.

In the following sections, I will present the case of the national tests of citizenship competencies in Colombia. This case, as I see it, is related to the more theoretical discussion in this section in at least two ways. On the one hand, it illustrates—as it is a particular instance—the general principles developed by Mouffe and other authors. As such, it serves to explain in a better way the meaning of those general principles precisely because in a particular practical context they are connected with other elements with which, collectively, they acquire some meaning. Therefore it is a *vehicle* for interpretation. On the other hand, it is an interpretive result in itself, which can contribute to our present understanding of this as well as other contexts of educational practice. In this particular sense, it is an interpretation of an element of public policy. Now, it is important to stress that in this case philosophy takes as its object of inquiry *both* a general idea or principle *and* a particular situation or event—what Stake (2000) calls a *case*. And studying a case requires looking at the particular conditions that make that situation be what it is, in a particular place and moment in time. The next section presents such a context for the national tests of citizenship competencies, and its analysis will occupy the following one. I take it that this double relation between the general and the particular in philosophy of education is one way in which it can become relevant to practice.

The Assessment of Citizenship Competencies

A Short History

Within the current educational tendencies, in which formal evaluation has assumed a prominent place in education, the assessment of citizenship comes as a natural consequence of having acknowledged the need for an education for citizenship. In Colombia, interestingly enough, there was first a test for citizenship competencies in 2003, which was then followed by the National Standards of Citizenship Competencies (Ministerio de Educación Nacional 2004) and even later by the

publication of the conceptual framework underlying both the test and the standards (Ruiz-Silva and Chaux 2005). I take it that this inversion of the expected logical order is a sign for the great importance presently attributed to evaluation. It can stem from the fact that it is the main instrument that the government has for exercising power over the schools and universities in the country, given that the Constitution and the General Law of Education gave a large degree of autonomy to schools and universities for developing their curricula.

But citizenship tests have a long history. In some countries, immigrants who want to become nationals of a particular country have to take a test that assesses their knowledge of the country's history, geography, and constitutional principles and political procedures, as well as rights and duties. Here, the idea of citizenship is a legal one. But what I am referring to in this paper is tests of the sort that attempt to determine how good a citizen somebody is, or could be, in social and political terms, that is, to determine how much the individual resembles the kind of citizen expected of a particular society. These are sometimes referred to as *civic engagement tests*.

The perhaps best known international tests of citizenship competencies are those constructed and administered by the International Association for the Evaluation of Educational Achievement (IEA). The first study was conducted in 1971 in nine countries and tested content knowledge, attitudes towards authoritarianism, the government and women's rights, and behavior concerning the discussion of political issues (Torney-Purta and Amadeo 2013). More recently, the arguably two most important studies are the 1999 Civic Education Study (CIVED) and the 2009 International Civics and Citizenship Education Study (ICCS). There were 28 participating countries in the CIVED study and 38 in ICCS. Colombia took part in both of them.

According to Torney-Purta and Amadeo (2013, p. 89),

In general, civic education studies conceptualize competent democratic citizenship as encompassing knowledge, skills, attitudes, values and behaviors (current and expected). Responsible citizens have fundamental knowledge of democratic processes, an awareness of issues in their nations and communities, and an understanding of ways to obtain and analyze information. They also participate in their communities (including volunteer activity) and in organizations (at school and in their neighborhoods), possess civic-related skills (such as cooperation in groups and effective and respectful communication), are concerned for the rights of others (as well as themselves), and are predisposed to find democratic methods to bring about change.

Moreover, the similarity of purposes between CIVED and ICCS extends to the level of the general content categories, despite the fact that some names were changed. Nevertheless, in some cases, ICCS shifted the focus of the topics that were tested, whereas in some others, it enlarged their range to include, for instance, modules that addressed topics of regional importance.

In Colombia, civic education received the name of *formación ciudadana* (citizenship education) and adopted competencies as its central pedagogical element for defining its objectives, as opposed to informational knowledge. Competencies came to be defined as "saber hacer en contexto" (knowing-how, in context) (Ministerio de Educación Nacional 2004).

The Tests for Citizenship Competencies in Colombia

As mentioned above, the first tests of citizenship competencies at a national level for children in grades 5 and 9 were applied in 2003 and then in 2005, 2009, and 2012. The 2012 test was different from the previous ones in at least two aspects: It was also applied to undergraduate students in their last year of their studies, and its structure was largely modified. Additionally, there are plans for the construction of a test for students in their last year of school (grade 11) with the same structure.

As can be seen, there are tests being applied in grades 5, 9, and 11 and in the last year of undergraduate studies, although at the time of writing this chapter, in grade 11 citizenship competencies were not included. These tests, of which citizenship competencies constitute only one of various components that include Maths and Spanish among others, are called SABER 5, SABER 9, SABER 11, and SABER PRO, respectively. The detailed results for each individual student are made public only in the cases of SABER 11 and SABER PRO and have an impact on the future possibilities for students to be accepted into university programs. For SABER 5 and SABER 9, only averages and standard deviations for each school are made public and then only for some of the areas that are tested.

The common nucleus of the citizenship competencies tests in SABER 5, SABER 9, and SABER PRO assesses knowledge and cognitive skills. It consists of four main components: knowledge of the Constitution, argumentation, multiperspectivism, and systemic thinking. The latter three are considered different kinds of dimensions, or *tools*, of critical thinking, roughly following Bermúdez's conceptualization (2008). I will not examine these components in detail here, but some description is in place. Knowledge of the Constitution refers to what it says about rights and duties, structure and organization of the state, and mechanisms for democratic participation. Argumentation refers to the skills needed to analyze and evaluate assertions, arguments, and discourses about issues of social concern. This component is closely related to critical thinking as it is conceptualized by the critical thinking movement (see Mejía 2009a). Multiperspectivism is the "capacity to analyse a problem situation from different perspectives" (ICFES 2013, p. 4, my translation) as well as to understand the various interests and perspectives in a conflict situation. And lastly, systemic thinking refers to the "capacity to identify and relate the different aspects that constitute or determine a problem situation in the social domain" (ibid.).

The rationale behind this choice is explained, *grosso modo*, in the following way:

The exercise of citizenship is understood here as more than the exercise of rights and duties, but it also includes active participation in the community that one belongs to. This way, a competent citizen knows his social and political context, knows his rights and duties, has the ability to reflect on social problems, is concerned about the issues of his society, participates in the search for solutions to social problems, and seeks the general well-being of his community. (ICFES 2013, p. 1, my translation)

A strong emphasis on participation can be seen here, which is directly related to the democratic ideal of a government *by* the people. But how does this ideal relate

to the structure of the test that we just saw, in which the various dimensions of critical thinking comprise about three fourths of it? All this suggests that the underlying premise is that for participation to occur in a meaningful way, the citizens need to have developed the skills that enable them to have a critical understanding of the social and political reality they live in.

The Decisions in the Construction of the Tests of Citizenship Competencies in Colombia and the Open Spaces of Liberal Democracy

As I have just said, it is expected that comprehensive political values beyond some possibly pretended purity of liberal democracy will occupy the space of tension between liberalism and democracy, in actual institutional and policy arrangements. And, of course, this is also applicable to those involved in the domain of citizenship education. Now, as a clarification, it is necessary to point out that this is not the same as proposing that education should be political or that it is inevitably so. Despite some voices from both inside and outside academia suggesting that politics should be restrained from entering the world of education, so that it can really focus on knowledge and learning (as documented by Davies 1999; Pring 1999; Kristjánsson 2004), the starting point in this essay is that education is political, at least in the sense that Freire (1994) argued that it is, and the more so when we are talking about citizenship education. The notion of citizenship is straightforwardly political, as it refers to how individuals relate to the state and to each other and to what role they have in decisions about issues of public concern. But this idea that education in general and citizenship education in particular are political is just a starting point for my analysis. The problem that I want to address stems from the fact that an education for liberal democracy, inasmuch as it should allow for a variety of political positions, should promote knowledge, skills, attitudes, and competencies that are proper to its own ideology but that do not favor or dismiss any other political ideology or vision of society. But then, the space opened by the tensions between liberalism and democracy needs to be filled, in actual political institutions and arrangements, by comprehensive political values and ideologies.

It is also important to clarify that I am not intending to address the political and sociological question about whether the government can exert some pressure on those constructing or administering evaluations that test for citizenship competencies, in order to advance their own partisan goals and pursue their political agenda. The degree of independence will be something that will surely vary from one case to another, from one government to the next. It is for critical sociological and political research to determine if this is so. My analysis intends to be philosophical instead. For this same reason, I do not intend to provide all the relevant evidence that might support my assertions concerning the tests and the decisions taken in their construction. Instead of that, I will attempt to show that had the decisions

been taken differently, there would have been a different configuration in which different political values would have crept in.

A third caveat concerns the fact that my analysis is about political ideology, examining conceptions of citizenship present in the national tests in Colombia, but it does not necessarily intend to make claims about the conceptions held by those who construct the tests. In any single decision, there are many factors and dimensions involved, many of which are not ideological but correspond to restrictions of different natures.

My analysis will concentrate on four decisions that were arguably taken in the construction of the national tests of citizenship competencies in Colombia. These decisions were taken within the framework of various practical, technical, and political conditions, and therefore it would be unfair to claim that they resulted only out of the particular political agenda of the government. But regardless of their origin, they have political implications that must be acknowledged. For each of them, I will discuss the issues that are at stake, politically, that can be located in the space opened by the tension between liberalism and democracy. These decisions are (1) constructing one public test for application at a national level, (2) having a paper-and-pencil test composed of multiple choice items, (3) using a minimalist interpretation of the Constitution (the *minimalist* strategy), and (4) taking critical thinking as a set of cognitive abilities that define the *form* rather than the *content* of thinking (the *formalist* strategy).

Public Tests at a National Level

The fact that the same tests are administered to students of all conditions and in all the regions suggests an approach to citizenship which can be seen as universalistic, that is, one that understands citizenship as something that defines all the individuals equally and that assumes that they all share the same conditions that enable them to be so (Mouffe 2005). Some features of liberal democracy, especially those associated with knowledge of human rights, of the organization of the state, and of the formal mechanisms for participation, seem to be particularly well suited to this universal (or at least national) arrangement. This is what can be especially expected of a liberal approach, with its abstract universalistic discourse that assigns differences between the individuals to the private domain and assumes an abstract citizen in the public realm. However, the obstacles for becoming an active citizen in a democracy, in a genuine and not merely a formal way, and therefore the attitudes and abilities that must be developed by the students in order to overcome those obstacles are different. And this is why, as we saw before, democracy depends on categories that define social actors, collectively, which cannot be set aside by an appeal to an abstract individual. Belonging to different categories will have particular implications for the individual, which restrict or potentiate her possibilities both to lead her life in the direction she wants and to democratically participate in the construction of her society. Becoming an active citizen in a liberal

democracy is something that occurs or that one does from particular locations in a social and political network.

Of course, it is extremely difficult to expect ICFES to produce different kinds of tests that can acknowledge the differences between students regarding their opportunities and obstacles to become citizens. That might perhaps be expected from education in general, in actual classrooms, when teachers and professors interact with actual children and youth. But then, even if unintendedly, the image suggested by the national tests of citizenship competencies will be one of a general abstract citizenship which ignores the particular conditions that determine each individual's possibilities to genuinely become a citizen. Whatever specific abilities and dispositions one needs to develop in order to deal with the particular conditions one faces that affect one's possibilities to be an active citizen become in this image the responsibility of the individual and not of education.

A Paper-and-Pencil Test Composed of Multiple Choice Items

Another *technical* decision that defines the test but that has political implications consists in the fact that these are pencil-and-paper tests. One implication of this decision is that the test is restricted to cognitive abilities and skills (or competencies, in the terms chosen by ICFES), but does not look at actual behavior. As was pointed out, the general idea of the four components of the tests was to assess the students' abilities to understand and analyze issues of public interest; and, as inferred from the discourse of the Ministry of Education, its ultimate purpose was participation. Now, one can wonder, what forms of participation? Given that participation in a democracy is more desirable if the citizens are well informed—have a good understanding of such issues and can analyze them critically—one might conclude that these abilities are useful for any kind of participation. However, some forms of participation require other additional kinds of knowledge—both *know-that* and *know-how*—which are not obvious or readily available and which therefore need to be learned. For instance, voting to choose our leaders in a responsible way probably does not require much in this sense beyond being well informed about issues, candidates, and programs. But more active forms of participation—such as social control of elected leaders, social mobilization and protest, or all the ways in which civil society can have a more direct influence on decisions about issues of public concern—require knowledge of how politics works, and the corresponding appropriate attitudes, which are much more demanding than those of responsible vote.

The conception of citizenship present in the test is defined *by means both of what the tests include and of what they exclude*. At least in this sense, the fact that actual behavior is not included would implicitly suggest that being a citizen does not demand from the individual much beyond the ability to understand and analyze issues of public concern (within the frame of the liberal democratic constitutional principles). This is more akin to voting to choose representatives, which requires

little from the voter in order to exercise this right, than to other more active but also more complex forms of participation which demand knowledge of how to go about the different actors and interests in the political game, the sources of power, and in general the social and political world in which institutions and policy are shaped.

Again, it may be hard to imagine that a national test would be able to include the assessment of actual behavior or that government would actively promote the non-formal mechanisms by means of which politics is actually exercised in practice—the *real politik*. However, that is not the point here. I do not intend to criticize the decisions taken in this particular case, but to show how policies or institutional arrangements within liberal democracies inevitably involve decisions with political ideological implications that are contestable but cannot be resolved purely by recourse to the basic principles of liberalism or democracy.

Another implication of this decision is derived from the fact that the tests, in the knowledge and cognitive skills module, are composed of multiple choice items. In each of them, there are four alternative answers of which one and only one must be correct. This particular decision of there being one and only one correct answer puts some restrictions on the kinds of items that can be constructed and particularly on the situations that are presented and that the students must analyze. One condition for this type of items, then, is that *correct* and *incorrect* must be uncontroversial¹, in line with the fact that multiple choice tests are also called “objective tests.” If one and only one answer must be uncontroversially correct, and then the degree of complexity of the situations represented in the items must be considerably reduced so that the analysis never feasibly and realistically depends on other unstated aspects of the situation depicted.

It is interesting that systemic thinking is, precisely, about complex situations in which various elements of the situation interact, both causally and normatively, in various nonlinear ways (Forrester 1994; Midgley 2008). The items of the systemic thinking component attempt to assess whether the students are able to identify that complexity: how different dimensions in a situation interact with each other and what unexpected consequences there might be if certain actions are carried out. Nevertheless, complexity usually emerges out of the many aspects of a situation in interaction with each other, which cannot be stipulated in a short description in a multiple choice test. As a result, the complexity in those situations is unavoidably very limited. In the end, the underlying even if unintended idea is that situations of

¹ Curiously, the idea of an item’s correct answer being uncontroversial may be itself controversial. The fact that the items must have a certain degree of difficulty, so that some students will answer them incorrectly in the test, implies that *uncontroversial* cannot mean that everyone will agree. One possible way to understand it is as agreement of the experts. This would, however create a paradox: it would take us to accept some form of expert authority in matters of citizenship while at the same time citizenship in a democracy is, as we saw, declared on the basis of some kind of equality between the citizens—although some authors, such as Mill, may have suggested differential forms of participation (Cunningham 2002). Yet another possible way to take this idea of the uncontroversial is to see it as agreement after a justification has been given—which test taking assumes does not happen before the test, but which might *in principle* occur after it. I favor this latter option.

public concern have only a limited complexity and, for example, that forms of exclusion and violence that take place in them are rather easily recognizable without a deep knowledge of the situation. As a consequence, the conception of citizenship present in the tests is one that suggests that there is no need for spending the time and effort to be well informed about the social situations of public concern.

Minimalism

As we saw, it is supposed that in a liberal democracy, the only comprehensive values that are to be promoted by the state are those that guarantee the viability of liberal democracy itself. In this case, the political principles embodied in the Constitution served as those referents that specify the political values to be assessed with the tests. Further parameters for constructing this referent came from the sentences of the Constitutional Court. This is particularly obvious in the component of the test dedicated to knowledge of the Constitution and its principles.

Now, this kind of knowledge might be evaluated in different ways. One of them would be to take it as information and see if the students are able to remember it. Although in a very few cases this approach was adopted, especially when it concerned functions of particular state organisms, it was largely discarded to favor another in which the ability to apply that knowledge to assess particular situations was evaluated. For instance, given a certain situation, the student would be asked to identify the kinds of basic human rights that were at risk or effectively being violated.

A problem emerges, nevertheless, when one notices that the very application of the principles is not free from polemics. For instance, do systemic structural conditions exist that put at risk or effectively violate human rights? This question is answered differently from different political ideologies and therefore cannot be taken for granted (see Cunningham 2002). In terms of the tests, the corresponding question is whether it would be just, following the liberal democratic principles of the Constitution, to assess whether students are able to identify systemic structural conditions that violate or put human rights at risk. It was decided in this case, not before much discussion, that a *minimalist* approach would be adopted. Such approach is one which tries to only take interpretations for granted which are deemed to not be polemical, within the framework provided by the Constitution. Minimalism was particularly important because it reduced the probability that the test would be attacked from the various sides of the political ideological spectrum, as has reportedly happened in the past. But this way, for instance, systemic structural situations that put at risk or violate human rights were discarded from the tests.

Minimalism is an approach that does more than just solve the problem of keeping everyone happy—or at least not making them too unhappy. As remarked above, the tests create a conception of citizenship by means of both what they include and what they exclude. As a result, it can be said that the tests in themselves suggest a minimalist idea of the application of the principles of the Constitution

including human rights. And in so doing, presumably (rightist?) ideologies that consider systemic structural oppression inexistent or irrelevant are given primacy over (leftist?) ones that think otherwise.

It must be remembered, however, that the fact that minimalism was the choice made in this case should not obscure the fact that had it not been so, primacy would have been given to some other ideological tendency and their interpretations of the Constitution would have been favored. This openness of interpretation, which still needs to be filled, is inevitable.

Formalism

If minimalism was a characteristic that mostly applied to the component of knowledge of the Constitution and its principles, the three other components—argumentation, multiperspectivism, and systems thinking—can be more clearly characterized as the result of a *formalist* approach. These three components attempted to assess the abilities that students had developed for analyzing and understanding all sorts of issues of public interest. It was decided, as far as possible, not to evaluate what judgments and opinions the students had about such issues, but instead whether the students had certain abilities that are instrumental in the production of those judgments and opinions. So, for instance, the students are given a problem situation in which someone proposes some policy and produces an argument to justify it. They are then asked to detect logical mistakes in the argument—in the argumentation component—or to infer world views and conceptions behind the argument, in multiperspectivism, or to identify the relation between different dimensions in the problem situation. But they are not asked to give their opinion concerning what the best solution would be or how good the solution proposed is for that problem situation. In short, to adopt this formalist approach means to not evaluate *what* the students think but *how* (the form) they think.

This strategy—of evaluating *how* students reason instead of *what* their opinions are—is well aligned with the liberal principle that different substantive values must be accommodated within society and that the state must not interfere with them, as well as with the democratic principle that decision making and participation will be better realized if citizens have the ability to understand issues of public interest. Nevertheless, a closer look at this shows that it is not so easy to fully separate *how* from *what*. I have argued elsewhere (Mejía 2001, 2009b) that critical thinking abilities, such as *identifying assumptions in an argument*, are always exercised from contexts of meaning within which the critical person can make sense of the argument that she was asked to analyze. Now, contexts of meaning are substantive; that is, they are constituted by the views that the person holds in some domain. This means that different people, with the same general critical thinking abilities, will be able to provide different analyses of the same argument when it comes to complex situations. All this is very desirable, when these different

analyses provide us with different perspectives and help us see different aspects of the same situation. However, surely not all perspectives count in the same way in the same contexts, when it comes to the analysis of issues of public interest; and therefore not all assumptions that are made in an argument will be equally relevant. For instance, depending on context, noticing that a proposed policy of giving old-age citizens less priority in health care might be assuming a certain polemical conception of human dignity may be more important than noticing that it assumes that there is scarcity of resources. Furthermore, even though they are both cases of identifying assumptions, the knowledge (beliefs) and abilities that enable one to do either kind of noticing are different. I take it that this analysis resonates with Taylor's (1979) discussion of the idea that not all the restrictions that the state can impose on people's actions count in the same way for deciding how free they are. Taylor's point about the inevitability for a positive conception of liberty can perhaps be seen as one example of the inevitability of a positive conception of the public and by consequence also of the kind of critical thinking appropriate for citizenship. In a general way, it can be said that to meaningfully educate in critical thinking is not only to teach *how* to think but also to point out—and perhaps to argue—*what* is worth thinking about.

Now, in an exam made of open questions, the student may be allowed to bring her own contexts of meaning in the analysis of an argument or situation. In multiple choice items, those contexts of meaning have to be provided in advance, either implicit or explicitly. But then, what contexts of meaning should be used in the tests? In order to be uncontroversial, and combining minimalism with formalism, it has to be only very general ones that can be readily accepted by all. But then, this will effectively restrict the potential of critical thinking. Liberal democracy is ambiguous in this sense: it suggests that people should be critical, but it does not, and cannot, put too much into an idea of what critical thinking substantively should look like.

Some Implications

When one looks at liberal democracy as a political ideology, one has to acknowledge, as so many authors have, that its two supporting pillars of democracy and liberalism leave some open spaces of ambiguity and tension. When one regards liberal democracy as an actual form of political organization, a look at actual institutions and policies will show that those spaces opened by the tensions between liberalism and democracy are necessarily filled by political ideals that may threaten to undermine either one of them, or both. This is something that I have tried to show in this paper, by means of an analysis of some decisions taken in the construction of the citizenship competencies tests in Colombia.

Following Mouffe (1993, 1997), this characteristic is not something that must be avoided or the seed for self-destruction of liberal democracy; it is its constitutive condition and what restores in it the political as a site of conflict and struggle.

The citizenship competencies tests in Colombia are just one of the multiple elements of institutions and policy that are the result of just that political struggle, which has its own exclusions and inclusions.

Various suggestions for policy and action in education can be derived from this analysis, in which the possibility of political conflict and struggle is protected, particularly as regards citizenship education and its evaluation in Colombia. The first one relates to the need to promote other forms of assessment on different levels—municipalities, for instance, but mainly schools and universities, or even classrooms—that can exert a real influence on the kind of citizenship that is actually taught in educational institutions. This implies that such institutions must become sites of discussion about what citizenship should mean and the role of education in promoting it.

A second element corresponds to the need to make explicit, as far as possible, the inclusions and exclusions present in the current tests or the conceptions of citizenship enacted in the decisions taken in their construction, regardless of whether they were intended or unintended. This move would mean that the government accepts to have a visible agenda at the same time that it acknowledges its limits so that other actors can more easily participate in the definition and implementation of public policy in education. Of course, I am aware of the difficulty involved in demanding such transparency in the actions of political actors. Indeed, as Gaber (2009) has suggested, we face here one of the contradictions of liberal democracy: it appears in the world of the *real politik* as the fact that governmental communications are not usually designed to provide maximum information so that the public is well informed, but to keep a “permanent campaign.” Nevertheless, it is possible for the citizens to demand more, rather than less, transparency from the government. And it is also possible for the intellectuals, the academia, and other actors of the civil society to perform this critical role.

In the end, the sort of conflict and struggle to which Mouffe draws our attention occurs between different actors, including the state. And it is everyone’s responsibility to protect liberal democracy by means of exercising a kind of political struggle that can guarantee its own continuous existence.

Final Remarks

The research project whose results and interpretive process I have been discussing throughout this chapter is, effectively, the meeting point in which roles, concerns, and hopes of various natures converge: me as a citizen, as a philosopher researcher, and as a consultant; a concern for general principles and for an understanding of the particular; and the hope to be recognized as a serious philosopher as well as to exert the best possible influence on the practical affairs regarding citizenship education and evaluation. I think that this ambitious approach is especially apparent in some

interpretive choices and convictions that I have pointed out in various moments in this chapter. Some of these are the following:

- *Going from the general to the particular and vice versa.* My interpretation of the national tests of citizenship competencies in Colombia was made possible by the interpretive frame provided by Mouffe’s discussion of the open space of liberal democracy, so that the more general and theoretical principles illuminated the particular case. At the same time, however, by illustrating the general principle, the particular case also helped to develop the theoretical understanding of the former.
- *Interpretation from within and from without.* It is difficult to draw a clear line that separates the inner space of a situation, in which a participant is located—from the outer space of that situation, in which an external observer is situated. In this project, I, as the researcher, was positioned in such a way that I could have an insider’s knowledge of the elements and events that configure the normative and causal complexity of the situation, as well as the philosopher’s knowledge and independence (at least to a certain extent) that allowed me to establish connections between this case and other developments and conversations that have been produced in a wider academic audience around the issues of citizenship and citizenship education.
- *Interpretation of a work instead of its authors’ intentions.* As I pointed out in various moments in the discussion of the decisions involved in the citizenship competencies tests, the object of interpretation was the tests themselves, rather than the intentions that their authors may have had when constructing them. This interpretive decision is based on the idea that the elaboration and implementation of an element of public policy such as these tests is a complex matter that involves multiple factors and that only partially reflects the intentions of its authors. Eco (1990) usefully illustrates this in the case of literature, showing how even aspects that appear by accident in the production of a work—which the author may not even realize they are there—can contribute to its production of meaning. Interestingly, this very fact may have actually favored my possibilities of achieving a critical attitude concerning a product of public policy for which I am at least partially responsible, such as these tests.
- *The impossibility of meaningfully distinguishing between first-order and second-order interpretations.* Even though my research project concerned the production of a critical interpretation of the interpretation of the idea of an educated citizen in Colombia embodied in the citizenship competencies tests, in fact it at the same time uses or produces an alternative interpretation of what such an educated citizen should be like. Because of this, my argument is actually involved in the first-order conversation about the educated citizen rather than only stay on the second-order or meta-level. I am interested not only in what and how things are said about citizenship and citizenship education but in citizenship and citizenship education themselves. Accepting this involvement allows me to “get my hands dirty” and advance recommendations rather than maintain a pedantic position of a philosopher that thinks that he sees from the sky above what goes on down on the ground.

This approach, as I see it, embodies a both/and rather than an either/or attitude. After all, the very idea of interpretation seems to carry with it the possibility of listening, exploring, and, in general, being attentive. None of these is possible without a willingness to embrace rather than to dismiss.

6.5 A “Jill” of All Trades and Mistress of One: Interpretation, School Leadership, and Philosophy of Education

Janet Orchard

Accepting that good leadership is a critical factor in the flourishing of schools, my research was concerned to argue that within the context of a democratic society, such leadership ought to be informed by democratic values. I illustrated my argument with particular reference to maintained schools in England. These are designated places that will prepare the next generation for their future lives as citizens, while established leadership practices in those same schools continue to promote an autocratic model of good leadership which centers on the agency of an individual, the “headteacher” or principal.

I considered the influence of past practice on this hierarchical tradition of school leadership and criticized its continuing presence in current policy and practice. I offered an alternative conception of good school leadership, based on democratic principles of political liberty and equality. I justified my argument on moral grounds, supported by empirical evidence from other educational researchers (e.g., Gold et al. 2003; Gronn 2003; Harris and Muijs 2005). This suggests that democratic leadership is possible within the existing structures that commonly regulate schools, although in England these structures are under threat.

I established at the level of principle what an approach to school leadership must necessarily entail if it is to be genuinely “democratic,” illustrating my argument with further examples of democratic practice commonly found in schools, for example, in initiatives intended to promote “student voice” (e.g., Fielding 2004; Flutter and Rudduck 2004), and with the inclusion of parents and guardians in decision making (Elliott et al. 1981). I also identified further—pedagogical—reasons why democratic school leadership is desirable. I argued that where activity

This is a play on the phrase “A Jack of all trades and a master of none” in English.

J. Orchard (✉)

Graduate School of Education, University of Bristol, 35 Berkeley Square,
Clifton Bristol BS8 1JA, UK

e-mail: edjlo@bristol.ac.uk

within schools is coordinated in a distinctive spirit by people who are both morally committed to and practically skilled at translating democratic values into daily life, other people learn from this experience and can make informed choices about their own future behavior and moral commitments.

I concluded that schools should be free to determine for themselves how they wish to be led, within limits. Since 2004, a particular conception of good school leadership captured in the National Standards for Headteachers in England (DfES 2004) has been promoted, even though it presents a view of leadership that is in tension with democratic values. I argued that those national standards ought to be scrapped, to be replaced by a new National Framework for School Leadership. I recognized the potential benefits to schools of expert educational decision making but argued that the power of those specialists should also be held in check. I concluded that schools should ensure that strategic decisions concerning their future direction are shared widely among directly interested parties, including pupils, parents, and local citizens.

An Issue of Interpretation

My investigation was concerned with the kind of leadership that is best suited to the particular needs of maintained schools in England. I did not set out to discover reliable or consistent patterns common to successful leadership behavior through my research. Rather, I was concerned to interpret what the nature of “good” school leadership should be in a democracy in particular. Educational Leadership, Management and Administration research (ELMA) is commonly motivated by a concern to understand the nature of good practice in order to contribute positively to school reform. However, ELMA researchers do not agree consistently either on what good school leadership entails or on what measures are needed to bring about the best school leadership possible. Even the assertion just made—that the nature of good leadership should be identified if schools are to improve—is contentious.

Thus different discourses of ELMA research have developed within the field of study, and these are often in tension with each other. I used the word “discourse” in my study to refer to a narrative that is used to frame understanding of the world as it is experienced and which is expressed through language and the choice of certain concepts rather than others. In the context of research, the notion of a discourse has profound implications because it implies that the way in which experiences are interpreted by the researcher could be very different at a fundamental level from one paradigm to another. In another discourse, the research question underpinning my study would be framed entirely differently, conducted by other means, and likely reach alternative conclusions. I used the phrase “dominant discourse” to describe the narrative that frames official interpretations of experience. In schools in England, the dominant school leadership discourse emanates from national education policies formulated by central government and its representative agencies. These include: the Department for Education (DfE); the Office for

Standards in Education, Children’s Services and Skills (Ofsted); and the National College for School Leadership (NCSL).

Grogan and Simmons (2007, p. 37) identify a spectrum of such discourses within the ELMA field of study, with the critical approach (e.g., Grace 1995; Alvesson and Wilmott 1996; MacBeath 1999; MacBeath and Moos 2004) that I adopted in my study at one end of that spectrum. I assumed, as Gerald Grace argues, that notions of leadership and management “do not float freely in the discourse of textbooks of educational administration or in the prescriptions of technical primers of school management” (Grace 1995, p. 5). I assumed that concepts develop meaning(s) over time that need to be interpreted in relation to the particular context(s) in which they are situated.

Interpretive ELMA Research

There are various traditions of interpretive research already in the ELMA field of study (Morrison 2007, p. 23), but I do not engage with the detail of those distinctions here. Instead, I highlight three specific groups of existing ELMA research that exercised a particular influence on my study. These are: leadership research concerned with values in general, leadership research concerned with democratic values in particular, and critical school leadership research.

Where existing ELMA research has explored the relationship between values and leadership in some detail with reference to philosophical writing, I sought to develop this body of existing work further (e.g., Hodgkinson 1991; Bottery 2000; Haydon 2007), based on a shared interest in moral and ethical deliberation in the school leadership context. One important study has suggested that the very best formal school leaders manage both (Gold et al. 2003) although this finding has been challenged (Wright 2003). While welcoming the study in general terms, I found further difficulties with it which I explored in greater detail in my study.

A group of ELMA studies seeking to capture accounts of democratic school leadership practice (Harris and Chapman 2002; MacBeath and Moos 2004; Harris and Muijs 2005; Woods 2005) also influenced my argument. These researchers appeared to share my interest in decision making in schools which extended beyond the ranks of senior managers. It was broadly speaking interpretive, in that it does not seek to identify standardized solutions for educational reform to apply to any kind of school context.

In other respects, research studies of this kind are considerably more loosely associated than the first group which I identified. The interpretive nature of John MacBeath’s research (1999) is clear—he insists that schools should be encouraged to “speak for themselves”—but it is less evident in the work, for example, of Alma Harris. Her commitment to a broad and inclusive conception of leadership, with particular emphasis on the leadership role of teachers (e.g., Harris and Muijs 2005), is evident, but she mixes the language of “improving” schools with that of “effectiveness” (e.g., Harris and Chapman 2002).

ELMA research concerned to criticize the dominant school leadership discourse (e.g., Smyth 1989; Greenfield 1993) exercised a formative influence on the argument I developed, in particular the work of Gerald Grace (1995, 1997) (see below). Grace argues persuasively for “policy scholarship” as an interpretive and interdisciplinary approach to studying school leadership. This, rather than “policy science”—Grace’s categorization of positivist ELMA research—is needed, if the nature of good school leadership in its sociopolitical and cultural sense is to be understood.

An Interdisciplinary Project

Inspired by Gerald Grace, I decided at an early stage that an interdisciplinary approach to my investigation would be necessary, with no single scholarly tradition on its own able to do justice to the complexity of a social, cultural, and ideological interpretation of school leadership. To use a gender-appropriate variation of a commonplace phrase in English, I was a “Jill”—as opposed to a Jack—of all trades. I mean this in the positive sense that I sought to know enough about those established disciplines in the study of education most pertinent to my research questions with the aims of bringing them together in a practical and meaningful manner. However, wary that my investigation would offer only very superficial findings if it operated purely at that general level alone, I lean on one discipline, the philosophy of education, more than others.

One important reason for undertaking an interdisciplinary approach to researching school leadership is that, like other forms of human experience, it does not fall neatly into those discrete and specific social, political, and cultural categories which academic communities have constructed. In this very loose sense, interdisciplinary approach to Educational Leadership, Management and Administration (ELMA) research is commonplace. It takes its lead from the subject to be investigated, not the demands of any one research method. While a good deal of ELMA research claims to be interdisciplinary in this general sense, far fewer studies are connected explicitly to the foundational disciplines in education in particular (e.g., Grace 1995, 1997; Gunter et al. 1999; Gunter 2005). My approach was more unusual still because of its strong philosophical bias; educational leadership research is underrepresented in established literature in the philosophy of education. Its unashamedly theoretical turn, being concerned primarily with an analysis of pertinent ideas and concepts, was also relatively unusual in the ELMA research field. In some respects, this was a significant limitation; were I to develop my findings further, I would seek to do so as part of a wider, part empirical investigation. However, in other respects, it presented clear advantages. I found considerable potential for creative and original thought in the intellectual space created by bringing together an unashamedly theoretical exploration of school leadership, with considerable lived experience of leadership practice. As William Blake observed, “Without Contraries is no progression” (*The Marriage of Heaven*

and Hell, 31); by “thinking otherwise,” new light is cast on what might appear self-evidently true or necessary.

While still a practitioner, working in a school located euphemistically in “challenging circumstances,” I realized that the—individualistic and charismatic—ideal of leadership with which I had been presented uncritically on a school leadership training course could be read differently with reference to *The Theory of Social and Economic Organization* (Weber (1947)). When I had read the text several decades before as an undergraduate on a nonvocational degree course at an elite university, I had done so without realizing that this knowledge would prove “useful” in the future. Having made an initial connection between those theoretical “tools” that I had acquired during my (interdisciplinary) undergraduate degree and educational practice, I rolled up my sleeves and got to work. I found ways in which other disciplines shed further light on school leadership. For example, another substantial part of my study was concerned to think differently about familiar school leadership practices by putting them in their historical context. This was challenging, as historical research is relatively underdeveloped in the ELMA field of study (Walker 1980; Sungaila 1982; Thody 1994), although necessary. As Gerald Grace (1995) argues, the study of history offers us a sense of the regulative principles that have been inherited from the past. With reference to schooling in England, I discovered that a particular view of school leadership which had been valued in the past had been passed down to become established as a normative view of the ideal school leader. This had happened even though the view was based on stories of school leaders who were, by their very nature atypical, thus unreliable as general patterns or examples (Bamford 1960). For example, they included the four “great” headmasters: Samuel Butler, Thomas Arnold, William Sewell, and Edward Thring assessed in Roach’s (1986) *A History of Secondary Education in England, 1800–1870*. At the same time, other stories of good school leadership that had been exercised collectively by groups were either forgotten entirely or categorized either as “democratic” or “progressive” schooling rather than as leadership. There were stories to be told of resistance to the highly individualistic ideal of headship that came to predominate in schools in England as well as attempts to introduce alternative leadership traditions based on democratic values in mainstream educational practice. I applied ideas from the psychology of education too, where they have helped me to explain ideas about thinking and learning, for example, in discussing the various ways in which people learn, including from their experiences. I found sociological methods of educational research particularly helpful. In tandem with my philosophical work, I used social theory to make sense of concepts of leadership as they are practiced in the context of schooling.

I have alluded already to the work of German social theorist Max Weber and how I found his analysis of authority particularly helpful. Furthermore, I found that those difficulties which contemporary sociologists of education have identified in the dominant school leadership discourse (e.g., Ball 1990, 1998, 1999; Hatcher 2004, 2005) resonated with my own concerns. I found Stephen Ball’s description of the role of the educational foundations invaluable in seeking to justify and clarify

the approach I had taken to my research. Ball argues for the researcher establishing a “critical distance” (Ball 1998) between those particular examples of policy and practice they might encounter directly and other possible but currently abstract alternatives that exist at the level of principle.

A Philosophical “Leaning”

Within this more general sociopolitical and historical analysis of school leadership, I sought to become a “mistress” of one foundation discipline in particular, the philosophy of education. Like other academics in that field, my main concerns were overwhelmingly moral in their character. Note how I litter the introductory account of my research with references to what ought or should be the case, with matters of “principle.” Philosophy has been defined as “rational critical thinking, of a more or less systematic kind” (Quinton 1995, p. 666) in three areas of intellectual enquiry: the general nature of the world, the justification of belief, and the conduct of life. While the conduct of life was a particular focus in my study, I strayed into the other areas just identified. For example, “justification of belief” is a theme that Charles Taylor pursues (1985a) and which I draw upon to position my argument in relation to other critical school leadership studies. I referred to a wide range of existing literature in my study, both in general philosophy and the philosophy of education. Here I use the term “general” to describe philosophical literature reflective of a broad academic discipline. Examples of general political theory I referenced included classic texts in the history of western philosophy (e.g., Aristotle 1953; Plato 1987; Mill 2006) alongside work by contemporary political philosophers (e.g., Harrison 1995; Wolff 1996; Swift 2001). General philosophers may direct their theoretical concerns to educational issues in particular (e.g., Brighouse 2002, 2003; Swift 2003), making a valuable contribution of one kind to the philosophy of education. I took their arguments to support a characteristically democratic account of school leadership. I also drew on early work by R.S. Peters while still a general philosopher to argue that people should only be denied a right to consideration in decision making when there was a reasonable and relevant distinction which warrants their exclusion (Benn and Peters 1959).

“Philosophy of education” describes a specific, applied form of the discipline which relates more general moral or epistemological questions to educational examples or considers how the process of thinking rationally and critically through educational problems might shed light on various difficulties. For example, I dwelt on claims other ELMA research makes about “shared” or “distributed” school leadership (e.g., Harris and Chapman 2002), analyzing the use of language where this was unclear. I pursued research into the principles of school principals (Gold et al. 2003) where the theoretical underpinning the study invited further attention.

Philosophy of Education and ELMA Research

Next I explain in further detail how this philosophical leaning applied to the research I undertook. I identified six distinctive but related contributions which general and applied philosophy could offer my research. These were:

- Clarifying concepts
- Highlighting logical contradictions
- Considering values and leadership
- Asserting what should the case
- Setting out a practical alternative
- Anticipating likely concerns and addressing them

Clarifying Concepts

One recurrent role that philosophy played in my study was to clarify the use of concepts and ideas where these become muddled in the language of practice and public policy. For example, I set out organizing principles that allowed the moral worth of competing notions of leadership found in the ELMA literature to be evaluated. In this way philosophy supported both other forms of educational research and the formation of social policy, by making the sense of words clear where their meaning had become obscured or distorted. Hence, I considered in detail the National Standards for Headteachers (DfES 2004), as few authors within the ELMA field have addressed difficulties with standards at this conceptual level within two national education systems; two honorable exceptions are Anderson and English (English 2000; Anderson 2001), who raise the matter in the *International Journal of Leadership in Education*. I developed my critique by applying relevant critical observations made by philosophers of education about other policy initiatives. I referred to Richard Smith’s (1999) damning indictment of “effectiveness” in management and Andrew Davis’s (1998) dissection of the claim that direct causal links can be traced between educational professionals’ activities and attainments by pupils that are measurable.

Highlighting Logical Contradictions

“Democracy” was a particularly significant concept for my study. I drew initially on the work of general political philosophers to define and explain the term simply. I went on to offer an extended account of what democracy characteristically entails, i.e., adherence to two principles—political liberty and political equality—rather than practicing any one specific model or type of democracy. This distinction is important yet missing elsewhere in the ELMA literature (e.g., Woods 2005) where

use of the word has become somewhat muddled. I drew on authoritative sources in general philosophy to suggest how the term might be applied meaningfully with reference to the particular example of publicly funded schooling in England. Where I highlighted logical contradictions, I did so in the spirit of being constructive. I was influenced in my approach to policy analysis by David Bridges (1996), who seeks potential benefits as well as likely difficulties in competence-based assessment and, likewise Christopher Winch (1996), who identifies good moral reasons—a concern for pupils' welfare as well as the stewardship of relatively scarce public resources—why the work of educational professionals should be held to account, if not in the way that policy makers have indicated. In being constructive, neither Bridges nor Winch pulls his punches; each spells out quite clearly what conceptual difficulties belie the respective schemes they are assessing.

Considering Values and Leadership

One point which recurred through the study was this: that while various accounts of school leadership may be possible, some are undesirable in a democratic society and ought to be debarred. Acknowledging that notions of competence and capability are necessary attributes of educational professionals, including those in positions of formal authority in schools, nonetheless notions of good school leadership cannot be reduced simply to matters of competence. A significant body of existing research in the ELMA field already emphasizes the importance of values to educational leadership, with the best practitioners being both technically skilled and possessed of finely honed moral judgment (Gold et al. 2003). I pursued this idea further, suggesting that practical wisdom along the lines pursued in neo-Aristotelian thinking is what characterizes very good school leadership, rather than a privileged form of knowledge that unusually morally and intellectually insightful individuals might demonstrate. This argument built on earlier work in the ELMA field of study, to the effect that values have a critical role to play in the quality of school leadership (e.g., Hodgkinson 1991; Bottery 2000; Gold 2004), but developed it, emphasizing the importance of democratic values in particular. I argued that two dimensions, one formal and another which I described as “informal,” needed to be included in interpretations of leadership that inform policies for English schools. This being the case, practical wisdom is a quality to be developed in all rational citizens, not only a few. However, the moral qualities that senior leaders in positions of formal authority need in schools are the dominant concern of existing discussion.

Asserting What Should Be the Case

The value of clarity in applied philosophical work extends to include those arguments which identify a more desirable alternative. In my case, I was concerned to develop an argument for school leadership practiced in the context of a democratic

society being rooted in values of liberty and political equality. I drew both on work in general political philosophy (Berlin 1958; Benn and Peters 1959; Taylor 1985b; Harrison 1995; Wolff 1996; Swift 2001; Mill 2006; White 2006) and philosophy of education to inform my discussion (sort out references). In putting this argument, it was important to address a common concern over the practical application of democratic principles to educational practice. Typically, this suggests that while democracy may represent a laudable ideal, it is nevertheless unworkable in this context (e.g., Tooley 1995, 1996; Eason 2007). I used established philosophical arguments to defend democracy against its detractors (e.g., White and Bridges, Swift and Woolf), given its value is recognized so widely, if not universally. Despite its imperfections, I argued, democracy represents the best means currently conceived of by which to organize society.

I made a further argument to support democratic school leadership on principle based on a concern with matters of pedagogy. I referred to work in the philosophy of education concerned with moral education (e.g., Dewey 1916; Haydon 1997; McLaughlin 1999) to argue that those values which pupils develop while at school are influenced through the means by which it is organized. This being the case, those values mediated through its leadership ought to be consistent with the accepted norms of the context in which the school is located, which in the case of English schools consists of democratic values.

Setting Out a Practical Alternative

Philosophy can help not only to assert what ought to be the case at the level of principle but to offer an outline of what that alternative conception of practice ought to be like, for example, by conducting a thought experiment. In my study, I explained how and why representative democratic school leadership might be introduced—in the case of English schools, at least through a rigorous overhaul of existing structures and practices. The philosophical dimension to my enquiry was complemented by existing theoretical arguments (e.g., Ranson 1993, 1994; Woods 2004, 2005) and empirical evidence (e.g., Court 1998, 2003; Flutter and Rudduck 2004) developed by educationalists from a variety of disciplinary backgrounds. I used arguments to propose a National Framework for School Leadership (NFSL) along similar lines to those that have been used elsewhere (e.g., White 1990; O’Hear and White 1991) by philosophers to argue for a statutory national curriculum. I argued that the NFSL would identify general principles—rather than “standards”—of leadership that all schools would be required to follow. It would legislate for greater power to influence decision making at a local level among ordinary citizens at the expense of quasi-autonomous agencies appointed by national government and their advisors. At the same time, the NFSL would be informed by a commitment to representative democracy, with tiers of government in place to hold the actions of schools and their local leadership to account.

Anticipating Likely Concerns and Addressing Them

Given the ideological assumptions underpinning the proposals that I have outlined, it is reasonable to expect that difficulties and objections will be raised to them. In the context of a democratic society, whereby value pluralism is actively encouraged, moral and political philosophy have an invaluable role to play in modeling a reasonable response to ethical disagreement. I anticipated what the likely objections to my proposals would be and articulated them sympathetically. I found an existing philosophical debate concerning the democratic control of schooling (e.g., Jonathan 1985, 1989; Ranson 1993, 1994; Tooley 1995, 1996) particularly useful. It helped me to identify potential problems with the conclusions I had reached and, in turn, to develop arguments that showed those objections were found wanting. A second aspect of my alternative proposals for school leadership that was likely to attract negative comment came from a different source. For those who contend that a child's moral education is a private matter and the responsibility of her parents, not a public body like a school, my contention that moral education takes place through school leadership will be unacceptable. Again, a number of philosophers, separately or in dialogue with each other (e.g., McLaughlin 2000; Tooley 2000; Sennett 2003; Stern 2007), have considered this kind of argument before, and I drew on these well-modeled examples in my discussion of the pertinent issues.

What the Analysis Revealed

I was concerned to explore a major paradox and contradiction (Grace 1995) at the heart of schooling in one national education system at the start of the twenty-first century. Although my study was in one sense particular to that context, it shed light on issues that are of relevance and concern to other education systems too. The case for democratic school leadership that I pursued revealed a number of important issues. Through the care I had taken to immerse myself in an established philosophical literature dating back to the 1970s and 1980s, I found that the theme of democratic school leadership had largely been overlooked within the philosophy of education since David Bridges's (1979) and Patricia White's work (e.g., White 1982, 1983) in the early 1980s. Michael Fielding's consideration of school leadership as one aspect of more radical approaches to state education (e.g., Fielding 1984, 2001, 2004) represented an honorable exception to that observation. My investigation makes three new contributions to knowledge in this field. First, I took Patricia White's earlier argument for democratic school leadership on direct or deliberative lines in *Beyond Domination: An Essay in the Political Philosophy of Education* (1983) and pursued a related but distinct argument for representative democratic school leadership. Secondly, I resolved a paradox identified by Gerald Grace (1995) between school leadership and learning, both at the level of theory and in relation to pedagogy. Thirdly, the interdisciplinary nature of the argument I made is relatively unusual in philosophy of education. I demonstrated both the

value of working across the educational foundation disciplines, when seeking to interpret education policies and practices within the sociopolitical context in which they are situated and the power of a theoretical argument informed by empirical data.

My research also showed a parallel neglect of philosophical methods in the field of Educational Leadership, Management and Administration (ELMA). I demonstrated how theoretical argument could help to frame future study more coherently, as well as help to interpret the results with greater logical clarity. I critically reviewed ideas that are established descriptors of practice in ELMA research, for example, shared and distributed leadership, and demonstrated how the relative worth of these different, potentially competing accounts of good practice might be evaluated on moral grounds. Concerned to establish what it is that makes school leadership good, I demonstrated how the moral and political philosophy of Aristotle as he develops it in the *Nicomachean Ethics* (1953) can help to explain those distinguishing qualities that have been found (Gold et al. 2003) in the practice of the best formal school leaders. While Aristotle’s ideas have been applied before to describe the qualities of good school leadership (e.g., Bottery 1992), my analysis was innovative because I teased out the distinguishing qualities of good school leaders, given the democratic context in which their practice is situated. Although various specific approaches to democratic school leadership are possible—hence the argument I made for a national school leadership framework rather than a more prescriptive account of the best practice—I highlighted the necessary commitment to political liberty and political equality that is implicit to a notion of good leadership in this context.

This being the case, I qualified the common perception that good headteachers are key to school improvement. I accepted that the professional competence of those in formal school leadership roles matters but that this does not offer a sufficient account of good school leadership on its own. In a democracy, it is wrong at the level of principle for the many to depend on the few for direction, I argued. Therefore, good school leaders need to hold certain moral commitments rather than others and be able to translate these beliefs into their professional practice. In making this argument, I highlighted a considerable and long-standing moral shortcoming in state-maintained schooling. Not only did I pursue a theme that is of considerable intellectual interest; I constructed a case for social reform. Moreover, I did so in an area of great practical importance, not only in England or indeed the UK as a whole but in any democratic country concerned with the moral education of its future citizens. Too often, decisions about schooling are made by too few people. Accepting that the detail of how schooling might best be run should be entrusted to experts—including educational practitioners, policy makers, and researchers—at the level of strategy, ordinary citizens are entitled to a greater say in determining what education is for. This is particularly the case with regard for the needs and wants of individual children and young people and the communities to whom they belong.

Good leadership concerns a process by which decisions ought to be made as an end in its own right, not just as a means to achieving other desired ends. The capacity to contribute to good leadership in this second sense is something all normal people may achieve given the opportunity to learn how to do so.

This requires a combination of lived experience, theoretical learning, and structured reflection on practice. As well as the civic responsibility of participating in school leadership, education to support this role should be a right. I argued that children and young people should learn what leadership is while they are at school as well as how it is done, through both the taught and hidden curriculum. Misconceiving leadership in this way creates issues at the level of policy and in individual schools. First, leadership is often conceived of in terms of the agency of individuals and their effectiveness. My study affirmed the importance of the effectiveness of individuals—qualities that individuals bring to formal leadership positions which do make a difference to the way in which they undertake their role—but argued that it is a moral matter not just an instrumental concern. The implications of this finding for the continuing professional development of educational professionals include how awareness of the moral and ethical dimensions of professional practice as well as more instrumental concerns might be fostered.

For example, good school leaders need to be able to distinguish between actions informed by appropriate and inappropriate moral values, given the sociopolitical context in which their work is situated. Furthermore, good school leaders will need to be prepared for their role as civic educators through the hidden curriculum of the school. These programs of continuing professional development would be supported well by extending the existing bank of case studies (e.g., Elliott et al. 1981) which illustrate democratic school leadership at work. Secondly, although the quality of professional work undertaken by individuals in positions of formal authority is significant, good leadership also depends on having structures in place that foster a collective commitment to the future flourishing of the school as an organization. I sketched out very briefly the principles that might inform a new National Framework for School Leadership, arguing that these were ideas that needed a future project to develop them further.

In summary, I found that English schooling culture in the twenty-first century continues with a major paradox and contradiction at its heart. It is still designated the cultural agency for “making democracy work,” still involved, at specific periods with explicit pedagogical projects intended to enhance education for citizenship, yet its own practice—as this thesis has demonstrated—remains “largely undemocratic” (Grace 1995, p. 65). I reached this conclusion at the end of a complex and demanding study which took a long time to complete. At a personal level, I could rejoice that my argument continued to be relevant, moreover, that no one else had completed a very similar project first. I consider next whether that effort was worth it, particularly as I am skeptical that my findings will enjoy much impact.

Why I Chose This Approach Rather than Any Other

A Critical Voice

One important reason for pursuing my chosen topic along these lines was the example other researchers set. In *School Leadership: Beyond Educational Management*,

Gerald Grace (1995) analyzes the dominant school leadership discourse critically, through historical, sociological, and philosophical lenses. I adopted a different balance of philosophical to sociological argument to Grace, and I did not undertake any field work. However, I was impressed by the ability Grace showed to combine academic depth and rigor with engaged concern for the subject of his study.

Patricia White (1983), in *Beyond Domination: An Essay in the Political Philosophy of Education*, shares similar concerns about the implications of school leadership as it is commonly practiced in England and the implications for democracy. White not only identifies similar moral concerns but articulates them in clear, no-nonsense terms. In “our world,” she observes (1983, p. 9), there are no “super-people” expert in the good life in detail for others; and even were such “super-people”—who knew unerringly what the good was—to exist, why would they be morally justified in taking control over the affairs of other people? White’s approach to applied philosophical research is at once scholarly and useful, written in a style that is at once rigorous and accessible to nonphilosophers.

I accept that this style of approach to philosophy of education on its own would be no more helpful to the interpretation of education than a purely general approach to philosophy (Hirst in Hirst and Carr 2005). Applied philosophy engages with contemporary issues and problems with an eye to what is feasible and possible given practical circumstances. Theoretical philosophy focuses on clear articulation of abstract concepts and values. Theoretical philosophy is valuable to applied philosophy; without it, engaged or applied philosophical work could lose sight of general philosophical principles and become, as Stuart White (2009) suggests, hostage to the vagaries of conventional or commonsense wisdom. Meanwhile, were all philosophical work conducted at the level of principle, the value of this thinking to everyday life would never be realized, as Patricia White (1983) has emphasized. That philosophy of education could be valuable to reflection on my everyday life as an educational practitioner came as something of a surprise. Like many beginning teachers in England at the end of the 1980s, an appreciation of theory had evaded me during my PGCE course. However, with nearly a decade of professional experience on which to reflect, I engaged with educational theory once again and found this to be an empowering and uplifting experience. Texts I have just identified gave legitimacy to the discontent I felt while caught up in the dominant leadership discourse. This discourse has changed very little since the late 1980s. Take, for example, a speech to the National College for School Leadership Annual Conference 2009, made by its chief executive, Steve Munby, who declared

Being an effective leader means we first have to believe in our own leadership; to fully accept the fact that we are in charge. We put on the mantle of leadership. (Munby 2009, p. 2)

He argues for particular qualities that outstanding individuals must demonstrate if schools are to respond to those “profound challenges” faced in the early twenty-first century (ibid. 1) in ways that will enable pupils to flourish. I accept that the quality of work contributed by key individuals in senior positions of authority in schools is one important factor in their likely success. I recognize the importance of authority in schools and that the way in which it is exercised matters. However,

my interpretation of what “quality” in school leadership entails is rather different from Munby’s. I am clear—where he is ambiguous—that those qualities and skills which distinguish very good school leaders from others are acquired through nurture rather than nature. Good school leaders are made rather than born, with their aptitude for leadership depending on the education those in leadership positions receive and the quality of their reflection on professional experience.

This remains an unfashionable view. The National Standards for Headteachers (DfES 2004) emphasize:

the key role that headteachers play in engaging in the development and delivery of government policy and in raising and maintaining levels of attainment in schools in order to meet the needs of every child.

In England ordinary citizens enjoy relatively little direct influence over the direction of decision making in education, leaving considerable power in the hands of educational professionals. At a local level headteachers, like the linchpin of a wheel (White 1983), hold schools together so that all action revolves around them. Nonetheless, I have come to understand in my own mind what I consider leadership to be about and am able to apply that to my own practice as a teacher and educator, albeit now in a university rather than school-based context. I feel I can talk about leadership with clarity and integrity when I reflect on practice and policy with those beginning teachers who are my students. Moreover, my material is organized and my case is made, should anyone in the future be concerned, as I was, with the paradox of autocratic leadership practice in a supposedly democratically governed school system.

A Political Matter

To lead a school that is located in a democratic context well requires specific value commitments. These—rather than other values—should inform both the agency of those key individuals and the structures within which their leadership activity is conducted. However, I found that those values have been sidelined in the dominant discourse and that going back to much earlier studies, outside more recent work in the ELMA field, was needed to reconnect reflection on school leadership with those political and moral dimensions to educational practice, as well as to analyze it. While existing research conducted in the ELMA field has been concerned to investigate values and school leadership in general, it has paid insufficient attention to the place of democratic values in particular in accounts of good school leadership suited to democratic societies. This is not to denigrate that earlier work. Mike Bottery (1992, 2000) had usefully connected and articulated a notion of good educational leadership influenced by Aristotelian notions of virtue (1953). Anne Gold (2004) had linked abstract ideas from her reading of the field to concrete examples of very good school leadership practice. Their relative neglect of political matters in order to pursue other issues of importance has enabled me to bring my

own counter-story into the spaces they have left, without having to generate entirely new material.

My study is likely to prove of interest to those concerned with democracy and school leadership in various education systems across the world. The principles of democratic school leadership which I developed could be adapted to their needs and do not depend on the particularities of English schooling. For those readers familiar with traditions of democratic school leadership and governance better established than those in England, the ideas I developed identified principles of particularly good and successful leadership practice within those alternative contexts. Where there is pressure within those systems to move away from democratic school leadership, my argument reinforces moral reasons why the status quo ought to be argued for.

Co-constructors of Ideas

Another very important dimension to the way in which I approached my research was its conversational turn. I was influenced in the direction I took, not only by books and journal articles but through ongoing dialogue with people who embody those ideas. Like Bruner (1996), I conceive of learning in simple terms according to four “Folk Pedagogies” and recognize them in the learning I have undertaken as a researcher. The “Folk Pedagogies” Bruner draws attention to are:

- Learning propositions through traditional forms of didactic teaching
- Learning from example or modeling, particularly associated with forms of vocational learning including apprenticeship
- Learning in groups that co-construct knowledge together
- Learning through critical engagement with knowledge that has been constructed in the past and has stood the test of time

I have acquired factual knowledge about educational leadership and research in the field through reading, attending conferences, and holding conversations with others. Moreover, I have learned from the example that others have set how to conform to certain academic conventions in my own academic work. I have particularly, though not exclusively, drawn on studies that are congenial to the concerns of my research and rooted in similar moral assumptions. Learning to interpret educational research, policy, and practice as part of a community of academic practice was another important aspect of the research I undertook. In the earlier stages of my research that community of academic practice was dominated by the foundational disciplines, particularly though not exclusively philosophy of education, I was influenced by work that members of that community undertook which related clearly to the concerns of educational policy and practice, although other work impressed me that was more or less directly relevant and useful. Without a clear sense of community members being keen to specialize in philosophical work in depth, I could not have enjoyed the experience of immersion

in a very particular and often rigorously conducted form of expertise in action. One potential danger that strong communities of academic practice face is the potential of becoming too inward looking, preoccupied with affairs that are internal to it for their own sake and of little concern or interest to the world outside. Given my concern to apply philosophy through engagement with the wider field of educational studies, I benefited considerably from membership of a second academic community—within a much smaller education department, as part of a Social Sciences Faculty within another research-intensive UK university—at a later stage in my research and once my identity as a philosopher of education was established.

The advantage to my research of belonging to a disciplinary community of academic practice corresponds with the learning which Bruner describes as a process of critical engagement with knowledge that has been constructed in the past and which has stood the test of time. The foundational disciplines offer intellectual resources of this kind, enabling the researcher to analyze, in my case, school leadership, drawing on intellectual traditions based on ways of structuring knowledge which have stood the test of time. I have in mind the notion of knowledge in the “intersubjective” sense that Bruner uses, rather than regarding linguistic structures as forms of knowledge that offer final and essential definitions of what is the case conceptually.

Taking philosophy of education as one example, I find it helpful to treat the foundational disciplines as entities whose boundaries are fluid and which do not own exclusive rights to certain forms of intellectual activity. For example, philosophers need to recognize that while analyzing language may be characteristic to the work they do, it is not exclusive to them. In my research, I strayed into theological reflection when it became apparent that to interpret those common assumptions which underpin conceptions of leadership found in English schooling, I needed to dwell on the quasi-religious nature of the language in which those ideals were expressed in the dominant discourse.

If the disciplines are taken to operate along the lines of “language games,” as Wittgenstein describes them (in the *Philosophical Investigations*), rather than possessing an essential core, they display certain “family resemblances” of the kind I identify for philosophy of education in my research report (see above). Philosophy of education, like other foundational disciplines, comprises a “complicated network of similarities, overlapping and criss-crossing” (PI 66). It is a “form of life” or practice as much as a way of thinking (note my comments above about embodiment), that is, rule governed (note my definition of what philosophy necessarily entails).

Once the intellectual efforts of an educational researcher are spread across several of these disciplinary language games, rather than concentrated on one discipline in particular, it may be inevitable that the quality of their work according to the terms set out by the discipline in its own right will be compromised. I do not claim to have made an original contribution to general philosophy through my research project. However, what I have achieved is a rich, interconnected understanding of school leadership from engaging with education as a wider field, at the levels of theory, policy, and practice.

I suggested earlier (see above) that a good deal of ELMA research is interdisciplinary in a weak sense of taking its lead from the subject to be investigated, not the demands of any one research method. Although there are advantages to this approach, nevertheless I have also alluded to a lack of coherence in a good deal of interpretive school leadership which might be addressed were a stronger sense of engagement with the disciplines in evidence. I note too the relative priority afforded purely interpretive and critical approaches to Educational Leadership, Management and Administration (ELMA) research, compared to more quantitatively orientated approaches in the field, for example, in terms of which projects attract funding. I am not optimistic that those broader questions about what leadership means, who it should include, and why, given the wider sociopolitical context in which those schools are located is democratic, will be addressed in a large research project in the near future. This is a pity; our collective knowledge of the history of school leadership remains so thin that we know very little in general terms about how leadership was practiced in the past, beyond the example of outstanding individuals, most notably Thomas Arnold; and there is an urgent need for philosophers to make a contribution at the level of theory to issues in public policy concerning democratic governance and schooling.

What Was the Role of Interpretation in This Research Study?

The ideas reflected in my research were first formed when I considered becoming a senior school leader. Professionally ambitious, I was not interested in adequate or competent headship: I wanted to do it extremely well. Yet no principal from my own teaching experience captured the approach to leadership to which I personally aspired. This was the case, even though in other respects I was fortunate to work with senior school leaders who were successful and experienced professionals. Part of my frustration stemmed from the experience of collaborative leadership as a middle manager within the same school system. Within curriculum areas of schools, it seemed possible to ensure that decisions were made democratically within the confines of that more immediate sphere of influence where those individuals concerned were committed in principle and understood how to practice those values. The approach could be time-consuming, particularly in the short term, but yielded positive results. Experienced practitioners contributed their complementary skills and perspectives, making careful, considered choices. We honored the commitments we made collectively, presumably because we had all agreed to them. In short, we led both wisely and well.

However, this approach did not appear to translate to senior and whole school leadership because, in English schools at least, decision making tends to be dominated by the headteacher. Although they may consult other people through the process, invariably they determine the final outcome, operating a form of benign

dictatorship. This situation is commonly justified on the grounds that headteachers as “experts” are uniquely well placed to know “their” school’s best possible future. In my research, I challenged this assumption on pedagogical and moral grounds, arguing that maintained schools in England should be led democratically. I did not bring a particular conception of the democratic school to my argument, nor did I attempt to define a “one size fits all” account of the democratic school leader. Rather, I argued that in a democracy local groups should determine for themselves how they wished schools to be led, within the constraints of a national framework for school leadership. On this representative account, while specialists take responsibility for aspects of school leadership in detail on behalf of society, at a strategic level all those people with a direct interest in the future of a particular school should be consulted.

What Interpretation Involved for Me Personally

Situated but Not Parochial

I was concerned to establish at the level of principle the nature of “good” school leadership in a democratic society. I drew on the specific example of schooling in England with which I was very familiar in order to develop an argument which will also be of interest and relevance to a wider readership. My study benefited from the richness of immersion in one particular educational context in order to illustrate themes with a much wider application. The method and structure of the study I undertook is readily adaptable to an investigation of leadership in another context. The argument I developed—that learning takes place from the experience of leadership in a school—holds true whether or not the particular setting concerned is democratic. Furthermore, the method and structure could also be used to frame the investigation of an entirely different topic entirely. I am considering how it might be adapted to a completely new and different investigation of teacher education, with particular reference to English schooling.

My ability to interpret the context was enriched by my experience through immersion in that practice, as a teacher and pupil as well as citizen. Although ultimately this degree of exposure to practice was invaluable, at the beginning of the study, this closeness also proved difficult to navigate. Had I been aware of the approach when I started out, I might have been drawn to John Elliott’s notion of philosophy as a form of action research (1987). On the other hand, while the passage from practitioner to researcher was long, demanding, and difficult, ultimately it was rewarding. It is as though I am bilingual, fluent in both “practice speak” and “lingua academica.”

One practical difficulty created early on in the study by close engagement with professional experience was being too busy with the demands of “doing” educational practice to meet the demands of “doing” educational research. I had to move

beyond the idea that being a researcher was a form of self-indulgence, a hobby rather than “proper” work! A more significant obstacle was a strong sense that something needed to be done about the way in which leadership was being promoted in English schools. While a powerful motivation for initiating a research project, it impeded my sense of “critical distance” (see above) from that which I was attempting to analyze.

The process of initiation involved a good deal of listening to and learning from others who had made a similar journey before me, either through personal conversation or by engaging with their ideas in articles and books. My evolution as a researcher was hastened when my professional identity shifted from classroom practitioner. To me, applied philosophy conducted well makes considerable demands both in terms of interest and academic skill. The practice and general theory of that to which philosophy is to be applied—in this case education—must be understood rigorously and the same degree of attention focused on general philosophy as well. I did refer directly to my personal experience of schooling in England at strategic points in my study, in particular to create plausible examples of what school leadership practice could be like in this context in the future. I was concerned to counter the perception that democratic educational practice is an unattainable ideal, by demonstrating that there are glimpses of it already working in established practices. However, I also took great care not to rely too heavily on my partial perspective, developing a priori philosophical arguments first that could be illustrated with reference to my own experience where this corresponded to findings of more rigorously conducted empirical research. For example, when identifying the ways in which schools might interpret a need to respect the “student voice” in decision making, I used my own experiences to support Michael Fielding’s argument (2004) that these initiatives may not in practice enable young people to influence in any significant way the future direction that strategy takes.

Situated on Thresholds

Applied philosophy is certainly no poor relation to a “purer” form of academic enquiry. The applied philosopher is required, Janus-like, to stand on the threshold of two distinct but related areas of study, looking in both directions. Moreover, the applied philosopher may need to be prepared to pursue their enquiries across academic disciplines if they are to understand the subject of their research in the particular context in which it is situated, and these may extend beyond the established foundational disciplines. For example, I was concerned in my research to analyze the word “vision” in the dominant school leadership discourse. In addition to using resources in general philosophy and the philosophy of education, I took into account the clear influence that religious belief has had on everyday English language that is used by people to articulate their understanding of an imaginative and creative form of thinking which characterizes very good leadership. Allusions to the Book of Proverbs Chapter 18, “for without vision the

people perish,” are made by people whether or not they consider themselves personally to be religious. I drew on my academic background in theology to consider what might be meant by such a remark.

However, the theory/practice threshold was not the only one I occupied. I was committed intellectually to working across and beyond the foundational disciplines in educational studies in an attempt to do justice to the complexity of a social, cultural, and ideological interpretation of school leadership. In so doing, I made life very difficult for myself, feeling myself pulled in several directions at once and struggling to do justice to the various and complex strands to my investigation. I did bring capacities to the project from my first degree, although ironically philosophy was not one of these! In particular, I was confident in my background in history and I am proud as a philosopher of education to have been able to reappraise the influence of Thomas Arnold on the developing notion of the “headteacher” in English schools, having engaged in some depth with an eclectic range of relevant historical literature. Were I to undertake this or a similar project again, I would be less overoptimistic about my capacity to keep quite so many disciplinary “plates” spinning at the same time. That said, with practice, my plate spinning much improved.

Situated as an Underdog

I was aware that as a researcher engaged in a theoretical analysis of ELMA research within a tradition of ELMA research that was critical of the dominant discourse, I was likely to attract a good deal of moral support but miss out on the material benefits I might have enjoyed had I chosen to research this topic from another perspective. The philosopher Charles Taylor (1985a) accepts that basic, elemental patterns in human activity exist and describes the “product” of researching these systematically as “brute data” (1985a, p. 19). However, Taylor argues that analyzing “brute data” alone will yield a very limited understanding of human behavior, given that it is constituted in such large part by beliefs or layers of meaning with which human behavior becomes invested. During my long engagement with empirical research in the ELMA field, I did find a good deal of research in the interpretive tradition. Nonetheless, a good deal more of it made positivist assumptions and was keen to bracket out those questions of value and meaning which I take to be necessary if what makes a school or its leadership good is to be appreciated.

I assumed from the outset that notions of good leadership are contested, influenced by the sociopolitical context in which they are situated. Thus, I did not accept the notion that certain behaviors essential to the best school leadership in all circumstances can be identified through carefully structured empirical research. Like Grace (1995, p. 5), I saw considerable limitations to research that has sought to isolate and describe general patterns of management behavior that might characterize all successful organizations, including schools. While other

ELMA research has raised awareness of the role that their values play in the agency of school leaders, I highlighted the role that values play in determining how that notion of agency is itself socially constructed. These are not ideas or methods of research that are likely to prove attractive to a number of grant-making bodies or policy makers.

Why Interpretation Proved to Be So Valuable

Nonetheless, interpretation was key to the findings of my research. First, it informed the distinction that I came to make between notions of “leadership” concerned with an office or specific position of formal authority in one sense; and in another sense, leadership concerns the influence that some members of a social group exercise over other people informally. Second, I was also concerned to locate the notion of leadership in the task or activity of “organizing the group effort,” rather than associating leadership with the personal qualities and characteristics of particular individuals. I did not discount the importance of individual people in leadership roles who have a valuable role to play in any democratic account of leadership. Even very direct forms of democracy may delegate key functions of the group effort to key individuals for limited periods of time. What is critical is the principle that all members of the group are equally entitled to a say in those matters which concern them, with no group member becoming too powerful.

The alternative account of leadership that I proposed developed from the following assumption: that while individual school leaders should be competent and efficient at the tasks they undertake to do on behalf of others, their actions should be consistent with the values and beliefs of the particular society in which their leadership practice is situated. This requires in turn that the construction of that formal role, the expectations that others have of the competent school leader, should also be informed by those values. For schools in England, these principles are democratic.

This also requires citizens in democratic societies to accept that educational professionals on their own cannot be held responsible entirely for school leadership. I pointed to examples of practice whereby democratic principles had been translated to arrangements in schools so that pupils, teachers, parents, and members of the wider community were already included in decision making. If we accept that one of the aims of education is to “make democracy work” as Grace suggests, these promising practices need to be developed and more systematically applied.

As Gerald Grace has observed (1995), schools remain designated places where young people should be prepared for citizenship. The National Curriculum for England and Wales states that every young person while at school should

develop the knowledge, understanding, skills and attitudes necessary for their self-fulfilment and development as active and responsible citizens. (DfES 2007, p. 1)

Yet while a linchpin tradition of leadership persists, the learning from experience that takes place runs counter to the promotion of democratic values.

Conclusion

Good school leadership cannot be reduced to the implementation of processes by which specified outcomes, including positive examination results and university entrance, may be achieved by pupils in optimal numbers. Leadership is a form of moral education which initiates members of a social group into certain behaviors and skills, attitudes, and dispositions associated with the particular social practice in which they are engaged. Nor is this phenomenon limited to life at school; it also operates in the world at large, presenting myriad opportunities for civic education both in school and in the wider community.

Thus, if learners are to be prepared for their future lives as citizens, they need exposure from an early age to the cultural norms assumed by democratic society. This includes, although it is not limited to, their experience of school leadership. They will learn from the models of formal school leadership practice to which they are exposed as well as through opportunities to participate personally in informal school leadership activity. Through interpretive methods, I developed an argument along these lines which applied theory to a significant problem that has implications, not only for educational policy and practice as it is now but in the future. Given its particular tradition of autocratic leadership practice, truly “radical” change to schooling in England is needed; yet only a very serious engagement with “thinking otherwise” about such practice will trigger such a change. A more nuanced distinction needs to be drawn between the kinds of school leadership that relies on the opinion of experts and that which requires deliberation involving all directly interested citizens. However, these moral and political questions will not be addressed adequately while interpretive ELMA research continues to be sidelined.

6.6 Philosophical Approaches to Educational Research: Justice, Democracy, and Education

Penny Enslin and Mary Tjiattas

In this case study we show how methods of philosophical interpretation can illuminate fundamental questions concerning education, justice, and democracy. In line with the project of the handbook, we set out to demonstrate how developments within our work on education, justice, and democracy over the last decade can be attributed, at least in part, to the use of such methods.

Although we will abide by the spirit of our brief and talk about research methods and procedures as though they can be explicitly set out and consciously and intentionally followed, we wish to signal at the outset that these forays are essentially reconstructive rather than descriptive. Philosophical thought is an activity that is not easily captured in an algorithm, however complex, or even by an analytic account of its constituent parts. Certainly, it is possible to identify “methods” that are invariably present and can be cited in attempting to describe the procedures of philosophical investigation. But the employment of such methods is really a tacit affair and so only partially corresponds to what is said or claimed in the attempt to capture it. This is also why philosophical pedagogy itself, at all levels, includes both courses in logical argumentation, on the one hand, and a systematic exposure to historical and contemporary discussion of the central issues in the various subfields of philosophy. Students are required to model processes of analysis, distinction making, argument construction, and criticism by close examination of the work of others. Although instructors may from time to time make methodological observations, this is not ever to the fore. We suggest that

the reason for this is that any methodological pronouncements are partial at best and tendentious at worst.

As we show how philosophical interpretation illuminates both educational policy and debates about education in the public sphere, we will draw the reader's attention to examples of how philosophy interprets by making sense; elucidating, explaining, arguing, and analyzing concepts and arguments; discerning and critiquing assumptions; making distinctions; and conducting thought experiments. Our chapter will draw selectively from our previously published examples of the kind of interpretive research that exemplifies a philosophical approach.

Framework and Methodological Approach

Our engagement with the issues mentioned above emerged from our own educational backgrounds and careers, particularly our shared interest in political philosophy. Though our research and teaching has drawn on much else in the history of philosophy that illuminates education, politics, and society—from Plato to Foucault—the kind of political philosophy we learned to practice is largely located in the analytical style, especially as influenced by the work of John Rawls. Rawls's accounts of justice and of liberalism (1971, 1993) have set the agenda of so much of political and moral philosophy since the early 1970s. While many have challenged details of his work, it has defined much of the debate, including in philosophy of education's attention to themes that embrace justice, democracy, citizenship, equality, inclusion, and diversity. These issues acquired a specific aspect and significance in the context of South Africa after apartheid, where the pursuit of justice and democracy in and through education had also long been an urgent problem demanding analysis. But even engaging with these questions from within and later outside South Africa could never be separated from the global context as a frame for both the educational problems and the philosophical debates that now reflect increasing integration across national boundaries.

As we explain in more detail in the following section, the Rawlsian framework provides both substantive guidelines deriving from a broadly Kantian political philosophy centered on impartiality and equality and a methodological approach that we believe is especially well suited to philosophical research, namely, "reflective equilibrium." The method of reflective equilibrium made famous by Rawls and oft-invoked by philosophers, when pressed to describe their procedures, fits, we believe, what we do. It assumes not only that tensions between particular judgments and general principles inevitably occur in the course of deliberation but also that such tensions are the motor driving the development of interpretations and explanations in philosophical work. Some (e.g., Sandel 2009, p. 28) have gone so far as to say that such clashes are at the source of the "impulse to philosophy."

This process of mutual accommodation between concrete issues and the ways in which we conceptualize them is one that is widely employed in moral and political philosophy and in normative philosophy more generally. General principles and

theoretical accounts do not, in this domain, provide fixed, determinate answers to more particular positions and judgments. Correspondingly, considered judgements are not taken as fixed, but are, rather, provisional starting points in moral reflection, to be revised as the process of seeking reflective equilibrium proceeds. Philosophical labor is, then, a matter of bringing abstractions to bear on more concrete concerns, e.g., applying principles to cases, determining whether alleged similarities and dissimilarities between cases are relevant or salient. In this way, the development of positions on substantive issues goes hand in hand with that of an analytic framework. Reflective equilibrium allows for the simultaneous and interdependent development of substantive and methodological positions. Much of our grappling with specific issues and themes that we discuss below can be construed as developing substantive positions on particular issues while modifying the framework we initially adopted.

Of course, the notion of reflective equilibrium, which effectively describes a provisional goal of inquiry, provides only very general guidelines concerning how to achieve coherence and consistency between our many beliefs (and levels of beliefs). It leaves much room to fill in the specific procedures that make the attainment of such an endpoint likely or probable, and such methodological inquiry is itself open-ended and ongoing.

Starting Points

Philosophical research, like a lot of academic work, proceeds within a conceptual space with well-defined delineations. We find the framework developed by Rawls especially useful both for articulating the questions we address and working out the range of possible responses to them.

For many contemporary political philosophers, Rawls's *A Theory of Justice* (1971) is the field's defining and most influential work. Recent discussions have called it "... a sophisticated, deeply complex, and revolutionary theory of justice for democratic societies" (Voice 2011, p. 2), claiming (Maffettone 2009, p. 7) that it has changed the "dictionary of political thought." These accolades attest to the ongoing centrality of Rawls's work and point to the sources of its influence: it has both set the substantive agenda of contemporary political philosophy and provided a methodology that has become entrenched in the discipline.

Substantively, social justice theory, the centerpiece of Rawls's work, focuses on the most basic and formative institutions of society (social, political, and economic), namely, those which exert pervasive influence on the choices, life prospects, and opportunities of individuals. The central aim of *A Theory of Justice* is to specify the conditions under which the basic structure of society is just the principles that would ensure that activities of the basic institutions result in just outcomes or, as Rawls puts it, that the terms of cooperation are fair and that burdens and benefits of social cooperation are fairly distributed.

Principles of justice define the fundamental terms of association, agreement, and forms of social cooperation, which regulate and determine the distribution of wealth, income, goods, and opportunities in society. In addition, they mediate both intimate and non-intimate relations between people, providing the means by which they discharge at least some of their moral duties to one another. For Rawls, this requires that the principles be endorsable by free, equal, reasonable, and rational people. Significant features of Rawls's theory of justice include its commitment to moral equality, respect for the dignity of persons through recognition of rights, the moral constraints that determine the fair distribution of benefits and burdens of social and economic activity, and reasonable agreement as the central method of justification. Formulated as two ordered principles, his conception of justice is tailored to (1) guarantee fundamental individual liberties, assigning them inalienability and absolute priority, and (2) embody an egalitarian ideal of social cooperation based on reciprocity, ensuring fair equality of opportunity and demanding that any inequalities benefit the worst off.

In parallel with his project to set out and elaborate a theory of justice, Rawls presents an extensive, evolving, and multifaceted moral methodology (which is intended to operationalize reasonable agreement as a method of justification). Perhaps best known is his contractualist argument to show that the two principles of justice would be agreed to by reasonable people under fair conditions of choice, i.e., it shows they are rationally grounded, universal moral principles applied impartially across cases or, in Kant's terms, universalizable. Rawls realizes that it is not enough simply to claim that the principles he proposes would be the ones that reasonable persons would accept. In order to show that such agreement would take place and moreover constitute a moral justification of the principles, he constructs a hypothetical "original position" in which parties to the agreement (representatives of actual individuals) operate under reasonable constraints on choice (corresponding to exclusion of information about morally irrelevant individual interests) that ensure that they consider the matters under discussion from the point of view of all, so making decisions and choices that are fair. Under these constraints, rational parties will choose principles that would guarantee equal basic liberties and equality of opportunity and that would permit inequalities only if they benefitted the worst off. Moreover, Rawls insists that the principles chosen under conditions of constraint also match our considered judgments about justice in reflective equilibrium. If not, the constraints in the original position must themselves be revised. So the contract device itself and our beliefs about justice must be in reflective equilibrium with what we believe about justice (Daniels 2008). The structure of the original position is itself justified by employing the method of reflective equilibrium (Scanlon 2003).

The method of reflective equilibrium, the most general feature of Rawls's moral methodology, is evident in his construction of the original position. It is a (dynamic) coherentist approach to justification of claims that deems a belief or judgment justifiable if and only if it is consistent with other well-established constituents of the relevant system of beliefs. Reflective equilibrium thus supplies a heuristic goal of normative investigations: investigations into the right and the good

incorporate but go beyond simple conceptual analysis (or what McGinn (2012) calls “decompositional” analysis). They need to answer questions not merely about the meaning or definition of concepts but about the connections of a particular analysis with other concepts that feature in our beliefs (and so require both “compatibility analysis” and “connective analysis” (McGinn 2012)). Reflective equilibrium is thus designed so that the analysis of concepts progressively corrects and refines relations between the elements of the web of concepts. In addition to providing a method of justification, reflective equilibrium is also a method of belief revision. In effecting clarifications, and making concepts and their relations more explicit, corrections ensue. Attending to the compatibility between concepts draws attention to inconsistencies and hence the need to resolve them.

The starting point of this endeavor, for Rawls, is our pre-theoretical “considered convictions of justice” (1971, p. 18), from which we move towards principles that capture them. We then test principles against our considered convictions. We repeat this process until our judgments and principles are reciprocally coherent. This, in sketchy outline, is essentially the procedure involved in narrow reflective equilibrium. In later work Rawls extends the notion (wide reflective equilibrium), to include the testing of considered judgments and principles against alternative accounts of what justice requires, so moving from mere coherence of our own judgments to engagement with others. He envisages that this will ideally issue in a comprehensive moral view that “. . . would survive the rational consideration of all feasible moral conceptions and all reasonable arguments for them” (1999, p. 289). The “evolution” of reflective equilibrium from something resembling a formal decision procedure in narrow reflective equilibrium to something increasingly interactive or in wide reflective equilibrium which seeks to establish reasons we can present to others as considerations they can be expected to share reflects the interpersonal aspect of Rawls’s contractualism of his later work (Maffettone 2009, p. 113).

An example of reflective equilibrium at work substantively is Rawls’s later work (e.g. 1993), concerned to show how liberalism, in engaging with opposed positions, can both defend and clarify its central concepts, e.g., how its insistence on universal principles can be rendered compatible with pluralism in contemporary democracies via the notions of public reason and the overlapping consensus (of reasonable comprehensive doctrines). Public reason, the main function of which is to provide a public basis of justification (Rawls 1993), seems particularly apt to modern society with its array of different (and sometimes incommensurable) ideas of the good life. It also goes hand in hand with institutions and practices that connect the exercise of political power to a system of public reasoning among citizens, understood as free and equal (Cohen 1996, p. 96). Reasonable people are “. . . willing to govern their conduct by a principle from which they and others can reason in common” (Rawls 1993, p. 49 n.1).

Shared political values and ideals need to be animated through a discursive framework that allows for genuine democratic deliberation between citizens (Rawls 1993, p. 390). The idea of public reason has been construed (e.g., Scanlon 2003), as the result of reflective equilibrium. It generates a discursive framework that addresses requirements for social unity in a pluralistic democratic society

through an account of how decisions are made and how disagreement is to be handled. Only if “reasonable” citizens who are committed to different comprehensive doctrines endorse the same political conception of justice can there be stability in pluralistic societies. Thus wide reflective equilibrium is now seen in action in identifying public reasons, namely, those that provide the basis for an overlapping consensus and for the construction of an account of democratic legitimacy (Rawls 1993, p. 391). One of our own attempts at wide reflective equilibrium has been our ongoing interpretive engagements with the work of theorists who adopt a variety of (evolving) positions on social justice and who, moreover, are committed to maintaining a meaningful connection with concrete social and political issues. Our own work draws on, integrates, and modifies their views. We hope that our reflections below on our research project convey the process of coming to terms with the rich material they proffer, the ways it allows for continuous refinements and reformulations of the questions that we consider.

We have applied the tools and resources of political philosophy to educational issues in relation to three broad sets of concerns raised by liberal feminism, global democracy, and cosmopolitan justice. Each of these presents a challenge to what may be taken to be the standard framework in political philosophy. Although each foregrounds its own substantive ethical and political questions, generally speaking, all of these domains of inquiry raise the question of whether the framework of political philosophy has the resources to accommodate important forms of diversity. This is an issue which many contemporary political philosophers have grappled with, most famously Rawls himself. It is, arguably, what motivated the shift in his overall position from comprehensive to political liberalism, a development that can be taken (with Scanlon) as a paradigmatic example of reflective equilibrium at work. As Scanlon (2003, pp. 160–161) describes it, Rawls from the very beginning took a just society to be one whose institutions are justifiable on the basis of standards acceptable to all, and this fundamental idea persists throughout his work. However, with the recognition of reasonable pluralism, he no longer can rely on principles central to his comprehensive liberalism, and he modifies his position in order to meet the requirement of providing principles acceptable to all (replacing comprehensive values with political ones). Effectively, as Scanlon sees it, Rawls moves from the fact of reasonable pluralism, via the process of reflective equilibrium to a refinement of his earlier ideas of legitimacy.

This account resonates for us, because worries about inclusion shaped the way in which we examined and subsequently modified the standard framework in order to address vital questions raised by the contemporary political context. For example, we have addressed questions of how liberal feminists should envisage the project of fostering fundamental liberal goals in the face of challenges by proponents of diversity and inclusion, of the forms that democratic participation should take in a globalized world, and of how cosmopolitan institutions could accommodate inclusive participation across multiple sites and levels. In doing so we have suggested ways in which problems stemming from the pluralism of conflicting values might be addressed.

Research Report

The Westphalian principle, that sovereign states do not intervene in each others' affairs and hence that questions of social justice are strictly a domestic matter for nation states, has been steadily eroded. This has prompted the emergence of globalist political theories that have challenged standard liberal accounts to show how their commitment to moral egalitarianism can be reconciled with particularism about political responsibility. How, in Scheffler's terms (2001), can communal identification be reconciled with globalization and its pull towards integration within a coherent theory of justice? So we have focused on the question of national borders as divisions of basic significance in ethics and political philosophy. In short, we examine a range of ways of construing the relations between universal and particular values and principles and how they connect to fundamental debates about cultural relativism and the politics of recognition and work out their implications for questions of identity and ultimately for central educational issues like the fostering of common citizenship, autonomy, and intercultural understanding (Enslin and Tjiattas 2008, 2009a, b). We are sympathetic to observations like that of Bohman (2007), who says that globalization requires that many basic categories of democracy need to be "rethought in the plural": the people, the public, citizenship, human rights, federalism, and the possibility of a transnational polity. We find the view that theories of social justice emphasizing redistribution on the one hand and those emphasizing recognition on the other are mutually exclusive and too restrictive and that a more satisfactory framework can be achieved by integrating the perspectives of different universalist theorists, in part by proposing more nuanced analyses of social justice in terms of which there is not a dichotomous relation between these conceptions of justice.

With respect to educational issues, we have looked at how lifelong learning and the campaign for Education for All should be interpreted if they are to play a role in providing educational prerequisites for inclusion in a just and democratic polity (Enslin and Tjiattas 2009a, 2012). In so doing, we have found ourselves engaged in a process of mutually adjusting conceptions of democracy, from a relatively narrow, instrumental conception to a deliberative conception, and of learning, from instrumental and economically driven to a conception centered on the development of practical rationality of citizens, required if lifelong learning is to contribute to the development of capacities for citizenship: public reasoning and justification.

In exploring both justice and democracy in our more recent papers (Enslin and Tjiattas 2012, 2015), we take the "fact" of globalization to heart. With respect to democracy especially, we discovered that an "analysis of the normative foundations of global democracy" (Tinnevelde and De Schutter 2009, p. 6) calls for radical reconstruction within political thought, where theorists along with others are still entranced by national borders. What form should democratic participation take in a globalized world? This led us to consider novel interpretations of democracy, e.g., democratically deliberative polyarchy, and cosmopolitan institutions that need to accommodate inclusive participation and to start to think about how to develop an account of global legitimacy that does not invoke the authority of the

nation state. Much of the work in this area is speculative and thought experiment dependent—although we do attempt a sustained account of the European Union (EU) as embodying promising institutional structures.

We found public sphere theory as developed within critical theory (Habermas, Benhabib) to be a useful starting point, perhaps able to suggest deliberative decision-making mechanisms that meet conditions of participatory parity on a global scale. But it would need to be reinterpreted along the lines suggested by Cohen and Sabel's (2006) conception of a "directly deliberative polyarchy." The remaining and crucial question is how to develop the corresponding deliberative citizenship. Preparing citizens for a directly deliberative polyarchy calls for wide participation and capacities for problem solving that will make global institutions democratically accountable, for "globalization from below." Critical discussion of the role of transnational institutions needs to be complemented by serious and thoroughgoing investigations of concrete global issues (Singer 2002; Sachs 2008) and broadened understanding of the situation and perspectives of others.

In retrospect, it is clear to us that a unifying theme of our research has been to develop a defense of universalism that takes into account but withstands some of the major objections to it. In part this is because in recent years anti-universalism has become a *sine qua non* for respectable positions in philosophy of education, largely motivated by a concern with diversity and inclusion (reflected in the dominance of a set of related trends: identity politics, the politics of difference, and the politics of recognition as well as the broad trends of postmodernism, postcolonialism—and from a different quarter, communitarianism).

We have resisted this anti-universalist presumption, developing a defense of qualified universalism, because we remain convinced that, aside from its conceptual strengths (including its ability to respect many of the considerations advanced in favor of opposing, anti-universalist positions), such an approach is indispensable to addressing contemporary problems of justice in education, both domestically and globally. We are concerned about the retrogressive implications of overstated sensitivity to the dangers of some types of anti-universalism. Preoccupation with avoiding universalism obstructs possibilities of addressing the effects of globalization, and it fails to acknowledge the extent to which the international system is now constituted by a human rights framework (Benhabib 2007). Since the Universal Declaration of Human Rights (UNDHR), we have entered a phase in the evolution of global society that marks a transition from international to cosmopolitan norms of justice, which limit state sovereignty and accrue to individuals in a worldwide civil society, obliging states to treat them as moral and legal persons, in accordance with human rights standards. These features of the cosmopolitan order prompt Benhabib (2007) to ask, with reference to Rawls and noting that the UNDHR is a document that comes closest to international public law, how philosophers can continue to limit the application of human rights norms and standards in spite of such international agreements. Our research on liberal feminism as well as justice and democracy in global education echoes Benhabib's call for such belief correction, as we have tested prevalent principles, theories, and concepts against the emerging global order.

Universalism and Liberal Feminism

Our extended process of thinking about how to conceive of the universality of the normative perspective, especially in the face of diversity of cultural practices and norms, began with developing a version of liberal feminism that promotes autonomy and equality for girls and women. We have argued (Enslin and Tjiattas 2004, 2006) that a viable universalist liberal feminist education is able both to accommodate a thin and so defensible form of multiculturalism and to leave room for critical perspectives as well as understanding of different ways of life. Such a qualified accommodation of difference, for us, still allows for “liberalism with spine” (Macedo 2000). The work of Martha Nussbaum and of Susan Moller Okin demonstrates different ways—sometimes in disagreement with each other—in which liberal feminism addresses demands to accommodate and protect diversity, showing how universalist feminism can foster fundamental liberal aims in the face of culturalist opposition. Both address the demand for recognition of cultural and other differences, working from the concern that uncritical deference to difference is dangerous to women and girls. Their internal critique of liberalism from a perspective that takes gender as a strong focus has arguably led to refinements in liberal aspirations, especially brands of liberalism that have attempted to be gender neutral.

Okin’s essay “Is multiculturalism bad for women?” (1999) raised many of the issues at stake between liberal feminists and multiculturalists, asking what liberal states should do when minority cultures or religions ask for special rights that are at odds with the norms of gender equality that the majority culture supports. Okin argues that when cultural minorities press for recognition of their traditional ways, they aim to control the personal, private domains of marriage and the family and to continue to socialize women into unquestioning acceptance of their traditional status. Liberal states, she argues, should not simply accept demands for recognition of the minority culture and should pay attention to the status of women in these groups. Policies about group rights should pay special attention to the views of these groups’ less powerful members, emphasizing that individual rights should be exercised as well as the desirability of cultural alternation towards gender equality.

Nussbaum shares Okin’s view of the potential of cultures and traditions to change, stressing (1999) that they are internally diverse and also emphasizing the role of powerful members of groups who proffer cultural excuses for violating women’s rights by appealing to tradition. Her *Sex and Social Justice* (1999) is an extensive elaboration of a feminist universalist position based on the principle of human dignity as a central value that grounds moral claims that limit illiberal and non-liberal conceptions of the good. Her liberal feminism is committed to global as well as national justice. Her central human capabilities are open to local interpretation, but Nussbaum eschews normative cultural relativism and believes her approach makes room for a reasonable pluralism (1999, 2000). Capabilities are “multiply realizable” (2000, p. 105). Drawing fire from cultural relativists, Nussbaum’s brand of universalism insists that it attends to diversity; pluralism and respect for difference are themselves universal values (2000, pp. 31–32).

Nussbaum's unease with Rawls's liberalism finds his list of basic goods (including liberties, opportunities, and wealth) that should be justly distributed falls short of ensuring people's well-being. People's varying needs prompt her to look to capabilities and functioning rather than primary goods as the focus of distribution. Furthermore, Rawls's free and equal contracting parties in the original position fail to take human diversity into account, and she prefers a conception of the person that also draws on Aristotle and Marx as well as Kant. But Nussbaum nonetheless insists that hers is a form of political rather than comprehensive liberalism. Okin's liberal feminism does not follow Rawls into political rather than comprehensive liberalism, though like much political theory in recent decades, his theory of justice is a target in developing her own, feminist, expression of liberalism while deploying some of Rawls's key concepts. In another statement of her stance that multiculturalism is bad for women (1998), her conclusion is stronger in resolving the tensions between feminism and multiculturalism, arguing that the state could make it clear to members of groups who assert their right to continue their traditions even if they violate the rights of some individual members that these practices will not be tolerated and may be punished if they persist.

The ideal of a "gender-free society" pervades Okin's work on culture and the family. She uses Rawls's original position differently from Rawls, applying the different principle to the family, also insisting that inequalities in the family contribute to the unequal distribution of goods in the wider society. This has implications for a liberal feminist interpretation of education and its values and practices. In *Justice, Gender, and the Family* (1989), she argues for a future society free of gender which she sees as is in line with mainstream liberal conceptions of social justice. Taking gender as "the deeply entrenched institutionalization of sexual difference" (1989, p. 6), Okin's argument for a gender-free society envisages that there would be no rigid sex role prescriptions in both public and private life, enhancing equal opportunities and creating an environment in which children are able to develop a sense of justice. In her critical evaluation of the public/private distinction common in mainstream liberal theory, she argues that the notion of the family as a private sphere that should be free of intrusive government measures entrenches vulnerability for women and children. Focusing in the first instance on structural change in institutions, Okin's elaboration on Rawls's treatment of the family as a school of moral development leads her to see this part of the basic structure as a site of inequality and injustice, especially in the developing world. A genderless family would be both more just and "a more favorable environment for the rearing of citizens of a just society" (1989, p. 183).

Nussbaum too embraces a brand of liberalism that builds on and departs from Rawls's liberalism, including his restriction of political liberalism largely to one society and to a society's basic structure. Her account of social justice proposes extensive strategies by the state and other bodies to change both the family and other institutions to address the place of women in society and the comprehensive doctrines that underpin them. In defending her list of capabilities as the result of years of discussion in many contexts and across cultures represents, she argues, using Rawlsian terminology, for an overlapping consensus. In doing so she

stipulates that although implementation of the capabilities approach should be left to internal interpretation and application within different nations, sometimes it is appropriate for international agencies and other governments to promote human capabilities, even if political and economic sanctions may be necessary.

The theme of education features prominently in Nussbaum's work; she declares that opportunities for education are the most important for women's life chances (1999, p. 100). The education of girls in particular should aim to foster their capabilities to the full, and its attention to countering assumptions of non-entitlement should include promoting images of "worth and possibility" (2000, p. 288). The worldwide problem of low levels of education among women and girls obliges nations to make their education a high priority, with richer nations obliged to support poorer ones towards raising educational levels. While sensitive to questions of sovereignty, Nussbaum defends support for NGOs operating internationally, especially those promoting literacy, while opposing traditionalist objections to the education of women. But women's education also requires opportunities for secondary and higher education, including knowledge of the sciences and education for world citizenship.

Okin's liberal feminism exposes the role of gender discrimination in education as well as gender inequalities in access to educational opportunities. She also comments on moral education in schools and families though, however evocative the idea is, what a gender-free world demands of formal schooling is less developed in her writings. In her focus on how a theory of justice needs to be adjusted, she attends more to domestic justice, especially in the workplace and the family, rather than to global justice. Whatever their different emphases and priorities, between them their liberal feminism has been a formidable critical response not only to gender injustice. It has also exposed some limitations of Rawls's liberalism and creatively extended some of his central innovations, testing his method, principles, and concepts by applying them to the case of gender. For us, liberal feminism exemplifies reflective equilibrium at work by effecting substantive belief correction about gender, justice, and education, though its extension of principles of equality and freedom to women achieves a form of recognition largely confined to justice within national boundaries as traditionally understood (although we acknowledge that both our liberal feminist philosophers' work includes a transnational focus). So convinced have we been by the case for liberal feminism and the requirements it makes of education that our project subsequently moved on to other causes and concepts, to boundaries beyond those that cut across the genders, from universal application of basic liberal principles to gender injustice to universalism on a global scale.

Universalism and Justice

The "fact" of globalization, the increasing interconnectedness of the world, and the integration of previously independent basic structures call for a reconceptualization of even the most basic concepts and norms of political philosophy. This stems from

the idea that the locus of political authority can no longer be uniquely situated within the nation state. In our work we explore two interconnected but distinct set of questions, centered on justice and democracy, respectively.

In exploring the implications for education and global citizenship that have arisen from the burgeoning literature on global justice (e.g., Moellendorf 2002; Pogge 1989, 2002), we have adopted the position that moral duties are owed to all, without restriction; duties of justice have global scope, and there is no principled way to confine duties of justice to compatriots alone. This, we have argued (Enslin and Tjiattas 2008), has implications for the distribution of goods like education and, perhaps more controversially, for certain kinds of duties of intervention on a global level. In Moellendorf's argument for the global reach of duties of justice, claims of sovereignty can no longer be taken as grounds for blocking those of rights and the correlative duties they imply. Global duties exist and can be ascribed to certain relevant agents. For Moellendorf duties of justice are associative; duties of cosmopolitan justice exist because the circumstances that give rise to duties of justice exist globally. The increasing political and commercial activities that bring people into contact with one another have a global impact, and state boundaries are no longer reliable boundaries of common interests. Taking this line of argument further than most, Pogge (e.g., 1989, 2002) has argued not only that there are duties to aid those who suffer as a result of global inequality. He insists, too, that anyone who participates in the shaping and sustaining of a global order slanted in favor of some to the detriment of others also has a duty to influence the global order for the better, to compensate those adversely affected. Poverty in developing countries is the result of the ways in which developed countries have constituted the global order to suit their own interests.

Applying these claims to education, we have argued that global association creates duties to make access to schooling and beneficial educational outcomes, a major issue of international justice, with the potential to enable developing economies to compete more equally with those of wealthier countries. Rawls's *A Theory of Justice* (1971) can be applied to those problems, with radical implications. If applied globally, his concept of "fair opportunity" can be interpreted to provide for more attention to be paid to those in less favorable social positions (1971, p. 100), to improve the long-term prospects for the least advantaged by allocating educational resources with the aim of equalizing global access to education, which, for Pogge (1989, p. 180), is a particularly appropriate way to reform unjust institutional arrangements. The redistributive duty to alleviate educational disadvantage requires the alleviation of the huge differences in expenditure on education between rich and poor countries. In this way proponents of cosmopolitan justice have enacted the process of reflective equilibrium by interpreting Rawls' difference principle in ways he did not originally intend.

We have developed our argument that global justice in education requires a shift in emphasis from recognition to redistribution through an ongoing commentary on the campaign for Education for All—primarily its goal of universal primary education. Drawing on Fraser's challenge (1997, 2003) to the prevalent assumption that recognition should be given priority over redistribution as a category of justice,

we have shown how global trends in educational development have reflected a justified shift towards redistribution, while also arguing that redistribution, recognition, and also representation can be viewed as complementary categories.

The agenda set at the World Education Forum in Dakar in 2000 committed international organizations and 146 governments to universal basic education. Centrally, the goal of the Dakar Framework for Action (UNESCO 2000) was free, compulsory primary education for all children by 2015. The emergence of this agenda, accounts of its underlying principles and strategies, and ongoing analyses of progress towards its achievement exhibit three features that we have explored in developing our interpretation of global justice.

First, the Dakar agenda was based on a mutual endorsement of universal basic education for all citizens in all the signature countries, emphasizing education as a basic human right, the key to stability and peace as well as sustainable development, and a prerequisite for effective social and economic participation, especially in the face of globalization (UNESCO 2000, Article 6). In similar global terms, the earlier Jomtien Declaration treated the basic need for learning as a universal responsibility. Both these initiatives can in turn be traced to the establishment of UNESCO in 1948, with a global agenda alongside those of UNICEF and the UNDP to support education worldwide, embedding education in a wider development agenda and reducing childhood mortality and poverty. Dakar Framework's restatement of the earlier commitments in the Universal Declaration of Human Rights and the Convention on the Rights of the Child to education as a human right reflects a universality of scope (Caney 2005) by urging that education be made universally available and the universality of human rights as "commonly accepted humanistic values" (Article 12; our emphasis). So the Expanded Commentary to the Dakar Declaration describes the millions of children without access to either primary or early childhood education as "an affront to human dignity and a denial of the right to education" (UNESCO 2000 Article 1.6).

Second, the framework emphasizes the need for resources to deliver universal basic learning, calling for an increase in external finances, through grants, debt cancelation, and debt relief. In doing so it noted that the Jomtien Declaration had called on the world community to augment the national budgets of the world's poorest countries to enable them to overcome constraints preventing the realization of basic education for all their citizens (Article 10.1). This continuing problem of a lack of resources is highlighted in subsequent EFA Monitoring Reports (e.g., 2008, 2010) leading to further calls for increased international support for the EFA campaign, in spite of some growth in aid for basic education after 2000. This emphasis on what we see as greater justice in redistribution of resources from the richest to the poorest countries is also an expression of recognition as a principle of educational justice. We interpret the observation in the campaign's 2008 Monitoring Report that constituencies like indigenous groups, migrants, and people with disabilities have less access to education than others as recognition that certain groups suffer maldistribution. This is not to the exclusion of more standard forms of recognition; the campaign allows for cultural norms to be renegotiated. The 2008 Global Monitoring Report argues that cultural norms that reduce access to

education need to be addressed, while espousing values that are universal in both justification and scope.

The global financial crisis, described in the 2010 Global Monitoring Report as a threat to improved contributions from both donor countries and private sources, is a significant setback to the campaign's target of universal primary education by 2015. But international collaboration towards the 2015 goals has also exhibited a third feature crucial to our account of global justice. The growth of multilateral initiatives and structures since UNESCO's foundation has involved governments, specialized agencies of the United Nations Organization, and nongovernmental organizations in significant forms of collaboration that support our stance that the nation state is no longer the default unit of analysis for interpreting the meaning of social justice. The international consensus on an agreed set of development priorities, with education at the heart of the Millennium Development Goals and the Global Campaign for Education, marks not only a global set of norms of justice, mechanisms for donor coordination, and recognition of universal primary education as a global public good. New actors in transnational networks now share multinational initiatives with national governments and international organizations, civil society, and advocacy networks (Mundy 2006; Jones 2007), in a global architecture that transcends the authority structures of nation states. While governments of nation states remain primarily responsible for funding and managing domestic educational provision, they are also now partners in pursuit of international development goals. And action and rule making with global reach is not confined to education; it is matched by similarly dense transnational interactions in labor regulation, economic security, and the environment.

In discussing the example of the Education for All campaign, we have illustrated our claim that a universalist conception of justice should prioritize redistribution ahead of recognition. This demonstrates an actual case of an attempt to forge a more just global order, implying in turn a shift from construals of social justice and of the principle of inclusion cast in purely domestic terms—a conceptual correction to the web of concepts involved in reflecting on justice in education. We will return to justice as representation to illustrate our universalist interpretation of the complementary concept of democracy.

Universalism and Democracy

In earlier work on democratic inclusion (Enslin et al. 2001), we defended a deliberative model of democracy and argued for a demanding (vs. minimalist) conception of democratic participation that accorded a central and indispensable role to deliberation and a robust conception of civic education as a way to meet the conditions of participatory democracy. In part, our emphasis on public reasoning in developing an account of democracy was motivated by a theoretical consideration, namely, that democratic arrangements be expressions of the general will and that all affected (subject to) binding collective decisions be afforded the opportunity

to participate actively in decision making by presenting reasons for proposals that culminate in joint agreements. But it was not coincidental that our interest in this problem peaked at a crucial time in the history of South Africa, namely, its transition to being a legitimately democratic country. Fully subscribing to the view that the importance of democracy lies in its justificatory and legitimating roles—including its authorization of power—we found Rawls’s ideal of democratic politics to be a fitting starting point. We proceeded by comparing and contrasting his views with those of Benhabib (1996) and Young (1996), who introduce, respectively, the important notions of a public sphere with fewer restrictions on debate and of communicative democracy that accommodates a range of styles of deliberation.

Our later work on democracy (Enslin and Tjiattas 2012) is built on our earlier deliberative stance and led to the question of whether the deliberative model of democracy could be extended beyond the boundaries of particular states and to the further questions of whether we needed (1) to modify our analyses of legitimacy and justification and (2) to work out more “logistical” questions of the structures of democratic participation in a global context.

It is worth mentioning, given our brief here, that our work on global democracy was significantly different from that on global justice. In contrast to the situation with respect to cosmopolitan justice, the literature on the global democracy domain is rather sparse. We became aware that in order to carry out the task described above, we would have to do considerably more than evaluate standard positions and apply them to new problems. In fact, we came to discover that the gap in the literature was closely linked to one of the central challenges of developing a transnational conception of democracy, as a result of which we would have to engage in extensive conceptual construction. In addition, we needed to address a particularly intractable resistance in the form of a widely held and largely unrecognized assumption, viz., that the nation state is a *sine qua non* of democracy. This is not only deeply entrenched in our culture, but political theorists and philosophers do not seem to be any less susceptible to its allure. It functions as an impediment to imaginative thinking, what Bachelard (1938) called an “epistemological obstacle.” Political theory in general seems unable to renounce the idea that the public sphere is located within the nation state—or that the “basic structure” is necessarily domestic and that democratic practice (inclusion, participatory parity) is intrinsically tied to it.

However, the fact of globalization is proving to be a sustained source of pressure on the idea that democratic requirements and practices apply only within the nation state and that national citizenship alone sets the bounds of inclusion. It leads to the questioning of deeply entrenched assumptions that questions of political legitimacy involve only the members of bounded states. Current geopolitical facts have the effect of unsettling the problematic of democratic political thought. In the post-Westphalian context, it becomes evident that we are affected not only by the basic structure of one’s own society (Pogge 1989, 2002). Globalization drives a wedge between affectedness and political membership. This requires that the meaning of inclusiveness undergo change, since its identity with political citizenship in a

nation state is no longer justified. A few notable exceptions among political theorists (Bohman 2007; Fraser 1997, 2003; Kuper 2004 inter alia) are sensitive to these changes and have accepted the challenge they imply. They have initiated attempts to address two kinds of questions: conceptual ones focusing on relations between democracy and globalization and more practical ones concerning the forms that global democratic institutions and practices would need to take if participatory parity is to extend to all potentially affected by global arrangements.

Among others, the central conceptual questions are: Will the same notions of legitimacy or justification apply to domestic and global political contexts? What form nontraditional political spaces must take in order to meet requirements of inclusiveness and political authority? How is the legitimacy of decisions to be demonstrated and achieved in nontraditional political spaces, those in which participants don't make up a "demos"? Who constitutes the "justificatory community" (Cohen 1991), and What is within the scope of its jurisdiction? Can cosmopolitan institutions overcome the obstacle of democratic deficit that seems an inevitable consequence of their vast scale? Can such relationships exist outside of well-defined cooperative schemes?

The train of thought that generates such questions calls for more than mere conceptual analysis, even when very broadly construed (see McGinn 2012). In order to answer questions about how democracy should be redefined for transnational settings, and to deflect skeptical objections to the possibility of such democratic arrangements, we felt pressed to consider what kinds of institutions may be envisaged that would provide the space for it to occur.

The idea of cross-border publics advanced independently by Bohman (2007) and Gould (2004) seems to be a promising starting point in thinking about institutional design. As Bohman sees it, the traditional role of a public is to allow for collective deliberation to influence a state's sovereign power. In transnational politics, demos exercise a democratizing effect through dispersed communicative networks. Although the idea of a cross-border public sphere made up of informal networks suggested by Bohman and Gould is an important starting point, contributing to the construction of intersociative democracy, such networks are not in and of themselves sufficient for global democracy. Although social movements can be important precursors to democratic organizations, on their own they do not supply all the conditions of how, in Dewey's terms "the inchoate public may function democratically" (1927, p. 327). In other words, they don't explain how the public sphere acquires authority—normative powers that allow it to inaugurate and sustain legitimate institutions.

Something like a transnational democratic constitution is required that would integrate networks so as to transform them into sources of authoritative decision making. This is the animating vision behind Cohen's and Sabel's notion of "directly deliberative polyarchy" (2006), a governance structure that incorporates decision making of institutions at various levels and a plurality of (disaggregated) authority structures. Within such a structure, public deliberation could clearly claim legitimacy. Pogge similarly (2002) imagines a multilayered institutional scheme characterized by "vertically dispersed" powers of sovereignty. And Kuper (2004, p. 45) describes a

“system of plurarchic sovereignty” embodied in “a complex global institutional configuration.” All of these proposals would meet the important requirement for global political inclusion—that it secures conditions of nondomination (Bohman 2007, pp. 30–31)—while allowing the structures normative powers established and distributed within a framework of institutions.

The idea that authoritative transnational structures could feasibly emerge is resisted by many on the grounds that political authority is intrinsically tied to the state. Our response is that normatively speaking, the principles of constitutional democracy are inherently universalistic and thus cosmopolitan; basic human rights are not derived from citizenship or nationhood, and we are not entitled to discriminate against people who are far away. Thus there do not seem to be principled obstacles to realizing constitutional principles in polyarchic structures. This is a crucial point, because the novel forms of authority embodied in these structures allow for transnational institutions that are authoritative and for deliberative legitimacy outside of the boundaries of nation states. Polyarchic structures support distributed will formation and dispersed institutional structures. They can be expected to foster new forms of citizenship: multilayered, and complex, which allow all members of global society to be included.

We have followed a number of theorists in exploring the possibility that the European Union could provide a model for a more universal transnational structure. Bohman (2007) cites the EU as a good example of how a reflexive, democratic, transnational order might work in a diverse polity with a constitutional framework that recognizes political rights as human rights and provides for nested and collaborative forms of decision making. As such it demonstrates the possibility of what Fraser (2003, p. 126) calls “governance without government.” Much of the recent work of Habermas is concerned with outlining a model of global governance that eschews both a realist rejection of any such proposal and cosmopolitan insistence on a world government that would replace national states. Developments in Europe that have replaced treaty-based alliances with transnational institutional procedures are taken to be important exemplars.

Habermas wishes his work on European integration to be seen against the background of a Kantian-inspired, cosmopolitan model of global governance (2009, p. ix). Individual and political basic rights apply in principle to relations between states, organizations, and individuals across national borders. The acceleration of globalization underlines the need for political regulation above the national level, and the financial crises of the past few years is compelling evidence that economic globalization poses political challenges that can be met only through concerted responses by the international community. Inclusive, representative global political institutions provide the only hope of bringing the rampant anarchy of globalized markets (which have outstripped competences of even the most powerful governments) under control. Habermas insists that the call for such institutions is not tantamount to a call for a world government superseding nation states. A supranational global regime tasked with enforcing human rights and a transnational regime concerned with regulating matters of collective concern, e.g., global economic crises and climate change, are necessary complements to nation states.

As a proponent of deliberative democracy, which ties democratic legitimacy to the reasonable nature of opinion and will formation (Habermas 2009, p. 138) (formation of political will is channeled through the filter of discursive opinion formation) and the cooperative search for solutions (145), Habermas finds it incumbent to address the question of whether and how public communication could operate above national level or, as he puts it, whether a Europe-wide public sphere is possible (xvi). The realization of deliberative democracy (and the legitimacy which it accords) requires a democratic procedure that includes all possibly affected on equal terms (146). He envisages the emergence not of a higher-level, supranational, public sphere superimposed on existing national ones but a process in which existing public spheres become responsive, or permeable to one another in such a way that people are informed about and are able to respond to and influence issues of joint concern, i.e., he anticipates the transnationalizing of existing national public spheres. In spite of the opposition of Euroskeptics and the evident hurdles of achieving the constitutionalization of the Eurozone, Habermas believes that “graduated integration” remains a viable goal, and he defends a deliberative model of transnational democracy and an associated Europe-wide public sphere. We would concur with the view that, far from signaling the end of the EU as a political project, the crisis of financial regulation is accelerating the growth of institutions in governance that will deepen European political integration. And we see EU as a case that stretches traditional assumptions and theories about the meaning of democracy.

As a model for more universal democratic structures and public spheres, EU thus interpreted demands much of citizens and of citizenship education, and we have argued that these demands should apply globally. In extending our cosmopolitan conceptions of democracy and justice to critical examination of the meaning and scope of democratic inclusion in education, we have asked what capacities citizens need as members of a post-Westphalian public. We endorse Gutmann’s proposal that the aim of democratic education is the inclusion of citizens in conscious social reproduction, including the shaping of social structures (Gutmann 1987 quoted in Crittenden 2007, p. 13). And like Gutmann we see learning to deliberate as key to the goal of educating all—globally and of course including women—to participate in the collective project of shaping their society. In doing so we have, as already noted, seen merit in models of public reason proffered by Rawls, Benhabib, and Young, which we have explored as all offering instructive ways of interpreting deliberation as providing the capacities for democratic inclusion in contexts that are both diverse and unequal. Each treats reason and justification, variously conceived, as central to political legitimacy.

All depictions of deliberative democracy presuppose that individual citizens’ participation in civic decisions demands a capacity for individual thought as well as a general understanding of the economic and political context in which those decisions are made. So a deliberative conception of citizenship education holds that a democratic state has a duty to enable its citizens to meet these requirements, which are considerable and take us far beyond the interest-based understandings of democracy (widely reflected in neoliberal positions on citizenship), to which deliberative theories were a response.

Our cosmopolitan conception of the changed global context presses these demands further; in the post-Westphalian world of global association, educating citizens to participate in decisions for the good of the nation state and its members, assumed to be in competition with the interests of citizens of competitor states, can be seen to be inherently unjust, once unequal international power relations are acknowledged. Here the global inequalities in access to primary schooling noted above—as well as secondary and higher education—become doubly problematic. Power imbalances in global politics include inequalities in the capacity of different states to educate their citizens and so to equip them for democratic participation in both domestic and international decision making, including asserting demands for global justice against the most powerful states. A problem of both justice and democracy is that global publics will provide advantages to citizens who have enjoyed the greater educational opportunities that will give them preferential access to the know-how they need to use global structures to their own advantage. Preparing citizens for global deliberation by all—with the capacity for wide participation and problem solving that this implies—thus becomes even more demanding than deliberative public reason in the nation state. The kinds of transnational agency required for “globalization from below” demand a citizenry that is sufficiently informed and motivated to be able to engage a range of institutions and issues involved with global issues and also to be aware of the needs and perspectives of others and of how their own actions affect them too. The new forms of inclusion this implies do not, and do not need to, disregard local and national obligations. The frame of the nation state is simply no longer sufficient on its own to enable democratic citizens to address matters of shared concern. Our critical stance on conceptions of lifelong learning that assume the persistence of the nation state as the unit of distribution of education (Enslin and Tjiattas 2012) applies as much to all levels of educational provision, globally; and Nussbaum’s liberal feminist arguments, noted earlier, about the importance of literacy as well as primary, secondary, and higher education can thus be seen to apply as much to the education of boys and men.

These claims bring our interpretation of global democracy full circle back to justice and the complementarity between these two concepts in our work. They lead us to conclude that the capacity to be represented in global structures, not just in the Westphalian electoral systems standardly assumed by default to mark democratic spaces, is necessary to both justice and democratic inclusion. And possibilities for achieving greater degrees of both justice and democracy depend crucially on education.

Philosophical Interpretation and Reflective Equilibrium

As we look back on the processes involved, it seems clear to us that insofar as we were engaged in an interpretive endeavor, the project described here consisted of attempting to resolve the tensions between current theoretical positions, their key

concepts and principles as well as their underlying assumptions, and the demands and constraints imposed by the contemporary global political, ethical, and educational issues we were attempting to address.

In our work we have attempted to show, often by discussing tensions between values, commitments, and allegiances, how philosophical reflection and concrete issues influence each other in an ongoing dynamic way. Although positions defended in pursuit of reflective equilibrium are held provisionally, we have developed and defended substantive liberal positions on gender, justice, democracy, and education, influenced strongly by but also in disagreement with Rawlsian liberalism. We think that our attempt to employ the philosophical method of reflective equilibrium has allowed us to argue that we can defend cosmopolitanism as a form of universalism, in a way that is sensitive both to actual conditions and circumstances—domestic and global—and to fundamental normative concerns, and to look critically at questions of global educational policy and its attendant structures and institutions. As Benhabib (2007) hopefully notes, new structures, norms, and policies mean that local and global are now imbricated, and new spaces that stretch the political imagination are continuously opening up.

This last observation leads us to conclude with a caution. In commenting on how he envisages the future of philosophical work on one of our central topics, Daniels says (2008, pp. 345–6):

The content of a theory of global justice and the justification for it can only emerge from the work of a generation of thinkers and doers grappling with the problem. The process will involve working back and forth between judgments, based on arguments and evidence, about what is just in particular practices or decisions of the operation of international agencies or rule makers and more theoretical considerations. We need time for reflective equilibrium to do its work.

Daniels captures the open-endedness of reflective equilibrium well. While the goal of philosophical interpretation may be well described by the idea of reflective equilibrium, we do not, of course, see it as an endeavor that can be completed. For our part, we concede that we have retreated from our earlier insistence that cosmopolitan justice requires redistribution so that all children everywhere enjoy equal access to education. We have not yet decided on the extent to which nation states and their institutions should remain a legitimate site of democracy and justice. Nor have we settled on a preferred account of public reason from among those we have described here.

In this respect philosophical interpretation may be like other genres of research in education. But perhaps one of the most obvious ways philosophy differs from other disciplines is that research is not just a matter of applying conceptual tools to the material of a different order or kind; rather the very objects of investigation are at least to a large extent themselves conceptual in nature and contestable. So the very interpretation of the idea of interpretation would be an appropriate topic of dispute.

6.7 Education Policy from the Perspective of Governmentality

Maarten Simons

Presentation of the Research Report

The Research Project: Focus and Major Findings

Studies of governmentality address the field of education policy at the level of the enacted modes of government and self-government. Governmentality is a neologism introduced by Michel Foucault and refers to a perspective on the assembly of particular rationalities and forms of thought (“mentalities”) with specific technologies and strategies to govern (Dean 1999). “To govern” is to be understood in a very broad sense: the structuring, guiding, or shaping of people’s behavior in very different contexts and in very different areas (including the structuring or shaping of human beings as subjects). Except for a specific approach of educational policy, the point of departure of studies of governmentality is a particular concern for the present and for how we live the present. This paper reports on a research project that focuses on a particular region of what is considered to be important in “our” present education: the collection and distribution of feedback information (Simons 2007, 2014). I start with a short clarification of that concern in order to present the main findings of the study.¹

An increasing number of activities in the context of educational policy can be placed under the heading “to inform people” and “to get informed.” For example, the inspectorate in Flanders (Belgium) sees it as her task to spread information about

¹ For the summary of research findings as well as for specific arguments about methodology and theoretical assumptions, I draw largely on previously published work throughout the article. The sources are listed in the references at the end of the article.

e-mail: maarten.simons@ppw.kuleuven.be

the performance of schools.² International assessment studies, like PISA and TIMSS, and European benchmark reports inform the Flemish government about the performance of educational systems. Through electronic newsletters, principals and teachers in Flanders are informed about recent legislation and examples of good practice concerning administration, innovation, and teaching. And journals are used to inform teachers, parents, and students about a wide range of educational issues such as the experiences of teachers in the classroom, the results of recent and relevant research, the implications and assumptions of new policy measures, published lists of recent initiatives in teacher training, etc. In short, it feels as “we”—and this “we” includes the author of this article—are permanently in need of information.

The research focuses on the current need of information by studying in detail the role of information for the Flemish government (and its educational system) in a global/European environment, on the one hand, and for schools in the Flemish context, on the other hand. The general question guiding the research project is how and to what extent the evident exchange of information mentioned above (and its supply, demand, and use) can be regarded as the articulation of a particular governmental regime. In line with the perspective of governmentality adopted in the study, this requires an analysis of the kind of information that is regarded as being indispensable today, of how actors within the field of education come to understand themselves and how this self-understanding installs the need for a specific kind of information, of how (Flemish) government comes to understand (and justify) its role and task in terms of collecting and offering information, and finally of what kind of power is involved in the governmental regime that puts information central stage.

Drawing on the analysis of European policy discourses and instruments and the circumstances of current educational policy in Flanders, the study concludes that an ongoing circulation of “feedback” information becomes of strategic importance in the current mode of governing. Procedures such as the “open method of coordination” and the resulting European benchmark reports as well as initiatives to create an “information-rich environment” for Flemish schools aim at collecting and distributing feedback. Feedback has become of strategic importance for national governments, as well as schools who have come to understand what they are doing as a performance in a competitive environment and have come to identify learning as a fundamental force to optimize this performance. As far as they have taken up this managerial relation to themselves and seek to govern/manage themselves accordingly, feedback information from their environment and regarding their performance is being experienced as a permanent need to orient their learning towards competitive change. In short, the study clarifies that when feedback is experienced as needed in order to inform and orient the learning process of states and schools towards optimal performance, the ongoing exchange and circulation of information are of strategic importance. The strategy at stake is to secure an optimal

²The analysis is limited to the current state of affairs in the Flemish community with the Flemish government being responsible for education within the federal state of Belgium.

performance for each and all and acts upon the “need for feedback” and “will to learn” of the actors involved. As the analysis of the policy documents and instruments indicates, this “need for feedback” and this “will to learn” are experienced as real and fundamental. However, they should not be regarded as organizational or anthropological universals. Although often conceived in this way, these are “singular, historical experiences” emerging within the current regime of “conduct on conduct” (Foucault 1984a, p. 13). The “need for feedback” (on one’s performance) and the “will to learn” (in order to improve one’s performance) are both the effect and instrument of a governmental regime that seeks to secure optimal performance.

Based on these findings, the study also formulates a thesis concerning the exercise of power in the present regime where the “conduct of conduct” takes shape as “feedback on performance.” The main component of this regime is a particular conduct or self-government of schools on the one hand and the requirements of the central government on the other hand. Part of this self-government is to control one’s performance (as a school, as a state) by using information from the environment that circulates through information media. The study clarifies that the mode of self-control and self-surveillance does not merely function according to the disciplinary strategy of the panopticon (Foucault 1972, p. 270). Modern panoptical power sought to discipline human beings through an internalized gaze of the other (i.e., the normalizing gaze of experts). Like inmates in a prison, pupils in a school, laborers in a factory, and patients in a clinic came to understand themselves in terms of normality and normalized development under the gaze of experts (teachers, managers, doctors). The panopticon referred to a form of power that works through the observation and surveillance of the many by the few, where the few (those in power) are often not visible. According to Foucault (1972, p. 298), this modern form of power is quite different from the classic form of power in the spectacle. In the spectacle of public punishments, as well as in the theater, for example, the many observe the few, and this observation is meant as to control the masses. Mathiessen (1997, p. 219) refers to this as the synopticon and argues that our present “viewer society” combines both panoptical and synoptical mechanisms: “Increasingly, the few have been able to see the many, but also increasingly, the many have been enabled to see the few – to see the VIPs, the reporters, the stars, almost a new class in the public sphere.”

The study argues that power mechanisms in the governmental regime of feedback performance indeed deploy mass spectacles. The instruments of information offer images of performance or best practice and organize a kind of spectacle. The arena of education, and its performance, is rendered visible to all. Thus, instruments of information function as a kind of “mass” media that allow the many (schools, states) to watch and observe the few (cf. Vinson and Ross 2001). What is being watched in this synoptical configuration is a spectacle or arena of the best performers or those representing in an exemplary way optimal performance or “good conduct.” Yet at the same time, it is through this spectacle, and its potential of feedback, that each of those who are watching comes to know her/his own performance. As such, the spectacle of performance orientates each and all and puts schools and states in a position in which they are able to monitor and orient themselves, and it creates the information-rich environment that is indispensable in order to satisfy the need for feedback and learning for optimal performance. Above all, the spectacle of performance puts states

and schools into a position in which they long themselves to become an image of good performance, to be part of the happy few being watched and admired by the many, and to be a champion themselves.

However, the synopticon only partly makes current power mechanisms intelligible. The study takes a further step by formulating the thesis that the paradigmatic articulation of today's power is perhaps to be found in the technique of 360° feedback (Simons 2014). As a management tool, 360° feedback puts the employee in the middle of a feedback circle composed of all relevant actors in the employee's environment: managers, subordinates, friends, family, customers, etc. The ideal situation is when the employee's self-evaluation coincides with how all others evaluate his or her performance. It promotes a kind of self-government where one submits oneself permanently and voluntarily to the gaze of others—and actually installs a dynamic in which one's own gaze and that of others merge. Its logic of operation is not the panopticon nor the synopticon. The panopticon is the paradigm of disciplinary power and works according to a logic where the few in the middle of the circle continuously observe the many, however, without the many necessarily having to know whether there is actually someone observing. This is “the power of surveillance.” The synopticon instead is the paradigm of sovereign power, where the many observe the few in the middle of the circle whose punishment or gratification is set as an example. This could be called “the power of the example” and, in its current form, “the power of performance spectacles.” 360° feedback takes elements of both the synopticon and panopticon but works differently. What is installed is a permanent and collective gaze while staging oneself in the middle of the arena and turning one's life into a performance spectacle in need of an audience to become real. The driving logic of “the power of feedback,” that is, the moment when feedback actually turns into a power mechanism and the circle closes, is when feedback decides on who and what one is and wants to become.

To conclude, the current governmental regime studied in the research project seems to be first and foremost accompanied by a power mechanism that turns feedback on performance into an indispensable navigation tool. Because power is involved in the governmental regime of performance, this is not necessarily bad but is potentially dangerous (Foucault 1984b, p. 386). And it is especially dangerous because the message becomes “perform, or else” (McKenzie 2001; Lyotard 1979) and because it becomes very difficult for us, in how we reflect upon ourselves and upon education, not to be part of it.

The Research Perspective

The analysis draws upon the work of Foucault in two related areas: firstly, on the analytics of government as “conduct of conduct” and, secondly, on the “ontology of the present.”

From a Foucaultian perspective, government is to be regarded as a form of “conduct of conduct” (Foucault 1982, p. 237, 2004a, b) or a more or less calculated and rational attempt to direct human conduct by the application of particular

technical means. An “analytics of government,” Dean (1999, p. 23) explains, “takes as its central concern *how* we govern and are governed within different regimes, and the conditions under which such regimes emerge, continue to operate and are transformed.” The assemblage and operation of these regimes of government can be analyzed by focusing on three related dimensions: the governmental rationality or program at stake, the “*techne*” of government being used, and the type of governable subject involved (cf. Foucault 1978a; Gordon 1991).

Governmental rationality refers to the mode of reasoning about how and why government takes place, the role of agencies and the justification of their authority, the entities to be governed, and the “*telos*” of government. It is important to stress at this point there is no single and universal governmental rationality. For instance, the perception of problems as social problems (e.g., accidents, illness), the reflections on the nation state as an agency that should organize social insurance, and the objectification of governable subjects as social citizens are all features of a particular governmental rationality (Rose 1999). This social governmental rationality however is quite different from a neoliberal reasoning that considers the nation state as an agency that has to organize and manage an enabling infrastructure for citizens to invest in themselves in order to protect themselves against risks (Rose 1996; Dean 1999).

A second dimension of analytics in a regime of government is the “*techne*” of government. This encompasses the instruments, procedures, techniques, and tools that are combined and used in order to accomplish the governmental objectives. Taxation and financial support are examples, as well as procedures of auditing and quality assurance. The focus on the technological dimension of governing however exceeds the common policy instrumentation (stick, carrot, sermon) at state level and includes a focus on the multiple instruments (e.g., benchmark reports), techniques (e.g., testing), and procedures (e.g., open method of coordination) enacted in multiple locales. Furthermore, the focus of the analytics is on the operational effects of governmental technologies, that is, how they shape the conduct of actors through what they make them do.

Finally, in order for people and organizations to be governable, they have to come to understand themselves in a particular way, to experience particular issues as relevant, and to govern or conduct themselves accordingly. As such, a regime of government presupposes a form of self-government in order to accomplish its goals. Within the social regime of government, for example, people have to understand themselves as being part of an entity with its own regularities (called “(civil) society”), as being protected by a central state, and to also experience their personal well-being as being connected to the progress of society as a whole and to govern themselves accordingly. This social form of governable self-government and governable self-understanding is quite different from what is at stake today. At present, regimes of government presuppose, for instance, that we come to understand ourselves as citizens who can and should invest in themselves in order to be “employable” and to perform well in networks and environments and to experience “choice” as a fundamental, human faculty (Miller and Rose 1997). At this point, it is important to stress that the aim of the

analytics is not to understand or explain the particular agency and underlying motives of multiple and different actors involved. The focus is, as explained by Rose (1999, p. 21), the space of thought and action for a particular self-government or conduct to emerge and hence the “conditions of possibility and intelligibility for certain ways of seeking to act upon the conduct of others, or oneself, to achieve certain ends.” As such, the scope of the analytics presented here is the space of thought and action for a government and self-government in the name of information to emerge.

The last remark is closely linked to a second area where the study draws upon Foucault: the critical concern or care for the present (Foucault 1980, p. 108; cf. Rajchman 1991, p. 141). Foucault (1982, pp. 231–232, 1983, p. 448, 1984a, p. 573) used the concept “(historical) ontology of the present” in order to describe in a general way the aim and focus of his work and in particular his perspective on government as the conduct of conduct. In short, his aim was to make our present understanding of the self (others and the world) and our present experiences less evident and to show how our self-government is being shaped within a particular governmental regime. In *Histoire de la sexualité*, for instance, his point of departure was the present experience of sexuality as something that is fundamental, as something that can be oppressed, and as something that can and should be liberated in order for people to find their true selves (Foucault 1976, p. 16). Consequently, his objective was not to reveal what sexuality really is about but how, at a particular moment in history, “we” came to understand the inner self in terms of (possible repressed and to be liberated) sexual drives. It is the constitution of this “we” or this particular form of subjectivity and this particular mode of self-understanding and self-government in terms of sexuality that was the focus of his research. In short, sexuality is not conceived as a kind of (anthropological) universal, but as a singular, historical experience emerging within a particular governmental regime. As such, Foucault’s focus is the (historical) conditions of possibility in order for sexuality to be experienced as meaningful.

In a similar way and as explained in the beginning of the article, the point of departure is our present experience of information and feedback in order to understand within which governmental regime it emerges. Thus, what is at stake, according to Rose (1999, p. 20), is “introducing a critical attitude towards those things that are given to our present experience as if they were timeless, natural, unquestionable” and “to enhance the contestability of regimes” that seek to govern us. As a result, the aim is to draw attention to what is familiar (i.e., our present need for feedback) and exactly what is often invisible (i.e., emerging power mechanisms) due to this familiarity (Foucault 1978b, pp. 540–541). In this context, Foucault’s claim that “knowledge is not made for understanding; it is made for cutting” is illuminating (Foucault 1984c, p. 88). The objective hence is not to increase our understanding by revealing hidden truths. Cutting refers to the (indeed almost physical activity) questioning of who we are and what we regard as fundamental in our understanding of ourselves and the world. Knowledge that cuts “introduces a discontinuity”; it cuts in our present and how we live and govern the present.

The Research Frame

The reported study of governmentality along this perspective draws on a specific analytical frame that focuses on processes of governmentalization and entails a specific approach to the interpretation of policy documents and instruments.

The main research interest is to understand the role of information for education policy and the Flemish government in the current global/European context and for schools in the Flemish policy context. In order to explain how a governmentality perspective allows to address these issues, additional analytical clarification is required. Drawing upon the terminology of Foucault once again, the concepts of the “governmentalisation of the state (Flanders)” and, in close relation to this, “governmentalisation of Europe” have to be introduced (Masschelein and Simons 2003; Walters 2004).

A main characteristic of the birth of the modern nation state, according to Foucault (1978a, 1981), is not the “etatization of society” but the “governmentalisation of the state.” This means that the state is to be conceived as a complex of centralizing governing relationships aimed at conducting the conduct of people (both as individuals and as a population). As a result, the birth of the modern state as a governmental state implies the emergence of a particular reasoning about the role of the state, its tasks and responsibilities, as well as its objectives and the entities to be governed. Furthermore, as Foucault (2004a, b) has elaborated in detail, the governmental state and its rationalities and mentalities have continually transformed throughout history: a governmentalization in the name of “reason of state” in the early modern period, in the name of individual freedom and security (and finding its intellectual articulation in the reflections on political economy) in the modern era, and in the name of “the social” in the twentieth century. Foucault (2004b) noticed a new phase in the governmentalization of the state in the second part of the twentieth century, and meanwhile many scholars (Gordon 1991; Rose 1999; Dean 1999; Olssen et al. 2004) have elaborated on this. The role of the state is no longer approached as a central agency of government that should intervene in society in the name of “the social” and in order to align individual freedom and social welfare (Rose 1999). Instead, the state today is increasingly regarded as a managerial agency that should enable an entrepreneurial type of freedom (at the individual level and at the level of organizations, communities, etc.) through, for example, marketization and investment in human capital and in collaboration with other agencies of governance (both local and global, public and private). This “advanced liberal” (Rose 1996) governmentalization of the state should be kept in mind in order to understand the current concern for information of the Flemish educational policy. Yet, this new phase in the governmentalization of the state is connected to a new phase in the governmentalization of Europe. Although in the reported research the focus is limited to Europe and its member states, processes of governmentalization both more local (e.g., public/private partnerships at regional and local levels) and global (e.g., transnational organizations) can be studied as well (Perry and Maurer 2003).

Instead of regarding Europeanization as a gradual process of integration ultimately resulting in a kind of “etatization” of Europe, we look at it in terms of a governmentalization of Europe (Masschelein and Simons 2003). Different mentalities, rationalities, and governmental procedures have emerged from the creation of the Coal and Steel Community to the present objective to make of the European Union “the most competitive and dynamic knowledge-based economy” (Walters 2004). From the 1980s onwards, and focusing on the creation of single European market and ultimately of a single currency, the role of Europe and the entities to be governed (such as the member states and their economies and financial policies) become rationalized and reconfigured in terms of “harmonization” and the “mutual recognition of national standards” (Barry 1994; Walters 2004, p. 166). As such, harmonization functions as an art of European government, and it constitutes the European Union and its institutions and experts as central agencies of coordination, i.e., of harmonization of the conduct of member states. Moreover, this governmentalization of Europe in the name of harmonization is connected with a governmentalization of (member) states. “Europe” and “Brussels” enter in a particular way governmental rationalities and mentalities of member states, that is, they come to understand their standards, capacities, and resources in relation to other member states and European norms and as being more or less in harmony. Thus, in analyzing, for instance, the open method of coordination, it is possible to address intertwined developments at the level of the governmentalization of Europe and the governmentalization of member states.

The Approach

A study of processes of governmentalization (both at the level of Europe and member states) premised on the assumptions of an ontology of the present includes a particular approach to interpretation. In line with Dreyfus and Rabinow (1982), the approach can be called an “interpretative analytics” for there is a concern to depict the conditions of possibility and intelligibility for the current discussions about the role of information in policy making to emerge. The approach to interpretation therefore is not hermeneutical. The aim is not to come to an understanding or to grasp the (true) meaning of particular policy decisions, policy measures, and polity texts by taking into account the historical or social context, the intentions of actors, or a particular systematic logic. Instead, the point of departure is that particular practices and the circulation of (feedback) information are to be considered as meaningful today and are part so to speak of our common lifeworld: it makes sense to reason about the collection and circulation of feedback information, to use techniques of benchmarking, and to ask for information about one’s performance as a member state and school. The question then is what are the conditions of possibility at the level of governmental reasoning, technologies, and self-government for these discursive and nondiscursive practices to become meaningful. Thus, instead of asking who or what is imposing for what reason a particular meaning to these practices, it should be asked for who, that is, for what form of

subjectivity and within what sort of governmental reasoning the circulation of feedback information becomes meaningful and even indispensable.

Furthermore, the objective of an interpretative analytics is not to look for “sources of meaning” behind or below the written (policy) texts and the policy instruments adopted in order to confront policy makers and other actors in the field of education with the true meaning of their words and the real reasons for the decisions that are taken. Contrary to such a kind of vertical interpretative move from surface to depth, the presented interpretative analytics includes a horizontal move and remains at the surface of what is given in experiences and practices. Hence, instead of an explanation based on a deep interpretation, the study is a “cartography” (Deleuze 1986) that “maps” (Flynn 1994) the present or, as Rose (1999, p. 57) puts it, an “empiricism of the surface” focusing on what is said and done and what allows it to be said and done. A cartographic description thus seeks to describe the governmental rationality, technology, and modes of self-government that are enacted in how the Flemish government positions itself within the European policy context and towards Flemish schools. Methodologically speaking, this requires to bracket the authorship and any contextual information of documents and policy instruments. These de-authorization and decontextualization allow to approach what is done and what is said as discursive and nondiscursive events and to put them side to side in order to map specific patterns and processes. By putting different documents (e.g., communication of European Commission, policy declaration, European report, etc.) and instruments and procedures (e.g., open method of coordination, benchmark graphics, etc.) side to side, what becomes visible is their interrelatedness in a field of discursive and nondiscursive practices whose “meaning” escapes the actions and attributed reasons of those involved. The effectuated field allows for a description of common discursive patterns (e.g., forms of argumentation, conceptualization, addressing problems and framing solutions, visual schematization, etc.) and technological processes (e.g., modes of operation, procedures, instrumentation, etc.) as part of emerging ways of governing and ways of thinking about governing. As a consequence, a cartographic account of the state of affairs has not the form of an explanatory report on formal structures and general mechanisms nor that of a story that gives meaning to actions and decisions in narrative terms. The map instead traces the characteristics of the technology and reason of current modes of governing by taking current practices of governing as a point of departure.

In line with an interpretative analytics that aims at a cartographic account of the state of affairs, specific sources are to be searched for. The data collection does not follow the exemplary logic of a case study design. A case study—also a single case study—has a fixed point of departure (general theory, (hypo)thesis, domain, entity, etc.) and assumes a predefined unit of investigation that allows to decide on a well-defined and exemplary practice. The assumed logic of unity and difference, and the presupposed horizon of the particular and universal, is not in line with an ontology of the present. The practices that make up the state of affairs regarding education policy in Flanders articulate who we are today and, hence, are not to be treated as an exemplification of who we are today or of what is the case. This means that what

comes into account for sources to be interpreted is everything through which current governing is enacted and, more specifically, in which the current need for information is manifest. As a consequence, the regional ontology of the present results in a cartography that does not make global claims. Due to that point of departure, the decision on practices to be investigated is to a certain extent arbitrary in time and space. In an ontology of the present, a decision has to be taken about what is considered to be “today” and “we.” For this study, it is indeed the researcher’s present—both in space and time—that motivates the decision. The focus thus is on policy-related practices at the level of the Flemish government and specifically during the first part of legislation period of Frank Vandenbroucke, minister of education between 2004 and 2009. This should however only partly to be considered as arbitrary, for what motivates this study is exactly the assumption that the logic of my personal self-understanding is not different from the logic of the self-understanding of others; it seems as “we,” today, are in need of specific information. It is the experienced self-evidence of information and feedback that constitutes the “we” and “today” and hence orients the researcher to particular practices.

Sources and Process

Two types of sources are collected and interpreted for the study: textual and technological materials. The textual material includes the policy declaration of the minister of education, policy notes of the minister that explicitly reflect about challenges to and developments within policy making today, the memoranda of new legislation, and a selection of European policy documents (communications and reports and narrowed down to education and training and the open method of coordination). For the technological material, the focus is on the enacted instruments, techniques, and procedures (and related discursive practices) where collection and distribution of information is of major importance: benchmark reports, rankings, reports on examples of best performance, assessment tests, testing grounds, and coordination procedures in view of European harmonization. Despite the analytical distinction between the textual and technological, the collected material is approached as practices that articulate how governmentalization takes shape today. Text thus is approached as a discursive practice. It is not regarded as a medium to transfer meaning or ideas about reality and, hence, not to be interpreted by looking for the intentions (on the side of messenger), by asking how reality is represented (on the side of the content) or by focusing on the reception of the content (on the side of audience). In a similar way, the technological material is not approached as a set of tools used by someone with specific intentions in order to arrive at certain objectives. Instead, these materials are considered as being part of practices that make up our current world, and since these technologies and this language is used, they make sense to us or have meaning for us. Hence, the question is not which meaning actors impose on particular texts or how they use particular technologies, but what kind of self-understanding from the side of the actors is

“required” for these practices to be meaningful and hence for these texts and technologies to make sense.

Applied to the research project, the interpretation process of the material follows three steps. The first step aims at an understanding of the kind of information that is suggested to be indispensable or required today and, based on that, an understanding of how the actors within the field of education have to come to understand themselves (and others) for this information to become needed and even to be indispensable. In answer to these questions, the study clarifies that the promoted and required information is “feedback information on performance” and that the Flemish government comes to understand itself as a calculating agency that embraces specific “managerial virtues”: a readiness to learn from comparison, to benchmark, to collaborate in order to compete, and to be proactive or reactive. The second step then focuses on how (Flemish) government comes to understand (and justify) its role and task in terms of collecting and offering information. An interpretative analytic of the sources allows to describe a governmental rationality which renders both educational policy and the educational system intelligible in terms of performance in a competitive, international environment that frames the state as a competition or performative state with a managerial and enabling role and that regards optimal performance as a governmental target. Through technologies such as benchmarking and the collection of practices of good performance at an international level, the new governmental state explicitly tries to satisfy its need for feedback, to orient itself within a competitive environment of nation states and to learn from comparison for the sake of optimal performance. The interpretative analytics also clarifies that part of this governmental rationality is a mode of thinking in which the Flemish government defines its role towards schools that are in “need of feedback” and hence where the centralized collection and distribution of feedback information on school performance becomes a critical issue; mutual learning, based on the stories of best performing schools, becomes regarded as a solution for optimal change in a competitive environment. The third step attempts to describe the kind of power that is involved in the governmental regime that puts information central stage. By drawing on literature that discusses several modes of power, this step aims to grasp the power mechanisms—that is, how power actually works—when the “conduct of conduct” takes shape as “feedback on performance.” In this synthetic research step, the study elaborates on how current processes of governmentalization are accompanied by mass spectacles and its images of best performance (through which each state and school are able to orient and optimize their own performance) and ultimately how power relations seem to culminate in full-circle feedback mechanisms.

An important aspect in the three steps of interpretation and the ultimate presentation of the results of the cartography is the particular way of developing and using concepts. For the cartographic account of the form of self-understanding, the emerging governmental rationality, and the mode of operation of technologies, the study is not relying on an existing conceptual framework or theoretical terminology. The implication is that a crucial part of the interpretation is finding and—to a certain extent—inventing a terminology that does justice to the investigated state

of affairs. Examples of invented terms are feedback on performance, managerial virtues, need for feedback, and competitive state. This terminology is rather close to the vocabulary used in the investigated practices; however, at the same time, it is used in a different way. The unusual use of common terms should be regarded exactly in line with the specific approach included in an interpretative analytics. The introduction of an academic terminology that circulates outside the examined practices often comes down to an interpretation from the outside. In that case, what is interpreted is assumed to be invisible because it is an underlying structure or not yet recognized intention or source of meaning. An interpretative analytics also assumes something remains invisible. But it is invisible because it is all too familiar and because that familiarity or self-evidence is always reinforced when being engaged in practices (Foucault 1978b, pp. 540–541). In that sense, the analytics includes an interpretative act from the inside, by taking fragments of the vocabulary of these practices as the point of departure but using it exactly to describe, for instance, the installed rationality, the emerging form of self-understanding, or the patterns of power. Linking common terms, managerial or feedback, for instance, to aspects at the level of self-understanding, virtues, or need, for instance, is an attempt to make the familiar unfamiliar. Another operation used in the cartography is to combine concepts that are often kept separate in current discourses, such as “competitive state.” While common understanding considers the political and economic to be distinct spheres, merging the lexicon of these spheres allows to point at the constitution of new entities and new modes of reasoning. The merging however does not seek to indicate that the borders between previously distinct social fields have collapsed nor points at structural tensions or contradictions, but attempts to describe the new modes of reasoning as singular events that install a specific logic and strategy.

Reasons for Choosing the Governmentality Approach

Within the field of policy studies that have education as their major concern, there is a wide range of approaches depending on the disciplinary background (sociology, political theory, philosophy, etc.). This study could be located within the genre of critical education policy studies. Before discussing the value and contribution of the governmentality perspective for the critical study of education policy, a short sketch of the critical orientation in education policy studies is presented (see also Simons et al. 2009).

Critical Education Policy Studies

It was the book *The Policy Sciences*, edited by Lerner and Lasswell in 1951, that can be regarded as programmatically setting the scene for the social sciences' orientation to public policy in the welfare state. Especially after the devastating effects of World War II, with the expansion of communism and the economic crisis,

social scientists in the West were eager to actively support the development of the Western democratic state and its public policy. Lerner and Lasswell's book expressed Western social scientists' commitment to improve the social and democratic basis of the state by studying issues related to such phenomena as full employment, equality, and peace and to optimize the effectiveness of public administration and organizational structures. The educational reforms during the 1980s and 1990s, and specifically the confrontation with the neoliberal and neo-conservative governments in the USA, the UK, Australia and New Zealand, acted as a "catalyst" for the development of a new "genre of policy studies" (Troyna 1994, p. 3; Trowler 1998). The studies at the beginning of the 1980s were mainly rooted in the research tradition interested in power, politics, and social regulation in and around schools and particularly confronting the crisis of the welfare state and the public role of education. In line with the broadened field of study, these scholars not only petitioned policy makers and educational administrators with their research but combined academic work, policy engineering, and social criticism (Hammersley 1994).

Focusing on the context and impact of the educational reforms relatively ignored by regular political and social scientists, educationalists and sociologists of education hence developed from the 1980s onwards their own particular policy studies (see Prunty 1984). Echoing the term "policy orientation," the notion "critical education policy orientation" can be used to describe their distinctive scope (Simons et al. 2009). Despite the diversity and despite what has been referred to as a condition of "theoretical eclecticism" (Ball 1997; Ozga 2000), they share the following features: the policy studies express specific educational, moral, and social concerns; they adopt a broad conception of policy, including politics, the mechanisms of power, and the relation with the wider social context; and the studies include diverse forms of critical advocacy related to a concern for education in society—that is, "the public and its education." At one level, this is far removed from Lasswell's policy orientation and the problem-solving focus developed in line with that orientation. However, at another level, the critical education policy orientation is perhaps still close to that program, for underlying Lasswell's orientation towards policy was a deep concern with democracy and public policy.

From the 1990s onwards, and in view of the challenges of contemporary society, the critical orientation was considered in need of "de-parochialization" (Lingard 2006) and a "recalibration of critical lenses" (Robertson and Dale 2009). Several challenges had to be faced. One important challenge became the concepts "education" and "policy" themselves. Current discourses on the global knowledge economy, lifelong learning, and (global) governance are clearly challenging the education-, school-, and government-oriented vocabularies (e.g., Fejes and Nicoll 2008). In relation to the fields of lifelong learning and human capital investment, the least one could say is that the terms "education" and "education policy" have become something that have to be clearly defined. Related to that, researchers start to globalize their research agenda and broaden the often state-oriented methodological and theoretical approaches. An important aspect here is that a particular kind of global policy analysis, comparative education, and international benchmarking

has become itself part of the assemblage of the global policy field (Nóvoa and Yariv-Marshall 2003). Critically oriented research hence had to come to terms with the practice of comparison and comparative educational research and the underlying assumptions regarding commensurability and the role of modern states. One particular challenge that is related to governing through comparison is the role of the nation state in education policy and the reemergence of the problematic of the state in the global policy field. Dale and Robertson (2007), for instance, suggest that the nation state should not be located at the level of the “explanans” but the “explanandum” and that scholars should take into account different overlapping “scales of politics and policy.” Here, scholars start to focus on the new policy actors that enter the global scene, how states are being repositioned and how they come to develop national education policies embedded within a competitive global/European framework (Lawn and Lingard 2002). This leads to a next set of challenges: the many guises of post-welfare policies. An interesting observation in that regard is that aside from the so-called liberal policy makers, also social democrats and “third way” political administrations came to rely on policy measures previously classified under the general term neoliberalism (Ball 2008). Measures related to output control, managerialism, and responsabilization did not disappear with the change of political coalitions. The widespread use of measures and policy options previously associated only with neoliberalism actually leads to a situation where social democracy can no longer be identified with social justice and neoliberalism can no longer be used as a synonym for social injustice (Seddon 2003). A final set of important challenges arises from the changed relation between research and policy making, particularly with the advent of the so-called evidence-based policy and related movements of evidence-based practice in teaching during the 1990s (Young et al. 2002). Confronted with evidence-based policy or the “governmental re-articulation of *analysis for policy*” (Lingard and Ozga 2007, p. 6, italics in original), the critical education policy scholar can no longer only be oriented towards the field of education policy but also towards the evidence-producing research fabric that becomes part of policy making.

The reported research study in this paper should be located within this line of critical educational policy studies and seeks to address several of the mentioned challenges. The study elaborates on the observed shift from the so-called welfare state to the “competition” (Yeatman 1994; Cerny 1997), “evaluative” (Neave 1998), or “performative” (Ball 2000) state and pays special attention to the way state government reformulates, justifies, and develops education policies within the global field of governance. As a consequence, it is important to locate this role within a European context and to focus on modes of governing and policy instrumentation beyond the classic state-centered approaches. The perspective of governmentality allows to address exactly those issues. The focus on processes of governmentalization helps to understand the state as what has to be explained instead of what is explaining current policy. Furthermore, the perspective of governmentality avoids a single focus on policy rhetoric but includes an analysis of governmental technologies and reasoning and how new entities and modes of self-government emerge.

Governmentality Studies

The work of Foucault has already played for a rather long period a role in educational research and in social and political theory of education. It is impossible to give an overview of all the—philosophical, historical, and sociological—uses of Foucault in educational research (Simons and Masschelein 2007). Yet, it seems that the teaching of Foucault on governmentality during his courses at the Collège de France in 1977–1978 and 1978–1979 has given a new impetus to critical education policy studies. One can rightly refer to studies of governmentality as a kind of new subdiscipline within the humanities (Dean 1999, p. 2). However, the term discipline may not be fully appropriate since it might mask the huge diversity of these studies, both in terms of research domain and in terms of method (Rose 1999, p. 9). What they share, however, is an interest in forms of governmentality, minimally conceived of as the strategies of governing people and governing ourselves. In this line of research, several scholars started to focus on processes of governmentalization in education and particularly in relation to educational policy and to restructurings in the wake of the so-called neoliberal and neoconservative governance (see the collection: Peters et al. 2009). Their focus is not in the first place on how education policy takes shape (e.g., policy process, political context) nor on the issue of legitimacy (e.g., institutional conditions, juridical procedures) but on how governing actually works and the kind of regimes of government that emerge. By addressing the regimes that emerge, it is possible to describe what was and is happening “to us” and “through us,” that is, how specific forms of self-government—for instance, articulated in the “need for feedback”—actually enact and stabilize specific modes of governing.

Despite the substantial amount of studies on governmentality and education, critical debates of studies of governmentality are widespread. Speaking broadly, studies in view of governmentality seem to fall apart into two registers. On the one hand, there are governmentality studies that are merely descriptive but incorporated within the broader domain of sociological and political analysis. In this register, an ongoing debate seems to be whether and/or how studies of governmentality can rely more on empirical methods in order to be able to grasp the “reality” of governmentalities (and not merely what they refer to as “the programs”) and to reveal the resulting contradictions and tensions (and not merely questioning what is self-evident) (Dale 2004). On the other hand, studies of governmentality seem to be integrated within broader critical programs that want to resist political, cultural, and social hegemony (and ultimately the consequences of different sorts of capital accumulation). In this register, ongoing debates include the issue of how agency (and the possibility of resistance towards forms of hegemony) can be thought of in the context of an analysis of governmentality and how the described processes of governmentalization can be explained by drawing upon materialist or idealist social and political theories (see also Reichert 2001; Osborne 2001).

Giving shelter to studies of governmentality in both disciplinary registers is tempting precisely when the particular critical heart is removed from these studies:

a critical concern with the present, that is, the critical ethos that is distinctive for an ontology of the present. The ethos is related to what according to Foucault is “the art of not being governed like that and at that cost” (Foucault 2007, p. 45; see also Foucault 1978a, b). Critique therefore is not to be regarded as the outcome of a theoretical standpoint that allows to take distance from the present in order to judge it, but a movement of conversion towards what in our experience presents itself as necessary or self-evident. It is a critical movement that is expressed in a question such as: “who are we for whom feedback has become indispensable to decide on who we are and what we should do?” As far as the critical attitude underlying these studies indeed is a kind of virtue or ethos (Butler 2004; Simons et al. 2005) and not the more common theoretical or normative attitude, the temptation to integrate studies of governmentality within one of the two registers is somehow understandable. The two disciplinary registers, then, are often welcomed as providing a sound intellectual and methodological context or an explicit normative foundation (e.g., Fraser 1981; Habermas 1985). Although we recognize and understand this temptation, this kind of integrationist and assimilating attitude towards studies of governmentality ignores their very heart: the concern with or vigilance towards how we are governed today—through governing ourselves in a particular way. The attitude of de-governmentalization—as Gros terms it—can be described in a very classical way as an “attitude of enlightenment,” that is, bringing to light mechanisms of power or speaking truth to power (Gros 2001, pp. 520–523). The distinctive public dimension of this kind of critical gesture is discussed in the last section of the paper. For the moment, I want to stress that an important reason for adopting the governmentality approach is to articulate an attitude of de-governmentalization by taking the unease with the current need for information and feedback—including my own need in that regard—as a point of departure.

The Role of Interpretation in This Study

To be able to discuss in more detail the role of interpretation in this study, it is helpful to return to some of the main findings. The interpretation of current practices in policy making starts from the question within which regime of governing a question for or concern with information on performance starts to make sense (and hence assuming that such a question or concern was not really expressed before). The interpretative analytics shows that this concern emerges when states understand themselves as competitive states, when actors in the field of education come to reflect upon themselves in terms of performance, and when policy objectives are being formulated in terms of competitive advantage. The study describes the birth of a kind of “need for feedback on performance,” and this need is interpreted as being both the effect and instrument of how we are being governed today. The “need for feedback” takes shape as part of current technologies of calculation and comparison but becomes at once an instrument in order to

justify the further collection and distribution of feedback information and to increase the overall performance. The study also indicates that the many public discussions about optimal feedback and useful performance indicators do not question the new regime of governing. These discussions and debates are interpreted instead as an indication that a way of thinking about and acting upon education that is centered around performance has taken shape. Finally, the concept of 360° feedback is introduced to articulate in a paradigmatic way the kind of power that is being exercised: feedback on performance becomes an indispensable tool to know who we are and to orient and hence govern our future actions. It is our “will to know” (our position, our performance) that becomes the engine of the governmental regime.

For these findings, the interpretation does not rely on the hermeneutical tradition. Moreover, the break with a hermeneutical approach to interpretation has an important consequence. In the hermeneutical approach—and I will take the specific approach of Habermas as an example—the issue of legitimacy or justification precedes the issue of meaning or relevance. From the perspective of Habermas, the meaning of something can be grasped if we know under which conditions something is accepted as relevant (Habermas 1985). An interpretative analytics in line with Foucault instead assumes that questions about legitimacy—for instance, debates about adequate information or relevant quality indicators for education—only come to the foreground if a (self-) understanding in terms of comparison, quality, and information circulation has emerged. In other words, part of our assumption that practices related to information and feedback are meaningful today is that they are currently debated, that is, that certain aspects are treated as in need of justification. These debates are regarded as part of current governmental reasoning and not as a symptom of its crisis of legitimacy. An interpretative analytics thus seeks to make a cartography of the conditions of possibility both regarding what we consider today to be meaningful and the rules and principles according to which we start to discuss its relevance and judge its legitimacy. It is however important to elaborate in more detail on how exactly to approach these conditions of possibility.

An interpretative analytics along the perspective of governmentality does not seek to “explain” the current state of affairs on the changed role of the state and the changed self-understanding of actors in terms of feedback. Schematically speaking, such an explanatory interpretative approach can take two different forms. For instance, one could interpret the current insistence on feedback and benchmarking as an articulation of the logic of capital in late modern societies and hence explain competitive benchmarking as an attempt to align member states and their educational system with the requirements of capital reproduction. Or one could interpret the European benchmarking as part of a political project in which member states transfer power to European institutions. The power transfer, it can be argued along these lines, explains new modes of political coordination and juridical regulation through competitive benchmarking in an attempt to safeguard both national welfare and European economic strength. What these approaches share is that something (logic of capital or political power) is assumed to be given and—while standing

behind the phenomena being investigated—allows for an understanding of its meaning through explaining its coming into existence. From Foucault, the idea is taken that in order to understand the impact of politics and the economy on society and people's life, we have to investigate how people are being governed and come to govern themselves. This is formulated very precisely by Lazzarato:

The remarkable novelty introduced by Foucault in the history of capitalism since its origins, is the following: the problem that arises from the relation between politics and the economy is resolved by techniques and dispositifs that come from neither. This 'outside', this 'other' must be interrogated. The functioning, the efficacy and the force of politics and the economy, as we all know today, are not derived from forms of rationality that are internal to these logics, but from a rationality that is exterior and that Foucault names 'the government of men'. (Lazzarato 2006, p. 1)

In order to clarify the consequence for interpretation, it is helpful to introduce Foucault's concept of "problematization." For Foucault (1990, p. 257), the concept "does not mean the representation of a pre-existent object nor the creation through discourse of an object that did not exist. It is the ensemble of discursive and nondiscursive practices that make something enter into the play of true and false and constitute it as an object of thought (whether in the form of moral reflection, scientific knowledge, political analysis, etc.)." What incites a form of problematization are clearly social, economic, and political developments in a particular period for they can render common practices problematic, that is, make it difficult to continue thinking and acting in the same way. Applied to this study, it could be said that developments at the level of the European Union or economic developments (related to changes in mode and factors of production in the knowledge economy, for instance) incite difficulties in common ways of governing education. However, the form of problematization that emerges at a given moment as an answer to these difficulties should not be approached as their direct manifestation or translation but elaborates the conditions based on which possible solutions can be proposed and debated. The focus hence is on the singular form of problematization that emerges at a given moment and that cannot be interpreted or explained as the logical or necessary outcome of given political or economic developments. The problematization of educational systems in terms of performance and the current experience of the need for feedback, for instance, should be approached in their singularity, that is, as an event. This is the "outside" or "other" that Lazzarato argues to be distinctive. The form of problematization opens up a space to think and act in a particular way, to discuss about possible solutions, and to start debates about legitimacy and relevance, and hence it installs a particular way of addressing the difficulties. The conditions of possibility investigated along the lines of an interpretative analytics exactly address the form of problematization. In that view, an interpretative analytics can be described as an act of re-problematization.

The following citation offers a point of departure to clarify in more detail the distinctive scope and objective of the act of re-problematization: "People know what they do, they frequently know why they do what they do; but what they don't know is what what they do does" (Foucault in Dreyfus and Rabinow 1982, p. 187). This citation allows to point out that the study, first, is not about a totalizing

explanation but a tracing of a singular assemblage and, second, does not aim at a foundational critique but is motivated by critique as a public gesture:

1. The descriptive, cartographic account of educational policy at the level of the enacted discursive and material practices addresses how power actually works in current forms of governing: what kind of power is exercised when governing—to be understood as “conduct of conduct”—takes shape as “feedback on performance”? The notion assemblage is useful to point out how heterogeneous practices with their own history and development connect with each other in a way that is mutually reinforcing and result in a kind of apparatus (“dispositif”) that gives shape to more or less stable power strategies and forms of problematization by which to govern people (“regimes”) (Foucault 1976). The resulted power mechanisms include a logic that cannot be reduced to the idea or doctrine of a single strategist (e.g., politician, economist, expert, etc.) and whose coming into existence is not to be explained by an underlying cause or actor (e.g., social class, state, etc.). In other words, what often escapes our attention—in our concern with distributing or collecting feedback information—is that it plays a role in the assemblage of an apparatus that works according to a logic that goes beyond our intentions. The “feedback apparatus” should be regarded, therefore, as a strategic assemblage that is stabilized and that has an intelligibility of its own and whose power operations are enacted to tackle problems in very diverse domains (Rabinow 2003, p. 54). An indication that the feedback apparatus is actually in operation is that European benchmark reports and international assessment studies, for instance, start to function as stabilizing mechanisms (Simons and Olssen 2010). The authority of these reports or studies is affirmed, and the collection and distribution of feedback gains further impetus, by the fact that they become “obligatory passage points” and hence indispensable in order to know and govern oneself (Callon 1986). Another indication of the stabilization of such a strategic assemblage is that increasingly problems in different domains are framed in terms of “lack of feedback” (for instance, about school performance), hence necessitating the production and circulation of feedback information. At this point of stabilization, it can be argued in Foucaultian terms that the current “need for feedback” (and “will to learn” and “will to quality”) functions as both the effect and instrument of an apparatus whose power mechanisms seek to secure optimal performance of each and all. This statement however is not a “totalizing explanation,” but results from an observation of the totalizing ambition of power mechanisms. Two additional methodological points have to be made regarding the description of how power works and the resulted apparatuses.

First, in studies of governmentality and Foucaultian-inspired studies in general, there is a tendency to use Foucault’s own concepts (such as disciplinary power, normalizing power) as heuristic or even explanatory tools in studying current or new practices. This mobilization of a kind of “Foucaultian apparatus” however contradicts the specific aim of an interpretative analytics. The objective is to describe practices as singular events and hence not to approach them as an illustration or interpret them as a manifestation of a mode of power existing out

there. The latter approach in fact results in a kind of deep or totalizing interpretation and often comes down to an explanation, as if the concept “disciplinary power” could explain what is going on today. Second, and as a consequence of this, the challenge is to conceptualize the exercise of power today. In describing modern disciplinary and normalizing power, Foucault introduced the concept “panopticon.” The concept however was not invented by himself but was actually used by Jeremy Bentham in 1791 for a very specific architectonic model of an inspection house. However, Foucault uses the concept panopticon in a paradigmatic way, that is, it is used to reveal the singularity of modern forms of power. As the “diagram of a mechanism of power in its ideal form,” Agamben (2002) argues, “the panopticon functions as a paradigm, as an example which defines the intelligibility of the set to which it belongs and at the same time which it constitutes.” The panopticon as a paradigm hence escapes the logic of the universal and the particular; the panopticon is not a universal that is exemplified in particular practices (prison, hospital, etc.), nor is it a particular practice that allows to get a grip on universal power mechanisms. Instead, the panopticon is the example that makes the mechanisms of power and the problematic of governing in their singularity intelligible and at the same time constitutes the field of discursive and material practices. In the reported study, a paradigmatic articulation of today’s power mechanism was explored by drawing on the technique of 360° feedback. It is an existing tool that makes the current problematic of governing intelligible and at the same time enacts the problematic.

2. The mapping of indirect consequences—that is, “what what we do does”—in terms of the assemblage of an apparatus in which feedback on performance becomes an obligatory passage point in order to come to understand oneself (as a country, a school, a teacher, etc.) leads to the critical ambition of the presented study of governmentality. As stressed before, critique should be approached in terms of an ethos of de-governmentalization that combines a “limit attitude” and “experimental attitude”; the critique of our current “need for feedback” takes shape through the description of the feedback apparatus that imposes limits on us and is at the same time an experiment with the possibility of modes of self-government beyond the imposed limits (Foucault 1984d, p. 319). This approach has to be distinguished from a foundational critique that judges the legitimacy of power mechanisms based on given principles (“limiting attitude”) or that unmasks particular strategies and tactics by recalling what is given in original experiences (“experiential attitude”). From the viewpoint of foundational critique, studies of governmentality are often judged or unmasked for their so-called apolitical character, their crypto-normativity, and the insistence on ethics and aesthetics at the dispense of politics and issues of public concern (Habermas 1985). Although often not explicitly elaborated, a critical ontology of the present that addresses processes of governmentalization does include a particular political, or rather public, focus.

The point of departure of an ontology of the present is what is considered to be self-evident today, that is, our ontological makeup or taken-for-granted modes of reasoning and related practices. The critical activity, however, is not

to debunk or unmask (what we today consider to be) matters of fact but to suspend our common, appropriate modes of reasoning and usage of objects, words, and practices. This act of suspension or de-appropriation is not about destruction. Instead, the act disrupts the set limits or followed rules, suspends the taken-for-granted economies and usages, puts something out of order, and hence displaces something in view of public use. In line with Latour (2005), the critical gesture includes a movement of “making things public”: an attempt to turn our dealing with education in terms of performance and feedback into a matter of concern and to gather people as a public around this issue. It is Dewey who explicitly links this notion of “public” with the unknown or indirect consequences of our actions (“what what we do does”): “The public consists of all those who are affected by the indirect consequences of transactions, to such an extent that it is deemed necessary to have those consequences systematically cared for,” and he adds, “the essence of the consequences which call a public into being is the fact that they expand beyond those directly engaged in producing them” (Dewey 1954, pp. 15–16). What is at stake then is an attempt to turn the indirect consequences of our cherished “need for feedback” into a matter of public concern. And for that reason, the study’s critical orientation is not about a form of teaching that addresses readers as ignorant citizens by revealing the matters of fact and not a form of judging that addresses readers as docile subjects by setting new limits or recalling old limits but about “invitations or public gestures” (Foucault 2000, p. 245). Critique as a public gesture aims at making things public, that is, turning the state of affairs in governing education into a matter of public concern again.

6.8 Philosophy at Work in the Study of Parenting and Parenting Support in Flanders

Stefan Ramaekers

Introduction: Understanding and Interpreting Parenting Support in Flanders

This chapter is an account of the way in which I tried to address particular developments in the area of parenting support (specifically in Flanders). It tries to cover a designated part of research activities in a period that started, roughly, by the end of 2009 and runs until now. Strictly speaking, what I will be presenting below applies to developments in the period 2009–beginning 2012. Most recently there have been some interesting new developments regarding the organization of parenting support in Flanders (i.e., in terms of what is being called “Huizen van het kind” (Children’s Houses)). In this chapter I will not go into the latter; instead I will limit myself to work that deals with these previous developments.

What has been “generated” in terms of “research output” on these developments in parenting support in Flanders during the designated period is an expression of an interest in these developments and arises from an unease with the ways in which parenting support has been conceptualized and parenting support practices have predominantly been shaped. I cannot say when exactly my interest first manifested itself, or when I felt this unease. What can be identified is its first material traces—i.e., a very brief research proposal (one page) for developing a “booklet of examples,” submitted to the department of Child Policy of the Province of Vlaams-Brabant by the end of 2009, and a paper, written during the Christmas holidays of December 2009 and January 2010, for the annual conference of the Philosophy of Education Society of Great Britain (Ramaekers 2010). Regarding the research proposal I was prompted by someone working in the department of Child

Policy of the Province of Vlaams-Brabant to “try out something in parenting support” based on a paper I had given (in Dutch), earlier that year, for parenting support practitioners and policy makers—a paper in which I addressed the trend that parents today are expected to professionalize themselves to a certain extent. I wrote the paper for the PESGB conference basically because I wanted to express my first attempts at making sense of recent developments in that particular area of parenting support in Flanders; it was a way of making clear, also for myself, what I thought was at stake.

In this chapter, then, the reader will not find an account of a more or less linear and more or less delineated research process—that is, a research process in a rather traditional sense of the word: research interest, research question(s), hypothesis, collection of data, analysis of data, and discussion. There was no clear set of research questions at the beginning; there was no hypothesis to be tested, or expectations to be explored; there was no stage that could beforehand, or can now in retrospect, properly be called a stage in which “the data” were being “collected”; nor was there a stage that could beforehand, or can now in retrospect, properly be called a stage in which data were being interpreted and interpretations were being discussed. Instead, there were (and still are) questions that (emerged) during reading, discussing, and writing; there were (and are) hunches and at times a sense of a meaningful direction in which to proceed; there were books and accounts of practices I read, websites on parenting support I browsed through, discussions I held with a number of people (both from the academic world and from the field of practice and policy), and meetings with local coordinators of parenting support I attended; interspersed with this was the work I did with Judith Suissa on parenting and the current parenting discourse (see, e.g., Ramaekers and Suissa 2011, 2012), a period of thinking and collaborative writing that was both informed by the work I was doing on meeting places (see below, I will come back to this extensively) and that gave further substance to that work; there was continuous development of understanding, clearing up of misunderstandings, and generation of new understandings throughout the entire period, up until now, and most likely for some time to come.

There is no “methodology” here either, or at least not a section in which something that can be called a proper methodology is being presented, discussed, and justified. In fact, to rehearse the words used in a book written together with Judith Suissa, “[i]t is notoriously difficult for philosophers to talk of methodology in their work, and we share the distaste of many of our colleagues for the use of this term” (Ramaekers and Suissa 2012, p. xiii). The most clear account of what I do when “using” a “philosophical approach” to address an issue in education (i.e., for this chapter, particular developments in parenting support in Flanders) is embedded in Wittgenstein’s expression “supplying remarks on the natural history of human beings”—and I have put “using” and “philosophical approach” deliberately between inverted commas because I find that I am not “using” an “approach” (as if it were a tool to collect data and extract meanings from data), rather I am doing philosophy, or trying to do so. Here is what Wittgenstein says:

What we are supplying are really remarks on the natural history of human beings; we are not contributing curiosities however, but observations which no one has doubted, but which have escaped remark because they are always before our eyes. (Wittgenstein 1953, I, #415)

Now, granted, there is a context to what Wittgenstein wrote here, this context being his critique of doing philosophy in a particular way as well as his account of doing philosophy in some other way. There is no space to go into that here. But I do not think I am being unjust to what he says when I say that the sense I am after in this passage is the sense in which someone is trying to describe something as clearly as possible, using many examples, putting these examples side by side. And this, in turn, is being done in order to point out something, i.e., something that has become so natural to us that we no longer see it anymore, but, crucially, something that has a certain significance for the ways in which we see the others and the world and for the ways in which we (accordingly) act towards those others and the world. In this sense, “supplying remarks” can be taken to mean as introducing an interruption, or a stutter with respect to what seems to have become so natural for us, today, that we do not only no longer seem to notice it but even seem to elevate what we are doing as the (only) right thing to do, as the very truth about (in the case of this chapter) parenting and parenting support.

Neither will the reader of this chapter find a separate account of the role of interpretation in this research process. The interpretation at work in dealing with these developments regarding parenting support in Flanders cannot be confined to some particular stage or stages of the investigative process. Rather, it is there at every stage.

I will explicitly come back to the role of interpretation at the end of this chapter and try to describe how it figured in the investigation I have been undertaking during the designated period. Below I will first give an elaborate account of what I have been doing, as a philosopher of education, with particular developments in parenting support in Flanders. It is meant to show philosophy at work in this area. This account is based, for the most part, on the paper I wrote for the PESGB conference and the report of the exploration on informal meetings for parents and their children (a report I wrote together with Philippe Noens). (The full report, in Flemish, as well as the “booklet of examples” (see below for explanation), can be downloaded from <http://ppw.kuleuven.be/ecs/les/onderzoek-1/onderzoeksproject-opvoedingsondersteuning-in-ontmoeten> (text in Dutch). The paper can be downloaded from <http://www.philosophy-of-education.org/uploads/papers2010/Ramaekers.pdf>.) I will also draw on the book (esp. Chapter 1) I wrote with Judith Suissa (Ramaekers and Suissa 2012) to elaborate on some issues here and there during my account. I will start with sketching what I call the traditional picture of parenting support—a sketch that is in itself already the result of an interpretative effort. I will then go on offering an understanding of the prominence of meeting places for parents and their children as a particular shape of parenting support, which comes down to situating this against the background of the traditional picture of parenting support (i.e., indicating why it is noteworthy, what its features are, its promises, and what is implied in its central tenets). Following from that I will zoom into a particular project that ran in 2010; this project can at once be understood as an attempt at bringing out a particular understanding of (the nature of) meeting places and informal meetings between parents and an intervention in the then dominant way of understanding parenting support.

Parenting Support: The Traditional Picture

During the recent decade and a half, parenting has increasingly become an object of public debate. The many (popular and academic) books on parenting, information evenings for parents, television programs on parenting, discussions on websites and in newspapers on the latest parenting “issues,” etc., can all testify to this. At least part of this increasing attention is not unrelated to a growing need of parenting support, as is evidenced by a number of researches (cf., e.g., Snijders 2006; Snyers et al. 2001).¹ Today parenting support is a concept that is widely known and that covers a broad spectrum of practices, initiatives, and methods (cf. Poot 1992; Nys and vandemeulebroecke 2000; Vandemeulebroecke and Nys 2002). In welfare policy in Flanders parenting support is undeniably a priority.

Parenting support can be given many concrete shapes. In the 2007 Flemish parenting support decree, the emphasis is on parenting support in terms of offering parents information about issues related to child-rearing and on giving parents specific advice about certain topics (e.g., about developmental milestones, or about sleeping routines, or about setting boundaries). Concrete practices in parenting support hence usually take the form of formally organized meetings such as information evenings for parents, workshops, etc., in which the emphasis lies on passing on information to parents and on enriching parents’ knowledge on raising children and on training their parenting skills. Almost without exception, this is something that is done in the presence of or under the guidance of some expert in the area of parenting: a (developmental) psychologist, a social worker, an educational consultant, etc.—in short persons who are expected to have the appropriate knowledge of issues related to parenting and who are offering parents guidance or even somewhat correct parents’ behavior towards their children. We could call this a “traditional” conception of parenting support—whereby “traditional” here is not meant to be taken as “old fashioned” or “out dated” but rather as “most common” and “predominant.”

A number of things stand out in this traditional conception of parenting support.² First of all, what is presupposed here is that parenting cannot do without some form of expertise. The predominant conception of parenting support is based on the premise that parents are lacking (or are in need of) knowledge or have insufficiently developed skills as it comes to raising their children, and that, hence, this

¹ Given that this chapter is an account of research activities that cover the period from 2009 till the beginning of 2012, I will also limit myself to referencing literature that was actually referenced at the time, in relation to the specific cases that were under investigation. So I will not refer to the most recent literature in this account. The point of this chapter is not to bring out particular points on parenting and parenting support today, but to try to deliver an account of the interpretive work involved when addressing particular developments in parenting support at a particular time in a particular country.

² See Ramaekers and Suissa 2012 for a fully developed account of this. The issues addressed in this chapter formed an important precursor to and became intertwined with the work I have been doing on parenting together with Judith Suissa.

knowledge needs to be imparted on them or these skills need to be taught them. The corollary of this, obviously, is that child-rearing is something for which exists a body of knowledge, that this in turn can be translated in terms of skills, and that parents can be trained in using these skills. In the predominant conception of parenting support, parents are seen as needing to professionalize themselves to a certain extent. They are called upon (summoned, expected) to actively engage with the way they are bringing up their children, in particular to prepare themselves as good as possible for what is to come, for example, by seeking out for information by reading books or going to information evenings or to attend parenting classes (cf. Lambeir and Ramaekers 2007). In short, the orientation here is one towards knowledge: parents are expected to behave as learning subjects, continually keeping themselves up to date with the latest scientific developments regarding, e.g., issues related to child development, potential disorders, etc. Good parenting thus is equaled to acting expertly, that is, to acting on the basis of scientific research. (see Ramaekers and Suissa 2012, Chapter 1, for a more fully developed account of what we there call the scientization of parenting.)

Within this picture, child-rearing is understood narrowly in terms of the things parents consciously and intentionally “do” in order to reach certain targets—something that is nicely captured by the English verb “to parent.” Raising children becomes a “task” (sic: “parenting”), whereby parents come to see themselves in a functional role. “[T]here is little notion,” Suissa argues, “of parents as people, of the parent-child relationship as constantly developing, in flux and challenging, intersecting with others and other roles” (Suissa 2006, p. 72). What is closely connected to this is the danger that child-rearing is being confined to a sphere of prevention and remediation. Within this knowledge-focused conception of parenting and parenting support, attention is almost invariably drawn to potentially problematical aspects of raising children, on potential risks and dangers on the route to adulthood (cf. Ramaekers 2009). And a parent’s “task” is understood in terms of ensuring that her child hits the necessary developmental milestone, of preventing the occurrence of potential problems and disorders by offering the appropriate stimulating and well-structured environment, etc.

Next to this focus on professionalization, knowledge, and expertise, what also stands out in the predominant picture of parenting support is the very language with which this is being conceptualized, i.e., the languages of various disciplines of psychology (developmental psychology, behavioral psychology, neuropsychology). Much of the jargon we are so familiar with today in the context of parenting support is drawn from these disciplines. Characteristic expressions here are, among others, “offering emotional support,” “enhancing well-being” (of parents and children), “accommodating children’s needs,” “creating stimulating contexts,” “enabling interactions” between parents and their children, “experimenting with taking distance from parents,” “ensuring one’s child’s attachment” or “enabling secure attachment,” etc.—and these are expressions, crucially, that are being used, in a self-evident and unproblematic way in parenting columns in magazines, in announcements of information evenings, on websites for parents, etc., as if they were an obvious part of our everyday language (see Ramaekers and Suissa 2012, esp. Chapter 1). These expressions may sound rather “neutral”

(i.e., because they sound “scientific” and (thus) “objective”), but that is only apparently so. That is, the very fact that this jargon has become an obvious part of our everyday language is far from neutral since it then also shapes our understanding of child-rearing and the parent–child relationship. The self-evident usage of the languages of the disciplines of psychology creates a particular way of looking at children and parents. These languages offer us a lens through which child-rearing and the parent–child relationship come to appear in a very particular way; they make us see (make visible/draw attention to) particular things, aspects, and elements and not others; and they accordingly direct the ways in which we act.

We could call this phenomenon a psychologization of child-rearing and the parent–child relationship. According to De Vos this has to do with the fact that the discourse of psychology, he argues, “has invaded in an unprecedented way companies, advertising, culture, politics, up to our social and family life” (2012, p. 1). The “psy-discourses,” as he calls them, “are becoming increasingly hegemonic as they furnish the human being with particular signifiers and particular discursive schemes (assigning particular positions) with which to look upon itself and its world” (ibid., p. 2). De Vos sees psychologization as all-encompassing, in the sense that, as he puts it, “[T]oday, more than ever, our understanding of ourselves, others and the world comes in psychological terms” (ibid.). And, importantly, he argues, it is not just about there being ever more psychological language in ordinary discourse but rather about psychology altering the very discursive positions of today’s subjects (cf. ibid., p. 9). It is exactly this what we mean here when saying that the languages of psychology position parents in very particular ways in relation to their children and themselves as parents, and that they make parents look at their children and themselves through a specific lens (i.e., a (behavioral, developmental, neuro-) psychological one).

The sense of expressions such as the ones mentioned above not being neutral is heightened by the realization that they assume a particular logic, i.e., a causal logic, as well as a particular kind of goal. And both logic and goal are taken for granted and imported into these very expressions themselves. As argued elsewhere, “[th]e way to understand child-rearing is in terms of a linear-developmental story, in which certain outcomes are implicitly posited as the desirable [...] end-point, and anything parents do along the way is understood as effecting the next step and, crucially, as taking us one step closer to reaching this end-point” (Ramaekers and Suissa 2012, p. 14). Whatever it is parents do, this is situated somewhere on the developmental line between birth and the presupposed outcome, which today is some version of the emotionally stable child, or happy child, or confident child, or emotionally literate child. Child-rearing thus tends to be seen only in terms of the one-to-one interaction between parent and child, whereby the parent’s primordial task is to ensure her child’s proper developmental process, to support, and to stimulate this process as good as possible (cf. Ramaekers and Suissa 2012, esp. Chapter 1). At the same time the prospect of the “right” (kind of) action is underscored.

Taken together, this professionalization and psychologization of child-rearing and the parent–child relationship strongly encourage a particular kind of attitude on

the part of parents: an attitude of continuous alertness for possible opportunities, risks, and shortcomings in their children’s development (see Masschelein 2008). In order to be a “good” parent, one has to be “attentive to” one’s child’s developmental and other needs, being attentive to developmental and other opportunities. This is something that is expected especially in parents of children age 0–3, since this is, as almost all handbooks, guides, websites, etc., for parents say, and as is recently repeatedly being stressed within the context of neuropsychological research, the crucial age in terms of children’s development. Parents are increasingly encouraged “to see the technological capacities of their offspring at ever earlier ages, contributing to the compression of developmental time in the rush to competence and ‘mastery’” (Burman 2008, p. 43) (cf. also Ramaekers and Suissa 2012, esp. Chapter 1).

What tends to be lost because of this predominant picture of child-rearing and the parent–child relationship, or at least, what tends to be relegated to the background because of predominant ways of conceptualizing these is an understanding of child-rearing and the parent–child relationship that goes beyond the one-to-one interaction scheme between parent and child, an understanding in which child-rearing is (also) conceived of as introducing children into a common world, as having to do with values and norms that are being passed on to children, or better perhaps into which children are inevitably being initiated. What tends to be lost here as well is some idea of parents not only (or not just) having a functional role but of parents also being representatives of some world that they are standing for something and that they, accordingly, also have to pass on that world to their children. And connected to this, what tends to be lost is the possibility of understanding the idea of parental responsibility in ways that go beyond an understanding of it in terms of being responsible for the next developmental milestone, or for managing and balancing needs and opportunities, or for successfully performing a set of “parenting” tasks. When opening up to this broader conception of initiation into a world, other questions and issues come into the picture. What is worthwhile to pass on to our children, to the next generation? What do we want to initiate this next generation into? What place do we envision the next generation to take and to give shape for itself? Given the fact that we all inhabit the same world, how do we organize a living together of the old and the new generations? It is questions such as these—questions that, at least partly, draw on another language—that are not (or no longer) asked within the predominant conceptualization of child-rearing and the parent–child relationship.

Informal Meetings Between Parents as a Form of Parenting Support: More of the Same or Something Different Altogether?

The idea of informal meetings between parents as a form of parenting support has increasingly gained attention in the context of welfare policy and practices in Flanders. And at the outset at least, this idea promised to introduce a somewhat

different take on parenting and parenting support, precisely because the emphasis is said to lie on informal aspects (i.e., parents among one another, in casual dealings) of the (potentially) supportive meeting as against the formalized nature of predominant practices (i.e., formally organized meetings such as information evenings, parenting classes, almost invariably in the presence, or under the guidance, of some “expert”). This idea of informal meetings between parents was explicitly inscribed—albeit in one sentence only—into the 2007 Flemish decree on parenting support.

Recently, research has shown that there is a growing interest, among young parents, for easy accessible, informal forms of parenting support (cf. Snyers et al. 2001; Vermulst 2002). And research by Vandenbroeck et al. (2007) and Buysse (2008) has shown that informal social support, i.e., support from friends and relatives, is experienced by parents as supportive for their parenting. In Buysse’s survey, e.g., it has become clear “that there is in particular one source of support that seems to be experienced as supportive by all parents in all [focus] groups: the social network” (Buysse 2008, my translation). It is no surprise then that, in Flanders, many initiatives were taken that in one way or another tried to work on strengthening parent’s social networks and that focused on stimulating informal meetings among parents and others involved in raising children as a form of parenting support. The most clear-cut cases here are probably the so-called meeting places for parents and their children, such as “De Speelbrug” in Antwerp, “Baboes in Brussels,” and “SpeelOdroom” in Leuven. Meeting places for parents and their children have existed for a long time already in other countries (e.g., the “Maison Vertes” in France and the “spazio insieme” in Italy), and these have been an important source of inspiration for the Belgian cases (see, e.g., Vandenbroeck et al. 2007, 2009). Meeting places usually are houses—sometimes called “open houses”—that are reorganized in such a way as to allow a number of parents and their children to come by and spend some time there. (I will come back to this later.) One other example of a practice that explicitly focuses on informal meetings among parents is “BijtankenOverOpvoeding@Home” organized by the Gezinsbond (cf. http://www.gezinsbond.be/index.php?option=com_content&view=category&id=197&layout=blog&Itemid=403, website in Dutch). Other examples are the many kinds of mother groups, baby cafés, etc. All of these initiatives and practices are forms of parenting support that are organized as an alternative to the more formal kinds of support for parents (c.q. mostly professional advice in institutionalized settings) and can be understood as a response to parents’ expressed need for informal support and networks, as mentioned above. They can be seen as offering parent an opportunity to share their concerns and worries with like-minded people (i.e., other parents, more or less sharing the same experiences) instead of talking about (bringing up) their children with professionals.

Notwithstanding the fact that this does indeed sound promising in terms of being an alternative to formalized practices, there are some issues for concern here as well. In general, these issues have to do with the (perceived, projected, etc.) need for expertise in a meeting place and can most clearly be brought out by going into how

the role of some kind of “facilitator” or “volunteer” or “host” or “professional,” who is recommended to be present in the meeting place, is being conceived. Opinions about the role of this person differ, but it is generally agreed that someone like this person should be present. A more or less minimalistic or soft account of this role is offered in the working paper by the network of meeting places for children and parents (cf. http://www.expo.be/sites/default/files/kennisdocument/discussietekst_ontmoetingsplaatsen_voor_kinderen_en_ouders.pdf, in Dutch). It can be called “minimalistic” or “soft” because the focus is not on the professional’s expertise (in the sense of what she should “know in order to”) but on her “way of being” in the particular setting: her friendly or kindly nature and her ability to heartily welcome parents and children, to listen attentively to the parents, and children, to be there in a nonjudgmental way such that the “free confrontation” between parents and their ideas about raising children is facilitated—a number of characteristics that are thematically expressed in the concept of “reflexive professionalism” (Ibid., p. 4, my translation). This professional does not take over child-rearing from the parents, but only “facilitates” and “invites” parents to an encounter with other parents and to a reflection on their own ideas on raising children.

A more outspoken account of the role of the professional, however, can be found in a report by the Flemish government’s expert center for parenting support (EXPOO), in which it is argued that the presence of such a professional or volunteer guarantees that a meeting place is more than a place where parents meet informally, such as a park or some other kind of public space (cf. EXPOO 2010, p. 8). Though one is not very specific about what exactly the professional is doing here, it is clear that she “does” something to the place such that it does more than offering opportunities for occasional and informal meetings, but can become a place for a more formal kind of parenting support (Ibid.). It is not unexpected, then, to also see the word “competences” showing up in relation to the professional’s role (Ibid. pp. 12ff). The shift in language is telling: it is a shift from the rather general concept of professionalism to the (supposed) clarity of the concept of competences. Competences can be operationalized into specific forms of behavior and are, thus, measurable. Professionals, also, can be trained to develop these competences. A further implication is that together with the language of competences, something like the “correct” way of acting comes into view. Professionals with the right competences can ensure that what is at stake in a meeting place is enacted in the “right” way.

It is interesting to see how this shift from a more general notion of “reflexive professionalism” to a notion of the professional with certain competences is accompanied by a shift in how the meeting places themselves have come to be conceptualized. Whereas in the working paper referred to above, one speaks of meeting places as having certain “functions,” the latter report speaks in terms of the “goals” of meeting places. Again, the shift in language is not neutral: “functions” refer to possibilities, without immediately implying what should be done or what is desirable or advisable to do. “Goals” on the other hand entail a clear indication of what is desirable or advisable to do.

Granted, the latter document explicitly tries to distinguish the role of the professional in meeting places from the role of an “expert.” Nevertheless, given the shifts in language indicated it is hard not to conceive of the professional here as some kind of expert, as someone who knows what is going on and what (preferably) should be done. In as far as the professional is understood as someone who is, in a figurative way of speaking, “transforming” a place into a meeting place (i.e., a place where a particular kind of meetings is expected to take place), this place then inevitably becomes a learning environment for parents. It is hard to resist, then, seeing parents (or at least relating to them) as lacking something (the “right” way of interacting with their children, the necessary skills for talking to their children, the appropriate kind of receptiveness, or whatever) and hence to step into a relationship with them from a deficit approach.³

What this eventually comes down to is that the very encounter itself between parents here has come to be of minor importance since, despite original intentions, the emphasis still lies on the content around which the meeting is organized, i.e., possible tips and tricks, relevant facts, things parents “should know in order to,” etc., instead of on the meeting itself. That parents enter into an encounter with other parents is not valued as such, but only because it is useful/functional for meeting other targets/for achieving other aims—targets/aims that have been externally determined.

The Project “Parenting Support Through Informal Meetings”: An Attempt to Conceptualize an Alternative⁴

In January 2010 a small research project called “parenting support through informal meetings” was funded by the province of Vlaams-Brabant (a province in the Flemish part of Belgium). In this project we wanted to advance a conceptualization of parenting support that is different from the predominant conceptualization of it precisely by explicitly focusing on informal meetings between parents. Our interest was in the informal meetings or encounters themselves, specifically in what could possibly happen in these encounters between parents (as “equals”). By doing so we connected our project explicitly to the survey conducted by Buisse (cf. *supra*) and took seriously its main conclusion, i.e., that the very encounter itself is something that is experienced by parents as being supportive for their parenting.

³ A recent qualitative investigation of a practice that has many affinities with this idea of meeting places (called “BijtankenOverOpvoeding@Home”) shows how difficult it is to give substance to the role of the professional and at the same time to escape from the presuppositions of the dominant discourse. In fact, the analysis shows that despite good intentions, the practice still is driven by the very logic of professionalization and psychologization that is so characteristic of the current dominant conceptualization of parenting and parenting support (cf. Vandezande 2012).

⁴ The project was carried out in collaboration with Philippe Noens, project assistant.

Focusing explicitly on informal meetings between parents as a form of parenting support opens up pathways for conceiving child-rearing and parenting support differently than in terms of its predominant understanding and offers possibilities for other forms of parenting support. First, it allows to leave child-rearing in the hands of the parents themselves. In the predominant understanding of it, the danger is that raising one's children is—not literally speaking but in a very particular sense of the word—"taken out of" the hands of parents, "taken over" by something or someone else (i.e., the expert discourse or "professionals"). Focusing on informal meeting among parents is a way of countering this. Parenting support can then also be what it is, conceptually, supposed to be: a form of support instead of something that leans against or even just becomes a form of formal assistance. At the same time parenting support can be safeguarded from being a vehicle to convey, under the disguise of labels such as "scientifically proven," a normative picture of what good parenting is.

Second, the focus on informal meetings allows to put parenting on the agenda as an ordinary human activity (instead of the specialized, knowledge-based undertaking that it is depicted to be in the media, popular literature, etc.). Informal meetings between parents open up the possibility of an ordinary (non-problematized) exchange between parents of the day-to-day things that (can) happen in family life. Undeniably family life can be very diverse and different among parents, but there is bound to be some overlap in issues, concerns, questions, and insecurities—on bedtime, e.g., or on the many interrupted nights, or on difficult mealtimes, or on how one's oldest son or daughter is behaving towards the new baby, or on how one's son or daughter is using his or her mobile phone, or etc.—all of which can be raised/asked in a non-problematized setting of parents among one another. This is not just a setting that offers parents an outlet (in some kind of psychological sense of the word, as in "relief"), though, to be sure, it can function as such. (It is in finding acknowledgment and in experiencing recognition that parents discover a form of support, as comes out in the research report by Buisse (cf. supra).) Allowing for these "ordinary" questions and concerns to be raised is also opening up the possibility for parents to express what is important for them in their relation to their children, what is important for them (values, norms) to pass on to their children, and what they judge to be of lesser importance and to find out what the differences are with other parents. What is reaffirmed here is the idea that the parent-child relationship is infused with values and inherently bound up with the dynamic context of any individual parent and not just a matter of "doing" the "right" things. Informal meetings between parents can thus be a space that is not colonized (or at least not as expressly colonized) by an expert discourse⁵—a space that allows "for a conversation on what kinds of interaction are most valuable in a parent-child relationship, to whom and why" (Ramaekers and Suissa 2012, p. 116). In these informal meetings raising children can become the subject of a moral and

⁵ See Ramaekers and Suissa 2012, esp. Chapter 2, for a more developed discussion of what is there called the third-person perspective of scientific accounts of good parenting.

cultural conversation instead of being approached as an object of technical deliberations.

Third, it allows to see raising children in a broader perspective. In the current predominant discourse, child-rearing has been situated within (narrowed down to) the one-to-one relationship between parent (mostly the mother) and child, in which anything parents (have to) do is understood as effecting the next step along the way to some desirable “outcome” (usually taken to be some version of the emotionally stable child, the safely attached child, etc.). What is left out here is a broader, societal perspective—the idea that raising children is something that is being done in a particular cultural and historical setting, in which particular values and norms hold sway—and the idea that raising children is actually constituted by a relationship between generations (and not just between one parent, teacher, educator, and some child), a relationship in which the preeminent questions have to do with what kind of values we want to pass on to the next generation, what kind of world we want to pass on to our children.

The concrete aim of the project was to develop what we call a booklet of examples of practices of parenting support (in the broad sense that we tried to advance) that could serve as a source of inspiration for all those involved in supporting parents.⁶ In order to develop this booklet, we decided to work with a think tank of relevant actors—who, in this case, were the local coordinators of parenting support on the level of the municipality. We were able to involve ten local coordinators of municipalities in the province of Vlaams-Brabant.⁷ During the term of the project, the think tank met on a monthly basis. The tasks set to this think tank were to make an inventory of all parenting support activities in each of the municipalities, to have a discussion on the rough outline of the concept of meeting/encounter we had in mind and with which we started this project (see below, I will get back to this), to discuss particular examples of practices in which encounters between parents are the focus of attention and to formulate fitting descriptions of these practices, and to contribute to selecting the practices for the booklet. In the booklet each example is presented by using a similar format: some pictures, a few testimonies from parents and/or children who were present during the activity or meeting, a brief description of the organization involved and the reasons for doing this or that activity of parenting support, and a description of the particular example that specifically tried to bring out the centrality of the encounter between parents (and children). The latter descriptions were presented in a colored frame, to draw attention to the text. Three different colors were used, but it was not explicitly explained why; rather, in the introduction to the booklet, a series of three different kinds of meetings/encounters was mentioned, more or less in passing, with each kind printed in a different color—this color referring to the colors used in the colored frames. On the basis of the discussions in the think tank, we came to

⁶ See <https://ppw.kuleuven.be/ecs/les/bestanden/Tekstbestanden/onderzoeksteksten/bronnenboek.pdf> for the examples, in Dutch.

⁷ For more information about Vlaams-Brabant, please visit <http://www.vlaamsbrabant.be/en/index.jsp>

distinguish the following three kinds of informal meetings: meetings between parents with the specific intention to provide time and space for talking about raising children, meetings between parents (and their children) in a context of child-rearing, and meetings between parents that at first sight do not have anything to do with child-rearing but that still are, in an important sense, supportive for parents in raising their children.

As said, we started this project having in mind a particular concept or conceptual framework of “meetings” or “encounters”—a concept we offered for discussion to the members of the think tank and which we tried to develop further during the term of the project. This conceptual framework was to a certain extent the occasion for this project, and at the same time it was also continuously at stake during the project (in the sense that this concept was open for criticisms and hence was continuously being reshaped during the project). Here we describe the most important elements of this conceptual framework—on the understanding that this is already a description that takes into account the critical remarks raised during the discussions of the think tank.

“Some Kind of Social Environment/Space”

As already indicated above, one of the interesting conclusions in the survey by Buysse was that parents themselves reported a lack of informal networks as well as a wish to have the opportunity to share their concerns and worries with like-minded people (i.e., other parents, more or less sharing the same experiences) instead of talking about (bringing up) their children with professionals. Buysse reports that what comes out in the parents’ stories as some kind of ideal scenario of parenting support is “a kind of social environment/space with shared responsibilities for raising children, lots of interaction and opportunities of finding support with one another” (Buysse 2008, my translation). Parents thus indicate to feel a need to have informal forms of contact with other parents, in which they can exchange tips, offer feedback to one another, and experience recognition and acknowledgment (cf. *ibid.*).

This idea/concept of “some kind of social space/environment” is an interesting and fruitful one in the context of the project that is being described here since it allows us to develop what is meant by informal meetings as a form of parenting support and to elaborate what these meetings can then entail. The concept of environment/space is a broad one, i.e., it is not limiting with regard to a particular kind of setting. It implies an openness with regard to the particular place these informal meetings can be held in as well as an openness with regard to the way in which these meetings should be held. This social environment/space can be a concrete place, i.e., a real (material) place, but it can also be a virtual place; and though it can be a structurally permanent place (e.g., a meeting place in a community center), it does not have to be such a place, since it can be a place that only temporarily functions as such a social space/environment; furthermore it does not have to be a space that is monitored by some expert or professional, though

it can, of course, be such a space. We took the focus on informal meetings among parents quite literally in this project; that is, we were not concerned with (or intended to develop) some kind of particular place; our concern was with the very informal meetings themselves, irrespective of the place which these are supposed to be held in, irrespective even of the fact whether or not these meetings are explicitly focused on (topics concerning) child-rearing, and irrespective of the fact whether or not there is someone present monitoring/supervising the meetings.

An “Unbounded”/“Unlimited” Environment/Space

If we want to take seriously the importance of informal, social support, then it is crucial that this social space is not already determined, i.e., bounded or limited by some particular conception of what good parenting is or, more generally speaking, not bounded or limited in a moral sense of the word or not bounded or limited by an idea of what is supposed to be happening in these meetings, or what is supposed to be “discussed,” but is, in a very broad sense, “unbounded.” When the space is bounded/limited, what is of importance (the diverse meanings that parents can attach to child-rearing) is already defined in advance. There is no room, or at least only limited room, for parents to define for themselves what is important for them in child-rearing, in their relationship with their children. In an important sense, parents then cannot express their own voice. Their voices are only heard, hence only count, within the contours of the framework that determines the nature of the encounter. On the other hand, in a space that is unbounded/unlimited (or in a space that one is willing to see as unbounded/unlimited), parents do in fact have the opportunity to give shape to this space and its contents themselves (instead of having to meet up with expectations regarding to what is “appropriate” to say and do within this space).

We can usefully link this up with what is already said above, about recent initiatives in this area not being able to escape the predominant discourse. An interesting challenge for recent initiatives and practices in which some idea of informal meetings is propagated exactly lies in trying to take a distance from this predominant discourse, which in the context under discussion here means trying to ensure that spaces that are offered to parents are not limited spaces, i.e., spaces in which the language spoken (and expected to be spoken) is the language of the “official” discourse on what constitutes good parenting and in which parents are incited to do exactly those kinds of things that are deemed important in the predominant discourse (i.e., stimulating one’s child’s development, doing whatever it is that is said to enhance one’s child’s self-esteem or to ensure one’s child’s safe attachment or to make sure the necessary neural connections are formed). In the words used above, it is trying to ensure that the idea of informal meetings between parents does not lead to a simple reaffirmation of the idea of child-rearing as something that only takes place within the one-to-one interactions between parent and child. Such a version of informal meetings, narrowed down to the predominant discourse, is, in the end, nothing more than yet another translation of what parents

do in terms of a “learning activity”: parents are brought together in (so-called) informal meetings so that they can learn about (issues regarding) child-rearing; informal meetings thus are taken to be “educative” for parents. And at the same time, such meetings come to form a framework within which parents can then be “evaluated.”

Informal Meetings as a Space in Which Child-rearing Can Be Given a Shape

Now, to be sure, we do not want to deny that parents can “learn” something in these informal meetings. But the problem with seeing informal meetings in terms of a learning activity is that within this conceptualization parents are being addressed as subjects that are lacking something and that have some kind of deficit—a deficit that needs expertise in order to solve it. As said, informal meetings then are in danger of becoming bounded/limited places or spaces. Put differently, places or spaces where parents meet one another are in danger then of becoming (what we would like to call) an already existing community (i.e., with more or less established rules and criteria, values, and norms), a community in which a particular concept of good parenting holds sway and in which it is already determined what counts as an issue of child-rearing. Encouraging parents to engage in informal meetings of this kind then implies that parents are primarily being shaped by the community in which they enter.

As said, we do not want to deny, or exclude, that parents can learn anything about raising children in informal meetings with other parents. But we are shifting the focus here to conceptualizing informal meetings between parents as places or spaces within which child-rearing can be given a shape, within which the very criteria about what constitutes (good) parenting can be expressed, hence (re)affirmed. Put differently, it is in the very encounter itself that the community and, crucially, what counts, what is of importance, are created. Drawing on Cavell (1979), here parents can be said to have a voice, in a full sense of the word. (And, in fact, this is precisely one way in which to conceive the idea of leaving parenting in the hands of the parents themselves.) Having a voice is not merely expressing one’s personal opinions, but is the active revelation of the conditions of intelligibility that the individual who is speaking takes to be authoritative. Informal meetings can then be understood not as an occasion for parents to “learn” from other parents but as places or spaces where parents are trying to find out who is willing to share their voice and also, importantly, to find out which voice is theirs. Having a voice, in this sense, is tantamount to seeking a community, of creating a public. This also implies that when having “found” a community (having heard one’s voice), an answer is expected to the question whether or not one wants to assume responsibility for this community (or for this voice), that is, for the claims to the world that are being voiced by this community. What happens in this kind of encounter is not “learning” in order to be able to “interact” in ways “better” than before (though, again, this need not be excluded). Rather, in this kind of encounter what comes to light fully is the idea of child-rearing as that human activity that is infused, to its very heart, with values and interpretation.

Informal Meetings as a Form of Parenting Support: Merging the Pedagogical and the Social

When conceiving informal meetings among parents in the way as described here, it can also be seen that a pedagogical reading of such meetings can no longer be (sharply) distinguished from a reading that emphasizes its social function. That is, in this idea of informal meetings, child-rearing and some idea of living together come together. Child-rearing is no longer that activity that takes place within the confines of a one-to-one relationship between parent and child, but immediately and inherently pertains to the question of living together in a community (parents with children, parents and other parents, families, the old and the new generations, etc.). Child-rearing is then freed from the pressures of a one-sided (psychologized and professionalized) discourse and can regain a sense of openness, i.e., as that human activity in which the idea of seeking (and working on) a place for the new generation in a community takes center stage.

Looking Back: The Role of Interpretation

In this chapter I deliberately did not want to include a section called “results” or “impact of the research.” For one thing, this would go against what I said in the introduction to this chapter, i.e., that interpretation cannot be confined to some particular stage, but that it is there at every stage. In this final section I will explicitly develop what I mean by this, on a more theoretical level by referring to how interpretation has been working in my investigations.

What I am trying to convey here is actually quite close to (or closely modeled on) the way Gadamer, while elaborating how Heidegger has described the hermeneutical circle in *Being and Time*, is rendering understanding in terms of a working out of one’s fore-structures or fore-conceptions (2004/1965, pp. 269ff): “. . . interpretation begins with fore-conceptions that are replaced by more suitable ones. This constant process of new projection constitutes the movement of understanding and interpretation.” It would go beyond the scope of this chapter to fully develop a reading of Gadamer’s hermeneutic. Here I want to emphasize two elements of how Gadamer describes the way interpretive understanding is achieved.

First, when trying to understand and interpret something—in Gadamer’s writings this is mostly a text; in the research described above, this is the more lucid “thing” called parenting and parenting support—we never approach this something in an “objective” way, if that is taken to mean “detached,” or “neutral,” or “unbiased,” but we always approach it with a particular set of meanings, some of which we may be conscious of and some of which we may not (yet) be aware of. Gadamer calls this set of meanings our “pre-understanding” or also our “prejudices.” “Prejudice” should not be taken in a negative sense (as in being judgmental or being prejudiced about something), but in a more literal sense, as a preliminary judgment, “a judgment that is

rendered before all elements that determine a situation have been finally examined” (Ibid., p. 273).

Second, this set of meanings or prejudices is not just a “perspective” one can take, or a “position” one can assume, but is something that has shaped the interpreter’s take on the world in a very deep sense. The concepts “perspective” and “position” imply too loose a sense of what an interpreter’s pre-understanding is. For pedagogical purposes Gadamer’s concept of prejudices or pre-understanding is sometimes explained using the example of a set of glasses the interpreter is wearing (as a concrete instance of what a “perspective” is), the suggestion being that the interpreter can only see what she sees because of the set of glasses she is wearing; without this set (or with a different set), she would be seeing something else, or perhaps nothing. What this misses, however, is the sense that one’s pre-understanding is not something that one has as the result of an act of free will and is not something that can be changed at will—as if it is “this” or “that” perspective one can take at will. Put differently and in a positive way, what the interpreter (subjectively) sees or intuits or understands is inextricably intertwined with the intersubjectively upheld meanings of the community of competent language users the interpreter has grown into over the course of her life. These intersubjectively upheld meanings make up what the world is for us and “determine” what is true and false, beautiful and ugly, good and bad, appropriate and inappropriate, just and unjust, green or red, round or square, etc. Gadamer refers to this as the tradition one is situated into, the tradition one has grown into. To be sure, this does not mean that the subject growing into a tradition can only repeat or reproduce what the tradition is passing on to her. Gadamer explicitly, and rightfully so, emphasizes an element of active involvement on the part of the subject. “Even the most genuine and pure tradition does not persist because of the inertia of what once existed. It needs to be affirmed, embraced, cultivated. It is, essentially, preservation, and it is active in all historical change” (Ibid., p. 282). I take this to mean that the set of pre-understandings that the interpreter “uses” to approach something is passed on by the tradition she finds herself in, shaping her in fundamental ways, and is simultaneously also “constructed” by the interpreter on the basis of the events of her individual life course.

To put this more in terms of how the editors of this book have put it, when I say that in the above investigations interpretation is there at every stage, I mean this to be taken in the first and third sense of the four senses of interpretation spelled out by the editors of this collection—interpretation “as understandings which are brought to the research” and as “our attempts to analyse, to make sense of, or to give meaning to the evidence, argument, scholarly work, and other material that we collect in the process of enquiry.” To be sure (and as should be clear on the basis of what I have described above), I also worked with and on interpretations by other people—the second sense pointed out by the editors, i.e., interpretations as the material someone is working on. What I want to bring out when saying that I find that in my investigation interpretation is there at every stage is an intertwined version of the first and third of these senses. If interpretation is the set of understandings one brings to the research (the first sense), then I am inclined to

emphasize in this that this set of understandings is there *all the time, throughout the research*. So it would be a bit misleading to say that my investigation—the “research”—set off “from” a deliberative interpretation (as understandings that I brought to the research). Rather, my very interpretation (as understandings) itself of the policy documents, texts, and papers on parenting support and meeting places is as much part of the investigative process as any step I took after my initial account of the issues at hand. These understandings are with me all the time and continuously “shape” my interpretations; or perhaps more correctly, my interpretations are always also expressions of my understandings in the sense meant here. It will be clear then that there is no sharp distinction with the third sense pointed out. In connecting pieces, trying to make something clear, or to point out what may be interesting, trying to make a case, etc., interpretation (as understandings that I bring to the research) is presupposed and at the same time a particular understanding (or interpretation) is expressed (shown to some reader). An interpretation is, then, perhaps not so much “what has come out of the research” as rather “the coming about of the argument” itself. There is, thus, no sharp distinction between understanding and interpretation. Some form of understanding is necessary in order to be able to interpret something; an interpretation can lead to further understanding, and interpretation itself is to be seen as a manifestation of understanding.

This can be easily related to the account of parenting support I’ve given above. It should be clear by now that, for instance, the writing up of the section “[Parenting support: The traditional picture](#)” (cf. above) is not a “neutral” description of an objective state of affairs (whatever that may mean), or a literal account of what I “found” “out there.” Rather, the very writing up of that section is tantamount to developing an elaborate understanding or interpretation of (what I take to be) the traditional picture of parenting support; and the text presented is the (tentative) result of my fore-conceptions being worked out in confrontation with the material at hand (books, policy documents, conversations, etc.). As a researcher (in this case a philosopher of education), I did not come to this area (of parenting and parenting support) “tabula rasa,” but inevitably so with particular understandings (of raising children, education, parenting, parenting support, etc.), “prejudices” that made me “see” particular things and bring these together in particular ways, that enabled me to make connections and to investigate these connections, etc. And, in close connection to what Gadamer says, what “followed” from these research activities is not something radically different from my “initial” understanding, but something that is at once connected to it and an elaboration of it, an elaborate understanding, or more developed understanding, or at least an expressed understanding. Or, put differently, by the ways in which things were being connected and put together, the writing up of this “traditional picture” became an interpretation.

This interpretation can perhaps helpfully be seen in terms of a “co-construction.” On the one hand, inevitably, the culture I grew up with passed on to me a set of meanings, ways to see the world, hence shaping the ways with which I came to understand myself (as a child of particular parents, as a brother to someone else, as a student of education and philosophy, as a doctoral researcher, as a father, etc.). On the other hand, this process of passing on is not, as said, a process of

conservative reproduction; rather, the set of meanings passed on is simultaneously shaped by my experiences as a child of particular parents, as a brother to someone else, as a student of education and philosophy, as a doctoral researcher, as a father, etc. And these experiences were of a kind that at some point an unease gradually made itself felt, a sense of something not being “right”; a sense that the current account of parenting support is perhaps only part of the story; a sense that the human subject (c.q. the parent), as it is made to figure in that account, is depicted in a way that can be contested; a sense that parents are addressed in ways that do not do justice to them as ethical persons; etc. And clearly, since this interpretation/particular understanding (of what I read, hear, come across) comes “from somewhere,” the radical consequence is that someone else’s account of the same issues could have been different from mine. Doing philosophy is, in an important sense, always personal; the philosophical writing that is being done is a kind of writing that always already involves one as a person. What Annette Baier said about doing moral philosophy applies well here: “Like everyone else, I come to moral philosophy with my own prejudgments concerning what is fair and what is unfair, what is cruel and what is humane, what is arrogant, what servile, and what properly self-assertive” (Baier 1995, p. vii). To be sure, this is not something “only” personal (if by this one means “subjectivist”) but, importantly, is at once shared and personally expressed.

It should also be clear by now why this chapter does not have a separate section titled “results” (or something of the sort). Including such a section would imply a kind of closure of the kind of research undertaken here that I do not think is possible. Such a section would suggest that it would be possible to consider the issues under investigation as being “addressed” (be it successfully or not), that (more or less clear) answers could now be offered, and that the impact of the research could be assessed now. The sense of “results” and “impact” that is operative in this way is a rather straightforward empirical sense. It invites questions such as: “Have parenting support practices changed?” (Answer: Well, some have, but most haven’t.) “Have conceptions of the role of professional in meeting places changed and given occasion to alternative practical manifestations of her role?” (Answer: Hardly, I would be inclined to say at this point in time.) “Has policy on parenting support been influenced by the “outcomes” (read: interpretations) of these investigations?” (Answer: Well, some words, such as “meetings” and “meeting places,” are clearly more prominent in recent policy documents, but the context in which these words are used is significantly different from what we have been trying to bring out in our research.) Though important in its own right, this is not the kind of “impact” I have in mind. Given how I have tried to explicate what understanding and interpretation is, the only reasonable thing I can say here is that I see the “impact” of this research in terms of a contribution to the ongoing interpretation of what parenting and parenting support is. Or in words closer to Gadamer’s, the investigations described are ways of affirming, embracing, cultivating, and preserving particular fragments of the tradition I find myself interwoven with. In this sense they are small additions to the ongoing process of trying to understand and trying to get a grip of parenting and parenting support—it is the “productive element”

(Ibid., p. 296) Gadamer sees as inherently connected to the act of understanding and interpreting. And as such, they are open to further acts of (not) affirming, (not) embracing, (not) cultivating, and (not) preserving; they are invitations to another's further interpretation.

In a very practical sense, this idea of contribution to an ongoing interpretation has been enacted in the project described above. As indicated, from the very beginning, we involved a number of local coordinators of parenting support into a think tank. This allowed us to present our (then rather rudimentary) ideas about different conceptions of parenting support to those who are directly involved on a daily practical level, make good use of the discussions among the participants to "test" our ideas, and thus to further develop these ideas in more substantial ways and to "translate" these to the field of practice. What happened here is that as researchers we (the project assistant and myself) followed up on existing understandings and interpretations of parenting and parenting support and shifted the weight of some concepts in relation to others—in this case, perhaps, by reviving "old" concepts (such as "generation" and "common world") and thereby making other more predominantly present concepts temporarily disappear in the background. Doing so, however, inevitably affects the participants, who are situated in largely the same set of meanings as we, the researchers, are. They can no longer see themselves in the ways they were used to see themselves for a different meaning has been offered to them. In this sense, introducing one's understanding is an intervention into another's existence. It is because offering one's understanding can potentially be productive for another's understanding of the issue at hand that it can be a contribution to an ongoing interpretation.

To conclude, it should also be clear (at least, I hope so) that the cumulative logic of improvement that is characteristic of the predominant understanding of scientific research today fits rather ill with the kind of interpretive understanding I wanted to advance in addressing parenting and parenting support. Simply put, it is hard to say what it is we now "know more" than before, or even if we "understand better" than before. I'm happy to follow Gadamer here, once again: "It is enough to say that we understand in a *different way, if we understand at all*" (Gadamer 2004/1965, p. 296). Doing philosophical work on parenting and parenting support is, in this sense, peculiarly similar to being a parent: there never has been a final answer, nor will there ever be one, to what it means to be a parent.

Genre 7 Quantitative Approaches

Introduction

Paul Smeyers

Numbers are everywhere: they tell us what date it is, how long I have to work, and how much money I have in my bank account. We rely on mathematics to build houses and bridges, to produce sweets and cast concrete, to calculate costs, to analyze economic trends, and to make estimations in many areas such as health care and education. Living our life without numbers, calculations, and estimations is nowadays almost impossible to conceive. But the grip they offer on “our reality” is also beset with a number of problems: more often than not they create an illusion of straightforwardness, of facts which cannot be doubted, of what cannot be denied, i.e., “what is the case.” Numbers have a seductive objectivity. We are likely to be forgetful of the presuppositions that are implied by certain uses of numbers. We tend to forget that everything starts with a choice about what one may want to focus on, i.e., a particular concept that is the beginning of our research. What is the case for things that can simply be counted gets even more complicated in statistics where various levels of measurement (nominal, ordinal, interval, and ratio scale) are involved. Analyzing the data according to the presuppositions of various scales and correlative statistical (often very complex) techniques for testing a hypothesis requires an in-depth understanding of probability (which itself requires mathematical insight and knowledge). The use of statistics in educational research is very widespread, as it is in many other fields of research. Sometimes, the outcomes of the analyses are critically discussed when presented in the popular media, but more often than not they are shaped as “facts.” Experts understand that things are not so simple. But where reports are broadcast on radio and television, or when figures or tables are printed in newspapers in a manner that lacks the sophistication and the nuance they require, we are on dangerous terrain: their distorting picture may be a travesty of reality. For the sake of clarity (in order to

make it less complex), such uses could cultivate one-sidedness, prioritizing *an* image of reality at the cost of many possible other views. The lack of understanding of the purposes and limits of statistics, of the different ways they can be interpreted, is particularly damaging.

A canonical text on the history of science, more particularly of educational research, reads as follows: “One cannot understand the history of education in the United States during the twentieth century unless one realizes that Edward L. Thorndike won and John Dewey lost” (Lagemann 2000, p. xi). Apart from whether or not one agrees with this bold claim, one has to admit that the kind of research that uses quantitative, i.e., statistical, techniques, gained prestige in the twentieth century. Various often interrelated factors are responsible for this, such as the belief in and the acceptance of the assumptions of positivism, the institutional growth of the educational market, the so-called scientization of educational research, the professionalization and academization of the training of educationists, and the supremacy of meritocratic values in modern societies and the constant need to legitimate these by “objective” and “neutral” research. The use of methods of testing and statistics was at the core of Thorndike’s success story, a story based on the unshakable belief that everything can be measured. William McCall (1922)—the residing statistician at Teachers College—immortalized this unbridled trust in quantification with the well-known assumptions: (1) “whatever exists at all, exists in some amount . . .”; (2) “anything that exists in amount can be measured . . .”; and (3) “measurement in education is in general the same as measurement in the physical sciences . . .” (McCall 1922, pp. 3–5). On the one hand, these assumptions relied to a large extent on Thorndike’s educational psychology; on the other hand, once they were made explicit, Thorndike and his followers were eager to adopt them in order to further justify the way they saw research: as the antidote against all societal evils (see, e.g., Travers 1983).

Statistics are (still) everywhere. Their power and undoubted efficacy in many areas has become almost an article of faith: the more statistics we gather, the more we will know. Their use relies upon a number of presuppositions: that reality is being represented, that it can be controlled, and that its risks can thereby be managed. But by emphasizing its exaggerated use or overuse, we do not mean to give the reader the impression that statistics has only negative connotations or that it should be banned from educational research altogether.

That sort of polarized position should be opposed. Statistics should neither be seen as the golden or only road we can follow to understand educational reality, nor should their importance be disregarded when the issues to be studied require such an approach. For instance, if one is interested in a phenomenon such as “bullying” in primary schools, one might want to know how many cases of bullying have been registered, or how particular subgroups, such as boys and girls, according to age, ethnicity, various living conditions, and so on and so forth, are affected by bullying. It goes without saying that to have an informed estimate of the frequency and scope of the occurrence of a particular problem (as detailed as this can be) is quite essential in educational contexts. Policy needs to take this into account, as an element in the process of determining how important and relevant the problem is.

This not only has implications for what should be done (by whom and at what level) but also for the kind of further research that should be carried out (not to mention the quantity of research funding that should be mobilized).

Nor should a sharp dichotomy of quantitative and qualitative studies be asserted. Correlational studies (requiring a sufficiently large sample), for instance, could alert scholars to qualitative phenomena that may have gone unnoticed. Conversely, a “thick description” of a school or community of the kind normally associated with qualitative research might and perhaps should include quantitative information about the social class makeup of the school, the distribution of test scores of pupils, staff student ratios, etc. There is a legitimate place for different kinds of quantitative research within educational research or, even more broadly, within the academic discipline of education. This does not warrant a blind trust in the exclusive use of randomized field trials and experimental or quasi-experimental approaches, which have often been used in educational policy to justify certain interventions. Finally, there are a plethora of criticisms internal to the use of particular statistical techniques, but there is generally a lack of external criticism that takes into account the overall picture of what education and child-rearing should be about. Here a crucial element is the way problems are conceptualized. This has far-reaching consequences for the kind of decisions that are taken on the basis of research, and this point is often forgotten when people look at what research “tells” us—as if this were an entirely neutral or objective voice. The use of statistics requires much more than choosing the correct statistical technique, more than simply following an algorithm. Interpretation is involved from the beginning till the very end. Some chapters say more about these implicit choices than others. The chapters do highlight the strengths and weaknesses of quantitative approaches in various educational fields. Some detail first of all internal statistical discussion; others offer a meta-reflection on what has to be taken into account when using this approach to investigate the educational field.¹

Ellen Vanderhoven, Annelies Raes, and Tammy Schellens address the process of designing effective learning materials. They demonstrate the role of interpretation in research about learning by an example using a specific methodology known as design-based research. This approach involves the design of educational interventions and learning materials to improve learning. In what follows, first the reasons to choose this particular approach are explained, referring to the main characteristics and procedure of this research methodology. Next, the contribution of this research approach is illustrated by a report of a study concerning the design of effective educational materials about the risks of social network sites. The research project described gives further insight into the total process of the design-based research methodology and approach. Finally, they describe the conclusions that are drawn and discuss what is happening in terms of the role of interpretation during design-based research in general and during the design and

¹ I would like to thank Daniel Muijs and Martin Valcke for their assistance in the process of finding contributors.

evaluation of educational materials about the risks of social network sites in particular. The specific advantages of this research approach are presented, but attention is also paid to the accompanying disadvantages and challenges of design-based research in an educational setting.

Researchers have called for renewed efforts in exploring what knowledge should be taught in pre-service teacher education programs with regard to technology. In addition they have also called for renewed efforts on how to best prepare teachers to effectively use that knowledge to support teaching and learning. From the multiple ways of approaching this problem, *Anne T. Ottenbreit-Leftwich, Peggy A. Ertmer, and Jo Tondeur* have selected a two-phase mixed-methods research design. Their chapter examines how the research focus and results were selected within the chosen design. Thus it is described why and how specific populations of teacher educators and practicing teachers were selected. In addition, the chapter details why certain data sources were selected (surveys and multiple case studies—interviews, documents). The analysis of data is also dealt with, noting the various statistical tests that are run as well as the methods used for coding open-ended data. Furthermore, descriptions of interpretations of the results and how findings were established are presented.

Theory-driven evaluation is a collection of different methodological approaches that can be used by evaluators in trying to understand the impact of a reform policy: for example, program theory, theories of change, and realism. In this chapter *Leonidas Kyriakides* describes the main features of theory-driven evaluation studies. It is argued that educational effectiveness research (EER) can influence the design of different types of theory-driven evaluation studies so that in-depth answers to policy makers concerned with why specific reform policies are more or less effective can be provided. Thus, EER is seen as a theoretical foundation upon which theory-driven evaluation studies can be built. Guidelines for conducting theory-driven evaluation studies that are based on EER are provided, and a framework for designing theory-driven evaluation studies is offered. It is finally argued that conducting theory-driven evaluation studies on educational effectiveness may contribute to the establishment of a theory-driven and evidence-based approach to school improvement. The importance of this approach to school improvement is demonstrated. This implies for the author that data from theory-driven evaluation studies of educational effectiveness should guide the design of school improvement efforts.

Research evidence suggests that the idea of leadership as a panacea for all the functional ills of schooling is unfounded, however convenient the notion has been for policy makers. Good leadership is a necessary but not a sufficient condition for good schooling, and we know that principals successful in one school context do not always operate with equal efficacy in a different setting. Research on school leadership has likewise suffered from the tension between evidencing and delivering improvement and challenging and informing policy, most obviously in the dearth of research on quantifying the impact of leadership on pupil outcomes. In this chapter *Marta C. Azaola and Anthony Kelly* sift through a range of research from developed and developing countries to get an overview of interpretations apart

from the hegemony of “Western” contexts, interrogating findings in terms of how they relate to method and interpretation. The link between interpretation and methodology is theory, they argue, in the absence of which the researcher cannot be sure what has been found. The appropriateness of the latter affects the legitimacy of the former, and hence ultimately the usefulness of the research. Their review suggests that good research, from whatever cultural tradition, should go beyond the folk knowledge of anecdote to the theoretically constructive.

Many examples of educational research, including international comparative studies, have clearly documented that children’s attainments and educational careers are linked to their ethnic and cultural origins and the socioeconomic situation of their families. However, the extent of the equity gap for specific student groups varies between countries, and explanations for this also vary. In this chapter *Pamela Sammons* and *Yvonne Anders* summarize two large, longitudinal studies conducted in England and Germany that investigate children’s development from preschool age through primary education. Both studies were set up to investigate the influences of individual child, family, home learning, preschool, and primary school influences on children’s development. A core question of both studies is how far preschool and school are able to reduce the negative influence of early childhood disadvantage and thus potentially help ameliorate inequity in later educational outcomes (Sammons et al. 2013). In England the EPPSE study has tracked 3,000+ children, whereas the German BiKS study investigates in more depth the development of around 550 children. The two studies share similarities in their designs and methodological approaches, although there are also some important differences. Key results of both studies are presented and discussed in terms of the quantitative strategies adopted and the interpretation of statistical findings.

Elias Hemelsoet deals with the statistical measurement and analysis of irregular migrants in policy making. As it concerns populations that are difficult to identify, quantitative estimations are often unreliable and pose various methodological problems. Moreover, and more important from an educational perspective, while many differences are implied in a concept like “irregular migrants,” these quantitative estimations tend to homogenize the people under consideration. Within an educational framework, inclusion seems to provide a better solution to acknowledge their differences. Still, as is argued with the case of Roma, homogenization is at work in the inclusion framework too, albeit in a different way. From the theoretical approach of looking at education as an initiation into practices, the need for a different kind of “understanding” in educational research is defended. Recognition of the inherent transformative character of educational practices suggests a move from the production of “knowledge of the case” as a scientific endeavor towards an increased attention to “knowing how to go on.” Practices are not fixed entities and therefore knowledge about these will by definition be partial and temporary. But focusing on “how to go on” implies that an investigation of what exists is only a starting point. Consequently, interpretation is not only a concern when mapping practices; it should also entail the educational practice of pondering on how these practices are to be transformed.

In his chapter *Peter Bowbrick* describes an evaluation carried out by a team. The technical problems to be tackled in interpreting statistical data are discussed. It is shown how the statistical analysis is then interpreted by the team as a whole to produce a consistent and coherent report. The objective of the evaluation was to influence government policy; hence, political and micro-political pressures are also examined. The way in which readers of the report drew inferences from the report and interpreted the statistical results and then disseminated them to influence policy is discussed. Bowbrick draws attention to the serious ethical issues this raises.

In the final chapter *Paul Smeyers* focuses on layers of interpretation in quantitative educational research. Starting from various child-rearing and educational examples which are detailed and critically discussed, he questions the aim of reducing the variability of the data (a promise statistics carries). He further questions how statistics are often used to offer an explanation (that is, how independent variables are presumed to affect dependent variables). He also addresses the possibility of manipulation of data that are intended to engender policy advice. The chapter points to the strengths of a quantitative approach, but it also highlights the limitations. Particular attention is paid to the presuppositions of causality and probability. It is then argued that though attention to the particular (the opposite of generalization) has much to be said for it, it is not the only alternative when trying to decide what needs to be done. Backed up by an amended correspondence theory of truth and an awareness of the limitations, it is argued that there is nothing necessarily problematic about the quantitative approach. On the contrary, it can contribute to the process of doing justice to the multilayered complex educational reality one finds oneself in. But in order to properly do so, attention must be given to interpretation all through the process of this kind of research.

7.1 Interpretation in the Process of Designing Effective Learning Materials: A Design-Based Research Example

Ellen Vanderhoven, Annelies Raes, and Tammy Schellens

Introduction

In this chapter, the role of interpretation in research about learning is demonstrated by a research example using a specific methodology known as design-based research. This approach supports the design of educational interventions and learning materials to improve learning. In what follows, first the reasons to choose for this particular approach are explained referring to the main characteristics and procedure of this research methodology. Next, the invaluable contribution of this research approach is illustrated by a report of a study concerning the design of effective educational materials about the risks on social network sites. The research project described gives more insight in the total process of the design-based research methodology and approach. Finally, we describe the conclusions that are drawn and we discuss what is happening in terms of interpretation during design-based research in general and during the design and evaluation of educational materials about the risks on social network sites in particular. The specific advantages of this research approach are presented, but we also discuss the accompanying disadvantages and challenges of design-based research in an educational setting.

The Design-Based Research Approach

What Is This Approach About?

The design-based research methodology is a well-used research approach in the learning sciences (Barab and Squire 2004; Brown 1992; The Design-based Research Collective 2003) and relies on multiple sources of evidence, both quantitative and qualitative, which are triangulated (Cohen 2011). Yet, although a design-based research approach includes several well-established research methods and is based on existing norms for sampling, data collection, and data analysis (McKenney and Reeves 2013), the approach as a whole is fairly recent and evolved only near the beginning of the twenty-first century (Anderson and Shattuck 2012). The method mostly stands out because of the goals it puts forth (McKenney and Reeves 2013): it wants to bridge theoretical research and educational practice (Vanderlinde and van Braak 2010), thereby resulting in both an increase of theoretical knowledge and a societal contribution, such as school programs (Reeves 2006). The methodology has been defined by Wang and Hannafin (2005) as

A systematic but flexible methodology aimed to improve educational practices through iterative analysis, design, development, and implementation, based on collaboration among researchers and practitioners in real world settings, and leading to contextually-sensitive design principles and theories. (p. 6–7)

This definition includes different important characteristics of design-based research that were described by several authors and summarized by Anderson and Shattuck (2012). First of all, it focuses on the design and testing of a significant intervention. It therefore starts from problems that are both *scientifically and practically significant*, as is revealed in an initial problem analysis (Edelson 2002; McKenney and Reeves 2013). Second, it involves *multiple iterations* of testing and refining of problems, solutions, methods and design principles (Phillips et al. 2012). Third, throughout all phases of the design-based research, it is involving a *collaborative partnership* between researchers and practitioners. Fourth, the research needs to be conducted in *real educational contexts*, and not in labo-settings. Fifth, next to the development of practical solutions, it results in *design principles, or “prototheories,”* that help communicate relevant findings towards other researchers and practitioners (The Design-based Research Collective 2003). Finally, another characteristic that is not explicitly apparent in the given definition is the fact that the approach makes use of mixed methods, including a variety of research tools and techniques, as integrative research with varying methods is necessary to meet new needs and issues that emerge during the process (Wang and Hannafin 2005).

Following these characteristics, the procedure of design-based research, depicted in Fig. 1, iteratively involves four sequential steps (Reeves 2006): (1) the analysis of practical problems, (2) the development of solutions based on existing knowledge, (3) evaluation research of the solutions in practice, and (4) reflection to produce design principles.

Fig. 1 Iterative steps of design-based research, based on Reeves (2006)

Why Choosing a Design-Based Research Approach?

The design-based research approach is partly originated in reaction to the lack of theoretical base in designing and developing interventions to improve learning, the lack of theoretical implications of intervention research, and the lack of evaluation studies in authentic settings (Phillips et al. 2012; The Design-based Research Collective 2003). Since the methodology eliminates the boundary between design and research (Edelson 2002) and results in both theoretical contributions and practical solutions, this research approach is appropriate for research about the design of new educational learning materials.

Several advantages of design-based research have been described in literature. Edelson (2002) summarized the three most important reasons why someone should choose to use a design-based research approach. First of all, it provides a *productive perspective for theory development*, as it starts from a fully specified theory, shows inconsistencies of this theory by evaluating the design that was based on it, and ends in context-specific guidelines. The goal-oriented nature of the design-based research guides this theory development (Edelson 2002).

A second advantage of design-based research that was described by Edelson (2002) is the *usefulness of the results*. He states that in the past, practitioners often complained that they did not know how to implement the results that were found in research in their daily practice. Design-based research not only results in practical solutions that can be used immediately in the learning context, it also delivers design guidelines that can be used easily to develop similar interventions.

The third reason to use a design-based research approach, following Edelson (2002), is the fact that design-based research directly *involves researchers in the*

improvement of education. Whereas previously, the design was often in the hands of publishers and practitioners, the expertise and knowledge of researchers now directly influences the development process, making innovative designs based on recent educational studies possible.

Next to these three advantages described by Edelson (2002), several other advantages have been described in design-based research literature. One of these is the fact that the use of real-life settings, in contrast to labo-settings, ensures the *ecologic validity* (Phillips et al. 2012). This aim for generalizability is highly valued, as it ensures the usability of materials in the classroom. Another advantage that is described is that it fulfills the norms of good research in general, including the articulation of clear goals and research questions, the cumulative and systematic nature of gathering evidence, and the use of methodologies that are appropriate to the research goals (Phillips et al. 2012).

Applying Design-Based Research: A Research Example

In this section, we describe a design-based research project that has been conducted from 2011 to 2013, as part of the Security and Privacy in Online Social Networks project, further referred to as SPION project. This project has received funding from the Strategic Basic Research (SBO) Program of the Flemish Agency for Innovation by Science and Technology (IWT). The main goal of the SPION project was to counter responsabilization (i.e., the process where the user of a social network site is responsible for its own safety and privacy) and to redirect responsibilities towards other institutions (e.g., service providers, schools, government, etc.). One of the subgoals was therefore to develop educational materials that can be used in secondary schools, to teach teenagers about the risks on social network sites.

IWT financed a 4-year PhD track, thereby allowing a multiyear project to be set up. By including researchers in the development of materials, the expertise necessary to do evaluation studies was ensured as well. The research group that was involved in this studies, a division of the Department of Education of Ghent University, already had built an expertise in doing design-based research and evaluation studies in secondary education (Raes et al. 2012; Schellens and Valcke 2004).

Since one of IWT's conditions for funding was that the project would result in both solutions for practice and in scientific progress, the advantages and characteristics of design-based research were ideally suited.

Focus of the Research

This research project focused on a form of learning situated in the field of media literacy. Traditionally, media literacy refers to the ability to analyze and appreciate literature, but this meaning has been enlarged the moment computers became

prominent in society (Brown 1998). With the rise of Web 2.0, the meaning of media literacy has evolved even more, as it covers not only interactive exploration of the Internet but also the critical use of social media and social network sites. Since social media give an excellent opportunity to create online content, the development of new skills is necessary. Livingstone (2004a) therefore describes media literacy in terms of four skills, this is the ability to access, analyze, evaluate, and create messages across a variety of contexts. Previous research shows that children are good at accessing and finding things on the Internet, but they are not as good in avoiding some of the risks posed to them by the Internet (Livingstone 2004b).

In this respect, schools are put forth as ideally placed to provide media literacy education to all children and teenagers (Livingstone and Haddon 2009; Marwick et al. 2010; Patchin and Hinduja 2010). In the current research, it was aimed to develop effective educational materials to teach children of secondary education (aged 12–19 years) how to behave safe on social network sites (i.e., to increase awareness and to change unsafe attitudes and behavior), and to describe critical design guidelines for the development of these materials.

Method and Results

As stated before, the procedure of design-based research iteratively involves four sequential steps as depicted in Fig. 1 (Reeves 2006): (1) analysis of practical problems, (2) development of solutions based on existing knowledge, (3) evaluation research of the solutions in practice, and (4) reflection to produce design principles. In the following, the methods used in this research throughout the sequential steps are described in detail, together with a short summary of the results.

Step 1: Analysis of Practical Problems

In a first step, the practical problem needs to be analyzed and a theoretical framework has to be articulated, including initial design guidelines to proceed to the next step (development). To analyze the practical problem, three important resources can be consulted: previous literature, shared experiences of researchers and practitioners, and one or more pilot studies (Reeves 2006).

In this research, the lead to answer the questions about the nature of the problem was taken from previous literature: do teenagers care about their privacy, are they behaving risky on social network sites, are they aware of the existing risks on social network sites, and what is the role of school education? The results of this literature study were extended with three pilot studies. First, an observation study of Facebook profiles was conducted, to find out what teenagers are doing on Facebook and whether they show risky information. Second, a theoretical evaluation of existing educational packages about safety on social network sites showed the gaps and challenges to develop new materials. And third, a survey study showed the impact of school attention for the topic of safety on social network sites on students' attitudes and behavior. Finally, the experiences of practitioners were

taken into account by organizing a focus group with educational stakeholders (i.e., teachers, developers of educational materials, educational counselors).

Following the results of the literature study and the three pilot studies, some conclusions were particularly important to guide the decisions in the next stage, that is, the development of solutions. In the literature study, it was found that the risks teenagers face on social network sites can be divided into three main categories: content risks, contact risks, and commercial risks (DeMoor et al. 2008). The first one includes encountering provocative or wrong content on your social network site, such as hate messages or gossip, respectively. The contact risks find their source in the fact that social network sites are made to communicate and have contact with others. Examples of contact risks are cyberbullying, sexual solicitation, and all kinds of privacy risks (De Moor et al. 2008; Livingstone et al. 2011). The third category of risks contains the commercial risks. These include the commercial misuse of personal data: information can be shared with third companies via applications, and user behavior can be tracked in order to provide targeted advertisements and social advertisement (Debatin et al. 2009). In the first pilot study that we conducted, the observation study, we found indeed that teenagers face a significant amount of risks (Vanderhoven et al. 2014e). In the organized focus group, it was found that cyberbullying and privacy risks are the most encountered risks by educational stakeholders such as teachers. These risks may form a threat, since research indicates that a significant amount of teenagers experience harm after exposure to online risks (Livingstone et al. 2011; McGivern and Noret 2011).

Further literature study revealed that a variety of prevention campaigns and awareness-raising interventions has been developed to account for the rising concerns about the new risks children face when using the increasingly popular social network sites (e.g., for an overview of European packages, see Insafe 2014). However, a systematic review showed that almost none of these interventions has been empirically evaluated (Mishna et al. 2010). The results of our second pilot study confirmed that most of the existing packages were developed without any theoretical consideration, nor with regard to the cause of the problem that is tackled, nor with regard to the intervention that is developed (Vanderhoven et al. 2014a). Moreover, the few evaluation studies that were conducted only show an impact of the interventions on Internet safety knowledge, but not on pupils' behavior (Mishna et al. 2010). This is in line with the results from quantitative intervention studies about media literacy education in general that typically show an increase in knowledge about the specific topic of the course, but lack a measurement of attitudes and behavior (Martens 2010). If measured, it is found that attitudinal and behavioral changes are much harder to obtain (Cantor and Wilson 2003) or not found (Duran et al. 2008; Steinke et al. 2007). Still, in our third pilot study, a survey study, we found that school attention for the topic of online safety has a positive influence on pupils' attitudes and behavior (Vanderhoven et al. 2013a).

As stated before, another typical characteristic of this first step of design-based research is the articulation of an initial framework (Reeves 2006). Therefore, next to the studies that were conducted to analyze the practical problem, initial design guidelines and predictors of effective materials were formulated. We took into

account both general principles that are shown to be important in prevention campaigns (Nation et al. 2003) and more specific instructional design principles that follow out of the leading theory in education, that is, constructivism. Furthermore, because of the goal of our materials (i.e., not only changing awareness but also changing unsafe attitudes and behavior), theories of behavior change are taken into account as well. More specifically the study was based on the transtheoretical model of behavior change (Prochaska et al. 1992) and the theory of planned behavior (Ajzen 1991).

Step 2: The Development of Solutions

Based on the results of the first phase, educational materials were developed. A detailed design was created, and explicit goals about the outcome of these materials were put forth: an increase in awareness about risks on social network sites and a decrease of unsafe attitudes and behavior on social network sites. There was a special focus on contact risks as these were of most concern to the educational stakeholders in our focus group (privacy risks, cyberbullying, and sexual solicitation; DeMoor et al. 2008). The package consisted of a syllabus for the pupils and a manual for the teacher. Every course lasted 1 h, trying to satisfy the need of teachers to limit the duration of the lessons and the work load (Vanderhoven et al. 2014a). The different criteria that were put forth in our theoretical framework were taken into account during the development of the materials (Vanderhoven et al. 2014). All courses followed the same structure:

1. Introduction. The subject is introduced to the pupils, using the summary of risks (De Moor et al. 2008).
2. Two-by-two exercise. Students receive a simulated social network site profile on paper and have to fill in questions about the profile together with a peer. These questions were scaffolding the pupils towards the different existing risks on the profile.
3. Class discussion. Answers of the exercise are discussed, guided by the teacher.
4. Voting cards. Different statements with regard to the different contact risks are given. Students agree or disagree using green and red cards. Answers are discussed, guided by the teacher.
5. Theory. Some real-life examples are discussed. All the necessary information is summarized.

Step 3: Evaluation Research of the Solutions in Practice

The materials that were developed were implemented in authentic classroom settings in secondary education, and the impact of the materials on the awareness, attitudes, and behavior of the pupils that were involved during the intervention was measured. Based on the results, materials have been refined. These revised materials were implemented again. In total, there were five iterations of development, evaluation, and refinement. The methodology was mostly equal for the five different intervention studies. However, some small changes have occurred. This is a

typical characteristic of design-based research, where integrative research with varying methods is necessary to meet new needs and issues that emerge during the process (Wang and Hannafin 2005).

The materials were implemented in classes in secondary schools. In the first intervention study 1,035 pupils participated, in the second intervention study 1,487 pupils were involved, and in the third intervention study 156 pupils followed the course. In all these studies, the pupils were on average 15 years old. In the last two intervention studies, slightly younger students were involved, because in these studies the importance of parental involvement was tested, which is particularly important in lower grades. The mean age of the 146 pupils that were involved in the fourth intervention and of the 205 pupils in the fifth intervention was therefore 13 years.

A pretest–posttest design was used in all intervention studies. This means that in all conditions, in all studies, pupils had to fill in an online pretest survey before the intervention took place. Afterwards, they followed the intervention, which was different in all studies. Finally, they filled in a posttest survey. In all intervention studies, a specific experimental intervention was compared with a control group. In the first two studies, no intervention took place in this control group, and pupils only had to fill in the surveys. In the last three studies, the intervention out of a previous phase was given to the control group, so that comparisons with the experimental group indicated the added value of the revised materials.

The survey measured pupils' awareness, attitudes, and behavior towards contact risks on social network sites. This survey was developed based on the contact risks as described by DeMoor et al. (2008). In the first two studies, three different scales were developed, one for awareness, one for attitudes, and one for behavior, all built on the base of the means of six or more items. They all had a satisfactory reliability as measured by Cronbach's alpha. In the last three studies, the survey was shortened, because pupils and teachers reported that it was too long and time consuming. Therefore, a new and shorter survey was developed with less items on the awareness scale and with attitudes, intention, and behavior measured based on the theory of planned behavior following the manual of Fishbein and Ajzen (2009).

In all studies, an open question asked pupils about what they had learned during the intervention, to have a direct measure of increased awareness. Moreover, a direct binary measure of behavioral change was conducted by the question; "Did you change anything on your profile since the first questionnaire?" If the latter was answered affirmatively, an open question about what they changed exactly gave us more qualitative insight in the type of behavioral change.

Multilevel modeling (MLM) with the software package MLwiN was used to analyze the data. Since our data clearly have a hierarchical structure, that is, pupils in classes, the obtained data from pupils out of the same class might be dependent and might so break the assumptions of simple regression analysis. In this respect MLM is suggested as an alternative and adequate statistical approach. Consequently, since a significant between-class variance could indeed be observed in the first two studies, a two-level structure is used: pupils (level 1) are nested within classes (level 2). The

Fig. 2 Iterative process of implementation, evaluation, and revision of the designed materials, based on Vanderhoven et al. (2014)

impact of the intervention on different posttest scores—when controlling for the pretest scores—is evaluated by comparing the control condition with the experimental conditions. Bonferroni corrections were used to control for multiple testing. However, in the last three studies, no significant between-class variance could be observed, so there was no need to use MLM. Therefore, a multivariate repeated measure approach has been used, using the software package SPSS.

The different iterations of implementation, evaluation, and revision were previously described in detail (Vanderhoven et al. 2014) and are summarized in Fig. 2. In the first intervention study, the originally developed materials (see step 2) were implemented and the impact was compared with a control condition where no intervention took place (Vanderhoven et al. 2014b). It was found that while there was an impact on pupils' awareness about the risks on social network sites, only limited impact on behavior could be found. Based on these results, observations in the classrooms and remarks of teachers and pupils, and the theoretical framework of behavioral changes that was put forth in step 1, the materials were revised: peer influences during the course were reduced by decreasing moments of collaborative learning, making place for more time for individual reflection. In the second intervention, it was found that this new intervention had more impact on attitudes and behavior, while the impact on awareness was still the same (Vanderhoven et al. 2012a). Since there is always room for improvements in the design (Anderson and Shattuck 2012), the materials were revised again. Based on remarks of pupils and teachers, the authentic setting that was used in the materials was made even more authentic by including the own social network site profile in the course. It was however found that this manipulation did not increase the impact of the intervention (Vanderhoven et al. 2013b). In the final two studies, the importance of parental involvement was tested by revising the materials so that parents were included. First, a parental evening was organized next to the course that was given to the

pupils. In the fourth evaluation study, it was found that this was not enough to involve all parents (Vanderhoven et al. 2014d). Second, the materials were revised so that parents were involved in a homework task. This appeared to increase the impact that the intervention had on the behavior of the pupils, especially for boys (Vanderhoven et al. 2014c).

Step 4: Reflection to Produce Design Principles

Summarizing the results of the previous step, it can be stated that materials need to include time for individual reflection and that involving parents in the intervention is beneficial, especially for boys. However, it needs to be taken into account that involving parents using an information evening might not be enough to include all parents. Involving parents as partners, using a homework task, is put forth as a good alternative. Considering the authentic context, exercises with simulated profiles are just as good as real online profiles to obtain the goals that were set. Taking into account all these findings, a final practical solution has been developed that effectively has an impact on both awareness and unsafe behavior.

However, design-based research results not only in practical solutions but also in a theoretical contribution. Therefore, the last step of design-based research includes a reflection of the total research procedure and all findings, resulting in both practical solutions and improved theoretical understandings (Reeves 2006). At the start of this research, different theoretical frameworks were put forth, such as the general principles that are shown to be important in prevention campaigns (Nation et al. 2003), more specific instructional design principles out of constructivism, and the theory of planned behavior (Ajzen 1991). In the light of the results found in this design-based research project, these frameworks needed to be reinterpreted and contextually sensitive design principles and theories were put forth. For example, collaborative learning, which was proposed as an important instructional strategy following constructivist theories (Duffy and Cunningham 1996), appears to be less effective in the case of reputation-related behavior like unsafe behavior on social network sites. In the same way, the importance of authentic learning and of parental involvement was put into perspective. Following these results, context-specific guidelines were formulated (for more details, see Vanderhoven et al. 2014).

Presenting Results

As stated, the results of this research are important for both researchers and practitioners, such as developers of new e-safety materials. Therefore, different formats of presenting these results were chosen. First of all, to reach researchers, the results of this research were disseminated by means of academic publications. Every single study of all stages of the design-based research was presented separately and in detail (Vanderhoven et al. *in press*, 2013a, b, 2014a–e). Moreover, the design-based research as a whole has been presented in detail in another academic manuscript (Vanderhoven et al. 2014). Second, to reach both researchers and practitioners, the results have been presented at several

academic and nonacademic conferences (e.g., EARLI, AERA, IAMCR, Media and Learning Conference, etc.). Finally, to reach practitioners, articles have been published in nonacademic journals (e.g., Vanderhoven and Schellens 2012), presentations were given at training seminars (e.g., Insafe training meeting), and workshops were organized.

Evaluating the Design-Based Research Approach

To overcome problems of previous research, in this study it was chosen to use a design-based research approach. So far, due to limited financial resources and expertise, the existing educational materials about the risks on social network sites were built without a strong theoretical base, and no research was carried out to evaluate the possible impact of these packages (Vanderhoven et al. 2014a). Since IWT financed a multiyear project involving researchers with expertise in design-based research, these problems could be overcome in the SPION project. Moreover, the advantages and specific characteristics of design-based research were well suited to fill in the gaps that existed in the literature and research about e-safety interventions. First, based on the fact that the originally developed materials did not obtain all the goals that were put forth (i.e., they did not change unsafe behavior), the initial design principles drawn from the initial framework during the first step of the research were adapted, and the design-based research project did not only result in the development of effective materials but also in contextually sensitive design principles. Second, the typical collaboration among researchers and practitioners in this type of research helped us to find a balance between the teachers' needs and the guidelines based on previous research. For example, while previous research about effective prevention campaigns shows that interventions should be sufficiently dosed (Nation et al. 2003), a short-term intervention would be more satisfying for teachers who reported a high workload (Vanderhoven et al. 2014a). In the design-based research, it was found that a short-term intervention appears to be enough to have an impact. This also maximizes the possibilities for dissemination and usefulness in practice. This is especially important given the conditions that were put forth by the financing institute IWT. Third, design-based research directly involves researchers in the improvement of education. Whereas, previously, the design and development of educational materials was often in the hands of publishers and practitioners, the expertise and knowledge of researchers now directly influences the design. For example, as stated before, previous e-safety interventions were often not evaluated, due to a lack of expertise of the designers. In our research example, it is the conjunction of the experiences of the practitioners, and the knowledge and theoretical background of the researcher that made several evaluation studies possible which led to an effective course that could change both risk awareness and unsafe behavior.

Yet, although most literature focuses on the invaluable contribution and advantages of design-based research, some of the pitfalls that are inherent to this

research approach also need to be mentioned (Anderson and Shattuck 2012; Barab and Squire 2004; McKenney and Reeves 2013). For example, while generalizability and ecological validity are often argued to be positive aspects of design-based research, the fact that design principles are context-specific might also jeopardize the external validity of the implications. In our research example, the research only assures that formulated design principles are applicable in the context of teaching pupils about the risks on social network sites and how to behave safely. However, these guidelines might also be applicable on the design of interventions about different behaviors that are typically tackled in other prevention campaigns, such as smoking, drug abuse, or aggressive behavior. However, further research is necessary to prove this generalizability.

A second challenge that is described in the literature, is the fact that it is difficult to know when (or if ever) the research program is completed. The multiple iterations ascertain cumulative knowledge and an improvement of the design, but as stated before, there is always room for upgrading (Anderson and Shattuck 2012). When can one decide a design is good enough to finalize the research? In the research example above, five iterations of development, implementation, and evaluation have been conducted. However, several more iterations could have been conducted, possibly even increasing the impact of the intervention. Most of the time, the end of funding means the end of research, independent of whether this happens after one or five iterations (Anderson and Shattuck 2012).

These time limits are a third disadvantage of design-based research: the total research procedure is very time consuming, considering the different iterative phases that need to be completed. It often needs a multiyear project to finish a design-based research (Anderson and Shattuck 2012). The research example described above indeed took about 3 years, with every step of the process lasting several months. The choice to conduct this time-consuming research was possible since a larger research agenda was financed, which is most often not the case. However, it also has more negative consequences for the research itself, such as the fact that only a short-term impact of the intervention is measured. Since conclusions of one study lead to the next step of the research, it is difficult to include long-term impact. If a long-term impact would be measured, several further steps of the research process would already have been started or even finished. Given the raising importance of sustainable learning, additional research using a longitudinal approach might be interesting, not only to find out if the materials have a delayed impact but also to find out whether the impact of the intervention is persistent over time.

Finally, it should be noted that although we elaborated on the advantages and disadvantages of design-based research for our research project, it is difficult to evaluate the impact of this research method in general. Anderson and Shattuck (2012) reviewed the impact of several design-based research interventions, concluding that it might be meeting its promised benefits, but McKenney and Reeves (2013) reacted that next to the scientific impact, which is easy to find in academic articles, there is also a practical impact, which is much harder to identify and therefore to evaluate.

The Role of Interpretation in DBR

In every research, interpretation plays a undeniable role. It is the interpretation of the context by the researcher that determines which research method will be used. It is the interpretation of the researcher that decides which measurement tools will be used. Participants interpret the questions asked in these measurement tools, which again has an impact on the results. Further, the results need to be interpreted by the researcher again: how will he or she analyze the gathered data. Finally, the researcher decides what is interesting for whom, when determining which results he or she will report, how and where.

In design-based research in particular, it is important to acknowledge the role of interpretation. One of the reasons is the close involvement of the researcher in the design process, and the bias that this involvement may cause. Some authors state that the results of the research must be biased because of the interpretations of the researcher, while others claim that these researchers with their biases, insights, and understanding are the best research tool (Anderson and Shattuck 2012; Barab and Squire 2004). Following the involvement of the researcher in the designing process, ethical issues are raised as well (Barab and Squire 2004). When observing problems in school, do they intervene, or do they minimize their impact in the classroom?

In addition, it should be noted that while the influence of interpretation is important in one single study, the accumulation of these interpretations and decisions in the different steps and studies of a design-based research even increases this influence. As different studies are sequentially conducted, with the results of each study influencing the setup of the following study, the interpretation of the results has a very big impact on the progress of the study as a whole and the final results. Moreover, as stated before, it is argued that because the researcher is closely involved in all the research steps, including the implementation of materials in real-life classroom settings, “researcher bias” is even larger when using this methodology (Barab and Squire 2004). However, as is shown in the different chapters of this book, interpretation is inherent to every research and should not paralyze us or prevent us to do any research at all.

In the following paragraphs, we will repeat the different steps of our research, thereby indicating the role of interpretation in every phase. The decisions and interpretations that we made as a research team are only examples of the interpretations any researcher needs to make when conducting design-based research.

Step 1: Analysis of Practical Problems

As explained in the methodology section, there are three important resources to describe the problem: previous literature, shared experience of researchers and practitioners, and one or more pilot studies (Reeves 2006). A first decision a researcher needs to make is what he or she will do to analyze the problem, and to what extent. It could be decided only to focus on previous research or to have one focus group with practitioners to have an idea of the state of the art. It could also be

decided to conduct multiple pilot studies, making a broad idea of the state of the art possible. Several aspects, such as time constraints, expertise, and practical opportunities, influence these decisions.

In our research, it was chosen to complete an extensive needs analysis, including three exploratory studies, next to the literature study, and one focus group with practitioners. Concerning the literature study, it is clear that the interpretation of the researcher is of very big importance. One example is the search for information about privacy care with teenagers (Vanderhoven et al. 2013a). In this search, we found that some authors reported that teenagers care about their privacy, while others reported the opposite, depending on the exact measure of privacy care in their study, the age of the respondents, and other methodological differences. These kinds of contradictions are often found in literature and should be taken into account when making a state of the art during this first needs-analysis phase.

Next to the interpretation of previous literature, different decisions needed to be made about the method, the data collection, the measures, the data analysis, and the reporting of every single pilot study. As an example, we analyzed the different interpretations made in the observational study of Facebook profiles (Vanderhoven et al. 2014e). We chose to use the method of observation, to overcome problems that are inherent to the self-report methods that are mostly used to study teenagers' behavior on social network sites, such as social desirability (Phillips and Clancy 1972). With this, we wanted to eliminate the amount of variation caused by the interpretation by the participants of the questions in a survey. However, this does not mean that observation is free of interpretation. A detailed codebook was developed to code the information that was observed on the different pages. It was tried to be as exhaustive as possible when composing this codebook, but there is always information that is excluded, depending on the choices of the researchers. Moreover, we chose to use research assistants to collect the information. A total of 179 research assistants coded the information on the Facebook profiles of their friends and friends of friends. By including so many researchers, it was aimed to randomize the researcher bias, a method rarely used in social sciences. While most of the time, researcher bias is tried to be eliminated (although it can be argued that this is quite impossible, hence the focus of this book), we tried to randomize the impact of the observer, thereby eliminating the importance of the different interpretations for the overall research results. Finally, the results of this study were also impossible to report without any interpretation. To give an example: 34 % of the minors in the study were tagged in pictures in which they were drinking alcohol. This is a fact, a number, that can be interpreted in several ways. Is it a risk? Is it a problem? Is 34 % a significant amount, enough to put effort in preventing it? In our research team, we concluded that indeed a significant amount of teenagers show risky behavior (of course, there were also other risk indicators that we found to be threatening), and we based our further intervention on these interpretations. It is important to note that this is a decision and that others might feel that the risks teenagers face are not important enough to put so much effort in prevention campaigns.

Step 2: The Development of Solutions

Design is a sequence of decisions made to balance goals and constraints that can be divided in three sets of decisions: how the design process will proceed, what needs and opportunities the design will address, and what form the resulting design will take (Edelson 2002). These decisions are guided by the results that are found in the previous step of the research, the needs analysis and other context variables, such as the financing resources. In our research example, the development of materials is guided by the results of the needs analysis but also by some context variables. As stated before, a research team funded by the Flemish Agency for Innovation by Science and Technology (IWT), more specifically in the context of a Strategic Basic Research (SBO) Program, conducted this research. These kinds of projects have an important focus on valorization of the research results and on the value of the research for society. The Flemish government showed special interest in the development of educational materials, because they believe that media literacy is very important to teach children how to behave safe on social network sites. This implicates that, as a researcher in this project, the stakes, norms, and values were colored, that is, the project started from the fact that a security problem was existing regardless of how the user felt about this (as was found in the first step, the needs analysis). While this is not detrimental by nature, and although the development of materials was still primarily based on the results of our extended needs analysis, it is important to keep in mind these norms and values that were part of our research from the start.

During the development process, interpretation is also involved when the researcher must decide about the goals he or she wants to accomplish with the educational materials. In our research example, we have put forth that our materials aim to raise awareness and to change unsafe behavior on social network sites. Putting forward the goal of changing behavior cannot be done without any consideration. Indeed, trying to change behavior can be seen as paternalistic and undemocratic (Kelman 2001). While it can be argued that teenagers deserve to be informed, so that they can make informed decisions when using social network sites, it can also be argued that it is unethical to decide how they actually should behave. One should keep in mind that developing educational materials always includes the developer's expectations of desirable attitudes and behavior. This is not always in line with the goals and expectations of the pupils. It can be argued that every individual has the right not to care about certain risks and to choose to behave "unsafe" on social network sites if that is what he or she wants, given the benefits this entails, such as communication (Pruulmann-Vengerfeldt and Runnel 2012) and identity formation (Hum et al. 2011; Madden and Smith 2010). However, it is generally believed that schools have a broad educational agenda, including the enhancement of pupils' character, health, and civic engagement (Greenberg et al. 2003). School education needs to enable pupils to participate fully in public life (Cazden et al. 1996). It can be argued that in the twenty-first century, this means that schools have a responsibility to teach teenagers how to behave safe on social network sites. In this line of thought, putting forward the goal of attitudinal and behavioral change next to raising awareness seemed appropriate.

Step 3: Evaluation Research of the Solutions in Practice

As mentioned before, the results of each study of the design-based research influence the setup of the following study. This is especially the case in the third step of the research: the iterative implementation, evaluation, and revision of the materials. For every cycle, the revisions are based on quantitative and qualitative results (sometimes contradicting each other, making an interpretation by the researcher necessary to proceed in the research), observations in the classroom, collaboration with practitioners, and a theoretical framework. It is the conjunction of all these different aspects, which guides the decision to change specific aspects of the materials and to improve the impact that these materials have on the pupils. It goes without saying that this amount of information can lead to different decisions, making the interpretation and the decisions of the researcher at the moment of revisions of materials of tremendous importance for the final results.

To demonstrate this importance, we analyze the decisions of our research team during the first revision of materials (after the first intervention study), described by Vanderhoven et al. ([in press](#)). The materials were changed so that moments of individual reflection were increased during the intervention, while moments of collaborative learning were decreased, trying to minimize peer pressure during the course. This decision was based on different pieces of information: the observation that popular kids raised their voice during the course to influence their peers, the quantitative and qualitative results of the first study indicating that there was no impact on unsafe behavior (Vanderhoven et al. [2014b](#)), the theory of planned behavior stating that the social norm has a significant impact on people's behavior (Ajzen [1991](#)), and theories about peer pressure in adolescence stating that teenagers are especially vulnerable for peer pressure (Sumter et al. [2009](#)). Of course, there were other observations as well that might have influenced the impact of the intervention but that were not chosen for revision. For example, maybe students did not have the technical skills to act safer and more attention should have been given to the training of specific skills.

Step 4: Reflection to Produce Design Principles

The design guidelines that are formulated are based on the results of the previous steps of the research and therefore again dependent on the interpretation of the researcher. Moreover, it is dependent on the amount of iterations, the choices made about the revisions of the materials, and so on. In our research example, the design guidelines that were put forth are not exhaustive, as time constraints limited the amount of iterations to five. More design guidelines might have been revealed in other iterations.

Finally, the interpretation of the researchers about the dissemination of the results is vital. For example, to reach practitioners we formulated simple rules of thumb in the final materials, derived from the design principles. This enabled teachers to use these guidelines during their courses. The rules of thumb are, by definition, a simplification of the conclusions of the results of the total design-based research and therefore dependent on the interpretation of the researcher with regard to what is most important in the conclusions of this research.

Conclusion

In this chapter, it was argued that a design-based research approach can eliminate the boundary between design and research (Edelson 2002), which can result in both theoretical contributions and practical solutions. Although this research approach is appropriate for studying the design of new educational learning materials, it must be concluded that interpretation plays an undeniable role in all research, which accumulates throughout the different studies in design-based research.

It is therefore of significant importance to acknowledge the presence of interpretations in this approach. In that sense, design-based research can be seen as a story, which can be told as objective as possible, but which is undoubtedly colored by the interpretations of the storyteller. Nevertheless, we hope that the methodology described in this chapter can inspire other researchers to write their own story based on their own interpretations.

7.2 Interpretation of Research on Technology Integration in Teacher Education in the USA: Preparation and Current Practices

Anne T. Ottenbreit-Leftwich, Peggy A. Ertmer, and Jo Tondeur

Introduction: Rationale for the Research Project

There is great promise for technology use in educational settings. For example, in the most recent US Department of Education's technology plan (2010), technology is described as offering teachers the means to enact a student-centered, technology-enabled curriculum. Unfortunately, studies have shown that most teachers are not using technology in these student-centered ways (Keengwe et al. 2008; NEA 2008), suggesting that they may be ill-prepared to use technology to affect meaningful learning in their classrooms (Spector 2010). This is causing various stakeholders to question how well teacher education programs are preparing their graduates to be effective technology-using teachers (for an overview, see Kay 2006; Tondeur et al. 2012).

Concerns about this lack of technology use have prompted leaders in higher education and at governmental levels to place a greater emphasis on providing more opportunities for pre-service teachers to use technology throughout their teacher preparation programs (Pellegrino et al. 2007; U.S. Department of Education 2002).

During the past decade, the US Department of Education's *Preparing Tomorrow's Teachers to Use Technology* (PT3) program provided over \$750 million to teacher education programs focusing on new methods for preparing future teachers to effectively integrate technology into their teaching (Pellegrino et al. U.S. Department of Education). For almost three decades now, US teacher education programs have made efforts to prepare their students to use technology as a teaching and learning tool in their K-12 classrooms (Polly et al. 2010).

Studies have examined what knowledge pre-service teachers need in order to be able to implement technology, as well as what teacher education programs should do to prepare their graduates to effectively use that knowledge to support teaching and learning (e.g., Kay 2006). Unfortunately, many of these studies only examined selected schools that were funded by large grants (Pellegrino et al. 2007) or conducted meta-analyses of already published studies (Kay 2006; Polly et al. 2010; Tondeur et al. 2012). Few studies have conducted large-scale evaluations of teachers' uses of technology. Even fewer studies have examined the connection between that which is learned in teacher education programs and that which is required or expected in practice. The study described in this chapter was designed to fill this gap, using a mixed methods approach.

Purpose

The purpose of the study described in this chapter was to address the knowledge gap regarding how teacher education programs should best prepare pre-service teachers to integrate technology into their teaching. We began by examining the topics, related to technology integration, that currently were included in pre-service teacher education programs. We then compared those topics to the ways in which practicing teachers used technology in their classrooms.

A two-phased mixed methods research design was conducted. Phase one focused on gathering data from teacher education programs via a 14-item online questionnaire and follow-up interviews with a selected sample. Phase two focused on examining the technology integration practices of K-12 teachers, via an online questionnaire, followed by one-on-one interviews with a smaller sample. Within both phases, we began by examining a larger population through the use of online questionnaires (Schmidt 1997). Utilizing this method, we could identify common themes to investigate to a greater depth through the one-on-one interviews. Teaching artifacts were collected from participants in both of the smaller samples to create case studies of both teacher educators and practicing teachers. The results explicate the differences in the perceptions of practicing teachers and teacher educators regarding the relevance of various technology integration skills and knowledge to achieving meaningful technology integration in today's K-12 classrooms.

The Focus of the Research

The study was guided by three research questions: (1) What technology topics are included in pre-service teacher education programs? (2) What technology topics do in-service teachers find relevant and meaningful to their teaching/learning practices? (3) What are the similarities and differences between the technology topics included in teacher education programs and those teachers find relevant to their current teaching/learning practices? Initially, the researchers intended to investigate the *types* of educational technology experiences that participants considered to be the most influential on their classroom practices (e.g., stand-alone technology courses, integrated field experiences), but it was difficult to assess that information. This is discussed in more detail later.

The Reason for Choosing Mixed Methods

A mixed methods research design enables researchers to combine the advantages of both quantitative and qualitative data (Teddlie and Tashakkori 2009). Using a sequential mixed design, we first used quantitative data collection methods (close-ended questions) to provide a broad, overarching view of the situation. We also collected qualitative data (from the open-ended questions) to help us elaborate on any common ideas through examination of a larger number of responses (Teddlie and Tashakkori). Through this process, we were able to identify participants from whom to gather additional information, which yielded 39 cases. A multiple case study design allowed us to view the patterns that emerged within and across settings (Yin 2003).

Identifying Participants

In large-scale survey studies, it is critical to identify the appropriate population (Barlette et al. 2001). Because this was a comparison study, there were two critical populations to identify: teacher education programs and technology-using teachers. The selection procedure and rationale for each population is discussed next.

Teacher Education Programs

In 2006, the US Department of Education conducted a similar study (Kleiner et al. 2007) with the intent of collecting information on how teacher education programs across the country incorporated technology into their courses/programs.

Kleiner et al. identified 1,439 schools and requested that one contact person fill out the survey. Although the researchers received a 96 % response rate, there was no information about the individuals who completed the survey for each institution. In other words, the individuals completing the survey may not have known all the various ways technology was being used and/or to what extent it was being used across all courses in the program. This, then, potentially compromised the results.

Therefore, the selection of participants in this study was deemed to be critically important. Using a US Department of Education database called the Postsecondary Education Quick Information System (PEQIS), we identified the institutions that met our specifications. Ideally, we would have selected all institutions that prepared teachers. However, there were certain limitations to using this system. Some institutions only offered master's degree programs (e.g., most California programs), which potentially could have included teachers who were returning for advanced degrees. However, our focus was on pre-service teacher education programs at 4-year institutions, specifically those programs that offered a teaching degree for initial licensure. Using the PEQIS, we identified all 4-year institutions in the USA that offered programs in general, elementary, and/or secondary education ($n = 1,283$).

Once we identified all the institutions, we focused our efforts on selecting the specific individual at each institution who would be asked to complete the questionnaire. This was an important aspect as it was a notable weakness in the previous study (Kleiner et al. 2007). Specifically, it was critical to identify a representative from each institution who had knowledge of the specific educational technology requirements at that institution. By using the institutions' websites, a representative, with knowledge of the uses of educational technology within the teacher education courses, was identified. Identified individuals were contacted by e-mail and asked to complete a 14-item online questionnaire describing the pre-service educational technology requirements at their institutions. Of the 1,283 institutions contacted, 426 individuals completed the questionnaire (response rate of 33 %). We e-mailed reminders three times in order to obtain this response rate. Forty-four percent of institutions responding were public institutions and the median number of teacher education students graduating from responding institutions was 139. Forty-eight percent of the teacher educators responding for their institutions had over 10 years of experience at their institutions, and 62 % of respondents stated that they had primary responsibility for teaching educational technology courses.

From among the 426 responding institutions, 12 were selected for follow-up analysis. Purposeful sampling was used to maximize the variety of institutions selected. Maximized purposeful sampling was important because depending on the location, size, and institution type, educational expectations might be expected to differ. Therefore, the selection of institutions was based on the location of institution [West ($n = 3$), Northeast ($n = 2$), Southeast ($n = 3$), Midwest ($n = 1$), Southwest ($n = 3$)], size of the teacher education programs [Large ($n = 8$), Small ($n = 4$)], and institution type [Public ($n = 6$), Private ($n = 6$)]. The teacher educator representative, who completed the initial questionnaire, also participated in the follow-up interview and document collection.

Technology-Using Teachers

For the second population for the study, we sought to investigate how practicing teachers actually used technology in their classrooms. Our intention was to find high-quality users of technology, in hopes of highlighting the intended goals of the new US Department of Education technology plan (2010). Therefore, we sought to recruit participants from the membership of the International Society for Technology in Education (ISTE). ISTE is a professional association dedicated to supporting teachers' uses of information technology in support of K-12 student learning. With over 18,500 individual members and 80 affiliate organizations, ISTE provided our best access to US teachers who were using technology in innovative and unique ways. Technology-using teachers were recruited through a self-nomination procedure. Requests to participate in the study were sent via e-mail to various listservs focused on educational technology (ISTE special interest groups and ISTE state affiliates). The e-mail requested that teachers complete a 23-item online questionnaire focusing on how they used technology in their classrooms. By completing the questionnaire, teachers self-nominated themselves as technology-using teachers and agreed to participate in the study.

However, not all the responses were used. Responses were selected for the study based on two criteria. First, teachers needed to report that their primary professional responsibilities were directly involved in teaching PreK-12 students; technology coordinators and administrators were not included in the study. This was important because the pre-service teachers graduating from our teacher education programs were most likely to obtain PreK-12 teaching positions. In order to identify the information that needed to be included in teacher preparation programs, we needed to study teachers who were using the technology in their classrooms and (hopefully) using it in ways that aligned with best practices as described by the US Department of Education (2010).

Second, teachers needed to report a high self-assessment of their classroom technology skills. Based on their responses to one questionnaire item in which they rated their comfort levels with technology on a 4-point scale, only those teachers responding at the upper two levels were included (e.g., (1) I'm not comfortable using technology in my classroom, (2) I'm somewhat comfortable using technology in my classroom, (3) I'm comfortable using technology in my classroom, and (4) I'm comfortable teaching others to use technology in their classrooms). If teachers reported feeling not comfortable or only somewhat comfortable, we did not include them in the sample.

A total of 457 individuals responded to the questionnaire. Of those respondents, 316 met both of the criteria. Sixty-eight percent of these respondents taught at the secondary level, and 60 % had more than 15 years of teaching experience. This was one of the trade-offs in our research design when selecting participants. Unfortunately, since more than half of our participants had more than 15 years of experience, their pre-service teachers' education programs did not include technology experiences. Therefore, we were unable to identify the experiences they perceived as being most influential from their teacher preparation programs. Instead, with this population, we chose to focus on the topic areas they believed were most critical to include now.

From among the 316 teachers responding to the questionnaire, 27 teachers were selected for follow-up interviews and additional data collection. Purposeful sampling was used to maximize the variety of teachers selected for follow-up analysis; selection of teachers was based on subject areas and grade levels taught. Because teachers use technology differently in various subject areas and grade levels (e.g., Tondeur et al. 2007), it was important to include representation from the four core subject areas (English language arts, social studies, math, and science) and both elementary and secondary (including middle school and high school) levels in the follow-up phase. The ten elementary teachers taught in classrooms from 1st grade to 5th grade. The secondary teachers included eight middle school teachers and nine high school teachers and varied in the core subject areas taught.

Description of Data Sources

To answer our research question about which technology topics were relevant to both practicing teachers and teacher education programs, we distributed a questionnaire with both closed- and open-ended questions to both sets of participants. A slightly different questionnaire was distributed to both populations. After comparing trends among responses, we conducted follow-up case studies of individual teacher education programs and technology-using teachers.

Questionnaires

Teacher Educator Questionnaire

The teacher educator questionnaire consisted of 14 items separated into three sections. The first section contained four items focusing on demographic information such as institution name, location, and the responsibilities of the individual respondent (teacher educator) with regard to the program. Demographic information was used to inform our selection of institutions for the follow-up interviews. The second section contained seven items focusing on the technology topics included in coursework and/or experiences required in the institution's teacher education programs. These items were based on several meta-analyses of teacher education programs (Brush et al. 2003; Ottenbreit-Leftwich et al. 2010; Polly et al. 2010). The last section referred specifically to relevant technology topics covered in the program. Respondents were provided with a list of technology topics and asked to select those that were included in all or some of the teacher education programs at their institution.

To create the list of topics for participants to respond to, we initially reviewed resources describing how teachers use technology. These resources included research articles (e.g., Brush et al. 2003; Ottenbreit-Leftwich et al. 2010) and

educational policy documents (e.g., US Department of Education technology plan, ISTE National Educational Technology Standards for Teachers, and the UNESCO ICT Competency Standards for Teachers) that described how technology had been used in the past and which also advocated how technology should currently be used.

Using these resources, we created a research-based conditional matrix that identified key topics/practices, along with research studies that provided evidence of the impact of those practices at the teacher knowledge level, teacher application level, and/or student achievement level (see Fig. 1 for example excerpt).

Research-Based Matrix			
	Knowledge Level	Application Level	Student Achievement
Content (knowledge base)			
Students use a wide variety of software	Hadley & Sheingold, 1993; Becker, 1994		Case study: Ravitz & Mergendoller, 2002; Peter-ongoing
Comfortable and confident with using technology	Hadley & Sheingold, 1993; Zhao, Byers, Mishra, Topper, Cheng, Enfield, et al., 2001	Ertmer, Gopalakrishnan, & Ross, 2001	<ul style="list-style-type: none"> Sexton, King, Aldrige, Goodstadt-Killoran, 1999 Collis, 1987

Fig. 2 Definitions of topic categories

A definition was provided for each main topic (see Fig. 2 for example). Content validity was established by synthesizing the literature that described teachers’ technology uses and/or technology topics covered by teacher education programs (Fink 2003). These categories were then examined, revised, and validated by a team of university faculty, K-12 teachers, and educational evaluation experts selected by the US Department of Education based on experience and expertise in the area of technology integration. Using external expert reviewers, we were able to establish the face validity of the questionnaire confirming that the measure included all the necessary questions and covered all the necessary constructs (Fink).

The final categories/topics included in the questionnaire were: personal productivity, information presentation, administration/classroom management, communication, access/use of electronic resources, analysis of student data, facilitation of specific teaching concepts, documentation of personal/professional growth, support for student learning styles, support of higher-order thinking skills, support for students with special needs, and classroom preparation. Examples for each category were provided so teacher educators would understand what each topic meant (see Fig. 3). Teacher educators were asked to indicate whether all programs, some programs, or none of their programs covered each topic.

We used the responses of the 426 respondents to test the reliability of the questionnaire. The Cronbach’s alpha measure of internal consistency for this portion of the questionnaire was 0.86. The second item in this section was open ended and asked respondents to indicate what technology topics they perceived to be the most important topics incorporated into the curriculum of their programs.

7) Below are various topics that are included in educational technology courses/experiences in elementary or secondary education programs. Please indicate if each of these topics is included in all elementary and secondary teacher education programs at your institution, some elementary and secondary teacher education programs, or no elementary and secondary teacher education programs by selecting the appropriate column.

	ALL programs	SOME programs	NO pro
Use of technology for personal productivity (e.g., word processors, spreadsheets)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Use of technology for information presentation (e.g., powerpoint, digital media)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Use of technology for administration and classroom management (e.g., gradebooks, attendance, seating charts)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Use of technology for communication with peers/parents/students (e.g., e-mail, online chats, parent newsletters, class websites)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Use of technology to access and use electronic resources (e.g., websites, online databases)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Use of technology to analyze student achievement/performance data (e.g., identify trends, provide remediation to learners)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Use of technology to facilitate teaching specific concepts (e.g., computer-based courseware, tutorials)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Use of technology to document personal/professional growth (e.g., electronic teaching portfolios)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Use of technology to support various student learning styles (e.g., use of media for auditory and visual learners)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
Use of technology to support activities that facilitate higher-order thinking (e.g., collaborative problem-based activities, activities that require analysis and synthesis of information)	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

Fig. 3 Technology topics included on the questionnaire for teacher educators

Technology-Using Teacher Questionnaire

The teacher questionnaire consisted of 23 items separated into three sections. The first section contained seven items focusing on demographic information such as current teaching position and location, grade level/content area, and years of teaching experience. Similar to the inclusion of demographic information for teacher educators, this information was used to identify potential follow-up case participants (using grade level/content areas).

The second section contained 12 items focusing on ways in which teachers used technology to support their teaching in a typical week, and the types of technology experiences completed in their teacher education programs (e.g., educational technology courses, technology activities in methods courses). Because most teachers

indicated that their pre-service technology experiences were not influential, with most having graduated over 10 years earlier, we did not include their responses to these items in this research. Instead, we focused on the technology that teachers used on a regular basis. The final section asked respondents to rate their technology expertise, to rate their pre-service teacher experiences, and to provide additional contact information if they were willing to participate in a follow-up interview.

The question focusing on technology topics utilized the same categories from the teacher educator questionnaire. The only difference was that we asked teachers to select the topic(s) that best matched the ways they used technology to support their teaching during a typical week (see Fig. 4).

We used the responses of the 316 teacher respondents to test the reliability of the questionnaire. The Cronbach's alpha measure of internal consistency for this portion of the questionnaire was 0.70. The next three items in this section were open-ended and asked respondents to indicate other ways they used technology to support their teaching and what they believed were the best ways to use technology to support teaching and learning.

16) Please identify all the different ways you use technology to support your work during a "typical" week (please check all that apply):

- I generally don't use technology during a "typical" week
- Personal productivity (e.g., word processors, spreadsheets)
- Information presentation (e.g., powerpoint, digital media)
- Administration and classroom management (e.g., gradebooks, attendance, seating charts)
- Communication with peers/parents/students (e.g., e-mail, online chats, parent newsletters, class websites)
- Access and use electronic resources (e.g., websites, online databases)
- Analyze student achievement/performance data (e.g., identify trends, provide remediation to learners)
- Facilitate teaching specific concepts (e.g., computer-based courseware, tutorials)
- Document personal/professional growth (e.g., electronic teaching portfolios)
- Support various student learning styles (e.g., use of media for auditory and visual learners)
- Support activities that facilitate higher-order thinking (e.g., collaborative problem-based activities, activities that require analysis and synthesis of information)
- Facilitate your support of students with special needs in your classroom (e.g. assistive technology, special software, etc.)?
- Classroom preparation (e.g., lesson planning, gathering resources)

17) Do you use technology to support your work that was not previously mentioned in question 16? If so, please describe that use below.

Fig. 4 Technology topic question for teachers

Follow-Up Interviews and Document Collection

Teacher Educator Follow-Up

We identified teacher educators from 12 institutions to participate in follow-up interviews, based on the recommendation of Guest et al. (2006), who indicated that data saturation typically occurs at 8–12 participants. Similar to the questionnaire instrument, items on the semi-structured interview protocol were developed by a team of experts in technology integration and approved by the team of university faculty, K-12 teachers, and educational evaluation experts selected by the US Department of Education. This helped establish the face validity of the instrument (Patton 2002). For example, the interview protocol initially included a question, “What competencies do the students leave with?” The experts recommended adding specific examples to make this question more specific and prompted us to ask teacher educators to provide information on the technology topics and/or areas that were included in their teacher education programs (question 3).

The interview protocol was pilot tested with other teacher educators (not identified for the follow-up study). This helped us identify unclear questions or areas of focus. Based on these pilot tests, slight wording modifications were made. In addition, some follow-up probing questions were added to extract specific examples, while some questions were removed due to duplicity. In one question, we asked the pilot test teacher educators to tell us, “How much interaction with technology do you think pre-service teachers get outside of the required courses?” Respondents had a difficult time answering this question, asking for clarification. Therefore, we modified this question to, “How do pre-service teachers use technology in other contexts (e.g., methods classes, field experiences, etc...)?” The interview protocol consisted of nine broad questions, focusing on the technology topics/areas included in their teacher education programs, unique aspects of their specific programs with regard to technology integration, and challenges faced when attempting to infuse technology into their programs (see Fig. 5).

Teacher Educator Supplemental Documents

For each of the 12 institutions selected for follow-up analysis, specific documents were also collected from a variety of sources (e.g., program websites, faculty). These documents included syllabi for various technology courses, overviews/program sheets for the teacher education programs offered at the institutions, sample assignments, course materials, and student work. The supplemental documents were collected to triangulate the data sources and themes emerging from the interviews and questionnaires (Stake 1995). Stake noted that through the use of *methodological triangulation*, “we are likely to illuminate or nullify some extraneous influences” (p. 114).

Let's begin...

- 1) Can you talk about your institution and your role in your institution's teacher education program?
 - What courses do you supervise/teach/direct?
 - Talk about the demographics of students in your teacher education program.

- 2) How does your institution prepare your elementary and secondary preservice teachers to use technology in their future classrooms?
 - What educational technology courses are your elementary and secondary preservice teachers required to take?
 - What other requirements in terms of technology exist for preservice teachers?
 - Are there different requirements for different programs? Can you describe them?
 - How have you integrated technology throughout the teacher education curriculum?
 - How do preservice teachers use technology in other contexts (e.g., methods classes, field experiences, etc.)?

- 3) What are the technology topics and/or areas that are included in your teacher education programs?
 - What are the main topics you teach? Theory or actual tools?
 - How do you determine these topics/areas?
 - What specific tools do you teach?
 - What types of assignments do the students need to complete?
 - What strategies are used to teach these topics/areas?
 - How do you prepare preservice teachers to use technology with diverse populations (special needs, ENL, etc.)?

- 4) What technology resources (hardware, software, etc) are available to faculty and students?
 - What technology resources are available in your college/school/university?
 - What specific resources related to technology integration in K-12 settings are available?
 - Are there resources available that can be taken off-site for use in K-12 schools?
 - Where can preservice teachers go if they have a question about educational technology or technology resources?

- 5) Could you describe what you feel are unique aspects of your teacher education program with regards to technology?
 - What are some of the most creative approaches used at your institution you've seen in terms of teaching preservice teachers to use technology in their future classrooms?
 - What are the most successful ways you have experienced in your program to teach preservice teachers how to use technology?
 - Do you have any unique projects (funded, university initiatives) focusing on technology that include preservice populations?

- 8) What feedback have you received from recent graduates of your program?
 - What technology requirements/experiences are they saying are relevant/beneficial to their current professional placements?
 - What technology requirements/experiences would they have liked more exposure to?
 - What technology topics/areas are they saying are relevant/beneficial to their current professional placements?
 - What technology topics/areas would they have liked more exposure to?

- 9) Do you have any additional comments on your institution and the methods you use to prepare future teachers to integrate technology?
 - Any samples of materials/syllabi/etc you would be willing to share?
 - Other individuals who might be beneficial to talk with?

Fig. 5 Teacher educator interview protocol

Technology-Using Teacher Follow-Up

Twenty-seven teachers agreed to participate in follow-up interviews. We selected individuals from both elementary and secondary schools, as well as the four core subject areas at the secondary level. Similar to the teacher educator interview protocol, items on the semi-structured interview protocol for technology-using teachers were developed by a team of experts in the area of technology integration and approved by the team of university faculty, K-12 teachers, and educational evaluation experts selected by the US Department of Education. To strengthen the validity of the interview protocol, experts made recommendations to improve the focus and suggested follow-up probes for questions.

The interview protocol was also pilot tested with other teachers (not identified for the follow-up study). This helped us identify unclear questions or areas of focus. Based on these pilot tests, small revisions were made, some follow-up probing questions were added, and a few questions were removed. The final interview protocol consisted of ten broad questions, focusing on how and why these teachers use technology for teaching and learning (Fig. 6).

Technology-Using Teacher Supplemental Documents

For each of the participating teachers, specific documents were collected from a variety of sources (e.g., teacher websites, e-mail correspondences). These documents included specific teacher-developed activities, sample assignments, course materials, and student work. It was important to collect these documents to (a) provide additional context for teachers' uses of technology (*data source triangulation*) and (b) provide triangulation for the technology uses they described during their interviews (*methodological triangulation*) (Stake 1995).

Preparing to Obtain the Data

It was critical to establish an online questionnaire that was easy to use and read, as well as one that organized the data and was easily accessible to the researchers. In this study, the questionnaire data were collected through a secure, survey tool. The data were then downloaded into a spreadsheet and organized. The more critical plans for organizing the data related to the follow-ups for both populations, as there were 39 cases whose data needed to be organized (questionnaires, interviews, documents). Furthermore, we needed to be able to organize and compare the data across those cases. As Stake (2006) noted, organization in multiple case studies is essential. Patton (1980) recommends utilizing a case record which "pulls together and organizes the voluminous case data into a comprehensive primary resource

- 1) Can you describe how you use technology in your [English / Language Arts] classroom with regards to teaching and learning?
- Ask for document examples (lesson plan, sample student work, student reflections on the lesson, teacher-created materials)
 - BEST WAY. What's the coolest way that you use technology?
 - INFORMATION PRESENTATION. Can you give me some specific examples of how you use technology in [insert specific grade/ English / Language Arts] for information presentation? (get at content specific) Samples via email.
 - What are your reasons for using technology for information presentation?
 - Why do you use that, as opposed to other non-digital technologies?
 - ADMINISTRATION/CLASSROOM MANAGEMENT. Can you give me some specific examples of how you use technology in [insert specific grade/ English / Language Arts] for administration and classroom management? (gradebooks, classroom management software) (get at content specific) Samples via email.
 - What are your reasons for using technology for administration and classroom management?
 - Why do you use that, as opposed to other non-digital technologies?
 - SPECIAL NEEDS. Can you give me some specific examples of how you use technology in [insert specific grade/ English / Language Arts] for supporting students with special/diverse needs? (get at content specific). Samples via email.
 - EXAMPLES. Describe the technologies that students with special needs use in your classroom.
 - REASONS. What are your reasons for using technology for supporting special needs?
 - Describe your responsibilities with regards to students with special needs in your classroom and technology.
 - STUDENT USE OF TECHNOLOGY. So, you described an example where you use the technology. Can you describe another example where you have your students use the technology?
 - Please explain why you think this use is meaningful.
 - TEACHER USE OF TECHNOLOGY. So, you described an example where your students used the technology. Can you describe another example where you use the technology?
 - Please explain why you think this use is meaningful.
 - STUDENT KNOWLEDGE. Explain the knowledge or skills your students gain from using technology in this unit.
 - Why you decided to have students use technology in this way during the unit?
 - Why was technology necessary instead of other methods?
 - Explain how this skill will help students be prepared for their futures. Do you think this is an important skill to have?
 - SPECIFIC TECHNOLOGY TOOLS. If you could use only one technology during the school year, what would it be?
 - Why?

Fig. 6 Technology-using teachers' interview protocol (English language arts example)

package ... information is edited, redundancies are sorted out, parts are fitted together, and the case record is organized for ready access either chronologically [or] topically ... complete but manageable" (p. 313). In this study, the data were organized by themes within each case (see Fig. 7).

For each case, documents (websites, syllabi, files, student work, etc.) were all uploaded to a secure server. A large spreadsheet was set up—each case received its own tab. A description and a link to all documents were included in that case's tab. This enabled us to view all the documents, interview transcripts, and questionnaire responses for one case within a single location (Merriam 1998).

Fig. 7 Example of case record organization

Obtaining the Data

The supplementary documents (e.g., syllabi, course websites, etc.) were obtained from publically available websites and via e-mail with the individual participants. To locate publically available documents and websites, the researchers conducted in-depth searches. The documents found in these searches were used to focus the follow-up interview questions for each teacher educator and practicing teacher. Furthermore, all documents were member-checked with the interviewee to ensure the documents were theirs. Finally, each interviewee was asked to supply additional documents illustrating concepts covered during the interview.

Interpreting the Results

To answer our research questions, we began by examining the basic demographics of those responding to the questionnaire. For the teacher educators, this helped identify the context of their programs: public or private, location of the institution, and size. For practicing teachers, this helped identify who was engaged in classroom teaching, as opposed to serving as a technology coach, media specialist, or administrator. Demographic data were analyzed using frequency counts.

Next, we examined the technology topics teacher educators were covering in their programs. This closed-ended questionnaire item asked teacher educators to select those topics that were included in all, some, none, or optional in their teachers' education programs. To compare these topics to those considered important to practicing teachers, the same list of technology topics was provided to our sample of classroom teachers, who were asked to indicate which ones were used during a typical week. Our main goal was to compare those topics being covered by a majority of the teacher education programs with how teachers were using technology. If there were no significant difference between the two groups, we could surmise that the majority of teacher education programs were preparing future teachers to use the kinds of technology current teachers actually use in their classrooms. However, if there were a significant difference, this would suggest that the majority of teacher education programs are either teaching topics that teachers do not utilize in their own classrooms or are not covering the topics teachers do use. Therefore, a chi-square test was used to compare the differences, on each topic, between teacher educators and practicing teachers.

With the chi-square test, we needed to limit the variables in the teacher educator responses. Therefore, instead of looking at which technology topics were included in all, some, none, or optional in their teachers' education programs, we decided to only look at the reports of the technology topics required by all teacher education programs. If we examined topics that were listed as being "optional" or only required in "some" teacher education programs, it was likely that these topic areas did not target most of the teacher education graduates in these programs. Significant chi-square results prompted our subsequent use of effect sizes to further differentiate between topics. The effect size "characterizes the degree to which sample results diverge from the null hypothesis" (Cohen et al. 2000, p. 610). An effect size above .3 is considered a moderate to strong effect size (Cohen et al.). Thus, based on our results, there was a strong difference between samples on the following topics: administrative purposes (.508), communication (.482), access and use electronic resources (.344), analyze student achievement data (.300), teach specific concepts (.335), support a variety of learning styles (.401), and support higher-order thinking (.334).

Once these significant differences were identified, it was important to gain a better understanding of why these occurred. Therefore, we examined participants' responses to the open-ended questions to help illuminate the reasons behind these differences. One of the open-ended items on both questionnaires was designed to garner perceptions of the importance of specific technology uses. Teacher educators

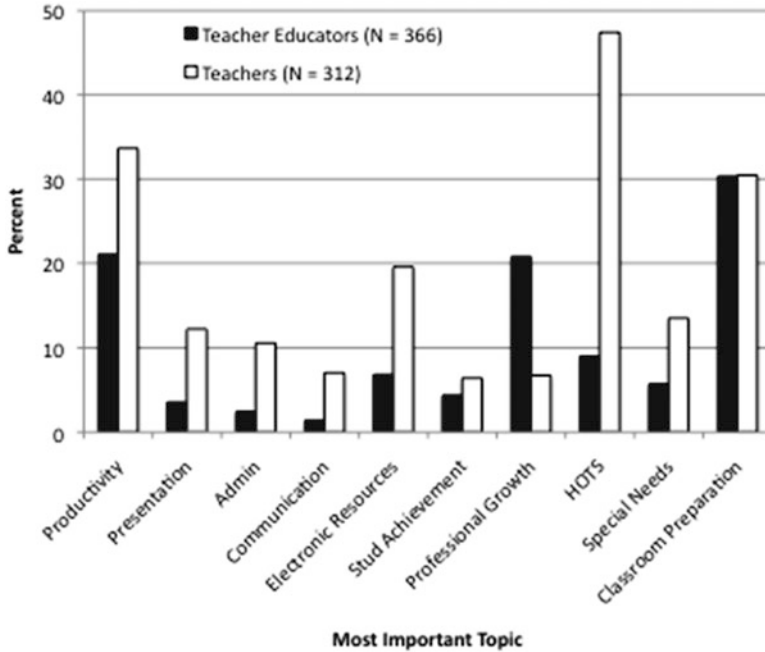

Fig. 8 Comparison of percentage of responses by teacher educators and practicing teachers regarding important technology topics/uses

were asked to describe the most important technology topic covered in their teacher education programs, while practicing teachers were asked to describe the best ways to use technology for teaching and learning. By examining the results of this open-ended question, we hoped to identify why certain topics were identified in teacher education programs, but not used by teachers or vice versa. The results reported were based on the percentage of teacher educators ($n = 366$) and practicing teachers ($n = 312$) who responded to the open-ended questionnaire item (see Fig. 8).

To code the open-ended responses, we used a deductive code list generated from the close-ended question described above (which was previously constructed from the literature and approved by experts). Using a constant-comparative method, two codes were combined with others due to an overlap in teacher responses. The *Teaching Specific Concepts* code was folded into a *Classroom Preparation* code since both emphasized searching for resources and lesson planning to teach specific concepts. We also combined the *Learning Styles* code with the *Special Needs* code. When teachers referenced using technology to address learning styles, they typically mentioned that technology could be used to address both the special needs and learning styles of individual students.

To increase the reliability of the coding, four researchers worked together to establish definitions and representative example responses. The four researchers then used that code list with descriptions and examples to code participant responses separately; two researchers reviewed all the teacher educator responses,

and two reviewed all the teacher responses. The researchers evaluated all the coded participant responses where disagreements occurred and resolved each issue separately.

To compare differences in frequencies of responses between teachers and teacher educators on the close-ended and open-ended questionnaire items described above, Pearson's chi-square analyses were conducted on those item responses. Since multiple tests were conducted on each item, the alpha level was set at a more conservative $.05/10 = .005$. To further determine the magnitude of the effect for each comparison, Cramer's V was computed and reported for each Chi-square test conducted. Seven of the ten codes were found to be significantly different.

Each code was then used to examine the significant differences among topics shown in Table 1. For example, there was a significant difference between teacher educators and teachers regarding how they reported using technology to support higher-order thinking skills. On the close-ended question, teachers reported using technology to achieve this goal much more frequently than teacher educators reported covering the topic during their classes. In the open-ended question, almost half of the teachers described that this was one of the best ways to use technology for teaching and learning. Teachers mentioned the best uses of technology to facilitate student learning included using the collaborative capabilities of technology (e.g., "The best ways to use tech to support teaching and learning are to take advantage of its collaborative abilities. Connect your students to the world around you." [Teacher 426]), increasing student engagement (e.g., "Creating interactive lessons with visuals and high-interest activities engages the students." [Teacher 396]), or facilitating student-centered activities (e.g., "Student-centered

Table 1 Comparison of selected technology topics covered by teacher education programs and those used on a weekly basis by teachers

Topic/use of technology	Teachers ^a	Teacher educators ^b	χ^2	Cramer's V
	(N = 368)	(N = 406)		
Personal productivity	97.8	78.3	67.35***	.295

^bRepresents percentage of respondents who indicated that this technology topic was included in all teacher education programs at their institutions

technology [is the best use]. The ability to have each student investigate and use technology.” [Teacher 318]). This suggests that teachers may value using technology to support higher-order thinking more than teacher educators.

In the second phase of the study (39 case studies of teacher educators and teachers), researchers used multiple case analysis procedures to analyze data obtained from interviews and artifacts. For each case, data were organized topically by the codes established in the first phase, thus developing a case record for each teacher and teacher educator participating in follow-up data collection (Yin 2003). One researcher reviewed each case record and recorded margin notes on emerging themes. The research team then collectively discussed the themes emerging both within and across the cases. Refer to Table 2 for examples of codes and corresponding themes (not all are listed).

Presenting the Results

The quantitative results were presented first to provide an overall picture of the similarities and differences between teacher education programs and technology-using teachers. Once this general picture was provided, we examined the nuances that emerged from the qualitative data. The qualitative data also provided an opportunity to explain the differences. Qualitative data were presented using verbs like “described” or “presented” to convey that we were summarizing the participants’ statements. For example, we discussed one teacher educator’s interview response as follows:

...described the importance of having pre-service teachers using Web 2.0 to collaborate: ‘You know, if every kid is making their own PowerPoint, that’s interesting – but if kids are getting together to discuss how to build one PowerPoint and it’s a group of aspect of the PowerPoint, you’ve got much richer and more meaningful use of technology there. And I think by focusing on the collaborative aspect of Web 2.0 technology, you get your foot in the door there, very naturally too’ [Teacher Educator L, lines 94–98]. Analysis of course assignments revealed that many programs incorporated other Web 2.0 tools (e.g. Google Docs, Titanpad) into the activities pre-service teachers completed. (p. 18)

When interpretations were presented, we attempted to use as much of the participant’s own language as possible. In addition, we triangulated any responses with additional data sources to increase the trustworthiness of our reported results.

Close-Ended Questionnaire Item

Based on our results, there was a strong difference between samples on the importance and/or use of technology for the following: administrative purposes (.508), communication (.482), to access and use electronic resources (.344), analyze student achievement data (.300), teach specific concepts (.335), support a variety of learning styles (.401), and to support higher-order thinking (.334) (see Table 1).

Table 2 Emerging theme examples based on topic codes

Code	Emerging theme	Example of emerging theme
Productivity	Presentations—using technology to present information (the importance of being able to do this)	“They have to pass a test. . .They have to actually do a presentation with Smartboard. I make sure that our teachers are ready to go out” (Teacher Educator E, lines 362–375)
Administration/ classroom management	Gradebook/course management system	“We do all our report cards on the computer. We have Power Grade” (Teacher b, lines 170–172)
Communication	Website (to communicate or post resources for students). Teacher education programs model this, students are not required to complete	“The gradebook program we used was called <i>SmartWeb</i> . . .is probably one of the more useful tools to me as a teacher – pushing that accountability factor on to the parents. I register every parents and make them accountable for being aware of what their children are doing. . .I put current grades weekly in there” (Teacher y, lines 200–214)
Access and use electronic resources	WebQuests, Google searches, websites, online databases	“We use Quest Garden. Questgarden.com. Bernie Dodge has a whole business online” (Teacher Educator G, line 144)
Assessment/ analyze student performance data	Clickers, cell phones, immediate feedback, accelerated reader results	“We have a SMART response system. . .I use that to generate what groups I’m going to be working with. I don’t want to pull kids that don’t need extra help that can be working and be furthering themselves” (Teacher g, lines 124–143)
Document personal/professional growth	Personal learning networks	“I spend 10–15 minutes going through Twitter reading and looking. And when I find something that looks like it might be interesting. . .I copy and paste it to Delicious” (Teacher u, lines 124–129)

Open-Ended Questionnaire Item

Teacher educators were asked to describe the most important technology topic covered in their teacher education programs, while practicing teachers were asked to describe the best ways to use technology for teaching and learning. Based on the descriptions provided by teacher educators, the most important technology

Table 3 Comparison of perspectives regarding the importance of specific technology uses: teacher education representative perceptions versus teacher perceptions

Topic/use of technology	Teachers ^a (N = 312)	Teacher educators ^b (N = 366)	χ^2	Cramer's V
Personal productivity	33.7	21.0	13.65***	.142
Information presentation	12.2	3.6	18.02***	.163
Administrative purposes	10.6	2.5	19.10***	.168

Document professional growth	6.7	20.8	27.06***	.200
Support students with special needs	13.5	5.7	11.92*	.133
Support higher-order thinking	47.4	9.3	124.80***	.429

* $p < .05/10 = .005$; *** $p < .001/10 = .0001$

^aRepresents percentage of respondents who indicated that they viewed this use of technology as the best/most important way to use technology for teaching and learning

^bRepresents percentage of respondents who indicated that this technology topic was the most important topic covered in the teacher education programs at their institutions

topic was introducing future teachers to how to use technology for classroom preparation and to teach specific concepts (30.6 %). In contrast, when teachers were asked to describe the best ways to use technology for teaching and learning, almost half (47.4 %) described technology uses that supported higher-order thinking. To further examine the magnitude of the effects, Cramer's V was computed for all comparisons. Based on these data, a moderate to strong effect size was calculated for using technology to support higher-order thinking (.429). This topic showed the widest disparity between teachers and teacher educators in terms of perceptions regarding the importance of specific technology uses (see Table 3).

Multiple Case Records

Analysis of interview and artifact data revealed several emerging themes that highlighted differences between teacher education programs and K-12 teachers with regard to the use of technology to support teaching and learning. These main differences included communication, analyzing student data, documenting professional growth, and supporting higher-order thinking skills.

Communication referred to using e-mail, websites, newsletters, and/or blogs to communicate with parents and students. Almost all of the 27 teachers interviewed discussed using technology for communication purposes in their classrooms. They described using a range of technologies from more traditional newsletters and websites, to blogs and e-mail. In contrast, very few teacher educators interviewed mentioned preparing pre-service teachers to use technology for communication purposes. For the few that did, pre-service teachers created newsletters or static websites to inform “parents” of classroom events.

Analyzing student data included statements about using technology for data-driven decision making, feedback, and assessment—specifically examining student data. For this particular code, three distinct themes emerged. For teachers, they mentioned using classroom performance systems (clickers) and portfolios for assessment purposes. Teacher educators did not discuss either of these themes, but some interviewees described the importance of designing assessments that aligned with objectives.

Using technology to document or engage in professional growth included any informal (e.g., collaboration with other teachers) or formal uses (e.g., e-portfolios). Most teachers responded that technology provided them with a constant source of professional growth. With the amount of resources and information available on the Internet, teachers established their own PLNs through a variety of social media sites (e.g., Twitter, blogs, Google bookmarks). One teacher stated that the Internet was “. . . a floodgate. I’m just constantly bookmarking, dog earing different things here and there.” This was perhaps the strongest theme revealed during interviews with teacher educators—the use of electronic portfolios. Electronic portfolios tended to be used to encourage pre-service teacher reflection and documentation of technology skills and pedagogical knowledge. Most teacher educators indicated that portfolios required pre-service teachers to document how they addressed the standards.

Using technology to support activities that facilitate higher-order thinking skills focused on using Web 2.0 technology tools to support student collaboration and using technology to support project-based learning. Both teachers and teacher educators discussed these two themes. Teachers reported using various technology tools to facilitate student collaboration. One teacher described using blogs and the commenting feature: “I allow them to comment on each other’s blogs. We have a lot of discussion.” Teacher educators did not discuss teaching pre-service teachers how to use technology to support K-12 collaborative projects. Instead, teacher educators described how they modeled the use of technology for collaboration by assigning pre-service teachers to group projects and using Web 2.0 technology to facilitate collaborative activities involved in completing those projects.

Discussion

The results of the study have relevant implications for practice because they help us identify areas of disconnect between preparation programs and actual practice. By investigating this gap, we have accomplished several things. First, we

documented several areas in which teacher education programs may not be preparing teachers to be successful in the field. For example, although 99.2 % of teachers reported using technology for communication on a weekly basis, only 59.3 % of teacher education programs reported covering this topic. These results can cue teacher educators as to the importance of this topic area to practicing teachers and thus suggest the need to address this during teacher preparation programs. Another example of an informative result is in the documentation of professional growth.

The research question posed at the beginning of the study focused on examining gaps between the current topics, related to technology integration, that are included in pre-service teacher education programs, and the ways in which practicing teachers use technology to support their teaching and learning efforts. Specifically, we asked the question, “What are the similarities and differences between the technology topics included in pre-service teacher education programs and the technology topics teachers find relevant and meaningful to their teaching/learning practices?” To investigate this, it was important to gather information from both teacher education programs (to see how we prepare teachers for practice) and teachers (to see what teachers are actually doing). Furthermore, it was critical to survey a large sample from both populations to determine what they typically do. The online questionnaire helped us gather this information from a large sample for both populations. Then using this information to identify common themes, we needed to follow-up in order to gather specific examples of these themes. Therefore, interviews and additional documents were gathered in case study format to understand how these themes were manifest in specific bounded contexts.

This study was commissioned by the US Department of Education to address concerns regarding the preparation of students in teacher education programs for meaningful technology use. Based on our own experiences as teacher educators, the authors felt compelled to examine this concern across teacher education programs, nationwide. As noted in the first author’s previous publications (Ottenbreit-Leftwich et al. 2010), she has made a concerted effort to elevate the voices of teachers to promote technology uses that align with their own values and needs. Results of this study confirmed that there are several technology topics/uses for which teachers and teacher educators differed in terms of the frequency of inclusion in teacher education programs versus the prevalence of use in the classroom. Although teacher educators are addressing a wide variety of topics in their programs, these are not completely aligned with the types of topics or uses that classroom teachers most value, as indicated by the technology they incorporate into their classrooms on a regular basis. Future efforts are needed to provide our future teachers with the skills and knowledge they need to be effective technology-using teachers.

7.3 Theory-Driven Evaluation Studies: Establishing Links Between Research, Policy, and Practice

Leonidas Kyriakides

Introduction

Theory-driven evaluation is a collection of different methodological approaches that can be used by evaluators in trying to understand the impact of a reform policy evaluation such as those of program theory, theories of change, and realism (Bledsoe and Graham 2005; Rosas 2005). In all of these perspectives, social programs are regarded as products of the human imagination; they are hypotheses about social betterment (Bickman 1985). Programs chart out a perceived course where wrongs might be put right, deficiencies of behavior corrected, and inequalities of condition alleviated. Programs are thus shaped by a vision of change and social justice, and they succeed or fail according to the veracity of that vision. In respect to these, evaluation has the task of testing out the underlying program theories (Chen and Rossi 1987) and also identifying unintended consequences, which may or may not be beneficial. This also implies that when one evaluates, he/she should return to the core theories about how a program is supposed to work and, then interrogate it by asking whether the basic plan is sound, plausible, durable, practical, and, above all, valid.

Evaluation projects that are theory driven take into account the needs and issues raised by the various stakeholders associated with an innovation, such as the practitioners and the policy makers. However, the evaluation agenda of these projects is also not entirely defined by the policy makers and the school stakeholders. The overall agenda is expanded in such a way as to allow evaluators to not only provide answers to the questions raised by stakeholders but also help them understand the reasons for which a reform is more or less effective (Weiss 1997). In this chapter, it is argued that in order to provide such answers, evaluators in

education should make use of the growing knowledge base of educational effectiveness research (EER) as it is concerned with the correlates of effective practice and provides theories about their relationships with each other and with student outcomes.

EER can be seen as an overarching theme that links together a conglomerate of research in different areas, including research on teacher behavior and its impacts, curriculum, student grouping procedures, school organization, and educational policy (Scheerens and Bosker 1997). The main research question underlying EER is the identification and investigation of which factors in the teaching, curriculum, and learning environments (operating at different levels such as the classroom, the school, and above-school) can directly or indirectly explain measured differences (variations) in the outcomes of students (Creemers and Kyriakides 2006). Further, such research frequently takes into account the influence of other important background characteristics, such as student ability, socio-economic status (SES), and prior attainment (Teddlie and Reynolds 2000). Thus, EER attempts to establish and test theories which explain why and how some schools and teachers are more effective than others in promoting better outcomes for students (Kyriakides 2008). In this context, this chapter argues that EER can be seen as a theoretical foundation upon which better evaluation studies can be built in education. Guidelines for conducting theory-driven evaluation studies that are based on educational effectiveness are provided, and a framework for designing theory-driven evaluation studies is offered. In the last part of the chapter, it is argued that EER could have a greater impact on policy and practice if theory-driven evaluation studies based on theoretical models of EER are conducted.

Designing Theory-Driven Evaluation Studies: The Role of EER

Programs are embedded in social systems as they are delivered (Shaw and Replogle 1996). As a result, it is through the workings of entire systems of social relationships in and outside the classroom and/or the school that any changes in behaviors, events, and social conditions in education occur. Serving to aid an understanding of variation within an effective implementation of a reform, theories of educational effectiveness can help evaluators identify factors most closely associated with the effective implementation of the reform policy.

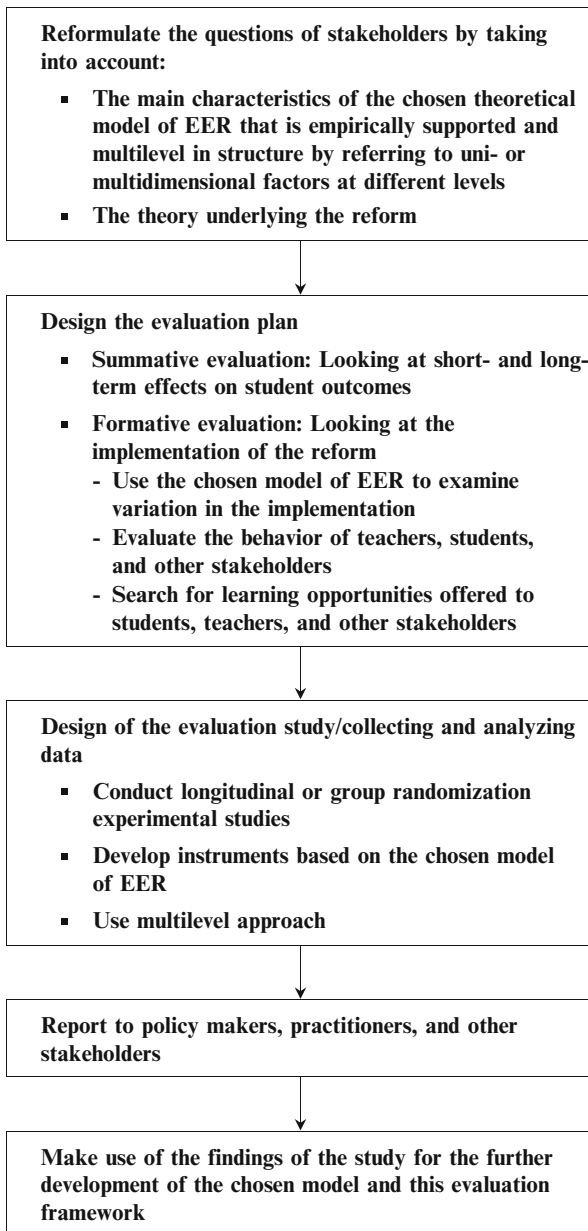

A typical example of a theory-driven evaluation is the evaluation of a 1998 Cypriot reform that concerned the use of schema theory in teaching mathematics (Kyriakides et al. 2006). Five years after the introduction of the reform, an evaluation study was conducted in order to determine its current implementation. The study aimed to examine the main stakeholders' (i.e., teachers' and students') reactions to the reform and the factors influencing its effectiveness. The study not only provided answers to policy makers but also revealed that student achievement was determined by a number of factors related to teachers' and students' personal

characteristics and teachers' reactions towards the reform itself. Moreover, the research verified the decisive role of teachers in implementing any reform. Based on the findings of this study and drawing on the theoretical assumptions of the "emergent design" research model, a conceptual framework for conducting program evaluations was proposed which attributes a central role to teachers' classroom behavior. It was claimed that teacher effectiveness research could be a foundation upon which to design studies regarding the evaluation of reforms (Kyriakides et al. 2006). In turn, this study revealed that EER can be seen as a foundation upon which a theory-driven evaluation project can be designed. Furthermore, this study reveals that it is possible to combine theoretical models of EER with evaluation projects that have their agendas defined by different stakeholders for political and practical reasons. Such projects contribute to the development of the knowledge base of EER and provide elaborate and better answers to the questions posed by the various stakeholders of education (see Creemers et al. 2010). Thus, this section provides more guidelines for conducting theory-driven evaluation studies that are based on educational effectiveness, and a theoretical framework is offered (see Fig. 1) which leads to the following observations.

First, evaluators need to reformulate the research questions that policy makers may have in relation to a reform process. In doing so, the theory upon which a reform is based and the main characteristics of the theoretical model that they consider as appropriate should be taken into account. The chosen model should meet the following criteria based on the current knowledge base of EER (Creemers and Kyriakides 2008; Townsend 2007). First, the model should be multilevel in nature and refer to factors operating at different levels such as students, teachers/classes/departments, schools, and various features of the local and national context. It should outline hypothesized relationships between factors and student outcomes (linear or nonlinear relations) and should refer to relationships among factors that exist both within and across levels (see Kyriakides and Creemers 2012). Second, the model should provide a clear framework for measuring the functioning of factors. Finally, the model should have sufficient empirical support. This implies that the multilevel structure of education and the factors that operate at different levels should at least be considered. For example, a reform program implementing a reduction of class size could investigate its impact on the quality of teaching, factors describing teacher and student behavior in the classroom, and finally only then student outcomes. Therefore, the reformulation of the evaluation questions of the stakeholders can be seen as a starting point for the design of the evaluation plan.

After the reformulation of policy questions, the second step should be to design an evaluation plan. It is expected that evaluators should not only attempt to achieve the summative purpose of evaluation but also address formative purposes. The latter are closely related to the implementation of the reform, whereas the summative aspect of evaluation is expected to study both short- and long-term effects of the reform on student outcomes. Given that we expect variation in the implementation of reforms, we propose that evaluators need to focus their attention on the behavior of those expected to make use of the reform policy.

Fig. 1 A framework for conducting theory-driven evaluation studies

Data concerning the impact of the reform on teachers' and students' behaviors as well as on the behaviors of other stakeholders may help to identify factors associated with its effective implementation. The chosen evaluation model may even be of use in identifying the impact of such effectiveness factors and may also suggest how the reform could be redesigned in such a way that it could provide further

support to those who need it. Rather than discussing issues related to the existence of prescribed plans for implementing reforms, there is a need to examine how teachers use and modify these plans in order to meet the needs of students and promote learning. Finally, instead of giving too much emphasis to students' reactions towards a reform, it is important to examine what learning opportunities students and other stakeholders (e.g., teachers and headteachers) have been provided with by participating in the reform. This suggestion can be attributed to findings of EER which show that the learning opportunity factor is one of the most important factors associated with student achievement (see Brookhart 1997; Creemers and Kyriakides 2008; Kyriakides and Tsangaridou 2008; Lughart et al. 1989; Trautwein et al. 2002).

The third step is the design of the study and should feature the collection and analysis of data. The framework proposed here suggests that beyond examining students' progress in terms of learning outcomes, we also need to collect longitudinal data for both teachers and students. Namely, it is worth examining both short-term and long-term effects on students since there is evidence that reforms and intervention programs may not have enduring effects on student learning (Plewis 2000). This framework also suggests that evaluators should examine whether teachers improve their practices throughout the years as a consequence of implementing the reform (i.e., the reform itself could be considered as a force able to bring about change in teachers' practice). In order to achieve these purposes, either an experimental study could be conducted by following the group randomization approach or a longitudinal design could be used (see Creemers et al. 2010). The choice of the research design depends not only on practicality issues but also on whether the reform program is implemented in the same way across the participating teachers/schools or by offering different treatments to different groups. The chosen model of EER and the way that factors are defined are both expected to help evaluators design appropriate instruments and also to investigate the properties of these instruments before conducting the main evaluation (Creemers and Kyriakides 2012). In addition, different measurement theories such as the item response theory (IRT) or the classical test theory (CTT) can be used for this purpose. Finally, the multilevel structure of the data to be collected should be taken into account by the analysis, using appropriate techniques such as multilevel modeling techniques (Goldstein 2003; Snijders and Bosker 1999) or structural equation modeling (SEM) techniques (Kline 1998; Muthén 1994; Raykov and Marcoulides 2006).

In the fourth step, evaluators are expected to report the results to different stakeholders. If a participatory model is adopted, then different reports for policy makers and teachers but also for parents and students should be produced. However, beyond providing answers to the specific questions raised by the policy makers and other stakeholders concerning the impact of the reform and possibilities for its development, evaluators are expected to draw implications for the further development of the chosen model of EER and/or for the development of the proposed evaluation framework presented above.

The framework proposed here does not however aim to provide a *comprehensive* model for evaluating educational reforms. Rather, it aims to incorporate different theoretical frameworks into a single model, acknowledging the fact that each theoretical framework could illuminate different aspects of the reform under scrutiny. It is acknowledged that further research is needed to refine and elaborate the framework described above, especially since it did not arise from empirical evidence or the results of evaluation studies. The evaluation framework is, thereby, offered as a set of hypotheses that need to be further tested. Nevertheless, this chapter provides a framework for developing a dynamic rather than a static model of evaluating educational reforms. In the next section, it also is argued that by using this framework an evidence-based and theory-driven approach to improve practice may be promoted.

Establishing a Theory-Driven and Evidence-Based Approach to Improving Education

Although the responsibility for, and the improvement of, educational practice cannot be dictated by educational theory and research, it is a major objective of educational science to contribute to the effectiveness and the improvement of education by providing a knowledge base for practice and helping schools develop effective intervention programs (Creemers and Kyriakides 2012). However, the relationship between general practice in education, science, and specifically educational effectiveness has not always been successful. There are many publications which spell out problems in attempts to create better links between theory and practice in education. In fact, these publications point out differences in approach, implementation problems, and the differences between teachers and schools which should make it almost impossible to use existing “knowledge” in school improvement (Creemers and Reezigt 1997; Scheerens and Bosker 1997; Teddlie and Reynolds 2000). By contrast, it is reasonable to expect that there would be a good linkage between EER and school improvement which aims to improve and develop education in classrooms and schools. The explicit purpose of those who initiated the research on the effectiveness of classrooms, schools, and educational systems was that the results of this research could be used in practice (see Townsend 2007). For example, one of the major aims of the 1988 establishment of the International Congress of School Effectiveness and Improvement (ICSEI) was to bring together researchers, practitioners, and policy makers in productive cooperation for the benefit of education in general and for the development of the participating “disciplines.” However, the question persists of how to best apply the knowledge base of effectiveness in practice or, in other words, how to get valid and useful information about school improvement out of EER (Creemers and Kyriakides 2006). In this section, conducting theory-driven evaluation studies on educational effectiveness is claimed to contribute to the establishment of a dynamic perspective on improvement (Creemers and Kyriakides 2012) and help

to establish stronger links between EER and policy and practice. This perspective gives emphasis to the use of theory-driven and evidence-based approaches to the development of improvement strategies and action plans. The importance of this approach is discussed below by showing that a valid theory of educational effectiveness and evaluation data should guide the design of improvement efforts.

Establishing Clarity and Consensus About the Aims of School Improvement

The first step of any school improvement effort is based on the assumption that it is important to start with a clear understanding of your destination and how you are seeking to improve the quality of education. This could be considered “a purposeful task analysis” (Wiggins and McTighe 1998, p. 8) and suggests a planning sequence, while a commitment to collaborative work also needs to be established. However, Fullan (1991) points out that people have different perceptions of change, meaning that it is difficult to reach consensus among the participants of school reform efforts, although this may be crucial in its success. Therefore, it is important to establish procedures to ensure clear understanding among stakeholders as to the aims of any school improvement program. To this end, results of theory-driven evaluation studies based on EER can be a useful tool for helping stakeholders realize that the ultimate aim of any school reform effort should be an improvement in student achievement across the school. This is the basic assumption upon which theory-driven evaluation studies in EER are based. For this reason, a major emphasis is given to measure the short- and long-term effects of reforms on student outcomes (see Fig. 1). Unless learning and learning outcomes are improved, any school improvement effort could not be considered truly successful no matter how much it has managed to improve any aspect of the climate of the school. This is due to the fact that learning is the mission of the school and so the main emphasis should be given to improving learning outcomes. An example of such an approach is the evaluation of the impact of network learning communities in England or New Community Schools in Scotland where a range of positive impacts were reported by teachers and headteachers but where little impact on student attainment was found (Sammons et al. 2003, 2007).

Addressing School Factors That Are Able to Influence Learning and Teaching Practice to Improve the Quality of Schools

Beyond providing support to school stakeholders in the design of improvement programs, the results of theory-driven evaluation studies in EER suggest that school stakeholders should attempt to build whole school reform efforts which are able to

improve the functioning of school-level factors that have been included in the chosen effectiveness model (see Fig. 1). This is due to the fact that the chosen model has to be multilevel in nature and thereby refer to school factors that are expected to be related to student learning outcomes. Therefore, designing improvement efforts focusing on only the classroom-level factors may improve the teaching practice of individuals but may not necessarily improve the functioning of the school-level factors also included in the chosen model. In such cases, teachers who may manage to improve aspects of their teaching practice that have been addressed by a specific improvement will need at some stage some other type of support to improve other teaching skills. But in cases where a reform does not aim to improve school factors, such support may not be available when needed, and the long-lasting effect of a program aiming to improve teaching practice could be questioned (see Creemers and Kyriakides 2012). At the same time, it is acknowledged that school stakeholders may develop interventions/improvement efforts which may not only improve the functioning of the school-level factors but may ultimately promote the quality of teaching and eventually raise student achievement. Therefore, results emerging from theory-driven evaluation studies will ideally demonstrate that efforts towards school improvement give emphasis to improving not only the teaching practice but improve practice through improved functioning of school-level factors as well. In this way, not only are new learning opportunities offered to different stakeholders as is supported by the proposed evaluation framework (see Fig. 1), but also the conditions are provided that enable them to continuously improve their teaching practice.

Collecting Evaluation Data and Identifying Priorities for Improvement

The use of a valid theory to design an improvement effort cannot in itself ensure that the aims of a proposed reform will be achieved even if it is implemented in the way it was designed (Kyriakides et al. 2006). In this section, a theory-driven approach to improve the quality of schools is suggested, and emphasis is given on using empirical evidence to identify the strengths and weaknesses of a school and design relevant improvement efforts. The importance of using an evidence-based approach to school improvement arises from the fact that several studies have revealed that the evaluation of school policy is an important factor operating at the school level (Creemers and Kyriakides 2010a, b; de Jong et al. 2004; Kyriakides 2008; Scheerens and Bosker 1997). Therefore, based on the results which emerge from theory-driven evaluation studies, the strengths and weaknesses of teachers/schools/systems should be identified. Moreover, stakeholders may also identify priorities for improving the functioning of specific factors and/or grouping of factors. Furthermore, evaluation data may reveal more than one improvement priority for each teacher/school/educational system although the identification of

more than one weakness is not always helpful for identifying how a particular teacher can be developed professionally. However, due to the dynamic nature of models of EER, different priorities for professional development for each teacher/school/educational system can also emerge from such theory-driven evaluation studies.

Establishing a Developmental Evaluation Strategy

The suggestions for designing theory-driven evaluation studies provided in the previous section may also help stakeholders establish a developmental evaluation strategy (Demetriou and Kyriakides 2012; Hopkins 1989; Kyriakides and Campbell 2004; Visscher and Coe 2002) in their attempt to improve the effectiveness status of teachers and schools. However, it is important to note that effectiveness studies support the use of a *continuous* model of evaluation since such a model allows teachers/schools/systems to adapt their policy decisions in relation to the needs of different groups of school stakeholders (Kyriakides et al. 2010; Scheerens et al. 2005). It can therefore be claimed that the results of theory-driven evaluation studies will eventually show that a developmental evaluation strategy should be established at either the macro or micro level. This strategy should ultimately contribute to the improvement of the effectiveness of teachers and schools.

One example of this might be where a developmental evaluation strategy of the school policy and of the actions taken for improving the relations of school with the parents can be used (Kyriakides 2005). In such case, the evaluation process is expected to follow a linear sequence that starts with the development of a plan for school policy on partnership and from which priorities and targets then emerge along with associated performance indicators. At the next stage, evaluation questions that followed from the targets and performance indicators will be established to provide the criteria for data collection. Next, the data will be collected and analyzed and fed back into the formative process of evaluation. In this way, stakeholders will be able to find out what is happening during the implementation of the school policy on partnership.

This strategy for improving effectiveness has a number of significant features. The evaluation process is expected to assist the implementation and development of a school policy since the establishment of targets and performance indicators may specify the developmental process of the partnership policy. Moreover, evaluation data may be related to the aims of the policy through the evaluation questions. As a consequence, a logical chain of action that relates aims to targets, to evaluation questions, and to particular information sources can then be established. However, although this evaluation process is linear, it is very likely to be less tidy in practice. Once the evaluation process is underway, different working groups of stakeholders (e.g., coordinators of partnership policy, teachers of different subjects) may implement parts of the policy at different rates (Kyriakides 2005). However, the extent to which there is a gap between the implementation of a reform policy and the design

of an intervention could be identified. Thus, the results of theory-driven evaluation studies, especially those addressing the formative aim of evaluation, may help stakeholders take decisions on how to improve school policy or how to provide additional support to those working groups that may need it (Creemers and Kyriakides 2010a). However, further research is needed to investigate the impact that the use of theory-driven evaluation studies may have on establishing an evidence-based and theory-driven approach to school improvement that is likely to have a significant impact on improving student learning outcomes (Creemers and Kyriakides 2012). In this way, strong links among EER, theory-driven evaluation, and improvement of quality in education might be established.

7.4 Juxtaposing Interpretations of Research on School Principalsip

Marta C. Azaola and Anthony Kelly

Introduction

It is said that if leadership, defined narrowly as principalship at the school level, as a subfield of school improvement and as a route to more effective education had delivered a fraction of what was promised for it three decades ago, we would not have such a significant number of failing schools throughout the developed world. In retrospect, the notion of leadership as a panacea seems overly optimistic: if all school needs in order to succeed are a “good” principal, then the system only needs a relatively small number of “good” staff to make for perfectly effective schooling, which is a more “realizable” target than replacing 20 teachers in every school, say. Unfortunately for both policy makers and pupils, the evidence is against this notion—good leadership on its own is not a sufficient condition for good schooling—and we have learned that good heads cannot always operate with equal effectiveness in different schools. Context matters, as does complexity. Research in the field has similarly been blighted by the tension between delivering (and evidencing) improvement and challenging (and informing) the evidential base for policy, most obviously in the dearth of research on quantifying the impact of leadership on pupil outcomes. This chapter sifts through a range of research from developed and developing countries to get an overview of interpretations away from the hegemony of “Western” (policy and socioeconomic) contexts because “context” matters at system level just as it does at school level. The purpose of the chapter is not to coalesce findings but to interrogate those findings in terms of how they relate to method and interpretation. Interpretation is the action of explaining the meaning of research; methodology is the means of doing it. The link between the two should be theory, in the absence of which the researcher cannot be sure what

has been found, and in nonexperimental research the complexity of relationships plays an important role in interpreting the findings. The appropriateness of methodology affects the legitimacy of the interpretation and ultimately the usefulness of the research. This is not to deny that there are many different conceptualizations of leadership and many different views on its desirable outcomes across cultures—“non-Western” conceptualizations of leadership can open “Western” eyes to theoretical treatments derived from different intellectual traditions—but an interrogation of the literature suggests that good research from every tradition shares the characteristic of going beyond the folk knowledge of anecdote to the theoretically constructive.

Methodological Issues in Pursuit of the Leadership Effect

The research underpinning of school leadership has occasionally been analyzed, in particular, the difficulty of conducting experimental research in the field and in schools generally. Hallinger and Heck (1996a, b) reviewed 15 years (1980–1995) of empirical research on school principalship and its conceptual and theoretical underpinnings within a school effectiveness paradigm. By the 1980s accountability and the evaluation of principals had become a major driving force in education and schooling, with diverse pro-choice and pro-privatization reforms emerging strongly in the USA, the UK, and elsewhere. The impact of principals on the lives of teachers and students is complex and not easily subject to empirical verification. The research suggests that it is a role best conceived as a web of environmental, personal, and professional in-school relationships, which combine with other factors to influence organizational outcomes, but research in the field of principalship and effectiveness—most explicitly defined as the impact of principalship on pupil outcomes—has not done justice to this complexity in terms of either theoretical or methodological sophistication, although Hallinger and Heck acknowledge that research in the period showed an improvement over the previous period.

Hallinger and Heck grouped studies by their underlying theoretical models: those that used bivariate designs with or without controls and those that used more sophisticated theoretical models and more powerful statistical methods. One third of studies in leadership and effectiveness at the time of analysis were classified as being theoretically driven, building on the theoretical work of others, but only one third were sophisticated in their theoretical orientation. Almost all the studies used a “nonexperimental” cross-sectional correlational design, with surveying and/or interviewing instruments, which makes it difficult if not impossible to understand causality. The Hallinger and Heck review implies that future research can progress conceptually if methodological progress in the field makes the study of comprehensive/complex models of principalship more feasible, and progress in the field is most likely to come from research that places the principal in the context of the school and its environment. However, researchers need to adopt a multilevel perspective to schools as organizations and treat data in a hierarchical way to assist in building theory about the nature of the effect across levels of the school, which in

turn will facilitate more refined investigations into a wider variety of theoretical perspectives on how impact is obtained in different types of organizational structure.

The Hallinger and Heck review yielded the slightly unexpected finding that the model used appeared to affect the research interpretation. Methods that used bivariate designs made weak or conflicting claims, whereas the more sophisticated theoretical models with stronger research designs yielded more positive findings more frequently. (Usually, more rigorous methods make it *more difficult*, not easier, to make definitive claims.) The conclusions were generally that principalship *can* make a difference to student learning, and that a school's socioeconomic environment influences the type of leadership exercised. The type of leadership that makes the greatest difference is the one aimed at influencing *internal school processes* if they themselves are directly linked to student learning and teachers' practice.

Logical positivism and quantitative approaches drove educational management and leadership research from the 1950s to the start of the period reviewed by Hallinger and Heck. From the 1980s onwards, scholars in the field tended to criticize these approaches, and this led to new ways of thinking about epistemology and the role of the researcher in leadership research. Supporters and exponents of the new approach moved away from empirical explication, but we know now that no single approach yields a universal understanding of school leadership; at best we have an incomplete (and somewhat) distorted view of its role in school improvement and effectiveness. To this day, researchers in the field use considerable flexibility in their approaches to the structure of knowledge (positivist, interpretive, and critical) about leadership and the theoretical lenses they use (structural-functional, constructivist, feminist, postmodernist, etc.), although researchers in educational leadership, in comparison to other education subdisciplines, do not start with well-developed theories so that the challenge is to integrate findings from studies conducted using different philosophical perspectives and methodologies. In short, it has been easier to *summarize* the approaches, perspectives, and findings than to *reconcile* them, and until we better understand the relationship between the school leader, the school context, and pupil outcomes, it will be difficult to justify the claim that leaders provide the critical impetus for improvement.

Levačić (2005) studied the methodological problems faced by empirical researchers in attempting to establish the causal effect of leadership on student outcomes, implied in national policy, professional practice, and the anecdotal claims of some research, which is critically important. Any study testing the hypothesis of a causal relationship in leadership research must have measures of key variables and be able to take account of the other factors that affect student outcomes, but causality is not easily replicated in natural settings. The counterfactual cannot be directly observed; that is to say, if X had *not* been present, Y would *not* have happened. The alternative is to use the random allocation of cases into control and non-control groups, but randomised controlled trials (RCTs) are regarded by many in education as ethically problematic. Quasi-experimentation, which is similar in many ways to RCT design, lacks the random allocation into control and treatment groups. Instead, it assigns to the treatment group using criteria other than random allocation or indeed

has no control at all over allocation. There are concerns over this approach in relation to internal validity because the treatment and control groups may not be *ab initio* comparable. With RCTs, participants have an equal chance of being assigned so that the treatment group will be statistically identical to the control group on both observed and unobserved characteristics, provided the sample is big enough, and any change in the characteristics of the intervention group is then due to the intervention. With quasi-experimental studies, it is obviously more difficult to demonstrate causality, particularly if there are confounding variables.

Both RCT and quasi-experiment have generalizability from the sample studied, but research on the effects of educational leadership on student outcomes has not employed either of these techniques to any significant extent because leadership is not generally represented as a treatment to be used or withheld, so that studies in the field have used only data generated from real-life contexts. While statistical purists advocate counterfactual research design, those on the other side of the argument respond that social science does not need to (and cannot easily) seek counterfactual causal explanations and that in any case the field should not be confined in this way. This argument that we need to develop causal explanations that are not necessarily counterfactual is the one that has emerged triumphant in the field of leadership research, particularly in the UK, with a commensurately lower incidence of quantitative research and the majority of observational data analyzed “to the best of our ability.” This is not to say that there is no value in conducting studies using observational data on schools and students, but more could be done to ensure that specific interventions are evaluated using a robust counterfactual design, and in this context, Levčić explicated a three-way typology of research model: the direct effects model, the mediated effects model, and the reciprocal effects model. In the direct effects model, “student outcome” is the dependent variable, and it can take account of antecedent variables like school context that can directly affect both student outcomes and leadership. In a mediated effects model, leadership is regarded as having an *indirect* effect on student outcomes in that it affects intervening variables such as school culture and teaching practice in the classroom. The reciprocal effects model assumes a dynamic two-way causality with leadership affecting mediating variables and in turn being affected by them.

The Gu et al. (2008) research is also an example of a quasi-counterfactual approach as they studied pupil attainment and the leadership of three subgroups of schools: “low start,” improving in attainment terms from a low base and very effective in value-added terms; “moderate start,” improving from moderate to higher attainment and with high value added; and “high start,” consistently high in both pupil attainment and value-added terms. Analyses of pupil characteristics, attainment, and value-added outcomes found that while some schools had significant and sustained improvement but no change of principal, changing the principal can contribute to the rapid improvement of schools with an initial low attainment profile, which type of conclusion is representative of the genre at the robust end.

In a comparative paradigm, relative both to other disciplines and other cultural settings, Thomas (2007) investigated issues arising from the use of evaluation (self-report) instruments in cross-cultural settings, specifically, issues of ethnocentrism

and cultural universalism in educational leadership in the Middle East. His interpretation was that educational leadership and management study has failed to keep pace with fields such as business and psychology at both theoretical and empirical/methodological levels. The latter concerns are borne out by the literature on leadership generally, not just by the literature on the effect of leadership on outcomes, in that the use of questionnaires (and the like) predominates to such an extent that there are concerns with matching sample populations and scale equivalency. Much of it is merely a compendium of anecdote, and at this end of the research spectrum, it has low reliability and is far from robust. The unexpected thing perhaps is that this unfortunate feature of research in the field seems to hold true across cultural boundaries. Pan and Chen (2011) analyzed the literature on school leadership in Taiwan, where educational reforms introduced in the 1990s created a more decentralized and participatory system for teachers, although the prevailing assessment practices remain test orientated. They found that although 63 % of research in the field used quantitative methods, while 30 % used qualitative methods, the predominance of the questionnaire as a research instrument resulted in a lack of attention to contextual factors and the interaction between structure and action. It seems that while cultural beliefs and norms play a vital role in shaping leadership, there is an undiminishing hegemony of “Western” approaches.

Leadership Agency and the Influence of Gender

The analysis of gender within the field of school leadership constitutes an important example of what Leithwood (2001) calls a “contextual perspective,” and research in the genre has straddled the globe. Studies from Western, well-established education systems are widely documented in the literature; what is less well documented are studies where gender, as an impacting factor *on* principalship and *by* principalship on pupil outcomes, is a *sub*-context to that of a developing, non-Western society. Sperandio (2000) analyzed the role of principalship in promoting gender equality in girls’ secondary schools in Uganda, arguing that women principals can combine power and influence with a caring maternal image to improve pupil outcomes. The results have been interpreted as suggesting that strong gender-impactful leadership can offset poor facilities and generate a positive atmosphere and well-motivated students, despite the fact that schools in the study had ranged from those focusing on tolerance and personal development, to those focused on regulation and prohibition. A decade later, Sperandio and Kagoda (2010) revisited the theme, specifically the under representation of women in secondary school leadership¹ in Uganda, finding that women teachers have a keen interest in promotion to principalship, but that Ugandan society was struggling to meet the goal of 30 %

¹ Sixty-two women teachers from six secondary schools were surveyed by questionnaire.

representation of women in leadership roles that the Beijing Platform² had considered critical. The findings suggest that women teachers' motivation for promotion in Africa is both financial (a preference for public sector jobs for job security and pension) and altruistic (a desire to improve schools and student outcomes) and that the most common reason for failing to achieve it is political corruption and lack of support from the establishment. Sperandio and Kagoda also reported that many women teachers and principals regard promotion as a reward for long service, though the contradiction between this interpretation and the reported belief of participants that promotion should be predicated only on ability was not explored.

The same year, Moorosi (2010) investigated the career progression of female secondary schoolteachers in South Africa, finding significant problems of gender disparity and barriers at the level of access. Participants³ were asked to narrate their career experiences to principalship and their own practices subsequently with regard to the appointment and promotion of women, the results suggesting that women continue to fight sexist cultural attitudes, and although appropriate policies provide a starting point, they are not enough to eradicate entrenched sociocultural traditions.

Agezo and Hope (2011) investigated the practice of both female and male principals in Ghana primary schools.⁴ Society in Ghana has traditionally favored male leadership in most aspects of life for many generations, but in the opening decade of the twenty-first century, women have had greater access to educational leadership positions, especially in primary schools. Six null hypotheses were framed by Agezo and Hope corresponding to six theoretical "dimensions" of leadership, finding in contradiction of findings from other researches, that there was no significant difference between female and male principals in decision making; in interpersonal relationships; in ethical, instructional, or collaborative leadership practices; or in professional development. The authors interpreted this as suggesting that the criteria used by the Ghanaian education system in selecting and appointing principals, and the induction processes that they undergo upon appointment, encourage stereotypical leadership so the opportunity for diversity is limited, with participants more concerned with managing their schools effectively than about representing gender-differentiated features of the role.

Investigating school leadership in Israel, Addi-Raccah (2006) looked at principalship in secular, Jewish, and Arab public schools and how male and female principals support applicants in this context. The research found that male principals tend to "sponsor" other men, but that female principals' support for other

²The United Nations convened the Fourth World Conference on Women in 1995 in Beijing, China, which prepared a Declaration and Platform for Action aimed at achieving greater equality and opportunity for women.

³A questionnaire was sent to all female secondary school principals, and from that a purposive sample of 28 female principals, ten provincial officials, and ten school governing body chairpersons was selected.

⁴The Principal's, Leadership Behaviour Questionnaire was used to collect the data. Five hundred and seventy-one teachers, 38 female principals, and 14 male principals completed it.

women was more equivocal, despite the traditional view that women in leadership roles act as sororal role models. Using regression techniques to analyze data from the Israel Central Bureau of Statistics and data from a survey of (approximately) 64,000 teachers and school administrators,⁵ the findings further suggested that female school leaders have more diversified behavior towards other women than male school leaders have towards other men, which was interpreted as suggesting that women's entry into leadership positions will not be enough to redress the gender bias generally.

The Supply and Turnover of School Principals

For some time, the supply of leaders has been a recurring theme in research in the field and a recurring concern for policy makers around the globe, though few conclusions have been reached as to the cause or extent of the problem. In 2005, Barty et al. examined the declining supply of principals in two states in Australia. They reported on the difficulty of acquiring information about applications as education systems typically do not aggregate data, but using equal opportunities data the researchers did manage to draw some conclusions on the spread, number, gender, and ethnicity of applicants. They found that the location and size of the school and the presence of an incumbent and local politics were key issues in the decline in the number of applications for principalship, but their recommendations were limited to suggesting that statistical data relating to school leadership be made public.

Still on the Pacific Rim, Kwan (2011) looked at principal recruitment in Hong Kong by analyzing the criteria used by recruiting bodies to assess potential candidates. The purpose of the research, somewhat unusually in the literature, was to identify what recruiters look for in applicants because in many ways this is a proxy for the traits that school governing bodies regard as desirable. Like the Addi-Racchah research from Israel, Kwan took account of leadership in context, which in Hong Kong meant a decentralization of decision making and an increase in principals' responsibilities. Participants were asked to identify the specific attributes they thought were sought in school leaders and found that job applicants tended to overemphasize the importance of communication skills and experience as a deputy. The findings also indicated that religious affiliation was a reliable and useful proxy indicator in judging the attitude and value orientation of potential recruits, with preference being given to candidates who had the appropriate (religious) commitment.

Leadership turnover has been identified as a major concern for academics in their research and politicians in their practice. The literature suggests that it is generally caused by high levels of stress and dissatisfaction as a result of overly

⁵ The study covered only schools where the percentage of female teachers was between 10 and 89 %.

managerialist approaches. Moving away from the paradigm's fixation with principalship as a synonym for leadership, Alsbury (2004) researched the turnover of *school board members* in Washington, USA. Turnover per se, no matter what the cause or the typology, disrupts the educational process within schools, but Alsbury presupposes a distinction between political and apolitical turnover, finding that it mostly (73 %) results from the "defeat" in a political sense of board members (rather than the result of personal, financial, or ethical considerations). Alsbury's findings also show that there is more "defeat" and greater politically motivated turnover in larger communities and in communities with higher political stakes, which could be interpreted (though Alsbury did not do so) as meaning greater within-school disruption for larger urban schools and schools in more ethnically diverse settings.

The same year, Saitis and Menon (2004) analyzed the perceptions of primary schoolteachers in Greece regarding the effectiveness of their principals, an underexplored (if slightly solipsistic) topic in leadership research: the hypothesis was that newly qualified teachers have certain preformed expectations regarding the skills and abilities of principals in advance of working in schools. The research found that dissatisfaction with principals encourages new teachers to abandon the profession and that perceived weakness in leadership is a major cause of teacher turnover, though older teachers experience less anxiety and frustration in this respect. The authors suggest that the negative outlook of future teachers needs to be recognized as a complicating factor in the transition of newly qualified teachers from training at university to employment in school. Three (somewhat *de trop*) policy implications emerged from the interpretation of findings: the need for future teachers to become familiar with school organization and leadership in advance of employment, the need for proper managerial training for principals prior to appointment, and the need for systems to be objective and transparent with regard to promotion and selection.

The converse research approach, of course, would be to accept leader turnover as an inevitable fact of life and instead examine ways to attenuate it. The turnover of school leaders, although inevitable, is receiving greater attention today because a large number of principals are approaching retirement age and the role is narrowing in definition as it becomes more managerial, but whatever the reason, turnover presents a significant challenge to schools, local authorities, and policy makers, not least because it diminishes the sense of shared purpose and makes it difficult to maintain an improvement focus long enough to accomplish anything meaningful. In Canada, Mascall and Leithwood (2010)⁶ found that where there is a high turnover of school principals, distributing leadership and coordinating handovers (which should not be solely the responsibility of the incoming principal) can mitigate some of the negative effects. In a practical sense, the authors interpreted their findings as suggesting that local authorities should aim to keep principals in post for a minimum of 4 years and should encourage incoming principals to understand their predecessors' work as a priority.

⁶ Both quantitative and qualitative methods were used. Two thousand five hundred and seventy teachers from a total of 80 schools were surveyed, with a 78 % response rate.

Turnover has been linked to training in several studies. While Saitis and Menon (2004) were attributing the weakness of principalship in Greece to a paucity of training in educational administration and management, Wong (2004) was investigating their professional development in Hong Kong. In the 1990s the implementation of school-based management in Hong Kong, as elsewhere, significantly increased demands on principals and changed the paradigm of school leadership from its traditional hierarchy to change, collegiality, and teamwork. Up to 2002, teachers in Hong Kong were eligible for promotion to headship provided they had at least 5 years experience and were not required to complete any training beyond their initial teacher training. They were instead prepared through an induction program that followed the dominant centralizing administrative guidelines, and Wong's research showed that the idea of ongoing training for principals was unpopular among practitioners who complained that they were too tied up with daily administrative chores. Wong's findings were interpreted as suggesting that in-service training courses are effective in implementing change and that joint collaborations between government, academics, and professionals can have beneficial results, but that it is difficult for improvement to be "realized" when practitioners do not engage with development opportunities. De Jaeghere et al. (2009) found that principal and deputy principal efficacy was also low in Africa in the areas of instructional leadership and community relations and that (perhaps unsurprisingly) principals and deputy principals were not adequately prepared for their roles and there are few professional development opportunities to provide them with the necessary skills.⁷ It is an interesting juxtaposition: in the well-established education system of Hong Kong, principals were provided with in-service development opportunities, but didn't want them because of the pressures of managerialism; in an underdeveloped system like that in Uganda, principals wanted development opportunities but they were not available because of a lack of managerialism. In both cases, failure to improve was attributed to their respective (but opposing) contexts, echoing the findings of much of the unsophisticated research in the field (see Fig. 1) that policy makers should consider location, school size, and so forth when developing leadership training to impart skills, manage school performance, and identify teachers' training needs.

Principal Efficacy, Professional Standards, and School Improvement

Research evidence has demonstrated how school principals around the world work in an increasingly demanding environment. Leithwood (2001) has investigated school leadership in the context of accountability policies to identify practices

⁷ Interviews were conducted with 97 principals and deputy principals. The sample was drawn from schools in three geographical areas of Uganda: one urban and two rural.

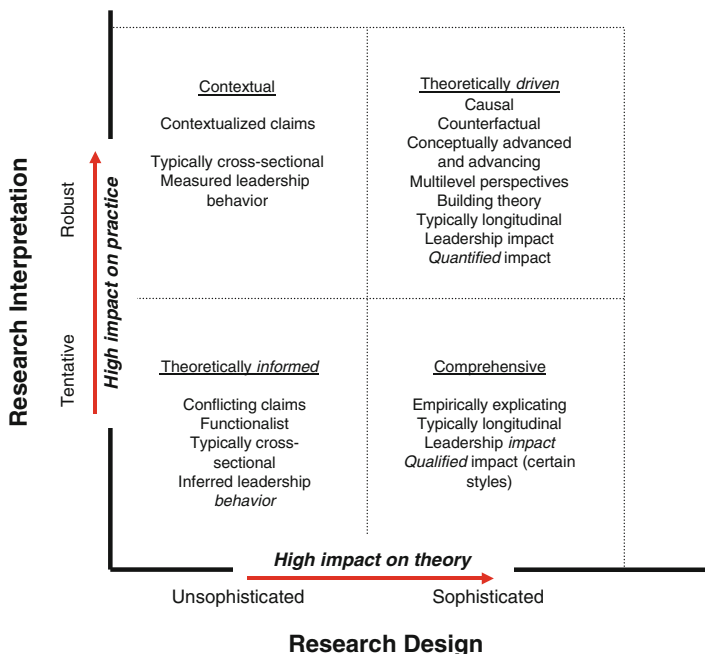

Fig. 1 How design and interpretation interact in the research literature on educational leadership

suitable for the new emerging contexts and has claimed that although some leadership practices are useful in most circumstances, *transformational* leadership practices are a necessary part of the repertoire, though insufficient on their own. He distinguishes leadership practices intended to be useful in most situations from those suited to a particular policy context, thus suggesting a contextual perspective on leadership that explains the small number of school leadership effects evident in quantitative studies. Leithwood suggests that the Hallinger and Heck (1996a, b, 1999) review only looked at common generic leadership practices and not at the additional practices used by principals as a means of dealing with their own unique contexts. For that reason, Leithwood suggests that quantitative research underestimates the effect of leadership on educative outcomes, and there is some justification for this view in the literature on leadership evaluation. In 2007, Catano and Stronge examined the evaluation instruments for principals in 132 school districts in Virginia, USA, where, like everywhere else in the developed world, principals find themselves dealing with competing tasks on a daily basis to satisfy the sometimes competing demands of internal and external stakeholders. The complexity and lack of clarity surrounding principalship make the formulation of appropriate assessment metrics a daunting task, and the expectations of school principals are often grounded as a result in theoretical conceptualizations of leadership that compete with the day-to-day managerial functions of running a school.

Catano and Stronge suggest that the evaluation for principals should be based on what they are expected to do and that evaluation instruments should reflect this.

In a similar vein, Torres et al. (2008) analyzed the perceptions of school improvement policies in the USA,⁸ finding that principals are struggling both to run their schools and to implement external initiatives, and this has changed the role of the leader from one of resource management to one of accountability. The results from the Torres et al. analysis (using both quantitative and qualitative data) indicate that principals regard site-based policies as less controversial and more relevant than wider external initiatives and that as a consequence the former have a greater (positive) impact on student outcomes. While aggressive school improvement policies *can* have positive outcomes, they can also have unintended consequences such as low staff morale and reduced commitment among teachers and principals. Tuytens and Devos (2010) carried out similar questionnaire research to analyze the influence of school leaders on the perceptions of teachers of evaluation policies in Belgium.⁹ Three multiple regression analyses were conducted, the first of which revealed a significant effect of leadership and trust on teacher perception. The second analysis showed that the *vision* of the principal significantly influences teacher perception of *the need for* evaluation (although the effect is low). The third analysis revealed that leadership did not significantly influence teacher perception of any of *the characteristics of* government policy.

Of course, how principals influence teacher perception and self-efficacy is not unrelated to how their deputies perceive themselves and their jobs. The number of studies focusing on deputy principalship has lagged behind those on other aspects (more senior and more junior) of leadership, and the research has sometimes produced contradictory findings. In terms of the research literature on deputyship in particular, there seems to be a double effect: in a positive sense, it is interpreted as (+) having a direct impact on pupil outcomes as part of the daily grind of the job and an additional (++) indirect/secondary effect of being a training ground for principalship; in a negative sense, it is interpreted (particularly when the role lacks a clearly defined job description) as having little influence (–) on the management of a school, in which case the additional indirect effect is the adverse (––) one of actively discouraging deputies from applying for promotion. In fact, Kwan's (2009) research in Hong Kong¹⁰ suggests that neither school-level factors nor gender has an effect on the desire of deputies for promotion and that their sense of efficacy is

⁸ Forty-five percent of elementary school principals in Texas were surveyed online (20 % middle school and 25 % high school).

⁹ Thirty-seven secondary schools (selected randomly from the 956 Flemish secondary schools) participated. Six hundred and ten teachers filled out the questionnaire representing a return rate of 82 %. Three years previously, the government had issued a new policy on teacher evaluation which obliged schools to evaluate all staff every 4 years.

¹⁰ Eight hundred and three questionnaires were sent to all secondary schools in Hong Kong. The response rate was 41 % (n = 331).

the most influential factor in their desire for principalship—although in a self-defeating way, those deputies who enjoy a better working relationship with their principals and colleagues are more reluctant to apply.

Juxtaposing Interpretations and Research Design: A Suggested Typology

Notwithstanding the desire to encourage both causal approaches to leadership research and the need to capture the actualité of life in schools, research in the field has rarely done both, and as we have noted already, relatively few studies have linked either to pupil outcomes in anything more than an anecdotal way. Researchers who have attempted to capture the complexity of everyday leadership through the use of appropriate research methodologies have generally avoided the use of approaches that measure the leadership effect; and those who have sought to quantify the effect have left practitioners no better off in terms of what they are expected to *do* with the findings. For researchers, both paradigms involve a great deal of data reduction, but when interpreting the results in either tradition, the field may be better served by asking instead whether or not the research is “capturing complexity” in the sense that it attempts to construct interpretations of leadership behavior or “capturing impact” in that it attempts to construct interpretations of leadership *as it affects outcomes* (e.g., research in the UK by Gu et al. 2008). Research in the “capturing-complexity” tradition is usually characterized by suggesting that principalship is an interactive and/or reciprocal and/or evolving process involving many players, influenced by and/or influencing the context in which it occurs (e.g., research in Australia by Mulford 2005¹¹). Research in the “capturing-impact” tradition is characterized by claims that leadership can make a difference if it satisfies certain descriptive criteria or “isms of the day” like distributiveness, but that these are only indirectly related to student outcomes. The interpretation of research in both traditions is frequently moderated in the literature by references to core moral values and the beliefs/vision of the principal, which are interpreted in turn as driving actions/behavior and decisions/impact, respectively.

Figure 1 offers a typology of interpretation and design that is flexible enough to acknowledge the value of research being “comprehensive” (which is largely a matter of method) and “contextual” (which is largely a matter of interpretation). The former is designed to help us understand the link to outcomes and to a lesser extent, depending on interpretability, explain reality (usually in a qualified way). Where it occurs in the literature, it is usually the result of sophisticated methodologies but relative tentative (or self-evident) interpretation. Contextual research, on

¹¹ Developed from surveys of more than 2,500 teachers and 3,500 15-year-old high school students.

the other hand, is driven by the need to have robust interpretation and facilitate improvement. Where it occurs in the literature, it is usually characterized by relatively unsophisticated methodologies but robust interpretation. And at the extremes of the literature, one finds research that is merely *informed* by theory without contributing to it (the result of simple design and tentative findings) and research that is driven by, and driving of, theory, which is usually the result of sophisticated approaches that enable causal claims to be made in the interpretation. We suggest that there is too little of the latter in the field of educational leadership. Both theoretically informed and contextual researches have had significant impact on practice, but the literature suggests that it is the latter (not unnaturally) that has led to *sustained* improvement.

7.5 Researching Equity and Effectiveness in Education: Examples from the UK and Germany

Pamela Sammons and Yvonne Anders

Introduction

International comparative school achievement studies such as the Progress in International Reading Literacy Study (PIRLS), Trends in International Mathematics and Science Study (TIMSS), and the Programme for International Student Assessment (PISA) have clearly documented over several decades that the school attainments and school careers of children are linked to their origins (ethnic, cultural, language) and the socioeconomic situation of the family they grow up in, but have also revealed marked variations between countries in the patterns of association and their strength (Goldstein 2004; Marks et al. 2006). These results underline the relevance of inequity as a problem of education. Educational systems can be both a source of inequity and a key factor that may help in overcoming inequity (Cox 2000; Sammons 2010a; Sammons et al. 2013a).

Following current definitions in the growing literature, the concepts of educational equality and equity are seen to be closely related and cover aspects such as access to educational resources and facilities for all students, equal amounts and quality of instruction, provision with same educational material, bias-free attitudes in the learning environment and curriculum, positive interactions with teachers, proper and positive language, and fair assessment procedures. However, in most education systems students from disadvantaged backgrounds (e.g., those from minority ethnic origins and those experiencing social disadvantage factors such as

low socioeconomic status (SES), low family income, or parents lacking qualifications) are more likely to show low attainment levels from a young age and are more likely to be regarded as underachieving at school and experience school failure (dropout, early leaving, low or no qualifications, etc.). Some psychologists define underachievement as the discrepancy between measured intelligence (IQ) and attainment in educational tests. This definition has been criticized since all IQ tests are, to some degree, tests of achievement themselves (see West and Pennell 2003 for a discussion). An alternative approach is to study under-attainment by identifying relative differences in attainment between various social and ethnic groups by the means of statistical measures.

Most of the studies in the quantitative arithmetic tradition follow such an approach, and a number of large educational studies have been set up to identify groups that experience inequality and to shed light on the question how to overcome such inequity. Quantitative approaches serve a number of needs in contributing to research of educational equity and inequity. First, absolute differences in attainment between specific groups of students can be measured and quantified to identify the size of the attainment gap. Factors associated with low attainment can be divided into broad categories such as individual child or student characteristics, family characteristics (e.g., SES, income), community (e.g., neighborhood disadvantage) and societal characteristics, and educational experiences (related to preschool, school, and peer characteristics). In addition the child's home learning environment can have a strong influence on children's attainment, and a low-quality learning environment at home can be defined as educational disadvantage (Anders 2013; Sammons et al. 2004; Melhuish et al. 2008).

Going beyond the identification of educational inequity, quantitative approaches can also be used to help identify potentially successful ways of how to reduce inequity in outcomes. Educational effectiveness research (EER) is set up to disentangle the complex links between the student's intake (the mix of abilities, prior attainments, and personal and family factors) which any young person brings to the educational setting, from those of their educational experiences, and explore the way these jointly influence their later attainment, progress, and development (Coleman et al. 1966; Rutter et al. 1979; Mortimore et al. 1988; Scheerens and Bosker 1997; Teddlie and Reynolds 2000; Creemers et al. 2010; Muijs 2012). The main areas of interest are the impact of social institutions (including size of school effects), characteristics that promote better educational outcomes, the influence of context, the processes of institutional change, and the long-term impact of schooling on life chances. An effective school is defined as one in which the students' progress further than might be expected from consideration of its intake. An effective school thus adds extra value to its students' outcomes, in comparison with other schools serving similar intakes (Sammons 2010a). As a consequence, SER can be an effective approach to identify the characteristics of educational systems that may be better placed to reduce inequalities and inequity (Muijs et al. 2004; Creemers and Kyriakides 2008; Creemers et al. 2010). In the study of educational inequity, international comparisons are also a popular means to compare the size of attainment gaps between different countries or different educational frameworks, although it is recognized that there are difficulties in making such comparisons due to the influence of cultural and other

contextual factors. Furthermore, to evaluate effective means to overcome inequalities, studies conducted in different countries are often reviewed and form the base for research synopses. But while interpreting international findings, in addition to cultural or country effects, one needs to take into account possible differences in study designs, methodological approaches, or data analysis methods. It must be recognized that comparative studies involving qualitative or quantitative approaches and international comparisons, in particular, are vulnerable to misinterpretation and potentially misleading conclusions.

In this chapter we will present two large, longitudinal studies that are conducted in England and Germany to investigate children's development from preschool age onwards. A core question of both studies is whether and how far (pre)school can contribute to reducing educational inequity. We will describe the design of both studies, discuss similarities and differences in their methodological approaches, and then examine results that are based on the use of multilevel modeling approaches, regression analyses, and latent growth curve modeling and the estimation of effect sizes. Following this, the reasons underpinning the choice of methods and their implications for the interpretation of results from the two studies will be discussed.

The EPPSE3-16 Project in England and the BiKS3-10 Study in Germany

The *Effective Provision of Pre-School, Primary, and Secondary Education (EPPSE 3-16) project* began in 1997, at a time when in England the main educational priority at national and local level was for children in statutory schooling. The Rumbold Report (DES 1990) and the Start Right Report (Ball 1994) had highlighted the potential for preschool education to give children a better start to school, and Kathy Sylva had made a case for the mid- and long-term effects of early education on motivational and academic outcomes. Since 1997 successive UK governments have shown strong commitment to expanding preschool and early years services. The EPPSE project investigates the effects of preschool, primary, and secondary education on children's development for children aged 3–16 years old in England. The EPPE team collected a wide range of information on 3,000 children who were recruited at age 3+ and studied longitudinally. Data were collected on children's family background, the child's home learning environment, the preschool settings children attended, their primary and secondary schools, and their developmental profiles (cognitive outcomes as well as sociobehavioral development). The initial project aimed at investigating the short-, medium-, and long-term effects of preschool on children's intellectual and social-behavioral development. In addition, data on the characteristics of effective and high quality preschool settings were derived. The research gave also answers to the relative impact of child, family, and home learning factors on children's development. As the children grew older, the project gave insight into the joint effects of preschool experience and primary and secondary schooling on children's attainment and progress.

In Germany, the study *BIKS3-10 (Bildungsprozesse, Kompetenzentwicklung und die Formation von Selektionsentscheidungen im Vor- und Grundschulalter)*

Educational Processes, competence development and selective decisions at pre- and primary school age) started in 2005. This was after international school achievement studies had documented not only that achievements of German students are at best average but also more importantly that school achievements and school careers of children in Germany are more strongly linked to children's origin and the social background of the family than in many other countries (Marks et al. 2006; Döbert and Sroka 2004; Döbert et al. 2004). These findings have been discussed broadly, and as a consequence there has been great interest in the potential of preschool education to give children a better start to school. Particularly since 2005 the German government has made significant efforts to expand early years services to give children a better start to school, to raise the birth rate in Germany, as well as to help mothers to move back quickly in employment after the birth of a child. The BiKS study was set up to answer the question of how to improve learning environments of young children and to reduce inequalities. Another focus was the formation and effects of selection decisions, as Germany belongs to those countries where tracking takes place quite early (after 4 years of primary school) in the school career of young children. The study follows approximately 550 children, which attended 97 different kindergartens in the federal states of Bavaria and Hesse. Children were at average 3 years old when they entered the study and they will be studied until age 10. For most of the children, this period covers 3 years of kindergarten experience and 4 years of primary school. Data collection took place once or twice (for a subsample) a year. Verbal and cognitive developments of the children were tested. In addition, measures of children's social-emotional development were included. BiKS collected a wide range of information on children's background, home learning environment, and the preschools and the primary schools they attended (von Maurice et al. 2007).

Both studies are designed to investigate differential effects of (pre)school experience, family background, child characteristics, and home learning on children's cognitive and social/behavioral development. In addition, both studies implemented a mixed methods design drawing on interview and questionnaire data as well as tests and observations. Relevant elements of the study design and central constructs (e.g., preschool quality) are assessed similarly. However, when comparing the results of both studies, there are some limitations, which need to be kept in mind and discussed carefully when interpreting or drawing conclusions. First, EPPSE started in 1997 and BiKS in 2005. As consequence any differences in findings between the studies are likely to be confounded with effects of different time cohorts. On the other hand, the policy contexts in the UK and Germany when both studies were born seem to be comparable. Second, the EPPSE sample was designed to give a nationwide picture of early education services, whereas BiKS draws on a sample in two federal states which represent different sociodemographic structure. The number of children in each individual preschool center is higher in EPPSE than in BiKS. Third, the educational outcomes which were assessed in both studies are comparable in some ways, but the tests were designed to investigate progress within the samples. Fourth, both studies provide extensive information on child factors and family background, but some predictors which have been shown to have impact in EPPSE were not assessed in BiKS and vice versa.

Keeping these limitations in mind, we will now present findings from England and Germany based on these two studies which have been published. The first study described is the German study that investigates learning environments at home and at preschool and their relations to the development of early numeracy skills between the ages of 3 and 5 years (Anders et al. 2012). The second study is based on the EPPSE project and investigates the potential continuing influence of preschool education on children's cognitive attainment and progress in English primary schools between the ages of 6 and 10 years (Sammons et al. 2008). The studies not only look at different age ranges, but relevant differences between the projects have also led to the choice of different methodological approaches. We will compare and discuss the choice of methods and the implications for interpretation in both studies. The description of both studies is intentionally compact and dense. We include all the information necessary to discuss methodological approaches and the role of interpretation but not all details of the studies, as these can be found in the original publications (Anders et al. 2012; Sammons et al. 2008).

Findings from Germany: Learning Environments at Home and at Preschool and Their Relations to the Development of Early Numeracy Skills

Based on the longitudinal BiKS project, Anders and colleagues (2012) examined the development of children's numeracy skills between the ages of 3 and 5 years while children attend preschool. Four research questions were addressed:

First, the authors sought to identify the influence of several child and family background factors on developmental progress.

Second, the influence of the quality of the learning environment at home on development was investigated.

Third, the power of measures of preschool experience to predict the development of numeracy skills was tested.

The fourth research question aimed at analyzing whether the effect of preschool process quality is the same among children exposed to home learning environments of different qualities.

Methods

Sample

The sample was drawn from two federal states (Bavaria and Hesse) that cover a wide range of living conditions in Germany. The sample can be assumed to be representative for the selected regions and federal states. A total of 532 children

with at least one valid outcome measure and predictor were included in the analyses. Of the children (48.1 % girls), 10.0 % had one parent and 9.6 % had two parents with a native language other than German. With respect to maternal education, 34 % had graduated from the academic track. The number of included preschool classes was 97. Preschool classes in Germany are usually age mixed, meaning that the age range within one class may be from 0 to 6 years. The target population for the study were children to be enrolled in school in fall 2008. The average number of children assessed per class was 5.5.

Measures

Outcome Measures

Children's early numeracy skills were assessed using the arithmetic subscale of the German version of the Kaufman Assessment Battery for Children (KABC; Melchers and Preuss 2003). The development over three measurement points (age 3, 4, and 5 years) was investigated. Raw scores were used to document change over time.

Predictors

Gender, age in months, parental native language status (German/other), highest socioeconomic status in the family (SES), maternal education, and age at entry to preschool were included as *child and family background factors*. To assess the *quality of the learning environment at home (HLE)* in terms of promoting (pre) reading literacy and numeracy skills, two scale measures were developed based on data from questionnaires, interviews, and observations. The HLE verbal and pre-reading literacy scale contains ten items tapping literacy-related activities and access to material that stimulates pre-reading and verbal literacy experiences, whereas the HLE numeracy scale contains ten items tapping numeracy-related activities and access to materials thought to stimulate numeracy experiences. *Preschool measures* include structural factors such as the proportion of children whose parents had a native language other than German, class size, child-staff ratio, amount of space (m² per child), average age of the class, and federal state. The assessment of preschools' process quality was based on researchers' observations of each preschool setting on the German versions of the ECERS-R (Harms et al. 1998; Tietze et al. 2007) and the ECERS-E (Sylva et al. 2003; Rossbach and Tietze 2007). Whereas ECERS-R is a measure of the global quality of preschools, ECERS-E focuses on four educational aspects: the quality of learning environments for verbal literacy, mathematics, science literacy, and catering for diversity and individual learning needs.

Statistical Analyses

The influences on development were examined using latent linear growth models to the data. Model fit was evaluated with reference to RMSEA and CFI, using criteria suggested by Hu and Bentler (1999). Furthermore the variance accounted for in the model was analyzed. Standardized coefficients were estimated. The data have a nested structure, with children being nested in preschool classes, although the number of children per preschool class was rather low as an effect of the sampling strategy. However, ignoring the multilevel structure of the data might have led to unreliable standard errors of the coefficients in the model (Raudenbush and Bryk 2002). Thus, standard errors adjusted for the multilevel structure of the data were estimated. To deal with missing data, we chose the full information maximum likelihood approach (FIML) (e.g., Arbuckle 1996) which uses all available data to estimate model parameters. To account for possible selection bias, we chose a covariate approach and included child and family background indicators that might be correlated with the outcome as well as with the indicators of the quality of learning environments.

A stepwise analysis procedure was used which is illustrated in Fig. 1.

First, a null model with an intercept representing initial achievement and a linear slope representing growth was specified, considering only age at assessment as a predictor of numeracy skills. Child and family background factors were then tested as factors potentially influencing initial achievement level (intercept) and growth (slope) (Model 1). In a next step (Model 2a, 2b) the predictive power of the two

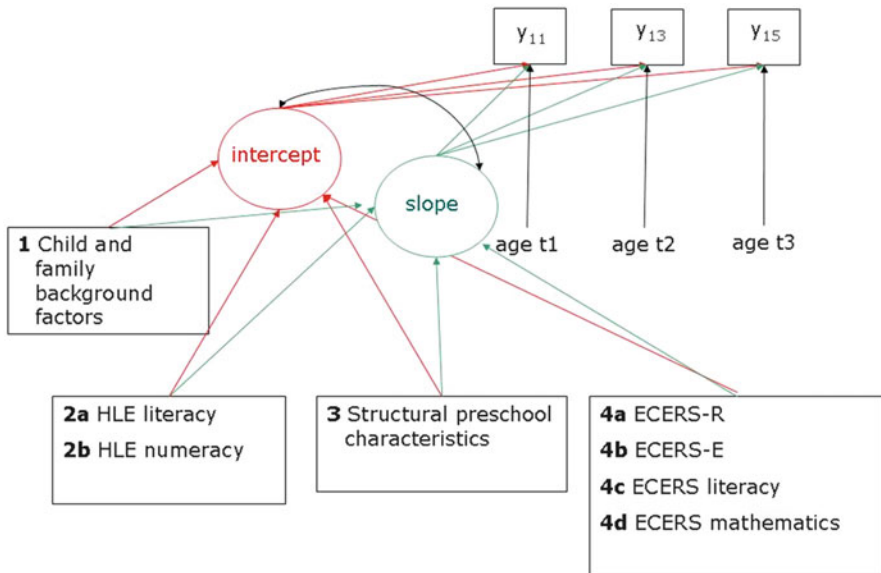

Fig. 1 Latent growth curve analysis: stepwise procedure (Anders et al. 2012)

scales assessing the quality of the home learning environment was tested, controlling for the child and family background used in Model 1. Third, the structural (quality) characteristics of preschools were added to the model, while controlling for child, family background factors, and the HLE indicators (Model 3). In the fourth step, indicators of preschool process quality (ECERS-R, ECERS-E, ECERS literacy, EECERS numeracy) were tested individually while controlling for child, family background, HLE, and structural preschool characteristics (Model 4a, 4b, 4c, 4d). Finally an interaction term to test whether the effect of preschool quality on development is different for children with different qualities of home learning environment was specified and included in the model (not included in Fig. 1).

Results

The null model confirmed linear growth of numeracy skills and a considerable variance in growth. Examining descriptive indicators for the quality of the HLE and preschool quality, we found that parental support in activities supporting (pre) reading and verbal literacy was significantly higher than in activities supporting numeracy. Furthermore, the mean scores of the ECERS revealed that preschool quality could be considered generally low to moderate in the sample, especially in terms of promoting children's academic development as measured by ECERS-E (see Anders et al. 2012 for more details on descriptive statistics).

Looking at the impact of child and family background factors (see Table 1), we found that mother's education had a significant influence on initial numeracy skills (intercept) but not on later growth. Girls started with higher levels of numeracy ($b = 0.36$, $p < 0.001$), but boys caught up over the years ($b = 0.60$, $p < 0.001$). Children whose parents' native language status was not German showed lower achievement at the first assessment, especially if both parents' native language was not German ($b = -1.21$, $p < 0.001$). This group also showed relatively stronger growth ($b = 1.01$, $p < 0.001$), although not closing the achievement gap to their peers completely. With respect to the influence of SES, children with higher SES already had higher numeracy scores at the first assessment ($b = 0.13$, $p < 0.05$), and the achievement gap even widened over the following 2 years ($b = 0.25$, $p < 0.01$).

Examining the impact of HLE, the results revealed that the quality of the home learning environment already explained substantial variance in numeracy at the first assessment (HLE literacy, $b = 0.29$, $p < 0.001$; HLE numeracy, $b = 0.14$, $p < 0.05$), when children were at average 3 years old. But there was no significant effect of HLE on the slope, indicating that the advantages of children with a high-quality HLE were maintained between the ages of 3 and 5 years. The influence of family background factors in the model was decreased when HLE indicators were included, suggesting that part of the relation between family background and numeracy is explained by the quality of the home learning environment.

Looking at the influence of preschool characteristics, we found that a number of structural characteristics (average age of the class, size of the preschool setting in m² per child, child-staff ratio) were associated with initial numeracy skills of the

Note: In all models, age at assessment was included as time-varying predictor, although not shown in the table. Coefficients were standardized using the variances of the continuous latent variables (Std-standardization)
 # $p < 0.10$, * $p < 0.05$

children, but not with further growth. In contrast, all of the indicators of preschools' process quality were not associated with initial numeracy skills. But the overall ECERS-E score was a significant predictor of growth ($b = 0.15$, $p < 0.05$) as well as the ECERS subscale mathematics ($b = 0.18$, $p < 0.05$). This scale was the preschool indicator showing to have the strongest influence on developmental growth.

The interactive effect between the quality of HLE and ECERS-E proved to be significant for the intercept ($b = 0.87$, $p < 0.05$) and for the slope ($b = 1.50$, $p < 0.05$). Comparing the effects of HLE and ECERS-E on children's development of numeracy skill, one observes that at the first measurement point (age 3), achievement differences seem to be influenced strongly by the quality of the HLE. Only the group of children with low-quality HLE seems to show already achievement differences related to preschool's process quality. At the third measurement point (age 5), average numeracy was especially high for those children exposed to medium- or high-quality HLE and high-quality preschool experience. Children with a medium-quality HLE seem to benefit particularly from a high-quality preschool. But children with a low-quality HLE did not seem to benefit from the quality of the preschool. These findings suggest that at least medium support at home may be necessary for children to take advantage of the opportunities for academic learning offered in preschool.

Findings from the UK: Investigating the Potential Continuing Influences of Preschool Education on Children's Cognitive Attainment and Progress in English Primary Schools During Key Stage 2

Sammons and colleagues (2008) examined children's cognitive development when they were already some years older (following up previous phases of the research on younger age groups studied from 3 to 7 years). They explored children's cognitive achievements at the end of Year 5 of primary school (age 10) and progress during Key Stage 2 (ages 6–10) based on EPPSE3-16 data. The first set of analyses examined achievement in reading and mathematics at age 10. The influences of a wide range of child, family, and home factors on children's attainment were tested. In addition, the authors investigated whether any net preschool or primary school effects could be established while controlling for the influences of the relevant child and background factors. Finally, the combined influences of different predictors such as pre- and primary school experience were explored.

The second set of analyses examined progress in reading and mathematics between the end of Year 1 of primary school (age 6) and end of Year 5 (age 10). Again, in a first step child, family and home learning factors were tested as potentially influencing factors. Additionally, it was investigated whether any

Fig. 2 Contextualized attainment models

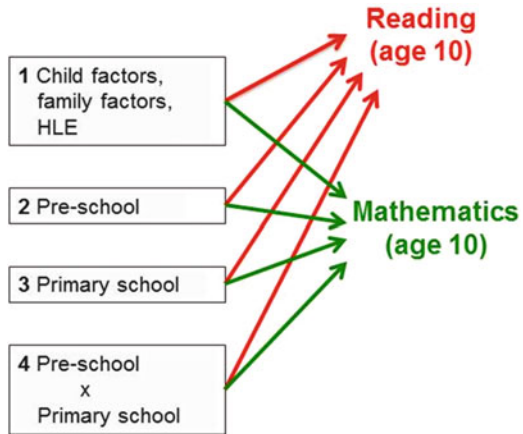

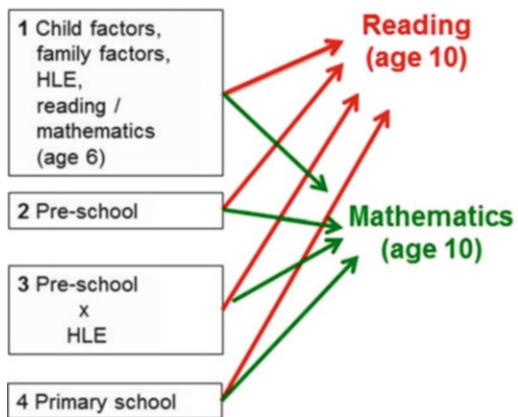

Fig. 3 Contextualized progress models

preschool effects for cognitive progress could be identified. In the last step analyses explored the combined effects of home learning environment and preschool experience on progress between age 6 and age 10. Figures 2 and 3 illustrate the strategy of analyses.

Data Source and Methods

Sample

The analyses of Sammons and colleagues (2008) are based on a sample of 2556 EPPSE3-16—children with valid standardized cognitive test scores at age 10. The sample may be regarded as nationally representative: a quarter of the children in the sample were classified as not white UK for ethnicity, and for 11 % English was a

second language (EAL). In terms of socioeconomic status, 19 % of the mothers' and 29 % of the fathers' occupations were in the professional categories. In total, nearly a fifth (19.4 %) of the children received free school meals, an indicator for low family income.

Measures

Outcome Measures

Cognitive achievements were assessed by NFER-Nelson Reading Level 2 and Mathematics Age 10 (NFER/France 1981; NFER/Patilla 1994) tests at the end of Year 5 of primary schooling. The test scores were age standardized using the EPPSE sample as a reference group ($M = 100$, $SD = 15$).

Predictors

The authors included the following *child and family factors* as potential predictors: gender, EAL, age in months, ethnic group, birth weight, parent record of early health problems, early developmental problems, premature child, number of siblings, family structure, parents' employment status, parental education, family salary, family SES, and the free school meals (FSM) proxy measure for low income. The *quality of the learning environment at home (early years HLE)* was assessed by an index that measures the frequency of engagement in certain activities at preschool age such as teaching songs and nursery rhymes, painting and drawing, reading to the child, taking the child to the library, practicing number, etc., as reported by the parents (Melhuish et al. 2008; Melhuish 2010). *Preschool measures* included the duration of preschool attendance and quality and effectiveness of the preschool center. The quality of preschool measure was based on researchers' observations of each preschool center using environment ratings (ECERS-E) (Sylva et al. 2003, 2006). The effectiveness measures for each preschool center in terms of promoting children's progress in pre-reading and early numeracy were obtained from earlier value-added analyses of children's progress between 3 and 5 years (Sammons et al. 2002, 2004). Similarly, measures of *primary school academic effectiveness* were derived from independent value-added analyses of pupil progress for three successive full national pupil cohorts (2002–2004) using national assessment data sets matched between Key Stages 1 and 2 over 3 years for all primary schools in England (Melhuish et al. 2006). The estimates for the individual primary schools attended by EPPSE children were added to the EPPSE database. *Children's prior cognitive achievements* were used as predictors in the progress models, but not in the Year 5 attainment models. Attainments at age 6 were assessed by NFER-Nelson Reading Level 1 and Mathematics Age 6 tests administered at the end of Year 1 of primary schooling (NFER/France 1981; NFER/Patilla 1999). Like

the outcome measures, these test scores were age- standardized using the EPPSE sample as reference group ($M = 100$, $SD = 15$).

Statistical Analyses

Contextualized Pupil Achievement Models

The influences on pupils' attainments at age 10 were examined using multilevel regression analyses. First, all available child, family, and home characteristics were tested stepwise. Only statistically significant variables were retained in the final models. This procedure produced two background models for reading and mathematics outcomes. The strengths of the influences of the different factors were compared using effect sizes (ES) and overall variance accounted for in the models. The effect sizes were based on the child level variance after controlling for background factors and coefficients for predictors included in the multilevel statistical models adopting the formulae outlined by Tymms et al. (1997).¹ The data have a nested structure, with children being nested in primary school classes, although the number of children per primary school class was rather low (2.7). However, ignoring the multilevel structure of the data might have led to unreliable standard errors of the coefficients in the model (Raudenbush and Bryk 2002). Thus, the use of multilevel models was retained to provide more efficient and accurate estimates of fixed effect predictors at level 1 (the main focus of this aspect of the research). The progress models were built using the background factors of the achievement models, but the equivalent prior cognitive assessments at age 6 were additionally included as baseline measures for the longitudinal analyses of pupils' progress between age 6 and age 10.

Results

Attainment Models

Null Models

The null models with no explanatory variables included indicate for reading that the intra-class correlation is 18.6 %. This shows the amount of variance in children's scores related to differences between individual primary schools, while the majority

¹ $ES = 2r/(1 - r^2)^{0.5}$ or $\Delta = \beta_1/\sigma_\epsilon$

In essence the effect size is being taken as the difference in standardized criterion residuals, after appropriate controls, corresponding to predictor scores one SD above and one SD below the mean.

reflects differences between individual children. The intra-class correlation for mathematics in the null model is slightly higher (21.2 %).

Contextualized Background Models

The contextualized multilevel model for attainment in reading includes mother's highest qualification level ($ES = 0.63$, degree versus no qualification) and the quality of the early years HLE ($ES = 0.58$, very high versus low) as the strongest predictors. Furthermore, gender ($ES = 0.11$, girls versus boys), birth weight ($ES = -0.40$, very low versus normal), the ethnic group ($ES = -0.37$, White European versus White UK), the number of siblings ($ES = -0.20$, 3+ siblings versus singleton), the need of EAL support in Year 5 ($ES = -0.38$), and early developmental problems ($ES = 0.42$, 2+ problems versus no problems) were child factors with a statistically significant influence on reading outcomes at age 10. With respect to family factors other than mother's education, eligibility for free school meals ($ES = -0.28$), family SES ($ES = -0.38$, unskilled versus professional nonmanual), father's education ($ES = 0.32$, degree versus no qualifications), and family salary ($ES = 0.27$, annual salary £ 67,500, and higher versus no salary) showed a statistically significant impact on reading outcomes.

The contextualized background model for mathematics achievement at age 10 is quite similar to the model for reading achievement with mother's qualification and the quality of HLE being the strongest predictors for achievement. Thus, we only highlight the relevant differences to the reading model. Looking at child factors, gender also showed a significant influence on test scores in mathematics, but here boys outperform girls ($ES = -0.10$). The number of siblings and the number of early developmental problems were not related to achievement at age 10, but the number of reported early health problems was ($ES = -0.45$, three or more problems versus no problems). With respect to family factors, all the factors that were predictive for reading outcomes were also found to be significantly related to outcomes in mathematics. The detailed results of the attainment models can be found in Table 2.

Preschool Effects

With respect to the influence of preschool experience, the findings revealed that at age 10 there were no longer any statistically significant net effects on cognitive outcomes for the most basic indicator: attendance at a preschool center compared to no preschool. This is in contrast to findings for the EPPSE sample at younger ages (Sammons et al. 2003, 2004) where attendance at any preschool center showed to have a significant positive net effect on early cognitive abilities like pre-reading or early number concepts. At age 10 years, this effect seemed to have faded, but when analyzing the influence of preschool quality, relatively small but statistically significant differences in reading attainment remain between children who went

to high-quality ($ES = 0.15$) or medium-quality preschool ($ES = 0.14$) compared to children who went to low-quality preschool. Interestingly, children who stayed at home did not show better or worse outcomes than those children who went to a low-quality preschool center. For mathematics, no statistically significant net quality effects were found. With respect to the effectiveness of the preschool attended, the analyses revealed that measures of preschool effectiveness still showed a small positive net impact on children's achievements in reading and mathematics at Year 5 of primary school (e.g., $ES = 0.13$ for reading when comparing preschool centers highly effective in promoting pre-reading to preschool centers low effective in promoting pre-reading; $ES = 0.21$ for mathematics when comparing preschool centers highly effective in promoting early number concepts to no preschool).

Primary School Effects

Further multilevel analyses were conducted to explore the net impact of overall primary school academic effectiveness controlling for all relevant family, child, and home learning characteristics. The results showed that the academic effectiveness of the primary school attended was a significant predictor of better academic outcomes for the EPPSE children in both domains. Children who had moved on to attend a high or medium academically effective primary school in terms of their school's overall mathematics results in national assessments measured across 3 years had significantly better scores in separate project tests of mathematics at age 10 than children who had attended a low academically effective primary school ($ES = 0.28$, when comparing highly effective primary schools to low-effective primary schools). Also, children who had attended a primary school identified as highly academically effective in terms of national assessment English results across 3 years also had significantly better reading attainment at age 10 compared to children who had attended a low academically effective primary school ($ES = 0.19$).

Combined Influences of Pre- and Primary School Effectiveness

In addition to separate analyses of pre- and primary school effectiveness, these two measures were combined and included in the same model, so that their joint effects on achievements could be examined. The aim of the analyses was to investigate whether going to a more effective preschool had a protective influence if a child then went on to attend a less academically effective primary school and whether home children or those who had attended only a less effective preschool center did better later if they moved on to a more academically effective primary school. For achievement in mathematics, the results indicate that children who went to a highly effective preschool center show the higher attainment irrespective of the academic effectiveness of the primary school attended later ($ES = 0.58$). They maintained the

early benefits received from attending a highly effective preschool center. But when looking at those children who did not go to preschool or went to a low-effective preschool center, these children benefit especially from then moving on to attend a medium to high academically effective primary school later ($ES = 0.45$, $ES = 0.44$). The results for reading followed very much the same pattern.

Progress Models

Simple Progress (Value Added) Models Only Controlling for Prior Achievements

Standardized test scores were used for reading and mathematics at age 6 and age 10. Therefore, progress and its influencing factors could only be analyzed in relative terms. The results of the simple value-added models only controlling for prior reading or mathematics achievements at age 6 showed that much of the variation of mathematics test scores at age 10 is accounted for by prior attainment by 42.4 %. The proportion for reading is somewhat lower (34.7 %), thus achievement in mathematics seems to be more stable over time. The intra-class correlations (ICC) were 0.18 for both reading and mathematics showing that 18 % of the unexplained variance in EPPSE children's academic progress was associated with the individual primary school attended.

Contextualized Progress Models

In a second step it was tested whether those predictors which had shown to be predictive for achievements at age 10 were also predictive for progress between age 6 and age 10. With respect to reading the analyses revealed that mother's qualification ($ES = 0.61$, degree compared to no qualification), the quality of the early years HLE ($ES = 0.44$, high-quality HLE versus low-quality HLE), and a record of early developmental problems ($ES = -0.45$, 3+ problems compared to no problems) remained significant predictors when prior attainment at age 6 was included in the model. With regard to mathematics the findings indicated that boys ($ES = 0.20$) and children with Indian background ($ES = 0.68$) showed better progress. The need of EAL support ($ES = -0.37$) and early health problems ($ES = -0.24$, 3+ problems compared to no problems) were negatively associated with progress in mathematics. In contrast, high parental qualification levels showed a positive influence (mother, $ES = 0.42$; father, $ES = 0.24$; degree versus no qualifications).

Preschool Effects

Attendance at a preschool center compared to no preschool experience was not significantly related to progress in reading or mathematics between age 6 and age

10 when controlling for all relevant child, family, and home background factors and prior attainment. But examining the effects of preschool quality and preschool effectiveness, we found a weak but significant positive effect of preschool quality for progress in reading ($ES = 0.13$, high preschool quality compared to low preschool quality). In addition, children who went to a highly effective preschool center in promoting pre-reading skills also showed better progress in reading between age 6 and age 10 at primary school ($ES = 0.16$, highly effective preschool center compared to low-effective preschool center). In contrast no significant net effects of preschool quality or preschool effectiveness could be established for progress in mathematics. To summarize, the results suggest that the effect of preschool experience on mathematics operates mainly by providing children with a better start at entry to primary school that lasts to age 10 at least, whereas in reading a high-quality or highly effective preschool can also give children a small boost in terms of promoting better academic progress in primary school, as well as better attainment at age 10.

Primary School Effects

Further multilevel analyses showed that children who attended a highly academically effective primary school progressed significantly better in reading ($ES = 0.25$ for highly effective primary schools compared to low-effective primary schools) and mathematics ($ES = 0.28$ for highly effective primary schools compared to low-effective primary schools) between Year 1 and Year 5 of primary school. In these models all relevant child, family, home, and preschool factors plus prior attainment at age 6 were controlled.

Comparing the Methodological Approaches in Both Studies and the Role of Interpretation

In the final part of this chapter, we compare the methodological approaches of both studies and discuss the role of interpretation. We have chosen ten aspects that may be used to illustrate the importance of interpretation in research methods.

The Definition of Disadvantage in Both Studies

Both studies are especially interested in the question of how to overcome social disadvantage in educational systems. A comparison of both studies reveals that already the selection of characteristics to define social disadvantage may have a

strong influence on later interpretation, e.g. HISEI in BiKS versus SES definition in EPPSE and, parental native language status as an indicator for migration background in BiKS versus ethnicity and the need for EAL support in EPPSE. Both studies apply a concept that underlines the importance of the quality of the early years home learning environment for educational advantage or disadvantage, but the measurement of the indicators is not the same, although there are similarities. Lack of preschool experience may be seen as one aspect of disadvantage. By design, EPPSE is able to investigate the impact of lack of preschool experience, whereas BiKS was—due to the very high preschool attendance rates in Germany—not able to realize a comparison home group. These differences in definitions need to be kept in mind when interpreting results especially when it comes to specific effects of preschool education for disadvantaged children. The reason that some studies, e.g., EPPSE (Sammons et al. 2008), are able to show that high-quality preschool education is especially beneficial for children from disadvantaged backgrounds and others, e.g., BiKS (Anders et al. 2012), cannot may be simply due to different concepts and measurements of disadvantage.

The Choice of Control Variables: Controlling for Selection Bias

This aspect is related to the definition of disadvantage. Both studies use a covariate approach to control for selection bias. But this approach may be less conservative than other approaches like propensity score matching, especially in unbalanced samples (NICHD ECCRN and Duncan 2003). The BiKS sample is relatively small, and to avoid problems of multicollinearity and to be able to fit the appropriate statistical models to answer the research questions, a limited number of control variables were chosen based on theory and driven by preliminary analyses. But when interpreting the data, one needs to consider that some indicators which have been shown to have impact in other large studies like EPPSE or the NICHD study are not controlled for (e.g., salary information or information on birth weight). The fact that structural preschool characteristics are related to initial numeracy skills at age 3 may be a hint that the set of control variables is not sufficient. EPPSE chose an exploratory, stepwise approach to define the set of control variables and included more variables in their background models. Thus, in EPPSE the danger of misinterpretation due to selection bias seems to be lower, although interpretation of net effects of individual predictors becomes more difficult, the higher the number of predictors in the models. The EPPSE research indicates that SES and income effects in terms of inequity in attainment are likely to be overestimated if other linked but conceptually different measures (education of parents and home learning environment) are not studied (Sammons 2010b, c; Sammons et al. 2004).

Designs With and Without a Control Group

To be able to investigate the disadvantage that may be experienced by children who do not get the chance to attend preschool, the inclusion of a control or comparison group in the study design is necessary. But control groups may not be easily realized due to the fact that attendance rates are now so high (e.g., over 90 % in Germany for the last year before children move on to primary school; Autorengruppe Bildungsberichterstattung 2012, p. 242). Furthermore, as the empirical evidence on potential benefits of preschool education has grown, they may not be realized anymore due to ethical reasons. In particular, experimental designs, like the Perry Preschool Project (e.g., Schweinhart et al. 2005), are unlikely to prove acceptable in societies in the twenty-first century in Germany or England. Parents are very unlikely to agree to random allocation of their children to attend or not attend a preschool. Applying strict interpretation standards, any study without a randomized control group cannot draw firm, causal conclusions related to the question whether pure attendance of preschool may be helpful to overcome social disadvantage. Nonetheless, by statistically controlling for other factors, we may make more tentative claims, such as attending preschool predicts better outcomes, particularly where we show gradations of impact by quality or duration of attendance. In BiKS, for example, we find that especially for children who grow up in families with both parents having a different native language status than German catch up markedly in their numeracy skills over the preschool period. All BiKS children attend preschool, and we might suggest that one interpretation is that this could be due to preschool attendance, but this interpretation can only be a speculation as it is methodologically not justified. On the other hand, designs with control groups in educational research can suffer from highly selective control groups. This selectivity also needs to be accounted for in interpretation, especially when small, unbalanced control groups are used. Overall, it is recognized that covariate approaches are unlikely to be able to fully control for potential selection bias and thus that causality cannot be claimed from such designs, but that they may nonetheless have an important role to play, just as in epidemiological research in health that studies naturally occurring variation (Steiner et al. 2010).

Methodological Approaches to Assess the Quality of Home Learning Environment

The EPPSE research relied on initial parent interviews conducted at entry to the study to collect data about parental learning activities with their children and then created an overall early years HLE index (Melhuish et al. 2008). While a strong predictor, there may be error and bias in parent self-reports by interview or survey. By contrast, observations of parent-child interactions in the home can provide other evidences from trained and reliability checked field researchers. Nonetheless, the

presence of an observer may well alter parent–child interaction and behavior. BiKS used observation-based measures of the quality of the home learning environment as well as parental interviews and created one index that integrates different contents and methods (Kluczniok et al. 2013). The HLE indicator used in BiKS accounts for a comparatively high amount of variance already at age 3 which may be due to superior measurement properties since the combination of different methods enabled the creation of a very powerful indicator. These differences also need to be kept in mind when comparing results of different studies. Another aspect related to the investigation of the influence of the quality of the home learning environment is the question of how to disentangle effects of social background and the home learning environment. Studies which were set up to investigate this research question most often look at the impact of social background and the quality of home learning environment individually as well as together. Using this strategy, the additional impact of the home learning environment when controlling for social background may be analyzed. However, the results will still highly depend on characteristics of the sample and definitions of social background and home learning environment (see above). So it is not altogether surprising that some researchers have argued that the effect of social background can be attributed to differences in the quality of home learning environment (Guo and Harris 2000), whereas others find that there is some overlap of explained variance but that this is not complete with both also having a unique contribution in predicting attainment for young children (Melhuish et al. 2008; Anders et al. 2011; Sammons et al. 2004, 2008, 2013a, b).

Pre(school) Quality and Effectiveness

Both BIKs and EPPSE collected internationally recognized ECERS measures (Harms et al. 1998; Sylva et al. 2003) of observed preschool center quality, which allows comparison of differences in observed quality between individual preschools and among types of preschools, as well as exploration of possible differences in quality between preschools in Germany and England to be studied. But there are some limitations in the use of ECERS in these studies. First, the development of the ECERS scales was based on the preschool tradition in the USA and England. So the traditions of other countries might not be fully reflected. Although we find that ECERS scores predict children’s cognitive progress in a German sample, still the relationships might be stronger if we used a measure that was developed with the German kindergarten tradition and the German curriculum in mind. Furthermore, the BiKS sample was drawn only from two federal states and cannot be treated as nationally representative. The EPPSE decision to sample approximately equal numbers of different types of preschool centers also means that EPPSE data is not nationally representative of overall quality differences; results would need to be weighted according to the prevalence of use of different types of provision.

Another aspect that needs to be kept in mind is the association of preschool quality based on ECERS scores and children's progress. Although a number of studies have found a moderate positive association between ECERS scores and students' progress (e.g., Anders et al. 2012, 2013; ECCE-Study Group 1999; Sammons 2010b, c), some others have not identified this association. So another perspective in looking at the potential of preschool education might be useful. EPPSE sought to examine preschool effects in several ways related to going to preschool or not, duration of attendance, the quality of preschool attended, and the effectiveness of the preschool attended. When studying effectiveness EPPSE sought to identify individual center effects based on studying the effects of individual centers. Effectiveness scores were derived by value-added analyses of children's progress during their time in preschool from ages 3 to 5 years on average (Sammons et al. 2002, 2004). These residual measures are used as indicators of the potential of individual preschool centers to promote children's development while controlling for relevant intake factors. Only studies that are designed to use multilevel modeling are able to obtain such effectiveness estimates for individual preschool centers. This aspect is further explored in the next paragraph.

Multilevel Modeling Versus Adjusted Standard Errors

Multilevel modeling is widely recognized a key methodological tool in much educational effectiveness research (Goldstein 2003; Sammons and Luyten 2009) because it allows researchers to model the effects of clustering in data sets that links with organizational units (preschools, classes, schools) of special interest in education. However, in longitudinal studies it is not always feasible to collect sufficient data to allow for clustering effects across different sectors and phases. Ideally cross-classified models can be applied (Goldstein and Sammons 1997; Leckie 2009), but this requires very large samples. In Germany, for example, children are often cared for in age-mixed groups covering the age range from 0 to 6. Any educational study will look at a certain cohort of children and due to restricted resources will not be able to conduct quality observations in all the groups. The BiKS study studied children that were to be enrolled in school in 2008 and decided to sample one group per preschool center (von Maurice et al. 2007). As a consequence, the number of children per group and per preschool center is most often comparatively small (average 5). In the analyses, the BiKS team needs to account for possible effects of the multilevel structure. However, due to the small number of children per group, the design is not ideal for multilevel modeling, and the possibilities to use cross-classified models or obtain individual center level effectiveness scores are restricted. The EPPSE research in England explicitly sought to study individual preschool center effects as well as effects of quality and type of preschool. It therefore recruited a child sample clustered at the preschool level from 141 settings with approximately 15–20 children per center. However, the preschool sample later moved on to attend over 800 primary schools, thus the sample was not clustered

at the school level due to the very small numbers of EPPSE children in most primary schools. Due to this cross-classified models were impractical. However, it proved possible to obtain data for full cohorts of pupils in all primary schools in England to investigate the academic effectiveness of individual primary schools using multilevel models to calculate value-added residual estimates (Melhuish et al. 2006) based on data for matched pupil cohorts across 3 years and based on over 15,000 primary schools.

Stepwise Explorative Versus Theory-Driven Choice of Variables in the Models

The EPPSE research sought to model first the child and then the family and then the early years HLE effects before testing potential preschool or school influences. Measures were collected that had been shown to be relevant in previous educational research as likely predictors and that were relevant to the concept and study of educational disadvantage. EPPSE created an additional indicator of multiple disadvantage based on combinations of child, family, and HLE measures employed to study the concepts of risk and resilience (see Hall et al. 2009, 2010; Sammons et al. 2013a, b).

The use of stepwise approaches meant that it became possible to disentangle net effects of different sources (child, family, preschool, and school) of children's development. With respect to the order, different predictor families were included in the model; the strategy of EPPSE reflects a typical socio-systemic approach in the tradition of Bronfenbrenner (1994) meaning that predictors are included in the model in the order they may be hypothesized to influence the child (from proximal to distal). The stepwise-explorative approach also means that individual predictors are included stepwise as long as they have a significant impact on the outcome or the model. With a large number of potential predictor variables, this approach always also implies a probabilistic decision in the choice of background variables finally included in the model. BiKS also used a stepwise approach, but defined driven by theory beforehand a relatively small set of control variables to be included in the analyses. The theory-driven selection of variables is an advantage, but there are also some disadvantages to this approach as has been mentioned previously: failure to include potentially important background variables in a model might lead to misinterpretation of significant results because the effects of certain background variables are not controlled. However, the sample of the BiKS study is relatively small compared with EPPSE, and the choice of a larger set of control variables might have led to problems of multicollinearity (Farrar and Glauber 1967), difficulties in convergence of the latent growth curve models (Stoel et al. 2003, 2004a, b), and difficulties in interpreting the net effects. In practice analyses showed that the limited set of common and potentially important, theoretically driven control variables worked well. In the BiKS study the preschool effects were comparable in size to other studies that had worked with larger sets of control variables (Anders et al. 2012).

Standardized Versus Unstandardized Outcome Measures

By using age standardized tests, the impact of a child's age is already controlled (thus, the poorer outcomes of young-for-their-year summer-born versus autumn-born children may be masked or overlooked in interpreting educational disadvantage).

However, there are advantages in comparing the strength of relationships across different measures within and between studies. In the EPPE research additional analyses on age unstandardized outcomes were used to examine age effects specifically (i.e., the summer impact in predicting SEN), but in other instances age standardized results were used to allow comparison across outcomes and models. The use of unstandardized outcome measures has the advantage that growth over time and the influence of age at different measurement points may be more easily observed. But growth curve models require instruments that are able to measure skills over a broad age range and few such instruments exist.

Value-Added Regression Analyses Versus Latent Growth Curve Modeling

Latent growth curve models are often deemed to provide a better picture of progress or developmental change over several years. In the BiKS study latent growth curve models were applied. However, there are data constraints that also affect interpretation. When applying latent growth curve analyses, outcome measures must cover the same constructs at different time points, and the larger the time span, the larger is the danger of reduced variance at the lower and upper bounds of a scale; in other words, ceiling or floor effects might occur. Ceiling or floor effects impair the ability to determine the central tendency of the data, and reduced variance on the dependent variable might impair the ability of detecting effects of independent variables on the dependent variables (Cramer and Howitt 2004). Furthermore, practice effects can occur when using the same test over several time points. In the reported BiKS study, the data were carefully checked, and ceiling or floor effects could be ruled out, and the possibility of practice effects was very low due to the specific scale used. However, any study using latent growth curve analyses needs to check very carefully if the data is appropriate for this type of analysis; otherwise, misinterpretations of results will occur. In the EPPSE research standardized external tests were used only in Years 1 and 5, while national assessment data were collected in Years 2 and 6. The measurement differences meant that growth curve modeling would be inappropriate for cognitive outcomes since the constructs measured were not identical. Thus, differences in measurement might be conflated with growth trajectories.

The Use of Effect Sizes

Effect sizes can provide a useful additional tool to express the strength of relationships between predictors and outcomes. Cohen (1988, 1992) proposed conventions for small, medium, and large values for different effect size indices that are now commonly used. For example, for d-type effect sizes an effect of under 0.2 is seen as fairly weak, one of 0.5 as moderate, and 0.8 plus as strong. Effect sizes are often used in economics and can be seen as helpful by policy makers especially in making decisions about funding (see Schagen and Elliot 2004 for a discussion). However, they are also dependent on the model adopted and set of controls included as predictors. Cohen (1992) describes his intentions for the effect size conventions and he states that the intent was that a “medium effect size represent an effect likely to be visible to the naked eye of a careful observer.” He set “small effect size to be noticeably smaller than medium but not so small as to be trivial,” and he “set large effect size to be the same distance above medium as small was below it.” It is obvious that the conventions are somewhat arbitrary. It is not difficult to think of situations where a small effect observed in one setting might be more important than a large effect observed in another. In educational studies effect sizes often tend to be rather small when applying Cohen’s rules; however, these small effects often have high practical relevance or imply large monetary benefits in the long run. For example, a small effect that raises attainment for large number of students in many schools at little cost could be more important overall to policy makers than a large effect for an expensive intervention that applied only to a very small number of students with special characteristics. When interpreting effect sizes the context of research always matters.

Conclusions

This chapter has provided an account of two ongoing large studies that provide insights into preschool and primary school research from the educational effectiveness tradition. Both studies had a strong interest in the investigation of equity and educational disadvantage. The two research projects sought to examine the way different child, family, HLE, and educational influences shape young children’s attainment and progress in academic outcomes as well as social behavior and affective domains using longitudinal designs and multivariate analyses. The examples discussed here provide a focus on the analyses of cognitive and academic outcomes and changes in these over time (elsewhere social behavior has been explored).

Further follow-up research on EPPSE has gone on to use structural equation models to investigate indirect and direct effects. It reveals that preschool quality can act as a protective influence (Hall et al. 2013) and also that the academic effectiveness of primary school attended can help to protect children from the adverse effects of experiencing multiple

(continued)

disadvantage in early childhood (Sammons et al. 2013a, b). Similarly, Anders et al. (2013) have provided further analyses of BiKS data that reveal preschool and primary school influences on the development of early numeracy skills up to age 7 in Germany. While there are similarities in design, measures, and methodology, there are also differences. This means that simple direct comparisons are not always appropriate, as in many comparative studies. However, the two examples highlighted here provide an opportunity to examine how research aims and questions, sample size, and measures collected helped to shape the analysis strategy. The chapter uses examples of findings and their interpretation to illustrate how quantitative research and different modeling strategies can be used and seeks to identify their strengths and limitations. There is growing evidence that methodological developments can lead to theoretical advances in educational effectiveness studies, also that theoretical insights can prompt the development of more appropriate analytic techniques (Creemers et al. 2010; Sammons 2012; Hall and Sammons 2013). In educational effectiveness research hierarchical regression approaches such as multilevel modeling have the power to explore the impact of clustering in data and potential institutional effects. However, all such approaches depend heavily on the quality of the sample and the measurement of key constructs and control variables. The adequacy of the model (both its technical fit and its theoretical underpinnings) is crucial in the evaluation of the confidence we can place in results. Clarity of aims, appropriate design, building on previous research, and good measurement linked with theory remain essential features of high-quality research and will be key to choices of appropriate methodology and statistical analysis.

7.6 Beyond the Quantification of Irregular Migrants: From “Knowledge on the Case” to “Knowing How to Go On”

Elias Hemelsoet

Introduction

For various reasons, irregular migration has become a more frequent phenomenon during the last decades. Without going deeper into the globalizing context of growing and changing migration tendencies in different parts of the world, it should be remarked that this topic is gaining attention. Until recently, there was only a limited amount of scientific evidence on irregular migration (with a focus on clandestine activities such as human trafficking and smuggling). But these days, in Western societies there are humanitarian and social problems related to the growth of this group, problems which have stimulated political discussion. This has subsequently led to scientific research on the subject. Irregular migrants have become visible in our everyday lives. They defend their rights in self-help groups, protest marches, and hunger strikes, and they are visible in the streets: we are all familiar with the salesman in the Pakistani night shop, the East European or South American cleaning lady in the hotel, and the gypsy woman begging for money. These clichés provide prototypical examples of the role irregular migrants play in the public imagination. As a consequence of this situation, both politicians and scientists want to “grab hold” of what is happening and to acquire an overview of the state of affairs. Predominantly short-term government-driven research is flourishing.

It is interesting to have a closer look at this research. In 2005, the UK government attempted to estimate the numbers of irregular migrants and published the UK’s first official estimate of irregular migration (Woodbridge 2005). The aim of the study was to review methods that have been used in different countries to estimate the number of illegal resident persons, followed by an assessment of the

B-9000 Ghent, Belgium

e-mail: elias.hemelsoet@ugent.be

applicability of these methods to the UK. The presupposition of this government-directed initiative is the idea that “sizing the illegal resident population” will contribute in some way or another to migration policy. The Institute for Public Policy Research (IPPR) tries to look at things in a broader perspective. This organization defines itself as the UK’s leading progressive think tank. Along with other tasks, it tries to engage the media and the public in an informed and evidence-based debate on current policy issues. In the 2006 report (described as a “FactFile”) “Irregular migration in the UK,” researchers are at a standstill regarding key questions considering this topic. Recognizing the usefulness of the estimate in the Home Office report, this “FactFile” attempts to do more than estimate numbers and deal with some of the broader policy issues that irregular migration raises. The following questions are at stake:

- Who are irregular migrants? How do they differ from illegal, undocumented, and unauthorized migrants?
- Why do irregular migrants come to the UK?
- How many irregular migrants are there?
- How do irregular migrants enter the UK?
- Where do irregular migrants come from?
- Where do irregular migrants work?
